A NEW AND COMPLETE

DICTIONARY

OF

ARTS and SCIENCES;

COMPREHENDING ALL

The Branches of Useful Knowledge,

WITH

ACCURATE DESCRIPTIONS as well of the various MACHINES, INSTRUMENTS, TOOLS, FIGURES, and SCHEMES necessary for illustrating them,

AS OF

The Classes, Kinds, Preparations, and Uses of NATURAL PRODUCTIONS, whether ANIMALS, VEGETABLES, MINERALS, FOSSILS, or FLUIDS;

Together with

The KINGDOMS, PROVINCES, CITIES, TOWNS, and other Remarkable Places throughout the WORLD.

Illustrated with above Three Hundred COPPER-PLATES, curiously engraved by Mr. JEFFERYS, Geographer to his Royal Highness the Prince of WALES.

The Whole extracted from the Best AUTHORS in all Languages.

By a SOCIETY of GENTLEMEN.

MDCCLV.

A NEW AND COMPLETE

DICTIONARY

OF

ARTS and SCIENCES.

R, or r, a liquid conſonant, being the ſeventeenth letter of our alphabet. Its ſound is formed by a guttural extruſion of the breath, vibrated through the mouth, with a ſort of quivering motion of the tongue drawn from the teeth, and cannulated with the tip a little elevated towards the palate. In greek words it is frequently aſpirated with an *h* after it, as in *rhapſody*, *rhetoric*, *&c.* otherwiſe it is always followed by a vowel at the beginning of words and ſyllables.

In the notes of the antients, R. or R O. ſignifies *Roma*; R. C. *Romana civitas*; R. G. C. *rei gerendæ cauſa*; R. F. E. D. *recte factum & dictum*; R G. F. *regis filius*; R. P. *res publica*, or *Romani principes*; and R. R. R. F. F. F. *res Romana ruet ferro, fame, flamma.*

Uſed as a numeral, R antiently ſtood for eighty, and with a daſh over it, thus $\overline{R}$, for eighty thouſand; but the greek r, or ρ, ſignified an hundred.

In the preſcriptions of phyſicians, R or ℞ ſtands for *recipe*, *i. e.* take.

RAAB, a city of lower-Hungary, ſituated at the confluence of the rivers Danube and Raab, and ſubject to the houſe of Auſtria: eaſt long. 18°, north lat. 48°.

RABATE, in falconry, is ſaid of a hawk, when by the motion of the hand, lure, *&c.* ſhe leaves off purſuing her prey or quarry.

RABBETING. in carpentry, the planning, or cutting of channels or grooves in boards, *&c.*

In ſhip-carpentry, it ſignifies the letting in of the planks of the ſhip into the keel; which, in the rake and run of a ſhip, is hollowed away, that the planks may join the cloſer.

RABBI, or RABBINS, a title which the phariſees and doctors of the law among the Jews aſſumed, and literally ſignifies maſters or excellents.

There were ſeveral gradations before they arrived at the dignity of a rabbin, which was not conferred till they had acquired the profoundeſt knowledge of the law and the traditions. It does not however appear that there was any fixed age, or previous examination neceſſary; but when a man had diſtinguiſhed himſelf by his ſkill in the written and oral law, and paſſed through the ſubordinate degrees, he was ſaluted a rabbin by the public voice.

Among the modern Jews, for near ſeven hundred years paſt, the learned men retain no other title than that of rabbi, or rabbins: they have great reſpect paid them, have the firſt places or ſeats in their ſynagogues, determine all matters of controverſy, and frequently pronounce upon civil affairs: they have even a power to excommunicate the diſobedient.

RABBINET, a ſmall piece of ordnance,

between a falconet and a baſe. See the article CANNON.

RABBINISTS, among the modern Jews, an appellation given to the doctrine of the rabbins concerning traditions, in oppoſition to the caraites, who reject all traditions. See CARAITE.

RABBIT, *cuniculus*, in zoology, a well known animal of the lepus, or hare-kind, with a very ſhort tail.

The rabbit, though a ſmaller, is a handſomer creature than the hare, but is of various colours even in the ſame country, its general one in this kingdom being a pale browniſh-grey on the back, and white on the belly; however, there are ſome darker, of a ſilvery-grey, and altogether white.

There is alſo a long-tailed ſpecies, of the ſize of our common rabbit, called the ſiberian rabbit, from its being frequent in Ruſſia and Tartary.

For the method of catching rabbits, by means of ferrets, ſee FERRET.

RACCOURCY, in heraldry, ſignifies the ſame as coupee; that is, cut off or ſhortened; and denotes a croſs, or other ordinary, that does not extend to the edge of the eſcutcheon, as they always do when abſolutely named without ſuch diſtinction.

RACE, in general, ſignifies running with others in order to obtain a prize, either on foot, or by riding on horſe-back, in chariots, *&c.*

Racing was one of the exerciſes among the antient grecian games, which was performed in a courſe containing an hundred and twenty-five paces; and thoſe who contended in theſe foot-races were frequently cloathed in armour. Chariot and horſe-races alſo made a part of theſe antient games. See GAMES.

For horſe-racing, as practiſed amongſt us, ſee HORSE-RACING.

RACE, in genealogy, a lineage or extraction continued from father to ſon.

RACHITIS, the RICKETS, in medicine. See the article RICKETS.

RACILLA, one of the leaſt of the iſlands of the Archipelago, near the iſland of Aio, not inhabited.

RACK, in the manege, a pace in which a horſe neither trots nor ambles, but ſhuffles as it were between.

The racking-pace is indeed much the ſame as the amble, only it is a ſwifter time and ſhorter tread.

RACK is alſo a wooden frame, made to hold hay or fodder for cattle.

RACK, an engine of torture, furniſhed with pullies and chords, *&c.* for extorting confeſſions from criminals.

RACK, ARAC, or ARRAC, in commerce, a ſpirituous liquor made by the Tartars of Tonguſia, who are ſubject to the czarina of Muſcovy. This kind of rack is made of mare's-milk, which is left to be ſour, and afterwards diſtilled twice or thrice between two earthen pots cloſely ſtopped, from whence the liquor runs through a ſmall wooden pipe. This liquor is more intoxicating than brandy diſtilled from wine.

Rack is alſo a ſpirituous liquor which the Engliſh get from Batavia or Malacca, of which there are three ſorts, the one being extracted from the cocoa-tree, the ſecond from rice, and the third from ſugar: but the firſt is the beſt and moſt in uſe. It is made of the bloſſom-bunch of the cocoa-tree: for which purpoſe they tie the bunch while it is ſtill wrapped up within its cod, or membrane, with a piece of packthread, and then with a knife make a-croſs cut in that bunch, a little above the place where it is tied, and adapt a pitcher to it to receive the liquor, which is called toddy, and is vinous, palatable and ſweet: others uſe a bamboe-cane inſtead of a pitcher. Having thus drawn the liquor, they let it ferment, and afterwards diſtil it.

Goa and Batavia are the chief places for rack. At Goa there are ſeveral kinds; ſingle, double, and treble diſtilled: but the double diſtilled, which is that commonly ſent abroad, is but a weak ſpirit when compared with batavia-rack; yet, on account of its peculiar and agreeable flavour, it is preferred to all the other racks of India. The prior rack, made at Madras, the Columbo and Quilone rack, being fiery hot ſpirits, are but little valued by the Europeans, and therefore ſeldom imported, though they are highly prized among the natives.

Rack, on being imported, pays a duty of 6 l. 15 s. 6 d. the ton, containing two hundred fifty-two gallons: and a drawback, on exportation, of 6 l. 1 s. 3 d. beſides which, it pays for the exciſe-duty, 4 s. 8 d. the gallon.

To RACK *wines, &c.* to draw them off from their lees, after their having ſtood long enough to clear and ſettle.

Hence rack-vintage is frequently uſed for the ſecond voyage our wine-merchants uſed to make into France for racked-wines.

RACKELSBURG,

RACKELSBURG, a town of Germany, in the circle of Auſtria, twenty-three miles ſouth-eaſt of Gratz.

RACKET, a kind of bat to ſtrike the ball with at tennis; uſually conſiſting of a lattice or net-work of cat-gut ſtrained very tight in a circle of wood, with a ſhaft or handle.

RACKET is alſo a kind of ſnow-ſhoe, or machine, which the ſavages of Canada bind to their feet, to enable them to walk more commodiouſly on the ſnow; made much in the manner of a tennis-racket. Its figure is a lozenge, of which the two obtuſe angles are turned off. It is bound about with very fine thongs of leather, the maſhes of which are much ſmaller and cloſer than thoſe of our rackets. In the middle is fitted a kind of ſhoe lined with wool or hair, to be tied on to the ancle.

RACKOON, *coati*, in zoology, an american quadruped of the ſhape of a beaver, only ſomewhat ſmaller, and with hair like that of a fox; its head too is like that of a fox, only that the ears are ſhorter, roundiſh, and naked; its tail is longer than its body, and not unlike that of a cat, with annular ſtreaks of different colours.

RADIÆA, in anatomy, a branch of the brachial artery. See ARTERY.

RADIÆUS, or RADIALIS. See the article RADIALIS.

RADIAL CURVES, are curves of the ſpiral kind, whoſe ordinates, if they may be ſo called, all terminate in the center of the including circle, appearing like radii of that circle, whence the name. See the articles CURVE and SPIRAL.

RADIALIS, or RADIÆUS, in anatomy, the name of two muſcles of the arm; one of which, called *radialis internus*, is one of the three flexor muſcles of the carpus, or hand, which ariſing from the internal condyle of the humerus, is inſerted into the bone of the carpus next the thumb; and the other, called *radialis externus*, is one of the three extenſor muſcles of the hand, which ariſing from the external condyle of the humerus, is inſerted into the firſt metacarpal bone. See FLEXOR and EXTENSOR.

RADIANT, or RADIATING POINT, in optics, is any point of a viſible object from whence rays proceed. See the articles VISION and RADIATION.

RADIANT, or RAYONANT, in heraldry. See the article RAYONANT.

RADIATED FLOWERS, in botany, are ſuch as have ſeveral ſemi floſcules ſet round a diſk, in form of a radiant ſtar: thoſe which have no ſuch rays are called diſcous flowers. See the articles FLOWER, BOTANY, *&c.*

The term radiated is alſo uſed with reſpect to one of the antient crowns. See the article CROWN.

RADIATION, the act of a body emitting or diffuſing rays of light all round, as from a center. See the articles LIGHT, RAY, *&c.*

Radiation is conſidered in optics as threefold, *viz.* direct, reflected, or refracted. See the articles VISION, REFLECTION, and REFRACTION.

Though every viſible body be radiating, yet it need not be luminous in itſelf, but only illuminated; that is, it may diffuſe rays received from a luminous body, as well as emit thoſe of its own.

Some uſe the term radiation, to denote the motion of the animal ſpirits; whereas others rather incline to the opinion of their circulation. See the articles ANIMAL SPIRITS, CIRCULATION, *&c.*

Plane of RADIATION. See PLANE.

RADICAL, in general, ſomething that ſerves as a baſis or foundation.

Hence phyſicians talk much of a radical moiſture. See MOISTURE.

In grammar, we give the appellation radical to primitive words, in contradiſtinction to compounds and derivatives. See the article PRIMITIVE.

Algebraiſts alſo ſpeak of the radical ſign of quantities, which is the character expreſſing their roots. See ROOT and CHARACTER.

RADICATION, a term uſed by ſome for the action whereby plants take root, or ſhoot out roots. See the articles ROOT and VEGETATION.

RADICLE, that part of the ſeeds of all plants, which upon vegetating becomes its root, and is diſcoverable by the microſcope. See VEGETATION.

RADICOFANI, a town of Tuſcany, forty-two miles ſouth of Sienna.

RADICULA, in botany, a plant otherwiſe called ſiſymbrium. See the article SISYMBRIUM.

RADIOMETER, an inſtrument otherwiſe called the fore ſtaff. See the article FORE-STAFF.

RADISH, *raphanus*, in botany, *&c.* See the article RAPHANUS.

RADIUS, in geometry, the ſemi-diameter of a circle, or a right line drawn from the center to the circumference. See the article CIRCLE.

In

In trigonometry, the radius is termed the whole ſine, or ſine of 90°. See the article SINE.

For the radius of the evolute, of curvature, &c. in the higher geometry, ſee EVOLUTE, CURVATURE, &c.

Some alſo call the fore-ſtaff *radius aſtronomicus*. See FORE-STAFF.

RADIUS, in anatomy, the exterior bone of the arm, deſcending along with the ulna from the elbow to the wriſt. See the article SKELETON.

In its upper extremity there is a glenoid cavity for its articulation with the humerus; alſo a creſt, by means of which it is articulated with the ulna: in the lower extremity the head is thicker, and of a more angular figure, with a very large hollow in its middle, for its articulation with the wriſt.

RADIX, the ſame with root. See the article ROOT.

RADNOR, the capital of the county of Radnor in Wales, ſituated in weſt long. 3° 6′, north lat. 52° 20.

RAFFLING, a game with three dice, in which he who throws the greateſt pair, or pair royal, in three caſts, wins the prize or ſtake.

The raffle is properly a doublet or triplet: for a raffle of all aces or duces, carries it againſt mere points.

Raffling is alſo uſed when a number of people club for the purchaſe of a commodity; and he that throws the higheſt on three dice takes it.

RAFTERS, in building, are pieces of timber, which ſtanding by pairs on the reaſon or raiſing piece, meet in an angle at the top, and form the roof of a building.

It is a rule in building that no raſters ſhould ſtand farther than twelve inches from one another: and as to their ſizes or ſcantlings, it is provided by act of parliament, that principal rafters, from twelve feet ſix inches to fourteen feet ſix inches long, be five inches broad at the top and eight at the bottom, and ſix inches thick. Thoſe from fourteen feet ſix inches to eighteen feet ſix inches long, to be nine inches broad at the foot, ſeven inches at the top, and ſeven inches thick: and thoſe from eighteen feet ſix inches, to twenty-one feet ſix inches long, to be ten inches broad at the foot, eight at the top, and eight thick. Single rafters, eight feet in length, muſt have four inches and a half, and three inches three quarters in their ſquare. Thoſe of nine feet long muſt be five and four inches ſquare.

Principal rafters ſhould be nearly as thick at the bottom as the beam, and ſhould diminiſh in their length one fifth or one ſixth of their breadth; the king-poſts ſhould be as thick as the principal rafters, and their breadth, according to the bigneſs of them that are intended to be ſet into them, the middle part being left ſomewhat broader than the thickneſs.

RAG, or RAKE, a company, or herd of young colts.

RAG-WORT, *jacobæa*, in botany. See the article JACOBÆA.

RAGGED-HAWK, among falconers, is one that has his feathers broken. See the article HAWK.

RAGGED, in heraldry. See RAGULED.

RAGOUT, or RAGOO, a ſawce, or ſeaſoning, intended to rouſe the appetite when loſt or languiſhing.

This term is alſo uſed for any high ſeaſoned diſh prepared of fleſh, fiſh, greens, or the like; by ſtewing them with bacon, ſalt, pepper, cloves, and the like ingredients. We have ragouts of celery, of endive, aſparagus, cock's-combs, giblets, cray-fiſh, &c.

The antients had a ragout called garum, made of the putrified guts of a certain fiſh kept till it diſſolved into a mere ſanies, which was thought ſuch a dainty, that, according to Pliny, its price equalled that of the richeſt perfumes.

RAGULED, or RAGGED, in heraldry, jagged or knotted. This term is applied to a croſs formed of the trunks of two trees without their branches, of which they ſhew only the ſtumps. See plate CCXXVII. fig. 2.

Raguled differs from indented, in that the latter is regular, the former not.

RAJA, the title of the indian black princes, the remains of thoſe who ruled there before the moguls. Some of the rajas are ſaid to preſerve their independency, eſpecially in the mountainous parts; but moſt of them pay an annual tribute to the mogul. The Indians call them *rai*; the Perſians *raian*, in the plural; and our travellers *rajas*, or *ragias*.

RAJA, in ichthyology, a genus of the chondropterygious order of fiſhes, with five apertures of the gills on each ſide; the head and body are depreſſed or flat; the ſides are terminated with broad fins, which ſupply the place of pectoral fins in other fiſhes; the eyes are

in

in the upper part of the head, and behind them is a ſingle foramen; and the tail is uſually long and ſlender.

To this genus belong the thornback, fire-flaire, ſea-eagle, white-horſe, ſkaite, and torpedo or cramp-fiſh.

RAJAMAHAL, a city of the hither India, ſituated on the river Ganges, in 86° 30′ eaſt long. and 24° 30′ north lat.

RAJANIA, in botany, a genus of the *dioecia hexandria* claſs of plants, without any flower-petals; the fruit is roundiſh, and contains a ſingle ſeed of the ſame ſhape.

RAIL, in architecture, is uſed in different ſenſes, as for thoſe pieces of timber which lie horizontally between the pannels of wainſcot; for thoſe which lie over and under the baluſters in balconies, ſtaircaſes, and the like; and alſo for thoſe pieces of timber which lie horizontally from poſt to poſt in fences, either with poles or without.

RAIL, *ortygometra*, in ornithology, a genus of birds of the order of the ſcolopaces, the beak of which is ſhorter than the toes: it is of a compreſſed form, and terminated in a point; but the two chaps are equal in length. It is of the ſize of the common magpye, and is an elegant bird, of a bright brown colour, variegated with black ſpots; it is common in rich paſtures, where its conſtant note is *crex, crex*.

RAIN, a watery-meteor, which deſcends from the clouds in form of drops of water. See CLOUD, METEOR, *&c.*

Rain is apparently the precipitated vapours of watery clouds: thus, when various congeries of clouds are driven together by the agitation of the winds, they mix and run into one body, and by that means diſſolve and condenſe each other into their former ſubſtance of water; alſo the coldneſs of the air is a great means to collect, compact, and condenſe clouds into water; which being heavier than the air, muſt of neceſſity fall through it in the form we call rain. Now the reaſon why it falls in drops, and not in whole quantities, as it becomes condenſed, is the reſiſtance of the air; whereby, being broken and divided into ſmaller and ſmaller parts, the farther it paſſes through the air, it at laſt arrives to us in ſmall drops.

Mr. Derham accounts for the precipitation hence, that the veſiculæ being full of air, when they meet with a colder air than that they contain, their air is contracted into a leſs ſpace; and, conſequently, the watery ſhell rendered thicker, ſo as to become heavier than the air, *&c.*

Others only allow the cold a part in the action, and bring in the winds as ſharers with it: indeed, it is plain, that a wind, blowing againſt a cloud, will drive its veſiculæ upon one another, by which means ſeveral of them coaleſcing, will be enabled to deſcend; and the effect will be ſtill more conſiderable if two oppoſite winds blow towards the ſame place. Add to this, that clouds already formed, happening to be aggravated by freſh acceſſions of vapour continually aſcending, may thence be enabled to deſcend.

According to Rohault, the great cauſe of rain is the heat of the air, which, after continuing for ſome time near the earth, is at length carried up on high by a wind, and there thawing the ſnowy villi, or flocks of the half frozen veſiculæ, reduces them into drops; which, coaleſcing, deſcend.

Others, as Dr. Clarke, *&c.* aſcribe this deſcent of the clouds rather to an alteration of the atmoſphere than of the veſiculæ; and ſuppoſe it to ariſe from a diminution of the elaſtic force of the air. This elaſticity, which depends chiefly or wholly on the terrene exhalations, being weakened, the atmoſphere ſinks under its burden, and the clouds fall.

Now the little veſicles, being once upon the deſcent, will perſiſt therein, notwithſtanding the increaſe of reſiſtance they every moment meet with. For as they all tend toward the center of the earth, the farther they fall, the more coalitions will they make; and the more coalitions, the more matter will there be under the ſame ſurface; the ſurface only increaſing as the ſquares, but the ſolidity as the cube; and the more matter under the ſame ſurface, the leſs reſiſtance there will be to the ſame matter. Thus, if the cold, wind, *&c.* act early enough to precipitate the aſcending veſicles, before they are arrived at any conſiderable height, the coalitions being but few, the drops will be proportionably ſmall; and thus is formed a dew. If the vapours be more copious, and riſe a little higher, we have a miſt or fog. A little higher ſtill, and they produce a ſmall rain, *&c.* If they neither meet with cold nor wind, they form a heavy, thick, dark ſky.

Hence,

Hence, many of the phænomena of the weather may be accounted for: as, why a cold ſummer is always a wet one, and a warm, a dry one; Why we have commonly moſt rain about the equinoxes; Why a ſettled, thick, cloſe ſky, ſcarce ever rains, till it have been firſt clear; As to the quantity of rain that falls, its proportion in ſeveral places at the ſame time, and in the ſame place at ſeveral times, we have ſtore of obſervations, journals, *&c.* in the Memoirs of the french academy, Philoſophical Tranſactions, *&c.*

Preternatural RAINS, as of blood, are very frequent in our annals, and even natural hiſtories; yet, if enquired into, they will be found other things than rain. Thoſe rains, Dr. Merret obſerves, are nothing more than the excrements of inſects, as butterflies, *&c.* And he adds, that it is very evident the rains of wheat are nothing but ivy-berries ſwallowed by the ſtarling, and voided again by ſtool.

RAINS, in the ſea-language, all that tract of ſea to the northward of the equator, between four and ten degrees latitude, and lying between the meridian of Cape Verde and that of the eaſtermoſt iſlands of the ſame name.

It is ſo called from the almoſt continual calms, conſtant rains, thunder and lightning found there.

RAIN-BOW, *iris*, in meteorology, a meteor, in form of a party-coloured arch, or ſemi-circle, exhibited in a rainy ſky, oppoſite to the ſun, by the refraction of his rays in the drops of falling rain. See the article REFRACTION.

In order to illuſtrate this phænomenon, ſuppoſe BNFG (Pl. CCXXVI. fig. 1.) to be a ſpherical drop of falling rain, and AN a ray of the ſun falling upon it in the point N; which ray ſuppoſe refracted to F, from thence reflected to G, and there again refracted in the direction GR to the eye of a ſpectator; and let IG be perpendicular to the drop in the point G; then will the ray or beam of light, by its refraction at G, be ſeparated into ſeveral ſorts of rays, which will paint their reſpective colours in that part of the drop; of which that next the perpendicular IG will be red, as being leaſt refracted; and the reſt in order above it, *viz.* orange, yellow, green, blue, indigo, violet. Now it is found by computation, that the greateſt angle SEO, (*ibid.* fig. 2.) or EOP, becauſe OP parallel to SE, under which the moſt refrangible rays can come to the eye of the ſpectator at O, is 40° 17′; and that the great angle FOP, under which the moſt refrangible rays come to the eye at O, is 42° 2′: and ſo all the particles of water, within the difference of thoſe two angles, EF, will exhibit ſeverally the various colours of the priſm, and conſtitute the interior rain-bow in the cloud. See COLOUR.

If the beam of light go not out of the drop, at G, but is reflected a ſecond time, to H; (*ibid.* fig. 1 and 2.) and is there refracted in the direction HS, making the angle SYA with the incident ray AN, it will paint on the part H the ſeveral colours of light; but in an inverſe order to the former, and more faint, by reaſon of the rays loſt by the ſecond reflection. It has been found alſo, that the leaſt angle SGO, or GOP, under which the leaſt refrangible rays can come to the eye at O, after two reflections and two refractions, is 50° 57′; and the leaſt angle HOP, under which the moſt refrangible rays can come to the eye in this caſe, is 54° 7′: whence all the colours of the exterior rain-bow, will be formed in the drops from G to H; which is the breadth of this bow, *viz.* 3° 10′; whereas the breadth of the former, or interior bow, *viz.* EF, is but 1° 45′; and the diſtance between the bows, *viz.* FG, is 8° 55′. And ſuch would be the meaſure of the bows, were the ſun but a point; but ſince his body ſubtends an angle of half a degree, it is evident, by ſo much will each bow be increaſed, and their diſtance diminiſhed.

To apprehend rightly the different affections of the rain-bow, we muſt attend to the following particulars. 1. That though the rain-bow be occaſioned by the refracted and reflected light of the ſun falling on the drops of rain, yet neither of them is produced by any rays falling on any part of the drop indifferently, but by thoſe only which fall on the ſurface of the drop BLQG (*ibid.* fig. 1, 2, 3.) in or about the point N, as the ray AN; thoſe which fall nearer to B, or farther towards L, being unconcerned in this production. 2. The internal bow is produced by two refractions and one reflection. The firſt refraction is of the incident rays extremely near AN, by which they proceed from N to one common point or focus at F, from whence they are reflected to G, and are there a ſecond time refracted

RAIN-BOW.

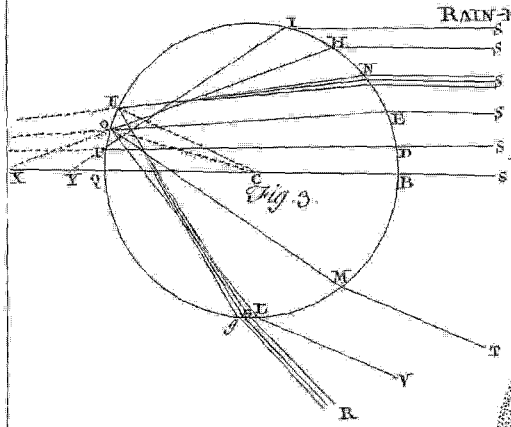

Fig. 3.

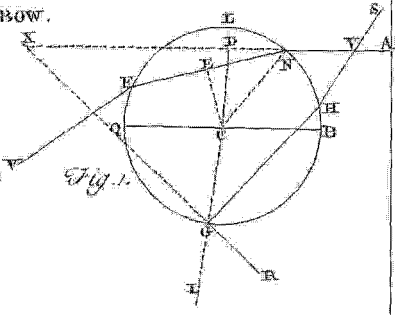

Fig. 1.

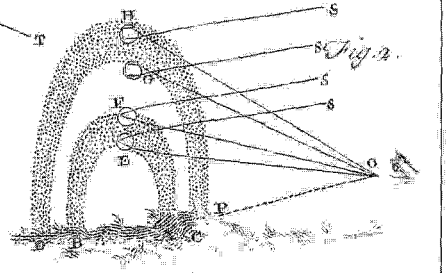

Fig. 2.

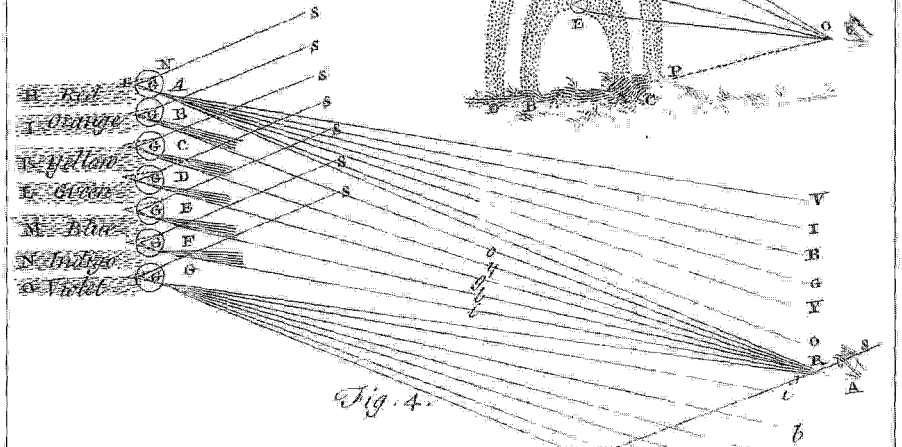

Fig. 4.

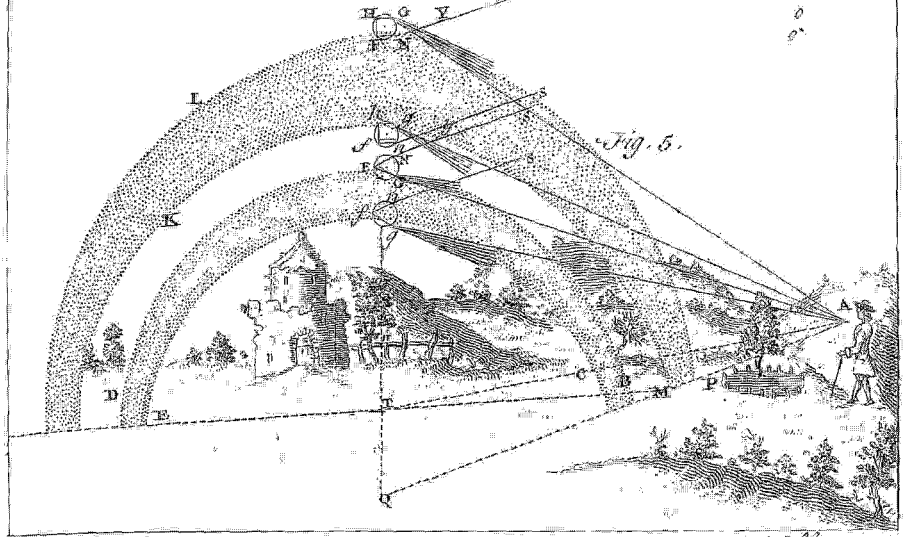

Fig. 5.

J. Jefferys sculp.

refracted towards R, and produce the various colours of the ſaid bow. 3. There is a neceſſity that ſeveral rays ſhould be refracted together to the point F, that being reflected together from thence to G they may there go out parallel, and ſo come in quantity ſufficient to excite the ſenſation of colours in a ſtrong and lively manner. Now thoſe rays, and thoſe only, which are incident on the globule about the point N, can do this, as will appear from what follows: for, 4. The point F makes the arch QF a *maximum*, or the diſtance QF from the axis of the drop SQ is greater than any other diſtance from whence any other rays nearer to the axis, as SD, SE, or farther from it, as SH, SI, are reflected; becauſe thoſe which are nearer after the firſt refraction tend to points in the axis produced more remote than that to which the ray SN tends; and therefore as their diſtance from the axis increaſes, ſo likewiſe will the diſtances of their points of reflection QP, QO, till the ray becomes SN; after which the rays more remote from the axis, as SH, SI, are refracted towards the points XY, which are nearer and nearer to the axis; and this occaſions the points of reflection on the fartheſt ſide of the drop to decreaſe again from F towards Q. 5. Hence it will neceſſarily happen, that ſome rays above and below the ray SN will fall upon the ſame point, as O or P, on the fartheſt ſide; and for that reaſon they will be ſo reflected from thence as to go out of the drop by refraction parallel to each other. Thus let SE below, and SH above the ray SN, be refracted both to one point O; from hence they will be reflected to M and L, and will there emerge parallel, 'tis true, but alone; being diveſted of their intermediate rays SN, which going to a different point F will be reflected in a different direction to G, and emerge on one ſide, and not between thoſe rays, as when they were incident on the drop. All which is evident from the figure. 6. As this will be the caſe of all the rays which are not indefinitely near to SN, it is plain, that being deprived of the intermediate rays, their denſity will be ſo far diminiſhed, as to render them ineffectual for exciting the ſenſation of colours; and they are therefore called inefficacious rays, in contradiſtinction to thoſe which enter the drop near SN, and which, having the ſame point F of reflection, are not ſcattered like the others, but emerge together at G, ſo as to conſtitute a beam GR of the ſame denſity with the incident beam SN, and therefore capable of exhibiting a vivid appearance of colours, and for this reaſon are called efficacious rays.

Phænomena of the RAINBOW. The firſt is, that each is variegated with all the priſmatic colours. This is a neceſſary conſequence of the different refrangibility of the rays refracted and reflected in drops of falling rain. Let *A* (*ibid.* fig. 4.) be ſuch a drop, SN a ray entering it at N, which is refracted to F, from whence refracted to G, where, as it emerges, it is refracted into all the ſeveral ſorts of rays of which it is compoſed, *viz.* GR, the leaſt refrangible or red-making ray, GO the orange, GY the yellow, GG the green, GB the blue, GI the indigo, and GV the violet, or moſt refrangible ray.

The truth of this may be eaſily proved by experiment, by ſuſpending a glaſs globe filled with water in the ſun-ſhine, and viewing it in ſuch a poſition, that the rays SN will fall upon it, and emerge to the eye at A, under the ſeveral angles from SFR to SFV; which may be eaſily effected by letting the globe deſcend from *A* to G, by a ſtring going over a pulley.

Hence, the ſecond phænomenon, *viz.* the circular form, is accounted for, and alſo the third, which is the breadth of the bow; for that will be equal to the angle $ARG = RGV = 1^\circ\ 45'$, where the ray, as here, emerges after one reflection. Theſe particulars are repreſented more completely in fig. 5. where BGD is the red circumference formed by the rotation of the ray *A*G, that can firſt come to the eye at A; and C*g*E is the violet arch formed by the leaſt refrangible ray *g A*; after which the rays are all refracted below the eye. And thus, by the intermediate rays and colours, the whole interior bow is produced.

The fourth phænomenon is the appearance of two bows. This follows from hence, that after an efficacious ray of light SN, entering a drop of rain, has been twice reflected on the fartheſt ſide at F and H, it will emerge refracted into all its ſimple or conſtituent rays at G upon the upper ſide of the drop, ſo as to make with the incident ray the angle $GYN = SYA = 54^\circ\ 10'$, if that ray

be the violet ſort, or moſt refrangible; but if it be of the red or leaſt refrangible ſort, then the ſaid angle is but 50° 58′ = S *y* A.

Therefore, all thoſe drops which are ſo ſituated around the eye, that their moſt refrangible rays ſhall fall upon it, muſt with thoſe rays make an angle with the line AP paſſing through the eye parallel to the ſun's rays, *viz.* the angle GAP, equal to the angle SYA, or GAP = 54° 10′. Theſe rays, therefore, will every-where exhibit a violet colour in the arch PGL. For the ſame reaſon, thoſe drops whoſe leaſt refrangible rays fall upon the eye at A, make the angle *g* AP = 50° 58′; and ſo the ray A *g*, revolving about the axis AQ, will deſcribe the circular arch M *g* K, which will exhibit the deepeſt red; and all the drops between G and *g* will paint the ſeveral other coloured peripheries, all which together will complete the exterior bow.

The fifth phænomenon is the greater breadth of the exterior bow. Thus, if from 54° 10′ we ſubduct 50° 58′, we ſhall have 3° 12′ = G*g* = the width of the outer bow; which, therefore, is almoſt twice as wide as the interior bow.

The ſixth phænomenon is the diſtance between the two bows, which is thus determined: from the angle which the leaſt refrangible ray in the upper bow makes with the axis AP, *viz.* 50° 58′, ſubtract the angle 42° 2′ which the moſt refrangible rays make therewith in the lower bow, and the remainder 8° 56′ = *g* AF is the arch of diſtance between the bows.

The ſeventh phænomenon is the inverſe order of the colours in the two bows. This follows from the contrary parts of the drop on which the ray is incident, and from whence it emerges and is refracted. Thus, becauſe the rays SN enter the upper part of the drop, and emerge from the lower, it is evident the rays refracted in this caſe (*viz.* in the interior bow) will have a ſituation quite the reverſe of thoſe which enter on the lower part of the drop, and are refracted from the upper, as in the exterior bow, whoſe colours are violet, indigo, blue, green, yellow, orange, and red; whilſt thoſe of the other are red, orange, yellow, green, blue, indigo, and violet; counting from the upper parts downwards in both.

The eighth phænomenon is the faintneſs of the exterior bow, in compariſon of the interior one. This is the conſequence of the rays being twice reflected within the drops which form the outer bow. They who make the experiment in a dark chamber, may wonder when they obſerve how large a part of the beam (that enters the globule at N) goes out at F, that there ſhould be enough in the remaining part F G to exhibit the colours ſo ſtrong and vivid in the firſt bow as they appear; but then, conſidering how much of this reſidual ray is refracted at G, it is rather a wonder how the very ſmall part reflected to H, ſhould there, when refracted, be in quantity ſufficient to excite any diſtinct ideas of colours at all.

The ninth phænomenon is, that ſometimes more than two bows appear; as in a very black cloud we have obſerved four, and a faint appearance of a fifth: but this happens rarely. Now, theſe ſpurious bows, as we may call them, cannot be formed in the manner as the two principal bows are, that is, by refraction after a third, fourth, fifth, *&c.* refraction; for the beam is by much too weak to exhibit colours by refraction, even after the third reflection only, much leſs would it after a fourth or fifth. Beſides, though after a third and fourth reflection of the rays they ſhould be ſuppoſed capable of ſhewing their colours, yet the bows made thereby would not appear at the ſame time with the other two, nor in the ſame part of the heavens, but in the rain between us and the ſun, and muſt be viewed by the ſpectator's face turned towards the ſun, and not from it, as in the other caſe.

The tenth phænomenon, is the appearance of the bows in that part of the heavens oppoſite to the ſun. This neceſſarily happens from the incident and emergent ray being both on one ſide of the drop; for it is evident, that in order to ſee the colours, we muſt look to that part againſt which the ſun ſhines.

The eleventh phænomenon is, that they never appear but when and where it rains. This is becauſe rain affords a ſufficient plenty of drops, or aqueous ſpherules, proper to reflect and refract the light fit for this purpoſe, which cannot be done without a requiſite ſize, figure, and diſpoſition of the particles, which the vapour of the cloud does not admit, and therefore clouds alone exhibit no ſuch appearance.

The

The twelfth phænomenon is the dimenſion of the bows. This is determined eaſily; for continuing the axis AP to Q, the center of the bows, we have the ſemidiameter of each bow in the angle QAg, or QAG; the double of which gives the angles which the whole diameters of the bows ſubtend, and are therefore the meaſure of their magnitude.

The thirteenth phænomenon is the altitude of the bow above the horizon, or ſurface of the earth. This is equal to the angle GAT, which may be taken by a quadrant, or it may be known for any time by having given the ſun's altitude, which is equal to the angle TAQ; which therefore ſubducted from the conſtant angles QAF, or QAY, will always leave the angle of the apparent height of the bow.

Lunar RAINBOW. The moon ſometimes alſo exhibits the phænomenon of an iris, by the refraction of her rays in drops of rain in the night-time.

Ariſtotle ſays, he was the firſt that ever obſerved it; and adds, that it is never viſible, but at the time of full moon.

The lunar iris has all the colours of the ſolar, only fainter. See Phil. Tranſ. n° 331.

Marine RAINBOW, the ſea-bow, is a phænomenon ſometimes obſerved in a much agitated ſea, when the wind, ſweeping part of the tops of the waves, carries them aloft; ſo that the rays of the ſun are refracted, &c. as in a common ſhower.

F. Bourzes, in Phil. Tranſ. obſerves, that there are ſcarce above two colours diſtinguiſhable, a dark yellow on the ſide next the ſun, and a pale green on the oppoſite ſide. But there are ſometimes twenty or thirty of them ſeen together.

They appear at noon-day, and in a poſition oppoſite to that of the common bow, the concave ſide being turned upwards.

There is a kind of white colourleſs rainbow which Mentzelius and others ſaw at noon-day. M. Marriote, in his fourth Eſſaie de Phyſique, ſays, they are formed in miſts, as the others are in ſhowers; having obſerved ſeveral of them both after ſun-riſing and in the night.

The want of colours in theſe, is owing to the exceeding tenuity of the veſicles of the vapour, which being only little watery pellicles bloated with air, the rays of light undergo but little refraction in paſſing out of air into them. Hence the rays are reflected from them compounded, as they come.

Rohault mentions coloured rainbows on the graſs formed in the morning dew.

RAISER, in building, a board ſet on edge under the fore ſide of a ſtep, ſtair, &c. See the article STAIR.

RAISING, in the manege, one of the three actions of a horſe's legs, the other two being the ſtay and the tread.

In caprioles, curvets, &c. the raiſing or lifting up of his leg is eſteemed good, if he perform it hardily and with eaſe; not croſſing his legs, nor carrying his feet too much out or in, yet bending his knees as much as is needful.

RAISING-PIECES, or REASON-PIECES, in architecture, are pieces that lie under the beams, and over the poſts or puncheons.

RAISINS, grapes prepared by ſuffering them to remain on the vine till they are perfectly ripe, and then drying them in the ſun, or by the heat of an oven. The difference between raiſins dried in the ſun, and thoſe dried in ovens, is very obvious: the former are ſweet and pleaſant, but the latter have a latent acidity with the ſweetneſs that renders them much leſs agreeable.

The common way of drying grapes for raiſins, is to tie two or three bunches of them together while yet on the vine, and dip them into a hot lixivium of wood-aſhes with a little of the oil of olives in it. This diſpoſes them to ſhrink and wrinkle, and after this they are left on the vine three or four days ſeparated on ſticks in an horizontal ſituation, and then dried in the ſun at leiſure, after being cut from the tree. The fineſt and beſt raiſins are thoſe called in ſome places Damaſcus and Jube raiſins; which are diſtinguiſhed from the others by their ſize and figures: theſe are flat and wrinkled on the ſurface, ſoft and juicy within, and near an inch long, and when freſh and growing on the bunch, are of the ſize and ſhape of a large olive.

The raiſins of the ſun, and jar-raiſins, are all dried by the heat of the ſun, and theſe are the ſorts uſed in medicine. However, all the kinds have much the ſame virtues; they are all nutritive and balſamic; they are allowed to be attenuant, are ſaid to be good in nephritic complaints, and are an ingredient in pectoral decoctions, in which caſes, as alſo in all

others where aſtringency is not required of them, they ſhould have the ſtones carefully taken out.

Raiſins, on being imported, pay the following duties: large raiſins, the hundred weight, 11s. $8\frac{17\frac{1}{2}}{100}$d. and on exportation, draw back, 10s. $11\frac{62\frac{1}{2}}{100}$d. Raiſins of the ſun, the hundred weight pay, on importation, 14s. $\frac{90}{100}$d. and on exportation, draw back, 13s. $1\frac{1}{2}$d. Of Lipra or Belvidera, the hundred weight pay, on importation, 7s. $1\frac{59\frac{1}{2}}{100}$d. and on exportation, draw back, 6s. $10\frac{46\frac{1}{2}}{100}$d. Of Smyrna, either black or red, the hundred weight pay, on importation, 9s. $3\frac{45}{100}$d. and, on exportation, draw back, 8s. $9\frac{3}{4}$d. Of Alicant, Denia, and other raiſins, not otherwiſe rated, the hundred weight pay, on importation, 6s. $10\frac{72\frac{1}{2}}{100}$d. and, on exportation, draw back, 6s. $7\frac{87\frac{1}{2}}{100}$d. More, if in a foreign bottom, for every 20s. value of the above rates, 3s.

RAITING, or RATING, the laying of flax, hemp, timber, *&c.* when green, in a pond or running water, to ſeaſon, and prepare it for future uſes.

RAKE *of a ſhip* is all that part of her hull which hangs over both ends of her keel. That which is before, is called the fore-rake, or rake-forward; and that part which is at the ſetting on of the ſtern-poſt, is called the rake-aft, or afterward.

RAKE *of the rudder*, is the hindermoſt part of it.

RAKE, among hunters, the ſame with rag. See the article RAG.

RAKE, in mining, the ſame with vein. See the article VEIN.

RAKEE, in falconry, a term applied to a hawk that flies out too far from the fowl.

RAKING, of an horſe, is drawing the ordure with the hand out of the fundament, when he is coſtive, and cannot dung: in doing which the hand ſhould be anointed with butter or ſallad-oil.

An horſe is alſo ſaid to rake, when being ſhoulder-ſplaid, or having ſtrained his fore-quarters, he goes ſo lame as to drag one of his fore-legs in a ſemi-circle.

RAKING TABLE, or RAKED TABLE, among architects, is a member hollowed in the ſquare of a pedeſtal, *&c.* See the articles CAVETTO and SCOTIA.

RALLYING, in war, reaſſembling or calling together troops broken and put to flight.

RAM, in zoology, the male of the ſheep kind. See the article SHEEP.

RAM, in aſtronomy, the ſame with aries. See the article ARIES.

Battering RAM, in antiquity, a military engine uſed to batter and beat down the walls of places beſieged.

The battering ram was of two ſorts, the one rude and plain, the other compound. The former ſeems to have been no more than a great beam which the ſoldiers bore on their arms and ſhoulders, and with one end of it by main force aſſailed the wall. The compound ram is thus deſcribed by Joſephus: it is a vaſt beam, like the maſt of a ſhip, ſtrengthened at one end with a head of iron, ſomething reſembling that of a ram, whence it took its name. See plate CCXXVII. fig. 1. This was hung by the middle with ropes to another beam, which lay acroſs two poſts; and hanging thus equally ballanced, it was by a great number of men drawn backwards and puſhed forwards, ſtriking the wall with its iron-head.

Plutarch informs us, that Mark Anthony, in the Parthian war, made uſe of a ram fourſcore feet long: and Vitruvius tells us, that they were ſometimes an hundred and ſix, and ſometimes an hundred and twenty feet in length; and to this perhaps, the force and ſtrength of the engine was in a great meaſure owing. The ram was managed at one time by a whole century of ſoldiers, and they being ſpent, were ſeconded by another century, ſo that it played continually without any intermiſſion.

In order to calculate the force of the battering-ram, R, (plate CCXXVII. fig. 1.) ſuppoſe it to be 28 inches in diameter, and 180 feet long; and conſequently its ſolid content 750 cubic feet; which, allowing 50 pounds for each foot, will weigh 37500 pounds: and ſuppoſe its head of caſt-iron, together with three iron-hoops, *&c.* to be 3612 pounds. Now all theſe weights, added together, make 41112 pounds, equal the weight of the whole ram; which will require 1000 men to move it, ſo as to cauſe it to ſtrike againſt the point L of the wall AHIGE, each man moving a weight of 41 pounds. The quantity of motion produced by this action, when the ram moves one foot in a ſecond,

Fig. 1. The Battering RAM.

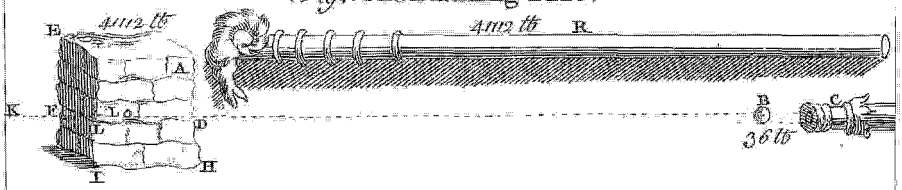

Fig. 2 RAGULED. Fig 3 RAMPANT.

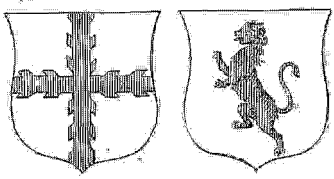

Fig. 4. RANA PISCATRIX.

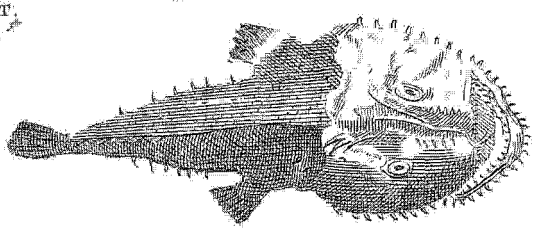

Fig. 5. RANUNCULUS.

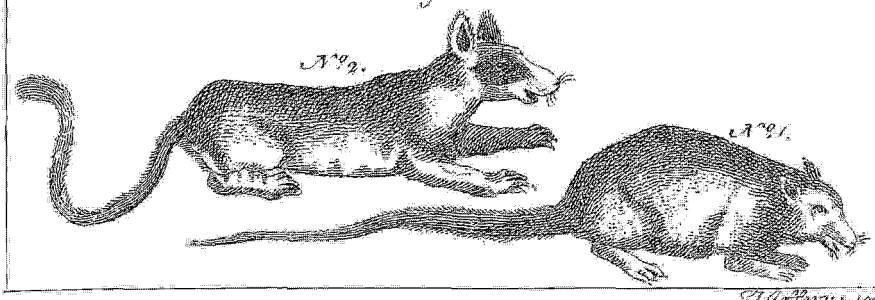
Fig. 6. RATS.



a ſecond, may be expreſſed by the number 41112; which motion or force compared with the quantity of motion in the iron-ball B, ſhot out of the cannon C, will be found equal to it: for a cannon-ball is known to move as faſt as ſound for about the ſpace of a mile; and if you multiply 36 pounds, the weight of the ball, by 1142, the number of feet which ſound moves in one ſecond, you will have the number 41112 for the quantity of motion or force, in the ball B ſtriking at L. And if, after a few ſtrokes given by the battering-ram, the mortar or cement is ſo looſened, that the piece of the wall ADDFE is at laſt by a ſtroke of the ram carried forward from F to K, and ſo beaten down; the ſame thing will be performed by a cannon-ball, after an equal number of ſtrokes.

This ſhews how advantageous the invention of gunpowder is; ſince we are thereby enabled to give ſuch a prodigious velocity to a ſmall body, that it ſhall have as great a quantity of motion as a body immenſely greater, and requiring vaſtly more hands to work it: for three men will manage a cannon, which ſhall do as much execution as the above battering-ram wrought by 1000. The ram, whoſe force is here calculated, is taken at a mean; being bigger than ſome, and leſs than others, of thoſe uſed by the antients.

RAM's HEAD, in a ſhip, is a great block belonging to the fore and main-halliards. It has three ſhivers in it, into which the halliards are put, and in a hole at the end of it are reeved the ties.

RAMADAN, a ſolemn ſeaſon of faſting among the mahometans, kept in the ninth month of the arabic year. This faſt conſiſts in abſtaining from meat and drink, and from lying with their wives each day, from the riſing of the ſun till the ſtars appear; and is of ſuch ſtrict obligation, that none is excuſed from it; for the ſick, and all others who cannot obſerve it in this month, are obliged to faſt another entire month inſtead of it. So ſuperſtitious are the mahometans in the obſervance of this lent, that they dare not waſh their mouths, or even ſwallow their ſpittle. The men are, indeed, allowed to bathe themſelves, on condition they do not plunge the head under water, leſt ſome drops enter by the mouth or ears, &c. but as for the women, they are ſtrictly forbid bathing, for fear of taking in water at the pudendum. However, they frequently feaſt all night. The mahometans call this month holy, and believe, that as long as it laſts, the gates of paradiſe are open, and thoſe of hell ſhut.

RAMAGE, the boughs or branches of trees.

RAMAGE-FALCON, or HAWK, one that is wild and coy, as having been long amongſt the boughs preying for itſelf. All falcons retain this name when they have left the aery; being ſo called in May, June, July and Auguſt. Theſe are very rarely reclaimed.

RAMAGE-VELVET. See VELVET.

RAMBERVILLERS, a city of Germany, in the dutchy of Lorrain: eaſt long. 6° 30′, north lat. 48° 20′.

RAMEKINS, a fortreſs of Zeland, one of the United Provinces, ſituated five miles ſouth of Middleburg.

RAMERA, a town of France, in the province of Champain, eighteen miles north-eaſt of Troyes.

RAMIFICATION, the production of boughs or branches, or of figures reſembling branches.

RAMILLIES, a ſmall town of the auſtrian Netherlands, in the province of Brabant, ten miles north of Namur.

RAMMER, an inſtrument uſed for driving down ſtones or piles into the ground; or for beating the earth, in order to render it more ſolid for a foundation.

RAMMER *of a gun*, the gun-ſtick; a rod uſed in charging of a gun, to drive home the powder, as alſo the ſhot and the wad, which keeps the ſhot from rolling out. The rammer of a great gun is uſed for the ſame purpoſe. It has a round piece of wood at one end, and the other is uſually rolled in a piece of ſheep-ſkin, fitted to the bore of the piece, and is uſed to clear her after ſhe has been diſcharged, which is called ſponging the piece.

RAMPANT, in heraldry, a term applied to a lion, leopard, or other beaſt that ſtands on his hind legs, and rears up his fore feet in the poſture of climbing, ſhewing only half his face, as one eye, &c. It is different from ſaliant, in which the beaſt ſeems ſpringing forward as if making a ſally. See plate CCXXVII. fig. 3.

RAMPART, in fortification, is an elevation of earth round a place capable of reſiſting the cannon of an enemy; and formed into baſtions, curtins, &c. See FORTIFICATION, BASTION, &c.

A ram-

A rampart ought to be ſloped on both ſides, and to be broad enough to allow room for the marching of waggons and cannon, beſide that allowed for the parapet which is raiſed on it: its thickneſs is generally about ten or twelve fathom, and its height not above three, which is ſufficient to cover the houſes from the battery of the cannon. The rampart is encompaſſed with a ditch, and is ſometimes lined or fortified on the inſide, otherwiſe it has a berme. See the article BERME.

Upon the rampart ſoldiers continually keep guard, and pieces of artillery are planted there for the defence of the place.

RAMPART, in civil architecture, is uſed for the ſpace left between the wall of a city, and the next houſes.

RAMSEY, a market town of Huntingtonſhire, ten miles north-eaſt of Huntington.

RAMSEY, an iſland in the iriſh channel, on the coaſt of Pembrokeſhire: weſt long. 5° 20′, north lat. 51° 55′.

RAMSGATE, a port-town of Kent, ſituated between the north and ſouth Foreland, eight miles ſouth-eaſt of Canterbury.

RAMPHASTOS, in ornithology, a genus of birds, of the order of the picæ, the beak of which is remarkably large, and without any viſible noſtrils: the toes are the ſame in number and the ſame way placed as in the parrot. See PARROT.

This genus comprehends the toucan, the pepper-bird, and ſeveral other ſpecies. See the articles TOUCAN, *&c.*

RAMUS, in general, denotes a branch of any thing, as of a tree, an artery, vein, *&c.*

RANA, the FROG, in zoology. See the article FROG.

RANA PISCATRIX, the FROG-FISH, in ichthyology, a fiſh of a very irregular figure, not unlike that of a tadpole; its body being very inconſiderable in proportion to the vaſt ſize of its head, which has a very large mouth furniſhed with ſharp teeth, and ſurrounded with fleſhy tubercles; and on the under part of the body there are two fins reſembling a mole's feet. See plate CCXXVII. fig. 4. It is the ſame with the lophius. See the article LOPHIUS.

RANA, or RANULA. See RANULA.

RANCHIERA, a port-town of Terra Firma, ſituated in weſt long. 72°, north lat. 11° 34′.

RANCID, denotes a fatty ſubſtance that is become rank or muſty; or has contracted an ill ſmell by being kept cloſe.

RANDIA, a genus of plants, the claſs of which is not yet fully aſcertained: its flower is monopetalous, and of the ſhape of a ſaucer; the limb is divided into five ſegments: the fruit is an oval, unilocular capſule, containing numerous compreſſed ſeeds, ſurrounded with a pulp.

RANDOM SHOT, in gunnery, is a ſhot made when the muzzle of a gun is raiſed above the horizontal line, and is not deſigned to ſhoot directly, or point-blank. The utmoſt random of any piece is about ten times as far as the bullet will go point-blank. The bullet will go fartheſt when the piece is mounted to about 45° above the level range. See GUNNERY.

RANFORCE RING. See RE-IN-FORCED-RING.

RANGE, in gunnery, the path of a bullet, or the line it deſcribes from the mouth of the piece to the point where it lodges. If the piece lie in a line parallel to the horizon, it is called the right or level range: if it be mounted to 45°, it is ſaid to have the utmoſt range, all others between 00 and 45° are called the intermediate ranges.

RANGER, a ſworn officer of a foreſt, appointed by the king's letters-patent, whoſe buſineſs is to walk through his charge, to drive back the deer out of the purlieus, *&c.* and to preſent all treſpaſſes within his juriſdiction at the next foreſt-court.

RANGES, in a ſhip, two pieces of timber that go acroſs from ſide to ſide; the one on the fore-caſtle, a little abaft the foremaſt, and the other in the beak-head, before the wouldings of the bow-ſprit.

RANGIFER, the REIN-DEER. See the article REIN.

RANGING, in war, diſpoſing the troops in the order proper for an engagement, or for marching.

RANGING, in building, ſignifies running ſtrait, when the ſides of a work do not break into angles.

RANINE VEINS. See RANULARES.

RANK, the order or place allotted a perſon, ſuitable to his quality or merit.

RANK, in war, is a row of ſoldiers, placed ſide by ſide.

To double the ranks, is to put two ranks into one. To cloſe the ranks, is to bring the men nearer: and to open them, is to ſet them farther apart.

RANSOM,

RANSOM, a ſum of money paid for the redemption of a ſlave, or for the liberty of a priſoner of war. In our law-books, ranſom is alſo uſed for a ſum paid for the pardon of ſome great offence, and to obtain the offender's liberty.

RANT, in the drama, an extravagant, unnatural, and improbable flight of paſſion.

RANULA, or RANA, in medicine, a tumour under the tongue, which like a ligature hinders a child from ſpeaking or ſucking.

The matter contained in theſe tumours is various, it being ſometimes a tenacious and mucous lymph, ſometimes a thick and purulent matter, and ſometimes of a hard and ſtony conſiſtence. The ſafeſt method of cure, according to Heiſter, is to turn the tongue upwards, and to make a tranſverſe inciſion through the tumour, in order to diſcharge the included matter; after which you may deterge or deſtroy the remaining tunic with honey of roſes ſharpened with ſpirits of vitriol, and then the cure may be eaſily completed with a mixture of oil and ſugar. Sometimes the tubercle breaks of itſelf, and then you muſt deterge and heal the ulcer as before.

RANUNCULUS, CROWFOOT, in botany, a genus of the *polyandria-polygnia* claſs of plants, the flower of which conſiſts of five obtuſe petals: there is no pericarpium; the ſeeds, which are numerous, being connected to the receptacle, by means of very ſhort peduncles. See plate CCXXVII. fig. 5.

This genus comprehends the ficaria, ranunculus, and ranunculoides of authors: there are a great many ſpecies of it in our meadow and paſture grounds, where they remain after the paſture is grazed; becauſe being very acrid, the cattle never eat them, otherwiſe they would bliſter their mouths and throats.

RANULARES, or RANINE VEINS, in anatomy, two veins under the apex of the tongue, which ariſe from the internal jugular, and run on either ſide the linea mediana. See the article TONGUE.

RAOLCONDA, a city of the hither India, ſituated in the province of Golconda: eaſt long. 79°, north lat. 17° 12′.

RAPACIOUS ANIMALS, are ſuch as live upon prey.

The characteriſtic marks of rapacious birds are, that they have a large head and a ſhort neck, hooked, ſtrong, and ſharp-pointed talons, a ſharp ſight, a membranous ſtomach, and not a muſculous one, or a gizzard like birds that live on grain.

RAPA, RAPE, in botany, is made by Linnæus a ſpecies of braſſica.

RAPE, in law, the having carnal knowledge of a woman by force and againſt her will. By ſtatute, whoever carnally knows a female child under ten years of age, ſhall ſuffer as a felon; and here it does not ſignify whether ſuch child conſented, or was forced; it is only to be proved that the offender entered her body; the crime itſelf conſiſts in penetration and emiſſion but where there is neither of theſe, an attempt to raviſh, be it never ſo outrageous, is deemed only an aſſault. In caſe a woman conceives, it is held to be no rape, from an opinion, that ſhe cannot conceive unleſs ſhe conſent. However, it is no excuſe that a woman at laſt yielded to the violence and conſented, if her conſent was extorted by the fear of death and impriſonment. However, it is a ſtrong preſumption againſt the woman, if ſhe make no complaint within forty days after the injury, which is the time allowed by law. A woman who has been raviſhed may proſecute, and likewiſe be a witneſs in her own cauſe: but it is remarked by chief juſtice Hales, that how far the woman's teſtimony is to be believed, muſt be entirely left to the jury on the trial; it being more or leſs credible according to the circumſtances of the fact. The aiders and abetters in the commiſſion of a rape are indictable as principals, and are guilty of felony without benefit of clergy. Antiently this crime was not deemed felony; but it was puniſhed with the loſs of the offenders eyes and privy members.

The civilians make another kind of rape, called rape of ſubornation or ſeduction; which is ſeducing a maid either to uncleanneſs or marriage, and that by gentle means, provided there be a conſiderable diſparity in the age and circumſtances of the parties. See the article RAVISHMENT.

RAPE *of the foreſt*, a treſpaſs commited in a foreſt by violence. See FOREST.

RAPE is alſo a name given to a diviſion of a county, and ſometimes means the ſame as a hundred, and at other times ſignifies a diviſion conſiſting of ſeveral hundreds; thus Suſſex is divided into ſix rapes, every one of which, beſides its hundreds, has a caſtle, a river, and a foreſt belonging to it. The like parts

in

in other counties are called tithings, lathes, or wapentakes.

RAPE alſo ſignifies the ſtalks of the cluſters of grapes when dried, and freed from the fruit. This is uſed in making vinegar. See the article VINEGAR.

RAPE-SEED, the ſeed of a plant deſcribed by authors under the name of napus ſylveſtris and bunias ſylveſtris. See the article NAPUS.

Rape-ſeed is cultivated to great advantage in ſeveral counties in England, particularly in Lincolnſhire, and conſiderable quantities of it are brought from Holland. From this ſeed is drawn an oil called rape-oil, which is uſed in the woollen manufacture, and in the materia medica is eſteemed attenuant, cordial, and ſudorific.

Rape-ſeed, on being imported, pays a duty of 5l. 13s. 6d. the laſt, containing ten quarters; and draws back, on exportation, 5l. 8s. 9d.

RAPHANUS, the RADISH, in botany, a genus of the *tetradynamia* claſs of plants, the flower of which conſiſts of four leaves diſpoſed in the form of a croſs: its fruit is a pod, containing ſeveral roundiſh and ſmooth ſeeds.

Radiſhes are attenuant, and good in ſcurvies and other diſorders proceeding from viſcidities of the juices, and other obſtructions of the glands.

RAPHIDIA, in zoology, a genus of four-winged inſects of the neuroptera order; the head of which is of a horny ſubſtance, and depreſſed; and its tail is armed with a ſlender horny weapon, not bifid at the extremity: it is about the ſize of the ſcorpion fly, and is common in meadows in July.

RAPIER, formerly ſignified a long, old-faſhioned broad ſword, ſuch as thoſe worn by the common ſoldiers: but it now denotes a ſmall ſword, as contradiſtinguiſhed from a back-ſword.

RAPINE, in law, taking away another's goods, *&c.* openly and by violence.

RAPISTRUM, in botany, the ſame with crambe. See the article CRAMBE.

RAPOLLA, a town of Italy, in the kingdom of Naples, ſixty-ſix miles eaſt of Naples.

RAPPAHANOCK, a large navigable river which riſes in the mountains weſt of Virginia, and diſcharges itſelf into the bay of Cheſepeak.

RAPPERSWEIT, a town of Switzerland, in the canton of Zurich, ſeventeen miles ſouth-eaſt of the city of Zurich.

RAPSODY. See RHAPSODY.

RAPTU HÆREDIS, an antient writ which lay at common law, for taking away an heir that held land in ſockage. See the article RAVISHMENT.

RAPTURE, an extaſy, or tranſport of mind. See EXTASY, ENTHUSIASM, *&c.*

RAPUNCULUS, in botany, a plant otherwiſe called pytheuma. See PYTHEUMA.

RAPUNTIUM, a plant called alſo lobelia. See the article LOBELIA.

RARE, in phyſics, ſtands oppoſed to denſe, and denotes a body that is very porous, whoſe parts are at a great diſtance from one another, and which contains but little matter under a large bulk. See the following article.

RAREFACTION, *rarefactio*, in phyſics, the act whereby a body is rendered rare; that is, brought to poſſeſs more room, or appear under a larger bulk without acceſſion of any new matter.

Rarefaction is oppoſed to condenſation. See CONDENSATION, COMPRESSION, and DENSITY.

Rarefaction is moſt properly reſtrained to that expanſion of a maſs into a larger bulk, which is effected by heat. All expanſion from other cauſes they call dilatation. See EXPANSION, DILATATION, and FIRE.

It is by rarefaction that gunpowder has its effect, and to the ſame principle alſo we owe our æolipiles, thermometers, *&c.* The degree to which the air is rarifiable, exceeds all imagination; ſuch is the rarefaction of common air from its own principle of elaſticity, and without any previous condenſation, that Mr. Boyle found it to dilate itſelf ſo as to take up 13679 times its former ſpace; and when compreſſed, the ſame author found its greateſt ſpace when moſt rarified, to its leaſt when moſt condenſed, as 55000 to 1. See AIR and ATMOSPHERE.

Such an immenſe rarefaction, Sir Iſaac Newton ſhews is inconceivable on any other principle than that of a repelling force inherent in the air, whereby its particles mutually fly from one another. This repelling force, he obſerves, is much more conſiderable in air than in other bodies, as being generated from the moſt fixed bodies, and that with much difficulty, and ſcarce without fermentation; thoſe principles being always found to fly each other with the moſt force, which, when in contact, cohere the moſt firmly. M. Mariotte eſtabliſhed this as a principle, from experiments, that the different

ent rarefactions or condenſations of the air, follow the proportion of the weights wherewith it is preſſed. Hence, ſuppoſing the mercury in the level of the ſea ſuſpended to 28 inches, which is the weight of the whole atmoſphere; and that 60 feet height of air are equivalent to a line or $\frac{1}{12}$ of an inch of mercury, ſo that the barometer at the height of 60 feet from the ſea, would fall a line. It is eaſy finding what height of air would be equal to a ſecond, or any other line of mercury; for, as 28 inches of mercury $\frac{1}{12}$ are to 28 inches, ſo is the height of 60 feet of air to a fourth term, which is the height of air correſponding to a ſecond line of mercury. And after the ſame manner may the height of air correſponding to each line be found, which will make a geometrical progreſſion, the ſum whereof will be the whole height of the atmoſphere, and of conſequence a certain part of that ſum will be the height of a mountain, at whoſe top the barometer ſhall have ſunk a certain quantity. See the article BAROMETER.

Meſſ. Caſſini and Maraldi, upon meaſuring the heights of ſeveral mountains, found that this progreſſion of M. Mariotte was defective; that it always gave the height of the mountains, and conſequently the rarefactions, leſs than they really were; and from ſome farther experiments M. Amontons found, that the principles will only hold in the mean rarefactions, not the extremes. See the article MOUNTAIN.

The open air, in which we breathe, ſays Sir Iſaac Newton, is 8 or 900 times lighter than water, and by conſequence 8 or 900 times rarer. And ſince the air is compreſſed by the weight of the incumbent atmoſphere, and the denſity of the air is proportionable to the compreſſing force, it follows by computation, that at the height of about ſeven engliſh miles from the earth, the air is four times rarer than at the ſurface of the earth; and at the height of 14 miles, it is 16 times rarer than at the ſurface of the earth; and at the height of 21, 28, or 35 miles, it is reſpectively 64, 256, or 1024 times rarer, or thereabouts; and at the height of 70, 140, and 210 miles, it is about 1000000, 1000000000000, or 1000000000000000000, &c.

Mr. Cotes has found, from experiments made with a thermometer, that linſeed-oil is rarified in the proportion of 40 to 39 in the heat of the human body; in that of 15 to 14, in that degree of heat wherein water is made to boil; in the proportion of 15 to 13, in that degree of heat wherein melted tin begins to harden; and, finally, in the proportion of 23 to 20, in that degree wherein melted tin arrives at a perfect ſolidity. The ſame author diſcovered, that the rarefaction of the air in the ſame degree of heat is ten times greater than that of the linſeed-oil; and the rarefaction of the oil, about fifteen times greater than that of the ſpirit of wine.

RAREFACTIVES, in medicine, remedies which open and enlarge the pores of the ſkin, to give an eaſy vent to the matter of perſpiration: or ſuch medicines as rarify the blood, as aniſe, mallows, pellitory, chamomile-flowers, linſeed, &c.

RASANT, or RAZANT, in fortification. Raſant-flank, or line, is that part of the curtin or flank whence the ſhot exploded raſe, or glance, along the ſurface of the oppoſite baſtion.

RASEBURG, a port-town of Sweden, in the province of Finland, and territory of Nyland, ſituated on the gulph of Finland: eaſt long. 23°, north lat. 60° 22′.

RASEN, a market-town of Lincolnſhire, ſituated twelve miles north-eaſt of Lincoln.

RASH, in medicine, an eruption upon the ſkin, thrown out in fevers or ſurfeits.

RASP, a rank ſort of file. See FILE.

RASTAT, the name of two towns of Germany; one in the circle of Bavaria, and archbiſhopric of Saltzburg, ſituated on the river Ens, thirty-five miles ſouth of the city Ens; another in the circle of Swabia, and marquiſate of Baden, ſituated on the eaſt ſide of the river Rhine, twenty-one miles ſouth-weſt of Philipſburg.

RAT, in zoology, the engliſh name of ſeveral ſpecies of the mus-kind; as the common-rat, the ground-rat, and the water-rat. See plate CCXXVII. fig. 6. where n° 1. repreſents the common, and n° 2. the ground-rat.

The common rat is a quadruped too well known to need much deſcription. It is of a browniſh-grey colour, with a long and almoſt naked tail. It greatly reſembles the common mouſe in form, but it is at leaſt five times as large: the tail is divided into more than an hundred and fifty annular joints.

The ground-rat is nearly of the ſize of the common rat, only that its tail is much ſhorter, as well as more hairy.

The water-rat is considerably larger than the common kind: its tail is all the way of the same thickness, and is abrupt at the end: its legs are shorter than those of the common rat, but its feet are longer, and the toes connected by membranes.

Norway-RAT. See NORWAY.

RAT-TAILS, or ARRESTS, in the manege, signify hard callous swellings upon the hinder legs under the hough, running along the sinew.

A horse is called rat-tail, when he has no hair upon his tail.

RATAFIA, a fine spirituous liquor, prepared from the kernels, *&c.* of several kinds of fruit, particularly of cherries, and apricots.

Ratafia of cherries is prepared by bruising the cherries, and putting them into a vessel wherein brandy has been long kept; then adding to them the kernels of cherries, with strawberries, sugar, cinnamon, white pepper, nutmegs, cloves; and to twenty pound of cherries, ten quarts of brandy. The vessel is left open ten or twelve days, and then stopped close for two months before it be tapped.

Ratafia of apricots is prepared two ways, *viz.* either by boiling the apricots in white wine, adding to the liquor an equal quantity of brandy with sugar, cinnamon, mace, and the kernels of apricots; infusing the whole for eight or ten days; then straining the liquor, and putting it up for use: or else by infusing the apricots cut in pieces in brandy, for a day or two, passing it through a straining bag, and then putting in the usual ingredients.

RATCH, or RASH, in clock-work, a sort of wheel having twelve fangs, which serve to lift up the detents every hour, and make the clock strike. See CLOCK.

RATCHETS, in a watch, are the small teeth at the bottom of the fusy, or barrel, which stops it in winding up.

RATE, a standard or proportion, by which either the quantity or value of a thing is adjusted.

RATE-TYTHE, when sheep or other cattle are kept in a parish for less time than a year, the owner must pay tythe for them, *pro rata*, according to the custom of the place.

RATE *of a ship of war* is its order, degree, or distinction, as to magnitude, burden, *&c.* The rate is usually accounted by the length and breadth of the gun-deck, the number of tons, and the number of men and guns the vessel carries. Of these there are six rates. A first rate man of war has its gun-deck from 159 to 174 feet in length, and from 44 to 50 feet broad; it contains from 1313 to 1882 tons, has from 706 to 800 men, and carries from 96 to 100 guns. Second rate ships have their gun decks from 153 to 165 feet long, and from 41 to 46 broad; they contain from 1086 to 1482 tons, and carry from 524 to 640 men, and from 84 to 90 guns. Third rates have their gun decks from 140 to 158 feet in length, from 37 to 42 feet broad; they contain from 871 to 1262 tons; carry from 389 to 476 men, and from 64 to 80 guns. Fourth rates are in length on the gun decks from 118 to 146 feet, and from 29 to 38 broad, they contain from 448 to 915 tons; carry from 226 to 346 men, and from 48 to 60 guns. Fifth rates have their gun decks from 100 to 120 feet long, and from 24 to 31 broad; they contain from 259 to 542 tons, and carry from 145 to 190 men, and from 26 to 44 guns. Sixth rates have their gun decks from 87 to 95 feet long, and from 22 to 25 broad; they contain from 152 to 256 tons, carry from 50 to 110 men, and from 16 to 24 guns.

It is to be observed, that the new-built ships are much larger, as well as better, than the old ones of the same rate; whence the double numbers all along: the larger of which express the proportions of the new-built ships, as the less those of the old ones. See the articles SHIP and NAVY.

RATEEN, or RATTEN, in commerce, a thick woolen stuff, quilled, woven on a loom with four treddles, like serges, and other stuffs, that have the whale or quilling. There are some rateens dressed and prepared like cloths; others left simply in the hair, and others where the hair or knap is frized. Rateens are chiefly manufactured in France, Holland, and Italy, and are mostly used in linings. The frize is a sort of coarse rateen, and the drugget is a rateen half linen, half woolen.

RATIFICATION, *ratificatio*, an act approving of, and confirming something done by another in our name.

This word is particularly used in our laws for the confirmation of a clerk in a benefice, prebend, *&c.* formerly given him by the bishop, *&c.* where the right of patronage is doubted to be in the king.

Rati-

Ratification is alſo uſed for an act confirming ſomething we ourſelves have done in our own name.

RATIO, in arithmetic and geometry, is that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of a third.

Two numbers, lines, or quantities, A and B, being propoſed, their relation one to another may be conſidered under one of theſe two heads: 1. How much A exceeds B, or B exceeds A; and this is found by taking A from B, or B from A, and is called arithmetic reaſon or ratio. 2. Or how many times, and parts of a time, A contains B, or B contains A; and this is called geometric reaſon or ratio; (or, as Euclid defines it, it is the mutual habitude, or reſpect, of two magnitudes of the ſame kind, according to quantity; that is, as to how often the one contains, or is contained, in the other) and is found by dividing A by B, or B by A; and here note, that that quantity which is referred to another quantity, is called the antecedent of the ratio; and that to which the other is referred, is called the conſequent of the ratio; as, in the ratio of A to B, A is the antecedent, and B the conſequent. Therefore any quantity, as antecedent, divided by any quantity as a conſequent, gives the ratio of that antecedent to the conſequent.

Thus the ratio of A to B is $\frac{A}{B}$, but the ratio of B to A is $\frac{B}{A}$; and, in numbers, the ratio of 12 to 4 is $\frac{12}{4}=3$, or triple; but the ratio of 4 to 12 is $\frac{4}{12}=\frac{1}{3}$, or ſubtriple.

And here note, that the quantities, thus compared, muſt be of the ſame kind; that is, ſuch, which, by multiplication, may be made to exceed one the other, or as theſe quantities are ſaid to have a ratio between them, which, being multiplied, may be made to exceed one another. Thus a line, how ſhort ſoever, may be multiplied, that is, produced ſo long as to exceed in length any given right line, and conſequently theſe may be compared together, and the ratio expreſſed; but as a line can never, by any multiplication whatever, be made to have breadth, that is, to be made equal to a ſuperficies, how ſmall ſoever; theſe can therefore never be compared together, and conſequently have no ratio or reſpect one to another, according to quantity; that is, as to how often the one contains, or is contained in the other. See the article PROPORTION.

RATIOCINATION, *ratiocinatio*, the act of reaſoning. See REASONING.

RATION, or RATIAN, in the army, a portion of ammunition, bread, drink, and forage, diſtributed to each ſoldier in the army, for his daily ſubſiſtence, &c. The horſe have rations of hay and oats when they cannot go out to forage. The rations of bread are regulated by weight. The ordinary ration of a foot ſoldier is a pound and a half of bread per day. The officers have ſeveral rations according to their quality and the number of attendants that they are obliged to keep. When the ration is augmented on occaſions of rejoicing, it is called a double ration. The ſhip's crews have alſo their rations or allowances of biſket, pulſe, and water, proportioned according to their ſtock.

RATIONABILES EXPENSÆ, *reaſonable expences*. The commons in parliament, as well as the proctors of the clergy, in convocation, were antiently allowed rationabiles expenſas; that is, ſuch allowance as the king, conſidering the prices of all things, ſhall judge meet to impoſe on the people, to pay for the ſubſiſtence of their repreſentatives.

RATIONABILI *parte bonorum*, in law, is a writ which lies for the widow againſt the executors of her deceaſed huſband, who deny to give her the third part of his goods after the debts and funeral charges are paid. It is obſerved, that by the common law of England, the goods of a deceaſed perſon, his debts being firſt paid, ſhall be divided into three equal parts, and go to the wife, her children, and executors; wherefore this writ may be brought by the children as well as the widow. But it has been held that the writ only lies where the cuſtom of the country warrants it.

RATIONABILIBUS *diviſis*, in law, a writ that is brought where there are two lords in different towns, who have ſignories adjoining together, and one of them finds his waſte by little and little to have been incroached upon; then the lord on whoſe ground the incroachment was made ſhall have this writ againſt the other

to rectify the bounds and divisions. In which respect it is said by Fitzherbert, to be in its nature a writ of right.

RATIONAL, *reasonable*. See REASON.

RATIONAL is also applied to integral, fractional, and mixt numbers: thus we say rational fraction, rational integer, and rational mixt number, for the explanation and doctrine of which, see NUMBER and FRACTION.

Rational is applied to the true horizon, in opposition to the sensible or apparent one. See HORIZON.

Rational is also applied to quantity, ratio, &c. See QUANTITY, RATIO, &c.

RATIONALE, a solution, or account of the principles of some opinion, action, hypothesis, phænomenon, or the like. See the articles PRINCIPLE, PHÆNOMENON, &c.

Hence rationale is the title of several books.

RATIONALE is also the latin name for an antient sacerdotal vestment, worn by the high priest, under the old law, being a piece of embroidered stuff, worn on the breast, about a span square. A rationale appears to have been antiently worn by the bishops, under the new law: but authors are in doubt about its form; some having it to resemble that of the Jews; others taking it to be only the pallium. See the article PALLIUM.

RATIONIS OS, in anatomy, a term sometimes used for the os frontis. See the article FRONTIS OS.

RATIPOR, a town of Bohemia, in the dutchy of Silesia, situated on the river Oder, sixteen miles north-east of Troppaw.

RATIPOR is also a city of hither India, capital of the province of Malva, situated east long. 80°, north lat. 25°.

RATISBON, a city of Germany, in the circle of Bavaria, situated at the confluence of the rivers Danube and Regen, in east long. 12° 5′, north lat. 49°. This is a free imperial city, and here the assembly or diet of the states of the empire meets. See the article DIET.

RATLINES, or as the seamen call them, RATLINS, those lines which make the ladder steps to get up the shrouds and puttocks, hence called the ratlings of the shrouds.

RATTLE, among the antients, a musical instrument of the pulsative kind, called by the Romans crepitaculum. The tintinnabulum, crotalum, and sistrum, were by the same esteemed only so many different kinds of rattles. See the articles BELL, CROTALUM, and SISTRUM.

What we commonly call rattles now, is no more than a stick of wax in a silver handle, to which is suspended a number of little bells of the same, or some other metal, serving in the hands of children to make a rattling or tinkling noise, or otherwise to play withal.

Rattles for children the groce, containing twelve dozen, pay, on importation, 1s. $1\frac{86}{100}$d. and, on exportation, draw back 1s. $\frac{15}{100}$d.

RATTLE-SNAKE, *crotalophorus*, in zoology, a genus of serpents, having scuta that cover the whole under-surface of the body and tail, and having the extremity of the body terminated by a kind of rattle, formed of a series of urceolated articulations, which are moveable, and make a noise. See plate CCXXVIII. fig. 1.

Of this serpent, there are two species, the greater one with the scuta of the abdomen a hundred and seventy-two, of the tail twenty-one; and the lesser rattle-snake, having the scuta of the abdomen a hundred and sixty-five, of the tail twenty-eight. The larger is a very terrible, and at its full growth, a very large serpent, growing to eight feet in length, with a proportionable thickness: the head is large, broad, depressed, and of a pale brown: the iris of the eye is red; the back is of a brown colour, with an admixture of a ruddy yellow, and variegated with a great many irregular transverse lists, of a deep black: the belly is of a palish blue; the rattle is of a firm, and as it were of a horny substance, and brown colour, composed of a number of cells, which are articulated one within another, which articulations being very loose, the included points strike against the inner surface of the rings they are admitted into, and makes that rattling noise, when the serpent vibrates, or shakes its tail. This serpent is frequent in the woods of America: the bite is fatal, but it is easy to avoid it, the creature being sluggish, moving slowly, never attacking a man unless provoked, and giving notice before it bites by shaking its rattle.

The lesser species of this serpent grows to about seven feet in length, and in most particulars is like the former one, and its bite is equally mischievous.

RATTLE-SNAKE-ROOT, the ſame with the ſenega, a ſpecies of polygala. See the article POLYGALA.

RAVA, a city of Great Poland, capital of the Palatinate of Rava, ſituated fifty miles ſouth-eaſt of Warſaw.

RAUCEDO, *hoarſeneſs*, in medicine. See the article HOARSENESS.

RAVELIN, in fortification, was antiently a flat baſtion, placed in the middle of a curtin; but now a detached work compoſed only of two faces, which make a ſaliant angle, without any flanks, and raiſed before the curtin on the counterſcarp of the place. A ravelin is a triangular work, reſembling the point of a baſtion, with the flanks cut off. See the article FORTIFICATION.

Its uſe before a curtin is to cover the oppoſite flanks of the two next baſtions. It is uſed alſo to cover a bridge, or a gate, and is always placed without the moat. There are alſo double ravelins that ſerve to cover each other: they are ſaid to be double, when they are joined by a curtin. See CURTIN.

RAVEN, in ornithology, a ſpecies of the corvus, of the bigneſs of a common hen, of a black colour, with a blue back: the head is ſmall, depreſſed on the crown, and flatted at both ſides: the eyes are large, bright and piercing; the beak is conſiderably long and thick, and ſomewhat ridged on the back, and ſharp at the point. See CORVUS.

RAVENGLAS, a port-town of Cumberland, ſituated on the Iriſh Channel, thirty-eight miles ſouth-weſt of Carliſle.

RAVENNA, a city of Italy, in the pope's territories, capital of the province of Romania, ſituated eaſt long. 13° north lat. 44° 30′.

RAVISHMENT, in law, denotes an unlawful ſeducing either of a woman, or an heir that is in ward: ſometimes it is alſo uſed in the ſame ſenſe as a rape. See the article RAPE.

RAVISHMENT *de garde*, in law, was a writ that formerly lay for the guardian by knight's ſervice, or in ſocage, againſt a perſon who took from him the body of his ward.

RAUVOLFIA, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla of which conſiſts of a ſingle funnel-faſhioned petal, with a large limb, divided into five lanceolated ſegments: the fruit is a very large, roundiſh and fleſhy bilocular drupe, with a ſingle ovated nut in each cell.

RAY, in optics, a beam of light, emitted from a radiant, or luminous body. See the article LIGHT.

Rays are defined by Sir Iſaac Newton, to be the leaſt parts of light, whether ſucceſſive in the ſame line, or cotemporary in ſeveral lines. For that light conſiſts of parts of both kinds is evident, ſince one may ſtop what comes this moment in any point, and let paſs that which comes preſently after: now the leaſt light, or part of light, which may be thus ſtopped, he calls a ray of light.

A ray, or right line, drawn from the point of concourſe of the two optical axes, through the middle of the right line, which paſſes by the centers of the two pupils of the eyes, is by ſome called a common ray. See VISION.

As for direct, converging and diverging rays; rays of incidence, inflection, refraction, curvature, &c. See the articles DIRECT, CONVERGING, &c.

RAY-FISH, *raja*. See RAJA.

RAYLEIGH, a market-town of Eſſex, ten miles ſouth-eaſt of Chelmsford.

RAYONANT, or *Croſs* RAYONANT, in heraldry, one which has rays of glory behind it, darting out from the center to all the quarters of the eſcutcheon, as repreſented in plate CCXXVIII. fig. 2.

RAZANT, or RASANT. See the article RASANT.

RAZOR, a well-known inſtrument, uſed by ſurgeons, barbers, &c. for ſhaving off the hair from various parts of the body.

All razors are prohibited to be imported.

RAZOR-BILL, *alka*, in ornithology. See ALKA.

RAZOR-FISH, *dactylus*, a ſpecies of ſolen. See the article SOLEN.

RE, in grammar, an inſeparable particle added to the beginning of words, to double or otherwiſe modify their meaning; as in re-action, re-move, re-export, &c.

REACH, in the ſea-language, ſignifies the diſtance between any two points of land, lying nearly in a right line.

RE-ACTION, in phyſiology, the reſiſtance made by all bodies to the action or impulſe of others, that endeavour to change its ſtate whether of motion or reſt. See the articles ACTION and MOTION.

The cauſe of the re-action of bodies is no other than their inertia. See the article INERTIA.

READING,

READING, a borough-town in Berkſhire, ſituated forty miles weſt of London, near the confluence of the rivers Kennet and Thames; it ſends two members to parliament.

READINGS, or *various* READINGS, *variæ lectiones*, in criticiſm, are the different manner of reading the texts of authors in antient manuſcripts, where a diverſity has ariſen from the corruption of time, or the ignorance of copyiſts. A great part of the buſineſs of critics lies in ſettling the readings by confronting the various readings of the ſeveral manuſcripts, and conſidering the agreement of the words and ſenſe.

Readings are alſo uſed for a ſort of commentary or gloſs on a law, text, paſſage, or the like, to ſhew the ſenſe an author takes it in, and the application he conceives to be made of it.

RE-AFFORESTED, is where a foreſt, having been diſafforeſted, is again made a foreſt. See FOREST.

RE-AGGRAVATION, in the romiſh eccleſiaſtical law, the laſt monitory publiſhed after three admonitions, and before the laſt excommunication. Before they proceed to fulminate the laſt excommunication, they publiſh an aggravation, and a re-aggravation. See the article EXCOMMUNICATION.

REAL, *reale*, is applied to a being that actually exiſts, in which ſenſe it coincides with actual. See ACTUAL.

REAL, in law, is oppoſed to perſonal. See the article PERSONAL.

Thus real action is that whereby the plaintiff lays title to land, *&c.* See the article ACTION, *&c.*

REAL, or CHIAPA, a city of Mexico, in north America, capital of the province of Chiapa, ſituated weſt long. 97°, north lat. 17°.

REALEIO, a port town of Mexico, in the province of Nicaragua, ſituated on the bay of the Pacific Ocean, in weſt long. 91° 30′, north lat. 12°.

REALGAR, *riſigallum*, in the materia medica, a name whereby the ſandarach has been a long time known in the ſhops. It has been alſo attributed to the factitious red arſenic. See the articles SANDARACH, and ARSENIC.

REALISTS, *realiſtæ*, a ſect of ſchool philoſophers, formed in oppoſition to the nominaliſts. See NOMINALISTS.

Under the realiſts are included the ſcotiſts, thomiſts, and all excepting the followers of Ocham. Their diſtinguiſhing tenet is that univerſals are realities, and have an actual exiſtence out of an idea, or imagination; or, as they expreſs it in the ſchools, a *parte rei*; whereas the nominaliſts contend that they exiſt only in the mind, and are only ideas, or manners of conceiving things.

REALITY, *realitas*, in the ſchools, a diminutive of *res*, thing, firſt uſed by the ſcotiſts, to denote a thing which may exiſt of itſelf; or which has a full and abſolute being of itſelf, and is not conſidered as a part of any other.

REALM, *regnum*, a country which gives its head, or governor, the denomination of a king.

REALMONT, a town of France, in the province of Languedoc, ſituated thirty-two miles north-eaſt of Toulouſe.

REAR, a term frequently uſed in compoſition, to denote ſomething behind, or backwards, in reſpect of another, in oppoſition to van: thus, in a military ſenſe, it is uſed for the hind part of an army, in oppoſition to the front. For the rear-guard, rear-half files, rear-line, rear-rank, and rear-admiral. See GUARD, FILE, LINE, RANK, and ADMIRAL.

REASON, *ratio*, a faculty, or power, of the mind, whereby it diſtinguiſhes good from evil, truth from falſhood; whereby man is diſtinguiſhed from beaſts; and wherein it is evident he greatly ſurpaſſes them: or reaſon is that principle whereby, comparing ſeveral ideas together, we draw conſequences from the relations they are found to have. See the article REASONING.

Some define reaſon to be the comprehenſion of many principles which the mind ſucceſſively can conceive, and from which concluſions may be drawn. And others conceive reaſon as no other than the underſtanding itſelf conſidered as it diſcourſes. See UNDERSTANDING.

Reaſon, Mr. Locke obſerves, contains two diſtinct faculties of the mind, *viz.* ſagacity, whereby it finds intermediate ideas; and illation, whereby it ſo orders and diſpoſes of them, as to diſcover what connection there is in each link of the chain, whereby the extremes are held together; and thereby, as it were, draws into view the truth ſought for. Illation, or inference, conſiſts in nothing but the perception of the connection there is between the ideas in each ſtep of the deduction, whereby the mind comes to ſee either the agreement or diſagreement of any two ideas, as in demonſtration,

ſtration, in which it arrives at knowledge; or their probable connection, on which it gives or with-holds, its aſſent, as in opinion. See the articles DEMONSTRATION, KNOWLEDGE, &c.

Senſe and intuition reach but a little way, the greateſt part of our knowlege depends upon deductions and intermediate ideas. In thoſe caſes where we muſt take propoſitions for true, without being certain that they are ſo, we would need to find out, examine, and compare the grounds of their probability. In both caſes the faculty which finds out the means, and rightly applies them to diſcover certainty in the one, and probability in the other, is that which we call reaſon. In reaſon, therefore, we may conſider four degrees, firſt the diſcovering and finding out of proofs. See INVENTION.

Secondly, the regular and methodical diſpoſition of them, and laying them in ſuch order, as that their connection may be plainly perceived. See METHOD.

Thirdly, the perceiving of their connection. See JUDGMENT. And,

Fourthly, the making a right concluſion. See CONCLUSION.

Concerning reaſon, Mr. Locke thinks that ſyllogiſm, as was generally thought, is not the proper inſtrument of it, nor the uſefulleſt way of exerciſing this faculty. See SYLLOGISM.

Reaſon, though of very large extent, fails us in ſeveral inſtances, as firſt, where our ideas fail; ſecondly, it is often at a loſs, becauſe of the obſcurity, confuſion, or imperfection of the ideas it is employed about: thus, having no perfect idea of the leaſt extenſion of matter, nor of infinity, we are at a loſs about the diviſibility of matter. Thirdly, our reaſon is often at a ſtand, becauſe it perceives not thoſe ideas which would ſerve to ſhew the certain or probable agreement or diſagreement of any two other ideas. Fourthly, our reaſon is very often engaged in abſurdities, and difficulties, by proceeding upon falſe principles, which being followed, lead men into contradictions to themſelves and inconſiſtency in their own thoughts. Fifthly, dubious words, and uncertain ſigns, often puzzle men's reaſon, and bring them to a nonplus. Though the deducing one propoſition from another be a great part of reaſon, and that which it is uſually employed about, yet the principal act of ratiocination is the finding the agreement or diſagreement of two ideas one with another by the intervention of a third; as a man by a yard finds two houſes to be of the ſame length, which could not be brought together to meaſure their equality by juxta-poſition. Words have their conſequences as the ſigns of ſuch ideas; and things agree or diſagree with what they really are, but we obſerve it only by our ideas. Hence we may be able to form an idea of that ordinary diſtinction of things into thoſe that are according to, thoſe that are above, and thoſe contrary to, reaſon. Thoſe according to reaſon, are ſuch propoſitions whoſe truth we can diſcover by examining and tracing thoſe ideas we have from ſenſation and reflection, and by a natural deduction find to be true or probable. Above reaſon are ſuch propoſitions, whoſe truth or probability we cannot by reaſon derive from theſe principles. Contrary to reaſon are ſuch propoſitions as are inconſiſtent with, or irreconcileable to, our clear and diſtinct ideas. Thus the exiſtence of one God is according to reaſon; the exiſtence of more than one God, contrary to reaſon; and the reſurrection of the body after death, above reaſon. Above reaſon may be alſo taken in a double ſenſe, *viz.* above probability, or above certainty.

Reaſon, as contradiſtinguiſhed to faith, Mr. Locke takes to be the diſcovery of the certainty or probability of ſuch propoſitions or truths, as the mind arrives at, by deductions made from ſuch ideas, which it has got by the uſe of its natural faculties, *viz.* by ſenſation or reflection; whereas faith, on the other hand, is the aſcent to any propoſition upon the credit of the propoſer, as coming immediately from God, which we call revelation. See FAITH and REVELATION.

This uſe of the word reaſon our author takes to be very improper; faith, as has been already obſerved, being nothing elſe but a firm aſſent of the mind, which if regulated, as is our duty, cannot be afforded to any thing but upon good reaſon, and ſo cannot be oppoſite to it.

REASON is alſo taken in different other ſignifications; ſometimes it denotes true and clear principles; ſometimes it is taken for clear and fair deductions from theſe principles; and ſometimes for the cauſe, particularly the final cauſe.

REASONABLE AID was antiently a duty that the lord of the fee claimed of his tenants holding by knight's ſervice, or ſocage, towards marrying his daughter, or the making his eldeſt ſon a knight.

REASON-

REASONING, RATIOCINATION, the exercise of that faculty of the mind called reason; or it is an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known. See REASON.

It often happens in the comparing ideas together, that their agreement or disagreement cannot be discerned at first view, especially if they are of such a nature as not to admit of an exact application to one another: here then, as has been already observed under REASON, it becomes necessary to look out after some third idea that will admit of such an application as the present case requires. Hence it appears that every act of reasoning necessarily includes three distinct judgments, two wherein the ideas whose relation we want to discover, are are severally compared with the middle idea, and a third wherein they are themselves connected, or disjoined according to the result of that comparison. Now, as our judgment when put into words are called propositions, so the expressions of our reasonings are termed syllogisms. And hence it follows that as every act of reasoning implies three several judgments, so every syllogism must include three distinct propositions. See the article SYLLOGISM.

In order therefore to infer a conclusion by a single act of reasoning, the premises must be intuitive propositions; where they are not, previous syllogisms are required, in which case reasoning becomes a complicated act taken in a variety of successive steps. This frequently happens in tracing the more remote relations of our ideas, where many middle terms being called in; the conclusion cannot be made out, but in consequence of a series of syllogisms following one another in train. Hence we may clearly perceive that reasoning, in the highest exercise of that faculty, is no more than an orderly combination of simple acts of reasoning. See DEMONSTRATION.

Thus we see that reasoning, beginning with first principles, rises gradually from one judgment to another, and connects them in such a manner that every stage of the progression brings intuitive certainty along with it.

All the aims of human reasoning may in the general be reduced to these two. 1. To rank things under those universal ideas to which they truly belong; and, 2. To ascribe to them their several attributes and properties in consequence of that distribution.

This first aim of reason then is to determine the genera and species of things; and the second end regards the sciences and the affairs of common life. See the articles GENUS, SPECIES, &c.

As in tracing the most distant relation of things we must always have recourse to intervening ideas, and are more or less successful in our researches, according to our acquaintance with those ideas, and ability of applying them, it is evident that to make a good reasoner two things are principally required; first an extensive knowledge of those intermediate ideas, by means of which things may be compared one with another; secondly, the skill and talent of applying them happily in all particular instances that come under consideration.

There is another species of reasoning with two propositions, which seems to be compleat in itself, and where we admit the conclusion without supposing any tacit or suppressed judgment in the mind from which it follows syllogistically. This happens between propositions where the connection is such that the admission of the one necessarily, and at the first sight, implies the admission also of the other: for if it falls out that the proposition on which the other depends is self evident, we content ourselves with barely affirming it, and infer that other by a direct conclusion: thus, by admitting an universal proposition we are forced also to admit of all the particular propositions comprehended under it; this being the very condition that constitutes a proposition universal. If then that universal proposition chances to be self evident, the particular ones follow of course, without any farther train of reasoning.

Another species of reasoning is that called by logicians induction; in order to the right understanding of which, it will be necessary to observe, that our general ideas are for the most part capable of various subdivisions: thus the idea of the lowest species may be subdivided into its several individuals; the idea of any genus into the different species it comprehends, and so of the rest. If then we suppose this distribution to be duly made, so as to take in the whole extent of the idea to which it belongs, then it is plain that all the subdivisions or parts of any idea taken together,

together conſtitute that whole idea: thus the ſeveral individuals of any ſpecies taken together conſtitute the whole ſpecies, and all the various ſpecies comprehended under any genus make up the whole genus; this being allowed, it is apparent that whatever may be affirmed of all the ſeveral ſubdiviſions and claſſes of any idea ought to be affirmed of the whole general idea to which theſe ſubdiviſions belong. What may be affirmed of all the individuals of any ſpecies, may be affirmed of the whole ſpecies; and what may be affirmed of all the ſpecies of any genus, may alſo be affirmed of the whole genus. This way of reaſoning, where we infer univerſally concerning any idea, what we had before affirmed or denied ſeparately of all its ſeveral ſubdiviſions and parts, is called reaſoning by induction. thus, if we ſuppoſe the whole tribe of animals ſubdivided into men, beaſts, birds, inſects and fiſhes, and then reaſon concerning them in this manner; all men have a power of beginning motion, all beaſts, birds, and inſects have a power of beginning motion, all fiſhes have a power of beginning motion; therefore all animals have a power of beginning motion.

For the method of reaſoning by a concatenation of ſyllogiſms, ſee the article DEMONSTRATION.

For the method of reaſoning by dilemma, ſee the article DILEMMA.

RE-ATTACHMENT, in law, is a ſecond attachment of a perſon, who was formerly attached and diſmiſſed the court without day, on account of the not coming of the juſtices, or other ſuch caſualty: without which, a cauſe diſcontinued cannot be revived, but the defendant muſt plead de novo.

RE-BAPTISANTS, the ſame with anabaptiſts. See ANABAPTITS.

REBATE, or REBATEMENT, in commerce, a term much uſed at Amſterdam, for an abatement in the price of ſeveral commodities, when the buyer, inſtead of taking time, advances ready money.

Rebate, which among us is uſually called prompt-payment, is eſtimated by months, and is only allowed for certain merchandize, which, according to the cuſtom of Amſterdam, are

German wools,	which are ſold at	15	months rebate.
Spaniſh wools,		21	
Aſhes and pot-aſhes,		18	
Italian ſilks,		33	
Sugars of Brazil,		18	

That is, thoſe commodities are ſold for ready money, only deducting or rebating the intereſt of the money, which need not have been paid till the end of 15, 21, &c. months. This intereſt is uſually regulated on the foot of 8 *per cent. per annum.*

REBATEMENT, in heraldry, a diminution or abatement of the bearings in a coat of arms. See ABATEMENT.

REBEL, a town of Germany, in the dutchy of Mecklenburgh, thirty-two miles ſouth-eaſt of Guſtrow.

REBELLION, a traiterous taking up of arms againſt the king by his own natural ſubjects, or thoſe formerly ſubdued.

Commiſſion of REBELLION. See the article COMMISSION.

REBELLIOUS ASSEMBLY, in law, an aſſembling together of twelve or more perſons, with an intent of unlawfully making uſe of their own authority, to change or alter any laws of this kingdom, or to deſtroy the incloſures of any ground, or the banks of any fiſh-pond, pool, or conduit, to the intent that it may lie waſte and void; or to deſtroy the deer in any park, fiſh in fiſh-ponds, coneys in any warren; or any houſe, barn, mills, or bays; or to burn ſacks of corn, abate rents, or prices of victuals, &c. See the article RIOT.

REBOUND. See RECOIL.

REBUS, an ænigmatical repreſentation of ſome name, &c. by uſing figures or pictures inſtead of words, or parts of words. Camden mentions an inſtance of this abſurd kind of wit in a gallant who expreſſed his love to a woman, named Roſe Hill, by painting in the border of his gown a *roſe*, a *hill*, an *eye*, a *loaf*, and a *well*; which, in the ſtyle of the rebus, reads, *Roſe Hill I love well.* This kind of wit was long practiſed by the great, who took the pains to find devices for their names. It was, however happily ridiculed by Ben Johnſon, in the humourous deſcription of Abel Drugger's device, in the Alchemiſt; and by the Spectator, in the device of Jack of Newbery; at which time the rebus, being raiſed to ſign poſts, was grown out of faſhion at court.

REBUTTER, in law, the defendant's anſwer to the plaintiff's ſurrejoinder, in a cauſe depending in the court of chancery, &c. Alſo when a perſon warrants lands, &c. to another, and he that has the warranty, or his heir, ſues him to whom the warranty is made, or his heir or aſſignee for the ſame

thing; if he, who is ſued, plead the deed or fine with warranty, and pray judgment whether the plaintiff ſhall be received to demand the thing which he ought to warrant to the party, againſt the warranty in the deed, &c. this is called a rebutter.

RECANATI, a town of Italy, in the province of Ancona, ſix miles weſt of Loretto.

RECAPITULATION, in oratory, &c. a part of the peroration. See the article PERORATION.

Recapitulation is a ſummary, or a conciſe and tranſient enumeration of the principal things inſiſted on in the preceding diſcourſe, whereby the force of the whole is collected into one view.

RECAPTION, in law, the taking a ſecond diſtreſs of one formerly diſtrained for the ſame cauſe during the plea grounded upon the former diſtreſs. It is alſo the name of a writ which lies for the party thus diſtrained, to recover damages, &c.

RECEIPT, or RECEIT, in commerce, an acquittance, or diſcharge, in writing, intimating that the party has received a certain ſum of money, either in full for the whole debt, or in part, or on account.

RECEIPT, in book-keeping, is an account of all the money and goods received. See the article BOOK.

RECEIPT, or RESCEIT, in law. See the article RESCEIT.

RECEIPT *of the exchequer*. See the article EXCHEQUER.

RECEIPT, in medicine. See RECIPE.

Auditor of the RECEIPTS. See the article AUDITOR.

RECEIVER, in chemiſtry, a veſſel of earth, glaſs, &c. for receiving any diſtilled liquor.

RECEIVER, in pneumatics, a glaſs-veſſel for containing the thing on which an experiment in the air-pump is to be made. See AIR-PUMP, EXHAUSTED, &c.

There are ſeveral ſorts of glaſs-receivers; As A (plate CCXXVIII. fig. 3. n° 1.) open at top, covered with a braſs-plate, and oiled leather, at D, and kept down by the croſs-piece EF, ſcrewed down upon the pillars B, C, which are ſcrewed into the table of the air-pump. See the articles AIR and PUMP.

H (*ib.* n° 2.) is a receiver open at top, with a plate and collar of wet leathers K, through which goes the ſlip-wire GI, ſo tight as to let in no air: this wire ſerves to lift any thing by its hook.

M (*ib.* n° 3.) is a transferrer, or receiver, that may be taken off from the pump, in an exhauſted ſtate; N being a plate and leather, on which ſtands the receiver M, cloſe at top; and O, a cock, to open or ſhut the paſſage. Now, the cock being open, and the air exhauſted by the pump, if the cock be ſhut, the receiver and pipe may be taken away from the air-pump, the vacuum remaining in M.

Mr. Boyle obſerves, that a very ſmall crack in the receiver, uſed in pneumatical experiments, does not render them uſeleſs; for upon evacuating the internal air, the external preſſing the glaſs on all ſides, brings the edges of the glaſs cloſe together. But in caſe of conſiderable flaws, a plaſter may be applied, made of quick-lime, finely powdered, and nimbly ground, with a proper quantity of the ſcrapings of cheeſe, and water enough to bring the mixture to a ſoft paſte; which, when the ingredients are well incorporated, will have a ſtrong and fetid ſcent; and then it muſt be immediately ſpread upon a linnen-cloth, and applied, leſt it begin to harden.

RECEIVER, *receptor* or *receptator*, in law, is commonly underſtood in a bad ſenſe, and uſed for ſuch as knowingly receive ſtolen goods from thieves, and conceal them. This crime is felony, and the puniſhment is tranſportation for fourteen years.

RECEIVER alſo ſignifies an officer; of which there are ſeveral kinds, denominated from the particular matters they receive, the places where, or the perſons from whom, &c. 1. Receiver of the fines is an officer appointed to receive the money of ſuch perſons as compound with the king, upon original writs ſued out of chancery. 2. Receiver general of the dutchy of Lancaſter is an officer belonging to the dutchy-court, who collects all the revenues, fines, forfeitures, and aſſeſſments within that dutchy. 3. Receiver general of the public revenue, is an officer appointed in every county, to receive the taxes granted by parliament, and remit the money to the treaſury.

RECEPTACULUM CHYLI, or PECQUET'S RESERVATORY, the reſervoir or receptacle for the chyle, ſituated in the left ſide of the upper vertebra of the loins, under the aorta, and the veſſels of the

Fig. 1. The RATTLE-SNAKE

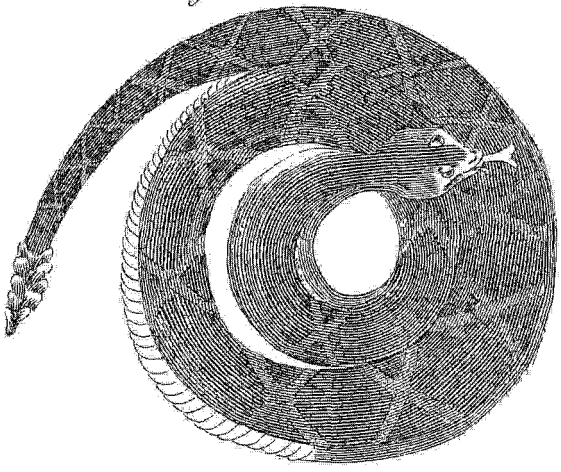


Fig. 2 RAVONANT

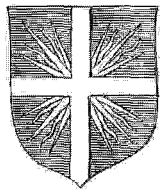

Fig. 3. RECEIVERS

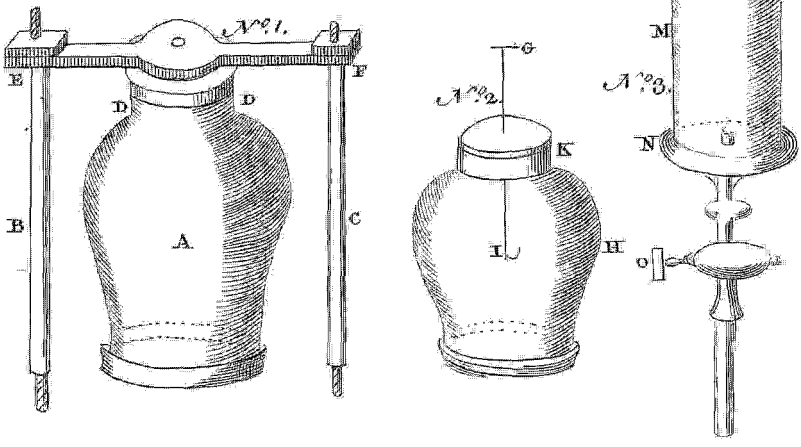

Fig. 4 RECIPIANGLE

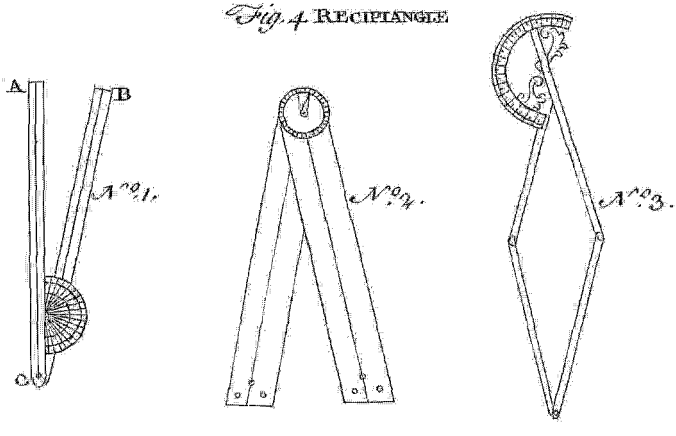

the left kidney. See CHYLIFICATION and THORACIC DUCT.

RECEPTACULUM SEMINUM, RECEPTACLE OF THE SEED, a term uſed by botaniſts, for the baſe, or thalamus, which ſupports the ſeeds: the diſc of this part is either flat, concave, convex, globular, or pyramidal; and its ſurface is ſometimes naked, and ſometimes paleaceous.

RECESSUS IMPERII, or RECESS *of the empire*, ſignifies a collection of the determinations of a diet of the german empire. See DIET and EMPIRE.

RECHABITES, a kind of religious order among the antient Jews, inſtituted by Jonadab, the ſon of Rechab, comprehending only his own family and poſterity.

Their founder preſcribed them three things: firſt, not to drink any wine; ſecondly, not to build any houſes, but to dwell in tents; and thirdly, not to ſow any corn, or plant vines. Theſe rules the rechabites obſerved with great ſtrictneſs.

RECHACING, in hunting, driving back the deer, or other beaſts, into the foreſts, chaces, *&c.* from whence they had ſtrayed.

RECHANGE, or RE-EXCHANGE. See the article RE-EXCHANGE.

At ſea they uſe the term rechange for a tackle kept in reſerve, in caſe that already in uſe ſhould fail. See TACKLE.

RECHARGE, a ſecond charge or loading of a fire-arm.

The recharge ſhould never be ſo deep as the firſt charge, leſt the piece, being overheated, ſhould burſt.

RECHEAT, in hunting, a leſſon which the huntſmen play on the horn, when the hounds have loſt their game, to call them back from purſuing a counter-ſcent.

RECIPE, in medicine, a preſcription or remedy, to be taken by a patient; ſo called becauſe always beginning with the word *recipe*, *i. e. take*; which is generally denoted by the abbreviature ℞.

For the rules proper to be obſerved in forming recipes, ſee PRESCRIPTION.

RECIPIANGLE, or RECIPIENT-ANGLE, a mathematical inſtrument, ſerving to meaſure re-entering and ſaliant angles, eſpecially in fortification.

It uſually conſiſts of two arms, or rulers, A C, and B C (plate CCXXVIII. fig. 4. n° 1.) riveted together at C, and capable of being opened and cloſed, like a ſector. To take an angle with it, they lay the center of a protractor over the joint C, and apply its diameter to one of the rulers; then the degrees cut by the edge of the other ruler, ſhew the quantity of the angle.

There are other forms of this inſtrument; that repreſented *ibid.* n° 2. has a graduated circle, by which the angles may be readily meaſured by its index: and n° 3. *ibid.* is another kind compoſed of four equal rulers of braſs, riveted together by their ends, ſo as to form a parallelogram; and on one of the rulers is fixed a graduated ſemi-circle, which meaſures the oppoſite angle of the parallelogram, by means of one of the rulers produced, ſo as to ſerve inſtead of an index.

RECIPIENT, the ſame with receiver. See the article RECEIVER.

RECIPROCAL, in general, ſomething that is mutual, or which is returned equally on both ſides, or that affects both parties alike.

There are reciprocal duties between the prince and his ſubjects, between the huſband and wife, *&c.* alſo in a phyſical ſenſe, the action between the agent and patient is reciprocal: that is, the patient re-acts as much upon the agent, as this acts upon it. See REACTION.

RECIPROCAL TERMS, among logicians, are thoſe which have the ſame ſignification; and conſequently are convertible, or may be uſed for each other.

RECIPROCAL VERSES, in grammar, are thoſe which expreſs an action that is reflected upon the agent or agents, as,

Ces quatre hommes s'entrebattoient.

Theſe four men fought together.

Reciprocal verſes, in poetry, are ſuch as run the ſame both forwards and backwards.

RECIPROCAL FIGURES, in geometry, thoſe which have the antecedents and conſequents of the ſame ratio, in both figures. Thus, in plate CCXXIX. fig. 4. the ſide A:B::C:D; or 12:4::9:3; that is, as much as the ſide A, in the firſt rectangle, is longer than B, ſo much deeper is the ſide C, in the ſecond rectangle, than the ſide D in the firſt; and, conſequently, the greater length of the one is compenſated by the greater breadth or depth of the other; for as the ſide A is $\frac{1}{3}$ longer than C, ſo B is $\frac{1}{3}$ longer than D, and the rectangles of courſe equal; that is, $A \times D = B \times C$, or $12 \times 3 = 4 \times 9 = 36$.

This is the foundation of that capital theorem, *viz.* that the rectangle of the extremes is always equal to that of the

means; and, conſequently, the reaſon of the rule of three. See RULE.

Hence it follows, that if any two triangles, parallelograms, priſms, parallelopipeds, pyramids, cones, or cylinders have their baſes and altitudes reciprocally proportional, thoſe two figures or ſolids are equal to each other; and *vice verſa*, if they are equal, then their baſes and altitudes are reciprocally proportional. See TRIANGLE, PARALLELOGRAM, *&c.*

RECIPROCAL PROPORTION, in arithmetic, is when, in four numbers, the fourth is leſs than the ſecond, by ſo much as the third is greater than the firſt; and *vice verſa*. See the article PROPORTION.

This is the foundation of the inverſe, or indirect rule of three: thus, 4:10:: 8:5. See the article RULE.

Reciprocal proportion is of great uſe in determining the laws of motion. See the article MOTION.

RECITATIVO, or RECITATIVE, in muſic, a kind of ſinging, that differs but little from ordinary pronunciation, ſuch as that in which the ſeveral parts of the liturgy are rehearſed in cathedrals; or that wherein the actors commonly deliver themſelves on the theatre at the opera, when they are to expreſs ſome action or paſſion, to relate ſome event, or reveal ſome deſign.

Notwithſtanding this ſort of compoſition is noted in true time, the performer is at liberty to alter the bars of meaſure, and make ſome long and others ſhort, as his ſubject requires: hence the thorough baſs to the recitative is uſually placed below the other, to the end that he, who is to accompany the voice, may rather obſerve and follow the ſinger, than the perſon that beats the time.

RECKONING, or *a ſhip's* RECKONING, in navigation, is that account, whereby at any time it may be known where the ſhip is, and on what courſe or courſes ſhe is to ſteer, in order to gain her port; and that account taken from the log-board is called the dead-reckoning. See LOG-BOARD, JOURNAL, *&c.*

But as the ſhip's motion is liable to be diſturbed from a variety of cauſes, ſuch as the lee-way, variation of the compaſs, currents, unſteadineſs of the wind, *&c.* her place, according to the dead-reckoning, may be juſtly doubted; and therefore mariners try every way to find the latitude their ſhip is in, by obſervations of the ſun or ſtars. See the articles LEE-WAY, VARIATION, CURRENT, WIND, and LATITUDE.

Now, if the latitude found by obſervation, and that found by the dead-reckoning, agree, it is preſumed the ſhip's place is well determined; but if they diſagree, the account of longitude muſt be corrected: and for the latitude, that found by obſervation is always to be depended on.

In correcting the longitude found by the dead-reckoning, conſider whether the difference may not have been occaſioned by a current; and, if poſſible, make an eſtimate of it, as directed under the article CURRENT.

The buſineſs of correcting the dead-reckoning is a very precarious operation, and at beſt is little more than gueſſing; ſince there may be unknown currents, occaſioned by trade-winds, the tides following the moon, ſtormy weather, *&c.* hence the beſt mariners are not able to pronounce with certainty, whether the ſhip may not be to the eaſtward or weſtward of the point wherein the dead-reckoning places her.

However, the following methods are thoſe uſually taken to diſcover her true place: 1. If the difference of latitude be much more than the departure, or the direct courſe has been within three points of the meridian, then the error is moſt likely in the diſtance run. 2. If the departure is much greater than the difference of latitude, or the direct courſe is within three points of the parallel, or more than five points from the meridian; the error may be aſcribed to the courſe. 3. But if the courſes are, in general, near the middle of the quadrant, the error may be either in the courſe, or in the diſtance, or in both. For to cauſe an alteration in the difference of latitude, the firſt of theſe caſes requires a greater error in the courſe, than can well be ſuppoſed to have been committed: in the ſecond caſe, the diſtances muſt be ſo faulty, as would ſcarce eſcape obſervation; and, in the third caſe, it is often doubtful, whether to attribute the error to the courſe or diſtance; and therefore it is uſually corrected in both.

As for the methods of correcting the dead-reckoning by the variation-chart, and by actually finding the ſhip's true longitude from celeſtial obſervations, ſee the articles VARIATION and LONGITUDE.

RECLAIMING, or RECLAMING, in our antient cuſtoms, a lord's purſuing, proſecuting,

ſecuting, and recalling his vaſſal, who had gone to live in another place without his permiſſion.

Reclaiming is alſo uſed for the demanding of a perſon, or thing, to be delivered up to the prince or ſtate to which it properly belongs; when, by any irregular means, it is come into another's poſſeſſion.

RECLAIMING, in falconry, is taming a hawk, *&c.* and making her gentle and familiar.

A partridge is ſaid to reclaim, when ſhe calls her young ones together, upon their ſcattering too much from her.

RECLINER, or RECLINING DIAL. See the article DIAL.

RECLUSE, among the papiſts, a perſon ſhut up in a ſmall cell of an hermitage, or monaſtery, and cut off, not only from all converſation with the world, but even with the houſe. This is a kind of voluntary impriſonment, from a motive either of devotion or penance.

The word is alſo applied to incontinent wives, whom their huſbands procure to be thus kept in perpetual impriſonment in ſome religious houſe.

Recluſes were antiently very numerous: they took an oath, never to ſtir out of their retreat; and having entered it, the biſhop ſet his ſeal upon the door; and the recluſe was to have every thing neceſſary for the ſupport of life, conveyed to him through a window. If he was a prieſt, he was allowed a ſmall oratory, with a window, which looked into the church, through which he might make his offerings at the maſs, hear the ſinging, and anſwer thoſe who ſpoke to him; but this window had curtains before it, ſo that he could not be ſeen. He was allowed a little garden, adjoining to his cell, in which he might plant a few herbs, and breathe a little freſh air. If he had diſciples, their cells were contiguous to his, with only a window of communication, through which they conveyed neceſſaries to him, and received his inſtructions. If a recluſe fell ſick, his door might be opened for perſons to come in and aſſiſt him, but he himſelf was not to ſtir out.

F. Helyot gives a particular account of the ceremonies practiſed in the recluſion of a woman, in that of mother de Cambray, in the year 1625. The biſhop waited for her, early in the morning at the church-door; and upon her arrival and proſtrating herſelf at the feet of that prelate, he gave her his benediction; conducted her to the grand altar, and there bleſſed a mantle, veil, and ſcapular, put them on her and gave her a new name. Having here made her vow, and the biſhop having harangued the people in praiſe of the new recluſe, he conducted her proceſſionally to her recluſion; the clergy all the way ſinging, *Veni, ſponſa Chriſti, &c.* Here the biſhop, bleſſing her afreſh, conſecrated the recluſion, and ſhut her up in perpetual confinement.

RECOGNITION, in law, an acknowledgement; a word particularly uſed in our law-books, for the firſt chapter of the ſtatute 1 Jac. I. by which the parliament acknowledged, that, after the death of queen Elizabeth, the crown had rightfully deſcended to king James.

RECOGNITIONE ADNULLANDA PER VIM, ET DURITIEM FACTA, in law, is a writ to the juſtices of the common pleas, for ſending a record of a recognizance, which the recognizor ſuggeſts to have been acknowledged by force and hard dealing; in order that if it ſo appear, it may be annulled.

RECOGNIZANCE, or RECOGNISANCE, in law, a bond or obligation of record, acknowledged to the king: thus called, becauſe recognized or acknowledged in ſome court of record, or before ſome judge, maſter in chancery, or juſtice of the peace.

There are recognizances as well for debt, as of bail, for good behaviour, and for appearance to proſecute felons, *&c.* which laſt kinds, acknowledged before juſtices of the peace, are by them to be returned to the ſeſſions, otherwiſe an information lies againſt them.

In recognizances for bail, *&c.* before a juſtice, the principal is bound in double the ſum of the ſureties, the uſual number of whom are two, and the penalty is 40l. at leaſt. Mere recognizances are not ſealed, but enrolled; and execution, by force thereof, is of all the recognizor's goods or chattels (except draught-horſes and implements of huſbandry) and the moiety of his land. The execution upon a recognizance, is termed an extent. See the article EXTENT.

The party bound in a recognizance, is called recognizor; and the perſon to whom he is bound, is termed the recognizee.

Recognizance is alſo uſed in our antient ſtatutes, for the verdict of the twelve jurors upon an aſſiſe; hence called recognitors.

RECOIL, or REBOUND, the ſtarting backward of a fire-arm, after an exploſion.

Merſennus

Merſennus tells us, that a cannon 12 feet in length, weighing 6400 lb. gives a ball of 24 lb. an uniform velocity of 640 feet per ſecond. Putting, therefore, $W = 6400$, $w = 24$, $V = 640$, and $v =$ the velocity with which the cannon recoils; we ſhall have (becauſe the momentums of the cannon and ball are equal) $Wv = wV$; and ſo $v = \frac{wV}{W} = \frac{24 \times 64}{6400} = 2\frac{4}{5}$; that is, it would recoil at the rate of $2\frac{4}{5}$ feet per ſecond, if free to move. See GUNNERY and PROJECTILE.

RECOLLECTION, a mode of thinking, by which ideas ſought after by the mind, are found, and brought again to view.

RECOLLECTS, a congregation of reformed franciſcans, called alſo friers-minors of St. Francis, of the ſtrict obſervance. See FRANCISCANS.

RECONCILIARI, in our law-books, *&c.* A church is ſaid reconciliari, to be reconciled, when it is conſecrated afreſh, after having been polluted or prophaned, as by being in the poſſeſſion of pagans, heretics, *&c.*

RECONNOITRE, in war, to view and examine the ſtate and ſituation of things.

RECORD, an authentic teſtimony in writing, contained in rolls of parchment, and preſerved in a court of record.

Records are ſaid to be of three kinds, *viz.* a record judicial, an attainder, *&c.* a record miniſterial, upon oath, as an office or inquiſition found; and a record made by conveyance and conſent, as a fine, *&c.*

RECORD, among fowlers, is a bird's beginning to tune or ſing, as it were within itſelf; or to perform its notes and diſpoſe its organs for ſinging. The cock-thruſh is diſtinguiſhed from the hen in recording, the firſt being more loud and frequent in it than the ſecond.

RECORDARE FACIAS, a writ directed to the ſheriff, to remove a cauſe out of an inferior court, into the king's bench or common pleas.

RECORDER, a perſon whom the mayor and other magiſtrates of a city or corporation aſſociate to them, for their better direction in matters of juſtice, and proceedings in law; on which account this perſon is generally a counſellor, or other perſon well ſkilled in the law.

The recorder of London is choſen by the lord-mayor and aldermen; and, as he is held to be the mouth of the city, he delivers the judgment of the courts therein, and records and certifies the city cuſtoms.

RECORDO ET PROCESSO MITTENDIS, is a writ to call a record, together with the whole proceedings in a cauſe, out of an inferior court into the king's court.

RECOVERY, in law, is obtaining any thing by judgment or trial at law.

Recoveries are of two kinds, a true recovery, and a feigned or common one. A true recovery is the actual recovering of any thing, or its value, by judgment and trial at law: as where a perſon is ſued for land, or other things real and perſonal, and obtains a verdict in his favour. A feigned or common recovery, is a formal act by conſent, made uſe of for the better ſecuring of lands, tenements, *&c.* the end and effect of which is, to dock and deſtroy eſtates-tail, remainders, and reverſions, and to bar the former owners. In a common recovery, there muſt be at leaſt three parties, *viz.* the demandant, tenant, and vouchee: the demandant is the perſon that brings the writ of entry, and therefore may be termed the recoveror; the tenant is he againſt whom the writ is brought, who may be termed the recoveree; and the vouchee is the perſon whom the tenant vouches, or calls to warrant for the lands demanded: thus, when a perſon is deſirous to cut off an eſtate-tail in lands, *&c.* he cauſes a feigned writ of entry ſur diſſeiſin en le port to be brought by ſome friend, who is the demandant, for thoſe lands, *&c.* who in a feigned declaration thereupon made, pretends that he was diſſeiſed by him, who, by a feigned fine, or deed of bargain and ſale, is named and ſuppoſed to be the tenant of the land: this feigned tenant, if it be a ſingle recovery, is made to appear and vouch to warranty the crier of the court of common pleas, or the bag-bearer of writs to the cuſtos brevium in that court, who is termed the common vouchee, and is ſuppoſed to warrant the title; but he making default, a judgment is by this fiction entered, that the demandant ſhall recover, and have a writ of ſeiſin for the poſſeſſion of the lands in queſtion; and that the tenants ſhall recover the value of the lands againſt the common vouchee: though this recovery in value is only imaginary, yet it is looked upon as a bar to the intail for ever.

RECREMENT, in chemiſtry, ſome ſuperfluous matter ſeparated from ſome other that

The RED-BREAST
Cock and Hen.

T. Jefferys sculp.

that is useful; in which sense it is the same with scoriæ, fæces, and excrements. See the article SCORIÆ, &c.

RECRIMINATION, in law, an accusation brought by the accused against the accuser, upon the same fact. See the article ACCUSATION.

RECRUITS, in military affairs, new-raised soldiers, designed to supply the place of those who have lost their lives in the service, or are disabled by age or wounds. See the article SOLDIERS.

RECTANGLE, in geometry, the same with a right-angled parallelogram. See the article PARALLELOGRAM.

In arithmetic and algebra, a rectangle signifies the same with factum or product. See the articles PRODUCT and MULTIPLICATION.

RECTANGLED, RECTANGULAR, or RIGHT-ANGLED, appellations given to figures and solids which have one or more right angles: thus a triangle with one right angle, is termed a rectangled triangle; also parallelograms with right angles, squares, cubes, &c. are rectangular.

Solids, as cones, cylinders, &c. are also said to be rectangular, with respect to their situation, when their axes are perpendicular to the plane of the horizon.

The antient geometricians always called the parabola, the rectangular section of a cone. See CONIC SECTIONS and PARABOLA.

RECTIFICATION, the art of setting any thing to rights: and hence, to rectify the globes, is to fit them for performing any problem. See GLOBE.

RECTIFICATION, in geometry, is the finding a right line, equal in length to a curve. See the article CURVE.

The rectification of curves is a branch of the higher geometry, where the use of the inverse method of fluxions, is very conspicuous.

Case I. Let ACG (pl. CCXXIX. fig. 3. n° 1.) be any kind of curve, whose ordinates are parallel to themselves, and perpendicular to the axis AQ. Then if the fluxion of the abscis AM be denoted by Mm, or by Cn, (equal and parallel to Mm) and nS, equal and parallel to Cr, be the representation of the corresponding fluxion of the ordinate MC; then will the diagonal CS, touching the curve in C, be the line which the generating point p, would describe, were its motion to become uniform at C; which line, therefore, truly expresses the fluxion of the space AC, gone over. See the article FLUXION.

Hence, putting AM $= x$, CM $= y$, and AC $= z$; we have $\dot{z}$ $(= \text{CS} = \sqrt{\text{C}n^2 + \text{S}n^2} = \sqrt{\dot{x}^2 + \dot{y}^2}$; from which, and the equation of the curve, the value of $\dot{z}$ may be determined. Thus, let the curve proposed be a parabola of any kind, the general equation for which is $x = \frac{y^n}{a^{n-1}}$; and hence $\dot{x} = \frac{n y^{n-1} \dot{y}}{a^{n-1}}$, and therefore $\dot{z}$ $(= \sqrt{\dot{y}^2 + \dot{x}^2}) = \sqrt{\dot{y}^2 + \frac{n^2 y^{2n-2} \dot{y}^2}{a^{2n-2}}} = \dot{y} \times 1 + \frac{n^2 y^{2n-2}}{a^{2n-2}}\Big]^{\frac{1}{2}}$; the fluent of which, universally expressed in an infinite series, is $y + \frac{n^2 y^{2n-1}}{2n-1 \times 2a^{2n-2}} - \frac{n^4 y^{4n-3}}{4n-3 \times 8a^{4n-4}} + \frac{n^6 y^{6n-5}}{6n-5 \times 16a^{6n-6}}$ &c. $= z$.

Case II. Let all the ordinates of the proposed curve ARM (*ibid.* n° 2.) be referred to a center C: then, putting the tangent RP (intercepted by the perpendicular CP) $= t$, the arch, BN, of a circle, described about the center C, $= x$; and the radius CN (or CB) $= a$; we have $\dot{z} : \dot{y} :: y$ (CR : t (RP); and, consequently, $\dot{z} = \frac{\dot{y} y}{t}$: from whence the value of $\dot{z}$ may be found, if the relation of y and t is given. But, in other cases, it will be better to work from the following equation, *viz.* $\dot{z} = \sqrt{\dot{y}^2 + \frac{y^2 \dot{x}^2}{a^2}}$, which is thus derived; let the right line CR, be conceived to revolve about the center C; then since the celerity of the generating point R, in a direction perpendicular to CR, is to $(\dot{x})$ the celerity of the point N, as CR (y) to CN (a), it will therefore be truly represented by $\frac{y \dot{x}}{a}$; which being to $(\dot{y})$ the celerity in the direction of CR, produced as CB (s) : RP (t), it follows that $\frac{y^2 \dot{x}^2}{a^2} : \dot{y}^2 :: s^2 : t^2$; whence, by composition, $\frac{y^2 \dot{x}^2}{a^2} + \dot{y}^2 : \dot{y}^2 :: s^2 + t^2$ $(y^2) : t^2$; there-

fore

fore $\frac{y^2\dot{x}^2}{a^2}+\dot{y}^2=\frac{y^2\dot{y}^2}{t^2}$, and consequently $\sqrt{\frac{y^2\dot{x}^2}{a^2}+\dot{y}^2}\left(=\frac{y\dot{y}}{t}\right)=\dot{z}$. Q. E. D.

But the same conclusion may be more easily deduced from the increments of the flowing quantities: for, if Rm, rm, and Nn be assumed to represent $(\dot{z},\dot{y},\dot{x})$ any very small corresponding increments of AR, CR, and BN; then will CN (a) : CR (y) :: $\dot{x}$ (the arch Nn) : the similar arch R$r=\frac{y\dot{x}}{a}$. And if the triangle Rrm (which, while the point m is returning back to R, approaches continually nearer and nearer to a similitude with CRP) be considered as rectilinear, we shall also obtain $\dot{z}^2\left(=\mathrm{R}m^2=\mathrm{R}r^2+rm^2\right)=\frac{y^2\dot{x}^2}{a^2}+\dot{y}^2$; and $\sqrt{\frac{y^2\dot{x}^2}{a^2}+\dot{y}^2}\left(=\frac{y\dot{y}}{a}\right)=\dot{z}$, as before.

Now from the right sine, versed sine, tangent, or secant of an arch of a circle OARB (*ibid.* n° 3.) given: to find the length of the arch itself, in terms thereof. Put the versed sine AB $=x$, the right sine R$b=y$, the tangent AT $=t$, the secant OT $=s$, the arch AR $=z$, and the radius AO, or RO $=a$; also let R$n=\dot{x}$, $nr=\dot{y}$, and R$r=\dot{z}$: then, since $\angle rn\mathrm{R}$ (= a right angle) $=\angle Ob\mathrm{R}$, and $r\mathrm{R}n=\mathrm{OR}b$, the triangles rRn, and ORb, are equiangular; and Rb (y) : OR (a) :: Rn $(\dot{x})$: Rr $(\dot{z})=\frac{a\dot{x}}{\sqrt{2ax-xx}}$; because, by the property of the circle, $y=\sqrt{2ax-xx}$. Also, Ob $\left(\sqrt{a^2-y^2}\right)$: OR (a) :: nr $(\dot{y})$: Rr $(\dot{z})=\frac{a\dot{y}}{\sqrt{a^2-y^2}}$.

These two values exhibit the fluxion of the arch, in terms of the versed sine and right sine, respectively: and to get the same in terms of the tangent and secant, we have OT $\left(=s=\sqrt{a^2+t^2}\right)$: OA (a) :: OR (a) : O$b=\frac{a^2}{s}=\frac{a^2}{\sqrt{a^2+t^2}}$. Hence A$b=a-\frac{a^2}{s}=a-\frac{a^2}{\sqrt{a^2+t^2}}$, whose fluxion $=\frac{a^2\dot{s}}{s^2}=\frac{a^2+t\dot{t}}{\left(a^2+t^2\right)^{\frac{3}{2}}}$; whence AT $\left(=\sqrt{s^2-a^2}=t\right)$: OT $\left(=s=\sqrt{a^2+t^2}\right)$ :: Rn : R$r=\frac{a^2\dot{s}}{s\sqrt{s^2-a^2}}=\frac{a^2\dot{t}}{a^2+t^2}=\dot{z}$.

Now from any one of these forms of fluxions, *viz.* $\frac{a\dot{x}}{\sqrt{2ax-xx}}$, $\frac{a\dot{y}}{\sqrt{a^2-y^2}}$, $\frac{a^2\dot{t}}{a^2+t^2}$, and $\frac{a^2\dot{s}}{s\sqrt{s^2-a^2}}$, the value of the arch itself (by taking the fluent in an infinite series) may be found. But the third form, expressed in terms of the tangent, being entirely free from radical quantities, will be the most ready in practice, especially where the required arch is but small, though the series, arising from the first form, always converges fastest.

If, therefore, $\frac{a^2\dot{t}}{a^2+t^2}$ be converted into an infinite series, we shall have $\dot{z}=\dot{t}-\frac{t^2\dot{t}}{a^2}+\frac{t^4\dot{t}}{a^4}-\frac{t^6\dot{t}}{a^6}+$, &c. and consequently, $z=t-\frac{t^3}{3a^2}+\frac{t^5}{5a^4}-\frac{t^7}{7a^6}+\frac{t^9}{9a^8}$ —&c. $=$ AR. Now if, for example, we suppose AR $=30°$, and AO (to render the operation more easy) $=$ unity, we shall have $t=\sqrt{\frac{1}{3}}=.5773502$; because O$b$ $\left(\sqrt{\frac{3}{4}}\right)$: bR $\left(\frac{1}{2}\right)$ :: OA (1) : AT $(t)=\frac{1}{\sqrt{3}}$. Whence $t^3=.1924500$, $t^5=.0641500$, $t^7=.0213833$, $t^9=0071277$, &c. And therefore AR $=.5773502-\frac{.1924500}{3}+\frac{.0641500}{5}-\frac{.0213833}{7}+\frac{.0071277}{9}$—&c. $=.5235987$; which, multiplied by 6, gives 3.141592, &c. for the length of the semi-periphery of a circle whose radius is 1.

RECTIFICATION, in chemistry, is nothing but the repetition of a distillation, or sublimation several times, in order to render the substance purer, finer, and freer from aqueous or earthy parts.

The perfection of rectifying spirits, according to Dr. Shaw, depends upon finding out a simple method of separating all the oil and water from it; and, he observes, that the great affinity betwixt the essential oil and spirit, is the physical cause of the difficulty found in the rectification of brandies. He recommends the way of working from a spirit largely diluted with water, into water again; whereby the essential oil would, at one operation, be doubly separated. See the article DISTILLATION, ALCOHOL, SPIRIT, &c.

RECTIFIER, in navigation, an inſtrument conſiſting of two parts, which are two circles either laid one upon, or let into, the other, and ſo faſtened together in their centers, that they repreſent two compaſſes, one fixed, the other moveable; each of them divided into the thirty-two points of the compaſs, and three hundred and ſixty degrees, and numbered both ways, from the north and the ſouth, ending at the eaſt and weſt, in ninety degrees.

The fixed compaſs repreſents the horizon, in which the north and all the other points of the compaſs are fixed and immoveable. See HORIZON.

The moveable compaſs repreſents the mariners compaſs, in which the north and all other points are liable to variation. See COMPASS.

In the center of the moveable compaſs is faſtened a ſilk thread, long enough to reach the outſide of the fixed compaſs. But, if the inſtrument be made of wood, there is an index inſtead of the thread.

Its uſe is to find the variation of the compaſs, to rectify the courſe at ſea; having the amplitude or azimuth given.

RECTIFYING *the globe*. See GLOBE.

RECTILINEAR, in geometry, right-lined; thus figures whoſe perimeter conſiſts of right lines, are ſaid to be rectilinear.

RECTITUDE, *rectitudo*, in philoſophy, refers either to the act of judging or of willing; and therefore whatever comes under the denomination of rectitude is either what is true or what is good; theſe being the only objects about which the mind exerciſes its two faculties of judging and willing.

Moral rectitude, or uprightneſs, is the chuſing and purſuing thoſe things which the mind, upon due enquiry and attention, clearly perceives to be good; and avoiding thoſe that are evil.

RECTO, in law, uſually termed a writ of right, is of ſo high a nature, that while other writs in real actions are only for the recovery of the poſſeſſion of the lands, *&c.* in queſtion, this writ tends to recover both the ſeiſin and the property; by which means both the rights of poſſeſſion and property are tried together. There are two kinds of this writ, *viz.* a writ of right patent, ſo called becauſe it is ſent open; it lies for him that has the fee-ſimple in the lands, *&c.* ſued for, againſt a tenant of the freehold at leaſt: the other is a writ of right-cloſe, and lies where a perſon holds lands or tenements by charter in antient demeſne, in fee-ſimple, fee-tail, for term of life, or in dower, and is diſſeiſed. This writ is directed to the king's manors, or to the lord of an antient demeſne, commanding him to do right in his court.

Recto, or right, is alſo prefixed to the title of ſeveral other writs: as 1. *Recto de advocatione eccleſiæ*, which is a writ of right that lies where a perſon has right of advowſon in fee to him and his heirs; and the incumbent dying, a ſtranger preſents his clerk to the church; and he, not having brought this action of *quare impedit*, *&c.* within ſix months, has ſuffered the ſtranger to uſurp upon him. 2. *Recto de dote*, a writ of right of dower, which lies for a woman who has received part of her dower, and demands the remainder againſt the heir of her deceaſed huſband, or his guardian. 3. *Recto de dote unde nihil habet*, a writ of right that lies where a huſband having lands or tenements, has aſſigned a dower thereof to his wife, on which account ſhe is driven to ſue the heir, or his guardian, for her thirds. 4. *Recto quando dominus remiſit*, is a writ of right which lies where lands, *&c.* in the ſignory of any lord, are demanded by a writ of right. Thus if the lord hold no court, or, at the prayer of the demandant or tenant, ſend his writ to the king's court, to carry the cauſe thither, this writ iſſues for the other party. 5. *Recto de rationabili parte*, a writ of right patent, that lies between privies in blood; as brothers in gavel-kind, ſiſters, or other coparteners for land in fee-ſimple, demanding a certain portion of it to hold in ſeveralty. 6. *Recto ſur diſclaimer*, a writ which lies where a lord, in the court of common-pleas, avows upon his tenant, and the tenant diſclaims to hold of him; upon which the lord may bring this writ.

RECTOR, a term applied to ſeveral perſons whoſe offices are very different: as, 1. The rector of a pariſh is a clergyman that has the charge and cure of a pariſh, and poſſeſſes all the tythes, *&c.* 2. The ſame name is alſo given to the chief elective officer in ſeveral foreign univerſities, particularly in that of Paris. 3. Rector is alſo uſed in ſeveral convents for the ſuperior officer who governs the houſe: and the jeſuits give this

name to the ſuperiors of ſuch of their houſes as are either ſeminaries or colleges.

RECTORY, a pariſh-church, parſonage, or ſpiritual living, with all its rights, tythes and glebes.

Rectory is alſo ſometimes uſed for the rector's manſion or parſonage-houſe.

RECTUM, in anatomy, the third and laſt of the large inteſtines, or guts. See INTESTINES.

The rectum is in length about three hands breadth, and its diameter about three fingers. It has its beginning at the loweſt vertebræ of the loins, and at the lower end is the anus. See ANUS.

It is connected to the os ſacrum, the os coccygis, and the urinary bladder in men; but in women to the vagina uteri. The coats of the rectum are more thick and fleſhy than thoſe of any other of the inteſtines: it has in general no valves, but it has ſeveral rugæ: the abſence of valves here, is to prevent the expulſion of the fœces from being retarded.

RECTUS, in anatomy, a name common to ſeveral pair of muſcles, ſo called on account of the ſtraightneſs of their fibres, as, 1. The rectus major anticus, which ariſes from the tranſverſe apophyſes of the five lower vertebræ of the neck, and is inſerted in the os occipitis. 2. The rector minor anticus, called, by Cowper, muſculus annuens: this ariſes from the anterior ſurface of the atlas, or firſt vertebra of the neck; and lies concealed, as it were, under the former, till it is at length inſerted a little behind it, into the os occipitis: theſe two pair of muſcles ſerve to move the head forward. 3. The rectus major poſticus, one of the extenſors of the head, which has its origin from the ſpinoſe apophyſis of the epiſtrophæus, and is inſerted into the os occipitis. 4. The rectus minor poſticus, which is alſo one of the five extenſors of the head, has its riſe from the poſterior part of the atlas, and its end under the former. 5. The rectus lateralis, which ſerves to bend the head on one ſide, has its origin from the upper ſurface of the tranſverſe apophyſis of the atlas: from this it aſcends ſtrait with a ſhort body, but conſiderably thick; and is inſerted partly into the os occipitis, and partly into the temporal bone, near the inciſure of the maſtoide proceſs. 6. The rectus tibiæ, one of the four extenſors of the leg, which has its origin from the anterior and inferior ſpine of the ileum.

RECTUS IN CURIA, in law, one who ſtands at the bar, and no man objects any thing againſt him. So alſo when a perſon who has been outlawed has reverſed the outlawry, and can partake of the benefit of the law, he is ſaid to be rectus in curia.

RECURRENTS, in anatomy, a name given to ſeveral large branches of nerves ſent out by the par vagum from the upper part of the thorax to the larynx. See the article NERVE.

RECURRENT VERSES, are the ſame with thoſe called reciprocal. See the article RECIPROCAL.

RECURVIROSTRA, in ornithology, a genus of the ſcolopaces order of birds, the beak of which is of a depreſſed or flatted figure, and is pointed at the extremity and bent upwards: it is about the ſize of our common lapwing, or a little larger; its colour is variegated, black and white; the figure of its beak is extremely ſingular, being long, black throughout, flatted, and appears to be of a coreaceous ſubſtance rather than of a horny one, like that of the beaks of other birds; and its bending upwards in a part of a circle is alſo ſingular. See plate CCXXIX. fig. 2.

There is another ſpecies common in England, with a yellow breaſt, about the ſize of the common pigeon.

RECUSANTS, ſuch perſons as acknowledge the pope to be the ſupreme head of the church, and refuſe to acknowledge the king's ſupremacy; who are hence called popiſh recuſants. Theſe are in England charged with double taxes, not merely as romaniſts but as recuſants.

RECUSATION, the deſiring a judge to refrain from judging in a certain cauſe, on account of his kinſhip, capital enmity, &c. to one of the parties.

By the french laws, kinſhip within the fourth degree, whether of conſanguinity or alliance, is deemed a legal cauſe of recuſation; as alſo the judge's being godfather, &c. of one of the parties.

RED, in phyſics, one of the ſimple or primary colours of natural bodies, or rather of the rays of light. See COLOUR, LIGHT, and RAY.

The red rays are thoſe which of all others are the leaſt refrangible: hence, as Sir Iſaac Newton ſuppoſes the different degrees of refrangibility ariſe from the different magnitudes of the luminous particles whereof the rays conſiſt, the red rays, or red light, is concluded to be that which

which conſiſts of the largeſt particles. Authors diſtinguiſh three general kinds of red; one bordering on the blue, as columbine, or dove-colour, purple, and crimſon. Another bordering on yellow, as flame-colour and orange; and between theſe extremes is a medium, partaking neither of the one nor the other, which is what we properly call red. Mr. Boyle obſerves that red is an obvious, and generally a pleaſing colour; and that antiently it was cuſtomary to preſent red objects to elephants, to render them more fierce; and that the ſame colour irritates turkey-cocks. He obſerves alſo, that among the ſeveral changes of colour which bodies acquire, or diſcloſe, by digeſtion, it is very remarkable to find a redneſs rather than any other colour in moſt tinctures; and even in the more groſs ſolutions made of almoſt all concretes that abound either with mineral or vegetable ſulphur, though the menſtruum employed about theſe ſolutions or tinctures be never ſo limpid.

RED, in dying, is one of the five ſimple or mother colours; ſome reckon ſix kinds or caſts of red, *viz.* ſcarlet-red, crimſon-red, madder-red, half-grain-red, lively-orange-red, and ſcarlet of cochineal: but they may be all reduced to the three following, according to the three principal drugs which give the colours: *viz.* the kermes, cochineal and madder. See the article KERMES, COCHINEAL, and MADDER.

For the ſcarlet and crimſon reds, ſee the articles SCARLET and CRIMSON.

Madder-red is made with madder, to which ſome add realgal and arſenic; others common ſalt, or other ſalts, with wheat-flour; or agaric, with ſpirit of wine, galls, or turmeric. The half-grain is made with agaric and bran-water; half-ſcarlet-grain, half madder, and ſometimes turmeric. As to the lively orange-red, the ſtuff muſt be firſt put in yellow, then in a liquor made of goats-hair, which has been boiled ſeveral times with madder, and now diſſolved over the fire with certain acids, as urine, tartar, *&c.*

Beſides theſe reds, which are good and allowed colours, there is alſo a brazil-red, which is diſcouraged as fading eaſily. Of the ſix good reds only four have particular caſts or ſhades, the madder-red, the crimſon-red, the lively-orange-red, and the ſcarlet of cochineal: the caſts or ſhades of crimſon are freſh-colour, peach-colour, carnation-roſe-colour, and an apple-tree-flower colour; Thoſe of madder are freſh-colour, onion-peel-colour, and flame-colour; thoſe of the orange are the ſame with that of the crimſon; ſcarlet, beſides the ſhades of all the reſt, has ſome peculiar to itſelf, as cherry-colour, fire-colour, *&c.*

RED, in painting. For painting in oil-colours, they uſe a red called cinnabar, or vermilion, and another called Lacca. See the articles CINNABAR and LACCA. In limning and freſco, for a violet-red, inſtead of lacca they uſe reddle, a natural earth found in England: for a brown, they uſe ochre. See the articles REDDLE and OCHRE.

RED, in heraldry. See GULES.

RED, in coſmetics, a fucus, or paint, wherewith the ladies enliven their cheeks and lips. There are two kinds of theſe reds, one in leaves called ſpaniſh-red; the other a liquor which is an extract of a ſcarlet dye. See COSMETICS.

RED is an epithet uſed in the engliſh names of ſeveral birds, as the red-game, red-ſhank, red-ſtart, red-breaſt, red-wing, *&c.*

The red-game is a ſpecies of the tetrao, common in the mountains of Yorkſhire, and ſome other of the northern countries. It is of the ſhape of a partridge, but much larger, and of a mixed colour of red and black, and is feathered down to the ends of the toes. See TETRAO.

The redſhank is a ſpecies of the tringa, called by authors gallinula erythropus, and callidrys, and is about the ſize of the common plover. The back is of a greyiſh or browniſh-green, uſually ſpotted with black; its neck grey, and its throat variegated with black and white: the breaſt is white, with a few looſe ſtreaks of black; the wing-feathers are variegated with black, brown, and white; the beak is two fingers breadth long, ſlender, and ſhaped like the beak of a woodcock, rediſh at the baſe, and blackiſh lower down: its legs are of a fine beautiful red, and the hinder toe is very ſhort and ſmall. See TRINGA.

The red-ſtart a ſpecies of the motacilla, with a black throat and reddiſh belly, is of the ſize of a chaffinch, but ſlenderer in proportion to its thickneſs; the head is ſmall, and ſomewhat depreſſed; the the eyes are large; the beak is ſlender, oblong, and of a dark colour; the head, the neck, and the beak, are of a bright grey; the anterior part of the head is

white; the throat and ſides of the head under the eyes are black; the breaſt is of a reddiſh colour, as are alſo the rump and the tail. See plate CCXXIX. fig. 1. The red-breaſt is alſo of the ſpecies of the motacilla, with the throat and breaſt reddiſh; it is of the ſize of the nightingale; the head is pretty large and rounded; the eyes are bright and ſmall; the beak ſlender and brown; the head, neck, and back, are of a pale olive-brown, with a tinge of grey; the throat and breaſt are throughout of a tawny colour, approaching to reddiſh; the belly is white; the wings and tail of the ſame browniſh colour, as are alſo the legs and feet. See plate CCXXIX. fig. 7. where n° 1. is the cock, and n° 2. the hen.

The red-wing is a ſpecies of the turdus, with a white breaſt. It is ſmaller than the common thruſh; the head is ſmall and flatted; the eyes are bright; the iris of a deep hazel; the ears are patulous, and the beak brown, with ſome admixture of yellow: the head, neck, and back, are of a duſky-grey; the ſides and under parts of the wings are of an orange-colour, approaching to red; the breaſt, belly, and throat, are white; the feet are of a paler colour.

RED-RUSSIA, or LITTLE-RUSSIA, a province of Poland, bounded by the province of Poleſia; on the north, by Volhinia and Podolia on the eaſt; by the Carpathian mountains, which divide it from Tranſilvania and Hungary, on the ſouth; and by the province of Little-Poland, on the weſt; being two hundred miles long, and one hundred broad.

RED-SEA ſeparates Aſia from Africa.

RED-BOOK of the Exchequer, an antient record or manuſcript volume, in the keeping of the king's remembrancer, containing divers miſcellany treatiſes relating to the times before the conqueſt.

REDDENDUM, in our law, is uſed ſubſtantively for the clauſe in a leaſe wherein the rent is reſerved to the leſſor. The proper place for it is next after the limitation of eſtate.

REDDIDIT SE, in law, is where a perſon procures bail to action, and the party that is bailed, any time before the return of the ſecond ſcire facias againſt the bail, renders himſelf in their diſcharge: ſuch bail are thereby diſcharged. On a reddidit ſe, the defendant's attorney is to give notice of the render to the plaintiff's attorney, and make oath of ſuch notice, &c. Alſo the bail-piece muſt be diſcharged, otherwiſe the plaintiff may notwithſtanding proceed to judgment and execution againſt the bail; for till that is done there is a record ſtill remains in court againſt them.

REDDITARIUM was antiently uſed for the rental of a manor, or other eſtate; as was

REDDITARIUS, a renter or tenant.

REDDITION, *redditio*, a ſurrendering or reſtoring. In law it alſo denotes a judicial acknowledgment that a thing in queſtion belongs to the demandant.

REDDLE, a ſoft, heavy, red marle, of great uſe in colouring; and being waſhed and freed from its ſand, is often ſold by our druggiſts under the name of bole-armenic. See the article MARLE.

REDEEMABLES, are lands, funds, &c. ſold with a reſervation of the equity of redemption. See REDEMPTION.

REDELIVER, in law, the yeilding and delivering a thing back, which in caſe of a robbery, &c. does not purge the offence.

REDEMISED ſignifies the granting back of lands demiſed or leaſed.

REDEMPTION, in law, a faculty or right of re-entering upon lands, &c. that have been ſold and aſſigned, upon reimburſing the purchaſe money with legal coſts. Bargains wherein the faculty, or, as ſome call it, the equity of redemption is reſerved, are only a kind of pignorative contracts. A certain time is limited within which the faculty of redemption ſhall be exerciſed, and beyond which it ſhall not extend.

In our old law writers, redemption denoted ſome grievous mulct, impoſed by way of commutation for the head or life of the delinquent.

REDENS, REDANS, or REDANT, in fortification, a kind of work indented in form of the teeth of a ſaw, with ſaliant and re-entering angles, to the end that one part may flank or defend another. It is called ſaw-work and indented work. The faces in this flank one another. Redens are frequently uſed in the fortifying of walls, where it is not neceſſary to be at the expence of building baſtions; as when they ſtand on the ſide of a river, a marſh, the ſea, &c.

REDHIBITION, *redhibitio*, in the civil-law, an action allowed a buyer, whereby to annul the ſtate of ſome moveable, and oblige the ſeller to take it back again, upon the buyer's finding it damaged;

or that there was ſome perſonal cheat, *&c.* The redhibition, or redhibitory action, has place in ſeveral caſes in the body of the civil law. If a horſe was ſold that had the glanders, were broken-winded, or foundered, it was a redhibitory caſe; and the buyer would be obliged to take him again within nine days.

REDINTEGRATION, *redintegratio*, in the civil law, the act of reſtoring a perſon to the enjoyment of a thing whereof he had been illegally diſpoſſeſſed.

REDINTEGRATION, in chemiſtry, the reſtoring of any mixt body or matter, whoſe form has been deſtroyed by calcination, corroſion, ſublimation, or the like, to its former nature and conſtitution.

REDISSEISIN, in law, ſignifies a diſſeiſin made by one who once before was found adjudged to have diſſeiſed the ſame perſon of his lands and tenements; in which caſe there lies a ſpecial writ called redisſeiſin. This writ may be brought againſt the perſon who committed the freſh diſſeiſin, and againſt another that was not a diſſeiſor, in caſe he be a tenant of the lands; and if after a recovery upon this writ, the party is diſſeiſed again, by him who made the firſt rediſſeiſin, he ſhall have a new writ, and ſo every time he is rediſſeiſed. On the fact being proved by the ſheriff's inquiſition, the offender is to be impriſoned, and the land reſeiſed.

REDOUBT, or REDOUTE, *reductus*, in fortification, a ſmall ſquare fort, without any defence but in front, uſed in trenches, lines of circumvallation, contravallation, and approach, as alſo for the lodgings of corps de gard, and to defend paſſages. In marſhy grounds, redoubts are frequently made of ſtone-works, for the ſecurity of the neighbourhood; their face conſiſts of from ten to fifteen fathom, the ditch round them from eight to nine feet broad and deep, and their parapets have the ſame thickneſs.

REDRESSING, the rectifying or ſetting any thing ſtrait again.

In a moral ſenſe, to redreſs grievances is to reform and remove them.

To redreſs a ſtag, among hunters, is to put him off his changes.

REDRUTH, a market-town of Cornwall, ſituated fifty miles ſouth-weſt of Launceſton.

REDUBBORS, thoſe who buy ſtolen cloths, *&c.* and, to the end they may not be known, convert them into ſome other form, or change the colour, *&c.*

REDUCE, in chemiſtry, the ſame with reduct. See the article REDUCT.

REDUCE *a place*, among military men, is to oblige the governor to ſurrender it to the beſiegers by capitulation.

REDUCT, or REDUIT, a military term ſignifying an advantageous piece of ground, entrenched, and ſeparated from the reſt of the place, camp, *&c.* for an army, garriſon, *&c.* to retire to in caſe of a ſurprize.

REDUCT, in building, a quirk or little place taken out of a larger to make it more uniform and regular; or for ſome other convenience, as for a little cabinet a ſide of a chimney, for alcoves, *&c.*

REDUCT, or REDUX, among chemiſts, a powder by which calcined metals and minerals are again reduced to their regulus, or pure ſubſtance. See REGULUS.

REDUCTION, *reductio*, in the ſchools, a manner of bringing a term or propoſition which was before oppoſite to ſome other, to be equivalent to it. This is effected by the addition or retrenchment of a negative particle: thus, to reduce this propoſition, *no man is an animal*, to be equivalent to its oppoſite, *every man is an animal*; I drop the negative and ſay, *man is an animal*. After the like manner might the term, *every man*, be reduced, by adding the negative, and ſaying, *there is no man*.

Reduction of propoſitions is uſed in a more general ſenſe for any expreſſion of one propoſition by another propoſition equivalent thereto. To a reduction, therefore, there are two propoſitions required; the reduced, and the reducing, which are conſidered as the extremes thereof, and to be connected in the reduction, by means of the particle, *that is*, which here has the effect of a copula. As here, *only animals think*; *that is*, *animals think, and nothing beſides animals think*; where the propoſition preceding the particle, *that is*, is reduced, and the ſubject of the reduction; that following reduces the particle, and acts as the predicate of reduction; and the particle, *that is*, acts as a copula, importing not barely that the propoſition is expreſſed by another, but by another equivalent one, or, as it were, the ſame.

REDUCTION *of ſyllogiſms*, is a regular changing or transforming of an imperfect ſyllogiſm into a perfect one; or it is a change of a ſyllogiſm in reſpect of form, whereby the neceſſity of the illation

tion or inference is made more evident. See the article SYLLOGISM.

Reduction obtains in ſyllogiſms of the ſecond and third figure, and alſo in the indirect modes of the firſt. By it theſe are all brought to the firſt. There are two kinds of this reduction; the one direct, or oſtenſive, performed merely by a converſion of one, or both the premiſes, or by a tranſpoſition thereof, as when *camectres* is reduced to *celarent*. The other indirect, called per impoſſibile, or ad abſurdum, whereby the perſon who denies the goodneſs or legitimacy of an imperfect ſyllogiſm, is reduced to aſſert or grant ſomething abſurd and impoſſible, or contradictory, to ſome other thing maintained by him: ſuppoſe, *e. gr.* a perſon, granting the premiſes of the following ſyllogiſm, denies the concluſion. *All fraud is prohibited, but ſome trading is not prohibited: therefore ſome trading is not fraud.* We thus proceed againſt him; if the ſyllogiſm is not good, the antecedent is juſt, but the conſequent falſe; and therefore the contrary of the concluſion muſt be true. Now I take the contrary of the concluſion, which you thus give, viz. *all trading is fraud*, and of that, with the other premiſe of the former ſyllogiſm, *viz.* the major, which you likewiſe grant, I make a new ſyllogiſm; thus, *all fraud is prohibited*; *all trading is fraud: therefore all trading is prohibited.* But this propoſition, *all trading is prohibited*, and the other, *ſome trading is prohibited*, which you granted me in the firſt ſyllogiſm, are contradictories.

REDUCTION, in arithmetic, that rule whereby numbers of different denominations are brought into one denomination. Reduction is but the application of multiplication and diviſion. For, firſt, a higher denomination is brought into a lower one, by multiplying the higher denomination with ſo many of the lower, as are contained in the higher; ſtill keeping them equivalent in value. This is called reduction deſcending. Secondly, a lower or inferior denomination is reduced into a higher or ſuperior one, by dividing the leſſer one with ſo many of its denomination as is contained in the greater. This is the converſe of the laſt, and is termed reduction aſcending. See the articles MULTIPLICATION and DIVISION.

The reduction of the principal monies, coins, weights, meaſures, *&c.* antient and modern, foreign and domeſtic, may be found under their reſpective articles MONEY, COIN, WEIGHT, MEASURE, POUND, FOOT, *&c.*

Thus pounds are reduced into ſhillings by multiplying with 20; ſhillings into pence, by multiplying with 12; and pence into farthings, by multiplying with 4. On the other hand, ſhillings are reduced into pounds, by dividing with 20; pence into ſhillings, by dividing with 12; and farthings into pence, by dividing with 4.

Examples. Let it be required to reduce 357l. into ſhillings, and thoſe ſhillings into pence; $357\times20=7140=$ the ſhillings in 357l. and $7140\times12=85680=$ the pence in 357l. as was required. Again, let it be required to reduce 85680d. into ſhillings, and thoſe ſhillings into pounds; $85680\div$ by $12=7140=$ the ſhillings in 357l. and $7140\div$ by $20=357$l. as was required.

If there remain any thing in each diviſion, it is reſpectively either odd pence, ſhillings, or farthings; thus 4123788 farthings, being reduced, give 4295l. 12s. 3d.

But when the numbers propoſed to be reduced are of ſeveral denominations, and it is required to bring them all to the loweſt, you muſt reduce, as before, the higheſt or greateſt denomination to the next leſs, adding the numbers that are of that next denomination together; then reduce their ſum to the next lower denomination; adding together all the numbers that are of that denomination, and ſo proceed gradually on until all is done.

To expedite the practice of this rule, ſeveral compendious ways of reduction have been invented. See PRACTICE.

REDUCTION *of fractions*. See the article FRACTION.

REDUCTION *of equations*, in algebra. See the article EQUATION.

REDUCTION *of curves*. See the article CURVE.

REDUCTION *of a figure, deſign, or draught*, is the making a copy thereof, either larger or ſmaller than the original; ſtill preſerving the form and proportion. The great uſe of the proportional compaſſes is the reduction of figures, *&c.* whence they are called compaſſes of reduction. See the article COMPASS.

There are various methods of reducing figures, *&c.* the moſt eaſy is by means of the pentagraph, or parallelogram:

but

but this has its defects. See the article PENTAGRAPH.

The beſt and moſt uſual methods of reduction are as follows: 1. To reduce a figure, as ABCDE (plate CCXXXI. fig. 1. n° 1.) into a leſs compaſs. About the middle of the figure, as z, pitch on a point, and from this point draw lines to its ſeveral angles A, B, C, &c. then drawing the line *ab* parallel to AB, *bc* parallel to BC, &c. you will have the figure *abcde* ſimilar to ABCDE.

If the figure *abcde* had been required to be inlarged, there needed nothing but to produce the lines from the point beyond the angles, as zD, zC, &c. and to draw lines, *viz.* DC, CB, &c. parallel to the ſides *dc*, *cb*, &c.

2. To reduce a figure by the angle of proportion, ſuppoſe the figure ABCDE (*ibid.* n° 2.) required to be diminiſhed in the proportion of the line AB to *ab*, (*ibid.* n° 3.) draw the indefinite line GH (*ibid.* n° 4.) and from G to H ſet off the line AB. On G deſcribe the arch HI. Set off the line *ab* as a chord on HI, and draw GI. Then with the angle IGH, you have all the meaſures of the figure to be drawn. Thus to lay down the point *c*, take the interval BC, and upon the point G, deſcribe the arch KL. Alſo on the point G deſcribe MN; and upon A, with the diſtance MN, deſcribe an arch cutting the preceding one in *c*, which will determine the ſide *bc*. And after the ſame manner are the other ſides and angles to be deſcribed. The ſame proceſs will alſo ſerve to enlarge the figure.

3. To reduce a figure by a ſcale. Meaſure all the ſides of the figure, as ABCDE, (*ibid.* n° 2.) by a ſcale, and lay down the ſame meaſures reſpectively from a ſmaller ſcale in the proportion required.

4. To reduce a map, deſign, or figure by ſquares. Divide the original into little ſquares, and divide a freſh paper of the dimenſions required into the ſame number of ſquares, which are to be larger or leſs than the former, as the map is to be enlarged or diminiſhed. This done in every ſquare of the ſecond figure, draw what you find in its correſpondent one in the firſt.

REDUCTION *to the ecliptic*, in aſtronomy. The place of any ſtar reduced to the ecliptic, is that point where the ſecundary paſſing through the ſtar interſects the ecliptic. See the articles REDUCTION and SECUNDARY.

REDUCTION, in metallurgy, is the bringing back metalline ſubſtances which have been changed into ſcoriæ or aſhes, or otherwiſe diveſted of their metallic form, into their natural and original ſtate of metals again. All metals and ſemimetals may be reduced by proper management, whatever have been their changes, except only zink, which having been burnt to aſhes, admits of no reduction; but the mixture of gold and ſilver was never yet radically diſſolved by any experiment, whatever ſome may have imagined. Even ſome earths will turn into metals by the admixture and intimate union of a phlogiſtion or inflammable principle.

REDUCTION *into firſt matter*, is a term which alchemiſts uſe when they find their ſubſtances putrify and grow black.

Reduction is more particularly uſed for the converting of a dry matter into a liquid, particularly into water, which by the alchemiſts is held the principle of all things.

REDUCTION, in ſurgery, denotes an operation whereby a diſlocated, luxated, or fractured bone is reſtored to its former ſtate or place. See the articles LUXATION and FRACTURE.

REDUIT, in military affairs. See the article REDUCT.

REDUNDANCY, or REDUNDANCE, a fault in diſcourſe, conſiſting in the uſe of a ſuperfluity of words. Words perfectly ſynonymous are redundant, and ought to be retrenched.

REDUNDANT HYPERBOLA, is a curve of the higher kind, thus called becauſe it exceeds the conic ſection of that name, in the number of its hyperbolical legs; being a triple hyperbola with ſix hyperbolical legs. See HYPERBOLA, CURVE, and CONIC.

REDUPLICATION, in rhetoric, a figure whereby a verſe begins with the ſame word as the preceding one ends with. See the article ANADIPLOSIS.

REDUPLICATION, in logic, a kind of condition expreſſed in a propoſition indicating or aſſigning the manner wherein the predicate is attributed to the ſubject. Hence reduplicative propoſitions, are ſuch wherein the ſubject is repeated with ſome circumſtance or condition. Thus, *men, as men, are rational: kings, as kings, are ſubject to none but God.*

REE, REIS, or REE, a little portugueze copper coin. See the article COIN.

REED,

REED, an antient jewiſh meaſure. See the article MEASURE.

REEF, a term in navigation. When there is a great gale of wind, they commonly roll up part of the ſail below, that by this means it may become the narrower, and not draw ſo much wind; which contracting or taking up the ſail they call a reef, or reefing the ſail: ſo alſo when a top-maſt is ſprung, as they call it, that is, when it is cracked, or almoſt broken in the cap, they cut off the lower piece that was near broken off, and ſetting the other part, now much ſhorter, in the ſtep again, they call it a reefed top-maſt.

REEL, in the manufactories, a machine ſerving for the office of reeling. There are various kinds of reels, ſome very ſimple, others very complex. Of the former kinds thoſe moſt in uſe are, 1. A little reel held in the hand, conſiſting of three pieces of wood, the biggeſt and longeſt whereof (which does not exceed a foot and a half in length, and $\frac{1}{4}$ of an inch in diameter) is traverſed by two other pieces diſpoſed different ways. 2. The common reel, or windlace, which turns upon a pivot, and has four flights traverſed by long pins or ſticks, whereon the ſkain to be reeled is put, and which are drawn cloſer or opened wider, according to the ſkain. A repreſentation of the common reel may be ſeen in plate CCXXIX. fig. 5. where A is the bench or ſeat of the reel, B the two uprights, C the arms of the reel. Its arbor turning and hitching, its little lantern of four notches in the teeth of the wheel; D two wheels, the upper one of which moves the lower, by means of a pinion. E a hammer, the handle whereof is lowered by a peg at the bottom of the lower wheel. F a cord which is rolled round the axle of the lower wheel, and ſupports a weight which ſtops after a certain numbers of turns, to regulate the work-woman.

Other reels uſed in particular arts, as the reel uſed in milling of ſilk, &c. are explained under MILLING, &c. and thoſe in the reeling and winding of ſilks, under the article SILK.

REELING, in the manufactories, the winding of thread, ſilk, cotton, or the like, into a ſkain, or upon a bottom, to prevent its entangling. It is alſo uſed for the charging or diſcharging of bobbins or quills, to uſe them in the manufacture of different ſtuffs, as thread, ſilk, cotton, &c. Reeling is performed different ways, and on different engines. See the article REEL.

RE-ENTRY, in law, ſignifies the reſuming or retaking that poſſeſſion which any one had lately forgone; as where a perſon makes a leaſe of lands to another, the leſſor thereby quits the poſſeſſion, and if the leſſee covenants that upon non-payment of the rent reſerved, the leſſor may lawfully re-enter, being as much as if it was conditioned for the leſſor to take the land again into his hands, and recover the poſſeſſion again by his own act without the aſſiſtance of the law. Likewiſe, if a leaſe for years be made, with condition that if the leſſee aſſign his terms, the leſſor may re-enter, and the leſſee in breach of the condition aſſigns unknown to the leſſor, who accepts of rent from the aſſignee without notice of the aſſignment, in that caſe it is held the leſſor may re-enter, notwithſtanding his acceptance of the rent.

REEVE *of a church*, the guardian of it, or the churchwarden. See CHURCH.

REEVING, in the ſea-language, the putting a rope through a block: hence to pull a rope out of a block, is called unreeving.

RE-EXCHANGE, in commerce, a ſecond payment of the price of exchange, or rather the price of a new exchange due upon a bill of exchange that comes to be proteſted and to be refunded the bearer by the drawer or indorſer. See the articles EXCHANGE and BILL.

RE-EXTENT, in law, a ſecond extent upon lands or tenements, complaint being made that the former was partially executed. See the article EXTENT.

REFECTION, among eccleſiaſtics, a ſpare meal or repaſt juſt ſufficing for the ſupport of life: hence the hall in convents, and other communities, where the monks, nuns, &c. take their refections or meals, in common is called the refectory.

REFERENCE, in writing, &c. a mark relative to another ſimilar one in the margin, or at the bottom of the page, where ſomething omitted in the text is added, and which is to be inſerted either in reading or copying. References are alſo uſed in books where things being but imperfectly handled, the reader is directed to ſome other part or place for a further explanation of them. For the uſe of theſe references in a work of this kind, we refer

refer the reader to what has been ſaid upon that ſubject in our introduction to this work.

REFINING, in general, is the art of purifying a thing; including not only the aſſaying or refining of metals, but likewiſe the clarification of liquors. See ASSAYING and CLARIFICATION.

REFINING *of gold* is performed three ways, *viz.* either with antimony, ſublimate, or aqua fortis; the laſt of which is the moſt uſual, and is called depart, or quartation.

To refine gold with antimony, they make uſe of a wind-furnace, and a common crucible of a ſize anſwerable to the quantity of gold to be refined; always taking care that the gold and antimony, both together, do not fill the crucible more than half full. After the gold is melted in the crucible, the antimony is thrown in in powder: the proportion of the antimony to the gold is eight ounces to a pound, if the gold be between ſixteen and twenty-two carats fine; if it be under ſixteen carats, then they uſe five quarters of a pound to eight ounces of gold; and ſtill the greater quantity of antimony is required, the coarſer the gold is.

As ſoon as they have put the antimony into the crucible, they cover it, and after they have charged the furnace with charcoal, they put on the capital, which is let to ſtand till ſuch time as the crucible is left quite bare; then they take off the capital, and leave the crucible to cool in the furnace of itſelf, till ſuch time as they can take it out by the hand; then they break it, to get out the button or culot, which is a maſs of fine gold remaining at the bottom, with the ſæces of the antimony, the ſilver and copper alloy, and ſometimes little particles of gold itſelf over it.

But notwithſtanding the gold thus prepared is very pure, yet the antimony gives it ſuch a harſh brittle quality, that it ceaſes to be ductile, and muſt be ſoftened by the fire with ſalt-petre and borax, to bring it to itſelf. In order to this operation, they prepare what is called a dry-coppel, which is a coppel made of crucible earth, that does not imbibe like the coppels made of aſhes. When the coppel has been ſufficiently heated in the refining furnace, they put the gold into it, and cover it over with charcoal. As ſoon as the gold is diſſolved, which is very ſoon, by reaſon of the remains of the antimony, they blow it with the bellows to drive the mineral entirely away which now goes off in ſmoak; and add to it, as ſoon as the fumes ceaſe, a little ſalt-petre and borax in powder, which collect the impurities that remained upon the diſſolution, and fix the gold in the coppel in the form of a plate. Then the gold is taken out of the coppel, and melted again in a crucible, with an addition of two ounces of ſalt-petre and borax in powder, to each eight ounces of gold, as ſoon as it has ceaſed to fume; and then it is caſt into an ingot, which upon trial is found to be twenty-three carats, twenty-ſix thirty ſeconds fine.

The particles of gold, detained with the alloy in the ſæces of the antimony, are got out by a dry coppel, with the ſame meltings and ingredients, as were uſed in ſoftening the former: and when they are certain, by the aſſay, how much gold that matter contains, they refine it to ſeparate the copper, and afterwards make the depart or quartation. See the article QUARTATION.

As for the gold which may be left ſticking to the dry coppels, it is got by breaking and pulverizing the crucibles, and by repeated waſhings of the powder of them.

The method of refining gold, by means of ſublimate, is this: they begin the proceſs like that with antimony; that is, in the ſame furnace, with the ſame coal, the ſame fire, and the ſame crucibles. When the gold is melted in the crucible, they caſt in the ſublimate, not in powder, but only broken into pieces: the proportion is, if the gold be of twenty-two carats, an ounce or an ounce and a half, or even two ounces of the ſublimate to eight ounces of the gold; if of twenty carats, three ounces; and if it be only from eighteen to twelve, five or ſix ounces of the ſublimate to eight of the gold, in which laſt caſe they part the ſublimate into two, and put in one half at a time with the gold into a new crucible; which, when the operation is over, leaves the gold of eighteen or twenty carats, according as it was in fineneſs before. This done, they put the broken ſublimate into a crucible with the melted gold, covering it immediately to ſmother the mineral; and then fill the furnace with charcoal, having firſt put on the capital; after a quarter of an hour they take off the capital, lay the crucible bare, and blow off all the aſhes and other impurities, that may be floating on the liquid gold, with

a pair of bellows. This is repeated again and again, till the impurities of the gold are carried off by the ſublimate, appearing of a bright glittering colour; after which being taken out of the crucible, it is caſt into an ingot.

This method of refining by ſublimate, is both cheaper and more complete than that by antimony; but they are both exceeding dangerous, by reaſon of the ſulphureous and arſenical exhalations; on which account the method by quartation is moſt practiſed. See the article QUARTATION.

REFINING *of ſilver* is performed two ways; one with lead, and the other with ſalt-petre.

In order to refine ſilver with lead, a coppel is filled with a mixture of brick-aſhes and aſhes of bullock's and other bones.

It is ſet on the fire, and heated red-hot; in which ſtate the ſilver and lead are put in together, in the proportion of a pound of lead to eight ounces of ſilver, and even ſomewhat more lead, if the ſilver be very coarſe.

As theſe two metals melt together, the copper before mixt with the ſilver diſſipates into ſmoak, or goes away with the ſcum; and ſo does the lead itſelf, leaving the ſilver alone in the coppel in its proper degree of fineneſs.

In this method of refining, wherein ſix or ſeven thouſand pounds may be refined at once, the metal is drawn out of the coppel two ways; the one by plunging in it, while ſtill liquid, a thick bar of iron, round which the ſilver ſticks in form of a ſhell or cruſt, repeating this again and again; the other is by letting the coppel ſtand till it is cold; in the bottom of which, the ſilver fixes in form of a cake.

This method of refining ſilver with lead, is both the beſt and the cheapeſt: however, for want of workmen who underſtand it, that with ſalt-petre ſtill obtains in many places; which is performed in a wind-furnace. They firſt reduce the ſilver to be refined into grains, about the ſize of a ſmall pea; which is done by firſt melting it, then throwing it into a tub of common water, and then heating it over again in a boiler. This being done, they put it into a crucible; putting to every eight ounces of ſilver two of ſalt-petre. Then they cover the crucible with an earthen lid (in the form of a dome) exactly luted; which lid, however, muſt have a little aperture in the middle. The crucible being ſet into the furnace, and covered with charcoal, which is only to be lighted by degrees, at length they give it the full force of the fire, to put the metal into a perfect fuſion. This is repeated three times ſucceſſively, at an interval of a quarter of an hour. After the third fire they uncover the furnace, and let the crucible cool; and at length break it, to get out the ſilver, which is found in a button or culot, the bottom of which is very fine ſilver; and the top mixed with the fæces of the ſalt-petre, and the alloy of the ſilver, and even ſome particles of fine ſilver. Then they ſeparate the culot from the impurities, and melt it in a new crucible; and throw charcoal-duſt into the diſſolution, and work the whole briſkly together. Then they cover the crucible up again, charge the furnace with coal, and give it a ſecond fire.

Having done this, they blow off the aſhes and impurities with bellows, from off the top of the metal, till it appears as clear as a looking-glaſs; and then they throw in an ounce of borax broken to pieces. Then, in the laſt place, they cover the crucible up again, and give it the laſt fire, and after this caſt it into ingots, which are found eleven penny-weight and ſixteen grains fine. To recover the ſilver that may be left in the fæces and ſcoria, they pound them, and give them repeated lotions in freſh water.

REFINING of ſugar, ſulphur, camphor, nitre, *&c.* See SUGAR, CAMPHOR, *&c.*

REFLECTING, or REFLECTIVE DIAL. See the article DIAL.

REFLECTION, or REFLEXION, in mechanics, the return or regreſſive motion of a moving body, occaſioned by ſome obſtacle which hindered it from purſuing its former direction.

For the laws of the reflection of moving bodies, ſee MOTION, COMMUNICATION *of motion*, and PERCUSSION.

REFLECTION *of the rays of light*, in catoptrics, is their return, after approaching ſo near the ſurfaces of bodies, as to be thereby repelled, or driven backwards. Thus the ray A B (plate CCXXX. fig. 2. n° 1.) proceeding from the radiant A, and ſtriking on the point B of the ſpeculum or plane D E, being returned thence to C; B C repreſents the reflected ray, and B the point of reflection; in reſpect whereof A B repreſents the incident ray, or ray of incidence, and B the point of incidence. See MIRROUR.

Again,

Fig. 1. REDUCTION.

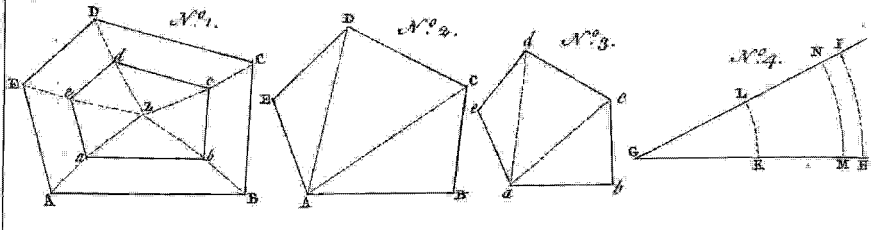

Fig. 2. REFLECTION

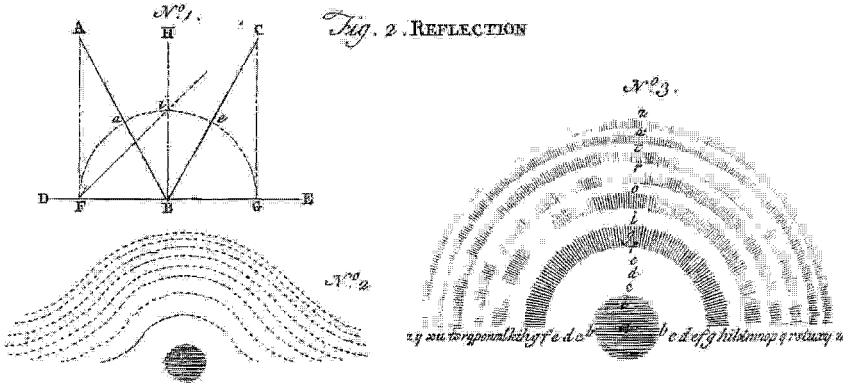

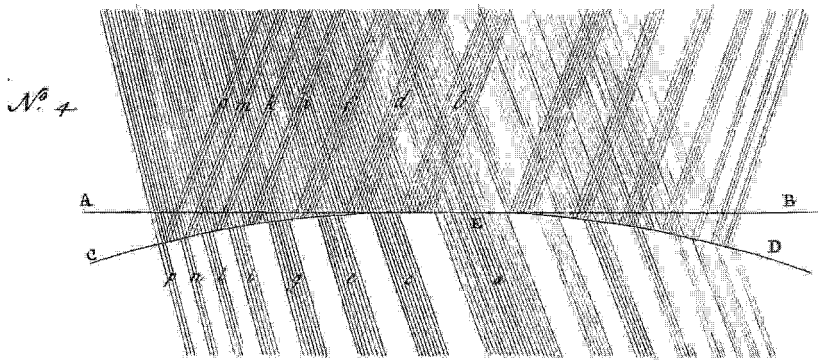

Fig 3. The REMORA.

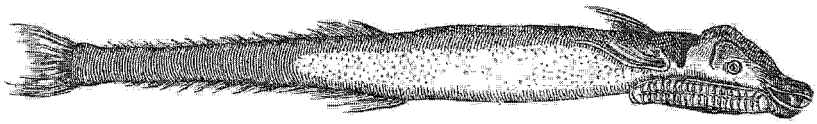

Again, a line, as C G, drawn from any point, as C, of the reflected ray B C, perpendicular to the ſpeculum, is called the cathetus of the reflection, or cathetus of the eye; as a line, A F, drawn from the radiant perpendicular to the ſpeculum, is called the cathetus of incidence.

Of the two angles which the reflected ray B C makes with the mirrour, the ſmalleſt, C B E, is called the angle of reflection; as, of the two angles the incident ray makes with the ſpeculum, the ſmalleſt, A B D, is called the angle of incidence.

If the mirrour be either concave or convex, the ſmalleſt angles the ray makes with a tangent to the point of reflection and incidence, are the angles of reflection and incidence.

The angle C B H, which the reflected ray makes with a perpendicular to the point of reflection, is called the inclination of the reflected ray; as the angle A B H is called the inclination of the incident ray.

The great law of reflection is, that the angle of reflection, C B E, is always equal to the angle of incidence, A B D, as has been demonſtrated under the article INCIDENCE.

The rays of light are found by experiment to be differently reflexible, in the ſame manner, and for the ſame reaſon, that they are differently refrangible; or that thoſe rays which were leaſt and moſt refrangible, were alſo leaſt and moſt reflexible; and, conſequently, exhibit the ſame colours, and in the ſame order. See the article COLOUR.

Cauſes of the REFLECTION *of light.* The opinions of philoſophers, relating to the cauſe of this difficult phænomenon, being principally four, are thus ſtated by Mr. Rowning. 1. It was the opinion of philoſophers, before Sir Iſaac Newton diſcovered the contrary, that light is reflected by impinging upon the ſolid parts of bodies. But that this is not the caſe, will appear from the following reaſons: and, firſt, it is not reflected at the firſt ſurface of the body, by impinging againſt; for it is evident, that in order to the due and regular reflection of light, that is, that the reflected rays ſhould not be diſperſed and ſcattered one from another, there ought to be no raſures or unevenneſs in the reflecting ſurface large enough to bear a ſenſible proportion to the magnitude of a ray of light: becauſe, if the ſurface abounds with ſuch, the reflected rays will rather be ſcattered like a parcel of pebbles thrown upon a rough pavement, than reflected with that regularity with which light is obſerved to form a well poliſhed one, which are far from being ſo; for to poliſh is no other than to grind off the larger eminences and protuberances of the metal with the rough and ſharp particles of ſand, emery, or putty, which muſt of neceſſity leave behind them an infinity of raſures and ſcratches, which, though inconſiderable with regard to the former roughneſſes, and too minute to be diſcerned by us, muſt, nevertheleſs, bear large proportion to, if not vaſtly exceed, the magnitude of the particles of light.

Secondly, that it is not reflected by impinging upon the ſolid particles which conſtitute this ſecond ſurface, is ſufficiently clear from the foregoing argument; the ſecond ſurfaces of bodies being as incapable of a perfect poliſh as the firſt; and it is farther confirmed from hence, *viz.* that the quantity of light reflected, differs according to the different denſity of the medium behind the body: and that it is not reflected by impinging upon the particles which conſtitute the ſurface of the medium behind it, is evident, becauſe the ſtrongeſt reflection of all at the ſecond ſurface of the body, is when there is a vacuum behind it.

2. It has been thought by ſome, that it is reflected at the firſt ſurface of a body, by a repulſive force equally diffuſed over it, and at the ſecond by an attractive force.

If there be a repulſive force diffuſed over the ſurface of bodies, that repels rays of light at all times, then, ſince by increaſing the obliquity of a ray, we diminiſh its perpendicular force (which is that only whereby it muſt make its way through this repulſive force) however weakly that force may be ſuppoſed to act, rays of light may be made to fall with ſo great a degree of obliquity on the reflecting ſurface, that there ſhall be a total reflection of them there, and not one particle of light be able to make its way through, which is contrary to obſervation; the reflection of light at the firſt ſurface of a tranſparent body being never total in any obliquity whatever. The hypotheſis, therefore, in this particular, muſt be falſe.

As to the reflection at the ſecond ſurface by the attractive force of the body, this may be conſidered in two reſpects, *viz.*

when the reflection is total, and when it is partial.

And firſt, in caſes where the reflection is total, the cauſe of it, undoubtedly, is that ſame attractive force by which light would be refracted in paſſing out of the ſame body: this is manifeſt from that analogy which is obſervable between the reflection of light at this ſecond ſurface and its refraction there. For, otherwiſe, what can be the reaſon that the total reflection ſhould begin juſt when the obliquity of the incident ray, at its arrival at a ſecond ſurface, is ſuch, that the refracted angle ought to be a right one; or when the ray, were it not to return in reflection, ought to paſs on parallel to the ſurface, without going from it? For, in this caſe, it is evident, that it ought to be returned by this very power, and in ſuch manner, that the angle of reflection ſhall be equal to the angle of incidence: juſt as a ſtone thrown obliquely from the earth, after it is ſo far turned out of its courſe by the attraction of the earth, as to begin to move horizontally, or parallel to the ſurface of the earth, is then, by the ſame power, made to return in a curve ſimilar to that which is deſcribed in its departure from the earth, and ſo falls with the ſame degree of obliquity that it was thrown with.

But, ſecondly, as to the reflection at the ſecond ſurface, when it is partial; an attractive force uniformly ſpread over it, as the maintainers of this hypotheſis conceive it to be, can never be the cauſe thereof, becauſe it is inconceivable, that the ſame force, acting in the ſame circumſtances in every reſpect, can ſometimes reflect the violet coloured rays and tranſmit the red, and at other times reflect the red and tranſmit the violet.

This argument concludes equally againſt a repulſive force uniformly diffuſed over the firſt ſurface of a body, and reflecting light there; becauſe ſome bodies reflect the violet and tranſmit the red, others reflect the red and tranſmit the violet at their firſt ſurface; which cannot poſſibly be upon this ſuppoſition, the rays of whichever of theſe colours we ſuppoſe to be the ſtrongeſt.

3. Some being apprehenſive of the inſufficiency of a repulſive and attractive force diffuſed over the ſurface of bodies, and acting uniformly, have ſuppoſed, that by the action of light upon the ſurfaces of bodies, the matter of theſe forces is put into an undulatory motion, and that where the ſurface of it is ſubſiding, light is tranſmitted, and in thoſe places where it is riſing, light is reflected. But this ſeems to advance us not one jot farther; for in thoſe caſes, ſuppoſe where red is reflected and violet tranſmitted, how comes it to paſs that the red impinges only on thoſe parts when the waves are riſing, and the violet when they are ſubſiding?

4. The laſt hypotheſis is that of Sir Iſaac Newton; who is of opinion, that light, in its paſſage from the luminous body, is diſpoſed to be alternately reflected by, and tranſmitted through, any refracting ſurface it may meet; and this diſpoſition he calls fits of eaſy reflection, and eaſy tranſmiſſion. Thus, if we take the diſtances as the numbers 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, &c. then at the diſtances 0, 2, 4, 6, 8, &c. the light will be tranſmitted; and, at the diſtances 1, 3, 5, 7, 9, &c. it will be reflected in coloured rings.

Theſe fits he thinks probably owing to ſome ſubtile and elaſtic ſubſtance, diffuſed through the univerſe, in the following manner: as bodies falling into water or paſſing through the air, cauſe undulations in each, ſo the rays of light may excite vibrations in this elaſtic ſubſtance: the quickneſs of which vibrations depending on the elaſticity of the medium, the motion of the particles of it may be quicker than that of the rays; and therefore, when a ray, at the inſtant it impinges upon any ſurface, is in that part of a vibration of this elaſtic ſubſtance which conſpires with its motion, it may be eaſily tranſmitted; and when it is in that part of a vibration which is contrary to its motion, it may be reflected. Alſo, when light falls on the firſt ſurface of a body, none is reflected there; but all that happens to it there is, that every ray that is not in a fit of eaſy tranſmiſſion is there put into one, ſo that, when they come to the other ſide, the rays of one colour ſhall be in a fit of eaſy tranſmiſſion, and thoſe of another in a fit of eaſy reflection, according to the thickneſs of the body, the intervals of the fits being different in rays of a different kind.

This doctrine of the eaſy reflection and eaſy tranſmiſſion of the rays of light, ought by no means to be looked on as a mere hypotheſis, ſince Sir Iſaac has evinced, by experiments, that this is the caſe.

caſe. The firſt experiment he mentions is the compreſſion of two priſms hard together, whoſe ſides were a little convex, by which means they touched by a ſmall part of their ſurfaces, and contained every where elſe a thin plate of air, as it may be properly called, whoſe thickneſs did every where gradually increaſe from the touching parts. He obſerved the place where they touched became abſolutely tranſparent, as if they had there been one continued piece of glaſs. For when the light fell ſo obliquely on the plate of air between the priſms as to be all reflected, it ſeemed in that place of contact to be wholly tranſmitted, inſomuch that when looked upon, it appeared like a black or dark ſpot, by reaſon that little or no ſenſible light was reflected from thence, as from other places. When he looked through the priſms, this place of contact ſeemed, as it were, a hole in the plate of air; and through this hole objects that were beyond might be ſeen diſtinctly, which could not be ſeen through other parts of the glaſſes where the air was interjacent. By harder compreſſion the ſpot was dilated by the yielding inwards of the parts of the glaſſes.

When the plate of air, by turning the priſms about their common axis, became ſo little inclined to the incident rays that ſome of them began to be tranſmitted, there aroſe in it many ſlender coloured arches, which at firſt were ſhaped almoſt like the conchoid, as in *ibid.* n° 2. and by continuing the motion of the priſms, theſe arches increaſed and bended more and more about the ſaid tranſparent ſpot, till they were compleated into circles or rings encompaſſing it; and afterwards continually grew more and more contracted. Theſe arches and rings became tinged with various colours, as the motion of the priſms was continued, being at firſt of a violet and blue; afterwards of a white, blue, violet; black, red, orange, yellow, white, blue, violet, &c. after this the coloured rings contracted, and became only black and white. The priſms being farther moved about, the colours all began to emerge out of the whiteneſs, and in a contrary order to what they had before.

But to obſerve more nicely the order of the colours which aroſe out of the white circles, as the rays became leſs and leſs inclined to the plate of air, Sir Iſaac Newton made uſe of the two object-glaſſes, one a plano-convex, and the other a double-convex, of the ſame ſphericity on both ſides, of fifty one feet focal diſtance; and upon this he laid the plane ſide of the other, preſſing them ſlowly together to make the colours ſucceſſively emerge in the middle of the circles, and then ſlowly lifted the upper glaſs from the lower to make them ſucceſſively vaniſh again in the ſame place. Upon compreſſion of the glaſſes, various colours would emerge and ſpread into concentric circles or rings of different breadths and tints encompaſſing the central ſpot. Their form, when the glaſſes were moſt compreſſed, is delineated, *ibid.* n° 3. where *a* is the central black ſpot, and the circuits of colours from thence outwards as follows:

1 { *b*, blue. *c*, white. *d*, yellow. *e*, red.
2 { *f*, violet. *g*, blue. *h*, green. *i*, yellow. *k*, red.
3 { *l*, purple. *m*, blue. *n*, green. *o*, yellow. *p*, red.
4 { *q*, green. *r*, red.
5 { *s*, greeniſh blue. *t*, red.
6 { *u*, greeniſh blue. *x*, pale red.
7 { *y*, greeniſh blue. *z*, reddiſh white.

Theſe rings were obſerved to be leaſt when the eye was held perpendicularly over the glaſſes in the axis of the rings: whereas, viewed obliquely, they became bigger, continually ſwelling as the eye was removed farther from the axis: and the coloured rings made in air, became much more diſtinct and viſible, when viewed in a dark room by the reflection of the coloured light of the priſm. The rings made by reflection of red light were manifeſtly bigger than thoſe made by the blue and violet; and it was very pleaſant to ſee them gradually ſwell and contract according as the colour of the light was changed. The motion was quickeſt in the red, and ſloweſt in the violet; and, by an eſtimation made of the diameters of the rings, the thickneſſes of air in the places where the rings are made by the limits of the ſeven colours, red, orange, yellow, green, blue, indigo, violet, ſucceſſively in order, were to one another as the cube roots of the ſquares of the eight lengths of a chord which ſound the notes of an octave, that is, of the numbers $1, \frac{8}{9}, \frac{5}{6}, \frac{3}{4}, \frac{2}{3}, \frac{3}{5}, \frac{9}{16}, \frac{1}{2}$.

Theſe rings were not of various colours, as thoſe made in the open air, but appeared all over of that priſmatic colour only with which it was illumined; and by

by throwing the coloured light directly on the glaſſes, that which fell on the dark ſpaces between the rings was tranſmitted through the glaſſes without any variation of the colour. This appeared by placing a white paper behind, on which the rings were painted of the ſame colour as thoſe by reflected light, and of the bigneſs of their immediate ſpaces. Hence the origin of theſe rings is manifeſt; namely, that the air between the glaſſes, according to its various thickneſs, is diſpoſed in ſome places to reflect, in others to tranſmit the light of any one colour; and in the ſame place to reflect that of one colour, where it tranſmits that of another; in the manner as you ſee repreſented *ibid.* n° 4. where AB, CD, are the glaſſes, as before; and *a*, *c*, *e*, *g*, *i*, *l*, *n*, *p*, the parts of the beam tranſmitted; and *b*, *d*, *f*, *h*, *k*, *m*, *o*, the parts of the beam reflected, making the coloured rings.

REFLECTION *of the moon*, the ſame with her variation. See VARIATION.

REFLECTION is alſo uſed, figuratively, for an operation of the mind; whereby it turns its view backwards as it were upon itſelf, and makes itſelf and its own operation the object of its diſquiſition; and by contemplating the manner, order, and laws which it obſerves in perceiving ideas, comparing them together, reaſoning, &c. it frames new ideas of the relations diſcovered therein. See the articles IDEA, KNOWLEDGE, REASONING, &c.

REFLEX, or REFLECT, in painting, is underſtood of thoſe places in a picture which are ſuppoſed to be illuminated by a light reflected from ſome other body, repreſented in the ſame piece.

REFLEX VISION, that performed by means of reflected rays, as from mirrours. See the articles VISION, REFLECTION, and MIRROUR.

REFLUX *of the ſea*, the ebbing of the water, or its returning from the ſhore. See the article TIDE.

REFORM, a re-eſtabliſhment, or revival of formerly neglected diſcipline, or a correction of the reigning abuſes therein.

To REFORM, in a military ſenſe, is to reduce a company, regiment, &c. either by diſbanding the whole, or breaking a part, and retaining the reſt.

REFORMADO, or REFORMED OFFICER, one whoſe troop, or company, is ſuppreſſed in a reform, and he continued either in the whole or half-pay, doing duty in the regiment.

REFORMATION, the act of reforming, or correcting an error or abuſe in religion, diſcipline, or the like.

The reformation, ſo called by way of eminence, is the ſeparation of the proteſtants from the church of Rome, in the beginning and towards the middle of the ſixteenth century. See the article LUTHERANS, &c.

REFRACTED, or REFRACTIVE DIAL, one that ſhews the hours by means of ſome refractive tranſparent fluid. See the article DIAL.

REFRACTION, in general, is the deviation of a moving body from its direct courſe, occaſioned by the different denſity of the medium it moves in; or, it is a change of direction, occaſioned by a body's falling obliquely out of one medium into another of a different denſity. The great law of refraction, which holds in all bodies, and all mediums, is, that a body, paſſing obliquely out of one medium into another wherein it meets with leſs reſiſtance, is refracted or turned towards the perpendicular; and, on the contrary, in paſſing out at one medium into another wherein the reſiſtance is greater, it is refracted or turned from the perpendicular. Hence the rays of light, falling out of air into water, are refracted towards the perpendicular; whereas a ball, thrown into the water, is refracted from it. Now the reaſon of this difference is, that water, which reſiſts the motion of light leſs than air, reſiſts that of the ball more; or, to ſpeak more juſtly, becauſe water, by its greater attraction, accelerates the motion of the rays of light more than air does.

In order to illuſtrate the refraction of light, let AB (plate CCXXXI. fig. 1. n° 1.) repreſent a ray moving in air from A to B, and paſſing into water at B; and let HK be perpendicular to the ſurface of the water at the point B. When therefore the ray enters the water, it does not continue its motion ſtraight forward in the line BC, but in ſome other line, as BD, which is nearer or more inclined to the perpendicular BK: and, on the other hand, if the line DB be ſuppoſed to be a ray of light moving in water from D to B, and there paſſing into air, inſtead of continuing its motion ſtraight forward in the direction BE, it goes on in ſome other direction as BA; which being

Fig. 1. REFRACTION.

REGULAR BODIES.

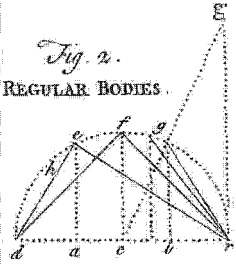

Fig. 3. The REGULUS without a Creſt.

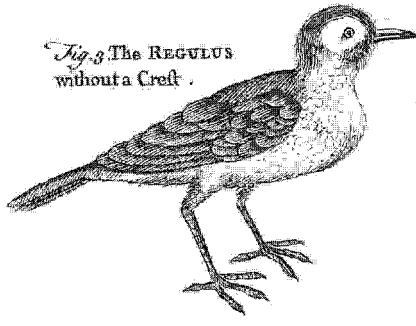

Fig. 4. RESARCELÉE

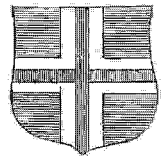

being leſs inclined to, is more diſtant from, the perpendicular B H, as will appear from the following experiment. Let an empty veſſel, as B C D E (*ibid.* n° 2.) have a ſmall object placed at its bottom at A; and let it be ſo ſituated as that the ſight of the object may be intercepted by the ſide of the veſſel, from an eye placed at Q; then let the veſſel be filled with water, and the ray A B, which before the water was poured in, moved in a right line from A to K, and by ſo doing paſſed above the eye, will, upon its emerſion out of the water be bent downward, ſo as to ſtrike upon the eye at Q, and thereby render the object at A viſible. This bending of the rays of light, in their paſſage out of one medium into another, is owing to the attractive force of the denſer medium acting upon the rays at right angles to the ſurface.

The fundamental law of the refraction of the rays of light is, that the ſine of the angle of incidence is always in a conſtant ratio to the ſine of the angle of refraction, in all inclinations of the incident ray whatever. See INCIDENCE.

Now that this is the caſe, whatever be the inclination of the incident ray, may be proved experimentally in the following manner: let a braſs quadrant, C F E, (*ibid.* n° 3.) graduated on both ſides, and fixed at its center C, to a perpendicular pillar, C D, have two indices, A and B, one on each ſide, moveable on the center C; and let the index A, whereof the ſtem G is a continuation, be made to point to the fifteenth degree, and the index B to the fifteenth minute of the twentieth degree: let then the pillar be immerſed in water, till C E, the horizontal edge of the quadrant touch the ſurface of the water; and upon viewing the ſtem G, immerſed in the water, it will, by reaſon of the refraction, appear to have changed its ſituation, and to lie in a line with the index B. And the ſame thing will likewiſe obtain, if the index A be ſet at the thirtieth degree, and B at the thirtieth minute of the forty ſecond degree; that is, twenty-five, the ſine of the leſſer angle of incidence, is to thirty-three, the ſine of the correſponding angle of refraction; as fifty, the ſine of the greater angle of incidence, is to ſixty-ſix, the ſine of the angle of refraction correſponding thereto. And the ſame holds of all other angles of incidence and refraction.

Since then the ratio of theſe ſines is conſtant, it remains that we determine what that ratio is in different mediums; in order to which we ſhall firſt premiſe the following lemma. Let G H D, (*ibid.* n° 4.) be an equilateral triangle, and let the angle D be biſſected by the right line D O; let A K, M C, be drawn parallel to the ſide G H, and through the point K draw I K N cutting O D in N: then is the angle A K I = N K B. Alſo the triangle is divided into two ſimilar and equiangular triangles, N K B and B K D, by the perpendicular K B; and, therefore, the angle N K B is equal to the angle K D B: all which is evident from Euclid's Elements.

Suppoſe now that G H D be the ſection of a priſm of water or glaſs, or any pellucid medium; and K M a ray of light paſſing through it, parallel to the ſide G H; and let it go out of the priſm, and be refracted into the air, on each ſide, into the directions K F, M E: and, laſtly, upon the point K, deſcribe the ſemi-circle P I Q: then is N K B (= K D B) = F K I, the angle of incidence out of the priſm into air, and A K I is the angle of refraction; conſequently A R, and F S, are the ſines of the angles of incidence and refraction, out of the priſm into air. On the contrary, we may conſider F K as the incident ray falling upon the priſm in the point K, and refracted in the direction K M, parallel to the ſide G H, which at the point M emerges again into the air in the direction M E, making the angle E M L, with the perpendicular M L, equal to the angle F K I. In this caſe the angle F K I is the angle of incidence, and N K B is the angle of refraction in the priſm; which angle of refraction is therefore given, or conſtant, as it is always equal to the angle K D B, or half the angle of the priſm.

The angle of incidence, F K I, conſiſts of two parts, *viz.* of the given angle A K I (= K D B) and the additional angle A K F. Now the angle A K I is known, as being equal to half the angle of the priſm; and the angle F K A is known by placing the priſm by the center of a graduated ſemi-circle, as A B C, (*ibid.* fig. 5.) carrying an index, whoſe two arms, F K and K E are equally elevated above the horizontal line A C, and

and correſpond to the incident and emergent ray FK and ME in the other figure. For here it is evident, if an object be placed on the end of the arm F, it will be ſeen by an eye looking through the ſights at the other end of the index E; and when the object is thus ſeen, the angle AKF is known by the number of degrees which each arm cuts upon the limb of the ſemi-circle.

This number of degrees, added to the conſtant number thirty degrees, which is equal to half the angle of the priſm, gives the whole angle of incidence FKI; and thus the angle of incidence and refraction being found, the proportion of the ſines FS and AR will be diſcovered, which ratio is always the ſame while the matter of the priſm remains the ſame, as was before ſhewn from the theory, and may by this inſtrument be proved by experiment. For example, let the priſm be of water, it will be neceſſary to elevate each arm twelve degrees upon the limb, before the image of the object at F can be ſeen by the eye at E; then $12 + 30 = 42^{\circ} = FKA + AKI = FKI$, the angle of incidence. But the ſine FS of 42°, is to the ſine AR of 30°, as 4 to 3 very nearly.

Now it is plain, if the ratio of the ſines AR and FS were not fixed, ſince FS might be in any ratio greater or leſs than AR, the incident ray FK may make an angle FKI greater or leſs than forty-two degrees, and yet the object at F be ſeen by the eye at E: but this we find by experiment to be impoſſible, becauſe there is no elevation of the arms of the index that will exhibit the appearance of the object but the one above-mentioned.

If GHD were a priſm of glaſs, as that is a denſer body than water, ſo its refractive power will be greater; and, conſequently, it will act more ſtrongly on the ray KM, at its exit into the air, and cauſe it to be refracted farther from the perpendicular IK or ML. Therefore the angle of incidence out of air into glaſs, *viz.* FKI, ought to be greater, and ſo to require a greater elevation of the legs of the index than before in the priſm of water: and this we find, by experiment, is the caſe; ſince then the elevation, inſtead of twelve degrees, muſt be about twenty-two or twenty-three degrees.

Hence it is plain, the ſine of incidence, FS, muſt be in a conſtant ratio to the ſine of refraction, AR; becauſe the angle AKL is invariable, being always equal to GDO; and in the ſame medium, GDH, the angle FKI muſt always be the ſame, becauſe the refractive power is every where ſo: therefore, the angles being conſtant, the ſines will be ſo too, or their ratio to each other always the ſame. And as by this inſtrument the angles of incidence and refraction are diſcovered, the ratio of their ſines will be known of courſe, for each reſpective medium: thus, in water the ſine of forty-two degrees, is to the ſine of thirty degrees, nearly as four to three; in glaſs, the ſine of forty-ſix degrees is to the ſine of thirty degreee, as three to two; or, more nearly as ſeventeen to eleven: and, to mention no more, it has been found, by ſome experiments, that the ſine of incidence is to the ſine of refraction in a diamond, as five to two. But, ſince in phyſical matters no authority is comparable to that of Sir Iſaac Newton, we ſhall give a table from his optics, ſhewing the proportion of the ſines of incidence and refraction of yellow light, that being nearly a mean between the greateſt and leaſt refrangible rays: this is contained in the firſt column; the ſecond column expreſſes the denſities of the bodies eſtimated by their ſpecific gravities; and the third ſhews the refractive power of each body, in reſpect of its denſity.

The refracting body.	Proportion of the ſines.	The denſity	Ref. power
Air	3201 to 3200	0,0012	5208
Glaſs of ant.	17 to 9	5,2800	4864
Pſeudo-topaz	23 to 14	4,2700	3979
A ſelenites	61 to 41	2,2520	5386
Com. glaſs	31 to 20	2,5800	5436
Cryſt. of rock	25 to 16	2,6500	5450
Iſland cryſt.	5 to 3	2,7200	6536
Sal gemmæ	17 to 11	2,1430	6477

Spt. of turp.	25 to 17	0,8740	13222
Amber	14 to 9	1,0400	13654
A diamond	100 to 41	3,4000	14556

The refraction of the air in this table is determined by that of the atmoſphere, as obſerved by aſtronomers; for if light paſs through many refracting ſubſtances, or mediums, gradually denſer and denſer, and terminated with parallel ſurfaces, the ſum of all the refractions will be equal to the ſingle refraction it would have ſuffered in paſſing immediately out of the firſt medium into the laſt.

As to the different refrangibility of the ſeveral ſorts of rays of light, it has already been explained under the articles COLOUR and RAINBOW.

REFRACTION, in aſtronomy. From what has been ſaid, the refraction of the rays of light, iſſuing from a heavenly body, in paſſing through the atmoſphere of our earth, will be eaſily underſtood. Thus, the ray AB (*ibid.* n° 6.) proceeds from the ſtar A in a right line, till it reach the atmoſphere of the earth at B; upon entering which, it will be refracted towards the perpendicular BC, ſuppoſed to be drawn from B to C, the center of the earth; and as it paſſes on through the atmoſphere towards it, D, it will be continually refracted the ſame way, by reaſon it all along enters a denſer part of the atmoſphere; and hence it will deſcribe the curve BD bending downwards, ſo as to render the object viſible to a ſpectator at D. But, as all viſion is performed in right lines, the ſpectator at D will ſee the ſtar in the tangent line DE; and, conſequently, the apparent place of the ſtar will be E; which is higher, or nearer the zenith than its true place A.

From hence it is, that the ſun, moon, and ſtars appear above the horizon when juſt below it; and higher than they ought to do when they are above it.

Farther, the refraction of the heavenly bodies is greateſt in the horizon, and gradually decreaſes as their altitudes increaſe, till near the zenith it becomes ſcarcely ſenſible, and in the zenith none at all. In taking, therefore, the altitudes of the heavenly bodies, it is abſolutely neceſſary to ſubtract from the obſerved altitude their refractions, a table of which we have given under the article QUADRANT. Refraction ſerves alſo to account for the oval appearance of the ſun and moon near the horizon: for the lower theſe objects are, the greater is the obliquity with which their rays enter the atmoſphere, or paſs from the nearer to the denſer parts of it; and, therefore, they appear to be the more elevated by refraction; ſo that, when very near the horizon, the lower part of them is thereby more elevated than the upper part: and hence they appear of an oval figure, by reaſon their horizontal diameters are no ways altered, while their vertical or upright diameters are ſhortened by the different refraction of the upper and lower limbs. There is alſo another alteration made by refraction in the apparent diſtance of ſtars: thus, if two ſtars are in the ſame circle of altitude, their apparent diſtance is leſs than the true; for ſince refraction makes each of them higher than they really are, it muſt bring them nearer the point of the verticals, where they come nearer together.

REFRACTION *of altitude* is an arch of a vertical circle, whereby the altitude is increaſed by the refraction.

REFRACTION *of declination* is an arch of a circle of declination, whereby the declination of the object is either increaſed or diminiſhed by the refraction.

REFRACTION *of longitude* is an arch of the ecliptic, whereby the longitude of the object is increaſed or diminiſhed by the refraction.

REFRACTION *of latitude*, is an arch of a circle of latitude, whereby the latitude of a heavenly object is either increaſed or diminiſhed by its refraction.

REFRACTION *in iſland cryſtal*. There is a double refraction in this ſubſtance, contrary ways, whereby not only oblique rays are divided into two, and refracted into oppoſite parts, but even perpendicular rays, and one half refracted.

Cauſtic by REFRACTION. See the article DIACAUSTIC.

REFRANGIBILITY *of light*, the diſpoſition of rays to be refracted. See REFRACTION, LIGHT, and RAY.

REFRIGERATIVE, in medicine, a remedy which refreſhes the inward parts, by cooling them, as clyſters, ptiſans, &c.

REFRIGERATORY, in chemiſtry, a veſſel filled with cold water, through which the worm paſſes in diſtillations; the uſe of which is, to condenſe the vapours as they paſs through the worm.

REFUGE, a ſanctuary or aſylum. See article ASYLUM.

REFUGEES, french proteſtants, who by the revocation of the edict of Nantz, have been conſtrained to fly from perſecution and take refuge in foreign countries.

REGAL, or ROYAL, ſomething belonging to a king. See ROYAL.

REGALE, a magnificent entertainment, or treat, given to embaſſadors, and other perſons of diſtinction, to entertain or do them honour.

It is uſual, in Italy, at the arrival of a traveller of eminence, to ſend him a regale, that is, a preſent of ſweetmeats, fruit, &c. by way of refreſhment.

REGALE, in the french juriſprudence, is a royal prerogative, which conſiſts in enjoying the revenues of biſhoprics during the vacancy of their ſees, of preſenting to benefices, and of obliging the new biſhop to take an oath of fidelity, and to regiſter it in the chamber of accounts. The enjoyment of the fruits of the ſee is called the temporal regale; and that of preſenting to the ſee, the ſpiritual regale.

REGALIA, in law, the rights and prerogatives of a king; which, according to civilians are ſix: *viz.* 1. the power of judicature: 2. the power of life and death: 3. the power of peace and war: 4. a right to ſuch goods as have no owner, as waifs, eſtrays, &c. 5. aſſeſſments; and 6. the coinage of money.

Regalia is alſo uſed for the apparatus of a coronation, as the crown, the ſceptre with the croſs, that with the dove, St. Edward's ſtaff, the globe, and the orb with the croſs, four ſeveral ſwords, &c.

REGALIA *of the church* are the rights and privileges which cathedrals, &c. enjoy by the grants of kings; and this term is particularly uſed for ſuch lands and hereditaments as have been given by kings to the church.

Regalia is alſo ſometimes uſed for the patrimony of the church.

REGARD *of the foreſt*, the inſpection or overſight thereof, or the office and province of the regarder. See REGARDER.

REGARDANT, in heraldry, ſignifies looking behind, and is uſed for a lion, or other beaſt, with his face turned towards his tail.

Villain REGARDANT, or REGARDANT *to the manor*, ſignifies a ſervant or retainer to the lord, who was thus called from his doing all the baſe ſervices within the manor, and being charged to ſee that it was freed from every thing filthy and loathſome.

REGARDER, an antient officer of the king's foreſt, ſworn to make the regard of the foreſt every year; that is, to take a view of its limits, to enquire into all offences and defaults committed by the foreſters within the foreſt, and to obſerve whether all the other officers executed their reſpective duties.

REGEL, or RIGEL, a fixed ſtar of the firſt magnitude, in orion's left foot, whoſe longitude is 72° 10′, and latitude 30° 10′. See ORION.

REGEN, a river of Germany, which riſes in the mountains that divide Bohemia from Bavaria, and falls into the Danube at Ratiſbon.

REGENERATION, in theology, the act of being born again by a ſpiritual birth, or the change of heart and life, experienced by a perſon who forſakes a courſe of vice, and ſincerely embraces a life of virtue and piety.

REGENT, one who governs a kingdom during the minority or abſence of the king. In France, the queen-mother has the regency of the kingdom during the minority of the king, under the title of queen-regent.

REGENT alſo ſignifies a profeſſor of arts and ſciences in a college, who has a ſet of pupils under his care; but here regent is generally reſtrained to the lower claſſes, as regent of rhetoric, regent of logic, &c. thoſe of philoſophy are rather called profeſſors. The foreign univerſities are generally compoſed of doctors, profeſſors, and regents.

REGICIDE, KING-KILLER, a word chiefly uſed with us in ſpeaking of the perſons concerned in the trial, condemnation and execution of king Charles I.

REGIFUGE, a feaſt celebrated in antient Rome on the ſixth of the calends of March, in memory of the expulſion of their antient kings, and particularly of Tarquin's flying out of Rome on that day.

REGIMEN, the regulation of diet, and in a more general ſenſe, of all the non-naturals, with a view to preſerve or reſtore health.

Dr. Mead obſerves, with reſpect to regimen, that diſeaſes from inanition are generally more dangerous than thoſe which proceed from repletion, becauſe we can more expeditiouſly diminiſh than increaſe the juices of the body. Upon this account, though temperance is beneficial to all men, the antient phyſicians adviſed perſons in good health to indulge a little now and then, by eating and drinking more plentifully than uſual: but of the two, intemperance in drinking is ſafer than in eating; and if a perſon has committed exceſs in the latter, cold water drank upon a full ſtomach will help digeſtion; to which it will be of ſervice to add lemon-juice or elixir of vitriol,

vitriol, if he has eaten high ſeaſoned things, rich ſauces, &c. Then let him ſit up for ſome time, and afterwards ſleep. But if a man happens to be obliged to faſt, he ought to avoid all laborious work. From ſatiety it is not proper to paſs directly to ſharp hunger, nor from hunger to ſatiety; neither will it be ſafe to indulge abſolute reſt immediately after exceſſive labour, nor ſuddenly to fall to hard work after long idleneſs. In a word, all changes in the way of living ſhould be made by degrees. It is alſo beneficial to vary the ſcenes of life, to be ſometimes in the country, ſometimes in town; to go to ſea, to hunt, to be at reſt now and then, but more frequently to uſe exerciſe, and a moderate ſleep. See EXERCISE and SLEEP.

The ſofter and milder kinds of aliment are proper for children, and for youths the ſtronger. Old people ought to leſſen the quantity of their food, and increaſe that of their drink. But yet ſome allowance is to be made for cuſtom, eſpecially in the colder climates, like ours; for as in theſe the appetite is keener, ſo is the digeſtion is better performed.

In the ſummer, ſays Dr. Brookes, when the ſpirits and fluid parts are apt to evaporate, the aliment ſhould be light, moiſt, fluid, and eaſy of digeſtion, to repair the loſs with the greater ſpeed: and as digeſtion depends in part on the due preparation of the aliments, it is neceſſary to chew them well, eſpecially if they are hard, that they may be the more intimately mixed with the ſaliva; for thoſe who eat in a hurry, without much chewing, are very ſubject to indigeſtions. For the qualities of different kinds of food, ſee DIET, DIGESTION, FLESH, FRUIT, &c.

It is well known, that cold ſtops the pores, and diminiſhes perſpiration. To ſhun this inconvenience, it will be neceſſary to put on winter garments pretty early, and to leave them off late, and not to paſs too ſuddenly from a hot into a cold air, and to avoid drinking any thing cold, when the body is hot, or when a perſon has been for ſome time ſpeaking in public.

In ſhort, the paſſions and affections of the mind produce very ſenſible effects. Joy, anger, fear, and ſorrow, are the principal. In the firſt, the ſpirits are hurried with too great vivacity; in fear or dread, they are as it were, curbed and concentrated; and continual ſorrow and anguiſh of mind render the fluids of the body thick, and the blood unapt for a due circulation, whence proceed many chronic diſeaſes: it is therefore, on all accounts, as much our intereſt as our duty, to keep the paſſions within due bounds, and to preſerve an inward ſerenity, calmneſs and tranquility.

REGIMEN, in chemiſtry, ſignifies the due regulation of fire. See FIRE.

REGIMEN, in grammar, that part of ſyntax, or conſtruction, which regulates the dependency of words, and the alterations which one occaſions in another.

Regimen is threefold, of nouns, of verbs, and of indeclinable words. See NOUN, VERB, and INDECLINABLE.

The regimen of latin-ſubſtantive nouns is moſtly of the genitive caſe, but that of adjectives, is of the genitive, dative, accuſative and ablative.

The regimen of verbs may be diſtributed into three claſſes, the firſt of which is the regimen of verbs perſonal; the ſecond is that of verbs imperſonal; and the third that of the infinitives, participles, gerunds and ſupines. See the articles VERB, PARTICIPLE, &c.

The regimen of indeclinable words is that of the adverbs, prepoſitions, interjections and conjunctions. See the articles ADVERB, PREPOSITION, &c.

In general, the regimen, or conſtitution of government, is almoſt intirely arbitrary, and varies greatly in all languages. For one language forms its regimen by caſes, as the latin and greek. Others, inſtead of caſes, make uſe only of ſmall particles, as the engliſh, *by*, *of*, *to*, &c. The french, ſpaniſh, and italian by *de*, *a*, *da*, &c. There are, however, ſome few maxims which hold good in every language, as, 1. That there is no nominative caſe in any ſentence but has a reference to ſome verb either expreſſed or underſtood. 2. That there is no verb which has not its nominative caſe expreſſed or underſtood, though in the latin before an infinitive, there is an accuſative. 3. That there is no adjective but has a relation to ſome ſubſtantive. 4. That there is no genitive caſe but is governed by ſome other noun. This rule does not ſo apparently hold in the modern, as in the antient languages, in regard the particles *of*, *de*, &c. which are the proper ſigns of the genitive caſe, are frequently uſed as prepoſitions. 5. That the regimen of verbs is frequently laid upon different kinds of relations, according to cuſtom or uſage,

which yet does not change the ſpecific relation of each caſe, but only ſhews that cuſtom has made choice of this or that according to fancy.

Sometimes theſe different governments have a power of changing the ſenſe according to the different cuſtom of languages, in which caſe the particular uſe of languages muſt be always conſulted.

There is one very common fault committed in regimen, which ſhould be carefully avoided by accurate writers, *viz.* the uſing two verbs that require different caſes together, as only governing one caſe, as in this example, "after em- "bracing and giving his bleſſing to his "ſon," where, "embracing," requires an accuſative caſe, and "giving," a dative. The ſame is to be obſerved in the regimen of nouns.

REGIMENT, in war, is a body of men, either horſe or foot, commanded by a colonel.

Each regiment of foot is divided into companies, but the number of companies is not always alike, though our regiments generally conſiſt of thirteen companies, one of which is always grenadiers.

Regiments of horſe moſt commonly conſiſt of ſix troops, but ſome have nine.

Regiments of dragoons, in time of war, are generally compoſed of eight troops, and in time of peace, of ſix. Each regiment has a chaplain and a ſurgeon. See TROOP and COMPANY.

Some german regiments conſiſt of two thouſand foot, and the regiment of Picardy in France, conſiſts of 120 companies, or 6000 men.

REGIO ASSENSU, a writ by which the king gives his royal aſſent to the election of a biſhop.

REGION, in geography, a large extent of land, inhabited by many people of the ſame nation, and incloſed within certain limits or bounds.

The modern aſtronomers divide the moon into ſeveral regions, or large tracts of land, to each of which they give its proper name.

REGION, in phyſiology, is taken for a diviſion of our atmoſphere, which is divided into the upper, middle, and lower regions. See ATMOSPHERE.

The upper region commences from the tops of the mountains, and reaches to the utmoſt limits of the atmoſphere. In this region reigns a perpetual, equable, calmneſs, clearneſs and ſerenity. The middle region is that in which the clouds reſide, and where meteors are formed, extending from the extremity of the loweſt to the tops of the higheſt mountains. The loweſt region is that in which we breathe, which is bounded by the reflection of the ſun's rays; or by the height to which they rebound from the earth. See ATMOSPHERE and AIR.

Æthereal REGION, in coſmography, is the whole extent of the univerſe, in which is included all the heavenly bodies, and even the orb of the fixed ſtars. See the article ÆTHER.

Elementary REGION, according to the Ariſtotelians, is a ſphere terminated by the concavity of the moon's orb, comprehending the atmoſphere of the earth.

REGION, in anatomy, a diviſion of the human body, otherwiſe called cavity, of which anatomiſts reckon three, *viz.* the upper region, or that of the head; the middle region, that of the thorax or breaſt; and the lower, the abdomen, or belly. See the articles HEAD, THORAX, and ABDOMEN.

REGISTER, a public book, in which is entered and recorded memoirs, acts and minutes, to be had recourſe to occaſionally, for knowing, and proving matters of fact.

Of theſe there are ſeveral kinds; as, 1. Regiſters of deeds in Yorkſhire and Middleſex, in which are regiſtered all deeds, conveyances, wills, *&c.* that affect any lands or tenements in thoſe counties, which are otherwiſe void againſt any ſubſequent purchaſers, or mortgagees, *&c.* but this does not extend to any copyhold eſtate, nor to leaſes at a rack-rent, or where they do not exceed twenty-one years. The regiſtred memorials muſt be ingroſſed on parchment, under the hand and ſeal of ſome of the grantors or grantees, atteſted by witneſſes who are to prove the ſigning or ſealing of them, and the execution of the deed.

But theſe regiſters which are confined to two counties, are in Scotland general, by which the laws of North Britain are rendered very eaſy and regular. Of theſe there are two kinds; the one general, fixed at Edinburgh, under the direction of the lord-regiſter; and the other is kept in the ſeveral ſhires, ſtewarties, and regalities, the clerks of which are obliged to tranſmit the regiſters of their reſpective courts to the general regiſter. No man in Scotland, can have a right to any

any eſtate, but it muſt become regiſtred within forty days of his becoming ſeiſed thereof; by which means all ſecret conveyances are cut off. 2. Pariſh regiſters, are books in which are regiſtered the baptiſms, marriages, and burials of each pariſh.

REGISTER, is alſo uſed for the clerk or keeper of a regiſter.

Of theſe we have ſeveral, denominated from the regiſters they keep; as regiſter of the high court of delegates; regiſter of the arches court of Canterbury; regiſter of the court of admiralty; regiſter of the prerogative court; regiſter of the garter, *&c.*

REGISTER SHIPS, in commerce, are veſſels which obtain a permiſſion either from the king of Spain, or the council of the Indies, to traffic in the ports of the Spaniſh Weſt-Indies; which are thus called, from their being regiſtred before they ſet ſail from Cadiz, for Buenos Ayres. Each of theſe permiſſions coſt 30,000 pieces of eight, and by the tenor of the cedula, or permit, they are not to exceed 300 tuns; but there is ſuch a good underſtanding between the merchants, and the council of the Indies, that ſhips of 5 or 600 tuns frequently paſs unnoted; and though the quantity and quality of the merchandizes on board are always expreſſed, yet, by means of preſents, the officers both in Spain and the Indies, allow them to load and unload, vaſtly more than the permiſſion expreſſes.

REGISTER, in printing, is diſpoſing the forms on the preſs, ſo as that the lines and pages printed on one ſide of the ſheet, fall exactly on thoſe of the other.

REGISTER, among letter-founders, is one of the inner parts of the mould, in which the printing types are caſt. See the article *Letter* FOUNDERY.

Its uſe is to direct the joining the mould juſtly together again, after opening it to take out the new caſt letter.

REGISTERS, in chemiſtry, are holes, or chinks with ſtopples, contrived in the ſides of furnaces, to regulate the fire; that is, to make the heat more intenſe, or remiſs, by opening them to let in the air, or keeping them cloſe to exclude it. There are alſo regiſters in the ſteam-engine. See ENGINE.

REGISTRY, the office, books, and rolls, in which the proceedings in chancery, or any ſpiritual court, are regiſtred.

REGIUS *profeſſor*. See PROFESSOR.

REGLET, or RIGLET, in architecture, a flat narrow moulding, uſed chiefly in pannels and compartiments, to ſeparate the parts or members from one another, and to form knots, frets, and other ornaments.

REGLETS, or RIGLETS, in printing, are thin ſlips of wood, exactly plained to the ſize of the body of the letter.

The ſmaller ſorts are placed between the lines of poetry, and both thoſe and the larger are uſed in filling up ſhort pages, in forming the whites or diſtances between the lines of titles, and in adjuſting the diſtances of the pages in the chaſe, ſo as to form regiſter. See the articles REGISTER and PRINTING.

REGRATOR, or REGRATER, in law, formerly ſignified one who bought wholeſale, or by the great, and ſold again by retail: but the term is now uſed for one who buys any wares or victuals, and ſells them again in the ſame market, or fair, or within five miles round it. See the article FORESTALLING.

REGRATOR, is alſo uſed for one who furbiſhes up old moveables to make them paſs for new. And maſons, who take off the outward ſurface of hewn ſtone, in order to whiten it, or make it look freſh again, are ſaid to regrate.

REGULAR, denotes any thing that is agreeable to the rules of art: thus, we ſay a regular building, verb, *&c.* See BUILDING, VERB, *&c.*

A regular figure, in geometry, is one whoſe ſides, and conſequently angles, are equal; and a regular figure with three or four ſides, is commonly termed an equilateral triangle, or ſquare, as all others with more ſides are called regular polygons. See the articles TRIANGLE, SQUARE, and POLYGON.

All regular figures may be inſcribed in a circle. See the articles CIRCLE, PENTAGON, HEXAGON, *&c.*

A regular ſolid, called alſo a platonic body, is that terminated on all ſides by regular and equal planes, and whoſe ſolid angles are all equal. See SOLID.

The regular bodies are the five following: 1. The tetrahedron, which is a pyramid, comprehended under four equal and equilateral triangles. 2. The hexahedron, or cube, whoſe ſurface is compoſed of ſix equal ſquares. 3. The octahedron, which is bounded by eight equal and equilateral triangles. 4. The dodecahedron, which is contained under twelve equal and equilateral pentagons.

5. The

5. The icoſihedron, conſiſting of twenty equal and equilateral triangles. Theſe five are all the regular bodies in nature. See TETRAHEDRON, *&c.*

The proportion of the five regular bodies inſcribed in the ſame circle from Peter Horigon. Curſus Math. vol. i. p. 779. and Barrow's Euclid, lib. xiii.

The diameter of the ſphere being 2.

The circumference of the greateſt circle is — —	6.28318
Superficies of the greateſt circle	3.14159
Superficies of the ſphere	12.56637
Solidity of the ſphere	4.18859
Side of the tetrahedron	1.62299
Superficies of a tetrahedron	4.6188
Solidity of a tetrahedron	0.15132
Side of a cube or hexahedron	1.1547
Superficies of the hexahedron	8.
Solidity of the hexahedron	1.5396
Side of an octahedron	1.41421
Superficies of the octahedron	6.9282
Solidity of the octahedron	1.33333
Side of the dodecahedron	0.71364
Superficies of the dodecahedron	10.51462
Solidity of the dodecahedron	2.78516
Side of the icoſihedron	1.05146
Superficies of the icoſihedron	9.57454
Solidity of the icoſihedron	2.53615

If one of theſe five regular bodies were required to be cut out of the ſphere of any other diameter, it will be as the diameter of the ſphere 2 is to the ſide of any one ſolid inſcribed in the ſame (ſuppoſe the cube 1.1547) ſo is the diameter of any one ſphere (ſuppoſe 8) to 9.2376, the ſide of the cube inſcribed in this latter ſphere.

Let *dr* (plate CCXXXI. fig. 2.) be the diameter of any ſphere, and *da* $\frac{1}{3}$ of it $=$ *ab* $=$ *br*. Erect the perpendiculars *ae*, *cf*, and *bg*, and draw *de*, *df*, *er*, *fr*, and *gr*. Then will

1. *re* be as the ſide of the tetrahedron.
2. *df* is the ſide of the hexahedron.
3. *de* is the ſide of the octahedron.
4. Cut *de* in extreme and mean propoſition in *h*, and *dh* will be the ſide of the dodecahedron.
5. Set the diameter *dr* up, perpendicularly, at *r*, and from the center *c*, to its top, draw the line *cg*, cutting the circle in *g*. Let fall the perpendicular *gb*; then is *br* the ſide of the icoſihedron.

REGULAR *curves*, ſuch as proceed gradually in the ſame geometrical manner, with regard to their curvities. See the article CURVE.

REGULAR, in a monaſtery, a perſon who has taken the vows; becauſe he is bound to obſerve the rules of the order he has embraced. See MONK.

REGULAR *prieſt*, a prieſt in ſome religious order; in contradiſtinction to a ſecular prieſt, or one that lives in the world at large. See PRIEST.

REGULAR *places*, thoſe contained within the boundary or incloſure of the convent. See the article CONVENT.

REGULATION, a rule or order preſcribed by a ſuperior, for the proper management of ſome affair.

REGULATOR *of a watch*, the ſmall ſpring belonging to the ballance; ſerving to adjuſt its motions, and make it go faſter or ſlower. See WATCH.

REGULUS, in ornithology, the name of ſeveral birds of the motacilla-kind, as,

1. The creſted regulus, about the ſize of the common wren; the head, neck, and back of which are of a mixed colour of greeniſh and grey, its breaſt and belly of a pale grey, and its wings variegated with black and yellow; the head in the male is ornamented with an orange-coloured creſt or crown; whence the names regulus, tyrannus, *&c.* 2. The yellow waſted, greyiſh green regulus, without a creſt: this is a very elegant little bird, about the ſize of the former ſpecies; the ſides of its head are ornamented with an oblong yellow line, running from the eyes to the hinder part of the head. See plate CCXXXI. fig. 3.

REGULUS, in chemiſtry, an imperfect metallic ſubſtance, that falls to the bottom of the crucible, in the melting of ores, or impure metallic ſubſtances.

This operation almoſt always requires the addition of ſuch ingredients as take away the mutual connection between the parts to be ſeparated; that is, the menſtrual virtue, by means of which one keeps the other in a ſtate of diſſolution. For inſtance, the reguline part of antimony, and mineral ſulphur, mutually diſſolve each other, and conſtitute crude antimony; nor can they be ſeparated by fire alone without deſtroying the regulus: but if you add iron, copper, ſilver, *&c.* which are more thoroughly penetrated by ſulphur, then the regulus of antimony is freed of the ſulphur, and being heavier than the additional bodies then joined to it, ſinks to the bottom. See FLUX.

Regulus of antimony is of three kinds, *viz.* the regulus of antimony, ſimply ſo called, martial regulus of antimony, and ſtellated regulus of antimony. 1.

The

The firſt is prepared as follows: Take antimony, nitre, and crude tartar, of each equal parts; grind them ſeparately into a powder, then mix, and rub them all together; after which, throw the powder by degrees into a red hot crucible, taking care to break the cruſt, which forms on the ſurface, with an iron rod; when the detonation is over, let a ſtrong fire be made, that the matter may flow like water, then pour it out into a warm greaſed cone, which is to be gently ſtruck on the ſides, that the regulus may ſeparate and fall to the bottom; when grown cold, let the regulus be cleaned from the ſcoriæ that lie a-top of it. 2. Martial regulus of antimony is thus made: Take antimony and nitre of each a pound; and crude tartar half a pound; and ſmall pieces of iron, half a pound: heat the iron in a crucible to a white heat: then gradually add the other ingredients, firſt powdered and mixed together, and proceed in the ſame manner as in the foregoing proceſs. 3. Stellated regulus of antimony is made by melting the martial regulus ſeveral times with freſh nitre and tartar.

The foregoing reguli are at preſent rarely, if ever, made uſe of in medicine: the emetic cups, and perpetual pills, formerly made from them, have long been laid aſide, as precarious and unſafe; but the ſcoriæ produced in theſe ſeveral proceſſes, afford medicines leſs violent, ſome of which are in conſiderable eſteem. However, they are of uſe in ſeveral mechanic arts, and particularly in mixing with tin, in making pewter. See the article PEWTER.

REGULUS, in aſtronomy, a ſtar of the firſt magnitude, in the conſtellation leo, called alſo from its ſituation, *cor leonis*, or, the lion's heart.

Its longitude, according to Mr. Flamſtead, is 25° 31′ 20″, and its latitude 0° 26′ 38″ north.

REHABILITATION, in the civil and canon law, the reſtoring a delinquent to his former condition.

REHEARSAL, in muſic, and the drama, an eſſay or experiment of ſome compoſition generally made in private, previous to its repreſentation or performance in public, in order to render the actors and performers more perfect in their parts.

REIMBURSEMENT, in commerce, the act of repaying another the expences he has been at on our account.

REIN-DEER, in zoology, a ſpecies of the cervus, with horns ramoſe and cylindric, with their tops palmated. See the article CERVUS.

This is a large and beautiful ſpecies, not inferior to the elk in ſize or ſtrength, but greatly exceeding it in form; it is of the ſize of a ſmall horſe, but its ſhape is exactly that of the red-deer. It is a native of the northern regions, there being no country ſo far north as not to afford it, where it is of vaſt uſe to the inhabitants, as a beaſt of draught.

REINFORCED, or RENFORCED RING, of a cannon, is the next after the trunnions, betwixt them and the touch-hole.

REINFORCEMENT, in war, a freſh ſupply of men, arms, ammunition, &c.

REINTEGRATION. See the article REDINTEGRATION.

REINS, in anatomy, the ſame with kidneys. See KIDNEYS.

REINS *of a bridle*, are two long ſlips of leather, faſtened on each ſide of a curb or ſnaffle, which the rider holds in his hand, to keep his horſe in ſubjection.

There is alſo what is called falſe reins, which is a lath of leather, paſſed ſometimes through the arch of the banquet, to bend the horſe's neck.

REINSTATING, reſtoring a perſon or thing, to its former ſtate or condition.

REJOINTING, in architecture, filling up the joints of the ſtones in buildings. This ought to be performed with the beſt mortar, as that of lime and cement, and ſometimes with plaſter, as in the joints of vaults.

REJOYNDER, or REJOINDER, in law, is the defendant's anſwer to the plaintiff's replication or reply. Thus, in the court of chancery, the defendant puts in an anſwer to the plaintiff's bill, which is ſometimes alſo called an exception; the plaintiff's anſwer to this is called a replication, and the defendant's anſwer to that a rejoynder.

REIS, RE, or RES. See REE.

REITERATION, the act of repeating a thing, or doing it a ſecond time.

RELAPSE, a falling again into a danger, evil, or diſeaſe, from which a perſon has eſcaped.

RELATION, *relatio*, in philoſophy, the mutual reſpect of two things, or what each is with regard to the other.

The idea of relation is acquired, by comparing one thing with another; and the denominations given to the reſpect, which they bear to each other, are termed

ed relatives, and the things themſelves related.

Relations make the largeſt claſs of our perceptions, ſince every ſingle object admits of almoſt innumerable compariſons with others: thus, if we compare one thing with another in reſpect of bulk, we get the ideas of greater, leſs, or equality; if in reſpect of time, of older and younger; and ſo for other relations, which we can purſue at pleaſure, almoſt without end; whence it is eaſy to conceive, how very extenſive this tribe of our perceptions muſt be. However, here, as well as in the other kinds of our complex ideas, we bound ourſelves for the moſt part to ſuch compariſons, as the exigencies of ſociety, the wants of life, and the different profeſſions of men render neceſſary; and are more or leſs accurate in tracing out the relations of things, according to the degree of importance they appear to have in theſe reſpects. The relations of men one to another, ariſing either from the ties of blood, their ſeveral ranks and places in the community, or a mutual intercourſe of good offices, being of great weight and concern in the commerce of life, have in a particular manner engaged our attention, and are therefore very minutely deſcribed. For the ſame reaſon men have found it neceſſary, to determine as exactly as poſſible, the various dependence of things, as their happineſs is nearly connected with this knowledge. When we conſider objects merely in reſpect of exiſtence, as either giving or receiving it, we come by the relative ideas of cauſe and effect, which are very nearly connected with the welfare of mankind; it being evident, that the ſeveral ſchemes and purpoſes of life are all conducted upon a previous ſuppoſition, that certain known cauſes will have their uſual regular effects, and ſuch and ſuch actions be attended with ſuch and ſuch conſequences. See the articles CAUSE, EFFECT, and EXPERIMENTAL PHILOSOPHY.

But there are other relations of this kind, as when we alſo take in the additional gifts of a capacity for happineſs, and the means of attaining it; which conſtitutes the relation of creator and creature, in the more ſolemn acceptation of theſe words. Again, when we conſider the great author of our being, not only as the creator of the univerſe, but alſo as preſerving and holding it together, and preſiding over the preſent frame of things with uncontrouled dominion; he then appears under the notion of a moral governor, to whom we are accountable for our actions, and the uſe we make of thoſe powers and faculties we derive from him. And thus we may, in ſome meaſure, perceive, how the mind proceeds in comparing its ideas together, and by what views it is chiefly governed in framing the compound notions of this claſs, by which it repreſents the various habitudes of things.

We ſhall only add two more obſervations upon this ſubject: 1. That our ideas of relations are, for the moſt part, very clear and diſtinct; for the comparing of things together being a voluntary act of the mind, we cannot but ſuppoſe it muſt be acquainted with its own views in the compariſon; and, of courſe, have a clear conception of the foundation of that relation; and what is ſtill more remarkable of the ideas of this claſs, they ceaſe not to be diſtinct, even the ſubjects compared are but imperfectly known; for though we cannot comprehend the manner of the world's being created, yet we find no difficulty in framing the ideas the relative words creator and creature ſtand for. 2. Our ideas of relations are among the moſt important conceptions of the underſtanding, and afford the largeſt field for the exerciſe and improvement of human knowledge. See the article KNOWLEDGE.

Moral actions are nothing but relations, it being their conformity or diſagreement with ſome rule that makes them either good or bad, or indifferent; and indeed, we ought carefully to diſtinguiſh between the poſitive idea or the action, and the reference it has to a rule. Thus, the taking from another what is his, without his conſent, is properly called ſtealing; but that name being commonly underſtood to ſignify alſo the moral pravity of the action, men are apt to condemn whatever they hear called ſtealing as an ill action, diſagreeing with the rule of right: and yet the private taking away his ſword from a madman, to prevent his doing miſchief, though it be properly denominated ſtealing, is nevertheleſs agreeable to the law of God. See the articles ETHICS and MORALITY.

It would be infinite to go over all ſorts of relations; we have therefore contented ourſelves with mentioning ſome of the moſt conſiderable, and ſuch as may ſerve

to let us ſee from whence we get our ideas of relations, and wherein they are founded.

RELATION, among the antient logicians, conſtituted one of the ten categories, or predicaments. See CATEGORY.

RELATION, in geometry, ſignifies the ſame with ratio. See RATIO.

RELATION, in grammar, is the correſpondence which words have to one another in conſtruction.

RELATION is alſo uſed for analogy. See the article ANALOGY.

RELATION, in law, is where two times, or other things, are conſidered as if they were one and the ſame; and by this the thing ſubſequent is ſaid to take its effect, by relation, from the time preceding: thus, in caſe of a deed of bargain and ſale inrolled, the inrollment ſhall have relation to the delivery thereof; and in our courts, a judgment has always relation to the firſt day of term.

RELATIVE, ſomething relating to, or reſpecting, another. See the preceding article.

RELATIVE TERMS, in logic, are words which imply a relation: ſuch are maſter and ſervant, huſband and wife, &c.

In grammar, relative words are thoſe which anſwer to ſome other word foregoing, called the antecedent: ſuch are the relative pronouns, *qui, quæ, quod*, &c. and in engliſh, *who, whom, which*, &c. The word anſwering to theſe relatives is often underſtood as, *I know whom you mean*, for, *I know the perſon whom you mean*.

RELAXATION, in medicine, &c. the the act of looſening or ſlackening, or the looſeneſs and ſlackneſs of the fibres, nerves, muſcles, &c.

RELAXATION, in law, is the ſame with releaſing. See the article RELEASE.

RELAY, a ſupply of horſes placed on the road, and appointed to be ready for a traveller to change, in order to make the greater expedition.

In hunting, relay ſignifies freſh ſets of dogs, or horſes, or both, placed in readineſs, in caſe the game comes that way, to be caſt off, or to mount the hunters, in lieu of the former, which are ſuppoſed to want reſpite.

RELAY, in tapeſtry, is an opening left, where the colours and figures are to be changed, when the piece is finiſhed.

RELEASE, in law, is an inſtrument in writing, by which eſtates, rights, titles, entries, actions, and other things, are extinguiſhed and diſcharged; and ſometimes transferred, abridged, or enlarged: and, in general, it ſignifies one perſon's giving up or diſcharging the right or action he has, or claims to have, againſt another, or his lands, &c.

A releaſe may be either in fact or in law; a releaſe in fact is where it is expreſly declared, by the very words, as the act and deed of the party; and a releaſe in law is that which acquits by way of conſequence, as where a feme creditor takes the debtor to huſband.

The perſon releaſing is termed the releaſor, and he to whom the releaſe is made, the releaſee.

RELEGATION, a kind of baniſhment or exile, in which a perſon is ſentenced to retire to a certain place preſcribed, and to continue there a certain time, or till he is recalled.

