

A NEW AND COMPLETE  
DICTIONARY  
OF  
ARTS and SCIENCES;  
COMPREHENDING ALL

The Branches of Useful Knowledge,

WITH  
ACCURATE DESCRIPTIONS as well of the  
various MACHINES, INSTRUMENTS, TOOLS, FIGURES,  
and SCHEMES necessary for illustrating them,

AS OF  
The Classes, Kinds, Preparations, and Uses of NATURAL  
PRODUCTIONS, whether ANIMALS, VEGETABLES,  
MINERALS, FOSSILS, or FLUIDS ;

Together with  
The KINGDOMS, PROVINCES, CITIES, TOWNS, and  
other Remarkable Places throughout the WORLD.

Illustrated with above Three Hundred COPPER-PLATES,  
curiously engraved by Mr. JEFFERYS, Geographer to his Royal  
Highness the Prince of WALES.

The Whole extracted from the Best AUTHORS in all Languages.

By a SOCIETY of GENTLEMEN.

MDCCLIV.

# A NEW AND COMPLETE DICTIONARY OF ARTS and SCIENCES.

## D A B

**D**, One of the letters of the alphabet, the fourth in order, and the third consonant, answering to the hebrew daleth, and greek delta.

As a numeral, D denotes 500; and with a dash over it, thus  $\overline{D}$ , 5000. Used in abbreviation, it has various significations: thus, D. stands for doctor, as M. D. doctor of medicine; D. T. doctor of theology; D. D. signifies doctor of divinity, or dono dedit; D. D. D. is used for dat, dicat, dedicat; and D. D. D. D. for dignum deo donum dedit.

Among musicians D marks, in thorough basses, what the italians call descanto, and intimates, that the treble ought to play alone, as T does the tenor, and B the bass. See the article DESCANT.

**D C**, in the italian music, an abbreviation of da capo, that is, from the head, or beginning; these words, or letters, being commonly met with at the end of rondeaus, or such airs and tunes as end with the first strain, intimate that the song is to be begun again, and ended with the first part.

Among roman writers D stands for *divus*, *decimus*, *devotus*, *diebus*, and *diutius*.

**DAB**, in ichthyology, the english name of a species of pleuronectes, with the eyes on the right side, obtuse teeth, a spine near the anus, and the body defended by rough scales.

**DABAS**, the name of cloths and woollen stuffs of the manufacture of Bas in Languedoc.

## D A C

**DABUIS**, a white cotton stuff, made in the East-Indies.

**DABUL**, a port town in the province of Decan, on the western coast of the hither India, north lat.  $17^{\circ} 30'$ . east long.  $72^{\circ} 30'$ .

**DACA**, a city of the province of Bengal, in the East-Indies, situated on a branch of the river Ganges, east long.  $89^{\circ}$  and north lat.  $23^{\circ} 30'$ .

**DA CAPO**. See D C, *supra*.

**DACE**, the english name of a species of cyprinus, very common in our rivers: it is longer and more slender than the roach, and has ten rays in the fin beside the anus. See the article CYPRINUS.

The dace is the slenderest and most rounded in the body of all the cyprini; its usual length is about six or seven inches, though it will grow much larger. See plate LXVII. fig. 1.

**DACOLITHUS**, in ichthyology, a species of cobitis, or loach, with a forked spine under each eye. See COBITIS.

**DACTYL**, *δακτυλος*, *daçtylus*, in antient poetry, a metrical foot, consisting of one long and two short syllables, as *ἀλκιμος*, and *μῦρμῦρ*.

The dactyl and spondee are the only feet or measures used in hexameter verses; the former being esteemed more sprightly, and the latter more solemn and grave. Accordingly, where great activity is signified, we find the dactyls used with much propriety, as in the following verses of Virgil.

*Quadrupedante putrem sonitu quatit ungula campum;* and,  
*Ferte citi ferrum, date tela, scandite muros.*

**DACTYL**, among antient botanists, the same with date. See the article **DATE**.

**DACTYLIC VERSES**, in antient poetry, hexameter verses ending with a dactyl. See **DACTYL** and **HEXAMETER**.

**DACTYLIOMANCY**, *daſtylomantia*, a sort of divination, performed by means of a ring; consisting chiefly in holding the ring suspended by a fine thread over a round table, on the edge whereof were made several marks with the twenty-four letters of the alphabet; and as the ring, in shaking or vibrating over the table, happened to stop over certain of the letters, these being joined together, composed the answer required.

**DACTYLIS**, in botany, a genus of the *triandria digynia* class of plants, the flower of which is a bivalve glume, and its fruit a single roundish seed, contained in the cup and flower.

**DACTYLUS**, **DACTYL**, in poetry. See the article **DACTYL**.

**DACTYLUS**, in zoology, a name used by the antients for the solen, or razor-fish. See the article **SOLE**.

**DACTYLUS IDÆUS**, the same with the belemnites. See **BELEMNITES**.

**DACZAJIE**, a silver money current in Persia, and worth five mamoudis. See the article **MAMOUDI**.

**DADO**, in architecture, the same with the dye. See the article **DYE**.

**DADUCHI**, in antiquity, priests of the goddess Ceres, so called, because, at the feasts and sacrifices of that goddess, they ran about the temple, carrying a lighted torch, which they delivered from hand to hand, till it had passed through them all. This they did in memory of Ceres's searching for her daughter Proserpine, by the light of a torch, which she kindled in mount Ætna.

**DÆMON**, *δαίμων*, a name given by the antients to certain spirits, or genii, which appeared to men, either to do them service, or to hurt them. The Platonists distinguish between gods, dæmons, and heroes. The gods are those whom Cicero calls *Dii majorum gentium*. The dæmons are those whom we call angels. See **ANGEL**. Christians, by the word dæmon, understand only evil spirits, or devils. Justin Martyr speaks of the nature of dæmons, as if he thought them not absolutely spiritual and incorporeal, for which

reason he attributes such actions to them as cannot be performed without the intervention of a body. It was a fabulous notion among the antient Hebrews, that Adam begot dæmons and spirits on certain succubuses. It is difficult to come at a satisfactory account of the dæmology of that people, and therefore it is no easy matter to explain what is meant by the worshipping of dæmons, or devils, which is the last species of idolatry, according to the division of the rabbins.

“The poets, says Minucius Felix, acknowledge the existence of dæmons; the philosophers make it a matter of dispute. Socrates was convinced of it, for he had a dæmon always at hand, by whose advice he governed himself in all his actions: the magi are not only acquainted with dæmons, but perform all their magical operations by the help of dæmons.”

The mahometans allow several sorts of dæmons; and the miners of Hungary, pretend that, while they are at work in the mines, they often see dæmons in the shape of little negro boys, doing them no other harm than often extinguishing their lights.

**DÆMONIAC**, a word applied to a person supposed to be possessed with an evil spirit, or dæmon. See **DÆMON**.

In the romish church there is a particular office for the exorcism of Dæmoniacs. See the article **EXORCISM**.

**DÆMONIACS**, in church-history, a branch of the anabaptists, whose distinguishing tenet is, that the devils shall be saved at the end of the world.

**DÆSION**, the macedonian name of the month called by the Athenians, anthesterion. See the article **ANTHESTERION**.

**DAFFODIL**, the same with the narcissus of botanists. See **NARCISSUS**.

**DAFFODIL-LILLY**, the lilio-narcissus of botanists. See **LILIO-NARCISSUS**.

*Sea-DAFFODIL*, a genus of plants called by latin writers *pancratium*. See the article **PANCRATIUM**.

**DAGO**, or **DAGERWORT**, the capital of an island of the same name in the Baltic, near the coast of Livonia, subject to Russia, east long. 21° 30', and north lat. 58° 45'.

**DAHGESTAN**, a country of Asia, bounded by Circassia on the north, by the Caspian Sea on the east, by Chirvein, a province of Persia on the south, and by Georgia on the west. Its chief towns are Tarku and Derbent, both situated on the Caspian Sea.

**DAHOMÉ**,

- DAHOMÉ**, a kingdom of Africa, on the Guinea-coast.
- DAILE**, in the sea-language, signifies the trough for carrying the water off the decks.
- DAILY**, the same with diurnal. See the article **DIURNAL**.
- DAIRY**, a house or building where milk, butter, cheese, &c. are made or kept. See the articles **MILK**, **BUTTER**, &c.
- DAISY**, the english name of a genus of plants, called by authors *bellis*. See the article **BELLIS**.
- Great DAISY**, the same with the *leucanthemum*. See **LEUCANTHEMUM**.
- Ox-eye DAISY**, a genus of plants, called by botanists *buphthalmum*. See the article **BUPHTHALMUM**.
- DACKER**, or **DICKER**, in our old statutes. See the article **DICKER**.
- DAKER-HEN**, a bird, otherwise called *ortygometra*. See **ORTYGOMETRA**.
- DALEA**, in botany, a genus of the *diadelphia decandria* class of plants, the corolla of which consists of five petals; four of which are equal and straight, and the fifth, or upper one, very small; the fruit is a roundish, acute pod, consisting of two valves, and containing only one cell: the seed is single.
- DALEBURGH**, the capital of the province of Dalia, in Sweden, situated on the western side of the Wener-lake, fifty miles north-east of Gottenburg, east lon. 13° and north lat. 59°.
- DALECARLIA**, a province of Sweden, abounding with iron and copper-mines.
- DALECARLIA**, is also the name of a river, which gives name to the above province.
- DALECHAMPIA**, in botany, a genus of the *polygamia monoecia* class of plants. There is no corolla, either in the male or female flower: the fruit is a globose-triangular scabrous capsule, with three cells: the seeds are roundish and solitary.
- DALKEITH**, a town of Scotland, in the county of Lothian, four miles south east of Edinburgh, west long. 2° 40', and north lat. 55° 50'.
- DALIA**, a province of Sweden, bounded on the north by Dalecarlia, on the east by Wermeland and the Wener-lake, on the south by Gothland, and on the west by Norway.
- DALLE**, a nominal money, used in keeping books of account in many cities of Germany. It is worth thirty-two sols lub, which make forty french sols.
- DALMATIA**, a frontier province of Europe, mostly subject to the Turks, but some towns on the sea-coast to the Venetians: it is bounded by Bosnia on the north, by Servia on the east, by Albania on the south, and by Morlachia and the gulph of Venice on the west.
- DAM**, among lawyers, signifies a boundary or confinement.
- DAM**, or **DYKE**. See the article **DYKE**.
- DAMA**, the **FALLOW-DEER**, in zoology, a species of the deer-kind, distinguished by its ramose and compressed, or palmed horns. See **CERVUS** and **DEER**.
- DAMAGE**, in law, is generally understood of a hurt, or hindrance attending a person's estate: but, in common law, it is a part of what the jurors are to inquire of in giving verdict for the plaintiff or defendant, in a civil action, whether real or personal: for after giving verdict on the principal cause, they are likewise asked their consciences, touching costs and damages, which contain the hindrances that one party hath suffered from the wrong done him by the other. See the article **COSTS**.
- DAMAGE-CLEER**, was a fee of the tenth part in the common pleas, and twentieth in the king's-bench and exchequer, formerly paid out of all the damages exceeding five marks, recovered in those courts, in actions on the case, covenant, trespass, and all others wherein the damages were uncertain.
- DAMAGE-FEASANT**, is when a stranger's beasts get into another man's ground, without license of the owner or occupier of the ground, and there do damage by feeding, or otherwise, to the grafs, corn, wood, &c. in which case the tenant whom they damage may therefore take, distrain, or impound them, as well in the night as in the day; but in other cases, as for rents and services, and such like, none may distrain in the night.
- DAMALA**, a sea-port town of the Morea in Greece, at the entry of the gulph of Engia.
- DAMAN**, a port town of the hither India, in the province of Guzurat, or Cambay, situated on the west coast, about eighty miles south of Surat, in 72° 20' east long. and 20° north lat. It is subject to the Portuguese.
- DAMARAS**, an indian taffeta, being a kind of armoisin. See **ARMOISIN**.
- DAMASCUS**, or **SCHAM**, the capital city of the south part of Syria, situated ninety

ty miles north east of Jerusalem, in a pleasant, extensive, and fruitful plain; east long.  $37^{\circ} 20'$ , and north lat.  $33^{\circ} 15'$ .

**DAMASK**, a silk-stuff, with a raised pattern, so as that the right side of the damask, is that which hath the flowers raised or fattened.

Damasks should be of dressed silk, both in warp and woof; and in France, half an ell in breadth: they are made at Chalons in Champagne, and in some places in Flanders, as at Tournay, &c. intirely of wool,  $\frac{3}{4}$  of an ell wide, and 20 ells long.

**DAMASK** is also applied to a very fine steel, in some parts of the Levant, chiefly at Damascus in Syria; whence its name.

It is used for sword and cutlafs-blades, and is finely tempered. See **STEEL**.

**DAMASKEENING**, or **DAMASKING**, the art or operation of beautifying iron, steel, &c. by making incisions therein, and filling them up with gold and silver wire; chiefly used for adorning sword-blades, guards and gripes, locks of pistols, &c.

Damasking partakes of the mosaic, of engraving, and of carving: like the mosaic, it hath inlaid work, like engraving, it cuts the metal representing divers figures, and as in chasing, gold and silver is wrought in relievo. There are two ways of damasking, the one, which is the finest, is when the metal is cut deep with proper instruments, and inlaid with gold and silver wire: the other is superficial only.

**DAMASONIUM**, in botany, a genus of plants called also alisma, and in english the starry-headed water-plantain. See the article **PLANTAIN**.

**DAMATRIUS**, a month called by the Athenians, pyanepsion. See the article **PYANEPSION**.

**DAMBEA**, the capital of Abyssinia, or Ethiopia, situated at the head of a lake, to which it gives name: east long.  $34^{\circ}$ , and north lat.  $15^{\circ}$ .

**DAMELOPRE**, a kind of bilander, used in Holland for conveying merchandize from one canal to another; being very commodious for passing under the bridges.

**DAMIANISTS**, in church-history, a branch of the antient accephali-severitæ. They agreed with the catholics in admitting the IVth council, but disowned any distinctions of persons in the Godhead; and professed one single nature, incapable of any difference; and yet,

they called God, the Father, Son and Holy Ghost.

**DAMIETTA**, a port-town of Egypt, situated on the eastern mouth of the river Nile, four miles from the sea, and a hundred miles north of Grand Cairo; east long.  $32^{\circ}$ , and north lat.  $31^{\circ}$ .

**DAMNATA TERRA**, among chemists, the same with caput mortuum. See the article **CAPUT**.

**DAMPS**, in natural history, noxious steams and exhalations, frequently found in mines, pits, wells, and other subterraneous places.

Damps are generally reckoned of four kinds. The first is the most ordinary; the workmen in the mines know when it is coming, by the flame of their candle's becoming orbicular, and by its lessening gradually till it goes quite out; as also, by the difficulty of breathing. Those that escape swooning, seldom suffer any harm by it: but such as swoon away, though they miss of downright suffocation, are, on their recovery, tormented with very violent convulsions. Their way of cure is to lay the person down on the earth, in a prone posture, with a hole dug in the ground under his mouth; if this fail, they fill him full of good ale, and if that will not do, they conclude the case desperate.

The second kind is the pease-bloom damp, being so called from its smell: this damp, they say, always comes in the summer-time, but hath never been known to be mortal. The miners in the Peak of Derbyshire, fancy it arises from the great number of red trefoil flowers, called by them honeysuckles, with which the limestone meadows of the peak abound. Probably the smell of this damp gives timely notice to get out of the way.

The third is the most pestilential, and the strangest of all, if what is said of it be true. They who pretend to have seen it, describe it thus. In the highest parts of the roof of those passages in a mine which branch out from the main grove, they see a round thing that hangs about the bigness of a foot-ball, covered with a film of the thickness and colour of a cobweb. If this bag should be broke by a splinter, or any other accident, the damp immediately flies out, and suffocates all the company. The miners have a way of breaking it at a distance, by means of a stick and long rope; and when they have done this, they purify the place with fire. They will

will have it, that it flows from the steam of their bodies and candles, ascends up into the highest part of the vault, and there condenses; and that in time, a film growing over it, it becomes pestilential.

The fourth is the fulminating, or fire-damp, whose vapour, being touched by the flame of a candle, presently takes fire, and has all the effects of lightening, or fired gun-powder. These are frequently met with in the coal-mines, and sometimes, though rarely, in the lead-mines.

The pernicious damps in mines, shew abundantly, that nature affords inflammable air in some cases; and we have found by experiments, that art can do the same, and that, very probably, on the same principles with the natural. Sir James Lowther, having collected the air of some of these damps in bladders, preserved it so well, that when brought up to London, it would take fire at the flame of a candle, on being let out at the orifice of a piece of tobacco-pipe. It is well known to all that are versed in chemical experiments, that most metals emit a great quantity of sulphureous vapours, during the effervescence they undergo in the time of their solutions, in their respective menstruums: this vapour, being received into bladders, in the same manner with the natural air of Sir James Lowther, has been found to take fire, in the like way, on being let out in a small stream, and answered all the phenomena of the natural kind.

**DAMSEL**, from the french *damoiselle*, or *damoiseau*, an appellation antiently given to all young people of either sex, that were of noble or genteel extraction, as the sons and daughters of princes, knights, and barons: thus we read of Damsel Pepin, Damsel Louis le Gros, Damsel Richard prince of Wales.

From the sons of kings this appellation first passed to those of great lords and barons, and at length to those of gentlemen, who were not yet knights.

At present, damsel is applied to all maids or girls, not yet married, provided they be not of the vulgar.

**DANAE**, in antiquity, a coin somewhat more than an obolus, used to be put into the mouths of the dead, to pay their passage over the river Acheron.

**DANCE**, an agreeable motion of the body, adjusted by art to the measures or tune of instruments, or of the voice,

Athenæus concludes, that in the early ages of antiquity, they accounted dancing an exercise becoming persons of honour and wisdom, and that, as such, it had been esteemed by the greatest men in all ages. Thus, Homer calls Merion a fine dancer, and says, that the graceful mein and great agility which he had acquired by that exercise, distinguished him above the rest in the armies of either Greeks or Trojans. Dancing was in very great esteem among the Greeks, even the Lacedæmonians encouraged it: but, at Rome, we find the custom was quite otherwise; for there, to use the words of Cicero, no man dances unless he is mad or drunk: Cicero reproaches Gabinus with having danced: and we read, that Domitian excluded several members from the senate for having danced.

Dancing in general, was by the antients divided into cubistic, spheristic, and orchestric: the cubistic dance was performed with certain wrestlings and contortions of the body; the spheristic with a sort of ball, or bowl play; but the orchestric was most usual, and what indeed was dancing properly so called.

Dancing is usually an effect and indication of joy, though Mr. Pallespratt assures us, that there are nations in South America, who dance, to shew their sorrow. It has been in use among all nations civilized and barbarous, though held in esteem among some, and in contempt among others. It has often been, and still is, sometimes, made an act of religion. Thus David danced before the ark to honour God, and express his excess of joy for its return into Zion. Among the Pagans it made a part of the worship paid to the Gods, it being usual to dance round the altars and statues; and at Rome, the salii, who were priests of Mars, danced through the streets in honour of that God. The poets made the Gods themselves dance. The Christians are not free from this superstition, for in popish countries certain festivals, particularly those of the sacrament, and passion of our Lord, are celebrated with dancing.

**Rope-DANCER**, *schoenobates*, a person who walks, leaps, dances, and performs several other feats upon a small rope, or wire.

The antients had their rope-dancers, who had four several ways of exercising their art; the first vaulted, or turned round the rope, like a wheel round its

axis, and there hung by the heels or neck. The second flew or slid from above, downwards, resting on their stomach, with the arms and legs extended. The third ran along a rope, stretched in a right line, or up and down. Lastly, the fourth, not only walked on the rope, but made surprising leaps and turns thereon.

This art is lately much improved, as well in this nation as in France, and several other parts of Europe; witness the admirable feats of Mr. Maddox, who, standing only with one foot on the wire, beats the drum, sounds the trumpet, plays the violin, &c. and all the while the wire is in full swing. The other feats which he performs on the wire by the help of a balance, are too many to be enumerated here.

**DANCETTE**, in heraldry, is when the outline of any bordure, or ordinary, is indented very largely, the largeness of the indentures being the only thing that distinguishes it from indented. See the article **INDENTED**.

There is also the bearing of a bend, called double dancette: thus, he beareth azure, a bend double dancette argent.

**DANCHE**, in heraldry, the same with dantelle, according to Guillim; but Columbian makes it the same with indented. See the articles **INDENTED** and **DANTELE**.

**DANDELION**, the english name of a genus of plants, called by Linnæus *leontodon*. See the article **LEONTODON**.

**DANEGETL**, a tax, or tribute, on every inch of land, imposed on our ancestors the Saxons by the Danes, on their frequent invasions, as the arbitrary terms of peace, and departure. It was first imposed as a continual yearly tax upon the whole nation, under king Ethelred. It was levied by William I. and II. but was released by king Henry the first; and finally abolished by king Stephen.

**DANK**, a piece of silver current in Persia, and some parts of Arabia, weighing the sixteenth part of a drachm. It is also a weight used by the Arabians to weigh jewels and drugs.

**DARIDAS**, a sort of india taffeta, made of silk drawn from plants.

**DARNAMAS**, the name of the best sort of cotton that comes from Smyrna, so called from a plain near that city.

**DANTELE**, in heraldry, the same with dancette. See the article **DANCETTE**.

**DANTIA**, in botany, a name used by Petiver, for the *isnardia* of Linnæus. See the article **ISNARDIA**.

**DANTZICK**, the capital of regal Prussia, in the kingdom of Poland, situated on the western shore of the river Wesel, or Vistula, which a little below falls into the Baltic Sea: east long. 19°, and north lat. 54°.

It is an excellent harbour, and has the best foreign trade within the Baltic.

**DANUBE**, one of the largest rivers in Europe, which, taking its rise in the Black Forest in Swabia, runs eastward through Bavaria, Austria, Hungary, and Turkey in Europe; discharging itself by several channels into the Pontus Euxinus, or Black Sea.

**DAPHNE**, in botany, a genus of the *ostandria monogynia* class of plants, the flower of which consists of a single petal; the tube is cylindric, imperforated, and longer than the limb, which is divided into four oval, acute, plane, patent segments: the fruit is a roundish berry, containing one cell; the seed is single, round and fleshy.

This plant is a strong cathartic, and too rough to be given with safety.

**DAPIFER**, the dignity or office of grand master of a prince's household. This title was given by the emperor of Constantinople to the czar of Russia, as a testimony of favour. In France the like officer was instituted by Charlemain, under the title of Dapiferat; and the dignity of dapifer is still subsisting in Germany, the elector of Bavaria assuming the title of arch-dapifer of the empire, whose office is, at the coronation of the emperor, to carry the first dish of meat to table, on horseback.

**DAPPLE-BAY**, in the manege; when bay horses have marks of a dark bay, they are called dapple-bays.

**DAPPLE-BLACK**; when a black horse has got spots or marks, more black or shining than the rest of his skin, he is called a dapple black.

**DARAPTI**, among logicians, one of the modes of syllogisms of the third figure, whose premises are universal affirmatives, and the conclusion is a particular affirmative: thus,

**DAR-** Every body is divisible;

**AP-** Every body is a substance;

**TI.** Therefore, some substance is divisible.

**DARBY**

**DARBY**, the capital of Darbyshire, situated on the river Darwent: west long.  $1^{\circ} 25'$ , and north lat.  $53^{\circ}$ .

It gives the title of earl to the noble family of Stanley, and sends two members to parliament.

**DARDANARIUS**, or **MONOPOLIST**, a name antiently given to such as occasioned a scarcity of provisions, particularly corn, by laying it up, to raise its price, in order to sell it again at an extravagant rate. See **MONOPOLY**.

**DARDANELLS**, two castles at the entrance of the Hellespont, where all ships going to Constantinople are examined: east long.  $27^{\circ}$ , and north lat.  $40^{\circ} 5'$ .

**DARE**, in ichthyology, the same with dace. See the article **DACE**.

**DARIEN**, a province of Terra Firma, in south America, being the narrow isthmus, which joins north and south America.

**DARII**, in logic, one of the modes of syllogism of the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives: thus,

DA- Every thing that is moved, is moved by another;

RI- Some body is moved:

I. Therefore, some body is moved by another.

**DARK CHAMBER**. See the article **CAMERA OBSCURA**.

**DARK TENT**, a portable camera obscura, resembling a desk, and fitted with optic glasses, to take prospects of landscapes, buildings, &c.

**DARKING**, a market-town of Surrey, situated ten miles east of Guilford, west long.  $20'$ , and north lat.  $51^{\circ} 18'$ .

**DARLINGTON**, a market-town of the county of Durham, situated twenty miles south of the city of Durham. west long.  $1^{\circ} 15'$ , and north lat.  $54^{\circ} 30'$ .

**DARMSTAT**, the capital of Hesse-Darmstadt, in the circle of the upper Rhine in Germany, situated on a river of the same name, fourteen miles south of Francfort, and thirteen south-east of Mentz: east long.  $8^{\circ} 25'$ , and north lat.  $49^{\circ} 45'$ .

**DARNEL**, the english name of the lolium of botanists. See the article **LOLIUM**.

**DARREIN**, in law, a corruption of the french word *dernier*, last, is used in this sense in our law, as *darrein continuance*, &c.

**DARREIN PRESENTMENT**, the last presentation to a church, on which an assize lies. See *ASSIZE of darrein presentment*.

**DART**, in astronomy, geometry, &c. See the article **SAGITTA**.

**DART**, or sting of gnats. See **GNAT**.

**DARTFORD**, a market-town of Kent, in the Dover-road, fourteen miles south-east of London: east long.  $16'$ , and north lat.  $51^{\circ} 25'$ .

**DARTMOUTH**, a borough and port-town of Devonshire, situated on the english channel, twenty-six miles south of Exeter, which sends two members to parliament: west longitude  $4^{\circ}$ , and north lat.  $50^{\circ} 25'$ .

**DARWENT**, a river, which, rising in the Peak of Darbyshire, runs from north to south through that county, and falls into the Trent.

**DASYPUS**, in zoology, the same with armadillo. See **ARMADILLO**.

**DATA**, among mathematicians, a term for such things or quantities as are given or known, in order to find other things thereby that are unknown. Euclid uses the word data (of which he hath a particular tract) for such spaces, lines and angles as are given in magnitude, or to which we can assign others equal.

In algebra, the given quantities, or data, are expressed by the first letters of the alphabet, and the unknown quantities by the last letters; thus, if the problem be, from the sum and product of two quantities given, to find the quantities themselves, the quantities are represented by  $y$  and  $z$ ; and  $y + z = a$  the sum given, and  $yz = b$ , the product given. See the article **EQUATION**.

**DATA** also expresses, in philosophy and medicine, any quantity which for the sake of a present calculation is taken for granted to be such, without requiring an immediate proof for its certainty, called also the given quantity, number or power.

**DATE**, in law, is the description of the day, month, year of our Lord, and year of the reign of the king, in which a deed or other writing was made. Antiently deeds had no dates but only of the month and year, and now, if in the date of any deed, the year of our Lord is right, though the year of the king's reign be wrong, it shall not hurt the same. A deed is good, though it has no date of the day, or if that be mistaken, or though it contains an impossible date; but then he that pleads such a deed, must set forth the time when it was delivered: for every deed or writing has a date in law, and that is the

day of the delivery ; and where there is none, a plaintiff, it is said, may count it of any date.

In writings of importance, the date should be written in words at length.

In letters, it is usually written in figures.

An antedate is a date prior to the real time when the instrument was signed.

A post-date is that posterior to the real time when the instrument was passed.

**DATE**, *daitylus*, the fruit of the phoenix, or great palm-tree. See **PHOENIX**.

Dates are esteemed moderately strengthening and astringent, for which reason they are prescribed for diarrhoeas that are habitual, for weaknesses of the stomach, and for strengthening the womb ; but at present, we make little use of them in England. The best for medicinal purposes are those of Tunis, and the country thereabout, of Egypt and many parts of the east ; the dates of Spain, and the south of France, though they look well, being never perfectly ripe, and very subject to decay. They are to be chosen large, full, fresh, of a yellow colour on the surface, soft and tender, not too much wrinkled, and such as have the pulpy part either of a good white throughout, or else reddish toward the surface, and white toward the kernel. Dates the hundred weight pay 1l. 14s. 4  $\frac{2}{8}$  d. on importation ; and draw back on exportation 1l. 11s. 6d. They are preserved in three different ways ; some pressed and dry, others pressed more moderately ; but the best are those not pressed at all, only moistened with the juice of other dates, as they are packed up in baskets or in skins.

**DATE-PLUM**, in botany, a name used by some for the *diospyros*, a distinct genus of plants. See **DIOSPYROS**.

**DATISCA**, in botany, a genus of the *doccia-decandria* class of plants, the cup of which consists of five leaves : there are no flower-petals ; and its fruit is a triangular, unilocular capsule, containing a great number of seeds.

**DATISI**, in logic, a mode of syllogisms in the third figure, wherein the major is an universal affirmative, and the minor and conclusion particular affirmative propositions. For example,

PA- All who serve God are kings,

TI- Some who serve God are poor,

SI- Therefore some who are poor are kings.

**DATIVE**, among grammarians, the third case in the declension of nouns, expres-

sing the relation of a thing to whose profit or loss some other thing is referred. It is called dative, because usually governed by a verb, implying something to be given to some person. In english, the dative is expressed by the signs *to* or *for*.

**DATURA**, **THORN-APPLE**, in botany, a genus of the *pentandria-monogynia* class of plants : the flower consists of an infundibuliform petal ; the fruit is a subovated, bilocular, quadrilobular, and commonly prickly capsule, fixed to the base of the cup ; the seeds are numerous and reniform. See plate LXVII. fig. 2. The thorn-apple is narcotic, and dangerous to be taken internally ; but a cataplasm of its leaves and seed is commended for burns.

**DAUCUS**, the **CARROT**, in botany, a genus of plants belonging to the *pentandria digynia* class. The general flower is unequal : the proper one consists of five inflexo-cordated petals, the exterior ones being the largest. There is no pericarpium : the fruit is of an oval figure every way covered with rigid hairs, and is divisible into two parts : the seeds are two, of a suboval figure, convex and hairy on one side, and plain on the other. See plate LXVII. fig. 3.

There are two kinds of daucus-seeds kept in the shops, distinguished by the name of *daucus creticus*, and *daucus vulgaris*. The seeds of the *daucus creticus* come principally from Germany and the Levant : these seeds are to be chosen fresh, sound, and large, not dusty, and of an acrid taste. It is very apt to breed insects, and must, on that account, be carefully looked into, as it has no virtue when that is the case. The seeds of the cretic and common daucus have the same general virtues ; they are powerful diuretics, and much celebrated as carminatives and uterines : they attenuate thick and viscid humours, and promote the menses. Many people esteem the seed of the common daucus a remedy for the stone : the cretic kind is one of the four lesser hot seeds of the shops.

**DAVENTRY**, a market-town of Northamptonshire, situated about ten miles north of Northampton : west long. 1° 15', and north lat. 52° 12'.

**DAUGHTER**, *filia*, a female child. See the article **CHILDREN**.

As they required greater expences to educate and settle them in the world, than sons, they were for that reason more frequently exposed by the antients.

Those

*Fig. 1. DACE.*

*Fig. 2. DATURA.*

DAUCUS, CARROT.

*Fig. 4. DAVIT.*

*Fig. 5. DEAD-EYES.*

*Fig. 7. DECLINATOR.*

*Fig. 8. DEGRADED.*

*Fig. 9. DEGREE.*

*J. Jefferys sculp.*

Those who had no legitimate sons, were obliged by the athenian laws, to leave their estates to their daughters, who were confined to marry their nearest relation, otherwise to forfeit their inheritance, as we find to have been practised among the Jews, many of whose laws seem to have been transcribed by Solon. And if an heiress happened to be married before her father's death, this did not hinder the nearest relation to claim the inheritance, and even to take the woman from her husband.

**DAUGHTER** of a voice, among the Jews. See the article **BATH-KOL**.

**DAVIDISTS**, in church history, a sect of christian heretics in the XVIIth century ; so called from David George, their leader, who began by giving out that he was the Messiah, and was sent into the world in order to people the kingdom of heaven, which was quite empty of inhabitants, for want of virtuous and good men : he rejected marriage, and denied the resurrection.

**DAVIDS**, or **ST. DAVID'S**, a city, and bishop's see, of Pembrokeshire, situated near the irish channel, about twenty miles north west of Pembroke : west long.  $5^{\circ} 26'$ , and north lat.  $52^{\circ}$ .

**ST. DAVID'S** is also the name of a town and fort situated on the coast of Coromandel, in the hither India, about eighty miles south of Fort Saint George : east long.  $79^{\circ} 40'$ , and north lat.  $11^{\circ} 45'$ .

**DAVIS'S STRAITS** run north west from Cape Farewell, in  $60^{\circ}$ , north lat. to Baffin's Bay, in  $80^{\circ}$  north lat. separating Greenland from North America.

**DAVIS'S QUADRANT**, the same with back-staff. See **QUADRANT** and **BACKSTAFF**.

**DAVIT**, in a ship, that short piece of timber with a notch at one end, wherein, by a strap, hangs the fish block. See plate **LXVII.** fig. 4.

The use of this block is to help up the fluke of the anchor, and to fasten it at the ship's bow, or loof. The davit is shiftable from one side of the ship to the other, as there is occasion.

There is also a small davit in the ship's boat, that is set over her head with a shiver, in which is brought the buoy-rope, wherewith to weigh the anchor ; it is made fast to the carlings in the boat's bow.

**DAUPHIN**, a title given to the eldest son of France, and heir presumptive of the crown, on account of the Province of Dauphiny, which, in 1343, was given to Philip of Valois, on this condition,

by Humbert, dauphin of the Viennois. The seigneurs, or lords of Auvergne, have likewise borne the appellation of dauphin, but the dauphins of Auvergne held it not till a good while after those of the Viennois, and even received it from them.

**DAUPHIN**, in the history of shell-fish, a species of cochlea, or snail, with a round mouth. See the article **COCHLEA**.

**DAUPHIN-FORT**, a fort built by the french, on the eastern coast of the island of Madagascar, east long.  $48^{\circ}$ , and south lat.  $24^{\circ}$ .

**DAUPHINE**, or **DAUPHINY**, a province of France, bounded by Burgundy on the north, by Piedmont on the east, by Provence on the south, and by the river Rhone, which separates it from Languedoc and the Lyonois, on the west.

**DAY**, according to the most natural and obvious sense of the word, signifies that space of time during which it continues to be light ; in contradistinction to night, being that partition of time wherein it is dark ; but the space of time in which it is light, being somewhat vague and indeterminate, the time between the rising and setting of the sun is usually looked on as the day ; and the time which lapses from its setting to its rising again, the night.

The word day is often taken in a larger sense, so as to include the night also ; or to denote the time of a whole apparent revolution of the sun round the earth, in which sense it is called by some a natural day, and by others an artificial one : but to avoid confusion, it is usual to call it in the former sense simply the day, and in the latter a nychthemeron, by which term that acception of it is aptly denoted, as it implies both day and night.

The nychthemeron is divided into twenty-four parts, called hours, which are of two sorts, equal and unequal, or temporary. See the article **HOURL**.

Different nations begin their day at a different hour : thus the Egyptians began their day at midnight, from whom Hippocrates introduced that way of reckoning into astronomy, and Copernicus and others have followed him : but the greatest part of astronomers reckon the day begun at noon, and so count twenty-four hours, till the noon of the next day ; and not twice twelve, according to the vulgar computation. The method of beginning the day at mid-

night prevails also in Great Britain, France, Spain, and most parts of Europe. The Babylonians began their day at sun-rising, reckoning the hour immediately before its rising again the twenty-fourth hour of the day, from whence the hours reckoned in this way are called the Babylonian. In several parts of Germany, they begin their day at sun-setting, and reckon on till it sets next day, calling that the twenty-fourth hour: these are generally termed Italian hours. The Jews also began their nychthemeron at sun-setting; but then they divided it into twice twelve hours, as we do, reckoning twelve for the day, be it long or short, and twelve for the night; so that their hours continually varying with the day and night, the hours of the day were longer than that of the night, for one half year, and the contrary the other; from whence their hours are called temporary: those, at the time of the equinoxes became equal, because then those of the day and night are so. The Romans also reckoned their hours after this manner, as do the Turks at this day. This kind of hours are called planetary, because the seven planets were antiently looked upon as presiding over the affairs of the world, and to take it by turns each of these hours, according to the following order: saturn first, then jupiter, mars, the sun, venus, mercury, and last of all the moon: hence they denominated each day of the week from that planet whose turn it was to preside the first hour of the nychthemeron. Thus assigning the first hour of Saturday to saturn, the second will fall to jupiter, the third to mars, and so the twenty-second of the same nychthemeron will fall to saturn again, and therefore the twenty-third to jupiter, and the last to mars: so that on the first hour of the next day, it will fall to the sun to preside; and by the like manner of reckoning, the first hour of the next will fall to the moon; of the next, to mars; of the next, to mercury; of the next, to venus: hence the days of the week came to be distinguished by the latin names of *dies saturni, solis, lune, martis, mercurii, jovis, and veneris*; and among us, by the names of Saturday, Sunday, Monday, &c.

**DAY**, in a legal sense, relates to the day of appearance of parties, or the continuance of suits, where a day is given, &c. See the article **ESSEIN**.

In real actions there are common days

and special days given by the judges, in an assize, &c.

**DAYS in bank**, are days set down by statute or order of the court, when writs shall be returned, or when the party shall appear on the writ served. They say also, if a person be dismissed without day, he is finally discharged.

**DAYS of grace**, are those granted by the court at the prayer of the defendant, or plaintiff, in whose delay it is.

**DAYS of grace**, in commerce, are a customary number of days allowed for the payment of a bill of exchange, &c. after the same becomes due.

Three days of grace are allowed in England; ten in France and Dantzic; eight at Naples; six at Venice, Amsterdam, Rotterdam, and Antwerp; four at Frankfurt; five at Leipzig; twelve at Hamburg; six in Portugal; fourteen in Spain; thirty in Genoa, &c.

**DAY-LIGHT**, in our law; some time after sun-setting, and before sun-rising, being accounted part of the day, when the hundred is liable for any robberies committed within that time.

**DAY'S MAN**, in the north of England, an arbitrator or person chosen to determine an affair in dispute.

**DAYS of prefixion** in the exchequer, see the article **REMEMBRANCER**.

**DOG-DAYS**, *dies caniculares*. See the article **CANICULAR DAYS**.

**Intercalary DAYS**. See the article **INTER-CALARY DAYS**.

**DAY-COAL**, among miners, an appellation given to the upper stratum of the coal, or that which lies next the surface of the earth. See the article **COAL**.

**DAZE**, among miners, denotes the same with the telaugia of naturalists. See the article **TELAUGIA**.

**DEACON**, *διακονος*, one of the three sacred orders of the christian church. The word is sometimes used in the New Testament for any one that ministers in the service of God, in which sense bishops and presbyters are stiled deacons; but in its restrained sense, it is taken for the third order of the clergy, as appears from the concurrent testimony of antient writers, who constantly stile them ministers of the mysteries of Christ, ministers of episcopacy and the church, and the like. The first institution of this order is recorded in Acts, ch. 6.

As to the office of deacons, the most common and ordinary was to be attendant on the bishops and presbyters in the service of the

the altar, to take care of the holy table and all the ornaments and utensils belonging to it, and, in the next place, to receive the offerings of the people, and to present them to the priest; at the same time reciting the names of those that offered. In some churches, tho' not in all, the deacons read the gospel both before and at the communion service; but their most peculiar office was to assist the bishop and presbyters in the administration of the eucharist, at which their business was to distribute the elements to the people who were present, and carry them to those who were absent. That they were never allowed to consecrate them at the altar, appears from the testimonies of Hilary, Jerom, and the author of the constitutions. They were permitted, however, to administer solely the sacrament of baptism in some cases. Another part of the office of deacons, was to be a sort of monitors and directors to the people in the exercise of their public devotions in the church; for which purpose they made use of certain known forms of words, to give notice when each part of the service began. Whence they are sometimes called *ιεροψήφους*, the holy cryers of the church. Deacons had, by licence and authority from the bishop, a power to preach, to reconcile penitents and grant them absolution, and to represent their bishops in general councils. Their office out of the church was to take care of the necessitous, such as orphans, widows, prisoners, and all the poor and sick who had any title to be maintained out of the public revenues of the church; to enquire into the morals and conversation of the people, and to make their report thereof to the bishop. Whence, on account of the variety of business, it was usual to have several deacons in the same church.

In the romish church, it is the deacons office to incense the officiating priest or prelate; to lay the corporal on the altar; to receive the paten or cup from the sub-deacon, and present them to the person officiating; to incense the choir; to receive the pax from the officiating prelate, and carry it to the sub-deacon; and at the pontifical mass, when the bishop gives the blessing, to put the mitre on his head, and to take off the archbishop's pall, and lay it on the altar. In England, the form of ordaining deacons, declares that it is their office to assist the priest in the distribution of the holy communion; in which,

agreeably to the practice of the antient church, they are confined to the administering the wine to the communicants. A deacon, with us, is not capable of any ecclesiastical promotion, yet he may be a chaplain to a family, curate to a beneficed clergyman, or lecturer to a parish church. He may be ordained at twenty-three years of age, *anno corrente*; but it is expressly provided, that the bishop shall not ordain the same person a priest and deacon in the same day. Deacons, according to St. Paul, should be chaste, sincere, and blameless; neither great drinkers, nor given to filthy lucre; they should hold the mystery of the faith in a pure conscience, and should be well approved before they are admitted to the ministry.

**DEACONESS**, a female deacon, an order of women, who had their distinct offices and services in the primitive church. This office appears as antient as the apostolical age; for St. Paul calls Phoebe a servant of the church of Cenchrea. The original word is *διακονος*, answerable to the latin word *ministra*. Tertullian calls them *viduæ*, widows, because they were commonly chosen out of the widows of the church; and, for the same reason Epiphanius, and the council of Laodicea, calls them *πρεσβυτιδας*, elderly women, because none but such were ordinarily taken into this office. For, indeed, by some antient laws, these four qualifications were required in every one that was to be admitted into this order. 1. That she should be a widow. 2. That she should be a widow that had born children. 3. A widow that was but once married. 4. One of a considerable age, forty, fifty, or sixty years old. Tho' all these rules admitted of exceptions. Concerning their ordination, whether it was always performed by imposition of hands, the learned are much divided in their sentiments. Baronius and Valefius think they were not, and make no other account of them than as mere lay-persons. But the author of the constitutions, speaking of their ordination, requires the bishop to use imposition of hands, with a form of prayer which is there recited. We are not, however, to imagine, that this ordination gave them any power to execute any part of the sacerdotal office. They were only to perform some inferior services of the church, and those chiefly relating to the women for whose sakes they were ordained. One part of their office was to assist the minister at the

the baptizing of women, to undress them for immersion, and to dress them again, that the whole ceremony might be performed with all the decency becoming to sacred an action. Another part of their office was to be private catechists to the women-catechumens who were preparing for baptism. They were likewise to visit and attend women that were sick and in distress; to minister to the martyrs and confessors in prison; to attend the women's gate in the church; and, lastly, to assign all women their places in the church, regulate their behaviour, and preside over the rest of the widows, whence in some canons they are styled *πρωτοκλήρικαι*, governesses. This order, which since the tenth or eleventh century has been wholly laid aside, was not abolished every where at once, but continued in the greek church longer than in the latin, and in some of the latin churches longer than in others.

**DEACONRY**, the order or ministry of a deacon or deaconess. See **DEACON**, &c.

**DEACONRY**, *diaconia*, is also the name of the chapels and oratories in Rome, under the direction of the several cardinal deacons in their respective quarters. Antiently they were seven in number, as the deaconry of St. Maria in the broad way, the deaconry of St. Eustachio near the Pantheon, &c. answering to the seven regions of the city. They had hospitals annexed to them for the distribution of alms, and an administrator for temporal concerns, called the father of the deaconry, who was sometimes a priest and sometimes a layman. At present, there are fourteen of these deaconries, or hospitals, under the direction of as many cardinals.

**DEAD**, in general, something void or deprived of life. See **DEATH**.

**DEAD-MAN'S HEAD**, in geography, a cape or promontory near Tregony in Cornwall, between St. Mawes and Fowey.

**DEAD-MENS-EYES**, in the sea-language, a kind of blocks with many holes in them, but no sheevers, whereby the shrouds are fastened to the chains: the crow-feet reeve also through these holes; and, in some ships, the main-stays are set taught in them; but then they have only one hole, thro' which the lanyards are passed several times. See plate LXVII. fig. 5.

**DEAD-NETTLE**, a genus of plants called by botanists *lamium*. See **LAMIUM**.

**DEAD-PLEDGE**, the same with mortgage. See the article **MORTGAGE**.

**DEAD-RECKONING**, in navigation, the calculation made of a ship's place by means of the compass and log; the first serving to point out the course she sails on, and the other the distance run. From these two things given, the skilful mariner, making proper allowances for the variation of the compass, lee-way, currents, &c. is enabled, without any observations of the sun or stars, to ascertain the ship's place tolerably well. See the articles **COURSE**, **SAILING**, **COMPASS**, **CURRENT**, **LEE-WAY**, &c.

**DEAD-RISING**, among sailors, that part of a ship which lies aft, between the keel and the floor-timbers, next adjoining to the stern-post, under the bread-room in a ship of war.

**DEAD-ROPEs**, on board a ship, such ropes as do not run in any block.

**DEAD-SEA**, in geography, a lake of Judea, into which the river Jordan discharges itself; being about seventy miles long, and twenty broad.

The water of this lake is both salt, and nauseously bitter; and the bitumen it affords exactly resembles pitch, from which it can only be distinguished by its sulphureous smell and taste.

**DEAD-TOPs**, a disease incident to young trees, and cured by cutting off the dead parts close to the next good twig or shoot, and claying them over as in grafting. See the article **GRAFTING**.

**DEAD-WATER**, at sea; the eddy-water just astern of a ship, so called, because it does not pass away so swift, as the water running by her sides does. They say, that a ship makes much dead water, when she has a great eddy following her stern.

**DEADLY FEUD**, in law, a profession of an irreconcilable hatred, till a person is revenged even by the death of his adversary. This enmity was allowed in the old saxon laws: for where any person was killed, if a pecuniary satisfaction was not made to the kindred of the slain, it was lawful for them to revenge themselves, by arms, on the murderer. See **FEUD**.

**DEADLY-CARROT**, a plant called by botanists *thapsia*. See **THAPSIA**.

**DEADLY-NIGHTSHADE**, a name given to the belladonna of botanists. See the article **BELLADONNA**.

**DEADS**, among miners, denotes the earth or other fossil substances which inclose the ore on every side. Hence, *breaking up the deads*, is the removing these substances for the conveniency of carrying on their work.

**DEAF-**

**DEAFFORESTED**, a term found in law-books, signifying that a place is discharged from being a forest, or freed from the forest-laws.

**DEAFNESS**, the state of a person who either wants the sense of hearing, or has it greatly impaired.

The causes of deafness are a cutting off the external ear, or an obstruction of the auditory passage, from wax, or other things; from a rupture of the membrane of the tympanum; or when it is corroded, or ulcerated, or the auditory nerve is obstructed or compressed. External causes, are falls from high places; excessive noise, such as the explosion of cannon; likewise acute diseases near their state, which are like to terminate by a critical hæmorrhage.

As to the prognostics, those who are born deaf are rarely cured. A real deafness is hard to remedy. A deafness in acute diseases, with crude urine, foretells a delirium: but when the signs of coction are good, it portends a critical hæmorrhage.

With regard to the cure, if the obstruction be in the external cavity of the ear, it is discernible by the sight. If there is occasion to syringe the ear, a decoction of sage and rosemary-flowers will be proper, with equal parts of water and white-wine: but great caution should be used. Some pump the head with warm-bath waters: some say, the eggs of ants bruised, and put into the ear, with the juice of an onion, cures the most inveterate deafness. Others affirm, that a salivation will sometimes perform a cure. A critical deafness will cease of itself. Etmuller recommends amber and musk; and hardness of hearing has been often cured by putting a grain or two of musk into the ear with cotton.

Hoffman says, deafness sometimes arises from a slackness of the auditory nerves, which often happens from too great a humidity, which, if neglected, will terminate in a perpetual and incurable deafness, and may be dispersed, if taken in time, by proper cephalics and sudorifics. Some, for this purpose, recommend equal parts of spirit of lavender and hungary-water, which should be dropt warm into the ear. Lindanus advises the gall of an eel, mixt with spirit of wine; and others, the fumes of sulphur conveyed into the ear with a pipe or funnel: but regard must always be had to the cause, if discoverable.

Heister informs us, that medicinal waters drank in the summer time pretty largely, are the best means as preservatives, and for curing disorders of the ears; and that they often perform more than any other remedies whatever.

Those born deaf are also dumb, as not being able to learn any language, at least in the common way: however, as the eyes, in some measure, serve them for ears, they may sometimes understand what is said, by observing the motion of the lips, tongue, &c. of the speaker.

**DEAL**, a thin kind of fir-planks, of great use in carpentry: they are formed by sawing the trunk of a tree into a great many longitudinal divisions, of more or less thickness, according to the purposes they are intended to serve.

Deals are rendered much harder, by throwing them into salt-water as soon as they are sawed, keeping them there three or four days, and afterwards drying them in the air or sun; but neither this nor any other method yet known, will preserve them from shrinking.

Deals called Burgendorp deals, the hundred containing six score, pay on importation 3l. 3s. 8 $\frac{4}{10}$ d. and draw back 3l. 3s. the rate 12l. Meabro deals, six score, pay 1l. 2s. 10 $\frac{8}{10}$ d. and draw back 1l. 1s. the rate 4l. Norway deals, six score, pay 1l. 8s. 7 $\frac{1}{2}$ d. and draw back 1l. 6s. 3d. the rate 5l. Spruce deals, six score, pay 4l. 5s. 10 $\frac{1}{2}$ d. and draw back 3l. 18s. 9d. the rate 15l. Deals from Russia, and all other countries not particularly rated, exceeding twenty foot in length, pay 4l. 5s. 10 $\frac{5}{10}$ d. and draw back 3l. 18s. 9d. the rate 15l. Deals from Sweden, or any other country, of twenty feet in length or under, not otherwise rated, the 120, pay 1l. 8s. 7 $\frac{1}{2}$ d. and draw back 1l. 6s. 3d. the rate 5l.

**DEAL**, in geography, a port-town of the county of Kent, between which and the Goodwin-sands, the shipping usually rides in the Downs, in going out or coming home: it is about sixty-seven miles eastward of London: east long. 1° 30', and north lat. 51° 16'.

**DEAN**, an ecclesiastical dignitary in cathedral and collegiate churches, and head of the chapter.

As there are two foundations of cathedral churches in England, the old and the new, so there are two ways of creating deans. Those of the old foundation, founded before the suppression of monasteries,

monasteries, as the deans of St. Paul's, York, &c. are raised to that dignity much after the manner of bishops, the king first sending his *congé d'elire*, the chapter electing, and the king granting his royal assent, the bishop confirms him, and gives his mandate to install him. Those of the new foundation, whose deaneries were raised upon the ruins of priories and convents, such as the deans of Canterbury, Durham, Ely, Norwich, Winchester, &c. are donative, and installed by virtue of the king's letters patent, without either election or confirmation. Canonists distinguish between deans of cathedral and those of collegiate churches. The first, with their chapter, are regularly subject to the jurisdiction of the bishop. As to the latter, they have usually the contentious jurisdiction in themselves, though sometimes this belongs to them in common with the chapter. There are cathedral churches which never had a dean, and in which the bishop is head of the chapter, and in his absence, the archdeacon: such are the cathedrals of St. David and Landaff. There are also deans without a chapter, as the dean of Battle in Sussex, dean of the arches, &c. and deans without a jurisdiction, as the dean of the chapel royal. In this sense the word is applied to the chief of certain peculiar churches or chapels.

**Rural DEAN**, called also archpresbyter, originally exercised jurisdiction over ten churches in the country, and afterwards became only the bishop's substitute, to grant letters of administration, probate of wills, &c. to convocate the clergy, and signify to them sometimes by letters, the bishop's will, and to give induction for the archdeacon. Their office is now lost in that of the archdeacons and chancellors.

**DEAN of a monastery**, was a superior established under the abbot, to ease him in taking care of ten monks, whence he was called *decanus*.

**DEAN and CHAPTER**, are the bishop's council to assist him in the affairs of religion, and to assent to every grant which the bishop shall make to bind his successors. As a deanry is a spiritual dignity, a man cannot be a dean and prebendary of the same church.

**DEAN**, in geography, the name of a forest in Gloucestershire, lying northward of the river Severn.

**DEARTICULATION**, the same with diarthrosis. See **DIARTHROSIS**.

**DEATH**, *mors*, is generally considered as the separation of the soul from the body; in which sense it stands opposed to life, which consists in the union thereof. Physicians teach, that as the life of those animals we call perfect consists in a continued flux and reflux of the blood, nervous juice and air, to and from the principal organs, so a man may be reckoned dead when he no longer breathes, and his heart and arteries have left off all circulation and pulsation. But Dr. Stevens, as we find in the Medical Essays, does not admit this doctrine, being of opinion, that after the motion of the heart, arteries, and lungs ceases, there often remains a small degree of vital principle deserving attention. He then proposes a theory of his own, in consequence of which it seems, that death does not inevitably attend an intire organic rest of what we call the solids of the body; nay, that one cannot be called dead, till the energy of the blood is so far gone, that, though assisted by all possible means, it can never be again able to fill and stimulate into contraction the right sinus venosus, and auricle of the heart.

Men, says lord Bacon, fear death as children fear the dark; and as that natural fear in children is increased by frightful tales, so is the other. Groans, convulsions, weeping friends and the like, shew death terrible; yet there is no passion so weak but conquers the fear of it, and therefore death is not such a terrible enemy. Revenge triumphs over death, love slights it, honour aspires to it, dread of shame prefers it, grief flies to it, and fear anticipates it. The same noble author thinks it the office of a physician to procure easy deaths, as well as to restore health.

In law, there is a natural death and a civil death: natural, where nature itself expires; civil, where a person is not actually dead, but adjudged so by law. Thus, if any person, for whose life an estate is granted, remains beyond sea, or is otherwise absent seven years, and no proof made of his being living, he shall be accounted naturally dead.

**DEATH-WATCH**, in zoology, an insect nearly of the size of the common louse, frequent among old wood, furniture, &c. It is of an oblong and flattish figure, and of a pale brownish-white colour; and the noise,

noise, resembling the beating of a watch; is the love-note of these animals, when the male or female woo each other.

**DEAURATA**, in ichthyology, a fish of the cyprinus kind, with forty rays in the fin near the anus. See **CYPRINUS**.

**DE BENE ESSE'**, a latin phrase used in our law in a doubtful meaning, as to take or do a thing *de bene esse*, is to allow it at present to be well done; but when it comes to be more fully examined, then to stand or fall according to the merit of the thing. In the chancery, upon a motion for one of the defendants of a suit to be examined, the court frequently orders it to be done *de bene esse*, viz. that his deposition shall be taken, and allowed or suppressed at the hearing of the cause upon the full debate of the matter as the court shall think fit. Also where a complainant's witnesses are sick or aged, or going beyond sea, so that he is in danger of losing their evidence, the court of chancery will order them to be examined *de bene esse*, in which case they are valid, if the plaintiff has not an opportunity of examining them afterwards.

**DEBENHAM**, a market-town of Suffolk, about twenty miles east of Bury: east long. 1° 20', and north lat. 53° 26'.

**DEBENTURE**, a term of trade used at the custom-house for a kind of certificate signed by the officers of the customs, which intitles a merchant exporting goods to the receipt of a bounty or drawback. All merchandises that are designed to be taken on board for that voyage being entered and shipped, and the ship being regularly cleared out, and sailed out of port on her intended voyage, debentures may be made out from the exporter's entries, in order to obtain the drawbacks, allowances, bounties or premiums; which debentures for foreign goods, are to be paid within one month after demand. And in making out these debentures, it must be observed, that every piece of vellum, parchment, or paper, containing any debenture for drawing back customs or duties, must, before writing, be stamped, and pay a duty of eight-pence.

The forms of debentures vary, according to the merchandise exported. In the execution of debentures for tobacco, it must be particularly observed, 1. That debentures for the same quantity, may be made in one or more parchments. 2. That the exporter's oath must be printed, specifying whether he acts for himself or by commission. If exported to any other

foreign ports than Ireland, the word Ireland must be added to the oath after Great Britain. 4. That as no tobacco may be consumed on board ships of war in Europe, but what has paid full duties, and been manufactured in Great Britain, no drawback is to be allowed for tobacco exported in any man of war.

5. That the eight pounds *per* hoghead of 350 pounds, or more, allowed for draught at importation, must not be deducted on exportation. 6. That debentures for tobacco exported to Ireland, must not be paid till a certificate be produced, testifying the landing thereof. 7. That no persons may swear to the exportation, but such as are permitted to swear to debentures for other goods. In debentures for all other foreign goods, no person may be admitted to swear to the exportation, but the true exporter, either as a proprietor, or, who being employed by commission, is concerned in the direction of the voyage. All kinds of debentures before delivered or paid to the exporters, are entered into a separate book kept for that purpose by the collector and comptroller of the customs. See **BOUNTY**.

**DEBENTURE**, in some of the acts of parliament, denotes a kind of bond or bill first given in 1649, whereby the government is charged to pay the soldier creditor, or his assigns, the money due on auditing the account of his arrears.

**DEBENTURE** is likewise used in the exchequer, and given to the king's servants for the payment of their wages.

**DEBET**, among merchants, signifies the sums due to them for goods sold on credit, for which they have charged their journal or ledger. It is more particularly understood of the remainder of debts, part of which has been paid on account.

**DEBET**, among book-keepers, is used to express the left-hand page of the ledger, to which are carried all articles supplied or paid, on the subject of an account.

**DEBET** and **SOLET**, in law, are formal words used in divers writs, sometimes both together, and sometimes only *debet*. As if a person by writ sues to recover any right whereof his ancestor was disseized, then he uses the word *debet* alone: but where he sues for any thing that is now first of all denied him, in that case he uses *debet* and *solet*.

**DEBET & DETINET**, *he owes and detains*, in law, are terms used in bringing of actions. Debt against an heir, must be in the *debet* and *detinet*; but against

executors, for money due in the time of the testator, the action ought to be in the detinet.

**DEBILITY**, among physicians, a relaxation of the solids, occasioning oftentimes weakneses and faintings.

**DEBRECHEN**, a town of upper Hungary, about seventy-seven miles east of Buda: east lon.  $21^{\circ} 10'$ , and north lat.  $47^{\circ} 45'$ .

**DEBRUIZED**, in heraldry, a term peculiar to the English, by which is intimated the grievous restraint of any animal, debarred of its natural freedom, by any of the ordinaries being laid over it.

**DEBT**, *debitum*, in law, any thing due to another, whether it be money, goods, or services; or, the action brought for recovering the same.

Where money is due upon any speciality, an action of debt, and no other, lies. On a bond, debt may be brought against the obligor or his heir, who has lands by descent, if the executors have not sufficient to pay it; and an heir mediate may be sued for debt, as if he were an immediate heir. If a person acknowledges, by deed, that he has so much of another's money in his hands, here the action of debt will lie for it; and where one owes a sum of money to another, who hath his note under hand, without a seal, action of debt on a mutuatus lies. Debt lies also on a recognizance; so upon a statute merchant, which is in nature of a bond, or obligation; but it is said to be otherwise, in case of a statute staple.

Whether an action of debt be brought on a bill, bond, lease, &c. the several writings are to be well considered, by which the plaintiff warrants his action, and the sum due must be rightly set forth: thus, if it be for rent, the time of commencement and ending must be specified; and the judgment, where the demand is in the detet and detinet, is to recover the debt, damages, and costs of suit. But in a debt on a single bill, a defendant may plead payment, before the action brought in bar; and, on bond, he may bring in the principal, interest, and costs pending the action, and thereupon be discharged.

**DEBT to the king**, comprehends in it all rents, issues, amerciaments, and other things due to the king, whose debts are preferred before those of a subject; and until his debt is satisfied, he may protect the debtor from the arrests of others. Pledges shall not be distrained for these debts, where the principal is sufficient.

**DEBTOR**, a person who owes any thing to another, in contradistinction to creditor, which is he to whom the debt is owing.

Where debt is a simple contract, it follows the person of the debtor, and, it is said, not of the creditor, as to actions brought, &c.

There have been divers statutes discharging debtors out of prison, when they had no effects to pay their creditors. See the article PRISONER.

**DEBTOR**, in merchants accounts. See the article BOOK-KEEPING.

**DECACHORDON**, in antiquity, a musical instrument with ten strings, called by the Hebrews hafur, being almost the same as our harp, of a triangular figure, with an hollow belly, and sounding from the lower part.

**DECACTIS**, a species of star-fish, with ten rays. See the article STAR-FISH.

**DECAGON**, in geometry, a plane figure with ten sides and ten angles: it is called a regular decagon, when all the sides and angles are equal.

If we suppose the radius of a circle to be

$$r, \text{ then will } \sqrt{\frac{5}{4}r^2 - \frac{1}{2}r}, \text{ or } \sqrt{\frac{5-1}{2}} + r,$$

be the side of a decagon inscribed in that circle. Again, supposing the side of a decagon to be 1, the area thereof will be 3.69; whence as 1 to 3.69, so is the square of the side of any given decagon to the area of that decagon.

**DECALITRON**, in antiquity, a coin equivalent to  $10 \frac{2}{3}$  attic oboli. See OBOLUS.

**DECALOGUE**, *δεκαλογος*, the ten precepts or commandments delivered by God to Moses, after engraving them on two tables of stone.

There are several refined speculations concerning the promulgation of those divine laws, as whether they were delivered by an angel, deputed by God for that purpose, or by the deity himself; and, if by the latter, whether it was the first or second person of the godhead that took upon him to be the legislator of the Jews: but these are debates of such a nature, that nothing can be concluded about them. The Jews, by way of excellence, call these commandments the *ten words*, from whence they had afterwards the name of decalogue: but it is to be observed, that they joined the first and second into one, and divided the last into two: they understand that against stealing, to relate to the stealing of men, or kidnapping;

kidnapping; alleging, that the stealing one anothers goods or property, is forbidden in the last commandment.

The Talmudists, and after them Pottellus, pretended that the decalogue was written, or engraved, in letters of light, *i. e.* luminous, shining letters, and that the engraving went quite thro' the tables. The emperor Julian objected to the decalogue, that the precepts it contained (those only excepted which concern the worship of false gods, and the observation of the sabbath) were already so familiar to all nations, and so universally received, that they were unworthy, for that very reason, to be delivered, by so great a legislator, to so peculiar a people. The church of Rome has struck the second commandment quite out of the decalogue, and to make their number complete, hath split the tenth into two. The reason of which may be easily conceived.

**DECAMERIS**, a term used by some writers upon sound, to denote a tenth part. See the article **SOUND**.

**DECAMPING**, in military affairs, is the marching of an army from the ground where it before lay encamped. See **CAMP**.

**DECAN**, a province of the hither India, bounded by the province of Cambaya, or Guzurat, on the north; by Golconda and Berar, on the east; by Visapour, on the south; and by the indian ocean on the west. Its chief inland town is Aurenghabad, and upon the coast the town of Bombay.

**DECANDRIA**, in the linnæan system of botany, a class of plants, the great characteristic of which is, that they have hermaphrodite flowers, with ten stamina in each. See **BOTANY**, **STAMINA**, &c.

**DECANTATION**, among chemists, &c. the gently pouring off a liquor from its fæces, by inclining the lip or canthus of the vessel; whence the name.

The design of this operation, is in order to have the liquor free from the sediment, which, upon standing, it lets fall to the bottom of the vessel.

**DECANUS**, in roman antiquity, an officer who preceded over ten other officers, and was head of the contubernium, or serjeant of a file of soldiers.

**DECAPITE'**, or **DEFFAIT**, in heraldry. See the article **DEFFAIT**.

**DECAPROTI**, *decemprimi*, in roman antiquity, officers for gathering the tributes and taxes.

The decaproti were also obliged to pay for the dead, or to answer to the empe-

ror for the quota parts of such as died, out of their own estates.

**DECASTYLE**, in the antient architecture, a building with an ordonnance of ten columns in front, as the temple of Jupiter Olympius was.

**DECEIT**, *dolus*, in law, a subtle trick, or device, to which may be added all manner of craft and collusion, or underhand practice, used to defraud another, by any means whatever.

Deceit is an offence both by common law and by statute. All practices of defrauding, or endeavouring to defraud, another of his right, are punishable by fine and imprisonment, and sometimes pillory, &c. and there is a writ called *deceptione*, that lies for one who receives injury or damage, &c.

A writ of deceit lies against attornies, for losses sustained by their default; also against bakers, brewers, and other artificers, for not selling good commodities, or refusing to perform a bargain: in all which cases, they are, by statute, liable to penalties in proportion to their offence.

**DECEIVED**, in the manege: a horse is said to be deceived, upon a demivault of one or two treads, when working, for instance, to the right, and not having yet finished above half the demivault, he is pressed one time or motion forwards, with the inner leg, and then is put to a reprite upon the left, in the same cadence with which he began; and thus he regains the place where the demivault had been begun to the right, and works to the left: thus a horse may be deceived upon any hand.

**DECEMBER**, in chronology, the last month of the year, consisting of thirty-one days, and so called as being the tenth month in the roman year, which commenced with march. See the articles **YEAR** and **MONTH**.

**DECEMPEDA**, *decempus*, in antiquity, a rule or rod divided into ten feet, each of which was subdivided into inches, and those into digits, used in measuring of land, and, by architects, in giving the proper dimensions and proportions to the parts of their buildings.

**DECEM TALES**, in law, a writ that issues directed to the sheriff, whereby he is commanded to make a supply of jurymen, where a full jury does not appear on a trial at bar.

**DECEMVIRI**, in roman antiquity, ten magistrates chosen annually at Rome, to govern the commonwealth instead of consuls,

fuls, with an absolute power to draw up and make laws for the people.

One of the decemviri had all the ensigns and honours of the function, and the rest had the like in their turn, during the year of their decemvirate. In them was vested all the legislative authority ever enjoyed by the kings, or, after them, by the consuls. It was the decemviri drew up the laws of the Twelve Tables, thence called *leges decemvirales*, which were the whole of the roman law, for a considerable time.

There were also other decemviri, created on frequent emergencies, to manage and regulate certain affairs, as conducting colonies, presiding at feasts, taking care of sacrifices, keeping the sibyls books, &c.

**DECENNALIA**, antient roman festivals celebrated by the emperors, every tenth year of their reign, with sacrifices, games, and largesses for the people. The emperor Augustus first instituted these solemnities, in which he was imitated by his successors: at the same time the people offered up vows for the emperor, and for the perpetuity of the empire, which were therefore called *vota decennialia*. Augustus's view in establishing the decennalia was to preserve the empire and the sovereign power without offence or restraint to the people.

**DECENNARY**, in our old law-books, denotes the precinct or district of ten fuburghs. See the next article.

**DECENNIERS, DECINERS, or DOZINNERS**, in our antient law, such as had the oversight of ten fuburghs, for the maintenance of the king's peace, the limits of whose jurisdiction was called decenna.

These seem to have had a great authority in the time of the Saxons, taking cognizance of causes within their circuits, and redressing wrongs, by way of judgment. In later times, the word came to signify such a person as by oath of loyalty to his prince, was settled in the combination or society of such a dozen.

**DECEPTIONE**, in law, a writ which lies in cases of deceit. See **DECEIT**.

**DECIDUOUS**, an appellation chiefly used in respect to plants: thus, the calyx or cup of a flower is said to be deciduous, when it falls along with the flower-petals; and, on the contrary, it is called permanent, when it remains after they are fallen. Again, deciduous leaves are those which fall in autumn, in contradistinction to those of the ever-greens, which remain all the winter.

**DECIES TANTUM**, in law, a writ that lies against a juror, for having taken money of either party in a suit, on account of giving his verdict.

This writ is so called because it recovers ten times as much as he took. Any person, though not a party in the suit, may bring this writ in the name of the king and himself, and recover the like; one half to the crown, and the other to the informer or prosecutor, which action the king may not release by pardon, after it is commenced.

**DECIL**, in astronomy, an aspect or position of two planets, when they are distant from each other a tenth part of the zodiac.

**DECIMÆ, TITHES**. See **TITHES**.

**DECIMAL ARITHMETIC**, the art of computing by decimal fractions.

**DECIMAL FRACTION**, that whose denominator is always 1, with one or more cyphers: thus, an unit may be imagined to be equally divided into 10 parts, and each of these into 10 more; so that by a continual decimal subdivision the unit may be supposed to be divided into 10, 100, 1000, &c. equal parts, called tenth, hundredth, thousandth parts of an unit. In decimal fractions, the figures of the numerator are only expressed, the denominator being omitted, because it is known to be always an unit with so many cyphers as there are places in the numerator. A decimal fraction is distinguished from an integer with a point prefixed, as .2 for  $\frac{2}{10}$ , .34 for  $\frac{34}{100}$ , .567 for  $\frac{567}{1000}$ , &c. The same is observed in mixed numbers, as 678.9 for  $678\frac{9}{10}$ , 67.89 for  $67\frac{89}{100}$ , 6.789 for  $6\frac{789}{1000}$ , &c.

Cyphers at the right hand of a decimal fraction alter not its value; for .5 or .50 or .5000 is each of them of the same value, equal to  $\frac{5}{10}$ , or  $\frac{1}{2}$ : but cyphers at the left hand, in a decimal fraction, decrease the value in a tenfold proportion; for .05 is  $\frac{5}{100}$ , .005 is  $\frac{5}{1000}$ , .0005 is  $\frac{5}{10000}$ , &c.

Decimal fractions are easily reduced into a common denominator, by making, or even supposing, all of them to consist of the same number of places; so .3, .45, .067, .0089, may be written thus, .3000, .4500, .0670, .0089; all which consisting of four places, their common denominator is an unit with four cyphers, namely 10000.

Addition and subtraction of decimals are the same as in whole numbers, when the places of the same denomination are set under

under one another, as in the following examples:

To	34.25	From	16.5
Add	3.026	Subtract	.125
Sum	37.276	Rem.	16.375

In multiplication the work is the same as in whole numbers, only in the product, separate, with a point, so many figures to the right hand as there are fractional places both in the multiplicand and multiplier; then all the figures on the left hand of the point make the whole number, and those on the right a decimal fraction. It is to be noted, that if there be not so many figures in the product, as ought to be separated by the preceding rule, then place cyphers at the left, to complete the number, as may be seen in Example V.

Ex. I. Mult.	456	Ex. II. Mult.	45.6
by	21.3	by	21.3
	1368		Product 971.28

Product 9712.8

Exam. III. Multiply	456
by	0.213
	97.128

Example IV. Multiply	45.6
by	0.213
Product	9.7128

Ex. V. Multiply	0.0456
by	0.213
Product	0.0097128

In division the work is the same as in whole numbers, only in the quotient, separate, with a point, so many figures to the right hand for a decimal fraction, as there are fractional places in the dividend, more than in the divisor, because there must be so many fractional places in the divisor and quotient together, as there are in the dividend.

As division of decimal fractions is extremely difficult, especially with regard to the value of the figures of the quotient, we shall here give a general rule for ascertaining their values, *viz.*

Rule, Place the first multiple of the divisor under the dividend, as in operations of common division; then will the unit's place of this multiple stand under such a place of the dividend, as the first significant figure of the quotient is to be; that is, the first significant figure of the quotient will be of the same name, or value, with the figure of the dividend which stands above the unit's place of the multiple.

This rule will hold in all cases. 1. When the number of decimals are equal in the divisor and dividend, the quotient will be integers, or whole numbers: for placing the first multiple of the divi-

Example I. for under the dividend, according to the rule, 8.45)295.75(35 (Exam. I.) the unit's place 5, is found to stand under 9, the place of tens in the dividend; so that 3, the first figure of the quotient, must be tens also, and 5, the next figure, units. 2. When the number of decimals in the dividend, exceed those in the divisor, as in Ex-

Example II. where 2, the unit's place of the multiple of the divisor, stands under 8, the place of tens of the dividend; whence 3, the first figure of the quotient, must be tens also; and 2, the next figure, units; so that the remaining figures, 12, must be decimals. This is done, more shortly, by making as many figures of the quotient decimals, as there are more decimal places in the dividend than in the divisor. 3. When there are not so many decimal places in the dividend, as there are in the divisor, cyphers must be added to the right hand of the dividend, to make them equal: thus, to divide 192.1 by 7.684,

Example III. as in Example III. add two cyphers, to make the decimals equal; and, by the above rule, the quotient 25 will be found to be integers, as 5,

the place of units, stands under 9, the place of tens. 4. If after division there are not so many figures in the quotient as there ought to be decimal parts, supply this defect by prefixing cyphers to the quotient found: thus, in Example IV.

Example IV. the quotient by division is found to be 758; and, by the above rule, the first figure, 7,

ought to stand in the decimal place of thousandths, which it is made to do by prefixing two cyphers.

Vulgar fractions are reduced to decimals of the same value, by dividing the numerator by the denominator.

Thus,  $\frac{1}{2} = \frac{1.0}{2} = .5$ , and  $\frac{3}{4} = \frac{3.00}{4} = .75$ , and

and  $\frac{2}{7} = \frac{2.000000, \&c.}{7} = .285714$ , nearly.

**DECIMAL SCALES** are those which are decimally divided. See **DECIMAL**.

**DECIMATION**, a punishment inflicted by the Romans on such soldiers as quitted their post, or behaved themselves cowardly in the field. The names of all the guilty were put into an urn or helmet, and as many were drawn out as made the tenth part of the whole number, and these were put to the sword, and the others saved.

**DECIPHERING**, the art of finding the alphabet of a cipher. See **CIPHER**.

Every language has, besides the form of its characters, something peculiar in the place, order, combination, frequency, and number of the letters; to all which particular regard is to be had in deciphering. In all languages, however, the following rules ought to be observed: 1. One word is to be compared with another, that their resemblance and difference may be known. 2. No word can be without a vowel. 3. A word of one letter is always a vowel, or a consonant with an apostrophe. 4. The vowels recur much more frequently than the consonants. 5. Double vowels may be at the beginning of a word, but not double consonants. 6. Double characters at the beginning of a word are always vowels. 7. Short words of two or three letters have two or three, or one or two consonants. 8. The vowels are therefore most easily learned from the short words which are to first considered by the decipherer. 9. If double characters are preceded by a single letter, the letter is a vowel. 10. In languages abounding with diphthongs one vowel is often joined with another. 11. The letter that precedes or follows double consonants is, if a consonant, always one of the liquids, *l, m, n, r*. 12. If two different characters occur, of which the latter is often conjoined with various letters, and the former is never found either by itself, or followed by any other letter, those two are *qu*. 13. These letters *qu* are always followed by a vowel. 14. One vowel recurs more frequently than another, as do the consonants, according to the language, &c.

**DECISE**, a town of the Orleanois, in France, situated on the river Loire, about fifteen miles south-east of Nevers: east lon.  $3^{\circ} 32'$ , and north latitude  $46^{\circ} 40'$ .

**DECK** of a ship is a planked floor from stem to stern, upon which the guns lie,

and where the men walk to and fro.

Great ships have three decks, first, second, and third, beginning to count from the lowermost.

Half deck reaches from the main-mast to the stem of the ship.

Quarter-deck is that aloft the steerage, reaching to the round-house.

Flush-deck is that which lies even in a right line fore and aft, from stem to stern.

A rope-deck is that made of cordages, interwoven and stretched over a vessel, thro' which it is easy to annoy an enemy, who comes to board her. They are little used but by small vessels, to defend them from privateers.

**DECKENDORF**, a town of Bavaria, in Germany, situated on the Danube, about thirty-seven miles south-east of Ratisbon: east long.  $13^{\circ}$ , and north lat.  $48^{\circ} 45'$ .

**DECLAMATION**, a speech made in public, in the tone and manner of an oration, uniting the expression of action to the propriety of pronunciation, in order to give the sentiment its full impression upon the mind.

Among the Greeks, declamation was the art of speaking indifferently on all subjects, and on all sides of a question.

With us it is restrained to certain exercises which scholars perform, to teach them to speak in public.

**DECLARATION**, in law, is a formal shewing in writing the ground of complaint of the plaintiff, in an action against the defendant, where the plaintiff is supposed to have received some injury. This declaration ought to be plain and certain, because it impeaches the defendant and obliges him to answer thereto. It is also an exposition of the writ, with the addition of time, circumstances, &c. and must be true as well as clear, for the court will not take things in it by implication: and it sets forth the names both of the plaintiff and defendant, the nature and cause of the action, &c. and the damage received.

Declaration, in an action real, is termed a count. See the article **COUNT**.

**DECLARATION** is also used for a confession which the quakers are obliged to make and subscribe, instead of the oaths of supremacy, &c. See **AFFIRMATION**.

**DECLARATION**, a term of the custom-house, and of commerce in France, contains a particular account or invoice of what is contained in the bales, &c. brought to the offices for entrance inward or outward.

**DECLENSION**,

**DECLENSION**, in grammar, an inflexion of nouns according to their divers cases, as nominative, genitive, dative, &c. It is a different thing in the modern languages, which have not properly any cases from what it is in the antient greek and latin. With respect to languages, where the nouns admit of changes, either in the beginning, the middle, or ending, declension is properly the expression of all those changes in a certain order, and by certain degrees called cases. With regard to languages, where the nouns do not admit of changes in the same number, declension is the expression of the different states a noun is in, and the different relations it has; which difference of relations is marked by particles, and called articles, as *a, the, of, to, from, by, &c.* See **ARTICLE**.

**DECLENSION** of a disease is when it is past its height.

**DECLINATION**, in astronomy, the distance of any celestial object from the equinoctial, either northward or southward. It is either true or apparent, according as the real or apparent place of the object is considered.

The declination being an arch of a secondary of the equinoctial intercepted between a given point and the equinoctial, and perpendicular to the same, the declination of a star, &c. is found in the following manner. First observe the altitude of the pole, as PR (plate LXVII. fig. 6.) this subtracted from  $90^\circ$ , gives the height of the equator AH; then the meridian altitude of the star HD being observed, if it be greater than the altitude of the equator AH, the latter subtracted from the former, leaves the declination northward AD: or if the altitude of the star HT be less than that of the equator AH, the former subtracted from the latter, leaves the declination southward TA. If the star be in the quadrant ZR, then the least altitude MR, subtracted from the altitude of the pole PR, leaves the distance from the pole PM; which subtracted again from the quadrant PQ, leaves the declination MQ.

By this method are constructed the tables of declination of the fixed stars, given us by Ricciolus and Dechalets.

To find the sun's or star's declination by the globe, bring the sun's place, or the star, to the meridian, and the degrees from the equinoctial there reckoned, either north or south, are the declination at noon.

The greatest declination of the sun, or of the ecliptic, is commonly computed  $23^\circ 30'$ . See **ECLIPTIC**.

**Circle of DECLINATION**. See **CIRCLE**.

**Refraction of the DECLINATION**. See the article **REFRACTION**.

**DECLINATION of the sea-compass, or needle**, is its variation from the true meridian of any place. See **VARIATION**.

**DECLINATION of a wall or plane for dials** is an arch of the horizon, contained either between the plane and the prime vertical circle, if you reckon it from the east or west; or else between the meridian and the plane, if you account it from north or south. There are many ways given by authors for finding the declination of a plane, of which all those that depend upon the magnetic needle deserve to be suspected on many accounts. The common method, by finding the sun's horizontal distance from the pole of the plane, is subject to many errors and difficulties. The way therefore we would recommend as the best for finding the declination of a plane, is by a declinator. See the next article.

**DECLINATOR**, or **DECLINATORY**, an instrument contrived for taking the declinations, inclinations, and reclinations of planes. It is constructed in the following manner: on a square wooden board, ABCD (plate LXVII. fig. 7. n<sup>o</sup> 1.) describe a semicircle AED, and divide the two quadrants AE and ED into  $90^\circ$ , each beginning from E, as in the figure: then having fixed a pin in the center F, fit a ruler HI upon the same, moveable thereon, with a box and needle K (*ibid.* n<sup>o</sup> 2.) In order to take the declination of a plane, apply the side AD to the plane proposed, as MN (*ibid.* n<sup>o</sup> 3.) and move the ruler FG, with the compass G, about the center F, till the needle rest upon the line of the magnetical meridian of the place: if the ruler cut the quadrant in E, the plane is either directly northern or southern; but if it cut between D and E, the plane declines to the west; and if between A and E, to the east, by the quantity of the angle GFE.

Would you take the inclinations and reclinations of planes with this instrument, instead of the ruler and needle, a thread with a plummet is fitted on a pin in the center F; then the side BC of the declinator ABCD (*ibid.* n<sup>o</sup> 4.) being applied to the proposed plane, as IL, if the plum-line FG cut the semicircle AED,

**AED** in the point E, the plane is horizontal ; or if it cut the quadrant ED, in any point at G, then will EFG be the angle of inclination : lastly, if applying the side AB to the plane, the plummet cut E, the plane is vertical. Hence if the quantity of the angle of inclination be compared with the elevation of the pole and equator, it is easily known whether the plane be inclined or reclined. See **INCLINATION** and **RECLINATION**.

**DECLINING DIALS**, those which do not face directly any of the four cardinal points. See the article **DIAL**.

**DECLIVIS**, in anatomy, a muscle otherwise called obliquus descendens. See the article **OBLIQUUS**.

**DECLIVITY** denotes just the reverse of acclivity. See **ACCLIVITY**.

**DECOCTION**, in pharmacy, the boiling simples, or other drugs, in order to extract their virtues for some medicinal purpose. The general subjects of decoction are animals and vegetables, and sometimes minerals, as antimony and quicksilver. The liquors which serve to boil them, are water, wine, vinegar, milk, and whey.

Decoction is mostly employed about bal-  
famics, detergents, and cathartics ; for it is not so proper for cephalics, &c. because it exhales the more volatile parts, in which the virtues of all those ingredients consist. The harder bodies, as woods, dried roots, &c. require most boiling ; but herbs and seeds need only be scalded. All those decoctions which are restraining, and most of the cathartics, may, for greater elegance, be clarified ; but all such as are emollient, and intended to consist of the soft and mucilaginous parts of simples are by no means to be so managed.

**DECOLLATION**, beheading, a term frequently used in the phrase, *decollation of St. John Baptist*, which denotes a painting representing the Baptist's head struck off from the body.

**DECOMPOSITE LEAF**, one whose petiole is twice divided before it gives rise to the leaf.

**DECOMPOSITION**, in chemistry and pharmacy, the reduction of a body into its principles or component parts. See the article **ANALYSIS**.

**DECORATION**, in architecture, is used for whatever adorns a building, either with-  
outside or within. The orders of architecture contribute a great deal to the decoration ; but then the several parts of these

orders must have their just proportion, characters and ornaments, otherwise the finest order will bring confusion rather than richness. See **CORINTHIAN**, **COMPOSITE**, &c. **ORDERS**.

Decorations, in churches, are paintings, festoons, vases, &c. occasionally applied to the walls, but with such discretion as not to destroy the form and beauty of the architecture, as is practised in Italy at the solemn feasts. See **FESTOON**, **VASE**, &c.

**DECORATION** also signifies the scenes of theatres. See the article **SCENE**.

In operas and other theatrical performances, they must be often changed, in conformity to the subject.

**DECORTICATION**, the same with barking of trees. See **BARKING**.

**DECORUM**, in architecture, is the suitability of a building, and the several parts and ornaments thereof, to the station and occasion.

Vitruvius is very exact in this point, and gives rules expressly for the appropriating the several orders to their natural characters.

**DECORUM** is used by some to signify the observing a due respect between the inhabitant and habitation. Whence Palladio concludes that the principal entrance must never be regulated by any certain dimensions, but according to the dignity of the person who is to live in it.

**DECOUPLE**, in heraldry, the same as uncoupled : thus, a chevron decouplé, is a chevron wanting so much of it towards the point, that the two ends stand at a distance from one another, being parted and uncoupled.

**DECOURS**, in heraldry, the same with decrement. See **DECREMENT**.

**DECOY**, a place made for catching wild-fowl. Hence,

**DECOY-DUCK** is a duck that flies abroad, and lights into company of wild ones, which by her allurements she draws into the decoy.

**DECREE**, an order made by a superior power, for the regulation of an inferior.

**DECREE**, in the civil law, is a determination that the emperor pronounces upon hearing a particular cause between plaintiff and defendant.

**DECREEES of councils** are the laws made by them, to regulate the doctrine and policy of the church.

**DECREEES in chancery**, are the determinations of the lord chancellor, upon a full hearing of the merits of a cause.

**DECREET**,

**DECREET**, in the law of Scotland, a final decree or judgment of the lords of session, from which an appeal only lies to parliament, where we find them but too often reversed; a circumstance surely not much to the honour of the august bench, from whence the appeal lies.

**DECREMENT**, in heraldry, signifies the wane of the moon from the full to the new. See the article **MOON**.

The moon in this state is called moon decreffant, or in *desours*; and when borne in coat-armour, faces to the left side of the escutcheon, as she does to the right side when in the increment. See the article **CRESCENT**.

**DECREPITATION**, in chemistry, the act of calcining salt over the fire, till it cease to crackle. The design of this is to free the salt from superfluous moisture: but as it is thereby rendered porous, and apt to imbibe the humidity of the air, it must always be kept very close afterwards, lest the air should moisten it anew.

**DECREPITATION** is also applied to the crackling of the salts during the operation.

**DECRETAL**, in the canon-law, a letter of a pope, determining some point or question in the ecclesiastical law. The decretals compose the second part of the canon-law. The first genuine one acknowledged by all the learned as such, is a letter of pope Siricius, written in the year 385, to Himerus bishop of Tarragona, in Spain, concerning some disorders which had crept into the churches of Spain. Gracian published a collection of decretals, containing all the ordinances made by the popes, till the year 1150. Gregory IX. in 1227, following the example of Theodosius and Justinian, formed a constitution of his own, collecting into one body all the decisions, and all the causes, which served to advance the papal power: which collection of decretals was called the *Pentateuch*, because it contains five books.

**DECTA**, in botany, a name used by some for the garden-beet. See **BEE**.

**DECUMANI DENTES**, in heraldry, the same with *dancette*. See the article **DANCETTE**.

**DECUPELATION**, a term used by Harris for decantation. See **DECANTATION**.

**DECUPLE PROPORTION**, that of ten to one. See the article **PROPORTION**.

**DECURIO**, in roman antiquity, a commander of ten men in the army, or the chief of a decury. See **DECURY**.

**DECURIO MUNICIPALIS**, a name given to the senators of the roman colonies.

**DECURIO**, as appears from an inscription in Gruter, was also a name given to certain priests, intended for particular sacrifices or other religious ceremonies. Struvius conjectures that their name was derived from their assisting at the sacrifices of private families and houses.

**DECURRENT LEAF**, one which adheres immediately to the stalk of a plant, without any pedicle, and which has its lower part extended, and running a little way along the branch.

**DECURY**, ten persons ranged under one chief, or leader, called the decurio. See the article **DECURIO**.

The roman cavalry was divided into decuries, which were subdivisions of a century, each century containing ten decuries.

**DECUSSATION**, a term in geometry, optics, and anatomy, signifying the crossing of any two lines, rays, or nerves, when they meet in a point, and then go on separately from one another.

**DECUSSORIUM**, a surgeon's instrument, which, by pressing gently on the dura mater, causes an evacuation of the pus collected between the cranium and the before-mentioned membrane, through the perforation made by the trepan.

**DEDDINGTON**, a market-town of Oxfordshire, about fifteen miles north of Oxford: west longitude  $1^{\circ} 20'$ , and north latitude  $51^{\circ} 55'$ .

**DEDHAM**, a market-town of Essex, about thirty-five miles north-east of Chelmsford: east long.  $1^{\circ} 10'$ , and north lat.  $52^{\circ} 5'$ .

**DEDI**, in conveyances, imports a warranty given to a feeoffee and his heirs. See the article **WARRANTY**.

**DEDICATION**, a solemn devoting, or setting apart, any person or thing, to the service of God, and the purposes of religion. See **CONSECRATION**.

Dedication of a temple was performed by the heathens in the following manner: early in the morning, on the day of dedication, the college of the pontiffs and other orders met, with a great crowd of people; and surrounding the temple, with garlands of flowers, the vestal virgins holding branches of olive-trees in their hands, sprinkled the outside of the temple with lustral water; then the person who consecrated the temple, being the office of some great magistrate, as prætor, censor, &c. drew near the gate, with a pontiff

tiff at his side, to shew him the ceremonies; and holding with one hand the side-post of the gate, spoke thus: *Ades, ades, Lucelle, (for example) dum dedico templum hoc, ut mihi praeatis, postemque teneatis.* Then the pontiff, holding the ceremonial in his hand, pronounced aloud the form of the consecration, which the consecrating person repeated after him, and the ceremony was expressed in these words, *solemnia verba praeunte pontifice effari.* After which they consecrated the court of the temple, by sacrificing a beast, whose entrails were laid on an altar of green turf; then, having taken the statue of the deity to whom it was consecrated, they anointed it with oil, and laid it on a pillow, rubbed with oil: the ceremonies being over, the consecrating person had an inscription, containing his name, quality, and the year of the consecration, set upon the temple. This dedication was to be authorised by the senate and people, and the college of pontiffs was to give their consent to it.

**Feast of DEDICATION**, an anniversary festival among the Jews, in memory of Judas Maccabæus, who repaired and dedicated anew the temple and altar, which had been plundered and profaned by Antiochus Epiphanes. It was observed on the twenty-fifth of Cisleu, and continued eight days.

**The feast of DEDICATION**, or rather the feast of a saint, or patron of a church, called in our law-books *dedicare*, was celebrated not only by the inhabitants of the place, but by those of all the neighbouring villages, who resorted thither; and such assemblies were authorised by the king. The custom is still retained in some places, under the name of wakes, or vigils.

**DEDICATION**, in matters of literature, the inscribing a book, poem, play, or the like, to some person of distinction, serving both as a protection, and honour to them, and a mark of the author's respect for the person to whom he dedicates his work.

Conringius has published a collection of dedications, which may be of use to those employed in this way, as containing many observations relative to divinity, history, physics, &c. according to the different subjects of the books. He has subjoined the prefaces and dedications of Puteanus, published by himself under the title of *Pompæ Prophoneticæ*.

We cannot help observing, that dedications partake much of the nature of pa-

negyric, being not only written in a pompous and florid style, but full of the praises of the patron. See the article **PANEGYRIC**.

One of the most singular dedications we ever met with, and for which the author makes a very good apology, is that of the last part of Mr. Edwards's *History of Birds*; it runs thus:

## T O G O D,

The ONE Eternal! the Incomprehensible! the Omnipresent! Omniscient, and Almighty CREATOR of all things that exist! from Orbs immensurably great, to the minutest Points of Matter, this ATOM is Dedicated and Devoted, with all possible Gratitude, Humiliation, Worship, and the highest Adoration, both of Body and Mind, by

his most resigned, low,  
and humble Creature,

GEORGE EDWARDS.

**DEDICATORY**, something belonging to a dedication. See the preceding article.

**DEDIMUS POTESTATEM**, in law, a commission granted to one or more persons, for the forwarding and dispatching some act appertaining to a judge, or some court; as to take answers in chancery, depositions of witnesses in a cause depending in that court, and levy a fine in the common pleas, &c. where persons live in the country, or cannot travel.

**DEDUCTION**, in commerce, a subtracting or retrenching a little sum paid, from a greater remaining yet unpaid.

**DEDUCTOR**, in roman antiquity, a client or person who attended his patron on public occasions.

**DEDUCTIONE**, in music, a name given to the rising of the voice, in pronouncing the syllables *ut, re, mi, fa, sol, la*; *quia per has deducitur vox*; in contradiction to *reductio*, when the voice descends by these *la, sol, fa, mi, re, ut*; *quia per has reducitur vox*.

**DEE**, the name of several rivers, as that on which Chester stands, that whereon Aberdeen stands, &c. See the articles **CHESTER** and **ABERDEEN**.

**DEED**, an instrument written on paper or parchment, comprehending some contract, bargain, or agreement between the parties thereto, in relation to the matter therein contained.

The validity of a deed consists in three principal things, *viz.* writing, sealing, and delivery. There are two kinds of deeds; *viz.* deeds indented, and deeds poll; which names chiefly import the shape of them, the one being cut in and out at top, and the other plain. A deed indented consists of two or more parts; for there are tripartite, quadripartite, quinquedartite, &c. deeds, in which respective deeds it is expressed, that the parties thereto have interchangeably set their hands and seals. The reason of indenting is, that whereas the several parties have each of them one, the indenture may make it appear, that they belong to one and the same contract, by their tallying. The several parts of deeds by indenture appertain to the feoffer, grantor, or lessor, &c. as to one part; the feeoffee, grantee, or lessee, of another part; and some other persons, as trustees, a third, &c. All the parts of an indented deed, in law, are judged to make but one entire deed, yet each part is of as great force as all the parts together.

A deed poll is that which consists only of one part, without being indented. It is used where a grantor, or venter in a bill of sale, &c. only seals: there is no need of a counterpart, the nature of the contract being such, that it requires no covenant from the grantee.

**DEEMSTERS, or DEMSTERS.** All controversies in the Isle of Man are decided without process, writings, or any charges, by certain judges, chosen yearly from among themselves, called deemsters; there being two of them for each division of the island: they sit judges in all courts, either for life or property; and, with the advice of the twenty-four keys, declare what is law, in uncommon emergencies.

**DEEP SEA-LINE, or DIP-SEA-LINE,** in the sea-language, a small line to sound with, some an hundred and fifty fathom long, with a hollow plummet at the head, and tallow put into it, to bring up stones, gravel, sand, shells, and the like, from the bottom, in order to know the differences of the ground; which being entered from time to time, in their books, by comparing of observations, they guess by their soundings, &c. what coasts they are on, though they cannot see land.

**DEEPING,** a market-town of Lincolnshire, about thirty-five miles south of Lincoln: west lon. 20°, and north lat. 52° 35'.

**DEER, *cervus*,** in zoology. See the article **CERVUS**,

**DEER-HAYS,** large nets, made of cords, to catch deer. Whoever keeps them, except in his own park, forfeits forty shillings a month.

**DEER-STEALERS** are punishable by various laws and statutes, made from time to time. Any offender convicted of deer-stealing, before a judge of gaol-delivery, may be transported by 5 Geo. I. cap. xxviii. And it is felony for persons to appear armed and disguised in a forest or park, and hunt or kill the deer, by 6 Geo. I. cap. xxii.

**DEER-WEED,** a name given to the luteola of botanists. See **LUTEOLA**.

**DE ESSENDO QUIETUM DE TOLONIO,** in law, a writ which lies for those, who, by privilege, are free from the payment of toll, whenever they are disturbed therein.

**DE EXPENSIS MILITUM,** in law, an ancient writ, commanding the sheriff to levy the expences of a knight of the shire, for his attendance in parliament, being four shillings a day. There is also another writ of the like nature, *de expensis civium & burgenfium*, for levying two shillings a day, for the expences of every citizen and burgess of parliament.

**DE FACTO,** something actually in fact, or existing, in contradistinction to *de jure*; where a thing is only so in justice, but not in fact: as a king *de facto* is a person that is in actual possession of a crown, but has no legal right to the same; and a king *de jure* is the person who has a just right to the crown, though he is out of possession thereof.

**DEFAMATION,** the speaking slanderous words of another; for which the slanderer is punishable, according to the nature of his offence, either by action upon the case at common law, or by statute, or in the ecclesiastical court. No damages are given in the ecclesiastical court, but the punishment of the party is by way of penance.

**DEFAULT,** in law, is generally taken for non-appearance in court, at a day assigned; but imports any omission of that which we ought to do, for which judgment may be given against the defaulter. In the usual sense, if the plaintiff in a suit make default in appearance on a trial, he will be non-suited; and where a defendant makes default, judgment shall be had against him by default. Jurors making default in their appearance, are to lose and forfeit issues.

**DEFEASANCE**, or **DEFEISANCE**. See the article **DEFEISANCE**.

**DEFECATE**, or **DEFÆCATE**, in chemistry, a term applied to a body freed and purged from fæces and impurities. See the article **CLARIFICATION**, &c.

**DEFECTION**, the deserting, abandoning, or falling off from a party, or interest, a person had been engaged in.

**DEFECTIVE**, in general, an appellation given to things which want some of the properties that naturally they ought to have. Thus,

**DEFECTIVE NOUNS** are those which want one of the numbers, or one or more cases. See the article **NOUN**.

**DEFECTIVE THIRD**, among musicians, the same with diminished third. See the article **DIMINISHED**.

**DEFEISANCE**, or **DEFEASANCE**, in our law, a condition relating to some certain deed, which being performed, the deed is defeated and rendered void, as if it had never been made.

There is this difference between a common condition and a defeisance, *viz.* that the condition is inserted in, or annexed to the deed; but the defeisance is a deed by itself, which has relation to another deed.

**DEFENCE**, in fortification, all sorts of works that cover and defend the opposite posts, as flanks, casemates, parapets, and faussebrays.

It is almost impossible to fix the miner to the face of a bastion, till the defences of the opposite one are ruined, that is, till the parapet of its flank is beaten down, and the cannon, in all parts that can fire upon that face which is attacked, are dismounted.

*To be in a posture of* **DEFENCE**, is to be in a condition to resist or oppose an enemy.

*Line of* **DEFENCE**, a supposed line drawn from the angle of the curtain, or from any other part in the curtain, to the flanked angle of the opposite bastion. See the articles **CURTIN** and **BASTION**.

A line of defence represents the flight of a musquet-ball from the place where the musqueteers stand, to scour the face of the bastion, and ought never to exceed the reach of a musquet. It is either *sichant* or *razant*; the first is when it is drawn from the angle of the curtain to the flanked angle: the last, when it is drawn from a point in the curtain, razing the face of the bastion.

**DEFENCE**, in law, signifies a plea, or what the defendant ought to make after the

plaintiff's count, or declaration, *viz.* that he defends all the wrong, force, and damages, where and when he ought, &c. If the defendant would plead to the jurisdiction, he must omit the words *where and when he ought*; and if he would shew any disability in the plaintiff, and demand judgment, if the plaintiff shall be answered unto, then he ought to omit the defence of the damage. There is a full defence usually in personal actions.

**DEFENCES**, in heraldry, are the weapons of any beast, as the horns of a stag, the tusks of a wild bear, &c.

**DEFEND**, a term used in our old statutes, for, to prohibit or forbid.

**DEFENDANT**, in law, the person sued in an action personal; as tenant is he who is sued in an action real. See **ACTION**.

**DEFENDEMUS**, in law, a word formerly used in gifts and grants, having this force, that it binds the donor and his heirs to defend the donee, if any persons claimed right to, or laid any incumbrance on, the thing given, otherwise than is contained in the deed of gift.

**DEFENDER of the faith**, a peculiar title, belonging to the king of Great Britain, as Catholic does to the king of Spain, Christian to the king of France, &c.

This title was first given by pope Leo X. to king Henry VIII. for writing against Luther.

**DEFENDERE SE PER CORPUS SUUM**, signified to offer duel or combat. See the articles **COMBAT** and **DUEL**.

**DEFENERRE UNICA MANU**, in law-writers, signifies to wage law by denying the accusation upon oath.

**DEFENDERS**, in church-history, the same with advocates. See **ADVOCATE**.

**DEFENDING**, in fortification, the same with flanking. See the articles **DEFENCE** and **FLANKING**.

**DEFENSITIVE**, in surgery, signifies a bandage, plaster, &c. to defend any part from external injuries.

**DEFENSOR**, **DEFENDER**, in ecclesiastical writers, the same with advocate. See the article **ADVOCATE**.

**DEFERENT**, in anatomy, a term applied to certain vessels in the body, that serve for the conveyance of humours from one part to another. See **DEFERENTIA VASA**.

**DEFERENT**, in the ptolemaic astronomy, a circle invented to account for the eccentricity, perigee, and apogee of the planets. See the articles **EPICYCLE** and **PTOLEMAIC SYSTEM**.

**DEFERENTIA**

**DEFERENTIA VASA**, two white, solid, flattened tubes, one lying on the right side, the other on the left, from the epididymis, of which they are continuations: each of them runs up in the cellular vagina of the spermatic vessels, as high as the openings in the abdominal muscles; the blood vessels lying forward, and the vas deferens behind them.

Their use is to carry the semen from the epididymes to the vesiculæ seminales; and, in the coitus, to discharge it into the urethra.

**DEFFAIT**, or **DECAPITE**, a term used by the french heralds, to signify that a beast has the head cut off smooth; in contradistinction to *estete*, which we call *erased*, where the head is, as it were, torn off, leaving the neck ragged.

**DEFICIENT**, in general, signifies much the same with defective. See **DEFECTIVE**.

**DEFICIENT HYPERBOLA**, one with only one asymptote, and two hyperbolic legs running out infinitely towards the asymptote, but contrary ways. See the article **HYPERBOLA**.

**DEFICIENT INTERVAL**, in music, one less by a comma than it ought to be. See **COMMA** and **INTERVAL**.

**DEFICIENT NUMBERS**, those whose parts or multiples added together, fall short of the integer whereof they are the parts; such is 8, its parts, 1, 2, 4, making only 7. See the article **NUMBER**.

**DEFILE**, in fortification, a strait narrow passage, through which a company of horse or foot can pass only in file, by making a small front; so that the enemy may take an opportunity to stop their march, and to charge them with so much the more advantage, in regard that those in the front and rear, cannot reciprocally come to the relief of one another.

To **DEFILE** is to reduce an army to a small front, in order to march through a defile.

**DEFINITE**, in grammar, is applied to an article that has a precise determinate signification; such as the article *the* in english, *le* and *la* in french, &c. which fix and ascertain the noun they belong to some particular, as *the king*, *le roy*; whereas in the quality of *king*, *de roy*, the articles of and *de* mark nothing precise, and are therefore indefinite.

**DEFINITION**, the shewing the meaning of one word by several other not synonymous terms.

The meaning of words being only the ideas they are made to stand for, by him that uses them, the meaning of any term is

then shewed, or the word is defined; when, by other words, the idea it is made the sign of, and is annexed to it in the mind of the speaker, is, as it were, represented and set before the view of another; and thus its signification is ascertained. This is the only end and use of definitions, and therefore the only measure of what is, or is not, a good definition.

The names then of simple ideas are incapable of being defined, because the several terms of a definition signifying several ideas, they can altogether by no means, represent an idea which has no composition at all; and therefore a definition, which is properly but shewing the meaning of any one word by several others, not signifying the same each, can in the names of simple ideas have no place.

Definitions, which then take place in compound ideas only, are of two sorts: the definition of the name, which is the explanation of what any word means; and the definition of the thing, which explains in what the nature of that thing consists.

In order to form a definition of any thing, we must employ these three acts of the mind, first compare the thing to be defined with other things that are most like to itself, and see wherein its essence and nature agrees with them; and that is called the general nature or genus in a definition: so, if you would define what *wine* is, first compare it with other things like itself, as cyder, perry, &c. and you will find that it agrees essentially with them in this, that it is a sort of juice. Secondly, consider the most remarkable and primary attribute, property, or idea, wherein the thing differs from those other things that are most like it, and that is its essential or specific difference: so that wine differs from cyder and perry, and all other juices, in its being pressed from a grape. This may be called its special nature, which distinguishes it from other juices.

Thirdly, join the general and special nature together, or the genus and the difference, and these make up a definition; so the juice of a grape, or juice pressed from grapes, is the definition of wine. Here it must be observed, that in speaking of the genus and difference, as composing a definition, it must always be understood, that the nearest genus and specific difference are required.

The next general nature, or the nearest genus, must be used in a definition, because

cause it includes all the rest; as if I were to define *wine*, I must say, *wine is a juice*, which is the nearest genus; and not say, *wine is a liquid*, which is a remote general nature; or, *wine is a substance*, which is yet more remote, for *juice* includes both *liquid* and *substance*. Besides neither of these two remote general natures would make any distinction betwixt wine and a thousand other substances, or other liquids: a remote genus leaves the thing too much undistinguished. The specific difference is that primary attribute which distinguishes each species from one another, while they stand ranked under the same general nature or genus; so that the specific difference of wine is its pressure from the grape, as cyder is pressed from apples, and perry from pears. In definitions we must also use the primary attribute that distinguishes the species, or special nature; and not attempt to define wine by its particular tastes, or effects, or rather properties, which are but secondary, or consequential, when its pressure from the grape is the most obvious and primary distinction of it from all other juices. In some cases, indeed, it is not so easily known, which is the primary idea that distinguishes one thing from another; so some would as soon define winter by the coldness of the season, as by the shortness of the days, tho' the shortness of the days is doubtless the most just, primary, and philosophical difference; since winter-days are always the shortest, but not always the coldest: besides, the shortness is one cause of the coldness, but the coldness is no cause of their shortness.

The special rules for a good definition are these: 1. A definition must be universal, or adequate, that is, it must agree to all the particular species or individuals that are included under the same idea. 2. It must be proper, and peculiar to the thing defined, and agree to that alone. These two rules, being observed, will always render a definition reciprocal with the thing defined, that is, the definition may be used in the place of the thing defined; or they may be mutually affirmed concerning each other. 3. A definition should be clear and plain; and indeed it is a general rule concerning the definition both of names and things, that no word should be used in either of them, which has any difficulty in it, unless it has been before defined. 4. A definition should be short, so that it must have no tautology in it,

nor any words superfluous. 5. Neither the thing defined, nor a mere synonymous name should make any part of the definition.

Though the defining by the genus and difference be the shortest way, yet it may be doubted whether it be the best; certainly it is not the only, and so not absolutely necessary. Thus, *man* may be defined to be a *solid extended substance, having life, sense, spontaneous motion, and the faculty of reasoning*: and certainly the meaning of the word *man* would be as well understood as when it is defined a *rational animal*.

DEFINITION, in rhetoric, is defined by Cicero, a short comprehensive explanation of a thing.

The definitions of the orator, it must be observed, differ much from those of the logician and philosopher: the orators take a large compass, and define things more ornamentally: thus, *man is a curious work of an almighty creator, framed after his own image, endued with reason, and born with immortality*: but this rhetorical definition, in strictness, comes nearer to the nature of a description, than any accurate definition.

DEFINITIVE, a term applied to whatever terminates a process, question, &c. in opposition to provisional and interlocutory.

DEFINITOR is used for an assessor or counsellor of a general or superior in monasteries, or other religious places. See MONASTERY and CONVENT.

DEFLAGRATION, in chemistry, the kindling or setting fire to a salt, mineral, &c. either alone or mixed for that purpose, with a sulphureous one, in order to purify it.

The following process is much recommended for its use in trying the strength of brandies, or other vinous liquor: measure out a quantity of the liquor, and then heat it, and set it on fire; if, after it ceases to burn, the quantity remaining is half as much as that measured out for the trial was, then the spirit is found to consist of half water, and half totally inflammable spirit, that is, it is what we understand by perfect proof; and according as the remainder is more or less than half the original quantity, it is so much below or so much above proof. This method is much more certain than that by the crown of bubbles, which arises upon shaking the spirit in a phial. The above process has been greatly improved by Mons. Geoffroy. See Mem. Acad. Paris, 1718.

DEFLECTION

**DEFLECTION**, of the rays of light, a property which Dr. Hook observed in 1675, and read an account of before the Royal Society, March 18, the same year. He says, he found it different both from reflection and refraction, and that it was made towards the surface of the opaque body, perpendicularly.

This is the same property, which Sir Isaac Newton calls inflection. See the article **INFLECTION**.

**DEFLOWERING**, the act of taking away a woman's virginity. See the article **VIRGINITY**.

**DEFLUXION**, in medicine, the falling of humours from a superior to an inferior part of the body. See the articles **CATARRH** and **PHTHISIS**.

**DEFLUXION** on the eyes. See the article **EYE**.

**DEFORCEMENT**, in law, the casting any one out of his land, or a withholding of lands and tenements by force from the right owner.

**DEFORCEMENT**, in the law of Scotland, is used for resisting, or offering violence to the officers of the law, while they are actually employed in the exercise of their functions, by putting its orders and sentences in execution.

The punishment of this crime is confiscation of moveables, joined with some arbitrary punishment, as fine, imprisonment, banishment, or corporal pains, according to the degrees of violence, and other circumstances which aggravate the crime.

**DEFORCEOR**, in law, is a person that overcomes and casts forth another from his lands and tenements by force, and differs from a disseisor on this account.

1. That a man may be disseised without force. 2. A man may deforce another that never was in possession, as where many have a right to lands, as common heirs, and one of them enters and keeps out the rest. A deforceor likewise differs from an intruder who is made by a wrongful entry only into land, &c. void of a possessor, whilst a deforceor is he that holds out against the right heir. See the articles **DISSEISOR** and **INTRUSION**.

**DEFORMITY**, the want of that uniformity necessary to constitute the beauty of an object. See the article **BEAUTY**. The deformity of the body may be prevented by forming and moulding it in infancy, as by stroking up the calves of the legs to keep them from falling too

low; and by stroking up the forehead, to keep it from sinking, by proper bandages, &c.

According to a late ingenious writer, the proper province of a deformed person is the improvement of the mind; and his business, only such as depends on ingenuity. If he cannot be a dancing-master, to adjust the heels, he may be a school-master, to instruct the head. He would appear ill, as a herald in a procession; but may pass very well, as a merchant upon the exchange. He cannot be a graceful actor on the stage, but he may produce a good play. He can acquire no glory by the sword, but he may by the pen. On looking about him, he will find many avenues to fame barred against him: but some are still open, through that of virtue; and those, if he has a right ambition, he will most probably attempt to pass.

In this manner does that truly ingenious writer apologize for, and make the encomium of deformity. See *Hay's Essay on Deformity*.

**DEFOSSION, BURYING ALIVE**, a punishment which the Romans inflicted on such of the vestals as were guilty of incontinency. The Hungarians too are said to punish women convicted of adultery in the same manner.

**DEFTERDAR, or DEFTARDAR**, in the turkish and persian polity, an officer of state, answering to our lord treasurer, who appoints deputies in every province. See the article **TREASURER**.

**DEGENERATION, or DEGENERATING**, in general, denotes the growing worse, or losing some valuable qualities whereof a thing was formerly possessed.

Some naturalists have been of opinion, that things are capable of degenerating into a quite distinct species; but this is a chimera. All that happens, in the degeneration of a plant, for instance, is the losing its usual beauty, colour, smell, &c. a misfortune entirely owing to its being planted in an improper soil, climate, &c.

**DEGLUTITION**, in medicine, the act of swallowing the food performed by means of the tongue driving the aliment into the oesophagus, which, by the contraction of the sphincter, protrudes the contents downwards.

**DEGRADATION**, the act of depriving a person for ever of a dignity or degree of honour, and taking away the title, badge and privileges of it.

**DEGRA-**

**DEGRADATION** is also a punishment of delinquent ecclesiastics. The canon-law distinguishes it into two sorts, the one summary by word only; the other solemn, by stripping the person degraded of those ornaments and rights which are the ensigns of his order or degree. The canonists likewise distinguish degradation from deposition, understanding by the latter the depriving a man of his clerical orders, but by the former, only the removing him from his rank or degree. In the antient primitive church, degrading a clergyman was reducing him to the state and communion of laymen, by which Vossius and others understand the thrusting down a clergyman to communicate with laymen, without the rails of the chancel. The full import of the phrase, however, is the depriving him of his orders, and reducing him to the simple condition of a layman, a punishment inflicted for several offences, as adultery, theft, or fraud: and clergymen thus reduced, were seldom allowed to recover their antient station, except upon some great necessity, or very pressing reason. Some have thought that degradation did not reduce the clergy to the state of mere laymen, and that on account of the indelible character acquired by ordination, but this is an opinion unknown to the antient writers of the christian church. Degradation in the romish church is attended with a great deal of ceremony. The offender is stripped of his pontifical vestments, and at the same time the person who degrades him scrapes his fingers with a knife, or a little piece of glass, declaring to him that the power of consecrating, blessing and sanctifying, is taken from him: he erases the marks of the tonsure in the same manner, which a barber compleats by shaving his head all over.

**DEGRADATION**, in painting, expresses the lessening the appearance of distant objects in a landscape, in the same manner as they would appear to an eye placed at that distance from them. See the articles **PERSPECTIVE** and **LANDSKIP**.

**DEGRADED CROSS**, in heraldry, a cross divided into steps at each end, diminishing as they ascend towards the center, called by the french *perronnée*. See plate LXVII. fig. 8.

**DEGREE**, in geometry, a division of a circle, including a three hundred and sixtieth part of its circumference.

Every circle is supposed to be divided into three hundred and sixty parts, called degrees, and each degree divided into sixty other parts, called minutes; each of these minutes being again divided into sixty seconds, each second into thirds, and each third into fourths, and so on. See the articles **MINUTE**, **SECOND**, &c. By this means no more degrees or parts are reckoned in the greatest circle than in the least that is, and therefore if the same angle at the center be subtended by two concentric arches, as many degrees are counted in the one, as in the other; for these two arches have the same proportion to their whole peripheries. For example. Let ACB (plate LXVII. fig. 9.) be an angle, and from the center C let there be described two arches, A B, D E, subtending the angle. There are as many degrees and minutes contained in the arch A B, as in the arch D E, altho' the radius of the arch A B were only a foot long, and the radius of the other reached the fixed stars. It is true indeed that a degree in the arch A B is so much less than a degree of the arch D E, as its radius C B is less than C E. The angle C is said to be of so many degrees or minutes as the arch which subtends it contains of such parts.

**DEGREE of latitude.** See the article **LATITUDE**.

**DEGREE of longitude.** See the article **LONGITUDE**.

A degree of the meridian on the surface of the globe is variously determined by various observers. Mr. Picart measured a degree in the latitude of  $49^{\circ} 21'$ , and found it equal to 57060 french toises. But the french mathematicians, who have lately examined Mr. Picart's operations, assure us, that the degree in that latitude is 57183 toises. Our countryman Mr. Norwood measured the distance between London and York, and found it 905751 english feet, and finding the difference of latitudes  $2^{\circ} 28'$ , determined the quantity of one degree to be 367196 english feet, or 69 english miles, 288 yards. Mr. Maupertuis measured a degree in Lapland, in the latitude of  $66^{\circ} 20'$ , and found it 57438 toises. A degree was likewise measured at the equator by other french mathematicians, and found to be considerably less than in the latitude of Paris. Whence it appears, that the earth is not a sphere, but an oblate spheroid. See the articles **EARTH**, **SPHEROID**, &c.

Our theory of navigation being founded upon an hypothesis of the degrees of latitude being all equal, must of consequence be very erroneous, wherefore we here insert a table of the degrees

in the quadrantal arch of the meridian, both in the sphere and spheroid with their differences, as calculated by the Rev. Mr. Murdoch.

A Table of Arches of the Meridian to the Spheroid and Sphere, in Minutes of the Equator.

Degrees	Sphe- roid.	Sphere.	Diff.	Degrees	Sphe- roid.	Sphere.	Diff.
1	58.7	60.0	1.3	46	2716.4	2760.0	43.6

**DEGREE**, in the civil and canon-law, denotes an interval in kinship, by which proximity and remoteness of blood are computed. In computing degrees of consanguinity, the rule of the civil law is universal, either in the direct or collateral, otherwise called the oblique line, for as many generations as there are, so many degrees there are likewise. But in the canon-law, the rule is different for the oblique line. And here a distinction is made between the equal and the unequal oblique line. In the first case the rule is, as many degrees as the persons allied are distant from the common stock, so many they are distant from one another. In the other case the rule is: As many degrees as the most remote is distant from the common stock, so many the persons are distant from one another. Hence the sister of a person's grandfather by the civil law is distant from that person in the fourth degree; whereas, by the canon-law, she is only in the third degree.

**DEGREE**, in chemistry, denotes the state or intensity of fire. See **FIRE**.

**Conjoint DEGREES**. See **CONJOINT**.

**DEGREES of comparison**, in grammar. See **COMPARISON** and **POSITIVE**, **COMPARATIVE** and **SUPERLATIVE**.

**DEGREES**, in music, are the little intervals whereof the concords, or harmonical intervals are composed. See the articles **INTERVAL** and **CONCORD**.

Musical degrees are three, 1st. The greater tone, whose ratio is 8 : 9. 2. The less tone, whose ratio is 9 : 10. and 3. The semitone, whose ratio is 15 : 16. By these alone a sound can be moved upwards or downwards successively, from one extreme of a concord to another, and produce true melody; and by means of these, several voices are also capable of the necessary variety in passing from concord to concord. As to the original of these degrees, they arise out of the simple concords, and are equal to their differences. Thus 8 : 9, is the difference of a fourth and a fifth; 9 : 10, is that of a lesser third and fourth, or of a fifth and greater sixth; and 15 : 16, is the difference of a greater third and fourth, or of a fifth and a lesser sixth.

The degrees being only certain mediums contrived to be put betwixt the extremes of concords, for moderating their inequality, are of use only with regard to concords; so that when the voice has moved one degree, the ear is not satisfi-

fied till we come to the other, which therefore must be concord to the first sound. By the fit division therefore, of the concurring intervals into lesser ones, the voice will move smoothly from one note to another, and the hearer be prepared for a more exquisite relish of the perfect intervals, whose extremes are the proper notes in which the ear finds the expected rest and pleasure. For the use of the degrees in the construction of the scale of music. See **SCALE** and **GAMUT**.

**DEGREES** in the peripatetic philosophy, are those entities which being multiplied in the same subject render it more active, and that intensively rather than extensively.

**Parodical DEGREE**, in algebra. See the article **PARODICAL**.

**DEGREE**, in universities, denotes a quality conferred on the students or members thereof as a testimony of their proficiency in the arts or sciences, and intitling them to certain privileges.

The degrees are much the same in all universities, but the laws thereof, and the previous discipline or exercise differ. The degrees are bachelor, master, and doctor, instead of which last, in some foreign universities, they have licentiate.

In each faculty, there are two degrees, bachelor and doctor, which were antiently called bachelor and master. In the arts likewise there are two degrees which still retain the antient denomination, *viz.* bachelor and master. See **BACHELOR**, **MASTER**, **DOCTOR**.

With regard to obtaining degrees at Oxford and Cambridge, matters are nearly on the same footing; only at Cambridge, the discipline is somewhat more severe, and the exercises more difficult. For the degree of bachelor of arts, besides residence in the university near four years, it is required that the person in the last year have defended three questions in natural philosophy, mathematics, or ethics, and answered the objections of three several opponents at two several times; as also, that he have opposed three times. After which, being examined by the master and fellows of the college, he is referred to seek his degree in the schools, where he is to sit three days, and be examined by two masters of arts appointed for the purpose. For the degree of master of arts, the candidate is obliged three several times to maintain two philosophical questions in the public schools, and to answer the objections brought against

against him by a master of arts. He must also keep two acts in the bachelors school, and declaim once.

To pass bachelor of divinity, the candidate must have been seven years master of arts : he must have opposed a bachelor of divinity twice, kept one divinity act, and preached before the university once in latin, and once in english.

For the degree of doctor. See DOCTOR.

DECIDE, *decida*, a term only used for the condemnation and execution of the Saviour of the world, by Pontius Pilate and the Jews.

DEJECTION, in medicine, the act of ejecting or evacuating the excrements. It is also applied to the excrements themselves thus evacuated, in which sense it is of the same import with stool. See the article STOOL.

DEJECTION, in astrology, is applied to the planets when they have lost their influence, as is pretended by reason of their being in opposition to some others : It is the contrary of their exaltation. See the article EXALTATION.

DEIFICATION, in antiquity, the same with apotheosis. See APOTHEOSIS.

DEINCLINERS, or DEINCLINING DIALS, are such as both decline and incline, or recline at the same time. Thus, if a plane cut the prime vertical circle at an angle of thirty degrees, and the horizontal plane under an angle of twenty-four degrees, the elevation of the pole being fifty-two degrees, a dial drawn on this plane is called a deincliner. See DIAL.

DEIPARA, MOTHER OF GOD. See the article MOTHER.

DEISM, the system of religion acknowledged by the deists. See the next article.

DEISTS, in the modern sense of the word, are those persons in christian countries, who acknowledging all the obligations and duties of natural religion, disbelieve the christian scheme, or revealed religion. They are so called from their belief in God alone, in opposition to Christians. The learned Dr. Clarke taking the denomination in the most extensive signification, distinguishes deists into four sorts. 1. Such as pretend to believe the existence of an eternal, infinite, independent, intelligent Being, and who teach that this supreme Being made the world, though they fancy he does not at all concern himself in the management of it. 2. Those who believe not only the being, but also the providence

of God with respect to the natural world, but who not allowing any difference between moral good and evil, deny that God takes any notice of the morally good or evil actions of men ; these things depending, as they imagine, on the arbitrary constitutions of human laws. 3. Those who having right apprehensions concerning the natural attributes of God, and his all-governing providence, and some notion of his moral perfections also ; yet being prejudiced against the notion of the immorality of the human soul, believe that men perish intirely at death, and that one generation shall perpetually succeed another, without any future restoration or renovation of things. 4. Such as believe the existence of a supreme Being, together with his providence in the government of the world, as also the obligations of natural religion ; but so far only, as these things are discoverable by the light of nature alone, without believing any divine revelation. These last are the only true deists ; but as the principles of these men would naturally lead them to embrace the christian revelation, the learned author concludes there is now no consistent scheme of deism in the world.

DEITY, a term frequently used in a synonymous sense with God. See GOD.

DELEGATES, commissioners appointed by the king under the great seal to hear and determine appeals from the ecclesiastical court.

Court of DELEGATES. See COURT.

DELEGATION, *delegatio*, a commission extraordinary given by a judge to take cognizance of, and determine, some cause, which ordinarily does not come before him.

DELEGATION, in the civil law, is a kind of nomination, whereby a debtor appoints one that is debtor to him, to answer a creditor in his place. This delegation differs from transferring, or translation, in that three persons intervene in a delegation, viz. the creditor, the debtor, and a third indebted to the debtor, whereas in a transfer, it is enough that the transferer and transferee be present.

DELETERIOUS, an appellation given to things of a destructive or poisonous nature. See POISON.

DELF, denotes a quarry or mine, where either stone or coal is dug ; but is more particularly used for the veins of coal

lying under-ground, before it is dug up. A delf, or delve of coals, also denotes a certain quantity when dug.

**DELF**, in heraldry, is by some supposed to represent a square rod or turf, and to be so called from delving, or digging. A delf tenne, is due to him that revokes his own challenge, or any way goes from his word; and to such this is given as an abatement to the honour of their arms, and is always placed in the middle of the escutcheon. However, if two or more delfs are found in an escutcheon, they are not then to be looked upon as signs of an abatement, but of honour. Also, if it be of metal, or charged upon, it then becomes a charge of perfect bearing.

**DELFT**, a city of the united Netherlands, in the province of Holland, eight miles north-east of Rotterdam, and thirty south-west of Amsterdam: east long.  $4^{\circ} 5'$ , and north lat.  $52^{\circ} 6'$ .

**DELIA**, in antiquity, feasts celebrated by the Athenians in honour of Apollo, furnished Delius, the principal ceremony whereof was an embassy, or rather a pilgrimage to Apollo, performed every five years by a certain number of citizens, deputed for that purpose, called deliastæ, and the first person of the embassy architheorus: to him were added, four more of the family of the Ceryci, priests descended from Mercury, who resided all the year at Delos, to assist in the temple. The whole deputation set out in five vessels, carrying with them every thing necessary for the feast and the sacrifices.

**DELIA** was also a quinquennial festival in the island of Delos, instituted by Thefeus, at his return from Crete, in honour of Venus, whose statue, given him by Ariadne, he erected on that place, having by her assistance met with success in his expedition.

**DELIAC**, or **DELIACAL PROBLEM**, a problem much celebrated in the writings of the antients, concerning the duplication of the cube. See the articles **DUPPLICATION** and **CUBE**.

**DELIBAMENTA**, in antiquity, a libation to the infernal gods, always offered by pouring downwards. See **LIBATION**.

**DELIBERATIVE**, an appellation given to a kind, or branch, of rhetoric, employed in proving a thing, or convincing an assembly thereof, in order to persuade them to put it in execution.

To have a deliberative voice in the assembly, is when a person has a right to give his advice and his vote therein. In councils, the bishops have deliberative voices; those beneath them have only consultative voices.

**DELICT**, in the scotch law, denotes much the same with misdemeanour. See the article **MISDEMEANOUR**.

**DELIGATION**, in surgery, the binding up of wounds, dislocations, fractures, &c. See the articles **WOUND**, **DISLOCATION**, **FRACTURE**, &c.

**DELIMA**, in botany, a genus of plants belonging to the *polyandria-monogynia* class, with an elongated style: it has no flower-petals; the cup consists of five leaves; the fruit is a bivalve capsule, and contains two seeds.

**DELINEATION**, or **DELINEATING**, the same with designing. See the article **DESIGNING**.

**DELINQUENT**, a guilty person, or one who has committed some fault, or offence, for which he is punishable.

**DELIQUIUM**, or **ANIMI DELIQUIUM**, the same with lipothymia. See the article **LIPOTHYMIA**.

**DELIQUIUM**, in chemistry, signifies the solution of any body, when exposed to a cool and damp place, by the humidity it attracts from the air. The salt of tartar dissolved in the above manner is called oil of tartar per deliquium.

**DELIRIUM**, in medicine, the production of ideas not answerable to external causes, from an internal indisposition of the brain, attended with a wrong judgment following from those ideas, and an affection of the mind, and motion of the body, accordingly: and from these increased through various degrees; either alone or joined together, various kinds of deliria are produced.

The causes of deliria are numerous, such as fevers, wounds in the head, internal inflammations, and immoderate losses of blood, whereby the brain is either disordered or weakened. It also arises from the feed or menses being retained in the womb, from the rotting of a gangrened member, &c. When a fierce and continual delirium is produced by an acute fever, from the brain itself originally affected, it is called a phrenzy: but a simple delirium only attends a violent fit of an intermitting fever, so that when the paroxysm is off, the delirium ceases. See the article **PHRENZY**.

Many

Many are the signs of a delirium, as gnashing of the teeth, a fierce and wild aspect, a pulsation in the hypochondrium and belly, watchings, vomiting of bile, in pains of the head, a tremor, or trembling of the tongue, &c. to all which Gallen adds, the doing any thing unusual, or indecent.

Various methods of cure, and different remedies are to be chose agreeable to the difference of the causes; but the chief of these remedies are warm bathing of the feet, with the application of blisters to them, and to the hams; frictions upon the same parts; diluent clysters often applied; a thin diet, and healing, quieting, deobstruent and diluent drinks; emollient remedies applied to the head; gentle purges; bleeding in the foot, a bringing down of the piles, or menstrual discharge, &c.

A delirium is always a bad sign in wounds of the head, because it denotes that the brain itself is injured.

**DELIVERANCE**, in law. See the article **REPLEGIARE**.

**DELIVERY, CHILD-BIRTH, or PARTURITION**, in medicine and surgery, the bringing forth a perfect *foetus*, or child, from its mother's womb, whether it be alive, or dead. See **FOETUS**.

In order to attain the knowledge of difficult childbirths, it is necessary to form a just idea of those that are natural. The time of the natural birth is, from the 15th day of the ninth month, to the end of the 10th of the same: yet some women affirm it may be sooner, or later. Hoffman says, the usual time is nine solar months; and Junker, that excretions from the uterus being by women referred to certain lunar phases, they reckon their going with child by the weeks, and that they usually exclude the *foetus* forty weeks from the time of their being with child, commonly on that very day they were used to have their menses.

The signs of an approaching delivery, are a remarkable descent of the womb, and a subsidence of the belly; the head of the *foetus* falls down to the orifice of the womb, and presses upon it. See plate **LXVIII. n° 1.** The orifice of the womb dilates by the weight; and the chorion and amnios, being driven forward with the waters they contain, form a kind of pouch, or bladder, at the said orifice; which should be suffered to break of itself, or, at least, it should not be burst

till the woman is in labour. There is a flux of a whitish matter from the said orifice: pains which extend from the loins and groin towards the genital parts: there is a frequent desire to make water, or to go to stool; or a continual tenesmus: a flux of the waters from the membranes which contain the child immediately before the birth, or more early: a trembling of the lower joints: sometimes the head aches, and the face looks intensely red.

The infant gradually advances, the above protuberance continually enlarging the passage, that the crown of the head may be felt; the birth is then advanced one third; and the midwife may now assist the exclusion. When the infant is advanced forward, as far as his ears, he is said to be in the passage. If the membranes are not already burst, they may now be opened, and the waters by their effusion, will render the vagina slippery, and promote the expulsion of the infant. When the child is born, the midwife should lay him on her knees, so as to give issue to the waters from the mouth, if any has been imbibed: soon after, the placenta appears of itself, if not attached to the uterus: if otherwise, the midwife must separate it gently, by introducing her hand. The navel-string must now be cut, having first made a ligature as well on the child's side as on the mother's, to prevent a hæmorrhage. The midwife, at first, having asked a few questions, ought to examine, by the touch, with the fore and middle finger, introducing them from time to time, to know the state of the uterus; and, as the child advances, she must relax the vagina by some oily remedy. The mother should regulate her throws, and use her efforts all at once, not divide them, especially when the head is advanced, that the shoulders may immediately follow, and the child escape the danger of strangling.

After the child is born, and the after-birth brought away, let a warm linnen cloth be applied to the parts, but not so as to hinder the flowing of the lochia. An hour after, let the mother take a little oil of sweet almonds, to ease the after-pains, and let a cataplasm of the oil of sweet almonds ʒij. and two or three new laid eggs be boiled together, and laid to the parts, renewing it every six hours, for two days: fifteen days after

after the birth, the parts may be bathed with an astringent decoction of red roses, balsamifines, or nut-galls, in red wine, in order to brace them. If the labour is long and difficult, it will be proper to bleed, to prevent inflammations, and to give a little Alicant-wine, or with the addition of Cinnamon-water, or confectio alkermes, not forgetting an oily clyster.

*A difficult DELIVERY* may be caused by the mother, the midwife, or the foetus. The fault is in the mother, if, when the orifice of the womb is open, and the child rightly placed, she has not strength to expel the foetus, especially if the waters are come away, and the pains cease: or when the mother will not exert herself; or there is a natural fault in the genital parts. In a defect of strength, or pains, all else being right, a draught of generous wine should be given, with cinnamon and mace, again and again, if the work does not go forward. If there wants a greater stimulus, borax, cinnamon, or myrrh, may be given, with a proper drink, which must be repeated in an hour or two, if occasion requires. But the abuse of forcing medicines is dangerous: stimulating clysters may be injected now and then, especially if the woman is costive. The midwife should also press back the os coccygis, which tends to excite the pains, and to ease the labour. If the parts are overstrait, as in the first birth, especially if the woman is not young, emollient liniments are to be used, and the parts must be anointed with fresh butter, or oil, and to be dilated gently with the fingers. If there is a tumor, caruncle, or membrane, opposing the birth, a surgeon's assistance is required.

The midwife is in fault, when she hastens the labour before the time, when there is no true pains, when the orifice of the uterus is not open, which alone distinguishes the true pains from false: the true time of birth must be waited for: the woman must be composed, and her spirits kept up with comfortable liquors.

If the fault is with the foetus; and the head too large, or the shape monstrous, or the situation preternatural, then forcing medicines are fruitless and noxious; and the foetus is brought forth by the feet, by a skilful hand, or the instrument called embryulcus, (ibid. n° 10, 11.) whether alive or dead. See EMBRYULCUS.

If the feet present first (ibid. n° 2.) the midwife must be wary, lest there be twins, and lest she should take a foot of each: the feet must be wrapped in a dry napkin, and the child must be drawn gently, till the waste is in the orifice of the uterus: then the infant's hands should be drawn close by the sides; and if the nose be towards the os pubis, it should be turned towards the coccyx, to prevent an obstacle. Then, the orifice must be dilated with the fingers, and the woman's throws should assist the midwife's efforts to educe the child. If the chin is embarrassed, the midwife must disengage it, by putting her finger into the mouth, in order to turn it to advantage.

If the infant's head presents across, (ibid. n° 3.) it must be put back, and gently turned to its natural situation; and if the shoulder presents, the same art must be used, (ibid. n° 4.) If the belly, hip, or thigh, appears first, (ibid. n° 5.) the child must be extracted by the feet, and the mother must lie horizontally on her back. If one or both hands are directed upwards, and lie close to the head, (ibid. n° 6.) the case is not so bad as some apprehend, for they will keep the orifice equally dilated, till the head passes, and prevents strangling. If one hand, or one foot appears, they must be returned, and the infant brought forth by the head in the former case, and by the feet in the latter. (n° 7, and 8.)

If the infant is dead, there is generally a collapion of the abdomen; the breasts are flaccid; the infant bears on the lower part of the pelvis; and the child, upon motion, rolls like a lump of lead. The bones of the skull are wrapped over one another; an ichorous lymphatic sanies flows from the uterus; the mother is subject to fainting. There is no pulsation in the navel string; it is soft and indolent to the touch, and absolutely deprived of motion. If the placenta comes first, and is hot, the child is alive. Above all, if any part of the infant's body appears, and is full of small vesicles livid, soft, and brittle, it is not only dead, but beginning to putrify. In these cases he must be extracted by the feet, and if it cannot be done otherwise, with an instrument; but a man midwife's assistance must not be neglected.

When the foetus dies before the time of birth, and the membranes continue whole, it will not putrify: therefore the work

Fig. 1. DELIVERY.

Fig. 2. EMBRYULCUS.

J. Jefferys sculp.

work must be left to nature, for birth-pains will at length come on spontaneously.

If the navel-string appears first, and is compressed soon after by the head of the infant, its life is in danger, and the remedy is to return the infant, and reduce the cord, till the head fills the orifice: but if this cannot be done, the woman must be put in a suitable posture, and the child must be extracted by the feet.

When the placenta presents itself, which is known by its spongy, soft, texture, and the great quantity of blood flowing at the same time, it requires speedy assistance. If the membranes are entire, they should be broke; the placenta and membranes should be reduced into the uterus, and the child be extracted by the feet; which is more easily performed in the membranes, than in the uterus, and put into a proper situation: but if the placenta is disengaged from its membranes, and these are broke, and the placenta, or both, appear before the infant, they may be brought away first, and the infant immediately afterwards.

When there is a great flux of blood from outward accidents, the infant should be immediately delivered by art, though the mother is not in true labour. If the uterus is opened, and the vagina relaxed, as in this case they commonly are, the child must be extracted by the feet; if not, they must be mollified with fresh oil, and the infant delivered as before.

After all laborious births, the woman is generally weak, and apt to faint: therefore, her spirits should be kept up by a glass of hot wine, or analeptic water, which must be repeated as oft as there is occasion.

If after the child is born, the placenta does not soon follow, and it adheres to the womb, the woman is not to change her posture immediately, but the midwife's hand is to be introduced into the womb, as far as the placenta, taking the navel-string for a guide; and taking hold of it, she is to move it gently to and fro, in order to loosen and extract it. (ibid. n<sup>o</sup> 9.) If it adheres too closely, it is not to be pulled forcibly, or broken: it will be best to wait half an hour, keeping the hand in the uterus, for fear of its closing, till it comes away of itself, or may be separated without force. If, through the unskilfulness of the midwife, the orifice of the womb closes, before it is come away, aloetic pills must be taken

every evening. If it putrefies, the patient dies, or falls into dangerous fevers. See the article PLACENTA.

After delivery, the woman should be put into bed, and a folded sheet put under her hips, in order to receive the lochia. See the article LOCHIA.

Warm linnen should be applied to the genital parts, to keep out the air, and a compress, dipped in warm wine, should be applied to the belly, but not too tight.

If there are violent pains after delivery, they generally proceed from the after-birth's being retained, or part of it; from blood clotted, or concreted, in the uterus; from hard labour; from a defect in the flux of the lochia; or from wind, especially if the woman has not been swathed in a proper way. In this case, hot diluents are proper, or an infusion of camomile flowers, drank as tea, or broths with caraway seeds; or wormwood, or camomile flowers; or thin orange peel 3j. or a bitter tincture in a proper infusion, taken hot. An ounce or two of oil of sweet almonds, taken in a hot vehicle, is excellent.

**DELLY**, the capital of a province of the same name, and at present of all the hither India: east long. 79°. and north lat. 28°.

It is a large and populous city, ten miles in circumference.

**DELOS**, the principal of the Cyclades-islands, in the Archipelago: east long. 25° 50', and north lat. 37°, 26'.

**DELPHIN**, or **DOLPHIN**. See the article DOLPHIN.

**DELPHINIUM**, **LARK'S SPUR**, in botany, a genus of the *polyandria-trigynia* class of plants, the corolla of which consists of five unequal petals, disposed circularly; of these the upper one is anteriorly more obtuse than the others, and is emarginated, and extended behind into a tubulated horn, which is straight, long, and obtuse; the others are of an ovato-lanceolated figure, patent and nearly equal: the fruit consists of one or three capsules, of an ovato-tubulated figure, straight, composed of a single valve, and opening inwards: the seeds are numerous and angular: these seeds called *staphisagria*, or *stavesacre*, in the shops, are used to destroy vermin in childrens heads. See plate LXIX. fig. 1.

**DELPHINUS**, in ichthyology, a genus of fishes, of the order of the *plagiuri*, the characters of which are, that they have

have teeth in each jaw, that the fistula is situated in the middle of the head, and that the back is pinnated, or furnished with fins.

To this genus belong the dolphin, the porpoise, and the grampus, or north caper. See the articles DOLPHIN, &c.

**DELPHINUS**, in astronomy, a constellation of the northern hemisphere, whose stars in Ptolemy's and Tycho's catalogues are ten, and in Mr. Flamsteed's eighteen.

**DELSBERG**, or **DESBERG**, a town of Switzerland, about seventeen miles south-west of Basil.

**DELTOIDES**, in anatomy, a thick triangular muscle of the arm, being one of the three elevators. See the article **ELEVATOR**.

This muscle arises from the clavicle, and the acromion and spine of the scapula; and terminates, at four fingers breadth below the neck of the humerus. See the article **HUMERUS**.

**DELUGE**, *deluvium*, an inundation, or overflowing of the earth, either wholly, or in part, by water.

We have several deluges recorded in history, as that of Ogyges, which overflowed almost all Attica, and that of Deucalion, which drowned all Thessaly, in Greece: but the most memorable was that called the universal deluge, or Noah's flood, which overflowed and destroyed the whole earth, and out of which only Noah, and those with him in the ark, escaped.

Men have been very solicitous to account for this catastrophe philosophically, and to discover from whence such an amazing quantity of water could come, as were necessary to cover all our globe, to the height of fifteen cubits, above the highest hills: for to that height Moses expressly saith, *Gen. vii. 20.* "The waters prevailed." Some have ventured to deny there were any mountains at all before the flood, though he expressly mentions them as a standard for the height of the water. Others have denied the universality of the deluge, though the words of the text be, "That all the hills over the whole earth were covered." Others have had recourse to the shifting of the earth's center of gravity, and therefore, will have all parts drowned successively; and our famous theorist, Dr. Burnet, fancies an earth made on purpose to be drowned at that time, which being in form of an

orbicular crust on the face of the sea, as we now call it, (for he says, there was none before the deluge) fell down into the water, and so drowned its inhabitants.

But the holy scriptures tell us, that the waters of the deluge came from two funds, "the great deep below," and the "rains above." Again, when we look to the internal parts of the earth, even to the greatest depth men have ever reached, we find that the body of the terrestrial globe is composed of strata, or layers, lying over one another, which appear to be sediments of a flood: besides, in the bodies of these strata, though never so solid, nay, even inclosed within the solidity of the firmest flints, marble, stone, &c. we find a prodigious variety of the exuviae, or remains of fishes, such as their shells, teeth, &c. as well marine ones, as those which live in lakes and rivers; and from a due observation of these, and repeated considerations upon them, it was, that the learned Dr. Woodward founded what he delivers upon this subject, which therefore is not so much a theory of the earth, as necessary deductions, and unavoidable consequences, drawn from the matters of fact, as they are laid down in the second part of his natural history of the earth.

1. That these marine bodies, and the other spoils of fresh water fishes, were borne forth out of the sea by the universal deluge, and on return of the water back again from off the earth, they were left behind on land.

2. That during the time of the deluge, all the stone and marble of the antediluvian earth, all the metals in it, all the mineral concretions, and in a word, all fossils whatever, that had before attained any solidity, were totally dissolved; their constituent corpuscles disjoined, and their cohesion perfectly ceased; and that the said corpuscles, together with the corpuscles of those which were not before solid, such as sand, earth, and the like; as also, all animal bodies, teeth, shells, vegetables, in short, all bodies whatever, that were either upon the earth, or that constituted the mass, if not quite down to the abyss, yet to the greatest depths we ever dig, were assumed up promiscuously into the water, and sustained therein; so that the water and these bodies made up one common mass.

3. That at length, all the mass that was thus borne up in the water, was again pre-

precipitated, and subsided toward the bottom, and that this subsidence happened generally according to the laws of gravity. See the article GRAVITY.

That the matter subsiding thus, formed the strata of stone, earth, marble, coal, &c. of which strata the terrestrial globe, or, at least, as much of it as hath been displayed to human view, doth mainly consist.

4. That the strata of marble, &c. attained their solidity as soon as the sand, or other matter, whereof they consist, was arrived at the bottom, and well settled there; and that all those strata which are solid at this day, have been so ever since that time.

5. That these strata were originally parallel, plane, and regular, and consequently rendered the surface of the earth even and spherical; that they were contiguous, and not broken and interrupted as we find them now; and that the water lay then upon them, constituting a fluid sphere, environing all the globe round.

6. That after some time, by the force of an agent seated within the earth, those strata were broken on all sides of the globe; that they were dislocated, and their situation varied; from whence these elevations and depressions on the surface of the globe, as the mountains, vallies, and other inequalities.

And afterwards, he concludes from his observations,

1. That Noah's deluge was quite universal, covering the whole earth, even the highest mountains quite round the globe.

2. That, at the time of the deluge, the water of the ocean was first brought out on the earth, and immediately succeeded by that of the abyss.

3. That, upon the disruption of the strata, or the elevation of some, and the depression of others, towards the end of the deluge, this mass of water fell back towards the lowest parts of the earth, into lakes, and other cavities, into the channel of the ocean, and through the fissures, by which this communicates with the ocean, in the abyss which it filled, till it came to an equilibrium with the ocean.

4. That the deluge commenced in the spring season, the waters coming forth upon the earth in the month which we call May.

5. That the deluge did not happen, from an accidental concurrence of natural causes;

but that many things then happened, which never could possibly happen, without the assistance of a supernatural power.

Mr. Whiston, on the contrary, in his new theory of the earth, supposes the deluge began on the 18th of November, in the 2365 year of the Julian period, that is, 2349 years before the Christian æra; that a comet descending towards its perihelion, in the plane of the ecliptic, passed quite near the globe of the earth, the very same day that the deluge began; he ascribes to the universal deluge all the changes and alterations that have happened in the surface and inside of the globe: he adopts the hypothesis of Dr. Woodward, and indiscriminately makes use of all the observations of this author, with regard to the present state of the globe.

The terrestrial globe having once met with the tail of the comet, consisting of a transparent fog, or aqueous atmosphere, it must, in passing through it, appropriate to itself some part of the matter it contained. All that was found within the sphere of attraction of the globe, must have fallen upon the earth, and that in form of rain, since this tail partly consisted of aqueous vapours. This tail being "the cataraacts of heaven that were "opened," the rain may be made as plentiful as one pleases, even to occasion an universal deluge, the waters of which would easily cover the highest mountains. However, Mr. Whiston does not attribute the whole deluge to these waters only, for, agreeably to scripture, he affirms that the earth, upon the approach of the comet, would no doubt feel the force of its attraction; so that the fluid, contained in the great abyss, would be agitated by so violent a flux and reflux, that the superficial crust of the earth could not resist it, but be broken in several places, and the internal waters diffused over the surface, "and the fountains of the great deep broken up."

Mr. Whiston, to dispose of all this water, supposes, that as soon as the earth in continuing its course, had got some way from the comet, the effects of its attraction, the flux and reflux ceased in the great abyss, and then the superior waters were violently precipitated through the same passages by which they came out; the great abyss swallowed up all the superfluous waters, and its cavity was found capable enough to

receive not only the waters which it had already contained, but also all those which the tail of the comet had left behind it; since during the time of its agitation, and the bursting of its crust, it had enlarged the space by breaking down, on all hands, the earth that environed it. It was, in like manner at this time, that the earth, which till then was spherical, became elliptic, occasioned not only by the effect of the centrifugal force caused by its diurnal revolution, but likewise by the action of the comet; and that because the earth, in passing through the tail of the comet, was situated in such a manner, that it presented its equatorial parts to this body; and because the force of the comet's attraction, concurring with this centrifugal force of the earth, took away those parts of the equator with so much the more facility, as the crust was broken and disjoined in a vast many places; and because the action of the flux and reflux of the abyss made a more violent impression upon the parts under the equator, than any where else.

Dr. Halley resolves the deluge into the shock of a comet, or some other such transient body: the great agitation that must have been occasioned by it in the sea, he observes, would be sufficient to account for all those strange appearances of heaping vast quantities of earth, and high cliffs upon the beds of shells, which once were the bottom of the sea, and raising up mountains, where none were before: such a shock as this, impelling the solid parts, would occasion the waters, and all fluid substances that were unconfined, as the sea is, to run violently with an impetus toward that part of the globe where the blow was received, and that with force sufficient to take with it the very bottom of the ocean, and would carry it upon land.

There are various other systems of the universal deluge, several of which may be seen in *Monf. Buffon's Natural History*, Tom. 1.

**DELVIN**, among the miners of Cornwall, a kind of slate more usually called killas. See the article **KILLAS**.

**DEMAIN**, or **DEMESNE**, in its common acceptation, is used for the lands round a manor-house, occupied by the lord. See the article **MANOR**.

**DEMAIN**, or **DEMESNE**, in law, is commonly understood to be the lord's chief manour-place, with the lands thereto belonging, which he and his ancestors have

time out of mind kept in their own manual occupation, for the maintenance of themselves and their families. See the article **MANOR**.

**DEMAIN** denotes also all the parts of any manor not in the hands of freeholders. And it is frequently used for a distinction between these lands, &c. that the lord of the manor has in his own hands, or of his lessee demised at a rack rent; or such other land appertaining to the manor, which belongs to free or copyholders.

**DEMAIN** is sometimes taken in a more special sense, as opposite to frank-fee; such lands as were in the possession of Edward the confessor, being called antient demesne, and all others frank-fee. In England, no private person has any demesnes, according to the simple acceptation of the word, because there is no land but what depends mediately or immediately upon the crown, as of some honour belonging to it, and not granted in fee to any inferior person; wherefore when a person in pleading would signify the land to be his own, he says, that he is seized thereof in his demain as of fee; by which it appears, that tho' his land be to him and his heirs for ever, yet it is not true demesne, but depending upon a superior lord, and is held by rent or service.

**DEMAND**, in law, the calling upon a person for any thing that is due.

There are two kinds of demands, the one in deed, and the other in law. And these are again divided into three sorts, one in writing, without speaking, as in every writ of præcipe; one other without writing, being a verbal demand of the person who is to perform something; and another made without either words or writing, which is termed a demand in law, as in cases of entries on lands, &c. And, as an entry upon land and taking distress for rent, are a demand in law of the land and rent, so the bringing an action of debt for money due on a bond, is a demand in law of the debt.

A demand is to be legal, and made in such a manner as the law directs; if for rent reserved on a lease of a messuage and lands, it ought to be made at the fore door of the house; and of land, on the most public part thereof. If a lessor or landlord in demanding of rent to re-enter, demands one penny more or less than is actually due to him, or does not shew the certainty of the rent, the day of its payment,

Fig. 4. DENTARIA.

Fig. 5. DESIGNING.

Fig. 6. DENTARIA, or TOOTH-WORT.

ment, and when due, it will not be a good demand. Debts and claims are to be demanded in time by the statute of limitations, or they will be lost by law.

**DEMANDANT**, in law, is the plaintiff in all real actions, wherein land, &c. is demanded; for these actions are by demands, as personal actions are by plaints.

**DEMARCHUS**, *δημαρχος*, in antiquity, the principal magistrate of the city Neapolis; also a magistrate who had the government of one of the districts of Attica, answering in some measure to our sheriffs.

**DEMEMBRE**, in heraldry, is said of dismembered animals, or those with their limbs cut off.

**DEMER**, a river in the austrian Netherlands, on which the city of Mechlin stands.

**DEMESNE**, the same with demain. See the article **DEMAIN**.

**DEMETRIA**, a festival celebrated by the Greeks in honour of Ceres, called *δημητρία*; wherein it was usual for the devotees to lash themselves.

**DEMETRIOWITZ**, a city of the dutchy of Smolensko, in the russian empire, situated upon the river Ugra, in  $37^{\circ}$  east long. and  $52^{\circ} 30'$  north lat.

**DEMI**, a word used in composition with other words to signify half. In words borrowed from the Latin we use semi. See the article **SEMI**.

**DEMI-BASTION**, a fortification having only one face and one flank. See the article **BASTION**.

**DEMI-CANNON lowest**, the name of a piece of ordnance generally about six inches bore, 5400 pound weight, ten or eleven feet long, and carrying a shot of about thirty pound weight. It carries point blank 156 paces.

**DEMI-CANNON ordinary**, is  $6\frac{1}{2}$  inches bore, 12 feet long, and weighs 5600 pound. It carries a shot of  $6\frac{3}{4}$  inches in diameter, whose weight is 32 pounds, and shoots point blank 162 paces.

**DEMI-CANNON of the longest size**, is  $6\frac{3}{4}$  inches bore, 12 feet long, and weighs 6000 pounds weight. It shoots point blank 180 paces.

**DEMI-CROSS**, an instrument used by the Dutch to take the sun's altitude, or that of a star, at sea. It consists of a staff AG (See plate LXIX. fig. 3.) divided into a line of tangents, and a cross piece or transum BE. It is furnished with three vanes; a horizon vane, at A; a sight vane, at H; and the shade vane, at E.

To take the sun's altitude by this instrument, hold it with the cross piece BE as upright as you can; and looking thro' the sight vane at H, observe the horizon thro' the slit in the horizon vane A, and slide the cross piece to and fro till the shade of the vane at E fall likewise upon the slit of the horizon vane A; then are the degrees cut on the staff AG, by the edge of the cross piece BE, the altitude of the sun required. But to find the height of a star, you must remove the horizon vane A, and put it on the end G, and transfer the sight vane H to A; then holding the instrument upright, as before, observe the horizon through the sight vane and horizon vane, and the star through the sight vane and shade vane, and then the transum will cut the degrees of the star's altitude on the staff AG; allowing about eight or ten minutes for your height above the level of the water. Instead of the demi-cross, we use the cross staff, or fore-staff. See **FORE-STAFF**.

**DEMI-CULVERIN**, a piece of ordnance usually  $4\frac{1}{2}$  inches bore, 2700 pound weight, ten feet long, and carrying point blank 175 paces.

**DEMI-CULVERIN of the least size**, is  $4\frac{1}{4}$  inches bore, 10 feet long, and 2000 pounds weight. It carries a ball of 4 inches diameter, and of 9 pounds weight, and its level range is 174 paces.

**DEMI-CULVERIN of the largest sort**, is  $4\frac{3}{4}$  inches bore,  $10\frac{1}{2}$  feet long, and weighs 3000 pounds weight. It carries a ball  $4\frac{1}{2}$  inches diameter, weighing 12 pounds 11 ounces, point blank 178 paces.

**DEMIDITONE**, in music, is the same with a third minor. See the article **THIRD**.

**DEMI-HAQUE**. See **HARQUEBUSS**.

**DEMI-GOD**, &c. See **GOD**, **HERO**; &c.

**DEMI-GORGE**, in fortification, is that part of the polygon which remains after the flank is raised, and goes from the curtain to the angle of the polygon. It is half of the vacant space or entrance into a bastion. See the article **GORGE**.

**DEMI-LUNE, half moon**, in fortification, an outwork consisting of two faces and two little flanks, frequently built before the angle of a bastion, and sometimes also before the curtain, tho' now much disused.

**DEMI-QUAVER**, a note in music, two of which are equal to a quaver. See the articles **SEMI-QUAVER** and **QUAVER**.

**DEMI-SEMI-QUAVER**, in music, the shortest note, two of them being equal to a semi-quaver. See the articles **SEMI-QUAVER**, **CHARACTER**, &c.

**DEMISE**, in law, is applied to an estate either in fee, for term of life or years, tho' most usually the latter. The king's death in law is termed the demise of the king, which does not discontinue any writ or process, nor determine any commission civil or military, nor a parliament till after six months.

**DEMISE** and **REDEMISE**, a conveyance where there are mutual leases made from one to another of the same land, or something out of it.

**DEMOCRACY**, the same with a popular government, wherein the supreme power is lodged in the hands of the people: such were Rome and Athens of old; but as to our modern republics, Basil only excepted, their government comes nearer to aristocracy than democracy.

**DEMOISELLE**, in ornithology, a bird of the crane-kind, something less than a heron, known also by the name of the dancing bird, on account of its frequent leaping and turning round, and varying the motion of its head at the same time. Immediately from behind each eye, springs forth a tuft of long, soft, white feathers, which tend backwards in a very graceful manner, and wave with the least air. The fore part of the neck, on the contrary, is covered with soft, long, and slender black feathers, which fall on the breast in a very pretty manner, sometimes close, and at other times detached like a lady's tippet.

**DEMONSTRABLE**, a term used in the schools, to signify that a thing may be clearly proved. Thus it is demonstrable, that the three angles of a triangle, are equal to two right ones.

**DEMONSTRATION**, in logic, a series of syllogisms, all whose premisses are either definitions, self-evident truths, or propositions already established.

The knowledge acquired by demonstration, tho' it be certain, is not so clear and evident as intuitive knowledge. It requires pains and attention, and steady application of mind, to discover the agreement or disagreement of the ideas it considers; and there must be a progression by steps and degrees, before the mind can in this way arrive at certainty. Before demonstration there was a doubt, which, in intuitive knowledge, cannot happen to the mind that has its faculty of perception left to a degree capable of distinct ideas. In every step that reason makes in demonstrative knowledge, there is an intuitive knowledge of that agree-

ment or disagreement it seeks with the next intermediate idea, which it uses as a proof; for if it were not so, that yet would need a proof, since without the perception of such agreement or disagreement, there is no knowledge produced. This intuitive perception of the agreement or disagreement of the intermediate ideas in each step and progression of the demonstration, must be exactly carried in the mind; and a man must be sure that no part is left out: hence because in long deductions the memory cannot easily retain each step, this knowledge becomes more imperfect than intuitive; and men often embrace falsehoods for demonstrations. See **KNOWLEDGE** and **INTUITION**.

It has been generally taken for granted, that mathematics alone are capable of demonstration. But to have such an agreement or disagreement as may be intuitively perceived being not the privilege of the ideas of number, extension and figure alone, it may possibly be the want of due method and application in us, and not of sufficient evidence in things, that demonstration has been thought to have so little to do in other parts of knowledge. For wherever the mind can perceive the agreement or disagreement of any two ideas by an intuitive perception of the agreement or disagreement they have with any intermediate ideas, there the mind is capable of demonstration, which is not limited to the ideas of figure, number, extension, or their modes. There are two things required in right demonstration, first, that every proposition of which it consists, considered separately, be true. Secondly, that the consequence drawn from other foreign things, necessarily flow from them; or that all the consequences be contained in the antecedents or premisses.

Demonstration is distinguished, 1. Into direct, called also offensive, demonstration, when beginning with definitions, self-evident propositions, or known and allowed truths, we form a train of syllogisms, and combine them in an orderly manner, continuing the series thro' a variety of successive steps, until at last we arrive at a syllogism, whose conclusion is the proposition to be demonstrated. 2. Indirect, or, as it is sometimes called, apagogical demonstration, when we assume a proposition which directly contradicts that we mean to demonstrate; and thence by a continued train of reasoning, in the way of a direct demonstration, deduce

deduce some absurdity or manifest untruth. For hereupon we conclude, that the proposition assumed was false; and thence again, by an immediate consequence, that the proposition to be demonstrated is true. Thus Euclid being to demonstrate, *that circles which touch one another inwardly have not the same center*, assumes the direct contrary to this, *viz. that they have the same center*: and thence by an evident train of reasoning proves, *that a part is equal to the whole*. The supposition, therefore, leading to this absurdity he concludes to be false, *that circles touching one another inwardly have the same center*; and thence again immediately infers *that they have not the same center*. This is also called *reductio ad impossibile*, and *ad absurdum*.

3. Geometrical demonstration, that framed of reasonings drawn from the elements of Euclid. 4. Mechanical demonstration, that, the reasonings of which are drawn from the rules of mechanics. 5. Demonstration a priori, that by which the effect is demonstrated from its cause either next or remote, as when we prove the existence of light by the existence of the sun. 6. Demonstration a posteriori, when we demonstrate the cause from the effect; as when from the existence of light, we demonstrate the existence of the sun.

The schoolmen make two kinds of demonstration, the one *dém,* or *propter quod*, in which an effect is proved by the next cause. As when it is proved that the moon is eclipsed, on account of the interposition of the earth between the sun and moon. The other *èri,* or *quia*, wherein the cause is proved from an effect, as, that fire is hot because it burns; or when an effect is demonstrated by a remote cause, as when it is proved that plants do not breathe, because they are not animals.

**DEMONSTRATIVE**, in rhetoric, one of the kinds of eloquence, *viz.* that which obtains in the composition of panegyrics, invectives, &c. See the article RHETORIC.

**DEMONSTRATIVE**, in grammar, a term given to such pronouns, as serve to indicate or point out a thing. Of this number are *hic, hæc, hoc*, among the Latins; and *this, that, these, those*, in English. See the article PRONOUN.

**DEMULCENTS**, among physicians, medicines good against acrimonious humours. Such are the roots of marsh-mal-

lows, of white lillies, of liquorice, and of viper grass, the five emollient herbs, &c. See the article EMOLLIENT.

**DEMURRAGE**, in commerce, an allowance made to the master of a ship by the merchants, for staying in a port longer than the time first appointed for his departure.

**DEMURRER**, in law, a stop put to any action upon some point of difficulty which must be determined by the court, before any further proceedings can be had in the suit. Demurrers are either general, without shewing any particular cause; or special, where the causes of it are particularly assigned; and one may not pray the judgment of the court on an insufficient declaration or plea, otherwise than by demurrer, when the matter comes judicially before them. In pleadings, if a matter is insufficiently alledged, that the court cannot give judgment thereon, a general demurrer will suffice, and so for want of substance in any plea, &c. But if there be a want of form, it is required that there be a special demurrer.

**DEMURRER to evidence**, is where a question of law arises thereon, as if the plaintiff in a suit gives in evidence any records, deeds, writings, &c. upon which a law question arises, and the defendant offers to demur upon it, then the plaintiff must join in such demurrer, or wave his evidence.

**DEMURRER to indictments**, is when a criminal joins issue upon a point of law in an indictment or appeal; allowing the fact as laid to be true. And if the indictment, or appeal, prove good in the opinion of the judges by whom the demurrer is to be tried, and not by the inquest, they proceed to judgment and execution, as if the party had been convicted by confession or verdict.

**DEN**, a syllable which added to the names of places shews them to be situated in vallies or near woods, as Tenterden.

**DEN and STROND**, in law, was antiently a liberty for ships to run or come ashore.

**DENARIATE of LAND**, *denarius terra*, in old law-books, signifies as much as was worth a penny by the year.

**DENARIUS**, in roman antiquity, the chief silver-coin among the Romans, worth in our money about seven-pence three farthings. As a weight, it was the seventh part of a roman ounce. See the articles COIN and WEIGHT.

**DENARIUS** is also used in our law-books for an english-penny.

**DENARIUS DEI**, GOD'S PENNY, denotes earnest-money, and is so called because in antient times it was given to the church or the poor.

**DENARIUS tertius comitatus**, a third part of the profits of county-courts. When these courts had superior jurisdictions, before others were erected, two parts of the profits went to the king, and a third part to the earl of the county.

**DENARII de caritate**, were customary oblations made to cathedral churches charged upon parish priests, though at first they were but a gift of charity.

**DENATES**, a term used by some for penates. See the article **PENATES**.

**DENBY**, the capital of Denbysshire, in north Wales: west long.  $3^{\circ} 30'$ , and north lat.  $53^{\circ} 15'$ .

It sends only one member to parliament.

**DENCHE'**, in heraldry, the same with danché. See the article **DANCHE'**.

**DENDERMOND**, a fortified town of Flanders, situated at the confluence of the rivers Scheld and Dender, twelve miles east of Ghent: east long.  $3^{\circ} 50'$ , and north lat.  $51^{\circ} 10'$ .

**DENDRACHATES**, in natural history, the name used by the antients for an extremely elegant and beautiful species of agate, the ground of which is whitish, variegated with veins of a brighter white. These veins are beautifully disposed in a number of various figures, but generally in many concentric irregular circles, drawn round one or more points. It is common also, in various parts of this stone, to find very beautiful delineations of trees, mosses, sea-plants, and the like, so elegantly expressed, that many have erroneously taken them for real plants included in the substance of the stone; whence the name dendrachates. See the article **AGAT**.

**DENDRANATOMY**; a term used by some for a description of the various parts of trees, as root, trunk, branch, bark, wood, pith, flower, fruit, &c. See the articles **ROOT**, **TRUNK**, **BRANCH**, &c.

**DENDRITÆ**, in natural history, a name given to those species of septariæ which have representations of trees, &c. See the article **SEPTARIÆ**.

**DENDROPHORIA**, in antiquity, the carrying of boughs or branches of trees, a religious ceremony so called, because certain priests called from thence dendrophori, tree-bearers, marched in procession, carrying the branches of trees in their hands in honour of some god, as Bacchus,

Cybele, Sylvanus, &c. The college of the dendrophori is often mentioned in antient marbles; and we frequently see in basso relievos the bacchanals represented as men carrying little shrubs or branches of trees.

Critics are at a loss to assign the office of the dendrophori who attend the roman army. Some hold that they fashioned the wood for the tents; others, that they provided the wood necessary for the machines of war; and others, that they were the same with the dendrophori of the feasts and sacrifices.

**DENEB**, an arabic term signifying tail, used by astronomers to denote several fixed stars. Thus deneb elecet, signifies the bright star in the lion's tail. Deneb adigege, that in the swan's tail, &c.

**DENEB**, or **ALDENEB ALCHAIL**, in the writings of the arabian physicians, denotes a plant called equisetum or horsetail. See the article **EQUISETUM**.

**DENIER**, a small french copper-coin, of which twelve make a sol.

There were two kinds of deniers, the one tournois, the other paris, whereof the latter was worth a fourth part more than the former. See the article **COIN**.

**DENIZEN**, in law, an alien made a subject by the king's letters patent, otherwise called donaison, because his legitimation proceeds *ex donatione regis*, from the king's gift. A denizen is enabled in several respects to act as natural subjects do, *viz.* to purchase and possess lands, and enjoy any office or dignity; yet it is short of naturalization, for a stranger, when naturalized, may inherit lands by descent, which a denizen cannot do. If a denizen purchase lands, his issue that are born afterwards may inherit them, but those he had before shall not; and as a denizen may purchase, so he may take lands by devise.

**DENMARK**, a kingdom situated between  $8^{\circ}$  and  $13^{\circ}$  of east longitude, and between  $54^{\circ}$  and  $58^{\circ}$  of north latitude: it comprehends the peninsula of Jutland, and the islands of Zeland, Funen, &c. To the king of Denmark likewise belong Norway, Iceland, and the dutchy of Holstein.

**DENNIS**, or **St. DENNIS**, a town of France four miles north of Paris, where the kings of France are interred.

**DENOMINATION**, a name imposed on any thing, usually expressing some predominant quality. Hence, as the qualities and forms of things are either inter-

nal or external, denomination becomes,  
 1. Internal, which is that founded on the intrinsic form. Thus Peter is denominated learned, on account of his learning, which is something internal. 2. External denomination, that founded on an external form. Thus, a wall is said to be seen and known, from the vision and cognition employed upon it. And thus, Peter is denominated honoured by reason of honour, which is not so much in the person honoured, as in him who honours.

**DENOMINATIVE QUALITY**, that quality from which things take their denomination. See the preceding article.

**DENOMINATOR**, in arithmetic, a term used in speaking of fractions.

The denominator of a fraction is the number below the line, shewing into how many parts the integer is supposed to be divided. Thus in the fraction  $\frac{3}{4}$ , the number 4 shews that the integer is divided into four parts. So in the fraction

$\frac{a}{b}$ ,  $b$  is the denominator. See the article **FRACTION**.

**DENOMINATOR of a ratio**, is the quotient arising from the division of the antecedent by the consequent. Thus 8 is the denominator of the ratio 40 : 5, because 40 divided by 5, gives 8 for a quotient. It is also called the exponent of a ratio. See the article **EXPONENT**.

**DE NON RESIDENTIA CLERICI REGIS**, a writ that lies where a person is employed in the king's service, in order to excuse him of non-residence upon his living.

**DENS, TOOTH**, in anatomy. See the article **TOOTH**.

**DENS CANIS, DOG'S TOOTH**, in botany, a distinct genus of plants, called by Linnaeus erythronium. See the article **ERYTHRONIUM**.

**DENS LEONIS, DANDELION**, a plant otherwise called leontodon. See the article **LEONTODON**.

**DENSHRING, or DEVENSHRING**, in husbandry. See **DEVENSHRING**.

**DENSALE, or DENSALIS**, a fish more usually called dentex. See **DENTEX**.

**DENSITY of bodies**, is that property directly opposite to rarity, whereby they contain such a quantity of matter under such a bulk.

Accordingly, a body is said to have double or triple the density of another body, when their bulk being equal, the quantity of matter is in the one double or

triple the quantity of matter in the other. The densities and bulks of bodies, are the two great points upon which all mechanics or laws of motion turn. It is an axiom that bodies of the same density contain equal masses under equal bulks. If the bulks of two bodies be equal, their densities are as their masses; consequently, the densities of equal bodies are as their gravities. If two bodies have the same density, their masses are as their bulks; and as their gravity is as their masses, the gravity of bodies of the same density is in the ratio of their bulk. Hence also bodies of the same density are of the same specific gravity; and bodies of different density, of different specific gravity. The quantities of matter in two bodies, are in a ratio compounded of their density and bulk: consequently their gravity is in the same ratio. If the masses or gravities of two bodies be equal, the densities are reciprocally as their bulks. The densities of any two bodies are in a ratio compounded of the direct ratio of their masses, and a reciprocal one of their bulks: consequently since the gravity of bodies is as their masses, the densities of bodies are in a ratio compounded of the direct ratio of their gravities, and a reciprocal one of their bulks. See the method of finding the specific gravities, and consequently the densities, of both solid and fluid bodies, and likewise a table of the specific gravities of bodies, under the articles **HYDROSTATICAL BALLANCE**, and **SPECIFIC GRAVITY**.

**DENSITY of the air**, is a property that has employed the later philosophers since the discovery of the toricellian experiment. It is demonstrated, that in the same vessel, or even in vessels communicating with each other at the same distance from the center, the air has every where the same density. The density of the air, *ceteris paribus*, increases in proportion to the compressing powers. Hence the inferior air is denser than the superior; the density, however, of the lower air, is not proportional to the weight of the atmosphere on account of heat and cold, and other causes perhaps which make great alterations in density and rarity. However, from the elasticity of the air, its density must be always different at different heights from the earth's surface; for the lower parts being pressed by the weight of those above, will be made

made to accede nearer to each other, and the more so as the weight of the incumbent air is greater. Hence, the density of the air is greatest at the earth's surface, and decreases upwards in geometrical proportion to the altitudes taken in arithmetical progression.

If the air be rendered denser, the weight of bodies in it is diminished; if rarer, increased, because bodies lose a greater part of their weight in denser than in rarer mediums. Hence, if the density of the air be sensibly altered, bodies equally heavy in a rarer air, if their specific gravities be considerably different, will lose their equilibrium in the denser, and the specifically heavier body will preponderate. See AIR and CONDENSER.

**DENSITY** of the planets. In homogeneous, unequal spherical bodies, the gravities on their surfaces are as the diameters, if the densities are equal. But if the bodies be equal, the gravities will be as the densities. Therefore, in bodies of unequal bulks and densities, the gravity will be in a compound ratio of the diameters and densities. Consequently, the densities will be as the gravities divided by the diameters, and therefore in the several bodies as follows, *viz.*

In the Sun. Jupiter. Saturn. Earth. Moon:  
10000. 9385. 6567. 39539. 48911.

As it is not likely that these bodies are homogeneous, the densities here determined are not to be supposed the true, but rather the mean densities, or such as the bodies would have if they were homogeneous, and of the same mass of matter, and magnitude.

**DENTALIUM**, in natural history, a simple shell having no hinge, and formed only of one piece: it is of a figure approaching to cylindric or conic, and is sometimes crooked, sometimes straight; sometimes closed at one end, sometimes open at both: its animal inhabitant is called nereis. See the article NEREIS.

The name dentalium has been given this shell, from the great resemblance it has to the dentes canini of quadrupeds. There are several species of it, frequent on the shores of Italy, Portugal, &c. Among us, they are found fossil in clay-pits, some smooth, some striated; but in much greater abundance in the mountains of France and Italy. See plate LXIX. fig. 4.

The true officinal dentalium is one of the canales, or tubuli marini simplices, of au-

thors: and the animal that inhabits it is of the genus of the nereis of Linnæus. See the article NEREIS.

Great things have been recorded of the virtues of the dentalium, but it has in reality no other than those of an alkali or absorbent, so that the readiness of oyster-shells has now put it out of use.

**DENTARIA, TOOTHWORT**, in botany, a genus of the *tetradynamia-filiquosa* class of plants, the corolla of which is cruciform, and consists of four roundish, obtuse petals, slightly emarginated, plane, and ending in unguis of the length of the cup: the fruit is a long, roundish, bilocular pod, consisting of two valves: the seeds are numerous and roundish. See plate LXIX. fig. 6.

The root of this plant, the only part used in medicine, is accounted drying and astringent.

**DENTARIÆ AFFINIS**, a name given by some to the orobanche of Linnæus. See the article OROBANCHE.

**DENTARIÆ FACIE**, in botany, the same with the hydrophyllum. See the article HYDROPHYLLUM.

**DENTATED LEAF**, among botanists, one notched at the edges with a number of blunt points in some measure resembling teeth. See the article LEAF.

**DENTED, or INDENTED**. See the article INDENTED.

**DENTES, TEETH**. See DENS.

**DENTEX**, in ichthyology, a species of sparus, of a deep olive-brown colour, elegantly variegated with darker and paler spots: its back is acute or ridged, and it has four large teeth: it is a well tasted fish. See the article SPARUS.

**DENTILES, or DENTILS**, in architecture, an ornament in corniches bearing some resemblance to teeth, particularly used in the ionic and corinthian orders. They are cut on a little square member, properly called denticulus, and the notches or ornaments themselves, dentils. In ancient times dentiles were never used in the ionic cornice, yet they are found in the remains of the theatre of Marcellus, which some take for an argument that Vitruvius had not the direction of that building. Vitruvius prescribes the breadth of each dentil to be half its height, and the indenture or interval between each two, he directs to be two thirds of the breadth of the dentil.

**DENTICULI ELEPHANTIS**, the same with the dentalia. See DENTALIUM.

**DENTIFORM**

**DENTIFORM PROCESS**, in anatomy.

See the article **PYRENOIDES**.

**DENTIFRICE**, in medicine, a remedy for rubbing the teeth, and purging them from fordes; and for cleansing and absterging the gums, when replete with humours. There are dentifrices of various kinds and forms, some in form of a powder composed of corals, pumice-stone, salt, allum, egg-shells, crabs-claws, hartshorn, &c. others in form of an electuary, consisting of the same powders mixt up with honey; others are in form of a liquor drawn by distillations from drying herbs, and astringent medicines, &c. See **TEETH**.

The generality of operators for the teeth allow acids, such as spirit of vitriol, &c. to be the readiest of all dentifrices, to take off the foulness and yellowness of the teeth: but yet, they don't advise a frequent use of these remedies, as they wear away too much of the teeth and injure the gums.

The Dutch account butter the best dentifrice for keeping the teeth white and sound, and the Spaniards hold urine to be good for that purpose.

**DENTIL**, in architecture, the same with denticle. See the article **DENTICLE**.

**DENTILLARIA**, **LEADWORT**, a plant more usually called plumbago. See the article **PLUMBAGO**.

**DENTISCALPRA**, in surgery, an instrument for scouring yellow, livid, or black teeth; to which being applied, near the gums, it scrapes off the foul, morbid crust.

Some of these instruments are furnished with narrow points; others with broader, and with edges; and some again are falciform; but all of them adapted to one and the same handle.

**DENTITION**, the breeding, or cutting, the teeth in children.

Among all the disorders which afflict children, there are none generate such grievous symptoms as difficult dentition. About five or six months after birth, the teeth generally begin to make their appearance: first, the incisors, or fore-teeth; next, the canini, or dog teeth; and, lastly, the molares, or grinders. About the seventh year there comes a new set; and at twenty-one the two inner grinders, called *dentes sapientiæ*, or teeth of wisdom. At the time of cutting their teeth, they slobber very much, and have a diarrhæa, which is no bad sign: but when it is difficult, especially when

the canine teeth begin to be in motion, and make their way out through the gums, the child has startings in his sleep, tumours of the gums, gripes, a loquacity or costiveness, greenish stools, the thrush, fevers, difficult breathing, suffocating catarrhs, convulsions, epilepsies, which often end in death.

It shews the dentition is like to be bad, if the child is perpetually crying, thrusts his finger into his mouth, and bites the nurse's nipples; if unequal tubercles are perceived in the gums, where the teeth are expected to appear; if there is a heat in the mouth, and the whole body; if they start without a cause, especially in sleep.

Harris observes, that when an inflammation appears, the physicians will labour in vain, if the cure is not begun by applying a leech under each ear. When the swelling of the gum shews it is time to cut it, to make way for the tooth, he would have it done with a pen-knife, not with a fine lancet, lest the wound should heal, and form a cicatrix. The food he directs to be no more than lukewarm.

Heister internally advises aqueous mixtures, temperating powders; externally, oil of sweet almonds, with spirit of violets, or spirit of wild poppies, lightly acidulated with spirit of vitriol, where-with often to rub the gums; as also with the coral, or other smooth thing, which will have the same effect. Some reckon the fresh blood of a cock's comb a specific for this purpose. Morgan affirms, in this case, it will be best to abate the effluence of the blood with diuters; to appease the pain with gentle opiates; to open the body with purges and clysters; to draw off the fermented serum by blisters; to promote the cutting of the teeth by cooling, relaxing, and opening the gums: for this purpose diacodium is good, or a strong decoction of marshmallows and poppy-heads, in thick milk, cream, or neats-foot oil.

Sydenham observes, that pains in dentition often produce fevers: for which he could find no remedy so effectual as three or four drops of spirit of hartshorn in a spoonful of simple water, or other convenient vehicle, given every four hours: the number of doses may be four, five, or six.

**DENUNCIATION**, a solemn publication or promulgation of any thing.

All vessels of enemies are lawful prize,

after denunciation or proclamation of war. The design of the denunciation of excommunicated persons, is that the sentence may be the more fully executed by the person's being more known.

**DEOBSTRUENTS**, in pharmacy, such medicines as open obstructions. See the article **DETERGENT**.

There is somewhat further expressed in the term *deobstruent* than in *detergent*, for a medicine may be *deobstruent* that is not, in the strictest sense, *detergent*; as are most metalline substances, as steel and mercury, which obtain the appellation *deobstruents*, from their acting by their natural weight, whereby they increase the momentum of the circulating fluids, and with greater force make it strike against the secretory outlets: because the momenta, or vis percussiois, of all projectiles, of which kind is a circulating fluid, is as their solidities, supposing their velocities equal. The more, therefore, the animal fluids are saturated with dense and solid particles, with the greater force they distend the vessels, and the more easily break through, where the structure favours their escape; and upon that account are medicines, which add to these qualities in the fluid, called *deobstruents*.

**DEODAND**, in our customs, implies a thing devoted or consecrated to God, for the pacification of his wrath, in case of any misfortune; as a person's coming to a violent end, without the fault of any reasonable creature; as if a horse should strike his keeper, and so kill him. In this case, the horse is to be a *deodand*; that is, he is to be sold, and the price distributed to the poor, as an expiation of that dreadful event.

**DE ONERANDO PRO RATA PORTIONIS**, in law, a writ that lies where a person is distrained for rent, which ought to be paid by others in proportion with him; as where one holds twenty acres of land by fealty, at a certain rent, and aliens one acre to one person, and another to another: here, if one of the alienees be distrained for the whole, or more rent than the value of what he purchased, he then may have this writ.

**DEOPPILATIVES**, in pharmacy, the same with *deobstruents*. See the article **DEOBSTRUENTS**.

**DEPART**, in chemistry, a method of refining, or separating gold from silver, by means of *aqua fortis*, generally called *quartation*.

For the operation of the *depart*, see the article **ASSAYING** and **QUARTATION**.

**DEPARTURE**, in law, signifies a departing or going from a plea given in bar of an action. It is likewise used where a plaintiff in his declaration sets forth one thing, and after the defendant has pleaded thereto, he in his replication shews new matter different from his declaration.

If a person pleads a general agreement in bar, and alleges a special one in his rejoinder, this will be a *departure* in pleading: so, where an action is brought at common law, and the plaintiff, by his replication, endeavours to maintain it by custom. It will also be accounted a *departure*, if, after performance is pleaded in debt upon hand, the defendant says any other thing, by way of excuse, &c. But in circumstances of time, &c. laid as to promises, if the defendant by his plea force the plaintiff to vary, it is no *departure*: for the plaintiff is not tied to a precise day.

**DEPARTURE in despite of the court**, is where a tenant or defendant appears to an action brought against him, and having a day over in the same term, does not appear at the day, but makes a default. This is a *departure in despite of the court*, and therefore he shall be condemned.

**DEPARTURE**, in navigation, is the easting or westing of a ship in respect of the meridian it departed or sailed from: or it is the difference of longitude, either east or west, between the present meridian the ship is under, and that where the last reckoning or observation was made. This *departure*, any where but under the equator, must be accounted according to the number of miles in a degree, proper to the parallel the ship is under.

**DEPHLEGMATED**, an appellation given to spirits well freed from phlegm. See the next article.

**DEPHLEGMATION**, in chemistry, the same as rectification, or the freeing a spirit from its phlegm, either by distillation, or some other means.

**DEPILATORY MEDICINES**, those applied in order to take off the hair: such are lime and orpiment known to be, but which ought to be used with great caution. See **LIME** and **ORPIMENT**.

**DEPONENT**, in latin grammar, a term applied to verbs, which have active significations, but passive terminations or conjugations, and want one of their participles passive.

**DEPONENT**,

**DEPONENT**, in the law of Scotland, a person who makes a deposition. See the article **DEPOSITION**.

**DEPOPULATION**, the act of committing waste. See the article **WASTE**.

**DEPORTATION**, a sort of banishment used by the Romans, whereby some island or other place was allotted to a criminal for the place of his abode, with a prohibition not to stir out of the same on pain of death.

**DEPOSIT**, among civilians, something that is committed to the custody of a person, to be kept without any reward, and to be returned again on demand.

Deposit is distinguished into simple and judiciary.

*Simple* **DEPOSIT** is either voluntary or necessary: necessary, is that done in case of hostility, shipwreck, fire, &c.

*Judiciary* **DEPOSIT** is that whose property is contested by several persons, and deposited in the custody of some third person, by order of a judge.

**DEPOSITARY**, in the french law, a person intrusted as keeper or guardian of a deposit. See the preceding article.

Ordinary depositaries are not to warrant the thing left with them, in case it be lost or stolen: they are only to answer for fraud or the like.

**DEPOSITION**, in law, the testimony given in court by a witness, upon oath.

In chancery, deposition is a testimony set down in writing, by way of answer to the interrogations exhibited in chancery, where such witness is called deponent. Depositions in one cause may be used at the hearing of another, where they are between the same parties, &c. without any motion: this is not permitted in other courts, without a special order of the court of chancery. The depositions in chancery, after the cause is determined there, may be given in evidence in a trial at bar, in any of the other courts.

**DEPOSITION** also signifies the sequestring or depriving a man of some dignity and office.

**DEPRECATION**, in rhetoric, a figure whereby the orator invokes the aid and assistance of some one; or prays for some great evil or punishment to befall him who speaks falsely, either himself or his adversary.

**DEPRECATORY**, or **DEPRECATIVE**, in theology, a term applied to the manner of performing some ceremonies in the form of prayer.

The form of absolution is deprecativ in

the greek church, being conceived in these terms, *May God absolve you*: whereas it is in the declarative form in the latin church, and in some of the reformed churches, *I absolve you*.

**DEPRESSION** of equations. See the article **EQUATION**.

**DEPRESSION** of the pole. When a person sails or travels towards the equator, he is said to depress the pole, because as many degrees as he approaches nearer the equator, so many degrees will the pole be nearer the horizon. This phenomenon arises from the spherical figure of the earth. See **EARTH** and **POLE**.

When a star is under the horizon, it is termed the depression of that star under the horizon. The altitude or depression of any star is an arch of the vertical intercepted between the horizon and that star. See **HORIZON** and **VERTICAL**.

**DEPRESSOR**, or **DEPRIMENS**, in anatomy, a name applied to several muscles, because they depress the parts they are fastened to.

**DEPRESSOR LABII INFERIORIS**, or **QUADRATUS**, is a muscle consisting of some thin fleshy fibres, which lie immediately under the skin of the chin; they arise from the edge of the fore-part of the whole under-jaw, and are inserted in the lower-part of the orbicularis.

**DEPRESSOR LABII SUPERIORIS**, or **TRIANGULARIS**, is a muscle that arises from the lower edge of the under-jaw, between the masseter and quadratus, and ascends by the angle of the mouth to the upper-jaw. These two muscles acting together, express a sorrowful countenance, because they draw downwards the corners of the mouth and cheeks.

**DEPRESSORES NASI**, a pair of muscles arising from the os maxillare, above the dentes incisores; and are inserted into the extremities of the alæ, which they pull downwards.

**DEPRESSOR ANGULI ORIS**, a name given by Albinus to the muscle called by others depressor labiorum communis. See the article **DEPRESSOR LABII**.

**DEPRESSORES OCULI**, a pair of muscles springing from each corner of the eye, and answered by another pair of the like figure and structure, in the lower eyelid. See **EYE**.

**DEPRIMENS**, the same with depressor. See the preceding article.

**DEPRIVATION**, in the canon-law, the deposing a bishop, parson, vicar, &c from his office and preferment.

There are two sorts of deprivation, the one *a beneficio*, the other *ab officio*: the deprivation *a beneficio*, is when, for some great crime, a minister is wholly deprived of his benefice. A deprivation *ab officio*, is when a minister is for ever deprived of his orders, which is also called deposition or degradation: this is generally for some heinous crime deserving death, and is performed by the bishop.

**DEPTFORD**, a town three miles east of London, on the southern banks of the Thames; chiefly considerable for its fine docks for building ships, and the king's yard.

**DEPTH**, in geometry, the same with altitude; though, strictly speaking, we only use the term depth to denote how much one body, or part of a body, is below another. See the articles **ALTITUDE**, **HEIGHT**, &c.

**DEPTH of a battalion, squadron, &c.** the number of men in a file, or who stand before each other, in a straight line. In the ancient armies this was very great.

**DEPURATION**, the same with clarification. See the article **CLARIFICATION**.

**DEPURATORY FEVER**, a name given by Sydenham to a fever which prevailed much in the years 1661, 1662, 1663, and 1664. He called it depuratory, because he observed that nature regulated all the symptoms in such a manner, as to fit the febrile matter, prepared by proper concoction, for expulsion in a certain time, either by a copious sweat, or a freer perspiration.

**DEPUTATION**, a mission of select persons out of a company, or body, to a prince or assembly, to treat of matters in their name. They are more or less solemn, according to the quality of those who send them, and the business they are sent upon.

**DEPUTY**, a person sent upon some business, by some community.

**DEPUTY** is also one that exercises an office in another's right; and the forfeiture or misdemeanor of such deputy shall cause the person, whom he represents, to lose his office. A principal officer may not appoint his deputy in all cases, unless the grant of the office will justify him in so doing; but when an office descends to an infant, he may make a deputy of course. Judges have no power to hold their courts by deputy: recorders, however, may do it. It is held a coroner cannot appoint a deputy, it being a judicial office of trust, annexed to the per-

son. And if the office of parkership be granted to one, he cannot depute another, because it is an office of trust and confidence.

**DEPUTATUS**, among the antients, a name applied to persons employed in making of armour: and likewise to brisk active people, whose business was to take care of the wounded in engagements, and carry them off the field.

**DEPUTATUS**, *demularis*, in the greek church, an inferior officer, like an usher, who in processions kept the crowd off the patriarch.

**DE QUIBUS SUR DISSEISIN**, in law, a writ of entry. See **ENTRY**.

**DERBENT**, a city of Dagistan, on the western coast of the Caspian sea: east lon.  $51^{\circ}$ , and  $41^{\circ} 15'$  north lat.

**DERBIA**, a name given by some surgeons to the impetigo. See **IMPETIGO**.

**DEREHAM**, a market-town of Norfolk, about fifteen miles west of Norwich: east long.  $1^{\circ}$ , and north lat.  $52^{\circ} 40'$ .

**DEREIGN**, or **DARAIGN**. See the article **DARAIGN**.

**DERELICTS**, in the civil law, such goods as are wilfully relinquished by the owner.

**DERELICT** signifies also a thing forsaken, or cast away by the sea.

**DERIVATION**, in medicine, is when a humour, which cannot be conveniently evacuated at the part affected, is attracted from thence, and discharged at some more proper place in its vicinity; or is drawn from a noble to a more ignoble part, where it is less capable of doing injury. Thus a blister is applied upon the neck to draw thither the matter, in cases of defluxions upon the eyes.

**DERIVATIVE**, in grammar, a word which is derived from another called its primitive. See **PRIMITIVE**.

Thus *manhood* is derived from *man*, *deity* from *deus*, and *lawyer* from *law*.

**DERMA**, in anatomy, the same with cutis. See the article **CUTIS**.

**DERMESTES**, in zoology, a genus of insects of the order of the coleoptera, the antennæ of which are of a clavated figure and perfoliated transversely.

There are a great many species of this genus, confounded by some with beetles. See plate **LXIX.** fig. 2.

**DERNIER RESSORT**. See **RESSORT**.

**DEROGATION**, in the french law, an act which annuls a preceding one, either in whole, or in part. In general terms, they are not regarded in judicature; they must be in specific, and in formal terms.

**DEROGATORY**,

**DEROGATORY**, a clause importing derogation. A derogatory clause in a testament, is a certain sentence, cypher, or secret character, which the testator inserts in his will, and of which he reserves the knowledge to himself alone, adding a condition that no will he may make hereafter is to be reckoned valid, if this derogatory clause is not inserted expressly, and word for word. It is a precaution invented by lawyers against last wills extorted by violence, or obtained by suggestion.

**DERPT**, a town of Livonia, situated on the river Eimbec : east lon.  $28^{\circ} 10'$ , and north lat.  $58^{\circ} 10'$ .

**DERVIS**, a name given to all mahommedan monks, though of various orders. The most noted among them are the bektasli, the mevelevi, the kadri, and the seyah. The bektasli, who are allowed to marry and live in cities and towns, are obliged, by the rules of their order, to visit remote lands, and to salute every one they meet with *gazel*, or love-songs, and with *esma*, or the invocation of the names of God, and humbly to wish him prosperity, which they do by repeating the word *eivallab*, a solemn exclamation of the wrestlers, by which the conquered yields the palm to the conqueror. The mevelevi, so called from Mevelava their founder, are used to turn round for two or three hours together, with such swiftness that you cannot see their faces; they are great lovers of music: in their monasteries they profess great humility and poverty, and when visited make no distinction of persons; they first bring their guests coffee to drink; and, if the ways have been dirty, they wash their feet and sandals. The kadri, with a peculiar superstition, emaciate their bodies; they go quite naked, except their thighs, and often join hands and dance, sometimes a whole day, repeating with great vehemence, *hu! hu! hu!* (one of the names of God) till, like madmen, they fall on the ground, foaming at the mouth, and running down with sweat: the prime vizir Kupruli Achmed Pasha, thinking this sect unbecoming the mahommedan religion, ordered it to be suppressed; but, after his death, it revived, and is at present more numerous than ever, especially at Constantinople. The seyah are wanderers, and though they have monasteries, yet they often spend their whole life in travelling; when they are sent out, their superiors impose upon them such a quantity of mo-

ney or provisions, forbidding them to come back till they have procured it, and sent it to the monastery; wherefore when a seyah comes into a town, he cries aloud in the market-place, *Ya allah senden, &c. O God! give me, I pray, five thousand crowns, or a thousand measures of rice*. Many of these dervises travel over the whole mahommedan world, entertaining the people wherever they come, with agreeable relations of all the curiosities they have met with. There are dervises in Egypt, who live with their families, and exercise their trades, of which kind are the dancing dervises at Damascus. They are all distinguished among themselves by the different forms and colours of their habits; those of Persia wear blue; the folitaries and wanderers wear only rags of different colours; others carry on their heads a plume made of the feathers of a cock; and those of Egypt wear an octagonal badge of a greenish white alabaster at their girdles, and a high stiff cap, without any thing round it.

**DERWENT**, a river, which taking its rise in the north riding of Yorkshire, runs south, and falls into the Ouse.

**DERWENT-WATER**, a river of Cumberland, which falls into the irish sea below Cockermouth.

**DESART**, a large extent of country entirely barren, and producing nothing. In this sense some are sandy desarts, as those of Lop, Xamo, Arabia, and several others, in Asia; in Africa, those of Lybia and Zara: others are stony, as the desert of Pharan in Arabia Petrea.

*The* **DESART**, absolutely so called, is that part of Arabia south of the holy land, where the children of Israel wandered forty years.

**DESCANT**, in music, the art of composing in several parts. See **COMPOSITION**.

Descant is threefold, *viz.* plain, figurative, and double.

*Plain* **DESCANT** is the ground-work and foundation of all musical compositions, consisting altogether in the orderly placing of many conecords, answering to simple counterpoint. See **COUNTERPOINT**.

*Figurative or florid* **DESCANT**, is that part of an air of music, wherein some discords are concerned, as well, though not so much, as conecords. This may be termed the ornamental and rhetorical part of music, in regard that there are introduced all the varieties of points, syncopes, diversities of measures, and whatever is capable of adorning the composition.

**DESCANT**

**DESCANT** *double*, is when the parts are so contrived, that the treble, or any high part, may be made the bass; and, on the contrary, the bass the treble. See the articles **HARMONY**, **COUNTERPOINT**, and **MELODY**.

**DESCENDANT**, in genealogy, a term relative to ascendant, and applied to a person who is born or issued from some other referred to: thus mankind are said to be the descendants of Adam. See the article **DESCENT**.

**DESCENSION**, or **DESCENDING**, in general, signifies much the same with descent. See the article **DESCENT**.

**DESCENSION**, in astronomy, is either right or oblique.

**Right DESCENSION** is an arch of the equinoctial, intercepted between the next equinoctial point and the intersection of the meridian, passing through the center of the object, at its setting, in a right sphere.

**Oblique DESCENSION**, an arch of the equinoctial intercepted between the next equinoctial point and the horizon, passing through the center of the object, at its setting, in an oblique sphere.

**DESCENSIONAL**, something belonging to descension. See **DESCENSION**.

**DESCENSIONAL DIFFERENCE**, that between the right and oblique descension of any heavenly body. See **DESCENSION**.

**DESCENT**, in general, is the tendency of a body from a higher to a lower place; thus all bodies, unless otherwise determined by a force superior to their gravity, descend towards the center of the earth: the planets too may be said to descend from their aphelion to the perihelion of their orbits, as the moon does from the apogee to the perigee.

Heavy bodies, meeting with no resistance descend with an uniformly accelerated motion, for the laws of which see the article **ACCELERATION**.

*Laws of the DESCENT of bodies.* 1. All bodies near the surface of the earth descend perpendicularly at the rate of sixteen feet one inch in a second of time. 2. The velocity of a body descending in an inclined plane, at the end of any given time, is to the velocity that it would acquire by descending perpendicularly in the same time, as the altitude of the inclined plane is to its length. 3. The last velocity acquired by the direct descent, is to the last velocity acquired in the same time by the oblique descent, as the absolute gravity is to the relative gravity of

the descending body. 4. The line described by the direct descent, is to the line described in the same time by the oblique descent, as the length of the oblique plane is to its height. 5. If the line described by the direct descent be to the line described by the oblique descent, as the height of the inclined plane to its length, then the times of descent shall also be in the same proportion, and the last velocities equal. 6. The last velocities acquired upon several inclined planes of the same height, however different in length, are equal. 7. The time of oblique descent thro' any chord of a circle, drawn from its lowest point, is equal to the time of a direct descent through the diameter of that circle. 8. The last acquired velocities of a body, descending to the lowest point of a given circle, through different chords, are as those chords. 9. The time of the descent of a body in any arch of a semicycloid, is equal to the time of its descent through any other arch, whether longer or shorter, of the same curve. 10. A body will descend sooner along an arch of a cycloid, than along that of any other curve, drawn between the same points. 11. If water runs out through a hole made in the bottom of a parabolic conoid, the surface of the water will descend equal spaces in equal times. 12. A body descends in a resisting medium with a force only equal to the excess of its gravity above that of an equal bulk of the medium. 13. If a body be thrown downwards, in a resisting medium, with such a force as shall make the resistance of the medium equal to the acceleration of gravity, it will afterwards descend with an uniform motion. 14. If a body descends through any number of inclined planes, it will acquire the same velocity at the end of its fall, as though it had fallen through a plane equal in height to the whole, and of the same inclination with the last of them.

**DESCENT**, or **DISCENT**, in law, an order or method whereby lands or tenements are derived to any man from his ancestors.

It is either by the common law, custom, or statute. By the common law, as, where a person has lands of inheritance in fee, and dies without having made any disposal thereof: wherefore the land descends and goes in course to the eldest son and heir. By custom, as where the lands sometimes descend to all the sons; or to all the brothers, where one brother dies without issue, as in gavel-kind, &c. And descent

descent by statute is a descent in fee-tail, as directed by the manner of the limitation or settlement, pursuant to stat. Westm. 2 and 13 Ed. I.

Descent, at common law, is either lineal or collateral.

Lineal descent is that conveyed down in a right line from the grand-father to the father, from the father to the son, and from the son to the grand-son. Collateral descent is that springing out of the side of the line, or blood, as from a man to his brother, nephew, or the like.

**DESCENT**, in genealogy, the order or succession of descendants in a line or family; or their distance from a common progenitor: thus we say, one descent, two descents, &c. See **EXTRACTION**.

**DESCENT**, in heraldry, is used to express the coming down of any thing from above; as, a lion en descent, is a lion with his head towards the base points, and his heels towards one of the corners of the chief, as if he were leaping down from some high place.

**DESCENTS**, in fortification, are the holes, vaults, and hollow places made by undermining the ground.

The descent into the moat or ditch is a deep passage made through the esplanade and covert-way, in form of a trench, whereof the upper part is covered with madriers and clays, to secure the besiegers from the enemy's fire. In wet ditches this trench is on a level with the surface of the water, but in dry ones it is sunk as deep as the bottom of the ditch.

**DESCRIBENT**, in geometry, a line or surface, which, by moving parallel to itself, describes a surface or solid. See the articles **LINE**, **SURFACE**, and **SOLID**.

**DESCRIPTION**, is such a strong and beautiful representation of a thing, as gives the reader a distinct view and satisfactory notion of it.

Descriptions are almost peculiar to poetry: historians indeed describe things, places, and persons; but not so much for the sake of ornament, as of necessity. Orators likewise attempt descriptions when they have a mind to work upon the passions; but neither the one nor the other use them as decorations to their writings, which poets generally do, very successfully, not only with a design to move the passions, but to please the fancy. Great judgment is required in the due exercise of this art. A judicious author will omit low and vulgar circumstances, and chiefly bestow his pains to

complete all the essential and masterly strokes, cutting off all superfluities, and rejecting the most pleasing thought and florid lines, when foreign to his subject: many things must be left to the imagination of the reader, and seasonable silence has its emphasis; thus Virgil tells us, Georg. iv. 457. that Eurydice was killed by a monstrous serpent, lurking in a bank; but says nothing more of that venomous creature. A poetaster would probably have spent as many lines in the description of it, as composed that admirable poem. The description of a person is called a character, in drawing which the true proof of art and judgment is to hit a beautiful likeness, and, with a delicate touch, to give those features and colours which are peculiar to the person, and distinguishing him from the rest of mankind. In every good and lively description, a man must come to an enumeration of the chief particulars; for generals are often obscure and faint. A judicious author, by setting every thing in full view, makes a strong and lasting impression on the reader.

**DESEADA**, or **DESIDERADA**, one of the Caribbee-islands, subject to France, lying eastward of Guardaloupe. See the article **CARIBBEE**.

**DEserter**, in a military sense, a soldier who, by running away from his regiment or company, abandons the service.

A deserter is, by the articles of war, punishable by death, and, after conviction, is hanged at the head of the regiment he formerly belonged to, with his crime writ on his breast, and suffered to hang till the army leave that camp, for a terror to others.

**DESHACHE'**, in heraldry, is where a beast has its limbs separated from its body, so that they still remain on the escutcheon, with only a small separation from their natural places.

**DESIDERATUM** is used to signify the desirable perfections in any art or science: thus, it is a desideratum with the blacksmith, to render iron fusible by a gentle heat, and yet preserve it hard enough for ordinary uses; with the glassman and looking-glass maker, to render glass malleable; with the clock-maker, to bring pendulums to be useful, where there are irregular motions; with the brasier and copper-smith, to make malleable solder; with the shipwright, to build vessels that will sail under water; with the diver, to procure manageable instruments

for conveying fresh air to the bottom of the sea, sufficient for respiration and the burning of lights; with the assayer-master, to melt or copel ores or metals immediately, without the use of bellows or furnaces; and with the carvers and joiners, to fashion wood in moulds like plaister of paris, or burnt alabaſter, &c. And tho', as Mr. Boyle observes, the obtaining of these desiderata may be thought chimerical, yet it is proper they should be proposed; for, although perfection may not be attainable, yet approaches to it may be made, and arts thereby improved. To this may be added, that the making of iron malleable with pit-coal was once looked upon as chimerical, yet it is now put in practice, to the great advantage of the owners of several mines in this kingdom.

All arts have their defects; and it is not at first to be guessed, for how many of these remedies may be found, by means of chemical researches, properly directed. Chemistry itself is greatly defective in many particulars, as in an experimental history of general fermentation, separatory and combinatory; in subjects of the animal, vegetable, and mineral kingdoms. The schemes for new trades will rise occasionally in prosecuting many of the subjects; thus it is natural for the common operations of brewing and sugar-baking, to suggest that sugar may be procured from malt and other vegetables. That nurseries of peculiar ferments, both native and foreign, may be raised on the common principles; and it is evident that the introduction of such new trades would greatly improve the business of brewing, sugar-baking, and the like.

**DESIGN**, in a general sense, the plan, order, representation, or construction of a building, book, painting, &c.

In building, the term *ichnography* may be used, when by design is only meant the plan of a building, or a flat figure drawn on paper: when some side or face of the building is raised from the ground, we may use the term *orthography*; and when both front and sides are seen, in perspective, we may call it *scenography*. See **ICHOGRAPHY**, **ORTHOGRAPHY**, and **SCENOGRAPHY**.

**DESIGN**, in the manufactories, expresses the figures wherewith the workman enriches his stuff, or silk, and which he copies after some painter, or eminent draughts-man, as in diaper, damask, and other flowered silk and tapestry, and the like.

In undertaking of such kinds of figured stuffs, it is necessary, says Mons. Savary, that, before the first stroke of the shuttle, the whole design be represented on the threads of the warp; we do not mean in colours, but with an infinite number of little packthreads, which, being disposed so as to raise the threads of the warp, let the workmen see, from time to time, what kind of silk is to be put in the eye of the shuttle, for woof. This method of preparing the work is called reading the design, and reading the figure, which is performed in the following manner: a paper is provided, considerably broader than the stuff, and of a length proportionate to what is intended to be represented thereon. This they divide lengthwise, by as many black lines as there are intended threads in the warp; and cross these lines, by others drawn breadthwise, which, with the former, make little equal squares: on the paper thus squared, the draughts-man designs his figures, and heightens them with colours, as he sees fit. When the design is finished, a workman reads it, while another lays it on the simblot. See the article **SIMBLOT**.

To read the design, is to tell the person who manages the loom, the number of squares, or threads, comprised in the space he is reading, intimating at the same time whether it is ground or figure. To put what is read on the simblot, is to fasten little strings to the several packthreads, which are to raise the threads named; and thus they continue to do till the whole design is read.

Every piece being composed of several repetitions of the same design, when the whole design is drawn, the drawer, to re-begin the design afresh, has nothing to do but to raise the little strings, with slip-knots, to the top of the simblot, which he had let down to the bottom: this he is to repeat as often as is necessary till the whole be manufactured.

The ribbon-weavers have likewise a design, but far more simple than that now described. It is drawn on paper with lines and squares, representing the threads of the warp and woof. But instead of lines, whereof the figures of the former consist, these are constituted of points only, or dots, placed in certain of the little squares, formed by the intersection of the lines. These points mark the threads of the warp that are to be raised, and the spaces left blank denote the threads that

are

are to keep their situation : the rest is managed as in the former.

**DESIGN** is also used, in painting, for the first idea of a large work, drawn roughly, and in little, with an intention to be executed and finished in large. The art of painting has been by some of the greatest masters divided into the design, or draught, the proportion, the expression, the *claro-obscuro*, the *ordonnance*, the colouring, and the perspective.

Design, in painting, is the simple contour, or outlines of the figures intended to be represented, or the lines that terminate and circumscribe them : such design is sometimes drawn in crayons, or ink, without any shadows at all ; sometimes it is hatched, that is, the shadows are expressed by sensible outlines, usually drawn across each other with the pen, crayon, or graver. Sometimes, again, the shadows are done with the crayon rubbed so as that there do not appear any lines : at other times, the grains or strokes of the crayon appear, as not being rubbed : sometimes the design is washed, that is, the shadows are done with a pencil in indian ink, or some other liquor ; and sometimes the design is coloured, that is, colours are laid on much like those intended for the grand work.

The essential requisites of a design are correctness, good taste, elegance, character, diversity, expression, and perspective. Correctness depends on the justness of the proportions, and knowledge of anatomy. Taste is a certain manner of correctness peculiar to one's self, derived either from nature, masters, or studies, or all of them united. Elegance gives a delicacy that not only strikes persons of judgment, but communicates an agreeableness that pleases universally. The character is what is peculiar to each thing, wherein there must be diversity, inasmuch that every thing has its peculiar character to distinguish it. The expression is the representation of an object, according to the circumstances it is supposed to be in. Perspective is the representation of the parts of a painting, or a figure, according to the situation they are in with regard to the point of sight. See **CORRECTNESS**, &c. The design or draught, is a part of the greatest import and extent in painting. It is acquired chiefly by genius and application, rules being of less avail here than in any other branches of the art, as colouring, &c. The principal rules that regard design are, that novices accustom themselves to copy good originals at first

sight ; not to use squares in drawing, lest they stint and confine their judgment ; to design well from life, before they practise perspective ; to learn to adjust the size of their figures to the visual angle, and the distance of the eye from the model or object ; to mark out all the parts of their design before they begin to shade ; to make their contours in great pieces, without taking notice of the little muscles, and other breaks ; to make themselves masters of the rules of perspective ; to observe the perpendicular, parallel, and distance of every stroke ; to compare and oppose the parts that meet and traverse the perpendicular, so as to form a kind of square in the mind, which is the great and almost the only rule of designing justly ; to have a regard not only to the model, but to the parts already designed, there being no such thing as designing with strict justness, but by comparing and proportioning every part to the first. All the other rules relate to perspective. See **PERSPECTIVE**.

**DESIGNATION**, the act of marking or indicating, and making a thing known. There were designations of the consuls and other magistrates among the Romans some time before their election.

**DESIGNATOR**, in roman antiquity, a sort of petty master of the ceremonies, who assigned every body their places in the theatres, and other public shews. The Romans had officers of this nature attending all their solemn shews and processions, for directing precedencies. The designator was one of the goddess Libitina's principal servants, the shews of the funerals of persons of quality being marshalled by the designator. When he went to raise the corps, he was attended with a train of funeral officers called *libitinarii*, subdivided into *pellinatores*, *vespiliones*, *uitores*, &c. All these, habited in black, walked before the designator, as mace-bearers before magistrates.

**DESIGNING**, the art of delineating or drawing the appearance of natural objects, by lines, on a plane.

To design according to the rules of mathematics, makes the object of perspective. See the article **PERSPECTIVE**.

To design by the camera obscura. See the article **CAMERA OBSCURA**.

*Mechanical method of DESIGNING*. There are several methods of designing mechanically. The following is the method of the learned Sir Christopher Wren, and may be put in practice with great ease.

A is a small fight, with a short arm B (plate LXIX. fig. 5.) which may be turned round about, and moved up and down the small cylinder CD, which is screwed into the piece ED, at D; this piece ED moving round about the center E, by which means the fight may be removed either towards E or F.

EF is a ruler fastened on the two rulers GG, which rulers serve both to keep the square frame SSSS perpendicular, and, by their sliding through the square holes TT, they serve to stay the fight, either farther from, or nearer, to the said frame; on which frame is stuck on, with a little wax, the paper OOOO, whereon the picture is to be drawn by the pen I. The pen I is, by a small brass-handle V, so fixed to the ruler HH, that the point I may be kept very firm, so as always to touch the paper. HH is a ruler that is constantly, by means of the small strings aaa, bbb, moved horizontally, or parallel to itself; at the end of which is stuck a small pin, whose head P is the fight, which is to be moved up and down on the out-lines of any object.

The contrivance of the strings is this: the two strings aaa, bbb, are exactly of an equal length. Two ends of them are fastened into a small leaden weight, which is employed in a socket on the backside of the frame, and serves exactly to counterpoise the ruler HH, being of an equal weight with it. The other two ends of them are fastened to two small pins HH, after they have rolled about the small pulleys MM, LL, KK; by means of which pulleys, if the pen I be taken hold of, and moved up and down the paper, the string moving very easily, the ruler will always remain in an horizontal position.