In Rome, relegation was a leſs ſevere puniſhment than deportation, ſince he who was relegated, neither loſt the rights of a roman citizen, nor thoſe of his family, as the authority of a father over his children, &c.

RELICS, in the romiſh church, the remains of the bodies or cloaths of ſaints or martyrs, and the inſtruments by which they were put to death, devoutly preſerved, in honour to their memory; kiſſed, revered, and carried in proceſſion.

This is a piece of ſuperſtition which began very early in the chriſtian church, and at preſent makes no inconſiderable article of popery. The ſhrines in which they are depoſited are firſt ſprinkled with holy water and ſolemnly bleſſed. The ſubſtance of the prayer on this occaſion is, that God would grant his protection to ſuch as revere the merits of his ſaints, and humbly embrace their relics; to the end that theſe faithful ſupplicants may be guarded from the power of the devil, from thunder, plague, bad air, wild beaſts, and from the hoſtilities and machinations of men.

The catacombs are an inexhauſtible fund of relics; yet it is ſtill diſputed who were the perſons interred in them. See the article CATACOMB.

The tranſlation of relics, or depoſiting them in ſome church, is performed with great care and ceremony. Before they are tranſlated, they are examined by the biſhop, who pronounces a ſolemn benediction over them. On the day of their tranſlation, the houſes in the ſtreets thro' which they paſs, are covered with tapeſ-

try: the church and altar are pompously adorned, and the images of the saints ranged in open view. The relics are carried in procession under a canopy, the clergy walking before, and the people surrounding them with lighted tapers in their hands. As soon as they enter the church, Te Deum is sung, and the relics are set upon the altar. Prayers are appointed in honour of them, and a lamp is left burning day and night before the place where they are afterwards deposited.

RELICT, in law, the same with widow. See the article WIDOW.

RELIEF, in law, a certain sum of money which every freehold-tenant, being at age, formerly paid, and in some places still pays, to his lord, on his entrance upon the inheritance of his ancestor's lands, &c. by the payment of which money the heir is said to relieve, or raise again the lands, after they were fallen into the superior's hands.

A person may hold lands of another, by rent, and a customary relief, which is only payable by freeholders; and for which the lord may distrain, but cannot bring an action of debt, though his executors may. These reliefs are, in some places, half a year, or a year's rent, and the profits of the lands; and in others, double the same for that year.

RELIEF, in chancery, is an order sued out, for dissolving contracts and other acts, on account of their being unreasonable, prejudicial, or grievous; or from some other nullity, either de jure, or de facto.

RELIEF *of a hare*, among hunters, is the place where she goes to feed in an evening.

RELIEF, in sculpture. See RELIEVO.

RELIEVE, in a military sense, is to send off those men that are upon duty, and to bring others to take their place: thus, to relieve the guard, the trenches, &c. is to bring fresh men upon duty, and to discharge those who were upon duty before.

RELIEVO, or RELIEF, in sculpture, &c. is the projecture or standing out of a figure, which arises prominent from the ground or plan on which it is formed; whether that figure be cut with the chissel, moulded, or cast.

There are three kinds or degrees of relievo, *viz.* alto, basso, and demi-relievo. The alto-relievo, called also haut-relief, or high-relievo, is when the figure is formed after nature, and projects as much as the life. Basso-relievo, bass-relief, or low-relievo, is when the work is raised but a little from the ground, as in medals, and the frontispieces of buildings; and particularly in the histories, festoons, foliages, and other ornaments of friezes. Demi-relievo is when one half of the figure rises from the plan. When, in a basso-relievo, there are parts that stand clear out, detached from the rest, the work is called a demi-basso.

In architecture, the relievo of projecture of the ornaments, ought always to be proportioned to the magnitude of the building it adorns, and to the distance at which it is to be viewed.

RELIEVO, or RELIEF, in painting, is the degree of boldness with which the figures seem, at a due distance, to stand out from the ground of the painting.

The relievo depends much upon the depth of the shadow, and the strength of the light; or on the height of the different colours, bordering on one another; and particularly on the difference of the colour of the figure from that of the ground: thus, when the light is so disposed as to make the nearest parts of the figure advance, and is well diffused on the masses, yet insensibly diminishing, and terminating in a large spacious shadow, brought off insensibly, the relievo is said to be bold, and the clair obscure well understood.

RELIGION, that worship and homage which is due to God, considered as our creator, preserver, and most bountiful benefactor.

As our affections depend on our opinions of their objects, it seems to be among the first duties we owe to the author of our being, to form the least imperfect, since we cannot form perfect, conceptions of his character and administration: for such conceptions will render our religion rational, and our dispositions refined. If our opinions are diminutive and distorted, our religion will be superstitious, and our temper abject. Thus, if we ascribe to the Deity that false majesty, which consists in the unbenevolent and sullen exercise of mere will or power, or suppose him to delight in the prostrations of servile fear, or as servile praise, he will be worshiped with mean adulation, and a profusion of compliments. If he be looked upon as a stern and implacable being, delighting in vengeance, he will be adored with pompous offerings, or whatever else may be thought proper to sooth and mollify him. But if we believe per-

fect goodneſs to be the character of the ſupreme Being, and that he loves thoſe who reſemble him moſt, in this, the moſt amiable of his attributes, the worſhip paid him will be rational and ſublime, and his worſhipers will ſeek to pleaſe him by imitating that goodneſs which they adore. Indeed, wherever right conceptions of the Deity, and his providence, prevail, when he is conſidered as the inexhauſted ſource of light, and love, and joy, as acting in the joint character of a father and governor, what veneration and gratitude muſt ſuch conceptions, thoroughly believed, excite in the mind? how natural and delightful muſt it be, to one whoſe heart is open to the perception of truth, and of every thing fair, great, and wonderful in nature, to engage in the exerciſes of religion, and to contemplate and adore him, who is the firſt fair, firſt great, and firſt wonderful; in whom wiſdom, power, and goodneſs dwell vitally, eſſentially, and act in perfect concert? what grandeur is here, to fill the moſt enlarged capacity, what beauty to engage the moſt ardent love, what a maſs of wonders, in ſuch exuberance of perfection, to aſtoniſh and delight the human mind, through an unfailing duration! When we conſider the unſullied purity, and abſolute perfection of the divine nature; and reflect on the imperfection and various blemiſhes of our own, and the ungrateful returns we have made to his goodneſs, we muſt ſink, or be convinced we ought to ſink, into the deepeſt humility and proſtration of ſoul before him, and be conſcious that it is our duty to repent of a temper and conduct ſo unworthy of our nature, and ſo unbecoming our obligations to its author; and to reſolve and endeavour to act a wiſer and a better part for the future. And if the Deity is conſidered as the father of mercies, who loves his creatures with infinite tenderneſs, and, in a particular manner, all good men; nay, who delights in goodneſs even in its moſt imperfect degrees; what reſignation, what dependence, what generous confidence, what hope in God, and in his allwiſe providence, muſt ariſe in the ſoul that is poſſeſſed of ſuch amiable views of him. We muſt further obſerve, that all thoſe affections which regard the Deity as their immediate and primary object, are vital energies of the ſoul, and conſequently exert themſelves into act, and, like all other energies, gain ſtrength or greater activity by that exertion: it is therefore our duty, as well as higheſt intereſt, often, at ſtated times, and by decent and ſolemn acts, to adore the great original of our exiſtence, to expreſs our veneration and love by a devout recognition of his perfections, and to evidence our gratitude by celebrating his goodneſs, and thankfully acknowledging all his benefits; by proper exerciſes of ſorrow and humiliation to confeſs our ingratitude and folly, to ſignify our dependence on God, our confidence in his goodneſs, and our reſignation to the diſpoſals of his providence, and this not only in private, but in public worſhip, where the preſence of our fellow-creatures and the powerful contagion of the ſocial affections, conſpire to kindle and ſpread the devout flame with greater warmth and energy.

Religion is divided into natural and revealed: by natural religion is meant that knowledge, veneration, and love of God, and the practice of thoſe duties to him, our fellow-creatures, and ourſelves, which are diſcoverable by the right exerciſe of our rational faculties, from conſidering the nature and perfections of God, and our relation to him and to one another. See ETHICS. And by revealed religion is meant, natural religion explained, enforced, and enlarged, from the expreſs declarations of God himſelf, from the mouths or pens of his prophets, *&c.*

Religion, in a more contracted ſenſe, is uſed for that ſyſtem of faith and worſhip, which obtains in ſeveral countries of the world; and even for the various ſects into which each religion is divided. See PAGANS, MAHOMETANS, JEWS, *&c.* ROMAN CATHOLICS, LUTHERANS, CALVINISTS, *&c.*

RELIGIOUS, in popiſh countries, is particularly uſed for a perſon engaged, by ſolemn vows, to the monaſtic life: or a perſon ſhut up in a monaſtery, to lead a life of devotion and auſterity, under ſome rule or inſtitution. See the articles MONK, NUN, *&c.*

RELIQUARY, a ſhrine or caſket, wherein the relics of a dead ſaint are kept.

RELIQUÆ, in roman antiquity, the aſhes and bones of the dead, that remained after burning their bodies; which were gathered up, put into urns, and afterwards depoſited in tombs. This word is alſo uſed for relics. See RELICS.

REMAINDER, in law, is an eſtate in lands, tenements, or rents, not to be enjoyed till after a term of years, or another perſon's deceaſe: thus, a perſon grants

lands or tenements to one perſon, for a term of years, or for life, and the remainder to another perſon for life, or in fee.

There is this difference between a remainder and a reverſion; in caſe of a reverſion, the eſtate granted, after the limited time, reverts to the grantor or his heirs; but by a remainder it goes to ſome third perſon, or a ſtranger.

REMAINDER, in mathematics, is what is left after taking a leſſer number out of a greater.

REMARRYING, marrying a ſecond time. See the article MARRIAGE.

REMEDY, in medicine, a preparation applied either internally or externally, for the cure of a diſeaſe. See PRESCRIPTION.

REMEMBRANCE, the ſame with memory. See the article MEMORY.

REMEMBRANCERS, antiently called clerks of the remembrance, certain officers in the exchequer, whereof three are diſtinguiſhed by the names of the king's remembrancer, the lord treaſurer's remembrancer, and the remembrancer of the firſt fruits. The king's remembrancer enters in his office, all recognizances taken before the barons, for any or the king's debts, for appearances or obſerving of orders; he alſo takes all bonds for the king's debts, *&c.* and makes out proceſſes thereon. He likewiſe iſſues proceſſes againſt the collectors of the cuſtoms, exciſe, and others, for their accounts; and informations upon penal ſtatutes, are entered and ſued in his office, where all proceedings in matters upon engliſh bills in the exchequer-chamber, remain. His duty further is to make out the bills of compoſitions upon penal laws, to take the ſtatement of debts; and into his office are delivered all kinds of indentures and other evidences, which concern the aſſuring any lands to the crown. He, every year, in craſtino animarum, reads in open court, the ſtatute for election of ſheriffs; and likewiſe openly reads in court, the oaths of all the officers, when they are admitted.

The lord treaſurer's remembrancer is charged to make out proceſs againſt all ſheriffs, eſcheators, receivers, and bailiffs, for their accounts. He alſo makes out writs of fieri facias, and extent for debts due to the king, either in the pipe or with the auditors; and proceſs for all ſuch revenue as is due to the king, on account of his tenures. He takes the account of ſheriffs; and alſo keeps a record, by which it appears whether the ſheriffs or other accountants pay their profers due at Eaſter and Michaelmas: and at the ſame time he makes a record, whereby the ſheriffs or other accountants keep their prefixed days: there are likewiſe brought into his office, all the accounts of cuſtomers, comptrollers, and accountants, in order to make entry thereof on record: alſo all eſtreats and amercements are certified here, *&c.*

The remembrancer of the firſt-fruits takes all compoſitions and bonds for the payment of firſt-fruits and tenths; and makes out proceſs againſt ſuch as do not pay the ſame.

REMINISCENCE, *reminiſcentia*, that power of the human mind, whereby it recollects itſelf, or calls again into its remembrance ſuch ideas or notions as it had really forgot: in which it differs from memory, which is a treaſuring up of things in the mind, and keeping them there, without forgeting them. See the article MEMORY.

Hence memory may be conſidered as a continual remembrance, and reminiſcence as an uninterrupted memory. How near akin ſoever theſe two faculties may ſeem, yet they are generally found ſeparated ſo, that they who excel in the one, are uſually defective in the other.

REMINISCERE, the ſecond Sunday in lent. See the article LENT.

REMISSION, in phyſics, the abatement of the power, or efficacy of any quality, in oppoſition to the increaſe of the ſame, which is called intenſion. In all qualities, capable of intenſion and remiſſion, the intenſion decreaſes reciprocally as the ſquares of the diſtances from the center of the radiating quality increaſe.

REMISSION, in medicine, is when a diſtemper abates, but does not go quite off before it returns again, as is common in fevers, which do not quite intermit.

REMISSION, in law, *&c.* denotes the pardon of a crime, or the giving up the puniſhment due thereto.

REMIT, in commerce. To remit a ſum of money, bill, or the like, is to ſend the ſum of money, *&c.*

To remit is alſo uſed among bankers, for what is uſually given a banker, or as it were diſcounted with him, for his giving a bill of exchange.

REMITTANCE, in commerce, the traffic or return of money from one place to another, by bills of exchange, orders, or the like.

This

This word is alſo uſed in ſpeaking of the payment of a bill of exchange. It alſo ſignifies the fee or reward given a banker, both of his wages and the different value of the ſpecies in the places where you pay the money, and where he remits it.

REMITTER, in law. Where a perſon has two titles to lands, *&c.* and he comes to ſuch lands by the laſt title, which, proving defective, he ſhall be reſtored to, and adjudged in, by virtue of his former more antient title, this is called remitter. In caſe lands deſcend to a perſon, that had right to them before, he ſhall be remitted to his better title, if he pleaſes. Where a tenant in tail makes a feoffment of land, upon condition, after whoſe death, his iſſue within age enters, for the condition broken, he ſhall be firſt in as a tenant in fee, and be remitted as heir to his father: yet if the heir is of age, it will be no remitter to him, who is to bring his writ of formedon againſt the feoffee. Alſo if a tenant in tail infeoff his ſon or heir apparent, at that time under age, and afterwards dies, this is a remitter to the heir; but here it would be otherwiſe, were he of full age. By a remitter of iſſue in tail, all charges on the land are avoided; and where a perſon is remitted to an eſtate for life, the dower claimed by a widow may be gone; in which caſe alſo an eſtate is liable to be forfeited upon making a feoffment thereof, *&c.*

REMITTITUR, in law, an entry made in the king's bench, on a writ of error's abating in the exchequer chamber.

REMONSTRANCE, an expoſtluation or humble ſupplication, addreſſed to a king, or other ſuperior, beſeeching him to reflect on the inconveniences, or ill conſequences of ſome order, edict, or the like.

This word is alſo uſed for an expoſtulary counſel, or advice; or a gentle and handſome reproof, made either in general, or particular, to apprize or correct ſome fault, *&c.*

REMORA, the SUCK-FISH, in ichthyology, a genus of fiſh, the ſame with the echenis. See ECHENIS.

This ſingular fiſh grows to about nine inches in length, and more than two in diameter in the largeſt part of the body, which is near the head, whence it becomes gradually ſmaller to the tail; the back is convex, the belly flat, and the ſides are rounded by means of the ſtructure of its head. This fiſh applies itſelf firmly to any ſolid body that it pleaſes; and is frequently found ſticking to the bottom of ſhips, and often to large fiſh. See plate CCXXX. fig. 3.

REMOUNT, in war. To remount the cavalry, is to furniſh troopers or dragoons with freſh horſes, inſtead of ſuch as have been killed or diſabled in the ſervice.

REMOVER, in law, is where a ſuit is removed or taken out of one court into another; and is the oppoſite of remanding a cauſe, or ſending it back into the ſame court from whence it was firſt called.

REMPLY, in heraldry, ſomething filled up. The term is chiefly uſed to denote that the chief is quite filled up with a ſquare piece of another colour, leaving only a bordure of the proper colour of the chief, about the ſaid piece. See plate CCXXIX. fig. 6.

RENAL, ſomething belonging to the reins or kidneys. See the article KIDNEY.

For the renal glands, in anatomy, ſee the article CAPSULÆ ATRABILIARIÆ.

RENCOUNTER, in the military art, an engagement of two little bodies or parties of forces; in which ſenſe it ſtands in oppoſition to a pitched battle. See the article BATTLE.

In ſingle combats, rencounter is uſed by way of contradiſtinction to a duel, when perſons fall out and fight on the ſpot, without having premeditated the combat.

RENCOUNTRE, or RENCONTRE, in heraldry, is applied to animals when they ſhew the head in front, with both eyes, *&c.* or when the face ſtands right forward, as if they came to meet the perſon before them.

RENDER, in law, ſignifies to yield or return a thing; and it is frequently made uſe of, in the levying of a fine, which is either ſingle, on which nothing is given or rendered back by the cogniſee; or double, containing a grant or render back of rent, *&c.* out of the land, to the cogniſor. In another ſenſe of this word, it is obſerved, that there are ſome things in a manor which lie in prender, that is, which may be taken by the lord or his officer, when they happen without any offer made by the tenant, ſuch as eſcheats, *&c.* and there are ſome that lie in render, *viz.* ſuch as may be rendered or anſwered by the tenant, as rents, heriots, and other ſervices.

RENDEZVOUS, or RENDEVOUS, a place appointed to meet in, at a certain day and hour.

RENEALMIA, in botany, a genus of the *hexandria-monogynia* claſs of plants, the corolla whereof is long, erect, and of the infundibuliform-kind; the tube is of the length of the calyx; the limb is ſhort, plane, and divided into three ſegments; the fruit is an ovato-oblong capſule, rounded, pointed at the edge and marked with three furrows, formed of three valves, and containing three cells; the ſeeds are numerous, oblong, and have each a capillary plume.

RENEGATE, or RENEGADO, a perſon who has apoſtatized or renounced the chriſtian faith, to embrace ſome other religion, particularly mahometaniſm.

RENES SUCCENTURIATI, in anatomy, the ſame with the capſulæ atrabiliariæ. See CAPSULÆ ATRABILIARIÆ.

RENFREW, a town of Scotland, the capital of the county of Renfrew, ſituated on the river Clyde, forty-ſix miles weſt of Edinburgh.

RENIFORM, ſomething reſembling the figure or ſhape of the kidneys. See the article KIDNEY.

RENITENCY, *renitentia*, among philoſophers, that force in ſolid bodies, whereby they reſiſt the impulſe of other bodies, or re-act as much as they are acted on. See the article REACTION, *&c.*

RENNES, a city of France, capital of the province of Britany, ſituated on the river Villaine: weſt long. 1° 45′, north lat. 48° 5′.

RENNET. See the article RUNNET.

RENT, *reditus*, in law, a ſum of money, or other conſideration, iſſuing yearly out of lands or tenements.

Rents are uſually diſtinguiſhed into three kinds, *viz.* Rent-ſervice, rent-charge, and rent-ſec. Rent-ſervice is where a perſon holds lands of his lord by fealty and certain rent, whilſt the reverſion of lands continues in the grantor; and if his rent be behind-hand, the landlord may diſtrain for it, without any covenant, *&c.* Rent-charge is where a perſon, by deed, makes over his eſtate in fee-tail, or for term of life, where the whole intereſt does paſs; yet, by the ſame deed, reſerves to himſelf a ſum of money, to be paid him yearly, with a clauſe therein, impowering him to diſtrain in caſe of non-payment. Rent-ſec, or a dry-rent, is that which a perſon, making over his eſtate by deed, reſerves yearly to be paid him, without any clauſe of diſtreſs contained in the deed.

To theſe may be added a rent reſerved on leaſes at will, called rents diſtrainable of common right: but this rent is due by the poſſeſſion only, which therefore muſt be proved; whereas in leaſes for years the rent becomes due on the contract, and the leſſee muſt pay the ſame, though he never enters on the land. A perſon may alſo hold a rent by preſcription, as where he and his anceſtors have been ſeiſed thereof, and uſed to diſtrain for it, when in arrears, *&c.*

RENTAL ſignifies a roll in which the rents of manors are ſet down, in order for the lord's bailiff, thereby to collect the ſame. It contains the lands let to each tenant, with their names, and the ſeveral rents ariſing.

RENTERING, in the manufactories, the ſame with fine-drawing. See the article *Fine*-DRAWING.

RENVERSE', INVERTED, in heraldry, is when any thing is ſet with the head downwards, or contrary to its natural way of ſtanding. Thus, a chevron renverſé, is a chevron with the point downwards. They uſe alſo the ſame term when a beaſt is laid on its back.

RENUENTES, in anatomy, a pair of muſcles of the head, thus called as being antagoniſts to the annuentes, and ſerving to throw the head backwards. See the article ANNUENTES.

RENUNCIATION, *renunciatio*, the act of renouncing, abdicating, or relinquiſhing any right, real or pretended. Renunciations are ſometimes expreſs, as by contracts, *&c.* ſometimes tacit, as by contrary acts. To renounce an inheritance, a community, *&c.* is to paſs a ſolemn act before a notary or public officer, whereby a perſon declares he will not intermeddle in an inheritance or profit in a company, but ſurrenders his part and quits all pretenſions.

REPAIRING, or REPARATION, *reparatio*, the act of retrieving, mending, or eſtabliſhing a building or other work damaged or gone to decay. In reſpect to reparations, if a tenant or leſſee covenants that from and after the amendment of the tenements by the leſſor he will, at his own charge, keep and leave them in repair, in that caſe the leſſee is not obliged to do the ſame until the leſſor has firſt made good the reparations; and here if a houſe be well repaired at firſt, when the leaſe began, and afterwards decays, it is ſaid the landlord muſt put it in repair before the tenant is bound to keep it ſo.

REPARATIONE FACIENDA, is a writ that lies in divers caſes, one of which is where there are tenants in common or joint tenants of a mill or houſe that is fallen to decay, and one of them is willing to repair the ſame, but the others will not, in which caſe the party that is willing to repair it ſhall have this writ againſt the perſons refuſing. Alſo if a perſon has a paſſage over a bridge, and another ought to repair the ſame, but ſuffers it to decay, *&c.* this writ lies.

REPARTEE, or REPARTY, a ready ſmart reply, eſpecially in matters of wit, humour, or raillery.

REPARTITION, a dividing or ſharing a thing a ſecond time.

REPAST, a meal or refection taken at a ſtated hour.

In our old law books it is particularly uſed for a meal's meat given to ſervile tenants while at work for their lord.

REPEALING, in law, the revoking or annulling of a ſtatute, or the like. See ABROGATION and REVOCATION.

No act of parliament ſhall be repealed the ſame ſeſſion in which it was made. A deed or will may be repealed for a part, and ſtand good for the reſt. It is held that a pardon of felony may be repealed on diſproving the ſuggeſtion thereof.

REPEAT, in muſic, a character ſhewing that what was laſt played or ſung muſt be repeated or gone over again. See the article REPETITION.

The repeat ſerves inſtead of writing the ſame thing twice over: there are two kinds of repeats, the great and ſmall; the firſt is a double bar dotted on each ſide, or a double bar dotted in the middle, or two parallel lines drawn perpendicularly acroſs the ſtaff, with dots on either hand. The form of which may be ſeen under CHARACTER *in muſic*. This ſhews that the preceding ſtrain is to be repeated, that is, if it be near the beginning of the piece, all hitherto ſung or played is to be repeated; or if towards the end thereof, all from ſuch another mark. In gavots we uſually find the repeat at about a third part of the piece. In minuets, borees, courants, *&c.* towards the end, or in the laſt ſtrain: ſome make this a rule, that if there be dots on each ſide of the bars, they direct a repetition both of the preceding and following ſtrains; if there be only dots on one ſide the ſtrain, that ſide alone is to be ſung or played over again. The ſmall repeat is when ſome of the laſt meaſures of a ſtrain are to be repeated. This is denoted by a character ſet over the place where the repeat begins (ſee CHARACTER *in muſic*) and continues to the end of the ſtrain.

REPEATING WATCHES. See WATCH.

REPEHAM, a market-town of Norfolk, ſituated eight miles north-weſt of Norwich.

REPELLENTS, in medicine, remedies which drive back a morbid humour into the maſs of blood from which it was unduly ſecreted. To underſtand rightly, ſays Quincy, the operation of repellents, it may be obſerved, that theſe are medicines which prevent ſuch an afflux of a fluid to any particular part as would raiſe it into a tumour; but to know how this may be effected, we muſt advert, that all tumours ariſe either from an increaſe in the velocity or quantity of the fluids, or a weakneſs in ſome particular part; and ſometimes both concur. An increaſe in the velocity of the fluids makes them more forcibly puſh againſt and diſtend all the parts in their circuit. If, therefore, any part be unequally preſſed or relaxed by external injuries, that will be more elevated than any other, and for want of equal reſiſtance with the reſt of the body, will at length receive ſuch a quantity of fluid as will raiſe it into a tumour, eſpecially if any of its veſſels be obſtructed; becauſe the protruſion of freſh matter a tergo, will continue to add thereto until the part is upon the utmoſt ſtretch, and can hold no more. In this caſe all thoſe means are ſaid to be repellent which check the growth of the tumour, and aſſiſt the refluent blood in taking up the obſtructed matter, and waſhing it again into the common ſtream. This intention is chiefly anſwered by evacuation and revulſion; for whatever leſſens the quantity of the fluid, will diminiſh the force upon the tumified part. A medicine comes to be repellent by conſiſting of ſuch ſubtil parts as may tranſmit ſome of them through the pores, and help to render the obſtructed matter more fluid, ſo that it comes the more eaſy to be looſened, and fall again into the circulating current. But in this caſe there is a hazard of ſuch things likewiſe putting the obſtructed humour into a ferment, whereby it ſooner turns into pus, and then comes under the denomination of ſuppuratives or ripeners. What, therefore, in the moſt ſtrict ſenſe, is to be reputed a repeller, is that which aſtringes and ſtrengthen

thens the part ſo as to make it reſiſt any ſuch lodgment. Theſe are ſuch whoſe qualities are moſt manifeſt in their coldneſs and drying properties; but there are ſo few inſtances wherein bandage is not better than any ſuch application, that very little comes to be uſed for that purpoſe. In hæmorrhages and ouſings out of ſerum, ſo as to deform the ſkin, ſimples of this nature moſtly take place, which anſwer their ends by aſtringing the fibres, whence thoſe apertures are ſo cloſed as not to admit through them afterwards any ſuch fluid. See TUMOUR, *&c.*

The moſt remarkable in the claſs of repellents are the white of an egg, the lapis calaminaris, litharge of gum, red-lead, tutty, pampholyx, houſe-leek, putty, and cobweb. See EGG, *&c.*

REPELLING POWER, *vis repellens*, in phyſics. See the article REPULSION.

REPERCUSSION, in mechanics. See the article REFLECTION.

REPERCUSSION, in muſic, a frequent repetition of the ſame ſound. See the article REPETITION.

This often happens in the modulation, where the eſſential chords of each mode of the harmonical triad are to be ſtruck oftener than the reſt: and of theſe three chords the two extremes, *i. e.* the final and the predominant one (which are properly the repercuſſions of each mode) oftener than the middle one.

REPERTORY, *repertorium*, a place wherein things are orderly diſpoſed, ſo as to be eaſily found when wanted. The indices of books are repertories, ſhewing where the matters ſought for are treated of. Common-place books are alſo kinds of repertories.

REPETITION, *repetitio*, the reiterating of an action.

REPETITION, in muſic, denotes a reiterating or playing over again the ſame part of a compoſition, whether it be a whole ſtrain, part of a ſtrain, or double ſtrain, *&c.* The repetition is denoted by a character called a repeat, which is varied ſo as to expreſs the various circumſtances of a repeat. See REPEAT.

When the ſong ends with a repetition of the firſt ſtrain, or part of it, the repetition is denoted by *da capo*, or D. C. *i. e.* from the beginning.

Repetition or reply is alſo uſed in muſic when after a little ſilence one part repeats or runs over the ſame notes, the ſame intervals, the ſame motions, and, in a word, the ſame ſong which a firſt part had already gone over during the ſilence of this, and is nearly the ſame with figure. See FIGURE and IMITATION.

Repetition, or reply, is alſo a doubling, trebling, *&c.* of an interval or a reiteration of ſome conſonance or diſſonance, as a fifteenth is a repetition of the octave, *i. e.* double octave, or ſecond octave. See the articles OCTAVE and INTERVAL.

REPETITION, in rhetoric, a figure which gracefully and emphatically repeats either the ſame word, or the ſame ſenſe in different words.

In the uſe of this figure care is to be uſed that we run not into inſipid tautologies, nor affect a trifling ſound and chime of inſignificant words. All turns and repetitions are ſo that do not contribute to the ſtrength and luſtre of the diſcourſe, or at leaſt one of them. The nature and deſign of this figure is to make deep impreſſions on thoſe we addreſs. It expreſſes anger and indignation, full aſſurance of what we affirm, and a vehement concern for what we have eſpouſed.

REPLANTING, in gardening, the act of planting a ſecond time. See the article PLANTING.

REPLEADER, *replacitare*, in law, is to plead over again what was once pleaded before.

REPLEGIARE, in law, ſignifies to redeem a thing taken or detained by another, by putting in legal ſureties.

REPLEGIARE DE AVERIIS, is a writ which is brought by him whoſe cattle is diſtrained or impounded for any cauſe by another perſon, on ſecurity being given to the ſheriff to proſecute or anſwer the action at law.

REPLETION, in medicine, a plenitude or plethora. See PLETHORA.

Repletion is more dangerous than inanition. Bleeding and diet are the great reſources whence a perſon is incommoded with a repletion.

Repletion is ſometimes alſo uſed where the ſtomach is overloaden with too much eating or drinking. The phyſicians hold all repletion to be prejudicial, but that of bread is of all others the worſt.

REPLETION, in the canon law, is where the revenue of a benefice or benefices is ſufficient to fill or occupy the whole right or title of the graduate who holds them. Where there is a repletion, the party can demand no more by virtue of his degrees. In England, where benefices are not appropriated to degrees, repletion, ſtrictly ſpeaking, has no place.

REPLEVIN,

REPLEVIN, in law, a remedy granted on a diſtreſs, by which the firſt poſſeſſor has his goods reſtored to him again, on his giving ſecurity to the ſheriff that he will purſue his action againſt the party diſtraining, and return the goods or cattle, if the taking them ſhall be adjudged lawful.

In a replevin the perſon diſtrained becomes plaintiff, and the perſon diſtraining is called the defendant or avowant, and his juſtification an avowry.

At the common law replevins are by writ, either out of the king's bench or common pleas; but by ſtatute, they are by plaint in the ſheriff's court, and court-baron, for a perſon's more ſpeedily obtaining the goods diſtrained.

If a plaint in replevin be removed into the court of king's bench, &c. and the plaintiff makes default and becomes non-ſuit, or judgment is given againſt him, the defendant in replevin ſhall have the writ of retorno habendo of the goods taken in diſtreſs. See the article REPLEVY.

REPLEVISH, in law, ſignifies to admit one to mainpriſe upon ſurety. See the article MAINPRISE.

REPLEVY, in law, is a tenant's bringing a writ of replevin, or replegiari facias, where his goods are taken by diſtreſs for rent; which muſt be done within five days after the diſtreſs, otherwiſe at the five days end, they are to be appraiſed and ſold. 2 W. and M. c. 5.

This word is alſo uſed for bailing a perſon, as in the caſe of a homine replegiando.

REPLICATION, in logic, the aſſuming or uſing the ſame term twice in the ſame propoſition.

REPLICATION, in the courts of common law, ſignifies an exception or anſwer made by the plaintiff to the defendant's plea; in the court of chancery, it is what the complainant replies to the defendant's anſwer.

REPORT, the relation made upon oath, by officers or perſons appointed to viſit, examine, or eſtimate the ſtate, expences, &c. of any thing.

REPORT, in law, is a public relation of caſes judicially argued, debated, reſolved or adjudged in any of the king's courts of juſtice, with the cauſes and reaſons of the ſame, as delivered by the judges. Alſo when the court of chancery, or any other court, refers the ſtating of a caſe, or the comparing of an account to a maſter of chancery, or other referee, his certificate thereon is called a report.

REPOSE, in poetry, &c. the ſame with reſt and pauſe. See REST, &c.

REPOSE, in painting, certain maſſes or large aſſemblages of light and ſhade, which being well conducted, prevent the confuſion of objects and figures, by engaging and fixing the eye ſo as it cannot attend to the other parts of the painting for ſome time; and thus leading it to conſider the ſeveral groups gradually, proceeding, as it were, from ſtage to ſtage.

REPOSITORY, a ſtone houſe, or place in which things are laid up, and preſerved.

In this ſenſe we ſay, the repoſitory of the royal ſociety. See MUSEUM.

REPRESENTATION, in the drama, the exhibition of a theatrical piece, together with the ſcenes, machines, &c.

REPRESENTATIVE, one who perſonates or ſupplies the place of another, and is inveſted with his right and authority. Thus the houſe of commons are the repreſentatives of the people in parliament. See PARLIAMENT.

REPRIEVE, or REPRIVE, in law, is ſuſpending or deferring the execution of the law upon a priſoner for a certain time; or a warrant from the king for deferring the execution of a perſon condemned.

Every judge, who has the power of paſſing ſentence on criminals, has alſo the power to reprieve them: but in London, no perſon convicted of felony can be reprieved without the king's warrant. However, where a woman is condemned for treaſon or felony, and, upon pleading her belly, is found to be quick with child, execution is of courſe reſpited, and the woman becomes reprieved till her delivery: but this favour can only be granted once. The execution of offenders is frequently ſtayed by reprieve, upon condition of tranſportation.

REPRISALS, a right which princes claim of taking from their enemies any thing equivalent to what they unjuſtly detain from them.

Repriſals is alſo uſed for a letter of marque granted by a prince to his ſubject. See the article MARQUE.

REPRISE, or REPRIZE, at ſea, is a merchant-ſhip which, after its being taken by a corſair, privateer, or other enemy, is retaken by the oppoſite party.

If a veſſel thus retaken has been twenty-four hours in the poſſeſſion of the enemy,

it is deemed a lawful prize; but if it be retaken within that time, it is to be reſtored to the proprietor, with every thing therein, upon his allowing one third to the veſſel who made the repriſe. Alſo if the repriſe has been abandoned by the enemy, either in a tempeſt or from any other cauſe, before it has been led into any port, it is to be reſtored to the proprietor.

REPRIZES, in law, are deductions or payments annually made out of a manor or lands; as rent-charges, penſions, annuities, *&c.*

REPROBATION, in theology, a decree by which God is ſuppoſed either from all eternity, or from the creation of the world, to conſign over to eternal miſery the greateſt part of mankind, and to ſave none of the human race, except thoſe whom he made the heirs of glory by election.

Caſuiſts diſtinguiſh two kinds of reprobation, poſitive and negative. Poſitive reprobation, is that by which God is ſuppoſed to create men with a poſitive and abſolute reſolution to damn them eternally: and negative reprobation, is that whereby God, though he creates all men with a ſincere deſire to ſave them, and furniſhes them with all the neceſſary means of ſalvation, ſo that all may be ſaved that will; yet ſees there are ſeveral who will not do it, with the aids he ſhall afford them, and ſees, at the ſame time, they would do it with certain other aids, which he ſees, but will not give them.

REPRODUCTION, the act whereby a thing is produced anew, or grows a ſecond time.

The reproduction of ſeveral parts of lobſters, crabs, *&c.* is one of the greateſt curioſities in natural hiſtory. It ſeems, indeed, inconſiſtent with the modern ſyſtem of generation, which ſuppoſes the animal to be wholly formed in the egg; that, in lieu of the organical part of an animal cut off, another ſhould ariſe perfectly like it: the fact, however, is too well atteſted to be denied. The legs of lobſters, *&c.* conſiſt each of five articulations; now when any of the legs happen to break, by any accident, as by walking, *&c.* which frequently happens, the fracture is always found to be at the future near the fourth articulation; and what they thus loſe, is exactly reproduced in ſome time afterwards; that is, a part of the leg ſhoots out, conſiſting of four articulations, the firſt whereof has two claws, as before; ſo that the loſs is entirely repaired.

If the leg of a lobſter be broken off by deſign at the fourth or fifth articulation, what is thus broke off is always reproduced. But, if the fracture be made in the firſt, ſecond, or third articulation, the reproduction is not ſo certain. And it is very ſurprizing, that, if the fracture be made at theſe articulations, at the end of two or three days, all the other articulations are generally found broke off to the fourth, which, it is ſuppoſed, is done by the creature itſelf, to make the reproduction certain. The part reproduced is not only perfectly ſimilar to that retrenched, but alſo, in a certain ſpace of time, grows equal to it. Hence it is that we frequently ſee lobſters, which have their two large legs unequal, in all proportions. And, if the part reproduced be broken off, a ſecond will ſucceed.

REPTILES, in natural hiſtory, a kind of animals denominated from their creeping or advancing on the belly. Or reptiles are a genus of animals and inſects, which, inſtead of feet, reſt on one part of the body, while they advance forward with the reſt.

Such are earthworms, ſnakes, caterpillars, *&c.* Indeed, moſt of the claſs of reptiles have feet; only thoſe very ſmall, and the legs remarkably ſhort in proportion to the bulk of the body.

Naturaliſts obſerve a world of artful contrivance for the motion of reptiles. Thus, particularly in the earth-worm, Dr. Willis tells us, the whole body is only a chain of annular muſcles; or, as Mr. Derham ſays, it is only one continued ſpiral muſcle, the orbicular fibres whereof being contracted, render each ring narrower and longer than before; by which means it is enabled, like the worm of an augre, to bore its paſſage into the earth. Its reptile motion might alſo be explained by a wire wound on a cylinder, which when ſlipped off, and one end extended and held faſt, will bring the other near to it. So the earth-worm having ſhot out or extended his body (which is with a wreathing) it takes hold by theſe ſmall feet it hath, and ſo contracts the hinder part of its body. Dr. Tyſon adds, that when the fore-part of the body is ſtretched out, and applied

plied to a plane at a diſtance, the hind part relaxing and ſhortening is eaſily drawn towards it as a center.

Its feet are diſpoſed in a quadruple row the whole length of the worm, with which, as with ſo many hooks, it faſtens down ſometimes this and ſometimes that part of the body to the plane, and at the ſame time ſtretches out or drags after it another.

The creeping of ſerpents is effected after a ſomewhat different manner; there being a difference in their ſtructure, in that theſe laſt have a compages of bones articulated together.

The body here is not drawn together, but as it were complicated; part of it being applied on the rough ground, and the reſt ejaculated and ſhot from it, which, being ſet on the ground in its turn, brings the other after it. The ſpine of the back variouſly wreathed has the ſame effect in leaping, as the joints in the feet of other animals; they make their leaps by means of muſcles, and extend the plicæ or folds.

REPTILE is alſo uſed, by ſome botanical writers, to ſignify plants which creep upon the earth, unleſs ſuſtained by ſome other plant, prop, *&c.* As cucumbers, melons, the vine, *&c.*

REPUBLIC, *reſpublica*, commonwealth, a popular ſtate or government; or a nation where the people have the government in their own hands.

REPUBLIC *of letters*, a phraſe uſed collectively of the whole body of the people of ſtudy and learning.

REPUDIATION, *repudium*, in the civil law, the act of divorcing. See DIVORCE.

REPULSION, *repulſio*, in phyſics, that property in bodies, whereby, if they are placed juſt beyond the ſphere of each other's attraction of cohesion, they mutually fly from each other.

Thus if an oily ſubſtance, lighter than water, be placed on the ſurface thereof, or if a piece of iron be laid upon mercury, the ſurface of the fluid will be depreſſed about the body laid on it: this depreſſion is manifeſtly occaſioned by a repelling power in the bodies, which hinders the approach of the fluid towards them. But it is poſſible, in ſome caſes, to preſs or force the repelling bodies into the ſphere of one another's attraction; and then they will mutually tend toward each other, as when we mix oil and water till they incorporate.

Dr. Knight defines repulſion to be that cauſe which makes bodies mutually endeavour to recede from each other, with different forces, at different times; and that ſuch a cauſe exiſts in nature, he thinks evident for the following reaſons. 1. Becauſe all bodies are electrical, or capable of being made ſo; and it is well known, that electrical bodies both attract and repel. 2. Both attraction and repulſion are very conſpicuous in all magnetical bodies. 3. Sir Iſaac Newton has ſhewn from experiments, that the ſurfaces of two convex-glaſſes repel each other. 4. The ſame great philoſopher has explained the elaſticity of the air, by ſuppoſing its particles mutually to repel each other. 5. The particles of light are, in part at leaſt, repelled from the ſurfaces of all bodies. 6. Laſtly, it ſeems highly probable, that the particles of light mutually repel each other, as well as the particles of air.

The ſame gentleman aſcribes the cauſe of repulſion, as well as that of attraction, to the immediate effect of God's will; and as attraction and repulſion are contraries, and conſequently cannot, at the ſame time, belong to the ſame ſubſtance, the doctor ſuppoſes there are in nature two kinds of matter, one attracting, the other repelling; and that thoſe particles of matter which repell each other, are ſubject to the general law of attraction in reſpect of other matter. A repellent matter being thus ſuppoſed, equally diſperſed through the whole univerſe, the doctor attempts to account for many natural phænomena by means thereof. He thinks light is nothing but this repellent matter put into violent vibrations, by the repellent corpuſcles which compoſe the atmoſphere of the ſun and ſtars; and that, therefore, we have no reaſon to believe they are gulphs of fire, but, like the reſt of the heavenly bodies, inhabitable worlds. From the ſame principles, he attempts to explain the nature of fire and heat, the various phænomena of the magnet, and the cauſe of the variation of the needle: and, indeed, it is difficult, if not impoſſible, by the doctrine of attraction alone, to account for all the phænomena obſervable in experiments made with magnets, which may now be ſolved by admitting this doctrine of a repellent fluid; but whether it will be ſufficient to account for all the particular phænomena of nature, which are the proper teſts of an hypotheſis, time and experience alone muſt determine.

The doctor alſo endeavours to ſhew, that the attractions of coheſion, gravity and magnetiſm are the ſame, and that by theſe two active principles, *viz.* attraction and repulſion, all the phænomena of nature may be explained; but as his ingenious treatiſe on this ſubject is laid down in a ſeries of propoſitions, all connected together, it would be impoſſible to do juſtice to his arguments, without tranſcribing the whole: we ſhall therefore refer the curious to the book itſelf.

According to 'sGraveſande and others, when light is reflected from a poliſhed ſpherical ſurface, the particles of light do not ſtrike upon the ſolid parts, and ſo rebound from them; but are repelled from the ſurface, at a ſmall diſtance before they touch it, by a power extended all over the ſaid poliſhed ſurface. And Sir Iſaac Newton obſerves, that the rays of light are alſo expelled by the edges of bodies, as they paſs near them; ſo as to make their ſhadows, in ſome caſes, larger than they would otherwiſe be. See 's Graveſande's Introd. P. I. n° 40 to 44. and Sir Iſaac Newton's Optics, B. II. P. III. prop. 8. and B. III. P. I. where this repulſive force is illuſtrated from other phænomena.

REQUENA, a town of New Caſtile, forty-five miles weſt of Valencia.

REQUEST, in law, a ſupplication or petition preferred to a prince, or to a court of juſtice; begging relief in ſome conſcionable caſes where the common law grants no immediate redreſs.

Court of REQUESTS, an antient court of equity, inſtituted about the nineteenth year of Henry VII. See COURT.

In the fortieth and forty firſt years of queen Elizabeth, it was adjudged, upon ſolemn argument, in the court of common-pleas, that the court of requeſt was then no court of equity.

REQUIEM, in the romiſh church, a maſs ſung for the reſt of the ſoul of a perſon deceaſed. See the article MASS.

RESARCELE'E, in heraldry, is where a ſlender croſs is charged upon another, as repreſented in plate CCXXXI. fig. 4.

RESCEIT, *receptio*, in law, an admiſſion or receiving of a third perſon to plead his right, in a cauſe formerly commenced between the other two.

RESCHT, the capital of the province of Gilan, in Perſia, ſituated on the ſouth-weſt coaſt of the Caſpian ſea.

RESCISSION, *reſciſſio*, in the civil law, an action intended for the annulling, or ſetting aſide, any contract, deed, *&c.*

RESCOUS, or RESCUE, in law, an illegal taking away and ſetting at liberty a diſtreſs taken, or a perſon arreſted, by proceſs, or courſe of law. See the article DISTRESS, *&c.*

Reſcous, in matters relating to treaſon, is deemed treaſon; and in matters concerning felony, is felony.

RESCRIPT, *reſcriptum*, an anſwer delivered by an emperor, or a pope, when conſulted by particular perſons, on ſome difficult queſtion, or point of law; to ſerve as a deciſion thereof.

RESEARCH, a ſcrutiny, or diligent enquiry into any thing.

RESEARCH, in muſic, is a kind of prelude or voluntary played on the organ, *&c.* wherein the performer ſeems to ſearch or look out for the ſtrains and touches of harmony, which he is to uſe in the regular piece to be played afterwards. See the article PRELUDE.

RESEARCHING, in ſculpture, the repairing of a caſt figure, *&c.* with proper tools; or the finiſhing it with art and exactneſs, ſo as the minuteſt parts may be well defined.

RESEDA, BASE-ROCKET, in botany, a genus of *polyandria-trigynia* claſs of plants, the corolla of which conſiſts of certain unequal petals, ſome one of which is always ſemitrifid; and its fruit is a gibboſe and angulated capſule, containing one cell, with numerous kidney-ſhaped ſeeds.

RESERVATION, in law an action or clauſe whereby ſomething is refenced, or ſecured to one's ſelf.

Mental RESERVATION, a propoſition, which ſtrictly taken, and according to the natural import of the terms, is falſe; but, if qualified by ſomething concealed in the mind, becomes true.

Mental reſervations are the great refuge of religious hypocrites, who uſe them to accommodate their conſciences with their intereſts: the jeſuits are zealous advocates for mental reſervations; yet are they real lyes, as including an intention to deceive.

RESERVE, in law, the ſame with reſervation. See the article RESERVATION.

Body of RESERVE, or *corps de* RESERVE, in military affairs, the third or laſt line of an army, drawn up for battle; ſo called becauſe they are reſerved to ſuſtain the reſt,

reſt, as occaſion requires; and not to engage, but in caſe of neceſſity.

RESERVOIR, a place where water is collected and reſerved, in order to be conveyed to diſtant places through pipes, or ſupply a fountain, or jet d'eau.

RESET, in law, the receiving or harbouring an outlawed perſon. See the article OUTLAWRY.

RESIDENCE, in the canon and common law, the abode of a perſon, or incumbent, upon his benefice; and his aſſiduity in attending on the ſame.

RESIDENT, a public miniſter, who manages the affairs of a kingdom or ſtate, at a foreign court.

They are a claſs of public miniſters inferior to ambaſſadors or envoys; but, like them, are under the protection of the law of nations.

RESIDENTIARY, *reſidentiarius*, a canon inſtalled into the privileges and profits of reſidence.

RESIDUAL FIGURE, in geometry, the figure remaining after ſubtracting a leſſer from a greater.

RESIDUAL ROOT, in algebra, a root compoſed of two parts or members, connected together by the ſign —.

Thus $x-y$ is a reſidual root, ſo called, becauſe its value is no more than the difference between its parts x and y.

RESIDUE, *reſiduum*, the remainder or balance of an account, debt, or obligation.

RESIGNATION, in the canon law, the ſurrendering a benefice into the hands of the collator, or biſhop.

RESIGNEE, in law, the perſon to whom a thing is reſigned.

RESIN, in natural hiſtory, a viſcid juice ouzing either ſpontaneouſly, or by inciſion, from ſeveral trees, as the pine, fir, *&c.*

For the difference between reſins and gums, ſee the article GUM.

Natural reſins are either ſolid or fluid. Of the ſolid reſins, ſome are uſed more frequently in medicine, as ſtorax, benjamin, maſtich, olibanum, elemi, lac, dragons-blood, and camphor; and others more rarely, as anime, copal, caranna, tacliamahaca, ladanum, ſandarach, *&c.* See STORAX, BENJAMIN, *&c.*

The liquid reſins, uſed in medicine, are leſs numerous, *viz.* balſam of gilead, of peru, of tolu, of capivi, turpentine, liquid amber, and liquid ſtorax. See the articles BALSAM, TURPENTINE, *&c.*

All reſins are uſed, more or leſs, in all officinal plaſters; both as being ripeners and drawers, and becauſe they give a due conſiſtence and tenacity.

The reſins of vegetables may be prepared nearly in the ſame manner as extracts, by uſing rectified ſpirit of wine inſtead of water: for ſuch a ſpirit is the only proper menſtruum that will diſſolve the groſſer reſinous matter of vegetables, as water is of the mucilaginous and ſaline parts; yet theſe principles are ſo intimately combined in almoſt all plants, that whichever of theſe liquors is applied at firſt, it will take up a portion of what is directly ſoluble only in the other: hence ſundry vegetables, extremely reſinous, and whoſe virtues conſiſt chiefly in their reſin, afford nevertheleſs very uſeful extracts with water, though not equal to thoſe obtained by a prudent application of ſpirit. See EXTRACT.

The indiſſolubility of pure reſins in aqueous fluids, and their tenacious quality by which they ſtick to the coats of the inteſtines, occaſion gripes and other inconveniencies; ſo that it is not ſafe to give them alone: the better way of fitting them for internal uſe, is by triturating them with the teſtaceous powders, or with almonds, into the form of an emulſion; or by diſſolving them in ſpirit of wine, and mixing the ſolution with a proper quantity of ſyrup. Six or eight grains of the reſin of jalap, or ſcammony, managed in this manner, prove powerfully cathartic without griping, or greatly diſordering the body.

For the preparation of the reſins, ſee the articles JALAP, SCAMMONY, *&c.*

RESISTANCE, or RESISTING FORCE, in philoſophy, denotes, in general, any power which acts in an oppoſite direction to another, ſo as to deſtroy or diminiſh its effect.

Hence the force wherewith bodies, moving in fluid mediums, are impeded or retarded, is the reſiſtance of thoſe fluids. See the article FLUID.

Authors have eſtabliſhed it as a certain rule, that, whilſt the ſame body moves in the ſame medium, it is always reſiſted in the duplicate proportion of its velocity; that is, if the reſiſted body move in one part of its track, with three times the velocity with which it moved in ſome other part, then its reſiſtance to the greater velocity will be nine times the reſiſtance to the leſſer: if the velocity in one place be four times the velocity in another, the reſiſtance to the greater velocity will be

ſixteen

ſixteen times the reſiſtance to the leſſer, and ſo on. This rule, though exceſſively erroneous, when taken in a general ſenſe, is yet undoubtedly very near the truth, when confined within certain limits.

In order to conceive the reſiſtance of fluids to a body moving in them, Mr. Robins diſtinguiſhes between thoſe fluids, which being compreſſed by ſome incumbent weight, perpetually cloſe up the ſpace deſerted by the body in motion, without permitting, for an inſtant, any vacuity to remain behind it; and thoſe fluids in which, they being not ſufficiently compreſſed, the ſpace left behind the moving body remains for ſome time empty. Theſe differences, in the reſiſting fluids, will occaſion very remarkable varieties in the laws of their reſiſtance, and are abſolutely neceſſary to be conſidered in the determination of the action of the air in ſhot and ſhells; for the air partakes of both theſe affections, according to the different velocities of the projected body.

If a fluid was ſo conſtituted that all the particles compoſing it were at ſome diſtance from each other, and there was no action between them, then the reſiſtance of a body moving therein, would be eaſily computed from the quantity of motion communicated to theſe particles: for inſtance, if a cylinder moved in ſuch a fluid in the direction of its axis, it would communicate to the particles it met with a velocity equal to its own, and in its own direction, ſuppoſing that neither the cylinder, nor the parts of the fluid were elaſtic; whence, if the velocity and diameter of the cylinder be known, and alſo the denſity of the fluid, there would thence be determined the quantity of motion communicated to the fluid, which (action and re-action being equal) is the ſame with the quantity loſt by the cylinder, conſequently the reſiſtance would be hereby aſcertained.

In this kind of diſcontinued fluid, the particles being detached from each other, every one of them can purſue its own motion in any direction, at leaſt for ſome time, independent of the neighbouring ones; wherefore, if inſtead of a cylinder moving in the direction of its axis, a body, with a ſurface oblique to its direction, be ſuppoſed to move in ſuch a fluid, the motion the parts of the fluid will hereby acquire, will not be in the direction of the reſiſted body, but perpendicular to its oblique ſurface; whence the reſiſtance to ſuch a body will not be eſtimated from the whole motion communicated to the particles of the fluid, but from that part of it only which is in the direction of the reſiſted body. In fluids then, where the parts are thus diſcontinued in each other, the different obliquities of that ſurface, which goes foremoſt, will occaſion conſiderable changes in the reſiſtance; although the ſection of the ſolid, by a plain perpendicular to its direction, ſhould in all caſes be the ſame. And Sir Iſaac Newton has particularly determined, that in a fluid thus conſtituted, the reſiſtance of a globe is but half the reſiſtance of a cylinder of the ſame diameter, moving in the direction of its axis with the ſame velocity.

But though the hypotheſis of a fluid, thus conſtituted, be of great uſe in explaining the nature of reſiſtances; yet, in reality, no ſuch fluid does exiſt within our knowledge: all the fluids with which we are converſant are ſo formed, that their particles either lie contiguous to each other, or at leaſt act on each other in the ſame manner as if they did; conſequently, in theſe fluids, no one particle, contiguous to the reſiſted body, can be moved, without moving at the ſame time a great number of others, ſome of which will be diſtant from it; and the motion thus communicated to a maſs of the fluid will not be in any one determined direction, but will in each particle be different, according to the different manners in which it lies in contact with thoſe, from which it receives its impulſe; whence, great numbers of the particles, being diverted into oblique directions, the reſiſtance of the moving body, which will depend on the quantity of motion communicated to the fluid in its own direction, will be hereby different in quantity, from what it would be in the preceding ſuppoſition, and its eſtimation becomes much more complicated and operoſe. Sir Iſaac Newton, however, has determined, that the reſiſtance to a cylinder, moving in the direction of its axis in ſuch a compreſſed fluid as we have here treated of, is but one fourth part of the reſiſtance, which the ſame cylinder would undergo, if it moved with the ſame velocity, in a fluid, conſtituted in the manner we have deſcribed in our firſt hypotheſis, each fluid being ſuppoſed to be of the ſame denſity.

But again, it is not only in the quantity of their reſiſtance that theſe fluids differ, but

but likewiſe in the different manner in which they act on ſolids of different forms moving in them.

We have ſhewn, that in the diſcontinued fluid, which we firſt deſcribed, the obliquity of the foremoſt ſurface of the moving body would diminiſh the reſiſtance; but in compreſſed fluids this holds not true, at leaſt not in any conſiderable degree; for the principal reſiſtance in compreſſed fluids ariſes from the greater or leſſer facility, with which the fluid, impelled by the forepart of the body, can circulate towards its hindermoſt part; and this being little, if at all, affected by the form of the moving body, whether it be cylindrical, conical, or ſpherical, it follows, that while the tranſverſe ſection of the body, and conſequently the quantity of impelled fluid is the ſame, the change of figure in the body will ſcarcely affect the quantity of its reſiſtance.

The reſiſtance of bodies of different figures, moving in one and the ſame medium, has been conſidered by Mr. J. Bernouli in the Acta Lipſienſ. for May, 1693; and the rules he lays down, on this ſubject, are the following: 1. If an iſoſceles triangle be moved in the fluid according to the direction of a line which is normal to its baſe; firſt with the vertex foremoſt, and then with its baſe; the reſiſtances will be as the legs, and as the ſquare of the baſe, and as the ſum of the legs. 2. The reſiſtance of a ſquare moved according to the direction of its ſide, and of its diagonal, is as the diagonal to the ſide. 3. The reſiſtance of a circular ſegment (leſs than a ſemi-circle) carried in a direction perpendicular to its baſis, when it goes with the baſe foremoſt, and when with its vertex foremoſt (the ſame direction and celerity continuing, which is all along ſuppoſed) is as the ſquare of the diameter to the ſame, leſs one-third of the ſquare of the baſe of the ſegment. Cor. Hence the reſiſtances of a ſemi-circle, when its baſe, and when its vertex go foremoſt, are to one another in a ſeſquialterate ratio. 4. A parabola moving in the direction of its axis, with its baſis, and then its vertex foremoſt, has its reſiſtances, as the tangent to an arch of a circle, whoſe diameter is equal to the parameter, and the tangent equal to half the baſis of the parabola. 5. The reſiſtances of an hyperbola, or the ſemi-ellipſis, when the baſe and when the vertex goe foremoſt, may be thus computed; let it be, as the ſum, or difference, of the tranſverſe axis, and latus rectum, is to the tranſverſe axis, ſo is the ſquareof the latus rectum to the ſquare of the diameter of a certain circle; in which circle apply a tangent equal to half the baſis of the hyperbola or ellipſis. Then ſay again, as the ſum, or difference, of the axis and parameter is to the parameter, ſo is the aforeſaid tangent to another right line. And further, as the ſum, or difference, of the axis and parameter is to the axis, ſo is the circular arch, correſponding to the aforeſaid tangent, to another arch. This done, the reſiſtances will be as the tangent to the ſum, or difference, of the right line thus found, and that arch laſt mentioned. 6. In general, the reſiſtances of any figure whatſoever going now with its baſe foremoſt, and then with its vertex, are as the figures of the baſis to the ſum of all the cubes of the element of the baſis divided by the ſquares of the element of the curve line.

All which rules, he thinks, may be of uſe in the fabric or conſtruction of ſhips, and in perfecting the art of navigation univerſally. As alſo for determining the figures of the balls of pendulums for clocks. See the article SHIP, &c.

As to the reſiſtance of the air, Mr. Robins, in his new principles of gunnery, took the following method to determine it: he charged a muſket-barrel three times ſucceſſively with a leaden ball $\frac{3}{4}$ of an inch diameter, and took ſuch precaution in weighing of the powder, and placing it, as to be ſure, by many previous trials, that the velocity of the ball could not differ by 20 feet in 1″ from its medium quantity. He then fired it againſt a pendulum, placed at 25, 75, and 125 feet diſtance, &c. from the mouth of the piece reſpectively. In the firſt caſe it impunged againſt the pendulem with a velocity of 1670 feet in 1″; in the ſecond caſe with a velocity of 1550 feet in 1″; and in the third caſe with a velocity of 1425 feet in 1″; ſo that in paſſing through 50 feet of air, the bullet loſt a velocity of about 120, or 125 feet in 1″; and the time of its paſſing through that ſpace being about $\frac{1}{3\frac{1}{2}}$ or $\frac{1}{3\frac{1}{3}}$ of 1″, the medium quantity of reſiſtance muſt, in theſe inſtances, have been about 120 times the weight of the ball; which, as the ball was nearly $\frac{1}{2\frac{1}{2}}$ of a pound, amounts to about 10 lb. avoirdupoiſe.

Now

Now if a computation be made, according to the method laid down for compreſſed fluids in the 38th Propoſ. of lib. 2. of Sir Iſaac Newton's Principia, ſuppoſing the weight of water to be to the weight of air, as 850 to 1, it will be found that the reſiſtance of a globe of three quarters of an inch diameter, moving with a velocity of about 1600 feet in 1″, will not, on thoſe principles, amount to any more than a force of $4\frac{1}{6}$ lb. avoirdupoiſe; whence we may conclude (as the rules in that propoſition for ſlow motions are very accurate) that the reſiſting power of the air in ſlow motions is leſs than in ſwift motions, in the ratio of $4\frac{1}{6}$ to 10, a proportion between that of 1 to 2, and 1 to 3.

Again, charging the ſame piece with equal quantities of powder, and balls of the ſame weight, and firing three times at the pendulum, placed at 25 feet diſtance from the mouth of the piece, the medium of the velocities with which the ball impinged was 1690 feet in 1″. Then removing the piece 175 feet from the pendulum, the velocity of the ball, at a medium of five ſhots, was 1300 feet in 1″. Whence the ball, in paſſing through 150 feet of air, loſt a velocity of about 390 feet in 1″; and the reſiſtance, computed from theſe numbers, comes out ſomething more than in the preceding inſtance, amounting to between 11 and 12 pounds avoirdupoiſe: whence, according to theſe experiments, the reſiſting power of the air to ſwift motions is greater than in ſlow ones, in a ratio which approaches nearer to the ratio of 3 to 1, than in the preceding experiments.

Having thus aſcertained the reſiſtance to a velocity of near 1700 feet in 1″, he next proceeded to examine this reſiſtance in ſmaller velocities: the pendulum being placed at 25 feet diſtance, was fired at five times, and the mean velocity with which the ball impinged was 1180 feet in 1″. Then removing the pendulum to the diſtance of 250 feet, the medium velocity of five ſhot at this diſtance, was 950 feet in 1″; whence the ball, in paſſing through 225 feet of air, loſt a velocity of 230 feet in 1″, and as it paſſed through that interval in about $\frac{3}{4}$ of 1″, the reſiſtance to the middle velocity will come out to be near $33\frac{1}{2}$ times the gravity of the ball, or 2 lb. 10 oz. avoirdupoiſe. Now the reſiſtance to the ſame velocity, according to the laws obſerved in ſlower motions, amounts to $\frac{7}{11}$ of the ſame quantity; whence in a velocity of 1065 feet in 1″, (the medium of 1180 and 950) the reſiſting power of the air is augmented in no greater proportion than of 11 to 7; whereas in greater degrees of velocity, as before, it amounted very near to the ratio of 3 to 1.

That this reſiſting power of the air to ſwift motions, is very ſenſibly increaſed beyond what Sir Iſaac's theory for ſlow motions makes it, ſeems hence to be evident. It being, as has been ſaid, in muſket, or cannon ſhot, with their full charge of powder, near three times the quantity aſſigned by that theory.

The reſiſtance of a bullet of three quarters of an inch diameter, moving in air with a velocity of 1670 feet in 1″, amounting, as we ſaid, to 10 lb. the reſiſtance of a cannon ball of 24 lb. fired with its full charge of powder, and thereby moving with a velocity of 1650 feet in 1″, may hence be determined. For the velocity of the cannon ball being near the ſame as the muſket bullet, and its ſurface above 54 times greater, it follows, that the reſiſtance on the cannon ball will amount to more than 540 lb. which is near 23 times its own weight. And from hence it appears how raſh and erroneous the opinion of thoſe is, who neglect the conſideration of the reſiſtance of the air as of no importance in the doctrine of projectiles. See the articles PROJECTILE and GUNNERY.

RESISTANCE of the fibres of ſolid bodies is more properly called coheſion. See the article COHESION.

Solid of leaſt RESISTANCE. See SOLID.

RESOLUTION, in chemiſtry, *&c.* the reduction of a mixed body into its component parts, or firſt principles, by a proper analyſis. See the articles MENSTRUUM and SOLUTION.

The reſolution of bodies is effected by divers operations, as diſtillation, ſublimation, fermentation, precipitation, *&c.* See the articles DISTILLATION, SUBLIMATION, *&c.*

Some logicians uſe the term reſolution for what is more uſually called analyſis, or the analytic method. See the articles ANALYSIS and METHOD.

RESOLUTION, in medicine, that coction or alteration of the crude peccant matter of any diſeaſe, either by the natural ſtrength of the patient, or of its own accord, or by the application of remedies, whereby its bulk, figure, coheſion,

heſion, &c. are ſo far changed, as that it ceaſes to be morbid, and becomes laudable. This, Boerhaave obſerves, is of all others the moſt perfect cure, where it is effected without any evacuation, as ſuppoſing the matter favourable, the conſtitution excellent, and the medicines good.

RESOLUTION, in muſic, is when a canon or perpetual fugue is not wrote on a line, or in one part, but all the voices that are to follow the guide or firſt voice are wrote ſeparately either in ſcore, that is in ſeparate lines, or in ſeparate parts, with the pauſes each is to obſerve, and in the proper tone to each.

RESOLVENTS, *reſolventia*, in medicine, remedies proper to reſolve and diſſipate tumors and gatherings, to ſoften indurations, and, by their tenuity and warmth, evacuate redundant or peccant humours through the pores. Under this claſs come various unguents, emplaſters, &c.

RESONANCE, RESOUNDING, in muſic, &c. a ſound returned by the air, incloſed in the bodies of ſtringed muſical inſtruments, as lutes, &c. or even in the bodies of wind inſtruments, as flutes, &c. See SOUND and MUSIC.

Elliptic and parabolic vaults, reſound ſtrongly, that is, they will reflect or return a ſound. The mouth and the parts thereof, as the palate, tongue, teeth, noſe, and lips, Monſieur Dodart obſerves, contribute nothing to the tone of the voice, but their effect is very great as to the reſonance of this we have a very ſenſible inſtance in that vulgar inſtrument called a jews-harp, or trompe de Bearn; for if you hold it in your hand, and ſtrike the tongue or ſpring thereof, which is the method practiſed to ſound this inſtrument, it yields ſcarce any noiſe, but holding the body of it between the teeth, and ſtriking it as before, it makes a muſical buzz, which is heard at a good diſtance, and eſpecially the lower notes.

So alſo in the haut-boys, the tune of the reed is always the ſame; being a ſort of drone, the chief variety whereof is in the tune of reſonance produced in the mouth, by the greater or leſs aperture, and the various motions of the lips.

RESORT, or RESSORT. See RESSORT.

RESPECTU COMPUTI VICECOMITIS HABENDO, in law, a writ directed to the treaſurer and barons of the exchequer for the reſpiting of a ſheriff's account.

RESPIRATION, *reſpiratio*, the act of reſpiring, or breathing the air. What reſpiration is, and why it is uninterruptedly carried on without the concurrence of the mind, will appear from the following conſiderations of Boerhaave. The lungs ſuſpended in the air, which every where acts upon them, and equally preſſes them always, collapſe, contract themſelves into a ſmaller ſpace, and become much leſs than when they remained in the intire thorax. This is principally performed by the contractile force of the muſcular fibres, which connect the ſquamous ſegments of the bronchia. If the lungs thus contracted, are filled with air, forcibly blown through the glottis, they are ſo diſtended as in bulk not only to equal that which they had in the intire thorax, but even to exceed it; all which is ſufficiently certain from experiments. The ſame thing happens if, when an acceſs for the air through the glottis is left to the lungs, the air externally acting on the lungs, is either removed, or its preſſure diminiſhed. Hence it is obvious, that the lungs, by their proper force have always a tendency to become leſs in all their parts than they are when placed in the intire thorax. For this reaſon, it is certain that they are in a continual ſtate of diſtraction ſo long as a perſon is alive, ſo that they muſt collapſe, and be diminiſhed, whilſt the whole of the animal remains in a vacuum, obtained by an exhauſtion of the air in an air-pump. For there is nothing ſimilar to a circumambient air between the external membrane of the lungs, and all the internal ſurface of the pleura in a ſound perſon; nothing therefore externally compreſſes the lungs, except the diaphragm. There is, however, always an internal air contained in them, and freely conveyed to them through the glottis. Hence the lungs are always ſomewhat more diſtended by the internal, than they are compreſſed by the external, air, the acceſs of which is hindered by the diaphragm, which is ſo connected with the ribs and vertebræ, that the air cannot enter the thorax in ſuch a manner as would be requiſite for an equilibrium. See the article LUNGS, DIAPHRAGM, &c.

Since, therefore, in inſpiration, a greater quantity of air enters the lungs through the glottis, it will extend the lungs more, and overcome their natural force, ſo that in this action the lungs are paſſive; but how far they are active is only to be diſcovered from certain phænomena. In vital inſpiration, then, eſpecially conſidered in a ſleeping perſon, firſt the ribs, particularly the nine ſuperior ones, articulated at the vertebræ, and by cartilages joined to the ſternum, with their arched part, riſe to the clavicles, ſo that this motion is principally obſerved in the middle of the arch, whilſt three, or perhaps four, inferior ribs are turned downwards, backwards, and obliquely outwards, but in ſuch a manner that the ſeventh, eighth, ninth, and tenth ribs are by their cartilaginous ſegments, as it were, drawn inwards. Secondly, the whole abdomen, to the very end of inſpiration, is gradually rendered more tumid and preſſed downwards. Thirdly, at the ſame time the cavity of the thorax is enlarged, as is obvious from repeated experiments.

Whilſt the parts remain in this ſituation, the air acts upon the lungs with a force equal to that with which the thorax reſiſts, ſo that the lungs will remain in a ſtate of reſt. Hence leſs blood will paſs through them, and a ſmaller quantity of it will be forced into the left ventricle of the heart, and conſequently leſs blood will be conveyed to the cerebellum and its nerves. The arterial blood will alſo act leſs upon the intercoſtal muſcles and diaphragm, ſo that the cauſes dilating the thorax are weakened. Hence the elaſticity of the cartilaginous ſegments again depreſſes the ribs, in which work they are alſo aſſiſted by the muſcular fibres ariſing from the ſide of the ſternum within the thorax, and inſerted into the bony extremities, and cartilages of the true ribs. At the ſame time the diſtracted fibres of the peritonæum and abdominal muſcles reſtore themſelves. Hence the compreſſed viſcera thruſt the relaxed diaphragm upwards into the thorax, which is by this means contracted, and the air expelled from the lungs. By this means, expiration and the action already mentioned, are performed. But in a particular manner by theſe two actions the blood is not only carried through the lungs, but its motion accelerated. See CIRCULATION, &c.

Phyſicians are not agreed about the uſe and effects of reſpiration; ſome think that the air is inſinuated into the veſſels of the lungs, to give a greater fluidity and motion to the blood; others, that it conveys very ſubtile nitrous corpuſcles thereunto, which gives it the red colour; others again, believe the air ſerves to condenſe the blood, which has been heated by circulation. This is certain, that the air entering into the lungs, and all the ſmall ramifications which ſurround its veſicles is broke, comminuted, and rendered more fluid, and that it is deprived of a ſeroſity, which proceeds from the lungs by perſpiration in the form of a vapour that is viſible in cold weather. It may be added, that the voice, laughter, coughing, ſneezing, yawning, and ſucking, depend upon reſpiration. Boerhaave takes the principal uſes of reſpiration to be the further preparation of the chyle, its more accurate mixture with the blood, and its converſion into a nutritious juice, proper to repair the decays of the body. Other authors take a great uſe of reſpiration to be, by the neighbourhood of the cold nitrous air, to cool the blood coming reeking hot out of the right ventricle of the heart through the lungs, and to act as a refrigeratory; others aſſert one grand uſe of reſpiration to be the throwing off the ſuliginous vapours of the blood, along with the expelled air; and for inſpiration they aſſert, that it conveys a nitro-aerial ferment to the blood, to which the animal ſpirits, and all muſcular motion, are owing. But Dr. Thurſton rejects all theſe, as being the principal uſes of reſpiration, and from the experiments of Dr. Croon, Dr. Hook, and others, made before the Royal Society, he ſhews the principal uſe of reſpiration to be that of moving, or paſſing the blood from the right to the left ventricle of the heart, and ſo to effect circulation; whence it is, that perſons hanged, drowned, or ſtrangled, ſo ſuddenly die, *viz.* becauſe the circulation of the blood is ſtopped, and for the ſame reaſon it is, that animals die ſo ſpeedily in the air-pump. This uſe of reſpiration Dr. Drake not only confirms, but carries farther, making it the true cauſe of the diaſtole of the heart, which neither Borelli, Dr. Lower, nor Mr. Cowper, had well accounted for. See the articles DIASTOLE and SYSTOLE.

From

From experiments made upon dogs, and other animals, Dr. Hales ſhews, that without reſpiration, the blood would ſoon turn putrid and peſtilential; and indeed the only animal exempted from the neceſſity of reſpiration is a foetus. See FOETUS.

With regard to the force of reſpiration, the laſt mentioned author obſerves, that though a man by a peculiar action of his mouth and tongue, may ſuck mercury twenty-two inches, and ſome men twenty-ſeven or twenty-eight, high, yet he found from experience, that by the bare inſpiring action of the diaphragm and dilating thorax, he himſelf could ſcarcely raiſe the mercury two inches, at which time the diaphragm muſt act with a force equal to the weight of a cylinder of mercury, whoſe baſe is commenſurate to the area of the diaphragm, and its height two inches, whereby the diaphragm muſt at the ſame time ſuſtain a weight equal to many pounds; neither are its counteracting muſcles, thoſe of the abdomen, able to exert a greater force.

With regard to the quantity of moiſture carried off by reſpiration, the Dr. from an experiment on wood-aſhes, eſtimates that quantity to be equal to ſeventeen grains in fifty expirations, whence there will proportionably be four hundred and eight grains evaporated or breathed off in twelve hundred expirations, being the number in an hour, and thence in twenty-four hours 9792 grains, or 1.39 pounds, which ſuppoſing the ſurface of the lungs to be 41635 ſquare inches, then the quantity evaporated from that inward ſurface will be $\frac{1}{1074}$th part of an inch depth.

From the violent and fatal effects of very noxious vapours on the reſpiration and life of animals, the Dr. ſhews how the reſpiration is proportionably incommoded when the air is loaded with leſſer degrees of vapours, which vapours do in ſome meaſure clog and lower the air's elaſticity, which it beſt regains by having theſe vapours diſpelled by the ventilating motion of the free open air, that is beſt rendered wholeſome by the agitation of winds; thus what we call a cloſe warm air, ſuch as has been long confined in a room, without having the vapours in it carried off by communicating with the open air, is apt to give us more or leſs uneaſineſs in proportion to the quantity of vapours which are floating in it. And thus many of thoſe who have weak lungs, but can breathe very well in the freſh country air, are greatly incommoded in their breathing, when they come into large cities where the air is full of fuligenous vapours; and even the moſt robuſt and healthy, in changing from a city to a country air, find an exhilerating pleaſure ariſing from a more free and kindly inſpiration, whereby the lungs being leſs loaded with condenſing air and vapours, and thereby the veſicles more dilated with a clearer and more elaſtic air, a freer courſe is thereby given to the blood, and probably a purer air mixed with it. See the article AIR.

RESPITE, in law, *&c.* ſignifies a delay, forbearance, or prolongation of time, granted any one, for the payment of a debt, or the like.

RESPONDENT SUPERIOR, in law, is a ſuperior's anſwering for the inſufficiency of an inferior. Thus, if the ſheriffs of London are inſufficient, the lord-mayor and commonalty muſt anſwer for them, as the ſheriffs ſuperior.

Superior officers muſt alſo anſwer for their deputies, in civil actions, in caſe they are inſufficient to anſwer damages; as where a gaoler deputes another under him, and the perſon deputed ſuffers an eſcape, the gaoler muſt anſwer for his deputy's inſufficiency.

RESPONDENT, in the ſchools, one who maintains a theſis, in any art or ſcience; who is thus called, from his being to anſwer all the objections propoſed by the opponent.

The reſpondent is to ſee whether the poſition made by the contrary party be juſt and legitimate; or whether ſome of the laws of oppoſition be not broken. He is alſo to manage the modes and figures of the ſyllogiſms, to ſee whether the premiſes be juſt; and through the whole, to anſwer rather by diſtinguos, than by direct negation.

RESPONDENT, in law, a perſon who undertakes to anſwer for another; and alſo, one who binds himſelf as a ſecurity for another perſon's good behaviour.

RESPONSALIS, in law, is a perſon who anſwers for another, in court, at a day aſſigned.

RESPONSARY SONG, an anthem, in which the choriſters ſing by turns.

RESPONSE, an anſwer or reply. A word chiefly uſed in ſpeaking of the anſwers

made by the people to the prieſt, in the litany, the pſalms, *&c.*

RESSAULT, in architecture, is the effect of a body which either projects or ſinks back; that is, ſtands more out or in, than another, ſo as to be out of the line or level with it.

RESSORT, or RESORT, a french word, ſometimes uſed by engliſh authors, to ſignify the juriſdiction of a court, and particularly one from which there is no appeal.

Thus it is ſaid, that the houſe of lords judge en dernier reſſort, or in the laſt reſſort.

RESSOURCE, a french word, uſed by engliſh writers, to denote an after-game, for recovering a perſon's loſſes, or ſomething to apply back to, for ſuccour.

REST, *quies*, the continuance of a body in the ſame place, or its continual application or contiguity to the ſame parts of the ambient or contiguous bodies; and, therefore, is oppoſed to motion. See the article MOTION.

Sir Iſaac Newton defines true or abſolute reſt, to be the continuance of a body in the ſame part of abſolute ſpace; and relative reſt to be the continuance of a body in the ſame part of relative ſpace. See the article SPACE.

It is one of the laws of nature, that matter is indifferent to motion or reſt, as has been ſhewn under the article INERTIA.

Reſt, conſidered in a phyſical view, is only ſalutary, in ſo far as it is duly proportioned to the exerciſe; for a ſedentary idle life brings on many indiſpoſitions. See the article EXERCISE.

REST, in poetry, is a ſhort pauſe of the voice, in reading, being the ſame with with the cæſura, which, in alexandrine verſes, falls on the ſixth ſyllable; but in verſes of ten or eleven ſyllables, on the fourth. See CÆSURA, ALEXANDRINE, *&c.*

REST, in muſic, the ſame with pauſe. See the article PAUSE.

RESTAURATION, the act of re-eſtabliſhing or ſettling a thing in its former good ſtate.

RESTAURATION, in architecture, the act of repairing thoſe parts of a building that are gone to decay, in ſuch a manner as to give it its original ſtrength and beauty.

From the plinths of the corinthian columns of the Pantheon, which are almoſt wholly under-ground, it is evident that the pavement of this temple is only a reſtauration made in the time of Septimus Severus.

RESTAURATION, in ſculpture, is the repairing a mutilated ſtatue, *&c.*

Many of the antique ſtatues have undergone a reſtauration; as the wreſtlers, in the gallery of the great duke of Florence; the farneſe Hercules; the Faunus in the villa Borgheſe, at Rome; and the Venus of Arles, in the gallery at Verſailles: but theſe reſtaurations have all been made by the ableſt ſculptors.

RESTINCTION, in chemiſtry, is the quenching a metal or mineral, in ſome liquor, in order either to correct or exalt it, by giving it ſome new power or quality.

RESTITUTION, in phyſics, is reſtoring an elaſtic body, forcibly bent, to its natural ſtate. See the article ELASTICITY.

RESTITUTION, in a moral and legal ſenſe, is reſtoring a perſon to his right; or returning ſomething unjuſtly taken or detained from him.

In the romiſh church, uſurers, *&c.* are obliged to a reſtitution of their ill-gotten goods; otherwiſe the prieſt has no authority to give them abſolution.

RESTITUTION IN INTEGRUM, the ſame with reſciſſion. See RESCISSION.

RESTITUTION *of medals*, or RESTITUTED MEDALS, is a term uſed by antiquaries, for ſuch medals as were ſtruck by the emperors, to retrieve the memory of their predeceſſors.

Hence, in ſeveral medals we find the letters REST. This practice was firſt begun by Claudius, by his ſtriking afreſh ſeveral medals of Auguſtus. Nero did the ſame; and Titus, after his father's example, ſtruck reſtitutions of moſt of his predeceſſors. Gallienus ſtruck a general reſtitution of all the preceding emperors, on two medals, the one bearing an altar, the other an eagle, without the REST. See the article MEDAL.

RESTITUTIONE TEMPORALIUM, is a writ that lies when a man is elected and confirmed biſhop of a dioceſe, for the recovery of the temporalities of the biſhopric.

This writ is directed from the king to the eſcheator, or rather ſheriff of the county.

RESTIVE, or RESTY, in the manege, a ſtubborn, unruly, ill-broken horſe, that ſtops, or runs back, inſtead of advancing forward.

RESTORATION, the ſame with reſtauration. See RESTAURATION.

In England, the return of king Charles II. in 1660, is, by way of eminence, called the Reſtoration; and the 29th of May is kept as an anniverſary feſtival, in commemoration of that event, by which the regal and epiſcopal government was reſtored.

RESTORATIVE, in medicine, a remedy proper for reſtoring and retrieving the ſtrength and vigour both of the body and animal ſpirits.

All under this claſs, ſays Quincy, are rather nutrimental than medicinal; and are more adminiſtered to repair the waſtes of the conſtitution, than to alter and rectify its diſorders. Whatſoever can anſwer this end, muſt be both endued with a diſpoſition to enter into, and mix with, the moſt ſubtile of the animal fluids, and to fall into and adhere with ſuch interſtices of the ſolids, as have been wore away by action, and ſtand in need of recruit. Theſe are one of the claſſes of balſamics, and are diſtinguiſhed by the term analeptics. See the articles ANALEPTICS, BALSAMICS, &c.

Some of the principal medicines of this intention are the leaves of white and black maiden-hair, eruca, colts-foot, piſtachio-nuts, ſcabious, balſam of Tolu, bdellium, benzoin, eryngo, ſtorax, barley, &c. Hoffman obſerves, that a true and genuine reſtoration of the natural ſtrength depends upon proper aliments, both of the eatable and drinkable kind, being converted into good blood, and laudable juices, which afterwards generate that ſubtil fluid which is ſecreted in the brain; and being carried through the nerves to the muſcles and muſcular coats, principally ſupplies the body, and its ſeveral parts, with ſtrength and vigour. Thoſe nutritives, therefore, which afford a matter moſt proper for this purpoſe, are the beſt analeptics; of which kind are glutinous broths of fleſh, capons, and bones with their marrow, boiled in a cloſe veſſel, with water, a little wine, ſome ſlices of lemon, a little ſalt, powder of mace and cloves; broths alſo made of coarſe weſtphalian bread, water, wine, and eggs; chocolate, with or without milk, aſſes milk, &c. But thoſe nutritive and ſtrengthening aliments, he adds, are not to be uſed in the very time of the diſeaſe, nor when the whole maſs of blood and humours are impure; but when the diſtemper is over, and where, by a preceding diſeaſe, or by long watching, fatigue, and labour of body, or large hæmorrhages, the ſtrength is waſted and impaired: but even then a proper moderation is to be obſerved and kept up to, becauſe theſe aliments paſs very ſpeedily into the blood, and augment its quantity.

RESTRICTION, among logicians, is limiting a term, ſo as to make it ſignify leſs than it uſually does.

RESTRINGENT, in medicine, the ſame with aſtringent. See ASTRINGENT.

RESULT, what is gathered from a conference, inquiry, meditation, or the like; or the concluſion and effect thereof.

RESUMMONS, in law, is the ſecond ſummons or calling a perſon to anſwer an action, where the firſt ſummons is defeated by any accident, as the death of a party, or the like.

RESUMPTION, a word uſed in various ſenſes: thus, in law, it ſignifies the king's taking again into his own hands, ſuch lands, &c. as he had before, on falſe ſuggeſtions, granted to a perſon by letters patent.

In the ſchools, reſumption ſignifies a ſummary repetition of an argument, in order to confute it.

The ſame word is alſo uſed by logicians for the reduction either of ſome figurative or quaint propoſition, to one more plain or intelligible; as, the meadows ſmile; that is, look pleaſant.

RESURRECTION, in theology, riſing again from the dead; or a perſon's returning to a ſecond life, with new bodily organs, adapted to the ſtate of its new exiſtence.

One of the greateſt arguments for the truth of chriſtianity is drawn from the reſurrection of our Saviour; the circumſtances of which are handed down to us in ſo plain and diſtinct a manner, by the evangeliſts, as make the evidence of this important truth amount to a demonſtration.

Chriſtians generally believe, that at the day of judgment, the very identical body they have now, with the ſame fleſh, blood, and bones, will be raiſed from the dead. But, in oppoſition to this opinion, many texts of ſcripture have been urged, particularly the account given of this important event by St. Paul; beſides ſeveral philoſophical objections, the principal of which are theſe.

That

That the ſame ſubſtance may happen to be a part of two or more bodies: thus a fiſh feeding on a man, and another man afterwards feeding on the fiſh, part of the body of the firſt man becomes incorporated with the fiſh, and afterwards with the body of the laſt man. Again, inſtances have been known of one man's immediately feeding on the body of another; and among the cannibals in the Weſt-indies, who devour their enemies, the practice is frequent. Now it is alledged, where the ſubſtance of one is thus converted into the ſubſtance of another, each cannot ariſe with his whole body; to which then ſhall the common part be alloted?

To this objection ſome anſwer, that as all matter is not capable of being aſſimilated to the body, and incorporated with it, human fleſh may very probably be of this kind; and, therefore, what is thus eaten, may be again excreted and carried off.

But Mr. Leibnitz obſerves, that all that is eſſential to the body, is the original ſtamen, which exiſted in the ſemen of the father: this may be conceived as the moſt minute point imaginable, and therefore not to be ſeparated, nor any part of it united to the ſtamen of any other man. That all this bulk we ſee in the body, is only an accretion to this original ſtamen; and therefore there is no reciprocation of the proper matter of the human body.

Another objection is, that we know, by the late diſcoveries in the animal œconomy, that the human body is continually changing, and that a man has not entirely the ſame body to-day, as he had yeſterday; and it is even computed that in leſs than ſeven years time, the whole body undergoes a change. Which of thoſe many bodies then, which the ſame perſon has in the courſe of his life, is it that ſhall riſe? or does all the matter that has ever belonged to him, riſe again? or does only ſome particular ſyſtem thereof? the body, for example, he had at twenty, at forty, or at ſixty years old? If only this or that body ariſe, how ſhall it be rewarded or puniſhed for what was done by the other? and with what juſtice does one perſon ſuffer for another?

To this it has been anſwered, on the principles of Leibnitz, that notwithſtanding theſe ſucceſſive changes, this ſtamen, which is the only eſſential part of the body, has always remained the ſame; and that on Mr. Locke's principles, perſonal identity, or the ſameneſs of a rational being, conſiſts in ſelf-conſciouſneſs, in the power of conſidering itſelf the ſame thing in different times and places. By this, every one is to himſelf what he calls ſelf; without conſidering whether that ſelf be continued in the ſame, or in ſeveral ſubſtances. It is the ſame ſelf now, it was then; and it was by the ſame ſelf which now reflects on an action, that action was performed. Now it is this perſonal identity that is the object of rewards and puniſhments, which, it is obſerved may exiſt in different ſucceſſions of matter; ſo that to render the rewards and puniſhments juſt and pertinent, we need only to riſe again with ſuch a body as that we retain the conſciouſneſs of our paſt actions.

RESUSCITATION, the ſame with reſurrection and revivification. See the preceding article, and REVIVIFICATION. The term reſuſcitation, however, is more particularly uſed by chemiſts, for the reproducing a mixed body from its aſhes; an art to which many have pretended, as to reproduce plants, &c. from their aſhes.

RETAIL, in commerce, is the ſelling of goods in ſmall parcels, in oppoſition to wholeſale. See the article COMMERCE.

RETAINER, in law, a ſervant who does not continually dwell in the houſe of his maſter, but only attends upon ſpecial occaſions.

RETAINING FEE, the firſt fee given to a ſerjeant or counſellor at law, in order to make him ſure, and prevent his pleading on the contrary ſide. See FEE.

RETALIATION, among civilians, the act of returning like for like. See the article TALIONIS LEX.

RETARDATION, in phyſics, the act of diminiſhing the velocity of a moving body. See the article MOTION.

If bodies of equal bulk, but of different denſities, be moved through the ſame reſiſting medium, with equal velocity, the medium will act equally on each, ſo that they will have equal reſiſtances, but their motions will be unequally retarded, in proportion to their denſities. See the article RESISTANCE.

Retarded motion from gravity, is peculiar to bodies projected upwards, and this in the ſame manner as a falling body is accelerated; only in the latter, the force of gravity acts in the ſame direction with the motion of the body; and in the former

mer in an oppoſite direction. See the article ACCELERATION.

As it is the ſame force which augments the motion in the falling, and diminiſhes it in the riſing body, a body will riſe till it has loſt all its motion; which it does in the ſame time wherein a body falling would have acquired a velocity equal to that wherewith the body was projected upwards.

RETE MIRABILE, in anatomy, a ſmall plexus, or net-work of veſſels in the brain, ſurrounding the pituitary gland.

The rete mirabile is very conſpicuous in brutes, but either not exiſtent in man, or ſo very minute that is exiſtence is fairly doubted. See the article BRAIN.

RETENTION, is defined, by Mr. Locke, to be a faculty of the mind, whereby it keeps, or retains, thoſe ſimple ideas it has once received, by ſenſation or reflection.

This is done two ways; firſt, by keeping the idea which is brought into the mind for ſome time in view; this is called contemplation. See the article CONTEMPLATION.

Secondly, by reviving thoſe ideas in our minds which have diſappeared, and have been as it were laid out of ſight; this is memory, which is as it were the repoſitory of our ideas. See the article MEMORY.

RETENTION is alſo uſed, in medicine, *&c.* for the ſtate of contraction in the ſolids or vaſcular parts of the body, which makes them hold faſt their proper contents. In this ſenſe retention is oppoſed to evacuation and excretion. See EVACUATION and EXCRETION.

Retention and excretion make two of the non-naturals.

Retention is alſo frequently conſidered as a diſorder, and defined to be the act of retaining the excrements, humours, *&c.* ſo as they cannot be voided out of the body. See COSTIVENESS.

For the retention of the urine, ſee the articles DYSURY, ISCHURY, and STRANGURY.

RETIARII, in antiquity, a kind of gladiators, thus denominated from a net which they made uſe of againſt their antagoniſts, who were called ſecutores, and ſometimes mirmillones. See the article GLADIATOR.

This net they carried under their buckler, and when opportunity ſerved, caſt it over the head of their antagoniſt, and in this condition killed him with a trident which they bore in the other hand.

RETICENCY, *reticentia*, a figure in rhetoric whereby we make oblique mention of a thing, in pretending to paſs it over unmentioned.

RETFORD, a borough-town of Nottinghamſhire, ſituated twenty-five miles north of Nottingham.

It ſends two members to parliament.

RETICULA, or RETICULE, in aſtronomy, a contrivance for the exact meaſuring the quantity of eclipſes.

The reticule is a little frame, conſiſting of thirteen fine ſilken threads, equidiſtant from each other, and parallel, placed in the focus of object-glaſſes of teleſcopes; that is, in the place where the image of the luminary is painted in its full extent: of conſequence, therefore, the diameter of the ſun or moon is hereby ſeen divided into twelve equal parts or digits; ſo that to find the quantity of the eclipſe, there is nothing to do but to number the luminous and the dark parts. As a ſquare reticule is only proper for the diameter, not for the circumference, of the luminary, it is ſometimes made circular by drawing ſix concentric equi-diſtant circles. This repreſents the phaſes of the eclipſe perfectly.

RETICULAR BODY, *corpus reticulare*, in anatomy, a very fine membrane, perforated, in the manner of a net, with a multitude of foramina. It is placed immediately under the cuticle, and when that is ſeparated from the cutis, whether by art or by accident, this adheres firmly to it, and is ſcarce poſſible to be parted from it, ſeeming rather to be its inner ſuperficies than a diſtinct ſubſtance. In regard to this, we are to obſerve, firſt, the places in which it is found, being all thoſe in which the ſenſe of feeling is moſt acute, as in the palms of the hands, the extremities of the fingers, and on the ſoles of the feet. The tongue, however, is the part where it is moſt accurately to be obſerved: it is more eaſily diſtinguiſhable there than any where elſe, and its nature and ſtructure are moſt evidently ſeen there.

Its colour in the Europeans is white, but in the Negroes, and other black nations, it is black; in the tawny it is yellowiſh; the ſkin itſelf in both is white; and the blackneſs and yellowneſs depend altogether on the colour of this membrane.

The uſes of the corpus reticulare are to preſerve the ſtructure of the other parts of the integuments, and keep them in their determinate form and ſituation. Its apertures give paſſage to the hairs, and let through the papillæ and excretory ducts of the ſkin: it retains theſe in a certain and determinate order, that they cannot be removed out of their places, and has ſome ſhare in preſerving the ſoftneſs of the papillæ, which renders them fit for the ſenſe of feeling. See the article CUTICLE and CUTIS.

RETICULAR PLEXUS, *plexus reticularis*, ſometimes denotes the choroides, which is thus called becauſe its fibres are interwoven like a net. See CHOROIDES.

RETICULUM, the caul or omentum, a name ſometimes given to this part, from its net-like ſtructure. See the article OMENTUM.

RETIFORMIS LACIS, in anatomy, the ſame with the rete mirabile. See the article RETE.

RETINA, in anatomy, the expanſion of the optic nerve on the internal ſurface of the eye, whereupon the images of objects being painted, are impreſſed, and by that means conveyed to the common ſenſory in the brain, where the mind views and contemplates their ideas. See the article EYE.

Diſeaſes of the RETINA. The retina is liable to two ſorts of diſeaſes; the firſt is a ſeparation of ſome parts of this membrane from the choroides. At the place where this ſeparation is made, there follows an elevation or fold which ſtops the light, and hinders its paſſage to that part of the choroides which is covered by this fold: this occaſions a ſort of ſhade which the patients ſee in the air. The ſecond diſeaſe of the retina is an atrophy, or waſting of that membrane.

The cauſe of the firſt diſeaſe may be accounted for, from the blood-veſſels of the retina's turning varicous; for it is eaſily conceived that the dilatation of theſe veſſels may ſeparate the retina from the choroides, in that part which anſwers to the dilated veſſels. This diſeaſe is obſerved to proceed from a cold in the head after ſome violent exerciſe, or whatever elſe may have put the blood into a violent motion. Its ſigns are certain appearances in the air, more or leſs diſtant from the patient's eye, being a kind of ſhadows of different figures, modified according to the ſize and form of the parts of the retina, which are ſeparated. A further account of this diſeaſe, and the manner of treating it, may be ſeen in *Atoms and flies appearing before the* EYES, under the article EYE.

In an atrophy of the retina, as the rays of light are not ſufficiently modified in that membrane, they make too vivid an impreſſion on the choroides, which is very detrimental to it. Hence enſues a confuſed viſion, ſo that the patients at the firſt look can ſee very well; but if they continue to read any time, or to look at a ſhining object, they feel a certain wearineſs in their head and a dimneſs in their ſight, which obliges them to cloſe their eyes; then opening them a moment after they ſee as at their firſt look, but for a very ſhort time.

Embroiderers, ſtocking-weavers, and ſhoe-makers, are ſubject to this diſeaſe; the firſt becauſe the brightneſs of the gold, ſilver, and other colours, damages the ſight by the lively impreſſion it makes on the eye; and the ſhoe-makers, in order to find the hole made by the awl, to run the end through it. By this continual attention, they fatigue and weaken their ſight. No remedies cure this diſeaſe; nothing avails but reſt, and little exerciſe of the ſight.

RETINUE, *retinentia*, the attendants or followers of a prince or perſon of quality, chiefly in a journey.

In law, theſe perſons are properly ſaid to be a nobleman's retinue, who belong to him in quality either of ſervants or retainers.

RETIRADE, in fortification, a kind of retrenchment made in the body of a baſtion, or other work, which is to be diſputed, inch by inch, after the defences are diſmantled. It uſually conſiſts of two faces, which make a re-entering angle. When a breach is made in a baſtion, the enemy may alſo make a retirade or new fortification behind it.

RETLINGEN, an imperial city of Germany, in the circle of Swabia and dutchy of Wirtemberg, ſituated in eaſt long. 9°, north lat. 48° 18'.

RETORT, in chemiſtry, a kind of hollow ſpherical veſſel, ABCDEF (plate CCXXXII. fig. 1. n° 1, 2, 3.) ending in a cylindrical neck, whoſe upper horizontal line, AF, is a tangent of the ſphere in its upper apex, A, whilſt the lower line of the neck, DE, is a diameter of the ſame ſphere, parallel to that tangent, whence ſuch a retort eaſily determines the riſing volatile particles into the

the cylindrical neck of the receiver, after being ſomewhat confined and beat back by the arched part of the veſſel. This kind of retort is adapted to the ſeparation of very fixed parts from thoſe that are quite fixed, as we ſee in the diſtillation of oil of vitriol, ſpirit of nitre, ſpirit of ſalt, *&c.* The glaſs-men commonly bend the neck of the retort downwards, and draw it into a conical figure, open at the ends, in order that the vapours riſing in the wideſt part of the neck may thus ſpontaneouſly fall downwards, condenſe, and diſtil into the receiver, which ſhews us the reaſon of the common form of the retort.

But in low diſtillations, where the ſtrongeſt fire is for a long time required to raiſe ponderous particles, Boerhaave recommends the uſe of a cylindrical veſſel, ABCD, n° 4. placed horizontally, with its upper horizontal part opening into an horizontal neck, by means whereof the diſtillation of phoſphorus, and other bodies which riſe with difficulty, is commodiouſly performed: and when he prepared large quantities of oil of vitriol, or other foſſile acids, inſtead of retorts he uſed cylindrical earthen bodies, or long necks, as ABCDEFGH, (*ibid.* n° 5.) with wide cylindrical mouths, which he found to be an advantageous way of diſtilling the mineral acids; for by inſerting hollow cylinders, as IKLM, (n° 6.) into the mouths of theſe veſſels, and applying large glaſs receivers, as ONPQ, n° 7. horizontally to the other ends, and luting the junctures, he thus diſtilled with ſafety.

RETRACTION, *retractio*, the act of drawing back, or unſaying what a perſon had ſaid before.

Among anatomiſts, retraction frequently ſignifies the contraction or ſhortening of any part.

RETRACTS, among horſemen, pricks in a horſe's feet, ariſing from the fault of the farrier in driving nails that are weak, or in driving them ill pointed, or otherwiſe amiſs. Theſe, unleſs timely prevented, feſter and prove very dangerous. When the farrier, in ſhoeing, perceives the horſe to ſhrink at every blow on the nail, it is the ſign of a retract, and the nail is to be pulled out again, which is done without any harm. When the horſe halts immediately after he is ſhod, it is concluded ſome of the nails preſs the veins, or touch him in the quick. To find where the grievance lies, they knock the nails round with a hammer, till the horſe, ſhrinking upon hitting a particular nail, diſcovers the place. Some farriers give this as a rule, that, throwing water on the hoof, the place where he is hurt will dry ſooner than any of the reſt. The places where the horſes are moſt uſually pricked, are the heel in the fore-foot, and the toe in the hind-foot.

RETRAHENS *auriculam*, in anatomy, a muſcle of the external ear, conſiſting of a parcel of fleſhy fibres, which in ſome bodies are divided into three diſtinct muſcles ariſing from the os temporale, and fixed to the hind part of the concha. But theſe muſcles are ſo ſmall in men, that the auricle is ſeldom moveable at all. See the article EAR.

RETRAXIT, in law, is where a plaintiff comes in perſon to the court where his action is brought, and declares he will not proceed in it, in which caſe the action is barred for ever.

A retraxit differs from a nonſuit in this, that it is always where the plaintiff or demandant is perſonally in court. See the article NONSUIT.

RETREAT, in war, the retiring or moving back again of any army or part thereof.

RETREAT, or RELAY, in maſonry, a little receſs or diminution of the thickneſs of a wall, rampart, *&c.* in proportion as it is raiſed. The retreat, properly, is the diminution of a wall without-ſide, or the contraction of its upper courſes more than the foundation. Where the foundation is very long, they uſually make two or three retreats.

RETRENCHMENT literally ſignifies ſomething cut off or taken from a thing; in which ſenſe it is the ſame with ſubtraction, diminution, *&c.*

RETRENCHMENT, in the art of war, any kind of work raiſed to cover a poſt, and fortify it againſt the enemy, ſuch as faſcines loaded with earth, gabions, barrels of earths, ſand-bags, and generally all things that can cover the men and ſtop the enemy. But retrenchment is more particularly applicable to a foſs bordered with a parapet; and a poſt fortified thus is called poſt retrenched, or ſtrong poſt. Retrenchments are either general or particular: general retrenchments are new fortifications made in a place beſieged, to cover the beſiegers when the enemy become maſters of a lodgment on the fortification, that they may be in a condition of diſputing the ground inch by

inch, and of putting a ſtop to the enemy's progreſs in expectation of relief. See the article RETIRADE.

Particular retrenchments are ſuch as are made in the baſtions when the enemy are maſters of the breach. Theſe can never be made but in new full baſtions, for in empty, or hollow ones, there can only be made retirades. The particular retrenchments are made ſeveral ways, according to the time they have to cover themſelves: ſometimes they are made before hand, which are certainly the beſt. The parapets of ſuch retrenchments ought to be five or ſix feet thick, and five feet high, with a large and deep foſs, from whence ought to run out ſmall fougades and countermines. See FOUGADE.

RETRIBUTION, *retributio*, a handſome preſent, gratuity, or acknowledgment, given inſtead of a formal ſalary, or hire, to perſons employed in affairs that do not ſo immediately fall under eſtimation, nor within the ordinary commerce in money.

RETRIEVE, to recover, get again, or repair a thing loſt or damaged.

To retrieve, in falconry, ſignifies to ſpring or find partridges again which have been once ſprung before.

RETROACTIVE, in law, that which has an influence or effect on time paſt.

RETROCESSION, *retroceſſio*, the act of going backwards; more uſually called retrogreſſion, or retrogradation. See the next article.

RETROCESSION *of the equinox*. See the article PRECESSION.

RETROGRADATION, or RETROGRESSION, the act or effect of a thing moving backwards.

The retrograde motion of the planets is an apparent motion, whereby they ſeem, to an obſerver placed on the earth, to move backwards, or contrary to the ſigns. See PLANET, ORBIT, *&c.*

As to the retrograde motion of the ſun, when in the torrid zone, and has his declination AM (plate CCXXXII. fig. 3.) greater than the latitude of the place AZ, but either northern or ſouthern as that is, the ſun will appear to go backwards, or to be retrograde both before and after noon.

For draw the vertical circle, ZGN, to be a tangent to the ſun's diurnal circle in G, and another, ZON, through the ſun riſing in O. It is evident all the intermediate vertical circles cut the ſun's diurnal circle twice; firſt, in the arch GO, and the ſecond time in the arch GI. Wherefore, as the ſun aſcends through the arch GO, it continually arrives at farther and farther verticals. But, as it continues its aſcent through the arch GI, it returns to its former verticals; and, therefore, is ſeen retrograde for ſome time before noon. The ſame, it may be ſhewn after the ſame manner, it does for ſome time after noon.

The retrograde motion of the nodes, is a motion of the line of nodes, whereby it continually ſhifts its ſituation from eaſt to weſt, contrary to the order of the ſigns; completing its retrograde circulation in the compaſs of about nineteen years, after which time either of the nodes, having receded from any point of the ecliptic, returns to the ſame again.

RETROGRESSION *of curves*, their bending or turning backwards. See the articles FLEXURE and INFLECTION.

RETROMINGENTS, in natural hiſtory, a claſs or diviſion of animals, whoſe characteriſtic it is that they ſtale, or make water backwards, both male and female.

RETURN, *returna*, or *retorna*, in law, is uſed in divers ſenſes. 1. Return of writs by ſheriffs and bailiffs is a certificate made by them to the court, of what they have done in relation to the execution of the writ directed to them. This is wrote on the back of the writ by the officer, who thus ſends the writ back to the court from whence it iſſued, in order that it may be filed. 2. Return of a commiſſion, is a certificate or anſwer ſent to the court from whence the commiſſion iſſues, concerning what has been done by the commiſſioners. 3. Returns, or days in bank, are certain days in each term, appointed for the return of writs, *&c.* Thus Hillary term has four returns, *viz.* in the king's bench, on the day next after the octave, or eighth day after Hillary day: on the day next after the fifteenth day from St. Hillary: on the day after the purification, and on the next after the octave of the purification. In the common pleas, in eight days of St. Hillary: from the day of St. Hillary, in fifteen days: on the day after the purification: in eight days of the purification. Eaſter term has five returns, *viz.* in the king's bench, on the day next after the fifteenth day from Eaſter: on the day next after three weeks from Eaſter: on the day next after one month from Eaſter: on the day next after five weeks from Eaſter:

Fig. 1. RETORTS

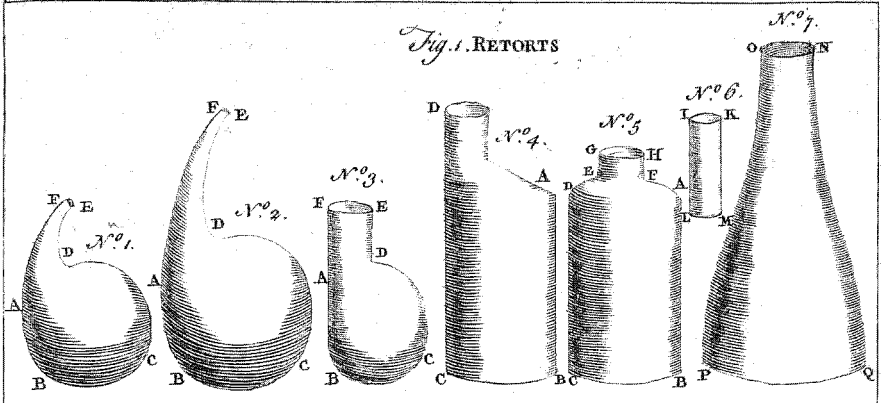

Fig. 2. The RHINOCEROS.

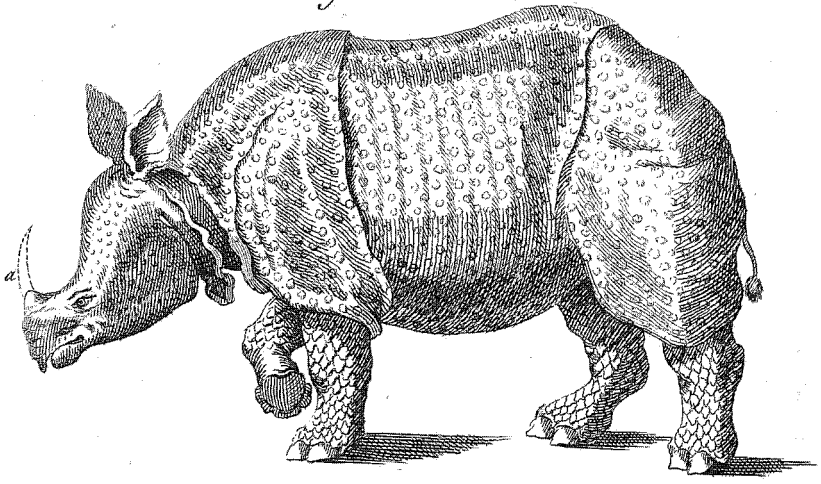

Fig. 3. RETROGRADATION

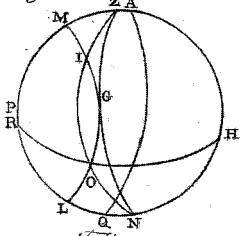

Fig. 4. RHOMBUS

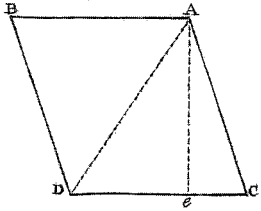

Fig. 5. RHOMBOIDES.

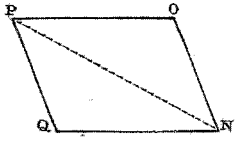

Fig. 7. RHUMB.

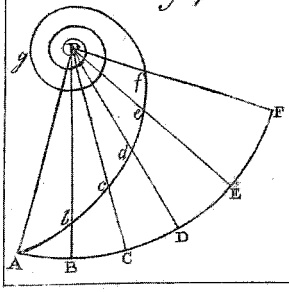

Fig. 8. RIBBAN.

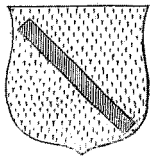

Fig. 6. The RHINOCEROS-BIRD

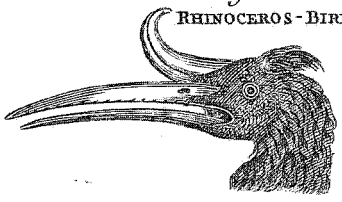

J. Jefferys sculp

Eaſter: and on the day next after the day following aſcenſion-day. In the common pleas, in fifteen days from the feaſt of Eaſter: in three weeks from the feaſt of Eaſter: in one month from Eaſter day: in five weeks from Eaſter day: on the day after the aſcenſion-day. Trinity term has four returns, *viz.* on the day following the ſecond day after Trinity: on the day following the eighth day after Trinity: on the day next after the fifteenth day from Trinity on the day next after three weeks from Trinity. In the common pleas, on the day after Trinity: in eight days of Trinity: in fifteen days from Trinity: in three weeks from Trinity. Michaelmas term has ſix returns, *viz.* on the day next after three weeks from St. Michael: on the day next after one month of St. Michael: on the day following the ſecond day after All-ſouls: on the day next after the ſecond day after St. Martin: on the day following the octave of St. Martin: on the day next after fifteen days of St. Martin. In the common pleas, in three weeks from St. Michael: in one month from St. Michael: on the day after All-ſouls: on the day after St. Martin: on the octave of St. Martin: in fifteen days from St. Martin. It is to be obſerved, that, as in the king's bench, all returns are to be made on ſome particular day of the week in each term, care muſt be taken not to make the writs out of that court returnable on a non-judicial day; ſuch as Sunday, and All-ſaints, in Michaelmas term, the purification in Hillary, the aſcenſion in Eaſter, and Midſummer-day, except it ſhould fall on the firſt day of Trinity term. See the article TERM.

RETURN, in building, is a ſide or part that falls away from the foreſide of any ſtrait work.

RETURNS *of a trench*, in fortification, are the turnings and windings which form the lines of a trench.

RETURNS *of a mine*, in fortification, are the windings of the gallery. See the articles GALLERY and MINE.

RETURNO HABENDO or RETURNUM AVERIORUM, is a writ which lies for a perſon who has avowed a diſtreſs by him made, and proved the ſame to be lawfully taken, for returning to him the cattle diſtrained which were before replevied by the party diſtrained.

The ſame writ is alſo granted when the action is removed by recordari or accedas ad curiam, into the court of common pleas; and he whoſe cattle were diſtrained, makes default and does not proſecute his action.

RETURNUM IRREPLEGIABILE, a writ for the final return of cattle to the owner, when found to be unjuſtly diſtrained.

REVE, REEVE, or GREVE, the bailiff of a franchiſe, or manor, thus called, eſpecially in the weſt of England. Hence ſhire-reve, ſheriff, port-greve, *&c.* See the article GREVE.

REVEILLE, a beat of drum about break of day, to give notice that it is time for the ſoldiers to ariſe, and that the centries are to forbear challenging.

REVEL, a port-town of Livonia, ſituated at the ſouth entrance of the gulph of Finland: eaſt long. 24°, north lat. 59°.

REVELATION, the act of revealing, or making a thing public that was before unknown: it is alſo uſed for the diſcoveries made by God to his prophets, and by them to the world; and more particularly for the books of the Old and New Teſtament. See BIBLE, INSPIRATION, FAITH, PROPHECY, *&c.*

The principal teſts of the truth of any revelation are, its being worthy of God, and conſiſtent with his known attributes, its being agreeable to the clear dictates of unprejudiced reaſon, and its having a tendency to refine, purify, and exalt the mind of man to an imitation of the Deity in his moral perfections.

Mr. Locke, in laying down the diſtinct provinces of reaſon and faith, obſerves, 1. That the ſame truths may be diſcovered by revelation, which are diſcoverable to us by reaſon. 2. That no revelation can be admitted againſt the clear evidence of reaſon. 3. That there are many things of which we have but imperfect notions, or none at all; and others, of whoſe paſt, preſent, or future exiſtence, by the natural uſe of our faculties we cannot have the leaſt knowledge: and theſe, being beyond the diſcovery of our faculties, and above reaſon, when revealed become the proper object of our faith. He then adds, that our reaſon is not injured or diſturbed, but aſſiſted and improved by new diſcoveries of truth coming from the fountain of knowledge. Whatever God has revealed is certainly true: but whether it be a divine revelation or no, reaſon muſt judge, which can never permit the mind to reject a greater evidence to embrace what is leſs evident. There can be no evidence that any traditional revelation is of divine original,

in the words we receive it, and the ſenſe we underſtand it, ſo clear and ſo certain, as that of the principles of reaſon: and, therefore, nothing that is contrary to the clear and ſelf-evident dictates of reaſon, has a right to be urged or aſſented to as a matter of faith, wherein reaſon has nothing to do. Whatſoever is divine revelation ought to over-rule all our opinions, prejudices, and intereſts, and has a right to be received with full aſſent: and ſuch a ſubmiſſion as this, of our reaſon to faith, takes not away the land-marks of knowledge.

REVELATION *of St. John*, the ſame with the apocalypſe. See APOCALYPSE.

REVELS, entertainments of dancing, maſking, acting comedies, farces, *&c.* antiently very frequent in the inns of court, and in noblemens houſes, but now much diſuſed. The officer who has the direction of the revels at court, is called the maſter of the revels.

REVENUE, the annual income a perſon receives from the rent of his lands, houſes, intereſt of money in the ſtocks, *&c.*

REVENUE, in hunting, a fleſhy lump formed chiefly of a cluſter of whitiſh worms on the heads of deer, ſuppoſed to occaſion their caſting their horns by gnawing them at the roots.

REVENUE is alſo uſed for a new tail of a partridge, growing after the lop of a former; this is meaſured by fingers; and thus they ſay a partridge of two, three, or four fingers revenue.

REVERBERATION, *reverberatio*, in phyſics, the act of a body repelling or reflecting another after its impinging thereon. See REPULSION.

REVERBERATION, in chemiſtry, denotes a kind of circulation of the flame by means of a reverberatory, or the return of the flame from the top of the furnace back to the bottom, chiefly uſed in calcination. Reverberation is of two kinds: the firſt with a cloſe fire, that is, a reverberatory furnace, where the flame has no vent atop, being covered with a dome or capital, which repells its action back on the matter or the veſſel that contains it, with increaſed vehemence. After this manner is refining, the diſtillation of acids, ſpirits, *&c.* performed. Reverberation with an open fire is that performed in a furnace or reverberatory, whoſe regiſters are all open, uſed in calcination, *&c.* See the next article.

REVERBERATORY, or REVERBERATING FURNACE, a chemical furnace built cloſe all around, and covered at the top with a capital of brick or tiles, ſo as not to give any vent to the heat or flame, but to determine it to reverberate or turn back from the brick-work with new force upon the matter placed at bottom. When the fire has no vent or paſſage atop, it is a whole reverberatory. When the middle of the capital is open, and only the ſides cloſe, ſo that there is only a half circulation of the flame, it is called an half reverberatory. The reverberatory furnace is chiefly uſed in the fuſion and calcination of metals and minerals, and on other occaſions where the moſt intenſe heat is required, as in aſſaying, *&c.* Whence it is alſo called the melting furnace, and aſſaying furnace. See the articles FURNACE, ASSAYING OVEN, LABORATORY, *&c.*

REVEREND, *reverendus*, a title of reſpect given to eccleſiaſtics.

The religious abroad are called reverend fathers; and abbeſſes, prioreſſes, *&c.* reverend mothers. With us, biſhops are right reverend, and archbiſhops, moſt reverend. In France, their biſhops, archbiſhops, and abbots, are all alike moſt reverend.

REVERIE, the ſame with delirium, raving, or diſtraction. See DELIRIUM, *&c.* It is uſed alſo for any ridiculous, extravagant imagination, action, or propoſition, a chimera or viſion. But the moſt ordinary uſe of the word, among engliſh writers, is for a deep diſorderly muſing or meditation.

REVERO, a town of Italy, in the dutchy of Mantua, ſituated on the ſouth of the Po, oppoſite to Oſtiglia, fifteen miles ſouth-eaſt of Mantua.

REVERSE, in law, *&c.* To reverſe ſignifies to undo, repeal, or make void.

REVERSE *of a medal, coin*, &c. denotes the ſecond or back-ſide, in oppoſition to the head or principal figure.

REVERSE, in fencing, a back ſtroke. See the article FENCING.

REVERSED, in heraldry, a thing turned backwards, or upſide down.

REVERSION, *reverſio*, in law, is defined to be returning of lands, *&c.* into the poſſeſſion of the donor, or his heirs.

Reverſion, in the law of England, has two ſignifications; the one of which is an eſtate left, which continues during a particular eſtate in being; and the other

is the returning of the land, &c. after the particular eſtate is ended; and it is further ſaid, to be an intereſt in lands, when the poſſeſſion of it fails, or where the eſtate which was for a time parted with, returns to the grantors, or their heirs. But, according to the uſual definition of a reverſion, it is the reſidue of an eſtate left in the grantor, after a particular eſtate granted away ceaſes, continuing in the grantor of ſuch an eſtate. The difference between a remainder and a reverſion, conſiſts in this, that the remainder may belong to any man except the grantor; whereas the reverſion returns to him who conveyed the lands, &c. See the article REMAINDER.

In order to render the doctrine of reverſions eaſy, we ſhall give the following table; which ſhew the preſent value of one pound, to be received at the end of any number of years not exceeding forty; diſcounting at the rate of 5, 4, and 3 per cent. compound intereſt. See the article INTEREST.

Years.	Value at 5 per Cent.	Value at 4 per Cent.	Value at 3 per Cent.
1	.9524	.9615	.9709
2	.9070	.9245	.9426
3	.8638	.8898	.9151
4	.8227	.8548	.8885
5	.7835	.8219	.8626
6	.7462	.7903	.8375
7	.7107	.7599	.8131
8	.6768	.7307	.7894
9	.6446	.7026	.7664
10	.6139	.6756	.7441
11	.5847	.6496	.7224
12	.5568	.6246	.7014
13	.5303	.6006	.6809
14	.5051	.5775	.6611
15	.4810	.5553	.6419
16	.4581	.5339	.6232
17	.4363	.5134	.6050
18	.4155	.4936	.5874
19	.3957	.4746	.5703
20	.3769	.4564	.5537
21	.3589	.4388	.5375
22	.3418	.4219	.5219
23	.3255	.4057	.5067
24	.3100	.3901	.4919
25	.2953	.3757	.4776
26	.2812	.3607	.4637
27	.2678	.3468	.4502
28	.2551	.3335	.4371
29	.2429	.3206	.4243
30	.2314	.3083	.4120
31	.2204	.2965	.4000
32	.2099	.2851	.3883
53	.1999	.2741	.3770
34	.1903	.2636	.3660
35	.1813	.2534	.3554
36	.1726	.2437	.3450
37	.1644	.2343	.3350
38	.1566	.2253	.3252
39	.1491	.2166	.3158
40	.1420	.2083	.3066

The uſe of the preceding table.—To find the preſent value of any ſum to be received at the end of a given term of years, diſcounting at the rate of 3, 4, or 5 per cent. compound intereſt. Find by the above table the preſent value of 1l. to be received at the end of the given term, which multiply by the number of pounds propoſed (cutting off four fingers from the product on account of the decimals) then the reſult will be the value ſought: For example, the preſent value of 10,000l. to be received ten years hence, and the rate of intereſt 5 per cent. is equal to .6139 × 10000 = 6139.0000l. or 6139l. Again, the preſent value of 10,000l. due in ten years, the rate of intereſt being 3 per cent. is .7441 × 10,000 = 7441.

REVERSION *of ſeries*, in algebra, a kind of reverſed operation of an infinite ſeries. See the article SERIES.

REVIEW, in chancery, is uſed for a bill, where a cauſe has been heard, and a decree thereon ſigned; but ſome error in law appearing upon the decree, or new matter being diſcovered after it was made, this bill is given for a freſh examination into the merits of the cauſe.

A bill of review muſt be exhibited by leave of the court, and is generally obtained upon oath made of the diſcovery of ſuch new matter. The ſum of 20l. muſt likewiſe be paid into court on the bringing of this bill, by way of ſecurity for coſts and delay, in caſe the matter ſhould be found againſt the party.

If one part of a decree in chancery be repugnant to another, the decree may be reverſed by a bill of review.

REVIEW, in war, is the appearance of an army, or part of an army, in order of battle, and their being viewed by the general, that he may know the condition of the troops, ſee that they are complete,

plete, and be a witneſs of the expertneſs with which they perform their evolutions and other exerciſes.

REVISE, among printers, a ſecond or third proof of a ſheet to be printed, taken off in order to be compared with the laſt proof, to ſee whether all the miſtakes marked in it are corrected. See the article PRINTING.

REVIVIFICATION, in chemiſtry, the ſame with reſuſcitation. See the article RESUSCITATION.

Bill of REVIVOR, in chancery, is a bill for reviving a cauſe, where either of the parties dies after the bill and anſwer, and before the cauſe is heard, or if heard, before the decree is inrolled: in which caſe this bill muſt be brought, praying that the former proceeding may ſtand revived, and be put upon the ſame footing as at the time of the abatement.

REVOCATION, in law, ſignifies the recalling, or annulling and making void ſome power, grant, deed, *&c.* made before.

REVOLUTION, in politics, ſignifies a grand change or turn in government. In which ſenſe, the revolution is uſed by way of eminence, for the great turn of affairs in England, in the year 1688, when king James II. abdicating the throne, the prince and princeſs of Orange were declared king and queen of England, *&c.*

In geometry the revolution of any figure, is its motion quite round a fixed line, as an axis.

The revolution of a planet, or comet, round the ſun, is nothing but its courſe from any point of its orbit till its return to the ſame. See ORBIT, PERIOD, PLANET and COMET.

REVULSION, in medicine, turning a flux of humours from one part to another, by bleeding, cupping, friction, ſinapiſms, bliſters, fomentations, bathings, iſſues, ſetons, ſtrong purging of the bowels, *&c.* Dr. Van Sweiten, in his Commentaries upon the Aphoriſms of Boerhaave, obſerves, that the uſe of revulſions in diſeaſes, is confirmed by daily experience as well as by reaſon; for ſo ſoon as the reſiſtance to the blood's motion is either diminiſhed or totally removed in any part of the body, it immediately flows into that part with a greater velocity. Thus when all the veſſels and viſcera of the abdomen are ſuddenly freed from a conſiderable preſſure by the birth of an infant, all the blood is frequently derived into thoſe veſſels ſo forcibly, that unleſs the fluid veſſels and viſcera are compreſſed by ſwathing with a roller, the child-bed woman may ſuddenly periſh in a fatal ſwoon, for want of the blood's due preſſure in the veſſels of the brain and cerebellum: the ſame thing alſo happens if the abdomen is not ſwathed, when all the water is diſcharged at once by paracenteſis, in the dropſy. If again we conſider, that the blood propelled by the heart is ſent partly up to the head, and ſuperior parts of the trunk, and partly downward to the viſcera and lower extremities, it will be from hence evident, that, by diminiſhing the reſiſtance of the lower veſſels, or by evacuating them, the quantity and impulſe of the blood will then be derived more towards the inferior parts, and drawn from thoſe that are ſuperior. It is therefore poſſible to make a revulſion of the arterial blood from an inflamed part to any other, eſpecially when the part towards which the revulſion is made, receives its blood from the ſame common trunks or larger arteries. The phyſicians foment the external parts of the head in inflammatory diſorders thereof, that the impulſe of the blood, being increaſed in the branches of the external carotide, may preſs with a leſs force upon the parts contained in the head. And Galen has long ago obſerved, that pains are eaſed almoſt as with a charm, by making a revulſion with cupping-glaſſes.

The different kinds of revulſion are phlebotomy, cupping, friction, veſicatories, iſſues, ſetons, warm bathing, fomentations, *&c.* See the articles PHLEBOTOMY, CUPPING, FRICTION, VESICATORY, *&c.*

REYGATE, or RYGATE, a borough of Surry, twenty-two miles ſouth-weſt of London.

It ſends two members to parliament.

REZANSKOI, the capital of the province of Rezan, in Ruſſia: eaſt long. 41°, north lat. 55°.

RHABDOIDES, in anatomy, the ſame with the ſagittal ſuture of the ſkull. See the articles SKULL and SUTURE.

RHABDOLOGY, in arithmetic, the doctrine of Neper's rods. See NEPER.

RHABDOMANCY, ῥαβδομαντεια, a ſpecies of divination performed by means of rods. See the article DIVINATION.

RHACHITIS, in medicine, the rickets. See the article RICKETS.

RHAGADES, in medicine, denotes chaps or clefts in any part of the body; ariſing either

either from an aridity of the parts, or acrimony of the humours; in both which caſes, cooling and emollient applications are proper.

RHAGADIOLIDES and RHAGADIOLUS, in botany, the ſame with lapſana. See the article LAPSANA.

RHAGOIDES, in anatomy, the ſecond coat or tunic of the eye, more uſually called uvea. See the article UVEA.

RHALADERGWY, a market-town in Radnorſhire, in Wales, ſituated fifteen miles weſt of Radnor.

RHAMNOIDES, in botany, Tournefort's name for the hippophae. See the article HIPPOPHAE.

RHAMNUS, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle, unperforated, infundibuliform petal, rude on the outſide, and coloured within: the tube is of a turbinated cylindric figure; the limb patent, divided and acute at the baſe of every ſegment: the petal has little ſquammula, which is connivent inwardly; the fruit is a roundiſh naked berry, divided within into fewer cells than there are ſegments of the corolla; the ſeeds are ſingle, roundiſh, gibbous, and compreſſed on one ſide.

This genus comprehends the buckthorn, the black alder, Chriſt's thorn, the alaternus, and the jujube-tree. See the articles JUJUBE and ALATERNUS.

Buckthorn-berries bruiſed on white paper, give it a green tincture; they are in conſiderable eſteem as a cathartic, and are celebrated in dropſies, rheumatiſms, and even in the gout; but they generally occaſion gripes, ſickneſs, dry the mouth and throat, and leave a thirſt of long duration. the doſe is about twenty of the freſh berries in ſubſtance, and twice or thrice this number in decoction; an ounce of the expreſſed juice, or a dram of the berries dried. A ſyrup prepared of the juice is kept in the ſhops.

RHAPHONTICOIDES and RHAPHONTICUM, the ſame with the centauria. See the article CENTAURIA.

RHAPHONTICUM is alſo the name for the root of the rheum. See RHEUM.

RHAPSODI, ῥαψῳδοι, *rhapſodiſts*, in antiquity, perſons who made a buſineſs of ſinging pieces of Homer's poems. Cuper informs us, that the rhapſodi were cloathed in red when they ſung the Iliad, and in blue when they ſung the Odyſſee. They performed on the theatres, and ſometimes ſtrove for prizes in conteſts of poetry, ſinging, &c. After the two antagoniſts had finiſhed their parts, the two pieces or papers they were written in were joined together again: whence the name, *viz.* from ῥαπτω, *ſuo*, and ωδη, *canticum*: but there ſeems to have been other rhapſodi of more antiquity than theſe people, who compoſed heroic poems or ſongs in praiſe of heroes and great men, and ſung their own compoſitions from town to town for a livelihood, of which profeſſion Homer himſelf is ſaid to be.

RHAPSODOMANCY, an antient kind of divination performed by pitching on a paſſage of a poet at hazard, and reckoning on it as a prediction of what was to come to paſs. There were various ways of practiſing this rhapſodomancy. Sometimes they wrote ſeveral papers or ſentences of a poet on ſo many pieces of wood, paper, or the like, ſhook them together in an urn, and drew out one which was accounted the lot: ſometimes they caſt dice on a table whereon verſes were written, and that whereon the die lodged, contained the prediction. A third manner was by opening a book, and pitching on ſome verſe at firſt ſight. This method they particularly called the ſortes Præneſtinæ; and afterwards, according to the poet made uſe of, ſortes Homericæ, ſortes Virgilianæ, &c. See the article SORTES.

RHAPSODY, ῥαψῳδια, in antiquity, a diſcourſe in verſe ſung or rehearſed by a rhapſodiſt. Others will have rhapſody to ſignify a collection of verſes, eſpecially thoſe of Homer, which having been a long time diſperſed in pieces and fragments, were at length, by Piſiſtratus's order, digeſted into books called rhapſodies, from ῥαπτω, *ſuo*, and ωδη, *canticum*. Hence, among moderns, rhapſody is alſo uſed for an aſſemblage of paſſages, thoughts, and authorities raked together from divers authors, to compoſe ſome new piece.

RHE, or REE, a little iſland in the bay of Biſcay, near the coaſt of Aunis in France: weſt long. 1° 30′, north lat. 46° 14′.

RHEEDEA, in botany, a genus of plants the characters whereof are not perfectly aſcertained: there is no calyx; the corolla conſiſts of four patent, concave, vertically ovated petals; the filaments are numerous, the germen globoſe; the fruit is oval, ſmall, ſucculent, and unilocular;

locular; the ſeeds are three, of an ovato-oblong figure, long and odly furrowed.

RHEIMS, or REIMS, a city of France, capital of the province of Champain, one of the moſt elegant cities in France, ſituated ſeventy-five miles north-eaſt of Paris: eaſt long. 4°, north lat. 49° 20'.

RHETORIANS, a ſect of heretics in Egypt, ſo denominated from Rhetorius their leader. The diſtinguiſhing doctrine of this hereſiarch, as repreſented by Philaſtrius, was, that he approved of all the hereſies before him, and taught that they were all in the right.

RHETORIC, *rhetorica*, the art of ſpeaking copiouſly on any ſubject, with all the advantage of beauty and force.

Lord Bacon defines rhetoric very philoſophically, to be the art of applying and addreſſing the dictates of reaſon to the fancy, and of recommending them there ſo as to affect the will and deſires. The end of rhetoric, the ſame author obſerves, is to fill the imagination with ideas and images which may aſſiſt nature without oppreſſing it. Voſſius defines rhetoric, the faculty of diſcovering what every ſubject affords of uſe for perſuaſion. Hence, as every author muſt invent arguments to make his ſubject prevail, diſpoſe thoſe arguments, thus found out, in their proper places, and give them the embelliſhments of language proper to the ſubject; and if this diſcourſe be intended to be delivered in public, utter them with that decency and force which may ſtrike the hearer; rhetoric becomes divided into four parts, invention, diſpoſition, elocution, and pronunciation. See INVENTION, DISPOSITION, ELOCUTION, and PRONUNCIATION.

Rhetoric and oratory differ from each other as the theory from the practice; the rhetorician being he who deſcribes the rules of eloquence, and the orator he who uſes them to advantage. Ordinarily, however, the two are uſed indifferently for each other. See the article ORATORY.

For the characters in rhetoric, ſee the article CHARACTER.

RHETORICAL NUMBERS. See the article NUMBER.

RHEUM, ῥεῦμα, a thin ſerous humour, occaſionally ooſing out of the glands about the mouth and throat. See the article HUMOUR.

Rheum is alſo uſed for a catarrh. See the article CATARRH.

For the rheum in the eyes, ſee the article EPIPHORA.

RHEUM, the RHAPHONTIC PLANT, in botany, a genus of the *enneandria-trigynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, which is narrow at the baſe and impervious: the limb is divided into ſix obtuſe ſegments, alternately ſmaller: there is no pericarpium: the ſeed is ſingle, large, triquetrous, acute, and ſurrounded with membranaceous rims.

The root of this plant, which appears evidently to have been the rhubarb of the antients, is by many confounded with the modern rhubarb, though conſiderably different both in appearance and quality. The rhaphontic root is of a duſky colour on the ſurface, of a looſe ſpongy texture, conſiderably more aſtringent, but leſs purgative than the rhubarb; in this laſt intention two or three drams are required for a doſe. It is an ingredient in the venice-treacle, and in ſome of the colder compoſitions of the ſhops, but in theſe rhubarb is generally uſed in its place.

Rhaphontic-root, the pound, pays, on importation, 2 s. and 7 d. and, on exportation, draws back 2 s. $3\frac{20}{100}$ d.

RHEUMATISM, in medicine, a diſtemper that happens moſt commonly in ſpring or autumn, when there is a remarkable change of air from hot to cold, and from cold to hot, or when the wind ſuddenly ſhifts to any oppoſite point. It begins, according to Sydenham, with a ſhivering and other ſymptoms of a fever, and in a day or two's time, or ſometimes ſooner, a vehement pain ſeizes one or more of the limbs, raging ſometimes in one place and ſometimes in another, eſpecially in the arms, wriſts, ſhoulders, and knees: very often there is a redneſs and ſwelling, and the fever gradually goes off while the pain remains. This diſtemper often runs out into a great length, continuing ſometimes for ſome months or years, not perpetually, with the ſame violence, but coming and going, and from time to time renewing its paroxyſms.

It chiefly attacks perſons in the flower of their age, after violent exerciſe, or a great heat of the body from any other cauſe, and then being too ſuddenly cooled. Its proximate cauſe Boerhaave takes to be an inflammation of the lymphatic arteries of the membranes near the liga-

ments

ments of the joints, but not ſo violent as to bring on a ſuppuration. This diſeaſe is nearly a-kin to the gout and ſcurvy, and the blood is like that of thoſe afflicted with the pleuriſy. The pain is exaſperated upon the leaſt motion: it ſometimes attacks the loins and coxendix, and ſometimes the brain, lungs, and viſcera: when it ſeizes the loins it is then called lumbago: in this caſe, Sydenham obſerves that there is a moſt violent pain in the ſmall of the back, which ſometimes extends to the os ſacrum, and is like a fit of the gravel, only the patient does not vomit. If this diſeaſe is unſkilfully treated, it may continue ſeveral months or years, but not always with the ſame violence, but by fits. If it continues and encreaſes, it may cauſe a ſtiff joint, which will ſcarce yield to any remedy.

Sydenham directs to take away ten ounces of blood on the ſide affected; this muſt be repeated three or four times, or oftener, once every other or every third day, according as the ſtrength of the patient will bear. The diet muſt be very thin, and an emulſion of the four cold ſeeds may be given; as alſo a pultice of white-bread and milk, tinged with a little ſaffron, may be laid to the part affected: a clyſter of milk and ſugar may be injected on thoſe days the bleeding is omitted. If the patient cannot bear frequent bleeding, after the ſecond or third time give the common purging potion every other day, and an ounce of diacodium at night, till he recovers.

In an incipient rheumatiſm of the ſhoulders, Hoffman ſays that nothing is better than a bliſter laid between the ſcapulæ; but if it happens to the plethoric, cupping, with ſcarification in the lower parts, repeated every month, does ſignal ſervice. The ſame phyſician thinks it may be proper to chew rhubarb, from two ſcruples to a dram, with raiſins or currants, two or three times a week.

The ſpirit of hartſhorn and the balſam of guaiacum, given in the quantity of twenty or thirty drops, three or four times a day, Dr. Shaw ſays, is of great ſervice: but he thinks nothing better than a decoction of the ſudorific woods, to the quantity of a quart a day, for a month or ſix weeks together. This laſt, when aſſiſted with crude antimony and mercurius dulcis, Hoffman recommends in the venereal rheumatiſm, which often ariſes from the remains of a lues venerea contained in the maſs of blood. In a ſcorbutic rheumatiſm, or that ariſing from the ſcurvy, Sydenham directs the patient to take the ſcorbutic electuary and water, if he cannot bear any kind of evacuation.

He obſerves, that young perſons who live temperately may be cured by a ſimple refrigerating diet, and moderate nouriſhing, with as much certainty as by repeated bleeding: for inſtance, let the patient live four days upon whey alone; and after that white bread may be allowed for dinner, and on the laſt day of his illneſs he may be allowed it for ſupper. When the ſymptoms ceaſe he may have boiled chickens, or any thing of eaſy digeſtion, but every third day he muſt live upon whey only, till his ſtrength returns. Boerhaave's method of cure is to the ſame effect, only he adviſes warm baths and ſtrong bliſters to be laid upon the part affected, nay even cauteries themſelves: but Hoffman obſerves that great caution ſhould be uſed with regard to topics, for if the patient's conſtitution is ſanguineous they ſhould all be avoided, and the part covered carefully with the bed-cloaths; but if there is a thick, cold, ſtagnating humour in the part, and a ſenſe of cold, with a ſtricture of the pores, then frictions may be uſed with rough warm cloths, and afterwards cupping with ſcarifications. If the part becomes ſtiff and inflexible, with a numbneſs, which is called a pareſis, then take human or canine axungia, two ounces; balſam of Peru, and oil of cloves, each two drams; with which make a liniment for the part: this has been known to have a wonderful effect.

Arbuthnot ſays that cream of tartar in water-gruel, taken for ſeveral days, will abate the pains and ſwellings conſiderably by its acidity, correcting the alkaline ſalts of the blood.

Cheyne ſays, that the hot and inflammatory rheumatiſms have all the ſymptoms of the gout, and, like it, change from place to place, and by over violent evacuations may be tranſlated upon the noble organs.

RHEXIA, in botany, a genus of the *octandria-monogynia* claſs of plants, the corolla whereof conſiſts of four roundiſh patent petals inſerted into the calyx; the fruit is a roundiſh capſule, formed of four valves, containing four cells, and incloſed in the belly of the cup; the ſeeds are roundiſh and numerous.

RHEXIS, among oculiſts, denotes a rupture of the cornea of the eye. See the article EYE.

RHIME, in poetry. See RHYME.

RHINANTHUS, YELLOW-RATTLE, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, the corolla whereof is a ringent ſingle petal; the tube is almoſt cylindric, and of the length of the cup; the limb is dehiſcent, and compreſſed at the baſe; the upper lip is galeated, compreſſed, emarginated and narrow; the lower one is patulous, plane and ſemitrifid: the fruit is an orbiculated, erect, compreſſed, bilocular and bivalved capſule: the ſeeds are numerous and compreſſed.

RHINE, a great river riſing in the country of the Griſons, in Switzerland, and running north, continues its courſe till it forms the lake of Conſtance; from whence it turns weſt, and having viſited Baſil, runs north, dividing Suabia from Alſatia; from thence it runs through the Palatinate, and receiving the Neckar, the Maine and the Moſelle, continues its courſe north by Mentz, *&c.* After entering the Netherlands at Skenkinchans, it is divided into ſeveral channels, the two largeſt whereof obtain the names of the Lech and the Waal, which running through the United-provinces diſcharge themſelves into the German Sea, below Rotterdam.

RHINE *lower circle* conſiſts of the Palatinate of the Rhine and the three eccleſiaſtical electorates, *viz.* thoſe of Cologn, Mentz, and Triers.

RHINE *upper circle* conſiſted of the Landgraves of Alſatia and Heſſe, comprehending the Wetteraw: but only Heſſe can be accounted a part of Germany at preſent, France having united Alſace to that kingdom.

RHINEBURG, a town of Germany, in the circle of the lower Rhine and electorate of Cologn, ſituated fifteen miles eaſt of Gelder.

RHINEFIELD, the name of two towns of Germany, one whereof is ſituated in the circle of Suabia, on the Rhine, eight miles eaſt of Baſil; the other is the capital of the county of Rhinefield, ſituated in the circle of the upper Rhine, ſixteen miles north-weſt of Mentz.

RHINE-LAND-ROD, in fortification, *&c.* a meaſure of two fathoms, or twelve feet, uſed by the Dutch and German engineers, *&c.*

RHINOBATUS, in ichthyology, a ſpecies of the raja, with only a ſingle row of prickles in the middle of the back. See the article RAJA.

RHINOCEROS, in zoology, an order of the jumenta, having eleven fore-teeth in each jaw; there are no canine teeth; the noſe is ornamented with a ſingle or double horn, which is permanent. This, of all quadrupeds, approaches neareſt to the elephant in ſize, the body being nearly as bulky, but the legs much ſhorter. A full grown rhinoceros is fourteen feet high, and the legs are ſo ſhort with all this height, that the belly comes near the ground: the head is very large and oblong, of an irregular figure, broad at top and depreſſed towards the ſnout: the ears reſemble thoſe of a hog: the eyes are very ſmall, and ſituated at a ſmall diſtance from the extremity of the ſnout: on the upper part of the ſnout, near the extremity, ſtands the horn, growing to about two feet and a half in length, bent a little back, of a black colour, and vaſtly firm and hard: the ſkin is remarkably thick and hard, ſo that the creature could not turn its body in any direction but for the joints and folds in it: the tail is ſhort, and furniſhed with ſome long and extremely thick black hairs. See plate CCXXXII. fig. 2. which repreſents a young rhinoceros with a ſhort obtuſe horn; there being ſome ſpecies which have the horn much longer.

RHINOCEROS BIRD, a large bird about the ſize of the european raven, which it greatly reſembles: it is ſo called from a true horn, which, riſing from the root of the beak, bends upwards. See plate CCXXXII. fig. 6.

There are other two varieties of this horn brought from the eaſt-Indies, all belonging to different ſpecies of hydrocorax. See HYDROCORAX.

RHIZOPHORA, in botany, a genus of the *dodecandria-monogynia* claſs of plants, called, by Plumier, mangles: the flower is erect, being compoſed of a ſingle petal, divided into four ſegments; the ſeed is ſingle, very long, and of a clavated figure, pointed at the end.

RHODES, the capital of an iſland of that name, ſituated in the Mediterranean-ſea, in eaſt long. 28°, and between 36° and 37° north lat.

RHODIOLA, or RHODIA, in botany, a genus of the *polygamia-dioecia* claſs of plants, which produces two kinds of flowers, *viz.* hermaphrodite and female ones; both which are compoſed of four petals,

petals, only much longer in the hermaphrodite than in the female flowers: the fruit conſiſts of four corniculated capſules, containing numerous roundiſh ſeeds.

RHODIUM LIGNUM, RHODIAN WOOD, in botany, the ſame with aſpalathum. See the article ASPALATH.

Jamaica affords a wood, called, by the people there, roſe-wood; which, though not the rhodium of the ſhops, has nevertheleſs much of its ſmell: it is deſcribed by Sir Hans Sloane to be a tree growing to twenty or more feet in height, and thick enough to afford the largeſt ſegments we ever meet with of it; and poſſibly an adulteration of the true rhodium with this wood may be the true cauſe why the rhodium is not allowed to be the root, but a ſpecies of cytiſus, as Hoffman affirms.

The flowers of the jamaica roſe-wood are ſmall and white, conſiſting of three petals, and ſtanding in cluſters: the fruit is a berry of the ſize of a pepper-corn; and the leaves of the tree are pinnated.

RHODON, in pharmacy, an appellation given to ſeveral compoſitions, on account of roſes being the chief ingredient in them; as the diarrhodon, rhodoſaccharum, *&c.* See DIARRHODON and ROSE.

RHOMBOIDES, in geometry, a quadrilateral figure whoſe oppoſite ſides and angles are equal, but is neither equilateral nor equiangular; as the figure N O P Q, plate CCXXXII. fig. 5.

RHOMBOIDES, in anatomy, a thin, broad, and obliquely ſquare fleſhy muſcle, ſituated between the baſis of the ſcapula and the ſpina dorſi; ſo called from its figure. Its general uſe is to draw, backward and upward, the ſubſpinal portion of the baſis ſcapulæ.

RHOMBUS, in geometry, an oblique-angled parallelogram, or a quadrilateral figure whoſe ſides are equal and parallel, but the angles unequal, two of the oppoſite ones being obtuſe, and the other two acute, as A B C D, plate CCXXXII. fig. 4.

To find the area of a rhombus, upon C D, aſſumed as a baſe, let fall the perpendicular A *e*, which is the altitude of the figure; then multiply the baſe by the altitude, the product will be the area.

RHOMBUS, the PEARL-FISH, in ichthyology, a ſpecies of pleuronectes, with the eyes on the left ſide: it is a moderately large ſpecies, but is not ſo thick and fleſhy as the turbot, nor is its fleſh ſo well taſted. See the articles PLEURONECTES and TURBOT.

RHONE, one of the largeſt rivers in France, which riſing in one of the Alps of Switzerland, paſſes through the lake of Geneva, viſits that city, and then runs ſouth-weſt to Lyons, where joining the river Soane, it continues its courſe due ſouth, paſſing by Orange, Avignon, and Arles, and falls into the Mediterranean a little weſtward of Marſeilles.

RHOPALIC VERSES, in antient poetry, a kind of verſes, which beginning with monoſyllables, were continued in words growing gradually longer and longer to the laſt.

RHOPOGRAPHI, in antiquity, painters who confined themſelves to low ſubjects, as animals, plants, landſkips, *&c.* See the article PAINTING.

RHUBARB, *rhabarbarum*, in pharmacy, a thick root, of an oblong figure, large at the head, and tapering pretty ſuddenly as it extends in length. It is ſometimes ſingle, but more uſually divided into two or three parts at the lower end. We frequently meet with it in pieces of four, five, or ſix inches long, and three or four in diameter at the top; it is of a tolerably ſmooth and even ſurface, and externally of a faint yellow colour, with a large admixture of brown; it is moderately heavy but not hard; it cuts through very freely and eaſily with a knife, eſpecially if the blade of it has been rendered a little unctuous, firſt by drawing it over an almond or any other fatty ſubſtance. When freſh cut it is found to be of a marbled or variegated appearance; its colours are a pale but bright yellow, and a faint reddiſh. The yellow is the ground-colour, and the red is diſpoſed in ſhort irregular veins, much in the manner of the darker colour in the common nutmeg. It is of a ſomewhat lax and ſpongy texture; it has an agreeable and aromatic ſmell, and a bitteriſh, aſtringent, and ſubacid taſte, upon the whole not diſagreeable: it tinges the ſpittle to a fine bright yellow on being held ſome time in the mouth.

Rhubarb is to be choſen freſh, tolerably hard and moderately heavy, and ſuch as does not duſt the fingers in handling; ſuch as infuſed a few minutes in water gives it a fine yellow, and, when bruiſed in a mortar, has a reddiſh colour with the yellow. Rhubarb is not ſo often adulterated as damaged; care is to be taken

that it be not wet, nor rotten; much of it is ſubject, after ſteeping too long, to be worm-eaten and full of holes on the ſurface. There are certain traders in this drug, who have a way of filling up theſe holes with the powder of ſome of the worſt and moſt decayed pieces; but this is eaſily diſcovered, and ſuch rhubarb ought always to be rejected.

The antients were not acquainted with the true rhubarb: their rhubarb appears to be the rheum, or raphontic plant which, tho' Linnæus makes it the ſame with the rhubarb, is yet very different in quality if not in characters. See RHEUM.

The rhubarb is brought to us from Ruſſia, and from the eaſt-Indies. It is produced in great plenty on the confines of China and Tartary, and in many parts of Tartary itſelf: the mountains of Tibet abound with it, and a very conſiderable part of what is ſent into Europe grows there.

It was long before the rhubarb was known in Europe, but of late it has been ſent from Ruſſia to the gardens of Paris and Chelſea, in both which it thrives extremely well, and ſtands the ſeveral colds unhurt. Other authors make it the lapathum bardanæ folio undulato glabro: and as there are ſufficient proofs that we now have the true rhubarb among us, it will be eaſy to propagate a quantity of it, in order to try whether its virtues, when produced with us, will be the ſame with thoſe it poſſeſſes as brought from its native climate. See LAPATHUM.

The root of the native rhubarb plant is long, thick, and perennial; its bark, while growing, is of a browniſh red colour; but under this the ſubſtance of the root is of the true colour of dried rhubarb, only deeper, of the right nutmeg-grain, marbled with red and yellow, and has the true ſmell and taſte of rhubarb, eſpecially about the upper part of the root: it has a viſcoſity indeed in the mouth, tho' rhubarb, as we meet with it in the ſhops, has not; but this may only be the difference of the ſame root freſh and dried.

Rhubarb poſſeſſes the double virtue of a cathartic and an aſtringent; it readily evacuates particularly the bilious humors, and afterwards gently aſtringes and ſtrengthens the ſtomach and inteſtines. It is given with great ſucceſs in all obſtructions of the liver, in the jaundice, in diarrhœas, and in the fluor albus and gonorrhœas: it is alſo an excellent remedy againſt worms. It is ſometimes given as a purgative, ſometimes as only an alterant; and, which ever way it is taken, it is an excellent medicine, agreeing with almoſt all ages and conſtitutions. The only caſes in which its uſe is to be avoided, are thoſe in which the blood and viſcera are too hot. Fallopius ſays it is never to be given to people who have diſorders of the kidnies or bladder, as it is apt to occaſion an extraordinary heat in thoſe parts; and Simon Pauli tells us of vertigoes brought on by a too free and continued uſe of it.

Rhubarb is given in powder in infuſion, and in its own crude ſolid ſtate; the chewing it perhaps being the beſt way of giving it of all others, when it is intended to ſtrengthen the ſtomach and aſſiſt digeſtion; the quantity of twenty-five grains, or thereabout, ſhould be chewed daily on thoſe occaſions, an hour before eating; this is alſo by much the beſt way of taking it againſt obſtructions of the viſcera. Its doſe in powder is from half a ſcruple to two ſcruples; in infuſion, about a drachm of it will purge gently; but the doſe may be increaſed to two drachms. It is obſervable, that neither the infuſion, nor the decoction, nor even the extract of rhubarb, purge near ſo briſkly as the root itſelf in powder.

The preparations of rhubarb in uſe in the ſhops are, 1. The tincture in ſpirit. 2. The tincture in wine: and, 3. The extract; though the laſt is but little uſed.

Monk's RHUBARB, *rhaponticum*. See the article RHAPONTICUM.

White RHUBARB, a name given to mechoacan. See the article MECHOACAN.

RHUMB, RUMB, or RUM, in navigation, a vertical circle of any given place, or the interſection of ſuch a circle with the horizon; in which laſt ſenſe rhumb is the ſame with a point of the compaſs. See the article COMPASS.

RHUMB-LINE, *loxodromia*, is alſo uſed for the line which a ſhip deſcribes when ſailing in the ſame collateral point of the compaſs, or oblique to the meridians. Now that ſuch rhumb-lines are ſpirals, which continually approach to the pole but never fall into it, as *A b c d e f g*, plate CCXXXII. fig. 7, is evident for the following reaſons. In any place on the ſurface of the globe, the rhumb running north and ſouth, coincides with the meridian of that place; the eaſt and weſt

rhumbs

rhumbs are perpendicular to the meridian, and the other rhumbs are oblique to it: but this obliquity is the ſame under every meridian; and therefore all the rhumbs, except the north and ſouth, cut the meridians at equal angles. When right lines are parallel to each other, a right line will cut them at equal angles; but not ſo when they are inclined to one another: therefore ſeveral inclining lines cannot be cut at equal angles, but by a curve line bending towards the place where thoſe lines would meet. Now the meridians being inclined to each other, and meeting in the poles, the oblique rhumbs muſt be curve-lines continually approaching the poles. But, in every latitude, an oblique rhumb runs between the preſent parallel and the pole; and a line cannot cut ſeveral other lines at equal angles in the ſame point: conſequently the rhumb-lines are ſpirals, which continually wind round the poles without ever falling into them.

Again, that theſe ſpiral rhumbs, on the globe, are of the ſame kind with the proportional ſpiral, will appear hence: let PABC, *&c.* (*ibid.*) be the ſtereographic projection of part of the ſphere, on the plane of the equator; where ABC DEF is part of the equator; P the pole; PA, PB, PC, *&c.* are meridians; and the ſpiral A*bcdefg*, one of the rhumbs. Now, in ſuch a projection, the lines interſecting each other, form angles equal to the angles on the ſphere which they repreſent: therefore the projection of the rhumb, A*bcd*, *&c.* cuts the radii, or meridians, PA, PB, PC, *&c.* at equal angles; and as this is a property of the proportional ſpiral, the ſpiral rhumbs muſt be analogous to the proportional ſpiral. Hence the differences of longitude AB, AC, AD, *&c.* are the logarithms of the intercepted parts of the meridians, P*b*, P*c*, P*d*, *&c.*

RHUS, *ſumach*, in botany, *&c.* See the article SUMACH.

RHYME, RHIME, RYME, or RIME, in poetry, the ſimilar ſound, or cadence and termination of two words which end two verſes, *&c.* Or rhyme is a ſimilitude of ſound between the laſt ſyllable or ſyllables of a verſe, ſucceeding either immediately or at a diſtance of two or three lines.

Rhymes are either ſingle, double, or triple, though the two laſt are much diſuſed. Single rhymes are divided into perfect or whole rhymes, and imperfect or half rhymes. A whole or perfect rhyme is where there is a ſimilitude of ſound without any difference: an imperfect rhyme is where there is a ſimilitude of ſound, with a difference either in reſpect of the pronunciation or orthography, but chiefly the former. Single rhymes are again divided into feminine and maſculine rhymes: the feminine rhyme is that where the laſt ſyllable of the rhyme ends with an *e* mute: and the maſculine rhymes are thoſe of all other words. Double rhymes are thoſe where two words terminate alike through the whole two laſt ſyllables. Plain rhymes are thoſe where the two rhyming verſes ſucceed immediately to each other: and croſs rhymes are thoſe where the verſes are ſo diſpoſed as that the firſt rhymes with the third, and the ſecond with the fourth.

There is no rule in poetry, ſays Du Bos, whoſe obſervance coſts ſo much trouble, and is productive of leſs beauties in verſe, than that of rhyming. Rhyme frequently maims and almoſt always enervates the ſenſe of the diſcourſe, for one bright thought which the paſſion of rhyming throws in our way by chance, is, without doubt, every day the cauſe of a hundred others that people would bluſh to make uſe of were it not for the richneſs or novelty of the rhyme with which theſe thoughts are attended.

And yet the allurement of rhyme has nothing in it worth comparing to the charms of numbers and harmony. The terminating of a ſyllable with a particular ſound is no beauty in itſelf. The beauty of a rhyme is only a relative one, which conſiſts in a conformity of termination between the two laſt of two correſponding verſes. This ornament therefore, which is of ſo ſhort a duration, is perceived only at the end of two verſes, and after having heard the laſt word of the ſecond verſe, which rhymes to the firſt. One is not even ſenſible of this pleaſure, but at the end of three or four verſes, if the maſculine and feminine rhymes are interwoven, ſo that the firſt and fourth be maſculines, and the ſecond and third feminines: a mixture which is very much uſed in ſeveral kinds of poetry. But even in thoſe verſes where the richneſs thereof diſcovers itſelf at the end of the ſecond verſe, it is the greater or leſſer conformity between the two laſt words of theſe verſes, which forms its elegance. Nor, for the moſt part, do people upon hearing the ſecond rhyme,

recal

real the firſt diſtinctly enough, to be charmed with their perfection. Their merit is known rather by reflection than ſenſation, ſo trifling is the pleaſure by which it tickles the ear. Numbers and harmony are a light which throws out a conſtant luſtre; but rhyme is a mere flaſh, that diſappears after having given only a ſhort-lived ſplendor. See the articles NUMBER, METRE, *&c.*

Rhyme owes its origin to the barbarouſneſs of our anceſtors. The people from whom the modern nations are deſcended, and who ſubverted the roman empire, had their poets, who being ignorant, and the languages in which they wrote not ſufficiently improved to bear a handling according to the rules of metre, they fancied there would be ſome ornament in terminating with the ſame ſound two conſecutive or relative parts of a diſcourſe, both of which were to be of an equal extent. Thus, in all probability, it was that rhyme firſt roſe in Europe. Theſe new-born languages were not only forced to ſubmit to the ſlavery of rhyming, but it paſſed even to the latin tongue, the uſe of which was ſtill retained by a particular ſet of people. The practice of leonine verſe was introduced as early as the VIIIth century, and prevailed at the time the following ones were made,

Fingitur hac ſpecie bonitatis odore refertus,
Iſtius eccleſiæ fundator rex Dagobertus.

Theſe leonine verſes diſappeared upon the riſing of that light, whoſe dawn appeared in the XVth century.

Since the reſtoration of learning in the XVIth century, attempts have been made to baniſh rhyme out of the modern poetry, and to ſettle the engliſh and french verſes on the footing of the antient greek and latin ones, by fixing the qnantities of ſyllables and truſting wholly to thoſe, and to the numbers and meaſure. This Milton has done with great ſucceſs, and after him Philips, Addiſon, Thomſon, Young, and ſome others. Verſes of this kind are called blank verſes. The French have attempted the ſame, but not with equal ſucceſs; which has convinced the world, that this kind of meaſure is inconſiſtent with the french tongue.

RHYPTICS, *ῥυπτικα*, in medicine, detergent remedies. See DETERGENTS.

RHYTHM, *ῥυθμος*, in muſic, the variety in the movement, as to the quickneſs or ſlowneſs, length or ſhortneſs of the notes. Or it may be defined more generally, the proportion which the parts of the motion have to each other. See the next article.

Ariſtides, among the antient muſicians, applies the word rhythmus three ways, *viz.* either to immoveable bodies, when their parts are rightly proportioned to each other, as a well made ſtatue, *&c.* Or to things that move regularly, as in dancing, in the dumb-ſhews of pantomimes, *&c.* Or, thirdly, to the motion of ſound, or voice, in which the rhythmus conſiſts of ſhort and long ſyllables, or notes, joined together in ſome kind of order, ſo as their cadence on the ear may be agreeable. This, in oratory, is what we call numerous ſtyle; and when the tones of the voice are well choſen, an harmonical ſtyle. See STYLE.

In effect, rhythm, in general, is perceived either by the eye or ear, and may be either with or without metre; but the ſtrict rhythm of muſic is only perceived by the ear, and cannot exiſt without it. The firſt either exiſts without ſound, as in dancing; or with ſounds. It may be either without any difference of acute and grave, as in a drum; or with a variety of theſe, as in a ſong. The rhythm of the antients, Mr. Malcolm obſerves, was very different from that of the moderns: the former was only that of the long and ſhort ſyllables of the words and verſes, and had no other forms or varieties than what the metrical art afforded. The changes therein are nothing but thoſe made from one kind of metre to another, as from iambic to choraic, *&c.* In the modern muſic, the conſtitution of the rhythm differs from that of the verſe ſo far, that in ſetting muſic to words, the thing chiefly regarded, is to accommodate the long and ſhort notes to the ſyllables in ſuch a manner as that the words be well ſeparated, and the accented ſyllables of each word ſo conſpicuous, that what is ſung may be diſtinctly underſtood. See MELODY.

Voſſius ſays, the rhythm, which does not expreſs the very forms and figures of things, can have no effect; and that the antient poetical numbers alone are juſtly contrived for this end. He adds, that the modern languages and verſe are altogether unfit for muſic; and that we ſhall never have any right vocal muſic, till our poets learn to make verſes capable to be ſung, *i. e.* till we new-model our language, reſtore the antient quantities and metrical feet, and baniſh our barbarous rhymes. Our verſes, ſays he, run as it were all on one foot, ſo that we have no real rhythm at all in our poetry: and

real

Fig. 1. Astronomical RING.

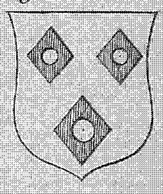

Fig. 5. The RIBBAND-Weaver's Loom.

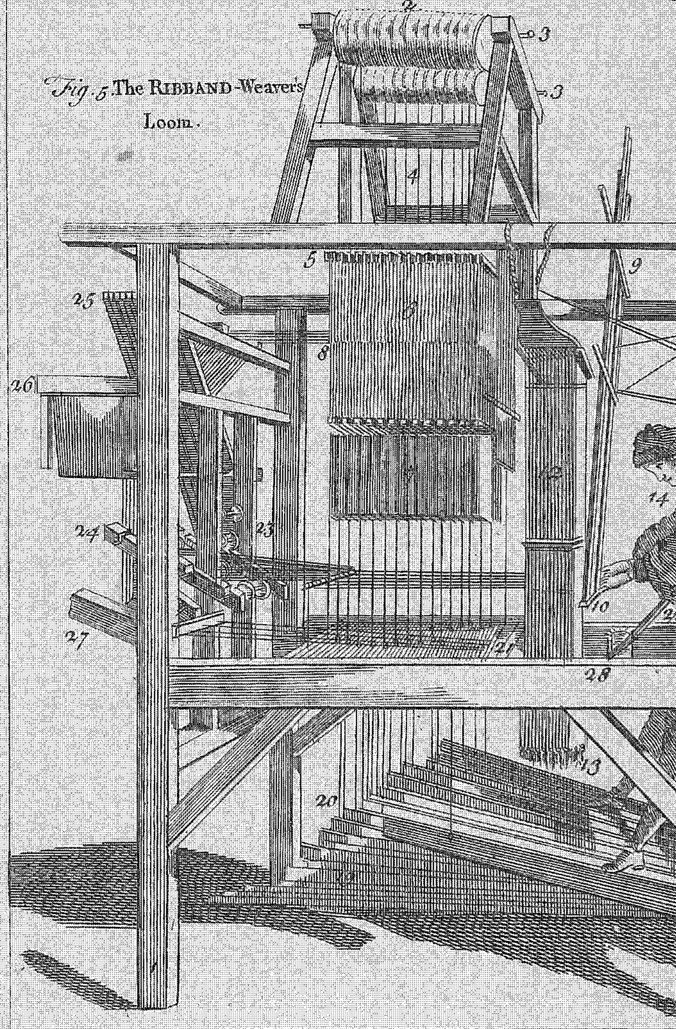

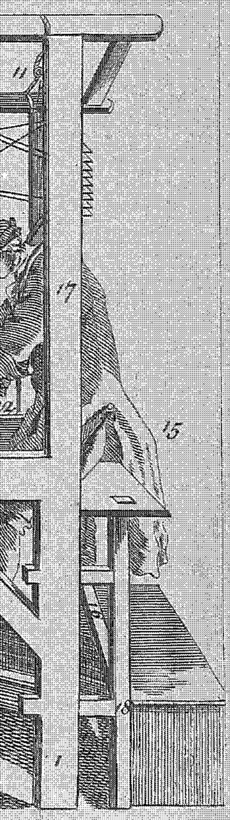

T. Jefferys sculp

adds, that we mind nothing farther than to have ſuch a number of ſyllables in a verſe, in whatever nature, and in whatever order.

RHYTHMICA, ῥυθμικη, in the antient muſic, that branch which regulated the rhythm. See the preceding article.

The rhythmica conſidered the motions, regulated the meaſures, order, mixture, &c. ſo as to excite the paſſions, keep them up, augment, diminiſh, or allay them. Ariſtides, and other antient muſical writers, divided artificial muſic into harmonica, rhythmica, and metrica. See the article MUSIC. But the rhythmica with them likewiſe comprehended dumb motions, and, in effect, all rhythmical, *i. e.* regular motions.

RHYTHMOPOEIA, one of the antient muſical faculties, as they are called, which preſcribes rules for motion, or rhythm.

The antient rhythmopoeia is very defective: we find nothing of it in their books but ſome general hints, which can ſcarce be called rules. In their explications, there appears nothing but what belongs to words and verſes of their ſongs, which is a very ſtrong preſumption they had no other. See RHYTHM, and the preceding article.

RIAL, or RYAL, a ſpaniſh ſilver-coin. See the article COIN.

RIAL, or ROYAL, is alſo the name of a piece of gold, antiently current among us for ten ſhillings.

RIB, *coſta*, in anatomy. See RIBS.

RIBBAN, or RIBBON, in heraldry, the eighth part of a bend, like that repreſented in plate CCXXXII. fig. 8.

RIBBAND, or RIBBON, a narrow ſort of ſilk, chiefly uſed for head-ornaments, badges of chivalry, &c.

In order to give our readers an idea of the manner in which this curious and valuable branch of manufacture is managed, we ſhall preſent him with a view of the ribbon-weaver in his loom, as repreſented in plate CCXXXIII. fig. 5. where 1 is the frame of the loom. 2, The caſtle, containing forty-eight pullies. 3, The branches, on which the pullies turn. 4, The tires, or the riding-cords, which run on the pullies, and pull up the high-liſſes. 5, The lift-ſticks, to which the high-liſſes are tied. 6. The high-liſſes, or liſts, are a number of long threads, with platines, or plate-leads, at the bottom; and ringlets, or loops, about their middle, through which the cords or croſs-threads of the ground-harneſs ride, 7, The plate-leads, or platines, are flat pieces of lead, of about ſix inches long, and three or four inches broad at the top, but round at the bottom; ſome uſe black ſlates inſtead of them: their uſe is to pull down thoſe liſſes, which the workman had raiſed by the treddle, after his foot is taken off. 8, The branches or cords of the ground-harneſs, which go through the loops in the middle of the high-liſſes: on the well ordering of theſe cords chiefly depends the art of ribbon-weaving, becauſe it is by means of this contrivance that the weaver draws in the thread or ſilk that makes the flower, and rejects or excludes the reſt. 9, The batton; this is the wooden-frame that holds the reed, or ſhuttle, and beats or cloſes the work: where obſerve that the ribbon-weaver does not beat his work; but as ſoon as the ſhuttle is paſſed, and his hand is taken away, the batton is forced by a ſpring from the top, to beat the work cloſe. 10, The ſhuttle, or reed. 11, The ſpring of the batton, by which it is made to cloſe the work. 12, The long-harneſs are the front-reeds, by which the figure is raiſed. 13, The linguas are the long pieces of round or ſquare lead, tied to the end of each thread of the long-harneſs, to keep them tight. 14, The broad piece of wood, about a foot ſquare, leaning ſomewhat forward, intended to eaſe the weaver, as he ſtoops to his ſhuttle; it is fixed in the middle of the breaſt-beam. Some weavers, inſtead of this, have a contrivance of a cord or rope, that is faſtened to the front-frame, and comes acroſs his breaſt; this is called a ſlopfall. 15, The ſeat-bench; this leans forwards very much. 16, The foot-ſtep to the treddles. 17, The breaſt-beam, being a croſs-bar that paſſes from one of the ſtandards to the other, ſo as to front the workman's breaſt: to this breaſt-bar is fixed a roll, upon which the ribbon paſſes in its way to be rolled upon the roller, that turns a little below. 18, The clamps, or pieces of wood, in which the broaches, that confine the treddles, reſt. 19, The treddles are long narrow pieces of wood, to the ends of which the cords, that move the liſſes, are faſtened. 20, The treddle-cords are only diſtinguiſhed from the riding-cords by a board full of holes, which divide them, in order to prevent the plate-leads, which are tied to the high-liſſes, from pulling them too high, when the workman's foot is off the treddle: which ſtop is made by a knot in the treddle-

cord

cord, too big to be forced through that hole in the board. 21, The lames are two pieces of thin narrow boards, only uſed in plain works, and then to ſupply the place of the long-harneſs. 22, The knee-roll, by which the weaver rolls up his ribbon, as he ſees proper, or by bit and bit, as it is finiſhed. 23, The back-rolls, on which the warp is rolled. It is to be obſerved, that there are always as many rolls as colours in the work to be wove. 24, The clamps, which ſupport the rollers. 25, The returning-ſticks, or, as others call them, the returns, or the tumblers, or pullies, to which the tires are tied, to clear the courſe of cords through the high-liſſes. 26, The catch-board, for the tumblers. 27, The tire-board. 28, The buttons for the knee-rolls and treddle-board, deſcribed in number 20.

Ribbands of all ſorts are prohibited to be imported.

RIBBAND-SCREW-SHELL, a ſpecies of turbo, with broad ſpiral faſciæ, and a ſmall mouth. See the article TURBO.

RIBBLE, a river which riſes in the weſt-riding of Yorkſhire, and, running ſouth-weſt croſs Lancaſhire, falls into the Iriſh channel, below Preſton.

RIBES, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of five ſmall, obtuſe, erect petals, inſerted into the margin of the cup: the fruit is a globoſe, umbilicated berry, containing only one cell, with two lateral, oppoſite, longitudinal receptacles; the ſeeds are numerous, roundiſh, and ſomewhat compreſſed.

This genus comprehends the currant, the black currant, and the purple gooſeberry.

RIBESIUM, in botany, the ſame with the ribes. See the preceding article.

RIBS, *coſtæ*, in anatomy, certain long arched bones, ſerving to form or ſuſtain the inner ſides of the thorax. See the article THORAX.

The ribs are twenty-four in number, twelve on each ſide; their figure is an imperfect ſegment of a circle; their ſize is very different, the middle ones being largeſt, and the upper and lower much ſmaller: they are harder, rounder, and more incurvated towards their articulations with the vertebræ, than at the other extremity towards the ſternum, which is thinner, broader, and more ſpongy. The ribs are diſtinguiſh'd into true and ſpurious; the true ribs are the ſeven upper pair, which are thus diſtinguiſhed, as forming the moſt perfect arches, and as having a ſtrong articulation with the ſternum. The five lower are called nothæ, or ſpurious ribs, as being ſmaller, ſhorter, and more cartilaginous than the reſt, and not reaching ſo far as the ſternum, which make their articulations very lax, in regard they terminate in long ſoft cartilages, which, bending upwards, are joined to the upper ribs. The ſeveral ribs have been diſtinguiſhed by many authors, each under its peculiar name; but this is not neceſſary, as they are as eaſily known by the names firſt, ſecond, *&c.* On the inſide of the true ribs, except the loweſt, and ſometimes the next to it, runs a pretty deep ſinus, reaching from the end next the ſpine, almoſt to its junction with the cartilage. In the anterior extremities the cartilages of the ſeven true ribs are all joined to the ſternum; the eighth, ninth, and ſometimes the tenth, cohere either with the ſternum, or mutually adhere to one another, by means of their tranſverſe cartilages. The anterior extremities of all the others are looſe and free, between the muſcles of the abdomen and the diaphragm. In the poſterior extremities there are in moſt of them two capitulæ, or heads, which are firmly joined to the vertebræ of the back, yet ſo as to form moveable articulations; for the uſe of which, ſee the article RESPIRATION.

The ribs are liable both to fractures and luxations. In a ſlight fracture, the ſeparated bones are to be put into their places, a compreſs diped in ſpirit of wine is to laid on, and then covered with ſplints and a circular bandage. If any ſharp pieces of the ribs ſhould pierce the pleura, *&c.* it will be proper to open the ſkin, and extract the fragment. The ribs are but ſeldom diſlocated; but when this happens, they are to be replaced as ſoon as poſſible. See FRACTURE and LUXATION.

RICCIA, in botany, a genus of the *cryptogamia-algarum* claſs of plants, conſiſting of a foliaceous matter, procumbent on the ground, on which there are evident male and female fructifications, ſometimes both on the ſame, and ſometimes on different plants of the ſame ſpecies; the male flower has neither calyx nor corolla, but conſiſts of a ſingle anthera, of an oblong tubulated form, which grows to the leaves, without any pedicle: the female flower has no corolla, and ſcarce any calyx, it conſiſts principally of a pericarpium of a globular figure, in which

which there are contained a number of ſeeds.

RICE, *oryza*, in botany and medicine. See ORYZA.

RICHLIEU, a town of France, in the province of Orleanois and territory of Poictou, ſituated twenty-ſix miles north of Poictiers.

RICHMOND, a village in the county of Surry, ten miles weſt of London, formerly the reſidence of the kings of England.

RICHMOND is alſo a borough-town of Yorkſhire, thirty-three miles north-weſt of York.

It ſends two members to parliament.

RICINOCARPOS, in botany, the ſame with the mercurialis. See MERCURIALIS.

RICINOCARPOS is alſo the name whereby ſome call the acalypha. See the article ACALYPHA.

RICINOIDES, in botany, the ſame with the croton. See CROTON.

RICINUS, in botany, a genus of the *monoecia-polyadelphia* claſs of plants, having no corolla, the fruit is a roundiſh triſulcated capſule, conſiſting of three valves, and containing three cells; the ſeed is ſingle, and of a roundiſh figure.

RICKETS, *rhachitis*, in medicine, a diſorder incident to children, proceeding from an unequal nutrition.

Children are ſeldom attacked with rickets before they are nine months old, and after they are two years old. It may originally proceed from the diſorders of the parents, and may be increaſed by thoſe of the nurſe. It is alſo promoted by feeding the child with aqueous and mucous ſubſtances, crude ſummer-fruits, fiſh, and too great a quantity of ſweet things; by ſitting too much, eſpecially in a perforat-chair, with its coats up; by a ſtriking in of the itch, *&c.*

This diſorder is known from a flaccid tumour of the head and face, a flabby-looſe ſkin, a ſwelling of the belly, and a falling away of the reſt of the other parts, eſpecially of the muſcles; from protuberances of the apophyſes of the joints, ſuch as the wriſts, ancles, and knees; from the largeneſs of the jugular veins and arteries, while the reſt decreaſe; from knotty ribs, a narrow breaſt, and carious teeth, *&c.*

The cure, according to Boerhaave, is to be attempted with light, nouriſhing, dry aliment; not fat, but ſeaſoned, and taken often; with little ſound drink, ſuch as mild beer, or ale; with a dry warm air, and warm woolen clothing; with being carried about in the arms, or drawn in a vehicle over the ſtones, and often ſhook, ſwung, and put in motion; with repeated frictions, eſpecially of the belly and ſpine of the back with warm dry flannel, ſprinkled with aromatics; with gentle emetics, frequently tho' prudently repeated; with ſtrengthening purges for ſeveral days ſucceſſively; and with cold bathing, the child being put to ſweat between blankets every day, as ſoon as he comes out of the water.

Particularly for food, the bread ſhould be biſcuit, with a little ſaffron and ſpices; the fleſh ſhould be pigeons, pullets, veal, rabbits, mutton gently roaſted, minced and mixed with biſcuit, ſalt, a little parſley, thyme, nutmeg, or the like. He may alſo eat rice, millet, or pearl-barley, boiled with raiſins, to which add a little wine and ſpice. The drink may be red wine, of which an ounce may be given three or four times a day; as alſo brunſwic mum and engliſh beer, which, in the ſummer, may be mixed with ſpaw-water. Let the pillow and bed be filled with the following leaves dried in the ſhade, *viz.* of male-fern, three pounds; of marjoram, baum, and mint, each two handfuls; and of the flowers of melilot, ſweet-trefoil, elder, and roſes, dried in the ſhade, of each two ounces: reduce them all to powder, and mix them with double the quantity of barley-chaff.

RIDE, in the ſea-language, is a term variouſly applied: thus, a ſhip is ſaid to ride, when her anchors hold her faſt, ſo that ſhe does not drive, by the force either of the wind or tide. A ſhip is ſaid to ride acroſs, when ſhe rides with her fore and main yards hoiſted up to the hounds, and both yards and arms topped alike. She is ſaid to ride well, when ſhe is built ſo as not to over-beat herſelf in a head-ſea, the waves over-raking her from ſtem to ſtern. To ride athwart, is to ride with her ſide to the tide. To ride betwixt wind and tide, is to ride ſo as the wind has equal force over her one way, and the tide the contrary way. If the wind has more power over the ſhip than the tide, ſhe is ſaid to ride wind-round, or to ride a great wind. And ſhe is ſaid to ride a-portoiſe, when the yards of a ſhip are ſtruck down upon the deck. For to ride hawſefull, a-peek, or land-locked, ſee HAWSES, PEEK, and LANDLOCKED.

RIDE, of hazel, or other wood, is a cluſter of ſprigs ſhooting out from the ſame root.

RIDEAU, in fortification, is a ſmall elevation of earth, extending lengthwiſe on a plane, and ſerving to cover a camp, or to give an advantage to a poſt. Rideaus are alſo convenient for thoſe who would beſiege a place, and ſerve to ſecure the workmen in their approaches to the foot of a fortreſs.

Rideau is alſo uſed ſometimes for a trench, the earth of which is thrown upon its ſides, to ſerve as a parapet for covering the men.

RIDER, a term uſed for an after-clauſe added to a bill, while depending in parliament.

RIDER-ROLL. See the article ROLL.

RIDERS, in a ſhip, are large timbers, both in the hold and aloft, bolted on to other timbers to ſtrengthen them, when the ſhip is diſcovered to be too ſlightly built.

Out-RIDERS. See OUT-RIDERS.

RIDGE, in agriculture, a long piece of riſing land, between two furrows.

Mr. Tull obſerves, that the method of ploughing lands up into ridges is a particular kind of tillage, the chief uſe of which is the alteration it makes in the degrees of heat and moiſture. But the principal advantage this gentleman propoſes from ridges is the draining wet hills, where the upper ſtratum is mould, and the ſecond ſtratum clay. Theſe ridges, he obſerves, ſhould be plowed acroſs the hill, almoſt horizontally, that their parting furrows lying open, may each ſerve as a drain to the ridge next below it; for when the plough has made the bottom of theſe horizontal furrows a few inches deeper than the ſurface of the clay, the water will run to their ends very ſecurely, without riſing into the mould, provided no part of the furrows be lower than their ends. Theſe ridges and their parting furrows muſt be made more or leſs oblique, according to the form and declivity of the hill; but the more horizontal they are, the ſooner the rain-water will run off the lands: for in that caſe, it will run to the furrows, and reach them at right angles. Every one of theſe horizontal trenches receives all the water from the rills, or little gutters, which in theſe quagmire-hills, run betwixt the mould and the clay; theſe are all cut off by the trenches, which receive the water at their upper ſides, and carry it away, as the gutters of lead, placed under the eaves of a houſe, carry away the rain-water.

Theſe ridges ſhould be plowed in pairs, without throwing any earth into the trenches; and at every time of plowing, the pairs muſt be changed, ſo that the furrow which had two ridges turned towards it one time, muſt have two turned from it the next.

RIDGE, in building, the higheſt part of the roof or covering of a houſe.

RIDGES *of a horſe's mouth*, are wrinkles or riſings of fleſh in the roof of the mouth, running a-croſs from one ſide of the jaw to the other, with furrows between them. On the third or fourth of theſe ridges the farriers ſtrike with a horn, in order to bleed a horſe, whoſe mouth has been over-heated.

RIDGLING, or RIDGEL, among farriers, *&c.* the male of any beaſt that has been but half gelt.

RIDICULE, in matters of literature, is that ſpecies of writing, which excites contempt with laughter.

The objects of ridicule are falſhood, incongruity, impropriety, or turpitude of certain kinds: but as the object of every excited paſſion muſt be examined by reaſon, before we can determine whether it be proper or improper; ſo ridicule muſt, apparently at leaſt, eſtabliſh the truth of the improprieties, deſigned to excite the paſſion of contempt. Hence, it comes in to the aid of argument and reaſon, when its impreſſions on the imagination are conſiſtent with the nature of things; but when it ſtrikes the fancy and affections with fictitious images, it becomes the inſtrument of deceit. But however ridicule may impreſs the idea of apparent turpitude, or falſhood, in the imagination; yet ſtill reaſon remains the ſupreme judge: and thus ridicule can never be the final teſt or touch-ſtone of truth and falſhood, as has been obſerved by lord Shafteſbury.

RIDING, a diviſion of Yorkſhire, of which there are three, *viz.* the eaſt, weſt, and north ridings.

In all indictments in that county, both the town and riding muſt be expreſſed.

RIDING-CLERK, one of the ſix clerks in chancery, who, in his turn, annually keeps the controlment-books of all grants that paſs the great ſeal that year.

RIENS ARREAR, in law, is a plea uſed in an action of debt, for arrearages of accounts, by which the defendant alledges, that there is nothing in arrear.

RIENS PASSE PAR LE FAIT, NOTHING PASSES BY THE DEED, is the form of an exception, in ſome caſes taken to an action. See EXCEPTION.

RIENS PAR DESCENT, NOTHING BY DESCENT, is the plea of an heir, ſued for his anceſtor's debt, though he has no lands from him by deſcent, nor aſſets in his hands. See DESCENT.

RIER, or REER-COUNTY, in law, is oppoſed to full and open county, and, in our ſtatutes, is taken to be ſome public place appointed by the ſheriff, for the receipt of the king's money, after the end of the county-court.

RIES, a town of Provence, in France, twenty-ſeven miles north-eaſt of Aix.

RIETI, a town of Italy, in the territory of the pope and dutchy of Spoletto, ſixty-three miles eaſt of Rome.

RIEUX, a town of France, in the province of Languedoc, twenty-two miles ſouth of Toulouſe.

RIGA, a port-town of Livonia, one of the beſt harbours and trading towns in the Baltic: eaſt lon. 24°, north lat. 57°.

RIGADOON, a gay and briſk dance, borrowed originally from Provence in France, and performed in figure, by a man and a woman.

RIGEL, the ſame with regel. See the article REGEL.

RIGGING *of a ſhip*, is all her cordage and ropes, belonging to her maſts, yards, *&c.* See SHIP, ROPE, CORDAGE, *&c.*

A ſhip is ſaid to be well rigged, when all her ropes are of a fit ſize and proportion: and ſhe is ſaid to be over-rigged, when her ropes are too large; which is of great prejudice to her ſailing, and is apt to make her heel.

RIGHT, in geometry, ſignifies the ſame with ſtraight: thus, a ſtraight line is called a right one. See LINE.

As for right angle, right aſcenſion, right cone, right deſcenſion, right line, right ſphere, *&c.* they are explained under the articles ANGLE, ASCENSION, *&c.*

RIGHT, *jus*, in law, not only denotes property, for which a writ of right lies, but alſo any title or claim, either by virtue of a condition, mortgage, *&c.* for which no action is given by law, but an entry only. See JUS, ENTRY, PROPERTY, *&c.*

By ſtat. 1 Will. & Mar. cap. ii. the following particulars relating to the ill conduct of king James II. were declared to be illegal, and contrary to the antient rights and liberties of the people, *viz.* his exerciſing a power of diſpenſing with, and ſuſpending, of laws; his levying money without conſent of parliament; violating the freedom of elections; cauſing partial and corrupt jurors to be returned on trials, exceſſive bail to be taken, and exceſſive fines to be impoſed, as well as cruel puniſhments to be inflicted, *&c.*

RIGIDITY, in phyſics, denotes a brittle hardneſs. See the article HARDNESS.

It is oppoſed to ductility, malleability, and ſoftneſs. See DUCTILITY, *&c.*

RIGLET, or REGLET. See REGLET.

RIGNANO, or REGUANO, a town of Italy, in the territories of the pope and St. Peter's patrimony, fifteen miles north of Rome.

RIGOL, a kind of muſical inſtrument, conſiſting of ſeveral ſticks bound together, only ſeparated by beads. It makes tolerable muſic, on being well ſtruck with a ball at the end of a ſtick.

RIGOR, in medicine, a convulſive ſhuddering, from ſevere cold, an ague-fit, or other diſorder.

RIM, in a watch, or clock, the edge or border of the circumference or circular part of a wheel.

RIME, or RHYME, in poetry. See the article RHYME.

RIMINI, a port-town of Italy, in the territories of the pope, and province of Romania, ſituated on the gulph of Venice: eaſt lon. 13° 30′, and north lat. 44° 8′.

RIND, the ſkin of any fruit that may be cut off or pared.

The outer coat of the cheſnut, ſet with prickles, is particularly termed the urchin-like rind.

Rind is alſo uſed for the inner bark of trees or that whitiſh ſoft ſubſtance which adheres immediately to the wood.

In the modern theory of vegetation, the ſap is ſuppoſed to paſs through the rind, in its return from the extremities of the branches to the root. Others ſuppoſe its veſſels to do the office of arteries, whence Mr. Bradley call them arterial veſſels.

RING, an ornament of gold, ſilver, *&c.* made of a circular form, and generally worn on the finger. That worn by the antient roman knights is repreſented in plate CCXXXIII. fig. 2.

Nuptial or wedding rings were uſed by the antient Greeks and Romans; and from them the chriſtians took them up very early, as appears from Tertullian, and ſome antient liturgies, where we find

the form of bleſſing the nuptial ring. See MARRIAGE and NUPTIAL.

The epiſcopal ring is alſo of very antient ſtanding; it makes a part of the pontifical apparatus, and is eſteemed a pledge of the ſpiritual marriage between the biſhop and his church.

There is ſcarcely any part of the body on which rings have not been worn. In India, the people commonly wear them on the noſe, lips, cheeks, and chin. As to the ears, the cuſtom ſtill obtains of wearing rings in them, both by men and women, throughout the greateſt part of the world. When Peter Alvarez had his firſt audience of the king of Calicut, he found him covered with ſtones ſet in rings, both on his hands, fingers, feet, and toes: and Louis Bartome repreſents a king of Pegu with precious ſtones on every toe.

Rings have alſo been uſed as ſeals. See the article SEALS.

RING, in navigation and aſtronomy, a braſs-inſtrument, made in the form of a ring, and ſerving to take altitudes of the ſun. See plate CCXXXIII. fig. 1.

At C is a ſmall hole, in the direction CD, which is perpendicular to CE; this hole is preciſely 45° from A, and CE is parallel to the vertical diameter AB. From C, as a center, they deſcribe a quadrant of a circle CED; which being nicely divided into 90°, they mark upon the internal ſurface of the ring the places where rays, drawn from C, to theſe degrees, cut the ſaid ſurface.

To uſe this ring, they hold it up by the ſwivel, and turn the ſide with the hole C, towards the ſun; and then the ſun-beams paſſing through the hole, make a luminous ſpot among the degrees, whereby the altitude is found. Some prefer the ring to the aſtrolabe, by reaſon its diviſions are larger: however, it is far from being exact enough to be much depended on in aſtronomical obſervations, which are better made by quadrants. See ASTROLABE and QUADRANT.

RING-BONE, in farriery, a hard callous ſubſtance, growing in the paſtern of a horſe, above the coronet: it is thus called from its growing quite round like a ring.

RING-DIAL. See the article DIAL.

RING-OUZEL, in ornithology, a ſpecies of black turdus, with a white ring, a little larger than the common black-bird. See the article TURDUS.

RING-WORM, in medicine, the ſame with the ſerpigo. See the article SERPIGO.

Fairy-RING, or CIRCLE. See FAIRY.

Saturn's RING, in aſtronomy. See the article SATURN.

RINGWOOD, a market-town of Hampſhire, twenty-five miles ſouth-weſt of Wincheſter.

RIO GRANDE, a river of Terra Firma, which, riſing almoſt under the equator, and running north, falls into the north ſea between Carthagena and St. Martha.

RIO GRANDE is alſo a river of Africa, which runs from eaſt to weſt through Negroland, and falls into the Atlantic ocean, in 11° north latitude.

RIO JANEIRO, a river of ſouth America, which riſes in the mountains weſt of Brazil, and falls into the Atlantic ocean almoſt under the tropic of capricorn.

RIONDO, in ichthyology, a ſpecies of red zeus, with an even tail, and the roſtrum turned upwards. See ZEUS.

RIOM, a town of the Lionois, in France, ſeven miles north of Clermont.

RIOT, in law, is where three or more perſons, aſſembled together, commit ſome unlawful act, with force and violence, to the diſturbance of the peace; as beating ſome perſon, forcibly entering upon the poſſeſſion of the lands, houſes, *&c.* of another, or breaking down incloſures, houſes, *&c.*

By ſtat. 1 Geo. I. cap. v. if any perſons to the number of twelve or more, unlawfully and riotouſly aſſembled, continue together for an hour, after being required, by a juſtice of the peace, or other magiſtrate, to diſperſe, they ſhall be deemed guilty of felony without benefit of clergy. However, proſecutions upon this ſtatute, muſt be begun within one year after the offence is committed.

RIPAILLE, a town of Savoy, ſituated on the ſouth ſide of the lake of Geneva, twenty miles north-eaſt of that city.

RIPEN, a city and port-town of north Jut'and, ſubject to Denmark.

RIPENERS, in ſurgery, medicines that promote ſuppuration, otherwiſe called ſuppuratives. See SUPPURATIVES.

RIPPON, a borough-town of Yorkſhire, twenty-one miles north-weſt of York. It ſends two members to parliament.

RISING, *ortus*, in aſtronomy, the appearance of the ſun, a ſtar, *&c.* above the horizon of any place.

There are three kinds of poetical riſing of the ſtars, *viz.* acronycal, coſmical, and heliacal. See ACRONYCAL, *&c.*

The

The heavenly bodies always appear above the horizon before they really arrive at it, on account of refraction. See the article REFRACTION.

RISK, or HAZARD, in gaming, *&c.* See the articles CHANCE, HAZARD, *&c.*

RITE, *ritus*, among divines, denotes the particular manner of celebrating divine ſervice, in this or that country. See the article RITUAL.

RITORNELLO, or REPEAT, in muſic, the burden of a ſong, or the repetition of the firſt or other verſes of a ſong at the end of each ſtanza or couplet.

Cuſtom has extended the uſe of the word to all ſymphonies played before the voices begin; and which ſerve by way of prelude to what follows.

In the partitions of the ſcore of the italian muſic, we frequently find the ritornellos ſignified by the words *ſi ſuona*, to ſhew that the organ, ſpinet, harpſichord, or the like, are to repeat ſome bars of what the voice has been ſinging. See the article REPETITION.

RITUAL, a book directing the order and manner to be obſerved in celebrating religious ceremonies, and performing divine ſervice in a particular church, dioceſe, order, or the like.

The antient heathens had alſo their rituals, which contained their rites and ceremonies to be obſerved in building a city, conſecrating a temple or altar, in ſacrifiſing, deifying, *&c.*

RIVA, a city of Italy, at the north end of the Lake de Garda, ſixteen miles ſouth-weſt of Trent.

RIVADEC, a city and port of Spain, in the province of Galicia; weſt long. 7° 10′, north lat. 43° 36′.

RIVAL, a term applied to two or more perſons, who have the ſame pretenſions, and which is properly applied to a competitor in love, and figuratively to an antagoniſt in any other purſuit.

RIVER, *fluvius*, or *flumen*, a current, or ſtream of freſh water flowing in a bed or channel, from its ſource into the ſea. See the article SPRING.

The great, as well as the middle-ſized rivers, proceed either from a confluence of brooks and rivulets, or from lakes; but no river of conſiderable magnitude flows from one ſpring, or one lake, but is augmented by the acceſſion of others. Thus the Wolga receives above two hundred rivers and brooks before it diſcharges itſelf into the Caſpian Sea; and the Danube receives no leſs, before it enters the Euxine Sea. Some rivers are much augmented by frequent rains, or melted ſnow. In the country of Peru, and Chili, there are ſmall rivers, that only flow in the day; becauſe they are only fed by the ſnow upon the mountains of the Andes, which is then melted by the heat of the ſun. There are alſo ſeveral rivers upon both ſides the extreme parts of Africa, and in India, which for the ſame reaſon are greater by day than by night. The rivers alſo in theſe places are almoſt dried up in ſummer, but ſwell and overflow their banks in winter, or in the wet ſeaſon. Thus the Wolga in May and June is filled with water, and overflows its ſhelves and iſlands, though at other times of the year it is ſo ſhallow, as ſcarcely to afford a paſſage for loaded ſhips. The Nile, the Ganges, the Indus, *&c.* are ſo much ſwelled with rain or melted ſnow, that they overflow their banks; and theſe deluges happen at different times of the year, becauſe they proceed from various cauſes. Thoſe that are ſwelled with rain, are generally higheſt in winter, becauſe it is uſually then more frequent than at other times of the year; but if they proceed from ſnow, which in ſome places is melted in the ſpring, in others, in ſummer, or between both, the deluges of the rivers happen accordingly. Again, ſome rivers hide themſelves under-ground, and riſe up in other places, as if they were new rivers. Thus the Tigris meeting with mount Taurus, runs under it, and flows out at the other ſide of the mountain: alſo, after it has run thro' the lake Toſpia, it again immerges, and being carried about eighteen miles under-ground, breaks out again, *&c.*

The channels of rivers, except ſuch as were formed at the creation, Varenius thinks, are artificial. His reaſons are, that, when a new ſpring breaks out, the water does not make itſelf a channel, but ſpreads over the adjacent land; ſo that men were neceſſitated to cut a channel for it, to ſecure their grounds. He adds, that a great number of channels of rivers are certainly known from hiſtory to have been dug by men.

The water of moſt rivers flow impregnated with particles of metals, minerals, *&c.* Thus ſome rivers bring ſands intermixed with grains of gold; as in Japan, Peru, and Mexico, Africa, Cuba, *&c.* particularly in Guinea is a river, where the negroes ſeparate the gold duſt from

from the ſand, and ſell it to the Europeans, who traffic thither for that very purpoſe. The Rhine in many places is ſaid to bring a gold mud. As to rivers that bring grains of ſilver, iron, copper, lead, *&c.* we find no mention of them in authors; though, doubtleſs there are many, and it may be to them that mineral waters owe many of their medicinal virtues. See the article MINERAL.

Theory of the motion of RIVERS. The running of rivers is upon the ſame principle as the deſcent of bodies on inclined planes; for water no more than a ſolid can move on an horizontal plane, the re-action of ſuch a plane being equal and contrary to gravity, entirely deſtroys it, and leaves the body at reſt: here we ſpeak of a plane of ſmall extent, and ſuch as coincides with the curved ſurface of the earth. But if we conſider a large extent or long courſe of water, then we ſhall find that ſuch water can never be at reſt, but when the bottom of the channel coincides every where with the curved ſurface of the earth.

Let ADF (plate CCXXXIV. fig. 1. n° 1.) be the curved ſurface of the earth, C its centre, CD, CE two right lines drawn from thence, and EG a tangent to the earth in the point D. Then it is plain if BD were a channel of water, the water could not run, or move, becauſe they are every where at an equal diſtance from the center C, and therefore equally affected by gravity. But if there be any place above the ſurface of the earth, as E, where water can be found, 'tis evident that water can deſcend in a channel to any part of the earth's ſurface between B and D, becauſe every point in the line ED is nearer to the center of the earth, and therefore below the point or place E; and its velocity will be ſo much the greater as it tends to a point nearer B, and ſloweſt of all, when it moves in the direction of the tangent ED. See FLUID.

Hence it appears that the ſource E of all rivers and ſtreams muſt be more than a ſemi-diameter of the earth CB diſtant from the center C. And ſince all great rivers run to the ſea or ocean where they diſembogue their waters at the point D, the line DC is a ſemidiameter, and = 4000 miles nearly. Alſo the courſe of all long rivers being in the direction of the tangent at the point D, if they were repreſented by the tangent-line EG, then the height of the ſource E above the common ſurface of the earth at B would be eaſily found. Thus, ſuppoſe ED were the river Niger in Africa, whoſe ſource is more than 3000 miles from the ſea; but put ED = 3000, and ſince CD = 4000, we ſhall have CE = 5000, and CE − CB = 1000 = BE = the height of the ſource. But ſince we know of no mountains above three or four miles high, it is plain the river Niger, and all ſuch long rivers, are ſo far from moving in a tangent, that their courſe muſt be very nearly of the ſame curvature with the earth's ſurface, and inſenſibly diſtant from it.

Since bodies move on planes ever ſo little inclined, except ſo far as they are prevented by friction, and ſince the friction of the particles of water among themſelves is inconſiderable, it follows that the water ſituated on a plane ever ſo little inclined, will commence a motion; and if the plane be conſiderably inclined, and the quantity of water great, its velocity will be proportional, and its momentum ſuch as will ſoon begin to wear away the earth, and create itſelf a courſe or channel to glide in. In rivers that are made, it is uſual to allow the fall of one foot in 300.

If we allow the ſame declivity to rivers which make their own way, then we find their height at their ſource above the common ſurface of the ſea, as in example of the Niger thus: As 300 : 1 :: 5280 : $\frac{5280}{300}$ = the height at one mile, or 5280 feet. Then again ſay, as 1 : $-\frac{5280}{300}$ :: 3000 : $\frac{5280 \times 3000}{300} = 5280 \times 10 = 10$ miles.

From whence it is evident, that the continents and iſlands ought to be much above the ſurface of the ſea, to give a neceſſary deſcent and courſe to the waters through them.

Let ABCD (*ibid.* n° 2.) be the ſection of a reſervoir, and BCIK the ſection of a canal of water ſupplied from thence, and ABN the horizontal line. Now, ſince the particles of water are governed by the common laws of gravity, the velocity of a particle at any part of the bottom of the canal, as F or H, will be the ſame as it would acquire by falling through the perpendicular altitude OF or LH, that is, as $\sqrt{OF}$ to $\sqrt{LH}$. Hence the velocity of the ſtream is accelerated.

For

For the ſame reaſon the velocity of a particle at the bottom of the ſtream H is to the velocity of a particle at the top G, as $\sqrt{LH}$ to $\sqrt{MG}$; conſequently the ſtream moves with a greater celerity at bottom than at top.

The quantity of the water which paſſes through the ſection of the ſtream H G, is the ſame that paſſes through the ſection of the reſervoir B C in the ſame time. The ſame may be ſaid of any other ſection F E; therefore the quantity of water, paſſing by any two ſections of the ſtream FE and GH, in the ſame time, is the ſame.

Since there runs the ſame quantity of water by G H as by F E in the ſame time; and ſince the velocity at G H is greater than at F E; and, laſtly, ſince the breadth of the canal is ſuppoſed to be every-where the ſame; therefore it follows, that the depth G H muſt be leſs than the depth F E, and ſo the depth of the ſtream muſt continually decreaſe as it runs.

As the ſtream proceeds, the depth H G decreaſing, the lines M G and L H will approach nearer to an equality; and therefore the different velocities of the water at top and bottom will approach much faſter to an equality, as being proportionate to the ſquare roots of thoſe lines. This approach to an equality is much farther promoted, by the upper parts being continually accelerated by the lower, and the lower parts retarded continually by the ſlower motion of the waters above, and preſſing upon them.

Since the difference of the deſcending velocities is greateſt near the head of the ſtream, the waters will there fall or deſcend with the greateſt impetuoſity, or cauſe the loudeſt noiſe. But in the courſe of rivers, the accelerated velocity is quickly reduced to an equable or uniform velocity, by the reſiſtance it meets with from the bottom and ſides of the channel, which reſiſtance will be as the ſquares of the velocities, and therefore ſoon become ſo great as to equal the accelerating force, and be communicated to the middle part of the ſtream, cauſing the whole to move uniformly. Hence, in rivers, the motion of the water is ſloweſt at the ſides and bottom of the channel, becauſe there the reſiſtance begins, which is afterwards communicated to all the other parts; and in different parts of the ſame river, the uniform velocity is greateſt, where the bottom of the channel has the greateſt inclination, or declivity, becauſe the relative gravity of the moving particles is here greateſt. Again, in thoſe parts of the river where the velocity of the ſtream is leaſt, the depth of the water is greateſt, and vice verſa, becauſe equal quantities paſs thro' unequal ſections of the river in the ſame time. Hence alſo it follows, that the momentum of running water muſt be every where the ſame, or a given quantity.

RIVULET, a diminutive of river. See the article RIVER.

RIVINIA, or RIVINA, in botany, a genus of the *tetrandria-monogynia* claſs of plants, without any flower petals: the fruit is a globoſe berry, containing a ſingle roundiſh and compreſſed ſeed.

RIX-DOLLAR, a ſilver-coin, current in different parts of Europe. See COIN.

ROACH, in ichthyology, a ſpecies of cyprinus, with the iris and belly-fins uſually red: it is generally, when full grown, nine inches long, but it ſometimes grows conſiderably larger. See the article CYPRINUS.

ROACHING *of alum*, is the laſt proceſs in making alum, which, being ſufficiently waſhed in a ciſtern of ſtrong alum-water, is put into large pans, and a quantity of water added to it; and then being ſet over the fire to melt, and boil a little, it is ſcooped into a great caſk, where it is ſuffered to ſtand and cryſtalize, and is what they call roach, roached, or rock alum. See ALUM.

ROAD, an open way, or public paſſage, forming a communication between one place and another.

Of all the people in the world the Romans took the moſt pains in forming roads, and the labour and expences they were at in rendering them ſpacious, firm, ſtrait, and ſmooth, is incredible. They uſually ſtrengthened the ground by ramming it, laying it with flints, pebbles or ſands, and ſometimes with a lining of maſonry, rubbiſh, bricks, &c. bound together with mortar. In ſome places in the Lionois, F. Meneſtrier obſerves, that he has found huge cluſters of flints cemented with lime, reaching ten or twelve feet deep, and making a maſs as hard and compact as marble, and which, after reſiſting the injuries of time for 1600 years, is ſtill ſcarce penetrable by all the force of hammers, mattocks, &c. and yet the flints it conſiſts of are not bigger than eggs. The moſt noble

of the roman roads was the Via Appia, which was carried to ſuch a vaſt length, that Procopius reckons it five days journey to the end of it, and Leipſius computes it at 350 miles: it is twelve feet broad, and made of ſquare free-ſtone, generally a foot and a half on each ſide; and though this has laſted for above 1800 years, yet in many places it is for ſeveral miles together as intire as when it was firſt made.

The antient roads are diſtinguiſhed into military roads, double roads, ſubterraneous roads, *&c.* the military roads were grand roads, formed by the Romans for marching their armies into the provinces of the empire; the principal of theſe roman roads in England, are Watling-ſtreet, Ikenild-ſtreet, Foſs-way, and Erminage-ſtreet. Double roads among the Romans, were roads for carriages, with two pavements, the one for thoſe going one way, and the other for thoſe returning the other: theſe were ſeparated from each other by a cauſeway raiſed in the middle, paved with bricks for the conveniency of foot paſſengers; with borders and mounting ſtones from ſpace to ſpace, and military columns to mark the diſtance. Subterraneous roads are thoſe dug through a rock, and left vaulted; as that of Puzzoli near Naples, which is near half a league long, and is fifteen feet broad, and as many high.

For the engliſh roads, ſee HIGHWAY.

ROAD, in navigation, is a place of anchorage at ſome diſtance from ſhore, where veſſels uſually moor, to wait for a wind or tide proper to carry them into harbour, or to ſet ſail.

When the bottom is firm, clear of rocks and ſheltered from the wind, it is called a good road; and when there is but little land on any ſide, it is termed an open road.

The roads in his majeſty's dominions are free to all merchant veſſels, belonging to his ſubjects and allies. Captains and maſters of ſhips who are forced by ſtorms, *&c.* to cut their cables, and leave their anchors in the roads, are obliged to fix marks or buoys, on pain of forfeiting their anchors, *&c.* Maſters of ſhips coming to moor in a road, muſt caſt anchor at ſuch a diſtance, as that the cables, *&c.* do not mix, on pain of anſwering the damages; and when there are ſeveral veſſels in the ſame road, the outermoſt to the ſea-ward is obliged to keep a light in his lanthorn in the night-time, to appriſe veſſels coming in from ſea.

ROADER, among ſailors, a ſhip that rides at anchor in a road.

ROAN. See the article ROUEN.

ROANE, a town of France, in the province of Lionois, forty miles north-weſt of Lyons.

ROANOAK, an iſland in north America, near the coaſt of Albemarle-county, in north Carolina: weſt long. 75°, north lat. 35° 40′.

ROASTING, in metallurgy, the ſeparation of volatile bodies from thoſe which are more fixed, by the combined action of air, and fire; and is generally the firſt proceſs in the ſeparation of metals from their ores: it differs from ſublimation only in this, that in this operation the volatile parts are diſſipated, when reſolved into vapours; whereas in that, they are preſerved. See SUBLIMATION. Sulphur and arſenic are in this manner collected, and preſerved, in the roaſting of many ores; and ſublimation made, as it were, occaſionally in the proceſs.

The ſeparation of the volatile parts of bodies, from the more fixed is, however, in many caſes very difficult, and much nicety is required in the conducting this operation; this is the caſe, for inſtance, when the whole compound body melts in almoſt the ſame degree of fire that is neceſſary to raiſe, and diſſipate the volatile parts in the air; in ſuch caſes, care muſt be taken, firſt previouſly to pound a little the body to be roaſted, that its ſurface contiguous to the air may be increaſed in extent. A gentle fire is alſo neceſſary on ſuch occaſions, and a very free acceſs of the air, which is the vehicle of theſe vapours. When the body in the roaſting grows on theſe occaſions into large lumps or clots, the ſurface of it muſt be reſtored to the neceſſary extent, by repeated poundings, for it is neceſſary above all things, that the matter be kept extended and recent, and never collected into a heap.

Roaſting, as commonly practiſed, is ſubject to many inconveniencies, which may be moſt of them eaſily remedied, and the whole buſineſs reduced to a few eaſy rules. 1. The roaſting of ores ſhould be always performed, without addition, when the ores are rich, or of itſelf merely of a metallic nature. But the additions of quicklime, pot-aſhes, iron-filings, and the like, are neceſſary, when arſenical, antimonial and ſulphureous matters are found

found to be mixed with the ores. 2. The fire is to be ſo regulated from the firſt, that only the lighter or more volatile ſulphureous or arſenic fumes may fly off, otherwiſe the more metallic part would likewiſe go, and without ſome contrivance to catch it would be loſt. The ore muſt, however, always feel the force of an open flame, otherwiſe the ſulphur, arſenic, *&c.* will never be thoroughly diſlodged. 3. The more theſe immature ſubſtances abound in ore, the gentler the fire ſhould be at firſt; and when the greater part of the ſulphureous matter is thus exhaled, the fire is then to be quickened. 4. Where ſuch additions are uſed, as are not metalline, as lime, mud, pot-aſh, *&c.* they ought always to be ſeparated afterwards from the matter before the fuſion, by waſhing.

ROB, in pharmacy, the juices of fruits purified and inſpiſſated till it is of the conſiſtence of honey.

Rob of alderberries is thus prepared: Take two quarts of the juice of ripe alderberries, and half a pound of refined ſugar. Evaporate over a gentle fire, or in a water-bath, till it is of a due conſiſtence.

ROBBERY, in law, a felonious taking away another man's goods, from his perſon, preſence, or eſtate, by putting him in fear.

Robbery on the highway, is felony without benefit of clergy, though the ſum or value taken be under twelve-pence, or even be no more than a ſingle penny: but if any thing be taken from the perſon of another without putting him in fear, this is properly no robbery, but felony, in which benefit of clergy is allowed; the putting in fear being the chief article that diſtinguiſhes robbery from ſtealing from a man's perſon.

In the caſe of robberies, there is therefore, a taking in deed, which is the very act; and a taking in law, as where a robber compels a man, from the fear of death, to ſwear he will bring him a ſum of money, which the ſworn perſon delivers to the other. The ſtreets in cities are made highways, in reſpect to robberies, by 6 Geo. I. Perſons who aſſault, or in a forcible manner demand money of another, with an intent to commit a robbery, are guilty of felony, and are to be tranſported for ſeven years.

The hundred in which a robbery on the highway is committed, is liable to pay the damage, when it is committed between the riſing and ſetting of the ſun, in any day, except Sunday, in caſe the robbers are not taken in forty days; hue and cry being made after the robber. And he who apprehends and proſecutes a robber on the highway, ſo as to convict him, is intitled to receive of the ſheriff of the county where the robbery was committed, the ſum of 40l. with the horſe, furniture, arms, *&c.* upon ſuch perſon's producing a proper certificate from the judge before whom the robber was convicted.

Houſe-ROBBING. See the article HOUSE-BREAKING.

ROBE, a garment of ſtate, being a kind of gown, which hangs looſe, and covers the whole body.

Maſter of the ROBES. See the article MASTER *of the Wardrobe*.

ROBERVALLIAN LINES, certain lines uſed for the tranſmutation of figures, and ſo called from their inventor M. de Roberval.

ROBIGALIA, or RUBIGALIA. See the article RUBIGALIA.

ROBINIA, in botany, a genus of the *diadelphia-decandria* claſs of plants, with a papilionaceous flower; its fruit is a large and long pod, of a compreſſed and gibboſe ſhape, and containing a few kidney-ſhaped ſeeds.

ROBORANTS, *roborantia*, in pharmacy, medicines which ſtrengthens the parts, and give new vigour to the conſtitution. See the article STRENGTHENERS.

ROCAMBOLES, in cookery, a mild kind of garlic, by ſome called ſpaniſh garlic. See the article GARLIC.

ROCELLA, in commerce, *&c.* the ſame with the alga tinctoria, uſed by the dyers for a purple colour. See the article ALGA.

ROCHDALE, a market-town, thirty-two miles ſouth-eaſt of Lancaſter.

ROCHEFOUCAUT, a town of Orleanois, in France, fifteen miles eaſt of Angouleſme.

ROCHELLE, a city and port-town of Orleanois, in France: weſt long. 1° 5′, north lat. 46° 7′.

ROCHESTER, a city of Kent, ſituated on the river Medway, thirty miles eaſt of London, and twenty two weſt of Canterbury.

Roceſter bridge, over the Medway, makes a much finer appearance than London bridge, there being no houſes

on it, and an iron paliſade running its whole length on each hand.

ROCHFORD, a market-town of Eſſex, thirty-three miles eaſt of London, and fifteen ſouth-eaſt of Chelmsford.

ROCHFORT, a port-town of Guienne, in France, twenty-three miles ſouth of Rochelle: weſt long. 1°, north lat. 46°. It is one of the ſtations of the french navy, having a commodious harbour, well ſecured by forts and batteries.

ROCKET, in pyrotechny, an artificial fire work, conſiſting of a cylindrical caſe of paper, filled with a compoſition of certain combuſtible ingredients; which, being tied to a ſtick, mounts into the air, to a conſiderable height, and there burſts.

Rockets make a conſiderable part of all fire-works of entertainment; being not only uſed ſingly, but alſo as an ingredient in others.

The rocket, above defined, is properly the ſky-rocket; the method of making which, is this. 1. A concave cylindrical mould, AB (plate CCXXXIV. fig. 2. n° 1.) is turned of hard wood, with a baſe BD, and a capital HC, uſually adorned with ſuitable mouldings. This cylinder muſt be open at both ends, and its dimenſions, for rockets of various ſizes, as in the following article. When large, it is ſometimes alſo made of braſs or tin; and when ſmall, of bone. 2. Of the ſame matter with the cylinder, is prepared a quadra, or foot ME; in the middle of which is turned a hemiſphere GO, conſiderably leſs than the cavity of the cylinder; making the cap or head of another cylinder IK, and reaching up within the caſe, where it is kept ſteady by a pin LM.

Authors do not agree about the proportions.—Simionowitz preſcribes thoſe that follow: if the diameter of the aperture HN be equal to that of a leaden ball of a pound, or at moſt two pounds weight; the height of the cylinder, with the baſe and capital HC, to be ſeven diameters, and the heighth of the quadra FE $1\frac{1}{3}$. The altitude of the cylinder KI, 1. The diameter HN, $\frac{1}{2}\frac{2}{3}$. The diameter of the hemiſphere G, $\frac{2}{3}$. The heighth of the capital AC, 1. The ſame author adds, that he finds by abundant experience, that, if the diameter of the aperture be divided into 100 parts, according to the different weight of the leaden balls, to whoſe diameter it is equal, the following numbers, being multiplied by 7, give the heighth HE.

Weight of leaden ball.	Subſeptuple of altitude HE.

100	57

The mould being ready, a wooden cylinder or mould AB (*ibid.* n° 2.) is provided, whoſe diameter is $\frac{3}{4}$ of the aperture of the frame, and its length equal to the heighth of the ſame; to which is fixed a haft or hilt AD. About this mould is a thick ſtrong paper rolled, till ſuch time as it fills the cavity of the frame. This done, where the haft is joined to the cylinder, as at A, it is choaked, *i. e.* firmly bound round with fine pack-thread, ſo as to conſtringe or ſtraighten the cavity thereof. The part thus choaked or bound up FG (*ibid.* n° 3.) to be equal to the hemiſphere GO n° 1.

The caſe is now taken off the mould, and put into the cavity of the frame (n° 1.) the choak GF upon the hemiſphere; and in this diſpoſition is filled with a compoſition deſcribed in the following table, rammed ſtrongly in by means of a wooden cylinder, or rammer fitting the cavity, and a mallet.

When filled, a paper-cap of a conical form is glued over the end of the caſe filled laſt; and the ſpace left a-top filled with whole gunpowder, to the heighth of about one diameter; then the rocket bound, or choaked in E, as before in G.

Laſtly, the rocket is bored, as is repreſented in AL (n° 3.) care being taken to do it in the middle. Some, indeed, bore the rocket, as they fill it, by thruſting a long, ſharp ſpike through the lower baſis, and drawing it out again, when the rocket is full; but it is beſt not to bore till the rocket be uſed.

The boring is to go two thirds of the heighth of the rocket, abating one diameter of the cavity. The diameter of the

Fig. 1. Motion of RIVERS.

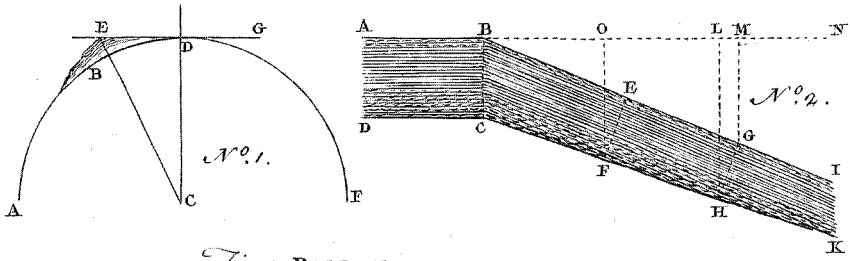

Fig. 2. ROCKETS

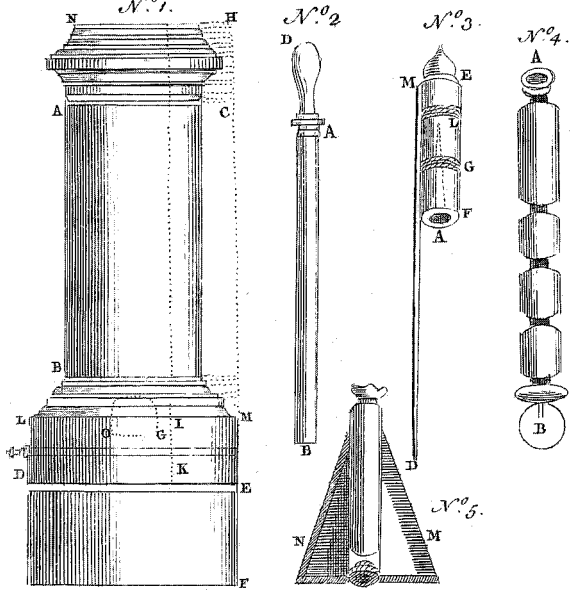

Fig. 3. The ROSE.

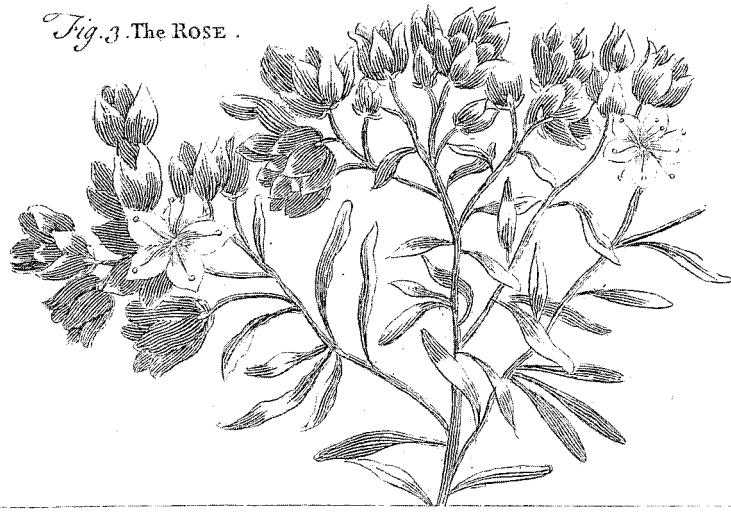

Fig. 4 Coggeshal's sliding-RULE.

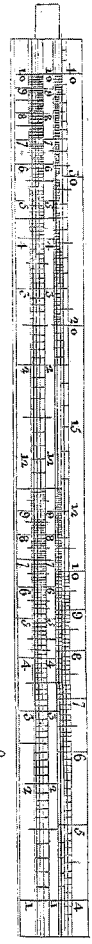

T. Jefferys sculp

the bore in G is to be $\frac{1}{4}$ of the diameter of the cylinder; and in L $\frac{1}{8}$ of the lower diameter.

To make the rocket mount ſtraight up, it is tied faſt to the end of a long ſlender ſtick, MD (*ibid.* n° 3.) eight times as long as the rocket, in ſuch manner, as that, when poiſed on the finger near the touch-hole F, the ſtick (which is uſually made biggeſt at this end, and ſloping gently to the other) may preponderate, though very little. The rocket, thus equipped, is hung at freedom, and lighted with port-fire.

Note, ſome, inſtead of a ſtick to make the rocket mount, furniſh it with two wings, as MN (*ibid.* n° 5.) which have the ſame effect; and, inſtead of paper, ſome make the caſes of wood covered with leather; others of a thin iron-plate. And ſome, inſtead of a wooden ſtick, uſe an iron-wire, with a plummet at the end of it.

The compoſition wherewith rockets are filled, conſiſts of the following ingredients, *viz.* ſalt-petre, charcoal, and ſulphur, all well ground; but the proportions of theſe are various, for rockets of various ſizes; as in the following table. Noting, that, in ſmall rockets, gun-powder-duſt is added.

Compoſitions of ROCKETS of various ſizes.

Weight of Rocket.	Salt-pet.	Sulphur.	Charcoal.	Gun-powder duſt.

Note, ſeveral rockets being diſpoſed round the circumference of a wheel, whether circular or polygonous, the head of the one applied to the tail of another, and the wheel put in motion; as one rocket is ſpent, another will take fire; and the wheel be continued in its rotation.

As an additional ornament to rockets, it is uſual to furniſh them either with ſtars or with ſerpents, or ſparks, which take fire when the rocket burſts; and ſometimes little rockets are incloſed in great ones, to take fire when the large one is at its greateſt height.

To make ſtars for ROCKETS. Mix three pounds of ſalt-petre with eleven ounces of ſulphur, three ounces of beaten gun-powder, and ten of antimony. Moiſten the maſs with gum-water, and form them into little balls of the ſize of filberds; drying them well, either in the ſun or an oven. When dry, incloſe a number of them in the conical cap of the rocket.

Theory of the flight of ſky-ROCKETS. Mariotte takes the riſe of rockets to be owing to the impulſe or reſiſtance of the air againſt the flame: Dr. Deſaguliers accounts for it otherwiſe.

Conceive the rocket to have no vent at the choak, and to be ſet on fire in the conical bore; the conſequence will be, either that the rocket would burſt in the weakeſt place, or, if all its parts were equally ſtrong, and able to ſuſtain the impulſe of the flame, the rocket would burn out immoveable. Now, as the force of the flame is equable, ſuppoſe its action downwards, or that upwards, ſufficient to lift forty pounds. As theſe forces are equal, but their directions contrary, they will deſtroy each other's action.

Imagine, then, the rocket opened at the choak; by this means the action of the flame downwards is taken away, and there remains a force equal to forty pounds acting upwards, to carry up the rocket, and the ſtick it is tied to. Accordingly, we find that if the compoſition of the rocket be very weak, ſo as not to give an impulſe greater than the weight of the rocket and ſtick, it does not riſe at all; or if the compoſition be ſlow, ſo that a ſmall part of it only kindles at firſt, the rocket will not riſe.

The ſtick ſerves to keep it perpendicular; for if the rocket ſhould begin to ſtumble, moving round a point in the choak, as being the common center of gravity of rocket and ſtick, there would be ſo much friction againſt the air, by the ſtick between the center and the point, and the point would beat againſt the air with ſo much velocity, that the reaction of the medium would reſtore it to its perpendicularity.

When the compoſition is burnt out, and the impulſe upwards is ceaſed, the com-

mon center of gravity is brought lower towards the middle of the ſtick; by which means the velocity of the point of the ſtick is decreaſed, and that of the point of the rocket increaſed; ſo that the whole will tumble down, with the rocket-end foremoſt.

All the while the rocket burns, the common center of gravity is ſhifting and getting downwards, and ſtill the faſter and the lower, as the ſtick is the lighter; ſo that it ſometimes begins to tumble before it be burnt out; but when the ſtick is a little too heavy, the weight of the rocket bearing a leſs proportion to that of the ſtick, the common center of gravity will not get ſo low, but that the rocket will riſe ſtraight, though not ſo faſt.

Method of making a water-ROCKET. Make a rocket after the uſual manner, excepting the number of choaks. Let its diameter be equal to that of a leaden-ball, of two or three inches diameter, and let it be bored to a third part of its height. Incloſe the rocket in a hollow paper cylinder, which ſmear over with melted pitch or wax, that it may reſiſt the moiſture.

Note, the weight of the rocket is to be ſo proportioned to that of the water, that the whole cylinder may be immerged. Some, inſtead of a cylinder, uſe a truncated cone, or even a ſpheroid; and ſome hang a weight to the end at which it is lighted.

ROCKINGHAM, a market-town of Northamptonſhire, ſituated nineteen miles north of Northampton.

ROD, a wand, or long ſlender ſtaff.

ROD is alſo uſed for a land meaſure of ſixteeen feet and a half: the ſame with perch and pole.

ROD, in gauging. See GAUGING.

Black-ROD, a ſtaff carried by the king's gentleman-uſher, as a badge of his office; this rod or ſtaff is black, and has a lion in gold on its top. See USHER.

Fiſhing-ROD, a long taper rod or wand, to which the line is faſtened for angling.

Of theſe there are ſeveral ſorts; as, 1. The troller, or trolling-rod, which has a ring at the end, for the line to go through, when it runs off a reel. 2. The whipper, or whipping-rod, which is weak in the middle, and top-heavy, but very ſlender. 3. The dopper, which is a ſtrong rod, and very light. 4. The ſnapper, or ſnap rod, which is a ſtrong rod, peculiarly uſed for the pike. 5. The bottom-rod, which is the ſame as the dapper, only ſomewhat more pliable. 6. The ſniggling or poking ſtick, which is a forked ſtick, that has a ſhort ſtrong line baited with a lob-worm: this is only uſed for eels in their holes. See the article ANGLING, *&c.*

RODEZ, a city of France, in the province of Guienne: eaſt long. 2° 8′, north lat. 44° 20′.

RODRIGO. See CASTEL-RODRIGO.

ROE, the ſpawn or ſeed of fiſh. That of the male-fiſhes is uſually diſtinguiſhed by the name of ſoft-roe, or milt, and that of the female, by hard-roe, or ſpawn.

So inconceivably numerous are theſe ovula, or ſmall eggs, that M. Petit found 342144 of them in a carp of eighteen inches: but Mr. Leewenhoeck found in a carp no more than 211629. This laſt gentleman obſerves, that there are four times this number in a cod, and that a common one contains 9344000 eggs.

ROE is alſo one of the beaſts of chaſe, of the deer kind. See CERVUS.

The roe buck is called, the firſt year, a hind; the ſecond, a gyrle; the third, an henuſe; the fourth, a roe-buck of the firſt head; and the fifth, a fair roe-buck.

ROELLA, in botany, a genus of the *pentandria monogynia* claſs of plants, with a monopetalous infundibuliform-flower, divided into five parts at the limb; the fruit is a cylindraceous capſule, ſhorter than the cup, compoſed of a ſingle valve, and containing numerous angulated ſeeds; whence it is evidently diſtinct from the companula and polemonium.

ROER, the name of two rivers in Germany, one of which riſes on the confines of Heſſe, and falls into the Rhine, a little below Duyſburg; the other riſes in the dutchy of Juliers, and falls into the Maeſe at Roermond.

ROERMOND, a city of the United Netherlands, in the province of Gelderland: eaſt long. 5° 33′, north lat. 51° 18′.

ROGA, in antiquity, a preſent which the emperors made to the ſenators, magiſtrates, and even to the people; and the popes or patriarchs to their clergy.

Theſe rogæ were diſtributed by the emperors on the firſt day of the year, on their birth-day, or on the natalis dies of the cities: and by the popes and patriarchs, in paſſion-week.

Roga is alſo uſed for the common pay of the ſoldiers.

ROGA-

ROGAROFF, a city of Poland, in the dutchy of Lithuania: east long. 30°. north lat. 52° 45′.

ROGATION, in the roman juriſprudence, a demand made by the conſuls, or tribunes of the roman people, when a law was propoſed to be paſſed. Rogatio is alſo uſed for the decree itſelf made in conſequence of the peoples giving their aſſent to this demand, to diſtinguiſh it from a ſenatus conſultum, or decree of the ſenate.

ROGATION-WEEK, the week immediately preceding Whitſunday, ſo called from the three faſts therein on Monday, Tueſday, and Wedneſday, which are alſo called rogations, or rogation-days, from the extraordinary prayers and ſupplications at this time offered to God by devout chriſtians, to appeaſe his anger and deprecate his judgments.

ROGUE, in law, an idle ſturdy beggar; who by antient ſtatutes is for the firſt offence called a rogue of the firſt degree, and puniſhed by whipping, and boaring through the griſtle of the right ear with a hot iron; and for the ſecond offence, is termed a rogue of the ſecond degree, and if above eighteen years of age, ordered to be executed as a felon.

ROHAN, a town of France, in the province of Britany, ſituated twenty miles north of Vannes.

ROLDUC, a town of the Netherlands, in the dutchy of Limburg, five miles north of Aix-la-Chapelle.

ROLL, in manufactories, ſomething wound and folded up in a cylindrical form.

Few ſtuffs are made up in rolls, except ſattins, gawſes, and crapes, which are apt to break, and take plaits not eaſy to be got out, if folded otherwiſe. Ribbons, laces, galloons, and paduas of all kinds, are alſo thus rolled.

A roll of tobacco is tobacco in the leaf, twiſted on the mill, and wound twiſt over twiſt, about a ſtick or roller. A great deal of tobacco is ſold in America in rolls of various weights; and it is not till its arrival in England, Spain, France and Holland, that it is cut. See TOBACCO.

A roll of parchment, properly denotes the quantity of ſixty ſkins.

The antients made all their books up in the form of rolls, and in Cicero's time the libraries conſiſted wholly of ſuch rolls. See the article *Form of* BOOKS.

ROLL, in law, ſignifies a ſchedule or parchment which may be rolled up by the hand into the form of a pipe.

In theſe ſchedules of parchment all the pleadings, memorials, and acts of court, are entered and filed by the proper officer; which being done, they become records of the court. Of theſe there are in the exchequer ſeveral kinds, as the great wardrobe-roll, the cofferer's roll, the ſubſidy-roll, *&c.*

Roll is alſo uſed for a liſt of the names of perſons of the ſame condition, or of thoſe who have entered into the ſame engagement. Thus a court-roll of a manor, is that in which the names, rents, and ſervices of each tenant are copied and inrolled.

Calves-head ROLL, a roll in the two temples, in which every bencher is taxed yearly at 2 s. every barriſter at 1 s. 6 d. and every gentleman under the bar at 1 s. to the cook, and other officers of the houſe; in conſideration of a dinner of calves-heads, provided in Eaſter-term.

Muſter-ROLL, that in which are entered the ſoldiers of every troop, company, regiment, *&c.*

As ſoon as a ſoldier's name is written down on the roll, it is death for him to deſert.

ROLLS-OFFICE, is an office in Chancery-lane, London, appointed for the cuſtody of the rolls and records in chancery. See the article MASTER *of the rolls.*

Rider-ROLL, a ſchedule of parchment frequently ſewed or added to ſome part of a roll or record.

ROLLS *of parliament*, are the manuſcript regiſters, or rolls of the proceedings of our antient parliaments, which before the invention of printing were all engroſſed on parchment, and proclaimed openly in every county. In theſe rolls are alſo contained a great many deciſions of difficult points of law, which were frequently in former times referred to the deciſion of that high court.

ROLL, in antiquity. See ACACIA.

ROLL, or ROLLER, is alſo a piece of wood, iron, braſs, *&c.* of a cylindrical form, uſed in the conſtruction of ſeveral machines, and in ſeveral works and manufactures.

Thus in the glaſs manufacture they have a running-roll, which is a thick cylinder of caſt braſs, which ſerves to conduct the melted glaſs to the end of the table on which large looking-glaſſes, *&c.* are caſt. See the article GLASS.

Founders alſo uſe a roll to work the ſand which they uſe in making their moulds.

The preſſes called calenders, as ſerving

to

to calender ſtuffs withal, conſiſt, among other eſſential parts, of two rollers. It is alſo between two rollers that the waves are given to ſilks, mohairs, and other ſtuffs proper to be tabbied.

Impreſſions from copper-plates are alſo taken by paſſing the plate and paper between two rollers. See the article *Rolling-preſs* PRINTING.

Rolls, in flatting-mills, *&c.* are two iron inſtruments of a cylindrical form, which ſerve to draw or ſtretch out plates of gold, ſilver, and other metals.

Rolls, in ſugar-works, are two large iron barrels, which ſerve to bruiſe the canes, and to expreſs the juice. Theſe are caſt hollow, and their cavities are filled up with wood, the cylinders of which are properly the rollers.

Rolls, among book-binders, are indeed of a different form; theſe being a kind of ſmall braſs-wheels with flowers, leaves, *&c.* cut on the edge: theſe wheels are fixed on an axis to which there is a handle, and being rolled when hot round the edges, *&c.* of the cover of a book, leave the impreſſion of the flowers cut on the wheel, either plain or in gold.

Rollers, among gardiners, are large ſtone, iron, or wooden cylinders fixed in a large handle; and drawn over walks, graſs-plots, *&c.* to render them ſmooth and even.

Rolls, or rollers, among carpenters, maſons, *&c.* are plain cylinders three or four feet long, uſed for the moving of beams, huge ſtones, *&c.* Theſe are placed ſucceſſively under the fore-part of the body to be removed, which is at the ſame time puſhed forwards by leavers, *&c.* applied behind. For moving loads exceſſively heavy, the maſons, *&c.* have what they call endleſs rollers, which are about double the length and thickneſs of the common rollers, and beſides are girt with ſeveral large iron-hoops at each end: at a foot diſtance from the ends are four mortoiſes, or rather only two, but pierced through, into which are put the ends of long levers, which the workmen draw by long ropes faſtened to the ends, ſtill changing the mortoiſe as the roll has made a quarter of a turn. See LEVER.

ROLLER, in ſurgery, a long and broad bandage uſually of linnen-cloth, rolled round any part of the body, to keep it in, or diſpoſe it to a ſtate of health. See the article BANDAGE.

ROLLER, in ornithology, the grey ampelis, with the head variegated with black. See the article AMPELIS.

ROLLER is alſo the name of a ſpecies of the corvus, with a blood-red back, a green tail, and black wings. See the article CORVUS.

ROLLING-PRESS *printing*. See the article PRINTING.

ROMAN, in general, ſomething belonging to the city of Rome. See ROME.

For the roman ſenate, emperors, conſuls, prætors, quæſtors, ædiles, games, *&c.* See SENATE, EMPEROR, *&c.*

The term roman purple, is at preſent uſed to denote the dignity of a cardinal. See the article CARDINAL.

The roman catholics are thoſe chriſtians who follow the doctrines and diſcipline of the church of Rome; the ſubſtance of which may be ſeen in pope Pius's creed, and has been treated of in the courſe of this work, under the articles TRANSUBSTANTIATION, MARRIAGE, CELIBACY, BAPTISM, SACRAMENT, MONK, MASS, HOST, IMAGE, RELICS, PURGATORY, *&c. &c.*

King of the ROMANS, in modern hiſtory, is a prince elected to be ſucceſſor to the reigning emperor of Germany. See the articles EMPEROR, ELECTOR, *&c.*

ROMAN ORDER, in architecture, the ſame with the compoſite order. See the articles ORDER and COMPOSITE.

As to the roman ballance, indiction, year, language, citizens, *&c.* ſee the articles BALLANCE, INDICTION, *&c.*

ROMANCE, in matters of literature, a fabulous relation of certain adventures deſigned for the entertainment and inſtruction of the readers. See FABLE.

The true nature and genuine characteriſtics of this ſpecies of writing are excellently explained by the ingenious author of the Rambler; who obſerves, that the works of fiction, with which the preſent generation ſeems more particularly delighted, are ſuch as exhibit life in its true ſtate, diverſified only by the accidents that daily happen in the world, and influenced by thoſe paſſions and qualities which are really to be found in converſing with mankind.

This kind of writing may be termed not improperly the comedy of romance, and is to be connected nearly by the rules of comic poetry. Its province is to bring about natural events by eaſy means, and to keep up curioſity without the help of wonder: it is therefore precluded from the

the machines and expedients of the heroic romance, and can neither employ giants to ſnatch away a lady from the nuptial rites, nor knights to bring her back from captivity; it can neither bewilder its perſonages in deſarts, nor lodge them in imaginary caſtles.

Scaliger, upon Pontanus, remarks, that all his writings are filled with images, and that if you take from him his lillies and his roſes, his ſatyrs and his dryads, he will have nothing left that can be called poetry. In like manner, almoſt all the fictions of the laſt age will vaniſh, if you deprive them of a hermit and a wood, a battle and a ſhipwreck.

Why this wild ſtrain of imagination found reception ſo long, in polite and learned ages, it is not eaſy to conceive; but we cannot wonder, that, while readers could be procured, the authors were willing to continue it; for when a man had, by practice, gained ſome fluency of language, he had no farther care than to retire to his cloſet, to let looſe his invention, and heat his mind with incredibilities; and a book was produced without fear of criticiſm, without the toil of ſtudy, without knowledge of nature, or acquaintance with life.

The taſk of our preſent writers is very different; it requires, together with that learning which is to be gained from books, that experience which can never be attained by ſolitary diligence, but muſt ariſe from general converſe, and accurate obſervation of the living world. Their performances have, as Horace expreſſes it, *plus oneris quantum veniæ minus*, little indulgence, and therefore more difficulty. They are engaged in portraits of which every one knows the original, and can therefore detect any deviation from exactneſs of reſemblance. Other writings are ſafe, except from the malice of learning, but theſe are in danger from every common reader; as the ſlipper was cenſured by a ſhoemaker, who happened to ſtop in his way at the Venus of Apelles.

But the danger of not being approved as juſt copiers of human manners is not the moſt important apprehenſion that an author of this ſort ought to have before him. Theſe books are written chiefly to the young, the ignorant, and the idle, to whom they ſerve as lectures of conduct, and introductions into life. They are the entertainment of minds unfurniſhed with ideas, and therefore eaſily ſuſceptible of impreſſions; not fixed by principles, and therefore eaſily following the current of fancy; not informed by experience, and conſequently open to every falſe ſuggeſtion and partial account.

That the higheſt degree of reverence ſhould be paid to youth, and that nothing indecent or unſeemly ſhould be ſuffered to approach their eyes or ears, are precepts extorted by ſenſe and virtue from an antient writer, by no means eminent for chaſtity of thought. The ſame kind, though not the ſame degree of caution, is required in every thing which is laid before them, to ſecure them from unjuſt prejudices, perverſe opinions, and improper combinations of images.

In the romances formerly written, every tranſaction and ſentiment was ſo remote from all that paſſes among men, that the reader was in very little danger of making any applications to himſelf; the virtues and crimes were equally beyond his ſphere of activity; and he amuſed himſelf with heroes, and with traitors, deliverers and proſecutors, as with beings of another ſpecies, whoſe actions were regulated upon motives of their own, and who had neither faults nor excellencies in common with himſelf.

But when an adventurer is levelled with the reſt of the world, and acts in ſuch ſcenes of the univerſal drama, as may be the lot of any other man, young ſpectators fix their eyes upon him with cloſer attention, and hope, by obſerving his behaviour and ſucceſs, to regulate their own practices, when they ſhall be engaged in the like part.

For this reaſon, theſe familiar hiſtories may perhaps be made of greater uſe than the ſolemnities of profeſſed morality, and convey the knowledge of vice and virtue with more accuracy, than axioms and definitions. But if the power of example is ſo great, as to take poſſeſſion of the memory by a kind of violence, and produce effects almoſt without the intervention of the will, care ought to be taken, that, when the choice is unreſtrained, the beſt examples only ſhould be exhibited; and that which is likely to operate ſo ſtrongly, ſhould not be miſchievous or uncertain in its effects.

The chief advantages which theſe fictions have over real life, is, that their authors are at liberty, though not to invent, yet to ſelect objects, and to cull

from the mass of mankind, those individuals upon which the attention ought most to be employed; as a diamond, though it cannot be made, may be polished by art, and placed in such a situation, as to display that lustre which before was buried among common stones.

ROMANIA, a province of the pope's territories in Italy, including the Bolognese and Ferrarese. See the articles BOLOGNA and FERRARA.

ROMANIA is also the modern name of antient Thrace, which now makes a province of Turky in Europe; lying westward of the Propontis, between the Euxine sea and the Archipelago.

ROMANS, or ROMANT, an appellation formerly given to the polite french language, in opposition to the waloon. See the articles FRENCH and WALOON.

ROMANS is also a town of Dauphine, in France, situated on the river Isere, fifteen miles south-west of Grenoble.

ROME, *roma*, the capital of the pope's territories and of Italy, and antiently the mistress of the roman empire: east long. 13°, north lat. 41° 45'.

Rome is still a large and fine city, though not to be compared to antient Rome; the streets are spacious and magnificently built; it has five bridges over the Tiber, twenty gates, three hundred churches, and a vast number of palaces, convents, triumphal arches, pillars, obelisks, statues, theatres, &c.

ROMNEY, a borough-town of Kent, and one of the cinque ports, situated twelve miles south-west of Dover.

It sends two members to parliament.

ROMPEE, or ROMPU, in heraldry, is applied to ordinaries that are represented as broken, and to chevrons, bends, or the like, whose upper points are cut off. See plate CCXXXIII. fig. 3.

RONCIGLIONE, a town of Italy, in the pope's territories, and in St. Peter's patrimony, twenty-five miles north of Rome.

RONDA, a town of Spain, in the province of Granada, twenty-two miles north of Gibraltar.

RONDEL, in fortification, a round tower, sometimes erected at the foot of a bastion.

RONDELETIA, in botany, a genus of the *pentandria-monogynia* class of plants, the corolla whereof consists of a single petal of the infundibuliform-kind; the tube is cylindric and longer than the cup, and ventricose at the top; the limb is divided into five roundish segments, which bend backward: the fruit is a roundish coronated capsule, containing two cells; the seeds are numerous and small.

ROOD, a quantity of land equal to forty square perches, or the fourth part of an acre.

ROOF, in architecture, the uppermost part of a building.

The roof contains the timber-work, and its covering of slate, tile, lead, &c. tho' carpenters usually restrain the word to the timber-work only.

The form of roofs is various: sometimes it is pointed, in which case the most beautiful proportion is to have its profile an equilateral triangle: sometimes it is square, that is, the pitch or angle of the ridge is a right angle, which therefore is a mean proportion, between the pointed and flat roof, which last is in the same proportion as a triangular pediment: this is chiefly used in Italy, and the hot countries where there is but little snow. Sometimes roofs are made in the pinnacle-form: sometimes they have a double ridge, and sometimes they are mutilated, that is, consist of a true and a false roof, which is laid over the former: sometimes again they are in the form of a platform, as most of the eastern buildings are; and sometimes they are truncated, that is, instead of terminating in a ridge, the roof is cut square off at a certain height, covered with a terrass, and incompassed with a ballustrade; and sometimes, again, a roof is made in the manner of a dome. When the walls have been raised to their designed height, the vaults made, the joists laid, the stairs, &c. brought up, then the roof is to be raised, which embracing every part of the building, and with its weight equally pressing upon the walls, is a band to all the work; and besides, defends the inhabitants from rain or snow, the burning heat of the sun, and the moisture of the night, and is of no small advantage to the building, in casting off the rain water from the walls. See the article GUTTER.

ROOF-TREES, or RUFF-TREES, in a ship, are small timbers which go from the half-deck to the fore-castle, and serve to bear up the gratings.

This term is also used for the upper timbers in any building.

Hip-ROOF. See the article HIP-ROOF.

ROOK, in ornithology, a species of the wholly black corvus. See CORVUS.

ROOM, a chamber, parlour, or other apartment in a house. See BUILDING.

Rooms are either made with a vaulted

or flat ceiling. If with a flat ceiling, Palladio says, that the height from the floor to the ceiling must be equal to their breadth; and the rooms above must be a sixth part less in height than those below: but if they are vaulted, the height of the vaults in rooms that are square, is a third part more than its breadth.

With regard to the compartment and disposition of rooms, he says, that the halls and magnificent rooms ought to be light and easy of ascent; and that the small rooms may be divided off to make closets. That the rooms for summer ought to be spacious and turned to the north; and those for the winter to the south and west, and rather small than otherwise: because we seek the shade in summer, and in winter the sun; besides small rooms are more easily warmed than large. But the large rooms with the middling, and those with the small, ought to be so distributed that one part of the fabric may correspond with the other, and that the body of the edifice may have in itself a certain convenience in its members, which may render the whole beautiful and graceful.

ROOMS, in a ship, are places divided by partitions or bulk-heads. See the articles GUN-ROOM, COOK-ROOM, &c.

ROOMER, in the sea-language; a ship is said to be a roomer when she is larger than ordinary.

ROOT, *radix*, among botanists, denotes that part of a plant which imbibes the nutritious juices of the earth, and transmits them to the other parts. See the articles PLANT and VEGETATION.

The roots of plants are distinguished, according to their different forms, into bulbose, fibrose, granulose, grumose, tuberose, and tap-roots. See BULBOSE, &c.

As to the gathering and preserving roots for medicinal uses, the Edinburgh-dispensatory directs, that the annual roots be taken up before they shoot out stems or flowers; the biennial ones, for the most part, in the autumn of the first year; and the perennial ones when the leaves begin to fall, and therefore generally in autumn: then being cleansed by washing, and freed from the withered and decayed fibres, they are to be hung in a shady place pervious to the air, till they are moderately dry: the thicker roots should be slit lengthwise; or they may be cut transversely into thin pieces, and the pith taken out. These roots, which are very numerous, have been treated of under their several articles RHUBARB, JALAP, HELLEBORE, &c. &c.

ROOT-GRAFTING, in gardening. See the article GRAFTING.

ROOT, in mathematics, a quantity considered as the basis or foundation of a higher power; or one which being multiplied into itself any number of times, produces a square, cubic, biquadratic, &c. quantity; called the second, third, fourth, &c. power of the root, or quantity, so multiplied into itself: thus a is the square root of $a \times a$, or a^2; and 4 the square root of $4 \times 4 = 16$. Again, a is the cube-root of $a \times a \times a = a^3$; and 3 the cube-root of $3 \times 3 \times 3 = 27$: and so on. See the articles INVOLUTION, POWER, and EXTRACTION *of roots*.

The roots of powers are expressed by placing the radical sign $\sqrt{\ }$ over them, with a number denoting what kind of root they are: thus the square or second root of 16 is expressed by $\sqrt[2]{16}$, and the cube or third root of 27 by $\sqrt{27}$; and, in general, the nth root of a raised to the power m, is expressed by $\sqrt[n]{a^m}$. When the root of a compound quantity is wanted, the vinculum of the radical sign must be drawn over the whole: thus the square root of $a^2 + 2ab + b^2$ is expressed by $\sqrt[2]{a^2 + 2ab + b^2}$; and it ought to be observed, that when the radical sign has no number above it, to denote what root is wanted, the square root is always meant; as $\sqrt{a^2}$, or $\sqrt{16}$, is the square root of a^2, or the square root of 16.

ROOTS, *radices*, in grammar, are the primitive words of a language, whence the others are formed or derived. See the articles WORD and LANGUAGE.

ROPE, hemp, hair, &c. spun out into a thick yarn, and then several strings of this yarn twisted together by means of a wheel. When made very small it is called a cord, and when very thick, a cable. See CORD and CABLE.

Dr. Desaguliers, in the first volume of his Experimental Philosophy, has computed the forces necessary to bend ropes of different diameters, stretched by different weights, round rollers of different bigness, to be as in the following table.

Diameters of the ropes of three ſtrands, expreſſed in tenth parts of an inch.	Weights ſtretching the ropes, expreſſed in *lb.* avoirdupois.	Reſiſtance about a roller of half an inch diameter, in *oz.* avoirdupois.	Reſiſtance about a roller of one inch diameter in *oz.* avoirdupois.	Reſiſtance about a roller 1 ½ inches diameter in *oz.* avoirdupois.
0.5	60*lb.*	225 *oz.*	112½ *oz.*	75 *oz.*
0.2	60	90	45	30
0.1	60	45	22½	15
0.5	40	150	75	50
0.2	40	60	30	20
0.1	40	30	15	10
0.5	20	75	37½	25
0.2	20	30	15	10
0.1	20	15	7½	*

On the whole, it is found by experiments, that the difficulty of bending a rope round a roller decreaſes directly as the diameter of the roller increaſes; or is, inverſely, as the diameter of the roller.

Ropes are made for various uſes, as for binding, ſtaying, drawing, ſuſpending, *&c.*

The greateſt conſumption of ropes is in navigation, for the tackling of ſhips: where, though ropes include the whole cordage, there are ſeveral particularly ſo denominated, and which have particular names given to them: theſe are, 1. Auning-ropes, which are for ſpreading the aunings. 2. Bell-ropes, which are made faſt to the crank for ſtriking it. 3. Boat-rope, that by which the boat at the ſtern is towed. 4. Bolt-ropes, the head and body ropes ſowed round the ſails. 5. Breaſt-rope, that made faſt to the ſhrouds in the chains, to ſupport the man that heaves the lead. 6. Bucket-rope, that which is tied to the bucket, for hauling up water. 7. Buoy-rope, that which is tied to the buoy by one end, and to the ſtock of the anchor by the other. 8. Can-hook-ropes, which are ſeized to each hook, to hoiſt hogſheads, *&c.* on board. Cat-rope, that uſed for hoiſting up the anchor in order to be ſtowed at the bow. 10. Davit-rope, is reeved through a hole made at each end, for hauling the davit to either ſide of the fore-caſtle. 11. Entring-rope, to take hold of, in going up the ſhip's ſide. 12. Luff-hook-rope, is for bouſing the tack aboard, when it blows hard, and is a ſort of preventer to the tack. 13. Grapnel-rope, that which being bent to a grapnel, either the long-boat, pinnace, or yawl rides by it. 14. Gueſs-rope, is for keeping the long-boat, pinnace, or yawl from ſteeving, or going too much in and out when towing. 15. Parrel-rope is reeved through the ribs and trucks, and, with the breaſt-ropes, laſhes the parrel to the maſts. 16. Rudder-rope, that reeved through a hole in the boat's rudder. 17. Slip-rope is for triſeing up the bites of the cable to the rails of the head. 18. Stantion-ropes, thoſe reeved through the eyes of the ſtantions. 19. Swabb-rope ſerves as a handle to the eyes of the ſtantions. 20. Top-ropes are thoſe with which the top-maſts are ſet or ſtruck; they are reeved through an iron-bound block, which hooks under the cap, and then reeved through the heel of the top-maſt; the other part of them comes down to the top-tackle-falls, which has double blocks iron-bound, and hooks to ring bolts upon the deck. 21. Tiller-ropes, are to keep the tiller ſteady, that it may not fly from ſide to ſide. 22. Waſt-ropes, for boats to make faſt to, along ſide. 23. Wheel-rope, that which goes round the ſpindle of the ſteering-wheel, and from thence to the titter.

ROPE-YARN, among ſailors, is the yarn of any rope untwiſted, but commonly made up of junk; its uſe is to make ſinnet, mats, *&c.*

ROS, DEW. See the article DEW.

ROSACEOUS, among botaniſts, an appellation given to ſuch flowers, as are compoſed of ſeveral petals or leaves, diſpoſed in a ſort of circular form, like thoſe of the roſe: ſuch are the flowers of the piony, crowfoot, cinquefoil, *&c.* In this ſort of flowers the diſpoſition only of the leaves is regarded, their number being of no conſequence. It is very ſeldom that the number is two or four, except in the circæa and onagra. The moſt frequent number of leaves in theſe flowers is five, and ſuch as have four differ from the cruciform flowers, not only in their diſpoſition, but in this, that the number is in the ſame ſpecies indeterminately, four, five, or ſix, as is the caſe in the clematitis, the capers, and the ſpecies of rue, whereas in the cruciform ones it is ever conſtant. See BOTANY.

ROSARY, among the roman-catholics, the ſame with chaplet. See CHAPLET.

Before a perſon repeats his roſary, he muſt croſs himſelf with it; he muſt then repeat

repeat the apoſtles' creed, and ſay a paternoſter, and three aves, on account of the three relations which the virgin bears to the three perſons in the trinity; after which he paſſes on to his decads.

Roſary alſo denotes a particular form of devotion addreſſed to the virgin, to which the chaplet of that name is accommodated.

ROSCOMMON, a county of Ireland, bounded by Letrim on the north, and Galway on the ſouth.

ROSE, *roſa*, in botany, a genus of the *icoſandria-polygynia* claſs of plants, the flower of which is compoſed of five petals, obverſely cordated, and arranged in a circular form: the fruit is formed of the fleſhy baſe of the cup, which is of a turbinated figure, coloured, ſoft, containing only one cell drawn together at the neck, and coronated with ſome irregular laciniæ; the ſeeds are numerous, oblong and hairy. See plate CCXXXIV. fig. 3.

The wild briar, with beautiful pinnated leaves, a white or pale red flower, and the common hip for its fruit, is that above deſcribed: and, indeed, all the beautiful roſes in our gardens, are only varieties of this ſpecies, principally owing to culture; the red, the damaſk, the white, the variegated, *&c.* roſes, being all produced from this original ſpecies.

The flowers of the red roſe are aſtringent, thoſe of the damaſk-roſe purgative, and the fruit of the wild roſe pectoral. The roſe-water of the ſhops, diſtilled from the flowers of the damaſk-roſe, has been celebrated for many virtues; but its fragrant ſmell is the only quality now regarded in it. There is alſo a ſyrup, made either from the juice, or infuſion of the freſh flowers of damaſk-roſes.

Bay-ROSE, and ROSE *of Jericho*. See the articles NERIUM and HESPERIS.

ROSE, in architecture, an ornament cut in the form of a roſe, chiefly uſed in corniches, frizes, vaults of churches, *&c.* and particularly in the middle of each face in the corinthian abacus.

ROSE-NOBLE, an antient engliſh gold-coin, firſt ſtruck in the reign of Edward III. It was formerly current at 6s. 8d. and ſo called becauſe ſtamped with a roſe.

ROSE-WOOD, *rhodium*, or *aſpalathum*, in the materia medica. See ASPALATH.

ROSEBRUGGE, a town of Flanders, eleven miles north-weſt of Ypres.

ROSEMARY, *roſmarinus*, in botany, a genus of the *diandria-monogynia* claſs of plants, with a ringent monopetalous flower, whereof the upper lip is bifid and erect, and the under lip trifid and reflex; there is no pericarpium, the cup holding the four ſeeds in its bottom.

Roſemary has at all times been a favourite ſhrub in medicine: it is full of volatile parts, as appears by its taſte, ſmell, and analyſis. It is a very valuable cephalic, and is good in all diſorders of the nerves, and in hyſteric and hypochondriac caſes. It is good in palſies, apoplexies, epilepſies, and vertigoes. It ſtrengthens the ſight, and ſweetens the breath. It is greatly commended by ſome againſt obſtructions of the viſcera, particularly of the liver and ſpleen; and in the jaundice. The flowers have the credit of being great cordials; and ſome imagine they even poſſeſs the virutes of the whole plant in a more exalted degree than any other part. However, the flowery tops, leaves, and huſks, together with the leaves themſelves, are much fitter for all purpoſes, than the flowers alone.

ROSICRUCIANS, or ROSYCRUCIANS, See the article ROSYCRUCIANS.

ROSIENNE, a town of Samogitia, in Poland: eaſt longit. 23° 30′, north lat. 55° 50′.

ROSIN, or RESIN. See RESIN.

ROSS, a county of Scotland, bounded by Sutherland on the north, by the German ſea and the Murray frith on the eaſt and ſouth, and by Inverneſs-ſhire and the weſtern ocean on the ſouth and weſt.

ROSS is alſo a market-town, ſituated on the river Wye, eleven miles ſouth of Hereford.

ROSSANO, a city and port-town of Calabria, in the kingdom of Naples, eighty miles ſouth-weſt of Taranto.

ROSSE, a port-town of Ireland, twenty-two miles weſt of Kinſale.

ROS-SOLIS, SUN-DEW, an agreeable ſpirituous liquor, compoſed of burnt brandy, ſugar, cinnamon, and milk-water; and ſometimes perfumed with a little muſk. it is ſo called, as being at firſt prepared wholly of the juice of the plant ros-ſolis, or droſera. See the article DROSERA.

ROSTING, or ROASTING. See the article ROASTING.

ROSTOCK, an imperial city of lower Saxony, ſituated on a bay of the Baltic ſea: eaſt longit. 12° 15′, and north lat. 54° 20′.

ROSTOF, or ROSTOVA, the capital of a territory of the ſame name, in Ruſſia:

eaſt longitude 40°, and north latitude 57° 20′.

ROSTRA, in antiquity, a part of the roman forum, wherein orations, pleadings, funeral harangues, *&c.* were delivered.

ROSTRI-FORMIS PROCESSUS, in anatomy. See the article CORACOIDES.

ROSTRUM literally denotes the beak or bill of a bird; and hence it has been figuratively applied to the beak, or head of a ſhip.

ROSTRUM, in chemiſtry, implies the noſe or beak of the common alembic, which conveys the liquor diſtilled into its receiver. See the article ALEMBIC.

ROSYCRUCIANS, ROSICRUCIANS, or *brothers of the roſy croſs*, a name aſſumed by a ſect or cabal of hermetical philoſophers, who appeared, or at leaſt were firſt taken notice of, in Germany, in the beginning of the XVIth century. They pretended to be maſters of all ſciences, and to have many important ſecrets, particularly that of the philoſopher's ſtone. See the article PHILOSOPHER.

Their ſociety is frequently denoted by the abbreviatures F. R. C.

ROT, a diſeaſe incident to ſheep, ariſing from wet ſeaſons, and too moiſt paſture.

It is a very hard thing to prevent the rot, if the year prove very wet, eſpecially in May and June. Salt-marſhes, and lands where broom grows, are the beſt places of preſervation for them. Sheep are ſometimes all cleared of the rot, when not too far gone with it, only by removing them into broom-fields. Scurvy-graſs, muſtard, parſley, and thyme are alſo good for the prevention of it.

Some propoſe the giving ſheep half a handful of bay-ſalt, every month or oftener; and there is great probability that this may be of ſervice: but the rational way of attacking all diſorders in cattle, is by conſidering what are the cauſes of them. It will appear, upon enquiry, that wet ſeaſons are the general occaſions of the rot in ſheep, and therefore it would be adviſable for the owners, when ſuch ſeaſons come on, to remove thoſe animals into the drieſt paſtures they can, and then to feed them principally with dry ſweet hay, oats, bran, and the like; this would prevent the occaſion: and if they were already a little infected, ſome ſalt given with their dry food, would be a happy means of curing them.

ROTA, WHEEL, in mechanics. See the article WHEEL.

There is a celebrated problem in mechanics, called rota ariſtotelica, Ariſtotle's wheel, becauſe that philoſopher is the firſt who took notice of it. The matter to be accounted for, is how a point in the nave of a wheel comes to deſcribe, during one revolution, a line equal to the length of the outer circumference of the wheel, when a point in the outer circumference does no more.

Many great men having attempted in vain to account for this phænomenon, Mr. de Meyran, a french gentleman, had the good fortune to light on a ſolution of it, which the Academy of Sciences declared to be ſatisfactory. It is this: a wheel is only acted on, or drawn forward, in a right line: its circular motion, or rotation, ariſing purely from the reſiſtance of the ground whereon it is applied. Now this reſiſtance is equal to the force wherewith the wheel is drawn in the right line, inaſmuch as it defeats that direction; and, conſequently, the cauſes of the two motions being equal, their effects are equal too; or, a point in the wheel deſcribes, during one revolution, a right line on the ground equal to its outer circumference.

But as to the nave of the wheel, the caſe is otherwiſe; for though it is drawn in a right line by the ſame force as the outer circumference, yet it only turns round becauſe the wheel turns, and can only turn with it, and in the ſame time. Hence it follows, that its circular velocity is leſs than that of the circumference of the wheel, in the ratio of the two circumferences; and therefore, of courſe, its circular motion is leſs than its rectilinear one. Since then it neceſſarily deſcribes a right line equal to that deſcribed by the circumference of the wheel, it can only do it by ſliding along.

ROTA is alſo the name of an eccleſiaſtical court at Rome, compoſed of twelve prelates, whereof one muſt be a German, another a Frenchman, and two Spaniards; the other eight are Italians, three of whom muſt be Romans, and the other five a Bologneſe, a Ferraran, a Milaneſe, a Venetian, and a Tuſcan.

This is one of the moſt auguſt tribunals in Rome, which takes cognizances of all ſuits in the territory of the church, by appeal; as alſo of all matters beneficiary and patrimonial.

ROTATION, in geometry, a term chiefly applied to the circumvolution of any ſurface

ſurface round a fixed and immoveable line, which is called the axis of its rotation: and by ſuch rotations it is, that ſolids are conceived to be generated. See the article GENESIS.

The late ingenious Mr. de Moivre ſhews, how ſolids, thus generated, may be meaſured or cubed. His method is this: for the fluxion of ſuch ſolids, take the product of the fluxion of the abſciſs, multiplied by the circular baſe; and ſuppoſe the ratio of a ſquare to the circle inſcribed in it to be $\frac{n}{1}$: then the equation expreſſing the nature of any circle, whoſe diameter is d, is $yy = dx - xx$. Therefore $\frac{4dxx - x^2x}{n}$ is the fluxion of a portion of the ſphere; and, conſequently, the portion itſelf $4\frac{1}{2}dxx - x\frac{1}{3}x^3$, and the circumſcribed cylinder is $\frac{4dxx - x^3}{n}$; and therefore the portion of the ſphere is to the portion of the circumſcribed cylinder, as $\frac{1}{2}d - \frac{1}{3}x$ to $d - x$.

ROTATION, or REVOLUTION, in aſtronomy. See REVOLUTION.

ROTATORES, in anatomy, the name by which ſome call the oblique muſcles of the eye. See EYE and OBLIQUUS.

ROTATORES is alſo applied to the trochanters of the thigh-bone. See the article FEMORIS OS and TROCHANTER.

ROTENBURG, a town of Franconia, in Germany: eaſt long. 10° 5′, north lat. 49° 20′.

ROTENBURG is alſo a town of lower Saxony, in the dutchy of Verden, twenty-four miles eaſt of Bremen.

ROTHER, or RUDDER. See RUDDER.

ROTHERAM, a market-town of Yorkſhire, thirty-five miles ſouth-weſt of York.

ROTHSAY, a parliament-town of Scotland, in the iſle of Bute: weſt longit. 5°, and north lat. 55° 50′.

ROTING, a town of Franconia, in Germany: eaſt long. 9° 50′, and north lat. 49° 30′.

ROTONDO, or ROTUNDO, in architecture, an appellation given to any building that is round both within and without ſide, whether it be a church, a ſalon, or the like. The moſt celebrated rotondo of the antients, is the pantheon at Rome. See the article PANTHEON.

ROTTENNESS, or PUTREFACTION. See the article PUTREFACTION.

ROTTERDAM, a city of the province of Holland, ſituated on the north bank of the Maeſe, thirty miles ſouth of Amſterdam, and thirteen miles ſouth-eaſt of the Hague: eaſt long. 4° 20′, and north lat. 52°.

ROTULA, in anatomy, the ſame with the patella. See the article PATELLA.

ROTULORUM CUSTOS. See CUSTOS.

ROTULUS, a ROLL. See ROLL.

ROTUNDO, or ROTONDO. See the article ROTONDO.

ROTUNDUS, in anatomy, a name given to ſeveral muſcles, otherwiſe called teres. See the articles TERES and MUSCLE.

Pronator ROTUNDUS. See PRONATOR.

ROTWEIL, a town of Swabia, in Germany, ſituated on the river Neckar: eaſt long. 8° 30′, and north lat. 48° 8′.

ROUCOU, in botany, the name of a ſpecies of mitella. See MITELLA.

ROUEN, a city of France, and capital of Normandy, ſituated on the north ſide of the Seyne, ſixty-five miles north of Paris, and forty-five miles ſouth-eaſt of Havre de Grace and the Britiſh Channel: eaſt long. 1° 6′, north lat. 49° 30′.

ROVEREDO, a city of the biſhopric of Trent, eight miles ſouth of Trent.

ROVERGNE, a diviſion of Guienne, in France.

ROUGE-CROSS. See POURSUIVANT.

ROUGHNESS, in mechanics. See the articles FRICTION and RESISTANCE.

ROVIGO, the capital of the Poleſin de Rovigo, in Italy, ſubject to Venice: eaſt long. 12° 25′, north lat. 45° 6′.

ROUND, *rotundus*, in geometry. See the articles CIRCLE, GLOBE, and SPHERE.

The italian muſicians give the name of *b* round, to what we call a flat *b*. See the article FLAT.

ROUND, in a military ſenſe, ſignifies a walk which ſome officer, attended with a party of ſoldiers, takes in a fortified place around the ramparts, in the night-time, in order to ſee that the centries are watchful, and every thing in good order.

The centries are to challenge the rounds at a diſtance, and reſt their arms as they paſs, to let none come near them; and when the round comes near the guard, the centry calls aloud, *who comes there?* and being anſwered, *the rounds*; he ſays *ſtand*; and then calls the corporal of the guard, who draws his ſword, and calls alſo, *who comes there?* and when he is anſwered, *the rounds*, he who has the word advances, and the corporal receives it.

it with his ſword pointed to the giver's breaſt. In ſtrict garriſon the rounds go every quarter of an hour.

Way of the ROUNDS. See WAY.

Counter-ROUNDS. See COUNTER.

ROUND-HOUSE, a kind of priſon, for the nightly watch in London to ſecure diſorderly perſons, till they can be carried before a magiſtrate. See WATCH.

ROUND-HOUSE, in a ſhip, the uppermoſt room, or cabbin, on the ſtern of a ſhip, where the maſter lies.

To ROUND *a horſe*, in horſemanſhip, a general term for all ſorts of maneges upon a volt, or circular tread. See the article VOLT.

ROUNDELAY, a kind of antient poem, thus termed, according to Menage, from its form, becauſe it turns back again to the firſt verſe, and thus goes round. This poem is little known among us, but is very common among the French, who call it rondeau. It conſiſts commonly of thirteen verſes, eight whereof are in one rhyme, and five in another. It is divided into couplets, at the end of the ſecond and third whereof the beginning of the roundelay is repeated, and that if poſſible in an equivocal or pauſing ſenſe.

ROUNDELET. See RUNDLET.

ROUNDNESS, ROTUNDITY. See the article SPHERICITY.

ROUNDO, ROUNDELAY, in muſic, a kind of burden or ritornello, where the beginning of each couplet is repeated at the end thereof.

ROUSE, among falconers, is when a hawk lifts up and ſhakes herſelf.

ROUSE *a hawſer*, or *cable*, in the ſea-language, ſignifies to haul in part of the hawſer or cable, which lies ſlack in the water.

ROUSELAER, a town of the Netherlands, in the province of Flanders, ſituated eleven miles north-eaſt of Ypres.

ROUSILLON, formerly a province of Spain, now united to France, is bounded by Languedoc on the north, by the Mediterranean ſea on the eaſt, by Catalonia on the ſouth, and by the Pyrenean mountains on the weſt, being about fifty-five miles long, and thirty-ſix broad.

ROUSSIN, in the manege, is a ſtrong, well-knit, and ſtowed horſe, ſuch as are brought into France from Germany and Holland.

ROUT, a public road, highway, or courſe, eſpecially that which military forces take. This word is alſo uſed for the defeat and flight of an army.

ROUT, in law, is applied to an aſſembly of perſons, going forcibly to commit ſome unlawful act, whether they execute it or not.

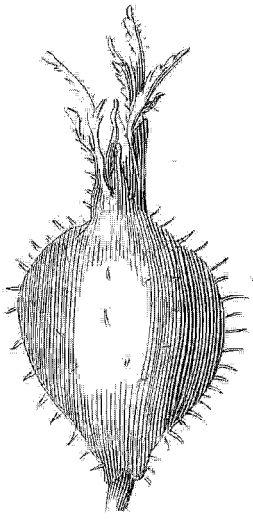
The difference between a rout and a riot ſeems to be this, that a rout is where perſons are unlawfully aſſembled, and have moved forwards, in order commit the unlawful act intended, but part without doing it: whereas riot is taken for the diſorderly fact commited by any ſuch unlawful aſſemby. Two things, however are common both to riot and rout, as alſo unlawful aſſembly; the one is, that three perſons at leaſt be gathered together: the other is, that, being gathered together, they diſturb the peace either by words, ſhew of arms, turbulent geſture, or actual violence. See RIOT.

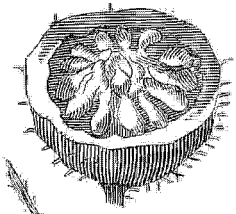
ROWEL, among farriers, a kind of iſſue, made by drawing a ſkain of ſilk, thread, hair, or the like, through the nape of the neck, or other part, of a horſe; anſwering to what, in ſurgery, is called a ſeton. See the article SETON.

The rowelling of horſes is a method of cure frequently had recourſe to, in caſes of inward ſtrains, eſpecially about the ſhoulders or hips, as alſo for hard ſwellings not eaſy to be diſſolved. The operation is this: a little ſlit being made through the ſkin, about an handbreadth below the part aggrieved, big enough to put a ſwan's quill in; the ſkin is raiſed from the fleſh, the end of the quill put in, and the ſkin blowed from the fleſh upwards, and all over the ſhoulder; then the hole being ſtopped with the finger, the part blown is beat with an hazel-ſtick, and the wind ſpread with the hand all over, and then let go; this done, a ſkain of horſe-hair, or red ſarſenet, half the thickneſs of the little finger, is put in a rowelling needle, ſeven or eight inches long, and the needle is put into the hole, and drawn through again, ſix or ſeven inches higher; then the needle is drawn out, and the two ends of the rowel tied together, anointing it every day, as well as before the putting it in, with ſweet butter and hog's greaſe, and drawing it backwards and forwards in the ſkin, to make the putrid matter diſcharge itſelf more plentifully.

Others, diſliking theſe rowels, as making too large a ſore and ſcar, uſe the french rowel, which is a round piece of ſtiff leather, with a hole in the midſt, laying it flat between the fleſh and ſkin, the hole in the rowel juſt againſt that in the

Fig. 1. RUTA, *RUE*.





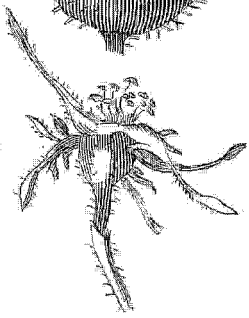


Fig. 2. RUBIA, *MADDER*.

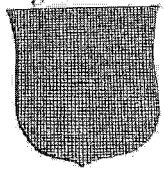
Fig. 4. RUBUS.

Fig. 3. The RUFF.

Fig. 5. SABLE.



the ſkin, ſewing it with a needle and thread drawn through the hole and the ſkin, cleaning it once in two or three days, and then anointing it afreſh.

ROWELS *of a ſpur*. See SPUR.

ROWS *of trees*. See PARALLELISM.

ROXBURGH. See TIVIOTDALE.

ROXENT CAPE, or ROCK *of Liſbon*, a mountain and remarkable promontory in Portugal, ſituated in the Atlantic ocean, at the north entrance of the river Tagus, twenty-two miles north of Liſbon.

ROYAL, or REGAL, ſomething belonging to a king: thus we ſay, royal family, royal aſſent, royal exchange, *&c.* See the articles FAMILY, ASSENT, *&c.*

ROYALTIES, the rights of the king, otherwiſe called the king's prerogative, and the regalia. See PREROGATIVE and REGALIA.

ROYAN, a caſtle of France, in the province of Saintonge, ſituated at the mouth of the river Garonne, thirty miles ſouth of Rochelle.

ROYENA, in botany, a genus of the *decandria digynia* claſs of plants, the corolla whereof is formed of a ſingle petal; the tube is of the length of the calyx; the limb is patent, reflex, and divided into five oval ſegments; the fruit is a roundiſh capſule, formed of four valves, marked with four furrows, but containing only one cell; the ſeeds are four oblong triangular nuts, included in a calyptra.

ROYENIA, in botany, the ſame with the loeſelia. See the article LOESELIA.

ROYSTON, a market-town, ſituated in the counties of Hertford and Cambridge, thirty-eight miles north of London.

RUATAN, an iſland in the gulph of Honduras, in north America: weſt longit. 89°, and north lat. 16°.

RUBARB. See RHUBARB.

RUBBING. See the articles ATTRITION and FRICTION.

RUBELLIO, in ichthyology, the name whereby ſome authors call the roach. See the article CYPRINUS.

RUBEOLA, in botany, the ſame with the crucianella. See CRUCIANELLA.

RUBETA, the TOAD, in zoology. See the article TOAD.

RUBIA, MADDER, in botany, a genus of the *tetrandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle, plane acute petal, hollowed at the baſe, and divided into four ſegments; the fruit conſiſts of two ſucculent, ſmooth, round berries, growing together; the ſeed is ſingle, roundiſh, and umbilicated. Se plate CCXXXV. fig. 2.

For the ſeveral uſes of this plant in dying, *&c.* ſee the article MADDER.

RUBICAN, in the manege. A horſe is ſaid to be of a rubican colour, when of a bay, ſorrel, or black, with a light grey or white upon the flanks, but ſo that this grey or white is not predominant there.

RUBIFYING, in chemiſtry, the act of turning a thing red by the force of fire, *&c.*

RUBIGALIA, in antiquity, a feaſt celebrated by the Romans, in honour of the god Rubigus, or the goddeſs Rubigo, to engage thoſe deities to preſerve the corn from blights and mildews.

The rubigalia were inſtituted by Numa, in the eleventh year of his reign, and were celebrated on the ſeventh of the calends of May.

RUBIGO, a diſeaſe incident to corn, commonly called mildew, being a ſpecies of blight. See the article BLIGHT.

RUBININSKA, one of the northern provinces of Ruſſia, bounded by the province of Dwina on the north, by Syrianes on the eaſt, by Belozero on the ſouth, and by the lake of Onega on the weſt.

RUBRIC, *rubrica*, in the canon-law, ſignifies a title or article in certain antient law-books; thus called becauſe written, as the titles of the chapters in our antient Bibles are, in red letters.

Rubrics alſo denote the rules and directions given at the beginning, and in the courſe of, the liturgy, for the order and manner in which the ſeveral parts of the office are to be performed. There are general rubrics and ſpecial rubrics, a rubric for the communion, *&c.* In the romiſh Miſſal and Breviary are rubrics for matins, for lauds, for tranſlations, beatifications, commemorations, *&c.*

RUBRICA, in natural hiſtory, a name given to ſeveral kinds of marles and ochres, the two principal of which are the rubrica fabrilis of authors, being a ſoft heavy red marle, commonly called reddle, and uſed by painters, *&c.* See the articles MARLE and REDDLE. The other, called the rubrica ſinopica of the antients, is a fine heavy purple ochre, much uſed both in painting and medicine. See OCHRE.

RUBUS, the BRAMBLE and RASPBERRY-BUSH, in botany, a genus of the *icoſandria-pentagynia* claſs of plants, the corolla whereof conſiſts of five roundiſh erecto-patent petals, of the length of the cup, and inſerted into it; the fruit is a compound

compound berry; the acini it is compoſed of are roundiſh, and arranged into a cluſter, convex at top and concave below, each acinus has only one cell; the ſeeds are ſingle and oblong; the receptacle of the pericarpia is conic; the acini in moſt of the ſpecies grow together ſo as to be inſeparable without breaking. See plate CCXXXV. fig. 4.

The uſe of this plant in medicine is as a refrigerant and aſtringent, and therefore the fruit, leaves, *&c.* are recommended in dyſenteries, vomitings, hæmorrhages of the womb, noſe, *&c.*

RUBY, *rubinus*, in natural hiſtory, a ſpecies of the *chroſtaſima* claſs of gems, being a beautiful gem of a red colour with an admixture of purple. See GEM.

This, in its moſt perfect and beſt coloured ſtate, is a gem of prodigious beauty and extreme value; it is often found perfectly pure and free from blemiſhes or foulneſs, but much more frequently debaſed greatly in its value by them, eſpecially in the larger ſpecimens. It is of very great hardneſs, equal to that of the ſapphire, and ſecond only to the diamond. It is various in ſize, but leſs ſubject to variations in its ſhape than moſt of the other gems. It is uſually found very ſmall, its moſt common ſize being equal to that of the head of the largeſt ſort of pins; but it is found of four, eight, or ten carats; and ſometimes, though very rare, up to twenty, thirty, or forty. It is never found of an angular or cryſtalliform ſhape, but always of a pebble-like figure, often roundiſh, ſometimes oblong and much larger at one end than at the other, and in ſome ſort reſembling a pear, and is uſually flatted on one ſide. It commonly is naturally ſo bright and pure on the ſurface, as to need no poliſhing; and when its figure will admit of being ſet without cutting, it is often worn in its rough ſtate, and with no other than its native poliſh. Our jewellers are very nice, though not perfectly determinate, in their diſtinctions of this gem, knowing it, in its different degrees of colour, under three different names: the firſt is ſimply the ruby, the name given it in its deepeſt coloured and moſt perfect ſtate: the ſecond is the ſpinel ruby; under this name they comprehend thoſe rubies which are of a ſomewhat leſs bright colour than the ruby ſimply ſo called: the third is the balaſs-ruby; under this name they expreſs a pale yet a very bright ruby, with a leſs admixture of the purple tinge than in the deeper coloured one; this is of leſs value than the deeper one.

We have the true ruby only from the eaſt-Indies; and the principal mines of it are in the kingdom of Pegu and the iſland of Ceylon. We have in Europe cryſtals tinged to the colour of the ruby, but they have nothing of its luſtre or hardneſs. The ruby ſeems to owe its colour to gold, it being poſſible to ſeparate a ſmall portion of gold from the little native rubies, and alſo to give the true colour of the ruby to fictitious paſte by means of that metal.

The way of preparing a metalline colour from gold and tin, for tinging glaſs of a ruby colour is, according to Shaw, as follows: Diſſolve gold in aqua-regia, and dilute the fine yellow ſolution with a large proportion of fair water; to the mixture add a ſufficient quantity of a ſaturated ſolution of tin, made alſo in aqua-regia, at ſeveral times, and a moſt beautiful red or purple-coloured powder will ſoon fall to the bottom of the containing glaſs: decant the liquor and dry the powder, a few grains whereof being melted along with white cryſtalline glaſs will tinge it throughout of an extremely fine purple or ruby colour.

In M. Savary's Dict. de Commerce, we have the following table of the value of rubies, from one carat, or four grains, to ten carats:

	l.	s.	d.
A ruby of one carat is worth	1	15	00
Of two	9	00	00
Of three	22	10	00
Of four	33	15	00
Of five	45	00	00
Of ſix	67	10	00
Of ſeven	84	00	00
Of eight	106	00	00
Of nine	150	00	00
Of ten	216	00	00

RUBY, in heraldry, denotes the red colour wherewith the arms of noblemen are blazoned; being the ſame which in the arms of others, not noble, is called gules. See the article GULES.

RUCTATION, BELCHING, a ventoſity ariſing from indigeſtion, and diſcharging itſelf at the mouth with a very diſagreeable noiſe. There are belches owing to repletion, and others to inanition, or emptineſs. Quincy ſays hypochondriac and hyſteric perſons are particularly liable to this diſorder. They are rather to be

be cured with proper ſtomachics than carminatives and hot liquors.

RUDBECKIA, DWARF SUN-FLOWER, in botany, a genus of the *ſyngeneſia-polygamia* claſs of plants, the compound flower of which is radiated; but the hermaphrodite corollulæ of the diſc are tubuloſe and very numerous: the ſtamina are five very ſhort capillary filaments; and there is a ſmall orbiculated ſeed after each of the hermaphrodite corollulæ, and are all contained in the cup, affixed to a paleaceous receptacle.

RUDDER, in navigation, a piece of timber turning on hinges in the ſtern of the ſhip, and which, oppoſing ſometimes one ſide to the water and ſometimes another, turns or directs the veſſel this way or that. See SHIP.

The rudder of a ſhip is a piece of timber hung on the ſtern-poſts by four or five iron-hooks, called pintles, ſerving as it were for the bridle of a ſhip to turn her about at the pleaſure of the ſteers-man. The rudder being perpendicular; and withoutſide the ſhip, another piece of timber is fitted to it at right angles, which comes into the ſhip, by which the rudder is managed and directed. This latter properly is called the helm or tiller; and ſometimes, though improperly, the rudder itſelf. The power of the rudder is reducible to that of the lever. See the article LEVER.

As to the angle the rudder ſhould make with the keel, it is ſhewn, that in the working of ſhips, in order to ſtay or bear up the ſooneſt poſſible, the tiller of the rudder ought to make an angle of 55° with the keel. A narrow rudder is beſt for a ſhip's ſailing, provided ſhe can feel it; that is, be guided and turned by it: for a broad rudder will hold much water when the helm is put over to any ſide; but if a ſhip have a fat quarter, ſo that the water cannot come quick and ſtrong to her rudder, ſhe will require a broad rudder. The aft-moſt part of the rudder is called the rake of the rudder.

RUDENTURE, in architecture, the figure of a rope or ſtaff, ſometimes plain, ſometimes carved, with which the third part of the flutings of columns are frequently filled up.

There are alſo rudentures in relievo laid on the naked of pilaſters not fluted: an inſtance of which we have in the church of St. Sapienza at Rome.

RUDERATION, in building, a term uſed by Vitruvius for the laying of pavement with pebbles.

To perform the ruderation it is neceſſary that the ground be well beaten, to make it firm, and to prevent it from cracking; then a ſtratum of little ſtones are laid, to be afterwards bound together with mortar made of lime and ſand. If the ſand be new, its proportion may be to the lime as three to one; if dug out of old pavements or walls, as five to two.

Ruderation, Daviler obſerves, is alſo uſed by Vitruvius for the coarſeſt and moſt artleſs kind of maſonry, where a wall is as it were cobled up.

RUDIARIUS, in antiquity, a veteran gladiator who had got a diſcharge from the ſervice. See GLADIATOR.

RUDIMENTS, *rudimenta*, the firſt principles or grounds of any art or ſcience, called alſo the elements thereof. See the article ELEMENT.

RUDIS, a knotty rugged ſtick, which the prætor among the Romans gave the gladiators as a mark of their freedom and diſmiſſion.

RUE, *ruta*, in botany. See RUTA.

RUELLIA, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, the corolla whereof conſiſts of a ſingle petal: the tube is of the length of the cup, with a patulous inclined neck: the limb is quinquifid, patent, and obtuſe, with the two upper lacinii more reflex than the reſt: the fruit is a round capſule, acuminated on both ſides, of the length of the cup, ſemibilocular and bivalve: the ſeeds being a few in number, are roundiſh and compreſſed.

RUFF, in icthyology, a ſpecies of the perca, with a cavernous head, and only one fin on the back. See PERCA.

The uſual ſize to which this ſpecies arrives is four or five inches, though ſometimes it will grow longer: the head, in its general form is compreſſed, but flatted a little between the eyes; the beak is ſomewhat acute; the breaſt and belly are flatted; the eyes are large, and of a variety of colours; the teeth are ſmall but numerous, there is a row of them in each jaw, and on the anterior part of the palate there are a number of teeth, ſo minute that they can ſcarce be ſeen; the lateral line is ſomewhat crooked; the colour of the fiſh is a browniſh yellow with a number of black ſpots; the fin on the back has twenty-eight rays, the

pectoral-fins eighteen, and the belly-fins each ſix.

RUFF, in ornithology, a ſpecies of the tringa, with a granulated face, and a red beak and legs; it is about the bigneſs of the common jack-daw. See the article TRINGA.

The head is round, and covered with a large tuft of feathers, except the anterior part, which is naked, but the ſkin is elegantly granulated with ſmall red tubercles, diſpoſed regularly and cloſely over it; the eyes are large, their aſpect bright and piercing, and their iris of a bright-hazel colour; the beak is moderately long and obtuſe at the end, it is of a bright fine red at the baſe, and ſometimes all over; the upper chap is a little longer than the under one; the tongue is extended to the very top of the beak. See plate CCXXXV. fig. 3.

RUFTER-HOOD, among falconers, a plain leathern hood, large and open behind, to be worn by an hawk when ſhe is firſt drawn.

RUGEN, an iſland of the Baltic-ſea, on the coaſt of Germany, being part of the dutchy of ſwediſh Pomerania, ſeparated from the continent by a narrow channel: this iſland is thirty miles long, and near as many broad.

RUINS, a term particularly uſed for magnificent buildings fallen into decay, by length of time, and whereof there only remains a confuſed heap of materials.

RULE, *regula*, in matters of literature, a maxim, canon, or precept, to be obſerved in any art or ſcience.

The rules of philoſophizing, of reaſoning, of method, as alſo thoſe to be obſerved in logic, morality, poetry, medicine, rhetoric, &c. have been already delivered under the articles PHILOSOPHIZING, REASONING, &c.

RULE, in arithmetic, denotes an operation performed with figures, in order to diſcover ſums or numbers unknown.

The fundamental rules are addition, ſubtraction, multiplication, and diviſion. See ADDITION, &c.

But beſides theſe, there are other rules denominated from their uſe; as the rule of alligation, fellowſhip, intereſt, practice, reduction, &c. See the article ALLIGATION, &c.

RULE OF THREE, GOLDEN RULE, or RULE OF PROPORTION, is one of the moſt eſſential rules of arithmetic; for the foundation of which ſee the articles GEOMETRICAL PROPORTION.

It is called the Rule of Three from having three numbers given to find a fourth but more properly, the Rule of Proportion, becauſe by it we find a fourth number proportional to three given numbers: and becauſe of the neceſſary and extenſive uſe of it, it is called the Golden Rule. But to give a definition of it, with regard to numbers of particular and determinate things, it is the rule by which we find a number of any kind of things, as money, weight, &c. ſo proportional to a given number of the ſame things, as another number of the ſame or different things, is to a third number of the laſt kind of thing. For the four numbers that are proportional muſt either be all applied to one kind of things; or two of them muſt be of one kind, and the remaining two of another: becauſe there can be no proportion, and conſequently no compariſon of quantities of different ſpecies: as, for example, of three ſhillings and four days; or of ſix men and four yards.

All queſtions that fall under this rule may be diſtinguiſhed into two kinds: the firſt contains theſe wherein it is ſimply and directly propoſed to find a fourth proportional to three given numbers taken in a certain order; as if it were propoſed to find a ſum of money ſo proportioned to one hundred pounds as ſixty four pounds ten ſhillings is to eighteen pounds ſix ſhillings and eight pence, or as forty pounds eight ounces is to ſix hundred weight. The ſecond kind contains all ſuch queſtions wherein we are left to diſcover, from the nature and circumſtances of the queſtion, that a fourth proportional is ſought; and, conſequently, how the ſtate of the proportion, or compariſon of the term, is to be made; which depends upon a clear underſtanding of the nature of the queſtion and proportion. After the given terms are duly ordered, what remains to be done is to find a fourth proportional. But to remove all difficulty as much as poſſible, the whole ſolution is reduced to the following general rule, which contains what is neceſſary for ſolving ſuch queſtions wherein the ſtate of the proportion is given; in order to which it is neceſſary to premiſe theſe obſervations.

1. In all queſtions that fall under the following rule there is a ſuppoſition and a demand: two of the given numbers contain a ſuppoſition, upon the conditions whereof a demand is made, to which

which the other given term belongs; and it is therefore ſaid to raiſe the queſtion; becauſe the number ſought has ſuch a connection with it as one of theſe in the ſuppoſition has to the other. For example; if 3 yards of cloth coſt 4l. 10s. (here is the ſuppoſition) what are 7 yards 3 quarters worth? here is the demand or queſtion raiſed upon 7 yards 3 quarters, and the former ſuppoſition.

2. In the queſtion there will ſometimes be a ſuperfluous term; that is, a term which, though it makes a circumſtance in the queſtion, yet is not concerned in the proportion, becauſe it is equally ſo in both the ſuppoſition and demand. This ſuperfluous term is always known by being twice mentioned either directly, or by ſome word that refers to it. Example, if 3 men ſpend 20l. in 10 days, how much, at that rate, will they ſpend in 25 days? Here the 3 men is a ſuperfluous term, the proportion being among the other three given terms, with the number ſought; ſo that any number of men may be as well ſuppoſed as 3.

Rule. Firſt, The ſuperfluous term (if there is one) being caſt out, ſtate the other three terms thus: of the two terms in the ſuppoſition, one is like the thing ſought (that is, of the ſame kind of thing the ſame way applied); ſet that one in the ſecond or middle place; the other term of the ſuppoſition ſet in the firſt place, or on the left hand of the middle; and the term that raiſes the queſtion, or with which the anſwer is connected, ſet in the third place, or on the right hand; and thus the extremes are like one another, and the middle term like the thing ſought: alſo the firſt and ſecond terms contain the ſuppoſition, and the third raiſes the queſtion; ſo that the third and fourth have the ſame dependance or connection as the firſt and ſecond. This done,

Secondly, Make all the three terms ſimple numbers of the loweſt denominations expreſſed, ſo that the extremes be of one name. Then,

Thirdly, Repeat the queſtions from the numbers thus ſtated and reduced (arguing from the ſuppoſition to the demand) and obſerve whether the number ſought ought to be greater or leſſer than the middle term, which the nature of the queſtion, rightly conceived, will determine; and accordingly, multiply the middle term by the greater or leſſer extreme, and divide the product by the other, the quote is like the middle term, and is the complete anſwer, if there is no remainder; but if there is, then,

Fourthly, Reduce the remainder to the denomination next below that of the middle term, and divide by the ſame diviſor, the quotient is another part of the anſwer in this new denomination. And if there is here alſo a remainder, reduce it to the next denomination, and then divide. Go on thus to the loweſt denomination, where, if there is a remainder, it muſt be applied fraction-wiſe to the diviſor; and thus you will have the complete anſwer in a ſimple or mixed number.

Note, If any of the dividends is leſs than the diviſor, reduce it to the next denomination, and to the next again, till it be greater than, or equal to, the diviſor.

EXAMPLES.

Queſt. I. If 3 yards of cloth coſt 8s. what is the price of 15 yards? Anſw. 40s. or 2l.

Work.

yds. s. yds.
3 — 8 — 15
15
3|120|40s.

Explanation. 3 yards and 8s. contain the ſuppoſition, and 8s. is like the thing ſought; therefore 8s. is the middle term, and yards on the left: then the demand ariſes upon 15 yards, and therefore it is on the right. Again, from the nature of the queſtion it is plain, that 15 yards require more than 3 yards, *i. e.* the anſwer muſt be greater than the middle term; wherefore 8s. is to be multiplied by 15 yards; the product is 120s. which divided by 3 yards, quotes 40s. without a remainder; ſo 40s. or 2l. is the number ſought.

Queſt. II. If 4lb. of ſugar coſt 2s. 9d. what is the value of 18lb.? Anſwer, 12s. 4½d.

Work.

lb. s. d. lb.
4 — 2 : 9 — 18
12
33 d.
18
264
33
4|594|148 d.
2
4.
4|8|12 farthings.

Expl. The ſuppoſition is in 4lb. and 2s. 9d. this laſt term being like the thing ſought, which is connected with 18lb. wherefore the terms are ſtated according to the rule: then the middle term being mixed, it is to be reduced to pence, and then argue thus; if 4lb. coſt 33d. 18lb. muſt coſt more; therefore multiply 33d. by 18lb. and divide their product

product by 4; the quotient is 148 d. and 2 remains, which is to be reduced to farthings, and the product divided by the former quotient, gives 2; ſo the anſwer is 148 d. 2 farthings, or 12 s. 4½ d. becauſe 148 d. is, by reduction, 12 s. 4 d. Queſt. III. What is the price of 50 lb. of tobacco, when 32 lb. 12 oz. coſt 4 l. 10 s.? Anſw. 6 l. 17 s. 4¾ d.

Work.

lb. oz. l. s. lb. oz. s. oz.

254
124
4
254|496|1 242/254 q.
254
242

Explanation. The terms ſtated, and reduced according to the rule, I find the anſwer ought to be leſs than the middle term; therefore I multiply 5 l. by 20 quarters, but the product is leſs than the diviſor; and ſo it is to be reduced to ſhillings, which makes 2000 s. this divided by 254, quotes 7 s. The reſt of the work is plain.

Queſt. V. What time will 7 men be boarded for 25 l. when 3 men paid 25 l. for 6 months? Anſw. 2 months 16 days, reckoning 28 days to 1 month.

Work.

men. mths. men.
3 — 6 — 7
3
7|18|2 months.
14
Rem. 4
28
7|112|16 days.

Explanation. The 25 l. is a ſuperfluous number; then the ſuppoſition is in the 3 men and 6 months, and the demand regards the 7 men: the terms being all ſimple, you are to argue thus; if 3 men are boarded 6 months for 25 l. (or any ſum), 7 men will be boarded for the ſame a ſhorter time: therefore multiply 6 months by 3, and divide the product 18 by 7, whereby the anſwer is found to be 2 months and 16 days.

Queſt. VI. If the carriage of 3 hundred weight coſt 10 s. for 40 miles, how much ought to be carried for the ſame price 25 miles and 3 quarters? Anſw. 4 cwt. 2 qr. 17 97/103 lb.

Work.

M. Cwt. M. qr.
40 — 3 — 25 : 3
4 4
160 — 3 — 103
160
103|480|4 Cwt.

28
528
132
103|1848|17 97/103 lb.
103
818
721
97

Explanation. The ſuperfluous number here is 10 s. and from the other three terms ſtated and reduced, it is argued thas; if 3 Cwt. is carried 160 quarters of a mile for 10 s. then a greater weight will be carried for the ſame price 103 qrs. of a mile; therefore multiply 3 by 160, and divide the product 480 by 103, the anſwer is 4 Cwt. 2 quarters 17 97/103 lb.

Note. The firſt four queſtions are what is called the rule of three direct, that is, where the third term being greater or leſſer than the firſt, requires that the anſwer alſo be greater or leſſer than the ſecond term. The two laſt queſtions are of the rule of three indirect, or reverſe: where the third term being greater or leſſer than the firſt, requires the fourth contrarily leſſer or greater than the ſecond. But we have comprehended both

in

in one general rule. And from this obſervation may be learned what queſtions are of either kind.

RULE, in a monaſtic ſenſe, a ſyſtem of laws or regulations, whereby religious houſes are governed, and which the religious make a vow, at their entrance, to obſerve. Such are the rules of the auguſtins, benedictins, carthuſians, franciſcans, &c. See AUGUSTINS, &c.

RULES *of Court*, in law, are certain orders made, from time to time, in the courts of law, which attornies are bound to obſerve, in order to avoid confuſion; and both the plaintiff and defendant are at their peril alſo bound to pay obedience to rules made in court relating to the cauſe depending between them.

It is to be obſerved, that no court will make a rule for any thing that may be done in the ordinary courſe; and that if a rule be made, grounded upon an affidavit, the other ſide may move the court againſt it, in order to vacate the ſame, and thereupon ſhall bring into court a copy of the affidavit and rule. On the breach and contempt of a rule of court an attachment lies; but it is not granted for diſobedience to a rule when the party has not been perſonally ſerved; nor for diſobeying a rule made by a judge in his chamber, which is not of force to ground a motion upon, unleſs the ſame be entered.

A rule of court is granted every day the courts at Weſtminſter ſit, to priſoners of the king's bench, or fleet, priſons, to go at large about their private affairs.

RULE, or RULER, an inſtrument of wood or metal, with ſeveral lines delineated on it, of great uſe in practical menſuration.

When a ruler has the lines of chords, tangents, ſines, &c. it is called a plane ſcale. See the article SCALE.

The carpenter's joint-rule is an inſtrument uſually of box, &c. twenty-four inches long, and one and a half broad; each inch being ſubdivided into eight parts. On the ſame ſide with theſe diviſions, is uſually added Gunter's line of numbers. On the other ſide, are the lines of timber and board-meaſure; the firſt beginning at 82, and continued to 36, near the other end; the latter is numbered from 7 to 36, 4 inches from the other end.

Uſe of the carpenter's joint-RULE. The application of the inches, in meaſuring lengths, breadths, &c. is obvious. That of the Gunter's line, ſee under GUNTER's *Line*.

The uſe of the other ſide is all we need here meddle with: 1. The breadth of any ſurface, as board, glaſs, &c. being given, to find how much in length makes a ſquare foot. Find the number of inches the ſurface is broad, in the line of broad-meaſure, and right againſt it is the number of inches required. Thus, if the ſurface were eight inches broad, eighteen inches will be found to make a ſuperficial foot. Or more readily thus: Apply the rule to the breadth of the board, or glaſs, that end, marked 36, being equal with the edge, the other edge of the ſurface will ſhew the inches, and quarters of inches, which go to a ſquare foot. 2. Uſe of the table at the end of the board-meaſure. If a ſurface be one inch broad, how many inches long will make a ſuperficial foot? look in the upper row of figures for one inch, and under it in the ſecond row is twelve inches, the anſwer to the queſtion. 3. Uſe of the line of timber-meaſure. This reſembles the former; for having learned how much the piece is ſquare, look for that number on the line of the timber-meaſure; the ſpace thence to the end of the rule is the length which, at that breadth, makes a foot of timber. Thus, if the piece be nine inches ſquare, the length neceſſary to make a ſolid foot of timber, is 21 $\frac{1}{3}$ inches. If the timber be ſmall, and under nine inches ſquare, ſeek the ſquare in the upper rank of the table, and immediately under it is the feet and inches that make a ſolid foot. If the piece be not exactly ſquare, but broader at one end than the other, the method is to add the two together, and take half the ſum for the ſide of the ſquare. For round timber the method is to girt it round with a ſtring, and to allow the fourth part for the ſide of the ſquare; but this method is erroneous, for hereby you loſe nearly one fifth of the true ſolidity; though this is the method at preſent practiſed in buying and ſelling timber.

The maſon's rule is twelve or fifteen feet long, in order to be applied under the level to regulate the courſes, and make the piedroits equal, &c.

Everard's ſliding RULE, has already been deſcribed under the article GAUGING.

Coggeſhal's ſliding RULE, is chiefly uſed for meaſuring the ſuperficies and ſolidity of timber, &c. It conſiſts of two rulers, each a foot long, one of which ſlides in a groove made along the middle of the other.

other, as represented in plate CCXXXIV. fig. 4.

On the sliding side of the rule are four lines of numbers, three whereof are double; that is, are lines to two radiuses; and one, a single broken line of numbers: the three first, marked A, B, C, are figured 1, 2, 3, &c. to 9; then 1, 2, 3, &c. to 10; their construction, use, &c. being the same as those of Everard's sliding rule. The single line, called the girt-line, and marked D, whose radius is equal to the two radiuses of any of the other lines, is broke for the easier measurement of timber, and figured 4, 5, 6, 7, 8, 9, 10, 20, 30, &c. From 4 to 5 it is divided into ten parts, and each tenth subdivided into 2, and so on, from 5 to 6, &c.

On the backside of the rule are, 1. A line of inch-measure, from 1 to 12; each inch being divided and subdivided. 2. A line of foot measure, consisting of one foot, divided into 100 equal parts, and figured 10, 20, 30, &c. The back part of the sliding piece is divided into inches, halves, &c. and figured from 12 to 24; so that, when drawn wholly out, there may be a measure of two feet.

Use of Coggeshal's RULE *for measuring plane superficies.* 1. To measure a square: suppose, for instance, each of the sides 5 feet; set 1 on the line B, to 5 on the line A; then against 5 on the line B is 25 feet, the content of the square on the line A. 2. To measure a long square. Suppose the longest side 18 feet, and the shortest 10; set 1 on the line B, to 10 on the line A; then against 18 feet, on the line B, is 180 feet, the contents on the line A. 3. To measure a rhombus. Suppose the side 12 feet, and the length of a perpendicular let fall from one of the obtuse angles, to the opposite side, 9 feet; set 1 on the line B, 12, the length of the side on the line A; then against 9, the length of the perpendicular on the line B, is 108 feet, the content. 4. To measure a triangle. Suppose the base 7 feet, and the length of the perpendicular let fall from the opposite angle to the base 4 feet; set 1 on the line B, to 7 on the line A; then against half the perpendicular, which is 2 on the line B, is 14 on the line A, for the content of the triangle. 5. To find the content of a circle, its diameter being given. Suppose the diameter 3.5 feet; set 11 on the girt line D, to 95 on the line C; then against 3.5 feet on D is 9.6 on C, which is the content of the circle in feet. 6. To find the content of an oval or ellipsis. Suppose the longest diameter 9 feet, and the shortest 4. Find a mean proportional between the two, by setting the greater 9 on the girt line, to 9 on the line C; then against the less number 4 on the line C is 6, the mean proportional sought. This done, find the content of a circle, whose diameter is 6 feet; this, when found, by the last article, will be equal to the content of the ellipsis sought.

Use of Coggeshal's RULE, *in measuring timber.* 1°. To measure timber the usual way. Take the length in feet, half feet, and, if required, quarters; then measure half way back again; then girt the tree with a small cord or line; double this line twice very evenly, and measure this fourth part of the girt or perimeter, in inches, halves, and quarters. The dimensions thus taken, the timber is to be measured as if square, and the fourth of the girt taken for the side of the square, thus; set 12 on the girt line D, to the length in feet on the line C; then against the side of the square, on the girt-line D, taken in inches, you have, on the line C, the content of the tree in feet. For an instance: suppose the girt of a tree, in the middle, be 60 inches, and the length 30 feet, to find the content, set 12 on the girt-line D, and 30 feet on the line C; then against 15, one fourth of 60, on the girt line D, is 46.8 feet, the content on the line C. If the length should be 9 inches, and the quarter of the girt 35 inches; here, as the length is beneath a foot, measure it on the line of foot-measure, and see what decimal part of a foot it makes, which you will find .75. Set 12, therefore, on the girt-line, to 75 on the first radius of the line C, and against 35 on the girt-line is 64 feet on C, for the content. 2°. To measure round timber the true way. The former method, though that generally in use, is not quite just. To measure timber accurately, instead of the point 12 on the girt-line, use another, *viz.* 10.635; at which there should be placed a center-pin. This 10.635 is the side of a square equal to a circle, whose diameter is 12 inches. For an instance: suppose the length 15 feet, and $\frac{1}{4}$ of the girt 42 inches, set the point 10.635 to 15, the length; then against 42 on the girt line is 233 feet for the content sought; whereas, by the common way, there arises only

184 feet. In effect, the common measure is only to the true measure, as 11 to 14.

3°. To measure a cube. Suppose the sides to be 6 feet each; set 12 on the girt-line D, to 6 on C; then against 72 inches (the inches 6 feet) on the girt-line, is 216 feet on C, which is the content required. 4°. To measure unequally-squared timber; that is, where the breadth and depth are not equal. Measure the length of the piece, and the depth (at the end) in inches: then find a mean proportional between the breadth and depth of the piece. This mean proportional is the side of a square, equal to the end of the piece; which found, the piece may be measured as square timber. For an instance: let the length of the piece of timber be 13 feet, the breadth 23 inches, and the depth 13 inches; set 23 on the girt-line D, to 23 on C; then against 13 on C is 17.35 on the girt-line D, for the mean proportional. Again, setting 12 on the girt-line D, to 13 feet, the length of the line C; against 17.35 on the girt line is 27 feet, the content. 5°. To measure taper timber. The length being measured in feet, note one-third of it; which is found thus: set 3 on the line A, to the length on the line B; then against 1 on A is the third part on B: then, if the solid be round, measure the diameter at each end in inches, and subtract the less diameter from the greater; add half the difference to the less diameter; the sum is the diameter in the middle of the piece. Then set 13.54 on the girt to the length of the line C, and against the diameter in the middle on the girt-line is a fourth number on the line C. Again, set 13.54 on the girt line to the third part of the length on the line C; then against half the difference on the girt-line is another fourth number on the line C; these two fourth numbers, added together, give the content. For an instance: let the length be 27 feet (one third whereof is 9) the greater diameter 22 inches, and the lesser 18; the sum of the two will be 40, their difference 4, and half the difference 2, which, added to the less diameter, gives 20 inches for the diameter in the middle of the piece. Now set 13.54 on the girt-line, to 27 on the line C, and against 20 on D is 58.9 feet. Again, set 13.54 of the girt-line to 9 on the line C; and against 2 on the girt line (represented by 20) is .196 parts; therefore, by adding 58.9 feet to .196 feet, the sum is 59.096 feet, the content.

If the timber be square, and have the same dimensions; that is, the length 27 feet, the side of the greater end 22 inches, and that of the lesser 18 inches; to find the content, set 12 on the girt-line to 27, the length on the line C, and against 20 inches, the side of the mean square on the girt-line, is 75.4 feet. Again, set 12 on the girt-line to 9 feet, one-third of the length, on the line C, and against 2 inches, half the difference of the sides of the squares of the ends on the girt-line, is .25 parts of a foot; both together make 75.65 feet, the content of the solid.

The girt or circumference of a tree, or round piece of timber given; to find the side of the square within, or the number of inches of a side, when the round timber is squared. Set 10 on A to 9 on B, then against the girt on A are the inches for the side of a square on the line B.

RUM, a species of brandy, or vinous spirit, distilled from sugar canes. See BRANDY, DISTILLATION, and SPIRIT.

Rum, according to Dr. Shaw, differs from simple sugar-spirit, in that it contains more of the natural flavour or essential oil of the sugar-cane; a great deal of raw juice and parts of the cane itself being often fermented in the liquor, or solution, of which the rum is prpared. The unctuous or oily flavour of rum is often supposed to proceed from the large quantity of fat used in boiling the sugar; which fat, indeed, if coarse, will usually give a stinking flavour to the spirit, in our distillations of the sugar-liquor, or wash, from our refining sugar-houses; but this is nothing of kin to the flavour of the rum, which is really the effect of the natural flavour of the cane.

The method of making rum is this: When a sufficient stock of the materials is got together, they add water to them, and ferment them in the common method, though the fermentation is always carried on very slowly at first; because, at the beginning of the season for making rum in the islands, they want yeast, or some other ferment to make it work; but by degrees, after this, they procure a sufficient quantity of the ferment, which rises up as a head to the liquor in the operation, and thus they are able afterwards to ferment and make their rum with a great deal of expedition, and in large quantities.

When

When the wash is fully fermented, or to a due degree of acidity, the distillation is carried on in the common way, and the spirit is made up proof: though sometimes it is reduced to a much greater strength, nearly approaching to that of alcohol or spirit of wine, and it is then called double distilled rum. It might be easy to rectify the spirit, and bring it to much greater purity than we usually find it to be of; for it brings over in the distillation a very large quantity of the oil; and this is often so disagreeable, that the rum must be suffered to lie by a long time to mellow before it can be used; whereas, if well rectified, it would grow mellow much sooner, and would have a much less potent flavour.

The best state to keep rum in, both for exportation and other uses, is doubtless that of alcohol, or rectified spirit. In this manner it would be transported in one half the bulk it usually is, and might be let down to the common proof-strength with water when necessary: for the common use of making punch, it would likewise serve much better in the state of alcohol; as the taste would be cleaner; and the strength might always be regulated to a much greater exactness than in the ordinary way.

The only use to which it would not so well serve in this state, would be the common practice of adulteration among our distillers; for when they want to mix a large portion of cheaper spirit with the rum, their business is to have it of the proof strength, and as full of the flavouring oil as they can, that it may drown the flavour of the spirits they mix with it, and extend its own. If the business of rectifying rum was more nicely managed, it seems a very practicable scheme to throw out so much of the oil, as to have it in the fine light state of a clear spirit, but lightly impregnated with it; in this case it would very nearly resemble arrac, as is proved by the mixing a very small quantity of it with a tasteless spirit, in which case the whole bears a very near resemblance to arrac in flavour.

Rum is usually very much adulterated in England; some are so barefaced as to do it with malt-spirit; but when it is done with molasses-spirit, the tastes of both are so nearly allied that it is not easily discovered. The best method of judging of it is, by setting fire to a little of it; and when it has burnt away all the inflammable part, examining the phlegm both by the taste and smell.

Rum, on importation, pays a duty of of 4s. $\frac{80\frac{5}{21}}{100}$d. the gallon.

RUMB, or RHUMB. See RHUMB.

RUMELIA, in geography, the same with antient Greece, now a part of Turky in Europe. See TURKY.

RUMEN, in comparative anatomy, the paunch, or first stomach of such animals as chew the cud, thence called ruminant animals.

The rumen is by far the largest of all the stomachs, and in it the whole mass of crude aliments, both solid and liquid, lies and macerates, to be thence transmitted to the mouth to be again chewed, comminuted, and fitted for farther digestion in the other ventricles. See the article DIGESTION.

The ruminant animals, Mr. Ray observes, are all hairy quadrupeds, viviparous, and have four stomachs; they also want the dentes primores, or broad teeth in the fore part of the upper jaw, and are furnished with that kind of fat called suet, sebum. See QUADRUPED.

We even find instances of ruminating men, particularly of one at Bristol, of of whom Dr. Slare gives the following account, in Phil. Trans. n° 193. He would begin to chew his meat over again within a quarter of an hour after his meals, if he drank upon them; if not, it was somewhat longer: this chewing after a a full meal lasted about an hour and an half. The victuals, upon their return into the mouth, tasted somewhat more pleasant than at first; and liquids, as broths and spoon-meats, returned all one as dry and solid food; and he always observed, that if he eat variety of things, what he swallowed first, would again come up first to be chewed; also if this faculty intermitted at any time, it portended sickness, and he was never well till it returned again.

RUMEX, in botany, a genus of the *hexandria-tryginia* class of plants, the flower of which consists of three connivent petals, of an oval figure: the seed is single, triquetrous, and contained in the corolla.

To this genus, among other species, belong rhubarb, bloody dock, common sorrel, &c. See the articles RHUBARB, DOCK, and SORREL.

RUMFORD, a market-town of Essex, ten miles east of London.

RUM-

RUMMAGE, in the ſea language, ſignifies to clear a ſhip's hold, or to remove goods from one place of it to another.

RUMPFIA, in botany, a genus of the *triandria-monogynia* claſs of plants, the corolla of which conſiſts of three oblong, obtuſe, and equal petals; its fruit is a coriaceous and turbinated drupe, with three furrows; and incloſing an oval trilocular nut, with a ſingle triquetrous kernel in each cell.

RUMSEY, a market-town of Hampſhire, nine miles ſouth weſt of Wincheſter.

RUN, in the ſea language, denotes ſo much of a ſhip's hull, as is under water.

RUNDLE, or ROUNDLE, in heraldry, the ſame with pellet. See PELLET.

RUNDLET, or RUNLET, a ſmall veſſel, containing an uncertain quantity of any liquor, from three to twenty gallons.

RUNIC, a term applied to the language and letters of the antient Goths, Danes, and other northern nations.

RUNNER, in the ſea language, a rope belonging to the garnet, and to the two bolt-tackles. It is reeved in a ſingle block, joined to the end of a pennant, and has at one end a hook to hitch into any thing, and at the other end a double block, into which is reeved the fall of the tackle, or the garnet, by which means it purchaſes more than the tackle would without it.

RUNNET, or RENNET, the acid juice found in the ſtomachs of calves that have fed on nothing but milk, and are killed before the digeſtion is perfect.

RUNNING *of goods*, a clandeſtine landing of goods, without paying the legal cuſtoms or duties for the ſame.

RUNNING ROPES. See ROPE.

RUPEE, ROUPIA, or ROUPIAS, names of a gold and ſilver coin, current in the Eaſt-Indies. See COIN.

RUPELMONDE, a town of Flanders, ſituated on the river Scheld, ſix miles ſouth of Antwerp. See RUPPLE.

RUPERT-FORT, a ſettlement belonging to the Hudſon's-Bay company, ſituated at the bottom of the ſaid bay, in weſt long. 80°, north lat. 51°.

RUPICAPRA, in zoology, the CHAMOIS-GOAT. See CHAMOIS and GOAT.

RUPPIA, in botany, a genus of the *tetrandia-tetragynia* claſs of plants, without any flower-petals: there are no ſtamina, the antheræ being foſſile: the fruit conſiſts of four oval, cortical ſubſtances, pointed, and ſtanding on the elongated ſtyles, and in each is contained a ſingle roundiſh ſeed.

RUPPLE, a river of Brabant, which, formed by Senne, Demer, and Dyle, falls into the Scheld at Rupelmond.

RUPTURE, in ſurgery, the ſame with hernia. See the article HERNIA.

RURAL, or RUSTIC, in general, denotes ſomething that relates to the country.

RURAL DEAN, in church-hiſtory. See the article DEAN.

RUSCUS, BUTCHER'S BROOM, in botany, a plant of the *dioecia-ſyngeneſia* claſs, with a globoſe monopetalous flower; and a globoſe trilocular berry for its fruit, with two ſeeds of the ſame ſhape in each cell. The root of this plant is one of the five aperient roots of the ſhops; being eſteemed a powerful attenuant and reſolvent, and therefore good in all chronic caſes and obſtructions of the viſcera, as alſo to promote urine.

RUSH, *juncus*, in botany. See JUNCUS.

RUSMA, in the materia medica, the ſame with ſory. See the article SORY.

RUSSIA, or MUSCOVY, a large empire, comprehending a vaſt extent of country, in the moſt northerly parts of Europe and Aſia, from 24° to 130°, eaſt long, and between 45° and 72° north lat.

Its capital cities are Moſcow and Peterſburg. See the articles MOSCOW and PETERSBURG.

RUSSIA-COMPANY, in commerce. See the article COMPANY.

RUST *of a metal*, the flower or calx thereof, procured by corroding and diſſolving its ſuperficial parts by ſome menſtruum. Water is the great inſtrument or agent in producing ruſt; and hence oils, and other fatty bodies, ſecure metals from ruſt; water being no menſtruum to oil, &c. and therefore not able to make its way through it.

All metals are liable to ruſt, even gold itſelf, if expoſed to the fumes of ſea ſalt.

RUST, or BLIGHT *of Corn*. See BLIGHT.

RUSTIC, in architecture, implies a manner of building in imitation of nature, rather than according to the rules of art.

RUSTIC WORK, is where the ſtones in the face, &c. of a building, inſtead of being ſmooth, are hatched, or picked with the point of a hammer.

RUSTIC ORDER, that decorated with ruſtic quoins, ruſtic work, &c.

RUSTRE, in heraldry, a bearing of a diamond-ſhape, pierced through in the

middle with a round hole. See plate CCXXXIII. fig. 4.

RUT, in hunting, the venery or copulation of deer. See DEER.

RUTA, RUE, in botany, a genus of the *decandria monogynia* claſs of plants, with a roſaceous flower, uſually conſiſting of four patent and hollow petals; its fruit conſiſts of four capſules affixed to an axis, or rather one gibbous capſule, with four lobes, and as many cells, in which are incloſed a great many kidney-ſhaped and angular ſeeds. See plate CCXXXV. fig. 1.

The dried herb is much uſed in medicine, by way of infuſion; being eſteemed an excellent alexipharmic and cephalic, and accordingly preſcribed in the ſmall-pox, meaſles, and hyſteric and nervous caſes; as alſo in peripneumonies and pleuriſies, to ſtrengthen the ſtomach, and to prevent the return of habitual colics.

Goat RUE, *galega*, a plant of the *diadelphia decandria* claſs, with a papilionaceous flower, and a long cylindric pod for its fruit.

It has been accounted a good ſudorific, but is little uſed in the preſent practice.

Meadow-RUE, *thalictrum*. See the article THALICTRUM.

Wall RUE, *ruta-muraria*, the ſame with the adiantum album. See the article ADIANTUM.

Wild-RUE, *harmala*, or *peganum*. See the article PEGANUM.

RUTHYN, a market-town of Denbighſhire, eight miles ſouth-eaſt of Denbigh.

RUTICILLA, in ornithology, a bird called in engliſh the Redſtart. See the article REDSTART.

RUTILUS, in ichthyology, a fiſh called in engliſh the Roach. See ROACH.

RUTLAND, the leaſt county in England, bounded by Lincolnſhire, on the north-eaſt; by Northamptonſhire, on the ſouth-eaſt; and by Leiceſterſhire, on the weſt and north-weſt.

RUVO, a town of the kingdom of Naples, ſeventeen miles ſouth-weſt of Barri.

RYAL, or RIAL. See RIAL.

RYE, *ſecale*, in botany. See SECALE.

Rye ſucceeds very well on any ſort of dry land, even on the moſt barren gravel or ſand. The farmers ſow it about the beginning of September, after a ſummer's fallow, in the drieſt time they can. Two buſhels of ſeed is the quantity generally allowed to an acre of land; but if it be ground newly broken up, or if it be ſubject to worms, they then allow a peck more to the acre. A little ſprinkling of dung, or mud, upon rye-land, will greatly advance the crop, though it is laid but half the thickneſs that it is for other corn; its produce is commonly about twenty buſhels upon an acre.

RYE, in geography, a borough and port-town of Suſſex, ſituated on a bay of the engliſh Channel, ſixty miles ſouth-eaſt of London. It ſends two members to parliament.

RYEGATE, or REYGATE. See the article REYGATE.

RYME, or RHYME. See RHYME.

RYPEN, a city and port-town of Jutland, in Denmark: eaſt long. 9°, north lat. 55° 30'.

RYSAGON, a name given to the caſſumunar-root. See CASSUMUNAR.

RYSWICK, a fine village in Holland, between the Hague and Delft, where the peace in 1697 was concluded.

RZECZICA, a city of Lithuania, in Poland, ſituated on the river Nieper, eaſt long. 30°, north lat. 53°.

S.

S, or s, the eighteenth letter, and fourteenth conſonant of our alphabet; the ſound of which is formed, by driving the breath through a narrow paſſage between the palate and the tongue elevated near it, together with a motion of the lower jaw and teeth towards the upper; the lips being a little way open, with ſuch a configuration of every part of the mouth and larynx, as renders the voice ſomewhat ſibulous and hiſſing. Its ſound however varies, being ſtrong in ſome words, as *this, thus, &c.* and ſoft in words which have a final e, as *muſe, wiſe, &c.* It is generally doubled at the end of words, whereby they become hard and harſh, as in *kiſs, loſs, &c.* In ſome words it is ſilent, as *iſle, iſland, viſcount, &c.* In writing or printing, the long character ſ, is uſed at the beginning and middle of words, but the ſhort s, at the end.

In abbreviations, S, ſtands for *ſocietas* or *ſocius*; as, R. S. S. for *regiæ ſocietatis ſocius*, i. e. fellow of the royal ſociety. In medicinal preſcriptions, S. A. ſignifies *ſecundum artem*, i. e. according to the rules of art; and in the notes of the antients, S ſtands for *Sextus*; SP. for *Spurius*; S C. for *ſenatus conſultum*; S. P. Q. R. for *ſenatus populuſque Romanus*; S. S. S. for *ſtratum ſuper ſtratum*, i. e. one layer above another alternately; S. V. B. E. E. Q. V. for *ſi vales bene eſt, ego quoque valeo*, a form uſed in Cicero's time, in the beginning of letters. Uſed as a numeral, S antiently denoted ſeven; in the italian muſic, S ſignifies ſolo; and in books of navigation, S ſtands for ſouth; S. E. for ſouth-eaſt; S. W. for ſouth-weſt; S. S. E. for ſouth ſouth-eaſt; S. S. W. for ſouth ſouth-weſt, *&c.* See COMPASS.

SABA, one of the Caribbee iſlands, ſubject to the Dutch: weſt long. 63°, north lat. 18°.

SABÆANS, in church-hiſtory, a ſet of idolaters, much antienter than the jewiſh law.

In the early ages of the world, idolatry was divided between two ſects; the worſhippers of images called ſabæans, or ſabians, and the worſhippers of fire called magi. See the article MAGI.

The ſabæans began with worſhipping the heavenly bodies, which they fancied were animated by inferior deities. In the conſecration of their images, they uſed many incantations to draw down into them from the ſtars thoſe intelligences, for whom they erected them, whoſe power and influence they held afterwards dwelt in them. This religion, it is ſaid, firſt began among the Chaldæans, with their knowledge in aſtronomy: and from this it was, that Abraham ſeparated himſelf, when he came out of Chaldæa. From the Chaldæans it ſpread all over the eaſt; and from thence to the Grecians, who propagated it to all the nations of the known world. The remainder of this ſect ſtill ſubſiſts in the eaſt, and pretend to derive their name from Sabius, a ſon of Seth; and among the books in which the doctrines of this ſect are contained, they have one which they call the book of Seth, and which they pretend was written by that patriarch.

SABBATH, or the day of reſt, a ſolemn feſtival of the Jews, on the ſeventh day of the week, or Saturday, beginning from ſun-ſet on Friday, to ſun-ſet on Saturday.

The obſervation of the ſabbath began with the world: for God having employed ſix days in its creation, appointed the ſeventh, as a day of reſt to be obſerved by man, in commemoration of that great event. On this day the Jews were commanded to abſtain from all labour, and to give reſt to their cattle. They were not allowed to go out of the city farther than two thouſand cubits, or about a mile; a cuſtom which was founded on the diſtance of the ark from the tents of the Iſraelites, in the wilderneſs, after their leaving Egypt; for being permitted to go, even on the ſabbath-day, to the tabernacle to pray, they from thence inferred, that the taking a journey of no greater length, though on a different account, could not be a breach of the ſabbatical reſt.

As the ſeventh day was a day of reſt to the people, ſo was the ſeventh year to the land; it being unlawful in this year to plow or ſow, and whatever the earth produced, belonged to the poor; this was called the ſabbatical year. The Jews, therefore, were obliged, during the ſix years, and more eſpecially the laſt, to lay up a ſufficient ſtore for the ſabbatical year.

The modern, as well as the antient, Jews, are very ſuperſtitious in the obſervance of the ſabbath; they carry neither arms, nor gold, nor ſilver about them, and are permitted neither to touch theſe, nor a candle, nor any thing belonging to the fire; on which account they light up lamps on Friday, which burn till the end of the ſabbath.

There is at preſent a ſect of baptiſts called ſabbatarians, from their obſerving the ſeventh day of the week, as a day ſet apart for the worſhip of God: they attempt to juſtify this practice by alledging that the jewiſh ſabbath was never abrogated in the New Teſtament; and that where God has given a command, it is our duty to obſerve it till he has abrogated or altered it by a new command. See the article SUNDAY.

SABELLIANS, a ſect of chriſtians of the IIId century, that embraced the opinions of Sabellius, a philoſopher of Egypt, who openly taught that there is but one perſon in the Godhead.

The ſabellians maintained, that the Word and the Holy Spirit are only virtues, emanations, or functions of the Deity; and held, that he who is in heaven is the father of all things, deſcended into the virgin, became a child, and was born of her as a ſon; and that having accompliſhed the myſtery of our ſalvation, he diffuſed himſelf on the apoſtles in tongues of fire, and was then denominated the Holy Ghoſt. This they explained by reſembling God to the ſun, the illuminative virtue or quality of which was the Word, and its warming virtue the Holy Spirit. The Word, they taught, was darted, like a divine ray, to accompliſh the work of redemption; and that, being reaſcended to heaven, the influences of the Father were communicated after a like manner to the apoſtles.

SABINA, SAVIN, in botany. See SAVIN.

SABINA, a province of Italy, in the pope's territories, bounded by Umbria on the north, by Naples on the eaſt, by the Campania of Rome on the ſouth, and by St. Peter's Patrimony on the weſt.

SABLE, or SABLE ANIMAL, in zoology, a creature of the weaſel-kind, called by authors muſtela zibellina. See the articles MUSTELA and ZIBELLINA.

SABLE, in heraldry, denotes the colour black, in coats of arms belonging to gentlemen; but in thoſe of noblemen it is called diamond; and in thoſe of ſovereign princes, ſaturn. See COLOUR.

It is expreſſed in engraving by perpendicular and horizontal hatches croſſing one another, as repreſented in pl. CCXXXV. fig. 5.

SABLE-MOUSE, a name given to the norway rat. See the article NORWAY.

SABLE, in geography, a town of Orleanois in France, twenty miles north of Angers.

SABLUSTAN, a province of Perſia, which, comprehending Gaur and Candahor, is bounded by Choraſſan on the north, by India on the eaſt, and by Sigiſtian on the ſouth.

SABRE, a kind of ſword or ſcimiter, with a very broad and heavy blade, thick at the back, and a little falcated or crooked towards the point: it is the ordinary weapon worn by the Turks, who are ſaid to be very expert in the uſe of it.

SABURRÆ, GRITTS, in natural hiſtory, a genus of foſſils, found in minute maſſes, forming together a kind of powder, the ſeveral particles of which are of no determinate ſhape, nor have any tendency to the figure of cryſtal, but ſeem rudely broken fragments of larger maſſes; not to be diſſolved or diſunited by water, but retaining their figure in it, and not cohering by means of it into a maſs; conſiderably opake, and in many ſpecies fermenting with acids; often fouled with heterogene matters, and not unfrequently taken in the coarſer ſtony and mineral or metalline particles.

Gritts are of various colours, as, 1. The ſtony and ſparry gritts, of a bright or greyiſh white colour. 2. The red ſtony gritts. 3. The green ſtony gritts, compoſed of homogene ſparry particles. 4. The yellow gritt, of which there is only one ſpecies. 5. The black and blackiſh gritts, compoſed of ſtony or talcy particles.

SAC, in law, is ſaid to be an antient privilege, which the lord of a manor claims of holding his court, in cauſes of treſpaſs among his tenants, and impoſing fines for the ſame. See COURT and MANOR.

SACCADE, in the manege, is a jerk more or leſs violent, given by the horſeman to the horſe, in pulling or twitching the reins of the bridle all on a ſudden, and with one pull, and that when a horſe lies heavy upon the hand, or obſtinately arms himſelf.

This is a correction uſed to make a horſe carry well, but it ought to be uſed diſcreetly, and but ſeldom.

SACCAI, a city and port-town of Japan, ſituated on the bay of Mecao, three hundred

hundred miles ſouth-weſt of Jeddo: eaſt long. 135°, and north lat. 36°.

SACCHARUM, SUGAR, in botany. See the article SUGAR.

SACCHARUM SATURNI, SUGAR OF LEAD, is thus ordered to be made in the London Diſpenſatory: boil ceruſs with diſtilled vinegar, until the vinegar becomes ſufficiently ſweet; then filter the vinegar thro' paper, and after due evaporation ſet it to cryſtallize.

Some have ventured to give ſugar of lead internally, in doſes of a few grains, as a ſtyptic, in hæmorrhages, profuſe colliquative ſweats, ſeminal fluxes, the fluor albus, &c. and indeed it muſt be allowed, that it very powerfully reſtrains the diſcharge; but then it occaſions other ſymptoms, often dangerous, and ſometimes fatal, as violent colic-pains, obſtinate conſtipations, cramps, tremors, &c. ſo that its internal uſe ſeems by no means innocent.

SACCO BENITO. See INQUISITION and ACT *of faith*.

SACCULUS, in anatomy, a diminutive of ſaccus, ſignifies a little bag: as, 1. The ſacculus lachrymalis, which is a little bag, into which the punctа lacrymalia of the eye open. 2. The ſacculus cordis, or pericardium. 3. The ſacculus chyliferus, the beginning of the thoracic duct, more uſually called receptaculum chyli. 4. Sacculi adipoſi, or the adipoſe cells, &c. See the article EYE, PERICARDIUM, RECEPTACULUM, &c.

A topical application, incloſed in a linnen-bag, is alſo termed ſacculus medicinalis; as is a bag filled with medicinal ſimples, and ſuſpended in a liquor, in order to make a diet-drink.

SACCUS JUGULARIS, the JUGULAR SACK, in anatomy, a receptacle formed at the termination of the internal jugular vein; the uſe of which is to bring back the blood from the ſinuſes of the dura mater, and from the brain. See the article JUGULAR and BRAIN.

SACER, in its common acceptation, ſignifies ſacred, or holy; but is alſo uſed to expreſs dreadful, horrid, or execrable: and in this laſt ſenſe Virgil calls the love of gold, *auri ſacra fames*.

It is uſed by medical writers in both theſe ſignifications: thus they call hiera picra, the ſacred tincture; a malignant kind of eryſipelas, ignis ſacer; and the epilepſy, morbus ſacer. See the articles HIERA, ERYSIPELAS, and EPILEPSY.

Some give the name ſacer muſculus to a muſcle called by Winſlow tranſverſo-ſpinalis lumborum: it is compoſed of ſeveral ſmall ones, and lies between the ſpinal and oblique apophyſes of the loins, reaching to the os ſacrum.

SACER, in ornithology, the engliſh name for the blue-legged falcon, with a duſky ferrugineous back. See FALCO.

This is a very large but not a very beautiful ſpecies of falco; it is of the ſize of a full-grown hen. It is a very ſwift flier, and ſo bold that there is ſcarce any bird it will not ſeize upon. The head is large and rounded; the beak is ſhort, broad at the baſe, and hooked at the point; the opening of the mouth is very wide, and the ſwallow remarkably large; the body is longer, as are alſo the wings and tail, than in moſt other ſpecies.

SACERDOTAL, ſomething belonging to prieſts. See the article PRIEST.

SACK *of wool*, a quantity of wool containing juſt twenty-two ſtone, and every ſtone fourteen pounds. In Scotland, a ſack is twenty-four ſtone, each ſtone containing ſixteen pounds.

SACK *of cotton-wool*, a quantity from one hundred and a half to four hundred weight.

SACKS *of earth*, in fortification, are canvas-bags filled with earth. They are uſed in making retrenchments in haſte, to place on parapets, or the head of the breaches, &c. or to repair them, when beaten down.

SACKBUT, a muſical inſtrument of the wind-kind, being a ſort of trumpet, though different from the common trumpet both in form and ſize: it is fit to play a baſs, and is contrived to be drawn out or ſhortened, according to the tone required, whether grave or acute. The Italians call it trombone, and the Latins tuba ductilis.

It takes aſunder in four pieces, and has frequently a wreath in the middle, which is the ſame tube only twice twiſted, or making two circles in the middle of the inſtrument, by which means it is brought down one fourth lower than its natural tone: it has alſo two pieces or branches on the inſide, which do not appear, unleſs drawn out by an iron-bar, and which lengthens it till it hit the tone required. The ſackbut is uſually eight feet long, without reckoning the circles, and without being drawn out: when it is extended to its full length, it is uſually fifteen feet; the wreath is two feet nine inches in circumference.

There are ſackbuts of different ſizes, diſtinguiſhed by the epithets primo or I°, ſecondo or II°, terzo or III°, &c. or 1°, 2°, 3°, &c.

SACRA, the SACRED ARTERY, in anatomy, is a branch of the aorta deſcendens; which, according to Heiſter, ſometimes deſcends through the os ſacrum to the pelvis; ſometimes ariſes one from each iliac, and ſometimes is altogether wanting. See the article ARTERY.

There is alſo a vein called the vena ſacra, which ariſes from the vena cava, juſt above the iliacs: it is ſometimes double. See the article VEIN.

SACRAMENT, *ſacramentum*, ſignifies, in general, a ſign of a thing ſacred and holy; and is defined to be an outward and viſible ſign of a ſpiritual grace. Thus there are two objects in a ſacrament, the one the object of the ſenſes, and the other the object of faith. Proteſtants admit only of two ſacraments, baptiſm, and the euchariſt, or Lord's ſupper: but the roman-catholics own ſeven, *viz.* baptiſm, confirmation, the euchariſt, penance, extreme unction, ordination and marriage. See the articles BAPTISM, CONFIRMATION, &c.

The romaniſts, however, by way of eminence, call the euchariſt the holy ſacrament. Thus to expoſe the holy ſacrament, is to lay the conſecrated hoſt on the altar to be adored. The proceſſion of the holy ſacrament, is that in which this hoſt is carried about the church, or about a town.

SACRAMENT was alſo uſed in the roman law for a pledge in money which both the plaintiff and defendant in a real action laid down in court to be forfeited by him who ſhould loſe the cauſe.

SACRAMENTARIANS, a name given by the romaniſts to all ſuch as in their opinion entertain erroneous doctrines of the ſacrament of the Lord's ſupper, and chiefly uſed by way of reproach to lutherans, calviniſts, and other proteſtants.

SACRAMENTARY, an antient romiſh church-book, which contains all the prayers and ceremonies practiſed at the celebration of the ſacraments.

It was wrote by pope Gelaſius, and afterwards reviſed, corrected, and abridged by St. Gregory.

SACRED, ſomething holy, or that is ſolemnly offered and conſecrated to God, with benedictions, unctions, &c. Thus kings and prieſts are held ſacred perſons; the deaconhood, ſubdeaconhood, and prieſthood, are all ſacred orders, and impreſs a ſacred indelible character. The ſacred college is that of the cardinals.

Sacred is alſo applied to things belonging to God and the church. Thus churches, church-lands, ornaments, &c. are held ſacred. But in the civil law, a ſacred place chiefly denotes, that where a perſon deceaſed has been interred.

Sacred majeſty is applied to the emperor and the king of England; though this title has by ſome been thought blaſphemous.

SACRIFICE, a ſolemn act of religious worſhip, which conſiſted in dedicating or offering up ſomething animate or inanimate on an altar, by the hands of the prieſt, either as an expreſſion of their gratitude to the deity for ſome ſignal mercy, or to acknowledge their dependance on him, or to conciliate his favour. The origin of ſacrifices is by ſome aſcribed to the Phœnicians, but Porphyry aſcribes it to the Egyptians, who firſt offered the firſt fruits of their grounds to the gods, burning them upon an altar of turf: thus in the moſt antient ſacrifices there were neither living creatures, nor any thing coſtly or magnificent; and no myrrh or frankincenſe. At length they began to burn perfumes: and afterwards men leaving their antient diet of herbs and roots, and beginning to uſe living creatures for food, they began alſo to change their ſacrifices. The ſcriptures, however, furniſh us with a different account; for Noah, is is ſaid, ſacrificed animals at his coming out of the ark; and even Abel himſelf ſacrificed the beſt and fatteſt of his flock; but Grotius thinks it more probable that he contented himſelf with making a mere oblation of his lambs, &c. without ſlaying them.

The Jews had two ſorts of ſacrifices, taking the word in its largeſt ſignification: the firſt were offerings of tythes, firſt-fruits, cakes, wine, oil, honey, and the like; and the laſt offerings of ſlaughtered animals. When an Iſraelite offered a loaf or a cake, the prieſt broke it in two parts, and ſetting aſide that half which he reſerved for himſelf, broke the other into crumbs, poured oil, wine, incenſe, and ſalt upon it, and ſpread the whole upon the fire of the altar. If theſe offerings were accompanied with the ſacrifice of an animal, they were thrown upon the victim to be conſumed along

along with it. If the offerings were of the ears of new corn, they were parched at the fire, rubbed in the hand, and then offered to the prieſt in a veſſel, over which he poured oil, incenſe, wine and ſalt, and then burnt it upon the altar, having firſt taken as much of it, as of right belonged to himſelf.

The principal ſacrifices among the Hebrews conſiſted of bullocks, ſheep and goats; but doves and turtles were accepted from thoſe who were not able to bring the other; theſe beaſts were to be perfect and without blemiſh. The rites of ſacrificing were various, all of which are very minutely deſcribed in the books of Moſes.

The manner of ſacrificing among the Greeks and Romans was as follows: in the choice of the victim, they took care that it was without blemiſh or imperfection; its tail was not to be too ſmall at the end; the tongue not black, nor the ears cleft; and that the bull was one that had never been yoaked. The victim being pitched upon, they gilt his forehead and horns, eſpecially if a bull, heifer, or cow. The head they alſo adorned with a garland of flowers, a woollen infula or holy fillet, whence hung two rows of chaplets with twiſted ribbands; and on the middle of the body a kind of ſtole, pretty large, hung down on each ſide; the leſſer victims were only adorned with garlands and bundles of flowers, together with white tufts or wreaths.

The victims thus prepared were brought before the altar; the leſſer being driven to the place, and the greater led by an halter; when if they made any ſtruggle or refuſed to go, the reſiſtance was taken for an ill omen, and the ſacrifice frequently was ſet aſide. The victim thus brought was carefully examined, to ſee that there was no defect in it: then the prieſt, clad in his ſacerdotal habit, and accompanied with the ſacrificers and other attendants, and being waſhed and purified according to the ceremonies preſcribed, turned to the right hand and went round the altar, ſprinkling it with meal and holy-water, and alſo beſprinkling thoſe who were preſent. Then the cryer proclaimed with a loud voice, Who is here? To which the people replied, Many and good. The prieſt then having exhorted the people to join with him by ſaying, Let us pray, confeſſed his own unworthineſs, acknowledging that he had been guilty of divers ſins; for which he begged pardon of the gods, hoping that they would be pleaſed to grant his requeſts, accept the oblations offered them, and ſend them all health and happineſs; and to this general form added petitions for ſuch particular favours as were then deſired. Prayers being ended, the prieſt took a cup of wine, and having taſted it himſelf, cauſed his aſſiſtants to do the like; and then poured forth the remainder between the horns of the victim. Then the prieſt, or the cryer, or ſometimes the moſt honourable perſon in the company, killed the beaſt, by knocking it down, or cutting its throat. If the ſacrifice was in honour of the celeſtial gods, the throat was turned up towards heaven: but if they ſacrificed to the heroes or infernal gods, the victim was killed with its throat towards the ground. If by accident the beaſt eſcaped the ſtroke, leaped up after it, or expired with pain and difficulty, it was thought to be unacceptable to the gods. The beaſt being killed, the prieſt inſpected its intrails, and made predictions from them. They then poured wine, together with frankincenſe, into the fire, to increaſe the flame, and then laid the ſacrifice on the altar; which in the primitive times was burnt whole to the gods, and thence called an holocauſt: but in after times, only part of the victim was conſumed in the fire, and the remainder reſerved for the ſacrificers; the thighs and ſometimes the entrails being burnt to their honour, the company feaſted upon the reſt. While the ſacrifice was burning, the prieſt, and the perſon who gave the ſacrifice, jointly prayed, laying their hands upon the altar. Sometimes they played upon muſical inſtruments in the time of the ſacrifice, and on ſome occaſions they danced round the altar, ſinging ſacred hymns in honour of the gods.

SACRIFICE is alſo the name of an iſland in the gulph of Mexico, forty-five miles eaſt of La Vera Cruz: it is ſubject to the Spaniards.

SACRILEGE, the crime of profaning ſacred things, or thoſe devoted to the ſervice of God.

SACRISTAN, *ſacriſta*, a church officer, otherwiſe called ſexton. See SEXTON.

SACRISTY, *ſacriſtia*, in church hiſtory, an apartment in a church, where the ſacred utenſils were kept; being the ſame with our veſtry. See VESTRY.

SACRO-

SACRO-LUMBARIS, in anatomy, one of the extenſor muſcles of the back and loins, has its origin at the os ſacrum and the poſterior ſpine of the ilium, and its termination in the upper part of the ribs.

SACRUM OS, the ſacred bone, in anatomy, the lower extremity of the ſpina dorſi, being a bone of a triangular figure, with a rough ſurface; its ſubſtance is ſpongy, and it has two lateral apophyſes for its articulation with the oſſa innominata; alſo two ſmaller upper apophyſes, with glenoide cavities for the articulation into the lower vertebra; and an inferior apophyſes, for its articulation with the os coccygis: it has alſo a canal, for the end of the ſpinal marrow.

The uſes of this bone are, 1. To ſerve as a baſis to the ſpine. 2. To form the pelvis along with the oſſa innominata, and to defend the parts contained in it. 3. To contain in its ſinus the lower part of the ſpinal marrow, called cauda equina. 4. To give paſſage at its foramina, which are ſometimes four ſometimes five pair, to the nerves of the inteſtinum rectum, the bladder, and of the parts of generation, and to the large crural and iſchiatic ones. 5. To ſerve as a place of origin to many of the muſcles.

In adults, the os ſacrum is one continued bone; but, in infants, it is almoſt entirely cartilaginous; and in children more grown up, it always conſiſts of ſeveral pieces, the junctures of four or five of which may be ſeen even in adults.

SADERASAPATAN, a port-town on the coaſt of Cormandel forty miles ſouth of Fort St. George. Here the Dutch have a factory.

SADDLE, is a ſeat upon a horſe's back, contrived for the conveniency of the rider.

A hunting-ſaddle is compoſed of two bows, two bands, fore-bolſters, pannels, and ſaddle-ſtraps; and the great ſaddle has, beſides theſe parts, corks, hind-bolſters, and a trouſſequin.

The pommel is common to both.

A horſeman that would ſit a horſe well, ought always to ſit on his twiſt, and never on his buttocks, which ought never to touch the ſaddle; and whatever diſorder the horſe commits, he ought never to move above the ſaddle.

The antient Romans are ſuppoſed not to have made uſe of ſaddles and ſtirrups, and it is thought that they did not come into uſe till the time of Conſtantine the Great, A. C. 340, as appears from the greek hiſtorian, Zonaras, who (through his whole hiſtory) makes no mention of a ſaddle for a horſe, before ſuch time as Conſtans attempting to deprive his brother Conſtantine of the empire, made head againſt his army, and entering into the ſquadron where he himſelf was, caſt him beſide the ſaddle of his horſe. The ſeveral ſorts of ſaddles in uſe at preſent are. 1. The running-ſaddle; which is a ſmall one with round ſkirts. 2. The Burford-ſaddle; which hath the ſeat and the ſkirts both plain. 3. The pad-ſaddle; of which there are two ſorts, ſome made with burs before the ſeat, and others with bolſters under the thighs. 4. A french pad-ſaddle; of which the burs come wholly round the ſeat. 5. The portmanteau-ſaddle, that has a cantle behind the ſeat, to keep the portmanteau or other carriage off from the back of the rider. 6. A war-ſaddle; which has a cantle and a bolſter behind and before; alſo a fair bolſter. 7. The pack-ſaddle. As for the ſeveral parts of a ſaddle, and the deſcription of them, they are to be found under their ſeveral heads. See the articles BOW, WITHERS, STRAPS, BAND, BOLSTER, *&c.*

SADDLE-GALLED, in farriery. See the article GALLING.

SADDUCEES, in jewiſh antiquity, a famous ſect among the antient Jews, ſo called from their founder Sadoc Antigonus of Socho, preſident of the ſanhedrim at Jeruſalem, and teacher of the law in the principal divinity-ſchool of that city. Having often, in his lectures, aſſerted to his ſcholars, that they ought not to ſerve God in a ſervile manner, with reſpect to reward, but only out of filial love and fear; two of his ſcholars, Sadoc and Baithus, inferred from thence, that there were no rewards or puniſhments after this life: and, therefore, ſeparating from the ſchool of their maſter, they taught that there was no reſurrection, nor future ſtate. Many, embracing this opinion, gave riſe to the ſect of the ſadducees, who were a kind of epicureans, but differing from them in this, that though they denied a future ſtate, yet they allowed the world was created by the power of God, and governed by his providence; whereas the followers of Epicurus denied both.

The ſadducees denied all manner of predeſtination whatever, and not only rejected all unwritten traditions, but alſo all the books of the Old Teſtament, excepting

cepting the pentateuch. See the article PENTATEUCH.

SAFE CONDUCT, a ſecurity given by the king under the great ſeal to a foreigner, for his ſafe coming into and paſſing out of the kingdom.

SAFE-GUARD, a protection formerly granted to a ſtranger, who feared violence from ſome of the king's ſubjects, for ſeeking his right by courſe of law.

SAFFRON, *crocus*, in botany, *&c.* See the article CROCUS.

Saffron is cultivated in fields for uſe, and is no where raiſed with ſo much ſucceſs as in England, the engliſh ſaffron being generally allowed to be greatly ſuperior to any other. The uſual way of propagating it is by the bulbs, of which it annually produces new ones. Theſe are planted out in trenches at five inches diſtance, or leſs, and they ſeldom fail. They produce only leaves the firſt year, but in September, or October, of the year following, they flower. The ſaffron is gathered as ſoon as the flowers open, and is then ſeparated from all filth, and formed into cakes, by a very careful preſſure and gentle heat. At the end of October, when the flowering ſeaſon is over, the bulbs are taken out of the ground, and hung up in a dry place, and in ſpring are put into the ground again.

It is not, however, the entire flower of the plant that produces it, but only ſome of its internal parts. It is met with in the ſhops in flat and thin cakes, into which it has been formed by preſſing, and which conſiſt of many long and narrow filaments, that are ſmalleſt in their lower part, where they are of a pale yellow colour; in their upper part they are broader and indented at their edges, and of a very ſtrong and deep orange colour, approaching to redneſs. They are ſomewhat tough, moderately heavy, very eaſily cut, of an acrid, penetrating, but not unpleaſant ſmell, ſomewhat affecting the head, and of a bitteriſh and hot, but highly cordial taſte. Thrown into water, they almoſt inſtantaneouſly give it a ſtrong yellow or reddiſh colour, according to the quantity uſed. Theſe filaments are the criſtated capillaments, into which the piſtil of the flower divides at its head; they are of a deep reddiſh orange-colour, while growing, and there are only three of them in each flower.

Saffron is to be choſen freſh, tough, flexile, difficult to be broken, of a ſtrong ſmell, and very bitter taſte, and ſuch as ſtains the hands.

Saffron is in many places in great eſteem in ſauces, and on many occaſions in foods; but its great uſe is in medicine, and indeed with us its ſole uſe. It is a high cordial, and a very powerful aperient, detergent, and reſolvent. It is of almoſt immediate relief againſt faintings and palpitations of the heart; it alſo ſtrengthens the ſtomach, and aſſiſts digeſtion. It is of great uſe in diſorders of the breaſt ariſing from the lungs, being loaded with a tough phlegm; and it ſoftens the irritating acrimony of a vitiated ſerum on thoſe parts, and by this means is often of great uſe againſt inveterate coughs: wherefore, it is called *anima pulmonum*. It opens obſtructions in the viſcera, and particularly in the liver; it cures jaundices, and promotes the menſes. It is alſo anodyne, and occaſionally ſerves as a paregoric; it is very happily joined with opium in the laudanum of Sydenham, and in many other preparations in which that medicine has a principal ſhare.

Yet, notwithſtanding all theſe virtues, ſaffron improperly adminiſtered may do great harm: women with child, and thoſe who have profluvia of the menſes, are never to meddle with it. It has an ebriating faculty, and when taken in immoderate doſes, may bring on dreadful head-achs, long ſleep, convulſions, and even death. The very ſmell of it affects the head greatly; its effluvia affect the eyes alſo, and give them great pain; and we have an account, in Borelli, of a druggiſt's ſervant who died by the effect of a large parcel of ſaffron lying near his bed. Convulſive laughter is no uncommon effect of an immoderate doſe of ſaffron, and there are not wanting inſtances of people who have died in that ſtate: the very external uſe of ſaffron is alſo to be dreaded on ſome occaſions; the oxycroceum plaiſter, of which it is an ingredient, muſt by no means be applied in caſes where inflammation is feared; for it often occaſions one.

The common doſe of ſaffron in ſubſtance, with us, is from five grains to ten, but we are told of much greater quantities given by many people.

Saffron, diſtilled in a retort, firſt yields a ſmall quantity of a fine volatile acrid ſpirit; after this a ſubacid phlegm, then a ſmall quantity of an eſſential oil, with

a mixture of a volatile urinous ſalt; and by lixiviation of the reſiduum, a pure alkaline ſalt may be obtained.

The preparations of ſaffron, in uſe in our ſhops, are the tincture and the ſyrup. The tincture may be extracted equally well, by means of water, and of ſpirits of wine. Its doſe is from thirty drops to a drachm, or more; it is good in all caſes where the ſaffron in ſubſtance is ſo. If wine be uſed inſtead of ſpirit, it is called vinum crocatum.

Syrup of ſaffron is thus prepared: take of fine ſaffron, an ounce; cut it ſmall, and put it into a pint of mountain-wine to infuſe; let it ſtand three days without heat; then ſtraining off the wine, filter it to render it perfectly clear, and add to it twenty-five ounces of doubly refined ſugar; melt the ſugar over a gentle fire, and ſet it by for uſe.

SAFFRON, *crocus*, is alſo a name given to ſeveral chemical preparations, from their reſembling the vegetable ſaffron in colour. See the article CROCUS.

Meadow-SAFFRON, *colchicum*, in botany, *&c.* See the article COLCHICUM.

SAFFRON WALDEN. See WALDEN.

SAGAN, a town of Sileſia, ſituated on the river Bober, fifty-ſix miles north-weſt of Breſlaw.

SAGAPENUM, in pharmacy, *&c.* a gum-reſin, brought to us in two forms; the finer and purer is in looſe granules, or ſingle drops; the coarſer kind is in maſſes compoſed of theſe drops of various ſizes, cemented together by a matter of the ſame kind. In either caſe it is of a firm and compact ſubſtance, conſiderably heavy, and of a reddiſh colour on the outſide, browniſh within, and ſpotted in many places with ſmall yellowiſh or whitiſh ſpecks. Its ſmell is ſtrong and diſagreeable; its taſte acrid and unpleaſant.

It is brought to us from Perſia and the Eaſt-Indies. The plant which produces it has never been deſcribed, but is ſuppoſed to be, as Dioſcorides ſays, of the ferula-kind, from the ſeeds and fragments of the ſtalks ſometimes met with in the body of it.

Sagapenum is a very great attenuant, aperient, and diſcutient; it is good in all diſorders of the breaſt that owe their origin to a tough phlegm. It has alſo been found to diſcuſs tumours in the nervous parts, in a remarkable manner, and to give relief in habitual head-achs, where almoſt all things elſe have failed. Its doſe is from ten grains to two ſcruples, but it is now ſeldom given alone. It has been found, however, to do great things in aſthmas, in obſtructions of the viſcera, particularly the ſpleen, in nervous complaints, and even in epilepſies. It alſo promotes the menſes, and expels the ſecundines; and is an ingredient in the theriaca, mithridate, and many other of the ſhop-compoſitions.

SAGATHEE, in commerce, a ſlight kind of woollen ſtuff, ſerge, or ratteen, ſometimes mixed with a little ſilk.

SAGE, *ſalvia*, in botany, a genus of the *diandria-monogynia* claſs of plants, with a monopetalous tubular flower, labiated at the mouth: there is properly no fruit, the ſeeds, which are four in number, and roundiſh, being contained in the bottom of the cup.

The common red ſage has always been eſteemed as a cephalic and ſudorific. An infuſion of it, made in the manner of tea, has been long famous, as the common drink of people in fevers. It is attenuant and diuretic; it promotes the menſes, and is good in vertigoes, tremors, palſies, and in catarrhs. The virtues and uſes of the ſage of virtue, are the ſame with the other. Its name, indeed, has made many prefer it to the common ſage for the making tea for people in fevers; but the more agreeable flavour of the common kind, and the pleaſant colour of the infuſion, when a little lemon-juice is added, have again of late reſtored it into general uſe.

SAGENE, a ruſſian long meaſure, five hundred of which make a werſt: the ſagene is equal to ſeven engliſh feet.

SAGINA, in botany, a genus of the *tetrandria tetragynia* claſs of plants, the flower of which conſiſts of four oval, obtuſe, and patent petals, ſhorter than the cup: the fruit is an oval quadrilocular capſule, conſiſting of four valves, and containing numerous very ſmall ſeeds, affixed to the receptacle.

SAGITTA, in aſtronomy, the arrow, or dart, a conſtellation of the northern hemiſphere, near the eagle; conſiſting of five ſtars, according to Ptolemy and Tycho; but in Mr. Flamſteed's catalogue, of no leſs than twenty-three.

SAGITTA, in botany, implies the top of any ſmall twig, cyon, or graft of a tree.

SAGITTA, in trigonometry, the ſame with the verſed ſine of an arch.

SAGITTAL

SAGITTAL *future*, in anatomy, the ſecond of the genuine ſutures of the cranium or ſkull. See the article SKULL.

SAGITTARIA, or SAGITTA, WATER ARROW-HEAD, in botany, a genus of the *monoecia-polyandria* claſs of plants, the male corolla whereof conſiſts of three roundiſh, obtuſe, plane, patent petals, thrice longer than the cup: the female corolla is like that of the male one: there is no pericarpium; the receptacle, which is globoſe, collects the ſeeds into a globe: the ſeeds are numerous, compreſſed, and ſurrounded longitudinally with a broad membranaceous margin.

SAGITTARIUS, the ARCHER, in aſtronomy, the ninth ſign of the zodiac. See the article ZODIAC.

The ſtars in this conſtellation in Ptolemy's catalogue are thirty-two, in Tycho's ſixteen, and in Mr. Flamſteed's fifty-two.

SAGO, a ſimple brought from the Eaſt-Indies, of conſiderable uſe in diet as a reſtorative.

Sago is a ſort of bread produced in the following manner, from a tree called landan, growing in the Moluccos. When a tree is felled, they cleave it in two in the middle, and dig out the pith, which is eatable, when it comes freſh out of the tree. They pound it in a mortar, till it is reduced into a kind of powder ſomewhat like meal. Then they put in a ſearce made of the bark of the ſame tree, placing it over a ciſtern made of its leaves, and pour water on it, which ſeparates the pure part of the powder from the woody fibres wherewith the pith abounds. The flour thus filtrated they call ſagu, which they make into paſte, and bake it in earthen furnaces.

SAGREE, in ichthyology, a ſpecies of the ſqualus with no pinna ani, and with the noſtrils at the extremity of the roſtrum. See the article SQUALUS.

This ſpecies grows to about five feet in length, the head is large and depreſſed, the roſtrum is ſubacute, and the noſtrils are ſituated at its extremity, each having two apertures.

SAICK, or SAIQUE, a turkiſh veſſel, very common in the Levant for carrying of merchandize.

SAIL, in navigation, an aſſemblage of ſeveral breadths of canvas, ſewed together by the lifts, and edged round with a cord, faſtened to the yards of a ſhip, to make it drive before the wind. See the article SHIP.

Every yard in a ſhip has its proper ſail, except the croſs-jack, which takes its name from the yard: and thoſe which are not bent to the yard, are the flying jibb, fore, foretop, main, maintop, maintop-gallant, mizen, mizentop-maſt, ſtay-ſails, main and maintop ſtudding-ſails. See the article SHIP.

SAILS alſo denote the vanes of wind-mills. See the article WIND-MILL.

SAILS, in falconry, a term for the wings of a hawk. See the article HAWK.

SAILING, properly denotes the art of navigating and working a ſhip, or of cauſing her to obſerve ſuch motions and directions as are aſſigned by the navigator; in which ſenſe, ſailing differs from navigation, and muſt be learned by practice on ſhipboard. See NAVIGATION.

The moſt advantageous poſition of the ſails and rudder of a ſhip, has been already treated of under the article MAXIMUM.

And that their action may be reduced to the principles of the lever, has been ſhewn under the article LEVER.

The reſiſtance too which the ſhip meets with from the water, has been conſidered under the article RESISTANCE.

SAILING alſo denotes a particular method of navigation; in which ſenſe we ſay, Mercator's ſailing, plane ſailing, parallel ſailing, middle latitude ſailing, and great circle ſailing: all which, except the laſt, have been already explained under the article NAVIGATION.

Great circle-SAILING, in navigation, the art of finding what places a ſhip muſt go through, and what courſes to ſteer; ſo that her tract ſhall be in the arch of a great circle, or nearly ſo, paſſing through the place ſailed from and that bound to.

It is chiefly on account of the ſhorteſt diſtance, that this method of ſailing has been propoſed; for in the ſphere, it is well known, that the ſhorteſt diſtance between two places is the arch of a great circle intercepted between them, and not in the rhumb or ſpiral paſſing through thoſe places. See the article RHUMB.

As, in Mercator's ſailing, the ſeveral caſes were ſolved by plane triangles; ſo the ſolution of the caſes of great circle-ſailing is obtained by means of ſpherical triangles: and, therefore, the navigator ſhould be maſter of ſpherical trigonometry, before he attempts this method. See the article TRIGONOMETRY.

A great variety of caſes might be propoſed in this kind of ſailing; but as

many of them may ſerve rather for exercifes in the ſolution of ſpherical triangles, than for any real uſe towards the navigating of a ſhip, we ſhall only conſider thoſe appertaining to the following problem, *viz.*

Prob. I. The latitudes and longitudes of two places on the earth being given, required their neareſt diſtance on the ſurface, together with the angles of poſition from either place to the other. This problem may be branched out into the ſix following caſes.

Caſe I. When the two places lie under the ſame meridian, their difference of latitude will give their diſtance, and the poſition of one from the other will be directly north or ſouth.

Caſe II. When the two places lie under the equator, their diſtance is equal to their difference of longitude; and the angle of poſition, with reſpect to the meridian of either, is a right angle, or the courſe from one to the other is due eaſt or weſt.

Caſe III. When both places are in the ſame parallel of latitude.

Example. What is the ſhorteſt diſtance between St. Mary's, in N. lat. 37°, and W. long. 22° 56′; and Cape Henry, in N. lat. 37°, and W. long. 76° 23′?

Let PESQ (plate CCXXXVI. fig. 1. n° 1.) repreſent the meridian of St. Mary's, AB *a* the parallel of 37° N. lat. and PBCS the meridian of Cape Henry; then will the point A be St. Mary's, and the point B Cape Henry: draw the diameter AD, and through the points A, B, D, deſcribe the great circle ABD; then is the arch AB the ſhorteſt diſtance, the angle PAB the angle of poſition from A to B; and the angle PBA the angle of poſition from B to A; and the angle APB, which is meaſured by the arch QC, is the difference of longitude. Now as the places have both the ſame latitude, therefore PA = PB, and ∠ PAB = ∠ PBA; and if PI be deſcribed making ∠ API = ∠ BPI = 26° 43′½, then will PI biſect AB, and be perpendicular to it in I. And in the triangle AIP, right-angled at I, there will be given the hypothenuſe AP = 53°, and the angle API = 26° 43′½; whence to find the leg AI =, half the diſtance ſought, we have this analogy, *viz.* radius = 90°: ſine of hypothenuſe PA = 53°:: ſine of ∠ API = 26° 43′½: ſine of the leg AI = 21° 3′; which doubled gives 42° 6′ for the ſhorteſt diſtance AB = 2526 nautical miles, which is 35 miles leſs than 2561, the nautical miles found by parallel ſailing.

To find the angle of poſition PAB, we have this analogy, *viz.* Radius = 90°: co-ſine of hypothenuſe, PA = 53°:: tangent of ∠ API = 26° 43′½: co-tangent of ∠ PAB, or angle of poſition = 73° 9′. Hence it appears, that to ſail from A to B, or from B to A, the ſhip muſt firſt ſteer, N, 73° 9′ weſt or eaſt; and then gradually increaſe her courſe till I, where it will be due weſt or eaſt; and from thence the courſe is to be gradually diminiſhed again till ſhe comes to the other port, where it will be 73° 9′, the ſame as ſhe ſets out with but how theſe courſes are to be altered will be ſhewn hereafter.

Caſe IV. When one place has latitude, and the other has none, or is under the equator.

Example. What is the neareſt diſtance between the iſland of St. Thomas, under the equator, and eaſt long. 1°, and port St. Julian in ſouth lat. 48° 51′, and weſt long. 65° 10′?

Let the point A (*ibid.* n° 2.) repreſent St. Thomas, and the point B port St. Julian; then is AB, an arch of a great circle paſſing through A and B, the neareſt diſtance; which may be found by this analogy, *viz.* Radius = 90°: co-ſine of difference of long. = AC = 66° 10′:: co-ſine of difference of latitude CB = 48° 51′: co-ſine of the diſtance AB = 74° 35′. So that the diſtance AB = 74° 35′ = 4475 miles; which is leſs, by fifty-ſeven miles, than the diſtance found by Mercator's ſailing.

For finding the angle of poſition at A, the proportion is R = 90°: ſine AC = 66° 10′:: co-tangent CB = 48° 51′: co-tangent of ∠ SAB = 51° 22′. And the angle of poſition at B may be found by this analogy, *viz.* R = 90°: ſine CB = 48° 51′:: co-tangent AC = 66° 10′: co-tangent ∠ B = 71° 36′.

Caſe V. When the latitudes of the given places are either both north or both ſouth.

Example. What is the neareſt diſtance between the Lizard in north lat. 49° 57′, and weſt long. 5° 14′. and the iſland of Bermudas, in north lat. 32° 25′, and weſt longitude 66° 38′?

Let SAPQ (*ibid.* n° 3.) repreſent the meridian of Bermudas; make PA = 57° 35′ = the co-latitude of Bermudas; and P*a* = 40° 3′ = co-latitude of the Lizard; and, with the tangent of P*a*, deſcribe the arch *a a*: alſo, with the ſe-

cant

Fig. 1. Great Circle-SAILING.

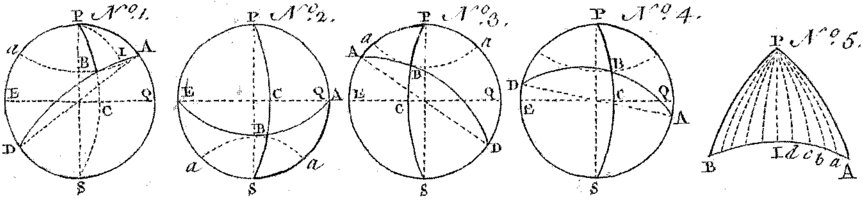

Fig. 2. SALIANT.

Fig. 3. SALTIER.

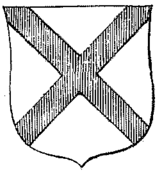

Fig. 4. SANICLE

Fig. 5. SATURN

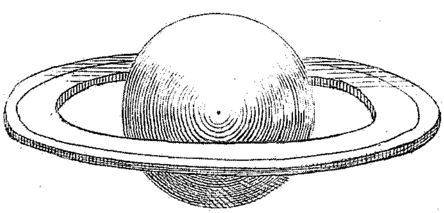

Fig. 6. SAXIFRAGE.

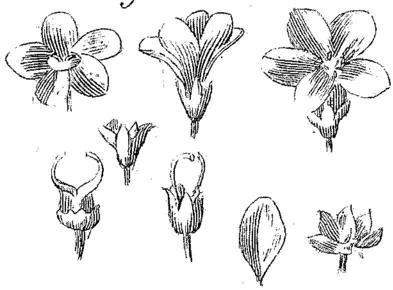

Fig. 7. The SAW uſed in Amputations.

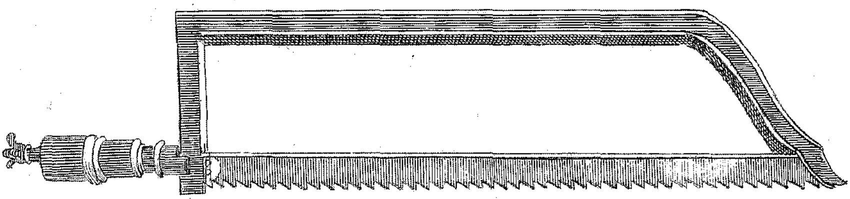

Fig. 8. The SAW-FISH.

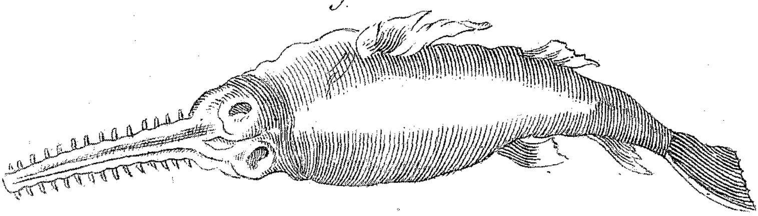


T. Jefferys sculp.

cant of 61° 24′ = difference of long. arcs described from P and S, give the center of the circle, PCS, the meridian of the Lizard; and its intersection with *aa* gives B the place of the Lizard. Lastly, a great circle being described through the points ABD, the intercepted arch AB is the nearest distance between the two places; and the angles PAB, PBA, are the angles of position.

In the oblique spheric triangle APB, are given PA = 57° 35′, PB = PA = 40° 3′, and ∠APB = difference of long. = 61° 24′. Hence, to find the distance AB, we have this analogy, *viz.* rad.: co-sine ∠APB:: tang. AP: tang. of a fourth arc = 37° 1′ = M; which taken from the co-latitude of the Lizard, leaves a fifth arc = 3° 7′ = N. Then, co-sine M: co-sine N:: co-sine PA: cosine of the distance AB = 47° 54′.

To find the angle of position PBA, the proportion is, sine of N: sine of M:: tangent ∠APB: tangent ∠PBA = 87° 15′. And the angle of position, PAB, may be found by the proportion between opposite sides and angles, *viz.* sine of PA: sine of ∠PBA:: sine of PB: sine of ∠PAB = 49° 35′.

Hence it appears that the shortest distance between the Lizard and Bermudas, is 47° 54′ = 2874 nautical miles; which is 178 miles less than the distance found by Mercator's sailing. And a ship, in order to run this shortest tract, must sail from the Lizard S. 87° 15′ W. and gradually lessen the course, so as to arrive at Bermudas on the rhumb bearing S. 49° 35′ W. whereas the direct course from one place to the other, as found by Mercator's sailing, is S. 69° 2′ W.

Case VI. When one of the given places has north latitude, and the other south latitude.

Example. What is the nearest distance from the island of St. Helena to the island of Bermudas; the former lying in S. lat. 16°, and W. long. 6° 15′; and the latter in N. lat. 32° 25′, and W. long. 66° 38′?

Let SEPQA (*ibid.* n° 4.) be the meridian of St. Helena, the point A St. Helena, and the point B Bermudas; then we have given PA = 106° = lat. of St. Helena + 90°, PB = co-latitude of Bermudas = 57° 35′, and ∠APB = difference of longitude = 60° 23′. Therefore, in the oblique spheric triangle ABP, we have the following proportions for finding the distance AB, *viz.* rad.: co-sine difference of long. = ∠APB:: tangent co-latitude of Bermudas = PB: tangent of a fourth arc M = 37° 54′; which taken from 106° leaves a fifth arc N = 68° 6′. And co-sine of M: co-sine of N:: co-sine of PB: co-sine of the distance AB = 75° 19′.

Next to find the angle of position PAB, the fourth and fifth arcs being found before, we have this proportion, *viz.* sine of N: sine of M:: tangent APB: tangent of PAB = 49° 20′. And to find the angle of position PBA, the proportion is as rad.: co-sine ∠P:: tangent PA: tangent of a fourth arc M = 59° 53′: But this fourth arc must be like PA, or obtuse; and therefore the supplement of 59° 53′, or 120° 7′, is the fourth arch M. Then, as sine of N: sine of M.: tangent ∠P: tangent of ∠PBA = 59° 45′: but this angle ought to be obtuse, and therefore we must take the supplement to it, *viz.* 120° 15′.

So that was a ship to sail from St. Helena to Bermudas, on the arc of a great circle, she must first shape her course N. 49° 20′ W. and gradually deflect from the north, so as to arrive at Bermudas on a course N. 59° 45′ W. after having run 75° 19′, or 4519 nautical miles. The course found by Mercator's sailing is N. 50° 5′ W. and the distance is 4527 sea-miles; whereby it appears, that when the places are one in N. latitude, and the other in S. latitude, there is but a small difference between the results found by Mercator's and great circle sailing, because the rhumb-lines near the equator do not greatly differ from great circles.

From the solutions of the foregoing cases it is plain, that to sail in a great circle the ship must continually alter her course: but as this is a difficulty too great to be admitted into the practice of navigation, therefore it has been thought sufficiently exact to effect this business by a kind of approximation; that is, by a method which nearly approaches the sailing on a great circle: for in small arcs the difference between the arc and its chord, or tangent, is so small that they may be taken one for the other in any nautical operations. Upon this principle the great circles on the earth are supposed to be made up of short lines, each of which is a segment of a rhumb-line; and on this supposition the solution of the following problem is deduced,

Prob. II.

Prob. II. Having given the latitudes and longitudes of the places ſailed from and bound to; to find the ſucceſſive latitudes in the arc of a great circle, in thoſe places, where alterations in longitude ſhall be a given quantity; together with the courſes and diſtances between thoſe places.

Solution. 1. Find the angle of poſition at each place, and their neareſt diſtance, by one of the caſes of prob. I. 2. Find the greateſt latitude the great circle runs through; that is, find the perpendicular from the pole to that circle; and alſo find the ſeveral angles at the pole, made by the given alterations of longitude between this perpendicular and the ſucceſſive meridians come to. 3. With this perpendicular and the polar angles, ſeverally, find as many correſponding latitudes, by ſaying, as radius : tangent of greateſt latitude

:: co-ſine of 1ſt. polar ∠ : tang. 1ſt. lat.

:: co-ſine of 2d. polar ∠ : tang. 2d. lat.

&c. &c.

4. Having thus found the ſeveral latitudes paſſed through, and the difference of longitude between each, find by Mercator's ſailing the courſes and diſtances between thoſe latitudes: and theſe are the ſeveral courſes and diſtances the ſhip muſt run to keep nearly on the arc of a great circle.

Now the ſmaller the alterations in longitude are taken, the nearer will this method approach the truth: but the uſual way is to compute to every five degrees of difference of longitude, the length of the arc of five degrees, differing from its chord, or tangent, only by 0,0002.

If the reſults of the ſeveral operations, for inſtance of the example of caſe III. prob. I. wrought by this method, be entered in ſuch a table as the following, it will be found of convenience to the operator.

Polar angles (*ibid.* n° 5.)	Succeſs longs.	Succeſs lats.	Diff. long.	Diff. lat.	Merid. parts.	Merid. diff. lat.	Courſes.	Diſtances.
∠ IP B = 26° 43′ ½	22° 56′	37° 00′			2392.6			
∠ IP *a* = 21° 43′ ½	27° 56′	38° 05′	300	65	2474.6	82.0	74° 43′	246.6
∠ IP *b* = 16° 43′ ½	32° 56′	38° 56′	300	51	2539.8	65.2	77° 44′	240.0
∠ IP *c* = 11° 43′ ½	37° 56′	39° 33′	300	37	2587.6	47.8	80° 57′	235.2
∠ IP *d* = 6° 43′ ½	42° 56′	39° 57′	300	24	2618.8	31.2	84° 04′	232.2
	49° 39′ ½	40° 09′	403.5	12	2634.5	15.7	87° 46′	307.9
								1261.9

Hence it appears that the ſhip muſt firſt ſail N. 74° 43′ W. the diſtance of 246.6 nautical miles; againſt which time ſhe will have changed her latitude and longitude, &c. as expreſſed in the reſpective columns ſtanding in a line with the above courſe and diſtance. Her ſecond courſe will be N. 77° 44′ W. the diſtance 240 nautical miles; and the other particulars as expreſſed in the ſame line under their ſeveral columns. Now the column of diſtances, being ſummed up, amounts to 1261.9; which being doubled, gives 2523.8 nautical miles for the diſtance between St. Mary's and Cape Henry; differing only from 2526, the diſtance found by prob. I. caſe III. by 2. 2. miles.

The tract of a ſhip, when thus directed nearly in the arc of a great circle, may be delineated on the Mercator's chart, by marking thereon, by the help of latitudes and longitudes, the ſucceſſive places where the ſhip is to alter her courſe: then thoſe places, or points, being joined by right lines, will ſhew the path along which the ſhip is to ſail, under the propoſed circumſtances.

SAILORS, the elder ſeamen, who are employed in working or managing the ſails, the tackle, ſteering, &c. See NAVAL *affairs*, SEAMEN, &c.

SAINT, in the romiſh church, a holy perſon deceaſed, and ſince his deceaſe canonized by the pope, after ſeveral informations and ceremonies. See the articles CANONIZATION, BEATIFICATION, &c.

One of the points wherein the roman catholics and proteſtants differ is, that the former addreſs, invoke, and ſupplicate ſaints, &c. to intercede for them; whereas the latter hold it ſufficient to propoſe their good examples for our imitation. The number of ſaints, allowed a ſuch in the romiſh church, is prodigious

Fathe

Father Papebroche reckons ſeventeen or eighteen to have died on the firſt of June only. Father Mabillon, in an expreſs diſſertation on the worſhip of unknown ſaints, obſerves, that honours are given to ſaints who perhaps were not chriſtians, and whoſe very names were never known: hence being under a neceſſity of giving them names, they are therefore called baptized ſaints. He adds, that they every day beſeech ſaints to intercede for them with God, when it is a matter of doubt whether they themſelves be in heaven.

SAINT-FOIN, *anabrychis*, in botany, a ſpecies of the hedyſarum. See the article HEDYSARUM.

For the uſe of this plant in feeding cattle, ſee HAY and GRASS.

SAINTES, a city of France, in the province of Guienne, capital of the territory of Saintogne, ſituated on the river Charente, in weſt long. 36′, north lat. 45° 50′.

SAKER, a ſmall ſort of cannon, whereof there are three ſpecies, extraordinary, ordinary, and middle ſized. See the article CANNON.

SAL, in chemiſtry, *&c.* See SALT.

For the preparations and uſes of ſal-armoniacum, ſal-anatron, ſal-Glauberi, ſal-prunellæ, ſal-tartari, ſal-polycreſtum, ſal-gemmæ, ſal-volatile, *&c.* See the articles ARMONIACUM, ANATRON, GLAUBER, PRUNELLA, *&c.*

SAL, one of the iſlands of cape Verd, ſituated in the Atlantic-ocean: weſt long. 23°, lat. 17°.

SALA, a river of Germany, which riſing in Franconia and running north, enters Saxony and falls into the Elbe below Deſſau.

SALA, a town of Sweden, in the province of Weſtmania, ſituated thirty miles weſt of Upſal.

SALACIA, in zoology, a genus of the gymnarthria, or thoſe inſects which have ſoft and naked bodies furniſhed with limbs.

The body of the ſalacia is of an ovato-oblong form, and the tentacula are numerous and diſpoſed in little cluſters. There are two ſpecies of the ſalacia, the one with an undulated ſurface, about an inch and three quarters in length, and its thickneſs about an inch: it is largeſt at the naked extremity, where it terminates in a rounded but not very thick end. The other is the ſmooth and oblong ſalacia, of about two inches and a half long, and an inch aud a half in diameter.

SALAMANCA, a city of Spain, in the province of Leon, ſituated on the river Tormes: weſt long. 6° 10′, north lat. 41°.

SALAMANCA is alſo a city of Mexico, in north-America, in the province of Jucatan, ſituated near the gulph of Honduras: weſt long. 93°, north lat. 17° 15′.

SALAMANDER, *ſalamandra*, in zoology, a name given by authors to ſeveral ſpecies of the lizard kind; but the principal are two, the ſalamandra aquatica, the water-newt, and the ſalamandra terreſtris. See the articles LACERTA and NEWT.

The ſalamandra aquatica is the two-edged-tailed lizard, with four toes on the anterior, and five on the hinder, feet. It grows to about four inches in length, and to the thickneſs of a man's finger: the back is of a deep ſhining brown; the belly of a bright and gloſſy yellow.

The ſalamandra terreſtris, or land ſalamander, is a ſpecies of lizard, the tail of which is ſhort, and its colour of a fine black, marked with red ſpots of a bright and ſhining gloſſy appearance.

SALAMANDER'S-BLOOD, among chemiſts, denotes the redneſs remaining in the receiver after diſtilling the ſpirit of nitre. See the article NITRE.

SALAMIS, an iſland in the gulph of Engia, in european-Turky, ſituated in eaſt long, 34°, lat. 37° 32′, being about fifty miles in circumference.

SALANKAMEN, a town of Sclavonia, ſituated on the Danube, twenty miles north-weſt of Belgrade.

SALARY, *ſalarium*, a recompence made to a perſon for his pains or induſtry about another perſon's buſineſs, as in the caſe of officers, *&c.* And it is generally taken for any wages, ſtipend, or allowance.

SALE, in general, ſignifies the transferring the property of goods from one to another, upon ſome valuable conſideration, as where in a bargain one agrees to give another a certain ſum of money for ſuch goods, and thereupon gives the ſeller earneſt, which he accepts; this is a perfect ſale, and ſhall bind the buyer and ſeller.

A perſon may at any time ſell his goods or chattels, even though he fears and knows of an execution againſt him for debt, unleſs there be a private truſt between the parties, and the writ of execution

cution is delivered to the ſheriff, *&c.* And it is held that upon the ſale of a horſe, or other beaſt, it may not only be detained till the ſame is paid for, but if ſuch horſe, *&c.* happens to die, after being ſold, and before delivery, the ſeller may have an action for the money agreed, the property being in the buyer. See BARGAIN, EARNEST, *&c.*

Where a perſon affirms a particular thing ſold to be of a certain value, and at the ſame time it is not, for this no action lies; but if he actually warrants the ſame, and this be not the caſe after ſale, it will bear an action, as being part of the agreement. As to the ſale of goods in fairs and markets, ſee the articles FAIR and MARKET.

SALEM, a port town of New-England, a little north of Boſton.

SALEP, in the materia medica, the root of a ſpecies of orchis. See ORCHIS.

Salep ſhould be choſen clean, firm and hard: it is very little liable either to decay or ſophiſtication. The people of the eaſt-Indies look upon ſalep to be one of the greateſt reſtoratives and provocatives to venery in the whole vegetable world. The ſalep differs very little from the common orchis in virtue. Its appearance is owing to the manner of preparing it, and conſequently this may be done from the roots of orchis of our own growth. To prepare theſe in imitation of ſalep. Mr. Geoffroy choſe the largeſt, faireſt, and plumpeſt roots he could find: theſe he nicely ſkinned; then throwing them into cold water he ſuffered them to macerate there for ſome time: after this he lightly boiled them, and then taking them out of the water and draining them, he had them ſtrung upon threads to be dried in a warm dry air: when the roots were thoroughly dried they were very tranſparent, and reſembled pieces of tragacanth, and continued dry and hard. The roots thus prepared may be reduced to powder, which will diſſolve away in boiling water, and a ſcruple of it will make a baſon full of jelly, in the manner of the turkiſh ſalep. This jelly is an admirable medicine in all caſes in which ſalep is preſcribed; and the powder may be given with great ſucceſs in aſſes-milk for diſeaſes of the breaſt. The ſalep which we receive from Turky is always a tranſparent root, of a whitiſh or reddiſh colour, according to its different age, and is chiefly recommended in conſumptions, bilious dyſenteries and diſorders of the breaſt proceeding from an acrimony of the juices.

SALERNO, a city and port town of Italy, in the kingdom of Naples, and the hither principat, ſituated on a bay of the tuſcan-Sea: eaſt long. 15^{g} 20′, north lat. 40^{g} 40′.

SALET, SALLET, or SALADE, in war, a light covering or armour for the head, antiently worn by the light horſe, only differing from the caſk in that it had no creſt, and was little more than a bare cup.

SALIANT, in fortification, denotes projecting. There are two kinds of angles, the one ſaliant, which are thoſe that preſent their point outwards; the other re-entering, which have their points inwards. Inſtances of both kinds we have in tenailles and ſtar-works. See the article ANGLE, *&c.*

SALIENT, SALIANT, or SAILLANT, in heraldry, is applied to a lion, or other beaſt, when its fore-legs are raiſed in a leaping poſture. See plate CCXXXVI. fig. 2.

A lion ſalient is that which is erected bendways, ſtanding ſo as that his right fore-foot is the dexter chief point, and his hinder left foot is the ſiniſter baſe point of the eſcutcheon, by which it is diſtinguiſhed from rampant. See the article RAMPANT.

SALIC, or SALIQUE LAW, *lex ſalica*, an antient and fundamental law of the kingdom of France, uſually ſuppoſed to have been made by Pharamond, or at leaſt by Clovis, in vertue whereof males are only to inherit. Du Haillan, after a critical examination, declares it to have been an expedient of Philip the long, in 1316, for the excluſion of the daughter of Lewis Hutin from inheriting the crown. Father Daniel, on the other hand, maintains that it is quoted by authors more antient than Philip the long, and that Clovis is the real author of it. This law has not any particular regard to the crown of France; it only imports, in general, that in ſalic land no part of the inheritance ſhall fall to any female, but the whole to the male ſex. By ſalic lands, or inheritances, were antiently denoted, among us, all lands, by whatever tenure held, whether noble or baſe, from the ſucceſſion whereto women were excluded by the ſalic law; for they were by it admitted to inherit nothing but moveables and purchaſes wherever there were any males.

SALICARIA, in botany, Tournefort's name for the lythrum. See the article LYTHRUM.

SALICORNIA, in botany, a genus of the *monandria-monogynia* claſs of plants, having no corolla: there is no pericarpium, but the calyx becomes more ventricoſe and contains a ſingle ſeed.

A decoction of the leaves of this plant is very opening, provokes urine and the menſes, accelerates the birth and ſecundines, purges watry humours, whence it is of ſervice in a dropſy. Its aſhes are uſed in making ſoap and glaſs: and being infuſed in water, cure the itch and all cutaneous diſeaſes, the part affected being waſhed therewith.

SALII, in roman antiquity, prieſts of Mars, whereof there were twelve, inſtituted by Numa, wearing painted particoloured garments and high bonnets, with a ſteel-cuiraſſe on the breaſt. They were called ſalii from *ſaltare*, to dance; becauſe, after aſſiſting at ſacrifices, they went dancing about the ſtreets, with bucklers in the left hand, and a rod in the right, ſtriking muſically on one another's bucklers with their rods, and ſinging hymns in honour of the gods. In ſinging they had a peculiar antient ſong, called Saliare carmen; and after the ceremony they were entertained with a feaſt. There were two companies or colleges of the ſalii; the antient one eſtabliſhed by Numa, called palatini; the latter by Tullus Hoſtilius, called collini and quirinales. Sextus Pompeius makes mention of ſalian maids, *virgines ſaliares*, hired on purpoſe, and joined with the ſalii, wearing a kind of military garb, with high round bonnets, like the ſalii.

SALINA, antiently Salamis, a port-town of the iſland of Cyprus, ſituated on the ſouth ſide of the iſland, in eaſt long. 34° 30′, and north lat. 34° 30′.

SALINS, a city of France, in the province of Franche Comte, ſituated in eaſt long. 5° 50′. and north lat. 47°.

SALISBURY, the capital city of Wiltſhire, ſituated eighty miles weſt of London, and thirty-five miles ſouth eaſt of Briſtol.

It ſends two members to parliament.

SALIVA, SPITTLE, a thin pellucid humour, ſeparated from the arterial blood, by the glands about the mouth and fauces, and conveyed, by proper ſalival ducts, into the mouth, for ſeveral uſes.

It conſiſts of a great deal of water or phlegm, and a volatile ſalt, and ſome add a ſulphureous ſpirit; and is void both of taſte and ſmell. Its uſes are very great; it moiſtens the throat, preſerves it from the injuries of the air, and facilitates ſpeech. Being mixed with aliment, it renders ſwallowing eaſy, and aſſiſts digeſtion by its aqueous, ſaline, and oily parts. Some imagine it to do the office of a menſtruum, by mixing the oily and aqueous parts of the food more intimately, diſſolving the ſaline parts, and procuring a fermentation in the ſtomach: but Dr. Drake is of opinion, that were the ſaliva acrimonious enough for this purpoſe, it muſt greatly offend the ſtomach, eſpecially conſidering the quantities of it that many ſwallow, even upon an empty ſtomach. In hungry perſons, ſays Boerhaave, it is fluid, acrid, and copiouſly diſcharged; and in thoſe who have faſted long, it is highly acrid, penetrating, and reſolvent. In farinaceous and ſucculent vegetables, it not only produces a fermentation, but alſo augments one already begun. It is ſwallowed not only by brutes, but by human creatures, in a ſound ſtate, even when aſleep. Too copious an evacuation of it, made voluntarily, produces loſs of appetite, bad digeſtion, and an atrophy. By manducation therefore the ſaliva is expreſſed and accurately mixed with the attenuated food; which contributes, firſt, to the aſſimilation of the aliments to the nature of the body to be nouriſhed: ſecondly, to the due mixture of the oleous to the aqueous parts: thirdly, to the ſolution of the ſaline parts: fourthly, to fermentation: fifthly, to a change of the taſte and ſmell of the aliments: ſixthly, to an augmentation of the inteſtine motion: ſeventhly, to a momentaneous relief from hunger; and, eighthly, an application of the ſapid parts, though inſipid itſelf. See CHYLIFICATION, MANDUCATION, DIGESTION, *&c.*

SALIVAL, an epithet applied to the glands and ducts which ſupply and ſecrete the ſaliva. See the articles GLAND, DUCT, and the preceding article.

Anatomiſts commonly reckon three pair of ſalival glands, *viz.* two parotides, two maxillares, and two ſublinguales. See the articles PAROTID, *&c.*

Theſe indeed are the largeſt, and furniſh the greateſt quantities of ſaliva; but there are a great number of other leſſer glands of the ſame kind, which may be reckoned aſſiſtants, or ſubſtitutes to the former; all theſe may be determined ſalival glands, and they may be enumer-

ated in the following manner: the parotid glands, the maxillary glands, the ſublingual glands, the glandulæ molares, buccales, labiales, the linguales, the amygdalæ, the palatinæ, the uvulares, the arytenoidææ, and the glandula thyroidæa. See MOLARES, BUCCALES, *&c.*

With regard to the ſalival ducts, the moſt noted of them is that of the parotides, produced by the union of a great number of ſmall tubes, repreſenting ſo many roots; it is called the ductus ſtenonis, or ductus ſuperior; it runs obliquely forwards, on the outſide of the maſſeter, and then perforates the buccinator from without inward, oppoſite the interſtice between the ſecond and third dentes molares, where the hole or orifice repreſents the ſpout of an ewer. The duct of the maxillary glands, called alſo the lower or inferior duct, and the ductus ſalivalis Whartoni, advances on the ſide of the muſculus genioglooſſus along the inner part and ſuperior edge of the glandula ſublingualis to the frenum of tongue, where it terminates by a ſmall orifice, in form of a papilla. The glandulæ ſublinguales ſend out laterally ſeveral ducts, which open near the gums, by the ſame number of orifices, all ranked in the ſame line, but a ſmall diſtance from the frenum, and a little more backward.

Extirpation of the SALIVAL *glands*, a method which Heiſter tells us he often has had recourſe to, when theſe glands have been violently ſwelled and ſeverely indurated, even approaching to a carcinomatous nature, after they had been treated by other phyſicians with corroſives, digeſtives and other medicines. In this operation the ſurgeon muſt open the ſkin above the tumor, with a longitudinal inciſion, and carefully ſeparate the ſchirrhous glands from the contagious part with a knife, and at laſt from the arteries with which it is connected; then immediately, whilſt the blood ruſhes out in great abundance, the operator muſt dip a ball of linnen-rags in a ſtyptic liquor, and preſs it upon the larger wounded arteries; the remainder of the cavity of the wound muſt be filled with ſcraped lint and dry rags, and compreſſed with the finger, and then a larger piece of puff-ball, with three or four thick compreſſes muſt be applied, ſecuring the whole with a proper bandage. After the third or fourth day, the bandage and compreſs may be removed, and ſo much of the puff-ball as is looſe, leaving every thing that has a ſtrong adheſion; then new compreſſes, dipped in warm ſpirit of wine, or digeſtive fomentations may be directly applied, and ſecured with the bandage, as before, but a little more relaxed: the ſecond and third dreſſings muſt be performed every other day, and the reſt muſt be renewed every day. In all the dreſſings it muſt be obſerved, that none of the compreſſes, puff-ball, or lint be removed, but what are quite looſe: the wound may be cleanſed by ſome digeſtive ointment, and incarnated by a vulnerary balſam. See the article WOUND.

SALIVATION, in medicine, a promoting of the flux of ſaliva, by means of medicines, moſtly by mercury. The chief uſe of ſalivation is in diſeaſes belonging to the glands, and the membrana adipoſa, and principally in the cure of the venereal diſeaſe, though it is ſometimes alſo uſed in epidemic diſeaſes, cutaneous diſeaſes, *&c.* whoſe criſes tend that way. See the articles POX, *&c.*

A ſalivation is excited, according to Boerhaave, 1. By waſhing the mouth with certain liquors. 2. By the ſlow and protracted maſtication of ſome viſcid matter, ſuch as maſtich, wax, and myrrh, eſpecially if acrid ſubſtances are mixed with theſe, ſuch as pellitory of Spain, pyrethrum, ginger, and pepper. 3. By drawing into the mouth acrid and irritating vapours, ſuch as thoſe of tobacco, ſage, roſemary, marjoram, thyme, and mother of thyme. 4. A ſalivation is excellently excited by the action of ſuch medicines as produce a gentle but long continued nauſea, ſuch as antimony neither entirely fixed nor totally emetic, taken with a ſmall quantity of common vitriol. 5. By ſuch ſubſtances as totally diſſolve all the parts of the blood, convert it into lymph, and render it fit for a diſcharge by way of ſaliva; ſuch as crude quickſilver, cinnabar, a ſolution of quickſilver in aqua fortis, white precipitate, red precipitate, turbith mineral, and ſublimate mercury diſſolved: the action of thoſe medicines is promoted by warm fomentations applied to the head, neck, and face. An exceſſive ſalivation is leſſened or ſtopped, 1. By a large and continual uſe of mild and tepid drinks, ſuch as decoctions of mallows and liquorice in milk and water. 2. By allaying the impetus of the humours, by means of mild, oleous, and anodyne emulſions, with a proper addition

tion of diacodium or opium. And, 3. By making a revulſion of the humours to other parts, eſpecially that by ſtool. But great caution is neceſſary, leſt the impetus of the moved matter, which in this caſe is always acrid, ſhould ruſh to other parts, and produce a greater danger.

The regular, ſafeſt, and moſt commodious method of ſalivation is by mercurius dulcis ſix times ſublimed, given inwardly in the milder pox, &c. or by mercurial unction, when the diſeaſe is got into the bones. According to Turner, fifteen grains of mercurius dulcis may be given in a morning, and a like doſe at night, with electuary of ſcordium. After three, four, or five days, with this management, the fauces are obſerved to inflame, the inſide of the cheeks to tumify, the tongue to look white and foul, the gums to ſtand out, the breath to ſtink, and the whole inſide of the mouth to appear ſhining and lie in furrows as if parboiled. The patient now refuſes nouriſhment, while all parts of his chaps are ſo ſwelled and ſore that he cannot chew any ſolid food, but is forced to take liquids and the ſofter aliments. They are now frequently ſick, and throw up a thin phlegm. The inſide of the mouth thus beginning to be whealed, will ſoon be ulcerated, eſpecially about the ſalival glands, which empty themſelves thereinto. Now it may be proper to deſiſt a day or two, to obſerve the increaſe of the ulcers, what ſloughs are like to be raiſed, and what their depth and dimenſions are like to prove, from which a near conjecture may be made of the duration as well as quantity of the ſpitting now begun, and the conſiſtence of the drilling lympha. The ſalivation thus begun, the patient is to be ſometimes refreſhed by a little mulled wine. Let his diet be ſmall chicken-broth, water-gruel, and panada; his drink ſmall ſack-whey, or poſſet-drink, and a draught of good ſmall beer, with a toaſt, between whiles; and in caſe of gripes or a looſeneſs, the white decoction.

Thus, after ſome days reſpite, if the patient is hearty, his chaps but little ſwelled on the outſide, and as little ſore within, the ulcers not increaſing, and the flux inconſiderable, you may give one ſcruple of mercurius dulcis in electuary of ſcordium at going to reſt, repeating it two or three days following, as you find occaſion; or you may vomit him with eight or ten grains of turpeth mineral, in conſerve of roſes: but if the ſalivation cannot be raiſed to any quantity, you muſt forbear, and purge it off, and give calomel once or twice a week, and purge it off the next day, or two days after. When the ſpitting goes well forward, it may be left to take its courſe, till it declines of itſelf, which, in proportion to the ulcers and thickneſs of the ſloughs about the mouth, may happen at the end of twenty-one days, or a month from its firſt riſing; that is, from the time of ſpitting a pint and a half a day, till it come to three pints or even five pints in twenty-four hours, then it gradually goes off again.

In the more ſtubborn and rebellious pox, &c. attended with grievous ſymptoms, ſuch as rotten bones, &c. and the patient has been uſed to mercurials, or ſalivated before, then the cure muſt be attempted with ſalivation by unction. To this end mix an ounce of quickſilver with three ounces of axunguia, of which an eighth part is to be uſed night and morning, letting the patient rub it with his own hands gently by the fire, beginning with his ancles, up to his ſhins and knees, all round his joints, and ſo to his thighs, which are preſently after to be covered with yarn-ſtockings and flannel-drawers; then let him uſe the remainder of his eighth part about his elbows and ſhoulders, wiping his hands clean about the glands of his arm-pits, or thoſe of his groin: his body, during the unction, ſhould be ſcreened from the cold with a blanket hung behind him, and then be wrapped up in warm flannel, that is, a flannel-ſhirt, waiſtcoat, drawers, cap, and muffler. And the ſame is requiſite in the former way, to defend the patient from the cold air. The weak need only to anoint once a day; but thoſe that are ſtrong, may take a fourth part of the ointment, and rub it in at once every night; after which let him get between flannel-ſheets or blankets, diſpoſing him to a gentle breathing ſweat with a draught of warm poſſet, mace-ale, or if very feeble, with a cup of mulled wine. If, when the ointment is divided into four parts, after the third unction, the patient begins to complain of his chaps, you may ſtay a day or two before you proceed farther; the ſame when gripes or bloody ſtools approach. On the other hand, if an ounce or an ounce and an half of quickſilver will not do, give the turpeth, as before directed. and if the ſpitting declines too ſuddenly, give a

ſcruple of calomel every day, for two or three times, as you ſee occaſion. When the ſalivation is going off, the patient may be purged with two or three ounces of the common infuſion of ſenna, and one ounce of the ſyrup of buckthorn.

For the ſeveral diſeaſes that ſupervene a ſalivation, ſee each of them ſeparately treated of, under their ſeveral heads.

To prevent the jaws from being locked up, it is neceſſary to uſe a bit of ſtick, covered with a ſoft rag, to be held between his backward teeth; and if there ſhould happen an adheſion of the inſide of the cheek to the gum, the ſame is to be carefully divided. If, during the ſalivation, a blood-veſſel burſt open, it is to be cloſed up with a little pellet, covered with powder of alum or vitriol, and dipped in the tinctura ſtyptica: if it happens from the ſeparation of ſloughs from the ſides of the cheeks, a little oxycrate held in the mouth will do the buſineſs. If the patient has been without a ſtool for ſome time, give him an emollient clyſter of warm milk, ſugar, and oil: and if the fauces ſhould ſuddenly tumify, ſo as to endanger a ſuffocation, the moſt certain relief is to bring the humours downwards by ſharp clyſters and cathartics.

The patient ſhould be prepared for a ſalivation by a lenitive purge or two; and if plethoric, he ſhould bleed: likewiſe bathing in warm water, for ſome hot, lean, emaciated people, has been found of ſervice. Women ſhould be laid down juſt after their menſtrual flux is over. Temperate weather is the moſt ſuitable.

SALIX, the WILLOW, in botany, a genus of the *dioecia-diandria* claſs of plants, having no flower-petals; the nectarium is a very ſmall, cylindric, truncated, melliferous gland, in the center of the flower; the common omentum is oblong, and every where imbricated with oblong, plane, and patent ſquammæ, conſiſting of a ſingle flower; the fruit is an ovato-ſubulated capſule, formed of two valves, and containing only one cell, in which there are ſeveral very ſmall oval ſeeds, crowned with down.

The leaves of the willow are a very grateful food to cattle: a decoction of them is very good in a hæmoptoe; and a clyſter is prepared of the ſame, for a dyſentery. Externally they are of ſervice in baths for the feet, in order to procure ſleep, and cool the heat of fevers; the bark has the like virtues; and beſides, the aſhes thereof are reckoned effectual for extirpating warts and corns.

SALEE, a port-town of the empire of Morocco, in the kingdom of Fez, ſituated on the coaſt of the Atlantic ocean: weſt long. 7°, and north lat. 34°.

SALLET, or SALLAD, a diſh of eatable herbs, ordinarily accompanying roaſt meat, compoſed chiefly of crude freſh herbage, ſeaſoned with ſalt, oil, and vinegar: ſome add muſtard, hard eggs, and ſugar; others pepper; and others ſpices, with orange-peel, ſaffron, *&c.* The principal ſallet-herbs, and thoſe which ordinarily make the baſis of our ſallets, are lettuce, celeri, endive, creſſes, raddiſh and rape; to which are ſometimes added purſlane, ſpinach, ſorrel, tarragon, burnet, corn-ſallet, and chervil.

SALLY, in architecture, is what we more uſually call projecture. See the article PROJECTURE.

SALLY, in the military art, the iſſuing out of the beſieged, from their town or fort, and falling upon the beſiegers in their works, in order to cut them off, nail their cannon, hinder the progreſs of their approaches, deſtroy their works, *&c.*

SALM, a town of Germany, in the dutchy of Lorrain, forty-five miles ſouth-eaſt of Nancy.

SALMO, SALMON, in ichthyology, a genus of the malacopterygious claſs of fiſhes, having large, ſharp, and ſtrong teeth in both jaws, and on the palate, tongue, and fauces; the back-fin is placed nearer the head of the fiſh than the ventral ones; the body is, in moſt of the ſpecies, variegated with ſpots; and the branchioſtege membrane contains ten, eleven, or twelve bones. The ſeveral ſpecies of this fiſh are the common ſalmon, the trout, the red charr, *&c.* See TROUT, *&c.*

The common ſalmo, or ſalmon, with the roſtrum extending beyond the lower jaw, is an inhabitant both of the ſea and rivers; the head is ſmall in proportion to the body; the eyes are round, and their iris of a ſilvery colour, with a faint admixture of green; the pupil is black; the covering of the gills is of a ſilvery colour, and are compoſed of two, or rather of four bony laminæ, and of twelve broad and ſomewhat crooked bones, connected by a membrane; there are ſome irregular black ſpots on them; the lateral line is very ſtraight; the ſcales are moderately large, and placed in an imbricated manner; there is a ſingle ſeries

of

of teeth in the upper and under jaw; there are two more teeth in the upper than the lower jaw; at the ſides of the palate there are two ſeries of teeth in longitudinal lines; the palate itſelf is entirely ſmooth, but deep in the fauces; the tongue is thick, and has on it a few ſharp teeth; there are two fins on the back, the one having fifteen rays, and the other none at all.

SALON, or SALOON, in architecture, a very lofty ſpacious hall, vaulted at top, and ſometimes comprehending two ſtories or ranges of windows. The ſalon is a grand room in the middle of a building, or at the head of a gallery, *&c.* Its faces or ſides ought all to have a ſymmetry with each other; and as it uſually takes up the height of two ſtories, its ceiling, as Daviler obſerves, ſhould be with a moderate ſweep. Salons are frequently built ſquare, and ſometimes octogonal.

SALON is alſo the name of a town of Provence, in France, twenty-four miles ſouth-weſt of Marſeilles.

SALONA, a port-town of Dalmatia, ſubject to Venice: eaſt long. 18°, north lat. 43° 15′.

SALONICHI, a city and port-town of Macedon, in Turky, antiently called Theſſalonica, two hundred and ſixty miles weſt of Conſtantinople: eaſt long. 24°, north lat. 41°.

SALPA, in ichthyology, a ſpecies of the ſparus, with eleven parallel longitudinal yellow lines on each ſide. See SPARUS.

SALSA, in botany, a plant otherwiſe called medeola. See the article MEDEOLA.

SALSETTE, an iſland on the weſtern coaſt of the hither India, ſeparated from that of Bombay by a narrow channel: it belongs to the Portugueſe, and is twenty miles long, and ſeventeen broad.

SALSES, a town of Rouſſillon, ten miles north of Perpignan, and ſubject to France.

SALSOLA, in botany, the name by which Linnæus calls the kali of other botaniſts. See the article KALI.

SALSONNA, a town of Catalonia, in Spain, forty-ſix miles north-weſt of Barcelona.

SALT, *ſal*, in natural hiſtory, the name of a ſeries or ſubdiviſion of foſſils, naturally and eſſentially ſimple, not inflammable, and ſoluble in water.

Dr. Shaw defines ſalt to be a ſubſtance that readily diſſolves in water, taſtes ſharp or pungent upon the tongue, and has a great diſpoſition to unite with earth, ſo as to appear in a ſolid form; as in common ſalt, alum, *&c.*

Salts then are foſſile bodies, friable, pellucid, not inflammable, but fuſible by fire, and congealing again in the cold; ſoluble in water, ſo as to diſappear in it, naturally concreting into regularly figured cryſtals, and impreſſing a ſenſation of acrimony on the tongue. Theſe are the characters and qualities common to all ſalts, and to no other bodies: and theſe they always manifeſt when pure and freed from heterogeneous ſubſtances; but in the ſtate in which they are naturally found in the earth, though they have that in their taſte alone which may ſufficiently diſtinguiſh them, yet they do not exhibit all their genuine characters: ſome of them being found ſolid and pure, either within the earth or on its ſurface, but commonly without their proper form; others embodied in earths and ſtones, as the particles or metals in their ores; and others in a fluid ſtate ſuſpended in waters.

Of the foſſils of this claſs, nature therefore affords us three diſtinct orders, and under thoſe they are diſtinguiſhable into five genera. The ſalts of the firſt order are thoſe found native and pure, either in the earth or without its ſurface, and exhibiting all other natural characters, though often without their proper form. Of the ſecond, are thoſe found not native, but in form of ores, never pure, but diſtinguiſhable by their taſte, and immerſed in and blended with the conſtituent matter of earths and ſtones in extremely ſmall particles. And of the third are thoſe naturally found ſuſpended in waters, and in a fluid form, but ready to aſſume their proper figures on the evaporation of a part of that water.

Of the firſt of theſe orders are the common alimentary ſalt or muria, and the natrum or nitre of the antients; of the ſecond are alum and nitre; and of the third are borax and halcryptium, an alkaline ſalt hid in the chalybeate waters. See the articles NATRUM, ALUM, NITRE, BORAX, and HALCRYPTIUM.

Alimentary ſalt, or muria, is found under a great variety of forms in its different ſtates; but is immediately diſtinguiſhed by applying it to the tongue, and always aſſumes a cubic, pyramidal, or parallelopiped figure after ſolution, and a regular cryſtallization. It is ſuſtained in vaſt quantities in a liquid form among

among ſea-water, and that of ſalt-ſprings; but is alſo found ſolid in the bowels of the earth in vaſt maſſes, which are either of a fine pellucid ſtructure, and called ſal-gem; or various debaſed and ſtriated, reſembling the fibroſe talcs, and is the ſal ammoniac of the antients. See the articles GEM and AMMONIAC.

But in which ever of theſe forms this ſalt is found, it affords the ſame cryſtals on evaporation: theſe, according to the degree of heat uſed in the evaporation, are either pyramidal, cubic, or parallelopiped. All theſe ſalts are ſoluble in water, but they require different quantities of it to diſſolve them, and this makes one of their criterions. This ſalt requires thrice and one ſeventh part its own quantity of water, to make a perfect ſolution.

The ſea-water, in different parts of the world, is very differently ſated with it, ſome parts containing twice as much as others. But that of the ſalt ſprings is always much more ſalted with it, than the ſtrongeſt of the ſea-water: in ſome places it is found loaded with nearly as much as it could be made to contain, ſome ſprings yielding a brine that affords near a quarter of a pound of ſalt, from the pound weight of this liquor, and many of them being ſo ſtrongly impregnated, that the workmen are obliged to let them down or lower them, by mixing them with a large quantity of ſea or common water, before they are fit to be boiled for the ſalt: the common run of ſea-water does not hold ſo much as one fourth part of this quantity, ſome not one eighth of it.

The ſalt produced from the ſea-water of all the parts of the world, and from the brine of all the ſprings of the world, is abſolutely the ſame; but differs in ſtrength, and ſome other qualities, according to the operation by which it is made. In general, the quicker the liquor is evaporated, the weaker is the ſalt; the more time is employed in the proceſs, the ſtronger. This is not wonderful, when we conſider, that, over a gentle heat, water alone, or almoſt alone, evaporates from the liquor, but, over a more violent fire, a part of the ſtrength or acid of the ſalt is raiſed with it.

It is upon this principle, and owing to this cauſe, that we find the ſalt of our ſalt ſprings, which is uſually ſold us under the name of baſket-ſalt, the weakeſt of all. It is not that there is any difference in the waters from which theſe ſeveral kinds of ſalt are produced, that they appear to us in different degrees of ſtrength, but that the people who work the brine-pits, make the ſalt with leſs expence of the workman's time; that the ſea-ſalt is formed over ſomewhat ſlower fires, and that the bay-ſalt is made only by the ſun's heat, where the proceſs is very long, and the heat very moderate, and the ſalt is found ſtrong in proportion. This is ſo indiſputable a truth, that once every week, a very ſtrong ſalt, little inferior to bay-ſalt in that quality, is made at the brine-pit works, where the common run of the ſalt is the weakeſt in the world. The liquor is the ſame in this caſe, but the workmen who do not work on Sundays, leave a pan full to evaporate ſlowly over the fire, which they prepare on the Saturday night, and the moderate heat and length of time under which this weekly parcel of ſalt is made, render it very different from the common ſalt of the works, both in form and qualities: it is found to be made up of large and hard grains, inſtead of the ſmall and ſoft ones of the common kind, and is vaſtly ſuperior to it in ſtrength.

This circumſtance, overlooked by the workmen, and even by their maſters too, for many years, gave the hint to Mr. Lownds, and afterwards to the very ingenious Dr. Browning, author of an excellent treatiſe on this ſubject, to propoſe to the government a method of making a ſtrong ſalt fit for all the purpoſes for which we buy it of our neighbours, only by a new, that is, a ſlower way of working our own brines. The latter of theſe gentlemen has proved, inconteſtably, that we may, if we will encourage proper manufactures, have common ſalt of every kind made at home, equal in ſtrength, and equally fit for all purpoſes, with the ſalt of any part of the world.

After theſe accounts of the muria of common ſalt under its different forms, and as expreſſed by different names, it remains to treat of its qualities and virtues in general.

It reſolves ſpontaneouſly in the air, but this in different times, according to the dampneſs or dryneſs of that element, and according to it own laxer or firmer ſtructure. The coarſer ſalts diſſolve ſooner than the finer, and there are even ſome pieces of ſal gemmæ ſo firm, that they are ſcarce to be at all affected, even on their

their ſurface, by the moiſteſt common air.

Common ſalt, added to aqua fortis, enables it to diſſolve gold, making it into what is called aqua regia; by diſtillation it yields a ſtrong and acid ſpirit; it is the moſt, of all ſubſtances, endued with keeping animal bodies from putrefaction, and it alſo preſerves vegetables in the ſame manner in long digeſtions. In medicine, it is a common ingredient in clyſters, and ſerves to ſoften and bring away indurated fæces. Suppoſitories are alſo made of a mixture of it with honey, and are put up the fundament, to promote a tendency to deſuctions. Aloes and colocynth are ſometimes added on theſe occaſions, when there is required more power in the medicine. In apoplectic caſes, it is generally an ingredient among the ſtimulating things adminiſtered in clyſters; only it is neceſſary to have this caution, that if there appear reaſon to ſuſpect an inflammation of the inteſtines, or but a tendency to it, every thing of this kind is to be avoided.

Common ſalt that has not been expoſed to the fire, makes no change in the colour of ſyrup of violets; it does not make any efferveſcence with oil of tartar, nor does it make lime-water turbid, but added to ſpirit of ſal armoniac, it manifeſts ſome ſigns of a latent acidity, by rendering it cloudy: on the contrary, alſo, it manifeſts ſomething of an alkaline nature, by rendering a ſolution of mercury whitiſh; and it raiſes an efferveſcence with oil of vitriol, attended with heat.

On ſolution in water, common ſalt manifeſts alſo two very different principles after evaporation. When reduced to a proper conſiſtence, that is, when the quantity of water is not more than as three to one to that of the ſalt, a part of it concretes into grains of ſalt of the ordinary kind; but there remains yet in the liquor, after all that can be ſeparated this way has been procured, a ſtrong taſte of a ſaline nature: the ſalt that gives it this, will never be brought to cryſtallize, but muſt be ſeparated by evaporating all the liquor away; it is then found to be of an alkaline nature, aſſuming no regular form in its cryſtals, and eaſily imbibing the humidity of the air, and running into a liquor with it.

The baſis of ſea-ſalt, therefore, is a mineral alkali, which is ſo intimately blended with its peculiar acid, that the latter has ſcarce any power of exerting itſelf. The acid, drawn by diſtillation from ſea-ſalt, turns the ſyrup of violets red, and ferments vehemently, though without heat, with oil of tartar, but it does not heat on being poured into lime-water. This ſpirit is the only one that can be properly called a ſolvent for gold and for tin, but ſilver and lead reſiſt it. The acids of nitre and vitriol, alſo, obtain the ſame qualities on being mixed with it, and become aquæ regales. If this acid be perfectly ſaturated with ſalt of tartar, cryſtals of the form and qualities of thoſe of common ſalt may be obtained from the mixture; theſe cryſtals are called regenerated ſea-ſalt, and ſerve to prove what we obſerved above, that an alkali is the baſis of ſea-ſalt, and that more alkalies than one may ſerve to that purpoſe with the peculiar acid, which is the eſſential part of this ſalt.

Phyſicians are of opinion, that ſea-ſalt has the ſame effects in the human body that it has out of it, in checking fermentation, and preventing putrefaction; they therefore eſteem it of good uſe mixed with the generality of our foods in the ſtomach: they are of opinion alſo, that it carries its effect into the blood, and has the qualities of a moderate dryer, detergent and attenuant, added to thoſe of a ſtimulant, which common reaſon declares it to be. Hence may be deduced all the virtues attributed to ſalt, as an aperient, ſtomachic, or warming medicine, and a provocative to venery; but in what degree it poſſeſſes all theſe qualities, we are, by its univerſal uſe in foods, prevented from being able to determine. Van Helmont recommends it as a good preſervative againſt the ſtone and gravel: he has been ſeverely cenſured for this by others, who are of opinion, that all ſalted foods, ſuch as ſalt beef, and the like, are very bad in thoſe caſes: but both parties may be in the right; for there is a great deal of difference between common ſalt eaten with the freſh juices of our food, and the brine and pickle into which it runs in the time of its being left upon the meat preſerved by it. Salt is very properly put into the mouths of people in apoplectic fits, as it not only irritates but attenuates the juices there, and promotes a diſcharge of them; and in a palſy which affects the tongue, a ſage-leaf, bruiſed and covered with ſalt, has been a famous remedy among the good women, and not without reaſon.

Mixed

Mixed with bran, and heated in a canvas bag, it is recommended to be applied externally to the head in head-achs, ariſing from a moiſt cauſe, and in defluxions; and we find the old phyſicians very ſtrenuouſly recommending a cataplaſm made of the ſame ingredients for pains.

Methods of making alimentary SALT are theſe. 1. By the evaporation of the ſun's rays: this is the moſt eaſy and ſimple method of all, when the waters of ponds and lakes, whether natural or artificial, impregnated with ſalt, being wholly exhaled by the force of the ſun and air, the ſalt is left concreted into a hard cruſt at the bottom of the lake, and is what commonly goes by the name of bay-ſalt; the cryſtals of which differ in ſize, according to the different degrees of heat, and the time it lies in the pits. All bay-ſalt has ſome mud, ſlime, or the like, in the making, and ſome kinds are mixed with the bittern-ſalt, or what is called Epſom ſalt; they are all more white while dry, and more pellucid when moiſt, and they differ in colour, according to the earth which makes the bottoms of the pits. Thus ſome of the french bay-ſalt is grey, ſome reddiſh, and ſome white, according as a blue clay has lined the pits, or a red, or white one. Some kinds have an agreeable ſmell in large heaps; ſuch are the Portugal, and the Hampſhire bay-ſalts; and this ſeems owing to the ſea-water they were made from, having a bituminous matter in it. It differs alſo greatly in taſte, according to the various foreign mixtures it contains; and it will often alter in taſte, and other qualities, by long keeping: for, in general, it is much fitter for uſe, after it has been kept ſome time in a dry place, than when it is firſt made.

2. By boiling or coction; the moſt convenient works for which proceſs are conſtructed in the following manner: the ſaltern or boiling houſe, is erected near the ſea-ſhore, and is furniſhed with a furnace and one or two large pans, which are commonly made of iron-plates, joined together with nails, and the joints filled with a ſtrong cement; and the bottoms of the pans are prevented from bending down, by being ſupported by ſtrong iron-bars.

The ſalt-pan being filled with ſea-water, a ſtrong fire of pit-coal is lighted in the furnace, and then, for a pan which contains about fourteen hundred gallons, the ſalt-boiler takes the whites of three eggs, and incorporates them all with two or three gallons of ſea-water, which he pours into the ſalt-pan, while the water contained therein is only lukewarm, and mixes this with the reſt by ſtirring it about with a rake. In many places they uſe, inſtead of eggs, the blood of ſheep or oxen to clarify the ſea-water; and in Scotland they do not give themſelves the trouble to clarify it at all. As the water heats, there ariſes a black frothy ſcum upon it, which is to be taken off with wooden ſkimmers. After this the water appears perfectly clear, and by boiling it briſkly about four hours, a pan loaded in the common way, that is about fifteen inches deep, will begin to form cryſtals upon its ſurface. The pan is then filled up a ſecond time with freſh ſea-water; and about the time when it is half filled, the ſcratch-pans are taken out and emptied of a white powder, ſeeming a kind of calcarious earth, which ſeparates itſelf from the ſea-water, during its boiling, before the ſalt begins to ſhoot. When theſe have been emptied, they are again put into their places, where they are afterwards filled again. This powder being violently agitated by the boiling liquor, does not ſubſide till it comes to the corners of the pan, where the motion of the maſs is ſmaller, and it there falls into theſe pans placed on purpoſe to receive it.

The ſecond filling of the pan is boiled down after clarifying in the ſame manner as the firſt, and ſo a third and a fourth; but in the evaporation of the fourth, when the cryſtals begin to form themſelves, they ſlacken the fire, and only keep the liquor ſimmering. In this heat they keep it all the while that the ſalt is granulating, which is nine or ten hours. The granules or cryſtals all fall to the bottom of the pan; and when the water is almoſt all evaporated, and the ſalt lies nearly dry at the bottom, they rake it all together into a long heap on one ſide of the pan, where it lies a while to drain from the brine, and then is put into barrows and carried to the ſtore-houſe, and delivered into the cuſtody of his majeſty's officers. In this manner the whole proceſs is uſually performed in twenty four hours, the ſalt being commonly drawn out every morning. This is the method in moſt of our ſalt-works, but in ſome they fill the pan ſeven times before they boil up the ſalt, and ſo take it

it out but once in two days, or five times in a fortnight. In the common way of four boilings, a pan of the uſual ſize, containing one thouſand three hundred gallons, they draw from fifteen to twenty buſhels of ſalt every day, each buſhel weighing fifty-ſix pounds.

When the ſalt is carried into the ſtore-houſe, it is put into drabs, which are partitions, like ſtalls for horſes, lined at three ſides, and the bottom with boards, and having a ſliding board on the fore-ſide to draw up on occaſion. The bottoms are made ſhelving, being higheſt at the back, and gradually inclining forward; by this means the brine remaining among the ſalt, eaſily ſeparates and runs from it, and the ſalt in three or four days becomes ſufficiently dry; in ſome places they uſe cribs and barrows, which are long and conic wicker-baſkets, for this purpoſe; and in ſome places wooden troughs with holes in the bottom. The ſaline liquor which remains from the making of ſalt, is what is called bittern. See the article BITTERN.

Much in the ſame manner is the ſalt obtained from the brine of ſalt ſprings, pits, *&c.* White ſalt is prepared from ſea-water, or any other kind of ſalt-water, firſt heightened into a ſtrong brine by the heat of the ſun, and the operation of the air. It may alſo be prepared from a ſtrong brine, or lixivium, drawn from earths, ſtones, or ſands, ſtrongly impregnated with common ſalt. Refined rock-ſalt is that obtained by diſſolving foſſile or rock-ſalt in ſalt of freſh water, and afterwards boiling the ſolution. And, laſtly, ſalt upon ſalt is made from bay-ſalt diſſolved in ſea-water, or other water, and boiled to a white ſalt.

Preparations of common SALT, in uſe in the ſhops, are, 1. Decrepitated ſalt, thus made: put a quantity of ſalt in an earthen veſſel capable of bearing the action of the fire, cover it with a lid, and ſet it on a moderately ſtrong charcoal fire, heaping up the coals about it as high as the ſalt reaches within; let the lid be taken off at times, and the matter ſtirred well about with an iron-ſpatula. It will make a violent crackling for a long time, but at length the noiſe will ceaſe, and the ſalt be reduced to a dry powder; this is decrepitated ſalt. It is uſed in the cementation of metals, in many other chemical and metallurgical operations, and in diſtilling the acid ſpirit from the ſalt, much trouble and time being ſaved by this previous calcination, though none of the ſpirit will be diſſipated by it. 2. The acid ſpirit of ſea-ſalt, which may be diſtilled by the retort, by mixing two parts of pipe-clay, or the like earth, with one part of decrepitated ſalt; forming the whole into balls with water, and diſtilling theſe after they are dried, in a reverberatory furnace, with a coated retort and a large receiver. Another method of obtaining this ſpirit is this: take ſea-ſalt and oil of vitriol, of each an equal quantity; of common water, a fourth part of the weight of the whole: mix the water and the oil of vitriol together, in an earthen veſſel; then pour them into a retort, and add to them the ſalt by ſmall quantities at a time fit on a receiver, and diſtil the ſpirit by a fire, gentle at firſt, but afterwards raiſed to a conſiderable ſtrength. The mixture of theſe ingredients ſhould be made under a chimney, and the vapours carefully avoided, as being of the moſt fatal ſuffocating kind. This ſpirit is uſed in many metallurgic operations. 3. The ſweet ſpirit of ſalt, made thus: mix together three parts of rectified ſpirit of wine, and one part of ſpirit of ſalt; let them ſtand in digeſtion three weeks or a month, in a tall matraſs. The mixture will in this time acquire a very fragrant ſmell, and is to be preſerved for uſe. It is given in the ſame caſes with the ſweet ſpirit of nitre, and promotes the diſcharges by urine, and therefore is good in the gravel and dropſies: it is alſo recommended in malignant fevers and hernias; its doſe being from five to fifteen drops, in any convenient vehicle. 5. Glauber's ſalt, a very cheap cathartic or purging ſalt. See GLAUBER.

SALT, in chemiſtry, makes one of the leading and moſt active principles, or elements, procurable from mixt bodies. See PRINCIPLE and ELEMENT.

There are three kinds thus obtained, two whereof are volatile, and the third fixed. The volatile, are acrid and urinous ſalts; the fixed, lixivious, or thoſe drawn from aſhes: the urinous and lixivious ſalts are alſo called alkalies, or alkalious ſalts; the former being volatile, and the latter fixed. We do not know the preciſe figure of each of theſe ſalts; but to judge of them by their effects, acid ſalts ſhould ſeem to be pointed, and thoſe points tipped with ſulphureous matter whereas the urinous and lixivious ſalts ſeem to be like a ſponge, containing a

part of the acid, and a little fetid oil. See ACID, ALKALI, and LIXIVIOUS.

Acid ſalts are ranged, by Homberg, under three claſſes, *viz.* ſuch as contain an animal or vegetable ſulphur; as all the acids diſtilled from plants, fruits, woods, &c. and ſpirit of nitre: ſuch as contain a bituminous ſulphur, to which belong the acids of vitriol, common ſulphur, and alum: and ſuch as contain a more fixed mineral ſulphur; as the acids drawn from the ſea ſalt, and ſal gem. Thoſe of the firſt claſs act more ſwiftly than thoſe of the others, and thoſe of the ſecond are the leaſt nimble. Acid ſalts, joined with lixivious ones, compoſe mixed or intermediate ſalts: thus, ſpirit of nitre, with ſalt of tartar, produce a true ſalt-petre; ſpirit of ſalt, with ſalt of tartar, produce true common ſalt; and ſpirit of vitriol, with ſalt of tartar, produce true vitriol; which are all mixed or intermediate ſalts, *i. e.* partly fixed and partly volatile, the ingredients ſtill retaining their original natures. Acids, joined with urinous ſalts, compoſe another ſalt called ammoniac ſalts, which are always volatile.

In all native ſalts, both foſſile, vegetable, and animal, after the violence of the fire has ſeparated all the volatile parts, there ſtill remains a fixed ſalt, to be drawn from the fœces by lotion, or lixiviation; hence called a lixivious ſalt, which is no other but the relics of the acid ſalts, that the fire was not able to ſeparate from the earth of the mixed body, but may be ſeparated by diſſolving them in common water. The taſte of theſe lixivious ſalts is very different, according to the quantity of the acids ſtill remaining after calcination; part of which is ſtill capable of being volatilized by a more intenſe heat, or by diſſolution, digeſtion, filtration, and evaporation frequently repeated; or, by adding ſome urinous ſalt, to abſorb the ſame.

We have three ſorts of urinous ſalts, *viz.* that of plants or animals, which is the ſame; the ſecond is foſſile; and the third of an intermediate kind, partaking both of the foſſile and vegetable nature; the firſt is volatile, and the two latter fixed. By urinous ſalts, we mean all ſuch as partake of the taſte or ſmell of urine; their effect in volatilizing fixed ſalts is well known; for being added to common ſalt, there ariſes, by fire, a volatile ſalt, called ſal ammoniac. However, for volatilizing the fixed ſalts of plants, the urinous ſalts of plants are not ſo proper as the urinous ſalts of the intermediate claſs, ſuch as alum; and for the fixed ſalts of foſſils, the urinous ſalt is fitteſt, *viz.* borax.

All the ſorts of ſalts, then, appear evidently compound and unelementary; and that they are producible *de novo*, and convertible into one another is ſtrenuouſly argued by Mr. Boyle. The two chief qualities wherein they all agree, he obſerves, are to be eaſily diſſoluble in water, and to affect the palate, ſo as to cauſe a ſenſe of taſte. Now that a diſpoſition to be diſſoluble in a liquor, may be acquired by mixture, and a new texture of parts, appears from many inſtances; and as for the taſte, it is ſome queſtion, how far the neceſſity thereof may conſiſt with another principle; for the pureſt oils are ſapid, yet will not diſſolve in water; ſo that there does not appear any ſtrict connection between being ſapid and ſoluble in that fluid.

For acid ſalts, we may inſtance in nitre; which, though it have no acid taſte, may be made to afford by diſtillation, above three quarters of its weight, of a highly acid liquor: yet it does not appear, that ſuch a great proportion of acid particles, or poſſibly any proportion at all, is employed by nature in the compoſition of nitre.

For urinous ſalts, we have an inſtance of their production, in the ſalt obtained by diſtillation from ſoot: for though the wood, we burn in our chimneys, ſeems to have nothing of the taſte or ſmell of urine, nor have the diſſolutions of the ſaline parts of ſuch wood been obſerved to have any affinity, in taſte or odour, thereto; yet when wood is burnt in the fire, and the ſoot afforded by it diſtilled, we get a white volatile urinous ſalt, like what is obtained from blood, urine, or the like.

For lixivious, or the fixed ſalts of calcined bodies, the chemiſts themſelves are not entirely agreed; for however the prevailing opinion may be, that thoſe fixed alkalies pre-exiſt in mixed bodies, Helmont very ingeniouſly propoſes another origin, and holds them, as to their alkaline form, productions of the fire, by whoſe violent action a part of the ſalt, which in the concrete is all naturally volatile, laying hold of ſome parts of the ſulphur of the ſame body, both become melted together, and thus fixed into an alkali.

It

It would, no doubt, contribute greatly to the improvement of chemiſtry, and natural philoſophy, to form a table of the time and quantity wherein all the known ſalts are diſſoluble in water. Epſom-ſalt preſently diſſolves in about an equal quantity of water; common ſalt diſſolves in about four times; nitre, in about five or ſix times; and ſalt of tartar, in about twice its own quantity of water; but cream of tartar requires twenty times its own quantity of boiling water, to diſſolve it. Such a table, regularly formed, might eaſe the trouble of refining ſalts; by ſhewing, at once, how much water each ſalt requires to diſſolve it, for clarification, or cryſtallization. It would likewiſe ſupply us with a ready and commodious way of ſeparating any mixture of ſalts, by ſhewing which would ſhoot out of the mixture firſt upon cryſtallization: for the rule is, that the ſalt which requires the largeſt proportion of water to diſſolve it, will ſhoot the firſt; and thus it is, that nitre is totally ſeparated from common ſalt, in the ordinary proceſs for refining it. The ſame table might alſo direct us to a ready method of ſeparating two ſalts, without waiting for cryſtallization: thus ſuppoſe tartar of vitriol were mixed with epſom-ſalt, if water be poured upon the mixture, it will preſently drink in the epſom-ſalt, leaving the tartar of vitriol untouched; and the ſame is to be underſtood of other mixtures of ſalts.

If, ſays Dr. Shaw, the phyſical reaſon be demanded, why one ſalt more-readily diſſolves in water than another, we recommend it to farther examination, whether all ſalts do not diſſolve in water with greater or leſs facility, and in greater or leſs proportion, according as they contain more or leſs of a groſs, unctuous ſubſtance, unſuitable to the nature or fineneſs and lubricity of parts required in water. The comparing epſom-ſalt, ſalt of tartar, common ſalt, &c. with nitre, alum, crude tartar, &c. he thinks will make this more than a conjecture. Hence, in order to leſſen the trouble and expence of procuring the volatile ſalt of animal ſubjects, they ſhould be firſt purged of their oil and unctuous parts, by boiling in water; after which, they will afford volatile ſalts and ſpirits, as pure, or purer, than thoſe obtained from unboiled hartſhorn.

The ſame gentleman obſerves farther, that the unrectified volatile ſalts of vegetable and animal ſubſtances, are true ſales volatiles oleoſi; and according to the difference of the oil wherein they abound, they are properly diſtinguiſhed into ſalt of hartſhorn, of ox-bone, of human blood, of ſilk, &c. But that when theſe oils are totally ſeparated from them, they become one and the ſame undiſtinguiſhable volatile ſalt; for that it is the admixture of oil that gives the colour to volatile ſalts, they being permanently white when the oil is ſeparated.

Theſe volatile ſalts are obtainable from all kinds of land-animals, the amphibious and ſubterraneous tribe, birds, fiſhes, and reptiles; alſo from alkaline vegetables without putrefaction, and from other vegetables after putrefaction; from ſoot, horns, hoofs, and all refuſe animal and vegetable matters, as urine, the blood of ſlaughter houſes, &c. and this as pure and perfect as from hartſhorn; whence volatile alkalies, and ſal ammoniac, might be afforded very cheap.

The volatile animal, and fixed vegetable ſalts, differ chiefly with regard to their volatility, and fixedneſs, and the effects thereon depending; but agree in other reſpects thus they both make an efferveſcence, and turn neutral, when ſaturated with acids; they are both corroſive, hot, and fiery, &c.

SALT, or SAULT, in the manege, the ſame with leap. See LEAP.

SALTASH, a borough of Cornwal, which ſends two members to parliament, is ſituated twenty miles ſouth of Launceſton.

SALTIER, in heraldry, an ordinary in form of a St. Andrew's-croſs; which may be ſaid to be compos'd of a bend dexter and ſiniſter, croſſing each other in the center of the eſcutcheon. See plate CCXXXVI. fig. 3.

SALT-PETRE, the ſame with nitre. See the article NITRE.

SALTSBURG, the capital of an archbiſhopric of the ſame name, in Bavaria, ſituated on the river Saltza, ſeventy miles eaſt of Munich: eaſt long. 13°, north lat. 47° 45'.

SALVAGE MONEY, a reward allowed by the civil and ſtatute law, for the ſaving of ſhips or goods from the danger of the ſeas, pirates, or enemies.

Where any ſhip is in danger of being ſtranded, or driven on ſhore, juſtices of the peace are to command the conſtables to aſſemble as many perſons as are neceſſary to preſerve it; and on its being preſerved by their means, the perſons

assisting therein shall in thirty days after be paid a reasonable reward for the salvage, otherwise the ship or goods shall remain in the custody of the officers of the customs, as a security for the same.

SALVATELLA, in anatomy, a branch of the axillary vein, which runs over the back of the hand towards the little finger.

SALVATERRA, a town of Spain, in the province of Estremadura: west long. 7° 5′, north lat. 38° 30′.

SALVATIERRA, a town of Spain, in the province of Galicia, fifty miles south of Compostella.

SALVE REGINA, among the romanists, a latin prayer addressed to the Virgin Mary, and sung after complines; also at the execution of criminals.

SALVER, a plate, commonly of silver, and supported with a foot; used to set glasses on, to serve wine and other liquors.

SALVIA, *sage*, in botany, *&c.* See SAGE.

SALVINIA, or MARSILEA, in botany. See MARSILEA.

SALUTATION, the act of saluting, greeting, or paying respect and reverence to any one.

There is a great variety in the forms of salutation. The orientals salute by uncovering their feet, laying their hands on their breasts, *&c.* In England, we salute by uncovering the head, bending the body, *&c.* The pope makes no reverence to any mortal, except the emperor, to whom he stoops a very little, when he permits him to kiss his lips. A prince, or person of extraordinary quality, is saluted at his entering a garrison by the firing of the cannon round the place. In the field, when a regiment is to be reviewed by a king, or his general, the drums beat, as he approaches, and the officers salute him one after another, as he passes by, stepping back with the right foot and hand, bowing their half pikes to the ground, and then recovering them gently, bringing up the foot and hand, and planting them; which done, they pull off their hats without bowing. The ensigns salute all together, bringing down their colours near the ground directly before them at one motion, and having taken them up again, gently lift their hats.

At sea, they salute by a discharge of cannon, which is greater or less, according to the degree of respect they would shew; and here ships always salute with an odd number of guns, and galleys with an even one. To salute with muskets is to fire one, two, or three volleys; which is a method of salutation that sometimes precedes that of cannon, and is chiefly used on occasion of feasts. After the cannon, they also sometimes salute or hail with the voice, by a joint shout of all the ship's company, repeated three times; which salutation also occasionally obtains where they carry no guns, or do not care to discharge any. Saluting with the flag is performed two ways, either by holding it close to the staff so as it cannot flutter, or by striking it so as it cannot be seen at all, which is the most respectful. Saluting with the sails is performed by hovering the topsails half-way of the masts. Only those vessels that carry no guns salute with the sails.

SALUZZO, a city of Italy, the capital of a marquisate of the same name in Piedmont, seventeen miles south of Turin.

SALZ, SULZ, SALTZ, or SULTZ, a sort of brine or pickle made of salt dissolved by the coldness or moisture of a cellar.

SAMARCAND, a city of Usbec Tartary, formerly its capital: east lon. 66°, north lat. 40°.

SAMARIA, an antient city of Palestine, in asiatic Turky, forty-five miles north of Jerusalem.

SAMARITANS, an antient sect among the Jews, still subsisting in some parts of the Levant, under the same name.

Its origin was in the time of Rehoboam, under whose reign the people of Israel were divided into two distinct kingdoms, that of Judah and that of Israel; when the capital of the latter being Samaria, the Israelites obtained the name of Samaritans.

They were antiently guilty of idolatry, and the rabbins pretend, that they worshipped the figure of a dove on mount Gerizim; but the present Samaritans, who are but few in number, are far from being idolaters. They celebrate the passover every year, on the fourteenth day of the first month, on mount Gerizim, and begin that feast with the sacrifice appointed for that purpose in Exodus: they keep the sabbath with all the rigour with which it is injoined in the book of Exodus; none among them stirring out of doors but to the synagogue: they sacrifice no where but on mount Gerizim: they observe the feasts of expiation, tabernacles,

bernacles, harveſt, &c. and never defer circumciſion beyond the eighth day; they never marry their nieces as the Jews do; have but one wife; and in fine, do nothing but what is commanded in the law.

SAMARITAN MEDALS, ſome antient medals in the cabinets of our antiquaries, the inſcriptions and legends of which are in hebrew; but the character different from the hebrew of our bibles, which is the ſquare hebrew, or chaldee; from this character, and not from their being ſtruck by the Samaritans, they are denominated Samaritan.

Of theſe there are four kinds: the firſt bear expreſsly the name of Simon, and the ſubject for which they were ſtruck, *viz.* the deliverance of Jeruſalem. The ſecond have not the name Simon, but only the deliverance of Sion or Jeruſalem. The third, have neither Simon, nor the deliverance of Sion; but only the epochas, firſt year, ſecond year, &c. The fourth claſs have neither any inſcriptions, nor any thing whence we may judge of the time when they were ſtruck. The three firſt were certainly ſtruck by the Jews, after their return from the babyloniſh captivity, and in the time of Simon Maccabeus, after Jeruſalem had been freed from the yoke of the greeks; but though they were ſtruck after the captivity, the learned jeſuit Souciet obſerves, that their character ſhews itſelf to be that of the antient hebrew, the uſe of which was loſt by the people during their ſojourn in Babylon and Chaldæa; but was again reſtored after their return, on the ſame footing as before.

SAMBALLAS, or SAMBLAS ISLANDS, ſeveral iſlands ſituated in the american ocean, near the coaſt of Darien, none of which are inhabited: eaſt long. 81° north lat. 10°.

SAMBRE, a river of the Netherlands, which riſes in the confines of Picardy, and falls into the Maeſe at Namur.

SAMBUCUS, the ELDER, in botany, a genus of the *pentandria-trigynia* claſs of plants, the flower of which conſiſts of a ſingle rotated ſemiquinquifid petal; its fruit is a roundiſh unilocular berry, containing three ſeeds, convex on one ſide, and angulated on the other.

The inner green bark of this ſhrub is gently cathartic: an infuſion of it in wine, or its expreſſed juice, in the doſe of half an ounce, or an ounce, is ſaid to purge moderately; and in ſmall doſes, to prove an efficacious deobſtruent, capable of promoting all the fluid ſecretions. The young buds, or rudiments of the leaves, are ſtrongly purgative, but are reckoned unſafe. The expreſſed juice, inſpiſſated to the conſiſtence of a rob, proves an uſeful aperient medicine, which is good in obſtructions of the viſcera, and promotes the natural evacuations.

SAMBUCUS, is alſo an antient muſical inſtrument of the wind-kind, reſembling a flute; probably thus called, becauſe made of elder.

SAMIAN EARTH, in the materia medica, the name of two ſpecies of marl uſed in medicine, *viz.* 1. The white kind, called by the antients, collyrium ſamium; being aſtringent, and therefore good in diarrhæas, dyſenteries, and hæmorrhages; they alſo uſed it externally in inflammations of all kinds. 2. The browniſh-white kind, called after ſamius, by Dioſcorides: this alſo ſtands recommended as an aſtringent. See MARL.

SAMOGITIA, a maritime province of Poland, bounded by Courland on the North, and by the Baltic on the weſt.

SAMOIDA, the moſt northerly province of Ruſſia in Europe, ſituated on the frozen ocean, and the river Oby.

SAMOLUS, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, the tube is very ſhort, only the length of the cup, and patalous; the limb is plane and divided into five ſegments, and there are placed five connivent ſquammulæ at the baſe of the ſinus of the limb; the fruit is an oval capſule ſurrounded by the cup, and containing only one cell; the ſeeds are numerous, oval and ſmall.

SAMOS, a fertile iſland of the Archipelago, thirty miles ſouth of Smyrna: eaſt long. 27° 30′, north lat. 37° 30′.

SAMOSATENIANS, in church-hiſtory, the ſame with paulianites. See the article PAULIANITES.

SAMOTHRACIA, a ſmall iſland in the Egean ſea, near the coaſt of Thrace.

SAMPSEANS, in church-hiſtory, an antient ſect, who were properly neither jews, chriſtians, nor gentiles, though they took their name from the hebrew word *ſemes*, ſun; as though they worſhipped that planet.

They acknowledged only one God; waſhed themſelves often; and in almoſt every thing attached themſelves to the religion

ligion of the Jews. Many among them abſtained wholly from eating of fleſh. Scaliger will have the ſampſeans to be the ſame with the eſſeni; and indeed the ſampſeans, eſſeni, elceſaites, and maſſalians, appear to be no more than ſo many different names for the ſame ſect.

SAMYDA, in botany, a genus of the *icoſandria-monogynia* claſs of plants, the calyx of which is ſituated under the germen, and it has no corolla or flower petals.

SANAMUNDA, in botany, *&c.* the ſame with the empetrum, or heath ſpurge.

SANBENEDITO, a town of Italy, in the dutchy of Mantua, nine miles ſouth of the city of Mantua.

SAN BENITO, or SACO BENITO, a kind of linnen-garment worn by perſons condemned by the inquiſition. See the articles INQUISITION and *Act of* FAITH.

SANCTIFICATION, the act of ſanctifying, or rendering a thing holy.

The reformed divines define ſanctification to be an act of God's grace, by which a perſon's deſires and affections are alienated from the world, and by which he is made to die to ſin, and to live to righteouſneſs; or, in other words, to feel an abhorrence of all vice, and a love of virtue and religion.

SANCTION, the authority given to a judicial act, by which it becomes legal and authentic.

Thus the royal aſſent gives a ſanction to all bills that have paſſed both houſes of parliament.

Pragmatical SANCTION. See the article PRAGMATICAL.

SANCTI VITI CHOREA. See the article VITUS's DANCE.

SANCTUARY, among the Jews, alſo called ſanctum ſanctorum, or holy of holies, was the holieſt and moſt retired part of the temple of Jeruſalem, in which the ark of the covenant was preſerved, and into which none but the high prieſt was allowed to enter, and that only once a year, to intercede for the people.

Some diſtinguiſh the ſanctuary from the ſanctum ſanctorum, and maintain that the whole temple was called the ſanctuary.

To try and examine any thing by the weight of the ſanctuary, is to examine it by a juſt and equal ſcale: becauſe, among the Jews, it was the cuſtom of the prieſts to keep ſtone weights, to ſerve as ſtandards for regulating all weights by, though theſe were not at all different from the royal, or profane weights.

Sanctuary, in the romiſh church, is alſo uſed for that part of the church in which the altar is placed, incompaſſed with a rail or balluſtrade.

SANCTUARY, in our antient cuſtoms, is the ſame with aſylum. See ASYLUM.

SAND, *arena*, in natural hiſtory, a genus of foſſils, the characters of which are, that they are found in minute concretions; forming together a kind of powder, the genuine particles of which are all of a tendency to one determinate ſhape, and appear regular, though more or leſs compleat concretions; not to be diſſolved or diſunited by water, or formed into a coherent maſs by means of it, but retaining their figure in it; tranſparent, vitrifiable by extreme heat, and not diſſoluble in, nor efferveſcing with, acids.

Sands are ſubject to be variouſly blended both with homogene and heterogene ſubſtances, as that of talcs, *&c.* and hence, as well as from their various colours, are ſubdivided into, 1. White ſands, whether pure or mixed with other arenaceous or heterogeneous particles; of all which there are ſeveral ſpecies, differing no leſs in the fineneſs of their particles, than in the different degrees of colour, from a bright and ſhining white, to a browniſh, yelloviſh, greeniſh, *&c.* white. 2. The red and reddiſh ſands, both pure and impure. 3. The yellow ſands, whether pure or mixed, are alſo very numerous. 4. The brown ſands, diſtinguiſhed in the ſame manner. 5. The black ſands, whereof there are only two ſpecies, *viz.* a fine ſhining greyiſh-black ſand, and another of a fine ſhining reddiſh-black colour. 6. The green kind, of which there is only one known ſpecies, *viz.* a coarſe variegated duſky green ſand, common in Virginia.

Sand is of great uſe in the glaſs-manufacture; the white writing ſand being employed for making of the white glaſs, and a coarſe greeniſh-looking ſand for the green glaſs.

In agriculture, it ſeems to be the office of ſand to make unctuous earths fertile, and fit to ſupport vegetables, *&c.* For earth alone, we find, is liable to coaleſce, and gather into a hard coherent maſs, as appears in clay; and being thus embodied, and as it were glued together, is no way diſpoſed to nouriſh vegetables. But if ſuch earth be mixed with ſand,

its pores are thereby kept open, and the earth itſelf looſe, ſo as thus to give room for the juices to aſcend, and for plants to be nouriſhed thereby. A vegetable planted only in ſand, or in a fat glebe, or in earth, receives little growth or increaſe; but a mixture of both renders the maſs fertile. In effect, earth is in ſome meaſure made organical by means of ſand; pores and ſpaces, ſomething analogous to veſſels, being thereby maintained, by which the juices may be conveyed, prepared, digeſted, circulated, and at length diſcharged.

Common ſand is a very good addition, by way of manure, to all ſorts of clay-lands; it warms them, and makes them more open and looſe. The beſt ſand for the farmer's uſe is that which is waſhed by rains from roads or hills, or that which is taken from the beds of rivers; the common ſand that is dug in pits never anſwers nearly ſo well. However, if mixed with dung, it is much better than laid on alone: and a very fine manure is made by covering the bottom of ſheep-folds with ſeveral loads of ſand every week, which are to be taken away, and laid on cold ſtiff lands, impregnated as they are with the dung and the urine of the ſheep.

Beſide clay-land there is another ſort of ground very improveable by ſand; this is that ſort of black foggy land on which buſhes and ſedge grow naturally, and which they cut into turf, in ſome places. Six hundred load of ſand being laid upon an acre of this land, according to the Cheſhire-meaſure, which is near double the ſtatute-acre, meliorate it ſo much, that without plowing, it will yield good crops of oats or tares, though before it would have produced ſcarce any thing. If this crop is taken off, the land be well dunged, and laid down for graſs, it will yield a large crop of ſweet hay.

Once ſanding this land will improve it for a vaſt number of years, and it will yield two crops of hay in the year, if there be weather to make it in. Some land in Cheſhire has been, by this means, rendered of twelve times its former value to the owner. The bogs of Ireland, when drained, have been rendered very fruitful land, by mixing ſand in this manner among the earth, of which they conſiſt. Add to this, that in all theſe boggy lands, the burning them, or firing their own turf upon them, is alſo a great advantage. The common peat, or turf-aſhes, mixed with the ſand for theſe purpoſes, add greatly to its virtue. Sea-ſand, which is thrown up in creeks and other places, is by much the richeſt of all ſand for manuring the earth; partly its ſaltneſs, and partly the fat and unctuous filth that is mixed among it, give it this great virtue. In the weſtern parts of England, that lie upon the ſea-coaſt, they make very great advantages of it. The fragments of ſea-ſhells alſo, which are always in great abundance in this ſand, add to its virtues; and it is always the more eſteemed by the farmers, the more of theſe fragments there are among it.

The ſea-ſand, uſed as manure in different parts of the kingdom, is of three kinds: that about Plymouth, and on other of the ſouthern coaſts, is of a blue-grey colour, like aſhes, which is probably owing to the ſhells of muſcles, and other fiſh of that or the like colour, being broken and mixed among it in great quantity. Weſtward, near the land's end, the ſea-ſand is very white, and about the iſles of Scilly it is very gliſtering, with ſmall particles of talc; on the coaſts of the north ſea, the ſand is yellowiſh, brown, or reddiſh, and contains ſo great a quantity of fragments of cockle-ſhells, that it ſeems to be chiefly compoſed of them. That ſea-ſand is accounted beſt, which is of a reddiſh colour: the next in value to this is the bluiſh, and the white is the worſt of all. Sea-ſand is beſt when taken up from under the water, or from ſand-banks, which are covered by every tide. The ſmall grained ſand is moſt ſudden in its operation, and is therefore beſt for the tenant who is only to take three or four crops; but the coarſe or large grained ſand is much better for the landlord, as the good it does laſts many years.

When the land has been well manured with the large ſand, they take four crops of corn from it, and then lay it down for paſture for ſix or ſeven years before they plow it again. The graſs is ſo good, that they commonly mow it for hay the firſt year; it always abounds very much with the white-flowered clover. If the graſs grows but ſhort, it is the farmer's intereſt to feed his cattle upon it, and it will turn to as good account this way, being very ſweet and rich, and making the cattle fat, and the cows yield a very large quantity of milk.

SAN-

SANDBACH, a market-town twenty-two miles eaſt of Cheſter.

SAND-BAGS, in the art of war, are bags filled with earth or ſand, holding each about a cubic foot: their uſe is to raiſe parapets in haſte, or to repair what is beaten down.

SANDECK, a town of little Poland, thirty-five miles ſouth-eaſt of Cracow.

SAND-EEL, *ammodytes*, in ichthyology. See the article AMMODYTES.

SAND-FLOOD, a terrible miſchief, incident to the lands of Suffolk, and ſome other parts of England; which are frequently covered with vaſt quantities of ſand, rolling in upon them like a deluge of water, from ſandy hills in their neighbourhood.

The beſt way of ſtopping its progreſs is, by hedges of furze, planted one over another as they become level.

SAND-LANDS, or SANDY LANDS, in agriculture, are made up of ſands of different colours and qualities; as white, blackiſh, reddiſh, or yellowiſh; and in the ſize of their particles, ſome being milder or harſher, and others very light, ſeeming mere duſt. The grey, black, and aſh-coloured ſands, are the worſt of all, and are generally found on heaths and commons.

The moſt ſuitable plants for arable lands of this kind, are white oats, rye, black wheat, and turneps: the natural produce in weeds, is quick-graſs, ſorrel, broom, furze, fern, and heath. The beſt manure for them is either marl, or ſuch clay as will break with the froſts. Cow-dung is alſo ſaid to be good for ſuch lands; and many uſe with ſucceſs chalk, mud, and the half rotten ſtraw of dunghills.

SANDAL, in antiquity, a rich kind of ſlipper, worn on the feet by the greek and roman ladies, made of gold, ſilk, or other precious ſtuff, conſiſting of a ſole, with an hollow at one extreme to embrace the ancle, but leaving the upper part of the foot bare.

Sandal, is alſo uſed for a ſhoe or ſlipper worn by the pope, and other romiſh prelates, when they officiate. It is alſo the name of a ſort of ſlipper worn by ſeveral congregations of reformed monks. This laſt conſiſts of no more than a mere leathern ſole, faſtened with latches or buckles, all the reſt of the foot being left bare. The capuchins wear ſandals, the recollects, clogs: the former are of leather, and the latter of wood.

SANDARACH, in natural hiſtory, a very beautiful native foſſil, though too often confounded with the common factitious red arſenic, and with the red matter formed by melting the common yellow orpiment.

It is a pure ſubſtance, of a very even and regular ſtructure, is throughout of that colour which our dyers term an orange-ſcarlet, and is conſiderably tranſparent even in the thickeſt pieces. But though with reſpect to colour, it has the advantage of cinnabar while in the maſs, it is vaſtly inferior to it when both are reduced to powders. It is moderately hard, and remarkably heavy, and when expoſed to a moderate heat, melts and flows like oil: if ſet on fire, it burns very briſkly.

It is found in Saxony and Bohemia, in the copper and ſilver mines, and is ſold to the painters, who find it a very fine and valuable red: but its virtues or qualities in medicine, are no more aſcertained at this time, than thoſe of the yellow orpiment.

Gum-SANDARACH, is a dry and hard reſin, uſually met with in looſe granules, of the bigneſs of a pea, a horſe-bean, or larger; of a pale whitiſh yellow, tranſparent, and of a reſinous ſmell, brittle, very inflammable, of an acrid and aromatic taſte, and diffuſing a very pleaſant ſmell when burning. It is produced from a ſpecies of the juniper, and the cedrus baccifera. See JUNIPER.

It flows only from theſe trees in hot countries; but the natives promote its diſcharge by making inciſions in the bark.

What is obtained from the cedar is more fragrant, eſpecially when burnt; but it is ſeldom to be met with ſeparate in the ſhops, both being mixed together under the common name of ſandarach.

Sandarach is good in diarrhœas, and in hæmorrhages; where its doſe is from ten grains to half a dram: it is alſo ſometimes preſcribed in gonorrhœas, and the fluor albus; but at preſent it is much diſuſed in medicine. It is, however, much uſed by our writing-maſters, who make a powder of it which they call pounce.

The varniſh-makers make a kind of varniſh of it by diſſolving it in oil of turpentine, or linſeed, or in ſpirit of wine. See VARNISH.

Gum-

Gum-ſandarach, on its being imported, pays a duty of 5s. $5\frac{10}{100}$d. the 112 pounds, and on exportation draws back 4s. $9\frac{12}{100}$d.

SANDIVER, a whitiſh ſalt, continually caſt up from the metal, as it is called, whereof glaſs is made; and ſwimming on its ſurface, is ſkimmed off. See the article GLASS.

Sandiver is alſo plentifully thrown out in the eruptions of vulcanos; ſome is of a fine white, and others tinged blueiſh, or yellowiſh.

Sandiver is detergent, and good for foulneſſes of the ſkin. It is alſo uſed by gilders of iron. See GILDING.

SANDIX, a kind of minium, or red-lead, made of ceruſe; but much inferior to the true minium. See the articles MINIUM and CERUSE.

SANDOMIR, a city of little Poland, and capital of a Palatinate of the ſame name, eighty miles north-eaſt of Cracow.

SANDVLIET, a town of Brabant, ten miles north of Antwerp.

SAND WALK. See WALK.

SANDWICH, one of the cinque-ports, in Kent, ten miles eaſt of Canterbury: it ſends two members to parliament, and gives the title of earl to the noble family of Montague.

SANE MEMORY, in law, denotes ſound and perfect memory to do any lawful act. See MEMORY and COMPOS.

SANGUESSA, a town of Spain, twenty miles ſouth of Pampeluna: weſt long. 1° 30′, north lat. 42° 40′.

SANGUIFICATION, in the animal œconomy, the converſion of chyle into true blood. See the articles CHYLE, CHYLIFICATION and BLOOD.

Blood is formed from chyle by various and ſucceſſive degrees. A few hours after meals, the chyle is found conveyed into the blood, though not aſſimilated. Hence, when after a liberal meal blood is taken from the vein, beſides the ſerum and the red part, there is a white, ſweet, and chylous part found fluctuating in the blood. In a few hours the chyle, conveyed with the blood through the veſſels, is ſeparated from the blood by the fabric of the breaſts, and affords milk, which is of a different nature both from blood and chyle; for in milk there begins to be formed that tendency to concretion which is already preſent in the ſerum of the blood, for it yields cheeſe. But this tendency to concretion is never found in the chyle. Hence we may artificially imitate the preparation of chyle in emulſions, but never the nature of milk.

When a ſound woman for twelve hours totally abſtains from meat and drink, her milk begins to be ſaline and yellowiſh. If ſhe abſtains ſtill longer, nothing is found in the blood taken from her veins, but what (like the white of an egg) is by means of the fire concreted, which never happens in the chyle.

Hence we may conclude that the bodies of ſound perſons are the formers and producers of their own blood, in the ſame manner as any plant, by its peculiar fabric, prepares its ſap from the juices of the fertile earth and the genial influences of the circumambient air.

But in the human body the formation of blood depends principally upon the efficacy of the circulation, by which the veſſels act upon their contained fluids. Hence in the moſt robuſt perſons the blood is reddeſt, or rather almoſt black, in conſequence of its ſaturated red colour, and is concreted almoſt the very moment it is left in a ſtate of reſt. And in acute diſeaſes, when the circulation is increaſed, all the parts are intenſely red, and the ſerum of the blood is converted into a ſciſſile maſs. But in weak perſons in whom the efficacy of the circulation is far leſs, all the parts are pale and languid, whilſt the blood is thin and hardly capable of concretion. But when in ſuch perſons, with due exerciſe and proper remedies, the circulation is augmented, the red colour and due coheſion of the blood return.

SANGUINARIA, BLOOD-WORT, a genus of the *polyandria-monogynia* claſs of plants, the flower of which conſiſts of eight very patent petals; and the fruit is an oblong ventricoſe capſule, containing a great many roundiſh and acuminated ſeeds.

SANGUINE, in general, ſomething abounding with, or reſembling blood. See the article BLOOD.

Among heralds, the term ſanguine is often given to the colour more uſually called murrey; being made of red lake tinged with a little ſpaniſh brown; it is chiefly uſed in the coats of the knights of the bath, and is repreſented, in engraving, by hatches like thoſe of purpure. See the article PURPURE.

SANGUINE-STONE, *lapis hæmatites*. See the article HÆMATITES.

SANGUIS, BLOOD, in the animal œconomy. See the article BLOOD.

SANGUIS DRACONIS, *dragon's-blood*, in pharmacy. See DRAGON.

SANGUIS HIRCI, *goat's-blood*, in pharmacy, the dried blood of a middle-aged goat, which is eſteemed in Germany as a ſudorific, and a great medicine in pleuriſies; but with us is little regarded.

SANGUISORBA, BURNET, in botany, a plant of *tetrandria-monogynia* claſs, with a monopetalous flower, divided into four deep ſegments, cohering only at the ungues; the fruit is a ſmall bilocular capſule, containing very ſmall ſeeds.

The great burnet, ſanguiſorba major, is celebrated as a cordial, ſudorific, and aſtringent; but though great cures are ſaid to have been effected by it, the preſent practice neglects it.

SANGUISUGA, in zoology, a name given to the hirudo or leech. See the article LEECH.

SANHEDRIM, or SANHEDRIN, among the Jews, the great council of the nation, conſiſting of ſeventy ſenators, taken partly from among the prieſts and levites, and partly out of the inferior judges, who formed what was called the leſſer ſanhedrim. The room they met in, was a rotunda, half of which was built without the temple, and half within. The naſi, or preſident of the ſandrehim, ſat upon a throne, with his deputy on his right hand, his ſub-deputy on his left, and the other ſenators ranged in order on each ſide.

The authority of this council was very extenſive, for they decided ſuch cauſes as were brought before them by way of appeal from the inferior courts; and the king, the high-prieſts, and prophets were under the juriſdiction of this tribunal. They had the right of judging in capital caſes, and ſentence of death might not be pronounced in any other place; for which reaſon the Jews were forced to quit this hall, when the power of life and death was taken out of their hands, forty years before the deſtruction of the temple, and three years before the death of Chriſt.

There were ſeveral inferior ſanhedrims in Paleſtine, each of which conſiſted of twenty-three perſons; all theſe depended on the great ſanhedrim of Jeruſalem.

SANICLE, *ſanicula*, in botany, a genus of the *pentandria-digynia* claſs of plants, with an umbelliferous flower; each partial one being compoſed of five compreſſed and bifid petals; the fruit is compoſed of two ſeeds, plane on one ſide, and convex and ſcabrous on the other. See plate CCXXXVI. fig. 4.

The leaves of this plant have long been celebrated for their vulnerary qualities, both internally and externally; but are, nevertheleſs, diſregarded by the preſent practitioners.

SANIES, in medicine, a ſerous putrid matter, iſſuing from wounds; it differs from pus, which is thicker and whiter.

SAN MATHEO, a town of Spain, in the province of Valencia, fifty-five miles north of the city of Valencia.

SANQUHAR, a borough town of Scotland, in the county of Nithſdale, twenty-one miles north of Dumfries.

SANTA CLARA, an iſland in the Pacific Ocean, ſituated in the bay of Guyaquil: weſt long. 80°, ſouth lat. 3° 15′.

SANTA CRUZ, a port-town on the north ſide of the iſland of Cuba, in north America: weſt long. 85° 30′, north lat. 22° 30′.

SANTA FE, the capital of New Mexico: weſt long. 109°, north lat. 36°.

SANTA FE DE BAGOTA, the capital of Terra Firma, in ſouth America: weſt long. 74°, north lat. 4° 30′.

SANTA MARIA, a town of Terra Firma, in the province of Darien, ſituated on a river of the ſame name, a little eaſt of the bay of Panama: weſt long. 80°, north lat. 7° 40′.

SANTALUM, SAUNDERS, in the materia medica, a hard, odoriferous medicinal wood, brought from the Eaſt-Indies, of which there are three ſorts, *viz.* the yellow, white and red: the yellow or citrine ſaunders, is a beautiful wood; of the colour of lemon-peel; of a ſmell ſomewhat like a mixture of muſk and roſes, and of a ſomewhat acrid and aromatic taſte, with a ſlight bitterneſs. The white ſaunders reſembles the yellow, and is of the ſame fragrant ſmell and aromatic taſte, but in a more remiſs degree. Both theſe ſorts ſhould be choſen ſound, firm, heavy, and of a good ſmell when cut; they ſhould alſo be choſen in the block, and not cut into chips as they uſually are, for in this manner they ſoon loſe much of their virtue. The red ſaunders is of a denſe and compact texture, remarkably heavy and very hard. It is brought to us in logs of conſiderable length, the out part of which is of a duſky, and the inner of a blood red; it has but little ſmell, and is of an auſtere taſte.

All theſe ſorts are attenuants, and all have an aſtringency, but the red moſt of all. They are accounted cordials, and are ſaid to be good in obſtructions of the viſcera; but they are little uſed, except as ingredients in ſome of the compoſitions of the ſhops.

Santalum is a plant of the *octandria-monogynia* claſs, with a monopetalous campanulated flower, and a berry for its fruit.

SANTAREN, a city of Portugal, in the province of Eſtremadura, ſituated on the river Tagus, fifty miles north-eaſt of Liſbon.

SANTEN, a town of Germany, in the circle of Weſtphalia and dutchy of Cleeve, fifteen miles ſouth-eaſt of the city of Cleeve, ſubject to Pruſſia.

SANTERRE, the ſouthern diviſion of Picardy, in France.

SANTILLANA, a city and port-town of Spain, the capital of the eaſtern Aſturia, ſituated on the bay of Biſcay: weſt lon. 5°, and north lat. 43° 35′.

SANTOLINA, FEMALE SOUTHERN-WOOD, or LAVENDER-COTTON, a plant of the *ſyngeneſia-polygamia* claſs, the compound flower of which is uniform, conſiſting of a number of infundibuliform hermaphrodite corollulæ, quinquifid at the limb; which are each followed by a ſingle ſeed, contained in the cup.

The medicinal virtues aſcribed to ſantolina, are, in general, the ſame with thoſe of the abrotanum mas, or male ſouthernwood: it is however particularly recommend in uterine complaints; and its ſeed is good for deſtroying worms. See the article SOUTHERN-WOOD.

SANTOLINOIDES, or ANACYCLUS, in botany, a plant nearly allied to the cotula, the compound flower of which is radiated; the diſc being occupied by funnel-ſhaped hermaphrodite corollulæ, quinquifid at the limb; and the female flowers are ligulated; there are five capillary and very ſhort ſtamina; and the ſeeds are ſingle, after each partial flower.

SANTORINI, an iſland of the Archipelago, thirty-five miles in circumference: eaſt longit. 25° 35′, north lat. 36° 10′.

SAONE, a river of France, which riſes in Lorrain, and falls into the Rhone, at Lyons.

SAP, in phyſiology, a juice furniſhed by the earth, and changed into the plant, conſiſting of foſſil parts, other parts derived from the air and rain, and others from putrified animals, plants, *&c.* See the article JUICE.

This juice enters the plant in form of a fine and ſubtile water, which the nearer it is to the root, the more it retains of its proper nature; and the farther from the root, and the more action it has ſuſtained, the nearer it approaches to the nature of the vegetable: conſequently, when the juice enters the root, it is earthy, watry, poor, acid, and ſcarcely oleaginous at all. In the trunk and branches it is farther prepared, though it ſtill continues acid, as we find by tapping a tree in the month of February. The ſap being here carried to the germs or buds, is more concocted; and here having unfolded the leaves, theſe come to ſerve as lungs for the circulation and farther preparation of the juice. By ſuch means is the ſap ſtill farther altered and digeſted, as it is farther in the petals or leaves of the flowers, which tranſmit the juice, now brought to a farther ſubtility, to the ſtamina; theſe communicate it to the farina, or duſt, in the apices, which is, as it were, the male ſeed of the plant; where, having undergone a farther maturation, it is ſhed into the piſtil, which performs the office of an uterus or womb: and thus having acquired its laſt perfection, it gives riſe to a new fruit or plant. The ſap having thus gone its ſtage, from the root to the remote branches, and even the flower; and having, in every part of its progreſs, depoſited ſomething both for aliment and defence, what is redundant paſſes out into the bark, the veſſels of which are inoſculated with thoſe in which the ſap mounts; and through which it deſcends to the root, and thence to the earth again. And thus a circulation is effected. See the article CIRCULATION.

SAP, or SAPP, in the art of war, is the digging deep under the earth of the glacis, in order to open a covered paſſage into the moat. It is only a deep trench, covered at top with boards, hurdles, earth, ſand-bags, *&c.* and is uſually begun five or ſix fathoms from the ſalliant angle of the glacis. See FORTIFICATION and APPROACH.

SAPATA, or ZOPATA. See ZOPATA.

SAPINDUS, the SOAPBERRY-TREE, in botany, a plant of the *octandria-trigynia* claſs, the flower of which conſiſts of four oval petals; and the fruit of three capſules, each including a globoſe nut.

The berries of this tree are uſed for waſhing, inſtead of ſoap, whence the engliſh name.

SAPINUS, a name uſed by ſome for the fir-tree. See the article ABIES.

SAPO, SOAP. See the article SOAP.

SAPONARIA, SOAPWORT, in botany, a plant of the *decandria-digynia* claſs, the flower of which conſiſts of five petals, with a plane limb; and its fruit an unilocular capſule, containing a number of ſmall ſeeds.

The root of this plant is accounted aperient, corroborant, and ſudorific; and even preferred by ſome to ſaſſafras in theſe intentions. The leaves, agitated with water, raiſe a ſaponaceous froth, which has nearly the ſame effects with ſolutions of ſoap itſelf, in taking out ſpots from cloths, whence the name.

SAPOTA, in botany, the ſame with the achras. See the article ACHRAS.

SAPPHIRE, a pellucid gem, which, in its fineſt ſtate, is extremely beautiful and valuable, and ſecond only to the diamond in luſtre, hardneſs, and price. Its proper colour is a pure blue; in the fineſt ſpecimens it is of the deepeſt azure, and in others varies into paleneſs in ſhades of all degrees between that and a pure cryſtal brightneſs and water, without the leaſt tinge of colour, but with a luſtre much ſuperior to the cryſtal. They are diſtinguiſhed into four ſorts, *viz.* the blue ſapphire, the white ſapphire, the water ſapphire, and the milk ſapphire.

The gem known to us by this name is extremely different from the ſapphire of the antients, which was only a ſemi-opake ſtone, of a deep blue, veined with white, and ſpotted with ſmall gold-coloured ſpangles, in the form of ſtars, and was only a more beautiful kind of the lapis lazuli: but our ſapphire they have deſcribed under the name of beryllus aeroides, or the ſky-blue beryl.

The fineſt ſapphires in the world are brought from the kingdom of Pegu, in the Eaſt-indies, where ſome are found perfectly colourleſs, and others of all the ſhades of blue; theſe are all found in the pebble-form. We have very fine ſapphires alſo, partly pebble, partly cryſtal-ſhaped, from Biſnagar, Conanor, Calicut, and the iſland of Ceylon: theſe alſo are of all the ſhades of blue. And in Ceylon there are ſometimes found a ſort of baſtard gems, of a mixed nature between the ſapphire and ruby. The occidental are from Sileſia, Bohemia, and many other parts of Europe; but though theſe are often very beautiful ſtones, they are greatly inferior, both in luſtre and hardneſs, to the oriental.

The ſapphire is ſaid to have very great virtues as a cordial, ſudorific, and alexipharmic; but we have no good teſtimony of any body's having ever found this by experiment.

For the manner of making counterfeit ſapphires, ſee GEMS ARTIFICIAL.

SAPPHIRINE WATER, in the materia medica, alſo called blue eye-water, is thus prepared: pour a pint of lime-water, made ſtrong and freſh, into a copper-veſſel, add to it a dram of crude ſal armoniac, and throw in ſome filings or ſmall pieces of copper, and let it ſtand till it has acquired a beautiful colour.

This is uſed as an eye-water; as alſo to deterge old ulcers: and ſometimes it is mixed with other things in injections in gonorrhœas.

SAQUEM, a port-town, ſituated on the Red ſea, in the province of Abex, in Africa: eaſt long. 38° 30′, and north lat. 19°.

SAR, a river of Germany, which riſes in Alſace, and falls into the Moſelle, a little above Triers.

SARABAITES, a ſort of monks among the antient chriſtians, who did not reſort to the wilderneſs, as others did, but lived publicly in cities. Two or three of them uſually dwelt together, but they had no rule or government; they however obſerved very ſtrict faſts; wore looſe ſleeves, wide ſtockings, coarſe cloaths, frequently ſighed, and always bitterly inveighed againſt the clergy.

SARABAND, a muſical compoſition in triple time, the motions of which are ſlow and ſerious.

Saraband is alſo a dance to the ſame meaſure, which uſually terminates when the hand that beats riſes; by which it is diſtinguiſhed from a courant, which ends when the hand that beats the time falls; and is otherwiſe much the ſame as the minuet.

The ſaraband is ſaid to be originally derived from the Saracens, and is uſually danced to the ſound of the guitar or caſtanettes.

SARACENS, the inhabitants of Arabia; ſo called from the word *ſara*, which ſignifies a deſart, as the greateſt part of Arabia is: and this being the country of Mahomet, his diſciples were called Saracens.

SARAGOSSA, the capital of the province of Arragon in Spain: weſt lon. 1° 15′, and north lat. 41° 32′.

SARCASM, in rhetoric, a keen bitter expreſſion which has the true point of ſatyr, by which the orator ſcoffs and inſults his enemy;

enemy: ſuch was that of the Jews to our Saviour, He ſaved others, himſelf he cannot ſave.

SARCOCELE, in ſurgery, a ſpurious rupture, or hernia, wherein the teſticle is conſiderably tumified or indurated, like a ſcirrhus, or much enlarged by a fleſhy excreſcence, which is frequently attended with acute pains, and ſometimes ulceration, ſo as to degenerate at laſt into a cancerous diſpoſition. See HERNIA.

When the tumour of the teſticle is accompanied with hardneſs, the cauſes are much the ſame with thoſe of a ſcirrhus. When there is a fleſhy excreſcence, then the cauſe is uſually ſome contuſion or other external violence. The tumour differs as to its magnitude, being frequently no larger than a hen's egg, tho' ſometimes as big as a man's fiſt. The ſigns whereby the ſarcocele may be diſtinguiſhed from other ruptures are principally the hardneſs of the tumour, and its ſeat being in the teſticle; whereas the trne herniæ are diſtinct from the teſticle, and ſofter to the touch. If a ſarcocele be not timely brought to a ſuppuration, it very eaſily degenerates into a cancer; and if both teſticles are affected, caſtration is often neceſſary; but if the tumour proceeds through the inguen, up to the abdomen, even caſtration will be uſeleſs, and death is the conſequence.

A recent ſarcocele, according to Heiſter, may frequently be ſuppurated by digeſtive medicines, as well internal as external. When theſe medicines prove ineffectual, the ſize and pain of the tumour increaſe, and it ſeems inclined towards a cancerous diſpoſition, if it has not reached the ring of the abdominal muſcles, there is then but one way left of relieving the patient, and that is by a dextrous and timely extirpation of the diſordered teſticle, or both if they are affected, which is termed caſtration, and renders the patient impotent.

In this operation the ſpermatic veſſels are firſt to be tied ſecurely, with a ligature near the inguen, and afterwards divided, to give the patient leſs pain; and as a diviſion of theſe veſſels, which are ſo much enlarged, may be attended with a fatal hæmorrhage, it may be prudent, for the greater ſecurity, to paſs a double ligature round thoſe veſſels, one below the other; or elſe not to extirpate the teſticle ſo ſoon as it is freed from the ſcrotum, and its veſſels ſtrictly tied, but to wait a few days, till the teſticle begins to grow flaccid and mortifies, which is a ſign the ſpermatic veſſels are well ſecured, and may be divided without any danger; but if that does not follow, the ligature is not ſtrict enough, and another muſt be made, much tighter.

If a patient ſhould be troubled with a fleſhy excreſcence upon his teſticle, which is in other reſpects ſound, and finds no relief from medicines, the teſticle may be preſerved, and yet the patient freed from his diſorder, by opening the ſcrotum, and extirpating the offending part only.

With regard to the dreſſing, it is to be done with ſcraped lint and compreſſes, and ſecured by a proper bandage; and to abate the inflammation, which ſometimes ariſes, a diſcutient cataplaſm may be uſed, and the wound afterwards treated with ſome digeſtive ointment or vulnerary balſam. See WOUND.

SARCOCOLLA, in pharmacy, a gum-reſin, which approaches greatly to the nature of the ſimple gums. See the articles GUM and RESIN.

It is brought to us from Perſia and Arabia, in ſmall granules, moderately heavy, and of a whitiſh, browniſh, or reddiſh colour, very friable, of a faintiſh diſagreeable ſmell, and of an acrid and nauſeous taſte.

Hoffman abſolutely condemns the internal uſe of it. However it is recommended in ophthalmias, and defluxions of a ſharp matter upon the eyes; and is generally ordered to be diſſolved in milk for this purpoſe.

SARCOCOLLA is alſo a name given to the penæa. See the article PENÆA.

SARCOLOGY is that part of anatomy which treats of the ſoft parts, *viz.* the muſcles, inteſtines, arteries, veins, nerves, and fat. See MUSCLE, INTESTINES, *&c.*

SARCOMA, in ſurgery, denotes any fleſhy excreſcence. See EXCRESCENCE.

Sarcomata of the noſe, eyes, *&c.* may be ſometimes removed by cauſtics; but the extirpating them with the knife or ſciſſars is the ſafeſt and moſt eligible method. The wound ſhould be ſuffered to bleed a while, after which it may be waſhed with a collyrium made of aloes, tutty, and ſugar of lead, mixed in roſe-water.

SARCOPHAGOUS MEDICINES, in ſurgery, *&c.* are thoſe which eat away proud fleſh, and otherwiſe called cauſtics. See the article CAUSTICS.

SARCOTICS, in ſurgery, medicines which generate fleſh in wounds. See the articles WOUND and VULNERARIES.

SARCULATION,

SARCULATION, in the antient agriculture, a kind of hoeing, uſed to root up the weeds in their peas, *&c.*

SARDA, the PILCHARD, in ichthyology. See the article PILCHARD.

SARDA, the CARNELIAN, in natural hiſtory. See the article CARNELIAN.

SARDACHATES, a beautiful ſpecies of agat, of a cloudy and ſpotted fleſh colour. See the article AGAT.

SARDAM, a port-town of Holland, ſituated on the north ſide of the Wye, ſeven miles north-weſt of Amſterdam.

SARDINIA, an iſland of the Mediterranean, ſituated between 8° and 10° eaſt lon. and between 39° and 41° north lat. It is about one hundred and forty miles long, and ſixty broad; and gives the title of king to the duke of Savoy, under whoſe dominion it is.

SARDIS, the antient capital of Lydia, in Aſia, now in ruins.

SARDONYX, in natural hiſtory, a genus of ſemi-pellucid gems, of the onyx-ſtructure, zoned or tabulated, and compoſed of the matter of the onyx variegated with that of the red or yellow carnelian. See the articles CARNELIAN and ONYX.

Of this ſtone there are ſeveral beautiful ſpecies; as, 1. The thin zoned red ſardonyx; or whitiſh onyx with thin ſnow-white and red zones. 2. The broad zoned red ſardonyx; or horny onyx, with punctuated zones. 3. The horny onyx, with whitiſh and yellow zones; and is properly the yellow ſardonyx and the chryſolite onyx of the antients. 4. The orange-coloured ſardonyx; or bluiſh white onyx, with orange-coloured and whitiſh zones.

SARFE, in ichthyology, a ſpecies of cyprinus, with the iris of the eye and all the fins and tail red. See CYPRINUS.

This is a large ſpecies, and ſomewhat reſembles the roach, but it is narrower in proportion to its length, being, when full grown, ten inches long, and no more than three in breadth in the largeſt part.

SARGUS, in ichthyology, one of the ſpecies of ſparus, which have the teeth in the jaws broad. See the article SPARUS.

The ſargus is the yellow ſparus with a black annular mark at the tail.

SARK, a little iſland between Guernſey and Jerſey, ſubject to Great Britain.

SARPLAR *of wool*, the ſame with a pocket or half a ſack.

SARRACENA, in botany, a plant of the *polyandria-monogynia* claſs, with a rotaceous flower, conſiſting of five oval petals; the fruit is a roundiſh capſule, containing a great many roundiſh ſeeds.

SARRASIN, or SARRAZIN, in fortification, the ſame with herſe. See the article HERSE.

SARRITION, in the antient huſbandry, the ſame with what we call hoeing. See the article HOEING.

SARSAPARILLA, in pharmacy, the root of the rough ſmilax of Peru, conſiſting of a great number of long ſtrings hanging from one head: theſe long roots, the only parts made uſe of, are about the thickneſs of a gooſe-quill, or thicker, flexible, and compoſed of fibres running their whole length: they have a bitteriſh but not ungrateful taſte, and no ſmell: and as to their medicinal virtues, they are ſudorific and attenuant, and ſhould be given in decoction, or by way of diet-drink.

SARSINA, a town of Romania, in Italy, twenty-three miles ſouth of Ravenna.

SARTORIUS, in anatomy, is both an abductor and elevator, ſerving to move the legs upwards and forwards, determining them to croſs each other, as taylors ſit with them, whence the name; it riſes from the internal part of the anterior and ſuperior ſpine of the ileum; and deſcending obliquely, is inſerted into the upper and inner part of the tibia.

SARUM, or OLD SARUM, a borough-town of Wiltſhire, ſituated a little north of Saliſbury.

It ſends two members to parliament.

SASSAFRAS, in pharmacy, the wood of an american tree, of the laurel-kind, imported in large ſtraight blocks: it is ſaid to be warm, aperient, and corroborant; and frequently employed, with good ſucceſs, for purifying and ſweetening the blood and juices; for which purpoſe an infuſion, in the way of tea, is a very pleaſant drink: its oil is very fragrant, and poſſeſſes moſt of the virtues of the wood.

It is an excellent diuretic and diaphoretic, and therefore good in obſtructions of the viſcera, cachexies, ſcorbutic complaints, and in the venereal diſeaſe.

SASSARI, a town of Sardinia, ſixty-five miles north of Oriſtagni.

SAS VAN GHENT, a town of dutch Flanders, twelve miles north of Ghent.

SATELLITE, in aſtronomy, the ſame with a ſecondary planet, or moon; ſo called from its continually waiting upon or revolving round one of the primary planets. See the article PLANET.

Thus

Thus the moon may be called the ſatellite of the earth: but the term is chiefly applied to the new-diſcovered planets, which make their revolution about ſaturn and jupiter. See the articles MOON, JUPITER, and SATURN.

SATIR, SATIRE, or SATYR. See SATYR.

SATISFACTION, in law, is the giving a recompence for ſome injury done; or the payment of money due on bond, judgment, &c.

SATRAPA, or SATRAPES, in perſian antiquity, denotes an admiral; but more commonly the governor of a province.

SATTIN, a gloſſy kind of ſilk-ſtuff, the warp of which is very fine, and ſtands out ſo as to cover the coarſer woof.

Some ſattins are quite plain, others wrought; ſome flowered with gold or ſilver, and others ſtriped, &c.

The chineſe ſattins are moſt valued, becauſe of their cleaning and bleaching eaſily, without loſing any thing of their luſtre: in other reſpects they are inferior to thoſe of Europe.

SATTINET, a ſlight thin kind of ſattin, commonly ſtriped, and chiefly uſed by the ladies for ſummer night-gowns.

SATURANTS, in pharmacy, the ſame with abſorbents. See ABSORBENTS.

SATURATION, in chemiſtry, is the impregnating an acid with an alkali, or *vice verſa*, till either will receive no more, and the mixture become neutral.

SATURDAY, the ſeventh or laſt day of the week, ſo called from the idol Seater, worſhiped on this day by the antient Saxons, and thought to be the ſame as the Saturn of the Latins. Saturday anſwers to the jewiſh ſabbath. See SABBATH.

SATUREIA, SAVORY, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, with a monopetalous ringent flower, and no pericarpium; the ſeeds, which are four and roundiſh, being contained in the bottom of the cup.

The leaves of ſummer-ſavory are very pungent, warm, and aromatic; and afford, in diſtillation with water, a ſubtile eſſential oil. Both are eſteemed good in crudities of the ſtomach, aſthmas, and menſtrual obſtructions.

SATURN, ♄, in aſtronomy, the remoteſt of the ſuperior planets, which, by reaſon of its great diſtance from the ſun, ſhines but with a feeble light. See PLANET.

Though Galileo's teleſcope was ſufficient to diſcover all jupiter's moons, it could not reach ſaturn's, on account of their great diſtance; but yet this ſagacious obſerver found ſaturn, by reaſon of his ring, had a very odd appearance; for his glaſs was not good enough to exhibit the true ſhape of the ring, but only a confuſed idea of that and ſaturn together, which, in the year 1610, he advertiſed in the letters of this ſentence tranſpoſed: "Altiſſimum planetam tergeminum obſervavi;" *i. e.* I have obſerved ſaturn to have three bodies.

This odd phænomenon perplexed the aſtronomers very much, and various hypotheſes were formed to ſolve it; all which appeared trifling to the happy Huygenius, who applied himſelf purpoſely to improve the grinding of glaſſes, and perfecting long teleſcopes, to arrive at a more accurate notion of this planet and its appendage. Accordingly, in 1655, he conſtructed a teleſcope of twelve feet; and viewing ſaturn divers times, he diſcovered ſomething like a ring encompaſſing his body; which afterwards, with a tube of twenty-three feet, he obſerved more diſtinctly, and alſo diſcovered a ſatellite revolving about the planet. This huygenian ſatellite is the fourth in order from ſaturn. See plate CCXXXVI. fig. 5.

In the year 1659, Huygens publiſhed his diſcovery in relation to ſaturn's ring, in the letters of this ſentence tranſpoſed: "Annulo cingitur tenui plano, nuſquam cohærente, ad eclipticam inclinato;" *i. e.* ſaturn is encompaſſed by a thin plane ring, no where cohering to his body, and inclined to the plane of the ecliptic. This inclination of the ring to the ecliptic is determined to be about 31 degrees by Huygens, Romer, Pickard, Campani, &c. tho' by a method not very definitive. However, ſince the plane of the ring is inclined to the plane of the earth's motion, it is evident, when ſaturn is ſo ſituated that the plane of his ring paſſeth through the earth, we can then ſee nothing of it; nor can we ſee it when the plane paſſes between the ſun and the earth, the dark ſide being then turned to us, and only a dark liſt appearing upon the planet, which is probably the ſhadow of the ring. In other ſituations the ring will appear elliptical, more or leſs; when it is moſt ſo, the heavens appear through the ecliptic ſpace on each ſide ſaturn (which are called the anſæ), and a fixed ſtar was once obſerved by Dr. Clarke's father in one of them.

The nodes of the ring are in 19° 45′ of virgo and piſces. During ſaturn's heliocentric motion from 19° 45′ to the oppoſite

oppoſite node, the ſun enlightens the northern plane of the ring.

Since ſaturn deſcribes about one degree in a month, the ring will be viſible thro' a good teleſcope till within about fifteen or twenty days before and after the planet is in 19° 45′ of virgo or piſces. The time therefore may be found by an ephemeris, in which ſaturn, ſeen from the earth, ſhall be in thoſe points of the ecliptic; and likewiſe when he will be ſeen from the earth in 19° 45′ of gemini and ſagittarius, when the ring will be moſt open, and in the beſt poſition to be viewed.

There have been ſome grounds to conjecture that ſaturn's ring turns round an axis; but that is not yet demonſtrable. This wonderful ring, in ſome ſituations, does alſo appear double; for Caſſini, in 1675, obſerved it to be diſſected quite round by a dark elliptical line, dividing it, as it were, in two rings, of which the inner one appeared brighter than the other. This was oftentimes obſerved afterwards, with tubes of thirty-four and twenty feet, and more evidently in the twilight or moon-light, than in a darker ſky. This ring is the moſt remarkable thing in the whole planetary ſyſtem, there being nothing of that nature hitherto diſcovered in any of the other planets. Kepler, in his Epitom. Aſtron. Copernic. and after him Dr. Halley, in his enquiry into the cauſes of variation of the needle, Philoſ. Tranſact. n° 195, ſuppoſe our earth may be compoſed of ſeveral cruſts or ſhells, one within another, and concentric to each other. And if ſo, then it is poſſible the ring of ſaturn may be the fragment or remaining ruins of his formerly exterior ſhell, the reſt of which is broken or fallen down upon the body of the planet. And if ſaturn ever had ſuch a ſhell round it, its diameter would then have appeared as big to an eye at the ſun, as that of jupiter doth now, when ſeen from thence.

Since the outward margin of the ring is diſtant from ſaturn $2\frac{1}{4}$ of ſaturn's ſemidiameter, this cannot be ſeen at the diſtance of 64 degrees from ſaturn's equator, in whoſe plane the ring is placed. Therefore, a ſpectator, placed in a latitude higher than that, can never ſee the ring at all; ſo that there is a zone of almoſt 53 degrees broad towards either pole, to whom this famous ring can never appear. And as the ſpectator ſhall move nearer the pole, firſt one, then the ſecond ſatellite, next the third and fourth, and, when he is come within one degree of the pole, even the fifth ſatellite cannot be ſeen, unleſs by refraction; and, in the winter-time, neither ſun, moon, nor any planet will be there viſible, unleſs perhaps a comet.

If the eye be ſuppoſed to be placed in the equator of ſaturn, or in the zone nearly adjoining, it can never ſee thoſe ſtars that are in or very near the equator, nor any one of the ſatellites; becauſe the ring will always hide them; and then at the equinoxes it cannot ſee the ſun; and if it were any where elſe placed, it could not then ſee the ring; becauſe neither of its faces will then appear illuminated by the ſun. The breadth of this ring it is hard to determine from our earth, becauſe its thickneſs is ſo ſmall; but Mr. Huygens makes it to be about 600 german miles.

For one half of ſaturn's years (*viz.* fifteen of ours) only one face of the ring will be enlightened by the ſun; whence the inhabitants, which may be ſuppoſed to live in that hemiſphere, to which this face of the ring is turned, or to whom it is ſummer, will ſee that part of the ring which is above their horizon, ſhining faintly by day, as our moon doth when the ſun is above our horizon, but brighter and ſtronger by night, as our moon doth in the ſun's abſence: and, after ſun-ſet, the eaſtern part of this enlightened arch will fall within the ſhadow of ſaturn; which ſhade will aſcend, as night comes on, and at night will be at the higheſt; and then will deſcend again towards the weſtern part of the ring, according as the ſun comes more and more to the eaſtward.

This enlightened arch will always ſhew how to deſcribe a meridian line; for a plane perpendicular to the horizon, and paſſing through the vertex of the arch, will be in the true meridian.

To an eye placed any where without, and at leſs than fifty degrees diſtant from the equator, this enlightened arch of the ring will appear concave as well as convex, like a kind of furnace or vault, riſing above the horizon: but to an eye more than 52 minutes, and leſs than 64 degrees, diſtant from the equator, the hollow or concave part will not be viſible; but there will appear a brightiſh body ariſing, as it were, out of the ground, and contiguous to the horizon.

For the other half of ſaturn's year, while the ſun declines towards the depreſſed pole, or during the fifteen years winter, the

the ring will not be viſible, as having not that face illuminated which is turned to the ſpectator's eye; but, however, will render itſelf ſenſible, by covering from the ſight ſuch ſtars and parts of the heavens as are oppoſite to it, or apparently behind it. The ſhade of the ring alſo will be extended more and more towards the nearer pole; ſo that to an eye placed any where within the aforeſaid ſpace, the ſun, when he attains ſuch a certain declination, will appear to be covered or eclipſed juſt at noon, and then ſtraight to emerge out of the ſhadow. The next day, the like phænomenon will happen, but the eclipſe will begin ſooner, and will be over later: and theſe meridian eclipſes will daily increaſe in their duration until the middle of winter; and then they will decreaſe again gradually, till at laſt they will come to nothing again, *viz.* when the ſun, returning from the tropic, hath the ſame declination as he had when theſe meridional eclipſes began.

And this will happen, if an eye be placed in any latitude greater than 25 or 26 degrees; but if in a latitude leſs than this, when the meridional darkneſs is of the greateſt duration, the ſun will ſuddenly appear juſt in the meridian, and then ſtraightway will be eclipſed again. The next day there will appear the like ſort of light, but it will laſt longer; and this meridian light will grow ſtill longer and longer in duration, till mid-winter, and then, like the darkneſs above-mentioned, it will be continually decreaſing, until it quite diſappear.

And from hence it is plain, that there is the greateſt difference between ſummer and winter in the globe of ſaturn, of all the other planets; and this both on the account of the long duration of each, and the great declination of the ſun from the equator; and alſo by reaſon of theſe meridional darkneſſes of the winter, ariſing from the ring's eclipſing the ſun.