The manner of using it is this: set the instrument upon a table, and fix the fight A at what height above the table, and at what distance from the frame SSSS, you please. Then looking through the fight A, holding the pen I in your hand, move the head of the pin P up and down the out-lines of the object, and the point of the pen I will describe on the paper OOOO the shape of the object so traced.

**DESION**, the macedonian name of the month, called by the Athenians antheſterion. See the article **ANTHESTERION**.

**DESISE**, a town of France, situated on the river Loire, fifteen miles south-east of Nevers: east long.  $3^{\circ} 32'$ , north lat.  $46^{\circ} 48'$ .

**DE SON TORT DEMESN**, in law, a formula used, in an action of trespass, by way of reply to the defendant's plea; signifying that the trespass was his own voluntary and free act.

**DESPOTE**, a term sometimes used for an absolute prince. See the next article.

Under the emperors of Constantinople, despote was a title of honour given to the emperor's sons, or sons in law; as also to their colleagues, and partners in the imperial dignity, in the same manner as Cæſar was at Rome. See **CÆSAR**.

**DESPOTICAL**, in general, denotes any thing that is uncontroled and absolute; but is particularly used for an arbitrary government, where the power of the prince is unlimited, and his will a law to his subjects: such are those of Turkey, Persia, and most of the eastern governments; and even those of Europe, if we except the republics, our own, and the swedish government.

**DESPOUILLE**, in heraldry, the whole case, skin, or slough of a beast, with the head, feet, tail, and all appurtenances, so that being filled and stuffed, it looks like the intire creature.

**DESPUMATION**, a term sometimes used for the clarifying a liquor, by the skimming off its froth. See **CLARIFICATION**.

**DESQAMATION**, the same with exfoliation. See **EXFOLIATION**.

**DESSAW**, a city of upper Saxony, in Germany, situated on the river Elbe, sixty miles north-west of Dresden, and subject to the prince of Anhalt Dessaw: east long.  $12^{\circ} 40'$ , north lat.  $51^{\circ} 50'$ .

**DESSERT**, or **DESART**, a service of fruits and sweet-meats, usually served up last to table.

**DESSICCATIVE**, or **DESICCATIVE**, in pharmacy, an epithet applied to such topical medicines as dry up the humours flowing to a wound or ulcer. See the article **WOUND**.

**DISTILLATION**, or **DISTILLATION**. See the article **DISTILLATION**.

**DESTINIES**, in mythology, the same with parcae. See the article **PARCÆ**.

**DESTINY**, among philosophers and divines, the same with fate. See **FATE**.

**DESTRUCTION**, in general, an alteration of any thing from its natural state to one contrary to nature; whereby it is deemed the same with corruption. See the article **CORRUPTION**.

A chemical destruction, or corruption, is nothing but a resolution of the whole naturally mixt body into its parts.

DELU.

**DESUDATION**, in medicine, a profuse and inordinate sweat, succeeded by an eruption of pustules, called sudamina, or heat-pimples. See the articles **SUDAMINA** and **HIDROA**.

**DESULTOR**, in antiquity, a vaulter, or leaper, who, leading one horse by the bridle, and riding another, jumped from the back of one to the other, as the custom was after they had run several courses, or heats.

This practice required great dexterity, being performed before the use of either saddles or stirrups. The custom was practised in the army, when necessity required it; but chiefly among the Numidians, who always carried two horses, at least, with them for that purpose, changing them as they tired. The Greeks and Romans borrowed the practice from them, but only used it at races, games, &c. The Sarmatæ were great masters of this exercise, and Hussars have still some remains of it.

**DETACHED PIECES**, in fortification, are such out-works as are detached, or at a distance from the body of the place; as demilunes, ravelines, bastions, &c. In painting, the figures are said to be well detached, when they stand free and disengaged from each other.

**DETACHMENT**, in military affairs, a certain number of soldiers drawn out from several regiments or companies equally, to be employed as the general thinks proper, whether on an attack, at a siege, or in parties to scour the country.

A detachment of two or three thousand men, is a command for a brigadier; eight hundred, for a colonel; four or five hundred, for a lieutenant-colonel. A captain never marches on a detachment with less than fifty men, a lieutenant, an ensign, and two serjeants. A lieutenant is allowed thirty, and a serjeant; and a serjeant ten or twelve men. Detachments are sometimes made of intire squadrons and battallions.

**DETENTS**, in clock-work, are those stops, which, by being lifted up or let down, lock or unlock the clock in striking. See the article **CLOCK-WORK**.

**DETENT-WHEEL**, or **HOOP-WHEEL**, in a clock, that wheel which has a hoop almost round it, wherein there is a vacancy at which the clock locks.

**DETERGENTS**, *detergentia*, in pharmacy, such medicines as are not only softening and adhesive, but also, by a peculiar activity, conjoined with a suitable

configuration of parts, are apt to abrade, and carry along with them such particles, as they lay hold on in their passage.

Medicines of this kind are supposed to cleanse, and fill up with new flesh, all ulcerations and foulnesses occasioned thereby, whether internal or external. To do this internally, the medicine is supposed to maintain its primary properties, till it arrives at the place of action, where it is intitled to the appellation of a detergent and vulnerary, by its adhesive quality, which consists in the comparative largeness of its surface, and flexibility of its component parts: for by this it readily adheres to the slough of ulcerous exudations, which are easily carried along with the medicine; and when this is done, what was instrumental in detaching, will afterwards stick to the cutaneous filaments, till, by the protrusion of proper nourishment, the ulcer is healed; and, in like manner, the operation of external substances are accounted for: only this is to be taken notice of, that internally whatsoever mixes with the animal fluids, will be the first separated and left behind; for all those parts which are specifically heaviest, will move nearest the axis of the canals, because their momenta are greatest, and will carry them nearly in a straight line: but the lighter parts will be always jostled to the sides, where they soonest meet with out-lets, or are struck into the eroded cavities, in which they adhere and make part of the substance. Thus it is easy to conceive how an increase of those qualities of activity and adhesion may make a medicine arise to the greatest efficacy in this respect, even so far, as to fetch off the membranes and capillary vessels. *Quincy*.

**DETERIORATION**, the impairing or rendering a thing worse: it is just the reverse of melioration. See the article **MELIORATION**.

**DETERMINATE PROBLEM**, in geometry, that which has but one, or, at least, a limited number of answers: as the following problem, which has but one only solution, *viz.* To describe an isosceles triangle on a given line, whose angles at the base shall be double that at the vertex. But the following hath two solutions, *viz.* To find an isosceles triangle, whose area and perimeter are given.

A determinate problem may be either simple or linear, plain, solid, or surfolid.

**DETERMINATION**, in mechanics, signifies much the same with the tendency or direction of a body in motion. See the articles **DIRECTION** and **MOTION**.

**DETERMINATION**, among school-divines, is an act of divine power, limiting the agency of second causes, in every instance, to what the deity predestinated concerning them. See **PREDESTINATION**.

Such a determination the Thomists, and other predestinarians, maintain necessary to all the actions of natural agents, particularly mankind. The Jesuits, on the other hand, deny such a determination, as supposing it inconsistent with liberty and free-will. See the articles **LIBERTY** and **FREE-WILL**.

**DETERATION**. See the article **BARE-ING of trees**.

**DETERSIVES**, in pharmacy, the same with detergents. See **DETERGENTS**.

**DETHMOLD**, a town of Westphalia, in Germany, fifteen miles north of Paderborn : east long.  $8^{\circ} 35'$ , north lat.  $52^{\circ}$ .

**DETINUE**, in law, a writ or action that lies against one who has got goods or other things delivered to him to keep, and afterwards refuses to deliver them. In this action the thing detained is generally to be recovered, and not damages; though, if a person cannot recover the thing itself, he shall recover the damages, and also for the detainer. The nature of a thing must continue without any alteration, to intitle this action: besides, it is necessary that the thing detained be known; therefore it does not lie for money out of a bag, corn out of a sack, &c. Where goods are delivered to a person, and he delivers them over to another, action of detinue may be had against the second person; and notwithstanding he deliver the things to a person who has a right to the same, yet he is chargeable. If the person to whom a thing is delivered happen to die, action of detinue lies against his executors, &c. A man may have a general detinue against another that finds his goods; but if before the owner brings his action, the finder sells them, or they are recovered from him on an execution, &c. he cannot have detinue.

**DETINUE of charters**. An action for detinue lies for deeds and charters which make the title to lands. An heir, in case of disseisin, may have a detinue of charters, though he has not land. If in this action the issue be upon the detinue, and

it is found by jury that the defendant hath burnt the charters, the plaintiff shall have judgment to recover the lands in damages.

**DETINUE of goods in frank marriage**, is had after a divorce between a man and his wife, for her to recover the goods given with her in marriage.

**DETONATION**, in chemistry, the noise and explosion which any substance makes upon the application of fire to it. It is also called **fulmination**. See the article **FULMINATION**.

**DETRAHENS QUADRATUS**, in anatomy, a muscle otherwise called **platysma**. See the article **PLATYSMA**.

**DETRANCHE**, in heraldry, a line bendwise, proceeding always from the dexter side, but not from the very angle, diagonally athwart the shield.

**DETTANDER**, or **DITTANDER**, in botany. See the article **DITTANDER**.

**DETTINGEN**, a village of Germany, about nine miles east of Hanau, in the circle of the upper Rhine: east long.  $8^{\circ} 45'$ , and north lat.  $50^{\circ} 8'$ .

**DEVA**, a port-town of Spain, situated on the bay of Biscay, forty miles east of Bilboa: west long.  $2^{\circ} 10'$ , and north lat.  $43^{\circ} 20'$ .

**DEVASTAVIT**, or **DEVASTAVERUNT**, **BONA TESTATORIS**, in law, a writ which lies against executors or administrators for wasting the testator's goods, or paying debts upon simple contracts before debts on bonds, and other specialities; also for paying legacies before debts; and, generally, for squandering the effects of the deceased, and not paying his debts.

**DEVENERUNT**, in law, a writ which lay formerly on the death of the heir of the king's tenant, and directed to the escheator; commanding him to inquire by the oaths of good and lawful men, what lands and tenements came to the king by the death of the tenant.

**DEVENSHRING**, or **DENSHRING**, a term used in many parts of the kingdom for burning of land. See **BURNING of land**.

**DEVENTER**, a city of the united Provinces, and province of Overysse, about eight miles north of Zutphen: east long.  $6^{\circ}$ , and north lat.  $52^{\circ} 20'$ .

**DEVESTING**, in old law-books, the reverse of investing or investiture. See the article **INVESTITURE**.

**DEVIATION**, in old astronomy, signified the motion of the deferent or excentric, whereby

whereby it advanced to, or receded from, the ecliptic. *Harris.*

**DEVICE**, or **DEVISE**, among painters. See the article **DEVISE**.

**DEVIL**, *δαιμόνιον*, an evil angel, one of these celestial spirits, cast down from heaven, for pretending to equal himself with God. The Ethiopians paint the devil white, to be even with the Europeans who paint him black. There is no mention of the word devil in the old Testament, but only of the word Satan and Belial: nor do we meet with it in any heathen authors, in the sense it is taken among christians, that is, as a creature revolted from God. Their theology went no farther than to evil genii, or dæmons. See the articles **GENII** and **DEMONS**.

Some of the american idolaters have a notion of two collateral, independent beings, one of whom is good, and the other evil; which last they imagine has the direction and superintendence of this earth, for which reason they chiefly worship him: whence those that give us an account of the religion of these savages give out, with some impropriety, that they worship the devil. The Chaldeans, in like manner, believed both a good principle and an evil one, which last they imagined was an enemy to mankind.

Isaiah, speaking, according to some commentators, of the fall of the devil, calls him Lucifer, from his former elevation and state of glory: but others explain this passage of Isaiah in reference to the king of Babylon, who had been precipitated from his throne and glory. The Arabians call Lucifer, Eblis, which some think is only a diminutive or corruption of the word Diabolus. See the articles **LUCIFER** and **EBLIS**.

**DEVIL-IN-A-BUSH**, a plant called by authors *nigella*. See the article **NIGELLA**.

**DEVIL'S BIT**, the same with the scabious of botanists. See the article **SCABIOUS**.

**DEVIL'S MILK**, a species of tithymal, or spurge. See the article **TITHYMAL**.

**DEVINCTION**, in antiquity, a kind of love-charm, described by Virgil in his eighth eclogue: it consisted in tying certain knots, and repeating a formula of words.

**DEVISE**, or **DEVICE**, in heraldry, painting, and sculpture, any emblem used to represent a certain family, person, action, or quality; with a suitable motto, applied in a figurative sense. See **MOTTO**. The essence of a devise consists in the metaphorical similitude between the things

representing and represented: thus a young nobleman, of great courage and ambition, is said to have borne for his devise, in the last carrousal at the court of France, a rocket mounted in the air, with this motto in italian, *poco duri purché m'inalzi*; expressing, that he preferred a short life, provided he might thereby attain to glory and eminence.

The Italians have reduced the making devises into an art, some of the principal laws of which are these: 1. That there be nothing monstrous or extravagant in the figures. 2. That figures be never joined which have no relation or affinity to each other; excepting some whimsical unions established in antient fables, which custom has authorised. 3. That the human body be never used. 4. The fewer the figures, the better. 5. The motto should be every way suitable.

**DEVISE** is frequently also used for cypher. See the article **CYPHER**.

**DEVISE**, in law, the act whereby a person bequeaths his lands or tenements to another, by his last will and testament.

The person who makes this act, is called the devisor, and he in whose favour the act is made, is termed in law the devisee. The law interprets the words of a will in a larger and more favourable sense than those of a deed: for if land be devised to a man to have to him for ever, or to have to him and his assigns, in those cases the devisee shall have a fee-simple; yet if given in the same manner by feoffment, grant, or gift, he shall have but an estate for life: so if one devise land to an infant in his mother's belly, it is a good and valid devise, though it is otherwise by feoffment, grant or gift; for in those cases, there ought to be one of ability to receive presently, otherwise it is void. See **DEED** and **WILL**.

**DEVISES**, a borough-town in Wiltshire, eighteen miles north-west of Salisbury: west long.  $2^{\circ} 6'$ , and north lat.  $51^{\circ} 25'$ . It sends two members to parliament.

**DEUNX**, in roman antiquity, eleven ounces, or  $\frac{1}{12}$  parts of the libra. See **LIBRA**.

**DEVOLVED**, something acquired by right of devolution.

**DEVOLUTION**, in law, a right acquired by succession from one to another. See the articles **INHERITANCE**, **HEIR**, **SUCCESSOR**, &c.

**DEVONSHIRE**, a county in the west of England, bounded by the Bristol channel, on the north; by Somersetshire and Dorsetshire, on the east; by the english channel,

channel, on the south ; and by Cornwall, on the west. From this county the noble family of Cavendish take the title of duke.

**DEVOTION**, *devotio*, a sincere ardent worship of the deity. See **PRAYER**, **ADORATION**, **WORSHIP**, &c.

Devotion, as defined by Jurieu, is a softening and yielding of the heart, with an internal consolation, which the souls of believers feel in the practice or exercise of piety. By devotion is also understood certain religious practices, which a person makes it a rule to discharge regularly, and with reason, if the exactitude be founded on solid piety, otherwise it is vanity or superstition. That devotion is vain and trifling, which would accommodate itself both to God and to the world. *Trevoux.*

**DEVOTION**, among the Romans, was a kind of sacrifice, or ceremony, whereby they consecrated themselves to the service of some person. The antients had a notion, that the life of one might be ransomed by the death of another, whence those devotions became frequent for the lives of the emperors. Devotion to any particular person, was unknown among the Romans till the time of Augustus. The very day after the title of Augustus had been conferred upon Octavius, Pacuvius, a tribune of the people, publicly declared, that he would devote himself to Augustus, and obey him at the expence of his life, as was the practice among barbarous nations, if he was commanded. His example was immediately followed by all the rest, till, at length, it became an established custom never to go to salute the emperor, without declaring that they were devoted to him. Before this, the practice of the Romans was that of devoting themselves to their country. The devotion of Decius, who, after devoting himself to his country, threw himself into the hands of his enemies and was killed, is said to have gained the Romans the victory.

**DEVOURING**, in heraldry, is when fishes are borne in an escutcheon in a feeding posture, for they swallow all the meat whole.

**DEUS**, **GOD**, among divines and philosophers. See the article **GOD**.

**DEUTERO-CANONICAL**, in theology, a term applied to certain books of scripture which were added to the canon after the rest ; either because they were

not wrote till after the canon was compiled, or because of some debate in regard to their canonicity.

The Jews undoubtedly acknowledge several books in their canon which were put there later than the rest. They alledge, that under Esdras, a great assembly of their doctors, which, by way of eminence, they term the great synagogue, collected the holy books, which now compose the hebrew old Testament : and they allow, that this assembly put books therein, that had not been in it before the babylonish captivity. Such are those of Daniel, Ezekiel, Haggai, &c. and the books of Esdras and Nehemiah.

The church of Rome added, since then, others to the canon that were not in the canon of the Jews, nor could be there, by reason some of them were not composed till after : such are the books of Ecclesiasticus, with several of the apocryphal books ; as those of the Maccabees, Wisdom, &c. Others were added still later, by reason their canonicity had not been examined ; and till such examen and judgment, they might be set aside at pleasure.

The deutero-canonical books in the modern canon, are the books of Esther, either the whole, or, at least, the seven last chapters of it ; the epistle to the Hebrews, those of James and Jude ; the second of St. Peter, the second and third of St. John, and the Revelations. The deutero-canonical parts of books are the hymn of the three Children, the prayer of Azariah, the histories of Susannah, of Bel and the Dragon, the last chapter of St. Mark, the bloody sweat and appearance of the angel, related in Luke xxii. and the history of the adulterous woman in John viii. *Trevoux.*

**DEUTERONOMY**, a canonical book of the old Testament, and the last of the pentateuch of Moses. See the articles **BIBLE**, **CANON**, and **PENTATEUCH**.

This book was called Deuteronomy by the seventy greek translators, as being a recapitulation of the laws before delivered at large.

**DEUTEROPOTMI**, *δευτεροποτμοι*, in grecian antiquity, a designation given to such of the Athenians as had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered. It was unlawful for the deuteropotmi to enter into the temple of the Eumenides, or to be admitted to the holy rites, till after they were

were purified, by being let through the lap of a woman's gown, that they might seem to be new born.

**DEUTEROSIS**, the greek name by which the Jews called their mischnah, or second law. See the article **MISCHNAH**.

Eusebius accuses the Jews with corrupting the true sense of scripture with the trifling explanations of their deuterosis. Epiphanius says, that there were four sorts of these quoted: the first under the name of Moses, the second under that of Akiba, the third under that of Adda, or Judah, and the fourth under the name of the sons of the Asmonæans, or Maccabees. It is not easy to say, whether the present Mischnah is the same with any of these; whether it contains them all, or only some part, or whether it be different from them all. St. Jerom says, that the Hebrews referred their deuterosis to Shammai, and Hillel; he speaks of the deuterosis with the utmost contempt; he looked upon them as a collection of fables, childish stuff, and obscenities.

**DEUIDER**, in the manege, is applied to a horse that, upon working upon volts, makes his shoulders go too fast for the croupe to follow; so that, instead of going upon two heads as he ought, he endeavours to go only upon one. This comes from the resistance he makes in defending against the heels; or from the fault of the horseman, who is too hasty with his hand.

**DEUX PONTS**, a city of Germany, in the palatinate of the Rhine, sixty miles north east of Nancy: east long.  $7^{\circ} 15'$ , and north lat.  $49^{\circ} 25'$ .

**DEW**, a dense moist vapour, falling on the earth in form of a misting rain, while the sun is below the horizon. In the summer-season, when the weather is fair and very dry, and the earth's surface has, for a considerable time, been parched with the great heat of the sun, then, not only the watery, but likewise other less volatile particles, as the oily and saline, are, by the power of the solar rays, carried up into the air, and fill that part of it which lies nearest to the surface of the earth; and so long as these exhalations are kept in agitation by the heat of the sun, so long nothing of them appears to the eye: but as soon as the solar heat, which at three in the afternoon is the greatest, begins to remit, the air not long after begins to grow cool, though the earth, which retains the heat

communicated to it by the sun a thousand times longer than the air, being still hot, continues to exhale the agitated corpuscles: by which means there is collected a white, dense, vapour, which is cool above, but still continues warm below. This vapour therefore appears first in ditches, and watery or marshy places, whence dispersing itself by degrees, it covers the face of the earth, in the evening and night-time, with a cloud, consisting of this kind of particles, which in the morning is again dissipated by the heat of the rising sun. By this it appears, that dew is a very compound liquid, so that nothing can be asserted of its nature, which in every circumstance would hold true. In gravel-pits, for instance, and in high, dry, healthy grounds of a large extent, there is collected but a very small quantity of this vapour, and that almost intirely watery; whilst that which is collected about standing waters, fens, marshes, and fat bituminous grounds, abounding with putrified fish, and other animals, is of a quite different nature, and very often pernicious to mankind: whence it is no wonder that chemists, in their analysing of dew, should find such different results, that scarce any two are agreed about them: some dew, that had been collected in a certain part of the earth, has afforded a liquor, by distillation, which struck the colours of the rainbow upon glass, so strong as not to be effaced by friction, alkaline lixiviums, or aqua regia: it also burnt like spirit of wine: again some distilled dew, having been digested with a gentle heat for eight days, and then rectified six times over, till it was exceeding subtle, is reported to have broke three glass vessels successively, though it still remained perfectly insipid: again some dew is described to be like a yellowish butter, that melts by being rubbed upon the hand, yet grows hard and dry with a moderate heat, being of a fetid odour, and to be found in pretty large lumps in the night, especially in the spring and winter. The nature of dew also differs surprizingly with the different seasons of the year, and the various successions of meteors: hence, exceedingly small seeds of vegetables, and invilible eggs of minute animals, with numerous other things coming to be digested, fermented, or putrified therein, it must afford many very different productions by distillation: whence

chemists

chemists have formed very odd opinions about it.

**DEW-BORN**, in country affairs, a distemper in cattle, being a swelling in the body, as much as the skin can hold, so that some beasts are in danger of bursting. This distemper proceeds from the greediness of a beast to feed, when put into a rank pasture: but commonly when the grass is full of water. In this case the beast should be stirred up and down, and made to purge well: but the proper cure is bleeding in the tail; then take a grated nutmeg, with an egg, and breaking the top of the shell, put out so much of the white as you may have room to slip the nutmeg into the shell; mix them together, and then let shell and all be put down the beast's throat; that done, walk him up and down, and he shall soon mend.

**Sun-DEW**, *ros solis*, in botany. See the article *ROS SOLIS*.

**DEX**, in zoology, the same with thrips. See the article *THRIPS*.

**DEXTANS**, in roman antiquity, ten ounces, or  $\frac{1}{2}$  of their libra. See the article *LIBRA*.

**DEXTER**, in heraldry, an appellation given to whatever belongs to the right side of a shield, or coat of arms: thus we say, bend-dexter, dexter-point, &c. See the articles *BEND*, *POINT*, &c.

**Ambo-DEXTER**, or **AMBIDEXTER**. See the article *AMBIDEXTER*.

**DEXTROCHERE**, or **DESTROCHERE**, in heraldry, is applied to the right arm painted in a shield, sometimes naked, sometimes clothed, or adorned with a bracelet; and sometimes armed, or holding some moveable, or member used in the arms.

**DEY**, in matters of government, the sovereign prince of Algiers, answering to the bey of Tunis. See the article *BEY*.

**DEYNSE**, a town of Flanders, nine miles south west of Ghent: east long.  $3^{\circ} 30'$ , north lat.  $51^{\circ}$ .

**DIA**, *dia*, the beginning of several terms in medicine, pharmacy, surgery, &c. Where these three letters commence the name of a remedy, unguent, plaster, &c. they signify composition and mixture, as *diaplasma*, &c.

**DIA** is also the beginning of many terms in the other arts, as diameter, dialogue, &c. See the article *DIAMETER*.

**DIABE**, a species of hystrix, or porcupine-fish. See the article *HISTRIX*.

**DIABETES**, *diacetes*, in physic, an excessive discharge of urine, which comes away crude, and exceeds the quantity of liquids drank.

It proceeds from weakness of the kidneys, which are too feeble and lax, especially in those who have been accustomed to drink too much.

Lifter observes, that a diabetes comes slowly on, and is a long while a breeding. In the beginning the mouth is dry, and the spittle a little white and frothy; the urine being somewhat more than usual, with a small thirst. A heat begins to be perceived in the bowels, which is a little pungent; the patient falls away, and the mind is anxious and unstable. In time the thirst greatly increases, the urine is plentiful, and the body wastes: when they make water, without intermission, the thirst is intolerable, and though much is drank, it is not proportionable to the water; when the urine is retained a little while, there is a swelling of the loins, illia, and testes, and it comes away with pain. Now death is at hand. The urine is pale, and not sweet, but more sweetish at last than at first.

Sydenham observes, that the juices brought into the blood go off by urine: whence the strength gradually fails, the body wastes, and its substance is drained away: there is a thirst, heat of the bowels, &c.

Strengtheners, moderate aftringents, and a species of hyacinth, with crocus martis, are good in this disease, especially with anodynes: or japan earth; or the tincture of vitriol of mars; and red wine; with water in a small quantity: the drink should be sparing, and all excesses avoided exercise and friction of the body are useful.

Lifter says, almonds and a milk-diet are proper in this distemper; as also, wine with ginger, allowing in the mean time a draught of milk and water to allay the thirst.

Wallis prescribes tincture of antimony and lime water, with saffras, aniseeds, raisins, or liquorice. Bristol-water is reckoned excellent upon these occasions: but Morgan says, that the tincture of cantharides is a medicine that may almost be depended on for checking, restraining, and stopping the immediate flux of urine.

**DIABOLUS**, *diabolos*, the devil. See the article *DEVIL*.

**DIABOLUS**

**DIABOLUS MARINUS**, the SEA-DEVIL, a name given by some authors to a species of ray fish, with a bifid-snout, and of a very ugly appearance. See the article **RAIA**.

**DIABOLUS METALLORUM**, a title given by chemists to jupiter or tin, because when incorporated with other metals, it renders them incapable of reduction, or at least very difficult to undergo that operation.

**DIABOTANUM**, in pharmacy, a plaister prepared of herbs described by Galen, *De C. M. P. G. lib. vi. c. 2.* It resolves and dissolves wens.

**DIABROSIS**, in medicine, the same with anabrosis. See the article **ANABROSIS**.

**DIACARTHAMI**, in pharmacy, an electuary composed of some purgatives with the addition of the pulp of the seed of carthamus, formerly mixed in medicines along with other purgatives, but now wholly out of use.

**DIACARYON**, in pharmacy, the same with dianucum. See **DIANUCUM**.

**DIACAUSTIC CURVE**, a specie of the caustic curves formed by refraction. Thus if you imagine an infinite number of rays BA, BM, BD, &c. (plate LXX. fig. 1.) issuing from the same luminous point B to be refracted to or from the perpendicular MC, by the given curve AMD, and so, that CE, the lines of the angles of incidence CME, be always to CG, the lines of the refracted angles CMG, in a given ratio, then the curve HFN, which touches all the refracted rays, is called the diacaustic, or caustic by refraction. See the article **CAUSTIC CURVE**.

**DIACELTATESSON**, in chemistry, a name given by Van Helmont, to a purging preparation procured from the fixed flowers of antimony. It is said by its author to cure all intermittent and continued fevers. It is to be given without any acid, and if it operate too violently, the violence may be stopped by taking any thing acid. Boerhaave observes, that he had often given it with good success, but never with those effects which the author ascribes to it, who says, that it radically cures the gout and fevers, heals ulcers of the larynx, œsophagus and bladder, and purges the body when in perfect health, but not otherwise.

**DIACENTROS**, a term used by Kepler, for the lesser diameter of a planet's orbit.

**DIACHALASIS**, among antient physicians, signifies the recess of the bones of

the cranium, or the opening of its sutures, frequently owing to wounds.

**DIACHALCITIS**, in surgery and pharmacy, a plaister composed of oil, axungia, and chalcitis, which formerly used to be applied after the amputation of a cancer, and on many other occasions.

**DIACHYLON**, in pharmacy, an emollient digestive plaister, composed of mucilages or viscid juices drawn from certain plants. See **MUCILAGE**.

There are several plaisters described by dispensatory writers under the name of diachylon, but the following are those ordered by the college of physicians.

1. Simple diachylon, compounded of fine oil, litharge of gold, the mucilages of fenugreek, linseeds, and marshmallow roots. 2. Diachylon magnum, the greater diachylon, made of the mucilages of raisins, figs, marshmallow roots, fenugreek, and linseeds, birdlime, of the juices of orrice and squills, of oesypus, of the oils of orrice, camomile and dill, of litharge of gold, of turpentine, of rosin of the pine-tree, and of yellow wax. 3. Diachylon magnum cum gummi, the great diachylon with gums, which consists of the former with the addition of strained galbanum, bdellium, sagapenum, and ammoniacum. 4. Compound diachylon or the mucilage plaister, composed of yellow wax, the oil of mucilages, gum ammoniac, and common turpentine.

**DIACODIUM**, in pharmacy, a syrup prepared from poppy heads. It is also called the *syrupus de meconio*. As it is of consequence that all the circumstances in the directions for compounding this medicine, be exactly followed, we here give the method of preparing it from the London Dispensatory. Take of the heads of dried white poppies without their seeds, three pounds and a half, of water six gallons. Slice the heads and boil them in the water, often stirring them that they may not burn, till about a third only of the liquor is left, which will be almost all imbibed by the poppy heads: then take all from the fire, and press the liquor strongly out from the heads: in the next place, boil the liquor by itself, to about two quarts, and strain it while hot, first through a sieve, and then through a thin flannel: set it by for a night, that what faeces have passed the strainers, may subside, next morning pour off the clear liquor, and boil it with six pounds of double refined sugar,

till the whole comes to the weight of nine pounds, or a little more, that it may become a syrup of a just consistence. This syrup partakes of all the virtues of the poppy. See the article **POPPY**.

**DIACODUS**, among antient writers, a name given to a kind of beryl, or sapphire, of which many fabulous things are related.

**DIACONATE**, **DIACONISSA**, the office of a deacon. See the article **DEACON**.

**DIACONICON**, in church history, an apartment answering to our vestry. See the article **VESTRY**.

**DIACOPE**, in grammar, the same with tmesis. See the article **TMESIS**.

**DIACOUSTICS**, called also **DIAPHONICS**, the consideration of the properties of refracted sound, as it passes through different mediums. See **SOUND**.

**DIACRII**, in grecian antiquity, an appellation given to a faction at Athens, who favoured oligarchy; in opposition to the *pediaci*, who were for a pure democratical government.

**DIACYDONITES**, in pharmacy, a term applied to these remedies where quinces are a principal ingredient.

**DIADELPHIA**, in the linnæan system of botany, a class of plants, the seven-teenth in order; comprehending all those with papilionaceous and hermaphrodite flowers, and leguminous seed-vessels. See **PAPILIONACEOUS** and **LEGUMEN**. The distinguishing characteristic of this class is, that the stamina adhere together; forming two dissimilar bodies or filaments, the one standing above the pistil, and the other surrounding it. See plate XXX. fig. 17.

The lower part of this last is membranaceous, and of a cylindrical figure, only open above; but towards the top, it is divided into several tubulated bodies, whereof those in the middle are alternately longer and shorter by pairs. The upper filament is single, altogether tubulated, and covers the slit of the cylindrical part of the under one. Add to this, that the pistil is single; its germ oblong, and rounded; its style, tubulofiliform; and the stigma covered with down, of the length of the style, and lying directly below the antheræ of the stamina. This is a very natural class, and comprehends pease, beans, vetches, liquorice, and a great many other genera. See the articles **PEASE**, **BEANS**, &c.

**DIADEM**, in antiquity, a head band, or fillet, worn by kings, as a badge of

their royalty. It was made of silk, thread, or wool, and tied round the temples and forehead, the ends being tied behind, and let fall on the neck. It was usually white, and quite plain, tho' sometimes embroidered with gold, and set with pearls and precious stones. In latter times, it came to be twisted round crowns, lawrels, &c. and even appears to have been worn on divers parts of the body. See **CROWN**.

**DIADEM**, in heraldry, is applied to certain circles, or rims, serving to inclose the crowns of sovereign princes, and to bear the globe and cross, or the flower de luces for their crest. The crowns of sovereigns are bound, some with a greater, and some with a less number of diadems. The bandage about the heads of moors on shields is also called **diadem**, in blazoning.

**DIADROME**, the same with vibration, or swing of a pendulum. See the articles **VIBRATION** and **PENDULUM**.

**DIÆRESIS**, in surgery, an operation serving to divide and separate the part when the continuity is a hindrance to the cure. Some professors divide surgery into six parts, assigning to each greek names, of which *diæresis* is one.

**DIÆRESIS**, in medicine, is the consuming of the vessels of an animal body, when from some corroding cause certain passages are made, which naturally ought not to have been; or certain natural passages are dilated beyond their ordinary dimensions, so that the humours which ought to have been contained in the vessels extravasate or run out.

**DIÆRESIS**, in grammar, the division of one syllable into two, which is usually noted by two points over a letter, as *aulai* instead of *aulæ*, *disfoluendæ* for *dissolvendæ*.

**DIÆRESIS** is also the same with what is otherwise called tmesis. See **TMESIS**.

**DIÆTETÆ**, in grecian antiquity, a kind of judges, of which there were two sorts, the *cleroti* and *diallasterii*. The former were public arbitrators, chosen by lot to determine all causes exceeding ten drachms, within their own tribe, and from their sentence an appeal lay to the superior courts.

The *diallasterii*, on the contrary, were private arbitrators from whose sentence there lay no appeal, and accordingly they always took an oath to administer justice without partiality.

**DIAGLAUCIUM**, the name of a collyrium, recommended by Scribonius Largus, for beginning lippitudes and ophthalmics. See the composition in the above-mentioned author, n° 22.

**DIAGLYPHICE**, the art of cutting or engraving figures on metals, such as seals, intaglias, matrices of letters, &c. or coins for medals. See the articles **ENGRAVING** and **SCULPTURE**.

**DIAGNOSTIC**, in medicine, a term given to those signs which indicate the present state of a disease, its nature and cause. There are two principles upon which the diagnosis of diseases is founded: the first depends on a knowledge of the preceding causes, which are such as appear to have produced the same disease before: and the second is a knowledge of the disease in its own nature, and present effects. To the diagnosis of fevers, belongs the knowledge of their various stages or times, as distinguished into beginning, increase, height and declension.

**DIAGONAL**, in geometry, a right line drawn across a quadrilateral figure, from one angle to another, by some called the diameter, and by others, the diametral of the figure. Thus *a b* in plate LXX. fig. 2. is called a diagonal. It is demonstrable, 1. That every diagonal divides a parallelogram into two equal parts. 2. That two diagonals drawn in any parallelogram bisect each other. 3. A line *f g*, passing through the middle point of the diagonal of a parallelogram, divides the figure into two equal parts. 4. The diagonal of a square is incommensurable with one of its sides. 5. That the sum of the squares of the two diagonals of every parallelogram is

equal to the sum of the squares of the four sides. This proposition is of great use in the theory of compound motions; for, in an oblique angled parallelogram, the greater diagonal being the subtense of an obtuse, and the lesser of an acute angle which is the compliment of the former, if the obtuse angle be conceived to grow till it be infinitely great with regard to the acute one, the great diagonal becomes the sum of the two sides, and the lesser one, nothing. Now two contiguous sides of a parallelogram being known, together with the angle they include, it is easy to find one of the diagonals in numbers, and then the foregoing proposition gives the other. This second diagonal is the line that would be described by a body impelled at the same time by two forces which should have the same ratio to each other, as the contiguous sides have, and act in those two directions; and the body would describe this diagonal in the same time, as it would have described either of the contiguous sides in, if only impelled by the force corresponding thereto. See the article **COMPOUND MOTION**.

**DIAGRAM**, in geometry, a scheme for explaining and demonstrating the properties of any figure, whether triangle, square, circle, &c. See the articles **TRIANGLE**, **SQUARE**, &c.

**DIAGRAM**, among antient musicians, the same with the scale of the moderns. See the article **SCALE**.

Its utmost extent was only two octaves; the lowest note being to the highest as 1 to 4. Within this compass, they had eighteen notes or sounds; the names of which, beginning with the lowest, are these:

This diagram, it is to be observed, represents only the diatonic genus, where the notes or sounds are by no means distinct, the paranete synemmenon coinciding with the trite diezeugmenon, and the nete synemmenon with the paranete diezeugmenon. It is also observable, that some of the notes stand nearer together than the rest; the interval between the latter being a tone, and between the former only a semitone. See the article INTERVAL.

**DIAGRYDIUM**, in pharmacy, a preparation of scammony, invented by Galen: it consists in baking the scammony in a quince, but is at present seldom used, the scammony being found not to need any correction. See the article SCAMMONY.

**DIAHEXAPLA**, or **DIAHEXAPTE**, among farriers, a compound medicine, so called from its containing six ingredients, *viz.* birthwort and gentian roots, juniper-berries, bay-berries, myrrh, and ivory shavings. It is commended for colds, consumptions, purinsels, and many other disorders in horses.

**DIAL**, or **SUN-DIAL**, an instrument serving to measure time by means of the shadow of the sun.

Sun-dials are differently denominated, according to their different situation, and the figure of the surfaces upon which they are described, as horizontal, vertical, equinoctial, polar, direct, erect, declining, inclining, reclining, cylindrical, &c. We shall here proceed to describe these particular kinds of dials; and explain the philosophical principles on which dialling is founded under the article dialling. See **DIALLING**.

Dials are distinguished into primary and secondary. The first are either drawn on the plane of the horizon, called horizontal dials; or perpendicular thereto, on the planes either of the meridian, or prime verticle, called vertical dials; to which are added those drawn on the polar and equinoctial planes, though neither horizontal nor vertical.

**Equinoctial DIAL**, is that described on an equinoctial plane, or a plane representing that of the equinoctial. They are usually distinguished into upper, which look towards the zenith, and lower which respect the nadir. Now as the sun only illumines the upper surface of an equinoctial plane, while he is in our hemisphere, or on the northern side of the equator, an upper equinoctial dial will

only shew the hour during the spring and summer season. And again, as the sun only illumines the lower surface of an equinoctial plane, while he is in the southern hemisphere, or on the other side of the equator, a lower equinoctial dial will only shew the hour in autumn and winter. To have an equinoctial dial therefore that shall serve all the year round, the upper and lower must be joined together; that is, it must be drawn on each side of the plane.

*To describe an upper equinoctial DIAL.*

From a center C (plate LXX. fig. 3. n<sup>o</sup> 1.) describe a circle ABDE, and by two diameters AD and BE, intersecting each other at right angles, divide it into quadrants AB, BD, DE and EA. Subdivide each quadrant into six equal parts by the right lines. C I, C II, C III, &c. which lines will be hour lines, and thro' the center C drive a style or pin perpendicular to the plane ABDE. The dial thus described being raised so as to be in the plane of the equator, the line C XII, in the plane of the meridian, and the point A looking towards the south; the shadow of the style will shew the hours both of the forenoon and afternoon.

*A lower equinoctial DIAL* is described in the same manner, with this exception, that no hour lines are to be drawn beyond that of six o'clock.

*To describe an universal equinoctial DIAL:*

join two metal planes ABCD and CDEF. (ibid. n<sup>o</sup> 2.) so as to be moveable at the joint. On the upper surface of the plane ABCD describe an upper equinoctial dial; and upon the lower, a lower, as already directed, and through the center I. drive a style. In the plane DEFC cut a box, and put a magnetical needle G therein; fit on the same plane a brass quadrant L H, nicely graduated, and passing through a hole H cut in the plane ABCD. Now since this may be so placed by means of the needle, as that the line I 12 shall be in the plane of the meridian, and by means of the quadrant so raised, as that the angle BCF shall be equal to the elevation of the equator, it will serve as a dial in any part of the world. On this dial may be drawn several concentric circles, which will shew the sun's place and declination. Thus divide the style into 100 parts, which being the radius of a circle, take the complement of the declination 5°, 10°, 15°, &c. and with the

Fig. 1. DIACAUSTIC

the tangent of these degrees describe concentric circles, and when the end of the shadow of the style comes into one of them, it shews the declination and the sun's place, which may be marked on the circles.

**Horizontal DIAL**, that described on a plane parallel to the horizon.

*To draw the hour lines upon an horizontal DIAL*, geometrically, draw a right line NS (ibid. n<sup>o</sup> 3.) for the meridian and hour line of 12, and cross it with another EW. for the hour line of 6 at right angles in Z: and upon Z as a center describe a circle ENWS. representing the horizon, of London for example, whose latitude is  $51^{\circ} 32'$ , and likewise this dial plane. Within this circle project the sphere according to your latitude: then shall the several hour circles touching the plane of the horizon give you points to draw the hour lines upon your dial plane. If a ruler therefore is laid to Z, and every one of the points 1, 2, 3, &c. 11, 10, 9, &c. and straight lines drawn, these lines shall be the true hour lines for your horizontal dial. There is nothing required to compleat this dial but to make the height of the style equal to the latitude of the place. Wherefore for the latitude of London take  $51^{\circ} 32'$  from your scale of chords, and set them upon the horizon from S to A, and draw a line ZA for the style. The substyle, upon which the style stands in all horizontal dials, is the meridian, or hour line of 12.

In large dials, where great accuracy is required, it is best to determine the lines of the dial by trigonometrical calculation, in which the elevation of the pole of the place being given, the angles which the hour lines make with the meridian in the center of the dial are found by the following canon. As the sine of  $90^{\circ}$ , is to the sine of the elevation of the pole or latitude of the place; so is the tangent of each hour's equinoctial distance from the meridian, to the tangent of the angle required.

**Vertical DIAL**, that drawn on the plane of a vertical circle. The verticals chiefly used are the prime vertical and the meridian, whence arise south, north, east, west dials. If the dial respects the cardinal points of the horizon, it is called *direct*, but if any other vertical be chosen, it is said to *decline*. Again, if the circle whose plane is used be perpendicular to the horizon, the dial is denominated

*erect*; but if the plane be oblique to the horizon, it is said to *incline* or *recline*.

**Erect, direct, south or north DIAL**, is that described on the surface of the prime vertical circle, looking southward or northward.

*To describe the hour lines upon a vertical erect, direct, south or north DIAL*. Having drawn a right line NS. (ibid. n<sup>o</sup> 4. and 5.) for the meridian, or line of 12, and another at right angles EW. for the horizontal line of the plane, crossing in the point Z; upon Z as a center, describe a circle NESW representing the horizon, and thereon project the sphere. Then draw a line upon your projection to represent your plane. Now an erect direct plane, which beholds the south, must needs be in the azimuth circle of east and west, and therefore a right line drawn from east to west shall represent your plane. Having drawn the plane upon the projection, you must find its pole. Now, this plane EW lying in the azimuth of east and west, its poles must lie in the azimuth of north and south, so that N is the pole of the north face of this plane, and S of the south face, either of which poles are removed 90 degrees from the plane, and a line drawn from the one pole to the other, will cut the plane at right angles in Z. The next thing to be found is the elevation of the pole of the world above the plane. Now P the pole of the world is elevated above this plane EW the quantity of the arch of the meridian ZP. To find the quantity of which, take the distance ZP in your compasses, and measure it upon the scale of half tangents, and you will find it to be equal to the complement of the latitude. Then as for the hour distances upon the plane, they are found thus. Lay a ruler to N, the pole of the plane, and to the several points 1, 2, 3, &c. 11, 10, 9, &c. where the hour circles of the projection cut the plane, and where the ruler cuts the primitive circle make small \*\*\*: and lines drawn from the center Z, through these stars, shall be the true hour lines upon the dial plane. The height of the pole above the plane being equal to the complement of the latitude, take that in degrees from a scale of chords and set them from S to B, and draw a line ZB for the style, which must stand upon the meridian, and on the south face must point downwards to the south pole,

pole, and on the north face upwards to the north pole, as in n° 5.

To draw this dial trigonometrically, say, as the radius to the co-sine of the latitude, so is the tangent of 15° the first hour's equinoctial distance, to the tangent of the first hour's distance on the plane.

*Erect, direct, east or west DIAL*, that described on the plane of the meridian, looking to the east or to the west.

*To describe an erect, direct, east or west DIAL*. Let A B C D, plate LXX. LXXI.

n° 6 and 7. be the dial plane. 1. Upon the point C at the lowermost corner, if it be an east dial, or upon the point D, at the other lowermost corner, if it be a west dial, with 60 degrees of a line of chords, describe an obscure arch of a circle E F. Then from the same line of chords take the complement of the latitude of the place, which is also the elevation of the equinoctial above the horizon; and set that distance upon the arch from E to F, and draw the line C F A quite through the plane. This line will represent the equinoctial circle. 2. That you may the better proportion your style to your plane, and that all the hours may come on, and be at a convenient distance from one another, assume two points in the equinoctial line, one towards the end of C for the hour of XI, in the east dial, or of I in the west dial, as the point G; and another towards the other end thereof, for the hour of VI, as the point H; and through these two points G and H, draw two lines at right angles to the equinoctial for the hour lines of XI and VI o'clock. 3. Upon the point G with 60 degrees of the line of chords, describe an obscure arch of a circle, below the equinoctial line, as I K, setting thereon 15° of your line of chords from I to K, and draw the obscure line G K L extending it till it cut the hour line of VI in the point L; so shall the distance L H be the height of the perpendicular style proportioned to this plane. 4. Open your compasses to 60° of your line of chords, and setting one foot in the point L with the other, describe an obscure arch of a circle M N between the hour line of VI and the line G L. 5. Divide the arch M N into five equal parts, at the points ☉ ☉ ☉ ☉ ☉, and lay a ruler from L to each of these points, and the ruler will cut the equinoctial line C H in the points \* \* \* \*, through which

points draw right lines parallel to the hour line of VI, as the lines VII \* VII, VIII \* VIII, IX \* IX, X \* X, and they will be the true hour lines of an east dial from six in the morning to eleven before noon. 6. For the hour lines before VI, namely, of IV and V in the morning, you may put them on by transferring the same distances upon the equinoctial line before VI, as there is between VI, and the hour lines of VII and VIII, after VI. and through these points draw lines parallel to the hour line of VI, and they will be the hour lines of IV and V in the morning. 7. For the style of east or west dials it may be either a straight pointed pin or wire exactly of the length of the line H L, fixed in the point H, or some other part of the line of VI, perpendicularly to the plane, which will shew the true hour only by the shadow of the very top, as in the west dial n° 7; or, which is better, it may be a plate of brass of the same breadth with the distance between the hour lines of VI and IX upon the equinoctial, as in the east dial n° 6, which plate being set perpendicularly upon the hour line of VI, will shew the hour by the shadow of the upper edge. 8. If you would insert the halves and quarters of hours, divide each space between ☉ and ☉ on the arch M N into four equal parts, and so transfer them to the equinoctial circle, as you did the whole hours. In an east and west dial every thing is the same, with this difference only, that whereas the arch E F in the east dial, through which the equinoctial passes, was described on the right hand of the plane upon the center C; in the west dial it must be described on the left hand on the center D; and the hour lines of IV, V, VI, VII, VIII, IX, X, XI in the forenoon on the east dial, must be VIII, VII, VI, V, IV, III, II, I in the afternoon on the west dial.

*Polar DIAL*, that described on a plane passing through the poles of the world, and the east and west points of the horizon, denominated *upper* or *lower*, according as it looks up towards the zenith, or down towards the nadir. It is therefore inclined to the horizon in an angle equal to the elevation of the pole.

*To draw an upper polar DIAL*. Draw a right line A B (n° 10) parallel to the horizon; and if the plane be immoveable,

able, find the meridian line CE. Divide CE into two equal parts, and thro' C draw a right line FG parallel to AB. Then from the center D, with the interval DE, describe a quadrant, which divide into six equal parts; and from the center D, through the several points of division, draw right lines D 1, D 2, D 3, D 4, D 5, and set off the intervals E 1, E 2, E 3, E 4, E 5, contrary way, viz. E 11, 10, 9, 8, 7. From the points 5, 4, 3, 2, 1, raise perpendiculars, meeting the line FG in the correspondent points. Lastly, in D erect a perpendicular style equal to DE, or on two equal pieces, E, C, fix a cross iron rod, then will 12, 12; 1, 1; 2, 2; 3, 3, &c. be hour lines to be pointed out at the proper times by the shadow of the indices. A lower polar dial is made by putting out the hours of the forenoon 9, 10, 11, and those of the afternoon 1, 2, 3, with the noon-hour 12 itself, and only leaving the hours 4 and 5 in the morning and 7 and 8 in the afternoon.

**Secondary DIAL**, that drawn on the plane of other circles than the horizon, prime vertical, equinoctial, and polar circles; or that which either declines, inclines, reclines, or deinclines.

**Declining DIALS** are erect or vertical dials, which cut either the plane of the prime vertical, or of the horizon at oblique angles. They are of very great use, as the walls of houses, upon which dials are frequently drawn, commonly deviate from the cardinal points.

*To describe a vertical DIAL, declining from the south to the east, or west, trigonometrically.* In order to do this, 1. The height of the pole or style above the plane must be found. 2. The deflexion or substyle's distance from the meridian. And 3. The plane's difference of longitude. All which are parts of the spherical triangle PRZ. ( $n^{\circ} 8.$ ) right angled at R, in which are given the side PZ, equal to the complement of the latitude of the place; the angle PZR, the complement of the plane's declination; and the right angle at R. From these three data are found, 1. The height of the style above the plane by this canon,

As the sine of  $90^{\circ}$

Is to the sine complement of the latitude,

So is the sine complement of the plane's declination

To the sine of the height of the style.

2. The distance of the substyle from the meridian by this canon.

As the sine of  $90^{\circ}$

To the sine of the plane's declination,  
So is the tangent of the complement of the latitude of the place

To the tangent of the substyle's distance from the meridian.

3. To find the plane's difference of longitude, say,

As the sine of the complement of latitude

To the sine of  $90^{\circ}$ ,

So is the sine of the substyle's distance from the meridian

To the sine of the plane's difference of longitude.

4. To find the angle that each hour makes with the substyle, say,

As the sine of  $90^{\circ}$

To the sine of the height of the pole above the plane,

So is the tangent of the difference of the sun's distance from the meridian and the difference of longitudes

To the tangent of the angle required.

An example of a north dial declining east, which is only a south dial inverted, may be seen in ( $n^{\circ} 9.$ )

**Inclined DIALS** are those delineated on planes inclining towards the southern side of the horizon in an angle either greater or less than the equinoctial plane.

*To draw an inclined DIAL.* The inclination of the plane, as DC, ( $n^{\circ} 11$ ) being found by a declinator, as taught under the article DECLINATOR, if it fall between the equinoctial plane CE, and the vertical one CB, so as that the angle of inclination DCA be greater than the elevation of the equator ECA, on the upper side draw a north dial, and on the lower a south dial to an elevation of the equator, which is equal to the aggregate of the elevation of the equator of the given place, and the complement of the inclination to a quadrant. If the inclined plane CF fall between the horizontal one CA, and the equinoctial one CE, so as that the angle of inclination FCA is less than the elevation of the equator ECA, describe an horizontal dial to an elevation of the pole equal to the aggregate of the elevation of the pole of the given place, and the inclination of the plane. See the article *Horizontal-DIAL*

Inclined

Inclined dials are drawn after the same manner as primary dials, except that the index in the former case must be fitted under the angle ADC, and in the latter, under the angle DFC, and that the distance of the center of the dial from the line of contingency is in the former case DC, and in the latter FC.

*Reclining DIALS*, those delineated on planes reclining backwards from the zenith towards the north, in an angle greater or less than the polar plane.

*To describe a reclining DIAL.* If the reclined plane HC, ( $n^{\circ} 11.$ ) fall between the vertical plane BC, and the polar plane IC, so as that the angle of reclination BCH is less than the distance of the pole from the zenith BCI, describe two vertical south and north dials to an elevation of the equator equal to the difference between the elevation of the equator of the given place, and the angle of reclination. See *vertical, south and north DIAL.*

If the reclined plane, as KC, fall between the polar plane IC, and the horizontal one CL, so as that the angle of reclination BCK is greater than the distance of the pole from the zenith ICB, describe an horizontal dial thereon to an elevation of the pole equal to the difference between the angle of reclination, and the elevation of the equator of the given place. See *Horizontal DIAL.*

*De-inclined DIALS* are those which both decline and incline, or recline. The use of these being very rare, we shall not trouble the reader with a description of them.

*Construction of an universal inclined, horizontal and equinoctial DIAL.* This instrument consists of two plates of brass, or other solid matter, whereof the under one A ( $n^{\circ} 12.$ ) is hollowed about the middle, to receive a compass fastened underneath with screws. The plate B is moveable by means of a strong joint at C. Upon this plate is drawn a horizontal dial for some latitude greater than any of those the dial is to be used in, with a style E proportionable to that latitude. For when the plane B is raised by means of the quadrant D, the horizontal plane must always have a less latitude than that the dial is made for, otherwise the axis of the style will have an elevation too little. Instead of the quadrant D is generally placed an arch from the equator to  $60^{\circ}$  numbered down-

wards,  $60$  being at the bottom, and for this latitude of  $60^{\circ}$ , the horizontal dial is commonly drawn. The arch of  $60^{\circ}$  is fastened by two small tenons, and may be laid down upon the plate A, as likewise may the style upon the plate B, and both of these are kept upright by means of little springs underneath the plates.

*The use of the inclined horizontal DIAL.* Raise the upper plate B to the degree of latitude of the place where you are, by means of the gradations on the quadrant D. Then if the plane A be set horizontal, so that the needle of the compass settles over its line of declination, the shadow of the axis will shew the hour of the day.

*Use of the equinoctial DIAL.* You must place the edge of the equinoctial circle HBI to the degree of the elevation of the pole by means of the quadrant, and if the dial be set north and south by means of the compass, the shadow of the style will shew the hour of the day at all times of the year, even when the sun is in the equinoctial, because the circle is hollowed.

*Ring-DIAL*, a kind of dial, consisting of a brass ring, seldom exceeding two inches in diameter, and one third of an inch in breadth. In a point of this ring there is a hole, through which the sun beams being received, make a lucid speck on the concavity of the opposite semicircle, which gives the hour of the day in the division mark'd therein. But it only holds good about the times of the equinox, unless the hole is made moveable, and the days of the month are marked on the convex side of the ring. In this case the dial can be rectified for any time, and will shew the hour of the day throughout the year.

To use it, put the moveable hole to the day of the month, then suspending it by the little ring, turn it towards the sun till his rays point out the hour among the the divisions on the inside.

*Universal or astronomical ring-DIAL*, a dial serving to shew the hour of the day in any part of the earth; whereas the former is confined to a certain latitude. It is composed of two rings, or flat circles, from two to six inches in diameter, and their breadth proportional. The outward ring HREP (plate LXXI. fig. 13.) represents the meridian of the place of the observer, and contains two divisions of

of 90° each, as HR and EP diametrically opposite to each other, the one serving from the equator to the north pole, and the other from the equator to the south. The inner ring BC represents the equator, and turns exactly within the outward ring, by means of two pivots at the points of the hours of 12. A cursor N composed of two little pieces, slides along an aperture, in the middle of the bridge I. which cursor has a small hole to admit the rays of the sun. The middle of this bridge represents the axis of the world, and its two extremities the two poles; on one side of it are drawn the signs of the zodiac, and on the other, the days of the month. On the edge of the meridian slides a piece *ba*, with a ring I. fitted to it, by which the instrument is to be suspended during the observation. This ring represents the zenith.

*Use of the universal ring-DIAL.* Place the line on the middle of the sliding piece, immediately below the ring, to the latitude of the place, and fix the line crossing the hole of the cursor to the day of the month, or degree of the sign in which the sun then is. Open the instrument so, that the two rings be at right angles to each other, and suspend it by the ring I: turn the flat side of the bridge towards the sun, so that his rays coming through the little hole in the middle of the cursor fall exactly on a line drawn round the middle of the concave surface of the interior ring, where it will point out the hour. Let it be observed, however, that this dial will not shew the hour of 12, because the outer circle being then in the plane of the meridian, hinders the sun's rays from falling on the inner. Neither will it shew the hour when the sun is, in the equinoctial, for then his rays fall parallel to the plane of the inner circle.

*Quadrantal DIAL.* See the article HORODICTIC QUADRANT.

*Reflecting DIAL,* a sort of dial shewing the hour of the day by means of a thin piece of looking-glass plate, so placed, as to reflect the sun's rays on the top of a ceiling, where the hour-lines are drawn.

*Nocturnal DIAL,* that which shews the hours of the night, of which there are two kinds, lunar and sidereal.

*Lunar, or moon-DIAL,* shews the hour of the night by means of the shadow of the moon, projected from an index.

*To describe a horizontal moon-DIAL.* Draw first a horizontal sun-dial. 2. Erect two lines AB, CD. (plate LXXII. fig. 1.) perpendicular to the line of 12 o'clock; and dividing the interval GF into twelve equal parts, draw lines parallel through the several points of division. 3. If the first line CD be appropriated to the day of the new moon, and the second line to the day when the moon comes later to the meridian than the sun by one hour, and so the last line AB correspond with the day of full-moon, the intersections of these lines with the hour-lines will give points, through which to draw a curve line, 12, 12, for the meridian line of the moon. 4. In the same manner determine the other hour lines 1, 1; 2, 2; 3, 3, &c. which the shadow of the moon projected from the style of the dial, intersects at the respective hours. 5. Blot out the hour lines of the sun-dial, together with the perpendiculars, by means of which the lunar hours were drawn, and divide the interval GF by other parallel lines into fifteen equal parts, because there are nearly fifteen days between new moon and full moon. Lastly, to these lines write the several days of the moon's age. Now the moon's age being learnt from the calendar, the intersection of the line of the moon's age, with the lunar horary lines, will give the hour of the night.

We may likewise find the hour of the night by a sun-dial. Thus, observe the hour which the shadow of the index points at by moon-light: find the moon's age in the calendar; multiply the number of days by  $\frac{2}{3}$  and the product is the number of hours to be added to the hour shewn by the shadow, to give the hour required. But if this number exceed 12, then twelve hours are to be subtracted, and the remainder will be the hour required.

*DIALS without centers,* those whose hour-lines converge so slowly, that the center they converge towards cannot be expressed on the given plane. Horizontal dials of this kind are to be made for places, the elevation of whose pole is either very great or very small; and vertical dials without centres are for places, which have the pole very much elevated.

*Furniture of DIALS.* See FURNITURE. *DIALECT,* *διαλέκτος*, an appellation given to the language of a province, in

so far as it differs from that of the whole kingdom. The term, however, is more particularly used in speaking of the antient greek, whereof there were four dialects, the attic; ionic, æolic, and doric, each of which was a perfect language in its kind, that took place in certain countries, and had peculiar beauties.

In Great Britain, besides the grand diversity of english and scotch, almost every county has a dialect of its own, all differing considerably in pronunciation, accent, and tone, although one and the same language.

The way of the Gileadites proving the Ephraimites, by the pronunciation of *schibboleth*, or *fibboleth*, with *schin*, or *sa-mech*, is well known. So the Flemings are said to prove whether a man be a native of France, or not, by bidding him pronounce *ach ten tachtentick*, which they pronounce *act en tahtentick*, as being unable to articulate the aspirate *ch*.

**DIALECTICS**, *dialektica*, in the literary history of the antients, that branch of logics which taught the rules and modes of reasoning. See the article LOGICS.

**DIALIA**, and **FLAMEN DIALIS**, in roman antiquity. See **FLAMEN**.

**DIALLING**, the art of constructing all manner of dials. See **DIAL**.

Having described the most useful dials under the word **DIAL**, we now proceed to explain the philosophic principles of the art of dialling. In order to this, therefore, we are to consider, that as the time which passes between any meridian's leaving the sun, and returning to it again, is divided into 24 hours, so if we conceive a sphere to be constructed with 24 of these meridians, the sun will orderly come upon one of them at the beginning of every hour. Such a sphere may be represented by the figure PDSB (plate LXXII. fig. 2. n° 1.) where the several meridians are represented by P1S, P2S, P3S, and so on to 24 in all: since these meridians divide the equinoctial into 24 equal parts, each part will contain just 15°, because  $15 \times 24 = 360$ , the whole circle; and since all the meridians pass through the poles of the world, the planes of those meridians all intersect each other in one common line PS, which is the axis of the sphere, therefore the said axis PS is in the plane of each of the 12 meridians. Suppose Z to be the zenith of any place, and DWBE the plane of the horizon fixed within the sphere, constructed with the 12 meridians, 1, 1; 2, 2; 3, 3; 4, 4;

&c. then will the axis of the sphere-PS pass through the center of the plane at N; so that one half NP will be above the plane, and the other half NS below it. Suppose now this dialling sphere to be suspended by the point Z, and moved about so as to have the points D and B exactly in the south and north points of the horizon, and E and W in the east and west points, then will the sphere have a situation every way similar to that of the earth and heavens with respect to the given place, and the axis of the sphere to that of the earth. The sun, therefore, shining on such a sphere, will be attended with all the same incidents, and produce all the same effects as would happen if the said sphere were at the center of the earth, or the center N of the sphere coincided with the center of the earth, because the distance between the surface and center of the earth is insensible at the distance of the sun. Now it is evident, as the sun revolves about such a sphere, it will every hour be upon one half or other of the 12 hour circles, viz. from midnight to noon, it will be on those parts of the circles which are in the eastern hemisphere; and from noon to midnight, it will pass over all those in the western. It is also farther evident, that while the sun is in the eastern hemisphere, it will be first below and then above the plane of the horizon, and *vice versa* on the other side. Again, when the sun is upon any of these hour circles, by shining upon the axis it causes it to cast a shadow on the contrary side, on the plane of the horizon, on the lower or upper surface, as it is below or above the said plane. This shadow of the axis will be precisely in the line in which the plane of the hour-circle would intersect the plane of the horizon: if, therefore, lines were drawn through the center N, joining the points on each side the plane where the hour-circles touch it, as 4N4, 5N5, 6N6, &c. the shadow of the axis will fall on those lines at the beginning of each respective hour, and thereby indicate the hour-circle the sun is in for every hour of the day. These lines are properly called hour-lines, and among the rest that which represents the hour of 12 at noon is NB, half the meridian line DB; whence it appears that the hour-lines N1, N2, N3, &c. which serve for the afternoon, lie on the east side of the plane, and are numbered from the north to the east; and on the contrary.

It

Fig. 3. DIAMETER.

Fig. 5. DICTAMNUS.

Fig. 6. DIGITALIS FOX-GLOVE.

*D. purpurea* sculp.

It also appears, that as the sun's altitude above the plane is greater or less, the number of hour-circles the sun will possess above the horizontal plane will be also greater or less. Thus when the sun is at S in the equinoctial, its diurnal path for that day being the equinoctial circle itself  $\text{ÆEQW}$ , it is plain, since the arch  $\text{ÆE} = \text{EQ}$ , the sun will apply to six hour-circles below the horizon, and to six above it, in each half of the day; and consequently that on this day the shadow will occupy but 12 of the hour-lines on each surface of the plane, beginning and ending at six. But when the sun is in the tropic of cancer, its diurnal path for that day being the tropic itself,  $\text{TCRF}$ , it is manifest the sun in the forenoon ascends above the plane in passing between the hour-circles of 3 and 4 in the morning, and descends below it in the afternoon between the hours of 8 and 9: therefore on the summer tropic the shadow will pass over 16 of those hour-lines. On the contrary, when the sun is in the winter tropic at O, its path being then  $\text{OGIH}$ , it rises above the plane between 8 and 9, and leaves it between 3 and 4.

From what has been said, it is evident that if the circles be supposed removed, and only the horizontal plane remain, with the half of the axis NP (*ibid.* n° 2.) above it in the same position as before, then should we have constituted a horizontal dial, every way the same with those in common use, with only the addition of a substyle PO, to render the style NP very firm. Hence appears the reason why the gnomon or style NP, in those dials in our latitude, is always directed to the north pole, and always contains such an angle PNO, with the hour of 12 line, NB, as is equal to the latitude of the place. Lastly, the reason appears why the number of hour-lines on these dials exceeds not 16, and are all drawn from 6 to 12 and 6 again, on the northern part, the rest on the southern; and why the hour-line of 6 lies directly east and west, as that of 12 does north and south. If a plane be fixed within the same sphere in a vertical position, or perpendicular to the horizon, and coinciding with the plane of the prime vertical, that is, facing full south and north; then will the axis PS (*ibid.* n° 3.) still pass through the center of the plane N; and the lower semi-axis NS will by its shadow mark out the

hour-lines on the southern surface, and the upper semi-axis NP will do the same on the northern. These hour-lines are determined in the same manner as those on the horizontal dial; and it is plain the sun cannot come on the southern face of this plane before six in the morning, nor shine on it after six in the evening. It is also evident, that all the hours before 6 in the morning, and after 6 at night, will be shewn on the northern face or side of this plane, for the time of the sun's being above the horizon in any place. Hence the reason of a direct south and north vertical dial easily appears, both which are represented in fig. 3. n° 4 and 5 of plate LXX.

The gnomon NS (pl. LXXII, fig. 2. n° 3.) contains an angle  $\text{SNF} = \text{ZNP}$  with the meridian or hour-line of 12, viz. ZF, which is exactly the complement of PNB to 90°; hence the elevation of the gnomon in vertical dials is equal to the complement of the latitude of the place. The principles of a direct south dial being understood, it will be easy to understand those of a dial which does not face the south or north directly, but declines therefrom any number of degrees from east to west. But we refer the reader, who requires more ample instruction on this head, to the authors who have treated professedly of dialling; the most remarkable of these, besides Wolfius, to whom we are indebted for a great part of the article DIAL, are Clavius; Comandine, De Horologiorum descriptione; Joann. Bapt. Benedictus, De Gnomonum Usumque solarium usu; Geo. Schomburg, Exegetis fundamentorum Gnomonicorum; Solomon de Caus, Traite des Horologes solaires; Desargues, Maniere universelle pour poser l'effieu, & placer les heures, & autres choses, aux cadrans solaires; Kircher's Ars magna Lucis & Umbræ; Leybourn's Art of Dialling; Ozanam's Dialling; and M. De la Hire's Gnomonique, ou l'art de tracer les cadrans, avec les demonstrations.

DIALING-GLOBE, an instrument of brass or wood, with a plane fitted to the horizon, and an index, so contrived as to give a clear illustration of the principles on which dials are made. See the preceding article.

DIALING-LINES, or SCALES, are graduated lines placed on rulers, or the edges of quadrants and other instruments, to expedite the construction of dials. These

arc, 1. A scale of six hours, which is only a double tangent, or two lines of tangents each of  $45^\circ$ , set together in the middle, and equal to the whole line of fines, with the declination set against the meridian altitudes in the latitude of the place. 2. A line of latitudes, which is fitted to the hour-scale, and is made by this canon. As the radius : to the chord of  $90^\circ$  :: so are the tangents of each respective degree of the line of latitudes : to the tangents of other arcs. And then the natural fines of these arches are the numbers, which taken from a diagonal scale of equal parts, shall graduate the divisions of the line of latitudes to any radius. The lines of hours and latitudes are general, for pricking down all dials with centers.

The other scales are particular, and give the several requisites for all upright declining dials by inspection. They are, 1. A line of chords. 2. A line for the style's distance from the meridian. 3. A line for the style's height. 4. A line of the angle of 12 and 6. 5. A line of inclination of meridians.

**DIALLING-SPHERE**, an instrument made of brass, with several semi-circles sliding over each other upon a moveable horizon ; serving to demonstrate the nature of spherical triangles, as well as to give the true idea of drawing dials on all sorts of planes. See the article **DIALLING**.

**DIALLING**, among miners, the same with plumbing. See **PLUMBING**.

**DIALOGISM**, *διαλογισμός*, in rhetoric, is used for the soliloquy of persons deliberating with themselves, as the following of Juno, in the first *Æneid* of Virgil :

*mene incepto desistere victam ?  
Nec posse Italia Teucrorum avertere regem ?*

*Quippe vector satis ? &c.*

In this sense, it is distinguished from dialogue. See the article **DIALOGUE**.

**DIALOGISM** is also, in a more extensive sense, taken for discourse in general, whether held by a person alone, or in company.

**DIALOGUE**, in matters of literature, a conversation between two or more persons, either by writing or by word of mouth.

Dialogue appears to be the most ancient form of writing, and is greatly recommended by several authors. The archbishop of Cambray, at the head of his pastoral instruction, gives an account

of the advantages of dialogue. The Holy Spirit has thought proper to teach us in dialogue, *viz.* patience, in the book of Job ; and love of God, in the Canticles. The Dies Caniculares of Simon Maiolus, concerning various subjects of nature, is by the way of dialogue. That learned philosopher Claud Beringardus, a man of most profound judgment and ingenuity, wrote his *Circulus Pisanus*, wherein he lays open the most impenetrable secrets of all natural philosophy, by way of dialogue between Charilæus, as defender of the peripatetics, and Aristæus, as maintaining the principles of Anaximander. Also Joh. Bodinus, in his *Physics*, as well as in all the rest of his writings, treats, in his *Theatrum universæ naturæ*, of the various subjects of nature, in the form of a dialogue : and indeed under this appearance, and in this method of style, he has better opportunities, by way of objections, to introduce his own paradoxes, and the rest of his monstrous opinions. We have also several writers of travels, &c. in this way, both in the french and german languages ; and not a few medical and chemical authors, who have chose to instruct by way of dialogue.

Among religious writers, Justin Martyr opened this way in his controversy against the Jews. Minutius Felix followed it, in his against the idolaters. It is in this form that Origen judged he could best refute the error of Marcian. Many others might be mentioned who thought it no diminution to the majesty of the mysteries of faith, to maintain them by the familiarity of dialogue.

**DIALOGUE**, in music, a composition for at least two voices, or two instruments, which answer one another, and which frequently uniting at the close, make a trio with the thorough bass.

These are very much used by the Italians in their operas, oratorios, serenatas, &c.

**DIALTHÆA**, in pharmacy, an unguent much used as a resolvent, so called from althæa, or marsh-mallows, which is the principal ingredient in it. See the article **ALTHÆA**.

This ointment consists also of linseed and fenugreek seed ; the other ingredients are common oil, wax, resin, and turpentine. It is applied by rubbing it on the part affected.

**DIALYSIS**, in grammar, a mark or character, consisting of two points, *..*, placed over

over two vowels of a word, in order to separate them, because otherwise] they would make a diphthong, as mosaic, &c. See the article DIÆRESIS.

**DIAMARGARITON**, in pharmacy, the name of an antidote in Myrepsus, § i. cap. 37. in which pearls are a principal ingredient.

There are two kinds of the diamargariton, the hot and the cold, but neither of them are at present used.

The hot diamargariton, is a powder composed of pearls, pellitory, ginger, cinnamon, and several other hot ingredients.

Cold diamargariton is a solid electuary, composed of pearls ground fine, and white sugar dissolved in rose-water, or that of bugloss, and boiled to a consistence.

Compound cold diamargariton is a powder made of pearls, red roses, flowers of nenuphar and violet, lignum aloes, red and citron santal, tormentil root, &c.

**DIAMASTIGOSIS**, *διαμαστισις*, in grecian antiquity, a solemnity at Sparta, in honour of Diana Orthia, wherein the children of the most distinguished families were wont to slash and tear each others bodies with rods, before the altar of the goddess: the parents of the children being always present, used to animate and excite them not to give the least sign of pain or concern; and indeed so great was the bravery and resolution of the boys, that seldom or ever any cry or groan was heard to proceed from any of them, though they frequently whipped one another to death. The design of this custom was, no doubt, to fortify the children betimes, and harden them against wounds, bruises, &c.

**DIAMETER**, in geometry, a right line passing through the center of a circle, and terminated at each side by the circumference thereof. See the article CIRCLE.

The chief properties of the diameter are, that it divides the circumference of a circle into two equal parts: hence we have a method of describing a semicircle upon any line, assuming its middle point for the center. The diameter is the greatest of all chords.

For finding the ratio of the diameter to the circumference. See CIRCLE.

**DIAMETER of a curve** is a right line AC (plate LXXII, fig. 3.) bisecting the right lines DE, DE, drawn parallel to

one another; and are either of a finite or infinite lengths. Though a right line, bisecting all parallel lines drawn from one point of a curve to another, is taken in a strict sense only for the diameter of a curve line, yet it may not be amiss, more generally, to define a diameter in saying that it is that line, whether right or curve, which bisects all parallels drawn from one point of a curve to another, so that, according to this, every curve will have a diameter: and thence sir Isaac Newton's curves of the second order have all either a right-lined diameter, or else the curves of some one of the conic sections for diameters: and many geometrical curves of the higher orders may also have for diameter curves of more inferior ones, and that *ad infinitum*. See the article CURVE and CONIC SECTION.

**DIAMETER CONJUGATE**. See the article CONJUGATE DIAMETER.

**DIAMETER of a sphere** is the diameter of the semicircle, by whose rotation the sphere is generated; in which sense it is the same with axis. See the article AXIS.

**DIAMETER of gravity**, in any surface or solid, is that line in which the center of gravity is placed. See CENTER.

**DIAMETER**, in astronomy. The diameter of the planets are either apparent or real: the apparent diameters are such as they appear to the eye; and being measured by a micrometer, are found different in different circumstances and parts of their orbit. See the article PLANET.

The real diameters of the planets are such as they are in themselves, as expressed in the following table.

A Table of the real Diameters of the Sun and primary Planets in British Miles.

The diameter of	the Sun	763,460	} british miles.
	Mercury	4,240	
	Venus	7,906	
	the Earth	7,970	
	Mars	4,444	
	Jupiter	81,155	
	Saturn	67,870	

For the real diameters of the secondary planets, see MOON and SATELLITE.

The apparent diameters of the planets measured with a micrometer, are found different in different circumstances and parts of their orbits, as expressed in the following table.

## Apparent Diameters of the Planets.

		Least.	Mean.	Greatest.
According to De la Hire	{ Sun	31' 38" 0"	32' 1" 0"	32' 43" 0"
	{ Moon	29 30 0	31 30 0	33 30 0
	{ Saturn	0 14 10	0 16 2	0 19 40
	{ Jupiter	0 14 36	0 18 2	0 24 22
According to Hevelius	{ Mars	0 2 46	0 5 2	0 20 50
	{ Venus	0 9 30	0 16 46	1 5 58
	{ Mercury	0 4 4	0 6 3	0 11 48

The least apparent diameter of the planets, according to Huygens, are as follows: saturn 30", his ring 1' 8", Jupiter 1' 4", Mars 30", Venus 1' 25".

**DIAMETER** of a column, in architecture, is its thickness just above the base. See **COLUMN**. From this the module is taken, which measures all the other parts of a column. See the article **MODULE**.

**DIAMETER** of the diminution of columns, that taken from the top of the shaft. See the article **DIMINUTION**.

**DIAMETER** of the swelling, that taken at the height of one third from the base.

**DIAMOND**, *adamas*, in natural history, a genus of precious stones, of a fine pellucid substance, of great hardness, never fouled by any admixture of earthy or any other coarse matter, susceptible of elegant tinges from metalline particles, giving fire with steel, not fermenting with acid menstruums, scarcely calcinable by any degree of fire, and of one simple and permanent appearance in all lights.

This is the most valuable and hardest of all gems, and, though found of different shapes, and sometimes accidentally tinged to several colours; yet ever carries the same distinguishing characters, and is very evidently in all those states the same body. It is, when pure, perfectly clear and pellucid as the purest water, and is eminently distinguished from all other substances, by its vivid splendor, and the brightness of its reflections. It is extremely various in shape and size, being found in the greatest quantity very small, and the larger ones extremely seldom met with; the largest diamond certainly known ever to have been found is that in the possession of the Great Mogul, which weighs 279 carats, and is computed to be worth 779,244 l.

The diamond has certainly one proper and determinate figure, into which it naturally must concrete, when in a state of rest, and impeded by no other accident in its formation: the true figure then is an inequilateral octohedron; and wherever it has concentered in a perfect manner, and

without any interrupting accidents, it has always formed itself into this figure; and often in this its several surfaces are as bright as if polished by art: but, as in common salt, though its figure be pyramidal, yet very easy accidents can determine it into cubes and parallelopipeds; so the diamond has often, in the state of formation, been thrown into two other figures, both also seeming regular ones; the one a prismatic columnar one, of six angles somewhat emulating the figure of crystal, the other an oblong quadrilateral column with two truncated ends: these seem the only regular figures of this gem; but besides these it is every day found in numberless other mis-shapen forms, often roundish, emulating the shape of pebbles, but full of small flat planes or faces; frequently oblong, very often flat, and as often tapering, either from one end to the other, or else from the middle to both ends. A diamond bears the force of the strongest fire, except the concentrated solar rays, without hurt, and even that infinitely fiercest of all fires does it no injury, unless directed to its weaker parts.

It is a common thing for diamonds to be too thick or deep for the extent of their surface, and there is a certain proportion of depth, beyond which the gem should not be allowed: in this case two diamonds are often made, by the regularly dividing one: this, when the mass is of an angular figure, is done by cutting it through with a wire, wetted with oil, and covered with diamond-powder; but in the flat or more common masses, it is done much more expeditiously by finding the grain of the stone, and introducing the point of a fine flat chissel between them. This is not the only use of the splitting, for when a diamond has a flaw or blemish in it, which greatly debases its value, the plates may be separated at a proper breadth, and the flaw removed; in which case the thinner crust, struck off, is of value in proportion to its size, and the remainder, being now freed from its flaw,

is of much more value than it was at first. The places whence we have the diamonds are the East-Indies, in the island of Borneo, and in the kingdoms of Visapour, Golconda, Bengal; and the Brasils in the West-Indies. They are not unfrequently found yellowish, blueish, and reddish, but more rarely greenish.

There have not been wanting people who have attributed to the diamond great virtues as a cordial; but we are apt to believe no body ever did, or will, try whether this has been said with any sort of foundation.

**Valuation of DIAMONDS**, among jewellers, is thus calculated: they suppose the value of a rough diamond to be 2 l. per carat; then to find the value of those of greater weight, they multiply the square of their weight by 2, and this last product is the value of the diamonds in their rough state: thus, the value of a rough diamond weighing 4 carats, is equal  $4 \times 4 \times 2 = 16 \times 2 = 32$  l. and so in other cases. Again, to find the value of wrought diamonds, they suppose half their weight lost in the manufacturing them, and therefore multiply the square of double their weight by 2; thus the value of a wrought diamond, weighing 3 carats, is equal  $6 \times 6 \times 2 = 36 \times 2 = 72$  l.

**Cornish DIAMOND**, in natural history, a name given to a kind of crystals, from their being found in Cornwall. See the article CRYSTAL.

**Rough DIAMOND** is the stone as nature produces it in the mines.

**Rose-DIAMOND** is that quite flat underneath, with its upper part cut in divers little faces, usually triangles, the uppermost of which terminate in a point.

**Table-DIAMOND** is that which has a large square face at top, encompassed with four lesser.

**Brilliant DIAMOND** is that cut in faces both at top and bottom; and whose table, or principal face at top, is flat.

**DIAMOND**, in the glass-trade, an instrument used for squaring the large plates or pieces; and, among glaziers, for cutting their glass.

These sort of diamonds are differently fitted up; that used for large pieces, as looking-glasses, &c. is set in an iron ferril, about two inches long, and a quarter of an inch in diameter; the cavity of the ferril being filled up with lead, to keep the diamond firm: there is also a handle of box, or ebony, fitted to the ferril, for holding it by.

**DIAMOND**, in heraldry, a term use for expressing the black colour in the achievements of peerage.

Guillim does not approve of blazoning the coats of peers by precious stones instead of metals and colours; but the english practice allows it. Morgan says the diamond is the emblem of fortune.

**DIAMOND-CUTTER**. See LAPIDARY.

**DIAMORUM**, in pharmacy, a preparation of mulberries and honey, used against diseases of the throat, and for stopping dysenteries, &c.

**DIANÆ ARBOR**, or **ARBOR LUNÆ**, in chemistry, the beautiful crystallizations of silver, dissolved in aqua fortis, to which some quicksilver is added; and so called from their resembling the trunk, branches, leaves, &c. of a tree.

This elegant arrangement, however, of the particles of silver is not peculiar to this state or menstruum, since copper filings dropped into the solution of silver in aqua fortis, is found to have the same effect, when viewed by the microscope: nay, the silver-ores are frequently found ramified in the same manner.

**DIANDRIA**, in the linnæan system of botany, a class of plants comprehending all those with hermaphrodite flowers, and only two stamina in each; such are sage, olive, phillerea, jessamin, rosemary, &c.

**DIANO**, a town of the Genoese, about three miles from the sea. The country about produces great numbers of olives.

**DIANTHERA**, in botany, a genus of the *diandria-monogynia* class of plants, whose corolla consists of a single ringent petal; the tube is patulous, of the length of the limb: the upper lip is of an ovated figure, the lower lip is divided into three oblong and equal segments.

**DIANTHUS**, in botany, a genus of the *decandria-digynia* class of plants, whose corolla consists of five petals, the ungues of which are of the length of the cup; they are narrow, and inserted into the receptacle; the limb is plane; and the bractæ of the petals broadest at the extremity, and crenated; the fruit is a cylindric covered capsule, consisting of one cell, and opening four ways at the top; the seeds are numerous, compressed, and roundish. See plate LXXII. fig. 4. which represents the pink.

This genus comprehends the clove-juliy-flowers or carnations, the pinks, and sweet-williams; all beautiful flowers, which may be propagated by seeds or layers.

**DIAPASMA**,

**DIAPASMA**, in pharmacy, a name for all powders sprinkled on the body, whether as perfumes or otherwise. See the article **CATAPASMA**.

**DIAPASON**, in music, a musical interval, by which most authors, who have wrote upon the theory of music, use to express the octave of the Greeks. See **OCTAVE**. The diapason is the first and most perfect of the concords; if considered simply, it is but one harmonical interval; though, if considered diatonically, by tones and semitones, it contains seven degrees, *viz.* the three greater tones, two lesser tones, and two greater semitones.

The interval of a diapason, that is the proportion of its grave sounds to its acute is duplicate, *i. e.* as 2:1. See the articles **INTERVAL**.

**DIAPASON**, among the musical instrument makers, a kind of rule or scale, whereby they adjust the pipes of their organs, and cut the holes in their flutes, hautboys, &c. in due proportion, for performing the tones, semitones, and concords just.

A square being divided into eight parallelograms, the points wherein a diagonal line intersects all these parallelograms, express all the usual intervals in music: and on this principle it is that the diapason is founded. There is a particular kind of diapason for trumpets serving as a standard of the different magnitudes they must have to perform the four parts of music. See the article **TRUMPET**.

There is another for sackbuts, shewing how far they are to be lengthened and shortened, to raise or fall from one tone to another.

The bell-founders have likewise a diapason, serving to regulate the size, thickness, weight, &c. of their bells.

**DIAPASON DIAEX**, in music, a kind of compound concord, whereof there are two sorts; the greater, which is in the proportion of 10:3; and the lesser, in that of 16:5.

**DIAPASON DIAPENTE**, in music, a compound consonance in a triple ratio, as 3:9. This interval, says Martianus Capella, consists of nine tones and a semitone; nineteen semitones, and thirty-eight dieses. It is a symphony made when the voice proceeds from the first to the twelfth sound.

**DIAPASON DIATESSARON**, in music, a compound concord, founded on the proportion of 8:3. To this interval Martianus Capella allows eight tones and a semitone, seventeen semitones, and thirty-four dieses.

This is when the voice proceeds from its first to its eleventh sound. The moderns would rather call it the eleventh.

**DIAPASON DITONE**, in music, a compound concord, whose terms are as 10:4, or 5:2.

**DIAPASON SEMIDITONE**, in music, a compound concord, whose terms are in the proportion of 12:5.

**DIAPEDESIS**, in medicine, a transfusion of the fluids through the sides of the vessels that contain them, occasioned by the blood's becoming too much attenuated, or the pores becoming too patent.

**DIAPENSIA**, in botany, a genus of the *pentandria-monogynia* class of plants, the flower of which consists of one saucer-like petal, the tube being cylindrical, and the limb divided into five obtuse and plane segments; the fruit is a trilocular roundish capsule, containing a great many roundish seeds.

**DIAPENTE**, in the ancient music, an interval marking the second of the concords; and, with the diatessaron, an octave. See the article **DIATESSARON**. This is what in the modern music is called a fifth. See the article **FIFTH**.

The diapente is a simple concord; yet, if considered diatonically, it contains four terms; two greater tones, a less tone, and a greater semitone. The diapente is the greatest part of the octave harmonically divided. It is produced when the voice passes from its first to its fifth sound.

**DIAPENTE COL DITANO**, in music, is, by Zarlino, and many others, used for what we call the seventh major. See the article **SEVENTH**.

**DIAPENTE COL SEMIDITANO**, in music, is the seventh minor. See the articles **MINOR** and **MAJOR**.

**DIAPENTE**, in pharmacy, is used for a medicine compounded of five several drugs or ingredients.

**DIAPERED**, or **DIAPRE'**, in heraldry, the dividing of a field in planes, like fretwork, and filling the same with variety of figures. This chiefly obtains on bordures, which are diapered or fretted over, and the frets charged with things proper for bordures. Baron renders it *variatus*, which is not sufficient to express the several things of which it is variated.

**DIAPHANOUS**, an appellation given to all transparent bodies, or such as transmit the rays of light; a quality which, according to the cartesianians, is owing to the rectitude or straightness of their pores; but,

but, according to Sir Isaac Newton, to the homogeneity of the substance of these bodies, and of the medium which occupies their pores.

**DIAPHOENICUM**, in pharmacy, a sort of medicine or electuary chiefly made of dates. It purges serosities, and excites the menses. It is also used in dropsies, lethargies, apoplexies, and palsies.

**DIAPHORESIS**, *διαφροσις*, in medicine, an elimination of the humours in any part of the body through the pores of the skin. See the article PERSPIRATION.

**DIAPHORETICS**, among physicians, all medicines which promote perspiration. See the article ALEXIPHARMIC.

**DIAPHRAGM**, in anatomy, a large, robust, muscular membrane or skin, placed transversely in the trunk, and dividing the thorax from the abdomen, whence the latin writers call it *septum transversum*.

Its situation is not exactly even, but somewhat oblique, so that the anterior part is higher, the posterior lower; its upper superficies convex, and its lower concave. It is connected with the sternum, the spurious ribs, the pericardium, the mediastinum, and the vertebrae of the loins. Its figure, taken transversely, is somewhat oblong and elliptic. There are in the diaphragm two large foramina; the first is in the left side of it, and gives passage to the gula, and the par vagum; the second is in the right side of it, and the lower trunk of the vena cava passes thro' it: there is also an interstice between the two heads of the lower part, through which pass the aorta, the vena azygos, and the ductus thoracicus. The diaphragm is covered with a membrane on the upper part from the pleura; on the lower, from the peritonæum. Its substance is muscular: the upper part, which is large and elliptic, arises from the spurious ribs, the transverse muscles of the abdomen, and the cartilago xiphoides; and, with its tendon, renders the nervous center of the diaphragm almost triangular: the lower arises from a double base, from the vertebrae of the loins on each side, and is inserted nearly into the center of the superior.

The uses of the diaphragm are, first, to assist in respiration; for, in taking in the breath, it is pressed downwards, and, in expiration, it rises upward into the cavity of the thorax: secondly, to assist the necessary motions of the contents of the abdomen, *viz.* of the stomach, intestines,

liver, and spleen; and in the promoting the secretions of the chyle, bile, &c. And, lastly, for assisting the expulsion of the feces, the urine, the foetus in parturition, and of the secundines.

**DIAPORESIS**, in rhetoric, a figure of oratory, expressing the uncertainty of the speaker how he shall proceed in his discourse: such is that beautiful line of Homer,

*Τι πρῶτον, τι δ' ἐπεῖτα, τι δ' ὕστατον καταλέξω;*

**DIAPRE**, **DIAPERED**, in heraldry. See the article DIAPERED.

**DIAPRUNUM**, in pharmacy, the name of two compositions directed thus in the London dispensatory.

The *diaprunum lenitivum*: Take of new and ripe damask prunes, one hundred; boil them in a sufficient quantity of water, till they are soft: then remove them from the fire, and when cold, drive the pulp through a sieve, and set by for use. In the liquor strained from the prunes, before pulping, boil one ounce of violet flowers, and after straining again, dissolve in it two pounds of sugar, and boil into a syrup; to which add of the before-mentioned pulp half a pound; of cassia and tamarinds, dissolved in a little of the same decoction and pulped, of each one ounce; boil them again over a gentle heat, and frequently stir the mixture; after which sift in the following powders, of coriander-seed, rhubarb, liquorice, and marsh-mallow roots, of each a sufficient quantity to make into a soft electuary.

The *diaprunum solutivum*: Take of the lenitive composition of prunes, four pounds; of prepared scammony, two ounces five drams, and mix them together into an electuary.

**DIARBEC**, or **DIARBECK**, the capital of a province of the same name, answering to the ancient Mesopotamia: it is situated on the river Tigris, near its source, in 42° east long. and 37° 30' north lat.

**DIARRHODON**, in pharmacy, a name given to divers compositions in which roses are the principal ingredient. In the old college dispensatory, one of these is directed *diarrhodon abbatis*; but it is omitted in the last. There are also the trochisci diarrhodon, composed of red roses, shavings of ivory, the saunders, liquorice, mastic, saffron, camphor, and rose-water: they are good to fortify the heart, stomach, and liver, and to stop dysenteries, and other fluxes of the belly.

Pilule diarrhodon are composed of aloes, 6 A trochisci

trochisci diarrhodon, worinwood leaves, mastic, and rock-salt. They are said to purge, fortify the stomach, promote digestion, and prevent a stinking breath. Neither are these too much used at present.

**DIARRHOEA, or LOOSENESS**, in medicine, is a frequent and copious evacuation of liquid excrement, by stool; and may proceed from aliments or humours of various kinds, derived from different parts into the intestines.

The cause is a stimulus, which irritates the viscera, occasioning the expulsion of their fluids; and may, therefore, proceed from the vessels of the liver, pancreas, mesentery, and intestines; whence, at the same time, the mouths of the mesenteric veins, and of the lacteals, are obstructed: or there may be an extraordinary laxity of the intestinal fibres: or, lastly, it may arise from a stoppage of other excretions.

It is frequently attended with gripings; the patient is weak, makes but little urine, has a depressed pulse, a depraved appetite, and is sometimes feverish. In a diarrhoea arising from sharp, fermenting juices in the primæ viæ, which accelerate the peristaltic motion of the intestines, the first indication is to discharge the stimulating matter, which may be perfected by a dose or two of rhubarb in the morning; at night the patient may take fifteen drops of the thebaic tincture, in two or three spoonfuls of simple cinnamon water: the rhubarb is to be repeated till the looseness abates, which is generally after the second dose.

If there is a saburra of ill-concocted matter in the stomach, a vomit will be necessary, of ipecacuanha, or two ounces of its tincture. If the diarrhoea continues to be violent, it will be proper to mix astringents with the rhubarb. If it proceeds from a suppressed perspiration, and if the stools are thin, and the patient feverish, first bleed, and then give emetics with a gentle purge. A bilious diarrhoea ought not to be too suddenly stopped, but the humours are to be corrected gradually: for which purpose, a scruple of rhubarb slightly toasted, with a few grains of nitre, is very useful. Likewise half a dram of the expressed oil of nutmeg, either alone, or mixed with a grain of opium, and given in broth, is very efficacious. The humours are likewise corrected with thin emulsions of almonds and white poppy seeds, with the addition of diacodium. When a diarrhoea is

very obstinate, after toasted rhubarb has been given for some days, a sweat should be promoted, with a dram of new venice treacle, and twelve grains of burnt hartshorn, calx of antimony and purified nitre. The patient's common drink may be decoct. alb. with solution of gum arabic; rice boiled in water, with a little cinnamon; or a decoction of the cort. granat. these may be made palatable with syrup of orange-peel. Clysters are likewise often serviceable.

An obstinate diarrhoea, according to Et-muller, is to be cured by a course of vomits of ipecacuanha. An habitual diarrhoea is greatly relieved by wearing a flannel shirt, and keeping the body warm, according to Wainwright.

The diarrhoea of children is not to be stopped, either with astringents, or narcotics: for the astringents turn the flux of sharp humours towards the noble parts, and endanger the life of the child. And though narcotics appease the severity of the turgescent humours for a time, yet they afterwards break out with greater force. Besides, opiates are too powerful for the tender constitution of infants, and must not be given at all, or with the utmost caution. In slight cases, diascordium may be ventured on, to five or six grains: but if there is a fever, it cannot be given without danger.

Therefore, the best way is to give chalk, coral, pearls, and the like, of which about half a scruple is a dose: after which the cure may be completed with rhubarb, from six grains to half a scruple in solution of syrup of roses.

In dangerous cases, a few grains of the eleuther bark may be added, or a dram of the extracts of peruvian bark may be dissolved in half an ounce of mint, or cinnamon water, and given from one to nine drops, every three or four hours. Externally the abdomen may be anointed with expressed oil of nutmegs, impregnated with carminative and stomachic oils. The nurse should shun the cold air, abstain from drinking too much, and use a temperate diet.

**DIARTHROSIS**, in anatomy, a kind of articulation, or juncture of the bones, in which there is a manifest motion. See the article **ARTICULATION**.

The diarthrosis comprehends, 1. The enarthrosis, in which the head of one of the bones is received into a deep cavity in the other, as in the articulation of the femur. 2. The arthrodia, in which the

head

head of one of the bones is received into a slighter cavity in the other, as in the juncture of the os humeri with the scapula. 3. The ginglymus, in which the bones mutually receive, and are received by one another, as is the case in the articulation of the humerus and cubitus. To these, Fallopius adds the trochoides, in which the motion is like that of a wheel about its axis, as is the case of the articulation of the first vertebra of the neck with the second: and to all these some of the modern anatomists have added also the amphiorthisis, a term which comprehends all those junctures of the bones which have a manifest motion, and which differ from the several articulations now described, either in regard of their figure, or the motion they allow of. See the articles ENARTHROSIS, ARTHRODIA, GINGLYMUS, &c.

**DIARY**, among traders, denotes a day-book containing the proceedings of one day. See the article **BOOK**.

**DIARY FEVER**, the same with an ephemera. See the article **EPHEMERA**.

**DIASCHISM**, διασχιζμα, among musicians, denotes the difference between the comma and enharmonic diesis, commonly called the lesser comma. See the articles **COMMA** and **DIESIS**.

**DIASCORDIUM**, in pharmacy, a celebrated composition so called from scordium, one of its ingredients. It is otherwise termed *confectio fraxastorii*, and is thus directed by the college.

Take of cinnamon and cassia-wood, of each half an ounce; of true scordium, one ounce; of cretan dittany, tormentil, bistort, galbanum, and gum-arabic, of each half an ounce; of storax, four drams and an half; of opium, and seeds of sorrel, of each one dram and an half; of gentian, half an ounce; of american bole, one ounce and an half; of lemnian sealed earth, half an ounce; of long pepper and ginger, of each two drams; of clarified honey, two pounds and a half; of sugar of roses, one pound; of generous canary, eight ounces; make into an electuary. See the article **ELECTUARY**. It is excellent in all kinds of fluxes, and a great strengthener both of the stomach and bowels. Nurses frequently give children this medicine to make them sleep; but the practice is very detrimental, and generally the cause of many disorders, as it keeps them too costly. It is also used against the plague, and to prevent putrefaction.

**DIASEBESTEN**, in pharmacy, a soft purgative electuary, whereof sebestens are the principal ingredients. The other ingredients are prunes, tamarinds, juices of iris, anguria and mercurialis, penidies, simple diaprunum, violet seeds, and diagyridium. It is good in remitting and continued fevers, &c.

**DIASENNA**, in pharmacy, the name of a medicine in which senna is the principal ingredient.

The other ingredients are sugar-candy, cinnamon, lapis lazuli, silk, cloves, galanga-minor, black pepper, nardus indica, seed of basilicum, flowers of cloves, cardamoms, saffron, ginger, zeolary, &c. This electuary is taken against melancholy and spleen, and against diseases arising from an atrabilis.

**DIASIA**, in grecian antiquity, a festival kept at Athens in honour of Jupiter the propitious.

**DIASIASIS**, a term used by antient physicians for a distention of the muscles, or separation of the bones.

**DIASTEM**, διαστημα, among antient musicians, the same with what the moderns call interval. See **INTERVAL**.

Musicians divide intervals into two kinds; one of them is called system, which is to contain, at least, two intervals in the diatonic kind of music; but in the enharmonic, it contains more: the other, which they call diastem, is a mere simple interval.

**DIASTOLE**, διαστολη, among physicians, signifies the dilatation of the heart, auricles, and arteries; and stands opposed to the systole, or contraction of the same parts. See **SYSTOLE** and **HEART**.

Many are the opinions of authors concerning the cause of the diastole of the heart; but the most probable one seems to be that of Dr. Drake, who attributes it to the operation of the air in the lungs; which, expanding the pulmonary arteries and veins, acts like the drawing of the embolus of a pump; and as this enlargement, which is very considerable, makes way for the blood to circulate, so the contraction of the heart acts like the pressure of the atmosphere upon the surface of water, compelling it to flow where the resistance is least. See **CIRCULATION**. Thus a passage is opened for the blood to pass from the right ventricle to the left, through the lungs; and at the same time, by emptying the right ventricle, facilitates the systole, whereby the blood is protruded from the left ventricle.

**DIASTOLE**, in grammar, a figure of prosody, whereby a syllable naturally short is made long : such is the first syllable of Priamides, in the following verse of Virgil.

*Atque hic Priamides : nihil è tibi, amice, relictum.*

This figure is used either out of mere poetic licence, without any necessity for so doing, or through necessity, for the sake of the verse ; as when three or more short syllables follow each other in hexameter verse.

**DIATYPE**, in the antient architecture, an edifice, where the columns stand at such a distance one from another, that eight modules, or four diameters, are allowed for the intercolumniation.

**DIASYRMUS**, *διασυρμος*, in rhetoric, a kind of hyperbole, being an exaggeration of some low, ridiculous thing.

**DIATESSARON**, *διατεσσαρον*, among antient musicians, a concord, or harmonical interval, composed of a greater tone, a less tone, and one greater semi-tone : its proportion in numbers is as 4 : 3. See the article CONCORD.

**DIATESSARON**, in pharmacy, the name of a composition so called, from the four ingredients it comprehends : it is prepared thus.

Take of gentian root, bay-berries, myrrh, and roots of birthwort, of each two ounces ; of honey, two pounds ; mix them into an electuary. This, with the addition of the shavings of ivory, two ounces, is entitled *diapente*, or a composition of five ingredients.

This medicine was at first entered in the college dispensatories under the name of *theriaca*. Quincy recommends it as a medicine of great importance in the diseases of cattle. It is also used against the sting of venomous beasts, epilepsies, convulsions, &c.

**DIATONIC**, an epithet given to music, as it proceeds by tones and semi-tones, both ascending and descending. See the article MUSIC and GENUS.

The greek authors divide the genera or kinds of music into diatonic, chromatic, and enharmonic. See CHROMATIC and ENHARMONIC.

Diatonic music, according to Nicomachus and others, allows of three degrees, the greater tone, less tone, and semi-tone. See the article TONE.

Hence diatonic music appears the most natural, and of consequence the most ancient. In the diatonic music, there is a

tone between every two notes in the scale, except *mi, fa*, and, as the French term it, *si* and *ut*, where there is only a greater semi-tone. The diatonic genus was by the antients divided into two species, the *molle*, and the *intensum*. The last is in daily practice. It is commonly said to consist of two tones and a semi-tone ; but to speak exactly, it consists of a semi-tone major, a tone minor, and a tone major.

**DIATONICO-DIATONICO**, according to Zarlino, is the pure and natural diatonic genus, or when the progress of the notes is B quarré or B natural, in which not one of the sounds is the least altered. Such is the plain chant of the church.

**DIATRAGACANTH**, in pharmacy, a name applied to certain powders, whereof gum tragacanth is the principal ingredient ; of which there are two kinds, the cold and the hot : the cold is directed thus : take of gum tragacanth, two ounces ; of gum arabic, an ounce and two drams ; of starch, half an ounce ; of liquorice, and the seeds of melons and white poppies, of each two drams ; of sugar-candy, three ounces ; mix them into a powder. This is frequently prescribed in hectic heats, in choleric constitutions, in distempers of the breast, in stranguries, heat of urine, and the pungency of venereal gleet.

Powder of hot diatrachanth is composed of gum tragacanth, cinnamon, hyssop, almonds, linseed, fenugreek, liquorice, and ginger. It is good against asthma, to promote expectoration, strengthen the stomach, and assist digestion.

**DIAUGOPHRAGMIA**, in natural history, a genus of fossils of the order of septariæ, whose partitions, or septa, consist of spar with an admixture of crystal. Of this genus there are three species. 1. A red kind, with brownish-yellow partitions. 2. A brownish-yellow kind, with whitish partitions. 3. A bluish-white kind, with straw-coloured partitions.

**DIAULODROMI**, *διαυλοδρομοι*, in antiquity, an appellation given to such racers as passing round the meta, or goal, returned to the carcer, or place of starting, before the race was finished.

**DIAZEUCTIC**, or **DIEZEUCTIC TONE**, in the antient greek music, a tone which disjoined two fourths, one of each side of it ; and which, being joined to either, made a fifth : this, in their music, was from *meze* to *parmeze* ; that is, from our A to B ; supposing *mi* to stand in B *fa* *mi*,

*2*; they allowed to their diezeugdic tone, which is our *la mi*, the proportion of 9 : 8, as being the unalterable difference of the diapente and the diatessaron. See the article **DIAPENTE**, &c.

**DIBBLE**, among gardeners, the name of the tool, or forked stick, wherewith they set plants.

**DICE**, among gamesters, certain cubical pieces of bone or ivory, marked with dots on each of their faces, from one to six, according to the number of faces.

Sharpers have several ways of falsifying dice. 1. By sticking a hog's bristle in them, so as to make them run high or low, as they please. 2. By drilling and loading them with quicksilver; which cheat is found out by holding them gently by two diagonal corners; for if false, the heavy sides will turn always down. 3. By filing and rounding them. But all these ways fall far short of the art of the dice-makers; some of whom are so dextrous this way, that your sharpening gamesters will give any money for them.

Dice formerly paid 5 s. every pair imported, with an additional duty of 4 s. 9  $\frac{1}{2}$  d. for every 20 s. value upon oath; but are now prohibited to be imported.

**DICHORÆUS**, in antient poetry, the same with a double choræus. See **CHORÆUS**.

**DICHOTOMY**, a term used by astronomers for that phasis, or appearance of the moon, wherein she is bisected, or shews just half her disk. In this situation the moon is said to be in a quadrature aspect, or to be in her quadrature.

**DICHOTOMY**, in botany, a term used to express that division of the branches which we see in the mistletoe, and in the greater part of the sea fucus's, in which each branch is divided into two.

**DICHOTOPHYLLUM**, in botany, a name used by Dillenius for the ceratophyllum of Linneus. See the article **CERATOPHYLLUM**.

**DICKER**, *dicra*, in old writers, denotes the quantity of ten hides of skins, whereof twenty made a last: also ten pair of gloves, ten bars of iron, and the like, are sometimes expressed by the term dicker.

**DICROTUS**, a name given by antient naturalists to a deer in its third year. See the article **DEER**.

**DICROTUS**, among antient physicians, a rebounding pulse, or one which beats double. See the article **PULSE**.

This is said to be an infallible sign of an approaching hæmorrhage; which may

be expected in twenty-four hours, if the dicrotus happens at every second or third pulsation; in two days, if at every eight; in three days, if at every sixteenth; and in four days, if only at every thirtieth, or thirty-second pulsation.

**DICTAMNUS**, **DITTANY**, in botany, a genus of the *decandria-monogynia* class of plants, the corolla of which consists of five ovato-lanceolated, acuminate, unguiculated, and unequal petals; three of which are turned upwards, and two are placed obliquely at the sides: the fruit is composed of five capsules, growing together by their insides; they are compressed, acuminate, distant at the top, and formed of two valves: the seeds are numerous, and turbinate. See plate **LXXII.** fig. 5.

The antients have recorded almost miracles of the virtues of this plant in the cure of wounds, and in the prevention of mischief from venomous bites: they tell us, that even the beasts were informed of its virtues on these occasions, and had recourse to it when hurt: they gave it also to promote the menses, and to assist delivery, in the expelling of the secundines, and in malignant fevers: with us it is wholly out of use, except as an ingredient in some of the officinal compositions.

The white dittany-root, which we call *fraxinella* in the shops, is accounted cardiac, uterine, and alexipharmic.

**DICTATE**, *dictamen*, among schoolmen, a motion, or suggestion of a man's conscience, contrary to which if any action is performed, it is properly termed a bad one, even if the consequences should prove otherwise. See **CONSCIENCE**.

**DICTATE**, *dictata*, is also used in the schools for the lecture of a master, which the scholars take down in writing: whence this act of the master is termed dictating.

**DICTATOR**, in the policy of the antient Romans, a magistrate invested with sovereign and even arbitrary power.

He had power of life and death; also to raise or disband troops, make war or peace, and that without the consent either of the senate or people, or being accountable for his proceedings. He was elected by one of the consuls in the night-time on the frontiers of the commonwealth, and no where else; and the ordinary duration of his office was only for six months, during which time all other magistracies ceased, the tribuneship excepted.

cepted. Whenever he appeared in public, he was attended by twenty-four licitors, or double the number allowed a consul. However, notwithstanding all this power, he could not go out of Italy, or even ride on horseback during a march, without leave from the people.

This office was accounted the safeguard of the commonwealth for four hundred years together, till Sylla and Cæsar, by assuming the title of perpetual dictators, converted it into tyranny, and rendered the very name odious.

**DICTION**, the phrase, elocution, or style of a writer, or speaker.

It is required that the diction, or language, of an orator, should be pure, proper to the subject, rich without affectation, strong and close without drineis, and suitable to the person, time, place, and audience. In tragedy, the diction is accounted the fourth essential part; and though it is of the least importance of any of the other essentials, yet special care must be taken that every passion speak in its peculiar diction. It is observed, that the diction of the Italians abounds too much with shrewd words, querks, and quibbles; and even the French are charged with the like fault in their diction. Some authors are, again, thought so preposterously fond of jocose and facetious repartees, and ludicrous sentences, that they have indulged this affectation to a fault; whence arose that sort of diction commonly called burlesque, of which the French have afforded us a specimen in the works of the celebrated Scarron.

**DICTIONARY**, a collection, or catalogue, of all the words of a language, art, science, &c. with their explanations, ranged in alphabetical order.

The most antient dictionaries for the latin tongue, are that called Papias, compiled by Solomon, abbot of St. Gall, and bishop of Constance, who lived about the year 1409; another compiled in 1496, called *Gemma Vocabulorum*; a third, called *Promptorium Parvulorum*, five Clericorum, printed in folio, at London, in the year 1499, by Richard Pynson: this work consisted only of one part, which exhibited the english words before the latin, being destitute both of the latin and historical parts: but these defects were supplied by a dictionary which was printed at London in quarto in the year 1616, by Wynkyn de Worde, entitled, *Ortus Vocabulorum alphabetico ordine*

*fere omnia quæ in Catholico, Brevisloquio, Cornucopia, Gemma Vocabulorum, atque medulla grammaticæ ponuntur, cum vernaculæ linguæ Anglicanæ expositione, continens.* The most celebrated old latin dictionary, is that of Ambrose Calepine, a hermit of St. Augustine, at Bergamo, and son of the count Calepin. The most noted old dictionaries in english and latin, are those of Cooper, Holyoake, and Gouldman: among the modern ones, Littleton, Cole, &c. but that of Ainsworth merits most consideration, as being agreeable to its title, *Thesaurus linguæ Latinæ compendarius*. The last editions of this book have been greatly improved by Samuel Patrick, L. L. D.

For the Greek, the most noted dictionaries are those of Stephens, Scapula, Schrievelius, Hedericus, &c. The most celebrated historical dictionary is that of Mr. Bayle, in two volumes folio, entitled, an historical and critical dictionary. The philosophical dictionary of greatest note, is that of Chauvinus; for commerce, that of Savary; for law, those of Calvinus and Jacob; and among the dictionaries of arts and sciences, may be reckoned those of Harris, Chambers, and Barrow.

In the French, the most worthy of notice among works of this nature, are the dictionary of Trevoux, and the *Encyclopedie*, of which last only three volumes in folio have yet appeared.

A performance of this kind being a digest of the body of learning, or, rather, of general knowledge, is thought capable of being made universally useful and instructive; and as the objects of our knowledge grow daily more numerous, and improvements in arts and sciences are continually made, a work of this kind is continually capable of new improvements. It is farther advanced, that, besides preventing, in some measure, the necessity and expence of a multitude of books, which too frequently retard rather than promote, and bewilder rather than guide in the pursuit of knowledge, there is no form or method of writing so advantageously disposed to propagate knowledge through the body of a people, or that can be made to comprehend so great a part of the circle of learning, and so well answer the purposes of a library, as a dictionary of this nature. The writers of a dictionary of arts and sciences, are exempted from the observation of certain laws concerning property; never pre-  
tending

tending to build upon their own foundation, or treat at their own expence, being privileged to raise contributions for the public service wherever they can. In effect, their quality as dictionaryists, or collectors, give them a title to every thing that may suit their purpose, without rendering them liable to the imputation of plagiarism. See more relating to the nature, character, and office of a dictionary, in the introduction.

**DICTUM**, in our old writers, signifies an arbitrament or award; and hence the term *dictores* is used for arbitrators.

**DICTUM DE KENELWORTH**, was an award between king Henry III. and his barons and others who had been in arms against him, wherein was contained a composition of those that had forfeited their estates in the rebellion. It was so called, on account of its being made at Kenelworth castle in Warwickshire.

**DIDACTIC**, or **DIDACTICAL**, in the schools, signifies the manner of speaking, or writing, adapted to teach or explain the nature of things.

**DIDAPPER**, in ornithology, the same with the *dob-chick*, a species of *colymbus*.

**DIDELPHIS**, in zoology, a genus of quadrupeds, of the order of the *glires*, the characters of which are these: there are two obtuse and four conical fore-teeth in the upper jaw; those of the lower jaw are eight, and very small; and the dog-teeth, in each jaw, are three in number. To this genus belong the opossum, and african rat, called by some *hayopolin*. See **OPOSSUM** and **HAYOPOLIN**.

**DIDYNAMIA**, *διδυναμία*, in the linnæan system of botany, a very comprehensive class of plants, the fourteenth in order; the essential characteristic of which is, that there are four subulated stamina, inserted into the tube of the flower, two whereof are shorter than the others, and placed together; the antheræ being commonly hid under the upper lip of the flower, and connivent in pairs. It has its name from the two longer stamina being supposed more efficacious in fecundating the seeds, than the rest; and as the genera belonging to it are very numerous, they have been divided into two series or orders, under the names of *gymnospermia* and *angiospermia*; the latter having, and the former wanting a pericarpium, or seed-vessel. See the article **BOTANY**.

To this genus belong *baum*, *germander*, *lavender*, *thyme*, *betony*, *mint*, *basil*, *fox-glove*, *bear's-breech*, &c.

**DIE**, in architecture, the same with *dye*. See the article **DYE**.

**DIE**, in geography, a town of France, in the province of Dauphiny, situated on the river Drome, twenty-two miles south of Grenoble: east long.  $5^{\circ} 20'$ , north lat.  $44^{\circ} 50'$ .

**DIEBEL**, in ornithology, a name given to the *chub*. See the article **CHUB**.

**DIEGEM**, a town of the austrian Netherlands, in the province of Brabant, about three miles north of Brussels: east long.  $4^{\circ} 20'$ , and north lat.  $51^{\circ}$ .

**DIEM CLAUSSET EXTREMUM**, a writ that formerly issued out of the chancery to the escheator of the county, upon the death of any of the king's tenants in capite, to inquire by a jury of what lands he died seised, of what value, and who was the next heir to him: and on the heir's coming of age, he was to sue livery of his land out of the king's hands.

**DIEPE**, a port-town of France, situated on the british channel, about thirty miles north of Rouen, and opposite to the port of Rye in England: east long.  $1^{\circ} 15'$ , and north lat.  $49^{\circ} 55'$ .

**DIEPHOLT**, a city of Westphalia, in Germany, situated at the north end of the Dummer-lake, thirty-five miles south of Bremen: east long.  $8^{\circ}$ , north lat.  $53^{\circ}$ . It is subject to the king of Great Britain, as elector of Hanover.

**DIER**, or **DYER**. See the article **DYER**.

**DIERVILLA**, in botany, a genus of the *pentandria-monogynia* class of plants; the flower of which is monopetalous, with an almost bilabiated limb, whereof the upper lip is again divided into two, and the under one into three segments: the fruit is an oval capsule surrounded by the cup, with only one cell, wherein are contained a great many very small oval seeds.

**DIES**, **DAY**, in chronology. See the article **DAY**.

**DIES**, in common law, are of two kinds, *dies juridici*, and *non juridici*.

**DIES JURIDICI**, or **FASTI**, are all days wherein justice is administered in court.

**DIES NON JURIDICI**, or **NEFASTI**, are all Sundays in the year, and, in easter term, the feast of ascension of our Lord; in trinity term, the nativity of St. John the baptist; in michaelmas term, the feast of all saints and all souls; and in hilyary term, the purification of the blessed virgin.

**DIES DATUS**, is a day, or time of respite, given by the court to the defendant in a cause.

**DIES MARCHIÆ**, was the day of congress, or meeting of the English and Scotch, annually appointed to be held on the marches, or borders, in order to adjust all differences between them.

**DIESIS**, in music, is the division of a tone less than a semi-tone; or, an interval consisting of a less or imperfect semi-tone.

Diesis is the smallest and softest change or inflexion of the voice imaginable: it is called a feint, expressed thus X, by a St. Andrew's cross, or saltier. Aristotle calls dieses the elements of the voice, as letters are those of discourse. It appears, however, that Aristotle's dieses were different from ours; and we find Vitruvius; and all the greek authors, expressly make the diesis a quarter of a tone: but the Pythagoreans, who are held inventors of the name diesis, did not make it so small: they only divided the tone into two unequal parts; and they called the lesser diesis, which we call a lesser semi-tone; and the greater, which we call the greater semi-tone, they called apotome. See the article **APOTOME**.

But in aftertimes, when the tone came to be divided into three or four parts, the name diesis was retained to them all.

The harmonical diesis is the difference between a greater and a less semi-tone. Dieses are divided into three kinds; the lesser enharmonical diesis, or simple diesis, marked by a single cross, which raises the note following two commas, or about a quarter of a tone, and is the least interval that is sung; and never more than two are found together in whatever genus; nor are those two of the same kind. The chromatic or double diesis, denoted by a double cross, raises the note following by a lesser semi-tone, or four commas, which is the common diesis. The greater enharmonical diesis, denoted by a triple cross, raises the following note six or seven commas, or about three quarters of a tone.

**DIEST**, a town of the austrian Netherlands, in the province of Brabant, situated on the river Demer, fifteen miles north-east of Louvain: east long.  $5^{\circ}$ , and north lat.  $51^{\circ} 5'$ .

**DIET**, *dieta*, *diæta*, in medicine, according to some, comprehends the whole regimen, or rule of life, with regard to the six non-naturals, air, meats and drinks, sleep and watching, motion and rest, passions of the mind, retentions and excretions. See the article **REGIMEN**, &c.

The more accurate writers, however, re-

strain the term diet to what regards eating and drinking, or solid aliments and drinks. See **FOOD** and **DRINK**.

The principal and most general aliment is bread, whereof the crust is esteemed most easy of digestion, the crum being more oily and heavy. Pulse of all kinds nourish much, but are heavy, windy, and viscous, and, consequently, are apt to cause obstructions. Rice, barley, and oats, properly prepared, are nourishing, emollient, and restorative. Nuts, almonds, and chefnuts are full of a nourishing oil, but are hard of digestion. Fruits, which are pulpy and tart, abound with water, and are refreshing, moistening, and sedative, appeasing the too rapid motions of the blood, quenching thirst, and digesting easily: such are strawberries, gooseberries, currants, apricots, peaches, pears, and apples. These should be eaten ripe, and in a small quantity at once; and the best way of all is to eat them boiled or baked, as being windy. Pot-herbs are less nourishing than the farinaceous or mealy substances. Lettuce, succory, sorrel, purslain, are cooling and refreshing; artichokes, cellery, cresses, asparagus, and parsley, are a little heating; and truffles, champignons, garlic, shallots, pepper, cloves, nutmegs, mustard, &c. heat very much.

Of animal substances used in diet, the flesh of young animals is preferred to that of old ones; and the flesh of wild animals is said to be lighter, and more easily digested, than that of tame.

Liquid aliments are milk, eggs, chocolate, soups, and broths. Milk is good for weak persons, whose stomach is languid; and for children new-laid eggs yield very good nourishment, are easy of digestion, and agree with old people, and those of an exhausted body. Chocolate is a very agreeable and nourishing liquor: it strengthens the stomach, restores the body, helps the digestion, and softens sharp humours; and consequently is very proper for persons of a weak stomach. See **EGGS**, **CHOCOLATE**, &c.

As to drinks, wine, taken too freely, is prejudicial; but, taken with moderation, it strengthens the stomach, and assists digestion. That malt liquor is accounted best, which is specifically lightest, and not saturated with too gross a substance, as passing more freely through the emunctories of the body, and especially by urine: for as to all thick, muddy, heavy, and stale beer, not sufficiently boiled, it  
offends.

offends the head, generates wind, obstructions, the strangury, asthma, and colic. See WINE, BEER, CYDER, OBSTRUCTION, STRANGURY, &c.

Tea promotes perspiration, strengthens and cleans the stomach, and helps digestion. Coffee, taken after dinner, helps digestion, and allays the fumes of wine. Moderately taken, it thins the blood and humours; but its excess agitates the blood, causes watching, and occasions hæmorrhages.

From this view of the materials of diet, it appears, that the best way to preserve health, is to live upon plain simple foods, lightly seasoned, and in a quantity agreeable to the age, strength of the stomach, sex, constitution, and chiefly to what nature has by experience been found to require. Hunger shews the best time of eating, as thirst does of drinking. Persons who find no inconvenience from dining and supping every day, need not change their manner of life; and, in youth, something taken between meals is not amiss. When a person is much fatigued, and his spirits dissipated, it is proper to rest before eating; and, in cases of distress and sorrow, the food should be very light, and small in quantity. In summer, when the spirits and fluid parts are apt to evaporate, the diet should be moist, cooling, and easy of digestion, to repair the loss with the greater speed; whereas, in winter, the stomach will admit of more solid and heating aliments. See the articles DIGESTION, FLESH, FRUIT, BUTTER, MILK, &c.

**DIET-DRINKS**, a form in physic, including all the medicated wines, ales, and wheys, used in chronic cases. They require a course or continuation to answer any intention of moment. In all acute cases they are of no use, but where the disorder of a constitution is gradually to be gained upon, much help may be had from this quarter.

**DIET**, or **DYET**, in matters of policy, is used for the general assembly of the states, or circles of the empire of Germany, and of Poland, to deliberate and concert measures proper to be taken for the good of the public.

The general diet of the empire is usually held at Ratisbon: it consists of the emperor, the nine electors, and the ecclesiastical princes; viz. the archbishops, bishops, abbots, and abbesses; the secular princes, who are dukes, marquesses, counts, viscounts, or barons; and the re-

presentatives of the imperial cities. It meets on the emperor's summons, and any of the princes may send their deputies thither in their stead. The diet makes laws, raises taxes, determines differences between the several princes and states, and can relieve the subjects from the oppressions of their sovereigns.

The diet of Poland, or the assembly of the states, consists of the senate and deputies, or representatives of every palatinate or county and city, and meet usually every two years, and oftener, upon extraordinary occasions, if summoned by the king, or, in his absence, by the archbishop of Gnesna. The general diet of Poland sits but six weeks, and often breaks up in a tumult much sooner: for one dissenting voice prevents their passing any laws, or coming to any resolutions on what is proposed to them from the throne. Switzerland has also a general diet, which is usually held every year at Baden, and represents the whole helvetic body: it seldom lasts longer than a month. Besides this general diet, there are diets of the protestant cantons, and diets of the catholic ones; the first assemble at Araw, and are convoked by the canton of Zurich; the second at Lucern, convoked by the canton of that name.

**DIETA**, a term used in old writers for a day's journey.

**DIETETIC**, denotes something belonging to diet, but particularly that part of physic which treats of this subject. See the article DIET.

**DIETS**, a town in the circle of the upper Rhine, in Germany, situated on the river Lohr, twenty miles north of Mentz, and subject to the house of Nassau-Orange: east long.  $7^{\circ} 46'$ , and north lat.  $50^{\circ} 28'$ .

**DIEU ET MON DROIT**, i. e. *God and my right*, the motto of the royal arms of England, first assumed by king Richard I. to intimate that he did not hold his empire in vassalage of any mortal.

It was afterwards taken up by Edward the third, and was continued without interruption to the time of the late king William, who used the motto *je maintiendrai*, though the former was still retained upon the great seal. After him queen Anne used the motto *semper eadem*, which had been before used by queen Elizabeth; but ever since queen Anne, *dieu et mon droit* continues to be the royal motto. See the article MOTTO.

**DIEU SON ACT**, words antiently often used in our law; and to this day, it is a

maxim in law, that the act of God shall prejudice no man : therefore, if a house is blown or beaten down by a tempest, thunder or lightning, the lessee, or tenant for life, or years, shall be quit of an action of waste ; and by the law he has likewise a special interest or liberty allowed to take timber, to rebuild the house for his habitation.

**DIEXAHEDRIA**, in natural history, a genus of pellucid and crystalliform spars, composed of two pyramids, joined base to base, without any intermediate column : the diexahedria are dodecahedral, or composed of two hexangular pyramids. See the article SPAR.

**DIFFAMATORY**, a term chiefly used in the phrase diffamatory libel, signifying a writing intended to scandalize or discredit a person, &c. See LIBEL.

By the roman law, and the antient ordonnances of France, the authors of diffamatory libels were punished with death.

**DIFFARRATION**, in roman antiquity, a ceremony whereby the divorce of the priests was solemnized, or the dissolving of marriage contracted by confarration. See the article CONFARRATION.

Vigeneré will have confarration and diffarration to be the same thing.

**DIFFERENCE**, in logic, signifies an essential attribute belonging to any species that is not found in the genus, and is the universal idea of that species : thus, body and spirit are two species of substance, which contain in their ideas something more than is in that of substance. In a body, we find impenetrability and extension ; in a spirit, a power of thinking and reasoning ; so that the difference of body is impenetrable extension, and the difference of a spirit is cogitation.

**DIFFERENCE**, in mathematics, is the remainder, when one number or quantity is subtracted from another.

It was a fundamental principle among the antient geometers, that the difference of any two unequal quantities, by which the greater exceeds the lesser, may be added to itself till it shall exceed any proposed finite quantity of the same kind. This principle seems inconsistent with the supposition of an infinitely small quantity, or difference, which added to itself by any number of times, is never to be supposed to become equal to any finite quantity whatsoever, which is the foundation of the modern method of infinitesimals : however, this last may, with proper caution, be made useful and accurate.

**DIFFERENCE of longitude**, of two places on the earth, is an arch of the equator, comprehended between the meridians of these two places.

**DIFFERENCE of ascension**. See the article ASCENSIONAL DIFFERENCE.

**DIFFERENCES**, in heraldry, certain additaments to coat armour, whereby something is added or altered to distinguish younger families from the elder.

Of these differences Sylvanus Morgan gives us nine ; *viz.* the label, for the first son ; the crescent, for the second ; the mullet, for the third ; the martlet, for the fourth ; the annulet, for the fifth ; the flower de lis, for the sixth ; the rose, for the seventh ; the eight-foil, for the eighth ; and the cross moline, for the ninth. See LABEL, CRESCENT, &c.

Again, as the first differences are single for the sons of the first house or descent, the sons of the younger house are differed by combining or putting the said differences upon each other. As the first differences are the label, crescent, &c. for the first house, the difference for the second house is the label on a crescent for the first of that house ; for the third brother of the second house, a mullet on a crescent, &c.

The original difference is controverted : Camden will have them to have begun about the time of king Richard : Paradin assigns differences worn as early as the year 870 ; wherein he contradicts the opinion of the president Fauchet, who says, arms were not hereditary in the french families, till after the time of Lewis the great, who came to the crown in the year 1110.

**DIFFERENTIAL CALCULUS**. See the article CALCULUS DIFFERENTIALIS.

**DIFFERENTIAL**, *differentialis*, in the doctrine of logarithms, a term used by Kepler for the logarithms of tangents, which we call artificial tangents. See the articles LOGARITHM and TANGENT.

**DIFFERENTIO-DIFFERENTIALIS CALCULUS**, is a method of differencing differential quantities.

We have observed, under the word calculus, that the differential of a quantity is expressed by the letter *d* prefixed to it, as the differential of *x* is called *dx* ; we are to remark, therefore, in this place, that the differential of *dx*, is *ddx* ; and the differential of *ddx*, is *dddxdx* ; or, as Sir Isaac Newton would express it, *x*, &c. These differentials may be expressed more compendiously thus, *d²x*, *d³x*, &c. whence

when we have powers or degrees of differentials. The differential of an ordinary quantity, is called a differential of the first degree, as  $dx$ . The differential of the second degree, is an infinitesimal of a differential quantity of the first degree, as  $ddx$ ,  $dxdx$ , or  $dx^2$ ,  $dx dy$ , &c. The differential of the third degree, is an infinitesimal of a differential quantity of the second degree, as  $ddd x$ ,  $dx^3$ ,  $dx dy dz$ , and so on.

The powers of differentials are differenced after the same manner as the powers of ordinary quantities: and as compound differentials either multiply or divide each other, or are perfect or imperfect powers of differentials of the first degree, the differentio-differentialis calculus is in effect the same with the differential calculus. See the article CALCULUS DIFFERENTIALIS.

For the use of the differentio-differentialis calculus, see Wolfii Elementa Analysis, par. 2. sect. iv.

**DIFFORM**, *difformis*, an appellation given to things whose appearance is irregular, in contradistinction to uniform. See the article UNIFORM.

It is much used in the description of plants of the *syngenesia* class, or those with compound flowers, when the partial flowers, or smaller floscules, happen to be of different kinds. See the article FLOWER.

**DIFFUSE**, an epithet applied to such writings as are wrote in a prolix manner. Among historians, Salust is reckoned sententious, and Livy diffuse. Thus also among the orators, Demosthenes is close and concise; Cicero, on the other hand, is diffuse.

**DIFFUSION**, the dispersion of the subtle effluvia of bodies into a kind of atmosphere all round them. Thus the light diffused by the rays of the sun, issues all round from that amazing body of fire; and thus are the magnetic particles diffused every where round about our earth, and parts adjacent to it.

The schoolmen make three kinds of diffusion. 1. That by which a pure quality is diffused, as light, force, &c. 2. That performed by the motion of bodies, as the diffusion of sound, smell, magnetic and electric bodies, &c. And, 3. That performed partly by the motion of corpuscles, and partly by the motion of a quality. Thus, say they, fire is diffused.

**DIGAMMA**, a name given to the letter F. See the article F.

**DIGAMY**, the same with bigamy. See the article BIGAMY.

**DIGASTRICUS**, in anatomy, a muscle of the lower jaw, called also biventer. See the article BIVENTER.

Mr. Monro assures us, that the digastric muscles not only pull down the lower jaw, but serve to draw up the os hyoides, and parts annexed to it, in deglutition. See the Medical Essays, vol. I. art. 2.

**DIGEST**, *digestum*, in matters of literature, a collection of the decisions of the roman lawyers properly digested, or arranged under distinct heads, by order of the emperor Justinian. It constitutes the first part or volume of the civil law.

**DIGESTER**, or **DIGESTOR**. See the article DIGESTOR.

**DIGESTION**, in medicine, is the dissolution of the aliments into such minute parts as are fit to enter the lacteal vessels, and circulate with the mass of blood.

Various are the systems and hypotheses framed by physicians and philosophers to account for digestion. Some contend that it is done by a kind of elixation of the solid and grosser parts of the food in the liquid by the heat of the stomach, and of the adjacent parts, the liver, spleen, &c. Others will have it done by attrition, as if the stomach, by those repeated motions, which are the effects of respiration, rubbed off the minuter particles from the grosser matters, and agitating the rest against each other, attenuated and dissolved them. See TRITURATION. Others think the bilious juice, others the spirits, chiefly concerned in digestion.

Others will have the food dissolved by a menstruum; but then they are greatly divided as to the nature and origin of this menstruum; some supposing it an acid furnished by the glands of the stomach; others, a nitro-aerial spirit, which by penetrating the mass of food, breaks the connection of the most solid parts; and others, a saline juice, which divides and volatilizes the parts of the food. Others, again, suppose digestion to be performed by means of a ferment or leaven, which mixing with the aliment, excites an intestine motion in the parts thereof, by which means the parts are attenuated and dissolved. But these likewise differ in their opinion of this ferment; some taking it to be the remains of the food last digested, which by its continuance in the stomach, has contracted an acid quality and become a ferment: others take the principles of fermentation to be contained in the ali-

ment itself, which when inclosed in the stomach, heated there, and put in motion, enters on its office of fermentation: others suppose the matter of the ferment supplied by the glands of the stomach; and lastly, others contend for the saliva, and make that the ferment serving principally for the digestion of the food. See the article FERMENTATION.

Some suppose digestion owing to gentle heat and motion. By this heat and motion, say they, the texture of the nourishment is changed in the bodies of animals; and then the constituent solid parts are indued with peculiar attractive powers of certain magnitudes, by which they draw, out of the fluids moving through them, like parts in certain quantities, and thereby preserve their forms, and just magnitudes. And, to mention no more, Boerhaave very justly, in our opinion, ascribes digestion to the joint action of several of the above-mentioned causes, aided by the expansion of the air contained in the aliments. See the articles CHYLE, CHYLIFICATION, BLOOD, &c. MASTICATION, NUTRITION, &c.

**Dysentery**, a disease attended with pain, and a sense of weight with cructations and copious flatulencies from corrupt humours in the stomach. See APEPSY.

It generally arises from a bad diet, particularly from eating too plentifully, especially fat and oily aliments, with a sedentary life and idleness. When the humours are corrupt, after a vomit, laxatives should be used: afterwards with a spare diet, stomachics and strengtheners, with exercise, and abstinence from studies. The use of spaw, or chalybeate waters is very efficacious for the cure of this disease. In almost all weaknesses of the stomach, chewing of rhubarb is convenient, especially in those that are costive.

**Digestion**, in chemistry, pharmacy, &c. the subjecting bodies, included in proper vessels, to the action of a gentle and continued heat.

The application of this operation, in regard to its end, is very various. In some cases, it is used with a view of producing a change in some one single body, as in the instance of the preparation called mercurius præcip. per se; in others, to promote solutions, or other combinations; but most frequently for extraction or separation, by means of fluids, of the required parts of some solid bodies, whose texture, impeding the quicker access and effect of menstrua,

renders a long infusion, and the relaxation of a gentle heat, necessary, in order to their being penetrated; or for accelerating the solution of bodies by menstrua, whose action when cold is not sufficiently vigorous.

The vessels generally used to contain the matter to be digested, are matrases, or bolt-heads, and sometimes glasses; but where the heat is so gentle as to make no evaporation, the structure is indifferent. In cases where an evaporation does happen, and the exhaling fluid is of any value, the vessels are to be constructed so as to confine the vapour, and return it in a condensed state. This is called circulation, and is commonly executed by inverting the neck of a smaller matras into that of a larger, in which case the conjoined glasses are called a pelican. There are several other kinds of pelicans of a more complex structure, but the flask used for Florence wine, divested of the straw-work, and inverted into a matras with a very long neck, will conveniently answer all the purposes. See CIRCULATION.

This operation is most generally performed in a sand-heat, and no greater adjustment of the degrees of heat is necessary for the purposes of pharmacy, than can be there effected; but formerly when the more mysterious and operose methods were followed, the heat of dunghills has been employed.

The degree of heat requisite in digestion, differs according to the nature of the subject: in tinctures, made with strong spirit of wine, or volatile salts, and in solutions where a great effervescence is apt to arise, a very gentle one should never be exceeded. In aqueous solutions, and most other cases, a greater may be allowed; but it must always be understood to be less than will make the matter boil, otherwise the operation comes not within the proper meaning of the word digestion, which is a distinction from coction.

The time which digestion ought to be continued, differs so greatly, according to the different application of the operation, that no other rule for it can be laid down, than that it should be continued till the intention to which it is made subservient be compleated.

In circulatory digestions, it is proper to lute the vessels, to prevent the escape of the vapours through the junctures, but in many cases this following precaution

caution is extremely necessary, *viz.* that a small aperture, or vent; be left, otherwise an incondensable vapour, which arises, will, if it cannot force the lute, inevitably burst the glasses. The instances in which this precaution is necessary, are all mixtures of acid spirits, with earths, metals, or alkaline salts; or of such salts of those substances which can be acted on by them. But in solution of salts in water, and in extracts of gums, or resins, made with volatile salts, wine, or spirits of wine, it may be safely omitted. The college of London have, in their dispensatory, as well according to the last edition as the former; used the word digestion in a sense different from the above definition, meaning by it only the suffering the ingredients of certain mixtures to be continued together without applying the use of heat, which they expressly order on each occasion to be applied or omitted, by saying, *digest with heat*, or *digest without heat*: this is confounding the sense of the word digest, with that of the word infuse. See the article INFUSION.

**DIGESTION**, among physicians, is used for maturation, or that state of a disease, when the morbid matter is so changed in bulk, figure, cohesion, mobility, &c. by the use of proper medicines, or even by the force of nature, as to be less noxious and hurtful, and consequently to abate the violence of the distemper. See the article DIGESTIVE.

**DIGESTION**, in surgery, is the disposing of an ulcer or wound to suppurate, or to discharge good pus, by the application of proper medicines. See the next article.

**DIGESTIVE**, in medicine, such remedies as strengthen and increase the tone of the stomach, and assist in the digestion of foods. See the article DIGESTION. To this class belong all stomachics and strengtheners, or corroborants.

**DIGESTIVE**, in surgery, such medicines as are applied to wounds, &c. in order to promote a good maturation and laudable suppuration of matter. Lenient, anodyne, and balsamic digestives, are to be applied to a gangrene. Digestives of turpentine, and the yolks of eggs, are useful in abscesses, wounds, and ulcers. See the article SUPPURATIVES.

**DIGESTOR**, in chemistry, a strong vessel made of copper, or iron, and fitted with a close cover and screws; so as to remain perfectly tight in a considerable degree of heat, whilst water, common air, and the

subject of the operation are contained therein. See the article DIGESTION.

The cover of the digester should always be provided with a valve to let out the steam, otherwise the vessel will certainly burst, whereby it may prove fatal to the by-standers.

Of all chemical vessels hitherto invented, the digester seems best calculated for increasing the action of menstrooms. Water, confined in a digester, is susceptible of so much heat, as to melt lead; and it is frequently found to melt the solder of lead and tin, wherewith the copper vessel was held together: here appears the necessity of using hard solder, made of spelter, or silver and brass, for this purpose; otherwise, the digester cannot contain the water, when much heated, without melting in the joints.

In this vessel, fresh ox-bone will be so digested in the space of a quarter of an hour, as to become soft and tender, and capable of being cut with a knife; and the water, in which it was boiled, turned into a hard jelly, and a large cake of fat on its surface, when all is properly cooled.

**DIGGING**, among miners, is appropriated to the operation of freeing any kind of ore from the bed or stratum in which it lies, where every stroke of their tools turns to account; in contradistinction to the openings made in search of such ore, which are called hatches or essay-hatches, and the operation itself, tracing of mines; or hatching. See the article TRACING OF MINES.

When a bed of ore is discovered, the beele-men, so called from the instrument they use, which is a kind of pick-ax, free the ore from the fossils around it, and the shovel-men throw it up from one shamble to another, till it reaches the mouth of the hatch. See the article BEELE, HATCH, &c.

In some mines, to save the expence as well as fatigue of the shovel-men, they raise the ore by means of a winder, and two buckets, one of which goes up as the other comes down.

**DIGGING A BADGER**, among hunters, is dislodging or raising him out of the earth.

**DIGIT**, **DIGITUS**, in astronomy, the twelfth part of the diameter of the sun or moon, is used to express the quantity of an eclipse. Thus an eclipse is said to be of six digits, when six of these parts are hid.

**DIGITS**, or **MONADES**, in arithmetic, signify any integer under 10, as 1. 2. 3. 4. 5. 6. 7. 8. 9.

**DIGIT** is also a measure taken from the breadth of the finger. It is properly  $\frac{3}{4}$  of an inch, and contains the measure of four barley corns laid breadth-wise.

**DIGITALIS**, **FOX-GLOVE**, in botany, a genus of the *didynamia angiospermia* class of plants, with a monopetalous and campanulated, or bell-fashioned flower, quadrifid at the edge : the fruit is an oval, acuminate, and bilocular capsule, containing a great number of small seeds. See plate LXXII. fig. 6.

The leaves and flowers of this plant, the only parts used in medicine, are reputed emetic and vulnerary.

**DIGITATED**, among botanists, an appellation given to compound leaves, each of which is composed of a number of simple foliola, placed regularly on a common petiole ; though, strictly speaking, there must be more than four foliola to make a digitated leaf. See plate LXXIII. fig. 7.

**DIGITUS**, **FINGER**, in anatomy. See the article **FINGER**.

**DIGITUS VENERIS**, in botany, a name used by some for the *nymphaea*, or water lily. See **NYMPHAEA**.

**DIGLYPH**, in architecture, a kind of imperfect triglyph, console, or the like, with two channels or engravings, either circular or angular. See the article **TRIGLYPH**.

**DIGNE**, a city and bishop's see of Provence, in France, fifty-five miles north of Toulon : east long. 6° 5', and north lat. 44° 6'.

**DIGNITARY**, in the canon law, a person who holds a dignity, that is, a benefice which gives him some pre-eminence over mere priests and canons : Such is a bishop, dean, arch-deacon, prebendary, &c. See the article **BISHOP**, **DEAN**, &c.

**DIGNITY**, as applied to the titles of noblemen, signifies honour and authority. As the omission of a name of dignity may be pleaded in abatement of a writ ; so may it be where a peer or nobleman, who has more than one name of dignity, is not named by that which is most noble.

**DIGNITY**, in the ecclesiastical sense, is defined by canonists, an administration joined with jurisdiction and some power. Simple prebendaries, therefore, without jurisdiction, are not dignities.

Dignities are sometimes simple, sometimes with cure of souls, and sometimes with jurisdiction and administration of sacred things. Camden reckons in England, including prebends, 544 ecclesiastical dignities. See the article **DIGNITARY**.

**DIHELIOS**, in astronomy, a name given by Kepler to that ordinate of the ellipses which passes through the focus, where the sun is supposed to be placed.

**DIJAMBUS**, in ancient poetry, a double iambus. See the article **IAMBUS**.

**DIJON**, the capital of the province of Burgundy, in France, situated on the river Ouche, 240 miles south east of Paris : east long. 5° 5', and north lat. 47° 15'.

**DIKE**, a ditch, or drain, made for the passage of waters. See **DITCH**, &c.

**DIKE** also signifies a work of stone, timber, earth, fascines, &c. raised to oppose the entrance of the waters of the sea, a river, lake, &c.

The most stupenduous works of this kind are the Dikes of Holland.

**DIKE-REEVE**, an officer who takes care of the dikes and drains in Lincolnshire.

**DILAPIDATION**, in law, a wasteful destroying or letting buildings, especially parsonage-houses, &c. run to decay, for want of necessary reparation. If the clergy neglect to repair the houses belonging to their benefices, the bishop may sequester the profits thereof for that purpose. And in these cases, a prosecution may be brought either in the spiritual court, or at common law, against the incumbent himself, or against his executor or administrator.

**DILATATION**, in physics, a motion of the parts of any body, by which it is so expanded as to occupy a greater space. This expansive motion depends upon the elastic power of the body, whence it appears that dilatation is different from rarefaction, this last being produced by the means of heat. See **RAREFACTION**. Gassendus and his followers affirm, that dilatation, by whatever cause it is produced, cannot happen without vacuities interpersed in the parts of the expanded body ; on the other hand, the Cartesianians teach that dilatation is performed by the intrusion or intromission of some subtile matter into the pores of the dilated body.

The moderns observe, that bodies, which being compressed, and afterwards left at liberty to restore themselves perfectly, endeavour

endeavour to dilate themselves with the same force, whereby they were compressed, and accordingly they sustain a force, and raise a weight equal to that by which they were compressed. They likewise remark, that bodies in dilating by their elastic power, exert a greater force at the beginning of their dilatation than towards the end, as being at first more compressed: and the greater the compression, the greater the elastic power and energy of dilatation. Wherefore these three, the compressing power, the compression, and the elastic power, are always equal. Again, the motion whereby compressed bodies restore themselves is for the most part accelerated. Thus an arrow shot from a bow does not quit the string till after it be perfectly restored to its natural state; nor does the arrow move swifter than the string: and if the string before it hath perfectly restored itself be stopped, the arrow will not go its full length; a proof that it is continually acquiring a new impetus from the string.

It may however happen, that where the compression is only partial, the motion of dilatation shall not be accelerated, but retarded, as appears in the compression of soft bread, sponge, gauze, &c.

**DILATATION** in surgery and anatomy, denotes the widening the orifice of a wound; or the distension of any vessel, or the like.

**DILATATOIRES**, in anatomy, a name given to several muscles in the human body; as, 1. *Dilatatores aë nasi*, a pair of muscles which serve to elevate the nose, and are very various in different subjects. In general, however, they are two on each side, though even in this they vary extremely, and sometimes are so thin and fine as scarce to be perceptible. They are also called the *pyramidalis* and *myrtiformis*. See the article **PYRAMIDALIS**, &c.

2. *Dilatatores urethræ*, of which the transversi arise from the tubercle of the os ischium on each side, and are inserted into the posterior part of the bulb of the urethra: they are not quite determinate and certain, however, either in their origin or insertion, and sometimes they are wholly wanting. When they act they dilate the urethra in its posterior part. The *dilatator posticus* arises from the anterior part of the sphincter of the anus, and is inserted into the posterior and lower part of the acceleratores; or

else into the lower part of the bulb of the urethra. Some have taken this muscle for a part of the sphincter ani. See the article **SPHINCTER**.

**DILE**, a name used by some botanists, for *isatis*, or woad. See **ISATIS**.

**DILEMMA**, in logic, an argument consisting of two or more propositions, which divides the whole into all its parts, or members, by a disjunctive proposition, and then infers something concerning each part, which is finally referred to concerning the whole.

Instances of this are frequent, as, "In this life we must either obey our vicious inclinations, or resist them: to obey them will bring sin and sorrow; to resist them is laborious and painful: therefore, we cannot be perfectly free from sorrow and pain in this life."

A dilemma becomes faulty, or ineffectual three ways. First when the members of the division are not well opposed, or not fully enumerated: for then the major is false. Secondly, when what is asserted concerning each part is not just, then the minor is not true. Thirdly, when it may be retorted with equal force upon him who utters it. There was a famous ancient instance of this case, wherein a dilemma was retorted. Euathlus promised Protagoras a reward when he had taught him the art of pleading: and it was to be paid the first day he gained any cause in court. After a considerable time, Protagoras goes to law with Euathlus for the reward, and uses this dilemma. "Either the cause will go on my side, or on yours: if the cause goes on my side, you must pay me according to the sentence of the judge: if the cause goes on your side, you must pay me according to your bargain. Therefore, whether the cause goes for me, or against me, you must pay the reward." But Euathlus retorted the dilemma thus. "Either I shall gain the cause, or lose it. If I gain the cause, then nothing will be due to you according to the sentence of the judge: but if I lose the cause, nothing will be due to you according to my bargain. Therefore, whether I lose or gain the cause, I will not pay you, for nothing will be your due."

A dilemma is usually described, as tho' it always proved the absurdity, inconvenience, or unreasonableness of some opinion or practice, and this is the most common design of it. But it is plain, that

that it may be used to prove the truth or advantage of any thing proposed. As, "In heaven we shall either have desires, or not : if we have no desires, then we have full satisfaction : if we have desires, they shall be satisfied as fast as they arise : therefore, in heaven we shall be completely satisfied."

This sort of argument may be composed of three or more members, and may be called *trilemma*. It is also called *sylogismus cornutus*, a horned syllogism ; its horns being so disposed, that if you avoid the one, you run against the other. It is also called *crocodilinus*, by reason that as the crocodile leads such as follow it, into the Nile, and pursues such as fly it, to destroy them ; so, whatever the adversary either affirms or denies in this kind of syllogism, is turned to his advantage.

**DILIGENZA**, in music, is used for a soft or sweet manner of singing or playing.

**DILL**, *ANETHUM*, in botany, a genus of the *pentandria digynia* class of plants, the compound flower of which is uniform ; the particular ones all consisting of five lanceolated petals, bending inwards : the fruit is naked, ovated, compressed, and separable into two parts ; and the seeds are two in number, sub-oval, convex, and striated on one side, and plane on the other.

To this genus Linnaeus likewise refers fennel, which differs only from dill, in that its seeds are not membranaceous at the edge, like those of dill.

The seeds of dill are recommended as good carminatives.

**DILLEMBURG**, a city of the circle of the Upper Rhine, in Germany, about forty miles north of Francfort, and subject to the house of Nassau : east long.  $8^{\circ} 8'$ , and north lat.  $50^{\circ} 45'$ .

**DILLENGEN**, a city of Swabia, in Germany, situated on the Danube, about twenty miles north east of Ulm : east long.  $10^{\circ} 20'$ , and north lat.  $48^{\circ} 40'$ .

**DILLENIA**, in botany, a genus of the *polyandria-polygynia* class of plants ; the corolla of which consists of five coriaceous, large, roundish, and hollow petals : the fruit is roundish, and externally covered with a number of cap-sules, which are oblong, and divided by a furrow ; within, there is a large column or pulpy receptacle : the seeds are numerous, and very small ; and nidulated underneath the capsules.

**DILUTE**. To dilute a body is to render it liquid ; or, if it were liquid before, to render it more so, by the addition of a thinner thereto. These things thus added, are called diluents, or dilutors. It is requisite for a diluent, that it be fluid, that it be more fluid than the liquor to be diluted ; and finally, that it retain its fluidity after a mixture. It is observed, that there is no body endued with these three properties besides water. Wine indeed is said to dilute ; but its diluent power depends on its quality, joined with its stimulating force. Water, if it be made warm, dilutes the more.

**DIMACHÆ**, in ancient military affairs, a kind of horsemen, answering to the dragoons of the moderns. See the article **DRAGOONS**.

**DIMACHÆRUS**, in antiquity, a gladiator who fought with two swords.

**DIMENSION**, in geometry, is either length, breadth, or thickness ; hence a line hath one dimension, *viz.* length ; a superficies two, *viz.* length and breadth ; and a body, or solid, has three, to wit, length, breadth and thickness.

**DIMENSION** is also used with regard to the power of the roots of an equation, which are called the dimensions of that root ; as in a cubic equation, the highest power has three dimensions, &c.

**DIMETIENT**, a term used by some for diameter. See the article **DIAMETER**.

**DIMINISHED COLUMN**, in architecture. See the article **COLUMN**.

**DIMINISHED INTERVAL**, in music, is a defective interval, or an interval that is short of its just quantity, by a lesser semitone, &c. See **INTERVAL**.

**DIMINUTION**, in architecture, a contraction of the upper part of a column, by which its diameter is made less than that of the lower part.

It generally commences from one third of the height of the column. Vitruvius would have the diminution of columns different according to their height, and not according to their diameter. But this rule is not found to have been observed in the antique. Mr. Perrault observes, that a difference of orders does not infer a difference in diminutions, and Mr. Le Clerc says, all diminutions of columns ought to be more or less sensible according as the orders are more or less delicate. For instance, in the Tuscan order, where the column is fifteen modules high, the diminution under the astragal may be five minutes

minutes and a half. In the Doric order, where the column is sixteen modules, the diminution may be but five minutes. In the Ionic, where the column is eighteen modules, the diminution may be but four minutes and a half; and in the Corinthian, no more than four. Diminutions are as differently adjusted in antique buildings, as in different modern authors.

**DIMINUTION**, in heraldry, a term used for what the french call brisures, and we denominate differences. See the article DIFFERENCE.

**DIMINUTION**, in law, is where the plaintiff or defendant in a writ of error alleges to the court, that part of the record remains in the inferior court not certified, and therefore prays, that it may be certified by certiorari. Diminution cannot be alleged of what is fully certified, but of something that is wanting, as the want of an original, or a warrant of attorney.

**DIMINUTION**, in music, is when there are several words which are to make tones, and several quick motions in a cadence, several quavers, semi-quavers, &c. corresponding to a crotchet or minim, as when a semi-breve is divided into two minims, four crotchets, &c. Of this there are several kinds, and if done in conjoint degrees, it is called trilli, tremoli, circoli mezzi, group, tirate, and if in disjoint degrees, it is said to be done per salto. See the articles TRILLI, TREMOLI, SALTO, &c.

**DIMINUTION**, in rhetoric, the exaggerating what you have to say by an expression that seems to diminish it.

**DIMINUTIVE**, in grammar, a word formed from some other, to soften or diminish the force of it, or to signify a thing is little in its kind. Thus cellule is a diminutive of cell, globule of globe, hillock of hill. The Italians abound in diminutives: the French are a good deal more reserved: in english we have very few. The Latins, and especially Catullus, use them as expressions of blandishment, and in that language, as well as in the Italian, French and English, they are generally formed from primitives by the addition of a few letters or syllables. They have a very pretty effect in that celebrated address of Adrian to his departing soul, which begins,

*Animula, vagula, blandula,  
Hospes comesque corporis, &c.*

**DIMISSORY LETTERS**, in the antient christian church, were letters granted to the clergy, when they were to remove from their own diocese, and settle in another, to testify that they had the bishop's leave to depart. In the canon-law, dimissory letters are such as are used when a candidate for holy orders has a title in one diocese, and is to be ordained in another: in which case the proper diocesan sends his letters directed to the ordaining bishop, giving leave that the bearer may be ordained to such a cure within his district. Persons inferior to bishops cannot grant these letters, unless by special commission; or unless the bishop be at a great distance, in which case the vicar general may grant such licence; as the chapter may do, *sede vacante*.

**DIMOERITÆ**, in church-history, a name given to the Apollinarians, from their separating the understanding from the human soul of Christ.

**DIMNESS OF SIGHT**, a disorder in horses, proceeding from blood-shot eyes. If the ball of the eye be found, the cure is effected by keeping the horse warm, with a hood of linnen cloth fitted to his head; and anointing the eyelids twice a day, with a composition of sugar-candy, honey, and white rose-water. In two or three days, the eyes will be well again, after which the creature should be blooded.

In this disorder, you ought by no means to clip or meddle with the bladders on any part of the eye.

**DIMORPHOTHECA**, in botany, a name used by Vaillant, for the calendula of Linnæus. See the article CALENDULA.

**DINANT**, a town of Germany, in the bishopric of Liege, situated on the river Maese, about twelve miles south of Namur: east long. 4° 50', and north lat. 50° 18'.

**DINANT** is also the name of a town of Britany, in France, about ten miles south of St. Malo: west long. 2° 5', and north lat. 48° 30'.

**DINGELFING**, a town of Bavaria, in Germany, situated on the river Isar, twenty miles south of Landshut: east long. 12° 40', and north lat. 48° 30'.

**DINGLE**, a port town of Ireland, in the county of Derry, and province of Munster, situated on Dingle-bay, 74 miles west of Limerick: west long. 10° 18', and north lat. 52°.

**DINGWEL**, or **DINGWAL**, a parliament-town of Scotland, situated at the west end of the Cromarty-bay, in the county of Ross : west long.  $4^{\circ} 15'$ , north lat.  $57^{\circ} 56'$ .

It classes with Dornoch, Wick, and Kirkwall.

**DINKELSPIEL**, a city of Swabia, about forty miles north of Ulm. east long.  $10^{\circ} 12'$ , and north lat.  $49^{\circ}$ .

**DINNER**, the meal taken about the middle of the day.

It is generally agreed to be the most salutary to make a plentiful dinner, and to eat sparingly at supper. This is the general practice among us. The French, however, in imitation of the antient Romans, defer their good cheer to the evening, and Bernardinus Paternus, an eminent italian physician, maintains it to be the most wholesome method, in a treatise expressly on the subject.

The grand Tartar emperor of China, after he has dined, makes publication by his heralds, that he gives leave for all the other kings and potentates of the earth to go to dinner, as if they waited for his leave.

**DINUS**, a name used by some physicians for a vertigo. See the article **VERTIGO**.

**DIOCALLIA**, in botany, a name sometimes used for chamæmile. See the article **CHAMÆMILE**.

**DIOCESE**, denotes a particular district, or division, under the direction and government of a bishop.

It is the general opinion, that the christian church, in the modelling her own external polity, followed the state and division of the roman empire, and that the ecclesiastical magistracy was originally formed upon the plan of the civil. As the empire therefore was divided into provinces and dioceſes, (a dioceſe, according to Constantine's distribution, comprehending several provinces under the direction of a general magistrate) so the church set up her metropolitical and patriarchal power, the metropolitan bishops answering to the civil magistrates of provinces, and the patriarchs to the civil magistrates of dioceſes. This is to be understood of the state of the church, after the empire became christian. See the articles **METROPOLITAN**, **PATRIARCH**, **PROVINCE**, &c.

Some pretend that a dioceſe, during the three first centuries, was never more than such a number of people as could meet, and ordinarily did meet, in a single con-

gregation : others extend the limits of the antient dioceſes, so as to include a whole city, and the region about it. And this is the plain reason of that great difference we find in the extent of antient dioceſes, some being very large, others very small, according as each city happened to have a larger or lesser territory under its jurisdiction. Dioceſes were originally called *παροικιαί*, parishes, by which name is to be understood the episcopal city, with the country places and villages round it. The name dioceſe began first to be used in the fourth century, when the exterior polity of the church began to be formed upon the model of the roman empire.

England in regard to its ecclesiastical state, is divided into two Provinces, *viz.* Canterbury and York, and each Province into subordinate dioceſes, of which there are twenty-two in England, and four in Wales.

**DIOCLESIAN EPOCH**, in chronology. See the article **EPOCH**.

**DIOLIA**, *διολία*, in grecian antiquity, a festival kept in honour of Diocles, who died in defence of a youth he loved.

**DIOCTAHEDRIA**, in natural history, a genus of pellucid and crystalliform spars, composed of two octangular pyramids, joined base to base, without any intermediate column. Of these some have long pyramids, others short and sharp-pointed ones, and others short and obtuse-pointed ones ; the two former species being found in the hartz-forest, and the last in the mines of Cornwall.

**DIODIA**, in botany, a genus of the *dynamia-angiospermia* class of plants, the corolla of which consist of a single petal, of the ringent kind. The tube is slender and longer than the cup, the upper lip is erect and bifid, the lower lip is patent, and divided into two lanceolated segments. The fruit is an oval quadrangular capsule, coronated, formed of two valves, and containing two cells : the seeds are single, of an ovato-oblong figure, smooth and flat on one side, and convex on the other.

**DIOECESIS**, *διοίκησις*, a dioceſe. See the article **DIOCESE**.

**DIONYSIA**, in grecian antiquity, solemnities in honour of *Διόνυσος*, or Bacchus, sometimes called by the general name of orgia ; and by the Romans, bacchanalia, and liberalia. See **BACCHANALIA**, &c. There were divers Dionysia observed, over all Greece : but those celebrated at Athens

Athen

Athens had more splendor and ceremonious superstition than in any other part; for the years were numbered by them: the chief archon had a share in the management of them, and the priests that officiated therein, were honoured with the first seat at public shews. But at first, they were without splendor and ornaments, being days set apart for public mirth, and observed only with the following ceremonies: first a vessel of wine, adorned with a vine branch, was brought forth, after that followed a goat; then was carried a basket of figs; and after all the phalli. At some of them, it was usual for the worshippers in their garments and actions to imitate the poetical fictions concerning Bacchus. They put on fawn skins, fine linnen and mitres, carried thyrsi, drums, pipes, flutes, and rattles, and crowned themselves with garlands of trees, sacred to Bacchus, such were the ivy, vine, fir, &c. Some imitated Silenus, Pan, and the Satyrs; exposing themselves in comical dresses, and antic motions: some rode upon asses, others drove goats to the slaughter. In this manner, persons of both sexes ran about the hills, desarts, and other places, wagging their heads, dancing in ridiculous postures, filling the air with hideous noises and yelling, personating people distracted, and crying aloud *Εὐοι Ἰαβοι, εὐοι Βακχε, or ὦ Βακχε, or Ἰο-βακχε, or ἰω Βακχε.*

In some of the festivals, a company of men called *Περιφάλλια*, carried long poles, at the end of which were fixed things in form of a man's privities. The *λακίον*, or mystical fan of Bacchus, was a thing essential to all his feasts.

**DIONYSIACA**, in grecian antiquity, an appellation given to all manner of theatrical entertainments, from their being sacred to Dionysius, or Bacchus.

**DIONYSIAN PERIOD**, in chronology. See the article **PERIOD**.

**DIOECIA**, in the Linnæan system of botany, the twenty-second class of plants, comprehending all those which have the male and female parts of fructification, or the stamina and pistil, on distinct plants of the same kind; in which respect, they bear some analogy to quadrupeds, whose males and females are likewise distinct. See **BOTANY**.

To this class belong the willow, hemp, poplar, juniper, pistachia, yew, &c. in all which, the female plants alone produce seeds; but even these prove

barren, unless planted near the male plants, so as to be within the reach of the farina fecundans. See **FARINA**.

**DIOMEDIS AVIS**, in ornithology, a bird of the duck-kind, about the size of the common hen, and of a dusky brown colour, said to be peculiar to the island Diomedea, or Tremiti, in the gulph of Venice.

**DIOPTER**, **DIOPTRA**, a name sometimes used for the hole pierced in sights of mathematical instruments. See **SIGHTS**.

**DIOPTRA**, among surgeons, the same with speculum. See **SPECULUM**.

**DIOPTRICS**, the science of refractive vision, or that part of optics which considers the different refractions of light in its passing through different mediums, as air, water, glass, &c. and especially lenses. See the articles **REFRACTION**, **LENS**, &c.

**DIOSCOREA**, in botany, a genus of the *dioecia-hexandria* class of plants, having no corolla in either the male or female flowers: the fruit is a compressed large capsule, of a triangular form, containing three valves, and divided into three cells: the seeds are two, compressed, and surrounded, with a large membranaceous margin.

**DIOSCURIA**, *διοσκυρια*, in grecian antiquity, a festival kept in honour of the Dioscouri, or Castor and Pollux, wherein the assistants shared plentifully of the gifts of Bacchus.

**DIOSMA**, in botany, a genus of the *pentandria-monogynia* class of plants, the flower of which consists of five obtusely-ovate, sessile, and erecto-patent petals, of the length of the cup: the fruit is composed of five capsules, adhering together by their inner sides, and containing each a single, oblong, and sharp-pointed oval seed.

**DIOSPOROS**, a name antiently used for lithospermum, or gromwell.

**DIOSPYROS**, in botany, a genus of the *octandria-digynia* class of plants, called by Turnefort, guaiacana, the flower of which is monopetalous, very small, and of an oval campanulated figure: the fruit is a large globose and multilocular berry, containing a few sharp-pointed oval seeds. See plate **LXXIII.** fig. 1.

**DIOTA**, a name used by some chemists for a circulating or double vessel.

**DIOTOTHECA**, in botany, the same with the morina of Linnæus. See the article **MORINA**.

**DIPHRYGES**, in antient pharmacy, the scoræ, sediment, or calx of melted copper, gathered in the furnace, when the metal was run out.

There are supposed to be three species of diphryges, one made of a clay, or bole dried in the sun ; another made of marcasite, or pyrites burnt ; and a third, that of the fæces of copper. See the article **COPPER**.

The last diphryges, which tastes of copper, is æruginous, astringent, and vehemently drying upon the tongue, qualities of which burnt oker, though sold for diphryges, is destitute. It is an astringent, a potent cleanser, absterfivè and drier, represses excrescences of flesh, induces malignant and spreading ulcers to cicatrize, and mixed with turpentine, or cerate, discusses an abscess.

**DIPHTHONG**, διφθόγγα, in grammar, a double vowel, or the mixture of two vowels pronounced together, so as to make one syllable. See the article **VOWEL**.

The Latins pronounced the two vowels in their diphthongs, *ae* or *æ*, *oe* or *œ*, much as we do, only that the one was heard much weaker than the other, though the division was made with all the delicacy imaginable. Diphthongs, with regard to the eyes, are distinguished from those with regard to the ears : in the former, either the particular sound of each vowel is heard in the pronunciation, or the sound of one of them is drowned ; or, lastly, a new sound, different from either, results from both : the first of these only are real diphthongs, as being such both to the eye and the ear. Diphthongs with regard to the ear are either formed of two vowels, meeting in the same syllable, or whose sounds are severally heard ; or of three vowels in the same syllable, which only afford two sounds in the pronunciation. English diphthongs, with regard to the eye and ear, are *ai*, *au*, *ea*, *ee*, *oi*, *oo*, *ou*. Improper english diphthongs, with regard to the eye only, are *aa*, *ea*, *eo*, *eu*, *ie*, *ei*, *oa*, *oe*, *ue*, *ui*. *Steele's Eng. Gr.*

**DIPHYES**, among natural historians, an appellation given to stones resembling the male and female parts of generation in mankind.

**DIPLASIASMUS**, in medicine, a reduplication of diseases.

**DIPLASIASMUS** is also used for two muscles of the arm, which serve to turn it round.

**DIPLOE**, in anatomy, the soft medullarium, or medullary substance, which lies be-

twixt the two laminæ of the bones of the cranium. See the article **CRANIUM**.

**DIPLOMA**, an instrument or licence given by colleges, societies, &c. to a clergyman to exercise the ministerial function, or to a physician to practise the profession, &c. after passing examination, or admitting him to a degree.

**DIPLOMA**, in chemistry, &c. a double vessel. To boil in diplomate, is to set one vessel, containing the ingredients intended to be acted upon, in another larger vessel, full of water, and to this last the fire is to be applied.

**DIPONDIIUS**, in the scripture-language, is used by St. Luke to signify a certain coin, which was of very little value: our translation of the passage is, *Are not two sparrows sold for two farthings?* In St. Matthew, who relates the same thing, we read, *Are not two sparrows sold for a farthing?* The greek reads *assarion* instead of *as*. See **AS**.

Dr. Arbuthnot says that this coin was at first *libralis*, or of a pound weight, and that even when diminished, it retained the name *libella* ; so that dipondius denoted two ases.

**DIPPING**, among miners, signifies the interruption, or breaking off, of the veins of ore ; an accident that gives them a great deal of trouble before they can discover the ore again.

**DIPPING NEEDLE**, or **INCLINATORY NEEDLE**. See the article **NEEDLE**.

**DIPSACUS**, TEASEL, in botany, a genus of the *tetrandria-monogynia* class of plants, the flower of which consists of only one tubular erect petal, divided into four segments at the mouth ; its fruit is a common receptacle, of a conical figure, beset with long scales, and containing a single columnar seed with a marginaceous rim. See plate **LXXIII.** fig. 2.

The leaves of wild teasel are recommended against flatulencies, and crudities of the stomach. See **TEASEL**.

**DIPSACUS**, in medicine, a term used by some for a diabetes. See **DIABETES**.

**DIPSAS**, in zoology, a species of serpent, so called from its bite creating a thirst that proved mortal. See **SERPENT**.

**DIPTERE**, or **DIPTERON**, in the antient architecture, signified a temple surrounded with two rows of columns, which form a sort of porticos, called wings, or isles. Pseudo-diptere is the same, except that instead of the double row of columns, this was only encompassed with a row of single ones.

**DIPTOTES**,

Fig. 1. DIOSPYROS.

Fig. 2. DIPSAEUS, TEASEL.

Fig. 7. DIGITATED.

Fig. 3. DIRECTOR  
N<sup>o</sup>. 1.

N<sup>o</sup>. 2.

N<sup>o</sup>. 3.

Fig. 5. DISPLAYED.

Fig. 4. DIRIGENT.

Fig. 6. DISTANCES.

**DIPTOTES**, in grammar, are such nouns as have only two cases, as *suppetia*, *suppetias*, &c.

**DIPTYCHS**, διπτυχα, in antiquity, a public register, in which were written the names of the consuls and other magistrates among the heathens; and among the christians, they were a sort of tablets, on one of which were written the names of the deceased, and on the other those of the living patriarchs, bishops, &c. or those who had done any service to the church, for whom prayers were offered, the deacon reading the names at mass.

It is certain there were prophane diptycha in the greek empire, as well as sacred ones in the greek church. The prophane diptycha were frequently sent as a present to princes, &c. on which occasion they were finely gilt and embellished, and usually of ivory. Carrion supposes that such presents were at first made to persons who had been nominated quæstors, to whom they were useful. Hence arose the custom of diptycha in the antient christian church; where some distinguish three sorts of diptycha, one wherein the names of bishops only were written, such especially as had been governors of that particular church; a second, in which the names of the living were written, such in particular as were eminent for any office or dignity, or some benefaction or good work, in which rank were bishops, emperors, and magistrates: lastly, a third, containing the names of such as were deceased in catholic communion. To erase a person's name out of these books, was the same thing as declaring him a heretic, or some way deviating from the faith.

**DIRECT**, in arithmetic. The rule of three direct, is opposite to the rule of three inverse. See the articles **RULE OF THREE** and **PROPORTION**.

**DIRECT**, in astronomy. A planet is said to be direct, when it appears to an observer on the earth to go forward in the zodiac, or according to the succession of the signs. See the article **PLANET**.

**DIRECT**, in matters of genealogy, is understood of the principal line, or the line of ascendants and descendants; in contradistinction to the collateral line. The heirs in the direct lines always precede those in the collateral lines.

**DIRECT RAY**, in optics, is a ray flowing from a point of a visible object directly to the eye, thro' one and the same medium.

**DIRECT east and west dials**, dials drawn upon planes that directly face the east and

west points of the horizon, or parallel to the meridian. See **DIAL**.

**DIRECT south and north dials**, are those which face directly the north and south points of the horizon, or parallel to the prime vertical circle. See the articles **DIAL** and **DIALLING**.

**DIRECT SPHERE**. See **SPHERE**.

**DIRECTION**, in mechanics, signifies the line or path of a body's motion, along which it endeavours to proceed, according to the force impressed upon it. See the articles **LINE** and **MOTION**.

*Angle of DIRECTION*, that formed by the lines of direction of two conspiring powers.

*Quantity of DIRECTION*, a term used by some mathematicians for the product of the velocity of the common center of gravity of a system of bodies, by the sum of their quantities of matter: this is nowise altered by any collisions among the bodies themselves.

*Magnetical DIRECTION* denotes the tendency of the load-stone, and other magnetic bodies, to certain points called their poles: thus, a magnetical needle always presents one of its ends towards the north pole of the world, and the other towards the south pole.

**DIRECTLY**. See **DIRECT**.

**DIRECTOR**, in commercial polity, a person who has the management of the affairs of a trading company: thus we say the directors of the India-company, South-sea-company, &c. See the article **COMPANY**.

The directors are considerable proprietors in the stocks of their respective companies, being chosen by plurality of votes from among the body of proprietors. The dutch East-india company have sixty such directors; that of France, twenty-one; the british East-india company has twenty-four, including the chair-man, who may be re-elected for four years successively. These last have salaries of 150 l. a year each, and the chair-man 200 l. They meet at least once a week, and commonly oftener, being summoned as occasion requires.

But besides these directors, who reside in Europe, and there superintend the general œconomy of the trading companies, there are also officers belonging to them in Asia, Africa, and America, under the title of directors-general, and, by an honourable abbreviation, generals. The English give these the title of presidents, whereof there used to be two in the East-indies,

indies, one at Surat, and the other at Bantam. They have the absolute disposal of all the company's effects, regulate their trade, establish new computing-houses, and command all the merchants, and even captains of ships; make presents to princes, treat with them, make peace and war with them, &c. It is true, they have a council, but one entirely subservient to their pleasure.

**DIRECTOR**, in surgery, a grooved probe, to direct the edge of the knife or scissars, in opening sinuses, or fistulæ, that by this means the subadjacent vessels, nerves, and tendons may remain unhurt. The ornament at the upper part of it, see plate LXXIII. fig. 3. n<sup>o</sup> 1. serves for a handle; tho' sometimes that end is made in the form of a spoon, as in n<sup>o</sup> 2. to contain powders to sprinkle upon wounds or ulcers: sometimes also it is forked at the end, to divide the frænum of the tongue, as in n<sup>o</sup> 3.

**DIRECTOR**, in anatomy, the same with the erector penis. See **ERECTOR**.

**DIRECTRIX**, in geometry, the same with dirigent. See the next article.

**DIRIGENT**, or **DIRECTRIX**, a term in geometry, signifying the line of motion, along which the describent line or surface is carried in the genesis of any plane or solid figure: thus, if the line AB (plate LXXIII. fig. 4.) move along the line AC, so that the point A always keeps in the line AC, a parallelogram, as ABCD, will be formed, of which the side AB is the describent, and the line AC the dirigent; so also, if the surface ABCD be supposed to be carried along CE, in a position always parallel to itself, in its first situation, the solid ADFH, will be formed, where the surface AD is the describent, and the line CE the dirigent.

**DIRITTA**, in music, a term intimating that the piece is to be played or sung in conjoint degrees: thus, contrapunto alla diritta, according to Angelo Berardi, is when one is obliged to raise or fall the voice by the same degree, *i. e.* by an equal number ascending or descending, without making a leap, even of the interval of a third.

**DIRSCHAW**, or **DIRCHAU**, a town of Prussia, in the palatinate of Culm, situated upon the Vistula, half way between Dantzic and Ghnief.

**DIS**, an inseparable article prefixed to divers words, the effect whereof is either to give them a signification contrary to

what the simple words have, as *disoblige*, *disobey*, &c. or to signify a separation, detachment, &c. as *disposing*, *distributing*, &c.

**DISABILITY**, in law, is when a person is rendered incapable of inheriting lands, or taking that benefit which otherwise he might have done.

Disability may happen four ways, *viz.* by the act of an ancestor, by the act of the party himself, by the act of God, or by the act of the law.

Disability by the act of an ancestor is where a man being attainted by treason or felony, his blood becomes corrupted, and thereby his children are rendered incapable to inherit.

Disability by the act of the party, is when one binds himself by obligation, that, upon the surrender of a lease, he will grant a new estate of the same premises to the lessee, and afterwards he grants over the reversion to another, whereby he is disabled to perform his obligation.

Disability by the act of God, is where a person is not *sana memorie*, not of sound memory, which incapacitates him to make any grant, &c. and in all cases where he gives or passes an estate from him, after his death, it may be disannulled and made void; though it is a maxim in our law, that a man of full age shall never be received to disabill his own person.

Disability by the act of the law, is where one, by the sole act of law, without any thing done by him, is rendered incapable of the benefit of the law, as an alien born, &c.

There are also, by the common law, other disabilities, as idiocy, infancy, and coverture, in respect to the making of grants, &c. and by statute in many cases; for papists are disabled to make any presentation to a church, or to purchase or take lands, &c. Officers not taking the oaths, to hold offices, &c.

**DISAFFORESTED**, the same with de-afforested. See **DEAFFORESTED**.

**DISARMING**, in law, the prohibiting people to wear arms. See **ARMS**.

It is an offence, by the common law of England, for persons to go or ride armed with dangerous and uncommon weapons: though gentlemen may wear common armour, according to their quality. It is also ordained by statute, that no persons shall come before the king's justices with force of arms, on pain of imprisonment, &c.

**DISARMING**,

**DISARMING** *the lips of a horse*, in the manege, is the preventing them from taking off the true pressure or appui of the mouth, when they happen to be so large as to cover the bars.

**DISBOSCATION**, the same with assart. See the article **ASSART**.

**DISBUDDING** of trees signifies the taking away such branches or sprigs, newly put forth, as are ill placed.

**DISBURDENING** of trees, the taking off part of the leaves and fruit, when too numerous, that those left may grow the larger.

**DISC**, *discus*, in antiquity, a quoit made of stone, iron, or copper, five or six fingers broad, and more than a foot long, inclining to an oval figure, which they hurled in the manner of a bowl, to a vast distance, by the help of a leathern thong tied round the person's hand who threw it, and put through a hole in the middle. Homer has made Ajax and Ulysses great artists at this sport; and Ovid, when he brings in Apollo and Hyacinth playing at it, gives an elegant description of this exercise, lib. x. ver. 175.

**DISC**, in astronomy, the body and face of the sun and moon, such as it appears to us on the earth; or the body or face of the earth, such as it appears to a spectator in the moon, &c. See **DIAMETER**. The disc in eclipses is supposed to be divided into twelve equal parts, called digits: in a total eclipse of the luminaries, the whole disc is obscured; in a partial eclipse, only a part thereof.

If we imagine a plane to pass through the center of the earth, so that the line which joins the centers of the sun and earth, may be perpendicular to this plane, it will make on the surface of the earth a circle, which will separate the illuminated hemisphere of the earth from the dark. This circle, otherwise termed the circle of illumination, Mr. Keil calls the illuminated disc of the earth, which is directly seen by a spectator placed at the distance of the moon, in the right line which joins the centers of the sun and earth. All lines drawn from the center of the sun to every single point of the disc are to be accounted parallel; and, therefore, since that line which is drawn to the center of the disc is perpendicular to it, all the rest will be perpendicular to it, and therefore all lines drawn from the center of the sun, and passing through every point of any circle upon the earth's surface, when they are produced, will be perpen-

dicular to the plane of the disc. Moreover, a spectator in the moon will see all countries, cities, and towns to move upon the disc, which motion is occasioned by the earth's rotation round its axis, and every point will have its way on the disc: the bigness of the earth's disc is to be estimated by the angle under which the earth is seen from the moon. See **EARTH**.

**DISC**, in botany, is an aggregate of florets forming, as it were, a plane surface.

**DISC**, in optics, is the width of the aperture of telescopic glasses, whatever their form be, whether plain, convex, concave, &c.

**DISC**, in the liturgy of the greek church, is nearly the same with the patena in the latin church. See **PATENA**.

**DISCEIT**, or **DECEIT**. See **DECEIT** and **DECEPTIONE**.

**DISCENT**, or **DESCENT**. See the article **DESCENT**.

**DISCERNING**, or **DISCERNMENT**, among logicians, a faculty of the mind, whereby it distinguishes between ideas. See **JUDGMENT** and **INTUITION**.

On this depends the evidence and certainty of several, even general, propositions, which pass for innate truths, that, in reality, proceed from this clear discerning faculty of the mind, whereby it perceives two ideas to be the same, or different. In being able nicely to distinguish one thing from another, consists, in a great measure, that exactness of judgment, and clearness of reason, which is observable in one man above another. To the well distinguishing our ideas it chiefly contributes that they be clear and determinate; and when they are so, it will not breed any confusion or mistake about them, though the senses should convey them from the same object differently on different occasions. *Locke*.

**DISCIPLE**, one who learns any thing from another: thus, the followers of any teacher, philosopher, &c. are called disciples. In the christian sense they were followers of Jesus Christ, in general; but in a more restrained sense, the disciples denote those alone who were the immediate followers and attendants on his person, of which there were seventy or seventy-two. The names *disciple* and *apostle* are often synonymously used in the gospel-history, but sometimes the apostles are distinguished from disciples as persons selected out of the number of disciples, to be the principal ministers of his religion; of these there were only twelve. The Latins kept the

the festival of the seventy or seventy-two disciples on July 15, and the Greeks on January 4.

**DISCIPLINE**, in a general sense, denotes instruction and government, as military discipline, ecclesiastical discipline, &c. Ecclesiastical discipline consists in putting those laws in execution by which the church is governed, and inflicting the penalties enjoined by them against the several sorts of offenders that profess the religion of Jesus: the primitive church never pretended to exercise discipline upon any but such as were within her pale, in the largest sense, by some act of their own profession; and even upon these she never pretended to exercise her discipline so far as to cancel or disannul their baptism: all that she pretended to, was to deprive men of the benefits of external communion, such as public prayer, receiving the eucharist, and other acts of divine worship. The church discipline was only confined to the admonition of the party, and to the lesser and greater excommunication.

As to the objects of ecclesiastical discipline, they were all such delinquents as fell into great and scandalous crimes after baptism.

Discipline, in a more peculiar sense, is used for the chastisements, or bodily punishments inflicted, on a religious of the romish church who has been found a delinquent; or even for that which the religious voluntarily undergo or inflict on themselves, by way of mortification.

**DISCLAIMER**, in law, is a plea wherein is contained an express denial of a thing; as where upon the distress of a lord, a tenant sues a replevin, and the lord avows the taking, by alledging the tenant holds of him as of his lord, and that he distrained for the rent unpaid, or service not performed: in this case, if the tenant denies that he holds of him, this is called a disclaimer; and on that account, if the lord proves the tenant to hold of him, the tenant, on a writ of right, shall lose his land. There is likewise a disclaimer of goods, as when a person arraigned of felony, disclaims the goods charged on him; though he should be acquitted, he loses the goods. When a defendant in his answer in chancery, denies his having any interest in the thing in question, it is also a disclaimer; and to these may be added a disclaimer or renouncing an executorship of a will, or the right to an administration,

**DISCLOSED**, a term used to signify buds or flowers just blown; also chickens newly hatched. See the articles **BUD**, **FLOWER** and **HATCHING**.

**DISCOIDES TRIBULA**, a genus of the echini-marini, or sea hedge-hogs. See the article **ECHINITES**.

**DISCONTINUANCE**, in law, signifies an interruption or cessation of the course of a thing, and is of two kinds. 1. Discontinuance of estate or possession, which has this effect, that a person may not enter upon his own land, &c. aliened, whatever his right be to it, of his own authority, but must bring his writ, and seek to recover possession by law. A discontinuance may be by seoffment, fine, recovery, lease, and confirmation with warranty; but grants of land without livery, or if made in fee without any warranty, are not discontinuances. 2. Discontinuance of process, where the opportunity to prosecute a suit is lost, or the plaintiff is, put *sine die*, and dismissed the court. After a verdict in a cause, no discontinuance is allowed without leave of the court, and costs are usually given the defendant on discontinuing suits. As discontinuance of process is helped by appearance at common law, so all discontinuances and miscontinuances of the plaintiff or defendant, are cured after verdict by statute.

**DISCONTINUANCE of plea**, is when divers things should be pleaded to in a suit or action, and some thereof are omitted in the pleading. Where a defendant's plea answers to part only, it is a discontinuance as to the part not answered, and the plaintiff may take judgment by *nil dicit* for that. But if the plaintiff pleads over thereto, the whole action is discontinued.

**DISCORD**, in music, the relation of two sounds which are always and of themselves disagreeable, whether applied in succession or consonance. Thus the second, fourth, and seventh, with their octaves, and, in general, all intervals, except those few which precisely terminate the concords, are called discords. Discords are distinguished into concinnous and inconcinnous intervals. See the article **INTERVAL**.

**Concinnous DISCORDS**, called by the antients *emmeli*, are such as are fit for music, next to and in combination with concords. These are relations which in themselves are neither very agreeable nor disagreeable, and have only a good effect in music, as by their mixture and combina-

tion with the more natural and essential principles, they produce a variety necessary to our being better pleased.

*Inconcinuous* DISCORDS, by the antients called *ecmeli*, are such as are never chosen in music, as having too great a harshness in them, though even the greatest discord is not without its use. The essential principles of harmony, harmonical intervals, or concords, are in number only eight: the indefinite numbers of other ratios are all discords. Hence Mr. Malcolm shews the necessity of taking some of the less untoward of these discords into the system of music. In order to this, he considers the effect of having none but harmonical intervals in the system of music. 1. With respect to a single voice. If that should move always from one degree to another, so as every note or sound to the next were in the ratio of some concord, not only the variety, which is the life of music, would be soon exhausted, but the very perfection of such relation of sounds would clog the ear, in the same manner as sweet and luscious things do the taste. 2. With respect to music in parts, that is, where two or more voices join in consonance, the general rule is, that the successive sounds of each be so ordered, that the several voices shall be all concords. Now there ought to be a variety in the choice of those successive concords, and also in the method of their succession; all which depends on the movement of the single parts. So that if these could only move in an agreeable manner by harmonical distances, there are but few different ways wherein they could move from concord to concord, and hereby we should lose much of the ravishment of sounds in consonance. A variety, therefore, is requisite, by which each single voice, or more in consonance, may move agreeably in the successive sounds, so as to pass from concord to concord, and meet at every note in the same or a different concord, from what they stood in at the last note. From these two considerations, it appears how imperfect music would be without any other intervals than concords; but in what cases, and for what reasons discords are allowed, the rules of composition must teach. See HARMONY. Besides the concinuous discords used designedly in music, there are several other discord relations which happen unavoidably in an accidental and indirect manner. Thus in the succession of several

notes, there are to be considered not only the relations of those which succeed others immediately, but also of those, betwixt which others intervene. Now the immediate succession may be conducted so as to produce melody; and yet among the distant notes there may be very gross discords, that would not be tolerable in mediate succession, and far less in consonance. Thus taking any one species, for example; that with the greater third, and marking the degrees between each term and the next, though the progression be melodious, as the terms refer to one common fundamental, yet there are several discords among the mutual relations of the terms, *e. g.* from the fourth to the seventh greater is 32:45, and from the second greater to the sixth greater is 27:40, and from the second greater to the fourth is 27:32, all discords.

Discords may transiently pass upon the unaccented part of a measure, without great offence to the ear. This is called supposition. See SUPPOSITION.

The harmony of discords, is that wherein the discords are made use of as the solid and substantial part of the harmony. For by a proper interposition of a discord, the succeeding concords receive an additional grace. Thus the discords are in music, what strong shades are in painting. See the article HARMONY.

The discords are the fifth when joined with the sixth, the fourth with the fifth. The ninth of its own nature is a discord; so is the seventh. The discords are introduced into harmony with due preparations, and must be succeeded by concords, which is the resolution of discords. The discord is prepared by substituting it first in the harmony, in quality of a concord; that is, the same note which becomes a discord, is first a concord to the bass note immediately preceding that to which it is a discord. Again, a discord is resolved by being immediately succeeded by a concord, descending from it only by the distance of a greater or lesser second.

DISCOVERY, in dramatic poetry, a manner of unravelling a plot, or fable, in tragedies, comedies, and romances, wherein, by some unforeseen accident, a discovery is made of the name, fortune, quality, &c. of a principal person, which were before unknown. See CATASTROPHE. A discovery ought never to be in vain, by leaving those who remember one another in the same sentiments they were in

before: it must produce either love or hatred in the principal, not inferior characters.

Those discoveries which are immediately followed by a change of fortune, are the most beautiful, as they never fail to produce terror or pity, which is the end and aim of tragedy. Thus, OEdipus in Sophocles, from his discovery of being the son of Jocasta and Laius, immediately from the most happy becomes the most miserable of mortals. See the article PERIPETIA.

There are several sorts of discoveries: the first, by certain marks of the body, either natural or accidental, as that of Ulysses, who having received a wound in the thigh by a boar before the trojan war, is discovered by the old nurse, upon washing his legs, after his return home incognito. The second is by tokens, and is often used by Terence. The third is by remembrance. Thus when Ulysses heard Demodocus sing his actions at Troy, the memory of them drew tears from his eyes, and discovered him to Alcious. The fourth sort is made by reasoning; but the finest of all is that which arises from the subject or incidents of the fable; as that of OEdipus, from his excessive curiosity, and the letter that Iphigenia sent by Pylades.

**DISCOUNT**, in commerce, a term among traders, merchants, and bankers. It is used by the two former on occasion of their buying commodities on the usual time of credit, with a condition that the seller shall allow the buyer a certain discount at the rate of so much *per cent. per annum*, for the time for which the credit is generally given, upon condition that the buyer pays ready money for such commodities, instead of taking the time of credit. Traders and merchants also frequently taking promissory notes for monies due, payable to them or order at a certain time; and sometimes having occasion for money before the time is elapsed, procure these notes to be discounted by bankers before the time of payment; which discount is more or less, according to the credit and reputation of the person who drew the note, and the indorser or indorsers. Bills of exchange are also discounted by bankers, and in this consists one article of the profits of banking. See the article BANK.

The *seur de la Poste* informs us, that they make a distinction in France with regard to money due for the purchase and

sale of commodities, and on account of raising money by discounting bills of exchange; the latter being computed upon the principles of common interest by so much on the 100*l.* whereas that on commodities is not only laid on the 100*l.* but on the hundred and discount added together. The best tables of discount in our language, are those of Mr. Smart, founded upon the true principles of decimal arithmetic. By these it appears, that he who allows 5*l.* for the discount of 100*l.* for one year at 5 *per cent.* wrongs himself; for he ought to receive so much money as at 5 *per cent.* interest will amount to 100*l.* in one year, and the sum is 95*l.* 4*s.* 9½*d.*

**DISCOURSE**, *discursus*, among logicians, signifies the progressive exercise of reason in the search of truth; as when from self-evident principles it discovers the truth of something it did not know before; by means of this, a second; by that second, a third; and so on. See the article REASONING.

**DISCOURS FLOWERS**, those furnished with a disc. See the article DISC.

**DISCRETE**, or **DISJUNCT PROPORTION**, is when the ratio of two or more pairs of numbers or quantities is the same, but there is not the same proportion between all the four numbers. Thus if the numbers 3:6::8:16 be considered, the ratio between 3:6, is the same as that between 8:16, and therefore the numbers are proportional; but it is only discretely or disjunctly, for 3 is not to 6 as 6 to 8; that is, the proportion is broken off between 8 and 3, and is not continued as in the following continual proportionals, 3:6::12:24. See PROPORTION.

**DISCRETE QUANTITY**, such as is not continuous and joined together. Such is a number whose parts being distinct units, cannot be united into one continuum; for in a continuum, there are no actual determinate parts before division, but they are potentially infinite.

**DISCRETIONE**, in music, intimates to play or sing with attention and care.

**DISCRETIVE PROPOSITIONS**, are those where various judgments are made and denoted by the particles *but*, *notwithstanding*, &c. either expressed or understood. Thus, *fortune may deprive me of my wealth, but not of my virtue*, is a discrete proposition.

**DISCUS**, in antiquity, an instrument used by the ancients in their public games. It is certain it was used in the gymnastic

art for preserving health and strengthening the constitution ; but as to its form, its dimensions, and various uses, authors disagree. See the article *Disc*.

The same exercise was performed with an instrument called *σολος*, which some distinguish from the discus, because that was made of iron, and the discus of stone; while others distinguish them by the form, the *σολος* being spherical, and the discus broad.

**DISCUSSION**, in matters of literature, signifies the clear treating or handling of any particular point, or problem, so as to shake off the difficulties with which it is embarrassed : thus we say, such a point was well discussed, when it was well treated of, and cleared up.

**DISCUSSION**, in a medicinal sense, the same with diaphoresis. See *DIAPHORESIS*.

**DISCUTIENTS**, in medicine, are such remedies as, by their subtilty, dissolve a stagnating or coagulated fluid, and dissipate the same without an external solution of continuity.

Discutient compositions consist of emollients and attenuants ; in which intention mercury, cinnabar, opium, and camphor are greatly recommended. Discutients ought to be carefully distinguished from suppuratives. See *DISPERSION* and *SUPPURATIVES*.

**DISDIACLASTIC CRYSTAL**, the name by which Bartholin calls a fine pellucid spar, more properly called parallelopipedum from its shape. See the articles *CRYSTAL* and *SPAR*.

**DISDIAPASON**, or **BISDIAPASON**, in music, a compound concord, described by F. Parran, in the quadruple ratio of 4 : 1, or 8 : 2.

The disdiapason is produced when the voice goes diatonically from its first to its fifteenth sound, and may be called a fifteenth. The voice ordinarily does not go farther than from its first sound to the disdiapason ; *i. e.* it does not go beyond the compound, or double octave ; for the disdiapason is an octave doubled. The voice sometimes rises several degrees above the disdiapason, but the effort or struggle disfigures it, and makes it false. In reality, the antient scale or diagram extended only to a disdiapason.

**DISDIAPASON-DIAPENTE**, a concord in a sextuple ratio of 1 : 6.

**DISDIAPASON-SEMI-DIAPENTE**, a compound concord in the proportion of 16 : 3.

**DISDIAPASON-DITONE**, a compound consonance in the proportion of 10 : 2.

**DISDIAPASON-SEMI-DITONE**, a compound concord in the proportion of 24 : 5.

**DISEASE**, in medicine, that state of a living body, wherein it is deprived of the exercise of any of its functions, whether vital, natural, or animal.

Some authors have given us compendious theories of diseases : Bontekoe deduces all human diseases from the scorbutus : Musgrave, from the arthritis ; Dr. Woodward, from the bile ; some from the venereal virus, which has lurked in the seed ever since the sin of Adam ; some from extraneous ferments, formed in or out of us ; and some from worms.

As the actions or conditions of the body, so also the diseases or defects thereof may be reduced to three general heads, *viz.* those of the solids and fluids, and those compounded of both.

The solids, *i. e.* the bones and flesh, may disordered five ways, *viz.* rendered turgid by tumors, cut by wounds, corroded by ulcers, &c. removed out of their places, or discontinued by fractions and contusions.

Diseases of the fluids are in the blood or spirits. Those of the blood are two, such as thicken and retard its motion, or such as attenuate and accelerate it. To the last kind, the fever and feverish affections only belong : all other diseases of the blood belong to the former.

The diseases of the animal spirits arise either from an intermission or retardation of their motion ; or a diminution of their quantity ; or disorder in their quality. Lastly, diseases of the fluids, whether those of the blood or spirits, are seldom long confined thereto, but presently come to disturb and impede some of the functions of the solid parts, and at last corrupt the substance of the solids themselves : hence arise compound or complicated diseases, which are infinitely various. The learned Boerhaave furnishes us with an accurate and scientific division of diseases into those of the solids and fluids, to which we refer the reader.

All diseases are owing to the bad regulation of our lives, either from too much or too little sleep, too much or too little exercise, &c. Sometimes they are caused by things without, and very often by an abuse of food ; that is, by our intemperance in eating and drinking, which is so much the more injurious to us, because it affects us inwardly. See *REGIMEN*.

Mr. Hacquet rejects the system of the materialists, who considered all diseases as

*entia nova*, or new productions, and endeavours to account for all new modifications on a destruction of proportions, or a change in the structure of parts: he supposes the pressure, structure, and convulsion of the nerves affecting the fluids, to be the principal cause of distempers; and undertakes to prove, that the first operations of poisons and infections is on the spirits, and from them communicated to the blood.

To attain a complete history of diseases, such enquiries are to be made, and circumstances known, which show the genius and state of the disease; and the operations and effects of the medicines are to be carefully observed. A particular regard must be had to the symptoms which differ strangely in all different subjects, on account of the various constitutions of different bodies. It will therefore be necessary to enquire into the age, sex, structure, and habit of the body; or the acquired habit and strength of the patient; and whether he has an hereditary disposition to this or that disease. From the different constitution of the parts, arise the different state and mechanism of the solids and fluids, and a proneness to certain diseases; as also, the variety of manners and inclinations. In childhood, there is a remarkable softness of the fibres, a lax and thin habit, with an abundance of serum; young persons have tense and contractile fibres, with more hot blood, which is more apt for motion: those that are old have a great rigidity of the solids, and a straitness of the passages, vessels, and canals, with a falso-sulphureous dyscrasy of the humours. Likewise, regard must be had to the female sex, for they are not only obnoxious to distinct diseases, which arise from disorders of the menses and child-bearing, but the system of their nerves is likewise more weak: whence they are more liable to spastic and convulsive disorders, and are more easily restored to health than men. See *MENSES, PREGNANCY, &c.* It is likewise proper to know whether the patient be of a lax or tense habit of body, whether the vessels are slender and numerous, or large and few; because in narrow and slender canals, the progressive motion of the fluids is more difficult, as well as the secretions and excretions: for these are more quick and ready when the fibres are tense, and the vessels pretty large. Whence we may observe, that they are more liable to disorders, and

grow well with more difficulty, whose fibres are more strong, and whose circulation of the fluids is more quick. The same may be said of lean and fat persons. Regard must also be had to the colour of the face and skin. A fair, florid, and clear complexion, show the purity of the lymphatic fluids; if it be livid, lurid, and yellow, they discover a salino-sulphureous impurity of the same, and a disordered secretion in the proper organs, especially in the liver. It appears from daily observation, that the debility, defects, and faults of the viscera and fibres, as well as diseases proceeding from thence, often descend to children; and the practitioner should be informed hereof: for hereditary imbecilities and weaknesses are more difficult to be cured, more readily return, and tire the physician's patience. It is likewise necessary to know the strength; whether the patient's spirits are low, especially in the beginning of an acute disease, for weaknesses and lownesses are then bad signs: but if the person is in strength and vigour, which appear from the motion and impulse of the fluids, there are great hopes of recovering health.

We are not only to examine the condition of the body, but the state of the mind, and what disorders it is liable to, because there is a wonderful connection between the mind and the body. For a greater tensility and mobility of the fibres and solids, dispose the mind to anger; whereas a laxity and defect of the vis-motrix, shows the person to be dispirited, timid, and fearful. On the other hand, anger increases the tone and contractions of the solids, and renders the fluids more impetuous; but timidity dissolves and defects the strength, whence the circulation of the fluids is more slow. Terror greatly constricts the surface and extreme parts of the body, and drives the blood to the interior and noble parts; that is, the præcordia and head; whence proceed grievous disorders, especially of the genus nervosum. The same may be said of sadness, which often proceeds from a defect of the viscera, and a faulty circulation of the fluids, as in the hypocondriac passion: but when its hurtful influence attacks the solid parts, it wonderfully defects the strength of the whole body, and hurts its functions, relaxing and lessening the strength of the fibres. See the articles *ANGER, TIMIDITY, TERROR, &c.*

If the mind is not composed, and at ease, but subject to various passions and commotions, diseases are cured with greater difficulty; therefore, enquiry is to be made whether the patient is not addicted to hard study, and to profound and fatiguing meditation: for it can hardly be imagined what a consent there is between the brain and its membranes, as well as between the stomach and the adjoining intestines. See *CONSENT of parts*.

Besides, it is necessary to consider the place where the patient lives, the nature of the air, and his usual diet. See the articles *AIR* and *DIET*.

Enquiry must be made into the kind of life: whether it be laborious or unactive, requiring exercise or sedentary; whether the person be a courtier, or a soldier; a student, or a tradesman; whether he be conversant among metals or minerals, or work at the fire: for every kind of life produceth particular diseases; thus brasiers are subject to diseases of the eyes; husbandmen, to those of the breast; makers of starch, to coughs and asthma; porters, to asthma, ruptures, and bursting of the vessels in the breast; tallow-chandlers, to diseases of the head and stomach; workers in tow, hemp, and silk, to shortness of breath; leather-dressers are generally cachectic and hydropical; runners of races are often troubled with a shortness of breath, and spit blood; carpenters are subject to sore eyes; night-men are apt to be blind; plasterers are subject to shortness of breath, and consumptions; washerwomen are liable to difficulties of breathing, and dropsies; makers of oil are cachectic and asthmatic; plumbers are subject to palsies; house-painters are generally valetudinarians, cachectic, and paralytic; fishermen have ulcers in their legs; bakers are subject to coughs, hoarseness, and lippitude, as well as a constipation of the pores; cutters of tobacco are subject to the vertigo; and the like.

Another thing to be examined is the excretions, for unless these are regular, health cannot be maintained; and therefore, if they are too plentiful, or defective and suppressed, they will cause various disorders. Regard is also to be had to perspiration, which carries off more matter than all emunctories besides. See *EXCRETION* and *PERSPIRATION*.

The practitioner should likewise enquire what diseases the patient has been subject to, at what time, and how cured; for

it often happens in the rash and imprudent cure of diseases, that terrible and dangerous symptoms are produced, and that the driving away one disease, is productive of a much worse.

Sometimes diseases are strangely complicated, inasmuch, that if the patient was affected with the hypocondriac passion, or a cachexy, scurvy, debility of the head, spitting of blood, consumption, piles, gravel, or gout, another distemper supervenes, which requires the utmost prudence, and a different method of cure.

It is likewise necessary to inquire whether the patient is plethoric, or cacochymic; what is the state of the stomach, and intestines; what is the condition of the liver, whether the circulation through it be impeded; whether the bile be duly secreted; what is the state of the lungs; and, lastly, the temperies of the brain, and nervous system, are to be considered. These things being mutually consulted, we must proceed to the disease itself, as whether it be common, or epidemic; whether the virulence appears on the skin in pustules, or otherwise. As there is no fever or other disease which has not sensible remissions and intermissions of the symptoms, the physician ought to know the state of the natural, vital, and animal functions, as well in, as out of the paroxysm.

In acute diseases, we may know the genius and force of the disorder, from the respiration, nature, and condition of the pulse; besides, as no patient dies without an inflammation and internal mortification, and as the inflammation of the stomach and membranes are produced easily in acute diseases, and in the chronic the mortifications of the viscera put a period to human life, the physician should carefully attend to these fatal symptoms, in order to manage the disease with greater certainty.

Likewise, the state of the *primæ viæ* is carefully to be examined, as whether they are replete with fordes; whether the body is costive, or otherwise, &c.

It is likewise necessary to observe the operations of the medicines, and what changes they produce, whether the force and vehemence of the symptoms mitigate or increase; or whether nothing of this kind happens. See *MEDICINE*.

Many diseases, and especially fevers of all kinds, attack the patient all at once, and are attended with particular symptoms, requiring sometimes one kind of management,

management, and sometimes another : therefore, the causes of these diseases can be nothing else but such as are common to many men, and equally affect them all. The most common of which is the unhealthy state of the air : but this alone is not sufficient for the generation of epidemic diseases ; for it is evident from observation, that, in the same climate, and the same constitution of the heavens, a disease shall infect the inhabitants of one place, and not another, as appears from the small-pox, dysenteries, and miliary fevers : wherefore, recourse must be had to the nature of exhalations from pools and marshy places, which are replete with sulphureous, vitriolic, aluminous, bituminous, saline, and other particles. Regard must likewise be had to the different way of living, and kinds of aliments, from whence the causes of epidemic diseases differ in their nature, matter, texture, power, and virtue ; and affect the structure and motion of the body in a preternatural manner : these causes and concurrent circumstances being known, an epidemic disease may be predicted, and the best methods of cure advised.

The method of distinguishing the various kinds of diseases, is affixed to our account of these diseases, as they occur under their several names, and is therefore omitted here.

**Endemic DISEASES.** See the article **ENDEMIC DISEASES**.

**Epidemic DISEASES.** See the article **EPIDEMIC DISEASES**.

**DISEMBOGUE**, in the sea-language, is said of a ship that passes out of a gulph or bay into the open sea : a river is also said to disembogue or discharge itself into the sea.

**DISERGOT**, in the manege. See the article **ERGOT**.

**DISFRANCHISING**, among civilians, signifies the depriving a person of the rights and privileges of a free citizen or subject. See **FRANCHISE**.

**DISGORING**, in the manege, the dispersing an inflammation or swelling. See the article **DISPERSION**.

**DISGUISE**, a counterfeit habit. Persons doing unlawful acts in disguise, are by our statutes sometimes subjected to great penalties, and even declared felons. Thus by an act, commonly called the black act, persons appearing disguised and armed in a forest, or grounds inclosed, or hunting deer, or robbing a warren or a fish-pond, are declared felons.

**DISH**, among miners, denotes a wooden measure, wherein they are obliged to measure their ore : it is kept by the bar-master, and contains about 672 solid inches. See **ORE**.

**DISHERISON**, a term used in old writers for disinheriting.

**DISJUNCT PROPORTION**, the same with that otherwise called discrete. See the article **DISCRETE**.

**DISJUNCTIVE**, something that separates or disjoins. Thus, *or, neither, &c.* which in connecting a discourse yet separates the parts of it, are called disjunctive conjunctions.

**DISJUNCTIVE PROPOSITION**, in logic, is that where of several predicates we affirm one necessarily to belong to the subject to the exclusion of all the rest, but leave that particular one undetermined. Such is the major of the following disjunctive syllogism.

The world is either self-existent, or the work of some finite, or of some infinite being.

But it is not self-existent, nor the work of a finite being.

Therefore it is the work of an infinite being.

**DISK**, or **DISC**. See the article **DISC**.

**DISLOCATION**, in surgery, the same with luxation. See **LUXATION**.

**DISMA**, a town of Japon, separated from Nanquesaque only by a narrow canal. The Dutch have a very fine magazine there.

**DISMEMBERED**, in heraldry, is applied to birds that have neither feet nor legs, and also to lions and other animals whose members are separated. See **MEMBERED**.

**DISMES**, *decime*, a term formerly used for tithes. See the article **TITHE**.

**DISMOUNTING**, in the military art, the act of unhorsing. Thus to dismount the cavalry, dragoons, &c. is to make them alight.

**DISMOUNTING CANNON**, is the breaking their carriages, wheels, axletrees, or any thing else, so as to render them unfit for service.

**DISORIENTATED**, a term chiefly used in speaking of dials, which have been some how altered from the situation of directly facing the east or any other of the cardinal points. See the articles **DIAL** and **DIALLING**.

**DISPARAGEMENT**, in our law, is properly used for the matching an heir in marriage under his degree, or against decency.

**DISPART**,

**DISPART**, in gunnery, is the setting a mark upon the muzzle ring, or thereabouts, of a piece of ordnance, so that a sight-line taken upon the top of the basering against the touch-hole, by the mark set on or near the muzzle, may be parallel to the axis of the concave cylinder. The common way of doing this, is to take the two diameters of the base-ring, and of the place where the dispart is to stand, and divide the difference between them into two equal parts, one of which will be the length of the dispart which is set on the gun with wax or pitch, or fastened there with a piece of twine or marlin. By means of an instrument it may be done with all possible nicety.

**DISPATCH**, a letter sent abroad by a courier on some affair of state, or other matter of importance. The business of dispatches lies upon the ministers of state and their clerks.

**DISPATCH** also signifies the packet or mail containing such letters.

**DISPAUPER**. A person suing in forma pauperis, is said to be dispaupered if, before the suit is ended, he has any lands or other estate fallen to him, or if he does any thing to make him lose his privilege. See the article **FORMA PAUPERIS**.

**DISPENSARY**, or **DISPENSATORY**, denotes a book containing the method of preparing the various kinds of medicines used in pharmacy. Such are those of Bauderon, Quercetan, Zwelfer, Charas, Bates, Mesue, Salmon, Lemery, Quincy, &c. but the latest and most esteemed are the Edinburgh and London Dispensatories. In compiling this last, the chief care of the college of physicians was to expunge the medicines no longer made use of in general practice, and to insert such as have come lately into esteem; and also to examine the articles they have retained or given admission to, both in regard to their pharmacæutic composition, and upon the genuine principles of medicine. The apothecaries in and about London are obliged to make up their compound medicines according to the formulas prescribed in the college dispensary, and are enjoined to keep always ready in their shops all the medicines there enumerated. See the article **PHARMACOPOEIA**.

**DISPENSARY**, or **DISPENSATORY**, is likewise a magazine or office for selling medicines at prime cost to the poor. The college of physicians maintain three of these in London, one at the college itself

in Warwick-lane; another in St. Peter's alley, Cornhill; and a third in St. Martin's-lane.

**DISPENSATION**, in law, the granting a license of doing some certain action that otherwise is not permitted.

The greatest dealer in dispensations is the pope, who claims the office *jure divino*, and extends it to every thing. The more moderate of the romanists themselves deny that he can give a dispensation for any thing contrary to the divine law, or the law of nature; and confine him to what is contrary to positive laws, or to things relating to fasts, marriages, holding several benefices, &c. and they limit him even in these things.

The archbishop of Canterbury has a power, by statute, of dispensing in any cause wherein dispensations were formerly granted by the see of Rome; and as well to the king as his subjects; and during the vacancy of the archbishop's see, the guardian of the spiritualities may grant dispensations. Every bishop of common right has the power of instituting into benefices, and of dispensing in common cases, &c. A dispensation of the king, makes a thing prohibited lawful to be done by the person that has it, though a thing evil in itself will not admit of a dispensation. And where the subject has an immediate interest in an act of parliament, the king cannot dispense with it; but may, if the suit be the king's own only, for the breach of a penal law that is not to the damage of a third person.

There is a dispensation by *non obstante*, which is where a statute tends to restrain some prerogative incident to the person of the king, as the right of pardoning, or commanding the service of the subjects for the benefit of the public, &c. each of which prerogatives are inseparable from the king, and therefore, by a clause *non obstante*, such a statute may be dispensed with. See the article **NON OBSTANTE**.

**DISPENSATORY**, or **DISPENSARY**. See the article **DISPENSARY**.

**DISPERSION**, in general, signifies the scattering or dissipating something. Hence, **DISPERSION**, in optics, the same with the divergency of the rays of light.

*Point of DISPERSION*, in dioptrics, the point from which refracted rays begin to diverge, where their refraction renders them divergent. See **REFRACTION**.

**DISPERSION of Inflammations**, in medicine and surgery, is the removing the inflammation.

inflammation, and restoring the inflamed part to its natural state.

Though the methods used to cure inflammations be various, according to the several causes and supervening symptoms, with other various circumstances, yet as the inflammation constantly arises from an inspissation of the blood in its smallest vessels, the grand intention of each of these methods should be, to open such small vessels as are thus obstructed, and to restore the blood to its natural consistence and free circulation.

If the cause of the inflammation is found to be external, and obvious to the senses, as thorns, splinters, the point of a sword, bullets, or any other foreign body stuck into the part, nothing can be more serviceable than speedily and carefully to remove whatever is lodged there, if it can be done with safety. So also, when the inflammation proceeds from too strait a bandage in wounds, &c. or from a luxation or fracture, the first and principal business is speedily to remove the bandage, or else set the fracture, or reduce the luxation.

When the external causes are once removed, and when the inflammation is great, and proceeds from internal causes, it is in both cases very useful to open a vein, either in the arm or foot, and to draw off a large quantity of blood proportionable to the strength and habit of the patient; giving afterwards a brisk purge, not one that heats the body, but judiciously accommodated to the age and constitution of the patient; and if the symptoms do not remit and grow milder, they must be repeated at discretion.

To resolve and attenuate the inspissated blood in the small vessels, benefit may arise from internal medicines, which are watry, diluent, cooling, and attenuating; but aliments which are of a difficult digestion, such as pickled or salted meats, with all spices and fermented liquors, or any thing else that may heat the blood, are to be altogether avoided. With regard to the regimen and diet, the most proper aliment seems to be broths and drinks, made with barley, oats, or flour; also viper's grass, succory, chervil, forrel, endive, apples, and vegetables of the like nature.