If an eye were placed in ſaturn, the diameter of the ſun would appear almoſt ten times leſs than it doth to us; and conſequently his diſc, light, and heat will be there ninety times leſs. Saturn's year is almoſt thirty of ours; but the length of his day is yet uncertain, becauſe the time of his revolution round his axis is not yet known; but Mr. Huygens judges they are longer than the days of jupiter. That great aſtronomer ſuppoſeth the axis of ſaturn to be perpendicular to the plane of his ring, and of the orbits of the ſatellites: if ſo, then there will be the ſame poſition of the equator and poles, as to the fixed ſtars, as there is in our earth; the ſame pole-ſtar and the fixed ſtars will appear to riſe and ſet after the ſame manner, in the ſame latitudes. There is a vaſt inequality, in the length of the day, in ſeveral parts of this planet; and as great a diverſity of ſummer and winter; which depends on the quantity of the inclination of the plane of the equator to the plane of the orbit of ſaturn round the ſun, which Huygens makes to be 51 degrees, which is almoſt one third more than our earth, where yet the differences and variety of ſeaſons and weather are very ſenſible. For in ſaturn, in the latitude of 50 degrees, the longeſt day will have no night at all, and the longeſt night will have no day. And the two frigid zones will be each of them 62 degrees broad, at leaſt ten times as large as the whole ſurface of our earth. The eye thus placed will be able to diſcern none of the planets but jupiter, which will appear always to accompany the ſun, and never to be from him above 37 degrees. The parallax of the ſun in ſaturn is but nine ſeconds, and therefore inſenſible; but the parallaxes of all his moons or ſatellites are very conſiderable, and therefore their diſtances from him will be eaſily computable.

For the other particulars relating to the aſtronomy of ſaturn, ſee the articles PLANET, COPERNICAN, DIAMETER, DISTANCE, INCLINATION, PERIOD, *&c.*

Satellites of SATURN, are five moons; the firſt or inmoſt of which revolves about ſaturn in 1 day, 21 hours, and 18 minutes, at the diſtance of near two ſemi-diameters of the ring; the ſecond, in 2 days, 17 hours, and 41 minutes, at the diſtance of $2\frac{2}{5}$ ſemi-diameters; the third, in 4 days, 12 hours, and 25 minutes, at the diſtance of $3\frac{3}{5}$ ſemi-diameters; the fourth, in 15 days, 22 hours, and 41 minutes, at the diſtance of 8 ſemi-diameters; and the fifth, in 70 days, 22 hours, and 4 minutes, at the diſtance of $23\frac{3}{10}$ ſemi-diameters of ſaturn's ring.

In the beginning of the year 1665, the celebrated Mr. Huygens, as already obſerved, diſcovered the biggeſt of ſaturn's ſatellites; the other four ſatellites of ſaturn were all the diſcovery of Mr.

Caſſini, the third and fifth in the years 1671, 1672, and 1673; but the firſt and ſecond were not diſcovered till the year 1684, by extraordinary teleſcopes of eighty, one hundred, one hundred and fifty, and two hundred feet in length.

SATURN, in chemiſtry, *&c.* an appellation given to lead. See LEAD.

SATURN, in heraldry, denotes the black colour, in blazoning the arms of ſovereign princes. See the articles SABLE, COLOUR, and BLAZONING.

SATURNALIA, in roman antiquity, a feſtival obſerved about the middle of December, in honour of the god Saturn, whom Lucan introduces, giving an account of the ceremonies obſerved on this occaſion thus: "During my whole reign, which laſts but for one week, no public buſineſs is done; there is nothing but drinking, ſinging, playing, creating imaginary kings, placing ſervants with their maſters at table, *&c.* There ſhall be no diſputes, reproaches, *&c.* but the rich and poor, maſters and ſlaves, ſhall be equal," *&c.*

On this feſtival the Romans ſacrificed bare-headed, contrary to their cuſtom at other ſacrifices.

SATURNINE, an appellation given to perſons of a melancholy diſpoſition, as being ſuppoſed under the influence of the planet ſaturn. See MELANCHOLY.

SATYR, in the heathen mythology, a fabulous kind of demi-god, or rural deity, of the antient Romans, repreſented with goat's feet, and ſharp pricked up ears.

Some think the notion of theſe ſatyrs might have been derived from the monkeys known at preſent under the ſame name. See the article MONKEY.

SATYR, or SATIRE, in matters of literature, a diſcourſe or poem, expoſing the vices and follies of mankind.

The ſatyr of the Greeks differed from that of the Romans, as being a kind of interlude annexed to tragedy, with a view to remove from the audience too melancholy impreſſions. But ſatyr, as we now have it, is entirely roman, if we may believe Quintilian, who ſays, "*Satira quidem tota noſtra eſt*;" or Horace, who ſtyles Ennius the inventor of a poem, unknown to the Grecians, meaning ſatyr, according to the opinion of all his interpreters. Scaliger however expreſly denies it to be of roman original; and there is reaſon, indeed, as we ſhall ſee hereafter, to underſtand theſe expreſſions of Quintilian and Horace with ſome abatement. Thoſe that will not allow it to be derived from the Grecians, but entirely roman, maintain that ſatyr ſhould be writ with an *i*, not a *y*; and that it is not derived from *ſatyrus*, but *ſatur*; *ſatira* therefore is the ſame as *ſatura*, as *maximus* antiently *maxumus*.

When the Romans grew more polite, theſe kind of verſes refined in proportion, but they retained ſtill their jibes and banters, and kept ſo far to their firſt inſtitution, as to make the follies of human life the object of their ridicule. From hence proceeded ſatyr, ſo called from the farrago and variety of matter it contained. It was improved likewiſe with muſic and dancing, which, conſidering its being carried on in dialogue, made it reſemble ſomewhat of the dramatic kind; nor had the Romans any thing that came ſo near the drama as this did. Afterwards, when they had received both tragedy and comedy from the Grecians, they were ſo taken with the novelty, that ſatyr for ſome time lay neglected: but coming again into eſteem, it was added as a kind of exodium to comedy. Thus things went on for ſome years till Ennius aroſe, endued with wit and true poetic fire, who obſerving how fond the people were of ſeeing the vices of mankind expoſed upon the ſtage, thought a poem on the ſaid ſubject, without the decoration of ſcenes and action, might have the ſame effect. Accordingly he attempted ſatyrs in the ſame form we now ſee them, only he did not confine himſelf to the hexameter, but made uſe of all ſorts of meaſure. The remains we have of this poet are noble indications of the ſtrength of his genius; and Horace and Virgil have ſhewn what opinion they had of his writings, by borrowing ſo much from them. After Ennius ſucceeded Pacuvius; but his works are all loſt, excepting ſome fragments, and thoſe of uncertain authority. Next came Lucilius, of whom alſo we have ſome fragments remaining: but his excellencies and imperfections are very amply ſet forth by Horace, whoſe words we have no occaſion to cite here.

It muſt be allowed however, that one ſpecies of ſatyr owes its perfection to Horace, as another does to Juvenal. A third kind was the varronian or menippean ſatyr, ſo called from Menippus, a cynic philoſopher among the Grecians, whoſe doctrine Varro followed. It was a ſort of medley, conſiſting of not only all kinds of verſe, but of verſe and proſe

mixed

mixed together; a ſpecimen of which we have in Petronius's Satyricon. We have none of Varro's poetical works remaining, except ſome ſmall fragments; which is the more to be lamented, conſidering the character Quintilian gives of him, that he was the moſt learned of all the Romans.

The word ſatyr was antiently taken in a leſs reſtrained ſenſe than it is at preſent, not only as denoting a ſevere poem againſt vice, but as conſiſting of precepts of virtue, and the praiſes of it: and even in the ſatyrs, as they are called, of Horace, Juvenal, and Perſius, *&c.* which are principally levelled againſt the weakneſs, the follies, or vices of mankind, we find many directions, as well as incitements, to virtue. Such ſtrokes of morality Horace is full of; and in Juvenal they occur very frequently. All of them, ſometimes, correct vice like moraliſts; we may ſay, like divines rather than ſatyriſts.

With reſpect to the nature and different ſpecies of it, ſatyr, in general, being a poem deſigned to reprove the follies and vices of mankind, is twofold; either the jocoſe, as that of Horace; or the ſerious, like that of Juvenal: the former hidden, the latter open: that generally makes ſport with vice, and expoſes it to ridicule; this probes it to the bottom, and puts it to the torture: and ſo far is it from not deſerving the title of ſatyr, as ſome pretend, that it ſeems rather a more noble ſpecies of it; and the genteel ſtrokes of Horace, how ingenious ſoever, are leſs affecting than the poetic rage and commendable zeal of Juvenal.

They both agree in being pungent and cutting, yet are diſtinguiſhed by very evident marks. The one is pleaſant and facetious, the other angry and auſtere: the one ſmiles; the other ſtorms: the foibles of mankind are the object of one; greater crimes of the other: the former is always in the pleaſing ſtyle; the latter generally in the ſublime: that abounds with wit only; this adds to the ſalt bitterneſs and acrimony. Either kind of ſatyr may be writ in the dialogue or epiſtolary manner; and we have inſtances of both forms in Horace, Juvenal, and Perſius. As ſome of Horace's, which are called Satyrs, are as truly epiſtles; ſo many of his epiſtles might as well be called ſatyrs: for example, *Qui fit Mecænas, &c.* might, with equal reaſon, be reckoned among the epiſtles; and *Prima dicta mihi, &c.* among the diſcourſes or ſatyrs; if the author or editor had ſo thought fit.

The chief ſatyriſts among the antients are Horace, Juvenal, and Perſius; thoſe among the moderns, Regnier, and Boileau, in French; and Dryden, Oldham, Rocheſter, Buckingham, Pope, Young, *&c.* among the Engliſh.

SATYRIUM, GOAT'S-STONES, a genus of the *gynandria-diandria* claſs of plants, the flower of which conſiſts of five ovato-oblong petals; and its fruit is an oblong, unilocular capſule, containing a great many ſcobiform and very ſmall ſeeds.

The root of this plant is compoſed of two oval bulbs, of a whitiſh colour, a ſweetiſh taſte, and a faint unpleaſant ſmell: it abounds with a glutinous ſlimy juice; and, like other mucilaginous vegetables, it ſerves to thicken the thin ſerous humours, and defend the ſolids from their acrimony: it has alſo been celebrated, though on no very good foundation, for analeptic and aphrodiſiac virtues; in which intentions it has alſo been frequently uſed.

SAVANNA, a town and river of Georgia, in north-America: weſt long. 81° 20′, north lat. 32°

SAVANT, or SCAVANT. See the article SCAVANT.

SAUCISSE, or SAUSAGE, in the military art, a long train of powder, ſewed up in a roll of pitched cloth, about two inches in diameter, ſerving to ſet fire to mines. See the article MINE.

There are uſually two ſauciſſes extended from the chamber of the mine to the place where the engineer ſtands; that in caſe one ſhould fail, the other may take effect.

SAUCISSON, in fortification, a maſs of large branches of trees bound together; and differing only from a faſcine, as this is compoſed of ſmall branches of twigs. See the article FASCINE.

Sauciſſons are employed to cover the men, and to make epaulements.

SAVE, a large river of Germany, which riſing in Carinthia, runs eaſt through Carniola and Croatia, and dividing Sclavonia from Turky, diſcharges itſelf into the Danube at Belgrade.

SAVIGLIANO, a town of Piedmont, twenty-one miles ſouth of Turin.

SAVIN, *ſabina*, in botany, is only a ſpecies of juniper. See JUNIPER.

Savin is famous as an hyſteric and attenuant: and, indeed, it promotes the diſcharges by urine, and the menſes, more forcibly than ſafely, if not under very careful management.

SAVIOUR, an appellation peculiarly given to Jeſus Chriſt, as being the true Meſſiah, and Saviour of the world. See MESSIAH.

Order of St. SAVIOUR, a religious order in the romiſh church, founded by St. Bridget, about the 1345; and ſo called from its being pretended that our Saviour himſelf dictated to the foundreſs its conſtitutions and rules.

According to the conſtitutions, this order is principally founded for religious women who pay a particular honour to the holy virgin: but there are ſome monks of the order, to adminiſter the ſacraments, and ſpiritual aſſiſtance to the nuns. The number of nuns is fixed at ſixty in each monaſtery; and that of the religious prieſts at thirteen, according to the number of the apoſtles, of whom St. Paul was the thirteenth. There are alſo four deacons, repreſenting the four doctors of the church, St. Ambroſe, St. Auguſtin, St. Gregory, and St. Jerom; and eight lay-brothers; who altogether make up the number of the thirteen apoſtles, and the ſeventy-two diſciples of Jeſus Chriſt. The nuns are not admitted till eighteen years of age, nor the friars before twenty-five; and they are to perform a year's novitiate.

SAUMUR, a city of France, in the province of Orleanois, and dutchy of Anjou; twenty-four miles eaſt of Anjou.

SAUNDERS, the ſame with ſantalum. See the article SANTALUM.

SAVOLAXIA, a ſubdiviſion of Finland, in Ruſſia, ſituated between Cajania, Kexholm, Carelia, and Bothnia.

SAVONA, a city and port-town of the territory of Genoa, ſituated twenty-ſix miles ſouth-weſt of the city of Genoa.

SAVORY, *ſatureia*, in botany, *&c.* See SATUREIA.

SAVOUR, or TASTE. See TASTE.

SAVOY, a dutchy, ſituated between France and Italy, on the weſt ſide of the Alps; bounded by the lake and territory of Geneva, on the north; by Switzerland and Piedmont, on the eaſt; by another part of Piedmont and Dauphine, on the South; and by Franche Compte and Dauphine, on the weſt.

SAURURUS, in botany, a plant of the *hexandria trigynia* claſs, without any flower petals: its fruit is an oval unilocular berry, containing only a ſingle oval ſeed.

SAUSAGE, or SAUCIDGE, a popular food, prepared of ſome crude meat, uſually either pork or veal chopped ſmall, ſeaſoned, and put up in a ſkin or gut in the manner of a black-pudding.

The moſt eſteemed confection of this kind is the bologna ſauſage, which is much thicker than the common ſort, and is made of freſh pork well beaten in a mortar, with a quantity of garlic, pepper in the grain, and other ſpices. Theſe ſauſages are made with moſt ſucceſs in ſome cities of Italy, particularly in Bologna, Venice, *&c.* whence great quantities are exported to other places: the Italians are furniſhed with great part of their ſkins or guts for theſe ſauſages from England.

Bologna ſauſages, on being imported into England, pay a duty of $2\frac{87\frac{1}{4}}{100}$d. the pound; and draw back, on exportation, $2\frac{58\frac{3}{4}}{100}$d.

SAUSAGE, in war, the ſame with ſauciſſe. See the article SAUCISSE.

SAUT, in the manege. See SALTS.

SAUVAGEA, in botany, a genus of the *polyandria-monogynia* claſs of plants, the corolla whereof conſiſts of five obtuſe equal petals, ſhorter than the leaves of the cup: the fruit is an oval acuminated capſule, covered by the cup containing one cell, and in it a number of ſeeds.

SAW, an inſtrument which ſerves to cut into pieces ſeveral ſolid matters; as wood, ſtone, ivory, *&c.*

The beſt ſaws are of tempered ſteel ground bright and ſmooth: thoſe of iron are only hammer-hardened: hence, the firſt, beſides their being ſtiffer, are likewiſe found ſmoother than the laſt. They are known to be well hammered by the ſtiff bending of the blade; and to be well and evenly ground, by their bending equally in a bow.

The edge in which are the teeth is always thicker than the back, becauſe the back is to follow the edge. The teeth are cut and ſharpened with a triangular file, the blade of the ſaw being firſt fixed in a whetting-block. After they have been filed the teeth are ſet, that is,

turned

# of a SAWING-MILL.

Fig. 1.

A Section & Plan

Fig. 2.

T. Jefferys sculp.

turned out of the right line, that they may make the kerf or fiſſure the wider, that the back may follow the better. The teeth are always ſet ranker for coarſe cheap ſtuff than for hard and fine, becauſe the ranker the teeth are ſet the more ſtuff is loſt in the kerf. The ſaws by which marble and other ſtones are cut have no teeth: theſe are generally very large, and are ſtretched out and held even by a frame.

The workmen who make the greateſt uſe of the ſaw, are the ſawyers, carpenters, joiners, cabinet-makers, eboniſts, ſtone-cutters, carvers, ſculptors, *&c.* The lapidaries too have their ſaw, as well as the workers in moſaic; but theſe bear little reſemblance to the common-ſaw. But of all mechanics, none have ſo many ſaws as the joiners; the chief are as follows: the pit-ſaw, which is a large two handed ſaw, uſed to ſaw timber in pits; this is chiefly uſed by the ſawyers. The whip-ſaw, which is alſo two handed, uſed in ſawing ſuch large pieces of ſtuff as the hand-ſaw will not eaſily reach. The hand-ſaw, which is made for a ſingle man's uſe, of which there are various kinds; as the bow or frame-ſaw, which is furniſhed with cheeks: by the twiſted cords which paſs from the upper parts of theſe cheeks, and the tongue in the middle of them, the upper ends are drawn cloſer together, and the lower ſet further apart. The tenon-ſaw, which being very thin, has a back to keep it from bending. The compaſs-ſaw, which is very ſmall, and its teeth uſually not ſet: its uſe is to cut a round, or any other compaſs-kerf: hence the edge is made broad and the back thin, that it may have a compaſs to turn in. See moſt of theſe ſaws repreſented in the plate of JOINERY.

The ſurgeons alſo uſe a ſaw to cut off bones; this ſhould be very ſmall and light, in order to be managed with the greater eaſe and freedom, the blade exceeding fine, and the teeth exquiſitely ſharpened, to make its way more gently, and yet with great expedition, in cutting off legs, arms, *&c.* See plate CCXXXVI. fig. 7.

Saws, on being imported, pay the following duties, *viz.* whip-ſaws, each $11\frac{5}{100}$d. draw back, on exportation, $10\frac{12\frac{1}{2}}{100}$d. Hand-ſaws, the dozen, 1s. $3\frac{40}{100}$d. draw back, on exportation, 1s. $2\frac{1}{2}$d. Tenon-ſaws, the dozen, 2s. $6\frac{80}{100}$d. draw back, on exportation, 2s. 3d. beſides the uſual duties on iron.

SAW-FISH, *ſerea piſcis*, or *priſtis*, in ichthyology, a ſpecies of ſqualus, with the roſtrum very long, flat, and dentated on both ſides. It is one of the moſt ſingular animals of the fiſh-kind, and grows to a conſiderable ſize, being often more than twelve feet in length, including the roſtrum, and very thick in proportion: the head is large, and terminates in a bony roſtrum, three or four feet, or more, in length, and furniſhed all along, on both ſides, with very long, robuſt, and ſharp teeth, or denticulations. See plate CCXXXVI. fig. 8.

SAWING, dividing timber, *&c.* by the application of a ſaw, either by the hand or mill.

The mechaniſm of a ſawing-mill may be reduced to three principal things, the firſt, that the ſaw be drawn up and down as long as is neceſſary, by a motion communicated by water to the wheel: the ſecond, that the piece of timber to be cut into boards be advanced by an uniform motion to receive the ſtrokes of the ſaw; for here the wood is to meet the ſaw, and not the ſaw to follow the wood, therefore the motion of the wood and that of the ſaw ought immediately to depend the one on the other: the third, that when the ſaw has cut through the whole length of the piece, the whole machine ſtops of itſelf and remains immoveable; for fear, leſt having no obſtacle to ſurmount, the force of the water ſhould turn the wheel with too great rapidity, and break ſome part of the machine. In plate CCXXXVII. and CCXXXVIII. we have given ſeveral views of this mill: plate CCXXXVII. fig. 1. repreſents a ſection of it taken lengthwiſe from A to B. Fig. 2. *ibid.* is a plan of the mill on a level with the ground: AB being the floor, and *ff*, *gg*, two grooves for receiving the ſhafts of the chariot, which carries the piece to be ſawed; by which means the piece not only advances with the chariot, but is alſo kept ſteady, ſo that the ſtrokes of the ſaw work always on the ſame line.

Fig. 1. plate CCXXXVIII. repreſents the breadth of the mill: and fig. 2. *ibid.* the plan of the cave of the mill. In each of theſe figures the ſame letters expreſs the ſame parts, only repreſented in a different view: thus MN, in fig. 1. and 2. *ibid.* repreſent the great wheel turned by a fall of the water, which has five feet and a quarter

quarter of radius, and its arbor is ſixteen inches. O, in each of the figures, is the cog-wheel turning on the ſame arbor with the great wheel, and inſerting its teeth into the ſpindles of the trundle-head P; and, on the other, into thoſe of the trundle-head R: in the trundle-head P there is a broad handle faſtened to the iron-blade Y, (plate CCXXXVII. fig. 1. which, as the trundle-head moves round, goes up and down, and gives the ſame motion to the ſaw T: this handle is ſeen in its true form at Q, (plate CCXXXVIII. fig. 1. and 2.). The other trundle-head, R, which turns with its axle-tree, or roller, S, (*ibid.* fig. 2.) winds up a rope, which brings towards the ſaw, the chariot *r*, (plate CCXXXVII. fig. 1.) on which the piece of wood to be ſawed is placed. When the wood is arrived cloſe to the ſaw the rope is no longer of uſe; there being then another moderator which regulates the motion of the piece in proportion as it is ſawed. Z, (pl. CCXXXVIII. fig. 1. is a cramp-wheel, containing three hundred and eighty-four hooked teeth, the axis of which wheel drives two ſmall trundle-heads, which are inſerted into teeth which line the undermoſt part of the ſhafts of the chariot; by which means, if the cramp-wheel advances, the chariot muſt alſo advance, and the piece of timber with it.

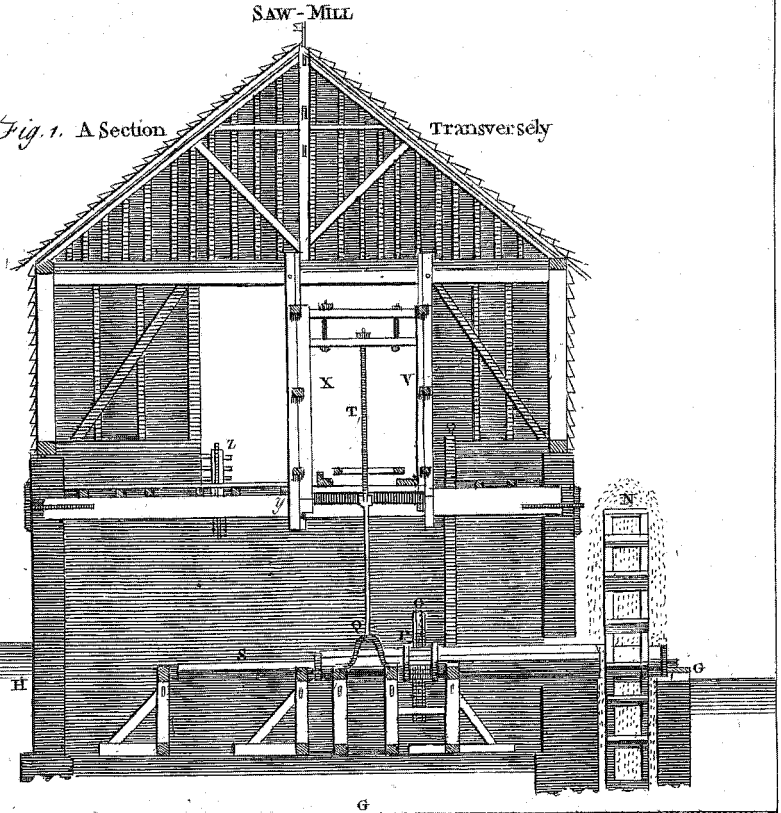
Upon the upper part of the entortiſe of the ſaw, (pl. CCXXXVII. fig. 1.) there is an iron-rod, *b*, faſtened to it, on the one end with a hinge, and on the ſide to a moving lever, *d*, which goes up and down with it; this lever is faſtened by a hinge at *a*: from the end of this lever there deſcends a wooden ſhaft, which carries at its extremity an iron in the form of a hind's foot, which enters the teeth of the cramp-wheel. In order to underſtand the uſe of all theſe parts, let it be obſerved, that after the rope, by being wound on the axis of the trundle-head R, has brought the chariot and piece of wood as far as the ſaw, the trundle-head P is let looſe to the cog-wheel, which makes the handle Q, and conſequently the ſaw, go up; which aſcending lifts up the lever *d*, which drawing the hinge at *a* the handle protracts itſelf, and drives farther a notch of the cramp-wheel Z: this cramp-wheel, in turning with its axis, drives round the trundle-heads, which inſerting their ſpindle into the teeth at the bottom of the chariot, carry off ſome of them, and make the piece of timber come a little forwards. This is all performed while the ſaw aſcends: and as it is larger at the top than at the bottom, it leaves at that inſtant an empty ſpace between itſelf and the piece of wood it has bit. The wood advances without any obſtacle, and receives a new ſtroke in the fall of the ſaw, which works only in going down; the wheel Z is at that time without any motion, and therefore communicates none to the chariot. It is during that reſt of the piece of wood that the ſtroke of the ſaw is given; and as the ſaw is broader at the top than at the bottom, it leans on the length of the wood, which is an ingenious imitation of the ſawyers, who bring the ſaw down obliquely, becauſe the fibres of wood are not eaſily cut when the ſtroke is tranſverſal: and as the arms of the ſaw move backwards and forwards occaſionally, to give the ſaw a proper inclination on the fibres of the wood; thus the upper iron rod, and the iron at the bottom of the ſaw obey the motion of the lever and handle, ſo as to form with the ſaw the inflexions neceſſary. This motion is continued, and the timber is ſtill brought under the ſaw, till a band of iron faſtened to the extremity of the piece of wood, meets with a trigger which draws out a pin applied to the ſluice to keep it up: when the ſluice falls the water ſtops, and the whole machine is without motion.

Sawing-mills are much uſed abroad, and were lately begun to be introduced in England; but the parliament taking it into conſideration that they would ſpoil the ſawyer's trade, and ruin great numbers of families, thought fit to ſuppreſs them.

Stones, *&c.* are alſo ſawed by an engine, the principal parts of which are repreſented in plate CCXXXIX. fig. 1. n° 1. where ILLI, is a ſquare frame perpendicular to the horizon, moving in the direction LL, in gutters made in the fixed beams AM, CB, and running upon little wheels. IL are two rods of iron, and *op* two hands of iron running along thoſe rods; to theſe are fixed the ſaws S, S. HIK is a triangle fixed to the axis of a great wheel. As the wheel and triangle go about from H towards I, the point I acting againſt the piece G, moves the frame towards MB, together with the ſaws S, S. When I is gone off, the angle K acts againſt the piece F, and moves the frame back again. Then H, and

SAW-MILL

Fig. 1. A Section Transversely



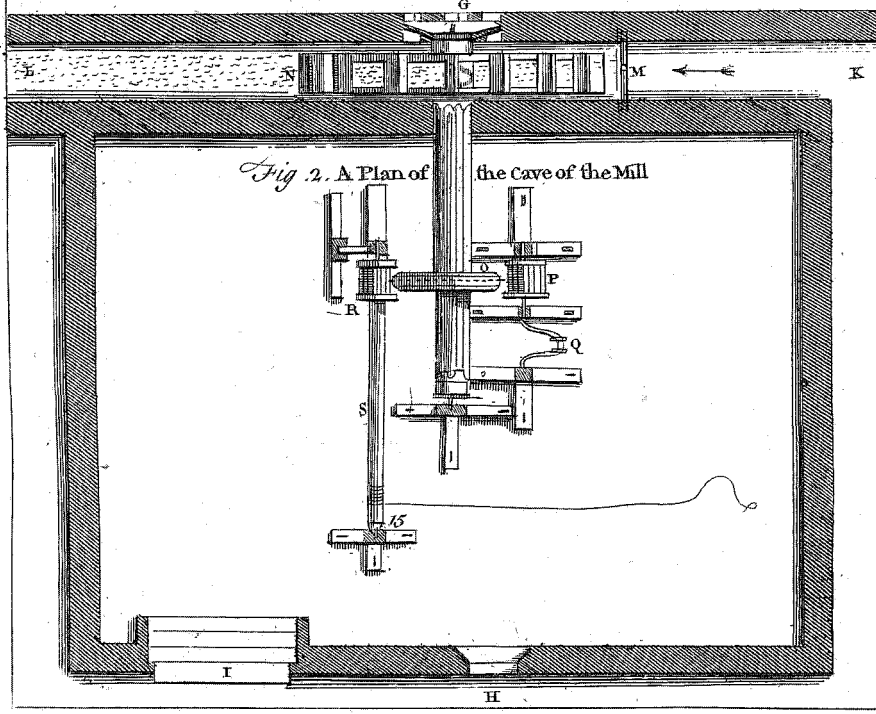


Fig. 2. A Plan of the Cave of the Mill

T. Jefferys sculp.

acting againſt G, moves it forward; and ſo the ſaws are moved backward and forwards, as long as the wheel turns round. As theſe ſaws work by the motion of the engine the hands *op* deſcend. The parts F and G ought to be made curved; and little wheels may be applied at the points of the triangle to take away the friction againſt F and G: and if the power be ſtrong enough, the axle of the wheel may be made to carry more triangles, and work more ſaws. Inſtead of the triangle H I K, the frame may be moved by the two pieces *ab*, *cd*, (*ib.* n° 2.) going through the axis acroſs one another, ſo that *ab* may only act on F, and *cd* on G; F being only in the plane of *ab*'s motion, and G in that of *cd*.

SAXENHAGEN, a town of Weſtphalia, in Germany, twenty miles north-weſt of Hanover.

SAXIFRAGE, *ſaxifraga*, in botany, a genus of the *decandria-digynia* claſs of plants, with a roſaceous flower, conſiſting of five plane ovated petals: the fruit is an unilocular capſule, of an oval form, containing a great many ſeeds. See plate CCXXXVI. fig. 6.

The tuberoſities at the root of the white-flowered ſaxifrage are kept in the ſhops, under the name of ſaxifrage-ſeeds: they are diuretic and attenuant; and therefore good in nephritic caſes and obſtructions of the menſes and viſcera: ſome alſo recommend them in the jaundice and dropſy.

As to the ſaxifrage of the antients, it is not known what plant they meant by it; ſo that no benefit can be reaped from their accounts of its virtues.

It is alſo to be obſerved, that though many different plants have been called ſaxifrage, from their ſuppoſed power of diſſolving the ſtone in the human bladder, yet it is very certain that none of them poſſeſs ſuch a virtue: thus the chryſoſplenium has been called golden-ſaxifrage; filipendula, red-ſaxifrage; and the common melilot, yellow-ſaxifrage. See the articles CHRYSOSPLENIUM FILIPENDULA, *&c.*

SAXMUNDHAM, a market-town of Suffolk, thirty-two miles eaſt of Bury.

SAXON, or SAXON-LANGUAGE. See LANGUAGE and ENGLISH.

SAXONY, the name of two circles of the german empire, diſtinguiſhed by the epithets upper and lower. The circle of upper-Saxony comprehends the dutchy of Saxony, the marquiſates of Miſnia, Luſatia, and Brandenburg, and the dutchies of Pomerania, Sax-Hall, Sax-Altemburg, Sax-Merſburg, and Sax Naumburg. The circle of lower-Saxony comprehends the dutchies of Mecklenburg, Holſtein, Lawenburg, Lunenburg, Zell, Bremen, Brunſwic, Hanover, and Magdeburg; the principalities of Verden and Halberſtat, and the biſhopric of Hildeſheim.

SAY or SAYE, in commerce, a kind of ſerge, or woollen-ſtuff, much uſed abroad for linings, and by the religious for ſhirts: with us it is uſed for aprons by ſeveral ſorts of artificers, being uſually dyed green.

Double ſays, or ſerge, pay, on importation, a duty of 5 s. $3\frac{72}{100}$ d. the yard, and draw back, on exportation, 2 s. $\frac{30}{100}$ d. Double Flanders ſays pay, by the piece of fifteen yards, on importation, 1 l. 14 s. $7\frac{80}{100}$ d. and draw back, on exportation, 1 l. 10 s. $4\frac{50}{100}$ d. Hounſcot ſays, and milled ſays, pay, by the piece of twenty-four yards, on importation, 1 l. 3 s. $1\frac{20}{100}$ d. and draw back, on exportation, 1 l. 3 d.

SAYBROOK, a port-town of New-england, in the province of Connecticut, ſituated at the mouth of the river of Connecticut: in weſt long. 72°, north lat. 41°.

SAYCOCK, or BONGO. See the article BONGO.

SCAB, or ITCH, in medicine and ſurgery. See the article ITCH.

SCABBARD, in the manege, denotes the ſkin that ſerves as a ſheath, or cover, to a horſe's yard.

SCABELLUM, in antient architecture, a kind of pedeſtal to ſupport buſts. See the article PEDESTAL.

SCABIOUS, *ſcabioſa*, in botany, a plant of the *tetrandria-monogynia* claſs, with a floſculous flower, each floſcule being monopetalous and tubular, and ſlightly divided into four or five ſegments at the limb; there is no pericarpium; the ſeeds, which are ſingle after each floſcule, being crowned with their proper cups, and contained in the common receptacle.

The leaves of ſcabious ſtand recommended as aperient, ſudorific, and expectorant; but the preſent practice has little dependance on theſe virtues.

SCAFFOLD,

SCAFFOLD, among builders, an aſſemblage of planks and boards, ſuſtained by treſſels and pieces of wood fixed in the wall; whereon maſons, bricklayers, &c. ſtand to work in building high walls, &c. and plaſterers, in plaſtering ceilings, &c.

Scaffold alſo denotes a timber-work raiſed in the manner of an amphitheatre, for the more commodious viewing any ſhew or ceremony: it is alſo uſed for a little ſtage, raiſed in ſome public place, whereon to behead criminals.

SCAGEN, or SCAGERIFF, a promontory of north-Jutland, at the entrance of the Scagerrack-ſea, or paſſage out of the ocean into the Baltic-ſea: eaſt long. 10°, north lat. 58°.

SCALA, in anatomy, a name given to two canals in the cochlea of the ear. See the article EAR.

SCALA, in architecture, the ſame with ſtair-caſe. See the article STAIR.

SCALA, in geography, a town of the kingdom of Naples, ſituated on the gulph of Salerno, twenty miles ſouth of the city of Naples.

SCALÆ GEMONIÆ. See GEMONIÆ.

SCALADO, or SCALADE, in the art of war, a furious aſſault made on the wall or rampart of a city, or other fortified place, by means of ladders, without carrying on works in form to ſecure the men.

SCALE, a mathematical inſtrument, conſiſting of ſeveral lines drawn on wood, braſs, ſilver, &c. and variouſly divided, according to the purpoſes it is intended to ſerve; whence it acquires various denominations, as the plain ſcale, diagonal-ſcale, plotting ſcale, Gunter's-ſcale, &c.

Conſtruction and uſe of the plain SCALE. The plain-ſcale is an inſtrument much uſed in navigation, &c. for ſolving the ſeveral caſes of ſailing. See the article NAVIGATION.

Having deſcribed the circle DBCA, (plate CCXXXIX. fig. 2. n° 1.) and divided it into four quadrants, by the diameters A B and C D croſſing each other at right angles: 1. To project the line of tangents, from the end C of the diameter C D, erect the perpendicular C G; then dividing the arch C B into nine equal parts, from the center E, through the ſeveral diviſions of the quadrant C B, draw lines till they cut the perpendicular C G, which will thereby become a line of tangents.

2. For the ſemi tangents, or half tangents, let lines be drawn from the point D, through the ſame diviſions upon the arch C B; and they will divide the radius B E into a line of ſemi-tangents, as is evident from Euclid. lib. 3. prop. 20.

3. For the ſecants, tranſfer the lines drawn from the center through the ſeveral diviſions of the quadrant C B to form the line of tangents, to the line E B continued to F, and the line E F will be a line of ſecants.

4. For the ſines, from the ſeveral diviſions of the quadrant C B, let fall perpendiculars upon the radius C E; which will will thereby be divided into a line of ſines, to be numbered from E to C for the right ſines, and from C to E for the verſed ſines: and theſe verſed ſines may be continued to 180°, if the ſame diviſions be tranſferred on the other ſide of the center E.

5. For the chords: the arch C B being divided into nine equal parts, in the points 10, 20, 30, &c. if lines be imagined to be drawn from C to theſe diviſions, they will be the chords of their reſpective arches: wherefore ſetting one foot of your compaſſes in the point C, and tranſferring the ſeveral lengths, C 10, C 20, C 30, &c. to the line C B, it will thereby be divided into a line of chords. Theſe ſeveral lines, which in the figure are drawn but to every tenth degree, might in the very ſame manner be conſtructed to every degree, if the circle were made large enough to admit of ninety diſtinct diviſions in the arch of one of its quadrants.

6. A line of rhumbs is thus conſtructed: divide the arch D B into eight equal parts, in the points 1, 2, 3, 4, &c. then ſetting one foot of the compaſſes in D, tranſfer the ſeveral diſtances D 1, D 2, D 3, from the arch to the line D B; which by this means will be divided into a line of rhumbs, each of which will anſwer to an angle of 11° 15'.

7. To conſtruct a line of longitude, divide the radius E A into ſixty equal parts, marking every ten with their proper numbers; from theſe diviſions let fall perpendiculars upon the arch A D, and having drawn the line A D, with one foot of the compaſſes in A, tranſfer the ſeveral diſtances, where the perpendiculars cut the arch to the line A D, which will thereby be divided into a line of longitude.

8. To project the line of latitude, the radius C E being already divided into a line of ſines, lay a ruler from the point B through

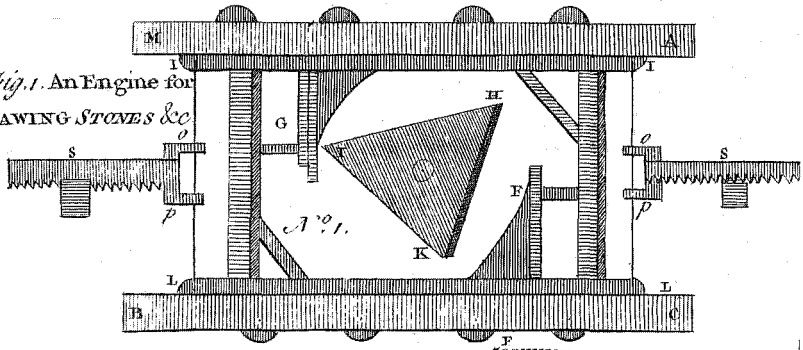

Fig. 1. An Engine for SAWING STONES &c

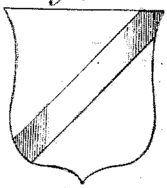

Fig. 4. Scorpion-Engine, & Insect.

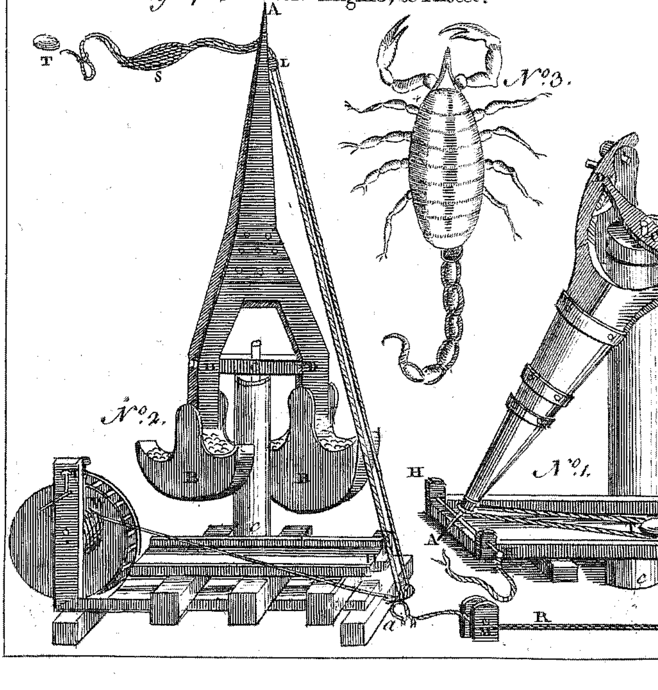

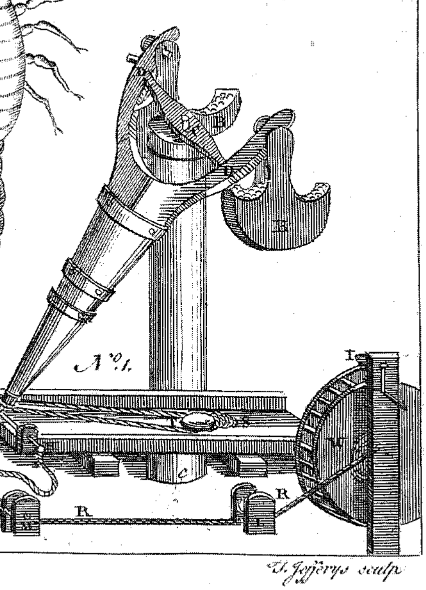

T. Jefferys sculp

B through each of the ſaid diviſions, and mark the points cut on the oppoſite arch AC with the numbers 10, 20, 30, &c. then having drawn the line AC, with one foot of your compaſſes in A, tranſfer the ſeveral interſections of the arch to the ſaid line, which will thereby become a line of latitude.

9. To project the hour-line, draw the tangent IK equal and parallel to the diameter CD, and divide half the arch of each quadrant AC, and AD, from the point A, into three equal parts, which will be 15° each part, for the degrees of every hour from twelve to ſix; each of which parts are to be again ſubdivided into halves and quarters, &c. then drawing lines from the center E, through each of their diviſions and ſubdiviſions, till they cut the tangent IK, the ſaid tangent will thereby be divided into a line of hours.

10. To the above lines may be added a line of inclination of meridians, which is projected in the ſame manner as the hour-line; being only divided into degrees, inſtead of time, every fifteen degrees being equal to an hour.

Now if theſe lines, with their reſpective diviſions, be transferred to a ſcale, and there alſo be added a line of equal parts, the inſtrument called the plain-ſcale will be compleated, as in *ib.* n°2. and as to the uſes of theſe lines, thoſe of tangents, ſemi-tangents, and ſecants, ſerve to find the centers and poles of projected circles, in the ſtereographic projection of the ſphere, &c. the line of ſines ſerves for the orthographic projection of the ſphere; the line of chords ſerves either to lay down any angle, or meaſure the quantity of one already laid down: the line of rhumbs ſerves with more readineſs than the line of chords, to lay down or meaſure the angle of a ſhip's courſe in navigation: the line of longitude being laid down on the ſcale contiguous to a line of chords of the ſame radius, and numbered the contrary way, ſhews by inſpection how many miles there are in a degree of longitude in each parallel of latitude; reckoning the latitude upon the line of chords, and the miles of longitude upon the line of longitude: the two lines of latitudes and hours are uſed conjointly, and ſerve very readily to mark the hour-lines in the conſtruction of dials, on any kind of upright planes.

For the farther uſes of the plain-ſcale, ſee the articles TRIGONOMETRY, NAVIGATION, PLOTTING, &c.

Diagonal-SCALE is projected thus: firſt draw eleven parallel lines at equal diſtances (ſee plate CCXL. fig. 1.) the whole length of which being divided into a certain number of equal parts, according to the length of the ſcale, by perpendicular parallels, let the firſt diviſion be again ſubdivided into ten equal parts, both above and below; then drawing the oblique lines from the firſt perpendicular below to the firſt ſubdiviſion above, and from the firſt ſub-diviſion below to the ſecond ſub-diviſion above, &c. the firſt ſpace ſhall thereby be exactly divided into one hundred equal parts; for as each of theſe ſub-diviſions is one tenth part of the whole firſt ſpace or diviſion, ſo each parallel above it is one tenth of ſuch ſub-diviſion, and conſequently one hundredth part of the whole firſt ſpace; and if there be ten of the larger diviſions, one thouſandth part of the whole ſcale. If therefore the larger diviſions be accounted units, the firſt ſub-diviſions will be tenth parts of an unit; and the ſecond ſub-diviſions, marked by the diagonals on the parallels, hundredth parts of an unit. Again, if the larger diviſions be reckoned tens, the firſt ſub-diviſions will be units, and the ſecond ſub-diviſions tenth parts: and if the larger diviſions be accounted hundredths, the firſt ſub-diviſions will be tens, and the ſecond units: and ſo on.

Gunter's SCALE, an inſtrument, ſo called from Mr. Gunter its inventor, and is generally made of box: there are two ſorts, the long Gunter and the ſliding Gunter, having both the ſame lines, but differently uſed, the former with the compaſſes, the latter by ſliding. The lines now generally delineated on thoſe inſtruments are the following, *viz.* a line of numbers, of ſines, tangents, verſed ſines, ſine of the rhumb, tangent of the rhumb, meridional parts, and equal parts; which are conſtructed after the following manner:

The line of numbers is no other than the logarithmic ſcale of proportionals, wherein the diſtance between each diviſion is equal to the number of mean proportionals contained between the two terms, in ſuch parts as the diſtance between 1 and 10 is 1000, &c. = the logarithm of that number. Hence it follows, that, if the number of equal parts expreſſed by the logarithm of any number be taken from the ſame ſcale of equal parts, and ſet off from 1 on the line of numbers, the

diviſion will repreſent the number anſwering to that logarithm. Thus, if you take .954, &c. (the logarithms of 9) of the ſame parts, and ſet it off from 1 towards 10, you will have the diviſion ſtanding againſt the number 9. In like manner, if you ſet off .903, &c. .845, &c. .778, &c. (the logarithms of 8, 7, 6) of the ſame equal parts from 1 towards 10, you will have the diviſions anſwering to the numbers 8, 7, 6. After the ſame manner may the whole line be conſtructed.

The line of numbers being thus conſtructed, if the numbers anſwering to the natural ſines and tangents of any arch, in ſuch parts as the radius is 10000, &c. be found upon the line of numbers, right againſt them will ſtand the reſpective diviſions anſwering to the reſpective arches, or which is the ſame thing, if the diſtance between the center and that diviſion of the line of numbers, which expreſſes the number anſwering to the natural ſine or tangent of any arch, be ſet off on its reſpective line from its center towards the left hand, it will give the point anſwering to the ſine or tangent of that arch: thus the natural ſine of 30 degrees being 5000, &c. if the diſtance between the center of the line of numbers (which in this caſe is = 10000, &c. = the radius) and the diviſion, on the ſame line repreſenting 5000, &c. be ſet off from the center, or 90 degrees, on the line of ſines, towards the left hand, it will give the point anſwering to the ſine of 30 degrees. And after the ſame manner may the whole line of ſines, tangents, and verſed ſines be divided. See the article GUNTER.

The line of ſines, tangents, and verſed ſines being thus conſtructed, the line ſine of the rhumb, and tangent of the rhumb are eaſily divided; for, if the degrees and minutes anſwering to the angle which every rhumb makes with the meridian, be transferred from its reſpective line to that which is to be divided, we ſhall have the ſeveral points required: thus if the diſtance between the radius or center, and ſine of 45 degrees = the fourth rhumb, be ſet off upon the line ſine of the rhumb, we ſhall have the point anſwering to the ſine of the fourth rhumb; and after the ſame manner may both theſe lines be conſtructed. The line of meridional parts is conſtructed from the table of meridional parts, in the ſame manner as the line of numbers is from the logarithms.

The lines being thus conſtructed, all problems relating to arithmetic, trigonometry, and their depending ſciences, may be ſolved by the extent of the compaſſes only; and, as all queſtions are reducible to proportions, the general rule is, to extend the compaſſes from the firſt term to the ſecond, and the ſame extent of the compaſſes will reach from the third to the fourth; which fourth term muſt be ſo continued as to be the thing required, which a little practice will render eaſy.

SCALE, *ſcala*, in muſic, is a denomination given to the arrangement of the ſix ſyllables invented by Guido Aretine, *ut, re, mi, fa, ſol, la,* called alſo gammut. See the article GAMMUT.

It bears the name ſcale (*q. d.* ladder) by reaſon it repreſents a kind of ladder, by means whereof, the voice riſes to acute, or deſcends to grave; each of ſix ſyllables being, as it were, one ſtep of the ladder. Scale is alſo uſed for a ſeries of ſounds riſing or falling towards acuteneſs or gravity, from any given pitch of tune, to the greateſt diſtance that is fit or practicable, through ſuch intermediate degrees as make the ſucceſſion moſt agreeable and perfect, and in which we have all the harmonical intervals moſt commodiouſly divided. See INTERVAL.

This ſcale is otherwiſe called an univerſal ſyſtem, as including all the particular ſyſtems belonging to muſic. See SYSTEM.

Origin and conſtruction of the ſcale of muſic. Every concord or harmonical interval is reſolvable into a certain number of degrees or parts; the octave, for inſtance, into three great tones, two leſs tones, and two ſemi-tones; the greater ſixth into two greater tones, one leſs tone, and two ſemi-tones; the fifth into two greater tones, one leſs tone, and one ſemi-tone; the fourth into one greater tone, one leſs tone, and one ſemi-tone; the greater third into one greater tone, and one leſs tone; and the leſſer third into one greater tone and one leſs tone. It is true, there are variety of other intervals or degrees, beſides greater tones, leſs tones, and ſemi-tones, into which the concords may be divided; but theſe three are preferred to all the reſt, and theſe three alone are in uſe. Farther, it is not any order or progreſſion of theſe degrees that will produce melody; a number, for inſtance, of greater tones, will make no muſic, becauſe no number of them is equal to any

concord, and the ſame is true of the other degrees; there is a neceſſity, therefore, of mixing the degrees to make muſic, and the mixture muſt be ſuch, as that no two of the ſame kind be ever next each other. See the article CONCORD.

A natural and agreeable order of theſe degrees, Mr. Malcolm gives us in the following diviſion of the interval of an octave, wherein (as all the leſſer concords are contained in the greater) the diviſions of all the other ſimple concords are contained. Under the ſeries are the degrees between each term, and the next. In the firſt ſeries, the progreſſion is by the leſs third; in the latter, by the greater third.

Great 2d. gr. 3d. 4th, 5th, 6th, 7th, 8th.

1 : 2/9 : 4/9 : 3/4 : 2/3 : 3/5 : 5/9 : 5/6 : 1/2.

Key or fund. tone. great tone. femi- tone. leſs tone. great tone. femi- tone. leſs

Now the ſyſtem of octave containing all the original concords, and the compound concords being only the ſums of the octave and ſome leſs concord; it is evident that, if we would have the ſeries of degrees continued beyond an octave, they are to be continued in the ſame order through a ſecond as through the firſt octave; and ſo on through a third and a fourth octave, &c. and ſuch a ſeries is what we call the ſcale of muſic. See OCTAVE.

Of this there are two different ſpecies, according as the leſs or greater third, or the leſs or greater ſixth are taken in; for both can never ſtand together in relation to the ſame key or fundamental, ſo as to make an harmonical ſcale. But, if by either of theſe ways, we aſcend from a fundamental or given ſound to an octave, the ſucceſſion will be melodious, though the two make two different ſpecies of melody. Indeed, every note is diſcerned with regard to the next; but each of them is concord to the fundamental, except the ſecond and ſeventh. In continuing the ſeries there are two ways of compounding the names of the ſimple interval with the octave; thus a greater or leſſer tone, or ſemi-tone, above an octave or two octaves, &c. or to call them by the number of degrees from the fundamental, as ninth, tenth, &c. See the article SERIES.

In the two ſcales above, the ſeveral terms of the ſcale are expreſſed, by the proportionable ſections of a line repreſented by 1, the key or fundamental of the ſeries. If we would have the ſeries expreſſed in whole numbers, they will ſtand as follows, in each whereof the greateſt number expreſſes the longeſt chord, and the other numbers the reſt in order; ſo that, if any number of chords be in theſe proportions of length, they will expreſs the true degrees and intervals of the ſcale of muſic, as contained in an octave concinnouſly divided in the two different ſpecies above-mentioned.

540 : 480 : 432 : 405 : 360 : 324 : 288 : 270.

This ſcale the antients called the diatonic ſcale, becauſe proceeding by tones and ſemitones. See the article DIATONIC.

The moderns call it ſimply the ſcale, as being the only one now in uſe; and ſometimes the natural ſcale, becauſe its degrees and their order are the moſt agreeable and concinnous, and preferable, by by the conſent both of ſenſe and reaſon, to all other directions ever inſtituted. Thoſe others are the chromatic and enharmoniac ſcales, which, with the diatonic, made the three ſcales or genera of melody of the antients. See the article CHROMATIC, &c.

The deſign of the ſcale of muſic is to ſhew how a voice may riſe and fall leſs than any harmonical interval, and thereby move from one extreme of any interval, to the other, in the moſt agreeable ſucceſſion of ſounds. The ſcale, therefore, is a ſyſtem exhibiting the whole principles of muſic; which are either harmonical intervals (commonly called concords) or concinnous intervals. The firſt are the eſſential principles, the other ſubſervient to them, to make the greater variety. See the article MUSIC.

Accordingly, in the ſcale we have all the concords with their concinnous degrees ſo placed, as to make the moſt perfect ſucceſſion of ſounds from any given fundamental or key, which is ſuppoſed to be repreſented by 1. It is not to be ſuppoſed that the voice is never to move up and down by any other more immediate diſtances than thoſe of the concinnous degrees; for, though that be the

moſt uſual movement, yet, to move by harmonical diſtances, as concords, at once, is not excluded, but is even abſolutely neceſſary. In effect, the degrees were only invented for variety's ſake, and that we might not always move up and down by harmonic intervals, though thoſe are the moſt perfect, the others deriving all their agreeableneſs from their ſubſerviency to them. See CONCORD. Add, that beſides the harmonical and concinnous intervals, which are the immediate principles of muſic, and are directly applied in practice; there are other diſcord-relations which happen unavoidably in muſic in a kind of accidental and indirect manner; for, in the ſucceſſion of the ſeveral notes of the ſcale, there are to be conſidered, not only the relations of theſe that ſucceed others immediately, but alſo of thoſe betwixt which other notes intervene. Now the immediate ſucceſſion may be conducted ſo as to produce good melody, and yet among the diſtant notes there may be very groſs diſcords that would not be allowed in immediate ſucceſſion, much leſs in conſonance. Thus, in the firſt ſeries or ſcale above delivered, though the progreſſion be melodious, as the terms refer to one common fundamental, yet are there ſeveral diſcords among the mutual relations of the terms; *e. gr.* from 4th to 7th is 32 : 45, and from the greater 2d to the greater 6th is 27 : 40, and from the greater 2d to 4th is 27 : 32, which are all diſcords; and the ſame will happen in the ſecond ſeries. See the article DISCORD.

SCALE, in geography and architecture, a a line divided into equal parts, placed at the bottom of a map, or plan, to ſerve as a common meaſure for all the parts of the building, or all the diſtances and places of the map.

SCALENE, or SCALENOUS TRIANGLE, *ſcalenum*, in geometry, a triangle whoſe ſides and angles are unequal. See the article TRIANGLE.

SCALENUS, in anatomy, a name given to one of the flexors of the neck. This muſcle has its origin from the firſt, ſecond, and ſometimes the third rib; and is inſerted into the apophyſes of the vertebræ of the neck, and is by ſome juſtly referred to the number of the elevators of the thorax. The ſcalenus is frequently divided into three parts, hence ſome anatomical writers have made three muſcles of it, under the names of the firſt, the ſecond, and the third ſcalenus.

SCALITS, a town of Upper Hungary, ſituated on the confines of Moravia, thirty-five miles north of Preſburg.

SCALLOP, or the IRISH SCALLOP, in ichthyology, a name for the blue-ribbed red pecten variegated with white; being about two inches long, and nearly as much in breadth, having on the ſurface about fifteen broad depreſſed ribs placed at nearly equal diſtances from one another; the valves are very little elevated, and the ears are moderately large, and one a little bigger than the other. See the article PECTEN.

SCALLOWAY, a town on the weſt ſide of Mainland, one of the iſlands of Shetland: weſt long. 1° 5′, north lat. 61° 12′.

SCALPEL, in ſurgery, a kind of knife uſed in anatomical diſſections and operations in ſurgery. See KNIFE.

SCALPER, or SCALPING-IRON, a ſurgeon's inſtrument uſed for ſcraping foul carious bones.

SCALPTOR ANI, in anatomy. See the article LATISSIMUS DORSI.

SCAMILLI IMPARES, in the antient architecture, certain zoccos or blocks which ſerve to raiſe the reſt of the members of an order, column, ſtatue, or the like, and to prevent their being loſt to the eye, which may chance to be placed below the level, or below the projecture of ſome of the ornaments.

SCAMMONY, in the materia medica, is a concreted vegetable juice of a plant of the ſame name, partly of the reſin and partly of the gum-kind, of which there are two ſorts, diſtinguiſhed by the names of the places from whence they are brought.

The Aleppo ſcammony is of a ſpongy texture, light and friable: it is of a faint diſagreeable ſmell, and its taſte is biteriſh, very nauſeous, and acrimonious. The Smyrna ſcammony is conſiderably hard and heavy, of a black colour, and of a much ſtronger ſmell and taſte than the former, otherwiſe it much reſembles it.

In general, ſcammony is to be choſen friable and eaſily powdered, gloſſy when freſh broken; ſuch as grows white on being moiſtened with the ſpittle; free from dirt, ſand, or other foulneſſes, and not too violently acrimonious in its taſte. Scammony is in great eſteem and frequent uſe, and would be more ſo, if it were

were more to be depended upon: but there is ſo much difference in the purgative virtue of ſome maſſes of it, and that of others, that it is ſeldom to be depended upon alone in extemporaneous practice. It is, however, an ingredient in many compoſitions of the ſhops; and theſe are preſcribed, with other cathartics, for purging off ſerous humours. It is in general, however, a better purge for robuſt people than for thoſe of more delicate conſtitutions, though with the correctives with which it is joined, it is given with ſafety and ſucceſs to children. The chemical writers have given us many preparations of ſcammony, among which are a tincture and a reſin; but the ſcammony in ſubſtance is preferable to either; for they both irritate more, and yet purge leſs; the reſin itſelf given in an equal doſe with the crude ſcammony, will give fewer ſtools, and thoſe attended with worſe gripings. The antients uſed ſcammony externally for cutaneous eruptions, and to ſoften hard tumours; but at preſent it is uſed only as a purge. For the preparation of ſcammony by baking it in a quince, See the article DIAGRYDIUM.

SCANDALUM MAGNATUM, in law, is a defamatory ſpeech or writing to the injury of a perſon of dignity; for which a writ that bears the ſame name is granted for the recovery of damages. By ſtatute, no perſon is either by writing or ſpeaking to publiſh any falſe or ſcandalous news of any lord, prelate, officer of the government, judge, *&c.* on pain of impriſonment, till he produce his author; and if the ſame be publiſhed in a libel, the publiſher is indictable, and may be fined and impriſoned. See LIBEL.

When an action of ſcandalum magnatum is brought, the ſame muſt be ſued in the name of the king and the party, on which the plaintiff recovers his damages for the wrong, and the defendant is to be impriſoned on the king's account. It is here to be obſerved, that the words ſpoke ſhall be taken in the worſt ſenſe, to preſerve the honour of great perſons; though at the ſame time it is ſaid, a defendant may juſtify in this action, ſetting forth the ſpecial matter.

SCANDEROON, a port-town of Aleppo, in aſiatic Turky, ſituated on the coaſt of the Leſſer Aſia: eaſt long. 37°, north lat. 36° 15′.

SCANDINAVIA, a large country which conſiſted of Sweden, Denmark, and Norway, which were ſometimes under the government of one prince; but is now under the dominion of Sweden and Denmark.

SCANDIX, or SCANDYX, in botany, a plant of the *pentandria-digynia* claſs, the compound flower of which is made up of hermaphrodite ones on the diſc, and female ones in the radius: there is no pericarpium, the ſeeds, which are two in number and ſubluated, being joined together ſidewiſe.

This genus comprehends the venus's comb or ſhepherd's needle, and chervil of authors.

SCANNING, *ſcanſio*, in poetry, the meaſuring of a verſe by feet, in order to ſee whether or no the quantities be duely obſerved.

The term is chiefly uſed in regard to the greek and latin verſes. Thus an hexameter verſe is ſcanned, by reſolving it into ſix feet; a pentameter, by reſolving it into five feet, *&c.* examples of which may be ſeen under the articles PENTAMETER, HEXAMETER, *&c.*

SCAPE-GOAT, in jewiſh antiquity, the goat which was ſet at liberty on the great day of expiation. See EXPIATION.

Spencer is of opinion, that the ſcape-goat was called azazel, becauſe it was ſent to azazel, *i. e.* the devil; the reaſons of which ceremony, he takes to be theſe. 1. That the goat, loaded with the ſins of the people, and ſent to azazel, might denote the miſerable condition of of ſinners. 2. The goat was ſent thus loaded to the dæmons, to ſhew that they were impure, and to deter the people from worſhiping them. 3. That the goat ſent to azazel ſufficiently expiating the ſins of the Iſraelites, they might the more willingly abſtain from the expiatory ſacrifices of the heathens.

SCAPHISM, σκαφισμος, in perſian antiquity, a kind of torture, or capital puniſhment; which conſiſted in locking the criminal in a ſort of box made of the trunk of a tree, with only five holes for his head, arms and legs to come through; then anointing the parts with honey and milk, in order to invite the flies, *&c.* he was expoſed to the ſun; and, in this unhappy ſituation, he continued till death put an end to his miſery.

SCAPHOIDES, in anatomy, the ſame with naviculare os. See the article NAVICULARE OS.

SCAPULA, in anatomy, the ſhoulder-blade, a triangular bone, ſituated on the outſide

outſide of the ribs, and commonly extended from the ſecond to the ſeventh rib; its ſuperior poſterior angle, when it is in the leaſt ſtraining poſition, being about three inches from the ſpinal proceſſes of the vertebræ, while the long ſide between that angle and the inferior one is ſtretched obliquely forward as it deſcends, having nothing between it and the ribs, except the thin extremities of ſome muſcles; but as the ſcapula advances forwards to its articulation with the arm bone, its diſtance from the ribs increaſes.

In the examination of the ſcapula, ſays Heiſter, we are to obſerve the head of the bone, with its glenoide cavity, called by ſome the acetabulum of the ſcapula; its neck; its baſe; its two angles, the ſuperior and inferior; its ſuperior and inferior coſtæ; its anterior ſurface, which is ſmooth and concave; and its poſterior, which is uneven. After theſe we are to obſerve its ſpine, its creſt, and its acromion; its ſupra and infra ſpinate cavity; its coracoide proceſs, and its two inciſures, the one between the neck and the acromion, the other behind the coracoide proceſs; and the robuſt ligament which joins the acromion and coracoide proceſs, and prevents the laxation of the os humeri upwards.

The uſes of the ſcapula are to ſuſtain the arms, and join them to the body, to ſerve for the inſertion of ſeveral muſcles, and to add ſomewhat to the neceſſary defence of the parts contained within the thorax.

SCAPULAR, *ſcapulares*, in anatomy, a name given to two pair of arteries, and as many veins; the arteries are the external ſcapular artery, which is ſent from the ſubclavians to the external parts of the ſcapula; and the internal ſcapular artery, which ariſes from the axillary arteries, and goes to the parts that lie under the ſcapula. The ſcapular veins, which are alſo external and internal, ariſe in like manner from the ſubclavians. See ARTERY and VEIN.

SCAPULAR, or SCAPULARY, a part of the habit of ſeveral religious orders in the church of Rome, worn over the gown, as a badge of peculiar veneration for the bleſſed Virgin. It conſiſts of two narrow breadths or ſlips of cloth, covering the back and the breaſt, and hanging down to the feet.

The devotees of the ſcapulary celebrate its feſtival on the 16th of July. The bulls of the popes have from time to time ſecured indulgences without number to them: but what ſets the ſcapulary above all other practices of devotion, is the ſabbatin bull of pope John XXII. in which that pope declares, that the bleſſed Virgin, one day as he was at prayers, gave him a poſitive promiſe, that ſhe would deliver the carmelites her children, and the brethren of the ſcapulary, out of purgatory, on the ſunday after their death, upon three conditions; 1. to wear their ſcapulary till their death: 2. to preſerve their virginity; and, 3. to abſtain from fleſh every Wedneſday and Friday in the year. See FRATERNITIES and CARMELITES.

SCAPUS, in architecture, the ſhaft or ſhaft of a column. See the article FUST.

In botany, the ſame word is uſed for the ſtrait ſtalk or ſtem of a plant, ſtanding upright like a pillar or column.

SCAR, or ESCHAR, the ſeam or mark of a wound after it is healed. See the article WOUND.

SCARA, a town of Sweden in the province of weſt Gothland, ſixty-ſix miles north-eaſt of Gottenburg.

SCARABÆUS, the BEETLE, in zoology, a numerous genus of inſects, of the coleoptera-order: the antennæ of the beetles are of a clavated figure, and fiſſile longitudinally; and their eggs all hatch into hexapode worms, from which the young beetles are afterwards produced. See the article COLEOPTERA.

We have already deſcribed the cervus volans or ſtag-beetle; beſides which there are numerous other ſpecies, the deſcription of which may be ſeen in Ray's Hiſtory of Inſects, Linnæus's Syſt. Nat. and Hill's Nat. Hiſt.

SCARBOROUGH, a borough and port-town of Yorkſhire, thirty-ſeven miles north-eaſt of York.

It is famous for its medicinal ſprings, and ſends two members to parliament.

SCARDONNA, a port-town of Dalmatia, ſituated on a bay of the gulph of Venice, forty-five miles north of Spalatto.

SCARE-CROW GULL, in ornithology, a name for the black larus with grey wings and red legs, being of the ſize of the common pigeon. See LARUS.

SCARIFICATION, in ſurgery, the operation of making ſeveral inciſions in the ſkin by means of lancets, or other inſtruments, particularly the cupping-inſtrument. See the article CUPPING.

With

With regard to the uſefulneſs of ſcarification, Heiſter obſerves, that as much and as thick blood may be diſcharged this way as by phlebotomy, and that of conſequence it muſt be equally beneficial in all diſorders which require bleeding. Beſides, ſcarification is highly neceſſary in violent inflammations, incipient or confirmed mortifications, peſtilential carbuncles, and the like, in order to diſcharge the ſtagnant and vitiated blood, by making many ſmall wounds or inciſions with a ſcalpel or lancet. Heiſter alſo thinks ſcarification of the gums, in the tooth-ach, may not unfrequently be very uſeful; as of the eyes in many diſorders, if performed with caution.

The inſtruments uſed by different operators for ſcarifying the eyes, are different: ſome of the antients uſed a ſteel-raſp in form of a ſpoon, ſee letter A plate CCXL. fig. 2. others uſed a prickly thiſtle, like the atractylis; or, the equiſetum majus. But the lateſt and beſt inſtrument for this operation, is the beards of barley or rye, furniſhed with rows of ſmall hooks, repreſented, *ibid.* at letter B. Ten, twelve, or fifteen of theſe beards may be tied together, ſo as to form a kind of bruſh, as at C; with which the inſide of the eye-lids, and even the eye itſelf, may be ſcarified. However, ſuch a bruſh cannot be uſed more than once, as a very ſmall force blunts it; it is alſo to be obſerved, that the beards of old or ripe barley is not ſo proper as thoſe of barley not quite ripe. Heiſter thinks this operation may be of conſiderable ſervice in all inflammatory diſorders of the eyes; but at the ſame time thinks bliſters, phlebotomy, and ſcarifications in other parts might do as well, and be attended with much leſs pain.

To perform this operation, the patient is to be ſeated in a good light, and his head held ſtill by an aſſiſtant, while the ſurgeon preſſes his thumb and fore-finger on the eyelids, ſo as to open them, and turn them outward, that their interior red ſurface may come into view; this is much more conveniently performed on the under than on the upper eyelid. When the ſurface is thus turned up, the ſurgeon draws the ſcarifying inſtrument backward and forward over it with great ſwiftneſs, as alſo over the white of the eye, if there be occaſion; and, by this means, opens all the turgid veſſels, and makes them bleed plentifully, fomenting the eye with a ſponge dipped in warm water.

When the operation is over, great care is to be taken, that the wounded parts do not cohere together; the patient muſt move the eyelids about at times to prevent this, and the eye, when bound up at night, muſt have a piece of gold-beater's ſkin applied between the eyelids and the eye.

SCARLET, a beautiful bright red. See the articles RED and COLOUR.

In painting in water-colours, minium mixed with a little vermilion produces a good ſcarlet: but if a flower in a print is to be painted of a ſcarlet-colour, the lights as well as the ſhades ſhould be covered with minium, and the ſhaded parts finiſhed with carmine, which will produce an admirable ſcarlet.

To dye cloth, ſtuff, &c. a ſcarlet, let the ſtuffs be alumed, as for crimſon, in river-water, boil them for two hours, then hang them out a whole night without rinſing; but in the morning rinſe them out. Then in order to dye them, take clean bran-water clean ſkimed, and for every pound of goods put in an ounce of pulverized tartar; having firſt mixed one half of it with half an ounce of cochineal, and when the liquor where the remaining half of the tartar is las boiled, then put in the cochineal, &c. Boil them together, afterwards add half an ounce of aqua fortis, in which a ſmall quantity of ſal armoniac (not bigger than a pea) has been diſſolved; which muſt be put in when the ſtuffs have boiled about a quarter of an hour; then boil them together for a little while, let the liquor cool, and rinſe out the ſtuffs.

To dye a ſcarlet in grain, take ſtale clear wheat-bran liquor, a ſufficient quantity; alum, three pounds; enter twenty yards of broad-cloth, and boil it three hours; cool and waſh it; take fair water, a ſufficient quantity; hedder or ſtrawel, a fit quantity; boil them well; cool them with a little water, enter your cloth and make a bright yellow; cool and waſh it again; take freſh wheat-bran-liquor, a ſufficient quantity; madder, four pounds; enter your cloth at a good heat; handle it to a boiling, cool and waſh it well: take more freſh bran liquor; cochineal in fine powder, five ounces; and tartar, three ounces; enter your cloth, and boil an hour or more, keeping it under the liquor, then cool and waſh it.

SCARLET-FEVER, the ſame with miliary fever. See MILIARY FEVER.

SCAROS, or SAROS, a town of Upper Hungary, near the Carpathian mountains: eaſt long. 20° 40', north latitude 48° 45'.

SCARP, in fortification, is the interior talus, or ſlope of the ditch next the place, at the foot of the rampart.

SCARP, in heraldry, the ſcarf which military commanders wear for ornament.

It is borne ſomewhat like a battoon ſiniſter, but is broader than it, and is continued out to the edges of the field: whereas the battoon is cut off at each end. See plate CCXL. fig. 3.

SCARPANTO, an iſland in the Mediterranean, twenty miles ſouth-weſt of Rhodes: eaſt long. 27°, north lat. 36°.

SCARPE, a river of the Netherlands, which riſes in the province of Artois, and falls into the river Scheld, a little below Mortaigne.

SCARUS, in ichthyology, a ſpecies of the labrus, variegated with purple, green, blue and black. See LABRUS.

SCAVAGE, a toll or cuſtom antiently exacted by mayors, ſheriffs and bailiffs of cities and towns-corporate, and of merchant-ſtrangers, for wares expoſed and offered to ſale within their liberties; which was prohibited by 19 Hen. VII. But the city of London ſtill retains this cuſtom.

SCAVANT, a term purely french, ſignifying learned; it is little uſed in our language, except in the phraſe Journal des Sçavans, a journal of the works of the learned, publiſhed monthly at Paris.

SCAVENGERS, two officers annually choſen in every pariſh in London and its ſuburbs by the church-wardens, conſtables, and other inhabitants, to hire perſons called rakers, with carts, to clean the ſtreets, and carry away the dirt and filth, with the aſhes and duſt from every houſe. For which purpoſe a ſcavenger's tax may be made and levied on the inhabitants, being allowed by the juſtices of the peace; but it muſt not exceed 4d. in the pound, of the rent paid for the houſes. Perſons who refuſe to take upon themſelves the office of ſcavenger, forfeit 10l. 2 W. and M. c. 2. 1 Geo. I. c. 48. 10 Geo. II. c. 22.

SCELASIUS, in natural hiſtory, an animalcule which has viſible limbs, arranged, according to Dr. Hill, in the claſs of the arthronia. See ANIMALCULE.

There are two ſpecies of the ſcelaſius, that with the body of a ſuboval figure of the ſhape of an egg, its ſkin perfectly ſmooth, very thin, and of a pale olive-colour, and ſo tranſparent, that the lineament of the inteſtines are ſeen eaſily through it.

SCENE, *ſcena*, in its primary ſenſe, denoted a theatre, or the place where dramatic pieces, and other public ſhews were exhibited: for it does not appear that the antient poets were at all acquainted with the modern way of changing the ſcenes in the different parts of the play, in order to raiſe the idea of the perſons repreſented by the actors being in different places.

The original ſcene for acting of plays was as ſimple as the repreſentations themſelves; it conſiſted only of a plain plot of ground proper for the occaſion, which was in ſome degree ſhaded by the neighbouring trees, whoſe branches were made to meet together, and their vacancies ſupplied with boards, ſticks, and the like; and to complete the ſhelter, theſe were ſometimes covered with ſkins, and ſometimes with only the branches of other trees newly cut down, and full of leaves. Afterwards more artificial ſcenes or ſcenical repreſentations were introduced, and paintings uſed inſtead of the objects themſelves. Scenes were then of three ſorts, tragic, comic, and ſatyric. The tragic ſcene repreſented ſtately magnificent edifices, with decorations of pillars, ſtatues, and other things ſuitable to the palaces of kings: the comic exhibited private houſes with balconies and windows, in imitation of common buildings: and the ſatyric was the repreſentation of groves, mountains, dens, and other appearances; and theſe decorations either turned on pivots, or ſlid along grooves, as thoſe in our theatres.

To keep cloſe to nature and probability, the ſcene ſhould never be ſhifted from place to place in the courſe of the play: the antients were pretty ſevere in this reſpect, particularly Terence, in ſome of whoſe plays the ſcene never ſhifts at all, but the whole is tranſacted at the door of ſome old man's houſe, whither, with inimitable art, he occaſionally brings the actors. The French are pretty ſtrict with reſpect to this rule; but the Engliſh pay very little regard to it.

Scene is alſo a part or diviſion of a dramatic poem. Thus plays are divided into acts, and acts are again ſubdivided into ſcenes; in which ſenſe the ſcene is properly the perſons preſent at, or concerned

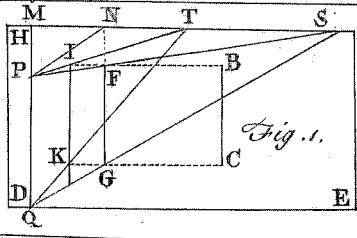

Fig. 1.

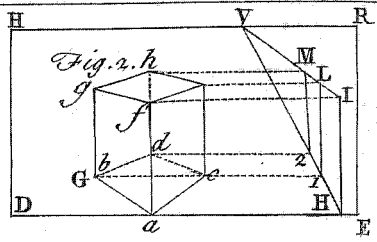

Fig. 2. h

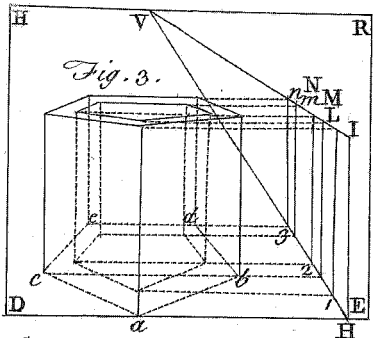

Fig. 3.

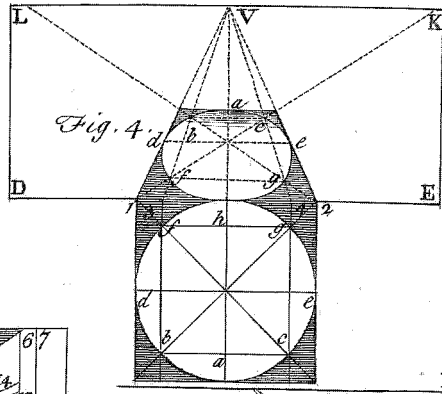

Fig. 4.

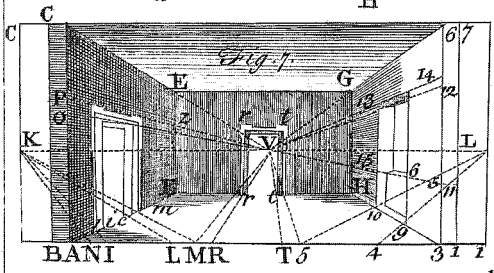

Fig. 7.

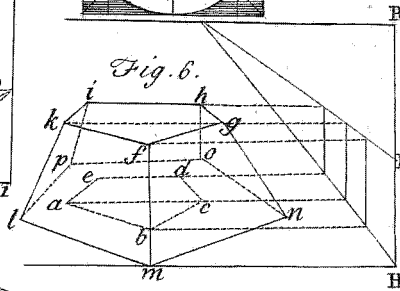

Fig. 6.

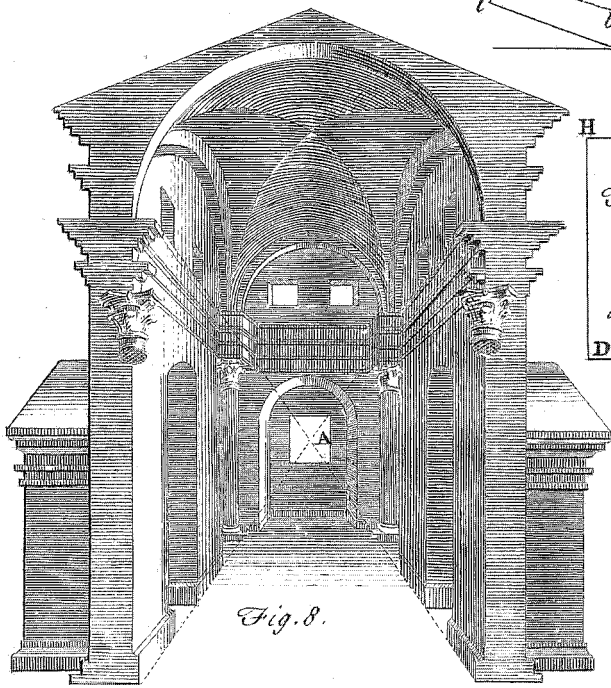

Fig. 8.

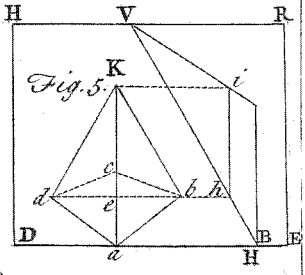

Fig. 5.

cerned in the action on the ſtage at ſuch a time: whenever, therefore, a new actor appears, or an old one diſappears, the action is changed into other hands; and therefore a new ſcene then commences.

It is one of the laws of the ſtage, that the ſcenes be well connected; that is, that one ſucceed another, in ſuch a manner as that the ſtage be never quite empty till the end of the act. See the articles ACT, DRAMA, &c.

SCENIC GAMES, among the antients, were entertainments exhibited on the ſcena or theatre, including plays, dancing, and other theatrical performances.

The Romans were four hundred years without any ſcenic games, and at their inſtitution ſome actors were ſent for from Hetruria; who, without reciting any thing, danced to the ſound of inſtruments; at length they began to rehearſe verſe, from thence they proceeded to plays, and thus by degrees, growing more and more perfect, their ſcenical ſhews were at laſt repreſented, with a juſtneſs and magnificence beyond every thing the world had ever ſeen.

SCENOGRAPHY, in perſpective, the repreſentation of a body on a perſpective plane; or, a deſcription thereof in all its dimenſions, ſuch as it appears to the eye. See the article PERSPECTIVE.

The ichnography of a building, &c. repreſents its plan, or ground-work; the orthography, is a view of the front, or one of its ſides; and the ſcenography, is a view of the whole building, front, ſides, height, and all, raiſed on the geometrical plan. See the articles ICHNOGRAPHY, and ORTHOGRAPHY.

To exhibit the ſcenography of any body, 1. Lay down the baſis, ground-plot, or plan of the body, according to the method taught under the article PERSPECTIVE. 2. Upon the ſeveral points of the plan, raiſe the perſpective heights thus will the ſcenography of the body be completed, excepting that a proper ſhade is to be added.

The method of raiſing the heights is as follows: on any point, as C (plate CCXLI. fig. 1.) to raiſe a perſpective altitude, anſwerable to an objective altitude PQ; on the terreſtrial line raiſe a perpendicular PQ, equal to the given objective altitude; from P and Q, to any point, as T, draw right lines PT and QT; from the given point C, draw a right line CK, parallel to the terreſtrial line DE, and meeting the right line QT in K; and in the point K, upon the line KC, erect a perpendicular IK, which will be the ſcenographic altitude required.

The application of this general method of drawing the ſcenography of a body, is not ſo obvious, in every caſe, but that it may be neceſſary to illuſtrate it by a few examples.

Example I. To exhibit the ſcenography of a cube, viewed by an angle: 1. As the baſis of a cube viewed by an angle, ſtanding on a geometrical plane is a ſquare, viewed by an angle; draw a ſquare, viewed angular-wiſe, on the perſpective table, or plane. 2. Raiſe the ſide HI (fig. 2.) of the ſquare perpendicularly on each point of the terreſtrial line DE; and to any point, as V, of the horizontal line HR, draw the right line VI and VH. 3. From the angles *d*, *b*, and *c*, draw *c* 1, *d* 2, &c. parallel to the terreſtrial line DE. 4. From the points 1 and 2, raiſe L 1 and M 2 perpendicular to the ſame. Laſtly, ſince HI is the height to be raiſed in *a*, LI in *c* and *b*, and M 2 in *d*; in *a* raiſe the line *f a* perpendicular to *a*E; in *b* and *c*, raiſe *b g* and *c e* perpendicular to *b c* 1; and, laſtly, raiſe *d h* perpendicular to *d* 2, and make *a f* = HI, *b g* = *e c* = L 1, and *h d* = M 2; if then the points *g*, *h*, *e*, *f*, be connected by right lines, the ſcenography will be compleat.

Ex. II. To exhibit the ſcenography of a hollow quinquangular priſm. 1. Since the baſe of a hollow quinquangular priſm, ſtanding on a geometrical plane, is a pentagon, with a limb or breadth of a certain dimenſion, find the appearance of this pentagon on a table, or plane. 2. On any point, as H, of the terreſtrial line DE (fig. 3.) raiſe a perpendicular HI, equal to the objective altitude, and to any point, as V, of the horizontal line HR, draw the lines HV and IV. 3. From the ſeveral angles *a*, *b*, *d*, *e*, *c*, of the perſpective ichnography, both the internal and external ones, draw right lines, as *b* 2, *d* 3, &c. parallel to the terreſtrial line; and from the points 1, 2, 3, raiſe perpendiculars to the ſame, as L 1, M 2, *m* 2, N 3, *n* 3. If theſe then be raiſed in the correſpondent points of the ichnography, as in the preceding article, the ſcenography will be compleat.

Ex. III. To exhibit the ſcenography of a cylinder. 1. Since the baſe of a cylinder, ſtanding on a geometrical plane,

is a circle, ſeek the appearance of a circle; in the points *a, b, d, f, h, g, e, c,* (fig. 4) raiſe the apparent altitudes, as in the preceding articles. If now their upper lines be connected by curve lines, in the baſe *a, b, d, f, c, h, e, c,* the ſcenography of their circle will be compleat.

It is evident that thoſe lines are to be omitted, both in the plan and in the elevation, which are not expoſed to the eye; though they are not to be diſregarded from the beginning, as being neceſſary for the finding of other lines; *e. gr.* in the ſcenography of the cube, viewed angle-wiſe, the lines *b d* and *d e* (fig. 2.) in the baſe, and the *d h* in the elevation, are hid from the eye, and are therefore omitted in the deſcription. But, ſince the point H is not to be found, unleſs the point *d* be had in the ichnography, nor the lines *g h* and *d e* be drawn without the height *d h*, the appearance of the point *d* is as neceſſary to be determined in the operation, as the height *h d*.

Ex. IV. To exhibit the ſcenography of a pyramid ſtanding on its baſe. Suppoſe, *e. gr.* it were required to delineate a quadrangular pyramid, viewed by an angle: 1. Since the baſe of ſuch pyramid is a ſquare ſeen by an angle, draw ſuch a ſquare. 2. To find the vertex of the pyramid, *i. e.* a perpendicular let fall from the vertex to the baſe, draw diagonals mutually interſecting each other in *e* (fig. 5.) 3. On any point, as H, of the terreſtrial line D E, raiſe the altitude of the pyramid H I; and, drawing the right lines H V and I V to each point of the horizontal line H R, produce the diagonal *r b*, until it meet the line V H in *h*. Laſtly, from *h* draw *h i* parallel to H I. This, being raiſed on the point *e*, will give the vertex of the pyramid K; conſequently the lines *d* K, K *a*, and K *b* will be determined at the ſame time. After the like manner is the ſcenography of a cone delineated.

Ex. V. To exhibit the ſcenography of a truncated pyramid. Suppoſe the truncated pyramid quadrangular: firſt then, if from the ſeveral angles of the upper baſe be conceived perpendiculars, let fall to the lower baſe, we ſhall have a pentagon, with another inſcribed therein, whoſe ſines are parallel to thoſe of the former; this coincides with a pentagon, furniſhed with a rim or breadth, *&c.* and may therefore be delineated in the ſame manner. 2. Raiſing the altitude of the truncated pyramid I H (fig. 6.) determine the ſcenographic altitudes to be raiſed in the points *a, b, c, d.* If now the points *f, g, h, i, k,* be connected by right lines, and the lines *l k, f m, g n,* be drawn, the ſcenography will be compleat. By drawing two concentric circles in a geometrical plane, and doing every thing elſe, as in this problem, the ſcenography of a truncated pyramid will be drawn.

Ex. VI. To exhibit the ſcenography of walls, columns, *&c.* or to raiſe them on a pavement. 1. Suppoſe a pavement A F, H I (fig. 7. 8.) repreſented in a plan, together with the baſes of the columns, *&c.* if there be any. 2. Upon the terreſtrial line ſet off the thickneſs of the wall B A and 1, 3. 3. Upon A and B, as alſo upon 3 and 1, raiſe perpendiculars A D and B C, as alſo 3, 6, and 1, 7. 4. Connect the points D and 6 with the principal point V, by the right lines D V and 6 V. 5. Upon F and H raiſe perpendiculars H G and E F. Thus will all the walls be delineated. Now to raiſe the pillars, *&c.* there needs nothing but from their ſeveral baſes (whether ſquare or circular) projected on the perſpective plan, to raiſe the indefinite perpendiculars; and on the fundamental line, where interſected by the radius F *a* paſſing thro' the baſe, raiſe the true altitude A D; for D V, being drawn as before, the ſcenographical altitudes will be determined.

Ex. VII. To exhibit the ſcenography of a door in a building. Suppoſe a door required to be delineated in a wall D E F A (fig. 7.) 1. Upon the fundamental line ſet off its diſtance A N from the angle A, together with the breadths of the poſts N I and L M, and the breadth of the gate itſelf L I. 2. To the point of diſtance K, from the ſeveral points N, I, L, M, draw right lines K N, K I, K L, K M, which will determine the breadth of the door *l i*, and the breadths of the poſts *i n* and *m l*. 3. From A to O ſet off the height of the gate A O, and from A to P, the height of the poſts A P. 4. Join O and P with the principal point by right lines P V and O V. 5. Then, from *n, i, l, m,* raiſe perpendiculars, the middle ones whereof are cut by the right line O V in *o*, and extreams, by the right line V P in *p*. Thus will the door be delineated, with its poſts; if the door were to have been exhibited in the wall E F G H, the method would be nearly the ſame: For, 1. Upon the terreſtrial

line

line, ſet off the diſtance of the door from the angle, and thence alſo the breadth of the door R T. 2. From R and T draw right lines to the principal point V, to have the breadth *r t* in the perſpective plan. 3. From *r* and *t* raiſe indefinite perpendiculars to F H. 4. From A to O ſet off the true height A O. Laſtly, from O to the principal point V, draw the right line O V, interſecting E F in ϰ, and make *r r* and *t t* equal to F ϰ. Thus is the door *r r*, *t t*, drawn, and the poſts are eaſily added, as before.

Ex. VIII. To exhibit the ſcenography of windows in a wall. When you know how to repreſent doors, you will find no difficulty in adding windows; all that is here further required, being to ſet off the height of the window from the bottom of the ground. The whole operation is as follows: 1. From 1 to 3, ſet off the thickneſs of the wall at the window; from 3 to 4, its diſtance from the angle 3; and from 4 to 5, its breadth. 2. From 4 and 5, to the point of diſtance L, draw the right lines L 5 and L 4, which will give the perſpective breadth 10, 9 of the window. 3. From 10 and 9, raiſe perpendiculars to the pavement, that is, draw indefinite parallels to 6, 3. 4. From 3 to 11, ſet off the diſtance of the window from the pavement 3, 11, and from 11 to 12, its height 11, 12. Laſtly, from 11 and 12, to the principal point V, draw the lines V 11 and V 12, which interſecting the perpendiculars 10, 13, and 9, 14, in the points 13 and 14, as alſo in 15 and 16, will exhibit the appearance of the window.

From theſe examples which are only applications of the firſt grand rule, it will be eaſily perceived what method to take to delineate any other object, and at any height from the pavement.

SCENOPEGIA, in jewiſh antiquity, the ſame with the feaſt of tabernacles. See the article TABERNACLE.

SCEPTER, a kind of royal ſtaff, or battoon, borne by kings, on ſolemn occaſions, as an enſign of command and authority. See REGALIA.

The ſcepter is of greater antiquity than the crown. The greek tragic poets, put ſcepters into the hands of the moſt antient kings they ever introduce. Among the Romans, the ſcepter was firſt aſſumed by Tarquin the elder. We are informed by Le Gendre, that the ſcepter borne by the firſt race of the french kings was a golden rod, crooked at one end like a croſier, and almoſt always of the ſame height as the king himſelf.

SCEPTER, in aſtronomy, one of the ſix new conſtellations of the ſouthern hemiſphere conſiſting of ſeventeen ſtars.

SCEPTICISM, the doctrines and opinions of the ſceptics, whoſe diſtinguiſhing tenet was, that all things are uncertain and incomprehenſible, and that the mind is never to aſſent to any thing, but to remain in perpetual doubt and ſuſpence. This doctrine was alſo called pyrrhoniſm, from the name of its author. See the article PYRRHONISM.

SCHAFFHOUSE, the capital of the canton of Scaffhouſe, one of the moſt northern cantons of Switzerland: eaſt long. 8° 40′, north lat. 47° 42′.

SCHALHOLT, the capital of Iceland, ſubject to Denmark: weſt long. 19° north lat. 64° 30′.

SCHAMACHIA, a city of Perſia, in the province of Chirvan, ſituated on the weſt ſide of the Caſpian Sea, in eaſt long. 50°, north lat. 41°.

SCHEAT, or SEAT, a fixed ſtar of the ſecond magnitude, in the juncture of the leg with the left ſhoulder of pegaſus. See the article PEGASUS.

SCHELD, a river which riſes in the confines of Picardy, and runs north-eaſt by Cambray, Valenciennes, Tournay, Oudenarde, &c. and receiving the Lis at Ghent, runs eaſt by Dendermond, and then north to Antwerp, below which city it divides into two branches, one called the Weſter-Scheld, which ſeparates Flanders from Zeland, and diſcharges itſelf into the ſea near Fluſhing; and the other called the Oſter-ſcheld, which runs by Bergen-op-zoom, and afterwards between the iſlands Beveland and Schowen, and a little below falls into the ſea.

SCHELLENBURG, a fortreſs of Germany, in the circle of Bavaria, ſituated on the Danube, twenty-two miles weſt of Ingolſtadt.

SCHELLING, an iſland of Holland, at the entrance of the Zuyder Sea, between Flie Iſland and Ameland: eaſt long. 5° 20′, north lat. 53° 34′.

SCHEMNITZ, capital of the mine towns in Upper Hungary, ſixty miles north-eaſt of Preſburg.

SCHENECTIDA, a fortreſs of New-York, in America, ſituated on Hudſon's River, in the province of Albany, a hundred miles north of New York city.

SCHETLAND, or SHETLAND, about forty iſlands, which conſtitute part of

the county of Orkney, or the Orcades, in Scotland, valuable on account of the herring-fiſhery on their ſhores: ſituated between 1° eaſt, and 2° weſt longitude, and between 61° and 62° of north latitude.

SCHEUCHZERIA, in botany, a genus of the *hexandria-trigynia* claſs of plants, having no corolla; the fruit conſiſts of three roundiſh compreſſed inflated bivalve reflexo-diſtant capſules; the ſeed is ſingle and oblong; there are ſometimes ſix germina, and as many capſules, but three is the more natural and uſual number.

SCHINUS, in botany, a genus of the *decandria-monogynia* claſs of plants, the corolla whereof conſiſts of five patent petals; the fruit is a globoſe berry, containing a large globoſe ſingle ſeed.

SCHIRAS, or SHERAS, a city of Perſia, in the province of Fars, 180 miles ſouth of Iſpahan; reckoned the ſecond city in that kingdom.

SCHISM, a ſeparation, or breaking off from communion with any church; on account of ſome diſagreement in matters of faith or diſcipline.

Eccleſiaſtical hiſtory preſents us with a view of ſeveral conſiderable ſchiſms, in which large bodies of men ſeparated from the communion of the church. Such were in the fourth century the ſchiſms of the donatiſts, and the many ſects that ſprung up in the church, as the photinians, apollinarians, &c. the ſchiſm of the church of Antioch, occaſioned by Lucifer, biſhop of Cagliari, in Sardinia, in the fifth century, the ſchiſm of the church of Rome, between Laurentius and Symmachus: in the ninth century, the ſeparation of the greek church from the latin; and particularly the grand ſchiſm of the popes of Rome and Avignon, in the fourteenth century, which laſted till the end of the council of Piſa, 1409.

The romaniſts reckon thirty-four ſchiſms in their church, and beſtow the name engliſh ſchiſm on the reformation in this kingdom. Thoſe of the church of England, again apply the term ſchiſm to the ſeparation of the nonconformiſts, *viz.* the preſbyterians, independants, quakers, &c. who contend for a further reformation.

SCHOENANTHUS, in botany, the ſame with the iſchæmum. See ISCHÆMUM.

SCHOENUS, in botany, a genus of the *triandria-monogynia* claſs of plants, the proper corolla whereof conſiſts of ſix permanent lanceolated acute and connivent petals, unequal in ſize and ſituation, diſpoſed in a kind of imbricated manner, and the exterior ones ſhorter than the reſt; there is no pericarpium; the ſeed is ſingle, gloſſy, of an oval, but ſomewhat triquetrous form, largeſt in the upper part, and contained till ripe in the corolla.

SCHOLASTIC, σχολαστικὸς, ſomething belonging to the ſchools. See SCHOOL.

Scholaſtic was a long time a title of honour, at firſt only given to ſuch as diſtinguiſhed themſelves by their eloquence in declaiming, &c. After Nero, this appellation was beſtowed upon advocates, and afterwards it became reſtrained to ſuch as had the government of eccleſiaſtical ſchools, eſtabliſhed under the firſt race of french kings, who inſtructed the clerks of the church firſt in the humanities, then in theology and the liturgy. Among the greeks, this was the name of an office or dignity anſwering to our divine or theologue.

Scholaſtic divinity, is that part or ſpecies of divinity which clears and diſcuſſes queſtions by reaſon and arguments, in which ſenſe it ſtands, in ſome meaſure, oppoſed to poſitive divinity, which is founded on the authority of fathers, councils, &c. The ſchool-divinity is now fallen into the laſt contempt, and is ſcarce regarded any where, but in ſome of the univerſities, where they are ſtill by their charters obliged to teach it.

SCHOLIAST, or COMMENTATOR, a grammarian, who writes ſcholia, that is, notes, gloſſes, &c. upon antient authors, who have written in the learned languages. See the next article.

SCHOLIUM, a note, annotation, or remark, occaſionally made on ſome paſſage, propoſition, or the like. This term is much uſed in geometry, and other parts of mathematics, where after demonſtrating a propoſition, it is cuſtomary to point out how it might be done ſome other way, or to give ſome advice, or precaution, in order to prevent miſtakes, or add ſome particular uſe, or application thereof.

SCHOOL, *ſchola*, a public place, wherein the languages, humanities, or other arts and ſciences are taught. Thus we ſay, grammar-ſchool, writing-ſchool, &c.

SCHUNDA-PANA, in botany, the ſame with the caryota. See CARYOTA.

SCHWALBASH, a town of Germany, in the circle of the Upper Rhine, and in the territory of the Wetteraw, and county

county of Naſſau, eight miles north of Mentz.

SCHWALBEA, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, the corolla whereof conſiſts of a ringent ſingle petal, the tube is of the length of the cup, the limb is erect, the ſuperior lip is erect, concave, and quite entire, the lower one is trifid and obtuſe; the fruit is either a bilocular capſule, or there is no pericarpium; the ſeed is ſingle, roundiſh, and ſmall.

SCHWARTSBURG, a town of Germany, in the circle of Upper Saxony, and Landgrave of Thuringia, eight miles ſouth-eaſt of Gotha.

SCHWARTZENBURG, a town of Germany, in the circle of Franconia, twenty miles eaſt of Wurtſburg.

SCHWATS, a town of Germany, in the county of Tyrol, ſituated on the river Inn, twenty miles north-eaſt of Inſpruc.

SCHWEIDNITZ, a town of Bohemia, in the dutchy of Sileſia, capital of a dutchy of the ſame name, ſituated twenty-ſix miles ſouth of Breſlaw.

SCHWEINFURT, an imperial city of Germany, in the circle of Franconia, and biſhopric of Wurtſburg, ſituated on the river Maine, in eaſt long. 10° 15′, north 50° 15′.

SCIÆNA, in ichthyology, a genus of the *acanthopterygious* claſs of fiſhes, the whole head and covering of the gills are ſcaly, and one of the laminæ of theſe coverings ſerrated at the edges, the body is compreſſed and broad, the back is acute, there are teeth in the jaws and fauces, the palate and tongue are ſmooth; there is only one fin on the back, which is divided in the middle to the very baſe; the tail is equal at the extremity; this genus comprehends the umbra and the umbrino.

SCIARRI, in natural hiſtory, the matter which runs down in burning torrents from the craters of volcanos, and which probably contains mineral and metallic particles, it being ponderous and hard. Some of the ſciarri are coarſe, and others fine and poliſhed on the ſurface; ſome of them are black, others grey, others reddiſh, and others of the colour of iron, and many of them have coverings of pure ſulphur over their whole ſurface. They ſeem to be the reſult of many ſorts of minerals melted together.

SCIATICA, the HIP-GOUT, a violent and obſtinate pain in the hip, chiefly in the joint, where the head of the thigh-bone is received into the acetabulum of the coxendix. This pain will ſometimes extend itſelf to the lower part of the loins, to the thigh, leg, and even the extremity of the foot, yet outwardly there is no ſwelling, no inflammation, nor change of colour in the ſkin; ſometimes there is ſuch a ſpaſm of the muſcles on the ſide affected, that the patient cannot ſtand upright without the utmoſt pain. When the ſciatica has continued very long, there is ſuch a collection of pituitous humour in the cavity of the joint, that by relaxing the ligaments, it often cauſes a luxation. Sometimes it cauſes an aridura, or waſting away of the adjacent parts. When the pain leaves the hip, and moves downwards, it is a ſign that the ſpaſms are reſolved; a violent motion of the body generally exaſperates the pain. This diſorder may ariſe from the ſame cauſe with that which produces the gout; but it is moſt generally the effect of catching cold, or being expoſed to the open air; it may alſo be occaſioned by contuſions and venereal diſorders. See the article GOUT, *&c.*

After a gentle cathartic, or clyſter, bleeding will be proper, eſpecially in the ancle; alſo leeches applied to the hæmorrhoidal veins, have been found beneficial; ſtrong purges are hurtful, but mercurius dulcis with ſcammony, or ſome other purgative, will be of ſervice; ſome give mercurial emetics, and afterwards mercurial purgatives, repeated twice a week, or as occaſion requires, for ſix times. If the patient is old, lenient purgatives will be moſt proper, and on intermediate days a doſe of calomel, which is afterwards to be purged off, and ſo repeated alternately for ſome time. Outwardly, the linimentum ſaponaceum is recommended by Riverius, Junker, and others; the part is to be anointed with it near the fire. Riverius ſays, he has known an obſtinate ſciatica cured in one day, by applying ſix cupping glaſſes on and about the part affected, and then anointing it with oil of bricks hot, and afterwards covering it with a linnen-cloth, made very hot. Zacutus Luſitanus affirms, that the ſciatica has been cured in a few hours, by applying eight or ten leeches to the part affected. Baglivi obſerves, that if nothing elſe will do, recourſe muſt be had to cauſtics, particularly the leaves of ranunculus, or a mixture of quick lime, and ſoft ſoap.

SCIENCE, *ſcientia*, in philoſophy, denotes any doctrine, deduced from ſelf-evident and

and certain principles, by a regular demonſtration. See DEMONSTRATION, METHOD, and KNOWLEDGE.

Sciences may be properly divided as follows: 1. The knowledge of things, their conſtitutions, properties, and operations: this, in a little more enlarged ſenſe of the word, may be called φυσικὴ, or natural philoſophy; the end of which is ſpeculative truth. See the article *Natural* PHILOSOPHY.

2. The ſkill of rightly applying theſe powers, πρακτικὴ: the moſt conſiderable under this head is ethics, which is the ſeeking out thoſe rules and meaſures of human actions that lead to happineſs, and the means to practiſe them; and the next is mechanics, or the application of the powers of natural agents to the uſes of life. See ETHICS and MECHANICS.

3. The doctrine of ſigns, σημειωτικὴ; the moſt uſual of which being words, it is aptly enough termed logic. See the article LOGIC.

This, ſays Mr. Locke, ſeems to be the moſt general, as well as natural, diviſion of the objects of our underſtanding. For a man can employ his thoughts about nothing but either the contemplation of things themſelves for the diſcovery of truth; or about the things in his own power, which are his actions, for the attainment of his own ends; or the ſigns the mind makes uſe of, both in the one and the other, and the right ordering of them for its clearer information. All which three, *viz.* things, as they are in themſelves knowable; actions, as they depend on us in order to happineſs; and the right uſe of ſigns, in order to knowledge, being *toto cœlo* different, they ſeem to be the three great provinces of the intellectual world, wholly ſeparate and diſtinct one from another.

SCIENTIFIC, or SCIENTIFICAL, ſomething relating to the pure, ſublimer ſciences; or, that abounds in ſcience or knowledge.

SCILLA, the SQUILL, in botany, a genus of the *hexandria-monogynia* claſs of plants, the corolla whereof conſiſts of ſix oval deciduous and very patent petals the fruit is a ſmooth capſule, of a ſub-oval figure, marked with three furrows, formed of three valves, and containing three cells; the ſeeds are numerous and roundiſh.

The middle part of the root of this plant is only uſed in medicine: the apothecaries cut the root perpendicularly in two; and ſeparating the heart and the outer parts, they expoſe the others to dry: this root is extremely acrid, attenuant and diſſolvent: it is apt to prove emetic in whatever form it is given, but this may be prevented by adding a few grains of cinnamon to it: it then becomes a powerful medicine in all obſtructions of the viſcera: it promotes urine and the menſes, and cuts the tough phlegm which almoſt choaks in aſthmas and many other diſorders of the breaſt: the moſt uſual form in which it is preſcribed is that of the oxymel, made of a ſtrong infuſion of the root in vinegar, or made into a ſyrup of honey.

SCILLA, SQUILL, in zoology. See the article SQUILL.

SCILLY, a cluſter of iſlands and rocks, ſituated in the Atlantic-ocean: weſt long. 7°, north lat. 50°.

SCIO, an iſland of Turky, in the Archipelago, ſituated in eaſt long. 27°, north lat. 38° 15′.

SCIOPTIC, a ſphere, or globe of wood, with a circular hole or perforation, wherein a lens is placed. It is ſo fitted that, like the eye of an animal, it may be turned round every way, to be uſed in making experiments of the darkened room. See CAMERA OBSCURA.

SCIRE-FACIAS, in law, a judicial writ moſt commonly iſſued to call a perſon to ſhew cauſe to the court whence it iſſues, why execution of a judgment paſſed ſhould not be made out; as where a plaintiff has recovered debt or damages in a court of record, and does not take out execution in a year and a day after judgment recovered: in that caſe he ſhall have this writ to ſummon the defendant to ſhew cauſe why execution ſhould not be had againſt him upon the ſaid judgment; which if the defendant does not, judgment is given and the plaintiff ſhall have execution. Where a plaintiff or defendant dies, execution may not be ſued out on a judgment till the writ of ſcire-facias is brought and judgment given thereupon. A ſcire-facias muſt likewiſe iſſue where judgment is recovered againſt a feme ſole who marries within the year and day, to ſummon the huſband to ſhew cauſe, *&c.* And when a judgment is obtained againſt a teſtator, a ſcire-facias iſſues againſt the executor, though within a year after the judgment is had; and alſo againſt an adminiſtrator to an inteſtate.

SCIRO,

SCIRO, an iſland of Turky, in the Archipelago, ſituated eaſt long. 25°, lat. 38° 15'.

SCIRPUS, in botany, a genus of the *triandria-monogynia* claſs of plants: there is no corolla nor pericarpium: the ſeed after every flower, is ſingle, and of a triquetrous figure, acuminated, and has villi or hairs on it longer than the cup.

This genus comprehends the club-ruſh and bul-ruſh.

SCIRRHUS σκίρρος, in ſurgery and medicine, a hard tumour of any part of the body, void of pain, ariſing from the inſpiſſation and induration of the fluids contained in a gland, though it may appear in any other part, eſpecially in the fat, being one of the ways wherein an inflammation terminates. [See TUMOUR and INFLAMMATION.

The ſeat of a ſcirrhus is very various, not being confined to the internal parts alone, *viz.* the liver, ſpleen, lungs, meſentery, pancreas, and, in females, to the uterus; but frequently happens to the external parts, as the lips, tongue, tonſils, fauces, palate, gum, neck, mammæ, axillæ, groin, penis, and teſticles, and that generally after a previous inflammation of theſe parts. As ſoon as a ſcirrhus is formed, the neighbouring parts of courſe are impeded in the performance of their offices, and, according to the nature of the part affected, become ſubject to inflammations, exulcerations, cancer, gangrene, tabes, ſtiffneſs, immobility, or the like.

With regard to an external ſcirrhus, when it is of a long ſtanding, and the patient infirm, Heiſter is of opinion that it is better to abſtain entirely from any attempt to cure it, particularly if it is in the breaſts of women, for fear the diſeaſed part ſhould become apparently cancerous. On the other hand, when the ſcirrhus is but newly formed, attended with no vehement pain or hardneſs, and when the patient is otherwiſe of a ſound habit of body, external and internal remedies may be uſed to ſet the confined fluids at liberty. The internal remedies which are found principally ſerviceable in anſwering this intention, are the decoction of the woods, digeſtive tinctures or eſſences, and mild mercurials, giving between whiles relaxing medicines to reſolve the inſpiſſated humours. With regard to external reſolvents, plaſters claim the firſt place, ſuch as are made with the warm gums, as gum ammoniac, galbanum, opopanax, ſagapenum, &c. which may be applied alone or mixed together; the next place is held by cataplaſms: ſome highly recommend acid vapours in this caſe, and to receive the ſteam of boiling vinegar upon the diſeaſed part: others ſet ſulphur on the fire, and hold the part over the fume: others, again, are fond of fumigations of cinnabar; but mercurial medicines perform wonders in this caſe. But if all medicines ſhould prove unſucceſsful, and the ſcirrhus is free and moveable, and its ſituation threatens no great danger from the neighbouring veſſels, and that the ſtrength of the patient will be ſufficient to undergo the operation, to prevent the caſe from turning cancerous, it muſt be cut out with a knife, after which the wound muſt be dreſſed with the linimentum arcei, or any other vulnerary medicine, and healed as other wounds. See the article WOUND.

For the methods of preventing the part from turning cancerous, ſee the article CANCER.

When this diſorder ſeizes the internal parts, and the ſeveral ſymptoms cannot be diſcovered by the ſenſes, in that caſe the effects of a ſcirrhus are only capable of guiding the phyſician's judgment and directing his practice: but obſcure caſes of this nature are illuſtrated by a conſideration of the following circumſtances. If the cauſe pre-diſpoſing to the generation of a ſcirrhus, is an atrabilious ſpiſſitude of the humours ariſing from long protracted uſe of auſtere, terreſtrial and coarſe aliments without violent exerciſe, or from a long continued influence of paſſion, eſpecially grief; and if, at the ſame time, the efficient cauſe is a contuſion; if an inflammation, is neither reſolved nor changed into a ſuppuration; if the uſual diſcharge of the menſes, or hæmorrhoides, is ſuppreſſed; or if the taint is hereditary, we may juſtly from ſuch cauſes dread an internal ſchirrhus. When after a mature conſideration of all circumſtances, it is probable that a ſcirrhus is capable of reſolution, emollients which relax the veſſels, and reſolvents which, without exciting a great commotion, fuſe the concreted humours, are the only medicines to be uſed. Aretæus affirms, that in order to remove a ſcirrhus, or hardneſs of the ſpleen, we are to uſe medicines as hot as fire. In a recent ſcirrhus of the liver, Junker directs that the bowels be cleanſed and relaxed

fixed by a clyſter made of a decoction of mallows, camomile-flowers, mullein, and fennel-ſeed. After this, bleeding in the foot is to be ordered, and then the nitrous and other reſolvent medicines are to be given, ſuch as tartar of vitriol and the like. After this, medicated wines ſhould be given as the common drink, prepared with byrony and arum-roots, centaury, hyſſop, and maidenhair-leaves, ſaſſafras, ſenna, black hellebore, and rhubarb: and externally, plaſters of the reſolvent and ſtrengthening kinds are to be applied. It is ſaid that no internal medicine is more efficacious than vinegar ſaturated with an highly pure alkaline ſalt; or, if to a pint of rheniſh-wine we add half an ounce of the ſalt of carduus benedictus, of the ſtalks of beans, or ſome ſuch ſubſtance, of which mixture the patient is to take half an ounce three or four times a day.

The efficacy of quickſilver in removing obſtructions is univerſally acknowledged, and both the external and internal uſe of it has often greatly contributed to the cure of a benign and incipient ſcirrhus; for when it has acquired a ſtony hardneſs, and begins to be malignant, no relief can be expected from the ſtrongeſt mercurial preparations, nor from a ſalivation excited by quickſilver, but all the ſymptoms are rather encreaſed by theſe means; and in conſequence of the increaſed motion of the humours, the ſcirrhus is the ſooner changed into a cancer: and after all directions for the treatment, it is to be acknowledged that an obdurate and inveterate ſcirrhus admits of no remedy.

SCISSARS, a well known inſtrument for cutting any thing aſunder. See the article FORCEPS.

SCITE, or SITE. See SITE.

SCIURUS, the SQUIRREL. See the article SQUIRREL.

SCLAREA, in botany, the name by which Tournefort calls ſeveral ſpecies of ſalvia, or ſage. See the article SAGE.

SCLAVONIA, a province ſubject to the houſe of Auſtria, and bounded on the north-eaſt by the rivers Drave and Danube, which ſeparate it from Hungary; being about two hundred miles long, and ſixty broad.

It takes its name from the Sclavi, an antient people of european Scythia; from whom is likewiſe derived the ſclavonic language, which is ſaid to be the moſt extenſive language in the world, except the arabic; as being the common mother of the ruſſian, hungarian, poliſh, bulgarian, carinthian, bohemian, *&c.* languages.

SCLERANTHUS, KNAWEL, in botany, a genus of the *decandria-digynia* claſs of plants, without any flower-petals: the fruit is an oval capſule, contained in the baſe of the cup, which is cloſed at the neck; and the ſeeds are two, convex on one ſide and plane on the other.

The hoary-perennial-knawel is the plant, at the roots of which is found the coccus polonicus, a very valuable ſcarlet dye. See COCCUS and SCARLET.

SCLEROPHTHALMIA, in medicine, a ſpecies of ophthalmia, wherein the eye is dry and inflamed, as are alſo the eyebrows. See OPHTHALMIA.

SCLEROTICA, in anatomy, one of the tunics, or coats, of the eye: it is hard, opake, and extended from the cornea to the optic nerve; its forepart is tranſparent, and called the cornea. See the article EYE and CORNEA.

SCLEROTICS, medicines proper to harden and conſolidate the fleſh of the parts to which they are applied; as purſlain, houſe-leek, flea-wort, garden-nightſhade, *&c.*

SCOLOPAX, the WOOD-COCK, in ornithology, a ſpecies of numenius, with a black line on each ſide the head: it is a very beautiful as well as delicate bird, ſomewhat ſmaller than the partridge; the upper part of its body being of a mixed colour, mottled with black, grey, and a reddiſh-brown: the breaſt and belly are a pale-grey, with little tranſverſe lines of a bright brown: the upper part of the throat is of a whitiſh-yellow, and the hinder part of the head chiefly black, with a few tranſverſe lines of brown on it: the male is ſomewhat darker than the female, in its general colouring. See NUMENIUS.

SCOLOPENDRA, in zoology, an inſect with a very ſlender and long body, and furniſhed with a vaſt number of legs.

According to Dale, it is ſometimes uſed as a depilatory boiled in wine.

SCOLYMUS, in botany, a genus of the *ſyngeneſia-polygamia-æqualis* claſs of plants, with a paleaceous receptacle, and imbricated cup, and no down: the flower is compoſed of a number of ſemifloſcules, each placed on an embryo-ſeed.

SCOMBER, in ichthyology, a genus of the acanthopterygious order of fiſhes, the tail of which is very much forked, ſo as to repreſent the figure of a creſcent: there are ſeven officles in the branchioſtege-membrane, on each ſide; the uppermoſt of which is covered by the operculum of the gills. This genus, beſides the common mackrel, comprehends the tunny, the horſe-mackrel, and ſeveral other ſpecies. See MACKREL, TUNNY, &c.

SCONCE, in fortification, a ſmall field-fort, built for the defence of ſome paſs, or other poſt. See FORT.

SCONE, or SCOON, a town of Scotland, near Perth, remarkable for being the place where the kings of Scotland were crowned.

SCOPARIA, in botany, a ſpecies of plantain. See the article PLANTAIN.

SCOPER, or SCUPER-HOLES, in a ſhip, are holes made through the ſides, cloſe to the deck, to carry off the water that comes from the pump. Theſe holes, in the lower deck, have round leathers nailed over them to keep the ſea-water from coming up into the ſhip; theſe are called ſcoper-leathers, and the ſhort nails with broad heads, which faſten theſe leathers down, are called ſcoper-nails.

SCOPS, in ornithology, an extremely elegant ſpecies of owl, about the ſize of a field-fare, with the head aurited by two ſingle feathers.

SCORBUTUS, the SCURVY, in medicine. See the article SCURVY.

SCORDIUM, WATER-GERMANDER, in in botany, is comprehended by Linnæus among the teucriums. See TEUCRIUM. It is celebrated for its ſudorific and alexipharmic virtues, and is accordingly preſcribed in malignant diſorders: but it is never uſed alone, being only kept in the ſhops as an ingredient of the confectio Fracaſtorii, which takes its name of diaſcordium from it. See DIASCORDIUM.

SCORE is ſometimes uſed to denote the number twenty.

SCORIA, or DROSS, among metallurgiſts, is the recrements of metals in fuſion; or, more determinately ſpeaking, is that maſs which is produced by melting metals and ores, and when cold is brittle, and not diſſoluble in water; being properly a kind of glaſs.

Some authors call by this name that ſaline maſs which is produced by melting ores and metals together with ſaline and reducing fluxes. But the word *ſcoria* is not properly to be underſtood of all this maſs, but only of the vitrified particles which are lodged between, and adhere to the ſmall maſſes of the ſalts, and which may be ſeparated from them by water. See the next article.

SCORIFICATION, in metallurgy, is the art of reducing a body, either entirely, or in part, into ſcoria.

It is uſed by metallurgiſts, in order that any metal, impriſoned in any ſolid body, may, on account of its weight, deſcend and ſeparate itſelf therefrom,; and finally, if that be required, be either wholly or in part converted into ſcoria. All fixed bodies are ſubject to this alteration, not totally excepting even gold and ſilver. There are alſo, among the volatile bodies, ſome that may be fixed, and which aſſume the name of ſcoriæ, by adding fixed bodies to them.

It is often proper to make this ſcorification in a veſſel that may abſorb the ſcoriæ, and retain only the metallic part of the maſs under trial. In this caſe the operation is called coppelling; and veſſels made of aſhes, called teſts and coppels, ſerve for this purpoſe. It is evident, in theſe proceſſes, that a great attenuation of the ſcoriæ is neceſſary, that they may be able to paſs through the veſſel; nor is there any fitter body to promote this operation than lead, which, by its undergoing itſelf a like attenuation in the fire, diſpoſes other bodies to be reduced into a ſubtle ſcoria for the ſame attenuation. See COPPEL and COPPELLING.

SCORODONIÆ SPECIES, in botany, a ſpecies of verbena. See VERBENA.

SCORODOPRASUM, a name uſed by Micheli for a ſpecies of porrum. See the article PORRUM.

SCORPÆNA, in ichthyology, a genus of the acanthopterygious order of fiſhes, the characters of which are theſe: the branchioſtege-membrane, on each ſide, contains ſeven bones: the head is large and very prickly: there is only one back-fin, and that is lower in the middle than elſewhere: the body grows ſmall towards the tail: the eyes are placed near one another, and are covered with the common ſkin: there are teeth in the jaws, palate, and fauces; and the appendices to the pylorus are eight or nine.

There are only two ſpecies of this genus, *viz.* the ſcorpæna with pinnules at the eyes and noſtrils; which very much reſembles the common pearch, and is alſo called ſcorpio, and ſcorpius minor; and the red ſcorpæna, with numerous cirri, which is thrice the ſize of the former ſpecies.

SCORPIO, the SCORPION. See SCORPION.

SCORPIOIDES, in botany, the ſame with ſcorpiurus. See SCORPIURUS.

SCORPION, *ſcorpio*, in zoology, a genus of wingleſs inſects, the body of which is of an oval figure: the tail is long and ſlender, and the whole body covered with a firm and ſomewhat hard ſkin: the eyes are eight in number, two of which are placed contiguous, and ſix ſide-ways: the legs are eight; and there are alſo a pair of claws at the head, and a pointed weapon at the extremity of the tail. See plate CCXL. fig. 4. n° 3. which repreſents the great yellowiſh barbary ſcorpion, with eight denticulations; and when full grown, meaſures ſix or ſeven inches in length: there are ſeveral other ſpecies.

SCORPION, *ſcorpio*, in aſtronomy, the eighth ſign of the zodiac, denoted by the character ♏. See the articles SIGN and ZODIAC.

The ſtars in the conſtellation ſcorpio, in Ptolemy's catalogue, are twenty: in Tycho's ten: and in Mr. Flamſteed's forty-nine.

SCORPION, in the antient art of war, an engine chiefly uſed in the defence of the walls of fortified places, by throwing arrows, fire-balls, or great ſtones. See plate CCXL. where fig. 4. n° 1. repreſents one of theſe machines charged, and n° 2. one in its natural ſituation; the point A of the longeſt brachium, A C, is kept uppermoſt by the boxes of ſtones B B: hence, in order to charge it, the point A being brought down by the rope R R, and loop *a*, drawn by means of the wheel W, and pinion at I, round the rollers L M, is detained by the pin H H. Then the loop *a* being taken off from A, and the ſling S charged with the ball or ſtone T, the ſcorpion is ready to be diſcharged; which is done by a ſmart blow of an hammer on the end of the pin H H, or by ſuddenly pulling it out by a rope; for then the point A riſes with great velocity, and one of the loops of the ſling ſlipping off, the ſtone T flies out, as repreſented in n° 2. which is another ſcorpion, differing a little from that repreſented in n° 1; the diſcharging end, A, being nearer to the axis of motion, D D, in the former than in the latter: in both, the ſcorpion turns upon the pivot C; as the whole frame H I turns round the upright ſhaft C *c*, that the machine may be directed any way. The hook H, in n° 2. does the office of the pin H in n° 1.

It appears, from Cæſar's Commentaries, that the Romans had great numbers of ſcorpions in their camps: but however powerful theſe machines were, and however numerous, yet they are not to be compared with a battery of cannon, either for force or expedition.

Thoſe who deſire a more particular account of this machine, may conſult Deſaguliers's Experim. Phil. vol. i. p. 72 and 73.

SCORPIURUS, ROUGH-CATERPILLARS, in botany, a genus of the *diadelphia-decandria* claſs of plants, with a papilionaceous flower; and its fruit is a contorted pod, ſomewhat reſembling a caterpillar.

This genus comprehends the ſcorpioides and campoides of authors.

SCORPIURUS is alſo uſed by ſome for the myoſotis. See MYOSOTIS.

SCORZONERA, VIPER'S-GRASS, in botany, a genus of the *ſyngeneſia-polygamia-æqualis* claſs of plants, with a compound imbricated flower, made up of a great many monopetalous, ligulated, and quinquedentated ſmall ones: the ſtamina are five very ſhort capillary filaments: there is no pericarpium, except the imbricated cup, which becomes connivent, and contains a ſingle oblong and ſtriated ſeed after each leſſer flower: the ſeeds are crowned with a plumoſe down. See plate CCXLII. fig. 2.

The roots of this plant abound with a milky juice, of a bitteriſh ſubacrid taſte; and hence may be of ſome ſervice for ſtrengthening the tone of the viſcera, and promoting the fluid ſecretions. They were formerly celebrated as alexipharmics, and for expelling the meaſles and ſmall-pox; but have, of late, almoſt loſt their character in theſe intentions.

SCOTLAND, excluſive of the iſlands, is ſituated between 1° and 6° weſt long. and between 54° 30′ and 58° 30′ north lat. being about three hundred miles long, from north to ſouth, and from fifty to one hundred and fifty miles broad, from eaſt to weſt.

Since the union with England, Scotland is divided into thirty three ſhires, or counties, which altogether ſend only thirty knights to parliament, by reaſon the ſhires of Bute and Cathneſs chooſe only alternately, or every other parliament, in their turns; as do thoſe of Cromartie and Nairn, Clacmannan and Kinroſs.

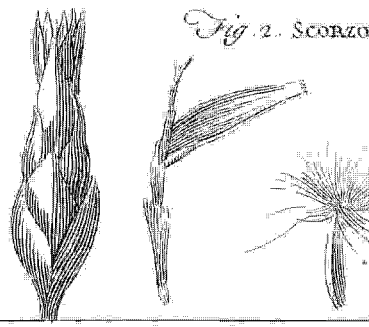

Fig. 2. SCORZONERA

The royal boroughs of Scotland are ſixty-five, but ſo claſſed as to ſend only fifteen burgeſſes to parliament.

New SCOTLAND, *Nova Scotia*, one of the britiſh colonies in north America, is ſituated between 62° and 72° weſt long. and between 43° and 51° north lat. being bounded by the river of St. Laurence on the north and north-weſt; by the bay of St. Laurence, and the Atlantic Ocean on the eaſt; by the ſame ocean and New-England on the ſouth; and by french Canada on the weſt.

SCREW, or SCRUE, *cochlea*, one of the five mechanical powers. A ſcrew is a cylinder cut into ſeveral concave ſurfaces, or rather a channel or groove made in a cylinder, by carrying on two ſpiral planes the whole length of the ſcrew, in ſuch a manner, that they may be always equally inclined to the axis of the cylinder in their whole progreſs, and alſo always inclined to the baſe of it in the ſame angle.

The ſcrew may alſo be conſidered as a wedge carried round a cylinder, which in that caſe is called the arbor of the ſcrew; the wedge, ſo carried on, making what is called the thread of the ſcrew, as may be ſeen in plate CCXLII. fig. 1. n° 1, 2, 3, 4, and 5. The arbor of the ſcrew being A B in n° 1. and *a c b d* in n° 2. as if the cylinder A C B D was inſcribed within the ſcrew. Here, we may ſee the manner how a ſcrew is made; for if it be cut out of the cylinder P H I Q, then H K L M N O P is a ſpiral line going about the cylinder, making the prominent part to be left of the ſaid cylinder; and *h k l m n o*, the line marking the depth to which the ſcrew is to be cut, ſuppoſing the ſame line to go round the inner cylinder or arbor A B C D, though not expreſſed here, to avoid confuſion; and then *h* L *l* N *n*, &c. will repreſent the prominent part or thread of the ſcrew. Now, if inſtead of cutting the hollows H *h* L, L *l* N, N *n* P, &c. into the cylinder P H I Q, a continued wedge be fixed to a ſmaller cylinder as A C B D, or rather *a c b d*, the ſame kind of ſcrew will be made, and *a b c d* will be the arbor of that ſcrew. Sometimes the moſt prominent part of the thread, as L N, &c. is not ſharp but flat, and then the thread is called a ſquare thread, as in (n° 5.) which repreſents the ſection of ſuch a ſcrew. This ſort of thread is not uſed in wood, but in iron, and in other metals; it is of good ſervice, being commonly more durable, and raiſing the weight with more eaſe than the ſharp thread.

Force of the SCREW. To make an eſtimate of the force of the ſcrew, which may be compared either to an inclined plane, or to a wedge, according as its arbor does or does not advance in a progreſſive motion whilſt it turns round its axis to raiſe or ſtop a weight, or to preſs bodies together, which are the ſeveral uſes of a ſcrew, let us take a flexible wedge, as, for example, one of paper, and coil it round a cylinder, (*ibid.* n° 1.) as is repreſented in the figure, where A B is the arbor, C I D one thread or helix, D H E another, and E T G part of the wedge left to ſhew the proportion between the power that turns the ſcrew and the weight W.

If the weight is puſhed up the wedge, (or, which is the ſame thing, raiſed perpendicularly by the wedge ſlipping under it) from F to H in the direction W *w*, then will H G be the velocity of the weight, and G T the velocity of the power, which is the caſe of the inclined plane becoming a wedge; and this will be the analogy for the ſcrew thus acting.

As a circle whoſe diameter is H *h*: to H I the diſtance of two threads :: (or as the baſe F G: to the perpendicular H G::) ſo is the weight: to the power applied to the arbor at A, to raiſe a weight up the thread H D I C.

N. B. We ſuppoſe the diameter of the arbor at A and of the ſcrew at H nearly equal.

This is the caſe of n° 4. where the moveable plank D K is carried down, by turning round the heads G G of the ſcrews A B and C D, in order to preſs ſtrongly the bodies placed between the planks D K and M L, whilſt the piece H I, fixed on the upper plank, is either guided through an hole, or, being only looked at, ſerves to ſhew whether the plank K D be brought down horizontally, as the ſcrews are turned. When long levers are thruſt into the ſquare holes at the heads of the ſcrews, the force of the ſcrew is much increaſed, and then the weight will be to the power:: as the circumference of the circle deſcribed by that part of the lever to which the hand is applied: to the diſtance between two threads. Wherefore, as the circumference of the circle is to the diſtance of two thirds of an endleſs ſcrew:: ſo is the reſiſtance of the teeth of the wheel: to the power applied to the handle.

Archimedes's SCREW, in hydraulics, a kind of ſpiral pump, for raiſing water, ſo called from its inventor Archimedes.

It conſiſts of a long cylinder, with a hollow pipe, tube, or groove coiled round it, as repreſented in *ibid.* n° 7. where AB repreſents the cylinder, and CD the tube open at each end. It is placed in an oblique poſition to the horizon, with the lower end in the water to be pumped away, the other end being ſupported on the lower part of the winch IK, by which the ſcrew and cylinder are turned round.

As ſoon as the ſcrew is immerſed in the water, it immediately riſes therein by the orifice C to the level of the ſurface of the water EF; and if the point of the helix or ſpiral, which in the beginning of the motion is coincident with the ſurface of the water, happens not to be on the lower ſide of the cylinder, the water will upon the motion of the ſcrew, move on in the ſpiral, till it comes to the point which is on the other ſide, and coincident with the ſurface of the water; when it is arrived at that point, which ſuppoſe at O, it cannot afterwards poſſeſs any other part of the ſpiral than that which is upon the loweſt part of the cylinder; for it cannot move from O towards H or G, becauſe they are ſituated higher above the horizon; and ſince this will conſtantly be the caſe, after the water in the ſpiral has attained the point O, it is plain that it muſt always be on the under ſide of the cylinder.

But becauſe the cylinder is in motion, every part of the ſpiral ſcrew, from O to D, will, by degrees, ſucceed to the ſaid under part of the cylinder; the water, therefore, in the ſpiral, muſt ſucceed to every part thereof, from O to D, as it comes on the lower ſide; that is, it muſt aſcend on the lower part of the cylinder through all the length of the pipe, till it comes to the orifice D, where it will run out, as having nothing farther to ſupport it. Hence it appears how much theſe gentlemen are miſtaken who, affecting the wonderful, ſay, 'That the water 'aſcends by deſcending;' whereas, if they would have made the moſt of the wonder, they might have truly ſaid, 'That the water aſcends becauſe it can-'not aſcend,' *i.e.* that it aſcends one way, becauſe it cannot aſcend another; but then the wonder is loſt.

Endleſs or perpetual-SCREW, one ſo fitted in a compound machine, as to turn a dented wheel; ſo called, becauſe it may be turned for ever without coming to an end: *ibid.* n° 6.

If in the endleſs, or perpetual-ſcrew, AB, whoſe threads take the teeth of the wheel CD, you take the diſtance of two threads, according to the length of the axis AB; or the diſtance of two teeth in the wheel CD, in the direction of the circumference; and if a weight, W, act at the circumference of the wheel: then, if the power D be to the weight W, as that diſtance of the teeth or threads, to the length deſcribed by the power P in one revolution, the power and weight will be in æquilibrio; becauſe in one revolution of P, the wheel DC, with the weight W, has moved only the diſtance of one tooth.

SCRIBE, an officer among the Jews whoſe buſineſs was to write; of which there were three kinds: the firſt and principal of which were the ſcribes of the law, whoſe office was to write and interpret ſcripture; theſe were in great credit and eſteem among the Jews, and had even the precedency of the prieſts and ſacrificers, and their deciſions were received with almoſt the ſame reſpect as the law of God itſelf: the ſecond kind, properly called ſcribes of the people, were a ſort of magiſtrates: and the third were public notaries, or ſecretaries of the council; which were the leaſt conſiderable.

The ſcribes, among the Romans, wrote out decrees, or acts, and made out authentic copies of them.

SCRIBING, in joinery, *&c.* is a term uſed when one ſide of a piece of ſtuff is to be fitted to another that is irregular. In order to make theſe join cloſe all the way they ſcribe it; that is, they lay the piece to be ſcribed cloſe to the other they intend to ſcribe it to, and opening their compaſſes to the wideſt diſtance theſe two pieces ſtand from each other, they bear the point of one of the legs againſt the ſide they intend to ſcribe to, and with the other point draw a line on the ſtuff to be ſcribed. Thus they form a line on the irregular piece parallel to the edge of the regular one; and if the ſtuff be cut exactly to the line, when theſe pieces are put together they will ſeem a joint.

SCRIPTURE, an appellation given, by way of eminence, to the ſacred and inſpired writings of the Bible. See BIBLE, CANONICAL, *&c.*

SCRIVAN, a port-town of the province of Darien, in Terra Firma, fifty miles eaſt of Porto Bello.

SCROPHULA, the KING'S EVIL, in medicine, a hard glandulous tumour, uſually of the ſame colour with the ſkin, ſeated principally in the ſides of the neck, behind the ears, and under the chin: but though the principal ſeat of this diſeaſe is in the ſides of the neck, ſcarcely any part of the body is exempted from it. The humour ſometimes falls on the lungs, and brings on a pulmonary conſumption; and it is a dreadful circumſtance, that this diſorder is tranſmitted from parents to their children, by way of inheritance. As to the cure of this ſtubborn diſeaſe, ſays Dr. Mead, it is to be attempted by bleeding, purging and ſuch medicines as are moſt proper for correcting the viſcidity, ſaltneſs, and acrimony of the humours. Of cathartics, the beſt is dulcified mercury ſix times ſublimed, which ſhould be joined with rhubarb, for children; but to adults it may be given alone, with a gentle purging draught ſome hours after it. The next to this in virtue is jalap: and our purging waters are alſo uſeful, as they ſcour the glands and open the body at the ſame time. In fine, a pill compoſed of mercury ſix times ſublimed, and precipitated ſulphur of antimony, each one grain; of aloes, three or four grains; made up with the ſyrup of balſam, and taken every night, will be found ſerviceable, not only in this diſeaſe, but in others ariſing from viſcid humours.

For correcting this pravity of blood and humours, the following powder may be taken twice a day, with three or four glaſſes of the leſs compound lime-water: take of burnt ſponge, one ſcruple; of purified nitre, coralline, and white ſugar, each ten grains; mix them together: and if the patient happen to be emaciated, equal quantities of milk may be mixed with the water. The expreſſed juice of millepedes will alſo be of ſome ſervice, on account of their diuretic quality. Iſſues likewiſe will be beneficial, to drain off the viſcous humour; and a change of aliment is often attended with good effects.

As to the patient's diet, which ought not to be neglected, let him feed on fleſh of eaſy digeſtion, and abſtain from all ſalt and ſmoke-dried meat and high-ſeaſoned things; and particularly from pork, hare, cheeſe, and in general from all things that are hard of digeſtion. Let him drink river-water, and that boiled; but ſtagnating or ſnow-water never.

For the manner of treating ſcrophulous tumours by outward applications, ſee the article SCHIRRUS.

SCROPHULARIA, FIGWORT, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, with a monopetalous flower, divided into five ſegments at the limb: the fruit is a roundiſh bilocular capſule, containing a great many ſmall ſeeds. The root of this plant is eſteemed externally, as a remedy for the piles, and for the king's evil-ſores: it is generally made into an ointment for theſe purpoſes; but ſome give it alſo internally, in diet-drinks.

SCROTUM, in anatomy, the capſula or bag in which the teſticles are contained, and which hangs down below the penis. See the article TESTICLE.

The ſcrotum is compoſed of a cuticula, cutis, and a muſculous membrane called the dartus, by means of which it is contracted. It has in the midſt a ſeptum, formed by a duplicature of the dartus, by which it is divided into two cells, and which anſwers to a longitudinal ſuture, by which it is externally divided into two ſides, a right and a left. It has its veſſels from the hypogaſtrics, and its nerves from the os ſacrum.

Its uſe is to contain, to cheriſh, and defend the teſticles.

SCROTUM CORDIS, the ſame with pericardium. See PERICARDIUM.

SCROWLS, or SCROLLS, in architecture, the ſame with volutes. See VOLUTE.

SCRUPLE, a weight equal to the third part of a dram, or to twenty grains. See the article WEIGHTS.

Among goldſmiths it is equal to twenty-four grains.

The ſcruples of the moon, *&c.* eclipſed, are the parts of the moon's diameter immerſed in the ſhadow, expreſſed in the ſame meaſure wherein the apparent diameter of the moon is expreſſed.

The ſcruples of half duration are an arch of the moon's orbit, which the center of the moon deſcribes, from the beginning of an eclipſe to its middle. Scruples of immerſion, are an arch which the moon's center deſcribes, from the beginning of the eclipſe to its middle. And ſcruples of emerſion, are an arch of the moon's orbit, deſcribed by her center from the time of the emerſion of her limb to the end of the eclipſe. See ECLIPSE.

SCRUTINY,

SCRUTINY, a ſtrict examination of the ſeveral votes taken at an election, in order to diſcover unqualified voters. See the article ELECTION.

SCULPTURE, an art by which, in taking away, or adding to matter, all ſorts of figures are formed by the hand, either in ſtone, wood, wax, or metal. In its full latitude it ſignifies both the art of working in creux, properly called engraving, and of working in relievo, which is more ſtrictly called ſculpture. See the articles ENGRAVING and RELIEVO.

The firſt works in ſculpture were with clay, not only in making ſtatues, but in forming models; and to this day a ſculptor never undertakes any thing conſiderable, without forming a model, either in clay or wax. In making figures of theſe materials, they begin and finiſh their work with their hands, uſing only three or four pieces of wood, which are roundiſh at one end, and at the other flat, with a ſort of claws and teeth, which are to ſmooth and ſcratch the work. For waxen models, to every pound of wax add half a pound colophony; ſome add turpentine, and melt it together with oil of olives; more or leſs of the latter being uſed as they would have the matter harder or ſofter: ſome alſo add a little vermillion, to give it a colour: this is wrought and moulded with the fingers like clay. See MOULDING.

For ſculpture in wood, which we properly call carving, the firſt thing required is to chooſe wood proper for the work the ſculptor is to perform. If it be any thing large, and that requires a great deal of ſtrength and ſolidity, the hardeſt and moſt durable wood is to be choſen; and for ſmaller works and ornaments, the ſofter wood is uſed; but it muſt be ſuch, however, as is firm and cloſe: for a large work, though it be only a ſingle figure, it is better to make uſe of ſeveral pieces of wood, or bits of board, glued together, than of one whole piece, which is more liable to crack; for a thick piece of wood may not be dried to the heart, however it may appear on the outſide.

Carving is performed with a great variety of chiſſels and other tools, for paring, ſcooping, rounding, &c. the ſeveral parts of the work.

In ſculpture in marble and other ſtone, the firſt thing to be done is to ſaw out a block of marble, of the bigneſs of the work to be performed; and this being done, the ſuperfluities are to be taken off by a ſtubbed point and a heavy mallet; thus, bringing it near the meaſures required, the ſculptor reduces it ſtill nearer with a finer tool, called a dog's tooth, it having two points, but one not ſo ſharp as the other. After this he makes uſe of his gradine, which is a flat cutting tool, with three teeth; he then takes off, with a ſmooth chiſſel, the ſcratches the gradine left on the marble, and uſes it with dexterity and delicacy, to give ſoftneſs and tenderneſs to his figure; till at length, taking raſps of different degrees of fineneſs, the work is gradually rendered fit for poliſhing. To poliſh the work, the ſculptor uſes pumice-ſtone and ſmalt, then he goes over it with tripoli; and when he would give it more luſtre, rubs it with leather and ſtraw-aſhes. There are ſeveral other tools uſed by ſculptors, adapted to the different parts of the work, and the nature of the ſtone they make uſe of.

As the models of clay ſhrink as they grow dry, whenever ſculptors undertake a conſiderable piece of work, they only uſe the model for making a mould of plaiſter or ſtucco, in which is formed a figure of the ſame matter, which ſerves them thenceforth for a model, and by which they adjuſt all their meaſures and proportions. To proceed the more regularly, on the head of the model they place an immoveable circle divided into degrees, with a moveable rule or index, fixed in the center of the circle, and divided alſo into equal parts: from the end of the rule hangs a line with a plummet, which ſerves to take all the points, to be transferred thence to the block of marble, from whoſe top hangs another plummet, like that of the model. But there are ſome excellent ſculptors, who diſapprove of this method; urging, that the ſmalleſt motion of the model changes their meaſures, for which reaſon they chooſe rather to take all their meaſures with the compaſſes. See the articles POLISHING, &c.

SCUM properly denotes the impurities, which a liquor, by boiling, caſts up to the ſurface. See CLARIFICATION.

The term ſcum is alſo uſed for what is more properly called the ſcoria of metals. See the article SCORIA.

In this laſt ſenſe, the ſcum of lead is a ſort of ſmalt, of various colours; and the ſcum of ſilver is what we commonly call litharge. See SMALT and LITHARGE.

SCUPER, or SCOPER-HOLES, in a ſhip. See the article SCOPER.

SCURRA,

SCURRA, in ornithology, the name by which the antients called the jackdaw.

SCURVY, *ſcorbutus*, in medicine, Dr. Mead obſerves, is the name given by medical writers to a diſeaſe ſo various and different in appearance, that it does not ſeem to be one and the ſame diſtemper.

Boerhaave obſerves, that the ſcurvy chiefly affects the inhabitants of cold northern countries, eſpecially thoſe who live in marſhy, low, fat, and moiſt ſoils, near ſtagnating waters, whether freſh or ſalt. Thoſe who live idle ſedentary lives are moſt ſubject, chiefly in the winter-time, to the attacks of this diſtemper; as alſo thoſe feeding upon ſalted and ſmoke-dried fleſh, or fiſh, ſea-biſcuit, ſtinking water, unfermented farinaceous vegetables, peas, beans, ſharp, ſalt, old cheeſe; likewiſe thoſe who are ſubject to melancholic, maniacal, hyſteric, or hypochondriacal diſorders; or thoſe who have taken large quantities of the peruvian bark without proper evacuations. Dr. Pringle conſiders the ſcurvy as ariſing from a putrid cauſe only; and thinks that the ſpecies of that malady, ſaid to be owing to an acid, is ſo far from being ſo, that it were to be wiſhed this ſuppoſed ſpecies of ſcurvy had not been denominated of this diſtemper, and the more ſo, as he apprehends that in the countries moſt liable to the true ſcurvy, an acid is rarely to be blamed. He thinks, that if the acrimony of the fluids is great and ſudden, a fever or flux will enſue; but if the accumulation is ſo ſlow, that the body grows habituated to the putrefaction, a ſcurvy prevails; this is the caſe in long voyages, occaſioned by corrupted air and proviſions, on board unventilated ſhips, in marſhy countries from ſimilar cauſes, and in a leſſer degree in all northerly climates in moſt ſituations, from a want of due perſpiration of what is putrid, and eſpecially with the uſe of ſalted meats.

The ſcurvy, according to Sydenham, is known by a ſpontaneous wearineſs, a heavineſs of the body, difficulty of breathing eſpecially after motion, rottenneſs of the gums, a ſtinking breath, frequent bleeding of the noſe, difficulty of walking, ſometimes a ſwelling and ſometimes a falling away of the legs, in which there are always livid, plumbeous, yellow, or violet-coloured ſpots, and the colour of the face is generally of a pale tawney.

Boerhaave obſerves, that the firſt ſtate of this diſeaſe begins with unuſual lazineſs, ſpontaneous wearineſs; the patient loves to be in a ſitting or lying poſture; there is a pain in all the muſcles, as if he was overtired, eſpecially in the legs and loins; when he awakes in the morning, all his joints and muſcles ſeem to be tired and bruiſed. In the ſecond ſtate, the gums ſwell, grow painful, hot, and itching, and bleed upon the leaſt preſſure: the roots of the teeth become bare and looſe; he feels pains in all the external and internal parts of the body, imitating diſtempers proper to the various parts. In the third ſtate, the gums at length grow putrid, with a cadaverous ſmell: when they are inflamed, blood diſtils from them, and a gangrene enſues; the looſe teeth by degrees grow yellow, black, and rotten; the ſublinguar veins become varicoſe and like rings; there are often fatal hæmorrhages, which break out from the external ſkin, without any appearance of a wound, from the lips, gums, mouth, noſe, lungs, ſtomach, liver, ſpleen, pancreas, inteſtines, womb, kidneys, *&c.* Obſtinate ulcers ariſe, which no application will cure, and are apt to turn to a gangrene; they break out in all parts of the body, but eſpecially the legs, and are attended with a ſtench; there is a kind of itch and dry ſcabs, with a dry and mild leproſy; the blood drawn from a vein is black and grumous, thick, and yet wants its due conſiſtence in the fibrous part; the ſerum is ſalt, ſharp, and abounding with a yellowiſh green mucus on the ſurface: there are gnawing rending pains, quickly ſhifting from place to place, which grow more violent in the night, affecting all the joints, bones, and viſcera. In the fourth ſtate there are fevers of various kinds, which bring on an atrophy; ſometimes diarrhæas, dyſenteries, or violent ſtranguries; as alſo faintings and mortal anxieties, a dropſy, conſumption, convulſions, trembling, a palſy, contractions, black ſpots, voiding of blood upwards and downwards, a putrefaction and conſumption of the liver, ſpleen, pancreas, meſentery: and now the contagion ſpreads very quick.

From this account of the diſeaſe it appears, continues the laſt-mentioned author, that one part of the blood is faulty in being too thick, and the other in being too thin, with a ſalt, alkaline, or acid acrimony; wherefore, to diſcover which of the three predominates, requires the utmoſt attention, and the moſt accurate enquiry: for, in the cure of this diſ-

eaſe,

caſe, that which is thick is to be attenuated, that which is ſtagnant rendered moveable, and that which is coagulated is to be made fluid.

It ought to be laid down, ſays Hoffman, as a general rule, that the ſcurvy, the moſt virulent of all chronical diſtempers, is not to be treated with draſtic, but with the moſt mild and ſimple medicines: likewiſe the patient ſhould change the air in which the diſeaſe was formed, and remove from unhealthy places, where the air is impure, vapid, and deprived of its due elaſticity, cloudy, or impregnated with noxious exhalations, to places more ſalutary, and where the air is more pure. If his circumſtances will not admit of travelling to Italy or France for a purer air, he ſhould burn juniper-wood in his chimney, or throw amber on live coals. The patient ſhould alſo uſe exerciſe, not indulge himſelf in much ſleep, be temperate in his diet, and feed upon aliment of eaſy digeſtion. Our author ventures to affirm, that mineral waters are a univerſal remedy for the ſcurvy; but the cure is ſtill more certain, if an accurate regimen be obſerved, and the waters aſſiſted by the repeated exhibition of proper antiſcorbutic and balſamic medicines. When theſe cannot be had, pure light fountain-water, wherein hot iron has been extinguiſhed, may be ſubſtituted in their room. Beſides mineral waters, nothing is more effectual in correcting a ſcorbutic acrimony than a milk-diet, or whey, or whey impregnated with the juices of antiſcorbutic herbs, as ſcurvy-graſs, and water-creſſes. Scurvy-graſs and all the ſpecies of garden and water-creſſes, horſe-radiſh, the roots of wild-radiſh, and muſtard are juſtly looked upon as antiſcorbutics, for they induce a ſurpriſing change both in the diſordered fluids and ſolids. To theſe may be added the roots of gentian and ſuccory, the leaves of ſcordium, carduus benedictus, wormwood, the leſſer centaury, water-trefoil, or bucks-beans. Balſamics and corroboratives, as juniper-berries, the tops of fir and pine-trees, winters-bark, cortex elutheriæ, and the peruvian bark: the gums ammoniac, ſagapenum, and galbanum; and the woods of ſaſſafras, guaiacum, and aloes. Medicines which allay the pains and ſpaſms, are the fat of animals, cream, oil of ſweet almonds, ſperma ceti, caſtor, aſſa fœtida, extracts of yarrow and chamomile, diaſcordium, ſaffron, earth-worms, elk-hoof, &c. As to evacuations, bleeding ſhould be uſed with the greateſt caution; and none but the gentleſt purges ſhould be uſed, ſuch as ſena, rhubarb, or manna; alſo pills made after the manner of Becher, with depurated aloes, extract of rhubarb, bitter herbs, and temperate balſamic ingredients. The diuretics ſhould not be ſtronger than the decoction of the roots of parſley, celeri, fennel, and aſparagus. The ſafeſt diaphoretics are dulcified ſpirit of nitre, flowers of ſulphur, æthiops mineral, infuſions in the manner of tea of Paul's betony, carduus benedictus, ſcordium, and elder-flowers, diaphoretic antimony, calcined and uncalcined hartſhorn, amber, native cinnabar, cinnabar of antimony, and compound powder of crab's claws: theſe things are adapted to a cold ſcurvy. But in the hot or alcaline, ſcurvy-graſs is too hot to be adminiſtered alone; wherefore it ſhould be corrected with acids, ſuch as wood-ſorrel, the juices of citrons, oranges, barberries, and pomegranates; this ſhould be accompanied with milk-meats, almond-emulſions, barley-broths, water-gruel, chicken-broths, with endive, lettuce, ſorrel, and creſſes, at intervals. When the ſcurvy proceeds from muriatic ſalts, which happens to thoſe who live on ſmoked or high-ſalted fiſh or fleſh, then whey, copiouſly drank, produces good effects; as alſo citrons, china-oranges, and ripe fruits; whereas ſpirituous and volatile antiſcorbutics are generally detrimental. Heiſter ſays, that when there is a continual ſalt taſte in the mouth, lime-water, drank morning and evening, is a high ſpecific. The late biſhop of Cloyne ſays, that if he may truſt what trials he has been able to make, tar-water is good in the ſeveral ſorts of ſcurvy, whether alkaline, acid, or muriatic; and that he believes it to be the only medicine that cures them all, without doing hurt in any. See TAR-WATER.

In a high degree of the ſcurvy, mercurial ſalivation is looked upon by many as the only cure; which, by the vehement ſhock it gives the whole frame, and the ſenſible ſecretion it produces, may be thought to be more adequate to ſuch an effect; but the diſorder occaſioned by that violent proceſs, it is to be feared, may never be got over. See SALIVATION.

SCURVY-GRASS, *cochlearia*, in botany. See the article COCHLEARIA.

SCUTAGE was antiently a tax impoſed on ſuch as held lands, &c. by knight's ſervice, towards furniſhing the king's army;

army: hence ſcutagio habendo was a writ that lay for the king, or other lord, againſt tenants holding by knight's ſervice, to ſerve in perſon, or ſend a ſufficient man in their room, or pay a certain ſum, &c.

SCUTARET, or SCUTARI, a caſtle and ſeraglio on the eaſt ſide of the Boſphorus, oppoſite to Conſtantinople, about a mile from it.

SCUTARI, a city of european Turky, in the province of Albania, ſituated in eaſt longit. 20°, and north lat. 42° 30'.

SCUTCHEON. See ESCUTCHEON.

SCUTELLARIA, in botany, a genus of the *didynamia-gymnoſpermia* claſs of plants, the corolla whereof conſiſts of a ſingle ringent petal; the tube is very ſhort, and reflected backwards; the faux is long and compreſſed; the upper lip is concave and trifid, and the middle lacinula concave and emarginated; there is no pericarpium; the mouth of the calyx is originally open, but after the flower is fallen it becomes ſhut, with an operculum; the ſeeds are roundiſh, and four in number. This genus comprehends the caſſida of Tournefort.

This plant is recommended as good in tertian agues.

SCUTIFORME OS, in anatomy, the chief bone of the knee, called alſo patella, mola, &c. See the article PATELLA.

SCUTIFORMIS CARTILAGO, in anatomy, one of the cartilages of the larynx, the broadeſt and biggeſt of them all, called alſo thyroides. See the article LARYNX. This cartilage is of a quadrangular figure, and ſtands in the anterior part, where the pomum Adami makes its prominence, whence it is ſometimes called the anterior cartilage. It is gibbous without ſide, and hollow within; ſometimes double, chiefly in women, in whom it does not advance ſo far forward as in men.

SCUTTLES, in a ſhip, ſquare holes cut in the deck, big enough to let in the body of a man, ſerving to let people down into any room below upon occaſion, or from one deck to another. They are generally before the main-maſt, before the knight in the forecaſtle; in the gun-room, to go down to the ſtern-ſheets; in the round-houſe, to go down into the captain's cabin, when forced by the enemy in a fight aloft. There are alſo ſome ſmaller ſcuttles, which have gratings over them: and all of them have covers, that people may not fall down through them in the night.

Scuttle is alſo a name given thoſe little windows and long holes which are cut out in cabins, to let in light.

SCYTALA, in mechanics, a term uſed by ſome writers, for a kind of radius, or ſpoke, ſtanding out from the axis of a machine, as an handle or lever to turn it round and work it by.

SCYTALA LACONICA, a ſtratagem or device of the Lacedemonians, for the ſecret writing of letters to their correſpondents, ſo that if they ſhould chance to be intercepted, no body might be able to read them. To this end they had two wooden rollers or cylinders, perfectly alike and equal, one whereof was kept in the city, and another by the perſon to whom the letter was directed. For the letter, a ſkin of a very thin parchment was wrapped round the roller, and thereon was the matter written; which done, it was taken off, and ſent away to the party, who, upon putting it in the ſame manner upon his roller, found the lines and words in the very ſame diſpoſition as when they were firſt written.

SCYTHIA. The northern parts of Europe and Aſia were antiently ſo called, which afterwards obtained the name of Tartary.

SEA, *mare*, is frequently uſed for that vaſt tract of water encompaſſing the whole earth; but is more properly a part or diviſion of theſe waters, and is better defined a leſſer aſſemblage of water, which lieth before and waſheth the coaſts of ſome particular countries, from whence it is generally denominated, as the Iriſh ſea, the Mediterranean ſea, the Arabian ſea, &c.

What proportion the ſuperficies of the ſea bears to that of the land is not preciſely known, though it is ſaid to be ſomewhat more than two thirds. As the waters of the earth muſt neceſſarily riſe to the ſurface thereof, as being ſpecifically lighter than the earth, it was neceſſary there ſhould be large cavities therein for receptacles to contain them, otherwiſe they would have overſpread all the ſuperficies of the earth, and ſo have rendered it utterly uninhabitable for terreſtrial animals; for the center of the earth being the common center of gravity, and the nature of fluids being ſuch, that they equally yield to equal powers; and the power of attraction being every where equal at equal diſtances from the center, it follows, that the ſuperficial parts of the water will every where conform themſelves

to an equidiſtant ſituation from the center, and conſequently will form the ſurface of a ſphere, ſo far as they extend. Hence, that the ſea ſeems higher than the earth or land, reſults from the fallacy of viſion, whereby all objects, and the parts of land as well as ſea, the farther they are off from us, the higher they appear; the reaſon of all which is plain from optics: for it is well known, that the denſer any medium is, through which we behold objects, the greater is the refraction; or the more their images appear above the horizontal level; alſo the greater quantity of the medium the rays paſs through, the more will they be bent from their firſt direction; on both theſe accounts the appearances of things remote, and on the ſea, will be ſomewhat above the horizon, and the more ſo, as they are the more remote. See the articles GRAVITY, FLUID, EARTH, REFRACTION, &c.

With regard to the depth or profundity of the ſea, Varenius affirms, that it is in ſome places unfathomable, and in other places very various, being in certain places $\frac{1}{20}$, $\frac{1}{5}$, $\frac{45}{100}$, $1\frac{1}{10}$, $2\frac{2}{10}$, $4\frac{1}{2}$ engliſh miles, in other places deeper, and much leſs in bays than in oceans. In general, the depths of the ſea bear a great analogy to the height of mountains on the land, ſo far as is hitherto diſcovered. See the article MOUNTAIN.

M. Daſſie has been at great pains to prove that the ſea has a general motion, independent of winds and tides, and of more conſequence in navigation than is generally ſuppoſed. He affirms, that this motion is from eaſt to weſt inclining towards the north, when the ſun has paſſed the equinoctial northward, and that during the time the ſun is in the northern ſigns; but the contrary way after the ſun has paſſed the ſaid equinoctial ſouthward: adding, that when this general motion is changed, the diurnal flux is changed alſo; whence it happens that in ſeveral places the tides come in, during one part of the year, and go out during the other, as on the coaſts of Norway, in the Indies at Goa, Conchinchina, &c. where, while the ſun is in the ſummer ſigns, the ſea runs to the ſhore; and when in the winter ſigns, runs from it. On the moſt ſouthern coaſts of Tonquin and China, for the ſix ſummer months, the diurnal courſe runs from the north with the ocean; but the ſun having repaſſed the line toward the ſouth, the courſe declines alſo ſouthward.

There are two principal reaſons why the ſea doth not increaſe by means of rivers, &c. falling every where into it. The firſt is, becauſe waters return from the ſea by ſubterranean cavities and aqueducts, through various parts of the earth. Secondly, becauſe the quantity of vapours raiſed from the ſea, and falling on the land, only cauſe a circulation, but no increaſe of water. It hath been found by calculation, that in a ſummer's day there may be raiſed in vapours, from the Mediterranean ſea 528000000 tuns of water; and yet this ſea receiveth not, from all its nine great rivers, above 182700000 tuns per day, which is but a third part of what is exhauſted in vapours.

The aſcent of the ſea-water, for the formation of ſprings, by a ſubterranean circulation of its water to their ſources, has been a great objection with many, againſt the ſyſtem of their being formed of the ſea; but Dr. Plot has obſerved, that there are many ways by which the water may aſcend above its own level: 1. By the means of ſubterranean heats. 2. By filtration. 3. By the unequal height of ſeveral ſeas. 4. By the diſtance of the center of magnitude from the center of gravity in the terraqueous globe: the ſuperficies of the Pacific ſea is ſaid to be farther from the center of gravity than the top of the higheſt hill on the adverſe part of the globe. And, 5. By the help of ſtorms. The ſea-water actually aſcends above its own level, in coming into wells, whoſe bottoms lie higher than the ſurface of the ſea at high-water mark.

With regard to the ſaltneſs of the ſea-water, it is very rationally judged to ariſe from great multitudes both of mines and mountains of ſalt, diſperſed here and there in the depths of the ſea. The ſalt being continually diluted and diſſolved by the water, the ſea becomes impregnated with its particles throughout; and for this reaſon the ſaltneſs of the ſea can never be diminiſhed. Dr. Halley ſuppoſes that it is probable the greateſt part of the ſea-ſalt, and of all ſalt lakes, as the Caſpian ſea, the Dead ſea, the Lake of Mexico, and the Titicaca in Peru, is derived from the water of the rivers which they receive; and ſince this ſort of lakes has no exit or diſcharge, but by the exhalation of vapours; and alſo ſince theſe vapours are entirely freſh, or devoid of ſuch particles, it is certain the ſaltneſs of the ſea and ſuch lakes muſt, from time

to

to time increaſe, and therefore the ſaltneſs at this time is greater than at any time heretofore. He further adds, that if, by experiments made in different ages, we could find the different quality of ſalt, which the ſame quantity of water (taken up in the ſame place, and in all other the ſame circumſtances) would afford, it would be eaſy from thence, by rules of proportion, to find the age of the world very nearly, or the time wherein it has been acquiring its preſent ſaltneſs.

With regard to the uſe of this ſalt property of ſea-water, it is obſerved that the ſaltneſs of the ſea preſerves its waters pure and ſweet, which otherwiſe would corrupt and ſtink like a filthy lake, and conſequently that none of myriads of creatures that now live therein, could then have a being. From thence alſo the ſea-water becomes much heavier, and therefore ſhips of greater ſize and quantity may be uſed thereon. Salt water alſo doth not freeze ſo ſoon as freſh water, whence the ſeas are more free for navigation. We have lately had publiſhed a diſſertation, by Dr. Ruſſel, concerning the medical uſes of ſea-water, in diſeaſes of the glands, *&c.* wherein the author premiſes ſome obſervations upon the nature of ſea-water, conſidered as impregnated with particles of all the bodies it paſſes over, ſuch as ſubmarine plants, fiſh, ſalts, minerals, *&c.* and ſaturated with their ſeveral effluvia, to enrich it, and keep it from putrefaction; hence this fluid is ſuppoſed to contract a ſoapineſs, and the whole collection being pervaded by the ſulphureous ſteams paſſing through it, to conſtitute what we call ſea-water, the confeſſed diſtinguiſhing characteriſtics of which are ſaltneſs, bitterneſs, nitroſity, and unctuoſity: whence the author concludes, that it may be juſtly expected to contribute ſignally to the improvement of phyſic. The caſes in which our author informs us we are to expect advantage from ſea-water, are, 1. In all recent obſtructions of the glands of the inteſtines and meſentery. 2. All recent obſtructions of the pulmonary glands, and thoſe of the viſcera, which frequently produce conſumptions. 3. All recent glandular ſwellings of the neck, or other parts. 4. Recent tumours of the joints, if they are not ſuppurated, or become ſcirrhous, or cancerous, and have not carious bones for their cauſe. 5. Recent defluxions upon the glands of the eye-lids. 6. All deſœdations of the ſkin, from an eryſipelas, to a lepra. 7. Diſeaſes of the glands of the noſe, with their uſual companion a thickneſs of the lip. 8. Obſtructions of the kidneys, when there is no inflammation, and the ſtone not large. 9. In recent obſtructions of the liver this method will be proper, where it prevents conſtipations of the belly, and aſſiſts other medicines directed in icteric caſes. The ſame remedy is ſaid to be of ſignal ſervice in the bronchocele; and is likewiſe recommended for the prevention of thoſe bilious colics that ſo frequently affect our mariners.

To make ſea-water freſh is a thing long and much wanted, for the advantage of navigation and commerce; a method for doing which has been long ago invented by Mr. Hauton, and the ſecret publiſhed in the Philoſ. Tranſact. It is performed by precipitating the water with oil of tartar, and then diſtilling it. But Mr. Appleby's proceſs, which was referred by the lords of the admiralty to the college of phyſicians, and communicated to the royal ſociety, with ſome experiments therewith, on Feb. 8, 1753, appears to be more ſucceſsful, and is performed thus: into twenty gallons of ſea-water put ſix ounces of a fixed alkali, prepared with quick-lime as ſtrong as lapis infernalis, and ſix ounces of bones, calcined to a whiteneſs, and finely powdered; with a ſlow fire, draw off, in a common ſtill, fifteen gallons. Mr. Appleby conceives that the alkali here employed is the beſt adapted to prevent the bituminous matter in ſea-water from riſing by heat in diſtillation.

For the ebbing and flowing of the ſea, ſee the article TIDES.

For the ſea-army, ſea-aſtrolabe, ſea-biſket, ſea-chart, ſea-compaſs, *&c.* ſee the articles ARMY, ASTROLABE, BISKET, CHART, *&c.*

SEA-MEN, ſuch as are reſerved to ſerve the king, or other perſons, at ſea, who may not depart without licenſe, *&c.* Seamen fighting, quarreling, or making any diſturbance, may be puniſhed by the commiſſioners of the navy, with fine and impriſonment. Regiſtered ſea-men are exempted from ſerving in any pariſh-office, *&c.* and are allowed bounty-money beſides their pay. By the law of merchants, the ſea-men of a veſſel are accountable to the maſter or commander, and the maſter to the owners, and the owners to the merchants, for damage ſuſtained either by negligence or otherwiſe. Where a ſea-

man is hired for a voyage, and he deſerts it before it is ended, he ſhall loſe his wages; and in caſe a ſhip be loſt by a tempeſt, or in a ſtorm, the ſea-men loſe their wages, as well as the owners their freight. See NAVAL AFFAIRS.

SEAFORD, a port-town of Suſſex, ſituated on the engliſh channel, ſeven miles ſouth of Lewes.

It ſends two members to parliament.

SEAL, *ſigillum*, a puncheon, or piece of metal, or other matter, uſually either round or oval, whereon are engraven the arms, device, &c. of ſome prince, ſtate, community, magiſtrate or private perſon, often with a legend or ſubſcription, the impreſſion whereof in wax, ſerves to make acts, inſtruments, &c. authentic.

Before the time of William the conqueror, the makers of all deeds only ſubſcribed their names, adding the ſign of the croſs, and a great number of witneſſes; but that monarch and the nobility uſed ſeals with their arms on them, which example was afterwards followed by others. The colour of the wax wherewith this king's grants were ſealed was uſually green, to ſignify that the act continued freſh for ever, and of force.

A ſeal is abſolutely neceſſary in reſpect of deeds, becauſe the ſealing of them makes perſons parties thereto, and without being ſealed, they are void in law. It is held, that if a ſeal be broken off, it will render the deed void, and that where ſeveral are bound in a bond, the pulling off the ſeal of one vacates it as to all the reſt.

The king's great ſeal is that whereby all patents, commiſſions, warrants, &c. coming from the king are ſealed. The keeping hereof is in the hands of the lord high chancellor, who is hence denominated lord keeper. Indeed there is ſome difference between the lord chancellor and lord keeper, not in office, but in the manner of creation, the latter being made by the delivery of the great ſeal to him by the king, but the former having a patent. The king's privy ſeal is a ſeal that is uſually firſt ſet to grants that are to paſs the great ſeal. See KEEPER.

SEAL is alſo uſed for the wax or lead, and the impreſſion thereon, affixed to the thing ſealed.

SEALER, an officer in chancery appointed by the lord chancellor or keeper of the great ſeal, to ſeal the writs and inſtruments there made in his preſence.

SEALING, in architecture, the fixing a piece of wood or iron in a wall with plaſter, mortar, cement, lead, and other ſolid binding. For ſtaples, hinges and joints, plaſter is very proper.

SEALING-WAX. See the article WAX.

SEAM or SEME *of corn*, is a meaſure of eight buſhels.

SEAM *of glaſs*, the quantity of 120 pound, or 24 ſtones, each five pounds weight. The ſeam of wood is an horſe load.

SEAMS *of a ſhip*, are places where her planks meet and join together. There is alſo a kind of peculiar ſeam in the ſowing of ſails, which they call monk-ſeam; the other ſeam of a ſail is the round ſeam, ſo called from its being round like the common ſeams.

SEARCE. See the article SIEVE.

SEARCHER. See the article ALNAGER.

Searcher is alſo an officer of the cuſtoms, whoſe buſineſs is to ſearch and examine all ſhips outward bound, to ſee whether they have any prohibited or unaccuſtomed goods on board.

SEAR-CLOTH, or CERE-CLOTH, in ſurgery, a form of external remedy ſomewhat harder than an unguent, yet ſofter than an emplaſter, though it is frequently uſed both for the one and the other. The ſear-cloth is always ſuppoſed to have wax in its compoſition, which diſtinguiſhes and even denominates it. In effect, when a liniment or unguent has wax enough in it, it does not differ from a ſear-cloth. Sear-cloths are a kind of ſubſtitutes to friction, and are ſometimes uſed for other purpoſes; the beſt are compounded of reſolvent drugs, as ſaffron, myrrh, and aloes, incorporated with wax and gums, as galbanum, gum ammoniac, and ſagapenum, the whole tempered with wine.

SEASE. See the article SEIZE.

SEASIN, or SEASING, in a ſhip, the name of a rope by which the boat rides by the ſhip's ſide when in harbour, &c.

SEASONS, in coſmography, certain portions or quarters of the year, diſtinguiſhed by the ſigns which the earth then enters, or by the meridian altitudes of the ſun, conſequent on which are different temperatures of the air, different works in tillage, &c. The year is divided into four ſeaſons, ſpring, ſummer, autumn, and winter. The beginnings and endings of each whereof, ſee under its proper article, SPRING, &c.

How the courſe of the earth's revolution about the ſun conſtitutes all the variety

of

of the ſeaſons, may be ſeen under the article EARTH.

SEASONING *of timber*. See TIMBER.

SEAT, in aſtronomy. See SHEAT.

SEAT, in the manege, the poſture or ſituation of a horſeman upon the ſaddle.

SEBASTIAN ST. a port-town of Spain, in the province of Biſcay, and territory of Guipuſcoa, ſituated in weſt long. 1° 50′, north lat. 43° 35′.

SEBESTENA, or CORDIA, SEBESTEN, in botany. See the article CORDIA.

The fruit of the ſebeſten is an attenuant and reſolvent, and has been frequently given in peripneumonies, in diſeaſes of the breaſt and lungs in general, and in ſtranguries and hoarſeneſſes, but now it is much grown out of uſe.

SEBUM, SUET, in anatomy. See the article SUET.

SECALE, or SECALINA, RYE, in botany, a genus of the *triandria-digynia* claſs of plants, the corolla whereof conſiſts of two valves; the exterior valve is rigid, ventricoſe, acuminated and compreſſed, its lower edge is ciliated, and it terminates in a long ariſta: the interior valve is lanceolated and plane; the nectaria are two, ovated and erect; the corolla ſerves the office of a pericarpium, incloſing the ſeed, and, at a proper time, opening and dropping it out; the ſeed is ſingle, oblong, and almoſt cylindric. See RYE.

SECANT, in geometry, is a line that cuts another, or divides it into two parts. See the article LINE.

Thus the line AM (plate CCXLIII. fig. 7. n° 1.) is a ſecant of the circle AED, *&c.* as it cuts it in B.

It is demonſtrated by geometers, 1. That if ſeveral ſecants MA, MN, ME, *&c.* be drawn from the ſame point M, that paſſing through the center MA is the greateſt, and the reſt are all ſo much the leſs as they are more remote from the center. On the contrary, the portions thereof without the circle MD, MO, MB, are ſo much the greater as they are farther from the center. 2. That if two ſecants, MA and ME be drawn from the ſame point M, the ſecant MA will be to ME, as MD to MB. See the article TANGENT.

In trigonometry, the ſecant denotes a right line drawn from the center of a circle, which cutting the circumference, proceeds till it meets with a tangent to the ſame circle: thus the line FC (*ibid.* n° 2.) drawn from the center C till it meet the tangent EF, is called a ſecant; and particularly the ſecant of the arch AE to which EF is a tangent. The ſecant of the arch AH, which is the complement of the former arch to a quadrant, is called the co-ſecant, or ſecant of the complement. See the articles CIRCLE, COMPLEMENT, *&c.*

For the properties and uſe of the ſecant, ſee the articles TRIGONOMETRY, NAVIGATION, SURVEYING, *&c.*

For the line of ſecants on the ſector, ſee the article SECTOR.

SECOND, in geometry, chronology, *&c.* the ſixtieth part of a prime or minute, whether of a degree, or of an hour: it is denoted by two ſmall accents, thus (″). See DEGREE, HOUR, MINUTE, *&c.*

SECOND, in muſic, one of the muſical intervals; being only the difference between any ſound, and the next neareſt ſound, whether above or below it. See the article INTERVAL.

As in the compaſs of a tone ſome reckon nine ſenſible ſounds, and others ten, which form the intervals called commas; ſo there are eight kinds of ſeconds according to the former opinion, and nine according to the latter. However, in practice, they uſually diſtinguiſh only four ſorts. 1. That called a diminiſhed ſecond, containing four commas; being the difference, for inſtance, of a natural *ut*, and an *ut* ſharp. 2. That called a ſecond minor, or imperfect ſecond, containing five commas, *viz.* from *mi* to *fa*; or from *la* to B *mol*; or from *fa* ſharp to *ſol*. 3. A major ſecond, called by the Italians a perfect ſecond, containing nine commas. 4. A redundant ſecond, compoſed of a whole tone, and a minor ſemitone.

SECONDARY, in general, ſomething that acts as ſecond, or in ſubordination to another.

Secondary circles of the ſphere, are circles paſſing through the poles of ſome great circle: thus the meridians and hour-circles are ſecondaries to the equinoctial. There are alſo ſecondaries paſſing through the poles of the ecliptic, by means of which all ſtars are referred to the ecliptic. See the articles ECLIPTIC, LONGITUDE, SPHERE, *&c.*

SECRETARY, an officer who by his maſter's orders writes letters, diſpatches, and other inſtruments, which he renders authentic by his ſignet. Of theſe there are ſeveral kinds; as, 1. Secretaries of ſtate, who are officers that have under their management and direction the moſt

important

important affairs of the kingdom, and are obliged conſtantly to attend on the king: they receive and diſpatch whatever comes to their hands, either from the crown, the church, the army, private grants, pardons, diſpenſations, *&c.* as likewiſe petitions to the ſovereign; which when read, are returned to them; all which they diſpatch according to the king's direction. They have authority to commit perſons for treaſon, and other offences againſt the ſtate, as conſervators of the peace at common law, or as juſtices of the peace throughout the kingdom. They are members of the privy-council, which is ſeldom or never held without one of them being preſent; and as to the buſineſs and correſpondence in all parts of this kingdom, it is managed by either of the ſecretaries without any diſtinction; but with reſpect to foreign affairs, the buſineſs is divided into two provinces, or departments, the ſouthern and the northern, comprehending all the kingdoms and ſtates that have any intercourſe with Great Britain; each ſecretary receiving all letters and addreſſes from, and making all diſpatches to, the ſeveral princes and ſtates comprehended in his province: which diviſion ſtill ſubſiſts, notwithſtanding the addition of a third ſecretary for Scotland. Ireland and the Plantations are under the direction of the elder ſecretary, who has the ſouthern province, which alſo comprehends France, Italy, Switzerland, Spain, Portugal, and Turky: the northern province includes the Low Countries, Germany, Denmark, Sweden, Poland, and Muſcovy. Each of the ſecretaries have an apartment in all the royal houſes, both for their own accommodation and their officers; they have alſo a table at the king's charge, or elſe board-wages. The two ſecretaries for South Britain, have each two under ſecretaries, and one chief clerk; and the ſecretary for North Britain has an under ſecretary, and one chief clerk, with an uncertain number of other clerks and tranſlators, all wholly depending on them. To the ſecretaries of ſtate belong the cuſtody of that ſeal properly called the ſignet, and the direction of two other offices, one called the paper-office, and the other the ſignet-office. See the articles PAPER-OFFICE and SIGNET-OFFICE.

2. Secretary of an embaſſy, a perſon attending an embaſſador for writing diſpatches relating to the negotiation. There is a great difference between the ſecretary of an embaſſy, and the embaſſador's ſecretary; the laſt being a domeſtic or menial of the embaſſador, and the firſt, a ſervant or miniſter of the prince.

3. The ſecretary of war, an officer of the war-office, who has two chief clerks under him, the laſt of which is the ſecretary's meſſenger. There are alſo ſecretaries in moſt of the other offices.

SECRETION, *ſecretio*, in the animal oeconomy, the ſeparation of ſome fluid mixed with the blood by means of the glands. See the article GLAND.

In the bodies of animals we obſerve a great number of juices of different natures, *viz.* the blood, lympha, ſaliva, ſtomach-liquor, inteſtinal juices, pancreatic juice, bile, urine, *&c.* and the blood is the general ſource of all. See the article BLOOD, LYMPH, SALIVA, *&c.*

The manner wherein this ſecretion is performed, has been greatly enquired into for a century paſt; but as the exceeding minuteneſs of the organs whereby ſecretion is effected prevents any regular ſearch, various authors have imagined various methods for explaining it. The antient phyſicians contented themſelves only with aſſerting certain particular virtues or faculties inherent in the viſcera, whereby they were determined to ſeparate one liquor rather than another. Some of the moderns, full of the effects they have obſerved from fermentations, maintain, that there are ferments in the ſeveral parts, by the aid whereof certain kinds of particles mixed in the blood are ſeparated therefrom, after the ſame manner as we ſee in muſt or new wine, from which, while fermenting, certain parts are detached in form of froth. Others conſider the glands as kinds of ſieves, whoſe holes having different figures, will only let paſs certain particles or molecules, whoſe figures reſemble thoſe of the holes; but the many inconveniencies which both theſe ſuppoſitions have to grapple with al, made ſome naturaliſts have recourſe to what is called imbibition: theſe maintain, that beſides the different diameters of the pores, it is required that the ſeveral parts be already imbued or moiſtened with a liquor like to that they are to filtre.

This opinion Winſlow adapted; and not ſatisfied with conjectural principles, applied himſelf to experiments, in order to inveſtigate the manner wherein ſecretion

is

is performed, and lays it down thus. It is well known that a piece of brown paper, which is only an aſſemblage of ſmall fibres compacted cloſe to each other, having once imbibed oil or water, will never let any other liquor paſs through it but of the ſame kind with what it is impregnated with; all others it ſtops. Now in the ſecretory ducts of the glands we find a parallel ſtructure, an aſſemblage of fine threads or filaments bound cloſe together, much as in brown paper, *&c.* only differently diſpoſed; this plexus then having once imbibed a certain juice, will not let paſs any of the liquors which arrive at the orifices of theſe ducts, but that which it had firſt imbibed: the cauſe of this phænomenon is referred to the attraction of coheſion, which is found ſtronger between the homogeneous than the heterogeneous parts of the ſame fluid. As the blood then is not a homogeneous liquor, but a compound of an infinity of different parts or molecules, ſome oily, others mucilaginous, aqueous, ſaline, ſubtile, groſs, *&c.* in its motion along the arteries of the gland, it becomes divided into all the little ramifications thereof, by which means its velocity is exceedingly abated, and the molecules are obliged to go off, one by one, through the narrow paſſage of the artery into the vein, and of conſequence to paſs over the orifice of the ſecretory ducts of the glands, whoſe down is already tinged with a juice of a certain nature: ſuch of the molecules, therefore, as are found of the ſame nature with the juice they met withal at the entrance of the ſecretory duct, join themſelves to them, and entering the ducts, are driven on by others that follow them, and are at length driven into the excretory duct. But how theſe parts ſhould have firſt imbibed the particular juices neceſſary for their reſpective ſecretions, is the queſtion. Mr. Winſlow thinks it probable that they had been imbued with the juices they were to filtrate at the firſt formation of the animal, or at the time when the ſolid parts were framed.

Kiel accounts for ſecretion from the joint conſideration of the different diameters of the veſſels, the different velocity of the blood, the different angles the ducts make with the arteries, and the different attraction of the various parts under all theſe different circumſtances. It is obſerved, that in this theory there is ſomething arbitrary and conjectural; beſides, that the reaſoning is carried on to ſuch a length, that in a thing, the principles whereof are ſo obſcure, the parts or organs ſo imperfectly known, and the whole proceſs carried on out of ſight, the mind cannot ſafely acquieſce in it.

Hales makes it evident from experiments, that the animal ſecretions are not made with the full force of the arterial blood, but more gradually and ſparingly, ſo as to be carried forward in thoſe very fine veſſels by an alternate pulſive force of the arterial fluid, and attractive power of the fine ſecerning veſſels, aſſiſted alſo by conſtant vibrations; for the animal fluids and ſolids are in an inceſſant, mutually, vibrating ſtate. In this manner, doubtleſs, the plentiful ſecretions are made into the ſtomach and guts, as alſo in the pancreas, meſenteric, ſalival, and other glands of the body; and thus alſo the perſpiring matter is carried off, not by the more protruſive force of the arterial blood alone, but alſo by the warmth and mutual action of the fluids and ſolids. See PERSPIRATION, *&c.*

For the uſe, *&c.* of the animal ſecretions, ſee EXCRETION and EXCREMENT.

SECT, *ſecta*, a collective term, comprehending all ſuch as follow the doctrines and opinions of ſome famous divine, philoſopher, *&c.* See the articles HERESY and SCHISM.

The principal ſects among the antient philoſophers were the epicureans, peripatetics, academics, ſtoics, pyrrhoniſts, *&c.* See the article EPICUREANS, *&c.*

Among the moderns, the newtonians, carteſians, *&c.* are the principal ones in Europe. See NEWTONIAN, *&c.*

And the calviniſts, lutherans, papiſts, anabaptiſts, arians, ſocinians, arminians, *&c.* are the principal ſects to be found among modern divines. See the article CALVINISTS, *&c.*

SECTION, in general, denotes a part of a divided thing, or the diviſion itſelf. Such, particularly, are the ſubdiviſions of a chapter; called alſo paragraphs and articles: the mark of a ſection is §.

SECTION, in geometry, denotes a ſide or ſurface appearing of a body or figure cut by another; or the place where lines, planes, *&c.* cut each other.

The common ſection of two planes is always a right line; being the line ſuppoſed to be drawn on one plane by the ſection of the other, or by its entrance into it.

SECTION *of a building*, in architecture, is the ſame with its profile; or a delineation of its heights and depths raiſed on a plane, as if the fabric was cut aſunder to diſcover its inſide.

Conic SECTIONS, in geometry. See the articles CONE and CONIC.

SECTOR, in geometry, is a part of a circle, comprehended between two radii and the arch; or it is a mixed triangle, formed by two radii and the arch of a circle. See the articles CIRCLE, ARCH, RADIUS, TRIANGLE, *&c.*

For the method of finding the area of a ſector, as well as of a ſegment of a circle, ſee the article SEGMENT.

SECTOR is alſo a mathematical inſtrument, of great uſe in finding the proportion between quantities of the ſame kind, as between lines and lines, ſurfaces and ſurfaces, *&c.* for which reaſon the French call it the compaſs of proportion.

The great advantage of the ſector above common ſcales, *&c.* is, that it is adapted to all radii, and all ſcales. For, by the line of chords, ſines, tangents, *&c.* on the ſector, we have lines of chords, ſines, tangents, *&c.* adapted to any radius betwixt the length and breadth of the ſector, when opened.

The ſector is founded on the fourth propoſition of the ſixth book of Euclid, where it is demonſtrated, that ſimilar triangles have their homologous ſides proportional; an idea of its foundation or theory may be conceived from what follows: let the lines AB, AC (plate CCXLIII. fig. 4.) repreſent the two legs of the ſector, and AD, AE, two equal ſections from the center. If now the points BC and DE be connected, the lines BC and DE will be parallel; therefore the triangles ADE, and ABC, will be ſimilar, and conſequently the ſides AD, DE, AB, BC, proportional; that is, as AD : DE :: AB : BC; whence, if AD be the half, third, or fourth part of AB, DE will be a half, third, or fourth part of BC. Whence it follows, that if AD be the chord, ſine, tangent, *&c.* of any number of degrees to the radius AB, DE will be the ſame to the radius BC.

Deſcription of the SECTOR. This inſtrument conſiſts of two equal legs, or rules of braſs, *&c.* riveted together, but ſo as to move eaſily on the rivet; (*ibid.* fig. 1, 2.) on the faces of the inſtrument are placed ſeveral lines; the principal of which are the line of equal parts, line of chords, line of ſines, line of tangents, line of ſecants, and line of polygons.

The line of equal parts, called alſo the line of lines, marked L, is a line divided into 100 equal parts, and, where the length of the leg will allow it, each of theſe is ſubdivided into halves and quarters. It is found on each leg, on the ſame ſide, and the diviſions numbered 1, 2, 3, 4, 5, *&c.* to 10, which is near the extremity of each leg. Note, in practice, 1 repreſents either 1, 10, 100, 1000, 10000, *&c.* as occaſion requires, in which caſe, 2, repreſents 2, 20, 200, 2000, 20000, *&c.* and ſo of the reſt. The line of chords, marked C on each leg, is divided after the uſual manner, and numbered 10, 20, 30, *&c.* to 60. The line of ſines, denoted on each leg by the letter S, is a line of natural ſines, numbered 10, 20, 30, *&c.* to 90. The line of tangents, denoted on each leg by the letter T, is a line of natural tangents, numbered 10, 20, 30, *&c.* to 45. Beſides which there is another little line of tangents on each leg, commencing at 45°, and extending to 75°, denoted by the letter *t*. Line of ſecants, denoted on each leg by the letter *ſ*, is a line of natural ſecants, numbered 10, 20, 30, *&c.* to 75, not commencing at the center of the inſtrument, but at ſome diſtance therefrom. The line of polygons, denoted by the letter P on each leg, is numbered 4, 5, 6, *&c.* to 12, which falls conſiderably ſhort of the center of the inſtrument. See CHORD, SINE, *&c.*

Beſides theſe lines, which are eſſential to the ſector, there are others placed near the outward edges on both ſides, and parallel thereto, which are in all reſpects the ſame as thoſe on Gunter's ſcale, and uſed after the ſame manner. Such are the lines of artificial ſines marked S, of artificial tangents marked T, and Gunter's line of numbers marked N; theſe lines do not extend to the end of the inſtrument. There are ſometimes other lines placed, to fill the vacant ſpaces, as the lines of hours, latitudes, and inclination of meridians, which are uſed the ſame as on the common ſcales. See the articles GUNTER, SCALE, *&c.*

The lines found by the ſector are of two kinds, lateral and parallel; the firſt are ſuch as are found by the ſides of the ſector, as AB, AC (*ibid.* fig. 4.) the latter ſuch as go acroſs from one leg to the other, as DE, BC. Note, the lines are not placed in the ſame order on

The SECTOR

T. Jefferys sculp.

all ſectors, but they may be eaſily found by the above directions.

Uſe of the line of equal parts on the SECTOR.

1. To divide a given line into any number of equal parts, ſuppoſe ſeven. Take the given line in your compaſſes, and ſetting one foot in a diviſion of equal parts, that may be divided by ſeven, for example, 70, whoſe ſeventh part is 10, open the ſector till the other point fall exactly on 70, in the ſame line on the other leg. In this diſpoſition, applying one point of the compaſſes to 10, in the ſame line, ſhut them till the other fall in 10, in the ſame line, on the other leg, and this opening will be the ſeventh part of the given line. Note, if the line to be divided be too long to be applied to the legs of the ſector, divide only one half, or one fourth by 7, and the double or quadruple thereof will be the ſeventh part of the whole.

2. To meaſure the lines of the perimeter of a polygon, one of which contains a given number of equal parts. Take the given line in your compaſſes, and ſet it parallel, upon the line of equal parts, to the number on each leg expreſſing its length. The ſector remaining thus, ſet off the length of each of the other lines parallel to the former, and the numbers each of them falls on, will expreſs their lengths.

3. A right-line being given, and the number of parts it contains, ſuppoſe 120, to take from it a ſhorter line, containing any number of the ſame parts, ſuppoſe 25. Take the given line in your compaſſes, open the ſector till the two feet fall on 120 on each leg; then will the diſtance between 25 on one leg, and the ſame number on the other, give the line required.

4. To multiply by the line of equal parts on the ſector. Take the lateral diſtance from the center of the line to the given multiplicator; open the ſector till you fit that lateral diſtance to the parallel of 1 and 1, or 10 and 10, and keep the ſector in that diſpoſition; then take in the compaſſes the parallel diſtance of the multiplicand, which diſtance, meaſured laterally on the ſame line, will give the product required. Thus, ſuppoſe it were required to find the product of 8, multiplied by 4: take the lateral diſtance from the center of the line to 4 in your compaſſes, *i. e.* place one foot of the compaſſes in the beginning of the diviſions, and extend the other along the line to 4. Open the ſector till you fit this lateral diſtance to the parallel of 1 and 1, or 10 and 10. Then take the parallel diſtance of 8, the multiplicand; *i. e.* extend the compaſſes from 8, in this line, on one leg, to 8 in the ſame line on the other, and that extent, meaſured laterally, will give the product required.

5. To divide by the line of equal parts on the ſector. Extend the compaſſes laterally from the beginning of the line to 1, and open the ſector till you fit that extent to the parallel of the diviſor; then take the parallel diſtance of the dividend, which extent, meaſured in a lateral direction, will give the quotient required. Thus ſuppoſe it was required to divide 36 by 4; extend the compaſſes, laterally, the beginning of the line to 1, and fit to that extent the parallel of 4, the diviſor; then extend the compaſſes parallel, from 36 on one leg, to 36 on the other, and that extent, meaſured laterally, will give 9, the quotient required.

6. To work any proportion by the ſector. Take the ſecond term lateral, and, opening the ſector, apply that extent parallel in the firſt term, and ſtay the ſector in that poſition; then take the parallel diſtance of the third term, which extent, meaſured laterally, gives the fourth term required. This is ſo eaſy, from what has already been ſaid, that it needs no example.

The uſe of the line of chords on the SECTOR.

1. To open the ſector ſo as the two lines of chords may make an angle or number of degrees, ſuppoſe 40. Take the diſtance from the joint to 40, the number of the degrees propoſed, on the line of chords; open the ſector till the diſtance from 60 to 60, on each leg, be equal to the given diſtance of 40; then will the two lines on the ſector form an angle of 40 degrees, as was required.

2. The ſector being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the center; the number whereon it terminates will ſhew the degrees, *&c.* required.

3. To lay off any number of degrees upon the circumference of a circle. Open the ſector till the diſtance between 60 and 60 be equal to the radius of the given circle; then take the parallel extent of the chord of the number of degrees on each leg of the ſector, and lay

it off on the circumference of the given circle. Hence any regular polygon may be eaſily inſcribed in a given circle.

Uſe of the line of polygons on the SECTOR.

1. To inſcribe a regular polygon in a given circle. Take the ſemi-diameter of the given circle in the compaſſes, and adjuſt it to the number 6, on the line of polygons, on each leg of the ſector: then, the ſector remaining thus opened, take the diſtance of the two equal numbers, expreſſing the number of ſides the polygon is to have; *e. gr.* the diſtance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, *&c.* Theſe diſtances carried about the circumference of the circle, will divide it into ſo many equal parts.

2. To deſcribe a regular polygon, *e. gr.* a pentagon, on a given right line. Take the length of the line in the compaſſes, and apply it to the extent of the number 5, 5, on the lines of polygons. The ſector thus opened, upon the ſame lines, take the extent, from 6 to 6; this will be the ſemi-diameter of the circle the polygon is to be inſcribed in. If, then, with this diſtance, from the ends of the given line, you deſcribe two arches of a circle, their interſection will be the center of the circle.

3. On a right line, to deſcribe an iſoſceles triangle, having the angles at the baſe double that at the vertex. Open the ſector, till the ends of the given line fall on 10 and 10 on each leg; then take the diſtance from 6 to 6. This will be the length of the two equal ſides of the triangle.

Uſe of the lines of ſines, tangents, and ſecants, on the SECTOR. By the ſeveral lines diſpoſed on the ſector, we have ſcales to ſeveral radiuſes; ſo that having a length or radius given, not exceeding the length of the ſector when opened, we find the chord, ſine, *&c.* thereto, *e. gr.* Suppoſe the chord, ſine, or tangent, of 10 degrees, to a radius of 3 inches, required; make 3 inches the aperture, between 60 and 60, on the lines of chords of the two legs; then will the ſame extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of the ſines on the other ſide; ſo that to whatever radius the line of chords is ſet, to the ſame are all the others ſet. In this diſpoſition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compaſſes, it will give the chord of 10 degrees. If the aperture of 10 and 10 be in like manner taken on the lines of ſines, it will be the ſine of 10 degrees. Laſtly, if the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10 degrees.

If the chord, or tangent, of 70 degrees were required; for the chord, the aperture of half the arch, *viz.* 35, muſt be taken, as before; which diſtance, repeated twice, gives the chord of 70 degrees. To find the tangent of 70 degrees to the ſame radius, the ſmall line of tangents muſt be uſed, the other only reaching to 45: making, therefore, 3 inches the aperture between 45 and 45 on the ſmall line; the extent between 70 and 70 degrees on the ſame, will be the tangent of 70 degrees to 3 inches radius.

To find the ſecant of an arch, make the given radius the aperture between 0 and 0 on the line of ſecants: then will the aperture of 10 and 10, or 70 and 70, on the ſaid lines, give the tangent of 10°, or 70°.

If the converſe of any of theſe things were required; that is, if the radius be required, to which a given line is the ſine, tangent, or ſecant, it is but making the given line, if a chord, the aperture on the line of chords, between 10 and 10, and then the ſector will ſtand at the radius required; that is, the aperture between 60 and 60, on the ſaid line, is the radius. If the given line were a ſine, tangent, or ſecant, it is but making it the aperture of the given number of degrees; then will the diſtance of 90 and 90 on the ſines, of 45 and 45 on the tangents, of 0 and 0 on the ſecants, be the radius.

Uſe of the SECTOR *in trigonometry.* 1. The baſe and perpendicular of a rectangled triangle being given, to find the hypotenuſe. Suppoſe the baſe AC (*ibid.* fig. 6.) 40 miles, and the perpendicular AB 30; open the ſector till the two lines of lines make a right angle: then for the baſe take 40 parts on the line of lines, on one leg; and for the perpendicular 30 on the ſame line, on the other leg: then the extent from 40 on the one, to 30 on the other, taken in the compaſſes, will be the length of the hypotenuſe, which line will be found 50 miles.

2. The perpendicular AB of a right-angled triangle ABC being given, 30, and the angle BCA, 37°, to find the hypo-

hypotenuſe BC. Take the given ſide AB, and ſet it over, on each ſide, upon the ſine of the given angle ACB; then the parallel diſtance of radius, or of 90 and 90, will be the hypotenuſe BC; which will meaſure 50 on the line of ſines.

3. The hypotenuſe and baſe being given, to find the perpendicular. Open the ſector, till the two lines of lines be at right angles; then lay off the given baſe on one of thoſe lines from the center. Take the hypotenuſe in your compaſſes, and, ſetting one foot in the point of the given baſe, let the other fall on the line of lines, on the other leg: the diſtance from the center to the point where the compaſſes fall, will be the length of the perpendicular.

4. The hypotenuſe being given, and the angle ACB, to find the perpendicular. Make the given hypotenuſe a parallel radius, *i. e.* make it the extent from 90 to 90 on the lines of ſines; then will the parallel ſine of the angle ACB be the length of the ſide AB.

5. The baſe and perpendicular AB given, to find the angle BCA. Lay off the baſe AC on both ſides of the ſector, from the center, and note its extent: then take the given perpendicular, and to it open the ſector, in the terms of the baſe; the parallel radius will be the tangent of BCA.

6. In any right-lined triangle, two ſides being given, with the included angle, to find the third ſide. Suppoſe the ſide AC (*ibid.* fig. 3.) 20, the ſide BC 30, and the included angle ACB 110°; open the ſector, till the two lines of lines make an angle equal to the given angle, *viz.* 110. Lay off the given ſides of the triangle from the center of the ſector, on each of the lines of lines; the extent between their extremes is the length of the ſide AB ſought.

7. The angles CAB and ACB given, and the ſide CB, to find the baſe AB. Take the given ſide CB, and turn it into the parallel ſine of its oppoſite angle CAB; and the parallel ſine of the angle ACB will be the length of the baſe AB.

8. The three angles of a triangle being given, to find the proportion of the ſides. Take the lateral lines of the ſeveral angles, and meaſure them in the line of lines; the numbers anſwering thereto give the proportion of the ſides.

9. The three ſides being given, to find the angle ACB. Lay the ſides AC, BC, along the line of lines, from the center; and ſet over the ſide AB in their terms: ſo is the ſector opened, in theſe lines to the quantity of the angle ACB.

10. The hypotenuſe AC (*bid.* fig. 5.) of a right angled ſpherical triangle ABC given, *e. gr.* 43°, and the angle CAB 20°; to find the ſide CB. The rule is: as radius is to the ſine of the given hypotenuſe 43°, ſo is the ſine of the given angle 20° to the ſine of the perpendicular CB. Take therefore 20° from the center, along the line of ſines, in your compaſſes, and ſet the extent from 90 to 90, on the two legs; and the parallel line of 43°, the given hypotenuſe, will, when meaſured from the center of the line of ſines, give 13° 30′, the ſide required.

11. The perpendicular BC, and the hypotenuſe AC being given, to find the baſe AB. As the ſine complement of the perpendicular BC is to radius, ſo is the ſine complement of the hypotenuſe to the ſine complement of the baſe. Make, therefore, the radius a parallel ſine of the given perpendicular, then the parallel ſine of the hypotenuſe meaſured along the line of ſines, will give the complement of the baſe required.

SECULAR, ſomething that is temporal, in which ſenſe the word ſtands oppoſed to eccleſiaſtical: thus we ſay, ſecular power, ſecular juriſdiction, *&c.*

Secular is more peculiarly uſed for a perſon who lives at liberty in the world, not ſhut up in a monaſtery, nor bound by vows, or ſubjected to the particular rules of any religious community; in which ſenſe it ſtands oppoſed to regular. The romiſh clergy is divided into ſecular and regular.

SECULAR GAMES, *ludi ſeculares*, in antiquity, ſolemn games held among the Romans once in an age. Theſe games laſted three days and as many nights, during which time ſacrifices were performed, theatrical ſhews exhibited, with combats, ſports, *&c.* in the circus. The occaſion of theſe games, according to Valerius Maximus, was to ſtop the progreſs of a plague. The firſt who had them celebrated at Rome was Valerius Publicola, the firſt conſul created after the expulſion of the kings. The ceremonies to be obſerved therein were found

prescribed in one of the books of the Sibyls. At the time of the celebration of the secular games, heralds were sent throughout all the empire, to intimate that every one might come and see those solemnities which he never yet had seen, nor was ever to see again. Authors are not agreed as to the number of years wherein these games returned, partly because the quantity of an age or seculum, among the antients, is not known, and partly on other accounts; some will have it that they were held every hundred years, and that the seculum or age was our century.

SECULAR POEM, *carmen seculare*, a poem sung or rehearsed at the secular games, of which kind we have a very fine piece among the works of Horace, being a sapphic ode at the end of his epodes.

SECULARIZATION, the act of converting a regular person, place, or benefice into a secular one. Almost all the cathedral churches were antiently regular, that is, the canons were to be religious; but they have been since secularized. For the secularization of a regular church, there is required the authority of the pope, that of the prince, the bishop of the place, the patron, and even the consent of the people. Religious that want to be released from their vow, obtain briefs of secularization from the pope.

SECUNDA AQUA, among chemists, *&c.* aqua fortis that has been already used to dissolve some metal.

SECUNDA SUPER ONERATIONE PASTURÆ, in law, a writ that lies where admeasurement of pasture has been made, and he that first surcharged the common, does again surcharge it, notwithstanding the admeasurement.

SECUNDARY, or SECONDARY. See the article SECONDARY.

SECUNDINES, *secundinæ*, *after birth*, in anatomy, the several coats or membranes wherein the fœtus is wrapped up in the mother's womb, as the chorion and amnios, with the placenta, *&c.* See the articles CHORION, AMNIOS, PLACENTA, ALLANTOIS, *&c.*

Hippocrates observes, that twins have always the same secundines. The secundines must never be left in the matrix, it being a foreign body which would destroy the mother. It is dangerous even to have the least piece of it left behind. See the article DELIVERY.

The human secundines are said to be of some use in medicine. Thus they are by some ordered to be applied warm as they come from the uterus to the face, in order to remove freckles. A water is also distilled from them in balnæo mariæ for destroying spots or blemishes of the face: when dried and reduced to a powder, they are used internally against epilepsies, for accelerating the delivery of the fœtus, and allaying the pain of wounds. The dose of this powder is from half a scruple to two scruples.

Dr. Grew, in his anatomy of plants, applies the term secundine to the fourth and last coat or cover of seeds, by reason this performs nearly the same office in plants, that the membranes investing the fœtus do in animals.

SECURIDACA, in botany, a genus of the *diadelphia-decandria* class of plants, the corolla whereof is papilionaceous; the vexillum is roundish and very large; the alæ are obtuse, and the carina lunulated. The fruit is roundish, ending in a very large, oblong, obtuse, perpendicular membrane, broadest above; the seed is single, and is invested with the whole pericarpium.

This plant taken inwardly is good for the stomach, and is an ingredient in antidotes used in a pessary with honey before coition, supposed to prevent conception.

SECURIDACA is also the name whereby some authors call the coronilla. See the article CORONILLA.

SECURITATE PACIS, in law, a writ lying for a person who is threatened with danger from another against him that threatens it issues out of the court of chancery, and is directed to the sheriff, *&c.*

SECURITATEM INVENIENDI QUOD SE NON DIVERTAT AD PARTES EXTERAS SINE LICENTIA REGIS, is an antient writ which lay for the king against any of his subjects, to stay them from going out of the kingdom to foreign parts.

SECUTORES, in antiquity, a kind of gladiators among the Romans, who fought against the retiarii. The secutores were armed with a sword and a buckler, to keep off the net or noose of their antagonists, and they wore a cask on their head.

This was also a name given to such gladiators as took the place of those killed in the combat, or who fought the conqueror.

SEDAN, a town of Champain, in France, situ-

ſituated on the river Maes, in eaſt long. 4° 45′, north lat. 49° 46′.

SEDANTIA, SEDATIVE MEDICINES, in pharmacy, ſuch medicines as are poſſeſſed of a power not only of compoſing, checking, and allaying the exorbitant and irregular motions of the ſolids and fluids, but alſo of alleviating and reſolving the painful ſpaſmodic ſtructures of the parts. As the effect of theſe medicines are very extenſive, we may juſtly include in their number paregorics, which not only relax and gently ſooth the rigid fibres, but alſo obtund the acrimony of the juices; anodynes, which alleviate the violence of racking pains; antiſpaſmodics, which mitigate and remove the ſpaſmodic ſtructures of the parts; antiepileptics, which check convulſive motions; hypnotics, which procure ſleep; and narcotics, which induce a conſiderable ſtupor of the ſenſes and torpor of all the motions of the body. See PAREGORIC, ANODYNE, ANTISPASMODIC, &c.

SE DEFENDENDO, in law, a plea uſed for him that is charged with the death of another, by alledging that he was under a neceſſity of doing what he did in his own defence; as that the other aſſaulted him in ſuch a manner, that if he had not done what he did, he muſt have been in hazard of his own life. But here the danger muſt appear ſo great, as to be inevitable. Any perſon in his juſt defence may kill others for the ſafety of his life; though if malice be coloured under a pretence of neceſſity, or one kill another before he is under a neceſſity of ſo doing, the ſame may be either murder or manſlaughter by our law. See the articles MURDER and MANSLAUGHTER. Where two perſons ſuddenly fall out, and one of them, being attacked, flies to the wall, or any unpaſſable place, as far as he can, in order to ſave his life, but being ſtill purſued, kills the perſon that attacked him, this killing, as well as others in the like caſes, is ſe defendendo. In ſe defendendo, though the affair juſtifies the killing to have been in his own defence, he is nevertheleſs obliged to ſue out his pardon from the lord chancellor, which of courſe is granted him, but yet his goods and chattels become forfeited to the king. It is ſaid, however, that upon the ſpecial matter found, he may be diſmiſſed without any forfeiture, &c.

SEDIMENT, the ſettlement or dregs of any thing, or that groſs heavy part of a fluid body which, upon reſting, ſinks to the bottom of the veſſel.

SEDR, or SEDRE, the high prieſt of the ſect of Ali among the Perſians. The ſedr is appointed by the emperor of Perſia, who uſually confers the dignity on his neareſt relation. The juriſdiction of the ſedr extends over all effects deſtined for pious purpoſes, over all moſques, hoſpitals, colleges, ſepulchres, and monaſteries. He diſpoſes of all eccleſiaſtical employments, and nominates all the ſuperiors of religious houſes. His deciſions in matters of religion are received as ſo many infallible oracles; he judges of all criminal matters in his own houſe without appeal. His authority is ballanced by that of the mudſitehid, or firſt theologue of the empire.

SEDUM, in botany, a genus of the *decandria-pentagynia* claſs of plants, the corolla whereof conſiſts of five accuminated, lanceolated, plane, patent petals; the fruit conſiſts of five erecto-patent, accuminated compreſſed capſules, emarginated towards the baſe, and opening longitudinally upwards and downwards; the ſeeds are numerous and ſmall.

This genus comprehends the ſedum, or houſe-leek, orpine, wall-pepper, and other ſpecies; all which agree in virtues with orpine. See ORPINE.

SEED, *ſemen*, in phyſiology, a ſubſtance prepared by nature, for the reproduction and conſervation of the ſpecies, both in animals and plants. See GENERATION.

The ſeed of animals, and particularly of mankind, is a whitiſh fluid ſecreted from the blood in the teſtes. See TESTES.

It is the thickeſt and moſt elaborated of all the humours in the human body; and by a chemical analyſis, is found to conſiſt almoſt entirely of oil and volatile ſalts blended with a little phlegm. The ſeminal liquor, however, ſuch as emitted for uſe, is a mixture of the true ſemen with the liquors of the proſtatæ, and other glands of the penis: all which, in the act of coition, are poured at the ſame time into the common canal of the urethra, either from the glands where they are ſecreted, or the reſervoirs where they are kept; and being there blended together, are injected into the uterus. See the articles CONCEPTION, GENERATION, FOETUS, &c.

The ſeed of vegetables is their laſt product, whereby the ſpecies are propagated; being frequently the fruit of a plant, but ſome-

ſometimes only a part included in the fruit.

Every ſeed conſiſts of an embryo-plant, called plantula ſeminalis, with its covers. The embryo, which is the whole future plant in miniature, is called the germ or bud; and is rooted in the cotyledon or placenta, which makes its involucrum or cover. The cotyledon is always double; and in the middle, and common center of the two, is a point or ſpeck, *viz.* the embryo plantule, which being acted on by the warmth of the ſun and of the earth, begins to protrude its radicle, or root, downwards, and its bud upwards; and as the requiſite heat continues, it draws nouriſhment by the root, and ſo continues to unfold itſelf and grow. See the article VEGETATION.

The two placentulæ, or cotyledons of a ſeed are, as it were, a caſe to the little embryo plant; covering it up, and ſheltering it from injuries, and feeding it from their own proper ſubſtance; which the plantule receives, and draws to itſelf by an infinite number of little filaments, which it ſends into the body of the placenta.

The cotyledons for the moſt part, abound with a balſam diſpoſed in proper cells; and this ſeems to be oil brought to its greateſt perfection, while it remains tumid, and lodged in theſe repoſitories: one part of the compoſition of this balſam is oily and tenacious, and ſerves to defend the embryo from any extraneous moiſture; and, by its viſcidity, to entangle and retain the fine, pure, volatile ſpirit, which is the ultimate production of the plant. This oil is never obſerved to enter into the veſſels of the embryo, which are too fine to admit ſo thick a fluid. The ſpirit, however, being quickened by an active power, may poſſibly breathe a vital principle into the juices that nouriſh the embryo, and ſtamp upon it the character that diſtinguiſhes the family; after which every thing is changed into the proper nature of that particular plant.

Now, when the ſeed is committed to the earth, the placenta ſtill adheres to the embryo for ſome time, and guards it from the acceſs of noxious colds, *&c.* and even prepares and purifies the cruder juice the young plant is to receive from the earth, by ſtraining it through its own body. This it continues to do, till the embryo-plant being a little enured to its new element, and its root tolerably fixed in the ground, and fit to abſorb the juice thereof, it then periſhes, and the plant may be ſaid to be delivered; ſo that nature obſerves the ſame method in plants contained in fruits, as in animals in the mother's womb.

To explain this proceſs of nature, let A, B, (plate CCXLIV. fig. 1.) be the two lobes, or cotyledons, of a bean ſlit open, and connected together by little white ſprigs in O; in each lobe are ſeen the branches, *a*, *a*, *a*, of the ſeed-roots, *e*, *e*, which feed the little bud or ſprout, *f*, with the pulp, or matter of the bean, till the earth root O C is capable of penetrating the earth, and extending its branches ſufficiently to extract nouriſhment from the earth, both for itſelf and the plant it is to ſuſtain. See the article VEGETATION.

Many ſorts of ſeeds will continue good for ſeveral years, and retain their vegetative faculty; whereas others will not grow after they are one year old; this difference is in a great meaſure owing to their abounding more or leſs with oil; as alſo to the nature of the oil, and the texture of their outward covering. All ſeeds require ſome ſhare of freſh air, to keep the germen in an healthy ſtate; and where the air is abſolutely excluded, the vegetative quality of the ſeeds will be ſoon loſt. But ſeeds will be longeſt of all preſerved in the earth, provided they are buried ſo deep as to be beyond the influence of the ſun and ſhowers; ſince they have been found to lie thus buried twenty or thirty years, and yet vegetate as well as new ſeeds. How the vegetative life is ſo long preſerved, by burying them ſo deep in the ground, is very difficult to explain; but as the fact is very well known, it accounts for the production of plants out of earth taken from the bottom of vaults, houſes, *&c.*

In the common method of ſowing ſeeds, there are many kinds which require to be ſown ſoon after they are ripe; and there are many others which lie in the ground a year, ſometimes two or three years, before the plants come up: hence when ſeeds brought from diſtant countries are ſown, the ground ſhould not be diſturbed, at leaſt for two years, for fear of deſtroying the young plants.

As to the method of preſerving ſeeds, the dry kinds are beſt kept in their pods

or outer coverings; but the ſeeds of all ſoft fruits, as cucumbers, melons, &c. muſt be cleanſed from the pulp and mucilage which ſurround them, otherwiſe the rotting of theſe parts will corrupt the ſeeds.

When ſeeds are gathered, it ſhould always be done in dry weather; and then they ſhould be hung up in bags in a dry room, ſo as not to deprive them of air.

Diſpenſatory-writers divide the ſeeds uſed in medicine into four claſſes: 1. The four greater hot ſeeds, *viz.* of aniſeed, fennel, caraway, and cummin. 2. The four leſſer hot ſeeds, *viz.* of biſhop's-weed, ſtone-parſley, ſmallage, and wild carrot. 3. The four greater cold ſeeds, *viz.* cucumber, cucurbit, citruls, and melons. 4. The four leſſer cold ſeeds, *viz.* endive, ſcariola, lettuce, and purſlain. See ANISE, FENNEL, &c.

But beſides theſe, there are many other ſeeds preſcribed for their medicinal virtues; as thoſe of coriander, dill, thlaſpi, muſtard, linſeed, fœnugreek, carthamus, navew, ricinus, ſorrel, pſyllium, ſtaveſacre, &c. See CORIANDER, &c.

Change of SEED. See CHANGE.

Seed-wheat ſhould be bought from the crop on a ſtrong clay-land, whatever kind of land it is to be ſowed upon. A white clay is a good change for a red clay, and a red clay for a white; but whatever the land be, from which the ſeed is taken, it may be infected, if that be not changed there the preceding year; and then there may be danger, though it be had from ever ſo proper a land. It is a rule among the farmers, never to buy ſeed-wheat from a ſandy ſoil; they expreſs their diſlike of this by the coarſe rhime; ſand is a change for no land.

Steeping of SEED. See SMUT.

SEEDLINGS, among gardiners, denote ſuch roots of gilliflowers, &c. as come from ſeed ſown. Alſo the young tender ſhoots of any plants that are newly ſown.

SEEDY, in the brandy-trade, a term uſed by the dealers, to denote a fault that is found in ſeveral parcels of french brandy, which renders them unſaleable. The French ſuppoſe that theſe brandies obtain the flavour which they expreſs by this name, from weeds that grow among the vines from whence the wine of which this brandy is made was preſſed. However it be, the thing is evident, and the taſte not of any one kind, ſome taſting ſtrongly of aniſeed, ſome of caraway-ſeed, and ſome others of the ſtrong flavoured ſeeds of plants. The buſineſs of rectification of ſpirits, Dr. Shaw obſerves, is very little underſtood abroad, though much practiſed with us; and there is no doubt but that the ſame means which we uſe to rectify malt ſpirits, would alſo ſerve to purify theſe brandies. See the article RECTIFICATION.

SEEING, the act of perceiving objects by the organ of ſight; or it is the ſenſe we have of external objects by means of the eye. See the article SIGHT.

The apparatus, or diſpoſition, of the parts neceſſary to ſeeing, as alſo the obſtruction of that ſenſe from whatever cauſe, may be ſeen under the article EYE, and the manner wherein ſeeing is performed under the article VISION.

SEELING, in the manege, a horſe is ſaid to ſeel when he begins to have white eye-brows, that is, when there grows on that part about the breadth of a farthing of white hairs, mixed with thoſe of his natural colour, which is a mark of old age. It is ſaid, that a horſe never ſeels till he is fourteen years old, and always does before he is ſixteen years. The light, ſorrel, and black ſooner ſeel than any other. Horſe-jockeys uſually pull out thoſe hairs with pincers, but if there be ſo many, that it cannot be done without making the horſe look bald and ugly, then they colour their eye-brows, that they may not appear old.

SEELING, at ſea, is uſed in the ſame ſenſe nearly with heeling: when a ſhip lies down conſtantly, or ſteadily on one ſide, the ſeamen ſay, ſhe heels, and they call it ſeeling when ſhe tumbles violently and ſuddenly, by reaſon of the ſea forſaking her, as they call it, that is, the waves leaving her for a time in a bowling ſea. When a ſhip thus tumbles to leeward, they call it leeſeel, and in this there is not much danger, even in a ſtorm, becauſe the ſea will eaſily right her up again; but if ſhe rowls or ſeels to windward, there is fear of her coming over too ſhort or ſuddenly, and ſo having the ſea break right into her, be either foundered, or have ſome of her upper works carried away.

SEES, a city of France, in the province of Normandy, ſituated eaſt long. 20′, north lat. 49° 46′.

SEGEBERG, a town of Germany, in the circle of lower Saxony, and dutchy of Holſtein,

Holſtein, ſituated twenty-ſeven miles north-eaſt of Hamburg.

SEGEDIN, a city of upper Hungary, ſituated on the river Teyſſe, in eaſt long. 21°, north lat. 46° 21′.

SEGESWAEE, a city of Tranſylvania, ſituated eaſt long. 24°, north lat. 47° 25′.

SEGMENT *of a circle*, in geometry, that part of the circle contained between a chord and an arch of the ſame circle. See CIRCLE, ARCH, and CHORD.

Thus the portion AFB (plate CCXLIV. fig. 2. n° 1.) comprehended between the arch AFB, and the chord, AB is a ſegment of the circle ABFD. As it is evident every ſegment of a circle muſt either be greater or leſs than a ſemicircle, the greater part of the circle cut off by a chord, *i. e.* the part greater than a ſemicircle, is called the greater ſegment, as ADEB, and the leſſer part, or the part leſs than a ſemicircle, the leſſer ſegment, as AFB.

From what has been ſaid under CIRCLE it appears, that the area of the ſector ABCD, n° 2. is produced by multiplying half of the arch into the radius, and likewiſe that the area of the ſegment ADC is found by ſubtracting from the area of the ſector, the area of the triangle ABC. See SECTOR.

SEGMENT *of a ſphere*, is a part of a ſphere terminated by a portion of its ſurface, and a plane which cuts it off, paſſing ſomewhere out of the center; being more properly called the ſection of a ſphere.

The baſe of ſuch a ſegment, it is evident, is always a circle for finding the ſolid contents of the ſegment of a ſphere. See the article FRUSTUM.

SEGMENT is ſometimes alſo extended to the parts of the ellipſes, and other curvilinear figures.

Line of SEGMENTS. See SECTOR.

SEGMENTUM, among the Romans, an ornament of lace, uſed by the women on their ſhoulders, which according to ſome, reſembled our ſhoulder-knots.

Segmenta, were alſo a kind of teſſelated or moſaic pavements, made up of pieces of various ſhapes and colours, but which had an uniform and regular arrangement.

SEGMOIDAL, *valves*, in anatomy, little valves of the pulmonary artery, thus called from their reſembling ſegments of circles, but more uſually called ſemilunar valves.

SEGORBE, a city of Spain, in the province of Valencia, ſituated thirty miles north-weſt of Valencia.

SEGOVIA, a city of Manila, the largeſt of the Philippine Iſlands, ſituated in eaſt long. 119°, north lat. 18° 30′.

This is alſo the name of a city of Spain, in the province of Old Caſtile, ſituated weſt long. 4° 35, north lat. 41°.

SEGRA, a river of Spain, which riſing in the north of Catalonia, and running ſouth-weſt, diſcharges itſelf into the Ebro, at Miquinença.

SEGREANT, is the herald's word for a griffon, when drawn in a leaping poſture, and diſplaying his wings as if ready to fly.

SEGUE, in the italian muſic, is often found before *aria*, *alleluja*, *amen*, &c, to ſhew that thoſe portions or parts are to be ſung immediately after the laſt note of that part over which it is writ; but if theſe words *ſi piace*, or *ad libitum*, are joined therewith, it ſignifies, that theſe portions may be ſung or not, at pleaſure.

SEGURA, a town of Portugal, in the province of Beira, ten miles north-weſt of Alcantara. This is alſo the name of a town in Spain, in the province of New Caſtile, and territory of La Mancha, ſituated among the mountains of Segura, weſt long. 2° 50′, north lat. 38° 25′.

SEJANT, a term uſed in heraldry, when a lion, or other beaſt, is drawn in an eſcutcheon, ſitting like a cat, with his fore-feet ſtrait.

SEIGNIORY, *dominium*, in our law, is uſed for a manor or lordſhip of a ſeigneur, or lord of the fee or manor.

SEIGNORAGE, ſignifies the right, or due belonging to a ſeigneur, or lord; but it is particularly uſed for a duty belonging to the prince, for the coining of money; called alſo coinage, which under our antient kings, was five ſhillings for every pound of gold brought in the maſs to be coined, and a ſhilling for every pound weight of ſilver. At preſent the king claims no ſeignorage at all, but the ſubject has his money coined at the public expence; nor has the king any advantage therefrom, but what he has from the alloy. See COINING.

SEISIN, in law, ſignifies poſſeſſion. See the article POSSESSION.

In this ſenſe we ſay, premier ſeiſin, for the firſt poſſeſſion, *&c.* See PREMIER.

Seiſin is divided into that in deed or in fact, and that in law; a ſeiſin in deed is where

where a poſſeſſion is actually taken; but a ſeiſin in law is, where lands deſcend, and the party has not entered thereon; or in other words, it is, where a perſon has a right to lands, *&c.* and is by wrong diſſeiſed of them. A ſeiſin in law is held to be ſufficient to avow on; though to the bringing of an aſſiſe, actual ſeiſin is required; and where ſeiſin is alledged, the perſon pleading it, muſt ſhew of what eſtate he is ſeiſed, *&c.* See the article LIVERY *of ſeiſin*.

Seiſin of a ſuperior ſervice, is deemed to be a ſeiſin of all inferior and caſual ſervices, that are incident thereto; and ſeiſin of a leſſee for years, is ſufficient for him in reverſion.

SEISINA HABENDA QUIA REX HABUIT ANNUM, DIEM ET VASTUM, a writ which lies for delivery of ſeiſin to the lord of lands or tenements, forfeited by a felon, after the king, in right of his prerogative, has had the year, day, and waſte therein.

SEISINAM HABERE FACIAS. See the article HABERE.

SEISOR. See the article DISSEISOR.

SEIZE, SEAZE, or SEASE, in the ſea-language, is to make faſt, or bind, particularly to faſten two ropes together, with rope-yarn. The ſeizing of a boat is a rope tied to a ring, or little chain in the foreſhip of the boat, by which means it is faſtened to the ſide of the ſhip.

SEIZING, in falconry, is when a hawk gripes her prey, or any thing elſe faſt between her claws.

SEIZURE, in commerce, an arreſt of ſome merchandize, moveable, or other matter, either in conſequence of ſome law, or of ſome expreſs order of the ſovereign. Contraband goods, thoſe fraudulently entered, or landed without entering at all, or at wrong places, are ſubject to ſeizure. In ſeizures, among us, one half goes to the informer, and the other half to the king.

SELAGINOIDES, in botany, a name whereby ſome authors call the lycopodium. See LYCOPODIUM.

SELAGO, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, the corolla whereof is monopetalous; the tube is very ſmall, and ſcarcely perforated; the limb is patent, quinquifid, and almoſt equal; there is no pericarpium, the corolla inveſting the ſeed, which is ſingle and roundiſh.

SELAGO, is alſo a ſynonymous name for the lycopodium. See LYCOPODIUM.

SELBY, a town of Yorkſhire, ſituated ten miles ſouth of York.

SELENDERS, in the manege, are chops, or mangy ſores, in the bending of a horſe's hough, as the malanders are in the knees. See MALANDERS.

SELENEUSIAN EARTH, in natural hiſtory, a looſe, friable light and white marle, called by late authors, mineral-agaric. See AGARIC.

SELENITÆ, MOON STONE, in natural hiſtory, a claſs of foſſils, naturally and eſſentially ſimple, not inflammable nor ſoluble in water, compoſed of ſlender filaments, ranged into fine and even thin flakes, and thoſe diſpoſed into regular figures, in the different genera, approaching to a rhomboide, a hexangular column, or a rectangled inequilateral parallelogram, fiſſil like the talcs, but that not only horizontally, but perpendicularly alſo, flexile in a ſmall degree, but not at all elaſtic; not fermenting with acid menſtrua, and readily calcining in the fire.

Of this claſs, Dr. Hill makes ſeven orders, and under theſe orders ten genera. The firſt order is the ſelenitæ, with horizontal plates, approaching to a rhomboidal form; the ſecond order is the ſelenitæ with horizontal plates, of a columnar and angular form; the third order comprehends thoſe ſelenitæ whoſe filaments are viſibly arranged into plates, but in the whole maſſes appear ſtriated, not tabulated; of the fourth order, are the flat ſelenitæ, of no determinately angular figure; of the fifth order, are the ſelenitæ formed of plates perpendicularly arranged; of the ſixth order are thoſe ſelenitæ formed of a congeries of plates, ranged in form of a ſtar; and of the ſeventh order are thoſe ſelenitæ of a complex and indeterminate figure. This foſſile is found in ſtrata of clay uſually of the blue tough kind; we have it in many parts in England, particularly about Shotover hills in Oxfordſhire; in ſeveral places of Northamptonſhire, Leiceſterſhire, and about Epſom, in Surry. In medicine, it is a very powerful aſtringent, and is of effect in diarrhœas, dyſenteries, and hæmorrhages of all kinds. It ſtands alſo recommended as a coſmetic. The people of Northamptonſhire call it ſtaunch, and uſe it in hæmorrhages of all kinds, with ſucceſs.

SELENOGRAPHY, a branch of coſmography, which deſcribes the moon and all the parts and appearances thereof, as

geography does thoſe of the earth. See the article MOON.

SELEUCIDÆ, in chronology. Æra of the ſeleucidæ, or the ſyro-macedonian æra, is a computation of time, commencing from the eſtabliſhment of the ſeleucidæ, a race of greek kings, who reigned as ſucceſſors of Alexander the Great, in Syria, as the Ptolomies did in Egypt. This æra we find expreſſed in the book of the Maccabees, and on a great number of greek medals, ſtruck by the cities of Syria, *&c.* The Rabbins call it the æra of contracts; and the Arabs therik dilkarnain, that is, the æra of the two horns. According to the beſt accounts, the firſt year of this æra falls in the year 311 before Chriſt, being twelve years after Alexander's death.

SELINGENSKOY, a town of Aſiatic Muſcovy, in the province of Siberia, ſituated on the road from Tobolſki to China, on the river Selinga: in eaſt long. 95°, north lat. 50°.

SELINUM, in botany, a genus of the *pentandria digynia* claſs of plants, the general corolla whereof is uniform; the ſingle flowers conſiſt each of five unequal inflexo-cordated petals; there is no pericarpium: the fruit is of an elliptico-oblong, compreſſo-plane figure, ſtriated each way in the middle, and ſeparable into two parts; the ſeeds are two, of an oblong elliptic figure, plane on each ſide, and edged with membranaceous rims at the ſides.

SELKIRK, a borough town of Scotland, in the county of Tweedale, ſituated thirty-two miles ſouth of Edinburgh.

SELL, in building, is of two kinds, *viz.* ground-ſell, which denotes the loweſt piece of timber, in a timber-building, and that on which the whole ſuperſtructure is raiſed; and the window-ſell, called alſo window-ſoil, is the bottom piece in a window-frame.

SELLA EQUINA, TURCICA, or SPHENOIDES, a name given to the four apophyſes of the os ſphenoides, or cruciforme, in the brain, in regard of their forming a reſemblance of a ſaddle, which the Latins call *ſella*. They are ſometimes called by the greek name *clinoides*. Herein are contained the pituarity gland, and in ſome animals, the rete mirabile.

SEMEIOTICA, or SEMEIOSIS, σημειωτικη, that part of medicine which conſiders the ſigns or indications of health and diſeaſes, and enables the phyſician to judge what is, was, or will be, the ſtate, degree, order, and effect, of health or ſickneſs.

SEMENDRIA, a town of european Turky, in the province of Servia, ſituated on the Danube, thirty miles ſouth-eaſt of Belgrade.

SEMENTINÆ FERIÆ, in antiquity, feaſts held annually among the Romans, to obtain of the gods a plentiful harveſt. They were celebrated in the temple of Tellus, where ſolemn ſacrifices were offered to Tellus and Ceres. Theſe feaſts were held about ſeed-time, uſually in the month of January; for Macrobius obſerves, they were moveable feaſts. They had their name from *ſemen*, ſeed.

SEMETS, SUMMETS, or SUMMITS, in botany, the ſame with the antheræ. See the article ANTHERÆ.

SEMI, a word borrowed from the latin, ſignifying *half*, but only uſed in compoſition with other words, as in the following articles.

In muſic, ſemi has three ſeveral uſages; firſt, when prefixed to the name of a note, it expreſſes a diminution of half its value, as in ſemi-breve, *&c.* Secondly, when added to the name of an interval, it expreſſes a diminution, not of half, but of a leſſer ſemi-tone, or four commas in the whole compaſs, as in ſemi-diapente, *&c.* Thirdly, it ſometimes alſo ſignifies an imperfection, thus, ſemi-circolo, or circolo-mezzo, ſignifies an imperfect circle, which is the mark of imperfect time, that is, of double time; whereas the circle being a character of perfection, marks triple time.

Semi-breve is a note or meaſure of time, comprehending the ſpace of two minims, or four crotchets, or half a breve. See MINIM, CROTCHET, *&c.*

The ſemi-breve is accounted one meaſure or time, or the integer in fractions and multuples, whereby the time of the other notes is expreſſed: thus a minim is expreſſed by $\frac{1}{2}$, a crotchet by $\frac{1}{4}$, *&c.* that is, by $\frac{1}{2}$ of a meaſure or ſemi-breve; a breve by two, and a long by four; that is, by four meaſures or ſemi-breves.

For the ſemi-chroma, ſee the articles CHROMA and QUAVER. For the ſemi-circolo ſee CIRCOLO-MEZZO. For the ſemi-diapaſon, ſemi-diapente, ſemi-diateſſaron, ſee DIAPASON, DIAPENTE, *&c.* And for the ſemi-tone and ſemi-tonic, ſee SEMI-TONE and SEMI-TONIC.

For

For the ſeveral characters of the ſemi-breve, *&c.* ſee the article CHARACTER.

SEMI-ARIANS, in church-hiſtory, a branch of the antient arians, conſiſting of ſuch as in appearance condemned the errors of that hereſiarch, but yet acquieſced in ſome of the principles thereof, only palliating and concealing them under ſofter and more moderate terms. They would not allow, with the catholics, that the ſon was homoouſios, *i. e.* of the ſame ſubſtance, but homoiouſios, *i. e.* of a like ſubſtance, with the father; and thus, though, in expreſſion, they differed from the orthodoxy in a ſingle letter only, yet, in effect, they denied the divinity of Jeſus Chriſt, and placed him in the rank of creatures.

SEMI-CIRCLE, in geometry, half a circle, or that figure comprehended between the diameter of a circle and half the circumference. See CIRCLE.

SEMI-CIRCLE is alſo an inſtrument uſed in ſurveying, otherwiſe called graphometer. See GRAPHOMETER.

SEMI-COLON, in grammar, one of the points or ſtops uſed to diſtinguiſh the ſeveral members of ſentences from each other. See PUNCTUATION.

The mark, or character, of the ſemi-colon is (;) and has its name as being ſomewhat of leſs effect than a colon, or as demanding a ſhorter pauſe. The uſe of the ſemi-colon, the grammarians generally ſay, is to mark a ſenſe leſs complete than the colon, and more complete than a comma; but this conveys a very obſcure idea: beſides, our beſt writers ſeem to uſe them promiſcuouſly. See COLON.

But Mr. Ward, who is ſaid to have firſt ſettled a juſt uſe of the ſemi-colon, holds, that it is properly uſed to diſtinguiſh the conjunct members of ſentences. Now by a conjunct member of a ſentence, he means ſuch a one as contains at leaſt two ſimple members. Whenever then a ſentence can be divided into ſeveral members of the ſame degree, which are again diviſible into other ſimple members, the former are to be ſeparated by a ſemi-colon. But though the proper uſe of the ſemi-colon be to diſtinguiſh conjunct members, it is not neceſſary that all the members divided hereby be conjunct; for upon dividing a ſentence into great and equal parts, if one of them be conjunct, all thoſe other parts of the ſame degree are to be diſtinguiſhed by a ſemi-colon. See SENTENCE, *&c.*

SEMI-CUBICAL *parabola*, in the higher geometry, a curve of the ſecond order, wherein the cubes of the ordinates are as the ſquares of the abſciſſes. Its equation is $axx = y^3$.

SEMI-CUPIUM, in medicine, an half-bath, wherein the patient is only placed up to the navel.

SEMI-DIAMETER, half the diameter, or a right line drawn from the center of a circle, or ſphere, to its circumference; being the ſame with what is otherwiſe called the radius. See RADIUS.

The diſtances, diameters, *&c.* of the heavenly bodies, are uſually eſtimated, by aſtronomers, in ſemi-diameters of the earth; and the diſtances of the ſecondary planets from their reſpective primary ones, by ſemi-diameters of the body of the primary planet. See DISTANCE, DIAMETER, and PLANET.

SEMI-DOUBLE, in the romiſh breviary, a term applied to ſuch offices and feſtivals as are celebrated with leſs ſolemnity than the double ones, but yet with more than the ſingle ones. The ſemi-double office has double veſpers, and nine leſſons at mattins, but the anthems are not re-doubled. It is performed on Sundays, on the octaves; and on feaſts, marked for ſemi-double in the calendar.

SEMIFLOSCULOUS, in botany, a term uſed to expreſs the flowers of a certain claſs of plants, of which the dandelion, hawk-weed, and the like, are kinds. Theſe ſemifloſcules are petals, hollow in their lower part, but in their upper flat, and continued in the ſhape of a tongue. See FLOSCULOUS.

SEMIGALIA, the eaſtern diviſion of the dutchy of Courland in Poland.

SEMI-INTEROSSEUS INDICIS, in anatomy, a ſmall, ſhort, flat muſcle, very like the antithenar, or internal ſemi-interoſſeus of the thumb. It is ſituated obliquely on one ſide of that of the thumb, between the firſt phalanx thereof and the firſt metacarpal bone. It is fixed by one end to the outſide of the baſis of the firſt phalanx of the thumb, and by the other end it is fixed near the head of the firſt phalanx of the index, on that ſide next the thumb.

SEMI-LUNAR VALVES, in anatomy, are three ſmall valves, or membranes, of a ſemi-lunar figure, placed in the orifice of the pulmonary artery, to prevent the re-

lapſe of the blood into the heart at the time of its dilatation. See the article HEART.

SEMI-MEMBRANOSUS, in anatomy, a long, thin muſcle, partly tendinous; ſituated on the backſide of the thigh, a little towards the inſide; being one of the five flexors of the tibia. It ariſes from the tubercle of the iſchium.

SEMI-ORDINATE, in conics, *&c.* the half of an ordinate. See ORDINATE.

SEMI-PARABOLA, in geometry, a curve defined by the equation $ax^{m-1}=y^m$; as $ax^2=y^3$, and $ax^3=y^4$. See the article PARABOLA.

In ſemi-parabolas, $y^m : v^m :: ax^{m-1} : az^{m-1} = x^{m-1} : z^{m-1}$; or the powers of the ſemi-ordinates are, as the powers of the ſemi-abſciſſes one degree lower; for inſtance, in cubical ſemi-parabolas the cubes of the ordinates are as the ſquares of the abſciſſes; that is, $y^3 : v^3 :: x^2 : z^2$.

SEMI-PELAGIANS, in church-hiſtory, a branch of the pelagians, ſo called becauſe they pretended to keep a medium between the pelagians and the orthodox. See the article PELAGIANS.

SEMI-PROOF, or HALF-PROOF, in matters of law. See PROOF.

SEMI-QUARTILE, or SEMI-QUADRATE, the ſame with octant. See the article OCTANT.

SEMI-QUAVER, in muſic. See QUAVER.

SEMI-QUINTILE, an aſpect of the planets when thirty-ſix degrees from each other. See the article ASPECT.

SEMI-SEXTILE, marked S. S. is an aſpect of two planets when diſtant only thirty degrees.

SEMI-TONE, in muſic, one of the degrees or concinnous intervals of concords. The ratio of the ſemi-tone is 15 : 16. See the article TONE.

SENI-TONIC *ſcale*, a ſcale, or ſyſtem of muſic, conſiſting of twelve degrees in the octave, being an improvement of the diatonic-ſcale, by inſerting between each two notes thereof another note, which divides the interval or tone into two unequal parts called ſemi-tones. See the article DIATONIC.

SEMINAL, *ſeminalis*, in anatomy and medicine, ſomething belonging to the ſemen, or ſeed. See the articles SEED and SPERMATIC.

SEMINARY, a kind of college, or ſchool, where youth are inſtructed in the ceremonies, *&c.* of the ſacred miniſtry, of which there are many abroad; it being ordained, by the council of Trent, that there be a ſeminary belonging to each cathedral, under the direction of the biſhop.

In the reign of queen Elizabeth, the roman catholics projected the founding engliſh ſeminaries abroad, in order from thence to be furniſhed with miſſionaries to perpetuate and increaſe their communion in Britain. But, by a ſtatute of that princeſs, it is made a premunire to contribute to the maintenance of a popiſh ſeminary: and by one of James I. no perſons are to go, or be ſent, to popiſh ſeminaries, to be inſtructed or educated, under divers penalties and diſabilities mentioned in the ſtatute.

SEMINARY, in gardening, denotes the ſeed-plot, or place allotted for raiſing plants from ſeed, and keeping them till they are fit to be removed into the garden or nurſery.

When the ſeminary is intended for trees, it muſt be large, and of a ſoil adapted to the generality of the trees intended to be raiſed in it: but that which is moſt in uſe is for the ſupply of the flower-garden, and is the place where flowers are to be raiſed from their ſeeds, to procure varieties; or, as the floriſts expreſs it, new flowers; as alſo for the ſowing all the biennial plants, to ſucceed thoſe which decay in the flower-garden.

The ſeminary ſhould always be ſituated at ſome diſtance from the houſe, and be walled or paled round, and kept under lock and key, to keep out dogs, *&c.* and to prevent a great deal of damage that is frequently done by thoſe who are not acquainted with gardening, before they are aware of it. The ſeveral directions for the management of the ſeminary, are to be ſeen under the names of the ſeveral plants intended to be raiſed in it.

SEMINATION, in natural hiſtory, denotes the manner, or act, of ſhedding and diſperſing the ſeeds of plants, which is effected ſeveral ways. Some are heavy enough to fall directly to the ground; others are furniſhed with a pappus, or down, that they may, by means thereof, be diſperſed by the wind; and others again are contained in elaſtic capſules, which burſting open with conſiderable force, dart or throw out the ſeeds to different diſtances.

SEMINERVOSUS, in anatomy, one of the flexor muſcles of the leg, which ariſes from the iſchium, and is inſerted into the upper part of the tibia.

SEMIS, in roman antiquity, the half of an as. See the article As.

SEMISPINALIS, or Semispinosus, in anatomy, one of the extenſor muſcles of the back and loins, has its origin from the os ſacrum and vertebræ of the loins, and its termination at the upper vertebræ of the thorax, eſpecially at their ſpinoſe apophyſes: it coheres very firmly to the longiſſimus dorſi and ſacro-lumbaris, the other two extenſors of the back and loins.

SEMITA luminosa, a name given to a lucid tract in the heavens, which may be ſeen about ſix o' clock at night, a little before the vernal equinox, extending from the weſtern edge of the horizon up towards the pleiades.

Caſſini and Facio have both obſerved this phænomenon; the former thinks it ariſes from a vaſt number of ſmall planets encompaſſing the ſun, which give this light from reflection.

SEMLIN, or Zemlin, a town of Sclavonia, ſubject to the houſe of Auſtria, eaſt long. 21°, and north lat. 45°.

SEMPERVIVUM, in botany, a genus of the *dodecandria-polygynia* claſs of plants, the corolla whereof conſiſts of twelve oblong, lanceolated, acute, hollow petals, a little larger than the cup; the fruit conſiſts of twelve oblong compreſſed capſules, placed in an orbicular order, acuminated outwards, and opening internally; the ſeeds are numerous, roundiſh, and ſmall.

This genus comprehends the great houſeleek and the tree-houſeleek.

This plant ſtands recommended as a cooler; though its ſenſible qualities diſcover no great foundation for any virtue of this kind.

SEMUR, the name of two towns of Burgundy, in France, one thirty-four miles weſt of Dijon, and the other forty-ſix miles north-weſt of Lyons.

SENA, or Senna, in botany, a ſhrub with crooked and compreſſed fruit, and lanceolated pinnæ: it is a ſpecies of caſſia. See the article Cassia.

Sena-leaves are much uſed for their purgative virtue; but are apt to gripe, unleſs given with proper correctives, as coriander, aniſeed, ginger, raiſins, and ſalt of tartar; which are added to the infuſion of the leaves, occaſionally: but there is no corrective ſo effectual, as diluting it with a large quantity of the liquid its infuſion is taken in, as broth or water-gruel. This, and the method of correcting it by the alkaline ſalts, are the only proper ones; becauſe they have it in full force as a purgative, and indeed rather add to it than otherwiſe. In inflammatory caſes, hæmorrhages, and diſorders of the breaſt, ſena is to be avoided as a purge; but, in all other caſes, it is a ſafe and excellent cathartic.

The pods of ſena are alſo purgative, and are obſerved to gripe the patient leſs; but then they alſo purge leſs, ſo that they require to be given in a much larger doſe, and even then operate but languidly.

SENATE, *ſenatus*, in general, is an aſſembly, or council, of ſenators; that is, of the principal inhabitants of a ſtate, who have a ſhare in the government.

The ſenate of antient Rome is, of all others, the moſt celebrated: it exerciſed no contentious juriſdiction, but appointed judges, either from among the ſenators or knights, to determine proceſſes: it alſo appointed governors of provinces, and diſpoſed of the revenues of the commonwealth, *&c.* Yet did not the whole ſovereign power reſide in the ſenate, ſince it could not elect magiſtrates, make laws, or decide of war and peace; in all which caſes the ſenate was obliged to conſult the people.

According to Dr. Middleton, the conſtant and regular ſupply of the ſenate was from the annual magiſtrates; who, by virtue of their ſeveral offices, acquired a right to ſit and vote in that aſſembly: the uſual gradation of theſe offices being that of quæſtor, tribune of the people, ædile, prætor, and conſul. See the articles Quæstor, Tribune, *&c.*

But though theſe offices gave both an immediate right, and actual entrance into the ſenate; yet the ſenatorial character was not eſteemed complete, till the new ſenators had been enrolled by the cenſors, at the next general luſtrum, or review of all the orders of the city. See the articles Censor and Lustrum.

The ſenate always met of courſe on the firſt of January, for the inauguration of the new conſuls; and in all months univerſally, there were three days, *viz.* the calends, nones, and ides, on which it regularly met: but it always met on extraordinary occaſions, when called together by conſul, tribune, or dictator.

SENATOR,

SENATOR, in general, denotes a member of ſome ſenate.

SENATUS AUCTORITAS, a vote of the roman ſenate, drawn up in the ſame form with a decree, but without its force, as having been hindred from paſſing into a decree, by ſome of the tribunes of the people.

SENATUS CONSULTUM, a decree of the roman ſenate, pronounced on ſome queſtion or point of law; which, when paſſed, made a part of the roman law. See the article CIVIL LAW.

SENECA, or SENEGA. See SENEGA.

SENECIO, GROUNDSEL, in botany, a genus of the *ſyngeneſia-polygamia-ſuperflua* claſs of plants, with a floſculous flower, contained in a one-leaved cup; there is a ſingle downy ſeed, after each floſcule.

Common groundſel, taken in a ſtrong infuſion, is emetic: it is preſcribed in ſmall doſes in the jaundice, dropſy, and hæmorrhages; and externally it is uſed in ointments, for diſorders of the ſkin.

SENEF, a town on the confines of Hainault, twelve miles eaſt of Mons.

SENEGA, or SENEGAL, a river of Negroland, in Africa, which falls into the Atlantic ocean, in 16° north lat. whence the gum ſenega is imported. See the article GUM.

SENEGA, SENECA, or SENEKA, RATTLESNAKE-ROOT, in the materia medica. See the article SERPENTARIA.

SENESCHAL, *ſeneſchallus*, a term antiently uſed for ſteward, or majordomo. See the article STEWARD.

SENEZ, a town of Provence, in France, forty-ſix miles north-eaſt of Aix.

SENLIS, a town of the Iſle of France, twenty-ſix miles north of Paris.

SENNA, or SENA. See SENA.

SENNE, a river of the auſtrian Netherlands, which, riſing in Hainault, paſſes by Bruſſels, and falls ito the Demer, below Mechlin.

SENOPLE, or SINOPLE. See the article SINOPLE.

SENORIA, in botany, a name uſed by ſome for the bonana-tree.

SENS, a town of Champain, in France, ſituated on the river Yonne, ſixty miles ſouth-eaſt of Paris.

SENSATION, in philoſophy, the act of perceiving external objects, by means of the ſenſes. See the articles SENSE and PERCEPTION.

SENSE, a faculty of the ſoul, whereby it perceives external objects, by means of the impreſſions they make on certain organs of the body. Theſe organs of ſenſation are commonly reckoned five, *viz.* the eye, whereby we ſee objects; the ear, which enables us to hear ſounds; the noſe, by which we receive the ideas of different ſmells; the palate, by which we judge of taſtes; and the cutis, or ſkin, which enables us to feel the different forms, hardneſs, or ſoftneſs of bodies. See the articles EYE, EAR, *&c.* alſo VISION, HEARING, *&c.*

Some alſo give the name of internal ſenſes to the determinations of the mind to be pleaſed with certain forms and ideas, perceived by the means of corporeal organs of ſenſe; and hence they uſe the term moral ſenſe, for a determination of the mind to be pleaſed with the contemplation of thoſe affections, actions, or characters, which we call virtuous.

SENSITIVE SOUL, a denomination given to the ſouls of brutes, either as intimating its utmoſt faculty to be that of ſenſation; or becauſe it is ſuppoſed to be corporeal, ſo as to be an object of our ſenſes. See the article SOUL.

SENSITIVE PLANT, *mimoſa*, in botany, a genus of the *polyandria-monogynia* claſs of plants, with a ſmall, funnel-faſhioned, ſemi-quinquifid flower: its fruit is a long pod, containing a great many roundiſh ſeeds.

This genus comprehends the mimoſa or ſenſitive plant, the acacia of Tournefort, and the inga of Plumier.

The ſenſitive plant is ſo denominated from its remarkable property of receding from the touch, and giving ſigns, as it were, of animal life and ſenſation: this motion it performs by means of three diſtinct articulations, *viz.* of a ſingle leaf with its pedicle, of the pedicle to its branch, and of the branch to the trunk or main ſtem; the primary motion of all which is the cloſing of the two halves of the leaf on its rib; then the rib or pedicle itſelf cloſes; and if the motion wherewith the plant is moved be very ſtrong, the very branches have the ſenſation propagated to them, and apply themſelves to the main ſtem, as the ſimple leaves did before to their ribs, and theſe ribs to their branches; ſo that the whole plant, in this ſtate, forms itſelf, from a very complexly branched figure, into a ſort of ſtraight cylindrical one.

SENSORY, *ſenſorium commune*, the ſeat of the common ſenſe, or what receives the impreſſions of all ſenſible objects, conveyed to it by the nerves of each particular

ticular organ, and conſequently is the immediate cauſe of perception. This office is, by Dr. Willis, attributed to the ſtriated part of the brain; and by Des Cartes to the glandula pinealis.

SENTENCE, in law, a judgment paſſed in court by the judge, on ſome proceſs, either civil or criminal.

SENTENCE, in grammar, a period or ſet of words, comprehending ſome perfect ſenſe or ſentiment of the mind. See the article POINTING.

SENTENCE, in poetry, is an inſtructive and lively remark made on ſomething very obſervable and agreeably ſurpriſing, which contains much ſenſe in few words.

It is either direct or plain, as, "In all the affairs of the world, ſo much reputation is really ſo much power;" or indirect or diſguiſed, as,

"Fool, not to think how vain
Againſt th'Omnipotent to riſe in arms."

This is a very dexterous and prevailing way of bringing in a ſentence. You are entertained with a noble reflection, when you did not expect it; and pleaſantly ſurprized and inſtructed, without the appearance or formality of art. Not to come down to uſeleſs nicety and diſtinction, a ſentence appears with moſt beauty and advantage, when it is put into ſome of theſe following forms.

1. When it is expreſſed in any way of exclamation, but peculiarly of wonder or indignation: as,

"How advantageous is it to paſs thro' adverſities, to the enjoyment of proſperity!"

"How ſharper than a ſerpent's tooth it is, to have a thankleſs child!"

2. When it is put into a moving expoſtulation, or preſſing interrogation.

"Are theſe our ſcepters? theſe our due rewards?
And is it thus that Jove his plighted faith regards?"

3. When the ſentence is delivered, and a reaſon immediately added to ſupport it.

"In a government, it is much better to be unmindful of good ſervices than bad; for a good man only becomes more ſlow, when you take no account of him; a bad man, more daring and inſolent."

4. When a ſentence is made up of a ſhort relation, and a clean and pertinent remark upon it.

"Meſſalina deſired the name of matrimony (with her adulterer Silius) purely for the greatneſs of the infamy; which is the laſt pleaſure of profligate people." And this is near a-kin to the epiphonema.

Sentences muſt not ſtand aukward and bulky out of the diſcourſe, but be neatly interwoven and wrought into it.

They muſt be unaffected and ſignificant, and ſuch as the ſubject eaſily ſuggeſts to a thoughtful and diſtinguiſhing man. Sentences are the ornaments and lights of a diſcourſe; and therefore, as lights and ſhades are in a good picture, ſo ought ſentences to be ſo exactly and judiciouſly mixed with the other parts of the diſcourſe, that all together may make up one uniform beauty, one regular and conſummate piece.

Epiphonema is an acclamation, containing a lively remark, placed at the end of a diſcourſe or narration. So Milton on the obſtinacy of the rebel angels, who were ſo infatuated, that they would not ſubmit, though they knew almighty power and majeſty came armed againſt them:

"In heav'nly minds can ſuch perverſeneſs dwell?"

This figure cloſes a narration in a very advantageous and taking manner; deeply impreſſes the thing related, upon the memory of the reader; and leave him in a good humour, well ſatisfied and pleaſed with the ſenſe and ſagacity of his author. See EPIPHONEMA.

SENTIMENTS, in poetry, and eſpecially dramatic, are the thoughts which the ſeveral perſons expreſs, whether they relate to matters of opinion, paſſion, buſineſs, or the like.

SENTINEL, CENTINEL, or CENTRY, in military affairs, is a private ſoldier, placed in ſome poſt, to watch any approach of the enemy, to prevent ſurprizes, and to ſtop ſuch as would paſs without order, or diſcovering who they are.

SEPARATION, a term ſomtimes uſed for what is more uſually called departure. See the article DEPARTURE.

SEPARATISTS, an appellation given to diſſenters, from their ſetting up a ſeparate church from the eſtabliſhed one. See the articles CHURCH and DISSENTERS.

SEPIA, the INK-FISH, or CUTTLE-FISH, in zoology, a genus of remarkable ſea-inſects, of an oblong figure, and depreſſed: it has ten tentacula, two of which are longer than the reſt, and are pedunculated.

There

There are ſeveral ſpecies of this animal, different in ſize and other properties: but that properly called the cuttle-fiſh is about ſix inches in length and three and a half in diameter; and is ſupported by an oblong, light, and ſpongy ſubſtance, of a friable texture, and lined with a light fungous pith: this is what our ſilver-ſmiths uſe, under the name of cuttle-bone; and is alſo uſed in tooth-powders, as a dentrifice. This animal is frequent in the european ſeas, but is not common on our coaſts: when in danger of being taken, it is ſaid to emit at its mouth a black liquor of a black colour, like ink, in a conſiderable quantity, which obſcures the water about it, and gives it an opportunity of eſcaping.

SEPS, in zoology, a ſpecies of lizard, with longitudinal black lines: its bite is ſaid to be very fatal. See LIZARD.

SEPTA OVILIA, in roman antiquity. See the article OVILIA.

SEPTARIÆ, in natural hiſtory, a large claſs of foſſils, commonly known by the names of ludus Helmontii and waxen veins.

They are defined to be foſſils not inflammable, nor ſoluble in water; of a moderately firm texture, and duſky hue, divided by ſeveral ſepta, or thin partitions, and compoſed of a ſparry matter greatly debaſed by earth, not giving fire with ſteel, fermenting with acids, and in great part diſſolved by them, and calcining in a moderate fire.

Of this claſs there are two diſtinct orders of bodies, and under thoſe ſix genera. The ſeptariæ of the firſt order are thoſe which are uſually found in large maſſes, of a ſimple uniform conſtruction, but divided by large ſepta either into larger and more irregular portions, or into ſmaller and more equal ones, called talc. The genera of this order are four: 1. Thoſe divided by ſepta of ſpar, called ſecomiæ. 2. Thoſe divided by ſepta of earthy matter, called gaiophragmia. 3. Thoſe divided by ſepta of the matter of the pyrites, called pyritercia. And, 4. Thoſe divided by ſepta of ſpar, with an admixture of cryſtal, called diaugophragmia. See all theſe under their ſeveral heads.

Thoſe of the ſecond order are ſuch as are uſually found in ſmaller maſſes, of a cruſtated ſtructure, formed by various incruſtations round a central nucleus, and divided by very thin ſepta. Of this order are only two genera: 1. Thoſe with a ſhort roundiſh nucleus, encloſed within the body of the maſs. And, 2. Thoſe with a long nucleus, ſtanding out beyond the ends of the maſs.

SEPTEMBER, the ninth month of the year, conſiſting of only thirty days: it took its name as being the ſeventh month, reckoning from March, with which the Romans began their year. See the articles YEAR and MONTH.

SEPTENTRIO, in aſtronomy, a conſtellation more uſually called urſa minor. See the article URSA.

In coſmography, the term ſeptentrio denotes the ſame with north: and hence, ſeptentrional is applied to any thing belonging to the north, as ſeptentrional ſigns, parallels, *&c.* See the articles SIGN, *&c.*

SEPTIER, or SETIER, a french meaſure of capacity. See MEASURE.

SEPTIZON, or SEPTIZONIUM, in roman antiquity, a celebrated mauſoleum, built by Septimus Severus, in the tenth region of the city of Rome: it was ſo called from *ſeptem* and *zona*, by reaſon it conſiſted of ſeven ſtories, each of which was ſurrounded by a row of columns.

SEPTUAGESIMA, in the calendar, denotes the third Sunday before lent, or before quadrageſima ſunday: ſuppoſed by ſome to take its name from its being about ſeventy days before eaſter.

SEPTUAGINT, the name given to a greek verſion of the books of the Old Teſtament, from its being ſuppoſed to be performed by ſeventy-two Jews, who are uſually called the ſeventy interpreters, becauſe ſeventy is a round number.

The hiſtory of this verſion is expreſly written by Ariſteas, an officer of the guards to Ptolemy Philadelphus, the ſubſtance of whoſe account is as follows: Ptolemy having erected a fine library at Alexandria, which he took care to fill with the moſt curious and valuable books from all parts of the world, was informed that the Jews had one, containing the laws of Moſes, and the hiſtory of that people, and being deſirous of enriching his library with a greek tranſlation of it, applied to the high-prieſt of the Jews; and to engage him to comply with his requeſt, ſet at liberty all the Jews, whom his father Ptolemy Soter had reduced to ſlavery. After ſuch a ſtep, he eaſily obtained what he deſired; Eleazar, the jewiſh high-prieſt, ſent back his embaſſadors,

doors with an exact copy of the moſaical law, written in letters of gold, and ſix elders of each tribe, in all ſeventy-two, who were received with marks of reſpect by the king, and then conducted into the iſle of Pharos, where they were lodged in a houſe prepared for their reception, and ſupplied with every thing neceſſary in abundance. They ſet about the tranſlation without loſs of time, and finiſhed it in ſeventy-two days; and the whole being read in the preſence of the king, he admired the profound wiſdom of the laws of Moſes; and ſent back the deputies, laden with preſents for themſelves, the high-prieſt, and the temple.

This verſion was in uſe to the time of our bleſſed Saviour, and is that out of which all the citations in the New Teſtament, from the Old, are taken. It was alſo the ordinary and canonical tranſlation made uſe of by the chriſtian church in the earlieſt ages; and it ſtill ſubſiſts in the churches both of the eaſt and weſt. It is however obſervable, that the chronology of the ſeptuagint is different from the hebrew text. See the article EPOCHA.

SEPTUM, in anatomy, an incloſure, or partition, a term applied to ſeveral parts of the body, which ſerve to ſeparate one part from another: as, 1. The ſeptum lucidum, or pellucidum, is a partition which ſeparates the upper ventricles of the brain, and is compoſed of a fine medullary ſubſtance, formed into two ſides, with a longitudinal cavity between them. 2. Septum cordis, a ſeparation between the two ventricles of the heart, which is about a finger thick, of the ſame ſubſtance with the heart itſelf, and conſiſting of muſcular fibres, which aſſiſt it in all its motions. For the ſeptum tranſverſum, ſeptum narium, ſeptum of the ſcrotum, &c. ſee DIAPHRAGM, NOSE, SCROTUM, &c.

SEPULCHRAL, ſomething belonging to ſepulchres, or tombs: thus a ſepulchral column is a column erected over a tomb, with an inſcription on its ſhaft; and ſepulchral lamps, thoſe ſaid to have been found burning in the tombs of ſeveral martyrs and others.

SEPULCHRE, a tomb, or place deſtined for the interrment of the dead. This term is chiefly uſed in ſpeaking of the burying places of the antients, thoſe of the moderns being uſually called tombs.

Sepulchres were held ſacred and inviolable, and the care taken of them has always been held a religious duty, grounded on the fear of God, and the belief of the ſoul's immortality. Thoſe who have ſearched or violated them, have been thought odious by all nations, and were always ſeverely puniſhed.

The Egyptians called ſepulchres, eternal houſes, in contradiſtinction to their ordinary houſes or palaces, which they called inns, on account of their ſhort ſtay in the one, in compariſon of their long abode in the other.

Regular canons of St. SEPULCHRE, a religious order, formerly inſtituted at Jeruſalem, in honour of the holy ſepulchre, or the tomb of Jeſus Chriſt.

Many of theſe canons were brought from the Holy Land into Europe, particularly into France, by Lewis the younger; into Poland, by Jaxa a poliſh gentleman; and into Flanders, by the counts thereof; many alſo came into England. This order was however ſuppreſſed by pope Innocent VIII. who gave its revenues and effects to that of our Lady of Bethlehem; which alſo becoming extinct, they were beſtowed on the knights of St. John of Jeruſalem. But the ſuppreſſion did not take effect in Poland, where they ſtill ſubſiſt, as alſo in ſeveral provinces of Germany. Theſe canons follow the rule of St. Auguſtine.

Knights of the holy SEPULCHRE, a military order, eſtabliſhed in Paleſtine about the year 1114.

The knights of this order in Flanders, choſe Philip II. king of Spain, for their maſter, in 1558. and afterwards his ſon; but the grand maſter of the order of Malta prevailed on the laſt to reſign: and when afterwards the duke of Nevers aſſumed the ſame quality in France, the ſame grand maſter, by his intereſt and credit, procured a like renunciation of him, and a confirmation of the union of this order to that of Malta.

SEQUEL, in logic, the ſame with concluſion. See the article CONCLUSION.

SEQUENCE, in gaming, a ſet of cards immediately following each other, in the ſame ſuit, as a king, queen, knave, &c. and thus we ſay, a ſequence of three, four, or five cards: but at piquet theſe are called tierces, quarts, quints, &c.

SEQUESTRATION, in common-law, is ſetting aſide the thing in controverſy from the poſſeſſion of both the parties that contend for it. In which ſenſe it is either voluntary, as when done by the conſent of the parties; or neceſſary, as where it is done by the judge, of his own authority, whether the parties will or not.

A ſequeſtration is alſo a kind of extent on an execution for debt, in the caſe of a beneficed clergyman, of the profits of his living, directed to the church-wardens, to receive the ſame, to ſatisfy the judgment.

Sequeſtration is granted on a perſon's ſtanding out and all the proceſſes of contempt for non-appearance in the court of chancery, or exchequer, upon a bill exhibited; and alſo where obedience is not yielded to a decree, in which caſe the court grants a ſequeſtration of the parties lands.

A ſequeſtration is alſo made in London, upon an action of debt; the courſe of proceeding in which caſe is this: the action being entered, the officer goes to the defendant's ſhop or warehouſe, when no perſon is there, and takes a padlock, and hangs it on the door, uttering theſe words: "I do ſequeſter this warehouſe, and the goods and merchandize therein, of the defendant in this action, to the uſe of the plaintiff," *&c.* after which he ſets on his ſeal, and makes a return of the ſequeſtration in the compter; and four days being paſſed after the return made, the plaintiff may, at the next court, have judgment to open the ſhop or warehouſe, and to have the goods appraiſed by two freemen, who are to be ſworn at the next court held for that compter; and then the ſerjeant puts his hand to the bill of appraiſement, and the court grants judgment thereon: but yet the defendant may put in bail before ſatisfaction, and by that means diſſolve the ſequeſtration; and after ſatisfaction, may put in bail to diſprove the debt, *&c.*

In the time of the civil wars, ſequeſtration was uſed for a ſeizing of the eſtates of delinquents, for the uſe of the commonwealth.

SEQUESTRATION, in the civil law, is alſo uſed in various ſenſes: it is taken for the act of the ordinary in diſpoſing of the goods of a deceaſed perſon, which no body will meddle with. A widow is ſaid to ſequeſter, when ſhe diſclaims having any thing to do with the eſtate of her deceaſed huſband. Sequeſtration is alſo uſed to ſignify the gathering up the fruits of a vacant benefice, for the uſe of the next incumbent of the church.

SEQUIN, a gold-coin, ſtruck at Venice, and in ſeveral parts of the grand ſeignor's dominions. See the article COIN.

SERAGLIO, a perſian word, which ſignifies the palace of a prince or lord, in which ſenſe the houſes of the embaſſadors of England, France, *&c.* are, at Conſtantinople, called their ſeraglios. But the term ſeraglio is uſed, by way of eminence, for the palace of the grand ſeignor at Conſtantinople, where he keeps his court, in which his concubines are lodged, and where the youth are trained up for the principal poſts of the empire. It is in form of a triangle, about two miles round, at the end of the promontory Chryſoceras, now called the Seraglio-point: the buildings extend to the top of the hill, and from thence there are gardens, that reach to the ſea. The outward appearance is not very beautiful, the architecture being irregular, conſiſting of ſeparate edifices, in the manner of pavilions and domes. The old ſeraglio is the palace where the grand ſeignor's old miſtreſſes are kept.

The ladies of the haram, which is the part allotted to the women, is a collection of young beautiful girls, who, on their admiſſion, are committed to the charge of ſome old lady, and taught muſic, dancing, and other accompliſhments. Theſe frequently play and dance before the grand ſeignor, while others entertain him with their converſation. Beſides theſe ladies, there are a great many black eunuchs, and female ſlaves, in the ſeraglio, whoſe buſineſs it is to guard and wait upon them.

SERAPH, or SERAPHIM, a ſpirit of the higheſt rank in the hierarchy of angels; who are thus called from their being ſuppoſed to be moſt inflamed with divine love, by their nearer and more immediate attendance at the throne of God, and to communicate their fervor to the remoter and inferior orders. See ANGEL.

SERAPHIC, burning or inflamed with love or zeal, like a ſeraphim: thus St. Bonaventure is called the ſeraphic doctor, from his abundant zeal and fervor.

St. Francis, founder of the cordeliers and franciſcans, is called the ſeraphic father, in memory of a pretended viſion on mount Alverna, in which, it is ſaid, he ſaw a ſeraph glide rapidly from heaven, who impreſſed on him certain marks, repreſenting the wounds which the nails and ſpear made in our Saviour's body, at his crucifixion.

SERAPIAS, BASTARD-HELLEBORE, in botany, a genus of the *gynandria-diandria* claſs of plants, the flower of which conſiſts of five ovato-oblong petals; and its

its fruit is an oval unilocular capſule, obtuſely trigonal, containing a great many ſcobiform ſeeds.

This genus comprehends the helleborine of Tournefort.

SERAVALLE, a town of Italy, in the dutchy of Milan, twenty-four miles north of the city of Genoa.

SERCELLI, a port-town of Algiers, on the coaſt of Barbary: eaſt long. 4°, and north lat. 37°

SEREGIPPE, a city and port-town of Brazil, in the bay of All Saints: weſt lon. 39°, and ſouth lat. 11°.

SERENA, the ſame with coquimbo. See the article COQUIMBO.

Gutta SERENA, in medicine. See the article GUTTA SERENA.

SERENADE, a kind of concert given in the night, by a lover to his miſtreſs, under her window. Theſe ſometimes only conſiſt of inſtrumental muſic, but at other times voices are added: the muſic and ſongs compoſed for theſe occaſions are alſo called ſerenades.

SERENE, a title of honour given to ſeveral princes, and to the principal magiſtrates of republic. The king of England, the republic and the doge of Venice, and the children of the king of Spain are called moſt ſerene: and when the pope, or the ſacred college, write to the emperor, to kings, or the doge, they give them no other title: in like manner the emperor gives no other title to any king, except to the king of France.

Biſhops were antiently addreſſed under the title of ſerene: and the kings of France, of the firſt and ſecond race, when ſpeaking of themſelves, uſed no other title but nôtre ſerenité. The king of Poland and other kings give the title of ſerene to the electors; but the emperor, on writing to the electors or other princes of the empire, only uſes the term dilection; yet in treating with them, he uſes electoral ſerenity to the electors, and ducal ſerenity to the other princes. The Venetians ſet the title of ſerenity above that of highneſs.

SERGE, in commerce, a woollen ſtuff manufactured in a loom, of which there are various kinds, denominated either from their different qualities, or from the places where they are wrought; the moſt conſiderable of which is the london-ſerge, which is highly valued abroad, and of which a manufacture has been for ſome years carried on in France.

In the manufacture of london-ſerges, the longeſt wool is choſen for the warp, and the ſhorteſt for the woof. But before either kind is uſed, it is firſt ſcoured, by putting it in a copper of liquor, ſomewhat more than lukewarm, compoſed of three parts of fair water and one of urine. After it has ſtaid in it long enough for the liquor to take off the greaſe, *&c.* it is ſtirred briſkly about with a wooden peel, taken out, drained, waſhed in a running water, and dried in the ſhade; beaten with ſticks on a wooden rack, to drive out the coarſer duſt and filth; and then picked clean with the hands. It is then greaſed with oil of olives, and the longeſt wool combed with large combs, heated in a little furnace for that purpoſe: to clear it from the oil, it is put into a veſſel of hot ſoap-water, whence being taken out, wrung, and dried, it is ſpun on the wheel. As to the ſhorter wool, intended for the woof, it is only carded on the knee, with ſmall fine cords, and then ſpun on the wheel, without being ſcoured of its oil: and here it is to be obſerved, that the thread for the warp is always to be ſpun finer, and much better twiſted, than that of the woof.

The wool both for the warp and woof being ſpun, and the thread reeled into ſkains; that of the woof is put on ſpools, fit for the cavity of the ſhuttle; and that for the warp is wound on a kind of wooden bobbins, to fit it for warping; and when warped, it is ſtiffened with a ſize, uſually made of the ſhreds of parchment; and, when dried, put into the loom, and mounted ſo as to be raiſed by four treddles, placed under the loom, which the workman makes to act tranſverſely, equally, and alternately, one after another, with his feet; and as the threads are raiſed, throws the ſhuttle. See the article WEAVING.

The ſerge, on being taken from the loom, is carried to the fuller, who fulls or ſcours it, in the trough of his mill, with fullers-earth: and after the firſt fulling, the knots, ends, ſtraws, *&c.* ſticking out on either ſide of the ſurface, are taken off with a kind of plyers or iron-pincers, after which it is returned into the fulling-trough, where it is worked with warm water, in which ſoap has been diſſolved; when quite cleared, it is taken out, the knots are again pulled off; it is then put on the tenter to dry, taking care, as faſt as it dries, to ſtretch it

out both in length and breadth, till it be brought to its juſt dimenſions; then being taken off the tenter, it is dyed, ſhorn, and preſſed.

SERGEANT, or SERJEANT *at law*, or *of the coif*, is the higheſt degree taken at the common law, as that of doctor is of the civil law; and as theſe are ſuppoſed to be moſt learned and experienced in the practice of the courts, there is one court appointed for them to plead in by themſelves, which is the common-pleas, where the common law of England is moſt ſtrictly obſerved: but they are not reſtrained from pleading in any other court, where the judges, who cannot have that honour till they have taken the degree of ſergeant at law, call them brothers.

Theſe ſergeants are created by the king's writ, commanding them to take upon them that degree therein aſſigned, under a great penalty: and one or more of theſe is ſtiled the king's ſergeant, who is choſen out of the reſt to plead for him in all cauſes, more eſpecially thoſe of treaſon, *&c.*

SERGEANT *at arms*, or *mace*, an officer appointed to attend the perſon of the king, to arreſt traitors, and ſuch perſons of quality as offend; and to attend the lord high ſteward when ſitting in judgment on a traitor.

The number of theſe officers is by ſtatute limited to that of thirty: there are now eight at court, who are created with great ceremony; for the perſon kneeling before the king, his majeſty lays the mace on his right ſhoulder, and ſays, "riſe up, ſergeant of arms, and eſquire, for ever." They attend in the preſence-chamber where the band of gentlemen-penſioners wait; and receiving the king at the door, they carry the maces before him, when he goes to chapel, or the houſe of lords.

There are four other ſergeants at arms created in the ſame manner; one of whom attends the lord chancellor; a ſecond, the lord treaſurer; a third, the ſpeaker of the houſe of commons; and a fourth, the lord-mayor of London, on ſolemn occaſions. There is alſo an inferior kind of ſergeants at mace, who attend the mayor, or other head officer of corporations.

SERGEANT, or SERJEANT, in war, is an inferior officer in a company of foot, or troop of dragoons, armed with an halbard, and appointed to ſee diſcipline obſerved, to teach the ſoldiers the exerciſe of their arms, and to order, ſtraiten, and form ranks, files, *&c.*

SERGEANTY, or SERJEANTY, in law, is taken for a ſervice that cannot be due from a tenant to any other lord beſides the king.

This is divided into grand and petit ſergeanty. Grand ſergeanty is where a perſon holds lands of the king, by ſuch ſervice as he ought to perform in perſon, as to aſſiſt at his coronation, bear his banner or ſpear, *&c.* Petit ſergeanty is when a man holds lands of the king, on account of his paying him annually ſome ſmall thing towards his wars, as a ſword, dagger, *&c.*

The honorary ſervices of grand ſergeanty ſtill continue, notwithſtanding the ſtatute 12 Car. II. c. 24.

SERIANIA, in botany, the name by which Plumier calls the paullinia of Linnæus. See PAULLINIA.

SERICUM, SILK, in natural hiſtory. See the article SILK.

Sericum is alſo a name given to the flowers of Zink, on account of their fibrous texture. See ZINK.

SERIES, in general, denotes a continued ſucceſſion of things in the ſame order, and having the ſame relation or connection with each other: in this ſenſe we ſay, a ſeries of emperors, kings, biſhops, *&c.*

In natural hiſtory, a ſeries is uſed for an order or ſubdiviſion of ſome claſs of natural bodies; comprehending all ſuch as are diſtinguiſhed from the other bodies of that claſs, by certain characters, which they poſſeſs in common, and which the reſt of the bodies of that claſs have not. See CLASS, ORDER, GENUS, *&c.*

SERIES, in mathematics, is a number of terms, whether of numbers or quantities, increaſing or decreaſing in a given proportion; the doctrine of which has already been given under the article PROGRESSION.

Infinite SERIES, is a ſeries conſiſting of an infinite number of terms, that is, to the end of which it is impoſſible ever to come; ſo that let the ſeries be carried on to any aſſignable length, or number of terms, it can be carried yet farther, without end or limitation.

A number actually infinite (that is, all whoſe units can be actually aſſigned, and yet is without limits) is a plain contradiction to all our ideas about numbers; for whatever number we can conceive, or have any proper idea of, is always deter-

determinate and finite; ſo that a greater after it may be aſſigned, and a greater after this; and ſo on, without a poſſibility of ever coming to an end of the addition or encreaſe of numbers aſſignable; which inexhauſtibility, or endleſs progreſſion in the nature of numbers, is all we can diſtinctly underſtand by the infinity of number; and therefore to ſay that the number of any things is infinite, is not ſaying, that we comprehend their number, but indeed the contrary; the only thing poſitive in this propoſition being this; that the number of theſe things is greater than any number which we can actually conceive and aſſign. But then, whether in things that do really exiſt, it can be truely ſaid, that their number is greater than any aſſignable number; or, which is the ſame thing, that in the numeration of their units one after another, it is impoſſible ever to come to an end; this is a queſtion about which there are different opinions, with which we have no buſineſs in this place; for all that we are concerned here to know, is this certain truth, that after one determinate number, we can conceive a greater, and after this a greater, and ſo on without end. And therefore, whether the number of any things that do or can really exiſt all at once, can be ſuch that it exceeds any determinable number, or not, this is true, that of things which exiſt, or are produced ſucceſſively one after another, the number may be greater than any aſſignable one; becauſe though the number of things thus produced, that does actually exiſt at any time, is finite, yet it may be increaſed without end. And this is the diſtinct and true notion of the infinity of a ſeries; that is, of the infinity of the number of its terms, as it is expreſſed in the definition.

Hence it is plain, that we cannot apply to an infinite ſeries the common notion of a ſum, *viz.* a collection of ſeveral particular numbers that are joined and added together one after another, for this ſuppoſes that theſe particulars are all known and determined; whereas the terms of an infinite ſeries cannot be all ſeparately aſſigned, there being no end in the numeration of its parts, and therefore it can have no ſum in ſenſe. But again, if we conſider that the idea of an infinite ſeries conſiſts of two parts, *viz.* the idea of ſomething poſitive and determined, in ſo far as we conceive the ſeries to be actually carried on; and the idea of an inexhauſtible remainder ſtill behind, or an endleſs addition of terms that can be made to it one after another; which is as different from the idea of a finite ſeries as two things can be: hence we may conceive it as a whole of its own kind, which therefore may be ſaid to have a total value whether that be determinable or not. Now in ſome infinite ſeries this value is finite or limited; that is, a number is aſſignable beyond which the ſum of no aſſignable number of terms of the ſeries can ever reach, nor indeed ever be equal to it, yet it may approach to it in ſuch a manner, as to want leſs than any aſſignable difference; and this we may call the value or ſum of the ſeries; not as being a number found by the common method of addition, but as being ſuch a limitation of the value of the ſeries, taken in all its infinite capacity, that if it were poſſible to add them all one after another, the ſum would be equal to this number.

Again, in other ſeries the value has no limitation; and we may expreſs this, by ſaying, the ſum of the ſeries is infinitely great; which indeed ſignifies no more than that it has no determinate and aſſignable value; and, that the ſeries may be carried ſuch a length as its ſum, ſo far, ſhall be greater than any given number. In ſhort, in the firſt caſe we affirm there is a ſum, yet not a ſum taken in the common ſenſe; in the other caſe we plainly deny a determinate ſum in any ſenſe.

Theorem I. In an infinite ſeries of numbers, increaſing by an equal difference or ratio (that is, an arithmetical or geometrical encreaſing progreſſion) from a given number, a term may be found greater than any aſſignable number.

Hence, if the ſeries encreaſe by differences that continually encreaſe, or by ratios that continually encreaſe, comparing each term to the preceding, it is manifeſt that the ſame thing muſt be true, as if the differences or ratios continued equal.

Theorem II. In a ſeries decreaſing in infinitum in a given ratio, we can find a term leſs than any aſſignable fraction.

Hence, if the terms decreaſe, ſo as the ratios of each term to the preceding do alſo continually decreaſe, then the ſame thing is alſo true, as when they continue equal.

Theor.

Theor. III. The ſum of an infinite ſeries of numbers all equal, or encreaſing continually, by whatever differences or ratios, is infinitely great; that is, ſuch a ſeries has no determinate ſum, but grows ſo as to exceed any aſſignable number.

Demonſ. 1. If the terms are all equal, as A : A : A, &c. then the ſum of any finite number of them is the product of A by that number, as A n; but the greater n is, the greater is A n; and we can take n greater than any aſſignable number, therefore A n will be ſtill greater than any aſſignable number.

Secondly, ſuppoſe the ſeries encreaſes continually, (whether it do ſo infinitely or limitedly) then its ſum muſt be infinitely great, becauſe it would be ſo if the terms continued all equal, and therefore will be more ſo, ſince they encreaſe. But if we ſuppoſe the ſeries encreaſes infinitely, either by equal ratios or differences, or by increaſing differences or ratios of each term to the preceding; then the reaſon of the ſums being infinite will appear from the firſt theorem; for in ſuch a ſeries, a term can be found greater than any aſſignable number, and much more therefore the ſum of that and all the preceding.

Theor. IV. The ſum of an infinite ſeries of numbers decreaſing in the ſame ratio is a finite number; equal to the quote ariſing from the diviſion of the product of the ratio and firſt term, by the ratio leſs by unity; that is, the ſum of no aſſignable number of terms of the ſeries can ever be equal to that quote; and yet no number leſs than it, is equal to the value of the ſeries, or to what we can actually determine in it; ſo that we can carry the ſeries ſo far, that the ſum ſhall want of this quote leſs than any aſſignable difference.

Demonſ. To whatever aſſigned number of terms the ſeries is carried, it is ſo far finite; and if the greateſt term is l, the leaſt A, and the ratio r, than the ſum is $S = \frac{rl - A}{r - 1}$. See *Geo.* PROGRESSION.

Now, in a decreaſing ſeries from l, the more terms we actually raiſe, the laſt of them, A becomes the leſſer, and the leſſer A be, $rl - A$ is the greater, and ſo alſo is $\frac{rl - A}{r - 1}$: but $rl - A$ being ſtill leſs than rl, therefore $\frac{rl - A}{r - 1}$ is ſtill leſs than $\frac{rl}{r - 1}$, that is, the ſum of any aſſignable number of terms of the ſeries is ſtill leſs than the quote mentioned, which is $\frac{rl}{r - 1}$, and this is the firſt part of the theorem.

Again: The ſeries may be actually continued ſo far, that $\frac{rl - A}{r - 1}$ ſhall want of $\frac{rl}{r - 1}$ leſs than any aſſignable difference; for, as the ſeries goes on, A becomes leſs and leſs in a certain ratio, and ſo the ſeries may be actually continued till A becomes leſs than any aſſignable number, (by Theorem. II.) now $\frac{rl}{r-1} - \frac{rl - A}{r-1} = \frac{A}{r-1}$, and $\frac{A}{r-1}$ is leſs than A; therefore let any number aſſigned be called N, we can carry the ſeries ſo far till the laſt term A be leſs than N; and becauſe $\frac{rl - A}{r - 1}$ wants of $\frac{rl}{r-1}$, the difference $\frac{A}{r-1}$, which is leſs than A, which is alſo leſs than N, therefore the ſecond part of the theorem is alſo true, and $\frac{rl}{r-1}$ is the true value of the ſeries.

Scholium. The ſenſe in which $\frac{rl}{r-1}$ is called the ſum of the ſeries, has been ſufficiently explained; to which, however, we ſhall add this; that whatever conſequences follow from the ſuppoſition of $\frac{rl}{r-1}$ being the true and adequate value of the ſeries taken in all its infinite capacity, as if the whole were actually determined and added together, can never be the occaſion of any aſſignable error in any operation or demonſtration where it is uſed in that ſenſe; becauſe if it is ſaid that it exceeds that adequate value, yet it is demonſtrated that this exceſs muſt be leſs than any aſſignable difference, which is in effect no difference, and ſo the conſequent error will be in effect no error: for if any error can happen from $\frac{rl}{r-1}$ being greater than it ought to be, to repreſent the complete value of the infinite ſeries, that error depends upon the exceſs of $\frac{rl}{r-1}$ over that complete value; but this exceſs being unaſſignable, that conſequent error muſt be ſo too; becauſe ſtill the leſs the exceſs is,

is, the leſs will the error be that depends upon it. And for this reaſon we may juſtly enough look upon $\frac{rl}{r-1}$ as expreſſing the adequate value of the infinite ſeries. But we are farther ſatisfied of the reaſonableneſs of this, by finding in fact, that a finite quantity does actually convert into an infinite ſeries, which happens in the caſe of infinite decimals. For example, $\frac{2}{3} = .6666$, &c. which is plainly a geometrical ſeries from $\frac{6}{10}$ in the continual ratio of 10 to 1; for it is $\frac{6}{10}+\frac{6}{100}+\frac{6}{1000}+\frac{6}{10000}$, &c.

And reverſely; if we take this ſeries, and find its ſum by the preceding theorem, it comes to the ſame $\frac{2}{3}$; for $l = \frac{6}{10}$, $r = 10$, therefore $rl = \frac{60}{10} = 6$; and $r-1 = 9$; whence $\frac{rl}{r-1} = \frac{6}{9} = \frac{2}{3}$.

We have added here a table of all the varieties of determined problems of infinite, decreaſing, geometrical progreſſions, which all depend upon theſe three things, *viz.* the greateſt term l, the ratio r, and the ſum S; by any two of which the remaining one may be found: to which we have added ſome other problems, wherein S—L is conſidered as a thing diſtinct by itſelf, that is, without conſidering S and L ſeparately.

Given	Sought		Or ſuppoſing the ratio $\frac{a}{b}$ or the ſecond term to be M, whereby the ratio is $\frac{l}{M}$, then is	Solutions
$r\ l$	s,	$s = \frac{rl}{r-1}$		$s = \frac{a}{a-b}$ of $l = \frac{l^2}{l-M}$
$r\ s$	l,	$l = \frac{s \times \overline{r-1}}{r}$		$l = \frac{a-b}{a}$ of $s = \frac{\overline{l-M} \times s}{l}$
$l\ s$	r,	$r = \frac{s}{s-l}$		$s-l = \frac{b}{a-b}$ of $l = \frac{M\,l}{l-M}$
$l\ r$	$s-l$,	$s-l = \frac{l}{r-1}$		$s-l = \frac{b}{a}$ of $s = \frac{M\,s}{l}$
$s\ r$	$s-l$,	$s-l = \frac{s}{r}$		$s = \frac{a}{b}$ of $s-l = \frac{l \times \overline{s-l}}{M}$
$r.s-l$	s, l	$s = \overline{s-l} \times r$; $l = \overline{s-l} \times \overline{r-1}$		$l = \frac{a-b}{b}$ of $s-l = \frac{\overline{l-M} \times \overline{s-l}}{M}$

Theorem V. In the arithmetic progreſſion 1, 2, 3, 4, &c. the ſum is to the product of the laſt term, by the number of terms, that is, to the ſquare of the laſt term; in a ratio always greater than 1:2, but approaching infinitely near it. But if the arithmetical ſeries begins with 0, thus, 0, 1, 2, 3, 4, &c. then the ſum is to the product of the laſt term, by the number of terms, exactly in every ſtep as 1 to 2.

Theorem VI. Take the natural progreſſion beginning with 0, thus, 0, 1, 2, 3, &c. and take the ſquares of any the like powers of the former ſeries; as the ſquares, 0, 1, 4, 9, &c. or cubes, 0, 1, 8, 27; and then again take the ſum of the ſeries of powers to any number of terms, and alſo multiply the laſt of the terms ſummed by the number of terms, (reckoning always 0 for the firſt term;) the ratio of that ſum, to that product is more than $\frac{1}{n \times 1}$ (n being the index of the powers) that is, in the ſeries of ſquares it is more than $\frac{1}{3}$; in the cubes more than $\frac{1}{4}$; and ſo on: But the ſeries going on in infinitum, we may take in more and more terms without end into the ſum; and the more we take, the ratio of the ſum to the product mentioned grows leſs and leſs; yet ſo as it never can actually be equal to $\frac{1}{n \times 1}$ but approaches infinitely near to it, or within leſs than any aſſignable difference.

SEROSITY, in medicine, denotes an over-abundance of ſerum. See SERUM and BLOOD.

SERPA,

SERPA, a town of Portugal, in the province of Alentejo, ſituated on the eaſt-ſide of the river Guadiana, in weſt long. 8° 20′, north lat. 37° 45′.

SERPENS, in aſtronomy, a conſtellation of the northern hemiſphere; conſiſting of ſeventeen ſtars, according to Ptolemy; of nineteen, according to Tycho; and of fifty-nine, in the britannic Catalogue.

SERPENT, *ſerpens*, in zoology, a general term for all amphibious animals without legs. See the article AMPHIBIOUS.

Mr. Ray defines ſerpents to be creatures breathing by means of lungs, having only one ventricle in the heart, having no feet, and having a long body, covered with ſcales. To which he adds, that in cold ſeaſons they can bear hunger a long time. The greater part of the ſerpent claſs are poiſonous, and dangerous in their bite, leaving a miſchievous liquor in the wound made by their tooth, which mixing by this means immediately with the blood, is of fatal conſequence; though the whole creature may be eaten with ſafety, or even the poiſonous liquor, which does this miſchief in the wound, taſted without hurt.

Notwithſtanding that ſerpents reſpire by means of lungs, they do not take in and diſcharge their breath by ſuch ſhort intervals as other animals, but what they have once inſpired will ſerve them a long time; for as they are of a cold nature, and their naturally neceſſary vital warmth very ſmall, they do not require ſuch an eternally renewed ſupply of that pabulum of vital heat, as thoſe which have more of it; and as with us they lie half the year torpid, and half dead, their vital warmth at that time, like fire ſmothered under aſhes, barely exiſts, and needs perhaps no more air than what the creature took in at one inſpiration, before its laying itſelf down for the ſeaſon, which ſerves it till the life-renewing ſpring returns.

Serpents, according to Mr. Ray, may be divided into the poiſonous and the harmleſs; the firſt having long dentes exerti, with poiſonous liquors contained at their bottom, which on biting they diſcharge into the wound; the others wanting theſe teeth, and this poiſon.

They may alſo be divided, in regard to their generation, into the oviparous and viviparous; but this is a leſs firmly founded diſtinction than may be ſuppoſed, ſince all ſerpents are truly and properly produced of eggs; and the only difference is, that ſome depoſit their eggs in dung-hills, and the like places, to be hatched by accidental heat; while others retain thoſe eggs to be hatched in their own bodies, and ſo bring forth living young ones. Of the firſt kind is the common ſnake, of the latter the viper.

This ſeries of animals comprehends ſeveral diſtinct genera; as the amphiſbæna, anguis, coluber, cenchris, and crotalophorus. See the articles AMPHISBÆNA, ANGUIS, *&c.*

Sea-SERPENT, *ſerpens marinus*, in ichthyology, a name given to ſeveral ſpecies of muræna. See the article MURÆNA.

SERPENT'S-TONGUES, a name by which ſome call the gloſſopetræ. See the article GLOSSOPETRA.

SERPENTARIA, SNAKE-ROOT, in botania and pharmacy, the name of a ſpecies of ariſtolochia, or birthwort, with auriculated leaves. See BIRTHWORT.

The virginian ſnake-root obtained its name, as being accounted a ſpecific againſt venomous bites: but whatever truth there may be in that, it is undoubtedly an excellent diuretic, diaphoretic, and alexipharmic medicine, and, conſequently, good in inflammatory and malignant fevers: it is alſo a powerful antiſeptic, and its doſe is from four to ten or fifteen grains, in powder.

SERPENTARIUS, in aſtronomy, a conſtellation of the northern hemiſphere; conſiſting, according to different authors, of 25, 29, or even 69 ſtars.

SERPENTINE, in general, denotes any thing that reſembles a ſerpent: hence, the worm or pipe of a ſtill, twiſted in a ſpiral manner, is termed a ſerpentine worm.

SERPENTINE COLUMN. See COLUMN.

SERPENTINE MARBLE, *ophites*, a ſpecies of marble, ſo called from its being variegated with ſtreaks and ſpots like the ſkin of a ſerpent. See MARBLE.

SERPENTINE VERSES, ſuch as begin and end with the ſame words.

SERPIGO, in medicine, a ſpecies of herpes. See the article HERPES.

SERPYLLUM, MOTHER OF THYME, in botany, a ſpecies of thyme. See THYME.

SERRATED, in general, ſomething indented, or notched, in the manner of a ſaw; a term much uſed in the deſcription of the leaves of plants, which are ſaid to be duplicately ſerrated, when the edges of the large ſerratures are again ſerrated with leſſer indentings of the ſame kind.

SERRATULA, SAW-WORT, in botany, a genus of the *ſyngeneſia-polygamia-æqualis* claſs of plants, the compound flower of which is tubuloſe and uniform; and the partial ones are monopetalous, infundibuliform, and quinquifid at the limb: the ſtamina are five very ſhort capillary filaments: the ſeeds are ſolitary, crowned with down, and contained in the cup.

SERPA, a town of Portugal, in the province of Alentejo, weſt long. 8° 20′, north lat. 37° 45′.

SERRATUS, in anatomy, a name given to ſeveral muſcles from their reſemblance to a ſaw: as, 1. The ſerratus major anticus, which ariſes by dentated origins from the ſix lower true ribs, and from one, or ſometimes two, of the upper ſpurious ones. 2. The ſerratus minor anticus, called alſo the pectoralis minor, which ariſes from the ſecond, third, and fourth true ribs, continues its courſe under the pectoralis magnus, and is inſerted into the caracoide proceſs of the ſcapula: theſe two ſerve to move the ſcapula forward and downward, and many anatomical writers have referred them to the number of the elevators of the ribs. 3. The ſerratus poſticus ſuperior, which ariſes with a thin and broad tendon, from the two lower vertebræ of the neck, and the two upper ones of the back; and terminates in the ſecond, third, and fourth ribs. 4. The ſerratus poſticus inferior, which riſes with a broad tendon from the three lower vertebræ of the back, and the two upper ones of the loins; it terminates in the four inferior ſpurious ribs, and ſurrounds the extenſors of the back, in the manner of a vagina, to prevent their fibres from ſeparating one from another, as they might otherwiſe do in violent motions theſe two laſt contribute to reſpiration.

SERTULARIA, in botany, a genus of the *cryptogamia-lithophytorum* of Linnæus, and the ſame with the corallina of Tourneſort. See CORALLINA.

SERVANT, a term of relation ſignifying a perſon who owes and pays a limited obedience for a certain time, to another in quality of maſter.

If any ſervant, who is hired for a year, depart before the end of his term, without reaſonable cauſe, to be allowed by a juſtice of the peace; or after the term is expired, without giving a quarter's warning, he is liable to be committed to priſon by two juſtices, till he gives ſecurity to ſerve out the time; or he may by one juſtice be ſent to the houſe of correction, there to be puniſhed as a diſorderly perſon, 7 Jac. I. c. 4. On the other hand, a maſter cannot put away his ſervant before the end of the term he was hired for, without ſome reaſonable cauſe allowed by a juſtice of the peace; nor after the expiration of the term, without a quarter's warning given, on pain of forfeiting 40 s. Where a ſervant that is hired for a year happens to fall ſick, ſuch ſervant ought not to be diſcharged, nor his wages abated on that account.

It is held, that if one being a creditor ſends his ſervant for money, to whom it is paid, this will be a good payment and diſcharge, though the ſervant does not bring the money to his maſter. It has been adjudged, that where a ſervant uſually buys goods for his maſter upon credit, and takes up things in his name, though it be for his own uſe, the maſter is liable: nevertheleſs it is not ſo where the maſter uſually gives him ready money. Where the maſter gives his ſervant money to buy goods for him, and he converts the money to his own particular uſe, and at the ſame time buys them upon credit, the maſter is anſwerable where ſuch goods come into his own poſſeſſion.

SERVETISTS, a name given to the modern antitrinitarians, from their being ſuppoſed to be the followers of Michael Servetus, who in the year 1559, was burnt at Geneva, together with his books.

SERVIA, a province of european Turky, bounded by the Save and the Danube, on the north; by Bulgaria, on the eaſt; by Albania and Macedon, on the ſouth; and by Boſnia and Dalmatia, on the weſt.

SERVICE, in law, is a duty which a tenant, on account of his fee, owes to his lord.

There are many diviſions of ſervices, as, 1. Into perſonal, where ſomething is to be done by the tenant in perſon, as homage and fealty. 2. Real, ſuch as wards, marriages, &c. 3. Accidental, including heriots, reliefs, and the like. 4. Intire, where, on the alienation of any part of the lands by a tenant, the ſervices become multiplied. 5. Frankſervice, which was performed by freemen, who were not obliged to perform any baſe ſervice, but only to find a man and horſe to attend the lord into the army, or to court. 6. Knight's ſervice,

by which lands were antiently held of the king, on paying homage, ſervice in war, &c. 7. The rights and prerogatives, which within certain manors belong to the lords thereof by the king's grants, ſuch as the power of judicature in matters of property, and in felonies and murders; minting of money, aſſize of bread, beer, weights and meaſures, aſſeſſments, &c.

SERVITES, a religious order in the church of Rome, founded about the year 1233, by ſeven florentine merchants, who with the approbation of the biſhop of Florence renounced the world, and lived together in a religious community on mount Senar, two leagues from that city. It is pretended, that when they firſt appeared in the black habit given them by the biſhop, the very children at the breaſt cried out, *ſee the ſervants of the Virgin*, and that this miracle determined them to take no other name but ſervites, or ſervants of the Virgin. This order became very numerous.

There are alſo nuns of this order, who have ſeveral monaſteries in Germany, Italy, and Flanders.

SERVITOR, in the univerſity of Oxford, a ſtudent who attends on another for his maintenance and learning.

SERVITORS *of bills*, ſervants or meſſengers of the marſhal of the king's bench, ſent with bills or writs, to ſummon people to that court: theſe are now called tipſtaves.

SERVITUDE, the condition of a ſervant, or rather ſlave. See the articles SERVANT and SLAVE.

SERUM, a thin, tranſparent, ſaltiſh liquor, which makes a conſiderable part in the maſs of blood. See *Analyſis of the* BLOOD. The ſerum is in reality the ſame with the lympha, which is carried by the arteries through the ſeveral parts of the body; whence it returns partly in the veins, and partly in the lymphatic veſſels. See the article LYMPHA.

Sweat and urine are nothing but ſerum drained of their nutritious parts, by repeated circulations, and ſecreted from the blood in the glands of the ſkin and kidneys.

SESAMOIDA OSSA, in anatomy, ſeveral ſmall bones that ſomewhat reſemble the ſeed of the ſeſamum, whence their name. Their moſt uſual ſituation is, 1. In the thumb or great toe; in each of which we often find two of them, though not unfrequently only one. 2. One in the juncture of the metacarpus with the little finger: this is frequently lodged in the muſcle of that finger. 3. One frequently in each external condyle of the os femoris. One under the os cuboides of the tarſus, in the tendon of the peronæus poſtius. Theſe are uſually found in adults, or in elderly people. Sometimes, though more rarely, there is alſo one in the internal condyle of the os femoris; and ſometimes there is one in the external ſurface of the os metacarpi, which ſuſtains the fore-finger, lodged in the tendon of the adductor muſcle of the index. Upon the whole, ſays Heiſter, there are very rarely found more than ſixteen of them; thoſe anatomiſts, therefore, err greatly, who place two at the articulation of each finger and toe.

The ſize and ſhape of theſe bones are various and irregular: they are cartilaginous in young ſubjects, but grow hard and bony by age. They ſerve as a kind of trochleæ to the muſcles, and increaſe their power.

SESAMUM, the OILY GRAIN PLANT, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, the corolla whereof conſiſts of a ringent petal; the tube is roundiſh, and almoſt the length of the cup; the faux is inflated, patent, and very large; the limb is quinquifid; the fruit conſiſts of an oblong quadragonal capſule, compreſſed, acuminated, and quadrilocular: the ſeeds are numerous and roundiſh.

The ſeeds of this plant, upon expreſſion, yield a larger quantity of oil than almoſt any other known vegetable; among the Indians they are uſed as food.

SESELI, DUTCH SARIFRAGE, in botany, a genus of the *pentandria-digynia* claſs of plants, the general corolla of which is uniform; the ſingle flowers are compoſed each of five inflexo-cordate and ſlightly unequal petals; the fruit is naked, oval, ſmall, ſtriated, and ſeparable into two parts; the ſeeds are two, oval, convex, and ſtriated on one ſide, and plane on the other.

SESQUI, a latin particle, ſignifying a whole and a half, which joined with *altera*, *terza*, *quarta*, &c. is much uſed in the italian muſic to expreſs a kind of ratios, particularly ſeveral ſpecies of triples. See the article TRIPLE.

The ratio expreſſed by ſeſqui is the ſecond ratio of inequality, called alſo ſuper-particular ratio, and is when the greater term contains the leſs once, and

ſome

ſome certain part over, as 3 : 2, where the firſt term contains the ſecond once, and unity over, which is a quota part of 2. Now if the part remaining be juſt half the leſs term, the ratio is called ſeſqui-altera; if it be a third part of the leſs term, as 4 : 3, the ratio is called ſeſqui-terza, or tertia; if a fourth, as 5 : 4, the ratio is ſeſqui-quarta, and thus to infinity, ſtill adding to ſeſqui the ordinal number of the leſs term. In Engliſh we ſometimes ſay, ſeſqui-alteral, ſeſqui-third, fourth, *&c.* As to the kinds of triples expreſſed by the particle ſeſqui, they are theſe, the greater perfect ſeſqui-alteral, *ſeſqui-altera magiore, perfctta*, which is a triple where the breve is three minims, and that without having any point or dot annexed to it. The greater imperfect ſeſqui-alteral, which is where the breve when pointed contains three minims, and that without any point, only two. The leſs perfect ſeſqui-alteral, is where the ſemibreve contains three minims, and that without any point. The leſs imperfect ſeſqui-alteral is a triple where the ſemibreve with a point contains three minims, and two without. According to Buontempi, one may likewiſe call the triples $\frac{6}{4}$ and $\frac{12}{8}$ ſeſqui-alterals. See the article PROPORTION.

Seſqui-octave, is a kind of triple marked $C\frac{9}{8}$, called by the Italians *nonupla di crome*, where there are nine quavers in every bar, whereof eight are required in common time. The double ſeſqui-fourth, or ſeſqui-quarta dupla, marked thus, $C\frac{9}{4}$, called by the Italians *nonupla di ſemiminime*, is where there are nine crotchets in a bar inſtead of four, in common time. Seſqui-terza, the triples $\frac{6}{8}$, and $\frac{12}{16}$, ſays Buontempi, may be thus denominated. Seſqui-ditone is a concord reſulting from the ſound of two ſtrings whoſe vibrations in equal time are to each other as 5 : 6. See the articles DITONE, VIBRATION, CHARACTER, *&c.*

SESQUI-ALTERAL PROPORTION, in geometry and arithmetic, is when any number or quantity contains another once and an half, and the number ſo contained in the greater, is ſaid to be to it in ſubſeſqui-alteral proportion. See the article PROPORTION.

SESQUI-DUPLICATE PROPORTION, is when of two terms the greater contains the leſs twice, with half another over.

SESQUI-QUADRATE, an aſpect or poſition of the planets, when they are at the diſtance of four ſigns and an half, or 135 degrees from each other; and ſeſqui-quintile is an aſpect of the planets when they are 108 degrees from each other.

SESQUI-TERTIONAL PROPORTION, is when any number or quantity contains another once and one third.

SESSA, a town of Italy, in the kingdom of Naples, and territory of Lavoro, ſituated a little weſt of the Tuſcan ſea, twenty-four miles north of Naples.

SESSILE ROOTS, among botaniſts, ſuch tuberous roots as adhere to the baſe of the ſtalk. And a ſeſſile leaf expreſſes a leaf immediately fixed to the ſtalk or root without any petiole.

SESSION, *ſeſſio*, in general, denotes each ſitting or aſſembly of a council, *&c.*

SESSION *of parliament*, is the ſeaſon or ſpace from its meeting to its prorogation. See the article PARLIAMENT.

Kirk-SESSION. See the article KIRK.

SESSION *for weights and meaſures*, is in London taken for a ſitting of four juſtices choſen from among the mayor, recorder, and aldermen, who hold a court in order to inquire into offences of perſons ſelling by falſe weights and meaſures contrary to the ſtatutes, and to puniſh the ſame.

SESSION, in law, denotes a ſitting of juſtices in court upon their commiſſion; as the ſeſſions of oyer and terminer, the quarter ſeſſions, otherwiſe called the general or open ſeſſions of the peace, in oppoſition to what is called a privy ſeſſion, held upon ſpecial occaſions for ſpeedier diſpatch of juſtice. This general ſeſſion of the peace is a court of record held before two or more juſtices, one being of the quorum, for the execution of the authority granted them by their commiſſion and particular ſtatutes, whereby they are authorized to hear and determine treſpaſſes againſt the public peace, *&c.* and likewiſe divers offences by ſtatute. This court of ſeſſions is held four times a year in every county. See the article COURT, *&c.*

SESTERCE, *ſeſtertius*, a ſilver coin in uſe among the Romans. See COIN.

Some authors make two kinds of ſeſterces, the leſs, called ſeſtertius, in the maſculine gender, and the great one, called ſeſtertium, in the neuter, the latter containing a thouſand of the other. See the article MONEY.

Others will have any ſuch diſtinction of great and little ſeſterces unknown to the Romans; ſeſtertius, ſay they, was an

adjective, and ſignified *as ſeſtertius*, or two aſes and an half, and when uſed plurally, as in quinquaginta ſeſtertium, or ſeſtertia, it was only by way of abbreviation, and there was always underſtood millia, or thouſands.

Seſterce, or ſeſtertius, was alſo uſed by the antients for a thing containing two wholes and an half of another, as *as* was taken for any whole or integer. See the article As.

SESTOS, a noted fortreſs of european Turky, ſituated at the entrance of the Helleſpont or Dardanells, twenty-four miles ſouth-weſt of Gallipoli.

SESTUPLO, in muſic. See SEXTUPLE.

SET, or SETS, a term uſed by the farmers and gardiners to expreſs the young plants of the white-thorn and other ſhrubs, with which they uſe to raiſe their quick or quickſet-hedges. See the articles HEDGE and OFFSET.

ET-BOLTS, in a ſhip. See BOLT.

SETHIANS, in church-hiſtory, chriſtian heretics, ſo called becauſe they paid divine worſhip to Seth, whom they looked upon to be Jeſus Chriſt the ſon of God, but who was made by a third divinity, and ſubſtituted in the room of the two families of Abel and Cain, which had been deſtroyed by the deluge. Theſe heretics appeared in Egypt in the ſecond century, and as they were addicted to all ſorts of debauchery, they did not want for followers, and continued in Egypt above two hundred years.

SETIMO, a town of Italy in the province of Piedmont, ſituated on the river Po, eight miles north of Turin.

SETON, in ſurgery, a few horſe-hairs, ſmall threads, or large packthread drawn through the ſkin, chiefly the neck, by means of a large needle or probe, with a view to reſtore or preſerve health.

There are chiefly three methods of performing this operation practiſed among ſurgeons. The firſt is by taking up the ſkin in the lower part of the neck, and introducing a needle armed with ſilk or thread through the ſkin, which is to be left in the neck after the needle is removed; the wound is then dreſſed with ſome digeſtive ointment, and covered with a plaſter perforated on each ſide for the ligature to paſs through; the ligature is to be ſhifted or drawn through the wound a little every day, and the matter is to be wiped off, by which means it will degenerate into an ulcer with a double orifice, making a copious diſcharge daily; and when one ligature is become foul and unfit for uſe, another may be introduced by faſtening it to the end of the old one. The ſecond way of making a ſeton differs little from the former; only inſtead of a large needle, a double-edged ſcalpel is made uſe of, by means of which a larger aperture is made, and a greater quantity of matter is thereby diſcharged. The third manner is by an inſtrument for the purpoſe, whereby the ſkin is pinched up, and afterwards perforated with a ſharp-pointed and red-hot iron, after which the ligature is introduced. We find by experience, that ſetons are very uſeful in the hydrocephalus, catarrhs, inflammations and other diſorders, particularly thoſe of the eyes, as a gutta ſerena, cataract, and incipient ſuffuſion; to thoſe we may add intenſe headachs, with ſtupidity, drowſineſs, epilepſies, and even an apoplexy itſelf.

SETTE, in geography, the ſame with cette. See the article CETTE.

SETTE, a veſſel very common in the Mediterranean, with one deck, and a very long and ſharp prow; they carry ſome two maſts, ſome three, without top-maſts. Their yards and ſails are all like the miſen; the leaſt of them are of ſixty tons burden. they ſerve to tranſport cannon and proviſion for ſhips of war, and the like.

SETTER, among farmers. To ſetter is to cut the dewlap of an ox or cow, and into the wound to put the root of the helleboraſter, whereby an iſſue is made for ill humours to vent themſelves.

SETTING, in aſtronomy, the withdrawing of a ſtar or planet, or its ſinking below the horizon. Aſtronomers and poets make three different kinds of ſetting of the ſtars, *viz.* the coſmical, acronycal, and helical. See the articles COSMICAL, ACRONYCAL, HELICAL, and RISING.

SETTING, in the ſea-language. To ſet the land or the ſun, by the compaſs, is to obſerve how the land bears on any point of the compaſs, or on what point of the compaſs the ſun is. Alſo when two ſhips ſail in ſight of one another, to mark on what point the chaſed bears, is termed ſetting the chaſe by the compaſs.

SETTING, among ſportſmen, a term uſed to expreſs the manner of taking partridges by means of a dog peculiarly trained to that purpoſe.

The ſetting dog generally uſed is a long land-ſpaniel, taught by nature to hunt partridges more than any other game,

and in his untaught ſtate running over the fields in ſearch of them; but being taught, the creature is under ſuch excellent command, that he will, in the midſt of his higheſt career, attend the leaſt hem from his maſter, and ſtand ſtill to look in his face and to take his orders by the ſlighteſt ſignals; and when he is ſo near his game that it is almoſt in his mouth, he will ſtand ſtock-ſtill, or lye down on his belly, till his maſter arrives, and he receives his directions. The ſetting-dog being taken to the haunt of the partridges, is to be caſt off, and ſent to range; but he muſt be made to keep near the ſportſman, and not to run wildly on, but to beat all the ground regularly. If in the dog's ranging he ſtops on a ſudden, the ſportſman is to make up to him, and as there is certainly game before him, he muſt be ordered to advance; if he refuſes this, and looks back and ſhakes his tail, it is a ſignal that they are cloſe before him, and the ſportſman is then to take a circumference, and look carefully before the dog's noſe, to ſee where they are, and how they lie; then going up and ſtaking down one end of the net, he is to command the dog to lie ſtill, and to draw the net gently over the birds, then making in with a noiſe, he is to ſpring them, and they will be entangled and taken, as they riſe.

SETTLE, a market-town in the weſt riding of Yorkſhire, ſituated forty-five miles weſt of York.

SEVENOAK, a market-town of Kent, fourteen miles weſt of Maidſtone.

SEVENTH, *ſeptima*, in muſic, an interval called by the Greeks heptachordon, whereof there are four kinds; firſt, the defective ſeventh, conſiſting of three tones and three greater ſemitones; the ſecond, called by Zarlin and the Italians demiditono con diapente, or ſettimo minore, is compoſed diatonically of ſeven degrees and ſix intervals, four whereof are tones, and the reſt greater ſemi-tones, and chromatically of ten ſemitones, ſix whereof are greater, and four leſs; it takes its form from the ratio quadriparziente quinto, as 9 : 5. The third, called by the Italians il ditono con diapente, or ſettimo maggiore, is compoſed diatonically of ſeven degrees, like the former, and ſix intervals, five whereof are tones and a major ſemi-tone, ſo that only a major ſemi-tone is wanting to make up the octave, and chromatically of twelve ſemi-tones, ſix greater and ſix leſs. It takes its form from the ratio of 15 : 8. The fourth is redundant, and compoſed of five tones, a greater ſemi-tone and a leſs, ſo that it wants only a comma of an octave, that is, ſo much as to make its ſecond ſemitone greater, called pentatonon. Hence many confound it with the octave, maintaining with good reaſon, that only the three firſt ſeventhes can be of any uſe.

SEVER, a town of France, in the province of Gaſcony, ſituated on the river Adour, thirty-eight miles north-eaſt of Bayonne.

SEVERAL, a term much uſed in law: thus ſeveral action, ſignifies an action wherein two or more are ſeverally charged. See ACTION.

Several covenant, that entered into by two or more perſons ſeverally. Any ſuch covenant, though contained in one deed or writing, is deemed as ſeveral deeds wrote on the ſame piece of paper or parchment. See COVENANT.

Several inheritance, is when an inheritance is conveyed ſo as to deſcend to two perſons ſeverally by moieties, *&c.* See the article INHERITANCE.

Several tail, ſignifies that eſtate or land which is intailed ſeverally on two; as where lands are given to two men and their wives, and to the heirs of their bodies to be lawfully begotten, in which caſe the donees hold jointly for their two lives, and at the ſame time have a ſeveral or ſeparate inheritance: for the iſſue of the one ſhall have his moiety in tail, and the iſſue of the other his. See TAIL.

Several tenancy, is a plea or exception to a writ which is taken out againſt two perſons as joint-tenants, who in fact are ſeveral. See TENANCY.

SEVERANCE, in law, the ſingling or ſeparating of two or more joined in one writ. According to Hale there are two kinds of ſeverances, one where a plaintiff will not appear, and the other where ſeveral plaintiffs appear, but ſome of them will not proceed in the ſuit. Severance is allowed as well in real as in perſonal actions. There is a ſeverance of the tenants in aſſiſe, which is where one or two diſſeiſes appear upon the writ, and not the other. There is alſo ſeverance in in debt, as where two or more executors are plaintiffs in a ſuit, and one of them refuſes to proſecute. Likewiſe if in a writ of error there are ſeveral plaintiffs, and the one only aſſigns errors, or in caſe the other releaſe the ſame, this will not

be

be good without ſummoning and ſevering the reſt. Where there is a ſeverance of joint tenants, in ſuch caſe the proſecution of the ſuit is ſevered, but not the eſtate in the lands, *&c.* And upon ſuing out a writ of ſummons and ſeverance, if the party does not come in thereon, the other ſhall have judgment *ad proſequendum ſolum*, to proſecute alone, which may be done in the court of king's bench by giving a rule, *&c.*

SEVERANCE *of corn*, ſignifies the cutting and carrying the ſame off the ground; and ſometimes it is taken for the ſetting out the tithe from the reſt of the corn.

SEVERINO ST. a city of Naples, in the province of Calabria, ſituated eaſt long. 17° 30′, north lat. 39° 16′. This is alſo the name of a town in the pope's territories and marquiſate of Ancona, ſituated twenty miles ſouth-eaſt of Loretto.

SEVERN, a river of ſouth-Britain, which riſing in Montgomery-ſhire, runs eaſt till it enters Shropſhire; and having paſſed by Shrewſbury turns ſouth, and diſcharges itſelf into the Briſtol-channel.

SEVIERO, a town of Italy, in the kingdom of Naples, and territory of Capitinat: ſituated in eaſt long. 16° 12′, north lat. 41° 32′.

SEVILLE, a city of Spain, capital of the province of Andaluſia, ſituated on the river Guadalquivir, in weſt long. 6°, north lat. 37° 15′.

SEVOLD, or SEGEWOLD, a town of Livonia, ſituated thirty miles north-eaſt of Riga.

SEVUM, or SEBUM, SUET, in anatomy. See SUET.

SEWER, in the houſhold, an officer who comes in before the meat of a king or nobleman, to place and range it on the table.

SEWER is alſo a paſſage or gutter made to carry water into the ſea or a river, whereby to preſerve the land, *&c.* from inundations and other annoyances. The buſineſs of the commiſſioners of ſewers, or their office in particular, is to repair ſea-banks and walls, ſurvey rivers, public ſtreams, ditches, *&c.* and to make orders for that purpoſe. See the article COMMISSION.

Theſe commiſſioners have likewiſe authority to make enquiry of all nuſances or offences committed by the ſtopping of rivers, erecting mills, not repairing banks, bridges, *&c.* and to tax perſons chargeable for the amending of defaults that tend to the obſtruction or hindrance of the free paſſage of the water through its antient courſes. They may not only make a rate and aſſeſſment for repairs, but alſo may decree lands to be ſold, in order to levy charges aſſeſſed, upon non-payment thereof, *&c.* But the decrees of the commiſſioners are to be certified into chancery, and have the king's aſſent to be binding, and their proceedings are ſubject to the juriſdiction of the king's-bench. In the making of a rate or tax, the commiſſioners are to aſſeſs every owner or poſſeſſor of lands in danger of receiving any damage by the waters, equally according to the quality of their lands, rents, and numbers of acres, and their reſpective portions and profits, whether it be of paſture, fiſhing, *&c.* And where no perſons or lands can be known that are liable to make repairs of banks and ſewers, then the commiſſioners are to rate the whole level. The 3. Jac. I. ordains that all ditches, banks, bridges, and water-houſes, within two miles of London, adjoining to, and falling into the Thames, ſhall be ſubject to the commiſſioners of ſewers. Alſo the lord-mayor, *&c.* may appoint perſons in that caſe to have the power of commiſſioners of ſewers. Perſons breaking down ſea-banks, whereby lands are damaged, are adjudged to be guilty of felony; and removing piles, *&c.* forfeit twenty pounds, by 6 and 10 Geo. II. c. 32.

SEX, *ſexus*, ſomething in the body which diſtinguiſhes male from female.

SEXAGENARY, ſomething relating to the number ſixty: thus ſexagenary or ſexageſimal arithmetic, is a method of computation proceeding by ſixties; ſuch is that uſed in the diviſion of a degree into ſixty minutes, of the minute into ſixty ſeconds, of the ſecond into ſixty thirds, *&c.* Alſo ſexagenary tables are tables of proportional parts, ſhewing the product of two ſexagenaries that are to be multiplied, or the quotient of the two that are to be divided.

SEXAGESIMA, the ſecond ſunday before Lent, or the next to Shrove-ſunday, ſo called as being about the ſixtieth day before Eaſter.

SEXAGESIMALS, or SEXAGESIMAL FRACTIONS, fractions whoſe denominators proceed in a ſexagecuple ratio; that is, a prime, or the firſt minute $= \frac{1}{60}$; a ſecond $= \frac{1}{3600}$; a third $= \frac{1}{216000}$.

Antiently

Antiently there were no other than ſexageſimals uſed in aſtronomy, and they are ſtill retained in many caſes, though decimal arithmetic begins to grow in uſe now in aſtronomical calculations. In theſe fractions, which ſome call aſtronomical fractions, the denominator being always ſixty, or a multiple thereof, is uſually omitted, and the numerator only written down, thus, 4°, $59'$, $32''$, $50'''$, $16''''$, is to be read four degrees, fifty-nine minutes, thirty-two ſeconds, fifty thirds, ſixteen fourths, *&c.*

SEXANGLE, in geometry, a figure having ſix ſides, and conſequently ſix angles.

SEXTANS, *ſextant*, a ſixth part of certain things. The Romans having divided their as into twelve ounces, or unica, the ſixth part of that, or two ounces, was the ſextans.

Sextans was alſo a meaſure which contained two ounces of liquor, or two cyathi. See MEASURE.

SEXTANT, in mathematics, denotes the ſixth part of a circle, or an arch comprehending ſixty degrees. See the article CIRCLE.

The word ſextant is more particularly uſed for an aſtronomical inſtrument made like a quadrant, excepting that its limb only comprehends ſixty degrees. The uſe and application of the ſextant is the ſame with that of the quadrant. See the article QUADRANT.

SEXTARIUS, an antient roman meaſure. See the article MEASURE.

SEXTERY LANDS, ſignifies lands formerly given to a church, or religious houſe, for the maintenance of a ſexton. See the article SEXTON.

SEXTILE, *ſextilis*, the poſition or aſpect of two planets when at ſixty degrees diſtance, or at the diſtance of two ſigns from one another. It is marked thus (✶). See ASPECT.

SEXTON, a church-officer, whoſe buſineſs is to take care of the veſſels, veſtments, *&c.* belonging to the church, and to attend the miniſter, church-wardens, *&c.* at church. He is uſually choſen by the parſon only. The office of ſexton, in the pope's chapel, is appropriated to the order of the hermits of St. Auguſtine. He is generally a biſhop, though ſometimes the pope only gives a biſhopric in particular to him on whom he confers the poſt: he takes the title of prefect of the pope's ſacriſty, and has the keeping of the veſſels of gold and ſilver, the relics, *&c.* When the pope ſays maſs the ſexton always taſtes the bread and wine firſt. If it be in private he ſays maſs, his holineſs of two wafers gives him one to eat; and if in public, the cardinal who aſſiſts the pope in quality of deacon, of three wafers gives him one to eat. When the pope is very ſick he adminiſters to him the ſacrament of extreme unction, *&c.* and enters the conclave in quality of firſt conclaviſt.

SEXTUPLE, *ſeſtuplo*, in muſic, denotes a mixed ſort of triple which is beaten in double time. See TRIPLE.

Authors uſually make mention of three ſpecies hereof, to which Mr. Broſſard adds two others, five in all, which are theſe: ſextuple of a ſemi-breve, called by the French triple of 6 for 1, as being denoted by the numbers $\frac{6}{1}$; or becauſe here are required ſix ſemi-breves to a meaſure inſtead of one, in common time, three for the riſing and three for the falling of the hand. Sextuple of a minim, called by the French 6 for 2, as being denoted by $\frac{6}{2}$, which ſhews that ſix minims muſt be contained in a bar, whereof two are ſufficient in common time. Sextuple of a crotchet, called by the French triple of 6 for 4, becauſe denoted by $C\frac{6}{4}$, wherein ſix crotchets are contained in the bar inſtead of four. Sextuple of the chroma, denominated 6 for 8 by the French, as being denoted by $\frac{6}{8}$, which ſhew that ſix quavers here make a bar, or ſemi-breve, inſtead of eight in common time. Sextuple of the ſemi-chroma, or triple of 6 for 16, ſo called as being denoted by the figures $\frac{6}{16}$, which ſhews that ſix quavers are here required to a meaſure inſtead of ſixteen. See the article TIME, *&c.*

SEXUALISTÆ, among botanical writers, thoſe who have eſtabliſhed the claſſes of plants upon the differences of the ſexes and parts of fructification in plants, according to the modern method, as Linnæus, *&c.* See the article BOTANY.

SEYNE, a river of France, which riſing near Dijon, in Burgundy, runs north-weſt through Champain and the iſle of France, through Paris, *&c.* and croſſing Normandy falls into the Britiſh-channel, between Havre-de-grace and Honfleur.

SGRAFFIT, *ſgraffiata*, in painting, denotes ſcratch-work, a method of painting

ing in black and white only, not in freſco, yet ſuch as will bear the weather. Sgraffit performs both the deſign and painting all in one. It is chiefly uſed to embelliſh the fronts of palaces and other magnificent buildings.

SHACK, in antient cuſtoms, a liberty of winter paſturage. In the counties of Norfolk and Suffolk, the lord of the manor has ſhack; that is, a liberty of feeding his ſheep at pleaſure in his tenants lands, during the ſix winter months.

SHACKLES, or SHAKLES. See the article SHAKLES.

SHAD, *alauſa*, in ichthyology, a ſpecies of clupea, with the upper jaw bifid at the extremity, and ſpotted with black: it greatly reſembles the common herring, and is, on that account, ſometimes called the mother of herring: all the fins are whitiſh, except that on the back: the tail is very much forked.

SHADOW, *umbra*, in optics, a privation or diminution of light, by the interpoſition of an opake body; or, it is a plane where the light is either altogether obſtructed, or greatly weakened, by the interpoſition of ſome opake body between it and the luminary.

A ſhadow of itſelf is inviſible; and, therefore, when we ſay we ſee a ſhadow, we partly mean that we ſee bodies placed in the ſhadow, and illuminated by light reflected from collateral bodies; and, partly, that we ſee the confines of the light. See the article LIGHT.

If the opake body that projects the ſhadow be perpendicular to the horizon, and the place it is projected on be horizontal, the ſhadow is called a right ſhadow; and ſuch are the ſhadows of men, trees, buildings, mountains, *&c.* But if the opake body be placed parallel to the horizon, the ſhadow is called a verſed ſhadow; as the arms of a man ſtretched out, *&c.*

The laws of the projection of SHADOWS *from opake bodies.* 1. Every opake body projects a ſhadow in the ſame direction with its rays; that is, towards the part oppoſite to the light. Hence, as either the luminary or the body changes place, the ſhadow likewiſe changes. 2. Every opake body projects as many ſhadows as there are luminaries to enlighten it. 3. As the light of the luminary is more intenſe, the ſhadow is the deeper: hence the intenſity of the ſhadow is meaſured by the degrees of light that ſpace is deprived of. 4. If a luminous ſphere be equal to an opake one it illuminates, the ſhadow, which this latter projects, will be a cylinder, and conſequently will be propagated ſtill equal to itſelf, to whatever diſtance the luminary is capable of acting; ſo that if it be cut in any place, the plane of the ſection will be a circle, equal to a great circle of the opake ſphere. 5. If the luminous ſphere be greater than the opake one, the ſhadow will be conical. If, therefore, the ſhadow be cut by a plane, parallel to the baſe, the plane of the ſection will be a circle; and that ſo much the leſs as it is a greater diſtance from the baſe. 6. If the luminous ſphere be leſs than an opake one, the ſhadow will be a truncated cone; and, conſequently, grows ſtill wider and wider; and therefore, if cut by a plane, parallel to the ſection, that plane will be a circle, ſo much the greater as it is further from the baſe.

Of SHADOWS *from the ſun.* The ſun being vaſtly larger than the whole globe of the earth, muſt give all its ſhadows pointed, by reaſon it illumines more than half of them.

In conſequence of this demonſtration, we might conclude, that all the ſun's ſhadows muſt be leſs than the bodies that project them, and diminiſhed more and more as they recede further and further. Now this would be true were there any relation between the body illuminated and the body illumining; but as all objects on the earth are ſo ſmall in compariſon of that ſtar, the diminution of their ſhadows is imperceptible to the eye, which ſees them always equal; *i. e.* either broader or narrower than the body that forms them: on this account all the ſhadows cauſed by the ſun are made in parallels.

From the whole it appears, that to find the ſhadow of any body whatever oppoſed to the ſun, a line muſt be drawn from the top of the luminary perpendiular to the place where the foot of the luminary is to be taken: and through this place an occult line is to be drawn through one of the angles of the plan of the object, and another from the ſun to the ſame angle; and the interſection of the two lines will ſhew how far the ſhadow is to go: all the other lines muſt be drawn parallel hereto.

The

Fig. 1. SEED.

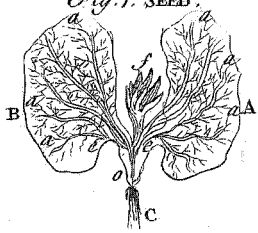

Fig. 2. SEGMENT

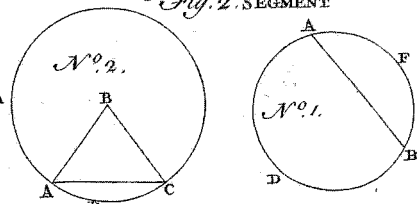

Fig. 3. SHADOWS.

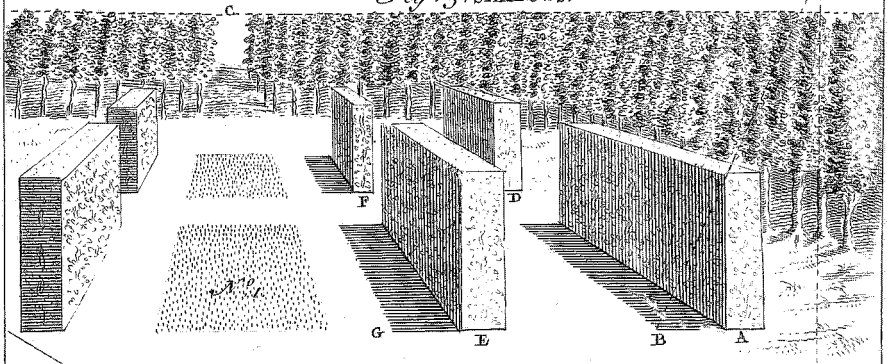

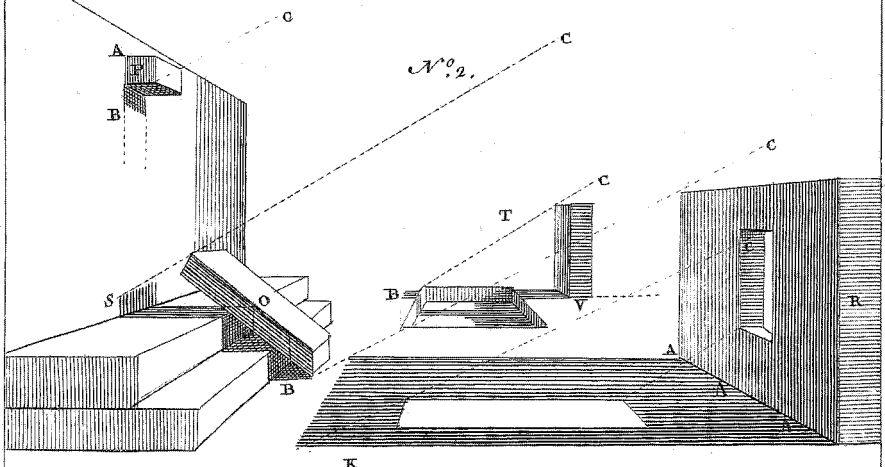

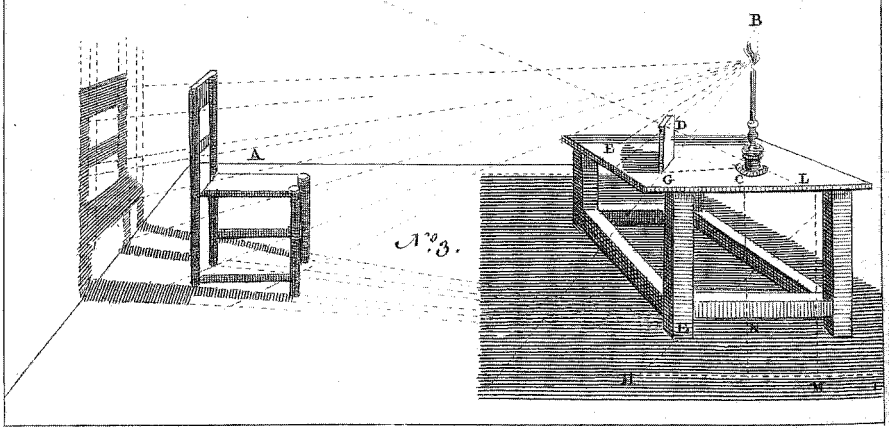

J. Jefferys sculp.

The ſhadows of the ſun are equal in objects of the ſame height, though at a diſtance from each other. See plate CCXLIV. fig. 3. n° 1.

Experience teaches, that ſtiles, or elevations of the ſame height, removed to a diſtance from each other, do yet project equal ſhadows at the ſame time: for they are lengthening and ſhortening, in proportion as the ſun comes nearer, or recedes further off; one or other of which he is continually doing.

For this reaſon, when the ſhadow of an object is to be caſt any way, you muſt determine the place of the ſun, and the point underneath, to draw two occult lines from the ſame, for the extremity of the ſhadow; as here the paliſade A gives the extreme of its ſhadow in B: and if from this point B, you draw a point of ſight C, this line B C will be the ſhadow of the paliſade D, as well as that of A, and of all the reſt in the ſame line to the very point of ſight.

In effect, it muſt be held for a certain maxim, that ſhadows always retain the ſame point of ſight as the objects. On the footing of this obſervation, that objects of the ſame height give equal ſhadows: if you would give the ſhadow of the paliſades, E, F, which are of the ſame height as A, D, take in your compaſſes the diſtance A D, and ſet it on the foot of the paliſade E, by which you will have E G; then from G draw a line to the point of ſight C; and thus you are to proceed, let the number of walks be ever ſo great.

Though the ſun is made to appear in this figure, it muſt not be ſuppoſed that he is ſo near the objects; the deſign being only to ſhew, that the rays proceed from him in this manner, when at ſuch a height, though far without the limits of the piece; as *ibid.* n° 2. which yet has the line for the foot of the object A B; and thoſe of the rays of the ſun C, C, C, becauſe theſe are always required for finding the extremities of the ſhadows.

The ſhadow of the object O is found by continuing the line A B, and making it riſe over the ſteps, and againſt the wall, till cut by the ray in the point S, by the rays paſſing over the corner of the object, and from S drawing a line to the point of ſight T.

To find the ſhadow of the object P, it muſt be remembered that the foot of the light muſt always be ſuppoſed on the plane where the object is placed. Accordingly, the ray C, cutting the little line A B, ſhews how far the ſhadow of the little object P muſt go, to be thence drawn to the point of ſight T. The object V caſts its ſhadow all along, though in its way it deſcends into a ditch.

The ſhadow of the wall R is found by the ſame rule as the reſt; as appears from the lines A B and the ray C.

SHADOWS *by torch-light*. The ſhadow of an erect pyramid by torch-light falls as it would by the light of the ſun; and in both caſes there is but one line, whereon the vertical point of the pyramid will be found.

Upon the planes B C D E (pl. CCXLV. fig. 1.) draw the diagonals E B and D C; through the central point F, raiſe the perpendicular F A; and from the four points, B, C, D, E, draw lines to the point A, and the pyramid will be erected.

Then, to find its ſhadow, draw an indefinite line from its baſis G of the illuminating body, paſſing through F; and from the central flame of the torch H draw another line over the vertex of the pyramid in the line G F, till it cut the point I, which point will limit the ſhadow of the pyramid.

Laſtly, draw a line from C to I, and another from E to I, and the triangle C I E will be the ſhadow of the pyramid.

To gain the ſhadow of an inverted pyramid, draw perpendicular lines from the angular points of its baſe, and form the ſubjacent plane, by means thereof, after the manner directed for the ſun.

And from all the angles of this plane draw lines to the baſe of the torch G; then from H, the central point of the flame, draw other lines touching all the angles of the baſe of the inverted pyramid, and dividing thoſe of the plane, whereby the ſhadow will be defined.

Shadows from the ſun are caſt all the ſame way, and have the ſame diſpoſition; it being impoſſible that the ſun ſhould occaſion one ſhadow towards the eaſt, and another towards the weſt, at the ſame time.

It is true, in different times of the day, it makes this difference; but never in one and the ſame hour.

But the torch, candle, and lamp, have always this effect; for in what place ſoever one of theſe luminaries be found,

provided there be a number of objects about them, the ſhadows will be caſt various ways; ſome to the eaſt, ſome to the weſt, ſome to the north, and others to the ſouth, according to the ſituation of the objects around the luminary: the foot of which, here repreſented by A, (*ibid.* fig. 2.) ſerves as a common center, from which they all proceed: and the flame, here repreſented by B, ſhews where they are to terminate, though at different diſtances; as the neareſt produce the ſhorteſt ſhadows, and the remoteſt the longeſt.

SHADOWS *on ſeveral parallel planes.* The firſt plane here is the floor, whereon the chair A (pl. CCXLIV. fig. 3. n° 3.) ſtands; the ſecond plane is the upper part of the table, parallel to the firſt, and may be either above or below it. There might alſo be more of theſe planes, wherein to find the foot of the illuminating body, in order to come at the ſhadow of the object. Suppoſe the foot of the illuminating body to be C, and the upper flame B; from the points C and B draw lines through the upper and under parts of the object D, which will give the ſhadow E upon the table.

To find the ſhadow of the chair A, which is placed on the ground, determine the foot of the luminary on the table in C on the ground: this is eaſy by the following inſtructions. From the point of diſtance, which is here ſuppoſed to be without the limits of the paper, draw a line through the foot of the table F; then from the angle G upon the table let fall a perpendicular, cutting the line F in the point H, and from H draw a parallel to the baſe H I, which is equal to the upper part of the table, and will direct to the thing required. For drawing a line from the point of ſight K, through the foot of the luminary C, to the extremity of the table L; from the ſame point L, let fall a perpendicular to H I, which will give the point M.

Then from M draw a line to the point of ſight K, in which line M K the foot of the luminary will be found.

To determine the preciſe point, let fall a perpendicular from the point C, which, cutting the line M H, will give the point N for the foot of the luminary.

This point N being thus found, there will be no difficulty in finding the ſhadow of the chair A, the method being the ſame as for the other objects taught before, that is, from the foot of the luminary N draw lines through all the angles of the plane of the chair, and other lines through the upper part of the chair from the luminary B; theſe latter, by interſecting the former, expreſs the bounds of the ſhadow. For the reſt, the figure gives ſufficient directions.

When two luminaries ſhine on the ſame object, two ſhadows muſt be produced; each of the luminaries occaſioning its reſpective ſhadow, and that in proportion to the circumſtances of the luminary.

If ſuch luminaries, when at equal diſtances, be equal, the ſhadows themſelves muſt be equal: but if there be any diſproportion, that is, if one of them be a little bigger than the other, or one of them a little nearer the object than the other, the ſhadows will be unequal.

Thus the object O, (pl. CCXLV. fig. 3.) being illuminated by two candles, the one near at hand in P, the other farther off in Q, it is evident the ſhadow of the candle P will be deeper than that of the candle Q, as is expreſſed in the figure.

The rules for ſuch ſhadows are the ſame with thoſe already given, both for the ſun and the torch.

From what has been obſerved before may be drawn this concluſion, that the ſame object may project ſhadows of divers forms, though ſtill illumined on the ſame ſide; the ſun giving one form, the torch another, and the day-light no preciſe form at all.

The ſun always makes its ſhadow equal to the object, that is, projects it parallelwiſe.

It is certainly of conſequence to all painters, engravers, &c. to obſerve theſe rules preciſely, and not to take the rules for candles, lamps, and the like, in lieu thereof, as is too frequently done.

The ſhadow of a torch, or flambeau, is not projected in parallel lines, but in rays proceeding from a center, whence the ſhadow is never equal to the body, but always bigger, and grows more ſo as it recedes farther off. It appears therefore a groſs abuſe to repreſent the ſhadow of a torch like that of the ſun, and the ſhadow of the ſun like that of a candle, when the difference is ſo conſiderable.

There is a third kind of ſhadow, neither produced by the ſun nor a torch; but only a fine ſunny day, which wanting ſtrength to finiſh and define its form, occaſions a dimneſs near the object. Now for this there is no certain rule, but every body conducts it at diſcretion.

SHADOWS

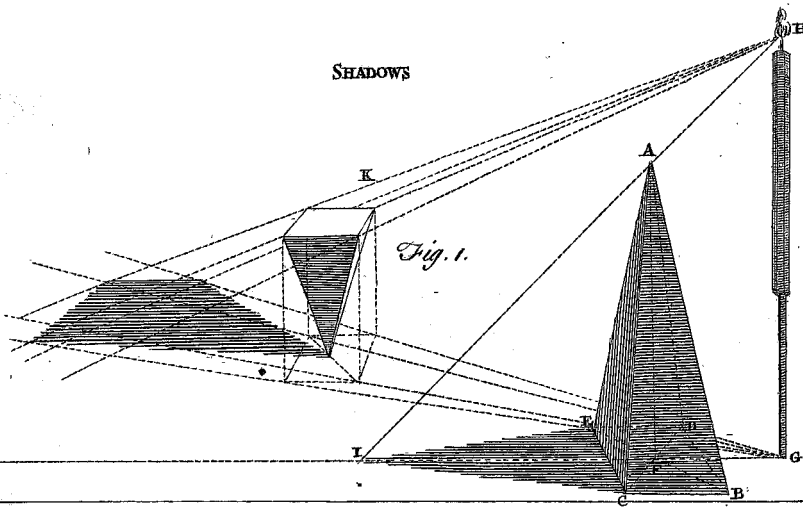

Fig. 1.

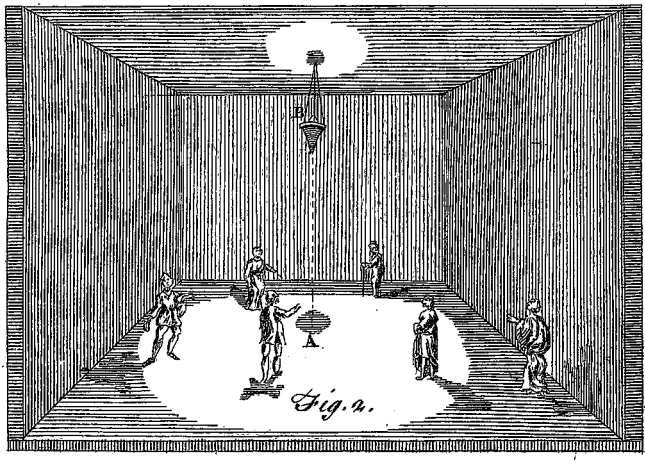

Fig. 2.

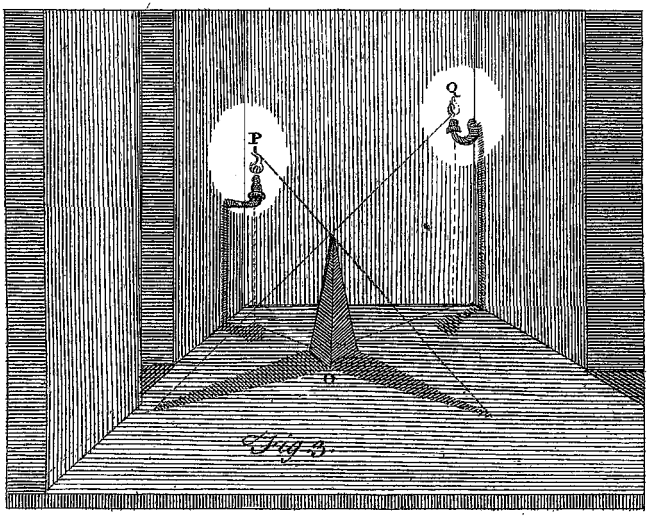

Fig. 3.

T. Jefferys sculp

All theſe ſhadows, both of the ſun, of the torch, and of the day-light, muſt appear darker than the parts of objects not illumined; and that part of the ſhadow that is moſt remote from the object muſt be ſtill darker than that nearer it.

SHADOW, in geography. The inhabitants of the terraqueous globe of the earth receive different denominations, according to the different ways wherein their ſhadows are projected; as aſcii, amphiſcii, heteroſcii, and periſcii. See the articles ASCII, *&c.*

SHADOW, in painting, an imitation of a real ſhadow, effected by gradually heightening and darkening the colours of ſuch figures, as by their diſpoſitions cannot receive any direct rays from the luminary that is ſuppoſed to enlighten the piece.

The management of the ſhadows and lights makes what the painters call claro-obſcuro. See CLARO-OBSCURO.

Geneſis of curves by SHADOWS. See the article CURVE.

SHAFT *of a column*, in building, is the body thereof between the baſe and capital: ſo called from its ſtraightneſs. See the article COLUMN.

The term ſhaft is alſo uſed for the ſpire of a church-ſteeple, and for the tunnel of a chimney. See the articles SPIRE and CHIMNEY.

SHAFT, in mining, is the pit or hollow entrance into it. See MINE.

SHAFTSBURY, a borough of Dorſetſhire, twenty-five miles north-eaſt of Dorcheſter; from whence the noble family of Cooper took the title of earl. It ſends two members to parliament.

SHAG, or SHAGG, in ornithology, a ſpecies of pelican, brown underneath, with twelve feathers in the tail; being very like the cormorant in ſhape, but of a different colour: it is about the ſize of a well fed duck, and is known among authors by the names corvus aquaticus minor, and graculus palmipes.

SHAGREEN, or CHAGREEN, in commerce, a kind of grained-leather, prepared, as is ſuppoſed, of the ſkin of a ſpecies of ſqualus, or hound-fiſh, called the ſhagree, or ſhagrain; and much uſed in covering caſes, books, *&c.*

It is imported from Conſtantinople, Tauris, Tripoli, Algiers, and from ſome parts of Poland, where it is prepared in the following manner: The ſkin being ſtretched out is firſt covered over with muſtard-ſeed, which is bruiſed upon it; and being thus expoſed to the weather for ſome days, it is then tanned.

The beſt is of a browniſh colour, as the white ſort is the worſt: it is extremely hard; yet, when ſteeped in water, it becomes ſoft and pliable; and being faſhioned into caſe-covers, it readily takes any colour, as red, green, yellow, black, according to the fancy of the workman.

Each ſhagreen ſkin pays, on importation, a duty of $4\frac{78\frac{3}{4}}{100}$ d. and draws back, on exportation, $4\frac{51\frac{1}{4}}{100}$ d.

SHAKLES, in a ſhip, are the rings with which the ports are ſhut faſt, by laſhing the port-bar to them. There are alſo ſhakles put upon bilbow-bolts, for confining the men who have deſerved corporal puniſhment.

SHALLOP, or SHALLOOP, a particular ſort of ſhip. See the article SHIP.

SHAMADE, ar CHAMADE. See the article CHAMADE.

SHAMBLES, among miners, a ſort of niches, or landing places, left at ſuch diſtances in the adits of mines, that the the ſhovel-men may conveniently throw up the ore from ſhamble to ſhamble, till it comes to the top of the mine. See DIGING, MINE, *&c.*

SHAMMY, or CHAMOIS-LEATHER, a kind of leather, dreſſed either in oil or tanned; and much eſteemed for its ſoftneſs, pliancy, and being capable of bearing ſoap without hurt.

The true ſhammy is prepared of the ſkin of the chamois-goat. See the article CHAMOIS.

In France, *&c.* ſome wear the ſkin crude without any preparation; it is alſo uſed for the purifying mercury, which is done by paſſing it through the pores of this ſkin, which are very cloſe. See the article MERCURY.

The true chamois leather is counterfeited with common goat, kid, and even ſheep-ſkin; the practice of which makes a particular profeſſion, called by the French chamoiſure. The laſt is the leaſt eſteemed, yet ſo popular, and ſuch vaſt quantities prepared, eſpecially about Orleans, Marſeilles, and Tholouſe, that it may not be amiſs to give the method of preparation.

The manner of chamoiſing, or of preparing ſheep, goat, or kid-ſkins in oil, in imitation of Chamois.

The ſkins being waſhed, drained, and ſmeared over with quick-lime, on the fleſhy ſide, are folded in two, lengthwiſe, the wool outwards, and laid on heaps, and ſo left to ferment eight days; or if they had been left to dry after fleaing, for fifteen days.

Then they are waſhed out, drained, and half-dried, laid on a wooden leg or horſe, the wool ſtripped off with a round ſtaff for the purpoſe, and laid in a weak pit, the lime whereof had been uſed before, and had loſt the greateſt part of its force.

After twenty-four hours they are taken out, and left to drain twenty-four more; then put in another ſtrong pit. This done, they are taken out, drained, and put in again by turns; which begins to diſpoſe them to take oil: and this practice they continue for ſix weeks in ſummer, or three months in winter; at the end whereof they are waſhed out, laid on the wooden leg, and the ſurface of the ſkin on the wool ſide peeled off, to render them the ſofter; then, made into parcels, ſteeped a night in the river; in winter, more; ſtretched ſix or ſeven over one another, on the wooden leg; and the knife paſſed ſtrongly on the fleſh-ſide, to take off any thing ſuperfluous, and render the ſkin ſmooth.

Then they are ſtretched as before, in the river, and the ſame operation repeated on the wool-ſide; then thrown into a tub of water with bran in it, which is brewed among the ſkins till the greateſt part ſtick to them; and then ſeparated into diſtinct tubs, till they ſwell and riſe of themſelves above the water.

By this means, the remains of the lime are cleared out: they are then wrung out, hung up to dry on ropes, and ſent to the mill, with the quantity of oil neceſſary to fill them: the beſt oil is that of ſtock-fiſh.

Here they are firſt thrown in bundles into the river for twelve hours, then laid in the mill-trough, and fulled without oil till they be well ſoftened; then oiled with the hand, one by one, and thus formed into parcels of four ſkins each, which are milled and dried on cords a ſecond time, then a third; then oiled again and dried.

This proceſs is repeated as often as neceſſity requires: when done, if there be any moiſture remaining, they are dried in a ſtove, and made up into parcels wrapped up in wool; after ſome time they are opened to the air, but wrapped up again as before, till ſuch time as the oil ſeems to have loſt all its force, which it ordinarily does in twenty-four hours.

The ſkins are then returned from the mill to the chamoiſer to be ſcoured; which is done by putting them into a lixivium of wood-aſhes, working and beating them in it with poles, and leaving them to ſteep till the lye have had its effect; then wrung out, ſteeped in another lixivium, wrung again, and this repeated till all the greaſe and oil be purged out. They are then half dried, and paſſed over a ſharp-edged iron inſtrument, placed perpendicular in a block, which opens, ſoftens, and makes them gentle: laſtly, they are thoroughly dried, and paſſed over the ſame inſtrument again, which finiſhes the preparation, and leaves them in form of chamois.

Kid and goat-ſkins are chamoiſed in the ſame manner as thoſe of ſheep, excepting that the hair is taken off without the uſe of any lime; and that when brought from the mill they undergo a particular preparation called ramalling, the moſt delicate and difficult of all the others.

It conſiſts in this, that as ſoon as brought from the mill they are ſteeped in a fit lixivium: taken out, ſtretched on a round wooden leg, and the hair ſcraped off with the knife; this makes them ſmooth, and in working caſt a fine nap. The difficulty is in ſcraping them evenly.

SHANK, in the manege, that part of a horſe's fore-leg which lies between the knee and the fetlock.

SHANK-PAINTER, in a ſhip, a ſhort chain faſtened under the fore-ſhrouds, by a bolt, to the ſhip's ſide; having at the other end a rope ſpliced to the chain, on which the after-part of the anchor reſts when it lies by the ſhip's ſide.

SHANKER, or CHANCRE, in medicine, a malignant ulcer, uſually occaſioned by ſome venereal diſorder. See the articles GONORRHOEA and POX.

Shankers are generally ſituated on thoſe parts which have a fine and tender covering, as the inward duplicature of the prepuce in men, the inſide of the pudenda in women, the nipples of nurſes, and the lips and tongue of proſtitutes: in very bad caſes they will appear on the dorſum penis, as well as on the pubes and inſide of the thighs.

In the cure of a recent ſhanker, Aſtruc firſt orders bleeding, to abate the inflammation, then fomentations to reſolve the induration; not omitting mercurials in the mean time, but ſo as to avoid a ſalivation. After which he adviſes the uſe of ſudorific decoctions of china, ſarſaparilla, guaiacum, and ſaſſafras boiled with antimony. In ſlight ſhankers, he recommends an ointment made of lapis calaminaris, half an ounce; of ſulphur and quickſilver, each one dram; which are to be mixed with a ſufficient quantity of turpentine to make an ointment. Cockburn ſays, any ſhanker may be cured with an ointment of quickſilver and turpentine, without farther trouble; and Heiſter approves of the ſame method. Turner ſays, he always found ſmoaking the parts with cinnabar ſucceſsful in ſhancrous ulcerations on the glans and prepuce of men, as well as the labia and ſinus pudoris of women. His method was, to throw a dram of cinnabar on a hot iron, letting a fume aſcend through a funnel, or a ſeat perforated like a cloſe-ſtool all round the diſeaſed parts. This was done every day, and ſometimes twice a day, for a week; the iron being hot enough to raiſe a flame with ſmoak, but not ſo fiery hot as to make it inſtantly conſume in flame alone.

SHANNON, the largeſt river in Ireland, which riſing in the county of Leſtrim, runs ſouthwards, dividing the provinces of Leinſter and Connaught; and then turning ſouth-weſt, runs through the province of Munſter; and paſſing by the city of Limeric, afterwards falls into the weſtern or Atlantic-ocean.

SHARE *of a plough*, that part which cuts the ground, the extremity forewards being covered with a ſharp-pointed iron, called the point of the ſhare; and the end of the wood behind, the tail of the ſhare. See PLOUGH.

The length of the whole ſhare, from point to tail, according to Tull, ſhould be three feet nine inches: at the top of the iron it has an upright piece, called the fin; and near the iron, at the other end, there is an oblong ſquared hollow, called the ſocket; the uſe of which is to receive the bottom of the ſheat. Near the tail there is a thin plate of iron, well rivetted to the wood; by means of this plate the tail of the ſhare is held firmly to the hinder ſheat of the plough by a ſmall iron pin, with a ſcrew at the end, and a nut ſcrewed on it, on the inner or right ſide of the ſheat.

The point of the ſhare is that part in which it does not run up into the fin: this point is generally made of three inches and a half in length, and ſhould be flat underneath and round at top, and the lower part of it muſt be of hard ſteel. The edge of the fin ſhould alſo be well ſteeled, and ſhould make an acute angle with the ſhare.

The ſocket is a ſort of mortiſe; it ſhould be a foot long, and about two inches deep: the fore end of it muſt not be perpendicular, but oblique, conformable to the end of the ſheat which enters into it. The upper edge of the fore part muſt be always made to bear againſt the ſheat; but if this end of the ſocket ſhould not be quite ſo oblique as the ſheat, it may be helped by paring off a ſmall part of the wood at the point.

SHARK, in ichthyology, the engliſh name of two ſpecies of ſqualus, diſtinguiſhed by their different colours, blue and white. See SQUALUS.

The blue ſhark, with a triangular foſſula on the back, and no foramina at the eyes, is a moſt terrible fiſh of prey; growing to ſix, ſeven, or eight feet in length, and conſiderably thick in proportion: the mouth is large, and furniſhed with large broad teeth, ſome of them ſerrated at the edges.

The white ſhark is flat-backed, and has more numerous teeth than the preceding ſpecies, being the largeſt of the whole genus of ſquali; and weighing, when full grown, not leſs than a thouſand pounds: it is called by authors lamia, and canis carcharius.

There is alſo another ſpecies called the zygæna, or hammer-headed ſhark. See the article ZYGÆNA.

SHARP, in muſic, a kind of artificial note; for the character and uſe of which, ſee the articles CHARACTER, FLAT, SCALE, *&c.*

SHARP, in the ſea-language, ſignifies to hale taut, or tight.

SHARPING-CORN, a cuſtomary gift of corn, ſaid to be half a buſhel, for a plough-land, which the farmers pay in ſome parts of England to their ſmith, every Chriſtmas, for ſharping their plough-irons, harrow-tines, *&c.*

SHARPLING, one of the many names for the gaſteroſteus. See the article GASTEROSTEUS.

SHASTER,

SHASTER, or SHASTRAM, a ſacred book, containing the religion of the Banians: it conſiſts of three tracts; the firſt of which contains their moral law; the ſecond, the ceremonial; and the third, delivers the peculiar obſervances for each tribe of Indians.

SHAW, in our old writers, ſignifies a grove of trees.

SHEADING, a term uſed in the Iſle of Man for a riding, tything, or diviſion of that iſle; the whole being divided into ſix of theſe ſheadings; in each of which there is a coroner or conſtable, who is appointed by the delivery of a rod at the tinewald-court, or annual convention.

SHEARING, or SHEERING. See the article SHEERING.

SHEAT *of a plough*, a part paſſing through the beam, and faſtened to the ſhare. See the articles PLOUGH and SHARE.

SHEATHING, in the ſea-language, is the caſing that part of a ſhip, which is to be under water, with fir-board of an inch thick; firſt laying hair and tar, mixed together, under the boards, and then nailing them on, in order to prevent worms from eating the ſhip's bottom.

SHEATS, in a ſhip, are ropes bent to the clews of the ſails; ſerving, in the lower ſails, to haul aft the clews of the ſail; but, in top-ſails, they ſerve to haul home the clew of the ſail cloſe to the yard-arm.

SHEEP, *ovis*, in zoology, a well known genus of quadrupeds, the horns of which are hollow, bent backward, twiſted, and rugoſe: the fore-teeth are eight, and the hinder ones are narrower than the others: there are no canine, or dog-teeth.

Authors mention ſeveral ſpecies of ſheep. 1. The common kind, with compreſſed and lunated horns; a very valuable, and not uncomely creature, covered with a thick and deep wool, curled and twiſted. 2. The cretic ſheep, with erect and ſpiral horns, and about the ſize of the common kind, which it greatly reſembles in form. 3. The angola-ſheep, with pendulous ears, a lax dewlap, and with the back of the head prominent: this ſpecies differs greatly from the common kind.

As to the choice of ſheep to breed, the ram ſhould be young, and his ſkin of the ſame colour with his wool, for the lambs will be of the ſame colour with his ſkin. He ſhould have a large long body, a broad forehead, round, and well riſing, large eyes, and ſtrait and ſhort noſtrils. The polled ſheep, that is thoſe which have no horns, are found to be the beſt breeders. The ewe ſhould have a broad back, a large bending neck, ſmall, but ſhort, clean and nimble legs, and a thick deep wool covering her all over. To know whether they be ſound or not, the farmer ſhould examine the wool, that none of it be wanting, and ſee that the gums be red, the teeth white and even, the briſket-ſkin red, the wool firm, the breath ſweet, and the feet not hot. Two years old is the beſt time for beginning to breed, and their firſt lambs ſhould not be kept too long, to weaken them by ſuckling, but be ſold as ſoon as conveniently may be. They will breed advantageouſly, till they are ſeven years old.

The farmers have a method of knowing the age of a ſheep, as that of a horſe is known by the mouth. When a ſheep is one ſhear, as they expreſs it, it has two broad teeth before; when it is two ſhears, it will have four; when three, ſix; and when four, eight: after this, their mouths begin to break. The difference of land makes a very great difference in the ſheep. The fat paſtures breed ſtrait, tall ſheep, and the barren hills and downs breed ſquare ſhort ones; woods and mountains breed tall and ſlender ſheep; but the beſt of all are thoſe bred upon new-plowed land, and dry grounds. On the contrary, all wet and moiſt lands are bad for ſheep, eſpecially ſuch as are ſubject to be overflowed, and to have ſand and dirt left on them. The ſalt marſhes are, however, an exception to this general rule, for their ſaltneſs makes amends for their moiſture; any thing of ſalt, by reaſon of its drying quality, being of great advantage to ſheep.

Sheep's dung is one of the beſt manures we know, ſucceeding better on cold lands than any other dung whatever; but as it is not ſo eaſily collected as the dung of large animals, it is commonly conveyed to the land, it is intended for, by folding the ſheep upon it. See the articles DUNG and FOLDING.

Sheep-ſtealing, or killing them, in order to obtain their fat, *&c.* is felony without benefit of clergy.

SHEERING, or SHEARING, in woollen manufacture, is the cutting off, with large ſheers, the too long nap, in order to make the cloth more ſmooth and even. See the article CLOTH.

SHEERING,

SHEERING, in the ſea-language; when a ſhip is not ſteered ſteadily, they ſay ſhe ſheers, or goes ſheering; or, when at anchor, ſhe goes in and out, by means of the current of the tide, they alſo ſay ſhe ſheers.

SHEERS, in a ſhip, are two maſts ſet acroſs at the upper end of each other; a contrivance generally uſed for ſetting or taking out the maſts of a ſhip, where there is no hulk to do that office.

SHEEVES, or SHIVERS. See the article SHIVERS.

SHEFFIELD, a market-town of Yorkſhire, thirty-eight miles ſouth-weſt of York.

SHEFFORD, market-town of Bedfordſhire, ſeven miles ſouth of Bedford.

SHEFFNEL, a market-town of Shropſhire, fourteen miles eaſt of Shrewſbury.

SHEIK, an officer in the moſques of Egypt, whoſe buſineſs is the ſame with that of the imams of Conſtantinople. See IMAM.

SHEIK-BELLET, in the turkiſh affairs, a magiſtrate, anſwering to the mayor of a city with us.

SHEILDS, or SHEALS, a port-town of the biſhopric of Durham, ſituated at the mouth of the river Tyne, eight miles eaſt of Newcaſtle.

SHEKEL, in jewiſh antiquity, an antient coin, worth 2 s. $3\frac{1}{4}$ d. ſterling. See the article COIN.

Some are of opinion, that the Jews had two kinds of ſhekels, *viz.* the common one, already taken notice of, and the ſhekel of the ſanctuary; which laſt they make double the former, and conſequently equal to 4s. $6\frac{1}{2}$ d. But moſt authors make them the ſame; ſo that the ſhekel of the ſanctuary, according to them, is only worth 2 s. $3\frac{1}{4}$ d.

SHELF, among miners, the ſame with what they otherwiſe call faſt ground, or faſt country; being that part of the internal ſtructure of the earth, which they find lying even, and in an orderly manner, and, evidently having retained its primitive form and ſituation, unmoved by the waters of the general deluge, while the circumjacent, and upper ſtrata, have plainly been removed and toſſed about.

It is evident to reaſon, that there muſt have been a very violent concuſſion of the ſuperficial part of the earth, in the time of its being covered by the waters of the deluge; and experience as much evinces this as reaſon. Before this concuſſion it appears probable, that the uppermoſt ſurface of mineral veins, or loads, did in moſt places lie even with the then ſurface of the earth. The remains of this ſurface, found at different depths in digging, the miners expreſs by the word ſhelf. See MINE, TRACING, *&c.*

SHELL, *concha*, in natural hiſtory, a hard, and as it were ſtony covering, with which certain animals are defended, and thence called ſhell-fiſh.

As to the formation of a ſhell, it is now generally allowed to be formed by a viſcous fluid compoſed of glue, and ſeveral ſandy particles of an exquiſite fineneſs, which are tranſmitted through an infinite number of little channels to the pores where it tranſpires, condenſes, and hardens. When the animal increaſes in bulk, and the extremity of her body is not ſufficiently covered, it continues to evacuate and build in the ſame manner, finiſhing or repairing her habitation. This viſcous matter is proved, by undeniable experiments, to ariſe from the body of animals, and not from the ſhell, as ſome have imagined. Thoſe ſtreaks and clouds which we obſerve moſt ſhells to be beautified with, proceed, probably, from the different diſpoſition of the extreme parts of the animal's body that are viſible at the aperture of the ſhell, where we may frequently diſcover ſome minute lobes or lines of fleſh that differ from the reſt in colour, containing, perhaps, different juices which may acquire a particular complexion in that place; and many other different cauſes may concur to paint, vein, and diverſify the colours with a more or leſs lively glow. The quality of the food, the health or indiſpoſition of the animal, the inequality of its conſtitution according to the ſeveral periods of her age, and the changes that may happen to the different perforation of her ſkin; in ſhort, a thouſand accidents may intervene, to heighten or diminiſh certain tints, and diverſify the whole to infinity.

If the ſkill, in the variety of its colours, imitates the diverſity of the animal's pores, it is ſtill more apparent that it muſt aſſume the form of the body on which it is moulded. Thus we obſerve in all ſea ſhells, that if the animal has any ſwelling or inequality on its body, a tumor likewiſe riſes in the corresponding part of the incruſtation. When the creature diſplaces herſelf, and enlarges the dimenſions of her dwelling, the ſame tumor which had already raiſed the ſhell

in

in one part, ſwells it anew at a little diſtance, by which means you ſee the ſame ſpecies of inequality in a winding line round the ſhell. Sometimes theſe protuberances of the animal are ſo large, or ſo pointed, that thoſe which riſe over them in the ſhell are like horns. She afterwards fills the inſides of theſe cavities, and then, by new evacuations of ſweat, ſtrikes out another ſet of horns, that protect her from fiſhes, who are fond of fleſh. If her body happens to be channeled, the ſhell that covers it has the ſame configuration: if the fleſh riſes in ſwellings, that wind round her in the form of a ſcrew, the ſhell has likewiſe its elevations and depreſſions, that are carried on in a ſpiral line from her tail to the extremity of her body.

The genera of ſhells are extremely numerous, and the ſpecies under many of them are alſo very much ſo. However, they may be divided into three ſeries or orders; the firſt comprehending all ſhells formed only of one piece, called by authors ſimple or univalve ſhells; the ſecond, all thoſe ſhells compoſed of two parts, or valves, under the name of bivalves; and the third, all ſhells compoſed of ſeveral parts, or valves, under the name of multivalves. See BIVALVE, MULTIVALVE, and UNIVALVE.

This method takes in all the ſhells hitherto known; the land, as well as the ſea-ſhells, being all comprehended under one or other of the foreſaid diviſions: indeed, all the recent land-ſhells are univalves; but the foſſile-ſhells belong to all the three ſeries. See plate CCXLVI.

Foſſile-SHELLS, thoſe found buried at great depths in earth, and often immerſed in the hardeſt ſtones. Theſe foſſile-ſhells, as well as thoſe found lying on the ſea-ſhore, make an excellent manure, eſpecially for cold clayey lands; upon which it does not produce nearly ſo great an effect for the two firſt years, as it does in the ſucceeding ones; the reaſon of which is, that it is not then ſufficiently mixed, but in ſucceeding time it breaks itſelf into a number of very ſmall particles, and theſe all become intimately blended with the molecules of earth, and produce their effect more properly.

Poliſhing of SHELLS. See POLISHING.

SHELTIE, a ſmall but ſtrong kind of horſe, ſo called from Shetland, or Zetland, where they are produced.

SHEPPEY, an iſland at the mouth of the river Medway, making part of the county of Kent.

SHEPTON-MALLET, a market-town, fifteen miles ſouth-weſt of Bath.

SHERARDIA, in botany, a genus of plants, belonging to the *tetrandria-monogynia* claſs: its flower is monopetalous and tubular, divided into four ſegments at the limb; and its fruit is an oblong body, ſeparable longitudinally into two oblong ſeeds, convex on one ſide, and plane on the other, and with three points at their ſummit.

SHERARDIA is alſo a name given to a plant, called by Linnæus galenia. See the article GALENIA.

SHERBORN, a market-town, twelve miles ſouth-weſt of York.

SHERBRO, a fort at the mouth of the river Sherbro, in Guinea, formerly in the poſſeſſion of the Engliſh.

SHERENESS, a fort on the north-weſt part of the iſle of Sheppey, ſituated at the mouth of the river Medway, to defend its entrance.

SHERIFF, an officer in each county of England, nominated by the king, inveſted with a judicial and miniſterial power, and who takes place of every nobleman in the county, during the time of his office. His judicial authority conſiſts in hearing and determining cauſes in his county-court, and in keeping the peace of the county; he being by the common law the principal conſervator of the peace there; for which reaſon he is to aſſiſt the juſtices, and raiſe the poſſe comitatus when occaſion requires; and ſuch perſons, as on a hue and cry he ſhall apprehend upon ſuſpicion of felony, he is to commit to priſon; he may alſo impriſon any one who breaks the peace in his preſence. The miniſterial office of the ſheriff conſiſts in proclaiming ſtatutes, and making returns of writs for electing knights of the ſhire, *&c.* He collects the king's rents, ſeizes the profits of lands forfeited, and the goods of felons, levies the king's debts, fines, amercements, *&c.* and is accountable to the king for the profits of the county, on which account the ſum of 4000l. is ſet apart and annually allowed to the ſheriffs of the ſeveral counties of England, to help them to paſs their accounts, and to defray their expences at the aſſizes, *&c.* where no ſheriff is obliged to keep a table for the entertainment of any perſons but thoſe of his

own

SHELLS

Order 1. Univalves

own retinue; neither is he to have above forty ſervants in livery, or leſs than twenty attending him. It is alſo his office to execute the writs and proceſſes out of the king's court; and no proceſs is to be ſerved but by the ſheriff. He returns juries for trials, as well in civil as in criminal caſes, except where there is cauſe of challenge againſt him, in which caſe they are to be returned by the coroner. And, laſtly, the ſheriff is to ſee that criminals are executed, and the order of law obſerved in putting them to death.

A ſheriff has uſually under him an under-ſheriff, bailiffs, and a gaoler, for all of whom he is anſwerable. An under-ſheriff ought always to have his deputy in the courts of juſtice, in order to receive their commands, and give an account of buſineſs, *&c.* All returns made by the under ſheriff are in the name of the high-ſheriff; and for every default in the execution of his office, either by fraud or neglect, the high-ſheriff is amerceable in the exchequer. On the death of any ſheriff, the under-ſheriff ſhall officiate in his name, till another is appointed, and alſo be anſwerable, *&c.*

In London, the lord mayor and citizens elect their ſheriffs; and by a by-law of the city, if any perſon refuſe to take upon him the office, he is to pay 420 l. fine, unleſs he makes oath that he is not worth 10,000 l.

SHIELD, an antient weapon of defence, in the form of a light buckler, borne on the arm, to turn off lances, darts, *&c.*

SHIELD, in heraldry, the eſcutcheon or field on which the bearings of coats of arms are placed. See ESCUTCHEON.

SHILLING, an engliſh ſilver-coin. See the article COIN.

It is obſerved that there were no ſhillings or twelve-penny pieces in England till the year 1504, when they were firſt coined by Henry VIII.

SHINGLES, in building, ſmall pieces of wood, or quartered oaken boards, ſawn to a certain ſcantling, or, as is more uſual, cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long.

Shingles are alſo uſed inſtead of tiles or ſlates, eſpecially for churches and ſteeples: however this covering is dear; yet where tiles are very ſcarce, and a light covering is required, it is preferable to thatch; and where they are made of good oak, cleft, and not ſawed, and well ſeaſoned in water and the ſun, they make a ſure, light, and durable covering.

The building is firſt to be covered all over with boards, and the ſhingles nailed upon them.

SHINGLES, in medicine, a kind of herpes. See the article HERPES.

SHIP, *navis*, a general name for all large veſſels with ſails, fit for navigation on the ſea; except galleys, which go with oars and ſmack-ſails. See NAVIGATION, NAVAL AFFAIRS, and NAVY.

A ſhip is undoubtedly the nobleſt machine that ever was invented; and conſiſts of ſo many parts, that it would require a whole volume to deſcribe it minutely. However, we ſhall endeavour to ſatisfy the reader the more fully on this head, as it is an article of the utmoſt importance, of which no gentleman ſhould be ignorant: and firſt to give an idea of the ſeveral parts and members of a ſhip, both external and internal, with their reſpective names in the ſea-language, in plate CCXLVII. is repreſented a ſhip of war of the firſt rate, with rigging, *&c.* at anchor; where A is the cat-head; B, the fore-chains; C, the main-chains; D, the mizzen-chains; E, the entring-port; F, the hawſe-holes; G, the poop-lanterns; H, the cheſs-tree; I, the head; K, the ſtern.

L, the bowſprit; 1, 2, yard and ſail; 3, gammoning; 4, horſe; 5, bob-ſtay; 6, ſprit-ſail ſheets; 7, pendants; 8, braces and pendants; 9, halliards; 10, lifts; 11, clew-lines; 12, ſprit-ſail horſes; 13, bunt-lines; 14, ſtanding lifts; 15, ſprit-ſail top; 16, flying jib-boom; 17, flying jib-ſtay and ſail; 18, halliards; 19, ſheets; 20, horſes.

M, the ſprit-ſail top-maſt; 21, ſhrouds; 22, 23, yard and ſail; 24, ſheet; 25, lifts; 26, braces and pendants; 27, cap; 28, jack-ſtaff; 29, truck; 30, jack-flag.

N, the fore-maſt; 31, runner and tackle; 32, 33, ſhrouds; 34, laniards; 35, ſtay and laniard; 36, preventer-ſtay and laniard; 37, woolding the maſt; 38, yard and ſail; 39, horſes; 40, top; 41, crowfoot; 42, jeers; 43, yard-tackles; 44, lifts; 45, braces and pendants; 46, ſheets; 47, fore-tacks; 48, bow-lines and bridles; 49, fore bunt-lines; 50, fore leech-lines; 51, fore top-rope; 52, puttock-ſhrouds.

O, the fore-top-maſt; 53, 54, ſhrouds and laniards; 55, yard and ſail; 56, ſtay and ſail; 57, runner; 58, back-

ſtays; 59, halliards; 60, lifts; 61, braces and pendants; 62, horſes; 63, clew-lines; 64, bow-lines and bridles; 65, reef-tackles; 66, ſheets; 67, bunt-lines; 68, croſs-trees; 69, cap.

P, the fore-top gallant-maſt; 70, 71, ſhrouds and laniards; 72, yard and ſail; 73, back-ſtays; 74, ſtay; 75, lifts; 76, clew-lines; 77, braces and pendants; 78, bow-lines and bridles; 79, flag-ſtaff; 80, truck; 81, flag-ſtaff-ſtay; 82, flag of lord high-admiral.

Q, the main-maſt; 83, 84, ſhrouds; 85, laniards; 86, runner and tackle; 87, pendant of the gornet; 88, guy of ditto. 89, ſail of ditto. 90, ſtay; 91, preventer-ſtay; 92, ſtay-tackle; 93, woolding the maſt; 94, jeers; 95, yard-tackles; 96, lifts; 97, braces and pendants; 98, horſes; 99, ſheets; 100, tacks; 101, bow-lines and bridles; 102, crow-foot; 103, top-rope; 104, top; 105, bunt-lines; 106, leech-lines; 107, yard and ſail.

R, the main-top-maſt; 108, 109, ſhrouds and laniards; 110, yard and ſail; 111, puttock-ſhrouds; 112, back-ſtays; 113, ſtay; 114, ſtay-ſail and ſtay and halliards; 115, runnets; 116, halliards; 117, lifts; 118, clew-lines; 119, braces and pendants; 120, horſes; 121, ſheets; 122, bow-lines and bridles; 123, bunt-lines; 124, reef-tackles; 125, croſs-trees; 126, cap.

S, the main-top gallant-maſt; 127, 128, ſhrouds and laniards; 129, yard and ſail; 130, back-ſtays; 131, ſtay; 132, ſtay-ſail and halliards; 133, lifts; 134, braces and pendants; 135, bow-lines and bridles; 136, clew-lines; 137, flag-ſtaff; 138, truck; 139, flag-ſtaff-ſtay; 140, flag-ſtandard.

T, the mizzen-maſt; 141, 142, ſhrouds and laniards; 143, pendants and burtons; 144, yard and ſail; 145, crow-foot; 146, ſheet; 147, pendant-lines; 148, peck-brails; 149, ſtay-ſail; 150, ſtay; 151, derric and ſpann; 152, top; 153, croſs jack-yard; 154, croſs jack-lifts; 155, croſs jack-braces; 156, croſs jack-ſlings.

V, the mizzen-top-maſt; 157, 158, ſhrouds and laniards; 159, yard and ſail; 160, back-ſtays; 161, ſtay; 162, halliards; 163, lifts; 164, braces and pendants; 165, bow-lines and bridles; 166, ſheets; 167, clew-lines; 168, ſtay-ſail; 169, croſs-trees; 170, cap; 171, flag-ſtaff; 172, flag-ſtaff-ſtay; 173, truck; 174, flag-union; 175, enſign-ſtaff; 176, truck; 177, enſign; 178, poop-ladder; 179, bower-cable.

Thus we have pointed out the external parts, maſts, rigging, &c. an account of all which may be ſeen under their reſpective articles MAST, HULL, ROPE, RUDDER, &c.

In plate CCXLVIII. is repreſented the ſection of a firſt rate ſhip of war, ſhewing the inſide thereof: where A is the head; containing, 1, the ſtem; 2, the knee of the head, or cut-water; 3, the lower and upper cheek; 4, the tail-board; 5, the figure; 6, the gratings; 7, the brackets; 8, the falſe ſtem; 9, the breaſt-hooks; 10, the hauſe-hole; 11, the bulk-head, forward; 12, the cat-head; 13, the cat-hook; 14, neceſſary ſeats; 15, the manger within board; 16, the bow-ſprit.

B, upon the fore-caſtle; 17, the gratings; 18, the partners of the fore-maſt; 19, the gun-wale; 20, the belfry; 21, the funnel for the ſmoak; 22, the gang-way going off the fore-caſtle; 23, the fore-caſtle guns.

C, in the fore-caſtle; 24, the door of the bulk-head, forward; 25, the officers cabbins; 26, the ſtair-caſe; 27, the fore-top-ſail-ſheet bits; 28, the beams; 29, the car-lines.

D, the middle-gun-deck forward; 30, the fore-jeer bits; 31, the oven and furnace of copper; 32, the captain's cook-room; 33, the ladder, or way up into the fore-caſtle.

E, the lower-gun-deck, forward; 34, the knees fore and aft; 35, the ſpirketings, or the firſt ſtreak next to each deck; the next under the beams being called clamps; 36, the beams of the middle gun-deck, fore and aft; 37, the car-lines of the middle gun-deck, fore and aft 38, the fore-bits; 39, the after or main-bits; 40, the hatchway to the gunner's and boatſwain's ſtore-rooms; 41, the jeer capſton.

F, the orlop; 42, 43, 44, the gunner's boatſwain's, and carpenter's ſtore-rooms; 45, the beams of the lower-gun-deck; 46, 47, the pillars and the riders, fore and aft; 48, the bulk-head of the ſtore-rooms.

G, the hold; 49, 50, 51, the foot-hook-rider, the floor-rider, and the ſtandirt, fore and aft; 52, the pillars; 53, the ſtep of the fore-maſt; 54, the keelſon, or falſe keel, and dead riſing; 55, the dead wood.

H, a-midſhips in the hold; 56, the floor-timbers; 57, the keel; 58, the well;

59,

59, the chain-pump; 60, the ſtep of the main-maſt; 61, 62, beams and car-lines of the orlop, fore and aft.

I, the orlop a-midſhips; 63, the cable-tire; 64, the main hatchway.

K, the lower gun-deck a-midſhips; 65, the ladder leading up to the middle gun-deck; 66, the lower tire or ports.

L, the middle gun-deck a-midſhips; 67, the middle tire-ports; 68, the entring-port; 69, the main jeer-bits; 70, twiſted pillars or ſtantions; 71, the capſton; 72, the gratings; 73, the ladder leading to the upper deck.

M, the upper gun-deck a-midſhips; 74, the main-top-ſail-ſheet bits; 75, the upper partners of the main-maſt; 76, the gallows on which ſpare top-maſts, *&c.* are laid; 77, the fore ſheet-blocks; 78, the rennets; 79, the gun-wale; 80, the upper gratings; 81, the drift-brackets; 82, the piſs-dale; 83, the capſton-pall.

N, abaft the main-maſt; 84, the gangway off the quarter-deck; 85, the bulk-head of the coach; 86, the ſtair-caſe down to the middle gun-deck; 87, the beams of the upper deck; 88, the gratings about the main-maſt; 89, the coach, or council-chamber; 90, the ſtair-caſe up to the quarter-deck.

O, the quarter-deck; 91, the beams; 92, the car-lines; 93, the partners of the mizzen-maſt; 94, the gangway up to the poop; 95, the bulk-head of the cuddy.

P, the poop: 96, the trumpeter's cabbin; 97, the tafferel.

Q, the captain-lieutenant's cabbin.

R, the cuddy, uſually divided for the maſter and ſecretary's officers.

S, the ſtate-room, out of which is made the bedchamber, and other conveniencies for the commander in chief; 98, the entrance into the gallery; 99, the bulk-head of the great cabbin; 100, the ſtern-lights and after-galleries.

T, the ward-room, allotted for the lieutenants and land-officers; 101, the lower gallery; 102, the ſteerage and bulk-head of the ward-room; 103, the whipſtaff, commanding the tillar; 104, the after-ſtair-caſe down to the lower gun-deck.

V, ſeveral officers cabbin abaft the main-maſt, where the ſoldiers generally keep guard.

W, the gun-room; 105, the tillar commanding the rudder; 106, the rudder: 107, the ſtern-poſt; 108, the tillar-tranſom; 109, the ſeveral tranſoms, *viz.* 1, 2, 3, 4, 5; 110, the gun-room-ports, or ſtern-chaſe; 111, the bread-room-ſcuttle, out of the gun-room; 112, the main-capſton; 113, the pall of the capſton; 114, the partners; 115, the bulk-head of the bread-room.

X, the bread-room; Y, the ſteward's room, where all proviſions are weighed and ſerved out; Z, the cock-pit, where are ſubdiviſions for the purſer, the ſurgeon, and his mates.

AA, the platform, or orlop, where proviſion is made for the wounded in time of ſervice; 116, the hold abaft the main-maſt; 117, the ſtep of the mizen-maſt; 118, the keelſon, or falſe keel; 119, the dead-wood, or riſing.

Different kinds of SHIPS. All ſhips at firſt were of the ſame form, whatever uſes they were deſigned for; but the various ends of navigation, ſome of which were better anſwered by one form, ſome by another, ſoon gave occaſion to build and fit out ſhips, not only different in bigneſs, but alſo in their conſtruction and rigging: and as trade gave occaſion to the fitting out large fleets of different kinds of merchant-ſhips; ſo ſhips of war became neceſſary to preſerve them to their juſt propietors. Theſe laſt, or ſhips of war, have three maſts and a bow-ſprit, and are ſailed with ſquare ſails; the other parts being as deſcribed above, and repreſented in plate CCXLVII.

But beſides theſe, there are other forms: as, 1. The bilander, (plate CCXLVIII. fig. 2.) which has rigging and ſails, not unlike a hoy only broader and flatter: bilanders are ſeldom above twenty-four tuns, and can lie nearer the wind than a veſſel with croſs-ſails can do. 2. Bomb-veſſels (*ib.* fig. 3.) have ſometimes three maſts, and ſquare ſails, as repreſented; but they are alſo frequently ketch-faſhion, with one maſt and a mizen. 3. Brigantines (*ibid.* fig. 4.) are now diſuſed, but had two maſts, and ſquare ſails. 4. Hagboats (*ibid.* fig. 5.) are maſted and ſailed ſhip-faſhion, but are built in the form of the dutch fly-boats. 5. Hoys (*ib.* fig. 6.) are fitted with one maſt and a ſprit-ſail; whoſe yards ſtand fore and aft like a mizen, ſo that it can lie near the wind. 6. Hulks (*ib.* fig. 7.) are generally old ſhips cut down to the gun-deck, and fitted with a large wheel, for men to go in when careening: it has alſo ſeveral capſtons fixed on its deck, for ſetting ſhip's maſts. 7. Ketches (*ibid.* fig. 8.) are fitted with two maſts, and their main-ſail and top-ſail ſtand

ſquare, as thoſe of ſhips do; but their fore-ſail and jibbs, as thoſe of hoys do. 8. Lighters (*ib.* fig. 9.) are veſſels made uſe of for laying down or ſhifting the moorings, for bringing aſhore or carrying on board ſhips cables, anchors, *&c.* 9. Pinks (*ibid.* fig. 10.) ſail with three maſts, ſhip-faſhion, but are round ſterned, with a ſmall projection above the rudder. 10. Punts (*ib.* fig. 11.) are built ſquare, and uſed about the docks for fetching clay, and other ſervices as the maſter-ſhipwright wants them for. 11. Shallop (*ib.* fig. 12.) is a ſmall light veſſel, with only a ſmall main and fore-maſt, and lugg-ſails, to haul up and let down on occaſion. 12. Sloops (*ibid.* fig. 13.) have only one maſt, with ſhoulder of mutton, ſquare, lugg, and ſmack ſails. 13. Smacks (*ibid.* fig. 14.) are tranſporting-veſſels, with one maſt, and an half ſprit-ſail. 14. Yachts (*ibid.* fig. 15.) have only one maſt, with an half ſprit or ſmack-ſail, and ſometimes ketch-faſhion. See the articles BILANDER, BOMB-VESSEL, BRIGANTINE, *&c.*

Conſtruction of SHIPS. Naval architecture may be divided into three principal parts: 1. To give the ſhip ſuch a figure and proportion, as may ſuit the ſervice ſhe is deſigned for. 2. To find the true form of all the pieces of timber that ſhall be neceſſary to compoſe ſuch a ſolid. 3. To make proper accommodations for guns, ammunition, proviſions, and apartments for all the officers, and likewiſe room for the cargo.

As to the firſt part, the length of the keel, greateſt breadth, depth in the hold, height between decks and in the waſte, and ſometimes the height and breadth of the wing-tranſom, in ſhips for the merchants ſervice, are agreed on by contract; and from theſe dimenſions the builder forms a draught ſuitable to the trade the ſhip is deſigned for. The firſt thing that is generally done, is to lay down the keel, the ſtem, and ſtern-poſt upon the ſheer-plane, or plane ſuppoſed to paſs through the middle line of the keel, ſtem, and ſtern-poſt, cutting the ſhip in two halves lengthwiſe. They next determine the proper ſtation of the midſhip-timber, where a perpendicular is erected; and is generally about two thirds of the keel before the ſtern-poſt: on this line the given depth of the hold is ſet off, from the upper-ſide of the keel; to obtain which point, the thickneſs of all the timber and plank muſt be added to the height agreed on. This being fixed, will enable us to determine the upper-height of the extreme or greateſt breadth of the ſhip; which, ſometimes, is that very point; and from the ſame place the lower height of the breadth muſt be determined. The two main heights of the breadth-lines, which nearly unite abaft and afore, are next determined. The heighth of the breadth-line of the top-timber is next formed; being limited in the midſhip by contract, but afore and aft only by the judgment and fancy of the artiſt. If a ſquare ſtern is deſigned, the breadth at the wing-tranſom is limited, being generally about two thirds of the greateſt breadth. The artiſt next fixes the breadth of the top-timber, and then deſcribes the two half-breadth lines. After theſe are formed, the places where the ſeveral timbers are fixed: and for forming the midſhip-frame, radii are aſſumed at pleaſure, till the ſweeps are made to pleaſe the fancy and judgment of the artiſt. When this midſhip-frame is formed, a pattern or mould is made to fit exactly to the curve, and the dead-riſing or water-line; and by this and a hollow mould, all the timbers are formed, as far as the riſing-line, which is parallel to the lower height of the breadth-line.

We come next to conſider the upper-works, or all that is above water, called the dead-work: and here the ſhip muſt be narrower, by which means ſhe will ſtrain leſs by working the guns, and the main-ſail will be eaſier trimmed, as the ſhrouds ſpread leſs than they would otherwiſe do. But though theſe advantages are gained by narrowing a ſhip above water, yet great care muſt be taken not to narrow her too much, leſt there ſhould not be ſufficient room upon the upper deck for the guns to recoil. The ſecurity of the maſts ſhould likewiſe be conſidered, which requires ſufficient breadth to ſpread the ſhrouds: though this may be aſſiſted by enlarging the breadth of the channels.

Principal qualities belonging to SHIPS. A ſhip of war ſhould carry her lower tire of guns four or five feet above water; a ſhip for the merchants ſervice ſhould ſtow the cargo well: and both of them ſhould be made to go well, carry a good ſail, ſteer well, and lie-to eaſily in the ſea. 1. To make a ſhip carry a good ſail, Mr. Du Hamel recommends a flat floor timber, and ſomewhat long, or the lower futtock pretty round; alſo a ſtraight upper futtock, and the top-timber to throw the breadth out aloft; and, at any rate, to carry her main-

main-breadth as high as the lower-deck; for if the rigging be well adapted to ſuch a body, and the upper-works heightened as much as poſſible, ſo as all to concur to lower the center of gravity, there will be no room to doubt of her carrying a good ſail. 2. To make a ſhip ſteer well, and anſwer the leaſt motion of the helm, the faſhion-pieces ſhould be well formed, the tuck carried pretty high, and the midſhip-frame carried pretty forward; alſo there ſhould be a conſiderable greater draught of water abaft than afore, a great rake forward, and none abaft, and a ſnug quarter-deck and fore-caſtle: all theſe will make a ſhip ſteer well. But to make her feel the leaſt motion of her helm, it will be neceſſary to regard her maſts; for a ſhip that goes well, will certainly ſteer well. 3. To make a ſhip carry her guns well out of the water, is effected by a long floor-timber, and not of great riſing, a very full midſhip-frame, and low tuck, with light upper-works. 4. To make a ſhip go ſmoothly through the water, without pitching hard, her keel ſhould be long, her floor long and not riſing high afore or aft; the area or ſpace contained in the fore-body ſhould alſo be duly proportioned to that of the after-body, according to the reſpective weights they are to carry. 5. To make a ſhip keep a good wind, ſhe ſhould have a good length by the keel, not too broad, but pretty deep in the hold; which will make her floor-timber ſhort, and riſing great. As ſuch a ſhip will meet with great reſiſtance in the water going over the broad-ſide, and but little when going a-head, ſhe will not fall much to the leeward. Now ſome ſhip-builders imagine, that it is impoſſible to make a ſhip carry her guns well, carry a good ſail, and be a prime ſailer at the ſame time, becauſe it requires a very full bottom to gain the two firſt qualities, and a ſharp-bottomed ſhip beſt anſwers the latter: but when it is conſidered, that a full ſhip will carry a great deal more ſail than a ſharp one, a good artiſt may ſo form the body as to have all theſe three good qualities united, and likewiſe ſteer well: for which purpoſe, Mr. Du Hamel recommends ſomewhat more in length than has been commonly practiſed.

SHIP *of pleaſure, thalamegus*, in antiquity. See the article THALAMEGUS.

SHIPTON, a market-town, twenty-four miles ſouth-eaſt of Worceſter.

SHIRE, in geography, ſignifies the ſame as county; being originally derived from the ſaxon ſcipan, *to divide*. See the articles COUNTY, SHERIFF, and LORD LIEUTENANT.

SHIVERS, or SHEEVERS, in the ſea-language, names given to the little rollers or round wheels of pulleys. See the article PULLEY.

SHOAD, among miners, denotes a train of metalline ſtones, ſerving to direct them in the diſcovery of mines. See MINE.

SHOAL, in the ſea-language, denotes a place where the water is ſhallow.

SHOAR, or SHORE. See SHORE.

SHOE, *calceus*, a covering for the foot, uſually made of leather, by the company of cordwainers. See CORDWAINERS.

Horſe-SHOES. See the article HORSE.

SHOE *for an anchor*, in a ſhip, the place for the anchor to reſt, and fitted to receive the ſtock, *&c.* ſo as to prevent the ſheets, tacks, and other running-rigging, from galling, or being entangled with the flooks.

SHOOTING. See the articles GUNNERY and PROJECTILE.

SHORE, or SHOAR, a place waſhed by the ſea, or by ſome large river.

Count Marſigli divides the ſea-ſhore into three portions; the firſt of which is that tract of land which the ſea juſt reaches in ſtorms and high tides, but which it never covers; the ſecond part of the ſhore, is that which is covered in high tides and ſtorms, but is dry at other times; and the third is the deſcent from this, which is always covered with water. See SEA.

The firſt part is only a continuation of the continent, and ſuffers no alteration from the neighbourhood of the ſea, except that it is rendered fit for the growth of ſome plants, and wholly unfit for that of others, by the ſaline ſteams and impregnations: and it is ſcarce to be conceived by any, but thoſe who have obſerved it, how far on land the effects of the ſea reach, ſo as to make the earth proper for plants, which will not grow without this influence; there being ſeveral plants frequently found on high hills, and dry places, at three, four, and more miles from the ſea, which yet would not grow, unleſs in the neighbourhood of it, nor will ever be found elſewhere.

The ſecond part or portion of the ſhore is much more affected by the ſea than the former, being frequently waſhed and beaten by it. Its productions are rendered ſalt by the water, and is covered with ſand, or with the fragments of ſhells in form of ſand, and in ſome places with a tar-

a tartarous matter depoſited from the water; the colour of this whole extent of ground is uſually duſky and dull, eſpecially where there are rocks and ſtones, and theſe covered with a ſlimy matter.

The third part of the ſhore is more affected by the ſea than either of the others, and is covered with an uniform cruſt of the true nature of the bottom of the ſea, except that plants and animals have their reſidence in it; and the decayed parts of theſe alter it a little.

SHOREHAM, a borough and port-town of Suſſex, twenty-five miles eaſt of Chicheſter.

It ſends two members to parliament.

SHORT-SIGHTEDNESS, *myopia*, in medicine. See the article MYOPIA.

SHOT, a denomination given to all ſorts of balls for fire-arms; thoſe for cannon being of iron, and thoſe for guns, piſtols, *&c.* of lead.

For the method of granulating ſhot for uſe of fowlers, ſee GRANULATION.

Trundle-SHOT, an iron-ſhot, about ſeventeen inches long, and ſharp-pointed at both ends, with a ball of lead faſtened upon it, about a hand-breadth from each end.

SHOTTEN, or *Blood*-SHOTTEN. See the article BLOOD.

SHOVELER, in ornithology, a ſpecies of the anas, with the extremity of the beak broad and round, and its ungues bent. See the article ANAS.

SHOULDER-BONE, *humerus*, in anatomy. See the article HUMERUS.

SHOULDER-BLADE, *ſcapula*. See SCAPULA.

SHOULDER-PITCHED, among farriers, is ſaid of a horſe whoſe ſhoulder is diſplaced, which may be remedied by ſwimming the horſe a dozen times up and down in deep water.

SHOULDER-SPLAIT, is when a horſe's ſhoulder is parted from the breaſt.

SHOULDERING PIECE, among builders, the ſame with a bracket. See the article BRACKET.

SHOWER, in meteorology, a cloud reſolved into rain. See the article RAIN.

SHREW-MOUSE, or *Hardy*-SHREW, *ſorex*, or *mus araneus*, in zoology, a genus of quadrupeds, of the order of the glires; the upper fore-teeth of which are biſid, and the lower ones ſerrated: the upper canine teeth are very ſmall, and four in number.

The ſhrew-mouſe is an extremely ſingular little animal, which greatly reſembles the common mouſe, but is ſomewhat ſmaller.

SHREWSBURY, the county-town of Shropſhire, ſituated on the river Severn; weſt lon. 2° 46′, north lat. 52° 46′.

It ſends two members to parliament.

SHRIMP, in ichthyology, the engliſh name of two different ſpecies of the ſquilla, *viz.* the common ſhrimp, and the ſmooth-noſed ſhrimp. See SQUILLA.

The common ſhrimp is the long-tailed ſquilla, with the ſnout ſerrated above and tridentated below; the body is oblong and rounded above the beak or ſnout; which diſtinguiſhes it from all the other ſpecies: it is long, of a lanceolated figure, ſharp-pointed, and has eight denticulations above, and three below. The ſmooth-noſed ſhrimp, or long-tailed ſquilla, with a ſmooth ſnout, grows to the ſame ſize with the common ſhrimp; however, the body is thick, and the ſnout is very ſhort, without the ſpines or denticulations of the other.

SHRINE, in eccleſiaſtical hiſtory, a caſe or box, to hold the relics of ſome ſaint. See the articles RELICS and SAINT.

SHRITE, in ornithology, the ſame with the miſſel-bird. See MISSEL.

SHROPSHIRE, a county of England, bounded by Cheſhire on the north, by Staffordſhire on the eaſt, by Herefordſhire on the ſouth, and by Montgomeryſhire on the weſt.

SHROUDS, or SHROWDS. See the article SHROWDS.

SHROVE-TUESDAY, is the Tueſday after quinquageſima Sunday, or the day immediately preceding the firſt of lent; being ſo called from the ſaxon word ſhrive, which ſignifies *to confeſs*, as having been employed by the people, in time of popery, in confeſſing their ſins, in order to receive the ſacrament, and thereby qualify themſelves for a more religious obſervation of lent. See the article LENT.

In proceſs of time, this cuſtom was changed into that of mutual invitations, in order to take leave of fleſh-meat and other dainties; and this made way for ſports and other merriments, which at preſent make up the whole buſineſs of the carnival, or ſeaſon immediately preceding lent. See the article CARNIVAL.

SHROWDING *of trees*, the cutting or lopping off their top branches; which is practiſed only on trees not fit for timber, and deſigned to yield a preſent advantage, and ſerve for fuel.

Trees ſhould be three or four years old before they are ſhrowded, which ſhould be done

done in winter for the harder ſorts of wood, and in ſpring for the ſofter kinds, taking care to cut the remaining ſtump aſlope and ſmooth.

SHROWDS, or SHROUDS, in a ſhip, are the great ropes which come down both ſides of the maſts, and are faſtened below to the chains on the ſhip's ſide, and aloft to the top of the maſt; being parcelled and ſerved, in order to prevent the maſt's galling them. The top-maſt-ſhrowds are faſtened to the puttock-plates, by dead-eyes and laniards, as the others are. See the article SHIP.

Some of the terms relating to the ſhrowds are: eaſe the ſhrowds; that is, ſlacken them: and, ſet up the ſhrowds; that is, ſet them ſtiffer.

SHRUB, *frutex*, among naturaliſts, denotes a dwarf-tree, or a woody plant leſs than a tree: ſuch are holly, box, privet, *&c.*

SHUTTLE, in the manufactures, an inſtrument much uſed by weavers, in the middle of which is an eye, or cavity, wherein is incloſed the ſpoul with the woof. See the article WEAVING.

SI, in muſic, a ſeventh note or ſound, added by Le Maire to the ſix antient notes invented by Guido Aretine, *viz. ut, re, mi, fa, ſol, la, ſi.* See the articles GAMUT, SCALE, and SOLFAING.

SIAM, the capital of a kingdom of the ſame name, in the farther peninſula of India: eaſt lon. 101°, north lat. 14°.

SIBA, a province of the hither India, ſituated between Tibet on the eaſt, and Lahor on the weſt.

SIBALDIA, in botany, a genus of the *pentandria-pentagynia* claſs of plants, the flower of which conſiſts of five oval petals; and its ſeeds, which are five in number, are contained in the bottom of the cup, which cloſes for that purpoſe.

SIBERIA, or ASIATIC RUSSIA, the moſt northern country of Aſia, ſituated between 60° and 130° eaſt longitude, and between 47° and 72° north latitude; being upwards of two thouſand miles in length from eaſt to weſt, and one thouſand five hundred miles in breadth from north to ſouth. We include the Calmuc Tartars within the limits of Siberia, as they acknowledge themſelves ſubject to the empire of Ruſſia.

SIBIT, a town of Arabia Fœlix, ſituated in eaſt lon. 45°, north lat. 15°

SIBYLS, *ſibyllæ*, in pagan antiquity, certain women ſaid to have been endowed with a prophetic ſpirit, and to have delivered oracles, fore-ſhowing the fates and revolutions of kingdoms, *&c.* The moſt eminent of the ten ſibyls mentioned by antient writers, was ſhe whom the Romans called the cumæan or erythræan ſibyl, from her being born at Erythræ in Ionia, and removing from thence to Cumæ in Italy, where ſhe delivered all her oracles from a cave, dug out of the main rock, according to Virgil, Æn. III. 441, *&c.*

There is ſtill preſerved, in eight books of greek verſes, a collection of verſes, pretended to have been delivered by the ſibyls; but the generality of critics look upon it as ſpurious: and it is the opinion of Prideaux, that the ſtory of the three books of the ſibyls, ſold to Tarquin, was a ſtate-trick or fetch of politics.

SICE-ACE, a game with dice and tables, whereat five may play; each having ſix men, and the laſt out loſing.

At this game, they load one another with aces; ſixes bear away; and doublets drinks, and throws again.

SICHEM, or ZICHEM, a town of Brabant, eighteen miles eaſt of Mechlin.

SICILIAN, in muſic, a kind of air or dance, in triple time, and played ſlow, notwithſtanding it is marked the ſame as a jigg.

SICILY, the largeſt of all the italian iſlands, anciently called Trinacria, from its triangular figure: it is ſituated between 12° and 16° eaſt longit. and between 37° and 39° north latitude: being about one hundred and ſeventy miles long, and one hundred broad.

It is ſeparated from Calabria, in Italy, by the ſtreights of Meſſina, which, in the narroweſt part, is not ſeven miles over.

SICKNESS, *Falling*-SICKNESS, *Green*-SICKNESS, *&c.* See the articles DISEASE, EPILEPSY, CHLOROSIS, *&c.*

SICUT ALIAS, in law, another writ iſſued out like the former, where the firſt was not executed.

SICYANIA, or GOURD-WORM, in natural hiſtory, a genus of the apteria order of inſects, being of an oblong form, flat on the belly, and rounded on the back; the ſkin is ſoft; and the mouth large, horizontal, and emarginated, or dented in the middle. It grows to two thirds of an inch in length, though more uſually it is not half that ſize; its breadth is nearly two thirds of its length. See the article APTERIA.

SICYOS, or SICYOIDES, in botany, a genus of the *monœcia-ſyngeneſia* claſs of plants, the corolla of which is formed of a ſingle campanulated petal, divided into

five

five ſegments; and its fruit is a berry, containing only a ſingle ſeed.

Dillenius calls this plant bryonoides.

SIDA, in botany, a genus of the *monadelphia-polyandria* claſs of plants, with a pentapetalous flower: the fruit is a roundiſh capſule, terminating in a point, and compoſed of ſeveral horns, which finally ſeparating, tear the complex veſſel to pieces; the ſeeds are roundiſh and pointed, the one ſide being convex, and the other of an angular figure.

This genus comprehends the malvinda and abutilon of authors. See the article ABUTILON.

SIDA is alſo uſed for the althæa, or marſh-mallow. See the article ALTHÆA.

SIDE, *latus*, the half of any thing, as an animal, a ſhip, *&c.* The ſides of an animal are diſtinguiſhed into the right and left ſide; but thoſe of a ſhip, into the ſtarboard and larboard ſide. See RIGHT, LEFT, STARBOARD, *&c.*

In geometry, the ſides of a rectilinear figure are the lines which form its periphery. See FIGURE and PERIPHERY.

SIDE *of a power*, the ſame with its root. See the article ROOT.

SIDE-LAYS, among hunters, dogs that are let ſlip at a deer, as he paſſes.

SIDES-MEN, or SYNOD'S MEN, perſons who, in large pariſhes, are appointed to aſſiſt the church-wardens, in their enquiry and preſentments of ſuch offenders to the ordinary, as are puniſhable in the ſpiritual court.

SIDEN, a port-town of Arabia, ſituated on the eaſtern ſhore of the Red ſea, in eaſt lon. 42° 15′, and north lat. 21° 20′.

SIDERATION, a term uſed for a ſphacelus or mortification, See SPHACELUS. Some alſo uſe the term ſideration for the blaſting or blighting of trees. See the articles BLIGHT and TREE.

SIDEREAL YEAR. See YEAR.

SIDERITES, in natural hiſtory, the ſame with the magnet. See MAGNET.

SIDERITIS, IRON-WORT, in botany, a genus of the *didynamia-gymnoſpermia* claſs of plants, with a monopetalous, labiated, and ringent flower; the ſeeds are four in number, and contained in the cup, which ſerves inſtead of a capſule; add to this, that the flowers grow in circles round the ſtalks, at the joinings of the leaves. See plate CCL. fig. 4.

SIDEROXYLUM, in botany, a genus of the *pentandria-monogynia* claſs of plants, the flower of which conſiſts of a ſingle petal, divided into five roundiſh, erect, and concave ſegments; the fruit is a roundiſh berry, with two cells, in which are contained four ſeeds.

SIDMOUTH, a port-town of Devonſhire, ſituated on a bay of the Engliſh channel, ten miles ſouth-eaſt of Exeter.

SIDON, or SAYD, a port-town of Paleſtine, in aſiatic Turky, ſeventy miles north of Jeruſalem. It is ſtill a place of ſome conſideration, being the reſidence of of a turkiſh baſhaw.

SIDRA, an iſland of the Archipelago, ſituated at the entrance of the gulph of Napoli.

SIEGE, in the art of war, the encampment of an army before a fortified place, with a deſign to take it.

The method of encamping is very different in a ſiege, from that obſerved on a march; as in the former the army environs the place, without cannon-ſhot, that nothing may enter. If the place be ſituated on a river, a detachment is ſent to the other ſide, and bridges of communication made, both above and below the town. The army alſo encamp with their backs to the town, with the battalions and ſquadrons interlined: and having taken poſſeſſion of all the heights, whence the enemy may be annoyed, the engineers trace the lines of circumvallation and contravallation; every regiment working at the place appointed them. See the articles CIRCUMVALLATION and CONTRAVALLATION.

When the general has diſpoſed his guards, as well towards the place as towards the country, and eſtabliſhed the lieutenant-generals to command in the particular quarters, he goes with the engineers to view the place, and orders the attack in the place judged the weakeſt. See the article APPROACH.

To form a ſiege, there muſt be an army ſufficient to furniſh five or ſix reliefs for the trenches, pioneers, guards, *&c.* alſo artillery, and magazines furniſhed with a ſufficient quantity of ammunition and proviſions; and an hoſpital, for taking care of the wounded.

To raiſe a ſiege, is to give over attacking a place; ordering the works and poſts before it to be levelled.

SIEGEN, a city of Germany, thirty miles north of Naſſau.

SIEGENBERG, a town of Weſtphalia, fifteen miles ſouth-eaſt of Cologn.

SIENNA, a city of Italy, in the dutchy of Tuſcany, ſituated thirty-ſixs mile ſouth of Florence.

SIERRA LEON, a river of Guinea, which falls into the Atlantic ocean, in weſt lon. 14°, and north lat. 7°

SIEUR, a title of reſpect among the French, like *maſter* among us: it is much uſed by the lawyers, as alſo by ſuperiors in their letters to inferiors.

SIGAN, a town of China, in the province of Xenſi: eaſt longit. 108°. and north lat. 34°.

SIGESBECKIA, in botany, a plant of the *ſyngeneſia-polygamia-ſuperflua* claſs, with a compound radiated flower, and tubuloſe hermaphrodite corollulæ on the diſc; the receptacle of the ſeeds is paleaceous, and they have no down.

SIGETH, a town of lower Hungary, ſituated ſeventy-three miles ſouth-weſt of Buda, and ſubject to the houſe of Auſtria.

SIGHT, or VISION, in optics. See the article EYE and VISION.

SIGHTS *of a quadrant, &c.* thin pieces of braſs, raiſed perpendicularly on its ſide, or on the index of a theodolite, circumferentor, *&c.* They have each an aperture, or ſlit, up the middle, through which the viſual rays paſs to the eye, and diſtant objects are ſeen. See the articles QUADRANT, THEODOLITE, *&c.*

SIGILLATA TERRA, a kind of bole, called alſo lemnian earth. See the articles BOLE and LEMNOS.

SIGILLUM, a SEAL. See SEAL.

SIGISTAN, the capital of a province of the ſame name, in Perſia: eaſt lon. 62°. and north lat. 31°.

SIGN, *ſignum*, in general, the mark or character of ſomething abſent or inviſible. See the article CHARACTER.

Among phyſicians, the term ſign denotes ſome appearance in the human body, which ſerves to indicate or point out the condition of the patient, with regard to health or diſeaſes. See INDICATION, DISEASE, *&c.*

SIGN, in aſtronomy, a conſtellation containing a twelfth part of the zodiac, or 30°. See the article ZODIAC.

The names of the ſigns, in the order wherein they follow each other, are aries, taurus, gemini, cancer, leo, virgo, libra, ſcorpio, ſagittarius, capricornus, aquarius, piſces. See the articles ARIES, TAURUS, GEMINI, *&c.*

The three firſt of theſe ſigns are called the vernal, or ſpring-ſigns; the next three, cancer, leo, virgo, the æſtival, or ſummer-ſigns; libra, ſcorpio, and ſagittarius, the autumnal-ſigns; and capricornus, aquarius, piſces, the brumal, or winter-ſigns. The vernal and æſtival ſigns are alſo called the northern, and the autumnal and brumal the ſouthern ſigns.

SIGN-MANUAL, in law, is uſed to ſignify any bill, or writing, ſigned by the king's own hand.

SIGNALS, certain ſigns agreed upon, for ſuddenly conveying intelligence to places, to which the voice cannot reach. Thus, in ſome countries fires are lighted upon the hills, at the approach of danger: and at the beginning of a battle or an attack, ſignals are uſually made with drums and trumpets. At ſea they are given by firing cannon, or muſquets; by lights, flags, ſails, *&c.*

Signals at ſea are made by the admiral or commander in chief of a ſquadron, either in the day, or by night, whether for ſailing, fighting, or the better ſecurity of the merchant-ſhips under their convoy: theſe are very numerous and important, being all appointed and determined by the lords of the admiralty, and communicated in the inſtructions ſent to the commander of every ſhip of the fleet or ſquadron, before their putting to ſea. Some of the principal of which are as follow: when a commander in chief would have them unmoor, he looſes his main-top-ſail, and fires a gun, which, in the royal navy, is to be anſwered by every flag-ſhip, and every ſhip is to get under ſail as ſoon as ſhe can. When, in bad weather, he would have them wear, and bring to the other tack, he hoiſts a pendant on the enſign-ſtaff, and fires a gun: then the leward-moſt and ſtern-moſt ſhips are to wear firſt, and bring on the other tack, and lie-by, or go on with an eaſy ſail, till he comes a head. When any ſhip diſcovers land, he is to hoiſt his jack and enſign, and keep it abroad till the admiral anſwer him by hoiſting his, on ſight of which he is to haul down his enſign. If any diſcovers danger, he is to tack and bear up from it, and to hang his jack abroad from the main-top-maſt croſs-trees, and to fire two guns: but if he ſhould ſtrike or ſtick faſt, then, beſides the ſame ſignal with his jack, he is to keep firing, till he ſees all the fleet obſerve him, and endeavour to avoid the danger. When the admiral would have the vice-admiral to ſend out ſhips to chace, he hoiſts a flag ſtriped white and red on the flag-ſtaff at the fore-top-maſt-head, and fires a gun: but if he would have

the rear-admiral do ſo, he hoiſts the ſame ſignal on the flag ſtaff at the mizen-top-maſt head, and fires a gun. When he would have them give over chace, he hoiſts a white flag on his flag-ſtaff at the fore-top-maſt-head, and fires a gun; which ſignal is alſo to be made by that flag ſhip which is neareſt the ſhip that gives chace, till the chacing ſhip ſees the ſignal. When the admiral would have the fleet prepare to anchor, he hoiſts an enſign ſtriped red, blue, and white, on the enſign-ſtaff, and fires a gun; and every flag-ſhip makes the ſame ſignal.

Beſides theſe, there are many other ſignals uſed by day; and different ſignals, upon theſe and other occaſions, uſed by night: and others alſo when a fleet fails in a fog; all of which are to be found in the Book of Signals.

The ſignals for managing a ſea-fight are alſo very numerous, the principal of which are as follow: when the admiral would have the fleet form a line of battle, one ſhip a-head of another, he hoiſts an union-flag at the mizen-peek, and fires a gun; and every flag-ſhip does the like. But when they are to form a line of battle one a-breaſt of another, he hoiſts a pendant with the union-flag, *&c.* When he would have the admiral of the white, or he that commands in the ſecond poſt, to tack, and endeavour to gain the wind of the enemy, he ſpreads a white flag under the flag at the main-top-maſt-head, and fires a gun: and when he would have the admiral of the blue do ſo, he does the ſame with the blue flag. If he would have the vice-admiral of the red do ſo, he ſpreads a red flag from the cap, on the main-top-maſt-head downward on the back-ſtay; if the vice-admiral of the blue, he ſpreads a blue flag, and fires a gun: if he would have the rear-admiral of the red do ſo, he hoiſts a red flag at the flag-ſtaff at the mizen-top-maſt-head; if the rear-admiral of the white, a white flag; if the rear-admiral of the blue, a blue flag, and under it a pendant of the ſame colour, with a gun. If he would have him that commands in the ſecond poſt of his ſquadron, to make more ſail, he hoiſts a white flag on the enſign ſtaff; but if he that commands in the third poſt be to do ſo, he hoiſts a blue flag, and fires a gun; and all the flag-ſhips muſt make the ſame ſignal. Whenever he hoiſts a red flag on the flag ſtaff at the fore-top-maſt-head, and fires a gun, every ſhip in the fleet muſt uſe their utmoſt endeavour to engage the enemy in the order preſcribed. When he hoiſts a white flag on his mizen-peek, and fires a gun, all the ſmall frigates of his ſquadron, that are not of the line of battle, are to come under the ſtern. If the fleet be ſailing by a wind in the line of battle, and the admiral would have them brace their head-ſails to the maſt, he hoiſts up a yellow flag on the flag-ſtaff at the mizen-top-maſt head, and fires a gun, which the flag-ſhips are to anſwer, and then the ſhips in the rear are to brace firſt. After this, if he would have them fall their head-ſails, and ſtand on, he hoiſts a yellow flag on the flag-ſtaff of the fore-top-maſt-head, and fires a gun, which the flag-ſhips muſt anſwer; and then the ſhips in the van muſt fall firſt, and ſtand on. If, when this ſignal is made, the red flag at the fore-top-maſt-head be abroad, he ſpreads the yellow flag under the red flag. If the fleets being near one another, the admiral would have all the ſhips to tack together, the ſooner to lie in a poſture to engage the enemy, he hoiſts an union-flag on the flag-ſtaves at the fore and mizen-top-maſt-heads, and fires a gun; and all the flag-ſhips are to do the ſame. The fleet being in a line of battle, if he would have the ſhip that leads the van, hoiſt, lower, ſet, or hawl-up any of his ſails, he ſpreads a yellow flag under that at his main-top-maſt-head, and fires a gun; which ſignal the flag-ſhips are to anſwer: and the admiral will hoiſt, lower, ſet, or hawl-up the ſails which he would have the ſhips that lead the van do; which is to be anſwered by the flag-ſhips of the fleet. When the enemies run, and he would have the whole fleet follow them, he makes all the ſail he can after them himſelf, takes down the ſignal for the line of battle, and fires two guns out of his fore-chaſe, which the flag-ſhips anſwer; and then every ſhip is to endeavour to come up with, and board the enemy. When he would have the chaſe given over, he hoiſts a white flag at the fore-top-maſt-head, and fires a gun. If he would have the red ſquadron draw into a line of battle, one a-breaſt of another, he puts abroad a flag ſtriped red and white on the flag-ſtaff at the main-top-maſt-head, with a pendant under it, and fires a gun: if the white or ſecond ſquadron is to do ſo, the flag is ſtriped red, white, and blue: if the blue or third ſquadron is to do ſo, the flag is a genoeſe enſign and pendant: but if they are to draw into a line of battle one a-

head of another, the ſame ſignals are made without a pendant. If they are to draw into the line of battle one a-ſtern of another, with a large wind, and he would have the leaders go with the ſtarboard-tacks aboard by the wind, he hoiſts a red and white flag at the mizen-peek, and fires a gun: but if they ſhould go by the larboard-tacks aboard the wind, he hoiſts a genoeſe flag at the ſame place: which ſignals, like others, muſt be anſwered by the flag-ſhips.

SIGNATURE, a ſigning of a perſon's name at the bottom of an act or deed, wrote by his own hand.

SIGNATURE *of the court of Rome*, is a ſupplication anſwered by the pope, whereby he grants a favour, diſpenſation or collation to a benefice, by putting the fiat to it with his own hand; or the conſenſum is written in his preſence. This ſignature at the bottom of the ſupplication, gives the name to the whole inſtrument.

SIGNATURE, in printing, is a letter put at the bottom of the firſt page at leaſt, in each ſheet, as a direction to the binder, in folding, gathering, and collating them. The ſignatures conſiſt of the capital letters of the alphabet, which change in every ſheet: if there be more ſheets than letters in the alphabet, to the capital letter is added a ſmall one of the ſame ſort, as A a, B b; which are repeated as often as neceſſary. In large volumes it is uſual to diſtinguiſh the number of alphabets, after the firſt three or four, by placing a figure before the ſignature as 5 B, 6 B, *&c.*

SIGNATURE is alſo uſed, by ſome naturaliſts, for the reſemblance a vegetable or mineral bears to a part of the human body; which, by ſome fantaſtical people, is ſuppoſed to indicate its virtues and uſe.

SIGNET, one of the king's ſeals, made uſe of in ſealing his private letters, and all grants that paſs by bill ſigned under his majeſty's hand it is always in the cuſtody of the ſecretaries of ſtate. See the article SECRETARY.

SIGNIFICATION, in general, denotes the meaning of a ſign, word, phraſe, and the like.

In law, it is uſed for the notifying an act, *&c.* to the oppoſite party, by a copy thereof given and atteſted by the proper officer.

SIGNIFICAVIT, in law, a writ which iſſues out of the court of chancery, on a certificate given by the ordinary of a perſon's ſtanding excommunicated forty days, in order to have him impriſoned till he ſubmits to the authority of the church. See EXCOMMUNICATION.

SIGNING, in law. See SIGNATURE.

SIGUENCA, a city of old Caſtile, in Spain, ſixty miles north-eaſt of Madrid.

SILENE, SMALL-FLOWERED CAMPION, in botany, a genus of the *decandria trigynia* claſs of plants, the flower of which conſiſts of five petals; and its fruit is cylindraceous, divided into three or five cells, and containing numerous kidney-ſhaped ſeeds.

SILER, in botany, a ſpecies of liguſticum. See the article LIGUSTICUM.

SILER is alſo uſed for the plant ſeſeli. See the article SESELI.

SILESIA, a dutchy belonging to the king of Pruſſia, two hundred miles long, and ſeventy broad: it is bounded by Brandenburgh on the north, by Poland on the eaſt, by Hungary on the ſouth, and by Moravia and Bohemia on the weſt.

SILIQUA, a term uſed by botaniſts to denote a pod. See the article POD.

SILIQUA is alſo a name given to the ceratonia. See the article CERATONIA.

SILIQUASTRUM, in botany, the name by which Tournefort calls the cercis of Linnæus. See the article CERCIS.

SILIQUOSE PLANTS, thoſe which produce pods, and otherwiſe called leguminous. See the article LEGUME.

SILISTRIA, a city of european Turky, in the province of Bulgaria, ninety miles eaſt of Niſſa: eaſt long. 25°, north lat. 42° 40′.

SILK, *ſericum*, in natural hiſtory, is properly an animal fluid, hardened by the air; being an extremely ſoft and gloſſy thread, ſpun by the bombyx or ſilk-worm, the body of which conſiſts of eleven rings: it produces a ſpecies of phalenæ or moths, with pectinated wings, but no tongue. See PHALENÆ.

The humours, found in the body of this inſect, approach to the nature of ſilk; ſince, on being rubbed in the hand, they leave a ſolid cruſt behind. In the ſides of the belly, all about the ventricle, there are depoſited a vaſt number of veſſels, which contain the ſilky juice; theſe run with various windings and meanders to the mouth, and are ſo diſpoſed, that the creatures can diſcharge their contents at pleaſure at the mouth; and according to the nature of the juices, that they are ſupplied with, furniſh different ſorts of ſilk from them, all

the fluid contents of theſe veſſels hardening in the air into that ſort of thread, that we find the web, or balls of this creature conſiſt of.

As ſoon as the ſilk-worm is arrived at the ſize and ſtrength neceſſary for beginning his cod, he makes his web; for it is thus they call that ſlight tiſſue, which is the beginning and ground of this admirable work. This is his firſt day's employment. On the ſecond, he forms his folliculus or ball, and covers himſelf almoſt over with ſilk. The third day he is quite hid, and the following days employs himſelf in thickening and ſtrengthening his ball, always working from one ſingle end, which he never breaks by his own fault, and which is ſo fine, and ſo long, that thoſe who have examined it attentively, think they ſpeak within compaſs, when they affirm, that each ball contains ſilk enough to reach the length of ſix engliſh miles.

In ten days time the ball is in its perfection, and is now to be taken down from the branches of the mulberry tree, where the worms have hung it. But this point requires a deal of attention; for there are ſome worms more lazy than others, and it is very dangerous waiting till they make themſelves a paſſage, which uſually happens about the fifteenth day of the month.

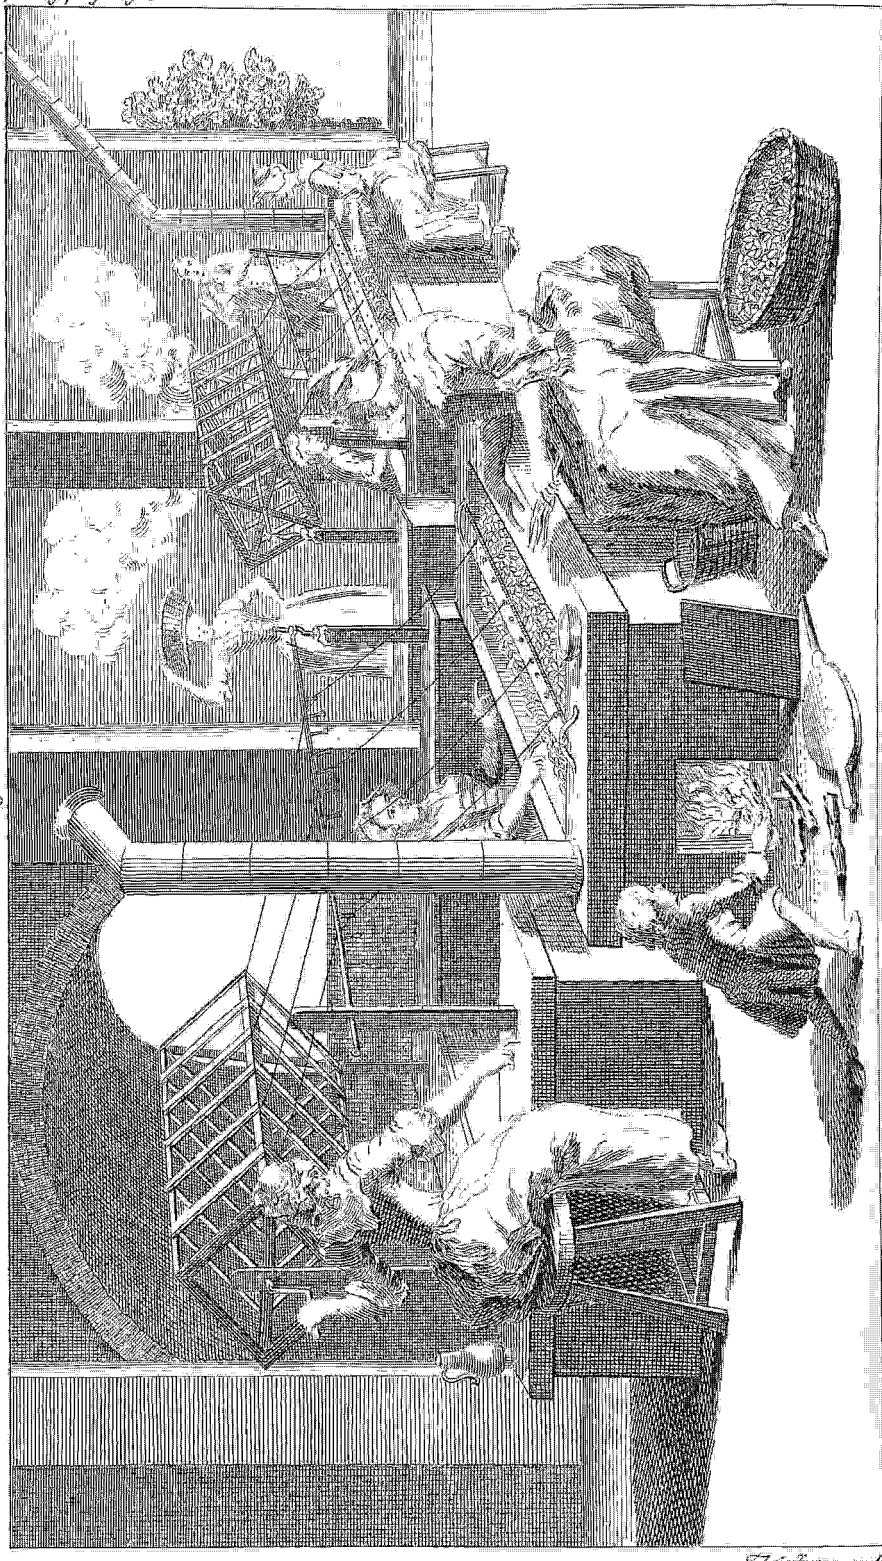
The firſt, fineſt, and ſtrongeſt balls are kept for the grain, the reſt are carefully wound; or if it is deſired to keep them all, or if there be more than can be well wound at once, they lay them for ſome time in an oven moderately hot, or elſe expoſe them, for ſeveral days ſucceſſively, to the greateſt heats of the ſun, in order to kill the inſect, which, without this precaution, would not fail to open itſelf a way to go and uſe thoſe new wings abroad, it has acquired within.

Ordinarily, they only wind the more perfect balls; thoſe that are double, or too weak, or too coarſe, are laid aſide, not as altogether uſeleſs, but that, being improper for winding, they are reſerved to be drawn out into ſkains. The balls are of different colours; the moſt common are yellow, orange-colour, iſabella, and fleſh-colour; there are ſome alſo of a ſea-green, others of a ſulphur-colour, and others white; but there is no neceſſity for ſeparating the colours and ſhades to wind them apart, as all the colours are to be loſt in the future ſcouring and preparing of the ſilk.

In the Philoſophical Tranſactions, n° 252, we find the following obſervations concerning the goodneſs of ſilk, which is beſt diſtinguiſhed by its lightneſs. The organcine ſilk is the beſt of any made in the country of Piedmont, and two threads are equal in fineneſs, that is in ſmoothneſs, thickneſs, and length, for the thread of the firſt twiſt. For the ſecond, it matters not whether the ſingle thread be ſtrong before the two are joined, unleſs to ſee whether the firſt twiſt prove well. It is neceſſary that the ſilk be clean; and it is to be obſerved, that the ſtraw-coloured is generally the lighteſt, and the white the heavieſt of all. The ſkains ſhould be even, and all of an equality, which ſhews that they were wrought together; otherwiſe we may with juſtice ſuſpect that it is refuſe ſilk, and cannot be equally drawn out and ſpun, for one thread will be ſhorter than the other, which is labour and loſs.

It will alſo be requiſite to ſearch the bale more than once, and take from out of the parcels a ſkain to make an eſſay; for unleſs it be known by trial what one buys, there is the greateſt danger of being cheated in this commodity. To make an eſtimate, and know the lightneſs, fix the eſſay upon one eighth of a portée, or hand of ſilk of a hundred and ten aunes or ells of Lyons in length, and ſee what it makes of aunes by the eighth part. The ſkain, which is of eighty threads, muſt be multiplied by a hundred and ten aunes of Lyons, and from this number muſt be deducted one eighth; as for example, 110 by 80 makes 8800, the eighth part of which is 1100; and this is the eighth part of a portée, or hand of ſilk. Now to calculate what theſe 1100 aunes weigh, which is the eighth part of a portée, or of 110 aunes of Lyons, it will be proper to take a ſkain out of the parcels, which you take from out of the bale which you judge may contain, at leaſt, 1100 aunes, to make the one eighth part of a portée, which portée muſt be divided on two bobbings, half on each; then fix the two bobbings on the center, or beam, and from thence paſs it through the comb hurdiſſoir, *viz.* 550 from the two bobbings, will make 1100, which will be one eighth part of what you deſire to know. This done, you cut off your ſilk, and carry it to put on the hurdiſſoir; then weigh it, and multiply the weight by eight, it will weigh juſt as much as

a por-



Winding of SILK

T. Jefferys sculp.

a portée of 110 aunes of Lyons, which is the general rule for calculating. When they draw the ſilk out by this means, one may learn to adjuſt the weight.

There are ſilks of Piedmont, which are very light and clean, and are to be preferred before any on the ſale: the portée of ſilk of the lighteſt weighs near twenty-four penny-weights, and from this it ariſes in gravity to twenty-five, and twenty-ſix penny-weights the portée, and ſometimes to twenty-ſeven and twenty-eight; but even theſe weights may be diſpenſed with, provided that the other qualities be good, that is, that it be well wrought, even and clean. When the ſilk is more than twenty-eight penny-weights the portée, it muſt always be proportionably cheaper.

Methods of preparing SILKS. The ſeveral preparations which ſilks undergo to fit them to be uſed in the manufacture of ſilken ſtuffs, are reeling, ſpinning, milling, bleaching, and dyeing. To wind ſilks from off the balls, two machines are neceſſary; the one a furnace, with its copper; the other a rell, or frame, to draw the ſilk. The winder, then ſeated near the furnace, throws into the copper of water over the furnace (firſt heated and boiled to a certain degree, which cuſtom alone can teach) a handful or two of balls, which have been firſt well purged of all their looſe furry ſubſtance. She then ſtirs the whole very briſkly about with birchen rods, bound and cut like bruſhes; and when the heat and agitation have detached the ends of the ſilks of the pods, which are apt to catch on the rods, ſhe draws them forth, and joining ten or twelve, or even fourteen of them together, ſhe forms them into threads, according to the bigneſs required to the works they are deſtined for: eight ends ſufficing for ribbands; and velvets, *&c.* requiring no leſs than fourteen. The ends, thus joined into two or three threads, are firſt paſſed into the holes of three iron-rods, in the fore-part of the reel, then upon the bobbings, or pullies, and at laſt are drawn out to the reel itſelf, and there faſtened; each to an end of an arm or branch of the reel. Thus diſpoſed, the winder, giving motion to the reel, by turning the handle, guides the threads; ſubſtitutes new ones, when any of them break, or any of the balls are wound out; ſtrengthens them, where neceſſary, by adding others; and takes away the balls wound out, or that, having been pierced, are full of water. See plate CCXLIX.

In this manner, two perſons will ſpin and reel three pounds of ſilk in a day; which is done with greater diſpatch than is made by the ſpinning-wheel or diſtaff. Indeed, all ſilks cannot be ſpun and reeled after this manner; either by reaſon the balls have been perforated by the ſilk-worms themſelves, or becauſe they are double, or too weak to bear the water; or becauſe they are coarſe, *&c.* Of all theſe together, they make a particular kind of ſilk, called floretta; which being carded, or even ſpun on the diſtaff, or the wheel, in the condition it comes from the ball, makes a tolerable ſilk.

As to the balls, after opening them with ſciſſars, and taking out the inſects (which are of ſome uſe for the feeding of poultry) they are ſteeped three or four days in troughs, the water whereof is changed every day to prevent their ſtinking. When they are well ſoftened by this ſcouring, and cleared of that gummy matter the worm had lined the inſide withal, and which renders it impenetrable to the water, and even to air itſelf, they boil them half an hour in a lye of aſhes, very clear and well ſtrained: and after waſhing them out in the river, and drying them in the ſun, they card and ſpin them on the wheel, *&c.* and thus make another kind of floretta, ſomewhat inferior to the former.

As to the ſpinning and reeling of raw ſilks off the balls, ſuch as they are brought from Italy and the Levant, the firſt is chiefly performed on the ſpinning-wheel; and the latter, either on hand-reels, or on reels mounted on machines, which ſerve to reel ſeveral ſkains at the ſame time. See the article REEL.

As to the milling, they uſe a mill compoſed of ſeveral pieces, which may mill two or three hundred bobbins at once, and make them into as many ſkains.

For the dyeing of ſilks. See the article DYEING.

SILK, in medicine, is very little uſed for medicinal purpoſes; though if the bags were burnt in a cloſe veſſel, in the ſame manner as ſponge, they would undoubtedly prove a medicine of ſimilar, and probably of ſuperior virtue: they yield a larger quantity of volatile ſalt, than any other animal ſubſtance we know of; and the ſpirit of raw ſilk, rectified with ſome eſſential oil, makes the medi-

cine

cine known by the name of engliſh drops. See the article DROPS.

Spider-SILK, that prepared of the webs of ſpiders; which, according to Reaumur, is inferior to that obtained from the bags of the ſilk-worm, both in ſtrength and luſtre.

Duties upon SILKS. Raw long ſilks of all ſorts, except from Bengal, pay, on importation, a duty of 1s. $11\frac{10}{100}$d. the pound, containing twenty-four ounces; and draw back, on exportation, 1s. $8\frac{25}{100}$d. Bengal raw-ſilk pays, on importation, 2s. $4\frac{72\frac{1}{2}}{100}$d. the pound of twenty-four ounces; and draws back, on exportation, 2s. $1\frac{87\frac{1}{2}}{100}$d. Raw ſhort ſilk pays, on importation, only 1s. $3\frac{40}{100}$d. the pound of twenty-four ounces; and draws back, on exportation, 1s. $1\frac{1}{2}$d. Sattin-ſilk pays, on importation, by the pound of ſixteen ounces, 7s. $8\frac{40}{100}$d. and draws back, on exportation, 6s. 9d. But raw ſilks, imported directly from any of the britiſh american plantations, and of the growth of the ſame, pay no duty at all. Thrown ſilk, dyed, pays, on importation, by the pound of ſixteen ounces, a duty of 19s. 3d. and, on being exported, draws back 16s. $10\frac{50}{100}$d. As to manufactured or wrought ſilks, french alamodes or luſtrings, pay, on importation, by the pound of ſixteen ounces, 2l. 15s. $10\frac{32}{100}$d. but if not french, only 1l. 15s. $10\frac{32}{100}$d. Indian wrought ſilks, imported in britiſh ſhipping, and duly entered at the port of London, pay only $4\frac{72\frac{1}{2}}{100}$d. the pound of ſixteen ounces. Wrought ſilks of the manufacture of Italy, imported in britiſh ſhips, pay 12s. $1\frac{55}{100}$d. the pound of ſixteen ounces; and draw back, on exportation, 11s. $7\frac{21\frac{2}{3}}{100}$d. All french wrought ſilks, except alamodes and luſtrings, pay, on importation, only 1l. 7s. $11\frac{16}{100}$d. the like pound; and draw back, on exportation, 17s. $3\frac{56}{100}$d. Wrought ſilks, except alamodes and luſtrings, from any part of the world, pay, on importation, only 14s. $2\frac{16}{100}$d. the like pound; and draw back, on exportation, 13s. $6\frac{56}{100}$d. Flowered ſilks, or thoſe mixed with gold or ſilver, except of India, Perſia, or China, pay, on importation, 1l. 1s. $6\frac{40\frac{1}{2}}{100}$d. the like pound; and draw back, on exportation, 19s. $10\frac{45\frac{1}{2}}{100}$d.

SILLON, in fortification, the ſame with envelope. See ENVELOPE.

SILPHIUM, in botany, a genus of the *ſyngeneſia-polygamia-neceſſaria* claſs of plants, the general corolla whereof is radiated with a great number of hermaphrodite floſcules in the diſc, and with a fewer number of the female ones in the radius: the partial corolla of the hermaphrodite is monopetalous, infundibuliform, and quinquedentated; there is no pericarpium; the female ſeed is ſolitary, membranaceous, and obverſely cordated.

SILVER, *argentum*, ☽, in natural hiſtory, the pureſt and moſt fixed of all metals, except gold, for the ſpecific gravity of which, ſee the article GRAVITY.

Silver, though frequently found native and pure, is however often found in the ſtate of ore; as among the grey ores of copper, the ore of lead, of cobalt, antimony, and other mineral bodies. The proper and peculiar ores of ſilver are of various appearances; as in that of a ſoft ſubſtance of a blackiſh-blue colour, greatly reſembling lead: another ore of ſilver is in form of brown or browniſh-yellow obſcurely tranſparent maſſes, not a little reſembling the coarſer ſorts of amber: there is another ſilver-ore of a very bright and beautiful red, a ſmooth even ſurface, and conſiderably pellucid, reſembling very much native ſandarach. Theſe are the more uſual and determinate ores of ſilver, which in many of the german mines are blended all together, ſometimes with the black kind wholly covering the red: the black kind is often ſoft enough to be cut with a knife.

The method of precipitating ſilver out of an eaſily fuſible ore is this: pound the ore very fine in an iron-mortar, and for an aſſay weigh one docimaſtical centner of it, and eight centners of granulated lead; pour into a new teſt about half the lead, ſtir it about with a finger, and ſpread it over the cavity of the teſt; put upon this lead the pounded ore, and then cover it with the remainder of the lead; put the teſt, thus loaded, under the muffle of an aſſay-furnace, and in the hinder part of it make the fire, and encreaſe it to a conſiderably high degree. The ore will ſoon be raiſed out of the melted lead, and ſwim upon it; a little after it will grow clammy, melt, and be thrown

thrown toward the border of the teſt; then the ſurface of the lead will appear clear in the middle of the teſt, and will ſmoak and boil; the fire muſt now be made a little leſs, till the boiling ceaſes, for a quarter of an hour, and then made violent again, and the ſurface of the lead will then diminiſh by degrees, and be covered with a maſs of ſcoriæ. At this time have at hand an iron hook ready heated, and with this ſtir all the matter from the ſides into the middle of the teſt; if the matter, adherring to the hook from the ſtirring, melts quickly again, and the extremity of the hook, when cold, is found covered with a ſhining cruſt, the ſcorification is perfected; but if the ſcoriæ feel clammy while ſtirred, and adhere in quantity to the hook, and are of a rough ſurface, the ſcorification is not perfect, but the matter adhering to the hook muſt be ſtruck off with a hammer, and beat to powder, and returned into the teſt, and the fire continued till the ſcorification is perfected; then take out the teſt, and pour the whole contents into a mould, heated and greaſed. This is the firſt proceſs, and this uſually takes up three quarters of an hour: the ſilver is now in form of a regulus, and muſt be ſeparated by the coppel in the uſual way. See the article COPPELLING.

When ſilver-ores are rendered refractory by an admixture of mundic, they muſt be pounded and put into a covered teſt, which is to be placed in an aſſay-furnace under a muffle, till all the mundic is evaporated; which you may know by the ceſſation of the ſmoke from the ore: let this roaſted ore cool leiſurely; then powder it fine, and mix it with an equal quantity of glaſs of lead reduced likewiſe to fine powder; and, laſtly, ſcorify the whole till the ſilver appear in the form of a bright bead in the middle of the teſt.

When the ſilver is well purified, ſo that all heterogeneous matter, either metallic or other, that might be mixed with it, is extracted, they ſay it is twelve carats fine. This is the expreſſion they uſe to denote the quality of the pureſt ſilver, without any mixture or alloy; but, if there ſhould remain any, they deduct the weight of the mixture from the principal weight, and the remainder ſhews the value of the ſilver. The carat conſiſts of twenty-four grains: ſo that, when to the weight of twelve carats there are twelve grains of mixture, the value of the ſilver is eleven carats twelve grains; and ſo of any other.

Silver, though conſiderably hard in compariſon of lead or gold, is yet malleable and ductile to a very great degree, and may be drawn out into an extremely fine wire. It is leſs capable of ruſt than any other metal, except gold; but it readily becomes black on being rubbed with ſulphur. It requires a middle degree of fire to fuſe it; bearing unaltered a ſtronger degree of heat than either lead or gold, but melting much more eaſily than copper or iron. It, indeed, grows red-hot, but then melts immediately. It amalgamates readily enough with mercury; the readieſt way of mixing them is to have the ſilver in fine filings, very clear from greaſe, and to rub it in a mortar with the mercury. It is fixed in a common fire, ſo as to loſe ſcarce any thing; and perhaps, truly ſpeaking, not any thing at all, in the fierceſt degree of it, if never ſo long continued: it has been tried by Boerhaave for two months together, in the eye of a glaſs-houſe-furnace, and found to loſe only one twelfth part of its weight in the operation; and it is highly probable, that even this loſs might be owing to the ſilver's not being perfectly purified at firſt.

Silver, expoſed to the fierceſt fire, collected in the focus of a large burning-glaſs, immediately becomes red-hot, and melts; it then crackles, and afterwards emits a thick ſmoak: ſoon after this, it is covered with a duſty ſubſtance, or calx. If the ſilver have been refined by means of antimony, the calx is of a yellowiſh hue, and, if kept long enough in the focus, it will vitrify in the ſame manner as gold; but, if it have been refined with lead, the calx is whiter, and, Homberg aſſures us, will never vitrify, however long expoſed, even to that degree of heat.

Silver is purified by means of lead, and bears its action without loſs. Fuſed with antimony, if the effect be not carefully prevented, it turns to ſcoria, and becomes volatile: there is no metal, indeed, except gold alone, that bears the teſt with this rapacious mineral, in the common way. See the article GOLD.

The proper ſolvent of ſilver is aqua fortis; it is diſſolved readily by this, and not at all by the common aqua regia; yet, under certain circumſtances, aqua regia will diſſolve ſilver: the firſt phlegm which

which ariſes in diſtilling that menſtruum, when newly made, and when it has been ſome time in digeſtion with gold, will diſſolve ſilver, and will not touch gold; though it cannot but be acknowledged, this liquor is as much aqua regia, as what follows in the diſtillation. This, however, is an experiment of mere curioſity, not likely ever to occur in the way of buſineſs, and in that reſpect, though we are acquainted with this accident, which was accidentally diſcovered by Homberg, we may ſay in general, that aqua fortis diſſolves ſilver, and not gold; and aqua regia gold, and not ſilver. If but the ſmalleſt quantity of ſea-ſalt be put into aqua fortis, it will no longer give a clear ſolution of ſilver. This gives us a teſt for the goodneſs of aqua fortis: and to this difference in the effect of theſe two menſtrua we owe the only method of ſeparating ſilver from gold, without loſs. If ſilver be fuſed with lead, it loſes its ſound, and its bright colour; if melted with tin, it becomes extremely brittle, and the two metals are very difficultly ſeparated again. It melts and mixes eaſily with copper, and by that means acquires a hardneſs which fits it for our coins and utenſils, much better than in its pure natural ſtate. See ASSAYING.

Silver, melted with arſenic (which is eaſily done by mixing the arſenic with a little chalk and a little tartar, then wetting it with common water, and then ſtratifying the ſilver with the maſs) receives a part of that ſubſtance into its own body, and ſhews the ſingular effect it has on it, in its loſing all its malleability; but the arſenic may be ſeparated from it again by only melting it in a ſtrong fire.

Silver, melted with biſmuth, is afterwards much the more eaſily amalgamated with quickſilver; and what is yet more remarkable, is, that it by this means becomes ſo attenuated, that it will paſs through a leather in much larger quantity mixed with the mercury, than it would otherwiſe have done. It is made much more fuſible, as well as volatile, by antimony, and is ſtrangely debaſed by the fume of burning ſulphur. Silver is ſaid by ſome to be able to colour the natural gems, and factitious glaſſes, and paſtes with a fine blue; but this is an error wholly owing to the alloy of copper, which is in moſt ſilver, and which has occaſionally ſhewn this effect in the artificial products of this kind. But though ſilver is not capable of communicating any colour to foſſils, it has, however, a power of influencing their figure, and that in a very ſingular manner: It has long been known, that iron determines the cryſtals it enters the compoſition of, into rhombs, and lead into cubes; but it has not been known that theſe truncated cryſtals and ſpars, preſerved as great curioſities in the cabinets of the curious, owe their figure to ſilver, till ſilver was lately ſeparated from them. As certainly, therefore, as iron or lead can form cryſtal into cubes and rhombs, ſo certainly can ſilver, even in a very ſmall quantity, influence the figure of thoſe foſſils, and form them into columns truncated at each end.

If ſilver be melted with common ſalt, it blends with proper management into a ſemipellucid maſs, called luna cornea; which is very difficultly reduced into ſilver again, as being ſo volatile as to fly wholly off in a ſmall degree of heat.

The chemiſts, who ſuppoſe ſilver to have ſome peculiar affinity to the moon, therefore call it luna: their character for it is ☽; by which they mean to denote the half of gold, whoſe character is a complete circle; the inner line of this figure, if turned outward, would make it the complete mark of gold.

Refining of SILVER. See REFINING.

Medicinal virtues and preparations of SILVER. The chemiſts have ſaid great things of the virtues of ſilver, and, accordingly, have endeavoured to introduce a long train of lunar medicines; ſuch as argentum potabile, diaphoreticum lunare, bezoardicum lunare, and fifty others as pompous as inſignificant: the only preparations of ſilver, which keep up their credit in the ſhops, are the lunar cryſtals and cauſtics. See the articles CRYSTAL and CAUSTIC.

As to the pretended tinctures of ſilver, being only tinctures of copper, they are by no means ſafe internally; and every coloured tincture of ſilver may be boldly declared to be of this kind.

The only preparation, therefore, we ſhall add, is, that liquor kept by many as a mighty ſecret for tinging hair of any colour to a fine black. It is thus prepared. take three drams of crude mercury, and diſſolve it in an ounce and half of aqua fortis; add to this, two ounces of the ſolution of ſilver in aqua fortis, and

and pour the whole into a veſſel of clean water, ſo much in quantity, that the liquor may not be able to corrode copper, nor raiſe bubbles on its ſurface; and when it has ſtood a month, it may be uſed with ſafety. See MERCURY.

SILVER-LEAF, that beaten out into fine leaves for the uſe of the gilders, which is performed in the ſame manner as gold-leaf. See GOLD-LEAF.

SILVER-WIRE, that drawn out into fine wire; for the manner of doing which, ſee the article GOLD-WIRE.

Shell-SILVER, is prepared of the ſhreads of ſilver-leaves, or of the leaves themſelves, for the uſe of painters, after the ſame manner as ſhell-gold. See GOLD.

SILVER-TREE, *eugenia*, in botany, a ſmall but beautiful tree of Jamaica, belonging to the *icoſandria-monogynia* claſs of plants; its leaves are ſmooth, very thin, and grow in pairs; the flowers are ſmall and whitiſh, and grow at the alæ of the leaves. See EUGENIA.

SILVERING, the covering of any thing with ſilver. It is uſual to ſilver metals, wood, paper, *&c.* which is performed either with fire, oil, or ſize. Metal-gilders ſilver by the fire; painter-gilders all the other ways. See GILDING.

To ſilver copper or braſs: 1. Cleanſe the metal with aquafortis, by waſhing it lightly, and immediately throwing it into fair water; or by heating it red hot, and ſcouring it with ſalt and tartar, and fair water, with a ſmall wire-bruſh. 2. Diſſolve ſome ſilver in aquafortis, in a broad-bottomed glaſs veſſel, or of glazed earth, then evaporate away the aquafortis over a chaffing-diſh of coals. 3. Put five or ſix times its quantity of water, or as much as will be neceſſary to diſſolve it perfectly, on the remaining dry calx; evaporate this water with the like heat; then put more freſh water, and evaporate again; and if need be, the third time, making the fire towards the latter end ſo ſtrong, as to leave the calx perfectly dry, which, if your ſilver is good, will be of a pure white. 4. Take of this calx, common ſalt, cryſtal of tartar, of each a like quantity, or bulk, and mixing well the whole compoſition, put the metal into fair water, and take of the ſaid powder with your wet fingers, and rub it well on, till you find every little cavity of the metal ſufficiently ſilver'd over. 5. If you would have it richly done, you muſt rub on more of the powder, and in the laſt place waſh the ſilver'd metal in fair water, and rub it hard with a dry cloth.

SILVERING *of glaſſes*. See the article FOLIATING *of looking glaſſes*.

SIMATIUM, or SIMAISE, in architecture. See the article CYMATIUM.

SIMEREN, a city of Germany, in the palatinate of the Rhine: eaſt long. 7° 5′, north lat. 50°

SIMIA, the MONKEY, in zoology, a genus of quadrupeds, of the order of the anthropomorpha, the characters of which are, that the face is naked, the claws rounded and flattiſh in ſome degree, like the nails on the human hand, and there is an eye lid each way. See the articles MONKEY and ANTHROPOMORPHA.

This genus, among ſeveral other ſpecies, comprehends the ſatyr, the baboon, and the rat-ape. See SATYR, and BABOON.

SIMILAR, in arithmetic and geometry, the ſame with like. Thoſe things are ſaid to be ſimilar or like, which cannot be diſtinguiſhed but by their compreſence, that is, either by immediately applying the one to the other, or ſome other third to them both, ſo that there is nothing found in one of the ſimilar things but is equally found in the other, notwithſtanding their ſimilitude may differ in quantity; and ſince in ſimilar things there is nothing wherein they differ beſides the quantity, quantity itſelf is the internal difference of ſimilar things. In mathematics, ſimilar parts have the ſame ratio to their wholes, and if the wholes have the ſame ratio to the parts, the parts are ſimilar. See PART. Similar angles are alſo equal angles. In ſolid angles, when the planes under which they are contained are equal, both in number and magnitude, and are diſpoſed in the ſame order, they are ſimilar, and conſequently equal. Similar arches of a circle are ſuch as are like parts of their whole circumferences, and conſequently equal. Similar plane numbers are thoſe numbers which may be ranged into the form of ſimilar rectangles, that is, into rectangles whoſe ſides are proportional; ſuch are 12 and 48, for the ſides of 12 are 6 and 2, and the ſides of 48 are 12 and 4; but 6 : 2 : : 12 : 4, and therefore thoſe numbers are ſimilar. Similar polygons are ſuch as have their angles ſeverally equal, and the ſides about thoſe angles proportional. Similar rectangles are thoſe which have their ſides about the equal angles proportional; hence, 1. All ſquares are ſimilar rect-

angles. 2. All ſimilar rectangles are to each other as the ſquares of their homologous ſides. Similar right-lined figures are ſuch as have equal angles, and the ſides about thoſe equal angles proportional. Similar ſegments of a circle are ſuch as contain equal angles. Similar curves: two ſegments of two curves are called ſimilar, if, any right lined figure being inſcribed within one of them, we can inſcribe always a ſimilar right lined figure in the other. Similar conic ſections: two conic ſections are ſaid to be ſimilar when any ſegment being taken in the one, we can aſſign always a ſimilar ſegment in the other. Similar diameters of two conic ſections: the diameters in two conic ſections are ſaid to be ſimilar, when they make the ſame angles with their ordinates. Similar ſolids are ſuch as are contained under equal numbers of ſimilar planes alike ſituated. Similar triangles are ſuch as have their three angles reſpectively equal to one another. Hence, 1. All ſimilar triangles have the ſides about their angles proportional. 2. All ſimilar triangles are to one another as the ſquares of their homologous ſides. See the articles ANGLE, ARCH, NUMBER, POLYGON, &c.

SIMILAR BODIES, in natural philoſophy, are ſuch as have their particles of the ſame kind and nature with one another. See BODY, PARTICLE, &c.

SIMILAR DISEASE, in medicine, denotes a diſeaſe of ſome ſimple, ſolid part of the body; as of a fibre with regard to its tenſion or flaccidity; of a membrane; a nervous canal, or the like. See DISEASE.

SIMILAR FIGURES, in geometry, ſuch as have their angles reſpectively equal, and the ſides, about the equal angles, proportional. See the articles RECTANGLE, TRIANGLE, and POLYGON.

SIMILAR PARTS, in anatomy, are thoſe parts of the body which at firſt ſight appear to conſiſt of like parts, or parts of the ſame nature, texture, and formation; of theſe we uſually reckon ten, *viz.* the bones, cartilages, ligaments, membranes, fibres, nerves, arteries, veins, fleſh, and ſkin. See BONE, CARTILAGE, &c.

SIMILE, or SIMILITUDE, in rhetoric, a compariſon of two things, which though different in other reſpects, yet agree in ſome one. The difference between a ſimile and compariſon, is ſaid to conſiſt in this, that the ſimile properly belongs to whatever we call the quality of the thing, and the compariſon to the quantity. See the article COMPARISON.

SIMILITUDE, in arithmetic, geometry, &c. denotes the relation of two things ſimilar to each other. See SIMILAR.

SIMONICAL is applied to any perſon guilty of ſimony. See SIMONY.

SIMONIANS, in church hiſtory, a ſect of antient heretics, ſo called from their founder, Simon Magus, or the magician. The hereſies of Simon Magus were principally his pretending to be the great power of God, and thinking that the gifts of the Holy Ghoſt were venal, and to be purchaſed with money. He is ſaid to have invented the Æons, which were ſo many perſons of whom the Godhead was compoſed. His concubine Helen, he called the firſt intelligence, and mother of all things; and ſometimes he called her Minerva, and himſelf Jupiter. Simon Magus gained a great many proſelytes, who paid himſelf and his concubine divine worſhip; theſe were the earlieſt heretics, and thoſe that St. John, St. Peter and St. Paul, in their epiſtles, ſo often warn the chriſtians againſt.

SIMONY, in eccleſiaſtical law, the crime of buying or ſelling ſpiritual gifts or preferments. In the antient chriſtian church, this crime was always thought to be committed when men either offered or received money for ordinations. The apoſtolical canons lay a double puniſhment both of depoſition and excommunication, on ſuch of the clergy as were found guilty of it. This was the firſt ſort of ſimony, and that which was moſt properly ſo called, and to this the antients reduced the exacting of any reward for adminiſtring the euchariſt or baptiſm, or for any ſpiritual offices. A ſecond ſort of ſimony conſiſted in buying the ſpiritual preferments of the church; this was puniſhed with depoſition in any biſhop, who promoted any church-officer for the ſake of lucre; and the perſons ſo promoted, were to be degraded from their office. By the laws of Juſtinian, every elector was to depoſe upon oath, that he did not chuſe the perſon elected for any gift or promiſe, or friendſhip, or any other cauſe, but only becauſe he knew him to be a man of the true catholic faith, of unblamable life, and good learning. This laſt ſort of ſimony was, when men by ambitious arts and undue practices, got themſelves inveſted in an office or preferment to which they had

had no regular call, or when they intruded themſelves into other mens places, which were legally filled before. The caſuiſts for the Church of Rome maintain, that all compacts or bargains in which benefices are concerned, are ſimonical, when it is done without the pope's concurrence; but that, once obtained, gives a ſanction to the thing, which they found upon this univerſal propoſition, that the pope cannot commit ſimony in beneficiary matters, ſince he hath a power ſo abſolute over all the eccleſiaſtical goods and benefices, that he can unite, divide, and beſtow them in whatever manner he pleaſes.

Againſt the corruption of ſimony, there have been many canons made in our own church, which puniſhes the offender with deprivation, diſability, *&c.* and by a ſtatute of the 31 Eliz. it is enacted, that if any perſon for any ſum of money, reward, gift, profit, or benefit, or by reaſon of any promiſe, agreement, grant, bond, covenant, or other aſſurance, ſhall preſent, or collate any perſon to any benefice with cure, dignity, or living eccleſiaſtical, every ſuch preſentation, or collation, and every admiſſion or induction thereupon, ſhall be utterly void, and the crown ſhall preſent for that turn; and the perſon that ſhall give or take any ſum of money, *&c.* ſhall forfeit double the value of one year's profit of any ſuch benefice; and the perſon ſo corruptly taking any ſuch benefice, ſhall from thenceforth be diſabled to have and enjoy the ſame.

SIMPLE, *ſimplex*, ſomething not mixed or compounded, in which ſenſe it ſtands oppoſed to compound. See the article COMPOUND.

Thus we ſay, ſimple form, ſimple mode, ſimple fee, ſimple force, ſimple equation, ſimple anomaly, ſimple glands, ſimple viſion, ſimple flank, ſimple fraction, *&c.* See the articles FORM, MODE, FEE, FORCE, EQUATION, *&c.*

SIMPLE, in pharmacy, a general name given to all herbs or plants, as having each its particular virtue, whereby it becomes a ſimple remedy.

SIMPLE, in muſic, is chiefly uſed in oppoſition to double, ſometimes to a compound of ſeveral parts or figures of different values, *&c.* Simple cadence is that where the notes are equal in every part. Simple concords are thoſe wherein we hear at leaſt two notes in conſonance, as a third and fifth, and of conſequence at leaſt three parts, which is either done immediately, and called the harmonical triad, or in a more remote manner; that is, when the ſounds which are not baſs, are one or two octaves higher. This diſtance has no bad effect in the third; but in the fifth it has, and generally ſpeaking, the nearer or more immediate the concords are, the better. They alſo ſay, C ſimple, or plain, in oppoſition to C accented. Simple counter-point is a harmonical compoſition, wherein note is ſet againſt note, in oppoſition to figurative counter-point. Simple fugue, or ſimple imitation, is where one part imitates the ſinging of another for ſome meaſures. See the articles COUNTER-POINT, IMITATION, FUGUE, *&c.*

For ſimple interval, and ſimple triple, ſee the articles INTERVAL and TRIPLE.

SIMPLEX BENEFICIUM, ſignifies an inferior dignity in a cathedral, or collegiate church, a ſine-cure, penſion, or any eccleſiaſtical benefice, oppoſed to a cure of ſouls, and which therefore is conſiſtent with any parochial cure, without coming under the denomination of pluralities.

SIMPLIFYING, in eccleſiaſtical matters, is the taking away the cure of ſouls from a benefice, and diſpenſing the beneficiary from reſidence. Several benefices which have been ſimplifyed, now require reſidence, and a great number of others, which required reſidence, have been ſimplifyed: ſome uſe this word in a more extenſive ſignification, *viz.* for the ſhortening a relation, *&c.* or retrenching every thing not preciſely neceſſary.

SIMPLUDIARIA, in antiquity, a kind of funeral honours paid to the deceaſed at their obſequies.

SIMUL-CUM, in law, words that formerly were made uſe of in indictments and declarations of treſpaſs, where there were ſeveral defendants, ſome whereof were known, and others not.

SIN, a breach or tranſgreſſion of ſome divine law, or command.

SINAI, a mountain of Arabia Petrea, ſituated eaſt long. 35°, north lat. 29°, and memorable on account of the laws being given to the Jews on this mount.

SINAI, *knights of.* See CATHARINE.

SINAPI, or SINAPIS, *muſtard*, in botany, a genus of the *tetradynamia ſiliquoſa* claſs of plants, the corolla whereof conſiſts of four cruciform, roundiſh, plane, patent, and intire petals, with erect linear ungues, and ſcarcely the length of the cup; the fruit is an oblong, rough pod, con-

ſifting of two valves, and containing two cells; the ſeeds are numerous and globoſe.

Muſtard-ſeed is an attenuant and reſolvent in a very high degree; it warms the ſtomach, and excites an appetite; but its principal medicinal uſe is external in ſinapiſms, applications made to certain parts when irritation is intended, but not bliſtering. It is uſually mixed with horſe-radiſh-root, and other ingredients of the ſame kind, for this purpoſe.

SINAPISM, in pharmacy, an external medicine, in form of a cataplaſm, compoſed chiefly of muſtard-ſeed pulverized, and mixed with the pulp of figs, or with briony, garlic, onion, or the like. See the preceding article.

SINAPISTRUM, in botany, the ſame with the cleome. See CLEOME.

SINCIPUT, in anatomy, the fore-part of the head, reaching from the forehead to the coronal ſuture. See the articles HEAD and SKULL.

SINCOPORA, a promontory of Malacca in the Eaſt-Indies, ſituated in 2°, north lat. oppoſite to the iſland of Sumatra, with which this cape forms the ſtraits, called the Straits of Sincopora.

SINDON, in ſurgery, a little round piece of linnen ſilk, or lint, uſed in dreſſing a wound after trepanning. See the article TREPANNING.

SINE, or *right* SINE *of an arch*, in trigonometry, is a right line drawn from one end of that arch, perpendicular to the radius drawn to the other end of the arch; being always equal to half the chord of twice the arch. Thus, SR (plate CCL. fig. 6.) is the right ſine of the arches SA and SD.

The radius, CB, is called the whole ſine, or the ſine of 90°. The ſine-complement, or co ſine, of an arch AS, is the part CR, intercepted between the center and right ſine; ſo called, as being always equal to SH, the ſine of the complement of that arch to 90°, *viz.* SR. And the verſed ſine of an arch, AS, is the part, RA, intercepted between the right ſine, SR, and the extremity of the arch, A.

For the uſe of ſines in trigonometrical calculations, ſee the articles TRIGONOMETRY, NAVIGATION, &c.

SINE ASSENSU CAPITALI, in law, a writ lying where a biſhop, dean, prebendary, or maſter of an hoſpital, aliens the lands held in right of his biſhopric, deanery, &c. without the conſent of the chapter, or fraternity; in which caſe his ſucceſſor ſhall have this writ, and ſometimes he may enter upon ſuch alienation, and need not bring it.

SINE-CURES, eccleſiaſtical benefices without cure of ſouls. No church, where there is but one incumbent, can properly be a ſine-cure: and though the church being down, or the pariſh being become deſtitute of pariſhioners, the incumbent may be thereby neceſſarily acquitted from the actual performance of public duty; yet he is ſtill under an obligation to do it whenever a church ſhall be built, and there are a competent number of inhabitants: and in the mean time, if the church be preſentative, as moſt ſuch churches are, the incumbent is inſtituted into the cure of ſouls; ſuch benefices are rather depopulations than ſine-cures, and it will be proper for the new incumbent to read the thirty-nine articles, and the liturgy in the church-yard, &c. and to do whatever other incumbents uſually do. But a rectory, or portion of it, may properly be a ſine-cure, if there be a vicar under the rector, endowed and charged with the cure, in which caſe it does not come within the ſtatute of pluralities, 21 H. VIII. *c.* 13. Here therefore, no diſpenſation is neceſſary to hold the ſine-cure with a former living, nor need the incumbent read the articles, or divine ſervice, as required by 13 Eliz. *c.* 12. which extends only to a benefice with cure. By the above-mentioned ſtatute of Hen. VIII. not only prebends and rectories, with vicarages endowed, but deaneries, and arch-deaneries are declared to be benefices without cure.

SINE DIE, *without day*, in law, a term frequently uſed in our proceedings at common law; as when judgment is given againſt the plaintiff, he is ſaid to be in *miſericordia pro falſo clamore ſuo*; ſo when judgment paſſes for the defendant, it is entered *eat inde ſine die*, being as much as to ſay, he is diſcharged, or diſmiſſed the court.

SINEW, denotes what we properly call a nerve, though in common ſpeech, it is rather uſed for a tendon. See the article NERVE and TENDON.

SINGING, the action of making divers inflexions of the voice, agreeable to the ear, and correſpondent to the notes of a ſong, or piece of melody. See MELODY. The firſt thing to be done in learning to ſing, is to raiſe a ſcale of notes by tones and ſemi-tones to an octave, and deſcend by the ſame notes; and then to riſe and fall

fall by greater intervals, as a third, fourth, fifth, &c. and to do all this by notes of different pitch. Then theſe notes are repreſented by lines and ſpaces, to which the ſyllables *fa*, *ſo*, *la*, *mi*, are applied, and the pupil taught to name each line and ſpace thereby; whence this practice is called *ſol-faing*, the nature, reaſon, effects, &c. whereof, ſee under the article SOLFAING.

SINGULAR NUMBER, in grammar, that number of nouns and verbs which ſtands oppoſed to plural; and is uſed when we only ſpeak of a ſingle, or one, perſon, or thing. See PLURAL and NUMBER.

The Latins, French, Engliſh, &c. have no numbers but the ſingular and plural; but the Greeks and Hebrews have likewiſe a dual number, peculiar to two perſons. See LATIN, FRENCH, &c.

SINGULTUS, the HICKUP, in medicine. See the article HICKUP.

SINICAL QUADRANT. See QUADRANT.

SINISTER, ſomething on, or towards, the left-hand; ſiniſter is alſo uſed, among us, for unlucky, though in the ſacred rites of divination, the Romans frequently uſed it in an oppoſite ſenſe.

SINISTER, in heraldry. The ſiniſter ſide of an eſcutcheon is the left hand ſide; the ſiniſter chief, the left angle of the chief; the ſiniſter baſe, the left hand part of the baſe. See ESCUTCHEON, &c.

SINISTER ASPECT, among aſtrologers, is an appearance of two planets happening according to the ſucceſſion of the ſigns, as Saturn in aries, and Mars in the ſame degree of gemini.

SINISTRI, a ſect of antient heretics, thus called, becauſe they held the left hand in abhorrence, and made it a point of religion not to receive any thing therewith.

SINKING FUND, a proviſion made by parliament, conſiſting of the ſurpluſage of other funds, intended to be appropriated to the payment of the national debts; on the credit of which very large ſums have been borrowed for public uſes.

SI NON OMNES, in law, the name of a writ on aſſociation of juſtices, by which, if all in commiſſion cannot meet at the day aſſigned, it is allowed that two or more of them may proceed to finiſh the buſineſs.

SINNET, on board a ſhip, a line or ſtring made of rope-yarn, conſiſting generally of two, ſix, or nine ſtrings, which are divided into three parts, and are platted over one another, and then beaten ſmooth and flat with a wooden mallet. Its uſe is to ſave the ropes, or to keep them from galling.

SINOPE, a port-town of aſiatic Turky, ſituated on the Euxine Sea: eaſt long. 36° 25′, north lat. 42° 25′.

SINOPLE, or SENOPLE, in heraldry, denotes vert, or the green colour in armories. See the article VERT.

Sinople is uſed to ſignify love, youth, beauty, rejoicing, and liberty, whence it is, that letters of grace, abolition, legitimation, &c. are always uſed to be ſealed with green wax.

SINUATED LEAF, in botany, a leaf whichhasanumber of ſinuſes on its ſide, but thoſe ſeparated by lobes, not very long, nor themſelves indented, or notched at the edges. *Sinuato-dentated* leaf, expreſſes a leaf like the former, but with the lateral lobes of a linear figure.

SINUOSITY, a ſeries of bends and turns in arches, or other irregular figures, ſometimes jetting out, and ſometimes falling in.

SINUOUS ULCERS. See ULCER.

SINUS, in anatomy, denotes a cavity in certain bones, and other parts, the entrance whereof is very narrow, and the bottom wider and more ſpacious. Of theſe ſinuſes we find ſeveral in divers parts of the body, particularly in the internal ſurface of the os occipitis; in adults, there is a croſs, to which adheres the ſinuſes and proceſſes of the dura mater, the uſe whereof is to carry the blood from the brain, by a very peculiar mechaniſm, under the ſella equina, or turcica of the os ſphenoides; there is alſo a ſinus called the ſphenoidal ſinus; this is ſometimes double, and opens into the noſtrils; ſometimes it is totally wanting. See the articles SKULL, BRAIN, SPHENOIDES OS, DURA MATER, &c.

For the ſinuſes of the larynx and vena portæ, ſee the articles LARYNX and VENA PORTÆ.

Sinus of an artery is uſed, by ſome, for any part of an artery where its ſides are ſtretched out beyond the ordinary proportional dimenſions elſewhere. Morgagni has obſerved four ſuch ſinuſes in the aorta, three of them anſwering to the ſemilunar valves; and the fourth is all that part of the aorta between the former ſinuſes, and the origin of the common trunk of the right ſubclavian and carotid arteries. Sinus of the womb is uſed for any cavity within its ſubſtance. See UTERUS.

SINUS, in ſurgery, a little cavity, or ſaculus, frequently formed by a wound

or

or ulcer, wherein pus is collected. See WOUND, &c.

A ſinus is properly a cavity in the middle of a fleſhy part, formed by the ſtagnation and putrefaction of the blood or humours, and which has wrought itſelf from vent or exit. See FISTULA.

SION, a town of Switzerland, in the county of Valais, ſituated on the river Rhone, twenty-three miles ſouth-eaſt of the lake of Geneva, being a ſovereign ſtate.

SION-COLLEGE. See COLLEGE.

SIPHON, or SYPHON, in hydraulics, a bended pipe, one end of which being put into a veſſel of liquor, and the other hanging out of the ſaid veſſel over another, the liquor will run out from the firſt into the laſt, after the air has been ſucked out of the external or lower end of the ſiphon, and that as long as the liquor in the upper veſſel is above the upper orifice of the ſiphon. Thus, H D S (plate CCL. fig. 1. n° 1.) is a ſiphon whoſe two parts H D, D S, are called its legs, and by its operation, the water is drawn out of the upper veſſel A B C D, into the lower *a b*. When you have ſucked out the air at S, the water follows, coming in at H, going in the direction H G D S, and out at S, as long as the ſurface E F is above I H; the level of the mouth of what is called the driving leg of the ſiphon, being that in which the water goes up, as that through which it goes down is called the iſſuing leg, and is always longer than the driving leg. Now, the cauſe of the ſiphon's running is this. The air which preſſes into the veſſel A B C D, repreſented by the column K L, ſuſtains the column of water L D, in the ſhort leg of the ſiphon, preſſing againſt that air with its perpendicular height D F, whilſt the column of air M S, preſſing upwards againſt the hole of the long or iſſuing leg D S (which acts according to the height D C) muſt yield and ſuffer the water to run out as long as the leg D S is longer, or rather higher in perpendicular than D G. For ſince K and M are ſuppoſed at top of the atmoſphere, the column K L and M S are equal in height and preſſure, (the height of L above S being of no account in the height of the atmoſphere) as long as M S is acted upon by the deſcending water D S, whoſe height is from D to S (ſuppoſe fifteen inches) an height ſuperior to that of the column D G (ſuppoſe of ſeven inches) ſupported by the column of air K L, the column M S muſt yield to the water iſſuing out at S; and however the ſurface of the water E F deſcends, the column K L, by its preſſure, will always overcome the reſiſtance of the column M S, becauſe it has a leſs height of water to ſuſtain than M S has. If the mouth of the iſſuing leg had been at T, the water would hang in equilibrio, filling both legs of the ſiphon, when the water is come down in the upper veſſel to I H T, becauſe then the two columns of air K L and M S will be acted againſt by an equal height of water in the legs of the ſiphon; but if then you raiſe the iſſuing end of the ſiphon, now ſuppoſed at T, up to the level of *u* V above I H, the water will run back up from V to D, and ſo out at H, in the upper veſſel, becauſe then the column M S having only the height V D to ſuſtain, will be acted againſt with leſs force than the column K L, which is preſſed againſt by the whole height D H, ſuperior to V D. See the articles FLUID, ENGINE, AIR, &c.

Since the preſſure of the air is the cauſe of the water being puſhed up into the ſiphon, and the difference of its preſſure (as one column is acted againſt by the water in the ſhort leg more weakly than another column of air is acted upon by the water in the long leg) is the cauſe of its running continually from one veſſel into another, when once ſet agoing, it follows, that the bend D of the upper part of the ſiphon muſt not be above thirty-two feet higher than the water in the upper veſſel, becauſe the air cannot ſuſtain a column of water, whoſe height exceeds thirty-two feet. If therefore there was a crane, or ſiphon A C E D B (*ibid.* n° 2.) of about forty feet high, reckoning from A to E, with cocks A and B at its lower ends, and an hole at the top E, to be ſtopped with a cork upon occaſion, there might be made the following experiment; water being poured into the veſſels A and B, let the cocks A and B be ſhut, then with a funnel, pouring in water at E, till both legs of the ſiphon are full, ſtop the hole E, and open the two cocks at once. The water inſtead of running from the veſſel A into B, which it would do if the height C A was much under thirty-two feet, will in the two legs fall back to C and D thirty-two feet above A and B, where it will hang, the air not being able to ſuſtain the water above thoſe heights, and conſequently to drive

it

Fig. 1. Siphons

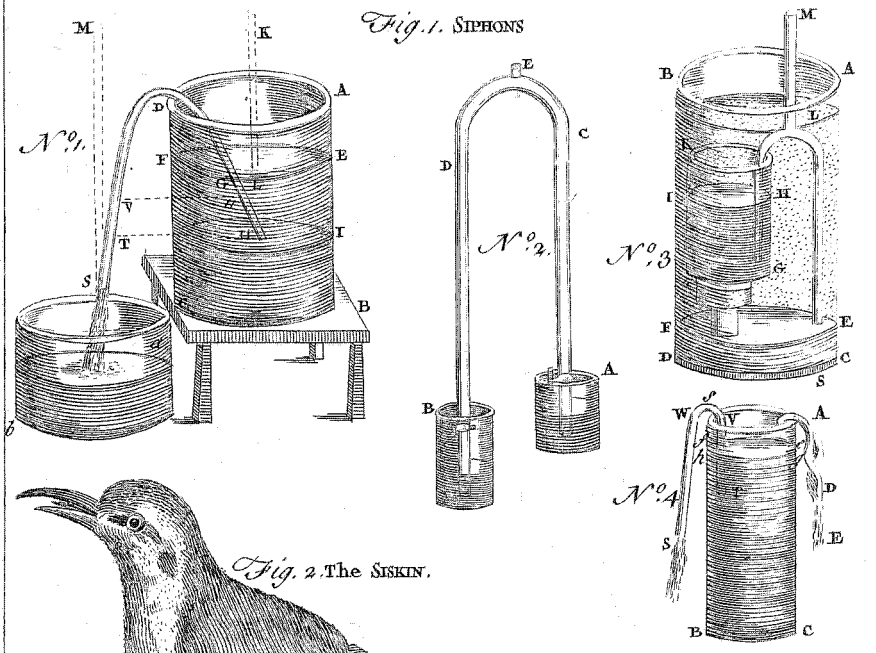


Fig. 2. The Siskin.

Fig. 3. Sitta.

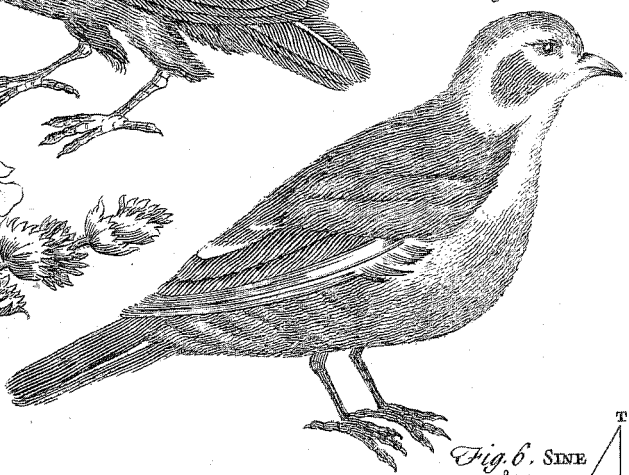

Fig. 4. Sideritis

Fig. 5. Sisymbrium

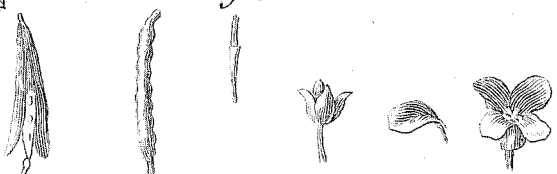

Fig. 6. Sine Tangent & Secant

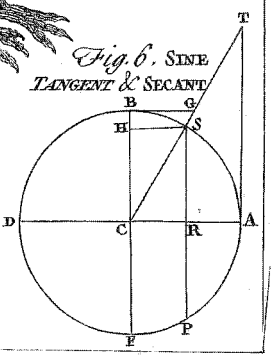


T. Jefferys sculp.

drive it up over the bend E. Nay, unleſs the water be purged of air before the experiment, the top of the water at C and D will not be quite thirty feet above the water in the veſſels A and B, becauſe air will extricate itſelf out of the water, and getting into the cavity CED, preſs a little on the top of the water at C and D, ſo that its height will be leſs to ballance the preſſure of the atmoſphere. See the article ATMOSPHERE.

Mercury will run in a ſyphon in the ſame manner as water, but then the bend of the ſyphon muſt not be more than thirty inches and eight tenths above the ſtagnant mercury in the upper veſſel; becauſe, as it is near fourteen times ſpecifically heavier than water, it will be lifted up by the preſſure of the air but the fourteenth part that water is lifted.

To prove further, that a different preſſure againſt the orifices of the unequal legs of a ſiphon, is the cauſe of a liquor running thro' that inſtrument from a higher into a lower veſſel, we may make uſe of any other fluid, lighter than the fluid to be brought over, inſtead of air, and leave the bend of the ſiphon open to the air, as in the following experiment: ABCD, (*ibid.* n° 3.) is a pretty large glaſs jar with a little water (tinged red to make the experiment the more conſpicuous) in its bottom, to the height of an inch, as at EF. On a ſtand between F and G in the great jar, there is placed a little jar, GHKI, almoſt full of the ſaid red water: let down the ſiphon SLMG, open at S, M, and G, into the veſſel, ſo that the end S of the long leg ſtands in the water at the bottom of the great jar; and G, the end of the ſhort leg in the little jar, at the bottom of its water; pour in oil of turpentine into the great jar up to L, ſo that the water in the little jar may alſo be covered with it, and the water will firſt riſe up in both legs of the ſiphon, ſo as to meet at the bend L, then it will run out of the little jar into the great one through the ſiphon, in the direction GHLS, as long as there is any water in the little jar above G. See the article BAROMETER.

Inſtead of hanging a ſiphon over the ſide of a veſſel, it may be adapted to a cup; ſo that the ſhort leg being in the cup, the long leg may go down through the bottom of the cup; and then it is called Tantalus's cup. See the article TANTALUS.

There are ſome ſiphons through which the water will run out of a veſſel without ſucking the air from them, or making them in the manner of a waſte pipe: but theſe muſt be made of capillary tubes whoſe bore muſt not be bigger than one tenth of an inch; and as ſoon as they are put into a veſſel of water TsS (*ibid.* n° 4.) they will begin to run, and ſo continue as long as there is any water above the driving leg. This happens becauſe the attraction of coheſion, which makes water riſe up in ſmall tubes, draws the ſurface V to W in the ſiphon; where being lower than the ſurface of the water in the veſſel, it muſt run down; becauſe the column of water WS, is longer or higher than the column SV; and the air puſhing down at V, muſt overcome the reſiſtance of the air puſhing upwards at S. For the ſame reaſon, a piece of liſt of cloth, AD, will make the water come out of the veſſel and fall down in drops at E; as this piece of cloth is in effect a bundle of capillary ſiphons made by its interſtices. But if the ſurface of the water in the veſſel was at *g h*, the ſiphon being put in the water, would not run out, but only riſe in the ſiphon up to *ef*, the height to which a tube of that bore would raiſe the water by the attraction of coheſion. Whenever the veſſel is full, this experiment will ſucceed in vacuo. See the articles COHESION, CAPILLARY, *&c.*

SIPHONANTHUS, or SIPHONANTHEMUM, a genus of the *tetrandia-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle funnel-ſhaped petal: the fruit conſiſts of four roundiſh berries within a patulous cup: the ſeed is ſolitary and roundiſh.

SIRADIA, a city of great Poland, in the palatinate of that name, ſituated on the river Warta: eaſt long. 18°, north lat. 52°.

SIRANAGER, a city of hither India, capital of the province of Siba, ſituated on the river Ganges: eaſt long. 80°, north lat. 31° 30'.

SIRE, a title of honour in France, now given to the king only, as a mark of ſovereignty. In all placets and petitions, epiſtles, diſcourſes, *&c.* to the king, he is addreſſed under the title of ſire.

Sire was antiently uſed in the ſame ſenſe with ſieur and ſeigneur, and applied to barons, gentlemen, and citizens.

SIREN,

SIREN, σειρην, in antiquity, a kind of fabulous animal, otherwiſe called a mermaid. See MERMAID.

The ſirens are repreſented by Ovid, &c. as ſea-monſters, with womens faces and fiſhes tails; and by others decked with plumage of various colours. The three ſirens are ſuppoſed to be the three daughters of the river Achelous, and are called Parthenope, Ligea, and Leucoſia. Homer makes mention of only two ſirens, and ſome others reckon five. Virgil places them on rocks where veſſels are in danger of ſplitting. Some repreſent them as ſuch charming monſters, who ſung ſo harmoniouſly that ſailors were wrecked on their rocks without regret, and even expired in raptures.

SIRIK, or SERQUES, a town of Lorrain, ſituated on the Moſelle, twelve miles ſouth-eaſt of Luxemburg.

SIRIUS, the DOG-STAR, in aſtronomy, a very bright ſtar of the firſt magnitude, in the mouth of the conſtellation canis major. See the articles CANICULA and CANIS.

SIRMIUM, a city of Sclavonia, ſituated on the north ſide of the river Save: eaſt long. 20°. north lat. 45°.

SIRNAME. See the article SURNAME.

SISARUM, in botany, the ſame with ſium. See the article SIUM.

SISKIN, in ornithology, a ſpecies of the fringilla, with a ſpotted breaſt, of the bigneſs of the green-finch: the head is large and round: the iris of the eyes is hazel: the beak ſhort, conic and robuſt: the head black: the back tinged with green: the belly white, and wings elegantly variegated with a tranſverſe ſtreak of yellow. See plate CCL. fig. 2.

SISON, CORN-PARSLEY, or BISHOP'S-WEED, in botany, a genus of the *pentandria-digynia* claſs of plants, the general corolla whereof is uniform: the partial corolla is formed of five equal lanceolated inflex petals: there is no pericarpium: the naked fruit is oval, ſtriated, and ſeparable into two parts: the ſeeds are two, oval, convex, ſtriated on one ſide, and plane and ſmooth on the other. The ſeed of this plant is one of the four leſſer hot ſeeds of the ſhops, and is an attenuant, aperient and carminative. It is preſcribed in flatulencies and colics, and againſt obſtructions of the menſes; and is ſaid alſo to be a lithontriptic.

SISTERON, a city of France, in the province of Provence, ſituated on the river Durance: eaſt long. 5° 45′, north lat. 44° 16′.

SISTRUM, or CISTRUM, a kind of antient muſical inſtrument, uſed by the prieſts of Iſis and Oſiris. It is deſcribed by Spon as of an oval form, in manner of a racket, with three ſticks traverſing it breadth-wiſe, which playing freely by the agitation of the whole inſtrument, yielded a kind of ſound which to them ſeemed melodious. Mr. Malcolm takes the ſiſtrum to be no better than a kind of rattle. Oiſelius obſerves, that the ſiſtrum is found repreſented on ſeveral medals and on taliſmans.

SISYMBRIUM, WATER CRESS, in botany, a genus of the *tetradynamia-ſiliquoſa* claſs of plants, the corolla whereof conſiſts of four cruciform, oblong, erecto-patent petals, oftentimes leſs than the cup, with a great number of ungues: the fruit is a long, crooked, cylindrical pod, conſiſting of two valves, and containing two cells: the ſeeds are numerous and ſmall. See plate CCL. fig. 5.

The young leaves of this plant are frequently eaten in ſpring as a ſallad: the whole plant is of an acid taſte, and is a powerful attenuant and reſolvent. It is recommended as a kind of ſpecific in the ſcurvy, and is eaten in large quantities for that intention with great ſucceſs. It is good againſt obſtructions of the viſcera, and conſequently in jaundices, and many of the chronic diſeaſes. It is alſo a powerful diuretic, and promoter of the menſes: the beſt way of uſing it is in manner of a ſallad, or by drinking the expreſſed juice, which is at preſent much a cuſtom with us in ſpring with that of brook-lime, &c.

SISYRINCHIUM, in botany, a genus of the *gynandria-triandria* claſs of plants, the corolla whereof conſiſts of ſix oblong erecto-patent plane petals, rounded vertically with a point. The fruit is a triquetrous capſule, rounded vertically, conſiſting of three cells, and containing three valves: the ſeeds are numerous and roundiſh.

SISYRINCHIUM, is alſo the name whereby ſome authors call the plant iris. See the article IRIS.

SITE, or SCITE, *ſitus*, denotes the ſituation of an houſe, meſſuage, &c. and ſometimes the ground-plot, or ſpot of earth it ſtands on.

In logic, ſitus is one of the predicaments declaring a ſubject to be ſo and ſo placed: and in geometry and algebra, it denotes the ſituation of lines, ſurfaces, &c.

SITOPHYLAX, in grecian antiquity, an athenian magiſtrate, who had the ſuperintendance of the corn, and was to take care that nobody bought more than was neceſſary for the proviſion of his family. By the attic laws, particular perſons were prohibited buying more than fifty φορμαι, or meaſures of wheat a man; and the ſitophylax was to look to the obſervation of this law. It was a capital crime to prevaricate in it. There were fifteen of theſe officers, ten for the city and five for the pyræus.

SITTA, the NUTHATCH, in ornithology, the name of a diſtinct genus of birds, uſually confounded with the picæ. The beak of the ſitta is of a conic and ſomewhat cultrated form: the tongue is lacerated and emarginated: the feathers of the tail are rigid. The ſitta is of the ſize of our common goldfinch: the head is ſmall and depreſſed: the beak is ſhort, black on the upper part and white on the lower towards the throat: the head, neck, back, and wings, are grey: the breaſt of a pale yellow; and the lower part of the belly ſomewhat reddiſh. See pl. CCL. fig. 3.

SIUM, WATER-PARSNEP, SKIRRET, and NINZIN, in botany, a genus of the *pentandria-digynia* claſs of plants, the general corolla whereof is uniform: the partial one conſiſts of five inflex equal petals: the fruit is naked, and of an oval or roundiſh figure, ſmall, ſtriated, and ſeparable into two parts: the ſeeds are two, roundiſh, ſtriated, and convex on the one ſide, and plane on the other.

The leaves of this plant, eaten either crude or boiled, are ſaid to break and expel the ſtone; to excite urine and the menſes; to promote the expulſion of the fœtus, and to be good in a dyſentery.

SIXAIN, SIXTH, *ſexagena*, in war, an antient order of battle, wherein ſix battalions being ranged in one line, the ſecond and fifth were made to advance, to form the van-guard; the firſt and ſixth to retire, to form the rear-guard; the third and fourth remaining on the ſpot, to form the corps, or body, of the battle.

SIX-CLERKS. See CLERK.

SIXTH, *ſexta*, in muſic, one of the ſimple original concords, or harmonical intervals. See CONCORD.

The ſixth is of two kinds, greater and leſs, and therefore is eſteemed one of the imperfect concords, though each of them ariſe from a different diviſion of the octave: the greater ſixth is a concord reſulting from the mixture of the ſounds of two ſtrings, that are to each other as 3 : 5: the leſs from thoſe of two ſtrings, in the ratio of 5 : 8. See SCALE.

The leſs ſixth is compoſed diatonically of ſix degrees, whence its name, and five intervals, three whereof are tones, and two ſemi-tones; chromatically of eight ſemi-tones, five whereof are greater, and three leſs: it has its form, or origin, from the *ratio ſuper tri-partiens quinta*.

The greater ſixth is diatonically compoſed, like the other, of ſix degrees and five intervals, among which four are tones and one ſemi-tone; chromatically, of nine ſemi-tones, five whereof are greater, and four leſs; conſequently, it hath a leſs ſemi-tone more than the former. It has its origin from the *ratio ſuper bi-partiens tertia*. See the article PROPORTION.

Antiently the ſixth had only one duplicate, which was the thirteenth; but in the modern ſyſtem of muſic it has the twentieth for its triplicate, the twenty-ſeventh for its quadruplicate, &c. every one of which are indifferently marked in thorough baſs by the figure 6. And even the ſixth itſelf both greater and leſs, when natural, is not expreſſed any otherwiſe, than by a ſimple 6: but when it is greater or leſs, by accident, the characters of ſharp or flat are ſet along with the 6.

Beſides theſe two kinds of ſixths, which are both good concords, there are two others that are vicious and diſſonant; the firſt, called the defective ſixth, compoſed of two tones and three ſemi-tones, or of ſeven ſemi-tones, five of which are greater, and two leſs; the ſecond is the redundant ſixth, compoſed of four tones, a greater ſemi-tone and a leſs; whence ſome call it pentatonon, as comprehending five tones. Theſe two, being both diſſonant, ſhould never be uſed in melody, and very rarely in harmony.

As to the two conſonant ſixths, they were antiently uſed very ſparingly: at preſent they are allowed to be uſed as often as one pleaſes, as is the caſe with thirds; the ſixths being in reality no other

than inverted thirds: but care is uſually taken that the firſt ſixth that occurs be a leſs, the laſt a greater; and from the greater we riſe to the octave; and from the leſs, fall to the fifth.

SIZE, the name of an inſtrument uſed to find the bigneſs of fine round pearls withal. It conſiſts of thin pieces or leaves, about two inches long and half an inch broad, faſtened together at one end by a rivet. In each of theſe are round holes drilled of different diameters. Thoſe in the firſt leaf ſerve for meaſuring pearls from half a grain to ſeven grains; thoſe of the ſecond, for pearls from eight grains, or two carats, to five carats, &c. and thoſe of the third, for pearls from ſix carats and a half to eight carats and a half.

SIZE is alſo a ſort of paint, varniſh, or glue, uſed by painters, &c.

The ſhreds and parings of leather, parchment, or vellum, being boiled in water and ſtrained, make ſize. This ſubſtance is uſed in many trades. Mr. Boyle mentions, among other uſes, that fine red ſtands and hanging ſhelves are coloured with ground vermillion tempered with ſize, and when dry are laid over with common varniſh. There is alſo a ſize made of iſing-glaſs, in the ſame manner, and for the like purpoſes; but this ſize will not keep above three or four days, ſo that no more ſhould be made of it at once than preſent occaſion requires.

The manner of uſing ſize is to melt ſome of it over a gentle fire, and ſcraping as much whiting into it as may only colour it, let them be well incorporated together; after which you may whiten frames, &c. with it. After it dries, melt the ſize again, and put more whiting, and whiten the frames, &c. ſeven or eight times, letting it dry between each time: but before it is quite dry, between each waſhing, you muſt ſmooth and wet it over with a clean bruſh-pencil in fair water.

To make gold-ſize take gum animi and aſphaltum, of each one ounce; minium, litharge of gold, and umber, of each half an ounce; reduce all into a very fine powder, and add to them four ounces of linſeed-oil, and eight ounces of drying-oil; digeſt them over a gentle fire that does not flame, ſo that the mixture may only ſimmer, but not boil; for fear it ſhould run over and ſet the houſe a-fire, keep it conſtantly ſtirring with a ſtick till all the ingredients are diſſolved and incorporated, and do not leave off ſtirring it till it becomes thick and ropy; and being boiled enough, let it ſtand till it is almoſt cold, and then ſtrain it through a coarſe linnen-cloth and keep it for uſe.

To prepare it for working, put what quantity you may have occaſion to uſe in a horſe-muſcle ſhell, adding ſo much oil of turpentine as will diſſolve it, and making it as thin as the bottom of your ſeed-lac varniſh, hold it over a candle, and then ſtrain it through a linnen-rag into another ſhell; add to theſe ſo much vermilion as will make it of a darkiſh-red. if it is too thick for drawing, you may thin it with ſome oil of turpentine. The chief uſe of this ſize is for laying on metals.

The beſt gold-ſize for burniſhing is made as follows: take fine bole, what quantity you pleaſe, grind it finely on a marble, then ſcrape into it a little beef-ſuet; grind all well together; after which mix a ſmall proportion of parchment-ſize with a double proportion of water, and it is done.

To make ſilver-ſize: take tobacco-pipe clay, in fine powder, into which ſcrape ſome black-lead and a little Genoa-ſoap, and grind them all together with parchment-ſize, as already directed.