With regard to external medicines, it must be generally observed never to apply hot remedies to hot constitutions, nor the contrary. Among the domestic medicines cow's dung, fresh and warm,

mixt with warm vinegar, is an application of no small efficacy: the external medicines should always be applied hot, and the disordered limb first well rubbed with a cloth dipped in some warm discutient fomentation, before any fresh cataplasm be laid on. Of the cooling external medicines proper in this case, are the litharge vinegar, applied warm on linnen rags folded together; or hot vinegar mixt with red-lead, or with bole-armoniack, and applied in the same manner. Among the hot remedies for cold constitutions, are spirit of wine alone; or camphorated spirit; or either of these, with an admixture of a small quantity of venice-treacle applied on a linnen cloth; also spirit of wine mixed with lime-water, or even lime-water alone; or hungary-water with lapis calaminaris, cerus, sal armoniac; or a mixture of a pint of rectified spirit of wine with two ounces of castile soap.

**DISPLAYED**, in heraldry, is understood of the position of an eagle, or any other bird, when it is erect, with its wings expanded or spread forth. See plate LXXIII. fig. 5.

**DISPONDEE**, *dispondeus*, in the greek and latin poetry, a double spondee or foot, consisting of four long syllables, as *θάρμαζόντων*, *mæcênâtes*, *conclûdêntes*.

**DISPOSITION**, in architecture, the just placing the several parts of an edifice, according to their proper nature and office. See the article **BUILDING**.

**DISPOSITION**, in rhetoric, the placing words in such an order as contributes most to the beauty and sometimes even to the strength of a discourse.

Nature formed man with a taste which makes him sensible of harmony and cadence: for this we need only consult nature, study the genius of the language and sound, and, as it were, interrogate our ears: for let a thought be ever so beautiful in itself, if the words which express it are ill placed, the delicacy of the ear is shocked at it; a harsh and unharmonious composition grates it, whereas it is generally flattered with that which is soft and flowing. There are no expressions, however harsh they may appear in themselves, but may contribute to the harmony of a discourse, when judiciously ranged. Isocrates was the first among the Greeks that made them sensible of the beauty of disposition, as Cicero did the Romans.

**DISPRO-**

**DISPROPORTION**, a general term for any kind of irregularity, or want of proportion in the parts of a thing. See the article **PROPORTION**.

**DISPROVING**, in rhetoric and logic, the same with refutation. See the article **REFUTATION**.

**DISPUTATION**, in the schools, a contest, either by word or writing, on some point of learning for a degree, prize, or for an exercise. See **DEGREE** and **THESIS**.

**DISQUISITION**, a serious and exact examination into the circumstances of any affair, in order to discourse clearly about it. See **REASONING**.

**DISS**, a market-town of Norfolk, on the river Waveny, sixteen miles south of Norwich.

**DISSECTION**, in anatomy, the cutting up a body, with a view of examining the structure and use of the parts. See the article **ANATOMY**.

Le Gendre observes, that the dissection of a human body, even dead, was held a sacrilege till the time of Francis I. and the same author assures us, he has seen a consultation held by the divines of Salamanca, at the request of Charles V. to settle the question whether or no it were lawful in point of conscience to dissect a human body in order to learn the structure thereof.

It is easily perceived that surgery and physic must improve in a country, according to the opportunities of enquiring into the structure of the animal oecconomy; for which reason we could wish that students in anatomy were furnished with subjects for dissection in this country, in as great abundance, and with as little inconvenience, as in France.

**DISSEISIN**, in law, an unlawful dispossessing a person of his lands or tenements. It is of two sorts, either single disseisin, which is committed without force of arms, or disseisin by force of arms, more properly termed forcement. See the article **DEFORCEMENT**.

The disturbing a person from entering on his land, or hindring him from tilling it, are both disseisins of land; and denial of rent, when lawfully demanded, is a disseisin of the rent.

If a disseisor, after he has expelled the right owner, gains peaceable possession of the lands five years without claim, and continues in possession so as to die seised, and the land descends to his heirs, they will have a right to the possession

till the owner recovers at law; and here the owner shall lose his estate for ever, if he do not prosecute his suit within the time limited by the statute of limitations.

**DISSEISOR**, a person who is guilty of disseisin. See the preceding article.

**DISSENTIERS**, separatists from the service and worship of the church of England.

At the revolution a law was enacted, that the statutes of queen Elizabeth and king James I. concerning the discipline of the church, should not extend to the protestant dissenters. Persons dissenting, however, are to subscribe the declaration of 30 Car. II. cap. 1. and take the oaths of fidelity, &c. Besides, they are not to hold their meetings till their place of worship is certified to the bishop, or to the justices of the quarter sessions, and registered. Also they are not to keep the doors of their meeting-houses locked during the time of divine service. And to secure to them the free exercise of their religion, whoever disturbs or molests them in the performance of divine worship, on conviction at the sessions is to forfeit twenty pounds by the statute 1 William and Mary. Unless dissenters conform and receive the sacrament as administered by the church of England, they are excluded from holding any public places under the government.

The dissenters tolerated by law, may be reduced to four classes, *viz.* presbyterians, independants, anabaptists, and quakers; to which may be added another sect, which some years ago obtained a toleration in this country, namely, the unitas fratrum, or moravians. See the articles **PRESBYTERIANS**, **ANABAPTISTS**, &c.

**DISSIMILAR**, in general, an appellation given to things which are unlike: thus the seminal or first leaves of plants, are called dissimilar, as being generally of a different figure from those of the grown plants.

**DISSIMILAR PARTS**, in anatomy, those compounded of parts of various structure, such are all the limbs of the body.

**DISSIMILITUDE**, in general, denotes whatever constitutes the difference between two dissimilar things. See the articles **DISSIMILAR** and **SIMILITUDE**.

**DISSIMILITUDE**, in rhetoric, an argument wherein from dissimilar or unlike things, other dissimilars are deduced, as in the following argument from Catulla.

*Soles occidere & redire possunt.*

*Nobis cum semel occidit brevis lux,*

*Nox est perpetua una dormienda.*

*Voss. de institut. orator.*

**DISSIPATION**, in physics, an insensible loss or consumption of the minute parts of the body; or, that flux whereby they fly off, and are lost. See **EFFLUVIA**.

**Circle of DISSIPATION**, in optics, is used for that circular space upon the retina, which is taken up by one of the extreme pencils or rays issuing from an object.

To understand this, it is to be observed, that when the distance of an object from the eye is too small or too great for perfect or distinct vision, the rays of each pencil, issuing from the object, cannot be united at a point on the retina, but beyond it, or before they arrive at the retina; consequently, the rays of each pencil will occupy a circular space upon the retina, and this circle is called the circle of dissipation, because the rays of a pencil, instead of being collected into a central point, are dissipated all over this circle.

The consideration of the circles of dissipation, formed by the rays coming from the extremities of objects, is of use to account for several curious phenomena of vision. *Smith's optics.*

**DISSOLVENT**, in general, whatever dissolves or reduces a solid body into such minute parts as to be sustained in a fluid.

The principal dissolvents for metals, are aqua-regia and aqua-fortis; for salts, earths, and gums, water; for coral, and other alkaline substances, distilled vinegar or spirits of wine. See the article **AQUA-REGIA**, &c.

Dissolvents are the same with what the chemists call menstrua. See the article **MENSTRUUM**.

**Universal DISSOLVENT**. See the article **ALKAHEST**.

**DISSOLUTION**, in chemistry, the same with solution. See the articles **SOLUTION** and **MENSTRUUM**.

**DISSOLUTION**, in music, is when a sound in the enharmonic genus is lowered three dièses; for thereby that genus is dissolved, and the music, or that interval at least, is chromatic.

**DISSONANCE**, in music, the same with discord. See the article **DISCORD**.

**DISSYLLABLE**, among grammarians, a word consisting only of two syllables; such are nature, science, &c.

**DISTAFF**, an instrument about which flax is tied in order to be spun.

**DISTANCE**, in general, an interval between two things, either with regard to time or place.

**Accessible DISTANCES**, in geometry, are such as may be measured by the chain, &c. See **CHAIN**, **THEODOLITE**, &c.

**Inaccessible DISTANCES**, are such as cannot be measured by the chain, &c. by reason of some river, or the like, which obstructs our passing from one object to another. Inaccessible distances may be measured in the following manner: suppose it were required to measure the distance between the station A (plate LXXIII. fig. 6. n° 1.) and the object at C. Assume another station as B, from whence the object may be seen. Then, with any proper instrument, take the angles CAB, and CBA, and measure the distance AB. Then, in the triangle ABC are given three angles, and the distance AB, whence the distance AC required may be easily found, thus: as the sine of the angle C: the distance AB :: the sine of the angle B: AC required.

But small inaccessible distances may be measured from one station, in the following manner. Let AB (*ibid.* n° 2.) represent an inaccessible distance to be measured; set up perpendicular a stick CA, of a known length, place the center of your quadrant C, on the top of the stick; and look through the sights of it till the visual ray points to the object at B. Then in the right angled triangle BAC, are given the perpendicular AC, and the angle ACB, and therefore, if AC be supposed the radius, the required side will be the tangent to the given angle ACB; whence to find AB it will be as the radius to AC, so is the tangent of the angle ACB, to AB required.

**DISTANCE**, in navigation, the number of minutes or leagues a ship has sailed from any given place or point.

**DISTANCE**, in astronomy. The distance of the sun, planets, and comets, is only found from their parallax, as it cannot be found either by eclipses or their different phases: for from the theory of the motions of the earth and planets we know, at any time, the proportion of the distances of the sun and planets from us; and the horizontal parallaxes are in a reciprocal proportion to these distances. See the article **PARALLAX**.

The mean distances of the planets from the sun, in british miles, are as follow.

Mercury	32,000,000	} miles distant from the sun.
Venus	59,000,000	
The Earth	81,000,000	
Mars	123,000,000	
Jupiter	424,000,000	
Saturn	777,000,000	

The distance of the fixed stars, as having no sensible parallax, can be little more than guessed at.

The distances of the secondary planets, from their respective primary ones, are as follow.

The moon is distant from the earth 60 semi-diameters and a half of the earth, from its center, or 240,000 miles.

The first moon of jupiter is at the distance of  $5\frac{1}{10}$  semi-diameters of jupiter's body from his center, as measured with a micrometer.

The second at the distance of 9 semi-diameters.

The third at the distance of  $14\frac{3}{10}$  semi-diameters.

The fourth at the distance of  $25\frac{1}{10}$  semi-diameters.

The first saturnian moon is at the distance of near 2 semidiameters of saturn's ring from its center.

The second at the distance of  $2\frac{2}{3}$  semi-diameters of the ring.

The third at the distance of  $3\frac{2}{3}$  semi-diameters.

The fourth at the distance of 8 semi-diameters.

The fifth at the distance of  $23\frac{7}{10}$  semi-diameters. See DIAMETER.

**Curtate DISTANCE**, the distance of the planet's place, reduced to the ecliptic, from the sun. See the article CURTATE.

**DISTANCE of the eye**, in perspective, is a line drawn from the eye to the principal point. See PERSPECTIVE.

**DISTANCE of the bastions**, in fortification, is the side of the exterior polygon. See the article POLYGON.

**DITASTE** properly signifies an aversion or dislike to certain foods, and may be either constitutional, or owing to some disorder of the stomach; in which last case emetics are recommended.

**DISTEMPER**, among physicians, the same with disease. See the article DISEASE.

**DISTEMPER**, in painting, a term used for the working up of colours with something besides water or oil. If the colours are prepared with water, that kind of painting is called limning; and if with oil, it

is called painting in oil, and simply painting. If the colours are mixed with size, whites of eggs, or any such proper glutinous, or unctuous matter, and not with oil, then they say it is done in distemper. In this manner the admirable cartoons at Hampton-court are painted. The greatest disadvantage of distemper is, that it has no glittering, and all its colours look dead, by which means they appear alike in all sorts of lights, which oil colours, or even colours in distemper, when varnished, do not.

**DISTEMPER**, or **DISTEMPER** of trees. See the article TREE.

**DISTENSION**, in general, signifies the stretching or extending a thing to its full length or breadth.

**DISTENSION**, *distensio*, among antient musicians, is used in a synonymous sense with Interval. See INTERVAL.

**DISTICH**, *distichon*, a couplet of verses making a complete sense. Thus hexameter and pentameter verses are disposed in distichs.

There are excellent morals in Cato's Distichs.

**DISTICHIASIS**, in surgery, a disease of the eye-lids, when under the ordinary eye-lashes there grows another extraordinary row of hair, which frequently eradicates the former, and pricking the membrane of the eye, excites pain, and brings on a defluxion.

It is cured by pulling out the second row of hairs with nippers, and cauterizing the pores out of which they issued.

**DISTILLATION**, in chemistry, the act of drawing off the spirituous, aqueous, oleaginous, or saline parts of a mixed body from the grosser and more terrestrial parts by means of fire, and collecting and condensing them again by cold. The end of distillation is of two kinds: the first, and by far the most general, is for the separation of some acquired bodies, from others with which they were mixed, as in the case of vinous and volatile spirits, and essential oils: the other is for the quicker and more effectual combination of such bodies, whose mixture is assisted by a boiling heat, as in the case of spirit. nitr. dulc.

Distillation is performed by several kinds of apparatus, for all which the general name is an alembic; to form each kind whereof, two or more vessels are conjoined, viz. a proper reservoir to contain the matter while the heat acts upon it, a refrigerant to condense the vapour as it

rises, and a receiver to contain it when condensed. See ALEMBIC, RETORT, and RECEIVER.

Distillation is usually performed by means of fire, raised to a greater or less degree of heat, as circumstances require. And the fire is either applied immediately to the vessels in which the matters are to be distilled; or it is applied mediately by means of water, sand, iron-filings, &c. Hence these different methods are called *balneum marie*, *balneum arenorum*, &c. See the article BALNEUM.

Distillation is either *per ascensum*, by ascent, or *per descensum*, by descent. In the former, the matter to be distilled is above the fire, and the spirit or other principle is raised from it. In the latter, the matter to be distilled is below the fire, and the vapour drawn from it is precipitated to the bottom of the vessel.

Distillation by ascent is either right, performed with a common alembic, wherein the liquor is raised perpendicularly, and descends again in form of drops into a receiver, being chiefly used when the texture of the body allows of an easy ascent, as in vegetables; or oblique, performed laterally, as in distillation by the retort; the use of this is for bodies, as almost all minerals and metals, which cannot be raised without a strong impulse, nor even by the strongest, so high as the top of the alembic.

The process and measures of distillation are very different, according to the different subjects to be distilled. Acid spirits are usually drawn in a reverberatory furnace, and with a vehement fire: ponderous woods, as guaiacum, box, &c. are distilled in a retort after the same manner. Odoriferous plants, as baum, wormwood, sage, hyssop, &c. are distilled by the cucurbit, or vesica, first pouring a strong decoction of the same plant hot upon the plant itself bruised, or adding common water to the plant, whether dry or fresh, cut into small pieces, and letting the whole digest in a close vessel for two days. In distilling plants that are not odoriferous, pound the plant, and then fill two thirds of the vesica or alembic with it; after which pour a good quantity of the expressed juice of the same plant upon it, so as the bruised matter may float therein, without sticking any where to the vessel; then draw off about half as much water as there was juice, which is the distilled water of the plant: if what remains be passed in a cloth, and the settled juice

be filtrated and evaporated to two thirds, then setting it in a cool place, the essential salt shoots into crystals.

The precautions to be used in regard to distillation, are, 1. To leave sufficient room in the containing vessel for the expansion and ebullition of the matter to be distilled, otherwise it is very apt to overflow in the neck, and break the vessels if of glass, hazard the firing of the building in case of vinous spirits, and frustrate the operation in all. 2. To take care that the condensing surface be sufficiently large, and the heat accommodated to it; for if an error of this kind occur in the case of the worm-still, the head will be blown off, and the vapour dissipated with considerable loss; and in that of vinous spirits, whoever may happen to be in the place will be in very great danger. 3. It is necessary in distillation, as well as in digestion, to avoid luting the vessels too closely with any tenacious substance; for if a sufficient vent be not left for the escape of the air which is generated during the distillation of some substances, as also for the expansion which attends the increase of heat of that air which is included in the vessels at the time of their junction, the vessels will be in extreme danger of being burst with great violence.

*The method of distilling malt-wash, or a fermented mixture of meal and malt, for spirit.* Fill two thirds of a still, first moistened by the steam of boiling water, with malt-wash, immediately clap on the head, and lute it down, there will soon run a spirituous inflammable liquor. Thus is obtained what the malt-distillers call a malt low-wine; what comes over after the spirit falls off from being proof, is called faints. This experiment may be rendered general, with slight variation; for if any wine, beer, or fermented liquor from sugar, treacle, or fruits, &c. be thus treated, it affords a spirit differing only according to the nature of the subject: but none of them will afford the least inflammable spirit without a previous fermentation. The requisite cautions for success, are, 1. That the fermentation be well performed. 2. That it be gently distilled, with a soft well regulated fire. 3. That the grosser oil, apt to rise along with the spirit, be let out by flannel under the nose of the worm. These cautions observed, the low-wines will be pure and vinous.

*The method of distilling the lower wines into proof spirits for sale.* The lower wines of

of the last process, distilled in a bath-heat, give a higher rectified spirit than before, which being let down with fair water to a certain size or standard, called proof, is what the malt-distillers understand by proof-goods, or their rectified malt-spirit.

The inconveniencies of this art, on account of the many large vessels required, which increase the labour and price of the commodity, might perhaps be remedied by the introduction of a new art, subservient to the malt-distillers, and confined to the boiling down the malt-wort to a rob; wherefore it were to be wished that those who were skilled in this branch of distillation would try whether a spirit superior to that of treacle may not be procured from the rob of malt, prudently prepared and fermented. See the article RECTIFICATION.

*Combinatory DISTILLATION*, a term used by Dr. Shaw, to express that sort of rectification of distilled spirits, which is done with additions, and which he otherwise calls *improper rectification*, by way of distinction from that called proper rectification which is only the method of reducing a spirit to its utmost degree of purity and perfection. Malt-spirit is the general subject of combinatory distillation, and the means to rectify it on this plan may be reduced to three heads: 1. That by fixed alkaline salts alone. 2. That by fixed alkaline salts and acid spirits. And, 3. That by saline bodies and flavouring additions. The effect of this operation, when carefully performed, is to attenuate and thin the spirit, and to keep back a part of its gross and fetid oil, and so far to alter the part of the oil which comes over, as scarce to leave the spirit distinguishable from a malt spirit.

The salts used on this occasion are either the fixed alkalies, as potash and calcined tartar, or decrepitated common salt, or calcined vitriol, alum, or sandiver. The most common flavourers are mace, orris-root, parsnips, artichokes, rhodium, raisin-stalks, damask roses, wine lees, rape or grape husks, and the oil of wine, which is infinitely preferable to all the others, but is not so well known. The ultimate perfection aimed at in all the processes of combinatory distillation, is the depurating the english malt-spirit at one operation, so as to render it tasteless and inodorous and yet vinous; or else to make it resemble the french brandy, arrack, or some other low-flavoured vinous spirits.

**DISTILLED**, something that has undergone the action of distillation: thus we say distilled water, distilled vinegar, &c. See the preceding article.

**DISTILLER**, he who makes distillations, and commonly denotes a tradesman who makes spirits from malt, &c.

Distillers are to make an entry of all warehouses for keeping brandy, on pain of 20 l. and forfeiture of the liquor; and no brandy shall be sold but in places entered, under penalty of 40 s. a gallon.

By stat. 24 Geo. II. distillers who shall knowingly sell spirituous liquors to be unlawfully retailed, or to any unlicensed retailer, forfeit 10 l. and treble the value of the liquors so sold and delivered; and such unlawful retailer, discovering and convicting the distiller, is intitled to his share of the penalty, and indemnified against the penalties incurred by himself. The same act further provides, that no person whatsoever shall recover, either in law or equity, any debt for spirituous liquors under 20 s. contracted at one time; nor shall any item in any account for such be allowed, where the value of such item shall not amount to 20 s. at the least. Distillers are also to give notice to the gauger, before they receive any fermented wash, of the quantity, &c. under penalty of 50 l. They are also to make entry of all vessels for distillation, under the same penalty of 50 l. and forfeit 20 l. for defacing the gauger's mark.

**DISTILLERY**, the art of distilling brandies, and other spirits. See the article DISTILLATION.

To this art likewise belong the peculiar processes of brewing and fermentation, the knowledge of proper additions, and the rectification of spirits. See the articles BREWING, FERMENTATION, ADDITIONS, and RECTIFICATION.

**DISTINCT NOTION**, or **IDEA**, is that wherein the mind perceives a difference from all other ideas.

It will be useful, says Mr. Locke, to distinguish ideas as they are perceptions in our minds, from what they are in the bodies that cause such perceptions in us; for we are not to think the former exact images and resemblances of something inherent in the subject, most of those of sensation being in the mind no more the likeness of something existing without us, than the names that stand for them are the likeness of our ideas, which yet upon hearing they are apt to excite in us.

**DISTINCT BASE**, in optics, is that distance from

from the pole of a convex glass, in which objects beheld through it appear distinct and well described, so that it is the same with the focus. See FOCUS.

The distinct base is caused by the collection of the rays that proceed from a single point in the object into a single point in the representation; and therefore concave glasses which dissipate the rays, can have no real distinct base.

**DISTINCTION**, in logic, is an assemblage of two or more words, whereby disparate things, or their conceptions, are denoted. There are three kinds of distinctions taken from the three different modes of existence, real, modal, and rational. The first is that between two substances, or the modes of two substances. The second, or modal distinction, is that between several things, one whereof may exist without the other, but not *vice versa*, the other without that. The third, or rational distinction, is that between several things which are really one and the same, and whereof one cannot exist without the other; nor *vice versa*, the other without this: such is that between a thing and its essence, between the essences and properties, &c. Of this distinction some authors admit two kinds, the one barbarously called *rationis ratiocinata*, having some foundation in things, as when we distinguish the justice of God from his mercy; the other called *rationis ratiocinantis*, which has no foundation at all, and therefore is by many rejected. *Chauvin.*

**Metaphysical DISTINCTION** is the non-agreement of being, whereby this entity is not that, or one thing is not another. See ESSENCE.

**DISTINCTION**, *distinctio*, or *distinguo*, is also used, in the schools, as an expedient to evade an argument, or to clear up and unfold an ambiguous proposition, which may be true in one sense, and false in another: as we say, The respondent was hard pressed, but he disengaged himself by a *distinguo*. *Trevoux.*

**DISTORTION**, in medicine, a contraction of one side of the mouth, occasioned by a convulsion of the muscles of one side of the face: and it is likewise used to denote any part of an animal body, when it is ill placed or ill favoured. It is very justly observed, that this terrible malady to the human shape has often been the mere effect of carelessness and ill habits.

**DISTORTOR ORIS**, in anatomy, a muscle otherwise called *zygomaticus*. See the article ZYGOMATICUS.

**DISTRACTION**, *distractio*, in chemistry, a forcible division of substances from each other, which were before united, either by separation or calcination.

**DISTRACTION**, in medicine, sometimes denotes the act of pulling a fibre, membrane, or the like, beyond its natural extent.

**DISTRAINING**, in law, the same with attaching. See the article ATTACHING.

**DISTRESS**, in law, the seizing or distraining any thing for rent in arrear, or other duty unperformed.

The effect of this distress is to compel the party either to replevy the things distrained, and contest the taking, in an action of trespass against the distrainer; or rather to oblige him to compound and pay the debt or duty, for which he was so distrained.

There are likewise compulsory distresses in actions, to cause a person appear in court; of which kind there is a distress personal of one's moveable goods, and the profits of his lands, for contempt in not appearing after summons: there is likewise distress real, of a person's immoveable goods. In these cases none shall be distrained to answer for any thing touching their freeholds, but by the king's writ.

Distress may be either finite or infinite: Finite distress is that which is limited by law, in regard to the number of times it shall be made, in order to bring the party to a trial of the action. Infinite distress is that which is without any limitation, being made till the person appears: it is farther applied to jurors that do not appear, as upon a certificate of assize, the process is *venire facias*, *habeas corpus*, and distress infinite.

It is also divided into grand distress and ordinary distress: of these the former extends to all the goods and chattels that the party has within the county. A person, of common right, may distrain for rents and all manner of services; and where a rent is reserved on a gift in tail, lease for life, or years, &c. though there be no clause of distress in the grant or lease, so as that he has the reversion: but on a feoffment made in fee, a distress may not be taken, unless it be expressly reserved in the deed.

**DISTRIBUTION**, in a general sense, the act of dividing a thing into several parts, in order to the disposing each in its proper place.

**DISTRIBUTION**, in architecture, the dividing and dispensing the several parts and pieces which compose a building, as the plan directs. Dis-

**DISTRIBUTION** of ornaments, is an equal orderly placing of the ornaments in any member of architecture.

**DISTRIBUTION**, in logic, is a kind of division which distinguishes an universal whole into its several kinds of species; as division is to distinguish an integral whole into its several parts.

The rules of a good distribution are much the same as those of division. See the article **DIVISION**.

**DISTRIBUTION**, in rhetoric, a kind of description, whereby an orderly division and enumeration is made of the principal qualities of the subject. David supplies us with an example of this kind, when in the heat of his indignation against sinners, he gives a description of their iniquity, " Their throat is an open sepulchre; they flatter with their tongues; the poison of asps is under their lips; their mouth is full of cursing and lies; and their feet are swift to shed blood."

**DISTRIBUTION**, in printing, the taking a form asunder, separating the letters, and disposing them in the cases again, each in its proper cell. See **PRINTING**.

**DISTRIBUTIVE JUSTICE**, is that whereby we give every person what properly belongs to him.

**DISTRIBUTIVES**, in grammar. See the article **NUMERALS**.

**DISTRICT**, in geography, a part of a province, distinguished by peculiar magistrates, or certain privileges; in which sense it is synonymous with hundred. See the article **HUNDRED**.

It is also used to denote the territory belonging to a city, town, or borough; or the extent of a judge's jurisdiction. See **TERRITORY** and **JURISDICTION**.

**DISTRINGAS**, in law, a writ commanding the sheriff, or other officer, that he distrain a person for debt to the king, &c. or for his appearance at a certain day. There is a great diversity of this writ.

**DISTRINGAS JURATORES**, a writ directed to the sheriff, whereby he is commanded to distrain upon a jury, to appear, and to return issues on their lands, &c. for non appearance. This writ of distringas juratores issues for the sheriff to have their bodies in court, &c. at the return of the writ.

**DISVELLOPED**, in heraldry, is used much in the same sense with displayed, as flying colours are said to be disvelloped.

**DISUNITE**, in the manege, is said of a horse that drags his haunches in galloping.

**DITCH**, in country-affairs, a narrow channel or trench made for draining marshy grounds, the conveyance of water, or inclosing fields.

Ditches for draining must be more or less deep and wide, according as there is more or less water to be carried off. Ditches used about inclosures are five or six feet wide, and proportionably deep, where there is no quick-set hedges; but where these are set on the banks, they are only three feet wide at the top, one at the bottom, and two deep: the slope is of great advantage, as by means of it the sides of the ditch are prevented from being washed down. See **DRAIN** and **INCLOSURE**.

**DITCH**, in fortification, the same with moat. See the article **MOAT**.

**DITHYRAMBIC**, something belonging to the dithyrambus, as a dithyrambic verse, a dithyrambic poet, &c. See the next article.

The dithyrambic poetry was very bold and irregular, for the poets not only took the liberty to forge new words for the purpose, but made double and compound words, which contributed very much to the magnificence of this sort of poetry.

**DITHYRAMBUS**, in ancient poetry, a hymn in honour of Bacchus, full of transport and poetical rage.

This poetry owes its birth to Greece, and to the transports of wine; and yet art is not quite exploded, but delicately applied to guide and restrain the dithyrambic impetuosity, which is indulged only in pleasing flights. Horace and Aristotle tell us, that the ancients gave the name of dithyrambus to those verses wherein none of the common rules or measures were observed. As we have now no remains of the dithyrambus of the ancients, we cannot say exactly what their measure was.

**DITMARSH**, a territory in the dutchy of Holstein. See **HOLSTEIN**.

**DITONE**, in music, an interval comprehending two tones. The proportion of the sounds that form the ditone is 4:5, and that of the semiditone is 5:6. F. Parra makes the ditone the fourth kind of simple concord, as comprehending two tones, according to Aristotle, a greater and a less. Others make it the first discord, dividing the ditone into eighteen equal parts, or commas; the nine on the acute side making the greater tone, as asserted by Salmon de Caux.

**DITRIGLIPH**, in architecture, the space between two triglyphs. See **TRIGLYPH**.

**DITRIHEDRIA**,

**DITRIHEDRIA**, in mineralogy, a genus of spars with twice three sides, or six planes, being formed of two trigonal pyramids joined base to base, without any intermediate column. See SPAR.

The species of ditrihedria are distinguished by the different figures of these pyramids.

**DITTANY**, *distamnus*, in botany, &c. See the article **DICTAMNUS**.

**DITTO**, usually written **D°**, in books of accounts, an Italian word, signifying *the aforementioned*.

**DIVAL**, in heraldry, the herb nightshade, used by such as blazon by flowers and herbs, instead of colours and metals, for sable, or black.

**DIVALE**, in botany, a name sometimes used for the solanum lethale, or deadly nightshade. See **SOLANUM**.

**DIVALIA**, the same with angeronalia. See the article **ANGERONALIA**.

This feast was instituted on occasion of a disease which destroyed man and beast. It was held on December 21. when the pontiffs performed sacrifice in the temple of Volupia, or the goddess of joy and pleasure, and was the same with Angerona, supposed to drive away all sorrows and chagrins in life.

**DIU**, a little island and town on the coast of Guzurat, in the hither India, and subject to Portugal: east long. 69°, north lat. 21° 15'.

**DIU** is also a town of Bulgaria, upon the Danube.

**DIVAN**, a council chamber, or court of justice, among the eastern nations, particularly the Turks.

**DIVAN-BEGHI**, the superintendant of justice in Persia, whose place is the last of the six ministers of the second rank, who are all under the athemadauler, or first minister. To this tribunal of the divan-beghi he appeals from sentences passed by the governors: he has a fixed stipend of 50,000 crowns for administering justice. All the serjeants, ushers, &c. of the court, are in his service: he takes cognizance of the criminal causes of the chams, governors, and other great lords of Persia, when accused of any fault. There are divan-beghi's not only at court, and in the capital, but also in the provinces, and other cities of the empire. The alcoran is the sole rule of his administration of justice, which also he interprets at pleasure. He takes no cognizance of civil causes, but all differences arising between the officers of the king's

household, and between foreign ministers, are determined by him.

**DIVANDUROW**, the name of seven islands which lie a league north of the Maldives, and twenty-four from the coast of Malabar, almost opposite to Cananor.

**DIVAR**, an island in the Indian sea, situated north of Goa. It belongs to the Portuguese.

**DIVER**, *colymbus*, in ornithology, the English name of a genus of birds, for the characters of which see **COLYMBUS**. Of this genus there are a great many beautiful species. The speckled diver, about the bigness of a tame duck, is represented in plate LXXIV. fig. 1. n° 1. The hinder part of the neck is of an ash colour; the back and wings are black, spotted with white; the throat is black, and belly white. This is thought to be the cock of the red-throated duck, or loon, represented *ibid.* n° 2. The upper part of the body of this last is of a dark grey colour, the quill feathers of the wings approaching to black: the legs and feet of both are of a blackish colour.

**DIVERGENT**, or **DIVERGING LINES**, in geometry, are those which constantly recede from each other.

**DIVERGENT RAYS**, in optics, are those which going from a point of the visible object, are dispersed, and continually depart one from another, in proportion as they are removed from the object: in which sense it is opposed to convergent. See the article **CONVERGENT**.

Concave glasses render the rays divergent, and convex ones convergent.

Concave mirrors make the rays converge, and convex ones make them diverge. See **CONCAVE** and **CONVEX**.

**DIVERGENT**, or **DIVERGING HYPERBOLA**, one whose legs turn their convexities towards one another, and run outwards quite contrary ways. See **HYPERBOLA**.

**DIVERGING SERIES**. See **SERIES**.

**Point of DIVERGENCY**. See the article **VIRTUAL FOCUS**.

**DIVERSIFYING**, among orators, is the handling a subject different ways, in order to throw new light on it, and enforce it the stronger on the hearers.

According to Vossius, there are six ways of doing this: 1. By enlarging on what was said before. 2. By recapitulating. 3. By adding something new. 4. By repeating the principal heads. 5. By urging the same arguments, only in a different order. 6. By imitating them.

**DIVER-**

DIVERS.

T. Jefferys sculp.

**DIVERSION**, in military affairs, is, when an enemy is attacked in one place where they are weak and unprovided, in order to draw off their forces from another place, where they have made, or intend to make, an irruption. Thus the Romans had no other way in their power of driving Hannibal out of Italy, but by making a diversion, in attacking Carthage.

**DIVERSION**, in physic, is when by means of medicines, an attempt is made to give a different turn to the flux of humours: thus blood-letting makes a great diversion.

**DIVERSITY**, in logic, stands in opposition to identity. See **IDENTITY**.

**DIVERSITY**, in painting, consists in giving every part or figure in a piece, its proper air and attitude.

The skilful painter has the penetration to discern the character of nature, which varies in all men. whence the countenances and gestures of the persons he paints continually vary.

**DIVESTING**, or **DIVESTITURE**, in law, is used for the act of surrendering one's effects. By a contract of donation, or sale, the donor, or seller, is said to be disseised and divested of his property, in such a commodity. In this sense it stands contradistinguished from investiture, where the donee or purchaser becomes invested with the property of the donor or seller. See the articles **INVESTITURE** and **DISSEISIN**.

**DIVIDEND**, in arithmetic, the number proposed to be divided into equal parts. It must always be greater than the divisor. See the articles **DIVISOR** and **DIVISION**.

**DIVIDEND**, in the Exchequer, is one part of an indenture, as used in the stat. 10 Ed. I. c. 11.

**DIVIDEND**, in law proceedings, is taken for a dividing of fees and perquisites between officers of courts, arising from writs, &c.

**DIVIDEND of Stocks**, is a share, or proportion of the interest of stocks erected on public funds, as the south-sea, &c. divided among, and paid to the adventurers half yearly.

Stealing of any dividend warrants of the Bank, South-sea company, East-india company, or of any other corporation, is made felony with or without benefit of clergy, in the same manner as if the offender had stolen, or taken by robbery, goods to the value of the

money due on such dividend warrants. Stat. 2 Geo. II. c. 25. S. 3.

**DIVIDEND**, in the university, signifies that part or share which every one of the fellows equally divide among themselves of their yearly stipend. See the articles **FELLOW** and **UNIVERSITY**.

**DIVINATION**, the knowledge of things obscure, or future, which cannot be attained by any natural means.

It was a received opinion among the heathens, that the Gods were wont to converse familiarly with some men, whom they endowed with extraordinary powers, and admitted to the knowledge of their councils and designs. Plato, Aristotle, Plutarch, Cicero, and others, divide divination into two sorts, or species, *viz.* natural and artificial. The former was so called, because not attained by any rules or precepts of art, but infused or inspired into the diviner without his taking any further care about it, than to purify and prepare himself for the reception of the divine afflatus. Of this kind were all those who delivered oracles, and foretold future events by inspiration, without observing external signs or accidents. The second species of divination was called artificial, because it was not obtained by immediate inspiration, but was the effect of experience and observation. Such was soothsaying, as depending upon human art and invention, which however was supposed not to be altogether destitute of divine direction and concurrence, and such was divination by lots. Of this sort there were various kinds, as by sacrifices, entrails, flame, cakes, flour, wine, water, augury, birds, lots, verses, omens, &c. The several sorts of divination are alectryomancy, alphetomancy, arithmomancy, axinomancy, bellomancy, catoptromancy, ceromancy, chiromancy, cledomancy, dactylomancy, galtramancy, geomancy, hydromancy, lithomancy, necromancy, oneirocritica, &c. See the article **ALECTRYOMANCY**, &c.

**DIVINE**, something relating to God. See the article **GOD**.

**DIVINE STONE**, in natural history, a species of the jasper. See **JASPER**. The indians attribute great medicinal virtues to this stone: they wear it externally as a cure for the gravel; they say it promotes urine extremely, and seldom fails to bring away large quantities of gravel with it, when there has

been any lodged in the passages; they wear it also by way of amulet, to preserve them from the bites of venomous animals, and tie it to the part bitten, by way of cure.

**DIVING**, the art of descending under water, to considerable depths, and abiding there a competent time; the uses of which are considerable, particularly in fishing for pearls, corals, sponges, wrecks of ships, &c.

There have been various engines contrived to render the business of diving safe and easy; the great point is to furnish the diver with fresh air, without which he must either make but a short stay, or perish. Those who dive for sponges in the Mediterranean, carry down sponges dipt in oil in their mouths, but considering the small quantity of air that can be contained in the pores of a sponge, and how much that little will be contracted by the pressure of the incumbent air, such a supply cannot subsist a diver long, since a gallon of air is not fit for respiration above a minute. See the next article.

**DIVING-BELL**, a machine contrived for the safe conveyance of a diver to any reasonable depth, and whereby he may stay more or less time under water, as the bell is greater or less.

That the reader may have a just idea of the diving-bell, according to the latest improvements by Dr. Halley, and Mr. Triewald of Stockholm, we have here exhibited two figures of the same. The first (plate LXXV. fig. 1. n<sup>o</sup> 1.) is that of Dr. Halley's form, which was three feet wide at top, five at bottom, and eight feet high, and contained about sixty-three cubic feet, or near eight hogheads in its concavity.

This was coated with lead, so heavy, that it would sink empty, and the weight was distributed about the bottom I K, so that it would go down in a perpendicular position, and no other. In the top was fixed a strong but clear glass D, to let in the light from above; and likewise a cock, as at B, to let out the hot air that had been breathed; and below, was fixed a circular seat, L M, for the divers to sit on; and lastly, from the bottom was hung, by three ropes, a stage for the divers to stand on, to do their business. This machine was suspended from the mast of a ship by a sprit, which was sufficiently secured by stays to the mast-head, and was directed by

braces to carry it over-board, clear of the side of the ship, and to bring it in again.

To supply the bell with air under water, two barrels, such as C, of about sixty-three gallons each, were made, and cased with lead, so that they might sink empty, each having a hole in its lowest part, to let in the water, as the air in them is condensed in their descent, and to let it out again when they were drawn up full from below. And to a hole in the top of the barrel was fixed a hose, or hollow pipe, well prepared with bees-wax and oil, which was long enough to fall below the hole at the bottom, being sunk with a weight appended, so that the air in the upper part of the barrels could not escape, unless the lower end of these pipes were first lifted up.

These air barrels were fitted with tackle proper to make them rise and fall alternately, like two buckets in a well. In their descent, they were directed by lines fastened at the under edge of the bell to the man standing on the stage to receive them, who, by taking up the ends of the pipes above the surface of the water in the bell, gave occasion for the water in the barrels to force all the air in the upper parts into the bell, while it entered below, and filled the barrels; and as soon as one was discharged by a signal given, it was drawn up, and the other descended to be ready for use.

As the cold air rushed into the bell from the barrel below, it expelled the hot air (which was lighter) through the cock B, at the top of the bell, which was then opened for that purpose. By this method air is communicated so quick, and in such plenty, that the doctor tells us, he himself was one of the five who was at the bottom in nine or ten fathom water, for above an hour and a half at a time, without any sort of ill consequence; and he might continue there so long as he pleased, for any thing that appeared to the contrary.

In going down, it is necessary it should be very gentle at first, that the dense air may be inspired to keep up; by its spring, a ballance to the pressure of the air in the bell: upon each twelve feet descent, the bell is stopt, and the water that enters is driven out by letting in three or four barrels of fresh air.

By the glass above, so much light was transmitted, when the sun shone, that he could see perfectly well to write and read, and

*Fig. 1. DIVING-BELLS.*

*N<sup>o</sup> 1.*

*N<sup>o</sup> 2.*

*Fig. 2. DIVISIBILITY.*

*Fig. 3. DIURNAL.*

*Fig. 4. DOB-CHICKS.*

*N<sup>o</sup> 1.*

*N<sup>o</sup> 2.*

and by the return of the air-barrels, he could send up orders, written with an iron pen, on small pieces of lead, directing, that they were to be moved from place to place : but in dark weather, when the sea was rough and troubled, it would be as dark as night, in the bell ; but then the doctor perceived he could keep a candle burning in the bell, as long as he pleased, it being found, by experiment, that one candle consumes much about the same quantity of confined air, as one man does, *viz.* about a gallon per minute. The only inconvenience the doctor complained of, was, that upon first going down, they felt a small pain in their ears, as if the end of a quill were forcibly thrust into the hole of the ear. This may proceed from its being some time before the air can get from the mouth, through the small canal of the eustachian tube, which leads to the inner cavity of the ear, where, when it comes, it makes an equilibrium with the outward air, pressing on the tympanum, and thus the pain, for a short time, ceases : then descending lower, the pain of the ear returns, and is again abated ; and so on, till you come down to the bottom, where the air is of the same density continually.

This bell was so improved by the doctor, that he could detach one of his divers to the distance of fifty, or a hundred yards from it, by a contrivance of a cap, or head-piece, somewhat like an inverted hand-basket, as at F, with a glass in the fore-part, for him to see his way through. This cap was of lead, and made to fit quite close about his shoulders ; in the top of it was fixed a flexible pipe, communicating with the bell, and by which he had air, when he wanted, by turning a stop cock near his head-piece. There was also another cock at the end in the bell, to prevent any accident happening from the person without. This person was always well clothed with thick flannels, which were warmed upon him, before he left the bell, and would not suffer the cold water to penetrate. His cap contained air enough to serve him a minute or two : then by raising himself above the bell, and turning the cock F, he could replenish it with fresh air. This pipe he coiled round his arm, which served him as a clue to find his way to the bell again.

This diving bell received its last improvement from Mr. Martin Triewald,

F. R. S. and military architect to his Swedish majesty. The manner and form whereof is shewn in a figure of his own drawing (*ibid.* n<sup>o</sup> 2.) A B is the bell, which sinks with leaden weights D, D, appended at the bottom : the substance of the bell is copper, and tinned within all over : the bell is illuminated with three strong convex lenses G, G, G, with copper lids H, H, H, to defend them. The iron ring, or plate E, serves the diver to stand on, when he is at work, and it is suspended at such a distance from the bottom of the bell, by the chains F, F, F, that when the diver stands upright, his head is just above the water in the bell, where it is much better than higher up in it, because the air is colder, and consequently more fresh, and fit for respiration : but as there is occasion for the diver to be wholly in the bell, and his head of course in the upper part, Mr. Triewald has contrived that, even there, when he has breathed the hot air as long as he well can, by means of a spiral copper tube b c, placed close to the inside of the bell, he may draw the cooler and fresher air from the lowermost parts ; to which end, a flexible leather tube, about two feet long, is fixed to the upper end of the tube at b ; and to the other end of this tube is fixed an ivory mouth-piece for the diver to hold in his mouth, by which to respire the air from below.

**DIVING-BLADDER**, a term used by Borelli, for a machine which he contrived for diving under water to great depths. The vesica, or bladder, as it is called, is to be of brass or copper, and about two feet diameter. This is to contain the diver's head, and is to be fixed to a goat's skin exactly fitted to the body of the diver. Within the vesica are pipes, by means of which, a circulation of air is contrived, and the person carries an air pump by his side, in order to make himself heavier and lighter, as the fishes do by contracting or dilating their air-bladder.

**DIVINITY**, properly signifies the nature, quality, and essence of the true God. See the article **GOD**.

The heathen divinities may be reduced to three classes, 1. Theological, representing the divine nature under divers attributes. Thus Jupiter is the absolute power of God, Juno his justice, &c. 2. Physical. Thus Eolus is that power in nature which collects vapours and exhalations.

halations in order to form winds. 3. Moral. For example, the furies are only the secret reproaches and stings of conscience.

**DIVINITY** is also used in the same sense with theology. See **THEOLOGY**.

**DIVISIBILITY**, that property by which the particles of matter in all bodies are capable of a separation, or disunion from each other.

The Peripatetics and Cartesians hold divisibility to be an affection of all matter. The Epicureans again, allow it to agree to every physical continuum, but they deny that this affection agrees to all bodies, for the primary corpuscles or atoms they maintain to be perfectly insecable and indivisible. See **ATOM**.

As it is evident that body is extended, so it is no less evident that it is divisible; for since no two particles of matter can exist in the same place, it follows, that they are really distinct from each other, which is all that is meant by being divisible. In this sense the least conceivable particle must still be divisible, since it will consist of parts which will be really distinct. To illustrate this by a familiar instance, let the least imaginable piece of matter be conceived lying on a smooth plain surface, it is evident the surface will not touch it every where: those parts therefore which it does not touch, may be supposed separable from the others, and so on, as far as we please; and this is all that is meant when we say matter is infinitely divisible.

The infinite divisibility of mathematical quantity is demonstrated thus geometrically. Suppose the line *AD* (plate LXXV. fig. 2.) perpendicular to *BF*, and another, as *GH*, at a small distance from it, also perpendicular to the same line: with the centers *C C C*, &c. describe circles cutting the line *GH* in the points *eee*, &c. Now the greater the radius *AC* is, the less is the part *eH*. But the radius may be augmented in infinitum, so long therefore, the part *eH* may be divided into still less portions, consequently it may be divided in infinitum.

All that is supposed in strict geometry, (says Mr. Maclaurin) concerning the divisibility of magnitude amounts to no more than that a given magnitude may be conceived to be divided into a number of parts, equal to any given or proposed number. It is true, that the number of parts into which a given

magnitude may be conceived to be divided, is not to be fixed or limited, because no given number is so great but a greater may be conceived and assigned: but there is not, therefore, any necessity of supposing the number of parts actually infinite; and if some have drawn very abstruse consequences from such a supposition, yet geometry ought not to be loaded with them.

How far matter may actually be divided, may in some measure be conceived from hence, that a piece of wire gilt with so small a quantity as eight grains of gold, may be drawn out to a length of thirteen thousand feet, the whole surface of it still remaining covered with gold. We have also a surprising instance of the minuteness of some parts of matter from the nature of light and vision. Let a candle be lighted, and placed in an open plane, it will then be visible two miles round, and consequently was it placed two miles above the surface of the earth, it would fill with luminous particles a sphere whose diameter was four miles, and that before it had lost any sensible part of its weight. A quantity of vitriol being dissolved, and mixed with nine thousand times as much water, will tinge the whole, consequently will be divided into as many parts as there are visible portions of matter in that quantity of water. There are perfumes which without a sensible diminution of their quantity, shall fill a very large space with their odoriferous particles, which must therefore be of an inconceivable smallness, since there will be a sufficient number in every part of that space, sensibly to affect the organ of smelling. Dr. Keill demonstrates that any particle of matter how small soever, and any finite space how large soever being given, it is possible for that small particle of matter to be diffused through all that space, and to fill it in such a manner, as that there shall be no pore in it whose diameter shall exceed any given line. See **EFFLUVIA**.

The chief objections against the divisibility of matter in infinitum are, that an infinite cannot be contained by a finite, and that it follows from a divisibility in infinitum either that all bodies are equal, or that one infinite is greater than another. But the answer to these is easy, for the properties of a determined quantity are not to be attributed to an infinite considered in a general

neral sense; and who has ever proved that there could not be an infinite number of infinitely small parts in a finite quantity; or that all infinities are equal? The contrary is demonstrated by mathematicians in innumerable instances. See the article INFINITE, and 'S Gravelande, Elem. Mathem. lib. 1. cap. iv.

**DIVISION**, in general, is the separating a thing into two or more parts.

**DIVISION**, in arithmetic, one of the four fundamental rules, whereby we find how often a less number, called the divisor, is contained in a greater, called the dividend; the number of times which the divisor is contained in the dividend being termed the quotient.

In effect, division is only a compendious subtraction: for since the divisor is so many times contained in the dividend as there are units in the quotient, if we subtract the former from the latter as many times as possible, the sum of these subtractions will be equal to the quotient. To perform this operation with expedition, one ought to be previously well acquainted with the table of multiplication: thus, if I know that  $5 \times 5 = 25$ , it will be easy for me to say how many times 5 is contained in 25; and so in other instances, where the dividend does not exceed the square of the divisor. But where this is the case, we must follow a different method, which is this: set down the divisor first, and then the dividend, both in the same line, but with a stroke of your pen between them, as in the example in the margin; then beginning from the left hand, set a dot under that part

divis. divid. quot.  
6) 7284 (1214  
6  
12  
12  
8  
6  
24  
24

of the dividend in which the divisor can be found; which is the figure 7, wherein the divisor 6 is found 1: place this 1 after the dividend, only with a stroke between them, and it will make the first

figure of the quotient: you must next multiply the divisor by this number, viz.  $6 \times 1$ , and subtract the product from 7, and there will remain 1; after which place the next figure of the dividend, viz. 2, marking it with a dot, that you may know how many figures of the dividend are taken down. Find how many times the divisor is contained in these two

figures, viz. 12, which is twice exactly: place this 2 in the quotient after the former one, 1; and then multiplying and subtracting, you will find no remainder. However, taking down and dotting the next figure of the dividend, viz. 8, you will find 6 only once in it: place this 1 in the quotient, and multiplying and subtracting as formerly, there will remain 2; after which place the last figure of the dividend, which is also to be doted, and you will have 24, wherein 6 is contained just 4 times; place this 4 in the quotient, and the operation is finished. Hence it appears, that the divisor 6 is contained in the dividend 7284 just 1214 times, as expressed in the quotient.

The method is much the same, when there are several figures in the divisor: thus, in the example annexed, as 54 is 54) 24084 (446 not contained once in 2 or 24, we must take down three figures, viz. 240, and the first dot is to be placed under the 0. We then proceed, and find 54 contained in 240 four

times: this 4 we place in the quotient, and multiplying the divisor 54 by it, and subtracting the product, viz. 216 from 240, there remains 24. After this place the next figure of the dividend, viz. 8, and the sum is 248, in which 54 is found 4 times. Multiply and subtract as formerly, and there will remain 32; after which placing the last figure of the quotient, viz. 4, you will have the sum 324, in which 54 is found just 6 times. So that the divisor 54 is contained in the dividend 24084 exactly 446 times, as expressed in the quotient.

**DIVISION of fractions.** See the articles DECIMAL and FRACTION.

**DIVISION**, in algebra, is performed by placing the dividend above a small line, and the divisor under it; expunging any letters that may be found in all the quantities of the dividend and divisor, and dividing the co-efficients of all the terms by any common measure.

Thus, if  $10ab + 15ac$ , is to be divided by  $20ad$ , they are first placed in this

manner,  $\frac{10ab+15ac}{20ad}$ ; which after expunging the letter  $a$  out of all the terms, and dividing all the co-efficients by 5, is reduced to  $\frac{2b+3c}{4d}$ . In the same man-

$$\text{ner } 2b) ab + bb = \frac{ab + bb}{2b} = \frac{a+b}{2} \cdot A-$$

$$\text{gain, } 12ab) 30ax - 54ay = \frac{30ax - 54ay}{12ab}$$

$$= \frac{5x - 9y}{2b}; \text{ and } 4aa) 8ab + 6ac =$$

$$\frac{8ab + 6ac}{4aa} = \frac{4b + 3c}{2a}; \text{ and, to add no}$$

$$\text{more, } 2bc) 5abc = \frac{5abc}{2bc} = \frac{5a}{2}.$$

With respect to the signs, if those of the divisor and dividend be like, the sign of the quotient must be +; but if they are unlike, the sign must be -.

Powers of the same root, are divided by subtracting their exponents, as they are multiplied by adding them. Thus if  $a^5$  be divided by  $a^2$ , the quotient is  $a^{5-2} = a^3$ ; and  $b^8$  divided by  $b^2$ , gives the quotient  $b^{8-2} = b^6$ ; and so in other cases.

If the quantity to be divided is compound, then its parts must be ranged according to the dimensions of some one of its letters, as in the following example. In the dividend  $a^2 + 2ab + b^2$ , they are ranged according to the dimensions of  $a$ , the quantity  $a^2$ , where  $a$  is of two dimensions, being placed first;  $2ab$ , where it is of one dimension, next; and  $b^2$ , where  $a$  is not to be found, last. The divisor  $a + b$  being ranged in the same manner, you are to divide the first term of the dividend, by the first term of the divisor; and after setting down the quotient, which in this case is  $a$ , multiply this quotient by the whole divisor, and subtract the product, viz.  $a^2 + ab$  from

$$\begin{array}{r} a+b) a^2+2ab+b^2(a+b) \\ \underline{a^2+ab} \phantom{+b^2} \\ ab+b^2 \\ \underline{ab+b^2} \\ 0 \end{array}$$

the two first terms of the dividend  $a^2 + 2ab$ , and the remainder  $ab$ , together with the last term  $b^2$ , gives a new dividend  $ab + b^2$ . Divide the first term of this new dividend, by the first term of the divisor, and set down the quotient, which in this example is  $b$ ; then multiplying the whole divisor by this part of the quotient, subtract the product from the new dividend; and if there is no remainder, as is the case here, the division is finished. If there is a remainder, you are to proceed after the same manner till no remainder is left, or till it appear that there will always be some remainder, as in the annexed examples.

Example I. without any remainder.

$$\begin{array}{r} 3a-6) 6a^4-9b(2a^3+4a^2+8a+16 \\ \underline{6a^4-12a^3} \phantom{-9b} \\ 12a^3-9b \\ \underline{12a^3-24a^2} \phantom{-9b} \\ 24a^2-9b \\ \underline{24a^2-48a} \phantom{-9b} \\ 48a-9b \\ \underline{48a-9b} \\ 0 \end{array}$$

Example II. with a remainder.

$$\begin{array}{r} a+x) a^2+x^2(a-x+\frac{2x^2}{a}-\frac{2x^3}{a^2}+\frac{2x^4}{a^3}-\frac{2x^5}{a^4}+c. \\ \underline{a^2+ax} \phantom{+x^2} \\ -ax+x^2 \\ \underline{-ax-x^2} \phantom{+x^2} \\ +2x^2 \\ \underline{+2x^2+\frac{2x^3}{a}} \\ -2x^3 \\ \underline{-2x^3} \phantom{+x^2} \\ a \\ \underline{-2x^3+\frac{2x^4}{a^2}} \\ a \\ \underline{+2x^4} \\ a^2, \&c. \end{array}$$

In this last example the signs are alternately + and -, the co-efficient is constantly 2, after the two first terms, and the letters are powers of  $x$  and  $a$ ; so that the quotient may be continued as far as you please, without any farther division. But in common examples of division, after you come to a remainder of one term, as  $2x^2$ , it is usually set down in the quotient, with the divisor under it, after the other terms; and the quotient in the last example will stand thus,  $a - x + \frac{2x^2}{a+x}$ .

As for the other signs of division, see the article CHARACTER.

**DIVISION**, among logicians, is the explication of a complex idea, by enumerating the simple ideas whereof it is composed; in which sense it is nearly allied to definition, only that this last regards names and things, whereas division is employed wholly about ideas.

When the parts of an idea are divided, in order to a clearer explication of the whole, this is called a subdivision: thus, a year is divided into twelve months, a month is subdivided into weeks, weeks into days, days into hours, and so on.

The rules for a good division are these, that the members entirely exhaust the whole;

whole; that they be opposite; that subdivisions be not too numerous; that the whole be first divided into its larger parts, and these into the more remote and minute parts.

**DIVISION**, in natural philosophy, is the taking a thing to pieces, that we may have a more complete conception of the whole: this is frequently necessary in examining very complex beings, the several parts of which cannot be surveyed at one view. Thus, to learn the nature of a watch, the workman takes it to pieces, and shews us the spring, wheels, axles, pinions, ballances, dial-plate, pointer, case, &c. and after describing the uses and figures of each of them apart, explains how they contribute to form the whole machine.

**DIVISION**, in music, the dividing the interval of an octave into a number of less intervals. See **OCTAVE**.

The fourth and fifth divide the octave perfectly, though differently: when the fifth is below, and serves as a basis to the fourth, the division is called harmonic; but when the fourth is below, it is called arithmetical.

To run a division, is to play, or sing, after the manner above-mentioned; that is, to divide the intervals of an octave, fifth, fourth, &c. into as many parts, and as agreeably as possible, which depends intirely upon taste and fancy.

**DIVISION**, in rhetoric, the arrangement of a discourse under several heads, each of which is to be separately spoken to.

**DIVISION of proportion**, among mathematicians. See the article **PROPORTION**.

**DIVISION of a battalion**, are the several parcels into which a battalion is divided in marching. The lieutenants and ensigns march before the divisions.

**DIVISION**, in the sea-language, the third part of a fleet of men of war, and sometimes the ninth part; which last happens when the fleet is divided into three squadrons: for then each squadron is distributed into three divisions. In a sea engagement, the order of battle is to place all the squadrons, and all the divisions of each side, in one line. This order is kept as long as the wind, and other circumstances will permit.

**DIVISOR**, in arithmetic, the number that divides another, called the dividend; or, which shews into how many parts the dividend is to be divided. See the article **DIVISION**.

**DIUL**, a port-town of Asia, situated on the indian ocean, westward of the river Indus, and sixty miles west of the city of Tatta: east long. 67°, and north lat. 25° 15'.

**DIVORCE**, a breach or dissolution of the bond of marriage. See **MARRIAGE**.

The usual divorces, among us, are of two kinds, *viz.* a *mensa & thoro*, from bed and board, and a *vinculo matrimonii*, from the bond or tie of marriage. That a *mensa & thoro*, does not dissolve the marriage; since the cause thereof is subsequent to it, and, at the same time, supposes the marriage to be lawful: and this divorce may be on account of adultery in either of the parties, for cruelty of the husband, &c. As this divorce dissolves not the marriage, it does not debar the woman of her dower, nor bastardize her issue, or make void any estate for the life of the husband and wife, &c. A divorce a *vinculo matrimonii* entirely dissolves the marriage, as a pre-contract with some other person, consanguinity, or affinity within the levitical degrees, impotency, impuberty, &c. The consequences attending this last divorce are, that the dower is gone thereby, and the children begotten between the parties divorced are bastards: but here, it is said, the wife shall receive all again that she brought with her; because the nullity of the marriage arises from some impediment, and the goods of the wife were given for her advancement in marriage, which now ceases: yet this is when the goods are not spent; for if the husband gives them away during the coverture, without any collusion, it shall be binding to her. A divorce remains good so long as the sentence continues, and issue of a second marriage shall inherit lands until such sentence is repealed. See **BASTARD**. On the divorce a *vinculo*, &c. the parties are at liberty to marry again; and in divorces for adultery, several acts of parliament have allowed the innocent party marriage with another person. Divorces are only to be had by consent of parliament.

Among the Hebrews, divorce was made for the advantage of the wives, that they might not be discharged nor turned out of doors at pleasure: it was necessary that a bill of divorce should be executed in form by the husband: the wife was obliged to remain ninety days after the divorce, before she married again, that it might be known, if she proved with child,

whole

whose it was. The first husband was never allowed to marry her again, after being married, or even contracted, to another; otherwise he might. The mahometans, usually fond of copying after the Jews, differ from them in this particular, allowing a man to take his wife again, though he had divorced her three times. It is observed, that the women among the Jews, in the latter time of their government, took the same liberty as the men, and divorced their jealous and disagreeable husbands.

The grecian laws concerning divorces, were different: some permitted men to put away their wives on slight occasions: the Cretans allowed it to any man that was afraid of having too great a number of children. The Athenians likewise did it upon very small grounds, but not without giving a bill, wherein was contained the reasons of the divorce, to be approved, if the party divorced made an appeal to the chief magistrate. The Spartans, though marrying without much nicety in choice, seldom divorced their wives. At Athens, persons that divorced their wives, were obliged to return their portions, or to pay them an alimony: here a woman might also sue for a divorce. The distinction of *repudium* and *divortium*, among the Romans, was owing to the nicety of their lawyers: the first they made the breaking of a contract; the last, a separation after actual matrimony. By the laws of Romulus, a man was at liberty to leave his wife, but not a wife to leave her husband. The man might divorce his wife either upon poisoning her children, counterfeiting his private keys, or for the crime of adultery: but if he put her away upon any other occasion, one moiety of his estate was to be given to his wife, and the other was to fall to the goddess Ceres.

**DIURESIS**, in medicine, an excretion of urine: whence,

**DIURETICS**, in pharmacy, such simples as increase the discharge of urine; or which are supposed to have a power of removing obstructions in the urinary passages. Diuretics must increase the liquor to be secreted in the proper glandules, and are of the five following kinds: the first contains all relaxing and emollient decoctions, emulsions, &c. which do not stimulate, but only remove obstructions, by relaxing the vessels. The second comprehends all those which dissolve and dilute the blood. The third

contains three kinds of medicines, 1. AN acids which stimulate the vessels. 2. All saline bodies. 3. All fixed and volatile salts. The fourth takes in all that preserve a moderate heat of the body, without sweat. The fifth class contains those whose effects discover themselves about the kidneys and bladder; also all acrid and solvent diuretics.

**DIURNAL**, in astronomy, something relating to the day, in opposition to nocturnal, which regards the night.

**DIURNAL ARCH**, the arch or number of degrees that the sun, moon, or stars describe between their rising and setting.

**DIURNAL CIRCLE**. See **CIRCLE**.

**DIURNAL motion of a planet**, is so many degrees and minutes as any planet moves in twenty-four hours. Hence the motion of the earth about its axis, is called its diurnal motion. See **EARTH**.

**DIURNAL** is also used in speaking of what belongs to the nyct-hemeron, or natural day of twenty-four hours, in opposition to annual, menstrual, &c. The diurnal phenomena of the heavenly bodies, arise from the motion of the earth round its axis. For since the earth turns round its own axis from west to east, every spectator on its surface must necessarily be carried round in the same way; and consequently those parts of the heavens which lie hid towards the east, will by and by come into his sight, and those which are visible to him, will depart out of it towards the west. From hence it is that the spectator not being sensible of his own motion (the reason of which is, because all things about him move along with him) imagines the whole heavens to turn round the contrary way, viz. from east to west every twenty-four hours, which is nearly the time in which the earth performs one revolution about its axis. This may be illustrated in the following manner.

Let the circle STV (plate LXXV. fig. 3.) represent the earth; S, the place of the spectator; ABC, so much of the heavens as is visible to him in that situation; and let A be the place of the sun, or any other of the heavenly bodies. When S, the place of the spectator, is carried by the rotation of the earth about its axis to T, the visible part of the heavens will become BAD; and the point A, which before was just at one edge of the visible portion of the heavens, is now in the midst of it, or directly over the spectator's head. Again, when the spectator is got to V, the visible part of the heavens

heavens is become ADX, and the point A is got to the other extremity of it, and just ready to disappear; after which it is seen no more till the spectator arrives at the point S again. From this motion of the earth arises that apparent revolution of the planets and fixed stars once in twenty-four hours, as also that of the sun, and therewith the succession of day and night. See EARTH.

DIURNAL *parallax*. See PARALLAX.

DIURNARY, *diurnarius*, an officer in the greek empire, who wrote down in a book, kept for that purpose, whatever the prince did, or ordered, &c. every day.

DIUTURNITY, in chronology, the length of duration, or long continuance of any being. See the article DURATION.

DIVUS and DIVA, in antiquity, appellations given to men and women who had been deified. See DEIFICATION.

We find this title on medals struck for the consecration of an emperor or empress: thus, DIVVS IVLIVS, DIVA FAVSTINA AVG. &c.

DIXMUDE, a town of Flanders, situated on the river Ypres, about eleven miles north of the city of Ypres, and thirty-three west of Ghent: east long. 2° 40', and north lat. 51°.

DIZIER, or ST. DIZIER, a city of Champagne in France, situated on the river Marne, about forty-five miles north-east of Troyes: east long. 5°, and north lat. 48° 32'.

DIZOSTOS, in botany, a name used by the Greeks for the tuberose rooted tithymal, comprehended by Linnæus among the euphorbia. See the article EUPHORBIA.

\* DIZZINESS, in medicine, a disease of the head, called by physicians vertigo. See the article VERTIGO.

DO, in music, a note of the italian scale, corresponding to *ut* of the common gamut. See the article GAMUT.

DO LAW, the same with make law. See the article MAKE.

DOB-CHICK, in ornithology, the english name of the colymbus minor. See the article COLYMBUS.

It is a pretty little bird, smaller than the common teal; and, as it is seen swimming, appears like the young of some of the duck-kind; not yet fledged or feathered. But what is most singular in it, is, its having absolutely no tail. See plate LXXV. fig. 4. n° 1.

There are several other species of this bird, one of the most elegant of which is the eared dob-chick, of a blackish

brown on the upper part of the back, except the ridge thereof, which is white; the ears are formed of a tuft of loose, long, and reddish feathers. *Ibid.* n° 2.

DOBLAC, a town of the Tyrolese, in Germany, situated at the foot of the Alps, about two miles north of the frontiers of the state of Venice.

DOBULA, in ichthyology, a name used by some for the chub. See CHUB.

DOCIMASIA, in greek antiquity, a probation of the magistrates and persons employed in public business at Athens. It was performed publicly in the forum, where they were obliged to give account of themselves and their past life before certain judges. Among several questions proposed to them, we find the following, whether they had been dutiful to their parents, had served in the wars, and had a competent estate.

DOCK, *lapathum*, in botany and medicine. See LAPATHUM.

DOCK, or DOCKING, in law, an expedient for cutting off an estate-tail in lands or tenements, that the owner may be enabled to sell, give, or bequeath the same.

Dock, in maritime affairs, is a pit, great pond, or creek, by the side of an harbour, made convenient either for the building or repairing of ships. It is of two sorts, 1. Dry-dock, where the water is kept out by great flood-gates, till the ship is built or repaired, when the gates are opened, and the water let in to float and launch her. 2. Wet-dock, a place where the ship may be halled into, out of the tide's way, and so dock herself, or sink herself a place to lie in.

Dock, in the manege, called by the French trouffequue, is a large case of leather, as long as the dock of a horse's tail, which covers the tails of leaping horses. It is made fast by straps to the crupper, and has leathern thongs that pass between his thighs, and along the flanks to the saddle-straps, in order to keep the tail tight, and to hinder it to whisk about, or make the horse appear broader at the croupe.

Dock, among sportsmen, the fleshy part of a boar's chine, between the middle and the buttocks.

DOCK-YARDS, in ship-building, are magazines of all sorts of naval stores. The principal ones in England are those of Chatham, Portsmouth, Plymouth, Woolwich, Deptford, and Sheerne's. In time of peace, ships of war are laid up in these docks; those of the first rates mostly at Chatham,

Chatham, where, and at other yards, they receive from time to time such repairs as are necessary. These yards are generally supplied from the northern crowns with hemp, pitch, tar, rosin, &c. but as for masts, particularly those of the larger size, they are brought from New England.

How much it imports the good of the public to keep these magazines constantly replenished, every one is able to judge; and it were to be wished the improving the before-mentioned commodities, in our english plantations, might meet with all possible encouragement, lest, one time or other, it may prove difficult to get them elsewhere.

**DOCKET**, a little bill tied to wares or goods, directed to the person or place they are to be sent to.

**DOCKET**, or **DOGGET**, in law, signifies a brief in writing, made on a small piece of paper, or parchment, containing the purport and effect of a large writing. The rolls of judgment, when brought into the court of common pleas, are entered on the docket of that term: and attorneys keep docket-books, where-in they enter judgments.

**DOCTOR**, a person who has passed all the degrees of a faculty, and is impowered to teach or practise the same: thus we say, doctor in divinity, doctor in physic, doctor of laws.

The title of doctor seems to have been created in the XIIth century, instead of *master*, and established with the other scholastic degrees of batchelors and licentiates, by Peter Lombard and Gilbert Porreus, then the chief divines of the university of Paris. Gratian did the same thing, at the same time, in the university of Bologna. Though the two names of *doctor* and *master* were used a long time together, yet many think that their functions were different, the masters teaching the human sciences, and the doctors those sciences depending on revelation and faith. Spelman takes the title of doctor not to have commenced till after the publication of Lombard's Sentences, about the year 1140, and affirms that such as explained that work to their scholars were the first that had the appellation of doctors.

To pass doctor in divinity at Oxford, it is necessary the candidate have been four years batchelor of divinity. For doctor of laws, he must have been seven years in the university to commence batchelor of

law, five years after which he may be admitted doctor of laws. Otherwise in three years after taking the degree of master of arts, he may take the degree of batchelor in laws, and in four years more that of doctor: which same method and time are likewise required to pass the degree of doctor in physic. At Cambridge, to take the degree of doctor in divinity, it is required the candidate have been seven years batchelor of divinity: though in several colleges the batchelor's degree is dispensed with, and they may go out *per saltum*. To commence doctor in laws, the candidate must have been five years batchelor of laws, or seven years master of arts. To pass doctor in physic, he must have been batchelor in physic five years, or seven years master of arts. It is remarkable, that by a statute of 37 Hen. VIII. a doctor of civil law may exercise ecclesiastical jurisdiction, though a layman.

**DOCTOR**, is also an appellation adjoined to several specific epithets, expressing the merit of some of the schoolmen: thus Alexander Hales is called the irrefragable doctor; Thomas Aquinas, the angelic doctor; St. Bonaventure, the seraphic doctor; John Duns Scotus, the subtle doctor; Raimond Lully, the illuminated doctor; Roger Bacon, the admirable doctor, &c.

**DOCTOR of the church**, a title given to certain of the fathers, whose doctrines have been most generally received: of these are usually reckoned four in the greek church, *viz.* St. Athanasius, St. Basil, St. Gregory Nazianzen, and St. Chrysostom: and three in the latin church, namely St. Jerom, St. Augustine, and Gregory the great.

**DOCTOR, διδασκαλος**, in the greek church, is a particular officer appointed to interpret part of the scripture. He who explains the gospels is called doctor of the gospels; he who explains St. Paul's Epistles, doctor of the apostle; and he who interprets the Psalms, doctor of the psalter. The grecian bishops still confer those sort of offices by imposition of hands, as it is practised in ordinations.

**DOCTOR of the law**, a title of honour among the Jews. The investiture, if we may so say, of this order was performed by putting a key and a table-book in their hands, which is what some authors imagine our Saviour had in view, Luke xi. 52. when speaking of the doctors of the law, he says, "Woe unto you, doctors of the law, for you have taken away

away the key of knowledge, you entered not in yourselves, and them that were entering you hindered." The greek text of St. Luke calls them *νομικοι*, and the vulgate *legis periti*: agreeably to which our english translators call them *lawyers*. The word *νομικος*, however, in St. Matt. is rendered by the vulgate *legis doctor*, though the english version still retains the word *lawyer*.

These jewish doctors are otherwise called rabbins. See the article RABBI.

DOCTORS-COMMONS. See COLLEGE of *civilians*.

DOCUMENT, in law, some written monument produced in proof of any thing asserted.

DODARTIA, in botany, a genus of the *didymia-angiospermia* class of plants, the flower of which consists of one ringent petal, with the upper lip erect and semibifid; and the lower lip patent, twice broader than long, and trifid: the fruit is a globose bilocular capsule, containing a great number of very small seeds. See plate LXXVI. fig. 1.

DODDER, the english name of a plant, called by authors *cuscuta*. See the article CUSCUTA.

DODECACTIS, in zoology, a species of star-fish with twelve rays.

DODECADACTYLON, in anatomy, the same with the duodenum. See the article DUODENUM.

DODECAGON, in geometry, a regular polygon consisting of twelve equal sides and angles.

DODECAGON, in fortification, is a place surrounded by twelve bastions.

DODECAHEDRON, in geometry, one of the platonic bodies, or regular solids, contained under twelve equal and regular pentagons.

Its solidity is found by multiplying the area of one of the pentagons by 12, and then this product by  $\frac{1}{3}$  of the distance of the face from the center of the dodecahedron, which is the same with the center of the circumscribing sphere.

The side of a dodecahedron, inscribed in a sphere, is the greater part of the side of a cube, inscribed in the same sphere, cut into extreme and mean proportion. If the diameter of the sphere be 1.0000, the side of the dodecahedron, inscribed in it, will be .3682 nearly.

All dodecahedrons are similar, and are to one another as the cubes of their sides; their surfaces are also similar, and therefore they are as the squares of their sides;

whence as .509282 is to 10.51462, so is the square of the side of any dodecahedron to the superficies thereof; and as .3637 is to 2.78516, so is the cube of the side of any dodecahedron to the solidity of it.

DODECANDRIA, in the linnæan system of botany, a class of plants, the eleventh in order, comprehending all those with hermaphrodite flowers, and only twelve stamina in each: such are agrimony, asarum, rhizophora, &c.

DODECATEMORY, an appellation given to the twelve signs of the zodiac, because each of them contains a twelfth part of the whole. See SIGN.

It is also applied to the twelve houses or parts of the zodiac of the primum mobile, to distinguish them from the twelve signs. See the article HOUSE.

DODECUPLA DI CROME, in the italian music, a name given to the triple  $1\frac{2}{3}$ , in four of which twelve notes are required, instead of four in common time.

DODECUPLA DI SEMI CROME, is our triple  $1\frac{2}{3}$ , wherein there are twelve notes instead of sixteen, in a bar of duple time.

DODO, in ornithology, a large exotic bird, supposed to belong to the swan-kind, only some-what bigger than the common swans: add to this, that its head is covered with a membrane resembling a hood. See plate LXXVI. fig. 2.

DODONÆA, in botany, a genus of plants, of the *oëlandria-monogynia* class: it has no corolla; the fruit is a roundish trilocular capsule, with prominent inflated angles, containing solitary seeds.

DODONÆA is also a name given by Plu-mier to the ilex. See ILEX.

DODONIAN, *dodoneus*, in antiquity, an epithet given to Jupiter, because he was worshiped in a temple built in the forest of Dodona, where was the most famous and it is said the most antient oracle of all Greece. It is reported that the pigeons and the very oaks of the forest of Dodona spoke and delivered oracles. In the temple was a fountain, which the antient naturalists assure us had a property of re-kindling torches when newly extinguished. It is also said to have extinguished lighted torches, which is no great miracle, since plunging them into a place where the air was too dense, or into the water, must necessarily have that effect.

DODRANS, in antiquity, three fourths of the as. See the article AS.

**DOESBURG**, a town of the United Netherlands, in the province of Guelderland, situated on the river Yffel, about nine miles south of Zutphen: east long. 6°, and north lat. 52°.

**DOFRINE MOUNTAINS**, those which divide Sweden from Norway.

**DOG**, *canis*, in zoology, a genus of quadrupeds. See the article **CANIS**.

The dog, in its wild state, lives comfortably in the woods, in many parts of the east: it does not attack a man, but neither does it discover any of that familiarity which we find in the tame ones; and indeed many other animals may be made as tame as the dog, by the same kind of treatment, which has been tried on the otter with success.

Authors have mentioned a great many species of this animal, as the mastiff, wolf-dog, greyhound, hound, spaniel, water-spaniel, bull-dog, lap-dog, &c. but all these are only varieties of the original wild kind, which is of a middle size between the mastiff and greyhound.

*Choosing of Dogs.* In order to choose a dog and bitch for good whelps, take care that the bitch come of a generous kind, be well proportioned, having large ribs and flanks, and likewise that the dog be of a good breed and young. Hounds for chase are to be chosen by their colours; the white with black ears and a black spot at the setting on of the tail, are the best to compose a kennel of, and of good scent. The black hound, or the black tanned, or the liver-coloured or white; the true talbots, are the best for the stronger line: the grizel, whether mixed or unmixed, so they be shag-haired, are the best verminers, and a couple of these are proper for a kennel. In short, take these marks of a good hound, that his head be of a middle proportion, rather long than round; his nostrils wide; the ears large; his back fowed; his fillet great; haunches large; thighs well trussed; ham straight; tail big near the reins, the rest being slender; the leg big; the sole of the foot dry, and in the form of that of a fox with large claws.

*Bite of a mad Dog*, in medicine. See the article **HYDROPHOBIA**.

**DOG**, *canis*, in astronomy. See **CANIS**.

**DOG'S BANE**, *apocynum*, in botany, a genus of the *pentandria digynia* class of plants, the corolla of which consists of a campanulated, roundish, single petal, lightly divided into five segments, which are revolute: there is no other nectarium;

the fruit is composed of oblong, acuminate follicles, each formed of two valves and containing one cell; the seeds are numerous, very small, and coronated with long down.

**DOG-BERRY-TREE**, a name sometimes used for the cornel-tree. See **CORNUS**.

**DOG-DAYS**, the same with those called canicular. See **CANICULAR**.

**DOG-DRAW**, a term in the forest-law, used when a man is found drawing after a deer, by the scent of a hound which he leads in his hand.

**DOG'S FENNEL**, in botany, a name by which the cotula is sometimes called. See the article **COTULA**.

**DOG-FLY**, a kind of fly so called from its being particularly troublesome to dogs: it is not unlike that species which infests cattle.

**DOG'S GRASS**. See the article **GRASS**.

**DOG'S MERCURY**, in botany, the name of a species of mercury. See **MERCURY**.

**DOG'S ROSE**, a name sometimes given to the common briar, or hip-bush, a species of wild rose. See the article **ROSE**.

**DOG'S STONES**, a species of orchis, said to be a great provocative to venery.

**DOG'S TAIL**, in botany, the same with the cynosurus. See **CYNOSURUS**.

**DOG'S TONGUE**, a plant called by botanists cynoglossum. See **CYNOGLOSSUM**.

**DOG'S TOOTH**, *dens canis*, a plant called by Linnæus, erythronium. See the article **ERYTHRONIUM**.

**DOG'S TOOTH SHELL**, the same with the dentalium. See **DENTALIUM**.

**DOG-WOOD**, the same with the dog-berry-tree, *supra*.

**DOG-WOOD of Jamaica**, the robinia of botanical writers. See **ROBINIA**.

**DOG-WOOD of Virginia**, a species of bay-tree. See the article **LAURUS**.

**DOGADO**, a dutchy of Italy, of which Venice is the capital. See **VENICE**.

**DOGE**, the chief magistrate in the republics of Venice and Genoa.

This dignity is elective in both places: at Venice it continues for life, at Genoa it is only for two years. His title is serenity: he is chief of the council, and mouth of the republic, he being to answer for her. The Venetians do not go into mourning at his death, being only the phantom of majesty, as all the authority is vested in the republic; the doge only lends his name to the senate; the power is diffused through the whole body though answers to foreign ambassadors, &c. are made in the name of the doge.

The

The money is struck in his name, but does not bear his arms. All the magistrates rise and salute him when he comes into the council : but he rises to none but foreign ambassadors. He must not stir out of Venice, without leave of the counsellors, &c.

**DOGGERS**, in the alum-works, a poor kind of alum-ore. See **ALUM**.

**DOGGERS** is also a name used for fishing vessels ; whence, in some of our old statutes, we meet with dogger-men, denoting the fishermen of those vessels.

**DOGS** denote iron machines for burning wood on ; also hooks fixed in large timbers, for drawing them with horses.

**DOGMA**, a principle, maxim, tenet, or settled opinion, particularly with regard to matters of faith and philosophy.

**DOGMATICAL**, something belonging to a doctrine or opinion. A dogmatical philosopher is one who asserts things positively ; in opposition to a sceptic, who doubts of every thing.

**DOGMATISTS**, *dogmatici*, a sect of ancient physicians, of which Hippocrates was the first author. They are also called *logici*, logicians, from their using the rules of logic in subjects of their profession. They laid down definitions and divisions, reducing diseases to certain genera, and those genera to species, and furnishing remedies for them all ; supposing principles, drawing conclusions, and applying those principles and conclusions to particular diseases under consideration : in which sense the dogmatists stand contradicting distinguished from empirics and methodists. They reject all medicinal virtues that they think not reducible to manifest qualities : but Galen hath long ago observed of such men, that they must either deny plain matter of fact, or assign but very poor reasons and causes of many effects they pretend to explain.

**DOLE**, in our ancient customs, signified a part, or portion, most commonly, of a meadow, where several persons have shares. It also still signifies a distribution or dealing of alms, or a liberal gift made by a great man to the people.

**DOLE-FISH** seems to be that fish which the fishermen, yearly employed in the north seas, do, of custom, receive for their allowance or shares.

**DOLE**, in the law of Scotland, is used for malevolent intention.

Dole, in the law of Scotland, as well as *dolum* in the civil law, from whence it is taken, is an essential ingredient to consti-

tute an action criminal. In crimes wherein the will, not the event, must be regarded, no negligence can equal dole, unless the negligence be so extremely supine as not to be conceivable without implying dole.

Under dole are comprehended the vices and errors of the will, which are immediately productive of the criminal fact, though not premeditated, but the effect of sudden passion. In this respect dole differs from what the english law calls malice. See the article **MALICE**.

**DOLET**, a term sometimes used for red vitriol, or colcothar of vitriol.

**DOLG-BOTE**, in our old writers, signifies a recompence for a scar or wound.

**DOLICHOS**, in botany, a genus of the *diadelphia-decandria* class of plants, the corolla of which is papilionaceous ; the vexillum is roundish, large, emarginated, and wholly reflected ; the fruit is a large, acuminate, oblong pod, composed of two valves, and containing two cells ; the seeds are numerous, elliptical, and frequently compressed.

**DOLIMAN**, a kind of long cassock, worn by the Turks, hanging down to the feet, with narrow sleeves buttoned at the wrist.

**DOLIUM**, in natural history, the name of a genus of shells, called by some *conchæ-globosæ*.

The dolium is a simple shell, without any hinge, formed of one continuous piece, which makes a body of a figure approaching to round, distended, and, as it were, inflated. The animal inhabiting this shell is a limax. See the article **LIMAX**.

Some of these have the mouth dentated ; others smooth ; in some the clavicle is moderately long, though in most it is depressed ; and the columella is in some species smooth, in others wrinkled : these shells are found on the shores of many parts of the East-indies, and are also frequently brought from America. See plate **LXXVI**. fig. 3.

**DOLLAR**, a silver coin current in several parts of Germany and Holland. There are various species of dollars, as the rix-dollar, the semi-dollar, the quarter-dollar, &c. for each of which see **COIN**.

**DOLPHIN**, in ichthyology, the english name of the *delphinus*, with an oblong rounded body, and a long acute rostrum. It is considerably longer than the porpoise : the opening of the mouth is vastly wide, reaching on each side to the breast ;

and

and the fistula, or aperture for discharging the water, is in the middle of its head. See plate LXXVI. fig. 4.

**DOLPHIN** is also a name given by some to the hippurus. See **HIPPURUS**.

**DOLPHIN**, *delphinus*, in astronomy. See the article **DELPHINUS**.

**DOM**, or **DON**, a title of honour, invented and chiefly used by the Spaniards, signifying sir, or lord.

This title, it seems, was first given to Pelayo, in the beginning of the VIIIth century. In Portugal no person can assume the title of don, without the permission of the king, since it is looked upon as a mark of honour and nobility. In France it is sometimes used among the religious. It is an abridgment of *domnus*, from *dominus*.

**DOM** and **SOM**, in old charters, signifies full property and jurisdiction.

**DOMAIN**, the inheritance, estate, or possession of any one. See **DEMESNE**.

**DOME**, in architecture, a spherical roof, or a roof of a spherical form, raised over the middle of a building, as a church, hall, pavillion, vestibule, stair-case, &c. by way of crowning.

Domes are the same with what the Italians call cupolas, and we cuppolas: Vitruvius calls them tholi. See the article **CUPOLA**, &c.

They are generally made round, or resembling the bell of a great clock; but there are some instances of square ones, as those of the Louvre. Some of them also are in the form of polygons, as that of the jesuit's church in the Rue St. Antoine, at Paris. Domes have commonly columns ranged around their outides, both for the sake of ornament and support to the work.

**DOME**, or **DOOM**, signifies also a sentence, judgment, or decree.

**DOMEA**, a great river of Tonquin, in Asia, sometimes called Chaule.

**DOMESDAY**, or **DOOMS-DAY-BOOK**, a very ancient record made in the time of William the Conqueror, which now remains in the exchequer, and consists of two volumes, a greater and a less; the greater contains a survey of all the lands in most of the counties in England, and the less comprehends some counties that were not then surveyed. The book of domesday was begun by five justices, assigned for that purpose in each county, in the year 1081, and finished in 1086. It was of that authority, that the Conqueror himself submitted, in some cases wherein

he was concerned, to be determined by it. Camden calls this book the Tax-book of king William; and it was farther called Magna rolla.

There is likewise a third book of *Domesday*, made by command of the Conqueror; and also a fourth, being an abridgment of the other books.

**DOMES-MEN**, judges or persons appointed to determine suits and controversies between parties. See **DAY'S MAN**.

**DOMESTIC**, any man who acts under another, serving to compose his family; in which he lives, or is supposed to live, as a chaplain, secretary, &c. Sometimes domestic is applied to the wife and children, but very seldom to servants, such as footmen, lacquies, porters, &c.

**DOMESTIC**, *domesticus*, in antiquity, was a particular officer in the court of Constantinople.

According to some, this officer was one intrusted to manage affairs of importance: others say, the greek *domestici* were the same with the roman *comites*; and that they began first to be used when count became a dignity; domestics therefore were such as served the prince in the administration of affairs, as well those of the family, as the affairs of justice and the church.

*The grand DOMESTIC*, or **MEGADOMESTICUS**, was a sort of dapifer, or major domo. See the articles **DAPIFER** and **MAJOR DOMO**.

**DOMESTICUS MENSÆ**, officiated as grand seneschal, or steward.

**DOMESTICUS REI DOMESTICÆ**, did the office of master of the household.

**DOMESTICUS SCHOLARUM**, or **LEGIONUM**, commanded the reserved forces, called *scholæ palatinæ*, whose office it was to put the immediate orders of the emperor in execution.

**DOMESTICUS MURORUM** had the superintendence of all the fortifications.

**DOMESTICUS REGIONUM** was a sort of attorney, or solicitor-general, of the east and west.

**DOMESTICUS ICANATORUM** commanded the military cohorts. There were several other officers of the army, who were called by the name *Domesticus*, which meant no more than their commander. There were also two *domestici chori*, or chantors, called also *protopsalter*, belonging to the church at Constantinople; one of them was on the right side of the church, and the other on the left.

**DOMESTICI**,

**DOMESTICI**, was also a body of forces in the roman empire.

Pancirollus takes them to be the same with those called *protectores*, who had the chief guard of the emperor's person, in a degree above the prætorians, and who, under the christian emperors, had the privilege to bear the grand standard of the cross. They are supposed to have been 2500 before Justinian's time, who added 2000 more to the number. They were divided into several companies, or bands, called *scholæ*. Some whereof are said to have been instituted by Gordian: some of them were cavalry, and others infantry. Their commander was called *comes domesticorum*.

**DOMESTIC NAVIGATION**, coasting, or sailing along the shore, in which the lead and compass are the chief instruments.

**DOMIFYING**, in astrology, the dividing or distributing the heavens into twelve houses, in order to erect a theme, or horoscope, by means of fix great circles, called circles of position.

There are various ways of domifying: that of Regiomontanus, which is the most common, makes the circles of position pass through the intersections of the meridian and the horizon: others make them pass through the poles of the zodiac.

**DOMINANT of a mode**, in music, that sound which makes a perfect fifth to the final in authentic modes; and a third to the final or sixth, to the lowest chord of a plagal mode. See the articles **MODE** and **FINAL**.

**DOMINATION**, in theology, the fourth order of angels, or blessed spirits, in the hierarchy, reckoning from the seraphim.

**DOMINGO**, or **ST. DOMINGO**, the capital of the island of Hispaniola, the see of an archbishop, and the most antient royal audience in America: west long. 70° north lat. 18° 20'.

**DOMINI**, or **ANNO DOMINI**. See the article **ANNO**.

*Bull in cæno DOMINI*. See the article **BULL**.

**DOMINICA**, one of the Caribbee-islands, subject to Britain: west long. 61° 20' north lat. 16°.

**DOMINICAL LETTER**, in chronology, is that letter of the alphabet which points out in the calendar the Sundays throughout the year, thence also called *Sunday-letter*. See **CALENDAR** and **BISSEXTILE**. The distribution of days into weeks is

made by the seven first letters of the alphabet A, B, C, D, E, F, G, beginning, at the first of January, to place the letter A; to the second of January B is joined; to the third C; and so on to the seventh, where G is figured: and then again beginning with A, which is placed at the eighth day, B will be at the ninth, C, at the tenth, and so continually repeating the series of these seven letters, each day of the year has one of them in the calendar. By this means the last of December has the letter A joined to it, for if the 365 days, which are in a year, be divided by seven, we shall have fifty-two weeks, and one day over. If there had been no day over, all the years would constantly begin on the same day of the week, and each day of a month would constantly have fallen on the same day of the week: but now, on account, that besides the fifty-two weeks in the year, there is one day more, it happens, that on whatever day of the week the year begins, it ends upon the same day, and the next year begins with the following day.

The letters being ranked in this order, that letter which answers to the first Sunday of January, in a common year, will shew all the Sundays throughout the year, and to whatever days in the rest of the months, that letter is put, these days are all Sundays. If the first day of January be on a Sunday, the next year will begin on Monday, and the Sunday will fall on the seventh day, to which is annexed the letter G, which therefore will be the Sunday letter for that year: the next year beginning on Tuesday, the first Sunday will fall on the sixth of January, to which is adjoined the letter F, which is the Sunday letter for that year; and in the same manner, for the next following, the dominical letter will be E; and so on. By this means the Sunday letters will go on in a retrograde order, *viz.* G, F, E, D, C, B, A. But because every fourth year consists of 366 days, the series of letters will be interrupted, and the order will not return till twenty-eight years, or four times seven; and hence arises the cycle of twenty-eight years. See the article *CYCLE of the Sun*.

Thus, if in a leap year, the first of January be Sunday, and consequently the dominical letter A, the twenty-fourth day of February will fall on a Friday, and the twenty-fifth on a Saturday; and

Since both these days are marked in the calendar with the letter F, the following day, which is Sunday, will be marked with G, which letter will mark out all the Sundays, and consequently be the dominical letter the remaining part of the year; and hence it is, that every leap year has two dominical letters, the first of which serves from the beginning of the year to the twenty-fourth or twenty-fifth day of February, and then the other takes place and serves for the rest of the year.

The intercalary day is placed between the twenty-third and twenty-fourth day of February, and so makes two twenty-fourths of February, which in the calendar are esteemed one and the same day, and have the same letter affixed to them; but by our way of reckoning, they are called the twenty-fourth and twenty-fifth days of February.

For finding the dominical letter, divide the year, and its fourth part, by seven, which will give the index of the dominical letter, reckoning 1 for A, 2 for B, 3 for C, &c.

Thus, if it were required to find the dominical letter for the year 1754, it will be found to be F. For, if to the given year 1754, you add its fourth part 438, the sum will be 2192, which divided by 7, the remainder will be 1, and that subtracted from 7, the index will be 6, which corresponds to the letter F.

But as the years 1800, 1900, 2100, 2200, 2300, &c. according to the new stile, consist of 365 days only, and therefore have but one dominical letter, whereas, according to the Julian calendar, they would have two; for this reason the dominical letters will be changed, and consequently this method of finding the dominical letter will only hold good for this century; after which a number must be added to the year, and its fourth, in order to find the dominical letter for ever: for which purpose observe the following rule.

Reject the figures or cyphers to the place of hundreds; divide the remaining figures or cyphers by 4; from this quotient subtract 1, and this number subtracted from the hundred years; and then this last remainder taken from the least number of sevens possible, leaves a number which must be added to the year and its fourth, in order to find the dominical letter: Example, what will be the dominical letter for the year 1842.

This question, by the above rule, will be solved in the following manner,  $18 \div 4 = 4$  from which subtracting 1; and the remainder 3 taken from 18, gives 15, which being subtracted from 21, the nearest sevens gives 6, the number to be added. Then to the given year 1842, add its fourth part 460, and the number found 6, the sum is 2308; which being divided by 7, gives 329 for the quotient, and the remainder is 5; which taken from 7, leaves 2, the index of the letter B, the dominical letter required.

**DOMINICANS**, an order of religious, called in France, jacobins, and in England black fryers, or preaching fryars. This order, founded by St. Dominic, a native of Spain, was approved of Innocent III. in 1215, and confirmed by a bull of Honorius III. in 1216. The design of their institution was, to preach the gospel, convert heretics, defend the faith, and propagate christianity. They embraced the rule of St. Augustine, to which they added statutes and constitutions, which had formerly been observed either by the Carthusians or Præmonstratenses. The principal articles enjoined perpetual silence, abstinence from flesh at all times, wearing of woollen, rigorous poverty, and several other austerities. This order has spread into all the parts of the world. It has produced a great number of martyrs, confessors, bishops; and they reckon three popes, sixty cardinals, 150 archbishops, and 800 bishops of their order, besides the masters of the sacred palace, who have always been dominicans. They are inquisitors in many places.

The nuns or sisters of this order, owe their foundation to St. Dominic himself, who built a monastery at Prouilles, where poor maids might be brought up and supplied with all necessaries for their subsistence. The habit of these religious was a white robe, a tawney mantle, and a black veil. Their founder obliged them to work at certain hours of the day, and particularly to spin yarn and flax to make their own linnen. The nuns of this order have 130 houses in Italy, forty-five in France, fifty in Spain, fifteen in Portugal, forty in Germany, and many in Poland, Russia, and other countries. They lie on straw beds, and never eat flesh excepting in sickness; but many monasteries have mitigated this austerity.

**DOMINION**, *dominium*, in the civil law signifies the power to use or dispose of a thing as we please. *Dominium plenum*, is when the property is united with the possession. *Dominium nudum*, when there is the property without the possession. *Dominium* is again divided into that which is acquired by the law of nations, and that which is acquired by the civil law. The former can never be got without possession, the latter may. Another distinction of *dominium* is, into natural and civil. Natural is that which is common to all nations, or that which is acquired by the means which all nations use in acquiring estates. Civil is peculiar to the roman citizens, and consists of these three methods. Sale, prescription, cession of right. *Directum dominium*, is the right alone of dominion. *Dominium utile*, the profit redounding from it. Thus the wife retains the *dominium directum* of her jointure, and the *dominium utile* passes to her husband.

**DOMINIUM**, domain, in our antient customs. See the article DOMAIN.

**DOMINUS**, in the civil law, he who possesses any thing by right of purchase, gift, loan, legacy, inheritance, payment, contract, or sentence.

**DOMINUS**, in the feudal law, he who grants a part of his estate in fee to be enjoyed by another.

**DOMINUS**, in the antient times, a title prefixed to a name, usually to denote the person either a knight or a clergyman.

*Recto quando DOMINUS remisit.* See the article RECTO.

**DOMO REPARANDO**, in law, is a writ which lies for a person against his neighbour, whose house he fears will fall to the damage of his own.

**DON**, the name of two rivers; one very large, which after dividing Asia from Europe, falls into the Palus Meotis; the other, in the county of Aberdeen in Scotland.

**DONATION**, an act whereby a person transfers to another either the property or the use of some thing, as a free gift. In order to be valid, it supposes a capacity both in the donor and donee, and requires consent, acceptance, and delivery; and, by the French law, also registry. Civilians distinguish donation into pure and conditional. *Donatio pura* is when one gives a thing with an intention that it become immediately the property of the donee, never to revert to

the donor; and this from no other motive, than his generosity. *Donatio conditionalis* is when one gives a thing with an intention that it become the property of the donee, upon performing some condition stipulated.

**DONATISTS**, christian schismatics in Africa, who took their name from their leader Donatus. A secret hatred against Cæcilian, elected bishop of Carthage about the year 311, excited Donatus to form this sect. He accused Cæcilian of having delivered up the sacred books to the pagans, and pretended that his election was void, and all his adherents heretics. He taught that baptism administered by heretics was null, that every church but the African was become prostituted, and that he was to be the restorer of religion. Some accuse the donatists of arianism. Constantius and Honorius made laws for their banishment, and Theodosius and Honorius condemned them to grievous mulcts.

**DONATIVE**, a gratuity, or present made to any person.

Donative among the Romans was properly a gift made to the soldiers, as congiarium was that made to the people. See the article CONGIARIUM.

Salmasius says, the common and legitimate rate of a donative, was three pieces of gold per head; and Casaubon observes, that the legal donative was 20,000 denarii; and that it was not customary to give less, especially to the prætorian soldiers; that the centurions had double, and the tribunes, &c. more in proportion.

Donative, in the canon-law, is a benefice given by the patron to a priest, without presentation to the ordinary, and without institution or induction. The king may found a church or chapel, and exempt it from the jurisdiction of the ordinary. He may also by his letters patent grant licence to a common person to found such a church, and ordain it to be made donative. The resignation of a donative must be to the donor or patron, nor may the ordinary visit the same, but the patron by commissioners appointed by him. There can be no lapse of this benefice, though the bishop may compel such patron to nominate a clerk by ecclesiastical censures; and the clerk must be qualified as other clerks of churches are.

**DONAWERT**, a city of Bavaria in Germany, forty miles north-west of Ulm : east long.  $10^{\circ} 40'$  north lat.  $48^{\circ} 40'$ .

**DONAX**, in ichthyology, a name used by some for the solen. See the article **SOLE**N.

**DONAX**, in botany, the great reed. See the article **REED**.

**DONCASTER**, a market town of Yorkshire, thirty miles south of York. See the article **YORK**.

**DONEE**. See the article **DONOR**.

**DONJON**, in fortification, signifies a strong tower, or redoubt of a fortress, whither the garrison may retreat, in case of necessity, and capitulate with greater advantage.

**DONOR**, in law, the person who gives lands or tenements to another in tail, &c. as he to whom such lands, &c. are given is the donee.

**DONZY**, a town of France in the Orleanois : east long.  $3^{\circ} 16'$ , north lat.  $47^{\circ} 17'$ .

**DOOR**, in architecture, an aperture in a wall, to give entrance and exit into and out of a building, or any apartment thereof.

It is laid down as a rule, that the doors of an house be as few in number, and as moderate in dimensions, as possible ; as all openings are weakenings.

Secondly, that they do not approach too near the angles of the walls, it being a very great solecism to weaken that part which strengthens all the rest.

Thirdly, that the doors, if possible, be placed over one another, that void may be over void, and full over full, which circumstance will greatly strengthen the whole fabric.

Fourthly, that, if possible, they may be opposite to each other, in such a manner, that one may see from one end of the house to the other, which will not only be very graceful, but most convenient, in respect that it affords means of cooling the house in summer, by letting the air through it, and by keeping out the wind in winter, which way soever it fit.

Fifthly, 'tis not only ornamental, but very secure, to turn arches over doors, which will discharge them in great measure from the superincumbent weight.

The proportions of doors are adjusted by those of a man. In large buildings, they must be always larger than in smaller : but should not be less than six feet high in any, to admit a man of a just stature erect : and as the breadth of a man, with his arms placed akimbo, is

nearly subduple his height, the width ought never to be less than three feet. Some architects gives us these dimensions following : in small buildings, the breadth of the door four feet, or four and a half ; in middling buildings five, or six ; in large ones seven, or eight : in chambers of the first story three and a half, three and three-fourths, or four ; of the second, four, or four and a half ; and of the third, five, or six ; in churches seven or eight ; in gates, nine, ten, or twelve : hence their height is easily determined, except for the gates of cities, which should only be four-fifths of their breadth.

In plate LXXVI. fig. 5. are represented two doors, of which that marked N is two diameters high ; and that marked O,  $2 \frac{1}{2}$  diameters. Here the architrave being divided into three parts, two is for the breadth of the pilaster, as at P ; and on these pilasters are placed the trusses, scrolls, or corbels, as in Q ; whose shape is almost at pleasure. If either of these be used as frontispieces of external doors, the pediment ought not to be broken, or opened, and the architrave should stand on a plinth, equal to two thirds thereof, or to the height of the step, by which one ascends into the house.

**DORADO**, in ichthyology, the same with guaracapema. See **GUARACAPEMA**.

**DORCHESTER**, the capital of Dorsetshire, situated on the river Frome, six miles north of Weymouth : west long.  $2^{\circ} 35'$ , and north lat.  $50^{\circ} 40'$ .

It gives the title of marquis to the noble family of Pierpoint, dukes of Kingston, and sends two members to parliament.

**DORDONNE**, a river of France, which runs through the province of Guienne, and falls into the Garonne, twelve miles below Bourdeaux.

**DORDRECHT**, in geography. See **DORT**.

**DOREAS LYBICA**, in zoology, the same with the gazella. See **GAZELLA**.

**DOREE**, or **JOHN DOREE**, a fish called by authors faber. See the article **FABER**.

**DORIA**, in botany, the name by which some call a species of solidago. See the article **SOLIDAGO**.

**DORIC**, in general, any thing belonging to the Dorians, an antient people of Greece, inhabiting near mount Par-nassus.

**DORIC ORDER**, in architecture, the second of the five orders, being that between the tuscan and ionic. See the articles **ORDER**, **TUSCAN**, and **IONIC**.

Fig. 2. DOSSILS.

Fig. DOUBLE FICHE.

This order seems the most natural and best proportioned of all the orders, the several parts of it being founded on the natural position of solid bodies. Accordingly, the doric is the first, and most antient of the orders of architecture, and is that which gave the first idea or notion of regular building. See plate LXXVII, fig. 1.

It was indeed more simple at its first invention; than it is at present; and when they came in after times to adorn and enrich it more, the appellation of Doric was restrained to this richer manner, and then they called the primitive, simple manner, by the new name of Tuscan.

Some time after its invention, it was reduced to the proportions, strength and beauty of the body of a man: hence as the foot of a man was judged the sixth part of his height, they made the doric column six diameters high. After that, they added another diameter to it, and made it seven; which augmentation seemed to bring it nearer to the proportion of a man; the human foot, at least in our days, not being a sixth but nearly a seventh part of the body.

The characters of the doric order, as they are now managed, are, the height of its column, which is eight diameters; the frieze which is adorned with triglyphs, drops, and metopes; its capital, which is without volutes, and its admitting of cymatiums.

It has been already observed, that the antients had two dorics; the first of which was the more simple and massive, and was chiefly used in temples; the second, which was the more light and delicate, they used in porticoes and theatres.

The doric is used by the moderns, on account of its solidity, in large, strong buildings; as in the gates of cities and citadels; the outsidcs of churches, and other massy works, in which delicacy of ornaments would not be suitable.

The most considerable antient monuments of this order is the theatre of Marcellus at Rome, the capital, the height of the frieze, and projecture of which are much smaller than in the modern architecture.

Vignola adjusts the proportion of the doric order as follows: he divides the whole height of the order without the pedestal into twenty parts, or modules, one of which he allows to the base; fourteen to the shaft, or fust; one to the capital, and four to the entablature: the

several parts and members may be seen under their respective heads. See the articles COLUMN, CORNICHE, BASE, FRIEZE, &c.

*The DORIC order delineated by equal parts, instead of modules and minutes.* The height of the pedestal being two diameters, and  $\frac{1}{2}$ , is divided into 4, giving one to the base, whose plinth is  $\frac{2}{3}$  thereof; the other part is divided into seven, giving four to the torus, one to the fillet, and two to the hollow. The breadth of the base is a diameter and one third. The projection of the base is equal to its height, and the fillet has 4 of these parts. The height of the cornice is half the base, being  $\frac{1}{2}$  of the whole height; and is divided into nine, giving two to the hollow, one to the fillet, five to the corona, and one to the fillet: the projection of the hollow is three of these parts, of the corona six, and of the whole seven.

*Base of the column.* The height is half a diameter, and is divided into six, giving two to the plinth, 1 and  $\frac{1}{2}$  to the lower torus,  $\frac{1}{4}$  to the fillet, and one to the scotia,  $\frac{1}{4}$  to the fillet, and one to the upper torus. The fillet above the torus is equal to the others, and is part of the column. The projection is two of these parts, and one third thereof is for the upper fillet, and  $\frac{2}{3}$  to the upper torus; and the fillet, under it, is perpendicular to the center. For forming the scotia, divide its height into 3, and on the line that separates the one part above from the other two parts below, and perpendicular to the fillet, is the center for the first quarter sweep; and the same distance forwards, in the line, is the center for the other quarter, and is also the projecture of the lower fillet.

The diminishing of this column is  $\frac{1}{8}$  of the diameter. The height of the capital is half a diameter, and is divided into 9, giving three to the frieze of the capital, one to the fillets, which are three, and are equal; two to the oval, two to the abacus, and one to the ogee and fillet which is  $\frac{1}{3}$ . For the projections, the fillets have one of these parts, the abacus three, and the whole four.

The height of the architrave is  $\frac{1}{2}$  a diameter, and is divided into six parts, giving two to the first face, two to the second, one to the bells and fillet, which is one third, and one to the band at top: the projection is equal to the band.

The frieze is in height  $\frac{3}{4}$  of the diameter, and the triglyphs are in breadth  $\frac{1}{2}$  a diameter, which are divided into 6, giving 1 to each of the channels, and 1 to the spaces between the channels.

The projection from the naked of the frieze is  $\frac{3}{4}$  of a part; and the spaces, or metopes, between the triglyphs, ought to be equal to the height of the frieze.

The height of the cornice is  $\frac{3}{4}$  of the diameter, and is divided into 9, giving 1 to the cap of the triglyph, 1 to the hollow and fillet, which is  $\frac{1}{2}$ , 1 to the ovolo, 1 to the mutule and fillet under it, which is equal to the other;  $\frac{1}{2}$  part to the cap of the mutule and fillet, which is  $\frac{1}{3}$ , 1 and  $\frac{3}{4}$  to the corona,  $\frac{3}{4}$  to the cima reversa,  $\frac{1}{4}$  to the fillet, 1 and  $\frac{1}{4}$  to the cima recta, and  $\frac{1}{2}$  part to the fillet.

For the projections, the cap of the triglyph hath 1 of these parts, the hollow 1 and  $\frac{3}{4}$ , the ovolo 2 and  $\frac{3}{4}$ , the mutule 8 and  $\frac{3}{4}$ , the corona 9 and  $\frac{3}{4}$ , the cima reversa 10 and  $\frac{3}{4}$ , and the whole 12 parts.

**DORIC DIALECT**, in grammar, one of the five dialects, or manners of speaking which were principally in use among the Greeks.

It was first used by the Lacedemonians, particularly those of Argos; afterwards it passed into Epirus, Lybia, Sicily, and the islands of Rhodes, Crete, &c.

According to the doric dialect, the vowels  $\alpha$ ,  $\epsilon$ ,  $\sigma$ ,  $\omega$ , are changed into  $\alpha$ ; the diphthongs  $\epsilon\iota$  into  $\alpha$  or  $\alpha\iota$ ; and the consonants  $\beta$  into  $\gamma$ ;  $\zeta$  into  $\sigma\delta$ ;  $\kappa$  and  $\varsigma$  into  $\tau$ ;  $\tau$  and  $\rho$  into  $\kappa$ ;  $\lambda$  with a  $\tau$  or  $\theta$  following it, into  $\nu$ . Thus for  $\phi\eta\mu\eta$ ,  $\tau\rho\epsilon\chi\omega$ ,  $\kappa\lambda\epsilon\iota\delta\alpha$ ;  $\beta\lambda\epsilon\phi\alpha\rho\alpha$ , &c. they say  $\phi\alpha\mu\alpha$ ,  $\tau\rho\alpha\chi\omega$ ,  $\kappa\lambda\alpha\delta\alpha$ ,  $\gamma\lambda\epsilon\phi\alpha\rho\alpha$ , &c.

They likewise change  $\upsilon$  into  $\omega$ , as  $\lambda\omicron\gamma\omega$  for  $\lambda\upsilon\gamma\omega$ ; also  $\epsilon\theta$  into  $\epsilon\upsilon\varsigma$ , as  $\beta\alpha\sigma\iota\lambda\epsilon\upsilon\varsigma$  for  $\beta\alpha\sigma\iota\lambda\epsilon\theta$ ;  $\epsilon\alpha$ ,  $\alpha\epsilon$ , and  $\alpha\epsilon\iota$  into  $\eta$ , as  $\kappa\eta\eta\varsigma$  for  $\kappa\epsilon\epsilon\alpha\varsigma$ ,  $\epsilon\gamma\epsilon\lambda\eta\varsigma$  for  $\epsilon\gamma\epsilon\lambda\alpha\epsilon\varsigma$ , and  $\gamma\epsilon\lambda\eta\varsigma$  for  $\gamma\epsilon\lambda\alpha\epsilon\iota\varsigma$ : with other transmutations of the like nature.

**DORIC MODE**, in music, the first of the authentic modes of the antients; its character is to be severe, tempered with gravity and joy; and is proper upon religious occasions, as also to be used in war. It begins *D, la, sol, re*. Plato admires the music of the doric mode, and judges it proper to preserve good manners, as being masculine; and on this account allows it in his commonwealth. The antients had likewise their sub-doric or hypodoric mode, which was one of the plagal modes. Its character was to be

very grave and solemn: it began with *re*, a fourth lower than the doric.

**DORING**, or **DARING**, among sportsmen, a term used to express a method of taking larks by means of a clap-net and a looking-glass. See **CLAP-NET**.

**DORMANT**, in heraldry, is used for the posture of a lion, or any other beast, lying along in a sleeping attitude, with the head on the fore-paws; by which it is distinguished from the couchant, where though the beast be lying, yet he holds up his head.

**DORMANT-TREE**, in architecture, is a name given by workmen to a great beam lying across a house, commonly called a summer.

**DORMANT-TYLES**. See **TYLE**.

**DORMER**, in architecture, signifies a window made in the roof of an house, or above the entablature, being raised upon the rafters.

**DORMITORY**, a gallery in convents or religious houses, divided into several cells, in which the religious sleep or lodge.

**DORMITORY** is sometimes used for a burying place.

**DORONICIS AFFINIS**, a name given by Plukenet to a plant called by Linnæus *gerbera*. See the article **GERBERA**.

**DORONICUM**, **LEOPARD'S BANE**, in botany, a genus of the *Syngenesia-polygamia-superflua* class of plants, the compound flower of which is radiated: the proper flower is funnel-formed; there is no pericarpium, but the cup, being slightly connivent, contains a solitary seed, vertically ovated, compressed, fulcated, and crowned with a downy pap.

The root of the *doronicum officinarum* is said to be an alexipharmic, but it is not used in the present practice.

**DORPT**, or **DORPAT**, a city of Livonia, about fifty miles south of Narva: east lon.  $27^{\circ} 25'$ , and north lat.  $58^{\circ}$ .

**DORSAL**, an appellation given to whatever belongs to the back. See **DORSUM**.

**DORSAL MUSCLES** are the muscles of the back and loins, which are for the most part common: there are of the extensors usually reckoned three on each side, *viz.* the *sacro-lumbaris*, the *longissimus dorsi*, and the *femispinosus*: the flexors are three also, *viz.* the *quadratus lumborum*, the *psoas parvus*, and the *intertransversales lumborum*. See each under its proper head.

**DORSAL NERVES**. See **NERVE**.

**DORSIFEROUS PLANTS**, among botanists, such as are of the capillary kind, without

*Fig. 1. DODARTIA.*

*Fig. 2. DODO.*

*Fig. 3. DOLIUM.*

*Fig. 4. DOLPHIN.*

*Fig. 5. DOORS.*

without stalks, and which bear their seeds on the backside of their leaves.

**DORSTENIA**, in botany, a genus of the *tetrandria-monogynia* class of plants, which have no flower-petals, only a great many collections of the male and female parts on the disc; each collection, or partial flower, being surrounded by its proper perianthium, as the whole are by a common involucre or cup; the seeds, which are roundish and solitary, are contained in a common pulpy receptacle. See the article **CONTRAYERVA**.

**DORSUM**, BACK, in anatomy, comprehends all the posterior part of the trunk of the body, from the neck to the buttocks. The back is furnished with several muscles, which are common to it with the loins, as the *longissimus dorsi*, the *sacro-lumbaris*, and *semispinosus*; these are called extensors. See **EXTENSOR**.

To the back likewise belong the *intertransversales lumborum*, the *quadratus lumborum*, and the *psoas*. See the article **INTERTRANSVERSALIS**, &c.

Its bones are the *spina dorsi*, ribs, and os sacrum. See **SPINE**, **RIB**, &c.

**DORSUM** is also used to denote the upper side of the hand and foot, in contradistinction to the lower side, called the palm and sole. See **HAND** and **FOOT**.

**DORSUM NASI**, the ridge of the nose. See the article **NOSE**.

**DORT**, a city of the United Provinces, situated in that of Holland, on an island in the river *Maese*, about ten miles east of Rotterdam: east lon.  $4^{\circ} 40'$ , and north lat.  $51^{\circ} 47'$ .

**DORTMOND**, a city of Westphalia in Germany, about thirty miles north-east of Dusseldorp: east lon.  $6^{\circ} 50'$ , and north lat.  $51^{\circ} 25'$ .

It is an imperial city, and constitutes a sovereign state.

**DORTMANNIA**, the name of a plant comprehended by Linnæus among the *lobelia*. See the article **LOBELIA**.

**DORYCNium**, in botany, a genus of the *diadelphia-decandria* class of plants, the corolla of which is papilionaceous; the vexillum is vertically cordated and reflex; the alæ are oblong, of the length of the carina, which is short and straight; the fruit is a roundish, acuminate, bivalve, and unilocular pod, almost covered; the seed is either one or two.

**DORYPHORI**, in antiquity, an appellation given to the life-guard men of the roman emperors: they were held in such great estimation, as frequently to

have the command of armies conferred on them. It was likewise usual for the chief commanders, to have their *doryphori* to attend them.

**DOSE**, in medicine and pharmacy, the quantity of a medicine given at one time; or the proportion of which the several ingredients of a compound medicine bear to each other.

It is the business of the physician to adjust the doses of medicines to the cases of his patients; in doing which he cannot use too much caution, since the same dose that would prove highly beneficial to one, may be fatal to another. See **MEDICINE**, **PHARMACOPOEIA**, &c.

**DOSITHEANS**, *dosithei*, in church-history, a sect among the Hebrews, being one of the branches of the Samaritans. See the article **SAMARITANS**.

They abstained from eating any creature that had life, and were so superstitious in keeping the sabbath, that they remained in the same place and posture wherein that day surprised them, without stirring till the next day. They married but once, and a great number never married. Dositheus, their founder, being dissatisfied among the Jews, retired to the Samaritans, who were reputed heretics, and invented another sect; and to make it more authentic, he went into a cave, where, by too long abstinence, he killed himself. The name of dositheans was also given to some of the disciples of Simon Magus.

**DOSSER**, in military matters, a sort of basket, carried on the shoulders of men, used in carrying the overplus earth from one part of a fortification to another, where it is wanted.

**DOSSIL**, in surgery, lint made into a cylindric form, or resembling the shape of dates, or olive-stones, the size of which is very different. Dossils are used in dressing a disordered part; and are sometimes secured by a thread, tied round their middle. See plate **LXXVII**. fig. 2.

It requires a good deal of time and experience to acquire a proper expertness in making up these forms.

These different forms of scraped lint are used, 1. To stop the bleeding of fresh wounds; and in large wounds they should first be dipped in some styptic liquor, or sprinkled with a styptic powder. 2. To agglutinate and heal wounds, especially if spread with some digestive ointment, or dipped in some vulnerary liquor. 3. In drying up wounds and ulcers. 4.

In

In keeping the lips of wounds, at a proper distance, that they may not unite before the bottom is well digested and healed. 5. To preserve wounds from the injuries of the air.

The dossils tied round with a thread, are chiefly used in dressing deep wounds and ulcers, that none of it may be left in them.

**NOTE ASSIGNANDA**, in law, a writ that formerly lay for a widow, on its being found by office, that the king's tenant was seized of lands in fee or tail at the time of his death, and that he held of the king in chief, &c. in which case the widow was to come into the court of chancery, and there make oath that she would not marry without the king's leave; upon which she had this writ to the escheator, to assign her dower.

**NOTE UNDE NIHIL HABET**, a writ of dower which the widow may have against a person that bought land of her husband in his life-time, whereof he was seized in fee simple or fee tail, and of which she is dowerable.

*Resto de DOTE.* See the article **RECTO**.

**DOTIS ADMENSURATIONE**, admeasurement of dower. See **ADMEASUREMENT**.

**DOTTEREL**, the english name of a bird called by authors morinellus. See the article **MORINELLUS**.

**DOUAY**, a fortified city of the french Netherlands, situated on the river Scarpe, about fifteen miles south of Lille: east lon. 3°, and north lat. 50° 25'.

**DOUBLE ASPECT**, in painting. See the article **ASPECT**.

**DOUBLE BASTION**, in fortification. See the article **BASTION**.

**DOUBLE CAST**, in husbandry, a term used by the farmers for that method of sowing that does not dispense the necessary quantity of seed for a piece of land at one bout, but requires going over every place twice.

**DOUBLE DESCANT**, in music. See the article **DESCANT**.

**DOUBLE DIESIS**. See **DIESIS**.

**DOUBLE horizontal dial**, one with a double gnomon, one of which points out the hour on the outward circle, and the other shews the hour upon the stereographic projection drawn upon it. This dial not only finds the meridian, hour, &c. but shews the sun's place, rising and setting, declination, amplitude, altitude, and azimuth, with many other useful propositions. See the article **DIAL**.

**DOUBLE DANCETTE**, in heraldry. See the article **DANCETTE**.

**DOUBLE EXCENTRICITY**. See the article **EXCENTRICITY**.

**DOUBLE FEAST**. See **FEAST**.

**DOUBLE FEVER**. See the article **FEVER**.

**DOUBLE FICHY, or FICHE**, in heraldry, the denomination of a cross, when the extremity has two points, in contradistinction to *fiché*, where the extremity is sharpened away to one point. See plate LXXVII. fig. 3.

**DOUBLE FINE**, in law. See **FINE**.

**DOUBLE FUGUE**, in music. See **FUGUE**.

**DOUBLE LETTER**, in grammar, a letter which has the force and effect of two. The Greeks have three of these, viz. *Ξ, Ψ, Ω*; the Latins have two *X* and *Z*; and most of the modern languages have the same.

**DOUBLE MEASURE**. See **MEASURE**.

**DOUBLE PEDESTAL**. See **PEDESTAL**.

**DOUBLE PLEA**, in law, is where the defendant in a suit alleges two several matters in bar of the plaintiff's action, when one of them is sufficient. This is not admitted in common law. Thus when a person pleads several things, the one having no dependance upon the other, such plea is accounted double, and will not be admitted; but where the things pleaded mutually depend on each other, and the party cannot have the last plea without the first, there the whole shall be received.

**DOUBLE PLOUGH**. See **PLOUGH**.

**DOUBLE POINT**, in the higher geometry. See *CURVES of the second order*.

**DOUBLE POSITION**. See **POSITION**.

**DOUBLE QUARREL**, a complaint made by any clerk, or other, to the archbishop of a province, against an inferior ordinary, for delaying justice in some spiritual cause, as to give sentence, institute a clerk, or the like. It seems to be termed double quarrel, because the complaint is usually made both against the judge, and the party at whose suit justice is delayed.

<b>DOUBLE RATIO,</b>	} See {	<b>DUPLE.</b>
<b>DOUBLE ROADS,</b>		<b>ROADS.</b>
<b>DOUBLE TENAILLE,</b>		<b>TENAILLE</b>
<b>DOUBLE TIME,</b>		<b>TIME.</b>
<b>DOUBLE VAULT,</b>		<b>VAULT.</b>

**DOUBLE VESSEL**, in chemistry, is when the neck of one bolt-head or matrafs is put and well luted into the neck of another, in order to refine and exalt spirits as high as can be. It is sometimes called a pelican, and also a diota.

*Grafting by DOUBLE incision.* See the article **GRAFTING**.

*Recovery with DOUBLE voucher.* See the article **RECOVERY**.

**DOUBLES**, in our statutes, signify as much as letters patent.

**DOUBLETS**, a game on dice within tables : the men, which are only fifteen, being placed thus ; upon the six, cinque, and quater points, there stand three men a-piece ; and upon the trey, duce, and ace, only two. He that throws highest hath the benefit of throwing first ; and what he throws he lays down, and so doth the other : what the one throws, and hath not, the other lays down for him, but to his own account ; and thus they do till all the men are down, and then they bear. He that is down first bears first, and will doubtless win the game, if the other throws not doublets to overtake him ; which he is sure to do, since he advances or bears as many as the doublets make, viz. eight for two fours.

**DOUBLING**, in the military art, is the putting two ranks or files of soldiers into one. Thus, when the word of command is, *double your ranks*, the second, fourth, and sixth ranks march into the first, third, and fifth, so that the six ranks are reduced to three, and the intervals between the ranks become double what they were before. *To double by half files*, is when the fourth, fifth, and sixth ranks march up to double the first, second, and third, or the contrary. *To double the files to the right*, is when every other file faces to the right, and marches into the next file to it, so that the six ranks are turned into twelve, and every file is twelve deep. *To double the files to the left*, is when every other file faces to the left, and marches into the next. In doubling the files, the distance betwixt the files becomes double.

**DOUBLING**, among hunters, who say that a hare doubles, when she keeps in plain fields, and winds about to deceive the hounds.

**DOUBLING**, in the manege, a term used of a horse, who is said to double his reins, when he leaps several times together, to throw his rider : thus we say, the ramingue doubles his reins, and makes pontlevis. See the articles **RAMINGUE** and **PONTLEVIS**.

**DOUBLING a cape or point**, in navigation, signifies the coming up with it, passing by it, and leaving it behind the ship.

**DOUBLINGS**, in heraldry, the linings of robes and mantles of state, or of the mantlings in achievements.

**DOUBLON**, or **DUBLOON**, a spanish and portuguese coin, being the double of a pistole. See **COIN** and **PISTOLE**.

**DOUBTING**, *dubitatio*, the act of withholding our assent from any proposition, on suspicion that we are not thoroughly apprised of the merits thereof ; or from not being able peremptorily to decide between the reasons for and against it.

Doubting is distinguished by the schoolmen into two kinds, *dubitatio sterilis*, and *dubitatio efficax* : the former is that where no determination ensues ; in this manner the sceptics and academics doubt, who withhold their assent from every thing. See the articles **SCEPTICS**, &c.

The latter is followed by judgment, which distinguishes truth from falsehood : such is the doubting of the peripatetics and cartesianians ; the last in particular are perpetually inculcating the deceitfulness of our senses, and tell us that we are to doubt of every one of their reports, till they have been examined and confirmed by reason. On the other hand, the epicureans teach that our senses always tell truth, and that, if you go ever so little from them, you come within the province of doubting. See the articles **CARTESIANS**, **EPICUREANS**, &c.

**DOUBTING** in rhetoric, signifies the debate of the mind with itself, upon a pressing difficulty. It is, for the most, part expressed by interrogation, though that is not necessary. Thus Cicero for Roscius : " Quid primum querar ? aut unde potissimum, iudices, ordear ? aut quod, aut a quibus, auxilium petam ? deorum immortalium ? populine romani ? " &c. This figure keeps us in eager attention.

**DOUCINE**, in architecture, a moulding concave above and convex below, serving commonly as a cymatium to a delicate corniche. It is likewise called *gula*. See **CYMATIUM** and **GULA**.

**DOUCKER**, or **DUCKER**. See **DUCKER**.  
**DOVE**, *columba*, in ornithology. See the article **COLUMBA**.

**DOVE**, in geography, the name of a river dividing Derbyshire from Staffordshire : also of a town of the Orleanois, in France, about twenty miles south-east of Angers.

**DOVE-TAILING**, in carpentry, is the manner of fastening boards together by letting one piece into another, in the form of the tail of a dove. The dove-tail is the strongest of the assemblages or jointings, because

because the tenon, or piece of wood which is put into the other, goes widening to the extreme, so that it cannot be drawn out again, by reason the extreme or tip is bigger than the hole.

The French call it *queue d'aronde*; which name is also used by the English in fortification.

**DOVELLA**, in ichthyology, a species of labrus with two large teeth in the upper jaw. See the article **LABRUS**.

**DOVER**, a borough and port-town of Kent, situated on a rock, opposite to Calais in France, with a strong castle: east lon.  $25^{\circ}$ , and north lat.  $51^{\circ} 10'$ .

Dover gives the title of duke to the dukes of Queensbury, a branch of the noble family of Douglas; and sends two members to parliament, styled barons of the cinque ports, whereof Dover is the chief. See the article **CINQUEPORTS**.

**DOUGLAS**, a port-town, and the best harbour in the Isle of Man: west long.  $4^{\circ} 25'$ , and north latitude  $54^{\circ} 7'$ .

**DOULEIA**, in grecian antiquity, a kind of punishment among the Athenians, by which the criminal was reduced to the condition of a slave.

It never was inflicted but upon the *αἰσχροί*, sojourners, and freed servants.

**DOURLACH**, or **DURLACH**. See the article **DURLACH**.

**DOWAGER**, *doïssa*, a widow endowed, is a title applied to the widows of princes, dukes, earls, and persons of high rank only.

**DOWER**, that portion which the law allows a widow out of the lands of her husband, after his decease. It is distinguished into five kinds: 1. Dower by the common law, is a third part of such lands and tenements as the husband was solely seized in fee or tail, during the coverture, and this the widow is to enjoy during her life. 2. Dower by custom, that part of the husband's estate to which the widow is intitled, after the death of her husband, by the custom of some manor, so long as she shall live single and chaste: this is sometimes more than one third part, for in some places she has half the land, and in others the whole, during life. See the article *Free BENCH*. 3. Dower ad ostium ecclesie, formerly made by the husband immediately after the marriage, when the particular lands were expressly named, of which his wife should be endowed. 4. Dower ex assensu patris, made of lands named by a son who was husband with the consent of his father; and this was

always reduced into writing, as soon as the son was married. 5. Dower de la plus belle, which was where the wife was endowed with the fairest part of the husband's estate. Of these five the two first only of these writs of dower are now in use.

*Admeasurement of DOWER*. See the article **ADMEASUREMENT**.

*Assignment of DOWER*, the setting out a woman's marriage-portion by the heir.

*Tenant in DOWER*. See **TENANT**.

**DOWLE-STONES**, in our old writers, the same with land-marks.

**DOWN**, in geography, the capital of a county of the same name in the province of Ulster, in Ireland: west longit.  $5^{\circ} 50'$ , and north lat.  $54^{\circ} 23'$ .

**DOWNETON**, or **DUNKTON**, a borough-town of Wiltshire, five miles south of Salisbury.

It sends two members to parliament.

**DOWNHAM**, a market-town of Norfolk, ten miles south of Lynn, famous for its good butter; there being a thousand, and sometimes two thousand firkins bought here every Monday, and sent up the river Ouse to Cambridge, from whence it is conveyed to London, in the Cambridge waggons.

**DOWNS**, a famous road near Deal, in Kent, where both the outward and homeward bound ships frequently make some stay; and squadrons of men of war rendezvous in time of war.

It affords excellent anchorage, and is defended by the castles of Deal, Dover, and Sandwich.

**DOWRY**, *dos*, is properly the money or fortune which the wife brings her husband in marriage: it is otherwise called *maritagium*, marriage-goods, and differs from dower. See the article **DOWER**.

Among the Germans it was customary, in former times, for the husband to bring a dowry to his wife.

**DOWRY** is also used, in a monastic sense, for a sum of money given along with a maid, upon entering her in some religious order.

In France, the dowry of persons entering a monastery, to make profession of a religious life, is limited by law. That given upon entering a monastery of carmelites, urselines, and others not regularly founded, but established since the year 1600, by letters patent, must not exceed the sum of 8000 livres in towns where parliaments are held; nor 6000, in other places.

**DOXOLOGY**, an hymn used in praise of the Almighty, distinguished by the title of greater and lesser.

The lesser doxology was antiently only a single sentence, without response, running in these words, *glory be to the Father, and to the Son, and to the Holy Ghost, world without end, amen.* Part of the latter clause *as it was in the beginning, is now, and ever shall be*, was inserted some time after the first composition. Some read this antient hymn, *glory be to the Father, and to the Son with the Holy Ghost.* Others, *glory be to the Father in or by the Son, and by the Holy Ghost.* This difference of expression occasioned no disputes in the church, till the rise of the arian here; but when the followers of Arius began to make use of the latter, as a distinguishing character of their party, it was intirely laid aside by the catholics, and the use of it was enough to bring any one under suspicion of heterodoxy. The doxology was used at the close of every solemn office. The western church repeated it at the end of every psalm, and the eastern church at the end of the last psalm. Many of their prayers were also concluded with it, particularly the solemn thanksgiving, or consecration prayer at the eucharist. It was also the ordinary conclusion of their sermons.

The greater doxology, or angelical hymn, was likewise of great note in the antient church. It began with these words, which the angels sung at our Saviour's birth, *glory be to God on high, &c.* It was chiefly used in the communion service, and in men's private devotions. In the mozarabic liturgy, it is appointed to be sung before the lessons on christmas day; and St. Chrysostom observes, that the ascetics met together daily to sing this hymn. Both the doxologies have a place in the church of England, the former being repeated after every psalm, and the latter used in the communion service.

**DOZEINERS.** See **DECENNIERS.**

**DRABA**, **ARABIAN MUSTARD**, or **TURKY CRESSES**, in botany, a genus of the *tetradynamia-siliculosa* class of plants, the flower of which consists of four oblong petals, and is cruciform: it has six stamina, four whereof are longer than the other two: the fruit is a bilocular, elliptico-oblong, compressed pod, containing a number of small roundish seeds, and wanting a style.

**DRABLER**, in the sea-language, a small sail in a ship, being the same to a bonnet

that a bonnet is to a course, and is only used when the course and bonnet are too shoal to cloath the mast. See **COURSE** and **BONNET.**

**DRABS**, in the salt-works, a kind of wooden boxes for holding the salt when taken out of the boiling pan, the bottoms of which are made shelving or inclining forwards, that the briny moisture of the salt may drain off. See the article **SALT.**

**DRACHM**, a grecian coin of the value of seven-pence three-farthings. See **COIN.**

**DRACO**, the **DRAGON**, in zoology. See the article **DRAGON:**

**DRACO MARINUS**, the **SEA-DRAGON**, in ichthyology, the same with the araneus of Pliny: it is a species of trachinus, growing to six or eight inches in length, and called by some the weaver. See plate **LXXIX.** fig. 1.

**DRACO VOLANS**, in meteorology, a fiery exhalation, frequent in marshy and cold countries.

It is most common in summer, and tho' principally seen playing near the banks of rivers, or in boggy places, yet sometimes mounts up to a considerable height in the air, to the no small terror of the amazed beholders; its appearance being that of an oblong, sometimes roundish, fiery body, with a long tail. It is entirely harmless, frequently sticking to the hands and cloaths of people without injuring them in the least.

**DRACO**, in astronomy, a constellation of the northern hemisphere, said by different authors to contain 31, 32, 33, or even 49 stars.

**DRACOCEPHALUM**, **DRAGON'S HEAD**, in botany, a genus of the *dodynamia-gymnospermia* class of plants, the corolla of which consists of a single ringent petal; the tube is of the length of the cup; the upper lip is fornicated and obtuse, the lower is lightly divided into three segments; there is no pericarpium, but the cup cherishes the seeds, which are four ovato-oblong, and three sided ones. See plate **LXXIX.** fig. 3.

**DRACOCEPHALUS**, the same with **dracocephalum.** See the preceding article.

**DRACONARIUS**, in antiquity, the person who carried the standards called dragons, from the figures of these animals painted on them. These were in use among the Persians, Parthians, Scythians, Romans, &c.

**DRACONIS CAPUT, CAUDA, &c.** See the article **DRAGON.**

**DRACONTEAS**, a name used by the ancients for two distinct plants, *dracunculus* and *arum*. See **DRACUNCULUS** and **ARUM**.

**DRACONTIC MONTH**, the time of one revolution of the moon, from her ascending node, called *caput draconis*, to her return thither.

**DRACONTIUM**, **DRAGONS**, in botany, a genus of the *gynandria-polyandria* class of plants, the corolla of which consists of five concave, ovated, obtuse, and almost equal petals: the fruit is a single roundish berry; and the seeds are numerous.

Its root is esteemed a good alexipharmic and sudorific, and accordingly prescribed in the plague and malignant fevers, and for the bites of serpents.

**DRACUNCULI**, in medicine, small long worms, which breed in the muscular parts of the arms and legs, called Guinea-worms.

This distemper is very common in Guinea, and principally among the natives: Kempfer found it so also at Ormuz, upon the persian gulph, and likewise in Tartary. Dr. Tawne, in his treatise of the diseases of the West-Indies, informs us, that this distemper is not so frequent any where as on the Gold coast, at Anamboe, and Cormantyn.

The worm is white, round, and uniform, very much resembling white, round tape, or bobbing. It is lodged between the interstices and membranes of the muscles, where it insinuates itself sometimes exceeding five ells in length. It occasions no great pain at the beginning, but at such times as it is ready to make its exit, the part adjoining to the extremity of the worm, where it attempts its exclusion, begins to swell, throb, and be inflamed: this generally happens about the ankle, leg, or thigh, and rarely higher.

The countries where this distemper is observed, are very hot and sultry, liable to great droughts, and the inhabitants make use of stagnating and corrupted water, in which it is very probable that the ova of these animalcula may be contained; for the white people who drink this water, are obnoxious to the disease as well as the negroes.

The surgeons seldom attempt to extract this worm by making an incision; but as soon as they perceive the tumor rise to a competent bulk, they endeavour to bring it to a suppuration, with all convenient expedition; and then the head of the worm discovers itself, which they secure,

by tying it to a bit of stick, or cotton, that it may not draw itself up again: thus they continue to roll it round the stick, sometimes one inch, sometimes two or more, each day, taking great care not to break the worm, else it will be very difficult to recover the end of it again; and an abscess will be formed, not only at the suppurated part, but likewise through the whole winding of the muscles, where the dead putrifying worm remains, which generally occasions very obstinate ulcers. During the extraction of the worm, the patient should be plied with bitter aloetic and other anthelmintic medicines, in order to dislodge the worm the sooner from his tenement. When the worm is totally extracted, the remaining ulcer may be treated in the same manner as other common ulcers; nor does any farther inconvenience remain in the parts of which it had possession. This disease, simply considered, very rarely, if ever, proves mortal.

**DRACUNCULI** is also used for a disease in children, arising from little worms called by that name. See the article **WORMS**.

**DRACUNCULOIDES**, in botany, the name by which Boerhaave calls the *hæmanthus* of Linnaeus.

**DRACUNCULUS**, **DRAGONS**, in botany, is comprehended by Linnaeus among the *arums*. See the article **ARUM**.

**DRACUNCULUS** is also the name of the linear-leaved *artemisia*, called in english tarragon. See the article **TARRAGON**.

**DRACUNCULUS**, the little **SEA-DRAGON**, in ichthyology, a species of *cottus*, with the second back-fin white. See the article **COTTUS**.

The *dracunculus* is a very singular fish, growing to five or six inches in length. See plate **LXXIX**. fig. 2.

**DRAGANT**, the same with *tragacanth*. See the article **TRAGACANTH**.

**DRAGOMAN**, **DROGMAN**, or **DRUGGERMAN**, a name given in the Levant to the interpreters kept by the ambassadors of christian nations, residing at the Porte, to assist them in treating of their master's affairs.

**DRAGON**, *draco*, in zoology, an animal called also the flying lizard, being furnished with two lateral, membranaceous, and radiated wings: it is a true lizard, with a naked and four-legged body, and a long tail; though there are not wanting some who deny the existence of any such animal. See plate **LXXX**. fig. 2.

**Sea-DRAGON**. See **DRACO MARINUS**, and **DRACUNCULUS**, *supra*.

**DRAGON'S**

**DRAGON'S BELLY**, in astronomy. See the article **VENTER DRACONIS**.

**DRAGON'S BLOOD**, *sanguis draconis*, in pharmacy, a moderately heavy resin, of which there are two kinds : the one firm and compact, brought to us in lumps, of an inch long, or more, and about half an inch in diameter : these are wrapped up in certain long and narrow leaves, and are called the drops, or tears, of dragon's blood. The other is brought to us in larger masses or cakes, of an irregular figure. This is less compact than the former, and less pure : it is called the common dragon's blood, and is greatly inferior to the former in value. Besides these two common kinds, we sometimes meet with a third, which is soft, and will take an impression from the finger ; but we are to avoid a counterfeit sort of dragon's blood that is sometimes offered to sale, and is made up of several different resinous matters, coloured with the dragon's blood, or with brasil-wood : this is of no value. The dragon's blood in drops, is to be preferred to any other : the genuine dragon's blood is the fruit of a tall tree of the palm-kind, common in the island of Java, and some other parts of the East-Indies. It is a very powerful astringent, inebriant, and drier. It is given in diarrhoeas, dysenteries, and hæmorrhages of all kinds ; and, externally, in drying and healing ulcers. Its dose is from five grains to twenty-five.

**DRAGON-FLY**, the english name of the libella. See the article **LIBELLA**.

**DRAGON'S HEAD AND TAIL**, the two nodes of the moon. See the article **NODE**.

**DRAGON-SHELL**, the english name of a species of concamerated patella, with its rostrum very much bent. See the article **PATELLA**.

**DRAGON-TREE**, a term used by some for the palm-tree.

**DRAGONS**, in botany. See the article **DRA-CUNCULUS**, *supra*.

**Wild DRAGONS**, the same with tarragon. See the article **TARRAGON**.

**DRAGONNE'E**, in heraldry ; a lion dragonnée is where the upper half resembles a lion, the other half going off like the hinder part of a dragon. The same may be said of any other beast as well as a lion.

**DRAGOON**, in military affairs, a musqueteer, mounted on horseback, who sometimes fights or marches on foot, as occasion requires.

Dragoons are divided into brigades, as

the cavalry, and each regiment into troops ; each troop having a captain, lieutenant, cornet, quarter-master, two sergeants, three corporals, and two drums. Some regiments have hautboys : they are very useful on any expedition that requires dispatch, for they can keep pace with the cavalry, and do the duty of infantry : they encamp generally on the wings of the army, or at the passes leading to the camp ; and sometimes they are brought to cover the general's quarters : they do duty on the generals of horse and dragoons, and march in the front and rear of the army.

**DRAGOON**, in ornithology, the name of a small kind of carrier-pigeon, called *columba tabellaria minima*, by Moore. It is a bastard breed between the two species of pigeons called the horseman and the tumbler. They are very good breeders, and as they are lighter than the horseman, they are supposed more expeditious in flight, for a few miles : but the horseman outdoes them at greater lengths.

**DRAGS**, in the sea-language, are whatever hangs over the ship in the sea, as shirts, coats, or the like ; and boats, when towed, or whatever else that, after this manner, may hinder the ship's way when she sails, are called drags.

**DRAINING of lands**, the freeing them from an over abundance of water, by means of drains. See the next article.

**DRAINS**, a name given, in the fen-countries, to certain large cuts or ditches, of twenty, thirty, nay, sometimes forty foot wide, carried, through the marshy ground, to some river, or other place, capable of discharging the water they carry out of the fen-lands.

The best way is to begin the drain at the lowest place, and so to carry it into the bog towards the spring-head ; where it will be proper to make cross trenches, in order to drain it thoroughly. If the drains are deep, so that there is danger of cattle falling into them, they may be partly filled with stones, brick-bats, and the like ; and covered with wood, flags, turf, &c. and the water will drain away through the stones. When the drains are left open, the earth should not be laid in heaps by their sides, as is too often done ; but spread over the low places near them, or even carried off in carts. See the articles **DITCH** and **FEN**.

Most of these drains are made in our fen-countries by a body of men called the undertakers, whose reward is one third

of the ground they drain: they erect sluices also at a great expence, often not less than two thousand pounds each; yet these, with all the care they employ in erecting them, are subject to be blown up by the vast weight of water that lies on them when the lands are overflowed: some of these sluices have two or more pair of doors, of six, eight, or ten feet high, which shut, when the water in the river is higher than in the drains, by the weight and force of it, and so, *e contra*, throw out a body of eight feet square of water, for about six or seven hours, during the ebb. The real use of these drains is very evident from the visible improvement of the lands where they have been cut. The inhabitants of Essex have a particular way of draining lands in such grounds as lie below the high-water and somewhat above the low-water mark, and have land floods or fleets running through them, which make a kind of small creek. When these grounds are first enclosed from the sea, it is done with a bank raised from one side of the land designed to be taken in to the other, except a space left where the creek or land-floods run into the sea. When they begin to stop this, it is done at once, with a strong firm head; only according to the quantity of water to be vented, they lay therein several square troughs, composed of four large planks, of the same length that they design the thickne's of the head to be; and towards the sea is fitted a small door, which opens when the fresh water bears out on it, and shuts when the salt water rises, as already described.

**DRAKE**, in ornithology, the male of the duck-kind. See **ANAS** and **DUCK**.

**DRAMS** are accounted a kind of cordials. See **CORDIALS**, **BRANDY**, **RUM**, &c.

**DRAM**, or **DRACHM**, in commerce, a small weight. See **DRACHM** and **WEIGHT**.

**DRAMA**, a poem containing some certain action, and representing a true picture of human life, for the delight and improvement of mankind.

The principal species of the drama are two, comedy and tragedy. Some others there are of less note, as pastoral, satire, tragi-comedy, opera, &c. See the articles **TRAGEDY**, **COMEDY**, &c.

The primary parts of the drama, as divided by the antients, are the protasis, epistasis, catastasis, and catastrophe. The secondary parts are the acts and scenes. The accessory parts are the prologue, chorus, mimus, and epilogue, which

pointed out the use of the piece, or conveyed some other notice to the audience in the poet's name. See **PROTASIS**, **PROLOGUE**, **CHORUS**, &c.

The drama, says Vossius, owes its rise to the days of festivity; for in antient times, it was usual for men, when they gathered in the fruits of the earth, to meet together that they might sacrifice to the deity, and unbend their minds from the fatigues of the harvest. Hence arose two sorts of poetry, the one grave, in praise of the gods, the other jocose and full of lampoon, against one another. Thus, from the former arose tragedy, and from the latter, satire, comedy, and mimicry.

The drama, in some circumstances, is superior to epic poetry, particularly in action; for in the drama, the persons themselves are introduced, every thing is transacted in our sight, and our eyes and ears at once are gratified. Besides, the action in the drama, is much more compendious than in the epic; it takes up less time, and therefore requires more art to conduct it. It excites in the mind more rapid commotions, and consequently makes the pleasure and admiration more intense. For which reasons, Aristotle gives the preference to the drama; not that he reckons it more noble in general than the epic, for that would be contrary to truth and reason, but only as far as its sphere extends.

According to the Abbe du Bos, tragic poets ought to place their scenes in times remote from that in which they live; but that comedy, on the contrary, ought to be fixed in the very places and times in which it is represented; its design being to make us laugh at the expence of ridiculous persons, in order to purge us of those faults it exposes. Now we cannot distinguish nature so easily, when she appears in strange customs, manners, and apparel, as when she is clad, as it were, after our own fashion; whereas we always distinguish human nature in the heroes of tragedies, whether their scenes be at Rome or Sparta, by reason only great virtues or great vices are there represented. The dramatic poetry of the Romans, was at first divided into three sorts, tragedy, satire, and comedy; which were afterwards subdivided into several species. They had two species of tragedies, *viz.* the *tragœdiæ palliatæ*, in which the personages, manners, and dress were entirely greek; and the *tragœdiæ prætextatæ*, or *prætextæ*, wherein the person-

ages and manners were roman. The satire was a kind of pastoral poetry, which some authors assert to have held a kind of middle rank between tragedy and comedy; which is almost all we know of it. Comedy, in like manner as tragedy, was divided first into two species, *viz.* the greek, or palliata; and the roman, or togata, by reason of the introducing plain citizens into the latter, whose dress was called toga. The roman comedy was again subdivided into four species; the togata, properly so called, the tabernaria, the attellana, and the mimus. Pieces of the first sort were very serious, and admitted even of persons of distinction, for which reason they were sometimes called *prætextatæ*. The second were comedies of a less serious nature, and took their name from taberna; which strictly signified a place of rendezvous, proper for assembling persons of different conditions, whose characters were played off in those pieces. The attellana was a kind of piece very like the italian comedies; that is, those whose dialogues are not written. The actor, therefore, of the attellanæ, performed his part just as he pleased. The mimus resembled our farces, and the actors thereof performed always bare-foot: whereas, in tragedy, they wore a sort of shoe, or boot, called *cothurnus*; and, in the other species of comedy, another kind called *soccus*.

For the laws of the drama, see the articles UNITY, ACTION, CHARACTER, FABLE, &c.

**DRAMATIC**, in poetry, an epithet given to pieces written for the stage. See the article **DRAMA**.

**Stilo-DRAMATICO**, in the italian music. See the article **STYLE**.

**DRANK**, among farmers, a term used to denote wild oats, which never fail to infest worn-out lands; so that when plowed lands run to these weeds and thistles, the farmer knows it is high time to fallow them, or else to sow them with hay-feed, and make pasture of them.

Some, indeed, destroy the drank, by sowing the lands with beans, and letting loose sheep upon them when young. This must be done in dry weather, and the sheep eat up the drank and other weeds, without touching the beans.

**DRAPERY**, in sculpture and painting, signifies the representation of the clothing of human figures, and also hangings, tapestry, curtains, and most other things that are not carnations or landscapes.

The art of drapery consists, 1. In the order of the folds or plaits, which ought to be so managed, that you may easily perceive what it is they cover, and distinguish it from any thing else. Again, the folds ought to be large, as breaking and dividing the sight the less; and there should be a contrast between them, otherwise the drapery will be stiff. 2. In the quality of the stuffs; for some make their folds abrupt and harsh, others more soft and easy: the surface of some have a lustre, others are flat and dead; some are fine and transparent, others firm and solid. 3. In the variety of colours, which, when well managed, makes the greatest beauty of painting; all not being equally amicable and friendly with respect to each other, and some never to be placed near certain others.

M. De Piles observes, that drapery must never be made to adhere to the parts of the body; that a great motion and lightness of the drapery are only proper in figures in great agitation, or exposed to the wind; and that the nudities of the figures should always be designed, before the painter proceeds to the draperies.

Observe the following directions. Draw the out-lines of garments lightly, beginning with the great folds, which you may afterwards stroke into lesser; but be sure they cross not one another. Make the drapery bend with the body, according as it stands in or out, straight or crooked, or turns one way or another; observing that the closer the garment sits on the body, the narrower and smaller must the folds be. All the folds must consist of two lines, and no more, which you may turn with the garment at pleasure, shadowing the inner deep, and the outermost more light; and if the folds be never so curiously contrived, spare not to shadow them, if they fall inward from the light, with a double or triple shadow, as the occasion requires. The out-lines must be continued through the whole garment; the lesser you may break off and shorten as you please. The shades in silk and fine linnen, require little folds, and a light and rare shadow; and so also fine drapery requires more and sharper folds than coarse. Observe the motion of the wind and air for drawing loose apparel all one way; and examine the nature and disposition of light, especially as it has relation to the sun or any bright body. Moreover, the plaits and folds

fold must have their motions according as they are managed by the wearer, as under the arm, and under the knee, by opening and stretching out the arm and leg, making always hard, stiff, and gross folds, that by their appearance the nature and quality of the garment may be known, &c. But mean motions, such as appear in the folds of stuff and other cloths of fine wool, may become pliable to a person's limbs, and so made not only into sweet and pleasant folds, but may follow the bare flesh very well, falling plially about the loins or any other part. In other kinds of mixt motions, called turnings or crossings, which are proper unto damasks, cloths of gold, &c. the folds crossing and breaking one another, appear from the various qualities of the drapery, and must be so performed, as not to favour of an over-affected imitation, without grace or order.

**DRASTIC**, in physic, an epithet bestowed on such medicines as are of present efficacy, and potent in operations; and is commonly applied to emetics and cathartics.

**DRAVE**, a large navigable river, which, taking its rise in the archbishopric of Saltzburg, in Germany, runs south-east through Stiria; and continuing its course, divides Hungary from Sclavonia, and falls into the Danube at Esseck.

**DRAUGHT**, or **DRAFT**, in architecture, the figure of an intended building, described on paper, in which is laid down, by scale and compasses, the several divisions and partitions of the apartments, rooms, doors, passages, &c. in their due proportion to the whole building.

It is customary, and also exceedingly convenient, for any person, before he begins to erect a building, to have designs or draughts drawn upon paper or vellum, wherein the ichnography or ground-plot of every floor or story is delineated; as also the form or fashion of each front, with the windows, doors, ornaments, in an orthography, or upright. Sometimes the several fronts, &c. are taken and represented in the same draught, to shew the effect of the whole building, which is called scenography, or perspective. See the article **SCENOGRAPHY**.

**DRAUGHT-COMPASSES**, are such as have moveable points, to draw fine draughts in architecture. See **COMPASSES**.

**DRAUGHT**, in medicine. See **POTION**.

**DRAUGHT**, in painting. See the articles **DESIGN** and **DRAWING**.

**DRAUGHT**, in trade, called also **CLOFF** or **CLOUGH**, is a small allowance on weighable goods, made by the king to the importer, or by the seller to the buyer, that the weight may hold out when the goods are weighed again.

The king allows 1½ lb draught for goods weighing no less than 1 Cwt. 2½ lb for goods weighing between 1 and 2 Cwt. 3½ lb for goods weighing between 2 and 3 Cwt. 4½ lb from 3 to 10 Cwt. 7½ lb from 10 to 18 Cwt. 9½ lb from 18 to 30, or upwards.

**DRAUGHT-HOOKS**, are large hooks of iron, fixed on the cheeks of a cannon-carriage, two on each side, one near the trunnion hole, and the other at the train, distinguished by the name of fore and hind draught-hooks. Large guns have draught-hooks near the middle transum, to which are fixed the chains that serve to keep the shafts of the limbers on a march. The fore and hind hooks are used for drawing a gun backwards or forwards, by men with strong ropes, called draught-ropes, fixed to these hooks.

**DRAUGHT-HORSE**, in farming, a sort of coarse-made horse, destined for the service of the cart or plough. In the choice of these horses, for what is called the slow draught, they are to be chosen of an ordinary height; for otherwise, when put into the cart, one draws unequally with the other, and the tall ones hang upon the low ones. The draught horse should be large bodied, and strong loined, and of such a disposition as rather to be too dull than too brisk; and rather to crave the whip, than to draw more than is needful. Mares are the fittest for this use for the farmer, as they will be kept cheap, and not only do the work, but be kept breeding, and give yearly increase of a foal of the same kind, and fit to be bred to the same purposes. They should have a good head, neck, breast, and shoulders: for the rest of the shape, it is not of much consequence, only for breeding; the mare should have a large belly; for the more room a foal has in the dam, the more fit he will be for that employ. See the article **FOAL**.

**DRAW**, in the sea-language. A ship is said to draw so much water, according to the number of feet she sinks into it; so that if a ship sink into the water eighteen feet perpendicularly, she is said to draw eighteen feet water; and according as she draws more or less, she is said to be of more or less draught.

**DRAW,**

**DRAW**, or **DOG-DRAW**, in the forest-law. See the article **DOG-DRAW**.

**DRAW-BACK**, in commerce, certain duties, either of the customs or of the excise, allowed upon the exportation of some of our own manufactures; or upon certain foreign merchandize, that have paid duty on importation.

The oaths of the merchants importing and exporting, are required to obtain the draw-back of foreign goods, affirming the truth of the officer's certificate of the entry, and the due payment of the duties: and these may be made by the agent or husband of any corporation or company, or by the known servant of any merchant usually employed in making his entries, and paying his customs. In regard to foreign goods entered outwards, if less quantity or value be fraudulently shipped out than is expressed in the exporter's certificate, the goods therein mentioned, or their value, are forfeited, and no draw-back to be allowed for the same. Foreign goods exported by certificate, in order to obtain the draw-back, not shipped or exported, or re-landed in Great Britain, unless in case of distress, to save them from perishing, are to lose the benefit of the draw-back, and are forfeited, or their value, with the vessels, horses, carriages, &c. employed in the re-landing thereof; and the persons employed in the re-landing them, or by whose privacy they are re-landed, or into whose hands they shall knowingly come, are to forfeit double the amount of the draw-back. Officers of the customs conniving at, or assisting in any fraud relating to certificate-goods, besides other penalties, are to forfeit their office, and to suffer six months imprisonment, without bail or mainprize; as are also masters, or persons belonging to the ships employed therein. Bonds given for the exportation of certificate-goods to Ireland, must not be delivered up, nor draw-back allowed for any goods, till a certificate under the hands and seals of the collector or comptroller, &c. of the customs be produced, testifying the landing.

The computation of what is to be drawn back upon the exportation of foreign goods, may be seen under their respective heads.

**DRAW-BRIDGE**, a bridge made after the manner of a floor, to draw up, or let down, as occasion serves, before the gate of a town or castle. See **BRIDGE**.

A draw-bridge may be made after several

different ways, but the most common are made with plyers, twice the length of the gate, and a foot in diameter. The inner square is traversed with a cross, which serves for a counterpoise; and the chains which hang from the extremities of the plyers to lift up or let down the bridge, are of iron or brass.

In navigable rivers it is sometimes necessary to make the middle arch of bridges with two moveable platforms, to be raised occasionally, in order to let the masts and rigging of vessels pass through. This kind of draw-bridge is represented in plate LXXVIII. where AB is the width of the middle arch; AL and BL, the two piers that support the draw-bridge NO, one of the platforms of which is raised and the other let down, having the beam PQ for its pleyer. To NO are suspended two moveable braces EH, EH, which resting on the support E, press against the bracket M, and thereby strengthen the draw-bridge. These braces are conducted to the rest by means of the weight S, pulling the chain SLE.

**DRAW-GEAR**, denotes any kind of harness for draught horses.

**DRAW-NET**. See the article **NET**.

**DRAWER** of a bill of exchange, the person who draws the bill upon his correspondent. See **BILL** and **EXCHANGE**.

**DRAWING**, in general, denotes the action of pulling out, or haling along: thus we read of tooth-drawing, wire-drawing, &c. See **TOOTH** and **WIRE**.

**DRAWING**, the art of representing the appearances of objects by imitation, or copying without the assistance of mathematical rules.

The general precepts for drawing, are as follow. 1. Begin with plain, geometrical figures, as lines, angles, triangles, polygons, arches, circles, ovals, cones, cylinders, and the like, being the foundation of all other proportions. The circle is of use in the several orbicular forms, as the sun, moon, globes, &c. the oval in giving a just proportion to the face and mouth, and the square confines a picture you are to copy, &c. the triangle is of use in drawing a side or half face; angles and arches in perspective, and the polygon in ground plots, fortifications, &c. the cone, in spires, steeples, tops of towers, &c. the cylinder, in columns, pillars, pilasters, &c. See the article **PERSPECTIVE**. 2. Having brought your hand to be fit and ready in general proportions, accustom yourself to give every object its due shade,

shade, according to its concavity or convexity, and to elevate or depress the same, as the object appears either nearer or farther off the light. See the articles PROPORTION, DESIGN, and SHADE.

3. The second practice of drawing, consists in forming fruits, as apples, pears, cherries, &c. with their leaves; the imitation of flowers, as roses, tulips, carnations, &c. herbs, trees, &c. of different kinds.

4. The third, in the imitation of beasts, fowls, fishes, &c.

5. The fourth practice of drawing consists in the imitation of the body of man, with all its lineaments, as head, nose, eyes, ears, cheeks, arms, and shadows, all exactly proportioned, both to the whole, and to one another.

6. The fifth is in the drapery, in the imitation of cloathing, and artificially setting off the outward coverings, habit, and ornaments of the body, either of cloth, stuff, silk, or linnea, in their natural and proper folds. See DRAPERY.

7. In drawing of all the forms before-mentioned, it is requisite to be first perfect in the laying down the exact proportion; secondly, in the general or outward lines, before you proceed to shadowing, or trimming the work within.

8. In mixed and uncertain forms, where the circle, square, &c. will be of no use, but only in the idea thereof in your own fancy, as horses, oxen, and the like, you must do it by judgment, and so gain the true proportions by assiduous practice: thus, having the shape of the thing in your mind, first draw it rudely with a coal; then, with more exactness, with a lead or pencil; then peruse it well, and mend it in those parts you have erred in, according to the idea you carry in your mind. When it is mended by your own judgment, compare it with some good pattern of the same kind, and amend it by that.

9. Having good copies to draw after, learn to reduce them to other proportions, either larger or smaller; and this by frequent practice.

10. Let a perfection in drawing be attained by diligent exercise, and the instruction of a good master, before there be any attempts as to colouring and painting; for the former being attained, the rest will be easily understood, and gained by frequent practice.

*Particular observations with regard to DRAWING, are as follow.* 1. If you

draw after a print or picture, place it in such a light, that the gloss of the colours may not interrupt your light, and that the light and your eye may equally and obliquely fall upon the piece, which should be placed at such a distance, that, upon opening your eye, you may view it at once: the larger the picture is, the greater distance off it should be placed: it should also be right before you, and a little reclining.

2. Draw your out-lines at first very faint, and with a coal; and let them be drawn agreeable to the pattern, before you begin to shadow any part of it. When you have drawn one feature, it should, in some measure, be a direction for you to draw the other, by observing the distance from that to the next feature; making a small mark at the place with your coal, then draw it, and so to the next, till you have drawn the whole figure.

3. Then observe the middle of the picture you would copy, and touch upon the paper with the point of your coal: afterwards, observe the more conspicuous and uppermost figures, if there are more than one, which you are to touch lightly in their proper places: thus running over the whole draught, you will see, as it were, the skeleton of the piece to draw.

4. Having made out these sketches, view them diligently, if they answer your pattern or not; for the gestures of the life ought to shew themselves eminently in the first and rudest draughts thereof: correct and mend whatever you perceive amiss, adding and diminishing as it varies from the pattern; by which method it will be brought nearer and nearer to the life.

5. Observe the distance of one limb, joint, or muscle, from another, and the same in all other accidents of the figure, their length, breadth, turnings, &c. shadow next to the light very faintly; and where you see bold and free touches, be not timorous in expressing the same. In drawing a head by the life, or otherwise, take care to place the features exactly right upon the cross lines, whether it be a full face, or three quarter face. In foreshortening you must make the cross lines to fly upwards, where they look upwards; but where the aspect is downwards, they must be made downwards, in a circular manner. Having drawn the out-lines true, with a coal, you are to proceed to trace the same lines again with a pen, indian ink,

ink, &c. drawing them with more exactness, and by imitating all the hatches with their exact distances one from another, their crossings, turnings and windings, with more boldness and freedom perfect your design.

6. In drawing after a naked body, all the muscles are not to be so plainly expressed as in anatomical figures; but that side whose parts are most apparent, and of signification in the performance of any action, must be made to appear more or less, according to the force of that action.

7. In drawing young persons, the muscles must not appear manifestly so hard, as in elder and full grown persons: the same is to be observed as to fat and fleshy persons, and such as are very delicate and beautiful; and in women, scarce any muscles at all are to be expressed, or but very little, unless it be in some very terrible action, and then too they are to be represented very faintly; the like is also to be observed as to little children.

8. The motion of the whole body must be considered in drawing of the muscles; as in the rising and falling of the arms, the muscles of the breast do appear more or less; the hips do the like according as they are bent outward or inward; and it is the same chiefly in the shoulders, sides, and neck, according to the several actions of the body.

9. The proportion of the figure ought to be multiplied by degrees, in proportion of one to two, three, four, &c. for herein the chief skill consists: the diameter of the biggest place, between the knee and the foot, is double to the least, and the largest part of the thigh, triple.

**DRAWING MEDICINES**, those more usually called epispastics and ripeners. See the articles **EPISPASTICS** and **RIPENERS**.

**DRAWING of a bill of exchange**. See the articles **DRAWER** and **BILL**.

**DRAWING**, among sportmen, the beating the bushes after a fox.

Drawing amiss, is said of the hounds or beagles, when they hit the scent of their chase contrary, so as to pursue it up the wind, when they should have done it down.

Drawing on the shot, is when the hounds touch the scent, and draw on till they hit on the same scent.

**DRAWING a cast**, among bowlers, is winning the end, without stirring the bowl or block.

**Fine-DRAWING**, among taylors, the art of sewing up button-holes, or any rents in cloth, in so nice a manner, as that they cannot be discovered from the entire part of the cloth.

**DRAY**, a kind of cart used by brewers, for carrying barrels of beer or ale; also a sledge drawn without wheels.

**DRAY**, among sportsmen, denotes squirrel-nests, built in the tops of trees.

**DRAY-PLOUGH**. See the article **PLOUGH**.

**DRAYTON**, a market-town of Shropshire, fourteen miles north-east of Shrewsbury.

**DREDGE**, or **DREG**, among farmers, denotes oats and barley mingled together.

**DREDGERS**, the term used in the admiralty-court for the oyster-fishers.

**DREIN**, in the military art, a trench made to draw the water out of a moat, which is afterwards filled with hurdles and earth, or with fascines, or bundles of rushes and planks, to facilitate the passage over the mud. See the article **TRENCH**.

**DRENCH**, among farriers, a physical potion for horses. The ingredients for this purpose are to be beat coarsely, and either mingled with a decoction, or with wine. Then let all infuse about a quarter of an hour, and give it to the horse with a horn, after he has been tied up two hours to the rack.

**DRESDEN**, the capital of upper Saxony, in Germany, situated on the river Elbe, sixty-five miles north-west of Prague, and eighty-five south of Berlin: east long. 13° 36', north lat. 51°. It is one of the largest and strongest towns in Germany, and is the usual residence of the elector of Saxony.

**DRESSING of hemp and flax**. See the articles **HEMP** and **FLAX**.

**DRESSING of hops**. See the article **HOPS**.

**DRESSING of meats**, that part of cookery which regards animal foods, whether flesh or fish. See the article **COOKERY**.

**DRESSING of ores**, the breaking and powdering them in the stamping-mill, and afterwards washing them in a wooden trough. See the articles **STAMPING-MILL** and **WASHING**.

**DRESSING**, in surgery, the treatment of a wound or any disordered part. The apparatus of dressing consists of dossils, tents, plaisters, compresses, bandages, bands, ligatures, and strings. See the articles **WOUND**, **DOSSIL**, **TENT**, **PLASTER**, &c.

**DREUX**, a town of Orleans, in France, seventeen miles north of Chartres, and thirty-five west of Paris.

**DRIE**, the same with dry. See **DRY**.

**DRIFT** *of the forest*, is an exact view and examination taken at certain times to know what beasts are there; in order that none may come on the forest but such as have right; and that the forest be not overcharged with beasts.

**DRIFT**, in mining, a passage cut out under the earth, betwixt shaft and shaft, or turn and turn; or a passage or way, wrought under the earth, to the end of a meer of ground, or part of a meer.

**DRIFT**, a term used at sea. Thus any thing that floats upon the water, is said to run a-drift.

**DRIFT-SAIL**, a sail used under water, veered out right a head by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to hinder her driving too fast in a current.

**DRILL**, in mechanics, a small instrument for making such holes as punches will not conveniently serve for. Drills are of various sizes, and are chiefly used by smiths and turners.

**DRILL**, or **DRILL-BOX**, a name given to an instrument for sowing land in the new method of horse-hoeing husbandry. It plants the corn in rows, makes the channels, sows the seeds in them, and covers them with earth when sown; and all this at the same time, and with great expedition. The principal parts are the feed-box, the hopper, the plough and its harrow, of all which the feed-box is the chief. It measures, or rather numbers, out the seeds which it receives from the hopper, and is for this purpose as an artificial hand; but it delivers out the seed much more equally than can be done by a natural hand. See the article **PLOUGH**.

Whoever is desirous of knowing more intimately the whole apparatus for this method of sowing, may see it fully described, and illustrated with figures, by Tull, in his *Horse-hoeing husbandry*.

**DRINK**, a part of our ordinary food in a liquid form, serving to dilute and moisten the dry meat. See the article **DIET**. The drinks in different countries are different. The common drink in England is either water, malt-liquor, wine, or mixtures of these.

The first drinks of mankind were certainly water and milk, but the love of luxury and debauchery soon introduced

the art of preparing intoxicating and enervating drinks out of vegetables. The vine gave the first of these liquors; after this, wheat, barley, millet, oats, rice, apples, pears, and pomegranates; and after those the juices drained from the pine, sycamore, and maple, were brought to this use: in latter times, roots, berries, and the pith of the sugar-cane, have been employed for the same purposes. Honey also is in some repute, and before the use of the things above-mentioned, the vinous liquor made of honey and water, was in the very highest estimation. It is acknowledged by many physicians, that among the strong drinks, wine is the most pernicious; and that good water, milk, beer, and cyder, are greatly preferable to it; none of them bringing on the variety of disorders to which immoderate wine-drinkers are subject, such as decay of sight, trembling of the limbs, &c.

Of all drinks, water is the least flatulent, because the unelastic air lodged in it, cannot be extricated by the heat of the body, so as to become elastic. The most flatulent of all drinks, are these taken in the act of fermentation; as for example, the ale which is close shut up in very strong bottles, and flies out with the greatest force upon opening them; for by an imprudent use of such, the most severe colic, iliac passion, and cholera morbus, frequently ensue. Next to these come such drinks as have not yet fermented, but are soon set to work by the heat of the body; as for example, must, new wine, or ale, wherein no bitter herbs, such as hops, wormwood, &c. have been boiled as a preservative.

Dr. Bryan Robinson thinks that the proportion of meat to drink, ought to be such as shall make perspiration and urine nearly equal at all seasons of the year.

**DRINKING-GLASSES**. See **GLASSES**.

**DRIPS**, in architecture. See the article **LARMIER**.

Drips are used in building for a certain kind of steps made on flat roofs to walk upon, a way of building much used in Italy, where the roof is not made quite flat, but a little raised in the middle, with drips or steps lying a little inclined to the horizon. See the article **ROOF**.

**DRIVERS**, among sportsmen, a machine for driving pheasant-powts, consisting of good strong ozier-wands, such as the basket-makers use; these are to be set in

*Fig. 1. DRACO MARINUS, the SEA-DRAGON.*

*Fig. 2. DRACUNCULUS, the Little SEA-DRAGON.*

*Fig. 3. DRACOCEPHALUM, DRAGON'S HEAD.*

*Fig. 4. DROMEDARY.*

in a handle, and twisted or bound with small ozers in two or three places.

With this instrument, the sportsman drives whole eyes of young powns into his nets. See the next article.

**DRIVING**, among sportsmen, a method of taking pheasant-powts. It is thus : the sportsman finds out the haunts of these birds ; and having fixed his nets there, he calls them together by a pheasant-call, imitating the voice of the dam : after this he makes a noise with his driver, which will make them run a little way forward in a cluster ; and this he is to repeat till he has made sure of them, which an expert sportsman never fails to do, by driving them into his nets.

**DRIVING**, in metallurgy, is said of silver, when in the operation of refining, the lead being burnt away, the remaining copper rises upon its surface in red fiery bubbles. See the article **SILVER**.

**DRIVING**, in the sea-language, is said of a ship when an anchor being let fall will not hold her fast, nor prevent her sailing away with the tide or wind. The best help in this case is to let fall more anchors, or to veer out more cable ; for the more cable she has out, the safer she rides. When a ship is a-hull or a-try, they say she drives to leeward.

**DRIVE-BOLTS**, in ship-building. See the article **BOLT**.

**DROCK**, in husbandry, the upright piece of timber on the right side of a plough's tail, to which is fixed the earth-board. See the article **PLOUGH**.

**DROGHEDA**, a port-town of Ireland, twenty-three miles north of Dublin.

**DROGMAN**, the same with dragoman. See the article **DRAGOMAN**.

**DROIT**, *jus*, signifies right or law, of which some distinguish six kinds. 1. *Jus recuperandi*, right of recovery. 2. *Jus entrandi*, right of entering. 3. *Jus habendi*, right of having. 4. *Jus retinendi*, right of retaining. 5. *Jus percipiendi*, right of receiving. 6. *Jus possidendi*, right of possessing. See the articles **ENTRY**, **POSSESSION**, and **RECOVERY**.

**DROIT** is also the highest writ of all other real writs, and takes its name of a writ of right, from the greatest regard being shewn to it ; and as it has the most assured and final judgment. There are several sorts of these writs used in our law, as *droit de avowson*, *droit de dower*, *droit de garde*, *droit patent*, *droit rationabili parte*, and *droit sur disclaimer*. See the article **RECTO**.

**DROITWICH**, a borough six miles north of Worcester, which sends two members to parliament.

**DROMEDARY**, *dromedarius*, a large animal of the camel-kind, with only one bunch on its back : it is taller than the horse, and has a much longer and slenderer neck : its ears are short, and the upper lip is divided in the manner of that of the hare : it is a native of Asia, and more used for riding on, than for carrying heavy loads. See plate **LXXXIX**. fig. 4.

**DROMEUS**, a name given by the antients to two very distinct animals, the stag and dromedary.

**DRONE**, in the history of insects, a kind of bee, larger than the common working or honey-bees : it is so called from its idleness, as never going abroad to collect either honey or wax. See **BEE**.

The number of these drones in a hive is more or less, according to the season and age of the swarm. In a full hive, they sometimes amount to five or six hundred, or even a thousand.

**DRONE-FLY**, a two-winged insect, extremely like the common drone-bee, whence also the name.

**DRONTE**, a name used by some for the dodo. See the article **DODO**.

**DROPAX**, an external medicine used by the antients for inducing a redness upon a part, and also for taking off the hairs from the body. It was either simple or compound. The simple consists of pitch and wax. The compound *dropax*, besides pitch and wax, admits pepper, bitumen, rosemary-feed, and euphorbium. It was used in the form of a plaster, or cataplasm.

**DROPPING**, or **DRIPPING**, among falconers, is said of a hawk which mutes directly downwards in several drops, not jerking her dung straight forwards.

**DROPS**, in architecture, an ornament in the doric entablature representing drops, or little bells immediately under the triglyphs.

**DROPS**, in meteorology, small spherical bodies which the particles of fluids spontaneously form themselves into, when let fall from any height. This spherical figure, the newtonian philosophers demonstrate to be the effect of corpuscular attraction ; for considering that the attractive force of one single particle of a fluid is equally exerted to an equal distance, it must follow that other fluid particles are on every side drawn to it, and will therefore take their places at an

equal distance from it, and consequently form a round superficies. See the articles **ATTRACTION, FLUID, and RAIN.**

**DROPS**, in medicine, a liquid remedy, the dose of which is estimated by a certain number of drops.

**DROPS of life, gutta vitæ**, a tincture produced from opium, english saffron, russiaca, castor, cochineal, and Virginia-snake-root, nutmegs, zedoary and camphire, with the tincture of antimony. This medicine, though not commonly met with, is accounted one of the best preparations of the kind. It promotes sweat very much, and is wonderfully carminative. The dose is from ten to forty, fifty, or sixty drops.

**English DROPS, gutta anglicana**, a name given to a chemical preparation esteemed of great virtue against vapours, and lethargic affections, and purchased at 5000*l.* by king Charles II. from the inventor Dr. Goddard. The medicine appeared to be only a spirit drawn by the retort from raw silk, and afterwards rectified with oil of cinnamon, or any other essential oil, and was in reality no better than the common sal volatile oleosum, or any of the volatile spirits impregnated with an essential oil, except that it was less disagreeable than any of them to the taste.

**DROPSY**,  *Dropsy*, in medicine, an unnatural collection of watry humours in any part of the body.

Dropsies are of various kinds, but those most common are the anasarca, ascites, and tympanites. See the article **ANASARCA**; &c.

Among the causes of these diseases may be reckoned a family or constitutional disposition thereto; a hasty drinking cold water in too large quantities; a stoppage of the natural discharges of perspiration and urine; a hienterious disorder of long continuance; all obstinate obstructions of the viscera; the jaundice, diarrhoea, dysentery, coeliac passion, and gout; drinking sharp, fermented, and spirituous liquors; and the like.

As to the symptoms, the feet and legs first swell; and when these are distended to the utmost, the waters rush into the abdomen, and cause it to swell by little and little; till at length the more noble viscera are affected thereby, and the patient is soon overwhelmed with the deluge. In proportion as the diseased parts increase in bulk, the rest fall away; and at the same time, the difficulty of

breathing, and other symptoms grow more intolerable.

When the abdomen is swelled, it will rebound when struck, if the disease be a tympany; and if an ascites, the noise of the fluctuating waters is heard. Besides these symptoms, the patient is also afflicted with a heaviness, stupor, costiveness, and at length with a slow fever. The waters too, after being long pent up in a close place, grow acrimonious; and hence ulcers, gangrenes, bleeding at the nose, a mortification of the viscera, and death.

In the anasarca, as well as in the more advanced stages of a dropsy, the chief indications of cure, are to restore the humours to their natural fluidity, invigorate the languid circulation, brace up and strengthen the relaxed solids, promote the secretions, and carry off the redundant stagnating juices. To this purpose, drastic purges, steel-medicines, absorbents, detergents, and stomachics are recommended. A brisk purge should be taken early every morning, or every other day, according to the strength of the patient, till the swelling of the parts affected abate.

Elaterium, and antimonial wine, are said to be excellent for dropical patients, who are not easily purged; two grains of the former being a proper dose for most constitutions; and of the latter, or antimonial wine, a dram and a half, or two drams, may be taken every morning: this frees the abdomen from the load of waters. Some greatly recommend Bon-tius's pills, the dose of which is from half a scruple to a scruple. Mercurius dulcis, and the juice of the root of iris palustris lutea are also recommended: eighty drops of this last may be given every hour in a little syrup of buck-thorn.

As to cathartics, the slow ones are rather hurtful than beneficial; and therefore, the purge had better be too strong than too weak, that the waters may be carried off with as much speed as the patient's strength will bear. When the patient is of a very weakly constitution, it is proper to omit all purgatives, and give diuretics and the lixivial salts in their stead, especially nitre. Some also have been cured by a pertinacious abstinence from all liquids, excepting a little rich wine.

When the waters are by these means carried off, the tone of the debilitated viscera

viscera should be restored by the use of wines, steel, and such strengtheners as are greatly astringent; in which case, purging must be omitted, as also during the use of the lixivial salts; but strengtheners may be properly used with these last.

For the operation of tapping, called by surgeons paracentesis. See the article PARACENTESIS.

**DROP-WORT**, in botany, the same with the filipendula. See FILIPENDULA.

*Water DROP-WORT*, the english name of a plant, called by authors oenanthe. See the article OENANTHE.

**DROSER A**, *SUN-DEW*, in botany, a genus of the *pentandria-pentagynia* class of plants, with a funnel-fashioned flower, consisting of five obtusely-ovated petals; the fruit is an unilocular, suboval capsule, containing a great many very small seeds.

**DROUGHT**, in the history of the air, a long continuance of dry weather.

Great droughts are often very prejudicial to the farmer, unless the lands lie very low, and are well supplied with water, or defended from the scorching heat of the sun by tall inclosures. See the articles INCLOSURE, and WATERING OF LANDS.

**DROWNING**, the act of suffocating, or being suffocated, by water.

Naturalists and physicians furnish us with divers well attested instances of surprising recoveries of persons drowned. It is certain from repeated dissections made on persons drowned, that they generally have less water in their stomachs than if they had voluntarily drunk a considerable quantity; whence it does not seem expedient to hang the drowned person by the heels, a position that must prove uneasy as soon as the humours of the body should resume their ordinary motion. In order to know whether the person has swallowed too much water, or not, and to make him vomit it up if he has, it is proper to put him in a tun, open at both ends, which is to be rolled in different directions; or the bearded end of a feather should be introduced into the œsophagus. After taking off the cloaths of the drowned person, we ought, with the utmost expedition, to shelter him from the impressions of the cold air, and begin to warm him by wrapping him up with cloaths, and coverings: to do this more effectually, he is afterwards to be put

into a pretty warm bed, applying also to his body hot napkins and cloths. A hot scorching sun, to which drowned persons have been exposed, and hot baths, have produced the same happy effects.

The great intention to be pursued is, to put the solid parts of the machine in action, that thus they may restore the motion of the fluids: in order to this, the drowned person should be agitated in various directions, in a bed, in the arms of persons of sufficient strength.

Spirituous liquors should be poured into his mouth; or warm urine; and some persons prescribe a decoction of pepper and vinegar, as a gargalism; we must also attempt to irritate the internal fibres of the nose, either by volatile spirits, and by the liquors used in apoplectic cases; or by tickling the nerves of the nostrils with a bearded feather, or by blowing through a quill, snuff, or some other more powerful stimulatory. One of the means frequently used with success, is to blow warm air, by means of a pipe, into their mouths; or to introduce it by a pair of bellows; or, by injecting warm clysters, to irritate the intestines: the smoke of tobacco conveyed into the intestines, by means of a tobacco-pipe, is much recommended. Venesection is by no means to be neglected; and perhaps most successfully in the jugular vein; and when all these measures prove unsuccessful, the last resource is branchotomy.

See the article BRANCHOTOMY.

**DRUG**, a general term for goods of the druggist and grocery kinds, especially for those used in medicine and dying.

The principal drugs in medicine make the greatest part of the wholesale trade in the druggist and spicery ways. Some are produced in France, England, &c. but the greatest part is brought from the Levant, and the East Indies. The chief drugs imported into this kingdom, are from the East-Indies, being as follows, alum, china-root, camphor, rhubarb, musk, vermilion, soy of japan, ketchup, stick-lack, rosam aloes, shell-lack, borax, lapis lazuli, galangal, benjamin, aquila-wood, gamboge, putchuck, or costus dulcis, dragonblood, cubebs, cardamoms, olibanum, chengue, salt-petre, aloë-hepatica, bezoar-stone, lignum aloes, cassia, goa-stone, opium, unicorn's horn, civet, frankincense, tamarinds, turmeric, rock-salt, saffron, myrrh, manna, renes, cacamahac, ambergrease, dammer, coyr,

cowries,

cowries, chank, nux vomica, snake-stone, cassia lignum, assafoetida, dry ginger, long pepper, tyncal, sago, lapis tutiæ, wormseed, galbanum, gum-elemi, ammoniacum, tragacanth. See the articles ALUM, CHINA-ROOT, &c.

Drugs for dying are of two principal sorts, *viz.* drugs that do not give any colour of themselves, but prepare the stuff to take the dye, or make the colours more lively and strong; and drugs that colour.

Of the first sort are alum, tartar, arsenic, realgal, salt-petre, nitre, sal-gem, sal-armoniac, common salt, mineral salt, salt of crystal, of tartar, agaric, spirit of wine, urine, pewter, bran, starch, &c. Some of the colouring drugs are wood, indigo, scarlet wood, logwood, ironwood, &c. scarlet grain, cochineal, madder, goats hair, greenening weed, savory, chimney-foot, &c.

There are other drugs used in common by both, which colour either faintly, or very much; as the root, bark, and leaf of the walnut-tree, the rind of the nut, gall-nuts, sumach, copperas, &c.

DRUG is used to signify things of little value exposed to sale.

DRUG, among fan-makers, is a composition of gum arabic, and some other ingredients used in laying gold or silver leaf upon fans; or, in covering them with either of these metals in powder. They use it also to paste together the papers, gauzes, taffeta's, and other like matters, used by them in their fans.

DRUG signifies also a salt, or cinder of glass, used by some in bleaching cloth.

The use of this drug is prohibited in France, as being found corrosive, destructive of the linnen, and capable of hurting the health of those who use it. See BLEACHING.

DRUGS of the french dominions pay for every 20 s. value of their respective rates, (a few excepted) on importation, 4 s. 9  $\frac{7}{10}$  d. and draw back on exportation 4 s. 4  $\frac{1}{10}$  d. If for dyer's use, they pay 6 s. 7  $\frac{1}{10}$  d. and draw back 6 s. 1  $\frac{1}{10}$  d. Drugs of the growth, product, or manufacture of France, for every 20 s. value of their respective rates (some excepted) pay 6 s. 5  $\frac{1}{10}$  d. and draw back 4 s. 4  $\frac{1}{10}$  d. but if for dyer's use, they pay 11 s. 7  $\frac{1}{10}$  d. and draw back 6 s. 1  $\frac{1}{10}$  d. All drugs imported from the british plantations, in british built shipping, notwithstanding they come

from the spanish West-Indies to ours, shall pay as from the place of growth and no otherwise.

DRUGGET, in commerce, a stuff sometimes all wool, and sometimes half wool half thread, sometimes corded, but usually plain.

Those that have the woof of wool, and the warp of thread, are called threaded druggets; and those wrought with the shuttle on a loom of four marches, as the serges of Moui, Beauvois, and other like stuffs, corded, are called corded druggets. As to the plain, they are wrought on a loom of two marches, with the shuttle, in the same manner as cloth, camlets, and other like stuffs, not corded.

DRUIDS, the priests or ministers of religion of the antient Britons, and Gauls. The druids were chose out of the best families; and were held, both by the honours of their birth, and their office, in the greatest veneration. They are said to have understood astrology, geometry, natural history, politics, and geography: they had the administration of all sacred things, were the interpreters of religion, and the judges of all affairs indifferently.

Whoever refused obedience to them, was declared impious and accursed: they held the immortality of the soul, and the metempsychosis; they are divided by some into several classes, as the vaceni, bardi, bubagis, semothii: they had a chief, or arch-druid, in every nation: he was a sort of high-priest, having an absolute authority over the rest, and was succeeded by the most considerable among his survivors. The youth used to be instructed by them, retiring with them to caves, and desolate forests, where they were sometimes kept twenty years. They preserved the memory and actions of great men by their verses; but are said to have sacrificed men to Mercury. Cæsar imagined that the druids came from Britain into Gaul, but several among the modern writers are of a different opinion.

DRUM, *lympanum*, is a martial musical instrument in form of a cylinder, hollow within, and covered at the two ends with vellum, which is stretched or slackened at pleasure by the means of small cords and sliding knots. It is beat upon with sticks. Some drums are made of brass, but they are commonly of wood.

There

DUBLIN, the capital of the province of Leinster, and of all Ireland, situated at the mouth of the river Liffey, sixty miles west of Holyhead in Wales: west long.  $6^{\circ} 25'$ , north lat.  $53^{\circ} 16'$ . It is a large and beautiful city, pleasantly situated; having a view of the sea on one side, and of a fine country on the other.

other. It is the seat of the courts of justice, and an archbishop's see; and has a noble college, which is an university of itself.

**DUCAL**, in general, something belonging to a duke. See the article **DUKE**.

**DUCAL CROWN**, or **CORONET**.<sup>2</sup> See the article **CROWN**.

**DUCAT**, a coin, current in Germany, and other countries abroad, for the different values of which see **COIN**.

**DUCATOON**, a silver coin, likewise frequent in several parts of Europe. See the article **COIN**.

**DUCENARIUS**, in roman antiquity, a military officer, who had the command of two hundred men.

The title *ducenarii* is also given to certain procurators of the emperors, so called either from their having a salary of 200 sesterces, or from their being appointed to raise the tax of the two hundredth penny.

**DUCES TECUM**, in law, a writ that commands a person to appear in the court of chancery, and bring with them certain writings, evidences, or other things, which the court is inclined to view.

**DUCES tecum licet languidus**, in law, is a writ directed to the sheriff on a return, that he is not able to bring his prisoner without danger of death, he being *adeo languidus*: upon which the court grants a habeas corpus, in nature of a *duces tecum licet languidus*.

**DUCK**, *anas*, in ornithology, is characterized in general under the article **ANAS**.

There are two sorts of ducks common with us, the tame and wild; whereof the first is very beneficial to the husbandman, and at the same time requires no charge to keep, living on lost corn, worms, snails, &c. Indeed once a year this fowl is a great layer of eggs, and when she sits, must be carefully fed with barley or other grain. As to the ducklings, they are fed in the same manner as goslings, and may be fattened in three weeks time, by giving them any kind of pulse or grain, and plenty of water.

For preserving wild ducks, a place (with a pond in it) must be walled in, and covered a-top with a strong net: the pond is to be set with tufts of ozers, and have many secret holes and creeks, whereby they will be induced to feed freely, though imprisoned. Teals, widgeons, shell-drakes, and green plovers, may also be ordered in the same manner.

Of exotic or foreign ducks, authors describe a great many species, as the muscovy-duck, with a naked papillose face; the tufted duck, the brasilian duck, as large as a goose, St. Cuthbert's duck, the forked-tailed duck, the black duck, &c. See plate **LXXX**. fig. 1. where n<sup>o</sup> 1. represents the little black and white duck, somewhat less than the common kind; and n<sup>o</sup> 2. the summer duck of Mr. Catesby, likewise less than the common duck: it has a double plume or crest, the uppermost of a shining green, and the under one of a dark, shining purple colour. *Edwards*.

**DUCKER**, or **DOUCKER**, a particular kind of game-cock, that in fighting runs about the clod almost at every blow he gives.

**DUCKER**, is also a name given to the colymbus, or diver. See **COLYMBUS**.

**DUCKING**, plunging in water, a diversion antiently practised among the Goths; by way of exercise; but among the Celts, Franks, and antient Germans, it was a sort of punishment for persons of scandalous lives.

They were shut up, naked to the shift, in an iron cage, fastened to the yard of a shallop, and ducked several times.

**DUCKING at the main-yard**, among seamen, is a way of punishing offenders on board a ship; and is performed by binding the malefactor, by a rope, to the end of the yard, from whence he is violently let down into the sea, once, twice, or three times, according to his offence: and if the offence be very great, he is drawn underneath the keel of the ship, which they call keel-hauling.

**DUCKUP**, at sea, is a term used by the steer's man, when the mainfail, forefail, or spritfail, hinders his seeing to steer by a land-mark: upon which he calls out, *duckup the clew lines of these sails*, that is, hale the fails out of the way. Also, when a shot is made by a chase-piece, if the clew of the sprit-fail hinders the sight, they call out, *duck-up*, &c.

**DUCT**, *ductus*, in general, denotes any tube or canal.

It is much used by anatomists, who mention the adipose ducts, concerning the reality of which authors are not agreed; the thoracic, or chyloferous duct; the excretory ducts of the glands; the hepatic duct, or porus biliaris; the salival ducts; the lachrymal ducts; the ductus communis choledochus, &c. concerning all which it is to be observed, that their use

Fig. 1. Ducks.

Fig. 2. DRAGON.

Fig. 3. DYTISCUS.

use is to convey certain animal fluids secreted in the glands of the parts to which they severally belong : thus it is, the salival ducts discharge the saliva, or pellucid liquor, secreted in the glands of the mouth ; and so of the rest.

*Air-DUCT*, among ichthyologists, a canal reaching from the air-bladder in fishes to their stomach. See *AIR-BLADDER*.

*Alimentary DUCT*, an appellation used by some for the whole canal of the intestines, reaching from the mouth to the anus.

**DUCTILITY**, in physics, a property of certain bodies, whereby they are capable of being expanded, or stretched forth, by means of a hammer, press, &c.

The vast ductility of some bodies, especially gold, is very surprizing : the gold-beaters and wire-drawers furnish us with abundant proofs of this property ; they, every day, reduce gold into lamellæ inconceivably thin, yet without the least aperture, or pore discoverable, even by the microscope : a single grain of gold may be stretched under the hammer, into a leaf, that will cover a house, and yet the leaf remain so compact, as not to transmit the rays of light ; nor even admit spirit of wine to transude. Dr. Halley took the following method to compute the ductility of gold : he learned from the wire-drawers, that an ounce of gold is sufficient to gild, that is, to cover, or coat, a silver-cylinder of forty-eight ounces weight, which cylinder may be drawn out into a wire so very fine, that two yards thereof shall only weigh one grain ; and consequently ninety-eight yards of the same wire, only forty-nine grains : so that a single grain of gold here gilds ninety-eight yards ; and, of course, the ten thousandth part of a grain is here above one third of an inch long. And since the third part of an inch is yet capable of being divided into ten lesser parts visible to the naked eye, it is evident that the hundred thousandth part of a grain of gold may be seen without the assistance of a microscope. Proceeding in his calculus, he found, at length, that a cube of gold, whose side is the hundredth part of an inch, contains 2,433,000,000 visible parts ; and yet, though the gold where-with such wire is coated, be stretched to such a degree, so intimately does its parts cohere, that there is not any appearance of the colour of the silver underneath.

Mr. Boyle examining some leaf-gold, found that a grain and a quarter's weight took up an area of fifty square inches ; supposing therefore the leaf divided by parallel lines  $\frac{1}{160}$  of an inch apart, a grain of gold will be divided into five hundred thousand minute squares, all discernable by a good eye : for gold-wire, the same author shews, that an ounce of gold drawn out therein, would reach 155 miles and a half.

But Mr. Reaumur has carried the ductility of gold to a still greater length : a gold-wire every body knows is only a silver one gilt. This cylinder of silver, covered with leaf-gold, they draw thro' the hole of an iron, and the gilding still keeps pace with the wire, stretch it to what length they can. Now Mr. Reaumur shews, that in the common way of drawing gold-wire, a cylinder of silver twenty-two inches long, and fifteen lines in diameter is stretched to 1,163,520 feet, or is 634,692 lines longer than before, which amounts to about ninety-seven leagues. To wind this thread on silk for use, they first flatten it, in doing which it stretches at least  $\frac{1}{2}$  farther, so that the twenty-two inches are now 111 leagues : but in the flattening, instead of  $\frac{1}{2}$ , they could stretch it  $\frac{1}{4}$ , which would bring it to 120 leagues. This appears a prodigious extension, and yet it is nothing to what this gentleman has proved gold to be capable of.

**DUDERSTAT**, a town of Upper Saxony, thirty-five miles north-east of Cassel.

**DUEL**, a single combat, at a time and place appointed, in consequence of a challenge. This custom came originally from the northern nations, among whom it was usual to decide all their controversies by arms. Both the accuser and accused gave pledges to the judges on their respective behalf ; and the custom prevailed so far amongst the Germans, Danes and Franks, that none were excused from it but women, sick people, cripples, and such as were under twenty-one years of age, or above sixty. Even ecclesiastics, priests, and monks, were obliged to find champions to fight in their stead. The punishment of the vanquished was either death, by hanging or beheading ; or, mutilation of members, according to the circumstances of the case. Duels were at first admitted not only on criminal occasions, but on some civil

civil ones for the maintenance of rights to estates, and the like: in latter times, however, before they were entirely abolished, they were restrained to these four cases: 1. That the crime should be capital. 2. That it should be certain the crime was perpetrated. 3. The accused must, by common fame, be supposed guilty. And, 4. The matter not capable of proof by witnesses. In England, though the trial by duel is disused, the law on which it is founded is still in force. See the article **CHAMPION**.

**DUEL**, at present, is used for a single combat on some private quarrel, and must be premeditated, otherwise it is called a rencounter. If a person be killed in a duel, both the principals and seconds are guilty of murder, whether the seconds engage or not. It is also a very high offence to challenge a person, either by word or letter, or to be the messenger of a challenge. The severe edicts made by Lewis XIV. against duels, have in a great measure put a stop to the custom in France.

**DUERO**, or **DURO**, a large river, which, rising in Old Castile, in Spain, runs from east to west, crosses the province of Leon, and, after dividing Portugal from Spain by a southerly course, turns westward, crosses Portugal, and falls into the Atlantic ocean at Porto-Port.

**DUKE** is either the title of a sovereign prince, as the duke of Savoy, Parma, &c. the grand duke of Tuscany, Muscovy, &c. or it is the title of honour and nobility next below princes. The commanders of armies in time of war, the governors of provinces, and wardens of marches, in time of peace, were called *duces*, under the latter emperors. The Goths and Vandals divided all Gaul into duchies and counties, the governors of which they sometimes call *duces* and sometimes *comites*. In France, under the second race of kings, though they retained the name and form of ducal government, there were scarce any dukes except those of Burgundy, Aquitain, and France. In England, among the Saxons, the commanders of armies, &c. were called dukes, *duces*, without any addition, till Edward III. made his son, the black prince, duke of Cornwall; after whom there were more made in the same manner, the title descending to their posterity. Duke, then, at present, is a mere title of dignity, without giving any domain, territory, or jurisdiction over the

place from whence the title is taken. A duke is created by patent, investiture of sword, mantle of state, imposition of a cap and coronet of gold on his head, and a verge of gold put into his hand. His title is Grace; and, in the style of the heralds, Most high, potent, high-born, and noble prince.

**DUKE**, among hebrew grammarians, an appellation given to a species of accents, answering to our comma.

**DULCICHNIUM**, in botany, a name used by some for the sweet cyperus. See the article **CYPERUS**.

**DULCIFYING**, in pharmacy, is the sweetening any matter impregnated with salts, by frequently washing it in pure water.

**DULCIS ASSA**, or **ASA**. See the articles **BENZOIN** and **ASA**.

**DULEDGE**, in gunnery, a peg of wood which joins the ends of the six fellows that form the round of a wheel of a gun-carriage. The plate of iron on the out side of the wheel, which strengthens the joint, is called the duledge-plate.

**DULL**, in the manege. The marks of a dull horse, called by the French, *marquis de ladre*, are white spots round the eye, and on the tip of the nose, upon any general colour whatsoever. Though the vulgar take these spots for signs of stupidity, it is certain they are great marks of the goodness of a horse; and the horses that have them are very sensible and quick upon the spur.

**DULNESS of hearing**. See the article **DEAFNESS**.

**DULWICH**, a village near London, remarkable for its mineral waters, which are said to contain a bitter cathartic salt, but no iron. See **EPSOM-SALT**.

**DUMBLAIN**, a town of Scotland, about five miles north of Stirling.

**DUMBNESS**, the deprivation of speech. See the article **SPEECH**.

Dumbness may be owing either to the want, or bad conformation of the tongue. See the article **TONGUE**.

**DUMFERMLING**, a parliament-town of Scotland, situated in the county of Fife, fifteen miles north-west of Edinburgh: west lon. 3° 20', and north lat. 56° 15'. Here was formerly a magnificent abbey and palace of the kings of Scotland, in which the princess Elizabeth, daughter of King James VI, and mother of the princess Sophia, from whom the present royal family are descended, was born.

**DUMFRIES**, the capital of a county of the same name, in Scotland, lying northwards

wards of the Solway frith : west lon.  $3^{\circ} 26'$ , and north lat.  $54^{\circ} 45'$ .

**DUM FUIT INFRA ÆTATEM**, is a writ, that an infant, who by feoffment has aliened his lands, may have, when he arrives to full age, for the recovery of what he so aliened : and during his non-age, it is said, he may enter on the land, and take it back again ; for, by his entry, he shall be remitted to his ancestor's right.

**DUM NON FUIT COMPOS MENTIS**, in law, a writ which a person who is not found in memory, having aliened lands or tenements, shall have against the alienee ; in which he must alledge, that he was not *sane memorie*, but being visited with infirmity, lost his discretion for a time, so as not to be capable of making any grant, &c.

**DUNBAR**, a parliament and port-town of Scotland, about twenty-five miles east of Edinburgh.

**DUNBARTON**, the capital of a county of the same name in Scotland, called by some Lenox : it is a parliament-town, situated at the confluence of the rivers Clyde and Leven ; sixteen miles north-west of Glasgow.

**DUNCANNON**, a town of the county of Wexford, in Ireland, six miles east of Waterford.

**DUNDALK**, a port town of Ireland eighteen miles north of Drogheda.

**DUNDEE**, a large parliament-town of Angus, in Scotland, situated on the north-side of the frith of Tay, fourteen miles north-west of St. Andrews : west lon.  $2^{\circ} 42'$ , and north lat.  $56^{\circ} 32'$ .

**DUNG**, in husbandry, is of several sorts, as that of horses, cows, sheep, hogs, pigeons, geese, hens, &c. for the several properties of which, see HORSE, COW, SHEEP, &c.

All dungs are very enriching to lands ; but some, as horse's, sheep's, pigeon's, &c. being hot and light, are fittest for cold lands ; as those of cows, hogs, &c. are for hot and dry lands, on account of their cooling qualities ; or mixed together in different proportions, they may be made to answer for all sorts of ground. In winter, or rainy weather, it is proper to turn up the dung in as large heaps as possible, to prevent the rain's washing away its fatness and nitrous quality ; which purpose the dung-meers answer extremely well. See the article DUNG-MEERS.

**DUNGANNON**, a town of Ireland, eleven miles north of Armagh,

**DUNGEON**. in fortification. See the article DONJON.

**DUNGING of pastures, &c.** The best time for dunging pastures and meadows is in the winter season, about January or February, that the rain may wash the fatness of the soil to the roots of the grafs before the sun drives it away. The dung may be spread with a bush, drawn over the ground like a harrow, before the grafs is too high : and for rusty cold land, wood-ashes, sea-coal, peat, turf, or the like fuel, is very proper to be laid on. The dung of pigeons, or other fowl, has a better effect here than on any other lands ; also all hot and sandy soils are fittest for this sort of ground : but for such land of this kind as is sandy, or hot, lime, chalk, marl, or any cold soils, digged out of the earth, are of singular use, as well as for corn-lands : so is urry in like manner. As for meadows, or grounds of a middle quality between these extremes, the ordinary soil is best. The principal part of good husbandry consists in a proper application of the compost.

**DUNKELD**, a town of Perthshire in Scotland, formerly a bishop's see, situated about twelve miles north of Perth.

**DUNG-MEERS**, in husbandry, places where soils and dungs are mixed and digested together. For this purpose it is usual to dig a pit sufficient to hold the stock of soil the husbandman is capable of making ; and to prepare it at the bottom with stone and clay, that it may hold water, or the moisture of the dung ; and besides, it should be so situated that the sinks and drips of the houses and barns may run into it. Into this pit they cast refuse-fodder, litter, dung, weeds, &c. where they lie and rot together, till the farmer have occasion for it. Where such a pit is wanting, it is proper to cover the dung with turf, or other stuff, to prevent the sun and wind from drawing off its virtues.

**DUNKIRK**, a port town of the french Netherlands : east lon.  $2^{\circ} 28'$ , and north lat.  $51^{\circ}$ .

**DUNLIN**, in ornithology a small species of snipe, with the breast and throat white, the belly black spotted with white, and the upper part of the body red variegated with pretty large black spots.

**DUNNEGAL**, the capital of a county of the same name in Ireland, situated on a bay, to which it likewise gives name : west lon.  $8^{\circ} 22'$ , and north lat.  $54^{\circ} 35'$ .

**DUNNINGTON**, a market-town of Lincolnshire, about twenty-three miles south-east of Lincoln.

**DUNS**, a market-town of Scotland, twelve miles west of Berwick upon Tweed.

**DUNSTABLE**, a market-town, fifteen miles south of Bedford, and thirty north-west of London.

**DUNWICH**, a borough of Suffolk, forty miles east of Bury.

It sends two members to parliament.

**DUO**, in music, a song or composition to be performed in two parts only, one sung, the other played on an instrument, or by two voices.

**DUO** is also when two voices sing different parts, as accompanied with a third, which is a thorough base. It is seldom that unisons and octaves are used in duos, except at the beginning and end.

**DUODECIMA**, in music, is the twelfth, or the fifth doubled. See **FIFTH**.

**DUODENUM**, in anatomy, the first of the small guts, intestina tenuia, so called from its length, which is about twelve fingers breadth. It has its origin at the pylorus, or right orifice of the stomach; from which ascending a little; it afterwards descends again, and towards its end re-ascends, and runs transversely towards the left kidney: at the distance of three or four fingers from the pylorus it receives, at one prominent hiatus or mouth, the choledochic and pancreatic ducts, which discharge their respective liquors into it. The coats of the duodenum are thicker than those of any other of the small guts, and its cavity is also greater than that of any of them. Near its origin it has no valves, nor rugæ or wrinkles; but in its continuation it has very numerous and remarkable ones, called by authors *juga*. It has also the glands of Brunnerus in great number, which serve for the secreting of a thin aqueous fluid: and it receives an artery from the *cœliac*, and a vein from the *porta*.

**DUPLÉ**, among mathematicians, denotes the ratio of 2 to 1. Thus the ratio of 8 to 4 is *duplé*, or as 2 to 1.

*Sub-Duplé Ratio* is just the reverse of the former, or as 1 to 2. Such is 4 to 8, or 6 to 12.

**DUPLEX QUERELA**. See the article **DOUBLE QUARREL**.

**DUPLICATE**, among lawyers, denotes a copy of any deed, writing, or account. It is also used for the second letters patent, granted by the lord chancellor in a case wherein he had before done the same,

Also a second letter written and sent to the same party and purpose as a former, for fear of the first's miscarrying, is called a duplicate.

**DUPLICATE PROPORTION**, or **RATIO**, is a ratio compounded of two ratios: thus, the duplicate ratio of *a* to *b*, is the ratio of *aa* to *bb*, or of the square of *a* to the square of *b*. Hence the duplicate ratio ought to be well distinguished from double.

In a series of geometrical proportionals, the first term to the third is said to be in a duplicate ratio of the first to the second: thus in 2, 4, 8, 16, &c. the ratio of 2 to 8 is duplicate of that of 2 to 4, or as the square of 2 to the square of 4. Duplicate ratio is therefore the proportion of squares, as triplicate is of cubes, &c. and the ratio of 2 to 8 is said to be compounded of that of 2 to 4, and of 4 to 8.

**DUPLICATION**, in general, signifies the doubling of any thing, or multiplying of it by 2: also the folding of any thing back again on itself.

The duplication of a cube is a problem famous in antiquity: it was proposed by the oracle at Delphos, as a means to stop the plague, to double Apollo's altar, which was cubical.

The difficulty of the problem consists in this, to find the side of a cube that shall be double in solidity to a given cube; which is only to be solved by finding two mean proportionals between the side of the given cube and double that side. Thus, if the given side be represented by *a*, its double by *b*, and the side sought by *y*; we shall have *aa:yy::y:b*; and making  $z = \sqrt[3]{a}$ , it will be *a:z::y:b*. So that

*y*, the side of the cube sought, is the second of two mean proportionals between *a* and *b*.

**DUPLICATION**, among anatomists, a term used to denote the folds of any membrane, or vessel: thus we say, the duplicatures of the intestines, peritonæum, &c. See **INTESTINES**.

**DUPONDIUS**, in antiquity, the weight of two pounds: also a piece of money equal to two asēs in value. See the articles **AS**, **POUND**, and **LIBRA**.

**DURA MATER**, in anatomy, one of the membranes, or meninges, as they are called, which surround the brain. See the article **BRAIN**.

It is a robust and thick membrane, composed of tendinous fibres, and situated immediately

immediately under the cranium : its figure and magnitude correspond exactly to those of the brain. It adheres every where to the skull, only more laxly on the upper part than elsewhere : it adheres also, tho' not very firmly, to the parts placed under it. It receives arteries from the carotids, beautifully ramified in the manner of shrubs. Its veins are of two kinds, some as in other parts of the body, and others of a triangular figure, called sinuses, for carrying off the blood from the brain. It has nerves for sensation, from the fifth and seventh pair of the brain.

The dura mater has a motion, said to be peculiar to itself, and of a muscular kind : but it seems much more natural to suppose it owing to the pulsations of the arteries of the brain.

As to the uses of this membrane, it serves in the place of a periosteum to the internal parts of the skull ; also to defend the brain by its processes, to prevent the compression of its parts ; and by its sinuses to give warmth to the brain.

**DURANCE**, a river of France, which falls into the Rhone, a little below Avignon.

**DURANTA**, a genus of plants, the class of which is not yet ascertained : the flower is formed of a single petal, with a cylindrical tube and ringent mouth, the upper limb of which is oval, erect, and hollow ; and the lower one divided into three parts : the fruit is a roundish unilocular berry, covered with the cup : the seeds are four, and of an angular figure. *Linnaeus*.

**DURATION**, an idea which we get by attending to the fleeting and perpetually perishing part of succession ; the idea of succession being acquired by reflecting on that train of ideas which constantly follow one another in our minds, as long as we are awake. The simple modes of duration are any different lengths of it whereof we have distinct ideas, as hours, days, years, time, eternity, &c.

Duration, as marked by certain periods and measures, is what we most properly call time. See the article **TIME**.

**DURATION of action**, according to Aristotle, is confined to a natural day in tragedy ; but the epopea, according to the same critic, has no fixed time.

**DURATION of an eclipse**. See **ECLIPSE**.

**Scruples of half DURATION**. See the article **SCRUPLE**.

**DURESSE**, in law, is where a person is wrongfully imprisoned, or restrained of his liberty, contrary to law ; or is threat-

ened to be killed, wounded, or beaten, till he executes a bond, or other writing.

Any bond, deed, or other obligation, obtained by duresse, will be void in law ; and in an action brought on the execution of any such deed, the party may plead that it was brought by duresse. A deed must be avoided by special pleading, in these cases ; for the party cannot plead to it, *non est factum*, because it is his deed.

**DURHAM**, a city and county, in the north of England, situated on the river Were, fourteen miles south of Newcastle : west lon.  $1^{\circ} 12'$ , and north lat.  $54^{\circ} 50'$ .

Durham is the see of a bishop, and sends two members to parliament.

**DURION**, an east-india fruit, much esteemed by the natives, who prefer it to all others, though the Europeans cannot endure its nauseous smell, which is not unlike that of rotten onions.

**DUSSELDORP**, a city of Germany, situated on the eastern shore of the Rhine, twenty miles north of Cologne : east lon.  $6^{\circ} 20'$ , and north lat.  $51^{\circ} 15'$ .

**DUST** is nothing else but dry earthy particles, reduced to a fine light powder.

Dust and sand will sometimes get into horses mouths, and make them lose their appetites ; in which case it is proper to give them bran well moistened with water, to cool and refresh their mouths and tongues.

The Hebrews, when they mourned, put dust or ashes upon their heads ; and in their afflictions, they sat down in the dust, and threw themselves upon the ground.

**DUTCHY**, in geography, an appellation given to the dominions of a duke. See the article **DUKE**.

**DUTCHY-COURT**, a court of the dutchy-chamber of Lancaster, held at Westminster, before the chancellor of the same, for matters concerning the lands and franchises of that dutchy. See the article **CHANCELLOR**.

The proceedings in this court are by english bill, as in chancery. Gwyn says, that this court grew out of the grant of king Edw. III. who gave the dutchy to John of Gaunt, and endowed it with royal rights and privileges : several others of our antient kings likewise separated this dutchy from the crown, and settled it in the natural persons of themselves and their heirs ; though, in succeeding times, it was united to the crown again.

**DUTY**,

**DUTY**, in general, denotes any thing that one is obliged to perform.

**DUTY**, in polity and commerce, signifies the impost laid on merchandizes, at importation or exportation, commonly called the duties of customs; also the taxes of excise, stamp-duties, &c. See the article **CUSTOMS**, **EXCISE**, &c.

The principles on which all duties and customs should be laid on foreign merchandizes, which are imported into these kingdoms, are such as tend to cement a mutual friendship and traffic between one nation and another; and, therefore, due care should be taken in the laying of them, that they may answer so good an end, and be reciprocal in both countries: they should be so laid as to make the exports of this nation at least equal to our imports from those nations wherewith we trade, so that a ballance in money should not be issued out of Great Britain, to pay for the goods and merchandizes of other countries; to the end that no greater number of our landholders and manufacturers should be deprived of their revenues arising from the product of the lands, and the labour of the people, by foreign importations, than are maintained by exportations to such countries. These are the national principles on which all our treaties of commerce with other countries are to be grounded.