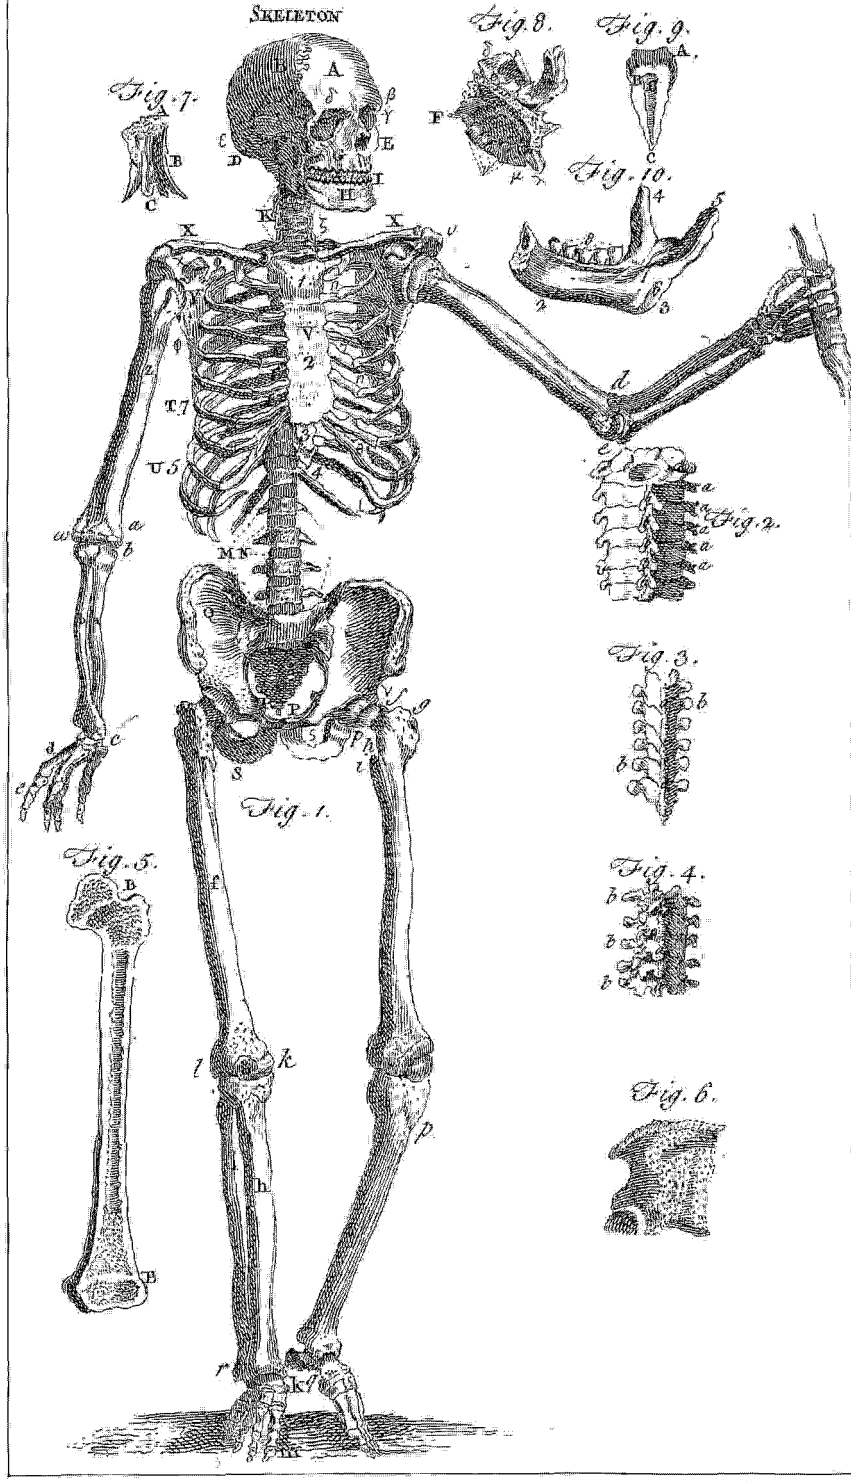
SIZYGY, or SYZYGY. See SYZYGY.

SKAITE, in ichthyology, the variegated raia, with the middle of the back ſmooth, and one row of ſpines on the tail. See the article RAIA.

This is one of the largeſt of the raia, growing to more than a yard in length, and its breadth equal to about three fourths of its length, and its thickneſs ſo conſiderable that it often weighs a hundred pounds: the back is ſomewhat gibboſe: the belly more flat: the colour is a pale grey, variegated with irregular ſpots of black: the roſtrum is long and ſub-acute: the eyes are large and prominent: there are two apertures, one behind each eye: the mouth is large and tranſverſe: the gills are ſmall, and run in two ſeries, five in each, down the breaſt: the lateral fins of the male fiſh have a great number of little ſpines on them, both on the upper and under ſides: theſe are not found in the female.

SKELETON, σκελετον, in anatomy, an aſſemblage or arrangement of all the bones

SKELETON



D. Jeffreys sculp

bones of a dead animal, dried, cleanſed, and diſpoſed in their natural ſituation, and kept in that order by means of wires, *&c.*

The ſkeleton of the human body being of great uſe in learning its oſteology, we have given a figure of it in plate CCLI. where fig. 1. is the entire ſkeleton of a man; A, the frontal bone; B, the parietal bone; C, the temporal bone; D, the occipital bone; E, the bones of the noſe; F, the os malarum; G, the ſuperior maxillary bone; H, the lower jaw; I, the teeth; K, the ſeven vertebræ of the neck, with their cartilages between them; L, L, L, *&c.* the twelve vertebræ of the back; M, the five vertebræ of the loins; N, the cartilages between the vertebræ of the loins; O, the os ſacrum; P, the os coccygis; Q, the os ilium; R, the os pubis; S, the os iſchium; T, the ſeven true ribs; U, the five falſe ribs; V, the ſternum; X, X, the clavicles; Y, the ſcapula; Z, the humerus, or arm-bone; a, the ulna; b, the radius; c, the carpus; d, the metacarpus; e, the phalanges digitorum; f, the thigh-hone, g, the rotula; h, the tibia; i, the fibula; k, the tarſus; l, the metatarſus; m, the phalanges of the toes; *a*, the head of the radius; *b*, the head of the ulna; *c*, the bones of the carpus; *d*, the lower appendix, which receives the head of the radius; *e*, the lower appendix, which receives the head of the ulna; *f*, the upper head of the os femoris, which is received into the acetabulum or coxendix; *g*, the outer trochanter; *i*, the trochanter minor; *k*, *l*, the two lower heads of the thigh-bone; *p*, the head of the tibia; *q*, the os calcis; *r*, the articulation of the fibula with the tibia.

Fig. 2. *ibid.* is a hind-view of the vertebræ of the neck; *a*, *a*, *a*, *&c.* being the tranverſe proceſſes, and *b*, *b*, *b*, *&c.* the ſpine or direct proceſſes.

Fig. 3. is a hind-view of the vertebræ of the back; *a*, *a*, *a*, being the ſpine or direct proceſſes, and *b*, *b*, *b*, the tranſverſe proceſſes.

Fig. 4. is a hind-view of the vertebræ of the loins, *a*, *a*, *a*, being the ſpine, and *b*, *b*, *b*, the tranſverſe proceſſes.

Fig. 5. is the thigh-bone ſawed longitudinally through the middle; B, B, being the union of the bone with its epiphyſis; and fig. 6. the marrow viewed with a microſcope.

Fig. 6. the os ilium ſawed through; by comparing which with fig. 5. the different internal ſtructure of round and broad bones is ſeen.

Fig. 7. A poſterior view of the two naſal bones; A, their ſuperior ſides; B, their exterior ſides; C, their inferior ſides.

Fig. 8. A view of the lower part and ſide next the noſe of the left os maxillare, with the palate-bone, and os turbinatum inferius; *γ*, the naſal proceſs; *δ*, the great tuber; *ε*, the palate-plate; *ζ*, the naſal ſpine; *η*, the orifice of the antrum maxillare; *ϰ*, the os ſpongioſum, or turbinatum inferius; *λ*, the two dentes inciſores; *μ*, the caninus; *ν*, the five dentes molares.

Fig. 9. A tooth cut perpendicularly, viewed with a microſcope; A, the fibres of the cortical part; B, the bony part; C, the entry at the point of the root to D, the channel for the nerve and blood-veſſels.

Fig. 10. A view of the ſurface next to the mouth of the right ſide of the lower jaw; 1, the ſubſtance in the middle of the chin; 2, the baſe of the jaw; 3, the angle; 4, the corone; 5, the condyle; 6, the rough print of the internal pterygoid muſcle; 7, the entry of the channel for the nerve and blood-veſſels; 8, the five grinders.

SKIE, one of the greateſt weſtern iſlands of Scotland, divided from the counties of Roſs and Inverneſs by a narrow channel; being upwards of ſixty miles in length and twenty in breadth.

SKIFF, or SQUIFF, the leaſt of two ſhip-boats, ſerving chiefly to go aſhore in, when the ſhip is in harbour.

SKIN, *cutis*, in anatomy. See the article CUTIS and CUTICULA.

SKIN, in commerce, is particularly uſed for the membrane ſtripped off the animal to be prepared by the tanner, ſkinner, currier, parchment-maker, *&c.* and converted into leather, *&c.* See the articles LEATHER, FURR, PARCHMENT, HIDE, *&c.*

Skins and the hair of beaſts manufactured become parchment and vellum; leather, of which are made ſhoes and boots, ſaddles, harneſſes, and furniture for horſes, gloves and garments, coaches and chairs, houſhold ſtuff, covers of books, drinking veſſels, *&c.* and furrs for cloathing, hats, caps *&c.* Theſe branches of trade that are derivable from

the ſkin trade, render it a very great mercantile concern, and well deſerving preſervation as much as we can within ourſelves. The Britiſh have greatly increaſed their quantity of furrs and ſkins of all ſorts from their northern colonies, ſince they planted northward towards Nova-ſcotia, Annapolis, and other places towards the river Canada.

The ſeveral ſorts of ſkins brought to Europe from thoſe parts are of the following kinds, *viz.* deer-ſkins, bear, beaver, otter, rackoon, fox, elk, cat, wolf, martin, mink, muſqueſh, fiſher, *&c.* Elk-ſkins, dreſſed or undreſſed, pay, on importation, 1 s. $5\frac{23\frac{1}{2}}{100}$ d. *per* ſkin; and draw back, on exportation, 1 s. $3\frac{52\frac{1}{2}}{100}$ d. and more, if dreſſed in oil, for every pound weight, on importation, 7 d. and draw back, on exportation, $4\frac{66\frac{2}{3}}{100}$ d. Fox-ſkins, the dozen, pay, on importation, 3 s. $9\frac{96}{100}$ d. and draw back, on exportation, 3 s. $5\frac{40}{100}$ d. and for every twenty ſhillings value, upon oath, on importation, pay 6 s. Goat-ſkins, in the hair, not otherwiſe rated, the dozen, pay, on importation, 4 s. $9\frac{45}{100}$ d. and draw back, on exportation, 4 s. $3\frac{75}{100}$ d. but thoſe of Ireland, the dozen, on importation, pay only 1 s. $7\frac{15}{100}$ d. and draw back, on exportation, 1 s. $5\frac{25}{100}$ d. and when tanned, the dozen, pay, on importation, 13 s. $6\frac{90}{100}$ d. and draw back, on exportation, 8 s. $7\frac{50}{100}$ d. Hare-ſkins, the dozen, pay, on importation, $9\frac{5\frac{3}{4}}{100}$ d. and draw back, on exportation, $8\frac{6\frac{1}{4}}{100}$ d. Kid-ſkins, in the hair, the hundred, pay, on importation, 17 s. $3\frac{45}{100}$ d. and draw back, on exportation, 4 s. $3\frac{75}{100}$ d. and for every twenty ſhillings value, upon oath, they pay 4 s. $9\frac{45}{100}$ d. and draw back, on exportation, 4 s. $3\frac{75}{100}$ d. Lamb-ſkins, dreſſed in alum, pay, the hundred, on importation, 4 s. $9\frac{45}{100}$ d. and draw back, on exportation, 4 s. $3\frac{75}{100}$ d. dreſſed in oil, every hundred, pay, on importation, 19 s. $1\frac{80}{100}$ d. and draw back, on exportation, 17 s. 3 d. undreſſed, in the wool, the hundred and twenty, pay, on importation, 2 s. $4\frac{27\frac{1}{2}}{100}$ d. and draw back, on exportation, 2 s. $1\frac{87\frac{1}{2}}{100}$ d. tanned, for every twenty ſhillings value, upon oath, the lamb-ſkins pay, on importation, 4 s. $9\frac{45}{100}$ d. and draw back, on exportation, 4 s. $3\frac{75}{100}$ d. Lion and panther-ſkins, undreſſed, the piece, pay, on imtation, 2 s. $4\frac{72\frac{1}{2}}{100}$ d. and draw back, on exportation, 2 s. $1\frac{87\frac{1}{2}}{100}$ d. and the mouſe-ſkins, and the pelts of goats, undreſſed, pay the ſame duties, both on importation and exportation, as the lion and panther-ſkins do. Seal-ſkins, on importation, pay, *per* ſkin, $4\frac{78\frac{3}{4}}{100}$ d. and draw back, on exportation, *per* ſkin, $4\frac{31\frac{1}{4}}{100}$ d. Shagreen-ſkins, each, on importation, pay $4\frac{78\frac{1}{4}}{100}$ d. and draw back, on exportation, $4\frac{31\frac{1}{4}}{100}$ d. Sheep-ſkins dreſſed, the dozen, pay, on importation, 1 s. $2\frac{36\frac{1}{4}}{100}$ d. and draw back, on exportation, 1 s. $\frac{93\frac{3}{4}}{100}$ d. Slink calf-ſkins, dreſſed with the hair on, the pound, pay, on importation, 2 d. and draws back, on exportation, $1\frac{33\frac{1}{3}}{100}$ d. and dreſſed without the hair, the pound, pay, on importation, 1 d. and draw back, on exportation, $\frac{66\frac{2}{3}}{100}$ d.

SKINNER, one who works in ſkins. Skinners, or fellmongers, ſhall not retain any journeyman, *&c.* to work in their trade, except they themſelves have ſerved ſeven years as apprentices thereto, on pain of forfeiting double the value of the wares wrought by ſuch perſons. 3 Jac. I. c. 9.

SKIPTON, a town in the weſt riding of Yorkſhire, ſituated thirty-five miles weſt of York.

SKIRMISH, in war, a diſorderly kind of combat, or encounter, in preſence of two armies, between ſmall parties, or perſons, who advance from the body for that purpoſe, and introduce to a general and regular fight.

SKULL, *cranium et calvaria*, in anatomy, that part of the head which forms its great bony cavity; and in a living ſubject contains the brain. See the articles HEAD and BRAIN.

The ſhape of the ſkull is oval; its exterior ſurface is convex; and its interior, concave: its round figure is an advantage to its capacity: it is a little depreſſed and longiſh, advancing out behind and flatted on the two ſides that form the temples, which contributes to the enlargement of the ſight and hearing: it is of unequal thickneſs in the ſeveral parts, and is compoſed of two lamellæ, or tables, an exterior and interior, laid or applied over each other, between which there is a diploë, or meditullium, being a thin ſpongious ſubſtance, made of bony fibres detached from each lamina, and full of little cells of different bigneſſes: the tables are hard and ſolid, the fibres being cloſe to one another: the diploë is ſoft, in regard the bony fibres are here at a greater diſtance; a contrivance whereby the ſkull is not only made lighter, but leſs liable to fractures: the external lamina is ſmooth and covered with the pericranium: the internal is likewiſe ſmoooth, abating the furrows made by the pulſation of the arteries of the dura mater before the cranium be arrived at its conſiſtence: it has ſeveral holes, through which it gives paſſage to the ſpinal marrow, nerves, arteries, and veins, for the conveyance and re-conveyance of the blood, &c. between the heart and the brain. See the articles DIPLOE, PERICRANIUM, DURA-MATER, &c.

The bones of the ſkull are eight, *viz.* the os frontis, the two parietal bones, the two bones of the temples, the occipital, the ſphenoides, and the ethmoides; each of which are deſcribed under their ſeveral names. See the articles FRONTIS, PARIETALIA, PETROSA, OCCIPITALIA, &c.

All the bones of the cranium are found to be imperfect in new-born infants: the ſinus and its meditullium are almoſt wholly wanting; the bony fibres in the formation of almoſt all of them, are carried in form of rays from a center towards the circumference; and moſt of them are not ſingle, as in adults, but compoſed each of ſeveral fruſtules, or little pieces; nor are the ſutures at that time formed, and frequently there are triquetrous little bones between them.

In adults the ſeveral bones of the ſkull are in general joined by ſutures: theſe ſutures are either common or proper; the proper ſutures are diſtinguiſhed into the true and the falſe or ſpurious; they are called true ſutures when the bones are joined together by means of a multitude of unequal denticulated eminences, forming an appearance ſomewhat like the edge of a ſaw: theſe denticulations enter mutually into each others ſinuſes, and on the outſide are moſt plainly viſible: of this kind are thoſe called the coronal, ſagittal and lambdoidal ſutures. The falſe or ſpurious ſutures, are thoſe ſquamoſe ones of the temporal and parietal bones, and of the os frontis and ſphenoides, in the angle where they unite with the parietal ones. The common ſutures are the tranverſal one which joins the os frontis with the bones below it, the ſphenoidal, the ethmoidal, and the zygomatic; but theſe are of little moment. Some authors mention the having met with ſkulls in which there were no ſutures at all. Between the ſutures, particularly the lambdoidal and ſagittal, there are found, in many ſkulls, certain ſmall bones; theſe are called, by ſome, oſſa triquetra, from their figure; by others, oſſa wormiana: they are uncertain in their figures and ſituation, and are joined to the others by ſutures: theſe bones are by ſome eſteemed a great medicine in epilepſies.

The uſe of the ſutures is, 1. That the dura mater may in thoſe parts be very firmly joined to the cranium and pericranium. 2. That, in infants, the head may the more eaſily be extended in its growth from the ſeveral bones being at that period diſunited at theſe places. 3. That the tranſpiration from the brain may be the more free and eaſy at that time of life in which they are open, and at which alſo the habit is more humid. 4. That very large fractures of the ſkull might in ſome meaſure be prevented: and finally, there is another advantage in their openneſs in children; namely, that medicinal applications to the external part of the head may penetrate and do ſervice.

The foramina in the cranium are numerous, and their uſes important: theſe are divided into the external and internal; by the external are meant thoſe which are eaſily diſcovered on the external ſurface of the ſkull; and by the internal are meant thoſe which are moſt obvious in the

the internal ſurface: of the larger internal foramina we count eleven pair, affording paſſage to the arteries, veins, and nerves of the brain; beſides theſe, we are to remark one which is ſingle, namely, the great foramen of the occipital bone, that gives paſſage to the medulla ſpinalis, and with it to the acceſſory ſpinal nerves, and to the vertebral arteries. Particular regard is to be had to the firſt pair of theſe foramina, (which may indeed be more properly called a congeries of the foramina of the os cribroſum) theſe give paſſage to the filaments of the firſt pair of nerves, called the olfactory nerves: the ſecond pair are in the ſphenoidal bones, and give paſſage to the optic nerves: the third pair are called the unequal and lacerated foramina, and give paſſage to the third and fourth pair of the nerves, to the firſt branch of the fifth pair, and to the ſixth pair; as alſo to the emiſſary of the receptacles of the dura mater: the fourth pair are in the ſphenoidal bone, and give paſſage to the ſecond branch of the fifth pair of nerves, which is diſtributed to the ſeveral parts of the upper jaw: the fifth, or oval foramina, give paſſage to the third branch of the fifth pair, and to the emiſſary of the dura mater: the ſixth is a very ſmall foramen, and admits of an artery, which is diſtributed over the dura mater, and is that which forms the impreſſions of little ſhrubs or trees on the parietal bones: the ſeventh is placed between the ſella equina and the petroſe apophyſis, and it tranſmits no veſſels, but is ſhut up by the dura mater: the eighth pair of foramina give paſſage to the carotid arteries, whence it is called the carotic foramen; and the intercoſtal nerve has its egreſs alſo at this opening: thro' the ninth, which is in the os petroſum, paſſes the auditory nerve: through the tenth, which is between the os petroſum and the occipital bone, paſs the par vagum and the lateral ſinuſes of the dura mater, together with the ſpinal nerve: the eleventh is in the os occipitis, near the edge of the foramen magnum; and through this paſs the ninth pair of nerves, called the linguale. See NERVE, *&c.*

Beſides theſe foramina, there are a number of little ones in the os petroſum, often very viſible; one of theſe carries back a branch of the auditory nerve to the dura mater; and the other principal one tranſmits the ſanguiferous veſſels to the labyrinth, or the internal organ of hearing. See the article EAR.

Of the external foramina, there are two proper ones of the os frontis, a little above the orbits; theſe are, from their ſituation, called ſupraorbitalia: they give paſſage to the ophthalmic nerve of Willis. Beſides theſe, there are four other foramina common to the os frontis, and to the plane or papyraceous bones of the orbit; two of theſe are placed on each ſide, and they tranſmit little nerves and veſſels to the ſinus of the ethmoidal bone. In the parietal bone there is one, which ſerves for the paſſage of a vein from the cutis of the cranium into the ſagittal ſinus of the dura mater, or from the ſagittal ſinus to the external veins of the head; but this is often wanting. In each of the oſſa temporum there are three common foramina; the firſt of theſe is the foramen jugale, which ſerves for the paſſage of the crotaphite-muſcle; the ſecond is large, in which is the ſinus of the jugular vein; and the third is the ductus Euſtachii, ſituated between the petroſum and the ſphenoides, and leading from the mouth into the internal ear. Beſides theſe common foramina of the oſſa temporum, there are alſo three proper ones: 1. The meatus auditorius. 2. The aquæduct of Fallopius, ſituated between the maſtoide and ſtyloide proceſs, and tranſmitting the hard portion of the auditory nerve. 3. A foramen behind the maſtoide proceſs, ſerving for the ingreſs of a vein into the lateral ſinus, or for the egreſs of one from the lateral ſinus into the veins of the occiput. In the occipital bone there are two foramina, ſituated behind the condyloide apophyſes, and ſerving to give paſſage to the vertebral veins, into the lateral ſinuſes of the dura mater: theſe, however, are wanting in many ſkulls. In the ſphenoides, beſides the internal ones already deſcribed, are the apertures of the ſinuſes into the noſtrils, common to them with the bones of the palate, and which are the apertures of the nares and fauces: there is another canal in the upper part of the pterygoide proceſſes, ſerving for the paſſage of the novum emiſſarium of the of the dura mater. In the os ethmoides there are, 1. Thoſe common to this bone with the os frontis, ſituated in the interior ſide of the orbit, and already deſcribed. And, 2. The apertures of the ethmoidal ſinuſes into the noſtrils. In the examination of different ſkulls, other foramina, beſides theſe, will occaſionally be found in different places; but theſe are either extraordinary and luſus naturæ, as

is often the caſe; or they are otherwiſe ſuch as ſerve only to give paſſage to veſſels ſerving for the nutrition of the bones in which they ſtand.

For the foramina of the maxillary bones, ſee the article MAXILLÆ.

For a view of the human ſkull, ſee the article SKELETON.

For the method of treating fiſſures, &c. of the ſkull, ſee the articles FISSURE, CONTRA-FISSURE, EXTRAVASATION, FRACTURE, &c.

For the treatment of depreſſions of the ſkull, ſee the articles TREPANNING and ELEVATORY.

Concealed injuries and wounds of the SKULL. When a blunt inſtrument is the occaſion of any injury of the cranium, if the injured part does not ſufficiently appear of itſelf, great induſtry is neceſſary to diſcover it. Where the common integuments appear tumid and ſoft, they are in this caſe to be divided to the bone; but in making the inciſion, care muſt be taken not to lay too much ſtreſs upon the knife, leſt ſplinters of the fractured cranium ſhould, by that means, be forced upon the brain. The beſt way to make this inciſion, according to Heiſter, is in form of the letter X, and about an inch and half in length, lifting up the ſkin at each angle, and leaving the bone bare. The blood that is ſpilt, may be taken up by a ſponge, and dry lint ſtuffed between the ſkin and the cranium: and having thus found out the injured part of the cranium, the trepan is to be applied, if it be found neceſſary. If ſplinters of the bone are now found, they muſt be removed either with the fingers or forceps, or, when they hang to the pericranium, with ſciſſars; but when they adhere pretty firmly to the neighbouring parts of the cranium, it is more adviſeable to replace them, than to endeavour to remove them by violence.

In wounds of the cranium, or ſkull, the firſt buſineſs is to find whether they are terminated in the external parts of the cranium, or whether they penetrate into its cavity: this is to be known, 1. By the eye. 2. By the probe; which, however, muſt be gently uſed here, for fear of bringing on farther miſchief. 3. By examining the inſtrument with which the blow was given, and conſidering the degree of force with which it was impelled. And, laſtly, the preſence or abſence of very bad ſymptoms; for a violent blow upon the head will always be attended with vomitings and vertigos, and blood will be diſcharged from the noſe, ears, and mouth, and the wounded perſon will loſe his ſpeech and ſenſes. Theſe diſorders will appear, ſometimes ſooner and ſometimes later, but are always moſt violent, when the wound is by a fall, or by ſome blunt inſtrument; in which caſes the cranium is uſually much ſhattered. The blood which diſcharges itſelf by the wound, that is made by a ſharp inſtrument, will inſinuate itſelf between the common integuments and the cranium: in the contuſions that are made with blunt inſtruments, ſometimes it will be concealed under the cranium; and, by corrupting the perioſteum and the cranium, will bring on ulcers and caries of the bone, and frequently occaſions fevers, convulſions, and death. See the articles CONTUSION, EXTRAVASATION, CARIES, &c.

SKY, the blue expanſe of air and atmoſphere. See the articles AIR, ÆTHER, and ATMOSPHERE.

The azure colour of the ſky ſir Iſaac Newton attributes to vapours, beginning to condenſe there, and which have got conſiſtence enough to reflect the moſt reflexible rays. M. De la Hire attributes it to our viewing a black object, *viz.* the dark ſpace beyond the regions of the atmoſphere, through a white or lucid one, *viz.* the air illumined by the ſun; a mixture of black and white always appearing blue. See COLOUR.

SLAB, an outſide ſappy plank or board ſawed off from the ſides of a timber-tree: the word is alſo uſed for a flat piece of marble.

SLANEY, a city of Bohemia, ſituated eighteen miles north-weſt of Prague.

SLATE, *ſtegania*, in the hiſtory of foſſils, a ſtone of a compact texture and laminated ſtructure, ſplitting into fine plates.

Dr. Hill diſtinguiſhes four ſpecies of ſtegania: 1. The whitiſh ſteganium, being a ſoft, friable, flaty ſtone, of a tolerably fine and cloſe texture, conſiderably heavy, perfectly dull and deſtitute of brightneſs, variegated with a pale brown, or browniſh yellow: this ſpecies is very common in many counties in England, lying near the ſurface of the ground; it is generally very full of perpendicular as well as horizontal cavities, many of which are filled up with a ſpar a little purer and more cryſtalline than the reſt, and is commonly uſed for covering houſes. 2. The red ſteganium is a very fine and elegant ſlate, of a ſmooth

ſurface,

ſurface, firm and compact texture, conſiderably heavy, and of a very beautiful pale purple, glittering all over with ſmall gloſſy ſpangles: it is compoſed of a multitude of very thin plates or flakes, laid cloſely and evenly over one another, and cohering pretty firmly: this is very common in the northern parts of England, and is much valued as a ſtrong and beautiful covering for houſes. 3. The common blue ſteganium is very well known, as an uſeful and valuable ſtone, of a fine ſmooth texture and gloſſy ſurface, moderately heavy, and of a pale greyiſh blue; compoſed of a multitude of even plates, laid cloſe upon one another, and eaſily ſplitting at the commiſſures of them: this is alſo very common in the north parts of England, and is uſed in moſt places for the covering of houſes. There are other ſpecies of this ſlate, *viz.* the browniſh blue friable ſteganium, uſually called coal-ſlate; the greyiſh black friable ſteganium, commonly called ſhiver; and the greyiſh blue ſparkling ſteganium. 4. The friable, aluminous, black ſteganium, being the iriſh ſlate of the ſhops: this is compoſed of a multitude of thin flakes, laid very evenly and regularly over one another, and ſplits very readily at the commiſſures of them. It is common in many parts of Ireland, and is found in ſome places in England, always lying near the ſurface, in very thick ſtrata. In medicine it is uſed in hæmorrhages of all kinds with ſucceſs, and is taken often as a good medicine in fevers.

There is a ſort of ſlate-ſtones called, by Dr. Hill, ammoſchiſta: of this kind there are only two ſpecies: 1. That compoſed only of ſparry and cryſtalline particles; or the grey, friable, dull ammoſchiſtum; being a coarſe, harſh, and rough ſtone, of a very looſe texture, conſiderably heavy; and compoſed of a large, coarſe, obtuſely angular gritt, ſurrounded, and in part held together, by a looſe earthy ſpar. This ſtone is very common in moſt countries, and is frequently uſed to cover houſes, inſtead of tiles: it bears the weather but badly, and is apt to crumble after froſts. 2. That compoſed of talcy, ſparry, and cryſtalline particles. This comprehends five ſpecies, *viz.* the browniſh white glittering ammoſchiſtum; the greeniſh grey ſhining ammoſchiſtum; the yellowiſh grey glittering ammoſchiſtum; the hard purple and white laminated ammoſchiſtum; and the bluiſh glittering ſlate-ſtone. Theſe ſorts of ſtate-ſtone are very common in the northern countries, and are uſed for covering houſes, paving, building, *&c.*

SLAVE, a perſon in the abſolute power of a maſter, either by war or conqueſt. We find no mention of ſlaves before the deluge; but immediately after, *viz.* in the curſe of Canaan: whence it is eaſily inferred, that ſervitude increaſed ſoon after that time; for in Abraham's time we find it generally eſtabliſhed. Some will have it to commence under Nimrod, becauſe it was he who firſt began to make war, and of conſequence to make captives; and to bring ſuch as he took, either in battles or irruptions, into ſlavery. Among the Romans, when a ſlave was ſet at liberty, he changed his name into a ſurname, and took the nomen or prænomen of his maſter; to which he added the cognomen he had been called by, when a ſlave. Great part of the roman wealth conſiſted in ſlaves: they had the power of life and death over them, which no other nation had; but this ſeverity was afterwards moderated by the laws of the emperors. The ſlaves were eſteemed the proper goods of their maſters, and all they got belonged to them; but if the maſter was too cruel in his correction, he was obliged to ſell his ſlave at a moderate price. The Romans not only approved of, but even invented, new manners of making ſlaves; for inſtance, a man born free among them might ſell his freedom and become a ſlave. There were generally three ways of obtaining ſlaves; either when they bought them with the booty taken from the enemy, diſtinct from the ſhare reſerved for the public; or of thoſe who took them priſoners in war; or of merchants who dealt in them, and ſold them at fairs.

Slavery is abſolutely aboliſhed in Britain and France, as to perſonal ſervitude. Slaves make a conſiderable article of the traffic in America. The engliſh ſouth-ſea company have, by treaty, the ſole privilege of furniſhing the ſpaniſh Weſt-indies with ſlaves. See NEGRO.

For an account of the Lacedemonian ſlaves, ſee the article HELOTS.

For the cuſtom of marking or ſtigmatizing ſlaves, ſee STIGMATIZING.

SLAUGHTER. See the articles MANSLAUGHTER, HOMICIDE, MURDER, BUTCHER, *&c.*

Slaughter-ſkins is a term uſed by our curriers and leather-dreſſers, for the ſkins of oxen or other beaſts, when freſh and co-

vered with the hair; ſuch as they receive them from the ſlaughter-houſes, where the butchers flea the carcaſs.

SLEDGE, a kind of carriage without wheels, for the conveyance of very weighty things, as huge ſtones, &c.

This is alſo the name of a large ſmith's hammer, to be uſed with both hands. Of this there are two ſorts; the uphand-ſledge, which is uſed by under-workmen, when the work is not of the larger ſort; it is uſed with both the hands before, and they ſeldom raiſe it higher than their head; but the other, which is called the about-ſledge, and which is uſed for battering or drawing out the largeſt work, is held by the handle with both hands, and ſwung round over their heads at their arm's end, to ſtrike as hard a blow as they can.

SLEEP is defined to be that ſtate wherein the body appearing perfectly at reſt, external objects move the organs of ſenſe as uſual, without exciting the uſual ſenſations. Sleep, according to Rohault, conſiſts in a ſcarcity of ſpirits, which occaſions that the orifices or pores of the nerves in the brain, whereby the ſpirits uſed to flow into the nerves, being no longer kept open by the frequency of the ſpirits, ſhut up of themſelves. For, this being ſuppoſed, as ſoon as the ſpirits, now in the nerves, ſhall be diſſipated, the capillaments of thoſe nerves, having no ſupplement of new ſpirits, will become lax, and cohere as if cemented together, and ſo be unfit to convey an impreſſion to the brain: beſides, the muſcles being now void of ſpirits, will be unable to move, or even to ſuſtain the members; thus will ſenſation and motion be for the time deſtroyed. See WATCHING.

Sleep is broken off unnaturally, when any of the organs of ſenſation is ſo briſkly acted on, that the action is propagated to the brain; for upon this, the new ſpirits remaining in the brain, are all called together, and unite their forces to unlock the pores of the nerves, &c. But if no object ſhould thus affect the organ, yet ſleep would in ſome time be broken off naturally; for the quantity of ſpirits generated in ſleep, will at length be ſo great, that ſtretching out the orifices of the nerves, they will open themſelves a paſſage. See the articles ANIMAL SPIRITS, CIRCULATION, &c.

With regard to medicine, ſleep is defined by Boerhaave, to be that ſtate of the medulla of the brain, wherein the nerves do not receive ſo copious nor ſo forcible an influx of ſpirits upon the brain, as is required to enable the organs of ſenſe and voluntary motion, to perform their functions. Sleep being one of the non-naturals, it is not poſſible for thoſe to preſerve their health, who do not go to ſleep in a regular manner; for ſleep repairs the ſpirits, which are diſſipated by watching; and conſequently it reſtores the ſtrength of thoſe who are weak, indiſpoſed, or labour much. It likewiſe promotes perſpiration, contributes greatly to digeſtion, and more to nutrition. The night is the moſt proper for ſleep; for the vigour of the mind and body are better reſtored in the night than in the day; thus nocturnal labour and lucubrations impair the health. A ſound undiſturbed ſleep is much the beſt: unquiet interrupted ſleep contributes little to reſtore the ſtrength, and hinders perſpiration and digeſtion. Exerciſe and cuſtom ought to regulate the duration of ſleep: ſix or ſeven hours at a time is generally thought to be ſufficient; for too much ſleep makes a perſon ſluggiſh, heavy, dulls the faculties, and renders them unfit for buſineſs. Immoderate watching is as prejudicial to health, as ſleep is beneficial: it may occaſion great diſorders in the animal œconomy, by waſting the ſpirits, and more fluid parts of the blood. The beſt place for ſleep, is a dry ſpacious room, where the air is good; for cloſe, little, moiſt places, too much heated, are bad. The beſt poſture, is to lie on the right ſide at night, and on the left in the morning, with the head raiſed and the body bent. See REGIMEN, &c.

Some of the more extraordinary phænomena of ſleep, yet to be accounted for, are, that when the head is hot, and the feet cold, ſleep is impracticable; that ſpirituous liquors firſt bring on drunkenneſs, and then ſleep; that perſpiration in time of ſleep is twice as great as at other times; that upon ſleeping too long, the head grows heavy, the ſenſes dull, the memory weak, with a coldneſs, pituitouſneſs, an indiſpoſition of the muſcles for motion, and a want of perſpiration; that much ſleeping will ſuſtain life a long time, without either meat or drink; that upon a laudable ſleep, there always follows an expanſion of all the muſcles, frequently a repeated yawning, and the muſcles and nerves acquire a new agility; that fœtuſes always ſleep, children often, youth more than grown perſons, and they more than old perſons; and that people

recovering from violent diſtempers ſleep much more than when in perfect health. For the ſleepy diſeaſes, ſee the articles CARUS, COMA-VIGIL, COMA-SOMNOLENTUM, LETHARGY, *&c.*

SLEEPER, or the GREAT SLEEPER, in zoology, the hairy-tailed mus with red feet. See the article MUS.

This is of the ſize of the rat, but more corpulent; the head is ſhort and thick; the opening of the mouth ſmall; the noſtrils fleſh coloured; the eyes large, black, and prominent; and the ears large and naked. This is frequent in many parts of Europe, and retires in winter into caverns under the ground, where it carries however a conſiderable ſtore of nuts and other fruits.

SLEEPERS, in natural hiſtory, a name given to ſome animals, which are ſaid to ſleep all the winter; ſuch as bears, marmotes, dormice, bats, hedge-hogs, ſwallows, *&c.* We are told, in Med. Eſſays of Edinb. that theſe do not feed in winter, have no ſenſible evacuations, breathe little or none at all, and that moſt of the viſcera ceaſe from their functions. Some of theſe creatures ſeem to be dead, and others to return to a ſtate like that of the fœtus before the birth: in this condition they continue, till by length of time maturating the proceſs, or by new heat, the fluids are attenuated, the ſolids ſtimulated, and the functions begin where they left off.

SLEEPERS, in the glaſs-trade, are the large iron-bars croſſing the ſmaller ones, and hindering the paſſage of the coals, but leaving room for the aſhes.

SLEEPERS, in a ſhip, timbers lying before and aft, in the bottom of the ſhip, as the rung-heads do the lowermoſt of them is bolted to the rung-heads, and the uppermoſt to the futtocks and rungs.

SLESWICK, the capital of the dutchy of Sleſwick, otherwiſe called ſouth Jutland, ſituated on the river Sley: eaſt longit. 9° 45′, and north lat. 54° 45′. See the article JUTLAND.

SLIDING, in mechanics, is when the ſame point of a body, moving along a ſurface, deſcribes a line on that ſurface.

For the ſliding-rule as variouſly contrived by Everard, Coggeſhal, Gunter, Hunt, and Partridge, ſee the article RULE.

SLIGO, a county of Ireland, in the province of Connaught, bounded by the ocean on the north, by Letrim on the eaſt, by Roſcommon, on the ſouth, and by Mayo on the weſt.

SLING, *funda*, an inſtrument ſerving for caſting ſtones with great violence. The inhabitants of the Balearic iſlands were famous in antiquity, for the dexterous management of the ſling: it is ſaid they bore three kinds of ſlings, ſome longer, others ſhorter, which they uſed according as their enemies were either nearer or more remote. It is added, that the firſt ſerved them for a head-band, the ſecond for a girdle, and that the third they conſtantly carried with them in the hand.

SLINGING is uſed variouſly at ſea, but chiefly for the hoiſting up caſks, or other heavy things, with ſlings, *i. e.* contrivances of ropes ſpliced into themſelves, at either end, with one eye big enough to receive the caſk, or other thing, to be ſlung.

SLIPPING, among gardeners, the tearing off a ſprig from a branch, or a branch from an arm of the tree. Theſe ſort of ſlips take root more readily than cuttings.

SLOANEA, or SLOANA, in botany, a genus of the *polyandria-monogynia* claſs of plants, having no corolla but the calyx, which is ſometimes taken for one; the fruit is a large, roundiſh, echinated capſule, formed of four valves; the ſeeds are oval, obtuſe, fleſhy, and have long nuclei.

SLOATH, or SLOTH, *bradypus*, in zoology. See the article BRADYPUS.

The face of the ſloath is covered with hair; the claws are of a ſubulated form; there are no ears, nor are there any middle teeth. This is a very extraordinry animal, both in figure and qualities. It is hard to ſay to what other it is equal in ſize, ſince it is like none in ſhape; the length of the body is about a foot, and when well fed its thickneſs is equal to its length; the feet are flatted or plain, in the manner of thoſe of the bear or monkey, but are extremely narrow; the claws are very long and ſharp; the head is ſmall and round; and the face ſomething reſembling that of the monkey; the colour of the whole animal is a pale greyiſh brown. It is the ſloweſt mover of all the quadrupeds; the traverſing the ſpace of fifty yards is the labour of a day for it: it is uſually ſeen on the tops of tall trees, for ſecurity.

SLOATS *of a cart*, the under-pieces which keep the bottom of the cart together. See the article CART.

SLOE, *prunus ſylveſtris*, the engliſh name for the wild plum. See PRUNUS.

SLONIM,

SLONIM, a city of Poland, in the province of Lithuania, and palatinate of Novogrodeck, ſituated in eaſt lon. 25°, and north lat. 53°.

SLOOP, a ſort of floating veſſel, otherwiſe called ſhallop. In our navy, ſloops are tenders on the men of war, and are uſually of about ſixty tons, and carry about thirty men. See SHIP.

SLOOT, or SLOTEN, a town of the united Netherlands in the province of Frieſland, ſituated twenty-one miles ſouth of Lewarden.

SLOT, among ſportſmen. Drawing on the ſlot, ſee the article DRAWING.

SLOTH, or SLOATH. See SLOATH.

SLOUGH, a deep muddy place. The caſt ſkin of a ſnake, the damp of a coal-pit, and the ſcar of a wound, are alſo called by the ſame appellation. The ſlough of a wild boar is the bed, ſoil, or mire, wherein he wallows, or in which he lies in the day-time.

SLOUTH, or SLOUGHT, in hunting, is uſed for a company of ſome ſorts of wild beaſts, as a ſlouth of bears.

SLOW-WORM, in zoology, the engliſh name for a ſpecies of anguis. See the article ANGUIS.

SLUCZK, the capital of the palatinate of the ſame name, in the dutchy of Lithuania and kingdom of Poland, ſituated in eaſt long. 27°, and north lat. 53°.

SLUICE, in hydraulics, a frame of timber, ſtone, earth, &c. ſerving to retain and raiſe the water of the ſea, a river, &c. and on occaſion to let it paſs: ſuch is the ſluice of a mill, which ſtops and collects the water of a rivulet, &c. in order to diſcharge it at length, in greater plenty, upon the mill-wheel: ſuch alſo are thoſe uſed in drains, to diſcharge water off lands; and ſuch are the ſluices of Flanders, &c. which ſerve to prevent the waters of the ſea overflowing the lower lands, except when there is occaſion to drown them.

Sometimes there is a canal between two gates or ſluices, in artificial navigation, to ſave the water, and render the paſſage of boats equally eaſy and ſafe, upwards and downwards; as in the ſluices of Briare, in France, which are a kind of maſſive walls, built parallel to each other at the diſtance of twenty or twenty-four feet, cloſed with ſtrong gates at each end, between which is a kind of canal or chamber, conſiderably longer than broad, wherein a veſſel being incloſed, the water is let out at the firſt gate, by which the veſſel is raiſed fifteen or ſixteen feet, and paſſed out of this canal into another much higher. By ſuch means a boat is conveyed out of the Loire into the Seyne, though the ground between them riſe above one hundred and fifty feet higher than either of thoſe rivers.

Conſtruction of SLUICES. The conſtruction of ſluices ought to be conducted by an able engineer, who is well acquainted with the action of fluids in general; and particularly with the ſituation of the place, the nature of the ſoil, &c. where the ſluice is to be erected: if on the ſea-ſhore, he ought to be perfectly well acquainted with the effects of the ſea on that coaſt, and the ſeaſons when it is calm or ſtormy, that he may be able to prevent the fatal accidents thence ariſing: and, if in a river, it is neceſſary to know whether it uſually overflows its banks, and at what ſeaſons of the year its waters are higheſt and loweſt. The machines for driving the piles ſhould be placed about forty yards from the ſide of the ſluice, above and below it. As to the depth of ſluices, it muſt be regulated by the uſes for which they are deſigned; thus, if a ſluice is to be erected at the entrance of a baſon for ſhipping, its depth muſt correſpond with the draught of water of the largeſt ſhip that may, at any time, have occaſion to enter thereby. The rule uſually obſerved, is to make the ſurface of the bottom of the canal on a level with the low-water-mark: but if the bottom or the harbour and canal be ſuch, as to be capable of becoming deeper by the action of the water, Belidor very juſtly obſerves, that the bottom of the ſluice-work ſhould be made deeper than either.

When a ſluice is to be placed at the bottom of an harbour, in order to waſh away the filth that may gather in it, by means of the waters of a river or canal, in this caſe the bottom of the ſluice-work ſhould be two feet or eighteen inches higher than the bottom of the harbour, that the water may run with the greater violence.

An engineer ought always to have in his view, that the faults committed in the conſtruction of ſluices are almoſt always irreparable. We ſhall therefore lay down ſome rules, from Belidor, for avoiding any overſights of this kind: 1. In order to adjuſt the level of the ſluice-work with the utmoſt exactneſs, the engineer ought to determine how much deeper it muſt be than a fixed point: and this he ſhould mark down in his draught, in the moſt

preciſe terms poſſible. 2. When the proper depth is ſettled, the foundation is next to be examined; and here the engineer cannot be too cautious, leſt the apparent goodneſs of the ſoil deceive him: if the foundation is judged bad, or inſufficient to bear the ſuperſtructure, it muſt be ſecured by driving piles, or a grate-work of carpentry. 3. There ſhould be engines enough provided for draining the water; and theſe ſhould be entirely under the direction of the engineer, who is to take care that they be ſo placed as not to be an obſtacle to the work; and alſo cauſe proper trenches to be cut, to convey the water clear off from the foundation. 4. When the ſluice is to be built in a place where the workmen will be unavoidably incommoded by the waters of the ſea, *&c.* all the ſtones for the maſon-work, as well as the timbers for that of carpentry, ſhould be prepared beforehand; ſo that when a proper ſeaſon offers for beginning the work, there remains nothing to be done, but to fix every thing in its place. 5. In order to ſhew the ſtate of the work, an exact journal ſhould be kept of the materials employed, to be ſigned every week by the chief engineer and undertaker; obſerving to diſtinguiſh the different pieces of materials, and the places where they were employed. 6. When an undertaker is found, who is not only able to be at the expence of providing all the materials, but likewiſe vigilant and active to execute whatever is judged neceſſary for the perfection of the work, it would be the worſt of policy to give the preference to others, who, through ignorance, or diſhoneſty, bring in eſtimates lower than it is poſſible to execute the work as it ought. However, that the conditions of the contract may be properly executed, the chief engineer, or other perſons of unqueſtionable underſtanding and honeſty, commiſſioned for that purpoſe, ſhould take care that able workmen be employed, and that they execute their ſeveral parts in a proper manner.

Sluices are made different ways, according to the uſes they are intended for: when they ſerve for navigation, they are ſhut with two gates, preſenting an angle towards the ſtream; but when made near the ſea, there are two pair of gates, one to keep the water out, and the other to keep it in, as occaſion requires: the pair of gates next the ſea preſent an angle that way, and the other pair the contrary way; the ſpace incloſed by theſe gates is called a chamber.

When ſluices are deſigned to detain the water in ſome parts of the ditch of a fortreſs, they are made with ſhutters to ſlide up and down in grooves; and when they are made to cauſe an inundation, they are then ſhut by means of ſquare timbers let down into culliſes, ſo as to lie cloſe and firm.

Particular care muſt be taken, in the building of a ſluice, to lay the foundation in the ſecureſt manner poſſible; to lay the timber-grates and floors in ſuch a manner, that the water cannot penetrate through any part, otherwiſe it will undermine the work; and, laſtly, to make the grates of a proper ſtrength, in order to ſupport the preſſure of the water; and yet to uſe no more timber than is neceſſary.

As a general conſtruction is much preferable to a particular one, we ſhall here give the deſcription of a large ſluice, with two pair of gates, from Mr. Muller's Fortification; which may be adapted to any particular caſe, provided a proper allowance be made for the various circumſtances in regard to their uſe and ſituation, as already obſerved.

To conſtruct then the plan of a ſluice, ſuppoſe half its width, O C, (plate CCLII. fig. 1.) to be divided into ſix equal parts, or the whole breadth into twelve: theſe parts ſerve for a ſcale whereby the dimenſions of the ſeveral parts of the work are determined. Through the point O, draw the line A B at right angles to O C, and take O B = 30 of the above parts; or, which is the ſame, equal $2\frac{1}{2}$ the width: through the points A and B, draw the lines A R, B S, at right angles to A B; and let the lines paſſing through the point C, and parallel to A B, meet theſe laſt lines in M and Q: then, if M N and P Q be taken each equal to nine parts, and each of the lines M R and Q S equal to ſix, the lines N R and P S will determine the wings of the ſluice, and N P the body: and if the lines A R, B S, be produced, ſo that the parts R V and S T be each ſix parts, they will determine the faces.

The part of the length, O B, exceeds the other part, O A, by $\frac{1}{4}$ of the width; becauſe we ſuppoſe a turning bridge is to be placed on that ſide, for a communication from one ſide of the ſluice to the other: but when there is no occaſion for ſuch a bridge, O B is made equal to O A; and

facing page 298

and then the whole length will be but four times and a half the width, which is, Mr. Belidor thinks, the beſt length for a great ſluice.

Next to determine the chamber, and the poſition of the gates, take OD and OL, each equal to four parts; and draw the lines DG and HL parallel to OC: then if the lines GK and HI be drawn, ſo as to make the angles DGK and LHI each $= 35^{\circ}\ 16'$, it will be the beſt poſition that can be given. The cavities x, y, are a foot each way in large ſluices, and but nine inches in middling ones: they ſerve for letting down ſquare timbers to form a batardeau on each ſide, in caſe the gates or floor want to be repaired.

The receſſes G a, H b, in the wall, are made to receive the gates when open; and are of ſuch a depth, that they may be fluſh with the wall, and not make that part narrower than the reſt of the ſluice.

The thickneſs of the wall from N to P is equal to $\frac{4}{5}$ of the depth of water; the parts RN and PS are $\frac{3}{5}$, and at V and T $\frac{2}{5}$. The counter-fort W is determined by producing the lines LH and DG, and projects beyond the wall by $\frac{1}{4}$ of the width of the ſluice.

As to the timber-grates under the floor and foundation (*ibid.* fig. 2.) if the foundation be bad, we ſuppoſe piles to be driven under the croſſings of the ſleepers m and the tie-beams n; and to prevent the water from getting under the foundation, fix rows of dove-tail piles are driven, *viz.* one at each end, one at each of the angles N and P, marked p (*ibid.* fig. 1. and 2.) and one on each ſide of the chamber: and it muſt be obſerved, that, excepting thoſe at the angles N and P, the reſt are all driven between two ſleepers in order to keep them tight and cloſe together. The ſleepers and tie-beams are partly let into each other, and bolted together. And as to the maſonry between the gratings, bricks are preferred to ſmall ſtones; as being much cloſer, and filling up every part more exactly: they are laid in terras-mortar, as well as the reſt of the foundation; and the whole is covered with a floor of three-inch thick oaken planks, laid lengthwiſe. This done, the frames made to ſupport the gates at the bottom, are laid in their proper places; which are compoſed of a cell r, two hurters s, two braces v, and a tong t. The cell enters about three feet into the ſide walls, and the ſockets to receive the pivots of the gates are placed in it; the tong ought to be ſo long as to croſs three ſleepers, to which it is ſtrongly faſtened; and the cell, tong, and hurters ought to have the ſame dimenſions; and their height muſt be ſuch as to be a foot above the laſt floor of the ſluice and chamber; for which reaſon, the piles under the chamber are left a foot higher than the reſt.

Over the firſt floor is placed another, compoſed of ſleepers and tie-beams, *&c.* anſwering exactly to thoſe underneath, and covered with ſtrong oaken planks, laid lengthwiſe and nailed to the ſleeps, as in the firſt floor. But upon the ſecond floor is laid another of only two-inch thick planks, which do not enter the wall, that they may be repaired when needful: this laſt floor may be made of yellow deal, and its ſeams muſt be well caulked, to prevent the water from making its way through them.

The walls muſt be made about three feet higher than the greateſt depth of the water; and the faces are formed of the largeſt ſtretchers and heads that can be had, laid in terras-mortar, and cramped together: but the reſt of the work may be done with good common mortar. The top of the wall muſt be covered with large flat ſtones or bricks laid in terras-mortar, to prevent the water from penetrating into the maſonry: and when all is finiſhed, a bed of clay ſhould be rammed againſt the wall, two feet thick, all round the outſide; beginning as low as the foundation, and raiſed as high as the wall.

To prevent the water from carrying off the earth, by its fall at the ends of the ſluice, a falſe floor of faſcines is made of as many fathoms long as the water in the ſluice is feet high: this falſe floor is faſtened with pickets upon an artificial bed of clay, nearly level with the floor of the ſluice; and above the faſcines is laid a pavement of hard ſtones well ſecured, ſo that the current may not tear them up. And for the greater ſecurity, a row of dove-tail piles is driven at each end: and it ought to be obſerved, that both floors, *viz.* that of the ſluices, and that above the faſcines, muſt have a gradual deſcent of about $\frac{1}{48}$ part of the length.

The croſs ſection (*ibid.* fig. 3.) ſhews the poſition of a row of piles, and the ſleepers above them, into which they are tenoned; alſo the heads of the tie-beams, the floor between them, the cell and

and the two floors above it: there is alſo ſeen a row of dove-tail piles, broken off in the middle, in order to ſee part of the maſonry *a*, *a*, between the piles, and under the ſleepers. The outſides of the gates are alſo ſeen in this ſection; alſo how the planks are joined to the frame, the ſhutters *x*, *x*, and the irons both of the gate and ſhutters.

In the conſtruction of gates, particular care ſhould be taken to join the ſeveral pieces together, in ſuch a manner, that the whole frame may be as ſtrong as poſſible, and yet not to make them more heavy than neceſſary. The principal parts of the frame of a gate are two ſtiles or uprights; that which is next to the wall, and to which the pivots are fixed, being called the pivot-poſt, and the other the chamfered ſtile, from being edged off ſo as to make a plain joint with the other gate. The other pieces, which cannot be ſeen in this ſection, conſiſt of ſeveral rails, placed not nearer to each other than twenty-four inches, nor farther than thirty; and of ſeveral braces, which form the ſame angle with the pivot-poſt, as the joints of the planks on the outſide.

As it would be too tedious to calculate the proper ſtrength of each piece, we ſhall give their dimenſions from Mr. Belidor, which, he ſays, were taken from thoſe moſt approved in practice. Suppoſing then the pieces of the principal frame to be the ſame, in the ſame ſluice, they will be as follows in different ſluices. In thoſe from 8 to 12 feet wide, the principal pieces ſhould be 8 inches thick, and 10 broad; the intermediate rails, 6 by 8; the braces and monions, or ſhort uprights to form the wickets, 4 by 6; and the whole covered by two-inch thick planks, as well as all the gates of ſluices under 37 feet wide. In ſluices from 13 to 18 feet wide, the principal pieces ſhould be 10 by 12 inches; the intermediate rails, 8 by 10; and the braces and monions, 4 by 6. In ſluices from 19 to 24 feet wide, the principal pieces ſhould be 12 by 14 inches; the intermediate rails, 10 by 12; and the braces and monions, 5 by 7. In ſluices from 25 to 30 feet wide, the principal pieces ſhould be 14 by 16; the intermediate rails, 12 by 13; and the braces and monions 6 by 8. In ſluices from 31 to 36 feet wide, the principal pieces ſhould be 15 by 17; the intermediate rails, 13 by 14; and the braces and monions, 7 by 9. In all ſluices from 37 to 42 feet wide, the principal pieces ſhould be 16 by 18; the rails, 14 by 16; and the braces and monions, 7 by 9. Laſtly, in all ſluices from 42 to 48 feet wide, the principal pieces ſhould be 18 by 20; the rails, 15 by 18; and the braces and monions, 8 by 10. However, it ought to be obſerved, that when the gates are very high, the middle rail is made of the ſame dimenſions with the principal pieces: alſo in ſluices above 36 feet wide, the planks of the gates muſt be $2\frac{1}{2}$ inches thick; or it may anſwer ſtill better, to lay two rows of plank of that thickneſs, in order that the ſeams of the under row may be covered by the planks of the upper one.

Thoſe who deſire to be more particularly informed of the manner of conducting theſe works, agreeably to their ſituation, uſes, and the nature of the ſoil where they are built, may conſult Belidor's Architecture Hydraulique, T. II. P. I. p. 134, ſeq. alſo Mr. Muller's Book, already mentioned, p. 287, ſeq.

SLUTTELBURG, a town of Ruſſia, in the province of Ingria, ſituated on the ſouth ſide of the lake Ladoga, in eaſt long. 31° 20′, north lat. 60°.

SLUYS, a port-town of dutch Flanders, ſituated oppoſite to the iſland of Cadſant: eaſt long. 3° 15′, north lat. 51° 18′.

SMACK, a ſmall veſſel with but one maſt. Sometimes they are employed as tenders on a man of war, and are uſed for fiſhing upon the coaſt, *&c.* See SHIP.

SMALLAGE, in botany, a ſpecies of apium. See the article APIUM.

Smallage has the leaves of the ſtalks wedge-like, and is called by authors apium paluſtre, paludapium, and eleoſelinum. It is aperient and diſcuſſive, and its root is one of the five great openers. It is very good in groſs conſtitutions, and infarctions of the lungs, eſpecially if eat with oil and muſtard. There needs no trouble to reduce it into any medicinal form, ſince it may be eaten ſo conveniently and agreeably in ſallads.

SMALAND, a province of Sweden, in the territory of Gothland, bounded by Eaſt Gothland, on the north; by the Baltic ſea, on the eaſt; by Blecking, on the ſouth; and by Halland, on the weſt.

SMALKALD, a town of Germany, in the landgraviate of Heſſe, ſituated ten miles ſouth of Saxgotha, near which are conſiderable iron-mines.

SMALT, a preparation of arſenic, made as follows: the remaining matter of the cobalt from which the flowers have been ſublimed being ſuffered to cool, and then taken out of the furnace, is reduced to fine powder, and calcined over again in the ſame furnace, and this repeated till there is not the leaſt particle of flame or ſmoke ſeen to ariſe from any part of it. The cobalt thus freed from its arſenical and ſulphureous part, is then ground to an impalpable powder, and a mixture is made of one hundred pound of this powder, fifty pounds of pure white pot-aſh, and a hundred and fifty pounds of pure white ſand; this is all ground together upon a mill, and then put into a proper furnace, like thoſe of our glaſs-houſes, where it runs into an elegant deep blue glaſs. This is afterwards ground to powder in mills for that purpoſe, and makes what we call ſmalt or powder-blue, uſed by our painters and waſherwomen. It has no uſe in medicine. See the article COBALT.

SMARAGDUS, the EMERALD, in natural hiſtory. See the article EMERALD.

SMARIS, in ichthyology, a ſpecies of the ſparus with a red ſpot in the middle of each ſide, and with the pectoral fins and tail red. See the article SPARUS.

SMATCH, a bird more uſually called oenanthe. See the article OENANTHE.

SMECTIS, a name by which ſome call fuller's earth. See the article FULLER.

SMELL, *odor*, with regard to the organ, is an impreſſion made on the noſe, by little particles continually exhaling from odorous bodies: with regard to the object, it is the figure and diſpoſition of odorous effluvia, which, ſticking on the organ, excite the ſenſe of ſmelling: and with regard to the ſoul, it is the perception of the impreſſion of the object on the organ, or the affection in the ſoul reſulting therefrom. See SENSE.

The principal organs of ſmelling are the noſtrils, and the olfactory nerves; the minute ramifications of which latter are deſcribed throughout the whole concave of the former. See the articles NOSE and NERVE.

According to Boerhaave, the act of ſmelling is performed by means of odorous effluvia floating in the air; being drawn into the noſtrils, in inſpiration, and ſtruck with ſuch force againſt the fibrillæ of the olfactory nerves, which the figure of the noſe, and the ſituation of the little bones, render oppoſite thereto, as to ſhake them, and give them a vibratory motion; which action, being communicated thence to the common ſenſory, occaſions an idea of a ſweet, or fœtid, or ſour, or an aromatic, or a putrified object, *&c.* The matter in animals, vegetables, foſſils, *&c.* which chiefly affects the ſenſe of ſmelling, Boerhaave obſerves, is that ſubtile ſubſtance inherent in the oily parts thereof, called ſpirit; for that, when this is taken away from the moſt fragrant bodies, what remains has ſcarce any ſmell at all; but this, poured on the moſt inodorous bodies, gives them a fragrancy.

Willis obſerves, that brutes have, generally, the ſenſe of ſmelling in much greater perfection than man; and by this alone, they diſtinguiſh the virtues and qualities of bodies unknown before; hunt out their food at a great diſtance, as hounds, and birds of prey; or hid among other matters, as ducks, *&c.* Man having other means of judging of his food, *&c.* did not need ſo much ſagacity in his noſe; yet have we inſtances of a great deal, even in man. In the Hiſtoire des Antilles, we are aſſured, there are negroes who, by the ſmelling alone, can diſtinguiſh between the footſteps of a Frenchman and a negro.

The chemiſts teach, that ſulphur is the principle of all ſmells, and that thoſe are more or leſs ſtrong, as the ſulphur in the odorous body is more or leſs dried or exalted. Sulphur, they ſay, is the foundation of odours, as ſalt is of ſavours, and mercury of colours. See the article SULPHUR, *&c.*

Smell, like taſte, conſiſts altogether in the arrangement, compoſition, and figure of the parts, as appears from the following experiments of Mr. Boyle. 1. From a mixture of two bodies, each whereof is of itſelf void of ſmell, a very urinous ſmell may be drawn, that is, by grinding of quick lime with ſal ammoniac. 2. By the admixture of common water, which, of itſelf, is void of all ſmell, or inodorous; another inodorous body may be made to emit a very rank ſmell. Thus camphor, diſſolved in oil of vitriol, is inodorous, yet, mixed with water, immediately exhales a very ſtrong ſmell. 3. Compound bodies may emit ſmells which have no ſimilitude to the ſmell of the ſimples they conſiſt of. Thus oil of turpentine, mixed with a double quantity of oil of vitriol, and diſtilled; after diſtillation, there is no ſmell but of ſulphur, and what is left behind, the retort being

being again urged by a more violent fire, yields a ſmell like oil of wax. 4. Several ſmells are only to be drawn forth by motion and agitation. Thus glaſs, ſtones, &c. which even when heated yield no ſmell, yet, when rubbed and agitated in a peculiar manner, emit a ſtrong ſmell; particularly beech-wood, in turning, yields a kind of roſy ſmell. 5. A body that has a ſtrong ſmell, by being mixed with an inodorous one, may ceaſe to have any ſmell at all. Thus if aqua fortis, not well dephlegmated, be poured on ſalt of tartar, till it ceaſes to ferment, the liquor when evaporated will yield inodorous cryſtals, much reſembling ſalt of nitre; yet when burnt, will yield a moſt noiſome ſmell. 6. From a mixture of two bodies, one whereof ſmells extremely ill, and the other not well, a very pleaſant aromatic odour may by gained, *viz.* by a mixture of aqua fortis, or ſpirit of nitre, with an inflammable ſpirit of wine. 7. Spirits of wine, by mixing with an almoſt inodorous body, may gain a very pleaſant aromatic ſmell. Thus inflammable ſpirits of wine, and oil of Dantzic vitriol, mixed in equal portions, then digeſted, and at laſt diſtilled, yield a ſpirit of a very fragrant ſmell. 8. A moſt fragrant body may degenerate into a fœtid one, without the admixture of any other body. Thus, if the ſpirit mentioned in the former experiment be kept in a well cloſed receiver, it will ſoon turn to the rankneſs of garlic. 9. From two bodies, one whereof is inodorous and the other fœtid, a very pleaſant ſmell may ariſe, much reſembling muſk, &c. by putting pearls into ſpirit of vitriol; for, when diſſolved, they yield a very agreeable ſmell.

SMELT, in ichthyology, the oſmerus with ſeventeen rays in the pinna ani. This is a beautiful little fiſh; its length is five or ſix inches, and its breadth not great in proportion, but the thickneſs is conſiderable: the head is of an oblong figure, and ſomewhat acute; the opening of the mouth is large, the back is convex, and the belly ſomewhat flat; the lower jaw is a little longer than the upper; the noſtrils ſtand in the middle between the eyes and the extremity of the roſtrum; they have each two apertures; the eyes are large and round, the pupil is black, and the iris of a ſilvery white, but tinged a little with blue towards the upper part.

SMELTING, in metallurgy, the fuſion or melting of the ores of metals, in order to ſeparate the metalline part from the earthy, ſtony, and other parts. See the articles FUSION, ORE, FLUX, GOLD, SILVER, &c.

SMEW, in ornithology, a name uſed in ſome parts of the kingdom for the common mergus. See the article MERGUS.

SMILACIS SPECIES, in botany, the name by which Tournefort calls a ſpecies of convallaria. See CONVALLARIA.

SMILAX, PRICKLY BINDWEED, in botany, a genus of the *dioecia-hexandria* claſs of plants, without any flower-petals: its fruit is a bilocular berry, with two ſeeds in each cell.

SMIRIS, in natural hiſtory, the ſame with emery. See the article EMERY.

SMITHERY, or SMITHING, a manual art, by which an irregular lump of iron is wrought into an intended ſhape.

The utenſils, tools, and operations of this art either have been, or will be, deſcribed under their reſpective articles FORGE, ANVIL, HAMMER, TONGS, VICE, FILING, CASE-HARDENING, NEALING, SOLDERING, &c.

In the annexed plate (CCLIII.) fig. 1. repreſents the ſmith's forge and bellows; fig. 2. the anvil ſet in a wooden block, its face being A, and B its beak or beak-iron, corruptly called bickern; fig. 3. and 4. two kinds of tongs, where A, A are the chaps, B the joint, and C, C the handles; fig. 5. repreſents two kinds of hammer, of which A is the face, B the pen, C the eye, and D the handle; fig. 6. is the vice, of which A, A are the chaps, C the ſcrew-pin, D the nut, E the ſpring, and F the foot; G is a hand-vice; and H, H the pliers; fig. 7. is the ſcrew-plate and its tap; and fig. 8. a drill.

Theſe are the moſt eſſential tools uſed in the black-ſmith's trade; however, as ſome kinds of work require different tools, we ſhall here deſcribe a machine for iron-work. AB (plate CCLIV.) is called the ſlitting-mill, CD the plate-mill, and SP the clipping-mill. E and F are two great water-wheels, ſo diſpoſed that when the water has paſſed the wheel E in the direction QW, it comes about the wheel F in the direction XY. The water-wheel E, with the lantern G on the ſame axis, carries the ſpur-wheels, or cog-wheels, H, M, with the cylinders B and D: and the wheel F, with the lantern I, carries the cog-wheels K, N, with the

T. Jefferys sculp

A Machine used in SMITHERY for making and Slitting Iron-Plates

T. Jefferys sculp.

Fig. 1. A Smoke-Jack

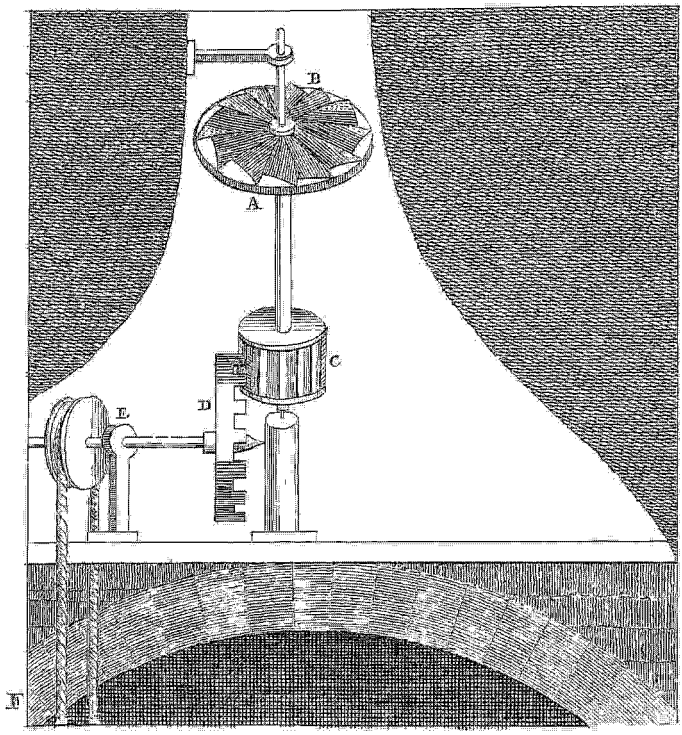

Fig. 2. Snails

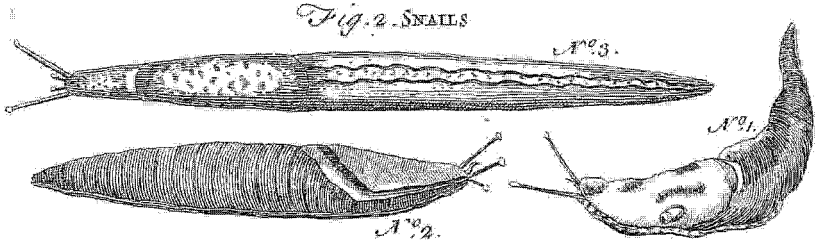

Fig 3. The Solen, or Razor-Shell

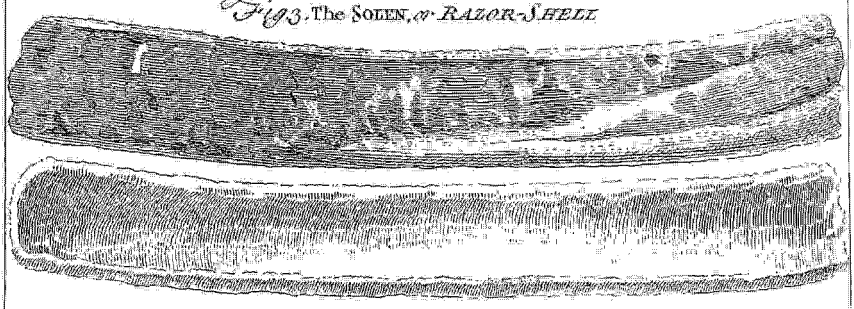

the cylinders A and C. Now the cylinders A and B, as alſo C and D, turn contrary ways about; the cylinders A and B are cut into teeth for ſlitting iron-bars, and are about twelve inches in diameter, whereas C and D are only eight inches in diameter. Theſe cylinders may be taken out, and others put in at pleaſure; they may alſo be brought nearer to, or removed farther from, each other, by means of ſcrews which ſcrew up the ſockets where their axles turn. The axles of N, I, K, lie all in one horizontal plane; and ſo do thoſe of M, G, H: but the cylinders A and B, as alſo C and D, lie one above another.

In order to make iron-plates, if a bar of iron be heated and made thin at the end, and that end put in between the cylinders C and D, whilſt the mill is going, the motion of the cylinders will draw it through, on the other ſide, into a thin plate. Likewiſe, if a bar of iron be heated and thinned at the end, and put in between the toothed cylinders A and B, it will be drawn through on the other ſide, and ſlit into ſeveral ſmall pieces, or ſtrings; and then, if there be occaſion, any of theſe ſtrings may be drawn through the plate-mill with the ſame heat, and faſhioned into plates.

In the clipping-mill, OPQ (*ibid.*) is the ſheers for clipping bars of cold iron; V, a cog in the axis of the water-wheel; OP, one ſide of the ſheers made of ſteel, and moveable about P. The plane LPR is perpendicular to the horizon. When the mill goes, the cog V raiſes the ſide OP, which as it riſes, clips the bar TQ into two, by the edges SP and RP.

The whole of this engine, except the water-wheels, is within the houſe.

SMOKE, or SMOAK, *fumus*, an humid matter, exhaled in the form of vapour, by the action of fire or heat. See the articles FIRE, HEAT, and EXHALATION.

A ſmoke-jack (plate CCLV. fig. 1.) is a very ſimple and commodious machine, in a kitchen; ſo called from its being moved by means of the ſmoke, or rarified air, moving up the chimney, and ſtriking againſt the tail of the horizontal wheel, AB; which being inclined to the horizon, is thereby moved about the axis of the wheel, together with the pinion C, which carries the wheel D and E; and E carries the chain F, which turns the ſpit.

The wheel AB ſhould be placed in the narrow part of the chimney, where the motion of the ſmoke is ſwifteſt, and the greateſt part of it muſt ſtrike upon the ſails. The force of this machine is ſo much greater, as the fire is greater.

SMOKE-SILVER, and SMOKE-PENNY, a payment made to the miniſters of ſeveral pariſhes in lieu of tithe-wood.

SMOLENSKO, the capital of a province of the ſame name, in Muſcovy, ſituated on the confines of Poland, in eaſt long. 33°, and north lat. 56°.

SMUGGLERS, in law, thoſe perſons who conceal or run prohibited goods, or goods that have not paid his majeſty's cuſtoms. See DUTY, CUSTOMS, *&c.*

SMUT, in huſbandry, a diſeaſe in corn, when the grains, inſtead of being filled with flour, are full of a ſtinking black powder.

As to the cauſe of this diſtemperature, ſome have attributed it to exceſſive rankneſs, or fatneſs of the ſoil; to the manuring the land with rotten vegetables, and to the ſowing ſmutty ſeed. Mr. Bradley thinks it is owing to the ſame cauſe with a blight, *viz.* to multitudes of inſects. But Mr. Tull is convinced, from experiment, that it is cauſed by too much moiſture; for planting ſeveral plants of corn in troughs of very moiſt earth, they all produced ſmutty ears, while very few ſuch were found in the field, from whence theſe plants were taken.

There are two remedies for the ſmut, recommended by writers on huſbandry, *viz.* ſteeping the ſeed in ſalt brine, and changing the ſeed. See the articles SEED and CHANGE.

As to the ſteeping of ſeed, when wheat is intended for drilling, it muſt be ſoaked in a brine of pure ſalt, diſſolved in water, ſince urine is found to be highly prejudicial. The moſt expeditious way of brining wheat for drilling, is to lay it in a heap, and waſh it with a ſtrong brine ſprinkled on it, ſtirring it up with a ſhovel, that it may be all equally brined, or wetted with it; after this, ſift on ſome fine lime all over the ſurface, and ſtir it up, ſtill ſifting on more in the ſame manner till the whole is duſted with the lime, it will then be ſoon dry enough to be drilled without farther trouble. It muſt be quick-lime, in its full ſtrength, that is uſed on this occaſion.

The bread made of ſmutty corn, is very pernicious, acting as a narcotic, and occaſioning not only ſleepineſs, but vertigoes, and even convulſions.

SMYRNA, a city and port-town of aſiatic Turky, ſituated on a bay of the Archipelago, in the province of Ionia, in leſſer Aſia, a hundred miles north of Rhodes, and two hundred miles nearly ſouth of Conſtantinople: eaſt long. 27°, north lat. 37° 30′.

SMYRNIUM, ALEXANDERS, in botany, a genus of the *pentandria digynia* claſs of plants, with an umbelliferous compound flower, made up of leſſer roſaceous ones, with five lanceolated petals: the fruit is naked, ſub-globoſe, ſtriated, and ſeparable into two parts; and the ſeeds are two, lunulated, convex on one ſide, with three ſtriæ, and plane on the other.

The leaves, roots, and ſeeds of this plant are uſed in medicine; its virtues being the ſame with thoſe of ſmallage, only in a ſomewhat ſtronger degree.

SNAFFLE, in the manege, is a very ſlender bit-mouth, without any branches, much uſed in England; the true bridles being reſerved for the ſervice of war.

The ſnaffle, or ſmall watering-bit, is commonly a ſcratch-mouth, with two very little, ſtraight branches, and a curb, mounted with a headſtall, and two long reins.

SNAIL, *limax*, in zoology, a genus of the gymnarthria, or naked inſects, the body of which is of a figure approaching to cylindric, and is perforated at the ſide: the tentacula, or horns, as they are called, are four in number, and two of them have the appearance of eyes.

There are a great many ſpecies of ſnails, whereof we ſhall only mention a few.

1. The black naked ſnail, a conſiderably large inſect, being commonly three inches long, and half an inch broad; its whole body is furrowed and much wrinkled, and is of a deep black, except the belly, which is grey. See plate CCLV. fig. 2. n° 1.

2. The naked reddiſh ſnail grows only to about two inches in length, and is alſo covered with numerous ſlight furrows. *ibid.* n° 2.

3. The amber-coloured ſnail, (*ibid.* n° 3.) when full grown, is only about an inch and a half long: its colour is a gloſſy yellow, with a caſt of brown in it, and the whole body is variegated with ſpots of a greyiſh colour.

Snails are all hermaphrodites, and are eſteemed provocatives by the Aſiatics.

SNAKE, *anguis*, in zoology. See the article ANGUIS.

The common ſnake is a harmleſs and inoffenſive animal, and might even be kept tame in houſes, to deſtroy vermin. Its fleſh is reſtorative, like that of the viper. See the article VIPER.

For the blood-ſnake, rattle-ſnake, *&c.* See the articles HÆMORRHUS, RATTLE-SNAKE, *&c.*

SNAKE-ROOT, *ſerpentaria*, in botany, a ſpecies of polygala. See POLYGALA.

SNAKE-STONE, a name given to the ammonitæ. See AMMONITÆ.

SNAKE-WEED, in botany, the ſame with biſtort. See BISTORT.

SNAPDRAGON, *antirrhinum*, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, with a monopetalous perſonated flower, divided into two lips; the upper one of which is bifid, and the lower one trifid: the fruit is a roundiſh bilocular capſule, containing a great many kidney-ſhaped ſeeds.

This genus comprehends alſo the linaria, or toad-flax, the aſarina, elatine, and cymbalaria of authors.

SNATCH-BLOCK, among ſeamen, a kind of pulley. See PULLEY.

SNEEK, a town of Frieſland, in the United Provinces, twelve miles ſouth of Lewarden.

SNEEZING, *ſternutatio*, a convulſive motion of the muſcles of the breaſt, whereby the air is expelled from the noſe, with much vehemence and noiſe.

Sneezing is cauſed by the irritation of the upper membrane of the noſe, occaſioned by acrid ſubſtances floating in the air, or by medicines called ſternutatories. See SNUFF and STERNUTATORY.

SNETHAM, a market-town of Norfolk, twenty-eight miles north-weſt of Norwich.

SNIATIN, a town of Red Ruſſia, in Poland, on the confines of Moldavia: eaſt long. 25° 20′, north lat. 48°.

SNIGGLING, a method of catching eels, when they hide themſelves in holes: it is performed by thruſting a baited hook and ſtrong line into the holes where they are ſuppoſed to lie concealed; and if there be any, they will cetainly bite; ſo that if the tackling hold, the largeſt eels may be thus taken.

SNIPE, in ornithology, a ſpecies of numenius, with four brown ſtreaks on the head; it is a ſmall but beautiful bird, and

its

its fleſh is delicate, and much eſteemed at table.

SNOUT, or CALF'S-SNOUT; in botany, the ſame with ſnapdragon. See the article SNAPDRAGON.

SNOW, *nix*, in meteorology, a meteor produced in this manner: when the vapours are become conſiderably condenſed, yet not ſo far as to be liquified, or diſſolved into water; then by a ſpecial degree of coldneſs in the upper region of the air, the particles of the condenſed vapour are changed into ice; ſeveral of which adhering together, form little fleeces of a white ſubſtance, ſomewhat heavier than the air; and therefore deſcend in a ſlow and gentle manner thro' it; being ſubject, by reaſon of its lightneſs, to be driven about by the various motions of the air, and wind; and is what, when arrived to the ſurface of the earth, we call ſnow. See FROST, HAIL, *&c.*

The uſes of ſnow muſt be very great, if all be true Bartholin has ſaid in its behalf, in an expreſs treatiſe, *De nivis uſu medico*; he there ſhews, that it fructifies the earth (which, indeed, is a very old and general opinion) preſerves from the plague, cures fevers, cholics, toothachs, ſore eyes, and pleuriſies (for which laſt uſe, his countrymen of Denmark uſe to keep ſnow-water gathered in March.) He adds, that it contributes to the prolongation of life; giving inſtances of people in the Alpine mountains that live to great ages; and to the preſerving dead bodies, inſtances whereof he gives in perſons buried under the ſnow in paſſing the Alps, which are found uncorrupted in the ſummer, when the ſnow is melted.

He obſerves, that, in Norway, ſnow-water is not only their ſole drink in the winter, but ſnow even ſerves for food; people having been known to live ſeveral days, without any other ſuſtenance.

Indeed the generality of theſe medicinal effects of ſnow are not to be aſcribed to any ſpecific virtue in ſnow, but to other cauſes. It fructifies the ground, for inſtance, by guarding the corn or other vegetables, from the intenſer cold of the air, eſpecially the cold piercing winds. And it preſerves dead bodies, by conſtipating and binding up the parts, and thus preventing all ſuch fermentations or internal conflicts of their particles, as would produce putrefaction.

Snow may be preſerved by ramming it down in a dry place, under-ground, and covering it with chaff, in the manner of Ice. See the article ICE.

SNOWDON-HILL, the higheſt mountain in Wales, ſituated in Carnarvonſhire.

SNOW-DROP, in botany, the engliſh name of the galanthus. See GALANTHUS.

SNOWDROP-TREE, the ſame with the chionanthus. See CHIONANTHUS.

SNUFF, a powder chiefly made of tobacco, the uſe of which is too well known to need any deſcription here. See the article TOBACCO.

However, though tobacco be the baſis of ſnuff, yet a multiplicity of other matters are often added, to give it an agreeable ſcent.

The kinds of ſnuff being endleſs, we ſhall only obſerve, that there are three grand ſorts, *viz.* that which is only granulated, and called rappee; that which is reduced to a very fine powder, and called ſcotch, ſpaniſh, *&c.* ſnuff; and the third, a coarſe kind, remaining after ſifting the ſecond ſort.

SOAL-FISH, *ſolea*, in ichthyology, the engliſh name of the long-bodied pleuronectes, with rough ſcales on both ſides. See PLEURONECTES.

This is a fiſh deſervedly held in great eſteem at table: its uſual length is from five, or ſix, to fourteen inches in length; it is of an oblong elliptical figure, and thin in proportion to its other dimenſions: its eyes are not protuberant, but are placed at a greater diſtance than in moſt other ſpecies, and both on the left ſide.

SOAP, or SOPE, in commerce, and the manufactures, a kind of paſte, ſometimes hard and dry, and ſometimes ſoft and liquid, much uſed in waſhing, whitening linnens, and by dyers, fullers, *&c.*

The principal ſoaps of our manufacture, are the ſoft, the hard, and the bale ſoap; all which conſiſt of an intimate union of the ſalt of pot-aſh, with oil, or animal-fat.

1. The ſoft ſoap is either green or white. The principal ingredients in the green-kind are lyes drawn from pot-aſhes, and lime boiled up with tallow and oil. Firſt, the lye and tallow are put into the copper together, and when melted, the oil is put to them, and the copper made to boil; then they damp or ſtop up the fire, while the ingredients remain in the copper to knit or incorporate; which being done, they ſet the copper a boiling again,

feeding or filling it with lyes as it boils, 'till they have put in a ſufficient quantity; after which they boil it off with all convenient ſpeed, and put it into barrels.

One ſort of white ſoap is made after the ſame manner with green ſoap; excepting that they do not uſe any oil in this.

Another ſort of white ſoft ſoap is made from lyes of aſhes of lime, boiled up twice with tallow. Firſt they put a quantity of lyes and tallow into the copper together, which is kept boiling, being fed with lyes as it boils, till it is boiled enough, or that they find it grains; then they ſeparate or diſcharge the lyes from the tallowiſh part, which they put into a tub, throwing away the lye; this they call the firſt half-boil. Then they charge the copper again with freſh tallow and lye, and put the firſt half-boil out of the tub into the copper a ſecond time, and keep it boiling with freſh lye and tallow, till it is brought to perfection, and afterwards filled out into ſoap-caſks.

2. Hard ſoap is made of aſhes and tallow, and commonly boiled at twice; the firſt boiling they alſo call a half-boiling, which is performed exactly after the ſame manner as the firſt half-boil of the ſoft white-ſoap. Then they charge the copper again with freſh lye, and put into it the firſt half-boil again, feeding it with lye, as it boils, till it is boiled enough, or till it grains; then they diſcharge the lye from it, and put the ſoap into a frame to boil and harden.

3. Ball-ſoap is made alſo of lye from aſhes and tallow; they put the lye into the copper, and boil it till the watery part is quite gone, and there is nothing left in the copper but a ſort of nitrous matter (which is the very ſtrength and eſſence of the lye) then they put tallow to it, and keep the copper boiling and ſtirring for half an hour or more, in which time the ſoap is compleated, which they put into tubs or baſkets with ſheets in them, and immediately (while ſoft) make it into balls.

It takes up near twenty-four hours to boil away the watery part of the lye.

The proceſs of ſoap-boiling, as at preſent practiſed, being a very tedious, as well as expenſive, operation, Dr. Shaw propoſes a method to ſhorten it, by ſubſtituting motion in the place of fire: this motion might be eaſily given, by an engine, to any quantities of the ingredients at a time; and that ſuch a method is effectual for making ſoap, the doctor proved by the following experiment: he mixed, in a large phial, half a pint of ſoap-lye, with an ounce, or more, of oil-olive; and ſhaking theſe together, for a quarter of an hour, a true cake of ſoap was obtained on the top of the liquor, which hardened on being expoſed to the air.

SOAP, *ſapo*, in medicine. The purer hard ſoap is the only ſort intended for internal uſe; this, triturated with oily or reſinous matters, renders them ſoluble in water; and hence becomes an ingredient in pills compoſed of reſins, promoting their diſſolution in the ſtomach, and union with the animal fluids. Boerhaave always preſcribed ſoap in reſinous pills, unleſs where an alkaleſcent or putrid ſtate of the juices forbad its uſe. From the ſame quality, ſoap ſeems well fitted for diſſolving oily or unctuous matters and viſcidities in the human body; thereby opening obſtructions, and deterging all the veſſels it paſſes through. It is likewiſe a powerful menſtruum for the calculus, or ſtone in the bladder; a ſolution of it in lime-water being one of the ſtrongeſt diſſolvents that can with ſafety be taken into the ſtomach: the virtue of this compoſition is conſiderably greater than the aggregate of the diſſolving powers of the ſoap and lime-water, when unmixed. See the articles LIME-WATER and LITHONTRIPTICS.

The ſoft ſoaps are more penetrating and acrimonious than the hard, and are therefore only uſed externally.

The proper menſtruum of ſoap is a proof ſpirit, freed from its acid; this diſſolves it the moſt perfectly, and in the greateſt quantity, three ounces taking up one or more; and in this form, ſoap may, in ſome caſes, be conveniently exhibited.

To purify ſoap for medicinal uſe, ſlice it into a clean pewter veſſel, and pour upon it two gallons of rectified ſpirit of wine: place the veſſel in a bath-heat, and increaſe the fire ſo as to make the ſpirit boil, and it will ſoon diſſolve the ſoap. Let the veſſel ſtand cloſe covered in a warm place, till the liquor has grown perfectly clear; and, if any oily matter ſwim upon the ſurface, ſcum it off; then decant the limpid liquor, and diſtill off from it all the ſpirit that will ariſe in the heat of a water-bath. Expoſe the remainder to a dry air, for a few days, and it will become a white, opake, and ſome-

ſomewhat friable maſs, not in any degree acrimonious, and conſequently well fitted for medicinal purpoſes.

There are alſo ſeveral other ſaponaceous medicines, as ſoap of almonds, of tartar, &c. See ALMONDS, &c.

SOAP-EARTH, or SOAP-ROCK, in natural hiſtory. See STEATITES.

SOAR-HAWK, an appellation given to an hawk, from the time of taking her from the eyrie, till ſhe has mewed, or caſt her feathers.

SOC, or SOK, *ſoca*, in law-books, denotes juriſdiction. See JURISDICTION.

SOCAGE, an antient tenure, by which lands were held on condition of ploughing the lord's lands, and doing the operations of huſbandry, at their own charges. See TENURE.

SOCO, in ornithology, the ferrugineous ardea variegated with black. See the article ARDEA.

This is nearly of the ſize of our common heron, but the body is ſmaller in proportion to the length of the neck and legs; the head is large, and of an oblong figure, narroweſt at the front, and broader behind; the beak is five inches long, and of a greeniſh olive-colour; the eyes are large, their iris yellow, the head is a deep brown, has no creſt, and very little of the black variegation.

SOCCUS, in antiquity, a kind of high ſhoe, reaching above the ancle, worn by comedians, as the cothurnus was by tragedians. See COTHURNUS, COMEDY, TRAGEDY, and DRAMA.

SOCIETY, *ſocietas*, in general, denotes a number of perſons united together for their mutual aſſiſtance, ſecurity, intereſt, or entertainment.

The ſocial principle in man is of ſuch an expanſive nature, that it cannot be confined within the circuit of a family, of friends, or a neighbourhood: it ſpreads into wider ſyſtems, and draws men into larger communities and common-wealths; ſince it is in theſe only, that the more ſublime powers of our nature attain the higheſt improvement and perfection of which they are capable.

In ſociety, the mutual aids, which men give and receive, ſhorten the labours of each; and the combined ſtrength and reaſon of individuals give ſecurity and protection to the whole body. There is a variety of genius among mankind; ſome being formed to lead and direct others, to contrive plans of employment for individuals, and of government for communities, to invent laws and arts, and ſuperintend their execution, and in ſhort to refine and civilize human life: others again, who have not ſuch good heads, may have honeſt hearts, a true public ſpirit, love of liberty, order, &c. and finally, others ſeem beſt diſpoſed for manual exerciſes, as bodily labour. Society finds proper employment for every genius, and the nobleſt objects and exerciſes for the nobleſt geniuſes. In ſociety, a man not only finds more leiſure, but better opportunities of applying his talents with ſucceſs.

From this ſhort detail it appears, that man was formed for ſociety; which reſts on theſe two principal pillars. 1. That it afford ſecurity againſt thoſe evils, which are unavoidable in ſolitude. 2. That it enables us to obtain thoſe goods, ſome of which cannot be obtained at all, and others not ſo well, in a ſtate of ſolitude, wherein men depend wholly on their own ſagacity and induſtry. See GOVERNMENT and LAW.

Royal SOCIETY, an academy, or college, eſtabliſhed by charter, by king Charles II. for promoting natural knowledge, and uſeful arts, by experiments. See the article ACADEMY.

It conſiſts of ſeveral hundred fellows, or members, moſtly britiſh; ſome perſons of the higheſt rank, and many eminent gentlemen and learned men of other nations. Their meetings are held once a week, at their houſe in Crane-Court, Fleet-Street, London; where they diſcourſe upon the productions and rarities of nature and art, and conſider how the ſame may be improved for the good of mankind: here are alſo read letters, and other philoſophical papers, ſent by ingenious perſons, both at home and abroad; upon which they diſcourſe in the plaineſt manner, without affecting ſtudied ſpeeches. See *Philoſophical* TRANSACTIONS.

This ſociety, of which his britannic majeſty is perpetual patron, is governed by a council of twenty-one members, ten of whom are yearly choſen out of the ſociety, on St. Andrew's-day: the chief of the council bears the title of preſident, whoſe proper office is to call and diſſolve the meetings, to propoſe the matter to be debated, call for experiments, and admit ſuch members as ſhall be elected, which muſt be by a majority of at leaſt twenty-one votes: whereupon he is admitted, after paying 40 s. and ſubſcribing, That he will endeavour to promote

promote the good of the Royal Society of London, by the improvement of natural knowledge; and being thus admitted, he afterwards pays 13s. a quarter, as long as he continues a member of the ſociety.

SOCIETY *for the reformation of manners*, and putting in execution the laws againſt immorality and profaneneſs. It was ſet on foot, about thirty years ago, by five or ſix private perſons in London, but is ſince exceedingly increaſed by numbers of all denominations. A particular body of the moſt conſiderable hereof bear the expence of proſecutions, *&c.* without any contribution from the reſt. Theſe chiefly apply themſelves to the proſecuting people for ſwearing, drunkenneſs, and prophaning the ſabbath. Another body, of about fifty perſons, apply themſelves to the ſuppreſſing lewdneſs, and by them above five-hundred lewd houſes have been actually ſuppreſſed; a third body conſiſts of conſtables; and a fourth of informers. Beſides theſe, are eight other regular mixed bodies of houſe-keepers and officers, who inſpect the behaviour of the conſtables and other officers, aſſiſt in ſearching diſorderly houſes, ſeizing offenders, giving information, *&c.* There are ſeveral other ſocieties of this kind at Briſtol, Canterbury, Nottingham, *&c.*

SOCIETY *for propagating the goſpel in foreign parts*, was inſtituted by King William, in 1701, for ſecuring a maintenance for an orthodox clergy, and making other proviſions for the propagation of the goſpel in the plantations, colonies, frontiers, *&c.* To that end he incorporated the archbiſhops, ſeveral biſhops, and other nobility, gentry, and clergy, to the number of ninety, with privilege to purchaſe two-thouſand pounds, per year, inheritance and eſtates for lives, or years, with other goods, to any value. They meet yearly on the third Friday in February, to chuſe a preſident, vice-preſident, and other officers; and the third Friday in every month to tranſact buſineſs, depute fit perſons to take ſubſcriptions for the ſaid uſes, and of all monies ſo received to give account to the lord chancellor, *&c.* They have a ſtanding committee at the chapter-houſe, to prepare matters for the monthly meeting which is held at St. Martin's library.

SOCIETY *for propagating chriſtian knowledge*. This was begun in 1699, by ſome perſons of worth, *&c.* Its original deſign was to propagate religion in the plantations, to ſecure the pious education of the poor at home, and to reclaim thoſe that err in the fundamentals of chriſtianity. In the year 1701, they had procured conſiderable charities, and tranſmitted the ſame to the plantations, in libraries, bibles, catechiſms, *&c.* with a voluntary maintenance for ſeveral miniſters to be employed in the plantations; but the ſociety for propagating the goſpel in foreign parts being then inſtituted, they were incorporated by charter in the ſame, and thus diſcharged as a particular ſociety from the further purſuit of that branch of their original deſign, whereupon they wholly turned themſelves to the other, and are now very conſiderable by great acceſſions from the clergy and laity. They meet weekly to concert meaſures for raiſing charity for educating poor children, and ſetting up ſchools for that purpoſe, as alſo for the more regular diſpoſals of books for the inſtruction of the ignorant, erroneous, *&c.*

For the other ſocieties eſtabliſhed by charter, ſee the articles COLLEGE, COMPANY, and CORPORATION.

SOCIETY, in a commercical ſenſe, the ſame with partnerſhip or fellowſhip. See PARTNERSHIP and FELLOWSHIP.

SOCINIANS, in church hiſtory, a ſect of chriſtian heretics, ſo called from their founder Fauſtus Socinus, a native of Sienna, in Italy. He, about the year 1574, began openly to declare againſt the catholic faith, and taught, 1. That the eternal father was the one only God; that the word was no more than an expreſſion of the godhead, and had not exiſted from all eternity; and that Jeſus Chriſt was God no otherwiſe than by his ſuperiority above all creatures who were put in ſubjection to him by the Father. 2. That Jeſus Chriſt was not a mediator between God and men, but ſent into the world to ſerve as a pattern of their conduct; and that he aſcended up to heaven only as it were to take a journey thither. 3. That the puniſhment of hell will laſt but for a certain time, after which the body and ſoul will be deſtroyed. And, 4. That it is not lawful for princes to make war. Theſe four tenets were what Socinus defended with the greateſt zeal. In other matters, he was a lutheran or a calviniſt; and the truth is, that he did but refine upon the errors of all the antitrinitarians that went before him. The ſocinians ſpread extremely in Poland, Lithuania, and Tranſylvania. Their

Their ſentiments are explained at large in their catechiſm, printed ſeveral times under the title of Catecheſis Eccleſiarum Polonicarum, unum Deum Patrem, illiuſque filium unigenitum, una cum Sancto Spiritu, ex ſacra ſcriptura confitentium. They were exterminated out of Poland in 1655, ſince which time they have been chiefly ſheltered in Holland, where though their public meetings have been prohibited, they find means to conceal themſelves under the names of arminians and anabaptiſts. See the article ARMINIAN.

SOCKAGE, or SOCAGE. See SOCAGE.

SOCKET, BALL AND SOCKET. See BALL.

SOCKETS in a ſhip, are the holes which the pintles of the murthering pieces go into.

SOCLE, or ZOCLE, in architecture, a flat ſquare member under the baſes of pedeſtals of ſtatues, vaſes, &c. which ſerves as a foot or ſtand. Continued ſocle is a kind of continued ſtand or pedeſtal without either baſe or corniche, ranging round the whole building, called by Vitruvius ſtereobata. See STEREOBATA.

SOCMEN, or SOKEMEN, ſuch tenants as held their lands and tenements in ſocage; but the tenants in antient demeſne, ſeem moſt properly to be called ſocmans. See the article SOCAGE.

SOCNA, in our old writers, denotes ſome privilege, liberty, or franchiſe.

SOCOME, is taken for a cuſtom of grinding corn at the lord's mill; whence came the name or term of bond ſocome, by which the tenants were bound to it; and alſo love ſocome, where they did it voluntarily out of love to their lord.

SOCONUSCO, a port-town of Mexico, in north America, capital of the province of that name, ſituated on the Pacific ocean: weſt long. 98°, north lat. 15°.

SOCOTORA, an iſland in the indian ocean, about ſeventy miles long, and fifty broad, ſituated in eaſt long. 53°, north lat. 11°.

SOCRATIC PHILOSOPHY, the doctrines and opinions, with regard to morality and religion, maintained and taught by Socrates. By the character of Socrates, left us by the antients, particularly by his ſcholar Plato, Laertius, &c. he appears to have been one of the beſt and the wiſeſt perſons in all the heathen world. To him is aſcribed the firſt introducing of moral philoſophy, which is what is meant by that uſual ſaying, "That Socrates firſt called philoſophy down from heaven to earth;" that is, from the contemplation of the heavens and heavenly bodies, he led men to conſider themſelves, their own paſſions, opinions, faculties, duties, actions, &c. He wrote nothing himſelf, yet all the grecian ſects of philoſophers refer their origin to his diſcipline, particularly the platoniſts, peripatetics, academics, cyrenaics, ſtoics, &c. but the greateſt part of his philoſophy we have in the works of Plato. See the article PLATONISM, &c.

SODA, or HEAT *of the ſtomach*, in medicine, the name a diſtemper conſiſting in a heat or troubleſome burning about the pit of the ſtomach, or its leſt mouth, which ſometimes is extended the whole length of the oeſophagus, with a preſſure or ſpaſmodic conſtriction, uſually attacking the patient by fits. The cauſe is generally fat aliment, eſpecially veal, if cold drink be taken ſoon after. In ſome it proceeds from acids, in others from aromatics, ſpirituous liquors, or bilious humours. This diſorder is generally ſlight, and vaniſhes of its own accord, though in others it is of long duration. In the cure, the cauſe muſt always be attended to; if from acids, abſorbents are proper, particularly crabs-eyes and prepared ſhells mixed with a fourth or fifth part of powder of nutmeg given to half a dram, as alſo the tabellæ cardialgicæ. It is common to take chalk alone or mixed with nutmeg; but care ſhould be taken not to be too free in its uſe. Oil of tartar per deliquium, given from twenty to thirty drops in coffee, tea, broth, or warm beer, is generally efficacious, as alſo tincture of tartar and ſpirit of hartſhorn. If it proceeds from bilious humours, thirty or fifty drops of dulcified ſpirit of nitre in water, tea, or coffee, will take away the pain. When it is cauſed by fat things and draughts of cold liquor, a dram of brandy is good. Now and then laxatives ſhould be given to carry off the humours. In ſanguine conſtitutions, bleeding may be proper.

SODA *ſubethica*, among the antient phyſicians, was a term whereby they expreſſed a peculiarly ſharp and terrible pain of the head.

SODBURY, a market-town of Glouceſterſhire, ſituated ten miles north-eaſt of Briſtol.

SODDER, or SOLDER. See SOLDER.

SODOM RUINS, are ſaid to be ſometimes ſeen at the bottom of the lake called the Dead ſea, in Paleſtine: eaſt long. 38°, north lat. 31° 40'.

SODOMY,

SODOMY, the unnatural crime of buggery, thus called from the city of Sodom, which was deſtroyed by fire for the ſame. The levitical law adjudged thoſe guilty of this execrable crime to death, and the civil law aſſigns the ſame puniſhment to it. Our law alſo makes it felony. See the article BUGGERY.

There is no ſtatute in Scotland againſt ſodomy; the libel of this crime is therefore founded on the divine law, and practice makes its puniſhment to be burning alive.

SOFA, in the turkiſh cuſtoms, a bench of wood raiſed from the ground about a foot high, and placed round a hall or chamber for the people to ſit down upon, or to lie along, and in that poſture to take a view of what paſſes in the ſtreets, *&c.* for theſe benches are ſurrounded with windows; they are covered with fine turky carpets; and upon that are placed cuſhions of ſattin flowered with gold, or ſome other rich ſtuff.

SOFALA, the capital of the territory of that name in Africa, ſituated at the mouth of the river Sofala, in eaſt long. 35°, ſouth lat. 20°.

SOFFITA, or SOFFIT, in architecture, any plafond or ceiling formed of croſs beams of flying corniches, the ſquare compartiments or pannels of which are enriched with ſculpture, painting or gilding; ſuch are thoſe in the palaces of Italy, and in the apartments of Luxembourg at Paris. This word is particularly uſed for the under ſide or face of an architrave, and for that of the corona or larmier, which the antients called lacunar, the French plafond, and we uſually the drip. It is enriched with compartiments of roſes, and has eighteen drops in the doric order diſpoſed in three ranks, ſix in each, placed to the right-hand of the guttæ, and at the bottom of the triglyphs.

SOFI, or SOPHI. See the article SOPHI.

SOFTENING, in painting, the mixing and diluting of colours with the bruſh or pencil. To ſoften deſigns in black and white made with the pen, *&c.* ſignifies to weaken the tint. To ſoften a portrait, according to Felibien, is to change ſome of the ſtrokes, and give a greater degree of ſweetneſs and ſoftneſs to the air thereof, which before had ſomething rough and harſh in it.

SOGDIANA, a country of Aſia, ſituated on the north ſide of the river Oxus, which ſeparated it from antient Bactria, now a part of Uſbec Tartary.

SOGETTO, SUBJECT, in muſic, is uſed for a ſong or melody, above or below which ſome counterpoint is to be made: a counterpoint above the ſubject, is when the lower part is the ſubject; in this ſenſe it is called canto fermo, When the counterpoint is made below the ſubject, the upper part is the ſubject. If this ſubject does not change the figure or ſituation of notes, be it above or below the counterpoint, it is called the invariable ſubject, and if it changes, the variable ſubject. Sogetto is alſo uſed for the words to which ſome compoſitions is to be adapted. And, laſtly, this word is made uſe of for a ſucceſſion of many notes of one, two, or more meaſures, diſpoſed in ſuch a manner as to form one or more fugues. See COUNTERPOINT, *&c.*

SOHAM, a market-town of Cambridgeſhire, ſituated on a lake called Soham Meer, in the iſle of Ely, fourteen miles north-eaſt of Cambridge.

SOIGNIES, a town of the auſtrian Netherlands, ſituated in the province of Hainault, ten miles north-eaſt of Mons.

SOIL, *ſolum*, in agriculture and gardening, denotes earth or ground conſidered with regard to the quality of its mould for the production and growth of vegetables. See the article EARTH.

The land of England, as conſidered by the farmer, is reduced into nine ſorts of ſoil: the ſandy, the gravelly, the chalky, the ſtony, the rocky, the hazely, the black earth, the marſh, and the clay-land. See the articles SAND, GRAVEL, *&c.*

Mortimer obſerves, that theſe ſoils, in many places, are mixed and blended together, and that where it is ſo, it is much better than where they are ſeparate or ſingle; eſpecially where the mixtures happen to be of a right kind, as thoſe of the hot and the dry ſoils blended with the cold and the moiſt. Nature does this often, and art may imitate it. All ſands are hot, and all clays are cold, and therefore the laying clay upon ſandy lands, and ſand upon clayey lands, is the beſt of all manure: this alters and changes for the better the very nature of the land itſelf, whereas dung only improves it for a time, and after that leaves it as bad as it was before. Mixt ſoils, that tend to the clayey-kind, are the beſt of all others for corn. It is not only

only the natural ſoil we are to conſider, but the depth of it, and what ſoil is underneath; for the richeſt ſoil, if it be only eight or ten inches deep, and lies upon a cold clay, or upon ſtone, will not be ſo fruitful to the farmer as the leaner ſoils that lie upon better underſtrata. Gravel or ſand are the beſt under-ſtrata of all others, to make the land above prolific.

Cold and wet clays are much more fruitful in the ſouthern parts of England, than in the north. The climates, therefore, are to be conſidered, and the quantities or proportions of the different kinds in the mixed ſoils.

The greateſt article, in the culture of plants, trees, &c. is the ſoil; and in many caſes it is not ſufficient, when having found a ſoil, which once tried proves convenient, to ſuppoſe that it will always continue ſo. In track of time the ſoil, which was once proper for the nouriſhment of ſome peculiar vegetable, loſes its virtue; and this ſooner in ſome lands, and later in others. All who are converſant in huſbandry, are well acquainted with this. If a good piece of ground be choſen for the ſowing of wheat, and it produces very well the firſt year, it will not for ever continue to do ſo; the ſecond year's crop will be perhaps good, and the third and fourth tolerable: all this while the land is in heart, as the farmers expreſs it, but after this it becomes improper, and very little wheat will be raiſed if ſown upon it; yet when it refuſes to produce wheat, it will, without any alteration, produce barley in ſufficient plenty for ſome years; when it will yield no more good crops of barley, it may be ſtill ſowed with oats, and will produce that grain as well as freſh land; and when it has been worn out with all theſe, it will produce peaſe. After this it is made quite barren, and can be of no farther uſe to the farmer, the vegetative quality of it being worn off by theſe ſucceſſive crops, each ſort of grain taking off that part which is more peculiarly fitted for its own nouriſhment; the wheat firſt, and the reſt in their order.

Mr. Tull thinks, that the only difference of ſoil, except the richneſs, ſeems to be the different heat and moiſture it has; for that if theſe be rightly adjuſted, any ſoil will nouriſh any ſort of plant; for let thyme and ruſhes change places, and both will die; but let them change their ſoil, by removing the earth wherein the thyme grew from the dry hill down to the watry bottom, and plant ruſhes therein, and carry the moiſt earth wherein the ruſhes grew up to the hill, and there thyme will grow in the earth that was taken from the ruſhes, and ſo will the ruſhes grow in the earth that was taken from the thyme; ſo that it is only more or leſs water that makes the ſame earth fit for the growth of thyme or ruſhes; for our earth, when it has in the ſtove the juſt degree of heat that each ſort of plant requires, will maintain plants brought from both the Indies.

The ſame writer obſerves, that as we have no way to enrich the ſoil but by pulveration of manure, or of inſtruments, ſo nature has ordained that the ſoil ſhall be exhauſted by nothing but by the roots of plants.

There is a kind of hazely earth, Mortimer obſerves, with a rediſh caſt, frequent in Eſſex and ſome other countries, which approaches to the nature of loam, and is called by the farmers brickiſh-ſoil: the beſt produce of this earth is rye; if well dug it will bear white-oats, turnips, barley, wheat, buck-wheat, and peaſe; the natural produce in weeds, is broom, fern, quick-graſs, and the like. If it be well dunged, it will produce large crops of clover, but it ſoon wears out of it, and therefore ſhould be ſowed mixed with rye-graſs. The beſt manure for theſe lands is chalk mixed with coal-aſhes; marle makes a great improvement in them, and there is a ſtiff yellow kind of clay that moulders with the froſt, and anſwers the ſame purpoſe.

SOISSONS, a city of France, in the province of the iſle of France, ſituated on the river Ayſe, fifty-five miles north-eaſt of Paris.

SOIT FAIT COMME IL EST DESIRE', *be it done as it is deſired*, a form uſed when the king gives the royal aſſent to a private bill preferred in parliament.

SOK, SOKE, or SOC, in our antient cuſtoms. See the article SOC.

SOL, in muſic, the fifth note of the gammut, *ut, re, mi, fa, ſol, la*. See GAMMUT.

SOL, or SOU, a french coin made up of copper mixed with a little ſilver. See the article COIN.

SOL, the SUN, in aſtronomy, aſtrology, &c. See the article SUN.

SOL, in chemiſtry, is gold, thus called from an opinion that this metal is in a particular manner under the influence of the ſun. See the article GOLD.

SOL, in heraldry, denotes Or, the golden colour in the arms of ſovereign princes. See the article OR.

SOLÆUS, or SOLARIS, in anatomy, one of the extenſor muſcles of the foot, riſing from the upper and hinder part of the tibia and fibula. This is a large and fat muſcle, thicker at the middle than at the edges, and is nearly of an oval figure.

SOLANOIDES, in botany, the name of a plant otherwiſe called rivinia. See the article RIVINIA.

SOLANUM, NIGHT-SHADE, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle rotated petal; the fruit is a round ſmooth berry, punctuated at the top, and formed into two cells; the receptacle is fleſhy and convex on both ſides, and the ſeeds are numerous and roundiſh.

This genus comprehends the ſolanum, melongena and lycoperſicon of authors; or the common night-ſhade, the woody night-ſhade, the love-apple, and the mad-apple, *&c.*

Common night-ſhade is uſed to allay inflammations, to ſoften and relax the fibres which undergo too violent a tenſion; they apply the bruiſed herb to the piles, or bathe the part with the juice a little warmed: this juice is ſaid to be proper in wounds where the blood is extravaſated and grumous; it is alſo ſudorific and diuretic, expelling gravel from the kidneys.

SOLAR, ſomething belonging to the ſun: thus the ſolar ſyſtem is that ſyſtem of the world wherein the heavenly bodies are made to revolve round the ſun as the center of their motion. See COPERNICAN. Alſo the ſolar year is that conſiſting of of three hundred and ſixty-five days, five hours, and forty-nine minutes, in oppoſition to the lunar year, conſiſting of three hundred and fifty-four days. See YEAR. For the ſolar month, ſolar cycle, ſolar eclipſe, *&c.* ſee the articles MONTH, CYCLE, ECLIPSE, *&c.*

SOLDAN. See the article SULTAN.

SOLDANIA BAY, a bay of the Atlantic ocean, ſituated on the ſouth-weſt coaſt of Africa, in eaſt long. 15°, ſouth latitude 33° 30′.

SOLDANELLA, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal of a campanulated form, and jagged at the edge; the fruit is an oblong cylindric capſule, obliquely ſtriated, containing only one cell, and opening in ten places at the point; the ſeeds are numerous, acuminated, and ſmall; the receptacle columnar and free.

SOLDER, SODDER, or SODER, a metalic or mineral compoſition uſed in ſoldering or joining together other metals. See the next article.

Solders are made of gold, ſilver, copper, tin, biſmuth, and lead; uſually obſerving, that in the compoſition there be ſome of the metal that is to be ſoldered mixed with ſome higher and finer metals. Goldſmiths uſually make four kinds of ſolder, *viz.* ſolder of eight, where to ſeven parts of ſilver there is one of braſs or copper; ſolder of ſix, where only a ſixth part is copper; ſolder of four, and ſolder of three. It is the mixture of copper in the ſolder that makes raiſed plate come always cheaper than flat. The ſolder uſed by plumbers is made of two pounds of lead to one of block-tin. Its goodneſs is tried by melting it and pouring the bigneſs of a crown-piece upon a table; for if good, there will ariſe little bright ſhining ſtars therein. The ſolder for copper is made like that of the plumbers, only with copper and tin; for very nice works, inſtead of tin they ſometimes uſe a quantity of ſilver. Solder for tin is made of two thirds of tin and one of lead; but where the work is any thing delicate, as in organ pipes, where the juncture is ſcarce diſcernable, it is made of one part of biſmuth and three parts of pewter.

SOLDERING, among mechanics, the joining and faſtening together two pieces of the ſame metal, or of two different metals, by the fuſion and application of ſome metalic compoſition on the extremities of the metals to be joined. See the laſt article.

To ſolder upon ſilver, braſs or iron: take ſilver, five penny-weight; braſs, four penny-weight; melt them together for ſoft ſolder, which runs ſooneſt. Take ſilver, five penny-weight; copper, three penny-weight; melt them together for hard ſolder. Beat the ſolder thin, and lay it on the place to be ſoldered, which muſt be firſt fitted and bound together with wire, as occaſion requires; then take borax in powder, and temper it like pap, and lay it upon the ſolder, letting it dry; then cover it with quick coals, and blow, and it will run immediately; take it preſently out of the fire, and it is done. It is to be obſerved, that if any thing is to be ſoldered in two places, which

which cannot well be done at one time, you muſt firſt ſolder with the harder ſolder, and then with the ſoft; for if it be firſt done with the ſoft, it will unſolder again before the other is ſoldered. Let it be obſerved, that if you would not have your ſolder run about the piece that is to be ſoldered, you muſt rub ſuch places over with chalk.

In the ſoldering either of gold, ſilver, copper, and all the metals before-mentioned, there is generally uſed borax in powder, and ſometimes roſin. As to iron, it is ſufficient that it be heated red hot, and the two extremities thus hammered together, by which means they will become incorporated into one another.

SOLDIER, a military man liſted to ſerve a prince or ſtate, in conſideration of a certain daily pay.

The ſoldiers are properly the land forces of a kingdom or ſtate; but in England it is againſt the antient law to keep an army of ſoldiers in time of peace. Where any ſoldier that is lawfully retained ſhall depart from his colours without licence, he is declared to be guilty of felony by 18 Hen. VI. c. 9. and every ſoldier who either cauſes a mutiny or deſerts the ſervice, ſhall be puniſhed with death or otherwiſe, as a court-martial ſhall think fit. Alſo perſons ſuſpected of deſertion, are to be apprehended by conſtables, who ſhall be allowed a reward of 20s. for every ſuch deſerter. See the article DESERTER.

By the 4 Geo. I. c. 4. it is ordained, that no ſoldier ſhall be taken out of the ſervice by any proceſs at law, unleſs it be for ſome criminal matter, or where the debt he owes amounts to 10l. at the leaſt, of which affidavit is to be made, *&c.* Soldiers muſt be quartered in inns and alehouſes only, and not in private houſes, without the conſent of the owners, under certain penalties: and where victuallers refuſe ſoldiers quartered on them, or conſtables receive any reward for excuſing their neglect, they forfeit a ſum not above 5l. nor under 30s. by 3 Geo. II. c. 2. A perſon inliſted for a ſoldier, within four days after, is to be carried before the next juſtice or chief magiſtrate of a town, and is to declare his aſſent that he liſted voluntarily, *&c.* but if he then diſſents thereto, on his returning the money received, and paying 20s. he may be diſcharged. In caſe any ſubject of Great Britain or Ireland ſhall liſt or enter himſelf, or procure any one to be enliſted a ſoldier to go beyond the ſeas, without leave obtained from his majeſty, ſuch perſon ſhall be puniſhed as a felon by 8 and 9 Geo. II. There are acts annually made for puniſhing mutiny, *&c.* of ſoldiers and falſe muſters, and for the better payment of the army and their quarters, *&c.* See COURT-MARTIAL.

SOLDURII, in antiquity, a kind of military clients or retainers to the great men in Gaul, particularly in Aquitania, mentioned by Cæſar. The ſoldurii were people who ſhared all the good and ill fortune of their patrons, to whom if any diſaſter happened, they either underwent the ſame, or killed themſelves; and Cæſar aſſures us, that no one had been ever known to refuſe the alternative. Vigenere takes them to have been more than common ſoldiers, and to be even gentlemen in penſion, or appointment.

SOLE, in the manege, a nail or ſort of horn under a horſe's foot, which is much more tender than the other horn that incompaſſes the foot, and by reaſon of its hardneſs is properly called the horn or hoof. A horſe's ſhoe ought to be ſo ſet upon the hoof as not to bear upon the ſole, for otherwiſe the ſole would be hurt, and not only make the horſe lame, but corrupt the fleſh that ſeparates it from the coffin-bone. To take out the ſole, is to do it without touching the horn of the hoof; or if you take off the horn, you make a hoof-caſt.

SOLEA, the SOAL FISH. See SOAL.

SOLEÆ, among the Romans, a kind of ſandals or ſlippers which covered only the ſole of the feet, and were bound on with thongs of leather, inſtead of which the women and the effeminate ones of the other ſex tied them on with purple-coloured ribbons, or ſuch as were variouſly adorned with gold and ſilver.

SOLECISM, *ſoloeciſmus*, in grammar, a falſe manner of ſpeaking contrary to the uſe of language and the rules of grammar, either in reſpect of declenſion, conjugation, or ſyntax.

SOLEMN, *ſolennis*, ſomething performed with much pomp, ceremony, and expence: thus we ſay, ſolemn feaſts, ſolemn funerals, ſolemn games, *&c.* See the articles FEAST, FUNERAL, *&c.*

In law, ſolemn ſignifies ſomething authentic, or that is cloathed in all its formalities.

SOLEN, or RAZOR-SHELL, in ichthyology, a genus of ſhells of a bivalve, oblong

oblong and ſomewhat rounded figure, with both the extremities open; the animal inhabiting it is a tethys. See the article TETHYS.

There are ſeveral ſpecies of the ſolen, ſome whereof are ſtraight, others crooked, ſome red, others variegated with brown and blue, ſome brown and white, others of a violet-purple colour: this laſt is a beautiful ſmooth ſhell, from three to ſix inches long, and from one third to three quarters of an inch in diameter. There is alſo another not inelegant ſpecies, variegated with brown and blue, and a little arcuated. See plate CCLV. fig. 3.

SOLET and DEBET, words uſed in writs, *&c.* to recover rights, *&c.* See DEBET.

SOLE-TENANT, one that holds lands, *&c.* in his own right only, without any other perſon joined. A perſon muſt be ſeiſed of a ſole eſtate to deviſe the ſame by will, or for the wife to have a dower therein, *&c.* And where a man and his wife hold land for their lives, the remainder to their ſon, in that caſe if the man dies the lord ſhall not have heriot, becauſe he does not die ſole-tenant.

SOLFAING, in muſic, the naming or pronouncing the ſeveral notes of a ſong by the ſyllables *ut, re, mi, fa, ſol,* &c. and in learning to ſing it.

Of the ſeven notes in the french ſcale *ut, re, mi, fa, ſol, la, ſi,* only four are uſed among us in ſinging, as *mi, fa, ſol, la:* their office is principally in ſinging, that by applying them to every note of the ſcale, it may not only be pronounced with more eaſe, but chiefly that by them the tones and ſemitones of the natural ſcale may be better marked out and diſtinguiſhed. This deſign is obtained by the four ſyllables *fa, ſol, la, mi.* Thus from *fa* to *ſol* is a tone, alſo from *ſol* to *la,* and from *la* to *mi,* without diſtinguiſhing the greater or leſs tone; but from *la* to *fa,* alſo from *mi* to *fa,* is only a ſemitone. If then theſe be applied in this order, *fa, ſol, la, fa, ſol, la, mi, fa,* &c. they expreſs the natural ſeries from C; and if that be repeated to a ſecond or third octave, we ſee by them how to expreſs all the different orders of tones and ſemi-tones in the diatonic ſcale; and ſtill above *mi* will ſtand *fa, ſol, la,* and below it the ſame inverted *la, ſol, fa,* and one *mi* is always diſtant from another an octave, which cannot be ſaid of any of the reſt, becauſe after *mi* aſcending come always *fa, ſol, la, fa,* which are repeated invertedly deſcending.

To conceive the uſe of this, it is to be remembered, that the firſt thing in learning to ſing, is to make one raiſe a ſcale of notes by tones and ſemi-tones to an octave, and deſcend again by the ſame; and then to raiſe and fall by greater intervals at a leap, as thirds and fourths, *&c.* and to do all this by beginning at notes of different pitch. Then thoſe notes are repreſented by lines and ſpaces, to which theſe ſyllables are applied, and the learners taught to name each line and ſpace thereby, which makes what we call ſolfaing, the uſe whereof is, that while they are learning to tune the degrees and intervals of ſound, expreſſed by notes on a line or ſpace, or learning a ſong to which no words are applied, they may not only do it the better by means of articulate ſounds, but chiefly, that by knowing the degrees and intervals expreſſed by thoſe ſyllables, they may more readily know the places of the ſemi-tones, and the true diſtance of the notes. See the article SINGING.

SOLICITOR, or SOLLICITOR, *ſolicitator,* a perſon employed to take care of, and manage ſuits depending in the courts of law or equity; and thoſe of the lower ſort, it is obſerved, are too often made uſe of, to the damage of the people, and the increaſe of champerty and maintenance. Solicitors are within the ſtatute to be ſworn and admitted by the judges, before they are allowed to practiſe in our courts, in like manner as attornies.

There is alſo a great officer of the law, next to the attorney-general, who is ſtiled the king's ſolicitor-general; who holds his office by patent, during the king's pleaſure; has the care and concern of managing the king's affairs, and has fees for pleading, beſides other fees ariſing by patents, *&c.* He hath his attendance on the privy council; and the attorney-general and he were antiently reckoned among the officers of the exchequer; they have their audience, and come within the bar in all other courts.

SOLID, in philoſophy, a body whoſe parts are ſo firmly connected together, as not to give way, or ſlip from each other upon the ſmalleſt impreſſion: in which ſenſe ſolid ſtands oppoſed to fluid. See the article FLUID and BODY.

Geometricians define a ſolid to be the third ſpecies of magnitude, or that which has three dimenſions, *viz.* length, breadth, and thickneſs or depth.

A ſolid

Fig. 1. SOLID of least resistance

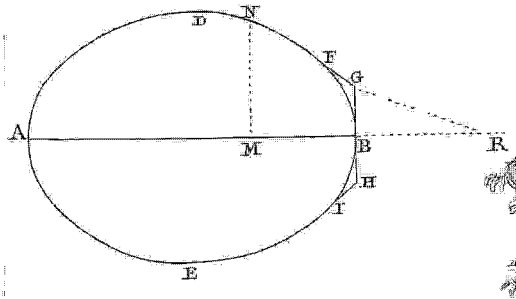

Fig. 2. SOLIDAGO, GOLDEN ROD

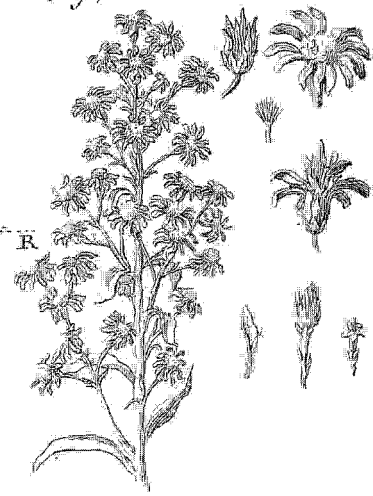

Fig. 3. SONCHUS, the SOW-THISTLE

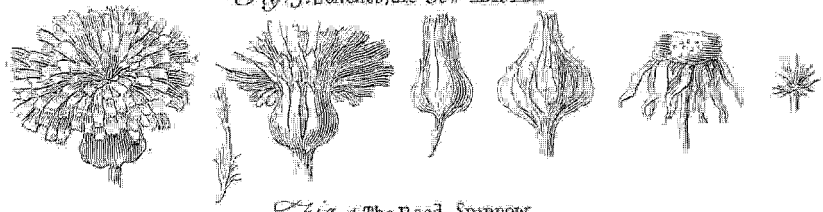

Fig. 4 The Reed-SPARROW

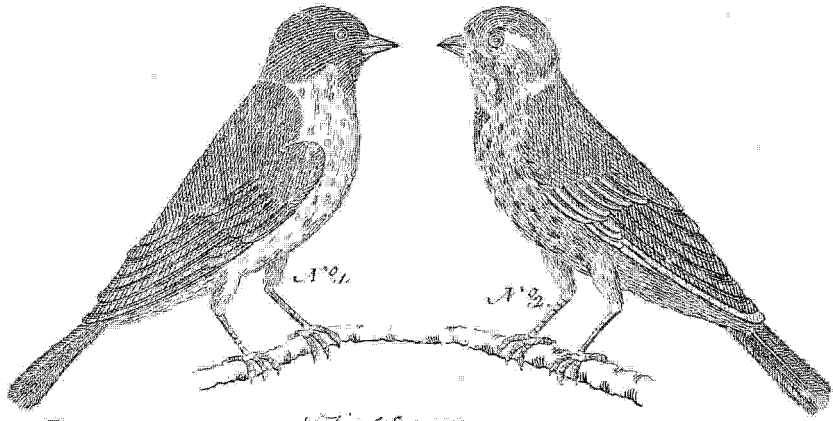

Fig. 5. SPATULA

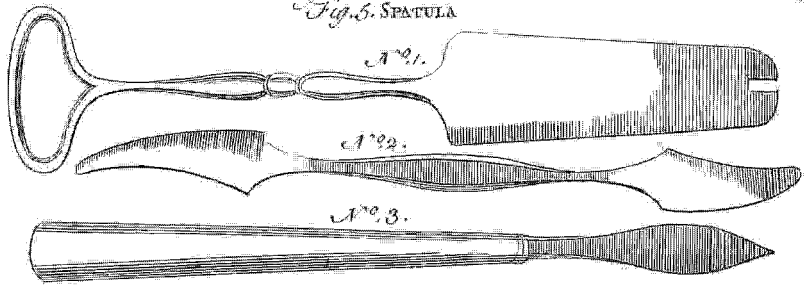


T. Jefferys sculp

A ſolid may be conceived to be formed by the revolution, or direct motion, of a ſuperficies of any figure whatever, and is always terminated or contained under one or more planes or ſurfaces, as a ſurface is under one or more lines.

Solids are commonly divided into regular and irregular. The regular ſolids are thoſe terminated by regular and equal planes, and are only five in number, *viz.* the tetrahedron, which conſiſts of four equal triangles; the cube, or hexahedron, of ſix equal ſquares; the octahedron, of eight equal triangles; the dodecahedron, of twelve; and the icoſihedron, of twenty equal triangles. See the articles TETRAHEDRON, CUBE, *&c.*

The irregular ſolids are almoſt infinite, comprehending all ſuch as do not come under the definition of regular ſolids; as the ſphere, cylinder, cone, parallelogram, priſm, parallelopiped, *&c.* See the article SPHERE, CYLINDER, *&c.*

SOLID *of leaſt reſiſtance.* Sir Iſaac Newton, in his Principia, ſhews, that if there be a curve figure, as DNFG (plate CCLVI. fig. 1.) of ſuch a nature, as that from any point, as N, taken in its circumference, a perpendicular NM be let fall on the axis AB; and if from a given point, as G, there be drawn the right line GR, parallel to a tangent to the curve in the point N, cutting the axis produced in R, and the proportion then be, as $NM : GR :: GR^3 : 4BG \times GR$; the ſolid generated by the revolution of this curve about its axis AB, when moved ſwiftly in a rare and elaſtic medium, will meet with leſs reſiſtance from the medium, than any other circular ſolid whatever, of the ſame length and breadth.

SOLID ANGLE, is that formed by three or more planes meeting in a point, like the point of a diamond well cut.

SOLID BASTION. See BASTION.

SOLID NUMBERS, are thoſe which ariſe from the multiplication of a plane number, by any other whatſoever; as 18 is a ſolid number made of 6 (which is plane) multiplied by 3; or of 9 multiplieed by 2.

SOLID PROBLEM, in mathematics, is one which cannot be geometrically ſolved unleſs by the interſection of a circle and a conic ſection: or, by the interſection of two other conic ſections, beſides the circle.

As to deſcribe an iſoſceles triangle on a given right line, whoſe angle at the baſe ſhall be triple to that at the vertex.

This will help to inſcribe a regular heptagon in a given circle; and may be reſolved by the interſection of a parabola, and a circle.

This problem alſo helps to inſcribe a nonagon in a circle; and may be ſolved by the interſection of a parabola, and an hyperbola between its aſymptotes, *viz.*

To deſcribe an iſoſceles triangle, whoſe angle at the baſe ſhall be quadruple of that at the vertex.

And ſuch a problem as this hath four ſolutions, and no more; becauſe two conic ſections can cut one another but in four points.

Line of SOLIDS, on the ſector. See the article SECTOR.

SOLIDS, in anatomy, *&c.* denote the continent parts of the human body; being a congeries of pipes, or veſſels, which contain a liquor.

The ſolid parts of the body, though equally compoſed of veſſels, are different with regard to their conſiſtence; ſome being hard, and others ſoft. The hard, as the bones and cartilages, give firmneſs and attitude to the body, and ſuſtain the other parts: the ſoft parts, either alone, or together with the hard, ſerve to execute the animal functions.

The ſolids are commonly divided into ſimilar or ſimple; and diſſimilar, compounded, or organic. The ſimilar parts are the fibres, membranes, bones, cartilages, ligaments, muſcles, tendons, aponeuroſes, glands, arteries, veins, nerves, the ſecretory and excretory canals, and the common integuments. See the articles FIBRE, MEMBRANE, *&c.*

The diſſimilar are ſuch as are compoſed of the former, as the viſcera and other parts of the body, *viz.* the head, neck, thorax, abdomen, and extremities: every one of which is again ſubdivided into leſſer portions. See the articles HEAD, THORAX, INTESTINES, *&c.*

SOLIDAGO, GOLDEN ROD, in botany, a genus of the *ſyngeneſia-polygamia-ſuperflua* claſs of plants, the receptacle of which is naked, the down ſimple, and the radii of each corollula about five in number: add to this, that the ſquamæ of the cup are imbricated and cloſed.

The flowers of the golden-rod are of the radiated kind, the diſc of which is covered with floſcules and ſemi-floſcules, as repreſented in plate CCLVI. fig. 2.

Golden-rod grows wild in heaths and woods, producing ſpikes of yellow flowers

in

in Auguſt: its leaves, which have a moderately aſtringent and bitter taſte, are eſteemed good in diſorders ariſing from debility and laxity of the viſcera.

SOLIDITY, *ſoliditas*, that property of matter, or body, by which it excludes all other bodies from the place which itſelf poſſeſſes: and as it would be abſurd to ſuppoſe, that two bodies could poſſeſs one and the ſame place at the ſame time, it follows, that the ſofteſt bodies are equally ſolid with the hardeſt. See the articles MATTER and IMPENETRABILITY.

Among geometricians, the ſolidity of a body denotes the quantity or ſpace contained in it, and is called alſo its ſolid content, which may be ſeen under the ſeveral articles CUBE, CYLINDER, SPHERE, PYRAMID, CONE, &c.

SOLIDITY, in architecture, is applied both to the conſiſtence of the ground, whereon the foundation of a building is laid; and to a maſſive in maſonry, of extraordinary thickneſs, without any cavity within.

SOLILOQUY, *ſoliloquium*, a reaſoning or diſcourſe which a man holds with himſelf; or, more properly, according to Papias, it is a diſcourſe by way of anſwer to a queſtion, that a man propoſes to himſelf.

Soliloquies are become very common things on the modern ſtage; yet can nothing be more inartificial, or more unnatural, than an actor's making long ſpeeches to himſelf, to convey his intentions to the audience. Where ſuch diſcoveries are neceſſary to be made, the poet ſhould rather take care to give the dramatic perſons ſuch confidants as may neceſſarily ſhare their inmoſt thoughts, by which means they will be more naturally conveyed to the audience: yet is even this a ſhift, an accurate poet would not be found to have occaſion for. The uſe and abuſe of ſoliloquies is well delivered by the duke of Buckingham, in the following lines:

Soliloquies had need be very few,
Extremely ſhort, and ſpoke in paſſion too.
Our lovers talking to themſelves, for want
Of others, make the pit their confidant:
Nor is the matter mended yet, if thus
They truſt a friend, only to tell it us.

SOLINGEN, a town of Germany, in the circle of Weſtphalia and dutchy of Berg, fifteen miles ſouth-eaſt of Duſſeldorp.

SOLIS VIA. See the article VIA.

SOLITARY, *ſolitarius*, ſomething retired, or in private, remote from the company or commerce of others of the ſame ſpecies.

SOLITARIES, a denomination of nuns of St. Peter of Alcantara, inſtituted in 1676, the deſign of which is to imitate the ſevere penitent life of that ſaint: thus they are to keep a continual ſilence, never to open their mouths to any body but themſelves; employ their time wholly in ſpiritual exerciſes, and leave the temporal concerns to a number of maids, who have a particular ſuperior in a ſeparate part of the monaſtery: they always go bare-footed, without ſandals; gird themſelves with a thick cord, and wear no linnen.

SOLITAURILIA. See the article SUOVETAURILIA.

SOLMS, the capital of the county of Solms, in the landgraviate of Heſſe-Caſſel, in Germany, thirty-five miles north of Frankfort.

SOLO, in muſic, a term uſed in pieces conſiſting of ſeveral parts, to mark thoſe that are to perform alone: it is ſometimes denoted by S.

When two or three parts play, or ſing, ſeparately from the grand chorus, they are called a dio ſoli, a tre ſoli, &c.

SOLOMON'S ISLANDS, a cluſter of iſlands in the Pacific ocean, ſituated between 130° and 140° weſt longit. and between 7° and 12° ſouth latitude.

SOLOMON'S SEAL, in botany. See the article POLYGONATUM.

SOLOTHURN, or SOLEURE, one of the cantons of Switzerland, lying between thoſe of Baſil and Bern, the former on the north, and the latter on the ſouth.

The city of Solothurn, capital of the ſaid canton, is ſituated in eaſt long. 7° 15′, and north lat. 47° 18′.

SOLSTICE, in aſtronomy, that time when the ſun is in one of the ſolſtitial points; that is, when he is at his greateſt diſtance from the equator, thus called, becauſe he then appears to ſtand ſtill, and not to change his diſtance from the equator for ſome time; an appearance owing to the obliquity of our ſphere, and which thoſe living under the equator are ſtrangers to.

The ſolſtices are two in each year, the æſtival or ſummer-ſolſtice, and the hyemal or winter-ſolſtice: the ſummer-ſolſtice is when the ſun ſeems to deſcribe the tropic of cancer, which is on June 22, when he makes the longeſt day: the winter-ſolſtice is when the ſun enters the firſt degree, or ſeems to deſcribe the tropic of capricorn, which is on December 22, when

when he makes the ſhorteſt day. See the article TROPIC.

This is to be underſtood as in our northern hemiſphere; for in the ſouthern, the ſun's entrance into capricorn makes the ſummer-ſolſtice, and that into cancer the winter-ſolſtice. See the article GLOBE.

The two points of the ecliptic, wherein the ſun's greateſt aſcent above the equator, and his deſcent below it, are terminated, are called the ſolſtitial points; and a circle, ſuppoſed to paſs through the poles of the world and theſe points, is called the ſolſtitial colure. See the article COLURE.

The ſummer-ſolſtitial point is in the beginning of the firſt degree of cancer, and is called the æſtival or ſummer-point; and the winter-ſolſtitial point is in the beginning of the firſt degree of capricorn, and is called the winter-point. Theſe two points are diametrically oppoſite to each other.

SOLVENT, the ſame with diſſolvent. See the article DISSOLVENT.

SOLUTION, in chemiſtry, denotes an intimate mixure of ſolid bodies with fluids, ſo as ſeemingly to form one homogene liquor: the diſſolving fluid is termed the diſſolvent or menſtruum. See the articles DISSOLVENT and MENSTRUUM.

The principles of ſolution have been already explained under the article MENSTRUUM.

As to the manner of effecting ſolutions, it varies according to the different ſolvents uſed for that purpoſe, and is reduced to the following heads by Boerhaave: 1. Solution is perſormed by water, by diluting, infuſing, boiling, diſtilling, mixing, fermenting, putrefying, and ſeparating. 2. With oil, by diluting, infuſing, boiling, diſtilling, mixing, ſeparating; but not by fermenting, or by putrefying. 3. With fire, by calcining, roaſting, burning, melting, ſubliming, mixing, ſeparating, and promoting ſeveral other operations. 4. With the aſſiſtance of air, by fermenting, putrefying, agitating, exciting, and adding other parts capable of diſſolving. 5. With fermented ſpirits, by diluting, infuſing, boiling, diſtilling, mixing, and making oils thinner. 6. With alkaline ſalts, by calcining, torrefying, burning, melting, mixing, and ſeparating, according to the various force of a dry fire employed. 7. By volatile alkaline ſalts, by ſubliming in the dry way; and by diluting, diſtilling, and digeſting in the moiſt way. 8. With fixed alkaline ſalts, aſſiſted and moved by water and fire, by digeſting, boiling, diluting, ſeparating, and mixing. 9. With fixed acid ſalts, as thoſe of alum, ſulphur, and vitriol; either ſeparately in a liquid form, or in their calxes, by diluting, boiling, diſtilling, digeſting: or in a dry form, by calcining, roaſting, burning, and diſtilling. 10. With volatile acid ſalts, by diluting, digeſting, diſtilling and inſinuating. 11. With compound ſalts and ſoaps, by calcining, ſubliming, diſtilling, and digeſting, either in a dry or a liquid form. 12. With metals, by fuſion and amalgamation. See the articles DILUTING, DISTILLING, &c.

In pharmacy, however, the principal menſtrua are water, vinous ſpirits, oils, and acid and alkaline liquors.

Water is the diſſolvent of all ſalts, vegetable gums, and of animal jellies: of the firſt it diſſolves only a determinate quantity, though of one kind of ſalt more than another; and being thus ſaturated, leaves any additional quantity of the ſame ſalt untouched: but it is never ſaturated with the two latter, uniting readily with any proportions of them and forming, with different quantities liquors of different conſiſtencies. When aſſiſted by trituration, it likewiſe diſſolves the vegetable gummy reſins, as ammoniacum and myrrh; the ſolutions of which, though imperfect, or not tranſparent, but turbid and of a milky hue, are nevertheleſs applicable to valuable purpoſes in medicine.

Rectified ſpirit of wine diſſolves the eſſential oils and reſins of vegetables, the pure diſtilled oils of animals, and ſoaps; though it does not act upon the exſiccated oil and fixed alkaline ſalt of which ſoap is made: it alſo, by the aſſiſtance of heat, diſſolves volatile alkaline ſalts, but more eſpecially the neutral ones, as the diureticus, &c.

Oils diſſolve vegetable reſins and balms, wax, animal fats, mineral bitumen, ſulphur, and certain metallic ſubſtances, particularly lead: however, the exſiccated oils are more powerful menſtrua for moſt of theſe bodies, than the oils obtained by diſtillation; becauſe the former are more capable of ſuſtaining, without injury, a ſtrong degree of heat, which, in moſt caſes, is neceſſary to enable them to act.

Acids

Acids diſſolve alkaline ſalts and earths, and metallic ſubſtances: however, the different acids differ greatly in their action upon theſe laſt. The vegetable acids diſſolve a conſiderable quantity of zinc, iron, copper, and tin; and extract ſo much from the metallic part of antimony as to become powerfully emetic: they likewiſe diſſolve lead, if previouſly calcined; but more copiouſly, if corroded by their ſteam. The marine acid diſſolves zinc, iron, and copper; and though it ſcarce acts upon any other metallic ſubſtance, in the common way, may nevertheleſs be artfully combined with them all, except gold: ſuch is the corroſive ſublimate of the ſhops. The nitrous acid is the common menſtruum of all metallic ſubſtances, except gold and the antimonial ſemi-metal, which are ſoluble only in a mixture of the nitrous and marine acids, called aqua regia. The vitriolic acid eaſily diſſolves zinc, iron, and copper: and may be made to corrode, or imperfectly diſſolve, moſt of the other metals. See ACID.

Alkaline lixivia diſſolves oils, reſins, and ſulphur; but their power is greatly promoted by the addition of quick-lime, as is evident in the making of ſoap and the common cauſtics. Thus aſſiſted, they reduce the fleſh, bones, and other ſolid parts of animals, into a gelatinous matter.

Solutions made in water and in ſpirit of wine, poſſeſs the virtues of the bodies diſſolved: whereas oils generally blunt its activity, and acids and alkalies alter natural qualities. Hence watery and ſpirituous liquors are the only proper menſtrua of the native virtues of vegetable and animal matters.

Moſt of the foregoing ſolutions are eaſily effected by pouring the menſtruum on the body to be diſſolved, and ſuffering them to ſtand together, for ſome time, expoſed to a ſuitable warmth: a ſtrong heat is generally neceſſary to enable oils and alkaline liquors to perform their office. The action of acids is uſually accompanied with heat, effervescence, and a copious diſcharge of fumes. And as theſe fumes, which ariſe during the diſſolution of ſome metals in the vitriolic acid, are inflammable, the operator ought to be careful, leſt, by the imprudent approach of a candle, the exhaling vapour take fire.

Solution is much facilitated, by powdering ſuch tenacious bodies as are friable; and ſlicing, or raſping, into ſmall parts ſuch whoſe texture does not admit of being powdered: this, in ſome caſes, is of ſuch importance, that the operation proves extremely tedious, if it be neglected. In ſolutions of metals, earths, or ſalts, with acid ſpirits, care ſhould be taken not to mix them too haſtily, otherwiſe the ebulition will cauſe the mixed liquor to overflow the veſſels; and, in ſome caſes, the unmanageable heat, together with the noxious fumes, will give the operator great embarraſſment.

But beſides the ſolutions made by adding fluid menſtruums to the bodies to be diſſolved, there is another kind, called deliquiation, or ſolution per deliquium, in which the moiſture of the air is the menſtruum. It is performed by expoſing the matter to be diſſolved to the air, in cellars, or other damp places; for fixed alkaline and neutral ſalts, and ſome metallic ſalts, being thus expoſed, attract its humidity, and at length become liquid. Some ſubſtances, not diſſoluble by the application of water in its groſſer form, as the butter of antimony, are eaſily liquified by this ſlow action of the aerial moiſture. See ANTIMONY.

SOLUTION, in algebra and geometry, is the anſwering a queſtion, or the reſolving any problem propoſed. See the articles ALGEBRA and GEOMETRY.

SOLUTION *of continuity*, in ſurgery, is the ſeparation of the natural coheſion of the ſolid parts of the body, by a wound. See CONTINUITY and WOUND.

SOLUTIVE, an appellation given to laxative and looſening medicines. See the article LAXATIVE.

Solutive tartar is a preparation of tartar, made by boiling eight ounces of cream of tartar with four ounces of fixed ſalt of tartar. See TARTAR.

SOMERSETSHIRE, a county of England, ſituated on the Briſtol-channel, and bounded by Wiltſhire, on the eaſt; by Dorſetſhire, on the ſouth; and by Devonſhire, on the weſt: it is famous for the cloth manufacture.

SOMERTON, a market-town of Somerſetſhire, twelve miles ſouth of Wells.

SOMME, a river of France, which runing from eaſt to weſt through Picardy, by Amiens and Abbeville, falls into the Britiſh-channel near St. Vallery.

SOMMIERS, a town of Languedoc, in France, fourteen miles north-eaſt of Montpelier.

SOMNAMBULI,

SOMNAMBULI, in medicine, perſons who walk in their ſleep, otherwiſe called noctambuli. See NOCTAMBULI.

SOMNIFEROUS, or SOPORIFEROUS. See the article SOPORIFEROUS.

SOMNOLENTUM COMA, in medicine. See the article COMA.

SON, *filius*, an appellation given to a male child, conſidered in the relation he bears to his parents.

A baſtard is termed an illegitimate, or natural ſon. See BASTARD.

SONATA, in muſic, a piece, or compoſition, intended to be performed by inſtruments only; in which ſenſe it ſtands oppoſed to cantata, or a piece deſigned for the voice. See CANTATA.

There are ſonatas from one to eight parts, but uſually they are performed by a ſingle violin, or with two violins and a thorough baſs for the harpſichord, and frequently a more figured baſs for the baſs-viol.

Sonatas, though extremely numerous, are reduced by the Italians to two kinds: 1. Thoſe proper for church-muſic, which uſually begin with a grave and ſolemn motion, and afterwards ſtrike into a briſker and gayer manner: theſe are what they more peculiarly call ſonatas. 2. Thoſe for the chamber, being little pieces for dancing.

SONCHUS, the SOW-THISTLE, in botany, a genus of the *ſyngeneſia-polygamia-æqualis* claſs of plants, the compound flower of which is imbricated and uniform; and the leſſer corollulæ of which it is compoſed, monopetalous, linear, and quinquedentated: the ſtamina are five very ſhort capillary filaments: there is no pericarpium but the cup, which cloſes for that purpoſe, and within it are the ſeeds, ſomewhat oblong, winged with down, and affixed to the thalamus, or receptacle. See plate CCLVI. fig. 3.

Sonchus is accounted cooling and attenuant, and accordingly preſcribed in the ſtranguries, as alſo in inflammations of all kinds, to be applied externally in the form of a cataplaſm.

SONCINO, a town of the dutchy of Milan, in Italy, thirty-three miles eaſt of the city of Milan.

SONDRIO, a town of the Griſons, being the capital of the Valteline: eaſt long. 9° 50′, north lat. 46° 15′.

SONG, in poetry, a little compoſition, conſiſting of eaſy and natural verſes, ſet to a tune in order to be ſung.

The ſong much reſembles the madrigal, and ſtill more the ode, which is nothing but a ſong according to the antient rules. See MADRIGAL and ODE.

The ſubject of a ſong is uſually love or wine; whence M. le Brun defines a modern ſong to be either a ſoft and amorous, or a lively and bacchic thought, expreſſed in a few words. But, be the ſubject of the ſong what it will, the verſes are to be eaſy, flowing, and natural, and muſt contain a certain harmony which neither ſhocks the reaſon or the ear, and which unites poetry and muſic agreeably together.

SONG, in muſic, is applied in general to a ſingle piece of muſic, whether contrived for the voice or an inſtrument. See the article COMPOSITION.

A ſong, ſays Mr. Malcolm, may be compared to an oration: for as, in this latter, there is a ſubject, *viz.* ſome perſon or thing the diſcourſe is referred to, and which is always to be kept in view through the whole; ſo, in every regular and melodious ſong, there is one note which regulates the reſt; wherein the ſong begins, and at laſt ends; and which is, as it were, the principal matter, or muſical ſubject, to be regarded in the whole courſe of the ſong; and this principal or fundamental note is called the key of the ſong. See KEY.

SONNA, a book of mahometan traditions, wherein all the orthodox muſſulmen are required to believe. See SONNITES.

SONNET, in poetry, a compoſition contained in fourteen verſes, *viz.* two ſtanzas, or meaſures, of four verſes each, and two of three; the eight firſt verſes being all in three rhimes.

The ſonnet is of italian origin, and Petrarch is allowed to be its father. It is held the moſt difficult and artful of all compoſitions, as requiring the utmoſt accuracy and exactneſs. It ſhould end with ſome pretty and ingenious thought, and its cloſe ſhould be particularly beautiful, otherwiſe the ſonnet is naught.

SONNITES, among the mahometans, an appellation given to the orthodox muſſulmen, or true believers; in oppoſition to the ſeveral heretical ſects, particularly the ſchiites, or followers of Ali.

The ſonnites are ſo called from their believing in the ſonna, or book of mahometan traditions; which the ſchiites reject as apocryphal. The Turks aſſume the name of ſonnites in oppoſition to the Perſians, who are ſchiites.

SOOP, or SOUP. See SOUP.

SOOT, *fuligo*, a volatile matter, arising from wood, and other fuel, along with the smoke; or rather, it is the smoke itself, fixed and gathered on the sides of the chimney.

Wood-soot is of a shining black colour, a disagreeable smell, and an acrid, bitter and nauseous taste; its chief use, for medicinal purposes, being in hysterical cases, in which it is sometimes exhibited in conjunction with the fetid gums.

The volatile salt and spirit of soot are, when sufficiently purified, not different in quality from those of animal substances; though some prefer them in nervous complaints, and particularly in epileptic cases. The tincture of soot is made thus: take of wood-soot, two ounces; of asa fœtida, one ounce; and proof-spirit, two pints; digest and strain. It is good not only in hysterical cases, but also in epilepsies, and other nervous disorders.

Soot makes an excellent manure for cold lands that have been over run with moss; but the soot of sea-coals is better for this purpose than that of wood. The dyers also make considerable use of soot, for a dun-colour.

SOPE, or SOAP. See SOAP.

SOPHI, or SOFI, a title given to the emperor of Persia; importing as much as wise, sage, or philosopher. There is no prince in the world whose authority is more absolute than that of the sophi of Persia.

SOPHIA is also a city of Turky, in Europe, in the province of Bulgaria: east long. 24°, north lat. 42° 30'.

SOPHISM, *σοφισμα*, in logic, *&c.* an argument which carries much of the appearance of truth, and yet leads into error.

There is some need of a particular description of these fallacious arguments, that we may with more ease and readiness detect and solve them.

1. The first sort of sophism is called ignoratio elenchi; or a mistake of the question. 2. The next sophism is called petitio principii, or a supposition of what is not granted. 3. That sort of fallacy which is called a circle, is very near a-kin to the petitio principii. 4. The next sort of sophism is called non causa pro causa, or the assignation of a false cause. 5. The next is called fallacia accidentis, or a sophism, wherein we pronounce concerning the nature and essential properties of any subject, according to something which is merely accidental to it. 6. The next sophism borders upon the former; and that is when we argue from that which is true, absolutely, simply, and abstracted from all circumstances: this is called, in the schools, a sophism *a dicto secundum quid ad dictum simpliciter*. This sort of sophism has also its reverse; as, when we argue from that which is true, simply and absolutely, to prove the same thing true in all particular circumstances whatsoever. 7. The sophisms of composition and division come next to be mentioned. The sophism of composition is, when we infer any thing concerning ideas in a compound sense, which is only true in a divided sense. The sophism of division is, when we infer the same thing concerning ideas in a divided sense, which is only true in a compounded one. This sort of sophism is committed when the word *all* is taken in a collective and distributive sense, without a due distinction. It is the same fallacy, when the universal word *all*, or *no*, refers to species in one proposition, and to the individuals in another. 8. The last sort of sophisms arises from our abuse of the ambiguity of words, which is the largest and most extensive kind of fallacy; and, indeed, several of the former fallacies might be reduced to this head. When the words or phrases are plainly equivocal, they are called sophisms of equivocation. This sophism, as well as the foregoing, and all of the like nature, are solved by shewing the different senses of the words, terms, or phrases.

But, where such gross equivocations and ambiguities appear in arguments, there is little danger in imposing on ourselves or others; the greatest danger, and what we are perpetually exposed to, in reasoning, is, where the two senses or significations of one term are near a-kin, and not plainly distinguished; and yet are sufficiently different in their sense to lead us into great mistakes, if we are not watchful. And, indeed, the greatest part of controversies, in the sacred or civil life, arise from the different senses that are put upon words, and the different ideas conveyed by them.

There is, after all these, another sort of sophism, which is wont to be called an imperfect enumeration or a false induction, when, from a few experiments or observations, men infer general theorems and universal propositions.

SOPHIST,

SOPHIST, a perſon who uſes ſophiſms, with a view to deceive thoſe he would perſuade or convince. See the preceding article.

SOPHISTICATION, the adulterating any thing with what is not good or genuine; a practice too common in the making up medicines for ſale; as alſo among vintners, diſtillers, and others, who are accuſed of ſophiſticating their wines, ſpirits, oils, &c. by mixing with them cheaper and coarſer materials: and, in many caſes, the cheat is carried on ſo artfully as to deceive the beſt judges. See WINE, SPIRIT, OIL, &c. and the articles HYDROMETER and HYDROSTATICAL BALLANCE.

SOPHORA, in botany, a genus of plants belonging to the *decandria monogynia* claſs, with a papilionaceous flower: its fruit is a very long and ſlender unilocular pod, containing a great many roundiſh ſeeds. It agrees in every thing with the diadelphia and papilionaceous plants, except that its ſtamina is diſtinct and ſeparate.

SOPORIFIC, or SOPORIFEROUS, MEDICINES, are thoſe capable of procuring ſleep, as opiates, &c. See OPIATES, &c.

SOPOROUS, SLEEPY or DROWSY DISEASES, are the coma, lethargy, and carus; to which ſome add the apoplexy. See COMA, LETHARGY, &c.

SOPRON, a city of lower Hungary, thirty miles ſouth of Vienna.

SORA, a town of the kingdom of Naples, fifty miles north of the city of Naples.

SORAW, a town of upper Saxony, near the confines of Sileſia: eaſt long. 15° 20′, north lat. 51° 38′.

SORBON, or SORBONNE, the houſe or college of the faculty of theology, in the univerſity of Paris; ſometimes alſo uſed for the faculty itſelf, becauſe it uſually aſſembles in the houſe of the ſorbon.

SORBUS, the SERVICE and QUICKEN-TREE, in botany, a genus of the *icoſandria-monogynia* claſs of plants, the flower of which conſiſts of five hollow and roundiſh petals; and its fruit is a ſoft, globoſe, and umbilicated berry, containing three oblong and cartilaginous ſeeds.

SORCERY, the crime of witch-craft, or divination by the aſſiſtance of evil ſpirits. See the article WITCH-CRAFT.

SORET, a province of the hither India, lying northwards of Guzerat: its chief town is Jaganat.

SOREX, the SHREW-MOUSE, in zoology. See the article SHREW.

SORGUM, a plant called by Linnæus holcus. See the article HOLCUS.

SORITES, in logic, a ſpecies of reaſoning, in which a great number of propoſitions are ſo linked together, that the predicate of the one becomes continually the ſubject of the next following, till at laſt a concluſion is formed by bringing together the ſubject of the firſt propoſition and the predicate of the laſt: ſuch is the following argument, 'God is omnipotent; an omnipotent being can do every thing poſſible; a being that can do every thing poſſible, can do whatever involves not a contradiction; therefore, God can do whatever involves not a contradiction.'

This combination of propoſitions may be continued to any length we pleaſe, without in the leaſt weakening the ground upon which the concluſion reſts; and the reaſon is, becauſe the ſorites may be reſolved into as many ſimple ſyllogiſms as there are middle terms in it; and the concluſion of the laſt ſyllogiſm is univerſally found to be the ſame with the concluſion of the ſorites. See SYLLOGISM.

SORRANCE, among farriers, a malady incident to horſes; of which there are two kinds: 1. An evil counted twofold, as either an evil ſtate or compoſition of a horſe's body; which is to be obſerved either by the ſhape, number, quantity, or ſight of the member ill affected or diſeaſed. 2. It is uſed for the looſening and diviſion of an unity, which as it may change diverſely, ſo it has divers names accordingly; for if ſuch a looſening and diviſion be in a bone, then it is called a fracture; if in any fleſhy part, a wound or ulcer; if in the veins, a rupture; if in the ſinews, a convulſion or cramp; and if in the ſkin, an excoriation.

Sorrance-water is a ſolution of roman-vitriol and ſome other ingredients, in vinegar: it is much eſteemed as a remedy in many of the diſeaſes of horſes, but eſpecially the ſorrance: whence the name.

SORREL, or COMMON SORREL, *acetoſa*, in botany, a ſpecies of rumex. See the article RUMEX.

The ſeeds of this plant are eſteemed aſtringent and good in diarrhœas, dyſenteries, and hæmorrhages.

Wood-SORREL, *oxalis, oxys*, or *oxyoides*, in botany, a genus of the *decandria-pentagynia* claſs of plants; the corolla of which is divided into five parts, which cohere only by their ungues, and are erect,

obtuſe, and emarginated: the fruit is a pentagonal capſule, containing five cells, with roundiſh ſeeds.

The leaves of wood-ſorrel are of a very agreeable acid taſte, and are recommended in fevers of all kinds, and the ſcurvy: there is a conſerve of them kept in the ſhops, as a refrigerant.

SORREL-COLOUR, in the manege, is a reddiſh colour, generally thought to be a ſign of a good horſe.

SORRENTO, a city and port-town of the kingdom of Naples, eighteen miles ſouth of that city.

SORTILEGE, *ſortilegium*, a ſpecies of divination, performed by means of ſortes or lots.

The ſortes preneſtinæ, famous in antiquity, conſiſted in putting a number of letters, or even whole words, into an urn; and then, after ſhaking them together, they were thrown on the ground, and whatever ſentences could be made out from them conſtituted the anſwer of the oracle.

Another kind of ſortes conſiſted in taking ſome celebrated poet, as Homer or Virgil, and opening the book, whatever preſented itſelf firſt to the eye made the anſwer: and hence it got the name of ſortes homericæ, and ſortes virgilianæ, *&c.*

The ſuperſtitious among the antient chriſtians practiſed a ſimiliar kind of divination, by opening the Old and New Teſtament; whence it got the name of ſortes ſanctorum.

SORY, or RUSMA, in natural-hiſtory, a vitriolic mineral, formed of metalline, ſulphureous, and earthen matter; being truly an ore of blue vitriol, or of the vitriol of copper alone, there not appearing to be a grain of any thing approaching to iron in it.

It is found in looſe maſſes of different ſizes, and moſtly of a blackiſh colour, though ſometimes reddiſh or bluiſh. It is found in many parts of Turky and in Germany, where it is wrought for blue vitriol, which may be ſeparated from it by a very eaſy proceſs, by powdering the ſory, then expoſing it to a moiſt air for three or four days, and laſtly boiling it in ſix times its weight of water: for if this liquor be filtrated and evaporated in the uſual manner to a pellicle, and then ſet in a cool place to ſhoot, there will be found cryſtals of pure blue vitriol adhering to the ſides of the veſſel. See VITRIOL.

SOSPELLO, a town of Piedmont, fifteen miles north-eaſt of Nice.

SOSPIRO, in the italian muſic, denotes a pauſe equal to the time of a crotchet.

SOTERIA, in antiquity, ſacrifices offered to the gods for delivering a perſon from danger; as alſo poetical pieces compoſed for the ſame purpoſe.

SOTOVENTO ISLANDS are ſituated on the coaſt of Terra-Firma; the chief of which are Trinidad, Margaretta, Tortuga, *&c.* They are alſo called the leſſer Antilles.

SOU, or SOL, a french coin. See COIN.

SOVANA, a town of Tuſcany, in Italy, ſituated on the confines of the pope's territories, twenty-five miles weſt of Orvietto.

SOUBISE, a town of Guienne, in France, ſituated on the river Charente, ſeventeen miles ſouth of Rochelle.

SOUGH, among miners, denotes a paſſage dug under ground, to convey off water from mines. See MINE.

SOVERAIGN, *ſupremus*, ſtrictly ſpeaking, ſignifies the Supreme Being, or God. See the article GOD.

SOVERAIGN, in matters of government, is applied to the ſupreme magiſtrate, or magiſtrates, of an independent government or ſtate; by reaſon their authority is only bounded by the laws of God, of nature, and the fundamental laws of the ſtate: ſuch are kings, princes, *&c.*

SOVERAIGN is alſo an appellation given to the ſupreme courts of judicature. See the article COURT.

SOUILLAC, a town of Guienne, in France, thirty-two miles north of Cahors: eaſt long. 1° 12′, north lat. 45°.

SOUL, *anima*, in philoſophy, a ſpiritual ſubſtance, which animates the bodies of living creatures: it is the principle of life and activity within them. See the articles ANIMAL, LIFE, SPIRIT, *&c.*

Various have been the opinions of philoſophers concerning the ſubſtance of the human ſoul. The epicureans thought it a ſubtle air, compoſed of their atoms, or primitive corpuſcles. The ſtoics, on the contrary, maintained it was a flame, or portion of heavenly light. And the carteſians make thinking the eſſence of the ſoul. Others, again, hold, that man is endowed with three kinds of ſoul, *viz.* the rational, which is purely ſpiritual, and infuſed by the immediate inſpiration of God; the irrational or ſenſative, which being common to man and brutes, is ſuppoſed to be formed of the elements; and laſtly, the vegetative ſoul, or principle of growth and nutrition, as the firſt is of underſtanding, and the ſecond of animal life.

Lord

Lord Bacon obſerves, that there are many excellencies in the human ſoul above thoſe of brutes; and that where ſo many and ſuch great excellencies are found, a ſpecific difference ſhould always be made. Hence he highly diſapproves of the confuſed and promiſcuous manner of philoſophers in treating of the functions of the human ſoul, as if it differed in degree rather than kind from the ſouls of brutes. However, he allows, that the doctrine concerning the rational ſoul of man muſt be deduced from revelation: for as its ſubſtance, in its creation, was not formed out of the maſs of heaven and earth, but immediately inſpired by God; and as the laws of the heavenly bodies, together with thoſe of our earth, make the ſubject of philoſophy, ſo no knowledge of the ſubſtance of the rational ſoul can be had from philoſophy. But he might have ſaid the ſame of corporeal ſubſtances, ſince, as Mr. Locke juſtly obſerves, we have no idea of one more than of the other. See ESSENCE.

It is only from the primary, or eſſential, qualities of body, *viz.* extenſion, ſolidity, *&c.* that we form an idea of it; and why may we not frame the complex idea of a ſoul, or ſpirit, from the operations of thinking, underſtanding, willing, *&c.* which are experiments in ourſelves? This idea of an immaterial ſubſtance is as clear as that we have of a material one: for though this notion of immaterial ſubſtances may be attended with difficulties, we have no more reaſon to deny or doubt of its truth, than we have to deny or doubt of the exiſtence of the body. See EXISTENCE.

That the ſoul is an immaterial ſubſtance appears from hence, that its primary operations of willing and thinking have not only no connection with the known properties of body, but ſeem plainly inconſiſtent with ſome of its moſt eſſential qualities. For the mind not only diſcovers no relation between thinking, and the motion and arrangement of parts; but it likewiſe perceives that conciouſneſs, a ſimple act, can never proceed from a compounded ſubſtance, capable of being divided into many parts. To illuſtrate this, let us only ſuppoſe a ſyſtem of matter endowed with thought; then either all the parts of which this ſyſtem conſiſts, muſt think, which would make it not one but a multitude of diſtinct conſcious beings: or its power of thinking muſt ariſe from the connection of the parts one with another, their motion and diſpoſition, *&c.* which, all taken together, contribute to the production of thought. But it is evident that the motion of parts, and the manner of combining them, can produce nothing but an artful ſtructure and various modes of motion. Hence all machines, however artfully their parts are put together, and however complicated their ſtructure, tho' we conceive innumerable different motions, variouſly combined, and running one into another with an endleſs variety, yet never produce any thing but figure and motion. If a clock, or watch, tells the hour and minutes of the day, it is only by the motion of the different hands, pointing ſucceſſively at the different figures marked on the hour-plate for that purpoſe. We never imagine this to be the effect of thought or intelligence, nor conceive it poſſible, by any refinement of ſtructure, ſo to improve the compoſition as that it ſhall become capable of knowledge and conſciouſneſs: and the reaſon is plainly, that thought being ſomething altogether different from motion and figure, without the leaſt connection between them, it can never be ſuppoſed to reſult from them. See MATTER, MOTION, and FIGURE.

This then being evident, that intelligence cannot ariſe from an union or combination of unintelligent parts; if we ſuppoſe it to belong to any ſyſtem of matter, we muſt neceſſarily attribute it to all the parts of which that ſyſtem is compoſed; whereby, inſtead of one, we ſhall, as was before obſerved, have a multitude of diſtinct conſcious beings. And becauſe matter, how far ſoever we purſue the minuteneſs of its parts, is ſtill capable of repeated diviſions, even to infinity; it is plain, that this abſurdity will follow us through all the ſuppoſitions that make thought inherent in a material ſubſtance. Wherefore, as conſciouſneſs is incompatible with the coheſion of ſolid ſeparable parts, we are neceſſarily led to place it in ſome other ſubſtance, of diſtinct nature and properties; and this ſubſtance we call ſpirit, which is altogether diſtinct from body, nay, and commonly placed in oppoſition to it: for which reaſon the beings of this claſs are called immaterial; a word that implies nothing of their true nature, but merely denotes its contrariety to that of matter. See MATTER and SPIRIT.

As to the immortality of the human ſoul, the arguments to prove it may be reduced to the following heads: 1. The nature of the ſoul itſelf, its deſires, ſenſe of moral good and evil, gradual increaſe in knowledge and perfection, *&c.* 2. The moral attributes of God.

Under the former of theſe heads it is urged, that the ſoul, being an immaterial intelligent ſubſtance, as has been already proved, does not depend on the body for its exiſtence; and therefore may, nay, and muſt, exiſt after the diſſolution of the body, unleſs annihilated by the ſame power which gave it a being at firſt; which is not to be ſuppoſed, as there are no inſtances of annihilation in nature. This argument, eſpecially if the infinite capacity of the ſoul, its ſtrong deſire after immortality, its rational activity and advancement towards perfection, be likewiſe conſidered, will appear perfectly concluſive to men of a philoſophical turn; becauſe nature, or rather the God of nature, does nothing in vain.

But arguments drawn from the latter head, *viz.* the moral attributes of the Deity, are not only better adapted to convince men unacquainted with abſtract reaſoning, but equally certain and concluſive with the former: for as the juſtice of God can never ſuffer the wicked to eſcape unpuniſhed, nor the good to remain always unrewarded; therefore, arguments drawn from the manifeſt and conſtant proſperity of the wicked, and the frequent unhappineſs of good men in this life, muſt convince every thinking perſon, that there is a future ſtate wherein all will be ſet right, and God's attributes of wiſdom, juſtice, and goodneſs fully vindicated. We ſhall only add, that had the virtuous and conſcientious part of mankind no hopes of a future ſtate, they would be of all men moſt miſerable: but as this is abſolutely inconſiſtent with the moral character of the Deity, the certainty of ſuch a ſtate is clear to a demonſtration.

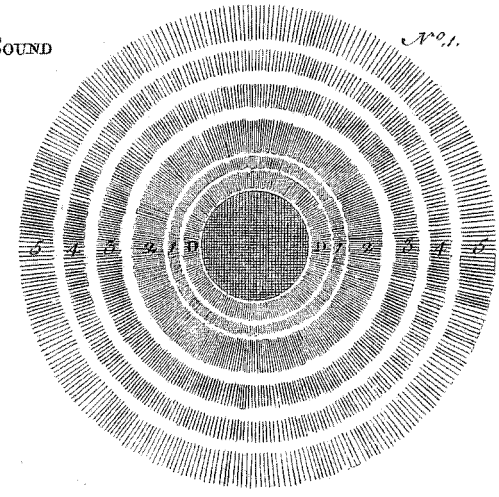
SOUND, *ſonus*, a ſimple perception, or idea, communicated to the ſoul, by means of the ear, which is the primary organ of hearing. See EAR.

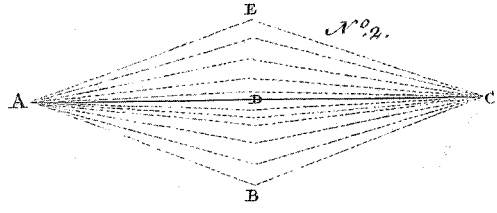
Sound is cauſed by an undulatory, or wave-like, motion of the air, ariſing from the tremulous motion of the parts of any ſonorous body when ſtruck upon; for thoſe undulations, or pulſes, of the air, beating on the tympanum or drum of the ear, convey by the auditory nerves the ſenſation of ſound to the mind. See the article HEARING.

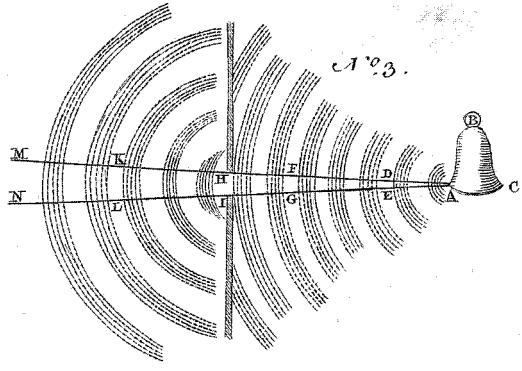
For that ſound has a neceſſary dependence on the the air, is proved by the experiment of the bell in an exhauſted receiver; and the parts of a ſonorous body being put into motion by percuſſion, excite concentric vibrations in the air all around the ſaid body; ſo that let a perſon be any how, or any where, ſituated within the verge of thoſe motions, and he will equally hear the ſound, at equal diſtances from the body whence it comes. See plate CCLVII. fig. 1. n° 1. where D D repreſents a drum, and D 1, 2, 3, 4, 5, *&c.* the circular pulſes of the air, made by, and conveying the ſound of, the beats to our ears. For the particles of air contiguous to the ſonorous body, being compelled by the firſt impulſe to move forewards, propel thoſe next to them, and theſe, others again, and ſo on to a conſiderable diſtance, according to the intenſity of the percuſſive force. But when the particles of the ſonorous body make the ſecond part of the vibration, by returning back again, the particles of air alſo, by their repulſive power, repel each other towards their proper places, and thus again expand themſelves. Now ſince motion, once generated in elaſtic bodies, continues ſome time before it can be deſtroyed by the reſiſtance and counter-action of contiguous bodies, it follows, that the particles of the ſonorous body, and conſequently thoſe of the adjacent air, have for ſome time a reciprocal vibratory motion, by going forewards and backwards through very ſmall ſpaces in indefinitely ſmall portions of time; which motion gradually decreaſes till it be totally deſtroyed. To illuſtrate this, let A C (*ibid.* n° 2.) be an elaſtic ſtring or chord, fixed at the points A and C; and let it be drawn out of its natural poſition A C, into another, A B C, upon which, being let go, it will, by its elaſticity, not only fly back to its firſt poſition A C, but into another A E C, near as far on the other ſide A C, as A B C was on the firſt: after this it will return again almoſt to B, and then return almoſt to E; and theſe courſes and recourſes of the ſtring growing ſtill leſſer and leſſer, it will at laſt ſettle in its firſt and natural poſition A D C.

When the chord begins its motion at firſt from B, it ſtrikes the particle of air contiguous to it; and that will, by its approach

Fig. 1. Sound







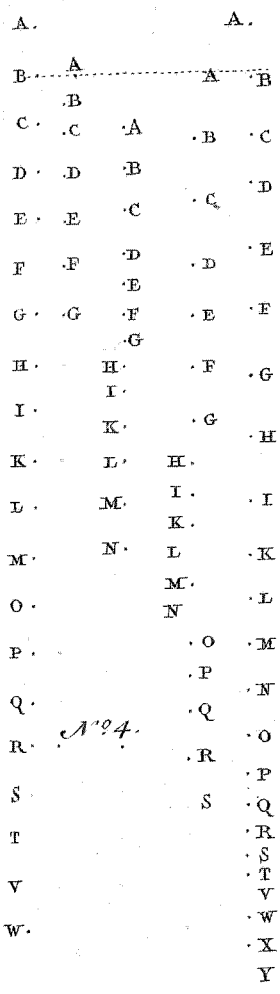


Fig. 2. Spartium, Spanish Broom

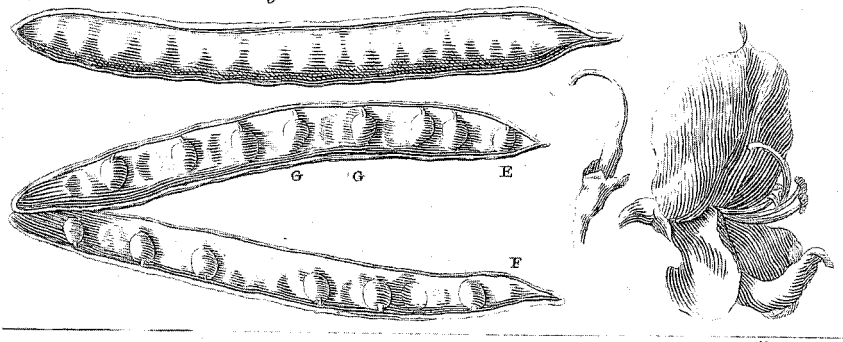


T. Jefferys sculp

proach towards the next particle, affect it, by means of its repulsive power, which keeps all the particles at equal distances from each other; and so on, through such a number of particles as can receive the motion while the string moves from B to D. Let, therefore, A, B, C, D, E, F, G, &c. (*ibid.* n° 4.) represent such a series of particles of air, at an equal distance, and the first particle A contiguous to the middle point B of such a string, and agitated by it in its motion. The string beginning to move, all the particles A, B, C, will begin to move forwards also; and, since this motion is propagated in time, let E be the remotest particle moved, while the chord is moving from B to D; during which time the chord, having an accelerated motion, will cause the particles to approach each other with an accelerated motion likewise; and because those accelerated approaches begin at A, and reach to E, in the time the chord is going from B to D, therefore the distance AB will be less in BC, and this less than CD, and that less than DE, and the distance EF will begin to be lessened, when the string is arrived at the site ADC, and the particles A, B, C, D, E, F, &c. will have the arrangement represented in the second line. But now the chord, having acquired the situation ADC, will be no farther accelerated, but on the contrary retarded, as it will now go on from D to E; the effect of which, upon the particles of air before it will be as follows: they will all go on forwards till the chord comes to E, and the particle A to its situation in the third line; but since the force upon A begins to abate, as the string begins to move from D, the elastic force now between A and B will, by acting both ways, continue to accelerate the motion of B, and retard that of A. Thus the distance BC will still diminish, till B comes to lie equi distant between A and C; and C will be accelerated till it be equi-distant between B and D, and so on. So that, as the acceleration is continued forwards, the distances will diminish towards F; and, by the time the chord is arrived at E, the particles EE will be at their nearest distance. And, since the motion of A is continually retarded, it will lose what before it had gained in the same time, and will therefore now be at the same distance from B, as at first nearly. So that the particle from A to G will have the situations as represented in the third line.

The chord now returning from E to D, gives liberty to the repulsive power between A and B to separate them to a greater distance than in their natural state, and which they at present have. By this means all the other intervals, BC, CD, DE, EF, will increase, and become successively greater than the natural distance; but that excess will be lesser in each, till you come to FG, which will be equal to the natural distance at present between A and B. The motion at the same time continuing in all the particles from H to N, they will all move forwards, and the present contracted interval between H and I will succeed between all the rest, till it arrives at the particle N, when the interval MN will be the same as at present is HI. And those particles beyond N to S will, by the preceding ones, be put into the same respective distances, but in an inverse order, as those have between G and N. And the whole series, now the string is at D, will have the intervals of the particles resembling those in the fourth line.

The chord not stopping at the situation ADC, but going on to ABC, with a retarded motion, the velocity of the contiguous particle A will also be retarded, and becomes less than that of B; upon which, the distance between them will be lessened, and the more so, as the string approaches to B. Hence all the intervals, now dilated beyond their natural state, will, by degrees, contract; but gradually slower, till you come to F, where the present largest interval between A and B will be found between F and G, and that between A and B will have acquired its natural extent, when the chord is arrived at B. Then, likewise, the particles from G to N will acquire the same situation as those now have between A and G; and from N to S, the same as now is seen between G and N; and from S forwards the same as is now before the particle N, the point S being now the middle point of condensation; all which is clearly seen in the fifth line of the figure. Thus the condensation which begins at A, by the first part of the vibration, was propagated to G by the second, from thence to N by the third, and, lastly, to S by the fourth part of the whole motion of the string, in going and returning; and this extent of air, thus agitated by the chord in going

ing and returning, is called by Sir Iſaac Newton a wave, or pulſe of air. In which wave the particles from A to N are in a dilated ſtate, and from N to X in a contracted or condenſed ſtate; which two parts of the wave anſwer to the concave and convex, or low and high part of a watery wave.

As the chord goes on to make another vibration, it will not only continue to agitate the air, at preſent in motion, but will ſpread the pulſation of the air as much farther, and by the ſame degrees as before; and the like will happen after a very complete vibration of the ſtring. Thus the air being a fluid body, and the impreſſion made on any one part affecting all the particles alike around it, it is plain thoſe pulſes will be propagated in every direction all around in concentric aerial ſhells, or ſpherical waves of air.

That the motion of the pulſes in an elaſtic medium is analogous to that of waves generated in the ſurface of ſtagnant water, is evident, when we conſider that the condenſation of the parts of the elaſtic medium is in lieu of the elevation of the water; the elaſtic force effects the ſame in the medium, as gravity does in the water, and the denſeſt part of the pulſes correſponds to the higheſt part of the waves. Thus, let A B C (*ibid.* n° 3.) repreſent the ſonorous body; by the tremulous motion of its parts, it will agitate the air contiguous to every point as A, where it will be condenſed to a certain ſmall diſtance, and make a pulſe or wave of air, in the manner as has been already ſhewn. The firſt wave or pulſe will, by its elaſtic power in expanding itſelf, produce a ſecond, that a third, and ſo on; till the impreſſed motion be diffuſed through too large a quantity of air, to be any longer ſenſible.

The quantity of motion, produced by each tremor of the ſonorous body, being communicated ſucceſſively to large portions of air, the part thereof, which each particle will acquire, will conſtantly decreaſe. This decrement of the motion will be as the increment of the number of particles, which is as the ſuperficies of the ſpherical ſhell; and ſince all ſuperficies are as the ſquares of their diameters, or ſemi-diameters, therefore the force in the particles of the wave or ſhell at D is to that in the particles of the ſhell at F, as AF^2 to AD^2, that is, the force of ſound decreaſes as the ſquares of the diſtances increaſe.

It is plain the diſtance to which ſounds may be heard, will be proportional to the magnitude, or intenſity, of the ſtroke made on the tremulous body emitting the ſound; for, the greater that ſtroke is, the greater will be the agitation of the parts of the ſonorous body, and, of courſe, the greater will be the force with which they will ſtrike the particles of air. Laſtly, the greater the force is upon the air, the more cloſely will it be condenſed and expanded; hence the greater will be the ſtroke at any given diſtance on the drum of the ear, and, conſequently, the greater will be the diſtance at which the agitation of the air will be ſenſible.

The experiments are numerous by which it has been found, that ſound is audible to the diſtance of fifty, ſixty, or eighty miles: but Dr. Hearn, phyſician to the king of Sweden, tells us, that at the bombardment at Holmia, A. D. 1658, the ſound was heard to the diſtance of thirty ſwediſh miles, which make 180 of ours. And in the fight between England and Holland, A. D. 1672, the noiſe of the guns was heard even in Wales, which cannot be leſs than 200 miles.

But ſince the atmoſphere conſiſts not of pure air, but has an admixture of vapours of a different elaſticity and tone; theſe vapours will not participate of the motion of pure air, by which ſound is propagated; in like manner as an elaſtic ſtring, if ſtruck, will not move another very near it, unleſs it be under the ſame degree of tenſion, and of the ſame tone. Therefore the quantity of air producing ſound muſt be diminiſhed in proportion to the quantity of vapour, in a given ſpace; in which Sir Iſaac ſuppoſes the air is to the vapour as 10 to 1. Whence the air and vapour together in a given ſpace is to the pure air as 11 to 10.

But the velocity of the pulſes will increaſe in the ſubduplicate ratio of the diminiſhed quantity of matter, that is, in the ſubduplicate ratio of 11 to 10, or in the entire ratio of 21 to 20, (as he has ſhewn, Princip. Prop. 48. lib. II.). Therefore, if we ſay, as 20 : 21 :: 1088 : 1142; whence the real velocity of ſound (thus inveſtigated from the nature of elaſtic air by our great author) is at length found to be at the rate of 1142 feet per ſecond.

The truth and accuracy of this noble theory have been ſufficiently confirmed by experiments, particularly thoſe made by the late Rev. Dr. Derham, of which

we ſhall give ſome account by and by; but will firſt lay before the reader a view of the different eſtimates made of the velocity of ſound by ſeveral eminent philoſophers, as in the table following.

	Feet per ſecond.
The honourable Mr. Roberts	1300
The honourable Mr. Boyle	1200
Mr. Walker	1338
Merſennus	1474
The academy at Florence	1148
Royal academy at Paris	1172
Sir Iſaac Newton, Flamſtead, Halley, and Derham	1142

As no man ever had a better opportunity, ſo none could improve it with greater diligence, aſſiduity, and accuracy, in determining and ſettling the various phænomena of ſounds, than the ſo often celebrated philoſopher laſt mentioned. He proved by experiments made with the ſtrokes of a hammer, and the explоſion of a gun at the ſame time, at the diſtance of a mile, that the velocity of ſounds produced from different bodies was the ſame, or came to his ear in the ſame time.

That the motion of ſound was equable and uniform, or that it paſſed through ſpaces proportional to the times, he found by various experiments made by the explоſion of guns, at different diſtances, as appears by the following table which he has given us, where the firſt column ſhews the places at which the guns were fired; the ſecond, the number of vibrations of an half-ſecond pendulum; the third, the diſtance of places in miles and decimal parts, as meaſured by trigonometry; the fourth, the diſtances meaſured by the velocity of ſound, admitting it to be at the rate of one mile every 9 ¼ half-ſeconds.

At Hornchurch,	9	0.9875	
North Okenden church,	18½	2,004	2,000
Upminſter-mill,	22½	2,4	2,4
	23		2,48
Little Warley church,	27½	3,0	2,97
Rainham church,	33¼	3,58	3,59
Alvel-mill,	33	3,58	3,57
Dagenham-mill,	35	3,85	3,78
Southweal church,	45	4,59	4,86
Eaſt Thornden church,	46½	5,09	5,03
Barking church,	70½	7,7	7,62
Guns at Blackheath,	116	12,5	12,55

The great exactneſs of meaſuring diſtances by ſounds appears from the above table, as well as the equability of the motion; but to render this matter ſtill more certain and indiſputable, the Dr. took a journey to Foulneſs-ſands, on the coaſt of Eſſex, which form a ſmooth large plain for miles. On this plain he meaſured ſix miles in a right line, and, cauſing a gun to be fired at the end of each mile, he found that his former obſervations were very juſt and true, and that ſound paſſed the firſt mile in 9 ¼ half-ſeconds, two miles in 18½, three miles in 27¾, and ſo on to the end of the ſix.

The Academia del Cimento made experiments of this ſort, from which they concluded, that the velocity of ſounds was ſo far equable, as not to be accelerated or retarded by conſpiring or adverſe winds; but in this they led themſelves and many others into a very great miſtake, which was owing to their firing of guns at too near a diſtance; for in great diſtances the difference is ſenſible.

SOUND, in muſic. The principal affection of ſound, whereby it becomes fitted to produce harmony, and raiſe agreeable ſenſations, is that whereby it is diſtinguiſhed into acute and grave; the cauſe of which appears to be no other than the different velocity of the vibrations of the ſounding body. See the articles HARMONY, TUNE, &c.

SOUND, in geography, denotes in general any ſtreight, or inlet, of the ſea, between two head-lands. However, the name ſound is given, by way of eminence, to the ſtreight between Sweden and Denmark, joining the german Ocean to the Baltic, being about four miles over.

SOUND-BOARD, in an organ, is a reſervoir into which the wind, drawn in by the bellows, is conducted by a port-vent, and hence diſtributed into the pipes placed over holes in its upper part: this wind enters them by valves, which open by preſſing upon the ſtops or keys; after drawing the regiſters, which prevent the air from entering any of the pipes, except thoſe it is required in.

SOUNDING, in navigation, is the trying the depth of the water, and the quality of the bottom, either by an inch or three-quarter rope, with a deep ſea-lead at the end of it. The ſounding line or rope, is marked at two, three and four fathoms, with a piece of black leather betwixt the ſtrands; and, at five fathoms, with a piece of white leather, or cloth. The plummet, or lead, is uſually in the form of a nine-pin, and weighs eighteen pounds; and its lower end is frequently greaſed, to know whether the bottom is ſandy, rocky, &c. Near banks, ſhores, &c. they ſound continually.

SOUP, or SOOP, a kind of pottage made of bread and broth, or the juice of fleſh, or ſome other matters, uſually ſerved at the beginning of a meal.

Soup is eſteemed eſſential to a french dinner, ſometimes they heighten the reliſh by the addition of onions, or leeks, or cabbage, &c.

SOURCE. See the article SPRING.

SOURIS, in the menage, is a cartilage in the noſtrils of a horſe, by means of which he ſnorts. See SNORT.

SOUTH, in coſmography, one of the four cardinal points. See the article COMPASS.

SOUTHAM, a market-town of Warwickſhire, ſituated ſeven miles ſouth-eaſt of Warwick.

SOUTHAMPTON, a borough and port-town of Hampſhire, ſituated on a bay of the engliſh channel, twelve miles ſouth-weſt of Wincheſter. It ſends two members to parliament.

SOUTHERN-WOOD, *abrotanum*, in botany, a ſpecies of artemiſia. See the articles ABRATANUM and ARTEMISIA.

Southern-wood is an attenuant, and is ſerviceable in all obſtructions of the viſcera, and in deſtroying worms. It is recommended in ſuppreſſions of urine, a dram of it in powder for a doſe; and a decoction of it is in repute with ſome as a lotion for the recovering hair upon the head when fallen off; others recommend its juice as a great cleanſer and healer of old ulcers.

SOUTHMOULTON, a market-town of Devonſhire, ſituated twenty-four miles north-weſt of Exeter.

SOUTHPETHERTON, a market-town of Somerſetſhire, ſituated twenty-two miles ſouth of Wells.

SOUTHWARK, a borough of Surry, and a ſuburb to London, with which it has a communication by a magnificent bridge. It is ſituated on the ſouth-ſide of the Thames, and ſends two members to parliament.

SOUTHWELL, a market-town of Nottinghamſhire, ſituated eight miles north-eaſt of Nottingham.

SOUTHWOULD, a port-town of Suffolk, ſituated on a bay of the german Sea, forty-two miles eaſt of Bury.

SOUVIGNY, a town of France, in the province of Lyonois, and territory of Bourbonois, ſituated fifty miles ſouth-eaſt of Bourges.

SOW, in zoology, the female of the hog-kind. See the article HOG.

SOW, in the iron-works, the name of the block or lump of metal they work at once in the iron-furnace. The ſize of theſe ſows of iron is very different, even from the ſame workmen, and the ſame furnace. Theſe furnaces having ſand-ſtones for their hearths and ſides up to the height of a yard, and the reſt being made of brick, the hearth by the force of the fire is continually growing wider, ſo that if it at firſt contains as much metal as will make a ſow of ſix or ſeven hundred weight, it will at laſt contain as much as will make a ſow of two thouſand weight.

SOWING, in huſbandry, &c. See the articles SEED, SEMINATION, &c.

One great article in ſowing to advantage, Mr. Tull obſerves, is to know exactly at what depth the ſeed may be laid without danger of burying it. Seed is ſaid to be buried, when it is laid at a depth below what it is able to come up at. Different ſorts of ſeeds come up at different depths, ſome ſix inches and more, and others will not bear to be buried at more than half an inch. For coming at an accurate knowledge of the depth at which every ſeed will come up beſt from the ſowing, Mr. Tull propoſes to make gages; for the method of conducting which, we refer the reader to his own account of it, in page 58, of his Horſe-hoeing huſbandry.

However, it is to be obſerved, that it is not proper to ſow the ſeeds of all plants at the greateſt depths at which they will come up; for it may be ſo deep as that the wet may rot or chill the firſt root, as is the caſe with wheat in moiſt land. The nature of the land, and the manner how it is laid, either flat or in ridges, and the ſeaſon of ſowing, with the

the experience of the husbandman, must determine the proper depths for different sorts of seed.

The quantity of seed is to be different also, according to the manner of the sowing. The proper quantity to be drilled on an acre is much less than must be sown in the common way, not because hoeing will not maintain as many plants as the other, for on the contrary, it will maintain many more; but the difference is upon many other accounts, as that it is impossible to sow it so even by hand as the drill will do. For let the hand spread it never so exactly, which yet is difficult enough to do with some seeds in windy weather, yet the unevenness of the ground will alter the situation of the seeds, the greatest part of them rebounding into holes, and the lowest places; or else the harrows, in covering, drawing them down thither; so that these low places may have ten times too much seed, and the high places may have little or none of it; and this inequality lessens in effect the quantity of the seed, because fifty seeds in room of one will not produce so much as one will do, and where they are too thick, they cannot be well nourished, their roots not spreading to near their natural extent, for want of hoeing, to open the earth and give them way.

The distances of the rows is one extremely material point in the obtaining a good crop; but as a much larger distance is to be allowed in these than common practice has been used to, it is very difficult to persuade the farmer to venture a trial at such distances as he may have experience from.

SOWNE, a term used in the exchequer, where estreats that sowne not, are such as the sheriff by his care and diligence cannot levy, wherefore they are not regarded; and the estreats that sowne, are such as he may levy.

SPA, or SPAW, a town of Germany, in the circle of Westphalia, and bishopric of Liege, situated seventeen miles south-east of Liege, famous for its mineral waters ever since the time of the Romans, of which there are still great quantities sent abroad to all parts of Europe.

Spaw waters are the lightest and most subtil of all the mineral waters, as is proved by several experiments, and the small quantity of earth, and the large portion of subtile mineral spirit they contain, bespeak their possessing the most exalted virtues of all the other mineral waters. One very remarkable virtue of this water is, that it greatly relieves in all disorders of the kidneys, ureters and bladder, whether occasioned by stone, gravel, or ulcerations. It possesses, beside, all the virtues of the other mineral waters, and is of the greatest service in edulcorating sharp, and dividing viscous, humours, and removing all diseases arising from these causes, by disposing them to pass off by proper emunctuories. See the article MINERAL *waters*.

These waters drank at the spring, cause a sort of drunkenness, which does not last above a quarter of an hour; when carried to any distant place, though ever so well stopped down, they will always, after some time, precipitate a small quantity of a yellow ochreous earth; mixed with milk, they do not coagulate it, but when mixed with wine, make a great ebulition, and throw up a large quantity of air-bubbles, with a peculiarly pleasing smell.

SPACE, *spatium*, is defined by Mr. Locke, to be a simple idea, which we attain both by our sight and touch. The modes whereof are distance, capacity, extension, duration, *&c.* See the articles DISTANCE, CAPACITY, *&c.*

Space considered barely in length, between two bodies, is the same idea which we have of distance. If it be considered in length, breadth, and thickness, it is properly called capacity; when considered between the extremities of matter which fills the capacity of space, with something solid, tangible, and moveable, it is then called extension, so that extension is an idea belonging to a body, but space, it is plain, may be conceived without it. Each different distance is a different modification of space, and each idea of any different space is a simple mode of this idea: such are an inch, foot, yard, *&c.* which are the ideas of certain stated lengths, which men settle in their minds for the use, and by the custom of measuring. When these ideas are made familiar to mens thoughts, they can repeat them as often as they will, without joining to them the idea of body, and frame to themselves the ideas of feet, yards, or fathoms, beyond the utmost bounds of all bodies, and by adding these still one to another, enlarge their idea of space as much as they please. From this power of repeating any idea of distance without ever coming to an end, we come

by the idea of immenſity. See the article IMMENSITY.

Another modification of ſpace is taken from the relation of the termination of the parts of extenſion, or circumſcribed ſpace, amongſt themſelves; and this is what we call figure. This, the touch diſcovers in ſenſible bodies, whoſe extremities come within our reach; and the eye takes, both from bodies and colours, whoſe boundaries are within its view; where obſerving how the extremities terminate, either in ſtreight lines, which meet at diſcernible angles; or in crooked ones, wherein no angles can be perceived: by conſidering theſe as they relate to one another in all parts of the extremities of any body or ſpace, it has that idea we call figure, which affords to the mind infinite variety. See FIGURE.

Another mode belonging to this head is, that of place. See PLACE.

There is another mode of ſpace, the idea of which we get from the fleeting and perpetually periſhing parts of ſucceſſion, which we call duration. See the article DURATION.

Space is uſually divided into abſolute and relative. Abſolute ſpace is that conſidered in its own nature, without regard to any thing external, which always remains the ſame, and is infinite and immoveable.

Relative ſpace, is that moveable dimenſion, or meaſure of the former, which our ſenſes define by its poſitions to bodies within it, and this is the vulgar uſe for immoveable ſpace.

Relative ſpace in magnitude and figure, is always the ſame with abſolute; but it is not neceſſary it ſhould be ſo numerically; as if you ſuppoſe a ſhip to be, indeed, in abſolute reſt, then the places of all things within her will be the ſame, abſolutely and relatively, and nothing will change its place: but ſuppoſe the ſhip under ſail or in motion, and ſhe will continually paſs through new parts of abſolute ſpace; but all things on board, conſidered relatively in reſpect to the ſhip, may be, notwithſtanding, in the ſame places, or have the ſame ſituation and poſition in regard to one another.

Proper and abſolute motion is defined to be the application of a body to different parts of abſolute, that is, infinite and immoveable ſpace. The carteſians, who maintain extenſion the eſſence of matter, aſſert, that the ſpace any body takes up is the ſame thing with the body itſelf; and that there is no ſuch thing as mere ſpace void of all matter in the univerſe. See CARTESIAN and VACUUM.

SPACE, in geometry, denotes the area of any figure, or that which fills the interval or diſtance between the lines that terminate it.

SPACE, in mechanics, the line a moveable body, conſidered as a point, is conceived to deſcribe by its motion.

SPADE, an inſtrument for digging up the ground, the handle or ſhaft whereof is about three feet long; the head is all of iron; the upper part being flat for the workman to ſet his foot on, to force it into the ground; the length of the head is about a foot or fifteen inches, and the breadth ſix or eight.

SPAGIRIC ART, *ars ſpagirica*, a name given by authors to that ſpecies of chemiſtry which works on the metals, and is employed in the ſearch of the philoſopher's ſtone.

SPAHI'S, horſemen in the ottoman army, chiefly raiſed in Aſia. The great ſtrength of the grand ſeignior's army conſiſts in the janizaries, who are the foot, and the ſpahi's, who are the horſe.

SPAIN, including Portugal, is a large peninſula of Europe, lying between 10° weſt and 3° eaſt longitude, and between 36° and 44° north latitude, being about ſeven hundred miles in length from eaſt to weſt, and about five hundred in breadth from north to ſouth: it is bounded by the bay of Biſcay, on the north; by the Pyrenean mountains, which ſeparate it from France, on the north-eaſt; by the Mediterranean-ſea, on the ſouth-eaſt; and by the Atlantic-ocean, on the weſt. See PORTUGAL.

The kingdom of Spain, conſidered ſeparately from Portugal, comprehends fourteen provinces, each of which may be ſeen under its proper name.

New SPAIN. See MEXICO.

SPALATTO, a city and port-town of Dalmatia, ſituated on the gulph of Venice: eaſt long. 17° 45′, north latitude 43° 16′.

SPALDING, a market-town of Lincolnſhire, ſituated under the meridian of London, thirty miles ſouth eaſt of Lincoln.

SPAN, a meaſure taken from the ſpace between the thumb's end and the tip of the little finger, when both are ſtretched out. The ſpan is eſtimated at three hand's breadths, or nine inches. See MEASURE.

SPANDAW, a town of Germany, in the circle of Upper Saxony, and marquiſate

of

of Brandenburg, ſituated on the river Havel, eight miles north-weſt of Berlin.

SPANIEL, in zoology, a ſpecies of the canis or dog-kind. See CANIS.

There are two ſorts of ſpaniels which neceſſarily ſerve for fowling: the firſt of theſe finds game on land, and the other on the water. Such ſpaniels as play their parts by land, do it either by ſwiftneſs of foot, by ſpringing the bird, or by diſcovering to the fowler, by ſome ſecret ſign, the place where the game lights; they ſerve the hawk and the net, or train. See the article SETTING.

The water-ſpaniel, partly by natural inclination, and partly by being well trained, has recourſe to the water for his game, and by this means moſt of the water-fowl are taken. The ſize of this ſpaniel is ſomewhat larger than the other, but he is generally remarkable for long rough curling hair, which muſt be clipped at proper times, to render him more light for ſwimming.

SPAR, in natural hiſtory, a claſs of foſſils, not inflammable nor ſoluble in water; when pure, pellucid and colourleſs, and emulating the appearance of cryſtal, but wanting its diſtinguiſhing characters; compoſed of plane and equable plates, not flexile nor elaſtic; not giving fire with ſteel; readily calcining in a ſmall fire, and fermenting violently with acids, and wholly ſoluble in them. See the article CRYSTAL.

The ſpars, in general, are found in the fiſſure of ſtones, and about mines. Derbyſhire affords enough of them to ſupply the whole world; and the german mines afford yet larger quantities.

If cryſtal be ſubject to a vaſt variety of appearances, ſo as to conſtitute different orders and genera, ſpar is much more ſo, there being no leſs than ten orders of it. 1. The pellucid, cryſtalliform and perfect ſpars, compoſed of a column terminated at each end by a pyramid. 2. Thoſe compoſed of two pyramids joined baſe to baſe, without any intermediate column. 3. The cryſtalliform columnar ſpars, adhering by one end to ſome ſolid body, and terminated at the other by a pyramid. 4. The pyramidal cryſtalliform ſpars without columns. 5. The ſpars of a parallelopiped form. 6. The ſpars externally of no regular form, but breaking into rhomboidal maſſes. 7. The cruſtaceous ſpars; theſe are of a cryſtallino-terrene ſtructure, or debaſed from their native pellucidity by an admixture of earth, and formed into plates or cruſts of a ſtriated figure within. 8. The cruſtaceous terrene ſpars; bodies ſo highly debaſed with earth, as to appear merely earthy, of an irregular ſtructure, and not ſtriated within: theſe often encruſt fiſſures of ſtone, and ſometimes vegetable and other extraneous bodies in ſprings. 9. The ſpars formed into oblong cylindric bodies, known by the name of ſtalactitæ, or ſtony icicles. 10. The ſpars formed into ſmall round figures, compoſed of various cruſts encloſing one another, and generally known by the name ſtalagmitæ: and adding to theſe the ſpars, influenced in their figures by metalline particles, we have the whole ſeries of theſe bodies, *viz.* 1. The cubic ſpars, owing their figure to lead. 2. The pyramidal ſpars, with four planes, owing their figure to tin. 3. The rhomboidal ſpars, conſiſting of ſix planes, owing their figure to iron.

For medicinal uſe, the pureſt and moſt pellucid ſpars ſhould be choſen: theſe perfectly diſſolve in acids, and are recommended in nephritic caſes. Some have uſed one kind, ſome another, as the lapis judaicus, the ſparry incruſtations of caverns, petrified oyſter-ſhells, and water in which large quantities of ſpar are ſuſtained. After all, the nephritic virtues of ſpar want ſufficient proof; ſome even ſuſpect its uſe to be more hurtful than beneficial.

It were to be wiſhed, that whoever attempts to aſcertain this point, would chooſe for the experiment ſome determinate kind of ſpar in its natural form, rather than under appearances, whereby its efficacy may be confounded with that of other bodies.

SPARADRAP, *ſparadrapum*, in pharmacy, *&c.* a ſort of cere-cloth, called alſo tela Gualteri, the form whereof is directed as follows. Take of the diapalma plaiſter, and diachylon with the gums, each one pound; ceruſs, half a pound; root of orris finely powdered, an ounce and a half. Mix theſe together, and whilſt they are in fuſion, dip them in ſoft worn-out linnen-rags, ſo that they may be covered with the plaiſter on each ſide; then take them out, ſpread them, and let them dry; and ſmooth the ſurfaces with a knife or ſpatula. The principal uſe of theſe is for iſſues.

SPARAGUS, or ASPARAGUS, in botany. See the article ASPARAGUS.

SPAR-

SPARGANIUM, COMMON BUR-REED, in botany, a genus of the *monoecia-triandria* claſs of plants, having no corolla; the male and female flowers have a roundiſh amentum; the calyx of the male is formed of two leaves, and that of the female of three; the fruit is a dry drupe, turbinated with a point, and angulated underneath; the ſeeds are two oſſeous, oblongo-ovated and angulated nuts.

The root of this plant is recommended by Dioſcorides as excellent againſt the poiſon of ſerpents, when taken in wine.

SPARRING, among cock-fighters, is the fighting a cock with another to breathe him. In ſparring they put hotts on their ſpurs that they may not hurt one another. See the article HOTTS.

To ſpar the cock in general, ſignifies to breathe him, in order to embolden him to fight.

SPARROW, *paſſer*, in ornithology, a ſpecies of the fringilla. See FRINGILLA.

The common ſparrow is the brown fringilla, with a black throat and brown temples. It is larger than the linnet, and the male is an erect and handſome bird; the head is large, the eyes ſmall, and the beak ſhort; the wings are ſhort, and the tail ſhort and forked.

The reed ſparrow, or the fringilla with a black head, brown at the ſides, and with a white ring round the neck, and a mottled black and white breaſt, is a very beautiful and ſingular bird, of the ſize of the common linnet; the head is ſmall and depreſſed, the beak ſhort and black, and the eyes hazel; and in moſt other particulars it correſponds with the common ſparrow. See plate CCLVI. fig. 4. where n° 1. repreſents the cock, and n° 2. the hen.

SPARROW-HAWK, in ornithology, the yellow-leged falco with a white undulated breaſt, and a faſciated brown tail. See the articles FALCO and HAWK.

This bird is about the bigneſs of a pigeon, but conſiderably longer bodied, in proportion to its thickneſs; its wings, when expanded, meaſure twice the length of the body and tail; the tail is ſhort but very ſtrong, thick at the baſe, very ſharp at the point, and conſiderably hooked; the head is ſmall, ſomewhat flatted, and of a browniſh colour; the eyes are as it were ſunk in the head, and their iris is yellow and bright.

SPARSE LEAVES, among botaniſts, leaves which are placed irregularly over the ſeveral parts of the plant.

SPARTEL CAPE, a promontory of the coaſt of Barbary, at the entrance of the ſtraits of Gibraltar.

SPARTIUM, SPANISH BROOM, in botany, a genus of the *diadelphia-decandria* claſs of plants, the corolla whereof is papilionaceous, and the fruit is a long, cylindric, obtuſe pod of two valves: the ſeeds are numerous, globoſe, and kidney-ſhaped. See plate CCLVII. fig. 2.

SPARTIUM is alſo Tournefort's name for the geniſta of Linnæus, as geniſta is Linnæus's name for Tournefort's ſpartium. See GENISTA.

SPARTIVENTO CAPE, the moſt ſouthern point or promontory of Italy, ſituated in eaſt long. 16° 30′, north lat. 38° 20′.

SPARUS, in ichthyology, the name of a genus of fiſh of the order of the acanthopterygii, the characters of which are, that the coverings of the gills are ſcaly, with lips covering the teeth in the ſame manner as in quadrupeds; the teeth themſelves are either like thoſe of the human head, or like thoſe of a dog; the molares are like thoſe of quadrupeds; the teeth ſtand only in the jaws and fauces; the palate and the tongue are ſmooth; there is only one back-fin; the tail is forked, and the eyes covered with a lax ſkin.

SPASM, *ſpaſma*, or *ſpaſmus*, in medicine, a convulſion. See CONVULSION and CONVULSIVE DISORDERS.

A ſpaſm, according to Hoffman, may be univerſal or particular, ſalutary or morbous. An univerſal ſpaſm happens if the whole vaſcular genus, chiefly the heart and arteries, as alſo the fibres of the ſyſtem, are affected, and there is a preternatural conſtriction therein, whereby the ſyſtole and diaſtole are increaſed, and the progreſs of the blood accelerated; this conſtitutes a fever, whereof a frequent pulſe is the moſt certain ſign. The other kind of ſpaſms is particular, and affects only one part of the body, which it conſtringes, and intercepts the free progreſs of the blood, rendering it unequal, and ſending it in greater plenty to the other parts of the body. But particularly this ſpaſtic affection affects the nervous and membranous parts, ſuch as the ſtomach, and the whole volume of the inteſtines; whence proceed the hyſteric and hypochondriac paſſions. A ſpaſm is likewiſe preſent in hæmorrhages, congeſtions of the blood, and unequal flux of the fluid in all anxieties and ſuppreſſed

preſſed excretions. See HYPOCHONDRIAC, HYSTERIC, HÆMORRHAGE, &c.

If a violent ſpaſm happens to affect the dura mater, an epilepſy or univerſal convulſion follows; and convulſive motions of the membranes and nerves have their origin from the medulla ſpinalis. A ſpaſm is ſalutary when it deſtroys the cauſe of the diſeaſe, by taking away the ſtagnation of the humours, correcting acid cauſtics, and promoting the excretion of the morbid matter; but it is very pernicious when it conſtringes the ſkin and all the excretory veſſels, detaining the morbous matter therein, and forcing it upon the vital parts. The cauſes and treatment of ſpaſms in general, have already been treated of under the articles CONVULSION and CONVULSIVE DISORDERS.

In a ſpaſm of the lower jaw, when the patient can neither open his mouth nor eat; as when perſons are wounded, and ſomething foreign is lodged therein, or when the nerves are hurt, or when ſharp things, ſuch as vitriol, are applied to ſtop the blood, the cure muſt be performed according to the diverſity of the cauſes as particularly treated of in ſurgery; but when this happens ſpontaneouſly in infants, it is obſerved that they generally die, though the beſt nervous and antiſpaſmodic medicines be uſed.

In the cynic ſpaſm, or as it is otherwiſe called, the ſardonian laughter, if it proceeds from poiſons, as it generally does, eſpecially hemlock or oenanthe, Heiſter directs that they be expelled immediately from the body by a vomit; then giving generous wines, warm with ginger or pepper, as was the practice of the antients. If it happens from other cauſes, it muſt be treated with antiſpaſmodics and nervous medicines, both inwardly and outwardly, and chiefly with plaſter of betony and bayberries prepared with oil of amber, and applied to the temples, and behind the ears.

For that ſpecies of convulſion called cramp, ſee the article CRAMP.

SPASMODIC, ſomething belonging to a ſpaſm or convulſion. See the laſt article.

SPATHA, a word uſed by different authors in various ſenſes; among botaniſts it expreſſes that ſort of cup which conſiſts of a ſimple membrane growing from the ſtalk; this kind of cup is of various figures, often diphyllous, or divided into two parts; often ſimple; ſometimes more divided: it incloſes ſometimes a ſingle flower, ſometimes ſeveral flowers together, and theſe have often no perianthium; the ſpatha is of very different texture and conſiſtence in different plants. See plate CCLVIII. fig. 1.

Some authors, by this word, expreſs a rib; others, the chirurgical inſtrument called ſpatula; others, a ſort of inciſion-knife, and by others it is taken for a ſword, this laſt being, indeed, its proper ſignification, and all the reſt being only metaphorical applications of it to different things, which bear ſome reſemblance to a ſword.

SPATULA, or SPATHULA, an inſtrument uſed by ſurgeons and apothecaries. This inſtrument is made of different ſhapes, according to the various uſes of it: that marked n° 1. plate CCLVI. fig. 5. is uſed to depreſs the tongue in order to examine the ſtate of the tonſils, uvula and fauces, when they are affected with any diſorders: it is alſo uſed to ſuſpend the tongue when the frenum is to be divided, for which purpoſe it has a fiſſure at its extremity, and ſhould therefore be made of ſilver rather than any other metal: thoſe marked n° 2 and 3. *ibid.* are chiefly uſed in ſpreading plaſters, ointments, and cataplaſms, and ſometimes with their fulcated extremity they are of ſervice in raiſing up fractured bones of the cranium.

SPAVIN, in the manege, a diſeaſe in horſes, being a ſwelling or ſtiffneſs uſually in the ham occaſioning a lameneſs. There are two kinds of ſpavins, *viz.* the ox-ſpavin, which is a callous tumour at the bottom of the ham on the inſide, hard as a bone, and very painful; while it is yet recent, ſome only hault with it at the firſt coming out of the ſtable: the other, which is the dry ſpavin, is more eaſily perceived by the horſe's raiſing one of his hind legs with a twitch higher than the other; but ſometimes it is found on both legs. This kind, which ſome alſo call ſtring-halt, frequently degenerates into the ox-ſpavin, for which there is no remedy but to apply the fire, and even this is not always ſucceſsful.

There are two other kinds of ſpavin which have their ſeat in the hoof, *viz.* the blood-ſpavin, being a ſoft tumour which grows through the horſe's hoof, and is uſually full of blood; the other is the bone-ſpavin, being a cruſty ſubſtance growing on the inſide of the hoof under the joint.

SPAW, or SPA. See the article SPA.

SPAYING,

SPAYING, or SPADING, the operation of caſtrating the females of ſeveral kinds of animals, as ſows, bitches, &c. to prevent any further conception, and promote their fattening.

It is performed by cutting them in the mid flank, on the left-ſide, with a ſharp knife or lancet, taking out the uterus and cutting it off, and ſo ſtitching up the wound, anointing the part with tar, and keeping the animal warm for two or three days. The uſual way is to make the inciſion aſlope two inches and a half long, that the fore-finger may be put in towards the back to feel for the ovaries, which are two kernels as big as acorns on both ſides of the uterus, one of which is drawn to the wound, the ſtring thereof cut, and thus both taken out.

SPEAKER *of the houſe of commons*, a member of the houſe elected by a majority of the votes thereof, to act as chairman or preſident in putting queſtions, reading briefs or bills, keeping order, reprimanding the refractory, adjourning the houſe, &c.

The firſt thing done by the commons, upon the firſt meeting of a parliament, is to chuſe a ſpeaker, who is to be approved of by the king, and who, upon his admiſſion, begs his majeſty that the commons, during their ſitting, may have free acceſs to his majeſty, freedom of ſpeech in their own houſe, and ſecurity from arreſts. The ſpeaker is not allowed to perſuade or diſſuade in paſſing a bill, but only to make a ſhort and plain narrative; nor to vote unleſs the houſe be equally divided. See PARLIAMENT.

The lord chancellor or keeper is uſually ſpeaker of the houſe of lords; the ſpeaker of the convocation is called the prolocutor. See the article PROLOCUTOR.

SPEAKING, the art or act of expreſſing one's thoughts in articulate ſounds or words.

SPEAKING TRUMPET. See TRUMPET.

SPEAR, in the manege. The feather of a horſe, called the ſtroke of the ſpear, is a mark in the neck or near the ſhoulders of ſome barbs and ſome turky and ſpaniſh horſes, repreſenting the blow or cut of a ſpear in theſe places, with ſome reſemblance of a ſcar; this feather is an infallible ſign of a good horſe.

SPECIAL, ſomething that is particular, or has a particular deſignation, from the Latin *ſpecies*, in oppoſition to general from *genus*. See GENERAL, &c.

SPECIAL *matter in evidence*, in law, denotes that which is alledged ſpecially, and does not come into the general iſſue.

SPECIALTY, is uſed for a bond, bill, or other deed or inſtrument executed under the hand and ſeal of the partiest hereto.

SPECIES, in logic, a relative term, expreſſing an idea which is comprized under ſome general one, called a genus. See the article GENUS.

The idea of a ſpecies is formed, by adding a new idea to the genus: thus if the genus be a circumſcribed ſpace, and we ſuppoſe this circumſcription to be by lines, we ſhall obtain the notion of that ſpecies of figures which are called plain figures; but if we conceive the circumſcription to be by ſurfaces, we get an idea of the ſpecies of ſolid figures. This ſuperadded idea is called the ſpecific difference, not only as it ſerves to diſtinguiſh the ſpecies from the genus; but becauſe being different in all the ſeveral ſubdiviſions, we thereby alſo diſtinguiſh the ſpecies one from another: and as this ſuperadded conception completes the notion of the ſpecies, it is plain that the genus and ſpecific difference are the proper and conſtituent parts of the ſpecies. If we trace the progreſs of the mind ſtill farther, and obſerve it advancing through the inferior ſpecies, we ſhall find its manner of proceeding to be always the ſame; ſince every lower ſpecies is formed, by ſuperadding ſome new idea to the ſpecies next above: thus if animal be the genus, by ſuperadding the notion of four limbs, we obtain the idea of quadrupeds; if to this we add farther, the peculiar form and characters which diſtinguiſh mankind, we get the idea of the human ſpecies; and by adding the peculiarities which diſtinguiſh a particular perſon from all others, we form the notion of an individual, which is called the laſt ſpecies, or ſpecies ſpecialiſſimum.

For the uſe of the genus, ſpecies, and ſpecific difference in defining things, ſee the article DEFINITION.

SPECIES, in logic, is one of the five words called by Porphyry univerſals. See the article UNIVERSAL.

SPECIES, in rhetoric, is a particular thing, contained under a more univerſal one.

SPECIES, in optics, the image painted on the retina, by the rays of light reflected from the ſeveral points of the ſurface of an object. See the article VISION.

SPECIES, in commerce, are the ſeveral pieces of gold, ſilver, copper, &c. which, having paſſed their full preparation and

coinage, are current in public. See the article COIN.

SPECIES, in algebra, the characters or ſymbols made uſe of to repreſent quantities. See the article CHARACTER.

SPECIES, in pharmacy, denotes the ingredients of a compound medicine, as the diaſcordium in a dry form, or only reduced powder. See DIASCORDIUM.

The ſpecies aromaticæ, according to the Edinburgh-diſpenſatory, conſiſt of equal parts of canella, leſſer cardamom-ſeeds, mace and ginger, reduced to powder: but the college of phyſicians, London, order them to be made of cinnamon, two ounces; and leſſer cardamom-ſeeds huſked, ginger and long pepper, of each one ounce, all beat together into a powder. Both theſe compoſitions are agreeable, hot, ſpicy medicines; and as ſuch may be uſefully exhibited in cold phlegmatic habits and decayed conſtitutions, for warming the ſtomach, promoting digeſtion, and ſtrengthening the tone of the viſcera in general. The doſe is from ten grains to a ſcruple and upwards.

Change of SPECIES, in huſbandry, is the ſowing firſt one kind of plant, then another, and then a third, and ſo on, upon the ſame land: by this means the moſt is made of the ſoil; and it is found, when it will no longer give a good crop of the firſt corn planted on it, that it will ſtill give a good one of ſome other ſpecies; and, finally, of peaſe after all. After this laſt change of ſpecies, it is found neceſſary, in the common method of huſbandry, to renew the land with fallowing and manure, in order to its producing any thing again.

SPECIFIC, in philoſophy, that which is peculiar to any thing, and diſtinguiſhes it from all others.

SPECIFIC, in medicine, a remedy whoſe virtue and effect is peculiarly adapted to ſome certain diſeaſe, is adequate thereto, and exerts its whole force immediately thereon.

The illuſtrious Hoffman has given a curious account of ſpecific medicines, but it is too long to be inſerted here.

SPECIFIC GRAVITY, is that by which one body is heavier than another of the ſame dimenſion, and is always as the quantity of matter under that dimenſion. See the article GRAVITY.

As to the method of finding the ſpecific gravities of bodies, ſee HYDROMETER and HYDROSTATICAL BALLANCE.

SPECILLUM, in ſurgery, the ſame with ſpeculum. See SPECULUM.

SPECIOUS ARITHMETIC, the ſame with algebra. See the article ALGEBRA.

SPECTACLES, in dioptrics, a machine conſiſting of two lenſes, ſet in ſilver, horn, *&c.* to aſſiſt the defects of the organ of ſight. See LENS.

Old people, and others who have flat eyes, uſe convex ſpectacles, which cauſe the rays of light to converge ſo as to fall upon the retina: whereas myopes, or ſhort-ſighted perſons, uſe concave lenſes for ſpectacles, which cauſing the rays to diverge, prevent their meeting ere they reach the retina. The convexity or concavity of the glaſſes, ſuited to the different degrees of flatneſs or convexity of people's eyes, is beſt determined by trial; obſerving only to uſe thoſe glaſſes which are the leaſt convex or concave of any, that will fit the eye: for ſince they cannot be put quite cloſe to the eye, the leſs any glaſs is convex or concave, the leſs it will magnify or diminiſh the pictures of objects upon the retina. See VISION and MYOPIA.

Were there no other uſe of dioptrics, than that of ſpectacles for defective eyes, the advantage that mankind receives thereby is certainly inferior to none other whatſoever, that is not abſolutely requiſite to the ſupport of life; for as the ſight is the moſt noble of all our ſenſes, ſurely that inſtrument that relieves the eyes when decayed, and ſupplies their defects, rendering them uſeful when otherwiſe almoſt uſeleſs, muſt needs, of all others, be eſteemed of the greateſt advantage.

The antients knew nothing of ſpectacles, the invention of which is ſaid to have been about the year 1300.

Spectacles, without caſes, pay, on importation, a duty of 6 s. $7\frac{5}{10}$ d. for each groſs, containing twelve dozen; and draw back, on exportation 5 s. $2\frac{25}{100}$ d.

SPECTRE-SHELL, *concha ſpectrorum*, a ſpecies of voluta, variegated with ſeveral reddiſh faſciæ or bands. See the article VOLUTA.

SPECULARIS LAPIS, in natural hiſtory, a genus of talcs, compoſed of large plates viſibly ſeparate, and of extreme thinneſs; and each fiſſile again ſeparated into a number of plates ſtill finer. See TALC.

Of this genus there are three ſpecies: 1. The white ſhining ſpecularis, with large and broad leaves, commonly called iſin-

glaſs and muſcovy-glaſs: its lamellæ, or leaves, are extremely thin, elaſtic, and tranſparent; it makes not the leaſt effervescence with aqua fortis, and is not eaſily calcined in the fire. It is imported in great quantities; the miniature-painters cover their pictures with it; the lantern-makers ſometimes uſe it inſtead of horn; and minute objects are uſually preſerved between two plates of it, for examination by the microſcope. 2. The bright brown ſpecularis, with broad leaves; a very valuable ſpecies, though inferior to the former. 3. The purple bright ſpecularis, with broad leaves; which is the moſt elegant of all the talcs, and not leſs beautifully tranſparent than the firſt kind.

SPECULATIVE, ſomething relating to the theory of ſome art or ſcience, in contradiſtinction to practical. See the article THEORY.

SPECULUM, a LOOKING-GLASS, or MIRROUR, capable of reflecting the rays of the ſun, &c. See the articles MIRROUR, LIGHT, REFLECTION, &c.

SPECULUM, in ſurgery, an inſtrument for dilating a wound, or the like, in order to examine it attentively.

Theſe ſpecula are of different figures, according to the parts they are intended to ſearch: 1. The ſpeculum ani (plate CCLVIII. fig. 2. n° 1.) ſerves to dilate and inſpect the anus, vagina, and uterus, in diſorders of theſe parts; it conſiſts of a hollow cone or beak, whoſe two ſides are marked A A and B B, which, being gently warmed and lubricated with oil, are then preſſed into the anus or vagina; and by preſſing together the two handles C and D, the ſides of the cone are thereby gradually ſeparated, and dilate the parts for inſpection. the hinge E, is in manner of a ginglymus. 2. The ſpeculum oculi, the deſcription and uſe of which may be ſeen under the article COUCHING. 3. The ſpeculum oris, for inſpecting the mouth, is almoſt like a pair of forceps; A (*ibid.* n° 2.) being the part that depreſſes the tongue, while the parts B, B, elevate the dentes inciſores of the upper jaw, by preſſing the handles C, C, together. *Ibid.* n° 3. is another ſpeculum oris, furniſhed with a ſcrew, to open the teeth in convulſions; A A being the parts interpoſed between the dentes inciſores, and which are opened by means of the ſcrew B.

SPEECH, in general, the art or act of expreſſing a perſon's thoughts, by means of articulate ſounds, which we call words. See the article WORD.

Grammarians generally make eight parts of ſpeech, *i. e.* eight kinds of words, generally uſed in diſcourſe, *viz.* noun, pronoun, participle, adverb, prepoſition, interjection, and conjunction; each of which ſee under its proper article.

Others, particularly engliſh grammarians, refer all words to four general heads or claſſes, *viz.* 1. Such words as denote things actually exiſting, or their properties, which are called nouns or names, as *houſe, tree, man, horſe, convenient, large, &c.* 2. Such words as expreſs action or paſſion, as *I love, I am loved*; and theſe are called verbs or affirmations. 3. Such words as denote the manner or way of doing or ſuffering, as *ſwiftly, ſlowly, &c.* which are called adverbs. 4. Particles, or ſuch ſmall words as ſerve to connect others together, in forming a ſentence, as *and, or, alſo, before, after, &c.* See the articles PARTICLE, NOUN, VERB, &c.

SPEEDWELL, *veronica*, in botany. See the article VERONICA.

SPELL, in general, denotes the ſame with charm or amulet. See the articles CHARM and AMULET.

In the ſea-language, the word ſpell ſignifies to do any work for a ſhort time, and then leave it; therefore, a freſh ſpell is when freſh men come to work; and to give a ſpell, is to work in another's room.

SPELLING, in grammar, that part of orthography which teaches the true manner of reſolving words into their ſyllables. See the article ORTHOGRAPHY.

All words are either ſimple or compound, as *uſe, diſuſe*; *done, undone*: and the rules for dividing each, muſt be ſuch as are derived from the analogy of language in general, or from the eſtabliſhed cuſtom of ſpeaking; which, for the engliſh language, are reduced to the following rules: 1. A conſonant between two vowels muſt be joined with the latter in ſpelling, as *na-ture, ve ri-ly, ge-ne-rous*: except, however, the letter *x*, which is joined to the firſt, as in *flax-en, ox-en, &c.* and compound words, as in *up-on, un-uſed, &c.* 2. A double conſonant muſt be divided, as in *let-ter, man-ner, &c.* 3. Thoſe conſonants which can begin a word, muſt not be parted in ſpelling, as in *de-fraud, re-prove, di-ſtinct*: however, this rule is found ſometimes to fail; for tho'

gn begins a word, as *gnaw*, *gnat*, &c. yet it muſt be divided in ſpelling, as in *cog-ni-zance*, *ma-lig-ni ty*, &c. 4. Thoſe conſonants which cannot begin a word muſt be divided, as *ld* in *ſel-dom*, *lt* in *mul-ti-tude*, *mp* in *tem-per*, *rd* in *ar-dent*; but, in final ſyllables, there are exceptions, as *tl* in *ti-tle*, *dl* in *han-dle*, &c. 5. When two vowels come together, and are both of them diſtinctly ſounded, they muſt be ſeparated in ſpelling, as in *co-e-val*, *mu-tu-al*, &c. 6. The grammatical terminations, or endings, muſt be ſeparated in ſpelling, as *ed* in *wing-ed*, *edſt* in *de-li-ver edſt*, *ing* in *hear-ing*, *ance* in *de-li-ver-ance*, &c. 7. Compound words muſt be reſolved into their ſimple or component words, as *up-on*, *in-to*, *never-the-leſs*, *not-with-ſtand-ing*, &c.

SPELTER, in natural hiſtory, the ſame with zinc. See the article ZINC.

SPENT, in the ſea-language, ſignifies the ſame as broken.

SPERGULA, SPURRY, in botany, a genus of the *decandria-pentagynia* claſs of plants, the flower of which conſiſts of five oval, concave, patent petals; and its fruit is an oval, covered, unilocular capſule, formed of five valves, and containing numerous rounded ſeeds, ſurrounded with an emarginated rim.

SPERM, σπέρμα, the ſame with ſeed. See the article SEED.

SPERMA-CETI, in pharmacy, a white flaky ſubſtance, prepared from the oil of a ſpecies of whale, called by ichthyologiſts catodon, by reaſon it has teeth only in the under jaw. See CATODON.

The ignorance of the people who firſt uſed this medicine, gave it a name which ſeemed to expreſs its being the ſemen of the whale; but it is, in reality, no more than a preparation of the oil, with which that fiſh abounds.

Sperma-ceti is a fine, bright, white, and ſemi-pellucid ſubſtance, compoſed of a fine furfuraceous ſubſtance, formed into oblong flakes, very light, ſoft, and unctuous to the touch, inflammable, ſoluble in oil, but not in watery menſtrua; of ſcarce any ſmell, when freſh and fine, and of a ſoft, agreeable, and unctuous taſte. The largeſt, firmeſt, and whiteſt flakes of it are to be choſen. It is liable to become rancid and yellowiſh in keeping, and the ſmaller fragments contract this bad quality ſooner than the larger.

The ſperma-ceti of the ſhops was firſt made from the head of this fiſh; the oil obtained from its brain, and the diploe of the cranium, furniſhing all that we had of it; and hence the conſiderable price it was long kept at. It was ſome time after found out, however, that any whale-oil would do as well as this, which occaſioned the price to fall conſiderably. At preſent it is made in England from whale-oil of any kind, the ſettlings of our oilmen's larger veſſels particularly, which are boiled with a lixivium of german pot-aſh, or pearl-aſhes, till white and firm; and after ſeveral other meltings, and a thorough ſeparation of what ſaline particles might have got into the matter, it is, when cold, cut out with knives into the flakes we ſee it in. The proceſs is eaſy, but it requires care, and a nice inſpection towards the end: if not enough boiled, it is apt to turn yellow, and ſoon grow rancid.

Sperma-ceti is, therefore oil of the animal-kind, rendered very ſweet, and fit for internal uſe. Its virtues are emollient and pectoral; it is good in coughs, and other diſorders of the breaſt; and excellent in external applications, ſuch as liniments, and the like: it readily diſſolves in oil, or other fatty ſubſtances, for the latter purpoſes; and, for the former, it blends with the yolk of an egg, and after that mixture with an aqueous fluid, and makes a pleaſant emulſion.

SPERMACOCE, in botany, a genus of the *tetrandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal; the tube is cylindric, and longer than the cup; the limb is divided into four parts, patent, reflex, and obtuſe; the fruit conſiſts of two oblong capſules, growing together, gibbous on one ſide, plane on the other, and each of them having two horns or points; the ſeeds are ſingle and roundiſh.

SPERMATIC, in anatomy, ſomething belonging to the ſperm or ſeed.

The ſpermatic veſſels, called alſo vaſa præparantia, are certain veſſels appointed for bringing the blood to the teſticles, &c. to be ſecreted and prepared into ſeed, and for carrying back again the blood remaining after the ſecretion is effected. The ſpermatic veſſels are two arteries and as many veins. The ſpermatic arteries ariſe, by a very narrow origin, from the fore part of the trunk of the aorta, below the emulgents: their ſtructure is very ſingular, in that, contrary to the fabric of all other arteries, which are largeſt at their exit from the trunk, theſe are ſmalleſt at

their origin, and grow bigger in their progreſs towards the teſtes; by this means the blood receives a check at its firſt going off for thoſe parts, which diſpoſes it for the future changes, &c. it is to paſs thro'. The ſame end is anſwered in quadrupeds, by having theſe arteries curled and contorted in their paſſage, like a ſcrew. The reaſon why nature has taken another method in man, Mr. Cowper obſerves, is, that in this caſe the abdominal muſcles muſt have been larger than they are; by which means the inteſtines would have been frequently let down into the ſcrotum; an inconvenience which quadrupeds are ſecured from, by the horizontal poſition of their bodies.

The ſpermatic arteries, in their progreſs, meeting with the ſpermatic veins, enter together with them the inner lamella of the peritonæum; where inſinuating into the duplicature of the proceſs, and being cloathed therewith, they paſs on to within three or four fingers breadth of the teſticles, where they divide into two unequal branches, the biggeſt of which goes to the teſticle, and is diſtributed therein; and the leſſer in the paraſtata or epididymis. See ARTERY, TESTICLE, and PARASTATA.

The ſpermatic veins take the ſame courſe with the arteries, only a little above the teſticles they ſplit into ſeveral branches, which uniting, form a plexus, called the corpus pampiniforme, or pyramidale. The blood returned by the ſpermatic veins, is delivered on the right ſide to the cava, and on the left into the emulgent vein. Their nerves ariſe from the plexes of the pelvis and of the loins. See VEIN, NERVE, CORPUS, &c.

SPERMATOCELE, in medicine and ſurgery, the ſame with the cirſocele, or hernia varicoſa. See the article CIRSOCELE.

SPERMATOPOEA, the name given to ſuch medicines as are ſuppoſed to increaſe the ſemen.

SPEY, a river of Scotland, which, running north eaſt, through Badenoch and Murray, falls into the German ſea, eaſt of the firth of Murray.

SPEZIA, a town of Italy, in the territory of Genoa, ſituated on a bay of the Tuſcan ſea, fifty miles ſouth-eaſt of Genoa.

SPHACELUS, in ſurgery and medicine, an abſolute and perfect corruption or death of the parts; whereby it is diſtinguiſhed from a gangrene, which is that very great and dangerous degree of inflammation, wherein the parts affected begin to corrupt and put on a ſtate of putrefaction. See GANGRENE.

In caſes of a perfect ſphacelus, or mortification, wherein the parts are become abſolutely dead, and wholly without ſenſe, and ſoft ſo as to retain the impreſſions of one's finger-end, and are plainly fetid and corrupted, all the medicines in the world will be inſufficient to reſtore the parts to life again; and all that remains to be done, is the one miſerable remedy of preſerving the reſt of the body, by cutting off that part, to prevent the mortification from ſpreading farther. A different method, however, is to be taken in this operation, according to the degree of the ſymptoms and the parts affected. If only ſome extremity of the foot, tarſus, metatarſus, ancle, or inſtep, or only the bare ſkin and fat are ſphacelated, the whole foot, in that caſe, ought not to be amputated, but preſerving the limb entire, the ſurgeon is only to remove that part which is vitiated: and Heiſter's opinion is, that this is frequently beſt of all done by ſuppuration; or elſe by cauſtic medicines. When it is to be done by ſuppuration, that is to be brought on as faſt as poſſible; and when it is done, the cruſt, or eſchar, of the ulcer is to be ſuppurated from the ſound parts with proper caution. To haſten effectually a ſuppuration in theſe caſes, nothing is ſo ſerviceable as the making numerous long and deep ſcarifications near the ſound parts; and afterwards the inciſed parts are to be well anointed with the common digeſtive ointment, and after that treated with the balſamic cataplaſms and fomentations, in common uſe on the like occaſions. A fomentation alſo ſerviceable in theſe caſes, is made by mixing, in a quart of a decoction of ſcordium, or of barley-water, vinegar of rue, ſix ounces; ſpirit of wine with venice-treacle, four ounces; and an ounce or two ounces of common ſalt; this is to be applied hot, with compreſſes, to the inciſed part, and frequently repeated till the diſorder appears to ſpread no farther, which is known to be the caſe, when the tumour of the vitiated part ſubſides, and the edges of the ſound part become tumid all round; and the ſecond or third day after this, a ſuppuration is uſually formed, and the ſound parts become gradually ſeparated from the vitiated. After this, to ſoften and promote

mote a ſpeedy ſeparation of the eſchar, the following cataplaſm is always found highly ſerviceable: take of ſcordium, two handfuls; mallows, marſh-mallows, and henbane, of each one handful; lavender-flowers, half a handful. let theſe be boiled to the conſiſtence of a cataplaſm in vinegar or oxycrate; and when in that ſtate, add to them three ounces of the flour of linſeed, one ounce of linſeed-oil, and two ounces of ſal armoniac. This is to be applied warm over the whole, and is to be retained in that condition, as long as ſhall be found neceſſary, by means of a brick boiled in water, and applied wrapped in a linnen-cloth, or ſome other like means. See SUPPURATION and FOMENTATION.

After theſe medicines have been uſed, and the whole ſurrounding ſkin is gently tumefied with redneſs, a cruſt or eſchar is then formed by degrees, and the ſound fleſh begins to ſeparate from the reſt; by this we know that the diſorder has done ſpreading, and that an entire ſuppuration of the vitiated parts will very ſhortly follow. When this ſeparation ſhews itſelf beginning, it ſhould be promoted as much as poſſible, by dreſſing the part with the common digeſtive, either alone, or mixed with venice-treacle, which muſt be retained on between the ſound and the dead parts. To make way for this, it is ſometimes neceſſary to divide them a little by the lancet; and when that is done, and the dreſſing has been applied, the before-deſcribed cataplaſm ſhould be laid on warm; and in all the ſucceeding dreſſings, whatever is found looſe of the dead part muſt be carefully removed. And if it be neceſſary, from the adheſion of the vitiated parts to the ſound, to uſe the ſciſſars, or ſcalpel, to divide them, this is always to be done with very little either of pain or danger; it will then be proper to dreſs the part with the digeſtive, and a plaſter of diachylon, or the like, over it, till the corrupted parts are entirely caſt off, and the ulcer appears perfectly well cleanſed, and the cure is then eaſily perfected in the common way.

This is the gentler and moſt common method: ſome ſurgeons, however, from the tedioufneſs of it, have recourſe directly, in theſe caſes, to the cauſtic. They anoint either the edges only, or elſe the whole of the corrupted part, every day with butter of antimony, or the cauſtic-ſtone liquified, till the living parts are ſurrounded by a ſort of eſchar, applying afterwards the cataplaſms before deſcribed, or others of the ſame kind, to prevent the diſorder from ſpreading, and to make the corrupted parts ſeparate from the ſound: the corroſive lixivium of Boerhaave is greatly in repute, and much uſed on thoſe occaſions; it is made of three ounces of very ſtrong quick-lime, mixed with nine ounces of pot-aſhes, firſt ground ſeparately to powder, and afterwards mixed, adding a little water; they are then to be put into a glaſs-veſſel, and ſet in a cellar, to run by deliquium. As ſoon as they are found to become fluid, the matter muſt be put into a filtre of coarſe paper, and the clear liquor that runs through, muſt be kept for uſe. It is to be uſed by dipping a bruſh, or feather into it, and rubbing it over the part affected, once or twice a day; or fine linnen-rags may be wetted with it, and applied all over the part, not forgetting, however, at the ſame time, the uſe of the fore-mentioned cataplaſm: this application is to be continued till the corrupted matter begins to caſt off in cruſts or ſcales; and when this is the caſe, it muſt be dreſſed with the common digeſtive; and, when perfectly cleanſed, healed with a vulnerary balſam.

Another cauſtic highly commended by Belloſte in theſe caſes, is made by diſſolving one part of crude mercury, in two parts either of ſpirit of nitre, or of aqua fortis: this is to be rubbed over the parts as the former, and will occaſion a ſpeedy ſeparation.

Finally, when the ſphacelus is ſo deeply affixed in any part of the upper or lower extremity, that it has penetrated through the muſcles ſo far as the bone, and has either reſiſted the force of all medicines, or the proper times for applying them has been neglected, in this caſe, to preſerve the reſt of the body, the injured part muſt be amputated. See AMPUTATION.

SPHÆRANTHUS, in botany, a genus of the *ſyngeneſia-polygamia-neceſſaria* claſs of plants, the general corolla whereof conſiſts of hermaphrodite corollulæ in the center, and the female ones in the verge of the flower; the proper hermaphrodite one is monopetalous, funnel-ſhaped, and open, and quinquifid at the limb; there is ſcarce any female corolla; there is no pericarpium; the receptacle is naked; the ſeed is ſingle, oblong, and naked.

SPHÆROCARPUS, in botany, a genus of the *cryptogamia* claſs of plants, conſiſting of foliaceous

foliaceous matter, expanded on the ground and producing very large and obvious fructifications. Dr. Hill thinks it probable, that the male flowers are produced on ſeparate plants from the female, and have not been diſcovered to belong to the ſame ſpecies: no male parts of fructification are deſcribed to us; the female parts conſiſt of a tubulated and inflated vagina, within which are contained a large globular capſule, containing a great number of ſmall, looſe ſeeds.

SPHÆROMACHIA, *σφαιρομαχια*, in antiquity, a particular kind of boxing, wherein the combatants had balls of ſtone, or lead, in their hands, which were called *σφαιραι*; hence the ſeventh part of the gymnaſium, where this exerciſe was practiſed, was called the ſphæriſterium.

SPHAGNUM, in botany, a genus of the *cryptogamia-muſcorum* claſs of plants, conſiſting of ſtalks furniſhed with leaves, and of capſules, in ſome reſpects reſembling thoſe of the bryum, but without any calyptræ, and ſtanding on ſo ſhort pedicles, that they do not appear to have any. Dr. Hill ſays, that the pedicles which ſupport the capſules, grow in many of the ſpecies from the ſummits of the ſtalk; but Linnæus ſuppoſes it to be ſo in all, and makes it a part of the generical character.

SPHENOIDAL SUTURE, in anatomy, a ſuture thus called from its encompaſſing the os ſphenoides, which it ſeparates from the os frontis, the os petroſum, and the os occipitis. See SKULL, and the next article.

SPHENOIDES, or OS CRUCIFORME, in anatomy, the ſeventh bone of the cranium, or ſkull. See SKULL.

This bone is fixed in manner of a wedge among the other bones of the cranium, and ſerves as a baſis, as it were, to ſupport ſeveral of them, and ſome of thoſe of the upper jaw: the figure of this bone is very irregular; in its upper part is ſeen the ſella equina, or turcica, under which there is a ſinus; this is ſometimes double, and opens into the noſtrils; ſometimes it is totally wanting: it is called the ſphenoidal ſinus. The ſphenoides has thirteen apophyſes; ſix of them are internal, and are placed near the ſella equina; and the other ſeven are external; four of theſe are of a pterygoide form, and thence named pterygoide apophyſes; two of the other three are very ſmall and ſtyloide, and the ſeventh is placed under the vomer: there are alſo three foſſæ, or cavities, in this bone, one in the ſella equina, and the other between the pterygoide apophyſes.

SPHENOPHARYNGÆUS, in anatomy, a pair of muſcles, called alſo the pterygopharingæus. See PTERYGOIDÆUS.

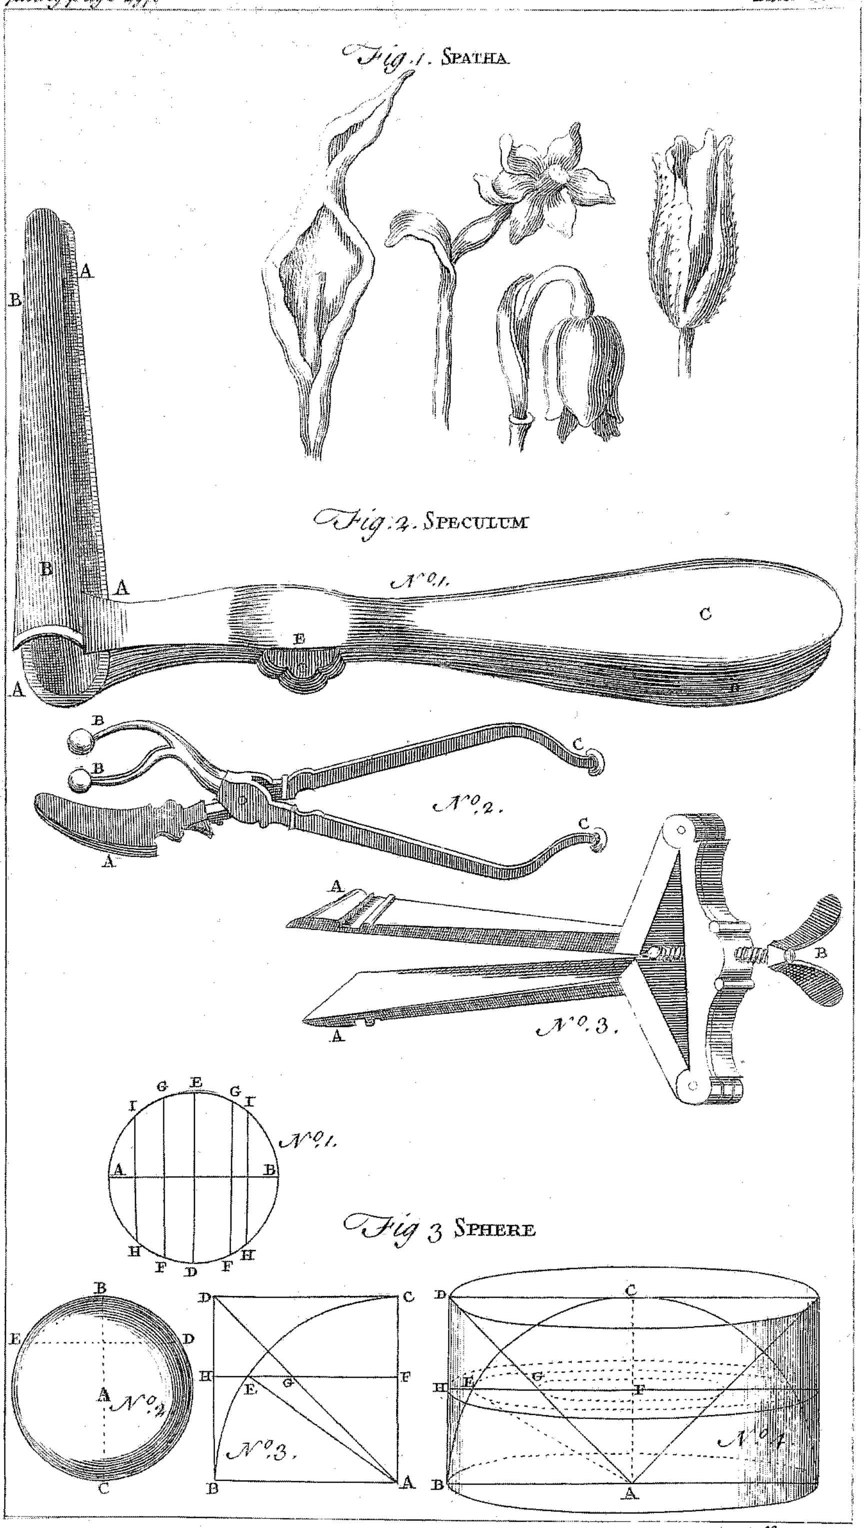
SPHENOSTAPHYLINUS, in anatomy, a muſcle of the larynx. It deſcends from a round fleſhy origination, near the root of a proceſs of the os ſphenoides, and from thence runs obliquely to the uvula, and is inſerted into its hinder and upper part, where it joins its partner. It ſerves to draw the uvula upwards and backwards, and hinders the maſticated aliment from paſſing into the foramina narium, in deglutition.

SPHERE, *ſphæra*, *σφαιρα*, is a ſolid contained under one uniform round ſurface, ſuch as would be formed by the revolution of a circle about a diameter thereof, as an axis. Thus the circle AEBD (plate CCLVIII. fig. 3. n° 1.) revolving about the diameter AB, will generate a ſphere, whoſe ſurface will be formed by the circumference of the circle.

Definitions. 1. The center and axis of a ſphere, are the ſame as the center and diameter of the generating circle: and as a circle has an indefinite number of diameters, ſo a ſphere may be conſidered as having alſo an indefinite number of diameters, round any one of which the ſphere may be conceived to be generated. 2. Circles of the ſphere are thoſe circles deſcribed on its ſurface, by the motions of the extremities of the chords ED, FG, IH, *&c.* at right angles to AB; the diameters of which circles are equal to thoſe chords. 3. The poles of a circle on the ſphere, are thoſe points on its ſurface, equally diſtant from the circumference of that circle: thus A and B are the poles of the circles deſcribed on the ſphere by the ends of the chords ED, FG, IH, *&c.* 4. A great circle of the ſphere is one equally diſtant from both its poles; as that deſcribed by the extremities of the diameter ED, which is equally diſtant from both its poles A and B. 5. Leſſer circles of the ſphere are thoſe which are unequally diſtant from both their poles; as thoſe deſcribed by the extremities of the chords FG, HI, *&c.* becauſe unequally diſtant from their poles A and B. See the article CIRCLE.

Axioms. 1. The diameter of every great circle paſſes through the center of the ſphere; but the diameters of all leſſer circles do not paſs through the ſame center: hence alſo the center of the ſphere is

the



T. Jefferys sculp

the common center of all the great circles. 2. Every ſection of a ſphere by a plane, is a circle. 3. A ſphere is divided into two equal parts, or hemiſpheres, by the plane of every great circle; and into two unequal parts, called ſegments, by the plane of every leſſer circle. 4. The pole of every great circle is 90° diſtant from it on the ſurface of the ſphere; and no two great circles can have a common pole. 5. The poles of a great circle are the two extremities of that diameter of the ſphere, which is perpendicular to the plane of that circle. 6. A plane paſſing through three points on the ſurface of the ſphere, equally diſtant from any of the poles of a great circle will be parallel to the plane of that great circle. 7. The ſhorteſt diſtance between two points, on the ſurface of a ſphere, is the arch of a great circle paſſing through theſe points. 8. If one great circle meets another, the angles on either ſide are ſupplements to each other; and every ſpherical angle is leſs than 180°. 9. If two circles interſect each other, the oppoſite angles are equal. 10. All circles on the ſphere, having the ſame pole, are cut into ſimilar arches, by great circles paſſing through that pole.

Properties of the SPHERE. 1. All ſpheres are to one another as the cubes of their diameters. 2. The ſurface of a ſphere is equal to four times the area of one of its great circles, as is demonſtrated by Archimedes in his book Of the Sphere and Cylinder, lib. i. prop. 37. hence, to find the ſuperficies of any ſphere, we have this eaſy rule; let the area of a great circle be multiplied by 4, and the product will be the ſuperficies: or, according to Euclid, lib. vi. prop. 20. and lib. xii. prop. 2. the area of a given ſphere, CEBD (*ibid.* n° 2.) is equal to that of a circle, whoſe radius is equal to the diameter of the ſphere BC. Therefore, having meaſured the circle deſcribed with the radius BC, this will give the ſurface of the ſphere. 3. The ſolidity of a ſphere is equal to the ſurface multiplied into one third of the radius: or, a ſphere is equal to two thirds of its circumſcribing cylinder, having its baſe equal to a great circle of the ſphere. Let ABEC (*ibid.* n° 3. and 4.) be the quadrant of a circle, and ABDC the circumſcribed ſquare, equal twice the triangle ADC: by the revolution of the figure about the right line AC, as an axis, a hemiſphere will be generated by the quadrant, a cylinder of the ſame baſe and height of the ſquare, and a cone by the triangle: let theſe three be cut any how by the plane HF, parallel to the baſe AB; and the ſection of the cylinder will be a circle, whoſe radius is FH; in the hemiſphere, a circle whoſe radius is FE; and in the cone, a circle of the radius FG. But EA^2 ($=HF^2$) $=$ EF^2+FA^2: but $AF^2=FG^2$, becauſe AC $=$ CD; and therefore $HF^2=EF^2+FG^2$; or the circle of the radius HF, is equal to a circle of the radius EF, together with a circle of the radius GF: and ſince this is true every where, all the circles together deſcribed by the reſpective radii HF, that is the cylinder, are equal to all the circles deſcribed by the reſpective radii EF and FG, that is, to the hemiſphere and cone taken together. But by Euclid, lib. xii. prop. 10. the cone generated by the triangle DAC, is one third part of the cylinder, generated by the ſquare BC, whence it follows, that the hemiſphere generated by the rotation of the quadrant ABEC, is equal to the remaining two thirds of the cylinder, and that the whole ſphere is two thirds of the cylinder circumſcribed about it. Hence it follows, that a ſphere is equal to a cone, whoſe height is equal to the ſemi-diameter of the ſphere, and its baſe equal to the ſuperficies of the ſphere, or to the area of four great circles of the ſphere, or to that of a circle, whoſe radius is equal to the diameter of the ſphere. See the articles CONE, CIRCLE, CYLINDER, *&c.*

Circles of the SPHERE. See CIRCLE.

Projection of the SPHERE. See PROJECTION.

Sector or ſegment of a SPHERE. See the articles SECTOR and SEGMENT.

SPHERE, in aſtronomy, that concave orb, or expanſe, which inveſts our globe, and in which the heavenly bodies appear to be fixed, and at an equal diſtance from the eye.

The better to determine the places of the heavenly bodies in the ſphere, ſeveral circles are ſuppoſed to be deſcribed on the ſurface thereof, hence called the circles of the ſphere: of theſe, ſome are called great circles, as the equinoctial, ecliptic, meridian, *&c.* and others, ſmall circles, as the tropics, parallels, *&c.* See each under its proper article.

Armillary SPHERE. See ARMILLARY SPHERE.

SPHERE *of activity of a body*, is that determinate ſpace or extent, to which, and no farther, the effluvia continually emit-

ed

ed from that body, reach; and where they operate, according to their nature. See the article POWER.

SPHERICAL ANGLE, TRIANGLE, and TRIGONOMETRY. See the article ANGLE, TRIANGLE, and TRIGONOMETRY.

SPHERICS, is that part of geometry which treats of the position and menſuration of arches of circles, deſcribed on the ſurface of a ſphere. See the article SPHERE.

SPHEROID, in geometry, a ſolid, approaching to the figure of a ſphere.

The ſpheroid is generated by the entire revolution of a ſemi-ellipſis about its axis, See the article ELLIPSIS.

Thus, if the ſemi-ellipſis AHFB (plate CCLIX. fig. 1. n° 1.) be ſuppoſed to revolve round its tranſverſe axis AB, it will generate the oblong ſpheroid AHFBG. Now as all circles are as the ſquares deſcribed upon their radii; that is, the circle of the radius EH, is to the circle of the radius EG, as CF^2 to CD^2, becauſe EH : EG :: CF : CD; and ſince it is ſo every where, all the circles deſcribed with the reſpective radii EH, (that is, the ſpheroid made by the rotation of the ſemi-ellipſis AFB about the axis AB) will be to all the circles deſcribed by the reſpective radii EG, (that is, the ſphere deſcribed by the rotation of the ſemi-circle ADB on the axis AB) as FC^2 to CD^2; that is, as the ſpheroid is to the ſphere on the ſame axis, ſo is the other axis of the generating ellipſis to the ſquare of the diameter or axis of the ſphere: and this holds whether the ſpheroid be formed by a revolution around the greater or leſſer axis.

Hence it appears, that the half of the ſpheroid, formed by the rotation of the ſpace AHFC, around the axis AC, is double of the cone generated by the triangle AFC, about the ſame axis. Hence, alſo, is evident the meaſure of the ſegments of the ſpheroid, cut by planes perpendicular to the axis: for the ſegment of the ſpheroid, made by the rotation of the ſpace ANHE round the axis AE, is to the ſegment of the ſphere, having the ſame axis AC, and made by the rotation of the ſegment of the circle AMGE, as CF^2 to CD^2. But the meaſure of this ſolid may be found with leſs trouble by this analogy; *viz.* as BE : AC + EB :: ſo is the cone generated by the rotation of the triangle AHE round the axis AE : to the ſegment of the ſphere made by the rotation of the ſpace ANHE round the ſame axis AE, as is demonſtrated by Archimedes of conoids and ſpheroids, prop. 34. This agrees as well to the oblate as to the oblong ſpheroid. See the articles SPHERE and SEGMENT.

A ſpheroid is alſo equal to two thirds of its circumſcribing cylinder. See the articles CYLINDER and FRUSTUM.

As to the ſuperficies of a ſpheroid, Mr. Huygens gives the two following conſtructions in his Horolog. Oſcill. For deſcribing a circle equal to the ſuperficies of an oblong and prolate ſpheroid: 1. Let an oblong ſpheroid be generated by the rotation of the ellipſis ADBE, (*ibid.* n° 2.) about its tranſverſe axis AB, and let DE be its conjugate; make DF equal to CB, or let F be one of the foci, and draw BG parallel to FD, and about the point G, with the radius BG, deſcribe an arch, BHA, of a circle; then between the ſemi-conjugate CD, and a right line equal to DE + the arch AHB, find a mean proportional, and that will be the radius of a circle equal to the ſuperficies of the oblong ſpheroid. 2. Let a prolate ſpheroid be generated by the rotation of the ellipſis ADBE (*ibid.* n° 3.) about its conjugate axis AB. Let F be one of the foci, and biſſect CF in G, and let AGB be the curve of the common parabola whoſe baſe is the conjugate diameter AB, and axis CG. Then if between the tranſverſe axis DE, and a right line equal to the curve AGB of the parabola, a mean proportional be taken, the ſame will be the radius of a circle equal to the ſurface of that prolate ſpheroid.

For the ſpheroidical figure of the earth, and the difference this muſt occaſion in the meridional parts, uſed in the projection of Mercator's chart, ſee the articles EARTH and MERIDIONAL.

SPHINCTER, in anatomy, a term applied to a kind of circular muſcles, or muſcles in form of rings, which ſerve to cloſe and draw up ſeveral orifices of the body, and prevent the excretion of the contents: thus the ſphincter of the anus cloſes the extremity of the inteſtinum rectum. It has its origin from the bottom of the os coccygis, and the ſkin that is under this bone; and its fibres, from hence ſeparating every way from one another, and ſurrounding the anus in every part, aſcend afterwards in men into the lower part of the bulb of the urethra,

urethra, or into the acceleratores muſcles which ſurround this bulb, and are there terminated. In women, they are inſerted into the lower part of the vagina of the uterus. Many fibres alſo deſcend from the interior and lower part of the os pubis, near the ſynchondroſis; and forming a body of an oval figure, and of the breadth of a man's thumb, they ſurround the extremity of the rectum; and when they act, have the ſame effect of drawing it together and cloſing it: there are indeed but few merely circular, or annular fibres, ſuch as are uſually ſaid to compoſe the ſphincter, obſerved in diſſection. See the article ANUS.

The ſphincter of the bladder is compoſed of a ſeries of tranſverſe fibres running croſswiſe, under the ſtrait fibres of the neck of the bladder, in form of a circle, and ſerving to cloſe it, to prevent the involuntary diſcharge of the urine. In men this is connected to the fibres of the inteſtinum rectum, and in women to thoſe of the vagina. See BLADDER.

The ſphincter gulæ, or, as it is otherwiſe called, the oeſophagæus, is a ſingle muſcle, which ſerves for the conſtriction of the pharynx. This riſes on each ſide of the os hyoides, and the thyroide, and the cricoide of the larynx, which ſurrounds the hinder part of the gulæ. See the article PHARYNX.

The ſphincter of the pupil of the eye appears upon the poſterior ſurface of the uvea when its blackneſs is cleared away, and is formed of circular fibres for contraction, as the ciliary fibres are for the dilatation of the pupil. See EYE.

The ſphincter of the vagina is compoſed of a ſeries of muſcular fibres ariſing from the ſphincter of the anus, and ſurrounds the orifice of the vagina; after which it is inſerted under the crura of the clitoris. For the ſphincter of the lips, ſee the article CONSTRICTOR.

SPHINX, σφίγξ, in ſculpture, &c. a figure or repreſentation of a monſter of that name, famed among the antients, now moſtly uſed as an ornament in gardens, terraces, &c. It is repreſented with the head and breaſts of a woman, the wings of a bird, the claws of a lion, and the reſt of the body like a dog. It is ſuppoſed to have been engendered by Typhon, and ſent by Juno to be revenged on the Thebans. Its office, they ſay, was to propoſe dark enigmatical queſtions to all paſſers by; and if they did not give the explication thereof, to devour them. It made horrible ravages, as the ſtory goes, on a mountain near Thebes, and could not by any means be deſtroyed, till after OEdipus had ſolved the following riddle, "What animal is it that in the morning walks on four legs, at noon on two, and at night on three?" The anſwer was "Man."

Among the Egyptians, the ſphinx was the ſymbol of religion, by reaſon of the obſcurity of its myſteries: and on the ſame account the Romans placed a ſphinx in the porch of their temples.

SPHONDYLIUM, in botany, Tournefort's name for the heracleum of Linnæus. See HERACLEUM.

SPICA VIRGINIS, a ſtar of the firſt magnitude, in the conſtellation virgo. Its place is in the more ſoutherly hand. Its longitude, according to Mr. Flamſteed, is 19° 31′ 22″: its lat. 2° 1′ 59″ ſouth.

SPICE, any kind of aromatic drug that has hot and pungent qualities: ſuch are pepper, nutmeg, ginger, cinnamon, cloves, &c. See the articles AROMATIC, PEPPER, &c.

Some alſo apply the word to divers other medicinal drugs brought from the eaſt: as ſenna, caſſia, frankincenſe, &c. See the articles SENNA, &c.

SPICE-ISLANDS, ſituated in the Eaſt-Indies. See BANDA-ISLANDS, MOLUCCAS, and CEYLON.

SPIDER, *aranea*, in zoology, an inſect of a roundiſh or elliptic figure, having eight eyes placed on the hinder part of the thorax, and having alſo eight legs. This creature has a power of ſpinning. See WEB.

The ſpecies of ſpiders are very numerous; but authors have made them more ſo, by admitting among them other inſects of a very different genera.

SPIDER-WORT, in botany. See the article PHALANGIUM.

SPIEL, in the glaſs-trade, an iron-inſtrument, hooked at the end and pointed, with which the workmen take the metal up out of the melting-pots, for proofs or eſſays, to ſee whether it be fit for work.

SPIGELBURG, a town of Germany, in the circle of Weſtphalia, capital of the county of Spigelburg: eaſt long. 9° 25′, north lat. 52° 6′.

SPIGELIA, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, of the ſhape of a funnel: the tube is much longer than the cup, and is narrower below than above: the pericarpium

conſiſts of two globoſe fruits, growing together, and ſituated on the cup: the ſeeds are roundiſh, very ſmall, and numerous.

SPIGNEL, in botany, the engliſh name of the plant meum. See MEUM.

SPIGNO, a town of Italy, in the dutchy of Monferrat: ſituated ſixty miles ſouth-eaſt of Turin.

SPIKE, or *oil of* SPIKE, a name given to an eſſential oil diſtilled from lavender, and much uſed by the varniſh-makers, and the painters in enamel, and of ſome uſe in medicine. It is brought from Provence, and other parts of France, where the lavender is called aſpic, and thence came the name of oil of ſpike. This oil, when in perfection, is very limpid; of a pleaſant yelloviſh colour; very fragrant; poſſeſſing, in an eminent degree, the peculiar ſmell generally admired in the flowers. In medicine it is uſed, both externally and internally, in paralytic and lethargic complaints, rheumatic pains, and debilities of the nervous ſyſtem. The doſe is from one drop to five or ſix; but our artificers, in their varniſhes, uſe more of this oil than the apothecaries do: and wanting it at a cheap rate, they have taught the druggiſts, who uſed to import and ſell it to them, ſo many ways of adulterating it, that at preſent it is ſcarce any where to be met with genuine; and ſo coarſe an ingredient as common oil of turpentine is uſed as the baſis of all the counterfeits: they alſo ſometimes adulterate it with ſpirit of wine. But both theſe cheats are eaſily diſcovered: that mixed with ſpirit of wine may be known by only mixing the whole with water, in which caſe the water, uniting with the ſpirit, leaves the oil at the top alone: that mixed with oil of turpentine, is diſcovered by burning a ſpoonful of it; for the genuine oil of ſpike burns with a clear flame and without ſmoke, and its ſmell, while burning, is very fragrant; whereas, when there is oil of turpentine mixed, it burns more furiouſly, emits a thick ſmoke, and is of a very bad ſmell. This oil is diſtilled from the ſmaller ſpecies of lavender, in the common way, by the alembic. See LAVANDULA.

SPIKENARD, *nardus*, in botany. See the article NARDUS.

Ploughman's SPIKENARD, in botany, the ſame with the conyza, or flea-bane. See the article CONYZA.

SPIKING *up the ordnance*, a ſea-phraſe, uſed for faſtening a quoin with ſpikes to the deck cloſe to the breech of the carriages of great guns, that they may keep cloſe and firm to the ſhip's ſides, and not get looſe when the ſhip rolls, and by that means endanger the breaking out of a butt-head of a plank. See QUOIN.

SPILIMBERGO, a town of Italy, in the territory of Venice, and province of Friuli, ſituated forty-five miles north of Venice.

SPILSBY, a market-town of Lincolnſhire; ſituated twenty-ſeven miles eaſt of Lincoln.

SPINA BIFIDA, in anatomy, a parting of the ſpinal proceſſes into two rows: the exiſtence of ſuch a caſe is doubted. See the article SPINE.

SPINA VENTOSA, in ſurgery and medicine, that ſpecies of corruption of the bones which takes its riſe in the internal parts, and by degrees enlarges the bone, and raiſes it into a tumour, and which, when it happens to children, is termed by Severinus, and many others, pædarthrocaces. See PÆDARTHROCACES and TUMOUR.

In the ſpina ventoſa, the caries or eroſion of the bone, is, according to Heiſter, occaſioned by a depravity of the contained fluids, and generally ariſes ſpontaneouſly, or without any external cauſes: nor does it begin upon the ſurface of the bone, but between its lamellæ, or elſe in its internal cavity; from thence it extends, by degrees, to the external parts; and at length either affects the whole bone or a greater or ſmaller part of it; expanding itſelf to different widths, and riſing to a tumour which is ſometimes hard and without pain, and at other times feels as if it were filled with wind: it is attended with a greater or leſſer degree of pain, pricking and ſhooting; at laſt it grows red, and is accompanied with other bad ſymptoms, till the diſordered bone, being by degrees corroded, the common integuments, and other ſofter parts that lay over it, remaining at firſt intire, partake of the diſorder; then foul ulcers of a very terrible ſort break out. When tumours of the bone are hard, and the ſoft parts about them are not inflated, but free from redneſs, inflammation, and pain, as is very frequently the caſe in ricketty diſorders, the bad ſymptoms juſt deſcribed ſeldom come on: this is properly the pædarthrocaces: but the painful, red, inflated tumours, happening equally to children and to adults, are the

the ſpina ventoſa. It differs from a caries, by being attended with tumour; and from an exoſtoſis, as this latter is an excreſcence of the bone, whether attended with eroſion or not. See CARIES, RICKETS, EXOSTOSIS, &c.

The ſpina ventoſa generally begins about the heads or epiphyſes of the larger bones, where they are moſt tender and ſpongy, and where the noxious matter may not only have ſufficient room to lodge in the cellular ſubſtance, but where it will alſo meet with the leaſt reſiſtance in ſoftening and expanding the parts. The os frontis is ſubject to diſorders of this kind in venereal caſes; and it is frequently ſituated in the bones of the neck, face, and breaſt.

Though this diſorder uſually ariſes from internal, yet it is ſometimes found to be owing to external cauſes, eſpecially in perſons conſtitutionally addicted to a diſorder of this kind; when the veſſels between the lamellæ of the bone, or in the medulla itſelf, are by a blow, fall, or other external violence, injured or torn. But the proximate cauſe of this diſorder is either a collection, or congeſtion, of a viſcid and thick, or of an acrimonious and corroding humour; or an inflammation ariſing in the medulla, or in the ſubſtance or cells of the bone degenerating into an abſceſs, and forming an ichor or pus. The collection of viſcid and pituitous matter, and the expanſion of the bones, ſometimes happens without pain; but the eroſion of the parts can never happen without the moſt acute pains. When the internal parts of the bones only are affected by this diſorder, the pain does not encreaſe upon external preſſure. When the pain encreaſes upon external preſſure, the external parts are brought into conſent; and when this happens, the periofteum, and parts which ſurround it, with the ſubſtance of the bone, and tunica cellularis, enlarge; from whence a ſenſation frequently ariſes as if the parts were filled with air or wind.

A ſpina ventoſa, ſtrictly ſo called, is by Heiſter divided into three degrees: the firſt is, when the patient complains of a grievous pain in the bone, which ſeems to him to proceed from the medulla. At this time there is no external pain nor tumour. In this ſtate the diſeaſe is confined to the internal part of the bone. The ſecond degree of the diſeaſe is, when after the pains a tumour appears upon the face of the bone, either hard or ſoft, and as it were windy, with external pain more or leſs. The third degree is, when after all the ſymptoms, an abſceſs is formed in the tumour, which either burſts ſpontaneouſly or is opened with the knife, and diſcharges a fetid ichor, or purulent matter, ſmelling like rank butter or lard.

There are two methods of treating this diſorder: one ſuited to the two milder degrees of it, and the other to the more violent ſtate of it. In the milder ſtages, Heiſter directs that the acrimony of the blood be corrected by large draughts of the decoctions of the woods with the china and ſarſaparilla roots: that the parts affected be fumigated with the ſteam of decoctions of aromatic herbs; and twice a day, in the intermediate times, that the part be rubbed over with mercurial ointment, and afterwards covered with the common mercurial plaſter. Mercurial medicines muſt alſo be given internally, according to the ſtrength of the patient; and ſometimes a ſalivation is neceſſary. By diligently purſuing this method for ſome weeks, the firſt and ſecond ſtages of this diſorder may be cured, even where there are bony tumours formed; and the tumours may either be reduced, or at leaſt brought to that ſtate, that they will remain as they are without farther increaſe or without pain, or any farther inconveniency. But when theſe tumours are ſo far advanced as to be out of the reach of remedies, the pains and tumours increaſing, and abſceſſes forming, there is great reaſon to fear the entire deſtruction of the bone. If the abſceſs does not burſt of itſelf, the ſurgeon muſt not wait for its maturation, but lay the bone bare, in the loweſt or moſt painful part. When the abſceſs is already burſt, if the opening is too ſmall it muſt be enlarged, either with the knife or a cauſtic; and after this ſeveral holes muſt be made in the bone with a ſmall piercer, perforating it into the medulla, to give way for the diſcharge of the confined matter; and when theſe ſmall holes are not ſufficient, a larger muſt be made by the trepan, if the bone will admit it.

Whilſt this is under cure, the patient muſt uſe, internally, the decoction of the woods, and mild mercurial and antimonial medicines; and externally, the wound muſt be treated with cleanſing and balſamic remedies, ſuch as decoctions of agrimo-

ny, ſanicle, St. John's-wort, or birth-wort, and eſſence of myrrh and aloes, which muſt be injected with a ſyringe twice every day, as may alſo a ſolution of mercurius dulcis, made in plantane-water or lime-water. Honey of roſes ſhould be added, in a ſmall quantity, to either of the decoctions uſed as eſſences; and after the uſe of them the wound ſhould be dreſſed with the forementioned eſſences, or with thoſe of maſtich, or amber, ſpread upon lint, and covered with a mercurial or other plaſter. This method is to be continued till the parts are healed. The actual cautery is ſometimes neceſſary to root out the diſorder, eſpecially when it is only between the lamellæ of the bone. See CAUTERY. But when all theſe methods are unſucceſs- and the part is already too much corroded and deſtroyed, there is no hope of ſaving it, nor indeed the life of the patient, by any other means than cutting off the limb. When the diſorder is ſituated, however, in ſome ſmall bone, as on the carpus, tarſus, metacarpus, or metatarſus, or fingers, it will not be neceſſary to take off the whole limb, as it will frequently ſuffice to remove the corrupt bone alone. In larger bones, where the whole bone is not affected, but only a part of its external ſurface is diſordered, by either a caries or a ſpina ventoſa, the whole limb is by no means to be taken off, but the diſeaſed part of the bone only removed: but when a large bone, as the os humeri, tibia, or femur, or an intire joint of the arm, knee, or foot, is diſeaſed, there is no remedy but amputating it in the ſound parts juſt above.

SPINACHIA, or SPINACIA, SPINACH, or SPINAGE, in botany, a genus of the *dioecia-pentandria* claſs of plants: the calyx of the male flower is divided into five parts, having no corolla: the calyx of the female flower is divided into four parts, having no corolla neither: the ſtyles are four: the ſeed is ſingle, roundiſh, and incloſed within the cup, which becomes indurated.

This plant is well enough known in food, but has nothing to do in medicine, except in counterfeiting the colours of ſome things of value, as particularly giving to Gaſcoign's powder the ſame colour as is given by bezoar: however, the leaves of ſpinach are, by ſome writers, claſſed among the coolers.

SPINAL MARROW. See the article MEDULLA SPINALIS.

SPINALIS, in anatomy, the names of ſeveral muſcles, *&c.* of the ſpine, but more particularly that of a muſcle on the ſide of the neck, ariſing from the five ſuperior proceſſes of the vertebræ of the thorax, and the inferior of the neck; and which in its aſcent, becoming more fleſhy, is inſerted into the inferior part of the vertebræ of the neck laterally. It ſerves to draw the neck backwards.

Other muſcles of the back, neck, *&c.* called by ſome anatomiſts ſpinalis, are, 1. the ſpinalis cervicis, called by others tranſverſalis: 2. ſpinales colli minores, are muſcles lying between the ſix ſpinal apophyſes of the neck, and between the laſt of the neck and the firſt of the back, called by ſome interſpinales. Other muſcles of this name are, 3. the ſpinalis dorſi, being called by ſome, a part of the ſemi-ſpinatus; and by others, a part of the longiſſimus dorſi. 4. The ſpinalis dorſi major, is a pretty, long and ſlender muſcle, lying upon the lateral parts of the extremities of the ſpinal apophyſes of the back, called, by ſome, ſemi-ſpinalis. 5. Spinales dorſi minores are muſcles of two kinds, ſome going laterally from the extremity of one ſpinal apophyſes to another, being often mixed with the ſhort faſciculi of the ſpinalis major; the reſt lie directly between the extremities of two neighbouring ſpinal apophyſes; being ſeparated from thoſe on the other ſide by the ſpinal ligament: theſe are ſometimes termed interſpinales. 6. Spinales, and tranſverſales lumborum, are ſome faſciculi which run up from the ſuperior falſe ſpines of the os ſacrum, to the lower ſpinal apophyſes of the loins. See the articles MUSCLE, TRANSVERSALIS, *&c.*

For the ſpinal nerves, *&c.* ſee the article NERVE, *&c.*

The ſpinal acceſſory nerve of Willis, is a ſort of ninth pair of nerves of the neck, ariſing from the ſpinal marrow, about the origin of the third or fourth pair, and paſſing through the great foramen of the os occipitis up into the cranium: it is then joined to the par vagum, and coming out of the cranium again by the ſame aperture, it recedes from the par vagum, and is bent back to the muſculus ſcapulæ cucullaris or trapezius.

SPINDLE,

SPINDLE, in the ſea-language, is the ſmalleſt part of a ſhip's capſtan, which is betwixt the two decks. The ſpindle of the jeer-capſtan has whelps to heave the viol. See CAPSTAN.

The axis of the wheel of a watch or clock, is alſo called the ſpindle. Among miners, the ſpindle is a piece of wood faſtened into either ſtow-blade.

SPINDLE-SHELL, in ichthyology, the ſlender tuberculous buccinum, with an elongated roſtrum. See BUCCINUM.

SPINE, SPINA-DORSI, in anatomy, the bony column reaching from the head down to the anus; being the ſeries or aſſemblage of vertebræ which ſuſtain the reſt of the body, contain the ſpinal marrow, and to which the ribs are connected. See the articles VERTEBRÆ, MEDULLA SPINALIS, and RIBS.

The uſual diviſion of the ſpine is into the neck, the back, the loins, and the os ſacrum, and coccygis. See the articles NECK, DORSUM, *&c.*

Luxations, fractures, and other injuries of the SPINE. The ſigns common to luxations in the ſpine are cheifly the following: The back itſelf is found to be crooked after ſome external violence has been inflicted upon it; the patient can neither ſtand nor walk, and his whole body ſeems to be paralytic; the parts which are beneath the luxated vertebræ are nearly without all ſenſe and motion; the excrements and urine cannot be diſcharged, or elſe they are ſometimes emitted involuntarily; the lower extremities grow dead by degrees, and at length death itſelf follows: but theſe ſymptoms vary in proportion to the degree of violence in the luxation. Where there is but one vertebra luxated, the cuvature is gibbous, making a ſort of angle: if the proceſſes of the vertebræ are diſplaced forwards, then the ſpine will ſeem to bend inwards, and the pains will be more gentle, when the patient lies on his back: if the vertebra is luxated on the right ſide, the body will incline towards the left, and *vice verſa*. Luxations of the ſpinal vertebræ are in general very difficult to reduce; but the following ſeems to be the beſt method of reducing them, according to Heiſter: When the apophyſes are diſlocated on both ſides, the patient is to be laid leaning upon his belly over a caſk, drum, or ſome other gibbous body, and then two aſſiſtants are ſtrongly to preſs down both ends of the ſpine on each ſide; then the ſurgeon is to preſs down the luxated vertebræ, and at the ſame time to puſh nimbly the ſuperior part of the body upwards, by which means the luxated vertebra are ſometimes commodiouſly reduced into their right places: but if ſucceſs ſhould not attend the firſt time, the method ſhould be repeated two or three times more. When the vertebra comes out on one ſide, the patient is then to be placed as before, but ſo that when the left apophyſis is diſplaced, one aſſiſtant may preſs the lower vertebræ inwards to the right, and another aſſiſtant may depreſs the right humerus, and *vice verſa*. For the remainder, it ſeems proper, after the vertebræ are reduced, to bathe the ſpine with ſpirit of wine, or to lay on compreſſes dipped in ſpirit of wine camphorated, and to bind the parts up with the napkin and ſcapulary. See the article LUXATION.

When any of the vertebræ are fractured either by a fall, blow, or any other cauſe, without hurting the ſpinal marrow, it is to be ſuppoſed that the fracture is confined to ſome of the oblique or ſpinal proceſſes, and therefore the patient will be in no great danger; but when the body of the vertebræ is either broke or ſplit, and the contiguous ſpinal marrow bruiſed or compreſſed, all the parts of the limbs and viſcera beneath that vertebra will become immoveable and rigid, and death will ſooner or later follow the accident: and if the tranſverſe proceſſes of the vertebræ are broke, which incline towards the cavity of the thorax, it is ſcarce poſſible that the heads of the ribs, which are there connected, ſhould eſcape being fractured. Theſe fractures are to be judged of from the nature of the external violence which occaſioned them, from the pains ſeated about the affected vertebra, and from the touch, eye, *&c.* When only the proceſſes of the vertebræ are found broken, it will be much the beſt way to force them into their places with the fingers, placing narrow compreſſes dipt in warm ſpirit of wine on each ſide of the vertebræ, and over them ſlips of thick paſteboard, to be kept on by the napkin and ſcapulary. See the article FRACTURE.

When the ſpine is ſo injured that the ſpinal marrow is wounded, ſuch wounds as are ſlight may be dreſſed with peruvian balſam, eſſence of myrrh, or medicines of a like nature, mixed with a quantity of honey of roſes ſpread upon

a pledget, and applied moderately warm; by which means, if the patient is of a good conſtitution, the parts ſometimes heal, but large wounds here bring certain death.

For the luxations, fractures, &c. of the other parts of the ſpine, ſee the articles NECK, LOINS, OS SACRUM, &c.

SPINET, or SPINNET, a muſical inſtrument ranked in the ſecond or third place among harmonious inſtruments. It conſiſts of a cheſt or belly made of the moſt porous and reſinous wood to be found, and a table of fir glued on ſlips of wood called ſummers, which bear on the ſides. On the table is raiſed two little prominences or bridges, wherein are placed ſo many pins as there are chords or ſtrings to the inſtrument. It is played on by two ranges of continued keys, the former range being the order of the diatonic ſcale, and that behind the order of the artificial notes or ſemi-tones. The keys are ſo many flat pieces of wood, which, touched and preſſed down at the end, make the other raiſe a jack which ſtrike and ſound the ſtrings by means of the end of a crow's quill wherewith it is armed. The thirty firſt ſtrings are of braſs, the other more delicate ones of ſteel or iron-wire; they are all ſtretched over the two bridges already mentioned. The figure of the ſpinet is a long ſquare or parallelogram; ſome call it an harp-couched, and the harp an inverted ſpinet. See the article HARP.

This inſtrument is generally tuned by the ear, which method of the practical muſicians is founded on a ſuppoſition, that the ear is a perfect judge of an octave and fifth. The general rule is to begin at a certain note, as C, taken towards the middle of the inſtrument, and tuning all the octaves up and down, and alſo the fifths, reckoning ſeven ſemi-tones to each fifth, by which means the whole is tuned. Sometimes to the common or fundamental play of the ſpinet is added another ſimilar one in uniſon, and a third in octave to the firſt, to make the harmony the fuller; they are either played ſeparately or together by means of a ſtop; theſe are called double or triple ſpinets; ſometimes a play of violins is added, by means of a bow, or a few wheels parallel to the keys, which preſs the ſtrings and make the ſounds laſt as long as the muſician pleaſes, and heighten and ſoften them more or leſs, as they are more or leſs preſſed. The harpſicord is a kind of ſpinet, only with another diſpoſition of the keys. See the article HARPSICORD.

SPINNING, in commerce, the act or art of reducing ſilk, flax, hemp, wool, hair, or other matters, into thread. Spinning is either performed on the wheel with a diſtaff and ſpindle, or with other machines proper for the ſeveral kinds of working. Hemp, flax, nettle-thread, and the like vegetable matters, are to be wetted in ſpinning; ſilks, wools, &c. are to be ſpun dry, and do not need water; but there is a way of ſpinning ſilk as it comes off the caſes or balls, where hot and even boiling water is to be uſed. See the articles SILK, THREAD, &c.

SPINOSE LEAF, in botany, expreſſes a leaf whoſe diſk or edge is armed with cartilaginous points, ſo firmly affixed that they cannot be ſeparated without injuring the leaf itſelf.

SPINOUS FISHES, ſuch as have ſome of the rays of the back-fins running out into thorns or prickles, as the pearch, &c. See the article ICHTHYOLOGY.

SPINOZISM, or SPINOSISM, the doctrine of Spinoza, or atheiſm and pantheiſm propoſed after the manner of Spinoza, who was born a Jew at Amſterdam.

The great principle of ſpinoziſm, is that there is nothing properly and abſolutely exiſting beſides matter and the modifications of matter; among which are even comprehended thought, abſtract and general ideas, compariſons, relations, combinations of relations, &c.

The chief articles in Spinoza's ſyſtem are reducible to theſe. That there is but one ſubſtance in nature, and that this only ſubſtance is endued with an infinite number of attributes, among which are extenſion and cogitation: that all the bodies in the univerſe are modifications of this ſubſtance conſidered as it is extended; and that all the ſouls of men are modifications of the ſame ſubſtance conſidered as cogitative: that God is a neceſſary and infinitely perfect being, and is the cauſe of all things that exiſt, but not a different being from them: that there is but one being and one nature, and that this nature produces within itſelf, by an immanent act, all thoſe which we call creatures; and that this being is at the ſame time both agent and patient, efficient cauſe and ſubject, but that he produces nothing but modifications of himſelf.

Thus

Thus is the deity made the ſole agent as well as patient in all evil, both phyſical and moral; a doctrine fraught with more impieties than all the heathen poets have publiſhed concerning their Jupiter, Venus, Bacchus, &c. It is obſerved, that what ſeems to have led Spinoza to this ſyſtem, was the difficulty of conceiving either that matter is eternal and different from God, or that it could be produced from nothing, or that an infinite and free being could have made a world ſuch as this is. A matter that exiſts neceſſarily, and which nevertheleſs is void of activity, and ſubject to the power of another principle, is an object that ſtartles our underſtanding, as there ſeems no agreement between the three conditions. It is alſo held, that a matter created out of nothing, ſeems to be no leſs inconceivable, whatever efforts we make to form an idea of the act of the will that can change what before was thought nothing into real ſubſtance. Beſides, its being contrary to that known maxim of philoſophers, *ex nihilo nihil fit*. In fine, that an infinitely good, holy, free being ſhould rather chooſe to have them wicked and eternally miſerable, is no leſs incomprehenſible; and the rather as it ſeems difficult to reconcile the freedom of man with the quality of a being made out of nothing. Theſe, it is obſerved, appear to have been the difficulties which led Spinoza to ſearch for a new ſyſtem, wherein God ſhould not be diſtinct from matter, and wherein he ſhould act neceſſarily, and to the extent of all his power, not out of himſelf (*ad extra*) but within himſelf. But it is certain, that if this ſyſtem reſcues us from ſome difficulties, it involves us in others much greater. See the articles GOD, SOUL, NATURE, MATTER, EXISTENCE, SUBSTANCE, EXTENSION, GENERATION, CORRUPTION, ESSENCE, &c.

SPINSTER, in law, an addition uſually given to all unmarried women from the viſcount's daughter downwards; but, according to Sir Edward Cooke, generoſa is a good addition for a gentlewoman; and that if ſuch a perſon be named ſpinſter in any original writ, appeal, or indictment, ſhe may abate and quaſh the ſame.

SPIRÆA, in botany, a genus of the *icoſandria-pentagynia* claſs of plants, with a roſaceous flower, conſiſting of five roundiſh, plane petals: its fruit conſiſts of five oblong, compreſſed, acuminated capſules, each formed of two valves, and containing a few acuminated and ſmall ſeeds.

This genus comprehends the white ſhrubby hypericum of authors.

SPIRÆA is alſo a name given to the dioſma of Linnæus. See the article DIOSMA.

SPIRAL, in geometry, a curve line of the circular kind, which, in its progreſs, recedes from its center.

A ſpiral, according to Archimedes, its inventor, is thus generated: if a right line, as AB (plate CCLIX. fig. 2.) having one end fixed at B, be equally moved round, ſo as with the other end A to deſcribe the periphery of a circle; and, at the ſame time, a point be conceived to move forward equally from B towards A, in the right line BA, ſo as that the point deſcribes that line, while the line generates the circle: then will the point, with its two motions, deſcribe the curve-line B 1, 2, 3, 4, 5, &c. which is called the helix or ſpiral line; and the plane ſpace, contained between the ſpiral line and the right line BA, is called the ſpiral ſpace.

If alſo you conceive the point B to move twice as ſlow as the line AB, ſo as that it ſhall get but half way along the line BA, when that line ſhall have formed the circle; and if then you imagine a new revolution to be made of the line carrying the point, ſo that they ſhall end their motion at laſt together, there will be formed a double ſpiral line, and the two ſpiral ſpaces, as you ſee in the figure. From the geneſis of this curve, the following corollaries may be eaſily drawn. 1. The lines B 12, B 11, B 10, &c. making equal angles with the firſt and ſecond ſpiral (as alſo B 12, B 10, B 8, &c.) are in arithmetical proportion. 2. The lines B 7, B 10, &c. drawn any how to the firſt ſpiral, are to one another as the arches of the circle intercepted betwixt BA and thoſe lines. 3. Any lines drawn from B to the ſecond ſpiral, as B 18, B 22, &c. are to each other as the aforeſaid arches, together with the whole periphery added on both ſides. 4. The firſt ſpiral ſpace is to the firſt circle as 1 to 3. And, 5. The firſt ſpiral line is equal to half the periphery of the firſt circle; for the radii of the ſectors, and conſequently the arches, are in a ſimple arithmetic progreſſion, while the periphery of the circle contains as many arches

arches equal to the greateſt; wherefore the periphery to all thoſe arches is to the ſpiral lines as 2 to 1.

SPIRAL, in architecture and ſculpture, implies a curve that aſcends, winding about a cone or ſpire, ſo as all the points thereof continually approach the axis. It is diſtinguiſhed from the helix, by its winding around a cone, whereas the helix winds in the ſame manner around a cylinder.

Proportional SPIRALS, are ſuch ſpiral lines as the rumb lines on the terreſtrial globe, which, becauſe they make equal angles with every meridian, muſt alſo make equal angles with the meridians in the ſtereographic projection on the plane of the equator; and therefore will be, as Dr. Halley obſerves, proportional ſpirals about the polar point. See RHUMB.

SPIRAL-STAIRS. See STAIRS.

SPIRATION, or rather RESPIRATION. See the article RESPIRATION.

SPIRE, *ſpira*, in architecture, was uſed by the antients for the baſe of a column, and ſometimes for the aſtragal or tore. But, among the moderns, it denotes a ſteeple that continually diminiſhes as it aſcends, whether conically or pyramidally. See the article STEEPLE.

SPIRE, in geography, an imperial city of Germany, capital of a biſhopric of the ſame name, and ſituated in the palatinate of the Rhine, fifteen miles ſouth-weſt of Heidelburg: eaſt long. 8° 17′, north lat. 49° 16′.

SPIREBACH, a town of Germany, ſituated on a river of the ſame name, eight miles north of Landau.

SPIRIT, *ſpiritus*, in metaphyſics, an incorporeal being or intelligence; in which ſenſe, God is ſaid to be a ſpirit, as are angels and the human ſoul. See the articles GOD, ANGEL, and SOUL.

The word ſpirit is, indeed, uſed in general to denote all thinking intelligent ſubſtances; but it would be the height of folly to imagine, becauſe this name is applied to the Creator as well as to the human ſoul, that therefore they partake of one common nature, and differ only as different modifications of the ſame ſubſtance: wherefore, when we call God a ſpirit, we ought by no means raſhly to preſume, that he is ſo in the ſame ſenſe in which the human ſoul is a ſpirit.

However, though we readily own there may be various ranks of ſpiritual beings; yet as we have no conceptions of the powers and operations of intellectual natures diſtinct from thoſe of our own minds, we are neceſſitated to conceive of them in a manner ſuited to our knowledge; and when we would rank them into ſpecies, according to the degrees of of ſuperiority they are imagined in the ſcale of being, we aſcribe to them what we find moſt excellent in ourſelves, as knowledge, thinking, foreſight, &c. and thoſe in different meaſures, proportioned to the ſtation peculiar to each rank. But that this is a very imperfect way of diſtinguiſhing the various orders of intellectual beings, needs not many words to make appear; eſpecially if we conſider, that the manner of communicating their thoughts without the intervention of bodily organs, is a thing to us altogether incomprehenſible; which neceſſarily leads us to ſuppoſe, that they have ways of perception and knowledge, whereof our faculties cannot give us any notice. See the articles ESSENCE, EXISTENCE, and SUBSTANCE.

SPIRITS, or ANIMAL SPIRITS, in phyſiology. See ANIMAL SPIRITS.

Our perceptions and actions are ſuppoſed to depend on the facility with which theſe ſpirits paſs from the brain to the nerves, and back from the nerves to the brain: for if the brain, the cerebellum, or the ſpinal marrow is hurt, there happens in all the parts where the nerves are diſtributed, which proceed from the diſordered part, convulſions and palſies; and if any nerve is tied or cut, the parts below the ligature loſe their ſenſe and motion, while thoſe above continue in their former ſtate. See the articles BRAIN, CEREBELLUM, MARROW, and NERVE.

SPIRIT, in chemiſtry, a name applied to ſeveral very different ſubſtances; however, in general, it denotes any diſtilled volatile liquor that is not inſipid, as phlegm, or pure water, nor inflammable as oil: but under this general idea are comprehended liquors of quite oppoſite natures, ſome being acid, and others alkaline; which laſt are ſuch enemies to the former, that as ſoon as they are put together they raiſe a violent efferveſcence, and grow hot: and to theſe may be added a third ſort, called vinous or inflammable ſpirits; which though very ſubtile and penetrating, are not manifeſtly either acid or alkaline.

All theſe ſorts of ſpirits Mr. Boyle ſhews to be producible: and, 1. The vinous, which nature ſcarce ever produces of herſelf,

herſelf, are the creatures of vinous fermentation, or are actually produced, though not ſeparated, in that operation. See FERMENTATION, BRANDY, RUM, RACK, &c.

2. The alkaline or volatile ſpirits, called alſo the urinous, by reaſon of their affinity in many qualities with ſpirit of urine, are manifeſtly not ſimple but compound bodies; conſiſting of the volatile ſalt of the reſpective concretes diſſolved in the phlegm, and for the moſt part accompanied with a little oil: ſo that theſe may be referred to the claſs of volatile ſalts. See the article SALT.

3. Acid ſpirits appear to be producible, becauſe thoſe drawn from common ſalt and nitre are very different in reſpect of taſte, &c. from the bodies they are procured from, which are not properly acid: ſo that it does not appear that theſe ſpirits pre-exiſted in that ſtate of thoſe bodies.

What farther confirms this doctrine of ſpirits is, that the ſame body, merely by different ways of ordering it, may be brought to afford either acid, vinous, or urinous ſpirits; add, that whereas ſalt is accounted the principle of all taſte, it follows that ſpirits, being ſapid, muſt contain ſalt; ſince it is taſte that characterizes and diſtinguiſhes it from phlegm, and denominates it acid, vinous, or urinous ſpirit.

Spirits, diſtilled from fermented liquors, conſiſt of very different ingredients, *viz.* a pure ſpirit or alcohol, phlegm, a certain acetous fermented acid, and a ſmall quantity of ill-ſcented oil; ſo that it becomes neceſſary, in order to obtain the ſpirit perfectly pure, to re-diſtil it ſeveral times, as directed under the articles DISTILLATION and RECTIFICATION. By reducing ſpirit, therefore, to the utmoſt degree of purity, an alcohol is obtained; which, as Dr. Shaw expreſſes it, is a liquor ſui generis, and poſſeſſed of many peculiar qualities; as, 1. When abſolutely purified, it is an uniform and homogeneous liquor, capable of no farther ſeparation, without loſs or deſtruction of ſome of its homogeneous parts. 2. It is totally inflammable, leaving no ſoot, nor any moiſture behind. 3. It has no peculiar taſte or flavour, any more than pure water, except what is owing to its nature as alcohol, or perfectly pure ſpirit. 4. It is an unctuous and criſpy fluid, running veiny in the diſtillation, and its drops rolling on the ſurface of any other fluid, like peaſe upon a table, before they unite. 5. It appears to be the eſſential oil of the body it is obtained from, broken very fine, and intimately and ſtrongly mixed with an aqueous fluid, which is aſſimilated, or changed in its nature in the operation. 6. And laſtly, it ſeems to be a kind of univerſal fluid, producible with the ſame properties from every vegetable ſubject; but to produce it thus, requires ſome care in the operation. See ALCOHOL.

On theſe principles is founded the opinion, that all ſpirits may be reduced to a perfect ſimilarity, or ſameneſs, from whatever ſubject they are produced, and on this depends their convertibility into one another; for when once they are brought to this ſtandard of ſimplicity, there needs nothing more than to add the oil of ſuch of the finer ſpirits as is required to convert the ſpirit into that particular kind. By this means the ſame taſteleſs ſpirit, whether obtained from malt, ſugar, or grapes, may be made into either malt ſpirit, brandy, or rum, by adding the eſſential oil of the grape, ſugar, or malt; and thus what was once malt ſpirit, ſhall become brandy, or whatever elſe the operator pleaſes.

Many methods have been attempted to obtain the firſt point, that is, the reducing the ſpirit to perfect and pure alcohol: the moſt practicable means ſeem to be long digeſtion, and the repeated diſtillation from water into water, where the eſſential oil will at once be left upon two ſurfaces, and the acid imbibed: the ſhorter ways, are thoſe by rectifying from neutral abſorbent ſalts and earths; ſuch are ſugar, chalk and the like; and, laſtly, the uſe of fixed alkalies may be tried, for theſe very forcibly keep down both the phlegm and oil; inſomuch that this laſt method promiſes to be the ſhorteſt of all, if the art were known of utterly aboliſhing the alkaline flavour, which the alcohol is apt to acquire.

For as vinous ſpirits ariſe with a leſs degree of heat than watery liquors, if due regard be had to this circumſtance, very weak ſpirits may, by one or two wary diſtillations, in a degree of heat leſs than that in which water boils, be tolerably well freed of their aqueous phlegm: and in order to free it from its foul oil, add to every gallon of it a pound or two of pure, dry, and fixed alkaline ſalt; which being digeſted together for ſome time, the alkali, from its known property of

attracting water and oils, will imbibe the remaining phlegm, and ſuch part of the diſagreeable unctuous matter as may be ſtill left in the ſpirit, and ſink with them to the bottom of the veſſel. If the ſpirit be now again gently drawn over, it will ariſe entirely free from its phlegm and nauſeous flavour; but as ſome particles of the alkaline ſalt are apt to be carried up with it, and give it an urinous reliſh, a ſmall proportion of any fixed acid liquor, or rather of an acid ſalt, as vitriol or alum, ſhould be added to it.

The ſpirit obtained by this proceſs is called alcohol, and is extremely pure, limpid, perfectly flavourleſs, and fit for the fineſt purpoſes: it may be reduced to the ſtrength commonly underſtood by proof-ſpirit, by mixing twenty ounces of it (by weight) with ſeventeen ounces of water. The diſtilled cordials made with theſe ſpirits, are much more elegant and agreeable than when the common rectified or proof ſpirits of the ſhops are made uſe of.

There are many occaſions in which chemiſts, and other artificers, ſtand in need of the true and pureſt alcohol, the leaſt remainder of water rendering the operation unſucceſsful: hence it is abſolutely neceſſary we ſhould have ſome marks, by which to diſtinguiſh whether our alcohol be pure or not. The principal of theſe are, 1. If the ſuppoſed alcohol contains any oil diſſolved in it, and ſo equably diſtributed through it, that it is no ways perceptible, then upon pouring of water into it, the mixture will grow white, and the oil ſeparate from the alcohol. 2. If any thing of an acid lies concealed in the alcohol, a little of it mixed with the alcaline ſpirit of ſal ammoniac will diſcover the acid by an effervеſcence excited by the affuſion of the acid; for otherwiſe there would be only a ſimple coagulation. 3. If there be any thing of an alkali intermixed, it will appear by the effervеſcence excited by the affuſion of an acid. 4. But it is a matter of great difficulty to diſcover whether there be any water intermixed with it. The beſt method of doing this is the following: take a chemical veſſel with a long narrow neck, the bulb of which will hold four or ſix ounces of alcohol. Fill this two thirds full with the alcohol you intend to examine, into which throw a dram of the pureſt and drieſt ſalt of tartar, coming very hot out of the fire; then mix them by ſhaking them together, and ſet them over the fire till the alcohol is juſt ready to boil. Being thus ſhaken, and heated, if the ſalt of tartar remains perfectly dry, without the leaſt ſign of moiſture, we are ſure that there is no water in the alcohol. The learned Boerhaave tells us, that by this method he diſcovered water in alcohol which had been looked upon as pure, having undergone every other method of trial.

Medicinal virtues of SPIRITS. The too free uſe of inflammable or vinous ſpirits, is attended with very bad effects; as the body is thereby greatly attenuated, the ſtrength impaired, and the brain ſtupified. However, as Dr. Pringle juſtly obſerves, we ought not to confound the neceſſary and moderate uſe of ſpirits, with the vice of indulging in them to exceſs. So far, therefore, from thinking the moderate uſe of ſpirits detrimental to ſoldiers, and others, who are expoſed to the extremes of heat and cold, and to moiſt and bad air, that he even recommends it; and as to ſoldiers in particular, he obſerves, that ſpirits, even when drank to exceſs, tend more to weaken the conſtitution than to produce any of the common camp-diſeaſes. Hence, in eſtabliſhing meſſes among the ſoldiers, which he thinks would be attended with many good conſequences, he alſo recommends ſome regulations to be made with regard to an allowance of ſpirits, whether by ſtoppages on the pay or otherwiſe: this he enforces by obſerving, that the like practice already obtains in the navy, and probably for the ſame reaſons for which it would be proper in the army; ſince, in ſhips, the men are alſo liable to diſtempers ariſing from moiſt and corrupted air. It is the abuſe, therefore, of vinous ſpirits that ought to be condemned; ſince, taken in moderation, they can do no harm; and if properly accommodated to circumſtance, may have very good effects.

Spirits are alſo of uſe, in external applications, to wounds and ſores; as they ſtimulate the fluids, reſiſt putrefaction, and quicken the pulſe when abſorbed. Tinctures of abſorbent and aromatic powders are often preſcribed with the ſame intention; by reaſon they partake of the nature of their ingredients, but principally of the ſpirit.

As to the volatile ſpirits, diſtilled from animal and other ſubſtances, they are in general extremely pungent and acrimo-

nious;

nious; applied to the ſkin, and prevented from exhaling, they inflame the part, and produce the effect of cauſtics; they alſo liquify the animal-juices, and diſſolve the coagula made from them with acids; with which being mixed, they effervesce, and unite into a neutral ſalt. With regard to their medical virtues, they ſtimulate the nervous ſyſtem, attenuate viſcid humours, promote a diaphoreſis, and other natural ſecretions, and abſorb acidities in the primæ viæ: they are particularly uſeful in the lethargic and apoplectic caſes, in hypochondriacal and hyſterical diſorders, and the languors, head-achs, inflations of the ſtomach, flatulent colics, and other ſymptoms which attend them. However, they are generally found more ſerviceable to aged perſons, and in phlegmatic habits, than in the oppoſite circumſtances: in febrile and inflammatory diſtempers, they are hurtful, except in ſuch fevers as are accompanied with a cough, hoarſeneſs, and redundance of phlegm: they are moſt conveniently exhibited in a liquid form, largely diluted with water, or other convenient liquors; the doſe being from five or ſix to thirty or more drops.

The acid ſpirits drawn from foſſils, and applied to animal bodies, coagulate the fluids, and mortify the ſolids: by being diluted with water, they approach to the nature of vinegar. Metallic ſubſtances, diſſolved in theſe ſpirits, increaſe their corroding ſphacelating quality, ſo as ſometimes to occaſion convulſions.

As for the ſpirituous diſtilled waters, which make no ſmall part of the ſhop-medicines. See *Diſtilled* WATERS.

SPIRITUAL, in general, ſomething belonging to, or partaking of, the nature of ſpirit. See SPIRIT.

The ſpiritual courts, in law, are ſuch as have juriſdiction in matrimonial cauſes, and for probate of wills, and granting adminiſtration of goods; as alſo in regard to tythes, and in caſes of defamation, *&c.* See the articles COURT, WILL, ADMINISTRATOR, *&c.*

SPIRITUALITIES *of a biſhop*, are the profits that he receives as a biſhop, and not as a baron of parliament; ſuch are the duties of his viſitation, preſentation-money, what ariſes from the ordination and inſtitution of prieſts, the income of his juriſdiction, *&c.* See BISHOP.

SPITAL, a town of Carinthia, in Germany: eaſt long. 13° 28′, north lat. 47°.

SPITHEAD, a road between Portſmouth and the Iſle of Wight, where the royal navy of Great Britain frequently rendezvous.

SPIT-INSECT, in zoology, the cicada with brown wings, and two white ſpots on them, and a double white line. See the article CICADA.

SPITTLE, *ſaliva*, in phyſiology. See the article SALIVA.

SPITZBERGEN, or GROENLAND. See the article GROENLAND.

SPLAIT, or SHOULDER-SPLAIT, among farriers. See SHOULDER.

SPLEEN, *σπλην, lien*, in anatomy, is a viſcus of a deep blackiſh-red colour, ſituated on the left ſide of the ſtomach, under the diaphragm, near the ribs, and above the left kidney. Its figure is ſomewhat uncertain; but is uſually like that of a tongue, being hollow towards the ſtomach, and convex towards the diaphragm and ribs: however, it is often irregular, and has in many parts fiſſures. It is connected with the ſtomach, by the vaſa brevia, and with the pancreas, omentum, the diaphragm, and left kidney by membranes. Its ſize is various, but is uſually five or ſix inches long, three broad, and one inch thick, in the human body: in dogs, hogs, and many other animals, it is much larger and thinner.

In human ſubjects, the ſpleen has but one membrane; but in calves, and ſome other animals, it has two: in this caſe, the external one is robuſt, common, and adheres but laxly, by means of the ſanguiferous veſſels to the inner one, which is proper and very thin, and, when the outer one is taken off, tranſmits the breath.

The veſſels of the ſpleen, conſidering its ſize, are remarkably large: its artery is from the cœliac, and is called the ſplenic artery; and in human ſubjects really tranſmits water, air, or mercury, thrown into it, into the veins: the ſplenic vein is, like thoſe of the other viſcera, very much ramified, and its branches are carried throughout the whole ſpleen; but, in calves, *&c.* it is ſoon after its ingreſs into the ſpleen, transformed into cells: in calves alſo, both veſſels enter at one extremity; but in the human body, they are divided into various branches, and run over the whole concave or internal ſurface: the nerves of the ſpleen are from the plexus ſplenicus: the ſpleen has no excretory duct; but there are in it

lymphatic veſſels, running to the receptacle.

The ſubſtance of the ſpleen has been ſaid to be celluloſe and glanduloſe: in calves, indeed, it is celluloſe; but in man, it is vaſculoſe and fibroſe. What authors have deſcribed as glands in the ſpleen, Ruyſch has proved to be only veſſels; all the glands about the ſpleen being only one or two lymphatic ones, of about the bigneſs of a bean, ſituated without it near where the veſſels enter.

The uſe of the ſpleen has been much controverted by authors; but the moſt probable opinion ſeems to be, that it ſerves to render the blood more fluid, out of which the bile is to be afterwards ſecreted; and that by this means obſtructions, which muſt otherwiſe be frequent, are prevented, and the ſecretion of the bile promoted.

Infarction of the SPLEEN. In this caſe, the ſpleen ſwells, together with the left adjacent region; and ſometimes there is a tenſeneſs of the belly: this diſeaſe is increaſed by reſt, and too rich a diet; and therefore exerciſe, and a ſpare diet are proper; as are acids, as vinegar, or thin and auſtere wine; and, in general, all meats and drinks, which have the virtue of promoting urine, as the ſeeds of treſoil, cummin, parſley, wild thyme, hyſſop, and ſavory; and the herbs rocket, ſpleenwort, and creſſes. See the article HYPOCHONDRIAC PASSION.

SPLEEN-WORT, *lonchitis*. See the article LONCHITIS.

SPLENETIC, a perſon affected with obſtruction of the ſpleen. See the articles SPLEEN and HYPOCHONDRIAC PASSION.

SPLENIC VESSELS, the artery and vein of the ſpleen. See SPLEEN.

SPLENIUS, in anatomy, a pair of the extenſor muſcles of the head, which riſing from the lower vertebra of the neck, and the five upper ones of the back, is inſerted a little above the maſtoide proceſs. See the article MUSCLE.

SPLENT, or SPLINT, among farriers, a callous, inſenſible excreſcence, breeding on the ſhank-bone of horſes; which, when it grows big, ſpoils the ſhape of the leg, and generally comes upon the inſide: but if there be one oppoſite to it on the outſide, it is called a peg, or pinned ſplent; becauſe it does, as it were, pierce the bone, and is extremely dangerous.

The ſimple ſplents are only faſtened to the bone, at a pretty diſtance from the knee, and without touching the back ſinew, and have not a very bad conſequence; but thoſe that touch the back ſinew, or are ſpread on the knee, will make a horſe lame in a ſhort time.

For the cure of this malady, ſhave away the hair, and rub and beat the ſwelling with the handle of a ſhoeing hammer; then having burnt three or four hazle-ſticks, while the ſap is in them, chafe the ſplent with the juice, or water that iſſues out at both ends, applying it as hot as you can, without ſcalding the part: after that, rub or bruiſe the ſwelling with one of the ſticks, and continue frequently to throw the hot juice upon the part, but ſo as not to ſcald it, and continue ſtill rubbing it, till it grows ſoft. Then dip a linnen-cloth, five or ſix times double, in the hazle-juice, as hot as your hands can endure it, and tie it upon the ſplent, where let it remain for twenty-four hours, keeping the horſe in the ſtable for the ſpace of nine days, not ſuffering him to be either ridden or led to water; by which time, the ſplent will be diſſolved, and the hair will afterwards grow on it again.

SPLENTS, or SPLINTS, in ſurgery, pieces of wood, uſed in binding up broken limbs. See the article FRACTURE.

SPLICING, in the ſea-language, is the untwiſting the ends of two cables or ropes, and working the ſeveral ſtrands into one another by a fidd, ſo that they become as ſtrong as if they were but one rope. See CABLE, *&c.*

SPLINTER, a ſmall ſhiver of wood, or the like. The ſplinters of fractured bones, if looſe, are to be carefully removed, otherwiſe replaced. See the article FRACTURE.

SPODIUM, in pharmacy, one of the fouleſt recrements of copper; being nothing but the worſt and heavieſt parts of the cadmia oſtracitis, thrown up in ſuch coarſe pieces by the blaſt of the bellows, that it does not adhere to the roof or ſides of the furnace, but falls down again into ſeveral parts of the furnace; and being collected along with many other kinds of foulneſſes, in form of a blackiſh heavy matter, is indeed no better than the ſweepings of the furnaces, where the copper is refined. See CADMIA.

SPOILS, *ſpolia*, whatever is taken from the enemy, in time of war.

Among

Among the antient Greeks, the ſpoils were divided in common among the whole army, only the general's ſhare was largeſt; but among the Romans, the ſpoils belonged to the republic.

SPOLETTO, the capital of Umbria, in Italy; it is ſituated fifty miles north-eaſt of Rome.

SPONDEE, *ſpondæus*, in antient poetry, a foot conſiſting of two long ſyllables, as *omnes*. See the article FOOT.

Some give the appellation ſpondaic to verſes compoſed wholly of ſpondees, or at leaſt that end with two ſpondees; as, *Conſtitit, atque oculis Phrygia agmina circumſpexit.*

SPONDIAS, HOG-PLUM, in botany, a genus of the *enneandria-trigynia* claſs of plants, the flower of which conſiſts of five ovated, plane, and patent petals; and its fruit is an oval berry, containing four nuts in each cell. It is called monbin by Plumier.

SPONDYLUS, in anatomy, a name antiently given to a vertebra of the ſpina dorſi. See the article VERTEBRÆ.

SPONGIA, SPUNGE, in botany, *&c.* See the article SPUNGE.

SPONGIOSE, in anatomy, an appellation given to ſeveral parts of the body, on account of their porous and cavernous texture, not unlike that of ſpunge; as the ſpongioſe or ethmoide bone of the noſe, the ſpongioſe bodies of the penis. See NOSE and PENIS.

SPONSORS, among chriſtians, are thoſe perſons, who, in the office of baptiſm, anſwer, or are ſureties, for the perſons baptized. See BAPTISM.

In the antient church, there were three ſorts of ſponſors, 1. For children, who could not anſwer for themſelves; and in moſt caſes, parents were ſponſors for their own children. 2. For ſuch perſons as, by reaſon of ſickneſs or infirmity were in the ſame condition with children; who might be baptized, if their friends teſtified, that they had before-hand deſired baptiſm, and at the ſame time became their ſponſors. 3. For all adult perſons in general; for theſe too had their ſponſors, as no perſons were baptized without them.

It is obſervable, that antiently no more than one ſponſor was required, namely, a man for a man, and a woman for a woman: however, in the caſe of infants, no regard was had to the difference of ſex; for a virgin might be ſponſor for a male child; and a father for his children, whether male or female.

In the modern chriſtian church, the office of ſponſors, or ſureties in baptiſm, is better known than practiſed; we call them god-fathers and god-mothers. See the article GOD-FATHERS.

SPONTANEOUS, a term applied to ſuch motions of the body, and operations of the mind, as we perform of ourſelves, without any conſtraint. See FREEDOM.

SPONTANEOUS, or EQUIVOCAL GENERATION. See EQUIVOCAL.

SPOON BILL, *platea*, in ornithology. See the article PLATEA.

SPOONING, in the ſea-language, is ſaid of a ſhip, which, being under ſail in a ſtorm at ſea, is unable to bear it, and conſequently forced to put right before the wind.

SPORADES, among antient aſtronomers, a name given to ſuch ſtars, as were not included in any conſtellation. See the articles CONSTELLATION and STAR.

SPORADIC DISEASES, among phyſicians, are ſuch as ſeize particular perſons at any time or ſeaſon, and in any place; in which ſenſe they are diſtinguiſhed from epidemical and endemic diſeaſes; the former whereof are peculiar to certain times or ſeaſons, and the latter to certain places or countries. See the articles EPIDEMICAL and ENDEMIC.

SPORTULA, in roman antiquity, a dole of meat or money, given by great men to the poor.

SPOTS, in aſtronomy, certain places of the ſun's or moon's diſc, obſerved to be either more bright, or darker, than the reſt; and accordingly, called faculæ and maculæ. See the articles FACULÆ and MACULÆ; as alſo SUN and MOON.

SPOUT, or WATER-SPOUT, in natural hiſtory, an extraordinary and dangerous meteor, obſerved at ſea, and ſometimes at land, called by the Latins typho and ſipho. Its firſt appearance is in form of a deep cloud, the upper part of which is white, and the lower black: then from the lower part of this cloud hangs, or rather falls down, what is properly called the ſpout, in form of a conical tube, biggeſt at top; and under this tube, there is always a great boiling and flying up of the water of the ſea, as in a *jet d'eau*. For ſome yards above the ſurface of the ſea, the water ſtands as a column or pillar, from the extremity whereof it ſpreads and goes off, as in a kind

kind of ſmoke. Frequently, the cone deſcends ſo low, as to touch the middle of this column, and continue for ſome time contiguous to it; though ſometimes it only points to it, at ſome diſtance, either in a perpendicular or oblique line. Frequently it is ſcarce diſtinguiſhable, whether the cone or the column appear the firſt, both appearing all of a ſudden againſt each other. But ſometimes the water boils up from the ſea to a great height, without any appearance of a ſpout pointing to it, either perpendicularly or obliquely. Indeed, generally, the boiling or flying up of the water has the priority, this always preceding its being formed into a column. Generally, the cone does not appear hollow, till towards the end, when the ſea-water is violently thrown up along its middle, as ſmoke up a chimney. Soon after this, the ſpout or canal breaks and diſappears; the boiling up of the water, and even the pillar, continuing to the laſt, and for ſome time afterwards; ſometimes till the ſpout form itſelf again, and appear a-new; which it ſometimes does ſeveral times in a quarter of an hour. See plate CCLIX. fig. 3.

M. de la Pyme, from a near obſervation of two or three ſpouts in Yorkſhire, deſcribed in the Philoſophical Tranſactions, gathers that the water-ſpout is nothing but a gyration of clouds by contrary winds, meeting in a point or center; and there, where the greateſt condenſation and gravitation is, falling down into a pipe or great tube, ſomewhat like Archimedes's ſpiral ſcrew; and, in its working and whirling motion, abſorbing and raiſing the water, in the ſame manner as the ſpiral ſcrew does; and thus deſtroying ſhips, &c. Thus, June the 21ſt, he obſerved the clouds mightily agitated above and driven together; upon which they became very black, and were hurried round, whence proceeded a moſt audible whirling noiſe, like that ordinarily heard in a mill. Soon after, iſſued a long tube or ſpout, from the center of the congregated clouds, wherein he obſerved a ſpiral motion like that of a ſcrew; by which the water was raiſed up. Again, Auguſt 15, 1687, the wind, blowing at the ſame time out of ſeveral quarters, created a great vortex and whirling among the clouds; the center whereof, every now and then, dropped down, in ſhape of a long, thin, black pipe, wherein he could diſtinctly behold a motion like that of a ſcrew, continually drawing upwards, and ſcrewing up, as it were, wherever it touched. In its progreſs it moved ſlowly over a grove of trees, which bent under it like wands in a circular motion. Proceeding, it tore off the thatch from a barn, bent a huge oak-tree, broke one of its greateſt branches, and threw it to a great diſtance. He adds, that, whereas it is commonly ſaid, the water works and riſes in a column, before the tube comes to touch it; this is doubtleſs a miſtake, owing to the fineneſs and tranſparency of the tubes, which do moſt certainly touch the ſurface of the ſea, before any conſiderable motion can be raiſed therein; but which do not become opake and viſible, till after they have imbibed a conſiderable quantity of water.

The diſſolution of water-ſpouts he aſcribes to the great quantity of water they have glutted; which by its weight impeding their motion, whereon their force, and even exiſtence, depends, they break and let go their contents; which uſe to prove fatal to whatever is found underneath. A notable inſtance hereof we have in the Philoſophical Tranſactions, related by Dr. Richardſon; for a ſpout in 1718 breaking on Emott-moor, nigh Coln, in Lancaſhire, the country was immediately overflowed.

In Pliny's time, the ſeamen uſed to pour vinegar into the ſea, to aſſuage and lay the ſpout, when it approached them: our modern ſeamen keep it off, by making a noiſe with filing and ſcratching violently on the deck, or by diſcharging great guns to diſperſe it.

SPOUTING FOUNTAIN. See the article FOUNTAIN.

SPRAIN, or STRAIN. See STRAIN.

SPRAT, in ichthyology, a ſpecies of clupea, with the lower jaw longeſt, and the belly very acute. See the article CLUPEA.

The ſprat has been generally, but erroneouſly, ſuppoſed a herring, not grown to its full ſize; its uſual length is about four or five inches, and its breadth ſomewhat more, in proportion, than in the herring; there is a ſpot on each ſide, near the extremity of the coverings of the gills. It is caught in moſt of our ſeas, and brought in ſurpriſing quantities to London.

SPREE,

SPREE, a river of Germany, which, rising in Bohemia, runs northward, thro' Luſatia, and, entering Brandenburg, viſits Berlin, and falls into the Havel, a little weſt of that city.

SPRING, *fons*, in natural hiſtory, a fountain or ſource of water, riſing out of the ground. See the article WATER.

Various have been the opinions of philoſophers concerning the origin of ſprings; but thoſe, which deſerve notice, are only the three following ones.

1. That the ſea-water is conveyed thro' ſubterraneous ducts, or canals, to the places where the ſprings flow out of the earth: but as it is impoſſible that the water ſhould be thus conveyed to the tops of mountains, ſince it cannot riſe higher than the ſurface, ſome have had recourſe to ſubterraneous heats; by which being rarified, it is ſuppoſed to aſcend in vapours through the bowels of the mountains. But as no ſufficient proof is brought of the exiſtence of theſe central heats, or of caverns in the mountains big enough to let the vapours aſcend, ſuppoſing ſuch heats, we ſhall not take up our reader's time with a formal refutation of this hypotheſis.

2. As to thoſe who advance the capillary hypotheſis, or ſuppoſe the water to riſe from the depths of the ſea through the porous parts of the earth, as it riſes in capillary tubes, or through ſand or aſhes, they ſeem not to conſider one principal property of this kind of tube, or this ſort of attraction: for though the water riſe to the top of the tube or ſand, yet will it riſe no higher, becauſe it is by the attraction of the parts above that the fluid riſes, and where that is wanting it can riſe no farther. Therefore, though the waters of the ſea may be drawn into the ſubſtance of the earth by attraction, yet it can never be raiſed by this means into a ciſtern, or cavity, to become the ſource of ſprings.

3. The third hypotheſis is that of the ſagacious naturaliſt, Dr. Halley, who ſuppoſes the true ſources of ſprings to be melted ſnow, rain-water, dew, and vapours condenſed.

Now in order to prove, that the vapours, raiſed by the heat of the ſun, from the ſurface of the ſeas, lakes, and rivers, are abundantly ſufficient to ſupply the ſprings and rivers with freſh water, the doctor made the following experiment: he took a veſſel of water, made of the ſame degree of ſaltneſs with that of the ſea, by means of the hydrometer; and having placed a thermometer in it, he brought it, by means of a pan of coals, to the ſame degree of heat with that of the air in the hotteſt ſummer. He then placed this veſſel with the thermometer in it, in one ſcale, and nicely counterpoſed it with weights in the other; after two hours, he found, that about the ſixtieth part of an inch was gone off in vapour, and conſequently in twelve hours, the length of a natural day, one tenth of an inch would have been evaporated.

From this experiment it follows, that every ten ſquare inches of the ſurface of the water yield a cubic inch of water in vapour per day, every ſquare mile 6914 tons, and every ſquare degree (or 69 engliſh miles) 33 millions of tons. Now, if we ſuppoſe the Mediterranean to be 40 degrees long, and 4 broad, at a medium, which is the leaſt that can be ſuppoſed, its ſurface will be 160 ſquare degrees, from whence there will evaporate 5280 millions of tons per day, in the ſummer-time. See the article SEA.

The Mediterranean receives water from the nine great rivers following, *viz.* the Iberus, the Rhine, the Tyber, the Po, the Danube, the Neiſter, the Boryſthenes, the Tanais, and the Nile; all the reſt being ſmall, and their water inconſiderable. Now let us ſuppoſe that each of theſe rivers conveys ten times as much water to the ſea as the Thames; which, as is obſerved, yields daily 76,032,000 cubic feet, which is equal to 203 millions of tons; and therefore all the nine rivers will produce 1827 millions of tons; which is little more than one third of the quantity evaporated each day from the ſea. The prodigious quantity of water remaining, the doctor allows to rains, which fall again into the ſeas, and for the uſes of vegetation, *&c.*

As to the manner in which theſe waters are collected, ſo as to form reſervoirs for the different kinds of ſprings, it ſeems to be this: the tops of mountains, in general, abound with cavities, and ſubterraneous caverns formed by nature to ſerve as reſervoirs; and their pointed ſummits, which ſeem to pierce the clouds, ſtop thoſe vapours which fluctuate in the atmoſphere, and being conſtipated thereby, they precipitate in water, and by their gravity eaſily penetrate through beds

beds of ſand and lighter earth, till they are ſtopped in their deſcent by more denſe ſtrata, as beds of clay, ſtone, &c. where they form a baſon or cavern, and work a paſſage horizontally, and iſſue out at the ſide of the mountain.

Many of theſe ſprings running down by the vallies, between the ridges of hills, and uniting their ſtreams, form rivulets or brooks; and many of theſe, again, uniting on the plain, become a river.

Different ſorts of SPRINGS. Springs are either ſuch as run continually, called perennial; or ſuch as run only for a time, and at certain ſeaſons of the year, and therefore called temporary ſprings. Others again are called intermitting ſprings, becauſe they flow and then ſtop, and flow and ſtop again: and, finally, reciprocating ſprings, whoſe waters riſe and fall, or flow and ebb, by regular intervals.

In order to account for theſe differences in ſprings, let A B C D E (plate CCLIX. fig. 4.) repreſent the declivity of a hill, whoſe ſection, from top to bottom, is ſhewn in the figure; in which let F G H be a cavern or baſon near the top, which collects the water gleeting through the ſtrata, and has a drain or duct leading to the ſide of the hill at B. It is evident, that, when the water ariſes to the drain H, it will deſcend through it to B, where it will break out in form of a fountain or ſpring, and will continue running while the reſervoir is ſupplied with water above the level F H, and after that it will become dry. Hence we ſee that a ſpring may be formed near the tops of the higheſt hills and mountains; but, on the very tops, it is impoſſible for them to be generated.

Intermitting ſprings, or thoſe which flow and ſtop by regular alternations and intermiſſions, may be thus accounted for: let I K L (*ibid.*) repreſent a cavity in the mountain, to which, at I, there is a feeding ſtream which brings the water from other parts; and at K, on the lower part, there goes a duct K *k* C, of a curved or crooked form, which conveys the water to the ſide of a hill at C, where it breaks out into a ſpring. Now, it is evident, that, as the water riſes in the cavern, it will alſo riſe in the duct, till the ſurface of the water I L be level with the higheſt part *k* of the duct, and then the water will deſcend from *k* to C, which point, being lower than the orifice of the duct at K, will exhauſt the cavern of all its water, and then the ſpring will ſtop, till the ciſtern is repleniſhed to the ſame level I K, by the feeding ſtream I, and then the fountain will play again. An artificial fountain of this kind may be alſo eaſily made.

Reciprocating ſprings, or thoſe which flow and ebb alternately, are occaſioned in the following manner: let M N O (*ibid.*) repreſent a reſervoir, fed by the ſtream P M, and alſo a ſiphon K *k* O, which brings water from another cavity above, as I K L; the duct N D carries the water to the ſide of the hill at D, and there makes a conſtant ſpring by virtue of a conſtant ſupply of water by the drain P M. The water at D will alſo flow and ebb alternately; for when the ſiphon K *k* O works, the ſurface of the water M O will be ſuddenly raiſed, and preſs upon the water at N with a greater force, by which means it will iſſue out at D with a greater velocity, and raiſe the ſurface, if confined; but when the ſiphon intermits or ceaſes, the momentum of the water at D is not ſo great as before, and then the ſpring will ſink or decreaſe.

In like manner we account for the riſing of water in wells. Thus ſuppoſe a well be ſunk at the foot of the hill at E, (*ibid.*) to ſuch a depth E V, as will bring the diggers to an eruption of a ſpring at V, whoſe water is brought by the duct R V (or many of them) from a cavity Q R S in the hill (or otherwiſe from a pond, a river, the ſea, &c.) it is evident the water in the well will riſe from the bottom V, to an altitude V T, where the ſurface of the water at T is upon a level with that in the reſervoir Q S, and thus conſtitutes a well.

Now, though every thing may not happen preciſely in the manner, as here repreſented, yet that it is in ſome way analogous to it, we believe no perſon will doubt, who has been at the Peak in Derbyſhire, or at Wookey-hole in Somerſetſhire, and ſeen the wonderful caverns, receptacles, and ſtreams of water, which nature has there furniſhed in the bowels of the mountains.

Medicinal virtues, &c. of SPRINGS. Theſe are owing to the different qualities and temperament of the ſtrata through which theſe waters may be collected, or paſs: if thoſe reſervoirs of water in the body of mountains be ſituated where mineral ores abound, or the ducts and feeding ſtreams run through mineral earths, it is eaſy to conceive that particles of metal will mix with, and be abſorbed by the

Fig. 1 SPHERIOD.

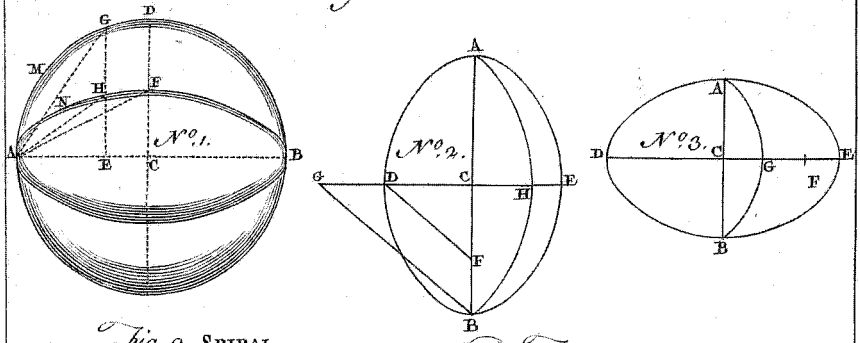


Fig. 2. SPIRAL.

Fig. 3. A WATER-SPOUT.

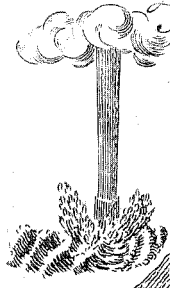

Fig. 4.
The Origin of SPRINGS.

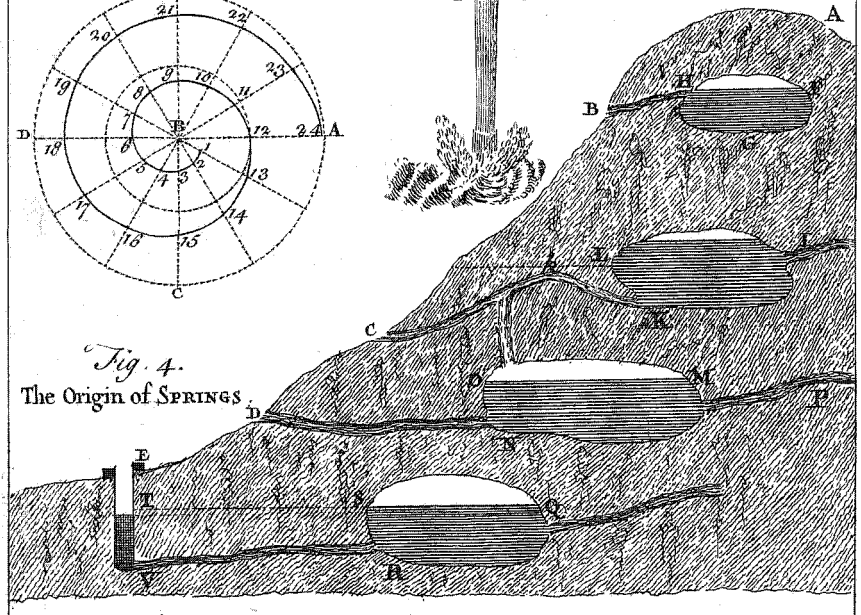

Fig. 5. The SQUIRREL.

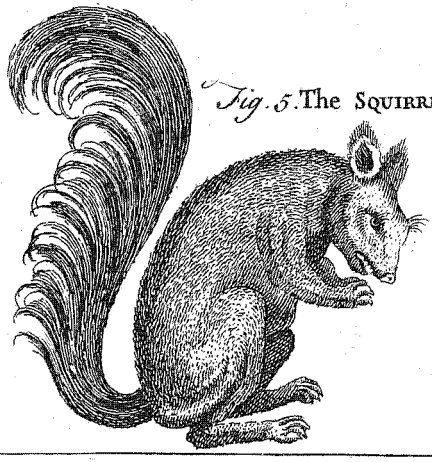

Fig. 6. SPUR-SHEL

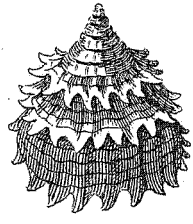

water, which being ſaturated therewith, becomes a mineral ſpring or well. If ſalt, ſulphur, lime-ſtone, &c. abounds in the ſtrata, through which the water paſſes, it will then be ſaline, ſulphureous, lime-water, &c. If ſulphur and iron ſhould both abound in the parts of the hill, whence the waters come, the waters will partake of the warmth or heat which is occaſioned by the mixture of two ſuch ſubſtances in the earth, where they are found. See the articles MINERAL WATERS, CHALYBEATE WATERS, SEA-WATER, BATH-WATERS, &c.

SPRING, *ver*, in coſmography, implies one of the ſeaſons of the year; commencing, in the northern parts of the world, on the day the ſun enters the firſt degree of aries, which is about the twenty-firſt of March, and ending when the ſun leaves gemini. See the articles EQUINOX and SEASON.

SPRING, *elater*, in mechanics, denotes a thin piece of tempered ſteel, or other elaſtic ſubſtance; which, being wound up, ſerves to put ſeveral machines in motion by its elaſticity, or endeavour to unbend itſelf: ſuch is the ſpring of a clock, watch, and the like. See the articles ELASTICITY, CLOCK, WATCH, &c.

The ſpring of a lock, gun, piſtol, or the like, is a piece of ſteel, violently bent; which, being ſet at liberty, beats back the bolt of the lock, or ſtrikes down the cock. See the article LOCK, &c.

SPRING-TIDE. See the article TIDE.

SPRINGE, among ſportſmen, a device made of twiſted wire, to catch birds or ſmall beaſts.

SPRINGING *of a maſt*, in the ſea-language, is when it cracks, but is not quite broken in any part of it; as the partners, hounds, &c. See MAST, PARTNERS, &c.

SPRINGING *a leak*. See the article LEAK.

SPRINGY BODIES, the ſame with elaſtic ones; or ſuch as, having had their figure changed by the ſtroke of another body, can recover again their former figure, which bodies not elaſtic cannot do. See the article ELASTICITY.

SPROTAW, a town of Sileſia, fifteen miles weſt of Glogaw: eaſt long. 15° 45′, north lat. 51° 36′.

SPUNGE, *ſpongia*, in botany, a genus of ſubmarine plants, belonging to the *cryptogamia lithophyta* claſs: it conſiſts of a ſoft, tough, and elaſtic matter, formed uſually into rude maſſes of a cavernous ſtructure, and having very little of the appearance of plants.

Upon a nice examination, ſpunge appears to be compoſed of capillary fibres, which are hollow and implicated in a ſurpriſing manner; and are ſurrounded by thin membranes which arrange them into a cellular form. This ſtructure, no leſs than the conſtituent matter, of ſpunge, renders it the fitteſt of all bodies to imbibe a great quantity of any fluid, and upon a ſtrong preſſure to part with almoſt the whole quantity again.

Spunge pays, on importation, a duty of $7\frac{75}{100}$d. the pound; and draws back, on exportation, $6\frac{80}{100}$d.

Spunge calcined to a blackneſs, and reduced to powder, has been lately brought into great uſe as a ſweetner of the blood, and a diuretic: ſome have pretended even to cure leproſies with it, and others have extolled it againſt the bite of a mad dog; but theſe are virtues leſs certainly known of it.

In the larger and coarſer pieces of ſpunge, there are often ſmall ſtones found imbedded in the ſubſtance of the matter; and yet, more frequently, a cruſtaceous ſpary matter gathered round the ſurface of certain parts of the plants; both theſe ſubſtances are called by the common name of lapis ſpongiæ, the ſponge-ſtone; and both are recommended as diuretics, and remedies againſt the ſtone and gravel. See the article SPAR.

Pyrotechnical SPUNGES, are made of the large fungous excreſcences growing on old oaks, aſhes, &c. which being boiled in common water, then dried and well beaten, are put in a ſtrong lye prepared with ſalt-petre, and again dried in an oven. Theſe make the black match or tinder brought from Germany, uſed to receive and ſuſtain the fire ſtruck from a flint and ſteel, &c.

SPUNGE, is alſo uſed, in gunnery, for a long ſtaff or rammer with a piece of ſheep or lamb-ſkin wound about its end, to ſerve for ſcouring great guns, when diſcharged, before they are charged with freſh powder.

SPUNGE *of a horſe-ſhoe*, the part next the heel, where the calkins are made. See the article HORSE SHOES.

SPUNGING, in gunnery, the cleaning a gun's inſide with a ſpunge, in order to prevent any ſparks of fire from remaining in her, which would endanger the life of him who ſhould load her again.

SPUN-YARN, among ſailors, is a kind of line made from rope-yarn, and uſed for ſeizing or faſtening things together.

SPUR, a piece of metal, conſiſting of two branches encompaſſing a horſeman's heel, and a rowel in form of a ſtar, advancing out behind, to prick the horſe.

SPUR-SHELL, in natural hiſtory, a ſpecies of cochlea, with the edges of its volutions ſerrated; ſo that, in ſeveral poſitions, it reſembles a ſpur with large rowels. See plate CCLIX. fig. 6. and the article COCHLEA.

SPUR-WAY, a road through another's ground, through which one may ride, by right or cuſtom.

SPURGE, in botany, the engliſh name of the tithymalus. See TITHYMALUS.

SPURGE-LAUREL, *laureola*, *thymelæa*, or *daphne*. See the article DAPHNE.

SPURIOUS DISEASES, ſuch as, in ſome ſymptoms, cannot be reduced to any one kind; and, therefore, are denominated from thoſe with which they agree in moſt particulars: thus we ſay, a ſpurious or baſtard pleuriſy, quinzy, *&c.* See the articles PLEURISY, QUINZY, *&c.*

SPURKETS, in a ſhip, ſpaces between the upper and lower futtocks, or betwixt the rungs fore and aft.

SPURRY, in botany, the engliſh name of ſeveral ſpecies both of alſine and ſpergula. See ALSINE and SPERGULA.

SPUTUM, among phyſicians, denotes the ſame with the ſaliva, or ſpittle. See the article SPITTLE.

SPY, a perſon hired to watch the actions, motions, *&c.* of another; particularly of what paſſes in a camp. When a ſpy is diſcovered, he is hanged immediately.

SQUACCO, in ornithology, a bird of the heron-kind, of a yellowiſh colour, and the head and neck variegated with black, white and yellow. It is a native of the coaſt of the Levant. See HERON.

SQUADRON, in military affairs, denotes a body of horſe whoſe number of men is not fixed; but is uſually from one to two hundred.

Each ſquadron uſually conſiſts of three troops, of fifty men each. See the articles ARMY and HORSE.

SQUADRON *of ſhips*, a diviſion or part of a fleet, commanded by a vice-admiral, or commodore. See FLEET and NAVY.

SQUAIOTTA, in ornithology, a ſpecies of heron, of a brown colour, with a black and white creſt, ſomewhat larger than the ſquacco, or former ſpecies.

SQUALUS, the SHARK-KIND, in ichthyology, a numerous genus of fiſhes, of the chondropterygious order; the characters of which are theſe: the foramina of the gills are five on each ſide, and are ſituated in a longitudinal direction, from the ſides of the head down to the pectoral fins; the head is of a depreſſed form; the body is oblong, and is either rounded or angulated, and the ſkin is rough; the eyes ſtand on the ſides of the head; the tail is bifid, and the upper part longer than the under; the mouth is uſually tranſverſe, and in the under part of the roſtrum, not at its extremity.

The ſpecies of this genus, being very numerous, are arranged under the following ſubdiviſions. 1. Thoſe which have granulated teeth, as the ſaw-fiſh, and the ſmooth hound-fiſh. 2. Thoſe which have acute teeth, and prickles on the back; as the common hound-fiſh, the ſhagreen-fiſh, centrine and monk-fiſh. 3. Thoſe which have acute teeth, but no ſpines or prickles on the back; as the zygæna, or ballance-fiſh, the ſea-fox, and the tope. 4. Thoſe which have the roſtrum ſhorter than uſual; as the bounce, morgag, and blue and white ſharks. See the articles SAW-FISH, HOUND-FISH, *&c.*

SQUAMÆ, SCALES, in natural hiſtory. See the article SCALE.

SQUAMARIA, or ANBLATUM, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, with a monopetalous ringent flower, both lips of which are entire, only the upper one is longeſt; the fruit is a roundiſh unilocular capſule, containing a great many round ſeeds.

SQUAMOUS, or SQUAMOSE, in anatomy, an appellation given to the ſpurious or falſe ſutures of the ſkull, becauſe compoſed of ſquamæ or ſcales like thoſe of fiſhes, or like tiles laid ſo as to reach over one another. See SKULL.

SQUARE, *quadratum*, in geometry, a quadrilateral figure, both equilateral and equiangular.

To find the area of a ſquare, ſeek the length of one ſide; multiply this by itſelf, and the product is the area of the ſquare.

SQUARE-NUMBER, the product of a number multiplied into itſelf. See INVOLUTION and POWER.

Thus 4, the product of 2 multiplied by 2; or 16, the product of 4 multiplied by 4, are ſquare numbers.

SQUARE ROOT, a number conſidered as the root of a ſecond power or ſquare number; or a number, by whoſe multiplication into itſelf, a ſquare number is generated. See the article EXTRACTION.

SQUARE BATTLE, or BATTALION *of men*, is one that hath an equal number of men in rank and file. See BATTLE.

Hollow SQUARE, in the military art, is a body of foot drawn up with an empty ſpace in the middle for the colours, drums, and baggage; faced and covered by the pikes every way, to keep off horſe.

SQUARE, *norma*, an inſtrument conſiſting of two rulers, or branches, faſtened perpendicularly at one end of their extremes, ſo as to form a right angle: it is of great uſe in the deſcription and menſuration of right angles, and laying down perpendiculars.

SQUATT, among miners, a ſmall bed of ore leſs valuable than a vein or load, as reaching only a little way.

SQUATINA, the MONK-FISH, or ANGEL-FISH, a ſpecies of ſqualus, with the mouth at the extremity of the head: it grows to about ſix feet in length, and is conſiderably thick in proportion. See the article SQUALUS.

SQUILL, *ſcilla*, in botany. See SCILLA.

SQUILLA, in zoology, a genus of inſects with ten legs, the foremoſt pair of which is cheliform, or made for pinching: the eyes are two, and the tail is foliated.

These are the characters of the ſhrimp, as alſo of the cray-fiſh, lobſter, and crab; of each of which there are numerous ſpecies. See CANCER, LOBSTER, &c.

SQUILLACE, a biſhop's ſee of the farther Calabria, in the kingdom of Naples, which gives name to the gulph of Squillace: eaſt long. 17°, north lat. 39°.

SQUINANCY, or ESQUINANCY, in medicine, the ſame with the quinzy. See the article QUINZY.

SQUINTING, *ſtrabiſmus*, in medicine and ſurgery. See the article STRABISMUS.

SQUIRREL, *ſciurus*, in zoology, the engliſh name of a genus of quadrupeds of the order of the glires, the fore-teeth of which are prominent; it has no canine teeth; and its legs are formed both for climbing and leaping.

The common reddiſh-brown ſquirrel, with a white belly, is a very lively little animal, with an extremely long and buſhy tail. See plate CCLIX. fig. 5.

But beſides this, there are ſeveral other ſpecies; as the american grey-ſquirrel, with a ſmaller tail, and twice as large as the common kind; the ceylon blackiſh ſquirrel, with a very large tail, and about the ſize of the common ſquirrel; the flying ſquirrel, with the ſides extended, ſo as to be able to leap from one tree to another at a great diſtance; and, laſtly, the barbary ſquirrel, of a blackiſh tawney-brown colour, with variegated ſides.

ST, an indeclinable term chiefly uſed to command ſilence.

The Romans had theſe two characters written over the doors of their eating rooms, as if one ſhould ſay *ſed tace*, or *ſilentium tene*. Porphyry obſerves, that the antients made a point of religion of it, not to ſpeak a ſingle word in paſſing in or out of the doors.

STABLE, a place or houſe for horſes, &c. furniſhed with ſtalls and proper apartments to contain their food, &c. See the article HORSE, &c.

Nothing conduces more to the health of a horſe than the having a good and wholeſome ſtable. The ſituation of a ſtable ſhould always be in a good air, and on a firm, dry, and hard ground, that in winter the horſe may go out and come in clean. It ſhould always be built ſomewhat on an aſcent, that the urine and other foulneſſes may be eaſily conveyed away by means of trenches or ſinks for that purpoſe. As there is no animal that delights more in cleanlineſs than the horſe, or that more abominates bad ſmells, care ſhould be taken that there be no hen-rooſt, hog-ſtie, or neceſſary houſe, near the place where the ſtable is to be built; for the ſwallowing of feathers, which is very apt to happen when hen-rooſts are near, often proves mortal to horſes; and the ſteams of a bog-houſe, or hog's-dung, will breed many diſtempers. The walls of a ſtable, which ought to be of brick rather than ſtone, ſhould be made of a moderate thickneſs, two bricks, or a brick and a half at leaſt, for the ſake of warmth in the winter, and to keep out the heat in the ſummer. The windows ſhould be made on the eaſt and north ſide of the building, that the north wind may be let in to cool the ſtables in the ſummer, and the riſing ſun all the year round, eſpecially in winter. The windows ſhould either be faſhed, or have large caſements, for the ſake of letting in air enough; and there ſhould always be cloſe wooden ſhutters, that the light may be ſhut out at pleaſure, by which means the horſe may be made to ſleep in the day as well as in the night,

when it is judged proper he ſhould do ſo. Many pave the whole ſtable with ſtone, but that part which the horſe is to lie on ſhould be boarded with oak-planks, which ſhould be laid as even as poſſible, and croſs-wiſe rather than length-wiſe; and there ſhould be ſeveral holes bored through them to receive the urine, and carry it off underneath the floor into one common receptacle; the ground behind ſhould be raiſed to a level with the planks, and it ſhould be paved with ſmall pebbles. There are two rings to be placed on each ſide of the ſtall, for the horſe's halter to run through, and a logger is to be fixed to the end of this ſufficient to poiſe it perpendicularly, but not ſo heavy as to tire the horſe, or to hinder him from eating; the beſt place for him to eat his corn in is a drawer or locker, made in the wainſcot partition, which need not be large, ſo that it may be taken out at pleaſure to clean it, by which means the common dirtineſs of a fixed manger may be avoided. Many people are againſt having a rack in their ſtables; they give the horſe his hay ſprinkled upon his litter, and if they think he treads it too much, they only nail up three or four boards, by way of a trough, to give it to him in: the reaſon of this is, that the continual lifting up of the head to feed out of the rack, is an unnatural poſture for a horſe, who was intended to take his food up from the ground, and makes him, as they expreſs it, withy-cragged. When there is ſtable-room enough, partitions are to be made for ſeveral horſes to ſtand in; theſe ſhould always allow room ſufficient for the horſe to turn about and lie down conveniently, and they ſhould be boarded up ſo high towards the head, that the horſes placed in ſeparate ſtalls may not be able to ſmell at one another, nor moleſt each other any way. One of theſe ſtalls ought to be covered in, and made convenient for the groom to lie in, in caſe of a match, or the ſickneſs of a horſe. Behind the horſes there ſhould be a row of pegs, to hang up ſaddles, bridles, and other utenſils; and ſome ſhelves for the bruſhes, pots of ointments, &c. The other requiſites for a ſtable are a dung-yard, a pump, and a conduit.

STABLESTAND, in the foreſt law, is one of the four evidences or preſumptions whereby a perſon is convicted of an intention to ſteal the king's deer in the foreſt; as when any perſon is found, at his ſtand in the foreſt, with his bow bent ready to ſhoot at a deer, or ſtanding cloſe by a tree with grey-hounds in a leaſh, ready to ſlip. See FOREST.

STABLO, a town of Germany, in the circle of Weſtphalia and biſhopric of Liege, ſituated ten miles ſouth of Limburg.

STACK *of wood*, among huſbandmen, a pile of wood three feet long, and as many broad, and twelve feet high.

STACHYARPAGOPHORA, in botany, the ſame with the celoſia. See the article CELOSIA.

STACHYS, BASE HOAR-HOUND, in botany, a genus of the *didynamia-gymnoſpermia* claſs of plants, the corolla whereof conſiſts of a ſingle ringent petal; the tube is very ſhort; there is no pericarpium; the calyx contains four oval and angular ſeeds.

This plant is cephalic, diuretic, and a promoter of the menſes.

STADIUM, an antient greek long-meaſure. See the article MEASURE.

Stadium was alſo the courſe or career wherein the Greeks ran their races. Vitruvius deſcribes it as an open ſpace 125 paces long, terminated at the two extremes with two poſts called by the Romans *carcer* and *meta*. Along the ſtadium was built a kind of amphitheatre, where the ſpectators were placed to ſee the athletæ exerciſe running, wreſtling, &c. There were ſtadia likewiſe covered over with colonnades and porticoes, ſerving for the ſame exerciſes in bad weather.

STADE, a town of Germany, in the circle of Lower Saxony and dutchy of Bremen, ſituated on the weſt ſide of the river Elbe, ſeventeen miles weſt of Hamburgh.

STADTHOLDER, STADTHOULDER, or STATHOLDER, the principal governor or magiſtrate of the united provinces.

The ſtadtholder ſeems to be impowered, either directly or by his influence, to change both the deputies, magiſtrates, and officers in every province and city. He is preſident in the ſtates of every province, though he has not ſo much as a ſeat or vote in the ſtates-general: but as he influences the ſtates of each province to ſend what deputies he pleaſes to the ſtates-general, he has, in effect, the appointing the perſons that conſtitute the ſtates general, and may be deemed ſovereign of the united provinces. The ſtadtholders

tholders had once a very great power. We find one of their ſtadtholders appointing what towns ſhould ſend deputies, or members, to the aſſembly of the ſtates of Holland: but the ſtadtholderſhip was never hereditary till now, when in the year 1747 it was made ſo in the family of Orange.

It is obſerved that the ſtates paſſed by the ſtadtholder's eldeſt ſon, and appointed his younger ſon, prince Maurice of Orange, their ſtadtholder: and at other times they have ſuppreſſed the ſtadtholderſhip intirely. The ſtadtholder always, in the council of ſtate, when the votes happen to be equal, has a deciſive voice.

STAEHELINA, in botany, a genus of the *ſyngeneſia-polygamia-æqualis* claſs of plants, the general corolla whereof conſiſts of uniform floſcules ſcarce riſing above the cup: the proper corolla is monopetalous and funnel-ſhaped: the limb is quinquifid, equal, acute, and campanulated: there is no pericarpium: the ſeed contained in the cup is ſolitary, oblong, very ſhort, tetragonal, and coronated with a downy pap of the length of the cup.

STAFF, *baculus*, an inſtrument ordinarily uſed to reſt on in walking. The ſtaff is alſo frequently uſed as a kind of natural weapon both of offence and defence, and for ſeveral other purpoſes.

STAFF, in muſic, five lines on which, with the intermediate ſpaces, the notes of a ſong, or piece of muſic, are marked.

Guido Aretin, the great improver of modern muſic, is ſaid to be the firſt who introduced the ſtaff, marking his notes by ſetting points (.) up and down them to denote the riſe and fall of the voice; and each line and ſpace he marked at the beginning of the ſtaff with pope Gregory's ſeven letters, A, B, C, D, E, F, G. See the article NOTE.

But others will have this practice of an older date; and Kircher particularly affirms, that in the Jeſuits Library at Meſſina, he found a greek manuſcript of hymns above ſeven hundred years old, wherein ſome hymns were written, on a ſtaff of eight lines, marked at the beginning with eight greek letters. The notes, or points, were on the lines, but no uſe made of the ſpaces.

STAFF, BASTON, or BATTON, in heraldry. See BASTON.

Back-STAFF. See BACK-STAFF.

Fore-STAFF. See FORE-STAFF.

Paſtoral-STAFF. See PASTORAL.

STAFF-OFFICERS. See OFFICERS.

STAFFORD, the county town of Staffordſhire, is ſituated one hundred and thirty miles north-weſt of London.

It ſends two members to parliament.

The county of Stafford is bounded by Cheſhire, on the north-weſt; by Derbyſhire, on the north-eaſt; by Worceſterſhire, on the ſouth; and by Shropſhire, on the weſt.

STAG, in zoology, a ſpecies of the cervus, with ramoſe, cylindric and crooked horns. See the article CERVUS.

This is a very ſtately and beautiful animal. People are apt to confound it with the common fallow deer, but with great impropriety, being of twice the ſize, and different in many other reſpects: the head is remarkably large: the neck ſtrong and thick: the eyes are full and large: the ears long and patulous: the horns tall, almoſt erect, and of a beautiful form; they riſe each with a ſingle and elegant ſtem, which continues its form to the top, only ſending off branches and divarications: they are hairy when once formed, but afterwards they become very ſtrong and loſe that downy appearance. The body of the ſtag is rounded and plump: the back ſomewhat flatted, and the belly prominent: the legs are long: the hoofs cloven: the fur deep, thick, and of a tawny-reddiſh colour.

STAG-BEETLE. See CERVUS-VOLANS.

STAG-HUNTING. See HUNTING.

STAGE, in the modern drama, the place of action and repreſentation, included between the pit and the ſcenes, and anſwering to the proſcenium, or pulpitum, of the antients.

The laws of the ſtage are the rules and decorums to be obſerved, with regard to the œconomy and conduct of a dramatic performance to be exhibited on the ſtage. Theſe relate principally to the unities, the diſpoſition of the acts and ſcenes, the unravelling, *&c.* See the articles DRAMA, ACTION, *&c.*

STAGGERS, or STAVERS, in the manege. See STAVERS.

STAIN, a town of Germany, in the circle of Auſtria, ſituated on the Danube, one hundred and forty miles weſt of Vienna.

STAINES, a town of Middleſex, ſituated nineteen meaſured miles weſt of London.

STAIR-CASE, in architecture, an aſcent incloſed between walls, or a balluſtrade, conſiſting of ſtairs, or ſteps, with landing-

ing-places and rails, ſerving to make a communication between the ſeveral ſtories of a houſe.

The conſtruction of a complete ſtair-caſe is one of the moſt curious works in architecture. The common rules to be obſerved therein are as follow: 1. That it have a full free light, to prevent accidents of ſlipping, falling, *&c.* 2. That the ſpace over head be large and airy, which the Italians call *un bel ſfocato*, i. e. good ventilation, in regard a man ſpends much breath in mounting. 3. That the half-paces, or landing-places, be conveniently diſtributed for repaſſing in the way. 4. That to prevent rencounters, *&c.* the ſtair-caſe be not too narrow: however, this laſt is to be regulated by the quality of the building. 5. That care be taken in placing the ſtair-caſe, ſo as the ſtairs may be diſtributed without prejudice to the reſt of the building.

The kinds of ſtair-caſes are various: in ſome the ſtairs are ſtraight, in others winding, in others both ways, or mixed. Again, of ſtraight-ſtairs, called alſo fliers: ſome fly directly forwards, others are ſquare, others triangular, and others are called french flights. Of winding-ſtairs, called alſo ſpiral or cockle-ſtairs: ſome are ſquare, ſome circular, and ſome elliptical: and theſe again are various; ſome winding round a ſolid, and others round an open newel. Laſtly, of mixed-ſtairs: ſome are called dog-legged, others both wind about a ſolid newel, and fly about a ſquare open newel.

Stair-caſes being of great importance in building, it will be neceſſary to give a particular account of each kind. Firſt, ſtraight-ſtairs are ſuch as always fly; that is, proceed in a right line, and never wind; whence their denomination. Of theſe there are ſeveral kinds, as, 1. Straight-fliers, or plain-fliers, which proceed directly from one floor to another, without turning either to the right or left: theſe are ſeldom uſed, except either for garret or cellar-ſtairs. 2. Square-fliers, which fly round the ſides of a ſquare newel, either ſolid or open, having at every corner of the newel a ſquare half ſtep, taking up one fourth of a circle, ſo that they fly from one half pace, or ſtep, to another; and the length of the ſtairs is perpendicular to the ſide of the newel. 3. Triangular-fliers are thoſe which fly round by the ſides of a triangular newel, either ſolid or open, having at each corner of the newel a trapezial half-ſtep, taking up two thirds of a circle, ſo that they fly from one half ſtep to another, and their length is perpendicular to the ſide of the newel. 4. French-fliers, thoſe which fly firſt directly forwards, till they come within the length of a ſtair of the wall, and then have a ſquare half-pace, from which you immediately aſcend to another half-pace, from which the ſtairs fly directly back again, parallel to their firſt flight.

Secondly, Winding-ſtairs are ſuch as always wind and never fly: of theſe there is great variety; as, 1. Circular winding ſtairs; of which there are four kinds, *viz.* ſuch as wind about a ſolid newel, the fore-edge of each being in a right line, pointing to the center of a newel; commonly uſed in church-ſteeples and great old houſes: ſuch as wind round an open newel, the fore ſide of each being in a right line, pointing to the center of the newel, as thoſe in the monument of London: ſuch as wind round a ſolid newel, only the fore-ſide of each an arch of a circle, either concave or convex, pointing near to the circumference of the newel, and ſuch as reſemble the laſt in all other reſpects, ſave that they have an open newel. Any of theſe winding-ſtairs take up leſs room than the other kinds. In ſtairs that wind round a ſolid newel, architects make the diameter of the newel either one ſixth, or one fourth, or one third, or three ſevenths, of the diameter of the ſtair-caſe, according as that is in bigneſs: if very ſmall, the newel is but one ſixth; and if large, three ſevenths, *&c.* In ſtairs that wind round an open newel, Palladio orders the newel to be one half of the diameter of the ſtair-caſe, though there does not appear any reaſon why the newel here ſhould not be proportioned to the ſtair-caſe, as in the former. As to the number of ſtairs in each revolution, Palladio orders, that if the ſtair-caſe be ſix or ſeven feet diameter, the ſtairs in each revolution to be twelve; if the diameter be eight, the ſtairs to be ſixteen; or if nine or ten, the ſtairs to be twenty; and if eighteen, to be twenty-four. 2. Elliptical winding-ſtairs, whereof there are two kinds, the one winding round a ſolid, the other round an open newel: they are much of the ſame nature with circular ſtairs, excepting that in the one the newel is a circle, and in the

the other an ellipſis. 3. Square winding-ſtairs are ſuch as wind round a ſquare newel, either ſolid or open, the fore ſide of each ſtair being a right line pointing to the center of the newel. 4. Triangular winding ſtairs are ſuch as wind round a triangular newel, the fore-ſide of each being a right line pointing to the center of the newel. 5. Columinated winding-ſtairs. Palladio mentions a ſtair-caſe in Pompey's portico, at Rome, ſet on columns, ſo as the light they receive from above may diſtribute itſelf to all parts alike. 6. Double winding-ſtairs. Scamozzi mentions a ſtair-caſe in this form made by Piedro del Bergo and Jean Coſſin, at Sciamburg, in France, in the king's palace. It is ſo contrived, that the one aſcending and the other deſcending, ſhall never meet. Dr. Grew deſcribes a model of this kind of ſtair-caſe kept in the Muſæum of the royal ſociety. The foot of one of the ſtair-caſes, he ſays, is oppoſite to that of the other, and both make a parallel aſcent, and within the ſame cylinder: the newel in the middle is hollow, and built with long apertures, to convey light from candles placed at bottom, and at the ſides of the newel, in both caſes. 7. Quadruple winding-ſtairs. Palladio mentions a ſtair-caſe of this form in the caſtle of Chambor, near Blois. It conſiſts of four ſtair-caſes, carried up together, having each its ſeveral entrance, and going up one over another in ſuch a manner as that being in the middle of the building, the four ſerve to lead to four apartments, ſo that the people of the one need not go up and down the ſtairs of the other; yet being open in the middle, they all ſee each other paſs.

Thirdly, mixed-ſtairs are ſuch as partly fly and partly wind; whence ſome call them fliers and winders. Of theſe there are ſeveral kinds: as, 1. Dog-legged-ſtairs, which firſt fly directly forwards, then wind a ſemi-circle, and then fly directly backwards parallel to that. 2. Square-fliers and winders have a ſquare newel, either ſolid or open, and fly by the ſides of the newel, winding a quadrant of a circle at each corner. 3. Solid and open newelled fliers and winders are of two kinds: the one winds the quadrant of a circle about a ſolid newel, then flies by the ſide of a ſquare open newel, then winds again by the ſide of a ſolid newel, then flies again as before, and ſo alternately. The other flies firſt, then winds, then flies again, alternately.

The dimenſions of ſtairs are differently aſſigned by different authors; but, however, they agree in this, that they muſt not be more than ſix, nor leſs than four inches high; nor more than eighteen, nor leſs than twelve inches broad; nor more than ſixteen, nor leſs than ſix feet long, each ſtair. But theſe meaſures regard only large and ſumptuous buildings; for in common and ordinary houſes they may be ſomething higher and narrower, and much ſhorter; yet even in theſe the ſtairs are not to exceed ſeven, or at moſt eight inches in heighth, nor be leſs than nine or ten inches in breadth, nor three feet in length. To reduce the dimenſions of ſtairs to ſome natural, or at leaſt geometrical, ſtandard, Vitruvius borrows the proportion of the ſides of a rectangled triangle, which the antient ſchool expreſſed by the numbers 3, 4, and 5; the firſt for the perpendicular height, from the ſtair-head to the ground; the ſecond for the horizontal breadth; and the third for the whole ſlope, or inclination, from the edge of one ſtair to that of another. But this rule is laid aſide, and with good reaſon, by the modern builders; for on this principle, the lower the ſtairs, the narrower they muſt be; and ſtairs, for inſtance, four inches high, ſuch as we find mentioned by antient architects, muſt be but five inches and one third broad.

One rule to be regarded in the making of ſtairs, is, that they be laid ſomewhat ſloping, or a little higher behind, that the foot may, as it were, both aſcend and deſcend at the ſame time; which, though it is obſerved by few, is found a ſecret and delicate deception of the pains in mounting.

STAKE, the name of a ſmall anvil, uſed by ſmiths; ſometimes it ſtands on a broad iron-foot on the work-bench, to be moved up and down occaſionally; and ſometimes it hath a ſtrong iron-ſpike at the bottom, by which it is fixed to ſome place on the work-bench. Its uſe is to ſet ſmall and cold work ſtraight, by hammering it on the ſtake; or to cut or punch upon the cold chiſſel or cold punch.

STALACTITÆ, or STALACTAGNIA, STONY ICICLES, in natural hiſtory, cryſtalline ſpars formed into oblong, conical, round, or irregular bodies, compoſed

compoſed of various cruſts, and uſually found hanging in form of icicles from the roofs of grottos, &c. See SPAR.

Of this claſs there are various ſpecies, as the hard, white ſtalactitæ; the white, ſhattery ſtalactitæ; and the yellow, ſhattery, cryſtalline ſtalactitæ, &c.

STALBRIDGE, a market-town of Dorſetſhire, ſituated eighteen miles north of Dorcheſter.

STALE, among ſportſmen, a living fowl put in a place to allure and bring others where they may be taken. For want of theſe, a bird ſhot, his entrails taken out, and dried in an oven in his feathers, with a ſtick thruſt through to keep it in a convenient poſture, may ſerve as well as a live one.

Stale is alſo a name for the urine of cattle. See the article URINE.

STALIMENE, an iſland in the Archipelago, or Egean-ſea.

STALK, in botany, that part of a plant which riſes immediately from the root, and which ſupports the leaves of the flowers and the fruit.

The term ſtalk is uſed on all occaſions; but in ſpeaking of the graſſes and gramineous plants, the word culm is uſed in its place, to diſtinguiſh that peculiar kind of ſtalk, which is general to all theſe plants, and is not found in any others.

STALKING, a term uſed in fowling, and applied to a kind of ſcreen, or device, to hide the fowler and amuſe the game, while he gets within ſhot. Of ſuch devices there are ſeveral kinds, *viz.* the ſtalking-hedge, being an artificial hedge two or three yards long, and about a yard and a half high, made with ſmall wands, to be light, and portable, yet buſhed out, like a real hedge, with ſtakes, to ſupport it, while the fowler takes his aim. Stalking-horſe, is an old horſe trained up for the purpoſe, which will gently walk up and down, as you would have him, in water, &c. beneath whoſe fore-ſhoulder the ſportſman ſhelters himſelf and gun. When thus got within ſhot he takes aim from before the forepart of the horſe, which is much better than ſhooting under his belly. For change, when the fowls become ſo uſed to the ſtalking-horſe as to know it, ſome ſtalk with an ox, cow, deer, or the like: others uſe a ſtalking-tree, and others a ſtalking-buſh.

STALLION, or STONE-HORSE, in the manege, an ungelt horſe, deſigned for the covering of mares, in order to propagate the ſpecies. See MARE.

In the choice of ſtallions for mares, care ſhould be taken that they have no natural blemiſh of any kind whatever, ſuch as moon-eyes, watery eyes, ſplints, ſpavins, curbs, &c. becauſe, in that caſe, the colts will have the defect hereditary from the parent. On the other hand, the ſtallion ſhould be choſe able, high-ſpirited, fair-coloured, and fine-ſhaped. As to his age, he ſhould not be younger to cover a mare than four years, nor older than twenty. Let the ſtallion be ſo highly fed as to be full of luſt and vigour: and being brought to the place where the mares are, take off his hinder ſhoes, and let him cover a mare in hand twice or thrice, to keep him ſober; then pull off his bridle and turn him looſe to the reſt of the mares, which ſhould be in a convenient cloſe, with ſtrong fences and good food, and there leave him till he has covered them all, ſo that they will bear him no longer; by which time his courage will be pretty well cooled. Ten or twelve mares are enough for one ſtallion, in one and the ſame year. It will be neceſſary to leave a little ſhed, or hovel, for him in the field, to which he may retreat from the rain, wind, or ſun. In this ſhed there ſhould be a rack and manger, to feed him during his covering time. After he has done with the mares he ſhould be removed to freſh paſture. For the further ordering of a ſtallion, before he is to cover, the following inſtructions are of uſe. Feed him, for three or four months before covering, with good oats, peaſe, or beans, or with coarſe bread and a little hays, but a good deal of wheat-ſtraw; carrying him twice a-day to water; walking him up and down, for an hour, before he has drank, but without making him ſweat.

STAMFORD, a borough-town of Lincolnſhire, ſituated thirty-five miles ſouth of Lincoln.

It ſends two members to parliament.

STAMINA, according to moſt botaniſts, are the male organs of generation in flowers, conſiſting of two parts, a filament and anthera, though ſometimes the anthera ſtands alone, See the articles ANTHERA and FILAMENT.

Mr. Tournefert takes the uſe of the ſtamina to be as it were ſo many excretory canals for diſcharging the growing embryo

bryo of its redundant juices; and of theſe excrements of the fruit, he takes that farina, or duſt, found in the apices, to be formed. But other writers, as Geoffroy, and Linnæus in particular, aſſign the ſtamina a nobler uſe. theſe authors, explaining the generation of plants, in a manner analogous to that of animals, maintain the uſe of the ſtamina to be that of ſecreting, in their fine capillary canals, a juice, which being collected, hardened, and formed into a farina, or duſt, in the tips of the apices, is thence, when the plant arrives at maturity, diſcharged by the burſting of the apices upon the top of the piſtil, whence is a paſſage for it to deſcend into the uterus, where being received, it impregnates and fecundifies the plant. See BOTANY, GENERATION *of plants*, FARINA, and PISTIL.

On this principle it may be ſaid, that the ſame flower contains both ſexes, which contribute each their part to the generation; that the ſtamina are the male part, and the farina, which is always found of an oily glutinous nature, the ſeminal liquor; and that the piſtil is the female part, which conducts the ſemen to the ova or embryos. Among the writers of the preſent age, who oppoſe this doctrine, is Dr. Alſton, profeſſor of botany at Edinburgh, who, in an expreſs diſſertation on the ſexes of plants, publiſhed in the Phyſical Eſſays, undertakes to overthrow all the arguments in favour of the ſexes of plants, by repeated experiments. This learned author, conſidering that there are ſeveral ſpecies of vegetables which bear flowers on one plant and ſeeds on another, as ſpinacia mercurialis, cannabis, *&c.* in order to determine the controverſy, thought of training up one or more of theſe ſeed-bearing plants at a ſufficient diſtance from thoſe that carry flowers, and obſerving the conſequence. To this end, in ſpring 1737, he tranſplanted three ſets of the common ſpinage, long before it could be known whether they were flowering or ſeed-bearing plants, from a little bed, on which it was raiſed, into a place of the garden full eighty yards diſtant, and almoſt directly ſouth, there being two hawthorn and three holly-hedges, all pretty thick and tall, between them and their ſeed-bed, and no other ſpinage in the garden, nor ſo near them by far; all the three, we are told, proved fertile plants, and ripened plenty of ſeeds; and further, they were ſown, grew, and proſpered as well as any ſpinage could do.

The ſame author, in ſpring 1741, made other ſeparate experiments on the common hemp, and the french mercury; each of which plants, notwithſtanding they were planted in a very high incloſure, many hundred yards diſtant from any other of the ſame claſs of plants, he aſſures us, ripened fertile ſeeds.

For the arguments and experiments of the ſexualiſtæ, or thoſe who eſtabliſh the claſſes of plants upon the differences of the ſexes and parts of fructification in plants, ſee the article GENERATION.

STAMINA, in the animal body, are defined to be theſe ſimple original parts, which exiſted firſt in the embryo, or even in the ſeed, and by whoſe diſtinction, augmentation, and accretion, by additional juices, the animal body, at its utmoſt bulk, is ſuppoſed to be formed. See GENERATION.

STAMINEOUS, in botany, a term uſed by authors, for thoſe flowers of plants which have no petals, or flower-leaves, but conſiſt only of a number of ſtamina and piſtils, placed in a cup. This cup is ſometimes miſtaken for a flower, and its leaves thought to be true petals, but they remain when the ſtamina are fallen, and become the capſules, containing the ſeed; which, according to Tournefort, is the true character of a cup, not of a flower.

STAMP-DUTIES, certain impoſitions laid on all parchment and paper, on which deeds, grants, or other inſtruments, or any proceſs in law or equity, are ingroſſed or written. Theſe duties when firſt granted were from forty ſhillings for letters patent, *&c.* to ſix pence for the uſual deeds; and one penny for declarations, pleadings, *&c.* They have been, in general, doubled and trebled, by ſubſequent ſtatutes; and the common ſtamp now is the treble ſix-penny. Perſons writing or ingroſſing any thing charged with the duty on parchment or paper, before it is ſtamped, or if it be marked with any lower duty than what is required, are liable to forfeit 5l. and the deed ſhall not be deemed good in law, till ſuch penalty is paid, and the ſame be ſtamped, *&c.*

The ſtamp-duties are alſo extended to almanacs, news-papers, pamphlets, cards, and dice. Almanacs printed on one ſide of a ſheet, muſt be on a penny ſtamp; and the firſt ſheet of book-almanacs on a two penny-ſtamp, under a penalty of 10l. News-papers, printed on a half-ſheet, are chargeable with ½d. ſtamp; or if upon a whole ſheet, 1d. All

pamphlets above a ſheet, and under ſix ſheets in octavo, twelve in quarto, or twenty in folio, are ſubject to a ſtamp-duty of 2s. per ſheet, which is to be paid within ſix days, if printed within the bills of mortality, or within fourteen days if printed at a greater diſtance, on penalty of 20l. and the loſs of the property of the copy. But the votes of the houſe of commons, public prayers or thankſgivings, printed by authority, and ſermons, are exempted. Cards pay a duty of 6d. each pack: and the penalty for expoſing cards to ſale, not having one card ſtamped, is 5l. or not incloſed in paper and thread, ſealed and ſtamped 10l. Dice pay 5s. a pair ſtamp-duty; the perſon expoſing unſtamped dice to ſale, forfeits 5l. for each dice: and whoever files, ſquares, or new-ſpots dice that have been played with, forfeits 10l.

STAMPS, in metallurgy, a ſort of large peſtles, lifted up by water-wheels, and ſerving to beat to powder the ores, and the refuſe of ores, of metals. This engine is called the ſtamping-mill, and ſometimes the knocking-mill. See MILL.

STAMPALIA, an iſland of the Archipelago, about fifty miles in circumference, ſituated in eaſt lon. 26° 30′, and north lat. 36° 20′.

STANCHEON. See PUNCHEON.

STANCHION, or STANCHIONS, in a ſhip, thoſe pillars, which being ſet up pillar-wiſe, do ſupport and ſtrengthen the waſte-trees.

STAND, in commerce, a weight, from two hundred and a half to three hundred, of pitch.

Stable-STAND. See STABLE-STAND.

STANDARD, in war, a ſort of banner, or flag, borne as a ſignal for the joining together of the ſeveral troops belonging to the ſame body. See FLAG, *&c.*

The ſtandard is uſually a piece of ſilk, a foot and a half ſquare, on which are embroidered the arms, device, or cypher, of the prince, or of the colonel: it is fixed on a lance, eight or nine feet long, and is carried in the center of the firſt rank of a ſquadron of horſe.

The ſtandard is uſed for any martial enſign of horſe, but more particularly for that of the general, or the royal ſtandard: thoſe borne by the foot are rather called colours.

STANDARD, in commerce, the original of a weight, meaſure, or coin, committed to the keeping of a magiſtrate, or depoſited in ſome public place, to regulate, adjuſt, and try the weights uſed by particular perſons in traffic. See the articles COIN, MEASURE, *&c.*

The juſtneſs of weights and meaſures is of that importance to the ſecurity and good order of trade, that there is no civilized nation, but makes it a part of their policy, to preſerve the equality thereof, by means of ſtandards. The ſtandards of weights and meaſures in England are appointed by magna charta to be kept in the exchequer, by a ſpecial officer, called the clerk or comptroller of the market. See the article CLERK *of the market.*

The ſtandard of gold-coin is twenty-two carats of fine gold and two carats of alloy in the pound weight troy: and the french, ſpaniſh, and flemiſh gold are nearly of the ſame fineneſs. The pound weight is cut into forty-four parts and a half, each current for twenty-one ſhillings.

The ſtandard of ſilver is eleven ounces and two penny-weights of ſilver, and eighteen penny-weights of alloy of copper. Whether gold or ſilver be above or below ſtandard, is found by aſſaying, and the hydroſtatical ballance. See the articles ASSAYING and HYDROSTATICAL BALLANCE.

STANDARDS, or STANDELS, in huſbandry, are young trees, reſerved at the felling of woods, for the growth of timber.

STANDING, in the ſea-language. Standing part of the ſheet, is that part of it which is made faſt to a ring at the ſhip's quarter. Standing part of a tackle, is the end of the rope where the block is faſtened. Standing ropes, are thoſe which do not run in any block, but are ſet taught or let ſlack, as occaſion ſerves; as the ſheet-ſtays, back-ſtays, or the like.

STANDON, a town of Hertfordſhire, ſituated under the meridian of London, and ſeven miles north of Hertford.

STANHOPE, a market-town of Durham, ſituated ſixteen miles weſt of Durham.

STANLEY, a town of Glocеſterſhire, ſituated twelve miles ſouth of Glocеſter.

STANNARIES, the mines and works where tin is dug and purified, as in Cornwal, Devonſhire, *&c.* There are four courts of the ſtannaries in Devonſhire, and as many in Cornwal, and great liberties were granted them by ſeveral acts of parliament, in the time of Edward I. *&c.* though ſomewhat abridged under Edward III. and Charles I.

STANTON, a town of Lincolnſhire, ſituated ſeventeen miles eaſt of Lincoln, under the meridian of London.

STANTS,

STANTS, a town of Switzerland, capital of the canton of Underwald, ſituated on the lake of Lucern, twenty-five miles ſouth of Zurich.

STANZA, in poetry, a certain ſtated number of verſes, generally containing a perfect ſenſe, that ought to end with ſome lively and ingenious thought, or juſt and pertinent reflection.

The word is italian, and literally ſignifies a ſtand, or ſtation, becauſe of the pauſe to be made at the end of each ſtanza, or complete ſenſe. What the couplet is in ſongs, and the ſtrophe in odes, the ſtanza is in the greater and graver pieces. The Italians, indeed, ſcarce write any poems, but they divide them into ſtanzas. There are ſtanzas of four, ſix, eight, ten, and twelve verſes; and ſometimes of an uneven number, but theſe laſt are ſomewhat more difficult to execute, by reaſon of the three verſes to one rhyme.

The uſe of ſtanzas in tragedy and comedy is condemned by all the beſt critics; for though we ſpeak verſe on the ſtage, it is preſumed we are ſpeaking proſe. Stanzas ſhew a degree of ingenuity on the part of the poet, which has nothing of nature in it on the part of the actor: add to this, that ſtanzas are not fit to expreſs but a few of the paſſions.

STAPELIA, in botany, a genus of the *pentandria-digynia* claſs of plants, the corolla whereof conſiſts of a large, plane, ſingle petal, quinquifid beyond the middle; the fruit conſiſts of two oblong ſubulated folicles, made up of only one valve, and containing one cell; the ſeeds are numerous, imbricated, compreſſed, and pappoſe.

STAPES, in anatomy, one of the officula auditoria, being a little bone ſituated in the cavity of the feneſtra ovalis: thus called from its reſembling a ſtirrup. See EAR. The head of this bone is joined to the longer leg of the incus; its baſis ſtands in the feneſtra ovalis of the labyrinth of the ear; and its two lateral parts have their internal ſurface furrowed; the head is articulated by arthrodia with the leg of the incus. See the article INCUS.

STAPHISAGRIA, in botany, a name for the delphinium. See DELPHINIUM.

STAPHYLÆA, BLADDER-NUT, in botany, a genus of the *pentandria-trigynia* claſs of plants, the corolla of which conſiſts of five oblong erect petals, of the length of the cup; the fruit is compoſed of three inflated flaccid capſules, affixed together longitudinally, by a ſuture, pointed at the tops, and opening on the inſides; the ſeeds are two, oſſeous, ſubgloboſe, with oblique points, and an orbicular hole at the ſide of the apex.

STAPHYLINUS, in botany, a name given by ſome authors to the daucus, or carrot. See the article DAUCUS.

STAPHYLINUS, in zoology, a genus of inſects, the antennæ of which are ſlender and filiform; there are two veſicles, ſituated above the tail; the exterior wings are dimidiated and ſhort, the interior ones are covered by them.

STAPHYLODENDRON, in botany, the name by which Tournefort calls the ſtaphylæa. See STAPHYLÆA.

STAPLE primarily ſignifies a public place or market, whither merchants, *&c.* are obliged to bring their goods to be bought by the people, as the Greve, or the places along the Seine, for ſale of wines and corn, at Paris, whither the merchants of other parts are obliged to bring thoſe commodities.

Formerly the merchants of England were obliged to carry their wool, cloth, lead, and other like ſtaple-commodities of this realm, in order to utter the ſame by wholeſale; and theſe ſtaples were appointed to be conſtantly kept at York, Lincoln, Newcaſtle upon Tyne, Norwich, Weſtminſter, Canterbury, Chicheſter, Wincheſter, Exeter, and Briſtol; in each whereof a public mart was appointed to be kept, and each of them had a court of the mayor of the ſtaple, for deciding differences, held according to the law-merchant, in a ſummary way.

The ſtaple-commodities of this kingdom are ſaid by ſome to be theſe, *viz.* wool, leather, wool-fells, lead, tin, butter, cheeſe, cloth, *&c.* but others allow only the firſt five to be ſtaple-commodities.

Staple ſignifies alſo a city or town, where the merchants jointly agree to carry certain commodities. The principal ſtaples at preſent are Amſterdam, for all goods from the Eaſt-indies, Spain, the Mediterranean, and the Baltic; Fluſhing, for thoſe of the Weſt-indies; Middleburgh, for french wines; Dort, for rheniſh wines and engliſh cloth; Verre, in Zealand, for ſcotch merchandizes, *&c.* The ſtaples in the Levant, are ſuch cities where the Engliſh, French, Dutch, Italians, *&c.* have conſuls, factors, and magazines; and whither they ſend veſſels regularly every year. See FACTORY, FAIR, *&c.*

STAR, *ſtella*, in aſtronomy, a general name for all the heavenly bodies, which,

like ſo many brilliant ſtuds, are diſperſed throughout the whole heavens.

The ſtars are diſtinguiſhed, from the phænomena of their motion, *&c.* into fixed, and erratic or wandering ſtars: theſe laſt are again diſtinguiſhed into the greater luminaries, *viz.* the ſun and moon; the planets, or wandering ſtars, properly ſo called; and the comets; each whereof has been fully conſidered and explained under their reſpective articles SUN, MOON, PLANET, and COMET.

As to the fixed ſtars, or ſimply ſtars, they are ſo called becauſe they ſeem to be fixed, or perfectly at reſt, and conſequently appear always at the ſame diſtance from each other.

Diſtribution and number of the fixed STARS.

An obſerver will firſt divide theſe ſtars into ſeveral claſſes, according to the ſplendor of their light; the brighteſt he will call ſtars of the firſt magnitude; thoſe of the next inferior light, he will call ſtars of the ſecond magnitude; and ſo in order to thoſe which can barely be ſeen by the naked eye, which are called ſtars of the ſixth magnitude: and thoſe which cannot be ſeen but by the help of magnifying glaſſes, are of the ſeventh, eighth, *&c.* magnitudes. Afterwards, to avoid confuſion, and to be able to point out any one ſtar, without being obliged to give a particular name to each, he will divide them into ſeparate parcels, of which he will make a particular plan; and to each of theſe conſtellations, or parcels of ſtars, he will aſſign a figure at pleaſure, as that of a ram, a bull, a dragon, a Hercules, *&c.* but ſo that all the ſtars in each of the parcels, drawn in the plan, may be encloſed in the deſigned figures, and correſpond to the different parts from whence they take their name: for example, having drawn the figure of a bull about a parcel, or conſtellation, of ſtars, that ſtar which falls in the eye, will be called the ſtar in the bull's eye, or ſimply, the bull's eye; another, which reſpects the tip of one horn, will be named the bull's horn; and ſo of others. A parcel of ſtars thus contained in any aſſigned figure, is called a conſtellation. See CONSTELLATION.

By this means, notwithſtanding the ſeeming impoſſibility of numbering the fixed ſtars, their relative ſituations one to another have been ſo carefully obſerved by aſtronomers, that they have not only been able to number them, but even to diſtinguiſh the place of each ſtar in the heavens, and that with greater accuracy than any geographer could ever point out the ſituations of the ſeveral cities or towns upon the ſurface of the earth; and not only the places of thoſe few, if they may be ſo called, which are to be ſeen with the naked eye, have been pointed out and regiſtered by them, but even of thoſe which are diſcovered only by the teleſcope. The moſt antient obſervations of the ſtars, which have reached theſe times, were made by Timocharis and Ariſtillus, about 300 years before Chriſt. The next after them, who made a catalogue of the ſtars viſible to the naked eye, and regiſtered their places, was Hipparchus of Rhodes; he flouriſhed about 120 years before Chriſt, and numbered 1022 ſtars. After him, Ptolemy enlarged his catalogue to 1026: Ulug Beigh, the grand-father of Tamerlane the great, about the year 1437, conſtructed a new catalogue, more exact than that of Ptolemy, containing 1017 ſtars: Tycho, in the year 1600, determined the places of 777 fixed ſtars, and reduced them to a catalogue: Kepler's catalogue contained 1163 ſtars; and that of the prince of Heſſe, 400: Ricciolus enlarged Kepler's catalogue to 1468; and John Bayer, a German, had deſcribed the places of 1725 ſtars: after this, about 1670, Hevelius of Dantzick, compoſed a catalogue of 1888 fixed ſtars: Dr. Halley alſo undertook a voyage to the iſland of St. Helena, in order to take the poſition of the ſtars within the antartic circle, of which he publiſhed a catalogue, containing 373 ſtars: but the largeſt and moſt complete catalogue ever yet publiſhed, is that of our accurate aſtronomer Mr. Flamſteed, in his Celeſtial Hiſtory, which contains near 3000 ſtars; all whoſe places are more exactly determined in the heavens, than the poſition of cities and other places on the earth.

We ought not, however, to imagine, that all the fixed ſtars are thus numbered, and reduced to their reſpective places in the heavens; ſince their number continually increaſes, according to the goodneſs of the teleſcope, appearing millions beyond millions, till, by their immenſe diſtance, they evade the ſight, even tho' aſſiſted by the beſt inſtruments. The teleſcopical ſtars with which Mr. Flamſteed has enriched his catalogue, are only the more remarkable ones, whoſe longitudes and latitudes, or ſituations in the heavens, it was thought worth while to regiſter and put down. Dr. Hook, with

a teleſcope of twelve feet, ſaw 78 ſtars among the pleiades; and with a longer teleſcope, ſtill more: and, in the ſingle conſtellation of orion, which, in Mr. Flamſteed's catalogue, has but 80 ſtars, there have been ſeen 2000. We may, therefore, venture to pronounce the number of fixed ſtars, including the teleſcopic ones as well as thoſe viſible to the naked eye, to be infinitely great, far beyond what it is poſſible for the beſt aſtronomers to calculate, much leſs to reduce to order. But though the ſtars are certainly innumerable, yet thoſe viſible to the naked eye, in one hemiſphere, ſeldom exceed a thouſand; which, perhaps, may appear ſtrange, ſince, at firſt ſight, their number ſeems immenſely great; but this is only a deception of ſight, ariſing from a confuſed and tranſient view; for let a perſon ſingle out a ſmall portion of the heavens, and after ſome attention to the ſituation of the more remarkable ſtars therein, begin to count, he will ſoon be ſurprized to find how few there are therein. However, even the number of ſtars viſible to the naked eye, ſmall as it is in compariſon with that of the teleſcopic ones, is far from being conſtant; ſince, beſides that the different ſtates of the atmoſphere renders many of the leſſer ſtars inviſible, ſome ſtars have been obſerved to appear and diſappear by turns; particularly one in the chair Caſſiopeia, in the year 1572, which, for ſome time, outſhone the biggeſt of the fixed ſtars, and in ſixteen months time, by degrees, vaniſhed quite away, and was never ſeen ſince: in the year 1640, the ſcholars of Kepler ſaw a ſtar in the right leg of ſerpentarius, which likewiſe gradually diſappeared: Fabricius, in the year 1596, gives the firſt account of the ſtella mira, or wonderful ſtar, in the neck of the whale; which has been ſince found to appear and diſappear periodically, its period being ſeven revolutions in ſix years, but is never quite extinguiſhed. Several other new ſtars have been obſerved: as one by Hevelius, in 1670; and another by Mr. Kirch, in 1689. Theſe new ſtars are generally obſerved in the galaxy, or milky way. See GALAXY.

As to the cauſes of this appearing and diſappearing of the fixed ſtars, ſir Iſaac Newton conjectures, that as it is poſſible our ſun may ſometimes receive an addition of fuel by the falling of a comet into it; ſo the ſudden appearance of ſome ſtars, which formerly were not viſible to us, may be owing to the falling of a comet upon them, and occaſioning an uncommon blaze and ſplendor for ſome time: but that ſuch as appear and diſappear periodically, and increaſe by very ſlow degrees, ſeldom exceeding the ſtars of the third magnitude, may be ſuch as having large portions of their ſurfaces obſcured by ſpots, may, by revolving round their axes, like the ſun, expoſe their lighter and darker parts to us ſucceſſively.

Nature and diſtance of the fixed STARS.

From the ſimilitude there appears to be between them and the ſun, it is generally ſuppoſed by philoſophers, that they are not placed in the heavens by way of ornament only, or to ſupply us with a faint light in the abſence of the moon; but that each of them is placed in the midſt of a ſyſtem of planetary worlds, and that it directs their motions, and ſupplies them with light and heat, in the ſame manner that the ſun does the ſeveral bodies of which our ſolar ſyſtem is compoſed; in ſhort, that they are ſo many ſuns, which no doubt have planets moving regularly round them, though inviſible to us. That this is not mere hypotheſis, will appear from the following arguments, drawn from the analogy they bear to our ſun the ſun ſhines by its own native light, and ſo do the fixed ſtars: the ſun, at the diſtance of the fix-ſtars, would appear no larger than a ſtar; none of our planets, at that diſtance, could be ſeen at all: is it not probable, therefore, that each of the fixed ſtars is a fixed ſun, ſurrounded by a ſyſtem of planets and comets, which may be again furniſhed with different numbers of ſatellites, or moons, though inviſible to us? Beſides, as the number of ſtars is immenſely great, diſperſed through ſpaces of the univerſe, far beyond the reach of the beſt teleſcopes, and as God has made nothing in vain, it ſeems highly probable that they ſeverally ſerve the purpoſes of light and heat for the planets of their ſyſtems; ſince nothing can be more abſurd than to pretend that myriads of unſeen ſtars were made to twinkle in the unknown regions of the univerſe.

That the fixed ſtars ſhine by their own light, is thus proved: when viewed thro' a teleſcope, they appear only as mere lucid points, deſtitute of all ſenſible magnitude, and conſequently muſt be at a vaſt diſtance; becauſe the ſatellites of jupiter and ſaturn, when viewed through a teleſcope, appear of very diſtinguiſhable magnitudes,

magnitudes, and yet are invisible to the naked eye. Since, then, the fixed ſtars are at ſuch a vaſt diſtance, that the beſt teleſcope has no power to magnify them, and nevertheleſs ſhine with a very bright and ſparkling light, it is inferred that they muſt ſhine with their own proper and unborrowed light; becauſe, if their light was only borrowed, they would, like the ſatellites already mentioned, be inviſible to the naked eye.

The celebrated Huygens found the brighteſt and largeſt, and conſequently the neareſt of the fixed ſtars, *viz.* ſirius, or the dog-ſtar, to be in appearance 27664 times leſs than the ſun; and ſince the diſtances of objects are greater as their apparent magnitudes are leſſer, the dog-ſtar muſt be diſtant from our earth 2000000000000, or above two millions of millions of engliſh miles; which is ſo very great, that a cannon-ball continuing in the ſame velocity it acquires when immediately diſcharged at the mouth of the cannon, would ſpend almoſt ſeven hundred thouſand years in paſſing thro' it: and it is very probable, that the fixed ſtars are equally diſtant from each other, as the neareſt of them is from our ſun; ſince, the better the teleſcopes we make uſe of, the more ſtars are ſeen. Hence it is very natural to conclude, that all the fixed ſtars are not placed at equal diſtances from us: but that they are every where interſperſed, at great diſtances beyond one another, throughout the univerſe; and that, probably, the different appearances which they make, in point of ſplendor and magnitude, may be rather owing to their various diſtances from us, than to any real difference in their magnitudes.

From what has been ſaid, concerning the number, nature, and diſtance of the fixed ſtars, the hypotheſis of a plurality of worlds, wherein each fixed ſtar ſerves as a ſun to a ſyſtem of planets, ſeems rational, worthy a philoſopher, and greatly diſplays the wiſdom, and redounds to the glory, of the great creator and governor of the univerſe.

Apparent motions of the fixed STARS. Since the fixed ſtars remain immoveable, whatever is ſaid of their motions, muſt be underſtood of their apparent motions only; and of theſe aſtronomers reckon four kinds.

I. The firſt, and indeed the moſt obvious, apparent motion of the ſtars, is that from eaſt to weſt; which, being entirely owing to the diurnal rotation of the earth round its axis, has been already explained under the articles EARTH and DIURNAL.

II. The ſecond apparent motion of the fixed ſtars, ariſing from the preceſſion of the equinoxes, is very ſmall, not exceeding 50″ in a year, or 1° in 70 years; and, therefore, to complete one revolution of a circle, it requires no leſs than 25920 years, after which period the ſtars all return to their former places: this motion has alſo been accounted for, under PRECESSION and PLATONIC YEAR.

III. The third apparent motion of the ſtars, is owing to what is called the aberration of light; the diſcovery of which we owe to our excellent aſtronomer Dr. Bradley, who, being deſirous to diſcover the parallax of the earth's annual orbit, cauſed an inſtrument to be made by the late accurate Mr. Graham; and found, by many obſervations, that the bright ſtar, γ, in the head of the conſtellation draco, appeared 39″ more northerly in September than in March; juſt the reverſe of what it ought to appear, by the annual parallax of the ſtars. This unexpected phænomenon perplexed the Doctor and Mr. Molyneux very much; and Mr. Molyneux died before the true cauſe of it was diſcovered. Afterwards, Dr. Bradley, with another inſtrument, more exact, and accurately adapted to this purpoſe, obſerved the ſame appearances, not only in that, but many other ſtars; and being fully ſatisfied, by many repeated trials; that the phænomenon was neither owing to any error in the inſtrument nor obſervation, applied himſelf to conſider what might be the true cauſe of it; and after many reflections and hypotheſes, which he ſtill found inſufficient, he at laſt diſcovered that it was really owing to the progreſſive motion of light, and the ſenſible proportion which the velocity thereof bore to the velocity of the annual motion of the earth.

This important diſcovery we ſhall now proceed to explain; and firſt, it is a known fact, by the obſervation of jupiter's ſatellites, that the light whereby objects become viſible to us, employs a ſenſible time in coming from the object to the eye, when at a great diſtance from each other: this we have proved under the article LIGHT; where it is ſhewn, that a ray is about 8′ in coming from the ſun to the earth.

It is alſo certain, that the viſibility of objects

Fig. 2. SURMOUNTED.

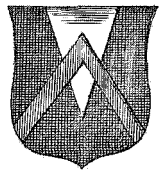

Fig. 1. Aberration of the STARS.

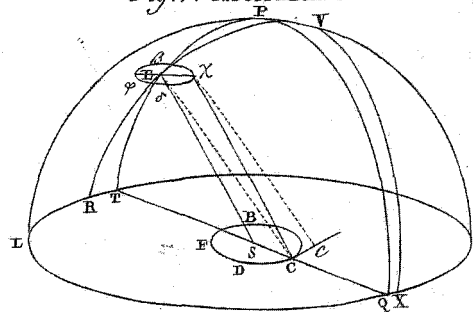

Fig. 3. STAR-FISH.

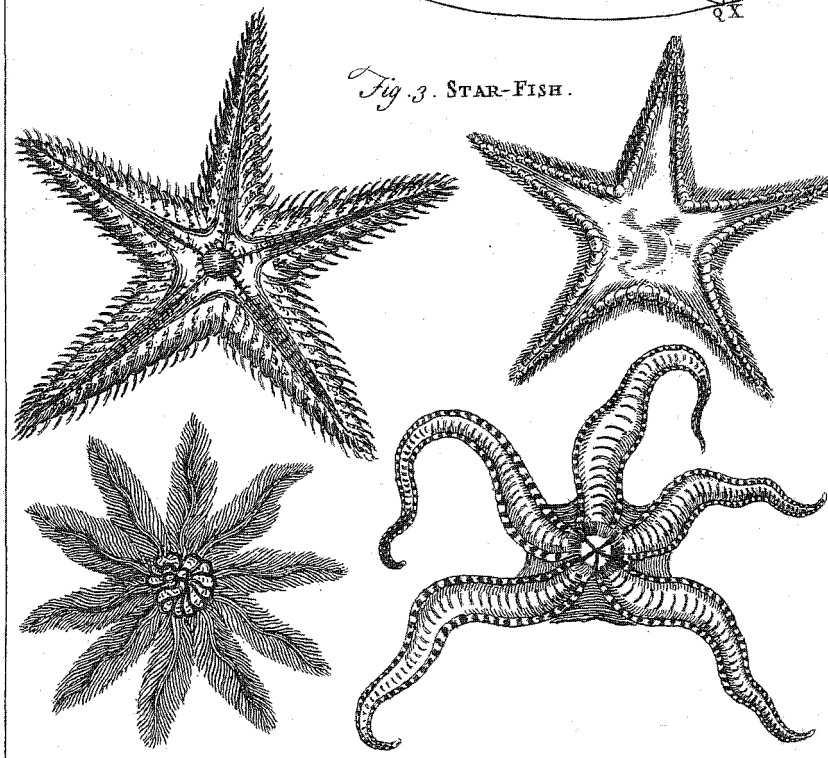

Fig. 4. STAR-STONES.

T. Jefferys sculp.

objects depends on the impreſſion made on the eye by the luminous rays they tranſmit; alſo the figure and poſition of objects are judged of according to this impreſſion, and therefore thought to be in the right line in whoſe direction they fall upon the eye. Hence, if the rays of light tranſmitted from objects arrive at the eye after having been reflected, refracted, or, by any phyſical accident, turned from their firſt courſe, the objects are however, judged to be in the direction of thoſe rays which enter the eye, and not in that of the rays immediately iſſuing from the object.

Now if the earth had no annual motion, a ray of light paſſing from a ſtar with any finite velocity, and arriving at the eye without being turned off by any phyſical cauſe, would ſhew the ſtar in its true ſituation, whatſoever time that ray might employ in coming from the ſtar to the eye: and the ſame would happen though the earth was moveable, provided the velocity of light was infinite; for then the earth's motion would be inconſiderable, when compared with a velocity infinitely great. But when the velocity of light has a finite proportion to that of the earth, the impreſſion of the ray on the eye is neither in the direction of the ray firſt tranſmitted, nor in that of the earth; but, like a body urged by two forces in different directions, the impreſſion is made in the diagonal of a parallelogram, formed by the directions of the ray, and a tangent to the earth's orbit at the point where the earth is when the ray falls on it, becauſe the ſides of this parallelogram are proportional to the velocities or ſpaces run through by the earth and ray, in the ſame time. So that the ſtar's apparent place will be at the end of that diagonal, which falls on one ſide of the ſtar's true place.

For example, let T L Q I (plate CCLX. fig. 1.) be an indefinitely great circle, repreſenting the ecliptic, with the ſun at its center S; P its pole, C B F D the earth's orbit, Q P E T a circle of latitude paſſing through any ſtar E, determining the longitude in T and latitude in T E. Let T Q be the interſection of the plane of this circle of latitude, with the plane of the ecliptic; and let the earth's place be firſt in C, when the ſtar is in conjunction with the ſun: then having joined C E, and drawn the tangent C c, which is perpendicular to the plane of the circle of latitude T P Q; C E is to C c, as the velocity of the ray of light is to the velocity of the earth in its orbit. Now it being known, that light is a little more than 8′ of time in paſſing from the ſun to the earth; alſo that the earth deſcribes in its orbit an arc of 20″ in that time, we have R: tang. 20″ :: C E = 8′ 13″: C c. Wherefore C c being thus determined, and the parallelogram E C c χ conſtructed, the point is the place in the heavens where the impreſſion of the light will occaſion the ſtar to appear; and the celeſtial arc, E χ, is called the ſtar's aberration.

From a like conſtruction made for every point of the earth's orbit, it follows, 1. That, ſuppoſing this orbit to be circular, and the velocities of light and the earth uniform, then all the apparent places of the ſame ſtar muſt be in a circle, with the ſtar's true place at its center, and whoſe plane is parallel to the ecliptic; conſequently, the projection of this circle in the heavens is an ellipſis, whoſe greater axis is parallel to the plane of the ecliptic, its leſſer axis perpendicular to that plane, and are in proportion as the radius to the ſine of the ſtar's latitude: and according to the niceſt obſervations, the greater axis of the ellipſis of aberration ſubtends in the heavens an arc of 40″ of a great circle. 2. The plane of a ſtar's parallelogram of aberration changes its ſituation every inſtant; being determined by the ſtar, and by the poſition of a tangent to every ſucceſſive place of the earth in its orbit: it muſt therefore make a revolution in a year; and becauſe of the almoſt infinite diſtance of the ſtars from the ſun and the earth, the earth's orbit may be taken only as the point S, and the plane of the angle of aberration may be ſuppoſed to turn in the right line E S, drawn from the ſtar to the ſun, in the ſame manner as the earth moves about the ſun. 3. The ſtar's apparent motion in this ellipſis, muſt differ from that in the epicycle; for when the plane of the parallelogram of aberration is become perpendicular to the plane T P Q of the circle of latitude, which happens in the ſyzygy, becauſe the tangent C c is then perpendicular to that plane, the angle of aberration is not in the plane T P Q, nor is there then any aberration in latitude but this angle is meaſured by the right line, E χ, parallel to the ecliptic, and perpendicular to the plane T P Q, being half the

greater

greater axis of the ellipſis; and is therefore the arc of a ſmall circle, parallel to the ecliptic, and paſſing through the ſtar's true place; the whole aberration being then in longitude, and at its greateſt. But when the plane of the angle of aberration co-incides with the plane T P Q, which happens when the earth has run through 90° from the ſyzygy, and conſequently where the ſtar is in quadrature with the ſun, the angle of aberration is wholly in latitude; and the ſtar being at the extremity of the leſſer axis of its ellipſe, the aberration in latitude is there greateſt, and nothing in longitude. In other poſitions of the plane of this angle, the aberration is divided partly in longitude, and partly in latitude, much like a force oblique to a plane; all which is juſt the reverſe of what it ſhould be, by the parallax of the annual orbit; ſince, according to it, the parallax in longitude is greateſt in the quadratures, and nothing in the ſyzygies; and the parallax in latitude is greateſt in the ſyzygies, and nothing in the quadratures. Moreover, if a circle of declination, R V X, be conceived to paſs through the ſtar E, conſequently croſſing its ellipſis of aberration by paſſing through the center; it is evident, that, when a ſtar appears at the points where that circle interſects the ellipſis, it will appear to have no aberration in right aſcenſion, becauſe its true and apparent place will be in the ſame circle of declination and when the ſtar is in the points where its ellipſis is cut by a diameter perpendicular to the circle R V X, it will have no aberration in declination, becauſe its true and apparent place will be in the ſame parallel to the equator. But all circles of declination being oblique to the ecliptic, except the ſolſtitial colure, the ſtar does not paſs from the term of no aberration in right aſcenſion, to that of no aberration in declination, in the time the earth takes to deſcribe 90° of its orbit; conſequently, when the aberration is greateſt in right aſcenſion, it is not abſolutely nothing in declination, and reciprocally.

Laſtly, to calculate the effect of the aberration of light on the planets, ſay; as the horary motion of the ſun multiplied by the radius of the annual orbit of the earth, is to the diſtance of the earth from the planet multiplied by 20″; ſo is the horary motion of the planet, in longitude, in latitude, in right aſcenſion, or in declination, to a quantity whereby the aberration of light has diminiſhed this longitude, this latitude, this right aſcenſion, or this declination. The demonſtration of this analogy may be found in the Memoirs of the Academy of Sciences at Paris, for the year 1746; and thoſe who deſire farther information on this ſubject, may conſult the ſaid Memoirs for 1737, the Philoſ. Tranſ. n° 485, and La Caille's Elem. Aſtron. §. 177, ſeq.

IV. The fourth apparent motion of the fixed ſtars is that ariſing from the nutation of the earth's axis; a diſcovery we alſo owe to doctor Bradley, who obſerved a greater declination in ſome of the fixed ſtars, lying nearly oppoſite in right aſcenſion, than the preceſſion of the equinoctial points would have occaſioned, and ſuch as a nutation or libratory motion of the earth's axis would effect. The quantity of this nutation, as collected from the doctor's obſervations, is 18″; which is equal to the diameter of the little circle, wherein the pole of the equator moves: but for the application of this theory to the practice of aſtronomy, in ſolving the various phænomena of the fixed ſtars, we muſt refer to the above-mentioned books; and ſhall only obſerve, that the corrections ariſing from the aberrations of light, as well as from the nutation of the earth's axis, muſt not be neglected in aſtronomical obſervations, ſince ſuch neglects may produce errors of near a minute in the polar diſtances of ſome ſtars. As to the cauſes of the nutation of the earth's axis, the doctor thinks ſome part of it at leaſt, if not the whole, is owing to the moon's action upon the equatorial parts of the earth; which, he conceived, might cauſe a libratory motion of the earth's axis. But as he was unable to judge, from only nine years obſervation, whether the axis would entirely recover the ſame poſition that it had in the year 1727, he found it neceſſary to continue his obſervations through a whole period of the moon's nodes; at the end of which he had the ſatisfaction to ſee, that the ſtars returned into the ſame poſitions again, as if there had been no alteration at all in the inclination of the earth's axis: which fully convinced him that he had gueſſed rightly as to the cauſe of the phænomenon. This circumſtance proves likewiſe,

likewiſe, that if there be a gradual diminution of the obliquity of the ecliptic, it does not ariſe only from an alteration in the poſition of the earth's axis, but rather from ſome change in the plane of the ecliptic itſelf: becauſe the ſtars, at the end of the period of the moon's nodes, appeared in the ſame places, with reſpect to the equator, as they ought to have done, if the earth's axis had retained the ſame inclination to an invariable plane.

Falling STARS, *ſtellæ cadentes*, in meteorology, fiery meteors, which dart thro' the ſky, in form of a ſtar; being occaſioned by a nitro-ſulphureous matter, the common cauſe of all ſuch meteors. See the article AURORA BOREALIS.

STAR, in heraldry, a charge frequently borne on the ſhield, and the honourable ordinaries, in figure of a ſtar; which differs only from the mullet, in not being pierced as this laſt is. See MULLET.

STAR is alſo a badge of honour, worn by the knights of the garter, bath, and thiſtle. See the article GARTER.

STAR, in pyrotechny, a compoſition of combuſtible matters, which, being thrown aloft in the air, exhibits the appearance of a real ſtar.

Stars are chiefly uſed as appendages to rockets, a number of them being uſually incloſed in a conical cap or cover, at the head of the rocket, and carried up with it to its utmoſt altitude, where the ſtars, taking fire, are ſpread around, and exhibit an agreeable ſpectacle. See the article ROCKET.

To make ſtars, mix three pounds of ſaltpetre, eleven ounces of ſulphur, one of antimony, and three of gun-powder duſt: or twelve ounces of ſulphur, ſix of ſaltpetre, five and a half of gun-powder duſt, four ounces of olibanum, one of maſtic, camphire, ſublimate of mercury, and half a one of antimony and orpiment. Moiſten the maſs with gum water, and make it into little balls of the ſize of a cheſnut, which dry either in the ſun or the oven. Theſe, ſet on fire in the air, will repreſent ſtars.

STAR-APPLE, *chryſophyllum*, in botany. See the article CHRYSOPHYLLUM.

STAR *of Bethlehem, ornithogalum*, in botany. See the article ORNITHOGALUM.

STAR-BOARD, in the ſea-language, denotes the right-hand ſide of a ſhip: thus they ſay, ſtar-board the helm, or helm a ſtar-board, when he that conds would have the men at the helm, or ſteering-wheel, put the helm to the right-ſide of the ſhip.

STAR-CHAMBER, a chamber at Weſtminſter, ſo called from having its roof painted with gilt ſtars, wherein the chancellor, aſſiſted by others, appointed for that purpoſe, formerly had authority to puniſh routs, riots, and other miſdemeanors, that were not by the common law provided againſt. See CHAMBER.

STAR-FISH, *aſterias*, or *ſtella marina*, in zoology, a genus of naked inſects, in the form of a radiated ſtar: the mouth is ſituated in the center, on the under part; and the anus in the center, on the upper part: the tentacula are extremely numerous, and in a manner cover, either the whole upper ſurface of the body, or the extremities of the ramifications.

The ſpecies of this genus, being very numerous, are diſtinguiſhed according to the number of their rays; they are alſo of different ſizes; the largeſt, or great magellanic ſtar-fiſh, forming a circle of three feet in diameter, when its rays are fully extended, others not exceeding an inch in diameter. See plate CCLX. fig. 3. where four of the leſſer ones are repreſented.

STAR-FORT, or REDOUBT, in fortification. See the articles FORT and REDOUBT.

STAR-GAZER, in ichthyology, the engliſh name of the uranoſcopus. See the article URANOSCOPUS.

STAR-SHOT, a gelatinous ſubſtance frequently found in fields, and ſuppoſed by the vulgar, to have been produced from the meteor, called a falling ſtar: but, in reality, is the half digeſted food of herons, ſea-mews, and the like birds; for theſe birds, when ſhot, have been found when dying, to diſgorge a ſubſtance of the ſame kind.

STAR-STONE, *aſteria*, in natural hiſtory, a name given to certain extraneous foſſile ſtones, in form of ſhort, and commonly ſomewhat crooked, columns, compoſed of ſeveral joints; each reſembling the figure of a radiated ſtar, with a greater or ſmaller number of rays in the different ſpecies: they are uſually found of about an inch in length, and of the thickneſs of a gooſe-quill. Some of them have five angles, or rays, and others only four, and in ſome the angles are equi-diſtant, while in others they are irregularly ſo; in ſome alſo they are ſhort and blunt, while in others they are long, narrow, and pointed; and ſome have

their angles ſo very ſhort and obtuſe, that at firſt ſight they might be taken for entrochoaſteriæ. The ſeveral joints in the ſame ſpecimen are uſually all of the ſame thickneſs; this however is not always theſe caſe, but in ſome they are larger at one end, and in others at the middle, than in any other part of the body; and ſome ſpecies have one of the rays bifid, ſo as to emulate the appearance of a ſix-rayed kind. See plate CCLX. fig. 4. where ſeveral ſorts of them are repreſented.

STAR-THISTLE, the engliſh name of a ſpecies of centauria, called by ſome calcitrapa. See CENTAURIA.

STAR-WORT, *after*, in botany. See ASTER.

STARCH, a fecula, or ſediment, found at the bottom of veſſels wherein wheat has been ſteeped in water, of which fecula, after ſeparating the bran from it, by paſſing it through ſieves, they form a kind of loaves, which being dried in the ſun or an oven, is afterwards cut into little pieces, and ſo ſold. The beſt ſtarch is white, ſoft, and friable, and eaſily broken into powder. Such as require fine ſtarch do not content themſelves, like the ſtarch-men, with refuſe wheat, but uſe the fineſt grain. The proceſs is as follows: The grain being well cleaned is put to ferment in veſſels full of water, which they expoſe to the ſun while in its greateſt heat, changing the water twice a day, for the ſpace of eight or twelve days, according to the ſeaſon. When the grain burſts eaſily under the finger, they judge it ſufficiently fermented. The fermentation perfected, and the grain thus ſoftened, it is put, handful by handful, into a canvas-bag, to ſeparate the flour from the huſks, which is done by rubbing and beating it on a plank laid acroſs the mouth of an empty veſſel that is to receive the flour.

As the veſſels are filled with this liquid flour, there is ſeen ſwiming at top rediſh water, which is to be carefully ſcummed off from time to time, and clean water is to be put in its place, which, after ſtirring the whole together, is alſo to be ſtrained through a cloth or ſieve, and what is left behind put into the veſſel with new water, and expoſed to the ſun for ſome time. As the ſediment thickens at the bottom, they drain off the water four or five times, by inclining the veſſel, but without paſſing it through the ſieve. What remains at bottom is the ſtarch, which they cut in pieces to get out, and leave it to dry in the ſun. When dry it is laid up for uſe.

To uſe ſtarch, they take as much as is needed, and ſteep it in water over night, changing the water four or five times. The ſtarchmen uſing the refuſe of wheat, only obſerve a part of theſe things in their proceſs, but their ſtarch falls far ſhort of this. Starch is uſed along with ſmalt, or blue ſtone, to ſtiffen and clear linnen; the powder thereof is alſo uſed to whiten and powder the hair. It is alſo uſed by the dyers to diſpoſe their ſtuffs to take colours the better.

Starch, the hundred weight, pays, on importation, three pounds, fifteen ſhillings, and four pence; and foreign ſtarch draws back nothing upon exportation. By the 23d. Geo. II. Starch may not be imported in any package that ſhall not contain two hundred and twenty-four pounds of neat ſtarch, at the leaſt, under penalty of forfeiting the goods, and the maſter, or other perſon, taking charge of the veſſel, to forfeit fifty pounds.

STARGARD, a town of Germany, in the circle of upper-Saxony, and dutchy of Pomerania, ſituated twenty miles eaſt of Stetin.

STARIA, a city of Ruſſia, in the province of great Novogorod, ſituated at the ſouth end of the Ilmen-lake: eaſt long. 34° 20′, north lat. 58°.

STARLING, *ſturnus*, in ornithology, a diſtinct genus of birds of the order of the paſſeres, the characters of which are theſe: the beak is of a ſubulated figure, and depreſſed in an angulated manner, and obtuſe at the extremity; the tongue is marginated and acute.

Of this genus there is only one known ſpecies; *viz.* the common ſtarling, much about the ſize of the black-bird, only that it ſtands more erect, and the body is ſlenderer. Its general colour is black, variegated with grey ſpots, and the tips of the feathers of the neck and back are yellowiſh: the principal feathers of the wings and tail are brown, and have ſome yellow at their edges. The ſtarling is frequent with us, and may be taught to imitate the human voice. See plate CCLXII. fig. 1. where n° 1. repreſents the cock, and n° 2. the hen.

STARTING, in the manege. A horſe is ſaid to be ſtarting, ſkittiſh, or timorous, that takes every object he ſees to be

be otherwiſe than it is; whence he frequently ſtops, flies out, and ſtarts ſuddenly to one ſide, inſomuch that the rider cannot make him go forwards. This fault is more common to geldings than ſtone-horſes, and theſe are moſt ſubject to it who have bad eyes, as well as thoſe that have been kept long in a ſtable without airing: but theſe laſt are eaſily cured of it. You ſhould never beat a ſtarting horſe in his conſternation, but get him to advance gently, and by fair means, to the object that alarms him.

START-POINT, a cape, or promontory, of Devonſhire, in the Engliſh channel, twelve miles ſouth of Dartmouth.

STATE, or ESTATE, an empire, kingdom, province, or extent of country under the ſame government. See the article ESTATE.

STATEN-ISLAND, an iſland of the province of New-York, in north-America, ſituated near the mouth of Hudſon's river, in weſt long. 72° 31′, north lat. 41°.

STATERA-ROMANA, or STEEL-YARD, a name given to the roman ballance. See the article BALLANCE.

STATES, or ESTATES, a term applied to ſeveral orders or claſſes of people aſſembled to conſult of matters for the public good. See ESTATE.

Thus ſtates-general is the name of an aſſembly conſiſting of the deputies of the ſeven united provinces; theſe are uſually thirty in number, ſome provinces ſending two, others more, and whatever reſolution the ſtates-general take, muſt be confirmed by every province, and by every city and republic in that province, before it has the force of a law. The deputies of each province, of what number ſoever they be, have only one voice, and are eſteemed as but perſon, the votes being given by provinces. Each province preſides in the aſſembly in its turn, according to the order ſettled among them. Guelderland preſides firſt, then Holland, &c. See STADTHOLDER.

States of Holland are the deputies of eighteen cities, and one repreſentative of the nobility, conſtituting the ſtates of the province of Holland: the other provinces have likewiſe their ſtates, repreſenting their ſovereignty, deputies from which make what they call the ſtates-general. In an aſſembly of the ſtates of a particular province, one diſſenting voice prevents their coming to any reſolution.

STATHOLDER. See STADTHOLDER.

STATICE, THRIFT, or COMMON SEA-LAVENDAR, in botany, a genus of the *pentandria-pentagynia* claſs of plants, the corolla whereof is infundibuliform, conſiſting of five petals, narrow at bottom, and broad, patent, and obtuſe at the top: there is no pericarpium: the cup becomes conſtringed about the neck, and its limb is expanded: and in this ſtate it retains the ſeed, which is ſingle, very ſmall, and roundiſh.

STATICS, that branch of mathematics which conſiders the motion of bodies ariſing from gravity. See MOTION.

Statics then is the doctrine, or theory, of motion, conſidered merely as ariſing from the weight of bodies; in which ſenſe it is diſtinguiſhed from mechanics, which is the application of ſtatics to machines, engines, &c. though, it muſt be owned, that ſtatics and mechanics are frequently confounded. See the article MECHANICS.

For the laws and principles whereon the doctrine of ſtatics is founded, ſee the articles GRAVITY, GRAVITATION, DESCENT, &c.

STATICS, *ſtatici*, in medicine, a kind of epileptics, or perſons ſeized with an epileptic fit; during which they contemplate ſome ſtrong and lively idea, whereby they are diſtinguiſhed from cataleptics, or perſons ſeized with a catalepſy. See CATALEPSY and EPILEPSY.

STATION, in geometry, ſurveying, &c. a place pitched upon to make an obſervation, take an angle, or the like. See OBSERVATION, SURVEYING, &c.

STATION, in the church of Rome, denotes certain churches where indulgences are to be had on certain days: thus we find in their calendar, Monday in Rogation week, ſtation at S. Maria Maggiore's; Tueſday, ſtation at St. John Lateran's, and S. Maria Novella's; and Wedneſday, ſtation at St. Peter's: and after the ſame manner, at other ſeaſons of the year.

STATION is alſo uſed, in the ſame church, for the ceremony of the prieſt's, or canon's, going out of the choir to ſing an anthem before the crucifix, or the image of our lady.

STATIONARY, in aſtronomy, ſignifies the appearance of a planet, when it ſeems to remain immoveable on the ſame point of the zodiac for ſeveral days.

As the earth, whence we view the motions of the planets, is out of the center of their orbits, the planets appear to proceed irregularly; being ſometimes ſeen to go forwards, that is, from weſt to eaſt, which is called the direction; ſometimes to go backwards, or from eaſt to weſt, which is called the retrogradation.

Now between theſe two ſtates there muſt be an intermediate one, wherein the planet neither appears to go backwards nor forwards, but to ſtand ſtill, and keep the ſame place in her orbit; which is called her ſtation: and this will happen, when the line that joins the earth's and planet's center is conſtantly directed to the ſame point in the heavens; that is, when it keeps parallel to itſelf. For all right lines, drawn from any part of the earth's orbit, parallel to one another, do all point to the ſame ſtar; the diſtance of theſe lines being inſenſible, in compariſon of that of the fixed ſtars.

Saturn is ſeen ſtationary at the diſtance of ſomewhat more than a quadrant from the ſun; jupiter at the diſtance of fifty-two degrees; and mars at a much greater diſtance.

Saturn is ſtationary eight days, jupiter four, mars two, venus one and an half, and mercury an half, though the ſeveral ſtations are not always equal.

STATIONARY-DAYS, in church-hiſtory, an appellation given to the weekly faſt-days, *viz.* Wedneſdays and Fridays; otherwiſe called half-faſts, and faſts of the fourth and ſixth days of the week. See the article FAST.

Theſe faſts are certainly as antient as Clemens Alexandrinus and Tertullian, who both mention them; and the reaſon of their inſtitution is, becauſe on the fourth day of the week the Jews took council to put our Saviour to death, which was actually accompliſhed on the ſixth: however, being in continual uſe throughout the year, they were not kept with ſuch rigour and ſtrictneſs as Lent. See the article LENT.

STATIONARY FEVER, a peculiar kind of fever, adapted, and owing, to ſome general conſtitution of the air and ſeaſons. Sydenham obſerves, that there are certain general conſtitutions of years, which owe their origin neither to heat, cold, dryneſs, nor moiſture, but rather depend upon a certain ſecret and inexplicable alteration in the bowels of the earth, whence the air becomes impregnated with ſuch kinds of effluvia as ſubject the human body to peculiar diſtempers, ſo long as that kind of conſtitution prevails, which after a certain courſe of years declines, and gives way to another. Each of theſe general conſtitutions is attended with its own proper and peculiar kind of fever, which never appears in any other; and this is thence called a ſtationary-fever. See FEVER.

STATIVA, among the Romans, a ſtanding-camp kept for the defence of the frontiers of the empire. Theſe camps gave riſe to a great many towns, which took their names from the legion ſtationed there.

STATUARY, *ſtatuaria*, a branch of ſculpture, employed in the making of ſtatues. See SCULPTURE and the next article.

Statuary is one of thoſe arts wherein the antients ſurpaſſed the moderns; and indeed it was much more popular, and more cultivated among the former than the latter. It is diſputed between ſtatuary and painting, which of the two is the moſt difficult and the moſt artful. Statuary is alſo uſed for the artificer who makes ſtatues. Phidias was the greateſt ſtatuary among the antients, and Michael Angelo among the moderns.

STATUE, *ſtatua*, is defined to be a piece of ſculpture in full relievo, repreſenting a human figure. Daviler more ſcientifically defines ſtatue a repreſentation, in high relievo and inſulate, of ſome perſon diſtinguiſhed by his birth, merit, or great actions, placed as an ornament in a fine building, or expoſed in a public place, to preſerve the memory of his worth. In ſtrictneſs, the term ſtatue is only applied to figures on foot, the word being formed from *ſtatura*, the ſize of the body.

Statues are formed with the chiſſel of ſeveral matters, as ſtone, marble, plaſter, *&c.* They are alſo caſt of various kinds of metal, particularly gold, ſilver, braſs, and lead. For the method of caſting ſtatues, ſee the article FOUNDERY *of ſtatues*.

Statues are uſually diſtinguiſhed into four general kinds: the firſt are thoſe leſs than the life, of which kind we have ſeveral ſtatues of great men, of kings, and of gods themſelves; the ſecond are thoſe equal to the life, in which manner it was that the antients, at the public expence, uſed to make ſtatues of perſons eminent

for

for virtue, learning, or the ſervices they had done: the third, thoſe that exceed the life, among which, thoſe which ſurpaſſed the life once and a half, were for kings and emperors, and thoſe double the life, for heroes: the fourth kind were thoſe that exceeded the life twice, thrice, and even more, and were called coloſſuſes. See COLOSSUS.

Every ſtatue, reſembling the perſon it is intended to repreſent, is called *ſtatua iconica*. Statues acquire various other denominations. 1. Thus allegorical ſtatue, is that which, under a human figure, or other ſymbol, repreſents ſomething of another kind, as a part of the earth, a ſeaſon, age, element, temperament, hour, *&c.* 2. Curule ſtatues, are thoſe which are repreſented in chariots drawn by bigæ, or quadrigæ, that is, by two, or four horſes; of which kind there were ſeveral in the circuſes, hippodromes, *&c.* or in cars, as we ſee ſome, with triumphal arches, on antique medals. 3. Equeſtrian ſtatue, that which repreſents ſome illuſtrious perſon on horſe-back, as that famous one of Marcus Aurelius, at Rome; that of king Charles the firſt, at Charing-Croſs; King George the ſecond, in Leiceſter-Square, *&c.* 4. Greek ſtatue, denotes a figure that is naked and antique; it being in this manner the Greeks repreſented their deities, athletæ of the olympic games, and heroes: the ſtatues of heroes were particularly called achillean ſtatues, by reaſon of the great number of figures of that prince in moſt of the cities of Greece. 5. Hydraulic ſtatue, is any figure placed as an ornament of a fountain or grotto, or that does the office of a jet d'eau, a cock, ſpout, or the like, by any of its parts, or by any attribute it holds; the like is to be underſtood of any animal ſerving for the ſame uſe. 6 Pedeſtrian ſtatue, a ſtatue ſtanding on foot; as that of king Charles the ſecond, in the Royal-Exchange; and of king James the ſecond, in the Privy Gardens. 7. Roman ſtatue, is an appellation given to ſuch as are cloathed, and which receive various names from their various dreſſes. Thoſe of emperors, with long gowns over their armour, were called *ſtatuæ paludatæ*: thoſe of captains and cavaliers, with coats of arms, *thoracatæ*: thoſe of ſoldiers, with cuiraſſes, *loricatæ*: thoſe of ſenators and augurs, *trabeatæ*: thoſe of magiſtrates, with long robes, *togatæ*: thoſe of the people, with a plain tunica, *tunicatæ*; and, laſtly, thoſe of women, with long trains, *ſtolatæ*.

The Romans had another diviſion of ſtatues into divine, which were thoſe conſecrated to the gods, as Jupiter, Mars Apollo, *&c.* Heroes, which were thoſe of the demi gods, as Hercules, *&c.* and Auguſti, which were thoſe of the emperors, as thoſe two of Cæſar and Auguſtus, under the portico of the capitol.

In repairing a ſtatue caſt in a mould, they touch it up with a chiſſel, graver, or other inſtrument, to finiſh the places which have not come well off: they alſo clear off the barb, and what is redundant in the joints and projectures.

STATURE, the ſize or height of a man.

STATUTE, *ſtatutum*, in its general ſenſe, ſignifies a law, ordinance, decree, *&c.* See LAW, *&c.*

Statute, in our laws and cuſtoms, more immediately ſignifies an act of parliament made by the three eſtates of the realm: and ſuch ſtatutes are either general, of which the courts at Weſtminſter muſt take notice, without pleading them; or they are ſpecial and private, which laſt muſt be pleaded. It is held, that a public ſtatute, made in affirmation of the common law, extends to all times after the making thereof, although it mentions only a remedy for the preſent: and where a thing is given or granted by ſtatute, all neceſſary incidents are at the ſame time granted with it. The moſt natural expoſition of a ſtatute is, to conſtrue one part by another of the ſame ſtatute, becauſe that beſt expreſſes the intent of the makers: alſo, ſtatutes, in general, ought to be expounded in ſuppreſſion of the miſchief, and for the advancement of the remedy deſigned by any ſtatute, yet ſo that no innocent perſon may ſuffer or receive any damage thereby. It is held, that ſtatutes will continue in force though the records of them are deſtroyed, *&c.* But if a ſtatute be againſt reaſon, or impoſſible to be performed, the ſame is void of courſe.

STATUTE is alſo uſed for a ſhort inſtrument in writing, termed ſtatute-merchant, or ſtatute-ſtaple, which are in the nature of bonds, and called by the name ſtatutes, on account of their being made purſuant to the forms preſcribed by certain ſtatutes, whereby it is directed, before what perſons, and how they are to be made. Statute-merchant is defined to be a bond acknowledged before one of the clerks of the ſtatutes-merchant of the city of London,

London, or two merchants aſſigned for that purpoſe, or before the mayor, or chief magiſtrate of other cities or corporations, or other ſufficient perſons, for that end appointed, ſealed with the ſeal of the debtor and the king, upon condition that if the obligor pay not the debt at the day, execution may be awarded againſt his body, lands, and goods; in which caſe the recogniſee, or obligee, ſhall hold the land to him, his heirs, and aſſigns, until ſuch time as the debt is levied; and a perſon who is in poſſeſſion of land, on ſuch a ſtatute, is called tenant, by ſtatute-merchant.

Statutes-ſtaple particularly concern merchants of the ſtaple, are of the ſame nature with ſtatutes-merchant, and are for debts acknowledged before the mayor of the ſtaple in our chief cities, *&c.* in the preſence of one or more of the conſtables of the ſtaple, by virtue of which the creditor, on non-payment of his money when due, has the ſame remedy againſt his debtor as is to be had upon a ſtatute-merchant. See STAPLE.

At firſt ſtatutes-merchant were contrived for the benefit of merchants only, to provide a ſpeedy remedy for recovering their debts; but now they are uſed by others, and are become one of the common ſecurities of the kingdom. And a ſtatute acknowledged on lands ſhall be ſatisfied before an obligation, the debt due whereon being but a choſe in action, and recoverable by law; as is a debt upon a ſtatute, or recogniſance, in which caſe execution may be taken out immediately without further ſuit; though ſtatutes-ſtaple, and likewiſe ſtatutes-merchant, are required to be entered within ſix months, or they ſhall not be good againſt purchaſers.

STATUTE-SESSIONS is taken for a meeting of conſtables and houſeholders in ſome hundreds, by cuſtom, for the debating of differences between maſters and ſervants, the rating of ſervants wages, and beſtowing perſons in ſervice, *&c.*

STATUTO-MERCATORIO, a writ which lies for the impriſoning of a debtor, on the forfeiture of his ſtatute-merchant-bond, until ſuch time as the debt be ſatisfied.

STATUTO-STAPULÆ, is a writ that lies for the taking of the body of a debtor on a ſtatute-ſtaple-bond, and for ſeizing the lands and goods of him that has forfeited ſuch bond.

STAVANGER, a port-town of Norway, in the province of Bergen, capital of the territory Stavanger, ſituated on a peninſula in the German-ocean: eaſt long. 6° 30′, north lat. 59° 30′.

STAVEREN, a port-town of the united Netherlands, in the province of weſt-Frieſland, ſituated on the Zuyder-ſea: eaſt long. 5° 12′, north lat. 53°.

STAVERS, or STAGGERS, among farriers, a giddineſs in a horſe's head, which ends in madneſs. This diſeaſe is frequently occaſioned by turning out a horſe to graſs too ſoon, before well cold, where, by hanging down his head to feed, bad vapours and humours are generated, which oppreſſing the brain, are the proximate cauſe of this diſeaſe. Sometimes it comes by over exerciſe in hot weather, which inflames the blood, *&c.* and ſometimes by noiſome ſmells in the ſtable, exceſſive eating, *&c.* The ſigns of it are dimneſs of ſight, reeling and ſtaggering, watery eyes, *&c.* At length, for perfect pain, he beats his head againſt the wall, thruſts it into the litter, riſes and lies down with fury, *&c.* For the cure of this diſtemper there are various preſcriptions, one of which is, firſt to bleed the horſe, then to diſſolve the quantity of a hazel-nut of ſweet butter in a ſaucer full of wine; then taking ſome lint, or fine flax, dip it in the mixture and ſtop his ears with it, and ſtitch them for twelve hours: ſome boil an ounce and a half of bitter-almonds, two drams of ox-gall, half a pennyworth of black hellebore made into powder, grains of caſtoreum, vinegar and varniſh, of each five drams; which they boil and ſtrain, and then put into his ears.

STAY, in the ſea-language, a big ſtrong rope faſtened to the top of one maſt, and to the foot of that next before it, towards the prow, ſerving to keep it firm, and prevent its falling aftwards or towards the poop. All maſts, top-maſts, and flag-ſtaves, have their ſtays, except the ſprit-ſail top-maſts. That of the main-maſt is called the main-ſtay. The main-maſt, fore-maſt, and thoſe belonging to them, have alſo back-ſtays to prevent their pitching forwards or over-board, as going on either ſide of her.

To ſtay a ſhip, or to bring her on the ſtays, is to manage her tackle and ſails ſo that ſhe cannot make any way forwards; which is done in order to her tacking about.

STAY, in the manege. To ſtay or ſuſtain the horſe, is to hold the bridle firm and high. We likewiſe ſtay or ſuſtain a horſe with the in-leg or the in heel, when he makes his croupe go before his ſhoulders upon volts. We ſtay a horſe again when we hinder him to traverſe, when we ride him equally, keeping him always ſubject, ſo that his croupe cannot ſlip out, and he can loſe neither his cadence nor his ground, but marks all his times equal

STEADY, a word of command, at ſea, for the man at the helm to keep the ſhip ſteady in her courſe, and not to make angles (or yaws, as they call them) in and out.

STEATOMA, a kind of encyſted tumour, conſiſting of a matter like ſuet or lard, ſoft, without pain, and without diſcolouring the ſkin. See TUMOUR.

STEEL, a kind of iron refined and purified by the fire with other ingredients. See the article IRON.

Steel, of all other metals, is that ſuſceptible of the greateſt degree of hardneſs when well tempered, whence its great uſe in the making of tools and inſtruments of all kinds. Mr. Cramer obſerves, that the difference between iron and ſteel is, that the latter being much harder will not yield to the hammer, but is brittle inſtead of being ductile, and reſiſts the file. Malleable iron grows rigid by being ſimply extinguiſhed in cold water, but it yet retains a conſiderable degree of ductility in the cold, and may be extended in all dimenſions with the hammer. Steel, however, if heated again, and cooled by ſlow degrees, may be filed and extended more or leſs by the hammer. But there are many degrees in the hardening of ſteel; for if it has been extremely red hot, and is then quenched in cold water in motion, it becomes greatly harder than if it had been but moderately red hot, and had been quenched in warm water. Steel is alſo of a darker colour than iron, and the ſurface of it, when broken, appears to conſiſt of ſmaller granulated, or even ſtriated, particles than the iron it was made of. Mr. Cramer further obſerves, that the method of making ſteel out of iron is either by cementation or by fuſion. That by cementation may be performed in the following manner: chooſe ſome bars of pure iron, not too thick, and quite free from heterogeneous matter, the flexibleneſs of it, both when hot and cold, being a very good ſign thereof: prepare a cement of charcoal-duſt, moderately pulverized, one part; and wood-aſhes, half a part: or of charcoal-duſt two parts, bones, horns, or hair of animals, burnt to a blackneſs, in a cloſe veſſel and in a gentle fire, and afterwards reduced to powder, one part; wood-aſhes, half a part: mix them together; prepare an earthen cylindrical veſſel, two or three inches higher than the bars are long; put into the bottom of this veſſel the cement, prepared as before directed, ſo that being gently preſſed down it may cover the bottom of the veſſel an inch and half deep; place then the bars perpendicularly, ſo that they may be every where about an inch from the ſides of the veſſel and from each other; fill the interſtices with the ſame cement, and cover alſo the bars with it, ſo that the veſſel may be quite full; next cover it with a tile, and ſtop the joints with thin lute: put this veſſel into a furnace, and keep it moderately but equally red hot, for ſix or ten hours together; when this is over, take the red hot bars out and dip them in cold water, they will then be brittle, and turned to ſteel. See CÆMENTATION.

The method of making ſteel by fuſion is as follows: take of iron-ore, or of unmalleable iron, of the firſt fuſion, divide it into ſmall parcels, and put them into a bed made of charcoal-duſt, in a ſmith's forge: let the quantity of iron be but ſmall for the experiment; put to it, as a defenſitive menſtruum, ſome of the vitreſcent ſcoriæ of ſand, or ſtones of the ſame nature; then put upon them a quantity of charcoal; light this, and admit only a gentle blaſt of the bellows, that the ſcoriæ and the metal may both melt regularly: when this has been ſome time kept in fuſion, take it out, and divide it into two parts, which make red hot, and hammer into long bars: finally, beat them red hot, and plunge them into cold water, and they will be found to be ſteel, ſo very hard as not to be fileable, and ſo brittle as to break aſunder when ſtruck with conſiderable force.

A bar of iron, when converted into ſteel, is not equally ſo converted in all its parts; the fire has always acted more ſtrongly upon its ſurface than on its central parts, and it is therefore more perfect ſteel there than in its inner parts; but a perfection in the operation is not neceſſary to the ſteel's being good and uſeful, for the whole

whole bar is often very good ſteel, as are alſo many bars made at the ſame time, yet all, perhaps, differently affected.

If the compoſition which is to convert the iron into ſteel be too ſtrong, or if the fire be too violent, or the matter continued too long in it, in all theſe caſes the ſteel will be over made. The way to meliorate ſuch ſteel as this, muſt be to diveſt it of part of its ſalts and its ſulphur, but particularly the laſt; and M. Reaumur found, that, burying the bars of ſuch ſteel in lime, or any other alkaline ſubſtance that would readily abſorb the ſulphurs, and placing it for a proper time in the fire, it would be in a manner decompoſed again, and come out a very good and perfect ſteel.

By this management ſteel may again be converted or reduced to its primitive iron, and a body of any middle degree between ſteel and iron may be produced by ſtopping the proceſs at different points of time, or continuing it till all the adventitious ſalts and ſulphurs are drawn off or abſorbed. See TEMPERING.

Annealing or nealing of ſteel, is by ſome uſed for the ſoftening it, in order to make it work eaſier, which is uſually done by giving it a blood-red heat in the fire, and then taking it out and letting it cool of itſelf: ſome have pretended to ſecrets in annealing, by which they could bring down iron or ſteel to the temper of lead: this was done by often heating the metal in melting lead, and letting it cool again out of the lead. But this method is found by Moxon to have no other effect than what is had from the former. Steel may, indeed, be made a little ſofter than in the common way, by covering it with coarſe powder of cow-horn or hoofs; thus incloſing it in a loam, heating the whole in a wood-fire till it be red hot, and then leaving the fire to go out of itſelf, and the ſteel to cool.

Steel manufactures, for every twenty ſhillings value, upon oath, pay, upon importation, 3 s. $10\frac{20}{100}$ d. and, on exportation, draw back, 3 s. $4\frac{50}{100}$ d. Steel manufactures, for every 112 lb. pay, on importation, 5 s. $1\frac{87\frac{1}{2}}{100}$ d. and, on exportation, draw back the ſame money. But if exported to the britiſh plantations, there is no drawback.

STEEL GLASSES, a name given by ſome authors to the metalline ſpheres uſed in optics. Theſe, according to Cardan, are made of three parts of braſs, one part of tin, and one of ſilver, with an eighteenth part of antimony; but moſt either totally leave out the ſilver, or add only a twenty-fourth part, to ſave the expence. There are many other methods directed by ſeveral authors, but moſt uſe arſenic and tartar mixed with the metals. Theſe are afterwards to be poliſhed with emery, rotten-ſtone, putty, and the like.

STEELYARD, *ſtatera romana*. See the article BALLANCE.

STEENBERG, a town of dutch Brabant, ſituated on the confines of Zeland, twenty-five miles north of Antwerp.

STEENKIRK, a village of the auſtrian Netherlands, in the province of Hainault, ten miles north of Mons.

STEENWICK, a town of the united Netherlands, in the province of Overyſſel, ſituated near the confines of Frieſland, eighteen miles north of Zwoll.

STEEPLE, an appendage erected generally on the weſtern end of a church, to hold the bells. Steeples are denominated from their form, either ſpires or towers; the firſt are ſuch as aſcend continually diminiſhing either conically or pyramidally. The latter are mere parallelopipeds, and are covered a-top platform-like. See SPIRE and TOWER.

In each kind there is uſually a ſort of windows or apertures to let out the ſound, and ſo contrived at the ſame time, as to drive it down.

STEERAGE, on board a ſhip, that part of the ſhip next below the quarter-deck, before the bulk-head of the great cabbin, where the ſteerſman ſtands in moſt ſhips of war. See the next article.

STEERING, in navigation, the directing a veſſel from one place to another by means of the helm and rudder. He is held the beſt ſteerſman who cauſes the leaſt motion in putting the helm over to and again, and who beſt keeps the ſhip from making yaws, that is, from running in and out. There are three methods of ſteering, 1. By any mark on the land, ſo as to keep the ſhip even by it. 2. By the compaſs, which is by keeping the ſhip's head on ſuch a rhumb or point of the compaſs, as beſt leads to port. 3. To ſteer as one is bidden or conned, which, in a great ſhip, is the duty of him that is taking his turn at the helm. See the article COND.

For the theory and effect of ſteering, ſee NAVIGATION, SAILING, *&c.*

STEEVE,

STEEVE, on board a ſhip. The ſeamen ſay the bowſprit or the beak-head of a ſhip ſteeves, when it ſtands two upright, or not ſtraight enough forward.

STEGANOGRAPHY, the art of ſecret writing, or of writing in cyphers, known only to the perſons correſponding.

STEGEBURG, a port-town of Sweden, in the province of eaſt Gothland, ſituated on a bay of the Baltic: eaſt long. 16°, north lat. 58° 30'.

STEGNOTICS, in medicine, remedies proper to cloſe and ſtop the orifices of the veſſels or emunctuories when relaxed, ſtretched, lacerated, *&c.* ſuch as pomegranate-leaves and roſes, plantain-leaves, tormentil-roots, *&c.* Stegnotics are proper in the hæmorrhoids and other fluxes of the blood.

STELLA, a STAR. See the article STAR.

STELLARIA, in botany, the ſame with the coriſpermum. See CORISPERMUM.

STELLARIS, in botany, the ſame with the ornithogalum. See ORNITHOGALUM.

STELLATE, among botaniſts, expreſſes leaves which grow not leſs than ſix at a joint, and are arranged like the rays of a ſtar.

STELLIONATE, *ſtellionatus*, in the civil law, a kind of crime committed by a fraudulent bargain, where one of the parties ſells a thing for what it is not; as if I ſell an eſtate for my own which belongs to another, or convey a thing as free and clear which is already engaged to another, or put off copper for gold, *&c.*

STEM, in botany, that part of a plant ariſing out of the root, and which ſuſtains the leaves, flowers, fruits, *&c.* See the article STALK.

STEM *of a ſhip*, that main piece of timber which comes bending from the keel below, where it is ſcarfed, as they call it; that is, pieced in; and riſes compaſſing right before the forecaſtle. This ſtem it is, which guides the rake of the ſhip, and all the butt-ends of the planks are fixed into it. This, in the ſection of a firſt rate ſhip, is called the main ſtem. See the article SHIP.

Falſe ſtem, in a ſhip, is that fixed before the right one, where that is made too flat for the ſhip to keep the wind well; this will make her rid more way, and bear a better ſail.

STEMPLES, in mining, croſs-bars of wood in the ſhafts which are ſunk to mines. In many places the way is to ſink a perpendicular hole or ſhaft, the ſides of which they ſtrengthen from top to bottom with wood-work, to prevent the earth from falling in; the tranſverſe pieces of wood uſed for this purpoſe, they call ſtemples, and by means of theſe the miners, in ſome places, deſcend without uſing any rope, catching hold of theſe with their hands and feet.

STENAY, a town of the french Netherlands, in the province of Luxemburg, ſituated on the eaſt ſide of the river Maes, twelve miles weſt of Montmedy.

STENCH. See the article STINK.

STENDEL, a town of Germany, in the circle of Upper Saxony, and marquiſate of Brandenburg, ſituated thirty-ſix miles north of Magdeburg.

STENFORT, a town of Germany, in the circle of Weſtphalia, and county of Bentheim, ſituated eighteen miles north of Munſter.

STENONIAN DUCT, or *ductus ſalivus ſtenonius*, in anatomy, a name given from Steno, its diſcoverer, to one of the ſuperior ſalival ducts running from each of the parotids, about three fingers long, and of the thickneſs of a wheat-ſtraw, having a great number of roots. This duct paſſes over the maſſeter muſcle through the middle of the cheek, and there perforates the buccinator muſcle, and the membrane of the mouth near the ſecond or third of the ductus molares, and at this perforation it diſcharges a very large quantity of its proper fluid into the mouth. See SALIVAL, PAROTID, *&c.*

STENTOROPHONIC TUBE, a ſpeaking trumpet, thus called from Stentor, a perſon mentioned by Homer. See the article TRUMPET.

STEP. See PACE, STAIRCASE, *&c.*

STEP *of the maſt and capſtan*, in a ſhip, is that piece of timber whereon the maſts or capſtans do ſtand at bottom.

STEP *and leap*, in the manege, one of the ſeven airs or artificial motions of a horſe, conſiſting, as it were, of three airs, *viz.* the pace or ſtep, which is terra a terra; the raiſing, which is the curvet, and the whole finiſhed with a ſault or leap. The ſtep properly puts a horſe on the hand, and gives him a riſe to leap; like one that runs before he leaps, that he may go the higher or the farther. For leaps of all kinds, the rider is not to give any aids or helps with his legs, only to hold the horſe well up with the bridle-hand when he riſes before, that he may riſe the higher behind. When he begins to riſe behind, he is to put the bridle-hand

a little forwards to hold him before, and ſtay him there on the hand as if he hung in the air, timing the motion of the bridle-hand ſo, as to make him like a ball on the bound, which is the great ſecret in leaping.

STEPHEN, or *St.* STEPHEN'S DAY, a feſtival of the chriſtian church, obſerved on the 26th of December, in memory of the firſt martyr St. Stephen.

STEREOGRAPHIC PROJECTION, is the projection of the circles of the ſphere on the plane of ſome one great circle, the eye being placed in the pole of that circle. The method and practice of this projection in all the principal places, *viz.* on the planes of the meridian, equinoctial, and horizon, have already been given under the articles MAP and PROJECTION.

STEREOGRAPHY, the art of drawing the forms and figures of the ſolids upon a plane. See SOLID and PLANE.

STEREOMETRY, *στερεομετρια*, that part of geometry which teaches how to meaſure ſolid bodies, *i. e.* to find the ſolidity or ſolid content of bodies, as globes, cylinders, cubes, veſſels, ſhips, *&c.* See the articles GLOBE, CYLINDER, *&c.*

STEREOTOMY, the art or act of cutting ſolids, or making ſections thereof, as walls or other members in the profiles of architecture. See SECTION.

STERILITY, the quality of a thing that is barren, in oppoſition to fertility. See the article FERTILITY.

Nature has annexed ſterility to all monſtrous productions, that the creation might not degenerate. Hence the ſterility of mules, *&c.*

Women frequently become ſterile after a miſcarriage or a difficult labour, by reaſon the uterus or ſome other of the genital parts are injured thereby.

STERLING, a term frequent in britiſh commerce. A pound, ſhilling, or penny ſterling, ſignifies as much as a pound, ſhilling, or penny of lawful money of Great Britain, as ſettled by authority.

STERN *of a ſhip*, uſually denotes all the hindermoſt part of her, but properly it is only the outmoſt part abaft. See the articles SHIP, ABAFT, *&c.*

STERN-FAST, denotes ſome faſtenings of ropes, *&c.* behind the ſtern of a ſhip, to which a cable or hawſer may be brought or fixed, in order to hold her ſtern to a wharf, *&c.*

STERN-POST, a great timber let into the keel at the ſtern of a ſhip, ſomewhat flopping, into which are faſtened the afterplanks; and on this poſt, by its pintle and gudgeons, hangs the rudder.

STERN, among hunters, is the tail of a wolf or greyhound. See TAIL.

STERN-CHASE. See the article CHASE.

STERNBERG, a town of Germany, in the circle of Upper Saxony and marquiſate of Brandenburg, ſituated twenty-three miles north-eaſt of Frankfort upon the Oder.

STERNOHYOIDÆUS, in anatomy, a long, thin, flat muſcle, fixed by its lower extremity in the ſuperior and lateral part of the inner or poſterior ſide of the ſternum, in the poſterior part of the ſternal extremity of the clavicle, in the tranſverſe ligament which connects theſe two bones, and in the inner or backſide of the cartilage of the firſt rib: from hence it runs up to the foreſide of the aſpera arteria, joins its fellow by a membrane which forms a ſort of linea alba, and is inſerted laterally in the lower edge of the baſis of the os hyoides.

STERNUM, in anatomy, the breaſt-bone, being a cartilaginous ſort of bone which compoſes the forepart of the breaſt, and into which the ribs are fitted. See the article RIB.

In adults this bone is often ſingle, but ſometimes it has two, ſometimes three, pieces concurring to form it. Its ſubſtance is fungous and ſpungy; its upper part is called the manubrium or handle, and in this there is on each ſide a cavity for the articulation of the clavicles. In the middle it is narrow, and broad at the lower part. To this alſo there adheres a cartilage called from its figure cartilago enſiformis, or xiphoides. This is uſually ſingle; ſometimes it is bifurcated, and not unfrequently bony throughout; and on each ſide of the ſternum there are ſeven cavities for the articulation of the ſeven true ribs.

The uſes of the ſternum are, 1. To form the anterior part of the breaſt. 2. To ſupport the ribs and the clavicles. 3. To defend the parts contained in the cavity of the breaſt. 4. To ſerve for the inſertion of the mediaſtinum, and for the ſuſtaining the heart itſelf and ſeveral muſcles.

The ſternum is equally ſubject to depreſſions and fractures from falls or blows with the reſt of the bones. When either of theſe happen, the part is not only uneven and painful, but the ſubjacent arteries and veins are alſo contuſed or ruptured;

ruptured; whence ariſe pains in the breaſt, difficulty of breathing, violent coughs, ſpitting of blood, or elſe extravaſations of it in the præcordia, or between the duplicatures of the mediaſtinum, with many bad ſymptoms of the like nature. A fractured ſternum will therefore be very evident from theſe ſigns, and from its being moveable to the touch, eſpecially when one part grates againſt another. In order to ſet the fracture of this bone, if any part of it be diſplaced, Heiſter directs the patient to be laid on his back on a bed or table, putting a hard pillow, a large parcel of cloth rolled up, or ſome other ſuch body under his back, and preſſing down his ſhoulders, by which means the ſternum will be elevated and extended; and to facilitate the reduction, the ſurgeon muſt preſs the ſides of the breaſt together, and ſtroke them pretty ſtrongly; but when this method is impracticable, or not proper, the ſkin muſt be divided, and the depreſſed part of the ſternum lifted up into its place by means of an elevatory, or elſe by a ſcrew gently wormed into the part, and then pulled upwards. If, as it ſometimes happens after the reduction, violent pains continue under the ſternum, and if blood ſhould gather and ſuppurate internally between the duplicature of the mediaſtinum, it will not be improper to trepan the lower part of the ſternum, after the manner done to the cranium; and when the putrid matter is diſcharged, and the cavity cleanſed, it ſhould be carefully treated with ſome vulnerary balſam. Laſtly, if any blood ſhould be found extravaſated in the cavity of the thorax, the cure ſeems to depend entirely upon diſcharging this by the paracenteſis. See the articles ELEVATORY, TREPANNING, EXTRAVASATION, and PARACENTESIS. As to the buſineſs of dreſſing, after the application of compreſſes dipped in warm ſpirit of wine, we muſt go on with that kind of bandage called the napkin and ſcapulary.

STERNUTATION. See SNEEZING.

STERNUTATIVE, or STERNUTATORY, a medicine proper to produce ſneezing. Sternutatives are of two kinds, gentle and violent. Of the firſt kind are betony, ſage, marjoram, tobacco, and the whole faſhionable tribe of ſnuffs. Of the latter kind are euphorbium, white hellebore, pellitory, &c. Sternutatives operate by their ſharp pungent parts, vellicating the inner membrane of the noſe, which is exceeding ſenſible, and occaſioning the ſerous matter contained in the glands of the noſe and in ſeveral ſinuſes ſituated in the baſe of the cranium and the os frontis, to be expelled.

STETIN, a city and port-town of Germany, in the circle of Upper Saxony, capital of the dutchy of Pomerania, ſituated on the weſt ſhore of the river Oder: eaſt long. 14° 50′, north lat. 53° 30′.

STEVENAGE, a market-town of Hertfordſhire, ſituated thirty miles north of London, and ten north-weſt of Hertford.

STEVENSWAERT, a fortreſs of the Netherlands, in the province of Gelder, ſituated on the river Maes, twenty miles north-eaſt of Maeſtricht.

STEW, a ſmall kind of fiſh-pond, the peculiar office of which is to maintain fiſh, and keep them in readineſs for the daily uſe of a family, &c. The fiſh bred in the large ponds, are drawn out and put in here. For two large ponds of three or four acres a-piece, it is adviſeable to have four ſtews, each two rods wide, and three long. The ſtews are uſually in gardens, or at leaſt near the houſe, to be more handy, and the better looked to. The method of making them is to carry the bottom in a continued decline from one end, with a mouth to ſavour the drawing with a net. See FISH-POND.

STEWS, or STUES, were alſo places antiently permitted in England to women of profeſſed incontinency, for the proffer of their bodies to all comers. Theſe were under particular rules and laws of diſcipline, appointed by the lord of the manor.

STEWARD, an officer appointed in another's ſtead or place, and always taken for a principal officer within his juriſdiction. Of theſe there are various kinds. The greateſt officer under the crown is the lord high ſteward of England, an office that was antiently the inheritance of the earls of Leiceſter, till forfeited by Simon de Mountfort, to king Henry III. But the power of this officer is ſo very great, that it has not been judged ſafe to truſt it any longer in the hands of a ſubject, excepting only *pro hac vice*, occaſionally: as to officiate at a coronation, at the arraignment of a nobleman for high treaſon, or the like. During his office, the ſteward bears a white ſtaff in his hand, and the trial, &c. ended, he breaks the ſtaff, and with it his commiſſion expires. There is likewiſe a lord ſteward of the king's houſe-

hold, who is the chief officer of the king's court, has the care of the king's houſe, and authority over all the officers and ſervants of the houſhold, except ſuch as belong to the chapel, chamber, and ſtable. See the article HOUSHOLD.

There is alſo a ſteward of the marſhalſea, who has judicial authority. And in moſt corporations, and all houſes of quality in the kingdom, there is an officer of the name and authority of a ſteward. The ſteward of a ſhip is he who receives all the victuals from the purſer, and is to ſee it well ſtowed in the hold; all things of that nature belonging to the ſhip's uſe are in his cuſtody; he looks after the bread, and diſtributes out the ſeveral meſſes of victuals in the ſhip; he hath an apartment for himſelf in the hold, which is called the ſteward's room.

STEYNING, a borough town of Suffolk, ſituated forty miles ſouth of London, and thirteen miles weſt of Lewes.

It ſends two members to parliament.

STEYRE, or STEYREG, a town of Germany, in the circle and dutchy of Auſtria, ſituated on the north ſide of the Danube, eight miles north-weſt of Ens.

STIBIUM, *antimonium*. See ANTIMONY.

STICKLEBACK, in ichthyology, a common name for the three ſeveral ſpecies of the gaſteroſteus. See GASTEROSTEUS.

The common ſtickleback is that with three prickles on the back; the leſſer ſtickleback is that with ten prickles on the back; and the great ſea-ſtickleback has fifteen prickles on the back, grows to ſix or ſeven inches in length, and is moderately thick in proportion.

STIGMATA, in natural hiſtory, the apertures in different parts of the bodies of inſects, communicating with the tracheæ, or air veſſels, and ſerving for the office of reſpiration. Nature has given to theſe minute animals a much larger number of tracheæ and bronchia than to us; all the two winged and four winged flies, which have a ſingle or undivided corcelet, to which their legs are all fixed, have alſo four ſtigmata in that corcelet, two on each ſide; they have them alſo on the rings of their body, but thoſe on the corcelet are the moſt conſiderable. Of the four on the corcelet, the two anterior ones are uſually the largeſt; theſe, as well as the poſterior ones are oblong, and placed obliquely to the length of the body. The colour of the ſtigmata frequently differs from that of the corcelet; ſome are yellowiſh, others of a coffee-colour, or ſome degrees of a fallow colour, in flies whoſe corcelet is brown, black, or blue. Flies have, beſide theſe, ſeveral ſtigmata alſo in the rings of their bodies, perhaps in every one of them: theſe ſtigmata are not like thoſe of the corcelet, but are round, uſually a little eminent above the reſt of the ſurface, and reſembling a pin's head.

STIGMATA, in antiquity, certain marks impreſſed on the left ſhoulders of the ſoldiers when liſted.

STIGMATA were alſo kinds of notes or abbreviations, conſiſting only of points diſpoſed various ways, as in triangles, ſquares, croſſes, *&c.*

STIGMATIZING, among the antients, was inflicted upon ſlaves, as a puniſhment, but more frequently as a mark to know them by, in which caſe it was done by applying a red-hot iron marked with certain letters to their foreheads, till a fair impreſſion was made, and then pouring ink into their furrows, that the inſcription might be the more conſpicuous. Stigmatizing, among ſome nations, was, however, looked upon as a diſtinguiſhing mark of honour and nobility.

STIL *de grain*, in the colour-trade, the name of a compoſition uſed for painting in oil or water, and is made by a decoction of the lycium or avignon-berry in alum-water, which is mixed with whiting into a paſte, and formed into twiſted ſticks. It ought to be choſen of a fine gold-yellow, very fine, tender and friable, and free from dirt.

STILE, *ſtilus*. See the article STYLE.

STILES, in carpentry, denote the upright pieces which go from the bottom to the top of any wainſcot, or the like.

STILLATITIOUS OILS, ſuch as are produced by diſtillation, in oppoſition to thoſe got by infuſion, expreſſion, *&c.*

STILL-BOTTOMS, in the diſtillery, a name given by the traders to what remains in the ſtill after the working the waſh into low wines. Theſe bottoms are procured in the greateſt quantity from the malt-waſh, and are of ſo much value to the diſtiller, in the fattening of hogs, *&c.* that he often finds them one of the moſt valuable articles of the buſineſs. They might alſo, as Dr. Shaw obſerves, be put to other uſes, ſuch as the affording a large proportion of acid ſpirit, an oil, a fuel, and a fixed ſalt, and with ſome addreſs, and good management,

nagement, a vinegar and tartar; Another very advantageous uſe of them, is the adding them to the next brewing of the malt for more ſpirit: the increaſe of the produce from this is more than is eaſily conceived. It alſo more readily diſpoſes the new waſh to ferment, and gives the ſpirit a vinoſity, that it cannot have without it; the proportion in this caſe muſt never exceed that of a fifth or a ſixth part of the whole quantity of liquor employed. See DISTILLERY.

STILL-HOUSE. The Dutch have much the advantage of us in the ſtructure of their ſtill-houſes. The general rules in building thoſe houſes, according to Shaw, ſhould be ſuch as follow. The firſt caution is, to lay the floor aſlope, not flat, where any wet work is to be performed. It ſhould alſo be well flagged, with broad ſtones, ſo that no wet be detained in the crevices, but all may run off, and be let out at the drains made at the bottom and ſides. The ſtills ſhould be placed abreaſt on that ſide of the ſtill-houſe to which the floor has its current. Fronting the ſtills, and adjoining to the back of the wall ſhould be a ſtage for holding the fermenting backs, and theſe being placed at a proper height, may empty themſelves by means of a cock and a canal into the ſtills, which are thus charged with very little trouble. Near this ſet of fermenting backs ſhould be placed a pump or two, that may readily ſupply them with water, by means of a trunk, or canal, leading to each back; under the pavement adjoining to the ſtills ſhould be a kind of cellar, wherein to lodge the receivers, each of which ſhould be furniſhed with its pump, to raiſe the low wines into the ſtill for rectification; and through this cellar the refuſe waſh, or ſtill-bottoms, ſhould be diſcharged by means of a hoſe, or other contrivance.

STIMULATING, *ſtimulans*, a property in angular or ſharp bodies, whereby they vellicate and cauſe vibrations and inflections of the fibres of the nerves, and a greater derivation of nervous fluid into the parts affected. Stimulants produce pain, heat, redneſs, &c. They may be reduced to violent penetrating depilatories, gentle ſinapiſms, veſicatories, and cauſtics. See the articles SINAPISM, VESICATORY, &c.

STING, *aculeus*, an apparatus in the body of certain inſects, in form of a little ſpear, ſerving them as a weapon of offence. The ſting of a bee or waſp, is a curious piece of mechaniſm, it conſiſts of a hollow tube, at the root whereof there is a bag full of ſharp, penetrating juice, which in ſtinging, is injected into the fleſh, through the tube; within the tube, Mr. Durham has obſerved, there lie two ſharp ſmall bearded ſpears: in the ſting of a waſp, he told eight beards on the ſide of each ſpear, ſomewhat like the beards of fiſh-hooks. One of theſe ſpears in the ſting, or ſheath, lies with its point a little before the other, to be ready, as ſhould ſeem, to be firſt darted into the fleſh, which once fixed by means of its foremoſt beard, the other then ſtrikes too, and ſo they alternately pierce deeper and deeper, their beards taking more and more hold in the fleſh; after which the ſheath or ſting follows to convey the poiſon into the wound, which that it may pierce the better, is drawn into a point with a ſmall ſlit below that point for the two ſpears to come out at. By means of theſe beards, it is, that the animal is forced to leave its ſting behind it, when diſturbed, becauſe it can have no time to withdraw the ſpears into the ſcabbard.

STINK, or STENCH, a diſagreeable ſmell exhaling from a corrupted, or other body, and which is prejudicial to the noſe and brain. A ſtinking breath is uſually the reſult either of diſeaſed lungs, or elſe of ſcorbutic gums, &c. A ſtinking noſe is the reſult of a deep ulcer within the noſe, whence ariſe fetid ſcales, &c. See the article FOETOR.

STIPEND, *ſtipendium*, among the Romans, ſignified the ſame with tribute; and hence ſtipendiarii were the ſame with tributarii.

STIPULATION, in the civil law, the act of ſtipulating, that is, of treating and concluding terms and conditions to be inſerted in a contract. Stipulations were antiently performed at Rome, with abundance of ceremonies; the firſt whereof was, that one party ſhould interrogate, and the other anſwer, to give his conſent, and oblige himſelf. By the the antient roman law, no body could ſtipulate but for himſelf; but as the tabelliones were public ſervants, they were allowed to ſtipulate for their maſters, and the notaries, ſucceeding the tabelliones, have inherited the ſame privilege.

STIRIA,

STIRIA DUTCHY, in Germany, is part of the circle of Auſtria, bounded by the dutchy of Auſtria on the north; by Hungary on the eaſt; and by Carinthia and Carniola on the ſouth-weſt.

STIRLING, or STRIVILING, a town of Scotland, capital of the county of Stirling, ſituated on the river Forth, thirty miles north-weſt of Edinburgh, defended by a caſtle and other works.

STIRRUP, or STIRROP, in the manege, a reſt, or ſupport for the horſeman's foot, ſerving to keep him firm in his ſeat, and to enable him to mount. The great art of a cavalier in the antient tournaments, was to make his antagoniſt looſe his ſtirrup, that is, ſlip the foot out of it. For combating, it is a rule to have the right foot-ſtirrup ſomewhat ſhorter than the other. The ſtirrup-foot is the near, or the left foot before. Stirrup-leather is a thong of leather deſcending from the ſaddle by the horſe's ribs, upon which the ſtirrups hang, and the ſtirrup-bearer is an end of leather made faſt to the end of the ſaddle, to truſs up the ſtirrup when the rider is alighted, and the horſe ſent to the ſtable.

STIRRUP *of a ſhip*, a piece of timber put upon a ſhip's keel, when ſome of her keel happens to be beaten off, and they cannot come conveniently to put or fit in a new piece; then they patch in a piece of timber, and bind it on with an iron, which goes under the ſhip's keel, and comes up on each ſide of the ſhip, where it is nailed ſtrongly with ſpikes, and this they call a ſtirrup.

STIRUM, a town of Germany, in the dutchy of Berg, twelve miles north of Duſſeldorp.

STIVES, the antient Thebes, in the province of Achaia, now Livadia, in european Turkey. See LIVADIA.

STOAKED, on board a ſhip. When the water in the bottom cannot come to the well of the pump, they ſay, the ſhip is a-ſtoak, or ſtoaked. ſo they ſay alſo, the the limber holes are ſtoaked, when the water cannot paſs through them; and the pump is ſtoaked, when ſomething is got into it, which choaks it up, ſo that it will not work.

STOCKHERN, a town of Germany, in the circle of Weſtphalia, and biſhopric of Liege, ſituated on the river Maes, twelve miles north of Maeſtricht.

STOCK, in gardening, *&c.* the ſtem or trunk of a tree.

STOCKBRIDGE, a borough town of Hampſhire, ſituated ſeven miles north-weſt of Wincheſter.

It ſends two members to parliament.

STOCK-BROKER, ſee the article BROKER, and the next article.

STOCK-JOBBING, the art or myſtery of trafficing in the public ſtocks or funds. If ſtock-jobbers make any contract for the ſale of ſtock, when they are not actually poſſeſſed of, or intitled to the ſame, thoſe contracts will be deemed void. Likewiſe the parties ſo agreeing to ſell, are liable to a penalty of 500 l. The time of tendering ſtock ſold, is held to be the laſt hour of the day on which it was to be transferred, and then an actual transfer is not neceſſary, unleſs the perſon to whom it ought to be made be at the place and time ready to receive the ſame. See the article BROKER.

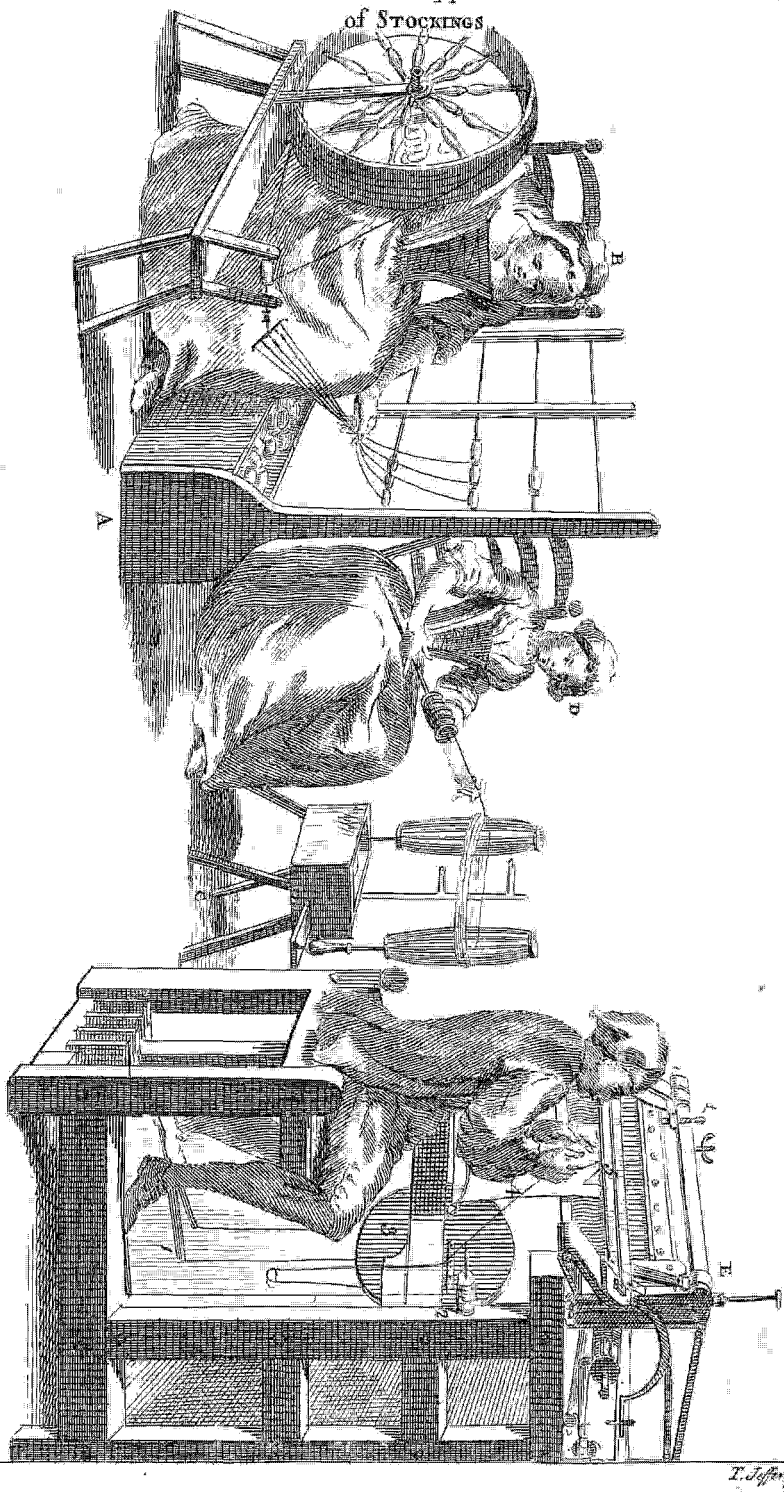
Capital STOCK. See the article CAPITAL.

STOCK-FISH, or STOCK-FISCH, in commerce, a kind of dried ſalted fiſh, of a greyiſh aſh-colour, and the belly ſomewhat whiter, being only cod-fiſh cured in a particular manner, which makes it neceſſary to beat it with ſticks before it is fit for dreſſing. See FISHERY.

STOCKHOLM, the capital city of Sweden, ſituated on ſeveral ſmall iſlands in the Meller Lake; eaſt long. 18°, north lat. 59° 30′, three hundred miles north-eaſt of Copenhagen; nine hundred north-eaſt of London; and four hundred weſt of Peterſburgh. It is neither walled nor fortified, being ſufficiently ſecured by nature, with little rocks and iſlands, which ſurround it, though it has a ſpacious harbour ſufficient for the largeſt fleets. That part of the town which is properly the city, ſtands upon a little iſland that is not more than a mile and a half in circumference, but the ſuburbs on the adjacent iſlands, are much larger. The inhabitants are computed about thirty-thouſand.

STOCKING, that part of the cloathing of the leg and foot which immediately covers their nudity, and ſcreens them from the cold, *&c.* Antiently, the only ſtockings in uſe were made of cloth, or of milled ſtuffs ſewed together; but ſince the invention of knitting and weaving ſtockings of ſilk, wool, cotton, thread, *&c.* the uſe of cloth ſtockings is quite out of doors. The modern ſtockings, whether woven or knit, are a kind of plexuſes, formed of an infinite number of

The STOCKING-FRAME, and other Apparatus used in the Manufactory of STOCKINGS



T. Jefferys sculp.

of little knots called ſtitches, loops, or maſhes, intermingled in one another. Knit ſtockings are wrought with needles made of poliſhed iron or braſs wire, which interweave the threads, and form the maſhes the ſtocking conſiſts of. This operation is called knitting, the invention whereof is commonly attributed to the Scots, on this ground, that the firſt works of this kind came from thence. It is added, that it was on this account that the company of ſtocking-knitters eſtabliſhed at Paris, in 1527, took for their patron St. Fiacre, who is ſaid to be the ſon of a king of Scotland. Woven ſtockings are ordinarily very fine; they are manufactured on a frame, or machine of poliſhed iron, the ſtructure and apparatus whereof being exceedingly ingenious, are repreſented in plate CCLXI. where A is the jack for the bobbins to turn upon; B is the ſizer, or woman whoſe buſineſs it is to twiſt the threads as they ſhall beſt ſuit the frame, in which the work is to be performed; C, the rices which wind the hanks or ſkains upon the bobbins for the uſe of the ſizer; D, the winder; and E the ſtocking frame, or engine, with the maker at work. 1. Are the treddles, like thoſe of other ſorts of looms; 2. is the bobbin of twiſted ſilk, *&c.* fixed on the bobbin-wire, which it turns with eaſe to feed the engine; 3. is the wheel, by whoſe motion the jacks are drawn together upon the needles; 4. is the ſilk, *&c.* which runs off the bobbin, and is in that poſture directed up to the needle to be looped; 5. is the needle on which the ſtockings are made according to art.

The Engliſh and French have greatly conteſted the honour of the invention of the ſtocking-loom; but we are aſſured, whatever pretenſions the French claim to this invention, that the ſame was certainly deviſed by William Lee, of St. John's College, Cambridge, in the year 1589, though it is true, that he firſt made it public in France, after deſpairing of ſucceſs in his own country.

Cotton and thread-ſtockings, the dozen, on importation, pay 8 s. 4 $\frac{53\frac{1}{4}}{100}$ d. and draw back on exportation, 7 s. 6 $\frac{56\frac{1}{4}}{100}$ d.

Frames and engines for the making and knitting of ſtockings, gloves, *&c.* ſhall not be exported upon penalty of 40 l.

STOCKPORT, a market-town of Cheſhire, ſituated thirty-four miles north-eaſt of Cheſter.

STOCKTON, a port-town of Durham, ſituated near the mouth of the river Tees, ſixteen miles ſouth of Durham.

STOCKZOW, a town of Bohemia, in the dutchy of Sileſia, ſituated on the river Viſtula, thirty-ſeven miles ſouth-eaſt of Troppaw.

STOCKS, among ſhip-carpenters, a frame of timber, and great poſts made aſhore, to build pinnaces, ketches, boats, and ſuch ſmall craft, and ſometimes ſmall frigates. Hence we ſay, a ſhip is on the ſtocks, when ſhe is a building.

STOCKS, *cippus*, a wooden machine to put the legs of offenders in, for the ſecuring of diſorderly perſons, and by the way of puniſhment in divers caſes, ordained by ſtatute, *&c.* And it is ſaid, that every vill within the precinct of a torn is indictable for not having a pair of ſtocks, and ſhall forfeit 5 l.

STOECHAS, in botany, a name whereby ſome authors call the lavandula. See the article LAVANDULA.

STOEBE, in botany, a genus of the *ſyngeneſia polygamia æqualis* claſs of plants; the hermaphrodite corolla of all the floſcules is equal; the proper one is monopetalous and funnel ſhaped; the limb is quinquifid and patulous; there is no pericarpium; the ſeed, which is contained in the cup, is ſolitary, oblong, and crowned with a long hairy pap.

STOICS, a ſect of antient philoſophers, the followers of Zeno, thus called from the greek στοα, which ſignifies a porch or portico, in regard Zeno uſed to teach under a portico, or piazza. It was the common fault of the ſtoics to introduce abundance of ſubtilty and dryneſs into their diſputations, either by word of mouth, or in writing. They ſeemed as carefully to avoid all beauty of ſtile, as depravity of morals. Chryſippus, who was one of the ſtoics, did no great honour to his ſect, and could only diſgrace it. He believed the gods periſhable; and maintained, that they would actually periſh in the general conflagration. He allowed the moſt notorious and moſt abominable inceſts, and admitted the community of wives amongſt ſages.

To the praiſe of the ſtoics in general, it muſt, however, be confeſſed, that, leſs intent than other philoſophers upon frivolous and often dangerous ſpeculations, they devoted their ſtudies to the clearing

up

up of thoſe great principles of morality which are the firmeſt ſupports of ſociety; but the dryneſs and ſtiffneſs that prevailed in their writings, as well as in their manners, diſguſted moſt of their readers, and abundantly leſſened their utility. Zeno's chief followers, among the Greeks, were Lucippus, Cleanthus, Chryſippus, Diogenes Babylonius, Antipater, Panætius, Poſſidonius, and Epictetus. Among the Romans, Cato, Varro, Cicero, Seneca, the emperor Antoninus, &c. The ſtoics cultivated logic, phyſics, metaphyſics, &c. but eſpecially ethics. The principal of their dogmata, of the former kinds, are, that there are certain catalepſias or comprehenſions, called alſo κοιναι εννοιαι, innate ideas or principles, naturally found in the mind; that God is the ſeminal cauſe of the univerſe, and with the Platoniſts, that the world is an animal, by reaſon of God's inhabiting and informing every part thereof; that nature is an artificial fire tending to generation; and that the world is at laſt to be deſtroyed by a conflagration. As for the morality of the ſtoics, it was couched much in paradoxes; as that a wiſe man is void of all paſſions, or perturbation of mind; that pain is no real evil, but that a wiſe man is happy in the midſt of torture, is always the ſame, and is always joyful; that there is none elſe free; that none elſe ought to be eſteemed king, magiſtrate, poet, or philoſopher; that all wiſe men are great men; that they are the only friends or lovers; that nothing can happen to them beyond their expectations; that all virtues are inſenſibly connected together; that all good things are equal, and equally to be deſired; that goodneſs admits of no increaſe or diminution. They own but one God, whom they however, call by various names, as Fate, Jupiter, &c. by which they did not mean various things, but various powers and relations of the ſame thing. Providence they expreſſed under the name Fate, which Chryſippus defines to be a natural ſeries, or compoſition of things mutually following each other, by an immutable nexus, or tie, fixed from all eternity. They held the immortality of the ſoul.

STOKEGOMER, a market-town of Somerſetſhire, ſituated twenty-two miles weſt of Wells.

STOKESLY, a market-town of Yorkſhire, ſituated thirty miles north of York.

STOLBERG, a town of Germany, in the circle of Upper Saxony, and territory of Thuringia, fifty-eight miles north-weſt of Leipſic.

STOLE, *ſtola*, a ſacerdotal ornament wore by the romiſh pariſh-prieſts over their ſurplice, as a mark of ſuperiority in their reſpective churches; and by other prieſts, over the alb, at celebrating of maſs, in which caſe it goes a-croſs the ſtomach; and by deacons, over the left ſhoulder, ſcarf-wiſe; when the prieſt reads the goſpel for any one, he lays the bottom of his ſtole on his head. The ſtole is a broad ſwath, or ſlip of ſtuff hanging from the neck to the feet, with three croſſes thereon. The biſhops antiently pretended, that the pariſh-prieſts were never to appear before them, but in their ſtole. In Flanders and Italy, they always preach in ſtoles; it is ſuppoſed to be a repreſentation of the extremities of the long robe, wore by the high-prieſt of the Jews.

Groom of the STOLE, the eldeſt gentleman of his majeſty's bed-chamber, whoſe office and honour it is to preſent and put on his majeſty's firſt garment, or ſhirt, every morning, and to order the things in the chamber. See BED-CHAMBER.

Order of the STOLE, an order of knights inſtituted by the kings of Arragon. Another military order, at Venice, is called the order of the golden ſtole; thus called from a golden ſtole, which thoſe knights wore over their ſhoulder, reaching to the knee, both before and behind, a palm and a half broad. None are raiſed to this order but patricians, or noble Venetians. It is uncertain when either of theſe orders was inſtituted.

STOLPE, a town of Germany, in the circle of Upper Saxony, and dutchy of Pomerania, ſituated on a river of the ſame name: eaſt long. 17°, north lat. 54° 36′.

STOMACH, στομαχος, in anatomy, is a hollow membraneous part, placed moſtly in the left hypocondrium, immediately under the diaphragm, and in an oblique ſituation, between the liver and the ſpleen. Its figure, as may be ſeen in our figure and deſcription of the inteſtines, is like that of the bag of a pair of bag-pipes. Its diviſion is into two parts, *viz.* into two orifices and a bottom. Its left orifice, called cardia, is placed much higher than its right, and is continuous with the gula, and furniſhed with a great number of nerves. Its right orifice is called

called the pylorus, and is connected with, or opens into, the inteſtines. In this part there is a ſingular valve, the office of which is, to cloſe the ſtomach. The pylorus is connected to the upper part of the ſtomach by a ligament. See HYPOCHONDRIA, DIAPHRAGM, &c.

The ſize of the ſtomach in human ſubjects is various; in people addicted to gluttony, it is uſually very large; and in men it is in general larger than in women. In the human body it is always ſingle, but many of the beaſts have ſeveral ſtomachs. Its veſſels are arteries, veins, nerves, and lymphatics. Its arteries, called gaſtricæ, it receives from the coeliac: the gaſtric veins all run to the vena portæ; among theſe are obſervable, the vaſa brevia, which go off to the ſplenic branch, and the vena coronaria, which ſurrounds the ſtomach. Its nerves principally enter at the left orifice; they come from the par vagum, and are very large, and hence it is, that the ſtomach is ſo ſenſible: the lymphatics go to the receptaculum chyli. The ſubſtance of the ſtomach is membranaceous, and is compoſed of four coats. The firſt coat is membranaceous, in the ſtrict ſenſe of the term: the fibres of this run tranſverſely. The ſecond is muſculous; in this the courſe of the fibres is various, and as it were inextricable. Some of them run circularly, as it were, from the upper part to the lower; and others only on the upper part of the ſtomach, between the two orifices; others run obliquely from the left ſide to the right, and ſome ſurround the orifice. The third coat of the ſtomach is nervous; this forms a multitude of wrinkles, and is furniſhed with a number of ſanguiferous veſſels, and ſmall glands, which ſecrete the liquor gaſtricus, or liquor of the ſtomach; this is more readily obſerved in hogs, than in the human body. The fourth is a thin, villoſe, and porous coat, and adheres very firmly to the former.

The uſe of the ſtomach is for the digeſtion of our food, that is, to receive, contain, diſſolve, and change what is ſwallowed by the mouth; and after a ſufficient concoction, to expel it through the pylorus into the inteſtines; poſſibly it alſo abſorbs, and retains the moſt ſubtle parts of what it has thus prepared for nutrition. It alſo is the organ in which the ſenſation of hunger reſides.

For the action of the ſtomach in turning the aliments into chyle, See CHYLIFICATION.

For an inflammation of the ſtomach. See the article INFLAMMATION.

Heat of the STOMACH. See SODA.

Heart-burn, or pain in the STOMACH. See the article CARDIALGIA.

STOMACHIA FEBRIS, the STOMACHIC FEVER, a name given to Heiſter, and others, to a ſpecies of fever, called by others, a meſenteric fever. See the article MESENTERIC FEVER.

STOMACHIC, in pharmacy, medicines that ſtrengthen the ſtomach, and promote digeſtion, &c. See DIGESTION.

Stomachic corroboratives are ſuch as ſtrengthen the tone of the ſtomach and inteſtines, among which are carminatives, as the roots of galangals, red gentian, zedoary, pimpinella, calamus aromaticus, and arum. Of barks and rinds, thoſe of canella alba, ſaſſafras, citrons, ſeville and china oranges, &c. Of ſpices, pepper, ginger, cloves, cinnamon, cardamums, and mace. Other things of this nature are, among ſimples, roman and common chamæmile, wormwood, mint, carduus benedictus, and the four carminative ſeeds. Of preparations, the oil of cedar, oil of oranges by expreſſion, oils of common chamæmile, daucus creticus, aniſum ſtellatum, cumin, caraway, mint, and wormwood, with the ſpirit of ſalt and ſweet nitre. Among compounds, are the ſal volatile ſylvii, the ſtomachic elixir, the eſſence of orange-peel, with ſweet ſpirit of nitre, tincture of tartar, oils of oranges prepared by expreſſion, the compound eſſence of wormwood, &c.

STOMACHIC, is alſo applied to the arteries, veins, &c. of the ſtomach. See the article STOMACH.

STOMACHUS, in anatomy, the ſame with the oeſophagus, or gula. See the article OESOPHAGUS.

STOMATIA, in natural hiſtory, a genus of ſimple ſhells, without any hinge, and formed of one piece; its figure is depreſſed and flat, its mouth the moſt patent of all the ſhells, the limpet only excepted; it has a ſhort ſpiral turn running into the mouth, at the head; and has no perforations in any part of the ſurface. The animal inhabiting this ſhell is a nereis.

STOMATICA, a term uſed by ſome for all medicines uſed in diſorders of the mouth and fauces.

STONES, in natural hiſtory, are defined to be eſſentially compound foſſils, not inflammable, nor ſoluble in water or

oil, nor at all ductile; found in continued ſtrata, or beds, of great extent; formed either of a congeries of ſmall particles, in ſome degree reſembling ſand, and lodged in a ſmoother cementitious matter, or elſe of this cementitious matter, and the gritt or ſand-like particles, running together into one ſmooth maſs; or, finally, of granules cohering by contact, without any cementitious matter among them; or compoſed of cryſtal or ſpar, uſually debaſed by earth, and often mixed with talc, and other extraneous particles. See the articles SAND, CRYSTAL, SPAR, TALC, *&c.*

Of this claſs of foſſils there are three orders; and under theſe, eight genera.

The firſt order comprehends all the coarſe, harſh, and rough ſtones, of a lax texture, and compoſed of a viſible gritt, reſembling ſand in form, and uſually immerſed in a cementitious matter, and of little natural brightneſs; ſcarce capable of any poliſh, and naturally mouldering away in form of powder from the tools of the workmen. The genera of this order are two, *viz.* the ammochiſta and pſaduria; the former of which conſtitute our grey and rough ſlates, and the latter comprehends moſt of the ſtones uſed in building, particularly portland ſtone. See SLATE and PORTLAND STONE.

The ſecond order conſiſts of ſtones, moderately fine, of a more compact and even texture, ſcarce diſtinguiſhable conſtruction, and affording no ſand-like particles to the view; of ſome natural brightneſs, capable of a tolerable poliſh, and flying off from the tools of the workmen in form of ſmall chips. Under this order are comprehended the ſympexia and ſtegania. See the articles SYMPEXIA and STEGANIA.

The third order conſiſts of ſtones, of a very fine ſubſtance and elegant ſtructure, naturally of a great brightneſs, and capable of an elegant poliſh; compoſed of granules of various ſhapes and ſizes, but uſually flattiſh, ſometimes more, ſometimes leſs diſtinct; and, in ſome ſpecies, running together into uniform maſſes, but never lodged in any cementitious ſubſtance. Of this order are the marbles, alabaſters, porphyries, and granites. See the articles MARBLE, ALABASTER, PORPHYRY, and GRANITE.

Figured or formed STONES, among naturaliſts, ſtones found in the ſhape of ſhells, or other parts of animals.

There are two very different opinions concerning the origin of theſe ſtones, which have occaſioned great diſputes among the learned. One is, that theſe bodies, though reſembling ever ſo exactly the ſea-fiſhes, yet never were in the ſea at all; but that the firſt ſemina of the ſea-ſhells, corals, and other ſubſtances, being carried by the ſea-water through the ſubterranean paſſages into all parts of the earth, even into the higheſt mountains, have been there left in vaſt numbers, and growing there among ſtony matter, have arrived at their true bulk and figure, but in a ſtony ſubſtance. But the other opinion ſeems to be a true one, which declares them to be all of marine origin at firſt, and that they were brought to the places where we find them in this foſſile ſtate, at the time of the univerſal deluge, and have been ſince altered into the nature of ſtones, by long lying in the earth in the way of waters impregnated with ſtony particles, which they have depoſited in them, after entering their ſubſtance in their paſſage through the earth. See SHELL.

As to the petrified teeth of animals, called by authors lycodontes, gloſſopetræ, *&c.* See the articles LYCODONTES, GLOSSOPETRA, *&c.*

STONE, *lithiaſis* and *calculus humanus*, in medicine, a ſtony or terreſtrial concretion in any of the urinary paſſages, which occaſions a difficulty in making water, and a pain in the ſmall of the back, or about the os pubis. When this collection is ſo large as to form one or more bodies, unable by reaſon of their ſize to paſs through the conduits of urine, they frequently cauſe great pain, ulcers in the parts, and an intire ſuppreſſion of urine; and, from the part where this obſtructing matter happens to lodge, this diſtemper receives its denomination, as from the kidneys, bladder, ureters, or urethra.

This diſorder, ſays Dr. Shaw, may ſometimes have an hereditary cauſe; that is, the urinary paſſages may be naturally ſtraighter than they ought to be; or the conſtitution may be naturally diſpoſed to generate a ſtony matter; an obſtructed perſpiration, and a cold or moiſt air, may alſo give riſe to it; for by means hereof the more heavy particles of the animal fluids will be detained in the body.

Another occaſion of this diſtemper may be the uſe of ſuch waters, as by running through various ſtrata of the earth, are impreg-

impregnated with ſtony particles. There are ſome wines too, and other liquors, which being either foul or not ſufficiently fined down, or abounding in tartar, or other terreſtrial corpuſcles, may lay the foundation for the ſtone. Again, in perſons ſubject to the aſthma or gout, who have a weak digeſtion, viſcid chyle, and ſtony concretions in the joints, there are manifeſt ſeeds of this diſtemper. In ſhort, whatever can bring on an accumulation of earthy particles in the urinary paſſages, whether by obſtructing or leſſening the capacity of the canals, or by immediately or remotely producing the ſubſtance itſelf, will cauſe gravel, and in time the ſtone.

The ſymptoms of the gravel or ſtone are, frequently, a nauſea and vomiting, with a numbneſs down the leg and thigh of the part affected; a pain fixed or moveable, great or leſs, in proportion to the bulk of impacted matter felt generally about the region of the loins, os pubis, and parts adjacent. This pain is very acute, and almoſt continual, when the gravel or ſtone remains at the head of the ureters; but begins to leſſen, as it is protruded forwards. Sometimes when the ſtone is angular, or continues long fixed, the urine is bloody; and, generally in nephritic obſtructions, it is thin, and made in a ſmall quantity, eſpecially at the beginning of the fit. Sometimes there happens a total ſuppreſſion of it, in which caſe both the ureters may be obſtructed. See ISCHURY.

When the obſtructed matter is forced into the bladder, the urine is turbid, and comes away plentifully; and there appears in it much ſand, and ſometimes ſmall ſtones; which when angular, are ſeldom voided without much pain: and when the paroxyſm is violent, and of long continuance, there ſometimes happens an entire ſuppreſſion of ſtool ſo far, that cathartics loſe their force; and ſometimes too, though rarely, the terreſtrial matter is depoſited in ſuch parts where the canals are lax and the circulation languid, ſo as at the ſame time to occaſion both an arthritic and a nephritic fit. When a ſtone is lodged in the urethra, the pain generally proves exquiſite, but limited to the part, where ſometimes the ſtone will bulge outwards, and may be felt with the fingers.

All paroxyſms in caſe of a confirmed ſtone, are dangerous. An accumulation of ſand in the kidneys or ureters, is leſs dangerous than a formed ſtone. A ſtone in the kidneys is of worſe conſequence than in the ureters, and more or leſs ſo in proportion to its bigneſs. The largeſt ſtone, naturally capable of paſſing the urethra in men, is ſuppoſed to be about the ſize of a ſmall hazel nut; but in women, one conſiderably larger may paſs the meatus urinarius. When both kidneys, or both ureters, are affected, it is ſo much the more dangerous, eſpecially if attended with ſharp pain, exulceration, inflammation, want of ſleep, loſs of ſtrength, a fever, ſuppreſſion of urine, &c. When the ſymptoms continue many days without intermiſſion, the caſe is deſperate; eſpecially if coldneſs has ſeized the extremities, the pulſe ticks, and the patient has cold ſweats, &c. When the caſe is habitual or hereditary, or happens in old age or gouty conſtitutions, it is difficult. The ſymptoms of bloody urine, continuing after the fit is gone off, prove hard to remove. When the urine is plentifully diſcharged, has its ordinary ſediment, is turbid, and the ſymptoms decreaſe, it is a ſign the paroxyſm is going off. If a large ſtone be long detained in the urethra, eſpecially if it be rugged, and can neither be propelled backwards nor forwards, and there be a total ſuppreſſion of urine, the caſe uſually proves mortal.

As to the method of cure, it conſiſts in the eaſy excluſion of the ſtone, and the preventing the breeding of others. To this purpoſe, Sydenham recommends bleeding, a poſſet-drink, in which two ounces of marſh-mallow roots have been boiled, and an emollient clyſter; after which, he adviſes a pretty large doſe of an opiate; that is, about twenty-five drops of the thebaic tincture, or fifteen grains of the ſaponaceous pills. And Huxham tells us, that nothing is ſo efficacious to eaſe the pain, and promote the deſcent of the ſtone through the ureters, as a tepid and emollient bath. Dr. Mead aſſures us, that it is an error in practice, to give ſtrong forcing diuretics, with a view of driving out the gravel with the urine: whereas this intention is anſwered with greater ſafety, in moſt caſes, by relaxing and lubricating medicines; eſpecially if, in caſe of violent pain, bleeding be premiſed, and anodynes interſperſed. He therefore adviſes, to give three or four grains of opium, diſſolved in five or ſix ounces of the common decoction, by way of clyſter. How-

ever, he allows, there are conjunctures, after the pain is abated, when powerful diuretics may be adminiſtered; but with this precaution, that as ſoon as they have had their effect, they are no longer to be continued. All this time the body ſhould be kept open, by giving a turpentine clyſter, and ſometimes purging gently with an infuſion of ſena and manna, becauſe ſtrong cathartics are to be avoided. The chief lubricating medicines are oil of ſweet almonds, ſyrup of marſhmallows, emulſions made with almonds, and the like; to which may be added the uſe of the warm bath. Soap and lime-water are alſo celebrated lithontriptics. See the articles SOAP, LIME, and LITHONTRIPTICS.