To shew, says the late sir Matthew Decker, how excises, customs, and salt-duties increase the expence of the people, and consequently ruin our trade, the following account may not be improper.

First the duties themselves. The net produce of the taxes following, was, before the late war, computed to be, one year with another, as under:

Excise, about	£. 2,800,000
Customs, about	1,700,000
Salt, about	150,000
	<hr/> 4,650,000

The charges of raising those }  
duties are about 10 per cent. } 465,000

Net produce 5,115,000

Secondly, the advanced price of those goods the above duties are laid on. Experience teaches us that a very small duty laid on commodities, raises the price of them considerably to the consumer, beyond the gross duty. By the fees given to officers; by tradesmens loss of time in attending upon excisemen, or at custom-houses; by taking away a quarter of our traders stocks for duties; and forcing

them to take as great pains on one quarter of their stock laid out in goods, in order to live, as they would on the whole if duty free; by tradesmens profits on the duty, and advances in all the hands that all taxed goods come through, to the consumer; as for example, suppose there should be no other tax but that on leather, let us see how many advances that would make on the price of shoes.

The grazier lays (1) on the beast he fatts, his advanced price of shoes: he sells to the butcher, who takes (2) his profit on the grazier's advanced price of the beast; and raises (3) on the hide his advanced price of shoes: he sells to the tanner, whose journeymen raise (4) their wages, on account of the advanced price of shoes; the tanner pays (5) the tax of two pence per pound on the leather; takes (6) his profit on the before-mentioned five advances, and raises (7) his advanced price of shoes on the tanned hide: he sells to the leather-cutter, who takes (8) his profit on the before-mentioned seven advances, and raises (9) on the hide he cuts, his advanced price of shoes: he sells to the shoe-maker, whose journeymen raise (10) their wages, on account of their advanced price of shoes; the shoe-maker takes (11) his profit on the before-mentioned ten advances, and raises (12) on the shoes he makes, the advanced price of the shoes he wears: he sells to the consumer with all these twelve advances, highly magnified beyond the bare duty.

So much for the tax on leather only; but the grazier, butcher, tanner, leather-cutter, and shoe-maker, use soap: that soap, like leather, is taxed, and, like that leather-tax, must be raised: but that caused twelve advances on our shoes; place therefore twelve advances more on shoes, for the soap-tax. These tradesmen use candles; twelve advances more for the tax on them; and the same for every other tax on necessities. All which duly considered, might be computed at above cent. per cent. on the gross produce of the duties; but though the large duties cause some farther advance on all the goods they are laid on, charged with profit upon profit, through every hand they pass; yet as they keep not pace with the small duties, and as all calculations appear fair when moderate, let us abate in the advances, and set them down only at 50 per cent. 2,557,500.

The amount of the advanced price of the goods these duties are laid on, 7,672,500 l.

Let

Let us see how this 7,672,500*l.* circulates through the people, advances the prices of our goods, and consequently ruins our trade. First, this dearness of all necessities, which raise the first cost of goods, must advance the price of all labour.

The Spectator, n<sup>o</sup> 200. computes, that the people without property, who work for their daily bread, consume two thirds of our customs and excises, and therefore they pay two thirds of them and their consequences. As these people live but from hand to mouth, whatever is laid on them they must, therefore, shift off, or they cannot live; and since these various taxes have been projected, they must earn enough, when they do work, to pay the taxes, the advanced price of taxed goods, and the advanced prices of all other necessities, *viz.* meat, bread, cloathing, or whatever they can use, not only for the consumption of the days they are employed, but for those also they are not: therefore they are the cause of raising the wages of the working people two thirds of 7,672,500*l.* the amount of the advanced price of the goods the above duties are laid on, which makes 5,115,000*l.*

Secondly, the dearness of all necessities forces the master-tradefmen to raise on their customers the taxes and advances on their consumption.

The same author allows one third consumption of our customs and excises to people with property; but as those may be divided into two classes, *viz.* those in trade, and those out of trade, and the proportion consumed by each not being ascertained by any author, they are computed by sir Matthew at half and half; therefore the master-tradefmen, or people with property in trade, *viz.* merchants, manufacturers, mechanics, farmers, wholesale dealers, and retailing shopkeepers, must each lay on the goods they consume, whether food, cloathing, or utensils, their one sixth consumption of 7,672,500*l.* the amount of the advanced price of the goods the above duties are laid on, makes 1,278,750*l.*

Thirdly, tradefmen's paying advanced prices on their goods, must have advanced profits: for whether they lay out their stocks of money in goods that bear their natural value only, or goods that double their value by taxes, still a living profit must be obtained on the stocks they employ. For the wages of the manufacturer, the mechanic, the labourer, and the expence: of the master-tradefman, being of ne-

cessity raised, the first cost of goods must be so too: and considering the various tradefmen's hands that goods pass through, from the workman or labourer, to the consumer, charged with profit upon profit by each of them, the advance thereby made, may, at a moderate rate be computed at 50 *per cent.* to the consumer on the above two articles, which raise the first cost of goods, and makes 3,196,875*l.* People with property, out of trade, their sixth of 7,672,500*l.* the amount of the advanced price of the goods the above duties are laid on, makes 1,278,750*l.* and the total advance is 10,869,375*l.*

This is part of the amount of the consequences of raising 4,650,000*l.* for the government, by our present manner of taxing goods.

Our other taxes are, the land-tax; the gross produce, at 4*s.* in the pound, is about 1,960,000*l.*

The stamps, windows, post office, &c. their computed gross produce about 500,000*l.* The poor's tax is computed, on a middling rate, to equal the land-tax, but must be much more when trade is reduced, and the price of provisions high: however, to reckon it at no more than the land-tax, or 1,960,000*l.* General amount of all our taxes, and part of their consequences, before the late war, 15,289,375*l.*

Let us now see the amount of our taxes with regard to our expences: The British Merchant computes our people at seven millions, and their expences at 7*l.* per head; but as necessities are grown dearer since the year 1713, when he wrote, and the number of people increased, let us compute the people at eight millions, and their expences at 8*l.* per head, which makes our total expences annually 64,000,000*l.* of which the people pay for the taxes and their consequences, as above, 15,289,375*l.* which being subtracted, their expences, if untaxed, would be only 48,710,625*l.*

15,289,375*l.* charged on 48,710,625*l.* is a tax of above 31 *per cent.* on the expences of the people, which must add a prodigious artificial value to our goods, consequently render them less saleable, and ruin our trade.

If it be admitted that foreigners pay on that consumption a great portion of our taxes, for what goods they take of us; yet if that was originally intended, and expected to continue the same, as at the first laying on our taxes, it will be the strongest argument to the contrary; for

as our taxes on necessities are proved to be so burdensome and extensive, by raising the prices of our goods, foreigners take less of them yearly; and when the demand is reduced, the people having less work, find less money to pay, and yet have their taxes proportionably increased on them as they lose their trade: for as the government abates neither expences or taxes, and, if one method of taxing fails, another is tried, what foreigners cease to pay, we must: or, in other words, the less trade and money, the more taxes; and the more our taxes are, the less trade and money we must expect. Through the whole of this work, we have, under the several articles, as they occurred, generally annexed the principal duties which belong to each as a branch of the royal revenue; and for further information upon this head, we refer the reader to what is said under the articles *CUSTOM, COMPANY, DRAWBACK, EXCISE, &c.*

In Spain, the duties of exportation and importation amount to about *5 per cent.* of the value of the goods. In Portugal, the duties of importation on all kinds of goods are at the rate of *18 per cent.* excepting silks, which are at *13 per cent.* for exportation the duties are only *6 per cent.* The duties for exportation and importation in Holland, are nearly alike, being about the rate of *5 per cent.* In Muscovy they are the same, *viz. 5 per cent.* At Hamburgh and Bremen the duties are only *1 per cent.* and at Lubeck but  *$\frac{3}{4}$  per cent.* At Venice the duties are  *$6\frac{3}{4}$  per cent.* for importation, and the duties of exportation are about *9 per cent.* At Leghorn the duties are much the same as at Venice.

In Constantinople, Smyrna, Aleppo, and the other ports of the Levant, the duties of exportation and importation, being nearly the same, are at *3 per cent.* In Cairo, Alexandria, and other cities of Egypt, the duties on goods brought in ships from Europe, are at *20 per cent.* but the duties on the goods brought by the caravans from Asia, are arbitrary, and always high: they pay no duty on exportation, besides the custom-house fee, which is only  *$1\frac{1}{2}$  per cent.*

**DUTY**, in the military art, is the exercise of those functions that belong to a soldier; with this distinction, that mounting guards and the like, where there is no enemy directly to be engaged, is called duty; but their marching to meet and fight an enemy is called going on service.

**DUUMVIRATE**, the office or dignity of the duumviri. See the next article.

The duumvirate lasted till the year of Rome 388, when it was changed into a decemvirate.

**DUUMVIRI**, in roman antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same functions.

**DUUMVIRI CAPITALES** were the judges in criminal causes: from their sentence it was lawful to appeal to the people, who only had the power of condemning a citizen to death. These judges were taken from the body of the decuriones; they had great power and authority, were members of the public council, and had two lictors to walk before them.

**DUUMVIRI MUNICIPALES**, were two magistrates in some cities of the empire, answering to what the consuls were at Rome: they were chosen out of the body of the decuriones; their office lasted commonly five years, upon which account they were frequently termed *quinquinales magistratus*. Their jurisdiction was of great extent: they had officers walking before them, carrying a small switch in their hands; and some of them assumed the privilege of having lictors, carrying axes and the fasces, or bundles of rods, before them.

**DUUMVIRI NAVALES** were the commissaries of the fleet, first created at the request of M. Decius, tribune of the people, in the time of the war with the Samnites. The duty of their office consisted in giving orders for the fitting of ships, and giving their commissions to the marine officers, &c.

**DUUMVIRI SACRORUM** were magistrates created by Tarquinius Superbus, for the performance of the sacrifice, and keeping of the sybils books. They were chosen from among the patricians, and held their office for life: they were exempted from serving in the wars, and from the offices imposed on the other citizens, and without them the oracles of the sybils could not be consulted.

**DUYVELAND**, or **DIVELAND**, one of the islands of Zealand, in the United Provinces, lying eastward of Schonen, from which it is only separated by a narrow channel.

**DWAL**, in heraldry, the herb nightshade used by such as blazon with flowers and herbs, instead of metals and colours, for sable or black.

**DWALE**, the same with the sleepy or deadly nightshade. See **NIGHTSHADE**.

**DWARF**,

**DWARF**, in general, an appellation given to things greatly inferior in size to that which is usual in their several kinds: thus there are dwarfs of the human species, dwarf-dogs, dwarf-trees, &c.

The Romans were so passionately fond of dwarfs, that they often used artificial methods to prevent the growth of boys designed for dwarfs, by inclosing them in boxes, or by the use of tight bandages. In Italy, even at present, they wash young puppies every day with astringent liquors, in order to prevent their growth by hardening the parts.

Dwarf fruit-trees are propagated by grafting them on a quince-stock, about six inches above the ground; and when the bud is shot so far as to have four eyes, it must be stopped, to give rise for lateral branches, for which purpose the uppermost eye should always be left outwards. Apple, pear, plum, and cherry-trees are thus formed into dwarfs, but the summer and autumn pears are found to succeed best.

As to the planting of dwarf-trees, they should be set at twenty-five feet square distance; and the ground between sown or planted for kitchen use while the trees are young, only keeping at some distance from their roots: stakes also should be fixed all round them, to which the branches may be nailed with liss, and thereby trimmed in an horizontal direction, and prevented from crossing one another.

**DWARF-FERN**, *filicula*, in botany. See the article **FILICULA**.

**DWINA**, the name of two large rivers, one of which rises in Lithuania, and, dividing Livonia from Courland, falls into the Baltic sea a little below Riga: the other gives name to the province of Dwina, in Russia, discharging itself into the White sea, a little below Archangel.

**DYADIC ARITHMETIC**, the same with binary. See the article **BINARY**.

**DYE**, in architecture, any square body, as the trunk, or notched part of a pedestal: or it is the middle of the pedestal, or that part included between the base and the corniche, so called because it is often made in the form of a cube or dye. See **CORINTHIAN ORDER**, **DORIC ORDER**, &c.

**DYE** is also used for a cube of stone placed under the feet of a statue, and over its pedestal, to raise it and shew it the more.

**DYES**, in the art of dying. See the articles **COLOURS** and **DYING**.

**DYER**, a person who professes the art of dying all manner of colours. See **DYING**.

All persons occupying the trade of dyeing woollen manufactures within the city of London, or ten miles round it, shall be subject to the inspection of the company of dyers of London; and the master, wardens, and court of assistants of the said company, may appoint searchers within the said limits; and out of these limits, justices, at their quarter-sessions, may appoint such searchers, who taking to their assistance a constable, or other peace-officer, may, at all seasonable times, enter the shop or work-house of any person using the trade of dyeing, and search all cloths or other woollen goods to be dyed black or blue; and any person opposing, forfeits 10 l.

Every person dyeing cloths, &c. madder-ed, and not woaded, shall, before delivery, fix a seal of lead to them, with the letter M, on forfeiture for every yard, &c. 3 s. 4 d. Any person within England, Wales, or Berwick, dying black any bays or other woollen goods, as madder-blacks, not being dyed throughout with woad, indigo, and madder only, or dyeing any cloths, long-ells, &c. for woaded blacks, not being woaded throughout, shall forfeit for every long Bocking-bays, containing seventy yards, 44 s. For every Colchester-bays, containing thirty-five yards, 22 s. and so in proportion for other bays. For every cloth dyed black, not being woaded throughout, containing forty four yards, 40 s. All woollen goods truly madder-ed black, shall be marked with a red and blue rose; and all woollen goods truly woaded black, with a blue rose; and any person counterfeiting the said marks, or fixing such to any goods falsely dyed, for madder-ed or woaded blacks, forfeits 4 l. for every piece so marked. Any person using logwood in dyeing blue, shall forfeit 40 s. for every piece so dyed, containing forty-four yards.

**DYER of leather**, is an artificer who colours skins, either on the one side, or on the other, in the cold or hot dye. See the articles **COLOURS** and **LEATHER**.

**Hat-DYER** is said of master-hatters, who give themselves particularly to the dyeing of hats. Though there be but one freedom in this company, the masters seem to be divided into three distinct professions, the one making the hats, the other dyeing them, and a third fitting them up, and selling them. See **HATTER**.

**DYER'S WEED**, *luteola*, in botany. See the article **LUTEOLA**.

**DYEING**, the art of giving a lasting colour to silks, cloths, and other substances, whereby their beauty is much improved, and value enhanced.

This art depends chiefly on three things, *viz.* 1. Disposing the surface of the stuffs to receive and retain the colours, which is performed by washing them in different lyes, digesting, beating them, &c. in which human urine putrified, a sharp salt of ashes, divers soaps, and galls of animals, are of principal use; by means whereof the visciduous gluten of the silk-worms naturally adhering to their threads, is washed and cleaned from them, and thus they become fitted gradually to imbibe the colours. By these also the greasy foulness adhering to wool and flax is scoured off. See **CLOTH**.

2. So to grind the colours, as that they may enter the body duly prepared, and preserve their brightness undiminished. See **COLOUR** and **COLOURING**.

3. The third consists in having beautiful colours.

According to Sir W. Petty's account of what is done in particular trades by the art of dyeing, 1. There is a whitening of wax, and several sorts of linnen and cotton cloths, by the sun, air, and reciprocal effusions of water. 2. Colouring of wood and leather, by lime, salt and liquors, as in stoves, canes, and marble leathers. 3. Colouring of paper, *viz.* the marbled paper, by ditempering the colours with ox-gall, and applying them upon a stiff gummed liquor. 4. Colouring, or rather discolouring, the colours of silks, tiffanies, &c. by brimstone.

5. Colouring of several iron and copper-works into black with oil. 6. Colouring of leather into gold-colour, or rather silver-leaves into gold by varnishes, and in other cases by urine and sulphur. 7. Dyeing of marble and alabaster, with heat and coloured oils. 8. Colouring silver into the brass-colour, with brimstone or urine. 9. Colouring the barrels and locks of guns into blue and purple, with the temper of small-coal heat. 10. Colouring of glaſs (made of sands, flints, &c.) as also of crystals and earthen ware, with the rusts and solutions of metals. 11. The colouring of live hair, as in Poland, horse and man's hair: as also the colouring of furs. 12. Enameling and annealing. 13. Applying colours, as in the printing of books and pictures, and as in making of playing cards, being each of them performed in a different

way. 14. Gilding and tinning with mercury, block-tin, sal armoniac. 15. Colouring of metals, as copper with calamy, into brass, and with zink or spelter into a golden colour, or into a silver one with arsenic; and of iron into a resemblance of copper with hungarian vitriol. 16. Making painters-colours by preparing of earth, chalk, and slates; as in umber, ochre, cullen-earth, &c. as also out of calces of lead, as ceruse and minium; by sublimates of mercury and brimstone, as in vermilion; by tinging whole earths variously, as in verdeter, and some of the lakes; by concrete juices, or *ſæculæ*, as in gambogium, indigo, pinks, sap-green, and lakes; as also by rusts, as in verdigrease, &c. 17. The applying these colours by the adhesion of ox-gall, as in the marble paper aforesaid; or by gum-water, as by limning; or by clammy drying oils, such as the oils of linseed, nuts, &c. 18. The watering of tabbies. 19. The colouring of wool, linnen, cotton, silk, hair, feathers, horn, leather, and the threads and webs of them with woods, roots, herbs, seeds, leaves, salts, limes, lixivi-ums, waters, heats, fermentations, macerations, and other great variety of management: an account of all which is a short history of dyeing.

*The materials used in the art of DYEING*, are iron and steel, or what is produced from them, in all true blacks, called spanish blacks, though not in fanders-blacks, *viz.* they use copperas, steel-slings, and slippe; they also use pewter for Bow-dye scarlet, *viz.* they dissolve bars of pewter in aquafortis; litharge is also used by some, though acknowledged by few to add weight to dyed silk. Antimony is much used to the same purpose. Arsenic is used in crimson upon pretence of giving lustre, although those who pretend not to be wanting in giving lustre to their silks, disown its use. Verdigrease is also used by linnen-dyers in their yellow and greenish colours; though, of itself, it strikes no deeper colour than that of a pale straw. Of mineral salts used in dyeing, the chief is alum; the true use whereof seems to be in regard to the fixation of colours. The next mineral salt is salt-petre, not used by antient dyers, and but by few of the modern: nor is it yet used but to brighten colours, by back-boiling of them, for which argol is more commonly used: lime is much used in working blue-watts.

Of the animal family are used cochineal, urine of labouring men kept till it be stale and stinking, honey, yolks of eggs, and ox-gall; the use of the urine is to scour, and help the fermenting and heating of woad; and is used also in blue-vats instead of lime: it dischargeth the yellow, and therefore is used to spend weld withal.

Dyers use two sorts of water, *viz.* river and well-water; the last, which is harsh, they use in reds and other colours wanting restraining, and in dyeing materials of the slacker contextures, as in callicoe, fustian, and the several species of cotton-works; but is not good for blues, and makes yellows and greens look rusty. River-water is more fat and oily, and is therefore used in most cases, and must be had in great quantities for washing and rinsing their cloths after dyeing. Water is called by dyers white liquor; but a mixture of one part bran, and five of river-water boiled an hour and put into leaden cisterns to settle, is what they call liquor absolutely.

Gums have been used by dyers about silk, *viz.* gum arabic, tragacanth, mastic, dragon's blood. These tend little to the tincture, any more than gum in writing-ink, which only gives it a consistence; so gum may give the silk a glossiness; and, lastly, to increase the weight.

The three peculiar ingredients for black are coppers, filings of steel, and slippe: the restraining binding materials are alder-bark, pomegranate-peels, walnut-rinds and roots, oaken-sapling-bark, and saw-dust of the same, crab-tree-bark, galls, and sumac.

The salts are alum, salt-petre, sal armoniac, pot-ashes, and stone-lime; among which urine may be enumerated as a liquid salt.

The liquors are well and river-water, urine, aquavivæ, vinegar, lemon-juice, aquafortis, honey, and molasses.

Ingredients of another class are bran, wheaten-flour, yolks of eggs, leaven, cummin-seed, fenugreek-seed, agaric and fenna.

The sinesctics, or abstersives, are fuller's earth, soap, linseed-oil, and ox-gall.

The metals and minerals are pewter, verdigrease, antimony, litharge, and arsenic.

The colourings are of three sorts, *viz.* blue, yellow, and red; of which log-wood, old fustic, indigo, and madder, are the chief.

### *General observations upon DYEING.*

1. All materials which of themselves do give colour are either red, yellow, or blue; so that out of them, and the primitive fundamental colour white, all that great variety which we see in dyed stuffs doth arise.

2. That few of the colouring materials, as cochineal, foot, wood-wax, woad, &c. are in their outward and first appearance of the same colour, which by the slightest distempers and solutions in the weakest menstrua, they dye upon cloth, silk, &c.

3. That many of them will not yield their colours without much grinding, steeping, boiling and fermenting, or corrosion by powerful menstrua, as red-wood, weld, woad, arnotto, &c.

4. That many of them will of themselves give no colouring at all, as coppers or galls, or with much disadvantage, unless the cloth or other stuff to be dyed be as it were first covered, or incrustated with some other matter, though colourless beforehand, as madder, weld, brazil, with alum.

5. That some of them, by the help of other colourless ingredients, do strike different colours from what they would of themselves, as cochineal, brazil, &c.

6. That some colours, as madder, indigo, and woad, by reiterated tinctures, will at last become black.

7. That although green be the most frequent and most common of natural colours, yet there is no simple ingredient now used alone to dye green with upon any material; sap-green being the nearest, which is used by country people.

8. There is no black thing in use which dyes black, though both the coal and foot of most things burnt or scorched be of that colour, and the blacker, by how much the matter before being burnt was whiter, as in ivory-black.

9. The tincture of some dyeing stuffs will fade even with lying, or with the air, or will stain with water only, but very much with urine, vinegar, &c.

10. Some of the dyeing materials are used to bind and strengthen a colour; some to brighten it; some to give lustre to the stuff; some to discharge and take off the colour, either in whole or in part; and some out of fraud, to make the material dyed, if costly, heavier.

11. That some dyeing ingredients, or drugs, by the coarseness of their bodies, make the thread of the dyed stuff seem coarser; and some, by shrinking them,

smaller ; and some, by smoothing them, finer.

12. Many of the same colours are dyed upon several stuffs with several materials, as red-wood is used in cloth, not in silks ; arnotto in silks, not in cloth, and may be dyed at several prices.

13. That scouring and washing of stuffs to be dyed, is done with special materials, as sometimes with ox-galls, sometimes with fullers-earth, and sometimes soap ; this latter being, in some cases, pernicious, where pot-ashes will stain, or alter the colour.

14. Where great quantities of stuffs are to be dyed together, or where they are to be done with any speed, and where the pieces are very long, broad, thick, or otherwise, they are to be differently handled, both in respect to the vessels and ingredients.

15. In some colours and stuffs the tingent liquor must be boiling, in other cases blood-warm, and in some it may be cold.

16. Some tingent liquors are fitted for use by long keeping, and in some the virtues wear away by the keeping.

17. Some colours or stuffs are best dyed by reiterated dippings in the same liquor, some by continuing longer, and others a lesser time therein.

18. In some cases, the matter of the vessel wherein the liquors are heated, and the tincture prepared, must be regarded, as the kettles must be pewter for Bow-dye.

19. There is little reckoning made how much liquor is used in proportion to the dyeing drugs, it being rather adjusted to the bulk of the stuffs, as the vessels are to their breadth ; the quantity of dyeing drugs being proportioned both to the colour, higher or lower, and to the stuffs ; as likewise the salts are to the dyeing drugs. Concerning the weight that colours give to silk, (in which it is most taken notice of, being sold by weight, and a commodity of great price) it is observed that one pound of raw silk loseth four ounces by washing out the gums, and the natural fordes. That the same scoured silk may be raised to above thirty ounces from the remaining twelve, if it be dyed black with some materials.

Of a thing very useful in dying, especially of black, nothing increases weight so much as galls, by which black silks are restored to as much weight as they lost by washing out their gum : nor is it counted extraordinary that blacks should gain about four or six ounces in the dyeing, upon each pound. Next to galls,

old fustic encreases the weight about 1  $\frac{1}{2}$  in 12 ; madder, about one ounce ; weld, half an ounce. The blue vats in deep blues of the fifth stall, give no considerable weight ; neither doth logwood, cochineal, nor even copperas, where galls are not : slippe adds much to the weight, and giveth a deeper black than copperas itself, which is a good excuse for the dyers that use it.

#### DYEING of wooll and woollen manufactures.

For black in woollen manufactures, it is begun with a strong decoction of woad and indigo, that communicate a deep blue ; after which the stuffs being boiled with alum and tartar, or pot-ash, are to be maddered with common madder, then dyed black with Aleppo-galls, copperas, and sumac, and finished by back-boiling in weld. Wools for tapestry are only to be woaded, and then put in black. For scarlet, wooll and woollen manufactures are dyed with kermes and cochineal, with which may also be used agaric and arsenic. Crimson-scarlet is dyed with cochineal, mastic, aquafortis, sal armoniac, sublimate, and spirit of wine. Violet-scarlet, purple, amaranth, and pansy-scarlets, are given with woad, cochineal, indigo, braziletto, brazil, and orchal. Common reds are given with pure madder, without any other ingredient. Crimson-reds, carnations, flame and peach-colours, are given, according to their several hues, with cochineal, mastic, without madder, or the like. Crimson-red is prepared with roman alum with cochineal. Orange-aurora, brick-colour, and onion-peel colour, are dyed with woad and madder, mixed according to their several shades. For blues, the dark are dyed with a strong tincture of woad ; the brighter with the same liquor, as it weakens in working. Dark browns, minims, and tan-colours, are given with woad, weaker in decoction than for black, with alum and pot-ashes, after which they are maddered higher than black : for tan-colours, a little cochineal is added. Pearl-colours are given with galls and copperas ; some are begun with walnut-tree roots, and finished with the former ; though to make them more useful, they generally dip them in a weak tincture of cochineal. Greens are begun with woad, and finished with weld. Pale yellows, lemon-colour, and sulphur-colour, are given with weld alone. Olive-colours of all degrees are first put in green, and taken down with foot, more or less, according to the shade

shade that is required. Feulemort, hair-colour, musk, and cinnamon-colour, are dyed with weld and madder. Nacaret, or bright orange, is given with weld and goats hair boiled with pot-ashes.

**DYEING of silks**, is begun by boiling them in soap, &c. then scouring and washing them in water, and steeping them in cold alum-water. For crimson, they are scoured a second time, before they are put into the cochineal-vat. Red crimson is given with pure cochineal, mastic, adding galis, turmeric, arsenic, and tartar, all mixed in a copper of fair water, almost boiling: with these the silk is to be boiled an hour and a half, after which it is allowed to stand in the liquor till next day. Violet-crimson is given with pure cochineal, arsenic, tartar, and galls; but the galls in less proportion than in the former: when taken out, it is washed and put in a vat of indigo. Cinnamon-crimson is begun like the violet, but finished by back-boiling, if too bright, with copperas, and if dark, with a dip of indigo. Light blues are given in a bath of indigo. Sky-blues are begun with orchal, and finished with indigo. For citron-colours, the silk is first alumed, then welded with indigo. Pale yellows, after aluming, are dyed in weld alone. Pale and brown aurora's, after aluming, are welded strongly, then taken down with rocou and dissolved with pot-ashes. Flame-colour is begun with rocou, then alumed, and afterwards dipped in a vat or two of brazil. Carnation and rose-colours are first alumed, then dipt in brazil. Cinnamon-colour, after aluming, is dipt in brazil, and braziletto. Lead-colour is given with fustic, or with weld braziletto, galls and copperas. Black silks of the coarser sort, are begun by scouring them with soap, as for other colours; after which they are washed out, wrung, and boiled an hour in old galls, where they are suffered to stand a day or two: then they are washed again with fair water, wrung, and put into another vat of new galls; afterwards washed again, and wrung, and finished in a vat of black. Fine black silks are only put once into galls of the new and fine sort, that has only boiled an hour: then the silks are washed, wrung out, and dipped thrice in black, and afterwards taken down by back-boiling with soap.

The dyeing of thread is begun by scouring it in a lye of good ashes: afterwards it is wrung, rinsed out in river-water,

and wrung again. A bright blue is given with braziletto and indigo: bright green is first dyed blue, then back-boiled with braziletto and verdeter, and lastly woaded. A dark green is given like the former, only darkening more before woad-ing. Lemon and pale yellow is given with weld mixed with rocou. Orange isabella, with fustic, weld, and rocou. Red, both bright and dark, with flame-colour, &c. are given with brazil, either alone, or with a mixture of rocou. Violet, dry rose, and amaranth, are given with brazil, taken down with indigo. Feulemort and olive-colour are given with galls and copperas, taken down with weld, rocou, or fustic. Black is given with galls and copperas, taken down and finished with braziletto wood.

**DYKE, or DIKE.** See the article **DIKE**.

**DYKE-REEVE**, in our statutes, an officer who held the oversight of the dykes in the fen-countries.

**DYNASTY**, among ancient historians, signifies a race or succession of kings of the same line or family: such were the dynasties of Egypt.

The Egyptians reckon thirty dynasties within the space of 36525 years; but the generality of chronologers look upon them as fabulous. And it is very certain, that these dynasties are not continually successive, but collateral.

**DYPTICHS, or DIPTYCHS.** See the article **DIPTYCHS**.

**DYSCRACY**, among physicians denotes an ill habit or state of the humours, as in the scurvy, jaundice, &c.

**DYSENTERY**, *δυσεντερία*, in medicine, a diarrhoea or flux, wherein the stools are mixed with blood, and the bowels miserably tormented with gripes.

Dysenteries are distinguished into benign and malignant. The former continues longer, but proceeds more gently, and is less dangerous. The latter is not only of a contagious nature, but is also attended with some fatal symptoms, such as a malignant fever, a defect of strength, and exanthematous disorders. It may likewise be observed, that dysenteries are distinguished into red and white: in the former, the humours evacuated are always bloody; but in the latter, sanious, and mixed with carnos filaments and ulcerous shreds abraded from the coats of the intestines. The immediate cause of a dysentery, according to the most received opinion, is seated in the intestines, and is a highly acrid humour, generated

by summer fruits when unripe, fermenting with other juices, especially those of the bilious kind, and vellicating, corroding, and excoriating the nervous coats of the intestines. Others think it occasioned by a certain specific kind of miasma, whose particular quality it is to ferment in the intestines, with the bile especially, and then to corrode them. And others think that the genuine and most immediate cause which produces the severe gripes, and all the other train of symptoms in a dysentery, is principally lodged in the blood-vessels which surround the nervous coat of the intestines.

As to the prognostics, dysenteries are dangerous to pregnant women, to old men and boys, to the scorbutic, the consumptive, and the cachectic. When they begin with vomiting, succeeded with a hiccup, there is danger of an inflammation of the stomach. When clysters are immediately returned, or the anus so obstinately closed that nothing can be injected, it is a sign of a palsy in the rectum. And when swallowing is attended with a murmuring noise, it shews the approach of a delirium, an inflammation of the fauces, aphthæ, or a palsy of the whole œsophagus. The common method of curing a dysentery, is first to bleed, then to vomit with ipecacuanha, afterwards to purge with rhubarb, and, last of all, to give astringents. When the bowels are ulcerated, it will be of service to inject clysters, either of fat broth with the addition of venice-treacle, or the electuary of scordium, or Lucatelli's balsam. Sydenham, after bleeding, prescribes a paregoric at night, and the next morning a cathartic. Mr. Ray, from the information of Aubrey, says, that the fungous substance between the lobes of a walnut dried and powdered, and given in a moderate quantity of wine, cured the english army of a dysentery, when all other remedies failed. Jussieu says, a thick yellow bark, called simaruba, has been found successful in the cure of a dysentery; and Kramer assures us, we may depend on the same effect from the decoction of common millet-seed. Another specific is the vitrum antimonii ceratum, which has been in use for some time, but was kept a secret till it was communicated to the public by Dr. Young, of Edinburgh. The ordinary dose for an adult is ten or twelve grains; and it has been found successful where bleeding and vomits have been premised,

and where they have not. It is best, says Dr. Pringle, to withhold opium till the patient is both vomited and purged, and when it becomes necessary, to begin with small doses. As to the diet, the same author confines the sick, in the beginning, to rice-gruel, panado, &c. and for drink, to rice or barley-water, or the white decoction. In the convalescent state they are allowed meat, but no small-beer, and never any milk, unless diluted with lime-water, it being observed, that milk by itself was apt to renew the gripes.

**DYSERT**, a parliament-town of Scotland, in the county of Fife, situated on the northern shore of the frith of Forth, about eleven miles north of Edinburgh.

**DYSOREXY**, among physicians, denotes a want of appetite, proceeding from a weakly stomach. See **APPETITE**.

**DYSPEPSY**, a difficulty of digestion, for which physicians prescribe bitters. See the articles **DIGESTION** and **BITTERS**.

**DYSPNOEA**, a difficulty of breathing, usually called asthma. See **ASTHMA**.

**DYSURY**, *dysouria*, in medicine, a difficulty of making urine, attended with a sensation of heat and pain. It is distinguished from a strangury, as, in the last, the urine is voided by only a drop, as it were, at a time, but, however, with pain; and from an ischury, as, in this disorder, there is an almost total suppression of urine. A dysury constantly attends a virulent gonorrhœa, accompanies many other distempers as a symptom, and is frequently excited by very acrimonious medicines, and the external application of cantharides. In a dysury, emollient and mucilaginous medicines, as gum-arabic dissolved in barley-water, emulsions and decoctions, with an addition of nitre, copious draughts of diluting fluids and camphor, are usually prescribed. See **STRANGURY** and **ISCHURY**.

**DYTISCUS**, **WATER-BEETLE**, in zoology, a genus of insects of the order of the coleoptera, the antennæ of which are slender and setaceous, and their feet formed for swimming. See **COLEOPTERA**. Authors enumerate a great many species of this animal, among which is the great water-beetle, the largest of all european beetles, being an inch and an half in length, and all over of a deep and somewhat glossy black. See plate **LXXX**. fig. 3. n° 1. where two other species, marked n° 2. n° 3. are likewise delineated.

*Fig. 1. The GOLDEN - EAGLE.*

*Fig. 2. The WHITE-TAILED EAGLE.*

## E.

**E**, the fifth letter of the alphabet, and second vowel, has different pronounciations in most languages. The Greeks have their eta, η, and epsilon ε, or long and short *e*. The French have their *e* open, pronounced much like our *a* in the words *face* and *make*; their *e* masculine, pronounced not unlike our *y* at the end of words, as *liberté*, *liberty*; their *e* feminine, or mute, very weakly if at all pronounced, added generally at the end of words, either to distinguish the feminine gender, or lengthen the syllable; and their *e* before an *m* or *n*, which sounds like our *a* in the word *war*; these are all exemplified in the words *empêchée* or *enfermée*. In english there are three kinds of *e*, viz. the open or long *e*, as in the words *bear*, *wear*; the close or short *e*, as in *wet*, *kept*; and mute *e*, which serves to lengthen the syllable, as in *love*, *came*, &c.

As a numeral, E stands for 250. In music it denotes the tone *e-la-mi*. In the calendar it is the fifth of the dominical letters. And in sea-charts it distinguishes all the easterly points: thus, E. alone denotes east, E. by S. and E. by N. east by south and east by north. See the article CHARACTER.

**EADISH**, or **EDDISH**, among farmers. See the article EDDISH.

**EAGLE**, *aquila*, in ornithology, the english name of several species of the falcon-kind. See the article FALCON.

The iron-coloured eagle with a yellow cere, called by authors *chrysaetos*, is a large and terrible bird of prey, about the size of a turkey, frequent in many parts of Europe; the tongue of which is in shape like that of the human species. The brown or chestnut-coloured eagle, with a blue cere, is likewise a very bold and fierce bird.

The *chrysaetos*, or common eagle, is very rapacious; it will seize on lambs, and, during the time of its having young, scarce any thing is safe from it. See plate LXXXI. fig. 1.

The white-tailed eagle, brought from Hudson's bay, differs from the common kind in the colour of its tail, which is white, only that the tips of the feathers are black, or dark brown; the breast too

is spotted with triangular spots. See plate LXXXI. fig. 2.

To these may be added the *pygargus* and *haliaetus*. See the articles **PYGARGUS** and **HALIAETUS**.

In heraldry, the eagle is accounted one of the most noble bearings in armoury, and, according to the learned in this science, ought to be given to none but such as greatly excel in the virtues of generosity and courage, or for having done singular services to their sovereigns; in which cases they may be allowed a whole eagle, or an eagle naissant, or only the head or other parts thereof, as may be most agreeable to their exploits.

The reason why eagles are generally borne with their wings and tail expanded, is because this posture is best fitted to fill up the escutcheon. However, there are eagles borne in other postures, though not so common; all which will be explained under their respective articles. The arms of the emperor of Germany are, Or, a spread eagle with two heads, fable; diademed, langued, beaked, and membered, gules. Some authors express the two heads by the term displayed. The kingdom of Poland bears, Gules, an eagle, argent; crowned and membered, or.

Among the antients, the eagle was held sacred to Jupiter, and on that account placed on his scepter. Philostratus, in his *Themistocles*, says, the Medes and Lacedæmonians took it for their ensign of royalty; and it is well known that the Romans had the greatest respect for it, looking upon it as the talisman of their state, and taking it for their principal ensign. It was either of gold or silver, borne single on the point of a pike, till the time of Constantine, when the empire being divided into the eastern and western, the eagle was afterwards represented with two heads.

**EAGLE**, *aquila*, in astronomy. See the article **AQUILA**.

**EAGLE**, in architecture, a figure of that bird antiently used as an attribute of Jupiter, in the capitals and friezes of the columns of the temples consecrated to that god.

**EAGLE-FLOWER**, a name sometimes given to the balsamina. See **BALSAMINA**.

**EAGLE-OWL**, the same with the **bubo**, or great horned owl. See **BUBO**.

**EAGLE-STONE**, **ÆTITES**, in natural history. See the article **ÆTITES**.

**Black EAGLE**, an order of knighthood, instituted by the elector of Brandenburg, in 1701, on his being crowned king of Prussia.

The knights of this order wear an orange-coloured ribband, suspending a black eagle.

**White EAGLE**, a like order in Poland, instituted in 1325, by Uladislaus V, on occasion of the marriage of his son Casimir to the daughter of the great duke of Lithuania.

The knights of this order wear a chain of gold, suspending a silver eagle, crowned.

**White EAGLE** is also a term used by chemists for mercurius dulcis.

**Sea-EAGLE**, *aquila marina*, a fish of the ray kind. See the article **RAIA**.

**EAGLET**, a diminutive of eagle, properly signifying a young eagle. In heraldry, when there are several eagles on the same escutcheon, they are termed eaglets.

**EALDERMAN**, or **EALDORMAN**, the same with alderman. See **ALDERMAN**.

**EAR**, *auris*, in anatomy, the organ of hearing. See **HEARING**.

Anatomists divide the ear into three parts, the exterior, the middle, and the interior. The exterior part is called simply the auricle, but more properly *auris externa*. In this there are a great many eminences and cavities; as, the pinna and lobule; the helix and anthelix; and the tragus and antitragus; the scapha, which is a cavity between the helix and the anthelix behind; and the concha, which is a larger cavity, situated before the meatus auditorius, or passage into the internal ear: here are to be observed the glandulæ sebaceæ of Valsalva, which are mere cutaneous follicles: their substance is composed of the common integuments and a cartilage.

The muscles of the external ear are in human subjects very small, often scarce discernible; however, sometimes two, three, or more of them may be distinguished. These, from their situation, may be called the superior, the posterior, and the anterior. Their use in moving the ear is none at all, or very inconsiderable; their real use, as is supposed,

is to render the ear tense, when we would hear more distinctly. The course of the meatus auditorius is tortuous and oblique, turning chiefly towards the anterior parts. Its substance is partly bony, and partly cartilaginous: it is covered with an elastic membrane: the membrane investing its internal part is continuous with the cutis. In the convex part of this membrane, about the middle of the passage, are situated certain small glands, of a yellow colour, called glandulæ ceruminosæ: they serve to secrete the cerumen, which they deposit for various purposes in the passage.

The use of the external ear is to receive and convey sounds in the manner of an acoustic tube, in order to our hearing them more distinctly.

The middle part of the ear is called the tympanum: in this we are to observe the membrana tympani, which is situated at the extremity of the auditory passage. Its situation is very oblique inwards; its figure elliptic, and its surface concave. It is connected in its circumference with a ring of a bony substance in infants, which becomes afterwards transformed into the auditory passage, and in the middle it is connected with the little bone, called the malleus. Its substance is membranaceous, composed of two or three lamellæ, and is furnished with a vast number of blood-vessels.

Some authors mention a natural foramen, very small, and placed in an oblique direction, penetrating this membrane, and letting the smoke of tobacco, taken in at the mouth, find a passage thro' it out at the ears. The bony cavity of the tympanum is much smaller in human subjects than in quadrupeds. In this cavity are to be observed the periosteum, which is very thin, and furnished with a great number of blood-vessels; the chorda tympani, being a little nerve composed by a combination of ramuli, or little branches of the fifth and seventh pairs: this is extended in the manner of a cord, under the membrane of the tympanum. Here may be observed the three ossicula auditus, covered with the periosteum; these are called the malleus, the incus, and the stapes. The manubrium, or handle of the malleus, adheres to the membrane of the tympanum, and its head is articulated by a ginglymus with the body of the incus; and, finally, the longer leg of this is articulated, by arthrodia, with the head

head of the stapes : the stapes also, at its base, adheres to the fenestra ovalis, by means of a membrane.

The muscles of the malleus are two, an external and internal : the stapes has but one. The two fenestræ, or openings, are distinguished by the oval and the round ; the fenestra ovalis leads to the vestibule, on which stands the stapes ; the fenestra rotunda leads to the cochlea, and is closed by a membrane.

Besides the fenestræ, there are two other foramina, the one of these opens into the tube or duct of Eustachius, and terminates in the mouth, almost immediately behind the tonsils : this duct is partly bony, partly cartilaginous, and partly membranous, affording a communication between the mouth and the ears : the other of these foramina goes to the cellulæ of the mastoide processes. The third division, or the inner part of the ear, is generally termed the labyrinth : here are to be observed the vestibulum, being a cavity that forms the middle part of the labyrinth : the passage into this is the fenestra ovalis ; after which may be observed the three semicircular canals, distinguished by the names of the largest, the middle one, and the least, which open by five orifices into the vestibulum. The cochlea of the ear is placed opposite to these canals, and is in the manner of a snail-shell, forming two turns and a half in a spiral form. In this are to be remarked the nucleus and the canal, which is divided into two, by a spiral lamina : the upper of these opens into the vestibulum, and is called the scala vestibuli, and the lower, which terminates in the hollow of the tympanum, through the fenestra rotunda, is called scala tympani.

A very delicate and fine membrane carried along through the cavities of the labyrinth, is formed of an expansion of the auditory nerve, and is the primary part of the organ of hearing, just as the retina is formed of the expansion of the optic nerve, and is the primary organ of seeing. Next may be observed the auditory canal, which is distinguished into the common and proper ; the common is large, and has foramina in it, passing into the labyrinth ; the proper one is narrow and longer, terminating partly in the cavity of the cranium, and partly between the styloide and mastoide processes.

The nerves of the inner ear are, 1. from the auditory pair. 2. from the third pair of the vertebrals of the neck, but these are principally sent to the external ear. The arteries are from the carotids, both external and internal ; the veins run partly to the juglars, and partly to the sinuses of the dura mater.

**EAR-ACH**, a grievous pain in the auditory passage, proceeding from a sharp extravasated serum, affecting the nervous membrane which covers the meatus auditorius.

When this matter is translated to the external part, then the ear-ach arises, which, unless speedily appeased, may cost the patient his life.

The principal scope is to ease the pain, which may be done with nitrous and cinnabarine powders, and with emulsions of the greater cold seeds : but if these are ineffectual, recourse must be had to opiates, such as styraç pills, or the bare tincture. Outwardly lay a plaster to the temple of the affected side, composed of mastic, galbanum, saffron, expressed oil of nutmegs, and opium. Afterwards let the ear be held over the vapour of milk, with the fragrant and emollient spices : the smoke of tobacco, blown into the ear, is of great efficacy ; as also an infusion of millepedes in sallad oil.

**Closed meatus auditorius**. Sometimes the meatus auditorius is from the birth closed with a membrane, differing in degrees of thickness ; sometimes immediately after the birth, and sometimes a considerable while after. When this membrane closes the external ear, the faculty of hearing may be restored by making a cruciform incision in the occluding membrane, and keeping the passage open for some time with lint, or a tent ; but when the said membrane is seated very deep, it is best to divide it by a transverse or longitudinal incision, taking care that you do not at the same time wound the membrane of the tympanum which in infants is not seated so deep in the ear as in adults.

**Tubercles in the meatus auditorius**. Tubercles or fleshy excrescences in the auditory passage of the ears give great uneasiness, and do partly, if not wholly, obstruct the hearing. When they are not of long standing, they may be removed with escharotics ; or, as these are dangerous when they touch the membrane of the

tympanum, they may be extirpated by the scissars, or scalpel, when they are not seated too low in the ear. Lastly, it appears from the observations of Hildanus, (cent. iii. obs. 1.) and Purmannus, (chirurg. pag. 280.) that these tubercles may be frequently removed with success by ligature.

For other disorders of the ear, and for the method of extracting extraneous bodies fallen into it, see the articles **DEAFNESS**, **TINNITUS**, &c. and the article **EXTRACTION**.

**EAR**, among gardeners, a name given to the leaves that first appear from the seed, which differ considerably from other leaves. See the article **LEAF**.

**EAR-PICK**, an instrument of ivory, silver, or other metal, somewhat in form of a probe, for cleaning the ear.

The Chinese have a variety of these instruments, with which they are mighty fond of tickling their ears; but this practice, as Sir Hans Sloane judiciously observes, must be very prejudicial to so delicate an organ, by bringing too great a flow of humours on it.

**EAR-SHELL**, *auris marina*. See the article **AURIS**.

Small pearls are sometimes found in these shells, whereof there are several species. See the article **PEARL**.

**EAR-WIG**, *forficula*, in zoology. See the article **FORFICULA**.

**EARING**, in the sea-language, is that part of the bolt-rope which at the four corners of the sail is left open, in the shape of a ring. The two uppermost parts are put over the ends of the yard arms, and so the sail is made fast to the yard; and into the lowermost earings, the sheets and tacks are seized or bent at the clew.

**EARL**, a british title of nobility, next below a marquis, and above a viscount. Earls were antiently called *comites*, because they were wont *comitari regem* to wait upon the king for council and advice. The Germans call them *graves*, as landgrave, margrave, palgrave, rheingrave; the Saxons ealdormen, unless that title might be more properly applied to our dukes; the Danes, eorlas; and the English, earls. The title, originally, died with the man. William the conqueror first made it hereditary, giving it in fee to his nobles, and allotting them for the support of their state the third penny out of the sheriff's court, issuing out of all pleas of the shire whence they had

their title. But now the matter is quite otherwise; for whereas heretofore *comes* and *comitatus* were correlatives, and there was no comes or earl, but had a county or shire for his earldom, of latter years the number of earls increasing, and no more counties being left, divers have made choice of some eminent part of a county, as Lindsey, Holland, Cleveland, &c. some of a lesser part, as Stafford, &c. others have chosen for their title some eminent town, as Marlborough, Exeter, Bristol, &c. and some have taken for their title the name of a small village: their own seat or park, as Godolphin, Clarendon, &c. An earl is created by cincture of sword, mantle of state put upon him by the king himself, a cap and a coronet put upon his head, and a charter in his hand. All the earls of England are denominated from some shire, town or place, except three; two of whom, *viz.* earl Rivers, and earl Paulet, take their denomination from illustrious families: the third is not only honorary, as all the rest, but also officary, as the earl marshal of England.

**EARL marshal of England**, is a great officer who had antiently several courts under his jurisdiction, as the court of chivalry, and the court of honour. Under him is also the herald's office or college of arms. He hath some pre-eminence in the court of Marshalsea, where he may sit in judgment against those who offend within the verge of the king's court. This office is of great antiquity in England, and antiently of greater power than now; and has been for several ages hereditary in the most noble family of Howard.

**EARNEST**, *arrhe*, money advanced to bind the parties to the performance of a verbal bargain. By the civil law, he who recedes from his bargain loses his earnest, and if the person who received the earnest give back, he is to return the earnest double. But with us, the person who gave it, is in strictness obliged to abide by his bargain; and in case he decline it, is not discharged upon forfeiting his earnest, but may be sued for the whole money stipulated.

**EARTH**, *terra*, in physiology, a fossile, or terrestrial matter, whereof our globe partly consists.

Earths are either simple or compound. The simple earths are friable, opaque, insipid bodies, not inflammable, vitri-fiable,

fiable by extreme heat, diffusible in water, and separable from it by filtration. Of these we have five genera or kinds, *viz.* boles, clays, marles, ochres, and tripelas. See **BOLES**, **CLAYS**, **MARLES**, &c.

The compound earths are composed of argillaceous or marley particles separated and divided by adventitious matter, and never free from these mixtures, or in the state of pure earths. Of these we have four genera, two of loams, *viz.* thraustomicthes, and glischromicthes; and two of moulds, *viz.* thruptomicthes, and gloromicthes. See the articles **LOAMS**, **MOULDS**, **THRAUSTOMICHTHES**, **THRUPTOMICHTHES**, &c.

Besides these earths, there are frequently found in digging a kind of terræ miscellanæ, of no determinate species, nor to be known by any peculiar name, being composed of masses of different sizes, of different species of earths, broken off from their strata, soon after their formation, and blended together at the time of the original subsidence of the strata. As for chian, eretrian, lemnian, and maltese earths, together with all the sealed earths which are the subjects of the materia medica. See the articles **BOLE**, **CLAY**, **MARL**, &c.

**EARTH**, in gardening and husbandry, if good, should be of a blackish colour, gravelly, fat, pliant, or easy to be digged; it should be neither cold nor light, it ought to have no ill smell or taste, and it should be of the same quality three or four feet deep for trees, which if they have not that depth, will languish and decay after they have been planted six years. Fruit trees will thrive in a less depth, and they generally produce the most generous fruits, when their roots spread near the surface of the earth.

Husbandmen call that new earth which lying three or more feet deep, never served to the nourishment of any plant; or earth that has been a long time built upon, though it had formerly bore; earth likewise of a sandy loamy nature, where cattle have been a long time fed, may be accounted such, and be of excellent use for most sorts of plants, especially if it has been thrown up in heaps to grow richer.

**EARTH**, in chemistry, is used for a principle or element, in the composition of bodies, entering them either as an ingredient, or giving them a power of performing various operations in nature and art. It is a body, as having three dimensions

impenetrability, figurability, and its own particular gravity. In weight it exceeds water, salts, and the spirits of animals and vegetables. When pure, or perfectly separated from other bodies, it is consistent, hard, and fine, though brittle with regard to our senses, and easily reducible by trituration into a certain powder, in which respect it differs from the true metals and gems; though still more in this, that it remains fixed and unchanged in the most violent fire, even so far as not to flow therein.

Boerhaave says, he never could obtain elementary earth from metals, but it may be obtained from water, from calcined vegetables, from smoak and soot, from putrified animals, from distilled animal fluids, from fossile salts, and from fluid and solid sulphurs. Whence he concludes, that the same simple elementary earth contributes as a constituent principle to form the particular corporeal fabric of animals, vegetables, and some fossils of a less permanent and less simple nature, and in them all serves as a firm basis to their form, whilst it unites the other principles to itself, and to one another, so as to constitute one determinate individual. Hence also, says he, the property of assimilating other substances into the nature of every body that receives nutriment, and consequently the seminal property of producing their like, is principally owing to the efficacy of this earth; for their properties no longer remain after the particular texture depending principally upon the earth is destroyed, or wanting in any body.

**EARTH**, in astronomy and geography, one of the primary planets, being this teraqueous globe whereon we inhabit.

*Figure of the EARTH* was accounted by some of the antients to be like that of an oblong cylinder; by others, of the form of a drum, and by others to be flat. The moderns demonstrate it to be nearly spherical from the following, among other considerations. 1. All the appearances of the heavens, both at land and at sea, are the same as they would be if the earth were a globe. 2. In eclipses of the moon which are caused by the shadow of the earth falling upon the moon, this shadow is always circular, and a body can be no other than a globe, which in all situations casts a circular shadow. 3. Several navigators have sailed quite round the globe, steering their course directly south and west till they came to the

magellanic sea, and from thence to the north and west, till they returned to their port from the east; and all the phenomena which should naturally arise from the earth's rotundity, happened to them. Besides, their method of sailing was also founded upon this hypothesis, which could never have succeeded so happily, if the earth had been of any other figure. It is true, the surface of the earth is not an exact geometrical globe, but then the inequalities are so inconsiderable, that the highest mountain bears no greater proportion to the bulk of the earth, than a grain of dust does to a common globe. The figure of the earth then was reckoned by mathematicians and geographers as perfectly spherical, excepting the small inequalities in its surface, of mountains and vallies, till an accident engaged the attention of Sir Isaac Newton, and Mr. Huygens, who demonstrated from the laws of hydrostatics, and the revolution of the earth about its axis, that its figure was not a true sphere, but an oblate spheroid flattened towards the poles. Monsieur Richer, when at the island of Cayenne, about five degrees distant from the equator, found that his clock, which at Paris kept true time, now lost two minutes and twenty-eight seconds every day. Now, though heat will lengthen pendulums, and consequently retard their motion, it is certain the heats of Cayenne were not sufficient to solve this phenomenon, which can flow only from a diminution in the pressure of gravity. For, as the earth revolves about its axis, all its parts will endeavour to recede from the axis of motion, and thereby the equatorial parts where the motion is quickest will tend less towards the center than the rest; their endeavour to fly off from the axis about which they revolve, taking off part of their tendency that way; so that those parts will become lighter than such as are nearer the poles. The polar parts, therefore, will press in towards the center, and raise the equatorial parts, till the quantity of matter in the latter is so far increased as to compensate for its lightness, and an equilibrium be restored. On which account, the form which the earth assumes will be that of an oblate spheroid, whose shorter axis passes thro' the poles. By virtue only of the rotation of the earth about its axis, the weight of bodies at the equator is less than at

the poles, in the proportion of 288 to 289. From hence arises, as before observed, a spheroidal form of the earth, and from that spheroidal form arises another diminution of gravity at the equator, by which, if the earth were homogeneous throughout, bodies at the equator would lose one pound in 1121, and so on both accounts taken together, the gravity of bodies at the poles would be to the same at the equator as 230 to 229. From whence, if we suppose the gravity of bodies within the earth to be directly as their distance from the center, those numbers will also express the relation between its polar and equatorial diameter. This is upon a supposition that the earth was at first fluid, or a chaos, having its solid and fluid parts confusedly mixed together; but if we suppose it at first partly fluid and partly dry, as it now is, since we find that the land is very nearly of the same figure with the sea, except raised a little to prevent its being overflowed, the earth must still be of the same form; for otherwise the major part of the water would flow towards the equator, and spread itself like an inundation over all the land in those parts. This theory met with great opposition from Monsieur Cassini, who having measured the meridian of France, declared (with great reason likewise if the observations had been correct) that the earth, instead of being flattened, was lengthened towards the poles, that is, instead of being an oblate, it was an oblong spheroid, higher at the poles by about ninety-five miles. So wide a difference, between philosophers of so high rank, determined at length the king of France, at an expence becoming a monarch, to employ two companies of mathematicians, the one to measure the length of a degree of the meridian at the equator, and the other the length of a degree at the polar circle, that by comparing them together, and with the length of the degree of France, it might be known whether the earth were oblong or flat towards the poles.

It is certain, if the lengths of the degrees of latitude decrease, as we go from the equator towards the poles, than the axis is greater, and the figure an oblong spheroid; but on the contrary, if these lengths increase, as you remove towards the poles, the axis is less than a diameter at the equator, and consequently the figure an oblate spheroid.

This

This last appears, by the respective mensurations of these mathematicians (as it did before by the theory of Sir Isaac Newton) to be the true figure; the result of their operations, which were performed with a surprising degree of exactness, being as follows. The measure of a degree of the meridian in the latitude of  $66^{\circ} 20'$ , was found to be 57437  $\frac{2}{5}$  toises, and in the latitude of  $49^{\circ} 21'$  only 57183 toises; for the observations of Mr. Cassini have been corrected by some gentlemen of the french academy, since the return of the academicians from the north. Now supposing those degrees accurately measured, the axis or diameter that passes through the poles will be to the diameter of the equator, as 177 to 178, and hence the earth will be twenty-two miles higher at the equator than at the poles. The length of a degree of the meridian under the equator, was found to be 56767 toises, and by reducing it to the level of the sea, 56746 toises. But as the heat must needs have produced some variation in the length of the toise that was used, when this correction is made, the length of a degree was found to be 56753 toises, and the ratio of the axis of the earth to the diameter of the equator, that of 178 to 179; whence it follows that the earth is oblate, or flated a 179th part towards the poles. Hence the length of the degrees of the meridian in any latitude are determined, for which we refer to the article DEGREE. If any one is desirous of being informed of the methods observed in performing these mensurations at the equator, and the arctic circle, let him consult Mr. Maupertuis's figure of the earth determined, with Mr. Murdoch's translation, and the book lately published by Mr. Bouguer and Condamine.

*Density of the EARTH.* See *quantity of matter in the EARTH*, infra.

*Geographical divisions of the EARTH*, comprehend, 1. Its natural divisions, as continent, island, peninsula, ocean, lake, gulph, &c. 2. Its political divisions, as empire, kingdom, province, city, Germany, Britain, Middlesex, London, &c. 3. The ecclesiastical divisions, as archbishopric, diocese, parish, &c. See the articles CONTINENT, ISLAND, &c.

*Magnetism of the EARTH.* Dr. Knight thinks the earth may be considered as a great loadstone, whose magnetical parts are disposed in a very irregular manner,

and that the south pole of the earth is analogous to the north pole in magnets; that is, the pole by which the magnetical stream enters. He observes, that the earth might become magnetical by the iron-ores it contains, and notwithstanding it might have remained unmagnetical, unless some cause had existed capable of making that repellent matter producing magnetism move in a stream thro' the earth, yet he thinks that such a cause does really exist. For if the earth revolves round the sun in an ellipsis, and the south pole of the earth is directed towards the sun at the time of its descent, a stream of repellent matter will thereby be made to enter at the south pole, and come out at the north. And he suggests, that the earth's being in its perihelion in the winter, may be one reason why magnetism is stronger in this season than in summer. Hence also the doctor thinks it probable, that the earth's magnetism has been improving since the creation, and that this may be one reason why the use of the compass was not discovered sooner. See the article MAGNET.

*Motion of the EARTH.* The earth has a triple motion. 1. A *diurnal motion* round its own axis, from west to east, in twenty-four hours, which occasions the perpetual succession of days and nights. It is agreeable to reason that the earth should revolve about its axis to account for the appearance of such a vast number of stars which seem to perform their revolutions round the earth in twenty-four hours; for the motion of these stars, were it real, would be incredibly swift and beyond all imagination, because their distance in respect of us, is almost infinite, and the orbit they have to run round so prodigiously great, that they must move at least 100,000 miles in a minute. See the articles DIURNAL and COPERNICAN System.

2. An *annual motion* round the sun in a year, which produces the different seasons, and the lengthening and shortening of days. We have, under the article COPERNICAN System, demonstrated that the earth moves round the sun: we shall here explain the phenomena that arise from that motion, in conjunction with the rotation round its axis, having first premised that the earth in its annual motion has its axis always in the same direction, or parallel to itself. See the article PARALLELISM.

Suppose

Suppose  $\varphi$   $\varphi$   $\varphi$   $\varphi$  (plate LXXXII. fig. 1.) the earth's orbit, and S the sun. Thro' the center of the sun draw the right line  $\varphi$  S  $\varphi$  parallel to the common section of the equator and the ecliptic, which will meet with the ecliptic in two points  $\varphi$   $\varphi$ . And when the earth seen from the sun is in either of the points  $\varphi$  or  $\varphi$ , a right line S  $\varphi$  or S  $\varphi$ , joining the center of the earth and sun, will coincide with the common section of the equator and ecliptic, and will then be perpendicular to AB, the axis of the earth, or of the equator, because it is in the plane of the equator. But the same line is also perpendicular to the circle which bounds the light and darkness, and therefore the axis of the earth will be in the plane of that circle, which will therefore pass through the poles of the earth, and will cut the equator and all its parallels into equal parts. When the earth, therefore, is in the beginning of  $\varphi$ , the sun will be seen in  $\varphi$ , in the common section of the equator and ecliptic, in which position, the circle of illumination touches both poles; the sun is vertical to the equator, and the days and nights are equal all the world over: and this will be the spring season, or vernal equinox. See the article EQUINOX.

The earth in its annual motion going through  $\varphi$ ,  $\varphi$ , and  $\varphi$  towards  $\varphi$ , and the common section of the equator and the ecliptic remaining always parallel to itself, it will no longer pass through the body of the sun; but, in  $\varphi$ , it makes a right angle with the line SP, which joins the centers of the sun and earth. And because the line SP is not in the plane of the equator, but in that of the ecliptic, the angle BPS, which the axis of the earth BA makes with it, will not now be a right angle, but an oblique one of  $66\frac{1}{2}$  degrees, which is the same with the inclination of the axis to the plane of the ecliptic. Let the angle SPL be a right angle, and the circle bounding light and darkness, will pass through the point L, and then the arch BL, or the angle BPL, will be  $23\frac{1}{2}$  degrees, that is, equal to the complement of the angle BPS to a right angle. Let the angle BPE be a right angle, and then the line PE will be in the plane of the equator. Therefore, because the arches BE and LT are equal, each of them being quadrants; if the common arch

BT be taken away, there will remain TE equal to LB, equal to  $23\frac{1}{2}$  degrees. Take EM equal to ET, and through the points M and T describe two parallel circles TC, MN; the one represents the tropic of cancer, and the other the tropic of capricorn. And the earth being in this situation, the sun will approach the nearest that it can come to the north pole: he will shine perpendicularly on the point T, and consequently will be vertical to all the inhabitants under the tropic of cancer, when he comes to their meridians. It is manifest that the circle which bounds light and darkness, reaches beyond the north pole B to L; but towards the south it falls short to the south pole A, and reaches no further than F. Through L and F, let two parallels to the equator be described. These will represent the polar circles, and while the earth is in P, all that tract of it which is included within the polar circle KL continues in the light, notwithstanding the constant revolution round the axis. On the contrary, those that lye within the antarctic circle remain in continual darkness. Besides, it is also manifest, that all the parallels between the equator and the arctic circle, are cut by the circle bounding light and darkness into unequal portions, the largest portions of these circles remaining in the light, and the smallest in darkness; but these parallels which are towards the antarctic circle have their greatest portions in darkness, and their least in light; and the difference of these portions will be greater or less, according as the circles are nearer to the pole, or to the equator. Therefore, when the sun is seen in cancer  $\varphi$ , the inhabitants of the northern hemisphere will have their days at the longest, and their nights at the shortest, and the season of the year will be summer. The contrary of this will happen to the inhabitants of the southern hemisphere. As the earth moves on from  $\varphi$  by  $\varphi$ ,  $\varphi$ , the north pole returns, the diurnal arches begin gradually to decrease, and the nocturnal to increase, and of consequence, the sun's rays will fall more and more obliquely, and his heat proportionably diminishes, till the earth comes to  $\varphi$ , when the sun will appear in  $\varphi$ , at which time, the days will again be equal to the nights to all the inhabitants of the earth, the circle bounding light

Fig. 2. ECHINOPS, GLOVE-THISTLE.

Fig. 3. ECHIUM, VIPER'S BUGLOSS.

Fig. 4. ECHO.

light and darkness passing, in this position, through the poles. This will be the season called autumn.

The earth moving on through  $\gamma$   $\delta$  and  $\Pi$ , the sun will be seen to go in the ecliptic through  $\alpha$   $\eta$  and  $\delta$ , and will appear to decline from the equator, towards the south, so that when the earth is really in  $\alpha$ , the sun will appear in  $\delta$ . And whereas the axis AB always retains its parallelism, the earth will have the same position and aspect in respect to the sun, that it had when it was in  $\delta$ ; but with this difference, that when the tract within the polar circle KL was in continual light while the earth was in  $\delta$ ; now the earth arriving at  $\alpha$ , that same tract will be altogether in darkness: but the opposite space within the circle FG, will be in a continual illumination, and at the pole A there will be no night for the space of six months. Here likewise of the parallels between the equator and the north pole, the illuminated portions are much less than the portions which remain in darkness, the contrary of which happened in the former position, so likewise the sun at mid-day will appear vertical to all the inhabitants that live in the tropic MN; so that it will appear to have descended towards the south from the parallel TC, to the parallel MN, through the arch CQN, which is forty-seven degrees. This will be the season called winter.

Lastly, as the earth journeys on from cancer through  $\Omega$  and  $\mu$  to  $\alpha$ , the sun appears to pass through  $\omega$  and  $\chi$  to  $\gamma$ , and the northern climes begin to return, and receive more directly the enlivening beams of the sun, whose meridian height does now each day increase; the days now lengthen, and the tedious nights contract their respective arches; and every thing conspires to advance the delightful season of the spring, with the equality of days and nights, as was shewn when the earth was in libra, from which point we began to trace its motion. *Keill.*

By the third motion of the earth, we mean that motion by which the poles of the world revolve about the poles of the ecliptic, and occasion what is commonly called the precession of the equinoxes, or more properly, the retrogression of the earth's nodes. See the article PRECESSION of the equinoxes.

As to the velocity of the earth's motion, and the figure and time in which it performs a revolution round the sun. See the articles PERIOD and ORBIT.

*Quantity of matter in the EARTH.* This arduous problem can only be solved by the principles of gravitation. We know the force of gravity towards our earth by the descent of heavy bodies, or by calculating how much the moon falls below the tangent of her orbit: also by computing, from their motions, how much a primary planet falls below its tangent in a given time, and how much any of Jupiter's and Saturn's satellites fall below their tangents in the same time, we are able to determine the proportion which the gravity of a primary planet to the sun, and of a satellite towards its primary, bears to the gravity of the moon towards the earth, in their respective distances. Then, from the general law of the variation of gravity, the forces that would act upon them at equal distances from the sun, Jupiter, Saturn, and the earth are computed; which give the proportion of the quantities of matter contained in these different bodies; that is, if we suppose the matter of the sun to be 1, the quantities of matter in Jupiter, Saturn, and the earth will be respectively  $\frac{1}{1067}$ ,  $\frac{1}{3021}$ ,

$\frac{1}{189237}$ . *Maclaurin.*

The quantities of matter in these bodies being thus determined, and their bulk being known from astronomical observations, it is easy to compute their different densities. Thus, the densities of the sun, Jupiter, Saturn, and the earth have been computed to be respectively as the numbers 100,  $94\frac{1}{2}$ , 67, and 400.

*Theory of the EARTH.* The earth in its natural and original state Des Cartes, Burnet, Woodward, and Whiston, suppose to have been perfectly round, smooth, and equable; and they account for its present rude and irregular form principally from the great deluge. See the article DELUGE.

Mr. de Bufon arguing from the spheroidal figure of the earth, and the laws of hydrostatics, supposes that the earth, as well as the other planets, are parts struck off from the body of the sun by the collision of comets, and consequently, when the earth assumed its form, it was in a state of liquefaction by fire. Of this, says he, we will be the more easily convinced, when we consider the nature of the

the matter contained in the body of the earth, the greatest part of which, as sand and clays, are vitrified, or vitrifiable substances; and, on the other hand, when we reflect upon the impossibility of the earth's being ever in a state of fluidity produced by water, since there is infinitely more land than water; and, besides, water has not the power of dissolving sand, stones, and other substances of which the earth is composed. How far the inequalities in the face of the earth, the beds of rivers, lakes, &c. and the various strata in its internal parts, serve to confirm this hypothesis, may be seen in *Histoire Naturelle*, &c. tom. 1. by M. de Bufon, and in the articles MOUNTAIN, RIVER, STRATA, &c.

*Latitude of the EARTH.* See LATITUDE.

*Longitude of the EARTH.* See LONGITUDE.

EARTH-BAGS, *sacs a terre*, in fortification.

See the article SAND-BAGS.

EARTHING, in agriculture and gardening, signifies the covering of shrubs and plants, as vines, celery, &c. with earth.

EARTHQUAKE, in natural-history, a violent agitation or trembling of some considerable part of the earth, generally attended with a terrible noise like thunder, and sometimes with an eruption of fire, water, wind, &c.

*Causes of EARTHQUAKES.* Earthquakes and vulcanos are both produced from the same cause, which may be thus explained. Those countries which yield great store of sulphur and nitre, or where sulphur is sublimed from the pyrites, are by far the most injured and incommoded by earthquakes; for where there are such mines, they must send up exhalations, which meeting with subterraneous caverns, must stick to the arches of them, as soot does to the sides of our chimnies; where they mix themselves with the nitre or saltpetre which comes out of these arches, in like manner as we see it come out of the inside of the arch of a bridge, and so makes a kind of crust which will very easily take fire.

There are several ways by which this crust may take fire, *viz.* 1. By the inflammable breath of the pyrites, which is a kind of sulphur that naturally takes fire of itself. 2. By a fermentation of vapours to a degree of heat, equal to that of fire and flame. 3. By the falling of some great stone which is undermined by water, and striking against another, produces some sparks that set fire to the neighbouring combustible matter, which

being a kind of natural gunpowder, at the appulse of the fire goes off with a sudden blast or violent explosion, rumbling in the bowels of the earth, and lifting up the ground above it, so as sometimes to make miserable havock and devastation, till it gets vent or a discharge. Burning mountains and vulcanos, are only so many spiracles serving for the discharge of this subterranean fire, when it is thus preternaturally assembled. And where there happens to be such a structure and confirmation of the interior parts of the earth, that the fire may pass freely and without impediment from the caverns therein, it assembles into these spirals, and then readily and easily gets out from time to time without shaking or disturbing the earth. See the article VULCANO.

But where a communication is wanting, or the passages are not sufficiently large and open, so that it cannot come at the said spiracles without first forcing and removing all obstacles, it heaves up and shocks the earth, till it hath made its way to the mouth of the vulcano; where it rusheth forth, sometimes in mighty flames, with great velocity, and a terrible bellowing noise. Earthquakes are sometimes confined to a narrow space, which is properly the effect of the re-action of the fire; and they shake the earth just as the explosion of a powder-magazine causes a sensible concussion at the distance of several leagues. Thus a violent eruption of Etna, will cause an earthquake over all the island of Sicily; but it will never extend to the distance of three or four hundred leagues. In like manner, when some new vents of fire have been formed in mount Vesuvius, there are felt at the same time earthquakes at Naples, and in the neighbourhood of the vulcano; but these concussions have never shaken the Alps, nor been communicated to France, or other countries remote from Vesuvius.

Sometimes they are felt at considerable distances, and shake a long tract of ground without any eruption or vulcano appearing. We have instances of earthquakes which were felt at the same time in England, France, Germany, and even in Hungary, and these extend always a great deal more in length than in breadth; they shake a tract of ground with more or less violence in different places, in proportion as it is remote from the fire; and they are almost always accompanied with a dull noise like that of a heavy carriage rolling along with great rapidity.

See

See Phil. Tr. n° 157. Woodward's Essay, and M. de Buffon's Hist. Nat. &c.

**Dreadful effects of EARTHQUAKES.** Catania, a city of Sicily, which was almost totally destroyed in the year 1693, is a melancholy instance of the dreadful effects of earthquakes. The shock was not only felt all over Sicily, but likewise in Naples and Malta; and it was so violent, that people could not stand upon their legs; and those who lay on the ground, were tossed from side to side, as if on a rolling billow. The earth opened in several places, throwing up large quantities of water; and great numbers perished in their houses by the fall of rocks that were rent from the mountains. The sea was violently agitated, and roared dreadfully: mount Etna threw up vast spires of flame, and the shock was attended with a noise exceeding the lowdest claps of thunder. Fifty-four cities and towns, with an incredible number of villages, were either destroyed or greatly damaged; and it was computed that near 60,000 persons perished in different parts of the island, of whom 18,000 were inhabitants of Catania. In 1746, the city of Lima, and port of Callao in Peru, suffered prodigiously from an earthquake. All the buildings of Callao, except one tower, were sunk in the sea, and consequently all the inhabitants drowned: of five and twenty ships that were in the port, four were carried a league up the country, and the rest swallowed up by the waves. At Lima, which is a pretty large city, only seven and twenty houses remained standing: a great number of people were crushed to death, especially monks and nuns, because their monasteries were higher, and built of more solid materials than the other houses. The shock lasted fifteen minutes. See an account of a terrible earthquake that happened at Jamaica in 1692, in Phil. Tr. n° 209, and an account of other earthquakes in n° 462, 463. See also Buffon's Hist. Nat. tom. 1.

**EASE**, among sailors. See **EASING**.

**EASEL-PIECES**, a denomination given by painters to such pieces as are contained in frames, in contradistinction from those painted on ceilings, &c.

**EASEMENT**, in law, a privilege or convenience which one neighbour has of another, whether by charter or prescription, without profit: such are a way through his lands, a sink, or the like. These, in many cases, may be claimed.

**EASING**, in the sea-language, signifies the

slackening a rope, or the like: thus, to ease the bow-line or sheet, is to let them go slack; to ease the helm, is to let the ship go more large, more before the wind, or more larboard.

**EASLOW**, a borough of Cornwall, twenty-two miles south of Launceston, which sends two members to parliament.

**EAST**, one of the four cardinal points of the world; being that point of the horizon, where the sun is seen to rise when in the equinoctial. See **COMPASS**, **HORIZON**, **EQUINOCTIAL**, &c.

**EAST** is also frequently compounded with other words, as east-indies, east-dial, east-wind, &c. to signify their being situated towards the east. See the articles **INDIES**, **DIAL**, **WIND**, &c.

**EASTER**, a festival of the christian church, observed in memory of our Saviour's resurrection.

The Greeks call it *πασχα*, the Latins, *pascha*, an hebrew word signifying *passage*, applied to the jewish feast of the passover, to which the christian festival of easter corresponds. It is called easter in the English, from the goddess Eostre, worshiped by the Saxons with peculiar ceremonies in the month of April. See the article **PASSOVER**.

The observation of this festival, is as ancient as the very time of the apostles. In the primitive ages of the church, there were very great disputes about the particular time when this festival was to be kept. The asiatic churches kept their easter upon the very same day the Jews observed their passover; and others, on the first Sunday after the first full moon in the new year. This controversy was determined in the council of Nice, when it was ordained that easter should be kept upon one and the same day, which should always be a Sunday in all christian churches throughout the world.

But though the christian churches differed as to the time of celebrating easter, yet they all agreed in shewing particular respect and honour to this festival: hence, in ancient writers, it is distinguished by the name of *dominica gaudii*, i. e. Sunday of joy. On this day prisoners and slaves were set free, and the poor liberally provided for. The eve, or vigil, of this festival was celebrated with more than ordinary pomp, which continued till midnight, it being a tradition of the church that our Saviour rose a little after midnight; but in the east, the vigil lasted till cock-crowing.

It was in conformity to the custom of the Jews, in celebrating their passover on the fourteenth day of the first month, that the primitive fathers ordered that the fourteenth day of the moon, from the calendar new moon, which immediately follows the twenty-first of March, at which time the vernal equinox happened upon that day, should be deemed the paschal full moon, and that the Sunday after should be easter-day; and it is upon this account that our rubric has appointed it upon the first Sunday after the first full moon immediately following the twenty-first day of March. Whence it appears, that the true time for celebrating easter, according to the intention of the council of Nice, was to be the first Sunday after the first full moon following the vernal equinox, or when the sun entered into the first point of aries; and this was pope Gregory's principal view in reforming the calendar, to have easter celebrated according to the intent of the council of Nice. Having first found the epact and dominical letter, according to the method delivered under these articles, easter-day may be found by the two following rules.

1. To find easter-limit, or the day of the paschal full moon, counting from March 1 inclusive, the rule is this: add 6 to the epact, and if this sum exceeds 30, take 30 from it; then from 50 subtract this remainder, and what is left will be the limit; if the sum of the epact, added to 6, does not amount to 30, it must be subtracted from 50, and the remainder is the limit required; which is never to exceed 49, nor fall short of 21.
2. From the limit and dominical letter, to find easter-day: add 4 to the domini-

cal letter; subtract this sum from the limit, and the remainder from the next higher number, which contains 7 without any remainder; lastly, add this remainder to the limit, and their sum will give the number of days from the first of March to easter-day, both inclusive.

Thus, to find easter-day for the year 1754, for instance. First find the epact 6, which added to 6 gives 12; and as this sum does not amount to 30, it must be subtracted from 50, and the remainder 38 is the limit. Then adding 4 to 6, the number of the dominical letter F, subtract this sum, *viz.* 10, from the limit 38, and the remainder 28 from 35, the next superior number that contains 7 a certain number of times without any remainder, and there remains 7, which being added to the limit 38, gives 45 for the number of days from the first of March to easter-day, both inclusive: hence, allowing 31 for March, there remains the 14th of April for easter-day. Here follows the operation at length.

$$6 + 6 = 12$$

$$50 - 12 = 38 = \text{paschal limit}$$

$$\text{Dominical letter F} = 6$$

$$6 + 4 = 10, \text{ and } 38 - 10 = 28; \text{ then}$$

$$35 - 28 = 7. \text{ And}$$

$$38 + 7 = 45; \text{ from which subtracting}$$

$$31, \text{ the number of days in March}$$

$$14 \text{ there remains } 14, \text{ the day of}$$

April answering to easter-day for the year 1754.

However, to save the trouble of calculation, we shall here give a table, by which easter-day may be found by inspection till the year 1900, according to the gregorian or new style.

Golden Number.	Dominical Letters.						
	A.	B.	C.	D.	E.	F.	G.
I. April 16	17	18	19	20	14	18	
II. April 9	3	4	5	6	7	8	
III. March 26	27	28	29	23	24	25	
IV. April 16	17	11	12	13	14	15	
V. April 2	3	4	5	6	March 31	April 1	
VI. April 23	24	25	19	20	21	22	
VII. April 9	10	11	12	13	14	8	
VIII. April 2	3	March 28	29	30	31	April 1	
IX. April 16	17	18	19	20	21	22	
X. April 9	10	11	5	6	7	8	
XI. March 26	27	28	29	30	31	25	
XII. April 16	17	18	19	13	14	15	
XIII. April 2	3	4	5	6	7	8	
XIV. March 26	27	28	22	23	24	25	
XV. April 16	10	11	12	13	14	15	
XVI. April 2	3	4	5	March 30	31	April 1	
XVII. April 23	24	18	19	20	21	22	
XVIII. April 9	10	11	12	13	7	8	
XIX. April 2	March 27	28	29	30	31	April 1	

As to the use of this table, easter-day will be found in the common angle of meeting of the given dominical letter and the golden number; the name of the month lying in a direct line with it, towards the left hand.

**EASTERN**, an appellation given to whatever relates to the east: thus we say, eastern amplitude, eastern church, &c. See **AMPLITUDE**, **CHURCH**, &c.

**EATON**, a town of Buckinghamshire, situated on the north side of the Thames, opposite to Windsor, and famous for its collegial school founded by king Henry VI. being a seminary for king's college Cambridge, the fellows of which are all from this school.

**EAVES**, in architecture, the margin or edge of the roof of an house; being the lowest tiles, slates, or the like, that hang over the walls, to throw off water to a distance from the wall. See the articles **WALL** and **ROOF**.

**EAVES-LATH**, a thick feather-edged board, generally nailed round the eaves of a house for the lowermost tiles, slates, or shingles to rest on.

**EBBING** of the tides. See **TIDE**.

**EBDOMARIUS**, in ecclesiastical writers, an officer formerly appointed weekly to superintend the performance of divine service in cathedrals, and prescribe the duties of each person attending in the choir, as to reading, singing, praying, &c.

**EBENUS**, the **EBONY-TREE**. See the article **EBONY**.

**EBIONITES**, in church-history, heretics of the first century, so called from their leader Ebion.

They held the same errors with the Nazareens, united the ceremonies of the mosaic institution with the precepts of the gospel, observed both the Jewish sabbath and Christian Sunday, and in celebrating the eucharist, made use of unleavened bread. They abstained from the flesh of animals, and even from milk. In relation to Jesus Christ, some of them held that he was born, like other men, of Joseph and Mary, and acquired sanctification only by his good works. Others of them allowed, that he was born of a virgin, but denied that he was the word of God, or had any existence before his human generation. They said, he was, indeed, the only true prophet, but yet a mere man, who by his virtue had arrived at being called Christ, and the son of God. They also supposed, that Christ and the devil were two principles, which

God had opposed to each other. Of the New Testament, they only received the gospel of St. Matthew, which they called the gospel according to the Hebrews. See the article **NAZAREENS**.

**EBLIS**, the name used by the mahometans for the devil. See the article **DEVIL**.

**EBONY**, *ebenus*, in botany, a tree supposed to be of the palm-kind, the wood of which is imported from different countries of the East and West-Indies.

Its wood is extremely solid, and capable of a fine polish; and, therefore, much used in toys and marquetry.

**EBRBUHARITES**, a kind of mahometan monks, so called from their founder Ebrbuhar.

They make great profession of piety, and contempt of the world; but are accounted heretics by the rest of the mahometans, because they believe themselves not obliged to go in pilgrimage to Mecca.

**EBRILLADE**, in the manege, a check of the bridle given to the horse by a jerk of one rein, when he refuses to turn. Some confound the ebrillade with the *saccade*. See the article **SACCADE**.

As the ebrillade is a chastisement, and not aid, the use of it is banished the academies.

**EBRO**, antiently **IBERUS**, a large river of Spain, which, taking its rise in old Castile, runs through Biscay and Arragon, passes by Saragosa, and continuing its course through Catalonia, discharges itself with great rapidity into the Mediterranean, about twenty miles below the city of Tortosa.

**EBULLITION**, the same with boiling. See the article **BOILING**.

**EBULLITION** is also used in a synonymous sense with effervescence. See the article **EFFERVESCENCE**.

**EUBULUS**, in botany, the same with the *sambucus*. See the article **SAMBUCUS**.

**EBUR**, **IVORY**. See the article **IVORY**.

**ECATOMBÆON**, or **HÆCATOMBÆON**. See the article **HÆCATOMBÆON**.

**ECAVESSADE**, in horsemanship, denotes a jerk of the cavesson. See **CAVESSON**.

**ECBOLIUM**, in botany, the same with *adhatoda*. See the article **ADHATODA**.

**ECCANTHIS**, the same with *encanthis*. See the article **ENCANTHIS**.

**ECCENTRIC** and **ECCENTRICITY**. See **EXCENTRIC** and **EXCENTRICITY**.

**ECCHO**, or **ECHO**. See the article **ECHO**.

**ECCHYMOsis**, *εκχυμωσις*, in surgery, an extravasation of the blood from a vein in the arm betwixt the flesh and skin.

There are various degrees of an ecchymosis, so that the arm is hereby not only much swelled, and of a black and blue colour, but is even sometimes violently inflamed with a most acute pain, and followed either with a suppuration or incipient mortification in the limb. This accident frequently proceeds from the vein's being cut quite asunder by the phlebotomist, but oftener from the patient's using his arm too early after bleeding in violent and long exercises, in which the contractions of the muscles make the veins swell, and force their blood through the orifice into the interstices betwixt the flesh and skin, either in a greater or less quantity, in proportion to the degree of violence and exercise.

In a slight ecchymosis, there is little to be feared, as the stagnant blood may be generally dispersed without any great difficulty by the application of a compress dipt in vinegar and salt, or in spirit of wine. Sometimes the blood suppurates, which may be promoted by a diachylon-plaster; and when the matter is once brought to maturity, it generally makes its own way through the integuments, without any incision; after which, being discharged, the wound may be healed by a bit of diachylon-plaster. If the stagnating blood be very large, there are no hopes left to disperse it: then the disorder is in danger of terminating either in a large abscess or a gangrene: but to prevent these consequences, the surgeon should scarify, and make little incisions upon the hard part to discharge the blood, and then apply diachylon-plaster; and if the vein is already possessed with a violent inflammation or gangrene, it should be well scarified and invested with discutient cataplasms. At the same time it is necessary to bleed in some other part, and to administer attenuating medicines internally till it abates, or the gangrene spreads no farther.

**ECCLESIA**, in law, signifies a church or parsonage. See the articles **CHURCH** and **PARSONAGE**.

**ECCLESIASTES**, a canonical book of the Old Testament, the design of which is to shew the vanity of all sublunary things.

It was composed by Solomon, who enumerates the several objects on which men place their happiness, and then shews the insufficiency of all worldly enjoyments.

The Talmudists make king Hezekiah to be the author of it; Grotius ascribes it

to Zorobabel, and others to Isaiah; but the generality of commentators believe this book to be the produce of Solomon's repentance, after having experienced all the follies and pleasures of life.

**ECCLESIASTICAL**, an appellation given to whatever belongs to the church: thus we say, ecclesiastical polity, jurisdiction, history, &c. See the articles **POLITY**, **JURISDICTION**, **HISTORY**, &c. Ecclesiastical jurisdiction may be exercised by doctors of the civil law, though they are laymen.

**ECCLESIASTICAL COURT**. See **COURT**. **ECCLESIASTICUS**, an apocryphal book, generally bound up with the scriptures, so called from its being read in the church, *ecclesia*, as a book of piety and instruction, but not of infallible authority.

The author of this book was a Jew, called Jesus the son of Sirach. The Greeks call it the wisdom of the son of Sirach.

**ECCOPE**, in surgery, the same with amputation. See **AMPUTATION**.

**ECCOPROTICS**, in pharmacy, the same with gentle cathartics and evacuants. See **CATHARTICS** and **EVACUANTS**.

**ECHAPE**, in the manege, a horse begot between a stallion and a mare of different breeds and countries.

**ECHAPER**, in the manege, a gallicism used in the academies, implying to give a horse head, or to put on at full speed.

**ECHARPE**, in the military art. See the article **BATTERY**.

**ECHAUGETTE**, in the military art, denotes a guerite of wood, and of a square form. See the article **GUERITE**.

**ECHENEIS**, in ichthyology, a genus of malacopterygious fishes, whereof the branchiostegæ membrane on each side contains about nine ossicles or small bones: its head is flat on the upper part, and marked with a number of rough transverse striæ, or ridges.

Of this genus, there is only one known species, the remora of authors. See the article **REMORA**.

**ECHEVIN**, *scabimus*, in the french and dutch polity, a magistrate elected by the inhabitants of a city or town, to take care of their common concerns, and the decoration and cleanliness of the city.

At Paris, there is a prévôt, and four echevins; in other towns, a mayor and echevins. At Amsterdam, there are nine echevins; and, at Rotterdam, seven.

In France, the echevins take cognizance of rents, taxes, and the navigation of rivers, &c. In Holland, they judge of civil

evil and criminal causes; and if the criminal confesses himself guilty, they can see their sentence executed without appeal.

**ECHEVIN** of the palace, an officer of the household under the first race of the french kings.

**ECHINATE**, or **ECHINATED**, an appellation given to whatever is prickly, thereby resembling the hedge-hog.

**ECHINATUS**, in ichthyology, a species of ostracion. See **OSTRACION**.

**ECHINITES**, in natural history, the name by which authors call the fossile centronia, frequently found in our chalk-pits. See the article **CENTRONIA**.

**ECHINOMETRA**, the same with echinodermata, or centronia.

**ECHINOPHORA**, in botany, a genus of the *pentandria-digynia* class of plants, the corolla of which consist of five unequal, patulous petals: it has no pericarpium; the general involucre is of a turbinated figure; and the seeds are two in number, and of an oblong form.

**ECHINOPHORA** is also used by Rivinus for the caulalis. See the article **CAUCALIS**.

**ECHINOPS**, or **ECHINOPUS**, **GLOVE-THISTLE**, in botany, a genus of the *syngenesia-polygamia-aqualis* class of plants, the flower of which is compound; consisting of a great number of floscules or small flowers, divided into several acute segments: there is no pericarpium: the seed, which is single, is of an ovato-oblong figure, narrower at the base, with an obtuse hairy apex. See plate **LXXXII.** fig. 2.

The roots and seeds of this plant are said to be attenuant and diuretic.

**ECHINUS**, in zoology, a name frequently used for the erinaceus, or common hedge-hog. See the article **ERINACEUS**.

**ECHINUS MARINUS**, the same with centronia. See the article **CENTRONIA**.

**ECHINUS**, in architecture, a member or ornament near the bottom of the ionic, corinthian, and composite capitals.

**ECHIUM**, **VIPER'S BUGLOSS**, in botany, a genus of the *pentandria-monogynia* class of plants; the flower of which consists of a single petal, the tube being very short, and the limb erect, growing gradually wider at the extremity, where it is divided into five unequal segments; the two upper segments are longer than the rest, and the lowest one is small, acute, and reflex; there is no pericarpium, instead of which the cup becomes rigid, and contains in it four roundish and obliquely

acuminated seeds. See plate **LXXXII.** fig. 3.

A powder of the root of this plant is recommended against epilepsies: It is also a sudorific, vulnerary, and prescribed against the erysipilas.

**ECHO**, a sound reverberated or reflected to the ear from some solid body. Whereas the undulatory motion of the air, which constitutes sound is propagated in all directions from the sounding body, it will frequently happen that the air, in performing its vibrations, will impinge against various objects, which will reflect it back, and so cause new vibrations the contrary way: now if the objects are so situated as to reflect a sufficient number of vibrations back, *viz.* such as proceed different ways, to the same place, the second will be there repeated, and is called an echo: and the greater the distance of the objects is, the longer will be the time before the repetition is heard: and when the sound, in its progress, meets with objects at different distances, sufficient to produce an echo, the same sound will be repeated several times successively, according to the different distances of these objects from the sounding body, which makes what is called a repeated echo. See **SOUND** and **REFLECTION**.

In order to account for the nature of echoes, we must consider that sound is perceived as coming from that place from which, as a center, the pulses are propagated. This is well known by experience; but to illustrate the matter, let **A** (plate **LXXXII.** fig. 4.) be the center from whence any sound is directly propagated, and strikes against any plane obstacle **BC**, sufficiently large; draw **AF** perpendicular to **BC**, and produce it to **H**, so that it may be  $AF = FH$ ; the sound reflected will be perceived as coming from the point **H**. For let **AE** be the incident ray, impinging against the obstacle **BC**, in the point **E**; from **E** draw the ray **ED** in such a manner that the angle **CED** may be equal to the angle **FEA**, or that the angle of incidence may be equal to the angle of reflection; then will **ED** be the reflected ray of sound, and if produced will pass thro' the point **H**; for the angle  $FEH = CED = FEA$ . Therefore in the triangle **AFE** and **EFH**, since the angles of the one are respectively equal to the angles of the other, and the side **EF** is common to both, the sides of one triangle will be respectively equal to the sides of the

the other; and therefore  $HF = AF$ . Wherefore the reflex sound will be heard by a person at D, as coming from the point H. As the place of the auditor, or point D, approaches towards A, the case will constantly be the same with respect to the center of sound H; the triangles will still be equal, and all their angles and sides respectively; and therefore when D coincides with H, the reflex sound or echo will be heard from the point H, which was to be demonstrated.

The same sound is also heard twice by an auditor at D; first by the direct ray A D, and secondly by the reflex ray A E D, provided the difference between A D and A E D be sufficiently great, that the direct and reflex sounds do not, in the same sensible moment of time, affect the ear: for if the reflex sound arrives at the ear before the impression of the direct sound ceases, the sound will not be double, only rendered more intense.

From the velocity of sound it follows, that a person speaking or uttering a sentence in A aloud, in order to observe the echo by reflection from the obstacle B C, ought to stand at least 73 or 74 feet from it, that is,  $AF = 74$ : and since at the common rate of speaking, we pronounce not above  $3\frac{1}{2}$  syllables per second; therefore, that the echo may return just as soon as the three syllables are expressed, we must have twice A F equal to 1000 feet, or the speaker must stand about 500 feet from the obstacle B C, and so in proportion for any other number of syllables.

ECHO, in architecture, a term applied to certain kinds of vaults and arches, most commonly of elliptical and parabolical figures, used to redouble sounds, and produce artificial echoes.

We learn from Vitruvius, that in several parts of Greece and Italy, there were brazen vessels artfully ranged under the seats of the theatres, to render the sound of the actors voices more clear, and make a kind of echo. A single arch or concavity can scarce ever stop and reflect the sound; but if there be a convenient disposition between it, part of the sound that is propagated thither, being collected and reflected as before, will present another echo; or if there be another concavity opposed at a due distance to the former, the sound reflected from the one upon the other will be tossed back again upon this latter, &c.

ECHO, in poetry, a kind of composition

wherein the last words or syllables of each verse contain some meaning, which being repeated apart, answers to some question or other matter contained in the verse, as in this beautiful one from Virgil:

*Crudelis mater magis, an puer improbus ille?*

*Improbus ille puer, crudelis tu quoque mater.*

The elegance of an echo consists in giving a new sense to the last words; which reverberate, as it were, the motions of the mind, and by that means affect it with surprise and admiration.

ECHOMETER, among musicians, a kind of scale or rule, with several lines thereon, serving to measure the duration and length of sounds, and to find their intervals and ratios.

ECHUS, or ECCHUS, a term sometimes used in a synonymous sense with piano. See the article PIANO.

ECLECTICS, *eclectici*, ancient philosophers, who, without attaching themselves to any particular sect, selected whatever appeared to them the best and most rational, from each.

Potamon of Alexandria was the first of the eclectics: he lived in the reigns of Augustus and Tiberius; and being tired with the scepticism of the pyrrhonians, he resolved upon a scheme that would allow him to believe something, but without being so implicit as to swallow any entire hypothesis.

ECLECTOS, the same with what is more usually called *linctus*. See the article LINCTUS.

ECLIPSE, in astronomy, the deprivation of the light of the sun, or of some heavenly body, by the interposition of another heavenly body between our sight and it. Thus, eclipses of the sun happen by the moon's intervening between it and the earth; by which means the shadow of the moon falls upon the earth, when the latitude of the moon does not prevent it, by elevating the moon above, or depressing it below the earth. On the other hand, an eclipse of the moon can only happen when the earth is interposed between the sun and it; for then, if the latitude of the moon does not prevent, the shadow of the earth may fall on the moon, and thereby cause either a partial or total eclipse. A total eclipse of the sun or moon is when their whole bodies are obscured; and a partial one is when part only

# ECLIPSE

only of their bodies is darkened : again, a central eclipse is when it is not only total, but the eclipsed body passes through the center of the shadow.

*Astronomy of ECLIPSES.* The sun being a luminous body, vastly larger than the earth, will enlighten somewhat more than one half of it, and cause it to project a long conical shadow, as represented in plate LXXXIII. n° 1. where S is the sun, E the earth, and HBD its conical shadow.

The height or length of this shadow, at the mean distance of the sun, may be found by this proportion : as the tangent of the angle CBD, or the semi-diameter under which the sun appears at the earth, viz.  $AS = 16' : \text{radius} :: 1 : \text{the length of the shadow } CB = 214.8 \text{ semi-diameters of the earth}$  : but when the sun is at its greatest distance, the length of the shadow CB will be equal 217 of these semi-diameters. Hence it appears, that though the height of the shadow is near three times as great as the mean distance of the moon, yet it falls far short of the distance of mars, and consequently can eclipse none of the heavenly bodies but the moon.

To find the height of the moon's shadow, supposed to be similar to that of the earth, and consequently proportional to the diameters of the bases, the proportion is, as the diameter of the earth 100 to the diameter of the moon 28, so is the mean altitude of the earth's shadow 214.8 to the altitude of that of the moon  $60 \frac{144}{1000}$  of the earth's semi-diameters. The shadow of the moon therefore will just reach the earth in her mean distance, which it cannot do in her apogee ; but in her perigee it will involve a small part of the earth's surface.

Besides the dark shadow of the moon, there is another, called the penumbra ; to represent which, let S (plate LXXXIV. n° 2.) be the sun, T the earth, D the moon, KCF and ABE the two lines touching the opposite limbs of the sun and moon ; then it is evident that CFEB will be the dark or absolute shadow of the moon, in which a person on the earth's surface, between F and E, is wholly deprived of the sun's light. Again, let KBG and ACH be two other lines touching the sides of the sun and moon alternately, and intersecting each other at the point I above the moon ; then will HCBG, a frustum of the cone GIH, be the penumbra above-mentioned, in

which a spectator on the earth's surface, between F and H, and E and G, will see part of the sun, whilst the rest is eclipsed.

To calculate the angle of the cone HIG, draw SB ; then in the oblique triangle BIS, the external angle BID is equal to both the internal and opposite angles IBS and ISB ; but ISB, the angle under which the semi-diameter appears at the sun, being insensibly small, the angle BID will be equal to IBS, or KBS, equal to the apparent semi-diameter of the sun. Therefore the part of the penumbral cone CIB is equal and similar to the dark shadow of the moon.

Next, to find how much of the earth's surface can be at any time involved in the moon's dark shadow, or the quantity of the arch EF (plate LXXXIII. n° 2.) let us suppose the sun to be in apogee, and the moon in perigee ; and, in this case, the height of the moon's shadow will be about 61 semi-diameters, and the distance of the moon about 56 ; that is,  $DK = 61$ ,  $DT = 56$ , and  $TE = 1$ . In this case also, the half angle of the shadow  $TKE = 15' 50''$ , as being least of all. Then the proportion is : as 1, or the side TE to the side TK  $= 5$  ; so is the sine of the semi-angle TKE  $= 15' 50''$  to the sine of the angle TEK  $= 1^\circ 19' 10''$ . Wherefore  $TEK + TKE = ATE = AE = 1^\circ 35'$  ; the double of which FE is  $3^\circ 10' = 190'$ , or 220 miles, the diameter of the dark shadow on the surface of the earth when greatest.

After a like manner you may find the diameter of the penumbral shadow at the earth, GEFH (plate LXXXIV. n° 2.) when greatest of all, that is, when the earth is in perihelio, and the moon in apogee ; for then will the sun's apparent diameter be equal to  $16' 23'' = TIG$ , the greatest semi-angle of the cone ; and thence we shall find  $ID = 58 \frac{1}{2}$  semi-diameters of the earth. In this case also, the distance of the moon from the earth is  $DT = 64$  semi-diameters. Therefore as  $TG = 1$  to  $TI = 122 \frac{1}{2}$ , so is the sine of the angle TIG  $= 16' 23''$  to the sine of the angle IGN  $= 35^\circ 42'$ . But  $IGN = TIG + ITG$ , and therefore  $ITG = IGN - TIG = 35^\circ 25'$  ; the double of which  $70^\circ 50' = GEFH = 4900$  english miles nearly, for the diameter of the penumbral shadow when greatest.

From the principles of optics it is evident, that if the plane of the moon's orbit coincided

incided with that of the earth's orbit, there would necessarily be an eclipse of the sun every new moon: thus, if S (plate LXXXIV. n° 1.) represent the sun, B the moon, and T the earth, since the apparent magnitude or disc of the sun is nearly the same with that of the moon, it must necessarily be hid or eclipsed as often as the new moon came between the earth and the sun. But if, as is really the case, the moon's orbit be not in the plane of the ecliptic, but inclined thereto under a certain angle, there may be a new moon, and yet no eclipse of the sun. To illustrate this, let ABCDE be a circle in the plane of the ecliptic, described at the distance of the moon's orbit FGH, intersecting the same in the points B and D, and making an angle therewith ABF, whose measure is the arch GC, as being  $90^\circ$  distant from the angular points or nodes B and D. Now it is evident if the arch GC be somewhat greater than the sum of the apparent semi-diameters of the sun and moon, then at G, and some distance from G towards B, there may be a new moon, and yet no eclipse of the sun; because, in this case, the disc of the moon G is too much elevated or depressed above or below the apparent disc or face of the sun C, to touch it, much less to hide or eclipse any part thereof. But at a certain point M (*ibid.*) in the moon's orbit, the moon will have a latitude only equal to the sum of the semi-diameters of the sun and moon; and, therefore, when the moon is new in that point, she will appear to a spectator in the point Z, to touch the sun only; from whence this point M is called the ecliptic limit, inasmuch as it is impossible there should happen a new moon in any part between it and the node B on each side, without eclipsing the sun less or more: thus, in the figure, may be seen a partial eclipse at K, and a total one in the node itself B.

What has hitherto been said regards, the phenomenon of an eclipse of the sun, as they appear to a spectator on the earth's surface, in whose zenith the moon then is, and where there is no refraction to alter the true latitude of the moon: but when the moon has any latitude, there the process of calculating the appearances of a solar eclipse will be somewhat more complex, on account of the variation of the moon's latitude and longitude for every different altitude, and consequently every

moment of the eclipse. See REFRACTION and PARALLAX.

The best way of representing a solar eclipse is by a projection of the earth's disc, and of the section of the dark and penumbral shadow, as they appear, or would appear, to a spectator at the distance of the moon in a right line joining the centers of the sun and the earth. In order to this, we are to find the dimensions of the apparent semi-diameters of the earth, dark shadow, and penumbra at the distance of the moon. As to the first, *viz.* the earth's semi-diameter, it is equal to the moon's horizontal parallax. That of the dark shadow is thus estimated: let C (plate LXXXIII. n° 5.) be the center of the moon, DB its diameter, DHB its dark shadow, and KAL the penumbral cone. Then let EF be the diameter of the penumbra at the earth, and IG that of the dark shadow, and draw CG and CE; then is the angle  $CGB = BHC + GCH$ , and so  $GCH = BGC - BHC$ ; that is, the apparent semi-diameter of the dark shadow, is equal to the difference between the apparent semi-diameters of the sun and moon. In like manner the angle  $ECH = DEC + DAC$ ; that is, the apparent semi-diameter of the penumbra, at the earth, is equal to the sum of the apparent semi-diameters of the moon and sun. Now the semi-diameters of the sun and moon, and also the moon's horizontal parallax, are all ready calculated for their various distances from the earth, and for the least, mean, and greatest eccentricity of the lunar orbit, in the astronomical tables. Therefore, let AE (plate LXXXIII. n° 3.) represent a small portion of the annual orbit, and FH the visible path of the center of the lunar shadows, which will exactly correspond to the position of the moon's orbit with respect to the ecliptic in the heavens; so that the point of intersection Q will be the node, and the angle HQE the angle of inclination of the lunar orbit to the plane of the ecliptic, which is about  $5^\circ$ . Hence, if AEPQS represent the disc of the earth, according to the orthographic projection, in the several places Q, B, C, D, whose semi-diameter is made equal to the number of minutes in the moon's horizontal parallax at the time of the eclipse; and if, in the path of the shadows in the points Q, R, N, G, we describe a small circle whose semi-diameter is equal to the difference of the semi-diameters

ECLIPSE

N<sup>o</sup> 2.

N<sup>o</sup> 1.

J. Jefferys sculp

semi-diameters of the sun and moon, that will be the circular section of the moon's dark shadow at the distance of the earth: again, if a circle is described on the same center, with a semi-diameter equal to the sum of the semi-diameters of the sun and moon, it will represent the penumbral shadow, expressed by the dotted area. Here then it is evident, that if the moon, when new, be at the distance  $\oslash G$  (*ibid.*) from the node, the penumbral shadow will not fall near the earth's disc, and so there cannot possibly happen an eclipse. Again, if the moon's distance from the node be equal to  $\oslash N$ , the penumbral shadow will just touch the disc, and consequently  $\oslash C$  is the ecliptic limit, which may be found by the following analogy, *viz.* as the sine of the angle  $N \oslash C = 5^\circ 30'$  (the angle of inclination of the lunar orbit to the plane of the ecliptic) is to the radius  $= 90^\circ$ , so is the logarithm of the side  $NC = TC + NT = 62' 10'' + 16' 52'' + 16' 23'' = 95' 25''$  to the logarithm of the side  $\oslash C$  equal to the ecliptic limit, which is found to be  $16^\circ 36'$ , beyond which distance from the node  $\oslash$  there can be no eclipse; and within that distance, if the moon be new, the shadow will fall on some part of the earth's disc, as at  $B$ ; where all those places over which the shadows pass, will see the sun eclipsed, in part only by the dotted penumbral shadow; but the sun will be centrally eclipsed in all places over which the center of the shadows pass, and if the moon be new in the node, then will the center of the shadows pass over the center of the disc, as represented at  $\oslash$ . In this case, if the apparent diameter of the moon be greater than that of the sun, the face of the sun will be wholly eclipsed to all places over which the center of the shadow passes; but if not, the sun will only be centrally eclipsed, his circumference appearing in the form of a bright annulus, or luminous ring; the width whereof will be equal to the difference of the diameters of the luminaries. The disc of the earth, here projected, represents the case of an eclipse on an equinoctial day;  $AK$  being the ecliptic,  $AQ$  the equator,  $XY$  the axis of the ecliptic,  $PS$  the axis of the equator,  $P$  and  $S$  the north and south poles, &c. By this projection the passage of shadows over the earth's disc may be exhibited for any place of the sun, or declination of the moon.

As to the calculation of eclipses of the sun, it is at best but a troublesome business, which depends upon the following data: 1. The mean conjunction, and from thence the true conjunction, together with the place of the luminaries at the apparent time of true conjunction. 2. The apparent time of the visible new moon, at the apparent time of the true conjunction. 3. The apparent latitude at the apparent time of the visible conjunction. From these data, the other quæstia may be obtained; so that the greatest part of the trouble arises from the parallaxes of longitude and latitude, without which the calculation of solar eclipses would be the same with that of lunar ones.

*Astronomy of lunar ECLIPSES.* These being occasioned by the immersion of the moon into the earth's shadow, all that we have to do, in order to delineate a lunar eclipse, is to calculate the apparent semidiameter of the earth's shadow at the moon. Thus, let  $AB$  (plate LXXXIII. n<sup>o</sup> 6.) represent the earth,  $T$  its center,  $AEB$  its conical shadow,  $DC$  the diameter of a section thereof at the moon; and drawing  $DT$ , we have the outward angle  $ADT = DTE + DET$ ; so that  $DTE = ADT - DET$ ; that is, the angle  $DTE$ , under which the semi-diameter of the earth's shadow appears at the distance of the moon, is equal to the difference between the moon's horizontal parallax  $ADT$ , and the semi-diameter of the sun  $DET$ . If, therefore,  $AE$ , (*ibid.* n<sup>o</sup> 4.) represent the path of the earth's shadow at the distance of the moon near the node  $\varphi$ , and  $FH$  a part of the lunar orbit, and the section of the earth's shadow be delineated at  $\oslash, B, C, D$ ; and the full moon at  $\oslash, I, N, G$ ; then it is evident there can be no eclipse of the moon, where the least distance of the centers of the moon and shadow exceeds the sum of their semi-diameters, as at  $D$ . But where this distance is less, the moon must be eclipsed either in part or wholly, as at  $B$  and  $\oslash$ ; in which latter case the moon passes over the diameter of the shadow. But in a certain position of the shadow, as at  $C$ , the least distance of the centers,  $NC$ , is equal to the sum of the semi-diameters; and consequently  $\oslash C$  is the ecliptic limit for lunar eclipses: to find which, we have this analogy, as the sine of the angle  $N \oslash C = 5^\circ$  (the in-

clination of the moon's orbit to the plane of the ecliptic) is to the radius, so is the logarithm of the side  $NC=63^{\circ}12'$  to the logarithm of the side  $EC=12^{\circ}5'$  the ecliptic limit. Hence, if the moon be at a less distance from the node  $C$  than  $12^{\circ}5'$ , there will be an eclipse; otherwise none can happen.

If the earth had no atmosphere, the shadow would be absolutely dark, and the moon involved in it quite invisible; but, by means of the atmosphere, many of the solar rays are refracted into, and mixed with the shadow, whereby the moon is rendered visible in the midst of it, and of a dusky red colour.

For calculating eclipses of the moon, the following data are necessary: 1. Her true distance from the node, at the mean conjunction. 2. The true time of the opposition, together with the true place of the sun and moon, reduced to the ecliptic. 3. The moon's true latitude, at the time of the true conjunction, and the distance of the luminaries from the earth: also their horizontal parallaxes, and apparent semi-diameters. 4. The true horary motions of the moon and sun, and the apparent semi-diameter of the earth's shadow. With these data it is easy to find the duration, beginning, middle, and quantity of eclipses.

**ECLIPSES of the satellites.** See **SATELLITES**.

**ECLIPTIC**, in astronomy, a great circle of the sphere, supposed to be drawn thro' the middle of the zodiac, making an angle with the equinoctial of about  $23^{\circ}30'$ , which is the sun's greatest declination; or, more strictly speaking, it is that path or way among the fixed stars, that the earth appears to describe, to an eye placed in the sun.

Some call it *via solis*, the way of the sun, because the sun, in his apparent annual motion, never deviates from it, as all the other planets do, more or less. See the articles **GLOBE** and **ZODIAC**.

It is called ecliptic, by reason all eclipses happen when the planets are in or near its nodes. See the article **NODE**.

The axis of the ecliptic is a right line supposed to pass through the center of the sun, and to be perpendicular to the plane of the ecliptic; and the points in the heavens, to which this axis points, are called the poles thereof; and the great circles, passing through these poles, will be perpendicular to its plane, and therefore are called its secondaries, and sometimes circles of longitude.

As to the obliquity of the ecliptic, or angle which its plane makes with that of the equinoctial, it is found to vary; the mean obliquity being found by Dr. Bradley to be  $23^{\circ}28'30''$ , who supposes this variation may be owing to a nutation of the earth's axis, or to a gradual approach of the ecliptic to the equinoctial, at about the rate of  $1'$  in 100 years.

**ECLIPTIC**, in geography, a great circle on the terrestrial globe, not only answering to, but falling within the plane of the celestial ecliptic. See **GLOBE**.

**ECLOGUE**, *εκλογία*, in poetry, a kind of pastoral composition, or a small elegant poem, in a natural simple style. See the article **PASTORAL**.

The eclogue, in its primary intention, is the same thing with the idyllium, but custom has made some difference between them, and appropriated the name eclogue to pieces wherein shepherds are introduced, and idyllium to those written like eclogues, but without any shepherds in them. The eclogue then is properly an image of pastoral life, upon which account the matter is low, and its genius humble. Its business is to describe the loves, sports, piques, jealousies, intrigues, and other adventures of shepherds; so that its character must be simple, the wit easy, and the expression familiar. Then the true character of the eclogue is simplicity and modesty; its figures are neat, the passions tender, the motions easy, and though sometimes it may have little transports, and despairs, yet it never rises so high as to be fierce or violent. Its narrations are short, descriptions little, the thoughts ingenious, the manners innocent, the language pure, the verse flowing, the expressions plain, and all the discourse natural.

The models in this sort of poetry are Theocritus and Virgil, who both have some eclogues of a lofty character. The eclogue therefore occasionally raises its voice: yet M. Fontenelle blames some modern poets for having made matters of high concern the subject of some of their eclogues, and caused their shepherds sing the praises of kings and heroes. The Italians are thought faulty in this respect, for aiming generally to be too witty or superbe in their style: however, since the establishment of the Academy of Arcadians at Rome, the taste for eclogues has been greatly improved amongst them. Some imagine the name eclogue to have been originally applied to such poems as were wrote in imitation of others: such

are

are the Eclogues of Virgil, which are only imitations of Theocritus.

**ECLOGUE** is also applied to certain compositions in prose: such are those of Strabo, Diodorus, &c. in which sense, the word signifies only an extract, or collection.

**ECOUTE'**, in the manege, a pace or motion of a horse, when he rides well upon the hands and the heels, is compactly put upon his haunches, and bears or listens to the heels or spurs, and continues duly balanced between the heels, without throwing to either side. This happens when a horse has a fine sense of the aids of the hand and heel.

**ECPHONESIS**, the same with exclamation. See the article **EXCLAMATION**.

**ECPHORA**, in architecture, commonly signifies the distance between the extremity of a member or moulding, and the naked of the column, or any other part it projects from.

Some authors, however, account for the ecphora from the axis of the column, and define it to be the right line intercepted between the axis and the outermost surface of a member or moulding.

**ECPHRACTICS**, in medicine, remedies which attenuate and remove obstructions. See the articles **ATTENUANTS** and **DEOBSTRUENTS**.

**ECPIESMA**, in surgery, a sort of fracture of the cranium, when the bones are much shattered, and, pressing inwardly, affect the membranes of the brain.

**ECPIESMA**, in pharmacy, signifies the mass remaining after the juices of vegetables have been pressed out: and, in this sense, is the same as magma. It sometimes further imports the juice pressed out.

**ECPIESMUS**, *εκπιεσμος*, in the ancient writers of medicine, a word used to express a distemperature of the eye, consisting in a very great prominence of the entire globe of the eye, which is, as it were, thrust out of its socket or orbit, by a great flux of humours, or an inflammation.

**ECPUCTICA**, in pharmacy, the same with incrassants. See **INCRASSANTS**.

**ECSTATICI**, *εκστατικοι*, in grecian antiquity, a sort of diviners, who were cast into trances or ecstasies, in which they lay like dead men, or persons asleep, deprived of all sense or motion, but after some time (it may be days, or months, or years, for Epimenides the Cretan is reported to have lain in this posture seventy-five years) returning to themselves,

gave strange relations of what they had seen and heard.

**ECTASIS**, in grammar, the same with diastole. See the article **DIASTOLE**.

**ECTHESIS**, in church-history, a confession of faith, in the form of an edict, published in the year 639, by the emperor Heraclius, with a view to pacify the troubles occasioned by the eutychian heresy in the eastern church. However, the same prince revoked it, on being informed that pope Severinus had condemned it, as favouring the monothelites; declaring at the same time, that Sergius, patriarch of Constantinople, was the author of it.

**ECTHLIPSIS**, *εκθλιψις*, among latin grammarians, a figure of prosody whereby the *m* at the end of a word, when the following word begins with a vowel, is elided, or cut off, together with the vowel preceding it, for the sake of the measure of the verse: thus they read *mult' ille*, for *multum ille*.

The reason of an ecthlipsis, which in latin verse ought always to take place when the immediately following word begins with a vowel, is to prevent the harshness of an hiatus, or concourse of vowels.

**ECTROPIUM**, in surgery, is when the eye-lids are inverted, or retracted so as to shew their internal or red surface, and cannot sufficiently cover the eye. Sometimes this is a simple or original disorder, and sometimes only a symptom, or consequence of another, as an inflammation, sarcoma, tumour, &c. When the disorder is simple, or original, it generally arises from a contraction of the skin of the eye-lid, by the scar of a wound, ulcer, burn, &c. or from an induration and contraction of the skin after an inflammation; and sometimes it may proceed, in a great measure, from the use of astringent collyria injudiciously applied, in disorders of the eyes.

The cure of this disorder consists in elongating, or relaxing, the external skin of the eye-lid so as to cover the eye. When the disorder is recent, it will be best to try the application of emollients, such as the vapours of hot milk or water, oil of almonds, or olives, mucilage of quince-seeds, hare's foot, ung. dialthææ, &c. to be continued for several days on the scar, or contracted skin of the eye-lid, which must be often extended, either upwards or downwards, according as the disorder is in the upper or lower lid. And every night, when the patient goes

to bed, it will be proper to bring the eye-lids close to each other, and to restrain them close by plaster, comprefs, and bandage, to be renewed every night. If none of these means take effect, it will be proper first to make a semilunar incision in the external skin of the eye-lid, next its tarsus; making the angles of the incision downwards in the upper lid, and upward in the lower lid, that the skin may be elongated. If the skin does not appear to be let out enough by one incision, two or three more must be made, running parallel to the first, and about the distance of a small packthread from each other, and when the eye-lid is thus sufficiently elongated, the incisions must first be stuffed with dry lint, and then with lint armed with vulnerary unguent; and lastly, a piece of sticking plaster should be fastened to the margin of the eye-lid, to keep it extended either up or down; which method should be continued till the eye-lids shut close. When the disorder arises from an inflammation, or fleshy excrescence within the eye-lid, the inflammation must be removed, and arming the eye with a defensive plate, the excrescence must be removed by lapis infernalis. When the skin of the eye-lid has continued violently distorted from the patient's birth, there are seldom any hopes of curing it.

**ECTYLOTICS**, in pharmacy, remedies proper for consuming callosities. See the article **CALLUS**.

**ECTYPE**, *εκτύπον*, among antiquarians, an impression of a medal, seal, or ring, or a figured copy of an inscription, or other ancient monument.

**ECU**, or **ESCU**, a french crown, for the value of which see the article **COIN**.

**ECUSSON**, in heraldry, a little escutcheon. See the article **ESCUTCHEON**.

**EDDISH**, or **EADISH**, the latter pasture, or grafs that comes after mowing, or reaping; otherwise called eagrafs, earls, and etch.

**EDDY-TIDE**, or **EDDY-WATER**, among seamen, is where the water runs back contrary to the tide; or that which hinders the free passage of the stream, and so causes it to return again.

**EDDY-WIND** is that which returns, or is beat back from a sail, mountain, or any thing that may hinder its passage.

**EDESSA**. See the article **ORFA**.

**EDGE**, in general, denotes the side or border of a thing; but is more particularly used for the sharp side of some weapon, instrument, or tool: thus we say,

the edge of a sword, knife, chissel, &c.

In the sea-language, a ship is said to edge in with another, when making up to it, **EDGINGS**, among gardeners, the series of small but durable plants, set round the edges or borders of flower-beds, &c.

The best and most durable plants for this use is box, which, if well planted, and rightly managed, will continue in strength and beauty for many years. The seasons for planting these are the autumn and very early in the spring; and the best species for this purpose is the dwarf dutch box.

The edgings of box are now only planted on the sides of borders next walls, and not, as was some time since the fashion, all round borders, or fruit-beds, in the middle of gardens, unless they have a gravel-walk between them, in which case it serves to keep the earth of the borders from washing down on the walks in hard rains, and fouling the gravel. Daisies, thrift, or sea-july-flowers, and chamomile are also used, by some, for this purpose; but they grow out of form, and require yearly transplanting.

**EDHELING**, *edhelings*, the same with atheling. See **ATHELING**.

**EDICT**, *edictum*, in matters of polity, an order or instrument, signed and sealed by a prince, to serve as a law to his subjects. We find frequent mention of the edicts of the prætor, the ordinances of that officer in the roman law. In the french law, the edicts are of several kinds; some importing a new law or regulation; others, the erection of new offices; establishments of duties, rents, &c. and sometimes articles of pacification. In France edicts are much the same as a proclamation is with us, but with this difference, that the former have the authority of a law in themselves, from the power which issues them forth; whereas the latter are only declarations of a law, to which they refer, and have no power in themselves. Edicts can have no room in Britain, because that the enacting of laws is lodged in the parliament, and not in the king. Edicts are all sealed with green-wax, to shew that they are perpetual and irrevocable.

**EDIFICE**, the same with building. See the article **BUILDING**.

**EDILE**, or **ÆDILE**. See **ÆDILE**.

**EDINBURGH**, the capital city of Scotland, situated about one mile south of Leith and of the firth of Forth, eighty-two miles north-west of Newcastle, and about three hundred north-west of London:

don: west long. 3°, and north lat. 56°. Here the parliament of that antient kingdom used to assemble, before its union with England; and here the supreme courts of justice for North Britain are still held. It has likewise a celebrated university, and exceeds all the cities of the world for the loftiness of its buildings, which are all of hewn stone, faſhied, and ten, eleven, or more stories high: it is also remarkable for the spaciousness of its High-street, its Castle, the palace of Holyrood-house, &c.

**EDITOR**, a person of learning, who has the care of an impression of any work, particularly that of an antient author: thus Erasmus was a great editor; the low-vain doctors, Scaliger, Petavius, F. Sirmund, bishop Walton, Mr. Hearne, Mr. Ruddiman, &c. are likewise famous editors.

**EDMOND'S-BURY**. See **BURY**.

**EDUCATION**, the instructing children, and youth in general, in such branches of knowledge and polite exercises, as are suitable to their genius and station.

Education is a very extensive subject, that has employed the thoughts and pens of the greatest men: Locke, the archbishop of Cambray, Tanaquil Faber, M. Crouſaz, and Rollin may be consulted on this head.

The principal aim of parents should be, to know what sphere of life their children are designed to act in; what education is really suitable for them; what will be the consequence of neglecting that; and what chance a superior education will give them, for their advancement in the world. Their chief study should be to give their children such a degree of knowledge, as will qualify them to fill some certain post or station in life: in short, to fit them for an employment suited to their condition and capacity, such as will make them happy in themselves, and useful to society. The education of a nobleman should contain every thing that is both useful and ornamental. Next to languages, he ought to be instructed in philosophy and history, particularly the history of his own nation. He should also be made acquainted with the customs, laws, and manners of different states, but more especially with the constitution of his own country. To this solid learning should be added the embellishment of polite literature, poetry, painting, and music; and, to complete the education, dancing, fencing, riding, and architecture.

As to the education of gentlemen, the plan above laid down will in general hold good. Every gentleman of fortune should certainly give all his sons the education of gentlemen; but the eldest ought to be graced with every ornament. Parents of this class, besides carefully attending to the genius, temper, and inclinations of their younger sons, should resolve on an employment suited to them; which being settled, they are to pursue their education accordingly. The three learned professions, divinity, law, and physic, require each a species of learning proper to itself. But besides these, the sea, the army, and the exchange, with many other genteel employments, are open for them to engage in: and hence appears not only the necessity of considering their fortune, but attending to their genius, temper and inclinations.

As many among the mercantile class are descended of the best gentlemen's families, and as intermarriages are frequent between them, it is highly proper that their children should be genteelly educated. However, even in this, regard should be had to their own fortune, and the real prospects before them: for nothing can be a greater misfortune than to educate a boy like a fine gentleman, and not be able to support it. A learned education is needless, in the case before us; but reading, writing, arithmetic, geography, and drawing, are extremely proper, or rather absolutely necessary.

With regard to manners, the quality should be cautioned never to sink beneath their rank; and while they learn to be humble, they must carefully avoid being mean. The gentry should approach as near to the quality in good behaviour, and politeness, as possible: and as to the trading part of the people, they should be taught that every thing coarse, vulgar, and mean is highly unbecoming them; is not only abusing the faculties providence has furnished them with, but is debasing their nature.

Before we conclude this article, it will be proper to take notice of the impropriety and inconvenience of not teaching young people to think and act of themselves. The art of a governor, and the lessons of a preceptor, change a child into a youth; they infuse into him a greater share of knowledge than he could be naturally supposed to have at his age. But this very child, when he arrives to that stage of life in which he must think, speak, and

and act of himself, is stripped all of a sudden of his premature merit. His summer is far from answering the fine blossoms of his spring. The too solicitous education he has received, becomes rather prejudicial to him, by reason of its being the occasion of his falling into the dangerous habit of letting other people think for him. His mind has contracted an internal laziness, which makes him wait for external impulses to resolve and to act. The mind contracts a laziness with as much facility as the legs and feet. A man who never stirs without the assistance of some vehicle, becomes soon incapable of the same free use of his legs, as a person that has been constantly accustomed to walk. As, therefore, we must lend a hand to the one when he walks, so we must help the other to think, and even to will : whereas in a child bred up with less care, his inward part labours of itself, and his mind grows active. He learns to reason and determine of himself, in the same manner as other things are learned. At length he attains to argue and resolve rightly, by mere dint of reasoning and reflecting on the cause of his deception, when the events convince him of the error of his judgment.

**EDULCORATION**, in pharmacy, the same with **dulcifying**. See the article **DULCIFYING**.

**EDULCORATION**, in chemistry, the separating, by a washing, or solution, in water, the salt that any body may be impregnated with, or those that may be left adhering to a body, after any operation. See the article **ÆLUTION**.

The solution here spoke of, is in metals only, and is properly a kind of moist one, the saline parts adhering to bodies not soluble in water, being by that menstruum taken up, and eaten off from the body, and the solution afterwards separated from the remaining solid, either by subsidence or filtration. See the article **FILTRATION**.

It is proper in this operation to enlarge the surface of the body to be edulcorated, by pounding it in a mortar, that the solution may have the speedier success; and for this purpose it should always be kept stirring with a stick, while the water is on it, that all the parts of the body to be edulcorated, which otherwise would some of them sink to the bottom, may be made equally, at one time or other, contiguous to the particles of the edulcorating fluid, by which all the solutions are

greatly facilitated. Boiling water is, in some cases, requisite; for the heat of that, by the inward motion and rarefaction it occasions, promotes in an extraordinary manner saline solutions. Very frequent repetitions of this operation are necessary; and, after all, a nice experiment will always find some small portion of salts remaining.

**EEL**, *anguilla*, in ichthyology, a species of *muræna*. See **MURÆNA**.

The common eel is the simple coloured *muræna*, with the lower jaw longest: it has three fins, *viz.* two pectoral ones, standing one on each side; and a single low back-fin, which beginning at some distance from the head, runs along the back to the tail, and comes up again continuous as far as the anus: the extremity of this fin, which forms what may be called the tail, is neither round nor square, but subacute. See plate **LXXXV**. fig. 1.

It is common in all our fresh waters, ponds, ditches, and rivers; and its general standard is about two feet in length, though some are often caught much larger.

The fat of eels is accounted **vulnerable**, and good in an **alopecia**, cases of **deafness**, and the **hæmorrhoids**.

Eel-fishing is of divers kinds, as **snigging**, **bobbing**, &c. See **FISHING**.

The silver-eel may be caught with several sorts of baits, as powdered beef, lobes, or garden-worms, minnows, hens-guts, fish-garbage, &c. The most proper time for taking them is in the night, fastening your line to the bank-sides, with your laying-hook in the water: or a line may be thrown with good store of hooks, baited and plummed, with a float to discover where the line lies, that they may be taken up in the morning.

**Microscopic EELS**, those discovered by the microscope in pepper-water and other infusions of plants, as well as in the seed of most animals. See **ANIMALCULES**.

**Sea-EEL**, *anguilla marina*, a fish otherwise called **conger**; being a species of *muræna*, with the upper edge of the back-fin black. See the articles **CONGER** and **MURÆNA**.

**EEL-BACKED**, an appellation given to such hories as have black lists along their back.

**EEL-POUT**, the english name of a fish of the *gadus*-kind, with three fins on the back, cirri at the mouth, and the two jaws equal: the generality of authors call it *mustela fluviatilis*. See **GADUS**.

**EEL-SPEAR**,

**EEL-SPEAR**, a forked instrument with three or four jagged teeth, used for catching of eels: that with the four teeth is best, which they strike into the mud at the bottom of the river, and if it strike against any eels, it never fails to bring them up.

**EFFARE'**, or **EFFRAYE'**, in heraldry, a term applied to a beast rearing on its hind legs, as if it were frightened or provoked.

**EFFECT**, in a general sense, is that which results from, or is produced by, any cause. See the article **CAUSE**.

**EFFECTS**, in commerce, law, &c. the goods possessed by any person, whether moveable or immoveable. See **CHATTELS**, **GOODS**, &c.

**EFFECTS**, in the manege, the motions of the hand that serve to conduct the horse. See the article **AIDS**.

There are four effects of the hand, or four ways of making use of the bridle, *viz.* to push a horse forwards, to give him head, to hold him in, and to turn the hand either to the right or left.

**EFFECTIONS**, in geometry, are used in the same sense with the geometrical construction of propositions, and often of problems and practices, which, when they are deducible from, or founded upon, some general proposition, are called the geometrical effections thereunto belonging.

**EFFERDING**, a town of upper Austria, about ten miles west of Linz.

**EFFERVESCENCE**, in a general sense, signifies a slight degree of ebullition in liquors exposed to a due degree of heat: but the chemists apply it to that intestine motion excited in various fluids, either by the mixture of fluids with others of a different nature; or by dropping salts, or powders, of various kinds into fluids.

The two most common opposites, acids and alkalis, on being mixed, cause a great ebullition, or frothing, but no great heat: but the solution of some metals in aquafortis, cause intense heat, and emit flame. The mixing aromatic oils with acid mineral spirits, actually kindle and burn with violent explosions; and some vegetable substances, putrifying with moisture, will, sometimes, heat so as to kindle whatever lies dry about that part of the heap where the putrefaction happens.

Hence, effervescences are distinguished into hot and cold; that which pro-

duces heat in the substances so mixt, is called a hot effervescence, but if no heat is excited, it is called a cold effervescence. Among the mixtures that excite a cold effervescence, is that of powdered coral mixt with distilled vinegar; which is accounted for hence, by Chauvin, that the pores of the coral being very great, it may be easily dissolved in the acid spirit, without any great friction, or collision of the parts, such as would be necessary to generate any considerable heat.

The principal bodies in which effervescences happen, according to Boerhaave, are, 1. Native vegetable acids, as most juices of trees, shrubs, and plants that run in the spring; most juices of unripe summer fruits; particular juices, remaining acid when ripe, as of oranges, citrons, lemons, tamarinds, sorrel, wood-sorrel; fermented acid vegetables, as the meals when they turn sour; rhenish and Moselle wine, and tartar vegetables twice fermented; native and distilled vinegars; the acids of animals from tartish or acid vegetable aliment, as in the chyle, four milk, whey, butter-milk. 2. The native acids of fossils; as the acid of sulphur, alum or vitriol; or those acids as they lye concealed in sulphur, or vitriol stones; or as thence extracted by a violent fire; or a stronger acid, as in the spirit of nitre, salt, alum, vitriol, and sulphur. 3. True fixed alkalies, made of any vegetable matter, by burning the more volatile alkalies, whether spontaneous, as in garlic, onions, scurvy-grass, mustard, &c. produced by putrefaction from animal or vegetable subjects, or procured from the same by distillation and burning. 4. Certain bodies improperly called alkalies, only on account of agreeing therewith in fermenting with acids: these are almost all the boles, bones, chalk, clays, coral, crab-eyes, earths, horns, hoofs, nails, pearls, shells, stones and teeth. 5. The seven metals. 6. The semimetals; antimony, bismuth, lapis calaminaris, lapis hæmatites, lime, &c.

Hence we have four general rules, *viz.* 1. The bodies of the first class constantly make an effervescence with those of the second and third, either sooner or latter, more or less; or as they are weak or strong. The effervescence continues till the point of saturation is gained, then ceases, and the acrimony, after a full saturation, is generally softened.

2. The

2. The bodies of the first class make an effervescence with those of the fourth, and at the end of the saturation, vitriols are usually produced. 3. The bodies of the third class act in the same manner with those of the fifth. 4. The bodies of the second, third, fourth, and fifth classes, being mixed together, are scarce found to make any effervescence.

**EFFERVESCENCE**, in vintage, a term appropriated by Portzius and others, to signify that working of wine which is by some improperly called fermentation, thereby confounding two very different things. See the article **FERMENTATION**.

**EFFICACIOUS**, a term used by divines, in speaking of grace; importing such grace, as never fails to produce its effect. See the article **GRACE**.

**EFFICIENT CAUSE**. See **CAUSE**.

**EFFICIENTS**, in arithmetic, the same with factors. See **FACTOR**.

**EFFIGY**, *effigies*, the portrait, figure, or exact representation of a person.

**EFFLORESCENCE**, among physicians, the same with exanthema. See the article **EXANTHEMA**.

**EFFLUENT FEVER**, the same with an inflammatory one. See the article **INFLAMMATORY**.

**EFFLUVIUM**, in physiology, a term much used by philosophers and physicians, to express the minute particles, which exhale from most, if not all, terrestrial bodies in form of insensible vapours. See the articles **VAPOUR** and **EXHALATION**. Sometimes indeed, these effluvia become visible, and are seen ascending in form of smoke; constituting what, in animals and plants, makes the matter of perspiration. See **PERSPIRATION**. Nothing can exceed the subtilty of the odoriferous effluvia of plants, and other bodies. Mr. Boyle tells us, that having exposed to the open air a certain quantity of *asa foetida*, he found its weight diminished only the eighth part of a grain in six days: hence, if we suppose, that during all that time a man could smell the *asa foetida* at the distance of five feet, it will appear that its effluvia cannot exceed the

$\frac{1}{282500000000000}$  part of an inch in magnitude.

The effluvia of mineral substances are called steams; and when collected in mines, or other close places, damps. See the article **DAMPS**.

Malignant effluvia are assigned by phy-

sicians, as the cause of the plague, and other contagious diseases; as the jail-distemper, hospital fever, and the like. See **PLAGUE** and **HOSPITAL FEVER**.

Effluvia issuing from corrupted substances, according to the ingenious Dr. Pringle, chiefly consist of the phlogiston or sulphur-principle, only combined with the saline parts of the body: for this principle, when single, is perhaps imperceptible to our sense of smelling; and, when divested of these salts, is never pestilential: so that the deleterious effluvia of rotten substances seem to consist of a certain combination of the sulphureous with the saline principle, which united, not only become the most irritating stimuli to the nerves, but act upon the humours as a putrid ferment, in promoting their corruption. See the article **MALIGNANT FEVER**.

**EFFUSION**, in a general sense, the pouring out of any thing liquid, and that with some violence.

**EFFUSION**, in astronomy, part of the sign aquarius. See **AQUARIUS**.

**EFT**, in zoology, the english name of the common lizard, *lacertus vulgaris*, called also, in several parts of the kingdom, the newt and swift. See the article **LIZARD**.

**EGER**, the same with *agria*. See **AGRIA**.

**EGERMOND**, a market town of Cumberland, ten miles south of Cockermouth.

**EGG**, *ovum*, in physiology, a body formed in certain females, in which is contained an embryo, or foetus of the same species, under a cortical surface, or shell. The exterior part of an egg is the shell, which is in a hen, for instance, a white, thin, and friable cortex, including all the other parts. The shell becomes more brittle by being exposed to a dry heat. It is lined every where with a very thin, but pretty tough membrane, which, dividing at, or very near, the obtuse end of the egg, forms a small bag, where only air is contained. In new-laid eggs this folliculus appears very little, but becomes larger when the egg is kept. Within this are contained the albumen, or white, and the vitellus, or yolk; each of which have their different virtues. See **ALBUMEN** and **VITELLUS**.

The albumen is a cold, viscuous, white liquor in the egg, differing in consistence, in its different parts. It is observed, that there are two distinct albumens, each of which are inclosed in its proper membrane; of these, one is very thin and liquid,

liquid, and the other more dense and viscous, and of a somewhat whiter colour, but, in old and stale eggs, after some days incubation, inclining to a yellow. As this second albumen covers the yolk on all sides, so it is itself surrounded by the other external liquid. The albumen of a fecundated egg, is as sweet and free from corruption, during all the time of incubation, as it is in new laid eggs; as is also the vitellus. As the eggs of hens consist of two liquors separated one from another, and distinguished by two branches of umbilical veins, one of which goes to the vitellus, and the other to the albumen, so it is very probable that they are of different natures, and consequently appointed for different purposes. Aristotle says, that the vitellus is condensed by cold, but the albumen rather liquified. On the contrary, the albumen is condensed by fire; the vitellus retains its softness, if it be not burnt, and concretes more in boiling than in roasting. When the vitellus grows warm with incubation, it becomes more humid, and like melting wax, or fat; whence it takes up more space, for as the foetus increases, the albumen insensibly wastes away, and condenses: the vitellus, on the contrary, seems to lose little or nothing of its bulk, when the foetus is perfected, and only appears more liquid and humid, when the abdomen of the foetus begins to be formed.

The chick in the egg is first nourished by the albumen; and when this is consumed, by the vitellus, as with milk. If we compare the chalazæ to the extremities of an axis, passing through the vitellus, which is of a spherical form, this sphere will be composed of two unequal portions, its axis not passing through its center; consequently, since it is heavier than the white, its smaller portion must always be uppermost, in all positions of the egg. See CHALAZA.

The yellowish-white, round spot, called cicatricula, is placed on the middle of the smaller portion of the yolk, and therefore, from what has been said in the last paragraph, must always appear on the superior part of the vitellus. See the article CICATRICULA.

Not long before the exclusion of the chick, the whole yolk is taken into its abdomen; and the shell, at the obtuse end of the egg, frequently appears cracked, some time before the exclusion of the chick. The

chick is sometimes observed to perforate the shell with its beak. After exclusion the yolk is gradually wasted, being conveyed into the small guts by a small duct. Aristotle says, that long eggs produce the female, and round the male kind: Scaliger seems to be of the same opinion. Pliny is of the opposite side, for he pretends, that the long eggs are for the males, and the round for the females: but these opinions are supported by no foundation, as the authors give neither good reason nor experiments to prove their respective assertions, and it is very likely that both the round and the long eggs may indifferently produce male and female.

Eggs differ very much according to the birds that lay them, according to their colour, form, bigness, age, and the different way of dressing them: those most used in food, are hens eggs: of these, such as are new laid are best. Galen says, that the best and wholesomest eggs are those of the hen and the pheasant, but he disallows the use of those of the goose and the ostrich. Eggs should be moderately done: some authors also require, that they should be very white and long. Eggs are nourishing and good food, they increase the seminal juices, qualify the sharp humours of the breast, are good for phthical people, easily digest, ease the piles, and are looked upon to be good to make the voice loud and fine. When eggs are too cold, they heat too much, produce bad juice, and are more especially noxious to those who are of a hot and bilious constitution: they contain much oil and salt, and agree at all times with any age and constitution, provided they are endued with the good qualities before-mentioned.

Aquapendente relates several ways how to know whether eggs are new laid or not; he would have them held to a candle, and then see whether the humours contained therein are clear, thin and transparent; for if they be otherwise, it is a sign the eggs are old, because the effervescence has embroiled and confounded the insensible parts of these humours, and made them dark. Lastly, hold an egg to the fire, and if a little watry moisture sticks to it, it is new; if not, it is old; because a new laid egg is moister than the old, and its humours being thinner, work easier through the pores of the shell.

As to the preservation of eggs, it is observed that the egg is always quite full when it is first laid by the hen, but from that time it gradually becomes less and less so, to its decay; and however compact and close its shell may appear, it is nevertheless perforated with a multitude of small holes, though too minute for the discernment of our eyes, the effect of which is a daily decrease of matter within the egg, from the time of its being laid; and the perspiration is much quicker in hot weather than in cold.

To preserve the egg fresh, there needs no more than to preserve it full, and stop its transpiration; the method of doing which, is, by stopping up those pores with matter which is not soluble in watry fluids; and on this principle it is, that all kinds of varnish, prepared with spirit of wine, will preserve eggs fresh for a long time, if they are carefully rubbed all over the shell: tallow, or mutton fat, is also good for this purpose, for such as are rubbed over with this will keep as long as those coated over with varnish.

It was antiently thought, that none but birds and fishes, with some other animals, were produced *ab ovo*, from the egg, but many of the moderns incline to think that all animals, even man himself, is generated that way. In the testes of women, are found little vesicles, about the size of green pease, which are accounted eggs; for which reason, these parts which the antients called testicles, the moderns call ovaries: these eggs, fecundated by the volatile and spirituous part of the seed of the male, are detached from the ovary, and fall down the fallopian tubes into the uterus, where they grow and increase. This system is countenanced by abundance of observations and experiments.

See the article **GENERATION**.

*Artificial method of hatching EGGS.* See the article **HATCHING**.

Other eggs, improperly so called, are the white oblong bodies whereof insects are formed: such are the eggs of flies, gnats, butterflies, &c. which the antients called *vermiculi*. The female fly, after a congress with the male, is seldom so much as twenty-four hours before she begins to deposit her eggs upon some substance proper to give nourishment to the worms that are to be produced from them: these eggs in general are

white and oblong. The gnat arranges her eggs in the form of a small boat; each separate egg is of the form of a ninepin; the thicker end of these are placed downwards, and are all firmly joined to one another by their middles.

**EGG**, in architecture, an ornament in that form, cut in the echinus, or quarter round of the ionic and composite capitals. The profile or contour of the echinus is enriched with eggs and anchors placed alternately.

**EGLANTINE**, in botany, a name frequently given to the sweet-briar, a species of rose. See the article **ROSE**.

**EGLEFINUS**, in ichthyology, the name by which authors call the common haddock, a species of gadus. See the articles **GADUS** and **HADDOCK**.

**EGRA**, a city of Bohemia, situated on a river of the same name, about seventy-five miles west of Prague: east long. 12° 22', north lat. 50° 10'.

It is remarkable for its medicinal waters, esteemed good in hypochondriacal cases, and other diseases arising from infarctions of the bowels. They are gently cathartic, and afford a salt of the same mixture with our Epsom-salt, much used in Germany, and called from the name of the place Egranum Sal.

**EGRIPOS**, the same with Negropont. See the article **NEGROPONT**.

**EGYPT**, an extensive country of Africa, lying between 30° and 36° of east longitude, and between 21° and 31° of north latitude, and bounded by the Mediterranean on the north; by the Red-sea and Isthmus of Suez, which divide it from Arabia, on the east; by Abyssinia or Ethiopia, on the south; and by the deserts of Barca and Nubia, on the west; being six hundred miles in length from north to south; and from one hundred to two hundred in breadth from east to west. Egypt is subject to the grand signior, and governed by a bashaw, or viceroy. It owes its fertility to the annual overflowing of the Nile, which it begins to do in the months of May and June, and is usually at its height in September, from which time the waters decrease till May or June again. By this supply of water, Egypt is rendered so fruitful, as to serve Constantinople, and other places with corn, as it did Rome and Italy of old. They only harrow their grain into the mud, on the retiring of the water, and in March following, usually have a plentiful

plentiful harvest ; and the lands, not sown, yield good crops of grass for the use of the cattle. According to Mr. Sandys, no country in the world is better furnished with grain, flesh, fish, sugar, fruits, melons, roots, and other garden stuff, than the lower Egypt.

**EGYPTEN**, a town of Courland, seventy miles south-east of Mittau.

**EGYPTIANS**. See the article **GYPSIES**.

**EJACULATOR**, a muscle of the penis, otherwise called the elevator.

**EICHTERNAC**, a town of Luxemburg, seven miles north-west of Treves.

**EIDER**, in ornithology, the same with St. Cuthbert's duck. See **DUCK**.

**EJECIT** *infra terminum*. See the article **QUARE EJECIT**.

**EJECTA**, a term used, by lawyers, for a woman deflowered, or cast from the virtuous.

**EJECTION**, in the animal oeconomy, evacuation, or the discharging any thing through some of the emunctories, as by stool, vomit, &c.

**EJECTIONE CUSTODIÆ**, in law, a writ that lies against a person who casts out the guardian from any land during the minority of the heir.

The writ *ravishment de gard* is of the like nature with this ; as is also *droit de gard*.

**EJECTMENT**, *ejectione firmæ*, in law, a writ, or action, which lies for the lessee for years, on his being ejected, or put out of his land before the expiration of his term, either by the lessor, or a stranger. It may also be brought by the lessor against the lessee, for rent in arrears ; or holding over his term, &c. Ejectment of late years is become an action in the place of many real actions, as writs of right, formedons, &c. which are very difficult, as well as tedious and expensive ; and this is now the common action for trial of titles, and recovering of lands, &c. illegally held from the right owner, yet where entry is taken away by disents, fines, recoveries, disseisins, &c. an ejectment shall not be brought ; whereby, we find, that all titles cannot be tried by this action.

The method of proceeding in the action of ejectment is to draw a declaration, and feign therein a lease for three, five, or seven years, to him that would try the title ; and also feign a casual ejector, or defendant, and then deliver the declaration to the ejector, who serves a

copy of it on the tenant in possession, and gives notice, at the bottom, for him to appear and defend his title ; or that he the feigned defendant will suffer judgment by default, whereby the true tenant will be turned out of possession ; to this declaration the tenant is to appear, the beginning of next term, by his attorney, and consent to a rule to be made defendant, instead of the casual ejector, and take upon him the defence, in which he must confess lease, judgment, entry, and ouster, and at the trial stand upon the title only : but in case the tenant in possession does not appear, and enter into the said rule in time, after the declaration served, then, on affidavit being made of the service of the declaration, with the notice to appear, as aforesaid, the court will order judgment to be entered against the casual-ejector by default, and thereupon the tenant in possession, by writ *habere facias possessionem*, is turned out of his possession. On the trial in ejectment, the plaintiff's title is to be set forth from the person last seized in fee of the lands in question, under whom the lessor claims down to the plaintiff, proving the deeds, &c. and the plaintiff shall recover only according to the right which he has at the time of bringing his action. And here, another who hath title to the land, upon a motion made for that purpose, may be defendant in the action with the tenant in possession, to defend his title ; for the possession of the lands is primarily in question, and to be recovered, which concerns the tenant, and the title thereto is tried collaterally, which may concern some other.

**EIENHOVEN**, a town of dutch Brabant, fifteen miles south of Boisleduc.

**EIFIELD**, or **ELFIELD**, a town of lower Saxony, six miles north-west of Mentz.

**EIGHT**, or **PIECE OF EIGHT**. See the article **COIN**.

**EIGHTH** pair of the nerves. See the article **NERVE**.

**EIMBECK**, a town of lower Saxony, belonging to the elector of Hanover, twenty-five miles south of Hildesheim.

**EINECIA**, the same with *esnechy*. See the article **ESNECY**.

**EIRE**, or **EYRE**, among lawyers. See the article **EYRE**.

**EISLEBEA**, a town of Upper Saxony, five miles east of Mansfield, remarkable for being the birth-place of Luther.

**EISNACH**, or **EYSNACH**. See the article **EYSNACH**.

**ELABORATORY**, the same with laboratory. See the article **LABORATORY**.

**ELÆAGNUS**, **DUTCH MYRTLE**, in botany, a genus of trees, belonging to the *tetrandria-monogynia* class of Linnæus, the characters of which are, that it has no flower-petals; the fruit is an oval, obtuse, and smooth drupe, including an oblong kernel or nut.

As to the medicinal virtues of its leaves, which are the only parts in use, they are reputed drying, discutient, and good against worms.

**ELÆAGNON** of **THEOPHRASTUS**, the same with the *agnus castus*, or *vitex*. See the article **AGNUS**.

**ELÆOMELI**, among antient physicians, a sweet-tasted oil, of the consistence of honey, said to flow from the trunk of a tree in Syria, and to purge bilious humours.

**ELÆOSACCHARUM**, in pharmacy, a preparation of some essential oil with sugar, thus performed: grind an ounce of dry loaf-sugar to an impalpable powder, in a glass-mortar, and with a glass-pestle, and by degrees add thereto a dram of any essential oil, or only half a dram, if the oil be very tenacious; and continue rubbing them together, till all the oil be thoroughly mixed, and drank in by the sugar. If a little fresh white of an egg be added in the grinding, the oil becomes thereby more easily miscible; but the mixture will not keep so long, without turning rancid.

If these elæosaccharums be well prepared, dried, and put into clean glasses, exactly closed with glass stopples, they may be preserved a long time perfect. By this method, therefore, you may prepare an excellent medicine, rich in virtues: for if the elæosaccharum of mint be dissolved in distilled mint-water, then strengthened with the addition of spirit of mint, and the mixture sweetened with the syrup of the same plant, the whole virtues of mint may be thus obtained. *Boerhaave*.

**ELÆOTHESIU**Μ, *ἐλαίοθσιον*, in antiquity, the anointing-room, or place where those who were to wrestle, or had bathed, anointed themselves. See **GYMNASIU**Μ.

**ELAPHEBOLIUM**, *ἐλαφεβόλιον*, in grecian antiquity, the ninth month of the athenian year, answering to the latter part of February and beginning of March. It consisted of thirty days, and took its name from the festival elaphebolia, kept

in this month, in honour of Diana the huntress; on which occasion, a cake made in the form of a deer, was offered to her.

**ELAPHOBOSCU**Μ, a name sometimes used for the parsnep. See **PARSNEP**.

**ELAPHOCAMELU**Σ, in zoology, the same with the glama, or peruvian camel. See the articles **CAMEL** and **GLAMA**.

**ELAPS**, or **ELAPHIS**, in zoology, a species of serpent, with longitudinal black lines running along the back from the head to the tail. See **SERPENT**.

**ELASMIS**, in natural-history, a genus of talcs, composed of small plates in form of spangles, and either single, and not farther fissile, or, if complex, only fissile to a certain degree, and that in somewhat thick laminæ. See the article **TALC**.

Of these talcs there are several varieties, some with large and others with small spangles, which differ also in colour, and other peculiarities.

**ELASTIC**, in natural philosophy, an appellation given to all bodies endowed with the property of elasticity. See the next article.

**ELASTICITY**, or **ELASTIC FORCE**, that property of bodies wherewith they restore themselves to their former figure, after any external pressure; being the same with what is otherwise called springiness, very observable in a bent bow, steel springs, and the like.

A perfectly elastic body, is that which restores itself with the same force wherewith it was bent, or depressed; those which do not so restore themselves with exactly the same force, being called imperfectly elastic bodies.

Philosophers account for elasticity from the principles of corpuscular attraction and repulsion: thus, if a steel spring, wire, or piece of very thin glass, be bent out of its natural position, the particles on the convex part are forced from the intimate union they had before; and, on the concave part, they are forced nearer together, or harder upon each other, than in the natural state: in both which cases, there will be a considerable resistance to overcome, and consequently require a superior force. During this state of the particles, they may be said to be under a sort of tension on one side, and compression on the other; and since by this force they are not drawn out of each others attraction, as soon as the force is remitted or ceases to act, the attractive power reduces the particles, and unbends the wire. Now it is well known, that many sub-

Fig. 1. The Common EEL.

Fig. 2. ELASTICITY. N<sup>o</sup> 1.

Fig. 3. ELEVATORY.

substances are composed of such fibrous parts or filaments which resemble fine wires, and are interwoven and disposed in such a manner, as in sponge, for instance, that they cannot be compressed without being bent or wrested from their natural position; whence all such bodies will, in such cases, exert a spring or force to restore themselves, in the same manner that the bent wire did.

All bodies that we know of, are in some degree or other elastic, but none of them perfectly so; such are most metals, semi-metals, stones, and animal and vegetable substances, however they may differ in degree. Elasticity seems to vary, according to the different densities of bodies; for the more metals are hammered, the more elastic they become; and the elasticity of the hardest tempered steel to that which is soft, may be found to be as 7809 to 7738.

We may consider all elastic bodies to be made up of such strings or fibres as AB (plate LXXXV. fig. 2. n° 1.) or rather of elastic strata parallel to each other, represented by AB, in the ball DC. If this ball be struck at D by a hard or elastic body, all the strata will be bent in towards C, as expressed by the dotted lines, whilst the ball is flattened or dented at D. But the strata quickly restoring themselves, the surface of the ball re-assumes its first figure, and that more or less exactly, according as the elasticity is more or less perfect.

The great law of perfectly elastic bodies, is, that their relative velocity will remain the same before and after collision; that is, perfectly elastic bodies will recede from one another after the stroke, with the same velocity that they came together. Many curious phænomena may be explained from this property in bodies.

If the ivory ball A, (*ibid.* n°. 2.) weighing two ounces, strike with the velocity 16 against B at rest, weighing also two ounces, the body B will move forward after the stroke with the velocity 16, A remaining at rest in its place. The reason of this is, that the body A loses one half of its motion by striking the equal body B, and the other half by the elasticity of B, recovering its former figure. From this experiment, several pretty odd phænomena arise: thus, if a row of shovel-board pieces (that is, metalline cylinders of about half an inch in height, and two inches diameter) be laid upon a smooth table, and you take a single

piece, and drive it against the row, the last piece of the row will fly off; for if A (*ibid.* n° 3.) strike the row of pieces B, C, D, E, F, G, H, I, in the direction Aa, then will the last piece I fly off to i with the same velocity that A struck B: and whatever be the velocity of A, no other piece but the last piece I will fly off. But if you take two pieces, as A and B, (*ibid.* n° 4.) and strike them together against the row C, D, E, F, G, H, I, the two last pieces, H and I, will fly off from the other end of the row with the same velocity that A and B made the stroke.

If three or more pieces are made use of to make the stroke, the very same number will fly off from the other end of the row; and, it is to be observed, that the same will happen with equal elastic balls, suspended in a row by strings of the same length.

Again, if the elastic body A, (*ibid.* n° 5.) weighing four ounces, strike the quiescent body B, weighing only two ounces, with a velocity equal to 12; then will the velocity of A, after the stroke, be 4, and that of B 16. Just the reverse of this happens, when a lesser body strikes against the greater; in which case, the striking or lesser body will be reflected with one fourth of its first motion, and the greater be carried forward with a motion which is as 16.

The magnitude and motions of spherical bodies perfectly elastic, and moving in the same right line, and meeting each other, being given, their motion after reflection may be determined thus: let the bodies be called A and B, and the respective velocities  $a$  and  $b$ ; then, if the bodies tend the same way, and A, moving swifter than B, follows it, the velocity of the body A, after the reflection, will be

$aA - aB + 2bB$   
 $\frac{A + B}{}$ , and that of the body  
 $B = \frac{2aA - bA + bB}{A + B}$ ; but if the bodies meet, then, changing the sine of  $b$ , the velocity of A will be  $\frac{aA - aB - 2bB}{A + B}$ ,

and that of B =  $\frac{2aA + bA - bB}{A + B}$ : and if

either of these happen to come out negative, the motion after the stroke tends the contrary way to that of A before it; which is also to be understood of the motion of the body A, in the first case.

**ELATE**, in botany, the same with the phoenix of Linnæus. See **PHOENIX**.

**ELATER**, in zoology, a genus of four winged flies, of the order of the coleoptera; the body of which is oblong, and the antennæ letaceous: add to this, that the creature, when laid on its back, leaps with great agility.

There are a great many species of elater, distinguished by their different colours, as red, brown, green, blue, and black; which, in some species, are variously blended together.

**ELATERIUM**, in botany, a name by which Boerhaave calls the momordica of other botanists. See **MOMORDICA**.

**ELATERIUM**, in pharmacy, imports, in general, any purging medicine; but is particularly applied to those which operate with violence. Hence the word was transferred to the wild cucumber, and the preparations thereof. See the article **CUCUMBER**.

In the writings of Hippocrates, elaterium is frequently mentioned as an external application, of a digestive and detergent nature.

**ELATINE**, **FLUELLIN**, in botany, a genus of the *clandria-tetragynia* class of plants, the corolla of which consists of four ovated, obtuse, sessile, patent petals: the fruit is an orbiculated great capsule, compressed globeways, containing four cells, and consisting of four valves: the seeds are numerous, lunulated, erect, and surrounding the receptacle in the manner of a wheel. This plant is an aperient, resolvent, and vulnerary.

**ELATINE** is also used by Dillenius for antirrhinum, or snapdragon. See the article **SNAPDRAGON**.

**ELAWANDUM**, in zoology, a species of monkey with whitish-grey hair, and a long black beard.

**ELBE**, a large river in Germany, which, rising on the confines of Silesia, runs through Bohemia, Saxony, and Brandenburg; and afterwards dividing the dutchy of Lunenburg from that of Mecklenburg, as also the dutchy of Bremen from Holstein, it falls into the german ocean, about seventy miles below Hamburgh.

It is navigable for great ships higher than any river in Europe.

**ELBOW**, in anatomy, the juncture of the cubitus and radius; or the outer angle made by the flexure or bend of the arm. See **CUBITUS** and **RADIUS**.

**ELBOW**, in architecture, a term used for

an obtuse angle of a wall, building, road, &c. which divides it from its right line.

**ELCESAITES**, in church-history, antient heretics, who made their appearance in the reign of the emperor Trajan, and took their name from their leader Elcesai. The elcesaites kept a mean between the jews, christians, and pagans; they worshipped but one God, observed the jewish sabbath, circumcision, and the other ceremonies of the law. They rejected the pentateuch, and the prophets; nor had they more respect for the writings of the apostles, particularly those of St. Paul. They detested chastity and continence, and obliged their disciples to marry. They acknowledged a messiah, whom they called their great king; but we do not know whether they meant Jesus Christ, or some pretended messiah. They gave him a human form, but invisible, the dimensions of which were thirty-eight leagues in height, and so in proportion. They pretended that the Holy Ghost was a woman, and of the same size with the messiah. They were much addicted to judicial astrology, magic, and enchantments. They held that it is lawful to renounce the faith with the lips, provided a man kept it in his heart.

**ELDER**, or **SENIORS**, in jewish history, were persons the most considerable for age, experience, and wisdom. Of this sort were the seventy men whom Moses associated to himself in the government of his people; such, likewise, afterwards were those who held the first rank in the synagogue, as presidents.

In the first assemblies of the primitive christians, those who held the first place, were called elders. The word presbyter, often used in the New Testament, is of the same signification: hence the first councils of christians were called presbyteria, or councils of elders.

**ELDER** is also a denomination still preserved in the presbyterian discipline. See the article **PRESBYTERIAN**.

They are officers who, with the ministers and deacons, compose the sessions of the kirk. The elder's business is to assist the minister in visiting the congregation upon occasion, to watch over the morals of the people of his district, and to give them private reproof in case of any disorder; but if the scandal be gross, or the person obstinate, he lays the thing before the session. The elders are chosen from among the most substantial, knowing, and regular people, by the session or consistory

istory of the kirk. There is a ruling elder in every session ; he should be a man of spotless character, and of principal consideration and interest in his parish : he is chosen out of the kirk-session : the congregation is to approve of the choice : the minister ordains him before the congregation : he may be chosen to assist in any church judicatory, and in all manner of government and discipline, has an equal vote with the minister.

ELDER, or ALDER, *alnus*, in botany. See the articles ALDER and ALNUS.

ELECAMPANE, *belemium*, is ranked by botanists among the star-worts. See the article ASTER.

The virtues of elecampane are much cried up, as a stomachic, alexipharmic, and sudorific ; and therefore prescribed in crudities of the stomach, the cough, asthma, plague, and other contagious diseases. Externally, it is recommended against the itch, convulsions, and rheumatism.

ELECT, *electi*, among ecclesiastical writers, those whom God has chosen, or predestinated to be saved. See the article PREDESTINATION.

ELECT, in matters of polity, is applied to archbishops, and other ecclesiastical officers, who are chosen, but not yet consecrated ; as also to secular officers before they are invested with their office or jurisdiction : thus the emperor is said to be elect, before he is inaugurated ; and the lord mayor, before his predecessor's mayoralty is expired.

ELECTARY, the same with electuary. See the article ELECTUARY.

ELECTION, the choice that is made of a person, or thing, in preference of any other ; as in the election of an emperor, of a pope, of a bishop, of members of parliament, &c. See EMPEROR, CONCLAVE, BISHOP, and PARLIAMENT.

ELECTION is also the state of a person who is left to his own free will, to take or do one thing or another, which he pleases. If a person makes a lease of land rendering so much money in rent, or a quarter of corn, &c. the lessee shall have his election which he will render, as being the first agent, by payment of the one, or delivery of the other. Where nothing passes to a grantee before election, to have one thing or the other, and no time is appointed, the election ought to be made during the life of the parties, and not afterwards : but where an estate conveys immediately to the grantee, or donee, &c.

in that case, election may be made by them, or their heirs and executors. And when a donee, or grantee, has his election in what manner he will take the thing granted, there the title or interest passes immediately, and the party and his heirs, &c. are at liberty to make the election when they will.

ELECTION of a clerk of statutes-merchant, is the writ that lies for the choice of a clerk, to take bonds, called statutes-merchant ; and issues out of the court of chancery, upon suggestion that the clerk formerly assigned is gone to dwell in another place, or is under some impediment to attend the duty of his office.

ELECTION of ecclesiastical persons. There is to be a free election for the dignities of the church, in which no person shall give any disturbance, on pain of forfeiture. Where any person that has a vote in such elections take any reward for an election in any church, college, school, &c. the election shall be void.

ELECTION of a verderer of the forest, a writ which lies for the choice of a verderer, on the death or removal of any such officer of the forest. It is directed to the sheriff, and the verderer is to be elected by the freeholders of the county.

ELECTION, in theology, signifies the choice which God, of his good pleasure, makes of angels and men for the objects of his grace and mercy. See GRACE, REPROBATION, and PREDESTINATION.

ELECTION is also used, by some medical writers, as a part of pharmacy, which consists in a knowledge of the various simples which compose the materia medica, and directs the choice of drugs.

ELECTION, in numbers, is, with regard to combinations, the different ways of taking any number of quantities given : thus, the quantities *abc* may be taken different ways, as *abc*, or *ab*, *ac*, and *a*, *b*, *c*.

ELECTIVE, something that is determined by election. See the preceding article.

The empire of Germany is elective, as is the kingdom of Poland ; and among us, the magistrates of cities, and other corporate-towns, members of parliament, &c. are elective.

ELECTOR, a person who has a right to elect or choose another to an office, honour, &c.

Electors are particularly, and by way of eminence, applied to those princes of Germany in whom lies the right of electing the emperor : being all sovereign princes, and the principal members of the empire.

The

The electoral college, consisting of all the electors of the empire, is the most illustrious and august body in Europe. Bellarmine and Baronius attribute the institution of it to pope Gregory V. and the emperor Otho III. in the tenth century ; of which opinion are the generality of historians, and particularly the canonists : however, the number of electors was unsettled, at least, till the thirteenth century. In 1356 Charles IV. by the golden bull, fixed the number of electors to seven ; three ecclesiastics, *viz.* the archbishops of Mentz, Treves, and Cologne ; and four seculars, *viz.* the king of Bohemia, count Palatine of the Rhine, duke of Saxony, and marquis of Brandenburg. In 1648 this order was changed, the duke of Bavaria being put in the place of the count Palatine, who having accepted the crown of Bohemia, was out-lawed by the emperor ; but being, at length, restored, an eighth electorate was erected for the duke of Bavaria. In 1692, a ninth electorate was created, by the emperor Leopold, in favour of the duke of Hanover, of the house of Brunswick Lunenburg.

There is this difference between the secular and ecclesiastic electors, that the first have an active and passive voice, that is, may choose and be chosen ; the last, an active only. The three archbishops are to be thirty years old, before they can be advanced to the dignity ; the seculars, eighteen, before they can perform the office themselves. These last have each their vicars, who officiate in their absence.

Besides the power of choosing an emperor, the electors have also that of capitulating with, and deposing him ; so that, if there be one suffrage wanting, a protest may be entered against the proceedings. By the right of capitulation, they attribute to themselves great privileges, as making of war, coining, and taking care of the public interest and security of the states ; and the emperor promises, upon oath, to receive the empire upon these conditions.

The electors have precedence of all other princes of the empire, even of cardinals and kings ; and are addressed under the title of electoral highness.

Their several functions are as follow : the elector of Mentz is chancellor of Germany, convokes the states, and gives his vote before any of the rest. The elector of Cologne is grand chancellor of Italy, and consecrates the emperor. The elector of

Treves is chancellor of the Gauls, and confers imposition of hands upon the emperor. The count Palatine of the Rhine is great treasurer of the empire, and presents the emperor with a globe at his coronation. The elector of Bavaria is great master of the imperial palace, and carries the golden apple. The marquis of Brandenburg is grand chamberlain, and puts the ring on the emperor's finger. The elector of Saxony is grand marshal, and gives the sword to the emperor. The king of Bohemia is grand butler, and puts Charlemaign's crown on the emperor's head. Lastly, the elector of Hanover, now king of Great Britain, is arch treasurer, though first erected under the title of standard-bearer of the empire.

**ELECTORAL**, in general, something belonging to electors. See **ELECTOR**.

**ELECTORAL CROWN**, or **CORONET**. See the article **CROWN**.

**ELECTORATE**, a term used as well to signify the dignity of, as the territories belonging to, any of the electors of Germany : such are Bavaria, Saxony, &c. Contrary to the common usage of Germany, the electorate, or territories belonging to electors, is hereditary ; passing entire to the eldest son.

**ELECTRICITY**, in physiology, that property of certain bodies, whereby, after being rubbed, excited, or heated in some particular degree, they acquire a power of attracting and repelling other remote bodies ; and frequently of emitting sparks and streams of light.

The ancients, having observed that amber, which they called *electrum*, upon being rubbed, attracts bits of straw, down, and other light bodies, first gave this property the name of electricity, which they thought peculiar to amber and a few stones mentioned by Theophrastus, Pliny, and some others. But the philosophers of the last, and more particularly of the present age, have found that numbers of other bodies possess this quality ; and made so many discoveries in electricity, that there is scarce any other subject in natural philosophy that has given occasion to more experiments.

This quality is of two sorts, *viz.* vitreous electricity, or that which belongs to glass ; and resinous electricity, or that which belongs to amber, rosin, wax, gum, and such like substances.

The bodies susceptible of electricity, are also divided into two classes : the one are electrical of themselves, or *electricæ per se* ; that

that is, they contain that quality in themselves, and need only be rubbed, &c. to excite it : the others do not contain that virtue in themselves, or they have so little of it, as to be reckoned to have none at all ; yet they acquire it by communication, or by emanation derived to them by a body that is electrical *per se* : those bodies are simply called non-electrics, or *non electrica per se*.

The electrics *per se*, or, as they are otherwise called, the originally electrics, are, according to Muschenbroeck, all sorts of gems, several stones, all crystals and resinous substances, sulphur, red arsenic, salts, alum ; all sorts of glass, porcellane, dried vegetables ; all woods, ropes, threads of lint, paper, the leaves of trees, the harder resins, pitch, cotton ; parts of animals, as their feathers, hair, horns, bones, ivory, whale-bone, the hide, parchment, the shells of fishes, silk, strings made of dried guts, gum, sealing-wax, feathered or hairy living animals, as cats, dogs, cocks, &c.

The non-electrics are several naked animals, or such as are covered with neither hair nor feathers ; metals, semi-metals, earths and dust, which, by reason of its minuteness, won't bear to be rubbed separately ; all watry gums, opium, galbanum, ammoniac, assafoetida, camphor ; all sorts of bodies that liquify with a small heat, all moist bodies, all fluids which will not bear rubbing, &c.

Electricity, according to the same author, consists in subtle exhalations, which, in exciting the electrical body, are put into motion ; and which, by flying to and from it, agitate all those light bodies that fall within the sphere of their attraction.

That these exhalations, or subtle effluvia, constitute electricity, appears from hence.

1. From the touch, as these bodies are perceived to be surrounded with a most subtle atmosphere, or covered with a gentle blast of wind, that continues to breathe every where around them. 2. From that offensive smell, which resembles phosphorus, the phlegm of aqua regia, or the spirit of vitriol. 3. Being taken into the mouth, they yield an acid and astringent taste. 4. They seem to adhere to the extremities of the bodies which they surround, and from which they recede, in the form of sparks, and of a subtle lucid flame. 5. This flame is sometimes attended with an explosion, that may be heard at the distance

of two hundred paces : besides, the greater flames occasion a continued hissing, or crackling noise in the air. Since, therefore, the electrical effluvia affect all the human senses, we can no longer doubt of their being a corporeal fluid.

Mr. Watson thinks, that electricity is not furnished from the electric bodies employed in the experiments, nor from the circumambient air ; but that it is the effect of a very subtile and elastic fluid occupying all bodies, in contact with the teraqueous globe ; that every where, in its natural state, it is of the same degree of density ; that glass and other bodies, which are electrics *per se*, have the power of taking this fluid from one body and conveying it to another, in a quantity sufficient to be obvious to all our senses ; that, under certain circumstances, it is possible to render the electricity in some bodies more rare than it naturally is, that, by communicating this to other bodies, to give them an additional quantity, and make their electricity more dense ; and that these bodies will thus continue, until their natural quantity is restored to each ; that is, by those which have lost part of theirs, acquiring what they have lost, and by those to whom more has been communicated, parting with their additional quantity. Both one and the other of these is, from the elasticity of the electric matter, attempted to be done from the nearest non-electric ; and when the air is moist, this is soon accomplished by the circumambient vapours, which here may be considered as preventing, in a very great degree, our attempts to insulate non-electric bodies.

In order to illustrate the phenomena of electricity, we shall give some select experiments.

1. Get a glass tube AB, of about three feet and a half in length, an inch and a half in diameter, and its sides a line thick : rub it with a piece of stuff, paper, or, which is still better, with the hand, provided it be very dry : you will succeed better if your hands be rubbed with chalk, or white lead. Afterwards bring this rubbed tube near any light bodies, as gold-leaf laid upon a glass stand CD ; then will the gold-leaf be attracted and repelled in the manner represented in plate LXXXVI. fig. 1.

If you do this in such a manner, that the gold-leaf, for example, be perpendicularly repelled above the tube, and that

it meet with no other body, it will sustain itself in the air, always at the same distance from the tube, and may be conveyed in this situation quite round the room; but if it touch any other body, it will come back and adhere to the tube, and then it will be repelled anew as at the first.

2. Again, if the tube be rubbed anew, pretty briskly, it will attract a feather, or other light body, at a considerable distance; and after they have stuck to it for some time, they are again driven off, and it will constantly repel them, till they are touched by some other non-electrical body, as a finger or stick: on which they will be again attracted by the tube; and if the finger be held pretty near the tube, the feather will alternately fly from the tube to the finger, and back again; always stretching out its fibres the way that it is going, and that before it comes off from the finger or tube. See plate LXXXVI. n° 2.

Before we proceed to more complicated experiments, it will be proper to observe, that, in order to know that non-electrics have received the communicated electricity, they must be insulated: that is, they must not be suspended from, nor supported by any body, but what is an electric *per se*. For if one non-electric be touched by another, and this by a third, &c. all the electricity received by the first will go to the second, and from this to the third, &c. till at last it be lost upon the ground. But, if several non-electric bodies, touching one another, are at length terminated by electric bodies, in that respect they make but one body, and receive and retain electricity for some time. From hence it may be observed, that non-electrics are conductors of electricity. Water conducts it very well, but metals are the most convenient conductors.

3. Let an iron-rod, pointed at one end, be suspended on silk lines, and by means of a glass or rosin-sphere (which can be more regularly and constantly excited than a tube) be electrified, it will be found to have all the properties of the excited tube already mentioned: that end of the iron-rod, suspended as already mentioned, which is next the sphere, must point to it at the distance of a quarter of an inch. This apparatus being disposed, as represented, *ibid.* n° 3. the globe will be electrified in whirling round against a leather cushion rubbed with whiting, or dry hand-rubbed in the same

manner. When the rod, by this means, is strongly electrified, a stream of light, in diverging rays, will be seen to issue from that point of it which is most distant from the sphere; and if any non-electric body, as a finger, be placed within a quarter of an inch of the said flame, it will perceive a gentle blast of wind from the end of the iron; that is, the electrical fire will issue out from the point in such a manner, as to blow against the finger very sensibly; and if the finger be still held nearer, the large pencil of rays will be condensed in such a manner, as to run out from the point upon the finger, in a stream or body of dense, yellow fire, and strike the finger like a gentle *jet d'eau*. The rod suspended before the glass-sphere, is properly termed the prime conductor in this machine.

4. While the flame continues to appear from the end of the iron-rod, the finger being placed any where upon it, the flame at the end disappears immediately; and when the finger is taken off, it again instantly appears; and so by putting the finger off and on successively, the electric flame will appear and disappear alternately. These eruptions of the electrical fire will snap very sensibly, both to the eye and the ear, upon any part of the rod that the finger is pointed to. See plate LXXXVI. n° 3.

5. If a chain, or hempen cord, be suspended by silken strings all round the room, of any length you please, and one end thereof be hung, by a loop, across the rod, the electrical fire will instantly be transmitted through the whole length of the chain, and appear upon every part at the approach of the finger, and be heard to snap and strike with as great force as from the rod itself.

6. Take two plates of metal, very clean and dry, whose surfaces are nearly equal; hang one of them horizontally to the electrified rod, and bring under it, upon the other, any thin light body, as silver leaf, &c. When the upper plate is made electrical, the silver will be attracted by it; and if the under plate is held at a proper distance, will be perfectly suspended at right angles to the plates, without touching either of them; but if they are either brought nearer together, or carried farther asunder, the leaf will cease to be suspended, and will jump up and down between them.

The same effect will be produced, if the experiment is reversed by electrifying the bottom

ELECTRICITY.

bottom plate, and suspending the other over it.

7. The following improvement, upon the electrical machine of the abbe Nollet, already exhibited, was made by Mr. Wat-son in 1746. In the periphery of his machine, see plate LXXXVI. n<sup>o</sup> 4. were cut four grooves, corresponding with four globes, which were disposed vertically: one, two, or the whole number of these globes might be used at pleasure. They were mounted upon spindles, and the leather-cushion with which they were rubbed, was stuffed with an elastic substance, as curled hair, and rubbed over with whiting. One of the globes was lined to a considerable thickness with a mixture of wax and rosin; but no difference appeared in the power of this globe from the others.

For performing most of the following experiments, some have imagined a gun-barrel absolutely necessary, as the prime conductor; but Mr. Wat-son says, that a solid piece of metal, of any form, is equally useful; having observed the stroke from a sword, as violent as that from a gun-barrel.

If, to the suspended barrel, a sponge, thoroughly dry, be hung, it gives no appearance of fire, which shews it to be an electric substance; but if when the sponge has been immerged in water, it be suspended to the barrel, and the finger applied near it, the fire issues out with considerable force and snappings; and the drops, which, before the sponge was applied, fell very slowly, will now fall as fast: if the room be darkened, these drops will appear to be drops of fire, and illuminate the basin into which they fall.

8. If a phial of water is suspended to the prime conductor by a wire, let down a few inches into the water through the cork; and some metallic fringes, inserted into the barrel, touch the globe in motion, the electrical power may be so accumulated in the phial, that a man grasping it with one hand, and touching the gun-barrel with a finger of the other, will receive a violent shock through both his arms, especially at his elbows and wrists, and across his breast. The commotion arising from the discharge of accumulated electricity in a phial, may be felt by a great number of men at once. M. le Monnier, at Paris, is said to have communicated this shock through a line of men, and other non-electrics, measuring nine hundred toises, being more than an english mile;

and the abbe Nollet made the experiment upon two hundred persons ranged in two parallel lines.

9. If the electrical machine, and the man who turns the wheel thereof, be mounted on electrical cakes, the electrical power is so far from being increased, that, on the contrary, it is so much diminished, as to be oftentimes not at all perceptible.

10. A person standing on a cake of rosin, holding a chain fastened to the prime conductor, will be electrized; that is, he will be all over possessed with electric virtue; and, at the same time, feel nothing of it, unless some person standing by put his finger near to any part, and then the virtue will be emitted in form of fire, and snap and become very sensible to both the parties. See plate LXXXVII. fig. 1.

11. A person standing on rosin, holding the chain of the conductor, points his finger to the warm spirits of wine; and by communicating the electric fire thereto, kindles the rising vapour, and so sets the whole on fire. In this manner any sort of matter, which, when warmed, will send forth an inflammable vapour, will be set on fire. See plate LXXXVII. fig. 2.

The electrical commotion, mentioned in experiment 8, arising from an accumulation of the electrical fire, has been made very sensible quite cross the river Thames, by the communication of no other medium than the water of that river, and spirit of wine fired at that distance.

By comparing the respective velocities of electricity and sound, that of electricity, in any distance yet experienced, appears instantaneous.

12. If the globe be exhausted of all its air, and then whirled about, the electricity will be observed to act wholly within the globe, where it will appear, in a darkened room, in form of a cloud or flame of reddish or purple-coloured light, filling the whole capacity of the globe.

13. If a loadstone, armed with iron, be hung on to the gun-barrel by an iron-wire, the electric virtue will rush out from every part, but more forcibly from the iron than from the stone itself: for from the stone, it seems to be emitted in a more lax manner, and diffused in a sort of steam, or fiery vapour; whereas from the iron, it issues in a more impetuous, dense, and penetrating steam; by which we learn, that the two most considerable powers of nature, electricity and mag-

netism, do not always interfere, or impede each other's actions.

14. The method of firing gunpowder by the electric flame, has something particular in it; as it does not require any inflammable vapour to be previously raised. The powder may be fired thus: a small cartridge is filled with dry powder, hard rammed, so as to bruise some of the grains: two pointed wires are then thrust in, one at each end, the points approaching to each other in the middle of the cartridge, till within the distance of half an inch: then the cartridge being placed in the circle, when four electrified glass-jars are discharged, the electric flame leaping from the point of one wire to the point of the other within the cartridge, among the powder, fires it, and the explosion of the powder is at the same instant with the crack of the electrical discharge.

15. As to metals, Mr. Franklin tells us, that he has been able, by electricity, to give polarity to needles, and to reverse it. A shock from four large glass-jars sent through a fine sewing needle, gives it polarity.

16. In consequence of Mr. Franklin's hypothesis, of being able, by a proper apparatus, to collect the electricity from the atmosphere during a thunder-storm, it has been found, that a pointed bar of iron, forty feet high, being placed upon an electric body; and a stormy cloud having passed over the place where the bar stood, those, appointed to observe it, attracted from it sparks of fire, perceiving the same kind of commotions as in the common electrical experiments. The like effect followed when a bar of iron ninety-nine feet high was placed upon a cake of rosin two feet square, and two inches thick: these were the first experiments made, but they have since been sufficiently varied and verified, so that it seems now certain, 1. That a bar of iron, pointed or not, is electrized during a storm. 2. That a vertical, or horizontal situation, is equally fitting for these experiments. 3. That even wood is electrized. 4. That, by these means, a man may be sufficiently electrized to set fire to spirit of wine with his finger, and repeat almost all the usual experiments of electricity.

17. Mr. Franklin has contrived a very ingenious and easy method of trying experiments of this kind, by means of an electrical kite, made of a large thin silk

handkerchief, extended and fastened, at the four corners, to two slight strips of cedar, of sufficient length for this purpose. This kite being accommodated with a tail, loop, and string, will rise in the air like those of paper. To the top of the upright stick of the cross, is to be fixed a very sharp-pointed wire, rising a foot or more above the wood. To the end of the twine, next the hand, is to be tied a silk ribband; and, where the twine and silk join, a key may be fastened. The kite is to be raised when a thunder-gust appears to be coming on; and as soon as the thunder clouds come over the kite, the pointed wire will draw the electric fire from them, and the kite, with all the twine, will be electrified; and the loose filaments of the twine will stand out every way, and be attracted by an approaching finger. When the rain has wet the kite and twine, so that it cannot conduct the electric fire freely, it will stream out plentifully from the key on the approach of a man's knuckle. At this key a phial may be charged; and from the electric fire, thus obtained, spirits may be kindled, and all the other electrical experiments be performed, which are done by the help of a glass-sphere or tube; and the sameness of the electric matter with that of lightning, may thereby be completely demonstrated.

From this identity some have conceived hopes of depriving the clouds of all their thunder, and thereby rendering thunder-storms harmless.

18. Mr. Stephen Gray, just before he died, hit upon an experiment which seemed to indicate, that the attractive power, which regulates the motions of the heavenly bodies, is of the electric kind. The experiment was thus: he fixed a large, round, iron-ball upon the middle of a large cake of rosin and wax; and exciting the virtue strongly in the cake, a fine feather, suspended by a thread, and held near the iron-ball, was carried round it, by the effluvia, in a circular manner, and performed several revolutions: it moved the same way with the planets, from west to east, and its motion, like theirs, was not quite circular, but a little elliptical.

These being most of the capital experiments hitherto exhibited in electricity, we shall conclude this article by mentioning some of the medicinal virtues lately attributed to this subject of philosophy. It has been pretended, that odours will

will pervade electrified globes and tubes of glass; and that the medicinal effects of drugs might likewise be transmitted this way; as also, that, if persons were to hold in their hands, or place under their naked feet, odoriferous or purging substances, and were then to be electrized, they would be sensible of the effects of these substances: but this seems now to be an imposition on the credulity of the world, no such effects having ever been perceived. However, it does not follow that medicinal advantages are not to be gained from electricity itself; so subtle and so elastic a fluid admitted in a large quantity into our bodies, as, from undoubted experience, it greatly heats the flesh and quickens the pulse, may more especially, when assisted with the expectation of success in the patient, in particular cases, be attended with advantages. In effect, we meet with some cures performed in paralytic cases, by the force of electricity.

**ELECTRUM**, *amber*, in natural history. See the article **AMBER**.

**ELECTUARY**, in pharmacy, a form in which both officinal and extemporaneous medicines are frequently made.

It may be considered as a number of boluses united together, but is made somewhat softer, by an addition of a due proportion of preserves or syrups. When the consistence is very soft, it is called, sometimes, by the name of opiata. See the articles **BOLUS** and **OPATA**.

The principal consideration in prescribing officinal electuaries is, that such things only be put together, as will not, by any opposite qualities, destroy one another, or lose their natural properties, by lying long in this manner; and likewise that the whole be of a consistence that will hold ingredients of different gravities in equal mixture.

Extemporaneous electuaries differ principally from the officinal, in that the latter are confined to such things as will for a long time keep together; whereas the former may be ventured on with materials which will not remain long without change, provided they agree in intention; as conserves with the testaceous powders, preparations with steel, and the like, will continue together long enough for present use, but will not lie many days without fermenting and spoiling.

The stronger cathartics ought not to be trusted in this form, because the manner of taking does not sufficiently ascertain

the dose. The most powerful alexipharmics also, which are commonly given in acute cases, are not conveniently thus trusted, so that an electuary is hardly ever met with in a fever. The quantity of an extemporaneous electuary should seldom exceed three ounces; and thereabout will an ounce and a half of conserve, two drams of the common powders, with a sufficient quantity of syrup, amount to; though cinnabar, and some of the heavier things, will not take up so much: and if this rule, as to quantity, be not observed by the prescriber, but more be ordered, it is a common thing for the compounder to do it for him, by proportioning the materials suitable thereto, as by making up half or a third of what is directed.

**ELEEMOSYNÆ** and **ELEEMOSYNARIUS**. See **ALMS** and **ALMONER**.

**ELEGANCE**, or **ELEGANCY**, an ornament of politeness and agreeableness, shewn in any discourse, with such a choice of rich and happy expressions, as to rise politely above the common manners, so as to strike people of a delicate taste, and diffuse a relish which hits every body.

It is observed that elegance, though irregular, is preferable to regularity without elegance: that is, by being so scrupulous of grammatical construction, we lose certain licences wherein the elegance of language consists.

**ELEGANCE**, in painting, a certain manner which embellishes and heightens objects, either as to their form, colour, or both, without destroying or perverting the truth. It is not seen in the correctness of the design, as appears from Raphael, and the antique. It is most sensibly perceived in works otherwise careless and inaccurate, as in Corregio, where, notwithstanding all the defects as to justness of design, there is an elegance even in the manner of the design itself, as well as in the turn of the attitudes, &c.

**ELEGIAC**, in antient poetry, any thing belonging to elegy. See **ELEGY**.

Elegiac verses are alternately hexameter and pentameter, as in the following verses of Ovid. See the articles **HEXAMETER** and **PENTAMETER**.

*Flebilis indignos, elegeia, solve capillos:*

*Ab nimis ex vero nunc tibi nomen erit.*

Sometimes, though very rarely, the pentameter preceded the hexameter, as in the following verses of Athenæus.

Ἑνδαιμὼν Χαρίτων, καὶ Μελανίππῳ ἐφύ  
Θείας ἀγιστρὲς ἐφεμερίους φιλοτῆτος.

Who

Who was the inventor of elegiac poetry, is not known. Horace professes himself quite ignorant of it. The principal writers of elegiac verse, among the Latins, were Propertius, Ovid, and Tibullus, the latter whereof Quintilian esteems the best elegiac poet; but Pliny the younger gives the preference to the first: the chief writers of elegy among the Greeks were Callimachus, Parthenius, and Euphorion.

**ELEGIT**, in law, a writ of execution, which lies for a person who has recovered debt or damages; or upon a recognizance in any court, against a defendant that is not able to satisfy the same in his goods.

It is directed to the sheriff, commanding him to make delivery of a moiety of the party's lands, and all his goods, beasts of the plough excepted; this is done by a jury, summoned to enquire what land the defendant had at the time of the judgment obtained; and the creditor, by virtue thereof, shall hold the said moiety of land delivered to him, until his whole debt and damages are paid and satisfied: and during that time he is tenant by elegit. This writ ought to be sued out within a year and a day after the judgment.

All other writs of execution may be good, though not returned, except it be an elegit; but that must be returned when executed, because an execution is taken upon it, and that the court may judge of the sufficiency thereof.

**ELEGY**, a mournful and plaintive kind of poem. See the article **ELEGIAC**.

As elegy, at its first institution, was intended for tears, it expressed no other sentiments, it breathed no other accents but those of sorrow: with the negligence natural to affliction, it sought less to please than to move; and aimed at exciting pity, not admiration. By degrees, however, elegy degenerated from its original intention, and was employed upon all sorts of subjects, gay or sad, and especially upon love. Ovid's book *Of Love*, the poems of Tibullus and Propertius, notwithstanding they are termed elegies, are sometimes so far from being sad, that they are scarce serious. The chief subjects then to which elegy owes its rise, is death and love: that elegy therefore ought to be esteemed the most perfect in its kind which has somewhat of both at once; such, for instance, where the poet bewails the death of some youth or damsel falling a martyr to love.

**ELEMENT**, in phyiology, a term used by philosophers to denote the original component parts of bodies, or those into which they are ultimately resolvable.

The elements or principles to which all bodies may be ultimately reduced, are these five: 1. Water, or phlegm, which, in the chemical analysis of them, rises first in form of vapour. 2. Air, which escapes unseen in great quantities from all bodies, so as to constitute half the substance of some of them. 3. Oil, which rises after, and appears swimming on the surface of the water. 4. Salt, which is either volatile, or rises in the still, as that of animal substances; or fixed, as that of vegetables, which is obtained by reducing them to ashes, making a lixivium or lye of these, and afterwards evaporating the moisture; by which means the salt shoots into crystals. 5. Earth, or what is called the *caput mortuum*, being what remains of the ashes after the salt is extracted. This is the last element of all bodies, which can be no farther altered by any art whatsoever. See the articles **WATER**, **AIR**, &c.

The elements of Aristotle were four, earth, water, air, and fire. The cartesians admit only three elements, the first a *materia subtilis*, or fine dust; the second, a coarser, but round kind; and the third, a still more irregular and hooked kind of particles. See the article **CARTESIAN**, &c.

For the doctrine of elements, as delivered by sir Isaac Newton, see the article **NEWTONIAN PHILOSOPHY**.

**ELEMENT**, in a figurative sense, is used for the principles and foundations of any art or science, as Euclid's *Elements*, &c.

**ELEMI**, or **ELEMY**, in the *materia medica*, a kind of resin, very improperly called gum-elemi. There are two sorts of it kept in the shops, the one genuine, and brought from Ethiopia; the other spurious, and the produce of America. The true kind is a yellowish resin, with a cast of green and white; its smell is acrid and pleasant, and its taste acrid and bitter. It is very inflammable, and readily dissolves in oil, and other fat substances, over the fire; which two characters alone sufficiently distinguish it from the gums: but this genuine elemi is very rare in Europe.

The spurious elemi is a whitish resin, produced from a tall tree, with pinnated leaves, not unlike those of the pear-tree.

Fig. 1. The ELEPHANT.

Fig. 2. The ELK.

Fig. 3. EPICYCLOID.

Fig. 4. ERMIN.

Fig. 5. ERMIN.

It is in some degree pellucid, and of a fragrant smell. It is only used externally, being greatly recommended for resolving tumours, deterring ulcers, wounds, &c.

**ELENCHUS**, in logic, a sophism, or fallacious argument, which deceives the hearer under the appearance of truth. See the article **SOPHISM**.

**ELEOSACCHARUM**, or **ELÆOSACCHARUM**. See **ELÆOSACCHARUM**.

**ELEPHANT**, *elephas*, in zoology, a genus of quadrupeds, of the order of the jumenta, the characters of which, according to Linnæus, are these: it has no fore-teeth; the upper canine, or dog-teeth, are considerably long; it has a very long flexible proboscis or trunk, and two paps placed on the breast. See plate **LXXXVIII. fig. 1.**

The teeth of this animal is what we call ivory. See the article **IVORY**.

The elephant, of which there is only one known species, is, when full grown, from seventeen to twenty feet high; and its body is withal so enormously bulky, that the belly reaches nearer the ground than could easily be conceived of a creature of its height. The trunk is, properly speaking, nothing but the nose continued to a great length; its substance is fleshy, but firm, being composed of three series or orders of fibres: this trunk the creature can contract or protrude forward with great violence, from the length of one foot to five or more.

**ELEPHANT'S TRUNK**, an east-indian species of acus, or needle-fish. See **ACUS**.

**Knights of the ELEPHANT**, an order of knighthood in Denmark, conferred upon none but persons of the first quality and merit. It is also called the order of St. Mary. Its institution is said to have been owing to a gentleman among the danish croisées having killed an elephant, in an expedition against the Sarracens, in 1184. in memory of which king Canutus instituted this order, the badge of which is a towered elephant, with an image of the holy virgin encircled with rays, and hung on a watered sky-coloured ribbon, like the George in England.

**ELEPHANTIASIS**, *elephantiasis*, called also the lepra of the Arabians, in medicine, a chronic disease, one of the two species of leprosy, which affects the whole body, where even the bones as well as the skin are covered with spots and tumours, which being red, at last turn black. See the article **LEPROSY**.

In this disease the body falls away, while the legs and feet are enormously swelled. When the disease is inveterate, the fingers and toes are hid in the tumour, and a slight fever arising, carries the patient off.

Lucretius supposed this disease to be generated in Egypt, and no where else; but if the leprosy of the Jews is the same with that of the negroes, which is highly probable, then it may be affirmed that it is endemic to the southern and inland parts of Africa.

**ELEPHANTINE**, in roman antiquity, an appellation given to the books wherein were registered the transactions of the senate and magistrates of Rome, of the emperors or generals of armies, and even of the provincial magistrates; the births and classes of the people, and other things relating to the census.

They are supposed to have been so called as being made of ivory; though some will have them to have been written on the intestines of elephants.

**ELEPHANTOPUS**, **BASTARD-SCABIOUS**, in botany, a genus of the *Jyngetia-polygamia-aqualis* class of plants, the compound flower of which is tubulose, consisting of four or five hermaphrodite and ligulated corollulæ, with a narrow limb, divided into five nearly equal segments: the stamina are five very short filaments: the seeds are solitary, and contained in the cup, being of a compressed figure, and crowned with bristly hairs.

**ELEPHAS**, the **ELEPHANT**, in zoology. See the article **ELEPHANT**.

**ELEVATION**, *elevatio*, the same with altitude or height. See **ALTITUDE**.

*Angle of ELEVATION*, in gunnery, that comprehended between the horizon and the line of direction of a cannon or mortar; or it is that which the chafe of a piece, or the axis of its hollow cylinder, makes with the plane of the horizon.

**ELEVATION**, in architecture, the same with an orthographic, or upright draught of a building. See **ORTHOGRAPHY**.

*ELEVATION of the host*, in the church of Rome, that part of the mass where the priest raises the host above his head for the people to adore. See the articles **MASS** and **HOST**.

**ELEVATOR**, in anatomy, the name of several muscles, so called from their serving to raise the parts of the body to which they belong: such are the elevator alæ nasæ, the elevator of the auricle

or external ear, the elevator of the epiglottis, of the eye-lids, humerus, lips, urethra, and those of the anus, called also levatores. See **MUSCLE**.

The elevator of the eye-lids is also called superbus, as being used when people put on a haughty or high look.

**ELEVATORY**, *elevatorium*, in surgery, an instrument for raising depressed or fractured parts of the skull, to be applied after the integuments and periosteum are removed. If there is any hole, the instrument must be fastened to it; but if there is none, the screw-end of the instrument must be applied. See plate LXXXV. fig. 3. n° 1.

But as these elevatories are so contrived, that, where the neighbouring bones are fractured or depressed, they cannot be applied without greatly increasing the pain, surgeons have invented another kind which might be applied with more safety, called *tripes*, from the number of its feet. It is near twice as big as the figure we have given of it; (*ibid.* n°. 2.) and the feet A A A stand nearer or farther from each other, as there is occasion. The manner of applying it is this: the feet are to be applied to the sound parts of the head, and the screw B C, by frequently turning its handle D D, will presently lay hold of the depressed part of the cranium, especially if a small hole has been made in it with the point of a sharp awl. Then upon turning the screw, E E, the trepan is raised by degrees, and with it the depressed part of the cranium. But if any opening shall appear between the fractured parts, it will be proper to take off the pointed end of the instrument B, and in its room fix the elevatory G, by the screw H, about the part F of the figure n° 2. by the assistance of which it will be easy to raise the depressed part. See the manner of applying this instrument represented *ibid.* n° 3.

**ELEVE**, a french term, sometimes met with in our language, signifying a disciple.

Formerly there were twenty eleves in the academy of sciences at Paris, and ten in that of inscriptions; but the term has since been changed for adjunct. See the articles **ACADEMY** and **ADJUNCT**.

**ELEUSINIA**, in grecian antiquity, a festival kept in honour of Ceres, every fourth, by some states, but by others, every fifth year. The Athenians celebrated it at Eleusis, a town of Attica, whence the name.

It was celebrated with a world of ceremony, and persons of both sexes were initiated in it; it being deemed impious to neglect doing so. The mysteries were of two sorts, the lesser, and the greater; whereof the former were sacred to Proserpine, Ceres's daughter, and the latter to Ceres herself. According to Lactantius, they consisted in a mystical representation of what mythologists teach of Ceres; though some of the christian fathers will have the great mystery, or secret, which they were forbidden by law, upon pain of death, to divulge, to have been the representation or figures of both male and female privities, which were handed about and exposed to the company.

**ELEUTHERIA**, another festival celebrated at Plataea, by delegates from almost all the cities of Greece, in honour of Jupiter Eleutherius, or the assessor of liberty.

It was instituted in memory of the victory obtained by the Grecians, in the territories of Plataea, over Mardonius, the persian general, left by Xerxes with a mighty army to subdue Greece.

**ELF**, a term, now almost obsolete, formerly used to denote a fairy, or hobgoblin, an imaginary being, the creature of ignorance, superstition, and craft. See the article **FAIRY**.

**ELF-ARROWS**, in natural history, a name given to the flints, antiently fashioned into arrow-heads, and still found fossil in Scotland, America, and several other parts of the world.

**ELFIELD**, or **EIFFIELD**. See **EIFFIELD**.

**ELGIN**, the capital of the county of Murray, in Scotland, situated on the river Lossy, about six miles north of the Spey: west long. 2° 25', north lat. 57° 40'.

**ELICHRYSUM**, or **HELICHRYSUM**, in botany, a species of gnaphalium. See the article **GNAPHALIUM**.

**ELICIT**, in ethics, is applied to an act of the will immediately produced by, and of, the will, and received within the same: as to be willing, unwilling, loving, hating, &c. Acts of which nature are termed elicited, because that, being before in the power of the will, they are now brought forth into act. But they are so far intrinsic, that some authors consider them as the will itself, and deny that they ought to be distinguished from it any more than light is to be distinguished from the sun. *Chauvin.*

**ELI-**

**ELIGENDO VIRIDARIO.** See the article **VIRIDARIO ELIGENDO.**

**ELIGIBILITY**, in the romish canon law, a bull granted by the pope, to certain persons to qualify them to be chosen to an office, or dignity, whereof they were before incapable by want of age, birth, or the like.

**ELIQUATION**, in metallurgy, a separation of the different parts of mixed bodies, by the different degrees of fire required to melt them.

When the nature of ores, or of metallic mixtures, is such, that while one part of them melts in the fire, the other, more refractory and difficult of fusion, remains still solid; the first, when the mass is placed in a mild fire, flows out of the interstices of the other, and is thus separated from it. The perfection of this operation requires a different fluidity of the parts that constitute the mass. Lead, for instance, melts into one mass with copper, by a strong fire, whereas these metals cannot dissolve each other in a moderate one, but if the mass composed of both these, thus blended together, is afterwards exposed to a mild fire on an inclined plane, the lead alone melts, the copper becoming only brittle and spongy, and remaining in its solid form, even when the lead has run out of it. This separation, however, is not so perfectly made, but that there ever remains some lead in the copper, and some small part of the copper is also carried away with the lead: wherefore it is necessary, for this experiment, that the metals are not mixed in too minute proportions; for if one thousandth part of lead were to be mixed with copper, or the same small proportion of copper with the lead, the separation by eliquation could not be effected.

It is generally necessary also, to make this operation succeed, to add ingredients that are capable either of destroying the force by which the different parts cohere together, or of procuring an easier flux of the metals: for the mixture of the other metals will not be separated like those of copper and lead, without the admixture of other substances. For instance, gold, silver, and copper melted together, and perfectly blended by that means with one another, remain in the same state in any degree of fire; to make the eliquation of the gold and silver, therefore, out of such a mixture, the

same additions must be used as in the operation of precipitation by fusion.

**ELIRE**, or **CONGE D'ELIRE.** See the article **CONGE.**

**ELISIUM**, or **ELYSIUM.** See **ELYSIUM.**

**ELISION**, in grammar, the cutting off, or suppressing a vowel at the end of a word, for the sake of sound, or measure, the next word beginning with a vowel. Elisions are pretty frequently met with in english poetry, but more frequently in the Latin, French, &c. They chiefly consist in suppressions of the *a*, *e*, and *i*, though an elision suppresses any of the other vowels: In the following example from Virgil there are three elisions.

*Philida amo ante alias* ----

**ELIXATION**, in pharmacy, the extracting the virtues of ingredients by boiling or stewing. See **DECOCTION.**

**ELIXIR**, in medicine, a compound tincture extracted from many efficacious ingredients. Hence the difference between a tincture and an elixir seems to be this, that a tincture is drawn from one ingredient, sometimes with an addition of another to open it, and to dispose it to yield to the menstruum; whereas an elixir is a tincture extracted from several ingredients at the same time. See the article **TINCTURE.**

There are a great number of elixirs described by chemical writers, and in the dispensaries, the most remarkable of which are prepared as follows.

**ELIXIR of aloe.** Take of the tincture of myrrh a quart; saffron, soccotrine aloe, of each three ounces. After digestion, strain off the spirit.

*The paregoric* **ELIXIR.** Take flowers of benjamin, and opium, strained, of each a dram; of camphor, two scruples; of the essential oil of anniseeds half a dram, or rectified spirit of wine a quart. After digestion, strain off the spirit.

*Acid* **ELIXIR of vitriol.** Take of the aromatic tincture a pint; of the strong spirit, or oil of vitriol the weight of four ounces; mix them gradually, and when the fæces are subsided, filtre thro' paper.

*Dulcified* **ELIXIR of vitriol.** Take of aromatic tincture a pint; of dulcified spirit of vitriol, eight ounces in weight; mix them. This preparation is intended, for stomachs which cannot bear the acidity of the preceding.

*The compound* **ELIXIR of myrrh.** Take of the extract of savine, one ounce; of the tincture of castor, a pint; of the tincture

of myrrh, half a pint. After digestion, strain off the liquor.

**ELIXIS**, in pharmacy, a name formerly used for a linctus. See **LINCTUS**.

**ELK**, *alce*, in zoology, an animal of the deer-kind, with the horns palmated, and without a stem. It is a native of the northern parts of Europe, and is a very large and strong animal; being equal in size to a horse, but much less beautiful. See plate **LXXXVIII.** fig. 2.

Elk's hoofs stand recommended for the cure of the epilepsy, but at present are only used as an ingredient in some old compositions.

**ELKHOLM**, a port-town of Gothland, in Sweden, twenty-four miles west of Carelsroon.

**ELL**, *ulaa*, a measure of length, different in different countries; but those mostly used in England, are the english and Flemish ells; whereof the former is three feet nine inches, or one yard and a quarter; and the latter only twenty-seven inches, or three quarters of a yard. In Scotland, the ell contains  $37\frac{2}{3}$  english inches. See **MEASURE**.

**ELLERENA**, a town of Estremadura, in Spain, fifty miles south-east of Merida.

**ELLIPSIS**, in geometry, a curve line returning into itself, and produced from the section of a cone by a plane cutting both its sides, but not parallel to the base. See **CONIC SECTIONS**.

The easiest way of describing this curve, in plano, when the transverse and conjugate axes **AB**, **ED**, (plate **LXXXVII.** fig. 3. n<sup>o</sup> 1.) are given, is thus: First take the points **F**, **f**, in the transverse axis **AB**, so that the distances **CF**, **Cf**, from the center **C**, be each equal to  $\sqrt{AC-CD}$ ; or, that the lines **FD**, **fD**, be each equal to **AC**. Then, having fixed two pins in the points **F**, **f**, which are called the foci of the ellipsis, take a thread equal in length to the transverse axis **AB**; and fastening its two ends, one to the pin **F**, and the other to **f**, with another pin **M** stretch the thread tight: then if this pin **M** be moved round till it returns to the place from whence it first set out, keeping the thread always extended so as to form the triangle **FMf**, it will describe an ellipsis, whose axes are, **AB**, **DE**.

The greater axis, **AB**, passing through the two foci **Ff**, is called the transverse axis; and the lesser one **DE**, is called the conjugate, or second axis: these two always bisect each other at right angles,

and the center of the ellipsis is the point **C**, where they intersect. Any right line passing through the center, and terminated by the curve of the ellipsis on each side, is called a diameter; and two diameters, which mutually bisect all the parallels to each other, bounded by the ellipsis, are called conjugate diameters. Any right line, not passing through the center, but terminated by the ellipsis, and bisected by a diameter, is called the ordinate, or ordinate-applicate, to that diameter. And a third proportional to two conjugate diameters, is called the latus rectum, or parameter of that diameter which is the first of the three proportionals.

The reason of the name is this: let **BA**, **ED**, be any two conjugate diameters of an ellipsis (see plate **LXXXVII.** fig. 3. n<sup>o</sup> 2. where they are the two axes) at the end **A**, of the diameter **AB**, raise the perpendicular **AF**, equal to the latus rectum, or parameter, being a third proportional to **AB**, **ED**, and draw the right line **BE**: then if any point **P** be taken in **BA**, and an ordinate **PM** be drawn, cutting **BE** in **N**, the rectangle under the absciss **AP**, and the line **PN** will be equal to the square of the ordinate **PM**. Hence drawing **NO** parallel to **AB**, it appears that this rectangle, or the square of the ordinate, is less than that under the absciss **AP**, and the parameter **AF**, by the rectangle under **AP** and **OF**, or **NO** and **OF**; on account of which deficiency, Apollonius first gave this curve the name of an ellipsis, from ελλειπειν, to be deficient. In every ellipsis, as **AEBD**, (*ibid.* n<sup>o</sup> 2.) the squares of the semi-ordinates **MP**, **mp**, are as the rectangles under the segments of the transverse axis **AP**  $\times$  **PB**, **Ap**  $\times$  **pB**, made by these ordinates respectively; which holds equally true of the circle, where the squares of the ordinates are equal to such rectangles, as being mean proportionals between the segments of the diameter. In the same manner, the ordinates to any diameter whatever, are as the rectangles under the segments of that diameter.

As to the other principal properties of the ellipsis, they may be reduced to the following propositions. 1. If from any point **M** in an ellipsis, two right lines, **MF**, **Mf**, (*ibid.* n<sup>o</sup> 1.) be drawn to the foci **F**, **f**, the sum of these two lines will be equal to the transverse axis **AB**. This is evident from the manner of describing an ellipsis.

ellipſis. 2. The ſquare of half the leſſer axis is equal to the rectangle under the ſegments of the greater axis, contained between the foci and its vertices; that is,  $DC^2 = AF \times FB = Af + fB$ . 3. Every diameter is biſected in the center C. 4. The tranſverſe axis is the greateſt, and the conjugate axis the leaſt, of all diameters. 5. Two diameters, one of which is parallel to the tangent in the vertex of the other, are conjugate diameters; and vice verſa, a right line drawn thro' the vertex of any diameter parallel to its conjugate diameter, touches the ellipſis in that vertex. 6. If four tangents be drawn through the vertices of two conjugate diameters, the parallelogram contained under them will be equal to the parallelogram contained under tangents drawn through the vertices of any other two conjugate diameters. 7. If a right line, touching an ellipſis, meet two conjugate diameters produced, the rectangle under the ſegments of the tangent, between the point of contact and theſe diameters, will be equal to the ſquare of the ſemi-diameter, which is conjugate to that paſſing thro' the point of contact. 8. In every ellipſis, the ſum of the ſquares of any two conjugate diameters, is equal to the ſum of the ſquares of the two axes. 9. In every ellipſis, the angles FGI, fGH, (*ibid.* n<sup>o</sup> 1.) made by the tangent HI, and the lines FG, fG, drawn from the foci to the point of contact, are equal to each other. 10. The area of an ellipſis is to the area of a circumscribed circle, as the leſſer axis is to the greater, and vice verſa, with reſpect to an inſcribed circle; ſo that it is a mean proportional between two circles, having the tranſverſe and conjugate axes for their diameters. This holds equally true of all the other correſponding parts belonging to an ellipſis.

The curve of any ellipſis may be obtained by the following ſeries. Suppoſe the ſemi-tranſverſe axis  $CB = r$ , the ſemi-conjugate axis  $CD = c$ , and the ſemi-ordinate  $= a$ ; then the length of the curve

$$MB = a + \frac{r^2 a^3}{6c^4} + \frac{4r^2 c^2 a^5 - r a^5}{40c^6} + \frac{8c^4 r^2 a^7 + r^6 a^7 - 4c^2 r^5 a^7}{112c^{12}}, \&c. \text{ And,}$$

if the ſpecies of the ellipſis be determined, this ſeries will be more ſimple: for if

$$c = 2r, \text{ then } MB = a + \frac{a^3}{96r^2} + \frac{3a^5}{2048r^4} + \frac{113a^7}{458752a^6} + \frac{3419a^9}{75497472r^8}, \&c. \text{ This}$$

ſeries will ſerve for an hyperbola, by making the even parts of all the terms affirmative, and the third, fifth, ſeventh, &c. terms negative.

The periphery of an ellipſis, according to Mr. Simpson, is to that of a circle, whoſe diameter is equal to the tranſverſe

$$\text{axis of the ellipſis, as } 1 - \frac{d}{2.2} - \frac{3d^2}{2.2.4.4} - \frac{3.3.5d^3}{2.2.4.4.6.6} - \frac{2.3.5.5.7d^4}{2.2.4.4.6.6.8.8}, \&c.$$

is to 1, where  $d$  is equal to the difference of the ſquares of the axes applied to the ſquare of the tranſverſe axis.

Thoſe who deſire to be more particularly informed concerning the properties of the ellipſis may conſult Simſon's Conic Sections, and Woliſius's Elements of Mathematics, tom. 1. alſo Maclaurin's Fluxions, Art. 609. ſeq. and the marquis de l'Hopital's Sect. Conic. lib. 6.

*Infinite ELLIPSIS.* See ELLIPTOIDES.

*Quadrature of the ELLIPSIS.* See the article QUADRATURE.

ELLIPSIS, in grammar, a figure of ſyntax, wherein one or more words are not expreſſed; and from this deficiency, it has got the name ellipſis.

To this figure, beſides the ellipſis properly ſo called, belong appoſition, ſynecdoche, aſyndeton, zeugma, ſyllepiſis, and prolepiſis. See the articles APPPOSITION, SYNECDOCHE, &c.

The ellipſis, properly ſo called, is when the deficient word or words muſt be ſupplied from elſewhere; as *Hectoris Andromache*, where *uxor* is underſtood; that is, Andromache Hector's wife.

ELLIPSIS, in rhetoric, a figure nearly allied to preterition, when the orator, through tranſport of paſſion, paſſes over many things; which, had he been cool, ought to have been mentioned.

In preterition, the omiſſion is deſigned; which, in the ellipſis, is owing to the vehemence of the ſpeaker's paſſion, and his tongue not being able to keep pace with the emotion of his mind.

ELLIPTIC, or ELLIPTICAL, ſomething belonging to an ellipſis. See ELLIPSIS. Thus we meet with elliptical compaſſes, elliptic conoid, elliptic ſpace, elliptic ſtairs, &c. See the articles COMPASSES, CONOID, &c.

The elliptic ſpace is the area contained within the curve of the ellipſis, which is to that of a circle deſcribed on the tranſverſe axis, as the conjugate diameter is to the tranſverſe axis; or it is a mean

proportional between two circles, described on the conjugate and transverse axis.

**ELLIPOMACROSTYLA**, in natural history, a genus of imperfect crystals, with single pyramids; one end of their column being affixed to some solid body. They are dodecahedral, with thinner hexangular columns, and hexangular pyramids. See the article **CRYSTAL**.

Of these crystals authors enumerate a great many species; among which are the whitish pellucid sprig crystal, a bright brown kind, a dull brown kind, and a bright yellow kind, all which are farther distinguished according to the different lengths of their pyramids.

**ELLIPOPACHYSTYLA**, in natural history, a genus of imperfect crystals, composed of twelve planes, in an hexangular column, terminated by an hexangular pyramid at one end, and irregularly affixed to some other body at the other, with shorter columns. See the article **CRYSTAL**.

There are two species of these crystals, one short, bright and colourless, found in great plenty in New Spain, and other parts of America; the other a short, dull, and dusky brown one, found in Germany and sometimes in England.

**ELLIPTOIDES**, in geometry, a name used by some to denote infinite ellipses, defined by the equation  $ay^{m+n} = bx^m$  ( $a-x$ )<sup>n</sup>.

Of these there are several sorts: thus, if  $ay^3 = bx^2$  ( $a-x$ ) it is a cubical ellipsoid; and if  $ay^4 = bx^2$  ( $a-x$ )<sup>2</sup>, it denotes a biquadratic ellipsoid, which is an ellipsis of the third order in respect of the apollonian ellipsis.

**ELM**, *ulmus*, in botany. See the article **ULMUS**.

The elm is very serviceable in places where it may lie continually dry, or wet in extremes. Accordingly, it is proper for water-works, mills, the ladders and soles of the wheel-pipes, pumps, aqueducts, pales, and ship-planks beneath the water-lines. It is also of use for wheelwrights, handles for single saws, axletrees, and the like. The clearness of the grain, makes it also fit for all kinds of carved works, and most ornaments relating to architecture. As to the medicinal uses of elm, the leaves are astringent, and the bark good for assuaging the pains of the gout.

**ELNA**, a town of Catalonia in Spain, but subject to France, situated ten miles south of Perpignan.

**ELOCUTION**, in rhetoric, the adapting words and sentences to the things or sentiments to be expressed. It consists of elegance, composition, and dignity. The first, comprehending the purity and perspicuity of a language, is the foundation of elocution. The second ranges the words in proper order; and the last adds the ornaments of tropes and figures to give strength and dignity to the whole. See **STYLE**, **PERIOD**, **FIGURE**.

**ELODES**, in botany, a species of hypericum. See the article **HYPERICUM**.

**ELOGY**, *elogium*, a praise or panegyric bestowed on any person or thing, in consideration of its merit. The beauty of elogy consists in an expressive brevity. Elogiums should not have so much as one epithet properly so called, nor two words synonymous. They should strictly adhere to truth; for extravagant and improbable elogies rather lessen the character of the person or thing they would extol.

**ELOINED**, in law, signifies restrained or hindered from doing something: thus it is said, that if those within age be eloined, so that they cannot sue personally, their next friends shall sue for them.

**ELONGATION**, in astronomy, the digression or recess of a planet from the sun, with respect to an eye placed on our earth. The term is chiefly used in speaking of Venus and Mercury, the arch of a great circle intercepted between either of these planets and the sun, being called the elongation of that planet from the sun.

But here it is to be observed, that it is only a circle which has the sun for its center; that the greatest elongation is in a line touching the planet's orbit. For in an elliptic orbit it may be, that the elongation from the sun may grow still greater, even after it has left the place where the line joining the earth and planet touches its orbit. For after that, the true distance of the planet from the sun may increase, whilst the distance of the sun and planet from the earth does not increase, but rather decrease. But because, the orbits of the planets are nearly circular, such small differences may be neglected in astronomy. The greatest elongation of Venus is found by observation to be about forty-eight degrees

degrees, and the greatest elongation of Mercury about twenty-eight degrees, upon which account this planet is rarely to be seen with the naked eye. See the articles **PLANET**, **VENUS**, **MERCURY**, &c.

**ELONGATION** is also used for the difference in motion between the swiftest and the slowest of two planets, or the quantity of space whereby the one has overgone the other.

*Angle of ELONGATION* is an angle contained under lines drawn from the center of the sun and planet to the center of the earth.

**ELONGATION**, in surgery, is an imperfect luxation, occasioned by the stretching or lengthening of the ligaments of any joint. See the article **LUXATION**.

**ELOPEMENT**, in law, is where a married woman departs from her husband, and cohabits with an adulterer; in which case the husband is not obliged to allow her any alimony out of his estate, nor is he chargeable for necessaries for her of any kind. However, the bare advertising a wife in the Gazette, or other public papers, is not a legal notice to persons in general not to trust her; tho' a personal notice given by the husband to particular persons, is said to be good.

An action lies, and large damages may be recovered, against a person for carrying away and detaining another man's wife.

**ELOQUENCE**, the art of speaking well, so as to affect and persuade.

Cicero defines it, the art of speaking with copiousness and embellishment.

Eloquence and rhetoric differ from each other, as the theory from the practice; rhetoric being the art which describes the rules of eloquence, and eloquence that art which uses them to advantage. For the most part, however, they are used indiscriminately for each other. See the articles **RHETORIC**, **ORATORY**, **INVENTION**, **DISPOSITION**, **EXPRESSION**, **PRONUNCIATION**, **ACTION**, &c.

**ELSIMBURG**, a port-town of Sweden, about seven miles east of Elsinore.

**ELSINORE**, a port-town of Denmark, about twenty-two miles north of Copenhagen, and situated on the Sound, or the entrance into the Baltic sea.

**ELTZ**, a town of lower Saxony, about eleven miles south-west of Hildesheim.

**ELVAS**, a city and bishop's see of Alentejo, in Portugal, situated near the frontiers of Spanish Estremadura: west long.  $7^{\circ} 35'$ , and north lat.  $38^{\circ} 45'$ .

It is one of the strongest fortresses in Portugal.

**ELVELA**, in botany, a genus of funguses smooth both on the upper and under side. Micheli calls this genus fungoides and fungoidaster.

**ELUL**, in antient chronology, the twelfth month of the Jewish civil year, and the sixth of the ecclesiastical: it consisted of only twenty-nine days, and answered pretty nearly to our August.

**ELUTRIATION**, in metallurgy, the separating the lighter matters from the mixt ores of metals, by means of great quantities of fair water. Solid bodies not dissoluble in water, are by this operation separated from each other, by water very well stirred, so that the lighter and more subtle parts are carried away by the water, while the heavier and more solid bodies remain at the bottom of the vessels. Some of the stones, earths, and other bodies naturally mixt with the ores of metals, are much lighter than the metalline parts of these ores, and are therefore very easily separated by elutriation, either by barely pounding and washing them, or by previous calcination, and then extinguishing them in water, and washing them.

The kinds of ores proper for elutriation are known, 1. By the heterogeneous matter, and the ores themselves being in such large masses, as to be very visible, and easily broken and separated by hammers, wedges, &c. 2. By the great specific gravity of the ore, which shews us that the metallic masses adhere to their matrix in firm, solid molecules, and are not scattered and dispersed sparingly through it. 3. From the lightness of the stony matrix. And, 4. From its brittleness, whether this property be naturally inherent in the stony matter, or procured by fire in calcination; for in each case it renders the comminution of the compound mass easy. In this case, however, it is necessary that the ore itself be of a nature sufficiently fixed, and that it do not fly off in the roasting, but only melt into solid spheroidal molecules. See Cramer's Art. Docim. pars i. § 381, 535.

**ELY**, a city and bishop's see of Cambridgeshire, situated about twelve miles north of Cambridge: east lon.  $15'$ , and north lat.  $52^{\circ} 24'$ .

It is a county of itself, including the territory around, and has a judge who determines all causes civil and criminal within its limits.

**ELYMUS**,

**ELYMUS**, in botany, a genus of the *triandria-digynia* class of plants, the calyx of which is a common involucre, consisting of four leaves, and containing several flowers in two spiculæ: the particular corollæ are composed of two valves: the seed is oblong.

**ELYSIUM**, or **ELYSIAN FIELDS**, in heathen mythology, certain plains abounding with woods, fountains, verdure, and every delightful object; supposed to be the habitation of heroes and good men, after death.

According to some, the fable of elysium is of phœnician extraction, or rather founded upon the account of paradise delivered in the scriptures. As to the situation of these happy regions, authors are not agreed: Homer makes them the same with certain pleasant meadows near Memphis, on the banks of the acherusian lake, mentioned by Diodorus Siculus in his description of the funerals of the Egyptians. Virgil seems to place them in Italy, only under-ground: and others in other places. But the generality of authors will have them to be situated in the Fortunate Islands. See **FORTUNATE ISLANDS**.

**ELYTROIDES**, or **VAGINALIS**, in anatomy, the second proper membrane that involves the testes. See **TESTICLE**.

**EMANATION**, the act of flowing or proceeding from some source or origin; or, the thing that proceeds from that action.

**EMANATION**, among schoolmen, is used for the production of a lesser thing, in order to the production of a greater, by virtue of some natural connection or dependance between them: for, as when several moveables are joined together, the same power that moves the first, moves all the rest; as in pulling up the trunk of a tree, you pull up the branches, roots, &c. or in drawing one link of a chain, you bring forwards all the rest: the same is to be understood in all conjunct natural effects, *viz.* that the same power whereby the first is produced, does also produce all the rest naturally connected to it, in that, by means of the connection the action of the agent is conveyed from the one to the other, so that the first determines the agent to the production of all the rest; and hence that is called an *emanative cause*, in contradistinction to an efficient cause, which produces an effect by its mere presence, without the intervention of any action.

**EMANCIPATION**, in the roman law, the setting free a son from the subjection

of his father; so that whatever moveables he acquires, belong in propriety to him, and not to his father, as before emancipation.

Emancipation put the son in capacity of managing his own affairs, and of marrying without his father's consent, though a minor. Emancipation differs from manumission, as the latter was the act of a master in favour of a slave, whereas the former was that of a father in favour of his son.

There were two kinds of emancipation, the one tacit, which was by the son's being promoted to some dignity, by his coming of age, or by his marrying, in all which cases he became his own master of course.

The other, express; where the father declared before a judge, that he emancipated his son. In performing this, the father was first to sell his son imaginarily to another, whom they called *pater fiduciarius*, father in trust, of whom being bought back again by the natural father, he manumitted him before the judge, by a verbal declaration. See **MANUMISSION**. Emancipation still obtains in France with regard to minors or pupils, who are hereby set at liberty to manage their own effects, without the advice or direction of their parents or tutors.

**EMARGINATED**, among botanists, an appellation given to such leaves as have a little indenting on their summits: when this indenting is terminated on each side by obtuse points, they are said to be obtusely emarginated; whereas when these points are acute, they are called acutely emarginated.

**EMASCULATION**, the act of castrating or depriving a male of those parts which characterize his sex. See **CASTRATION**.

**EMAUX DE L'ESCU**, in heraldry, the metal and colour of the shield or escutcheon. See the article **SHIELD**.

**EMBALMING** is the opening a dead body, taking out the intestines, and filling the place with odoriferous and desiccative drugs and spices, to prevent its putrifying. The Egyptians excelled all other nations in the art of preserving bodies from corruption; for some that they have embalmed upwards of two thousand years ago, remain whole to this day, and are often brought into other countries as great curiosities. Their manner of embalming was thus: they scooped out the brains with an iron scoop, out at the nostrils, and threw in medicaments to fill up the vacuum:

**vacuum** : they also took out the entrails, and having filled the body with myrrh, cassia, and other spices, except frankincense, proper to dry up the humours, they pickled it in nitre, where it lay soaking for seventy days. The body was then wrapped up in bandages of fine linnen and gums, to make it stick like glue, and so was delivered to the kindred of the deceased, entire in all its features, the very hairs of the eye-lids being preserved. They used to keep the bodies of their ancestors, thus embalmed, in little houses magnificently adorned, and took great pleasure in beholding them, alive as it were, without any change in their size, features, or complexion. The Egyptians also embalmed birds, &c. The prices for embalming were different; the highest was a talent, the next twenty minæ, and so decreasing to a very small matter: but they who had not wherewithal to answer this expence, contented themselves with infusing, by means of a syringe, thro' the fundament, a certain liquor extracted from the cedar, and leaving it there, wrapped up the body in salt of nitre: the oil thus preyed upon the intestines, so that when they took it out, the intestines came away with it, dried, and not in the least putrified: the body being inclosed in nitre, grew dry, and nothing remained besides the skin glued upon the bones.

**EMBARCADERO**, in the spanish, commerce, the port-town of some considerable inland city; such is Arica to Potosi. See the articles **ARICA** and **POTOSI**.

**EMBARGO**, in commerce, an arrest on ships, or merchandize, by public authority; or a prohibition of state, commonly on foreign ships, in time of war, to prevent their going out of port; sometimes to prevent their coming in; and sometimes both, for a limited time.

The king may lay embargoes on ships, or employ those of his subjects, in time of danger, for service and defence of the nation; but they must not be for the private advantage of a particular trader, or company; and therefore a warrant to stay a single ship is no legal embargo. No inference can be made from embargoes which are only in war-time; and are a prohibition by advice of council, and not at prosecution of parties. If goods be laden on board, and after an embargo, or restraint from the prince or state, comes forth, and then the master of the ship breaks ground, or endeavours to sail, if

any damage accrues, he must be responsible for the same; the reason is, because his freight is due, and must be paid, nay though the goods be seized as contraband.

**Embargo** differs from quarantine, inasmuch as this last is always for the term of forty days, in which persons from foreign parts infected with the plague, are not permitted to come on shore. See the article **QUARANTINE**.

**EMBASSADOR**, or **AMBASSADOR**, a public minister sent from one sovereign prince, as a representative of his person, to another.

Embassadors are either ordinary or extraordinary. Embassador in ordinary is he who constantly resides in the court of another prince, to maintain a good understanding, and look to the interest of his master. Till about two hundred years ago, embassadors in ordinary were not heard of; all, till then, were embassadors extraordinary, that is, such as are sent on some particular occasion, and who retire as soon as the affair is dispatched.

By the law of nations, none under the quality of a sovereign prince can send or receive an embassador. At Athens, embassadors mounted the pulpit of the public orators, and there opened their commission, acquainting the people with their errand. At Rome, they were introduced to the senate, and delivered their commissions to them.

Embassadors should never attend any public solemnities, as marriages, funerals, &c. unless their masters have some interest therein: nor must they go into mourning on any occasions of their own, because they represent the persons of their prince. By the civil law, the moveable goods of an embassador, which are accounted an accession to his person, cannot be seized on, neither as a pledge, nor for payment of a debt, nor by order or execution of judgment, nor by the king's or state's leave where he resides, as some conceive; for all actions ought to befar from an embassador, as well that which toucheth his necessities, as his person: if, therefore, he hath contracted any debt, he is to be called upon kindly, and if he refuses, then letters of request are to go to his master. Nor can any of the embassador's domestic servants, that are registered in the secretaries of state's office, be arrested in person or goods: if they are, the process shall be void, and the parties suing out

out and executing it, shall suffer and be liable to such penalties and corporal punishment as the lord chancellor, or either of the chief justices, shall think fit to inflict. Yet ambassadors cannot be defended when they commit any thing against that state, or the person of the prince, with whom they reside; and if they are guilty of treason, felony, &c. or any other crime against the law of nations, they lose the privilege of an ambassador, and may be subject to punishment as private aliens.

**EMBASSY**, the office or function of an ambassador. See the preceding article. The rights of embassies are, in some measure, founded on the law of nature, which authorizes all that is necessary for procuring and maintaining peace and friendship among men. All sacred and profane histories mention the sacred rights of embassies, and are full of instances of wars undertaken for violating them. In the scriptures we read of a war made by king David upon the Ammonites on that account. Cicero says, that the rights of embassies are guarded by all laws both divine and human; wherefore to violate this right, is not only unjust, but impious; and for this reason, if, for instance, whilst ambassadors of any nation are resident with us, war be declared against their sovereigns, they still remain at liberty: thus are ambassadors safe even amidst the arms of contending foes: and in case a banished man is appointed on an embassy to the country from whence he is banished, he may not be detained nor molested there: and, to speak in general, it is an established custom among all the nations of the world, even barbarians themselves, to reverence the characters of ambassadors.

**EMBATTLED**, in heraldry, the same with crenelle. See **CRENELLE**.

**EMBDEN**, a port-town and city of Germany, capital of a county of the same name, now in possession of the king of Prussia; it is situated at the mouth of the river Ems: east long.  $6^{\circ} 45'$ , and north lat.  $53^{\circ} 40'$ .

**EMBER-WEEKS**, or **DAYS**, in the christian church, are certain seasons of the year set apart for the imploring God's blessing, by prayer and fasting, upon the ordinations performed in the church at such times.

These ordination-fasts are observed four times in the year, *viz.* the Wednesday, Friday, and Saturday after the first Sun-

day in lent, after Whit-sunday, after the fourteenth of September, and the thirteenth of December; it being enjoined, by a canon of the church, that deacons and ministers be ordained, or made, only upon the sundays immediately following these ember-fasts.

The ember-weeks were formerly observed in different churches with some variety, but were at last settled as they are now observed, by the council of Placentia, anno 1095. The council of Mentz, convened by Charlemagne, mentions the ember-weeks as a new establishment.

**EMBERIZA**, in ornithology, a genus of birds, the characters of which are, that the beak is of a conic shape, each chap whereof is wholly entire at the point; the upper one gapes a little at the base from the under, which last is inflected, or turned inwards, at the sides.

To this genus belong the green-finch, bunting, yellow-hammer, &c. See the articles **GREEN-FINCH**, **BUNTING**, &c. Besides these, the schomburger of the spanish West-indies seems to claim a place among the emberizas: the upper part of the body is of a bright brown colour, somewhat inclining to orange, and the whole under part is of a pleasant light reddish brown.

**EMBLEM**, *εμβλημα*, a kind of painted enigma, or certain figures painted or cut metaphorically, expressing some action with reflections underneath, which, in some measure, explain the sense of the device, and, at the same time, instruct us in some moral truth, or other matter of knowledge. The emblem is somewhat plainer than the enigma, and the invention is more modern, it being entirely unknown to the antients. P. Bouhours has a long and accurate dissertation upon emblems, wherein he has precisely defined their nature, laid down rules for their composition, and for distinguishing the true from the false.

The Greeks gave this name to inlaid or mosaic work, and even to all kinds of ornaments of vases, garments, &c. and the Latins used emblem in the same sense.

**EMBLEMATICAL**, something belonging to an emblem. See the preceding article.

**EMBLEMENTS**, among lawyers, denote the profits of sown lands; but are sometimes used, more largely, for any products that naturally arise from the ground.

If a tenant for life sow the land, and afterward dies, his executors shall have the emblements,

emblems, and not the person in reversion. The case is otherwise with respect to a tenant for years; for if he sow the land, and his term expires before he has reaped them, the lessor, or he in reversion, is entitled to the emblems. Again, if a person devises sown lands by will, and dies before severance, the devisee shall have the emblems, provided no exception was made of corn.

**EMBOLISMIC**, or **INTERCALARY**, a term used by chronologists in speaking of the additional months and years, which they insert to bring the lunar to the solar year. Since the common lunar year consists of twelve synodic months, or 354 days nearly, and the solar consists of 365 days (throwing away the odd hours and minutes) it is plain that the solar year will exceed the lunar by about 11 days; and consequently in the space of about 33 years the beginning of the lunar year will be carried through all the seasons, and hence it is called the moveable lunar year. This form of the year is used at this time by the Turks and Arabians; and because in three year's time, the solar year exceeds the lunar by 33 days, therefore, to keep the lunar months in the same seasons and times of the solar year, or near it, chronologists added a whole month to the lunar year every third year, and so made it consist of 13 months; this year they called the embolismic year, and the additional month the embolismic, or embolimean, or intercalary month. This form of the year is called the fixed lunar year, and it was used by the Greeks and Romans till the time of Julius Cæsar. See **INTERCALARY**, **YEAR**, &c.

**EMBOLUS**, the moveable part of a pump, or syringe, called also the piston, or sucker. See the article **PISTON**, **PUMP**, **SYRINGE**, &c.

**EMBOSSING**, or **IMBOSSING**, in architecture and sculpture, the forming or fashioning works in relieve, whether cut with a chissel, or otherwise.

Embossing is a kind of sculpture, wherein the figures stick out from the plane whereon it is cut; and according as the figures are more or less prominent, they are said to be in alto, mezzo, or basso relieve; or high, mean, or low relief. See the article **ENCHASING**.

**EMBRACE** *the volt*, in the manege. A horse is said to embrace a volt, when, working upon volts, he makes a good way every time with his fore-legs.

**EMBRACEOR**, among lawyers, a person, who, having received a reward so to do, comes to the bar with one of the parties, and speaks in the case; or privily labours the jury, or stands in court to over-look them, whereby they are awed or put in fear. Actions of this kind will be embracery, whether the jurors give verdict on the side of the party or not. The penalty of this offence is 20*l*. and imprisonment of the party at the discretion of the court: and may be prosecuted either by indictment at common law, as well as by action on the statute. But attorneys and other lawyers are excepted.

**EMBRASURE**, in architecture, the enlargement made of the aperture of a door or window, on the inside of the wall; its use being to give the greater play for the opening of the door, or casement, or to admit the more light. When the wall is very thick, they sometimes make embrasures on the outside.

**EMBRASURE**, in fortification, a hole or aperture in a parapet, through which the cannon are pointed to fire into the moat or field.

Embrasures are generally twelve feet distant from one another, every one of them being from six to seven feet wide without, and about three within: their height above the platform is three feet on that side towards the town, and a foot and a half on the other side towards the field; so that the muzzle may be sunk on occasion, and the piece brought to shoot low.

**EMBROCATION**, in surgery and pharmacy, an external kind of remedy, which consists in an irrigation of the part affected, with some proper liquor, as oils, spirits, &c. by means of a woollen or linnen cloth, or a sponge, dipped in the same.

The use of embrocation is either to attenuate and dislodge something obstructed underneath the skin, to ease pains, or to irritate the part into more warmth and a quicker sense of feeling.

The pumping used in natural baths is properly an embrocation.

**EMBROIDERY**, a work in gold, or silver, or silk-thread, wrought by the needle upon cloth, stuffs, or muslin, into various figures. In embroidering stuffs, the work is performed in a kind of loom, because the more the piece is stretched, the easier it is worked. As to muslin, they spread it upon a pattern ready designed; and sometimes, before it is stretched upon

the pattern, it is starched, to make it more easy to handle. Embroidery on the loom is less tedious than the other, in which while they work flowers, all the threads of the muslin, both lengthwise and breadthwise, must be continually counted; but on the other hand this last is much richer in points, and susceptible of greater variety. Cloths too much milled are scarce susceptible of this ornament, and in effect we seldom see them embroidered. The thinnest muslins are the best for this purpose, and they are embroidered to the greatest perfection in Saxony: in other parts of Europe, however, they embroider very prettily, and especially in France.

There are several kinds of embroidery, as, 1. Embroidery on the stamp, where the figures are raised and rounded, having cotton or parchment put under them to support them. 2. Low embroidery, where the gold and silver lie low upon the sketch, and are stitched with silk of the same colour. 3. Guimped embroidery: this is performed either in gold or silver; they first make a sketch upon the cloth, then put on cut vellum, and afterwards sew on the gold and silver with silk-thread: in this kind of embroidery they often put gold and silver cord, tinsel, and spangles. 4. Embroidery on both sides; that which appears on both sides of the stuff. 5. Plain embroidery, where the figures are flat and even, without cords, spangles, or other ornaments.

**EMBRUN**, or **AMBRUN**, a city of Dauphiny, in France, near the confines of Piedmont: east longit.  $6^{\circ} 6'$ , and north lat.  $44^{\circ} 35'$ .

**EMBRYO**, in physiology, the first rudiments of an animal in the womb, before the several members are distinctly formed; after which period it is denominated a foetus. See the articles **CONCEPTION**, **GENERATION**, and **FOETUS**.

**EMBRYO-PLANT**, the same with *plantula* *feminalis*. See the article **PLANTULA**.

**EMBRYO-SULPHUR**, *embryonatum sulphur*, that united with metals or other mineral substances. See **SULPHUR**.

**EMBRYO-WORMS**, those contained in the bodies of viviparous two-winged flies, in surprising multitudes. See the articles **FLY** and **WORM**.

**EMBRYOTHLASTES**, in midwifery, an instrument contrived for breaking the bones, for the more easy extraction of the foetus, in difficult labours.

**EMBRYOTOMY**, the cutting a foetus to pieces whilst in the womb, practised in cases of necessity, when there is no other way of saving the mother.

**EMBRYULCUS**, a hook for extracting the child, in difficult labours. See plate **LXVIII.** fig. 2. where  $n^{\circ} 1.$  represents the broad steel-hook of Palfynus, for extracting a live-infant without danger, when its head sticks in the vagina. It is necessary to have two of them, that one may be applied to each side of the head.  $N^{\circ} 2.$  is the hook commonly used for extracting dead foetuses. See the article **DELIVERY**.

**EMENDALS**, in the accounts of the Inner-temple society, where so much in *emendals*, at the foot of an account, signifies so much money in the bank, or stock of the house, for repairing losses, and to supply other emergencies.

**EMENDATIO PANIS**, &c. in law. See the article **ASSIZE**.

**EMERALD**, *smaragdus*, in natural history, a genus of precious stones, of a green colour, and next in hardness to the ruby.

Our jewellers distinguish emeralds into two kinds, the oriental and occidental: the emeralds of the East-indies are evidently finer than those of any other part of the world; but our jewelers, seldom meeting with these, call the american emeralds the oriental, and usually sell crystal accidentally tinged with green, under the name of the occidental emerald: these being also the most common, there has grown an opinion among the lapidaries, that the emerald is no harder than the crystal; because what they take to be emeralds, are in general only crystals.

The genuine emerald, in its most perfect state, is, perhaps, the most beautiful of all the gems: it is found of various sizes, but usually small; a great number of them are met with of about the sixteenth part of an inch in diameter, and they are found from this to the size of a walnut. We have accounts of very large sizes among the antients, but they are certainly erroneous, the stones not being emeralds, but jaspers or other green stones: the larger specimens are at present very scarce, and are of considerable value, tho' much more so, when of the East or West-indies. The emerald is of different figures like the diamond and many of the other gems, being sometimes found in a roundish or pebble-like form, but much more frequently in a columnar one, resembling common crystal.

crystal: the pebble-emeralds are always the hardest and brightest, but are seldom found exceeding the size of a pea: the crystalliform ones grow several together, and are often larger: the pebble-kind are found loose in the earths of mountains, and sands of rivers; the columnar are found usually bedded in, or adhering to, a white, opaque, and coarse crystalline mass, and sometimes to the jasper, or the prasius.

The oriental emerald is of the hardness of the sapphire and ruby, and is second only to the diamond in lustre and brightness: the american is of the hardness of the garnet, and the european somewhat softer than that, yet considerably harder than crystal: but the coloured crystals, usually sold under the name of emeralds, has much debased the credit of this gem. It loses its colour in the fire, and becomes undistinguishable from the white sapphire.

The oriental emeralds are very scarce, and at present found only in the kingdom of Cambay; very few of them have of late been imported into Europe, inasmuch that it has been supposed there were no oriental emeralds; but within these ten years, some few have been brought from Cambay into Italy, that greatly excel the american ones. The american, being what our jewelers call oriental emeralds, are found principally about Peru; and the european, are principally from Silesia.

The medicinal virtues ascribed to this stone, are, that it stops hæmorrhages and diarrheas, and sweetens or obtunds the too acrid humours.

*To counterfeit EMERALDS.* Take of natural crystal, four ounces; of red-lead, four ounces; verdegrease, forty-eight grains; crocus martis, prepared with vinegar, eight grains; let the whole be finely pulverized and sifted; put this into a crucible, leaving one inch empty: lute it well, and put it into a potter's furnace, and let it stand there as long as they do their pots. When cold, break the crucible, and you will find a matter of a fine emerald-colour, which, after it is cut and set in gold, will surpass in beauty an oriental emerald.

**EMERGENT YEAR**, in chronology, the same with the *épôcha*, whence any æra, or method of reckoning time, commences: such is that of the creation of the world, of the birth of our Saviour, &c. See the article *ÆPOCHA*.

**EMERSION**, in astronomy, is when any planet that is eclipsed begins to emerge or get out of the shadow of the eclipsing body.

It is also used when a star, before hid by the sun as being too near him, begins to re-appear or emerge out of his rays.

*Scruples of EMERSION*, an arch of the moon's orbit, which the moon's center passes over from the time she begins to emerge out of the shadow of the earth, to the end of the eclipse. See the articles *ECLIPSE*, *TRAJECTORY*, &c.

**EMERUS**, in botany, &c. the same with coronilla. See the article *CORONILLA*.

**EMERY**, in natural history, a rich iron-ore found in large masses of no determinate shape or size, extremely hard, and very heavy. It is usually of a dusky brownish-red on the surface, but when broken, is of a fine, bright, iron-grey, but not without some tinge of redness, and is spangled all over with shining specks, which are small flakes of a foliaceous talc, highly impregnated with iron. It is also sometimes very red, and then usually contains veins of gold. It makes no effervescence with any of the acid menstruums, and is found in the island of Guernsey, in Tuscany, and many parts of Germany.

Emery is said to have a corroding and almost caustic quality, but this without any just foundation. It is recommended by the antients as an astrigent and dentifrice. In this last intention, however, it must be used with great caution, as its hardness and sharpness will be apt to wear off the enamel of the teeth.

Emery is prepared by grinding in mills, and the powder is separated into parcels of different degrees of fineness by washing; these are called the first, second, and third sort; the first being that which remains longest suspended in water, the others, such as sink sooner from the same liquor, and from which it is poured, while yet turbid, to settle for the finer kind. These several sorts are of great use to various artificers in polishing and burnishing iron and steel works, marble, cutting and scolloping glass, &c. The lapidaries cut the ordinary gems on their wheels, by sprinkling the wetted powder over them, the wheels they use being usually of lead, with a small admixture of pewter, that their softness may admit the emery the better. It will not cut diamonds.

The red emery of Peru is in great esteem

with those who seek after the philosopher's stone ; but the king of Spain suffers none of it to be exported.

*Patty of EMERY*, a kind of dirty matter found on the lapidaries wheels, containing part of the powder of emery.

**EMETIC**, a medicine which induces vomiting. Emetics and purges are so much alike in their operations, that one cannot be well apprehended without the other. Thus much, therefore, is common to them both, that any medicine which so far vellicates the membranes and coats of the stomach and bowels as to draw them into convulsive twitches, or much accelerate their natural motions, will be emetic or cathartic, and sometimes both. But the action of vomiting is more properly a convulsive motion in the stomach than in the bowels. Whatsoever, therefore, so irritates the fibres of the stomach as to make them contract with great force, will throw its contents upwards, the vent being much larger that way than through the pylorus, which would send them down by stool. The difference, therefore, between an emetic and a cathartic, lies only in this, that the latter consists of such particles as pass the stomach without any violent vellications of the fibres, and the former, of such as have that effect almost as soon as they come there, so that an emetic seems stronger than a cathartic ; and this is the reason why a cathartic in an increased dose will prove emetic. Some are of opinion, that the substance itself which procures a vomit, is thrown up again in the first or second ejection ; and that the following sollicitations are caused by the acrimony of the juices which the first motions pumped, as it were, and occasioned to drain into the stomach. Be that as it will, it is certain that the action of vomiting, gives the strongest shakes to all the muscles and solids of the body that any motion can give ; and that the last reachings generally discover a drain of humours derived into the stomach from some considerable distance. The service to be expected from emetics, is not so much, therefore, what they discharge upwards, as what their violent emotions and concussions render fit for separation, and force through the skin and other outlets.

Tinctures, extracts, and resins, are always observed to operate rougher this way than more simple preparations ; and the reason seems to be, that such management of an ingredient, divides its parts

too much, and makes them come too intimately into contact with the fibres ; whence they are not so soon shaken off by their convulsive twittings, as more gross parts might be. Upon this account, therefore, most of the simples which come under this head, are best ordered in their natural forms ; and the elaborate preparations of the chemical pharmacy especially, produce no emetic so good as we find amongst nature's own productions. Sydenham lays it down as a rule, that whenever a vomit and bleeding are necessary, bleeding should always precede the exhibition of an emetic. Dr. Harris informs us, that antimonial vomits are very safe in the heat of the summer, but are very dangerous in the cold of the winter. When emetics are too violent, common salt is used to check their operation. Mild aromatics and opiates also have the same effect, and corroborating medicines whether taken internally, or applied by way of cataplasm to the region of the stomach. The infusion of ipecacuanha in wine, according to Dr. Shaw, is the most safe, gentle, and agreeable emetic hitherto known ; whence, says he, it may in most cases be properly substituted for the vinum benedictum, the tartarum emeticum, and all the other antimonial emetics which are attended with some degree of virulency and uncertainty in their operation.

EMETIC TARTAR.	} See {	TARTAR.
EMETIC POWDER.		ALGAROT.
EMETIC WINE.		WINE.

**EMEU**, in ornithology, the same with the cassowary. See **CASSOWARY**.

**EMINENCE**, a title of honour peculiar to cardinals. See the article **CARDINAL**.

**EMINENCE**, in the military art, a high or rising ground, which overlooks and commands the low places about it : such places within cannon-shot of a fort, are a great disadvantage ; for if the besiegers become masters of them, they can, from thence, fire into the fort.

**EMINENTIAL EQUATION**, an artificial equation, containing another equation eminently : it is sometimes used in the investigation of the areas of curved-lined figures. See **EQUATION**.

**EMINENTLY**, *eminenter*, a term used in the schools in regard to things which possess some quality or virtue in a high degree.

**EMIR**, a title of dignity among the Turk signifying a prince.

This title was first given to the calip'

but when they assumed the title of sultans, that of emir remained to their children, as that of Cæsar among the Romans. At length the title became attributed to all who were judged to descend from Mahomet by his daughter Fatimah, and who wear the green turban instead of the white. The Turks make an observation, that the emirs, before their fortieth year, are men of the greatest gravity, learning, and wisdom; but after this, if they are not great fools, they discover some signs of levity and stupidity. This is interpreted by the Turks as a sort of divine impulse in token of their birth and sanctity. The Turks also call the viziers, bashaws, or governors of provinces, by this name.

**EMISSARY**, in a political sense, a person employed by another to sound the opinions of people, spread certain reports, or act as a spy over other people's actions. See the article **SPY**.

**EMISSARY VESSELS**, in anatomy, the same with those more commonly called excretory. See the article **EXCRETORY**.

**EMISSION**, in medicine, a term used chiefly to denote the ejaculation of the semen, or seed, in the act of coition. See **COITION** and **GENERATION**.

**EMMENAGOGUES**, in pharmacy, medicines which promote the menses, or monthly courses, either by giving a greater force to the blood in its circulation, whereby its momentum against the vessels is increased; or by making it thinner, whereby it will more easily pass through any outlet. The former intention is helped by chalybeates, and other substances of the like gravity and elasticity; and this is the case of a leuco-phlegmatic habit, or the green-sickness, and its cure: but in the latter case, where the blood is florid and too high, attenuating alteratives and detergents are the only remedies, because they are fittest to carry the blood through these little apertures destined for its discharge into the uterus. Obstructions are removed by the five aperient roots, bithwort, rhubarb, bryony, and wall-flowers, especially if exhibited by way of decoction with some stimulus of the saline kind, such as borax.

**EMMERIC**, a city of Westphalia, in Germany, subject to Prussia: east long. 5° 45', north lat. 51° 48'.

**EMOLLIENTS**, in medicine and pharmacy, are such remedies as sleek and soften the asperity of the humours, and relax and supple the solids at the same time.

It is very easy to conceive how both these are brought about by the same medicine. By what means soever, whether in the stomach or any other parts, the juices have obtained a sharpness and asperity, so as to vellicate and render uneasy the fibres and nervous parts, which often happens, those things that are smooth, soft, and yielding, cannot but wrap up their points, and render them imperceptible, whence they may gradually, by the proper course of circulation, be brought to some convenient emunctory, without doing any injury by the way. Such parts likewise draw the fibres into spasms, keeping them too tense, and thereby frequently occasion obstructions of the worst kind. In all such cases, emollients lubricate and moisten the fibres, so as to relax them into their proper dimensions, whereupon such disorders cease.

The chief of the emollient and softening remedies, are the roots of marsh-mallow, of white lillies, of liquorice, and of viper's grass; the five emollient herbs, lettuce, bear's breech, pellitory of the wall, the flowers of elder, of melilot, of mallows, of mullein, of yarrow, of chamæmile, of white lillies, of borragé, of the wild poppy, of the lime tree, of the egyptian thorn, of violets, and, most of all, saffron; the seeds of flax, of fenugreek, of anise, of quinces, of fleabane, of white poppies; of the four greater and lesser cold-seeds, the filiqua, sweet almonds, figs, pine-nuts, pistaches, cherry-tree gum, gum arabic, gum tragacanth, shavings and jelly of hartshorn, human grease, that of a dog, of a capon, the marrows of their bones, the fat about their osmentum, bones, and mesentery; the native oils of animals, fresh butter, cream, milk itself, crystals of milk, spermaceti, honey, the yolk of an egg, and its white dried and reduced to a powder. Of the prepared medicines, oil of sweet almonds, linseed-oil, rape-oil, oil of the male balsam apple, decoctions of hartshorn and viper's grass, mixed with the juice of citrons, the ptisan, sweet whey, Ferrius's syrup of marsh-mallows, ointment of marsh-mallows, simple dyachylon plaster, that of melilot, and that of frog's spawn.

**EMPALEMENT**, an ancient kind of punishment, which consisted in thrusting a stake up the fundament.

**EMPALEMENT of a flower**, among herbalists, the same with calyx. See **CALYX**.

**EMPA-**

**EMPANELLING**, or **IMPANELLING**, in law. See the article **IMPANELLING**.

**EMPARLANCE**, or **IMPARLANCE**, in law. See the article **IMPARLANCE**.

**EMPASTING**, or **IMPASTING**, in painting, is the laying on of colours thick and bold, or the applying several lays of colours, so as they may appear thick.

The term is also used when the colours are laid distinct and asunder, and not softened or lost in each other. See the article **COLOURING**.

**EMPATTEMENT**, in fortification, the same with talus. See the article **TALUS**.

**EMPERESS**, or **EMPRESS**, denotes either the wife of an emperor, or a woman who governs singly an empire, in her own right. See **EMPEROR** and **EMPIRE**.

**EMPEROR**, *imperator*, a title of honour among the antient Romans, conferred on a general who had been victorious, and now made to signify a sovereign prince, or supreme ruler of an empire.

The title of emperor adds nothing to the rights of sovereignty ; it only gives pre-eminence above other sovereigns. The emperors, however, pretend, that the imperial dignity is more eminent than the regal. It is disputed whether emperors have the power of disposing of the regal title ; however this may be, they have sometimes taken upon them to erect kingdoms : thus it is that Bohemia, Prussia, and Poland, are said to have been raised to that dignity. In the East, the title of emperor is more frequent than with us ; thus the sovereign princes of China, Mogul, &c. are called emperors. In the West, the title has been a long time restrained to the emperors of Germany. The first who bore it was Charlemagne, who was crowned by pope Leo III. in 800. And it is to be observed, that there was not a foot of land or territory annexed to the emperor's title.

In the year 1723, the czar of Muscovy assumed the title of emperor of all the Russia's. The kings of France were also called emperors, when they reigned with their sons, whom they associated in the crown : thus Hugh Capet was called emperor, and his son Robert, king. The kings of England were antiently stiled emperors, as appears from a charter of king Edgar.

The emperor of Germany is a limited monarch in regard to the empire, though he is an absolute sovereign in most of his hereditary dominions ; the late emperors of the austrian family, having here-

ditary dominions, enumerated all of them in their title. Charles VI. was stiled emperor of the Romans, always august, king of Bohemia and Hungary, archduke of Austria, &c. but the present empress inheriting those countries, her consort enjoys only the title of emperor of the Romans, duke of Lorrain and Tuscany. The emperor creates dukes, marquises, and other noblemen ; and he appoints most of the officers, civil and military, in the empire : he is elected by the nine electors ; and he summons the general diet of the empire. See **ELECTOR** and **DIET**.

The emperor of Russia is an absolute hereditary monarch.

**EMPETRUM**, **BERRY-BEARING-HEATH**, in botany, a genus of the *trioecia-polygamia* class of plants, the flower of which consists of three petals, of an oval-oblong figure : the stamina are three very long capillary filaments : the fruit is a globe, depressed, and unilocular berry, containing nine seeds, gibbous on one side, and angulated on the other.

**EMPETRUM** is also used for the heath-spurge, a species of *tithymalus*. See the article **TITHYMALUS**.

**EMPHASIS**, in rhetoric, a particular stress of the voice and action, laid on such parts or words of the oration, as the orator wants to enforce upon his audience. See the article **ACCENT**.

**EMPHEREPYRA**, in mineralogy, a genus of *siderochita*, composed of various coats surrounding a nucleus of the same substance and structure with themselves. See the article **SIDEROCHITA**.

Of this genus there are several species, distinguished by the different colours of their coats or crusts, as brown, yellow, purple, green, white, &c.

**EMPHRACTICS**, in medicine and pharmacy, obstructing topics, such as, when applied to the body, adhere and stop the pores.

**EMPHYSEMA**, in surgery, a windy tumour generally occasioned in a fracture of the ribs, and formed by the air insinuating itself, by a small wound, between the skin and muscles, into the substance of the cellular or adipose membrane, spreading itself afterwards up to the neck, head, belly, and other parts, much after the manner in which butchers blow up their veal. See the articles **FRACTURE** and **RIBS**.

When an emphysema happens, it will be very proper to enlarge the opening in the skin,

skin, when too narrow, with the scalpel, and to bring down the tumor with frictions and bandage ; carrying the compression gradually towards the opening, so as to expel the included air by degrees. Emphysema, in Hippocrates, imports an inflation of the belly, and sometimes a tumour in general. It is surprising to what degree the cellular membrane will be inflated by the air retained and rarefied in its cells. To this purpose Mr. Mery gives a very remarkable history in the memoirs of the royal academy of sciences for 1713, which the curious may consult.

**EMPHYTEUSIS**, in the civil and canon law, the letting out of poor barren lands for ever, or, at least, for a long term of years, on condition of the tenant's cultivating, meliorating, or mending them, and paying a certain yearly consideration. Emphyteuses are a kind of alienations, differing from sale, in that they only transfer the *dominium utile*, the benefits of the ground, not the property, or simple fee. Among the Romans, they were at first temporary, afterwards perpetual.

**EMPIRE**, *imperium*, in political geography, a large extent of land, under the jurisdiction or government of an emperor. See the article **EMPEROR**. The most antient empire we read of, is that of the Assyrian, which was subverted through the effeminacy of Sardanapalus ; the persian empire was destroyed through the bad conduct of Darius Codomannus ; the grecian empire, by its being dismembered among the captains of Alexander the great ; and the roman empire, through the ill management of the last emperors of Rome.

Empire, or the empire, used absolutely, and without any addition, signifies the empire of Germany, called also in juridical acts and laws, the holy roman empire. Authors are at a loss under what form of government to range the empire : some will have it a monarchical state, by reason all the members thereof are forced to ask the investiture of their states of the emperor, and to take an oath of fidelity to him. Others will have it an aristocratic state, by reason the emperor cannot determine any thing without the concurrence of the princes : and, lastly, others will have the empire to be a monarcho-aristocratic state. See **ELECTOR**, **DIET**, **CIRCLE**, &c.

**EMPIRIC**, an appellation given to those physicians who conduct themselves wholly by their own experience, without study-

ing physic in a regular way. Some even use the term, in a still worse sense, for a quack who prescribes at random, without being at all acquainted with the principles of the art.

**EMPLASTER**, *emplastrum*, in pharmacy, the same with plaster. See **PLASTER**.

**EMPLASTICS**, the same with emphractics. See the article **EMPHRACTICS**.

**EMPRESS**, or **EMPERESS**. See the article **EMPERESS**.

**EMPRIMED**, a term used by sportsmen for a hart that has forsaken the herd.

**EMPRASTHOTONOS**, a species of convulsion, wherein the chin presses against the breast. See **CONVULSION**.

**EMPYEMA**, in medicine, a disorder wherein purulent matter is contained in the thorax or breast, after an inflammation and suppuration of the lungs and pleura ; which, if it be not timely discharged, not only obstructs respiration, but also returning into the blood occasions a continual hectic, with a consumption of the whole body, and other bad symptoms.

In order to discharge this matter, or blood extravasated into the cavity of the thorax, in wounds of that part, it must be perforated ; which operation is called paracentesis. See **PARACENTESIS**.

After the affected side is opened, the puss must be drawn off slowly, and at several times ; and the cavity is to be cleansed by injections of decoctions with honey : which done, the wound is to be healed, giving at the same time plenty of vulnerary decoctions inwardly, of such things as deterge and resist putrefaction. See the article **ANTISEPTICS**.

**EMPYREUM**, a term used by divines for the highest heaven, where the blessed enjoy the beatific vision.

Some of the fathers suppose the empyreum to have been created before the heavens which we behold. See **HEAVEN**.

**EMPYREUMA**, among chemists and physicians, the fiery taste or offensive smell which brandies, and other bodies prepared by fire, are impregnated with. See **DISTILLATION** and **BRANDY**.

**EMRODS**, or **HÆMORRHOIDS**. See the article **HÆMORRHOIDS**.

**EMULGENT**, or **RENAL ARTERIES**, those which supply the kidneys with blood ; being sometimes single, sometimes double on each side. See **ARTERY**.

**EMULSION**, in pharmacy, a soft liquid remedy, of a colour and consistence resembling milk. It is composed by draw-

ing

ing out the oily or milky part of seeds or kernels by confusion, with proper liquors. Emulsions, if carefully made, are a very neat form, but a very small part of the materia medica is reducible thereinto, or only those seeds which yield a soft milky juice; and therefore the only intention which this form can properly be prescribed for, is that of an emollient, though some few are given for other purposes, but they are not so suitable: oils, likewise, may, by the help of an egg, and a little of any of the turpentine ballams, be reduced under this head, and, if well managed, will make an elegant medicine. In all emulsions the seeds are to be husked or blanched, and beat in the mortar to a paste: then the liquors ordered are to be put in by a little at a time at first, and beat with the mafs, so that the whole pulp may be washed out, and nothing but a little like chaff be left behind: this is always to be done in a marble mortar, and with a wooden pestle.

**EMUNCTORY**; in anatomy, a general term for all those parts which serve to carry off the excrementitious parts of the blood and other humours of the body. Such more especially are the kidneys, bladder, and most of the glands. See the articles **KIDNEY**, **BLADDER**, &c.

**ENÆMON**, *εναίμων*, in medicine, an epithet often applied by Hippocrates and Galen, to such topical medicines as are appropriated to a wound newly inflicted, before the blood be stopped.

**ENÆOREMA**, in medicine, that pendulous substance which floats in the urine. It is also called *sublimamentum* and *nubecula*, from its resemblance to little clouds. See **URINE**, **SUBLIMAMENTUM**, and **NUBECULA**.

**ENALLAGE**, in grammar, is when one word is substituted for another of the same part of speech: a substantive for an adjective, as *exercitus victor*, for *victoriosus*; *scelus*, for *sceleratus*: a primitive for a derivative, as *dardana arna*, for *dardania*; *laticem lyæum*, for *lyæum*: an active for a passive, as *nox humida celo præcipitat*, for *præcipitatur*, &c.

**ENALLAGE**, in rhetoric, is a figure whereby the discourse is changed and reversed contrary to all the rules of the language; but this is not done altogether at pleasure, or without reason.

**ENALURON**, according, to Guillim, is a bordure charged with birds; tho' others will have it to signify, in orle, or form of a bordure. See the article **BORDURE**.

**ENAMEL**, a kind of coloured glass, used in enamelling and painting in enamel.

Enamels have for their basis a pure crystal-glass or frit, ground up with a fine calx of lead and tin prepared for the purpose, with the addition usually of white salt of tartar. These ingredients baked together, are the matter of all enamels, which are made by adding colours of this or that kind in powder to this matter, and melting or incorporating them together in a furnace.

For white enamel, Neri De Arte Vitriar. directs only manganese to be added to the matter which constitutes the basis. For azure, zaffer mixed with calx of brass. For green, calx of brass with scales of iron, or with crocus martis. For black, zaffer with manganese, or with crocus martis; or manganese with tartar. For red, manganese or calx of copper and red tartar. For purple, manganese with calx of brass. For yellow, tartar and manganese. And for violet-coloured enamel, manganese with thrice calcined brass.

In making these enamels, the following general cautions are necessary to be observed. 1. That the pots must be glazed with white glass, and must be such as will bear the fire. 2. That the matter of enamels must be very nicely mixed with the colours. 3. When the enamel is good, and the colour well incorporated, it must be taken from the fire with a pair of tongs. 4. The general way of making the coloured enamels is this: powder, sift, and grind all the colours very nicely, and first mix them with one another, and then with the common matter of enamels; then set them in pots in a furnace, and when they are well mixed and incorporated, cast them into water; and when dry, set them in a furnace again to melt; and when melted, take a proof of it. If too deep-coloured, add more of the common matter of enamels; and if too pale, add more of the colours.

Enamels are used either in counterfeiting or imitating precious stones, in painting in enamel, or by enamellers, jewellers, and goldsmiths, in gold, silvers and other metals. The two first kinds are usually prepared by the workmen themselves, who are employed in these arts. That used by jewelers, &c. is brought to us chiefly from Venice or Holland, in little cakes of different sizes, commonly about four inches diameter, having the mark of the

the maker struck upon it with a puncheon. It pays the pound 1 s. 7 <sup>1</sup>/<sub>2</sub> d. on importation, and draws back 1 s. 5 <sup>1</sup>/<sub>2</sub> d. at the rate of 4 s. per pound.

**ENAMELLING**, the art of laying enamel upon metals, as gold, silver, copper, &c. and of melting it at the fire, or of making divers curious works in it at a lamp. It signifies also to paint in enamel.

*The method of painting in enamel.* This is performed on plates of gold or silver, and most commonly of copper, enamelled with the white enamel; whereon they paint with colours which are melted in the fire, where they take a brightness and lustre like that of glass. This painting is the most prized of all for its peculiar brightness and vivacity, which is very permanent, the force of its colours not being effaced or sullied with time, as in other painting, and continuing always as fresh as when it came out of the workman's hands. It is usual in miniature, it being the more difficult the larger it is, by reason of certain accidents it is liable to in the operation. Enamelling should only be practised on plates of gold, the other metals being less pure: copper, for instance, scales with the application, and yields fumes; and silver turns the yellows white. Nor must the plate be made flat; for in such case, the enamel cracks; to avoid which, they usually forge them a little round or oval, and not too thick. The plate being well and evenly forged, they usually begin the operation by laying on a couch of white enamel (as we observed above) on both sides, which prevents the metal from swelling and blistering; and this first lay, serves for the ground of all the other colours. The plate being thus prepared, they begin at first by drawing out exactly the subject to be painted with red vitriol, mixed with oil of spike, marking all parts of the design very lightly with a small pencil. After this, the colours (which are to be before ground with water in a mortar of agate extremely fine, and mixed with oil of spike somewhat thick) are to be laid on, observing the mixtures and colours that agree to the different parts of the subject; for which it is necessary to understand painting in miniature. But here the workman must be very cautious of the good or bad qualities of the oil of spike he employs to mix his colours with, for it is very subject to adulterations. See OIL.

Great care must likewise be taken, that the least dust imaginable come not to your colours while you are either painting or grinding them; for the least speck, when it is worked up with it, and when the work comes to be put into the reverberatory to be red hot, will leave a hole, and so deface the work.

When the colours are all laid, the painting must be gently dried over a slow fire to evaporate the oil, and the colours afterwards melted to incorporate them with the enamel, making the plate red hot in a fire, like what the enamellers use. Afterwards that part of the painting must be passed over again which the fire hath any thing effaced, strengthening the shades and colours, and committing it again to the fire, observing the same method as before, which is to be repeated till the work is finished.

*Method of ENAMELLING by the lamp.* Most enamelled works are wrought at the fire of a lamp, in which, instead of oil, they put melted horse-grease, which they call caballine oil. The lamp, which is of copper or white iron, consists of two pieces, in one of which is a kind of oval plate, six inches long, and two high, in which they put the oil and the cotton. The other part, called the box, in which the lamp is inclosed, serves only to receive the oil which boils over by the force of the fire. This lamp, or where several artists work together, two or three more lamps are placed on a table of proper height. Under the table, about the middle of its height, is a double pair of organ-bellows, which one of the workmen moves up and down with his foot, to quicken the flame of the lamps, which are by this means excited to an incredible degree of vehemence. Grooves made with a gauge in the upper part of the table, and covered with parchment, convey the wind of the bellows to a pipe of glass before each lamp; and that the enamellers may not be incommoded with the heat of the lamp, every pipe is covered at six inches distance with a little tin plate, fixed into the table by a wooden handle. When the works do not require a long blast, they only use a glass-pipe, into which they blow with their mouth. It is incredible to what a degree of fineness and delicacy the threads of enamel may be drawn at the lamp. Those which are used in making false tufts of feathers are so fine, that they may be wound on the reel like silk or thread. The ficti-

tious jets of all colours, used in embroideries, are also made of enamel; and that with so much art, that every small piece hath its hole to pass the thread through wherewith it is sewed. These holes are made by blowing them into long pieces, which they afterwards cut with a proper tool.

It is seldom that the venetian or dutch enamels are used alone; they commonly melt them in an iron-ladle, with an equal part glass or crystal; and when the two matters are in perfect fusion, they draw it out into threads of different sizes, according to the nature of the work. They take it out of the ladle while liquid, with two pieces of broken tobacco-pipes, which they extend from each other at arm's length. If the thread is required still longer, then another workman holds one end, and continues to draw it out, while the first holds the enamel to the flame. Those threads, when cold, are cut into what lengths the workman thinks fit, but commonly from ten to twelve inches; and as they are all round, if they are required to be flat, they must be drawn through a pair of pincers while yet hot. They have also another iron-instrument in form of pincers, to draw out the enamel by the lamp when it is to be worked or disposed in figures. Lastly, they have glass-tubes of various sizes, serving to blow the enamel into various figures, and preserve the necessary vacancies therein; as also to spare the stuff and form the contours. When the enameller is at work, he sits before his lamp with his foot on the step that moves on the bellows, and holding in his left hand the work to be enamelled, or the brass or iron-wires the figures are to be formed on, he directs with his right the enamel thread, which he holds to the flame with a management and patience equally surprising. There are few things they cannot make or represent with enamel; and some figures are as well finished, as if done by the most skilful carvers.

**ENARTHROSIS**, in anatomy, a species of diarthrosis. See **DIARTHROSIS**.

**ENCANIA**, the name of three several feasts celebrated by the Jews in memory of the dedication, or rather purification, of the temple, by Judas Maccabeus, Solomon, and Zorababel.

This term is likewise used in church-history for the dedication of christian churches.

**ENCAMPMENT**, the pitching of a camp. See the article **CAMP**.

**ENCANTHIS**, in surgery, a tubercle arising either from the caruncula lachrymalis, or from the adjacent red skin; sometimes so large, as to obstruct not only the puncta lachrymalia, but also part of the sight, or pupil itself.

In this disorder, the tears continually run down the cheek, which greatly deforms the eye and face.

It is of two kinds, *viz.* mild, without hardness or pain; or malignant, which is livid and very painful. The mild kind is to be treated first by scarifying, and afterwards applying escharotic or caustic medicines; and if this proves insufficient, the tumour may be touched, but with great caution, with lapis infernalis; and to divert the humours from the eye, issues and setons, with phlebotomy and cooling purges, are proper. If all these fail, the surgeon is to extirpate the tumour; in which case, it is better to leave part of the morbid tubercle, than cut off any part of the lachrymal caruncle, as the remains of it may be afterwards cleared away by escharotics. After the operation, it is proper to apply deterring and healing medicines, or a collyrium of lapis tutiæ, myrrh, &c. till the wound is healed.

As to the malignant encanthis, inclining to be cancerous, it is generally better to let it alone, and to mitigate its uneasiness with cooling and lenient collyria, rather than exasperate it by the operation, or by escharotic medicines. *Heister.*

**ENCAUSTICE** and **ENCAUSTUM**, the same with enamelling and enamel. See **ENAMELLING** and **ENAMEL**.

**ENCEINTE**, in fortification, is the wall or rampart which surrounds a place, sometimes composed of bastions or curtains, either faced or lined with brick or stone, or only made of earth. The enceinte is sometimes only flanked by round or square towers, which is called a roman wall.

**ENCEPHALI**, in medicine, worms generated in the head, where they cause so great a pain, as sometimes to occasion distraction.

The encephali are very rare, but there are some diseases wherein they swarm; from whence we are told pestilential fevers have wholly arisen. Upon the dissection of one who died of this fever, a little, short, red worm was found in the head, which malmsey wine, wherewith horse-radish had been boiled, could only destroy. This medicine was afterwards tried on the sick, most of whom it cured.

The

The like worms have also been taken out by trepanning, and the patient cured. Those worms that generate in the nose, ears, and teeth, are also called encephali.

**ENCEPPE'**, in heraldry, denotes fettered, chained, or girt about the middle, as is usual with monkeys.

**ENCHANTER**, a person supposed to practise enchantment, or fascination. See **FASCINATION**, **WITCHCRAFT**, &c.

**ENCHANTER'S NIGHTSHADE**, in botany. See the article **CIRCÆA**.

**ENCHASING**, **INCHASING**, or **CHASING**, the art of enriching and beautifying gold, silver, and other metal-work, by some design, or figures represented thereon, in low relief. See the articles **RELIEVO**, and **SCULPTURE**.

Enchasing is practised only on hollow thin works, as watch-cases, cane-heads, tweezer-cases, or the like. It is performed by punching or driving out the metal, to form the figure, from within side, so as to stand out prominent from the plane or surface of the metal. In order to this, they provide a number of fine steel-blocks, or punchions, of divers sizes; and the design being drawn on the surface of the metal, they apply the inside upon the heads or tops of these blocks, directly under the lines or parts of the figures; then, with a fine hammer, striking on the metal, sustained by the block, the metal yields, and the block makes an indentation, or cavity, on the inside, corresponding to which there is a prominence on the outside, which is to stand for that part of the figure.

Thus the workman proceeds to chase and finish all the parts by successive application of the block and hammer, to the several parts of the design. And it is wonderful to consider with what beauty and justness, by this simple piece of mechanism, the artists in this kind will represent foliages, grotesques, animals, histories, &c.

**ENCHELYS**, *εχχελυς*, the **EEL**, in ichthyology. See the article **EEL**.

**ENCHELIDES** is also used to denote the capillary eels discovered by the help of microscopes in pepper-water, and the like. See the article **ANIMALCULE**.

**ENCHESON**, in old law-books, signifies the occasion, cause, or reason wherefore any thing is done.

**ENCHYSMA**, in medicine, the same with **ENEMA**. See the article **ENEMA**,

**ENCLAVE'**, in heraldry, denote a thing's being let into another, especially when the piece, so let in, is square.

**ENCLITICA**, in grammar, particles which are so closely united with other words, as to seem part of them, as in *virumque*, &c.

There are three enclitic particles in latin, viz. *que*, *ne*, *ve*: but there are a great many in the greek, as *τι*, *τε*, *μη*, *μοι*, *ου*, *σοι*, &c.

**ENCRASICHOLUS**, the **ANCHOVY**, in ichthyology. See **ANCHOVY**.

**ENCRATITES**, *encratite*, in church-history, heretics who appeared towards the end of the second century: they were called encratites, or continentes, because they gloried in abstaining from marriage, and the use of wine and animal food. Their chastity, however, was a little suspected, on account of their using all sorts of means to draw women into their sect, and always keeping company with them.

**ENCRAULOS**, the **ANCHOVY**. See the article **ANCHOVY**.

**ENCROACHMENT**, or **INCROACHMENT**, in law. See **INCROACHMENT**.

**ENCURECK**, a poisonous insect, frequent in Persia, thought to be a species of tarantula. See the article **TARANTULA**.

**ENCYCLOPÆDIA**, *ενκυκλοπαίδεια*, in literary history, the same with cyclopædia. See **CYCLOPÆDIA** and **DICTIONARY**.

**END FOR END**, in the sea-language, is said of a rope that has run quite out of the block, wherein it was reeved.

**ENDECAGON**, in geometry, the same with hendecagon. See **HENDECAGON**.

**ENDECASYLLABUS**. See the article **HENDECASYLLABUS**.

**ENDECERIS**, in antiquity, denotes a vessel, or galley, with eleven tires of oars.

**ENDEMIC**, or **ENDEMICAL DISEASES**, those to which the inhabitants of particular countries are subject more than others, on account of the air, water, situation, and manner of living. See the article **DISEASE**.

It has been always observed, that people of particular countries were peculiarly subject to particular diseases, which are owing to their manner of living, or to the air and effluvia of the earth and water. Hoffman has made curious observations on diseases of this kind: he observes, that the Laplanders have often distempers of the eyes, which is owing to their living in smoke, or being blinded with the snow;

that pleurifies and inflammation of the lungs are also very frequent among them ; and that the small-pox often rages there with great violence : he observes also, that swellings of the throat have always been common to the inhabitants of mountainous countries ; and the old roman authors say, Who wonders at a swelled throat in the Alps ? the people of Carinthia, Styria, the Hartz-forest, Transylvania, and the inhabitants of Cronstrad, he observes, are all subject to this disease, from the same cause : and it seems that these strumous swellings are owing to the water which they drink, and which, in mountainous places, is usually very much impregnated with sparry or stony particles. The French are peculiarly troubled with fevers, with worms, and with hydroceles, and sarcoceles ; and all these disorders seem to be owing originally to their eating very large quantities of chestnuts. The people of our own nation are peculiarly afflicted with hoarsenesses, catarrhs, coughs, dysenteries, and consumptions ; the women with the fluor albus, or whites ; and the children with a disease scarce known else where, which we call the rickets. In different parts of Italy, different diseases reign : at Naples the venereal disease is more common than in any other part of the world : at Venice, people are peculiarly subject to the bleeding piles. At Rome, tertian agues and lethargic distempers are most known : in Tuscany, the epilepsy : in Apulia, burning fevers, pleurifies, and that sort of madness which is attributed to the bite of the tarantula, and which, it is said, is only cured by music. In Spain, apoplexies are common, as also melancholy, hypochondriacal complaints, and bleeding piles. The Dutch are peculiarly subject to the scurvy, and the stone in the kidneys. Denmark, Sweden, Pomerania, and Livonia are all terribly afflicted with the scurvy. The Russians and Tartars are afflicted with ulcers made by the cold, of the same nature with what we call chilblanes : and in Poland and Lithuania there reigns a peculiar disease, called the plica polonica, so terribly painful and offensive, that scarce any thing can be worse. The people of Hungary are very subject to the gout and rheumatism ; they are more infested with lice and fleas than any other people in the world ; and they have a peculiar disease, which they call cremor. The Germans, in different parts of the empire, are subject to different reigning dis-

eases ; in Westphalia they have the peripneumonies and the itch : in Silesia, Franconia, Austria, &c. they are subject to fevers of the burning kind ; to hæmorrhages, to the gout, inflammations, and consumptions. In Constantinople the plague always rages. And in the West-indian islands, malignant fevers, and the most terrible colics are frequent.

**ENDED**, or **INDENTED**, in heraldry. See the article **INDENTED**.

**ENDEAVOUR**, or **ATTEMPT** to commit crimes, is only punishable by fine and imprisonment. See **INTENDMENT**.

**ENDICTMENT**, or **INDICTMENT**. See the article **INDICTMENT**.

**ENDIVE**, *endivia*, in botany, &c. the broad-leaved succory. See the article **CICHORIUM**.

Marigli describes a plant, which he calls sea-endive, from its resemblance to the common garden-endive.

**ENDLESS**, something without an end : thus authors mention endless rolls, the endless screw, &c. See the articles **ROLL** and **SCREW**.

**ENDORSE**, in heraldry, an ordinary, containing the eighth part of a pale, which Leigh says is only used when a pale is between two of them.

**ENDORSED**, *endorfz*, in heraldry, is said of things borne back to back, more usually called *adosse*. See **ADOSSE**.

**ENDORSEMENT**, or **INDORSEMENT**, in law. See **INDORSEMENT**.

**ENDOWMENT**, in law, denotes the settling a dower on a woman ; though sometimes it is used figuratively, for settling a provision upon a parson, on the building of a church ; or the severing a sufficient portion of tithes for a vicar, when the benefice is appropriated.

**ENEMA**, in medicine, the same with clyster. See the article **CLYSTER**.

**ENEMY**, in law, an alien or foreigner, who publicly invades the kingdom. Whether enemies come into the realm by themselves, or in company with english traitors, they are only dealt with according to the martial law, and not punished as traitors : yet where a subject of a foreign nation, who lives here under the king's protection, takes up arms against the government, he shall be punished as a traitor.

**ENERGUMENS**. in church-history, persons supposed to be possessed by the devil, concerning whom there were many regulations among the primitive christians. They were denied baptism, and the eucharist ;

charist; at least, this was the practice of some churches: and though they were under the care of exorcists, yet it was thought a becoming act of charity to let them have the public prayers of the church, at which they were permitted to be present. See the article **EXORCISM**.

**ENERGY**, *ενεργεια*, a term of greek origin, signifying the power, virtue, or efficacy of a thing. It is also used, figuratively, to denote emphasis of speech. See the article **EMPHASIS**.

**ENFANS PERDUS**, the same with forlorn hope. See the article **FORLORN**.

**ENFILADE**, in the art of war, is used in speaking of trenches, or other places, which may be scoured by the enemy's shot, along their whole length. In conducting the approaches at a siege, care must be taken that the trenches be not enfiladed from any work of the place. See the article **TRENCHES**.

**ENFRANCHISEMENT**, in law, the incorporating a person into any society or body politic: thus, where any person is enfranchised, or made free, of any city, borough, or company, he is said to have a freehold therein during life; and cannot, for barely endeavouring any thing against the corporation, forfeit the same. Naturalization is also another kind of enfranchisement. See **NATURALIZATION**.

**ENGASTRIMYTHI**, in pagan theology, the pythians, or priestesses of Apollo, who delivered oracles from within, without any action of the mouth or lips. See **PYTHIA**. The antient philosophers, &c. are divided upon the subject of the engastrimythi. Hippocrates mentions it as a disease. Others will have it a kind of divination. Others attribute it to the operation or possession of an evil spirit. And others to art and mechanism. M. Scottus maintains that the engastrimythi of the antients were poets, who, when the priests could not speak, supplied the defect by explaining in verse what Apollo dictated in the cavity of the bazon on the sacred tripod.

**ENGENDERING**, a term sometimes used for the act of producing or forming any thing: thus meteors are said to be engendered in the middle region of the atmosphere, and worms in the belly. See the articles **GENERATION**, **METEOR**, **WORM**, &c.

**ENGERS**, the capital of a county of the same name, in Germany, situated on the river Rhine, about seven miles north of Coblentz.

**ENGHIEN**, a city of Hainalt, about fourteen miles south-west of Brussels.

**ENGINEA**, an island on the north-east of the Morea, about fifty miles east of Corinth.

**ENGINE**, in mechanics, is a compound machine, made of one or more mechanical powers, as levers, pullies, screws, &c. in order to raise, cast, or sustain any weight, or produce any effect which could not be easily effected otherwise.

Engines are extremely numerous; some used in war, as the battering-ram, ballista, waggons, chariots, &c. others in trade and manufactures, as cranes, mills, presses, &c. others to measure time, as clocks, watches, &c. and others for the illustration of some branch of science, as the orrery, cometarium, and the like. See **BATTERING-RAM**, **BALLISTA**, &c.

In general we may observe, concerning engines, that they consist of one, two, or more of the simple powers variously combined together; that in most of them the axis in peritrochio, the lever, and the screw are the constituent parts; that in all a certain power is applied to produce an effect of much greater moment; and that the greatest effect, or perfection, is when it is set to work with four ninths of that charge which is equivalent to the power, or will but just keep the machine in equilibrio. See the articles **MAXIMUM** and **MECHANICS**.

In all machines, the power will just sustain the weight, when they are in the inverse ratio of their distances from the center of motion. See the articles **POWER** and **EQUILIBRIUM**.

It being of the utmost importance to diminish the friction of engines, several contrivances have been invented for this purpose. See the article **FRICTION**.

**ENGINE for extinguishing fires**, a machine for raising a considerable quantity of water, in one continued stream, for the extinguishing accidental fires.

The best engine of this kind is that of Mr. Newsham, an engine-maker of London, which is so contrived that part of the men who work it, exert their strength by treading, the very best way of working such engines; the whole weight of the body being successively thrown on the forces of the pumps, and even part of a man's strength may be added to the weight, by means of horizontal pieces, to which he may apply his hands when treading. This is the reason why, with the same number of men, his engine will throw

throw water farther, higher, and in greater quantities than any engines of the same size, hitherto contrived. See a perspective view of the whole engine, ready for working, in plate LXXXIX. n° 1.

The nature and effect of this engine will be easily understood from a perpendicular section of it represented *ibid.* n° 2. The water is raised by the pressure of the atmosphere, by the force of the pistons, and by the spring of condensed air, in the following manner: thus, when the piston R is raised, a vacuum would be made in the barrel TV, did not the water follow it from the inferior canal EM (through the valve H) which rises through the glass tube EF, immersed in the water of a vessel, by the pressure of the atmosphere on the surface thereof. By the depression of the piston R, the water in the barrel TV is forced through the superior canal ON, to enter by the valve I, into the air-vessel *abcd*; and the like being done alternately by the other barrel WX, and its piston S, the air-vessel is by this means continually filling with water, which greatly compresses the air above the surface of the water in the vessel, and thereby proportionably augments its spring, which is at length so far increased, as to re-act with great force on the surface YZ of the subjacent water; which ascending through the small tube *ef*, to the stop-cock *g*, is there, upon turning the cock *p*, suffered to pass through a pipe *h*, fixed to a ball and socket, from the orifice of which it issues with a great velocity, to a very great height or distance, in a small continued stream, directed every way, or to any particular place, by means of the ball and socket.

The greatest artifice of this engine is its contrivance to produce a continued stream, which is done by compression, and the consequent increased elasticity of the air in the barrel *abcd*, called the air-vessel. See the article AIR.

When, therefore, the air-vessel is half filled with water, and the air thereby compressed into half its first space, its spring will be equal to twice the pressure of the atmosphere; so that, on turning the stop-cock *p*, the air within pressing on the subjacent water with twice the force it meets with from the external air in the pipe *ef*, will cause the water to spout out of the engine to the height of 32 or 33 feet, if the friction be not too great. When the air-vessel is  $\frac{2}{3}$  full of water,

the space which the air takes up is only  $\frac{1}{3}$  of its first space; whence its spring being three times as great as that of the common air, it will project the water with twice the force of the atmosphere, or throw it to the height of 64 or 66 feet. In the same manner, when the air-vessel is  $\frac{3}{4}$  full of water, the air will project it to the height of 96 or 99 feet; and when  $\frac{4}{5}$  full of water, to the height of 132 feet. Hence it is easy to calculate the different heights to which the water will rise, as in the following table.

Height of the water.	Height of the compressed air.	Proportion of the air's spring.	Height to which the water will rise.
1	$\frac{1}{2}$	2	33 feet.
2	$\frac{1}{3}$	3	66
3	$\frac{1}{4}$	4	99
4	$\frac{1}{5}$	5	132
5	$\frac{1}{6}$	6	165
6	$\frac{1}{7}$	7	198
7	$\frac{1}{8}$	8	231
8	$\frac{1}{9}$	9	264
9	$\frac{1}{10}$	10	297

As the air-vessel is the cause of the continued stream, we may naturally infer, that if such an air-vessel were adapted to the common house-pump, it would become a useful engine for extinguishing accidental fires. Now this may be effected in the following or some other analogous manner: let ABCD (*ibid.* n° 3.) be the barrel of the pump, PH the rod and piston, CW the pipe going down to the water of the well at W. Towards the lower part of the barrel is a short tube, by which the air-vessel FE is fixed to, and communicates with, the barrel of the pump. AMNL is a collar of leather, so fixed on the top of the barrel, and adapted to the rod, that it may move freely in the leathers, without permitting the air to pass in or out between. The nozzle or spout D, has a stop-cock S, to let out or keep in the water at pleasure. Q is a piece screwed on, to direct the stream, by a small leather-pipe at the end. When the piston is raised from the bottom of the pump-barrel, the water above will be forced into the air-vessel, and there compress the air; it will also compress the air on the top of the barrel, for the water will not be higher than the spout D at first, when the stop cock is shut; but afterwards,

ENGINE for extinguishing Fires.

*Fig. 1. PILE-ENGINES*

afterwards, as the air is confined, it will be compressed at top, the water rising to I. This compressed air, in each place, will act upon the water by its spring, and, upon turning the stop-cock, will force it out in a continued stream through the pipe at Q, and that with a greater or lesser degree of force, as occasion requires, that being absolutely in the power of the person working the pump.

**Pile-ENGINE**, one contrived for driving piles, whereof there are several kinds. See the article **PILE**.

The most common and simple engine of this kind, as represented in plate XC. fig. 1. n<sup>o</sup> 1. consists of the cill K I, and the frame F L, on which are fixed the upright pieces L H and L G, supported by the side braces C, C, and the hind brace F E (which has pins on it to make it serve as a ladder) and held together by a square collar E D. The rammer A, being a very heavy piece of wood, or iron, slides up and down between the cheeks or upright pieces L H, L G, and is drawn up by means of its hook B, with two ropes H O, G O, having each five smaller ropes with handles at N, N, for ten men to pull up the rammer to a certain height (the great ropes running over two pulleys or rollers on the iron-pin H G) and then let it fall again all at once upon the head of the pile at M, to drive it into the ground. Now, suppose the rammer A, weighs 500 lb, and falls the height of one foot, it will fall that height in a quarter of a second, and consequently have a velocity able to carry it uniformly 2 feet in the same time, that is, at the rate of 8 feet in a second, at the very instant it strikes the pile M. Therefore, measuring the mass by the velocity, *viz.*  $500 \times 8$  we shall have 4000 for the momentum of the rammer with such a fall. See the article **DESCENT**. But if the rammer be raised up to the height of four feet, it will fall that height in half a second, and have, at the time of percussion, a velocity to carry it 8 feet in half a second, without any farther help from gravity, so that we must now multiply 16 feet (the present velocity, since it goes at the rate of 16 feet in a second) by 500, the mass of the rammer, which will give us a double momentum, wherewith it will strike the pile in this last case; for  $500 \times 16 = 8000$ . If we consider any other height from which the rammer falls (for one may employ a capstan windlass, or pulleys to raise it to a very great height) the momentum

with which it strikes the pile, will always be as the square root of the height from which the rammer fell.

If a pile is to be driven obliquely, the engine must be set so that the cheeks may have the same obliquity, and the blow will still be perpendicular to the head of the pile; but then the force of the blow must not be estimated from the length, but from the height of the descent, in the manner already shewn.

*Mr. Valour's ENGINE for driving piles*, used at the new bridge of Westminster, is constructed as follows. A (plate XC. n<sup>o</sup> 2.) is the great shaft, on which are the great wheel and drum: B the great wheel with cogs, that turns a trundle-head with a fly, to prevent the horse's falling when the ram is discharged; C the drum on which the great rope is wound; D the follower (with a roller at one corner) in which are contained the tongs, to take hold of the ram, and are fastened to the other end of the great rope, which passes over the pulley, near the upper end of the guides between which the ram falls; E the inclined planes, which serve to open the tongs, and discharge the ram; F the spiral barrel that is fixed to the drum, on which is wound a rope with a counterpoise, to hinder the follower from accelerating, when it falls down to take up the ram; G the great bolt which locks the drum to the great wheel; H the small lever, which has a weight fixed at one end, passes through the great shaft below the great wheel, and always tends to push the great bolt upwards, and lock the drum to the great wheel; I the forcing bar, which passes thro' the hollow axis of the great shaft, bears upon the small lever, and has near the upper end a catch by which the crooked lever keeps it down; K the great lever, which presses down the forcing bar, and discharges the great bolt at the time the long end is lifted up by the follower; L the crooked lever, one end of which has a roller, that is pressed upon by the great rope, the other end bears upon the catch of the forcing bar during the time the follower is descending; M the spring that presses against the crooked lever, and discharges it from the catch of the forcing bar as soon as the great rope slackens, and gives liberty to the small lever to push up the bolt.

By the horse's going round, the great rope is wound about the drum, and the ram is drawn up, till the tongs come between

the

the inclined planes, where they are opened, and the ram is discharged.

Immediately after the ram is discharged, the roller, which is at one end of the follower, takes hold of the rope that is fastened to the long end of the great lever, and lifts it up; the other end presses down the forcing bar, unlocks the drum, and the follower comes down by its own weight.

As soon as the follower touches the ram, the great rope slackens, and the spring *M* discharges the crook *i* lower from the catch of the forcing bar, and gives liberty to the small lever to push up the great bolt, and to lock the drum to the great wheel, and the ram is drawn up again as before.

**Steam-ENGINE**, a machine to raise water by fire, or rather by the force of water turned into steam.

The following is a description of this engine in its first state, and original simplicity. *ABC* (plate *XC*. fig. 2.) is a copper-vessel, partly filled with water to *DE*, which, being set over a fire and made to boil, will fill the upper part *DBE* with an elastic vapour, the sufficient strength whereof is known by its forcing open a valve at *e*: this heated elastic steam is, by turning a cock at *F*, let into the barrel *abcd*, where, by its elastic force, it raises the piston *G*, which drives the air above it through a proper clack at the top. After this, that the piston may by its weight descend, a little cold water from the cistern *fgbi*, is let in at the bottom by turning a cock at *h*, which, in form of a jet, condenses the hot steam in the barrel into 13000 times less space than before it took up, which make a sufficient vacuum for the piston to descend in. The piston *G*, and lever *HI* being thus put into motion, do accordingly raise and depress the piston *K* in the barrel of the forcing pump *LM*, on the other side; which, by the pipe *N*, draws the water from the depth *W*, and forces it to rise and spout through the tube *O*, continued to any height at pleasure. See **PUMP**.

Thus is the steam-engine a very simple and plain machine, where a very powerful stroke for working of pumps is performed by only turning two cocks alternately; and yet a person who knows nothing of it, would imagine it to be very complex, by the number of parts that offer themselves to view. But here we must distinguish between what performs the material operations of the engine, and what

serves for conveniency and the just regulation of the said operations; for not above the hundredth part of the power of this engine is employed to turn the cocks and regulate all the motions, as will appear from what follows.

The structure of the steam-engine, as used at present, is represented in plate *XCI*. n<sup>o</sup> 1. concerning which we are to observe, 1. That there may be always water in the cistern *g*, to inject into the steam to condense it, there is an arch *x*, fixed near the arch *H*, at the pump end, from whence another pump-rod *k*, with its piston, draws water from a small cistern near the mouth of the pit, supplied from the water raised at *p*, and forces it up the pipe *mmm*, to keep the injecting cistern *g* always full. 2. As the piston *G* which moves up and down the cylinder ought to be air-tight, a ring of leather, or a piece of match, which lies upon its circumference next to the inside of the cylinder, must be kept moist and swelled with water; this is supplied from the injecting cistern by a small pipe *z*, always running down upon the piston, but in a very small quantity, if the work be well performed. *L* is a leaden cup, whose office is to hold the water that lies on the piston, lest it should flow over. When the piston is arrived at its greatest height in the cylinder, as *W*, at which time if the cup is too full, the water will run down the pipe *L'V*, into the waste-well at *Y*. 3. As the water, in the boiler *B*, must waste by degrees, as it is constantly producing steam, and that steam continually let out for working the engine, there ought to be a constant supply of the water to boil: this is performed by means of the pipe *Ff*, about three feet long, going down a foot under the surface of the water in the boiler, with a funnel *F*, at top, always open, and supplied by the pipe *W*, with water from the top of the cistern, which has the advantage of being always warm, and, therefore, not apt to check the boiling of the water in the copper. 4. That the boiler may not have the surface of the water too low (which would endanger bursting) or too high (which would not leave room enough for steam) there are two gauge-pipes at *G*, one going a little below the surface of the water when at a proper height, and the other standing a little above it: when every thing is right, the stop-cock of the shorter pipe being opened gives only steam, and that of the long one

STEAM-ENGINE.

N<sup>o</sup> 1.

N<sup>o</sup> 2.

one water ; but if otherwise, both cocks will give steam when the surface is too low, and both give water when it is too high ; and hence the cock which feeds the boiler at F may be opened to such a degree as always to keep the surface of water to its due heighth. 5. As cold water is injected into the cylinder at every stroke, and as that water might in time fill the cylinder, and hinder the operation of the engine, there is a pipe coming from the bottom of the cylinder *d T Y*, called the eduction pipe, through which the water that has been injected, comes down every time the steam is let into the cylinder. This eduction pipe goes an inch or two under water in the waste well Y, and having its end turned up is shut with a valve Y to keep out the air from pressing up the pipe, but permitting the injected air coming the other way to be discharged ; by which means the cylinder is kept empty. 6. Left the steam should grow too strong for the boiler, and burst it, there is a valve fixed at *b* with a perpendicular wire standing up from the middle of it, to put weights of lead upon, by which to examine the strength of the steam pushing against it from within. Thus the steam is known to be as strong as the air, if it will raise up so much weight on the valve as is at the rate of 15 lb. to an inch square ; because that is the weight of the air, nearly, on every inch square. When the steam becomes stronger than what is required, it will lift up the valve and go out. This valve is called the puppet-clack. 7. The steam is always in a fluctuating condition, yet never  $\frac{1}{10}$  stronger or weaker than common air. For it has been found that the engine will work well, when there is the weight of one pound on every square inch of the valve *b*. This shews that the steam is then  $\frac{1}{15}$  part stronger than the common air. Now as the heighth of the feeding pipe from the funnel F to the surface of the water Ss is not above three feet, and  $3\frac{1}{2}$  feet of water is  $\frac{1}{10}$  of the pressure of air ; if the steam were  $\frac{1}{10}$  part stronger than air, it would push the water out at E ; which since it does not do, it cannot be stronger than air, even in this case, where the regulator being shut, it is most of all confined. 8. When the regulator is open, the steam gives the piston a push on the

underside, then occupying more space, the steam comes to be a ballance only for the outward air, and so only sustains the piston ; but the over weight of the pump-rods, at the contrary end of the beam *b z*, draws up the piston beyond C as far as W. The steam, then, expanded so as to fill up all the cylinder, would not quite support it, if it was not for the over weight above-mentioned. If this was not true, when the end *b z* is down as low as it can go, and rests upon the beams that bear its center, the chain L H above the piston would grow slack, and the piston might sometimes be pushed out of the cylinder, which never happens. Again, when first the steam is let into the cylinder, the injected water is pushed out at the eduction pipe *d T Y*, and is all out of the cylinder by that time the piston is got up to C. If then the steam was stronger than air, it would fly out at Y after the water, the valve Y not being loaded. If it were exactly equal to the strength of the air, it would just drive all the water out at Y, but could not follow itself, the pressure being equal on each side of the valve by supposition. If it be weaker than the air, it will not force all the water out of the pipe *d T Y*, but the surface will stand, suppose at T, where the column of water T Y added to the strength of the steam, is equal to the pressure of the air. When the steam is  $\frac{1}{10}$  weaker than the air, the height T Y is equal  $3\frac{1}{2}$  feet. Now since the whole perpendicular distance from *d* to Y is but four feet, and the steam is always sufficient to expel the water ; it is plain it can never be more than  $\frac{1}{10}$  part weaker than the air, when weakest. 9. As there is air in all the water injected, and that air cannot be taken out, or condensed with the steam by the jet of cold water coming in at *n*, the whole operation would be disturbed, and only a very imperfect vacuum made, were it not for the following contrivance. We are to remember that when steam is become as strong as air, it is above sixteen times rarer ; so that air will precipitate in steam, as quicksilver would in water. Therefore all the air extricated from the injected water, lies at the bottom of the cylinder over the surface of so much of the injected water as is come down to *d n*. Now there is without the cylinder at 4, a little cup with a valve, and from

under the valve, a pipe going laterally into the cylinder above its bottom to receive the air into the cup. When, therefore, the steam first rushes into the cylinder, and is a little stronger than the outward air, it will force the precipitated air to open the valve at 4, and make its escape; but the steam cannot follow, because it is weaker than the external air, as the piston, by ascending, gives it room to expand. This valve from the noise it makes is called the snifting clack. 10. But amongst the greatest improvements of this engine, we may reckon that contrivance by which the engine itself is made to open and shut the regulator and injection-cock, and that more nicely than any person attending could possibly do it. For if the man who turns the regulator at E, and the injection cock N, when the piston is coming down, opens the regulator and lets in the steam too soon to raise the piston again, the stroke will be shorter than it ought to be; and if he does not open the regulator soon enough, the piston coming down with a prodigious force, will very probably strike against the throat pipe D at d, and crush it to pieces. Likewise when the regulator is open, the steam going into the cylinder, and the piston rising, the stroke will not have its full length, if the steam is turned off, and the cold water injected too soon; and if injected too late, the steam may throw the piston quite out of the cylinder's top at L. To prevent, therefore, all such accidents, there is fixed to an arch Z, at a proper distance from the arch P, a chain, from which hangs a perpendicular piece, or working beam QQ, which comes down quite to the floor, and goes through it in a hole which it fits very exactly. This piece has a long slit in it, and several pin holes and pins for the movement of several levers destined to the office of opening and shutting the cocks after the following manner. 11. Between two perpendicular pieces of wood on each side of P, there is a square axis AB (*ibid.* n<sup>o</sup> 2.) which has upon it several iron pieces of the lever kind. The first is the piece CED called the Y, from its representing that letter inverted by its two shanks, E and D; on the upper part is a weight F, to be raised higher and lower, and fixed as occasion requires. This Y is fixed very fast upon the said iron axle AB.

12. From the axle hangs a sort of an iron stirrup, IKLG, by its two hooks IG, and having on the lower part two holes K L, through which passes a long iron pin LK, and keyed in the same. When this pin is put in, it is also passed thro' the two holes in the ends EN of the horizontal fork or spanner EQN, joined at its end Q to the handle of the regulator V 10. From Q to O are several holes, by which the said handle may be fixed to that part of the end which is most convenient. 13. Upon the axis AB is fixed at right angles to the Y an handle or lever G 4, which goes on the outside of the piece QQ, and lies between the pins. Another handle is also fastened upon the same axle, *viz.* H 5, and placed at half a right angle to the former G 4: this passes through the slit of the piece QQ, lying on one of its pins. Hence we see that when the working beam goes up, its pin in the slit lifts up the spanner H 5, which turns about the axle so fast, as to throw the Y with its weight F from C to 6, in which direction it would continue to move after it passed the perpendicular, were it not prevented by a strap of leather fixed to it at *a*, and made fast at the ends *m* and *n*, in such manner as to allow the Y to vibrate backwards and forwards about a quarter of a circle, at equal distance on this side and that of the perpendicular. 14. As things are represented in the figure, the regulator is open, its plate TY being shewn on one side of the pipe S, which joins the cylinder and boiler. The piston is now up, and also the working beam near its greatest height, the pin in the slit has so far raised the spanner H 5, that the weight F on the head of the Y is brought so far from *n*, as to be past the perpendicular and ready to fall over towards *m*, which when it does, it will by its shank E, strike the iron pin K L with a smart blow, and drawing the fork O N horizontally towards the beam Q, will draw the end 10 of the regulator towards *i*, and thereby shut it, by slipping the plate Y under the holes of the throat-pipe S. 15. Immediately after the regulator is shut, the beam rising a little higher with its pin S on the outside upon the lower part, lifts up the end *i* of the handle of the injecting-cock, and opens it by the turning of the two parts with teeth. The jet immediately making a vacuum, the beam again descends, and the pin *n* depressing

depressing the handle *k i*, shuts the injection-cock; and the beam continuing to descend, the pin *p* bears down the handle *G 4*, and throwing back the *Y*, its shank *D* throws forward the fork *N Q*, and again opens the regulator to receive fresh steam. After this every thing returns as before, and thus is the engine most wonderfully contrived to work itself.

16. Many years after the engine had been made, as above described, it received another improvement of very great advantage, and that was, instead of feeding the boiler with warm water, from the top of the cylinder (fig. n<sup>o</sup>. 2.) by the pipe *W* above, and *F f* below, they contrived to supply it with the scalding hot water which came out of the eduction-pipe *d T Y*, which now, instead of going into the waste well at *Y*, was turned into the boiler on the top, and as the eduction pipe before went out at the side of the cylinder, it was now inserted in the bottom of it; and though the pressure of the steam in the boiler be somewhat stronger than in the cylinder, yet the weight of water in the eduction-pipe being added to the force of steam in the cylinder will carry the water down continually, by overcoming the resistance in the boiler.

This is the lever-engine with the improvements of Mr. Newcomen and others; but as captain Savary's, or rather the marquis of Worcester's, is very cheap in respect of this machine, and as it is also applicable with great advantage when the height to which the water is to be raised does not exceed 100 or 150 feet, we shall here subjoin a view of that engine, with the improvements of Dr. Defaguliers.

The boiler *BB* (plate *XCII.*) is a large copper body of a globular form, which will best of all withstand the very great force of steam that in this case is necessary. Round the body of this boiler the fire and flame are conducted as shewn at *T T T*. It has a copper-cover screwed on, which contains the steam-pipe *C D*, and two gage-pipes *n, o*, which by turning their cocks, shew the height of the water within as in the other engine. On the same cover *P* is a valve, over which lies a steel-yard, with its weight *Q* to keep it down, the strength of the vapour being this way most exactly estimated. For being in the nature of a lever of the third sort, it is plain, if the beam of

the lever be divided into ten equal parts, and the first of them be upon the middle of the valve, and the weight *Q* hangs at the 2<sup>d</sup>, 3<sup>d</sup>, 4<sup>th</sup>, &c. divisions, that then the force of the steam which can raise up the valve will be 2, 3, 4, &c. times as great as the weight. If the area of the valve be a square inch, and  $Q = 15$  lib. hanging at the second division is raised by a steam pushing up the valve, it will shew that the steam will then press with the force of two atmospheres, and so on to ten atmospheres; but great care must be then taken that the steam so very strong burst not the boiler to pieces. The steam is carried from the boiler to a copper-vessel *A*. by means of the pipe *C D*, and is let into it by turning the handle *K* of the steam-cock *D I*. The key of this cock is kept down by the screw *L*, held up by the Gibbet *D L*. The handle turned from *K* to *k* admits a passage to the steam into the copper-receiver *A*. This receiver *A* communicates at bottom with the sucking pipe *Z H* going down to the water *H* in the well *X*, and above with the forcing pipe *E E*, which goes up a little above the water of the reservoir *R*, and between these pipes are two valves *F* and *G* both opening upwards. The steam being let in upon the water of the receiver *A*, forces it up through the valve *F*, and the pipe *E E* to the reservoir, and then the receiver is full of hot steam. This steam in the receiver is condensed by a jet of cold water coming from the forcing pipe by the small pipe *M I*, being let in and shut off by the cock at *M*. The steam being condensed by this jet will be reduced within a very small space, and so make a vacuum, upon which the water in the well will rush up the forcing pipe to restore the equilibrium, and thus again fill the receiver *A*, the little air being compassed within a small compass at the top above *b c*. That there may be always water in the force-pipe for the jet, there is a little pipe which brings the water to it from the reservoir with the small stop-cock *Y*, to shut it off upon occasion. The valves at *F* and *G* are examined at any time by unscrewing the pin *r* to loosen the strap *2*, and let down the flanch *3*, all which parts are shewn larger in the figures n<sup>o</sup>. 5. By the particular contrivance of the cock at *D I*, and its key, the water is made to pass from the force-pipe to the boiler to supply the waste in steam.

steam. This is plainly shewn in the sections of the cock and key, where 5 is the top of the key, 6 is a hole on one side, which goes down to the bottom to convey the steam, or jet of water alternately to the receiver; 7 is a notch on the other side to take in the water from the force-pipe, and conduct it to the boiler B. How this is done is easy to conceive from a view of the two sections of the cock and key, in two positions within it. The boiler may hold about five or six hogheads, and the receiver one hoghead. It will work four or five hours without recruiting: about four strokes a minute will produce upwards of 200 hogheads per hour. This steam makes a vacuum so effectually, as to raise water from the well to the height of twenty-nine or thirty feet; and suppose the steam able to lift up the steelyard with its weight hanging at the 6th division, it will then be able to raise a column of water above fifty yards high, as being then six times stronger than the pressure of the atmosphere, as is easily understood from what has been said upon the fire-engine, the water being raised in a similar manner in both machines, there by the pressure of condensed elastic air, and here by the pressure of rarefied elastic steam. See the article *ENGINE for extinguishing fires*.

This engine consists of so few parts, that it comes very cheap in proportion to the water that it raises, but it has its limits. On the other hand, the lever-engine, often called Newcomens, has its limits also; that is, it must not be too small, for then it will have a great deal of friction in proportion to the water that it raises, and will cost too dear; having as many parts as the largest machines, which are the best and cheapest in proportion to the water they raise.

In the philosophical transactions there is an account of an improvement made in the steam-engine by Mr. Payne, as follows. He has contrived two iron-pots or vessels of a conical form inverted as represented by ABEF (n<sup>o</sup> 6.) on the upper part of which is fixed a globular copper-head, of about 5½ feet diameter, as LMN. Then there is placed on the inside a small machine H, called the dispenser, with spouts *a b c d e*, &c. round

the sides fixed to it, and the bottom thereof rests on a center pin O. In this machine is fixed an upright tube G with holes at the bottom, and a funnel P on the top, to receive a spout of water from a conduit-pipe Q, by the stop-cock R. Two or more of these vessels are placed in a reverberatory arch for conveying the intense heat of a strong fire, the flame whereof encompasses the iron-vessels, and keeps them in a red heat during the time of their use, at which time the cog-wheel I being turned by proper machinery, whirls the dispenser about with great velocity, and causes the water in it to fly through the spouts against the sides of the red hot pots. By this means, the greatest part of the water is converted into vapour or elastic steam, which is conveyed by a common pipe and cock to the barrel of the engine to put the piston in motion, and the waste water is conveyed away at bottom by means of a pipe CD, with a valve at D to keep out the air.

Before we conclude the subject of steam-engines, we shall add a most curious and useful table of the calculation of the power of the lever-engines, for the various diameters of the cylinder, or steam-barrel, and bore of the pump that are capable of raising water from 48 to 440 hogheads *per* hour, at any depth from 15 to 100 yards. It was composed by Henry Beighton, and is founded on this principle, that the ale-gallon of 282 cubic inches of water weighs 10lb. 33. averdupois, and a superficial square inch is pressed with the weight of 14lb 133 of air, when the mercury stands at a medium in the barometer. But allowing for several frictions, and to give a considerable velocity to the engine, it is found by experience that no more than 8lb of pressure must be allowed to an inch square on the piston in the cylinder, that it may make about sixteen strokes in a minute at about six feet to each stroke. This calculation is but the ordinary power in practice, for with large boilers the piston will make twenty or twenty-five *per* minute, and each of them seven or eight feet; and then a pump of nine inches bore will discharge more than 320 hogheads *per* hour, and for other sizes proportionably.

Table

Table shewing the Diameter of the Cylinder and Bore of the Pump that is capable of raising any Quantity of Water, from 48 to 440 Hogheads an Hour, at any Depth from 15 to 100 Yards.

The depths in yards.

An example of the use of the table. Suppose it were required to draw 150 hogheads per hour, at 90 yards deep: in the seventh column I find the nearest number 149 hogheads; and against it, in the first column, I find a seven inch bore; then, under 90, the depth, on the right in the same line, I have 27 inches, the diameter of the cylinder fit for that purpose: and so for any other.

**Water-ENGINES**, those made for raising water: such is the steam-engine, already described. See also **WATER-WORKS**, where several curious engines of this kind, moved by water, will be described.

**ENGINEER**, or **ENGINEER**, properly denotes a contriver, or maker, of engines. See the preceding article.

**ENGINEER**, in the military art, an able, expert man, who, by a perfect knowledge in mathematics, delineates upon paper, or marks upon the ground, all forts of forts, and other works proper for offence and defence. He should understand the art of fortification, so as to be able, not only to discover the defects of a place, but to find a remedy proper for them, as also how to make an attack upon, as well as to defend, the place. Engineers are extremely necessary

cellary

cessary for these purposes : wherefore it is requisite that, besides being ingenious, they should be brave in proportion. When at a siege the engineers have narrowly surveyed the place, they are to make their report to the general, by acquainting him which part they judge the weakest, and where approaches may be made with most success. Their business is also to delineate the lines of circumvallation and contravallation, taking all the advantages of the ground ; to mark out the trenches, places of arms, batteries, and lodgments, taking care that none of their works be flanked or discovered from the place. After making a faithful report to the general of what is a doing, the engineers are to demand a sufficient number of workmen and utensils, and whatever else is necessary.

**ENGLAND**, the southern division of Great Britain, situated in the Atlantic ocean, between  $2^{\circ}$  east and  $6^{\circ}$  west longitude, and between  $49^{\circ} 55'$  and  $55^{\circ} 55'$  north latitude.

There are in England, including Wales, fifty-two counties, two archbishoprics, twenty-four bishoprics, two universities, twenty-nine cities, upwards of eight hundred towns, and near ten thousand parishes ; supposed to contain about 7,000,000 of people.

As to the polity, trade, law, civil and religious antiquities, &c. of England, their several branches are treated of under the articles **PARLIAMENT**, **PRIVY COUNCIL**, **COURT**, **CUSTOM-HOUSE**, **ADMIRALTY**, &c.

**New-ENGLAND**, comprehending the colonies of Massachusetts, New Hampshire, Connecticut, Rhode-island, and Providence Plantation, is situated between  $67^{\circ}$  and  $73^{\circ}$  west longitude, and between  $41^{\circ}$  and  $45^{\circ}$  north latitude.

The provinces into which New England is divided, have different constitutions, and generally different governors, who have a negative voice in the choice of the members who are to serve as their council ; and besides, all laws must be sent to Old England to receive the approbation of the crown, and no act of government is valid without the governor's consent in writing.

**ENGLECE**RIE, **ENGLESHIRE**, or **ENGLISHERY**, an antient word signifying the being an englishman, which was used in the time of king Canutus, to distinguish the English from the Danes, especially in the case of murder, and its

punishment ; as where a person was privately killed, such a person was deemed francigena, which comprehended every alien, till englecery was proved ; that is to say, till he was made out to be an englishman, in which case the town, &c. wherein it was committed, was exempted from amercement, which it was liable to if the murderer of a dane escaped out of it unpunished. The manner of proving the party slain to be an englishman, was before the coroner, by two men that knew his father, and two women that knew his mother. This was taken away by statute 14 Ed. III. c. 4.

**ENGLISH**, or the **ENGLISH-TONGUE**, the language spoken by the people of England, and, with some variation, by those of Scotland, as well as part of Ireland, and the rest of the british dominions.

The antient language of Britain is generally allowed to have been the same with the gaulic, or french ; this island, in all probability, having been first peopled from Gallia, as both Cæsar and Tacitus affirm, and prove by many strong and conclusive arguments, as by their religion, manners, customs, and the nearness of their situation. But now we have very small remains of the antient british tongue, except in Wales, Cornwall, the islands and highlands of Scotland, part of Ireland, and some provinces of France ; which will not appear strange, when what follows is considered.

Julius Cæsar, some time before the birth of our Saviour, made a descent upon Britain, though he may be said rather to have discovered than conquered it ; but, about the year of Christ forty-five, in the time of Claudius, Aulus Plautius was sent over with some roman forces, by whom two kings of the Britons, Codigunus and Caractacus, were both overcome in battle : whereupon a roman Colony was planted at Malden in Essex, and the southern parts of the island were reduced to the form of a roman province : after that, the island was conquered as far north as the Firths of Dumbarton and Edinburgh, by Agricola, in the time of Domitian ; whereupon, a great number of the Britons, in the conquered part of the island, retired to the west part called Wales, carrying their language with them.

The greatest part of Britain being thus become a roman province, the roman legions,

legions, who resided in Britain for above two hundred years, undoubtedly disseminated the latin tongue; and the people being afterwards governed by laws written in Latin, must necessarily make a mixture of languages. This seems to have been the first mutation the language of Britain suffered.

Thus the british tongue continued, for some time, mixed with the provincial latin, till, the roman legions being called home, the Scots and Picts took the opportunity to attack and harass England: upon which, K. Vortigen, about the year 440, called the Saxons to his assistance, who came over with several of their neighbours, and having repulsed the Scots and Picts, were rewarded for their services with the isle of Thanet, and the whole county of Kent: but growing too powerful, and not being contented with their allotment, dispossessed the inhabitants of all the country on this side of the Severn: thus the british tongue was in a great measure destroyed, and the Saxon introduced in its stead.

What the saxon tongue was long before the conquest, about the year 700, we may observe in the most ancient manuscripts of that language, which is a gloss on the Evangelists, by bishop Edfrid, in which the three first articles of the Lord's prayer run thus.

" Uren fader thic arth in heofnas, sic  
 " gehalgud thin noma, so cymeth thin  
 " ric. Sic thin willa sue is heofnas, and  
 " in eorþho, &c."

In the beginning of the ninth century, the Danes invaded England, and getting a footing in the northern and eastern parts of the country, their power gradually increased, and they became sole masters of it in about two hundred years. By this means the antient british obtained a tincture of the danish language: but their government, being of no long continuance, did not make so great an alteration in the Anglo-saxon, as the next revolution, when the whole land, *A. D.* 1067, was subdued by William the Conqueror, duke of Normandy in France: for the Normans, as a monument of their conquest, endeavoured to make their language as generally received as their commands, and thereby rendered the british language an entire medley.

About the year 900, the Lord's prayer in the antient Anglo-saxon, ran thus:

" Thu ure fader the eart on heofenum,  
 " si thin nama gehalgod; cume thin  
 " rice si thin willa on eorþan swa, swa  
 " on heofenum, &c."

About the year 1160, under Hen. II. it was rendered thus by pope Adrian, an englishman, in rhyme:

" Ure fader in heaven rich,  
 " Thy name be hayled ever lich,  
 " Thou bring us thy michell blisse:  
 " Als hit in heaven y-doe  
 " Evar in yearth beene it also, &c."

Dr. Hicks gives us an extraordinary specimen of the english, as spoken in the year 1385, upon the very subject of the english tongue.

" As it is knowe how meny maner  
 " peple beeth in this lond; there beeth  
 " also so many dyvers longages and  
 " tonges. Notheles Walschemen and  
 " Scots that beeth nought medled with  
 " other nations, holdeth wel nyh hir  
 " firste longage and speche; but yif the  
 " Scottes that were sometime confederat  
 " and woned with the picles drawe  
 " somewhat after hir speche; but the  
 " Flemynge that woneth on the weste  
 " side of Wales, haveth lost her strange  
 " spech and speketh sexonliche now.  
 " Also englihemmen, they had from  
 " the bygynnyng thre maner speche:  
 " northerne, southerne, and middel  
 " speche in the middel of the lond, as  
 " they come of thre maner of peple of  
 " Germania: notheles by comyxtion  
 " and mellynge first with Danes, and  
 " afterwards with Normans in meny  
 " the contrary longage is apayred.  
 " (corrupted.)

" This apayrynge of the burthe of the  
 " tunge is bycause of tweie thinges;  
 " oon is for children in scole agenft  
 " the usiuge and maner of all other  
 " nations, beeth compelled for to leve  
 " hire own longage, and for to con-  
 " stitue hir lessons and here thynges in  
 " French, and so they haveth sethe Nor-  
 " mans come first into Engeland. Also  
 " gentlemen children beeth taught to  
 " speke Frensche from the tyme that  
 " they beeth rokked in here cradel, and  
 " kunneth speke and play with a childes  
 " broche; and uplondische men will  
 " lykne hymself to gentilmen, and  
 " fondeth with great besynesse for to  
 " speake Frensche to be told of.---Hit  
 " seemeth a greet wonder how englishe-  
 " men and her own longage and tonge  
 " is so dyverse of sown in this oon  
 " ilond; and the longage of Nor-  
 " mandie

"mandie is comlynge of another lond,  
 "and hath oon manner foun amonge.  
 "alle men that speketh hit ariht in  
 "Engelond. Also of the foresaid  
 "saxon tonge that is deled (divided) a  
 "three, and is abide scarceliche with  
 "fewe uplondische men is greet wonder.  
 "For men of the est, with men of the  
 "west, is, as it were, undir the same  
 "partie of hevne acordeth more in  
 "townynge of speche, than men of the  
 "north, with men of the south. There-  
 "fore it is that mercii, that beeth men  
 "of myddel Engelond, as it were, par-  
 "teners of the endes, underfondeth  
 "bette the side longages northerne, and  
 "southerne, than northerne or southerne  
 "underfondeth either other. --- All the  
 "longage of the Northumbers and  
 "spechialliche at York, is so scharp,  
 "slitting and frotynge, and unshape,  
 "that we southerne men may that  
 "longage unnethe underfonde, &c.

"*Hicks's Thesaur. liter. sept.*"

In the year 1537, the Lord's prayer was printed as follows: "O. oure father  
 "which arte in heven, halowed be thy  
 "name: let thy kingdome come, thy  
 "will be fulfilled as well in erth as it  
 "is in heven; geve us this daye in  
 "dayly bred, &c." Where it may be  
 observed that the diction is brought al-  
 most to the present standard, the chief  
 variations being only in the orthography.  
 By these instances, and many others  
 that might be given, it appears, that the  
 english saxon language, of which the  
 Normans despoiled us in a great measure,  
 had its beauties, was significant and em-  
 phatical, and preferable to what they  
 imposed on us. "Great, verily," says  
 Camden, "was the glory of our tongue,  
 "before the norman conquest, in this,  
 "that the old english could expresse,  
 "most aptly, all the conceptions of the  
 "mind in their own tongue, without  
 "borrowing from any." Of this he  
 gives several examples.

Having thus shewn how the antient  
 british language was, in a manner, ex-  
 tirpated by the Romans, Danes, and  
 Saxons, and succeeded by the Saxon, and  
 after that the Saxon blended with the  
 Norman French, we shall now mention  
 two other causes of change in the lan-  
 guage: the first of these is owing to the  
 Britains having been a long time a trading  
 nation, whereby offices, dignities, names  
 of wares, and terms of traffic are in-  
 troduced, which we take with the

wares from the persons of whom we  
 have them, and form them anew, ac-  
 cording to the genius of our own tongue;  
 and besides this change in the language,  
 arising from commerce, Britain's having  
 been a considerable time subject to the  
 see of Rome, in ecclesiastical affairs,  
 must unavoidably introduce some italian  
 words among us. Secondly, as to the  
 particular properties of a language, our  
 tongue, has undergone no small muta-  
 tion, or rather has received no small im-  
 provement upon that account: for, as  
 to the Greek and Latin, the learned have,  
 together with the arts and sciences, now  
 rendered familiar among us, introduced  
 abundance; nay almost all the terms of  
 art in the mathematics, philosophy, phy-  
 sic, and anatomy; and we have enter-  
 tained many more from the Latin,  
 French, &c. for the sake of neatness and  
 elegance: so that, at this day, our  
 language, which about 1800 years ago,  
 was the antient British, or Welch, &c.  
 is now a mixture of Saxon, Teutonic,  
 Dutch, Danish, Norman, and modern  
 French, embellished with the Greek and  
 Latin. Yet this, in our opinion, is so  
 far from being a disadvantage to the  
 english tongue, as now spoke (for all  
 languages have undergone changes, and  
 do continually participate with each  
 other) that it has so enriched it, as now  
 to become the most copious, significant,  
 fluent, courteous, amorous and masculine  
 language in Europe, if not in the  
 world: This, indeed, was Camden's  
 opinion of it in his time, and Dr.  
 Heylin's in his time: if then the english  
 tongue, in the opinion of these learned  
 authors, deserved such a character in their  
 days, how much more now, having  
 since received so considerable improve-  
 ments from so many celebrated writers.

**ENGONASIS**, a name given to the con-  
 stellation Hercules. See **HERCULES**.

**ENGRAFTING**, or **GRAFTING**, in gar-  
 dening. See the article **GRAFTING**.

**ENGRAILED**, or **INGRAILED**, in he-  
 raldry, a term derived from the french  
*greffy*, hail; and signifying a thing the  
 hail has fallen upon and broke off the  
 edges, leaving them ragged, or with  
 half rounds, or semicircles, struck out of  
 their edges.

**ENGRAVING**, the art of cutting metals  
 and precious stones, and representing  
 thereon figures, letters, or whatever de-  
 vice, or design, the artist fancies.

Engraving, properly a branch of sculp-  
 ture,

ture, is divided into several other branches, according to the matter whereon it is employed, and the manner of performing it. See the article *SCULPTURE*. The original way of engraving on wood is denominatèd, at present, with us, by cutting in wood; that on metals with aquafortis, is named etching; that by the knife, burnisher, punch, and scraper, is called mezzotinto; that on stones for tombs, &c. stone-cutting; and that performed with the graver, on metals or precious stones, keeps alone the primitive name of engraving, being that which we shall at present attend to. See the articles *CUTTING*, *ETCHING*, *MEZZO-TINTO*, and *STONE-CUTTING*.

*ENGRAVING on copper*, is employed in representing portraits, histories, landkips, foliages, figures, buildings, &c. either after paintings, or designs, for that purpose. See *DESIGN* and *PAINTING*.

It is performed with the graver on a plate of copper, which, being well polished, is covered over thinly with virgin-wax, and then smoothed, while warm, with a feather, so that the wax be of an equal thickness on the plate; and on this the draught or design, done in black lead, red chalk, or ungummed ink, is laid with the face of the drawing on the wax: then they rub the backside, which will cause the whole design of the drawing to appear on the wax. The design, thus transferred, is traced through on the copper, with a point, or needle; then heating the plate, and taking off the wax, the strokes remain to be followed, heightened, &c. according to the tenor of the design, with the graver, which must be very sharp, and well pointed. See the article *GRAVER*.

In the conduct of the graver consists almost all the art, which depends not so much upon rules as upon practice, the habitude, disposition, and genius of the artist, the principles of engraving being the same with those of painting; for if an engraver be not a perfect master of design, he can never hope to arrive at a degree of perfection in this art. In conducting the strokes, or cuts, of the graver, he must observe the action of the fingers, and of all their parts, with their outlines; and remark how they advance towards, or fall back from his sight, and then, conduct his graver, according to the risings or cavities of the muscles, or folds, widening the strokes in the light, and contrasting them in the shades;

as also at the extremity of the outlines, to which he ought to conduct the cuts of the graver, that the figures or objects represented, may not appear as if they gnawn; and lightening his hand, that the outlines may be perfectly sound, without appearing cut or slit; and, although his strokes necessarily break off where a muscle begins, yet they ought always to have a certain connection with each other, so that the first stroke should often serve to make the second, because this will shew the freedom of the graver.

If hair be the subject, let the engraver begin his work by making the outlines of the principal locks, and sketch them out in a careless manner, which may be finished, at leisure, with finer and thinner strokes to the very extremities.

The engraver must avoid making very acute angles, especially in representing flesh, when he crosses the first strokes with the second, because it will form a very disagreeable piece of tabby-like lattice-work, except in the representation of some clouds, in tempests, the waves of the sea, and in representations of skins of hairy animals, and leaves of trees. So that the medium between square and acute seems to be the best and most agreeable to the eye. He that would represent sculpture, must remember that, as statues, &c. are most commonly made of white marble, or stone, whose colour does not produce such dark shades as other matters do, have no black to their eyes, nor hair of the head, and beard flying in the air. If the engraver would preserve one quality and harmony in his works, he should always sketch out the principal objects of his piece before any part of them are finished.

The instruments necessary for this sort of engraving are, besides a graver, a cushion, or sand bag, made of leather, to lay the plate on, in order to give it the necessary turns and motions; a burnisher made of iron, or steel, round at one end, and usually flattish at the other, to rub out slips and failures, soften the strokes, &c. a scraper, to pare off the surface, on occasion; and a rubber of a black hat, or cloth rolled up, to fill up the strokes that they may appear the more visible.

*In engraving on precious stones*, they use either the diamond, or the emery. The diamond, which is the hardest of all stones,

stones, is only cut by itself, or with its own matter. The first thing to be done in this branch of engraving, is to cement two rough diamonds to the ends of two ticks big enough to hold them steady in the hand, and to rub or grind them, against each other, till they be brought to the form desired. The dust, or powder that is rubbed off serves afterwards to polish them, which is performed with a kind of mill that turns a wheel of soft iron. The diamond is fixed in a brass-dish, and, thus applied to the wheel, is covered with diamond-dust, mixt up with oil of olives; and when the diamond is to be cut facet-wise, they apply first one face, then another, to the wheel. Rubies, sapphires, and topazes, are cut and formed the same way on a copper wheel, and polished with tripoli diluted in water. As to agates, amethysts, emeralds, hyacinths, granates, rubies, and others of the softer stones, they are cut on a leaden wheel, moistened with emery and water, and polished with tripoli, on a pewter wheel. Lapis-lazuli, opal, &c. are polished on a wooden wheel. To fashion and engrave vases of agate, crystal, lapis-lazuli, or the like, they make use of a kind of lathe, like that used by pewterers to hold the vessels, which are to be wrought with proper tools; that of the engraver generally holds the tools, which are turned by a wheel; and the vessel is held to them to be cut and engraved, either in relieve or otherwise; the tools being moistened, from time to time, with diamond-dust and oil; or, at least, emery and water. To engrave figures or devices on any of these stones, when polished, such as medals, seals, &c. they use a little iron wheel, the ends of whose axis are received within two pieces of iron, placed upright, as in the turner's lathe; and to be brought closer, or set further apart, at pleasure: at one end of the axis are fitted the proper tools, being kept tight by a screw. Lastly, the wheel is turned by the foot, and the stone applied by the hand to the tool, and is shifted and conducted as occasion requires.

The tools are generally of iron, and sometimes of brass: their form is various, but it generally bears some resemblance to chisels, gouges, &c. Some have small round heads, like buttons, others like ferrels, to take the pieces out, and others flat, &c. when the stone has been en-

graven, it is polished on wheels of hair-brushes and tripoli.

ENGRAVING *on steel* is chiefly employed in cutting seals, punches, matrices, and dyes proper for striking coins, medals, and counters. The method of engraving with the instruments, &c. is the same for coins as for medals and counters: All the difference consists in their greater or less relieve, the relieve of coins being much less considerable than that of medals, and that of counters still less than that of coins.

Engravers in steel commonly begin with punches, which are in relieve, and serve for making the creux, or cavities, of the matrices, and dyes: though sometimes they begin with the creux, or hollowness, but then it is only when the intended work is to be cut very shallow. The first thing done, is that of designing the figures; the next is the moulding them in wax, of the size and depth they are to lie, and from this wax the punch is engraven. When the punch is finished they give it a very high temper, that it may the better bear the blows of the hammer with which it is struck to give the impression to the matrix. See the articles PUNCH and MATRIX.

The steel is made hot to soften it, that it may the more readily take the impression of the punch; and after striking the punch on it, in this state, they proceed to touch up or finish the strokes and lines, where, by reason of their fineness, or the too great relieve, they are any thing defective, with steel gravers of different kinds, chisels, flatters, &c. being the principal instruments used in graving on steel.

The figure being thus finished, they proceed to engrave the rest of the medal, as the mouldings of the border, the engrailed ring, letters, &c. with little steel punches, well tempered, and very sharp.

ENGRAULIS, in ichthyology, a name given to the anchovy. See ANCHOVY.

ENGROSSING, or INGROSSING. See the articles INGROSSER and INGROSSING.

ENGUCHE, in heraldry, is said of the great mouth of a hunting horn, when its rim is of a different colour from that of the horn itself.

ENGYSCOPE, the same with microscope. See the article MICROSCOPE.

ENHARMONIC, in the antient music, one of their genera or kinds of music, so called from its superior excellence; tho' wherein it consisted, says Mr. Malcom,

is hard to say: it was allowed by all to be so very difficult, that few could ever practise it.

Others say it is a species of music, the modulation whereof proceeds by intervals less than semitones; as the semitone minor, enharmonic diesis, and third major. See SEMITONE, DIESIS, and THIRD.

This genus, says Brossard, was greatly used in the greek music, especially in dramatic performances. But as those almost insensible elevations and fallings of the voice, whereof it consists, are too difficult, and as they sometimes make the concord false, it has been laid aside, and even lost, though several great authors have made many attempts to recover it. See the articles GENUS, INTERVAL, and SYSTEM.

ENHERITANCE, or INHERITANCE. See the article INHERITANCE.

ENHYDRUS, in natural history, a genus of siderochita or crustated ferrugineous bodies, formed in large and in great part empty cases, inclosing a small quantity of an aqueous fluid.

Of this genus there are only two species.

1. The thick-shelled enhydrus, with black, reddish-brown, and yellow crusts.
2. The thinner-shelled kind, with yellowish-brown, and purple crusts; neither of which ferments with aqua fortis, or gives fire with steel.

ENIGMA, or ÆNIGMA. See the article ÆNIGMA.

ENIXUM, among chemists, a kind of neutral salt, generated of an acid and an alkali.

The sal enixum of Paracelsus, is the caput mortuum of spirits of nitre with oil of vitriol, or what remains in the retort after the distillation of this spirit; being of a white colour, and pleasing acid taste. If this be dissolved in hot water, and crystallized, it will be a yet more pleasant medicine, agreeing in virtues with vitriolated tartar. It is diuretic, and may be given from a scruple to a dram, in broth or water-gruel.

ENLARGE, in the manege, is to make a horse go large, or embrace more ground than he before covered.

To this purpose you should prick with both heels, or aid him with the calves of the legs, and bear your hand outwards; or rather prick him with the inner heel, sustaining him with the outer leg, in order to press him forwards, and make his shoulders go.

ENMANCHE', in heraldry, is when lines are drawn from the center of the upper edge of the chief to the sides, to about half the breadth of the chief; signifying sleeved, or resembling a sleeve, from the french *manche*.

ENNEACTIS, in natural history, a species of star-fish, with nine rays. See the article STAR-FISH.

ENNEADECATERIS, in chronology, the name by which the Greeks called the lunar cycle of nineteen years. See the article CYCLE.

ENNEAGON, in geometry, a polygon with nine sides. See the article POLYGON.

ENNEAHEDRIA, in natural-history, a genus of columnar, crystalliform, and double-pointed spars, composed of a trigonal column, terminated at each end by a trigonal pyramid.

Of this genus there are several species, distinguished by the length or shortness of the column and pyramids, none of which will give fire with steel, but all of them ferment with aqua-fortis. See the article SPAR.

ENNEANDRIA, in botany, a class of plants with hermaphrodite flowers, and nine stamina or male parts in each. See the article BOTANY.

To this class belong the laurus, rheum, spondias, and butomus. See the articles LAURUS, &c.

ENNEOPHTHALMUS, a name used by some for the lamprey.

ENNERIS, in the naval architecture of the antients, a galley or vessel with nine tires of oars. See the article GALLEY.

ENORAINE, in the manege, denotes a wither-wrung horse, or one spoiled in the withers. See the article WITHERS.

ENORCHIS, a species of ætites, wherein the nucleus is fixed. See ÆTITES.

ENQUEST, or INQUEST, in law. See the article INQUEST.

ENRICHED and ENRICHING. See the articles INRICHED and INRICHING.

ENROLLMENT, and clerk of ENROLLMENTS, &c. See INROLLMENT and CLERK.

ENS, among metaphysicians, denotes entity, being, or existence: thus the schools call *ens reale*, and *ens positivum*, to distinguish it from their *ens rationis*, which is only an imaginary thing, or exists only in the imagination.

ENS, among chemists, imports the power, virtue, and efficacy which certain substances exert upon our bodies. Pa-

cellus speaks much of the *ens primum* of minerals, gems, herbs, and liquors ; by which he means, the parts in which their virtues reside, or the very virtue or efficacy itself. Authors relate wonders of the renovating power of the *ens primum* of baum, and other plants, which is different in each kind.

**ENS VENERIS**, the sublimate of equal quantities of dulcified calx of vitriol, and the dried flowers of sal ammoniac, a small proportion of which turns a large one of the infusion of galls black : it is red, saline, and astringent ; and said to be an excellent medicine in distempers arising from a weakness of the solids, as the rickets, and the like.

**ENS**, in geography, a city of Germany, situated at the confluence of the Danube and the river Ens, about eighty miles south of Vienna : east long.  $14^{\circ} 20'$ , north lat.  $48^{\circ} 16'$ .

**ENSAL**, a term used by some for the small cardamom of the shops.

**ENSCONCED**, or **INSCONCED**. See the article **INSCONCED**.

**ENSEELED**, in falconry, is said of a hawk that has a thread drawn through her upper eye-lid, and made fast under her beak, to take away the sight.

**ENSIENT**, and **ENSIENTURE**, among lawyers, signifies a woman's being pregnant, or with child. See the article **PREGNANCY**.

**ENSIFORM**, in general, something resembling a sword, *ensis* : thus we find mention of ensiform leaves, ensiform cartilage, &c. See **LEAF** and **XIPHOIDES**.

**ENSIGN**, in the military art, a banner under which the soldiers are ranged according to the different companies or parties they belong to. See the articles **COLOURS**, **FLAG**, **STANDARD**, &c.

The european ensigns are pieces of taffety with various figures, arms, and devices painted on them, in different colours : the turkish ensigns are horses-tails.

**ENSIGN** is also the officer that carries the colours, being the lowest commissioned officer in a company of foot, subordinate to the captain and lieutenant. It is a very honourable and proper post for a young gentleman, at his first coming into the army : he is to carry the colours both in assault, day of battle, &c. and should not quit them but with his life : he is always to carry them himself on his left shoulder : only on a march he may have them carried by a soldier. If the ensign

is killed, then the captain is to carry the colours in his stead.

**ENSISHEIM**, a town of Germany, in the langraviate of Alsace, about fifty miles south of Straßburg : east long.  $7^{\circ} 30'$ , north lat.  $47^{\circ} 50'$ .

**ENSKIRKEN**, a town of Germany, fifteen miles south-west of Cologn.

**ENTABLATURE**, or **ENTABLEMENT**, in architecture, is that part of an order of a column, which is over the capital, and comprehends the architrave, frieze, and cornice.

The entablature is also called the *trabeation*, and seems borrowed from the latin, *trabs*, a beam ; though others derive it from *tabulatum*, a ceiling, because the frieze is supposed to be formed by the ends of the joists which bear upon the architrave.

It is different in different orders ; for notwithstanding that it consists of the three above-mentioned divisions in all, yet these parts are made up of more or fewer particular members or subdivisions, according as the order is more or less rich. Vignola makes the entablature a quarter of the height of the whole column in all the orders. In the tuscan and doric, the architrave, frieze, and cornice, are all of the same height. In the ionic, corinthian, and composite, the whole entablature being of fifteen parts, five of these go to the architrave, four to the frieze, and six to the cornice. See the articles **TUSCAN**, **DORIC**, &c.

Mr. le Clerc observes, that were we to regard only the laws of strength and weakness, we should rather diminish the entablature of such columns as have pedestals, than those which have none. As to the projecture of the entablature, it should never be forgot, that its principal design is to shelter what is underneath.

**ENTABLATURE**, in masonry, is used sometimes to denote the last row of stones on the top of the wall of a building, on which the timber and covering rest. This is often made to project beyond the naked of the wall, to carry off the rain.

**ENTABLER**, in the manege, the fault of a horse whose croupe goes before his shoulders in working upon volts ; which may be prevented by taking hold of the right rein, keeping your right leg near, and removing your left leg as far from the horse's shoulder as possible.

This is always accompanied with another fault called *aculer*. See **ACULER**.

**ENTAIL**,

**ENTAIL**, in law, is a fee-estate intailed ; that is, abridged and limited to certain conditions prescribed by the donor or grantor. See the articles **FEE**, **RECOVERY**, and **TAIL**.

**ENTALIUM**, a name used by some for the dentalium. See **DENTALIUM**.

**ENTE**, in heraldry, a method of marshalling more frequent abroad than with us, and signifying grafted or ingrafted.

We have, indeed, one instance of ente in the fourth grand quarter of his majesty's royal ensign, whose blazon is Brunswick and Lunenburg impaled with ancient Saxony, *ente en pointe*, grafted in point.

**ENTELECHIA**, *ἐντελέχεια*, a word used by Aristotle to express the soul, and which, not occurring in any other author, has given the commentators upon that philosopher great trouble to discover its true meaning. See the article **SOUL**. Hemolaus Barbarus is even said to have consulted the devil about it, after which, in his paraphrase on Themistius, either from the devil or himself, renders it *perfectibilia*, which is nothing clearer.

Cicero, whose interpretation of this word should be esteemed preferable to that of any modern writer, defines *entelechia* *quædam quasi continuata & perennis motio*, a certain continued and perpetual motion : whence it would appear, that Aristotle took the soul for a mode of the body, a continuous and perpetual motion being undoubtedly a mode of body. The vulgar peripatetics hold *entelechia* to signify act, and under it suppose the form of the compound or animal to be understood. The latest peripatetics agree, that the act, or *entelechia*, whereby Aristotle meant to explain the nature of the soul, is either some mode of the body, or it is nothing at all.

*Chauvin*,

**ENTENDMENT**, or **INTENDMENT**, in law. See the article **INTENDMENT**.

**ENTERFERING**, in the manege, the same with cutting. See **CUTTING**.

**ENTERING** of a *hawk*, among sportsmen, the letting her kill for the first time.

**ENTERING** of *hounds*, is the instructing them how to hunt. See **ENTRANCE**.

**ENTERMEWER**, in falconry, a hawk that changes the colour of her wings by degrees. See the article **HAWK**.

**ENTEROCELE**, *επηρεκηλη*, in surgery, a tumor formed by a prolapsion of the intestines through the rings of the abdo-

men, and processes of the peritonæum, into the scrotum. It is sometimes termed an *oscheocele* and complete *hernia*, in contradistinction to the *bubonocèle*. See the article **BUBONOCELE**, &c.

This disorder arises from a violent distention of the peritonæum and rings of the abdominal muscles, through which the intestine prolapses into the scrotum ; and proceeds from some violence by a fall, blow, or straining to leap, lift up great weights, vomiting, &c. and according to the nature of the cause, the rupture is formed either instantly or imperceptibly by degrees. This rupture is always attended with pains, and usually happens but in one side, never in both at a time : sometimes the intestine alone falls down ; at other times, it is accompanied with the omentum. The tumor appears soft to the touch like an intestine, or bladder, distended with wind : it first appears small in the inguen, and gradually descends down to the testicle of the same side in the scrotum, which is thereby sometimes distended halfway down the thigh, and even down to the knee : the other symptoms are the same with those of the *bubonocèle*.

The tumor is increased by crying, plentiful eating, lifting, or carrying any burden ; is contracted with cold, and dilated with heat : it may be distinguished generally from the *hydrocele* or *pneumatocèle*, by its returning into the abdomen with a murmuring noise.

This kind of rupture may be sustained with but little inconveniencies by men not much addicted to hard labour, and women with child ; but it should never be left to itself without a support or truss, lest, by some accident, the intestines should become incarcerated, and incapable of being returned. When the disorder is recent, and in a young subject, it may be perfectly cured without danger of a relapse ; as it may also in adults and old people, by constantly wearing a proper truss. It is less dangerous when the intestine is attended with the omentum. When the intestine is returnable, the surgeon should immediately reduce the parts, and retain them in their proper situation, and to close up the aperture firmly with a truss, bandage, or by incision, termed *celotomy*.

Another method consists chiefly in passing a small gold-wire round the upper part of the process of the peritonæum, near the ring of the abdominal muscles, leaving

leaving the testicle in its natural position : the wire is twisted by a pair of forceps, so as to confine the process of the peritonæum without compressing the spermatic vessels, in order to prevent the intestine from falling through it again : this method, however, is not thought effectual in most cases by Heister.

In order to preserve the testicle, some surgeons do not tie the process of the peritonæum and spermatic vessels with a ligature, but having returned the intestines and omentum, they then scarify the ring of the abdomen, through which the intestine prolapsed, together with the skin, in order to render the cicatrix more firm. If in the enterocoele the intestine cannot be reduced, especially if it adhere to the process of the peritonæum, ring of the abdominal muscles, scrotum, or testicle, no truss or bandage will be of any service : there is, then, but one method of saving the patient, by a severe operation ; in order to which the integuments are to be divided ; and when the sacculus appears, it is to be separated, and a small aperture made in it big enough to introduce a quill, or some other instrument to separate the intestine from all its adhesions, before it is protruded into the abdomen, which should always be done when the intestine adheres ; after which the wound is to be healed, and the patient secured from a relapse, by wearing the bandage-spica. See **BANDAGE** and **TRUSS**.

If the stricture of the intestine is so great as to render all means ineffectual to reduce the rupture, the surgeon must then have recourse to the knife to save the patient.

**ENTERO-EPIPOCELE**, a species of rupture, wherein the omentum, together with the intestines, fall into the scrotum. See the preceding article.

**ENTEROLOGY**, a term used by physicians, for a discourse or treatise on the contents of the head, breast, and abdomen. See the articles **HEAD**, &c.

**ENTEROMPHALUS**, the same with a hernia umbilicalis, or rupture at the navel. See the article **EXOMPHALUS**.

**ENTERPLEADER**, in law, signifies the discussing or trial of a point, incidentally falling out, before the principal cause can be determined.

It is allowed that a defendant cannot be twice charged with the same thing, or to two severally, where no default is in him : thus if one man brings detinue against the defendant upon bailment of goods,

and another a trover against the same person ; in this case there shall be an enterpleader, to ascertain which of the parties has a right to his action.

Judgment may be given on an enterpleader, to recover what is demanded against the defendant ; and where two have enterpleaded, the person recovering shall have damages of the other.

**ENTERMENT**, or **INTERMENT**. See the articles **BURIAL** and **INTERMENT**.

**ENTERSOLE**, in architecture, a kind of little story, sometimes called a mezzanine, contrived occasionally at the top of the first story, for the convenience of a wardrobe, &c.

**ENTERTAINMENT**, in a theatrical sense. See the article **FARCE**.

**ENTHALIUM**, in natural history, a kind of tubulus marinus. See **TUBULUS**.

**ENTHUSIASM**, *ενθουσιασμος*, a transport of the mind, whereby it is led to think and imagine things in a sublime, surprising, yet probable manner. This is the enthusiasm felt in poetry, oratory, music, painting, sculpture, &c.

**ENTHUSIASM**, in a religious sense, implies a transport of the mind, whereby it fancies itself inspired with some revelation, impulse, &c. from heaven. Mr. Locke gives the following description of enthusiasm. " In all ages, men in whom melancholy has mixed with devotion, or whose conceit of themselves has raised them into an opinion of a great familiarity with God, and a nearer admittance to his favour than is afforded to others, have often flattered themselves with a persuasion of an immediate intercourse with the deity, and frequent communications from the divine spirit. Their minds being thus prepared, whatever groundless opinion comes to settle itself strongly upon their fancies, is an illumination from the spirit of God, and presently of divine authority. And whatsoever odd action they find in themselves a strong inclination to do, that impulse is concluded to be a call or direction from heaven, and must be obeyed. It is a commission from above, and they cannot err in executing it. This I take to be properly enthusiasm, which, though arising from the conceit of a warm and overweening brain, works when it once gets footing more powerfully on the persuasions and actions of men, than either reason or revelation, or both together. Men being

" most

"most forwardly obedient to the impulse they receive from themselves."

Devotion, when it does not lie under the check of reason, is apt to degenerate into enthusiasm. When the mind finds itself inflamed with devotion, it is apt to think that it is not of its own kindling, but blown up with something divine within it. If the mind indulges this thought too far, and humours the growing passion, it, at least, flings itself into imaginary raptures and ecstasies; and when once it fancies itself under the influence of a divine impulse, no wonder if it slight human ordinances, and refuses to comply with the established form of religion, as thinking itself directed by a much superior guide.

**ENTHUSIAST**, a person possessed with enthusiasm. See the preceding article.

**ENTHYMEME**, *εὐθυμια*, among logicians, denotes a syllogism, perfect in the mind, but imperfect in the expression, by reason one of the propositions is suppressed, as being easily supplied by the understanding of those with whom we discourse. e. g. *In every right-lined triangle, the three angles are just equal to two right ones; therefore, those of an isosceles are so:* where the proposition, *every isosceles is a right-lined triangle*, is omitted, as being sufficiently known. But to give a more familiar example; suppose the enthymeme to be, *every man is mortal; therefore every king is mortal*: where the minor proposition, *every king is a man*, is omitted for the reason already mentioned. There is a particular elegance in the enthymeme form of arguing, as leaving somewhat to the exercise and invention of the mind; for which reason it is very frequent, as well in common conversation, as in the most polite writers. It not only shortens discourse, and adds a certain force and liveliness to our reasoning, but gives the reader a pleasure not unlike that the author himself feels in composing. By this means we are put upon exerting ourselves, and seem to share in the discovery of what is proposed to us.

**ENTIER**, in the manege, a resty horse that not only refuses to turn, but resists the hand: provided he flies or parts for the two heels, you have a remedy for him, by using a cavesson made after the duke of Newcastle's way.

**ENTIER** also denotes a bit-mouth. See the article **BIT**.

**ENTIERTY**, or **ENTIERTIE**, among lawyers, signifies the whole of a thing,

in contradistinction to a moiety: thus a bond, damages, &c. are said to be intire, when they cannot be apportioned.

**ENTIRE TENANCY**, in law, is when the sole possession is in one person; in contradistinction to several tenancy, which is a joint or common possession in two or more.

**ENTITIVELY** and **ENTITY**, among metaphysicians. See the article **ENS**.

**ENTOMON PYRAMIDALE**, in zoology, a name by which some call the pyramidal oniscus. See the article **ONISCUS**.

**ENTOYER**, in heraldry, denotes a bordure charged wholly with things without life: it seems to be a corruption of the french *entour*, round about.

**ENTRAILS**, the same with intestines. See the article **INTESTINES**.

**ENTRANCE** of bounds, among sportsmen, denotes the instructing them how to hunt: for which purpose, it is proper to lead them through warrens and flocks of sheep, to enure them to be under command, and to run at nothing without the huntsman's orders; and when the game appears, the young hounds are to be entered along with the best and staunchest hounds that can be got, and not one barking dog suffered to be near. The hare is the best game on such an occasion, because, in this chase, the young hounds will learn all the doublings they can possibly meet with in any other kind. When the hare is killed, they must not be allowed to break her up; but the huntsman is to skin and cut her in pieces, with which the young hounds are to be rewarded.

**ENTRE MINHO DOURO**, a province of Portugal, having the river Mino on the north, Douro on the south, and the Atlantic ocean on the west.

**ENTRE TAYO** and **GUADIANA**, a province of Portugal, having that of Estremadura on the north, and the Atlantic ocean on the west.

**ENTREPAS**, in the manege, a broken pace or going that is neither walk nor trot, but has somewhat of an amble.

This is the pace or gait of such horses as have no reins or back, and go upon their shoulders; or, of such as are spoiled in their limbs.

**ENTRING a ship**, the same with boarding. See the article **BOARDING**.

**ENTRING-LADDERS**, in a ship, are of two sorts; one used by the vessel's sides, in a harbour, or in fair weather, for persons to go in and out of the ship: the other is made

made of ropes, with small staves for steps; and is hung out of the gallery to enter into the boat, or to come aboard the ship, when the sea runs so high that they dare not bring the boat to the ship's side for fear of staving it.

**ENTRING-PORTS.** See the article **PORT**.

**ENTRING-ROPE.** See the article **ROPE**.

**ENTROCHUS**, in natural history, a genus of extraneous fossils, usually of about an inch in length, and made up of a number of round joints, which when separate and loose, are called trochitæ: they are composed of the same kind of plated spar with the fossil shells of the echini, which is usually of a bluish-grey colour, and very bright where fresh broken; they are all striated from the center to the circumference, and have a cavity in the middle. See plate XCH. fig. 3.

The entrochi are found of all sizes, from that of a pin's head to a finger's length, and the thickness of one's middle finger; and are plainly of marine origin, having often sea-shells adhering to them. They seem to be the petrified arms of that singular species of the sea-starfish, called *stella arboreicens*.

They are esteemed very powerful diuretics, and prescribed in nephritic cases with good success; the dose being as much of the powder, as will lie on a shilling.

**ENTRUSION, or INTRUSION, in law.**

See the article **INTRUSION**.

**ENTRY, in law,** signifies taking possession of lands or tenements, where a person has a right so to do.

It is also used for a writ of possession, which is of divers kinds, as, 1. A writ of *entry sur disseisin*, which lies for the disseisee against the disseisor. 2. A writ of *entry sur disseisin in le per*, that lies for the heir by descent, who succeeding in right of his ancestor, is said to be in the *per* or *pere*. 3. A writ of *entry sur disseisin in le per & cui*, which lies where the feoffee of the disseisor makes a feoffment to another. 4. A writ of *entry sur disseisin in le post*, which lies where after a disseisin the land is removed from one hand to another beyond the degrees, that a writ of entry can be made in the usual form.

The writ of entry is put out of the degrees by five things. 1. Intrusion, as when the disseisor dies seised, and a stranger enters. 2. Succession, when the successor in office or profession enters. 3. Disseisin upon disseisin, when the disseisor

is disseised by another. 4. Judgment, where a person recovers against the disseisor. 5. Escheat, which is when the disseisor dies without heir, or commits felony, &c. on which account the lord enters. In all which cases, a disseisee, or his heir, shall not have a writ of entry within the degrees of the *per*, but in the *post*.

There are several other writs of entry, which lie for the person in reversion, where a tenant for life, for term of years, or by courtesy, aliens, and afterwards dies: and so in other cases.

**Forcible ENTRY.** See **FORCIBLE**.

**ENTRY, among sportsmen,** denotes the places or thickets through which deer are found lately to have passed.

**Bill of ENTRY, in commerce.** See **BILL**.

In making entries inwards, it is usual for merchants to include all the goods they have on board the same ship in one bill, though sometimes they may happen to be upwards of twenty several kinds; and in case the goods are short entered, additional or post entries are now allowed; though formerly the goods, so entered, were forfeited. As to bills of entry outwards; or including goods to be exported, upon delivering them, and paying the customs, you will receive a small piece of parchment called a *cocket*, which testifies your payment thereof, and all duties for such goods. See the article **EXPORTATION**.

If several sorts of goods are exported at once, of which some are free, and others pay customs, the exporter must have two cockets, and therefore must make two entries; one for the goods that pay, and the other for the goods that do not pay custom.

Entries of goods, on which a drawback is allowed, must likewise contain the name of the ship in which the goods were imported, the importer's name, and time of entry inwards. The entry being thus made, and an oath taken that the customs for those goods were paid as the law directs, you must carry it to the collector and comptroller, or their deputies; who, after examining their books, will grant a warrant, which must be given to the surveyor, searcher, or land-waiter, for them to certify the quantity of goods; after which the certificate must be brought back to the collector and comptroller, or their deputies, and oath made that the said goods are really shipped, and not landed

landed again in any part of Great Britain. See the articles **DRAWBACK** and **DEBENTURE**.

**ENVELOPE**, in fortification, a work of earth, sometimes in form of a simple parapet, and at others, like a small rampart with a parapet: it is raised sometimes on the ditch, and sometimes beyond it.

Envelopes are often made to inclose a weak ground, where that is practicable, with single lines, to save the great charge of horn-works and tenails, or where there is not room for such large works. Some give the name of *filion*, counter-guard, conserve, and *lunette*, to envelopes raised in the moat.

**ENVIRONNEL**, in heraldry, signifies surrounded with other things: thus, they say, a lion environné with so many bezants. See the article **BEZANT**.

**ENULA CAMPANA**, **HELENIUM**, or **ELECAMPANE**, in botany. See the article **ELECAMPANE**.

**ENUMERATION**, an account of several things, in which mention is made of every particular article.

**ENUMERATION**, in rhetoric, a part of peroration, in which the orator, collecting the scattered heads of what has been delivered throughout the whole, makes a brief and artful relation, or recapitulation thereof.

**ENUMERATION of the parts**, in rhetoric, is much the same with distribution. See the article **DISTRIBUTION**.

**ENUNCIATION**, a declaration of a thing either in terms of affirmation or denial.

**ENUNCIATION**, among logicians, the same with proposition. See the article **PROPOSITION**.

**ENVOICE**, the same with invoice. See the article **INVOICE**.

**ENVOY**, a person deputed to negotiate some affair with any foreign prince or state. Those sent from the courts of France, Britain, Spain, &c. to any petty prince or state, such as the princes of Germany, the republics of Venice, Genoa, &c. go in quality of envoys, not ambassadors; and such a character only do those persons bear, who go from any of the principal courts of Europe to another, when the affair they go upon is not very solemn or important. There are envoys ordinary and extraordinary, as well as ambassadors; they are equally the same under the protection of the law of nations, and enjoy all the privileges of ambassadors, only differing from them in this,

that the same ceremonies are not performed to them.

**ENURE**, in law, signifies to take effect, or avail: thus, they say, a release made to a tenant for life, shall enure and be of force to the person in reversion.

**ENURNY**, in heraldry, is applied to a bordure charged with beasts.

**ENVY**, in ethics, is defined to be an uneasiness of the mind, caused by the consideration of a good we desire, obtained by one we think less worthy of it than ourselves. See the article **PASSION**.

**EON**, among anatomists, is sometimes used for the whole ambit of the eye.

**EON**, or **ÆON**, in church-history. See the article **ÆON**.

**EPACT**, in chronology, a number arising from the excess of the common solar year above the lunar; whereby the age of the moon may be found out every year. See the articles **YEAR** and **MOON**.

The excess of the solar year above the lunar is 11 days; or the epact of any year expresses the number of days from the last new moon of the old year, which was the beginning of the present lunar year, to the first of January. The first year of the cycle of the moon, the epact is 0, because the lunar year begins with the solar. On the second, the lunar year has begun 11 days before the solar year, therefore the epact is 11. On the third, it has begun twice 11 before the solar year, therefore the epact is 22. On the fourth, it begins three times 11 days sooner than the solar year, the epact would therefore be 33: but 30 days being a synodical month, must that year be intercalated; or that year must be reckoned to consist of thirteen synodical months, and there remains three, which is the true epact of the year; and so on to the end of the cycle, adding 11 to the epact of the last year, and always rejecting 30, gives the epact of the present year. Thus to adjust the lunar year to the solar, through the whole of 19 years, 12 of them must consist of 12 synodical months each, and 7 of 13, by adding a month of 30 days to every year when the epact would exceed 30, and a month of 29 days to the last year of the cycle, which makes in all 209 days, *i. e.*  $19 \times 11$ ; so that the intercalary or embolimæan years, in this cycle are 4, 7, 10, 12, 15, 18, 19. See the article **CYCLE**.

If the new moons returned exactly at the same

same time after the expiration of nineteen years, as the council of Nice supposed they would do (when they fixed the rule for the observation of easter, and marked the new moons in the calendar for each year of the lunar cycle) then the golden number multiplied by 11, would always give the epact. But in a julian century, the new moons anticipate, or happen earlier than that council imagined they would, by  $\frac{8}{25}$  of a day. In a gregorian common century, which is one day shorter than a julian century, they happen  $\frac{1}{25}$  of a day later, ( $1 \text{ day} - \frac{8}{25} = \frac{17}{25}$ ). Now  $\frac{17}{25} \times 3 = \frac{51}{25}$  for the three common centuries, but  $\frac{8}{25}$  being subtracted, on account of the gregorian bissextile century, there will remain  $\frac{43}{25}$ . Therefore in four gregorian centuries, the new moons will happen later by  $\frac{43}{25}$  of a day, and the epacts must be decreased accordingly.

At present the gregorian epact is 11 days short of the julian epact; but the quotient of the number of the centuries divided by 4, which at this time is 4, multiplied by  $\frac{43}{25}$ , with the addition of the remainder 1 multiplied by  $\frac{17}{25}$ , makes in all but  $\frac{89}{25}$ , or 7 days  $+\frac{14}{25}$ , therefore  $\frac{86}{25}$ , i. e. 3 days  $+\frac{14}{25}$  must be added to complete the 11 days. Whence we have the following

**General rule for finding the gregorian EPACT for ever.** Divide the centuries of any year of the christian æra by 4, (rejecting the subsequent numbers;) multiply the remainder by 17, and to this product add the quotient multiplied by 43; divide the product  $+ 86$  by 25; multiply the golden number by 11, from which subtract the last quotient; and rejecting the thirties, the remainder will be the epact.

Example for 1754.

$$\begin{aligned} 17 \div 4 &= 4 \text{ remains } 1 \\ 1 \times 17 &= 17 \\ 43 \times 4 + 86 + 17 &= 275 \\ 275 \div 25 &= 11 \\ 11 \times 7 \text{ (G. N.º)} &= 77 \\ 77 - 11 &= 66 \\ 66 - 60 (2 \times 30) &= 6 = \text{Epact.} \end{aligned}$$

A shorter rule for finding the epact until the year 1900. Subtract 1 from the golden number; and multiplying the remainder by 11, reject the thirties, and you have the epact.

Example for the year 1754.

$$\begin{aligned} \text{G. N.} &= 7 \\ \text{G. N.} - 1 &= 6 \\ 66 - \text{twice } 30 &= 6 = \text{Epact.} \end{aligned}$$

$$\begin{aligned} \text{G. N.} &= 7 \\ 1 & \\ 6 & \\ 11 & \\ 30 \times 66 &= 2 \\ 6 & = \text{Ep.} \end{aligned}$$

A table of golden numbers, and their corresponding epacts, till the year 1900.

G. N.º	Epact.	G. N.º	Epact.	G. N.º	Epact.	G. N.º	Epact.
1	06	25	11	20	16	15	
2	11	7	6	12	17	26	
3	22	8	17	13	12	18	7
4	39	28	14	23	19	18	
5	14	10	9	15	4		

**EPANORTHOSIS**, in rhetoric, a figure by which a person corrects, or ingeniously revokes what he just before alledged, as being too weakly expressed, in order to add something stronger, and more conformable to the passion with which he is agitated.

The epanorthosis is distinguished into two kinds, the one is when we correct or revoke the word, as in the following example of the apostle, *but I laboured more abundantly than they all: yet not I, but the grace of God, which was with me.* 1 Cor. xv. 10. where what he first attributed to his own merit, he chooses afterwards to call the work of grace, as being the principal cause. The second kind of epanorthosis, is when we correct or revoke the sentiment, as in the following of Cicero: *Italiam ornare, quam domum suam, maluit: quamquam, Italia ornata, domus ipsa mihi videtur ornatio.*

**EPARER**, in the manege, signifies the flinging of a horse, or his yerking and striking with his hind legs. See **YERK**. In caprioles, a horse must yerk out behind with all his force; but in ballotades, he strikes but half out; and, in croupades, he does not strike out his hind legs at all. All such yerking horses are reckoned rude. See the articles **CAPRIOLE**, **BALLOTADE**, &c.

**EPAULE**, in fortification, denotes the shoulder of a bastion, or the place where its face and flank meet, and form the angle called the angle of the shoulder. See the article **BASTION**.

**EPAULEMENT**, in fortification, a work raised to cover sidewise, is either of earth, gabions,

gabions, or fascines, loaded with earth. The epaulements of the places of arms for the cavalry, at the entrance of the trenches, are generally of fascines mixed with earth.

**EPAULEMENT** also denotes a mass of earth, called likewise a square orillon from its figure, raised to cover the cannon of a cazemate, and faced with a wall.

It is likewise used for any work, thrown up to defend the flank of a post, or other place.

**EPEMBOLE**, in rhetoric, the same with parembolē. See the article **PAREMBOLE**.

**EPENTHESIS**, in grammar, the interposition or insertion of a letter or syllable in the middle of a word, as *akituum*, for *alitur*; *relligio*, for *religio*; *induperator*, for *imperator*, &c.

**EPERLANUS**, in ichthyology, the name used by authors for the olmerus, with seventeen rays in the fin beside the anus, and called in english the finelt. See the article **OSMERUS**.

**EPERON**, the SPUR-SHELL, in natural-history. See the article **SPUR-SHELL**.

**EPHA**, or **EPHAH**, in jewish antiquity, a measure for things dry, containing 1.0961 of a bushel. See **MEASURE**.

**EPHÆTUM**, in botany, a name used by some for the ranunculus, or crowsfoot. See the article **RANUNCULUS**.

**EPHEDRA**, the SEA-GRAPE, or SHRUB HORSE-TAIL, in botany, a genus of the *dioecia-syngenesia* class of plants, which has no corolla or flower-petals: the stamina are seven filaments, coalescing into a subulated column; the antheræ are roundish, three being superior, and the other four inferior: the seeds are acutely oval, convex on one side, and plain on the other, and contained in a baccated cup. The fruit is red, succulent, and of an acid austere taste: its juice, taken in wine, is said to be good for the coeliac passion and fluor albus.

**EPHEDRA** is also used by some for the equisetum, or horse-tail. See **EQUISETUM**.

**EPHEMERA**, in medicine, the name of a species of fever continuing the space of one day, or sometimes more; for the medical writers express themselves by *ephemera simplex*, *vel plurium dierum*.

This species of fever has this peculiar to it, that the pulse is at first large, but as it becomes afterwards moderately quick and frequent, so it is equal, soft, and regular, as in a natural state. The urine undergoes little or no change, nor is the disorder preceded by a loathing of food, a spontaneous lassitude of the body, dis-

turbed sleep, preternatural yawning, or horror; but it seizes the patient suddenly, and afflicts him with no other symptoms than a pain of the head and stomach, a nausea, heat and restlessness. The persons most subject to this fever, are young men who have much blood, and feed heartily, and such as have had any habitual discharge of blood stopped upon them, whether natural, as in the hæmorrhoidal or menstrual discharges, or artificial, such as frequent bleeding, cupping, and the like. And those who have thrown their blood into violent emotions by the too free use of spirituous liquors, too violent exercise, unusual watchings, long stay by large fires, a sudden repression of sweats by cold water, or by violent passions, particularly anger. In the treatment of this fever, the proper course is to temperate the violent motions of the blood with nitrous and the fixed antimonial medicines, and occasionally with gentle acids. Sweat is to be promoted. Nitre, crabs-eyes, &c. may be prescribed in small doses every three or four hours; and towards night, sudorifics should be joined to these, such as the contrayerva-root, or the like. The ephemera, properly so called, differs in nothing except the time of its duration, from that which commonly lasts four days.

**EPHEMERA MALIGNA**, is also a term by which some authors have called the sudor anglicanus, or malignant diary fever, which generally destroyed the patient in twenty-four hours. See the article **SUDOR ANGLICANUS**.

**EPHEMERA**, the DAY-FLY, in zoology, a genus of flies, belonging to the neuroptera order, and so called from their living only one day and a night: they are about the size of the lesser house-flies, and have two gibbous protuberances on the top of the head, resembling eyes: add to this, that the tail is furnished with hairs, and the antennæ are short.

Of this genus there are several species, distinguished by their different colours, and the number of hairs in their tail; some having two, and others three.

**EPHEMERIDES**, in literary history, an appellation given to those books or journals, which shew the motions and places of the planets for every day of the year. It is from the tables contained in these ephemerides, that eclipses, and all the variety of aspects of the planets, are found. See the articles **ECLIPSE**, **CONJUNCTION**, **OPPOSITION**, &c.

**EPHEMERUM**, in botany, the same with the *tradescantia* of Linnaeus. See the article **TRADESCANTIA**.

**EPHIALTES**, *επιαλτης*, in medicine, the same with the incubus, or night-mare. See the article **INCUBUS**.

**EPHIPPUIM**, in anatomy, the same with the *cella turcica*, being a part of the *os sphencoides*. See the article **SPHENOIDES**.

**EPHOD**, in jewisi antiquity, one part of the priestly habit; being a kind of girdle which, brought from behind the neck over the two shoulders, and hanging down before, was put cro's the stomach, then carried round the waist, and made use of as a girdle to the tunic.

There were two sorts of ephods, one of plain linnen for the priests, and the other embroidered for the high priest. Of this last Moses gives an ample description. It was composed of gold, blue, purple, crimson and twisted cotton. Upon part of it, which passed over the shoulders, were two large precious stones, one on each shoulder: upon these were engraven the name of the twelve tribes, six upon each stone.

The ephod was peculiar to the priesthood, and thought essential to their character; it being the opinion of the Jews, that no worship, true or false, could subsist without a priesthood and ephod.

**EPHORI**, *εφοροι*, in grecian antiquity, magistrates established in ancient Sparta to ballance the regal power. The authority of the ephori was very great. They sometimes expelled and even put to death the kings, and abolished or suspended the power of the other magistrates, calling them to account at pleasure. There were five of them, others say nine. They presided in the public shews and festivals. They were entrusted with the public treasure, made war and peace, and were so absolute, that Aristotle makes their government equal to the prerogative of a monarchy. They were established by Lycurgus.

**EPHYDRUM**, in botany, the same with the *equisetum*, or horse-tail. See the article **EQUISETUM**.

**EPIBATERION**, *επιβατηριον*, in antient poetry, a poem rehearsed at a person's return from a voyage, thanking the immortal gods for his preservation.

**EPIC**, or **HEROIC POEM**, a poem expressed in narration, formed upon a story partly real, and partly feigned; representing, in a sublime stile, some signal and fortunate action, distinguished by a va-

riety of great events, to form the morals, and affect the mind with the love of heroic virtue. See the article **POEM**.

We may distinguish three parts of the definition, namely, the matter, the form, and the end. The matter includes the action of the fable, under which are ranged the incidents, episodes, characters, morals, and machinery. The form comprehends the way or manner of the narration, whether by the poet himself, or by any persons introduced, whose discourses are related: to this branch likewise belong the moving of the passions, the descriptions, discourses, sentiments, thoughts, stile, and versification; and besides these, the similes, tropes, figures, and, in short, all the ornaments and decorations of the poem. The end is to improve our morals, and increase our virtue. See the articles **ACTION**, **FABLE**, **EPISODE**, **CHARACTER**, &c.

There are two things which chiefly distinguish epic from tragedy, the manner of the representation, and the event or catastrophe. As to the former it is certain that tragedy is formed upon action, and epic upon narration. This is the principal character in an heroic poem, and a very difficult part of it. The qualities a narration must have to be perfect, are these: it must be short and succinct, that nothing may be idle, flat, or tedious: it must be lively, quick, and delightful: it must be simple and natural. The most ordinary graces of a narration, must come from the figures, the transitions, and from all those delicate turns that carry the reader from one thing to another, without his regarding it. It must never point out all the matter, that some may be left for the natural reflections of the reader. It must likewise avoid the particulars and length of affected descriptions. Lastly, the narration must be delightful, not only by the variety of things it relates, but by the variety of its numbers. It is this variety that makes the greek versification more harmonious and more proper for narration than the Latin.

Epic also differs from tragedy in the event, or conclusion. In tragedy, the conclusion is generally unfortunate, but never so in epic: the reasons of which rule are the examples of Homer and Virgil, who are, and ought to be, our guides and patterns in this particular, and in which they have been universally followed by all who would have been thought

epic

epic writers ; and not only their authority, but the very reason of the thing supplies us with arguments for this rule.

1. Although in tragedy, where the action is much shorter, more simple, and finished, as it were, at a heat, an unfortunate conclusion may be so far from displeasing, that it may be more agreeable to the audience : yet in epic, after such a series and variety of adventures, after sustaining so many and such great difficulties, the reader must be out of humour with the poet, unless the whole should conclude happy at last. 2. The chief end of tragedy is to excite the passions, especially those of terror and pity, by a short and brisk emotion ; but the design of an epic poem is, by more slow and leisure operations, to remove bad habits, and restore good ones ; to subdue vice and recommend virtue, which would be done with a very ill grace, if the hero of the poem should come to a deplorable end. 3. An epic poem, properly so called, is, and should be, written in honour of the country and religion of the author, between which and the hero there is a near relation ; and therefore he ought to come off in triumph at last. These two differences are, as the schools call them, specific differences, being so in nature : the others are only accidental, being differences in degree, extent, and greatness. Although epic poetry is directed to the morals and the habit rather than the passions, yet it likewise has passions, but in an inferior degree to tragedy : for though it has a mixture of all the passions, yet joy and admiration are the most essential to it.

An epic poem must be formed upon a story partly real and partly fictitious. In tragedy, which is much shorter, the performance may not only be excusable, but commendable, though the whole fable should be fictitious ; but in such a long work as that of an epic poem, the reader will be tired unless he has the pleasure of finding some truth interwoven with the fable.

The moderns seem to mistake that part of the epic and tragedy which contain the wonderful, confounding it with improbable, and using the two words promiscuously. If it was really so, the wonderful would be always faulty ; for that is always so which is improbable. The great art is a just temperament and mixture of both, to make it natural and pro-

bable. Scarce any of the poets but Virgil had the art, by the preparation of incidents, to manage the probability in all the circumstances of an epic poem. Homer is not altogether so scrupulous and regular in his contrivances : his machines are less just, and all his measures, to save the probability, are less exact. Lastly, the sovereign perfection of an epic poem, in the opinion of Aristotle, consists in the just proportion and perfect connection of all the parts. It is not sufficient that all be grand and magnificent in an epic poem, but all must be just, uniform, and proportionable, in the different parts that compose it.

This is all that can be observed most essential to an epic poem : little need be said about the machinery, which, among the antient heathens, was the agency of their false gods, and of angels and dæmons among us christians : its beauty and magnificence is well known. The dignity of an epic poem would scarce be kept up without it, especially since the marvellous depends on it. The versification of epic poetry, among the Greeks and Romans, consisted of hexameters, a sort of verse so peculiar to epic, that when it is used upon other occasions, it is called heroic verse. Our english verse comes nearest to it both in gravity and majesty, but at how great a distance ? See the article *HEXAMETER*. An epic or heroic poem, is the best and most perfect kind of poetry ; it is the greatest work which the soul of man is capable of performing ; and here it is the utmost bounds are set to human composition. All the nobleness and the elevation of the most perfect genius, can hardly suffice to form such a one as is requisite for an heroic poet : the difficulty of finding together fancy and judgment, heat and imagination, and sobriety of reason, precipitation of spirit, and solidity of mind, renders this character so very rare : it requires great images, and yet a greater wit to form them. There must be a judgment so solid, a discernment so exquisite, such perfect knowledge of the language in which he writes, such obstinate study, profound meditations, and vast capacity, that scarce whole ages can produce one genius fit for an epic poet : even among the antients themselves, if we except Homer and Virgil, we shall scarce find one that is truly an epic poet.

**EPICALYMMA**, in the history of shell-fish, the same with operculum. See the article **OPERCULUM**.

**EPICARPIUM**, in antient pharmacy, denotes a remedy applied in form of a plaster to the wrists: it consisted of penetrating ingredients, as garlic, onion, camphor, &c.

**EPICEDIUM**, *ἐπιχέδιον*, in antient poetry, a poem rehearsed during the funeral solemnity of persons of distinction. See the article **NENIA**.

We find two beautiful epicediums in Virgil, one of Euryalus, and the other of Pallas.

**EPICERAS**, a name used by some for foenugreek. See the article **FOENUGREEK**.

**EPICRASTICS**, in pharmacy, denote much the same with emollients. See the article **EMOLLIENTS**.

Epicraastic medicines obtund the acrimony of the humours, and mitigate the uneasy sensation thence arising.

To this class belong, 1. The emollient roots, as marshmallow, liquorice, &c.

2. The leaves of mallows, water-lilly, the large house-leek, purslain and lettuce.

3. The seeds of barley decorticated, henbane, lettuce, flax, white poppy, and rue.

4. Fruits, as jubebs, raisins, sweet apples, prunes, and sweet almonds. 5. Cooling juices, whites of eggs, whey, oils, syrup, and sugar of violets, &c.

**EPICHIREMA**, *ἐπιχίρημα*, in logic, a mode of reasoning, which comprehends the proof of one or both the premises of a syllogism, before the conclusion is drawn.

**EPICHORDIS**, in anatomy, a name by which some call the mesentery.

**EPICOENE**, in grammar, a term applied to nouns, which, under the same gender and termination, mark indifferently the male and female species. See **GENDER**. These nouns are otherwise called *promiscua*, and comprehend the names of a great number of the wild beasts, more of the wild fowls, and almost all the fishes, whereof the difference of sexes is either difficult to be discerned, or is rarely adverted to; such are, in Latin, *elephantus*, *passer*, *aquila*, *salmo*, which equally signify a male or female elephant, sparrow, eagle, or salmon. As often as either of the sexes are to be distinctly mentioned, it is generally done by prefixing to the word male (*mas*) or female (*femina*.)

**EPICUREAN PHILOSOPHY**, the doctrine or system of philosophy maintained by Epicurus and his followers.

Epicurus, the Athenian, one of the greatest philosophers of his age, was obliged to Democritus for almost his whole system, notwithstanding he piqued himself upon deriving every thing from his own fund. He wrote a great number of books, which are made to amount to above 300. Though none of them are come down to us, no antient philosopher's system is better known than his, for which we are mostly indebted to the great Lucretius, Diogenes Laertius, and Tully.

His philosophy consisted of three parts, canonical, physical, and etherial. The first was about the canons, or rules of judging. The censure which Tully passes upon him for his despising logic, will hold true only with regard to the logic of the stoics, which he could not approve of, as being too full of nicety and quirk. Epicurus was not acquainted with the analytical method of division and argumentation, nor was he so curious in modes and formation as the stoics. Soundness and simplicity of sense, assisted with some natural reflections was all his art. His search after truth proceeded only by the senses, to the evidence of which he gave so great a certainty, that he considered them as an infallible rule of truth, and termed them the first natural light of mankind.

In the second part of his philosophy he laid down atoms, space, and gravity as the first principles of all things: he did not deny the existence of a God, but thought it beneath his majesty to concern himself with human affairs: he held him a blessed, immortal being, having no affairs of his own to take care of, and above meddling with those of others. See **ATOMICAL PHILOSOPHY**.

As to his ethics, he made the supreme good of man to consist in pleasure, and consequently supreme evil in pain. Nature, itself, says he, teaches us this truth, and prompts us from our birth to procure whatever gives us pleasure, and avoid what gives us pain. To this end he proposes a remedy against the sharpness of pain: this was to divert the mind from it, by turning our whole attention upon the pleasures we have formerly enjoyed: he held that the wise man must be happy, as long as he is wise; that pain,

pain, not depriving him of his wisdom, cannot deprive him of his happiness.

There is nothing that has a fairer shew of honesty than the moral doctrine of Epicurus. Gassendus pretends, that the pleasure in which this philosopher has fixed the sovereign good, was nothing else but the highest tranquillity of mind in conjunction with the most perfect health of body : but Tully, Horace, and Plutarch, as well as almost all the fathers of the church, give us a very different representation : indeed the nature of this pleasure, in which the chief happiness is supposed to be seated, is a grand problem in the morals of Epicurus. Hence there were two kinds of Epicureans, the rigid and the remiss : the first were those who understood Epicurus's notion of pleasure in the best sense, and placed all their happiness in the pure pleasures of the mind, resulting from the practice of virtue. The loose or remiss Epicureans, taking the words of that philosopher in a gross sense, placed all their happiness in bodily pleasures, or debauchery. Thus we have the whole mystery of this celebrated doctrine. It was innocent in expression, but criminal in thought ; it had a beautiful outside, but it was all corruption within. These loose philosophers took up a seeming austerity to disguise their secret indulgence, and all their schemes of morality were but so many veils for their immoral behaviour.

**EPICYCLE**, *ἐπικύκλιος*, in the antient astronomy, a little circle whose center is in the circumference of a greater circle ; or it is a small orb, or sphere, which being fixed in the deferent of a planet, is carried along with it ; and yet, by its own peculiar motion, carries the planet fastened to it round its proper center.

It was by means of epicycles, that Ptolemy and his followers solved the various phenomena of the planets, but more especially their stations and retrogradations. See the articles **PTOLEMAIC SYSTEM**, **STATION**, and **RETROGRADATION**.

The great circle they called the excentric or deferent, and along its circumference the center of the epicycle was conceived to move ; carrying with it the planet fixed in its circumference, which in its motion downwards proceeded according to the order of the signs, but, in moving upwards, contrary to that order.

The highest point of a planet's epicycle they called apogee, and the lowest perigee. See **APOGEE** and **PERIGEE**.

**EPICYCLOID**, in geometry, a curve generated by the revolution of the periphery of a circle, *ACE* (plate *LXXXVIII.* fig. 3.) along the convex or concave side of the periphery of another circle, *DGB*.

The length of any part of the curve, that any given point in the revolving circle has described, from the time it touched the circle it revolved upon, shall be to double the versed sine of half the arch, which all that time touched the circle at rest, as the sum of the diameters of the circles, to the semidiameter of the resting circle, if the revolving circle moves upon the convex side of the resting circle ; but if upon the concave side, as the difference of the diameters to the semidiameter of the resting circle.

In the philosophical transactions, n<sup>o</sup> 218, we have a general proposition for measuring the areas of all cycloids and epicycloids, *viz.* The area of any cycloid or epicycloid is to the area of the generating circle, as the sum of double the velocity of the center and velocity of the circular motion to the velocity of the circular motion : and, in the same proportion, are the areas of segments of those curves to those of analogous segments of the generating circle.

**EPICYEMA**, among physicians, denotes a superfoetation ; being a false conception or mole happening after the birth of a regular foetus. See **MOLE**.

**EPIDEMIA**, *ἐπιδημία*, in grecian antiquity, festivals kept in honour of Apollo and Diana, at the stated seasons when these deities, who could not be present every where, were supposed to visit different places, in order to receive the vows of their adorers.

The festival took its name *epidemia*, from *ἐπι*, among, and *δημος*, people ; on account of the imaginary presence of those deities among the people.

**EPIDEMIA** is also used for private feasts, or rejoicings, on account of the safe return of a friend from a voyage or journey.

**EPIDEMIC**, among physicians, an epithet of diseases which at certain times are popular ; attacking great numbers at or near the same time. See **DISEASE**.

Epidemic diseases differ from those called endemic. See the article **ENDEMIC**.

Boerhaave

Boerhaave observes, that though every particular disease, in various epidemical constitutions, appear, to unattentive observers, the same with regard to their names, signs, and consequences in some measure; yet to the judicious, they will appear quite otherwise, so as to require a different administration of the non-naturals, different treatment, and different medicines. This variety, however, in epidemical diseases, is so obscure, that physicians have not yet been able to deduce it from any abuse of non-naturals: and yet there are many circumstances which make it highly probable, that the causes reside in the air, but depend more upon the inexplicable variety of exhalations contained therein, which, by their mixture with the fluids of the body, or their stimulus, injure the human machine, than upon any change in the sensible qualities thereof. See EFFLUVIA.

Upon the invasion of any unknown epidemical distemper, the physician will receive some information with respect to the cure. 1. By reducing the distemper to some more known kind, which it most resembles. 2. By observing its tendency at the vernal and autumnal equinoxes; at which seasons it is generally most prevalent. 3. By attending to the spontaneous phenomena, which precede, accompany, or follow the death or recovery of the patient, and the better or worse state of the disorder. 4. By diligently remarking the benefit or injury received, from whatever the patients are unavoidably obliged to do; and from whatsoever is taken into, or discharged out of the body. 5. By comparing the cases of a great many patients, labouring under the distemper at the same time. 6. By abstaining from all remedies which are dubious, which irritate and induce a considerable change in the humours, and thereby obscure the nature and tendency of the disease.

According to Van Swieten, the origin of epidemic fevers, and we may add of other epidemical disorders, is always from some cause in common to the whole people who inhabit any particular place: thus, for example, when in besieged cities the scantiness of the market obliges all to use an ill course of diet; hence it is, that they have usually the same course and symptoms, in different patients, and therefore require the same method of

cure. See the articles FEVER, SMALL-POX, &c.

**EPIDENDRA**, in botany, a term used by some naturalists for the parasitical plants, or those which grow on trees, shrubs, and other vegetables: such are mistletoe, dodder, &c. See the articles MISLETOE, DODDER, &c.

**EPIDENDRUM, BASTARD-VANILLA**, in botany, a genus of the *gynandria diandria* class of plants, the flower of which consists of five very long and patent petals: the stamina are two very short filaments, growing upon the pistil: the fruit is a very long, rounded, and carnosé pod, containing a multitude of minute seeds.

**EPIDERMIS**, in anatomy, the same with the cuticle. See the article CUTICLE.

**EPIDIDYMIS**, in anatomy, the name by which some call the two bodies more usually known by that of parastatæ. See the article PARASTATÆ.

**EPIGASTRIC REGION**, a part or subdivision of the abdomen. See the article ABDOMEN.

**EPIGASTRIC VESSELS**, the arteries and veins belonging to the epigastric region; the former being branches of the coeliac artery, and the latter of the iliac veins. See the articles ARTERY and VEIN.

**EPIGLOTTIS**, in anatomy, one of the cartilages of the larynx, or wind-pipe. It is often of the shape of an ivy-leaf, and joined to the thyroide cartilage; over which it appears erect, immediately behind the root of the tongue; to which it is also connected by its middle ligament, by two lateral ones to the cornua of the os hyoides, and by two posterior ones, to the arytenoide cartilage. In the act of swallowing, it covers the glottis, or aperture of the larynx, and prevents any thing getting into it. See the articles LARYNX and GLOTTIS.

**EPIGRAM**, in poetry, a short poem in verse, treating only of one thing, and ending with some lively, ingenious, and natural thought or point.

Epigram originally signified the same as inscription, it being usual among the antients to cut inscriptions upon columns, walls, statues, trophies, shields, &c. which inscriptions, when expressed in poetical conceits, were afterwards termed epigrams. In process of time, other poems of the like nature went by the name of epigrams, from their affinity with those inscriptions, and people began

to use them for the relating of little facts and accidents, the characterizing of persons, &c.

The chief characteristics of the epigram are acuteness and facetiousness. It should only tend to one point, which is always to be expressed with strength and poignancy in the last verse, excepting some that are more remarkable for their softness and delicacy, or some other elegance. But above all things, a redundancy, or superfluity of expression, is to be avoided. Authors are much divided as to the length of an epigram. There are instances both among the antients and moderns of very long ones, but still it is allowed, that the shorter are the better, as seeming most natural to this kind of poem. The greek epigrams run upon a turn of thought which is natural, but fine and subtle. They have nothing that bite, yet they are not insipid except a few, which are quite flat and spiritless. We speak of these collected in the anthology. The latin epigram, by a false taste that prevailed in the beginning of the decay of pure latinity, endeavours to surprize the reader by a point. Catullus writ after the greek manner, for he endeavours to close a natural thought with a delicate turn of words, and with the simplicity of a very soft expression. Martial was in some measure the author of the other way. Boileau says, the finess and subtilty of the epigram should turn upon the words, rather than the thoughts, by which means he reduces it to the nature of a pun, or equivocal. See the article PUN.

**EPIGRAPHE**, *επιγραφή*, among antiquarians, denotes the inscription of a building, pointing out the time when, the persons by whom, the uses, and the like, for which it was erected.

**EPILEPSY**, *επιληψία*, in medicine, the same with what is otherwise called the falling-sickness, from the patient's falling suddenly to the ground. Sometimes this disease comes upon the patient unawares; but it more frequently gives notice of its approach, by a lassitude of the whole body, a heavy pain in the head, with some disturbance of the senses, unquiet sleep, unusual dread, dimness of sight, and a noise in the ears: in some there is a violent palpitation of the heart, a puffing or inflation of the breast, difficult respiration, a murmuring noise in the belly, foetid stools, a flux of the urine, and a refrigeration of

the joints: in others, there is a sensation as it were of cold air, ascending from the extreme parts towards the brain and heart. At length falling senseless to the ground, the thumbs are shut up close in the palms of the hands, and are with difficulty taken out: the eyes are distorted or inverted, so as nothing but the whites appear: all sensation is suspended, insomuch that no smell, no noise, nor even pinching of the body is able to bring them to themselves: they frothe at the mouth, with a hissing kind of noise; the tongue is lacerated, or torn by the teeth, and there is a shaking or trembling of the joints. However, in different patients, the symptoms vary; for sometimes instead of convulsive motions, the limbs are all stiff, and the patient is as immovable as a statue: in infants, the penis is erected; and, in young men, there is an emission of the semen, and the urine sometimes streams out to a great distance. At last there is a remission of the symptoms, and the patients come to themselves after a longer or shorter interval; then they complain of a pain and heaviness of the head, and a lassitude of all their joints.

These fits usually return on certain days, or age of the moon, but especially about the new or full moon; in women, chiefly about the time of menstruation; and as to the prognostics, they generally leave the patient about the time of puberty.

As to the cure, in adults, or grown persons, it is extremely difficult; but, in children, it is just the reverse. Blisters laid on the back part of the head are of great use a little before the fit is expected; which may the more certainly be foreknown, as this disease is influenced by the moon. The most proper medicines to correct the juices seem to be native cinabar, and wild valerian-root; a dram of which may be taken morning and evening for three or four months, and afterwards two or three days before the new and full moon. Or, two scruples of the powder of wild valerian-root, mixed with one of that of native cinabar may be taken morning and evening. Ambergrease and musk are also accounted excellent.

It must not however be forgot, that this disease owes its origin to so many different causes, and is bred in so many different constitutions of the body, that the same remedy which succeeds in one case, often fails in another; and, there-

fore, different medicines are to be tried, especially in adults. In case of a plethora, bleeding in the ankles will be proper. If the humours be in fault, cathartics, issues, cauteries, and blisters must be used. If in children, it proceeds from gripes, or the breeding of teeth, nothing is better than to cleanse the belly by milk clysters, with a little venice-soap dissolved in them. Some epileptic powder with cinnabar, or extract of rhubarb, and made into an electuary with syrup of roses and manna, may likewise be given in proper doses.

During the fit, too free an use of volatiles, spirituous liquors, and strong smells are hurtful, as causing the humours to flow too much to the head. The best method is to place the patient in an erect posture, and to rub the hands and feet pretty briskly; and the best drink is pure water, which will mitigate, if not cure, the symptoms.

When the disease is caused by external violence, or extravasations of humours in the head, cinnabar reduced into an impalpable powder, and given in large doses with other cephalics and diaphoretics, has a kind of specific virtue.

According to Dr. Cheyne, a milk-diet will cure the most inveterate epilepsy. Milletoe is also said to cure it, as sure as the bark does an intermitting fever: its dose, to grown people, is half a dram or more, in powder, to be taken every sixth hour, drinking after it a draught of a strong infusion of the same plant; and if to every ounce of the powder, a dram of *assa foetida* be added, the medicine will be still more effectual. Cinnabar of antimony is also greatly celebrated for the cure of this disease, and may be taken from four grains to a scruple, in conserve of rosemary-flowers. If the disease is inveterate, some advise to give the following pills for a month, *viz.* Take castor and gum ammoniac, of each eight grains; wild valerian-root, half a scruple; salt of tartar, seven grains; and as much of tincture of castor as is sufficient to form them into pills, one of which makes a dose. On every seventh day, a cathartic should be given; and sometimes, instead of the castor and gum, filings of steel may be substituted.

A decoction of guaiacum, or saffrafras, taken twice a day, six or eight ounces at a time, and continued for thirty or forty days, is also said to cure the epilepsy;

especially, if male piony-root, or the like, be added.

The following electuary is also recommended as a most excellent and certain anti-epileptic: Take of peruvian bark, pulverised, six drams; of virginia snake-root, likewise pulverised, two drams; and of the syrup of piony-flowers, as much as is sufficient to make a soft electuary. The dose, after proper evacuations, in adults, is a dram; which should be taken morning and evening for three or four months; and afterwards only repeated three or four days before the new and full moon.

**EPILINUM**, in botany, the same with *cuscuta* or dodder.

**EPILOBIUM**, in botany, the *WILLOW-HERB*, a genus of the *ostandria-monogynia* class of plants, the corolla whereof consists of four roundish patent petals, somewhat emarginated: the fruit is a very long capsule of a cylindraceous form, striated, made up of four valves, and containing four cells: the seeds are numerous, oblong, and crowned with down.

**EPILOGUE**, in oratory, the end or conclusion of a discourse, ordinarily containing a recapitulation of the principal matters delivered. See **PERORATION**.

**EPILOGUE**, in dramatic poetry, a speech addressed to the audience after the play is over, by one of the principal actors therein, usually containing some reflections on certain incidents in the play, especially those in the part of the person that speaks it.

The epilogue is but of modern date, much later than the prologue: several have taken the exodium of the Greek drama for an epilogue; but it appears that they are very different; as the exodium was the last of the four parts of the tragedy, containing the unravelling the plot, answering to the last act of modern tragedy.

In the modern tragedy the epilogue has usually somewhat of pleasantry, intended, in all probability, to compose the passions raised in the course of the representation. This is ridiculed by the Spectator, and compared to a merry jig upon the organ, after a good sermon, to wipe away any impressions that might have been made thereby, and send the people away just as they came. This practice, however, has the countenance of antiquity, for the Romans had something of the same nature, though under a different

different name; but their exodium was a kind of farce or pantomime, brought on the stage when the tragedy was over; to compose the minds of the audience.

**EPIMEDIUM**; **BARREN-WORT**, in botany, a genus of the *tetrandia-monogynia* class of plants, the flower of which consists of four ovated, obtuse, concave, patent petals: the fruit is an oblong acuminated pod, composed of one cell, but divided by two valves, containing several oblong seeds.

If we may believe Dioscorides, the leaves of this plant, triturated and drank to the quantity of five drams in wine, for five days together, after the menstrual purgation, effectually prevent conception.

**EPIMELIS**, a term used by some authors for the medlar. See **MEDLAR**.

**EPIMYTHION**, in rhetoric, the same with **FABLE**. See the article **FABLE**.

**EPINICION**, in the greek and latin poetry, denotes a poem or composition on occasion of a victory obtained. It also signifies a rejoicing, or festival, on account of a victory.

**EPIPACTIS**, in botany, the same with the helleborine. See **HELLEBORINE**.

**EPIPETRON**, a name sometimes given to the epimedium. See the article **EPIMEDIUM**.

**EPIPHANY**, a christian festival, otherwise called the Manifestation of Christ to the Gentiles, observed on the sixth of January, in honour of the appearance of our Saviour to the three magi, or wise men, who came to adore him, and bring him presents. The feast of epiphany was not originally a distinct festival, but made a part of that of the nativity of Christ, which being celebrated twelve days, the first and last of which were high or chief days of solemnity, either of these might properly be called epiphany, as that word signifies the appearance of Christ in the world.

The kings of England and Spain offer gold, frankincense, and myrrh, on epiphany, or twelfth day, in memory of the offerings of the wise men to the infant Jesus.

The festival of epiphany is called by the Greeks the feast of lights, because our Saviour is said to have been baptized on this day; and baptism is by them called illumination.

**EPIPHONEMA**, in rhetoric, a sententious exclamation containing a lively remark placed at the end of a discourse or narration; such is that of Virgil,

*Fas omne absumpit, Polydorum obruncat, & auro*

*Vi potitur. Quid non mortalia pectora cogis*

*Auri sacra fames?*

And that of Lucrētius, lib. i.

*Tantum religio potuit suadere malorum*

This figure elicits a narration in a very advantageous manner, deeply impresses the thing related upon the memory of the reader, and leaves him well pleased with the sense and sagacity of his author.

**EPIPHORA**, in medicine, a preternatural defluxion of the eyes, when they continually discharge a sharp serous humour, which excoriates the cheeks. The cure is performed by a derivation of the offending humour elsewhere, by bleeding, cupping, blisters, purges, &c. The acrimony is likewise to be corrected by bitter chalybeate wine: sometimes wine drank alone will perform the cure; after which, astrigent topics are to be made use of. See the article **RHEUM**.

If an epiphora has been of long standing, it is difficult to be cured, and often degenerates into a fistula lachrymalis. See the article **FISTULA LACHRYMALIS**.

Pitcairn calls an epiphora a sort of catarrh in the glands of the eye. See the article **CATARRH**.

**EPIPHYLLOSPERMOUS PLANTS**, the same with the capillary ones. See the article **CAPILLARY**.

**EPIPHYSIS**, in anatomy, a bony substance, or as it were a lesser bone, affixed to a larger or principal bone, by the intervention of a cartilage. In young subjects these epiphyses are not continuous to the principal bone, but are only connected by the intermediate cartilage, and hence they are called appendages to the bones. It is to be observed of epiphyses, 1. That they are all cartilaginous in infants; and though they afterwards grow hard, yet they never arrive at the true density of a bone. 2. That most of them degenerate into apophyses in adults. 3. That they do not grow along the plain surface of the bone, but unequally, or by a mutual ingress with the body of it.

The use of the epiphyses is very different in adults and in infants: in adults they seem to serve the bones which contain large quantities of marrow, by way of operculum, that this soft matter may not run out. 2. They are of service to the articulations, rendering the motions more

easy, as well as more determinate. 3. They make the whole bone lighter than it would be, if their place were supplied by absolute bony matter. 4. They increase the power of the muscles about the tendons, by means of their prominences. 5. They add to the size of the places destined for receiving the insertions of the muscles. 6. They give a firmer cohesion to the ligaments which serve in the articulations, and allow an entrance to the blood-vessels. The uses of the epiphyses in infants are, 1. That by means of their yielding softness, they may give way to the compression in the uterus, and suffer the whole bulk to be more folded together than otherwise it could, so that it may lie in a smaller compass. 2. That they may give way to the elongation and growth of the bones. 3. That they may prevent the frequent fractures, which would otherwise unquestionably happen to children from their falls, and the other accidents they are liable to.

**EPIPLASMA**, the same with cataplasim. See the article CATAPLASM.

**EPIPOCELE**, in medicine, is a kind of hernia, or rupture, in which the omentum subsides into the scrotum. The cure consists principally in a reduction of the tumour, by returning the omentum again into the abdomen, and in securing the parts from a relapse by a truss or bandage. See **HERNIA** and **ENTEROCELE**.

**EPIPOLOIS**, in anatomy, a term applied to the arteries and veins distributed thro' the substance of the epiploon or caul: thus, the dextra epiplois is a branch of the right side of the celiac artery, and the sinistra epiplois and gastro-epiplois are terms by which anatomists call branches from the left side of the celiac artery. See the articles **CÆLIAC** and **ARTERY**.

**EPIPLOOMPHALON**, *ἐπιπλοομφαλον*, in medicine, an hernia umbilicalis, proceeding from the omentum falling into the region of the umbilicus or navel. See the article **EXOMPHALUS**.

**EPIPLOON**, the same with what is otherwise called omentum. See **OMENTUM**.

**EPILOSARCOMPHALUS**, in surgery, a kind of exomphalus. See the article **EXOMPHALUS**.

**EPISARCIDIUM**, a term antiently used for the anasarca. See **ANASARCA**.

**EPISCOPACY**, the quality of episcopal government, or that form of church discipline, wherein diocesan bishops are established distinct from and superior to priests or presbyters. See **BISHOP**.

**EPISCOPAL**, something belonging to bishops. See the articles **BISHOP** and **EPISCOPACY**.

**EPISCOPALIANS**, in church-history, an appellation given to those who prefer the episcopal government and discipline to all others.

By the test act, none but episcopalians, or members of the church of England, are qualified to enjoy any office civil or military. See the article **TEST**.

**EPISCOPUS**, **BISHOP**. See **BISHOP**.

**EPISODE**, *ἐπισόδιον*, in poetry, a separate incident, story, or action, which a poet invents, and connects with his principal action, that his work may abound with a greater diversity of events: though, in a more limited sense, all the particular incidents whereof the action or narration is compounded, are called episodes. See the articles **EPIC** and **TRAGEDY**.

The episode, in its original, was only something rehearsed between the parts of the chorus, or antient tragedy, for the diversion of the audience. Episodes serve to promote the action, to illustrate, embellish, and adorn it, and carry it to its proper period. Episodes are either absolutely necessary, or very requisite. All episodes are incidents, tho' all incidents are not episodes; because some incidents are not adventitious to the action, but make up the very form and series of it. Examples will clear up this distinction: the storm in the first *Æneid* of Virgil, driving the fleet on the coast of Carthage, is an incident, not an episode, because the hero himself and the whole body of his forces are concerned in it; and so it is a direct and not a collateral part of the main action. The adventures of Nisus and Euryalus, in the ninth *Æneid*, are episodes, not incidents, *i. e.* not direct parts of the main action.

It is particularly by the art of episodes that the great variety of matter which adorns a poem is brought into the principal action: but though the episodes are a kind of digression from the subject, yet they ought to have a natural relation to the principal action, never be far-fetched, and must be handled with judgment, to avoid confusion and burdening the subject with too much action. Without this restriction the episode is no longer probable, and there appears an air of affectation which becomes ridiculous. Aristotle calls all those fables episodic, which abound in episodes not necessarily nor properly connected with each other.

The

The most natural episodes are the properest to circumstantiate the principal actions, namely, the causes, the effects, the beginnings, and the consequences of it. Homer and Virgil have shewn their principal art in this particular: the action of the *Iliad* and that of the *Æneid* were in themselves exceeding short, but are so beautifully lengthened and diversified by the intervention of episodes, that they make up an agreeable story, sufficient to employ the memory without overcharging it. See the article **EPIC**.

Our noble poet Milton has excelled in this art; he has no other episodes than what naturally arise from the subject, and yet his poem of *Paradise Lost* is filled with a multitude of astonishing incidents. Those great actions, the battle of the angels, and the creation of the world, are by way of episode to this noble poem. With the like art, and in the same manner, in that part of it which regards the fall of man, he has related the fall of these angels who are his professed enemies; besides the many other beauties of such an episode, its running parallel with the great action of the poem, hinders it from breaking unity so much as another episode would have done, that had not so great an affinity with the principal subject.

**EPISODIC**, an epithet given epic poems swelled too much with episodes. See the preceding article.

**EPISPASTIC**, in medicine, a topical remedy, which being applied to the external parts of the body, attracts the humours to that part. See **VESICATORY**.

**EPISTATES**, in the athenian government, was the president of the *proedri*. See the article **PROEDRI**.

To the custody of this officer was committed the public seal, and the keys of the citadel and the public exchequer: this therefore was an office of so great trust and power, that no man was permitted by the laws to continue in it above one day, nor to be elected into it a second time. The *epistates* were elected by lot out of the *prytanes*. See the article **PRYTANES**.

*Epistates* was also the president of the assembly, chosen by lot out of the *proedri*, the chief part of whose office seems to have consisted in granting the people liberty to give their voices, which they were not permitted to do till he had given the signal. If the people were remiss in coming to the assemblies, the magistrates used

their utmost endeavours to compel them, for they shut up all the gates, that only excepted through which they were to pass to the assembly, and took care that all vendibles should be taken out of the market, that there might be nothing to divert them from appearing.

**EPISTEMONARCH**, in the antient greek church, an officer of great dignity, who had the care of every thing relating to faith, in the quality of censor. His office answered pretty nearly to that of master of the sacred palace at Rome.

**EPISTLE**, *επιστολη*, denotes the same with a missive letter; but is now chiefly used in speaking of antient writings, as the epistles of St. Paul, epistles of Cicero, epistles of Pliny, &c. See the article **LETTER**.

The epistles of St. Paul, which are fourteen in number, make part of the canon of the New Testament; besides which there is one general epistle of St. James, two of St. Peter, three of St. John, and one of St. Jude.

**Dedicatory EPISTLE**, in matters of literature. See **DEDICATION**.

**EPISTOLARY**, something belonging to an epistle. See the article **EPISTLE**.

The art of epistolary writing is acknowledged to be very entertaining and instructive. The Romans ranked it in the number of liberal and polite accomplishments. And, indeed, it enters so much into all the occasions of life, that no gentleman can avoid shewing himself in this kind of composition; the chief excellence of which consists in expressing ordinary occurrences, in an elegant and uncommon manner. However, it is proper to observe, that such is the nature of epistolary writings, in general, as unavoidably renders them obscure, since the writer passes by many things, as being well known to him to whom the letter is addressed, which must be laid open to a stranger, before he can fully comprehend what is said. Hence it is, that the epistles of the antients, whether sacred or profane, are so difficult to be understood.

**EPISTROPHE**, in rhetoric, a figure, wherein that which is supposed of one thing, is strongly affirmed of another: thus, *Are they Hebrews? so am I. Are they Israelites? so am I. Are they of the seed of Abraham? so am I, &c.*

**EPISTYLE**, in the antient architecture, a term used by the Greeks for what we call architrave, viz. a massive piece of stone or wood, laid immediately over the capital

tal of a column. See ARCHITRAVE and COLUMN.

**EPITAPH**, a monumental inscription in honour or memory of a person defunct, or an inscription engraven or cut on a tomb, to mark the time of a person's decease, his name, family; and, usually, some eulogium of his virtues, or good qualities.

The elegance of an epitaph, as well as an elegy, chiefly consists in an expressive brevity. The French have a proverb, *He lies like an epitaph*, by reason they sometimes give characters absolutely false. At Lacedæmon epitaphs were only allowed to those who died in battle. The rest of the Greeks allowed of epitaphs, the form of which was generally as follows:

ΝΙΚΩΝ ΖΗΝΩΝΟΣ  
ΧΡΗΣΤΕ ΧΑΙΡΕ.

Nicon, son of Zenon,  
Good man, happiness to you.

ΟΛΥΜΠΙΑΣ  
ΧΡΗΣΤΗ  
ΧΑΙΡΕ.

Olympia,  
Good woman,  
Happiness to you.

The Romans, in their epitaphs, introduced their dead speaking, as in the following, wherein the dead wife thus bespeaks her surviving husband:

*Immatura peri: sed tu, felicior, annos  
Vive tuos, conjux optime, vive meos.*

Sometimes the roman epitaphs were full of moral expressions, and adorned with fine carved work, &c. At the top they always had the words *DIIS MANIBUS*. It has been much disputed by learned men whether or no epitaphs were in use among the antient Hebrews: however this be, it is certain the Jews have, of a very antient date, received this custom, of which Buxtorf produces several instances.

**EPITASIS**, in antient poetry, the second part or division of a dramatic poem, wherein the plot, entered upon in the first part, or protasis, was carried on, heightened, and worked up, till it arrived at its state, or height, called catastasis. See **PROTASIS**, **CATASTASIS**, **DRAMA**, &c. In the epitalis, accidents, as they are called by the moderns, arise; all things are in confusion, and involved in doubts and difficulties. Vossius says, the epitalis is contained in the second, sometimes in the third and fourth, but very rarely any part of it in the fifth act: but Dr. Trap says,

that there is no act to which the epitalis is not suitable; nay, that some of it ought always to be in the fifth act.

It is the epitalis that supports the weight and burden of the poem; upon it the crisis of the action chiefly turns. This division of tragedy is laid aside in the modern drama, instead whereof plays are divided into acts. See the article **ACT**.

**EPITASIS**, in medicine, the increase of a disease, or beginning of a paroxysm, particularly in a fever. See **FEVER**.

**EPITHALAMIUM**, in poetry, a nuptial song, or composition, in praise of the bride and bridegroom, praying for their prosperity, for a happy offspring, &c.

Among the Greeks, the married couple were no sooner bedded, than the young men and maids gathered round the door, dancing and singing the epithalamium, shouting and stamping with their feet, with intention to drown the maid's cries.

When they returned again in the morning, to salute the married couple, they sung the *ἐπιθαλαμια ἐσπρινα*, so named from the design of them, which was to wake and arise the bridegroom and bride; as those sung the night before were designed to dispose them to sleep, and on that account, were termed *ἐπιθαλαμια κοιμήσια*.

**EPITHEM**, in pharmacy, a kind of fomentation, or remedy of a spirituous or aromatic kind, applied externally to the regions of the heart, liver, &c. to strengthen and comfort the same, or to correct some intemperature thereof. See the article **FOMENTATION**.

There are principally three kinds of these external applications, the liquid, the solid, and the soft or poultice-kind. The liquid epithems are sometimes considerably thick; but when they are intended to penetrate deep, they are much better if very thin and fluid. As to the part to which the epithem is immediately applied, it is not what it is always intended to act upon, as this frequently lies deep within: the epithems, therefore, intended for this purpose, should consist of the most penetrating ingredients, for which reason astringents and inspissating remedies can be of no use; but in this form hot wine alone is sometimes used as an epithem, and often such medicines as are not to be safely taken inwardly, such as highly rectified spirits, preparations, of lead, henbane, mandrake, and other poisonous plants, and the like: but we are carefully to remember in regard to these, that the pores are capable of absorbing them, and ought therefore

therefore to know the effects they are capable of producing, when thus absorbed in the body. As to the vehicles of the liquid epithems, they are various, as linen or woollen-cloths, silk, stapes, toast-bread, &c. They are in some cases to be applied hot, in others, cold : when the intention is to resolve, penetrate, and attract, then the hot are to be preferred ; but these are injurious to parts constricted by intense cold.

The dry epithems are medicated powders, usually sewed up in a cloth, and applied to different parts of the body ; for which purpose the powders must be coarse. Sometimes the liquid epithems are added to the dry, to reduce the whole to a consistence, such as may be spread upon cloth, and applied.

**Volatile EPITHEM**, is a form of medicine prescribed in the London dispensatory, ordered to be made up of equal weights of common turpentine and spirit of sal armoniac, by stirring them together in a mortar.

**EPITHEM**, in poetry and rhetoric, an adjective expressing some quality of a substantive to which it is joined ; or such an adjective as is annexed to substantives by way of ornament and illustration, not to make up an essential part of the description. Nothing, says Aristotle, tires the reader more than too great a redundancy of epithets, or epithets placed improperly ; and yet nothing is so essential in poetry as a proper use of them. The writings of the best poets are full of them, especially Virgil.

We may distinguish two kinds of epithets, viz. 1. Those which add a new idea quite distinct from the general nature of a substantive. Thus Virgil in his Georgics,

*Inter cunctantes cecidit moribunda missis.*

And, 2. Those that bring with them some light and ornament, but not new ideas. Thus the same poet,

*Timidi damæ, corvique fugaces.*

The first kind of epithets entertain the mind with a more agreeable variety, but those of the second require, perhaps, more care and judgment in the proper choice of them. For instance, because Virgil has said, *the fearful deer and fleeting fags*, it by no means follows that these epithets are applicable whenever fags and deer shall happen to be mentioned. They are proper in the place where he uses them, but may not be so always.

**EPITHYME**, *epithymum*, the name by which some call the cuscuta, or dodder.

**EPITOME**, in literary history, an abridgment or summary of any book, particularly of a history. See **ABRIDGMENT**. It is pretended that the epitomizing of authors, frequently occasions the loss of the originals. Thus the loss of Pompeius Trogus, is ascribed to his epitomiser Justin ; and the loss of a great part of Livy, to Lucius Annæus Florus.

**EPITRITUS**, in prosody, a foot consisting of three long syllables and one short. Of these, grammarians reckon four kinds ; the first consisting of an iambus and spondee, as *salūtāntēs* : the second, of a trocheus and spondee, as *cōncitātī* : the third, of a spondee and an iambus, as *cōmmūcāns* : and the fourth, of a spondee and trocheus, as *incāntārē*. See the articles **SPONDEUS**, **TROCHEUS**, &c.

**EPITROPE**, in rhetoric, a greek term for the same figure which the Latins call *concessio*. See the article **CONCESSION**.

**EPITROPUS**, among the modern Greeks, a kind of arbitrator chosen by the greek christians under the dominion of the Turks, to terminate their differences, and avoid carrying them before the turkish magistrates. See **ARBITRATOR**.

**EPIZEUXIS**, in rhetoric, a figure which repeats the same word, without any other intervening : such is that of Virgil, *nunc, nunc, insurgite remis*.

**EPLYE**, in heraldry, the same with displayed. See the article **DISPLAYED**.

**EPOCH**, in chronology, a term or fixed point of time, whence the succeeding years are numbered or accounted. See the article **ÆRA**.

The most remarkable epochas are those that follow.

**EPOCH** of the creation of the world. According to the vulgate, archbishop Usher places this event 4004 years before the birth of Christ ; Scaliger makes it 3950 ; Petavius, 3984 ; and Ricciolus, 4184 years before Christ. According to the septuagint, Eusebius places the creation 5200 years before the nativity of our Lord ; the alphonine tables, 6934 ; and Ricciolus, 5634. The creation, therefore, as we follow the archbishop, happened in the year 710 of the julian period. See the article **JULIAN PERIOD**.

Sir Isaac Newton, again, makes the creation of the world later by 500 years than all other chronologists ; and the proofs by which this illustrious philosopher supports

ports his opinion, are of two different kinds. The Egyptians counted 341 generations from Menes to Setho, allowing an hundred years for three generations; and the antient Greeks computed one generation at about forty years. Now, says Sir Isaac, it is true, three ordinary generations may be computed at about 120 years; but generations are longer than the reigns of kings, because it is evident that mankind in general live longer than kings. The duration of a reign, therefore, taking one with another, is, according to him, about twenty years; whence he concludes, that the antients have erred in their calculation in allowing forty years for every generation. The second kind of proof is taken from the precession of the equinoxes. See PRECESSION, &c. According to Clemens Alexandrinus, Chiron, who was in the expedition of the argonauts, fixed the vernal equinox at the fifteenth degree of aries, and consequently the summer solstice at the fifteenth degree of cancer. Meto fixed the summer solstice at the eighth degree of cancer, a year before the peloponnesian war. Now since one degree answers to the retrograde motion of the equinoctial points in 72 years, there are seven times 72 years from the expedition of the argonauts to the beginning of the peloponnesian war; that is 504 years, and not 507 years, as the Greeks affirm. By combining these two different proofs, Sir Isaac concludes, that the expedition of the argonauts ought to be placed 909 years before Jesus Christ, and not 1400, as is generally believed; and therefore that the creation of the world ought to be placed about 500 years later than chronologists generally place it.

**EPOCHA of the deluge.** According to the hebrew text, there are 1656 years from the creation to the deluge; 1307, according to the Samaritan; 2242, according to Eusebius and the Septuagint; 2256, according to Josephus and the Septuagint, and 2262, according to Julius Africanus, Petavius, and the Septuagint. In following the hebrew text, this epocha begins in the year 2366 of the julian period.

**EPOCHA of the olympiads,** used principally by the Greeks, had its origin from the olympic games, which were celebrated at the beginning of every fifth year. This epocha begins 776 years before the incarnation, or in the 3938 of the julian period.

**Varronian EPOCHA of the building of Rome,** is fixed 753 years before our Saviour's birth, and in the 3961 of the julian period.

**EPOCHA of Nabonassar king of Babylon,** made use of by Ptolemy, Censorinus, and several other authors, began 747 years before the incarnation, and in the 3967 of the julian period.

**Julian EPOCHA.** The first year of Julius Cæsar's correcting the calendar stands 45 years before our Saviour's birth, and coincides with the 4669 of the julian period.

**EPOCHA of Christ.** The christian world generally reckoned from the epocha of the creation, the building of Rome, the consuls register, or the emperor's reign, till about 500 years after Christ, when the epocha of the nativity of our blessed Lord was introduced by Dionysius Exiguus. He began his account from the conception or incarnation properly called Lady-day. Most countries in Europe, however, at present reckon from the first of January next following, except the court of Rome, where the epocha of the incarnation still obtains for the date of their bulls and briefs. But here we are to observe, that there are different opinions touching the year of our Saviour's birth. Capellus and Kepler fix it at about the 748th year from the building of Rome. Decker and Petavius place the incarnation in the 749th of Rome. Scaliger and Vossius make it fall on the 751st of Rome. Dionysius Exiguus, Bede, &c. fix the birth of our Saviour to the year 751 of Rome; the diversity of these opinions proceeding from the difficulty of fixing Herod the great's death, who, as is evident from the evangelists, was living at our Saviour's birth, the taxation of Cyrenius, and the time of our Saviour's beginning his ministry. But let this be as it will, it is generally agreed, that as to computation and use, the common epocha is to be followed, which places the birth of Christ in the 4713th of the julian period, although the true birth rather corresponds with the 4711th of the same period.

**Dioclesian EPOCHA, or EPOCHA of martyrs,** called also the æra of the copti or Egyptians, because the emperor Dioclesian made a great many martyrs in Egypt, begins in the year 283 of our lord, and the 4997 of the julian period.

**EPOCHA of the begira, or flight of Mahomet,** used among the Turks, is the year of the julian period 5335, answering to the year of Christ 622.

*Yezdejerd*, or *Persian* EPOCHA, is the year of the julian period, 5345, answering to the year 622.

To reduce the years of one epocha to those of another, observe the following rule: add the given year of an epocha to the year of the julian period corresponding with its rise, and that will give the year of the period.

For example, if to 1754, the present year of the christian epocha, we add 4713, the year of the julian period corresponding with its rise, the sum, 6467, will be the present year of the julian period: now if we subtract from the year thus found, the year of the julian period corresponding with the rise of any epocha, the remainder shews the true method of making a just connexion betwixt that epocha and the known year of Christ.

Again, if we want to find the year of the julian period corresponding to a given year before Christ, we subtract the given year from 4714, and the remainder is the year required.

*Spanish* EPOCHA. See the article *ÆRA*.

EPODE, in lyric poetry, the third or last part of the ode, the antient ode being divided into strophe, antistrophe, and epode. See the articles *ODE*, &c.

The epode was sung by the priests, standing still before the altar, after all the turns and returns of the strophe and antistrophe, and was not confined to any precise number or kind of verses.

The epode is now a general name for all kinds of little verses that follow one or more great ones, of what kind soever they be; and in this sense, a pentameter is an epode after an hexameter. And as every little verse, which being put after another, closes the period, is called epode; hence the sixth book of Horace's odes is entitled *Liber Epodon*, Book of Epodes, because the verses are all alternately long and short, and the short ones generally, though not always, close the sense of the long one.

EPOMIS, in anatomy, a muscle, otherwise called deltoides. See *DELTOIDES*.

EPOPS, in ornithology, the variegated upupa. See the article *UPUPA*.

EPOPOEIA, in poetry, the story, fable, or subject treated of, in an epic poem. See the article *FABLE*.

The word is commonly used for the epic poem itself. See *EPIC POEM*.

EPOTIDES, in the naval architecture of the antients, two thick blocks of wood,

one on each side the prow of a galley, for warding off the blows of the rostra of the enemy's vessels. See *GALLEY* and *ROSTRUM*.

EPINGEN, a town of Germany, situated about ten miles north of Hailbron.

EPSOM, a town of Surry, about fifteen miles south-west of London; much resorted to on account of its medicinal waters; from which the bitter purging salt being first extracted, got the name of Epsom-salt. At present, however, the bitter purging salt is procured from the bittern, remaining after the crystallization of common salt; and this is found to answer all the purposes of that first obtained from Epsom-waters, and goes by its name.

Epsom-salt is esteemed good in colics, the scurvy, diabetes, loss of appetite, the rheumatism, jaundice, hypochondriac affection, and other chronic complaints. The best way of taking it is with any chalybeate waters, as those of Tunbridge; for instance, a dram, or a dram and an half, dissolved in the three or four first draughts.

EPTACTIS, in zoology, a species of star-fish, with seven rays. See the article *STAR-FISH*.

EPULIDES, or PARULIDES, in surgery. See the article *PARULIDES*.

EPULONES, in roman antiquity, ministers who assisted at the sacrifices, and had the care of the sacred banquet committed to them. At first they were only three in number, but afterwards increased to seven. Their office was, to give notice when feasts were to be held in honour of the gods; and, to take care that nothing was wanting towards the celebration.

EPULOTICS, *ἐπιλοτικά*, the same with cicatrizants. See *CICATRIZANTS*.

EQUABLE, an appellation given to such motions as always continue the same in degree of velocity, without being either accelerated or retarded.

When two or more bodies are uniformly accelerated or retarded, with the same increase or diminution of velocity in each, they are said to be equably accelerated or retarded.

EQUAL, a term of relation between two or more things of the same magnitude, quantity, or quality.

Mathematicians speak of equal lines, angles, figures, circles, ratios, solids, &c. See the articles *LINE*, *ANGLE*, &c.

EQUALITY,

**EQUALITY**, that agrément between two or more things, whereby they are denominated equal.

The equality of two quantities, in algebra, is denoted by two parallel lines placed between them: thus,  $4 + 2 = 6$ , that is, 4 added to 2, is equal to 6.

**EQUANIMITY**, in ethics, denotes that even and calm frame of mind and temper, under good or bad fortune; whereby a man appears to be neither puffed up, or overjoyed with prosperity; nor dispirited, soured, or rendered uneasy by adversity. See the articles **ETHICS** and **PASSIONS**.

**EQUANT**, in the old astronomy, a circle described on the center of the deferent, for accounting for the excentricity of the planets. See **EXCENTRICITY**.

**EQUATION**, in algebra, the mutual comparing two equal things of different denominations, or the expression denoting this equality; which is done by setting the one in opposition to the other, with the sign of equality ( $=$ ) between them: thus  $3s = 36d$ , or  $3 \text{ feet} = 1 \text{ yard}$ . Hence, if we put  $a$  for a foot, and  $b$  for a yard, we will have the equation  $3a = b$ , in algebraical characters.

When a problem is proposed to be resolved by means of equations, the first thing to be done is to form a clear conception of the conditions and nature of it; taking care to substitute the first letters of the alphabet for known quantities, and the last letters of the alphabet for unknown ones. Then by due reasoning from the conditions of the question, let the quantities concerned therein be justly stated, and carefully compared; so that their relation to one another may appear, and the difference, which renders them unequal, be discovered; and, consequently, the same thing found expressible two ways, or brought into an equation, or several equations independent on each other. And here it is to be observed, 1. That if there are as many equations given, as there are quantities sought, then the question has a determinate number of solutions, or is truly limited, *viz.* each quantity sought hath but one single value. Thus, suppose a question proposed concerning the age of three persons, was conditioned as follows, *viz.* the second is seven years older than the first, the age of the third is triple that of the first and second, and the sum of all their ages is 68. Required the age

of each. In order to bring this question to an equation, put  $z$  for the age of the first; then will the age of the second be  $z + 7$ , and the age of the third  $6z + 12$ : the sum of all their ages  $z + z + 7 + 6z + 12 = 68$ . So that here is but one equation given, and one quantity required, *viz.* the age of the first. 2. When the number of the quantities sought exceed the number of the given equations, the question is capable of an indeterminate number of answers; and, therefore, can be but imperfectly determined.

**Reduction of EQUATIONS**. If the question, when stated, is found to have a determinable number of solutions, then the equation, directly drawn from the conditions of the question, must be reduced into another, by equal augmentation and diminution; so that the known quantities may stand on one side, and one of the unknown quantities, or some power of it, on the other side of the equation. This is called reduction of equations, and depends upon a right application of the five following axioms: 1. If equal quantities be added to equal quantities, the sum of those quantities will be equal. 2. If equal quantities be subtracted or taken from equal quantities, the quantities remaining will be equal. 3. If equal quantities be multiplied by equal quantities, their products will be equal. 4. If equal quantities be divided by equal quantities, their quotients will be equal. 5. Quantities that are equal to one and the same thing, are also equal to one another.

If these axioms be well understood, the reduction of equations will appear very plain, and the operations be easily performed. 1. Reduction by transposition, is performed by transferring a quantity to the other side of the equation with a contrary sign; or by equal addition, if the quantity be negative; and by equal subtraction, if affirmative. Thus the equation  $x - 10 = 40$ , is reduced by adding  $+ 10$  to each side, and the result will be the same as if  $- 10$  had been transposed to the opposite side with the contrary sign; for  $x - 10 + 10 = 40 + 10$ , is the same with  $x = 40 + 10$ , the  $- 10$  and  $+ 10$  destroying each other. In the same manner  $x + 10 = 40$ , is reduced to  $x = 40 - 10$ , by transposing the  $+ 10$  with a contrary sign. 2. Reduction is performed by equal multiplication, in case there are fractional quantities; for by multiplying every

every term in the equation by the denominators of the fractions, it will be cleared of fractions: thus by multiplying every

term of the equation  $\frac{z}{a} = b$  by the denominator  $a$ , we will have  $z = ab$ . Again,

if  $\frac{z^3 + 3a^2}{c} + n + a = z + a$ ; then by

multiplying by the denominator  $c$ , we will have an equal equation free from fractions, *viz.*  $z^3 + 3a^2 + cn + ac = cz + ac$ , or  $z^3 + 3a^2 + cn = cz$ , the  $ac$  on each side being rejected. 3. By equal division, as in the equation  $ax = c$ ; for

by dividing each side by  $a$ , we will have

$x \left( \text{or } \frac{ax}{a} \right) = \frac{c}{a}$ . In the same manner,

in the equation  $ax + ez = cb$ , by dividing each side by  $a + e$ , we get the equation

$z = \frac{cb}{a + e}$ . 4. Equations are cleared of surd quantities by involution: thus,

if the equation be  $\sqrt{a} = 6$ ; then by involution or squaring each side of the equation, we have the equation  $a = 36$ . If

both sides be similar surds, or of the same power, all that we have to do is to reject

the radical sign: thus, for  $\sqrt{a} = \sqrt{d + c}$ ,

we write  $a = d + c$ , rejecting the radical sign of both. 5. When any single power

of the unknown quantity is on one side of the equation, evolve or extract the

root of both sides, according as the index of that power denotes, and their roots

will be equal. Thus if  $zz = 25$ , by extracting the root of each side we have

$z = 5$ . In the same manner, if  $aaa = 27$ , their cube roots will be equal, *viz.*

$a = 3$ . Or, if any compound power of an equation, that hath a true root of its

kind; then, by evolving both sides of the equation, it will be expressed in lower

terms: for example,  $a^2 + 2ba + b^2 = d^2$ , by evolving both sides, comes out

$a + b = d$ . 6. A proportion may be converted into an equation, asserting the product

of the extremes to be equal to that of the means; or, any one of the extremes

may be made equal to the product of the means divided by the other extreme: thus, if  $12 - x : \frac{x}{2} :: 4 : 1$ , then

$12 - x = 2x$ ; and by transposing the

$-x$ , we will have  $3x = 12$ , and dividing by 3,  $x = \frac{12}{3} = 4$ , by the preceding

rules. 7. If any quantities be found on

both sides of the equation, with the same sign prefixed, they may be taken away from both: thus, for  $3x + b = a + b$ , we say

$3x = a$ . Also, if all the quantities of the equation be multiplied or divided by

the same quantity, it may be struck out of them all: thus, if  $3ax + 5ab = 8ac$ ,

dividing by  $a$ , we have  $3x + 5b = 8c$ ; and transposing  $5b$  and dividing by 3,

we have  $x = \frac{8c - 5b}{3}$ , according to the

first and third rules. 8. Instead of any quantity in an equation, you may substitute another equal to it: thus, if  $3x + y$

$= 24$ , and  $y = 9$ ; then  $3x + 9 = 24$ ,

or  $x = \frac{24 - 9}{3} = 5$ .

*Solution of simple EQUATIONS.* 1. After an equation is formed, if you have only

one unknown quantity, then, by the preceding rules, bring it to stand alone on

one side, so as to have none but known quantities on the other side; by which

means you will discover its value. Thus, if the question proposed be that of the

three persons ages already mentioned, the equation thence resulting has been

found to be as in

#### Example I.

By quest.	1	$  z + z + 7 + 6z + 21 = 68$
1 transp.	2	$  8z = 68 - 28 = 40$
$2 \div 8$	3	$  z = \frac{40}{8} = 5 = \text{first age.}$
Hence	4	$  z + 7 = 12 = \text{second age.}$
And	5	$  12 + 5 \times 3 = 51 = \text{third age.}$

#### Example II.

$$\frac{3x}{4} \times \frac{x}{12} = x$$

$$\frac{3x^2}{48} = x$$

and  $3x^2 = 48x$  by the second rule.

and  $3x = 48$  by the seventh rule.

and  $x = \frac{48}{3} = 16$  by the third rule.

2. If there are two unknown quantities, then there must be two equations arising from the conditions of the question; suppose  $x$  and  $y$ . The rule is, to find a value of  $x$  or  $y$  from each of the equations, and then by putting these two values equal to each other, there will arise a new equation involving only one un-

known quantity, which must be reduced by the same rules as formerly.

Example: let the sums of two quantities be  $s$ , and their difference  $d$ ; let  $s$  and  $d$  be given, and let it be required to find the

$$\begin{array}{l} x+y=s \\ x-y=d \\ \hline x=s-y \\ x=d+y \\ s-y=d+y \\ 2y=s-d \\ y=\frac{s-d}{2} \\ \hline x=\frac{s+d}{2} \end{array} \quad \begin{array}{l} \text{quantities themselves. Suppose the quantities to be } x \text{ and } y; \text{ then, by the question, } x+y=s, \text{ and } x-y=d; \text{ whence } x=s-y=d+y; \text{ and, by transposition, } 2y=s-d; \text{ so that dividing by 2, we have } y=\frac{s-d}{2}; \text{ and by comparing the value of } x, \text{ viz. } s-y, \end{array}$$

we find  $x=s-\frac{s-d}{2}$ , or  $2x=2s-s+d$ ,

and dividing by 2, the value of  $x=\frac{s+d}{2}$ , as expressed in the margin.

3. When in one of the given equations, the unknown quantity is of one dimension, and in the other of a higher dimension; you must find a value of the unknown quantity from that equation where it is of one dimension, and then raise that value to the power of the unknown quantity in the other equation; and by comparing it, so involved, with the value you deduce from that other equation, you will obtain an equation that will have only one unknown quantity and its powers: that is, when you have two equations of different dimensions, if you cannot reduce the higher to the same dimension with the lower, you must raise the lower to the same dimension with the higher.

Example: the sum of two quantities,

$$\left. \begin{array}{l} x+y+z=12 \\ x+2y+3z=20 \\ \frac{x}{3}+\frac{y}{2}+z=6 \end{array} \right\} \text{ then } x=\left\{ \begin{array}{l} 12-y-z \\ 20-2y-3z \\ 18-\frac{3y}{2}-3z \end{array} \right\} \left\{ \begin{array}{l} \text{first} \\ \text{second} \\ \text{third} \end{array} \right\} \text{ value}$$

$$\begin{array}{l} 12-y-z=20-2y-3z \\ 12-y-z=18-\frac{3y}{2}-3z \end{array}$$

These two last equations involve only  $y$  and  $z$ , and are to be resolved by the second direction. Thus,

$$\begin{array}{l} \{ 2y-y+3z-z=20-12=8 \\ \{ y+2z=8 \\ \{ 36-3y-6z=24-2y-2z \\ \{ 12=y+4z \\ \text{whence } y=\left\{ \begin{array}{l} 8-2z \text{ first} \\ 12-4z \text{ second} \end{array} \right\} \text{ value} \end{array}$$

and the difference of their squares, being given, to find the quantities themselves. Suppose them to be  $x$  and  $y$ , their sum  $s$ , and the difference of their squares  $d$ . Then,

$$\begin{array}{l} x+y=s \\ x^2-y^2=d \\ \hline x=s-y \\ x^2=s^2-2sy+y^2 \\ x^2=d+y^2, \text{ whence} \\ d+y^2=s^2-2sy+y^2 \\ d=s^2-2sy \\ 2sy=s^2-d \\ y=\frac{s^2-d}{2s} \\ \text{and } x=\frac{s^2+d}{2s} \end{array}$$

4. If there are three unknown quantities, there must be three equations in order to determine them, by comparing which you may, in all cases, find an equation involving only one unknown quantity; which may be resolved by the rules for reduction of equations already mentioned.

From three equations involving any three unknown quantities,  $x$ ,  $y$ , and  $z$ , to deduce two equations involving only two unknown quantities, the following rule will always serve: find three values of  $x$  from the three given equations; then, by comparing the first and second value, you will find another equation involving only  $y$  and  $z$ : again, by comparing the first and third, you will find another equation involving only  $y$  and  $z$ ; and, lastly, those equations are to be solved by the second direction.

Example: suppose

$$\begin{array}{l} x+y+z=12 \\ x+2y+3z=20 \\ \frac{x}{3}+\frac{y}{2}+z=6 \end{array} \left\{ \begin{array}{l} \text{first} \\ \text{second} \\ \text{third} \end{array} \right\} \text{ value}$$

$$\begin{array}{l} 12-y-z=20-2y-3z \\ 12-y-z=18-\frac{3y}{2}-3z \\ 8-2z=12-4z \\ 2z=12-8=4 \\ z=\frac{4}{2}=2 \\ y=(8-2z)=4 \\ x=(12-y-z)=6 \end{array}$$

This method is general, and will extend to all equations that involve three unknown quantities; but there are often easier and shorter methods, to deduce an equation

equation involving only one unknown quantity, which is best learned from practice.

*Solution of quadratic EQUATIONS.* 1. If, after the equation is reduced as directed above, and the unknown quantity brought to stand on one side, it is found to be a simple square power, all that you have to do is to evolve both sides of the equation, by which means you will find the value of the simple unknown quantity. Thus, if  $x^2 = 36$ ; then, by evolution or extraction,  $x = 6$ . See EXTRACTION.

2. In the solution of any question, where you have got an equation that involves only one unknown quantity, but involves at the same time the square of that quantity, and the product of it multiplied by some known quantity; then you have what is called an affected quadratic equation, which may be resolved by the following rules: 1. Transpose all the terms

that involve the unknown quantity to one side, and the known terms to the other side of the equation. 2. If the square of the unknown quantity is multiplied by any coefficient, you are to divide all the terms by that coefficient, that the coefficient of the square of the unknown quantity may be unit. 3. Add to both sides the square of half the coefficient prefixed to the unknown quantity itself, and the side of the equation that involves the unknown quantity will then be a complete square. 4. Extract the square root from both sides of the equation, which you will find, on one side, always to be the unknown quantity with half the foresaid coefficient subjoined to it; so that by transposing this half, you may obtain the value of the unknown quantity expressed in known terms. Thus, suppose the quadratic to equation be,

$$y^2 + ay = b$$

Add the square of  $\frac{a}{2}$  to both sides,

$$y^2 + ay + \frac{a^2}{4} = b + \frac{a^2}{4}$$

Extract the root,

$$y + \frac{a}{2} = \pm \sqrt{b + \frac{a^2}{4}}$$

Transpose  $\frac{a}{2}$ , and

$$y = \sqrt{b + \frac{a^2}{4}} - \frac{a}{2}$$

Here it is to be observed, that the square root of any quantity, as  $+a^2$ , may be  $+a$ , or  $-a$ ; and hence all quadratic equations admit of two solutions. Also, since the squares of all quantities are positive, it is evident that the square root of a negative quantity is imaginary, and cannot be assigned. However, the following examples will illustrate the rules for quadratic equations.

Example I. The sum of two quantities is 32, and their product 240; required the quantities themselves. Suppose them to be  $x$  and  $y$ ; then

$$x + y = 32; \text{ and } x = 32 - y$$

$$xy = 240; \text{ and } x = \frac{240}{y}$$

$$\text{therefore } 32 - y = \frac{240}{y}$$

Suppose	1	$x, y, z$ , to represent each man's stock,
Then	2	$x + y + z = s$ = the whole stock,
	3	$s + 48$ = the whole gain.
By the question	4	$x + 13 = y$
	5	$y + z = 175$
	6	$x + y + z = 175 + x$

$$\begin{aligned} \text{and } 32y - y^2 &= 240 \\ \text{transpose, } y^2 - 32y &= -240 \\ \text{add } 16^2, y^2 - 32y + 256 &= -240 + 256 \\ \text{extract } \sqrt{\phantom{x}}, y - 16 &= \pm \sqrt{16} \\ \text{and } y &= \pm \sqrt{16} + 16 = 20 \\ x (= 32 - y) &= 12 \end{aligned}$$

Example II. Three merchants join stocks; the stock of the first was less than that of the second by 13 l. and the sum of the second and third man's stock amounted to 175 l. In trading they gained 48 l. more than their whole stock was; and the first man's share of the gain was 78 l. required each man's stock and share of the gain?

2, 6	7	$5 = 175 + x$
7, 3	8	$5 + 48 = 223 + x$
By the question	9	$175 + x = 223 + x : x : 78$
9 x	10	$x^2 + 223x = 78x + 13650$
10 - 78x	11	$x^2 + 145x = 13650$
11 □	12	$x^2 + 145x + 5256,25 = 18906,25$
12 $600^2$	13	$x + 72,5 = \sqrt{18906,25} = 137,5$
13 - 72,5	14	$x = 137,5 - 72,5 = 65$
14,4	15	$y = x + 13 = 78$
5,15	16	$z = 175 - y = 97$
Then	17	$65 + 78 + 97 + 48 = 288$ the whole gain
And	18	$y$ 's gain = 93 l. 12 s. and $z$ 's = 116 l. 8 s.

*Solution of cubic EQUATIONS.* The second term of a cubic equation can be taken away, so that it will be transformed to this form  $x^3 + qx + r = 0$ . See the article TRANSFORMATION.

Let us suppose that  $x = a + b$ ; and  $x^3 + qx + r = a^3 + 3a^2b + 3ab^2 + b^3 + qx + r = a^3 + 3ab \times a + b + b^3 + qx + r = a^3 + 3abx + b^3 + qx + r =$  (by supposing  $3ab = -qa^3 + b^3 + r = 0$ . But

$$b = -\frac{q}{3a}, \text{ and } b^3 = -\frac{q^3}{27a^3}, \text{ and con-}$$

$$\text{sequently } a^3 - \frac{q^3}{27a^3} + r = 0; \text{ or, } a^6 +$$

$$ra^3 = \frac{q^3}{27}. \text{ Suppose } a^3 = z, \text{ and you}$$

$$\text{have } z^2 + rz = \frac{q^3}{27}; \text{ which is a quadra-}$$

tic, the resolution whereof gives

$$z = -\frac{1}{2}r \pm \sqrt{\frac{1}{4}r^2 + \frac{q^3}{27}} = a^3, \text{ and}$$

$$a = \sqrt[3]{-\frac{1}{2}r \pm \sqrt{\frac{1}{4}r^2 + \frac{q^3}{27}}}; \text{ and}$$

$$x = a + b = a - \frac{q}{3a} = \sqrt[3]{-\frac{1}{2}r \pm \sqrt{\frac{1}{4}r^2 + \frac{q^3}{27}}} -$$

$$\frac{q}{3 \times \sqrt[3]{-\frac{1}{2}r \pm \sqrt{\frac{1}{4}r^2 + \frac{q^3}{27}}}}$$

in which expressions there are only known quantities. This method is commonly called Cardan's rule.

But when, in a cubic equation  $x^3 - qx \pm r$ ,  $q$  is negative; in this case the expression  $\sqrt{\frac{1}{4}r^2 + \frac{1}{27}q^3}$ , will be transformed into  $\sqrt{\frac{1}{4}r^2 - \frac{1}{27}q^3}$ ; which root becomes impossible, or imaginary, when  $\frac{1}{27}q^3$  is greater than  $\frac{1}{4}r^2$ , as being the square root of a negative quantity. And yet, even in this case, the root  $x$  may be a real quantity; though algebraists have not, hitherto, been able to find a real expression of its value. See the article IRREDUCIBLE.

Again, any cubic equation may be reduced to this form, and the value of  $x$  discovered, without exterminating the second term.

$$x^3 - 3px^2 - 3qx - 2r \left. \begin{matrix} + 3p^2x - p^3 \\ + pq \end{matrix} \right\} = 0; \text{ which}$$

by supposing  $x = z + p$ , will be reduced to  $z^3 - 3qz - 2r = 0$ , in which the second term is wanting. But, from what is advanced above, it follows that  $z = \sqrt[3]{r + \sqrt{r^2 - q^3}} + \sqrt[3]{r - \sqrt{r^2 - q^3}}$  (if you suppose that the cubic root of the binomial  $r + \sqrt{r^2 - q^3}$  is  $m + \sqrt{n}$ )  $= m + \sqrt{n} + m - \sqrt{n} = 2m$ . And, since  $x = z + p$ , it follows that  $x = p + 2m$ . But, as the square root of any quantity is twofold, so the cubic root is threefold, and can be expressed three different ways. See the article ROOT.

Example: let it be required to find the roots of the equation  $x^3 - 12x^2 + 41x - 42 = 0$ .

Comparing

Comparing the coefficients of this equation with these of the general equation, viz.

$$x^3 - 3px^2 - 3q \left\{ \begin{array}{l} x - 2r \\ + 3p^2 \end{array} \right\} x - p^3 \left\{ \begin{array}{l} - 2r \\ + 3pq \end{array} \right\} = 0, \text{ you}$$

will find,  $3p = 12$ , so that  $p = 4$ ;  $3p^2 - 3q (= 48 - 3q) = 41$ , so that  $q = \frac{7}{3}$ ;

$$1^\circ. x = p + 2m = 4 - 2 = 2.$$

$$2^\circ. x = p - m - \sqrt{-3n} = 4 + 1 - \sqrt{4} = 5 - 2 = 3.$$

$$3^\circ. x = p - m + \sqrt{-3n} = 5 + 2 = 7.$$

So that the three roots of the proposed equation are 2, 3, and 7.

**Solution of biquadratic EQUATIONS.** The roots of these may be found by reducing them to cubic ones, thus:

Let the second term be taken away, as directed under the article TRANSFORMATION of equations.

And let the equation that results, be  $x^4 + qx^2 + rx + s = 0$ . Suppose this biquadratic to be the product of these two quadratic equations,

$$x^2 + ex + f = 0.$$

$$x^2 - ex + g = 0$$

$$x^4 + \left\{ \begin{array}{l} f \\ + g \end{array} \right\} x^2 + \left\{ \begin{array}{l} ex - ef \\ - e^2 \end{array} \right\} x + fg = 0.$$

Where  $e$  is the coefficient of  $x$  in both equations, but affected with contrary signs; because when the second term is wanting in an equation, the sum of the affirmative roots must be equal to the sum of the negative.

Compare now the proposed equation with the above product, and the respective terms put equal to each other, will give  $f + g - e^2 = q$ ,  $eg - ef = r$ , and  $fg = s$ . Whence it follows, that  $f + g = q + e^2$ , and

$$g - f = \frac{r}{e}; \text{ and consequently, } f + g$$

$$+ g - f (= 2g) = q + e^2 + \frac{r}{e}, \text{ and } g =$$

$$\frac{q + e^2 + \frac{r}{e}}{2}. \text{ In the same manner you}$$

will find, by subtraction, &c.  $f =$

$$\frac{q + e^2 - \frac{r}{e}}{2}, \text{ and } f \times g (= s) = \frac{1}{4} \times q^2 +$$

$$\frac{2qe^2 + e^4 - \frac{r^2}{e^2}}{2}; \text{ and, multiplying by}$$

$4e^2$ , and ranging the terms, you have

$$\text{this equation, } e^6 + 2qe^4 + q^2 - 4s \times e^2 - r^2 = 0. \text{ Suppose } e^2 = y, \text{ and it be-}$$

comes  $3pq - p^3 - 2r (= 12 \times \frac{7}{3} - 4^3 - 2r) = 42$

so that  $r = 3$ . And consequently  $r^2 =$

$$9 = 9 - \frac{3 \times 7}{2} = -\frac{120}{2}, \text{ and } r + \sqrt{r^2 - q^3}$$

$$= 3 + \sqrt{-\frac{120}{2}}. \text{ Now the cubic root of}$$

this binomial is found to be  $-1 +$

$$\sqrt{-\frac{4}{3}} (= m + \sqrt{n}); \text{ whence}$$

comes  $y^3 + 2qy^2 + q^2 - 4s \times y - r^2 = 0$ ,

an equation whose roots are to be discovered by the method of resolving cubic equations.

Then the values of  $y$  being found, their

square roots will give  $e$  (since  $y = e^2$ );

and having  $e$ , you will find  $f$  and  $g$ ,

$$\text{from the equations } f = \frac{q + e^2 - \frac{r}{e}}{2}, \text{ and}$$

$$g = \frac{q + e^2 + \frac{r}{e}}{2}. \text{ Lastly, extracting the}$$

roots of the roots of the equations  $x^2 + ex +$

$f = 0$ , and  $x^2 - ex + g = 0$ , you will find

the four roots of the biquadratic  $x^4 +$

$qx^2 + rx + s = 0$ ; for either  $x = -$

$$\frac{1}{2}e \pm \sqrt{\frac{1}{4}e^2 - f}, \text{ or } x = \frac{1}{2}e \pm \sqrt{\frac{1}{4}e^2 - g}.$$

Or you may find the roots of a biquadratic,

without taking away the second term.

Suppose it to be of this form,

$$x^4 - 4px^3 - 2q \left\{ \begin{array}{l} x^2 - 8r \\ + 4p^2 \end{array} \right\} x - 4s \left\{ \begin{array}{l} x^2 - 4p^2 \end{array} \right\} = 0.$$

then the values of  $x$  will be

$$x = p - a \pm \sqrt{p^2 + q - a^2 - \frac{2r}{a}}$$

$$\text{and } x = p + a \pm \sqrt{p^2 + q - a^2 + \frac{2r}{a}}$$

where  $a^2$  is equal to the root of the cubic equation

$$y^3 - p^2 \left\{ \begin{array}{l} y^2 + 2pr \\ - q \end{array} \right\} y - r^2 = 0.$$

Every equation has as many roots, as the

unknown quantity of the first term has

dimensions, or as the exponent thereof

contains units. See the articles ROOT

and EXPONENT.

All equations have as many affirmative

roots as there are permutations of signs;

and as many negative roots as there are

successions of them: thus, in the quad-

dratic  $x^2 + x - 6 = 0$ , there is only one

succession

succession of signs,  $++$ ; and one permutation of them,  $+-$ ; hence the equation has two roots, one affirmative  $+2$ , and the other negative  $-3$ . Also in the cubic equation  $x^3 - 3x^2 - 10x + 24 = 0$ , there are two permutations of signs,  $+-$  and  $++$ ; and only one succession  $---$ : hence its roots are found to be two affirmative  $+2$  and  $+4$ , and only one negative  $-3$ . For the methods of approximating to the roots of equations, by means of their limits and series, see the articles LIMIT and SERIES.

**Construction of EQUATIONS.** See the article CONSTRUCTION.

**Exponential EQUATION.** See the article EXPONENTIAL.

**Transcendental EQUATION.** See the article TRANSCENDENTAL.

**Annual EQUATION** of the mean motion of the sun, and moon's apogee and nodes. The annual equation of the sun's mean motion depends upon the eccentricity of the earth's orbit round him, and is  $16\frac{1}{2}$  such parts, of which the mean distance between the sun and the earth is 1000; whence some have called it the equation of the center, which, when greatest, is  $1^\circ 56' 20''$ .

The equation of the moon's mean motion is  $11' 40''$ ; of the apogee,  $20'$ ; and of its node,  $9' 30''$ .

These four annual equations are always mutually proportionable to each other; so that when any of them is at the greatest, the three others will also be greatest; and when one diminishes, the rest diminish in the same ratio. Wherefore the annual equation of the center of the sun being given, the other three corresponding equations will be given; so that one table of the central equations will serve for all.

**EQUATION of a curve**, an equation expressing the nature of a curve, the relation between an absciss and a corresponding ordinate, or the relation of their fluxions. See the article CURVE.

**EQUATION of time**, in astronomy and chronology, the reduction of the apparent time or motion of the sun, to equable, mean, or true time.

The difference between true and apparent time arises from two causes, the eccentricity of the earth's orbit, and the obliquity of the ecliptic: Thus,

If the earth revolved in the plane of the equator, and in a circle about the sun,

then would the angle  $ASB$  (pl. XCIII. fig. 3. n° 1.) and consequently the angle  $eBm$ , be always of the same quantity; and, therefore, the time of describing the said angle,  $eBm$ , would always be equal; and the solar days and hours be equal among themselves. But neither of these two cases have place in nature; for the earth's orbit being an ellipsis, her annual motion cannot be equable, or the angle  $ASB$  (*ibid.*) described in the same space of time, will not be always equal; since, in the aphelium, the velocity of the earth will be less than in the perihelium, and consequently the arch  $AB$ , and the similar arch  $em$ , will be less; and, therefore, likewise the time of describing it. But the most considerable part of the equation of time is that which arises from the plane of the earth's orbit, or ecliptic, being inclined to that of the equator, or plane of the diurnal motion. To explain this, let  $\varphi H \triangle$  (*ibid.* n° 2.) be a semi-circle of the ecliptic, and  $\varphi H \triangle$  of the equinoctial,  $S$  the center of the sun, and  $A$  that of the earth, in the third quarter of the ecliptic,  $\varphi \triangle$ ;  $bf$  the meridian passing through the true sun  $S$ , and its apparent place at  $I$ , in the first quarter of the ecliptic  $\varphi \triangle$ . Suppose now the motion of the earth in every respect equable, and first that it set out from  $\triangle$ , and proceeded in the equinoctial in a given time to  $D$ ; the sun would apparently describe, in the same time, the arch of the equinoctial  $\varphi I$ . Again, suppose it set out from the same point,  $\triangle$ , and spent the same time, with the same equable velocity, in the ecliptic, it would arrive to the point  $A$ ; so that the arch  $\triangle A = \triangle D$ , and  $\varphi I = \varphi C$ . Then it is evident, as the earth revolves about its axis from west to east, the meridian of any place will first arrive at the sun  $I$ , in the ecliptic, and afterwards at the sun  $C$ , in the equinoctial; that is, the time of noon by the sun in the ecliptic will be sooner than that by the sun in the equinoctial, by the quantity of the arch  $bD$ , turned into time.

Now the arch  $bD = BC$  is the difference of the sun's longitude  $\varphi I$  or  $\varphi C$ , and his right ascension  $\varphi B$ . Draw  $ge$  parallel to  $DC$ , and the angle  $eAf$  will be equal to the angle  $DSb$ , and the arch  $ef$  similar to the arch  $Db$ . Therefore, the time in which the meridian  $bf$  revolves into the situation  $eg$ , is that which

is to be added to the ecliptic noon, to equate it with the time of the equinoctial noon, in the first and third quarters of the ecliptic. In the second and fourth quarters the said equation is to be subtracted, as would easily appear, by making the same construction there.

Since, in different parts of the quadrant this arch  $Dh$ , or  $BC$ , is of different lengths, the equation of time will be a variable quantity; and, therefore, as the motion and time measured by the sun in the equinoctial is always equal, it follows that the times measured by the sun in the ecliptic must be always unequal; or, in other words, the solar days are sometimes shorter, sometimes longer, than the equal time measured out in the equinoctial.

As the true motion of the earth precedes its mean motion in the first semi-circle of anomaly, and is preceded by the mean in the second, it follows, that while the earth is going from the aphelium to the perihelium, or while the sun apparently moves from the apogæum to the perigæum, the apparent time will be before the mean; and, in the other semi-circle of anomaly, it will be after it. The difference of these motions, converted into time, is the equation of time in this respect, and is to be subtracted from the apparent time to gain the mean, or added to the mean to gain the apparent, in the first semi-circle of anomaly; and, *vice versa*, in the latter.

Both these parts of the equation of time are calculated by astronomers for every degree of the sun's longitude in the

ecliptic, and disposed in tables with directions for adding or subtracting, as the case requires; by which means the true equal time may, at all times, be had.

From what has been said it appears, that the apparent time, or that shewn by a sun-dial, is but four days in the whole year the same with the mean or equal time, shewn by a good clock or watch, *viz.* about April 15, June 17, Aug. 31, and Dec. 24. It is also remarkable, that about the third of November the equation is greatest of all, clocks being then about 16' 13" slower than sun-dials.

As, therefore, the solar days are unequal, the hours must be so of course; and, according as the above-mentioned causes, which are independent on each other, concur, or counteract each other, this inequality is more or less. Besides, as the former of these causes, *viz.* the eccentricity of the earth's orbit, is affected by the precession of the equinoxes, tables of the equation of time, made for any year, must continually afterwards deviate more and more from the truth; yet, as this variation is extremely slow, the same tables may very well serve for an age, or more, without any sensible error.

Here follows a table of the equation of time, calculated for the new or gregorian style, and shewing how much equal or true time is faster or slower than apparent time, for every day throughout the year; or, which comes to the same thing, how many minutes and seconds a good clock or watch is faster or slower than a good sun-dial.

**EQUATOR**, in geography, a great circle of the terrestrial globe, equidistant from its poles, and dividing it into two equal hemispheres; one north, and the other south. See the article **GLOBE**.

It passes through the east and west points of the horizon, and at the meridian is raised as much above the horizon as is the complement of the latitude of the place. From this circle, the latitude of places, whether north or south, begin to be reckoned, in degrees of the meridian. See **LATITUDE** and **MERIDIAN**.

All people living on this circle, called by geographers and navigators, the line, have their days and nights constantly equal. See the article **EQUINOCTIAL**. It is in degrees of the equator, that the

longitude of places are reckoned; and as the natural day is measured by one revolution of the equator, it follows that one hour answers to  $\frac{360}{24} = 15$  degrees: hence one degree of the equator will contain four minutes of time; fifteen minutes of a degree will make a minute of an hour; and, consequently, four seconds answer to one minute of a degree.

**EQUERRY**, in the british customs, an officer of state, under the master of the horse.

There are five equerries, who ride abroad with his majesty; for which purpose they give their attendance monthly, one at a time, and are allowed a table.

As

As to the equerries of the crown-stable, they have this distinct appellation, as being employed in mounting, managing, and breaking the saddle-horses for his majesty's use, and holding his stirrup.

**EQUES AURATUS**, is used for a knight bachelor, called *auratus*, q. d. *gilt*, because antiently none but knights were allowed to beautify their armour, or other habiliments for war, with gold.

This term is not used in law, but instead of it *miles* & *chevalier* are made use of.

**EQUESTRIAN STATUE**, signifies the statue of a person mounted on horseback.

**EQUESTRIAN ORDER**, among the Romans, signified their knights, or equites; as also their troopers, or horsemen in the field; the first of which orders stood in contradistinction to the senators, as the last did to the foot, military, or infantry: each of these distinctions was introduced into the state by Romulus. See the articles **SENATOR** and **PEDITES**.

**EQUIANGULAR**, in geometry, an epithet given to figures, whose angles are all equal: such are a square, an equilateral triangle, &c.

**EQUICRURAL**, in geometry, the same with isosceles. See the article **ISOsceLES**.

**EQUICULUS**, or **EQUULEUS**. See the article **EQUULEUS**.

**EQUIDIFFERENT NUMBERS**, in arithmetic, are of two kinds. 1. Continually equidifferent is when, in a series of three numbers, there is the same difference between the first and second, as there is between the second and third; as 3, 6, 9. And, 2. Discretely equidifferent, is when in a series of four numbers or quantities, there is the same difference between the first and second, as there is between the third and fourth: such are 3, 6, 7, 10.

**EQUIDISTANT**, an appellation given to things placed at equal distance from some fixed point, or place, to which they are referred.

**EQUILATERAL**, in general, something that hath equal sides, as an equilateral angle.

**EQUILATERAL HYPERBOLA**, one whose transverse diameter is equal to its parameter; and so all the other diameters, equal to their parameters: in such an hyperbola, the asymptotes always cut one another at right angles in the center. Its most simple equation, with regard to the transverse axis, is  $y^2 = x^2 - a^2$ ; and, with regard to the conjugate,  $y^2 = x^2 + a^2$ , when  $a$  is the semitrans-

verse, or semiconjugate. The length of the curve cannot be found by means of the quadrature of any space, of which a conic section is any part of the perimeter. See the article **HYPERBOLA**.

**EQUILIBRIUM**, in mechanics, is when the two ends of a lever or balance hang so exactly even and level, that neither doth ascend or descend, but keep in a position parallel to the horizon; which is occasioned by their being both charged with an equal weight.

**EQUIMULTIPLES**, in arithmetic and geometry, are numbers or quantities multiplied by one and the same number or quantity. Hence, equimultiples are always in the same ratio to each other, as the simple quantities before multiplication: thus, if 6 and 8 are multiplied by 4, the equimultiples 24 and 32 will be to each other, as 6 to 8.

**EQUINOCTIAL**, in astronomy, a great circle of the celestial globe, whose poles are the poles of the world.

It is so called, because whenever the sun comes to this circle, the days and nights are equal all over the globe; being the same with that which the sun seems to describe, at the time of the two equinoxes of spring and autumn. See the article **EQUINOX**.

All stars, directly under this circle, have no declination, and always rise due east, and set full west. The hour circles are drawn at right angles to it, passing thro' every fifteenth degree; and the parallels to it are called parallels of declination. See the articles **DECLINATION** and **CIRCLE**.

EQUINOCTIAL	{	COLURE,	} See	COLURE.
		DIAL,		DIAL.
		HOUR,		HOUR.
		LINE,		LINE.
		OCCIDENT,		OCCIDENT.
		ORIENT,		ORIENT.
		POINT, &c.		POINT, &c.

**EQUINOX**, the time when the sun enters either of the equinoctial points, where the ecliptic intersects the equinoctial. See the preceding article.

It is so called, because when the sun is in these points, the days and nights are of an equal length all the world over. As the sun is in one of them, in the spring, *viz.* March 20th, it is called the vernal equinox; and in the other, in autumn, *viz.* September 23d, it is called the autumnal equinox.

*Precession of the EQUINOXES*. See the article **PRECESSION**.

**EQUINUS BARBATUS**, in astronomy, a kind of comet, called also hippcus. See the article HIPPEUS.

**EQUINUS VENTER**, among chemists. See the article VENTER EQUI.

**EQUIPOLLENCE**, in logic, is when there is an equivalence, or agreement, either as to the nature of the thing, or as to the grammatical sense of any two, or more propositions; that is, when two propositions signify one and the same thing, though they express it after different manners.

**EQUISELE**, or **EQUISELIS**, in ichthyology, the same with the guaracapema.

**EQUISELIS** is also the name of a two-winged fly, resembling the hornet both in size and shape.

**EQUISETUM**, **HORSETAIL**, in botany, a genus of the *cryptogamia* class of plants, and order of filices, or ferns; the fructifications of which are disposed on an oblong spike, and are of an orbicular figure, dividing in various angles from the base. The plant itself consists of jointed stalks, in some simple, in others branched; producing setæ, or smaller divisions, of the same structure with the larger ones.

Horse-tail is accounted vulnerable, and astringent, and therefore prescribed in hæmorrhages, and injuries of the kidneys and bladder.

**EQUITATA COHORTS**. See COHORT.

**EQUITY**, in a general sense, the virtue of treating all other men according to common reason and justice, or as we would be gladly treated ourselves, when we understand aright what is our due. See the article JUSTICE.

Equity is said to be of two kinds, the one of which abridges, and takes from the letter of the law, whilst the other enlarges, and adds thereto. The first is a correction of the law, generally made in that part wherein it fails, or is too severe, as where it is enacted that whosoever commits such a thing shall be deemed a felon, and suffer death: here, if a madman, or an infant, that has no discretion, commit the same, they shall not be deemed felons, nor suffer death for it; and where a person, to save his life, kills another that assaults him, tho' in general all killing is felony, this, by the law of reason, will be excused.

The other equity is defined to be an extension of the words of the law to cases unexpressed, yet having the same reason: as for example, the statute which

ordains, that in an action of debt against executors, he that appears by distress shall answer; this, by equity, extends to administrators, for such of them as appears first shall, by the equity of the said act, answer, because they are of the like kind and degree.

**EQUITY of redemption**, in our law, is applied to mortgages, as where money being due on a mortgage, the mortgagee is desirous to bar the mortgagor's equity of redemption, that is, his right to redeem the mortgage. In this case the mortgagee may oblige the mortgagor, either to pay the money, or to be foreclosed of his equity of redemption. The practice is to exhibit a bill, to which answer being put in, and a decree obtained, a master of that court certifies what is due for principal, interest, and costs, which is to be paid within the time limited by the decree, and thereupon the estate mortgaged is to be reconveyed to the mortgagor, otherwise for default of payment, the mortgagor is decreed to be foreclosed from all equity of redemption, and absolutely to convey the mortgaged premises to the mortgagee. See the article MORTGAGE.

**EQUITY** also frequently signifies the court of chancery, where controversies are determined according to the exact rules of equity and conscience, by mitigating the rigor of the common law; though even by the common and statute law there is also an equity. See the article CHANCERY.

*Equitas sequitur legem*, is an old maxim in law, but from the great increase of suits in chancery, some have thought fit to give it this construction, that in all causes, after a man hath been at law, he must go to equity.

**EQUIVALENT**, an appellation given to things which agree in nature, or other circumstances, as force, virtue, &c.

**EQUIVOCAL TERMS**, or **WORDS**, among logicians, are those which have a doubtful, or double meaning.

According to Mr. Locke, the doubtfulness and uncertainty of words has its cause more in the ideas themselves, than in any incapacity of the words to signify them; and might be avoided, would people always use the same term to denote the same idea, or collection of ideas: but, adds he, it is hard to find a discourse on any subject where this is the case; a practice which can only be imputed to folly, or great dishonesty; since a man,

in making up his accounts, might with as much fairness use the numeral characters sometimes for one, sometimes for another collection of unities.

**EQUIVOCAL ACTION** is, where the effect is of a different kind from the cause producing it.

**EQUIVOCAL CAUSE.** See **CAUSE**.

**EQUIVOCAL GENERATION**, the production of animals, without the intercourse between the sexes, by the influence of the sun or stars, &c.

The equivocal generation of plants, is their production without seed, in the ordinary course of nature. See the article **GENERATION**.

This kind of generation is now quite exploded by the learned. Mr. Ray is clearly of opinion, that there is no such thing as spontaneous or equivocal generation; but that all animals are the issue of parents of the same species with themselves; and with him agree Redi, Willughby, and Lister. This last author hath fully refuted the vulgar notion, that horse-hairs, thrown into water, will become animated bodies; by shewing, that appearances of this kind are hair-worms bred in the bodies of other insects, and particularly of the common black beetle.

**EQUIVOCATION**, in ethics, the crime of wilfully using equivocal terms. See the article **EQUIVOCAL**.

**ÆQUULEUS**, or **ECUULEUS**, in antiquity, a kind of rack used for extorting a confession, at first chiefly practised on slaves, but afterwards made use of against the christians.

The equuleus was made of wood, having holes at certain distances, with a screw, by which the criminal was stretched to the third, sometimes to the fourth, or fifth holes; his arms and legs being fastened on the equuleus with cords; and thus was hoisted aloft, and extended in such a manner, that all his bones were dislocated. In this state red hot plates were applied to his body, and he was goaded in the sides with an instrument called ungula.

**ÆQUULEUS**, in astronomy, a constellation of the northern hemisphere, whose stars, according to Ptolemy, and Tycho's catalogues, are four, but in Mr. Flamsteed's ten.

**EQUUS**, the **HORSE**, in zoology. See the article **HORSE**.

**ÆQUUS MARINUS**, in ichthyology, the same with the morse. See **MORSE**.

**ERA**, or **ÆRA**. See the article **ÆRA**.

**ERANARCHA**, a public officer among the ancient Greeks, whose business was to preside over, and direct, the alms and provisions made for the poor. Cornelius Nepos, in his life of Epaminondas, describes his office thus; when any person was reduced to poverty, taken captive, or had a daughter to marry, which he could not effect for want of money, &c. the eranarcha called an assembly of friends and neighbours, and taxed each according to his means and estate, to contribute towards his relief.

**ERANTHEMUM**, in botany, a genus of the *diandria-monogynia* class of plants, the corolla of which is quinquefid, the tube filiform, and the stigma single.

**ERANTHEMUM** is also a name given to the adonis flos. See the article **ADONIS**.

**ERASED**, in heraldry, the same with arrache. See the article **ARRACHE**.

It also denotes parts of animals torn, not cut off, from the part to which nature fixed them.

**ERECT FLOWERS**, such as grow upright without hanging or reclining the head. See the article **FLOWER**.

**ERECT DIAL**. See the article **DIAL**.

**ERECT-VISION**. See the article **VISION**.

**ERECTION**, in a general sense, the art of raising or elevating any thing, as the erection of a perpendicular, &c.

**ERECTION** is also used in a figurative sense, as the erection of a bishopric, marquisate, &c.

**ERECTION** is particularly used by medical writers, for the state of the penis, when swelled and distended by the action of the muscles called erectores. See the article **ERECTOR**.

There is also an erection of the clitoris, which is performed by muscles for that purpose. See the article **CLITORIS**.

De Graaf assigns two kinds of vessels with its muscles, for the performance of this office; the nerves, by which the animal spirits flow into its membranous parts, and render them more rigid and tumid, and the arteries carrying the blood to distend the corpora cavernosa.

**ERECTOR CLITORIS**, in anatomy, one of the two muscles of the clitoris that serve for its erection.

The erectores of the clitoris arise from the ossa ischia, and are inserted into the corpora cavernosa.

**ERECTOR PENIS**, one of the two muscles of the penis, that serve for its erection.

Their

These arise on each side from the ossa ischia between the tubercle of this bone and the beginning of the corpus cavernosum, and each of them is inserted into the corpus cavernosum of its own side. These muscles when they act together, press the veins of the back of the penis against the ossa pubis, by which they prevent the reflux of blood from the penis; and consequently when at the same time the blood flows impetuously into the part by the arteries, and cannot get back this way, the penis becomes erected.

EREMIT, or HERMIT. See HERMIT.

EREMITA, the HERMIT, in zoology, a species of squill, with a long soft tail, and the right claw the larger. See the article SQUILL.

Authors call it cancellus, or the little crab, as being only two inches and a half in length.

ERESIA, in botany, the same with theophrasta. See the article THEOPHRASTA.

ERETRIAN EARTH, in natural history, a kind of bole. See the article BOLE.

ERFURT, a large and beautiful city of upper Saxony, in Germany, capital of Thuringia, and subject to the elector of Mentz: east lon.  $11^{\circ} 6'$ , north lat.  $51^{\circ}$ .

ERGOT, in farriery, is a stub, like a piece of soft horn, about the bigness of a chestnut, placed behind and below the pastern-joint, and commonly hid under the tuft of the fet-lock.

To disergot, or to take it out, is done by cleaving it to the quick, with an incision-knife, in order to pull up a bladder full of water, that lies covered with the ergot. This operation is scarce ever performed in France, but in Holland 'tis frequently performed upon all four legs, with intent to prevent watery sores, and other foul ulcers.

ERICA, HEATH, in botany. See the article HEATH.

ERICA MARINA, SEA-HEATH, in botany, a plant of the fucus-kind. See the article FUCUS.

ERICHTHONIUS, in astronomy, a constellation more usually called auriga.

ERIDANUS, in astronomy, a constellation of the southern hemisphere; containing, according to different authors, 19, 30, or even 68 stars.

ERIE, a vast lake to the westward of Pennsylvania, in north America, situated between  $80^{\circ}$  and  $87^{\circ}$  west lon. and between  $41^{\circ}$  and  $42^{\circ}$  north lat.

ERIGERON, SWEET FLEABANE, in botany, a genus of the *syngenesia polygamia superflua* class of plants, the compound flower whereof is radiated; the partial hermaphrodite one infundibuliform; and the female flower is ligulated, linear, and subulated: The fruit has no pericarpium, the cup is connivent: the seeds of the hermaphrodite flower are oblong, small, and crowned with long down. This plant is a diuretic, and promotes the menses: the smell of it drives away flies, and kills lice and other like vermin.

ERINACEUS, in botany, the same with hydnum. See the article HYDNUM.

ERINACEUS, in zoology, the name by which authors call the hedge-hog.

ERINGO, in botany, the english name of the eryngium. See ERYNGIUM.

ERIOCAULON, in botany, a genus of the *triandria tryginia* class of plants, the general corolla of which is uniform and convex; the partial flower consists of three lanceolated, obtuse, hairy petals, narrow at the base, where they all three unite into one styiform hairy pedicle: the cup changes into a capsule, and contains a single seed winged with down.

ERIOCEPHALUS, in botany, a genus of the *syngenesia polygamia necessaria* class of plants, the compound flower of which is radiated; the proper hermaphrodite one is funnel-shaped; the female ones, being five in number, are ligulated in the radius: there is no pericarpium: the seed of the hermaphrodite produces no fruit; the seed of the female is single, roundish, naked, and placed vertically.

ERIOCEPHALUS is also used by Vaillant for a species of thistle.

ERIOPHORUM, in botany, a genus of the *triandria monogynia* class of plants, without any flower petals: the cup is a spike imbricated with oval, oblong squamæ; the seed is a triquetrous and acuminate seed, furnished with hairs longer than the spike.

ERIOPHORUS, in botany, the same with the andryala. See ANDRYALA.

ERIOX, in ichthyology, a name used by some for the salmon. See SALMON.

ERITHACE, the name given by the antients to rough, or crude wax, as collected by the bees. See WAX.

ERITHACUS, in ornithology, a species of motacilla, called also rubecula. See the articles MOTACILLA and RUBECULA.

ERIVAN,

**ERIVAN**, a city of Persia, on the frontiers of Turkey, situated on the south end of a lake of the same name : east long.  $45^{\circ}$ , north lat.  $40^{\circ} 6'$ .

**ERKELENS**, a city of Westphalia, in Germany, ten miles north of Juliers : east long.  $6^{\circ}$ , north lat.  $51^{\circ}$ .

**ERMIN**, *ermineum*, in zoology, a species of mustela, with narrow ears, and of the size of the weasel. See **MUSTELA**. The whole body of the ermin is of a pure snow-white, except the tip of the tail, which is of a deep black, and some spots of a greyish yellow about the head and shoulders. Its fur is much valued. See the article **FUR**.

**ERMIN**, in heraldry, is always argent and sable, that is, a white field, or fur, with black spots. These spots are not of any determinate number, but may be more or less; at the pleasure of the painter, as the skins are thought not to be naturally so spotted; but serving for lining the garments of great persons, the furriers were wont, in order to add to their beauty, to sow bits of the black tails of the creatures that produced them, upon the white of their skin, to render them the more conspicuous, which alteration was introduced into armory. See plate **LXXXVIII.** fig. 4.

**ERMIN**, or **EARS OF CORN**, an order of knights in France, instituted by Francis the last of that name, duke of Britany. This order was so called on account that the collar of it was made up of ears of corn, lying athwart one another in saltier, bound together, both above and below, each ear being crossed twice, the whole of gold. To this collar there hung a little white beast, called an ermin, running over a bank of grass, diversified with flowers.

**ERMINE'**, or cross erminé, is one composed of four ermin spots, placed as represented in plate **LXXXVIII.** fig. 5. It is to be observed, that the colours in these arms, are not to be expressed, because neither this cross nor these arms can be of any other colour but white and black.

**ERMINES** are, by some english writers, held to be the reverse of erminé, that is, white spots on a black field, and yet the French use no such word, but call this black powdered with white *contre ermin*, which is very proper, as it denotes the reverse of ermin. See the article **ERMIN**.

**ERMINITES** should signify little ermines, but it is otherwise; for it expresses a

white field powdered with black, only that every such spot hath a little red hair on each.

**Erminites** also signify a yellow field powdered with black, which the French express much better by *or semé d'ermine de sable*.

**EROSION**, among physicians, denotes much the same with corrosion, only in a stronger degree. See the articles **CORROSION** and **CORROSIVES**.

**EROTIC**, in general, any thing relating to the passion love.

Physicians take notice of the erotic delirium, or that melancholy occasioned by excessive love. See the articles **MELANCHOLY** and **LOVE**.

**ERPACH**, a city of Franconia, in Germany, capital of a county of the same name, and situated thirty miles south east of Francfort : east long.  $8^{\circ} 50'$ , north lat.  $49^{\circ} 42'$ .

**ERQUIKO**, a port-town of the Red-sea, on the coast of Abex in Africa : east long.  $39^{\circ}$ , north lat.  $17^{\circ}$ .

**ERRANT**, or **ITINERANT**, is a title that is applied to justices that go the circuits, and also to bailiffs at large. See the article **EYRE**.

**ERRATA**, a list of the errors or faults in the impression of a book, generally placed at the beginning thereof.

**ERRATIC**, in general, something that wanders, or is not regular; hence it is, the planets are called erratic stars; as those fevers, which observe no regular periods, are denominated erratic fevers.

**ERRHINES**, *ἐρρῖνα*, in pharmacy, medicines which, when snuffed up the nose, promote a discharge of mucus from that part.

The excretion of the mucous lymph is excellently promoted by errhines and sternutatories, the former of which stimulate the pituitary coats but gently, whereas the latter more forcibly stimulate them, to an excretory motion. See the article **STERNUTATORY**.

Among the milder kind of the errhines, we may reckon marjoram, basilicon, thyme, hyssop, savory, marum syriacum, the tops of origanum, flowers of lillies of the valley, and benjamin, the resin of guaiacum, fine raspings of aloes wood, dry volatile salt of sal-ammoniac perfumed with oil of marjoram, as also white vitriol. On the contrary, violent errhines are euphorbium, the powder of white hellebore, and, in a milder degree, several

several sorts of snuffs, precipitate mercury, and pepper.

Errhines are more friendly to the constitution and nerves than sternutatories, by their subtil, acrid, and volatile salt, gently stimulating the pituitary membrane, and drawing the mucid humour from it. They are also much safer than sternutatories, in their effects.

Errhines prepared of cephalic herbs are of singular service in oppressive pains of the head, a hemicrania, lethargic disorders, weaknesses of memory, stuffings of the head, and coryza, mucous defluxions of the eyes, drowsiness, vertigoes, and in cases where the malignant humours, generated by the lues venerea, are lodged in the membranes of the nostrils.

**ERROUR, ERROR**, in philosophy, a mistake of our judgment, giving assent to that which is not true.

Mr. Locke reduces the causes of error to these four, first, want of proofs; secondly, want of ability to use them; thirdly, want of will to use them; and, fourthly, wrong measures of probability.

That great writer observes upon the first of these causes of error, that the greatest part of mankind want conveniencies and opportunities of making experiments and observations themselves, or of collecting the testimonies of others, being prevented by the necessity of their condition. Upon the second of these causes he observes, that there are many who from the state of their condition, might bestow time in collecting proofs, but yet are not able to carry a train of consequences in their heads, nor weigh exactly the preponderancy of contrary proofs and testimonies, merely from the difference in mens understandings, apprehensions, and reasonings. Thirdly, he remarks, that though some have opportunities and leisure enough, and want neither parts, learning, nor other helps, that they never come to the knowledge of several truths within their reach, either upon the account of their attachment to pleasure or business; and otherwise because of their laziness, or aversion to study. The fourth cause of error, *viz.* wrong measures of probability, he imputes, 1. To the practice of taking for principles propositions that are not in themselves certain and evident, but, on the contrary, doubtful and false. 2. To received hypotheses. 3. Predominant passions or inclinations. And, 4. To authority, or the giving up our as-

sent to the common received opinions either of our friends or party, neighbours or country.

The causes of errors in philosophy, or the reasons why all former philosophers have through so many ages erred, according to lord Bacon, are these following.

1. Want of times suited to learning.
2. The little labour bestowed upon natural philosophy.
3. Few entirely addicted to natural philosophy.
4. The end of the sciences wrong fixed.
5. A wrong way chosen.
6. The neglect of experiments.
7. Regard to antiquity and authority.
8. Admiration of the works in use.
9. The artifice of teachers and writers in the sciences.
10. Ostentatious promises of the moderns.
11. Want of proposing worthy tasks.
12. Superstition and zeal being opposite to natural philosophy, as thinking philosophy dangerous, on account of the school-theology; from the opinion that deep natural enquiries should subvert religion.
13. Schools and academies proving unfavourable to philosophy.
14. Want of rewards.
- And, 15. Despair and the supposition of impossibility.

**ERUCA**, the **CATERPILLAR**, in zoology.

See the article **CATERPILLAR**.

**ERUCA**, the **WHITE-ROCKET**, in botany, a species of brassica, with lyrate leaves, hairy stalks, and smooth pods. See the article **BRASSICA**.

**ERUCA MARINA**, a sea-insect, more usually called aphrodita. See **APHRODITA**.

**ERUCAGO**, **CORN-ROCKET**, in botany, a genus of plants called also bunias. See the article **BUNIAS**.

**ERUCTATIONS**, in medicine, are the effect of flatulent foods, and the crudities thence arising. See **FLATULENCY**.

**ERUDITION**, *eruditio*, denotes an extensive acquaintance with books, especially such as treat of the belles lettres.

**ERVI SPECIES**, in botany, the name by which Dillenius calls sophora. See the article **SOPHORA**.

**ERUPTION**, in medicine, a sudden and copious excretion of humours, as pus or blood: it signifies also the same with exanthema, any breaking out, as the pustules of the plague, small-pox, measles, &c. See the article **EXANTHEMA**, &c.

The pestilent eruptions are spots of a purple or red colour; or they are black, or of a violet colour: commonly they are of a round figure, sometimes broad, or of an oblong or some other shape: they shew themselves in the skin up and down

the

the body. See the articles **PLAGUE**, **BUBOE**, **CARBUNCLE**, &c.

Spots of a purple, black, greenish, or violet colour, at whatever time they appear, are always fatal signs.

**Scabby ERUPTIONS** in the heads of children. See the articles **CRUSTA LACTEA**, and **ACHOR**.

The heads of children are often troubled with scabby eruptions : these are expelled by the benefit of nature ; and before the eruption, the child is often troubled with epileptic fits from the irritation of the morbid matter. If the humour strike in, either spontaneously, or by improper applications ; or if the exanthemata are of a blackish colour, they are very dangerous, and the child generally falls into an asthma, or a fatal epilepsy.

Harris prescribes the testaceous powders for infants in this case. Heister, if the child is suspected of the venereal disease, would have a grain or two of mercurius dulcis added with gentle purges between whites, especially if the body is not loose. Externally, nothing of sulphur, or mercury should be applied, or repellent lotions, or any cold thing. To mollify the scabs, fresh butter, or calves marrow, or cream, is sufficient. This case often proves obstinate, and then the nurse should observe a strict regimen, use a good diet, take sweeteners of the blood, and purgatives now and then.

**ERVUM**, a genus of the *diadelphia-decandria* class of plants, the corolla of which is papilionaceous ; the vexillum plane, slightly turned up, and of a roundish form ; the alæ are obtuse, and shorter by half than the vexillum ; the carina is acuminate, and shorter than the alæ : the fruit is a thick, knotty, obtuse and oblong pod, with protuberant seeds, which are four in number, and of a roundish figure. This plant, abounding with diuretic salt, is recommended for the stone.

**ERYNGIUM**, **ERINGO**, in botany, a genus of the *pentandria-digynia* class of plants, the general corolla of which is uniform and roundish ; the partial one consists of five oblong petals, knotted together by a longitudinal line. The fruit is of an oval figure, and divisible in two parts : the seeds are oblong and roundish. The root of eryngium is attenuant and deobstruent, and is therefore esteemed a good hepatic, uterine, and nephritic. Its whole virtue consists in the external or cortical part.

**ERYNGIUM** is also used by some for aloes and a species of ammi. See the articles **ALOES** and **AMMI**.

**ERYSIMUM**, **HEDGE-MUSTARD**, in botany, a genus of the *tetradynamia-siliquosa* class of plants, the corolla whereof consists of four oblong, cruciform petals, with a very obtuse point : the fruit is a long, linear, four-cornered pod, consisting of two valves, and divided into two cells : the seeds are numerous, small, and roundish.

This plant is recommended in paralytic and epileptic cases ; it expels poison, destroys worms, strengthens the stomach, and cures ulcers of the mouth.

**ERYSIPELAS**, in medicine, an eruption of a fiery or acrid humour, from which no part of the body is exempted, though it chiefly attacks the face.

As to the material cause of an erysipelas, it seems to be of a caustic, acrid, and putrefying nature ; perhaps corrupted bile, which, being conveyed into the mass of blood, indisposes the whole nervous and vascular systems, and excites a fever, till it is at last driven out to the surface of the body. Persons of a sanguine habit, young people, and pregnant women, are most subject to it ; and all hot things, violent passions, and whatever occasions other inflammations, likewise give rise to this. See the article **INFLAMMATION**.

The patient is taken suddenly, whilst he is in the open air, with chiliness, a shivering, and other symptoms common in a fever : the part affected swells a little with great pain, and intense redness, and is beset with a vast number of small pustles, which, when the inflammation is increased, are converted into small blisters. The malady gradually creeps further and further, spreads itself from place to place, and is attended with a fever. See the article **FEVER**.

There is another sort, though it seldom happens, commonly arising from a surfeit, or a debauch of drinking spirituous liquors. A small fever which precedes it, is followed presently by an eruption of pustles, almost all over the body, which look like the stings of nettles, and sometimes rise up into bladders : presently they go away again, with an itching scarce tolerable ; but as often as they are scratched, they appear again.

This distemper has a great affinity with a pestilential fever, as it is attended with most of the symptoms in that case : but

this is to be understood of the worst kind of erysipelas. On the third and fourth day, the malignant matter is thrown out on the surface of the body, and then the symptoms a little abate. There is often a pain, redness, and tumour in the inguinal glands, from whence the matter, of a hot, fiery quality, descends to the feet. If the head is attacked, the parotid glands are affected; if the breast, the axillary. The mammary and axillary glands are not seldom ulcerated, and affect the joints with a virulent corruption; and likewise, as in the plague, there is nothing more dangerous than the expelled matter to return back from the surface of the body to the inward parts.

In some, especially young persons, the matter is not so violent, nor the fever so great: the glands remain unaffected, and the eruption happens on the second day. This is not at all dangerous. In children, the umbilical region generally suffers, with a fatal event. In a day or two the tumor subsides, the heat and pain cease, the rosy colour turns yellow, the cuticle breaks, and falls off in scales, the danger is over. When the erysipelas is large, deep, and falls upon a part of exquisite sense, the patient is not very safe; but if the red colour changes into black and blue, it will end in a mortification. If the inflammation cannot be dissipated, it will suppurate, and bring on fistulas and a gangrene: when the patient is cachectical, the leg will sometimes swell three times as big as the natural size, and is cured with great difficulty. Those who die of this disease, die of the fever, which is generally attended with difficulty of breathing, sometimes a delirium, sometimes with sleepiness; and this in seven days time.

Let the patient's diet be water-gruel or barley-broth, with roasted apples. If he drinks any beer, let it be very small, and let him keep out of bed some hours in a day. The medicinal writers do not agree in their opinions, concerning purging in the cure of the erysipelas; but what they deliver upon this subject, is full of doubts and uncertainties, and that at a point of time when the distemper is most dangerous and threatening: however, it is the general opinion in this case, that it is a right practice, more especially if the head is affected with an erysipelas, and there comes upon it a coma, a delirium, or convulsions, wherein the brain is evident-

ly attacked; then purging is the only indication that can afford any hopes of recovering the patient: nor in these difficulties should the matter be delayed till the fever is abated, or the humor subsided. Therefore, the best practice appears to be that of taking away nine or ten ounces of blood, and the next morning giving the patient the common purging portion.

It will be safest to avoid external applications, unless a powder made of elder-flowers and liquorice sprinkled on the part; or lime-water mixt with a fourth part of spirit of wine and camphor, dipping a linnen cloth in it several times doubled, and applying it hot to the part. An infusion of scordium, elder-flowers, and fennel-seed, drank in the manner of tea, is useful to expel the morbid matter. If the disease does not yield to the first bleeding, let it be repeated. If that will not do, let it be reiterated twice more, one day being interposed between. On the days free from bleeding, prescribe a clyster of milk, and syrup of violets; also the cooling emulsion and julep.

Turner commends much a mixture of ol. sambucin. and aqua calcis, with some spirit of wine camphorated. A cataplasm of cow's dung is very good to ease the pain.

In a symptomatic erysipelas, the following liniment is good: R. Ol. sambucin. lixiv. tenuior. ana p. æ. m. let them be shaken well in a phial till they unite in an ointment.

In a scorbutic erysipelas, besides externals, sudorifics are to be given; as Rob. sambucin. spi. sambuci bezoar. min. sp. sal. armon. cochlear, &c.

**ERYTHOXYLUM**, a name given by some to brasil-wood. See **BRASIL**.

**ERYTHRINA**, **CORAL-TREE**, in botany, a genus of the *diadelphia-decandria* class of plants, the corolla of which is papilionaceous, and consists of four petals: the fruit is a very long pod, protuberated by the seeds, terminating in a small point, and consisting of one cell: the seeds are kidney-shaped.

**ERYTHRINUS**, in ichthyology, a species of sparus, of a strong and elegant red colour, and the iris of the eyes of a fine silver-white: its tail is very much forked. See the article **SPARUS**.

**ERYTHROCYANEUS**, the red and blue maccaw, with a wedge-like tail, and the sides of the head naked and rugose.

This

*Fig. 1. ERYTHROCYANEUS, or the RED and BLUE MACKAW.*

*Fig. 2. ESCHARA.*

*Fig. 3. ENTROCHUS.*

Fig. 4.

### EQUATION of Time.

This bird is undoubtedly, says Mr. Edwards, the first of the parrot-kind; being a full yard long, from the point of the bill to the end of the tail, and its plumage adorned with the most beautiful variety of colours. Its head, neck, breast, belly, thighs, upper part of the back, and lesser covert feathers of the wings, are of a very fine bright red, or scarlet-colour. The quill-feathers of the wings are of a very fine blue on their outides, and a faint red on their under sides; the next feathers above them are of a fine yellow colour, some of them being tipped with green, as are the blue quills next the back: the lower belly and under side of the tail, are of a beautiful blue, as are the short ones on its upper side; and its long feathers are red tipped with blue. See plate XCIII. fig. 1.

**ERYTHRODANUM**, a name sometimes used for madder. See **MADDER**.

**ERYTHROIDES**, in anatomy, the first of the proper tunics or coats which cover the testicles. See **TESTICLE**.

**ERYTHRONIUM**, **DOG'S TOOTH-VIOLET**, in botany, a genus of plants belonging to the *hexandria-monogynia* class; the flower consists of six oblong and lanceolated petals; and the fruit is a subglobose capsule, with three cells, in which are contained numerous ovato-acuminated seeds.

The root of this plant is recommended against the colic, epilepsy, and worms: it is also reckoned a provocative to venery.

**ERYTHROPTHALMUS**, the **SARPE**, or **RED-EYE**, in ichthyology, a species of cyprinus, with the iris of the eye, all the fins, and tail red. See **CYPRINUS**.

It somewhat resembles the roach, and is only ten inches in length.

**ERZERUM**, the capital of the province of Turcomania, or Armenia: east long. 41°, north lat. 40°.

It is a great thoroughfare from Persia and India to Constantinople, by the way of Trebisond and the Black-sea.

**ESCALADE**, or **SCALADE**, in the art of war. See the article **SCALADE**.

**ESCAMBIO**, or **EXCAMBIO**, the same with exchange. See **EXCHANGE**.

**ESCAPE**, in law, a violent or privy evasion out of some lawful restraint, without being delivered by due course of law. There are two sorts of escapes, voluntary and negligent. Voluntary, when a man arrests another for felony, or other crime, and afterwards lets him go freely by consent; in which case, the party that per-

mits such escape, is held guilty, committed, and must answer for it. Negligent escape, on the contrary, is where one is arrested, and afterwards escapes against the will of the person that arrested him, and is not pursued with fresh suit, and re-taken before the person pursuing hath lost sight of him. By stat. 8 & 9 Will. III. c. 26. the keepers of prisons, conniving at escapes, shall forfeit 500 l. and, in civil cases, the sheriff is answerable for the debt.

**ESCAPE-WARRANT**, a process which issues out against a person, committed in the king's bench or fleet prisons, that, without being duly discharged, takes upon him to go at large.

Upon this warrant, which is obtained on oath, a person may be apprehended on a Sunday.

**ESCHALOT**, *cepa ascalonica*, a species of onion cultivated in gardens, for its use in cookery. See the article **CEPA**.

**ESCHAR**, in surgery, the crust or scab occasioned by burns or caustic medicines. See the articles **BURN** and **CAUSTICS**.

**ESCHARA**, in botany, a genus of sea-plants, composed of a gritty matter, but not very hard, of a reticulate texture, and sometimes disposed in the form of leaves, perforated with numerous roundish holes: these are so equally distributed, as to give the whole the appearance of a net. See plate XCIII. fig. 2.

There are several species of eschara, distinguished from the fucus, no less by their brittleness, than by their net-like texture. See the article **FUCUS**.

**ESCHAROTICS**, in pharmacy, medicines which produce eschars. See **ESCHAR**.

**ESCHEAT**, in law, signifies any lands or tenements that casually fall to a lord within his manor, by way of forfeiture, or by the death of his tenant, without any heirs general or special.

The word escheat is sometimes used for the place or circuit within which the king or other lord is entitled to escheats; also for a writ, to recover the same from the person in possession after the tenant's death.

**ESCHEATOR**, in our old customs, an officer formerly appointed in every county, to make inquests of escheats due to the king; but since abolishing the court of wards, has been laid aside as useless.

**ESCHELLES**, a town of Savoy, sixteen miles south-west of Chamberry.

**ESCHEVIN**, or **ECHEVIN**. See the article **ECHEVIN**.

**ESCHRA.**

**ESCHRAKITES**, in matters of religion, a sect of mahometans, who believe that man's sovereign good consists in the contemplation of God. They avoid all manner of vice, and appear always in good humour, despising the sensual paradise of Mahomet. The most able preachers, in the royal mosques, are of this sect.

**ESCHYNOMENOUS**, or **ÆSCHYNOMENOUS**. See **ÆSCHYNOMENOUS**.

**ESCLAIRCISSEMENT**, a french term adopted into our language, signifying the explication or clearing up of some difficulty or obscurity.

**ESCLATTE'**, in heraldry, signifies a thing forcibly broken, or rather a shield that has been broken and shattered with the stroke of a battle-ax.

**ESCORT**, in the art of war, the same with convoy. See the article **CONVOY**.

**ESCROW**, among lawyers, a deed delivered to a third person, to be the deed of the party making it upon a future condition, that when a certain thing is performed, it shall be delivered to the party to whom it was made, to take effect as the deed of the person first delivering it.

**ESCUAGE**, in our old customs, a kind of knight-service, called service of the shield, by which the tenant was bound to follow his lord to the wars at his own charge. It is also used for a sum of money paid to the lord, in lieu of such service; or even for a reasonable aid, levied by the lord upon his tenants who held by the knight's service.

**ESCULENT**, an appellation given to such plants, or the roots of them, as may be eaten: such are beets, carrots, artichokes, leeks, onions, parsneps, potatoes, radishes, scorzonera, &c. See the articles **BET**, **CARROT**, &c.

**ESCULUS**, the **HORSE-CHESNUT**, a genus of trees, belonging to the *heptandriamono-gynia* class of plants: its flower consists of five roundish petals; and the fruit is a roundish, echinated, and coriaceous capsule, with only one cell, in which are contained two roundish seeds, tho' sometimes only one.

**ESCURIAL**, a palace of the king of Spain, twenty-one miles north-west of Madrid; being one of the largest and most beautiful in the world. It has eleven thousand windows, fourteen thousand doors, one thousand eight hundred pillars, seventeen cloysters or piazzas, and twenty-two courts; with every convenience and ornament that can render a place agreeable

in so hot a climate, as an extensive park, groves, fountains, cascades, grottos, &c. **ESCUTCHEON**, or **SCUTCHEON**, in heraldry, is derived from the french *escusson*, and that from the latin *scutum*, and signifies the shield whereon coats of arms are represented.

Most nations, of the remotest antiquity, were wont to have their shields distinguished by certain marks painted on them; and to have such on their shields was a token of honour, none being permitted to have them till they had performed some honourable action.

The escutcheon, as used at present, is square, only rounded off at the bottom.

As to the bearings on shields, they might at first be arbitrary, according to the fancy of the bearer; but, in process of time, they came to be the gift of kings and generals, as the reward of honourable actions.

**ESCUTCHEON of pretence**, that on which a man carries his wife's coat of arms; being an heiress, and having issue by her. It is placed over the coat of the husband, who thereby shows forth his pretensions to her lands. See the article **HEIRESS**.

**Points of an ESCUTCHEON**. See **POINT**.

**Quartering of an ESCUTCHEON**. See the article **QUARTERING**.

**ESDRAS**, the name of two apocryphal books, usually bound up with the scriptures. They were always excluded the jewish canon, and are too absurd to be admitted as canonical by the papists themselves. The first book is chiefly historical, giving an account of the return of the Jews from the babylonish captivity, and the building of the second temple; the second is written in the prophetic way, pretending to visions and revelations, but such as are extremely ridiculous.

**ESENS**, a town of Westphalia, twenty-five miles north of Embden.

**ESK**, a river which forms part of the boundary between England and Scotland; and, running from north-east to south-west, falls into the Solway-frith: it gives name to the country of Eskdale.

**ESKIMAUX**, sometimes called New Britain, and Terra de Labrador, is an extensive country of North America, situated between 59° and 80° west long. and between 50° and 64° north lat.

It is bounded by Hudson's straits, which separate it from Greenland, on the north; by the Atlantic ocean, on the east; by the

the river and bay of St. Lawrence, on the south-east ; and by Hudson's bay, on the west.

**ESLINGEN**, an imperial city of Swabia, in Germany, seven miles south-east of Stutgard.

**ESLIRASS**, in law, persons particularly appointed or chosen to impanel juries.

**ESNECY**, in law, a private prerogative allowed to the eldest coparcener, where an estate is descended to daughters for want of an heir male, to choose first, after the estate of inheritance is divided.

It has been also extended to the eldest son and his issue, holding first, this right being *jus primogenituræ*.

**ESOX**, in ichthyology, a genus of malacopterygious fishes, wherein the membrane of the gills contains from twelve to fourteen officles or little bones, and there is a fin on the back very near the tail.

To this genus belong the lucius or pike, the acus or needle-fish, and the greatest squamose acus. See the articles **LUCIUS** and **ACUS**.

**ESPALIERS**, in gardening, are rows of trees planted about a whole garden or plantation, or in hedges, so as to inclose quarters or separate parts of a garden ; and are trained up regularly to a lattice of wood-work in a close hedge, for the defence of tender plants against the injuries of wind and weather. They are of admirable use and beauty in a kitchen-garden, serving not only to shelter the tender plants, but screen them from the sight of persons in the walks.

The trees chiefly planted for espaliers, are apples, pears, and some plums : some plant apples grafted upon paradise-stocks ; but, as these are of short duration, it is better to plant those grafted upon crab-stocks, or upon what the gardeners call dutch-stocks ; which will both cause them to bear sooner, and prevent their growing too luxuriant. The best kind of apples for this purpose, are the golden pippen, nonpareil, rennete, &c. and the best sorts of pear, are the jargonelle, blanquette, &c. These last, if designed for a strong moist soil, should be grafted upon quince-stocks ; but, if for a dry soil, upon free-stocks.

While the trees are young, it will be sufficient to drive a few stakes into the ground on each side of them ; fastening the branches to these in an horizontal position, as they are produced. This method will do for the three first years ; after which an espalier should be made of

ash-poles, whereof there must be two sorts, larger and smaller ; the former to be driven upright into the ground a foot asunder, and the latter, or slender poles, to be nailed across these, at about nine inches. Some prefer to this another sort of espalier, made of square timber cut to any size : these are, indeed, more slightly, but withal vastly more expensive.

When the espalier is thus framed, the branches are to be fastened to it with osier-twigs ; observing to train them in an horizontal position, and at equal distances. Fruit-trees thus managed, are preferable to any others ; not only as bearing better tasted fruit, but as taking up very little room in a garden, so as to be less hurtful to plants which grow in the quarters.

**ESPALIER**, in the french gardening, denotes a wall-tree. See **WALL-TREE**.

**ESPAULE** and **ESPAULEMENT**. See the articles **EPAULE** and **EPAULEMENT**.

**ESPERIE**, a city of Hungary, forty miles north of Tockay : it is remarkable for its salt mines.

**ESPINAL**, a town of Lorrain on the Moselle, thirty-five miles south-east of Nancy.

**ESPLANADE**, in fortification, the sloping of the parapet of the covered way towards the campaign. See **PARAPET** and **CAMPAIGN**.

It is the same with glacis, but begins to be antiquated, and is more properly the empty space betwixt a citadel and the houses of a town, commonly called a place of arms. See the articles **FORTIFICATION**, **COVERT-WAY**, **GLACIS**, and **CITADEL**.

**ESPLEES**, in law, the general products which lands yield, or the profit or commodity that is to be taken or made of a thing ; as of a common, the taking of grass by the mouths of the beasts that common there ; of an advowson, taking of tythes by the parson ; of wood, the selling of wood ; of an orchard, selling the fruit growing there ; of a mill, the taking of toll, &c.

These and such-like issues are termed esplees. In a writ of right of land, advowson, &c. the demandant must allege in his count, that he or his ancestors took the esplees of the thing demanded, otherwise the pleading is not good.

**ESPOUSALS**, in law, signify a contract or promise made between a man and a woman, to marry each other ; and in cases where marriage may be consummated, espousals go before. Marriage is termed an espoual *de præfenti*.

**ESQUI-**

**ESQUINANCY**, in medicine. See the article **QUINZY**.

**ESQUIRE**, *armiger*, was antiently the person that attended a knight in time of war, and carried his shield.

This title has not, for a long time, had any relation to the office of the person, as to carry arms, &c. Those to whom the title of esquire is now of right due, are all noblemen's younger sons, and the eldest sons of such younger sons; the eldest sons of knights, and their eldest sons; the officers of the king's courts, and of his household; counsellors at law, justices of the peace, &c. though those latter are only esquires in reputation: besides, a justice of the peace holds this title no longer than he is in commission, in case he is not otherwise qualified to bear it: but a sheriff of a county, who is a superior officer, retains the title of esquire during life, in consequence of the trust once reposed in him: the heads of some antient families are said to be esquires by prescription.

**ESQUIRES of the king**, are such as have that title by creation, wherein there is some formality used, as the putting about their necks a collar of SS, and bestowing on them a pair of silver-spurs, &c.

There are four esquires of the body to attend the king's person.

If an esquire be arraigned of high treason, he ought to be tried by a jury each whereof have 40s. of freehold, and 100l. in goods; and a knight has no other privilege. The heir apparent of an esquire, is privileged to keep grey-hounds, setting-dogs, or nets to take partridges and pheasants, though he cannot dispend 10l. of estate of inheritance, or the value of 30l. of estate for life.

**ESSART**, or **ASSART**, in law. See the article **ASSART**.

**ESSAY**, a trial or experiment for proving the quality of any thing; or an attempt to learn, whether or no any invention will succeed.

**ESSAY** in coinage. See the article **ASSAY**.

**ESSAY**, in literature, a peculiar kind of composition, the character whereof is to be free, easy, and natural; not tied to strict order or method, nor worked up and finished like a formal system.

An essay chiefly consists in occasional reflections, leaving the subject and then returning to it again; as the thoughts happen to occur to the mind. Montaign is said to have excelled in this species of writing; and the great lord Bacon is also

a pattern in this way. Mr. Locke calls his treatise on the human understanding, an Essay; and Mr. Pope calls his four ethic epistles, an Essay on Man.

**ESSAY-HATCH**, is the miner's term for a little trench or hole, which they dig to search for shoad or ore.

**ESSE**, in the schools, the same with essence. See the article **ESSENCE**.

**ESSECK**, a town of Hungary, near the confluence of the rivers Drave and Danube, with a bridge five miles over: it lies about eighty miles north-west of Belgrade.

**ESSEN**, a town of Westphalia, about ten miles north-east of Dusseldorp.

**ESSENCE**, in philosophy, that which constitutes the particular nature of each genus or kind, and distinguishes it from all others; being nothing but that abstract idea to which this name is affixed; so that every thing contained in it, is essential to that particular kind.

This Mr. Locke calls the nominal essence, in contradistinction to the real essence, or constitution of substances, on which this nominal essence depends: thus the nominal essence of gold, is that complex idea the word gold stands for; let it be, for instance, a body, yellow, weighty, malleable, fusible, and fixed: but its real essence is the constitution of its insensible parts, on which those qualities and all its other properties depend, which is wholly unknown to us.

That essence, in the ordinary use of the word, relates to sorts, appears from hence, that, if you take away the abstract ideas by which we sort individuals, and rank them under common names, then the thought of any thing essential to any of them instantly vanishes. We have no notion of the one without the other, which plainly shews their relation. No property is thought essential to any individual whatsoever, till the mind refers it to some sort or species of things; and then presently, according to the abstract idea of that sort, something is found essential; so that essential, or not essential, relates only to our abstract ideas, and the names annexed to them.

Substances are distinguished into sorts and species, by their nominal essence; and the species of things are nothing to us, but the ranking them under distinct names, according to the complex ideas in us, and not according to precise distinct real essences in them.

We cannot rank and sort things by their real essences, because we know them not.

Our faculties carry us no farther in the knowledge of substances, than a collection of those sensible ideas we observe in them. But the internal constitution whereon these essences depend, is utterly unknown to us. This is evident when we come to examine but the stones we tread on, or the iron we daily handle; we soon find that we know not their make, and can give no reason of the different qualities we find in them; and yet how infinitely these come short of the fine contrivance, and unconceivable real essences of plants and animals, every one knows.

But though the nominal essences of substances are made by the mind, they are not yet made so arbitrarily as those of mixed modes. To the making of any nominal essence, it is necessary, 1. That the ideas whereof it consists, have such an union as to make but one idea, how compounded soever. 2. That the particular idea so united be exactly the same, neither more nor less: for if two abstract complex ideas differ, either in number or sorts of their component parts, they make two different, and not one and the same essence. In the first of these, the mind, in making its complex ideas of substances, only follows nature, and puts none together which are not supposed to have an union in nature; for men observing certain qualities always joined and existing together, therein copy nature, and of ideas so united make their complex ones of substances.

Though the nominal essences of substances are all supposed to be copied from nature, yet they are all, or most of them, very imperfect: and since the composition of these complex ideas is in several men very different, we may conclude that these boundaries of species are in men and not as nature makes them; if, at least, there are in nature any such prefixed bounds. If the first sorting of individuals depends upon the mind of man, variously collecting the simple ideas that make the nominal essence of the lowest species, it is much more evident that the more comprehensive classes called genera, do so in forming more general ideas that may comprehend different sorts: the mind leaves out those qualities that distinguish them, and puts into its new collection only such ideas as are common to several sorts: thus by leaving out those qualities that are peculiar to gold, silver, &c. and by retaining a complex idea made

up of those that are common to each species, there is a new genus constituted, to which the name metal is annexed.

**ESSENCE**, in chemistry, signifies the balsamic part of any thing, separated from the thicker matter; so that wherever this is done by means of extraction, the balsamic part is called essence by way of eminence: sometimes thickened juices are called essences, but it is better to call these by their own name, to avoid confusion.

**ESSENDO QUIETUM DE TOLLONIO**, in law, a writ which lies for citizens, burgesses, &c. who by charter or prescription ought to be free from toll, in case the same is exacted of them.

**ESSENES, or ESSENIANS**, in jewish antiquity, one of the three antient sects among that people, who outdid the Pharisees in their most rigorous observances. They allowed a future state, but denied a resurrection from the dead. Their way of life was very singular: they did not marry, but adopted the children of others, whom they bred up in the institutions of their sect: they despised riches, and had all things in common; and never changed their cloaths, till they were entirely worn out. When initiated, they were strictly bound not to communicate the mysteries of their sect to others; and if any of their members were found guilty of enormous crimes, they were expelled.

Pliny tells us, that they dwelt on the west side of the lake of Asphaltites; that they were a solitary kind of men, living without women or money, and feeding upon the fruit of the palm-tree: he adds, that they were constantly recruited by new comers, whom the surges of ill fortune had made weary of the world; in which manner the sect was kept up for several thousands of years, without any being born among them. The reason why we find no mention made of them in the New Testament, may be their reclusé and retired way of life, no less than their great simplicity and honesty, whereby they lay open to no censure or reproof.

**ESSENTIA, ESSENCE**. See the article **ESSENCE**.

**ESSENTIAL**, something necessarily belonging to the essence or nature of a thing, from which it cannot be conceived distinct: thus the primary qualities of bodies, as extension, figure, number, &c. are essential or inseparable from them in all their changes and alterations. See the article **QUALITY**.

**ESSENTIAL**

**ESSENTIAL OIL**, that procured from plants by distillation. See the article **OIL**.

**ESSENTIAL SALTS**, those obtained from vegetable juices by crystallization. See the article **SALT**.

**ESSEX**, a county of England, bounded by Suffolk, on the north; by the german sea, on the east; by the river Thames, which divides it from Kent, on the south; and by Middlesex and Hertfordshire, on the west.

**ESSLISORS**, or **ESLISORS**. See the article **ESLISORS**.

**ESSOIN**, in law, an excuse for a person summoned to appear and answer to an action, on account of sickness or other just cause of his absence.

It is a kind of imparlance or craving of longer time, and obtains in real, personal, and mixed actions.

There are divers essoins, as *de ultra mare*, when the defendant is beyond sea, whereby he is allowed forty days; in an expedition to the holy land, a year and a day; infirmity, called common esoin, when he is sick in bed; and, lastly, in the king's service.

**ESSOIN-DAY**, is regularly the first day of every term, though the fourth day after is also allowed by way of indulgence.

**ESSOIN DE MALO VILLÆ**, is where the defendant appears in court, but before pleading, falls sick in a certain village: this is also allowed, if found true.

**ESSOINS** and **PROFFERS**. See **PROFFER**.

**ESSORANT**, in heraldry, denotes a bird standing on the ground with its wings expanded, as if it had been wet, and were drying itself.

**ESTABLISHMENT of dower**, in law, an assurance of dower made to the wife by the husband, or some friend of his, on marriage. See the article **DOWER**.

**ESTAMPES**, a town of France, twenty-five miles south of Paris.

**ESTAPLES**, a port-town of Picardy, in France, twelve miles south of Boulogne.

**ESTATE**, in law, signifies the title or interest that a person has in lands, tenements, or other effects; comprehending the whole in which a person hath any property, and will pass the same.

Estates are either real or personal; otherwise distinguished into freeholds, which descend to heirs; or chattels, that go to executors or administrators. See the articles **FREEHOLD**, &c.

A fee simple is the amplest estate our law admits of. See the article **FREE**.

Estates are obtained several ways, as by

descent from a father to a son; by conveyance or grant, from one person to another; by gift or purchase; or by deed or will. See the articles **HEIR**, **CONVEYANCE**, **GRANT**, &c.

**ESTATES**, in a political sense, is used either to denote the dominions of some prince, or the general classes into which the people are divided.

In Britain, the estates are the king, lords, and commons; or rather the lords and commons, who meet the king in parliament, for reforming abuses, and enacting good and wholesome laws. See the articles **STATUTE**, **PARLIAMENT**, &c. In France, there are three estates, viz. the clergy, the nobility, and the people, who make the third estate.

**ESTATES GENERAL**, in the polity of Holland. See **STATES-GENERAL**.

**ESTE**, a town of Italy, fifteen miles south-west of Padua, and subject to Venice.

**ESTELLA**, a town of Navarre, in Spain, twenty miles south-west of Pampeluna.

**ESTENA**, a town of Spain, in the province of Granada, forty-five miles north of Malaga.

**ESTERLING**, or **STERLING**. See the article **STERLING**.

**ESTETE**, in heraldry, denotes the heads of beasts torn off by main force. See the articles **ARACHE** and **ERASED**.

**ESTHER**, a canonical book of the Old Testament, containing the history of a jewess virgin, dwelling with her uncle Mordecai at Shushan, in the reign of Ahasuerus, one of the kings of Persia.

The great beauty of this maid raised her to the throne of Persia, whereby she had an opportunity to save her countrymen, whose destruction was plotted by Haman, a favourite of that prince.

The learned are not agreed who this Ahasuerus was. Archbishop Usher supposes him to be Darius Hystaspes, and Artystona to be Esther. Scaliger makes him the same with Xerxes, and his queen Hamestris to be Esther. Josephus, on the contrary, positively asserts, that the Ahasuerus of the scriptures, is the Artaxerxes Longimanus of profane story; and the septuagint, throughout the whole book of Esther, translate Ahasuerus by Artaxerxes. Most people subscribe to this last opinion; and, indeed, the extraordinary kindness shewed by Artaxerxes to the Jews, can scarce be accounted for otherwise, than by supposing that they had so powerful an advocate as Esther to solicit for them.

**ESTIVAL**,

**ESTIVAL**, or **ÆSTIVAL**. See the article **ÆSTIVAL**.

**ESTOILE'E**, or **CROSS ESTOILE'E**, in heraldry, a star with only four long rays in form of a cross; and, accordingly, broad in the center, and terminating in sharp points.

**ESTONIA**, a province subject to Russia, on the north of Livonia.

**ESTOPPEL**, in law, an impediment or bar to an action, which arises from a person's own fact; or rather, where he is forbid by law to speak against his deed, which he may not do, even to plead the truth. Thus where a person is bound in a bond by such a name, and being afterwards sued by that name on the obligation, he shall not be allowed to say he is misnamed, but shall answer according to the bond, though it be wrong. Hence the parties in all deeds are estopped from saying any thing against them. However, a plaintiff is not estopped from saying any thing against what he had said in his writ or declaration; and though parties be estopped, yet juries are not so, who may find things out of the record.

**ESTOVERS**, in law, is most generally taken for certain allowances of wood made to tenants, as house-bote, hedge-bote, and plough-bote; which three are comprehended under reasonable estovers.

**ESTRANGEL**, **ESTRANGELUS** CHARACTER, in the syriac grammar, a particular species or form of syriac letters, serving as the majuscule letters of that language, and by several supposed to be the true antient chaldean character.

**ESTRAPADE**, in the manege, the defence of a horse that will not obey, who, to get rid of his rider, rises mightily before; and, while his forehead is yet in the air, yerks furiously with his hind legs, striking higher than his head was before; and during this counter-time, goes back rather than advances.

**ESTRAY**, in law, any beast not wild that is found within a lordship, and owned by nobody: in which case, being cried according to law in the two next market towns adjacent, and not claimed in a year and a day by the owner, it becomes the property of the lord of the manor, or liberty wherein it was found.

If the beast proclaimed stray to another lordship within the year, the first lord cannot retake it; and where the estray was never duly proclaimed, the owner may take it again, at any time, upon

paying the lord for keeping thereof: likewise the owner may seize an estray, without telling the marks or proving his property, which may be done at the trial, if contested: and here the tendering of amends is good, without shewing any particular sum.

**ESTREAT**, in law, a true copy, note, or duplicate of an original writing or record, especially fines, amercements, penalties, &c. set down and imposed in the rolls of a court, to be levied by the bailiff, or other officer.

Estreats relate generally to fines for crimes and offences, defaults and omissions of persons concerned in suits, and likewise of officers. Non-appearance of defendants and jurors, &c. and before process issues to levy forfeitures on recognizances to the king's use, the recognizances must be first estreated into the exchequer by sheriffs of counties. Fines, post fines, and forfeitures, are to be estreated twice a year on pain of 50*l*. and it is the course of the king's bench to send their estreats into the exchequer on the last days of the two issuable terms.

**ESTREMADURA**, a province of Spain, bounded by Leon, on the north; by the two Castiles, on the east; by Andalusia, on the south; and by the province of Alentejo, in Portugal, on the west.

**ESTREMADURA** is also a province of Portugal, lying north of Alentejo, and westward of spanish Estremadura. Lisbon is its capital, as also of the kingdom.

**ESTREMOS**, a town of Alentejo, in Portugal, eighty-five miles south-east of Lisbon.

**ESTREPEMENT**, in law, any spoil made by tenants for life on any lands, &c. to the prejudice of the reversioner: it is also taken to signify the making land barren, by continual plowing and sowing, and thereby drawing out the heart of the ground without manuring, or rather good husbandry, by which means it is impaired.

It may likewise be applied to the cutting down of trees, or lopping them farther than the law allows.

There is also a writ of estrepeement that lies in two cases, *viz.* the one is where a person having an action depending, as a freedman or writ of right, &c. sues to prohibit the tenant from making waste. The other is for the demandant, who is adjudged to recover seisin of the land, before execution, sued out by the writ habere

facias possessionem, in order to prevent waste being made before he gets into possession.

**ESULA**, in botany, a kind of spurge, comprehended under the euphorbia of Linnaeus.

It is one of the sharpest and most acrid spurges, and therefore hardly safe: it purges violently, both by vomit and stool. Some recommend it in dropfies, but it should be used with great caution; and it is a good method to macerate it a day or two in vinegar, before it is used.

**ESURINE SALTS**, such as are of a corroding, fretting, and eating nature; abounding chiefly in places near the sea-side, and where great quantities of coals are burnt, as appears from the speedy rusting of iron bars in the windows of houses built in such places.

**ESWEGEN**, or **ESCHWEGE**, a town of Germany, twenty-five miles south-east of the city of Cassel.

**ETAPPE**, a term used, in the french armies, for the provisions and forrage allowed an army in their rout through a kingdom, whether going into winter-quarters, or returning to take the field. Hence, *etapier* is the undertaker or person who contracts with the country or territory, for furnishing the said provisions.

**ETCHING**, a method of engraving on copper, in which the lines or strokes, instead of being cut with a tool or graver, are eaten in with aquafortis.

Etching is done with more ease and expedition than engraving: it requires fewer instruments, and represents most kind of subjects better and more agreeable to nature, as landscapes, ruins, grounds, and all small, faint, loose, remote objects, buildings, &c. See **ENGRAVING**.

The method of etching is as follows: choose the copper-plate as directed for engraving, and furnish yourself with a piece of ground, tied up in a bit of thin silk, kept very clean, to be laid upon the plate when both have been warmed; proper needles to hatch with on the ground; a pencil or brush, to wipe away the bits of ground which rise after hatching; a polisher; two or three gravers; a pair of compasses, to measure distances and draw circles; a ruler, to hatch straight lines; green wax, to make the wall round the edges of the plate, to contain the aquafortis; an oil-stone; a bottle of aquafortis; some red lead, to colour the back-side of the copy; a stiff, and a hand-vice,

to hold the plate over the candle. See the articles **NEEDLE**, **GRAVER**, **POLISHER**, **COMPASS**, &c.

To make the ground, take three ounces of asphaltum, two ounces of clean rosin, half an ounce of burgundy-pitch, three ounces of black wax, and three ounces of virgin's wax; let all these be melted in a clean earthen pipkin over a slow fire, stirring it all the time with a small stick; if it burn to the bottom, it is spoiled. After the ingredients are well melted, and it boils up, put it into a pan of fair water; and before it be quite cold, take it out, and roll it into small lumps to be kept from dust: this ground is what others call the varnish. The next thing is to clean the plate to receive the ground: take a piece of lisking, roll it up as big as an egg, tie it very tight, so as to make it a rubber, and having dropped a small quantity of sweet oil, and added a little powder of rotten-stone on the plate, rub it with this ball, till it will almost shew your face. Then wipe it all off with a clean rag, and after that, make it quite dry with another clean rag, and a little fine whiting.

The next thing is to lay on the varnish; to do which aright you must take a hand-vice, and fix it at the middle of one part of the plate, with a piece of paper between the teeth of the hand-vice and the plate, to prevent the marks of the teeth: then laying the plate on a chaffing-dish, with a small charcoal fire in it, till the plate be so hot, that, by spitting on the backside, the wet will fly off: rub the plate with the ground tied up in silk, till it be covered all over; and after that dab the plate with a piece of cotton wrapped up in silk till the ground be quite smooth, keeping the plate a little warm all the time. The varnish being thus smoothed upon the plate, it must be blacked in the following manner: Take a thick tallow candle that burns clear, with a short snuff, and having driven two nails into the wall, to let it rest upon, place the plate against the wall with the varnish side downward, and take care not to touch the ground with your fingers: then taking the candle, apply the flame to the varnish as close as possible, without touching the varnish with the snuff of the candle, and guide the flame all over it, till it become perfectly black. After this is done, and the plate dry, the design is traced with a needle through the varnish, and a rim or border

border of wax is raised round the circumference of the plate; and then the artist has a composition of common varnish and lamp-black, made very thin, wherewith he covers the parts that are not to be bitten, by means of a hair pencil. And he is every now and then covering or uncovering this or that part of the design, as occasion may require; the conduct of the aquafortis being the principal concern, on which the effect of the print very much depends. The operator must be attentive to the ground, that it does not fail in any part, and where it does, to stop up the place with the above composition. The plate is defended from the aquafortis every where, but in the lines or hatches cut through it with the needle, through which the water eats into the copper to the depth required; remembering to keep it stirring with a feather all the while, which done, it is to be poured off again.

Single aquafortis is most commonly used; and if it be too strong, mix it with vinegar, otherwise it will make the work very hard, and sometimes break up the ground: the aquafortis having done its part, the ground is taken off, and the plate washed and dried: after which nothing remains for the artist but to examine the work with his graver, to touch it up, and heighten it where the aquafortis has missed.

And, lastly, it is to be remembered, that a fresh dip of aquafortis is never given, without first washing out the plate in fair water, and drying it at the fire.

**ETERNITY**, an attribute of God, expressing his infinite or endless duration. See the article **GOD**.

According to Mr. Locke, we come by the idea of eternity, by being able to repeat any part of time, as a year, as often as we will, without ever coming to an end.

**ETHELING**, or **ATHELING**. See the article **ATHELING**.

**ETHER** and **ÆTHERIAL**. See the articles **ÆTHER** and **ÆTHERIAL**.

**ETHICS**, or **MORALITY**, the science of manners or duty, which it traces from man's nature and condition, and shews to terminate in his happiness; or, in other words, it is the knowledge of our duty and felicity; or the art of being virtuous and happy.

Moral philosophy inquires, not how man might have been, but how he is constituted; not into what principles or dispositions his actions may be artfully resolved,

but from what principles and dispositions they actually flow; not what he may, by education, habit, or foreign influence, come to be or do, but what by his nature, or original frame, he is framed to be and do. From a view, therefore, of man's faculties, appetites and passions, it appears, that the health and perfection of man must be in the supremacy of conscience and reason, and in the subordination of the passions and affections to their authority and direction; and virtue or goodness must consist in acting agreeably to this order and reason.

See the articles **APPETITE**, **CONSCIENCE**, **REASON**, **HAPPINESS**, &c.

It is true, some eminent philosophers have attempted to lay the foundation of morals much deeper, and on a more large and firm bottom, *viz.* the natures and reasons, the truth and fitnesses of things. Senses and affections, they tell us, are vague and precarious; and though they were not, yet irrational principles of action, and consequently very improper foundations, on which to rest the eternal and immutable obligations of morality. Hence they talk much of the abstract natures and reasons of things, of eternal differences, unalterable relations, fitnesses and unfitnesses resulting from those relations; and from these eternal reasons, differences, relations, and their consequent fitnesses, they suppose moral obligation to arise. A conduct agreeable to them, or, in other words, to truth, they call virtue; and the reverse, vice. See the articles **VIRTUE** and **VICE**.

But the truth is, that we might perceive all the possible relations, differences, and reasons of things, and yet be wholly indifferent to this or that conduct, unless we were endued with some sense or affection, by which we approved and loved the one, and disapproved and disliked the other conduct. Reason may perceive a fitness to a certain end, but without some sense or affection we cannot propose, or indeed have any idea of an end; and, without an end, we cannot conceive any inducement to action. Therefore, before we can understand the natures, reasons, and fitnesses of things, which are said to be the foundation of morals, we must know what natures are meant, to what ends they are fitted, and from what principles or affections they are prompted to act; otherwise we cannot judge of the duty required, or of the conduct becoming that being whom we suppose under

moral obligation. But let the natures be once given, and the relations which subsist among them be ascertained, we can then determine what conduct will be obligatory to such natures, and adapted to their condition and œconomy. And to the same natures, placed in the same relations, the same conduct will be eternally and invariably proper and obligatory.

Besides, to call morality a conformity to truth, gives no idea, no characteristic of it, but what seems equally applicable to vice. For whatever propositions are predicable of virtue, as, that it flows from good affections, or is agreeable to the order of our nature, tends to produce happiness, is beheld with approbation, and the like; the contrary propositions are equally true, and may be equally predicated of vice.

Another set of philosophers establish morals upon the will or positive appointment of the Deity, and call virtue a conformity to that will, or appointment. All obligation, they say, supposes one who obliges, or who has a right to prescribe, and can reward the obedient, and punish the disobedient. This can be none but the Creator. His will, therefore, is our law, which we are bound to obey. And this, they tell us, is only sufficient to bind or oblige such imperfect and corrupt creatures as we are, who are but feebly moved with a sense of the beauty and excellency of virtue, and strongly swayed by passion, or views of interest.

This scheme of morality entirely coincides with that deduced from our inward structure and condition, since these are the effects of the divine will. Whatever therefore is agreeable, or correspondent to our inward structure, must likewise be agreeable, or correspond to the will of God. So that all the indications, or sanctions of our duty, which are declared or enforced by our structure, are, and may be, considered as indications or sanctions of the will of our Creator. If these indications, thro' inattention to, or abuse of our structure, prove insufficient to declare; or if these sanctions, thro' the weakness or wickedness of men, prove insufficient to enforce obedience to the divine will, and the Deity is pleased to add new indications, or new sanctions; these additional indications and sanctions cannot, and are not supposed, by the assertors of this scheme, to add any new

duty, or new moral obligation; but only a new and purer promulgation of our duty, or a new and stronger sanction or motive from interest, to perform that duty, and to fulfil that obligation to which we were bound before. It makes no difference, as to the matter of obligation, after what manner the will of our Creator is enforced, or declared to us, whether by word or writ, or by certain inward notices and determinations of our own minds, arising according to a necessary law of our nature. Again, if the scheme of duty, as deduced from moral perceptions, and the affections of our nature, be thought too slight a foundation on which to rest morality, because these are found insufficient to bind, or rather to compel men to their duty, we fear the same objection will militate against the scheme of conformity to the divine will, since all the declarations and sanctions thereof have not hitherto had their due effect, in producing a thorough and universal reformation.

When some speak of the will of God, as the rule of duty, they do not certainly mean a blind, arbitrary principle of action, but such a principle as is directed by reason, and governed by wisdom, or a regard to certain ends in preference to others: for unless we suppose some principle in the Deity analogous to our sense of obligation, some antecedent affection, or determination of his nature, to prefer some ends before others, we cannot assign any sufficient reason why he should will one thing more than another, or have any election at all. Whatever therefore is the ground of his choice, or will, must be the ground of obligation, and not the choice or will itself. That this is the case, appears farther from the common distinction which divines and philosophers make between moral and positive commands and duties. The former they think obligatory antecedent to will, or at least to any declaration of it; the latter, obligatory only in consequence of a positive appointment of the divine will. But what foundation can there be for this distinction, if all duty and obligation be equally the result of mere will?

Before we conclude this article, it will be proper to say something of the extraordinary hypothesis of Hobbes, concerning the foundation of morality. This philosopher, who saw his country involved

volved in all the distraction and misery of a civil war, seems to have taken too narrow and partial a view of our nature, and has therefore drawn it in a very odious and uncomfortable light. Next to the desire of self-preservation, he makes the love of glory and of power to be the governing passions in man; and from these, by an arbitrary, unnatural, and unsupported hypothesis, contrary to common experience, and common language, he attempts to deduce all the other passions which inflame the minds, and influence the manners of men. According to him, all men are equal, all desire and have a right to the same things, and want to excel each other in power and honour; but as it is impossible for all to possess the same things, or to obtain a preeminence in power and honour, hence must arise a state of war and mutual carnage; which is what he calls a state of nature. But this shrewd philosopher subjoins, that men being aware that such a state must terminate in their own destruction, agreed to surrender their private unlimited right into the hands of the majority, or such as the majority should appoint, and to subject themselves for the future to common laws, or to common judges or magistrates. In consequence of this surrender, and of this mutual compact or agreement, they are secured against mutual hostilities, and bound or obliged to a peaceable behaviour; so that it is no longer lawful or just (he certainly means safe or prudent) to invade and encroach on one another, since this would be a violation of his promise. But one may ask him, what obligation is a man under to keep his promise, or stand to his compact, if there be no obligation, no moral tie distinct from that promise? On the whole, his state of nature is a mere chimera, and the superstructure he has raised on it no less so.

**ETHIOPIA**, or **ÆTHIOPIA**, a very extensive country of Africa, comprehending Abyssinia, Nubia, and Abex: it is bounded by Egypt, and the desert of Barca on the north, by the Red sea, and Indian Ocean on the east, by Anian, and the unknown parts of Africa on the south, and by other unknown countries on the west. See **ABEX** and **NUBIA**.

**ETHIOPIC YEAR**. See the article **YEAR**.

**ETHMOIDAL**, in anatomy, one of the common sutures of the skull, which goes round the os ethmoides, from which it

derives its name, separating it from the bone in contact with it. See the articles **SUTURE** and **ETHMOIDES**.

**ETHMOIDES OS**, in anatomy, the same with cribriform os, or cubiforme. See the article **CRIBROSUM**.

**ETHNARCH**, **ETHNARCHA**. See the article **ÆCHMALOTARCHA**.

**ETHNOPHRONES**, in church history, heretics of the seventh century, who, professing christianity, joined thereto all the ceremonies and follies of paganism, such as judicial astrology, divinations of all kinds, &c. and who observed all the feasts, times, and seasons of the Gentiles.

**ETHOPOEIA**, or **ETHOLOGY**, in rhetoric, a draught, or description, expressing the manners, passions, genius, tempers, aims, &c. of any person. Such is that noted picture of Cataline, as drawn by Sallust: *fuit magna vi & animi*, &c. "he was a man of great vigour both of body and mind; but of a disposition extremely profligate and depraved. From his youth he took pleasure in civil wars, massacres, depredations, and intestine broils; and in these he employed his younger days. His body was formed for enduring cold, hunger, and want of rest, to a degree indeed incredible: his spirit was daring, subtle, and changeable: he was expert in all the arts of simulation and dissimulation, covetous of what belonged to others, lavish of his own, violent in his passions: he had eloquence enough, but a small share of wisdom: his boundless soul was constantly engaged in extravagant and romantic projects, too high to be attempted."

**ETHUSA**, **FOOL'S PARSLEY**, in botany, a genus of the *pentandria-digynia* class of plants, the general corolla of which is commonly uniform; the partial one consists of five inflexo-cordated, unequal petals: the fruit is naked, of a roundish oval figure, and separable in two parts: the seeds are two, roundish, striated, and thence a third part plane.

**ETNA**, or mount **GIBELLO**, a volcano, or burning mountain of Sicily, situated fifty miles south-west of Messina, and twenty west of Catania. See **VULCANO**.

**ETRUSCA TERRA**, **TUSCAN EARTH**, a species of bole. See the article **BOLE**.

**ETYMOLOGY**, that part of grammar which considers and explains the origin and derivation of words, in order to arrive

arrive at their first and primary signification, whence Quintilian calls it *originatio*.

A judicious enquiry into etymologies, is thought by some of considerable use; because nations, who value themselves upon their antiquity, have always looked on the antiquity of their language as one of the best titles they could plead; and the etymologist, by seeking the true and original reason of the notions and ideas affixed to each word and expression, may often furnish an argument of antiquity, from the traces remaining thereof, compared with the antient uses. Then that etymologies are necessary for the thorough understanding of a language.

'Tis objected, however, that the art is arbitrary, and built altogether on conjectures and appearances; and the etymologists are charged with deriving their words from where they please; and indeed it is no easy matter to go back into the antient british and gaulish ages, and to follow, as it were, by the track, the various imperceptible alterations a language has undergone from age to age; and as those alterations have sometimes been merely owing to caprice, 'tis easy to take a mere imagination or conjecture for a regular analogy: so that it is no wonder the public should be prejudiced against a science, which seems to stand on so precarious a footing. It must certainly be owned, that etymologies are frequently so far fetched, that one can scarce see any resemblance or correspondence therein. Quintilian has shewn, that the antient etymologists, notwithstanding all their learning, fell into very ridiculous derivations.

The etymologies of our english words has been derived from the Saxon, Welch, Walloon, Danish, Latin, Greek, &c. See the article ENGLISH.

**EU**, a port town of Normandy, in France, fifteen miles north-east of Dieppe.

**EVACUANTS**, in pharmacy, are properly such medicines as diminish the animal fluids, by throwing out some morbid or redundant humour, or such as thin, attenuate, and promote the motion and circulation thereof. See the article ATTENUANTS, &c.

Evacuating medicines are prejudicial in intermitting fevers; are prejudicial as they weaken, exhaust the most fluid juices, and disturb the concoctions and

digestions which are here more especially necessary.

**EVACUATION**, in medicine, the art of diminishing, emptying, or attenuating the humours of the body.

Evacuations are, by Dr. Pringle, much recommended in the bilious fever and dysentery: but this sort of medicine is to be sparingly used in malignant fevers: in wounds of the head the best evacuations are plentiful bleeding and purging of the bowels; both which are to be made at one and the same time, as plentifully as the patient's strength will permit; and to be repeated again as often as necessary, if you find the symptoms relieved after their administration.

Evacuations are bad in nausea, from a disturbance of the spirits; but are of great use in curing the delirium in fevers: the provoking the menses in women, is to be attempted by such remedies as mollify and relax, and not by those called emmenagoges, most of which increase the impetus of the circulation, except in women of a cold and lax habit: blood-letting likewise supplies the deficiency of the piles, or menstrual discharge in men, by making this artificial evacuation of blood in a part the most remote from the head. But all these evacuations are only of use where the vessels are distended with too great a quantity of blood, or when the force of the circulation is too great. In intermitting fevers evacuations are very imprudent. In inflammatory disorders, where the chief intention should also be to diminish the force of the blood, to thin it, and to relax the fibres, evacuations, such as bleeding, purging, vomiting, attenuants, and diaphoretics, are the chief remedies.

**EVANGELIST**, a general name given to those who write, or preach the gospel of Jesus Christ.

The word is of greek origin, signifying one who publishes glad tidings, or is the messenger of good news.

According to Hooker, evangelists were presbyters of principal sufficiency, whom the apostle sent abroad, and used as agents in ecclesiastical affairs, wherever they saw need.

The term evangelist, however, is at present confined to the writers of the four gospels. See the article GOSPEL.

**EVANID**, a name given by some authors to such colours as are of no long duration,

ration, as those in the rainbow, in clouds before and after sun-set, &c.

Evanid colours are also called fantastical and emphatical colours.

**EVANTES**, in antiquity, the priestesses of Bacchus, thus called, by reason, that in celebrating the orgia, they ran about as if distracted, crying, *evan, evan, clé evan*. See **BACCHANALIA**.

**EVAPORATION**, in chemistry, the setting a liquor in a gentle heat to discharge its superfluous humidity, reduce it to a proper consistence, or obtain its dry remainder.

Evaporation may be accounted for from hence, that when the particles are so far separated by heat, as to be without each others attraction, they then begin to repel each other, and thus will seem to rise from the surface of the fluid in the form of a vapour, or body of particles, which are at equal distances from each other; and becoming thus specifically lighter than the same bulk of airy particles, they will rise in the fluid body of the air, where they form clouds, meteors, &c. See **CLOUD**, **METEOR**, &c.

**EVASION**, among lawyers, denotes a cunning or subtle endeavouring to set aside, or escape the punishment of the law; as where one says to another, that he will not strike him, but he will give him a shilling to strike first: in such a case, if the person who gives the first stroke be killed, it is murder, for no person shall evade the justice of the law, by any such pretence to screen his malice.

**EVATES**, a branch or division of the druids, or antient celtic philosophers. Strabo divides the british and gaulish philosophers into three sects, bards, *βαρδαι*, evates, *ουαται*, and druids, *δρυιδαι*. He adds, that the bards were the poets and musicians; the evates the priests and naturalists; and the druids were moralists as well as naturalists: but Marcellus and Hornius reduce them all to two sects, *viz.* the bards and druids.

**EUBAGES**, an order of priests, or philosophers, among the antient Celtæ, or Gauls: some will have the eubages to be the same with the druids, and saronidæ of Diodorus; and others, that they were the same with what Strabo calls evates.

**EUCCHARIST**, *ευχαριςτια*, the sacrament of the Lord's supper, properly signifies giving of thanks.

This sacrament was instituted by Christ himself, and the participation of it called communion. See **COMMUNION**.

As to the manner of celebrating the eucharist, among the antient Christians, after the customary oblations were made, the deacon brought water to the bishop and presbyters, standing round the table, to wash their hands, according to that of the psalmist, "I will wash my hands" in innocency, and so will I compass "thy altar, O Lord." Then the deacon cried out aloud, "Mutually embrace" and kiss each other;" which being done, the whole congregation prayed for the universal peace and welfare of the church, for the tranquility and repose of the world, for the prosperity of the age, for wholesome weather, and for all ranks and degrees of men. After this followed mutual salutations of the minister and people; and then the bishop, or presbyter, having sanctified the elements, by a solemn benediction, he brake the bread, and delivered it to the deacon, who distributed it to the communicants; and after that the cup. Their sacramental wine was usually diluted, or mixed with water. During the time of administration, they sang hymns and psalms, and having concluded with prayer and thanksgiving, the people saluted each other with a kiss of peace, and so the assembly broke up.

**EUCHITES**, in church-history, heretics, otherwise called Messalians. See the article **MESSALIANS**.

**EUCHOLOGIUM**, *ευχολογιον*, in the greek church, the ritual, or book of common-prayer of that church. See **RITUAL**.

**EUDISTS**, a congregation of missionary priests, in France, associated under the name and title of Jesus and Mary. It is governed by a superior, who receives his power from the bishops of each diocese, where they have an establishment.

**EUDOXIANS**, in church-history, a branch of Arians. See **ARIANS**.

**EVE**, the same with vigil. See **VIGIL**.

**EVECTION** of the moon, the same with libration. See the article **LIBRATION**.

**EVEN NUMBER**, in arithmetic, that which can be divided into two equal parts: such are 4, 10, 40, &c.

A number is said to be evenly even, when being even itself, it is measured by an even one, an even number of times: such is 32, as being measured by the even number 8, an even number of times 4. Evenly odd number is, that which an even number doth measure by an odd one: such is 30, which 2 or 6, both even numbers, do measure by 15 or 5, odd ones.

**EVERARD'S SLIDING-RULE.** See the article **SLIDING-RULE**.

**EVERDING**, a town of Austria, in Germany, situated on the Danube, twelve miles west of Lints.

**EVER-GREEN**, in gardening, a species of perennials, which continue their verdure, leaves, &c. all the year : such are hollies, phillyria's; laurustinus's, bays, pines, firs; cedars of Lebanon, &c.

**EVERLASTING-FLOWER**, in botany, a name given to the amaranthoides.

**EVERLASTING-PEA**, a genus of plants, otherwise called lathyrus.

**EVESDROPPERS**, in law persons who stand under the eves, walls, or windows of a house, by day or by night, to listen after news, and carry it to others, thereby raising strife and contention in the neighbourhood. They are punishable in the court-leet, or quarter-sessions.

**EVESHAM**, a borough-town thirteen miles south-east of Worcester, which sends two members to parliament.

**EUGENIA**, the **SILVER-TREE**, in botany, a genus of the *icosandra-monogynia* class of plants, the corolla whereof consists of four oblong, obtuse, concave petals, twice as large as the cup : the fruit is a quadrangular, coronated drupe, containing only one cell : the seed is a roundish, smooth nut.

**EUGUBIO**, a town and bishop's see of Italy, in the duchy of Urbino, and thirty-five miles south of that city.

**EVIAN**, a town of Savoy, situated twenty-five miles north-east of Geneva, on the south side of the lake of Geneva.

**EVICITION**, in law, signifies a recovery of lands, or tenements by law.

When lands, &c. are evicted before rent reserved upon a lease becomes due, the lessee is not liable to pay any rent. Likewise, if on an exchange of lands, either of the parties is evicted of the land given in exchange, the party evicted may, in that case, re-enter his own lands. And a widow being evicted of her thirds, shall be endowed in the other lands of the heir.

**EVIDENCE**, according to the Epicureans, is nothing else than that kind of certitude obtained by the senses, which, in the opinion of these philosophers, are the primary criterion of truth.

By evidence of sense the epicureans mean that species, or image, exhibited by the sense, or phantasy, which, when all impediments to a just judging, as distance, motion, medium, &c. are removed, can-

not be contradicted, or gain said : wherefore the question being put, whether or no a thing be just as it appears ; the answer is not given till it have been tried and examined all the ways, and by all the senses that it can be an object of. Some distinguish evidence into objective and formal.

Objective evidence, they say, consists in the clearness or perspicuity of the object ; or the object itself so constituted as that it may be clearly and distinctly known. An object may be clearly known, either immediately from the bare explication of the terms of a proposition ; or mediate, that is, we may arrive at a clear and distinct knowledge of it, by means of some medium ; thus space, according to the Epicureans, becomes evident by reason of motion, because there can be no motion where there is no space.

Formal evidence is the act of the intellect considered as clear and distinct ; and this is also immediate, or such as consists or depends upon the primary principles ; or it is mediate, and requires some medium whose attribute agrees with the subject of the proposition. The former consists in a certain natural light of the intellect, which is acquired without any study or pains : the latter is found nowhere but in the conclusion of demonstration, and is therefore termed mediate evidence. See the article **DEMONSTRATION**.

Others divide evidence into moral, physical, and metaphysical ; that is, by how many means the truth appears, by so many is the evidence said to arise : thus, a thing is said to be morally evident, so far as I have a distinct knowledge or notion thereof by unexceptionable witnesses. See the article **CERTITUDE**. Physically, so far as natural sense and reason, pointing out any thing, convinces me thereof. Metaphysically, when I enter so fully and clearly into the essence of any thing that nothing can be clearer.

But whatever may be the sentiments of these philosophers concerning evidence, says Chauvinus, this should at least be granted, that the evidence of human knowledge, of what kind soever it be, is not absolute, but comparative : that is, that there is no act in human knowledge quite void of all confusion.

The primary sign of evident knowledge requires that the object known should strike the intellect violently, in like man-

ner as a vehement light beats upon the eye: the second sign requires that the mind should acquiesce, with great calmness and tranquility, in distinct notions, as it were abiding securely in the midst of the light. The third sign of evidence is sought from subsequent judgments, and transferred to our notions or ideas: for clear and distinct notions will lay the understanding under the necessity of judging, and certain and undoubted judgments follow distinct and clear ideas. The fourth and last sign of evidence is when the common and universal consent of mankind universally agree upon one particular point, it follows that the idea obtained concerning that thing is a clear and distinct one.

Evidence must therefore be allowed the mark of truth; and these things must be allowed true, which carry with them such a degree of evidence as obliges us to assent to them. Whatever we see evidently agreeable to things whereof we speak, that we must acknowledge to be true.

**EVIDENCE**, in law, any proof, whether it be by testimony of men on oath, or by writings and records so called, because hereby the point in issue is made evident to the jury.

As to evidence, the common law requires no certain number of witnesses, though in some cases the statute-law does. The testimony of one single evidence is sufficient for the crown in all causes, except treason, where there must be two: sometimes violent presumption will be admitted as evidence, without witnesses, as where a person is run thro' the body in a house, and one is seen to come out of that house with a bloody sword. In general, a party interested in a suit, a wife for or against her husband, unless in cases of treason, an alien infidel, persons *non sane memoria*, such as are convicted of felony, perjury, &c. may not be evidence in the cause: but kinsmen, though never so near, also tenants, servants, masters, attorneys for their clients, one of the jurors upon trial, and all others that are not infamous, and who want not understanding, or are no parties in interest, may be allowed to give evidence; tho' the credit of servants is left to the jury.

In cases of crimes, as of robbery on the highway, in an action against the hundred, and rapes of women, &c. a man or woman may be an evidence in their

own cause; so likewise in private notorious cheats, where none else can be witness of the circumstances of the fact, but he that suffers. When any person is served with a process, and refuses to appear to give evidence in a criminal cause, the court may put off the trial, and grant an attachment against him; whereupon he shall be committed to prison and fined; and in a civil cause an evidence refusing to appear on being tendered his reasonable charges, and he having no lawful excuse, action of the case lies against him, and thereupon 10 l. damages shall be recovered, and other recompence to the party.

Evidence by writings and records is where acts of parliaments, statutes, judgments, fines and recoveries, proceedings of court, and deeds, &c. are admitted as evidence. And here it is to be observed, that the printed statute-book is good evidence upon a general act of parliament, which need not be pleaded; but in the case of a private act, it is otherwise: for there it must be pleaded and examined by the records of parliament, before it can be admitted in evidence. Records and enrolments prove themselves, and a copy of a record sworn to may be given as an evidence. A record of an inferior court has been rejected in evidence, and the proceedings in county-courts, courts-baron, &c. may be denied, and then tried by a jury. A copy of copyhold-lands shall be an evidence where the rolls are lost. An antient deed proves itself: the counterpart of a deed is no evidence, when the original is in being, and can be procured.

Although a witness swear to the hand and contents of a letter, if he never saw the party write, it will not be good evidence. And a shop-book may not be given in evidence for goods sold, &c. after one year, before the action brought, except there be a bill, &c. for the debt: but this does not extend to any buying or selling, or trading between one tradesman and another: here to make books evidences, there must be the hand of the person to whom who delivered the goods, which is to be proved. In debt, a release may be given in evidence, so may any matters of fact, tampering with witnesses, or fraud.

**EVIL**, *malum*, in philosophy, &c. is either moral or natural.

Moral evil is the disagreement between the actions of a moral agent, and the

rule of those actions, whatever it be. See the articles **ETHICS** and **GOOD**. Moral good and evil coincide with right and wrong, since that cannot be good which is wrong, nor that evil which is right. See **RIGHT** and **WRONG**.

Some make the essence of moral evil consist in the disagreement of our manners to the divine will, whether known by reason or revelation; others, in being contrary to reason and truth; and others, in being inconsistent with the nature, faculties, affections, and situation of mankind. See the article **ETHICS**.

Be this as it will, no act can be deemed morally evil, unless the agent be capable of distinguishing, choosing, and acting for himself; or, more briefly, is an intelligent and free agent. See the articles **AGENT** and **ACTION**.

**Natural EVIL**, whatever destroys, or any way disturbs the perfection of natural beings: such are blindness, diseases, death, &c. See the articles **BLINDNESS**, **DISEASE**, **DEATH**, &c.

**King's EVIL**, in medicine, the same with the scrophula. See **SCROPHULA**.

**Hungry EVIL**. See **BULIMY**.

**EULOGY**, in church history, a name by which the Greeks call the *panis benedictus*, or bread over which a blessing is pronounced, and which is distributed to those who are unqualified to communicate. The name Eulogiæ was antiently given to the consecrated pieces of bread, which the bishops and priests sent to each other, for the keeping up a friendly correspondence: those presents likewise which were made out of respect or obligation, were called eulogiæ.

St. Paulinus, bishop of Nola, about the end of the sixth century, having sent five eulogiæ, at one time, to Romanian, says, "I send you five pieces of bread, the ammunition of the warfare of Jesus Christ, under whose standard we fight."

**EUMENIDES**, furies, in antiquity. See the article **FURIES**.

**EUNOMIANS**, in church history, christian heretics, in the fourth century. They were a branch of Arians, and took their name from Eunomius, bishop of Cyzicus, who was instructed by Aëtius, in the points which were then controverted in the church, after having at first followed the profession of arians. Eunomius so well answered the designs of his master, and declaimed so vehemently against the divinity of the word, that

the people had recourse to the authority of the prince, and had him banished; but the Arians obtained his recall, and elected him bishop of Cyzicus. The manners and doctrines of the Eunomians were the same with those of the Arians.

**EUNUCH**, *εὐνοχ*, a castrated person. See the article **CASTRATION**.

In Britain, France, &c. Eunuchs are never made, but upon occasion of some disease, which renders such an operation necessary: but in Italy, they make great numbers of children, from one to three years of age, eunuchs, every year, to supply the opera's and theatres of all Europe with singers: though it is not one in three, that, after having lost their virility, has a good voice for a recompence. In the eastern parts of the world, they make eunuchs in order to be guards or attendants on their women. The seraglio of the eastern emperors are chiefly served and guarded by eunuchs; and yet, from good authority, we learn, that the rich eunuchs in Persia and other countries keep seraglio's for their own use. Those who, out of an imprudent zeal to guard themselves from sensual pleasures, made themselves eunuchs, were, by the council of Nice, condemned and excluded from holy orders. There are several severe prohibitions in Germany against the making of eunuchs; and in France an eunuch must not marry, not even with the consent of the woman.

**EUNUCHS**, in church history, a sect of heretics, in the third century, who were mad enough to castrate, not only those of their own persuasion, but even all others that they could lay hold of: they took their rise from the example of Origen, who, misunderstanding the following words of our Saviour, --- "And eunuchs who made themselves eunuchs for the kingdom of heaven," castrated himself.

**EVOCATION**, *EVOCATIO*, in roman antiquity, a solemn invitation preferred by way of prayer, to the gods and goddesses of a besieged town, to forsake it and come over to the Romans; who always took it for granted that their prayers were heard, provided they could make themselves masters of the place.

**EVOLUTE**, *EVOLUTA*, in the higher geometry, a curve, which, by being gradually opened, describes another curve. Such is the curve BCF; (plate

XCIV. fig. 4.) for if a thread FCM be wrapped about, or applied to, the said curve, and then unwound again, the point M thereof will describe another curve A M M, called by Mr. Huygens, a curve described from evolution. The part of the thread, MC, is called the radius of the evolute, or of the osculatory circle described on the center C with the radius M C.

Hence, 1. when the point B falls in A, the radius of the evolute MC is equal to the arch BC; but if not, to AB and the arch BC. 2. The radius of the evolute CM is perpendicular to the curve AM.

3. Because the radius MC of the evolute continually touches it, it is evident from its generation, that it may be described through innumerable points, if the tangents in the parts of the evolute are produced until they become equal to their corresponding arches. 4. The evolute of the common parabola is a parabola of the second kind, whose parameter is  $\frac{27}{16}$ , of the common one. 5.

The evolute of a cycloid is another cycloid equal and similar to it. 6. All the arches of evolute curves are rectifiable, if the radii of the evolute can be expressed geometrically. Those who desire a more particular account of these curves, may consult Huygens's *Horologium Oscillatorium*, Sir Isaac Newton's and Mac-Laurin's *Fluxions*, and Wolfius.

**EVOLUTION**, in algebra, the extraction of roots. See the article **EXTRACTION**.

**EVOLUTION**, in the art of war, the motion made by a body of troops, when they are obliged to change their form and disposition, in order to preserve a post, or occupy another, to attack an enemy with more advantage, or to be in a condition of defending themselves the better.

It consists in doublings, counter-marches, conversions, &c. A battalion doubles the ranks, when attacked in front or rear, to prevent its being flanked, or surrounded; for then a battalion fights with a larger front. The files are doubled either to accommodate themselves to the necessity of a narrow ground, or to resist an enemy which attacks them in flank; but if the ground will allow it, conversion is much preferable, because after conversion the battalion is in its first form, and opposes the file-leaders, which are generally the best men to the enemy; and likewise, because doubling

the files in a new, or not well disciplined regiment, they may happen to fall into disorder. See **DOUBLING**.

**EUONYMOIDES**, in botany, a name used by some for the *celastrus*. See the article **CELASTRUS**.

**ENONYMUS**, the **SPINDLE-TREE**, in botany, a genus of the *tetrandria monogynia* class of plants, the corolla whereof consists of four ovated, plane, and patent petals, longer than the cup: the fruit is a succulent, coloured capsule, of a quadragonal figure, formed of four valves, terminating in four points, and forming four cells: the seeds are single, of an oval figure, and covered with a calyptra. See plate XCIV. fig. 5.

The fruit of this plant provokes vomiting, is a stomachic, and purges by stool: however, it is dangerous, and should be taken cautiously.

**EVORA**, or **EBORA**, a city of Portugal, seventy miles south-east of Lisbon. It is an archbishopric and university, and is situated in one of the pleasantest and most fruitful countries of that kingdom. See the article **PORTUGAL**.

**EUPATORIOPHALACRON**, in botany, the same with the *verbescina*. See the article **VERBESINA**.

**EUPATORIUM**, **HEMP-AGRIMONY**, in botany, a genus of the *syngenesia-polygamia equalis* class of plants, the compound corolla of which is uniform and tubulose; the hermaphrodite flowers are equal; the partial flower is infundibuliform: the fruit is naked, only covered by the cup: the seeds are oblong, and crowned with a plumose down.

This plant is hepatic and vulnerary; but the principal use of it is in cachexies, catarrhs, and in suppressions of urine and the menses: the root purges just in manner of the white hellebore.

**EUPHEMIA**, a port-town of the further Calabria, in Naples, fifty miles north-east of Reggio.

**EUPHEMISM**, *εὐφημισμός*, in rhetoric, a figure which expresses things in themselves disagreeable and shocking, in terms implying the contrary quality: thus, the Pontus, or black Sea, having the epithet *αἰετός*, i. e. inhospitable, given it, by reason of the savage cruelty of those who inhabited the neighbouring countries, this name, by Euphemism, was changed into that of Euxinus. Thus *Ovid Trist. lib. iii. el. 13.*

*Dum me terrarum pars penè novissima  
Ponti*

*Euxinus falso nomine dictus habet.*

And again, in *Trist. lib. v. el. 10.*

*Quem tenet Euxini mendax cognomine litus.*

In which significations, nobody will deny its being a species of irony: but every euphemism is not irony, for we sometimes use improper and soft terms in the same sense with the proper and harsh.

**EUPHONY**, *ευφωνια*, in grammar, an easiness, smoothness, and elegance in pronunciation.

Euphony is properly a figure, whereby we suppress a letter that is too harsh, and convert it into a smoother, contrary to the ordinary rules: of this there are abundance of examples in all languages.

**EUPHORBIA**, in botany, a genus of the *polyandria-monogynia* class of plants, comprehending the tithymalus or spurge, the euphorbium properly so called, the tithymaloides, and the esula of authors. The flower consists of four or five petals, which are thick, gibbous, turbinate and truncated: the fruit is a roundish trilocular capsule, containing a single roundish seed.

The euphorbium has a fleshy or angular stalk, and the petals in some species are trifid; the tithymalus has leaves on the stalk, which the others have not; and the tithymaloides has the calyx gibbous on the under side. See the article **EUPHORBIIUM**, &c.

**EUPHORBIIUM**, in pharmacy, a gum resin brought us always in loose, smooth, and glossy gold-coloured drops or granules. It is the produce of the euphorbium antiquorum verum, which grows to ten or twelve feet high. Its principal use is externally in sinapisms, and plasters applied to the feet, which are intended to stimulate, but not absolutely to raise blisters: for it is observed by Avicenna, that when taken internally in large doses, it has been found to exulcerate the intestines, and bring on death itself, after the most terrible symptoms.

**EUPHRASIA**, **EYE-BRIGHT**, in botany, a genus of the *didynamia-angiospermia* class of plants, the corolla of which consists of a single ringent petal; the tube is of the length of the cup; the upper lip is concave and emarginated; the lower one is patent, and divided into three segments: the fruit is an ovato-oblong, compressed capsule, forming two

cells: the seeds are numerous, very small, and of a roundish figure.

This plant is an ophthalmic and cephalic, and good for a weak memory.

**EUPHRATES**, the finest river in Turkey in Asia, has two sources, northward of the city of Erzerum, in 40° north latitude. After passing through Armenia, it divides Syria from Diarbeck or Assyria, runs through Eyraca or Chaldea; and uniting with the Tigris, it passes by the city of Bassora, fifty miles below which it falls into the gulph of Persia.

**EUPHROSYNUM**, in botany, a name used by the antients for borrague.

**EUREUX**, a city of Normandy in France, twenty-five miles south of Rouen.

**EURIPUS**, a strait between the island of Negropont, and the continent of Greece, remarkable for its irregular tides.

The term euripus is sometimes used, in a more general sense, for any straits, where the water is much agitated.

**EUROPE**, the least of the four grand divisions of the earth, is situated between 36° and 72° north latitude; and between 10° degrees west longitude, and 65° east longitude; being about 3000 miles long from north to south, and 2500 miles broad from east to west. It is bounded by the frozen ocean on the north, by Asia on the east, by the Mediterranean, which separates it from Africa, on the south, and by the Atlantic ocean on the west.

Europe is commonly subdivided into three grand divisions, north, middle, and south. The north or upper division comprehends Russia or Muscovy, Sweden, Denmark, and Norway, and the islands of Britain, Iceland, Greenland, and those of the Baltic. The middle division contains Poland, Germany, and the hereditary dominions of the house of Austria, the Low Countries, or Netherlands, and France. The southern division comprehends Turkey in Europe, the antient Greece chiefly, Switzerland, Italy, Spain and Portugal, and the islands of Sicily, Sardinia, Corsica, Majorca, Minorca, Ivica, and those of the Archipelago. See the articles **RUSSIA**, **SWEDEN**, **DENMARK**, &c.

**EURYTHMY**, in architecture, painting, and sculpture, is a certain majesty, elegance, and easiness, appearing in the composition of divers members, or parts of

of a body, painting or sculpture, and resulting from the fine proportion of it. Vitruvius ranks the eurythmia among the essential parts of architecture: he describes it as consisting in the beauty of the construction, or assemblage of the several parts of the work, which renders its aspect, or its whole appearance, grateful; *e. g.* when the height corresponds to the breadth, and the breadth to the length. Evelyn, in his account of architecture, says, that from these three ideas, or designs, *viz.* orthography, scenography, and profile, it is, that the same eurythmia, majestic and beautiful appearance of an edifice does result, which creates that agreeable harmony between the several dimensions, *i. e.* between the length, breadth, and height of each room in a fabric, so that nothing seems disproportional, too long for this, or too broad for that, but corresponds in a just and regular symmetry and consent of all the parts with the whole.

**EUSEBIANS**, a name given to the arians. See the article **ARIANS**.

**EUSTATHIANS**, the same with the catholics of Antioch, in the IVth century, so called from their refusing to acknowledge any other bishop beside St. Eustathius, who was deposed by the arians.

**EUSTACE**, or **EUSTATIA**, one of the Caribbee-islands, four miles west of St. Christopher's, and subject to the Dutch.

**EUSTYLE**, in architecture, a sort of building in which the pillars are placed at the most convenient distance one from another, the intercolumniations being just two diameters and a quarter of the column, except those in the middle of the face, before and behind, which are three diameters distant.

**EUTYCHIANS**, in church-history, heretics in the Vth century, who embraced the errors of the monk Eutyches, maintaining that there was only one nature in Jesus Christ. The divine nature, according to them, had so entirely swallowed up the human, that the latter could not be distinguished; inasmuch, that Jesus Christ was merely God, and had nothing of humanity but the appearance. This heresy was condemned in a council held at Constantinople in 448, which sentence was confirmed by the general council of Chalcedon, in 451.

**EUXINE**, the same with the Black-sea. See the article **BLACK-SEA**.

**EWAGE**, a toll paid for the passage of water, and otherwise called aquage.

**EWEE**, the english name of a female sheep.

See the articles **OVIS** and **SHEEP**.

**EWRY**, in the british customs, an office in the king's household, which has the care of the table-linnen, of laying the cloth, and serving up water, in silver ewers, after dinner.

**EXACERBATION**, the same with **PAROXYSM**. See the article **PAROXYSM**.

**EXACHORD**, or **HEXACHORD**. See the article **HEXACHORD**.

**EXACTION**, in law, a wrong done by an officer, or a person in pretended authority, in taking a reward or fee, that is not allowed by law.

A person guilty of exaction may be fined and imprisoned. It is often confounded with extortion. See **EXTORTION**.

**EXACTIS**, in zoology, a species of starfish, with six rays. See **STAR-FISH**.

**EXACTOR REGIS**, is sometimes taken for the sheriff, though more generally it denotes any person that collects the public monies, &c.

**EXACUM**, in botany, a genus of the *terandria-monogynia* class of plants: the flower is monopetalous, patent, and divided into four segments at the limb; the fruit is a bilocular capsule, marked with two deep furrows, opening at the top, and containing numerous seeds.

**EXAGON**, or **HEXAGON**. See the article **HEXAGON**.

**EXÆRESIS**, in surgery, the operation of extracting or taking away something that is hurtful to the human body.

**EXAGGERATION**, in rhetoric, a kind of hyperbole, whereby things are augmented or amplified, by saying more than the truth, either as to good or bad.

There are two kinds of exaggeration, the one of things, the other of words. The first is produced, 1. By a multitude of definitions. 2. By a multitude of adjuncts. 3. By a detail of causes and effects. 4. By an enumeration of consequences. 5. By comparisons. And, 6. By the contrast of epithets and rational inference.

Exaggeration by words is effected, 1. By using metaphors. 2. By hyperboles. 3. By synonymous terms. 4. By a collection of splendid and magnificent expressions. 5. By periphrasis. 6. By repetition. And, lastly, by confirmation with an oath; as for example, *Parietes, medius fidius, gratias tibi agere gestiunt*. See **METAPHOR** and **HYPERBOLE**.

**EXAGGERATION**, in painting, a method by which the artist, in representing things, charges

charges them too much, or makes them too strong, either in respect of the design or the colouring. It differs from caricaturing, in that the latter perverts or gives a turn to the features of a face, &c. which they had not; whereas exaggeration only heightens or improves what they had.

**EXALTATION**, elevation, in a figurative sense, is applied to denote the inauguration, coronation, &c. of the pope. See the articles **INAUGURATION**, &c.

**EXALTATION of the cross**, in church-history. See the article **CROSS**.

**EXALTATION**, in astrology, is a dignity which a planet acquires in certain signs or parts of the zodiac, which dignity is supposed to give it an extraordinary efficacy and influence. Thus the 15° of cancer is the exaltation of jupiter, according to Albumazar; that of the sun is the 19° of aries, and that of the moon is in taurus.

**EXALTATION**, in chemistry, signifies an operation by which a substance has its properties changed, and raised to a higher degree of dignity and virtue.

There are two kinds of exaltation: 1. Maturation, which is nothing but the raising and promoting a thing from a crude to a mature and perfect state. And, 2. Gradation. See **MATURATION** and **GRADATION**.

**EXAMINATION**, an exact and scrupulous disquisition or enquiry, in order to find out the truth of any thing.

**Self-EXAMINATION**, by way of preparation to repentance, is reduced by divines to five points: 1. A returning thanks to God for his benefits. 2. A begging of grace and light, to know and distinguish our sins. 3. An enquiry into all our words, thoughts, and actions, in order to learn what has been offensive to God. 4. A begging of pardon, and conceiving a sincere sorrow for having displeased him. 5. Making a firm resolution not to offend him any more; and taking the necessary precautions to preserve ourselves from it.

**EXAMILION**, or **HEXAMILION**. See the article **HEXAMILION**.

**EXAMINERS**, in chancery, two officers of that court, who examine, upon oath, witnesses produced in causes depending there, by either the complainant or defendant, where the witnesses live in London, or near it. Sometimes parties themselves, by particular order, are examined. In the country, above twenty miles from London, on the parties joining in commission, witnesses are examined by

commissioners, being usually counsellors or attornies, not concerned in the cause. See the article **CHANCERY**.

**EXAMPLE**, in rhetoric, is a way of reasoning, by which a particular fact is produced, or cleared up, by another that is similar to it.

**EXANNUAL ROLL**, that wherein, according to the old way of exhibiting sheriffs accounts, the illeivable fines and desperate debts were transcribed.

This roll was yearly read over to the sheriffs, to see what might be gotten thereby.

**EXANTHEMA**, *εξανθημα*, among physicians, denotes any kind of efflorescence or eruption, as the measles, purple spots in the plague, or malignant fevers, &c.

**EXARCH**, *εξαρχος*, in antiquity, an officer sent by the emperors of the east, into Italy, in quality of vicar, or rather præfect, to defend that part of Italy which was yet under their obedience, and particularly the city of Ravenna, against the Lombards. The exarch resided at Ravenna, which place, with Rome, was all that was left to the emperors, of their italian dominions. The first exarch was under Justin the younger, in the year 567, after Belisarius and Narfes had driven the barbarians out of Italy. The last was Euty chius, defeated by Adolphus king of the Lombards, in 752. But Pepin, king of France, deprived him of the exarchate, and made a gift of it to the pope, ordering his chaplain to lay the keys of all the towns on the altar of St. Peter and Paul at Rome.

**EXARCH of a diocese** was the same with primate. See the article **PRIMATE**.

**EXARCH** also denotes an officer still subsisting in the greek church, being a kind of visitor, or one deputed by the patriarch into provinces, to see whether the bishops do their duty, and whether the rest of the clergy observe the canons of the church. There is another officer also of this name under the patriarchs of the greek church, who has the care and inspection of the patriarchal monasteries, or such as depend immediately on the patriarch.

**EXARCHOS** is a name given by Homer, Philo, and other ancient writers, for the choragus, or he who sung first in the ancient chorus. See the articles **CHORAGUS** and **CHORUS**.

**EXARTICULATION**, in surgery. See the article **LUXATION**.

**EXAUCTIONATION**, *exauktionatio*, in roman antiquity, corresponded, in some measure,

measure, to our keeping soldiers or sailors in half-pay; but differed in this, that the *exauctorati milites* were deprived of their pay and arms, without being absolutely discharged. Sometimes, indeed, it signifies a full, but ignominious discharge.

**EXCALCEATION**, among the Hebrews, was a particular law, whereby a widow, whom her husband's brother refused to marry, had a right to summon him to a court of justice, and, upon his refusal, might excalceate him, that is, pull off one of his shoes, and spit in his face; both of them actions of great ignominy.

**EXCAMBIATORS**, in our old customs, persons employed in exchanging lands, much the same as our brokers are between merchants. See the article **BROKER**.

**EXCELLENCY**, a title antiently given to kings and emperors, but now to ambassadors, and other persons, who are not qualified for that of *highness*, and yet are to be elevated above the other inferior dignities.

In England and France the title is now peculiar to ambassadors, but very common in Germany and Italy. Those it was first appropriated to, were the princes of the blood of the several royal houses; but they quitted it for that of *highness*, upon several great lords assuming excellency. The ambassadors have only bore it since the year 1593, when the pope complimented the duke de Nevers, ambassador from Henry IV. of France, with the title of excellency; and though it was on account of his birth, and not of his character, yet the ambassadors of all nations have ever since claimed the same appellation.

The ambassadors of Venice have only had the title of excellency since the year 1636, when the emperor and king of Spain consented to allow it to them. The court of Rome never allows that title to any ambassador who is a churchman, as judging it a secular title.

The ambassadors of France, at Rome, antiently gave the title of excellency to all the relations of the pope then reigning, and to several other noblemen; but now they are more reserved in that respect; though they still treat all the roman princes with excellency: on the other hand, the court of Rome bestows the same title on the chancellor, ministers, and secretaries of state, and presidents of the sovereign courts of France, the presi-

dents of the councils in Spain, and the chancellor of Poland, if they are not ecclesiastics. *Dist. Trevoux*.

**EXCELSIS**, or *Gloria in EXCELSIS*. See the article **GLORIA**.

**EXCENTRIC**, in geometry, a term applied to circles and spheres which have not the same center, and consequently are not parallel; in opposition to concentric, where they are parallel, having one common center.

**EXCENTRIC circle**, in the ptolemaic system, the very orbit of the planet itself, which it was supposed to describe about the earth. It was also called the deferent. See the article **DEFERENT**.

**EXCENTRIC circle**, in the new astronomy, a circle described from the center of the orbit of the planet, with half the axis as a radius.

**EXCENTRIC equation**, in the old astronomy, is an angle made by a line drawn from the center of the earth, and another drawn from the center of the excentric to the body or place of any planet, the same with the prosthaphæresis; and is equal to the difference (accounted in an arch of the ecliptic) between the sun's or planet's real and apparent place.

**EXCENTRIC place of a planet**, is the very point of the orbit, where the circle of inclination coming from the place of a planet in its orbit, falls thereon with right angles.

*Anomaly of the EXCENTRIC*. See the article **ANOMALY**.

**EXCENTRICITY**, in the old astronomy, is the distance of the center of the orbit of a planet from the center of the earth. It is generally allowed that saturn, jupiter, mars, venus, and mercury, have such an excentricity, because they appear to us of different magnitudes at different times, which could only proceed from hence that their orbits being excentric to the earth, in some parts thereof they are nearer us, and in others more remote. But some dispute has been made about the excentricities of the sun and moon. Many people maintain that the sun and moon appear sometimes larger, and sometimes less; not that they are nearer us at one time than at another, but because they are viewed through different columns of air, which producing a difference in the refraction of their light, may occasion those different appearances. Others again take the excentricities of the sun and moon to be sufficiently proved, both from eclipses, from the moon's greater and less  
parallax

parallax at the same distance from the zenith, and from the sun's being observed to continue longer in the northern than in the southern hemisphere.

**EXCENTRICITY**, in the new astronomy, is the distance of the center of the orbit of a planet from the center of the sun, that is, the distance between the center of the ellipsis and the focus thereof. It is also called single or single excentricity.

*To find the EXCENTRICITY of the earth's orbit, and the place of the apfides.* Take an observation of mars when he is in opposition with the sun, and then, if mars be in M (plate XCIV. fig. 3.) the sun in S, and the earth in T, they will be all in the same right line MTS. When mars, after 687 days, returns again to the same point M, and the earth not reaching the same till after  $730\frac{1}{2}$  days, in which time he completes two revolutions in her orbit, is found in the point A, observe the place of the sun seen from the earth by the right line AS, and the place of mars seen by the right line AM. We have, therefore, by means of the sun's place in E, at the time of the second observation, and his place in F, at the time of the first observation, the angle ESF given, to which the angle MSA is equal. And by knowing the place of the sun and mars in the second observation, we have the distance of mars from the sun, or the angle MAS. In the same manner may be found the angle MSB, and BS the distance of the earth from the sun in decimal parts of MS, when mars returns a second time to M, and likewise the angle MSC, and the right line SC, when mars returns a third time to M. Wherefore since the focus of the earth's orbit is in S, and A, B, and C are points in that orbit, the line of the apfides will be determined, the orbit will be described, and consequently the excentricity will be known. The excentricity of all the primary planets, and the position of the line of apfides may be found in the same manner, if three heliocentric places of the planet, together with its true distance from the sun are known. But it must be observed, that we suppose that the planet, in the same point of its orbit, has the same distance from the sun, which we may easily suppose on account of the slowness of the motion of the aphelia.

The excentricities of the several orbits of the planets are as follow; supposing

the distance of the earth from the sun, 1000 equal parts:

The excentricity of mercury's orbit is about	80	} of such parts.
Venus's	5	
The earth's	17	
Mars's	141	
Jupiter's	250	
Saturn's	247	

The excentricity of the moon's orbit is about  $3,3$  of the semi-diameter of the earth, and now and then it grows greater and now and then it diminishes. It is greatest when the line of the apfides is coincident with the syzygia, or is in the line which joins the centers of the sun and earth. And the excentricity is least when the line of the apfides cuts the other at right angles. The difference between the greatest and least excentricity is so considerable, that it exceeds the half of the least excentricity.

**Double EXCENTRICITY**, is the distance between the two foci in the ellipsis, which is equal to twice the single excentricity.

**EXCEPTION**, in law, denotes a stop or stay to an action, and is either dilatory or peremptory, in proceedings at common law: but in chancery it is what the plaintiff alledges against the sufficiency of an answer, &c.

An exception is no more than the denial of what is taken to be good by the other party, either in point of law, or pleading. The counsel in a cause are to take all their exceptions to the record at one time, and before the court has delivered any opinion of it.

**EXCEPTION to evidence**, is where a demurrer is offered in any civil cause, for the insufficiency of the evidence given, and the court does not agree to it; in such case, the court, upon request, is to seal a bill of exceptions to the evidence, which may be heard on a writ of error. A plaintiff or defendant may also alledge any exception to the judge's opinion, praying the same to be allowed; and if the judge refuses it, then the party concerned is to write it down, and, when signed by counsel, require the judge to seal the same, to be heard afterwards.

**EXCEPTIONS in deeds and writings**, is the saving a particular thing out of a general one granted by deed, as a room, shop, or cellar out of a house; a field, or timber trees, out of land, &c.

Exceptions of this kind must be something serviceable, and if they cross the grant, or are repugnant thereto, they are void

of course. Yet there may be a kind of exception, or saving out of an exception, so as to make a thing as if never excepted; as where a lease is made of a rectory, excepting the parsonage-house, saving to the lessee a chamber, this shall pass by the lease.

**EXCEPTIVE**, something that contains exceptions; such are exceptive propositions. See the article **PROPOSITION**.

**EXCERPTA**, in matters of literature. See the article **EXTRACT**.

**EXCESS**, in arithmetic and geometry, is the difference between any two unequal numbers or quantities, or that which is left after the lesser is taken from or out of the greater. See **SUBTRACTION**.

**EXCHANGE**, in a general sense, a contract, or agreement, whereby one thing is given or exchanged for another. See the article **BARTERING**.

**EXCHANGE**, in commerce, implies the trade of money, carried on between one place and another, by means of bills of exchange. See the article **BILL**.

The original traffic of mankind becoming troublesome, necessity led them to the invention of some more easy manner of continuing their commerce, for which end money was thought the most commodious medium, and consequently this was, many ages since, adopted to carry on their trade; and still, for a greater convenience of foreign trade, they not only made coins of the most valuable metals, but, by degrees, fell into an improvement even of this, and substituted remittances and exchange, by bills, to save the expence and risque which the portage of money from one kingdom to another occasioned.

But as commerce varied, so did exchange too, though long ago they were generally reduced in Europe into four, *viz.* cambio commune, cambio real, cambio sicco, and cambio fictitio.

Cambio commune, in England, was that which was constituted by the several kings, who, having received monies in England, would remit the like sum by exchange, to be paid in another kingdom, according to the value of the different coins current in these countries. Cambio real was when monies were paid to the exchanger, and bills were drawn without naming the species, but according to the value of the several coins; and was no more than the payment of money in England, with a proviso to be paid the just value in specie, in another country, ac-

cording to the price agreed on between the exchanger and deliverer, to allow or pay for the exchange of the money and the loss of time. Cambio sicco, or dry exchange, is when a merchant has occasion for 500*l.* for a certain time, and would pay interest for it; but the lender, being desirous to take more than the statute allows, and yet willing to avoid its penalty, offers the 500*l.* by exchange for Cadiz, to which the merchant agrees; but having no correspondent there, the lender desires him to draw his bill on the said place, payable at double or triple usance, by any feigned person, as the exchange shall then govern, with which the merchant complies; and on receipt of the bill, the banker pays the money and remits the bill to some friend at Cadiz, which, with the exchange and interest, the merchant is to pay his creditor: these expences formerly were very considerable. Cambio fictitio is when a merchant hath occasion for goods, but cannot spare money for their payment; and the owner of them, to secure his advantage, and avoid the penalty of the law, acts as the surer in the former case, and obliges the buyer to defray the expences of re-exchange, &c.

The just and true exchange for monies, that is at this day used both in England and other countries, by bills, is *par pro passu*, or value for value. Thus the english exchange is grounded on the weight and fineness of our own money, and the weight and fineness of those of each other country, according to their several standards, and proportionable to their valuations, which, being truly and justly made, ascertains and reduces the price of exchange to a sum certain for the exchange of monies to any country whatever. As money is the common measure of things between man and man within the realm, so is exchange between merchant and merchant both within and without the realm; the which is properly made by bills, when money is delivered simply here in England, and bills received for the repayment of the same in some other country, either within or without the realm, at a price certain, agreed on between the merchant and the deliverer; for there is not at this day any peculiar or proper money to be found in specie, whereon outland exchanges can be grounded; therefore, all foreign coins are called imaginary.

As the monies and species of almost every nation differ not only in their current prices, but also in their intrinsic value, there is a just and certain par established between them, according to the real and effective worth of each species, without any regard to their currency in the countries where they are coined; and the par is, by some authors, supposed to be of two sorts, *viz.* the one of real monies, the other of exchanges, or imaginary species, though both seem to be the same thing, as having a necessary dependance on each other. See the article PAR.

The relative abundance and scarcity of specie in different countries, form what is called the course of exchange. This scarcity or plenty, from whence results the mutability of the course of exchange, is not the real, but a relative scarcity or plenty; for example, when France has greater occasion for funds in Holland, than the Dutch of having funds in France, specie is said to be common in France, and scarce in Holland; and *vice versa*. See BALANCE of trade.

In order to judge of the scarcity or plenty of specie, we must know, for example, that if there are more bills from Holland than there are from France, then specie is scarce in France, and common in Holland: it then becomes necessary that the exchange should rise, and the Dutch give more for specie of the same value in France, than the French for that of an equivalent value in Holland. When money of the same standard and weight in France, yields money of the same standard and weight in Holland, it is said that the exchange is at par. In the actual state of specie, which was in 1741, the par was nearly at 54 gros to the french crown of three livres. When the exchange is above 54 gros, the French say it is high; when beneath, they say it is low.

In order to know the loss and gain of a state in a particular situation of exchange, it must be considered as debtor and creditor, as buyer and seller. When the exchange is below par, it loses as debtor, and gains as creditor; it loses as buyer, and gains as seller. It is obvious it loses as debtor. Suppose, for example, France owes Holland a certain number of gros, the greater number of gros there are in a crown, the more crowns she has to pay. On the contrary, if France is creditor for a certain number of gros, the less number of gros there are in a crown, the more crowns she will receive. The state loses also as a buyer;

for there must be the same number of gros to buy the same quantity of merchandise; and while the exchange is low, every french crown is worth fewer gros: for the same reason, the state gains as seller: you sell your merchandise in Holland for a certain number of gros: you receive then more french crowns, when for every 50 gros you receive a crown, than you would do if you received the same crown for every 54. The contrary to this takes place in the other state. If the Dutch are indebted a certain number of crowns to France, they will gain; if they are owing to them, they will lose; if they sell, they lose; if they buy, they gain.

Again, when the exchange between France and Holland is below par; for example, if it should be at 50 instead of 54, it should follow, that France, on sending bills of exchange to Holland for 54,000, could buy merchandises only to the value of 50,000; and that, on the other hand, the Dutch sending the value of 50,000 to France, might buy 50,000 crowns, which makes a difference of  $\frac{8}{3}$ , that is, a loss of more than  $\frac{1}{7}$ ; so that France would be obliged to send to Holland  $\frac{1}{7}$  more in specie or merchandise, than she would do was the exchange at par; and as the mischief must consequently increase, because a debt of this kind would bring the exchange still lower, France would in the end be ruined.

It seems, we say, as if this should certainly follow; and yet it does not, because states constantly lean towards a ballance, in order to preserve their independency. Thus they borrow only in proportion to their ability to pay, and measure their buying by what they sell; and taking the example from what has been said, if the exchange happens to fall in France from 54 to 50, the Dutch, who buy merchandises in France to the value of a thousand crowns, for which they used to pay 54,000 gros, would now only pay 50,000, if the French would consent to it. But the merchandise of France will rise insensibly, and the profit will be shared between the French and the Dutch; for when a merchant can gain, he easily shares his profit: there then arises a communication of profit between the French and the Dutch.

In the same manner, the French who bought merchandises of Holland for 54,000 gros, and who, when the exchange was at 54, paid for them 1000 crowns,

crowns, will be obliged to add  $\frac{3}{4}$  more in french crowns, to buy the same merchandises. But the french merchant, being sensible of the loss he suffers, will take up less of the merchandise of Holland: the french and the dutch merchant will then be both losers, the state will insensibly fall into a ballance, and the lowering of the exchange will not be attended with these inconveniencies we had reason to fear.

A merchant may send his stock into a foreign country, when the exchange is below par, without injuring his fortune, because when it returns, he recovers what he had lost; but a prince, who sends only specie into a foreign country, which can never return, is always a loser.

When the merchants have great dealings in any country, the exchange there infallibly rises. This proceeds from their entering into many engagements, buying great quantities of merchandises, and drawing upon foreign countries to pay for them.

A prince may amass great wealth in his dominions, and yet specie may be really scarce, and relatively common: for instance, a state is indebted for many merchandises to a foreign country, the exchange will be low, though specie be scarce.

The exchange of all places constantly tends to a certain proportion, and that in the very nature of things. If the course of exchange from Ireland to England is below par, that of Ireland to Holland will be still lower: that is, in a compound ratio of that of Ireland to England, and that of England to Holland: for a dutch merchant, who can have his specie indirectly from Ireland, by the way of England, will not choose to pay dearer, by having it the direct way.

This, we say, ought naturally to be the case; but, however, it is not exactly so: there are always circumstances which vary these things; and the different profit of drawing by one place, or of drawing by another, constitutes the particular art and dexterity of the foreign bankers. See the article **BANKER**.

This is what in a great measure constitutes what is called arbitration in exchanges, which is defined to be a truck, which two bankers mutually make of their bills upon different parts, at a conditional price, and course of exchange. This is the most beneficial, as well as the

most delicate branch of exchange to be thoroughly informed of.

1. Before any one applies himself to the study of this subject, it is necessary that he should be well skilled in the practical operations, in regard to the reducing of the sterling money of England into the foreign monies of exchange and of account of all places throughout Europe, according to the direct courses of exchange established for these purposes, and *vice versa*.

2. That he should be acquainted with the methods of converting sterling money into the monies of exchange and of account of all other places of commerce, wherewith England has no direct established courses of exchange, but is under the necessity of making use of the intermediate exchanges of other places; together with the nature of the agios, and the manner of converting their bank monies into current, and the reverse. See the article **AGIO**.

3. The manner of calculating all the foreign monies of Europe into those of every other distinct country, either according to the direct or intermediate exchange, which makes a much greater variety of cases than those who are not acquainted with this extensive subject can imagine.

4. It is necessary also to know the intrinsic value of foreign monies, according to the most accurate assays which have been made for that purpose; and this the reader will find done to his hand under the article **COIN**. See **COIN**.

5. Lastly, it is requisite to understand the general natural causes of the rise and fall of the courses of exchange between nation and nation, or between one trading city and another in the same nation; which depends upon the ballance of trade being either in favour of, or against a nation, or trading city. Another method of considering the arbitration of exchanges, is founded upon comparing the various occasional prices of exchange between nation and nation, in order to discover at all times, whether certain courses continue in an equality of proportion, or how far they deviate therefrom; by which means the advantage to be made by such a comparison of exchanges may be exactly ascertained, for the government of the merchant or remitter, to take his measures accordingly, and not to let the advantageous occasion

escape his cognizance. And this must necessarily prove the case, provided a person is not accomplished in this branch of the exchanges; and here it will be proper to observe, that in a comparison or combination of the courses of exchange of several places together, it is rare that they happen to ebb and flow in an exact equality of proportion; the reason whereof must be obvious to every one who considers, that the ballance of trade differs between different nations; which being the case, the judgment of the exchange-negotiator consists in vigilantly observing, from a due comparison of the courses, where the greatest inequality of proportion lies: for there lies the greatest profit to be made, by drawing and remitting to certain places preferably to others.

But the greatest profit to be made this way, does not always happen to arise from a comparison of these courses only, where the general currency of a trader's business lies: on the contrary, from the nature and circumstances of the trade of such countries, the rise and fall of the courses may generally continue in such an equality of proportion, as only occasionally, or seldom, to admit of any extra-profit by the exchange. When the exchange is lower than the specie of a country, a profit may be made by sending it abroad; when it is higher than the specie, there is a profit in causing it to return: but there is a case in which profit may be made by sending the specie out of the kingdom, when the exchange is at par; that is, by sending it into a foreign country, to be coined over again. When it returns, an advantage may be made of it, whether it be circulated in the country, or paid for foreign bills.

**EXCHANGE** signifies also a place in most considerable trading cities, wherein the merchants, negociants, agents, bankers, brokers, interpreters, and other persons concerned in commerce, meet on certain days, and at certain times thereof, to confer and treat together of matters relating to exchanges, remittances, payments, adventures, assurances, freightments, and other mercantile negotiations, both by sea and land.

These assemblies are held with so much exactness, that the absence of a merchant, &c. makes him suspected of drawing to a failure or bankruptcy, as not being able to stand the change.

The most considerable exchanges in Eu-

rope, are those of Amsterdam, and that of London, called the royal-exchange. See the article **ROYAL-EXCHANGE**.

**EXCHANGE**, in law, signifies a mutual grant of lands or tenements, the one in exchange for the other.

This word, in our law, is peculiarly used for that compensation which the warrantor must make to the warrantee, value for value, in case the land warranted be taken, or recovered from the warrantee. Exchanges are made of lands in fee, tail, or for term of life, &c. where a person is seised of certain lands or tenements, and another is seised of other lands, &c. those two persons may exchange their lands, so that each of them shall have the other's lands so exchanged. But in this exchange the estates granted must be equal; for should one have an estate in fee in his land, and the other an estate in the other land only for term of life, or in tail, such exchange is void, on account of the inequality; though, if the estates are equal, as estate in fee for another in fee, tail for tail, &c. the exchange will be good, if the lands be not of equal value.

**EXCHANGERS**, are such as return money by bills of exchange. See the articles **BILL** and **EXCHANGE**.

**EXCHEQUER**, in the british jurisprudence, an antient court of record, in which all causes concerning the revenues and rights of the crown are heard and determined, and where the crown-revenues are received.

It took this name from the cloth that covered the table of the court, which was party-coloured or chequered.

This court is said to have been erected by William the conqueror, its model being taken from a like court established in Normandy long before that time. Antiently its authority was so great, that it was held in the king's palace, and the acts thereof were not to be examined or controlled in any other of the king's courts; but, at present, it is the last of the four courts at Westminster.

In the exchequer, some reckon seven courts, viz. those of pleas, accounts, receipts, exchequer-chamber, (which is an assembly of all the judges on difficult matters in law) errors in the exchequer, errors in the king's bench, and, lastly, the court of equity in the exchequer.

But the exchequer, for dispatch of business,

ness, is generally divided into two parts ; one of which is chiefly conversant in the judicial hearing and deciding of all causes relating to the king's coffers, formerly termed the exchequer of accounts : the other is called the receipt of the exchequer, as being principally employed in receiving and payment of money.

Officers of the receipt may take one penny in the pound, as their fee for sums issued out ; and they are obliged, without delay, to receive the money brought thither ; and the money received is to be put in chests under three different locks and keys, kept by three several officers. All sheriffs, bailiffs, &c. are to account in the exchequer ; and in the lower part, termed the receipt, the debtors of the king, and persons in debt to them, the king's tenants, and the officers and ministers of the court, are privileged to sue one another, or any stranger, and to be sued in the like actions as are brought in the courts of king's bench and common-pleas.

The judicial part of the exchequer, is a court both of law and equity. The court of law is held in the office of pleas, according to the course of common law, before the barons : in this court, the plaintiff ought to be a debtor or accountant to the king ; and the leading process is either a writ of subpoena, or quo minus, which last goes into Wales, where no process out of our courts of law ought to run, except a *capias utlagatum*.

The court of equity is held in the exchequer-chamber before the treasurer, chancellor, and barons ; but, generally, before the barons only ; the lord chief baron being the chief judge to hear and determine all causes. The proceedings in this part of the exchequer, are by english bill and answer, according to the practice of the court of chancery ; with this difference, that the plaintiff here must likewise set forth that he is a debtor to the king, whether he be so or not. It is in this court of equity that the clergy exhibit bills for the recovery of their tithes, &c. Here too the attorney-general exhibits bills for any matters concerning the crown ; and a bill may be exhibited against the king's attorney by any person aggrieved in any cause prosecuted against him on behalf of the king, to be relieved therein : in which case, the plaintiff is to attend on the attorney-general with a copy of the bill, and procure him to give in an answer thereto ; in the

making of which he may call in any person interested in the cause, or any officer, or others, to instruct him, that the king be not prejudiced thereby, and his answer is to be put in without oath.

But besides the business relating to debtors, farmers, receivers, accountants, &c. all penal punishments, intrusion, and forfeitures upon popular actions, are matters likewise cognizable by this court ; where there also sits a puisne-baron, who administers the oaths to high sheriffs, bailiffs, auditors, receivers, collectors, controllers, surveyors and searchers of all the customs, &c. See the articles **BARON**, **CHANCELLOR**, &c.

The exchequer in Scotland, has the same privileges and jurisdiction as that of England ; and all matters competent to the one, are likewise competent to the other.

*Black book of the EXCHEQUER*, a book containing a description of the court of England in 1175, and its officers, with their ranks, wages, privileges, perquisites, &c. also the revenues of the crown, both in money and cattle.

**EXCIPIENT**, in pharmacy, denotes the ingredient, which, in compound medicines, receives all the rest ; as the conserve in electuaries, the syrup in boluses, &c.

**EXCISE**, a certain duty or impost charged upon liquors, as beer, ale, cyder, &c. malt, and several other commodities, within the kingdom of Great Britain, and town of Berwick upon Tweed.

The excise is one of the most considerable branches of the king's revenue. It was formerly farmed out, but is now managed for the king by commissioners in both kingdoms, who receive the whole product of the excise, and pay it into the exchequer. These commissioners are nine in number in England, and four in Scotland. The former have a salary of 1000*l.* a year, the latter, 500*l.* They are obliged by oath to take no fee or reward but from the king himself ; and from them there lies an appeal to five other commissioners, called commissioners of appeals.

The duty of excise was first granted to king Charles II. by act of parliament in the year 1660, during the life of that monarch. It was 15*d.* *per* barrel upon every barrel of beer or ale above 6*s.* the barrel, and 3*d.* *per* barrel for every barrel of 6*s.* or under, brewed for retail ; 15*d.* for every hoghead of cyder or perry sold by retail, 1*d.* for every gallon  
of

of strong water, aqua vitæ, &c. 2. A new excise was granted for ever by the fifth money act of Will. and Mary, being for every barrel of beer or ale above 6 s. the barrel, 9 d. and for every barrel of 6 s. or under, 3 d. for every hoghead of cyder or perry, 1 s. *per* hoghead. In this excise, the price of the liquor is to be reckoned exclusive of the duty. 3. An excise was granted of 6 d. a bushel on malt in the reign of king William, which by subsequent statutes has been continued yearly every since. But such malt as shall be made for exportation, and be so entered and kept separate from other malt, is exempted from the payment of this duty. 4. Another new excise upon home-made liquors was granted in queen Anne's reign; being an additional excise upon every barrel of beer or ale brewed for sale above 6 s. the barrel, 3 d. exclusive of the duties; and for every barrel at 6 s. or under, 1 d. for every hoghead of cyder or perry, 5 d. for every gallon of strong waters or aqua vitæ, 1 d. This excise was not laid upon any such liquors imported. 5. An excise on candles was first granted in the reign of queen Anne, and continued for ever, being a duty of 4 d. a pound on wax and a halfpenny the pound on tallow-candles, made in Great Britain for sale or not for sale; but makers for their own use may compound for 1 s. a head for every person in their family. An additional excise on candles was afterwards granted, being the same with the former in every respect. 6. An excise upon hides and skins tanned in Britain, first granted in queen Anne's reign, was an excise of seventeen different kinds, upon so many different kinds of hides and skins particularly named, and upon all others not named, 13 l. *per cent. ad valorem*. An additional excise was afterwards granted, being an additional duty of different kinds, upon so many different sorts of hides and skins particularly named, and on all others not named, 15 l. *per cent.* on the value. 7. An excise on home-made vellum and parchment, first granted by the same act, being 1 s. *per* dozen on vellum, and 6 d. the dozen on parchment. And afterwards an additional excise on vellum, &c. was granted, being an additional duty of 2 s. the dozen on vellum, and 1 s. the dozen on parchment. 8. An excise on hops of home growth was first granted in queen Anne's reign, being 1 d. *per* pound. 9. An excise on paper, paste-

boards, milled-boards, and scale-boards, was first granted in the reign of queen Anne, being a duty of eleven different kinds on so many different sorts of paper particularly named, made in Great Britain; on paste-boards, &c. 3 s. the hundred weight, and on all sorts of paper not named, 12 l. *per cent.* on the value. An additional duty on paper, &c. was granted of eleven different kinds, &c. on paste-board, 1 s. 6 d. the hundred weight, and on all sorts of paper not named, 6 l. *per cent.* on the value; and on painted paper for hangings, a halfpenny the yard square. 10. An excise of 1 d. *per* pound on soap made in Great Britain, was granted by the same act; to which an additional excise has been added of a halfpenny *per* pound. 11. An excise upon printed silks, callicoos, linnens and stuffs made in Great Britain, and printed, painted, stained or dyed here, was first granted in queen Anne's reign, being a duty of 3 d. on silks and callicoos, and 1 ½ d. on linnen and stuffs the yard square, excepting silk-handkerchiefs, linnens and suitains dyed of one colour, and stuffs made of woollen, or the greatest part in value of woollen. And an additional excise was granted of 6 d. the yard of half-yard broad silks; 1 d. the yard square of silk handkerchiefs; 3 d. the yard square of callicoos, and 1 ½ d. the yard square of linnens and stuffs, excepting, as before, callicoos, &c. dyed of one colour, and woollen stuffs. 12. An excise on starch was first granted for 1 d. the pound; and afterwards an additional excise of 1 d. the pound. 13. The excise on gilt and silver wire made in Great Britain, is 8 d. the ounce on gilt wire, and 6 d. the ounce on silver wire. If any brewers do not make true entries of their liquors brewed, once a week at the excise-office, they forfeit 10 l. but this is subject to mitigation, so as not to be less than double the duty; and the retailers of beer and ale and strong waters, neglecting to make their entries once a month of what liquors they retail, are liable to 40 s. penalty. In case any brewer erects or alters any back, copper, cooler, &c. or keeps a private store-house, or if any malster keeps any private vessel for steeping barley, without giving proper notice to the officers of excise, such brewer or malster forfeit 50 l. and where they bribe a gauger, it is 10 l. The officers of excise may go on board ships, and search for any exciseable liquors, as officers of the customs do, and seize commo-

alties forfeited, &c. and complaints made at the chief office of excise, are to be heard by three or more commissioners; but two justices of the peace have the power to determine, in seizures out of the limits of the excise-office in London.

**EXCLAMATION**, in rhetoric, a figure that expresses the violent and sudden breaking out, and vehemence of any passion. Such is that in the second book of Milton's *Paradise Lost*.

O unexpected stroke, worse than of death!  
Must I thus leave thee, Paradise? Thus leave

Thee, native soil; these happy walks and shades,

Fit haunt of gods!

Other figures are the language of some particular passion; but this expresses them all. It is the voice of nature, when she is in concern and transport.

**EXCLUSION**, or *Bill of Exclusion*, a bill proposed about the close of the reign of king Charles II. for excluding the duke of York, the king's brother, from the throne, on account of his being a papist.

**EXCLUSION**, in mathematics, is a method of coming at the solution of numerical problems, by previously throwing out of our consideration such numbers as are of no use in solving the question. Mr. Frencicle gives an account of it in the *Ouvrages de Mathématique, &c.*

**EXCLUSIVE**, is sometimes used adjectively, thus. *A parent carries with it an exclusive privilege*; and sometimes adverbially, as, *he sent him all the numbers from n<sup>o</sup> 145 to n<sup>o</sup> 247 exclusive*; that is, all between these two numbers, which themselves were excepted.

**EXCLUSIVE PROPOSITIONS**, in logic, are those where the predicate so agrees with its subject, as to exclude every other. Thus, *virtue alone constitutes nobility*, is an exclusive proposition.

**EXCOMMUNICATION**, an ecclesiastical penalty or censure whereby such persons as are guilty of any notorious crime or offence, are separated from the communion of the church, and deprived of all spiritual advantages.

Excommunication among the Jews, according to Elias; a german rabbin, was distinguished into three kinds, 1. *Niddui*, which was a separation of but a few days. 2. *Cherem*, a separation attended with execration and malediction. And, 3. *Shammatha*, which was the last and greater excommunication. But Selden

says, that *niddui* and *shammatha* are the same thing, and therefore that there were but two kinds of excommunication among the Jews, viz. the greater and the lesser. They made also another distinction in excommunication, into total or universal, by which a man was excommunicated with regard to all men; and partial, by which a man was excommunicated in one city, and with regard to certain persons, and not others.

It is observable, that not only the judges had the power of excommunicating, but that each particular person in conversation might excommunicate another, and himself likewise; and this excommunication, if well grounded, was of force: nay, if a man dreamed that he was excommunicated by himself or by another, he was considered as an excommunicated person, because this dream was supposed to be sent from God.

As to the effects of the jewish excommunication, the lesser excluded the excommunicated person from the society of men; that is, he was not to come nearer them than four cubits, neither he, his wife, children, or domestics, according to Buxtorf. The greater absolutely sequestered the person from the conversation of others; and sometimes he was shut up in a small chamber or prison, where he lived alone. Baronius and Beza pretend, that the greater excommunication excluded men from the use of sacred things. Selden, on the contrary, affirms, that they were allowed to be present in the temple, and partake of the public worship. Buxtorf, who is of the same opinion, adds, that whereas others came into the temple at the right hand, and went out at the left, the excommunicated were obliged both to go in and out at the left.

Excommunication among the modern Jews, is attended with the most terrible consequences. The excommunicated person is refused all human assistance: if there be a corpse in his house, or a child to be circumcised, none must help him. He is cursed by the book of the law, by the curse of Joshua against Jericho, by that of Elisha against the children, by heaven and earth, and God is besought that a whirlwind may dash him to pieces. He is pelted with stones if he appear in the streets; and if he obtains absolution, it is upon the most mortifying conditions; for he is publicly tied to a post and whipped, after which he lays him-  
self

self down at the door of the synagogue, and all those who go out, pass over him. This was the very case of the famous Jew Acofta. See BAYLE in the article Acofta.

In the antient christian church, the power of excommunication, as well as other acts of ecclesiastical discipline, was lodged in the hands of the clergy, who distinguished it into the greater and lesser. The lesser excommunication simply called *anathema*, separation or suspension, consisted in excluding men from the participation of the eucharist, and the prayers of the faithful. But they were not expelled the church; for they had the privilege of being present at the reading of the scriptures, the sermons, and the prayers of the catechumens and penitents. This excommunication was inflicted for lesser crimes, such as neglecting to attend the service of the church, misbehaviour in it, and the like.

The greater excommunication, called *anathema*, total separation and anathema, consisted in an absolute and entire exclusion from the church and the participation of all its rites. When any person was thus excommunicated, notice was given of it by circular letters to the most eminent churches all over the world, that they might all confirm this act of discipline, by refusing to admit the delinquent to their communion. The consequences of this latter excommunication was very terrible. The excommunicated person was avoided in civil commerce and outward conversation. No one was to receive him into his house, nor eat at the same table with him; and when dead, he was denied the solemn rites of burial. It has been a question, whether the antient church used to add execration to her censures. Grotius thinks this was done, though very seldom, as in the case of Julian the apostate, for whose destruction the antient christians absolutely prayed to God. St. Chrysostom was utterly against this practice, affirming that we ought not to pray against the sinner, but against his opinions or actions.

The romish pontifical takes notice of three kinds of excommunication. 1. The minor, incurred by those who have any correspondence with an excommunicated person. 2. The major, which falls upon those who disobey the commands of the holy see, or refuse to submit to certain points of discipline; in consequence of which they are excluded from the church

militant and triumphant, and delivered over to the devil and his angels. 3. Anathema, which is properly that pronounced by the pope against heretical princes and countries. In former ages, these papal fulminations were most terrible things; but at present, they are formidable to none but a few petty states of Italy. See ANATHEMA and FULMINATION.

Excommunication in the greek church, cuts the offender off from all communion with the 318 fathers of the first council of Nice, and with the saints; consigns him over to the devil and the traitor Judas; and condemns his body to remain after death as hard as a flint or piece of steel, unless he humbles himself and makes atonement for his sins by a sincere repentance. The form abounds with dreadful imprecations; and the Greeks assert, that if a person dies excommunicated, the devil enters into the lifeless corpse; and therefore in order to prevent it, the relations of the deceased cut his body in pieces, and boil them in wine. It is a custom for the patriarch of Jerusalem annually to excommunicate the pope and the church of Rome; on which occasion, together with a great deal of idle ceremony, he drives a nail into the ground with a hammer, as a mark of malediction.

The form of excommunication in the church of England, antiently ran thus: "By the authority of God the father almighty, the Son and Holy Ghost, and of Mary the blessed mother of God, we excommunicate, anathematize, and sequester from the pale of holy mother church," &c. The causes of excommunication with us, are contempt of the bishop's court, heresy, neglect of public worship and the sacraments, incontinency, adultery, simony, &c. It is published in the church, and if the offender does not submit in forty days, the civil magistrate interposes, and the excommunicated person is imprisoned till he submits and obtains absolution. Excommunication disables a person from doing any judicial act, as suing in an action at law, being a witness, &c. See EXCOMMUNICATIO CAPIENDO, &c.

Excommunication, among the pagans, excluded the person from the sacrifices and the temples, and delivered him over to the furies, which was called *exsecrare* and *diris devovere*. When Marcus C. Craffus set out on his expedition against the Parthians, Atticus, tribune of the people,

people, not being able to prevent him, ran to the gate of the city through which the general was to pass, and setting a chafing-dish in the middle of the way with fire in it, when Crassus drew near, he threw some perfumes into the chafing-dish, and pronounced curses against Crassus with great exclamation, and thus excommunicated him.

**EXCOMMUNICATO CAPIENDO**, a writ issued from the chancery upon the bishop's certifying an excommunication. This writ is directed to the sheriff to take the body of the person excommunicated, and imprison him until he has made satisfaction to the church for the contempt or wrong done. See **EXCOMMUNICATION**. In the certificate of an excommunication, the cause is to be particularly expressed, that the judges may see whether the ecclesiastical court has cognizance of the cause; and if the ordinary excommunicate a person for a thing of which he hath no cognizance, the party may bring an action against him, and in some cases may be delivered by habeas corpus, or by prohibition.

**EXCOMMUNICATO DELIBERANDO**, a writ directed to a sheriff for the delivery of an excommunicated person, upon the bishop's certifying to the king, that he hath conformed to the ecclesiastical jurisdiction.

**EXCOMMUNICATO RECIPIENDO**, a writ where excommunicated persons being committed to prison, and afterwards illegally delivered, are commanded to be retaken and imprisoned again.

**EXCORIATION**, in medicine and surgery, the galling or rubbing off the cuticle, especially of the parts between the thighs, and about the anus.

In adults, it is occasioned by riding, much walking, or other vehement exercise, and may be cured by vulnerary applications. In children, there is often an excoriation not only of the parts near the pudenda, chiefly of the groin and scrotum, but likewise in the wrinkles of the neck, under the arms, and in other places; proceeding from the acrimony of the urine and sweat, and occasioning itching pains, crying, watching, and restlessness.

To remedy this, the parts affected may be washed often with warm water, and sprinkled with drying powders, as chalk, hartshorn, but especially tutty, lapis calaminaris, and ceruss, which may be tied loosely in a rag, and the powder shook out on the disordered places. If the parts tend to a real ulceration, it will be proper

to add a little sugar of lead to the powder, or to anoint the place with ungent. alb. camphor. Likewise a little white vitriol, dissolved in spring-water, and daubed upon the part, will dry and heal it very powerfully.

**EXCORTICATION**, the same with barking of trees. See the article **BARKING**.

**EXCREMENT**, whatever is discharged out of the body of animals after digestion, or the fibrous parts of the aliment, mixed with the bile, saliva, and other fluids. Urine and the fæces are the gross excrements that are discharged out of the bladder or belly. Other excrements are the various humours that are secreted from the blood through the various strainers in the body, and which serve for several uses, such as the saliva, sweat, bile, the pancreatic juice, lymph, the semen, nails, the hair, the horns and hoofs of animals. The ejection of excrements is an evacuation by urine, stool, spittle, &c. Unless the excretions are regular, health cannot be maintained, and therefore, if they are too plentiful, defective, or suppressed, they will occasion various disorders: hence, if a person be costive, it is generally the forerunner of some disease. As a man generally takes more aliment than is necessary to generate blood and serum, and the common excretions are not sufficient to carry off superfluous humours, extraordinary ones sometimes happen, at stated times; as the piles, hæmorrhages, &c. See more upon this under the articles **DISEASE** and **EXCRETION**.

**EXCRESCENCE**, in surgery, denotes every preternatural tumour which arises upon the skin, either in the form of a wart or tubercle. If they are born with a person; as they frequently are, they are called *naevi materni*, or marks from the mother; but if the tumour is large, so as to depend from the skin like a fleshy mass, it is then called a sarcoma.

Excrecences arise in all parts of the body, but more especially the head, face, eye-brows, neck, breast, abdomen, anus, legs, and arms. Their size and figure are various; with regard to their colour, some resemble that of the skin, others are inclined to black or red; and, with respect to their figure, they resemble strawberries, mulberries, grapes, figs, pears, mice, and the like.

As to the general treatment of them, they may be removed either by ligature, the knife, or actual and potential cauteries, according as the patient's habit of

body and other circumstances may require. However, it is to be observed, that if these excrescences have a very large root, if there are large arteries or veins near the root, or if it be firmly joined to the bone, in these cases, the surgeon should remove them with great caution; or, in cases of great danger, wholly neglect them. When these tumours lie near large blood-vessels, it is proper to have styptics, bandages, and often actual cauteries in readiness to stop the hæmorrhage, especially if they are removed by abscission.

**EXCRETION**, or **SECRETION**, in medicine, a separation of some fluid, mixed with the blood, by means of the glands. Excretions, by which we mean those that evacuate superfluous and heterogeneous humours, purify the mass of blood: the humours which are generated in the blood are excreted by the glands, and are replaced by a sufficient quantity of aliment. This, in adults, keeps the body of an equal weight, and consequently preserves life and health: therefore the secretions ought neither to be disturbed or diminished, suppressed or increased: the extraordinary excretions, such as the bleeding piles, and hæmorrhages of the nose, also large sweats, looseness, running at the nose, coughs, catarrhs, plentiful spitting, all promote health; and if these are defective or suppressed, dangerous diseases may arise: wherefore it is highly hazardous to suppress secretions of this kind. See the article **EXCREMENT**.

**EXCRETORY**, in anatomy, a term applied to certain little ducts or vessels, destined for the reception of a fluid, secreted in certain glandules, and other viscera, for the excretion of it in the appropriated places. See the preceding article.

All the glands are usually furnished with an excretory duct. See **GLAND**.

**EXCURSION**, in astronomy, is used in a synonymous sense with elongation. See the article **ELONGATION**.

*Circles of EXCURSION.* See the preceding article.

**EXCUTIA VENTRICULI**, in surgery, the stomach-brush. See **STOMACH**.

**EXECRATION**, *execratio*, in antiquity, a kind of punishment, consisting of direful curses and marks of infamy: such was that used against Philip king of Macedon, by the Athenians. A general assembly of the people being called, they made a decree, that all the statues and images of that king, and of all his an-

cestors, should be demolished, and their very names razed; that all the festivals, sacred rites, priests, and whatever else had been instituted in honour of him, should be prophaned; that the very places where there had been any monument or inscription to his honour, should be detestable; that nothing should be set up, or dedicated in them, which could be done in clean places: and, lastly, that the priests, as often as they prayed for the athenian people, allies, armies, and fleets, should as many times detest and execrate Philip, his children, kingdom, land and sea forces, and the whole race and name of the Macedonians.

At the taking and demolishing a city, it was frequent to pronounce dreadful curses and execrations upon whoever should endeavour to rebuild it; which some imagine was the reason that Troy could never be raised out of its ashes, though several persons attempted it, being devoted to eternal and irreparable ruin by Agamemnon. We find Joshua at the destruction of Jericho, fix an imprecation upon the person who should endeavour to rebuild it, which was accomplished in Hiel the Bethelite, many ages after.

**EXECUTION**, in a general sense, the act of accomplishing, finishing, or achieving any thing to be done.

**EXECUTION**, in law, the completing or finishing some act, as of judgment, deed, &c. and it usually signifies the obtaining possession of any thing recovered by judgment of law. See **JUDGMENT**.

Sir Edward Coke observes, that there are two sorts of executions: the one final, and the other a quousque, that tends to an end. An execution final, is that which makes money of the defendant's goods, or extends to his lands, and delivers them to the plaintiff, who accepts the same in satisfaction; and this is the end of the suit, and the whole that the king's writ requires to be done. The writ or execution with a quousque, though it tends to an end, yet is not final, as in the case of a *capias* ad satisfaciendum, where the defendant's body is to be taken, in order that the plaintiff may be satisfied for his debt. See the article **CAPIAS**.

Executions are either in personal, real, or mixed actions. In a personal action, the execution may be made three ways, *viz.* by the writ of *capias* ad satisfaciendum, against the body of the defendant; *fieri facias*, against his goods; or *elegit*, against his lands. See **FIERI FACIAS** and **ELEGIT**.

In

In a real and mixed action, the execution is by writ of *habere facias seisinam*, and *habere possessionem*. See *HABERE*. Writs of execution bind the property of goods only from the time of delivery of the writ to the sheriff; but the land is bound from the day of the judgment obtained: and here the sale of any goods for valuable consideration, after a judgment, and before the execution awarded, will be good. It is otherwise as to lands, of which execution may be made, even on a purchase after the judgment, though the defendant sell such land before execution. Likewise, sheriffs may deliver in execution all the lands whereof others shall be seised in trust for him, against whom execution is had on a judgment, &c.

When any judgment is signed, the execution may be taken out immediately thereon; but if it be not issued within a year and a day after, where there is no fault in the defendant, as in the case of an injunction, writ of error, &c. there must be a *scire facias* to revive the judgment; though, if the plaintiff sues out any writ of execution within the year, he may continue it after the year is expired. After judgment against the defendant, in an action wherein special bail is given, the plaintiff is at liberty to have execution against such defendant, or against his bail: but this is understood where the defendant does not render himself, according to law, in safeguard of the bail: and execution may not regularly be sued forth against a bail, till a default is returned against the principal: also, if the plaintiff takes the bail, he shall never take the principal. It is held that an execution may be executed after the death of the defendant; for his executor, being privy thereto, is liable, as well as the testator. The execution is an entire thing, so that he who begins must end it: therefore, a new sheriff may distrain an old one, to sell the goods seised on a distress, and to bring the money into court.

**EXECUTION of judgment**, in criminal cases. This must be pursuant to the judgment, and the king may not alter it, for this reason, that no execution can be warranted by law, but where it is according to the judgment given; yet the king may pardon part of the execution in judgment for treason, *viz.* all but beheading.

The execution of criminals is to be made by the proper officer; and if the sheriff, or other officer empowered to do it, alters the execution, or any other executes an offen-

der, or if he be killed without authority of law, it is felony. Where a person condemned to die comes to life after he is hanged; in this case, as the judgment is not executed till he is dead, he ought to be hung up again. And the bodies of felons are forfeited to the king by the execution, who may dispose of them as he pleases.

**Military EXECUTION**, the pillaging or plundering of a country, by the enemy's army.

**EXECUTIONE FACIENDA**, a writ that issues for the execution of a judgment, and is used in divers cases. See the articles *EXECUTION* and *JUDGMENT*.

**EXECUTIONE FACIENDA IN WITHERNAM**, a writ which lies for taking a person's cattle, who has conveyed the cattle of another out of the country, so that the sheriff is not able to replevy them.

**EXECUTIONE JUDICII**, a writ directed to the judge of an inferior court, commanding him to execute a judgment therein, or to return reasonable cause why he delays the execution.

If on this writ execution be not done, or some reasonable cause shewn why it is delayed, an alias shall issue, and afterwards a pluries, &c. And if on this last writ execution is not done, or some reasonable cause returned for its being so delayed, the party shall have an attachment against him who delays the same, and the attachment is made returnable in the king's bench or common pleas.

**EXECUTOR**, in law, a person appointed by another's last will and testament, to have the execution of the same after his decease, and the disposing of the testator's goods and effects, according to the intent of the will.

The law accounts an executor one person with the party whose executor he is; having all the advantages of action, and being subject to the same actions as the deceased.

Hence as an executor derives his power wholly from the will, he may release a debt, or do any thing as executor, before probate of the will, provided he afterwards proves it: however, to maintain actions for debts, he must shew the testament proved. He may immediately take the goods, or give power to another to seize them for him.

A person capable of making an executor, either makes one, two, three, or more; and he may appoint, that one shall be his executor for one year, and another for another.

another. If he appoints executors only for a certain number of years, after they are elapsed, the ordinary may grant administration of the goods; as he may do, till the power of executors take place. It is also observable, that where there is no executor, there is properly no will; and where there is no will, there can be no executors: but this only regards goods; for where lands in fee are devised, it is a good will, though no executor be named therein.

An executor may either accept or refuse the executorship; but after he has accepted the office, he shall not refuse the same, nor take it up after refusal. If any one of several executors prove the will, it will serve for all; so that the rest may at any time after join with him, and intermeddle with the estate. When any action is brought, it must be in the names of all the executors, notwithstanding some of them may not act; but in any action commenced against them, he only that administers is to be sued. The possession of one executor, is held to be possession of them all; and most acts done by or to one, are deemed done by or to all of them.

The particular duty of an executor, is to bury the testator in a decent manner, according to his rank and circumstances, and with a due regard to the estate left; for whatever the executor lays out in funeral charges extravagantly, if there be not enough to pay debts, he must bear it at his own expence. He is to make an inventory of all the goods and chattels of the deceased, with their value; and then, or before, if requisite, where there is enough to pay the testator's debts and legacies, he ought to prove the will before the ordinary in common form, either by his own oath, or by witnesses, if required by those who have a right to question it: and when exhibited in the register's office of the ecclesiastical court, a copy thereof in parchment is delivered to the executor under the ordinary's seal, which is called the probate.

The executor is next to pay all debts, before legacies, in the order following, *viz.* the charges of the funeral being first paid, the king's debt is to be preferred before all others; then debts on judgments, and statutes or recognizances, those due upon mortgages, bonds, and other specialties; after them, rent on leases, servants wages, debts on notes,

and shop-books: for if he pays the debts in any other order, he is liable to the payment of debts of a higher degree, though out of his own estate; yet, among debts of equal degree, an executor may pay himself first: and such as are first sued for, shall be first paid; and if no suit be commenced, he may pay the whole debt to any one creditor, although there should be nothing left to pay another any part of his. In case the testator is bound in several bonds, his executor has the privilege to pay which bond he pleases, unless an action of debt is actually prosecuted against him upon some of the other bonds; and in such a case, if while an action of this kind is depending, another bond-creditor brings another action, before any judgment is obtained, he may prefer which he will by confessing a judgment to one, and paying him; which judgment may be pleaded in bar to the other action.

After the debts, an executor is to pay the legacies; and he may prefer a legacy to himself, though there should not be enough to pay any of the rest. He may likewise pay what legacies he pleases first, or give to each legatee a part, in proportion, if there is not enough to pay the whole. However, if there be a specific legacy of some particular thing, as a horse, or silver-cup, it must be delivered before any other legacy.

In case an executor pays out the assets in legacies, and afterwards debts appear, of which he had no notice, which he is obliged to pay; he may, by a bill in chancery, compel the legatees to refund.

After the debts and legacies are paid, whatever remains, it is said, belongs to the executor by the common law; but this has been construed, where the executor is a relation of the deceased, and had no legacy or other provision by the will. Hence, where a person made a will, and an executor, without disposing of the residue of his personal estate, it has been adjudged, that the remainder should not go to the executor, but be distributed among the relations of the testator by administration.

EXECUTOR DE SON TORT, or an executor of his own wrong, a person that takes upon him the office of an executor by intrusion, without being so constituted by the testator, or appointed by the ordinary to administer. Such a person is chargeable to the rightful executor, as also to

'all the testator's creditors and legatees, so far as the goods amount to which he wrongfully possessed.

**EXECUTORY**, in law, is where an estate in fee, that is made by deed or fine, is to be executed afterwards by entry, livery or writ. Leases for years, annuities, conditions, &c. are termed inheritances executory.

**EXECUTORY DEVISE**, is when the fee by devise is vested in any person, and is to be vested in another upon contingency. In all cases of executory devises, the estates descend until the contingencies happen. The remainder of a fee may not be limited by the rules of law after a fee simple, unless such estate depends upon a contingency or is conditional, when it may take place as an executory devise. Executory devises of terms for years, ought to arise within the compass of one life.

**EXEDRA**, in church-history, a name sometimes given to the ambo. See the article **AMBO**.

**EXEDRÆ**, in antiquity, a general name for such buildings as were distinct from the main body of the churches, and yet within the limits of the church taken in its largest sense. Among the exedræ the chief was the baptistery. See the article **BAPTISTORY**.

Exedræ were also halls or little academies with several seats, upon which philosophers, rhetoricians, &c. sat, when they met for conversation or disputation. Vitruvius speaks of them as places very open and exposed to the sun.

**EXEGESIS**, a discourse by way of explanation or comment upon any subject. In the Scotch universities, there is an exercise among the students in divinity called an exegesis, in which a question is stated by the respondent, who is then opposed by two or three other students in their turns; during which time the professor moderates, and solves the difficulties which the respondent cannot overcome.

**EXEGETICA**, a term used by some for the method of extracting the roots of equations. See the articles **EXTRACTION** and **EQUATION**.

**EXEMPLAR**, denotes much the same with model. See the article **MODEL**.

**EXEMPLIFICATION** of letters patent, a transcript or duplicate of them, made from the inrollment thereof, and sealed with the great seal.

These exemplifications are by statute equally effectual, and may be pleaded as well as the originals. One may exemplify

a patent under the great seal in chancery; also any record, or judgment, in any of the courts at Westminster, under the seal of each court; which exemplifications may be given in evidence to a jury. It is held, that nothing but matter of record ought to be exemplified.

**EXEMPLIFICATION**, in law, a writ granted for the exemplification of any original record. See the articles **EXEMPLIFICATION** and **RECORD**.

**EXEMPTION**, in law, a privilege to be free from some service or appearance: thus, barons and peers of the realm are, on account of their dignity, exempted from being sworn upon inquests; and knights, clergymen, and others, from appearing at the sheriff's turn. Persons of seventy years of age, apothecaries, &c. are also by law exempted from serving on juries; and justices of the peace, attornies, &c. from parish-offices.

**EXEMPTION**, in the church of Rome, a privilege granted by the pope to the clergy, and sometimes to the laity, to exempt or free them from the jurisdiction of their respective ordinaries. Thus monasteries, and even private priests, for a small charge, formerly procured exemptions from the jurisdiction of their bishops. In this, however, the council of Trent made a small reformation, by abolishing the exemption of particular priests, and monks not living in cloisters, and that of chapters in criminal matters.

**EXERCISE**, among physicians, such an agitation of the body as produces salutary effects in the animal oeconomy.

Exercise may be said to be either active or passive. The active is walking, hunting, dancing, playing at bowls, and the like; as also speaking, and other labour of the body and mind. The passive is riding in a coach, on horseback, or in any other manner. Exercise may be continued to a beginning of weariness, and ought to be used before dinner, in a pure light air; for which reason, journeys and going into the country contribute greatly to preserve and re-establish health.

Exercise increases the circulation of the blood, attenuates and divides the fluids, and promotes a regular perspiration, as well as a due secretion of all the humours; for it accelerates the animal spirits, and facilitates their distribution into all the fibres of the body, strengthens the parts, creates an appetite; and helps digestion. Whence it arises, that those

those who accustom themselves to exercise are generally very robust, and seldom subject to diseases.

Boerhaave recommends all bodily exercises in diseases of a weak and lax fibre. By riding on horseback, says his commentator, the pendulous viscera of the abdomen are shaken every moment, and gently rubbed as it were one against another, while in the mean time the pure air acts on the lungs with greater force. But it is to be observed, that a weak man should not ride on a full stomach, but either before dinner, or after the digestion is near finished; for when the stomach is distended, weak people do not bear these concussions of the horse, without difficulty; but when the *primæ viæ* are near empty, the remaining fæces are discharged by this concussion. Sailing in a ship is also an exercise of great use to weak people. If the vessel moves with an even motion, by increasing perspiration it usually excites a wonderful alacrity, creates an appetite, and promotes digestion. These exercises are more especially serviceable to weak people; but in order to corroborate the body by muscular motion, walking, running, and bodily exercises are to be used. In these we should begin with the most gentle, such as walking, and increase it by degrees till we come to running. Those exercises of the body are more especially serviceable which give delight to the mind at the same time, as tennis, fencing, &c. for which reason the wisdom of antiquity appointed rewards for those who excelled in these gymnastic exercises, that by this means the bodies of their youth might be hardened for warlike toils. See the article GYMNASTICS.

As nothing is more conducive to health than moderate exercise, so violent exercise dissipates the spirits, weakens the body, destroys the elasticity of the fibres, and exhausts the fluid parts of the blood. No wonder then, that acute and mortal fevers often arise from too violent exercise of the body; for the motion of the venal blood towards the heart being quickened by the contraction of the muscles, and the veins being thus depleted, the arteries more easily propel their contained humours through the smallest extremities into the now less resisting veins, and therefore the velocity of the circulation will be increased thro' all the vessels. But this cannot be per-

formed without applying the humours oftener, or in a greater quantity to the secretory organs in the same time, whence the more fluid parts of the blood will be dissipated, what remains will be inspissated, and by the greater action of the vessels upon their contained fluids, and of the reacting fluids upon the vessels, the blood acquires an inflammatory density. Add to this, that by the violent attrition of the solids and fluids, together with the heat thence arising, all the humours will incline to a greater acrimony, and the salts and oils of the blood will become more acrid and volatile. Hence, says Boerhaave, those fevers which arise from too much exercise or motion, are cured by rest of body and mind, with such aliments and medicines as moisten, dilate, and soften, or allay acrimony.

The exercise of a soldier in camp, considered as conducive to health, Dr. Pringle distinguishes into three heads, the first relating to his duty, the second to his living more commodiously, and the third to his diversions. The first consisting chiefly in the exercise of his arms, will be no less the means of preserving health, than of making him expert in his duty, and frequent returns of this early, and before the sun grows hot, will be made more advantageous than repeating it seldom, and staying out long at a time; for a camp affording little convenience for refreshment, all unnecessary fatigue is to be avoided. As to the second article, cutting boughs for shading the tents, making trenches round them for carrying off the water, airing the straw, cleaning their cloaths and accoutrements, and assisting in the business of the mess, ought to be no disagreeable exercise to the men for some part of the day. Lastly, as to diversions, the men must be encouraged to them either by the example of their officers, or by small premiums to those who shall excel in any kind of sports, as shall be judged most conducive to health; but herein great caution is necessary not to allow them to fatigue themselves too much, especially in hot weather, or sickly times; but above all, that their cloaths be kept dry, wet cloaths being the most frequent causes of camp diseases.

EXERCISE, in military affairs, is the ranging a body of soldiers in form of battle, and making them perform the several motions and military evolutions with

with different management of their arms, in order to make them expert therein.

**EXERCISES** are also understood of what young gentlemen learn in the academies and riding schools, such as fencing, dancing, riding the great horse, &c.

**EXERGUM**, among antiquarians, a little space around or without the figures of a medal, left for the inscription, cypher, device, date, &c.

**EXETER**, the capital city of Devonshire, situated on the river Ex, ten miles north of the british channel : west lon.  $3^{\circ} 40'$ , north lat.  $50^{\circ} 44'$ .

It is a bishop's see, sends two members to parliament, and gives the title of earl to a branch of the noble family of Cecil.

**EXFOLIATION**, a term used by surgeons for the scaling of a bone, or its rising and separating into thin laminæ or scales.

**EXFOLIATIVE TREPAN**, one for raising the flakes or scales of a bone, one after another. See the article **TREPAN**.

**EXFOLIATIVUM**, in surgery, the same with a raspatory. See **RASPATORY**.

**EX GRAVI QUERELA**, in law, is a writ, that lies for the person to whom any lands or tenements in fee are devised by will, and the heir of the devisor enters thereon, and detains them from the devisee. Also, where a person devises such lands to another in tail with the remainder over in fee : here if the tenant in tail enter, and is seized by force of the entail, and afterwards he dies without issue, the person in remainder, or reversion, may bring this writ to execute the devise. See the article **DEVISE**.

**EXHALATION**, a general term for all effluvia or steams raised from the surface of the earth, in form of vapour. See the articles **VAPOUR** and **EFFLUVIA**.

Some, indeed, distinguish exhalations from vapours ; expressing by the former, all steams emitted from solid bodies, as earth, fire, sulphur, salts, minerals, &c. and by the latter, the steams raised from water, and other fluids. Exhalations, therefore, according to them, are dry, subtle corpuscles, or effluvia, which are loosened and freed from hard earthy bodies, either by the heat of the sun, the agitation of the air, or the like causes ; and being blended in the atmosphere with the moist vapours, help to constitute or form clouds and meteors, See the article **CLOUD**, &c.

Nitrous and sulphureous exhalations are the chief matter of which thunder, lightening, and other meteors are generated in the air. True air is also generated by, or rather set at liberty along with, these exhalations, which it serves to buoy up in the atmosphere. See the articles **AIR** and **ATMOSPHERE**.

Mr. Boyle informs us, that the exhalations from mines are hot ; as are those ascending from some wells. See the article **DAMPS**, &c.

**EXHAUSTED RECEIVER**, a glass, or other vessel, out of which the air hath been drawn by means of the air-pump. See the article **AIR-PUMP**.

**EXHAUSTIONS**, in mathematics, a method in frequent use among the ancient mathematicians, as Euclid, Archimedes, &c. that proves the equality of two magnitudes, by a deduction ad absurdum, in supposing that, if one be greater, or less than the other, there would follow an absurdity.

This is founded upon what Euclid saith in his tenth book, *viz.* " That those " quantities, whose difference is less " than any assignable one, are equal." For if they were unequal, be the difference never so small, yet, it may be so multiplied, as to become greater than either of them : if not so, then it is really nothing. This he assumes in the proof of the 1st proposition of book 10, which is, " That if from the greater of " two quantities, you take more than " its half, and from the remainder " more than its half, and so continually, " there will, at length, remain a quantity less than either of those proposed."

On this foundation they demonstrate, that if a regular polygon of infinite sides be inscribed in, or circumscribed about, a circle ; the space that is the difference between the circle and the polygon will, by degrees, be quite exhausted, and the circle be equal to the polygon.

**EXHEREDATION**, *exhereditatio*, in the civil law, the exclusion of a son by the father from inheriting his estate ; termed, among us, disinheriting.

**EXHIBIT**, in law, is where a deed, or other writing, being produced in a chancery suit, to be proved by witnesses, the examiner, or commissioner appointed after the examination of any such, certifies on the back of the deed, or writing, that the same was shewn to the witness,

at the time of his examination, and by him sworn to.

**EXHIBITION**, a benefaction settled for the benefit of scholars in the universities, that are not on the foundation.

**EXHIBITION** was antiently an allowance for meat and drink, such as the religious appropriators made to the poor depending vicar.

**EXHORTATION**, in rhetoric, differs only from suasion, as being more directly addressed to the passions.

**EXHUMATION**, the digging up of a body interred in holy ground, by the authority of a judge. By the French law the exhumation of a dead body is ordered, upon proof that he was killed in a duel; and a parson may demand the exhumation of any of his parishoners, when interred out of the parish, without his consent.

**EXIGENT**, in law, a writ which lies where the defendant in a personal action cannot be found, nor any effects of his within the county, by which he may be attached or distrained.

This writ is directed to the sheriff, to proclaim and call the defendant five county-court days, one after another, charging him to appear under the pain of outlawry. Where a person indicted of felony, &c. absents himself so long, that the writ of exigent is awarded against him, such a withdrawing will be deemed a flight in law, whereby he is liable to forfeit his goods, and though he afterwards renders himself on the exigent, and is found not guilty, 'tis said the forfeiture shall stand: but if the party was in prison, or beyond the seas, he, or his executors, may reverse the award of the exigent, by writ of error. Upon all exigents, a proclamation shall be issued out to make proclamations in the county where the defendant dwells, for him to yield himself, &c.

**EXIGENTERS**, four officers in the court of Common-Pleas, who make all exigents and proclamations, in all actions where process of outlawry lies. Writs of supersedeas, as well as the prothonotaries upon exigents, were likewise drawn up in their office.

**EXILE**, the same with banishment. See the article **BANISHMENT**.

**EXILIUM**, in law, signifies a spoiling; but seems to be restrained to the injury done to tenants by altering their tenure, ejecting them, &c.

**EXILLES**, a strong fortress on the frontiers of Dauphine and Piedmont, about ten miles west of Susa, and twenty-five north-west of Turin: east long. 7°, north lat. 45° 5'.

**EXISTENCE**, that whereby any thing has an actual essence, or is said to be. See the article **ESSENCE**.

Mr. Locke says, that we arrive at the knowledge of our own existence, by intuition; of the existence of God, by demonstration; and of other things, by sensation. As for our own existence, continues that great philosopher, we perceive it so plainly, that it neither needs, nor is capable of, any proof. I think, I reason, I feel pleasure and pain; can any of these be more evident to me than my own existence? If I doubt of all other things, that very doubt makes me perceive my own existence, and will not suffer me to doubt it. If I know I doubt, I have as certain a perception of the thing doubting, as of that thought which I call doubt: experience then convinces us, that we have an intuitive knowledge of our own existence.

From the knowledge of our own existence, Mr. Locke deduces his demonstration of the existence of a God. See the article **GOD**.

It has been a subject of great dispute whether external bodies have any existence but in the mind, that is, whether they really exist, or exist in idea only: the former opinion is supported by Mr. Locke, and the latter by Dr. Berkley. The knowledge of the existence of other things, or things without the mind, we have only by sensation: for there being no necessary connection of real existence with any idea a man hath in his memory, nor of any other existence, but that of God, with the existence of any particular man; no particular man can know the existence of any other being but only, when, by operating upon him, it makes itself be perceived by him. The having the idea of any thing in our mind no more proves the existence of that thing, than the picture of a man evidences his being in the world; or the visions of a dream make a true history. It is therefore the actual receiving of ideas from without, that gives us notice of the existence of other things, and makes us know that something does exist at that time without us, which causes that idea in us, though perhaps

we neither know nor consider how it does it. This notice, which we have by our senses of the existence of things without us, though it be not altogether so certain as intuition and demonstration, yet deserves the name of knowledge, if we persuade ourselves that our faculties act, and inform us right concerning the existence of those objects that affect them: but besides the assurance we have from our senses themselves, that they do not err in the information they give us of the existence of things without us, we have other concurrent reasons; as, first, It is plain these perceptions are produced in us by external causes affecting our senses, because those that want the organs of any sense never can have the ideas belonging to that sense produced in their minds. Secondly, because we find sometimes that we cannot avoid the having those ideas produced in our minds. When my eyes are shut, I can, at pleasure, recal to my mind the ideas of light, or the sun, which former sensations had lodged in my memory; but if I turn my eyes towards the sun, I cannot avoid the ideas which the light or the sun then produces in me; which shews a manifest difference between those ideas laid up in the memory, and such as force themselves upon us, and we cannot avoid having: besides, there is nobody who doth not perceive the difference in himself between actually looking on the sun, and contemplating the idea he has of it in his memory; and therefore he hath certain knowledge that they are not both memory or fancy. Thirdly, add to this, that many ideas are produced in us with pain, which we afterwards remember without the least offence: thus the pain of heat, or cold, when the idea of it is revived in our minds, give us no disturbance, which when felt, was very troublesome; and we remember the pain of hunger, thirst, head-ach, &c. without any pain at all, which would either never disturb us, or else constantly do it, as often as we thought of it, were there no more but ideas floating in our minds, and appearances entertaining our fancies, without the real existence of things affecting us from abroad. Fourthly, our senses in many cases bear witness to the truth of each others report concerning the existence of sensible things without us: he that doubts when he sees a fire, whether it be real, may, if he

pleases, feel it too, and by the exquisite pain, may be convinced that it is not a bare idea, or phantom. *Locke.*

Dr. Berkeley on the other hand contends, that external bodies have no existence but in the mind perceiving them; or that they exist no longer, than they are perceived: his principal arguments, which several others, as well as himself, esteem a demonstration of this system, are as follow. That neither our thoughts, passions, nor ideas formed by the imagination, exist without the mind, is allowed; and that the various sensations impressed on the mind, whatever objects they compose, cannot exist otherwise than in a mind perceiving them, is equally evident. This appears from the meaning of the term exist, when applied to sensible things: thus, the table I write on, exists, *i. e.* I see and feel it; and were I out of my study, I should say it existed, *i. e.* that were I in my study, I should see and feel it as before. There was an odour, *i. e.* I smelt it, &c. but the existence of unthinking beings without any relation to their being perceived is unintelligible: their *esse* is *percipi*. Then to shew that the notion of bodies is grounded on the doctrine of abstract ideas, What, he asks, are light and colours, heat and cold, extension and figure, in a word, the things we see and feel, but so many sensations, notions, ideas, or impressions on the sense; and is it possible to separate, even in thought, any of these from perception? The several bodies then, that compose the frame of the world, have not any subsistence without a mind: their *esse* is to be perceived or known; and if they are not perceived by me, nor by any other thinking being, they have no shadow of existence at all: the things we perceive are colour, figure, motion, &c. that is, the ideas of those things; but has an idea any existence out of the mind? To have an idea is the same thing as to perceive; that, therefore, wherein colour, figure, &c. exist, must perceive them. It is evident, therefore, that there can be no unthinking substance, or substratum of those ideas. But you may argue, if the ideas themselves do not exist without the mind, there may be things like them, whereof they are copies or resemblances, which exist without the mind. It is answered, an idea can be like nothing but an idea, a colour or figure can be nothing else but another

colour or figure. It may be farther asked, whether those supposed originals or external things, whereof our ideas are the pictures, be themselves perceivable or not? If they be not, I appeal to any one whether it be sense to say, a colour is like somewhat which is invisible; hard or soft, like somewhat intangible, &c. Some distinguish between primary and secondary qualities, the former, *viz.* extension, solidity, figure, motion, rest, and number, have a real existence out of the mind; for the latter, under which come all other sensible qualities, as colours, sounds, tastes, &c. they allow the ideas we have of them are not resemblances of any thing without the mind, or unperceived, but depend on the size, texture, motion, &c. of the minute particles of matter. Now it is certain, that those primary qualities are inseparably united with the other secondary ones, and cannot even in thought be abstracted from them; and, therefore, must only exist in the mind. Again, great or small, swift or slow, are allowed to exist no where without the mind, being merely relative, and changing, as the frame or position of the organ changes: the extension, therefore, that exists without the mind, is neither great nor small; the motion, neither swift nor slow, *i. e.* they are nothing. That number is a creature of the mind is plain (even though the other qualities were allowed to exist) from this, that the same thing bears a different denomination of number as the mind views it with different respects: thus the same extension is 1, 3, or 36, as the mind considers it, with reference to a yard, a foot, or an inch.

In effect, after the same manner, as the modern philosophers prove colours, tastes, &c. to have no existence in matter, or without the mind, the same thing may be proved of all sensible qualities whatever: thus they say, heat and cold are only the affections of the mind, not at all patterns of real beings existing in corporeal substances, for that the same body which seems cold to one hand seems warm to another. Now why may we not as well argue that figure and extension are not patterns or resemblances of qualities existing in matter, because, to the same eye, at different stations, or to eyes of different structure, at the same station, they appear various. Again, sweetness, it is proved, does not exist in the thing *spad*, because the thing re-

maining unaltered, the sweetness is changed to bitterness, as in a fever, or by an otherwise vitiated palate. Is, it not as reasonable to say, that motion does not exist out of the mind, since if the succession of ideas in the mind become sinister, the motion, it is acknowledged, will appear slower, without any external alteration. Again, were it possible for solid figured bodies to exist out of the mind, yet it were impossible for us ever to know it: our senses, indeed, give us sensations of ideas, but do not tell us that any thing exists without the mind, or unperceived, like those which are perceived; this the materialists allow. No other way, therefore, remains, but that we know them by reason's inferring their existence from what is immediately perceived by sense: but how should reason do this, when it is confessed there is not any necessary connection between our sensations and these bodies. It is evident from the phenomena of dreams, phrensies, &c. that we may be affected with the ideas we now have, though there were no bodies existing without them; nor does the supposition of external bodies at all forward us in conceiving how our ideas should come to be produced.

As to the existence of spirits, Mr. Locke says, that our having ideas of them does not make us know that any such things do exist without us, or that there are any finite spirits, or any other spiritual beings but the eternal God. We have ground from revelation, and several other reasons, to believe with assurance that there are such creatures; but our senses not being able to discover them, we want the means of knowing their particular existence; for we can no more know that there are finite spirits really existing by the idea we have of such beings, than by the ideas any one has of fairies or centaurs, he can come to know that things answering those ideas do really exist.

**EXIT, exitus**, in law, properly signifies issue or offspring; but is also applied to issues, annual rents, and profits of lands.

**EXIT**, in a theatrical sense, the action of a player in going off the stage, after he has played his part.

To do this with propriety, or in a manner suitable to the occasion, is by no means the least difficult part of a player's office.

**EXLE-**

*Fig. 1. EXOCÆTUS, the FLYING-FISH.*

*Fig. 2. EXTREME.*

*Fig. 4. EVOLUTE.*

*Fig. 3. EXCENTRICITY.*

*Fig. 5. EUONYMUS, the SPINDLE-TREE.*

**EXLEGALITUS**, among lawyers, the same with an outlawed person. See the article **OUTLAW**.

**EX MERO MOTU**, a formula used in the king's charters and letters patent, signifying that he grants them of his own will and motion.

It is intended to bar all exceptions that might be taken to the charter or patent, by alledging the king, in granting them, was abused by false suggestions.

**EXOCATACOELI**, in church history, a general name by which several great officers in the church of Constantinople were called, as the grand master of the chapel, the grand steward, &c.

They were of great authority in public assemblies, and even had the precedence of bishops.

**EXACIONITES**, or **EXACIONITES**, names given to the Arians of the IXth century. See the article **ARIANS**.

**EXOCOETUS**, the **FLYING-FISH**, in ichthyology, constitutes a distinct genus of fishes of the malacopterygious or soft-finned order; it has ten small bones in the membrane of the gills the pectoral fins are extremely long, and situated just below the extremity of the covering of the gills on the sides, but elevated towards the back: they almost equal the whole body of the fish in length, which greatly resembles an herring, both in shape and colour. See plate **XCIV**. fig. 1.

It is caught in the Mediterranean, and other seas, and is called by different authors *exocætus*, *exochinus*, *hirundo piscis*, and *mugil alatus*.

When pursued by any fish of prey, it throws itself into the air, where it not only suspends itself, but moves very nimbly forward by means of its long fins, so long as they continue wet.

**EXODIARY**, *exodiarius* in the ancient roman tragedy, was the person who after the drama or play was ended, sung the exodium. See the article **EXODIUM**.

**EXODIUM**, in the ancient greek drama, one of the four parts or divisions of tragedy, being so much of the piece as included the catastrophe and unravelling of the plot, and answering nearly to our fourth and fifth acts. See **EPILOGUE**.

**EXODIUM**, among the Romans, consisted of certain humorous verses rehearsed by the *exodiarius* at the end of the *Fabulæ Atellanæ*.

**EXODIUM**, *ἐξόδιον*, in the septuagint signifies the end or conclusion of a feast. Par-

ticularly it is used for the eighth day of the feast of tabernacles, which, it is said, had a special view to the commemoration of the Exodus, or departure out of Egypt.

**EXODIUM** was also the name of a song sung at the conclusion of a feast.

**EXODUS**, a canonical book of the old Testament; being the second of the pentateuch, or five books of Moses.

It is so called, from the greek *ἐξ ὁδου*, going out, or departure of the children of Israel from the land of Egypt; the history of which is delivered in this book, together with the many miracles wrought on that occasion.

**EX OFFICIO**, among lawyers, signifies the power a person has, by virtue of his office, to do certain acts without being applied to. Thus a justice of peace may *ex officio*, at his discretion, take surety of the peace, without complaint made by any person whatsoever.

There was formerly an oath *ex officio*, whereby a supposed offender was compelled in the ecclesiastical court to confess, accuse, or clear himself of a crime; but this law is repealed.

**EXOMPHALUS**, *ἐξ ομφαλου*, in surgery, called also *omphalocele*, and *hernia umbilicalis*, is a preternatural tumor of the abdomen at the navel from a rupture, or distension of the parts which invest that cavity. These ruptures differ by their size and figure, some being small, especially when recent, others large and sometimes monstrous. Some are of a round figure, others acuminate, and Heister mentions an *exomphalos* in a woman with child, which resembled the size and figure of the penis.

Umbilical ruptures are again distinguished according to their contents, as if from the intestines, *enteromphalocele*; from the omentum *epi-omphalocele*; and if from air or wind, *pneumatomphalocele*: Some of these tumours are again distinguished by their consistence into hard or soft, returnable or not, painful or incarcerated.

An *exomphalos* arises from various causes; but the immediate cause is always some force exerted upon the abdomen, especially near the navel, such as a violent and sudden motion, a fall, a violent blow, or leap, strong coughing or sneezing, straining to lift great weights, difficult labour in women, &c. by which causes the peritonæum at the navel is either dilated, or as it sometimes

happens, entirely broke off. The method of cure is twofold, according as the intestines are returnable into the abdomen or not. If the first can be practised, it should be done without any delay, and the parts secured against a future relapse by a girdle or bandage. But if the intestine cannot be returned through the straitness of the aperture in the peritonæum, and the patient is tortured with violent pain in the part affected, with vomiting, and other bad symptoms, to apply the bandage in that case would not only be useless, but pernicious: the patient should rather be treated with emollient clysters and cataplasms, to relax the parts and facilitate their return; and if he is inclined to be feverish, it may then be proper to bleed, as in other inflammatory distempers, by which means the distended vessels of the intestine will be contracted, and probably afterwards returned by a gentle pressure of the hands, to be then secured with compress, bandage, and a proper instrument. If the disorder becomes still worse, after bleeding and the use of other medicines, the surgeon should then proceed to the operation, which consists chiefly in dilating the wound of the abdomen so as to make it large enough to return the intestine: for this purpose he makes a transverse incision through the integuments, and if the tumour be large, a crucial incision, taking great care not to injure the intestine; then the peritonæum, which immediately invests the intestine, may be dilated with as small an incision as possible, and the intestine afterwards returned into the abdomen. See the article HERNIA.

**EXONERATIONE SECTÆ**, in law, a writ which formerly lay, to free the king's ward from all suit to courts. See the article **WARD**.

**EXORCISM**, *εξορκισμός*, among ecclesiastical writers, the expelling devils from persons possessed, by means of conjurations and prayers. See **CONJURATION**. Exorcism makes a considerable part of the superstition of the church of Rome, the rituals of which forbid the exorcising any person without the bishop's leave.

The ceremony is performed at the lower end of the church, towards the door. The exorcist first signs the possessed person with the sign of the cross, makes him kneel, and sprinkles him with holy water. Then follow the litanies, psalms, and prayer; after which the exorcist asks the devil his name, and adjures him by the

mysteries of the christian religion, not to afflict the person any more: then, laying his right hand on the dæmoniac's head, he repeats the form of exorcism, which is this: "I exorcise thee, unclean spirit, in the name of Jesus Christ: tremble, O satan! thou enemy of the faith, thou foe of mankind, who hast brought death into the world, who hast deprived men of life, and hast rebelled against justice; thou seducer of mankind, thou root of evil, thou source of avareice, discord and envy."

The romanists likewise exorcise houses and other places, supposed to be haunted by unclean spirits; and the ceremony is much the same with that for persons possessed.

**EXORCISTS**, in church-history, an order of men, in the antient church, whose employment it was to exorcise or cast out devils. See the preceding article.

**EXORDIUM**, in rhetoric, is the preamble or beginning, serving to prepare the audience for the rest of the discourse.

Exordiums are of two kinds, either just and formal, or vehement and abrupt. The last are most suitable on occasions of extraordinary joy, indignation, or the like.

All exordiums should be composed with a view to captivate the good will, or attract the attention of the audience. The first may be done by paying them some compliment: thus St. Paul, *I think myself happy, king Agrippa, because I shall answer for myself this day before thee, touching all the things whereof I am accused of the Jews, especially because I know thee to be expert in all customs and questions which are among the Jews.*

Attention is procured by promising to treat some weighty, useful, pleasant, or surprising subject: and thus Horace, Ode i. lib. 3.

*Favete linguis: carmina non prius  
Audita, musarum sacerdos,  
Virginibus puerisque canto.*

The requisites in an exordium are, 1. Propriety, whereby it becomes of a piece with the subject, and matches it as a part does a whole: in this the Greeks were very defective. 2. Modesty, which very much recommends the orator to the favour of his audience. And, 3. Brevity, not amplified or swelled with a detail of circumstances.

The style should not be too much raised, nor should it run into bombast: and, above all things, the vain-glory should be

be avoided of that author, who, according to Horace, began his poem thus, *Fortunam Priami cantabo & nobile bellum*. See the article **PROPOSITION**.

It was forbidden to make exordiums in the areopagus at Athens, as it is an indirect and imperceptible manner of prepossessing the audience.

**EXORMISTOS**, in ichthyology, a name given to the petromyzon, or lampern.

**EXOS**, the same with the huso, or ising-glass fish. See the article **HUSO**.

**EXOSTOSIS**, in surgery, a preternatural eminence or excrescence of a bone, whether attended with an erosion or not.

When an exostosis is attended with no bad symptoms, it is best to let it alone, as the remedy will be worse than the disease. But if it occasions great deformity, impedes any action, or produces pain or other mischiefs, it may be removed in the manner directed under the article **SPINA VENTOSA**.

**EXOTIC**, an appellation denoting a thing to be the produce of foreign countries.

Exotic plants of the hot climates are very numerous, and require the utmost attention of the gardener to make them thrive with us. See the articles **STOVE** and **GREEN-HOUSE**.

**EXPANSION**, among metaphysicians, denotes the idea we have of lasting distance, all whose parts exist together.

**EXPANSION**, in physiology, the swelling or increase of the bulk of bodies when heated. See the article **HEAT**.

Dr. Halley found boiling water to expand one twenty-sixth part of its former bulk; but with a moderate heat, its expansion was imperceptible. Mercury, with a very gentle heat, expanded one seventy-fourth of its usual bulk, when cold. Spirit of wine, with a heat much less than that of boiling water, expanded itself to a twelfth part of its bulk, when cold, and then fell a boiling and emitting bubbles copiously. Mr. Boyle, in his book *Of Cold*, tells us, he found the expansion of water by freezing to be about a tenth part of a space more than the water usually takes up. See **FREEZING**.

Dr. Gregory shews, that if a globule of air, only one inch in diameter, had so great an expansion as it would have at a semi-diameter of the earth from its surface, it would fill all the planetary regions; as far as, and even beyond the sphere of Saturn. See the article **AIR**.

But besides fluids, the most solid bodies are expanded by heat, though not in the

inverse ratio of their specific gravities or cohesion, nor even in the ratio compounded of both. The degree of expansion seems rather to depend on the different arrangement, magnitude, and figure of their component parts. According to professor Muschenbroek, the expansions of metals in the same degree of heat, are as follows, *viz.* silver 78, iron 80, copper 89, brass 110, tin 153, lead 155. As to the time of their beginning to expand, it is found to be in the following order, *viz.* tin first, then lead, silver, brass, copper, and, last of all, iron; the reason of which is thought to depend upon the different structures of their pores, and their being more or less fitted to admit the influence of the fire.

For the expansion of the metalline rods of pendulums, and how remedied. See the article **PENDULUM**.

**EXPANSUM FOLIACEUM**. See the article **FOLIACEUM**.

**EX PARTE**, a term used in the court of chancery, where a commission is taken out and executed by one side or party only, upon the other party's neglecting or refusing to join therein.

When both the parties proceed together, it is called a joint commission.

**EX PARTE TALIS**, a writ that lies for a bailiff or receiver, that having auditors assigned to pass his accounts, cannot procure from them reasonable allowance, but is cast into prison; in which case the practice is to sue this writ out of the chancery, directed to the sheriff to take the four mainpernors to bring his body before the barons of the exchequer, at a certain day, and to warn the lord to appear at the same time.

**EXPECTANT**, in law, signifies having relation to, or depending on: thus, where land is given to a man and his wife, and to their heirs, they have a fee simple estate; but if it be given to them and the heirs of their bodies begotten, they have an estate tail, and a fee expectant, which is opposed to fee simple.

**EXPECTATIVE**, in the canon-law, an expectation grounded on the promise of having the next benefice that shall become vacant; or a right to the reversion of the next benefice. See **BENEFICE**.

**EXPECTATIVE GRACES**, *gratie expectative*, bulls antiently given by the popes, for obtaining some benefices that should become vacant.

These bulls were very mortifying to bishops, because they encroached on their

their privileges: besides, they were odious as they induced people to wish the death of others. The council of Trent annulled all expectatives; but the canons relating thereto were never admitted in France, where the right of conferring expectative graces is one of the king's prerogatives.

**EXPECTORANTS**, in pharmacy, medicines which promote expectoration. See the next article.

These medicines are very numerous: the most considerable in the vegetable kingdom are the roots of elecampane, arum, florentine orris, and liquorice; the herbs paul's betony, chervil, scabious, mouse-ear, germander, hyssop, and tarragon; the flowers of violets, mallows, red poppies, and saffron; the seeds of anise and fennel; the bark of cassiafras; and among resinous gums, benjamin and gum aminoniac: among fruits, raisins, figs, jujubes, and pine-kernels: honey, liquorice-juice, and oil of sweet almonds: among animal substances, sperma ceti and fats: among mineral substances, sulphur, together with its flowers and milk: among compound substances, the anisated spirit of sal ammoniac, the lohoch sanum, the syrup prepared of the lungs of a fox, the pectoral elixir, and the asthmatic spirit of Michaeli.

**EXPECTORATION**, the act of evacuating or bringing up phlegm, or other matters out of the trachea, lungs, &c. by coughing, haiking, spitting, &c. in order to which there are four things necessary; 1. That the matter contained there, be moveable and penetrable, so that its most fluid parts may not be dissipated, and the matter that remains become viscid, tough, and inextricable. 2. That the passages may be opened and lubricated. 3. That the matter be provoked to excretion. 4. That the stuffed vessels may be at rest, so as to become capable of relaxation; for if they are continually irritated, the moisture will be always thrown out of the glands of the aspera arteria with a sense of pain. See the preceding article.

**EXPEDITE**, in the forest-law, signifies to cut out the balls of a great dog's feet, belonging to people near the forest, for the preservation of the king's game: yet the ball of the foot of a mastiff is not to be cut out, but only the three claws of the fore foot.

Every person keeping a dog that is not expedited, forfeits 3 s. 4 d.

**EXPENDITORS**, the persons who disburse or expend the money collected by

the tax for repairs of sewers, after the same is paid into their hands by the collectors, as ordered by the commissioners, and for which they are to render accounts when required.

**EXPENSIS LITIS**, *COSTS of suit*. See the article *COSTS*.

**EXPENSIS MILITUM LEVANDIS**, a writ antiently directed to the sheriff, for levying the allowance for knights of the shire; and, *Expensis militum non levandis*, was a writ to hinder the sheriff from levying such allowance upon lands that held in antient demesne.

**EXPERIENCE**, a kind of knowledge acquired by long use, without any teacher. Mr. Locke says, that men receive all the materials of knowledge from experience and observation. See the article *IDEA*. Experience then consists in the ideas of things we have seen or read, which the judgment has reflected on, to form itself a rule or method.

Chauvinus enumerates three kinds of experience; the first is the simple use of the external senses, whereby we perceive the phenomena of natural things, without any direct attention thereto, or making any application thereof. The second is when we premeditatedly and designedly make trials of various things, or observe those done by others, attending to all the effects and circumstances. The third is that preceded by a foreknowledge, or, at least, an apprehension of the event, and determines whether the apprehension were true or false.

**EXPERIMENT**, in philosophy, is the trial of the result or effect of the applications and motions of certain natural bodies, in order to discover something of their motions and relations, whereby to ascertain some of their phenomena, or causes. See the article *EXPERIMENTAL PHILOSOPHY*.

*Torricellian EXPERIMENT*. See the article *TORRICELLIAN*.

**EXPERIMENTAL PHILOSOPHY**, that philosophy which proceeds on experiments, which deduces the laws of nature, and the properties and powers of bodies, and their actions upon each other, from sensible experiments and observations. The business of experimental philosophy is to enquire into and to investigate the reasons and causes of the various appearances or phenomena of nature, and to make the truth or probability thereof of obvious and evident to the senses, by plain, undeniable, and adequate experiments,

riments, representing the several parts of the grand machinery and agency of nature.

In our enquiries into nature, we are to be conducted by those rules and maxims which are found to be genuine, and consonant to a just method of physical reasoning; and these rules of philosophizing are by the greatest master in science, sir Isaac Newton, reckoned four; which are as follows:

1. More causes of natural things are not to be admitted, than are both true, and sufficient to explain the phænomena; for nature does nothing in vain, but is simple, and delights not in superfluous causes of things.

2. And, therefore, of natural effects of the same kind, the same causes are to be assigned, as far as it can be done: as of respiration in man and beasts, of the descent of stones in Europe and America, of light in a culinary fire and in the sun, and of the reflection of light in the earth and in the planets.

3. The qualities of natural bodies which cannot be increased or diminished, and agree to all bodies in which experiments can be made, are to be reckoned as the qualities of all bodies whatsoever: thus, because extension, divisibility, hardness, impenetrability, mobility, the vis inertiae, and gravity are found in all bodies which fall under our cognizance or inspection, we may justly conclude they belong to all bodies whatsoever, and are therefore to be esteemed the original and universal properties of all natural bodies.

4. In experimental philosophy, propositions collected from the phænomena by induction, are to be deemed (notwithstanding contrary hypotheses) either exactly or very nearly true, till other phænomena occur, by which they may be rendered either more accurate, or liable to exception. This ought to be done, lest arguments of induction should be destroyed by hypotheses.

These four rules of philosophizing are premised by sir Isaac Newton to his third book of the Principia; and more particularly explained by him in his Optics, where he exhibits the method of proceeding in philosophy, the first part of which is as follows.

As in mathematics, so in natural history, the investigation of difficult things, by way of analysis, ought always to precede the method of composition. This ana-

lysis consists in making experiments and observations, and in drawing general conclusions from them by induction (*i.e.* reasoning from the analogy of things by natural consequence) and admitting no objections against the conclusions, but what are taken from experiments or certain truths. And although the arguing from experiments and observation, by induction, be no demonstration of general conclusions, yet it is the best way of arguing which the nature of things admits of, and may be looked on as so much the stronger, by how much the induction is more general; and if no exception occur from phænomena, the conclusion may be pronounced generally; but if at any time afterwards, any exception shall occur from experiments, it may then be pronounced with such exceptions: by this way of analysis we may proceed from compounds to ingredients, and from motions to the causes producing them; and, in general, from effects to their causes; and from particular causes to more general ones, till the argument ends in the most general: this is the method of analysis. And that of synthesis, or composition, consists in assuming causes, discovered and established as principles, and by them explaining the phænomena, proceeding from them, and proving the explanations. See ANALYSIS, SYNTHESIS, SUBSTANCE, ELEMENT, WATER, VAPOUR, &c.

**EXPERIMENTUM CRUCIS**, a capital, leading, or decisive experiment; thus termed, either on account of its being like a cross, or direction post, placed in the meeting of several roads, guiding men to the true knowledge of the nature of that thing they are enquiring after; or, on account of its being a kind of torture, whereby the nature of the thing is as it were extorted by force.

**EXPIATION**, a religious act, by which satisfaction, atonement, or amends is made for the commission of some crime, the guilt done away, and the obligation to punishment cancelled.

The method of expiation, among the Jews, was chiefly by sacrifice, whether for sins of ignorance, or to purify themselves from certain pollutions; as a woman after child-birth, a leper after cleansing, &c. See the articles SACRIFICE and PURIFICATION.

*Great day of EXPIATION*, an annual solemnity of the Jews, upon the tenth day of the month Tisri, which answers to our September,

September. On this occasion the high priest laid aside his breast-plate and embroidered ephod, as being a day of humiliation. He first offered a bullock and a ram for his own sins, and those of the priests; then he received from the heads of the people two goats for a sin-offering, and a ram for a burnt offering, to be offered in the name of the whole multitude. It was determined by lot which of the goats should be sacrificed, and which set at liberty. After this he perfumed the sanctuary with incense, and sprinkled it with blood: then, coming out, he sacrificed the goat, upon which the lot had fallen. This done, the goat, which was to be set at liberty, being brought to him, he laid his hands upon its head, confessed his sins, and the sins of the people, and then sent him away into some desert place: it was called azazel, or the scape-goat. See the article *SCAPE-GOAT*.

As to the expiations among the heathens, they were of several kinds, as sacrifices and religious washings.

**EXPIATION**, in a figurative sense, is applied by divines to the pardon procured to mens sins, by the merits of Christ's death.

**EXPIATION**, among civilians, the carrying off, or sequestering, something belonging to an inheritance, before the heir had intermeddled therewith.

**EXPIATION** also denoted a robbery committed by night, and so called from the robbers stripping people of their cloaths.

**EXPIRATION**, in phisic, that part of respiration whereby the air is expelled, or driven out of the lungs. See the article *RESPIRATION*.

**EXPIRATION**, in chemistry, is applied to all sorts of evaporation, and subtile effluvia, that go off into the air.

**EXPIRATION** is also used for the end of any term agreed upon. It likewise signifies death.

**EXPLEES**, or *ESPLEES*, in law. See the article *ESPLEES*.

**EXPLICITE**, in the schools, something clear, distinct, formal, and unfolded.

**EXPLOSION**, in phisics, is properly applied to the going off of gun-powder and the report made thereby. Hence it is used to express such sudden actions of bodies, as generate air instantaneously: thus, half a dram of carraway-seed, poured upon a dram of the compound spirit of nitre, in an empty receiver, produces such a prodigious quantity of air as to blow up with an explosion a receiver of six inches

in diameter and eight inches deep; the pressure, therefore, of the atmosphere on the exhausted receiver, which it overcomes, is above 400 lb reckoning 15 lb to a square inch. From the experiments in Mr. Robins's New Principles of Gunnery, it appears, that the force of fired gun-powder, at the instant of its explosion, is the same as that of an elastic fluid of a thousand times the density of common air. See *GUN-POWDER*.

**EXPONAS VENDITIONE**. See the article *VENDITIONE*.

**EXPONENT**, in algebra, is a number placed over any power or involved quantity, to shew to what height the root is raised: thus, 2 is the exponent of  $x^2$ , and 4 the exponent of  $x^4$ , or  $xxxx$ .

We have observed, under the article *DIVISION*, in algebra, that the rule for dividing powers of the same quantity, is to subtract the exponents, and make the difference the exponent of the quotient; if, therefore, a lesser power is divided by a greater, the exponent of the quotient must, by this rule, be negative: thus,

$$\frac{a^4}{a^6} = a^{4-6} = a^{-2}. \text{ But } \frac{a^4}{a^6} = \frac{1}{a^2}; \text{ and}$$

hence  $\frac{1}{a^2}$  is expressed by  $a^{-2}$ , with a ne-

gative exponent. It is also obvious that

$$\frac{a}{a} = a^{1-1} = a^0; \text{ but } \frac{a}{a} = 1, \text{ and there-}$$

fore  $a^0 = 1$ . After the same manner,

$$\frac{1}{a} = \frac{a^0}{a} = a^{0-1} = a^{-1}; \quad \frac{1}{aa} = \frac{a^0}{aa} =$$

$$a^{0-2} = a^{-2}; \quad \frac{1}{aaa} = a^{0-3} = a^{-3};$$

so that the quantities,  $a, 1, \frac{1}{a}, \frac{1}{a^2}, \frac{1}{a^3},$

$\frac{1}{a^4},$  &c. may be expressed thus,  $a^1, a^0,$

$a^{-1}, a^{-2}, a^{-3}, a^{-4},$  &c. These are called the negative powers of  $a$ , which have negative exponents; but they are at

the same time positive powers of  $\frac{1}{a}$ , or

$a^{-1}$ . See the articles *POWER* and *INVOLUTION of quantities*.

**EXPONENT of a ratio**, is the quotient arising from the division of the antecedent by the consequent: thus, in the ratio of 5 to 4, the exponent is  $1\frac{1}{4}$ ; but the exponent of 4:5, is  $\frac{4}{5}$ .

If the consequent be unity, the antecedent itself is the exponent of the ratio: thus the exponent of the ratio 4:1 is 4.

Wherefore

Wherefore the exponent of a ratio is to unity as the antecedent is to the consequent. Altho' the quotient of the division of the antecedent by the consequent is usually taken for the exponent of a ratio, yet in reality the exponent of a ratio ought to be a logarithm. And this seems to be more agreeable to Euclid's definition of duplicate and triplicate ratios, in his fifth book. For 1, 3, 9, are continual proportionals; now if  $\frac{1}{3}$  be the exponent of the ratio of 1 to 3, and  $\frac{2}{9}$  or  $\frac{1}{3}$  the exponent of the ratio of 3 to 9; and  $\frac{1}{9}$  the exponent of the ratio of 1 to 9; and since, according to Euclid, if three quantities be proportional, the ratio of the first to the third is said to be the duplicate of the ratio of the first to the second, and of the second to the third; therefore according to this,  $\frac{1}{9}$  must be the double of  $\frac{1}{3}$ , which is very false. But it is well known, the logarithm of the ratio of 1 to 9, that is, the logarithm of 9, is the double of the ratio of 1 to 3, or 3 to 9, that is the logarithm of 3. From whence it appears that logarithms are more properly the exponents of ratios, than numerical quotients; and Dr. Halley, Mr. Cotes, and others, are of the same opinion.

EXPONENT is also used in arithmetic, in the same sense as index or logarithm. See INDEX and LOGARITHM.

EXPONENTIAL CALCULUS. See the article CALCULUS EXPONENTIALIS.

EXPONENTIAL CURVE, is that whose nature is expressed by an exponential equation. The area of any exponential curve whose nature is expressed by this exponential equation  $x^x = y$  (making  $1 + v$

$$= x) \text{ will be } \frac{1}{0.1.2} v^2 + \frac{1}{0.1.2.3} v^3 -$$

$$\frac{1}{0.1.2.3.4} v^4 + \frac{1}{0.1.2.3.4.5} v^5 -$$

$$\frac{1}{0.1.2.3.4.5.6} v^6, \text{ \&c. See the article } \text{CALCULUS EXPONENTIALIS.}$$

EXPONENTIAL EQUATION is that wherein there is an exponential quantity. See the next article.

EXPONENTIAL QUANTITY is a quantity whose power is a variable quantity, as  $x^x$ ,  $a^x$ . Exponential quantities are of several degrees and orders, according as the exponents themselves are more or less involved. If the exponent be a simple quantity, as  $x^y$ , it is called an exponen-

tial of the first or lowest degree; but when the exponent itself is an exponential of

the first degree, as  $x^x$  it is called an exponential of the second degree. In like manner, if the exponent itself be an ex-

ponential of the second degree, as  $x^{x^2}$ , it is called an exponential of the third degree, &c.

EXPORTATION, the shipping and carrying out of the kingdom wares and commodities, for other countries.

Exportation is part of foreign commerce, distinguished by the appellation active or selling part, in opposition to importation, which is called the passive, or buying part. Belloni observes, that commerce, when active, must produce a vast flow of riches, the ballance being always received in money; whereas, if it be passive, the most immense treasures will be soon exhausted, as the ballance of trade must be continually made good out of the remaining coin. Hence plenty of money in any place, implies that the quantity of goods exported far exceeds that of goods imported; and wherever we see money scarce, we may conclude that greater quantities of goods have been imported than exported. See the articles COMMERCE, MONEY, and EXCHANGE.

EXPOSITION, in general, denotes the setting a thing open to public view: thus it is the romaniſts say, the host is exposed, when shewn to the people.

EXPOSITION of children, among the antients, a barbarous custom of laying down children by the sides of highways, and other places most frequented, where they were left at the mercy of the public, and must unavoidably perish, unless taken up and educated by charitable and compassionate persons.

Many exposed their children merely because they were not in a condition to educate them; and as for those who exposed them for other reasons, they commonly did it with jewels, with a view no doubt to encourage those who found them to take care of their education if alive, or give them human burial, if dead.

EXPOSITION, in a literary sense, the explaining an author, passage, writing, or the like, and setting their meaning in an obvious and clear light.

Exposition of deeds, of all kinds, ought to be according to the true intent thereof, and reasonable and equal. See DEED.

**EXPOSITOR**, or **EXPOSITORY**, a title given to small dictionaries, serving to explain the hard words of a language.

**EX POST FACTO**, in law, something done after another: thus an estate granted may be good by matter *ex post facto*, that was not so at first, as in case of election.

**EXPOSTULATION**, in rhetoric, a warm address to a person, who has done another some injury, representing the wrong in the strongest terms, and demanding redress.

**EXPOSURE**, in gardening, the situation of a garden, wall, or the like, with respect to the points of the compass, as south or east. According to Mr. Miller, the best aspect or exposure for walls, in England, is to have one point to the east-ward of the south; by reason these will enjoy the benefit of the morning sun, and be less exposed to injuries from the west and south-west winds, than walls directly facing the south. The next best aspect is due south, and the next to that south-east, which is preferable to the south-west, for the reasons before assigned. However, as there will, for the most part, be south-west and west walls in every garden, these may be planted with such sorts of fruit as do not require so much heat to ripen them; and wherever there are north walls, they are only fit for baking-pears and plums, morello-cherries for preserving, or some duke-cherries may be thus continued longer in the season. See **GARDEN**, **PLANTING**, &c.

**EXPRESS**, something that is determinate and precise, or in such formal terms as leaves no room for doubt.

**EXPRESS** also denotes a courier. See the article **COURIER**.

**EXPRESSED OILS**, in chemistry, such oils as are obtained from bodies only by pressing. See the article **OIL**.

**EXPRESSED SPECIES**. See **SPECIES**.

**EXPRESSION**, in chemistry, or pharmacy, denotes the act of expressing out the juices or oils of vegetables, which is one of the three ways of obtaining them; the other two being by infusion and decoction.

Oils obtained by means of fire, are called stillatitious.

**EXPRESSION**, in rhetoric, the elocution, diction, or choice of words in a discourse. Beautiful expression is the natural and true light of our thoughts: it is to this we owe all the excellencies in discourse; which gives a kind of vocal life and spirit. As the principal end of discourse is to be understood, the first thing we should

endeavour to obtain, is a richness of expression, or habit of speaking so well as to make our thoughts easily understood. See **STYLE**, **TROPE**, **RHETORIC**, &c.

**EXPRESSION**, in painting, a natural and lively representation of the subject, or of the several objects intended to be shewn.

The expression consists chiefly in representing the human body and all its parts, in the action suitable to it: in exhibiting in the face the several passions proper to the figures, and observing the motions they impress on the external parts. See the article **ATTITUDE**.

The term expression is frequently confounded with that of passion, but they differ in this, that expression is a general term, implying a representation of an object agreeably to its nature and character, and the use or office it is to have in the work; whereas passion, in painting, denotes a motion of the body, accompanied with certain dispositions or airs of the face, which work an agitation in the soul: so that every passion is an expression, but not every expression a passion.

*The laws of EXPRESSION.* Expression being a representation of things according to their character, may be considered either with respect to the subject in general, or to the passions peculiar thereto.

First, with respect to the subject, it is to be observed, 1. That all the parts of the composition are to be transformed or reduced to the character of the subject, so as they may conspire to impress the same sentiment, passion, or idea. 2. In order to this, if any circumstance occur in history or description, that would avert or take from the idea, it must be suppressed, unless essential to the subject. 3. To this end the history or fable is to be well studied in the authors who describe it, in order to conceive its nature and character truly, and impress it strongly on the imagination, that it may be diffused and carried through all the parts of the subject. 4. A liberty may be taken, to choose favourable incidents, in order to diversify the expression, provided they are not contrary to the principal image of the subject, or the truth of history. 5. The harmony of the *tout ensemble* ought to be particularly regarded, both with respect to the actions and the light and colour. See **CLARO-OBSCURO**. 6. The modes and customs are to be observed, and every thing made conformable to time, place, and quality. 7. The three unities of time, place, and action ought

to be observed; that is, nothing should be represented in the same picture, but what is transacted or passes at the same time, and may be seen at the same view.

Secondly, with respect to the particular passions and affections of the subject, the rules are, 1. That the passions of brutes be few and simple, and have almost all an immediate respect either to self-preservation or the propagation of the species: but in the human kind there is a greater variety, and accordingly more marks and expressions thereof. 2. Children not having the use of reason, act much after the same manner as brutes, and express the motions of their passions directly, and without fear or disguise. 3. Though the passions of the soul may be expressed by the actions of the body, it is in the face they are generally shewn, and particularly in the turn of the eye, and motions of the eye-brows. 4. There are two ways of lifting up the eye-brows, the one at the middle, which likewise draws up the corners of the mouth, and argues pleasant motions; the other at the point next the nose, which draws up the middle of the mouth, and is the effect of grief or sadness. 5. The passions are all reducible to joy and sadness, each of which is either simple, or mixed and passionate. 6. Joy causes a dilatation of the parts: the eye-brows rise in the middle; the eyes half open, and smiling; the pupil sparkling, and moist; the nostrils a little open; the cheeks full; the corners of the mouth drawn a little upwards; the lips red; the complexion lively; the forehead serene. 7. Passionate joy, proceeding from love, shews the forehead smooth and even, the eye-brows a little elevated on the side the pupil is turned to, the eyes sparkling and open, the head inclined towards the object, the air of the face smiling, and the complexion ruddy. That proceeding from desire shews itself by the body, the arms extending towards the object in uncertain and unquiet motions. 8. Simple sadness is expressed by the body being cast down, the head carelessly hanging aside, the forehead wrinkled, the eye-brows raised to the middle of the forehead, the eyes half-shut, and the mouth a little open, the corners downwards, the under lip pointing and drawn back, the nostrils swelled and drawn downwards. That mixed with fear causes the parts to contract and palpitate, the members to tremble and fold up, the visage to be pale

and livid, the point of the nostrils elevated, the pupil in the middle of the eye, the mouth opened at the sides, and the under lip drawn back. In that mixed with anger, the motions are more violent, the parts all agitated, the muscles swelled, the pupil wild and sparkling, the point of the eye-brows fixed to the nose, the nostrils open, the lips big and pressed down, the corners of the mouth a little open and foaming, the veins swelled, and the hair erect. That with despair resembles the last, only more excessive and disordered. 9. The hand has a great share in the expression of the sentiments and passions; the raising of the hands, conjoined, towards heaven, expresses devotion; wringing the hands, grief; throwing them towards heaven, admiration; fainting and dejected hands, amazement and despair; folding hands, idleness; holding the fingers indented, musing; holding forth the hands together, yielding and submission; lifting up the hand and eye to heaven, calling God to witness; waving the hand from us, prohibition; extending the right hand to any one, pity, peace, and safety; scratching the head, thoughtfulness; laying the hand on the heart, solemn affirmation; holding up the thumb, approbation; laying the fourth finger on the mouth, bidding silence; giving with the finger and thumb, a giving sparingly; and the fore-finger put forth and the rest contracted, to shew and point at, as much as to say, *this is he*. 10. The sex of the figure is to be regarded; and man, as he is of a more vigorous and resolute nature, ought to be expressed in all his actions freer and bolder than women, who are to be more reserved and tender. 11. So also as to the age, the different stages whereof incline to different motions both of body and mind. 12. The condition or honours a person is invested with, renders their actions more reserved, and their motions more grave, contrary to the populace, who observe little conduct or restraint, giving themselves up, for the most part, to their passions; whence their external motions become rude and disorderly. Lastly, in spirits, all those corruptible things must be retrenched, which served only for the preservation of life, as veins, arteries, &c. only retaining what may serve for the form and beauty of the body. In angels particularly, as symbolical figures, their offices and virtues are to be marked out, without any draught of sensual

fual passions, only appropriating their characters to their functions of powers, activity and contemplation, *Dict. Polygr.*

**EXPULSION**, in a general sense, the act of violently driving a person out of any city, society, &c.

**EXPULSION**, in medicine, the act whereby any thing is forcibly driven out of the place in which it is: thus we say, the expulsion of the fœtus in delivery. See the article **DELIVERY**.

**EXPURGATION**, in astronomy, a term used by some authors for emersion. See the article **EMERSION**.

**EXQUIMA**, in zoology, a species of guinea monkey, of a reddish brown, spotted with white on the upper part of the body, and the under part white, with a beard of a beautiful snow-white colour. See the article **MONKEY**.

**EXTASY**, a transport which suspends the function of the senses, by the intense contemplation of some extraordinary or supernatural object, or when God impresses on the imagination the extraordinary ideas of any thing he would reveal.

**EXTASY**, in medicine, a species of catalepsy, when a person perfectly remembers, after the paroxysm is over, the ideas he conceived during the time it lasted. In an extasy there must be an unusual tension of the sensory, as is common in deliriums, &c.

**EXTEND**, in law, signifies to value the lands or tenements of a person bound by a statute, &c. who has forfeited the same, at such an indifferent rate, that by the yearly rent the creditor in time may be paid his debt. See **EXTENT**.

**EXTENDI FACIAS**, a writ to extend lands, &c. See the preceding article.

**EXTENSION**, in philosophy, one of the common and essential properties of body, or that by which it possesses or takes up some part of universal space, which is called the place of that body. See the articles **BODY** and **SPACE**.

Extension is threefold, 1. Either into length only, and then it is called a line. Or, 2. Into length and breadth, which is called a superficies. Or, 3. Into length, breadth, and depth, which is called a solid; being the three dimensions according to the quantity of which the magnitude or bulk of bodies are estimated. See **LINE**, **SUPERFICIES**, and **SOLID**.

Extension, according to Mr. Locke, is space considered between the extremities of matter, which fills up its capacity with something solid, tangible, and

moveable. Space, says that philosopher, may be conceived without the idea of extension, which belongs to body only.

**EXTENSION of fractured limbs**, in surgery, ought to be performed in the following manner: 1. The patient is to be kept firm and steady. The posture of body to be observed at this time differs, according to the circumstances of the case; sometimes the patient should sit, either upon a stool, or upon the floor. 2. An assistant should support the limb with his hands, both above and below the fractured part. 3. The assistant, who holds the lower part of the limb, should extend it strongly and equally, till the fractured bone can be replaced: if his hands alone are not sufficient to make the required extension, he must use a cord, or rather a napkin: if one man has not strength enough for this office, there must be two or more employed.

You must be careful not to use too great roughness in this operation, lest you give your patient unnecessary pain. If the tumour and inflammation is come on before the extension, it is best to defer it till these symptoms are removed. When the fractured bones maintain their natural situation, you are under no necessity of extending or replacing the limb; but when the fractured parts recede from each other, some degree of extension is necessary, which must be always suited to the distortion of the limb: the greater distance there is between the extremities of the divided parts of the bone, so much shorter will the limb be, from the contraction of the muscles; therefore the extension in this place ought to be so much the greater. See the article **FRACTURE**.

The extension in luxated bones is to be performed much in the same manner with that in fractures, viz. the outer or lower part of the dislocated limb is to be extended till the head of the disordered bone be reduced exactly into the sinus from whence it was luxated.

**EXTENSOR**, an appellation given to several muscles, from their extending or stretching the parts to which they belong: such are, 1. The common extensor of the fingers, which has its origin at the external condyle of the humerus, and the posterior part of the radius and ulna: it afterwards divides into four tendons, which pass under the ligament of the carpus, and terminate in the posterior surface of all the phalanges of the fingers, where they are gibbous. 2. The exten-

(or

for of the thumb, called also bicornis and tricornis, arises in the posterior and middle part of the radius and ulna, and terminates in two or three tendons in the first, second, and third phalanx of the thumb. 3. The proper extensors of each finger, which are a part of, or at least have their origin with the common extensor. 4. The long extensor of the toes, which has its origin in the upper part of the tibia, and in the anterior part of the ligament, between the tibia and fibula: it afterwards divides into five tendons, four of which are inserted into the four phalanges of the toes, and the fifth into the outer metatarsal bone. 5. The short extensor of the toes, arises from the upper part of the calcaneum, and dividing into tendons, is inserted into the toes.

Besides these, there are proper extensors of the toes; also the long and short extensors of the great toe, and the common extensor of the back and loins, which is divided into three. If these act only on one side, they draw the parts obliquely sideways.

**EXTENT**, in law, is used in a double sense; sometimes it signifies a writ or command to the sheriff for the valuing of lands or tenements; and sometimes the act of the sheriff, or other commissioner, upon this writ: but most commonly it denotes an estimate or valuation of lands; and hence come our extended or rack-rents. See the article **EXTEND**.

Every extent ought to be made on inquisition and verdict, without which the sheriff cannot legally execute the writ.

The cognizee, or party to whom the lands are delivered, has no absolute property in them, but is accountable to the cognitor according to the extended value only, not the real value. No seisin can be on an extent, nor may lands or goods be sold thereon.

**EXTERIOR**, or **EXTERNAL**. See the article **EXTERNAL**.

**EXTERMINATION**, in general, the extirpating or destroying something.

In algebra, surds, fractions, and unknown quantities are exterminated by the rules for reducing equations. See the article **EQUATION**.

We have two curious theorems in Mr. Maclaurin's algebra, for exterminating unknown quantities of given equations; and here it is proper to observe, that he calls all the coefficients, prefixed to the same unknown quantity, coefficients of

the same order: such are  $a, d, g$ , in the theorem 2. as being prefixed to the same quantity  $x$ : such also are  $b, e, h$ ; and  $c, f, k$ . But he calls those opposite coefficients, that are taken each from a different equation, and from a different order of coefficients, as  $a$  and  $e$ , and  $d$  and  $b$ , in the first theorem; and  $a, e, k$ ;  $a, h, f$ ; and  $d, b, k$ , in the second theorem.

**Theorem 1.** Suppose two equations given involving two unknown quantities, as

$$\begin{cases} ax + by = c \\ dx + ey = f \end{cases} \text{ then shall } y = \frac{af - dc}{ae - db}.$$

Where the numerator is the difference of the products of the opposite coefficients, in the orders in which  $y$  is not found; and the denominator is the difference of the products of the opposite coefficients, taken from the orders that involve the unknown quantities. For from the first equation it appears that  $ax = c - by$ ,

$$\text{and } x = \frac{c - by}{a}; \text{ and from the second}$$

$$\text{equation, that } dx = f - ey, \text{ and } x = \frac{f - ey}{d}.$$

$$\text{Therefore, } \frac{c - by}{a} = \frac{f - ey}{d}; \text{ and } cd - dby = af - aey, \text{ whence } aey - dby = af - cd; \text{ and } y = \frac{af - cd}{ae - db}. \text{ Q. E. D.}$$

To exemplify this theorem, suppose  $a = 5$ ,  $b = 7$ ,  $c = 100$ ,  $d = 3$ ,  $e = 8$ , and  $f = 80$ .

$$\text{Then } y = \frac{5 \times 80 - 3 \times 100}{5 \times 8 - 3 \times 7} = \frac{100}{19} = 5 \frac{5}{19};$$

$$\text{and } x = \frac{240}{19} = 12 \frac{12}{19}.$$

**Theorem 2.** Suppose now that there are three unknown quantities,  $x, y, z$ , and three equations: thus,

$$\begin{cases} ax + by + cz = m \\ dx + ey + fz = n \\ gx + hy + kz = p \end{cases} \text{ Then shall } z =$$

$$\frac{aep - abn + dbm - dbp + gbn - gem}{aek - afb + dbc - dbk + gbj - gec}.$$

Where the numerator consists of all the different products that can be made of three opposite coefficients, taken from the orders in which  $z$  is not found; and the denominator consists of all the products that can be made of the three opposite coefficients, taken from the orders that involve the three unknown quantities. For from the last it appears,

$$\text{that } y = \frac{an - afx - dm + dcx}{ae - db}, \text{ and } y =$$

$$y = \frac{ap - akz - gm + gcz}{ab - gb}; \text{ therefore}$$

$$\frac{an - afz - dm + dcx}{ae - db} = \frac{ap - akz - gm + gcz}{ab - gb}$$

$$\text{and } \frac{an - afz - dm + dcx \times ab - gb \times}{an - afz + gbdm - gbdcx} = \frac{ap - gm}{-akz + gcz \times ae - db \times ap - akz + gbdm - gbdcx}.$$

Then transposing and dividing will be found  

$$z = \frac{aep - abn + dbm - dbp + gbn - gem}{aek - ahf + dbc - dbk + gbj - gec}.$$
  
 The values of  $x$  and  $y$  are found after the same manner, and have the same denominator: *ex. gr.*

$$y = \frac{afp - akn + dkm - dep + gcn - gfm}{aek - ahf + dbc - dbk + gbj - gec}.$$

If any term is wanting in any of the three given equations, the values of  $x$  and  $y$  will be found more simple. Thus, suppose that  $f$  and  $k$  are equal to nothing, then the term  $fz$  will vanish in the second equation, and  $kz$  in the third; and

$$z = \frac{aep - abn + dbm - dbp + gbn - gem}{-dbc - gec}$$

$$\text{and } y = \frac{gcn - dep}{-dbc - gec}.$$

If four equations are given, involving four unknown quantities, their values may be found much in the same manner, by taking all the products that can be made of four opposite coefficients, and always prefixing contrary signs to those that involve the products of two opposite coefficients: See the articles COEFFICIENT and EQUATION.

**EXTERNAL**, or **EXTERIOR**, a term of relation applied to the surface or outside of a body; or that part which appears or presents itself to the eye, touch, &c. in contradistinction to internal. See the article INTERNAL.

**EXTERNAL MEDICINES**, the same with local or topical medicines. See the articles TOPICAL and LOCAL.

The senses are also divided into external, being those whereby we perceive ideas, or have the perception of external objects, as seeing, hearing, &c. and internal. See the article SENSE.

**EXTERNAL** is also used to signify any thing that is without-side a man, or that is not within himself, particularly in his mind, in which sense we may say external objects, &c.

The existence of an external world, that is, of bodies and objects out of the mind, was absolutely denied by Dr. Berkely. See the article EXISTENCE.

**EXTERNAL ANGLES**, are the angles on the outside of any right-lined figure, when all the sides are severally produced, and they are all, taken together, equal to four right angles. See the article ANGLE.

**EXTERNAL EAR**. See the article EAR.

**EXTINCTION**, in general, denotes the putting out or destroying something, as a fire or flame. See FIRE and FLAME.

Various engines have been contrived for extinguishing accidental fires, for which see ENGINE and WATER-BOMB.

**EXTINCTION**, in chemistry, is when a metal, mineral, &c. after having been heated red hot, is plunged into some fluid; either to soften and temper its acrimony, as tutty in rose-water; or to communicate its virtue to the liquor, as iron or steel to common water, &c.

**EXTINGUISHMENT**, in law, is a consolidation or union, as where one has due to him a yearly rent out of lands, and afterwards purchases the lands out of which the rent arises: in this case, both the property and the rent being united in one possessor, the rent is said to be extinguished. Likewise where a person has a lease for years, and he afterwards buys the property of what is leased, the lease becomes thereby extinguished.

There is, however, a difference on purchasing part of the lands, and the several sorts of rents: thus if a person has a rent-charge granted to him and his heirs, issuing out of land, and he purchases any part of that land to him and his heirs; as this rent is entire, and issuing out of every part of the land, the whole rent-charge is extinguished. Yet if such person has a rent-service, and he does purchase part of the lands where-out it issues, this shall not extinguish all the rent, but only for the land purchased.

**EXTINGUISHMENT of common**, is by purchasing all the lands which have interest therein: also if a commoner releases his common in one acre, it is an extinguishment of the whole; but where he aliens part of his lands, to which the common belongs, the common is not extinguished thereby, but shall be divided.

**EXTINGUISHMENT services**. If the lord purchases or accepts any part of the tenancy, out of which an entire service is to be paid, the service becomes thereby extinct; unless it be for the public good,

or homage and fealty, which are not subject to extinguishment.

**EXTINGUISHMENT** of *ways*, is where a person has a highway as appendant, and he makes a purchase of the land in which the way is, then the way is extinct: tho' it is held, that a way of necessity, to a market or church, is not so.

**EXTIRPATION**, the same with extermination. See **EXTERMINATION**.

**EXTIRPATIONE**, in law, a judicial writ that lies against a person, who, after a verdict found against him for land, &c. maliciously overthrows a house, or extirpates any trees upon it.

**EXTISPEX**, in antiquity, the person who drew prefaces from viewing the entrails of animals offered in sacrifice. See the articles **SACRIFICE**, **HARUSPEX**, and **DIVINATION**.

**EXTORTION**, in law, is an illegal manner of wresting any thing from a man either by force, menace, or authority. It is also the exaction of unlawful usury, winning by unlawful games, and taking more than is due under pretence of right, as excessive tolls in millers, &c.

At the common law, extortion is punishable by fine and imprisonment; and the statute of 3 Eliz. 1. c. 30. has enacted, that officers of justice guilty of extortion for the expedition of business, &c. shall render to the party treble value. There are likewise divers other statutes for punishing extortions of sheriffs, bailiffs, gaolers, clerks of the assize and of the peace, attornies, solicitors, &c.

**EXTRA**, a latin preposition signifying *without*, and used in composition with other words, as for instance, 1. *Extra-judicial*, where judgment is given in a cause that is not depending in the court where the same passed; or whereon the judgment has no jurisdiction. 2. *Extra-parochial*, which is said of places out of the bounds of any parish, or freed from the duties of a parish. The greatest part of the forests in England are extra-parochial.

**EXTRACT**, in pharmacy, is a solution of the purer parts of a mixed body inspissated, by distillation or evaporation, nearly to the consistence of honey. Extracts may be made almost of every part of the *materia medica*, or from any medicine, whether simple or compound, that is suited to give a tincture to any menstruum, in which it is customarily infused. They make a principal part of

modern pharmacy, and with great reason too; for the different elements of many compound bodies have qualities and powers, when separate and pure, which they are incapable of exerting when their force is suppressed by the quantity, or counteracted by the repugnant qualities of other species wherewith they are conjoined, as in the instances of acid spirits, testaceous earths, calces of metals, gums or resins of vegetables, and many others. The directions given by the college of physicians for making extracts, are these.

Take the matter from which the extract is to be prepared, cut, bruise, or otherwise manage it, as its nature requires, for infusion. Pour upon it spirit of wine, or any distilled waters, most accommodated to the prescriber's intention. Let it continue in infusion in a bath, or any other slow heat, for two days, or more, according as the hardness or softness of the matter requires, until the liquor is impregnated with the tincture of the thing infused. Then let the tinged liquor be separated by inclination, pouring on a fresh menstruum, infusing and separating, as before, as long as any tincture can be obtained. Let all the tinctures be put together and filtered through a paper, and then in a bath-heat evaporate the humidity, until the matter left is of the consistence of honey, which must be kept for use. And to this extract, for the sake of preserving it moist, may be added some portion of salt, or some other thing suitable to the main intention.

The most remarkable extracts of the London dispensatory are, 1. Extracts of the roots of elecampane, gentian, black hellebore, of the leaves of rue and savine, 2. Extract of liquorice. 3. Of logwood. 4. Of peruvian bark, both soft and hard. 5. Of lignum vitæ, both soft and hard. 6. Of jalap. And, 7. The cathartic extract which is prepared from proof spirit poured upon a proper quantity of succotrine aloes, the pith of coloquintida, scammony, and the lesser cardamom-seeds husked.

The thebaic extract consists only of opium dissolved in water, strained and evaporated to a consistence. Let it be remarked, that all watery extracts should be moistened or sprinkled with a little spirit of wine, to prevent their growing mouldy.

**EXTRACT**, in matters of literature, is something copied or collected from a book or paper.

**EXTRACTS** of writings or records, are notes upon them. See **ESTREAT**.

**EXTRACTA CURIÆ**, are the issues or profits of holding a court arising from the customary dues, fees and amercedments.

**EXTRACTION**, in chemistry and pharmacy, the operation by which essences, tinctures, &c. are drawn from natural bodies. See the article **EXTRACT**.

**EXTRACTION**, in surgery, is the drawing any foreign matter out of the body by the hand, or by the help of instruments. In extracting arrows and such like bearded weapons used by barbarous nations, the whole business consists in drawing out the head, so as that its protuberant beard or hooks may not wound and lacerate the contiguous parts. If it appears to be lodged but superficially under the integuments, it will be best to draw it out the same way it entered, provided the wound be first sufficiently dilated by incision, in order to prevent the laceration of the adjacent parts: otherwise it must be thrust forwards, and drawn out in the direction of its point in the opposite side, if possible, an incision being first made to meet it. This last method is most eligible, when the weapon has descended very deep; so that there is much less space for it to pass onward, than to be drawn back again; and also when it has passed beyond any large blood-vessels or nerves, so that it would induce a laceration of them to draw it back.

In extracting foreign bodies from the ear, you must first be informed by the account of the patient, and by searching with a probe, of what nature the offending body is; and if it happen to be a lump of dried indurated wax, it will be proper to inject some warm milk, or oil of olives or almonds, ordering the patient to hold his head inclined on the contrary side while you use the syringe. If a small calculus, &c. be lodged in it, you must first of all relax and mollify the passages of the ear, and then carefully extract the body with a probe or pliers. But if the foreign body should happen to be a pea, bean, or other grain, which is too much swelled by the humours to be discharged intire by the probe, or other instrument, you must break it with pliers, or cut it with small scissars, and extract it bit by bit. Sometimes an insect gets into the ear, and by struggling to get loose from the glutinous ear-wax, excites an into-

lerable pruritus and tickling, which in time turns to acute pain. When the insect can be perceived, it may be drawn out by a probe, &c. but if that fails, you must inject warm oil, or spirit of wine, which will quickly kill the insect, and then you may wash it out with the same or some other liquor, and afterwards cleanse the cavity of the ear with a bit of cotton or lint upon the end of your probe.

To extract bodies fallen into the eyes, the first and most easy method is by agitating and extending the eye-lids with one's fingers, holding the head down at the same time, by which means the increased flux of tears excited by the velli-cating body, very often washes it out of the eye without much difficulty. But if this method does not succeed, the next remedy is to blow some levigated pearl or crab-claws through a quill under the eye-lid, that as these are washed out by tears, they may also take the foreign body with them, otherwise the surgeon must take the small round head of a slender probe, or the end of a tooth-pick, and extending the eye-lids gently from the eye, carefully extract the offending body. Lime or any acrid salt may be washed from the eyes by a pencil brush of soft feathers, or a bit of fine sponge fastened in a quill, dipped in warm water.

The method of extracting small bones of fish, needles, pins, &c. sticking in the fauces or gula, is as follows. When the offending body cannot be removed by taking a large draught of some liquor, or swallowing a large mouthful of bread, &c. recourse must be had to some instrument. The tongue is first to be depressed with a spatula, in order to observe whether the obstacle can be seen; and if it appears near the upper part of the oesophagus, it should be cautiously extracted with a pair of pliers, or some such instrument. But if it is lodged deep in the oesophagus, the surgeon may then give the patient a piece of sponge to swallow, that has first been dipt in oil, and well fastened to a strong cord, by which it is to be pulled up again, after it has been swallowed by the patient as far as it will go; by which means the body sticking in the oesophagus, will be either forced down into the stomach, or else drawn up into the mouth.

For the extraction of bullets, &c. from wounds. See **GUN-SHOT wounds**.

**EXTRACTION**,

**EXTRACTION**, in genealogy, implies the stock or family from which a person is descended.

**EXTRACTION of roots**, in algebra and arithmetic, the method of finding the root of any power or number. See the articles **ROOT**, **SQUARE**, **CUBE**, &c.

The reader will perceive by the articles involution and power, that the extraction of roots, or the resolving of powers into their roots, is the reverse of involution, and consequently that the roots of single quantities are easily extracted by dividing their exponents by the number that denominates the root required; for the powers of any root are found by multiplying its exponent by the index that denominates the power; and therefore, when any power is given, the root must be found by dividing the exponent of the given power by the number that denominates the kind of root that is required. Thus the square root of  $a^8$  is  $a^{\frac{8}{2}} = a^4$ ; and the square root of  $a^4 b^8 c^2$ , is  $a^2 b^4 c$ . The cube root of  $a^6 b^3$ , is  $a^{\frac{6}{3}} b^{\frac{3}{3}} = a^2 b$ ; and the cube root of  $x^9 y^6 z^{12}$ , is  $x^3 y^2 z^4$ . It will also appear from what we shall say of involution, that any power that has a positive sign, may have either a positive or negative root, if the root is denominated by an even number. Thus the square root of  $+a^2$  may be  $+a$  or  $-a$ , because  $+a \times +a$  or  $-a \times -a$  gives  $+a^2$  for the product. But if a power have a negative sign, no root of it denominated by an even number can be assigned, since there is no quantity that multiplied into itself an even number of times can give a negative product. Thus the square root of  $-a^2$  cannot be assigned, and is what we call an impossible or imaginary quantity. See the article **ROOT**.

But if the root to be extracted is denominated by an odd number, then shall the sign of the root be the same as the sign of the given number whose root is required. Thus the cube root of  $-a^3$  is  $-a$ , and the cube root of  $-a^6 b^3$ , is  $-a^2 b$ . If the number that denominates the root required is a divisor of the exponent of the given power, then shall the root be only a lower power of the same quantity. As the cube root of  $a^{12}$  is  $a^4$ , the number 3 that denominates the cube root being a divisor of 12. But if the number that denominates what sort of root is required is not a divisor of the

exponent of the given power, then the root required shall have a fraction for its exponent: thus the square root of  $a^3$  is  $a^{\frac{3}{2}}$ , the cube root of  $a^5$  is  $a^{\frac{5}{3}}$ , and the square root of  $a$  itself is  $a^{\frac{1}{2}}$ . These powers that have fractional exponents, are called imperfect powers or surds, and are multiplied and divided, involved and evolved, after the same manner as perfect powers. Thus the square of  $a^{\frac{3}{2}}$  is  $a^2 \times \frac{3}{2} = a^3$ ; and the cube of  $a^{\frac{2}{3}}$  is  $a^2 \times \frac{2}{3} = a^{\frac{4}{3}}$ .

The square root of  $a^{\frac{2}{3}}$  is  $a^{\frac{2}{3} \times \frac{1}{2}} = a^{\frac{1}{3}}$ ; and the cube root of  $a^{\frac{4}{3}}$  is  $a^{\frac{4}{3} \times \frac{1}{3}} = a^{\frac{4}{9}}$ . See the article **SURD**.

The square root of any compound quantity, as  $a^2 + 2ab + b^2$ , is discovered after this manner. First take care to dispose the terms according to the dimensions of the alphabet, as in division; then find the square root of the first term  $aa$ , which gives  $a$  for the first member of the root. Then subtract the square from the proposed quantity, and divide the first term of the remainder  $2ab + b^2$ , by the double of that member, viz.  $2a$ , and the quotient  $b$  is the second member of the root. Add this second member to the double of the first, and multiply their sum  $2a + b$  by the second member  $b$ , and subtract the product  $2ab + b^2$  from the foresaid remainder  $2ab + b^2$ , and if nothing remains, then the square root is obtained.

The manner of the operation is thus:

$$\begin{array}{r} a^2 + 2ab + b^2 \quad (a + b \\ \underline{a^2} \phantom{+ 2ab + b^2} \\ (a + b) 2ab + b^2 \\ \underline{\times b) 2ab + b^2} \\ 0. \quad 0. \end{array}$$

But if there had been a remainder, you must have divided it by the double of the sum of the two parts already found, and the quotient would have given the third member of the root. Thus if the quantity proposed had been  $a^2 + 2ab + 2ac + b^2 + 2bc + c^2$ , after proceeding as above you would have found the remainder  $2ac + 2bc + c^2$ , which divided by  $2a + 2b$ , gives  $c$  to be annexed to  $a + b$ , as the third member of the root. Then adding  $c$  to  $2a + 2b$ , and multiplying their sum  $2a + 2b + c$  by  $c$ , subtract the product  $2ac + 2bc + c^2$  from the foresaid remainder; and since nothing now remains, you conclude that  $a + b + c$  is the square root required.

The operation is thus :

$$\begin{array}{r}
 a^2+2ab+2ac+b^2+2bc+c^2(a+b+c) \\
 \underline{a^2} \\
 2a+b)2ab+2ac+b^2+2bc+c^2 \\
 \times b)2ab \quad \quad +b^2 \\
 \hline
 2a+2b+c)2ac+2bc+c^2 \\
 \times c)2ac+2bc+c^2 \\
 \hline
 \text{o.} \quad \text{o.} \quad \text{o.}
 \end{array}$$

Another example. Required the square root of  $xx - ax + \frac{1}{4}aa$

$$\begin{array}{r}
 xx - ax + \frac{1}{4}aa(x - \frac{1}{2}a) \\
 \underline{xx} \\
 2x - \frac{1}{2}a) -ax + \frac{1}{4}aa \\
 \times -\frac{1}{2}a) -ax + \frac{1}{4}aa \\
 \hline
 \text{o.} \quad \text{o.}
 \end{array}$$

The square root of any number is found out after the same manner. If it is a number under 100, its nearest square root is found by the following table, by which also its cube root is found, if it be under 1000, and its biquadratic, if it be under 10000.

Root	1	2	3	4	5	6	7	8	9
Square	1	4	9	16	25	36	49	64	81
Cube	1	8	27	64	125	216	343	512	729
Biquad.	1	16	81	256	625	1296	2401	4096	6561

But if it is a number above 100, then its square root will consist of two or more figures, which will be found by different operations by the following rule. Place a point above the number that is in the place of units; pass the place of tens, and place again a point over that of hundreds; and go on towards the left hand, placing a point over every second figure, and by these points the number will be distinguished into as many parts as there are figures in the root. Then find the square root of the first part, and it will give the first figure of the root; subtract its square from that part, and annex the second part of the given number to the remainder. Then divide this new number (neglecting its last figure) by the double of the first figure of the root; annex the quotient to that double, and multiply the number thence arising by the said quotient; and if the product is less than your dividend, or equal to it, that quotient shall be the second figure of the root. But if the product is greater than the dividend, you must take a less number for the second figure of the root than that number. Much after the same manner may the other figures of the quo-

tient be found, if there are more points than two placed over the given number.

To find the square root of 99856, I first point it thus, 99856, then I find the square root of 9 to be 3, which therefore is the first figure of the root. I subtract 9 the square of 3 from 9, and to the remainder I annex the second part 98, and I divide (neglecting the last figure 8) by the double of 3 or 6, and I place the quotient after 6, and then multiply 61 by 1, and subtract the product 61 from 98. Then to the remainder 37, I annex the last part of the proposed number (56) and dividing 3756 (neglecting the last figure 6) by the double of 31, that is by 62, I place the quotient after, and multiplying 626 by the quotient 6, I find the product to be 3756, which subtracted from the dividend, and leaving no remainder, the exact root must be 316.

Examples.

$$\begin{array}{r}
 99856 \sqrt{316} \\
 9
 \end{array}$$

$$\begin{array}{r}
 61)98 \\
 \times 1)61
 \end{array}$$

$$\begin{array}{r}
 626)3756 \\
 \times 6)3756
 \end{array}$$

$$\begin{array}{r}
 \text{o}
 \end{array}$$

$$\begin{array}{r}
 27394756 \sqrt{5234} \\
 25
 \end{array}$$

$$\begin{array}{r}
 102)239 \\
 \times 2)204
 \end{array}$$

$$\begin{array}{r}
 1043)3547 \\
 \times 3)3129
 \end{array}$$

$$\begin{array}{r}
 10464)41856 \\
 \times 4)41856
 \end{array}$$

$$\begin{array}{r}
 \text{o}
 \end{array}$$

$$\begin{array}{r}
 529)23 \\
 4
 \end{array}$$

$$\begin{array}{r}
 43)129 \\
 \times 3)129
 \end{array}$$

$$\begin{array}{r}
 \text{o}
 \end{array}$$

In general, to extract any root out of any given quantity: first range that quantity according to the dimensions of its letters, and extract the said root out of the first term, and that shall be the first member of the root required. Then raise this root to a dimension lower by unit than the number that denominates the root required, and multiply the power that arises by that number itself; divide the second term of the given quantity by the product, and the quotient shall give the second member

member of the root required. Thus to extract the root of the fifth power out of  $a^5 + 5a^4b + 10a^3b^2 + 10a^2b^3 + 5ab^4 + b^5$ , I find that the root of the fifth power out of  $a^5$ , gives  $a$ ; which I raise to the fourth power, and multiplying by 5, the product is  $5a^4$ ; then dividing the second term of the given quantity  $5a^4b$  by  $5a^4$ , I find  $b$  to be the second member; and raising  $a + b$  to the fifth power and subtracting it, there being no remainder, I conclude that  $a + b$  is the root required. If the root has three members, the third is found after the same manner from the

first two considered, as one member, as the second member was found from the first, which may easily be understood from what was said of extracting the square root.

In extracting roots, it will often happen that the exact root cannot be found in finite terms. Thus the square root of

$$a^2 + x^2 \text{ is found to be } a + \frac{x^2}{2a} - \frac{x^4}{8a^3} +$$

$$\frac{x^6}{16a^5} - \frac{5x^8}{128a^7} + \&c. \&c.$$

The operation is thus :

$$\begin{aligned} & a^2 + x^2 \left( a + \frac{x^2}{2a} - \frac{x^4}{8a^3} + \frac{x^6}{16a^5} - \&c. \right) \\ & \underline{2a + \frac{x^2}{2a}} \quad * + x^2 \\ & \quad \times \frac{x^2}{2a} = x^2 + \frac{x^4}{4a^2} \\ & \underline{2a + \frac{x^2}{a} - \frac{x^4}{8a^3}} \quad - \frac{x^4}{4a^2} \\ & \quad \times - \frac{x^4}{8a^3} = - \frac{x^4}{4a^2} - \frac{x^6}{8a^4} + \frac{x^8}{64a^6} \\ & \quad + \frac{x^6}{8a^4} - \frac{x^8}{64a^6}, \&c. \&c. \end{aligned}$$

After the same manner, the cube root of  $a^3 + x^3$  will be found to be  $a + \frac{x^3}{3a^2} -$

$$\frac{x^6}{9a^5} + \frac{5x^9}{81a^8} - \frac{10x^{12}}{243a^{11}} + \&c.$$

The reader will find a general theorem for extracting the root of any binomial under the article BINOMIAL.

The roots of numbers are to be extracted as those of algebraic quantities. Place a point over the units, and then place points over every third, fourth, or fifth figure towards the left hand, according as it is the root of the cube, of the fourth or fifth power that is required; and if there be any decimals annexed to the number, point them after the same manner, proceeding from the place of units towards the right hand. By this means the number will be divided into so many periods, as there are figures in the root required. Then enquire which is the greatest cube, biquadrate, or fifth power in the first period, and the root of that power will give the first figure of the root required. Subtract the greatest cube, biquadrate, or fifth power from the first period, and to the remainder annex the first figure of your second period, which

shall give your dividend. Raise the first figure already found to a power less by unit than the power whose root is sought, that is, to the second, third, or fourth power, according as it is the cube root, the root of the fourth, or the root of the fifth power that is required, and multiply that power by the index of the cube, fourth or fifth power, and divide the dividend by this product, and the quotient will be the second figure of the root required.

Raise the part already found of the root, to the power whose root is required; and if that power be found less than the two first periods of the given number, the second figure of the root is right; but if it be found greater, you must diminish the second figure of the root, till that power be found equal to or less than those periods of the given number. Subtract it, and to the remainder annex the next period, and proceed till you have gone through the whole given number; finding the third figure by means of the two first, as you found the second by the first, and afterwards finding the fourth figure (if there be a fourth period) after the same manner from the three first.

Thus to find the cube root of 13824, point it 13824 : find the greatest cube in 13, *viz.* 8, whose cube root 2 is the first figure of the root required. Subtract 8 from 13, and to the remainder 5 annex 8, the first figure of the second period ; divide 58 by triple the square of 2, *viz.* 12, and the quotient is 4, which is the second figure of the root required, since the cube of 24 gives 13824, the number proposed.

Operation.

$$\begin{array}{r} 13824(24 \\ 8=2 \times 2 \times 2 \\ \hline 3 \times 4=12)58(4 \\ \text{Subtract } 24 \times 24 \times 24=13824 \\ \hline \text{Rem. } 0 \end{array}$$

After the same manner the cube root of 13312053, is found to be 237.

Operation.

$$\begin{array}{r} 13312053(237 \\ 8=2 \times 2 \times 2 \\ \hline 12)53(4 \text{ or } 3 \\ \text{Subtract the cube of } 23=12167 \\ \hline 3 \times 23 \times 23=1587)11450(7 \\ \text{Subtract the cube of } 237=13312053 \\ \hline 0 \end{array}$$

In extracting of roots, after you have gone through the number proposed, if there is a remainder, you may continue the operation by adding periods of cyphers to that remainder, and find the true root in decimals to any degree of exactness required.

For the method of extracting the root of any affected equation. See the article *Quadratic EQUATION*, &c.

**EXTRACTOR**, in midwifery, an instrument, or forceps, for extracting children by the head. See *DELIVERY*.

**EXTRAVAGANTES**, those decretal epistles, which were published after the clementines. See *CLEMENTINES*.

They were so called because, at first, they were not digested, or ranged, with the other papal constitutions, but seemed to be, as it were, detached from the canon law. They continued to be called by the same name when they were afterwards inserted in the body of the canon law. The first extravagantes are those of John XXII. successor of Clement V. the last collection was brought down to the year 1483, and was called the common extravagantes, notwithstanding that

they were likewise incorporated with the rest of the canon law. See the article *DECRETAL*.

**EXTRAVASATION**, in contusions, fissures, depressions, fractures, and other accidents of the cranium, is when one or more of the blood-vessels that are distributed on the dura mater, is broke or divided, whereby there is such a discharge of blood as greatly oppresses the brain, and disturbs its offices ; frequently bringing on violent pains, and other mischiefs ; and at length, death itself, unless the patient is timely relieved. See the articles *CONTUSION*, *FISSURE*, and *FRACTURE*.

If the extravasated quantity of blood be ever so small, it will certainly corrupt, and affect the meninges, and the brain itself, with the same disorder : from hence will proceed violent inflammations, deliriums, ulcers, &c. and even death itself, sooner or later. And this will frequently be the case, after a violent blow upon the cranium, though the bone should escape without any injury. In this case the blood is spilt either between the cranium and dura mater, or between the dura mater and pia mater, or between the pia mater and the brain, or lastly, between the sinuses of the brain. Each of these cases are attended with great danger, but the deeper the extravasation happens, so much greater will the danger be. See the article *WOUND*. You may suspect that blood is extravasated in the cavity of the cranium, from the violence of the symptoms which succeed, if the patient lies still without sense or motion, if blood flows from the mouth or nose, if the eyes are much inflamed and swelled, if vomiting succeeds ; and when upon the remission of these symptoms the patient complains of a remarkable heaviness of the head, a sleepiness, vertigo, blindness, spasms, &c. When the quantity of extravasated blood is very considerable the patient dies on the spot.

If no fissure or contrafissure in the cranium, nor any external injury appear on the head after a violent blow, then, in order to find out in what part of the head the extravasation is seated, it will be proper to shave the head all over, and if no mark of a stagnation of blood appears, cover the head with an emollient plaster, laying over it medicated bags well heated, which will, in a few hours, produce

produce tumour, and softness upon the injured part. See the article **CONTRA-FISSURE**.

When the seat of the injury is discovered, the first intention is to discharge the extravasated blood, for which intent many advise the use of the trepan: but as that should not be attempted, unless in a case of absolute necessity, 'tis best to try first the use of attenuating and dividing medicines. See the articles **TREPAN** and **ATTENUANTS**.

With this intention, open a vein, and draw away as much blood as the strength of the patient will admit; prescribe a brisk purge, or sharp clysters; foment the head with medicated bags, and apply a melilot plaster to it; give frequently attenuating warm fluids: the operation of bleeding must be repeated, especially if the patient is young and athletic.

**EXTRAVASATION of blood betwixt the flesh and the skin**, in phlebotomy, the same with ecchymosis. See **ECCHYMOSES**.

**EXTREMES**, in logic, the terms expressing the two ideas whose relation we enquire after in a syllogism. See the article **SYLLOGISM**.

**EXTREME and mean proportion**, in geometry, is when a line *AB*, (plate **XCIV**. fig. 2.) is so divided in *F*, that the rectangle under the whole line *AB*, and the lesser segment *FB*, is equal to the square of the greater segment *AF*. Let a square be formed upon the line *AB*, and one of its sides *AC* be equally divided in the point *D*; draw *DB*, and take the line *DG* equal to the line *BD*; then the square *AGHF* will be equal to the rectangle *FE*.

For since the line *AC* is equally divided in the point *D*, and is lengthened by the line *AG*, the rectangle *CH*, together with the square of the line *AD*, will (by 6. 2. of each) be equal to the square of the line *DG* or *DB*. But the square *AE*, with the square of the line *AD*, is also equal (47. 1.) to the square of the line *DB*. Therefore the square *AE* is equal to the rectangle *CH*. Taking then away from both the rectangle *CF*, the rectangle *FE* will be equal to the square *FG*.

But no number can be so divided into two parts, as is well demonstrated by **Clavius**, in his commentaries upon lib. 9. of **Euclid**; which is evident enough thus: Let *a* be the number, and *x* the greater part; then the lesser part will

be *a - x*, and so  $aa - ax = xx$ , and thence  $x = \frac{a + a\sqrt{5}}{2}$ . and since the

square root of 5 cannot be had in numbers exactly, it is plain that the value of *x* partly consisting of the square root, multiplied by *a*, cannot be had exactly in numbers neither.

**EXTREME UNCTION**. See **UNCTION**.

**EXTREMUM clausit diem**, in law. See the article **DIEM**.

**EXTRINSIC**, among metaphysicians, is taken in various senses: sometimes it signifies a thing's not belonging to the essence of another; in which sense, the efficient cause and end of a thing are said to be extrinsic. Sometimes it signifies a thing's not being contained within the capacity of another; in which sense these causes are called extrinsic, which introduce something into a subject from without, as when a fire introduces heat. Sometimes it signifies a thing added or applied to another, in which sense accidents and adherents are said to be extrinsic to the subjects to which they adhere. Sometimes the vision is said to be extrinsic from some form which does not exist in that thing, but is adjacent to it, or by some means or other without it. See the article **INTRINSIC**.

**EXULCERATION**, in surgery. See the article **ULCER**.

**EXUVIÆ**, among naturalists, denote the cast off parts, or coverings, of animals, as the skins of serpents, caterpillars, and other insects. See the articles **SERPENT** and **CATERPILLAR**.

Mr. **Reaumur** is very particular in describing the manner in which the caterpillar tribe throw off, or extricate themselves from, their exuviae. See vol. i. of his **History of Insects**, and the article **CATERPILLAR**.

The crab, as is well known, can even throw off its limbs at pleasure, which are again replaced by new ones. See the articles **CANCER** and **CRAB**.

**EXUVIÆ** is also used for the remains of sea-animals, found fossil, and more properly called extraneous, or marine fossils. See the article **FOSFILLS**.

**EYE, oculus**, in anatomy, the organ of sight; or that part of the body, whereby visible objects are represented to the mind. With regard to the eyes, we are to observe first, their situation, which is in the upper part of the face, to the end that

we may be able to see at a greater distance than otherwise we could. Secondly, their figure, which, excepting for the internal parts, is globular; and thirdly, their colour, which in the human species is variable; some being black, others greyish, and others bluish. The parts which do not enter into the composition of the eye, but are destined for the assistance of seeing, are the eye-brows, the eye-lids, and the muscles of the eyes.

The eye-lids, *palpebræ*, are the integuments of the eyes: there are two of them to each, an upper, and an underlid; and, at their joining, there are formed two corners, called *canthi*, an interior and larger, and an exterior and smaller; they are capable of closing and opening at pleasure, by means of muscles. They are composed of the epidermis, the cutis, which is there very thin, and an arched cartilage, called the *tarsus* of the eye-lid; and are lined on the inner surface with a fine and delicate soft membrane, very sensible and continuous to the periorbteum, and to the *albuginea* of the eye.

The eye-lashes, *cilia*, are certain rigid hairs, situated on the arch or tarsus of the eyelids, and bent in a very singular manner; they are destined for keeping external bodies out of the eye, and for moderating the influx of light.

The *glandulæ sebaceæ* are situated in the interior surface of the eye-lids: they serve for the secretion of an oleaginous fluid, which is of great use in preventing the attrition of the eye-lids, from their continual motion. See the articles *SEBACEÆ GLANDULÆ*.

After this we observe the *caruncula lachrymalis*. See the article *CARUNCULA*.

The *glandula lachrymalis* is situated in the orbit, above the smaller angle, with its excretory ducts under the upper eyelid. See the article *LACHRYMALIS*.

The *puncta lachrymalia* are two. See the article *LACHRYMALIA PUNCTA*.

The use of the eye-lids is to cover and defend the eyes; to wipe off foulness from the cornea; to moderate the influx of light, at pleasure; and, by their frequent motion, to occasion a secretion of a necessary fluid from the glands.

The muscles of the eyes, serving to their motions, are in the human frame six in number: four straight, *viz.* the *attollens*, *deprimens*, *adductor*, and *ab-*

*ductor*; and two oblique, the superior and inferior. See the articles *MUSCLE* and *ATTOLLENS*, &c.

Between, and among these, there is a considerable quantity of fat serving for various very important purposes.

The proper parts of the eye, which form its globe, or bulb, are its coats, or tunics, the humours and the vessels.

The coats of the eye are several, 1. The *albuginea*, *adnata*, or *conjunctiva*. 2.

The *cornea*. 3. The *sclerotic*, in which what is called the *aquæducts* of Nuck are to be observed. 4. The *choroides*.

5. The *uvea*; wherein we are to observe,

1. Its anterior coloured surface, called the *iris*, which is intirely vascular, and from which arises the variety of colours in the human eyes. 2. The *pupil* or

*foramen*, which is round in the human eye, is nearly in the middle of the *iris*, and is capable of dilatation and

contraction. 3. Its posterior surface, which is black, and in which, when this blackness is cleared away, there appears

the sphincter of the pupil, formed of circular fibres for contraction; the ciliary

fibres, or processes for the dilatation of the pupil; the ciliary ligament for the

motion of the vitreous and crystalline humours; the arterial and venal circles,

from which the vessels are in a wonderful manner distributed over the *uvea*; the

*choroides*; the *ligamentum ciliare*; and the vitreous and crystalline humours;

the *ductus nigri*, so called from their black colour, placed between the processes and the *legamentum ciliare*; the

space between the *uvea* and the *cornea*, called the anterior camera of the eye;

and that between the *uvea* and the crystalline, called its posterior camera,

which is either much smaller or intirely wanting. Many authors have attributed

glands to the *uvea*, but they are very difficult to be distinguished, if there be

any. See the articles *ALBUGINEA*, *CORNEA*, *SCLEROTIC*, &c.

Finally, we are to mention the *retina*, which is a very delicate, tender, and,

as it were, mucous coat of the eye; or, more properly, it is only an expansion

of the optic nerve at the bottom of the eye: it is a primary part of the eye,

and the great organ of vision; for the sake of which all the rest were formed.

See the article *RETINA*.

The humours of the eye are generally established to be three; their office is to

serve

serve for the expansion of the coats, and for the refraction of the rays of light, they are distinguished by the name of aqueous, vitreous, and crystalline. See the articles **AQUEOUS**, **VITREOUS**, and **CRYSTALLINE**.

After these three humours of the eye, we observe the tunica arachnoides: this is an extremely thin and fine vasculous membrane, which furrounds the crystalline and the vitreous humour, and by the assistance of which the crystalline lens is lodged in the fovea of the vitreous humour. On the cutting or breaking of this membrane, the crystalline falls out.

The blood-vessels are next to be considered: these are distributed in an amazing manner through the internal parts of the eye. Arteries from the internal and external carotids go to the eye in many different parts. There are also numbers of extremely minute ones, which convey only a fine and subtle lymph thither, by which means the tunics and humours of the eye are nourished; the veins partly carry the blood back to the sinuses of the dura mater, and partly to the jugulars.

Besides these vessels, Valsalva assures us, that he discovered a number of true and proper lymphatics in the eye of an ox.

The nerves of the eye are very numerous: besides the optic nerve, which, by its expansion forms the retina, and enters the eye from the side of the nose, there are the third and fourth pair of the brain, and a fifth and sixth branch distributed about the muscles, membranes, eyelids, and lachrymal sacculus and gland. See the article **NERVE**.

*Motions of the EYE* are either external or internal. The external motion is that performed by its four straight and two oblique muscles, whereby the whole globe of the eye changes its situation or direction. The spherical figure of our eyes, and their loose connection to the edge of the orbit, by the tunica conjunctiva, which is soft, flexible and yielding, does excellently dispose them to be moved this, or the other way, according to the situation of the object we would view. By the membranes already described, the eye is connected to the edge of the orbit, which being soft and flexible, they do in such a manner, as not in the least to impede its necessary motions; and that great quantity of fat placed all round the globe, betwixt it

and the orbit, lubricates and softens the eye, and renders its motions more easy: hence arise the three following remarkable observations. 1. When nature has denied the head any motion, it is observable, that she has, with great care and industry, provided for this defect. To this purpose belongs the surprizing beautiful and curious mechanism observable in the immovable eyes of flies, wasps, &c. They nearly resemble two protuberant hemispheres, each consisting of a prodigious number of other little segments of a sphere, all which segments are perforated by a hole, which may be called their pupil, in which this is remarkable, that every foramen, or pupil, is of a lenticular nature, so that we see objects through them topsy-turvy, as through so many convex glasses: yea, they become a small telescope, when there is a due focal distance between them, and the lens of the microscope by which they are viewed. Leuwenhoek's observations make it probable, that every lens of the cornea supplies the place of the crystalline humour, which seems to be wanting in those creatures, and that each has a distinct branch of the optic nerve answering to it, upon which the images are painted, so that as most animals are binocular, and spiders for the most part octonocular, so flies, &c. are multocular, having in effect as many eyes as there are perforations in the cornea, by which means, as other creatures but with two eyes are obliged, by the contraction of the muscles above enumerated, to turn their eyes to objects, these have some or other of their pupils always ready placed towards objects nearly all around them: whence they are so far from being denied any benefit of this noble and most necessary sense of sight, that they have probably more of it than other creatures, answering to their necessities and ways of living.

II. As in man, and most other creatures, the eyes are situated in the head, because, among other reasons, it is the most convenient place for their defence and security, being composed of hard bones, wherein are formed two large, strong sinuses, or sockets, commonly called orbits, for the convenient lodging of these tender organs, and securing them against external injuries; so in those creatures whose head, like their eyes and the rest of their body, is soft and without bones, nature hath provided for this

this necessary and tender organ, a wonderful kind of guard, by enduing the creature with a faculty of withdrawing his eyes into his head, and lodging them in the same safety within his body. We have a very beautiful example of this in snails, whose eyes are lodged in four horns, like atramentous spots, one at the end of each horn, which they can retract at pleasure, when in any danger. Here it may be also observed, that the hardness of the cornea in all animals that want eyelids, as fishes, exactly resembles the horn of a lanthorn; and therefore is not hurt by such particles as their eyes are commonly exposed to. And in the mole, because this animal lives under ground, it was necessary its eyes should be well guarded and defended against the many dangers and inconveniencies to which its manner of living exposes it; this is the reason why its eyes are so small, and that they are situated so far in the head, and covered so strongly with hair; and besides they can protrude, and retract them at pleasure.

III. The third and last reflection we shall make upon the external motion of our eyes, is what regards a problem which has very much perplexed both physicians and philosophers, *viz.* What is the cause of the uniform motion of both eyes.

In some creatures, such as fishes, birds, and among quadrupeds, the hare, cameleon, &c. the eyes are moved differently; the one towards one object, and the other towards another. But in man, sheep, oxen, and dogs, the motions are so uniform, that they never fail to turn both towards the same place: hence in operations upon the eye that require it to be kept immoveable, sometimes it is necessary to tie up the sound eye with a compress, by which means the other is easier kept fixed and immoveable.

The final cause of this uniform motion is, 1. That the sight may be thence rendered more strong and perfect: for since each eye apart impresses the mind with an idea of the same object, the impression must be more strong and lively, when both eyes concur; and that both may concur, it is necessary that they move uniformly; for though the retina, or immediate object of vision, be expanded upon the whole bottom of the eye, as far as the ligamentum ciliare, yet nothing is clearly and distinctly seen,

but what the eye is directed to. 2. A second advantage we reap from the uniform motion of the eyes, which is more considerable than the former, consists in our being thereby enabled to judge with more certainty of the distance of objects. See the article VISION.

There is yet another advantage, full as considerable as any of the former, that is thought to arise from the uniform motion of our eyes, and that is, the single appearance of objects seen with both our eyes; which, though at first view it does not appear probable, is true: for if in looking at an object, you impress one of your eyes aside with your finger, and alter its direction, every thing will be seen double.

By the internal motions of the eye, we understand those motions which only happen to some of its internal parts, such as the crystalline and iris; or to the whole eye, when it changes its spherical figure, and becomes oblong or flat. The internal motions of our eyes are either such as respect the change of conformation, that is necessary for seeing distinctly, at different distances, or such as only respect the dilatation and contraction of the pupil.

That our eyes change their conformation, and accommodate themselves to the various distances of objects, will be evident to any person, who but reflects on the manner and most obvious phenomena of vision.

Authors are very much divided in their opinions with regard to the mechanism by which this change is introduced, as well as what parts it consists in: for some are of opinion, that the whole globe changes its form, by being lengthened into an oblong figure, when objects are near, and by becoming flat, when they are removed to a greater distance; and others are of a quite contrary opinion.

With regard to the change of the crystalline, and the mechanism by which it is produced, some maintain, that according as objects are at different distances, this humour becomes more or less convex, which does indeed very well account for distinct vision at all distances; for objects painted on a sheet of white paper, by means of a lens placed in the hole of a window-shutter, in a dark room, have their images always distinct, at whatever distance they be from the window, provided that the lens be of a convexity

convexity answerable to that distance. See the article *LENS*, &c.

Others again are of opinion that the crystalline never changes its figure, but that it is moved to and from the retina, according to the distance or proximity of the object in view, and this also does equally well account for the distinct appearance of objects at all distances, as is evident from the laws of optics. See the articles *VISION* and *OPTICS*.

*Diseases of the EYE* are, an ophthalmia, or inflammation of the eyes; the gutta serena, or amaurosis; a suffusion, or cataract; an ectropium; a glaucoma; an amblyopia, or obscurity of sight, containing the myopia, the presbytopia, the nyctalopia, and the amaurosis; the strabismus, or squinting; an unguis, pannus, or pterygium of the membrane of the eye; the albugo, leucoma, or spot in the eye; a fucillation of the eye; an epiphora, or rheum in the eyes, and the fistula lachrymalis. See each disease under its respective name.

*Atoms and flies appearing before the EYES.*

These images, or appearances, arise before the eyes from an obstruction of the optic nerve, from the fine fibres of the retina, or from the small veins contained therein, that is, they seem to be too much dilated, and are cured with difficulty; and especially if they are inveterate, because they are not seldom the forerunners of a gutta serena; in the beginning they may be cured with such things as open obstructions, especially those medicines mentioned in the cure of the gutta serena. See *GUTTA SERENA*.

*Defluxion on the EYE.* For a watery eye, if it arises from a weakness of the lachrymal gland, it will be proper to use strengtheners externally, as spirit of wine, Hungary water, spring water, fennel, or Valerian water, wherewith the parts adjoining are to be washed. Internally the abounding serum must be evacuated, or revulsed: if it be too sharp, it must be corrected by balsamics, and medicines against catarrhs, such as essence of amber, and decoction of the woods. The revulsion must be made by blisters and issues.

*Wounds in the EYES.* If the eye is wounded, but not so as to let out the vitreous or crystalline humour, the following method will be of great service. The wound should be anointed, two or three times in a day, with a feather, or fine rag, well dipped in unguentum alabastrinum;

and afterwards, a small compress laid over it, being well saturated with a collyrium, made of the whites of two eggs, two ounces and a half of rose water, half a drachm of oil of roses, and three grains of camphor, well mixed together. The bowels should also be kept loose for some days, with cooling and opening medicines: if the patient is of a plethoric habit, blood should be drawn from the neck or feet; all warm or sharp things should be thrown out of the patient's diet, and great care taken to keep him quiet. When the crystalline humour sticks in the orifice of the wound, it should be pulled out, that it may not bring on any deformity, or other mischief. When the vitreous and crystalline humours are fallen out of the eye, not only the sight but figure of the eye must be entirely destroyed, therefore, at first, it should be dressed with compresses dipped in warm wine, and afterwards with some vulnerary balsam.

*Contusions of the EYE.* When the eye is contused by any accident, it will be entirely deprived of sight, except the contusion is very small, and proper remedies are instantly applied. If the eye therefore has received a slight contusion, you may wash it frequently, for the first day, with cold spring water, covering it with linnen rags, wet with the same. On the next day, rub it externally with camphorated spirit of wine, covering it with stupps wrung out of vinous decoctions of eye-bright, speedwell, hyssop, sage, camomile - flowers, and fennel - seeds. If you cannot get these herbs, apply bolsters dipped in warm wine, renewing them often. If the contusion is large, or the patient of a plethoric habit, you must open a vein.

*To extract bodies fallen into the EYE.* See the article *EXTRACTION*.

*Scarification of the EYES.* See the article *SCARIFICATION*.

*Falling out of the EYE.* See the article *PROLAPSUS OCULI*.

*EYE-BROW.* See the article *BROW*.

*Artificial EYE,* a kind of camera obscura. See *CAMERA OBSCURA*.

*EYE,* in architecture, is used to signify any round window, made in a pediment, an attic, the reins of a vault, or the like.

*EYE of a dome,* an aperture at the top of a dome, as that of the Pantheon at Rome, or of St. Paul's at London: it is usually covered with a lanthorn.

**EYE of the volute**, in architecture, is the center of the volute, or that point in which the helix, or spiral of which it is formed, commences: or it is the little circle in the middle of the volute, in which are found the thirteen centers for the describing the circumvolutions of it.

**EYE-BROW**, in architecture, is used in the same sense as *list* or *fillet*. See **FILLET**.

**EYE**, in agriculture and gardening, signifies a little bud, or shoot, inserted into a tree, by way of graft.

**EYE of a tree**, a small pointed knot to which the leaves stick, and from which the shoots or sprigs proceed.

**EYE-BRIGHT**. See **EUPHRASIA**.

**EYE of a pear**, the extremity opposite to the stalk.

**EYE-FLAP**, in the manege, a little piece of leather, that covers the eye of a coach-horse.

**EYE of the branch of a bridle**, the uppermost part of the branch, which is flat, with a hole in it, for joining the branch to the head-stall, and for keeping the curb fast.

**EYE of a bean**, in the manege, a black speck or mark in the cavity of the corner-teeth, which is formed there about the age of five and a half, and continues till seven or eight. See **TEETH**.

**EYE of the anchor**, on board a ship, the hole wherein the ring of the anchor is put in to the shank.

**EYE of the strap**, on board a ship, the ring or round which is left of the strap to which any block is seized. See **STRAP**.

**EYE**, in printing, is sometimes used for the thickness of the types; or more properly, it signifies the graving in relief on the top of the letter, otherwise called its face: the eye of the *e* is the small opening at the head of that letter, which distinguishes it from the *c*.

**EYE**, among jewellers, is used for the lustre and brilliancy of precious stones, more commonly called the *water*. See **WATER**.

**Bull's EYE**, in astronomy, the same with *aldebaran*. See **ALDEBARAN**.

**EYE-GLASS**, in the microscope. See the article **MICROSCOPE**.

**Cat's EYE**, in natural history, the same with *asteria*. See the article **ASTERIA**.

**Crab's EYE**. See the article **CRAB'S EYES**.

**Goat's EYE**, the same with *ægias*. See the article **ÆCIAS**.

**Hare's EYE**. See **LAGOPHTHALMIA**.

**EYEMOUTH**, or **AYMOUTH**, a port-town of Scotland, about six miles north of Berwick.

**EYERY**, or **AIRY**. See **AIRY**.

**EYESS**, or **NYESS**, among sportsmen, denotes a young hawk just taken out of the nest, and not able to prey for herself. See the article **HAWK**.

**EYNDHOVEN**, a town of dutch Brabant, about fifteen miles south of Boisleduc.

**EYRAC**, or **IZACA-ARABIC**, a province of Asiatic Turkey, situated on the river Euphrates, being the antient Chaldea or Babylonia.

**EYRAC**, or **IRAC-AGEM**, the antient Parthia, now the principal province of Persia, is situated almost in the center of that kingdom, its capital city being Isfahan, the metropolis of the whole kingdom.

**EYRE**, or **EIRE**, in law, the court of itinerant justices. See **JUSTICES**.

**EYSENACH**, a city of Germany, in the circle of upper Saxony: east lon. 10° 12', and north lat. 51°.

**EZAN**, in the mahometan theology, a hymn containing the profession of their faith, which is repeated five times a day, to call the people to prayers.

**EZEKIEL**, a canonical book of the Old Testament, referring chiefly to the degenerate manners and corruptions of the Jews of those times.

It abounds with fine sentences and rich comparisons, and discovers a good deal of learning in profane matters.

Ezekiel was carried captive to Babylon with Jeconiah, and began his prophecies in the fifth year of the captivity. He was cotemporary with Jeremiah, who prophesied at the same time in Judea. He foretold many events, particularly the destruction of the temple, the fatal catastrophe of those who revolted from Babylon to Egypt, and the happy return of the Jews to their own land.

**EZEKIEL'S REED**, or **ROD**, a measure of length mentioned by that prophet, and computed to be nearly equal to two english feet.

**EZRA**, a canonical book of the Old Testament, comprehending the history of the Jews from the time of Cyrus's edict for their return, to the twentieth year of Artaxerxes Longimanus. It specifies the number of Jews who returned, and Cyrus's proclamation for the rebuilding the temple, together with the laying its foundation, the obstructions it met with, and the finishing thereof in the reign of Darius. The illustrious author of this book, was also the restorer and publisher of the canon of the Old Testament. See the articles **CANON** and **BIBLE**.

*Fig. 1. FABER.*

*Fig. 2. FAGONIA.*

*Fig. 3. FALCINELLUS.*

*T. Jefferys sculp.*

## F.

**F**, the sixth letter of the alphabet, and fourth consonant, is by some reckoned a mute, and by others a semi-vowel: it has much the same sound with the greek  $\phi$ , or *ph* in english words, and is only written in words of latin origin, *ph* being used instead of it in those derived from the Greek.

Suetonius tells us, that the emperor Claudius invented the *f*, and two other letters; and that it had the force of *v* consonant, and was wrote inverted *d*.

As a numeral, *F* denotes 40, and with a dash over it thus  $\bar{F}$ , 40000: in music, it stands for the bass clef; and frequently for *forte*, as *ff* does for *forte forte*. See the articles CLEF and FORTE.

*F*, in medicine, stands for *fiat*, let it be done: thus *F. S. A.* stands for *fiat secundum artem*, let it be done according to art.

As an abbreviation, *F* stands for *filius*, *fel-low*, and the like: thus *F. R. S.* signifies fellow of the royal society.

*FA*, in music, one of the syllables invented by Guido Aretine, to mark the fourth note of the modern scale, which rises thus, *ut, re, mi, fa*. See the articles NOTE and GAMUT.

Musicians distinguish two *fa*'s *viz.* the flat, marked with a *b*, or  $\flat$ ; and the sharp or natural, marked thus  $\sharp$ , and called bquadro. See BQUADRO.

*FA FINTO*, a feigned *F*, or a feint upon that note: this is the case of every note that has the mark  $\flat$  before it; but more especially *mi* and *fi*, or our *E* and *B*, and is what we commonly call the flat of any note. See the article FLAT.

*FABA*, the BEAN, in botany, is comprehended by Linnæus among the *vicæ*. See the articles VICIA and BEAN.

*FABA ÆGYPTIACA*, EGYPTIAN BEAN, a kind of nymphæa, the root of which is accounted stomachic and astrigent.

*FABA BENGALENSIS*, in the materia medica, a roundish compressed substance, about an inch in diameter, brought from Bengal, and thought to be a vitiated fruit of the myrobalans-kind. It is a very good astrigent, and therefore prescribed with great success in fluxes and hæmorrhages.

*FABA STI. IGNATII*, *ST. IGNATIUS'S* BEAN, in the materia medica, a dry and hard fruit, or rather kernel, prescribed with good success in vertigos, lethargies, epilepsies, asthmas, quartan agues, and worms, but should be used with great caution. It is given in powder, 10 or 12 grains being the dose, when intended to vomit the patient. In smaller quantities it acts as a sudorific. Its tincture is safe even for children, and is said to be one of the best medicines for their convulsions, and other disorders arising from obstructions of the primæ viæ.

*FABA PURGATRIX*, the fruit of a species of ricinus. See the article RICINUS.

*FABAGO*, in botany, the same with the zygophyllum. See ZYGOPHYLLUM.

*FABARIA*, in botany, a name given to the telephium or orpine. See TELEPHIUM.

*FABER*, in ichthyology, a fish of the zeus-kind, called in english doree, or john dory. See the article ZEUS.

It is distinguished from the other species of zeus by its prickly belly, and ragged appearance. Its usual length is from six to ten inches, and its breadth nearly half its length. See plate XCV. fig. 1.

*FABIANS*, *fabii*, in roman antiquity. See the article LUPERCALIA.

*FABLE*, *fabula*, a tale or feigned narration, designed either to instruct or divert, disguised under the allegory of an action, &c.

Fables were the first pieces of wit that made their appearance in the world, and have been still highly valued, not only in times of the greatest simplicity, but among the most polite ages of the world. Jotham's fable of the trees is the oldest that is extant, and as beautiful as any that have been made since. Nathan's fable of the poor man is next in antiquity, and had so good an effect as to convey instruction to the ear of a king. We find Æsop, in the most distant ages of Greece; and in the early days of the roman commonwealth, we read of a mutiny appeased by the fable of the belly and the members. As fables had their rise in the very infancy of learning, they never flourished more than when learning was at its greatest height; witness HORACE, Boileau, and Fontaine. See APOLOGUE.

**FABLE** is also used for the plot of an epic or dramatic poem, and is, according to Aristotle, the principal part, and, as it were, the soul of a poem. See the articles **DRAMA** and **EPIC**.

In this sense the fable is defined to be a discourse invented with art, to form the manners by instruction, disguised under the allegory of an action. Aristotle divides the fable into simple and compound: the simple having no change of fortune; and the compound having a turn from bad fortune to good, and from good to bad. The contrivance of each fable must have two parts, the intrigue and the discovery. The compound fable, according to Aristotle, pleases most, as having most variety.

Lord Bacon observes that the use of allegorical poetry is to envelope things, whose dignity deserves a veil, as when the secrets and mysteries of religion, policy, and philosophy are wrapped up in fables and parabols. Others are of opinion that fable is so essential to poetry, that there is no poetry without it; the fable being as much the form and distinction of a poem, as the figure is to a piece of marble to denominate it a statue. It is requisite towards the perfection of a fable, that it be admirable and probable: however admirable the fable is, it can have no effect if it is not probable; and probability alone is too faint and dull for poetry, as what is only admirable is too extravagant and dazzling. It is, therefore, of the utmost importance to be able to know how to mingle these in such a just temperament as may please the fancy, without shocking the reason. The admirable is all that which is against the ordinary course of nature; the probable is whatever suits with the common opinion: but the most part of poets, by too great a passion to create admiration, take not sufficient care to temper it with probability. Almost all the antient poets, however judicious otherwise, have been guilty of this fault, not to speak of the moderns.

**FABRIC**, in general, denotes the structure or construction of any thing; but particularly of buildings, as a church, hall, house, &c. See **BUILDING**.

**FABRIC-LANDS**, those formerly given towards rebuilding or repairing of cathedrals and other churches; for antiently almost every body gave more or less, by his will, to the fabric of the parish-church where he dwelt,

**FABULOUS**, something consisting of, or connected with a fable. See **FABLE**.

**FABULOUS AGE**, among antient historians. See the article **AGE**.

**FAC**, an abbreviation of *facciata*.

**FACADE**, in architecture. See **FACE**.

**FACCIATA**, among italian musicians, signifies a shortened page.

**FACE**, *facies*, or *vultus*, in anatomy, comprehends all that part of the head which is not covered with the common long hair. See the article **HEAD**.

Of the parts common to the whole face are, 1. The epidermis and cutis, or skin, the colour and fineness of which constitutes the principal beauty of the face. 2. The fat, which being in considerable quantity, and frequently covered with a fleshy pannicle, adds much to the beauty of the face. The parts proper to particular parts of the face are the muscles and bones, which are described in their proper places: besides which, we may likewise refer to the face, the organs of the senses of seeing, hearing, talking, and smelling. See the articles **EYE**, **EAR**, **NOSE**, **PALATE**, **MOUTH**, **TONGUE**, &c.

To these may be added the forehead, cheeks, temples, &c. See **FOREHEAD**, **CHEEKS**, &c.

The chin is nothing but the angle of the lower jaw, with its fleshy integuments. See the article **MAXILLA**.

**FACE**, or **FACADE**, in architecture, the front of a building, or the side which contains the chief entrance. Sometimes, however, it is used for whatever side presents to the street, garden, court, &c. or is opposite to the eye.

**FACE of a stone**, in masonry, that superficies of it which lies in the front of the work. The workmen generally choose to make one of those sides the face, which, when in the quarry, lay perpendicularly to the horizon, and consequently the breaking, not the cleaving way of the stone.

**FACE**, in fortification, an appellation given to several parts of a fortress, as the face of a bastion, &c. See **BASTION**.

The face of a place is the front comprehended between the flanked angles of two neighbouring bastions, being composed of a curtain, two flanks, and two faces; and is likewise called the *tenaille* of a place. In a siege, the attacks are carried on against both bastions, when the whole *tenaille* is attacked.

**Prolonged FACE**, that part of the line of defence-*razant*, which is between the angle of the shoulder and the curtain, or the

the line of defence-razant, diminished by the length of the face.

**FACE of a gun**, the superficies of the metal at the extremities of the muzzle of the piece.

**FACE**, in the military art, a word of command, intimating to turn about: thus, *face to the right*, is to turn upon the left heel a quarter-round to the right; and, *face to the left*, is to turn upon the right heel a quarter-round to the left.

**FACE of plants**, among botanists, signifies their general appearance, which, being nearly the same in plants of the same genus, serves to distinguish them at first sight. See **BOTANY**, **PLANT**, &c. The same term, *face*, *facies*, is used by other naturalists to denote the like resemblance among other objects, as fishes, birds, &c. However, it is proper to remark, that this resemblance is too fallacious to serve as a general character; since things, belonging to very different genera, are sometimes found to be very like each other in external appearance.

**FACET**, or **FACETTE**, among jewellers, the name of the little faces or planes to be found in brilliant and rose diamonds. See the article **DIAMOND**.

**FACETANUS LACERTUS**, the same with the tarantula. See **TARANTULA**.

**FACIA**, or **FASCIA**. See **FASCIA**.

**FACIES**, **FACE**. See the article **FACE**.

**FAK**, or **FAKE**. See the article **FAKE**.

**FACTION**, a cabal or party formed in a state, city, or company.

**FACTION**, in antiquity, a name given to the different companies of combatants in the circus. They were four, *viz.* the white, the red, the green, and the blue; to which Domitian added another of purple colour. They were so denominated from the colour of the liveries they wore, and were dedicated, according to M. Aur. Cassiodorus, to the four seasons of the year, the green being consecrated to spring, the blue to winter, the red to summer, and the white to autumn. It appears from ancient inscriptions, that each faction had its procurators and physician; and from history, that party-rage ran so high among them, that in a dissension between two factions, in the time of Justinian, almost forty thousand men lost their lives in the quarrel.

**FACTITIOUS**, any thing made by art, in opposition to what is the produce of nature. Thus, factitious cinnabar is opposed to native cinnabar. See the article **CINNABAR**.

**FACTOR**, in commerce, is an agent or correspondent residing beyond the seas, or in some remote part, commissioned by merchants to buy or sell goods on their account, or assist them in carrying on their trade.

A factor receives from the merchants, his constituents, in lieu of wages, a commission or factorage, according to the usage of the place where he resides, or the business he transacts, this being various in different countries, and on the purchases and sales of different commodities. He ought to keep strictly to the tenor of his orders, as a deviation from them, even in the most minute particular, exposes him to make ample satisfaction for any loss that may accrue from his non-observance of them: and it is very reasonable it should be so, as the distance of his situation renders him unable to judge of his principal's views and intention. When unlimited orders are given to factors, and they are left to sell or buy on the best conditions they can, whatever detriment occurs to their constituents, they are excused, as it is to be presumed they acted for the best, and were governed by the dictates of prudence. But a bare commission to sell is not sufficient authority for the factor to trust any person, wherefore he ought to receive the money on the delivery of the goods; and, by the general power, he may not trust beyond one, two, or three months, &c. the usual time allowed in sales, otherwise he shall be answerable out of his own estate. If a factor sells on the usual trust to a person of good credit, who afterwards becomes insolvent, he is discharged; but not if the man's credit was bad at the time of sale. If a factor give a man time for payment of money contracted on sale of his principal's goods, and, after that time is elapsed, sell him goods of his own for ready money, and the man becomes insolvent, the factor in equity ought to indemnify his principal, but he is not compellable by the common law. A factor should always be punctual in the advices of his transactions, in sales, purchases, freights, and more especially in draughts by exchange: he should never deviate from the orders he receives in the execution of a commission for purchasing goods, either in price, quality, or kind; and if, after goods are bought, he sends them to a different place from what he was directed to, they must remain for his own account, except the merchant, on advice

advice of his proceedings, admits them according to his first intention. A factor that sells a commodity under the price he is ordered, shall be obliged to make good the difference: and if he purchases goods for another at a price limited, and afterwards they rise, and he fraudently takes them for his own account, and sends them to another part, in order to secure an advantage that seemingly offers, he will, on proof, be obliged, by the custom of merchants, to satisfy his principal for damages. If a factor, in conformity with a merchant's orders, buys with his money, or on his credit, a commodity he shall be directed to purchase; and, without giving advice of the transaction, sells it again to profit, and appropriates to himself the advantage, the merchant shall recover it from him, and besides have him amerced for his fraud. When factors have obtained a profit for their principal, they must be cautious how they dispose of it; for if they act without commission, they are responsible: and if a merchant remits goods to his factor, and about a month after draws a bill on him, the factor, having effects in his hands, accepts the bill, then the principal breaks, and the goods are seized in the factor's hands for the behalf of the creditors, it has been conceived the factor must answer the bill notwithstanding, and come in a creditor for so much as he was obliged, by reason of his acceptance, to pay. A factor who enters into a charter-party with a master for freight, is obliged by the contract; but if he loads aboard generally, the principal and the lading are liable for the freightment, and not the factor. If a factor, having money in his hands belonging to his principal, neglect to insure a ship and goods, according to order, if the ship miscarry, the factor, by the custom of merchants, shall make good the damage; and if he make any composition with the insurers after insurance, without orders so to do, he is answerable for the whole insurance. As fidelity and diligence are expected from the factor, so the law requires the like from the principal; if, therefore, a merchant remits counterfeit jewels to his factor, who sells them as if true; if he receive loss or prejudice by imprisonment or other punishment, the principal shall not only make full satisfaction to the factor, but to the party who bought the jewels.

What is here said of factors, is meant of such as reside abroad to act for merchants, and may be applied to supercargoes, who go a voyage to dispose of a cargo, and afterwards return with another to their principals: but it is also the custom of the merchants of the highest credit throughout the world, to act mutually in the capacity of factors for each other. The business so executed is called commission-business, and is generally desirable by all merchants, provided they have always effects in their hands, as a security for all the affairs which they transact for the account of others. And this class of traders of established reputation, have current as well as commission account, constantly between them, and draw on, remit to, and send commissions to each other only by the intercourse of letters which, among men of honour, are as obligatory and authoritative as all the bonds and ties of law.

**FACTOR**, in multiplication, a name given to the multiplier and multiplicand, because they constitute the product. See the article **MULTIPLICATION**, &c.

**FACTORAGE**, called also commission, is the allowance given to factors by the merchant who employs them. The gain of factorage is certain, however the voyage or sale prove to the merchant: but the commissions vary; at Jamaica, Barbadoes, Virginia, and most of the western parts of the world the commission runs at  $8 \text{ per cent.}$  generally through Italy,  $2 \frac{1}{2}$ ; in France, Spain, and Portugal, &c. 2; and in Holland, and other places near home,  $1 \frac{1}{2} \text{ per cent.}$

**FACTORY** is a place where a considerable number of factors reside, to negotiate for their masters or employers. See the article **FACTOR**.

The most considerable factories belonging to the British are those established in the East-indies, Portugal, Turkey, &c.

**FACTUM**, in arithmetic, the product of two quantities multiplied by each other.

**FACULÆ**, in astronomy, certain bright and shining parts, which the modern astronomers have, by means of telescopes, observed upon or about the surface of the sun: they are but very seldom seen. See the article **SUN**.

**FACULTY**, in law, a privilege granted to a person, by favour and indulgence, of doing what, by law, he ought not to do.

For granting these privileges, there is a court under the archbishop of Canterbury,

bury, called the court of the faculties, the chief officer whereof is styled master of the faculties; who has a power of granting dispensations in divers cases, as to marry without the bans being first published; to eat flesh on days prohibited; to ordain a deacon under age; for a son to succeed his father in his benefice; a clerk to hold two or more livings, &c.

**FACULTY**, in the schools, a term applied to the different members of an university, divided according to the arts and sciences taught there: thus in most universities there are four faculties, *viz.* 1. Of arts, which include humanity and philosophy. 2. Of theology. 3. Of physic. And, 4. Of civil law. The degrees in the several faculties in our universities are those of bachelor, master, and doctor. See the articles **DEGREE**, **BACHELOR**, &c.

**FACULTY of advocates**, a term applied to the college or society of advocates in Scotland, who plead in all actions before the court of session. They meet in the beginning of every year, and choose the annual officers of the society, *viz.* dean, treasurer, clerks, private and public examiners, and a curator of their library. The manner of admission into the faculty of advocates is by a trial in the civil law, and scotch law: the person desiring to be admitted, having, upon petition, obtained a recommendation to the dean of the faculty, he giveth a remit to the private examiners, who are nine in number, and who, after their election, having divided the body of the civil law into nine parts, each taking one, appoint a diet for examination: in this diet there must be at least seven present, each of whom examines the candidate; and the question being afterwards put, Qualified, yea or no? they give their opinion by balloting, upon which the candidate is either admitted by signing his petition, or remitted to his studies. After the private trial, the dean of the faculty assigns the candidate a title of the civil law, for the subject of a thesis, which being distributed among the advocates, the faculty meet on a day appointed, when three at least of fifteen public examiners dispute against the thesis; and afterwards the faculty give their opinions by balloting, as in the private trial. If the candidate is found qualified, the dean assigns him a law for an harangue before the lords, which harangue being made, he is admitted a member of the faculty, upon paying the fees, taking the oaths to the

government, and an oath to be faithful in his office.

**FACULTY** is also used to denote the powers of the human mind, *viz.* understanding, will, memory, and imagination. See the articles **UNDERSTANDING**, &c.

The doctrine of the use and objects of the mental faculties, says lord Bacon, has two parts well known, *viz.* logic and ethics, the one producing resolutions and the other actions. The imagination, indeed, on both sides performs the office of agent or ambassador, and assists alike in the judicial and ministerial capacity. Wolfius, in his *Analyt. Psycholog.* after establishing the existence of the soul, considers it with respect to its faculty of understanding, which he distinguishes into superior and inferior. The inferior comprehends perception, the source of ideas, thought, imagination, the power of feigning, memory, forgetfulness, and recollection. The superior part of the faculty of understanding consists in attention and reflection, in understanding in general, and its three operations in particular, and in the natural dispositions of the understanding. The second general faculty of the soul, is that of desiring an object, considered as a good; from whence results the contrary determination, when it is looked upon as an evil. This faculty he also distinguishes into inferior and superior: the first is nothing else than the sensitive appetite, the desire or aversion we entertain for objects, when we allow ourselves to be guided by the confused ideas of our senses; hence arise the passions: the superior part is the will, considered so far as it is determined by distinct ideas, exempt from all mechanical impressions; and the use we make of this power of determining, is liberty.

**FÆCES**, in chemistry, the gross matter, or sediment, that settles at the bottom after distillation, fermentation, and the like.

The fæces of wine are more generally known by the name lees. See **LEES**.

**FÆCES**, in medicine, the excrements voided by stool. See **EXCREMENT**.

**FÆCULA**, in pharmacy, a form of medicine, consisting of the fæces of vegetable juices, principally those of roots; the manner of making which may be gathered from the following example, as ordered in the college dispensatory. To make a fæcula of bryony, take the roots of that plant, any quantity; let them be scraped small with a knife, and squeeze

out

out their juice with a press; after standing a few hours, in vessels that are without any motion, there will be a white sediment like starch, and it must be dried in glazed pans, after the watery part is poured off by inclination.

After the same manner is prepared the *fæcula* of arum, wild radish, orrize, and the like.

**FÆCULENT**, in general, is applied to things abounding with fæces, or dregs: thus the blood and other humours of the human body, are said to be fæculent, when without that purity which is necessary to health.

**FÆNUGREEK**, or **FOENUGREEK**. See the article **FOENUGREEK**.

**FAENZA**, a city and bishop's see of Italy, situated in the pope's territories, about thirty miles east of Bologna: east long.  $12^{\circ} 38'$ , and north lat.  $44^{\circ} 30'$ .

**FÆTOR**, or **FOETOR**. See **FOETOR**.

**FAGARA**, in the materia medica, a fruit brought from the East-indies, much resembling the cubeb. This fruit is a berry, the exterior bark whereof is black and dusky, of an acrid aromatic taste: this berry, when ripe, being cut open, exhibits a dark, shining, solid seed, without either taste or smell. It is recommended against frigidities in the liver; it assists concoction, is an astringent and stomachic.

**FAGG**, in the sea-language, a term given to the end of those strands which do not go through the tops, when a cable or rope is closed.

**FAGGOT**, in times of popery here, was a badge worn on the sleeve of the upper garment of such persons as had recanted, or abjured what was then termed heresy; being put on after the person had carried a faggot, by way of penance, to some appointed place of solemnity. The leaving off the wear of this badge was sometimes interpreted a sign of apostasy.

**FAGGOTS**, among military men, persons hired by officers, whose companies are not full, to muster and hide the deficiencies of the company; by which means they cheat the king of so much money.

**FAGONA**, in anatomy, a conglomerate gland, the same with thymus. See the article **THYMUS**.

**FAGONIA**, the **CRETIC-TREFOIL**, in botany, a genus of the *decandria-monogymia* class of plants, the corolla of which consists of five cordated patent petals, with long slender ungues inserted in the

cup; the fruit is a roundish acuminate capsule composed of ten valves, which form five lobes, and as many compressed cells; the seed is single, and of a roundish figure. See plate **XCIV.** fig. 2.

**FAGOPYRUM**, **BUCK-WHEAT**, in botany, the same with helxine. See the article **HELXINE**.

**FAGOTTINO**, in music, is a single curtail, a musical instrument something like the bassoon. See the article **BASSOON**.

**FAGOTTO**, in music, the double curtail, or in reality a double bassoon, as big again as the former. See the preceding article.

**FAGUS**, the **BEECH**, in botany, a genus of the *monæcia-polyandria* class of plants, having no corolla; the stamina are generally twelve hairy filaments of the length of the cup; the antheræ are oblong; the fruit is a roundish capsule, very large, surrounded with soft prickles, composed of four valves, and containing only one cell; the seeds are two, roundish, acuminate, and three-cornered. This genus comprehends the common chefnut-tree.

**FAILLIS**, in heraldry, a french term denoting some failure or fraction in an ordinary, as if it were broken, or a splinter taken from it.

**FAILURE**, a species of bankruptcy, commonly called breaking, or stopping payments. See **BANKRUPTCY**.

**FAILURE of record**, in law, is where an action is brought against a person, who alleges, in his plea, matter of record in bar of the action, and avers to prove it by the record; to which the plaintiff replies, *Nul tiel record*, viz. There is no such record: whereupon the defendant has a day given him by the court to bring it in; and if he fails to do it, he is then said to fail of his record, and the plaintiff shall thereon have judgment. Where the tenor only of a record, &c. is brought in, or is no bar to the plaintiff's action, the party likewise fails of his record; but small variances in a record may be amended, and are no failure of record.

**FAINT-ACTION**, in law, a feigned action, or such as, although the words of the writ are true, yet, for certain causes, the plaintiff has no title to recover thereby.

**FAINT-PLEADER**, in law, a covinous, false, or collusive manner of pleading, to the deceit of a third person.

**FAINTING**. See **LIPOTHYMIA**.

**FAIR**,

**FAIR**, a greater kind of market, granted to a town, by privilege, for the more speedy and commodious providing of such things as the place stands in need of. See the article **MARKET**.

It is incident to a fair, that persons shall be free from being arrested in it for any other debt or contract than what was contracted in the same; or, at least, promised to be paid there. These fairs are generally kept once or twice a year, and, by statute, they shall not be held longer than they ought, by the lords thereof, on pain of their being seized into the king's hands, &c. Also proclamation is to be made, how long they are to continue; and no person shall sell any goods after the time of the fair is ended, on forfeiture of double the value, one fourth to the prosecutor, and the rest to the king. There is a toll usually paid in fairs, on the sale of things, and for stallage, pimage, &c. See the article **TOLL**.

Fairs abroad are either free, or charged with toll and imposition. The privileges of free fairs consist chiefly, first, in that all traders, &c. whether natives or foreigners, are allowed to enter the kingdom, and are under the royal protection, exempt from duties, impositions, tolls, &c. Secondly, that merchants, in going or returning, cannot be molested or arrested, or their goods stopped. They are established by letters-patent from the prince. Fairs, particularly free fairs, make a very considerable article in the commerce of Europe, especially that of the Mediterranean, and inland parts of Germany, &c.

The principal british fairs are, 1. Sturbridge-fair, near Cambridge, by far the greatest in Britain, and perhaps in the world. 2. Bristol has two fairs, very near as great as that of Sturbridge. 3. Exeter. 4. West Chester. 5. Edinburgh. 6. Wheyhill; and, 7. Burford-fair, both for sheep. 8. Pancras fair, in Staffordshire, for saddle-horses. 9. Bartholomew fair, at London, for lean and welch black cattle. 10. St. Faith's, in Norfolk, for scotch runts. 11. Yarmouth fishing fair for herrings, the only fishing fair in Great Britain. 12. Ipswich butter-fair. 13. Woodborough-hill, in Dorsetshire, for west country manufactures, as kerseys, druggets, &c. 14. Two cheese-fairs at Chipping-Norton: with innumerable other fairs, besides weekly markets, for all sorts of goods, as well our own as of foreign growth.

Among the principal free fairs in France are those of St. Germain, Lyons, Rheims, Chartres, Rouen, Bourdeaux, Troyes, Bayonne, Dieppe, &c.

The most noted fairs in Germany are those of Francfort, Leipzig, and Nuremberg, not only on account of the great trade, but the vast concourse of princes of the empire, nobility, and people, who come to them from all parts of Germany to partake of the diversions to be had.

**FAIRFIELD**, a town of New-England, in the province of Connecticut, about an hundred miles south-west of Boston: west long. 72°, and north lat. 41°.

**FAIRFORD**, a market-town, about nineteen miles south-east of Gloucester.

**FAIRY**, in antient traditions and romances, signifies a sort of deity, or imaginary genius, conversant on earth, and distinguished by a variety of fantastical actions, either good or bad.

The fairies are a peculiar species of divinities, that have but little relation to any of those of the antient Greeks or Romans, unless perhaps to the larvæ; though others, with great reason, will not have them ranked among gods, but suppose them an intermediate kind of beings, neither gods, angels, men, nor devils. They are of oriental extraction, and seem to have been invented by the Persians and Arabs, whose religion and history abound with relations concerning them: these have a particular country which they suppose the fairies to inhabit, called Fairy-land.

Spencer's *Fairy Queen* is an epic poem, under the persons and characters of fairies. In this sort of writing, the poet loses sight of nature, and entertains the reader's imagination with the characters of fairies, witches, magicians, dæmons, and departed spirits. It requires an odd turn of thought, and a peculiar cast of fancy, with an imagination naturally fruitful and superstitious.

This sort of poetry raises a pleasing kind of horror in the mind of the reader, and amuses his imagination with the strangeness and novelty of the persons who are represented in it; but the judicious object to it, as not having probability enough to affect the imagination.

**FAIRY-CIRCLE**, or **RING**, a phenomenon pretty frequent in the fields, &c. supposed, by the vulgar, to be traced by the fairies in their dances: there are two kinds of it, one of about seven yards in diameter, containing a round bare path,

a foot broad, with green grafs in the middle of it. The other is of different bigness, encompassed with a circumference of grafs, greener and fresher than that in the middle. Mess. Jeffop and Walker, in the Philosophical Tranfact. ascribe them to lightening, which is confirmed by their being most frequently produced after storms of that kind, as well as by the colour and brittleness of the grafs-roots, when first observed.

Lightening, like all other fires, moves round, and burns more in the extremity than in the middle: the second circle arises from the first, the grafs burnt up growing very plentifully afterwards. Others maintain that these circles are made by ants, which are frequently found in great numbers therein.

**FAIT**, in law, the same with deed. See the article **DEED**.

**FAITH**, *fides*, in antiquity, was deified by the Romans, and had a temple in the capitol.

Public faith is represented on medals sometimes with a basket of fruit in one hand, and some ears of corn in the other; and sometimes holding a turtle-dove. But the most usual symbol, is with her two hands joined together.

**FAITH**, in divinity and philosophy, the firm belief of certain truths upon the testimony of the person who reveals them.

The grounds of a rational faith are, 1. That the things revealed be not contrary to, though they may be above natural reason. 2. That the revealer be well acquainted with the things he reveals. 3. That he be above all suspicion of deceiving us.

Where these criterions are found, no reasonable person will deny his assent: thus, we may as well doubt of our own existence, as of the truth of a revelation coming from God, who can neither be deceived himself, nor deceive others by proposing things to be believed, that are contradictory to the faculties he has given us. Whatever propositions, therefore, are beyond reason, but not contrary to it, are when revealed, the proper matter of faith.

*Confession of FAITH.* See **CONFESSION**.

**FAITHFUL**, an appellation assumed by the mahometans. See **MUSSLUMEN**.

**LAKE**, among sailors, signifies one round or circle of a cable or hawser, coyled up out of the way.

**FAKENHAM**, a market-town of Norfolk, about sixteen miles north-west of Norwich.

**FAKIR**, in pagan theology, a kind of indian monks. who even outdo the mortifications and severities of the antient christian anachorets. See **ANACHORET**. Some of them mangle their bodies with scourges and knives; others never lie down; and others remain all their lives in one posture.

There are also another kind of fakirs, who do not practise such severities: these flock together in companies, and go from village to village, prophesying and telling fortunes. It is said that even persons of fortune, in India, become fakirs, and that there are more than two millions of them.

**FALAIS**, a town of lower Normandy, in France, sixteen miles south of Caen.

**FALCADE**, in the manege, the motion of a horse when he throws himself upon his haunches two or three times, as in very quick corvets; which is done in forming a stop and half stop. See the article **STOP**.

**FALCATED**, something in the form of a sickle: thus, the moon is said to be falcated when she appears horned. See the articles **MOON** and **PHASIS**.

**FALCARIA**, in botany, a name used by Rivinus for a species of *fium*. See the article **SIUM**.

**FALCATA**, a name used by the same botanist for the medicago. See the article **MEDICAGO**.

**FALCINELLUS**, a bird supposed to be of the heron-kind, with a long crooked bill, and called by some the black heron. See plate **XCV**. fig. 3.

It is somewhat larger than a pigeon, and is of a greenish colour, variegated with purple.

**FALCO**, in ornithology, a genus of birds, of the order of the accipitres, with three toes always before, and only one behind.

This genus comprehends the falcon-kind, properly so called, the hawk, gyrfalcon, eagle, buzzard, pygargus, lannar, kite, kestrel, &c. See **FALCON**, **HAWK**, &c.

**FALCON**, or *Gentle FALCON*, the yellow-legged falco, with a grey body spotted with brown, and with five or six broad and black fasciæ or waves on the tail. It is a very beautiful bird, about the size of a raven, and though very bold and voracious, is easily made tame and tractable.

Mr. Edwards has described two falcons brought from Hudson's Bay, both about the bigness of the common crow. One of

of these is brown on the upper part of the body, and the under part is whitish, variegated with crescent-like spots of a dark colour. The other is of a black, or very dark dusky colour, on the upper part of the body; the ridge of the wing, in the upper part, is white, and the whole under side is of a dirty clay colour, with black spots at the ends of the feathers. See plate XCVI. fig. 1. which represents the first of these.

In the choice of a falcon, take one that has wide nostrils, high and large eyelids, a large black eye, a round head, somewhat full on the top; barb feathers under the clasp of the beak, which should be short, thick, and of an azure colour; the breast large, round, and fleshy; and the thighs, legs, and feet large and strong, with the fear of the foot soft and bluish: the pounces should be black, with wings long and crossing the train, which should be short and very pliable.

**FALCON**, in gunnery, a piece of cannon. See the article **CANNON**.

**FALCONER**, one who tames, manages, and looks after falcons, or other hawks. See the next article.

A falconer should be well acquainted with the quality and mettle of his hawks, that he may know which of them to fly early, and which late. Every night, after flying, he should give them casting; one while plumage, sometimes pellets of cotton, and at another time physic, as he finds necessary. He ought also every evening to make the place clean under the perch, that by her casting he may know whether she wants scouring upwards or downwards. Nor must he forget to water his hawk every evening, except such days wherein she has bathed; after which, at night, she should be put into a warm room, having a candle burning by her, where she is to sit unhooded, if she be not ramage, that she may prune and pick herself.

A falconer should always carry mummy, and other medicines, into the field where a hawk frequently meets with accidents. Neither must he forget to take with him any of his hawking implements; and it is necessary he should be skilful in making lures, hoods of all sorts, jesses, bewets, and other furniture. Neither ought he to be without his coping-irons, to cope his hawk's beak when overgrown, and to cut her pounces and talons as there shall be occasion; nor should his cauting-irons be wanting.

**FALCONRY**, the art of training all manner of hawks, but more especially the larger sort, called falcons, to the exercise of hawking. See **HAWKING**.

When a falcon is taken, she must be seeled in such a manner, that as the feeling slackens, she may see what provision lies before her; but care ought to be taken, not to seel her too hard. A falcon or hawk newly taken, should have all new furniture, as new jesses of good leather, mailed leashes with buttons at the end, and new bewets. There should also be provided a small round stick, to stroke the hawk; because the oftener this is done, the sooner and better will she be manned. She must also have two good bells, that she may be found when she scattereth. Her hood should be well fashioned, raised and embossed against her eyes, deep, and yet strait enough beneath, that it may fasten about her head without hurting her; and her beak and talons must be a little coped, but not so near as to make them bleed.

If it be a soar-falcon, which hath already passed the seas, she will indeed be harder to reclaim, but will prove the best of falcons. Her food must be good and warm, and given her twice or thrice a day, till she be full gorged: the best for this purpose is pigeons, larks, or other live birds; because she must be broken off by degrees from her accustomed feeding. When she is fed, you must hoop and lure, as you do when you call a hawk, that she may know when you intend to give her meat. On this occasion she must be unhooded gently, and after giving her two or three bits, her hood must be put on again, when she is to get two or three bits more. Care must be taken that she be close seeled, and after three or four days, her diet may be lessened; the falconer setting her every night to perch by him, that he may awaken her often in the night. In this manner he must proceed, till he find her to grow tame and gentle; and when she begins to feed eagerly, he may give her a sheep's heart. He may now begin to unhood her in the day-time, but it must be far from company, first giving her a bit or two, then hooding her gently, and giving her as much more. When she is sharp set, he may now unhood her, and give her some meat just against his face and eyes, which will make her less afraid of the countenances of others. She must be borne continually on the fist, till she is properly

properly manned, causing her to feed in company, giving her in the morning, about sun rise, the wing of a pullet; and, in the evening, the foot of a hare or coney, cut off above the joint, flead and laid in water, which being squeezed, is to be given her with the pinnion of a hen's wing. For two or three days give her washed meat, and then plumage in more or less quantity, as she is thought to be more or less foul within. After this, being hooded again, she is to get nothing till she has gleamed and cast, when a little hot meat may be given her in company; and, towards evening, she may be allowed to plume a hen's wing in company also. Cleanse the feathers of her casting, if foul and slimy; if she be clean within, give her gentle castings; and when she is well reclaimed, manned, and made eager and sharp set, he may venture to feed her on the lure.

However, three things are to be considered before the lure be shewed her.

1. That she be bold and familiar in company, and not afraid of dogs and horses.
2. Sharp set and hungry, having regard to the hour of morning and evening, when you would lure her.
3. Clean within, and the lure well garnished with meat on both sides; and when you intend to give her the length of a leash, you must abscond yourself.

She must also be unhooded, and have a bit or two given her on the lure as she sits on your fist: afterwards take the lure from her, and hide it that she may not see it; and when she is unfeeled, cast the lure so near her, that she may catch it within the length of her leash, and as soon as she has seized it, use your voice as falconers do, feeding her upon the lure, on the ground, with the heart and warm thigh of a pullet.

Having so lured your falcon, give her but little meat in the evening; and let this luring be so timely, that you may give her plumage, and a juck of a joint next morning on your fist. When she has cast and gleamed, give her a little reaching of warm meat. About noon, tie a creance to her leash; and going into the field, there give her a bit or two upon her lure; then unwind the creance, and draw it it after you a good way; and let him who has the bird hold his right hand on the tassel of her hood, ready to unhood her as soon as you begin to lure; to which if she come well, stoop roundly upon it, and hastily seize it, let her cast two or

three bits thereon. Then unfeizing and taking her off the lure, hood her and give her to the man again; and, going farther off, lure and feed her as before.

In this manner is the falconer to proceed, luring her every day farther and farther off, till she is accustomed to come freely and eagerly to the lure; after which she may be lured in company, taking care that nothing afright her. When she is used to the lure on foot, she is to be lured on horseback; which may be effected the sooner, by causing horsemen to be about her when she is lured on foot.

When she is grown familiar to this way, let somebody on foot hold the hawk, and he on horseback must call and cast the lure about his head, the holder taking off the hood by the tassel; and if she seize eagerly on the lure without fear of man or horse, then take off the creance, and lure her at a greater distance. And if you would have her love dogs as well as the lure, call dogs when you give her her living or plumage. See the article **HAWKING**.

**FALDAGE**, an antient privilege reserved to lords, of setting up folds for sheep in any fields within their manors, for the better manurance of the same; and this, in former times, was usually done as well with their tenants sheep, as with their own.

**FALDFEY**, or **FALDFEE**, a rent or fee paid by some customary tenants, for liberty to fold their sheep on their own lands.

**FALKIRK**, a town of Scotland: west long.  $3^{\circ} 48'$ , north lat.  $56^{\circ} 20'$ .

**FALL**, the descent of a heavy body towards the center of the earth. See the articles **DESCENT**, **GRAVITY**, **ACCELERATION**, &c.

**FALL** is also the name of a measure of length used in Scotland, and containing six ells of that country. See **MEASURE** and **ELL**.

**FALL**, in the sea-language, that part of the rope of a tackle, which is hauled upon.

Also when a ship is under fail, and keeps not so near the wind as she should do, they say she falls off; or when a ship is not flush, but hath risings of some parts of her decks more than others, it is called falls.

**FALLACY**, a deception, fraud, or false appearance.

The epicureans deny that there is any such thing as a fallacy of the senses: for according to them, all our sensations and perceptions, both of sense and phantasy, are

are true : whence they make sense the primary criterion of truth. See the article **EVIDENCE**.

The cartesians, on the other hand, maintain, that we should suspect as false, or, at most, dubious, every thing that present themselves to us by means only of our external senses, because they so frequently deceive us. They add, that our senses, as being fallacious, were never given us by nature for the discovery of truth, or the contemplation of the principles of things, but only for pointing out to us what things are convenient or hurtful to our bodies. See **EXISTENCE**. The peripatetics keep a middle course : they say, that if a sensible object be taken in its common or generical view, the sense cannot be deceived about it ; but that if the object be taken under its specific view, the sense may be mistaken about it, from the want of the dispositions necessary to a just sensation, as a disorder in the organ, or any thing uncommon in the medium : thus in some disorders of the eye, all objects appear yellow ; a stick in water appears broken or crooked, &c.

**FALLACY**, or *sylogistical FALLACY*, in logic, a captious argument, which, on account of its apparent goodness and defect, is made use of to deceive a respondent not well versed in the art of sophistry. See the article **SOPHISM**.

Fallacies either arise from words or things. The foundation of all fallacy in words, is an ambiguity ; but that of fallacy in things, is very numerous.

**FALLING-SICKNESS**, the same with epilepsy. See the article **EPILEPSY**.

**FALLOPIAN TUBES**, two canals of a tortuous figure, but approaching to a conic form, joined to the fundus of the uterus, one on each side.

They are connected closely and continuously to the uterus, and more laxly to the ovaries by the *alæ vesperilionem*, and finally to the *ossâ ilei*, by the *ligamenta lata* : their length is different, six, seven, or eight fingers breadth, and sometimes more : their thickness about the middle is equal to that of one's little finger ; their extremities are smaller, that next the uterus is very small ; it opens into its cavity, and may be inflated by blowing into the uterus : or a small style may be thrust up into it : their small extremity is connected to the uterus, the other is free, and fluctuates about the abdomen : this is larger and is imbricated, or fringed round the edges ; and when there is oc-

clusion, this extremity applies itself to the ovary, embracing it with these muscular segments or fringes.

Their substance is membranaceous and cavernous : they are composed of a double membrane, the exterior one seem to be continuous with the peritonæum, and the interior with the interior membrane of the uterus. They are wrinkled on the inner surface, and are imbued with a lubricous humour ; but they are not cellulous in the human body as in beasts. They are furnished with a great number of vessels, and have a cavernous substance between their membranes, by means of which they are rendered rigid in applying their mouths to the ovary. They are also moistened on their inner surface by these vessels.

Their use in generation is very great ; they become erect in the time of the coitus, from the influx of the blood and spirits, and at that time, by a natural motion, they apply their loose fringed extremities to the ovaries, which are surrounded and imbraced by them. In this state they convey to them the prolific matter of the male semen injected into the womb ; and after one of the ovula is impregnated, they receive and convey it to the womb. The fallopian tubes are easily discovered in hens and other birds, and are called oviducts. See **OVIDUCT**.

See a representation of one of them in plate **XCVII.** fig. 1.

**FALLOW**, a pale red colour, like that of brick half burnt : such is that of a fallow-deer. See the article **DEER**.

**FALLOW-FIELD**, or **FALLOW-GROUND**, land laid up, or that has lain untilled for a considerable time.

**FALLOW-FINCH**, or **FALLOW-SMICH**, a bird otherwise called *oenanthe*. See the article **OENANTHE**.

**FALLOWING of land**, a particular method of improving land.

The great benefit of fallowing, appears by the common practice of landlords, who every where take care to oblige their tenants to a strict observance of it once in three years ; few lands being able to bear two crops without it.

It appears that none will find a year's fallowing a loss to them, let their land be what it will ; but, more particularly, the advantage of fallowing consists in, first, its laying of the land in ridges, and its exposing it to the frost, wind, sun and dews, all which sweeten and mellow the land very much ; the often stirring of it, and

and breaking the clots, dispose it for the bearing of good crops. Secondly, it kills the weeds, by turning up the roots to the sun and air; and kills not only the weeds that grew with the last corn, but wild oats, darnel, and other weeds that sow themselves, and that as soon as they begin to peep out of the ground; so that they have no time to suck out any of the heart of the land.

The way of ordering fallow-lands is, after the crop is off, to let the land lie all winter, and what grass and weeds grow on it, to eat off with sheep in April, or beginning of May. As soon as they have done sowing of corn, they begin to plow up their fallows. This first fallowing in many places, ought to be very shallow, well turned, and clapped close together, because the thinner the turf is, the easier will it dry through, and kill the weeds, especially if the weather be dry: but, in some places, where there is a very cold clay, that will not bear corn well without being exposed to the heat of the sun to warm it, they plow their first plowing the depth they design to go. About June is the time of the second plowing, which they call *two-fallowing*; at which plowing, you must go your full depth. About the latter end of July, or the beginning of August, is the time of *try-fallowing*, or last plowing, before they sow their rye or wheat: but some plow up their land oftener.

If the land rise full of clots, and if it is a binding land, you must make it fine by harrowing of it, when rain comes; but then you must not let it lie long before you strike, sieve, or plow it up into small ridges, especially if it is wet land; and as near as you can, leave no weeds, turfs, or grass unkilld, or unbroke with your harrows. But if your land will dissolve well with the frost, it is best to let it lie a little rougher, especially if you design to sow it with barley; for the rougher it lies for a winter-fallowing, the better. If the winter does not dissolve the clots, which it will not do in binding lands, you must wait rain for the fallowing of it. Where the land is but indifferent, and the manure is not to be got, fallowing every other year is found a great improvement. In some places they take a crop of wheat, and a crop of pease, and so fallow their land again.

**FALMOUTH**, a port-town of Cornwall, in England, situated in west long.  $5^{\circ} 30'$ , north lat.  $50^{\circ} 15'$ , on a fine bay of the

english channel, the entrance whereof is guarded by two forts.

**FALSE**, in general, something contrary to truth, or not what it ought to be: thus we say, a false witness, false action, false weights, false claim, &c. See the articles **WITNESS**, **ACTION**, &c.

**FALSE IMPRISONMENT**. See the article **IMPRISONMENT**.

**FALSE JUDGMENT**. See **JUDGMENT**.

**FALSHOOD**, in philosophy, an act of the understanding representing a thing otherwise than it is as to its accidents.

*Crimen falsi*, in the civil law, is fraudulent subornation or concealment with design to darken or hide the truth, and make things appear otherwise than they are. The *crimen falsi* is committed, 1. By words, as when a witness swears falsely. 2. By writing, as when a man antedates a contract, or the like. 3. By deed, as when he sells by false weights and measures.

**FALSIFYING**, in law, the proving a thing to be false.

The falsifying a record, is where a person purchases land of another, who is afterwards outlawed for felony; in this case, he may falsify the record as to the time when the felony is supposed to have been committed, and also as to the point of the offence. But in the case where a person is found guilty by verdict, such purchaser shall only falsify the time.

To falsify a recovery, may be done by the issue in tail, where it is suffered by a tenant for life.

**FALSO JUDICIO**. See the article **FALSE JUDGMENT**.

**FALSO RETURNO BREVIUM**, a writ that lies against a sheriff for false returning of writs he had got to execute.

**FALSO BORDONE**, in music, denotes the burden or ground bass of a song when it is not exact to the rules of harmony. It is also applied by the Italians to a certain harmony produced by the accompaniments of several sixths following one another, which make several fourths between two higher parts, because the third part is obliged to make tierces with the bass.

**FALX**, in anatomy, a process of the dura mater placed between the two hemispheres of the brain, and resembling a reaper's sickle.

**FALX**, the *SICKLE-FISH*, in ichthyology, a species of *tænia*, so called from its bending itself into the form of a sickle. See the article **TÆNIA**.

**FAMA**.

**FAMAGOUSTA**, a city of asiatic Turkey, situated on the east end of the island of Cyprus.

**FAMES CANINA**, an excessive appetite. See the article **BULIMY**.

**FAMILIARS** of the *inquisition*, are people that assist in the apprehending of such persons as are accused, and to carry them to prison; upon which occasion, the unhappy person is surrounded by such a number of these officious gentlemen, that there is no possibility of escaping out of their hands. As a reward of this base employ, the familiars are allowed to commit the most enormous actions, to debauch, assassinate, and kill, with impunity. See the article **INQUISITION**.

**FAMILY**, *familia*, denotes the persons that live together in one house, under the direction of one head or chief manager. It also signifies the kindred or lineage of a person, and is used by old writers for a hide or portion of land sufficient to maintain one family. See the article **HIDE**.

**FAMILY**, in natural history, a term used by authors to express any order of animals, or other natural productions of the same class. See **CLASS** and **ORDER**.

**FAMILY** of *curves*. See **CURVE**.

**FAN**, a machine used to raise wind and cool the air by agitating it. The custom which now prevails of wearing fans, was borrowed from the East, where they are almost indispensably necessary for keeping off the sun and the flies. Fans are made of a thin skin or piece of paper, taffaty, or other light stuff, cut semicircularly, and mounted on several little sticks of wood, ivory, tortoiseshell, or the like. The paper, &c. is usually painted, and in mounting is plaited in such a manner, as that the plaits may be alternately inward and outward. That this machine was known to the antients, we may infer from what Terence says, *cape hoc flabellum, & ventulum huic sic facito*. It was composed of different materials, but the most elegant were made of peacocks feathers, or perhaps were so painted as to represent a peacock's tail.

**FAN** is also an instrument used in winnowing corn.

Fans for corn pay on importation 1s. 3  $\frac{4}{10}$  d. and draw back on exportation, 1s. 1  $\frac{2}{10}$  d.

India fans pay for every 100 l. gross value at the sale 26 l. 14 s. 2  $\frac{5}{10}$  d. The draw-

back on exportation is 25 l. 2s. 11  $\frac{5}{10}$  d.

**FANANO**, a town of Italy, twenty-five miles south of Modena.

**FANATICS**, wild, enthusiastic, visionary persons, who pretend to revelation and inspiration.

The antients called those fanatici who passed their time in temples (*fana*) and being often seized with a kind of enthusiasm, as if inspired by the divinity, shewed wild and antic gestures. Prudentius represents them as cutting and flashing their arms with knives: shaking the head was also common among the fanatici; for Lampridius informs us, that the emperor Heliogabalus was arrived to that pitch of madness, as to shake his head with the gashed fanatics. Hence the word was applied amongst us to the anabaptists, quakers, &c. at their first rise, and is now an epithet given to the modern prophets, muggletonians, &c.

**FANATIO**, a term used for the fawning season in forests.

**FANCY**, or **IMAGINATION**. See the article **IMAGINATION**.

**FANIONS**, in the military art, small flags carried along with the baggage.

**FANO**, a bishop's see and port-town of Italy, situated on the gulph of Venice, in 14° east long. and 44° north lat.

**FANTASIA**, in music, the same with caprice. See the article **CAPRICE**.

**FANUM**, **TEMPLE**. See **TEMPLE**.

**FAPESMO**, a form of syllogism, wherein the major or first proposition is an universal affirmative, the minor an universal negative, and the conclusion a particular negative.

**FAQUIR**, or **FAKIR**. See **FAKIR**.

**FAR**, in horsemanship, an appellation given to any part of a horse's right side: thus the far foot, far shoulder, &c. is the same with the right foot, right shoulder, &c.

**FARCE**, was originally a droll or petty shew exhibited by mountebanks and their buffoons in the open streets, to gather the people together. At present it is of more dignity: it is removed from the street to the theatre, and instead of being performed by merry-andrews to amuse the rabble, is acted by comedians, and become the entertainment of a polite audience. Poets have reformed the wildness of the primitive farces, and brought them to the taste and manner of comedy. The difference between the two on our stage is, that comedy keeps to nature and probability, and therefore is confined to certain laws prescribed by antient critics, whereas

whereas farce difallows of all laws, or rather lets them aside on occasion. Its end is purely to make merry, and it sticks at nothing which may contribute thereto, however wild and extravagant. Hence the dialogue is usually low, the persons of inferior rank, the fable or action trivial or ridiculous, and nature and truth every where heightened and exaggerated to afford the more palpable ridicule.

**FARCEY**, or **FARCIN**. See the article **FARCIN**.

**FARCIMINALIS TUNICA**, in anatomy, the same with the allantois. See the article **ALLANTOIS**.

**FARCIN**, **FARCY**, or **FASHIONS**, in farriery, a creeping ulcer, and the most loathsome, stinking, and filthy disease that a horse can be affected with.

It proceeds from corrupt blood engendered in the body by over-heats and colds, and begins first with hard knots and pustules, which at length over-run the horse's whole body. Its origin is commonly in a vein, or near some master vein, which feeds and nourishes the disease.

Sometimes it is occasioned by spur-galling, with rusty spurs, snaffle-bit, or the bite of another horse infected with the same disease.

For the cure, first bleed the horse well; then take oil of bay and euphorbium mixed together, and anoint the knots with it; or bathe the place with the stale of an ox or cow, and the herb called lion's foot, all boiled together. Some apply tallow and horse-dung, burn the knots with a hot iron, or wash the sore with salt, vinegar, alum, verdigrease, green copperas, and gun-powder, boiled in chamber-lee. Others again anoint the sores with a salve made of a penny-worth of tar, two penny-worth of white mercury, and two handfuls of pigeon's dung.

*Water* **FARCIN**, a swelling under a horse's belly and chaps, which, being pierced with a hot iron, yields abundance of yellow, grey, and oily water. It proceeds from a horse's feeding in low watery grounds, or in pits and holes where the grass grows above water.

The common way of curing this malady, is by letting out the matter of the swelled parts with a long iron-rod, heated red hot; washing the parts with chamber-lee and salt, mixed with some powder of bole armenic, and made as hot as may be endured, for three or four times.

**FARDING-DEAL**, the fourth part of an acre of land. See the article **ACRE**.

**FARE**, most commonly signifies the money paid for a voyage, or passage by water; but, in London, it is what persons pay for being conveyed from one part of the town to another in a coach or chair. See the articles **COACH**, **WATERMEN**, &c.

**FAREHAM**, a market-town of Hampshire, ten miles east of Southampton.

**FAREWELL CAPE**, the most southerly promontory of Greenland, in 50° west long. and 60° north lat.

**FARFARA**, in botany, a name used by some for tussilago or colt's foot.

**FARINA**, a latin term signifying meal, or the flower of corn. See **CORN**.

**FARINA FOECUNDANS**, among botanists, the impregnating meal or dust on the apices or antheræ of flowers; which being received into the pistil, uterus, or seed-vessel of plants, secundates the rudiments of the seeds in the ovary, which otherwise would decay and come to nothing. See the article **GENERATION of plants**.

**FARINAGIUM**, signifies a toll of meal or flour.

**FARINGTON**, a market-town of Berkshire, twenty-five miles north-west of Reading.

**FARLEY**, or **FARLIEU**, money paid by tenants in the west of England, in lieu of a heriot. See the article **HERIOT**.

**FARM**, or **FERM**, signifies the chief messuage in a village, or any large messuage, whereto belongs land, meadow, pasture, wood, common, &c. and which has been used to let for term of life or years, under a certain yearly rent payable by the tenant for the same.

In different parts of the country, a farm is called by different appellations: in Lancashire, it is termed ferm-hold; in Essex, a wike; and in the north, a tack. According to some, a farm should make three rents, or its produce should amount to three times the rent, one for the landlord, another for the charges of cultivating it, and the third for the farmer and his family to live on.

**FARMER**, the person who occupies or is lessee of a farm, whether for life or years. See the articles **FARM** and **LEASE**.

Husbandman is the proper addition of a farmer, husbandry being the mystery or art he professes.

**FARMER**, among miners, signifies the lord of the field, or the person who farms the lot and cope of the king.

**FARNHAM**, a market-town in the county of Surrey, ten miles west of Guilford, remarkable for its large plantations of hops.

**FARO**,

**FARO**, a sea-port to vn of Portugal, in the province of Algarva: west long. 9°, north lat. 36° 50'.

**FARRA**, in ichthyology, the same with the albula nobilis. See **ALBULA**.

**FARREATION**, or **CONFARREATION**, in antiquity. See **CONFARREATION**.

**FARRIER**, one whose employment is to shoe horses, and cure them when diseased or lame.

**FARRIER'S POUCH**, a leather-bag, in which are contained nippers, drivers, shoes for all sizes of feet, good sharp nails, and all the implements for new shoeing a horse that has lost his shoe upon the road.

A gentleman on a journey ought to have one of these pouches well provided, and a groom that knows how to drive nails.

**FARRIERY**, the art of trimming the feet, and curing diseased horses. See **HORSE**.

**FARS**, or **FARSISTAN**, the antient Persis, being a province of Persia lying northward of the gulph of Persia. Its chief town is Schiras.

**FARTHELLING**, among seamen, the same with furling. See **FURLING**.

**FARTHING**, the least copper-coin used in Britain, being half of the half-penny. See the article **COIN**.

**FASCE**, or **FESSE**, in heraldry. See the article **FESSE**.

**FASCES**, in roman antiquity, axes bound up together with rods or staves, and carried before the roman magistrates as a badge of their authority and office.

The use of the fasces was introduced by the elder Tarquin, as a mark of sovereign authority: in after times they were borne before the consuls, but by turns only, each his day. They had twelve of them carried by so many lictors. See the article **LICTOR**.

After the consuls, the prætors assumed them, and Censorinus observes they had only two, though Plutarch and Polybius give them six. In the government of the decemviri, it was the practice at first for only two of them to have the fasces. Afterwards, each of them had twelve, in the same manner as the kings.

**FASCETS**, in the art of making glass, are the irons thrust into the mouths of bottles, in order to convey them into the annealing tower.

**FASCIA**, in architecture, signifies any flat member having a considerable breadth and but a small projecture, as the band of an architrave, larmier, &c.

Fascias, in brick buildings, are certain jutting out of the bricks over the win-

dows of each story, except the upper one. These are sometimes plain, like those of columns; but sometimes they are moulded, and the moulding is usually a scima reversa at the bottom, above which are two plain courses of bricks, then an astragal, and, lastly, a boudin. See the articles **ASTRAGAL** and **BOULTIN**.

**FASCIA LATA**, in anatomy, called also **musculus membranofus**, is a muscle of the tibia or leg, arising fleshy from the anterior part of the anterior and superior spine of the ileum. Soon after its origin it becomes intirely membranaceous, and closely surrounds the muscles of the thigh; after which it is inserted in the upper part of the tibia, near the head of the fibula, and from thence sends out an aponeurosis almost over the whole tibia.

The fascia lata serves to draw back the thigh, and to elevate both this and the leg; it is therefore, as well as some other of the adjacent muscles, common to both the thigh and the leg.

**FASCIÆ**, in astronomy, certain parts on jupiter's body resembling belts or swaths. They are more lucid than the rest of that planet, and are terminated by parallel lines, sometimes broader and sometimes narrower. Mr. Huygens observed a fascia in mars much broader than those of jupiter, and possessing the middle part of his disk, but very obscure.

**FASCIALIS**, in anatomy, a muscle of the leg called also **fastorius**. See the article **SARTORIUS**.

**FASICULUS**, in medicine, denotes a hand-ful, or according to some, as much as can be taken up between the finger and the thumb.

**FASCINATION**, a kind of witchcraft or enchantment supposed to operate by the influence either of the eye or tongue.

To the first kind of fascination, Virgil alludes in his third eclogue, *nescio quis teneros oculus mihi fascinat agnos*. To the second, in his seventh eclogue, in these lines.

*Aut, si ultra placitum laudarit, baccare frontem*

*Cingite, ne vati noceat mala lingua futuro.*

**FASCINES**, in fortification, faggots of small wood of about a foot diameter and six feet long, bound in the middle and at both ends. They are used in raising batteries, making chandealers, in filling up the moat to facilitate the passage to the wall, in binding the ramparts where the earth is bad, and in making parapets of trenches to screen the men.

Fascines are sometimes pitched over, to be thrown upon the enemies works in order to set them on fire. They differ from saucissons, being made of small wood, whereas the saucissons are made of branches of trees. See the article SAUCISSON.

See also fascines supported by a chandelier in plate XCVII. fig. 2.

**FASHION**, a term used among artificers in gold and silver, for the trouble, time, and labour employed in a piece of work. It is by the fashion that workmen's wages are regulated.

**FASHION-PIECES**, in the sea-language, are two compassing pieces of timber, into which is fixed on each side the transform. See the article TRANSOM.

**FASSETS**, or **FACETS**, among jewellers. See the article FACETS.

**FAST**, or **FASTING**, in general, denotes the abstinence from food; but is more particularly used for such abstinence on a religious account.

Solemn fasts have been observed in all ages and nations, especially in times of mourning and affliction.

Among the Jews, the calamities for which fasting was enjoined, were a siege, the sword, pestilence, locusts, the caterpillar, diseases, famine, and the like. Upon these days, they wore sack cloth next the skin, their cloaths were rent, and they wore no shoes: they likewise sprinkled ashes upon their heads, and neither washed their hands, nor anointed their bodies with oil, as usual.

The Greeks and Romans, and, in short, every nation of antiquity, had their stated as well as occasional fasts.

The ancient christians had two sorts of solemn fasts, *viz.* weekly and annually; the former being observed every Wednesday and Friday, and the latter, during lent. See the article LENT.

The church of England, greek and roman churches, &c. have likewise their stated and occasional fasts. But, by a statute of queen Elizabeth, it is enacted, that whosoever by preaching, teaching, writing, &c. affirms it to be necessary to abstain from flesh, for the saving of the soul of man, or for the service of God, shall be punished as a spreader of false news.

Fasting is likewise enjoined by the mahometan religion, witness their ramadan or lent; and even the pagans of India have several remarkable fasts. See the article RAMADAN.

**FAST-DAYS**, those appointed, by public authority, to be observed in fasting and humiliation.

**FAST-GROUND**, or **FAST-COUNTRY**, among miners, denotes the same with shelf. See the article SHELF.

**FASTERMANS**, among our saxon ancestors, were pledges or bondsmen, who were answerable for each others good behaviour.

**FASTI**, in roman antiquity, the calendar wherein were expressed the several days of the year, with their feasts, games, and other ceremonies.

There were two sorts of fasti, the greater and less; the former being distinguished by the appellation *fasti magistrales*, and the latter by that of *fasti calendares*.

The greater fasti contained the feasts, with every thing relating to religion and the magistrates.

The lesser were again distinguished into the city and country fasti, each adapted to the people for whom they were designed. In all these fasti, the court-days, or those whereon causes might be heard and determined, were marked with the letter F; these days were called fasti, from *fari*, to speak or pronounce; and the other days, not marked with this letter, were called nefasti.

**FASTI CONSULARES**, was also a tablet or chronicle, wherein the several years were denoted by the respective consuls, with the principal events that happened during their consulship. And hence, the term fasti is still applied to the archives and public registers of a nation.

**FASTIGIUM**, in architecture, the same with pediment. See PEDIMENT.

**FAT**, in anatomy, an oleaginous or butyraceous matter, secreted from the blood, and filling up the cavity of the adipose cells. Fat, properly and distinctly so called, is not secreted from glandules, but from the little arteries of the adipose membrane. Authors distinguish it into two kinds, which they express by the words *sebum* or *adeps*, and *pinguedo*. See the articles SEBUM and PINGUEDO.

According to this distinction, there is no such thing as *sebum* or hard fat in the human body, its fat being all of that sort expressed by *pinguedo*, or soft and oily. That this oleaginous matter has a circulatory motion, or an egress into the veins, is very evident from the sudden consumption of it in many diseases, and from its vast diminution by exercise or labour.

*Fig. 1.* FALLOPIAN TUBE.

*Fig. 2* FASSCINES.

*Fig. 3* FESSE.

*Fig. 4.* FIELDFARE.

*T. J. Jefferys sculp.*

The uses of fat are, 1. To serve as a kind of covering to the body, in order to defend it from cold and other injuries. 2. To defend the more tender and sensible parts from being too strongly velligated by the salts. 3. To preserve in good order the flexion of the muscles, of the cutis, and of the other parts between and about which it is placed. 4. To facilitate the motions of some parts, as the eyes, jaws, &c. 5. To fill up a number of empty interstitial spaces, and by that means to add greatly to the symmetry and beauty of the parts; as is evidently the case in the face, the neck, &c. and to facilitate the distension of the parts, the spaces between which it thus fills up. There is evidently a great use of the fat about the vagina, the anus, the ossa ischii, and pudenda; which filling up many large spaces there, gives way greatly in the distension of those parts in the exclusion of the fœtus, and even of the harder excrements. 6. To prevent the painful pressure and attrition of the parts, particularly in the soles of the feet, the nates, and other the like parts; in all which the fat is copiously disposed, and serves in the place of a cushion for the muscular flesh to rest upon. 7. And, finally, there is great reason to suppose, that when the body does not receive nourishment in the usual way, the regrefs of the fat into the veins supplies that defect.

The fat of several animals, as a goose, dog, viper, bear, and even that of mankind, are met with prescribed in the intention of suppuratives and digestives; for being of a penetrating nature, they are supposed to dissolve and rarify the inclosed humours, and bring them to what is called maturity. See SUPPURATIVES and RIPENERS.

The best way of preparing fat for medicinal use, is to free it from skins, veins, fibres, &c. and after washing it till it becomes unbloody, to melt, strain, and preserve it from air.

FAT, in the sea-language, signifies the same with broad. Thus a ship is said to have a fat quarter, if the trussing in or tuck of her quarter be deep.

FAT is also used for several utensils, as, 1. A great wooden vessel, used for the measuring of malt, and containing a quarter or eight bushels. 2. A large brewing-vessel, used by brewers to run their wort in. 3. A leaden pan or vessel for the making of salt at Droitwich.

FAT likewise denotes an uncertain measure

of capacity. Thus a fat of isinglass contains from  $3\frac{1}{4}$  hundred weight to 4 hundred weight; a fat of unbound books, half a maund or four bales; of wire, from 20 to 25 hundred weight; and of yarn, from 220 to 221 bundles.

FATE, *fatum*, denotes an inevitable necessity depending upon a superior cause. The Greeks called it *εὐαίμα*, as it were a chain or necessary series of things indissolubly linked together. It is also used to express a certain unavoidable designation of things, by which all agents, both necessary and voluntary, are swayed and directed to their ends. See the article NECESSITY.

In this last sense, fate is distinguished into, 1. Astrological, arising from the influence and position of the heavenly bodies, which (it is supposed) give laws both to the elements and mixed bodies, and to the wills of men. 2. Stoical fate, defined by Cicero an order or series of causes, wherein cause being linked to cause, each produces another, and thus all things flow from one prime cause. To this fate, the stoics subject even the gods.

Fate is divided by later authors into physical and divine.

Physical fate, is an order and series of natural causes appropriated to their effects.

By this fate it is that fire warms, bodies communicate motion to each other, &c. and the effects of it are all the events and phenomena of nature. See NATURE.

Divine fate, is what is more usually called providence. See PROVIDENCE.

FATES, *parcæ*, in mythology. See the article PARCÆ.

FATHER, a term of relation denoting a person who hath begot a child.

By the laws of Romulus, a father had an unlimited power over his children. Amongst the Lacedæmonians, as we learn in Aristotle's politics, the father of three children was excused from the duty of mounting guard for the security of the city; and a father of four children, was exempted from every public burden. The poppæan law amongst the Romans, granted many noble privileges to the fathers of three children, amongst which one was, that he should be excused from civil offices, and that the mother should have liberty, in her father's life-time, to make a will, and manage her estate without the authority of tutors.

Natural FATHER, is he who has illegitimate children.

**FATHER IN LAW**, is a person who has married a woman, who has children by a former marriage.

**Grand-FATHER.** See **GRAND-FATHER.**

**FATHER**, in theology, is used in speaking of the first person of the trinity. See the article **TRINITY.**

**FATHER** is also used in speaking of spiritual and moral things. Thus, Abraham is called the father of the faithful.

**FATHER** in church-history, is applied to antient authors who have preserved in their writings the tradition of the church. Thus St. Chrysostom, S. Basil, &c. are called Greek fathers, and St. Augustine and St. Ambrose latin fathers. No author who wrote later than the twelfth century is dignified with the title of Father.

**FATHER** is also a title of honour given to prelates and dignitaries of the church, to the superiors of convents, to congregations of ecclesiastics, and to persons venerable for their age or quality. Thus we say the right reverend father in God, the father general of the benedictines, the fathers of the council of Nice, father of his country, &c.

*Dist. de Trevoux.*

**FATHER-LASHER**, a name given by the people of Cornwall to a fish of the cottus-kind, with the upper jaw longest, and a prickly head. See **COTTUS.**

**FATHOM**, a long measure containing six feet, chiefly used at sea for measuring the length of cables and cordage.

**FATNESS.** See the article **CORPULENCY.**

**FATTENING** of oxen, horse, swine, poultry, &c. in husbandry. See the articles **OX**, **HORSE**, &c.

**FATUUS IGNIS**, in physiology, a meteor, otherwise called will with a wiip. See the article **WILL.**

**FAUCON**, or **FALCON.** See **FALCON.**

**FAUCONET**, or **FALCONET.** See the article **FALCON.**

**FAVIFORM**, in general, something resembling a honey comb. Surgeons give this appellation to certain ulcers, which emit a sanies thro' little holes, especially in the head. See **HONEY-COMB.**

**FAVISSÆ**, in antiquity, were according to Festus and Gellius, cisterns to keep water in: but the favissæ in the capital at Rome were dry cisterns, or subterraneous cellars, where they laid up the old statues, broken vessels, and other things used in the temple. These were much the same with what in some of the

modern churches are called the archives and treasury.

**FAUNALIA**, in roman antiquity, three annual festivals in honour of the God Faunus, the first of which was observed on the ides of February; the second on the 16th of the calends of March; and the third on the nones of December. The principal sacrifices on this occasion were lambs and kids. Faunus was a deity of the Romans only, being wholly unknown to the Greeks. Virgil makes him a God of oracles and predictions. Horace calls him the guardian and protector of men and wit, and recommends to him the care of his estate. Ovid represents this deity with horns on his head, and crowned with the pine-tree. It is supposed the roman Faunus was the same with the greek Pan.

**FAUNS**, *fauni*, a kind of rural deities, among the antient Romans, represented with horns on their heads, sharp pointed ears, and the rest of their bodies like goats; they were the sons of Faunus. See the preceding article.

The Fauni, when they met any person, would terrify and stupify him with their very looks; and were the frequent cause of miscarriages to big-bellied women: they were thought to inhabit the woods together with the nymphs and satyrs.

**FAVORITO**, in music, as *choro favorito*, a chorus, in which are employed the best voices and instruments, to sing the recitatives, play the ritornella's, &c. this is otherwise called the little chorus, or *choro recitante*. See **RECITANTE.**

**FAUQUEMONT**, in geography. See the article **VALKENBURG.**

**FAUSSE-BRAYE**, in fortification, a small rampart without the true one, about three or four fathom wide, and bordered with a parapet and banquette.

The design of a fausse-braye is to defend the fosse: it is not reckoned to useful, where there is a dry moat, because the besieged may make better works for the defence of it than a fausse-braye, such as traverses, scillons and coffers; but in places surrounded with a wet ditch, a fausse braye is more useful, provided it be made only before the curtain and flanks; for lying low, it cannot be easily hurt by the enemies cannon, and it defends the fosse better, because of its low situation, than the true rampart, which on account of its height cannot so well discover the fosse: fausse-brayes ought never

never to be made before the faces, especially in places faced with brick, or stone, because the breach being generally made in the face, the ruins and rubbish of the rampart are stopped in the fausse-braye, which facilitates the ascent of the breach, and in places lined with brick or stone, the pieces of stone or brick fly among the soldiers that are in the fausse-braye. See FORTIFICATION.

FAWN, among sportsmen, a buck, or doe, of the first year; or the young one of the buck's breed in its first year.

FAYAL, one of the Azores-islands. See the article AZORES.

FE, or St. FE, the capital of New Mexico: west long. 109°, north lat. 36°.

St. FE *de bagota*, the capital of the kingdom of New Granada: west long. 73°, north lat. 4°.

It is an archbishopric and the seat of the governor of the province, &c.

St. FE is also a town of Spain, in the province of Granada, situated on the river Xenil: west lon. 3° 45', north lat. 37° 20'.

St. FE is also the capital of a province of the same name, in Terra firma in south America, situated on the river of St. Martha, 200 miles south of Carthagena: west long. 77°, north lat. 7° 24'.

FEALTY, in law, an oath taken on the admittance of any tenant, to be true to the lord of whom he holds his land: by this oath the tenant holds in the freest manner, on account, that all who have fee, hold *per fidem & fiduciam*, that is, by fealty at the least.

This fealty, at the first creation of it, bound the tenant to fidelity, the breach of which was the loss of his fee. It has been divided into general and special: general, that which is to be performed by every subject to his prince; and special, required only of such as, in respect of their fee, are tied by oath to their lords. To all manner of tenures, except tenancy at will, and frank-almoign, fealty is incident, though it chiefly belongs to copyhold estates, held in fee and for life. The form of this oath by stat. 17 Ed. II. is to run as follows. "I  
" A. B. will be to you my lord D. true  
" and faithful, and bear to you faith  
" for the lands and tenements which I  
" hold of you, and I will truly do and  
" perform the customs and services that  
" I ought to do to you. So help me  
" God."

FEAST, or FESTIVAL, in a religious sense, is a day of feasting and thanksgiving.

Among the antients, feasts were instituted upon various accounts, but especially in memory of some favourable interposition of providence. Thus, the Jews had their feasts of passover, pentecost, and tabernacles; the Greeks, their cerealia, panathenæa, &c. and the Romans, their saturnalia, ambarvalia, &c. See PASSOVER, CEREALIA, &c.

In the antient Christian church, besides the high festivals of Christmas, Easter, Pentecost, Annunciation, &c. there were others instituted in honour of the apostles and martyrs: all which are retained by the church of England. See the articles CHRISTMAS, EASTER, &c. In the church of Rome, there are double, half-double, and simple feasts almost without number. The name of double feasts is given to such whose service is fuller and more solemn than the rest, which likewise constitutes the difference between the others; the churches being embellished, and the altars adorned, according to the rank which each saint holds in his respective church. All high festivals have an octave, consisting of the feast itself, and the seven following days.

In Italy, certain festivals are celebrated solely by the lovers of that country. When a lover wants to give his mistress the highest testimony of his gallantry, he immediately makes her the idol of his devotion; procuring vespers, and even masses, to be said in her honour. For this purpose he makes choice of the festival of some saint whose name she bears; and though the saint has the same name, they manage matters so, that the devotion of the festival is plainly relative to the lover's mistress.

The four quarterly feasts, or stated times, whereon rent on leases is usually reserved to be paid, are Lady-day, or the annunciation of the blessed virgin Mary, or 25th of March; the nativity of St. John the Baptist, held on the 24th of June; the feast of St. Michael the archangel, on the 29th of September; and Christmas, or rather of St. Thomas the apostle, on the 21st of December. See the article ANNUNCIATION, &c.

FEATHER, in physiology, a general name for the covering of birds; it being common to all the animals of this class

to have their whole body, or at least the greatest part of it, covered with feathers or plumage.

There are two sorts of feathers found on birds, *viz.* the strong and hard kind, called quills, found in the wings and tail; and the other plumage, or soft feathers, serving for the defence and ornament of the whole body. All birds, so far as yet known, moult the feathers of their whole body yearly.

Feathers make a considerable article of commerce, as serving for beds, writing-pens, &c. Those for beds pay, on importation, 1l. 3s. 1<sup>2</sup>/<sub>8</sub>d. and draw back 1l. 6s. 3d. Ostrich-feathers, if dressed, pay 7s. 8<sup>2</sup>/<sub>8</sub>d. the pound, but if undressed only 3s. 10<sup>2</sup>/<sub>8</sub>d.; drawing back in the former case, 6s. 9d. and in the latter, 3s. 4<sup>1</sup>/<sub>2</sub>d.

**FEATHER-BED.** See the article **BED**.

Feather-beds, whether old or new, pay, on importation, each 10s. 3<sup>1</sup>/<sub>8</sub>d. and drawback 9s. on exporting them.

**FEATHER**, in the manege, a sort of natural frizzling of the hair, which in some parts rises above the rest, resembling the tip of an ear of corn. This happens most frequently, between the eyes; and if lower, it is a sign of a weak sight.

A feather upon a horse's neck, is called a roman feather; being a row of hair turned back, and forming a mark like a sword-blade near the mane.

**Mid-FEATHER**, in the salt-works, the partition in the middle of the furnace, which it divides into two chambers. See the article **SALT-MAKING**.

**FEATHER-EDGED**, among carpenters, an appellation given to planks or boards, which have one side thicker than the other.

**FEATHER**, or *Cut a FEATHER*. See **CUT**. *Prince's FEATHER*, a plant otherwise called amaranth. See the article **AMARANTH**.

**FEAZING**, in the sea-language, signifies the ravelling out of any great rope, or cable, at the end.

**FEBRIFUGE**, in medicine, an appellation given to such medicines as mitigate, or remove a fever. These medicines are otherwise termed antifebrilia. Febrifuge is also a name for the centaurium minus.

**FEBRIS**, **FEVER**, in medicine. See the article **FEVER**.

**FEBRUARY**, in chronology, the second month of the year, reckoning from January, first added to the calendar of Romulus by Numa Pompilius.

February derived its name from *Februa*, a feast held by the Romans in this month, in behalf of the manes of the deceased, at which ceremony sacrifices were performed, and the last offices were paid to the shades of the defunct.

February in a common year, consists only of twenty-eight days, but in the bissextile year, it has twenty-nine, on account of the intercalary day, added that year. See the article **BISSEXTILE**.

**FECIALES**, or **FOECIALES**, a college of priests instituted at Rome by Numa, consisting of twenty persons, selected out of the best families. Their business was to be arbitrators of all matters relating to war and peace, and to be the guardians of the public faith. It is probable that they were ranked among the officers of religion, to procure them the more deference and authority, and to render their persons more sacred among the people. If the commonwealth had received any injury from a foreign state, they immediately dispatched these officers to demand satisfaction, who, if they could not procure it, were to attest the Gods against the people and country, and to denounce war: otherwise they confirmed the alliance, or contracted a new one, which they ratified by sacrificing a hog.

**FECULA**, or **FÆCULA**, in pharmacy. See the article **FÆCULA**.

**FECULENT**, or **FÆCULENT**. See the article **FÆCULENT**.

**FECUNDITY**, or **FOECUNDITY**, the same with fertility. See **FERTILITY**.

**FEE**, in law, signifies a certain allowance to physicians, barristers, attornies, and other officers, as a reward for their pains and labour.

If a person refuse to pay an officer his due fees, the court will grant an attachment against him, to be committed till the fees are paid; and an attorney may bring an action of the case for his fees, against the client that retained him in his cause.

**FEE** also denotes a settled perquisite of public officers, payable by those who employ them.

The fees due to the officers of the custom-house, are expressly mentioned in a schedule, or table, which is hung up in public view in the said office, and in all other places where the said fees are to be paid or received. And, if any officer shall offend, by acting contrary to the regulations therein contained, he shall

shall forfeit his office and place, and be for ever after incapable of any office in the custom-house.

The other public offices have likewise their settled fees, for the several branches of business transacted in them.

**FEE-ESTATE**, that held by the benefit of another, and for which some service, rent, or acknowledgment is paid to the chief lord, or superior, in whom the mere propriety of the soil always continues.

Fee is generally divided into absolute and conditional. Absolute, otherwise termed fee-simple, is where a person is seized of lands or tenements, to him and to his heirs for ever; whereas, fee-tail, or conditional fee, is where a person is seized of lands, with a limitation to him and the heirs of his body. A fee-simple is the largest estate a person can have, and can be conveyed by no other expression, but heirs for ever; yet, in a will, which is more favoured than a grant, the intention of the testator is more considered than the literal meaning of the words.

**FEE-FARM**, a kind of tenure without homage, fealty, or other service, except that mentioned in the feoffment; which is usually the full rent, or at least a fourth part of it.

The nature of this tenure is, that if the rent be behind, and unpaid for two years, then the feoffor and his heirs may have an action for the recovery of the lands.

**FEEL EXPECTANT**. See **EXPECTANT**.

**FEEDING** of fish. See **FISH**.

**FEELERS**, in natural history, a name used by some for the horns of insects. See the article **HORN**.

**FEELING**, one of the five external senses, by which we obtain the ideas of solid, hard, soft, rough, hot, cold, wet, dry, and other tangible qualities.

This sense is the coarsest, but at the same time, the surest of all others: it is besides the most universal. We see and hear with small portions of our body, but we feel with all. Nature has bestowed that general sensation wherever there are nerves, and they are every where, where there is life. Were it otherwise, the parts divested of it might be destroyed without our knowledge. It seems that upon this account nature has provided, that this sensation should not require a particular organization. The structure of the nervous papillæ is not absolutely necessary to it. The lips

of a fresh wound, the periosteum, and the tendons, when uncovered, are extremely sensible without them. These nervous extremities serve only to the perfection of feeling, and to diversify sensation.

Feeling is the basis of all other sensations. All the nervous solids, while animated by their fluids, have this general sensation; but the papillæ in the skin, those of the fingers in particular, have it in a more exquisite degree, so perfectly, that they convey some notice of the figure of the bodies which they touch.

The object of feeling is every body that has consistency or solidity enough to move the surface of our skin. It was necessary to perfect feeling, that the nerves should form small eminences, because they are more easily moved by the impression of bodies, than an uniform surface. It is, by means of this structure, that we are enabled to distinguish not only the size and figure of bodies, their hardness and softness, but also their heat and cold.

Feeling is so useful a sensation, that it supplies the office of the eyes, and in some sense indemnifies us for their loss.

**FEELING a horse**, in the manege, is of two sorts. 1. To feel a horse in the hand, is to observe, that the horse be under subjection, by obeying the bit. 2. To feel a horse upon the haunches, is to observe, that he plies or bends them.

**FEINT**, in music, the same with **diesis**. See the article **DIESIS**.

**FEINT**, in fencing, a shew of making a thrust at one part, in order to deceive the enemy, that you may really strike him in another.

A simple feint is a mere motion of the wrist, without stirring the foot.

**FELAPTON**, in logic, one of the six moods of the third figure of syllogisms, wherein the first proposition is an universal negative, the second an universal affirmative, and the third a particular negative.

**FELIN**, a town of Livonia, about an hundred miles north east of Riga.

**FELIS**, in zoology, is used by Linnæus, as the name of a large genus of quadrupeds, of the order of the fæx; the characters of which are these: the fore-teeth are small, obtuse, and equal; the tongue is furnished with prickles, all pointing backwards; and the feet are formed for climbing, with claws which may

may be drawn in or exerted at the creature's pleasure.

To this genus belong the lion, tiger, leopard, cat, cat of the mountain, lynx, and ounce. See LION, TIGER, &c.

**FELIS VOLANS**, the FLYING-CAT, an animal supposed to be the same with the flying squirrel. See SQUIRREL.

**FELIS ZIBETHICUS**, the CIVET-CAT: See the article ZIBETHICUM ANIMAL.

**FELKIRK**, a town of Aultria, in Germany, thirty-five miles south-east of Constance.

**FELLING** of timber. See TIMBER.

**FELLOWS**, in fortification, are six pieces of wood, each whereof form a piece of an arch of sixty degrees, and joined all together, by dulleges, make an intire circle; which with the addition of a nave, and twelve spokes, make the wheel of a gun carriage. Their thickness usually is the diameter of the ball of the gun they serve for, and their breadth something more.

**FELLOWSHIP**, or COMPANY, in arithmetic, is when two or more join their stocks, and trade together, dividing their gain, or loss, proportionably.

Fellowship is either with or without time. Questions without time, or in the single rule of fellowship, as it is frequently called, are wrought by the following proportion.

As the whole stock to the whole gain or loss, so is each man's particular stock to his particular share of gain or loss.

Example I. A, B, and C make a joint stock: A puts in 460l. B 510l. and C 480l. they gain 340l. what part of it belongs to each?

In order to the solution of this question, find the total of their joint stock, *viz.*

A's stock 460l. + B's stock 510l. + C's stock 480l. = 1450l. the total stock.

Then 1. To find A's share of the gain, state as follows: If 1450l. : 340l. :: 460l. which being worked by the rule of three, the answer will be 107l. 17s. 2½d. for A's share of the profit.

2. B's share of the gain, by stating thus, if 1450l. : 340l. :: 510l. and working by the rule of three, will be found to be 119l. 11s. 8½d.

3. C's share will appear 112l. 11s. 0¼d. when worked as before, after having stated thus. If 1450l. : 340l. :: 480l.

Ex. II. Suppose three partners, A, B, and C make a joint stock in this manner: A puts in 24l. B 32l. and C 40l. in all 96l. with which they trade, and gain 12l.

required each man's true share of that gain? The first operation for A's part of the gain will stand thus,

$$96l : 12l :: 24l : 3l = A's \text{ gain.}$$

$$96l : 12l :: 32l : 4l = B's \text{ gain.}$$

$$96l : 12l :: 40l : 5l = C's \text{ gain.}$$

Proof 3l. + 4l. + 5l. = 12l. the whole gain. That is, if the total of all their particular gains amounts to the whole gain, the work is true; if not, some mistake has been committed.

**FELLOWSHIP** *with time*, usually called the *Double Rule of Fellowship*, because every man's money is to be considered with relation to the time of its continuance in the joint stock. It is worked thus, multiply each man's stock by the respective time he puts it in for, and add all the products; the total of which must be your first number thro' all the statings: the gain or loss the second, as before; and each man's particular stock, multiplied by its time, the third.

Note, all the particular times (if not so given) must be reduced into one denomination, *i. e.* all years, all months, all weeks, or all days, &c. See REDUCTION.

Ex. 1. A put into company 560l. for eight months, B 279l. for ten months, and C 735l. for six months; they gained 1000l. What share of it must each have?

For the solution of this question, proceed as follows. A's stock 560l. × 8 its time = 4480, B's stock 279l. × 10 its time = 2790, C's stock 735l. × 6 its time = 4410. Then 4480 + 2790 + 4410 = 11680. Now, 1. To find A's share of the profit, state thus. If 11680l. : 1000l. :: 4480l. which being worked by the rule of three, the answer will be 383l. 11s. 2½d. for A's share of the gain.

2. For finding B's share, state thus, if 11680l. : 1000l. :: 2790l. and working as before directed, the answer will be 238l. 17s. 4¾d.

3. To find C's proportion of the gain, say, if 11680l. : 1000l. :: 4410l. then working it by the rule of three, the true amount of his share will appear to be 377l. 11s. 4¾d.

Ex. II. Three merchants, A, B, and C, enter into partnership thus; A puts into the stock 65l. for eight months; B puts in 78l. for twelve months; and C puts in 84l. for six months. With this joint stock they traffic, and gain 166l. 12s. 'Tis required to find each man's share of the gain proportionable to his stock and time of employing it.

1. A's stock 65l.  $\times$  8 months, the time it was employed = 520
2. B's stock 78l.  $\times$  12 months, the time it was employed = 936
3. C's stock 84l.  $\times$  6 months, the time it was employed = 504

The sum of all those products is 1960

Then, as before, the several proportions will stand thus :

1960:166,6::520:44l. 4s. for A's share.  
 1960:166,6::936:79l. 11s. 2½d. for B's share.  
 1960:166,6::504:42l. 16s. 9½d. for C's share.

The whole gain = 166l. 12s.

**FELL-WORT**, a plant more usually called gentian. See the article **GENTIAN**.

**FELO DE SE**, in law, a person that deliberately lays violent hands on himself, and is the occasion of his untimely death, whether by hanging, drowning, stabbing, shooting, or any other way.

It is a species of felony, of which infants, idiots, lunatics, and persons distracted by a disease, cannot be guilty, it being the willful and deliberate perpetration of self-murder, that constitutes this crime.

The goods and chattels, both real and personal, of a *felo de se*, are forfeited to the king : however, the jury frequently save the forfeiture, by finding their verdict lunacy ; to which they are inclined, on a favourable interpretation, that 'it is impossible for a person in his senses to do a thing so contrary to nature.

**FELON**, in law, a person guilty of felony. See the article **FELONY**.

**FELON-WORT**, in botany, the same with the solanum, or deadly nightshade.

**FELONY**, in law, a capital crime, next in degree to petit treason, and committed with an evil intention ; such are murder, theft, suicide, sodomy, rape, &c. See the articles **MURDER**, **THEFT**, &c. Felony is either by the common law, the civil law, or by statute.

Felony at common law is either against the life of a person, as murder, manslaughter, *felo de se*, and *se defendendo* ; against his goods, as larceny and robbery ; against his habitation, as burglary, arson, and house breaking ; or, lastly, against public justice, by breach of prison, rescue, and escape, &c.

Piracy, and robbery and murder on the sea, is felony both by the civil-law, and by statute. See the articles **MURDER**, **BURGLARY**, **ROBBERY**, &c.

There are usually reckoned two sorts of felony, one lighter, and such as for the first offence may be allowed benefit of clergy ; which the other, or greater, may not. See the article **CLERGY**.

Felony is punishable with loss of life and of lands not intailed, also of goods and

chattels. It also corrupts blood, unless the statute, making an offence to be felony, ordains it shall be otherwise, as some statutes do.

**FELT**, in commerce, a sort of stuff, deriving all its consistence merely from being fulled, or wrought with lees and fize, without either spinning or weaving.

Felt is made either of wool alone, or of wool and hair. Those of french make, 3½ yards long, and 1½ broad, for cloaks, pay each 2l. 14s. 1 800d. on importation, and draw back 1l. 12s. 3d. on exporting them again.

**FELTRI**, a town of Italy, subject to Venice, thirty-five miles north of Padua.

**FELUCCA**, in sea-affairs, a little vessel with six oars, frequent in the Mediterranean, which has this peculiarity, that its helm may be applied either in the head or stern, as occasion requires.

**FEMALE**, *fœmina*, a term peculiar to animals, signifying that sex which conceives and generates its young within itself. See **SEX** and **GENERATION**.

Females differ in many respects, besides sex, from males : in most quadrupeds they are smaller and weaker ; but, in birds of prey, the reverse of this generally holds. See the article **MALE**.

**FEMALE** is also applied, figuratively, to things without life, from the resemblance they bear to the females of animals : thus we say, a female screw, female flower, &c. See **SCREW**, **FLOWER**, &c.

**FEMME COVERT**, in law, a married woman. See the article **COVERTURE**.

**FEMME SOLE**, an unmarried woman, whose debts, contracted before marriage, become those of her husband after it.

A *femme sole* merchant, is where a woman, in London, uses a trade alone, without her husband, on which account she shall be charged without him.

**FEMININE**, or **FOEMININE**, in grammar, one of the genders of nouns. See the article **GENDER**.

The feminine gender serves to intimate that the noun belongs to the female. In latin, the feminine gender is most com-

monly distinguished by the article *hæc*, as it is in the greek by the article *ἡ*. In the french the article *la* commonly denotes this gender; but we have no such distinction by articles in the english language.

**FEMUR**, *os femoris*, in anatomy, the thigh-bone.

This is the longest and strongest bone in the whole human frame. In its upper extremity is to be observed a very large head, and in this head a cavity destined for the ligamentum rotundum, by means of which it is fixed in the acetabulum, and its luxation upwards prevented. To its neck is affixed a robust annular ligament, which contains the head and neck of the bone as it were in a case: it is observable, that the progress of this neck is not straight but oblique, nearly horizontal, and turning somewhat outward, being the contrivance of nature for keeping the thighs asunder, by which means we tread the firmer; and, by this situation of the neck of this bone also, several muscles have a much more commodious insertion than could otherwise have been possible.

Next, may be remarked the spongy cavernous structure of this extremity of the bone, by reason of which it is less liable to fractures, especially in this part: the apertures for the ingress of several vessels are also observable; and there are two apophyses, called trochanters, which serve for the insertion of the muscles of the thigh, and which, together with the head, become, before puberty, distinct epiphyses. In the lower extremity of the femur we observe two heads, with a cavity between them, for the articulation with the tibia; also a posterior cavity intended to give safe passage to the vessels of the tibia: there is, besides, an interior cavity, for the placing of the patella: and lastly, two condyles, or tubercles, placed near the heads, and serving for a fixed point to the origin of the muscles, which are to move the foot. In the exterior part of these we observe a peculiar depression, and often a single sesamoid bone; and sometimes there is also found another of these in the other tubercle: this usually, however, happens in old subjects. The whole extremity of the femur, is seen, quite to the age of puberty, a perfectly distinct epiphysis. In the body of the thigh-bone it is remarked that the anterior surface is convex, but the posterior somewhat concave: the obliquity of this part of the body is singular: its spine is remarkable, as is also its great cavity for containing

the marrow. The strength and firmness of this bone are surprisingly great; hence the use of the thigh-bone is to support and sustain the weight of the whole body, and its moveable articulation at the head gives way to the easy motion of the body, while the feet are unmoved.

**FEN**, a place overflowed with water, or abounding with bogs. See the articles **BOG** and **DRAINING**.

Fens are either made up of a congeries of bogs, or consist of a multitude of pools or lakes with dry spots of land intermixed, like so many little islands.

Several statutes have been made for the draining of fens, chiefly in Kent, Cambridgeshire, Bedfordshire, and Lincolnshire; and by a late act, 11 Geo. II. commissioners shall be appointed for the effectually draining and preserving of the fens in the isle of Ely, who are authorized to make drains, dams, and proper works thereon; and they may charge the landholders therein with a yearly acre-tax, and in default of payment sell the defaulter's lands.

**FENCE**, in country-affairs, a hedge, wall, ditch, bank, or other inclosure, made around gardens, woods, corn-fields, &c.

The chief reason why woodlands and plantations so seldom prosper, is in a great measure owing to the neglect of fencing them round, to keep out the cattle. This neglect prevails much in the northern parts of this island, though the use of fences is certainly more necessary there than in the south, as the lands require more shelter and warmth. There are several ways of fencing lands, but the usual is that of hedging it with either white or black thorn, crab, holly, alder, or furze, &c. See **HEDGE**.

But the best, and probably the cheapest, considering the duration and goodness of it, where flat stones are not to be had, is, in a grassy place, to dig turf, a spit or near a spit deep, the breadth of your spade, and about four or five inches thick: lay these turf with the grass outward, even by a line on one side, and on the backside of these lay another row of turf, leaving a foot space of solid ground on the inside, to prevent the bank from slipping in, if the ground should any way be faulty: on the outside of which you may make a ditch of what breadth or depth you please; or you may lower the ground on each side with a small slope, two feet deep, by which means you will have no loss of pasture by the fence, because it will bear grass on both sides. Then, with the

the earth that comes out of the ditches or sloped places, fill the middle of the bank level with the turf on each side, and then lay two more rows of turf upon the first, and then fill it again as before: this do, till your bank be four feet high, or of what height you please, only your foundation must be always broader the higher you raise it. You must observe on each side to give a small slope to the bank, so as to make the top about three feet wide, upon which plant quick, making on the top a little hollow, to keep as much of the rain to the quick as you can. Be sure to plant the quick about a foot or more in depth, by which means you will have a fence six feet high, besides the hedge on it, which will, in a very dry time, be always green on both sides, like a green wall, make a pleasant fence, and keep all sorts of cattle within their bounds.

In Devonshire they build two stone walls, first setting two edgeways, and then one between, and as it rises filling the interval or coffer with earth, to any height and breadth at pleasure. This is the neatest and most saving fence whatever, where they can be supplied with abundance of flatty stones. Upon these banks they not only plant quick-fets, but timber trees that thrive exceedingly.

In Cornwall the husbandmen secure their woods and lands with high mounds, on which they plant acorns, so that the roots of their sprouts bind in the lesser mould, and form a double and durable fence.

**FENCE-MONTH**, the month wherein deer begin to fawn, during which it is unlawful to hunt in the forest.

It commences fifteen days before midsummer, and ends fifteen days after it. This month, by antient foresters, is called defence-month. There are also certain fence-months, or seasons, for fish as well as wild beasts, as appears by stat. West. 13 Geo. II.

**FENCING**, the art of making a proper use of the sword, as well for attacking an enemy, as for defending one's self.

Fencing is a genteel exercise, of which no gentleman ought to be ignorant. It is learned by practising with foils, called in latin *rudes*. See the article FOIL.

According to Pyrrard, fencing is in so high repute in the East-indies, that the greatest noblemen and even princes teach it.

Fencing is either simple or compound.

Simple is that performed nimbly and off hand, on the same line. In this the

principal intention, in respect to the offensive part, should be to attack the enemy in the most unguarded part; and in the defensive, to parry or ward off the enemy's thrusts and blows. See the articles GUARD, THRUST, PARRYING, &c.

Compound fencing, on the offensive part, includes all manner of arts to deceive the enemy, by making him leave the part unguarded which we want to attack; such are feints, appeals, clashing and intangling of swords, half-thrusts, &c. And on the defensive, to parry and thrust at the same time. *Trevooux*.

An appeal is a simple thrust, made by beating with the right foot in the same place.

**FEND**, in the sea-language, imports the same as defend: thus, fending the boat, is saving it from being dashed to pieces against the rocks, shore, ship's sides. And hence

**FENDERS** are pieces of old hawfers, cable-ropes, or billets of wood, hung over the ship's sides, to keep other ships from rubbing against and injuring her.

**FENDER-BOLTS**, or FEND-BOLTS. See the article BOLT.

**FENDUE en pal**, in heraldry, a cross clove down in pale, that is, from top to bottom, and the two parts set at some distance from each other.

**FENESTRA**, in anatomy, a term applied to two openings or foramina within the ear, distinguished by the names of the oval and the round fenestra. The fenestra ovalis leads to the vestibule on which stands the stapes. The fenestra rotunda leads to the cochlea, and is closed by a membrane. See the articles EAR, STAPES, COCHLEA, &c.

**FENESTRELLES**, a town and fort of Piedmont, fifteen miles from Turin.

**FENNEL**, *fœniculum*, in botany. See the article FOENICULUM.

There are kept two very different sorts of fennel-seeds in the shops, called the common fennel-feed and the sweet fennel-feed. The common kind is of a sharp, biting, and pungent taste; whereas the sweet kind is not only larger and more beautiful, but of a pleasant aromatic sweetish taste, with nothing of the pungency of the other. Sweet fennel-feed is accounted carminative and attenuant, and considerably diuretic and sudorific, and recommended as a specific in the measles, small-pox, and malignant fevers. It is also an ingredient in many of the official compositions

compositions, and in the decoctions for clysters.

Fennel-roots are of the number of the five opening ones of the shops, and prescribed in the same intentions with the seeds. They are likewise said to be great antinephritics.

FENNEL-FLOWER, a plant known among botanists by the name of *nigella*. See the article *NIGELLA*.

FENNEL-GIANT, a plant also called *serula*. See the article *FERULA*.

Hog's FENNEL, the english name of the *peucedanum*. See *PEUCEDANUM*.

Sweet FENNEL, in botany. See the article *FINOCHIA*.

Scorbing FENNEL, a name given to the *thapsia*. See the article *THAPSIA*.

FENUGREEK, or FOENUGREEK. See the article *FOENUGREEK*.

FEOD, *feodum*, the same with fee. See *FE*.

FEODAL and FEODATORY. See the articles *FEUDAL* and *FEUDATORY*.

FEOFFMENT, in law, is a gift or grant of any manors, messuages, lands, or tenements to another in fee, that is, to him and his heirs for ever, by delivery of seisin, and possession of the estate granted. A deed of feoffment is the most antient conveyance of lands, and is said in some measure to exceed the conveyance by fine and recovery, because it clears all disseisins, abatements, intrusions, and other wrongful estates, which neither a fine, recovery, nor bargain and sale by deed indented and enrolled, does. It also bars the feoffor from all collateral benefit, in respect to conditions, powers of revocation, writs of error, &c. and destroys contingent uses. A feoffment however must not be made of such things, whereof livery and seisin may not be made; for no deed of feoffment is good to pass an estate, without livery of seisin: so that if either of the parties die before livery, the feoffment becomes void. Nevertheless a freehold may be granted without livery, on the statute of 27 Hen. VIII. by virtue of which a feoffment to the use of the feoffor or feoffee, supplies the place of livery and seisin.

A deed of feoffment is always applied to some corporeal and immoveable thing, and usually consists of the following parts, *viz.* the names and additions of the parties, the consideration, the granting part, the thing granted, the habendum or clause explaining for what estate or use it is granted, a covenant that the feoffor is seized in fee and has good right to grant,

that the feoffee shall quietly enjoy the premises free from incumbrances; and, lastly, a covenant for making further assurance with a letter or power of attorney to make livery and seisin.

FERÆ, in zoology, an order of quadrupeds, the distinguishing characters of which are, that all the animals belonging to it have six fore teeth in each jaw, and the canine or dog-teeth considerably long.

Under this order are comprehended several large genera, as the *ursus*, *felis*, *mustela*, *lutra*, *canis*, *phoca*, *meles*, *erinaceus*, *dasyus*, *talpa*, and *vespertilio*. See the articles *URSUS*, *FELIS*, &c.

FERÆ NATUREÆ, in law, signifies beasts and birds that are wild, as foxes, hares, wild-ducks, &c. in which no person can claim any property.

FERABATH, a port town of Persia, situated on the south coast of the Caspian sea: east lon. 50°, and north lat. 38°.

FERALIA, in antiquity, a festival observed among the Romans, on Feb. 21, or, according to Ovid, on the 17th of that month, in honour of the manes of their deceased friends and relations. During the ceremony, which consisted in making presents at their graves, marriages were forbidden, and the temples of the divinities shut up; because they fancied that during this festival, the ghosts suffered no pains in hell, but were permitted to wander about their graves, and feast upon the meats prepared for them.

FER DE FOURCHETTE, in heraldry, a cross having at each end a forked iron, like that formerly used by soldiers to rest their musquets on. It differs from the cross fourché, the ends of which turn forked, whereas this has that sort of fork fixed upon the square end. See plate *XCVI. fig. 2.*

FER DE MOULIN, *milrinde*, *inke de moulin*, in heraldry, is a bearing supposed to represent the iron-ink or ink of a mill, which sustains the moving mill-stone.

FERDEN, or VERDEN, a city of Germany, subject to Hanover; it is situated in lower Saxony, on the river Aller, twenty-six miles south-east of Bremen: east lon. 9°, and north lat. 53° 24'.

FERDWIT, a term formerly used to denote a freedom from going forth upon any military expedition; or, according to some, the being quit of manslaughter committed in the army.

FERE, a town of Picardy, in France, forty-two miles south-east of Amiens.

**FERE** is also a town of Champaign, about thirty miles north of Troyes.

**FERENTARII**, in roman antiquity, were auxiliary troops, lightly armed; their weapons being a sword, bow, arrows, and a sling.

There were another kind of *ferentarii*, who carried arms after the armies, and were ready to supply the soldiers in time of battle.

**FERETINO**, a city and bishop's see of Italy, about fifty miles east of Rome: east lon.  $14^{\circ} 5'$ , and north lat.  $41^{\circ} 45'$ .

**FERETTE**, a town of Alsace, subject to France, fifty-five miles south of Strasbourg.

**FERIÆ**, in roman antiquity, holidays, or days upon which they abstained from work.

It was a pollution of the *feriæ*, according to Macrobius, if the *rex sacrorum* or *flamines* saw any work done on them, and therefore they ordered proclamation to be made by the herald, that every one might abstain from work, and whoever transgressed the order, was fined. Nay, the same author informs us, that Mutius Scævola, the pontiff, was of opinion, that the breaking the *feriæ* was an unpardonable crime, unless it was done inadvertently, and in this case an expiation was to be made by sacrificing a hog.

The Romans had two kinds of *feriæ*: 1. The public, common to all the people in general. 2. The private, which were only kept by some private families.

The public *feriæ* were four-fold: 1. *Stativæ feriæ*, holidays which always fell out upon the same day of the month, and were marked in the calendar; of these the chief were the *agonalia*, *carmentalia*, and *lupercalia*. See the articles *AGONALIA*, *CARMENTALIA*, &c. 2. *Conceptivæ feriæ*, holidays appointed every year upon certain or uncertain days by the magistrates, or the pontiff; such were the *latiniæ*, *paganalia*, *compitalia*, &c. See the article *PAGANALIA*, &c. 3. *Imperativæ feriæ*, holidays commanded or appointed by the authority of the consuls or prætors; of this kind we may reckon the *lectisternium*. See *LECTISTERNIUM*. 4. *Nundinæ*, the days for fairs. See *NUNDINÆ*. The private *feriæ* were either confined to private families or particular persons, as birth-days; and those expiations upon the tenth day after a person died in a house, called *feriæ denicales*.

**FERIÆ LATINÆ** were instituted by Tarquinius Superbus, who having overcome

the Tuscans, made a league with the Latins, and proposed to them to build a temple in common to Jupiter Latialis, in which both nations might meet, and offer sacrifice for their common safety. At this festival a white bull was sacrificed, and each town, both of the Latins and Romans, provided a certain quantity of meat, wine, and fruits. At first the solemnity continued but one day; after the expulsion of the kings, the senate added a third, a fourth, and so on to ten days.

**FERIA**, in the romish breviary, is applied to the several days of the week; thus Monday is the *feria secunda*, Tuesday the *feria tertia*; though these days are not working days, but holidays. The occasion of this was, that the first christians were used to keep the easter-week holy, calling Sunday the *prima feria*, &c. whence the term *feria* was given to the days of every week. But besides these, they have extraordinary *feriæ*, viz. the three last days of passion-week, the two days following easter-day, and the second *feriæ* of rogation.

**FERIAL DAYS**, according to the statute 27 Hen. VI. cap. v. are taken for all days of the week except Sunday.

**FERM**, or **FARM**. See **FARM**.

**FERMANAGH**, a county of Ireland, in the province of Ulster, the chief town of which is Inniskilling.

**FERMENT**, any body which being applied to another, produces fermentation. See the article **FERMENTATION**.

Ferments are either matters already in the act of fermentation, or that soon run into this act. Of the first kind are the flowers of wine, yeast, fermenting beer, or fermenting wine, &c. and of the second are the new expressed vegetable juices of summer-fruits.

Among distillers, ferments are all those bodies which, when added to the liquor, only correct some fault therein, and by removing some obstacle to fermentation, forward it by secondary means; as also such as being added in time of fermentation, make the liquor yield a larger proportion of spirit, and give it a finer flavour. See the article **ADDITION**.

It appears that ferments are of use not only in beginning, but in regulating and determining the species of fermentation: thus fresh yeast determines the fermentation of wheat-flour, to make our common bread, which would prove of another kind with the flowers or lees of vinegar; and thus specific or determinate  
ferments

ferments have their correspondent effects. If sugar, honey, manna, treacle, or new wine be added to vinegar, themselves are soon changed into vinegar without stopping to make wine; because the acetous ferment or vinegar over-rules them; and so vinegar is soonest made in a cask that has before contained the same liquor. And if the best wine were put into a cask that had held putrified vinegar, the wine would not now make vinegar, but immediately run into corruption. So great and overruling a power have specific ferments; the use of which may afford considerable rules in chemistry, practical philosophy, and arts.

We recommend, therefore, to distillers to be careful in pitching upon a proper ferment, and also to consider its quantity, quality, and manner of operation. The quantity must be proportioned to that of the liquor, to its tenacity, and the degree of flavour it is intended to give, and to the dispatch required in the operation. As to the quality, it must be chosen perfectly sweet and fresh, for all ferments are liable to grow musty and corrupt; and if in this state they are mixed with the fermentable liquor, they will communicate their nauseous and filthy flavour to the spirit, which will scarce ever be got off by any subsequent refining. If the ferment be sour, it must by no means be used to any liquor; for it will give it an acetous instead of a vinous tendency. The ferment is to be put to the fermentable liquor in a state barely tepid, or scarce lukewarm. For the ferments most generally used, see the articles WINE-LEES, YEST, &c.

**FERMENTARIANS**, *fermentarii*, an appellation which those of the latin church have given to the Greeks, on account of their using leavened or fermented bread in the eucharist. The greek church, on the other hand, call the Latins azymites. See the article AZYMITES.

**FERMENTATION**, may be defined a sensible internal motion of the constituent particles of a moist, fluid, mixt or compound body; by the continuance of which motion, these particles are gradually removed from their former situation or combination, and again, after some visible separation is made, joined together in a different order and arrangement. The whole process then of fermentation, consists of two different operations, *viz.* an analytical one, whereby the particles are resolved; and a synthetical one, whereby

they are new ranged. And whenever these two different effects are found to be produced in direct sequence, the operation may be called by the name of fermentation, whether it happen in the blood or other animal, vegetable, or mineral substances. All separable, mixt, or compound bodies, may be the subjects of this operation; but the easier they are separable by means of water, air, and heat, the more readily they ferment. Thus the sweet or saccharine part of malt more readily dissolving in warm water, ferments easier than unmalted corn, which is more clammy, and will not dissolve so soon.

Fermentation, according to our later philosophers, arises from an inequality in the attractions of cohesion of the constituent particles of bodies. They distinguish it into two kinds, the one is that which happens when a solid is dissolved by a fluid; the other is, when two fluids being mixed together, ferment with each other. Dr. Friend and Keill are of opinion; that in order to cause a fermentation between a solid and a fluid, it is necessary, 1. That the particles of the solid attract those of the fluid with a greater force, than the particles of the fluid attract one another. 2. That the pores of the solid be not too small to admit the particles of the fluid into them. 3. That the body be of so loose a contexture, that the force of impact, with which the particles of the fluid rush into its pores, may be sufficient to disunite its parts. 4. That the elasticity of the particles tend to promote and augment the fermentation. Dr. Boerhaave makes also four conditions requisite, 1. That there be a due proportion between the size of the particles of the fluid, and the pores of the body to be dissolved. 2. That the figure of the particles of the fluid, have a determinate relation to that of the pores of the solid. 3. That the particles of the fluid be sufficiently solid, that their momentum or force of action may not be too weak. 4. That there be a fit disposition of the particles of the fluid, when received into the pores of the solid, to make some stay there and not immediately to pass through, but to act every way upon the solid, as they move towards the external surface thereof. Mr. Rowning thinks there is no occasion to have recourse to so many suppositions: if the particles of the solid (says he) attract those of the fluid with a greater degree of force than either those of

of the fluid or those of the solid attract one another, it is sufficient, and there will follow a dissolution of the body, as may clearly be demonstrated from the laws of mechanics, whatever the other circumstances relating to the figure or magnitude of pores, &c. may be. See Rown. Syst. of Nat. Phil. part II. Diff. VIII.

Fermentation is divided by chemists into many distinct species, particularly into vegetable, animal, and mineral. The vegetable kind again may be distinguished into vinous, acetous, and putrefactive; the vinous again into mucilaginous, mouldy, and putrefactive, and so of the acetous.

*Of vinous FERMENTATION.* The juice of the grape being chemically examined, proves to be no more than a large proportion of real sugar dissolved in water, with the addition only of a certain flavour in the juice of the grape, according to the nature of the vine; whence we may lay it down as an axiom, that a saccharine substance is the basis of wines; and indeed whoever would thoroughly enquire into the nature and means of improving vinous and acetous fermentation, cannot perhaps do better than to choose sugar for his subject; a chemical analysis of which will shew the principles necessarily required in this operation. These principles appear to be an acid salt, an oil, and earth so united together, as to be capable of dissolving perfectly in water. Experience shews us, that all fermentable bodies do not require ferments to begin their motion of fermentation. Raisins, we know, require none, much less does the fresh expressed juice of the grape, or other vegetable juices in the summer season, or in a warm air. But all sweet vegetable juices that have felt much of the fire, as treacle, wort high boiled, rob of malt, rob of elder, or the like, usually require a considerable proportion of vinous ferments to make them work. Water, we find, is absolutely necessary to begin and procure a fermentative motion in vegetable substances; for raisins and sugar being kept dry, will never ferment: and this holds universally of all the subjects of vinous and acetous fermentation. Whence water is an instrument that must be necessarily employed in these kinds of fermentation, whether natural or artificial. Warmth, with the free admission of the external air, is necessary to expedite the actions

of vinous fermentation; for if raisins and water were to stand either in a very cold place, or be kept intirely from the access of the common atmospherical air, either no fermentation, or a very slow and small one, would ensue, as has been often experienced. The lees remaining at the bottom of a cask where wine has fermented, will set any less fermentable subject at work, and determine its fermentation for the vinous kind. Whence it appears, that vinous fermentation consists, first, in an intestine struggle or commotion of the fluid; and, secondly, in a separation of a grosser part, which did not appear in that form before.

*Of acetous FERMENTATION.* The whole process of making vinegar being attentively considered, it is observable, that if wine were not bunged down when arrived at its vinous state, but suffered still to remain open and exposed to a warm air, it would spontaneously become vinegar; and the sooner, if a somewhat greater degree of heat than served for the making of wine, were employed. Acetous fermentation then requires a stronger heat than the vinous; and wines having once finished their fermentation, as wines, do not naturally stop there, but unless prevented, proceed directly on to vinegars; where again they make no stop, but unless prevented here also, spontaneously go on to vapidity, ropiness, mouldiness, and putrefaction: from which observation we would deduce this axiom, that, to speak philosophically, the intention and tendency of nature is to proceed from the very beginning of vinous fermentation directly in a continued series to putrefaction, and thence again to a new generation. See PUTREFACTION, &c.

If we examine the changes wrought upon vegetable subjects by vinous and acetous fermentation, we shall find that an inflammable spirit is produced by the action of vinous fermentation, from a vegetable subject and water, wherein no signs of any such spirit appeared before; inso-much, that this may be justly esteemed the criterion or inseparable effect of vinous fermentation; but that acetous fermentation, on the other hand, has a very different effect, and that it either conceals, alters, exhales, destroys, or some ways abolishes the inflammable spirit produced by the vinous fermentation. A part of this spirit is unquestionably exhaled by the heat employed in acetification, yet part also remains behind under a dif-

a different modification, so as to be recovered by art in an inflammable form, as we find by distilling the sugar of lead, which is only lead dissolved in spirit of vinegar. Having thus a criterion of acetous fermentation, as before we had of the vinous, (for if an acid unflammable liquor comes first by distillation over from a vegetable subject after fermentation, this will determine that fermentation to have been of the acetous kind) we are plainly led to allow of two very different kinds of fermentation in the same vegetable subject, and we make no doubt that some other species may be found upon due enquiry.

It has been disputed, whether animal bodies naturally undergo a fermentation after death; but supposing this not a dispute about words, it should seem that there is a proper species of fermentation peculiar to the animal subjects, as there is one peculiar to vegetables: and till this point be settled, we should not lay down vegetable fermentation as the test and standard of fermentation in general. For want of distinguishing in this case, all true fermentation seems denied to the blood and juices circulating in a living animal body, and, again, to the sap of vegetables. But, perhaps, were the enquiry into fermentation prosecuted in its full latitude, and not arbitrarily confined to any single species, many natural and artificial operations would prove to be actual fermentation. To say that there is no fermentation in the blood, because it affords no inflammable spirit upon distillation, is to say, in effect, that blood is not wine; whereas the question is not, whether there be a vegetable fermentation in the blood, but whether there be not an animal one; the criterion of which is the production of a volatile urinous salt, as the production of an inflammable spirit is the criterion of vinous fermentation.

Some of the processes in chemistry seem to prove, that fermentation is not confined to animal and vegetable substances, but that minerals are also liable to something of it. If an ounce of lead, and an ounce of bismuth be melted together in an iron ladle, and an ounce of quicksilver be heated in another ladle, and all three mixed together, this makes an amalgama, which appears perfectly uniform or homogeneous, and passes thro' leather in a running form. But this mixture being suffered to cool and stand

quiet for some hours, a gross matter will separate from it by degrees, and float upon the rest, which will now run easily through leather, and leave the gross metallic matter behind. Here then appears all the requisites of fermentation, a fluid form, an uniform matter, an intestine motion, and an actual separation of a grosser matter, leaving a thinner behind. There are many more instances of an apparent fermentation in mineral bodies; but this suffices to evince, that in a proper sense, there is an actual fermentation exercised not only in the vegetable and animal, but also in the mineral kingdom.

Upon the whole we may infer, 1. That the degrees of fermentation differ with the degrees of heat employed: thus vinous fermentation requires a less degree of heat than the acetous, the acetous less than the putrefactive, which last may consist with a degree of ignition. 2. That a particular kind of fermentation may be carried on in the bodies of living animals and vegetables, which are largely supplied with the requisite instruments of fermentation, *viz.* water, air, and heat; and in fact both animals and vegetables appear to have an intestine motion in all their circulating fluids, which continually deposit a grosser matter in the canals and parts they move through. 3. That when vegetables and animals die, there soon begins a different kind of fermentation in all their parts, tending not now to the repair, but to the entire destruction of their organical vessels. 4. That dry or solid substances, cannot in that state undergo a proper fermentation; for tho' they may in that state be separated into minute particles, yet they cannot range themselves together in any order, nor deposit a grosser matter without being agitated by some fluid, or, for some time, suspended therein.

We observed before, that heat, with a free admission and emission of the common air, were necessary to promote fermentation; the things which check or hinder it, are these: 1. The acid fume of burning sulphur, received in a large quantity at several times, and shut up along with the air, remaining on the top of the fermenting liquor. 2. Alkaline salts, if added in a large quantity to fermenting liquors, immediately excite a greater effervescence, which presently ceasing, all farther fermentation is stopped. But, in both these cases, the fermenting

menting liquor is spoiled. 3. The stopping up of the containing vessel so close, that nothing may escape or enter, provided the vessel be so strong as not to burst by the force of the confined liquor.

4. Too great a degree of cold stops all fermentation, which can scarce proceed with less than thirty-six degrees of heat.

5. Too great heat (it should not exceed ninety degrees) rather dissipates and throws off the active principles of fermentation, than excites and promotes them. 6. The extraction of the elastic air by means of the air-pump, and, lastly, a violent compression of the same air with the fermentable matter, entirely prevents the origin, and stops the progress of fermentation.

**FERMENTED**, in general, something that has undergone a fermentation. See the preceding article.

Fermented liquors are esteemed great antidotes to putrefaction; accordingly the abstinence from them is assigned as one cause why the Turks are more subject than other people to the plague, and other contagious distempers. It is likewise observed, that beer, wine, and spirituous liquors coming more into general use, has been one great means of suppressing putrid diseases. See **DRINK**.

The spirituous part, is the life of all fermented liquors; it keeps the whole together, and, in a manner, embalms and renders them durable, and not subject to corruption. It also, in a great measure, gives them that aromatic refreshing and restorative virtue, and the best effects they have on the human body.

**FERMO**, a port-town of Italy, situated on the gulph of Venice, about thirty miles south of Ancona. It is an archbishop's see.

**FERN**, *filix*, in botany. See **FILIX**.

Fern is very common in dry and barren places. It is one of the worst of weeds for lands, and very hard to destroy, where it has any thing of a deep soil to root in. In some grounds, the roots of it are found to the depth of eight feet. One of the most effectual ways to destroy it, is often mowing the grass, and if the field be ploughed up, plentiful dunging thereof is very good: but a most certain remedy for it is urine. However fern, cut while the sap is in it, and left to rot upon the ground, is a very great improver of land; for if burnt, when so cut, its ashes will yield double the quantity of salt that any other vegetable can do.

In several places in the north, the inhabitants mow it green, and burning it to ashes, make those ashes up into balls, with a little water, which they dry in the sun, and make use of them to wash their linen with; looking upon it to be near as good as soap for that purpose. It is said, that the frequent treading them down by sheep, while that sort of cattle feed upon them, is an infallible method of killing them.

The antients used the root of the fern and the whole plant, in decoctions and diet-drinks, in chronic disorders of all kinds arising from obstructions of the viscera, particularly in hypochondriac cases, and in obstructions of the spleen and pancreas. There are not wanting modern authors who give it as high a character in these cases as the antients have done, but it is an ill-tasted medicine, and in no great use in the shops. The country people esteem it as a sovereign remedy for that troublesome distemper the rickets in children, and they give it also as a powder, after drying it in an oven, to destroy worms.

*Sweet FERN*, a name by which some call the myrrhis, or wild chervil. See the article **MYRRHIS**.

**FERNAMBUC**, the same with brasil-wood. See the article **BRASIL**.

**FERNANDO**, or **FERNANDES**, an island in the Pacific ocean: west long. 83°, south lat. 33°.

**FERRA**, a truttaceous fish, much resembling a salmon: its usual length is a foot or more.

**FERRARA**, a city and archbishop's see of Italy: east long. 12° 6', north lat. 44° 50'.

**FERRARIA**, a name used for two distinct plants, agrimony and scrophularia.

**FERRE**, or *le FERRE*, a city of Picardy, in France, forty miles south-east of Amiens: east long. 3° 26', north lat. 49° 45'.

**FERRET**, *viverra*, in zoology, a quadruped of the mustela-kind. See the article **MUSTELA**.

The head is small and depressed; the snout sharp; the eyes look very fierce and red; the ears are short, patulous, and erect, they are considerably wide, especially towards the base; the mouth is large, and the teeth very sharp; the neck is short; the body is long and thin; the legs are short, and each divided at the foot into five toes, and there armed with sharp claws.

This animal is very frequent with us, but is a native of America. Our people use it in taking of rabbits; they plant nets at the mouth of the borrows, and turn in the ferret, after having muzzled him that he may not bite the rabbits, which are frightened by him out of their holes into the nets that are laid for them.

**FERRETS**, among glass-makers, the iron with which the workmen try the melted metal, to see if it be fit to work.

It is also used for those irons which make the rings at the mouth of bottles.

**FERRETTO**, in glass-making, a substance which serves to colour glass.

This is made by a simple calcination of copper, but it serves for several colours: there are two ways of making it, the first is this. Take thin plates of copper, and lay them on a layer of powdered brimstone, in the bottom of a crucible; over these lay more brimstone, and over that another lay of the plates, and so on alternately till the pot is full. Cover the pot, lute it well, place it in a wind furnace, and make a strong fire about it for two hours. When it is taken out and cooled, the copper will be found so calcined, that it may be crumbled to pieces between the fingers, like a friable earth. It will be of a reddish, and, in some parts, of a blackish colour. This must be powdered and sifted fine for use.

**FERRO**, west long.  $19^{\circ}$ , north lat.  $28^{\circ}$ , the most westerly of the Canary islands, near the african coast, where the first meridian was lately fixed in most maps; but now, the geographers of almost every kingdom make their respective capitals the first meridian, as we do London.

**FERRO**, some little islands situated in the northern ocean, 200 miles north-west of the Orcades, and as many south-east of Iceland: west long.  $7^{\circ}$ , north lat.  $63^{\circ}$ .

**FERROL**, a sea-port town of Spain, in the principality of Galicia, situated on a bay of the Atlantic ocean, twenty miles north-east of the Groyne, and fifty miles north of Compostella, a good harbour, where the spanish squadrons frequently secured themselves in the late war: west long.  $8^{\circ} 40'$ , north lat.  $43^{\circ} 30'$ .

**FERRUGINOUS**, any thing partaking of iron, or that contains particles of that metal.

It is particularly applied to certain mineral springs, whose waters are impregnated with the particles of iron, gene-

rally termed chalybeats. See the article **CHALYBEAT**.

**FERRUGO, RUST**. See the article **RUST**.

**FERRUM, IRON**. See the article **IRON**.

**FERRUMEQUINUM, HORSE-SHOEVETCH**, in botany, the same with the *hippocrepis* of Linnæus. See **HIPPOCREPIS**.

**FERRY**, a liberty by prescription, or the king's grant, to have a boat for passage, on a firth or river, for carrying passengers, horses, &c. over the same for a reasonable toll.

A ferry is in the nature of a common highway; and the not keeping it up has been held to be indictable.

**FERT SUR AUBE**, a town of Champaign, thirty miles south-east of Troyes.

**FERTILITY**, that quality which denominates a thing fruitful or prolific.

Nothing can produce fertility in either sex, but what promotes perfect health: nothing but good blood, spirits, and perfect animal functions, that is, high health, can beget perfect fecundity; and therefore, all means and medicines, all nostrums and specifics to procure fertility, different from those which procure good blood and spirits, are errant quackery. Dr. Cheyne says, that water-drinking males are very rarely infertile; and that if any thing in nature can prevent infertility and bring fine children, it is a milk and seed-diet persevered in by both parents.

To increase the fertility of vegetables, says lord Bacon, we must not only increase the vigour of the earth and of the plant, but also preserve what would otherwise be lost: whence he infers, that there is much saved by setting, in comparison of sowing. 'Tis reported, continues he, that if nitre be mixed with water to the thickness of honey, and after a vine is cut, the bud be anointed therewith, it will sprout within eight days. If the experiment be true, the cause may be in the opening of the bud, and contiguous parts, by the spirit of the nitre; for nitre is the life of vegetables.

How far this may be true, is not perhaps sufficiently shewn, notwithstanding the experiments of Sir Kenelm Digby and M. Homberg. Consult Mr. Evelyn's *Sylva*, the Philosophical Transactions, the french Memoirs, and Dr. Stahl's Philosophical Principles of Chemistry: but a proper set of accurate experiments seems still wanting in this view.

**FERULA, FENNEL-GIANT**, in botany, a genus of the *pentandria-digynia* class of plants;

plants; the compound flower of which is uniform, and the particular ones made up of five oblong and almost equal petals: the fruit is of an elliptical compressed figure, marked with three prominent lines on each side, and containing two seeds of the same figure. See plate XCVI. fig. 3.

Sagapenum is said to be the produce of a species of ferula. See SAGAPENUM.

**FERULA**, a little wooden pallet or slice, reputed the schoolmaster's sceptre, wherewith he chastises the boys, by striking them on the palm of the hand.

Under the eastern empire, the ferula was the emperor's sceptre, as is seen on variety of medals: it consisted of a long stem or shank, and a flat square head. The use of it is very antient among the Greeks, who used to call their princes ferula-bearers.

**FERULA**, in the antient eastern church, signified a place separated from the church, wherein the audientes were kept, as not being allowed to enter the church; whence the name of the place, the persons therein being under penance or discipline. This word was sometimes used to denote the prelate's crozier or staff. See the article CROZIER.

**FERULÆ**, in surgery, splinters or chips of different matter, as of wood, bark, leather, paper, &c. applied to bones that have been disjointed, when they are set again.

**FERULÆ** is also a word used by the antients, to express the horns growing on the deer or stag at the age of two years, at which early time those horns are unbranched.

**FESCENNINE VERSES**, in roman antiquity, satyrical verses, full of lewd and obscene expressions, sung by the company at the solemnization of a marriage.

**FESCHAMP**, a port-town of Normandy, thirty miles south-west of Rouen.

**FESSE**, in heraldry, one of the nine honourable ordinaries, consisting of a line drawn directly across the shield, from side to side, and containing the third part of it, between the honour-point and the nombril.

It represents a broad girdle or belt of honour, which knights at arms were antiently girded with. See plate XCVII. fig. 3.

**FESSE POINT**, is the exact center of the escutcheon. See the article POINT.

**FESSE WAYS**, or *in FESSE*, denotes any thing borne after the manner of a fesse;

that is, in a rank across the middle of the shield.

*Party per FESSE*, implies a parting across the middle of the shield, from side to side, through the fesse point.

**FESTI DIES**, in roman antiquity, certain days in the year, devoted to the honour of the gods.

Numa, when he distributed the year into twelve months, divided the same into the dies festi, dies profesti, and dies intercesi. The festi were again divided into days of sacrifices, banquets, games, and feriæ. See the articles SACRIFICE, EPULÆ, LUDI, and FERIÆ.

The profesti were those days allowed to men for the administration of their affairs, whether of a public or private nature: these were divided into fasti, comitiales, comperendini, statii, and præliares. See FASTI, COMITIALES, &c.

The intercesi were days common both to gods and men, some parts of which were allotted to the service of the one, and some to that of the other.

**FESTINO**, in logic, the third mood of the second figure of syllogism, the first proposition whereof is an universal negative, the second a particular affirmative, and the third a particular negative: as in the following example:

FES No bad man can be happy,

TI Some rich men are bad men:

NO *Ergo*, some rich men are not happy.

**FESTIVAL**, the same with feast. See the article FEAST.

**FESTOON**, in architecture and sculpture, &c. an ornament in form of a garland of flowers, fruits and leaves, intermixed or twisted together.

It is in the form of a string or collar, somewhat biggest in the middle, where it falls down in an arch; being extended by the two ends, the extremities of which hang down perpendicularly.

Festoons are now chiefly used in friezes, and other vacant places, which want to be filled up and adorned; being done in imitation of the long clusters of flowers, which the antients placed on the doors of their temples and houses on festival occasions.

**FESTUCA**, in botany, a genus of grasses, belonging to the *triandria-digynia* class; the flower of which is composed of two valves, and terminated by a straight arista or awn: the seed is single, of an oblong figure, very sharp-pointed at each end, and marked with a longitudinal furrow.

To this genus belong the capon's tail grass, wild oat grass, or drank, &c. which are said to be drying, and good against a stinking breath.

**FESTUCA** is also a name sometimes used for the bromus. See **BROMUS**.

**FETIPOUR**, a city of the hither India, twenty-five miles west of Agra: east long.  $78^{\circ} 40'$ , north lat.  $27^{\circ}$ .

**FETLOCK**, in the manege, a tuft of hair growing behind the pastern joint of many horses; for those of a low size have scarce any such tuft.

**FETUS**, or rather **FŒTUS**. See the article **FŒTUS**.

**FEUD**, *feodum*, the same with fee. See the article **FEE-ESTATE**.

**FEUDAL**, or **FEODAL**, denotes any thing belonging to a fee. See the article **FEE**.

**FEUDALARY**, or **FEODATARY**, a tenant who formerly held his estate by feudal service. See the article **VASSAL**.

**FEUD-BOTE**, a recompence for being concerned in a feud or quarrel.

**FEVER**, *febris*, in medicine, a disease, or rather class of diseases, whose characteristic is a preternatural heat felt through the whole body, or at least the principal parts of it. According to Sydenham, a fever is nothing else but the effort of nature, to free herself of some morbid matter, which she finds injurious, in order to establish a better health.

If any disease deserves the title of universal, it is a fever, because it disturbs the whole nervous system, and perverts all the functions of the body, inasmuch that the motion of the heart, arteries, and solids cease to be equal and just; the circulation of the blood and other fluids, to be free and natural; and the salutary secretions and excretions, to be regular; even the mind itself, when ruffled by the febrile onset, is affected with a delirium. Besides, this disease attacks all mankind, of what constitution, sex, or age, in all climates, let their diet and way of living be what they will: sometimes it is epidemic, and seizes many at a time. A fever is not always a primary disease, but is often the symptom of other maladies, as a cachexy, scurvy, phthisis, i. e. venerea, dropsy, &c. and renders them more cruel and dangerous: however, it is not always pernicious to the human race, but sometimes vanquishes its own cause, and supervening to other diseases, expels them out of the body: thus palsies, epilepsies, convulsions, spasmodic and hypochondriac af-

fections, have been cured by fevers; and many valetudinarians have, by a fever, been restored to a healthful and vigorous constitution.

Hence the most general and natural division of fevers, is into essential and symptomatic.

An essential fever is such whose primary cause lies in the blood itself, deriving its original from no other distemper of the solid parts, or any way depending on them; and this is absolutely speaking a fever properly so called.

A symptomatic is a secondary fever, which does not properly subsist of itself, but owes its origin to the disorder of some particular part, and most commonly depends on some remarkable inflammation; from whence proceed the variety of inflammatory fevers, peculiarly so called.

*The general causes of FEVERS.* "The cause of fevers is not heat alone, says "Hippocrates, *de vet. medic.* but heat "and bitterness together, heat and acidity, heat and saltness, and innumerable other combinations in the blood." It is found, nevertheless, by experience, that some persons, from sound and perfect health, where there has been neither a plethora or any cacochymical dispositions to cause it, have fallen into a fever; because, perhaps, some very extraordinary alteration in the air, or some great change in their way of living, or some considerable error in the six non-naturals, have happened. Sound bodies may, on such occasions, be seized with a fever, only to the end that their blood may acquire a new state and condition, thereby to accommodate itself to the alterations of the air, way of living, &c.

The formal or fundamental cause of a fever, consists in the spasmodic affection, of the whole nervous and fibrous genus which chiefly proceeds from the spinal marrow, and successively from the external to the internal parts: this plainly appears from the usual passions and phenomena of a fever. Hence it naturally follows; that whatever has a power to irritate and sollicit the nervous and vascular system to spasms, is most likely to generate a fever. To this class belong violent passions of the mind, especially terror and anger; a poisonous, subtle, caustic matter, either bred within the body, or received by infection; a stoppage of perspiration; a suppression of critical sweats; eruptions driven back; an abundance of purulent, ulcerous mat-

ter, adhering to various parts ; aliments over and above acrid and salt ; abuse of spirituous liquors ; corrupt and bilious crudities lodged in the primæ viæ ; excessive watching ; a violent pain and tension of the nervous parts ; inflammations ; tumours and abscesses ; hurting the nervous parts by sharp instruments ; acrid and corrosive drugs ; cold baths ; and, on the contrary, those that are too hot or astringent.

According to the different nature of these causes, and their various manner of affecting the nerves, arise fevers of divers kinds : some are benign, others malignant ; some are intermitting, others continual ; some are simple, others are compound ; some are regular, others anomalous ; others eruptive, spotted, putrid, hectic, or slow ; some admit of an easy cure, others a difficult ; some soon terminate, others are protracted a long time, and some again hurry the patient out of the world.

*The general signs of FEVERS* are a pain in the back, more particularly about the loins ; a coldness, especially of the extreme parts ; a shivering ; a shaking ; trembling ; a livid colour of the nails ; a subsidence of the vessels of the hands and feet ; a shrunk, dry skin ; a yawning ; a stretching ; a pale livid countenance ; a trembling and palpitating motion of the heart ; an anxiety of the præcordia ; difficult breathing ; inquietude, restlessness, a sensation of an ebullition of the blood about the heart ; a contracted, weak, small pulse ; a nausea, and an inclination to vomit ; a suppression of perspiration ; costiveness, with thin watry urine. When the symptoms are very urgent, and very hastily make their progress, the fever is called acute ; when they are more mild and gentle, it is denominated a slow fever.

*The general cure of FEVERS* is summarily comprehended in consulting the strength of nature, in correcting and discharging the acrimony from the blood, in dissolving gross humours, and expelling them, and in mitigating the symptoms. If we perceive the symptoms run high, and nature to grow exorbitant, we must moderate it, and enjoin abstinence, a slender diet, drinking water, bleeding, cooling clysters, &c. If nature seems to be too sluggish, she is to be excited by cordials, aromatics, volatiles, &c.

By how much the more acute a fever is, by so much the more sparing and slender

ought the diet to be. In fevers, though the patient lies many days without eating any thing, it is no matter : on the contrary, by eating and drinking, the fever would be exasperated.

Vomits in almost all fevers are of advantage, especially in the beginning. Even nature herself teaches us the use of sudorifics ; they are most beneficial when the signs of concoction appear ; and they are also useful through the whole course of the distemper ; yea, even by the promiscuous use of them, fevers are often cured. Spirit of sal armoniac, or its volatile salt, is esteemed an universal febrifuge, which, being given pretty often, seldom fails of success. All sugared things are very hurtful in fevers.

In acute and inflammatory fevers, but a very few medicines are required ; for it will be sufficient diligently to observe the ways that nature aims to relieve herself by, and to forward the cure in those ways, by assisting her. If there be any obstructions in the bowels, we are to take care, by proper evacuations, to remove the load, and by that means take away some of the fuel of the distemper. If the blood be too furiously agitated, we are to quell such an impetuosity : if it be embarrassed with gross and coagulated humours, we are to endeavour at dissolving it, and rendering it more fluid. In the due observation of these three precepts, consists, in a great measure, the whole cure of fevers, where the viscera are found, and the peccant humours are lodged in the blood, or in the primæ viæ ; and then, when nature tends to produce a crisis, or she has already begun it, we are altogether to refrain from the use of medicines, as much as we would avoid the plague.

They are grossly mistaken who, in acute and inflammatory disorders, make use of abundance of medicines so long, till nature, not knowing which way to turn herself, but being variously distracted to and fro, both by the violence of the distemper and the burden of the medicines, is at last forced to yield : for the orderly motion of nature being disturbed and distracted with the repetition of much medicines immethodically given, the fever is not lessened, and the crisis is postponed ; and the patient, exposed to a dubious event, either dies, or falls into a chronic distemper.

Therefore, since nature is the physician, it is a pernicious practice to suspend, suppress,

prefs, or destroy the febrile motions, which have a tendency to health. The most salutary work of nature ought rather to be promoted, which designs, by an increased progressive motion of the fluids, to correct, resolve, and at length to expel the morbid matter. And this is best performed by diluting, moistening, attemperating, apperient, corroborating and nitrous medicines; as also by those which in the time of the intermission, especially tend to promote the proper excretions. In all fevers, the drinking plentifully of warm weak liquors, is attended with many good consequences: the patient is always refreshed by it; the febrile heat is mitigated, and rest is promoted; and the proper and necessary sweats forwarded. Among these liquors, the common barley-water, teas made of sage, mint, baum, &c. with the milder alexipharmic roots, are most proper: with these, powders are to be given, composed of the absterfive and digestive salts: they should be fated with lemon-juice, and then mixed with a little nitre, and may be given every three, four, or six hours, as the urgency of symptoms require. Emulsions of sweet almonds, and the cooling seeds, are also very proper between whites.

The medicines by which the physician is to assist nature in her business of excretion, are the gentle diaphoretics; among which the diaphoretic antimony, when truly prepared, holds a very high place: alexipharmics, which have also a diuretic virtue, such as the mixtura simplex, when faithfully prepared and lightly camphorated, are very proper. All violent medicines are to be dreaded in fevers. Acids, in general, are by many much dreaded, but there is no real ground for this; on the contrary, in sanguineous fevers, during the time of the violent heat, and immoderate thirst, they are found of the greatest use and benefit. The use of astringent medicines, though too common, yet is extremely improper in all fevers. Nitre is an admirable remedy for fevers in general.

*The general crisis of FEVERS.* Whereas there is no fever cured without some considerable evacuation, raised either by nature or by art, the physician ought carefully to observe which way nature seems to intend the expulsion of the morbid matter, and assist her by all possible means. Now this expulsion is frequently made through several outlets of the body at a time, and an evacuation

by one outlet, more or less, checks that by another: thus a looseness checks sweat, and *vice versa*. Wherefore it is the physician's business to consider what evacuation is most likely to be of service, and so to promote this, as to give the least interruption possible to any other, for any one evacuation is not equally suitable to all persons, both on account of the difference of constitutions, and of diseases; although evacuations thro' every emunctuary, are sometimes necessary, as we find by experience in malignant fevers.

But of all solutions of the disease, the most desirable is by sweat; next to that, by stool and urine: the worst is by a hæmorrhage, whether it proceeds from the nose or from any other part, because it indicates that the blood is so far vitiated, that no proper separation of the humour can be made.

Lastly, some fevers terminate in abscesses, formed in the glands, which, if they happen in the decline of the disease, and suppurate kindly, are salutary. Wherefore the suppuration is to be forwarded by cataplasms, or plasters; and sometimes by cupping on the tumor; and then, if the abscess don't break spontaneously, it ought to be opened, either with a knife, or with a caustic. At this time this rule of practice is generally right, not to exhaust the patient's strength by evacuations of any kind. And yet in some cases there is a necessity for drawing a little blood, as when the humours are in great commotion, and the heat excessive: for this remedy prudently administered, makes the tumor ripen kindly, because nature has always a great abhorrence of a turbulent state. But in order to give a more distinct notion of the several kinds of fevers, it will be necessary to treat them particularly.

*Bilious FEVER.* See the article *BILIOUS*.

*Burning FEVER*, CAUSUS, attacks the patient with great fury and rage, with an excessive burning heat, an intolerable thirst, and other symptoms demonstrating a great and remarkable inflammation of the blood: the respiration is thick, difficult, and quick; the tongue is dry, yellow, parched and rough; there is a loathing of food, a nausea and vomiting, a little cough, a delirium, a coma, convulsions, and other general symptoms already mentioned.

On the third and fourth day it often proves

proves mortal; it seldom exceeds the seventh, if violent.

It is often terminated by a hæmorrhage, which, if small on the third and fourth day, is a fatal sign. A solution of this fever, on a critical day, may also be by vomiting, stool, sweat, urine, and spitting thick phlegm. If the exacerbation of this disease happens on the second or fourth day, it is a bad sign, on the sixth not so bad.

As to the cure of a burning fever, so far as it differs from the general treatment already prescribed, bleeding is necessary at the beginning, if there is a plethora, or signs of particular inflammation; or the heat intolerable, or the rarefaction too great, or a revulsion necessary, or the symptoms urgent, and not to be vanquished any other way.

Soft, diluting, laxative, antiphlogistic, cooling clysters, are to be repeated as oft as the heat, costiveness and revulsion requires them; the whole body is to be moistened by receiving into the nostrils the steam of warm water, by washing the mouth, throat, feet, and hands with the same; and by fomenting with warm sponges the places where the vessels are most numerous. Purgatives are dangerous before the crisis, but clysters may be used made of milk, honey, and a little nitre. After the crisis, which is known by the sediment of the urine, laxatives made with tamarinds, manna, rhubarb, raisins, or cream of tartar, are necessary. If a phrensy happen, cause bleeding of the nose, by thrusting up a straw, or with a scarifying knife: use also frictions of the feet and legs, with hot cloths.

*Catarrhal* FEVER may be reckoned in the class of slow fevers, which, in the beginning, is attended with a catarrh, a coryza, cough, hoarseness, &c. These fevers are most commonly gentle and flow by day-time, generally somewhat worse in the evenings: they are attended with a great weariness of the limbs, the symptoms continue with an increase of the coryza and cough, until the distemper arises to its highest pitch, when the matter of the catarrh is ripened, and the mucus, becoming thicker, is discharged, and the fever ceases: the seat of this distemper is in the conglobate glands.

In a catarrhal fever a decoction of saffras wood is convenient, with liquorice roots and raisins, on account of the acrimony of the humours. Also the ex-

pressed juice of turnips, with a little sugar; volatiles and sudorifics, a solution of gum ammoniac; and for the further treatment of this disorder, see the article CATARRH.

*Colliquative* FEVER is that in which the body is much emaciated and consumed in a short space of time, the solid parts, and the fat itself wasted, sometimes by a diarrhœa, sometimes by sweat, by urine, or by feverish heats alone, without any sensible discharge. A colliquative fever is observed to accompany a cancer of the breast, with a diarrhœa. See the articles DIARRHOEA, DIABETES, CANCER, &c.

For this disease, emulsions of almonds, and of the four cold seeds, as also ass's, goat's, or woman's milk, are proper; or cow's milk with the juice of watercresses; chicken broth, broth made of river crabs, or wood snails bruised.

*Continual* FEVER, the same with synochus.

See the article SYNOCHUS.

*Diary* FEVER, the same with ephemera.

See the article EPHEMERA.

*Epidemic* FEVER. See EPIDEMIC.

*Eruptive* FEVER. See the articles MILIARY FEVER, ERISYPELAS, &c.

*Gaol or Camp* FEVER. See GAOL.

*Hætic* FEVER. See HECTIC FEVER.

*Hospital* FEVER. See HOSPITAL.

*Hypochondriac* FEVER. See the article HYPOCHONDRIAC.

*Inflammatory* FEVER. See the article INFLAMMATORY.

*Intermitting* FEVER. See the articles QUOTIDIAN, TERTIAN, &c.

*Malignant* FEVER. See MALIGNANT.

*Mesenteric* FEVER. See MESENTERIC.

*Miliary* FEVER. See MILIARY.

*Milk* FEVER. See the article MILK.

*Nervous* FEVER, at first, affects the patient with a slight, transient chillness, several times in a day; also with uncertain flushes of heat, a listlessness, lassitude, and weariness.

The patient has a dryness of the lips and tongue, without any considerable thirst: they have frequent nausea, with reaching to vomit, but little brought up: the breathing is difficult by intervals, and especially towards night: there is an exacerbation of the symptoms, with a low, quick, and unusual pulse: the urine is pale, and made often, and suddenly; a torpor or obtuse pain, and coldness often affect the hind part of the head, or a heavy pain is felt along the coronary suture. The pulse is very remarkable.

markable in this disease, for it is generally low, quick and unequal.

Gilchrist makes this state previous to the fever, and says, that for a fortnight, or three weeks, before they are laid down, they shall be low-spirited, inappetent, loaded, sleep ill, sigh frequently, groan involuntarily, and feel unexpressible disorder, accompanied with fear, concern, and dejection, and perhaps slight alienations of mind. The same author says, that this disorder is frequently occasioned by people exposing themselves indiscreetly to the sun, or by being fatigued in it; by eating largely of fruit, or drinking bad wine; or by being long under a course of anxiety, care, fear, discouragement, and other enervating passions, together with irregularities of diet, &c. It commonly attacks people of weak nerves, and a lax habit of body, and is occasioned by an acrimony that gives an universal stimulus.

The cure is to be performed with gentle volatile medicines of the cordial and diaphoretic kind, in order to promote perspiration, by the application of blisters, and by a proper regimen and method of diet. In the beginning a gentle emetic may be given, or a small dose of rhubarb; when it has continued long, bleeding and sweating is very prejudicial. In giving the diaphoretic, we should always have regard to the urine, for if that from being pale, gradually heightens to an amber colour, we are right in our dose, especially if, in bed, a gentle dew or moisture comes on, without a restlessness. A little chicken broth is of service, both as food and physic, especially towards the decline of the disorder. Also, thin jellies of hartshorn, sago, panado, adding a little wine to them; at this time also, if the sweats are copious and weakening, 'tis proper to give small doses of the tincture of the bark, with saffron and snake-root, interposing now and then a dose of rhubarb, to carry off the putrid colluvies.

**Peripneumonic FEVER.** See the article **PERIPNEUMONY**.

**Pesilential FEVER.** See **PLAGUE**.

**Petechial FEVER.** See the articles **PETECHIAL** and **MALIGNANT**.

**Pituitous FEVER,** the same with catarrhal *supra*.

**Remitting FEVER.** See **REMITTING**.

**Scarlet FEVER.** See **SCARLET**.

**Scorbutic FEVER.** See **SCORBUTIC**.

**Slow FEVER,** much resembles the hectic fever, but has milder symptoms, and a

gentler heat than the hectic. See the article **HECTIC**.

This fever is attended with profuse sweats after sleeping; after which, and before noon, the pulse is natural, as in the hectic; but there is not such a want of appetite, nor excessive weakness, nor dryness of the skin, nor such dark coloured urine, nor such danger, as in the hectic.

The cause of a slow fever lies mostly in the fluids. It arises from obstinate intermittent, or continual fevers; from the small-pox and measles; from profuse hæmorrhages; from long diarrhoeas, dysenteries; from an excessive salivation, gonorrhœa, or fluor albus; from care, watching, intense study, hard, continual labour, inordinate coition, or the abuse of spirituous liquors. In the cure of this disease respect must always be had to the cause. If it proceeds from crudities, it is known by a languid feebleness, internal heat, propensity to sweat, especially in the balls of the hands, and soles of the feet; in which case the stomach and parts adjacent must be cleansed from the fœces by a gentle vomit of ipecacuanha. After the alimentary canal is cleansed, you must proceed to analeptics and stomachics.

If the disorder is in the hypochondria, when the patient is plethoric, cacochymical, cachectical, or scorbutical, or the menses or hemorrhoidal evacuations are stopped, and occasion this disorder; or, if it proceeds from voraciousness, or bad diet, or the abuse of spirituous liquors, then endeavours must be made to free the liver, spleen, and mesentery, and its vessels and glands from obstructions: for this purpose mineral waters are proper; as are also the thermæ, or hot bath waters. Where these cannot be had a decoction of thin veal broth, with the roots of succory, fennel, asparagus, dog-grass, and viper's grass, are proper; drinking a quart a day for some weeks; and before it some preparations of steel, as the tincture of steel, or of martial flowers. If from an erosion of the stomach and bowels, all sharp, salt, and stimulating things are as bad as poison. In this case a decoction of saffraas, and the bark of Eleutherius in milk, as also chamomile flowers, and the tops of yarrow, drank about a quart a day, are of great use: as are also the root of marshmallows, or rice boiled in milk; or gum dragant, dissolved in water.

If from the loss of necessary fluids, and want of strength, then it may be termed a colliquative fever, and must be treated as already directed in the treatment of that fever, above.

If it proceeds from the abuse of spirituous liquors, all heating liquors should be avoided, as also analeptics and stomachics. Gruel will be proper, with succory root, red poppy flowers, and some stibiated nitre.

If this fever proceeds from a suppression of the menses, it requires immediate bleeding in the foot, and resolvent decoctions of succory-roots, leaves of sow-thistles, daisies, and elder-flowers, forbearing all strong emmenagogues.

If from a marasmus senilis, and that the patient has been addicted to a sedentary inactive life, his appetite remaining good, and has omitted accustomed bleeding, or the spontaneous evacuations of blood are ceased, bleeding is indicated, and wholesome diluters must be freely drank, abstaining from food of too plentiful nourishment, and using convenient exercise: but if the disorder proceeds from a plenty of impure salt serum, not secreted thro' the skin, or otherwise, the fordes must be carried off by gentle laxatives of manna, rhubarb and raisins, and the roscid juices must be renewed by jellies and ass's milk.

*Synochus* FEVER. See *SYNOCHUS*.

*Yellow* FEVER. See the article *BILIOUS FEVER*.

*FEVERS of Children* are all owing to acidity, the primary cause of all the disorders that affect them; and the whole cure depends upon vanquishing that enemy. This is to be done two ways, the first is to prepare the acidity, and render it fit for expulsion; and then to purge it away by suitable evacuates. To prepare the acid does not require sudorifics, but absorbents; and though these are numerous, the powder of crab's claws is the chief. Purging to some may seem dangerous, but Sydenham has shewn us, that it is safe and salutary in the fevers of adults, inasmuch that he depends entirely upon it for the cure of the epidemic winter-fever; and it has been found of excellent use in the fevers of children. They recommend in this case a pearl julep, made by adding a dram of prepared pearls to two ounces of the simple waters, and two drams of the compound; the dose is three spoonfuls. When there is any unusual symptoms

arising from putrid humours, they prescribe about six grains of æthiops mineral the night before the purge, in a small spoonful of any agreeable syrup. After the purge, the testaceous powders are to be given three or four times in twenty-four hours for two days and nights, and then the purge is to be repeated.

*FEVERFEW*, the english name of a plant, called by botanists *matricaria*. See the article *MATRICARIA*.

*Bastard*-FEVERFEW. See *PARTHENIUM*.

*FEVERSHAM*, a port-town of Kent, and one of the cinqueports. See the article *CINQUEPORT*.

It stands seven miles west of Canterbury.

*FEUILLANS*, an order of bare-footed monks, who observe the same rules with the bernardines. See *BERNARDINES*.

*FEUILLE DE SCIE*, among the french heralds, imports that an ordinary, as a fesse or a pale, is indented only on one side; so called on account of its resemblance to a saw-blade, as the words signify.

*FEVILLEA*, in botany, a genus of the *monoecia syngenesia* class of plants, the flower of which is monopetalous, divided into five segments at the limb, and rotated: the fruit is a very long fleshy berry, with a hard rind, and containing compressed orbicular seeds. It is called by Plumier, *nhandiroba*.

*FEURS*, a town of France, situated on the river Loyre, twenty-seven miles west of Lyons.

*FEWEL*, or *FUEL*. See the article *FUEL*.

*FEWMET*, or *FUMET*. See *FUMET*.

*FEZ*, the capital of the empire of Fez and Morocco, in Africa: west long. 6°, north lat. 33° 30'.

It is a large and populous city, and the usual residence of the emperor. See the article *MOROCCO*.

*FIASCO*, a city and bishop's see of Italy, about twelve miles south of Orvietto.

*FIAT*, in law, a short order or warrant signed by a judge, for making out and allowing certain processes.

*FIAT JUSTITIA*, is where the king, on a petition to him for his warrant to bring a writ of error in parliament, writes on the top of it *fiat justitia*, let justice be done; upon which the writ of error is made out.

*FIBER*, the *BEAVER*, in zoology, is made, by Linnæus, a species of *castor*. See the article *CASTOR*.

**FIBRARIÆ**, a class of fossils, naturally and essentially simple, not inflammable nor soluble in water, and composed of parallel fibres, some shorter, others longer; their external appearance being bright, and in some degree transparent: add to this, that they never give fire with steel, nor ferment with, or are soluble in acid menstrua.

To this class belong the asbestos, amiantus, tricherizæ, and lachnides. See the articles **ASBESTUS**, **AMIANTHUS**, &c.

**FIBRE**, in anatomy, a perfectly simple body, or at least as simple as any thing in the human structure; being fine and slender like a thread, and serving to form other parts. Hence some fibres are hard, as the bony ones; and others soft, as those destined for the formation of all the other parts.

The fibres are divided also, according to their situation, into such as are straight, oblique, transverse, annular, and spiral; being found arranged in all these directions, in different parts of the body, for an account of which see **BONE**, **MUSCLE**, **NERVE**, **ARTERY**, **VEIN**, &c.

**FIBRE** is also used to denote the slender filaments which compose other bodies, whether animal, vegetable, or mineral; but more especially, the capillary roots of plants. See **PLANT**, **WOOD**, &c.

**FIBRILLA**, a term sometimes used for a very minute or slender fibre.

**FIBROSE**, something consisting of fibres, as the roots of plants. See **ROOT**.

**FIBULA**, in anatomy, the outer and smaller bone of the leg, called also perone. It is nearly of a triangular figure, and stands parallel to, but distant from the tibia, or inner bone of the leg. Its upper extremity does not reach to the os femoris, but is only joined to the external side of the tibia; and its lower extremity, called malleolus externus, concurs in the articulation of the tarsus, which its eminence serves to strengthen, by rendering a luxation less easy. It has no particular motion of its own, but wholly follows that of the tibia.

**FIBULÆUS**, a muscle of the leg, more usually called peronæus. See **PERONÆUS**.

**FICARIA**, in botany, the name by which Dillenius calls a species of ranunculus, called by Boerhaave chelidonium minus. See the article **RANUNCULUS**.

**FICEDULA**, in ornithology, a name given to several species of motacilla, particularly the brown kind, with a spotted breast, and white belly. See **MOTACILLA**.

**FICHE'** or **FITCHE'E**, in heraldry. See the article **FITCHE'E**.

**FICOIDEA**, a genus of the *polyandria-pentagynia* class of plants, without any flower-petals: the fruit is a ventricose, pentagonal capsule, consisting of five cells, wherein are contained a great many roundish seeds. The essential characteristic of the genus consists in this, that the stamina are inserted in series in the sinuses of the cup, usually three in each series.

**FICOIDES**, a name given to several distinct plants, as the mesembryanthemum musa, and opuntia. See the article **MESEMBRYANTHEMUM**, &c.

**FICTION**. See the article **FABLE**.

**FICUS**, the **FIG-TREE**, in botany, a genus of the *cryptogamia* class of plants, producing male and female flowers separate, neither of which have any flower-leaves: the stamina are three setaceous filaments, of the length of the cup; and the fruit is large, fleshy, and of a turbinated figure; being properly nothing but the common calyx or cup of the fructification. See the article **FIG**.

**FIDA**, a town on the slave-coast of Guinea: east long. 3°, and north lat. 6°.

**FIDD**, in the sea-language, an iron, or wooden pin, to splice and fasten ropes together. It is made taper-wise, and sharp at one end. The pin in the heel of the top-mast, which bears upon the cheffe-trees, is likewise called a fidd.

**FIDD-HAMMER**, one whose handle is a fidd, or made taper-wise.

**FIDDLE**, or **VIOLIN**. See **VIOLIN**.

**FIDE JUSSOR**, among civilians, the same with a surety. See **SURETY**.

**FIDEI COMMISSUM**, in roman antiquity, an estate left in trust with one person, for the use of another. See **TRUSTEE**.

**FIDICINALES**, muscles of the fingers, otherwise called lumbricales. See the article **LUMBRICALES**.

**FIEF**, or **FEE**. See the article **FEE**.

**FIELD**, *campus*, in agriculture, a piece of ground inclosed, whether for tillage or pasture. See **TILLAGE** and **PASTURE**.

The square contents, or superficies, of a field may be easily found, by the rules of surveying. See **SURVEYING**.

**FIELD**, in antiquity, the same with *campus*. See the article **CAMPUS**.

**FIELD**, in heraldry, is the whole surface of the shield, or the continent, so called because it containeth those achievements antiently acquired in the field of battle. It is the ground on which the colours, bearings,

bearings, metals, furs, charges, &c. are represented. Among the modern heralds, field is less frequently used in blazoning than shield or escutcheon. See the article SHIELD, &c.

**FIELD**, in a military sense, denotes the place where a battle was fought.

*Close FIELD* was antiently a place railed in with a barrier, for the performance of jousts and tournaments.

**FIELD**, among painters, is more usually called ground. See the article GROUND.

**FIELD-BOOK**, in surveying, that wherein the angles, stations, distances, &c. are set down. See SURVEYING.

**FIELD-COLOURS**, in war, are small flags of about a foot and half square, which are carried along with the quarter-master general, for marking out the ground for the squadrons and battalions.

**FIELD-FARE**, in ornithology, the english name of the variegated turdus, with a hoary head. See the article TURDUS. It is larger than the common black-bird, and with us is a bird of passage, coming over in great numbers in winter. See plate XCVII. fig. 4.

**FIELD-FORT**, in fortification. See FORT.

**FIELD-OFFICERS**, in the art of war. See the article OFFICER.

**FIELD-PIECES**, small cannons, from three to twelve pounders, carried along with an army in the field. See CANNON.

**FIELD-STAFF**, a weapon carried by the gunners, about the length of a halbert, with a spear at the end; having on each side, ears screwed on, like the cock of a match-lock, where the gunners screw in lighted matches, when they are upon command; and then the field-staffs are said to be armed.

**FIELD-WORKS**, in fortification, are those thrown up by an army in besieging a fortress, or by the besieged to defend the place. Such are the fortifications of camps, highways, &c.

*Elysian FIELDS*. See ELYSIAN.

**FIERENZUOLO**, a town of Italy, ten miles south-east of Placentia.

**FIERI FACIAS**, in law, a writ that lies where a person has recovered judgment for debt or damages in the king's courts against one, by which the sheriff is commanded to levy the debt and damages on the defendant's goods and chattels. This writ must be sued out within a year and a day after the judgment obtained, and where two fieri facias's against one person are delivered to the sheriff the same day, he ought to exe-

cute that first which was first delivered; but if he executes the last first, the execution will be good, though the other party in such case may have an action against him.

**FIFE** in music, is a sort of wind-instrument, being a small pipe. See PIPE.

**FIFE**, in geography, a county of Scotland bounded by the Frith of Tay on the north; by the German sea on the east; by the Frith of Forth on the south, and by Menteeth and Sterling on the west.

**FIFE-RAILS**, in a ship, are those that are placed on banisters, on each side of the top of the poop, and so along with hances or falls.

They reach down to the quarter-deck, and to the stair of the gang-way.

**FIFTEENTH**, an antient tribute or tax laid upon cities, boroughs, &c. through all England, and so termed because it amounted to a fifteenth part of what each city or town had been valued at; or it was a fifteenth of every man's personal estate according to a reasonable valuation. In Doomsday book, there are certain rates mentioned for levying this tribute yearly; but since, any such tax cannot be levied but by parliament.

**FIFTH**, in music, one of the harmonical intervals or concords. See the article INTERVAL.

The fifth is the second in order of the concords, the ratio of the chord that affords it is 3 : 2. See the articles CHORD and CONCORD.

It is called fifth, as containing five terms or sounds between its extremes, and four degrees, so that in the natural scale of music, it comes in the fifth place or order from the fundamental. The antients called this fifth diapente. The imperfect and defective fifth called by the antients semi-diapente is less than the fifth by a lesser semitone. See the articles DIAPENTE, SEMITONE, &c.

**FIG**, the fruit of the ficus, or fig-tree. See the article FICUS.

Figs, as well fresh as when dry, are very wholesome food: they are nutritive and emollient: they are good also in the disorders of the breast and lungs; but it is to be observed, that a too free use of them has sometimes brought on obstructions of the viscera, which are very common complaints also where they are eaten as food, as they are with bread by the poor people in many parts of the Levant. They are frequently made

ingredients in our pectoral decoctions, and are by some greatly recommended against nephritic complaints. They are much used externally by way of cataplasin, either roasted or boiled in milk, for the ripening of tumours, and for easing the pain of the piles. Figs should be chosen large, of a pale brownish colour, soft and mellow, heavy, and when broken, with the pulpy substance yellowish and sweet, and of a soft glutinous texture.

Figs the hundred weight pay on importation 9s. 6<sup>10</sup>/<sub>16</sub>d. the drawback on exportation is 8s. 9d. at the rate of 6l. the hundred weight.

**FIG**, in farriery, a sort of wart on the frush, and sometimes all over the body of a horse. The figs that appear on the frush or sole make an evacuation of malignant stinking humours that are very hard to cure.

**FIG-SHELL**, a species of dolium. See the article **DOLIUM**.

**FIGWORT**, a plant called by the botanists **SCROPHULARIA**. See **SCROPHULARIA**.

**Indian FIG**, } See } **OPUNTIA**.

**Infernal FIG**, } See } **ARGEMONE**.

**Marygold FIG**. See **MESEMBRYANTHEMUM**.

**Pharaoh's FIG**. See **MUSA**.

**FIGHT**, or **Sea-FIGHT**. See **BATTLE**.

**Running-FIGHT**, that in which the enemy are continually chased.

**FIGHTS**, in a ship, are the waste clothes hung round about a ship in a fight, to keep the men from being seen by the enemy.

**Cloze FIGHTS**, the bulk-heads, fore and aft the ship, put up for the men to stand secure behind in case of boarding, and fire upon the enemy.

**FIGHTWITE**, a fine or mulct for fighting or creating a quarrel.

**FIGUERRE**, a town of Catalonia in Spain, ten miles west of Roses.

**FIGURAL**, **FIGURATE**, or **FIGURATIVE**, a term applied to whatever is expressed by obscure resemblances. The word is chiefly applied to the types and mysteries of the mosaic law; as also to any expression which is not taken in its primary and literal sense.

**FIGURAL**, or **FIGURATE NUMBERS**, are such as do or may represent some geometrical figure in relation to which they are always considered, as triangular numbers, pentagonal numbers, pyramidal numbers, &c.

**FIGURATIVE**, among grammarians, is

the same with what is otherwise called **characteristic**. See **CHARACTERISTIC**.

**FIGURATIVE COUNTERPOINT**, in music, is that wherein there is a mixture of discords along with the concords. See the article **COUNTERPOINT**.

The French call it **supposition**, because the transient discords suppose a concord immediately following. See the article **SUPPOSITION**.

**FIGURATIVE DESCANT**, in music. See the article **DESCANT**.

**FIGURE**, in physics, expresses the surface or terminating extremities of any body; and considered as a property of body affecting our senses, is defined a quality which may be perceived by two of the outward senses. Thus a table is known to be square by the sight, and by the touch. The schoolmen therefore dispute whether or no the quality of figure be the same with that of form. Boethius affirms, that figure ought to be predicated of inanimate bodies, and form of animate: others again extend form to all natural bodies, and figure to all artificial ones: in the opinion of others, form and figure are applied to all sorts of bodies, but not in all relations. If only the bare circumference or circumscription be considered, they call it figure; but if the circumference be considered as endowed with colour, then they call it form. See the article **FORM**.

**FIGURES**, in arithmetic, are certain characters whereby we denote any number which may be expressed by any combination of the nine digits, &c. See the article **DIGIT**.

**FIGURE**, in architecture, and sculpture signifies the representation of things made in solid matter, as statues, &c. Daviler observes, that those representations of human bodies sitting, as popes, or kneeling, as on monuments, or lying as river-gods, &c. are more properly called figures than statues.

**FIGURE**, in astrology, a description of the disposition of the heavens at a certain hour, in which the places of the planets and stars are marked in a figure of twelve triangles, called houses. See **HOUSE**.

**FIGURE**, in conic sections, according to Apollonius, is the rectangle made under the latus rectum and transversum in the hyperbola and ellipsis.

**FIGURE of the diameter**; the rectangle under any diameter, and its proper parameter is, in the ellipsis and hyperbola, called the figure of that diameter.

**FIGURE**,

**FIGURE**, among divines, is used for the mysteries represented under certain types. See the article **TYPE**.

**FIGURE**, in dancing, denotes the several steps which the dancer makes in order and cadence, considered as they mark certain figures on the floor.

**FIGURE**, in fortification, the plan of any fortified place, or the interior polygon, which, when the sides and angles are equal, is called a *regular*, and when unequal, an *irregular* figure.

**FIGURE**, in geometry, the superficies included between one or more lines, is denominated either rectilinear, curvilinear, or mixt, according as the extremities are bounded by right lines, curve lines, or both. See the articles **RECTILINEAR**, **CURVILINEAR**, &c.

**Equilateral FIGURE**. See **EQUILATERAL**. **Circumscribed FIGURE**. See **CIRCUMSCRIBED**.

**Inscribed FIGURE**. See **INSCRIBED**.

**Similar FIGURE**, &c. See **SIMILAR**, &c.

**FIGURE**, in the higher geometry, a term applied to three mechanical curves, called the figure of the secants, figure of the sines, figure of the tangents.

**FIGURE of the secants**, is generated thus. Let PQ (plate **XCVIII.** fig. 1. n<sup>o</sup> 1.) be a tangent to the circle QSO, and an infinite right line POR revolve about the center O, cutting the circle in S, and the tangent in P: then if upon the infinite base, or abscissal line AK (ibid. n<sup>o</sup> 2.) be taken the point A, and afterwards, the absciss A B be taken upon the same always equal to the circular arch QS, and the correspondent ordinate BC at right angles to it, be equal to the secant OP of that arch, and moves along AK; by this motion the extremity C of that ordinate will describe the curve EDC called the figure of the secants.

This curve consists of an infinite number of such parts, of which EDC is one; having an infinite number of parallel asymptotes FG, HI, LK, drawn at distances from one another, each equal to half the circumference of the circle QSO, which parts alternately fall below and above the abscissal line AK; the least ordinates being *qd*, or AD, each equal to the radius QO of the circle. The quadrature of the space ADCB will give the meridional parts for a given latitude in Mercator's chart. See the article **MERIDIONAL PARTS**.

**FIGURE of the sines**, is generated much after the same manner as the figure of the

secants, the difference being only that here every ordinate BC (ibid. n<sup>o</sup> 3.) answerable to the absciss AB, is the sine of the correspondent arch QS of the circle (see the former figure) instead of being its secant, as OP. This curve consists of an infinite number of parts, such as ACG, alternately rising above and falling below the abscissal line AI, which in reality make but one continued infinite serpentine line. Any space ABC of this curve is squarable. See farther in *Philos. Trans.* n<sup>o</sup> 337.

**FIGURE of the tangents**, is generated like the figure of the secants, with this difference, that the ordinate BC (ibid. n<sup>o</sup> 4.) is here equal to the tangent QP of the arch QS, to which the absciss AB is equal; the curve consisting of an infinite number of such parts, of which EAD is one, and having a like number of parallel asymptotes at equal distances from each other.

**FIGURE**, in grammar, a deviation from the natural rules of etymology, syntax and prosody, either for brevity, elegance or harmony.

Figure in etymology, or figure of words, is generally called *metaplasmus*. See the article **METAPLASMUS**.

Figures in syntax, or figures of sentences, are reduced to four kinds, *viz.* Ellipsis, pleonasmus, enallage, and hyperbaton; and the figures in prosody are these six, synalæpha, ecthliphis, synæresis, diæresis, systole and diastole. See each of these under its proper head.

**FIGURE**, in heraldry, a bearing in a shield representing a human face, as a sun, a wind, an angel, &c.

**FIGURE**, in logic, denotes a certain order and disposition of the middle term in any syllogism.

Figures are fourfold, 1. When the middle term is the subject of the major proposition, and the predicate of the minor, we have what is called the first figure. 2. When the middle term is the predicate of both the premises, the syllogism is said to be in the second figure. 3. If the middle term is the subject of the two premises, the syllogism is in the third figure; and lastly, by making it the predicate of the major, and subject of the minor, we obtain syllogisms in the fourth figure. Each of these figures has a determinate number of moods, including all the possible ways in which propositions differing in quantity or quality can be combined, according to any disposition of the middle term, in order

order to arrive at a just conclusion. See the article MOOD.

**FIGURE**, in painting and designing, denotes the lines and colours which form the representation of any animal, but more particularly, of a human personage. Thus a painting is said to be full of figures, when there are abundance of representations of men; and a landscape is said to be without figures, when there is nothing but trees, plants, mountains, &c.

**FIGURE**, in rhetoric, is a manner of speaking different from the ordinary and plain way, and more emphatical; expressing a passion, or containing a beauty.

Figures, therefore, are highly serviceable to clear difficult truths, to make a style pleasant and pathetic, and to awaken and fix attention. But as, in order to obtain these ends, they are to be used with prudence and caution, the following directions ought to be observed. 1. Let the discourse always be founded on nature and sense, supported with strong reason and proof, and then add the ornaments and heightenings of figures; for a man of clear understanding will despise the flourish of figures without sense, and pomp of words that wants truth and substance of things. 2. Be sparing in the use of figures. A passion described in a multitude of words, and carried on to a disproportionate length, fails of the end proposed, and tires instead of pleasing. 3. Figures must not be over adorned, nor affectedly laboured, and ranged into new and scrupulous periods; for by affectation and shew of art, the orator betrays and exposes himself, and it is apparent, that he is rather ambitious to set off his parts and wit, than to express his sincere concern and passion.

The principal and most moving figures are exclamation, doubting, correction, omission, apostrophe, suspension, prevention, concession, repetition, periphrasis, exaggeration, climax, comparison, prosopopœia, transition, sentence, epiphœnema, &c. See each of these under its proper head.

**FIGURED**, in general, something marked with figures. See the article FIGURE.

The term *figured* is chiefly applied to stuffs, whereon the figures of flowers, and the like, are either wrought, or stamped. See the articles STUFF, WEAVING, VELVET, &c.

**FIGURED STONES**, in natural history, those found in the shape of shells, or other parts of animals. See STONE.

**FILACER**, or **FILAZER**. See **FILAZER**.

**FILAGO**, the name by which Vaillant calls the gnaphalium, or cudweed. See the article GNAPHALIUM.

**FILAMENT**, in physiology and anatomy, denotes much the same as fibre. See the article FIBRE.

**FILAMENTS**, among botanists, is particularly used for the stamina. See the article STAMINA.

**FILANDERS**, in falconry, a disease in hawks, &c. consisting of filaments, or strings of blood, coagulated; and occasioned by a violent rupture of some vein, by which the blood, extravasating, hardens into these figures, and incommodes the reins, hips, &c.

**FILANDERS** are also worms as small as thread, and about an inch long, that lie wrapt up in a thin skin, or net, near the reins of an hawk, apart from either gut or gorge.

This malady is known by the hawk's poverty; by ruffling her tail; by her straining the fist, or perch, with her pounces; and lastly, by croaking in the night, when the filanders prick her. The disease proceeds from bad food, and must be remedied in time, to prevent its spreading over the whole body, and destroying the bird. These mult not be killed as other worms are, for fear of imposthumes from their corruption, being incapable of passing away with the hawk's meat. They must only be stupified, to prevent their being offensive; and this is done by giving the hawk a clove of garlic, after which, she will feel nothing of the filanders for forty days. It will be prudent in the falconer when he observes the hawk poor and low, to give her a clove of garlic once a month by way of prevention.

**FILAZER**, or **FILACER**, an officer of the Common-Pleas, so called from his filing those writs whereon he makes out process.

There are fourteen of these officers, who are severally allotted to particular divisions and counties, and make out all writs and processes upon original writs, issuing out of the court of Chancery, and returnable in that court. They likewise make out all appearances and special bails, upon any process issued by them, and make the first fieri facias

on special bails, writs of habeas corpus, superiædeas upon special bail ; also writs of view in real actions, &c.

**FILBERT**, or **FILBERD**, the fruit of the corylus, or hazel. See **CORYLUS**.

This is the least sort of small nuts, and more nourishing than the common nuts ; but it is hard to digest. They are however worthy of being propagated in orchards and gardens ; which is done by sowing them in February.

In order to preserve them good, they should be kept in sand, in a moist cellar, where the vermin cannot come at them to destroy them : the external air should not be kept from them, for this would occasion their turning mouldy.

**FILE**, among mechanics, a tool used in metal, &c. in order to smooth, polish, or cut.

This instrument is of iron, or forged steel, cut in little furrows, with chissels, and a mallet, this and that way, and of this or that depth, according to the grain or touch required. After cutting the file, it must be tempered with a composition of chimney soot, very hard and dry, diluted, and wrought up with urine, vinegar, and salt ; the whole being reduced to the consistence of mustard. Tempering the files consists in rubbing them over with this composition, and covering them in loam ; after which they are put in a charcoal fire, and taken out by that time they have acquired a cherry colour, which is known by a small rod of the same steel put in along with them. Being taken out of the fire, they are thrown into cold spring water, and when cold, they are cleaned with charcoal and a rag ; and being clean and dry, are kept from rust by laying them up in wheat bran. Iron files require more heating than steel ones. Files are of different forms, sizes, cuts and degrees of fineness, according to the different uses and occasions for which they are made. Those in common use are the square, flat, three square, half round, round, thin file, &c. each of which may be of different sizes, as well as different cuts.

The rough or coarse toothed files are to take off the unevenness of the work which the hammer made in the forging ; and the fine toothed files are to take out of the work the deep cuts or file-strokes of the rough files : the files succeed one another in this order, first

the rubber, then the bastard toothed file, next the fine toothed file, and lastly, the smooth file. Thus the files of different cuts succeed one another, till the work is so smooth, as it can be filed. After which, it may be made still smoother, by emery, tripoli, &c. See **POLISHING**. In using all sorts of files, the rule is to lean heavy on the file in thrusting it forward, because the teeth of the files are made to cut forward ; but in drawing the file back again for a second stroke, it is to be lightly lifted, just above the work, by reason it does not cut in coming back.

The file is used in pharmacy to reduce hard substances to fine particles, whose consistence will not admit of powdering.

**FILES**, the gros, containing twelve dozen, pay on importation 7s. 8,  $\frac{4}{10}$ d. and on exportation draw back 6s. 9d. Moreover, for every 112 lb. of the iron, the duty is 4s. 8,  $\frac{2}{10}$ d. and on exportation the draw-back is 4s. 8,  $\frac{2}{10}$ d.

**FILE**, or **LABEL**, in heraldry. See **LABEL**.

**FILE**, in the art of war, a row of soldiers, standing one behind another, which is the depth of the battalion, or squadron. The files of a battalion of foot are generally three deep ; as are sometimes those of a squadron of horse. The files must be straight, and parallel one to another.

*To double the FILES*, is to put two files into one, which make the depth of the battalion double of what it was in number of men.

*The FILE leaders*, are the foremost men in each file ; the bringers up are the last men of each file, or the last rank of the battalion.

*To FILE OFF*, is the same as to defile, or to file off from a large front to march in length. See the article **DEFILE**.

**FILICULA**, the DWARF-FERN. See the article **FILIX**.

**FILIGRANE**, or **FILIGREE-WORK**, any piece of gold or silver-work, that is curiously done, with grains or drops on the filaments or threads.

**FILING**, in smithery, the operation of fashioning metalline bodies by means of a file. See the article **FILE**.

**FILIPENDULA**, **DROPWORT**, a genus of the *icofandria-pentagynia* class of plants, the corolla of which consists of five, or more, oblong, obtuse, plane, patent petals, inserted into the calyx : there is no pericarpium, except the crusts of the

the feed ; the receptacle is globose : the seeds are oblong, acuminate, and disposed in a circular manner.

This plant is a diuretic : it is recommended against colics, flatulencies, and the fluor albus : but its chief use consists in stopping too great a flow of the lochia.

**FILIX**, in botany, an order of the *cryptogamia* class of plants, comprehending the fern, horse-tail, adder's tongue, maiden-hair, spleenwort, polypody, &c. See the articles **FERN**, **HORSE-TAIL**, &c.

**FILLET**, in anatomy, the same with **froenum**. See the article **FROENUM**.

**FILLET**, or **FILET**, in architecture, a little square member, ornament, or moulding, used in divers places, and upon divers occasions, but generally as a crowning over a greater moulding.

**FILLET**, in heraldry, a kind of orle or bordure, containing only a third or fourth part of the breadth of the common bordure. It is supposed to be withdrawn inwards, and is of a different colour from the field. It runs quite round, near the edge, as a lace over a cloak. It is also used for an ordinary drawn like a bar, from the sinister point of the chief, across the shield, in manner of a scarf ; though it sometimes is also seen in the situation of a bend, fesse, cross, &c.

According to Guillim, the fillet is a fourth part of the chief, and is placed in the chief point of the escutcheon.

**FILLET**, in painting, gilding, &c. is a little rule or reglet of leaf-gold, drawn over some mouldings, or on the edges of frames, pannels, &c. especially when painted white, by way of enrichment.

**FILLET**, in the manege, the loins of an horse, which begin at the place where the hinder part of the saddle rests.

**FILLER-HORSE**, one yoked immediately to a cart. See the article **CART**.

**FILLY**, a term among horse-dealers, to denote the female or mare-colt. See the article **FOAL**.

**FILM**, a thin skin or pellicle. In plants, it is used for that thin, woody skin, which separates the seeds in the pods, and keeps them apart.

*White FILM upon the eye of a horse*, may be removed by lifting up the eyelid, after the eye has been washed with wine, and stroaking it gently, with one's thumb, with wheat flower ; also common salt, or salt of lead, beaten fine, and put into the eye, is proper to consume a film : or you may wash the horse's eye with your spittle

in the morning, fasting, having first put a little salt into your mouth : but there is nothing so effectual as sal armoniac, beaten and put into the eye, and repeated every day till the film is gone.

**FILTER**, or **FILTRE**, in chemistry, a strainer commonly made of bibulous or filtering paper in the form of a funnel, through which any fluid is passed, in order to separate the gross particles from it, and render it limpid. See the article **CLARIFICATION**.

There are several filters made of flannel and linnen-cloth.

**FILTRATION**, in chemistry, a species of clarification. See **CLARIFICATION**.

**FIMBRIÆ**, denotes appendages disposed by way of fringe round the border of any thing : such are those about the thicker extremities of the fallopian tubes. See the article **FALLOPIAN**.

**FIMBRIATED**, in heraldry, an ordinary with a narrow bordure or hem of another tincture.

This, in latin, is called *fimbriatus*, that is, edged or fringed.

**FIN**, *pinna*, in natural history, a well known part of fishes, consisting of a membrane supported by rays, or little bony or cartilaginous officles.

The number, situation, and figure of fins, are different in different fishes. As to number, they are found from one to ten, or more ; with respect to situation, they stand either on the back only, the belly only, or on both ; and as to figure, they are either of a triangular, roundish, or oblong square form. Add to this, that in some they are very small ; whereas, in others, they almost equal the whole body in length.

For the use of the fins in swimming. See the article **SWIMMING**.

*Whale-FINS*. See the article **WHALE**.

**FINAL**, in general, whatever terminates or concludes a thing.

**FINAL CAUSE**. See the article **CAUSE**.

**FINAL LETTERS**, among hebrew grammarians, five letters so called, because they have a different figure at the end of words from what they have in any other situation. These are caph, mem, nun, phe, tzade, all comprehending in the word *camnephatz* ; which, at the end of words, are written thus, פתצמנכ ; whereas, in any other situation, their form is this, פתצמנכ, on which account they are likewise called biform.

**FINAL**, in geography, a port-town of Italy, subject

subject to Genoa, and situated on the Mediterranean, about thirty-seven miles south-west of that city.

**FINANCES**, in the french polity, signify the revenues of the king and state.

**FINCH-KIND**, in ornithology, an appellation given to a genus of birds, known among authors by the name of *fringilla*, See the article **FRINGILLA**.

**FINE**, in law, has divers significations, it being sometimes taken for a sum of money advanced and paid for the income of lands. It is likewise used in another sense, where a sum is paid as an amends, or by way of punishment for an offence committed. See **MULET**.

Fine denotes also a covenant made before justices, and entered upon record, for conveyance of lands and other inheritable things, in order to cut off all controversies. As this fine is a concord acknowledged before a competent judge concerning lands, tenements, and other immoveable things, and for its better credit, is supposed to be made in the presence of the king, as it is levied in his court; it therefore binds women covert, who are parties, and others whom the law generally disables to act; for this reason, because all presumption of deceit is excluded, where the king and his court of justice are deemed privy to the matter transacted. Fines, on account of their solemnity, are acknowledged in the court of common pleas. Justices of assize may also take them, though they seldom do it without a special *dedimus potestatem*, by virtue of which writ, fines may be also taken by commissioners in the country, and the *dedimus* surmises that parties are not able to travel to Westminster; for by the common law, all fines are levied in court.

In every fine there are five parts, 1. An original writ, generally termed a writ of covenant. 2. The *licentia concordandi*, or the king's licence, for which a fine, called the king's silver, is paid. 3. The concord, which contains the agreement between the parties in what manner the land shall pass, and is the foundation and substance of the fine. 4. The note of the fine, or abstract of the original contract. 5. The foot of the fine containing the day, year, and place, and before what justices the contract was made.

There are four sorts of fines. 1. A *fine sur cognizance de droit comme ceo*, &c. which is the principal and surest kind of fine, as it gives possession, at least in law,

to the cognizee, without any writ of execution. 2. A *fine sur done, grant & render*, or double fine, whereby the cognizee, after a release and warrant to him by the cognizor, grants and renders back the lands, &c. or some rent, many times limiting remainders. 3. A *fine sur cognizance de droit tantum*, and this is a fine executory, that is commonly used to pass a reversion, and sometimes by tenant for life to release to the person in reversion. 4. A *fine sur concessit*, which is made use of to grant away estates for life or years, and it is also executory; so that the cognizee must enter or have a writ of *habere facias possessionem*, to obtain possession.

Fines are either with proclamation, called fines according to the statutes, or without proclamation, called fines at common law. The statutes ordain, that every fine shall be openly read and proclaimed in the common pleas, and a transcript of it sent to the justices of the assize, and another to the justices of the peace of the county where the land lies, in order to be proclaimed there; and when this is certified, privies in blood, as the heirs of the cognizor, are presently barred, but strangers to the fine have five years allowed them to enter and claim their right. The like time is given to infants, after they come to full age; to feme-coverts, not joining in fines after the death of their husbands; to prisoners, after they are set at liberty; and to persons out of the realm, after their return.

**FINE ADNULLANDO LEVATO DE TENEMENTO QUOD FUIT DE ANTIQVO DOMINICO**, is a writ directed to the common pleas to disannul a fine levied of lands in ancient demesne, to the prejudice of the lord.

**FINE for alienation**, was a fine paid to the king by his tenants in chief, for a licence to alien their lands. These fines are taken away by 12 Car. II. cap. 24.

**FINE CAPIENDO PRO TERRIS**, is a writ that lies where a person upon conviction of an offence by jury, having his lands and goods taken into the king's hands, and his body committed to prison, obtains the favour to be remitted his imprisonment, and his lands and goods to be restored to him for a sum of money.

**FINE FORCE**, is an expression in the statute 35 Henry VIII. c. 12. denoting that a person is forced to do that which he can no way avoid.

**FINE NON CAPIENDO PRO PULCHRE PLACITANDO**, is a writ to hinder officers

of courts from taking fines for fair pleading.

**FINE PRO REDISSEISINA CAPIENDA**, is a writ which lies for the release of a person imprisoned for a redisseisin, upon paying a reasonable fine.

**FINES for writs**, are paid in divers cases for original writs. Thus for every writ of plea of land, if it be not of right patent, which is for the yearly value of five marks; and all original writs in debt and trespass, where the debt or damage is 40 l. a fine is due to the king of 6 s. 8 d. and more proportionably when any writ is forthings of greater value.

**FINERS of gold and silver**, are those who separate these metals from coarser ores. See the article **REFINERS**.

**FINERY**, in the iron-works, one of the forges at which the iron is hammered and fashioned into what they call a bloom, or square bar. See the article **IRON**.

**FINGERS**, *digiti*, in anatomy, the extreme part of the hand divided into five members. See the article **HAND**.

The names of the fingers, reckoning from the thumb, are, 1. Pollex. 2. Index. 3. Medius. 4. Annularis. 5. Auricularis. In each of these there are three bones, which make three phalanges, the upper of which are much larger than the lower. Their exterior surface is gibbous or convex, and their interior is plane, but somewhat hollowed, for the convenience of seizing and laying hold of things. The first phalanx, in the part where they are articulated with the bones of the metacarpus at their heads, have a glenoid cavity, by means of which articulation, they have a free motion every way. In the other extremity, there are two heads with two cavities joined to the second phalanx, where the motions of flexion and extension are all that are possible; and the same is the case between the second phalanx and the third. In the upper extremities of the bones of the second and third phalanx, there is to be observed an eminence placed between two cavities: this has the same use with the olecranon. The farthest extremity of the last phalanx, has a point or apex somewhat broader than the body. See the articles **PHALANX** and **THUMB**.

The muscles of the fingers are in part common and in part proper. The common are the flexors of the first, second, and third phalanx, the extensor and interossei. See the articles **EXTENSOR** and **INTEROSSEI**.

Of the proper muscles of the fingers, those belonging to the thumb are five, *viz.* flexor, extensor, thenar, hypothenar, and antithenar. The proper muscles of the index and auricularis, are two in each, *viz.* an extensor and an abductor. See the articles **FLEXOR**, **EXTENSOR**, **THENAR**, &c.

**FINING**, or **REFINING**. See the articles **CLARIFICATION** and **REFINING**.

**FINING of wines**. See the article **WINE**.

**FINISHING**, in architecture, is frequently used for a crowning, acroter, &c. raised over a piece of building, to terminate, complete, or finish it. See the article **CROWNING**.

**FINISTERRA**, the most westerly cape or promontory of Spain, in 10° 15' west long. and 43° north lat.

This cape is likewise the most westerly part of the continent of Europe.

**FINITE**, something bounded or limited, in contradistinction to infinite. See the article **INFINITE**.

The schools distinguish finite into two kinds, *viz.* finite in perfection, and finite in extension. See **PERFECTION** and **EXTENSION**.

Finite in perfection, is applied to things which have not all possible perfection, but such only as may be comprehended by the mind. Thus the world, though supposed by the Cartesians infinite in point of extension, is yet finite in essence or perfection. In order to arrive at an idea of a thing finite in perfection, we must first conceive the thing as having certain perfections, and then conceive some other perfections which it has not; or some perfections in a greater degree. Thus when I say, that there is a finite number, I first conceive a number consisting of three units, then conceive other units beyond these three. I conceive my mind to be finite, by observing certain perfections beyond those I find in my mind.

Finite in extension, is applied to things which have not all possible or conceivable extension. To arrive at an idea of a thing finite in extension, we must first conceive the thing as having a certain extension, and then conceive some other extension which it has not; thus I conceive a room to be finite in extension, by having an idea of extension beyond what is contained therein.

**FINITO**, in music; a canon or fugue is said to be finito, when it is not perpetual, but when, at some certain place, all the parts join or unite, after having

ing followed one another for some time.

**FINITOR**, in astronomy, the same with horizon, so called because it terminates the sight or prospect. See **HORIZON**.

**FINLAND**, a province of Sweden, lying northward of the gulph of Finland, and eastward of the bothnic gulph. It is a frontier province, bounded by Russia on the east.

**FINNIKIN**, the english name of a species of pigeon, remarkable for its wheeling round several times, whenever it courts the female.

**FINNOCHIA**, **SWEET-FENNEL**, in botany, a species of fennel, cultivated in gardens as a sallad-herb, and as such much liked by some.

**FINSKALE**, a name used in some parts of the kingdom for a fish more usually called rudd. See the article **RUD**.

**FINTO**, in music, a feint, or an attempt to do something and not to do it; as cadenza finto is, when having done every thing proper for a true cadence, instead of falling on the right final, another note, either higher or lower, is taken, or perhaps a pause brought in. See the articles **INGANNO** and **SFUGGITA**.

**FIR-TREE**, *abies*, in botany. See the article **ABIES**.

*Scotch FIR*, a name given to the mountain-pine. See the article **PINE**.

**FIRE**, *ignis*, in physiology, according to Boerhaave, is something unknown, which has the property of penetrating all solid and fluid bodies, and dilating them so as to take up more space.

The most universal and sensible character of fire, and that which best distinguishes it from every other thing, is its giving heat: whence fire may be generally defined, to be whatever warms or heats bodies. However, by the general name of fire, men seem to understand a sensation or complex notion of light, heat, burning, melting, &c.

*Nature of FIRE*. The doctrine of fire, as laid down by modern philosophers, is very different. The great and fundamental difference in respect to the nature of fire is, whether it be originally such, formed thus by the creator himself at the beginning of things, or whether it be mechanically producible from other bodies, by inducing some alterations in the particles thereof. The former opinion is maintained by Homberg, Boerhaave, the younger Lemery, and s'Gravesande; the latter is chiefly supported by the

english philosophers, lord Bacon, Mr. Boyle, and Sir Isaac Newton.

Bacon, in his treatise *De Forma Calidi*, deduces, from a great number of particulars, that heat in bodies is no other than motion; only a motion so and so circumstantiated: so that to produce heat in a body, nothing is required but to excite a certain motion in the parts thereof.

Boyle seconds him in an express treatise of the mechanical origin of heat and cold, and maintains the same doctrine with new observations and experiments; as a specimen whereof, we shall here give the two following.

1. In the production, says he, of heat, there appears nothing on the part either of the agent or patient, but motion and its natural effects. When a smith briskly hammers a small piece of iron, the metal thereby becomes exceedingly hot; yet there is nothing to make it so, except the forcible motion of the hammer impressing a vehement and variously determined agitation on the small parts of the iron, which, being a cold body before, grows, by that super-induced commotion of its small parts, hot: first, in a more loose acceptation of the word, with regard to some other bodies, compared with which it was cold before: then, sensibly hot; because this agitation surpasses that of the points of our fingers; and in this instance oftentimes the hammer and anvil continue cold, after the operation: which shews that the heat acquired by the iron, was not communicated by either of those implements, as heat; but produced in it by a motion, great enough strongly to agitate the parts of so small a body as the piece of iron, without being able to have the like effect upon so much greater masses of metal as the hammer and the anvil. Though if the percussions were often and briskly renewed, and the hammer were small, this also might be heated; whence it is not necessary, that a body itself be hot to give heat.

2. If a large nail be driven by a hammer into a plank of wood, it will receive several strokes on its head, before it grow hot: but when it is once driven to the head, a few strokes suffice to give it a considerable heat; for while, at every blow of the hammer, the nail enters further into the wood, the motion produced is chiefly progressive, and is of the whole nail tending one way; but when that motion ceases, the impulse given by the

stroke being unable to drive the nail further on, or break it, must be spent in making a various, vehement, and intestine commotion of the parts among themselves, wherein the nature of heat consists.

Agreeable to this is the opinion of Sir Isaac Newton, who conceives that gross bodies may be converted into light, by the agitation of their particles; and light, again, into gross bodies, by being fixed therein.

On the other hand, M. Homberg, in his *Essai du Souffre Principe*, holds, that the chemical principle, or element sulphur, which is supposed one of the simple, primary, pre-existent ingredients of all natural bodies, is real fire, and consequently that fire is coeval with bodies.

Dr. s'Gravesande goes on much the same principle: fire, according to him, enters the composition of all bodies, is contained in all bodies, and may be separated or procured from all bodies, by rubbing them against each other; and thus putting their fire in motion: but fire, he adds, is by no means generated by such motion.

Mr. Lemery, the younger, agrees with these two authors in asserting this absolute and ingenerable nature of fire: but he extends it farther. Not contented to confine it as an element to bodies, he endeavours to shew, that it is equally diffused through all space, and that it is present in all places; in the void spaces between bodies, as well as in the insensible interstices between their parts.

This last sentiment falls in with that of Boerhaave, and the celebrated M. Musschenbroek. But, notwithstanding it is evident that fire, heat, flame, &c. are only the different modifications of the particles of light, and that the particles of light themselves depend entirely on velocity for their lucid quality; since, by many experiments, we know, that the particles of bodies become lucid, or particles of light, by only producing in them a requisite degree of velocity: thus the particles in a rod of iron, being hammered very nimbly, shine and become red hot: thus, also, the violent stroke of the flint against the steel, in striking fire, puts the particles of the steel, which it takes off, into such a motion, as causes them to melt and become red hot, which makes the sparks of fire produced by each stroke. As, therefore, fire consists in the great velocity of the particles, so

it may be communicated from one body in which it is, to another in which it is not, after the same manner that one body in motion will communicate motion to another that has got none.

Fire differs from heat only in this, that heat is a motion in the particles of a body, with a lesser degree of velocity; and fire a motion with a greater degree of velocity, viz. such as is sufficient to make the particles shine; though we often call such a state as will burn, fire, though it does not actually shine; and we seldom call those lucid bodies fires, which only shine, and do not burn. These are a sort of phosphori, which, though they have no heat, yet seem to owe their lucidity to the motion of their parts. See the articles HEAT and PHOSPHORUS.

There seems to be no other difference between fire and flame, than this; that fire consists in a glowing degree of velocity in the parts of a body, while yet subsisting together in the mass; but flame is the same degree of velocity in the particles dissipated and flying off in vapour: or, to use Sir Isaac Newton's expression, flame is nothing else but a red hot vapour.

See the article FLAME.

*General division of FIRE.* Fire, in general, is divided into three kinds or species, viz. celestial, subterraneous, and culinary.

By celestial fire we principally mean that of the sun, without regard to the fire of the fixed stars, though this, perhaps, may be of the same nature. By subterraneous fire, we understand that which manifests itself in fiery eruptions of the earth, volcanoes, or burning mountains; and by any other effects it produces in mines, or the more central parts of the earth. By culinary fire, we mean that commonly employed in all chemical operations in the animal, vegetable, atmospheric, marine, and mineral kingdoms. Considered in itself, fire seems to exist in greatest purity and perfection in the celestial regions; at least we are insensible of any considerable smoke it yields; for the rays of light come to us from the sun unmixed with any of that gross, feculent, or terrestrial matter found in culinary and subterraneous fires. And allowing for this difference, the effects of the solar fire appear the same as those of the culinary fire. To examine also the effects of subterraneous fires, we shall find them the same with those produced by the culinary fire. And thus all the three kinds of  
fires

fires agree in giving the motion of rarefaction to bodies. All subterraneous and culinary fires require some pabulum or fuel, wherein it resides, or is collected ; but whether the same is required for the subsistence of the celestial fire, is more than we know. See the article FUEL.

Sir Isaac Newton is of opinion, that the fire of the sun and fixed stars, is conserved by the greatness of these bodies, and the mutual action and re-action between them and the light which they emit ; that their parts are kept from fuming away, not only by their fixity, but by the vast weight and density of the atmospheres incumbent upon them, and very strongly compressing them, and condensing the vapours and exhalations which arise from them.

*Effects and properties of FIRE.* So great is the power, so extensive the action, and so wonderful the manner wherein fire acts, that it was antiently held and adored as the supreme god, by a notion reputed the wisest of all others. Thus some of the chemists, having found its extraordinary force, took it for an uncreated being ; and many of the most eminent among them, attributing all the knowledge they had acquired to this instrument, called themselves philosophers of fire, as thinking they could not be dignified by a higher title.

Fire, in effect, is the universal instrument of all the motion and action in the universe : without fire, all bodies would become immoveable ; whence fire is the universal cause of all motion or change. The effects of fire in burning, consists in this, that the velocity of the particles of fire so far increases the velocity of the parts of the body to which it is applied, as to cause a separation beyond the sphere of corpuscular attraction ; by which means the body will be dissolved, and the particles, which are volatile, will fly off in the form of steam, smoke, fume, &c. while that which remains appears in the form of coal, calx, ashes, caput mortuum, &c.

The parts of some bodies are extremely volatile, and will most of them be dissipated by the action of fire : but others, again, are to be found whose parts are of such a nature, or so fixed, as not to yield to the force of fire, or the velocity communicated to them will not be able to dissolve the corpuscular attraction ; but when this glowing velocity of the parts is abated, or, in other words,

when the fire in the body is extinct, the parts, and, of course, the whole body, appear unaltered ; of which sort of substance we have a notable instance in those fossils called the asbestus and amianthus. See ASBESTUS and AMIANTHUS.

All the physical knowledge we can have of a subject, must arise from attending to its properties and effects : but these properties and effects can never be discovered without the help of experiments, which in physical enquiries are the only interpreters betwixt the senses and the reason : whence all those notions of fire should be taken as precarious, that are taken from the testimony of the senses, or the naked reason unassisted by experiments.

We frequently find the effects of fire produced where no visible fire appeared. Thus the fingers are easily burnt by an iron heated below the degree of ignition, or so as to be no way visibly red ; whence we find, that the eye is no judge of fire : so likewise the touch gives us no positive notice of any degree of fire below the natural heat of the body, or any so great as to destroy the organ. Again, the effects of fire are often produced without any manifest signs of burning, melting, &c. as in evaporations, exiccations, &c. If this method of exclusion and rejection were pursued to its due length, we should find perhaps no criterion, infallible mark, or characteristic of fire in general, but that of a particular motion struggling among the small parts of bodies, and tending to throw them off at the surface. And if this should prove the case, then such a motion will be the form or essence of fire ; and which being present, makes fire also present ; and when absent, makes fire also absent ; whence to produce fire and produce this motion in bodies, will be the self-same thing.

But from repeated experiments we learn, 1. That, in general, both solids and fluids manifest an expansive motion upon being heated. 2. That the direct inflammable matter of fuel, is oil, or an unctuous substance. 3. That no fuel will burn or consume, without the admission of fresh air. 4. That the air which has once passed through burning fuel, is, of itself, unfit to animate fire again. And, 5. That flame exists only on the surface of fuel.

It appears a property belonging to fire, that its parts endeavour equally to diffuse themselves ; that is, by moving every way,

way, and consequently tend neither more nor less to one point than another. If fire be collected in any body so as to be perceivable by our senses, it removes itself out of the same by its own power, and expands every way from the center of its space or body; whence we learn the proper conatus of fire, and that the recession of it is spontaneous. From this last property of fire, may be computed its force and quantity: for the state of fire, as defined above, may be called its stagnation; and the powers of stagnating fires will then be as the spaces wherein it is contained; consequently the communication of powers will be to each other as the spaces.

It were to be wished that the proportional quantity of fire contained in a body, could be determined; but this is not so easy as at first sight it may seem, by reason, that though from the discovered effects of fire we may estimate its power, we cannot estimate its quantity; as the augmentation of the fire, arising from the nearness of its particles, is hitherto undetermined: for so long as the proportion of the power of fire depending on its density or closeness, to that depending on the quantity thereof is unknown, so long we shall be unable to argue from the effect of fire to the quantity thereof.

Yet fire, whilst it thus remains in a heated body, says Boerhaave, does not seem to unite with it into one corporeal concrete mass; since, though greater than before, it is not found heavier. Neither does fire diminish any thing of the weight which the body would have had at that time, and to which cold should restore it. Nothing of this kind appears from any experiment yet made.

It may be observed, that the same fire as applied in different quantities, first compounds bodies; and when raised to a higher pitch, decomposes them again. One and the same fire applied to the same body, with different circumstances, will have quite different effects, and especially as the air happens to be variously admitted during the operation; and the same fire, as applied in different degrees to the same object, has very different effects, as is found by experiments.

Fire and flame are abolished or extinguished by suffocation, or an action contrary to ventilation, as being destructive or preventive of that internal commotion and discharge of the oily particles of fuel, by means of the free air, where-

in the nature of open and consuming fire consists. And hence fire and flame are quenched by water, or even by spirit of wine, or oil of turpentine, if a live coal or lighted candle be suddenly plunged therein below the surface of the liquor. For the degree of heat which water, spirit of wine, or oil of turpentine unfired, are capable of receiving, is much less than that of a burning coal or candle: whence the greater heat is subdued by the less, as fire quenched by boiling water.

**FIRE**, in chemistry, the great instrument by which most of the operations in that art are performed.

The kind, degree, direction, &c. of fire, are things the chemist is principally to attend to. There are, in chemistry, as many kinds of fire, as there are mediums through which it may be conveyed, or fuels that afford it. For common use, fire is conveyed through ashes, sand, water, &c. or directly through the containing vessel. Hence, fires are denominated of various kinds, as those of sand, filings of iron, and ashes, the reverberatory fire, the *ignis rotæ*, or fire for fusion, the lamp fire, the *balneum mariæ*, the vapour bath, and the fire of suppression. The chemists use also several other kinds of heats, which may be classed among the fires, such as insolation, a bath of horse-dung, a bath of the skins of grapes, and the heat of quick-lime.

For the *balneum arenosum*, or the fires or baths of sand, filings of iron, and ashes, *balneum mariæ*, *balneum vaporis*, or vapour-bath, see **BALNEUM**.

The reverberatory fire is made in a furnace covered with a dome, that by this means the heat or flame, which has always a tendency to make its escape at the superior parts of the furnace, may be reverberated, or beat back on the vessel immediately exposed to it. To expose a vessel to a naked fire, or to distil with a naked fire, is when there is no intermediate substance between the distilling vessel and the fire.

The *ignis rotæ*, or fire for fusion, is when a crucible or any other vessel containing the matter destined for fusion, is surrounded with live-coals.

Lamp-fire, is when any matter contained in a glass-vessel is rendered hot by the equable heat of a lighted lamp.

Fire of suppression, is when, in order to distil per descensum, the fire is laid above the matter, so that the moisture forced from it, by means of the heat, is precipitated

pitated to the bottom of the vessel : or when the body of the retort, or other vessel, is covered over with fire.

Insolation, is when any matter designed either to be put into fermentation or dried, is exposed to the heat of the sun.

The bath of horse-dung, called also the horse's belly, is when a vessel containing any matter to be either digested or distilled, is placed in a large heap of horse-dung.

Bath of the skins of grapes, like the bath of horse's dung, serves for digestions or distillations ; the skins are to be collected after the vintage.

The heat of quick-lime moistened, may serve for some distillations.

Some differences may be found in the effects produced by these different fires, applied in the same degree. But they have not, perhaps, been noted as they deserve. In several bodies, it is evident that dry and moist heats have different effects, which we may find remarkably in the common culinary operations of boiling, roasting, baking, &c. And hence, when the same effects are required perfectly similar, the same kinds as well as degrees of fire are to be used.

The purest fire is that of alcohol, or perfectly pure spirit of wine ; the next in purity is that of distilled oils ; the next, that of charcoal, or charred turf ; and the impurest, pit-coal : but all these have nearly the same effect, when received through the same kind of medium.

*Degrees of FIRE.* The last thing to be considered is, how to regulate and ascertain the degrees of fire in chemical operations, so as to produce the effects required in every case. The common directions of chemists about this matter are full of uncertainty ; the first, second, third, and fourth degrees of heat, or fire, meaning no precise degrees, measured by any standard : however, according to Boerhaave, they are as follows.

The first degree of fire is that by which nature performs the office of vegetation in plants, and whereby chemistry imitates or does the like : this commences from the highest degree of cold, which, in Fahrenheit's thermometer, is denoted by one, and ends at 80 degrees : since in this whole interval we find certain plants give indications of life and growth.

This heat is suited to extracting of the native spirits of odoriferous vegetables with oils, as that of roses, jessamin, &c. and again, to making the more curious insolutions, &c.

The second degree of fire may be accounted that of the human body, in a healthy state. This degree is always greater than that of the ambient air, and may be supposed to commence at the 40th degree of the thermometer, and end about the 94th. Within this compass animals may live and subsist, that is, if their juices be of any degree of heat within these bounds. This degree is adapted to vinous and acetous fermentation, putrefaction, exclusion of the chick, the finer digestions, the making of tinctures and elixirs ; and the adepts have used it for the first digestion of their mercury, by carrying the including vessel constantly in their pocket. The third degree of fire is that which extends from 94 degrees of the thermometer to 212, at which last water usually boils. This degree is required in the distillation of simple and compound waters, the essential oils of vegetables, and will coagulate or consolidate the serum, blood, and other animal juices, and consequently destroy the creatures.

The fourth degree may be taken from 212 to 600 of the thermometer, within which latitude quicksilver or oil of vitriol boils, distils, or becomes volatile. This degree is suited to the melting of lead, tin, bismuth, &c. and the subliming of sal armoniac and sulphur, the calcining of antimony, &c.

The fifth degree is that wherein the other metals melt, and which commences from 600 degrees of the thermometer, and ends where iron is held in a state of fusion. In this degree most bodies are destroyed ; but glass, gold, silver, copper, and iron remain long unchanged ; all other fixed bodies grow red-hot in this degree, and all the unvitrifiable stones are calcined.

The sixth and highest degree of fire, hitherto known, is that of the burning lens or concave, by M. Villette, Tschirnhausen, Buffon, and others. The focus of these lenses will even volatilize what is called the metalline or mercurial part of gold, and vitrify the more terrestrial. See the article *BURNING-GLASS*.

The fires of sand, filings of iron, and ashes, have generally their degrees from the first to the third : the reverberatory fire has its degrees from the first to the fourth : the *ignis notæ* serves for calcinations and fusions ; and a vessel may receive different degrees of heat from a lighted lamp : the *bañeum mariæ* and *bañeum vaporis* have also their degrees, as has the fire of suppression its degrees :

*Insolation.*

Insolation has its degrees in proportion to the heat of the sun, to which the substances are exposed: the bath of horse's dung has its degrees, according to the bulk of the heap, or the place in which it is lodged: the bath of grape-skins has also its degrees, like that of the bath of horse's dung: and the heat of quick-lime has also its degrees; for according as we desire it more or less strong, we expose it in powder longer or shorter to the open air; and when we have occasion for all its heat, we use it as quick as we possibly can.

**FIRE**, in medicine. See **CAUSTICS**.

**FIRE**, in surgery. See **CAUTERY**.

*St. Anthony's FIRE*, in medicine. See the article **ERYSIPELAS**.

*Walking FIRE*, in meteorology. See the article **WILL-WITH-A-WHISP**.

**FIRE**, in theology. See the articles **HELL**, **CONFLAGRATION**, &c.

We read of the sacred fire in the first temple of Jerusalem, concerning which the Jews have a tradition that it came down from heaven: it was kept with the utmost care, and it was forbidden to carry any strange fire into the temple. This fire is one of the five things which the Jews confess were wanting in the second temple.

The pagans had their sacred fires, which they kept in their temples with the most religious care; and which were never to be extinguished. Numa was the first who built a temple to fire, as a goddess, at Rome, and instituted an order of priestesses for the preservation of it. See the article **VESTALS**.

Fire was the supreme god of the Chaldeans; the magi were worshippers of fire; and the Greeks and Armenians still keep up a ceremony called the Holy Fire, upon a persuasion that every easter-day a miraculous fire descends from heaven into the holy sepulchre, and kindles all the lamps and candles there. On this occasion the church of the holy sepulchre is crowded by a numerous and distracted mob, who make a solemn procession with standards, crucifixes, &c. after which the people light their candles at the sacred flame, and immediately apply it to their beards, faces, and bosoms, pretending that it will not burn like an earthly flame: they also think that if they are buried in a shroud smutted with this celestial fire, it will secure them from the flames of hell.

**FIRE**, in the art of war, a word of com-

mand to the soldiers, to discharge their muskets; to the cavalry, to discharge their carbines or pistols; to the grenadiers, to fire their grenades; and to the gunners, to fire the guns.

*Running FIRE* is when a rank of men, drawn up, fire one after another: or, when the lines of an army are drawn out to fire on account of a victory, each squadron or battallion takes it from another, from the right of the first line to the left, and from the left to the right of the second line.

**FIRE-ARMS** are all sorts of arms charged with powder and ball, as cannon, muskets, carbines, pistols, blunderbusses, &c. See the articles **CANNON**, **GUN**, &c.

**FIRE-BALL**, in the art of war, a composition of meal-powder, sulphur, salt-petre, pitch, &c. about the bigness of a hand-grenade, coated over with flax, and primed with a slow composition of a fusee. This is to be thrown into the enemy's works in the night time, to discover where they are: or to fire houses, galleries, or blinds of the besiegers; but they are then armed with spikes or hooks of iron, that they may not roll off, but stick or hang where they are designed to have any effect.

**FIRE-LOCK**. See **GUN**, **MUSQUET**, &c.

**FIRE-MASTER**, in our train of artillery, an officer, who gives the directions and proportions of ingredients for each composition required in fire-works, whether for the service of war, or for rejoicings and recreations.

His orders are given to the fire-workers and bombardiers, who must execute them.

**FIRE-POTS**, in the military art, small earthen pots, into which is put a charged grenade, and over that powder enough till the grenade is covered; then the pot is covered with a piece of parchment, and two pieces of match across lighted: this pot being thrown by a handle of match, where it is designed, it breaks and fires the powder, and burns all that is near it, and likewise fires the powder in the grenade, which ought to have no fuse, to the end its operations may be the quicker.

**FIRE-WORKERS**, officers subordinate to the fire-master.

**FIRE-WORKS**. See **PYROTECHNIA**.

**FIRE-SHIP**, in the navy, a vessel charged with artificial fire-works, which having the wind of an enemy's ship, grapples her, and sets her on fire.

**FIRE-BARRE**,

**FIRE-BARE**, in our old customs, signifies a beacon, or tower, by the sea-side, wherein there were kept continual lights.

**FIRE-BOTE** is fuel or firing for necessary use, allowed to tenants, out of the lands granted to them.

**FIRE-COCKS**. Churchwardens in London and within the bills of mortality, are to fix fire-cocks at proper distances in streets, and keep a large engine and hand-engine for extinguishing fire, under the penalty of 10l. stat. 6 Annæ, cap. xxxi.

On the breaking out of any fire in London and Westminster, the constables and headles of parishes shall repair to the place with their slaves, and assist in extinguishing it, and cause the people to work for that end, &c.

**FIRE-OFFICE**, an office of insurance from fire. See ASSURANCE.

**FIRE-ENGINE**. See the article ENGINE.

**Wild-FIRE**, a kind of artificial or factitious fire, which burns even under water, and that with greater violence than out of it. It is composed of sulphur, naphtha, pitch, gum, and bitumen; and is only extinguishable by vinegar mixed with sand and urine, or by covering it with raw hides. Its motion or tendency is said to be contrary to that of natural fire, and it always follows the direction in which it is thrown, whether it be downwards, sideways, or otherwise.

Several are of opinion that the antient Greeks and Romans used this fire in their engagements at sea: whether or not that was the case, it was applied against the Saracens in a sea-fight, commanded by Constantine Pogonates, in the Helespont, and with such effect that he burnt the whole fleet therewith, wherein there were thirty thousand men.

**Electrical FIRE**. See ELECTRICITY.

**FIRING-IRON**, in farriery, an instrument not unlike the blade of a knife; which being made red-hot, is applied to a horse's hams, or other places standing in need of it, as in preternatural swellings, farcy knots, &c. in order to discuss them. Sometimes this is done for wrenches of the patterns.

**FIRKIN**, an english measure of capacity, for things liquid, being the fourth part of the barrel: it contains 8 gallons of ale, soap, or herrings; and 9 gallons of beer. See MEASURE and BARREL.

**FIRLOT**, a dry measure used in Scotland. The oat-firlot contains  $21\frac{1}{4}$  pints of that country; the wheat-firlot contains about 2211 cubical inches; and the barley-

firlot, 31 standard pints. Hence it appears that the scotch wheat-firlot exceeds the english bushel by 33 cubical inches. See the article MEASURE.

**FIRMAMENT**, in the ptolemaic astronomy, the eighth heaven or sphere, with respect to the seven spheres of the planets which it surrounds. It is supposed to have two motions; a diurnal motion, given to it by the primum mobile, from east to west, about the poles of the ecliptic; and another opposite motion from west to east, which last it finishes, according to Tycho, in 25412 years, according to Ptolemy in 36000, and according to Copernicus in 25800, in which time the fixed stars return to the same points in which they were at the beginning. This period is commonly called the Platonic year, or the great year. *Trevoux.*

**FIRMAMENT** is also used in divers places of scripture, to denote the middle region of the air. Several of the antients have believed, with the modern philosophers, that the firmament is a fluid matter; but certainly those who gave it the name of firmament, thought it a solid matter.

**FIRMAN** is a passport or permit granted by the great mogul to foreign vessels, to trade within the territories of his jurisdiction.

**FIRMNESS**, *firmitas*, denotes the consistence of a body, or that state wherein its sensible parts cohere in such a manner, that the motion of one part induces a motion of the rest.

Many of the cartesians maintain, that firmness consists in the mere rest of the particles of a body, and their mutual immediate contact, alledging that a separation of parts can only arise from some matter interposed between them, which matter is excluded by the notion of contiguity. But the insufficiency of this hypothesis is obvious; and the firmness of all bodies is known to depend on the connection or cohesion of their particles. See the articles ATTRACTION, COHESION, &c.

**FIRST-FRUIT**, *primitia*, among the Hebrews, were oblations of part of the fruit of the harvest, offered to God as an acknowledgment of his sovereign dominion. The first of these fruits was offered in the name of the whole nation, being either two loaves of bread, or a sheaf of barley which was threshed in the court of the temple. Every private person was also obliged to bring his first-fruits to the temple, and these consisted

of wheat, barley, grapes, figs, apricots, olives, and dates.

There was another sort of first-fruits which were paid to God. When bread was kneaded in a family, a portion of it was set apart, and given to the priest or levite who dwelt in the place: if there was no priest or levite there, it was cast into the oven, and consumed by the fire. These offerings made a considerable part of the revenues of the hebrew priesthood.

First fruits are frequently mentioned in ancient christian writers as one part of the church-revenue. One of the councils of Carthage enjoins that they should consist only of grapes and corn, which shews that this was the practice of the african church.

**FIRST-FRUITs**, in the church of England, are the profits of every spiritual benefice for the first year, according to the valuation thereof in the king's books. See the article **ANNATES**.

**FIRST-MOVER**, *primum mobile*. See the article **PRIMUM MOBILE**.

**FISC**, *fiscus*, in the civil law, the treasury of a prince. It differs from the *crarium*, which was the treasury of the public or people: thus, when the money arising from the sale of condemned persons goods, was appropriated for the use of the public, their goods were said *publicari*; but when it was destined for the support of the prince, they were called *confiscari*.

**FISCAL**, in the civil law, something relating to the pecuniary interest of the prince or people. The officers appointed for the management of the fisc, were called *procuratores fisci*, and *advocati fisci*; and among the cases enumerated in the constitutions of the empire, where it was their business to plead, one is against those who have been condemned to pay a fine to the fisc on account of their litigiousness, or frivolous appeals.

**FISGUM**, a fish more usually called misgum. See the article **MISGUM**.

**FISH**, in natural history, constitutes a class of animals which have no feet, but always fins; add to this, that their body is either altogether naked, or only covered with scales; and that they are aquatic animals, which live mostly, if not always, in water.

This class is subdivided by authors into five series, or orders.

1. The plagiuri or cetaceous fishes, comprehending those who have the tail not perpendicular, like all other fishes, but

placed in an horizontal direction, or parallel to the horizon. 2. Chondropterygious fishes, comprehending those with perpendicular tails, and the rays of the fins not bony, but cartilaginous. 3. Branchioflegious fishes, or those which have perpendicular tails, the rays of the fins bony, and the branchiæ or gills not ossiculated. 4. Acanthopterygious fishes, or those with perpendicular tails, and the rays of the fins bony, and prickly at the ends. 5. Malacopterygious fishes, or such as have perpendicular tails, with the rays bony, but not prickly at their ends. See **PLAGIURI**, &c. and plate of ichthyology, where a fish of each series is delineated, in the same order as above.

Some distinguish fishes, from the place where they are found, into sea-fish, river-fish, and lake or pond-fish. Others again divide them into cetaceous, cartilaginous, and spinose. The cetaceous, or whale-kind, called *bellua marina*, have lungs, and breathe like quadrupeds; they copulate also like them, and conceive and bring forth their young alive, whom they suckle with their milk. The cartilaginous kind are produced from large eggs, like birds, which are excluded the womb also like those of birds. The spinose kind are also oviparous, but their eggs are smaller, and have spines up and down in their flesh, to strengthen it.

Willughby thinks it would be better to distinguish fishes, first, into the cetaceous kind, or those that breathe with lungs; and those that breathe with gills: then to subdivide those that breathe with gills, not into cartilaginous and spinose, but into oviparous and viviparous; with other the like subdivisions. But the division first laid down, is that followed by the best ichthyologists, Artedi, Linnæus, and others.

As to the structure of fishes, it is admirably adapted to the element in which they live. their fins, tail, gills, air-bladder, eyes, figure, &c. are all such as best suit their circumstances; for the description and uses of which, see the articles **FIN**, **TAIL**, &c.

**FISH**, in commerce. The exporter, on making oath that they were british taken, and really exported, is entitled to the following bounties, to be paid by the collector of the salt-duty, at the port of exportation, within thirty days after demand, upon a debenture prepared by the collector of the customs, *viz.*

Pilchards, or scads, the cask, containing 50 gallons,	s. d.	7 0
Cod, { if 14 inches or upwards in length, from the bone in the fin to the 3 <sup>d</sup> joint in the tail, the 100 wet, the barrel, containing 32 gallons, dried, the hundred wt.	5 0	2 0
Ling, or {	3 0	4 6
Hake {	2 8	1 9
Salmon, the barrel, containing 42 gallons	1 0	1 0
White herrings, the barrel, containing 32 gallons,	1 0	1 0
Full red herrings, the barrel as above	1 0	1 0
Clean shotten red herrings, the barrel as above,	1 0	1 0
Dried red sprats, the last	1 0	1 0
Fifth of all sorts, taken by foreigners, and imported in foreign ships, are forfeited, together with the ship, except stock-fish, live eels, sturgeon, botargo or cavear, and anchovies. And, by 1 Geo. I. cap. xviii. salmon taken in great rivers, and sea-fish fold, are to be of certain lengths, or the takers shall forfeit 5 l. and the sellers 20 s. besides the fish.		

*Generation of FISHES.* See the article GENERATION.

*Breeding of FISHES* may be turned to great advantage; for besides furnishing your table, obliging your friends, and raising money, your land will be thereby greatly improved, so as to yield more this way than by any other employment whatever.

When fish are fed in large pools or ponds, either malt boiled, or fresh grains, is the best food; thus carps may be raised and fed like capons, and tenches will feed as well.

The care of feeding them is best committed to a gardener, or the butler, who should be always at hand. In a stew, any sort of grain boiled, especially peas, and malt coarse ground; also the grains after brewing, whilst fresh and sweet: but one bushel of malt not brewed, will go as far as two of grains. See the article FISH-POND, *infra*.

*Royal FISHES.* See the article ROYAL.

*FISH*, in a ship, a plank or piece of timber, fastened to a ship's mast or yard, to strengthen it, which is done by nailing it on with iron-spikes, and wounding or winding ropes hard about them.

*FISHES, pîces*, in astronomy. See the article PISCES.

*FISHES*, in heraldry, are the emblems of silence and watchfulness, and are borne

either upright, imbowed, extended, endorsed respecting each other, surmounting one another, fretted, &c.

In blazoning fishes, those borne feeding, should be termed devouring; all fishes borne upright and having fins, should be blazoned haughty; and those borne transverse the escutcheon, must be termed naiant.

*FISH-BLOCK*, in a ship. See BLOCK.

*FISH-GARTH*, a wear or dam in a river, for catching of fish. See WEAR.

*FISH-SHELLS*, in husbandry. See SHELLS.

*FISH-PONDS*, those made for the breeding or feeding of fish.

Fish-ponds are no small improvement of watry and boggy lands, many of which are fit for no other use. In making of a pond, its head should be at the lowest part of the ground, that the trench of the flood-gate or sluice, having a good fall, may not be too long in emptying. The best way of making the head secure, is to drive in two or three rows of stakes above six feet long, at about four feet distance from each other, the whole length of the pond-head, whereof the first row should be rammed at least about four feet deep. If the bottom is false, the foundation may be laid with quick-lime, which flacking, will make it as hard as a stone. Some lay a layer of lime, and another of earth dug out of the pond, among the piles and stakes; and when these are well covered, drive in others, as they see occasion, ramming in the earth as before, till the pond-head be of the height designed.

The dam should be made sloping on each side, leaving a waste to carry off the overabundance of water in times of floods or rains; and as to the depth of the pond, the deepest part need not exceed six feet, rising gradually in shoals towards the sides, for the fish to sun themselves, and lay their spawn. Gravelly and sandy bottoms, especially the latter, are best for breeding; and a fat soil with a white fat water, as the washings of hills, commons, streets, sinks, &c. is best for fattening all sorts of fish. For storing a pond, carp is to be preferred for its goodness, quick growth, and great increase, as breeding five or six times a year. A pond of an acre, if it be a feeding and not breeding one, will every year feed two hundred carps of three years old, three hundred of two years old, and four hundred of a year old. Carps delight in ponds that have marl or clay-bottoms, with

plenty of weeds and grafs, whereon they feed in hot months.

Your pond ſhould be drained every three or four years, and your fiſh ſorted. If it is a breeding one, the ſmaller ones are to be taken out, to ſtore other ponds with; leaving a good ſtock of females, at leaſt eight or nine years old, as they never breed before that age. In feeding ponds, it is beſt to keep them pretty near of a ſize.

**FISHERY**, a place where great numbers of fiſh are caught.

The principal fiſheries for ſalmon, herring, mackrel, pilchards, &c. are along the coaſts of England, Scotland, and Ireland; for cod on the banks of Newfoundland; for whales, about Greenland; and for pearls, in the Eaſt and Weſt-indies.

**FISHERY** denotes alſo the commerce of fiſh, more particularly the catching them, for ſale.

Were we to enter into a very minute and particular conſideration of fiſheries, as at preſent eſtabliſhed in this kingdom, this article would ſwell beyond its proper bounds; becauſe to do juſtice to a ſubject of that concernment to the britiſh nation, requires a very ample and diſtinct diſcuſſion. We ſhall, however, obſerve, that ſince the divine providence has ſo eminently ſtored the coaſts of Great Britain and Ireland with the moſt valuable fiſh; and ſince fiſheries, if ſucceſſful, become permanent nurſeries for breeding expert ſea-men; it is not only a duty we owe to the ſupreme being, not to deſpiſe the wonderful plenty he hath afforded us, by neglecting to extend this branch of commerce to the utmoſt; but it is a duty we owe to our country, for its natural ſecurity, which depends upon the ſtrength of our royal navy. No nation can have a navy, where there is not a fund of buſineſs to breed and employ ſea-men, without any expence to the public, and no trade is ſo well calculated for training up theſe uſeful members of this ſociety, as fiſheries.

The ſituation of the britiſh coaſts is the moſt advantageous for catching fiſh in the world; the ſcotiſh iſlands, particularly thoſe to the north and weſt, lie moſt commodious for carrying on the fiſhing trade to perfection; for no country in Europe can pretend to come up to Scotland in the abundance of the fineſt fiſh, with which its various creeks, bays, rivers, lakes, and coaſts are replenished. King Charles I.

was ſo ſenſible of the great advantage to

be derived from fiſheries, that he began the experiment, together with a company of merchants; but the civil wars ſoon occaſioned that project to be ſet aſide. King Charles II. made a like attempt, but his preſſing wants made him withdraw what money he had employed that way, whereupon the merchants that joined with him, did ſo too. Since the union, ſeveral attempts have been made to retrieve the fiſheries, and a corporation ſettled to that effect, intitled the Royal Britiſh Fiſhery.

In the year 1750, the parliament of Great Britain taking the ſtate of the fiſheries into conſideration, an act was paſſed for the encouragement of the white-herring fiſhery, granting a charter, whereby a corporation is created, to continue twenty-one years, by the name of the Society of the Free Britiſh Fiſhery, to be under the direction of a governor, preſident, vice-preſident, council, &c. who are to continue in office the ſpace of three years, with power to make bye-laws, &c. and to raiſe a capital of 500,000l. by way of ſubſcription. And any number of perſons, who, in any part of Great Britain, ſhall ſubſcribe 10,000l. into the ſtock of this ſociety, under the name of the Fiſhing Chamber, and carry on the ſaid fiſhery on their own account of profit and loſs, ſhall be intitled to the ſame bounty allowed to the ſociety. The bounty is 30s. the tun, to be paid yearly, for fourteen years, beſides 3 per cent. for the money advanced by each chamber. The act contains other proper regulations relative to the nets, marks on the herring-barrels, numbers of hands, and the quantity of ſalt that is intitled to the bounty, &c. It is then by the encouragement given by this act, that we now ſee a laudable emulation prevailing all over the two kingdoms, and fiſhing buſſes fitted out from almoſt every port, in order to repair to the Shetland iſlands, where the herring-fiſhery is carried on with an ardor becoming ſo important a branch of trade. Scotland, which ſuffered incredibly from the neglect of this valuable and natural produce of the ſeas, has not been backward to join in a ſcheme that tends ſo evidently to its own advantage; for the cities of Edinburgh and Glaſgow, the towns of Montroſe, Dundee, Perth, Inverneſs, and ſome other boroughs, have raiſed the proper ſum, and chambers have been erected in each of them; the gentlemen of eſtates adjoining to the reſpective places above-mentioned, liberally contributing with

merchants,

merchants, towards the prosecution of an undertaking so visibly tending to the good of their country in general.

**Anchorvy-FISHERY.** Anchovies are fished on the coast of Provence, in the months of May, June, and July, at which season shoals of this fish regularly come into the Mediterranean through the straits of Gibraltar. They are likewise found in plenty in the river of Genoa, on the coast of Sicily, and on that of the island of Gorgone opposite to Leghorn; these last are reckoned the best. It is remarkable, that anchovies are seldom fished but in the night-time. If a fire be kindled on the poop of the vessels used for this fishing, the anchovies will come in greater numbers into the nets; but then it is asserted, that the anchovies taken thus by fire, are neither so good nor so firm, and will not keep so well, as those which are taken without fire. When the fishery is over, they pull off the heads of all the anchovies, gut them, and afterwards range them in barrels of different weights, the largest of which do not weigh above 25 or 26 pounds, and they put a good deal of salt in them. Some also pickle them in small earthen pots made on purpose, of two or three pounds weight more or less, which they cover with plaster, to keep them the better.

**Cod-FISHERY.** There are two kinds of cod-fish, the one green or white cod, and the other dried or cured cod, tho' it is all the same fish differently prepared; the former being sometimes salted and barrell'd, then taken out for use; and the later having lain some competent time in salt, dried in the sun or smoke. We shall therefore speak of each of these apart, and first of

**Green cod-FISHERY.** The chief fisheries for green cod are in the Bay of Canada, on the great bank of Newfoundland, and on the isle of St. Peter, and the isle of Sable, to which places vessels resort from divers parts both of Europe and America. They are from 100 to 150 tons burden, and will catch between 30 and 40 thousand cod each. The most essential part of the fishery, is to have a master who knows how to cut up the cod, one who is skilled to take the head off properly, and above all, a good salter, on which the preserving them, and consequently the success of the voyage, depends. The best season is from the beginning of February to the end of April; the fish which in the winter retire to the deepest

water, coming then on the banks, and fattening extremely. What is caught from March to June keeps well, but those taken in July, August, and September, when it is warm on the banks, are apt to spoil soon. Every fisher takes but one at a time: the most expert will take from 350 to 400 in a day, but that is the most, the weight of the fish and the great coldness on the bank fatiguing very much. As soon as the cod are taken, the head is taken off; they are opened, gutted and salted, and the salter stows them in the bottom of the hold, head to tail, in beds a fathom or two square; laying layers of salt and fish alternately, but never mixing fish caught on different days. When they have lain thus three or four days to drain off the water, they are replaced in another part of the ship, and salted again; where they remain till the vessel is loaded. Sometimes they are cut in thick pieces, and put up in barrels for the convenience of carriage.

**Dry cod-FISHERY.** The principal fishery for dry cod, is from Cape Rose to the Bay des Exports, along the coast of Placentia, in which compass there are divers commodious ports for the fish to be dried in. These, tho' of the same kind with the fresh cod, are much smaller, and therefore fitter to keep, as the salt penetrates more easily into them. The fishery of both is much alike; only this latter is most expensive, as it takes up more time, and employs more hands, and yet scarce half so much salt is spent in this as in the other. The bait is herrings, of which great quantities are taken on the coast of Placentia. When several vessels meet and intend to fish in the same port, he whose shallop first touches ground, becomes intitled to the quality and privileges of admiral: he has the choice of his station, and the refusal of all the wood on the coast at his arrival. As fast as the masters arrive, they unrig all their vessels, leaving nothing but the shrouds to sustain the masts, and in the mean time the mates provide a tent on shore, covered with branches of trees, and falls over them, with a scaffold of great trunks of pines, twelve, fifteen, sixteen, and often twenty feet high, commonly from forty to sixty feet long, and about one third as much in breadth. While the scaffold is preparing, the crew are afishing, and as fast as they catch they bring their fish ashore;

ashore; open and salt them upon moveable benches; but the main salting is performed on the scaffold. When the fish have taken salt, they wash and hang them to drain on rails; when drained, they are laid on kinds of stages, which are small pieces of wood laid across, and covered with branches of trees, having the leaves stripped off, for the passage of the air. On these stages, they are disposed, a fish thick, head against tail, with the back uppermost, and are turned carefully, four times every twenty-four hours. When they begin to dry, they are laid in heaps ten or twelve thick, in order to retain their warmth; and every day the heaps are enlarged, till they become double their first bulk; then two heaps are joined together, which they turn every day as before; lastly, they are salted again, beginning with those first salted, and being laid in huge piles, they remain in that situation, till they are carried on board the ships, where they are laid on the branches of trees disposed for that purpose, upon the ballast, and round the ship, with mats to prevent their contracting any moisture.

There are four kinds of commodities drawn from cod, *viz.* the sound, the tongues, the roes, and the oil extracted from the liver. The first is salted at the fishery, together with the fish, and put up in barrels from 6 to 700 pound. The tongues are done in like manner, and brought in barrels from 4 to 500 pounds. The roes are also salted in barrels, and serve to cast into the sea to draw fish together, and particularly pilchards. The oil comes in barrels, from 400 to 520 pounds, and is used in dressing leather. The Scots catch a small kind of cod on the coasts of Buchan, and all along the Murray Firth on both sides; as also in the Firth of Forth, Clyde, &c. which is much esteemed. They salt and dry them in the sun upon rocks, and sometimes in the chimney. They also cure skait, and other smaller fish in the same manner, but most of these are for home-consumption.

**Coral-Fishery.** See CORAL-FISHERY. **Herring-Fishery.** Herrings are chiefly found in the north sea. They are a fish of passage, and commonly go in shoals, being very fond of following fire or light, and in their passage they resemble a kind of lightning. About the beginning of June, an incredible shoal of herrings, probably much larger than the

land of Great-Britain and Ireland, come from the north on the surface of the sea; their approach is known by the hovering of sea fowl in expectation of prey, and by the smoothness of the water; but where they breed, or what particular place they come from, cannot be easily discovered. As this great shoal passes between the shores of Greenland and the north cape, it is probably confined, and as it reaches the extremities of Great Britain, is necessarily divided into two parts. For we find one part of the herrings, steering west, or south-west, and leaving the islands of Shetland and Orkney to the left, pass on towards Ireland, where being interrupted a second time, some keeping the shore of Britain, pass away south down St. George's channel; while the other part edging off to the south-west, coast the western ocean, till they reach the south shore of Ireland, and then steering south-east, join the rest in St. George's channel. The other part of the first division made in the north, parting a little to the east and south-east, pass by Shetland, and then make the point of Buchan-ness, and the coast of Aberdeen, filling as they go, all the bays, firths, creeks, &c. with their innumerable multitudes. Hence they proceed forward, pass by Dunbar, and rounding the high shores of St. Abbe's Head, and Berwick, are seen again off Scarborough; and even then not diminished in bulk, till they come to Yarmouth-Roads, and from thence to the mouth of the Thames, after which, passing down the British Channel, they seem to be lost in the western ocean.

The vast advantage of this fishery to our nation is very obvious, when we consider that tho' herrings are found upon the shores of north America, they are never seen there in such quantities as with us, and that they are not to be met with in considerable numbers in any of the southern kingdoms of Europe as Spain, Portugal, or the south parts of France on the side of the ocean, or in the Mediterranean, or on the coast of Africa. There are two seasons for fishing herring, the first from June to the end of August, and the second in autumn, when the fogs become very favourable for this kind of fishing. The Dutch begin their herring-fishing on the 24th of June, and employ no less than two thousand vessels therein called busses, being between forty-five and sixty tons burden, and carrying three

at four small cannon. They never stir out of port without a convoy, unless there be enough together to make about eighteen or twenty cannon among them, in which case they are allowed to go in company. Before they go out, they make a verbal agreement, which has the same force as if it were in writing. The regulations of the admiralty of Holland are partly followed by the French, and other nations, and partly improved and augmented with new ones, as, that no fisher shall cast his net within a hundred fathoms of another boat: that while the nets are cast, a light shall be kept on the hind part of the vessel: that when a boat is by any accident obliged to leave off fishing, the light shall be cast into the sea: that when the greater part of a fleet leaves off fishing, and casts anchor, the rest shall do the same, &c. By the late act of parliament in Great Britain, the regulations are, that every vessel intitled to the bounty, must carry twelve Winchester bushels of salt in new barrels, for every last of fish such vessel is capable of holding; and as many more new barrels as such vessels can carry; and two fleets of tanned nets, that is, a vessel of seventy tons shall carry one fleet of fifty nets, each net to be thirty yards full upon its rope, and seven fathoms deep; and so in proportion for greater or smaller vessels; and be provided with one other fleet of fifty like nets, on board a tender, or left on shore in a proper place for the use of the said vessel, &c.

There is nothing particular in the manner of fishing. The nets wherein the fish are drawn, should regularly have their meshes an inch square to let all the lesser fry go through.

*Curing and preparing Herring.* The commerce of herring both white or pickled, and red, is very considerable. The white Dutch herrings are the most esteemed, being distinguished into four sorts, according to their sizes; and the best are those that are fat, fleshy, firm, and white, salted the same day they are taken, with good salt and well barrelled. The british herrings are little inferior, if not equal to the Dutch, for in spite of all their endeavours to conceal the secret, their method of curing, lasting, or casking the herrings, has been discovered and is as follows. After they have hawled in their nets, which they drag in the sterns of their vessels backwards and forwards in

traversing the coast, they throw them upon the ship's deck, which is cleared of every thing for that purpose: the crew is separated into sundry divisions, and each division has a peculiar task: one part opens and guts the herrings, leaving the melts and roes: another cures and salts them, by lining or rubbing their inside with salt: the next packs them, and between each row and division they sprinkle handfuls of salt: lastly, the cooper puts the finishing hand to all by heading the casks very tight, and stowing them in the hold. It is customary with us to wash the herring in fresh water, and steep them twelve or fifteen hours, in a strong brine, before we proceed to barrel them.

*Red Herrings* must lie twenty-four hours in the brine, in as much as they are to take all their salt there, and when they are taken out, they are spitted, that is, strung by the head on little wooden spits, and then hung in a chimney made for that purpose. After which, a fire of brush-wood which yields a deal of smoke, but no flame, being made under them, they remain there till sufficiently smoked and dried, and are afterwards barrelled up for keeping.

*Mackrel-FISHERY.* The mackrel are found in large shoals in the ocean, but especially on the french and english coasts. They enter the english channel in April, and proceeding as the summer advances; about June, they are on the coasts of Cornwall, Suffex, Normandy, Picardy, &c. where the fishery is most considerable. They are taken either with a line or nets: the latter is preferable, and is usually performed in the night-time. They are pickled two ways, first by opening and gutting them, and cramming their bellies as hard as possible with salt, by means of a stick, and then laying them in rows at the bottom of the vessel, strewing salt between each layer. The second way is putting them directly into tubs full of brine, made of salt and fresh water, and leaving them to steep till they have taken salt enough to keep. After this, they are barrelled up and pressed close down.

*Pearl-FISHERY.* See PEARL FISHERY.

*Pilchard-FISHERY.* The chief pilchard fisheries are along the coasts of Dalmatia on the coast of Bretagne, and along the coasts of Cornwall and Devonshire. That of Dalmatia is very plentiful: that on the coasts of Bretagne employs annually about 300 ships. The pilchards caught

on our coasts, tho' bigger, are not so much valued as those on the coasts of France, owing principally to their not being so thoroughly cured. They naturally follow the light, which contributes much to the facility of the fishery: the season is from June to September. On the coasts of France they make use of the roes of the Cod-fish, as a bait; which thrown into the sea, makes them rise from the bottom, and run into the nets. On our coasts there are persons posted ashore, who spying by the colour of the water where the shoals are, make signs to the boats to go among them to cast their nets. When taken, they are brought on shore to a warehouse, where they are laid up in broad piles, supported with backs and sides; and as they are piled, they salt them with bay salt, in which lying to soak twenty or thirty days, they run out a deal of blood, with dirty pickle and bitterness: then they wash them clean in sea-water, and when dry, barrel and press them hard down to squeeze out the oil, which issues out at a hole in the bottom of the cask. The cornish men observe of the pilchard, that it is the least fish in size, most in number, and greatest for gain, of any they take out of the sea.

*Salmon-FISHERY.* The chief salmon fisheries in Europe are in England, Scotland, and Ireland, in the rivers, and sea-coasts adjoining to the river mouths. Those most distinguished for salmon in Scotland, are the River Tweed, the Clyde, the Tay, the Dee, the Don, the Spey, the Ness, the Bewley, &c. in most of which it is very common about the height of summer, especially if the weather happen to be very hot, to catch four or five score of salmon at a draught. The chief rivers in England for salmon are the Tyne, the Trent, the Severn, and the Thames. The fishing usually begins about January, and in Scotland, they are obliged to give over about the 15th of August, because, as it is then supposed the fish come up to spawn, it would be quite depopulating the rivers to continue fishing any longer. It is performed with nets, and sometimes with a kind of locks or weirs made on purpose, which in certain places have iron or wooden grates so disposed, in an angle, that being impelled by any force in a contrary direction to the course of the river, they may give way and open a little at the point of contact, and

immediately shut again, closing the angle. The salmon, therefore, coming up into the rivers, are admitted into these grates, which open, and suffer them to pass thro', but shut again, and prevent their return. Salmon are also caught with a spear, which they dart into him when they see him swimming near the surface of the water. It is customary likewise to catch them with a candle and lanthorn, or wisp of straw set on fire; for the fish naturally following the light, are struck with the spear, or taken in a net spread for that purpose, and lifted with a sudden jerk from the bottom. We make no mention of the method of catching salmon with a line or hook, because it is much the same with that explained under the article *Trout FISHING*.

*Curing Salmon.* When the salmon are taken, they open them along the back, take out the guts and gills, and cut out the greatest part of the bones, endeavouring to make the inside as smooth as possible, then salt the fish in large tubs for the purpose, where they lie a considerable time soaking in brine, and about October, they are packed close up in barrels, and sent to London, or exported up the Mediterranean. They have also in Scotland, a great deal of salmon salted in the common way, which after soaking in brine a competent time, is well pressed, and then dried in smoke: this is called kipper, and is chiefly made for home consumption, and if properly cured and prepared, is reckoned very delicious.

*Sturgeon-FISHERY.* The greatest sturgeon-fishery is in the mouth of the Volga, on the Caspian Sea, where the Muscovites employ a great number of hands, and catch them in a kind of inclosure formed by huge stakes, representing the letter Z, repeated several times. These fisheries are open on the side next the sea, and close on the other, by which means the fish ascending in its season up the river, is embarrassed in these narrow angular retreats, and so is easily killed with a harping-iron. Sturgeons, when fresh, eat deliciously, and in order to make them keep, they are salted or pickled in large pieces, and put up in cags from thirty to fifty pounds. But the great object of this fishery is the roe, of which the Muscovites are extremely fond, and of which is made the caviar or kavia, so much esteemed by the Italians. See the article *CAVEAR*.

*Whale-*

**Whale-FISHERY.** Whales are chiefly caught in the north sea : the largest fort are found about Greenland, or Spitzbergen. At the first discovery of this country, whales not being used to be disturbed, frequently came into the very bays, and were accordingly killed almost close to the shore, so that the blubber being cut off was immediately boiled into oil on the spot. The ships in these times, took in nothing but the pure oil and the fins, and all the business was executed in the country, by which means a ship could bring home the product of many more whales than she can according to the present method of conducting this trade. The fishery also was then so plentiful, that they were obliged sometimes to send other ships to fetch off the oil they had made, the quantity being more than the fishing ships could bring away. But time and change of circumstances have shifted the situation of this trade. The ships coming in such numbers from Holland, Denmark, Hamburgh, and other northern countries, all intruders upon the English, who were the first discoverers of Greenland, the whales disturbed, and gradually, as other fish often do, forsaking the place, were not to be killed so near the shore as before, but are now found, and have been so ever since, in the openings and spaces among the ice, where they have deep water, and where they go sometimes a great many leagues from the shore.

The whale-fishery begins in May, and continues all June and July ; but whether the ships have good or bad success, they must come away and get clear of the ice by the end of August ; so that in the month of September at farthest, they may be expected home ; but a ship that meets with a fortunate and early fishery in May, may return in June or July.

The manner of taking whales at present is as follows. As soon as the fishermen hear the whale blow, they cry out *fall ! fall !* and every ship gets out its long boat, in each of which there are six or seven men : they row till they come pretty near the whale, then the harpooner strikes it with his harpoon. This requires great dexterity, for through the bone of his head there is no striking, but near his spout there is a soft piece of flesh, into which the iron sinks with ease. As soon as he is struck, they take care to give him rope enough, otherwise, when he goes down, as he frequently does, he

would inevitably sink the boat : this rope he draws with such violence, that, if it were not well watered, it would by its friction against the sides of the boat, be soon set on fire. The line fastened to the harpoon is six or seven fathoms long, and is called the fore-runner : it is made of the finest and softest hemp, that it may slip the easier : to this they join a heap of lines of 90 or 100 fathoms each, and when there are not enough in one long-boat, they borrow from another. The man at the helm observes which way the rope goes, and steers the boat accordingly, that it may run exactly out before ; for the whale runs away with the line with so much rapidity, that he would overset the boat, if it were not kept straight. When the whale is stuck, the other long boats row before, and observe which way the line stands, and sometimes pull it ; if they feel it stiff, it is a sign the whale still pulls in strength ; but if it hangs loose, and the boat lies equally high before and behind upon the water, they pull it in gently, but take care to coil it so, that the whale may have it again easily if he recovers strength : they take care, however, not to give him too much line, because he sometimes entangles it about a rock, and pulls out the harpoon. The fat whales do not sink as soon as dead, but the lean one's do, and come up some days afterwards. As long as they see whales, they lose no time in cutting up what they have taken, but keep fishing for others : when they see no more, or have taken enough, they begin with taking off the fat and whiskers in the following manner. The whale being lashed along side, they lay it on one side, and put two ropes, one at the head, and the other in the place of the tail, which together with the fins is struck off, as soon as he is taken, to keep those extremities above water. On the off side of the whale are two boats to receive the pieces of fat, utensils and men that might otherwise fall into the water on that side. These precautions being taken, three or four men with irons at their feet, to prevent slipping, get on the whale, and begin to cut out pieces of about three feet thick, and eight long, which are hauled up at the capstane or windlass. When the fat is all got off, they cut off the whiskers of the upper jaw with an ax. Before they cut, they are all lashed to keep them firm, which also facilitates the cutting,

and prevents them from falling into the sea: when on board, five or six of them are bundled together, and properly stowed, and after all is got off, the carcass is turned adrift, and devoured by the bears, who are very fond of it. In proportion as the large pieces of fat are cut off, the rest of the crew are employed in slicing them smaller, and picking out all the lean. When this is prepared, they stow it under the deck, where it lies till the fat of all the whales is on board; then cutting it still smaller, they put it up in tubs in the hold, cramming them very full and close. Nothing now remains but to sail homewards, where the fat is to be boiled and melted down into train oil. See *Train OIL*.

It were in vain to speak in this place of the advantages that may be derived to Great Britain from the whale-fishery. We shall only remark, that the legislature think that trade of so great importance, as to grant a very considerable bounty for the encouragement of it; for every british vessel of 200 tons or upwards, bound to the Greenland-seas on the whale-fishery, if found to be duly qualified according to the act, obtains a licence from the commissioners of the customs to proceed on such voyage: and on the ship's return, the master and mate making oath that they proceeded on such voyage and no other, and used all their endeavours to take whales, &c. and that all the whale-fins, blubber, oil, &c. imported in their ship, were taken by their crew in those seas, there shall be allowed 40s. for every ton according to the admeasurement of the ship.

Besides these fisheries, there are several others both on the coasts of Great Britain and in the north seas, which although not much the subject of merchandize, nevertheless employ great numbers both of ships and men; as, 1. The oyster fishing at Colchester, Feverham, the Isle of Wight, in the Swales of the Medway, and in all the creeks between Southampton, and Chichester, from whence they are carried to be fed in pits about Weymouth, and other places. See the article *OYSTER*.

2. The lobster fishing all along the british channel, the firth of Edinburgh, on the coast of Northumberland, and on the coast of Norway, from whence great quantities are brought to London. And lastly, the fishing of the pot-fish, fin-fish, sea-unicorn, sea-horse, and the

seal, or dog-fish, all which are found in the same seas with the whales, and yield blubber in a certain degree; besides, the horn of the unicorn is as estimable as ivory, and the skins of the seals are particularly useful to trunkmakers.

**FISHING** in general, the art of catching fish, whether by means of nets, or of spears, lines, rods, and hooks. See the articles *NET*, *LINE*, *ROD*, &c.

By several statutes it is provided, that no persons shall fish in any pond or moat, without the owner's consent, on pain of three months imprisonment; nor shall any one take fish in a river without licence obtained from the owner, upon forfeiture of 10s. to the poor, and triple damages to the party aggrieved, to be levied by justices of the peace, by distress and sale of goods. The nets, and other implements, belonging to poachers, may be seized by the owners of rivers, &c.

Fishing performed with a rod, line, and hook, is called *angling*. See *ANGLING*.

*Carp-FISHING*, requires a world of patience, by reason they seldom bite in cold weather, and, in hot, the angler cannot be too early, or too late; but when they do bite, there is no fear of the hold. The baits proper for them, are the red worm in March, the cadew in June, and the grass-hopper in July, August, and September. See *CARP* and *BAIT*.

*Chub-FISHING*, is performed with a large bait, whether worm, snail, fly, cheele, &c. according to the season and time of the day; but the large yellow moth seems to be a favourite morsel of this fish. See the article *CHUB*.

*Cod-FISHING*. See *FISHERY*, *supra*.

*Dace-FISHING*, affords good sport, as they catch at any fly, particularly the stone-cadew, and may-fly, in the beginning of summer, and the ant-fly in June, July, August, &c. But to catch dace in winter, the bait is a white worm, with a large red head, found in ploughed lands. See the article *DACE*.

*Eel-FISHING*. The silver-eel may be caught with several sorts of baits, as powdered beef, garden-worms, lobbs, minnows, garbidge, &c. The night is the best time for this kind of fishing; throwing a line with good store of hooks, baited and well plumbed, into the places where eels resort, with a float to discover where the lines lie, that they may be taken up in the morning.

As to the method called bobbing and snig-

sniggling, it is only by means of a sick thrusting a baited hook into the holes where eels use to hide themselves. Some fish for eels with a three-forked spear jagged on the sides: this they strike into the mud, and if it chance to light where they lie, there is no fear of securing them. But to take the largest eels of all, the night hooks are to be baited with small roaches, and the hooks must lie in the mouth of the fish. See EEL.

*Flounder-FISHING*, in the months of April, May, June, and July, may be performed all day long, either in the stream, or still deep-water, but the stream is best; and the most proper baits are all sorts of red-worms, wasps, or gentles. See the article FLOUNDER.

*Gudgeon-FISHING*, may be performed with float, the hook being on the ground; or by hand, with a running line on the ground, without cork or float. A small red worm is the best bait for this fish, yet wasps, gentles, and cad-bits, will do very well; and, in order to gather them to the place, it may not be improper to stir the sand and gravel, above and below it, by which means they will bite faster, and with more eagerness. See the article GUDGEON.

*Herring-FISHING*. See the articles FISHERY, *supra*, and HERRING.

*Mackrel-FISHING*. See the article FISHERY, *supra*, and MACKREL.

*Pearch-FISHING*. The proper baits are a minnow, or little frog; but the best of all is a worm called a brandling. You may also angle for this fish with job worms, bobs, wasps, &c. If you row for a perch with a minnow, which of all baits yields the best sport to the angler, it must be alive, sticking the hook through the upper lip, or back-fin, letting it swim about midwater, or somewhat lower; for which end you ought to have an indifferent large hook, with a quill on your line; but some, with good success, have used a strong silk-line, and a hook armed with wire. If you fish with a frog, the hook must be fastened thro' the skin of the leg, toward the upper part thereof.

*Pike-FISHING*, is performed two ways, 1. By the ledger-bait, fixed in one certain place; which must be a living bait of fish or frog, as dace, roach, perch, and yellow frogs. 2. By the walking bait, with a troll and winch, so as to give the fish length enough to run off with the bait, then striking him with a smart jerk.

The rod must not be too slender at top; and the line should be of silk two yards and a quarter next the hook, and strongly armed with a wire about seven inches.

*Pilchard-FISHING*. See FISHERY, *supra*, and PILCHARD.

*Roach-FISHING*, is best performed, in April, with cads or worms; and, in summer, with white small snails, or flies; but then the baits should be under-water, for they will not bite at top. Some use a may-fly with good success; and, in autumn, a paste, made of the crumb of fine bread, will do very well. The manner of fishing for roach at London is peculiar. They take a strong cord, at the end of which is fastened a three pound weight; and a foot above the lead, a pack-thread of twelve feet is made fast to the cord; and to the pack-thread, at proper distances, they add twelve strong links of hair, with roach-hooks at them, baited with a white snail or periwinkle. Then holding the cord in their hands, the biting of the fish draws the pack-thread, and that the cord, which gives them notice what to do. By this means, they sometimes draw up half a dozen, and very commonly two or three at a draught.

*Salmon-FISHING*. See the articles FISHERY and SALMON.

*Sturgeon-FISHING*. See FISHERY and STURGEON.

*Tench-FISHING*, is best performed with large red worms, at which they will bite the more eagerly, if dipped in tar. Several other sorts of worms, and a paste made of brown bread, are also used for this purpose.

*Trout-FISHING*. The baits for this purpose are either natural or artificial, as earth worms, minnows, and fishing flies, both natural or artificial. Whatever worms are used, they answer best if kept some time in an earthen pot, with moss often changed in summer. If you fish for trout with hand on the ground, the hook is to be introduced into the worm a little above the middle, coming out again a little below; then draw the worm above the arming of the hook, making your first entrance at the tail end, that the point of the hook may come out at the head end. When you fish with minnows, take the whitest and middle-sized; and after putting the hook in at the mouth, and out at the gills, and drawing it thro' about three inches, slip it again into his mouth, so as the point and beard may

come out at the tail. This done, tie the hook and tail together with a fine white thread, and let the body of the minnow be almost straight upon the hook.

**FISSURE** of the bones, in surgery, is when they are divided either transversely or longitudinally, not quite through, but cracked after the manner of glass, by any external force. Fissures are not easily detected, since neither the senses of seeing, feeling, or hearing can give sight enough to determine any thing with certainty in this case. However, surgeons always suppose there is a fissure when there happen violent inflammations, suppurations, fistulæ, and caries, with excessive pain, after any external violence. When, from these symptoms, there appears to be a fissure, it is usual to apply the plaster used in fractures, placing splints above all. When the tumour becomes soft, it is to be laid open by incision, to let out the corrupted fluid; after which a tent should be put into the wound, dipped in some vulnerary unguent, using afterwards the bandage, which is applied in fractures accompanied with a wound. Some assert, that fissures, when just made, may be cured by the application of bandages, without the assistance of other remedies.

In fissures of the cranium, attended with no other bad symptoms, but white, yellow, or brown spots upon the face of the bone, it is sufficient to bore down to the diploe, and dress with some balsamic medicine; but where any violent symptoms come on, which shew that there is an extravasation of blood in the cavity of the cranium, the trepan is to be called in without delay. See the articles **CONTRA-FISSURE** and **EXTRAVASATION**.

**FISTULA**, in the antient music, an instrument of the wind-kind, resembling our flute, or flageolet. See **FLUTE**.

The principal wind-instruments of the antients, were the tibia and fistula. But how they were constituted, wherein they differed, or how they were played on, does not appear.

**FISTULA**, in surgery, a deep, narrow, and callous ulcer, generally arising from abscesses. See the article **ABSCESS**.

Fistulæ differ from sinuses in this, that the former are callous, the latter not. See the article **SINUS**.

Fistulas attack all parts of the body without exception, particularly the anus, the perinæum, and the foramen lacrymale.

**General treatment of FISTULAS.** As soon as you discover that ulcers are attended with fistulas, not yet become callous, the readiest way of curing them is to lay them open with the knife, to the very bottom, if it can be done with safety; and afterwards to cleanse and heal them: but if the patient will not agree to the use of the knife, let the fistula be cleansed with a proper injection. Tents should never be made use of, but where the opening of the fistula is so small as to be in constant danger of healing: and even in this case, the tent can scarcely be too short, nor the materials too soft.

The next thing to be observed is, to press the fundus as near the opening as possible. When the ulcer is cleansed, and the proper dressings applied, a small compress, or a slip of plaster, doubled in that form, should be clapped upon the part where you judge the fistula of the fistula to be seated, securing all with a bolster, plaster, and bandage; taking care to make the fastening tight upon the fundus: this will direct the matter contained within towards the opening, and the bottom will heal before the rest of the fistula.

If this method of cure is unequal to the intention of cleansing and healing, the knife is of the utmost service, especially if the fistula tends downwards, or takes such an irregular course, that the fundus cannot be pressed towards the opening. All the sinuses of the fistula being laid open by this operation, there is a passage made for a discharge of the corrupted matter, and then you can come at the diseased parts with your remedies.

**FISTULA in the anus**, is a sinuous ulcer, commonly arising from a phyma, or the internal hæmorrhoides. Fistulas which arise from the phyma are the worst, very painful, and hard to be cured, on account they penetrate deep into the interstices of the muscles, and then form sinuses; and the more remote the sinuses are from the anus, so much the worse, in regard they admit of no opening by incision.

Fistulas arising from the internal hæmorrhoides, are bred gradually betwixt the coats of the intestinum rectum, and have a small perforation near the verge of the anus; from whence there issues out a thin sanies, or ichor, without pain: but in process of time, the parts are attended with itching and excoriation, the orifices at last become callous, and some-

times

times for a time are shut up; and then at certain intervals break out again.

Unless these fistulas are attended with great molestation, such as an exorbitant evacuation of humours, with a foetor, or the like, they are in a great measure to be left to nature to be cured, as serving in manner of a drain, for the discharge of superfluous, peccant humours, in caco-chymical and cachectical bodies: these should rather be kept open; but simple fistulas, that are recent, may be cured without danger. When a fistula in the anus is so conditioned, that an operation may be performed without danger of injuring the sphincter muscle, so as to render it incapable of retaining the excrements, there are two ways of doing it, viz. either by a ligature, or incision.

By ligature it is to be done thus. Let the surgeon take a thread of silk, or some horse-hair, and thread it into the eye of a leaden, or tin probe, with which let him introduce the end of the thread into the fistula, and with the fore-finger of the other hand, being anointed with oil of roses, and thrust up into the anus, let him lay hold of the end of the probe, and draw forth the thread, and then tie the two ends together, as tight as the patient can well bear it; and thus by tying it afresh every day, somewhat freighter, it will cut quite through, and the fistula will be laid open; and after that the callus must be destroyed, and the ulcer healed, &c.

A more expeditious way is by making an incision with an instrument, after this manner. A hollow leaden probe is to be thrust into the fistula, till it penetrates into the intestinum rectum; and then the instrument being passed into the anus, with the guidance of a finger, the fistula is to be cut according to the direction of the conductor, yet taking care not to hurt the hæmorrhoid veins, to occasion an hæmorrhage. When the incision is made, a doffel is to be put in armed with the white of an egg, and astringent powders: the callus is to be destroyed with a powder made of burnt alum, præcipitate mercury, &c.

**FISTULA in the perinæum**, is usually the consequence of lithotomy, or making a puncture in the perinæum and bladder; or they may proceed from abscesses in the perinæum, near the urethra; or from a scirrhosity of the prostate gland; or from a wound, or ulcer, which can by no means be healed up, but the lips, be-

coming callous, form a fistula, through which the urine is sometimes preternaturally discharged.

The treatment of these fistulas is various, according to the habit and particular disposition of the parts affected. The general treatment is as follows. Let the callous lips of the fistula be cut off, and the parts brought together by a sticking plaster, after they have been dressed by some vulnerary balsam; over the plaster should be laid a narrow compress, on each side of the wound, and the whole retained by a strict bandage; which done, the patient's knees are to be tied together, and strict orders given him, to lie still in bed, that the lips of the wound may more easily unite with each other. For the first few days after the operation, the patient should be allowed very little drink, that he may not be often excited to make water, and the dressings should not be removed till the second or third day after the operation, or till the patient can contain his urine. For some time afterwards the patient must observe a strict regimen.

**FISTULA LACHRYMALIS**, a disease which attacks the great caruncle in the inward corner of the eye. See the article **EYE**. The first degree of this disease stops up the natural passage of the tears, and forces them to run down the cheek; the second is when pus is mixed with the tears, which proceeds sometimes from an opening in the skin, between the nose and the great corner of the eye; the last is when the pus has not only corroded the neighbouring parts, which are soft, but has affected the bone which lies underneath. This last sort of fistula sometimes turns cancerous, and Riverius advises not to meddle with it at all.

Whatever may be the cause of this disorder, whether the small-pox, or french disease, it always stops up the nasal conduit.

If the abscess is not open, a time must be chosen when it is fullest of pus. For this reason, the eye of the patient must be closed, and small long pieces of plaster must be put one upon another, across the eye-lids, from the puncta lachrymalia to the great angle of the eye. The superior branches of the canal being thus compressed, that nothing can pass that way, it will be amassed in the sack, and a place proper for an incision should then be pointed out. If the abscess is already open the orifice and the probe

will shew where it is to be dilated; which must be done by the bistoury, both above and below, from the superior part of the sack to the edge of the orbit. The sack being opened, it must be filled with dry lint, which may be taken away next day, and a pledgit dipt in a mild digestive applied, which must be repeated once or twice a day, according to the quantity of suppuration: when the suppuration begins to diminish at every dressing, a small probe must be introduced into the nasal canal, to dilate it a little, and to leave a passage for the tears and the pus. This method must be continued till the suppuration is almost ended; then it may be dressed superficially, with dry lint, or with a desiccative, which will complete the cure: after which it will be proper to wear a compressing bandage a few weeks longer to prevent its return. When the bone lies open; and it is necessary to penetrate into it, you must direct the instrument towards the nose, and not towards the nasal canal, for fear of entering the sinus maxillaris.

**FISTULAR, or FISTULOUS**, appellations given by surgeons to wounds and ulcers, which degenerate into fistulas. See the article **FISTULA**.

**FISTULAR**, among botanists, is applied to leaves and flowers that are tubular, or resemble a hollow pipe.

**FIT**, in medicine, denotes much the same with paroxysm. See **PAROXYSM**.

**FITS of easy reflection and transmission**, in optics. See the articles **REFLECTION** and **TRANSMISSION**.

**FITS of the mother**; the same with hysteric affection.

**FITCH**, or **FITCHOW**, in zoology, an animal more usually called putorius, and the pole-cat. See **PUTORIUS**.

**FITCHEE**, in heraldry, a term applied to a cross, when the lower end of it is sharpened into a point, as in plate **XCIII. fig. 3.**

Crosses are sometimes fitched by only a point going out from the broad foot thereof, and sometimes they go tapering away from the center to the point, in which case it is said to be fitched on the fourth part. The reason of this cross's being so painted, Mackenzy supposes to be, that as the primitive Christians were wont to carry crosses with them where-soever they went for devotion, when they settled themselves in their journey, at any place, they might fix these portable crosses in the ground.

**FITCHES**, in husbandry, a sort of pulse, more generally known by the name of chick pea; or cicer. See **CICER**.

Fitches are cultivated either for feeding cattle, or improving the land. They make a wholesome and nourishing food, whether given in the straw, or threshed out. When sown only to improve the soil, they are plowed in just as they begin to blossom, by which means a tough stiff clay soil is much enriched.

**FITZ**, makes part of the surname of some of the natural sons of the kings of England, as Fitz-roy; which is purely French, and signifies the king's son.

**FIVE CHURCHES**, a bishop's See of Lower Hungary, 76 miles south of Buda.

**FIVES**, or **VIVES**, in farriery. See the article **VIVES**.

**FIUME**, or **St. VEIT**, a port-town of Istria, subject to the house of Austria: east long. 15°, and north lat. 45° 45'.

**FIXATION**, in chemistry, the rendering any volatile substance fixed, so as not to fly off upon being exposed to a great heat; hence,

**FIXED BODIES** are those which bear a considerable degree of heat without evaporating, or losing any of their weight.

Gold is the most fixed of all metals. A quantity of very pure gold, after being placed in the eye of a glass furnace for two months, was found not to have lost any sensible part of its weight.

However, gold itself, exposed on a piece of charcoal to the focus of a burning-glass, is found to diminish; and, in proportion to this diminution, there arise an infinite number of little glassy drops of a greenish colour, which swell and enlarge as the gold disappears. But this, say some, is no demonstration that the gold is vitrified: it is rather the ashes of the coal; because, if the gold be evaporated on a body which yields no ashes, you have no glass. Be this as it will, the experiment shews that gold may be evaporated; and since gold is not fixed, we may safely conclude, that there is no body absolutely so. See the articles **GOLD** and **BURNING-GLASS**.

<b>FIXED MERCURY,</b>	} See {	<b>MERCURY.</b>
<b>FIXED NITRE,</b>		<b>NITRE.</b>
<b>FIXED SALTS,</b>		<b>SALT.</b>
<b>FIXED SIGNS,</b>		<b>SIGN.</b>
<b>FIXED STARS,</b>		<b>STAR.</b>

**FLACCIDITY**, among physicians, a disorder of the solids; cured by astringent and

and cardiac medicines, joined with exercise and good air.

**FLAG**, a general name for colours, standards, antients, banners, ensigns, &c. which are frequently confounded with each other. See **COLOUR**, &c.

The fashion of pointed, or triangular flags, as now used, Rod. Toletan assures, came from the mahometan Arabs, or Saracens, upon their seizing of Spain, before which time all the ensigns of war were stretched, or extended on cross pieces of wood, like the banners of a church. The pirates of Algiers, and throughout the coasts of Barbary, bear an hexagonal flag.

**FLAG** is more particularly used at Sea; for the colours, antients, standards, &c. borne on the top of the masts of vessels, to notify the person who commands the ship, of what nation it is, and whether it be equipped for war or trade, see plate XCIX.

The admiral in chief carries his flag on the main-top; the vice-admiral on the fore-top; and the rear-admiral on the mizzen-top.

When a council of war is to be held at sea, if it be on board the admiral, they hang a flag in the main shrouds; if in the vice-admiral, in the fore-shrouds; and if in the rear-admiral, in the mizzen shrouds.

Besides the national flag, merchant-ships frequently bear lesser flags on the mizzen mast, with the arms of the city where the master ordinarily resides; and on the fore-mast, with the arms of the place where the person who freights them lives.

**FLAG**, in French fanion, a small banner of distinction stuck in the baggage-waggons of the army, to distinguish the baggage of one brigade, or battalion, from that of another, that they may be marshalled by the waggon-master-general according to the rank of their brigades, where they are to keep during the march, to avoid confusion.

*To lower, or strike the FLAG*, is to pull it down upon the cap, or to take it in, out of the respect, or submission, due from all ships or fleets inferior to those any way justly their superiors. To lower or strike the flag in an engagement is a sign of yielding.

The way of leading a ship in triumph is to tie the flags to the shrouds, or the gallery, in the hind part of the ship, and let them hang down towards the water, and to tow the vessels by the stern.

Livy relates, that this was the way the Romans used those of Carthage.

*To heave out the FLAG*, is to put out, or put abroad, the flag.

*To hang out the white FLAG*, is to ask quarter; or it shews when a vessel is arrived on a coast, that it has no hostile intention, but comes to trade, or the like. The red flag is a sign of defiance, and battle.

**FLAG-OFFICERS**, those who command the several squadrons of a fleet, such are the admirals, vice-admirals, and rear-admirals.

The flag-officers in our pay, are the admiral, vice-admiral, and rear-admiral, of the white, red, and blue. See the article **ADMIRAL**.

**FLAG-SHIP**, a ship commanded by a general, or flag-officer, who has a right to carry a flag, in contradistinction to the secondary vessels under the command thereof.

**FLAG-STAVES**, are staves set on the heads of the top-gallant-masts, serving to let fly, or unfurl, the flag.

**FLAGS**, in falconry, are the feathers in a hawk's wing, near the principal ones.

**FLAG** is also used for sedge, a kind of rush; and for the upper part of turf, pared off to burn.

**FLAG-FLOWER**, in botany, a plant called by botanists iris. See **IRIS**.

**FLAG-WORM**, that found in flaggy or sedgey places. See the article **WORM**.

**Corn-FLAG**, in botany, the same with gladiolus. See the article **GLADIOLUS**.

*Sweet-scented FLAG*, a name sometimes given to the acorus or galangal. See the article **GALANGAL**.

**FLAGELLANTES**, **WHIPPERS**, in church-history, certain enthusiasts in the thirteenth century, who maintained, that there was no remission of sins without flagellation, or whipping. Accordingly, they walked in procession, preceded by priests carrying the cross, and publicly lashed themselves, till the blood dropped from their naked backs.

**FLAGELLARIA**, in botany, a genus of the *hexandria monogynia* class of plants, without any flower-petals; the perianthium is divided into six segments; and the fruit is a roundish berry, containing a single seed.

**FLAGEOLET**, or **FLAJOLET**, a little flute, used chiefly by shepherds, and country people. It is made of box, or other hard wood, and sometimes of ivory, and has six holes besides that at the bottom,

bottom, the mouth-piece, and that behind the neck. See the article FLUTE.

**FLAIL**, an instrument for threshing corn. See CORN and THRESHING.

A flail consists of the following parts, 1. The hand-staff, or piece held in the thresher's hand. 2. The swipec, or that part which strikes out the corn. 3. The caplins, or strong double leathers, made fast to the tops of the hand-staff and swipec. 4. The middle-band, being the leather-thong, or fish-skin, that ties the caplins together.

**FLAIR**, in the sea-language. When a ship is housed in near the water, so that the work above hangs over too much, it is said to flair over. This makes the ship more roomy aloft, for the men to use their arms.

**FLAIRE**, a species of ray-fish, more usually called skate. See SKATE.

**FLAKE**, among gardeners, a kind of striped carnations, with only two colours.

**FLAMBEAU**, a kind of large taper, made of hempen wicks, by pouring melted wax on their top, and letting it run down to the bottom. This done, they lay them to dry; after which they roll them on a table, and join four of them together by means of a red-hot iron; and then pour on more wax, till the flambeau is brought to the size required.

Flambeaus are of different lengths, and made either of white or yellow wax. They serve to give light in the streets at night, or on occasion of illuminations.

**FLAMBOROUGH-HEAD**, in geography, a cape or promontory of Yorkshire, five miles east of Burlington: east long. 20', north lat. 54° 15'.

The village of Flamborough has its name, as some think, from the word flame, because of a watch-tower here, with lights for the use of sailors.

**FLAME**, *flamma*, in physiology, the small parts of an inflammable or considerably unctuous body, that are set on fire, or briskly agitated and thrown off, with a certain vibrative motion at the surface of that body into the open air: or, in Sir Isaac Newton's words, the flame of a body is only the smoke thereof heated red hot; and the smoke is only the volatile part of the body separated by the fire. See FIRE and SMOKE.

Flame cannot exist without oil; whence it is that ashes, sand, glass, stones and earth, do not flame upon ignition, but rather damp and extinguish flame. As oil is then the only inflammable substance

in nature, we may be directed to the means of preventing conflagrations, by using such materials in buildings as contain little or no oil. And this direction might be likewise extended to the making incombustible paper, for valuable books and manuscripts, &c.

All flame catches and exists only on the surface of inflammable bodies: whence we are led to invent methods of casing or otherwise defending the wood-works of ships and buildings, from accidents by fire. All inflammable bodies, as sulphur, oil, wax, wood, &c. by flaming, waste and vanish into burning smoke; which smoke if the flame be hastily put out, is very thick and visible, and sometimes smells strongly; but in the flame, loses its smell by burning; and according to the nature of the smoke, the flame is of this or that colour: thus the flame of sulphur is blue; that of camphor, white; that of tallow, yellow, &c. When gun-powder takes fire, it goes off in a flaming smoke. Thence proceeds the difference of the colours of bodies, as viewed by day-light, candle-light, fire-light, sulphureous-light, &c.

As the pressure of the fire is greatest about the upper parts, and least towards the circumference of the base, whence the air finding least resistance from that part, drives the flame upwards; and as the fire is densest, and consequently strongest, about the middle, it thence follows, that the flame will rise higher from the middle of the fire than from its sides, where the quantity of fire is considerably lessened; and hence we see the reason of the pyramidal figure of flame.

**Vital FLAME**, a fine, warm, igneous substance, supposed, by some, to reside in the hearts of animals, as necessary to life; or rather as that which constitutes life itself.

To preserve this flame, they judge the air taken in by respiration, to be as necessary as it is to the conservation of ordinary flame. Others, however, not less to be depended on, find no more in the notion of a vital flame, than the natural warmth of the body, which is always as the velocity of the circulating blood, and is the effect of that circulation.

**FLAMEN**, in roman antiquity, the name of an order of priests, instituted by Romulus or Numa; authors not being agreed on this head.

They were originally only three, *viz.* the *flamen dialis*, *flamen martialis*, and *flamen*

flamen quirinus. They were chosen by the people, and installed by the sovereign pontiff. Afterwards, their number was increased to fifteen; the three first of whom were senators, and called flamines majores; the other twelve, taken from among the people, being denominated flamines minores.

The flamen dialis, or priest of Jupiter, was a considerable person at Rome; the flamen martialis, or priest of Mars, was the second in dignity; and the flamen quirinalis, was the next to him.

The greater flamens wore the robe edged with purple, like that of the great magistrates, had an ivory-chair, and sat in the senate. They wore a little band of thread (filamen) about their head; from whence, according to Varro, they had their name.

There were likewise flaminicæ, or priestesses, who were the wives of the flamines diales. These wore a flame-coloured habit, on which was painted the image of a thunder-bolt; and above their head-dress, they wore green oak boughs. They are often mentioned in inscriptions.

FLAMINGO, in ornithology, a bird otherwise called phœnicopterus. See the article PHœNICOPTERUS.

FLAMMA, or FLAMMULA JOVIS, in botany, a species of clematis, or virgin's bower. See the article CLEMATIS.

FLAMMULA, in antiquity, a kind of flag, so called from its pointed figure. It was painted of different colours, to distinguish the several battalions and companies from each other.

FLANCH, FLANQUE, or FLASQUE, in heraldry, an ordinary always borne double; being the segment of a circular superficies.

FLANDERS, a province of the Netherlands, bounded by the German sea and the United provinces, on the north; by the province of Brabant, on the east; by Hainault and Artois, on the south; and by another part of Artois and the German sea, on the west; being about sixty miles long, and fifty broad, and divided between the Austrians, the French, and the Dutch.

Flanders is a perfectly champaign country, with not a rising ground or hill in it, and watered with many fine rivers and canals. Its chief commodities are fine lace, linnen, and tapestry.

FLANEL, or FLANNEL, a loose sort of woollen stuff, not crossed, and wove on a loom with two treddles, like bays.

FLANK, in the manege, the side of a horse between the ribs and haunches. A well flanked horse, is one that has wide and well made ribs, and a good body.

FLANKS of an army, are the troops encamped on the right and left, as the flanks of a battalion are the files on the right and left.

FLANK of a bastion, in fortification, that part which joins the face to the curtain. See the article BASTION.

Engineers differ very much about raising the flank, some making it perpendicular to the face, some to the curtain, and others to the line of defence; some again make it an angle of 98° with the curtain, whereas Vauban makes it the chord of a segment, whose center is the angle of the shoulder of the next bastion. Its use is to defend the curtain, and the flank and face of the opposite bastion; to defend the passage of the moat, batter the salient angles of the counterscarp and glacis, from whence the besiegers ruin the flanks with their artillery, in order to take away the defence of the opposite bastion.

Oblique FLANK, or second FLANK, that part of the curtain, from whence the face of the opposite bastion may be discovered.

Retired FLANK, or low FLANK, or covered FLANK, one of the platforms of the cazemate. See the article CAZEMATE.

These retired flanks are a great defence to the opposite bastion, and to the passage of the moat, because the besiegers cannot see nor easily dismount their guns. The curtain is esteemed the strongest part of a fortification, because flanked at both ends; and the face is accounted the weakest, as having only one defence from the opposite flank.

FLANKED, *flanqué*, in heraldry, is used by the French to express our parti per saltier. See PARTI and SALTIER.

Coats, however, makes it to be the same with flanch. See the article FLANCH.

FLANKED ANGLE, in fortification, that formed by the two faces of a bastion.

FLANKING ANGLE, or *angle of the TENAILLE*, that composed of the two lines of defence, and pointing towards the curtain. See the article TENAILLE.

FLANKING line of defence. See the article LINE of defence.

FLASK, a horn, or the like, made for carrying of powder, having a measure for the charge of the piece for the top.

FLAT, in the sea-language. To flat in the fore-sail, is to hail it in by the sheet,

as near the ship's side as possible ; which is done, when a ship will not fall off from the wind.

**FLATS**, in music, a kind of additional notes, which, together with sharps, serve to remedy the defects of musical instruments, wherein temperament is required. See **TEMPERAMENT** and **SHARP**.

The natural scale of music being limited to fixed sounds, and adjusted to an instrument, the instrument will be found defective in many points ; and, particularly, in that we can only proceed from any note by one particular order of degrees ; that for this reason, we cannot find any interval required, from any note upwards or downwards ; and that a song may be so contrived, as that if it be begun by any particular note or letter, all the intervals, or other notes, shall be justly found on the instrument, or in the fixed series ; yet were the song begun with any other note, we could not so proceed. See the articles **SCALE** and **INTERVAL**.

To remove or supply this defect, musicians have recourse to a scale proceeding by twelve degrees, that is thirteen notes to an octave, including the extremes ; which makes the instrument so perfect, that there is but little reason to complain. This, therefore, is the present system or scale for instruments that have their sounds fixed, *viz.* betwixt the extremes of every tone of the natural scale, is put a sound or note, which divides it into two unequal parts, called semi-tones : hence the whole may be called the semi-tonic scale, containing twelve semi-tones betwixt thirteen notes, in the compass of an octave.

Now to preserve the diatonic series distinct, these inserted notes either take the name of the natural note next below, with the character  $\sharp$ , called a sharp ; or the name of the natural note next above it, with the character  $\flat$ , called a flat. Thus **D**  $\flat$ , or **D** flat, signifies a semi-tone below **D** natural ; and it is indifferent, in the main, whether the inserted note be accounted as a flat or sharp.

This semi-tonic series, or scale, is very exactly represented by the keys of the organ, &c. the lowermost range of keys being the natural or diatonic notes ; and those behind, the artificial ones, or the flats and sharps.

**FLATTING**, in gilding, is the giving the work a light touch, in the places not burnished, with a pencil dipt in size, in which

a little vermilion is sometimes mixt. This serves to preserve and prevent its flawing, when handled. See **GILDING**.

**FLATULENCY**, in medicine, a disorder of the bowels arising from a weak stomach, and crude flatulent aliment, as pease, beans, lentils, coleworts, hard fat flesh, and the like ; which degenerate into wind, creating great anxiety if not evacuated, and difficulty of breathing. Another cause of flatulencies are congestions of blood in the branches of the vena porta ; whence proceed anxieties of the præcordia, difficult breathing, colic pains, heart-burn, head-achs, vertigo, and watchfulness.

If the flatulency arises from crudities in the stomach, evacuations are first of all necessary ; after which may be given bitters, aromatics, carminatives, and strengtheners, with a spare diet and exercise. If it proceeds from congestions of blood, as is the case of hypochondriacs, a vein must be opened ; and if the body is costive, an emollient clyster or a gentle laxative will be proper. If these fail, chalybeate medicines are to be called in, as tincture of vitriol of iron, steel-filings finely powdered, from six to ten grains, or oil of cinnamon with sugar or bitters, spaw-waters, and constant exercise.

**FLATULENT TUMOURS**, in surgery. See the article **PNEUMATOCELE**.

**FLAUTINO**, in music, the same with flageolet. See the article **FLAGEOLET**.

**FLAW**, in the sea-language, signifies a sudden gust of wind.

**FLAX**, *linum*, in botany. See **LINUM**.

Flax is an excellent commodity, and the cultivation of it a good piece of husbandry. It will thrive in any sound land, but that which has lain long fallow is best ; which being well plowed, and laid flat and even, the seeds must be sown in a warm season, about the middle or end of March, or at farthest the beginning of April ; and if a wet season happen, weeding will be necessary. The best seed is that brought from the east country, which, tho' dear, yet easily repays the charge : this will last two or three crops, when it is advisable to renew the seeds again. Of the best seed, two bushels may serve for an acre ; but more must be allowed of home-feed, because it grows smaller. When grown up, it ought not to be gathered before it be fully ripe ; for if pulled before the blossom falls, it heckles away almost to nothing ; and, tho' in appearance very fine, yet it has

no substance, and the yarn spun of it is weak and ouzy: it not only wastes in the washing, but the linnen made of it grows extremely thin in the bleaching. The pluckers should be nimble, tie it up in handfuls, let them up till perfectly dry, and then house them. Flax pulled in the bloom, proves whiter and stronger than if left standing till the seed is ripe; but then the seed will be lost. An acre of good flax, is accounted worth from seven to twelve pounds, or more.

*Dressing of FLAX.* When flax has been watered, and twice swingled, as directed under the articles WATERING and SWINGLING, it is then to be heckled in a much finer heckle than that used for hemp. Hold the strike of flax stiff in your hand, and break it very well upon the coarse heckle; saving the hurds to make harden cloth of. This done, the strike is to be passed through a finer heckle, and the hurds coming from thence saved for middling cloth, and the tear itself for the best linnen.

But to dress flax for the finest use of all, after being handled as before, and laying three strikes together, plat them in a plat of three rows, as hard and close together as you can; joining one to the end of another, till you have platted as much as you think convenient: then begin another plat, and add as many several ones, as you think will make a roll; afterwards, wreathing them hard together, make up the roll; which done, put as many as you judge convenient into a hemp-trough, and beat them soundly, rather more than less than you do hemp. Next open and unplat them, dividing each strike very carefully from each other; and so strike it through the finest heckle of all, whereof there are three sorts.

Great care must be taken to do this gently and lightly, lest what is heckled from thence should run to knots; for if preserved soft like cotton, it will make very good linnen, each pound running at least two yards and an half. The tear itself, or finest flax, will make a strong and very fine holland, running at least five yards in the pound. See SPINNING.

In Scotland, they have a lint-mill, which greatly facilitates the dressing of flax; which if done by the hand, will cost 3d. the stone; whereas it may be dressed at the mill for 2s. the stone, which is one fourth saved.

*Laws, regarding FLAX and hemp.* Any person may set up the trade of breaking,

heckling, and dressing of flax or hemp; also of spinning, weaving, making, whitening, &c. cloth made of hemp or flax only; and that in all places, corporate or incorporate, privileged or not. Foreigners using the fore-said trades for three years, shall, upon taking the oaths to the government, enjoy all the privileges of natural subjects. Rough or undressed flax, imported from abroad, pays no duty; but that which is dressed or wrought, pays every hundred weight 4l. 10s. 5<sup>1</sup>/<sub>2</sub>d. whereof, upon exporting it, is drawn back 4l. 3s. 3<sup>1</sup>/<sub>2</sub>d. However, it is to be observed, that all manner of flax, wrought or unwrought, may be imported from Ireland free of all duty, provided it be done in british or irish bottoms.

*Purging-FLAX, linum catharticum.* See the article LINUM.

*Toad-FLAX, linaria.* See LINARIA.

**FLEA**, *pulex*, in zoology, a genus of insects without wings, of a roundish, compressed figure: the legs are three pair; and formed for leaping: the eyes are two, and simple: the mouth is bent downwards: the colour is a deep purple, approaching to black.

The flea is an insect which infests birds, as well as quadrupeds, and lays eggs, called nits: these produce a kind of nymphs, or white worms; which after some time are transformed, in the manner of caterpillars, into perfect fleas.

**FLEA-BANE**, in botany, a name given to the plant called by authors conyza. It got the name of flea-bane, from its supposed virtue of killing fleas. See CONYZA.

*African FLEA-BANE*, a plant called by botanists parthenium. See PARTHENIUM.

*Sweet FLEA-BANE*, the same with the erigeron of botanists.

**FLEA-BITTEN**, that colour of a horse, which is white or grey, spotted all over with dark reddish spots. See HORSE.

**FLEA-WORT**, the english name of the pylum of botanists.

**FLEAM**, in surgery and farriery, an instrument for letting a man or horse blood.

A case of fleams, as it is called by farriers, comprehends six sorts of instruments; two hooked ones, called drawers, and used for cleaning wounds; a pen-knife; a sharp-pointed lancet, for making incisions; and two fleams, one sharp and the other broad-pointed. These last are somewhat like the point of a lancet, fixed in a flat handle, only no longer than is just necessary to open the vein.

Many of the german surgeons let blood

with a fleam, represented in plate XCVIII. fig 4. They hold the part B in their hand; and, applying the point A to the vein, strike the part C with one of the fingers of the other hand. Others use a neater instrument, or spring-fleam, represented *ibid.* n<sup>o</sup> 2. This being drawn up, they apply the point A to the vein, and then let it go by pressing upon B.

However, as the position and size of the veins are different in different persons, the lancet is found to be the most convenient instrument for this purpose. See the article LANCET.

Fleams imported, besides the duty on steel, pay each  $\frac{38\frac{1}{2}}{100}$ d. and draw back on

exportation  $\frac{33\frac{3}{4}}{100}$ d. See STEEL.

FLECHE, a town of France, under the meridian of London, twenty miles north-east of Angers.

FLEECE, the covering of wool, shorn off the bodies of sheep. See WOOL.

*Order of the golden FLEECE*, an order of knighthood instituted by Philip II. duke of Burgundy. These knights at first were twenty-four, besides the duke himself, who reserved the nomination of six more: but Charles V. increased them to fifty. He gave the guardianship of this order to his son Philip king of Spain, since which the spanish monarchs are chiefs of the order. The knights had three different mantles ordained them at the grand solemnity, the collar and fleece.

FLEET, commonly implies a company of ships of war, belonging to any prince or state: but sometimes it denotes any number of trading ships, employed in a particular branch of commerce.

In sailing, a fleet of men of war is usually divided into three squadrons; the admiral's, the vice admiral's, and the rear admiral's squadron, all which, being distinguished by their flags and pendants, are to put themselves, and, as near as may be, to keep themselves in their customary places, *viz.* The admiral, with his squadron, to sail in the van, that so he may lead the way to all the rest in the day-time, by the sight of his flag in the main-top-mast-head; and in the night-time, by his lights or lanterns. The vice admiral and his squadron, is to sail in the center, or middle of the fleet. The rear admiral, and the ships of his squadron, to bring up the rear. But sometimes other divisions are made, and

those composed of the lighter ships and the best sailors, are placed as wings to the van, center, and rear. See the articles SQUADRON, ADMIRAL, FLAG, &c. For the disposition of a fleet in time of a sea-engagement or battle. See the article BATTLE.

Merchant-fleets generally take their denomination from the place they are bound to, as the Turkey fleet, East-India fleet, &c. These, in time of peace, go in fleets for their mutual aid and assistance: in time of war, besides this security, they likewise procure convoys of men of war, either to escort them to the places whither they are bound, or only a part of the way, to a certain place or latitude, beyond which they are judged out of danger of privateers, &c. See CONVOY.

FLEET is also a noted prison in London, where persons are committed for contempt of the king and his laws, particularly of his courts of justice: or for debt, where any person will not, or is unable to pay his creditors.

There are large rules and a warden belonging to the fleet prison, which had its name from the float or fleet of the river or ditch, on the side whereof it stands.

FLEGM and FLEGMATIC. See the articles PHLEGM and PHLEGMATIC.

FLEMISH, or the FLEMISH TONGUE, is that which we otherwise call low Dutch, to distinguish it from the German, whereof it is a corruption, and a kind of dialect. See GERMAN.

It differs from the Walloon, which is a corruption of the french language. The flemish is used through all the provinces of the Netherlands.

FLEMISH BRICKS, a neat, strong, yellow kind of bricks, brought from Flanders, and commonly used in paving yards, stables, &c. being preferable for such purposes to the common bricks. See the article BRICK.

FLENSBURGH, a port-town subject to Denmark, sixteen miles north of the city of Sleswick.

FLESH, *caro*, in anatomy, a similar, fibrous part of an animal body, soft and bloody, being that whereof most of the other parts are composed, and whereby they are connected together: or more properly, it is such parts of the body where the blood-vessels are so small, as only to retain blood enough to preserve their colour red.

The antient anatomists reckoned five different kinds of flesh. 1. Musculous, fibrous

brous, or fistular flesh; such as is the substance of the heart and other muscles. 2. The parenchymous flesh, as that of the lungs, liver, and spleen: but since the use of glasses, it is plainly discovered that there is no such thing as a parenchyma, properly speaking, but that all the viscera, as well as other parts of the body, are vascular, and nothing but plexus, or net-work, of small vessels and canals. 3. Viscerous, such as the flesh of the stomach and guts. 4. Glandulous, as that of the tonsils, the pancreas, the breasts, &c. 5. Spurious, so they called the flesh of the lips, gums, the glans of the penis, &c. because it is of a constitution different from all the rest.

The moderns admit only one kind of flesh, *viz.* the muscular. Sometimes, however, they apply the term to the glands, which they call, by way of distinction, glandulous flesh.

The fleshes of young animals abound with a soft and nourishing juice, but that of the older, is more nourishing. The juices of old animals are spirituous, gelatinous, and agreeable to the taste, but the flesh is hard and difficult of digestion. The flesh of wild animals are more light and digestible than that of tame.

Dr. Hales proposes to salt the fleshes put on shipboard, by injecting hydrostatically a strong brine into the blood-vessels of animals, immediately after they are killed.

**FLESH**, among botanists, is all the substance of any fruit that is between the outer rind and the stone; or that part of any root that is fit to be eaten.

**FLESH-COLOUR**. See **CARNATION**.

**FLESHUS**, the **FLOUNDER**, in ichthyology. See the article **FLOUNDER**.

**FLEUR DE LISE**, in heraldry, the same with flory. See the article **FLORY**.

**FLEURY**, a town of Burgundy, in France, thirty miles north of Chalons.

**FLEXIBLE**, in physics, a term applied to bodies capable of being bent or diverted from their natural figure or direction.

Every flexible body, say the schoolmen, is porous, and that in such a manner, as that the pores or chambers may become longer or shorter; and if any corporeal substance fills these pores, it must be conceived so subtle as to be easily expelled by compression, or at least capable of being driven from one chamber to another, according as the body is bent in this or that direction.

**FLEXION**, in anatomy, is applied to the motion by which the arm or any other member of the body is bent. It is also applied to the muscles, nerves, &c.

**FLEXION** or **FLEXURE** of curves. See the article **FLEXURE**.

**FLEXOR**, in anatomy, a name applied to several muscles, which are so called from their office, which is to bend the part to which they belong, in opposition to the extensors, which open or stretch them, as, 1. Flexors of the head, which are the mastoideus, the rectus major anticus, and the rectus minor anticus. 2. Flexors of the neck, *viz.* the scalenus and longus. 3. Flexors of the back and loins, the quadratus lumborum, the psoas parvus, the intertransversales lumborum. 4. Flexors of the cubitus, the brachius externus, and brachius internus. 5. Flexors of the carpus, the radius internus, the ulnaris internus, and the palmaris. 6. Flexors of the first, second, and third phalanx of the fingers, *viz.* the four lumbricales, the sublimis or perforatus, and the perforans or profundus. 7. Flexors of the thigh, called also elevators, the psoas magnus, the iliacus, and the pectinæus, called also lividus. 8. Flexors of the tibia, the gracilis, the semimembranosus, the seminovosus, the biceps, and the popliteus. 9. Flexors of the tarsus or foot, the tibialis anticus, and the peronæus anticus. 10. Flexors of the phalanges of the toes, the lumbricales, the perforatus, the perforans, and the flexor longus of the great toe, whose origin is in the posterior part of the fibula, and its termination in the lower part of the last phalanx, together with the flexor brevis, the origin of which is from the middle os cuneiforme, and its termination at the two sesamoide bones of the great toe, which are joined by ligaments to its first phalanx. See **MASTOIDÆUS**, **RECTUS**, **SCALenus**, **BRACHIÆUS**, &c. &c.

**FLEXURE** of curves, in the higher geometry, is used to signify that a curve is both concave and convex, with respect to a given right-line *Ap*, or a fixed point *P* (plate **XCVIII**. fig. 5. n<sup>o</sup> 1.). Thus the curve *CMD* having the part *CM* concave towards *AP* or *P*, and the part *MD* convex to the same, is said to have a flexure: and the point *M* which limits the concavity and convexity, is called the point of inflection or contrary flexure. See the article **INFLECTION**.

This

This is to be understood when the point, supposed to describe the curve, coming to M, continues its course towards the same side; but if it turn backwards, as in n° 2, 3, 4, *ibid.* the curve may either have a continued curvature, as in n° 4, or have a cuspis point of reflection or of retrogradation, as in n° 2, 3. As to the method of finding the points of contrary flexure, see l'Hospital's Anal. inf. Petit. sect. 4. See also INFLECTION.

**FLIE**, or **FLY**, in zoology, &c. See the article **FLY**.

**FLIE**, in geography, an island at the entrance of the Zuyder-sea.

**FLIGHT**, in general, denotes the act of flying. See the article **FLYING**.

**FLIGHT** in heraldry. See the article **VOL**.

**FLIGHT** of a *stair-case*. See **STAIR-CASE**.

**FLINGING**, in the manege, the same with jerking. See the article **YERK**.

**FLINT**, *sillex*, in natural history, a semi-pellucid stone, composed of crystal debased with earth, of one uniform substance, and free from veins; but of different degrees of colour, according to the quantity of earth it contains, and naturally surrounded with a whitish crust.

Flint is a stone of an extremely fine, compact, and firm texture, and very various, both in size and figure. It is of all the degrees of grey, from nearly quite black, to almost quite white. It breaks with a fine, even, glossy surface; and is moderately transparent, very hard, and capable of a fine polish. It readily strikes fire with steel, and makes not the least effervescence with aquafortis, and burns to a whiteness. Its uses in glass-making, &c. are too well known to need a particular recital.

It is not uncommon to find on our shores fine, pellucid, flinty bodies, streaked or veined with white, black, brown, &c. These are the agates of this country, and answer in every particular, but fineness, to the gem. See the article **AGAT**.

The manner of preparing flints for the nicer operations in the glass-trade, is this: after freeing them from the white crusts with which they are commonly surrounded, calcine them in a strong fire; then powdering them in an iron mortar, sift the powder through a very fine sieve: pour upon this powder some weak aquafortis, to dissolve any particles of iron it may have got from the mortar; then, after standing some time, wash it well with hot water, and dry it for use.

*Oil of FLINTS*, a name given to the liquor obtained from a mixture of four ounces of calcined and powdered flints, with twelve ounces of salt of tartar: this being melted together in a strong fire, runs into glass; which is to be powdered and set in a cellar, where it runs into an oil per deliquium.

**FLINT-CASTLE**, an old town and castle, which gives names to Flintshire, in Wales, is situated on the river Dee, ten miles east of St. Asaph, and sends one member to parliament: west long. 3° 12', north lat. 53° 20'.

**FLIP**, a drink common among sailors, made up of malt-liquor, brandy, and sugar, mixed together.

**FLIX**, a town and castle of Catalonia, in Spain, twenty miles north of Tortosa.

**FLIX-WEED**, a genus of plants called by authors erysimum. See **ERYSIMUM**.

**FLOAT** of a *fishing-line*, the cork or quill that floats or swims above water. See the article **FISHING**.

The quills of muscovy ducks are the best floats for slow waters, but for strong streams, cork-floats are the best; for which purpose take a good sound cork, without flaws or holes, and bore it thro' with a hot iron, into which put a quill of a fit proportion: then pare the cork into a pyramidal form, of what size you please, and then grind it smooth.

**FLOAT** also signifies a certain quantity of timber bound together with rafters, athwart, and put into a river to be conveyed down the stream; and even, sometimes, to carry burdens down a river with the stream.

**FLOAT-BOARDS**, those boards fixed to water-wheels of under-shot mills, serving to receive the impulse of the stream, whereby the wheel is carried round. See the article **WHEEL** and **MILL**.

It is no advantage to have too great a number of float-boards, because, when they are all struck by the water in the best manner that it can be brought to come against them, the sum of all the impulses will be but equal to the impulse made against one float-board at right angles, by all the water coming out of the penstock through the opening, so as to take place on the float-board. The best rule in this case is to have just so many, that each of them may come out of the water as soon as possible, after it has received and acted with its full impulse. As to the length of the float-board, it may

be regulated according to the breadth of the stream. See the article **MILL**.

**FLOATAGES**, all things floating on the top of the sea or any water, a word much used in the commissions of water-bailiffs.

**FLOATINGS**, in husbandry, the drowning or watering of meadows.

**FLOATING of cheese**, among housewives, separating the whey from the curd. See the article **CHEESE**.

**FLOATING-BRIDGE**. See **BRIDGE**.

**FLOATING-ISLANDS**. See **ISLAND**.

**FLOOD**, a deluge or inundation of waters. See the article **DELUGE**.

**FLOOD**, among seamen, is when the tide begins to come up, or the water begins to rise, then they call it young flood; after which it is quarter flood, half flood, and high flood. See the article **TIDE**.

**FLOOD-MARK**, the mark which the sea makes on the shore, at flowing water, and the highest tide: it is also called high water mark.

**FLOOK**, or **FLUKE**, of an anchor. See the article **ANCHOR**.

**FLOOKING**, among miners, a term used to express a peculiarity in the load of a mine. The load or quantity of ore is frequently intercepted in its course, by the crossing of a vein of earth or stone, or some different metallic substance; in which case the load is moved to one side, and this transient part of the land is called a *flook*ing.

**FLOOR**, in architecture, the under side of a room, or that part we walk on.

Floors are of several sorts, some of earth, some of brick, some of stone, and some of wood.

Earthen floors are commonly made of loam, and sometimes, when they are designed to make malt on, of lime and brook-sand, and gun-duff, or anvil-duff, from the forge.

The manner of making these floors for plain country habitations, is as follows. Take two thirds, of lime, and one of coal-ashes well sifted, with a small quantity of loamy clay; mix the whole together, and temper it well with water, making it up into a heap: let it lie a week or ten days: then temper it well over again. After which heap it up for three or four days, and repeat the tempering very high, till it become smooth, yielding, tough and glewy. Then the ground being levelled, lay your floor therewith, about two and a half or three inches thick, making it smooth with a trowel: the hotter the season is the bet-

ter; and when it is thoroughly dried, it will make the best floor for houses, especially for malt-houses.

If any would choose to have their floors look better, let them take lime made of rag-stones, well tempered with whites of eggs, covering the floor about a quarter or half an inch thick with it, before the under flooring be too dry. If this is well done, and thoroughly dried, it will look, when rubbed with a little oil, as transparent as metal or glass.

For brick and stone floors, see the article **PAVING**.

Carpenters, by the word floor, understand as well the framed work of timber, as the boarding over it.

Concerning boarded floors, it is to be observed, that the carpenters never floor rooms with boards, till the carcase of the house is set up, and also is inclosed with walls, lest the weather should wrong the flooring; yet they generally rough-plane the boards for flooring, before they begin any thing else about the building, that they may let them by to season; which is done by laying them flat upon three or four balks, each board about the breadth of a board a funder, the whole length of the balks: then, by laying another lay of boards athwart the last, and so on till they have laid them all in this manner, by which means they lie hollow for the air to play between them.

The best way of placing the principal timbers in a floor, is not to lay them over doors or windows, nor too near chimnies: the boards should all lie one way, which is generally the way that you have the best visto.

**FLOOR of a ship**, is so much of her bottom as she rests upon, when she rests on the ground. See the article **SHIP**.

Such ships as have long, and withal broad floors, lie on the ground with most security; and those that are narrow in the floor, cannot be grounded without danger either of being overfret, or at least of hurting their sides.

**FLORAL**, in general, something belonging to a flower. See **FLOWER**.

Thus floral leaves are those found only near flowers.

**FLORAL GAMES**, in roman antiquity, annual games instituted in honour of the goddess Flora, which began to be celebrated on the fourth of the calends of May, or April 28, and were continued to the calends, or first of May.

The *floralia*, or floral games, were celebrated

brated in the Campus Martius, being first proclaimed by sound of trumpet; and during the celebration, the ædiles scattered all manner of pulse among the people. It is also said, that during the floralia, harlots danced naked, playing a thousand lascivious tricks. They were first instituted in the 513th year of Rome.

**FLORENCE**, an archbishop's see and city of Italy, situated on the river Arno, in Tuscany, forty-five miles east of Leghorn: east lon.  $12^{\circ} 15'$ , and north lat.  $43^{\circ} 30'$ . Florence is one of the most elegant towns in Italy, has an university, and is six miles in circumference. The statues, paintings, and curiosities in the grand duke's palace are the admiration of travellers.

**FLORENTINE**, a town of Champaign in France, twenty-eight miles south-west of Troyes.

**FLORES, FLOWERS.** See the articles **FLOWER** and **FLOS**.

**FLORES**, in geography, one of the Azores-islands, subject to Portugal.

**FLORID STYLE**, is that too much enriched with figures and flowers of rhetoric.

Longinus uses the terms *florid* and *affected style* indifferently, and lays them down as quite contrary to the true sublime. See the article **STYLE**.

**FLORIDA**, in geography, a name first given by the Spaniards to all that part of north America which lies north of the gulph of Mexico. However, all that retains the name Florida, at present, is the peninsula between the british colony of Georgia and cape Florida, viz. between  $25^{\circ}$  and  $30^{\circ}$  of north latitude, and between  $81^{\circ}$  and  $85^{\circ}$  west longitude.

**FLORILEGE**, *florilegium*, a name the Latins have given to what the Greeks call *anthologion*, anthology. See the article **ANTHOLOGION**.

**FLORIN**, is sometimes used for a coin, and sometimes for a money of account. Florin as a coin, is of different values, according to the different metals and different countries where it is struck. The gold florins are most of them of a very coarse alloy, some of them not exceeding thirteen or fourteen carrats, and none of them seventeen and a half. As to silver florins, those of Holland are worth about 1s. 8d. those of Genoa were worth  $8\frac{1}{4}$ d. sterling.

Florin, as a money of account, is used by the Italian, Dutch, and German merchants and bankers, but admits of dif-

ferent divisions in different places: in Holland it is on the footing of the coin of that name, containing 20 stivers. At Frankfort and Nuremberg it is equivalent to 3s. sterling, and is divided into creutzers, and pfennings. At Liege it is equivalent to 2s. 3d. At Strasbourg, to 1s. 8d. In Savoy, to 11d. At Genoa, to  $8\frac{1}{4}$ d. And at Geneva, to  $6\frac{1}{2}$ d. See the article **COIN**.

**FLORINIANS**, *floriniani*, in church-history, a sect of heretics, of the 11d century, so denominated from their leader Florinus, who made God the author of evil.

They are a species of the gnostics, but deny the judgment and resurrection, and hold that our Saviour was not born of a virgin. They were also called borborites. See the article **BORBORITES**.

**FLORIST**, *florista*, according to Linnæus, is an author, or botanist, who writes a treatise called Flora, comprehending only the plants and trees to be found growing naturally in any place. However, in the more common acceptation of the word, florist signifies a person well skilled in flowers, their kinds and cultivation. See the article **FLOWER**.

**FLORUS**, in ornithology, a bird otherwise called whinchat. See **WHINCHAT**.

**FLORY, FLOWRY, or FLEURY**, in heraldry, a cross that has the flowers at the end circumflex and turning down, differing from the potence, inasmuch as the latter stretches out more like that which is called patee. See the article **POTENCE** and **PATEE**.

The cross flory is represented in plate **XCVIII.** fig. 2.

**FLOS, FLOWER**, in botany. See the article **FLOWER**.

**FLOS**, in chemistry, the most subtle part of bodies separated from the more gross parts by sublimation, in a dry form. 1. *Flores benzoini*, flowers of benjamin, are prepared in the following manner: put powdered benjamin into an earthen pot, placed in sand, and with a small heat the flowers will rise, and may be caught by a paper-cone placed over the pot. See the article **BENZOIN**. 2. *Flores sulphuris*, flowers of sulphur: let sulphur be sublimed in a fit vessel; and any part of the flowers which may have concentered are to be reduced to powder by a wooden mill, or in a marble mortar with a wooden pestle. They are used in diseases of the breast, and likewise in cutaneous distempers, both internally and externally. 3. *Flores sulphuris*

*phuris loti*, flowers of sulphur washed : pour water on the flowers, to the height of three or four fingers above them, and boil them for a time ; then pour off this water, and with fresh cold water wash the remains of this away ; then dry the flowers for use. 4. *Flores martiales*, martial flowers : take of washed colcothar of green vitriol, or of iron-filings, one pound ; of sal ammoniac, two pounds : mix and sublime them in a retort ; and mixing again the bottom with the flowers, renew the sublimation till the flowers acquire a beautiful yellow colour : to the residue may be added half a pound of fresh sal ammoniac, and the sublimation repeated ; and the same process may be continued, as long as the flowers rise duly coloured. They are reckoned very attenuating and aperient, and therefore are prescribed in many obstructions, and in asthma. 5. *Flores bismuthi*, flowers of bismuth, are used as a fucus, being mixed with pomatum or rose-water, &c.

**FLOSCULOUS**, among botanists, an appellation given to compound flowers, made up of a number of lesser ones, all inclosed in the same common cup.

The plants with flosculous flowers make one of Tournefort's classes, called by Linnæus *syngenesia*. See the articles **BOTANY** and **SYNGENESIA**.

**FLOTA**, or **FLOTTA**, **FLEET**, a name which the Spaniards give particularly to the ships that are annually sent from Cadiz to the port of Vera Cruz, to fetch thence the merchandizes gathered in Mexico for Spain. This fleet consists of the captains, admiral, and patach or pin-nace, which goes on the king's account ; and about sixteen ships, from four hundred to a thousand tons, belonging to particular persons. They set out from Cadiz about the month of August, and make it about eighteen or twenty months before they return.

**FLOTILLA**, a name given to a number of ships which get before the rest in their return, and give information of the departure and cargo of the flota and galleons. See the preceding article.

**FLOTSON**, or **FLOTSOM**, goods that by shipwreck are lost, and floating upon the sea ; which, with jettson and lagan, are generally given to the lord admiral : but this is the case only where the owners of such goods are not known. And here it is to be observed, that jettson signifies any thing that is cast out of a ship when in

danger, and afterwards is beat on the shore by the water, notwithstanding which the ship perishes. Lagan is where heavy goods are thrown overboard, before the wreck of the ship, and sink to the bottom of the sea.

**FLOUNDER**, the english name of a well-known fish, called by ichthyologists the pleuronectes with the eyes on the right side, the lateral or side lines rough, and small spines at the fins. See the article **PLEURONECTES**.

The flounder is a well tasted fish, known in some parts of the kingdom by the names fluke and bul.

**FLOUR**, the meal of wheat-corn, finely ground and sifted. See **MEAL**.

The grain itself is not only subject to be eaten by insects in that state, but when ground into flour it gives birth to another race of destroyers, who eat it unmercifully, and increase so fast in it, that it is not long before they wholly destroy the substance. The finest flour is most liable to breed these, especially when stale, or ill prepared. In this case, if it be examined in a good light, it will be perceived to be in a continual motion ; and on a nicer inspection, there will be found in it a great number of little animals, of the colour of the flour, and very nimble. If a little of this flour be laid on the plate of the double microscope, the insects are very distinctly seen in great numbers, very brisk and lively, continually crawling over one another's backs, and playing a thousand antic tricks together, whether for diversion, or in search of food, is not easily determined. These animals are of an oblong and slender form ; their heads are furnished with a kind of trunk, or hollow tube, by means of which they take in their food, and their body is composed of several rings. They do vast mischief among the magazines of flour laid up for armies, and other public uses : when they have once taken possession of a parcel of this valuable commodity, it is impossible to drive them out ; and they increase so fast, that the only method of preventing the total loss of the parcel, is to make it up into bread as soon as can be done. The way to prevent their breeding in the flour, is to preserve it from damp : nothing gets more injury by being put up in damp, than flour ; and yet nothing is more frequently put up so. It should be always carefully and thoroughly dried, before it is put up ; and the barrels also dried into which it is to be

put; then, if they are kept in a room tolerably warm and dry, they will keep it well. Too dry a place never does flour any hurt, though one too moist always spoils it.

**FLOUR**, in geography, a city of the Lyonsois, in France, -forty-five miles south of Clermont.

**FLOWER**, *flor*, among botanists and gardeners, the most beautiful part of trees and plants, containing the organs or parts of fructification. See the article **FRUCTIFICATION**.

The parts of a flower are the ovary or pistil, the corolla or flower-petals, the stamina or chives, the empalement or calyx, the perianthium, pericarpium, and fruit. See the articles **PISTIL**, **COROLLA**, **STAMINA**, &c.

According to the number of petals, or flower-leaves, flowers are called monopetalous or one-leaved, dipetalous or two-leaved, tripetalous or three leaved, &c. Flowers are again distinguished into male, female, and hermaphrodite: the male flowers are those containing stamina, without any pistil or fruit, commonly called stameneous flowers. The female flowers are such as contain the pistil, which is succeeded with fruit; these are called fruitful or knitting flowers. The hermaphrodites are those which contain the organs of both sexes, *viz.* stamina and pistils; and these are by far the most numerous. From the different figures and disposition of the flower-leaves of plants, Mr. Tournefort has established a system of botany; whereas that of Linnæus is chiefly founded on the number and disposition of the stamina. See **BOTANY**.

Flowers were in great request among the antients: they adorned their temples, houses, and even tombs with them; but their principal use seems to have been at entertainments, where the guests were always decked with flowers, and even the room strewed with them.

Quincy tells us, that flowers, designed for medicinal use, should be plucked when they are moderately blown, and on a clear day before noon: and that for conserves, roses must be taken in the bud.

For the method of preserving specimens of flowers, see the article **HORTUS SICCUS**.

**FLOWER of Bristol**, a plant more usually called lychnis. See **LYCHNIS**.

**Gentle FLOWER**, the same with amaranth. See the article **AMARANTH**.

**Eternal FLOWER**, the english name of the xeranthemum. See **XERANTHEMUM**.

**Everlasting FLOWER**, the english name of the gnaphalium. See **GNAPHALIUM**.

**FLOWER-FENCE**, the english name of the poinciana. See **POINCIANA**.

**FLOWER DE LUCE**, the same with the iris. See the article **IRIS**.

**Sultan-FLOWER**, the same with the cyanus. See the article **CYANUS**.

**Sun-FLOWER**, the english name of the helianthus. See **HELIANTHUS**.

**Trumpet-FLOWER**, the same with the bignonia. See the article **BIGNONIA**.

**Wind-FLOWER**, the same with the anemone. See the article **ANEMONE**.

**FLOWERS**, in chemistry. See the article **FLOS**, *supra*.

**FLOWER DE LIS**, or **FLOWER DE LUCE**, in heraldry, a bearing representing the lily, called the queen of flowers, and the true hieroglyphic of royal majesty; but of late it is become more common, being borne in some coats one, in others three, in others five, and in some semee, or spread all over the escutcheon in great numbers.

The arms of France are, three flower de lis or, in a field azure.

**FLOWN-SHEETS**, in the sea-language. A ship is said to sail with flown sheets, when her sails are not haled home, or close to the blocks. *The sheets are flown*, that is, they are let loose, or run as far as they will.

**FLOX**, among dyers, signifies well cleaned wool, used to absorb the colours of cochineal.

**FLUDDER**, or **FLUDER**, a large bird of the colymbus or diver-kind, nearly allied to the lumme. See **COLYMBUS** and **LUMME**.

**FLUELLIN**, the english name of a plant called by botanists elatine. See the article **ELATINE**.

**FLUENT**, in fluxions, the flowing quantity, or that which is continually either increasing, or decreasing, whether line, surface, solid, &c. See **FLUXION**.

It is easy to find the fluxions, where the fluents are given; but, on the contrary, it is very difficult to find the fluents of given fluxions.

**FLUID**, in physiology, an appellation given to all bodies whose particles easily yield to the least partial pressure, or force impressed.

Some philosophers make the following distinction in fluids; those which flow or spread

spread themselves till their surfaces become level or horizontal, they call liquid; in contradistinction to flame, smoke, vapour, &c. which are also fluids, but do not acquire such a surface. Those which are capable of exciting in us the idea of moistness, as water, &c. they call humid, distinguishing them thereby from air, quicksilver, and melted metals. But these distinctions are quite unnecessary in a philosophical sense; the surfaces of all fluids being level, or horizontal, when not prevented by the bodies about them: and humidity is only a relative quality; for though quicksilver will not moisten or stick to a man's finger, it will to silver or gold. See **FLAME**, **SMOKE**, **LIQUID**, &c.

The nature of a fluid, as distinguished from that of a solid, or hard body, consists in this, that its particles are so loosely connected together, that they readily move out of their places, when pressed with the least force one way more than another. From whence philosophers conclude, that these particles are exceedingly minute, smooth, and round, it being otherwise impossible they should move with such freedom upon the least inequality of pressure.

Those particles considered separately, are endued with all the common properties of matter, and are subject to the same laws of motion and gravitation with larger bodies. To enquire, therefore, into the nature of fluids, is to consider what appearances a collection of very small round bodies, subject to these laws, will exhibit under different circumstances.

**Laws and properties of FLUIDS.** 1. All fluids are incompressible, except air; or, they cannot, by any force, be compressed into a less space than what they naturally possess, as is proved by the florentine experiment, of filling a globe of gold with water, which, when pressed with great force, causes the water to transude or issue through the pores of the gold, in form of a dew all over its surface. See **AIR**. 2. All fluids gravitate, or weigh in proportion to their quantity of matter, and that not only in the air, but in *proprio loco*: or, a fluid weighs the same, communicating with a quantity of that fluid, as in *vacuo*; which all philosophers, till very lately, have denied.

The reason was this; because philosophers found that a bucket of water, in water, weighed nothing; that is, that because there was no relative gravity in water, they

very strangely infer'd there was no absolute gravity in any part or particle of water, whilst it remained in water, but only became heavy when taken out or separated from the rest. But their mistake is easily evinced by the following experiment: let a bottle, or phial, with shot in it, to make it sink in water when close stopped, be hung at the end of a nice balance, and then immersed into a jar of water: while thus hanging in water, let it be counterpoised very exactly by weights put into the scale at the other end; then, pulling out the cork, the water will rush into the bottle, and destroy the equilibrium, by causing the balance to descend; which will be a plain proof that water has weight in water.

That fluids gravitate, or are heavy, in the same manner with solids, is evident; because the earth's attraction, which is the center of gravity, equally affects the particles of all sorts of matter, and therefore excites the same endeavour, or tendency towards the center of the earth, in the particles of a fluid, as in those of a solid body: and this is what we call absolute gravity. See **GRAVITY**.

Now since in fluids of the same kind as water, all the particles are reasonably supposed equal and alike in all circumstances, they will be all equally affected by attraction, and therefore have, among themselves, an equal tendency towards the earth's center; whence, since they gravitate equally, if they are equally obstructed in their descent (as by the bottoms of the vessels, &c.) they will all retain the same position among themselves, as if they were affected by no power at all; and thus they are said to be relatively at rest, or in a state of quietus among themselves; since no one particle of the same fluid has a greater share of attracting power than another, no one will tend to descend before another; and therefore, among the particles of the same fluid, there is no such thing as what we call relative or residual gravity, which is nothing but the excess of gravity, by which one body tends downwards more than another.

3. From the gravity of fluids arise their pressure, which is always proportional thereto: and since we may suppose all the particles of a fluid to have equal bulk and weight, the gravity of the fluid, and consequently the pressure will be always proportional to the altitude or depth thereof: whence the weight and pressure of fluids on the bottoms of vessels, &c. must be equal,

4. The pressure of fluids upwards is equal to the pressure downwards, at any given depth. To illustrate this and the foregoing proposition, let ABCD (pl. C. fig. 1.) be a vessel of water, whose altitude EF suppose to consist of a column of 10 aqueous particles; then, it is evident, the first or uppermost particle 1 can affect the next particle 2, only by its weight and pressure, which therefore is as 1; and since that particle 2 is immovable, and action and re-action equal and contrary, the said particle 2 will re-act upwards upon the particle 1, with a force which is as 1. In the same manner the particle 2 acts on the particle 3, by pressure downwards, with two degrees of force, arising from its own weight and from that of the particle above it; and accordingly it is pressed upwards with an equal force by the re-action of the particle 3. And so of all the rest, wherefore the propositions are manifest.

5. The pressure is upon all particles of the fluid, at the same depth, equal in every part; or the particles of a fluid, at the same depth, press each other, every way and in all directions, equally. For if any particle were pressed more on one part than another, it must give way and yield, till the pressure become every way equal; otherwise an incessant intestine motion of the particles must ensue, which is absurd, and contrary to experience.

6. From the mutual pressure and equal action of the particles, it follows, that the surface of a fluid must be perfectly smooth and even; for should any part stand higher than the rest, by any force, as attraction, &c. it would immediately subside to a level with the other part, by the force of its own gravity, when that force is removed.

7. The figure of the surface of all fluids is spherical or convex; for all the particles equally gravitating towards the center of the earth, will take their places from it at equal distances at the surface, and so form a part of the superficies of a sphere, equal to the bulk of the earth. Besides the reason of the thing, we know from experiment, that the surface of large waters, as those of the sea or ocean, is convex; for a person standing on the shore, and viewing a ship under sail, directly before him, will lose sight thereof by degrees, the hull or body of the ship first disappearing, then the lower parts of the mast, then the top of the lower masts, and lastly the top of the tallest mast.

This is more fully explained in determining the figure of the earth. See the article EARTH.

8. Since fluids press equally every way, the pressure of each particle against the side of a vessel will be proportional to its altitude, and consequently the pressures of the particles 1, 2, 3, 4, &c. of a perpendicular column against the side BC (ib. fig. 1.) will be a series of numbers in arithmetical progression, whose first term is 0; therefore the sum of all the pressures is equal to the number of pressures multiplied by half the greatest pressure: but the number of pressures is as the number of particles, or altitude of the fluid BC; also the greatest pressure is as the same altitude; wherefore the total pressure against the side of a vessel, is as the square of the altitude of the fluid. See the article PROGRESSION.

This way of considering the quantity of lateral pressure, by the arithmetical series, is universal; whereas the common method restrains it to the property of an equicrural right-angled triangle, and to a vessel of a cubical form, which we shall here give, for the sake of proving it several ways: suppose ABCD (ib. fig. 1.) a vessel of a cubical form, that is, whose side BC is equal to the length of the bottom CD. If the diagonal BD be drawn, we shall have the lines  $1a = B1$ ,  $2b = B2$ ,  $3c = B3$ ,  $4d = B4$ , &c. but B1, B2, B3, B4, &c. being as the altitudes of the fluid, will represent the lateral pressures in the points 1, 2, 3, 4, &c. therefore also the lines  $a1$ ,  $b2$ ,  $c3$ ,  $d4$ , &c. will represent the same lateral pressures; hence when the distances B1, B2, B3, &c. are indefinitely small, the lines  $a1$ ,  $b2$ ,  $c3$ ,  $d4$ , &c. will be indefinitely near each other; and so all those lines drawn in the triangle BCD, will make the area of that triangle: therefore the sum of all the lateral pressure against the side BC, will be as the area of that triangle. But the area of the triangle BCD is as the square of the side BC; consequently the sum of all the lateral pressures is as the square of the altitude of the fluid BC.

9. Hence, if the vessel AC (ib. fig. 1.) be of a cubical form, the pressure against a side BC, is half that upon the bottom CD, and consequently the total pressure against the sides and bottom is equal to three times the weight of the fluid on the bottom of such a vessel.

10. The weight, pressure, or effect of a fluid, upon the bottom DE (ib. fig. 2.)

of

## FLUIDS.

Fig. 3.

Fig. 5.

Fig. 4.

Fig. 6.

Fig. 7.

of any vessel *ACDEF*, is proportional to the altitude *AE* only, and not to the quantity of the fluid in the vessel. For every column of particles *GH*, which presses downwards on the side of the vessel *EF*, has its force destroyed by the equal re-action of the subjacent particle *H* in the side, and so cannot at all affect the bottom of the vessel. Again, the pressure of any column of particles *LM* upwards, against the side of any vessel *CD*, is equally re-acted by the particle of the vessel over it, and so its force or pressure on the bottom must be the same as that of another column of particles *AB* of equal altitude with the fluid : whence the proposition is evident.

11. Hence a very small quantity of fluid *APRS* (*ib. 2.*) may be made to counter-balance, or be equivalent to the weight or force of any given quantity *T KGV*, how great soever.

12. When any body is immersed in a fluid, it loses just so much of its weight as is equal to the weight of an equal bulk of the fluid ; but the weight lost by the body is gained by the fluid, which will be so much heavier than before.

This is the fundamental principle of every hydrostatic process, particularly of the whole doctrine of specific gravities, which therefore cannot be made too plain and easy to be understood.