Such as have a ſtone in the bladder, ſhould, while they are taking the foreſaid medicines, have four ounces or upwards of tepid oyſter-ſhell lime-water injected into the bladder every day; taking care to evacuate their urine before injection, and to retain it as long as they can without pain. And were it not for the trouble of introducing the catheter, the injection might be made at leaſt twice every day; and if a flexible catheter were always kept in the bladder, it might be done at pleaſure, and the diſſolution of the largeſt ſtone quickly procured. The lime-water will be ſafer, and yet loſe nothing of its virtue, if a dram of ſtarch, or the fourth part of the yolk of an egg, be boiled in ſix or ſeven ounces of it.

Thoſe who, though they have no ſtone in the bladder, are nevertheleſs frequently troubled with fits of the gravel in the kidneys, may probably put a ſtop to the diſorder, by drinking every morning a pint of oyſter-ſhell lime-water, two or three hours before breakfaſt. Its diſagreeable taſte may be mitigated, by adding a very ſmall quantity of new-milk to it: alſo a dram and a half, or two drams, of juniper-berries, infuſed in every quart-bottle of it, will mend its taſte much.

As to the regimen to be obſerved, Dr. Mead recommends a mild diet, and ſuch as is eaſy of digeſtion; and wine and water, mead, or new ſoft ale, for drink; and gentle exerciſe, eſpecially riding. See the articles DIET and REGIMEN.

For the ſeveral operations in cutting for the ſtone, or the method of cure by extraction, ſee the article LITHOTOMY.

STONE alſo denotes a certain quantity or weight of ſome commodities. See the article WEIGHT.

A ſtone of beef, at London, is the quantity of eight pounds; in Herefordſhire, twelve pounds; in the north, ſixteen pounds.

A ſtone of wool (according to the ſtatute of 11 Hen. VII.) is to weigh fourteen pounds; yet in ſome places it is more, in others leſs; as in Glouceſterſhire, fifteen pounds; in Herefordſhire, twelve pounds.

A ſtone, among horſe-courſers, is the weight of fourteen pounds.

STONE, in geography, a market-town, ſeven miles north of Stafford.

STONE-BLUE, the ſame with ſmalt. See the article SMALT.

STONE-CHATTER, in ornithology, the engliſh name of the black motacilla, with a yellow throat and white belly: it is about the ſize of a linnet, and has a remarkable white ſpot on each ſide. See MOTACILLA.

STONEHENGE, in antiquity, a famed pile or monument of huge ſtones on Saliſbury plain, ſix miles diſtant from that city.

It conſiſts of the remains of four ranks of rough ſtones, ranged one within another, ſome of them, eſpecially in the outermoſt and third rank, twenty feet high, and ſeven broad; ſuſtaining others laid acroſs their heads and faſtened by mortiſes: ſo that the whole muſt have antiently hung together.

Antiquaries are now pretty well agreed that it was a britiſh temple; and Dr. Langwith thinks it might eaſily be made probable, at leaſt, that it was dedicated to the ſun and moon. Inigo Jones has given a fine ſcheme of the work, and ſtrives hard to perſuade the world, that it was Roman: but Dr. Langwith, who took his meaſures on the ſpot, aſſures us he could by no means reconcile them with that ſcheme.

STONY LANDS, in agriculture, ſuch as are full of flints, pebbles, or ſmall fragments of free-ſtone.

Theſe lands, in many places, yield good crops; and the general rule is, that, in cold and ſtiff lands, the ſtones ſhould be carefully removed; but, in light and dry lands, it will be advantageous to leave them. However, they always fallow theſe lands every other year, unleſs they ſow peaſe upon them; ſometimes they ſow them with lentils; and when they are quite worn out, they lay them down for clover, or rey-graſs.

STONY-

STONY-STRATFORD, a market-town of Buckinghamſhire, fourteen miles north of Aileſbury.

STOOL, *alvus*, in medicine, an evacuation or diſcharge of the fæces, &c. by the anus.

Spirit of vitriol, mixed with the patient's drink, is ſaid to be an excellent medicine in caſe of bloody ſtools. See the article DYSENTERY.

STOOL is alſo a kind of ſeat, without a back, much uſed by artificers, &c. and, among ſeamen, the reſts whereon the poop and top-lanterns ſtand, are called ſtools.

STOOMING *of wine*, is the putting bags of herbs, or other ingredients, into it. See the article WINE.

STOOPING, in falconry, is when a hawk being upon the wing, at the height of her pitch, bends down violently to take the fowl. See the articles FALCONRY and HAWKING.

STOP, in the manege, is a pauſe, or diſcontinuance of a horſe's motion.

To form a ſtop, you muſt, in the firſt place, bring to the calves of your legs to animate him, bend your body backwards, raiſe the bridle-hand without moving the elbow, then vigorouſly extend your hams, and reſt upon your ſtirrups, and make him form the times or motions of his ſtop, in falcading his haunches three or four times. After ſtopping your horſe, make him give three or four curvets. The oppoſite term of ſtop, is parting. In former times, the ſtop of a horſe was called parade.

Half a ſtop, is a ſtop not finiſhed, but a peſate; ſo that the horſe, after falcading three or four times upon the haunches, reſumes and continues his gallop, without making peſades or corvets.

STOPS, or POINTS, in grammar. See the articles POINT and PUNCTUATION.

STOPPER, in a ſhip, a piece of cable-laid rope, having a wale-knot at one end, with a laniard faſtened to it; and the other end is ſpliced round a thimble in the ring-bolts upon deck, and at the bits: its uſe is to ſtop the cable, that it may not run out too faſt; in order to which, they make turns with the laniard about the cable, and the wale-knot ſtops it, ſo that it cannot ſlip away faſter than is neceſſary.

STORAX, or STYRAX, in natural hiſtory and pharmacy, a dry and ſolid reſin, of a reddiſh colour, and a peculiarly fragrant ſmell, of which there are two kinds, the ſtyrax calamita, or ſtyrax in tears, and the ſtyrax vulgaris, whereof the former is by far the purer and finer kind, imported in ſmall looſe granules, or elſe in large maſſes compoſed of ſuch granules: it antiently uſed to be packed up in reeds, for the more ſecure carriage; whence the name. The common ſtorax is likewiſe a fine and pure reſin, though leſs ſo than the former; and is brought to us in large lumps, not formed of granules, but of one uniform conſiſtence.

Theſe are the two genuine kinds of ſtorax; but neither of them is that met with in our ſhops, which is a kind of ſaw-duſt connected into lumps, by juſt ſo much of the ſtorax-reſin as will make the other matters hang together. This is what our apothecaries uſe, under the name of ſtorax; but it is adviſeable, to ſtrain carefully the pure reſin from the filth, and uſe no part of the latter.

The two genuine kinds of ſtorax, which ought always to be uſed where they can be had, differ only in this; that the granulated ſtorax flows naturally from the ſtyrax-tree, and the common kind is obtained from the ſame tree, by inciſion. See the article STYRAX.

Storax is brought to us from Syria, and the Eaſt-Indies; and ought to be choſen pure, very fragrant, and of an acrid taſte. It is much recommended as a detergent and balſamic, in diſorders of the breaſt: it is alſo eſteemed a cordial, and is recommended in vertigos, and other diſorders of the head and nerves.

On importation, the ſtorax calamita pays a duty of $11\frac{62\frac{1}{2}}{100}$d. the pound; and draws back, on exportation, $10\frac{20}{100}$d.

Liquid STORAX, in pharmacy, is a drug very different from the reſin above deſcribed; being a reſinous juice, of the conſiſtence of venice-turpentine, or thicker: it is, when clean, pellucid, of a browniſh colour, with a caſt ſometimes of reddiſh, and ſometimes of greyiſh in it. Its ſmell is ſomewhat like that of common ſtorax, only much ſtronger, and even diſagreeable: its taſte is acrid, aromatic, and ſomewhat bitteriſh; and it is oily, or unctuous. It ſhould be choſen thin, pellucid, of a clean brown colour, and of a very ſtrong ſmell.

There is another coarſer and very impure kind, not at all pellucid, and of a grey or browniſh colour: its ſmell is much more languid, and alſo more diſagreeable than

than that of the pure kind; whereof it ſeems to be only the dregs, though it is by much the moſt common liquid ſtorax in the ſhops.

Petiver gives the moſt rational account of the origin of liquid ſtorax; which, he ſays, is prepared from the bark of a tree, called by the Turks roſa mallos, which is frequent in the iſland Cobras. The bark of this tree being bruiſed and macerated in ſea-water, is boiled to the conſiſtence of bird-lime; they then collect the reſinous matter that ſwims on the top; which, being foul, is boiled again in ſea-water, and ſtrained: what paſſes the bags is the finer, and what remains in them the coarſer liquid ſtorax. He adds, that liquid ſtorax is much eſteemed in the eaſt, as a perfume. As to its medicinal virtues, they are nearly related to thoſe of turpentine: it is preſcribed, internally, as a detergent and diuretic; and externally, to prevent mortifications. The French ſpeak much of the virtues of the ointment called unguentum de ſtyrace, which is thus prepared: melt in five ounces of nut-oil, gum-elemi and yellow wax, of each three ounces and three drams; add of colophony, ſeven ounces and a half: and when all theſe are perfectly melted together, add three ounces and three drams of pure liquid ſtorax; and let the whole be well mixed, and then cool.

STORGE, *ſοργη*, a greek term, frequently uſed for the parental inſtinct, or natural affection, which almoſt all animals bear their young; whereby they are moſt powerfully moved to defend them from dangers, and procure for them ſuitable nouriſhment.

STORK, *ciconia*, in ornithology, a ſpecies of ardea, with the long wing-feathers black: its general colour is white, which with the black wing-feathers makes a very pleaſing variegation: the legs are red, very long, and naked a great way up: when it ſtands erect, it is between three and four feet high; and its body is about the ſize of a gooſe.

But beſides the common ſtork, there are two other ſpecies of ardea known by the ſame name, *viz.* the black ſtork, with the breaſt and belly white, an erect and beautiful bird, ſomewhat larger than the common heron; and the braſilian ſtork, variegated with black and white, much about the ſize of the common heron. See the articles ARDEA and HERON.

STORM-BIRD, or STORM-FISH, *procellaria*, in ornithology. See PROCELLARIA.

STORMAR, the ſouth diviſion of Holſtein, whereof Hamburgh is the chief town.

STORTFORD, a market-town of Hertfordſhire, thirty miles north of London.

STOVES, in gardening, are buildings erected for the preſervation of tender exotic plants, which, without that aſſiſtance, will not bear the cold of our winter, becauſe they require an artificial warmth. Stoves are of two kinds, diſtinguiſhed by the names of the dry and the bark-ſtoves. The dry ſtove has the flues, in which the ſmoak is carried, either laid under the pavement of the floor, or erected in the back part of the houſe over each other, and returned ſix or eight times all along the ſtove. In theſe ſtoves the plants are placed on ſcaffolds, and benches of boards, raiſed above one another; and the plants, principally preſerved in theſe, are the aloes, cereuſes, euphorbiums, tithymals, and other ſucculent plants, which are impatient of moiſture in winter, and therefore are not to be kept among trees, or herbaceous, plants, which perſpire freely.

The bark-ſtoves are made with a large pit, nearly of the length of the houſe, which is three feet deep, and ſix or ſeven feet wide. This pit is to be filled with freſh tanner's bark to make a hot-bed, and in this the pots, containing the tender plants, are to be plunged.

This invention of tanner's bark for hot-beads, has been of prodigious ſervice to the curious in gardening, as many plants are, by this means, annually preſerved and raiſed, which no other method could have made endure our climate.

The dimenſions of theſe ſtoves muſt be wholly directed by the number of plants intended to be preſerved; and for the dry ſtove, the floor muſt be raiſed above the ſurface of the earth, more or leſs, according to the dryneſs or wetneſs of the ſoil. In the front there is to be a walk about twenty inches wide, for the convenience of walking. The fire-place may be made either in the middle, or at one end, and the furnace muſt be contrived according to the nature of the fuel which is to be burnt there. The beſt firing, when it can be had, is turf, for it burns longer, and more moderately, than any other fuel, as alſo more uniformly, and therefore requires leſs attendance.

The

The entrance into the bark-ſtove ſhould always be either out of a green-houſe, or the dry ſtove, or elſe through the ſhed where the fire is made; becauſe in cold weather the front glaſſes muſt not, by any means, be opened; and the top ſhould be covered either with tarpaulins, or ſliding ſhutters, in bad weather.

The tender ſhrubs and exotic plants muſt be plunged in their pots into the bark-beds; ſuch are the caſhew, cabbage-tree, cocoa-tree, dumb-cane, fuſtick, logwood, mancinel, papaw-tree, ſour-ſop, and the like; and upon the top of the ſtoves may be ſet the melon, thiſtle, the tender cereuſes, and the like.

The thermometer, by which the heat in the ſtove is regulated, muſt always be hung with its back to the ſun, and as far from the flues as may be. The proper ſtructure of theſe ſhelters, for the curious part of the vegetable creation, is to have a green-houſe in the middle, and two ſtoves, and a glaſs-caſe, at each end. See the article GREEN-HOUSE.

STOVE, among confectioners, denotes a little cloſet, well encloſed on all ſides; wherein they dry their ſweet-meats, ranged on ſeveral rows of ſhelves, made of wires.

STOUR, the name of ſeveral ſmall rivers, in England.

STOURBRIDGE, or STURBRIDGE, a market-town, nineteen miles north of Worceſter.

STOURBRIDGE is alſo the name of a field, near Cambridge, where Sturbridge-fair is kept yearly, on Sept. 7. and continues a fortnight.

STOW, a market-town, twenty miles eaſt of Gloceſter.

STOWAGE, in the ſea-language, the placing goods orderly in the hold of a ſhip, *viz.* the heavieſt next the ballaſt, *&c.*

STOWEY, a market-town of Somerſetſhire, eighteen miles weſt of Wells.

STOW-MARKET, a town of Suffolk, ten miles eaſt of Bury.

STRABISMUS, στραβισμὸς, SQUINTING, in medicine and ſurgery, a diſtortion of the eyes, whereby their pupils are turned from, inſtead of being directed towards, objects at which they look: ſometimes only one eye, but more frequently both are thus affected.

This diſorder is frequently cauſed in infants, from letting them conſtantly ſuck at one and the ſame breaſt; or from placing them in the cradle, ſo as that they always look the ſame way towards the light or window; by which repeated action, the muſcles on that ſide become too ſtrong to be ballanced by their oppoſite muſcles; and hence the eye is contorted, or looks obliquely at objects. But it may be alſo owing to convulſive and epileptic motions, to which the eyes of infants are extremely ſubject. And, laſtly, it may proceed, as well in adults as infants, from a ſpaſm, or rigor, or from a palſy in ſome of the muſcles of the eye; as alſo from a defect, or inſenſibility, of ſome part of the retina.

Squinting is a diſorder very difficult to be cured, eſpecially when in adults, and cauſed by ſome defect in the muſcles, or retina: but, in young infants, it may probably be cured, ſays St. Yves, by frequently placing them before a looking-glaſs, that their eyes may be directed towards the image of their own face. Thoſe more advanced in years may be aſſiſted by reading very ſmall writing or print; or by inſpecting very minute objects, provided they turn their eyes even, and bathe them at times with hungary-water. Others propoſe to cure this diſorder with a ſort of maſk, or eye-ſwath, repreſented in plate CCLXII. fig. 2. But this method is ſeldom practicable, through the moroſeneſs of infants, and other impediments.

STRADELLA, a town of the dutchy of Milan, in Italy, ſituated on the ſouth ſide of the river Po, fourteen miles ſouth-eaſt of Pavia.

STRAIGHT, STREIGHT, or STRAIT, in hydrography. See STRAIT.

STRAIN, in ſurgery, a violent extenſion of the ſinews, or tendons, of ſome muſcle.

STRAIT, or STREIGHT, in hydrography, is a narrow paſſage out of one ſea into another, as thoſe of Gibraltar and Magellan.

STRAKES, in the ſea-language, ſignify the uniform ranges of planks on the bottom, decks, and ſides of ſhips; and the garboard-ſtrake is that next the keel.

STRALSUND, a ſtrong city and port-town of Germany, in the circle of upper Saxony and dutchy of Pomerania, ſubject to Sweden: eaſt longit. 13° 22′, and north lat. 54° 23′.

STRAMONIUM, and STRAMONIOIDES, in botany, a plant called by Linnæus datura. See the article DATURA.

STRAND, ſignifies any ſhore of the ſea, or bank of a great river: hence an immunity

munity from paying cuſtoms on goods or veſſels, was antiently expreſſed by ſtrand and ſtream.

STRANDED, among ſeamen, is ſaid of a ſhip that is driven aſhore by a tempeſt, or runs on ground through ill ſteerage, and ſo periſhes.

Where any veſſel is ſtranded, the juſtices of the peace are impowered to command the conſtables near the ſea-coaſt to call aſſiſtance, in order to preſerve the ſame, if poſſible.

STRANGER, in law, ſignifies a perſon who is not privy to ſome act: thus, a ſtranger to a deed, is any perſon who has nothing to do therewith; in which ſenſe it is oppoſed to party or privy.

STRANGFORD, a town of Ireland, that gives name to a lough and bay, in the county of Down and province of Ulſter, ſituated nine miles eaſt of Down.

STRANGURY, in medicine, a difficulty of making water, wherein the urine comes away drop by drop, and is attended with a ſpaſmodic pain about the ſphincter and neck of the bladder; in which ſenſe it is diſtinguiſhed from a dyſury and iſchury. See DYSURY and ISCHURY.

As to the treatment, in order to obtund the acrimony of the blood, and take off the ſpaſtic motions, there is no medicine ſo uſeful as nitre, whether given alone, or mixed with ſome abſterſive ſalt, or with an abſorbent, mixed with a ſmall quantity of an acid to ſaturate it, and with a little cinnabar. A compound powder may be prepared of theſe ingredients, and a ſcruple of it given four times a day, will uſually ſoon take off the complaint. The cooling emulſions, made with barley-water and almonds, and with the cold ſeeds, are alſo of great ſervice: and when there is farther occaſion for medicines, gum arabic, and pills of boiled turpentine, are found very good ones; and decoctions of liquorice-roots in barley-water, with ſyrup of marſh-mallows, may be drank in large draughts. Many people are alſo fond of external remedies, and recommend onions, roaſted and buttered, to be applied to the pubes, and goat's ſuet to be rubbed warm about the navel.

A common ſtrangury is often carried off by mere diluters, ſuch as tea, barley-water, or any other watery liquor, drank in large quantities, till a ſweat comes on; and in the gentler caſes, where theſe alone are not quite effectual, there is no better addition to them than a little nitre. Bleeding in time often prevents great miſchiefs from theſe diſorders; and in caſes of a dyſury, brought on by the taking cantharides, there is no remedy ſo powerful as warm milk alone, drank in large quantities. Mr. Boyle has alſo ſaid much in favour of venice-ſoap on this occaſion.

STRANRAVER, a parliament-town of Scotland, ſituated in the ſhire of Galloway, on a bay of the frith of Clyde.

STRAP, among ſurgeons, a ſtrong piece of leather, or the like, uſed for ſtretching limbs, in the ſetting broken or diſlocated bones. See the articles DISLOCATION, LUXATION, HUMERUS, &c.

STRAPS *of a ſaddle*, are ſtrong leather-thongs, nailed to the bows of a ſaddle, in order to make the girths, &c. faſt. See the article SADDLE.

STRAP, in a ſhip, is a rope ſpliced about any block, or made with an eye, to faſten it any where, on occaſion.

STRAPADO, or STRAPPADO, a kind of military puniſhment, wherein the criminal is hoiſted up by a rope, and let down, ſo that, by the weight of his body in the fall, his arms are diſlocated.

STRASBURG, a free imperial city of Germany, capital of the landgraviate of Alſace, ſituated near the weſtern bank of the Rhine, in eaſt longit. 7° 35′, and north lat. 48° 38′.

STRATA, in natural hiſtory, the ſeveral beds or layers of different matters, whereof the body of the earth is compoſed.

The ſtrata include all the layers of earths, minerals, metals, ſtones, &c. lying under the upper tegument, or ſtratum, the turf or mould.

The time when theſe ſeveral ſtrata were laid, was doubtleſs at the creation; unleſs, with ſome great naturaliſts, as Steno, Dr. Woodward, &c. we ſuppoſe the globe of the earth to have been diſſolved by the deluge. See DELUGE.

The moſt frequent opportunities we have of obſerving theſe in England, is in the coal-mines; where we find them lying in a regular manner, on what appears to us a plane, as we ſee any ſmall part of it: but when we conſider the ſame ſtrata, according to the globular figure of the earth, and ſuppoſe the maſs of the earth to conſiſt of the foregoing, and perhaps in different parts, and at different depths, of ſtrata of ten thouſand other kinds, all originally, while in a ſoft and fluid ſtate, tending toward the center, we ſhall find

that

that it muſt mechanically and almoſt neceſſarily follow, by the continual revolution of the crude maſs from weſt to eaſt, like the winding up of a jack, or the rolling up of the leaves of a paper-book, that every one of theſe ſtrata, though they each reach the center, muſt, in ſome place or other, appear to the day, or on the ſurface. In which caſe there needs no ſpecific gravitation to cauſe the lighteſt to be uppermoſt; and were it practicable to ſink to the center of the earth, all the ſtrata that are would be found in every part, and, according to the poet, *ponderibus liberata ſuis*. Add to this, that, according to an obſervation of Dr. Stukely, the precipices of all hills are to the weſtward, whereas the aſcent to the eaſt is more gradual.

STRATAGEM, or STRATEGEM, in the art of war, any device for the deceiving and ſurpriſing an enemy.

STRATEGUS, in grecian antiquity, an annual officer among the Athenians, whereof there were two choſen, to command the troops of the ſtate.

STRATFORD, a market-town, ſituated ſix miles ſouth of Warwick.

STRATHNAVER, a ſubdiviſion or diſtrict of the county of Sutherland, in Scotland, having the Caledonian ocean on the north and weſt.

STRATIFICATION, in chemiſtry, the ranging any thing to be calcined in ſeveral layers or ſtrata one above another; which operation is denoted by the abbreviation *ſ. ſ. ſ.*

STRATIOTES, the FRESH-WATER-SOLDIER, in botany, a genus of the *polyandria-hexagynia* claſs of plants, the flower of which conſiſts of three obverſely cordated erecto-patent petals; the fruit is an oval berry, attenuated at each end, and covered with the cup; it conſiſts of ſix cells, and contains numerous, oblong, crooked, and, as it were, alated ſeeds.

STRATIOTES is alſo a name given to the hottonia and hydrocharis, two diſtinct genuſes of plants. See HOTTONIA and HYDROCHARIS.

STRATTON, a market-town of Cornwal, ſituated a little ſouth of the Briſtol channel, fourteen miles north-weſt of Launceſton.

STRAUBING, a city of Bavaria, ſituated on the Danube, twenty miles ſouth-eaſt of Ratiſbon.

STRAWBERRY, *fragaria*, in botany. See the article FRAGARIA.

Strawberry-leaves are ſomewhat ſtyptic and bitteriſh; and hence may be of ſome ſervice in debility and laxity in the viſcera, and immoderate ſecretions: they are alſo recommended in hæmorrhages and fluxes. The fruit is very grateful both to the palate and ſtomach, abating heat, quenching thirſt, looſening the belly, and promoting urine.

STRAWBERRY-TREE, *arbutus*, in botany. See the article ARBUTUS.

STRAY, or ESTRAY, in law. See ESTRAY.

STREAM-ANCHOR. See ANCHOR.

STRENÆ, in antiquity, preſents made on new-year's day, as a happy augury for the enſuing year.

STRENGTH, *vis*, in phyſiology, the ſame with force. See FORCE and POWER.

The ſtrengths of different animals of the ſame ſpecies, or of the ſame animal, at different times, are demonſtrated to be in a triplicate proportion of the quantities of the maſs of their blood; the whole ſtrength of an animal is the force of all the muſcles taken together; therefore, whatever increaſes ſtrength, increaſes the force of all the muſcles, and of thoſe ſerving digeſtion as well as others. See MUSCLE.

STRENGTHENERS, in pharmacy, medicines that add to the bulk and firmneſs of the ſolids: and ſuch are all abſorbent, agglutinant, and aſtringent medicines. See ABSORBENTS, AGGLUTINANTS, and ASTRINGENTS.

Medicines of this kind are of great ſervice in hectics, conſumptions, and the like diſorders.

STRIÆ, in the antient architecture, the ſame with the flutings of columns. See the article FLUTING.

Among naturaliſts, the term ſtriæ denotes the ſmall channels and ridges in ſcollop-ſhells, *&c.*

STRIATED LEAF, among botaniſts, one that has a number of longitudinal furrows on its ſurface.

STRICTOR, in anatomy, the ſame with conſtrictor and ſphincter. See the articles CONSTRICTOR and SPHINCTER.

STRIKE, a meaſure of capacity, containing four buſhels. See MEASURE.

STRIKE, among ſeamen, is a word variouſly uſed: when a ſhip, in a fight, or on meeting with a ſhip of war, lets down or lowers her top-ſails, at leaſt half-maſt-high, they ſay ſhe ſtrikes, meaning ſhe yields, or ſubmits, or pays reſpect to the ſhip of war. Alſo, when a ſhip touches ground, in ſhoal-water, they ſay ſhe ſtrikes. And when a top-maſt is to

be taken down, the word of command is, ſtrike the top-maſt, *&c.*

STRING, or CHORD, in muſic. See CHORD.

STRIX, the OWL-KIND, in ornithology, a genus of birds, with four toes on each foot; three of which ſtand forward, and the other backward.

To this genus belong the bubo, or great horned owl, the ſcops, *&c.* See the articles BUBO, SCOPS, *&c.*

STROBILUS, among botaniſts, a kind of pericarpium, formed of a number of vaginæ, with contorted points applied cloſe to one another. See PERICARPIUM.

STROMATEUS, in ichthyology, a genus of fiſhes of the malacopterygious, or ſoft-finned, kind, the characters of which are theſe: the body is very much compreſſed, and very broad and thin; it has no belly-fins, and has only one back-fin, which is extended over the whole back. The only known ſpecies of this genus is the callichthys of authors, a fiſh called the fiatola at Rome: the tail of which is very forked; the mouth is very ſmall; the teeth are placed in the jaws and palate; and the tongue is ſmooth and broad: the body is ſtriped croſs-ways.

STROMBOLI, one of the Lipari-iſlands, fifty miles north of Meſſina.

STRONGOLI, a town of the hither Calabria, in the kingdom of Naples, ſituated on the gulph of Taranto.

STROPHE, in antient poetry, a certain number of verſes, including a perfect ſenſe, and making the firſt part of an ode. See the article ODE.

STROUD, a market-town, nine miles ſouth of Glocester.

STRUMÆ, ſcrophulous tumours ariſing on the neck and throat, conſtituting what is commonly called the king's evil. See the article SCROPHULA.

STRUTHIA, in botany, the ſame with the gnidia. See the article GNIDIA.

STRUTHIO, the OSTRICH, in ornithology. See the article OSTRICH.

STRUTHIUM, in botany, the ſame with the luteola, or dyer's weed. See LUTEOLA.

STRYCHNUS, in botany, a genus of the *pentandria-monogynia* claſs of plants, with a monopetalous flower, quinquifid at the limb; its fruit is a very large and ſmooth unilocular berry, full of a pulpy matter, and containing orbiculated ſeeds, with hairs radiated from their edges.

STRYMON, or AMPHIPOLIS. See the article AMPHIPOLIS.

STUC, or STUCCO, in building, a compoſition of white marble, pulveriſed and mixed with plaſter of lime; and the whole being ſifted and wrought up with water, is to be uſed like common plaſter: this is what Pliny means by marmoratum opus, and albarium opus.

STUFF, in commerce, a general name for all kinds of fabrics of gold, ſilver, ſilk, wool, hair, cotton, or thread, manufactured on the loom; of which number are velvets, brocades, mohairs, ſattins, taffeties, cloths, ſerges, *&c.* See the articles VELVET, BROCADE, *&c.*

STULINGEN, a town of Swabia, in Germany, thirty-five miles weſt of Conſtance.

STUL-WEISSENBURG, a city of lower Hungary, thirty-ſix miles ſouth-weſt of Buda.

STUM, in the wine-trade, denotes the unfermented juice of the grape, after it has been ſeveral times racked off, and ſeparated from its ſediment. The caſks are, for this purpoſe, will matched, or fumigated with brimſtone every time, to prevent the liquor from fermenting, as it would otherwiſe readily do, and become wine. See MATCHING.

It is this fume of the ſulphur from the match, that prevents, in this caſe, all tendency to fermentation, and continues the natural juice of the grape in a ſweet ſtate, fit to be readily mixed with wines inſtead of ſugar; for which purpoſe it is very much uſed in Holland, and ſome other countries; as alſo for giving a new fret, or briſkneſs to decayed wines: ſo that very large quantities of this ſtum are annually imported to all parts, along with the foreign wines. And after the ſame manner a ſtum is prepared in England, from the juice of apples, which ſerves the ordinary purpoſes of the wine-cooper. In the preſerving this liquor in this ſtate, we ſee the vaſt uſe of brimſtone, for it could never be done otherwiſe than by the matching of the caſks.

Dr. Shaw gives the following method of preparing an artificial ſtum, nothing inferior to the natural; and as fit for the refermenting, fretting, improving, or making of wines, vinegars, and ſpirits. Take three pound of fine lump-ſugar, or ſuch as has been well refined from its treacle; melt it in three quarts of water, and add, in the boiling, of rheniſh tartar, finely powdered, half an ounce; this diſſolves with a remarkable ebullition, and gives a grateful acidity to the liquor: take the veſſel from the fire, and ſuffer it to cool, and you have an artificial muſt, which

which in all reſpects reſembles the natural taſte and ſweet juice of a white flavourleſs grape, when well purified, and racked off from its ſediment, in order to make ſtum. If this artificial muſt be ſtummed, that is, well fumigated with burning brimſtone, it becomes a perfect ſtum, and may be made of any flavour, at the diſcretion of the artiſt.

STUNG, or ADDER-STUNG. See the article ADDER.

STUPEFIERS, in medicine, the ſame with narcotics and opiates. See the articles NARCOTICS and OPIATES.

STUPOR, a numbneſs in any part of the body, whether occaſioned by ligatures obſtructing the blood's motion, by the palſy, or the like.

STUPHA, or STUPE, in medicine, is a piece of cloth dipped in ſome proper liquor, and applied to an affected part, by way of fomentation or epithem. See the articles FOMENTATION and EPITHEM.

STURGEON, *ſturio*, in ichthyology, a ſpecies of accipenſer, with the body armed with rough tubercles. See the article ACCIPENSER.

The ſturgeon is a very large fiſh, growing to fourteen, ſixteen, or eighteen feet in length; though the greater part are caught much ſmaller. There are four cirri at the extremity of the under jaw; the eyes are large, and ſtand at a great diſtance from the extremity of the roſtrum or ſnout: but what is very ſingular in the ſturgeon, is the ſpinoſe tubercles, of which there are ſeveral ſeries or rows. See plate CCLXII. fig. 4.

STURMINSTER, a market-town, eighteen miles north of Dorcheſter.

STURNUS, the STARLING, in ornithology. See the article STARLING.

STUTGART, a city of Swabia, ſituated on the river Neckar, in eaſt long. 9°, and north lat. 48° 40′.

STYE, or STITHE, a diſorder of the eyelids; being a ſmall encyſted tumour, about the bigneſs of a barley-corn.

The ſtye frequently occaſions much pain and uneaſineſs, and muſt be treated with great caution, on account of the tenderneſs, of the eye. Some recommend cataplaſms, and the like applications, to theſe; but the eye is often hurt by thoſe applications, and it is obſerved beſides, that theſe tubercles ſeldom give way to topical applications of any kind.

When they are ſmall, Heiſter thinks it beſt to let them take their own courſe; but if ſo large as to occaſion deformity or danger of hurting the ſight, the way to extirpate them, is to make a longitudinal inciſion on the part, and carefully take them out whole; or, if it cannot be thus got out clean, it muſt be cut out, as far as may be done, with ſciſſars, and dreſſed with ægyptian ointment, and a little red precipitate, or touched at times with the common cauſtic, till eaten thoroughly away, and then the wound dreſſed and healed in the common manner.

This is the method by which the flat and broad-bottomed tumours of this kind are to be extirpated; and in this, great care muſt be taken that none of the ſharp applications touch the eye, as they might injure the ſight. It is common, however, with theſe tumours to hang by a ſort of ſmall root, and then they are much more eaſily managed, there being no more neceſſary than the cutting them cloſe off, with a pair of ſciſſars, or the tying them firmly round with a piece of ſilk or horſe-hair. They are ſometimes, if taken in time, diſperſed by rubbing them with faſting ſpittle, or by applying the pulp of a roaſted apple mixed with ſome ſaffron and camphor.

STYGIAN LIQUORS, an appellation given to cauſtic and corroſive waters, and particularly to aqua regia. See the article AQUA.

STYLE, a word of various ſignifications, originally deduced from στυλος, a kind of bodkin, wherewith the antients wrote on plates of lead, or on wax, *&c.* and which is ſtill uſed to write on ivory-leaves, and paper prepared for that purpoſe, *&c.*

Lapidary's STYLE. See LAPIDARY.

STYLE, in dialling, denotes the gnomon or cock of a dial, raiſed on the plane thereof, to project a ſhadow. See the articles DIAL and GNOMON.

STYLE, in botany, is a part of the piſtil of plants, and is of various figures, but always placed on the germen: it gives origin to the ſtigma. In ſome plants it is extremely ſhort, and in others it ſeems entirely wanting. See the articles PISTIL, STIGMA, and GERMEN.

STYLE, in matters of language, a particular manner of expreſſing one's thoughts agreeably to the rules of ſyntax; or, as F. Buffier more accurately defines it, the manner wherein the words, conſtructed according to the laws of ſyntax, are arranged among themſelves, ſuitably to the genus of the language.

From this deſcription it appears, that the ſtyle ſuppoſes, or includes the ſyntax; and

that ſyntax does not extend ſo far as ſtyle, for the ſyntax may be juſt, where the ſtyle is wretched. A fault in ſtyle is not leſs a fault againſt grammar, than is a fault in ſyntax; only the former is leſs preciſe and palpable than the latter. A very common error in grammarians, F. Buffier adds, is to confound two kinds of ſtyles in one: grammatical ſtyle, or that directed by the rules of grammar; and the perſonal ſtyle, which depends leſs on the grammar than on the perſon that writes, whether with regard to his particular taſte and genius, or with regard to his matter, or the kind or character of his work. There are a great many differences between the two; the moſt eſſential is, that the one may be diverſified an infinite number of ways, and the other cannot. In effect, the perſonal ſtyle is naturally variable, according to the different genius, humours, and complexions.

It is the imagination that acts, that conceives, that propoſes, and that expreſſes things, according to its character, which is different in all men, and which is to be varied according to the particular kind of the work. Hence ariſe the gay, the grave, the florid, the jejune, the copious, the conciſe, the poetical, the epiſtolary, and the burleſque ſtyles. Theſe perſonal ſtyles are all independent on the grammatical; and we have authors who excel in the one, and are miſerably defective in the other. The perſonal ſtyle is not under the direction of grammar, but of the imagination, or rather of rhetoric, that art having to do directly with our thoughts, as grammar with our words. This, however, may be ſaid, that grammar is far from being able to vary the ſame words of a phraſe, with equal perfection; and that there is but one way of delivering them in the taſte and genius of the language.

In oratory and poetry, ſtyle is reſtrained wholly to what F. Buffier calls the perſonal ſtyle. Language refers principally to the matter of the diſcourſe, *viz.* the words; elocution to the particular members or parts thereof; and ſtyle to the whole compoſition. The maſters of the art reduce the kinds of ſtyle to three; the ſublime, the low, and the intermediate or equable ſtyle. The ſublime ſtyle is that conſiſting in magnificent words and ſentences; which, by its noble boldneſs, raviſhes the hearers, and extorts admiration, even from the unwilling. See the article SUBLIME.

Low or ſimple ſtyle is that ordinarily uſed in ſmaller and humbler works, as epiſtles, dialogues, and common diſcourſe. The chief virtues hereof are perſpicuity, ſmoothneſs, eaſineſs, and cleanlineſs. It muſt be very ſparing in the uſe of tropes and figures, eſpecially the more violent ones, as the proſopopœia, apoſtrophe, *&c.* See the article PROSOPOPOEIA, *&c.*

Intermediate or equable ſtyle partakes of the magnificence of the ſublime, and the ſimplicity of the low. It neither riſes to the majeſty of the one in words and ſentences, nor yet is ſmartly pointed like the other. Tully calls this the poliſhed and florid ſtyle; it being in this that all the graces and beauties of language are principally to be uſed.

As to the choice of ſtyle in the general, the nature of the ſubject is to determine it. Such ſtyle, ſays Cicero, is to be choſen as expreſſes great things magnificently, middle things moderately, and low things ſubtilly: but more particularly as there are three branches of the duty of an orator, to teach, to delight, and to move; the ſimple ſtyle is uſed to teach, the middle to delight, and the ſublime to move. Again, the ſimple or low ſtyle is fit for comedy, the ſublime for tragedy, and the middle for hiſtory. Again the ſimple ſtyle is fit for bucolics and eclogues, the intermediate for georgics, and the ſublime for epics: which triple difference we may diſcern in Virgil, though he ſometimes mixes them all in the Æneid itſelf, uſing the ſimple ſtyle in the fifth book, where he deſcribes games; and the intermediate in the beginning of the poem. Care is ſtill to be taken that the ſtyle be not flat and dull, on pretence of being ſimple.

The chief faults in ſtyle are its being tumid and ſwoln, or cold and puerile, or ſtiff, or looſe, or dry and jejune. A tumid ſtyle is that immoderately ſtuffed with big words and ſentences. Frigid or puerile ſtyle is that which affects certain trifling ornaments, inſipid jeſts, remote and ſtrained alluſions, redundant deſcriptions, *&c.* Looſe ſtyle is that which, wanting articles, numbers, *&c.* fluctuates here and there, not connected or joined together. Dry jejune ſtyle, is that which is deſtitute of ornament, ſpirit, *&c.*

The antients made a notable diſtinction of ſtyles into Laconic and Aſiatic: laco-

nic

nic ſtyle is diſtinguiſhed by its exceeding conciſeneſs, and by comprehending a deal of matter under a few words: aſiatic ſtyle, on the contrary, is that which is very diffuſive and prolix, or where abundance of words are uſed to expreſs a little matter.

STYLE, in jurisprudence, the particular form, or manner of proceeding in each court of juriſdiction, agreeable to the rules and orders eſtabliſhed therein: thus we ſay the ſtyle of the court of Rome, of Chancery, of Parliament, of the Privy-council, &c.

STYLE, in muſic, denotes a peculiar manner of ſinging, playing, or compoſing; being properly the manner that each perſon has of playing, ſinging, or teaching; which is very different both in reſpect of different geniuſes, of countries, nations, and of the different matters, places, times, ſubjects, paſſions, expreſſions, &c. Thus we ſay the ſtyle of Paleſtrina, of Lully, of Corelli, of Handel, &c. the ſtyle of the Italians, French, Spaniards, &c. The ſtyle of gay pieces of muſic is very different from that of ſerious ones; and the ſtyle of church muſic is very different from theatrical muſic. The ſtyle of the italian compoſitions is poignant, florid, expreſſive: that of the french compoſitions, natural, flowing, tender, &c. Hence the various epithets given to diſtinguiſh the various characters; as the antient and modern ſtyles; the italian and german ſtyles; the eccleſiaſtical and dramatic ſtyles; the gay, the grave, majeſtic, natural, ſoft, familiar, gallant, low, ſublime ſtyles, &c.

The ſtylo recitativo, or dramatico, in the italian muſic, is a ſtyle fit to expreſs the paſſions: the ſtylo eccleſiaſtico, is full of majeſty, very grave, and fit to inſpire devotion: ſtylo motectico, is a various rich, florid ſtyle, capable of all kinds of ornaments, and of conſequence fit to expreſs various paſſions, particularly admiration, grief, &c. ſtylo madrigaleſco is a ſtyle proper for love, and the other ſofter paſſions: ſtylo hyperchematico is a ſtyle proper to excite joy, mirth, and dancing, and conſequently full of briſk and gay motions: ſtylo ſymphoniaco, is a ſtyle fit for inſtrumental muſic: but as each inſtrument has its peculiar effects, there are as many different ſymphonical ſtyles: the ſtyle of the violin, for inſtance, is uſually gay; that of the flutes, melancholy and languiſhing; that of trumpets, ſprightly and animating: ſtylo meliſmatico is a natural artleſs ſtyle, which any body almoſt may ſing, fit for airs and ballads: ſtylo phantaſtico, is an eaſy humorous manner of compoſition, free from all conſtraints, &c. ſtylo choraico, a ſtyle that is proper for dancing, and is divided into as many different kinds as there are different dances; as the ſtyle of ſarabands, minuets, gavots, jiggs, rigadoons, chacones, &c.

Old-STYLE, the julian manner of computing times, as the

New-STYLE is the gregorian method of computation. See the articles JULIAN, GREGORIAN, BISSEXTILE, &c.

STYLET, or STILETTO, a ſmall dangerous kind of pionard, which may be concealed in the hand, chiefly uſed in treacherous aſſaſſinations. The blade is uſually triangular, and ſo ſlender that the wound it makes is almoſt imperceptible. The ſtylet is prohibited in all well-diſciplined ſtates.

STYLITES, an appellation given to a kind of ſolitaries, who ſpend their lives ſeated on the tops of columns, to be, as they imagine, the better diſpoſed for meditation, &c. Of theſe we find ſeveral mentioned in antient writers, and even as low as the eleventh century. The founder of the order was St. Simon Stylites, a famous anchoret in the fifth century, who took up his abode on a column ſix cubits high; then on a ſecond, of twelve cubits; a third, of twenty-two; and, at laſt, on another of thirty-ſix. The extremity of theſe columns were only three feet in diameter, with a kind of rail or ledge about it that reached almoſt to the girdle, ſomewhat reſembling a pulpit. There was no lying down in it. The faquirs, or devout people of the eaſt, imitate this extraordinary kind of life even to this day.

STYLOGLOSSUS, in anatomy, a muſcle ariſing from the apex of the ſtyloide proceſs; and, deſcending obliquely to the ſide and root of the tongue, moves it ſideways, backwards and forwards.

STYLOHYOIDÆUS, in anatomy, a pair of muſcles ariſing in the ſtyloide proceſs, and terminating in the horn and the baſe: this is often perforated by the digaſtric muſcle of the jaw. Theſe muſcles draw laterally upwards.

STYLOIDES, in anatomy, an apophyſis of the os petroſum, thus called from its reſembling a ſtyle or ſtylet.

STYLOPHARYNGÆUS, in anatomy, one of the ſix pair of muſcles which ſerve to dilate the pharynx. See the article PHARYNX.

The ſtylopharingæus ariſes from the beginning of the ſtyloide proceſs, and is inſerted on both ſides into this and into the thyroide proceſs: it ſerves alſo to elevate as well as dilate the pharynx.

STYPTIC, στυπτικον, in pharmacy, medicines which by their aſtringent qualities ſtop hæmorrhages. See the article HÆMORRHAGE.

When a conſiderable hæmorrhage is ſtopt by abſorbents or ſtyptics, it is always produced by means of a clot of blood, ſecured by compreſſion, ſo that the orifice of the veſſel is ſtopt. This clot generally conſiſts of two parts, the one without, and the other within, the veſſel: that without is formed by the laſt flowing blood, which, in coagulating, incorporates itſelf with the lint, moſs, or powders, uſed for ſtopping the blood: the other part of the clot within the veſſel, is only that portion of the blood which was ready to be diſcharged when the veſſel was ſtopped. Theſe two parts are often but one continued clot. That without the veſſel performs the office of a covering, whilſt that within ſerves as a kind of ſtopper. Alcohol, or pure ſpirit of wine, is the moſt uſual, and perhaps the beſt, ſtyptic; and is the baſis of moſt of the celebrated arcana for ſtopping hæmorrhages. Boerhaave ſays it becomes an immediate ſtyptic, as it prevents putrefaction, and occaſions a thin but very ſolid eſchar. For if pledgits be dipped in pure alcohol, made hot, and applied to a bleeding wound, if it be cloſely compreſſed upon the part, and covered with a piece of bladder lightly beſmeared with oil, and kept on with a proper bandage, the hæmorrhage preſently ceaſes, and the whole dreſſing may continue unremoved for three days, in which time the veſſels are uſually cloſed and ſtrongly contracted and conſolidated, by means of the alcohol.

The ſtyptic powder of Helvetius is a medicine ſaid to be ſerviceable in uterine hæmorrhages, either to correct the too frequent return of the menſes, or their too great abundance; alſo to ſtop the flooding to which women with child are ſubject, and to moderate the flow of the lochia. It is alſo found to have very ſurprizing good effects in the fluor albus. It is a compoſition of alum and dragon's-blood. and in the Edinburgh diſpenſatory, two parts of alum are directed to be made into powder with one of the dragon's-blood: others uſe equal parts of both. Heiſter recommends this powder or alum alone, with a decoction of linſeed.

Eaton's ſtyptic is famous for curing freſh wounds in a very ſmall time, and immediately ſtopping their bleeding: but Dr. Sprengel is ſaid to prove, beyond all poſſibility of doubt, that this is in effect no other than the ſtyptic of Helvetius.

The female agaric has been of late greatly celebrated as a ſtyptic, and is ſaid to reſtrain not only the venal but arterial hæmorrhages, without the uſe of ligatures. See AGARIC, (*appen.*)

STYRAX, STORAX, in botany, a genus of the *icoſandria-monogynia* claſs of plants, the corolla whereof is monopetalous and funnel-ſhaped: the tube is cylindric, and no longer than the cup: the fruit is a roundiſh drupe, having only one cell: the ſeeds are two roundiſh acuminated nuts, convex on one ſide and plane on the other. This tree is a native of ſeveral parts of Europe and of the eaſt: in the latter part of the world it affords the fragrant reſin called ſtyrax, on wounding its trunk: for the virtues, &c. whereof ſee the article STORAX.

SUANA, or SOVANA, a town of Italy, in the dutchy of Tuſcany, and province of Sienna: ſituated on the confines of the dutchy of Caſtro, fifty miles ſouth of Sienna.

SUB, a latin prepoſition, ſignifying *under*, or *below*, frequently uſed in compoſition in our language: thus, 1. Sub-brigadier is an officer in the cavalry who commands under the brigadier, aſſiſting him in the diſcharge of his office. 2. Sub-chantor, an officer in the choir, who officiates in the abſence of the chantor. 3. Sub-deacon, an antient officer in the church that was made by the delivery of an empty platter and cup by the biſhop; and of a pitcher, baſon, and towel by the arch-deacon. His office was to wait on the deacon with the linnen whereon the body, &c. was conſecrated, and to receive and carry away the plate with the offerings at the ſacraments, and the cup with the wine in it, &c. 4. Sub-dean, a dignity in ſome chapters beneath the dean. 5. Sub-marſhal, an officer in the

the Marſhalſea that is deputy to the chief-marſhal of the king's houſe, who is commonly called knight-marſhal, and has the cuſtody of the priſoners there. 6. Sub-prior, a clauſtral officer who aſſiſts the prior, &c. See the articles BRIGADIER, CHANTOR, DEACON, DEAN, &c.

SUBALTERN, a ſubordinate officer, or one who diſcharges his poſt under the command, and ſubject to the direction of another: ſuch are lieutenants, ſub-lieutenants, cornets and enſigns, who ſerve under the captain; but cuſtom has now appropriated the term to thoſe of much lower ranks, as ſerjeants, and the like. We alſo ſay ſubaltern-courts, juriſdictions, &c. ſuch are thoſe of inferior lords, with regard to the lord paramount; hundred courts, with regard to county-courts, &c.

SUBBUTEO, in ornithology, the yellow-legged falco, with the head brown, and the ſhoulders and belly white. See the article FALCO.

SUBCLAVIAN, *ſubclavius*, in anatomy, is applied to any thing under the arm-pit or ſhoulder, whether artery, nerve, vein, or muſcle.

Subclavius more particularly denotes a ſmall oblong muſcle lying between the clavicle and firſt rib. It is fixed by one end in all the middle lower portion of the clavicle, at the diſtance of about an inch from each extremity, and by the other in the cartilage, and a ſmall part of the bone of the firſt rib.

SUBCONTRARY POSITION, in geometry, is when two ſimilar triangles are ſo placed as to have one common angle V, (plate CCLXII. fig. 7.) at the vertex, and yet their baſes not parallel. If the ſcalenous cone, BVD, be ſo cut by the plane CA, as that the angle at C = the angle at D, the cone is then ſaid to be cut ſubcontrarily to its baſe BD.

SUBCOSTAL MUSCLES, *ſubcoſtales*, in anatomy. Theſe muſcles are fleſhy planes of different breadths, and very thin, ſituated more or leſs obliquely on the inſide of the ribs, near their bony angles, and running in the ſame direction with the external intercoſtals. They are fixed by other extremities in the ribs, the inferior extremity being always at a greater diſtance from the vertebræ than the ſuperior, and ſeveral ribs lying between the two inſertions. Theſe muſcles are more ſenſible in the lower ribs than in the upper, and they adhere cloſely to the ribs that lie between their inſertions.

SUBCUTANEOUS, in anatomy, a thin membranous muſcle, running under the ſkin, called alſo quadratus genæ, and platiſma myoides. It ariſes with a pretty broad origin from the hind part of the neck, and from the pectoral muſcle below the clavicle. It adheres firmly to the paniculus carnoſus, from which it is not ſeparated without difficulty, and therefore it was not antiently diſtinguiſhed from it. It is inſerted obliquely on each ſide into the lower jaw-bone, near the ſkin, lips, and ſometimes the bottom of the noſe, all which parts it draws downwards and awry. A convulſion herein is called the cynic ſpaſm. In ſome perſons it reaches to the ears, which is the reaſon that ſome have the faculty of moving their ears which others want.

SUBCUTANEOUS GLANDS, in anatomy. See the article GLAND.

SUBDUCTION, in arithmetic, the ſame as ſubſtraction. See SUBSTRACTION.

SUBDUPLE RATIO, is when any number or quantity is contained in another twice: thus 3 is ſaid to be ſubduple of 6, as 6 is duple of 3.

SUBDUPLICATE RATIO of any two quantities is the ratio of their ſquare roots. See the article RATIO.

SUBER, the CORK-TREE, in botany, a ſpecies of quercus. See OAK.

SUBJECT, *ſubditus*, a perſon under the rule and dominion of a ſovereign prince or ſtate.

SUBJECT, *ſubjectum*, is alſo uſed for the matter of an art or ſcience, or that which it conſiders, or whereon it is employed: thus the human body is the ſubject of medicine. In this ſenſe the anatomiſts call the body they are diſſecting, and whereon they read lectures, their ſubject. The ſubject of logic is thinking or reaſoning; but more particularly in a ſyllogiſm one of the terms of a propoſition is called the ſubject, and the other the attribute. In poetry, the ſubject is the matter treated of, or the event related or ſet to view. Subject alſo denotes the ſubſtance or matter to which an accident is added, whence the maxim that two contraries can never ſubſiſt in the ſame ſubject.

SUBJECT, in the manege. To keep the horſe ſubject, is an expreſſion relating to colts, ſignifying to keep the croupe of the horſe in the round ſo that it may not

ſlip

ſlip out; that he may not traverſe; and that he may work, in the manege, croupe in, marking his equal times, without loſing his ground.

SUBJECT, in muſic. See SOGETTO.

SUBJUNCTIVE, in grammar, the ſecond mood of verbs, thus called becauſe ſubjoined to another verb, or particle at leaſt, and not ſtanding alone in a ſentence: thus *Orat ut ad ſe venias. Quid faciam prorſus ignoro. Though this were true, &c.* See the article MOOD.

SUBLIMABLE BODIES, a term uſed by ſome of our chemical writers to expreſs ſuch ſubſtances as are capable of ſublimation in a dry form. See the article SUBLIMATION.

SUBLIMATE, a chemical preparation, the baſis whereof is mercury or quick-ſilver. There are two kinds of ſublimate, corroſive ſublimate and ſweet ſublimate, or mercurius dulcis ſublimatus, which ſee under MERCURY.

SUBLIMATION, the condenſing and collecting in a ſolid form by means of veſſels aptly conſtructed, the fumes of bodies raiſed from them, by the application of a proper heat. Sublimation is in all reſpects the ſame with diſtillation, except that in the firſt the produce is ſolid, but in the latter fluid. The only variation therefore neceſſary in the operation, is the accommodating the recipient part of the apparatus to this difference, which admits, in moſt caſes, that one veſſel may perform the office both of condenſer and receiver, as the matter cannot, like fluids, flow to another part, but muſt remain where it firſt ſettles, except in ſome inſtances where the matter is extremely volatile, or where a fluid riſing with it renders a depending receiver neceſſary. See DISTILLATION.

The veſſels proper, in reſpect of the different ſubjects of this operation, vary in their ſtructure and the ſubſtance of which they are made, as well on account of the degree of heat requiſite to be employed, as the nature of the matter to be ſublimed, ſince corroſions of them are here, and indeed in all other caſes, to be careſully avoided. In ſublimations of mercury, whether combined with acids or ſulphur, of ſal ammoniacum and of ſulphur alone, a ſingle veſſel may anſwer all the purpoſes, as their neceſſity of a great heat to keep them in the condition of fumes renders the upper part of the glaſs capable of detaining them when they are raiſed thereto; but it is proper, in theſe inſtances, that a glaſs in ſand, or earthen ware, ſhould be uſed. A glaſs body, in a ſtrong ſand heat, may very well ſerve for all theſe; but ſublimate of mercury is frequently ſublimed in a bolt-head, or matraſs; and the factitious cinnabar, by thoſe who make large quantities, in an earthen veſſel made in the ſhape of an egg. In the ſublimation of volatile ſalt of amber, and flowers of benjamin, a container and condenſer are ſeparately neceſſary, and may in all theſe caſes be extremely well ſupplied by a retort and receiver, though bodies with alembic heads, and receivers of glaſs fitted to them, have been generally recommended in ſeveral of them; but the trouble of luting two junctures, and the difficulty of fitting them to each other, with ſeveral other reaſons, make retorts far more convenient. A retort and receiver are likewiſe proper in the caſe of cinnabar of antimony; for though the cinnabar might be reſtrained in one glaſs, the butter of antimony makes the receiver neceſſary.

In ſublimations of factitious cinnabar, mercury ſublimate, and ſal-amoniacum, it is ſufficient to cover the aperture or neck of the veſſel with a tile; and in the ſublimation of cinnabar of antimony, and flowers of Benjamin, in retorts, it is unneceſſary to lute on the receiver; but in the ſublimation of volatile ſalts, it is requiſite to lute the veſſels as ſecure as poſſible, leaving only a ſmall vent till they attain the greateſt heat they are to ſuffer during the operation.

The requiſite degree of heat in ſublimation varies in almoſt every different ſubject of the operation. The limits are from the greateſt degree that can be given in ſand, to a degree ſomething leſs than that which will make water boil. See the article HEAT.

Hoffman obſerves, that only thoſe things are ſublimable which contain a dry exhaleable matter in their original conſtruction, and among theſe is found a great variety, which require various methods and means to execute that effect. Among the minerals, ſulphur, antimony, and orpiment, are named as the principal ſublimable bodies: theſe are of a very lax compage or ſtructure, and eaſily raiſed by fire in ſmall particles, which concrete again on being ſtopt from flying off by the cover of the veſſel; while, on the contrary, iron, ſilver, and the other metals, being of a cloſer ſtructure, remain

main fixed in the greateſt heat, and never aſcend without being mixed with ſome volatile ſubſtance that is of itſelf capable of riſing and taking up ſome of them with it. Thus copper and iron will be raiſed in ſublimation by means of ſal ammoniac mixed with them; and even gold itſelf is ſaid to be ſubject to the ſame law; Mr. Boyle aſſuring us that he had a ſecret method of preparing a certain ſaline ſubſtance, by means of a very ſmall admixture of which, gold would be made to riſe in ſublimation, and form fine purple cryſtals. The admixtures which make bodies ſublimable that are not ſo in themſelves, are to be of various kinds, according to the nature of the body to be ſublimed. Among theſe, ſome act by rendering the body more eaſily fuſible, and diſuniting thoſe particles more readily which the fire is expected to carry up: others act again by preventing the cohefions of the particles of the ſubſtance to be ſublimed, which heat would otherwiſe occaſion: and, finally, others, by entering the body of the fixed ſubſtance they are mixed with, and giving wings, as it were, to its ſubtle particles, ſo that they may aſcend with its eaſily ſublimable matter, and join with it in the formation of one mixed ſubſtance in the top of the veſſel, by partaking of the nature of both. Others act potentially in the ſame way, but by different means, themſelves not being capable of ſublimation, but acting on the ſubſtance to be ſublimed, by enervating, weakening, or abſorbing thoſe ſubſtances, or parts, of the mixed body, which would otherwiſe have prevented the aſcent of the reſt: and, finally, ſome act as diſſolvents only, and by that means render things eaſy of ſublimation, which would have been very difficultly ſo, while their parts were in a more ſtrict continuity.

SUBLIME, in diſcourſe, is defined by Boileau, to be ſomething extraordinary and ſurpriſing, which ſtrikes the ſoul, and makes a ſentiment or compoſition raviſh and tranſport.

From this definition it appears, that the ſublime is a very different thing from what the orators call the ſublime ſtyle. The ſublime ſtyle neceſſarily requires big and magnificent words; but the ſublime may be found in a ſingle thought, a ſingle figure, a ſingle turn of words. A thing may be in the ſublime ſtyle and yet not be ſublime; that is, it may have nothing extraordinary and ſurprizing. See the article STYLE.

Longinus makes five ſources of the ſublime: the firſt, a certain elevation of the mind, which makes us think happily: the ſecond is the pathetic, or that natural vehemence and enthuſiaſm which ſtrikes and moves us; theſe two are wholly owing to nature, and muſt be born with us; whereas the reſt depend partly on art: the third is the turning of figures in a certain manner, both thoſe of thoughts and of ſpeech: the fourth, nobleneſs of expreſſion; which conſiſts of two parts, the choice of words, and the elegant figurative diction: the fifth, which includes all the reſt, is the compoſition and arrangement of the words in all their magnificence and dignity.

SUBLINGUAL GLANDS, in anatomy, two glands under the tongue, placed one on each ſide thereof. Theſe, called alſo hypoglottides, filtrate a ſerous humour of the nature of ſaliva, which they diſcharge by little ducts near the gums into the mouth. See GLAND.

SUBMULTIPLE, in geometry, *&c.* A ſubmultiple number, or quantity, is that which is contained a certain number of times in another, and which, therefore, repeated a certain number of times, becomes exactly equal thereto: thus 3 is a ſubmultiple of 21; in which ſenſe ſubmultiple coincides with an aliquot part. See the article ALIQUOT PART.

SUBMULTIPLE RATIO, is that between the quantity contained and the quantity containing: thus the ratio of 3 to 21 is ſubmultiple. In both caſes ſubmultiple is the reverſe of multiple, 21, *e.g.* being a multiple of 3, and the ratio of 21 to 3 a multiple ratio. See the article RATIO.

SUBNORMAL, in geometry, a line which determines the point in the axis of a curve, where a normal, or perpendicular, raiſed from the point of contact of a tangent to the curve, cuts the axis. Or the ſubnormal is a line which determines the point wherein the axis is cut by a line falling perpendicularly on the tangent in the point of the contact: thus TM (plate CCLXII. fig. 6.) being a tangent to a curve in M, and MR a normal or perpendicular to the tangent, the line PR intercepted between the ſemiordinate PM, and the normal MR, is called the ſubnormal. Hence in a parabola as AM, *&c.* the ſubnormal PR is

to the ſemi-ordinate PM, as PM is to PT, and MR to TM. 2. In the parabola the ſubnormal PR is ſubduple the parameter, and, conſequently, an invariable quantity.

SUBORDINATION, a relative term, expreſſing the degree of inferiority between one thing and another.

SUBORNATION, a ſecret or under-hand preparing, inſtructing, or bringing in a falſe witneſs; or corrupting or alluring a perſon to do ſuch a falſe act. Hence, ſubornation of perjury is a corrupting or inticing a perſon to perjury. See the article PERJURY.

Perſons ſuborning a witneſs to give falſe evidence, are liable to 40l. forfeiture, or to be impriſoned for half a year, ſtand on the pillory, &c.

SUBPOENA, in law, a writ whereby all common perſons, or thoſe under the degree of peerage, may be called into chancery, in any caſe where the law cannot afford a remedy. The peers, in like caſes are called by the lord chancellor's letters, giving notice of the ſuit intended againſt them, and requiring them to appear. There are divers ſorts of theſe writs in the court of chancery, as the ſubpœna ad reſpondendum, to anſwer; ſubpœna ad replicandum, to reply; ſubpœna ad teſtificandum, to give evidence; and the ſubpœna ad audiendum judicium, &c. It is here to be obſerved, that a ſubpœna ad teſtificandum, lies for the bringing in of witneſſes, to give their evidence in a cauſe, not only in the court of chancery, but in all other courts. The ſubpœna to anſwer, is the leading proceſs in courts of equity; and by ſtatute, when a bill is filed againſt a perſon, this ſubpœna may be taken out, which muſt be ſerved perſonally on the defendant, or left at his houſe, with one of his family; on affidavit made whereof, if any ſuch defendant does not appear and anſwer the bill, an attachment ſhall iſſue againſt him. A writ of ſubpœna takes its name from the words thereof, which charge the party ſummoned to appear at the day and place aſſigned, *ſub pœna centum librorum*, on the penalty of 100l. which is inſerted in terrorem, it being never levied.

SUBREPTION, *ſubreptio*, the act of obtaining a favour from a ſuperior, by ſurpriſe, or a falſe repreſentation. See the next article.

SUBREPTITIOUS, or SURREPTITIOUS, a term applied to a letter, licence, patent, or other act, fraudulently obtained of a ſuperior, by concealing ſome truth, which, had it been known, would have prevented the conceſſion or grant; in which caſe, the benefits of letters, licences, &c. are forfeited.

SUBROGATION, or SURROGATION, in the civil law, the act of ſubſtituting a perſon in the place, and entitling him to the rights, of another: but, in its general ſenſe, ſubrogation implies a ſucceſſion of any kind, whether of a perſon to a perſon, or of a perſon to a thing. There are two kinds of ſubrogation, the one conventional, the other legal. Conventional ſubrogation is a contract, whereby a creditor transfers his debt, with all appurtenances thereof, to the profit of a third perſon. Legal ſubrogation is that which the law makes, in favour of a perſon who diſcharges an antecedent creditor, in which caſe there is a legal tranſlation of all rights of the antient creditor to the perſon of the new one. This the civilians more uſually call ſucceſſion, as being wholly the work of the law; and to diſtinguiſh it from the conventional ſubrogation, which they alſo call ceſſion.

SUBSCAPULARIS, in anatomy, a muſcle ariſing from the baſis and ſide of the ſcapula, and, ſpreading itſelf under the whole convex or under-ſide of it, is inſerted by a ſemi-circular tendon, into the neck of the os humeri, and draws it down to the ſide of the trunk. See SCAPULA.

SUBSCRIPTION, in general, ſignifies the ſignature put at the bottom of a letter, writing, or inſtrument.

In commerce, it is uſed for the ſhare or intereſt, which particular perſons take in a public ſtock, or a trading company, by writing their names, and the ſhares they require, in the books or regiſter thereof.

Subſcription, in the commerce of books, ſignifies an engagement to take a certain number of copies of a book intended to be printed, and a reciprocal obligation of the bookſeller, or publiſher, to deliver the ſaid copies, on certain terms. The uſual conditions of theſe ſubſcriptions are, on the part of the bookſeller, to afford the books cheaper to a ſubſcriber than to another, by one third or one fourth, of the price; and, on the part of the latter, to advance half the money in hand, and to pay the reſt on the delivery of the copies. Theſe ſubſcriptions, which had their riſe in England, about the middle of the laſt century,

century, are now become frequent in France and Holland, but exceedingly more ſo among ourſelves of late: and it is not without foundation complained, that their frequency has rendered them liable to ſome abuſes, which ſeem very much to diſcredit them.

SUBSEQUENT, ſomething that comes after another, particularly with regard to the order of time.

SUBSIDY, in law, ſignifies an aid or tax granted to the king, by parliament, for the neceſſary occaſions of the kingdom; and is to be levied on every ſubject of ability, according to the rate or value of his lands or goods: but this word, in ſome of our ſtatutes, is confounded with that of cuſtoms.

SUBSISTENCE, in the military art, is the money paid to the ſoldiers weekly, not amounting to their full pay; becauſe their cloaths, accoutrements, tents, bread, &c. are to be paid. It is likewiſe the money paid to officers upon account, till their accounts be made up, which is generally once a year, and then they are paid their arrears.

SUBSTANCE, *ſubſtantia*, ſomething that we conceive to ſubſiſt of itſelf, independently of any created being, or any particular mode or accident. See MODE.

Our ideas of ſubſtances, Mr. Locke obſerves, are only ſuch combinations of ſimple ideas, as are taken to repreſent diſtinct things ſubſiſting by themſelves, in which the confuſed idea of ſubſtance is always the chief. Thus the combination of the ideas of a certain figure, with the powers of motion, thought, and reaſoning joined to the ſubſtance, make the ordinary idea of a man: and thus the mind obſerving ſeveral ſimple ideas to go conſtantly together, which being preſumed to belong to one thing, or to be united in one ſubject, are called by one name, which we are apt afterwards to talk of, and conſider, as one ſimple idea. See the article IDEA.

We imagine theſe ſimple ideas do not ſubſiſt by themſelves, but ſuppoſe ſome ſubſtratum wherein they ſubſiſt, which we call ſubſtance. The idea of pure ſubſtances is nothing but the ſuppoſed, yet unknown ſupport of theſe qualities, which are capable of producing ſimple ideas in us. The ideas of particular ſubſtances are compoſed out of this obſcure and general idea of ſubſtance, together with ſuch combinations of ſimple ideas, as are obſerved to exiſt together, and ſuppoſed to flow from the internal conſtitution and unknown eſſence of that ſubſtance. Thus we come by the ideas of man, horſe, gold, &c. Thus the ſenſible qualities of iron, or a diamond, make the complex ideas of thoſe ſubſtances, which a ſmith, or a jeweller, commonly knows better than a philoſopher. The ſame happens concerning the operations of the mind, *viz.* thinking, reaſoning, &c. which we concluding not to ſubſiſt by themſelves, nor comprehending how they can belong to body, or be produced by it, we think them the actions of ſome other ſubſtance, which we call ſpirit, of whoſe ſubſtance or nature we have as clear a notion as of that of body, the one being but the ſuppoſed ſubſtratum of the ſimple ideas we have from without, as the other of thoſe operations which we experiment in ourſelves within; ſo that the idea of corporeal ſubſtance in matter, is as remote from our conceptions, as that of ſpiritual ſubſtance. See the articles ESSENCE and EXISTENCE.

Hence we may conclude, that he has the moſt perfect idea of any particular ſubſtance, who has collected moſt of thoſe ſimple ideas which do exiſt in it, among which we are to reckon its active powers and paſſive capacities, though not ſtrictly ſimple ideas.

Subſtances are generally diſtinguiſhed by ſecondary qualities, for our ſenſes fail us in the diſcovery of primary ones, as the bulk, figure, texture, &c. of the minute parts of bodies, on which their real conſtitutions and differences depend; and ſecondary qualities are nothing but powers with relation to our ſenſes. The ideas that make our complex ones of corporeal ſubſtances, are of three ſorts: firſt, the ideas of primary qualities of things, which are diſcovered by our ſenſes; ſuch are bulk, figure, motion, &c. Secondly, the ſenſible ſecondary qualities, which are nothing but powers to produce ſeveral ideas in us, by our ſenſes. Thirdly, the aptneſs we conſider in ſubſtance, to cauſe or receive ſuch alterations of primary qualities, as that the ſubſtance ſo altered, ſhould produce in us different ideas from what it did before; and they are called active and paſſive powers: all which, as far as we have any notice or notion of them, terminate in ſimple ideas. See the article QUALITIES.

Beſides the complex ideas we have of material ſubſtances, by the ſimple ideas taken from the operations of our own minds,

which we experiment in ourſelves, as thinking, underſtanding, willing, knowing, &c. co-exiſting in the ſame ſubſtance, we are able to frame the complex idea of a ſpirit; and this idea of an immaterial ſubſtance is as clear as that we have of a material one. By joining theſe with ſubſtance, of which we have no diſtinct idea, we have the idea of ſpirit; and by putting together the ideas of coherent, ſolid parts, and a power of being moved, joined with ſubſtance, of which likewiſe we have no poſitive idea, we have the idea of matter. See MATTER and and SPIRIT.

Further, there are other ideas of ſubſtances, which may be called collective; which are made up of many particular ſubſtances conſidered as united into one idea, as a troop, army, &c. which the mind makes by its power of compoſition. Theſe collective ideas are but the artificial draughts of the mind, bringing things, remote and independent, into one view, the better to contemplate and diſcourſe of them united into one conception, and ſignified by one name: for there are no things ſo remote, which the mind cannot, by this art of compoſition, bring into one idea; as is viſible in that ſignified by the name univerſe. See COMPOSITION.

SUBSTANTIAL, in the ſchools, ſomething belonging to the nature of ſubſtance.

It is generally diſputed, whether or no there be ſuch things as ſubſtantial forms? *i. e.* forms independent of all matter; or forms that are ſubſtances themſelves.

Subſtantial is alſo uſed in the ſame ſenſe with eſſential, in oppoſition to accidental.

SUBSTANTIVE, in grammar, a noun, or name, conſidered ſimply and in itſelf, without any regard to its qualities, or other accidents, in contradiſtinction to the noun termed adjective, or that which expreſſes a certain quality or accident of the noun ſubſtantive. Or, a noun ſubſtantive is that noun, which, joined to a verb, makes a perfect ſentence, as *a man, a horſe, a tree*; thus, *a man laughs, a horſe gallops, a tree buds*, are each of them perfect ſentences. All nouns, to which one cannot add the word *thing*, are ſubſtantives; and thoſe to which *thing* may be added, are adjectives. See the articles NOUN, ADJECTIVE, and VERB. Subſtantives are divided into proper and appellative. See the articles PROPER and APPELLATIVE.

SUBSTANTIVE VERB. See VERB.

SUBSTITUTE, a perſon appointed to officiate for another, in caſe of abſence, or other legal impediment.

SUBSTITUTE, in medicine, denotes a drug or remedy that may be uſed inſtead of another; or that ſupplies the place of another, of like virtue, which is not perhaps to be had: called alſo ſuccedaneum.

SUBSTITUTION, in grammar, the uſing one word for another. This the grammarians otherwiſe call ſyllepſis.

SUBSTITUTION, in the civil-law, a diſpoſition of a teſtament, whereby the teſtator ſubſtitutes one heir for another, who has only the uſufruit, and not the property of the thing left him. Subſtitution is only a kind of fiduciary inheritance, called alſo fidei commiſſio, in regard the immediate inheritor has only the uſe or produce of the thing; the body thereof being ſubſtituted and appropriated to certain perſons, who are likewiſe to have the uſufruit in their turns, but are never to have the property.

SUBSTITUTION, in algebra, &c. is the putting, in the room of any quantity in an equation, ſome other quantity, which is equal to it, but expreſſed in another manner.

SUBSTRACTION, or SUBTRACTION, in arithmetic, the ſecond rule, or rather operation, in arithmetic, whereby we deduct a leſs number from a greater, to learn their preciſe difference.

Prob. I. To ſubſtract integers of like names, when the minuend, or number to be ſubſtracted from, is greater than, or equal to, the ſubducend, or that which is ſubſtracted.

Rule 1. Place the ſubducend under the minuend, and draw a line under both. 2. Begin at the right hand; take the leſs from the greater, or equals from equals, and ſet the difference of each row underneath.

Example in integers alone.

Minuend	638
Subducend	213
Remainder	425

The manner of operation.

3, 1, 2 } from { 8, 3, 6 } and there remain { 5, 2, 4 } which ſet below.

That is, 3, 10, 200 } from { 8, 30, 600 } remainder is { 5, 20, 400

Therefore 213 { 638 } 425

For

For ſince the whole is equal to the ſum of all its parts, therefore the ſubſtraction of all its parts is the ſame with the ſubſtraction of the whole.

Examples in integers and parts.

Minuend	27°	48′	36″
Subducend	12	31	24
Remainder	15	17	12

Minuend	146l.	18s.	6d.
Subducend	22	8	2
	124	10	4

Prob. II. To ſubſtract integers of the ſame name or denomination, when ſome of the minuend numbers are leſs than their inferior in the ſubducend.

Rule 1. Place your numbers, and begin as before. 2. According to their reſpective value, take one of the next denomination, out of which ſubſtract, and to the remainder add the minuend, ſeting their ſum underneath. 3. Then add what you took, to the next place, on the left hand, and ſo proceed by this, or the former rule.

Example in integers alone.

From	2537
Subſtract	1648
Remainder	889

The manner of operation.

8 } from { 17 } remain { 9 } which
1 and 4 = 5 { 13 { 8 } ſet be-
1 and 6 = 7 { 15 { 8 } low.

That is 8 } from { 7+ 10 } remain { 9
10+ 40 { 30+ 100 { 80
100+ 600 { 500+1000 { 800
1000+1000 { 2000+0000 { 0000
therefr. 1648 } { 2537 } { 889

For by ſaying 8 from 17, I add 10 to the minuend; but I add alſo the ſame to the ſubducend, by ſaying 1 and 4 = 5, therefore the remainder muſt be the ſame.

The operation alſo may be thus:

8 } from { 17 } remain { 9 units,
4 { 13—1 { 8 tens,
6 { 15—1 { 8 hundreds.
1 { 2—1 { 0

That is 8 } from { 7+ 10 } remain { 9
40 { 30+ 100— 10 { 80
600 { 500+1000— 100 { 800
1000 { 2000+0000—1000 { 0000
Therefore 1648 } { 2537 } { 889

For by adding a ten to the units, and taking it away from the tens, the value of the number is not changed.

Examples in integers and parts.

	s.	d.		s.	d.		s.	d.
From	5	3	i.e.	5	15	or	4	15
Subſt.	2	9		3	9		2	9

	l.	s.	d.		l.	s.	d.
From	246	3	4	i.e.	246	23	16
Subſt.	68	10	6		69	11	6
Rem.	177	12	10	=	177	12	10

or

From	245l.	22s.	16d.
Subſtract	68	10	6
Remains	177	12	10

Theorem. In ſubſtraction, the ſubducend together with the remainder, is equal to the minuend.

For all the parts taken together are equal to the whole. And if the ſubducend be taken from the minuend, there reſts the remainder. But if a part be taken from the whole, the remainder will be the other part: therefore the ſubducend, together with the remainder, are all the parts of the minuend, and conſequently equal to it.

Corollary. Hence addition and ſubſtraction ſerve reciprocally to prove each other. See the article ADDITION.

For addition and ſubſtraction are oppoſite in all caſes; and what is done by the one, is undone by the other.

Thus, if to	6	And if from	10
be added	4	be ſubſtracted	4
Sum is	10	Remainder is	6

That is, if 6+4=10, then 10—4=6.

SUBSTRACTION, in algebra, is performed by the following general rule.

Change the ſigns of the quantity to be ſubſtracted, into their contrary ſigns, and then add it, ſo changed, to the quantity from which it was to be ſubſtracted, by the rules of addition: the ſum ariſing by this addition, is the remainder.

For to ſubſtract any quantity, either poſitive or negative, is the ſame as to add the oppoſite kind. See ADDITION.

Examples.

From	$+5a$	$8a-7b$
Subſt.	$+3a$	$3a+4b$
Rem.	$5a-3a$, or $2a$	$5a-11b$

From $2a-3x+5y-6$
Subſtract $6a+4x+5y+4$
Rem. $-4a-7x \quad 0-10$

It is evident, that to ſubſtract, or take away a decrement is the ſame thing as adding an equal increment. If we take away $-b$ from $a-b$, there remains a; and if we add $+b$ to $a-b$, the ſum is likewiſe a. In general, the ſubſtraction of a negative quantity is equivalent to adding its poſitive value. See the articles QUANTITY, CHARACTER, *&c.*

SUBSTYLAR LINE, in dialling, the line whereon the ſtyle, or gnomon, of a dial is duly erected. See the articles DIAL and LINE.

SUBTANGENT *of a curve*, in the higher geometry, is the line T P (pl. CCLXII. fig. 3. n° 1.) which determines the interſection of the tangent T M, with the axis; or, that determines the point wherein the tangent cuts the axis prolonged. See the article CURVE.

In any equation, if the value of the ſubtangent comes out poſitive, it is a ſign that the points of interſection of the tangent and axis fall on that ſide of the ordinate where the vertex of the curve lies, as in the parabola and paraboloids: but if it comes out negative, the point of interſection will fall on the contrary ſide of the ordinate, in reſpect of the vertex, or beginning of the abſciſſa; as in the hyperbola and hyperboliform figures. And univerſally, in all hyperboliform and hyperboliform figures, the ſubtangent is equal to the exponent of the power of the ordinate, multiplied into the abſciſſa.

If C B (*ibid.* n° 2.) be an ordinate to A B, in any given angle, terminating in any curve A C, and A B $=x$, B C $=y$, and the relation between x and y, that is, the nature of the curve, be expreſſed by this equation, $x^3-2xxy+bxx-bbx+byy-y^3=0$; then this will be the rule of drawing a tangent to it: multiply the terms of the equation by an arithmetical progreſſion, ſuppoſe, according to the dimenſions of y,

$x^3-2xxy+bxx-bbx+byy-y^3$; as
0 1 0 0 2 3

alſo according to the dimenſions of x, as, $x^3-2xxy+bxx-bbx+byy-y^3$;
3 2 2 1 0 0

the former product ſhall be the numerator, and the latter, divided by x, the denominator of a fraction expreſſing the length of the ſubtangent B D, which, in this caſe, will be

$$=\frac{-2xxy+2byy-3y^3}{3xx-4xy+2bx-bb}.$$

SUBTENSE, in geometry, the ſame with the chord of an arch. See CHORD. Hence, the ſubtenſe of an angle is a right line ſuppoſed to be drawn between the two extremities of the arch that meaſures that angle.

SUBTERRANEOUS, or SUBTERRANEAN, appellations given to whatever is under-ground: thus, naturaliſts ſpeak of ſubterraneous fires, damps, *&c.* See the articles VULCANO, DAMP, *&c.* Subterraneous bodies are more uſually called foſſils and minerals. See the articles FOSSILS and MINERALS.

SUBTILE, in phyſics, an appellation given to whatever is extremely ſmall, fine, and delicate; ſuch as the animal ſpirits, the effluvia of odorous bodies, *&c.* are ſuppoſed to be. See the articles ANIMAL SPIRITS, EFFLUVIA, *&c.*

Materia SUBTILIS, among the carteſians. See the article MATERIA.

SUBTRIPLE RATIO, is when one number, or quantity, is contained in another three times: thus, 2 is ſaid to be ſubtriple of 6, as 6 is triple of 2.

SUBULARIA, in botany, a genus of the *tetradynamia-ſiliculoſa* claſs of plants, with a tetralous cruciform flower; its fruit is a ſmall unilocular pod, of an obverſely cordate figure, containing a few, very ſmall and roundiſh ſeeds.

SUBULATED, ſomething in the ſhape of an awl: thus, a ſubulated leaf is one of an oblong and narrow figure, broadeſt at the baſe, and thence gradually decreaſing, till it terminates in a point.

SUCCEDANEUM, in pharmacy, denotes a drug ſubſtituted in the place of another, in medical compoſition. See the article MEDICINE and SUBSTITUTE.

SUCCENTURIATI RENES, in anatomy, the ſame with the capſulæ atrabiliariæ. See the article CAPSULÆ.

SUCCESSION, *ſucceſſio*, in philoſophy, an idea which we get by reflecting on that train of ideas conſtantly following one another in our minds, when awake. See the article IDEA.

SUCCESSION, in law, implies a right to the whole effects left by a defunct.

SUCCESSOR, in law, one that ſucceeds, or comes in the place of, another.

It is held, that a ſole corporation may take an eſtate in fee to them and their ſucceſſors, but not without the word *ſucceſſors*: whereas an aggregate corporation may take a fee in ſucceſſion, without expreſſing the word *ſucceſſors*; and likewiſe may have goods and chattels in ſucceſſion. See the article CORPORATION.

SUCCINUM, AMBER, in natural hiſtory. See the article AMBER.

SUCCISA, in botany and pharmacy, a ſpecies of ſcabioſa, called by ſome morſus diaboli, devil's bit; and ſaid to be alexipharmic, but is little uſed in the preſent practice.

SUCCORY, *cichorium*, in botany, *&c.* See the article CICHORIUM.

SUCCOTRINE ALOES. See ALOES.

SUCCUBUS, a term uſed by ſome imaginary writers, for a dæmon who aſſumes the ſhape of a woman, and as ſuch lies with a man; in which ſenſe it ſtands oppoſed to incubus, which was a dæmon in form of a man, that they ſuppoſed to lie with a woman.

But the truth is, the ſuccubus is only a ſpecies of the incubus, or night-mare. See the article INCUBUS.

SUCCULA, in mechanics, a bare axis, or cylinder, with ſtaves to move it round; but without any tympanum or peritrochium.

SUCCULENT PLANTS, thoſe whoſe leaves are thick, and abound with juice. See the article PLANT.

SUCCUS, JUICE, in pharmacy. See the article JUICE.

SUCHUEN, a province of China, bounded by that of Xenſi on the north, by Honam and Huquam on the eaſt, by Quecheu and Yunam on the ſouth, and by the mountains of India on the weſt: its chief town is Chingtu.

SUCK-FISH, *remora*, in ichthyology. See the article REMORA.

SUCKERS, in gardening, the ſame with off-ſets. See the article OFF-SETS.

SUCKING-PUMP. See PUMP.

SUCTION, *ſuctio*, the act of ſucking or drawing up a fluid, as air, water, milk, or the like, by means of the mouth and lungs.

There are many effects vulgarly attributed to ſuction, which, in reality, have very different cauſes. As when any one ſucks water, or any other liquor, up thro' a pipe, it is commonly thought, that by that action the perſon draws the air up into his mouth, and that the water, which is contiguous to it, follows it by a kind of attraction, as if the air and water hung together; and others fancy, that the air moves into the mouth of the ſucker, and the water moves up after the air, to prevent a vacuum, which, they ſay, nature abhors: whereas the true cauſe of this phænomenon is only, that the air and atmoſphere preſſes, with its whole weight, uniformly on the ſurface of the liquor in the veſſel; and, conſequently, prevents any one part of the water to riſe higher than the other there: and if a pipe be put in, of any tolerable large bore, and be open at both ends, the water will riſe within the pipe to the ſame height as without, and, indeed, a little higher, becauſe the preſſure of the air within the pipe is a little taken off by bearing againſt the ſides of the pipe. Now when any one applies his mouth to the upper end of the pipe, and ſucks, his lips ſo ſtrongly incloſe the pipe, that no air can get between them and it; and, by the voluntary motion of the ſpirits in the muſcles, the cavity of his thorax, or breaſt, is opened and enlarged; by which means the air, included there, hath now a much larger ſpace to dilate itſelf in, and, conſequently, cannot preſs ſo ſtrongly againſt the upper end of the pipe, as it did before the cavity of the thorax was ſo enlarged, and when the weight of the whole atmoſphere kept its ſpring bent. And that weight or preſſure being now taken off by the lips of the man that ſucks, the equilibrium is deſtroyed, the air gravitates on the ſurface of the water, but cannot do ſo on the upper orifice of the pipe, becauſe the juncture of the lips takes it off; and the ſpring of the air included in the thorax, being weakened by the dilatation of its cavity, it cannot preſs ſo hard againſt the upper orifice of the pipe, as the water will do againſt the lower, and, conſequently, the water muſt be forced up into the pipe. It is much the ſame thing in the ſuction of a common pump: the ſucker being tight, takes off entirely the preſſure of the atmoſphere on the ſurface of the water within the barrel of the pump; and, conſequently, the atmoſphere, by its weight, muſt force the water up to make the equilibrium.

SUCULA, or SUCCULA. See SUCCULA.

SUDAMINA, little heat pimples in the ſkin, like the millet-grains, frequent in youth, eſpecially thoſe of a hot temperament, and that uſe much exerciſe.

SUDATORY,

SUDATORY, *ſudatorium*, a name given by the antient Romans to their hot or ſweating-rooms; ſometimes alſo called laconica. See the article BATH.

SUDBURY, a borough-town of Suffolk, thirteen miles ſouth of Bury.

It ſends two members to parliament.

SUDER-KOPING, a town of Sweden, in the province of Gothland, ninety miles ſouth-weſt of Stockholm.

SUDOR, SWEAT, in phyſiology. See the article SWEAT.

SUDOR ANGLICANUS, the SWEATING-SICKNESS, a diſeaſe ſo called from its appearing firſt in England, in the year 1483.

It ſeized different patients in different manners; for in ſome it firſt appeared with a pain in the neck, ſcapula, legs, or arms; whilſt others perceived only a kind of warm vapour, or flatulence, running through thoſe parts. And theſe ſymptoms were ſuddenly ſucceeded by a profuſe ſweat, which the patient could not account for. The internal parts became firſt warm, and were ſoon after ſeized with an incredible heat, which thence diffuſed itſelf to the extremities of the body. An intolerable thirſt, reſtleſſneſs, and indiſpoſition of the heart, liver, and ſtomamach, were the next ſymptoms, which were ſucceeded by an exceſſive head-ach, a delirium, in which the patient was very trifling and talkative; and after theſe, a kind of extenuation of the body, and an irreſiſtable neceſſity of ſleeping.

For preventing this diſeaſe, temperance is ordered, and the choice of ſalutary aliments and drinks. No crude pot-herbs nor ſallads are to be uſed, becauſe they may have received a noxious quality from the air; or, if they are uſed, they are to be previouſly waſhed with warm water.

SUDORIFIC, in pharmacy, an appellation given to any medicine that cauſes or promotes ſweat. See SWEAT.

Sudorific, perſpirative, and alexipharmic medicines, ſays Dr. Shaw, make a large part of the common diſpenſatories. A few medicines well choſen, might ſupply the place of all theſe; and of theſe, the principal one would prove to be camphor, which trial will always ſhew to be greatly ſuperior to bezoar, Gaſcoign's powder, lapis contrayerva, and the like. The ſame gentleman gives the following eaſy method of preparing a ſafe and effectual ſudorific: take an ounce of refined camphor, beat it in a marble mortar, with two ounces of blanched almonds, till it be reduced to a ſmooth and even paſte. This may be formed into pills, or boluſes, and given, according to the ſtrength of the patient, and other conſiderations, from three grains to forty.

SUET, *ſevum*, or *ſebum*, in anatomy, the ſolid fat found in ſeveral animals, as ſheep, oxen, &c. but not in the human ſpecies. See the article FAT.

It is of the ſevum that tallow is made. See the article TALLOW.

SUEZ, a port-town of Egypt, ſituated at the bottom of the Red ſea, ſeventy miles eaſt of Cairo: it is from this town that the iſthmus of Suez, which joins Africa to Aſia, takes its name.

SUFFERANCE, or *Bill of* SUFFERANCE. See the article BILL.

SUFFITUS, in medicine, the ſame with fumigation. See FUMIGATION.

SUFFOCATION, in medicine, the privation of reſpiration, or breathing; which is ſometimes occaſioned by a congeſtion of blood in the lungs, ſo as to prevent the ingreſs of the air. See ASTHMA, QUINZY, CATARRH, &c.

The fumes of wine, or other ſtrong liquors, when boiling, likewiſe cauſe ſuffocation; as do the fumes of lime, charcoal, antimony, ſulphur, vitriol, ſpirit of nitre, &c.

SUFFOCATION *of the womb*, or *matrix*, is a diſeaſe pretty frequent in women, called alſo fits of the mother. See the article HYSTERIC.

In this the patient imagines a malignant vapour riſing from the matrix, and ſo preſſing againſt the lungs and diaphragm, as to prevent the free motion neceſſary to reſpiration.

SUFFOCATIVE CATARRH. See the article CATARRH.

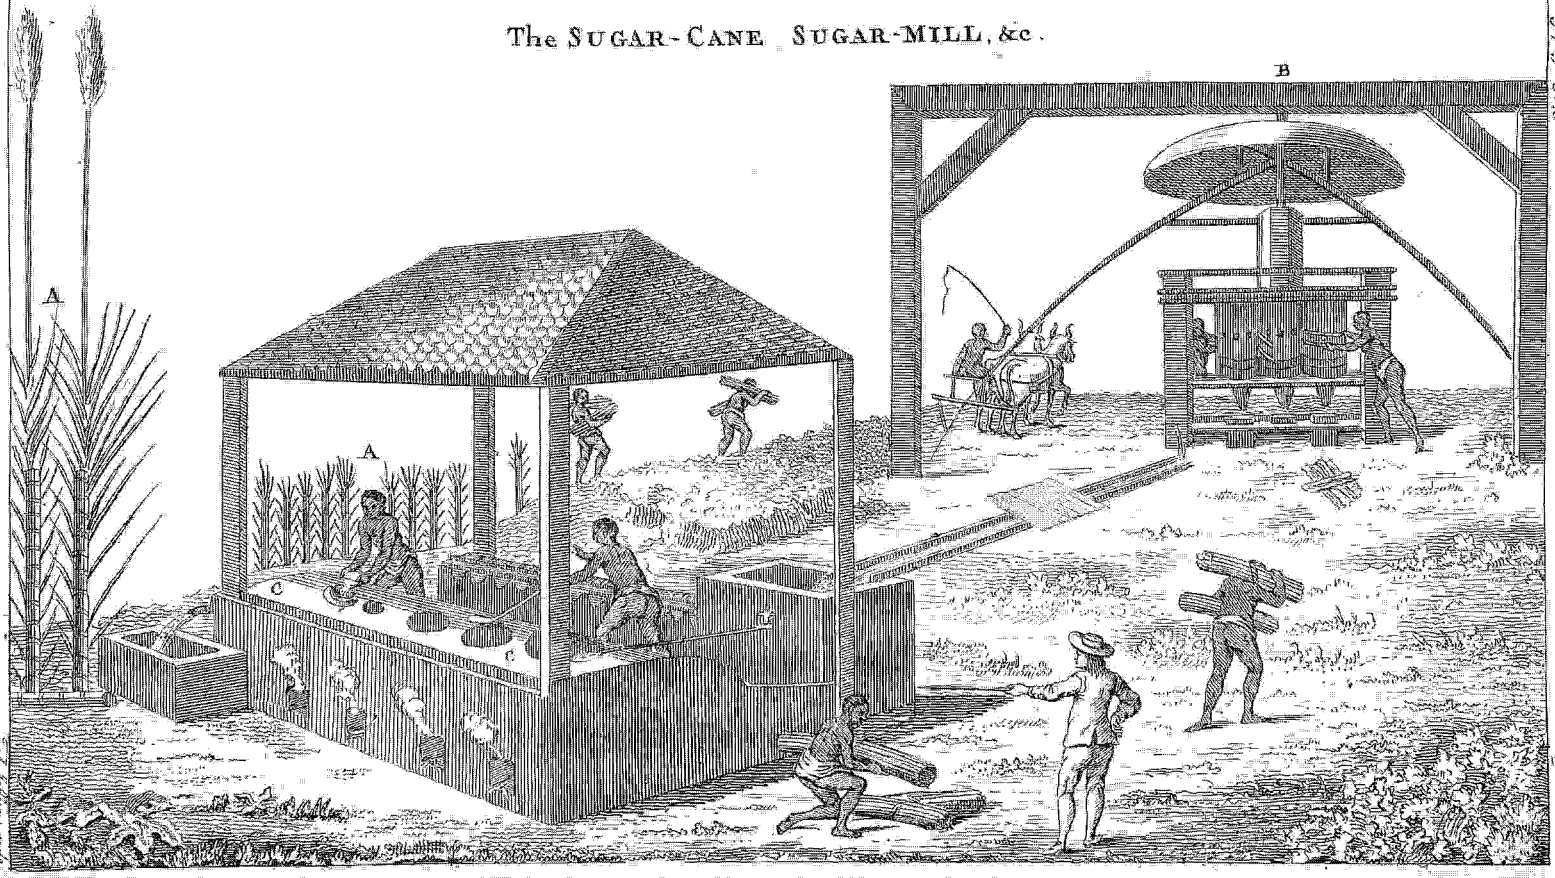
SUFFOLK, a county of England, bounded by Norfolk on the north, by the German ſea on the eaſt, by Eſſex, from which it is ſeparated by the river Maningtree, on the ſouth, and by Cambridgeſhire on the weſt; being ſixty-two miles long, and twenty-eight broad.

SUFFRAGAN, an appellation given to ſimple biſhops, with reſpect to archbiſhops, on whom they depend, and to whom appeals lie from the biſhop's courts. See the articles ARCHBISHOP, BISHOP, COURT, &c.

Sometimes, indeed, the term ſuffragan ſignifies a co adjutor, or aſſiſtant-biſhop.

SUFFRAGE,

The SUGAR-CANE SUGAR-MILL, &c.



SUFFRAGE, *suffragium*, denotes a vote given in an aſſembly, where ſomething is deliberated on, or where a perſon is elected to an office or benefice.

SUFFRUTEX, among botaniſts, denotes an under-ſhrub, or the loweſt kind of woody plants, as lavender, rue, *&c.*

SUFFUMIGATION, or FUMIGATION, See the article FUMIGATION.

SUFFUSION, in medicine, the ſame with a cataract. See CATARACT.

SUGAR, *ſaccharum*, in natural hiſtory, is properly the eſſential ſalt of the ſugar cane, as tartar is of the grape.

The ſugar-cane is a genus of the *triandria-digynia* claſs of plants, the corolla whereof is compoſed of two valves, equal in ſize, and without awns; they are of a lanceolated figure, hollowed, erect, and acuminated: there is no pericarpium; every flower containing within it a ſingle, oblong, and acuminated ſeed.

This plant riſes to eight, nine, or more feet high; the ſtalk, or cane, being round, jointed, and two or three inches in diameter at the bottom: the joints are three or four inches aſunder, and in a rich ſoil more: the leaves are long and narrow, and of a yelloviſh green colour; as is alſo the ſtalk itſelf, the top of which is ornamented with a panicle, or cluſter of of arundinaceous flowers, two or three feet in length. It grows ſpontaneouſly in many parts of the Eaſt-indies, in the Canary-iſlands, and in the warmer climates of America. See plate CCLXIII. letters A, A.

They propagate the ſugar-cane, by planting cuttings of it in the ground in furrows, dug parallel for that purpoſe; the cuttings are laid level and even, and are covered up with earth; they ſoon ſhoot out new plants from their knots or joints; the ground is to be kept clear, at times, from weeds, and the canes grow ſo quick, that in eight, ten, or twelve months, they are fit to cut for making of ſugar from them. The manner of doing it is thus: they cut off the reeds at one of the joints near the roots; they are then cleared of the leaves, and tied up in bundles, and ſent to the mills, which are worked either by water or horſes. The ſugar-mill is compoſed of three rollers of an equal ſize, and all armed with iron-plates, where the canes are to paſs between them; only the middle roller is much higher than the reſt, to give the larger ſweep to the two poles to which the horſes are yoked. This great roller in the middle is furniſhed with a cog full of teeth, which catch the notches in the two ſide rollers, and force them about to bruiſe the canes, which paſs quite round the great roller, and come out dry and ſqueezed from all their juice; which runs into a veſſel or back under the mill, and is thence conveyed through a narrow ſpout into the firſt boiler, in the manner repreſented, *ibid.* let. B, C, C.

After the juice is let out of the firſt veſſel, it is received into another, in which it is boiled more briſkly, and ſcummed from time to time with a large kind of ſpoon, pierced with holes to let the liquor through, while it retains the ſcum and foulneſs ſeparated from it in boiling: towards the end of this boiling, they throw into it a ſtrong lixivium of wood-aſhes, with ſome quick lime among it; this greatly promotes the ſeparation of the foulneſs that yet remains among it; and, after it has boiled ſome time with this addition, they ſtrain it off. The fæces left in the cloths make a kind of wine, when fermented properly with water. The ſtrained liquor, which is now tolerably clean, is let into a third boiler, in which it is boiled down to the conſiſtence of ſugar over a very briſk fire, the people who attend it continually ſtirring and ſcumming it.

Great caution is to be uſed that the boiling matter does not riſe over the ſides of the veſſel, which would be of very dangerous conſequence: they prevent this by taking up quantities of the boiling matter with a ladle, lifting it up high, and letting it run in again, and by now and then adding a ſmall piece of butter, or fat of ſome kind, which takes down the bubbling almoſt inſtantaneouſly. They are very careful that no lemon-juice, or any other acid of that kind, comes near the veſſels, a very ſmall admixture of that being ſufficient to keep the matter from granulating. When the liquor is boiled enough, which is known by its concreting, on throwing a ſpoonful of it up into the air, it is then let out into a fourth veſſel, under which there is a very gentle fire, only kept up that it may have leiſure to granulate; when it has begun to granulate, it is let out of this laſt boiler into a kind of conic earthen veſſels, open at both ends; the wideſt aperture is placed upwards, and the ſmaller end downwards, its aperture being ſtopped with a wooden plug. It is left in theſe veſſels twenty-four hours to concrete; after this

they are removed into ſugar-houſes, and are there aranged in regular order, with a veſſel of earthen-ware under each; the plug is then taken out of the bottom aperture of each, and they are left in this condition for about forty days, that all the thick liquor, or melaſſes, may run from them: after they have ſtood thus long to drain of themſelves, a quantity of clay is diluted, with water, into a thin paſte, and this is poured on the top of every parcel of ſugar in the veſſels, ſo as to cover it two or three inches deep. This water, by degrees, all leaves the clay, and penetrating into the maſs of ſugar, runs through it, and carries off yet more of this foul thick liquid with it, into the veſſels placed underneath to receive it.

When the clay is quite dry, it is taken off, and the firſt preparation of the ſugar is now finiſhed; they ſhake it out of the veſſels, and, cutting it into lumps, which are of a dirty, browniſh, or greyiſh colour, they put it up in hogſheads, and other caſks, under the name of grey or brown ſugar. The ſugar, in this ſtate, ought to be dry, not unctuous, and to have no taſte of burning. The liquor which has run from the ſugar in ſtanding, is boiled to a conſiſtence, and ſold under the name of melaſſes, or treacle; this affords, by fermentation, a very clean and good ſpirit. See MELASSES.

This coarſe ſugar is afterwards refined to various degrees of purity by new ſolutions, and is ſold at different prices, and under different names, according to the degree of purity it is brought to. Our ſugar refiners firſt diſſolve it in water, then clarify the ſolution by boiling with whites of eggs and deſpumation; and after due evaporation, pour it into moulds; where the fluid part being drained off, and the ſugar concreted, its ſurface is covered with moiſt clay, as before. The ſugar thus once refined, by repetition of the proceſs, becomes the double refined ſugar of the ſhops. The candy-ſugar, or that in cryſtals, is prepared by boiling down ſolutions of ſugar to a certain pitch, and then removing them into a hot room, with ſticks placed acroſs the veſſel for the ſugar to ſhoot upon: and theſe cryſtals prove of a white or brown colour, according as the ſugar uſed in the proceſs was pure or impure.

A pound of ſugar purified to the higheſt degree, and diſtilled in a retort, yields firſt about half an ounce of a limpid, inſipid phlegm, without ſmell; and after this comes over a liquor, at firſt limpid and colourleſs, afterwards reddiſh, and, finally, of an empyreumatic ſmell, in quantity not leſs than ſix ounces; this is partly of an acid, partly of an alkaline and urinous taſte; after this comes over a thick and reddiſh oil, in quantity about three drachms; and then more than an ounce of a brown oil of a thicker conſiſtence. The remainder in the retort, calcined and lixiviated, yields a drachm of a pure alkaline ſalt.

Sugar is a true ſalt, and when perfectly pure, after ſolution, it concretes into regular cryſtals; theſe are of a priſmatic figure, and conſiſt of eight plain ſurfaces, in two of which the oppoſite baſes are equal and parallel, the reſt are parallelograms. In its natural ſtate, it manifeſts not the leaſt token of any thing, either acid or alkaline. It is inflammable, in a great degree, burning with a very briſk white flame. It diſſolves, with the utmoſt readineſs, in all aqueous menſtruums, but very difficultly in ſpirituous or oily liquors: mixed with water, it, after a time, ferments, and acquires a vinous flavour; and at this time an inflammable ſpirit, like that of wine, may be drawn from it in a conſiderable quantity.

Many other plants and trees might be found which would yield ſugar: thus ſeveral ſpecies of maples afford a juice which boils into good ſugar. But the great quantity of it yielded by the ſugar-cane, and its eaſy culture, renders it unneceſſary to look farther after what it ſo abundantly ſupplies us with.

The uſes of ſugar, as a ſweetner, are ſufficiently known: it promotes the union of diſtilled oils with watery liquors, and prevents the ſeparation of the butyraceous parts from milk; and hence it is ſuppoſed to unite the unctuous part of the food with the animal juices. Sugar is not only innocent, but reconciles to the palate and ſtomach ſubſtances of themſelves diſguſtful to both; and the impure ſorts, in conſequence of their containing an unctuous or oily matter, prove emollient and laxative. The cryſtals are the moſt difficult of ſolution; and conſequently are moſt proper, where this lubricating ſweet is wanted to diſſolve ſlowly in the mouth.

The medicinal preparations of ſugar are, 1. Sugar of roſes, *ſaccharum roſaceum*, thus made: take of red roſe buds, freed from the heels, and haſtily dried, one ounce; and of double refined ſugar, one pound: reduce

reduce them ſeparately into powder, then mix and moiſten them with water, that they may be formed into troches, which are to be dried with a gentle heat.

2. Red ſugar of roſes, *ſaccharum roſatum rubrum*, is made thus: take of white ſugar, one pound; juice of red-roſes, four ounces; and red-roſes dried, one ounce: boil the ſugar and juice over a gentle fire, till the juice is almoſt all evaporated; then throw in the dry roſes reduced to a very fine powder. Pour out the matter upon a marble, and form it into lozenges according to art.

Theſe preparations are chiefly valued for their agreeableneſs to the eye and palate: ſome likewiſe eſteem them, medicinally, as light reſtringents; and look upon them, not undeſervedly, as an excellent addition to milk, in phthiſical and hectic caſes. Some have been accuſtomed to add a portion of acid, which improves their colour, but at the ſame time renders them leſs proper to be uſed with milk.

3. Barley-ſugar, *ſaccharum hordeatum ſeu penidiatum*, is made by boiling white ſugar in barley-water, *i. e.* a decoction of barley, till it acquires ſuch a conſiſtence, as that it may be drawn out, and twiſted into threads or ſtrings: this is rarely prepared by the apothecaries, or conſidered as a medicine.

SUGAR *of lead*, *ſaccharum ſaturni*. See the article SACCHARUM.

SUGILLATION, in medicine, an extravaſation of blood in the coats of the eye, which at firſt appears of a reddiſh colour, and afterwards livid or black. If the diſorder is great, bleeding and purging are proper, as are diſcutients. The following cataplaſm is ſaid to be very good: Take of comfry-root, ſix ounces; of ſolomon's ſeal, two ounces; of elder-flowers, one ounce and a half; of bean-flour, one ounce; let all theſe be boiled in a ſufficient quantity of ſpring-water. The decoction may be uſed as a fotus, and the ingredients for a cataplaſm.

SUILLUS, in botany, the ſame with the boletus. See BOLETUS.

SUIT, in law, is uſed in different ſenſes, as, 1. For an action, whether perſonal or real. 2. Suit of court, or ſuit-ſervice, which is an attendance the tenant owes to his lord's court. 3. Suit-covenant, where a perſon has covenanted to do ſervice in the court of the lord. 4. Suit-cuſtom, which is where one and his anceſtors have owed ſuit time out of mind. 5. It is uſed for a petition to the king, or any perſon of dignity; where a lord diſtrains his tenant for ſuit, and none is due; in this caſe, the party may have an attachment againſt him to appear in the king's court. 6. Suit of the king's peace, is an action brought againſt a perſon for breach of the king's peace; as in the caſe of treaſons, felonies, or treſpaſſes. See ACTION, COURT, *&c.*

SUIT-SILVER, a ſmall ſum paid in ſome manors, to excuſe the appearance of freeholders at their lord's courts. See the article COURT.

SULDY, a town of France, ſituated on the river Loire, twenty miles ſouth-eaſt of Orleans.

SULMONA, or SOLMONA, a town of the hither Abruzzo, in the kingdom of Naples: eaſt long. 15°, north lat. 42° 6'.

SULPHUR, in natural hiſtory, a genus of foſſils, defined to be dry, ſolid, but friable foſſile bodies; melting with a ſmall heat, when fired in the open air; burning almoſt wholly away with a blue flame, and noxious vapour; and indued with an electric power, and not diſſoluble in acids.

Some have uſed the word ſulphur as a name for the whole ſeries of inflammable bodies, but as we have alſo been uſed to diſtinguiſh thoſe of a particular kind by the ſame name, it ſeems much more eligible to reſtrain that name to thoſe bodies, and to give ſome other for the more general claſſes.

The word ſulphur, in this acceptation, becomes the name of a regular genus of foſſils, of which there are four known ſpecies. 1. The yellow native ſulphur, which in its pureſt ſtate is of a pale ſtraw colour, and as pellucid as the fineſt amber; but is more frequently found coarſer, and more opake. It is found in the gold mines of Peru, in Hungary, and in ſome other places. 2. The green native ſulphur. This is harder than the other, and is uſually found in ſmall maſſes compoſed of ſeveral cruſts. It is found, ſo far as is yet known, only about mount Veſuvius. 3. The grey native ſulphur, which is common in Iceland, and many other places, and is the coarſeſt and worſt of all the kinds. And, 4. the moſt rare and beautiful of all the kinds, the red native ſulphur. This is of a fine glowing red, like cinnabar, and very bright and tranſparent, and is found, ſo far as is yet known, only in the gold mines of Peru.

But beſides theſe native kinds of ſulphur, there is a factitious ſort, by far the moſt common in the ſhops, ſeparated from extraneous matters by means of fire. It is ſometimes met with in very large maſſes, and called ſulphur in the cake; but what we moſt frequently ſee of it is in oblong cylindric rolls of a yellow colour, ſometimes with, and ſometimes without, an admixture of greeniſh. The yellow contains leſs, the greeniſh more, of the vitriolic ſalt mixed with it; it is friable, and affords a ſort of crackling noiſe, when rubbed between the fingers; it is very eaſily reduced to powder, and melts with a ſmall degree of heat. It may be totally ſublimed, in a cloſe veſſel, without alteration. It takes fire on being brought into contact with a burning coal, or any ignited matter; and when pure and genuine, for we are liable to great cheats in regard to it, it does not burn away very quickly, but continues a conſiderable time, emitting a deep blue flame. It is to be choſen for internal uſe of the pureſt and brighteſt yellow, light, eaſily broken, and appearing very bright and gloſſy where it breaks. If it be for making oil of ſulphur, the greeniſh rolls are the beſt, as containing moſt acid.

This kind of ſulphur is ſeparated, by means of fire, from various minerals, which are found naturally to contain it. The greateſt part of what we have, is made from the common vitriolic pyrites, the ſame mineral yielding both ſulphur and vitriol, and often alum. They firſt give it a degree of fire ſufficient to melt the ſulphur it contains, and, when this is all run out into veſſels prepared to receive it, they expoſe the remaining matter to the air, after which they boil it in water, and obtain from the lixivium the common green vitriol or copperas; and after all this is obtained, by adding an alkali to the ſame liquor, they get alum from it. See VITRIOL and ALUM.

Sulphur, under whichever of theſe forms it appears, is ſtill the ſame in all its characters; it diſſolves in oils, and alkaline ſubſtances; it grows red when melted, but turns yellow again when it cools; it affords an acid, the ſame with that of vitriol, if its fumes in burning be catched in a proper manner; but it will not yield this acid by the common way of diſtillation.

Sulphur, melted with gold, provided that metal be pure, makes no ſort of alteration in it; but this is the only metal that eſcapes its effects. Thrown upon ſilver heated red hot, the metal immediately melts, and, if taken from the fire as ſoon as it does ſo, it will be found, when cold, to reſemble lead rather than what it really is. It retains its malleability perfectly, and cuts eaſily with a knife; but it is of a dull bluiſh colour. It is, however, eaſily reduced again to its proper appearance; for there requires no more to this, than the keeping it a few minutes in a ſtrong fire to burn away the ſulphur. If the heat is ſlackened towards the end of this fuſion, the ſilver will not fall into one uniform maſs, but will riſe up in ſmall ſprigs all over the ſurface in a very beautiful manner, reſembling the branches of ſilver, ſometimes ſeen on the ſurface of ores. Tin melted with brimſtone, if the metal be firſt granulated, and the brimſtone added in powder in three times its quantity, deflagrates as if nitre had been mixed with it. The remainder becomes ſolid, while yet in the fire, and, when cold, is a brittle regulus of the colour of lead, and greatly reſembling a ſemi-metal in its qualities. Tin may indeed be wholly turned into ſcoria by burning it with additional parcels of ſulphur. Sulphur melted along with lead deſtroys its malleability, as much as it does that of tin. It becomes hard and rigid, and very difficult of fuſion, and loſes the appearance of lead; being, in the regulus thus obtained, compoſed of broad, bright, and glittering particles. Copper melts immediately upon being made red-hot, if brimſtone be added to it; and becomes a black friable ſubſtance. Iron of all other metals melts the moſt freely and readily with the ſulphur, but it does not freely part with it again. A red hot iron applied to a roll of ſulphur immediately throws off particles diſſolved by the ſulphur into a ſpongy ſcoria. Regulus of antimony melted with ſulphur returns to common crude antimony again. Bizmuth melted with it aſſumes the appearance of antimony, and inſtead of broad flakes is found to be compoſed of needles or ſtriæ running acroſs one another. Zink ſuffers leſs change from it, and mixes indeed leſs eaſily with it; it at length becomes darker-coloured, and more brittle.

Uſes and preparations of SULPHUR. Beſides the great uſe of ſulphur in medicine, chemiſtry, metallurgy, and the making of gun-powder, it is of great ſervice for

for whitening ſilks, and woollen ſtuffs; for which purpoſe, its vapour is contrived to be received by them: its vapour alſo whitens red roſes; and even young rooks, taken out of their neſts, and expoſed thereto, become perfectly white: it has alſo the ſame effect upon gold, which may be reſtored to its colour, by boiling it in water with tartar: and, laſtly, its fumes check and prevent fermentation; on which account, it is much uſed by wine-coopers.

As to the medicinal virtues of ſulphur, it is given, in its crude ſtate with great ſucceſs in diſeaſes of the lungs. It ſtrengthens and cleanſes them, and promotes expectoration, and has at all times been famous for its virtues againſt cutaneous diſeaſes. It generally proves a little looſening to the bowels, and increaſes the diſcharges by perſpiration; it even communicates its ſmell to the perſpired matter for a conſiderable time after taking it, and will often blacken gold or ſilver that is worn by people who take any conſiderable quantity of it.

The preparations of ſulphur, in moſt frequent uſe in the ſhops, are, 1. Flowers of ſulphur, *flores ſulphuris*, a good pectoral medicine. See the article FLOS. 2. Precipitated ſulphur, commonly called milk of ſulphur, made by boiling flowers of ſulphur, with thrice their weight of quick lime, till the ſulphur is diſſolved; and then filtering the ſolution through paper, let a precipitation be made with weak ſpirit of vitriol; and laſtly, by waſhing the precipitated powder found at the bottom of the veſſel, till it becomes quite inſipid. This is good in all uſes, wherein ſulphur in ſubſtance, or its flowers, are uſed; its doſe being from ten grains to two ſcruples. 3. Balſam of ſulphur is made by boiling flowers of ſulphur in four times their weight of oil of olive, in a pot lightly covered, till the oil and ſulphur are united into the conſiſtence of a balſam; and in the ſame manner may a balſam of ſulphur be prepared with barbadoes-tar. This, though highly extolled as a pectoral by ſome authors, ought to be given with great caution; ſince its acrimony muſt render it injurious to weak lungs. 4. Spirit or oil of ſulphur is an acid, obtained by retaining in any manner the vapours of burning ſulphur; it is wholly the ſame with that of vitriol; being an agreeable acid, and good in every caſe in which the ſpirit of vitriol is ſo. 5. Sulphurated water, *aqua ſulphurata*, is made thus: take common water one quart, of pure ſulphur half a pound, ſet a part of the ſulphur on fire in an iron ladle, and ſuſpend it in that ſtate over the water in a cloſe veſſel; let the remainder of the ſulphur be afterwards fired and ſuſpended in the ſame manner, and when the operation is over, the water will have acquired a ſharp acid taſte, and is to be reſerved for uſe. The moſt commodious veſſel for making this is a large glaſs receiver fitted with a wooden plug, into which the handle of the ladle may be fixed; as ſoon as the ſulphur is fired, the ladle is to be thruſt ſo far into the receiver, that the plug may come to ſtop the aperture, and the covering the mouth over this with a wet cloth will be ſufficient to keep in the fumes.

This is the liquor called by ſome authors *gas ſulphuris*; it is an agreeable acid, and is good in malignant and petechial fevers, given in the common drink. It quenches thirſt, and cools the mouth and tongue.

SULPHUR-WORT, in botany, a name by which ſome call peucedanum. See the article PEUCEDANUM.

SULTAN, or SOLDAN, a title of honour, given to the emperor of the Turks. The wife of a ſultan is called ſultana, and the favourite one hhaſeki-ſultana, *i. e.* the private ſultana.

SULTZBACH, or SULTSBACH, a city of Bavaria, thirty-two miles north of Ratiſbon, ſubject to the duke of Neuburg.

SUM, SUMMA, in mathematics, ſignifies the quantity that ariſes from the addition of two or more magnitudes, numbers, or quantities together. See ADDITION.

The ſum of an equation is, when the abſolute number being brought over to the other ſide of the equation, with a contrary ſign, the whole becomes equal to 0: thus, the ſum of the equation $x^3 - 12x^2 + 41x = 42$, is $x^3 - 12x^2 + 41x - 42 = 0$. See EQUATION.

SUMACH, *rhus*, in botany, a genus of the *pentandria-trigynia* claſs of plants, the flower of which conſiſts of five ovato-acuminate and erecto-patent petals, twice as large as the cup; its fruit is a coriaceous roundiſh berry, with only one cell, containing a ſingle roundiſh, and oſſeous ſeed.

This genus comprehends the rhus and texicodendron of Tournefort, and the vernix of Kœmpfer; the berry of the rhus is hairy, and the kernel or ſeed is globoſe;

globoſe: the toxicodendron has the berry ſmooth, but ſtriated, and the nucleus compreſſed and ſulcated: and the vernix has the fructifications on different plants of the ſame ſpecies.

The ſeeds, or berries, of the common ſumach, are moderately aſtringent; and have formerly been preſcribed in this intention, but are now unknown in the ſhops. Their chief uſe, at preſent, is in the preparation of morocco, and other leather. See MOROCCO and LEATHER.

Myrtle-SUMACH, *coriaria*, in botany. See the article CORIARIA.

Venetian SUMACH, *cotinus*, in botany. See the article COTINUS.

SUMATRA, an iſland in the Eaſt-indian ocean, ſituated between 93° and 104° eaſt long. and between 5° 30′ north lat. and 5° 30′ ſouth lat. extending from north-weſt to ſouth-eaſt, nine hundred miles long, and from one hundred to one hundred and fifty broad.

SUMEREIN, a town of lower Hungary, fifteen miles ſouth of Preſburg, ſubject to the houſe of Auſtria.

SUMMARY, in matters of literature, the ſame with abridgment. See the article ABRIDGMENT.

Summary, however, is often uſed for a table of contents, placed at the beginning of books, to ſhew the principal heads treated of therein. See BOOK.

SUMMATORIUS CALCULUS, in mathematics. See the article CALCULUS.

SUMMER, one of the ſeaſons of the year, commencing in theſe northern regions on the day the ſun enters Cancer, and ending when he quits Virgo. Or, more ſtrictly and univerſally, the ſummer begins on the day when the ſun's meridian diſtance from the zenith is the leaſt; and ends on the day, when his diſtance is a mean betwixt the greateſt and ſmalleſt. The end of ſummer coincides with the beginning of winter. See SEASONS.

SUMMER, in architecture, is a large ſtone, the firſt that is laid over columns and pilaſters, in beginning to make a croſs vault; or it is the ſtone which, being laid over a piedroit or column, is hollowed to receive the firſt haunce of a platband.

SUMMER, in carpentry, is a large piece of timber which being ſupported on two ſtone piers or poſts, ſerves as a lintel to a door, window, &c.

SUMMIT, the top or vertex of any body, or figure; as of a triangle, cone, pyramid, &c. See TRIANGLE, CONE, &c.

SUMMITS *of Flowers*, the ſame with the antheræ, or apices. See ANTHERÆ.

SUMMONS, in law, a citing or calling a perſon to any court, to anſwer a complaint, or even to give in his evidence.

There muſt always be a ſummons in real actions, whereby the ſheriff warns the party to appear at a day on the tenants land; alſo fourteen days before the return, proclamation is to be made thereof, in order that the grand cape may iſſue.

SUMMONS and SEVERANCE. See the article SEVERANCE.

SUMMUM BONUM, in ethics. See the articles GOOD and HAPPINESS.

SUMPTUARY LAWS, *leges ſumptuariæ*, are laws made to reſtrain exceſs in apparel, coſtly furniture, eating, &c.

SUN, *ſol*, ☉ in aſtronomy, the great luminary which enlightens the world, and by its preſence, conſtitutes day. See the articles DAY and DIURNAL.

The ſun is the principal ſource of heat upon the earth's ſurface, and the confines of the earth and atmoſphere without this, ſays Dr. Shaw, all the bodies upon our globe would doubtleſs grow fixed, rigid and lifeleſs; it being the ſolar heat that ſtirs within them, as the main ſpring of their actions; cauſing all the operations in the animal, vegetable, and mineral kingdoms; and hence alſo, the ocean and atmoſphere continue in a fluid ſtate. See FIRE and HEAT.

Sir Iſaac Newton, in his optics, gives good reaſons to ſuppoſe the ſun and fixed ſtars to be great earths vehemently hot; whoſe heat is conſerved by the greatneſs of their bodies, and the mutual action and re-action between them and the light which they emit; and whoſe parts are kept from fuming away, not only by their fixity, but alſo by the vaſt weight and denſity of the atmoſpheres incumbent on them, and every way ſtrongly compreſſing them, and condenſing the vapours and exhalations which ariſe from them. The light ſeems to be emitted from the ſun and fixed ſtars (which probably are ſuns to other ſyſtems) much after the manner as iron, when heated to ſuch a degree as to be juſt going into fuſion, by the vibrating motion of its parts, emits, with force and violence, copious ſtreams of liquid fire all around. Great bodies muſt preſerve their heat longeſt, and that, perhaps, in the proportion of their diameters. See the article STAR.

The ſun, then, may be conceived to be a huge body of fire, whence all the planets

planets receive their light; and by the emanation of whoſe rays and beams of light, the whole ſyſtem of beings about us is illuminated and rendered viſible.

In order to compute the diameter, and bulk, or ſolid content, of the ſun, its diſtance from the earth muſt be firſt known by means of the horizontal parallax; to find which, aſtronomers have attempted a variety of methods, but have as yet found none that will determine it exactly: however, by many repeated obſervations of Dr. Halley, it is found to be not greater than 12″, nor leſs than 9″. Wherefore 10 ½″ (the mean) has been fixed upon as near the truth, which we muſt be contented with till May 26, 1761, when Venus will tranſit the ſun's diſk, by which means the ſame gentleman has ſhewn the ſun's parallax may be determined to a great nicety, *viz.* to within a five hundredth part of the whole. See Phil. Tranſ. n° 348, abridged by Jones, Vol. IV. See the article PARALLAX.

Suppoſing, then, the ſun's horizontal parallax to be 10″, its diſtance will be found to be 82136014 britiſh miles: and having a double convex lens, as L, (plate CCLXII. fig. 8.) whoſe focus of parallel rays is at C D, 12 feet, or 144 inches, diſtant from itſelf: let this lens be fixed in the window-ſhutter of a darkened room, to receive the ſun's rays A L, B L, which coming from the extreme parts of the ſun's body, and interſecting each other in the center of the lens, will determine the diameter of the ſun's image at C D; which, being nicely meaſured, will be found $1\frac{34}{100}$ of an inch, the half of which is C $e = \frac{67}{100}$ of an inch. Then ſay,

As the focal diſtance	C L =	144 =	2.158362
To ½ the diameter of the image	C e =	0. 67 =	0.173925
So is the radius	R =	90° 00′ =	10.000000
To the ſine of the angle	C L e =	00° 16′ =	7.667713

Therefore, the whole angle C L D (= A L B) = 32′, which is the ſun's apparent diameter, or that under which its diameter appears to the eye.

Now ſince the diameter of any object and its image, are proportional to their diſtances from the lens, the real diameter may be found by the following analogy:

As the diſtance of the image	C L =	144 =	2.158362
To its diameter	C D =	1.34 =	0.127105
So is the diſtance of the ſun	L A =	82136014 =	7.914533
To the ſun's diameter,	A B =	764320 =	5.883276

Hence the diameter of the ſun is found to be 764,320 engliſh miles; though by other computations, its diameter is found to be only 763,460 miles, and its diſtance from our earth 81,000,000 of miles. See the articles DISTANCE and DIAMETER, under the laſt of which articles its leaſt mean and greateſt apparent diameters may be ſeen, both according to de la Hire and Hevelius.

The quantity of matter in the ſun, compared with that of the earth, has already been taken notice of under EARTH.

From what has there been ſaid, it follows, that the common center of gravity, of the ſun and jupiter, is nearly in the ſuperficies of the ſun; of ſaturn and the ſun a little within it. And by calculation it is found that the common center of gravity of all the planets cannot be more than the length of the ſolar diameter diſtant from the center of the ſun: this common center of gravity is proved to be at reſt; and therefore, though the ſun, by reaſon of the various poſition of the planets, may be moved every way, yet it cannot recede far from the common center of gravity. And this it is thought ought to be accounted the center of our world. See the articles COPERNICAN, SYSTEM, CENTER, *&c.*

By means of the ſolar ſpots it hath been diſcovered, that the ſun revolves round his own axis, without moving (conſiderably) out of his place, in about twenty-five days. And that the axis of this motion is inclined to the ecliptic, in an angle of 87 degrees, 30 minutes, nearly. See MACULÆ and FACULÆ.

The ſun's apparent diameter being ſenſibly ſhorter in December than in June, as is plain and agreed from obſervation, the ſun muſt be proportionably nearer to the earth in winter than in ſummer: in the former of which ſeaſons will be the perihelion, in the latter the aphelion: and this is alſo confirmed by the earth's moving ſwifter in December than it doth in June. For ſince, as Sir Iſaac Newton hath demonſtrated, the earth always deſcribes equal areas in equal times, whenever it moves ſwifter, it muſt needs be

nearer

nearer to the ſun. And for this reaſon there are about eight days more from the ſun's vernal equinox to the autumnal, than from the autumnal to the vernal.

For the apparent annual motion round the earth, ſee the article EARTH.

If you divide 360 degrees (*i. e.* the whole ecliptic) by the quantity of the ſolar year, it will quote 59 minutes 8 ſeconds, *&c.* which therefore is the quantity of the ſun's diurnal motion. And, if this 59 minutes 8 ſeconds be divided by 24, you have the ſun's horary motion, which is 2 minutes 28 ſeconds; and, if you will divide this laſt by 60, you will have this motion in a minute, *&c.* And this way are the tables of the ſun's mean motion, which you have in the books of aſtronomical calculation, conſtructed.

For eclipſes of the ſun, cycle of the ſun, maculæ and faculæ of the ſun, *&c.* See ECLIPSE, CYCLE, *&c.*

SUN-FISH, *mola*, in ichthyology. See the article MOLA.

SUN-FLOWER, in botany. See the articles HELIANTHUS and HELIANTHEMUM.

Dwarf SUN-FLOWER, *rudbeckia*, in botany. See RUDBECKIA.

SUN-DEW, *ros ſolis*. See ROS.

SUNDA-ISLANDS, thoſe ſituated near the ſtraits of Sunda, in the indian ocean; the chief of which are Borneo, Java, Sumatra, *&c.* See BORNEO, *&c.*

SUNDAY, or the LORD'S-DAY, a ſolemn feſtival obſerved by Chriſtians on the firſt day of every week, in memory of our Saviour's reſurrection.

This is the principal and moſt noted of the chriſtian feſtivals, and was obſerved with great veneration in the antient church, from the time of the apoſtles, who themſelves are often ſaid to have met on that day for divine ſervice. It is likewiſe called the ſabbath-day, as being ſubſtituted in the room of the jewiſh ſabbath. See the article SABBATH.

The antients retained the name Sunday, or *dies ſolis*, in compliance with the ordinary forms of ſpeech, the firſt day of the week being ſo called by the Romans, becauſe it was dedicated to the worſhip of the ſun.

Beſides that the moſt ſolemn parts of the chriſtian worſhip were always performed on ſundays, this day was diſtinguiſhed by a peculiar reverence and reſpect expreſſed towards it in the obſervation of ſome ſpecial laws and cuſtoms. Among theſe, we may reckon in the firſt place, thoſe imperial laws which ſuſpended all proceedings at law upon this day, excepting only ſuch as were of abſolute neceſſity, or eminent charity; ſuch as the manumiſſion of ſlaves, and the like. Neither was it only the buſineſs of the law, but all ſecular and ſervile employments were ſuperſeded upon this day, ſtill excepting acts of neceſſity and mercy. Another thing which the chriſtian laws took care of, to ſecure the honour and dignity of the lord's day, was, that no ludricrous ſports or games ſhould be followed on this day; but all ſuch recreations and refreſhments as tended to the preſervation or conveniency of life were allowed of; and therefore, ſunday was always a day of faſting, and it was not allowable to faſt thereon, not even in Lent. The great care and concern of the primitive Chriſtians in the religious obſervation of the lord's-day, appears firſt from their conſtant attendance upon all the ſolemnities of public worſhip, from which nothing but ſickneſs, impriſonment, baniſhment, or ſome great neceſſity could detain them. Secondly, from their zeal in frequenting religious aſſemblies on this day, even in times of the hotteſt perſecution, when they were often beſet and ſeized in their meetings and congregations. Thirdly, from their ſtudious obſervations of their vigils or nocturnal aſſemblies that preceded the lord's-day. Fourthly, from their eager attendance on ſermons, in many places, twice upon this day, and their conſtant reſorting to evening prayers, where there was no ſermon. Laſtly, from the ſevere cenſures inflicted on thoſe who violated the laws concerning the religious obſervation of this day, ſuch perſons being uſually puniſhed with excommunication, as appears from the apoſtolical conſtitutions, and the canons of ſeveral councils. In the romiſh breviary, and other offices, we meet with a diſtinction of ſundays, into thoſe of the firſt and ſecond claſs; Sundays of the firſt claſs are, Palm-ſunday, Eaſter-ſunday, Advent, Whitſunday, *&c.* thoſe of the ſecond claſs are the common ſundays of the year. See PALM-SUNDAY, EASTER-SUNDAY, *&c.*

By our laws, no perſon is to do any worldly labour on this day, which is ſet apart for the ſervice and worſhip of God, except works of neceſſity and charity, under the penalty of five ſhillings. And if any perſon cry, or expoſe to ſale any wares, or goods on a Sunday, the

ſame

ſame will be forfeited to the poor, *&c.* the offender being convicted thereof before a juſtice of the peace, *&c.* who is authoriſed to cauſe the penalties and forfeitures to be levied by diſtreſs. Yet this extends not to dreſſing of meat, nor to the crying or ſelling of milk in the morning or evening, or the ſelling of mackrel on that day. The ſunday is not a day in law, ſo that no proceſs lies, or may be ſerved thereon, except for treaſon, or felony, or on an eſcape. A ſale of goods, or contract made on a ſunday, is deemed void. For the ſunday-letter, or that letter of the alphabet which points out in the calendar the ſundays throughout the year. See DOMINICAL LETTER.

SUNDERLAND, a port-town of Durham, ſituated on the German Sea, at the mouth of the river Ware, ten miles north-eaſt of Durham city.

SUNDERLAND, or SUDERMANIA, a province of Sweden, bounded by the Meller Lake, which divides it from Uplandia, on the north; by the Baltic Sea on the eaſt; and by Gothland on the ſouth and weſt.

SUNNEBERG, a town of Germany, in the circle of Upper Saxony, and marquiſate of Brandenburg, ſituated fifty miles north-eaſt of Berlin.

SUNTGOW, a territory in the circle of the upper Rhine in Germany, bounded by Alſace on the north; by the river Rhine, which divides it from the Briſgow, on the eaſt; by Switzerland on the ſouth, and by Franche-Compte on the weſt.

SUOVETAURILIA, an antient roman ſacrifice, ſo called becauſe it conſiſted of a pig (*ſus*) a ſheep, or rather ram (*ovis*) and a bull (*taurus*). They were all males, to denote the maſculine courage of the roman people. It was likewiſe called ſolitaurilia, becauſe the animals offered up were always (*ſolida*) whole or uncut.

SUPERBIPARTIENS. See the article RATIO.

SUPERCARGO, a perſon employed by merchants to go a voyage, and overſee their cargo, or lading, and diſpoſe of it to the beſt advantage. See the articles CARGO, FACTOR, *&c.*

SUPERCILIUM, in anatomy, the eyebrow. See the article EYE-BROW.

SUPERCILIUM, in the antient architecture, the uppermoſt member of the corniche, called by the moderns corona, crown, or larmier.

It alſo uſed for a ſquare member, under the upper tore in ſome pedeſtals; ſome authors confound it with the tore itſelf. See the article TORE.

SUPEREROGATION, in theology, what a man does beyond his duty, or more than he was commanded to do. The Romaniſts ſtand up ſtrenuouſly for works of ſupererogation, and maintain, that the obſervance of evangelical councils is ſuch. By means hereof, a ſtock of merit is laid up, which the church has the diſpoſal of, and which ſhe diſtributes in indulgences to ſuch as need. The reformed church do not allow of any work of ſupererogation.

SUPERFETATION, *ſuperfœatio*, in medicine, a ſecond, or after conception, happening, when the mother, already pregnant, conceives of a later coition; ſo that ſhe bears at once two fœtuſes of unequal age and bulk, and is delivered of them at different times. We meet with inſtances of ſuperfetations in Hippocrates, Ariſtotle, Du Laurens, *&c.* But they are ſaid to be much more frequent in hares and ſows. Naturaliſts hold, that female rats are frequently born with young rats in their wombs; and we are told of extraordinary inſtances of this kind in the female part of the human ſpecies, by Bartholine, Mentzelius, and in the hiſtory of the Royal Academy of Sciences.

SUPERFICIAL CONTENT. See SUPERFICIES, AREA, and MEASURING.

SUPERFICIAL *fourneau*, in fortification, the ſame with caiſſon. See CAISSON.

SUPERFICIES, or SURFACE, in geometry, a magnitude conſidered as having two dimenſions; or extended in length and breadth, but without thickneſs or depth. In bodies, the ſuperficies is all that preſents itſelf to the eye. A ſuperficies is chiefly conſidered as the external part of a ſolid. When we ſpeak of a ſurface ſimply, and without any regard to body, we uſually call it figure. The ſeveral kinds of ſuperficies are as follow. Rectilinear ſuperficies, that comprehended between right lines; curvilinear ſuperficies, that comprehended between curve lines; plane ſuperficies, is that which has no inequality, but lies evenly between its boundary lines; convex ſuperficies, is the exterior part of a ſpherical, or ſpheroidical body; and a concave ſuperficies, is the internal part of an orbicular or ſpheroidical body.

The meaſure or quantity of a ſuper-

ficies, or ſurface, is called the area thereof. See AREA and MEASURE.

The finding of this meaſure, or area, is called the quadrature thereof. See the article QUADRATURE.

To meaſure the ſurfaces of the ſeveral kinds of bodies, as ſpheres, cubes, parallelepipeds, pyramids, priſms, cones, *&c.* See the article SPHERE, *&c.*

Line of SUPERFICIES, a line uſually found on the ſector, and Gunter's ſcale, the deſcription and uſe whereof, ſee under SECTOR and GUNTER'S SCALE.

SUPERFINE, in the manufactories, a term uſed to expreſs the ſuperlative fineneſs of a ſtuff; thus a cloth, a camblet, *&c.* are ſaid to be ſuperfine, when made of the fineſt wool, *&c.* or when they are the fineſt that can be made. The term is particularly uſed among gold or ſilver wire-drawers, for the gold or ſilver wire, which after being drawn through an infinite number of holes, each leſs and leſs, is at length brought to be no bigger than an hair.

SUPERINSTITUTION, *ſuperinſtitutio*, denotes an inſtitution upon another, as where A B is admitted and inſtituted to a benefice upon one title, and C D is admitted and inſtituted on that of another.

SUPERINTENDANT, in the french cuſtoms, an officer who has the prime management and direction of the finances or revenues of the king. The term is alſo uſed for the firſt officer of the queen's houſhold, who has the chief adminiſtration thereof. They have alſo a ſuperintendant of the buildings, anſwering to the ſurveyor of the works among us. See the article SURVEYOR.

SUPERINTENDANT alſo denotes an eccleſiaſtical ſuperior in ſeveral reformed churches, where epiſcopacy is not admitted, particularly among the Lutherans in Germany, and the Calviniſts in ſome other places. The ſuperintendant is in effect little other than a biſhop, only his power is ſomewhat more reſtrained than that of the dioceſan biſhops. He is the chief paſtor, and has the direction of all the inferior paſtors within his diſtrict or dioceſe.

SUPERIOR, or SUPERIOUR, ſomething raiſed above another, or that has a right to command another.

SUPERJURARE, was antiently a term uſed in our law where a criminal endeavoured to excuſe himſelf by his own oath, or by the oath of one or two witneſſes; and the crime charged againſt him was ſo notorious, that he was convicted upon the oaths of many more witneſſes; this was termed ſuperjurare.

SUPERLATIVE, in grammar, one of the three degrees of compariſon, being that inflexion of nouns-adjective that ſerves to augment and heighten their ſignification, and ſhews the quality of the thing denoted to be in the higheſt degree. See the articles COMPARATIVE, POSITIVE, and COMPARISON.

In engliſh, the ſuperlative is uſually formed by the addition of *eſt* to the poſitive, as *richeſt*, *greateſt*, *&c.* and frequently by prefixing of *moſt*, as *moſt rich*, *moſt great*, *&c.*

SUPERNUMERARY, ſomething over and above a fixed number. In ſeveral of the offices are ſupernumerary clerks, to be ready on extraordinary occaſions. There are alſo ſupernumerary ſurveyors of the exciſe, to be ready to ſupply vacancies when they fall; theſe have but half-pay. In muſic, the ſupernumerary, called by the Greeks proſlambanomenos, is the loweſt of the chords of their ſyſtem, anſwering to *a*, *mi*, *la*, of the loweſt octave of the moderns. See the article DIAGRAM.

SUPERONERATIONE PASTURÆ, in law, a judicial writ which lies againſt a perſon that is impleaded in the county-court, for ſurcharging of a common with his cattle, in a caſe where he was formerly impleaded for it in the ſame court, and the cauſe is removed into one of the courts at Weſtminſter.

SUPERPARTICULAR, SUPERPARTIENS, } See RATIO.

SUPER-PRÆROGATIVA REGIS, in law a writ that formerly lay againſt the king's widow, for marrying without a licence.

SUPER-PURGATION, *hypercathraſis*, in medicine, an exceſſive over-violent purging, the uſual effects of colliquating, corroſive and ſtimulating medicines. In the beginning of this diſorder, a very thin matter is evacuated: but afterwards, when the relaxation and aperture of the veſſels are increaſed, the neceſſary humours are diſcharged; there is firſt an excretion of yellow bile, then of phlegm, then of black bile, and laſt of all blood. See the article FLUX.

Thoſe who labour under a ſuperpurgation, muſt be treated with frictions of the ſkin, and a warm bath, drinking before they bathe thin, red, or yellow wine, for ſuch is eaſieſt of diſtribution, with ſops of bread, and pomegranates.

If

If the evacuation continues, let the limbs be bound in ſuch a manner, that the bandage may be carried from the upper to the lower parts. Exhibit alſo a ſmall quantity of theriaca, to be taken with the fleſh of vipers, or for want of that, troches of theriaca, or troches of ſeeds, and of the antidote called philonium. Cupping-glaſſes may alſo be applied to the ſtomach, and cataplaſms of polenta and mulſum; after which, you may uſe aſtringent epithems, but the greateſt relief is had from frictions of the whole body, and potable remedies. The patient ſhould keep himſelf from cold air, or what is very warm. If the evacuation ſtill continues, the aforeſaid cataplaſms ſhould be applied, and obtundents injected in clyſters, ſuch as the fat of gooſe, ſweet wine, oil of ſpike, and the like.

SUPERQUADRIPARTIENS. See the article RATIO.

SUPERSCAPULARIS INFERIOR, in anatomy, the ſame with infraſpinatus. See the article INFRASPINATUS.

SUPERSCAPULARIS SUPERIOR, is the ſame with ſupraſpinatus. See the article SUPRASPINATUS.

SUPERSEDEAS, in law, according to Fitzherbert, is a writ which lies in divers caſes, and in general ſignifies a command to ſtay ſome of the ordinary proceedings in law, which, on good cauſe ſhewn, ought not to proceed. It is likewiſe uſed for ſtaying of an execution after a writ of error is allowed, and bail put in, but not before bail is given, in caſe there be a judgment upon verdict, or by default in debt, *&c.* A ſuperſedeas is alſo granted by the court for ſetting aſide an erroneous judicial proceſs, *&c.* And a priſoner may be thereby diſcharg'd upon entering his appearance, and on the plaintiff's not filing a declaration againſt him. For this writ is as good a cauſe to diſcharge the perſon, as the firſt proceſs is to arreſt him. There is a further writ of ſuperſedeas, where an audita querela is ſued, and in caſes of ſurety of the peace, when one is already bound to the peace in chancery, or elſewhere.

SUPER-STATUTO DE ARTICULIS CLERI, in law, a writ that lies againſt the ſheriff, or other officer that diſtrains in the king's highway, or in the lands antiently given to the church.

SUPER-STATUTO FACTO POUR SENESCHAL ET MARSHAL DE ROY, *&c.* a writ which lies againſt the ſteward or marſhal, for holding plea of freehold in his court, or for treſpaſs, or contracts not made within the king's houſhold.

SUPER-STATUTO VERSUS SERVANTES ET LABORATORES, a writ lying againſt a perſon who keeps another perſon's ſervant departed from his ſervice, contrary to law.

SUPERSTITION, extravagant devotion, or religion, wrong directed, or conducted.

SUPERVISOR, a ſurveyor, or overſeer. See the article SURVEYOR, *&c.*

It was formerly, and ſtill remains a cuſtom among ſome perſons, to appoint a ſuperviſor of a will, to ſee that the executors thereof do punctually obſerve and perform the ſame.

Superviſor formerly was uſed for ſurveyor of the highways. There are likewiſe certain officers of the exciſe, who are called ſuperviſors, on account of their having the ſuperviſing and inſpecting of the books, *&c.* of the inferior officers belonging to that branch of the revenue, to prevent their neglect of duty.

SUPINATION, in anatomy, the action of a ſupinator-muſcle, or the motion whereby it turns the hand ſo as that the palm is lifted up towards heaven. See the next article.

SUPINATOR, in anatomy, a denomination given to two muſcles of the arm, the one called the ſupinator longus, the other the ſupinator brevis, both ſerving to turn the palm of the hand upwards. The firſt has its origin from the exterior ſpine of the humerus, and its termination at the lower end of the radius; the ſecond riſes from the upper part of the ulna, and is inſerted into the upper part of the radius, which it totally ſurrounds and incloſes. This laſt muſcle may alſo be of uſe in the bending of the cubit.

SUPINE, in latin grammar, part of the conjugation of a verb, being a verbal ſubſtantive of the ſingular number, and the fourth declenſion.

There are two kinds of ſupines; one, called the firſt ſupine, ending in *um*, of the accuſative caſe, is always of an active ſignification, and marks a motion, as *abiit deambulatum*; the other, called the laſt ſupine, and ending in *u*, of the ablative caſe, is of a paſſive ſignification, and is governed by ſubſtantives or adjectives, as, *facile dictu*, &c.

SUPPLE, to ſupple a horſe in the manege, is to make him bend his neck,

ſhoulders, and ſides, and to render all the parts of his body more pliable.

SUPPLEMENT *of an arch*, in geometry, or trigonometry, is the number of degrees that it wants of being an intire ſemicircle; as a complement, ſignifies what an arch wants of being a quadrant. See the article COMPLEMENT.

SUPPLEMENT, in matters of literature, an appendage to a book, to ſupply what is wanting therein.

SUPPLICAVIT, in law, a writ that iſſues out of the court of Chancery for taking ſurety of the peace, where a perſon is in danger of receiving ſome bodily hurt from another. It is directed to the juſtices of the peace and ſheriff of the county, and is grounded on the ſtatute 1. of Edward III. which appoints, that certain perſons ſhall be appointed by the lord-chancellor to take care of the peace. In order to ſue out this writ, the party requiring it firſt goes before one of the maſters in Chancery and makes oath, that he does not deſire the ſame out of any malice, but purely for his own ſafety, and the ſecurity of his perſon; upon which the maſter will make out a warrant, ordering the writ to be made out by one of the clerks of the ſix clerk's-office, after which the writ muſt be delivered to the ſheriff to have his warrant thereon for arreſting the party, *&c.*

SUPPORTED, in heraldry, a term applied to the uppermoſt quarters of a ſhield when divided into ſeveral quarters, theſe ſeeming as it were ſupported or ſuſtained by thoſe below. The chief is ſaid to be ſupported when it is of two colours, and the upper colour takes up two thirds of it. In this caſe it is ſupported by the colour underneath.

SUPPORTERS, in heraldry, figures in an atchievement placed by the ſide of the ſhield, and ſeeming to ſupport or hold up the ſame. Supporters are chiefly figures of beaſts: figures of human creatures, for the like purpoſe, are properly called tenants. Some make another difference between tenant and ſupporter: when the ſhield is borne by a ſingle animal, it is called tenant; when by two, they are called ſupporters. The figures of things inanimate ſometimes placed aſide of eſcutcheons, but not touching or ſeeming to bear them, though ſometimes called ſupporters, are more properly cotiſes. See TENANT and COTICE.

The ſupporters of the britiſh arms are a lion and an unicorn. thoſe of the french arms are angels, *&c.* See ARMS.

In England, none under the degree of a banneret are allowed ſupporters, which are reſtrained to thoſe called the high nobility. The Germans permit none but princes and noblemen of rank to bear them: but among the French the uſe of them is more promiſcuous.

SUPPOSITION, in muſic, the uſing two ſucceſſive notes of equal value as to time, one of which, being a diſcord, ſuppoſes the other a concord. See HARMONY.

The harmony, Mr. Malcolm obſerves, is to be always full on the accented part of the meaſure or bar, and void of diſcords; yet here diſcords, by proper reſolution and preparation, are even neceſſary on the unaccented part of the meaſure. Diſcords, by conjoint degrees, may paſs without much offence, and it is not there required that the harmony be ſo complete as on the accented part. This tranſient uſe of diſcords, followed by concords, makes what the French call ſuppoſition. There are ſeveral kinds of ſuppoſition. The firſt is when the principal parts proceed gradually from concord to diſcord, and from diſcord to concord; the intervening diſcord ſerving only as a tranſition to the following concord. Another kind is when the parts do not proceed gradually from the diſcord to the concord, but deſcend to it by the interval of a third. A third kind, like the ſecond, is when the riſing to the diſcord is gradual, but the deſcending from it to the following concord, is by the diſtance of a fourth. A fourth kind, very different from all the reſt, is when the diſcords fall on the accented part of the meaſure, and the riſing to it is by the interval of a fourth; in which caſe it is abſolutely neceſſary to follow it immediately by a gradual deſcent into a concord that has juſt been heard before the harmony to make the preceding diſcord paſs without offence, and only ſeem a tranſition to the concord.

SUPPOSITORY, *ſuppoſitorium*, in pharmacy, a kind of medicated cone, or ball, which is introduced to the anus for opening the belly. Suppoſitories are uſually made of ſoap, ſugar, alum, or a piece of tallow-candle, about the length of a man's thumb and the breadth of a finger, though they may be made ſmaller for children, and ſometimes a little thicker for adults. Suppoſitories are ſometimes compounded

compounded of ingredients adapted to the diſeaſe and circumſtances of the patient, as of honey, ſalt, powder of aloes, colocynthia, and the like. If one ſuppoſitory does not occaſion a ſtool, it muſt be followed by another ſtronger one; and if that does not ſucceed, the repetition muſt be continued till the effect required is produced. They are ſometimes lubricated with oil or butter, that they may be introduced with greater eaſe. Some uſe a lozenge of ſugar, or a piece of thin linnen cloth rolled up with a little lard or ſalt-butter, which greatly looſens the belly. For ulcers of the rectum, the beſt ſuppoſitories are made of honey of roſes, powder of maſtich and myrrh, or of colophony. The ſtronger ſuppoſitories, which are compoſed of acrid and ſtimulating ingredients, are advantageouſly uſed in promoting a difficult birth, if the infant be in a natural poſition; and alſo for expelling the ſecundines when they are tenaciouſly retained in the uterus. In exhibiting them the patient ſhould be put in the ſame poſture as in giving a clyſter, and the ſuppoſitory muſt be gently thruſt up the anus with the finger.

SUPPRESSION, in law, the extinction or annihilation of an office, right, rent, or the like.

SUPPRESSION, in grammar and rhetoric, denotes an omiſſion of certain words in a ſentence, which yet are neceſſary to full and perfect conſtruction: as, "I come from my father's;" that is, "from my father's houſe."

Suppreſſion is a figure of ſpeech very frequent in our language, chiefly uſed for brevity and elegance. Some rules relating hereto are as follow: 1. Whenever a word comes to be repeated in a ſentence oftener than once, it is to be ſuppreſſed. Thus we ſay, "This is my maſter's horſe," not "This horſe is my maſter's horſe." 2. Words that are neceſſarily ſupplied may be ſuppreſſed: and 3. All words that uſe and cuſtom ſuppreſs in other languages, are alſo to be ſuppreſſed in Engliſh, unleſs there be particular reaſons for the contrary.

Suppreſſion is alſo a figure in ſpeech whereby a perſon in rage, or other diſturbance of mind, ſpeaks not out all he means, but ſuddenly breaks off his diſcourſe. Thus the gentleman in Terence, extremely incenſed againſt his adverſary, accoſts him with this abrupt ſaying, "Thou of all." The exceſs of his indignation and rage choaked the paſſage of his voice, and would not ſuffer him to utter the reſt. But in theſe caſes, though the diſcourſe is not complete, the meaning is readily underſtood, and the evidence of the thought eaſily ſupplies the defect of words. Suppreſſion ſometimes proceeds from modeſty and fear of uttering any word of ill and offenſive ſound.

SUPPRESSION, in medicine, is generally uſed for a retention of urine or the menſes. See the article DYSURY, ISCHURY, MENSES, &c.

SUPPRESSIONIS IGNIS, a fire of ſuppreſſion, a term uſed in chemiſtry to expreſs ſuch an application of fire to any ſubject that it ſhall at once act upon it, both above and below, in the ſame manner. The uſual way of giving this heat is by covering the veſſel in which the ingredients are put with ſand, and then laying hot coals upon that, ſo that they may heat through the ſand downwards.

SUPPURATION, in medicine and ſurgery, the ſecond way wherein an inflammation terminates, being a converſion of the inſpiſſated blood and the ſoft adjacent parts, as the veſſels and fat into pus, or matter: which diſorder, when it has not yet found an opening, is generally called an abſceſs. See the articles INFLAMMATION, ABSCESS, PHLEGMON, TUMOUR, &c.

The beſt cure of an inflammation is by reſolution or diſperſion: but when this is out of the power of the ſurgeon or phyſician to effect, and when tumours and phlegmons ſhew a tendency to ſuppuration, all the reſolving and diſperſing medicines muſt be laid aſide, and great care muſt be taken to forward the maturity of the inflammation; that is, to convert the ſtagnated blood into laudable matter; then to give a diſcharge or vent to this ſuppurated matter; afterwards to cleanſe the part; and finally to incarn and heal it. See the articles DISPERSION, ULCER, WOUND, &c.

In general, ſuppuration is to be promoted by ſuch of the emollient medicines as obſtruct the pores of the ſkin, as fats, oils, and glutinous medicines; as alſo the ſharp, pungent, and in ſome degree cauſtic medicines, which may be uſed in form of cataplaſms or plaſters. But to be more particular, ſuppurating medicines, beſides thoſe already enumerated under abſceſs, &c. are the fats of a gooſe, of a dog, of a man, of a viper, and of a bear; pigeon and cow-dung; bran, yeaſt,

yeaſt, herrings, leeches, melilot, tobacco, oil, burgundy pitch, common-pitch, roſin, deer-ſuet, ox-ſuet, ſheep-ſuet, and frankincenſe. Theſe medicines, either alone or compounded, are to be applied hot to the part, and the application frequently repeated, till the matter within is found to be ſufficiently ripened by the ſoftneſs and whiteneſs of the tumour: but when the abſceſs is ſmall, it is ſufficient and more convenient to apply ſome of the ripening plaſters, as diachylon, with the gums, or the like, till the ſuppuration is perfected.

A ripening cataplaſm from the London diſpenſatory, is as follows: Take of figs, four ounces; yellow baſilicum ointment, one ounce; galbanum ſtrained, half an ounce: beat the figs thoroughly in a mortar, occaſionally dropping in ſome ſpirit of wine, or ſtrong ale; then carefully mix them with the ointment firſt liquified along with the galbanum. And a ripening plaſter from the Edinburgh diſpenſatory is this, Take of gum-plaſter, an ounce and a half; burgundy-pitch, half an ounce: boil them together.

In general, it is to be obſerved, that ſuppurative medicines are ſuch as by the activity and warmth of their parts are able to penetrate the pores, and mix with and rarify any obſtructed matter, ſo that it may be rendered fit to diſcharge, upon laying open the part by a cauſtic or inciſion. Now, in many inſtances, as the matter by this means rarifies and grows more fluid, the refluent blood is apt to waſh it back into the common maſs, which ſometimes is of that nature as to do a great deal of miſchief; or by making it take up more room upon its rarefaction, occaſions it more to diſtend the parts in which it is contained, whereon a ſenſe of pain is excited, and thereby a greater concourſe of fluid, and conſequently a needleſs increaſe of the tumour; ſo that medicines under this denomination require to be in the hand of ſuch as are ſo well acquainted with the mechaniſm of the animal œconomy as to be able to apply them to the beſt advantage, and know how to avoid the hazards which may ariſe from their abuſe. Nor are internal remedies to be neglected in order to further a ſuppuration, eſpecially when the tumours are large and of conſequence. In theſe caſes, when the blood moves too ſlowly, which may be known by the pulſe, the patient muſt be allowed to eat meat, and muſt take ſuch medicines as are warm and ſtimulating, by means of which, and by the increaſed motion of the blood, the inſpiſſated particles contained in the ſmaller veſſels will be the more eaſily converted into matter. Strong broths are very proper for this purpoſe, as alſo the uſe of wine, or ale, in moderation; and venice-treacle, diaſcordium, and the confection of alkermes, are to be the medicines taken three or four times a day, and medicated teas made of ſaunders-wood, ſaſſafraſs, or cinnamon. But on the contrary, when the motion of the blood is too violent, and the heat too great, cooling medicines are to be given, ſuch as the thin and watery drinks, the ſub-acid medicines, and nitre: bleeding in a ſmall quantity is alſo often neceſſary in this caſe. But when the conſtitution is ſound, and the blood's motion regular, the uſe of internal medicines to promote ſuppuration is trifling, and may be altogether rejected.

SUPPURATIVES, or SUPPURATING MEDICINES, ſuch as promote ſuppuration. See the preceding article.

SUPPUTATION. See COMPUTATION.

SUPRACOSTALES, or LEVATORES COSTARUM, in anatomy, muſcles ſerving to reſpiration; being among thoſe that dilate the thorax for that end, and therefore reckoned among the dilatores. See the article DILATORES.

Theſe muſcles are of two kinds, being diſtinguiſhed from their figures into ſhort and long. The ſhort ones are twelve on each ſide; they have their origin from the tranſverſe proceſſes of eleven vertebræ of the back, and of one that is in the lower one of the neck, and they are inſerted into the hinder part of the ribs. The long ſupracoſtales are three or four: their origin is the ſame from the ſeventh, eighth, ninth, and tenth vertebræ, and their end in the ninth, tenth, eleventh, and twelfth ribs.

SUPRALAPSARY, in theology, a perſon who holds that God, without any regard to the good or evil works of men, has reſolved, by an eternal decree, to ſave ſome and damn others. Theſe are alſo called antelapſaries, and are oppoſed to ſublapſaries and infralapſaries.

SUPRASPINATUS, in anatomy, a muſcle thus called from its fleſhy origination at the upper end of the baſis of the ſcapula above the ſpine, to the upper part whereof it is connected, as alſo to the ſuperior edge of the ſcapula, whence marching along the upper interſcapulum,

or

er thin part of the ſcapula, which it fills, it paſſes under the acromium and articulation of the humerus. It helps to lift the arm upwards.

SUPREMACY, in our polity, the ſuperiority or ſovereignty of the king over the church as well as ſtate, whereof he is eſtabliſhed head. See KING.

The king's ſupremacy was at firſt eſtabliſhed, or, as others ſay, recovered, by king Henry VIII. in 1534, after breaking with the pope. It is ſince confirmed by ſeveral canons, as well as by the articles of the church, and is paſſed into an oath which is required as a neceſſary qualification for all offices and employments both in church and ſtate, from perſons to be ordained, from the members of both houſes of parliament, &c.

SURA, in anatomy, the calf, or fleſhy part of the leg. The word is alſo uſed by ſome for the fibula. See the article FIBULA.

SURAT, a city and port-town of hither India, in the province of Guzurat, or Cambaya, ſituated on the river Tapte, ten miles eaſt of the Indian-ſea: in eaſt long. 72° 20′, north lat. 21° 30′.

SURBATING, among farriers, is when the ſole of a horſe's foot is worn, bruiſed, or ſpoiled by beating the hoof againſt the ground in travelling without ſhoes, or going in hot ſandy lands, or with a ſhoe that hurts the ſole, lies too flat to it, or the like. Sometimes alſo it happens by over-riding a horſe while young, before his feet are hardened; and ſometimes by the hardneſs of the ground and high lifting his feet. The ſigns hereof are his halting on both fore-legs, and going ſtiffly, and creeping as if half foundered. In the general, there is nothing better for ſurbated feet than tar melted into the foot, or vinegar boiled with ſoot to the conſiſtence of a broth, and put into the foot boiling hot, with hurds over it, and ſplints to keep it in.

SURCHARGE, the ſame with overcharge, and whatever is above that which is juſt and right. Surcharge of the foreſt or a common, is when a commoner puts more beaſts in the foreſt or common than he has a right to do.

SURCINGLE, a girdle wherewith the clergy of the church of England uſually tie their caſſock. See GIRDLE.

SURCOAT, a coat of arms to be worn over the body armour. See the article COAT *of arms*.

The ſurcoat is properly a looſe thin taffaty-coat, with arms embroidered or painted on it, ſuch as is worn by heralds: antiently alſo uſed by military men over their armour, to diſtinguiſh themſelves by.

SURCULUS, in the anatomy of plants, a word uſed to expreſs that part of the branching of the ribs of a leaf, which is of a middle kind betwixt the great middle rib and the ſmalleſt reticular ramifications. The middle rib is by the writers on theſe ſubjects called petiolum. The firſt diviſion that go off laterally from theſe are called rami, or branches; the next diviſion of theſe into more minute ones, ſurculi; and the final divarications of theſe into the reticular work that ſpreads itſelf over the whole leaf, capillamenta. See PETIOLUM, &c.

SURD, in arithmetic and algebra, denotes any number or quantity that is incommenſurable to unity: otherwiſe called an irrational number or quantity.

The ſquare roots of all numbers, except 1, 4, 9, 16, 25, 36, 49, 64, 81, 100, 121, 144, &c. (which are the ſquares of the integer numbers, 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, &c.) are incommenſurables: and after the ſame manner the cube roots of all numbers but of the cubes of 1, 2, 3, 4, 5, 6, &c. are incommenſurables: and quantities that are to one another in the proportion of ſuch numbers, muſt alſo have their ſquare-roots, or cube-roots, incommenſurable. The roots, therefore, of ſuch numbers, being incommenſurable, are expreſſed by placing the proper radical ſign over them: thus $\sqrt[2]{2}$, $\sqrt[2]{3}$, $\sqrt[2]{5}$, $\sqrt[2]{6}$, &c. expreſs numbers incommenſurable with unity. However, though theſe numbers are incommenſurable themſelves with unity, yet they are commenſurable in power with it; becauſe their powers are integers, that is, multiples of unity. They may alſo be commenſurable ſometimes with one another, as the $\sqrt[2]{8}$ and $\sqrt[2]{2}$; becauſe they are to one another as 2 to 1: and when they have a common meaſure, as $\sqrt[2]{2}$ is the common meaſure of both; then their ratio is reduced to an expreſſion in the leaſt terms, as that of commenſurable quantities, by dividing them by their greateſt common meaſure. This common meaſure is found as in commenſurable quantities, only the root of the common meaſure is to be

be made their common diviſor: thus $\frac{\sqrt{12}}{\sqrt{3}} = \sqrt{4} = 2$, and $\frac{\sqrt{18a}}{\sqrt{2}} = 3\sqrt{a}$.

A rational quantity may be reduced to the form of any given ſurd, by raiſing the quantity to the power that is denominated by the name of the ſurd, and then ſetting the radical ſign over it: thus $a = \sqrt[2]{a^2} = \sqrt[3]{a^3} = \sqrt[4]{a^4} = \sqrt[5]{a^5} = \sqrt[n]{a^n}$, and $4 = \sqrt{16} = \sqrt[3]{64} = \sqrt[4]{256} = \sqrt[5]{1024} = \sqrt[n]{4^n}$.

As ſurds may be conſidered as powers with fractional exponents, they are reduced to others of the ſame value that ſhall have the ſame radical ſign, by reducing theſe fractional exponents to fractions having the ſame value and a common denominator. Thus $\sqrt[n]{a} = a^{\frac{1}{n}}$, and $\sqrt[m]{a} = a^{\frac{1}{m}}$, and $\frac{1}{n} = \frac{m}{nm}$, $\frac{1}{m} = \frac{n}{nm}$, and therefore $\sqrt[n]{a}$ and $\sqrt[m]{a}$, reduced to the ſame radical ſign, become $\sqrt[nm]{a^m}$ and $\sqrt[nm]{a^n}$. If you are to reduce $\sqrt[2]{3}$ and $\sqrt[3]{2}$ to the ſame denominator, conſider $\sqrt[2]{3}$ as equal to $3^{\frac{1}{2}}$, and $\sqrt[3]{2}$ as equal to $2^{\frac{1}{3}}$, whoſe indices reduced to a common denominator, you have $3^{\frac{1}{2}} = 3^{\frac{3}{6}}$, and $2^{\frac{1}{3}} = 2^{\frac{2}{6}}$, and, conſequently, $\sqrt[2]{3} = \sqrt[6]{3^3} = \sqrt[6]{27}$, and $\sqrt[3]{2} = \sqrt[6]{2^2} = \sqrt[6]{4}$; ſo that the propoſed ſurds $\sqrt[2]{3}$ and $\sqrt[3]{2}$, are reduced to other equal ſurds $\sqrt[6]{27}$ and $\sqrt[6]{4}$, having a common radical ſign.

Surds of the ſame rational quantity are multiplied by adding their exponents, and divided by ſubtracting them; thus, $\sqrt[2]{a} \times \sqrt[3]{a} = a^{\frac{1}{2}} \times a^{\frac{1}{3}} = a^{\frac{3+2}{6}} = a^{\frac{5}{6}} = \sqrt[6]{a^5}$; and $\frac{\sqrt[3]{a}}{\sqrt[5]{a}} = \frac{a^{\frac{1}{3}}}{a^{\frac{1}{5}}} = a^{\frac{1}{3}-\frac{1}{5}} = a^{\frac{5-3}{15}} = a^{\frac{2}{15}} = \sqrt[15]{a^2}$; $\sqrt[m]{a} \times \sqrt[n]{a} = a^{\frac{n+m}{mn}}$; $\frac{\sqrt[m]{a}}{\sqrt[n]{a}} = a^{\frac{n-m}{mn}}$; $\sqrt[2]{2} \times \sqrt[3]{2} = \sqrt[6]{2^5} = \sqrt[6]{32}$; $\frac{\sqrt[2]{2}}{\sqrt[3]{2}} = \sqrt[6]{2}$.

If the ſurds are of different rational quantities, as $\sqrt[n]{a^2}$ and $\sqrt[n]{b^3}$, and have the ſame ſign, multiply theſe rational quantities into one another, or divide them by one another, and ſet the common radical ſign over their product or quotient. Thus, $\sqrt[n]{a^2} \times \sqrt[n]{b^3} = \sqrt[n]{a^2 b^3}$; $\sqrt[2]{2} \times \sqrt[2]{5} = \sqrt[2]{10}$; $\frac{\sqrt[m]{a^4}}{\sqrt[m]{b^3 a}} = \sqrt[m]{\frac{a^4}{b^3 a}} = \sqrt[m]{\frac{a^3}{b^3}}$; $\frac{\sqrt[3]{9}}{\sqrt[3]{24}} = \sqrt[3]{\frac{9}{24}} = \sqrt[3]{\frac{3}{8}} = \frac{1}{2}\sqrt[3]{3}$.

If ſurds have not the ſame radical ſign, reduce them to ſuch as ſhall have the ſame radical ſign, and proceed as before; $\sqrt[m]{a} \times \sqrt[n]{b} = \sqrt[nm]{a^n b^m}$; $\frac{\sqrt[m]{a}}{\sqrt[n]{x}} = \sqrt[mn]{\frac{a^n}{x^m}}$; $\sqrt[2]{2} \times \sqrt[3]{4} = 2^{\frac{1}{2}} \times 4^{\frac{1}{3}} = 2^{\frac{3}{6}} \times 4^{\frac{2}{6}} = \sqrt[6]{2^3 \times 4^2} = \sqrt[6]{8 \times 16} = \sqrt[6]{128}$; $\frac{\sqrt[3]{4}}{\sqrt[2]{2}} = \frac{4^{\frac{1}{3}}}{2^{\frac{1}{2}}} = \frac{4^{\frac{2}{6}}}{2^{\frac{3}{6}}} = \sqrt[6]{\frac{4^2}{2^3}} = \sqrt[6]{\frac{16}{8}} = \sqrt[6]{2}$.

If the ſurds have any rational coefficients, their product or quotient muſt be prefixed; thus, $2\sqrt[2]{3} \times 5\sqrt[2]{6} = 10\sqrt[2]{18}$.

The powers of ſurds are found as the powers of their quantities, by multiplying their exponents by the index of the power required; thus the ſquare of $\sqrt[3]{2}$ is $2^{\frac{1}{3} \times 2} = 2^{\frac{2}{3}} = \sqrt[3]{4}$; the cube of $\sqrt[2]{5} = 5^{\frac{1}{2} \times 3} = 5^{\frac{3}{2}} = \sqrt[2]{125}$. Or you need only, in involving ſurds, raiſe the quantity under the radical ſign to the power required, continuing the ſame radical ſign; unleſs the index of that power is equal to the name of the ſurd, or a multiple of it, and in that caſe the power of the ſurd becomes rational. Evolution is performed by dividing the fraction, which is the exponent of the ſurd, by the name of the root required. Thus the ſquare root of $\sqrt[3]{a^4}$ is $\sqrt[3]{a^2}$ or $\sqrt[6]{a^4}$.

The

The surd $\sqrt[m]{a^m x} = a\sqrt[m]{x}$; and, in like manner, if a power of any quantity of the same name with the surd divides the quantity under the radical sign without a remainder, as here a^m divides $a^m x$, and 25 the square of 5, divides 75 the quantity under the sign in $\sqrt[2]{75}$ without a remainder; then place the root of that power rationally before the sign, and the quotient under the sign, and thus the surd will be reduced to a more simple expression. Thus $\sqrt[2]{75} = 5\sqrt[2]{3}$; $\sqrt[2]{48} = \sqrt[2]{3\times 16} = 4\sqrt[2]{3}$; $\sqrt[3]{81} = \sqrt[3]{27\times 3} = 3\sqrt[3]{3}$.

When surds are reduced to their least expressions, if they have the same irrational part, they are added or subtracted, by adding or subtracting their rational coefficients, and prefixing the sum or difference to the common irrational part.

Thus, $\sqrt[2]{75} + \sqrt[2]{48} = 5\sqrt[2]{3} + 4\sqrt[2]{3} = 9\sqrt[2]{3}$; $\sqrt[3]{81} + \sqrt[3]{24} = 3\sqrt[3]{3} + 2\sqrt[3]{3} = 5\sqrt[3]{3}$; $\sqrt[2]{150} - \sqrt[2]{54} = 5\sqrt[2]{6} - 3\sqrt[2]{6} = 2\sqrt[2]{6}$; $\sqrt{a^2 x} + \sqrt{b^2 x} = a\sqrt{x} + b\sqrt{x} = \overline{a+b}\times\sqrt{x}$.

Compound surds are such as consist of two or more joined together; the simple surds are commensurable in power, and by being multiplied into themselves, give at length rational quantities; yet compound surds multiplied into themselves, commonly give still irrational products. But, when any compound surd is proposed, there is another compound surd which, multiplied into it, gives a rational product. Thus if $\sqrt{a} + \sqrt{b}$ were proposed, multiplying it by $\sqrt{a} - \sqrt{b}$, the product will be $a - b$.

The investigation of that surd, which multiplied into the proposed surd, gives a rational product, is made easy by three theorems, delivered by Mr. Maclaurin, in his Algebra, p. 109, seq. to which we refer the curious.

This operation is of use in reducing surd expressions to more simple forms. Thus suppose a binominal surd divided by another, as $\sqrt[2]{20} + \sqrt[2]{12}$, by $\sqrt[2]{5} - \sqrt[2]{3}$, the quotient might be expressed by $\frac{\sqrt{20}+\sqrt{12}}{\sqrt{5}-\sqrt{3}}$. But this might be expressed in a more simple form, by multiplying both numerator and denominator, by that surd, which multiplied into the denominator, gives a rational product: thus, $\frac{\sqrt{20}+\sqrt{12}}{\sqrt{5}-\sqrt{3}} = \frac{\sqrt{20}+\sqrt{12}}{\sqrt{5}-\sqrt{3}}\times\frac{\sqrt{5}+\sqrt{3}}{\sqrt{5}+\sqrt{3}} = \frac{\sqrt{100}+2\sqrt{60}+6}{5-3} = \frac{16+2\sqrt{60}}{2} = 8 + 2\sqrt{15}$. To do this generally, see Maclaurin, lib. cit. p. 113.

When the square root of a surd is required, it may be found, nearly, by extracting the root of a rational quantity that approximates to its value. Thus to find the square root of $3+2\sqrt{2}$, first calculate $\sqrt{2} = 1{,}41421$. Hence $3+2\sqrt{2} = 5{,}82842$, the root of which is found to be nearly 2,41421.

In like manner we may proceed with any other proposed root. And if the index of the root, proposed to be extracted, be great, a table of logarithms may be used. Thus $\sqrt[7]{5+\sqrt{17}}$ may be most conveniently found by logarithms.

Take the logarithms of 17, divide it by 13; find the number corresponding to the quotient; add this number to 5; find the logarithm of the sum, and divide it by 7, and the number corresponding to this quotient will be nearly equal to $\sqrt[7]{5+\sqrt{17}}$.

But it is sometimes requisite to express the roots of surds exactly by other surds. Thus, in the first example, the square root of $3+2\sqrt{2}$ is $1+\sqrt{2}$: for $\overline{1+\sqrt{2}}\times\overline{1+\sqrt{2}} = 1+2\sqrt{2}+2 = 3+2\sqrt{2}$. For the method of performing this, the curious may consult Mr. Maclaurin's Algebra, p. 115, seq. where also rules for trinomials, &c. may be found.

SURDESOLID, or SURSOLID. See the article SURSOLID.

SURETY, in law, generally signifies the same with bail. See the article BAIL.

There is also a surety of the peace, whereby a person, in danger of hurt from another, is secured by a bond or recognizance of the offending party, and his sureties entered into to the king, and taken by a competent judge of record, &c.

SURFACE, or SUPERFICIES. See the article SUPERFICIES.

SURFEIT, in medicine, a ſickneſs proceeding from the ſenſation of a load at the ſtomach, uſually attended with eruptions, and ſometimes with a fever.

Surfaces may be cauſed, ſays Dr. Shaw, 1. By voracity; from whence the ſtomach and inteſtines are overcharged, digeſtion weakened, and the chyle rendered crude or viſcid, and the blood corrupted. If what was thus devoured were high ſeaſoned or inflammatory, or happens to lie long in the body, it is ſuppoſed to cauſe a fever alſo. 2. By drinking of ſmall liquors in hot weather, or when the body is heated by exerciſe; which, perhaps, chills the fluids, and gives a check to perſpiration; from whence alſo may ariſe a fever and eruptions. Summer fruits likewiſe, as cucumbers, apples, cherries, &c. may have the ſame effect. 3. By too great exerciſe or heat, whence the fluids are rarified and thrown into too rapid a circulation, which being ſuddenly ſtopped, as may happen by cooling too faſt, there enſues alſo a ſtoppage of perſpiration. 4. By the ſtate or ſome change of the air; as by blaſts, or vehemently hot and ſultry weather, or cold winds giving a ſudden check to, and preventing, perſpiration. See PERSPIRATION.

Eruptions may not appear in ſurfeits, either by reaſon of the ſlightneſs of the cauſe, or ſome wrong management at the firſt. Nauſea's, oppreſſion, ſickneſs, and ſometimes a vomiting and a fever, but ſeldom eruptions, attend on an overloaded ſtomach. This ſpecies of a ſurfeit is called crapula; ſickneſs, gnawing at the ſtomach, ſometimes eruptions and a fever attend ſurfeits, from the bad quality of any thing uſed as food. The fever always decreaſes as the eruptions increaſe; and if theſe ſuddenly diſappear, the fever increaſes. Thoſe ſurfeits, which proceed from too great exerciſe, or too ſudden cooling after it, appear with ſickneſs, a fever and eruptions, though the two laſt ſymptoms may be wanting. Thoſe cauſed from ſome alteration in the air, and vulgarly called blaſts, appear with redneſs of the face, ſpots, and a fever, often with bliſters on the ſkin. See FEVER.

SURGE, in the ſea-language, the ſame with a wave. See WAVE.

Alſo when heaving at the capſtan, if the cable royal, or meſſenger ſlip a little, they call it ſurging.

SURGERY, or CHIRURGERY, χειρουργικη, the art of curing all manner of wounds, and other diſorders, where the application of the hand, aſſiſted by proper inſtruments, is neceſſary.

Surgery, or manual operation, is highly beneficial to mankind, ſince by means hereof many grievous diſorders are relieved, as wounds, fractures, luxations, ulcers, &c. where diet and medicine would afford very little, and ſometimes no help at all. See the articles WOUND, FRACTURE, &c.

Surgery, ſays Celſus, is that branch of phyſic which informs us how to cure or prevent diſorders, by the aſſiſtance of our hands or inſtruments, or by the application of external remedies: thus diſorders are often prevented by bleeding, ſcarifying, iſſues, ſetons, &c. See the articles PHLEBOTOMY, SCARIFICATION, &c.

A thorough knowledge in anatomy is abſolutely neceſſary for a ſurgeon, otherwiſe his actions are always uncertain, and ever obnoxious to a multiplicity of dangers. He ought alſo to be expert in the art of managing his hands and inſtruments dexterouſly in the performance of ſuch operations as any caſe may require; as amputation, lithotomy, extirpation, cauterizing, &c. See the articles AMPUTATION, LITHOTOMY, &c.

In the days of Hippocrates, ſurgery was ſo connected with medicine, that the former was ſcarce diſtinguiſhed from the latter by any peculiar and diſcriminating name: and that Hippocrates himſelf aſſiſted the ſick, by manual operation, is a fact which cannot be called in queſtion. During theſe laſt fifty years, ſurgery has been cultivated with very great ſucceſs. M. le Dran has furniſhed us with inſtructions which will inform the moſt ſkilful proficients. M. de la Faye, the ingenious commentator on Dionis, has likewiſe given us, in his notes, not only what his own experience and reflections have ſuggeſted, but alſo, as he ſays, the opinions and obſervations of the greateſt ſurgeons at Paris; and indeed the frequent mention he makes of Meſſ. Morand, Petit, de la Peyronie, and others, are ſufficient proofs that his comments are an exact repreſentation of the preſent ſtate of ſurgery in France. M. Garengeot's treatiſe on the operations of ſurgery, lies under the diſadvantage of having been publiſhed ſome years ſince, and before many of thoſe improvements were made, which are now univerſally known: it, however, contains ſeveral caſes and remarks

remarks well worth the attention of a ſtudious reader. Heiſter's ſurgery is in every body's hands, and the character of Heiſter is ſo well eſtabliſhed, that any account of that work is needleſs. Nor need we mention the treatiſe of ſurgery, and critical enquiry, of the ingenious Mr. Sharp, ſince the name of the author is abundantly ſufficient. If the reader deſires a more particular account of chirurgical authors, we refer him to the article OPERATION, to Heiſter's Surgery, and to Dr. James's Medical Dict. under the article CHIRURGIA, where he will find a very large catalogue of them.

SURIANA, in botany, a genus of the *pentandria-pentagynia* claſs of plants, the corolla of which conſiſts of five petals, obverſely ovated, patent, and of the length of the cup: there is no pericarpium except the cruſts of the ſeeds, which are five in number, and roundiſh. It is a native of South America.

SURINAM, the capital of the dutch ſettlements in Guiana, in South America: weſt long. 56°, and north lat. 6° 30′.

SURMOUNTED, in heraldry, is when one figure is laid over another. As the pile ſurmounted of a chevron in plate CCLX. fig. 2.

SURNAME, or SIRNAME, a name added to the proper or baptiſmal name, to denote the perſon of ſuch a family.

SURREBUTTER, in law, a ſecond rebutter, or the replication of the plaintiff to the defendant's rebutter.

SURREJOINDER, is a ſecond defence of the plaintiff's declaration by way of anſwer to the defendant's rejoinder.

SURRENDER, in common law, an inſtrument in writing, teſtifying, that the particular tenant of lands and tenements for life or years, doth ſufficiently conſent and agree, that he who has the next or immediate remainder or reverſion thereof, ſhall have the preſent eſtate of the ſame in poſſeſſion, and that he thereby yields and gives up the ſame to him.

A ſurrender may not be made of eſtates in fee, nor of rights and titles only; neither can one termor regularly ſurrender to another. For it is ordained by ſtatute, that no eſtate of freehold, or term for years, ſhall be granted or ſurrendered but by deed in writing, ſigned by the parties, or by operation at law, *&c.* See the article DEED.

Beſides the uſual ſurrender at common law, there is a cuſtomary ſurrender of copyhold lands, and likewiſe a ſurrender of letters-patent to the king, in order that he may grant the eſtate to whom he thinks meet.

SURREPTITIOUS, or SUBREPTITIOUS. See SUBREPTITIOUS.

SURREY, a county of England, bounded by the river Thames, which ſeparates it from Middleſex, on the north; by Kent, on the eaſt; by Suſſex, on the ſouth; and by Berkſhire, on the weſt; being thirty-four miles long, and twenty-one broad.

SURROGATE, in law, denotes a perſon that is ſubſtituted, or appointed, in the room of another; and moſt commonly of a biſhop, or of his chancellor.

SURSISE, in law, a name eſpecially uſed for ſuch penalties and forfeitures, as are impoſed upon thoſe perſons that do not duly pay their duties or rent for caſtleward, in the caſtle of Dover.

SURSOLID, or SURDESOLID, in arithmetic and algebra, the fifth power, or fourth multiplication of any number or quantity conſidered as a root. See ROOT.

SURSOLID PROBLEM, in mathematics, is that which cannot be reſolved but by curves of a higher nature than a conic ſection, *v. gr.* in order to deſcribe a regular endecagon, or figure of eleven ſides in a circle, it is required to deſcribe an iſoſceles triangle on a right line given, whoſe angles at the baſe ſhall be quintuple to that at the vertex; which may eaſily be done by the interſection of a quadratrix, or any other curve of the ſecond gender. See the articles CURVE and QUADRATRIX.

SURVEY, in law, is the aſcertaining not only the boundaries and royalties of a manor, or eſtate in lands; but alſo the tenure of the reſpective tenants, and the rent and value of the ſame. In this laſt ſenſe, it is taken for a court; becauſe on the failing of an eſtate, conſiſting of manors, to a new lord, where there are tenants by leaſe, and copyholders, a court of ſurvey is generally held; and ſometimes upon other occaſions, to appriſe the lord of his right and intereſt.

SURVEYING, the art or act of meaſuring land; that is, of taking the dimenſions of any tract of ground, laying down the ſame in a map or draught, and finding the content or area thereof.

Surveying, called alſo geodæſia, is a very antient art; it is even held to have been the firſt or primitive part of geometry, and that which gave occaſion to, and laid the foundation of all the reſt. See the article GEOMETRY.

Surveying conſiſts of three parts or members; the firſt is the taking of the neceſſary meaſures, and making the neceſſary obſervations on the ground itſelf: the ſecond, is the laying down of theſe meaſures and obſervations on paper: and the third, the finding the area or quantity of ground thus laid down.

The firſt is what we properly call ſurveying: the ſecond we call plotting or protracting, or mapping: and the third caſting up. The firſt, again, conſiſts of two parts, *viz.* the making of obſervations for the angles, and the taking of meaſures for the diſtances. The former of theſe is performed by ſome one or other of the following inſtruments, *viz.* the theodolite, circumferentor, ſemicircle, plain table, or compaſs: the deſcription and manner of uſing each whereof, ſee under its reſpective article. The latter is performed by means either of the chain or the perambulator: the deſcription and manner of applying each whereof, ſee under its reſpective article.

It is uſeful in ſurveying to take the angles which the bounding lines form with the magnetic needle, in order to check the angles of the figure, and to plot them conveniently afterwards.

Large maps, repreſenting conſiderable extents of ground, are ſubject to a good many inconveniencies, eſpecially if carried into the fields, to be compared with them; ſuch maps become very troubleſome in the wind, and it is difficult to find out the part you want. To remedy this, a general and ſmall map of the manor, or county, *&c.* ſhould be firſt made on one ſheet of paper, the ſeveral parts may be ſet off on other ſeparate ſheets, and the general map being divided into as many ſquares as there are of theſe particular ſheets, the relation of the whole to the ſeveral parts is eaſily ſeen; and all theſe maps may then be bound up in a book.

The ſecond branch of ſurveying is the plotting or laying down upon paper, the ſeveral ſides and angles of the figure ſurveyed; the manner of doing which has already been explained under the article plotting. See PLOTTING.

However, it is proper to obſerve, that if the lands to be plotted are hilly, and not in any one plane, the lines meaſured cannot be truly laid down on paper, without being reduced to one plane, which muſt be the horizontal, becauſe angles are taken in that plane.

In viewing objects, if they have much altitude or depreſſion, either write down the degree and decimal, ſhewn on the double ſextant, or the links, ſhewn on the back ſide, which laſt ſubſtracted from every chain in the ſtation-line, leaves the length in the horizontal plane; but if the degree is taken, the following table will ſhew the quantity.

A table of the links to be ſubſtracted out of every chain in hypothenuſal lines of ſeveral degrees, altitude, or depreſſion, for reducing them to horizontal.

deg.	links.	deg.	links.	deg.	links.
4.05	¼	14.07	3	23.074	8
5.73	½	16.26	4	24.495	9
7.02	¾	18.195	5	25.84	10
8.11	1	19.95	6	27.13	11
11.48	2	21.565	7	28.36	12

Let the firſt ſtation-line really meaſure 1107 links, and the angle of altitude, or depreſſion, be 19° 95′; looking in the table, I find 19° 95′ is 6 links; now 6 times 11 is 66, which ſubtracted from 1107 leaves 1041, the true length to be laid down.

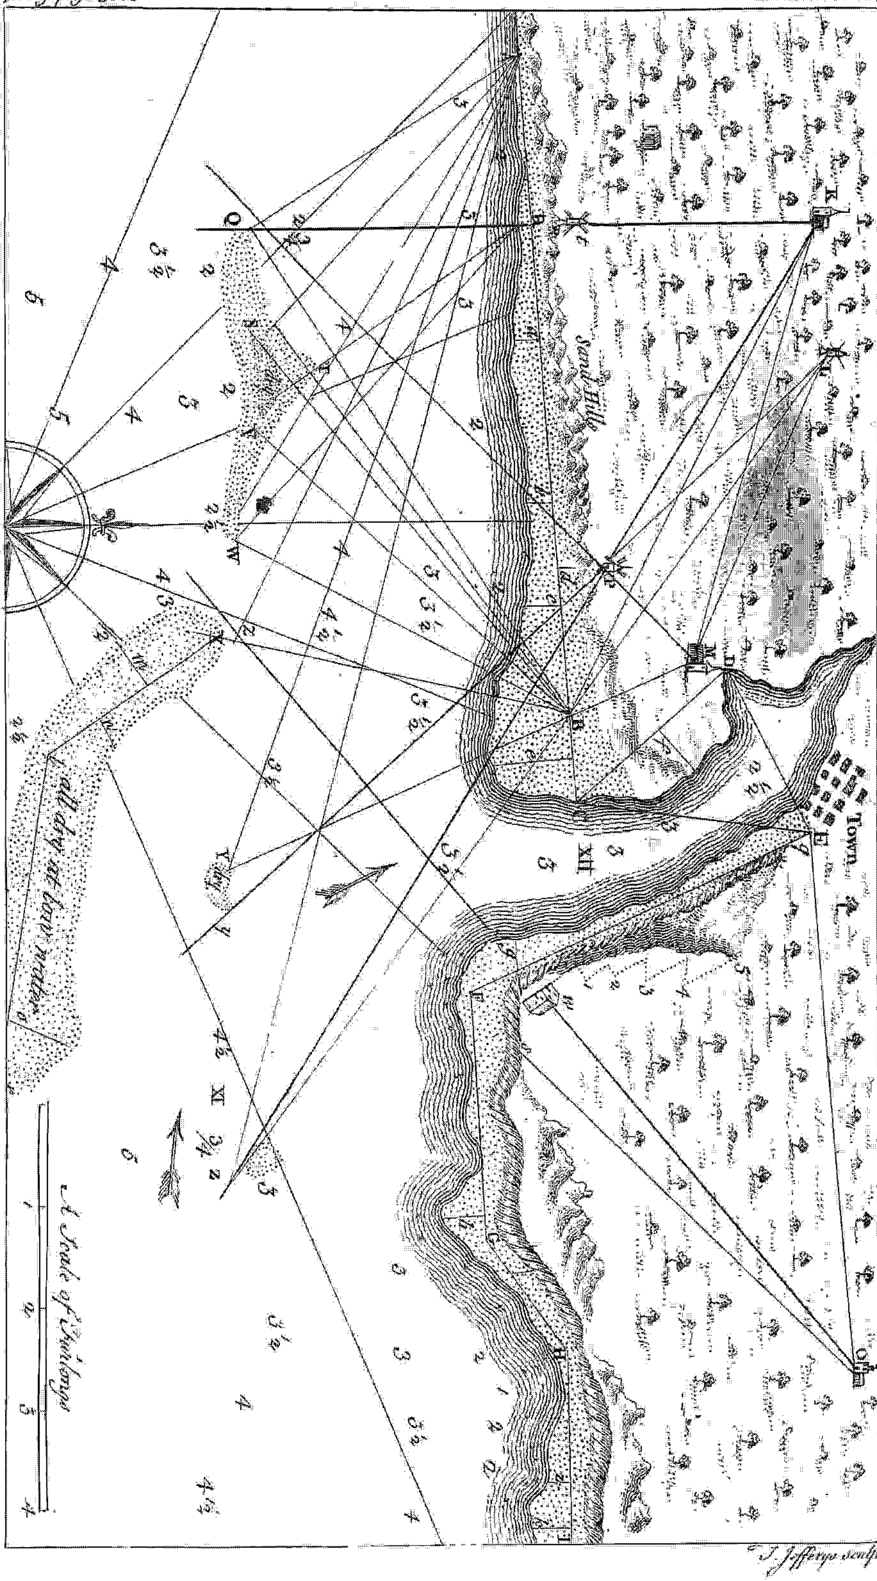
The third branch conſiſts in reducing the ſeveral diviſions, incloſures, *&c.* into triangles, ſquares, trapeziums, parallelograms, *&c.* but eſpecially triangles; and finding the areas or contents of theſe ſeveral figures. See the articles AREA, SUPERFICES, *&c.*

SURVEYING *a harbour.* This being an extremely uſeful, and, at the ſame time, difficult part of ſurveying; it will be proper to ſhew not only in what manner the obſervations ſhould be made, but how the plan or draught is to be plotted, or laid down on paper.

With reſpect to the obſervations, it will be requiſite, 1. To get as diſtinct an idea as poſſible of the place to be ſurveyed; for which purpoſe it will be neceſſary, before the work is begun, to walk ſeveral times along the coaſt, carefully obſerving the ſeveral particulars neceſſary to be taken notice of. 2. Having acquired an idea of the place, ſignals muſt be erected at every angle, *&c.* as at C, D, E, F, G, H, and I (plate CCLXIV.) alſo at the ends of the ſands, *&c.* as at Q, S, T, V, W, X, Y, and Z. And when you are at the point Q, erecting the ſignal, obſerve what objects on the land are in a right-line, which are the windmill at *t* and the church at K, which objects muſt be inſerted in your map as a mark for ſhips

to

-



J. Jefferys sculp.

to avoid the ſand Q T W. Likewiſe, when you are in the midſt of the channel between the ends of the ſands W and X, obſerve what objects are in a direct line, which are the houſe at *w* and the church at O. In like manner, when you are at *y*, the two windmills at P and L will be in a right-line, as will the windmill at P and the church at K when you are at Z. Theſe objects you muſt be careful to inſert in your map; and, if there be none that will anſwer the intention, ſome ought to be erected. 3. The ſignals, &c. being erected, place your inſtrument at A, and obſerve the bearing of the ſignal at C; alſo the ſeveral angles comprehended between the lines A Q, A S, A T, A Y, and A Z, and the line A C. And becauſe the object at X will be in a right-line with that at T, therefore the angle will be the ſame. 4. Meaſure along the line A C with your chain or perambulator, and, when you come to R, note down the diſtance from A to R; and, fixing your inſtrument in the ſame ſituation as at A, obſerve the angles intercepted between the lines R V and R W and the line R C. And becauſe the windmill at *t* is in a perpendicular direction to the line A C in the point R, meaſure the diſtance from thence to that windmill, noting it down alſo in your book. 5. Continue the meaſuring of the line A C from R towards C, obſerving, if the edge of the water is not parallel to the line A C, to meaſure the diſtance in a perpendicular direction, as the ſmall perpendiculars *a*, *b*, *c*, &c. but be ſure to remark the diſtance ſuch perpendiculars are from the point A, or firſt ſtation. Alſo, when you perceive that the windmill at P is in a perpendicular direction to the line A C, meaſure the diſtance *d* P. 6. When you have meaſured to B, fix your inſtrument there in the ſame poſition as at A, and obſerve the angles which the lines B Y and B Z form with the line B C. Then turn the inſtrument about (the index being fixed at the beginning of the graduations) till through the ſights you ſee the object at A; and fix the inſtrument by the ſcrew in that poſition; then obſerve the angles comprehended between the line B A and the lines B X, B W, B V, B S, B T, and B Q. Alſo turning about the braſs-limb of the inſtrument (the index being fixed at the beginning of the graduations) till the two ſights be in a right-line with the object at A; and, faſtening the inſtrument in this poſition, take the angles intercepted between the line B A and the lines B M, B L, and B K, and meaſure the diſtance B M. 7. Having meaſured the whole line A C, fix your inſtrument at C in the ſame poſition as before, and take the angles B C D, and D C E, meaſuring the diſtance C D and the perpendicular *f*. 8. Remove your inſtrument to D, and take the angle C D E; that is, place the inſtrument at D; and, having fixed the index at the beginning of the graduations, turn the inſtrument about till you perceive through the ſights the object at C, and fix the inſtrument in that poſition; then move the index, till you ſee through the ſights the object at E, and the degrees cut by the index will be the angle required. 9. Remove the inſtrument to M, and take the angles K M B and K M L after the preceding manner. 10. Having obſerved the angles and meaſured the diſtances requiſite on the weſt ſide of the harbour, remove your inſtrument to the other ſide and plant it at E, obſerving the bearing of the line E F, meaſuring its diſtance, together with that of the perpendicular *g*, in all reſpects as before; as alſo the lines F G, G H, H I, and their perpendiculars *b i k*, continuing the perpendicular *h* to the end of a ledge of rocks lying off that point. 11. Becauſe the cleft will interrupt your ſight from the church at O, therefore you muſt place your inſtrument on the top of the cleft at *q*, and take the bearing of the church; and either meaſure the diſtance from your inſtrument to it, or elſe remove your inſtrument thither, and, having placed ſignals at *q* and *s*, take the angle *q* O *s*. 12. Remove your inſtrument at low-water to the ſand at X, taking the bearings, and meaſuring the diſtances of the lines X *l* and *l r*, together with the perpendiculars *m*, *n*, *o*.

Having finiſhed your obſervations, proceed to conſtruct your map in the following manner.

1. Draw the eaſt and weſt line B A, ſetting off on it the ſeveral diſtances, *viz.* from A to R, A to *a*, &c. then by drawing the ſeveral perpendiculars, and making them of their proper lengths, you may eaſily draw the track of the ſurface of the water, and thoſe which are above the line will give the places where the ſeveral objects are to be delineated.

2. By the help of your protractor or line of chords, make the ſeveral angles at A and

and R, equal to their reſpective number of degrees, *&c.* drawing a right-line through each, which continue at pleaſure.

3. Conſtruct the angles at B in the ſame manner, continuing the right-lines from this ſtation till they cut thoſe projected from A and R, which will be the true places of thoſe objects; whence the ſands Q, Y, and Z may be eaſily drawn.

4. By projecting the angle ABM, and ſetting off on the line BM its proper diſtance, you will have the place where that church muſt be delineated.

5. Conſtruct the angles BCD and DCE, continuing the line CE at pleaſure, and ſet off its proper length on the line CD; then, by drawing the perpendicular *f* of its proper length, you may draw that part of the harbour between C and D.

6. Conſtruct the angle at D, continuing the line DE till it cuts CE in E, which will give the place of the ſtation at E.

7. By conſtructing the angles ABK, ABL, BMK, and KML; and continuing the lines BK, BL, MK, and ML, till they cut each other in K and L; you will have the ſituation of the objects at K and L.

8. Proceed in the ſame manner on the other ſide of the harbour, by projecting the lines EF, FG, GH, and HI, according to their ſeveral bearings, *&c.* and by drawing the ſeveral perpendiculars of their true length, the track of the ſurface of the water on the eaſt ſide of the harbour may be delineated; alſo, by continuing the perpendicular *b*, you will have the ſituation of the ledge of rocks lying off that point.

9. Obſerve to draw the appearance of the land; that is, from A to *d*, the ſand-hills which lie along above the high-water mark, and the cleft which ſtretches all along the eaſt ſide of the harbour.

10. In ſome convenient place draw the compaſs, but let it be in its true poſition without any variation; that is, obſerve to allow for the variation, if any, which muſt alſo be done before you begin your projection.

11. Draw the lines Q*t*K, QPM, *z w* O, *y*PL, and ZPK, which will ſhew the marks neceſſary to be obſerved by ſhips in coming into the harbour.

12. At low-water go off in your boat, and ſound the depth of the water in various places, which inſert in your map; and obſerve the ſetting of the tide, which you muſt repreſent by darts. Alſo the time of high-water at the full and change of the moon, muſt be inſerted in roman numbers.

13. Laſtly, in ſome convenient place of your map inſert a ſcale, of the ſame length of that which you made uſe of in the projection.

SURVEYOR, a perſon who hath the overſight and care of conſiderable works, lands, or the like.

Such are the ſurveyor-general of the king's manors, ſurveyor of the king's exchange, ſurveyor-general of the works, ſurveyor-general of the crown lands, *&c.*

SURVEYOR *of the melting*, is an officer of the mint, whoſe office is to ſee the bullion caſt out, and that it be not altered after the delivery of it to the melter.

SURVEYOR *of the navy*, an officer whoſe buſineſs is to know the ſtate of all ſtores, and ſee the wants ſupplied; to ſurvey the hull, maſts, and yards of ſhips; to audit the boatſwain's and carpenter's accounts, *&c.*

SURVEYOR *of the ordnance*, is an officer whoſe charge is to ſurvey all the king's ordnance, ſtores, and proviſions of war, in cuſtody of the ſtore-keeper of the Tower of London; to allow all bills of debts; to keep checks on labourers and artificers work, *&c.*

SURVEYOR likewiſe denotes a gauger; as alſo a perſon who ſurveys lands, and makes maps of them.

SURVIVOR, in law, ſignifies the longeſt liver of joint-tenants, or of any two perſons, jointly intereſted in a thing; in which caſe, if there be only two joint-tenants, upon the death of one, the whole goes to the ſurvivor: and if there be more than two, the part of the deceaſed is divided among all the ſurvivors.

SUS, the HOG-KIND, in zoology. See the article HOG.

SUS, in geography, a province of the empire of Morocco, lying on the Atlantic ocean, ſouth of Morocco proper: its chief towns are Taradant and Tafilet.

SUSA, a fortified town of Piedmont, in Italy, ſituated on the river Doria, on the confines of France, eighteen miles north of Turin.

SUSDAL, a city of the province of Moſcow, in Ruſſia, one hundred miles north-eaſt of Moſcow.

SUSPENCE, in law, is held to be a temporary ſtop of a perſon's right; and takes place where a rent or other profit iſſuing out of land, on account of the unity of poſſeſſion of the rent, *&c.* and of the land, whereout it iſſues, is not in eſſe for a time;

a time; but ſo as it may be revived afterwards, wherein it differs from extinguiſhment. See EXTINGUISHMENT.

SUSPENSION, or *Points of* SUSPENSION, in mechanics, are thoſe points in the axis or beam of a ballance, wherein the weights are applied, or from which they are ſuſpended.

In a law-ſenſe, ſuſpenſion is a ſpecies of cenſure, whereby eccleſiaſtical perſons are forbidden to exerciſe their office, or to take the profits of their benefices; or when they are prohibited in both of them for a certain time, either in whole or in part. Suſpenſion is alſo ſaid to relate to the laity, *viz. ſuſpenſio ab ingreſſu eccleſiæ, i. e.* from hearing divine ſervice, See the article EXCOMMUNICATION.

SUSPENSION *of arms*, in war, a ſhort truce agreed on by both armies, in order to bury the dead, wait for freſh inſtructions, or the like.

SUSPENSION, in rhetoric, is the carrying on a period or diſcourſe, in ſuch a manner as to keep the reader in expectation of ſomething conſiderable in the concluſion. But great care muſt be taken, that the reader's expectation be not diſappointed; for nothing is more contemptible, than to promiſe much and perform little; or to uſher in an errant trifle, with the formality of preface, and ſolemn preparation.

SUSPENSOR, in anatomy, the ſame with the cremaſter-muſcle. See CREMASTER.

SUSPICION, in law. Perſons may be taken up upon ſuſpicion, where a felony is committed, *&c.* however, there muſt be at leaſt ſome reaſonable grounds for the ſame.

SUSSEX, a county of England, bounded by Surrey and Kent on the north, by another part of Kent on the eaſt, by the Engliſh channel on the ſouth, and by Hampſhire on the weſt: being ſixty-five miles long, and twenty-nine broad.

SUSTERN, a town of Weſtphalia, in Germany, ten miles ſouth of Roermonde.

SUTHERLAND, a ſhire of Scotland, bounded by Cathneſs on the north, by the German ſea on the eaſt, by Roſsſhire on the ſouth, and by the Caledonian ocean on the weſt and north-weſt.

SUTTON-COLEFIELD, a market-town, twenty miles north-weſt of Warwick.

SUTTON'S QUADRANT. See QUADRANT.

SUTURE, *ſutura*, in anatomy, a kind of articulation peculiar to the cranium, or ſkull. See the article SKULL.

SUTURE, in ſurgery, a method of uniting the lips of wounds. See WOUND.

Sutures differ, according to the difference of wounds, but may be generally divided into the dry, bloody, and compound ſutures.

1. The dry ſuture, called alſo the baſtard ſuture, is only the application of ſticking plaſters, to keep the lips of the wound united: it may be uſed in ſlight wounds, and eſpecially when they happen in the face; or, indeed, wherever it is capable of keeping the lips of the wound together: and as it gives no freſh pain, and occaſions no ſcar, it is much fitter for wounds of the face than the needle. The plaſters which are to form the dry ſuture, ſhould be of a ſufficient length, and ſhaped like the part to which they are to be applied, ſo as to ſurround the greateſt part of it, but not the whole, leſt they ſhould retard the circulation of the blood, and bring on tumours and miſchiefs of that kind: they muſt be alſo ſuch as will ſtick very faſt; the diachylon if good, or the common ſticking plaſter, are fitteſt for this purpoſe. The hæmorrhage being well ſtopped, and the wound well cleanſed, ſome vulnerary balſam of the gummy kind, as the balſam of Peru, or the like, is to be applied, and over all a ſticking plaſter is to be laid, adapted to the ſize of the part. Two or more of theſe may be applied, as occaſion ſhall require, leaving a ſpace between; and they are to be ſecured in their place, by the application of proper bolſters and bandages.

Petit's method of making the ſuture of this kind, is by letting the plaſters have one, two, or more openings in the middle, through which the ſurgeon may diſcover, as by the ſpaces left between in the former method, whether the lips of the wound are properly united, or not; and may alſo be able to apply proper remedies to the part, without removing the plaſters. Theſe plaſters are applied in the ſame manner as the former, and left on till the cure is completed.

But there is yet alſo another manner of performing the dry ſuture, *viz.* ſpread two plaſters upon ſtrong cloth, anſwering in ſize to the wound; to the ſides or margins of theſe, faſten three or four tape-ſtrings, according to the length of the wound; and then, after warming the plaſters, apply them at each ſide of the wound, at about a finger's breadth from it; after this, bring the lips of the wound together; dreſs it as in the former method,

thod, and, while an aſſiſtant keeps the lips of the wound together in a proper ſituation, tie the ends of the tapes, firſt in a ſingle, and afterwards in a ſlip-knot, to keep the parts in contact; over each of theſe ſhould be laid an oblong compreſs, and over all a large ſquare one, and the whole kept on by a proper bandage. The day following, the wound is to be again examined, and if the tapes are looſened, they muſt be drawn tighter again; but if they are not looſened, let them remain untouched, and only moiſten the part with a few drops of balſam, and cover them up again with the compreſſes and bandages, as before. Some, inſtead of the tape, uſe claſps of braſs, or ſteel; but this method is much leſs convenient than the former, and therefore is little uſed.

2. The bloody or true ſuture is the uniting the lips of the wound, by means of a needle and thread: for, in large wounds, eſpecially tranſverſe ones, as their lips cannot be kept in their ſituation by means of the dry ſuture, which is frequently the caſe in wounds of the thigh, or in the abdomen, nates, or arms; or when pieces hang from the wounded part, as often happens in wounds of the forehead, cheeks, noſe, or ears; or when wounds are large, and made in an angular or cruciform manner, the needle muſt be uſed, to bring their lips together; and this is called the bloody or the true ſuture.

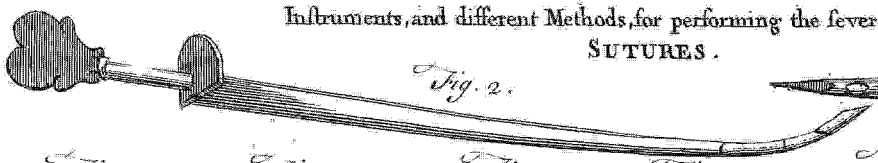
To this kind of ſuture belong the interrupted ſuture, the glover's ſuture, and the twiſted ſuture: the laſt of theſe is ſeldom uſed, but in caſes of the hare-lip; and the ſecond only in wounds of the inteſtines; but the firſt is in common uſe for all wounds which require the true or bloody ſuture.

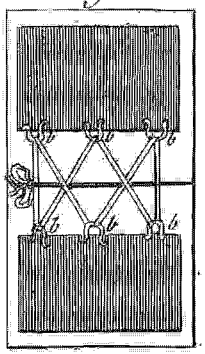
The beſt method of making the common or interrupted ſuture, is this: take a double thread, well waxed, paſs it thro' a ſtrong crooked needle; when the lips of the wound are brought together, and held firm in their proper ſituation, by an aſſiſtant, with one ſtroke pierce through them both, paſſing the needle through the lower lip from without inwards, almoſt to the bottom, and ſo on from within outwards, obſerving to make the punctures at a finger's breadth diſtance from the wound, which in this caſe we will ſuppoſe to be in length two fingers, varying this diſtance according to the ſize of the wound. After taking off the needle, tie the ends of the thread firſt in a ſingle knot, and then in a ſlip-knot, covering all with the ſame dreſſings as are uſed in the dry ſuture. But if the wound be ſo large, that one ſtitch will not be ſufficient, then two or more are to be made, according to the length of it, at about a finger's breadth diſtance one from the other. To prevent the knots from bringing on any miſchief, lay a ſmall linnen-compreſs over the ſingle knot, and make the ſlip-knot over that; which, if any pain or inflammation ſhould ſucceed, may be afterwards eaſily looſened at pleaſure.

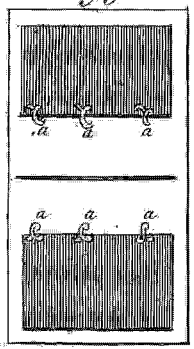
This is the method to be obſerved in ſtrait, oblique, or tranſverſe wounds; but where there are angles, as in a triangular wound, you are to proceed in the ſame manner, but obſerve to let the ſuture begin at the angle, and the other ſtitches to be taken about the middle, both ways; but if the wound be quadrangular, or have two angles, like the greek letter π, which ſometimes happens in the face, then the ſutures muſt be made in both the angles; and when the wound is ſo large, that theſe are not ſufficient, then as many more as are neceſſary muſt be made in the mid way between them. When you meet with a cruciform wound, and the lips of it cannot be kept together by the uſe of plaſters, the bloody ſuture muſt be made, by paſſing the needle through the lips, near the end of each extremity of the wound; and when all the ſtitches are thus made, the threads muſt be tied as in the other caſes.

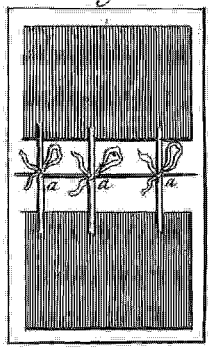
3. A kind of bloody ſuture, which requires other aſſiſtances beſides the needle and thread. It was preferred by the antient ſurgeons to the common or interrupted ſuture, becauſe it prevented the lips of the wound from being lacerated, which ſometimes happened when the other method was uſed, and not only prevented the wound from uniting, but frequently brought on other grievous diſorders; and though this method has of late years been rejected, and particularly by Dionis, in his Surgery, yet many ſtill prefer it, in ſeveral caſes, to the common interrupted ſuture: but inſtead of the pieces of wood, uſed by the antients, thoſe, who now practiſe it, uſe pieces of plaſter, rolled up in a cylindrical form, of the length of the wound, and of about the ſize of a gooſe-quill, from whence it is called by ſome the quilled ſuture. This method prevents tumours, pain, and inflammations, which might be

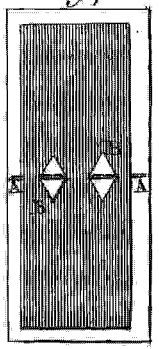
Instruments, and different Methods, for performing the several kinds of SUTURES.

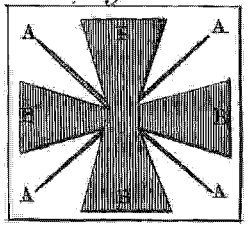


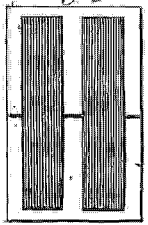


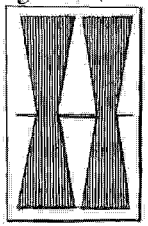


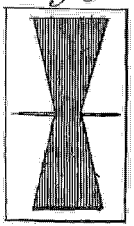


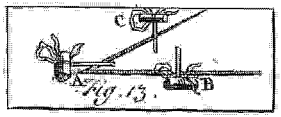


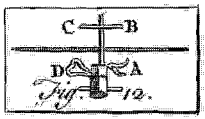


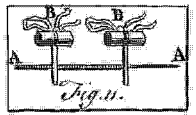


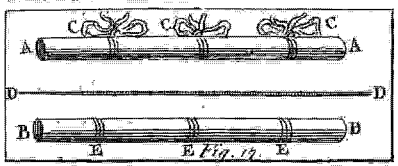


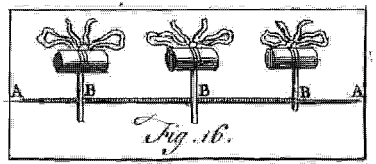


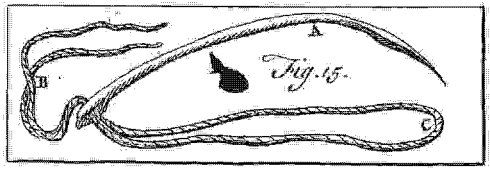


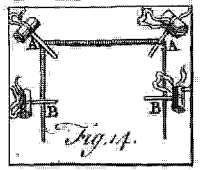


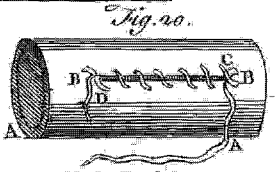


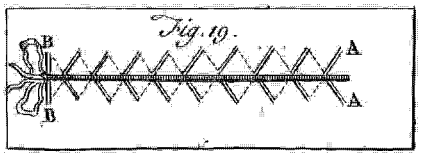


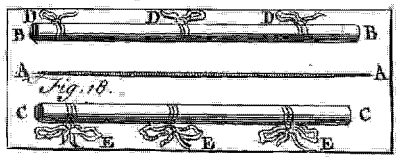












brought on by the hardneſs and preſſure of wood.

Palfynus performs this operation, in deep wounds of the muſcular parts, with a large and ſtrong crooked needle, furniſhed with a double thread well waxed, which has alſo a bow at one end. The needle thus fitted, being paſſed through both lips of the wound, in the ſame manner as in the other operations of the true ſuture, and afterwards a ſecond, and a third, paſſed in the ſame manner, a roll of plaſter is to be introduced into the bow-ends of the thread, which are left hanging out; then, when the needle is taken out at the other ſide, another roll of plaſter is to be placed between the ends of the thread; and the lips of the wound being brought together, theſe ends are to be gently tied over the roll, firſt in a ſingle, and then in a ſlip-knot: if there are three threads, the middle one ſhould be tied firſt, and then the reſt.

But, in order to illuſtrate this important article of ſurgery, we have given a plate (CCLXV.) of the inſtruments, and different methods, for performing the ſeveral kinds of ſutures; where fig. 1. is Petit's triangular needle. Fig. 2. is Heiſter's improvement of Petit's needle, which may be uſed where a ſtrait needle cannot with ſafety. Fig. 3. repreſents a wound, the lips of which are united by a ſticking plaſter, indented on both ſides. Fig. 4. ſhews a wound, to which two ſticking plaſters are applied. And fig. 5. a wound of the like nature, to which are applied two ſticking plaſters, without being indented. Fig. 6. repreſents a wound made croſs-ways, marked A, A, A, A, and united by two plaſters, laid likewiſe croſs-ways B, B, B, B. Fig. 7. is a wound, A, A, to which a ſticking plaſter is applied, with two openings in the middle, marked B, B. Fig. 8. is a wound, united by the application of two plaſters, with the tapes fixed to each of them; which are drawn together and faſtened by ſlip-knots, *a*, *a*, *a*. Fig. 9. is a like wound, united with plaſters of the ſame kind, only furniſhed with hooks, *a*, *a*, *a*, *a*, *a*, *a*, inſtead of tapes; by which, with the aſſiſtance of threads tied to them, the lips of the wound are drawn together. Fig. 10. is another method of doing the ſame thing, by means of the ſmall eyes *b*, *b*, *b*, *b*, *b*, *b*, inſtead of the hooks, uſed by the antients. Fig. 11. is a tranſverſe wound, A, A, united by the interrupted ſuture, B, B. Fig. 12. ſhews in what manner a croſs-wound is to be ſtitched up, and the lips of it brought together, by drawing the threads, A, B, C, D, tight. Fig. 13. ſhews where the ſtitches are to be made in a triangular wound, ABC. And fig. 14. how a wound, with two angles, is to be ſtitched with the interrupted ſuture; firſt, at the angles A, A; and then, if neceſſary, on each ſide at B, B. Fig. 15. is a crooked needle, with a double thread, to make the quill-ſuture; A being the needle, B the thread, and C the bow-end of the thread. Fig. 16. is a large tranſverſe wound, A A, united by the triple uninterrupted ſuture, B, B, B. Fig. 17. is the ſame kind of wound, D, D, which is united by rolls of ſilk, A A, B B, covered with ſome wax or plaſter, and contained in the bow-ends of the threads, E, E, E, which are tied with ſlip-knots, C, C, C. Fig. 18. is another method of making the quill-ſuture; A A being the wound, B B the upper roll, C C the lower roll, D, D, D, the ſingle knots which confine the upper roll, and E, E, E, the ſlip-knots which ſecure the lower roll. Fig. 19. repreſents Celſus's ſuture for gaſtroraphy; A A being the beginning of the ſtitches, and B B the end, where they are faſtened in a knot: but this Heiſter reckons a bad method. Fig. 20. is the glover's ſuture, uſed for uniting wounds of the inteſtines; A A being the inteſtine, B B the wound, C the beginning of the ſuture, and D the end of the ſuture, where it is faſtened in a knot. See the article GOSTRORAPHY.

For the ſuture in the operation for the hare-lip, ſee the article LIP.

SWABBER, an inferior officer on board ſhips of war, whoſe employment it is to ſee that the decks are kept neat and clean.

SWABIA, a circle of the german empire, bounded by Franconia and the Palatinate of the Rhine on the north, by Bavaria on the eaſt, by Switzerland and Tyrol on the ſouth, and by the river Rhine, which ſeparates it from Alſatia, on the weſt; being one hundred and thirty miles long, and one hundred and ten broad.

SWAFFAM, a market-town of Norfolk, twenty three miles weſt of Norwich.

SWAINMOTE, or SWANIMOTE. See the article SWANIMOTE.

SWALBEA, in botany, a genus of the *didynamia angioſpermia* claſs of plants, the ſtigma of which is ſimple, and the corolla perſonated: add to this, that the cup is quadrifid; the upper ſegment be-

ing very ſmall, and the lower one large, and emarginated.

SWALE, a river of Yorkſhire, which, riſing on the confines of Weſtmorland, runs ſouth-eaſt through Yorkſhire, and falls into the Ouſe.

SWALLEY, a port-town of India, in the province of Cambaya, twelve miles north-weſt of Surat.

SWALLOW, *hirundo*, in ornithology. See the article HIRUNDO.

SWALLOW-FISH, *hirundo*, in ichthyology. See the article HIRUNDO.

SWALLOW-WORT, in botany, the engliſh name of ſeveral ſpecies of aſclepias. See ASCLEPIAS and VINCETOXICUM.

SWALLOW'S TAIL, in fortification, the ſame with queue d'aronde. See QUEUE.

SWALLOW'S TAIL, in carpentry and joinery. See DOVE-TAILING.

SWALLOWING, or DEGLUTITION. See DEGLUTITION.

SWAN, *cygnus*, in ornithology. See the article CYGNUS.

SWANIMOTE, or SWAINMOTE, is a court touching matters of the foreſt, held thrice a year, before the verderers as judges, by the ſteward of the ſwanimote at this court all freeholders within the foreſt owe ſuit and ſervice; alſo the officers thereof are there to appear, in order to preſent offences. See FOREST.

SWANSEY, a port-town of Glamorganſhire, ſituated on the Briſtol-channel, thirty miles weſt of Cardiff.

SWARDY, in agriculture, an appellation given to lands well covered with graſs.

SWARM *of bees*, in what manner hived, ſee the article HIVING.

SWATH, *faſcia*, in ſurgery, a long and broad bandage, for binding up any diſordered limb. See BANDAGE.

SWEARING, an offence puniſhable by ſeveral ſtatutes: thus, ſtat. 6 and 7 Will. III. cap. 11. ordains, that if any perſon ſhall profanely ſwear, if he be a labourer, ſervant, or common ſoldier, ſhall forfeit 1s. to the poor, for the firſt offence, 2s. for the ſecond, &c. and any perſon not a ſervant, &c. forfeits 2s. for the firſt offence, 4s. for the ſecond, 6s. for the third, &c. to be levied by diſtreſs of goods.

SWEAT, *ſudor*, a ſenſible moiſture iſſuing out of the pores of the ſkins of animals. See PERSPIRATION.

Sweat, if it occaſions no bad ſymptoms, is rather to be promoted than checked, even though it may ſeem profuſe in quantity; and in this caſe the proper regimen is a moderate warmth, a quiet ſtate of the body, and frequent draughts of warm liquors: but when the ſtrength is found to be too much exhauſted by theſe ſweats, ſmall doſes of nitre are found of great ſervice.

When different diſorders ariſe from the ſuppreſſion of ſweats, nothing is of greater ſervice than the compound powder of antimonium diaphoreticum, crab's eyes, and nitre, given in ſmall doſes, every three hours; and a quiet poſture of the body is to be ordered, which greatly tends to promote ſweating; and frequent draughts of warm and weak liquors are to be taken; and the bowels are to be relaxed with a clyſter, or gentle purge, if there be no ſymptom neceſſarily forbidding it. In regard to thoſe perſons, who are naturally very difficult to be ſweated, a draught made of freſh arum-root and wine, or vinegar, uſually brings on profuſe ſweating, if they are put to bed, and warm liquors drank afterwards. It is a very good general caution, that profuſe ſweats, if they have continued ever ſo many months, are never to be ſuppreſſed by aſtringents; for in that caſe they are uſually attended with ſymptoms much worſe than the original complaint. The common way of forcing out ſuppreſſed ſweats by the hot alexipharmics and volatile ſalts, is by no means adviſeable in any caſe. Bleeding, judiciouſly timed, is often of very great ſervice in promoting ſweats. When the natural ſweats of children are repelled, they become ſuddenly feveriſh and ill, and nothing relieves them till the ſweats are recalled. This may be done ſimply, by keeping them warmer than before, in moſt caſes; but when that fails, the gentle abſorbents are to be preſcribed; and if they ſuck, the nurſe may take the common alexipharmic medicines: crab's eyes are as proper as any thing for the child, in this caſe; and for the nurſe, the lapis contrayerva. The convulſions of children very often ariſe from the ſuppreſſion of their ſweats, and are always then taken off, by making them ſweat again.

Exceſſive ſweating, in hectical and conſumptive patients, being never ſalutary, ſhould be diminiſhed by light covering, attemperating powder of crab's eyes, with nitre, taken in the evening, to which may be added a grain or two of ſtorax-pills, with a ſufficient quantity of whey, or butter-milk, or an emulſion.

The copious ſweats at the end of intermitting

mitting fevers, as alſo in the criſes of other fevers, are highly beneficial; and, therefore, ought to be promoted, by lying quietly in bed, and taking a ſufficient quantity of a proper fluid, with diaphoretic potions. But ſhould the patient ſweat too much after the cure of a fever, he ought to drink bitters, twice or thrice a day, with a fourth part of the eſſence of eleutheria; and at night to take a doſe of the ſpecies of hyacinth, with a grain or two of borax-pills.

SWEATING-SICKNESS. See the article SUDOR ANGLICANUS.

SWEDEN, one of the moſt northerly kingdoms of Europe, bounded by norwegian Lapland on the north, by Ruſſia on the eaſt, by the Baltic ſea on the ſouth, and by Norway on the weſt; being upwards of eight hundred miles from north to ſouth, and five hundred from eaſt to weſt.

SWEEP, in the ſea-language, is that part of the mould of a ſhip, where ſhe begins to compaſs in at the rung-heads: alſo, when the hawſer is dragged along the bottom of the ſea, to recover any thing that is ſunk, they call this action ſweeping for it.

SWEET, in the wine-trade, denotes any vegetable juice, whether obtained by means of ſugar, raiſins, or other foreign or domeſtic fruit, which is added to wines, with a deſign to improve them. See the article WINE.

It is plain, ſays Dr. Shaw, from the making of artificial muſt, or ſtum, by means of fine ſugar, with a ſmall addition of tartar, that the art of ſweet-making might receive a high degree of improvement, by the uſing pure ſugar, as one general wholeſome ſweet, inſtead of thoſe infinite mixtures of honey, raiſins, ſyrups, treacle, ſtum, cyder, &c. wherewith the ſweet-makers ſupply the wine-coopers, to lengthen out or amend their wines: for pure ſugar being added to any poor wine, will ferment therewith, and improve it, and bring it to a proper degree of ſtrength and vinoſity. If the wine that is to be amended is tart of itſelf, no tartar ſhould be added to the ſugar; but if it be too ſweet or luſcious, then the addition of tartar is neceſſary.

SWEET-ALMONDS. See ALMONDS.

SWEET-SUBLIMATE *of mercury*, the ſame with mercurius dulcis. See the articles MERCURY and CALOMEL.

SWEET-WILLIAMS, in botany, the engliſh name of ſeveral beautiful ſpecies of caryophyllus, or dianthus. See the article DIANTHUS.

SWELLING, in ſurgery. See the articles INFLAMMATION and TUMOUR.

SWERIN, a town of lower Saxony, in Germany, capital of the dutchy of Mecklenburg, and ſituated on the lake of Swerin, in eaſt longit. 11° 30′, and north lat. 54°.

SWERNICK, a town of european Turky; ſituated on the river Drino, on the confines of Servia and Boſnia: eaſt lon. 20°, north lat. 44° 30′.

SWERTIA, in botany, a genus of the *pentandria-digynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, with a plane limb, divided into five ſub-lanceolated ſegments; the fruit is a cylindric capſule, pointed at each end, with only one cell, in which are included numerous ſmall ſeeds.

SWIFTERS, in a ſhip, are ropes belonging to the fore and main-ſhrouds, for ſecuring thoſe maſts.

SWIFTING *a boat*, is encompaſſing her gun-wale with a ſtrong rope: ſwifting a ſhip, is either bringing her a-ground, or upon a careen: and ſwifting the capſtan-bars, is ſtraining a rope all round the outer ends of them, to prevent their flying out of the drum-head.

SWIMMING, the art or act of ſuſtaining the body in water, and of moving therein; in which action the air-bladder and fins of fiſhes bear a conſiderable part. See AIR-BLADDER and FINS.

Some have ſuppoſed, that the motion of fiſh in the water, depend principally upon the pectoral fins, but the contrary is eaſily proved by experiment; for if the pectoral fins of a fiſh are cut off, and it be again put into the water, it will be found to move forward or ſideways, upward or downward, as well as it did when it had them on. If a fiſh be carefully obſerved, while ſwimming in a baſon of clear water, it will be found not to keep theſe pectoral fins conſtantly expanded, but only to open them at ſuch times as it would ſtop or change its courſe; this ſeeming to be their principal, if not their only, uſe. The pectoral and ventral fins, in the common fiſhes of a compreſſed form, ſerve in the ſame manner in keeping the fiſh ſtill, and ſerve in ſcarce any other motion than that towards the bottom: ſo that that this motion of the fiſh, which has been generally attributed to their fins, is almoſt wholly owing

ing to their muſcles, and to the equipoiſe of their air-bladder. That the uſe of the pectoral and ventral fins is to keep the fiſh ſteady and upright in the water, is evident from the conſequences of their loſs: if they are cut off, and the fiſh put again into the water, it cannot continue in its natural erect poſture, but ſtaggers about, and rolls from ſide to ſide. The fins of the back and anus are alſo of great uſe to the keeping the creature in its natural poſition, as is eaſily ſeen by cutting them off, and obſerving the motions of the fiſh afterwards.

Though a great deal depends on the motion of the muſcles of the ſeveral parts of the body, in the ſwimming of the fiſh, yet the tail, and thoſe muſcles which move the lower part of the body, to which it is affixed, are the great inſtruments by which their ſwift motions in the water are performed. The moving the tail, and that part of the body to which it adheres, backward and forward, or ſideways any one way, throws the whole body of the fiſh ſtrongly the contrary way; and even in ſwimming ſtrait forward, the motion and direction are both greatly aſſiſted by the vibrations of this part, as may be experienced in the motion of a boat, which, when impelled forward, may be firmly guided by means of an oar held out at its ſtern, and moved in the water as occaſion directs. The dorſal muſcles, and thoſe of the lower part of the body between the anus and tail, are the principal that are uſed in the motion of this part, and theſe are therefore the moſt uſeful to the fiſh in ſwimming. The muſcles of the belly ſeem to have their principal uſe in the contracting the belly and the air-bladder. They have been ſuppoſed of uſe to move the belly-fins; but there are too many of them for ſuch a purpoſe, and theſe fins have each its peculiar muſcle fully ſufficient to the buſineſs. The uſe of the tail in ſwimming is eaſily ſeen, by cutting it off, and committing the fiſh to the water without it, in which caſe it is a moſt helpleſs creature.

Let AB (plate CCLXII. fig. 5. n° 1.) be a fiſh ſwimming, by expanding or contracting its air-bladder L, it can riſe or ſink in the water at pleaſure; and its direct motion is performed by means of its tail BCD, vibrating from one ſide to another; which is performed thus; ſuppoſe the tail in the poſition FG (*ibid.* n° 2.) being about to be moved ſucceſſively to H, I, and K; the fiſh firſt turns the end G, oblique to the water, and moves it quickly towards K; the reſiſtance of the water, acting in the mean time obliquely, moves him partly forward and partly ſideways; but this lateral motion is corrected by the next ſtroke, from K towards I, H, and G; which is performed by turning the tail obliquely the contrary way to what it was in the firſt ſtroke. By help of the tail they alſo turn about, by ſtriking ſtrongly with it on one ſide, and keeping it bent, ſo as to act like the rudder of a ſhip. The fins, eſpecially the pectoral ones E, E, ſerve to keep the fiſh upright, as alſo to aſcend and deſcend.

Brutes ſwim naturally, but men attain this art by practice and induſtry: it conſiſts principally in ſtriking alternately with the hands and feet; which, like oars, row a perſon forward: he muſt keep his body a little oblique, that he may the more eaſily erect his head, and keep his mouth above-water.

SWINDON, a market-town of Wiltſhire, twenty-five miles north of Saliſbury.

SWINE, in zoology, a general name for the ſus or hog-kind. See HOG.

Swine are very profitable creatures to the owner, being kept at ſmall expence, feeding on things that would be otherwiſe thrown away, and producing a very large increaſe. They are apt to dig up the ground, and break fences; but this may be prevented, by putting rings in their noſes, and yoaks about their necks.

For the properties of a boar, kept for breeding, ſee the article BOAR.

SWINGLING, the beating of flax, or hemp, after it has been well broken with the brake: this is done by taking up the flax in handfuls, and then beating it with a rod, or flatted and ſmooth ſtick, in order to free it from the bun, and prepare it for being heckled. See the articles FLAX and HEMP.

SWITZ, or SWISSE, the capital of one of the cantons of Switzerland, to which it gives name, ſituated on the eaſt ſide of the lake of Lucern, ſixteen miles ſouth-eaſt of the city of Lucern: eaſt lon. 8° 30′, and north lat. 47°.

SWITZERLAND, or SWISSERLAND, called Helvetia by the Romans, is ſurrounded by the territories of Germany, France, and Italy, being about two hundred and ſixteen miles long, and upwards of one hundred miles broad.

The ſeveral cantons or provinces of Switzerland, which are thirteen in number, have

have been mentioned under their reſpective heads BERN, BASIL, *&c.*

SWOLL, or ZWOLL, a town of the united Netherlands, ſituated in the province of Overyſſel: eaſt lon. 6°, and north lat. 52° 37'.

SWOONING, in medicine, a ſpecies of lipothymy, wherein the patient is deprived of all ſenſe and motion. See the article LIPOTHYMIA.

SWORD, *gladius*, an offenſive weapon worn at the ſide, and ſerving either to cut or ſtab: its parts are the handle, guard, and blade; to which may be added the bow, ſcabbard, pummel, *&c.* Fencing-maſters, however, divide the ſword into the upper, middle, and lower part; or the fort, middle, and foible. See the article FENCING.

SWORD-FISH, *xiphias*. See XIPHIAS.

SWORD-HAND, in horſemanſhip. See the article HAND.

SYCAMORE-TREE, in botany, the engliſh name of the acer major, or greater maple. See the article MAPLE.

SYCOPHANT, *συκοφάντης*, an appellation given by the antient Athenians to thoſe who informed of the exportation of figs, contrary to law; and hence it is ſtill uſed in general for all informers, paraſites, flatterers, cheats, *&c.*

SYLLABIC AUGMENTS, in greek grammar. See AUGMENT.

SYLLABLE, *συλλαβὴ*, in grammar, a part of a word, conſiſting of one or more letters, pronounced together. See the articles WORD and PRONUNCIATION.

According as words contain one, two, three, four, *&c.* ſyllables, they are denominated monoſyllables, biſſyllables, triſſyllables, tetraſyllables, polyſyllables, *&c.* and the diviſion of a word, into its conſtituent ſyllables, is called ſpelling. See the article SPELLING.

SYLLABUB, a compound liquor, made of white wine and ſugar, into which is ſquirted new milk with a ſyringe. If cream be uſed inſtead of milk, it is called whipt ſyllabub.

SYLLABUS, in matters of literature, denotes a table of contents, or an index of the chief heads of a book or diſcourſe.

SYLLEPSIS, in latin and greek grammar, is the agreement of a verb or adjective, not with the word next it, but with the word moſt worthy in the ſentence.

Syllepſis is threefold: 1. Of gender, when the adjective agrees with the maſculine noun, preferable to the feminine; as, *rex & regina beati*. 2. Of perſon, when the verb agrees with the firſt, or ſecond, perſon, preferably to the ſecond, or third; as, *erraſtis, Rulle, vehementer; & tu & collegæ tui*. 3. Of number, when the adjective or verb agrees with a noun plural preferably to one ſingular; as *Phrygii comites & lætus Julus incedunt*.

SYLLOGISM, *συλλογισμὸς*, in logic, an argument or term of reaſoning, conſiſting of three propoſitions; the two firſt of which are called premiſes, and the laſt the concluſion. See REASONING, PROPOSITION, *&c.*

Syllogiſms are nothing but the expreſſions of our reaſonings, reduced to form and method: and hence, as every act of reaſoning implies three ſeveral judgments, ſo every ſyllogiſm muſt include three diſtinct propoſitions. Thus, in the following ſyllogiſm:

Every creature poſſeſſed of reaſon and liberty is accountable for his actions.
Man is a creature poſſeſſed of reaſon and liberty:
Therefore man is accountable for his actions.

We may obſerve that there are three ſeveral propoſitions, expreſſing the three judgments implied in the act of reaſoning: the two firſt propoſitions anſwer the two previous judgments in reaſoning; and are hence called premiſes; as being placed before the other, which is termed the concluſion. We are alſo to remember, that the terms expreſſing the two ideas whoſe relation we enquire after, as here, *man* and *accountableneſs*, are in general called the extremes; and that the intermediate idea, by means of which the agreement or diſagreement of the two extremes is traced, *viz. a creature poſſeſſed of reaſon and liberty*, takes the name of the middle term. Hence, by the premiſſes of a ſyllogiſm, we are always to underſtand the two propoſitions where the middle term is ſeverally compared to the two extremes; for theſe conſtitute the previous judgments, whence the truth we are in queſt of is by reaſoning deduced. The concluſion is that other propoſition, in which the extremes themſelves are joined or ſeparated, agreeably to what appears upon the above compariſon. See PREMISES and CONCLUSION.

As, therefore, the concluſion is made up of the extreme terms of the ſyllogiſm; ſo that extreme, which ſerves as the predicate of the concluſion, goes by the name of the major term; and the other term

SYL

or ſubject of the concluſion, is called the minor term. From this diſtinction of the extremes ariſes alſo a diſtinction between the premiſes; that propoſition, which compares the greater extreme with the middle term, being called the major propoſition; and the other, where the leſſer extreme is compared with the middle term, being called the minor propoſition. See TERM, PREDICATE, *&c.*

In a ſingle act of reaſoning, the premiſes of the ſyllogiſm muſt be ſelf-evident truths, otherwiſe the concluſion could not follow. For inſtance, in the major of the above-mentioned ſyllogiſm, *viz. every creature poſſeſſed of reaſon and liberty is accountable for his actions*, if the connection between the ſubject and predicate could not be perceived by a bare attention to the ideas themſelves, the propoſition would require a proof itſelf; in which caſe, a new middle term muſt be ſought for, and a new ſyllogiſm formed to prove the ſaid major: and ſhould it ſo happen, that in this ſecond eſſay there was ſtill ſome propoſition whoſe truth did not appear at firſt ſight, recourſe muſt be had to a third ſyllogiſm to prove it. And when, by conducting our thoughts in this manner, we at laſt arrive at ſome ſyllogiſm, where the premiſes or previous propoſitions are intuitive or ſelf-evident truths; the mind then reſts in full ſecurity, as perceiving that the ſeveral concluſions it has paſſed thro' ſtand upon the immoveable foundation of ſelf-evidence, and when traced to their ſource terminate in it. The great art lies, in ſo adjuſting our ſyllogiſms to one another, that the propoſitions ſeverally made uſe of as premiſes may be manifeſt conſequences of what goes before, ſo as to form one connected demonſtration. See the article DEMONSTRATION.

With reſpect to the different forms or figures of ſyllogiſms, it frequently happens that the middle term is the ſubject of the major term, and the predicate of the minor: but though this diſpoſition of the middle term be the moſt natural and obvious, it is not, however, neceſſary; ſince the middle term is often the ſubject of both the premiſes, or the predicate in both; and ſometimes it is the predicate in the major and the ſubject in the minor propoſition. Now this variety in the order and diſpoſition of the middle term, conſtitutes what logicians call the forms or figures of ſyllogiſm. See FIGURE.

But beſides this diſtinction of ſyllogiſms into different figures, there is alſo a farther ſubdiviſion of them in every figure, called modes, or moods. See MOOD.

Theſe diſtinctions of ſyllogiſm, according to figure and mood, reſpects chiefly ſimple ſyllogiſms, or thoſe limited to three propoſitions, all ſimple; and where the extremes and middle term are connected immediately together. But as the mind is not tied down to any one form of reaſoning, but ſometimes makes uſe of more, ſometimes of fewer premiſes, and often takes in compound and conditional propoſitions, there hence ariſe other diſtinctions of ſyllogiſms.

When in any ſyllogiſm the major is a conditional propoſition, the ſyllogiſm itſelf is termed conditional. Such is the following one:

If there is a God, he ought to be worſhiped;
But there is a God:
Therefore he ought to be worſhiped.

In ſyllogiſms of this kind, the relation between the antecedent, or the conditional part *if there is a God*, and the conſequent *he ought to be worſhipped*, muſt ever be real and true; that is, the antecedent muſt always contain ſome certain and genuine condition, which neceſſarily implies the conſequent; otherwiſe the propoſition itſelf will be falſe, and therefore ought not to be admitted into our reaſonings. There are two kinds of conditional ſyllogiſms, one of which is called in the ſchools modus ponens; becauſe from the admiſſion of the antecedent they argue to the admiſſion of the conſequent, as in the ſyllogiſm above: the other is called modus tollens, becauſe in it both antecedent and conſequent are rejected, as in the following ſyllogiſm:

If God were not a being of infinite goodneſs, neither would he conſult the happineſs of his creatures;
But God does conſult the happineſs of his creatures:
Therefore he is a being of infinite goodneſs.

Again, as from the major's being a conditional propoſition, we obtain conditional ſyllogiſms; ſo where it is a diſjunctive propoſition, the ſyllogiſm is alſo called diſjunctive, as in the following example.

The world is either ſelf-exiſtent, or the work of ſome finite, or ſome infinite being.

But

But it is not ſelf-exiſtent, nor the work of a finite being:

Therefore it is the work of an infinite being.

Now a disjunctive propoſition is that, where of ſeveral predicates, we affirm one neceſſarily to belong to the ſubject, to the excluſion of all the reſt, but leave that particular one undetermined: hence it follows, that as ſoon as we determine the particular predicate, all the reſt are to be of courſe rejected; or if we reject all the predicates but one, that one neceſſarily takes place. When, therefore, in a disjunctive ſyllogiſm, the ſeveral predicates are enumerated in the major; if the minor eſtabliſhes any one of theſe predicates, the concluſion ought to remove all the reſt; or if in the minor, all the predicates but one are removed, the concluſion muſt neceſſarily eſtabliſh that one.

In the ſeveral kinds of ſyllogiſms hitherto mentioned, we may obſerve, that the parts are complete; that is, the three propoſitions of which they conſiſt, are expreſſed in form. But it often happens, that ſome one of theſe premiſes is not only an evident truth, but alſo familiar and in the mouths of all men; in which caſe it is uſually omitted, whereby we have an imperfect ſyllogiſm, that ſeems to be made up of only two propoſitions: ſuch is the following one:

Every man is mortal;

Therefore every king is mortal.

Here the minor propoſition, *every king is man*, is omitted, as being ſo clear and evident, that the reader may eaſily ſupply it.

SYMBOL, *συμβολον*, a ſign or repreſentation of ſomething moral, by the figures or properties of natural things.

Hence ſymbols are of various kinds, as hieroglyphics, types, ænigmas, parables, fables, *&c.* See HIEROGLYPHICS, *&c.*

Among chriſtians, the term ſymbol denotes the apoſtles creed. See CREED.

SYMMETRY, *συμμετρια*, the juſt proportion of the ſeveral parts of any thing, ſo as to compoſe a beautiful whole.

SYMPATHETIC, ſomething that acts, or is acted on, by ſympathy: thus we ſay, ſympathetic diſeaſes, inks, powders, *&c.* See DISEASE, *&c.*

SYMPATHETIC INK. See the article *Sympathetic* INK.

SYMPATHETIC POWDER. The compoſition of the famous ſympathetic powder, uſed at Goſſelaer by the miners in all their wounds, is this. Take of green vitriol, eight ounces; of gum tragacanth, reduced to an impalpable powder, one ounce; mix theſe together, and let a ſmall quantity of the powder be ſprinkled on the wound, and it immediately ſtops the bleeding. The vitriol is to be calcined to whiteneſs in the ſun, before it is mixed with the gum.

SYMPATHY, *συμπαθεια*, an agreement of affections and inclinations, or a conformity of natural qualities, humours, temperaments, *&c.* which make two perſons delighted and pleaſed with each other.

In medicine, ſympathy denotes an indiſpoſition befalling one part of the body, through the defect or diſorder of another; whether it be from the affluence of ſome humour, or vapour ſent from elſewhere; or from the want of the influence of ſome matter neceſſary to its action. See CONSENT *of parts*.

SYMPHONY, *συμφωνια*, in muſic, properly denotes a conſonance or concert of ſeveral ſounds agreeable to the ear, whether vocal or inſtrumental, called alſo harmony. See the articles HARMONY and CONCERT.

SYMPHYSIS, in anatomy, one of the kinds of junctures, or articulation, of the bones. See ARTICULATION.

Symphyſis is twofold. 1. Without a medium, or any thing between the two bones; which coaleſce or touch each other: ſuch is the articulation in the os frontis, the upper maxilla, the oſſa innominata, *&c.* 2. By the intervention of a medium, or ſubſtance different from the bones themſelves; as in the vertebræ, the ſutures of the ſkull, the ſcapula and gums. See VERTEBRÆ, SKULL, *&c.*

SYMPHYTUM, COMFREY, in botany, a genus of the *pentandria-monogynia* claſs of plants, with a monopetalous flower, quinquedentated at the limb: there is no pericarpium; the ſeeds, which are four in number and gibbous, being contained in the cup.

Comfrey-root agrees in medicinal virtues with thoſe of althæa. See the article ALTHÆA.

SYMPLEXIUM, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ, but not of the determinate and regular figure of moſt of the genera of thoſe bodies, but compoſed of various irregular connections of differently ſhaped, and uſually imperfect bodies. See the article SELENITÆ.

SYM-

SYMPOSIARCH, *συμποσιαρχος*, in antiquity, the director, or manager of an entertainment. This office was ſometimes performed by the perſon at whoſe charge the entertainment was provided; ſometimes by another named by him; and at other times, eſpecially in entertainments provided at the common expence, he was elected by lot, or by the ſuffrages of the gueſts. He was otherwiſe called *baſileus*, *rex*, and *modimperator*, &c. and determined the laws of good fellowſhip, obſerved whether every man drank his proportion, whence he was called *ophthalmus*, *oculus*, the *eye*.

SYMPTOM, *συμπτωμα*, in medicine, any appearance in a diſeaſe, which ſerves to indicate or point out its cauſe, approach, duration, event, &c. See DISEASE, INDICATION, &c.

In a ſtrict ſenſe, however, ſymptom means no more than the conſequences of diſeaſes, and of their cauſes, excluſive of the diſeaſes and cauſes themſelves; and ſo is no other than a preternatural affection, which follows the diſeaſe, as the ſhadow follows the body.

SYMPTOMATICAL, in medicine, is a term often uſed to denote the difference between the primary and ſecondary cauſes in diſeaſes: thus a fever from pain is ſaid to be ſymptomatical, becauſe it riſes from pain only; and therefore the ordinary means in fevers are not in ſuch caſes to be had recourſe to, but to what will remove the pain; for, when that ceaſes, the fever will ceaſe without any direct means taken for it.

SYNÆRESIS, *συναιρεσις*, contraction in grammar, a figure whereby two ſyllables are united in one: as *vemens* for *vehemens*.

SYNAGOGUE, *ſynagoga*, a particular aſſembly of Jews met to perform the offices of their religion. Alſo the place wherein they meet.

SYNALOEPHA, *συναλοιφη*, in grammar, a contraction of ſyllables, performed principally by ſuppreſſing ſome vowel or diphthong at the end of a word, on account of another vowel or diphthong at the beginning of the next. As *ill' ego*, for *ille ego*, &c.

SYNARTHROSIS, in anatomy, a ſpecies of articulation, wherein there is only an obſcure motion, as in the bones of the carpus and metacarpus, the tarſus and metatarſus, &c. or there is no motion at all, as in the ſutures of the ſkull, and articulations per harmoniam or bare application. See CARPUS, &c.

SYNCHONDROSIS, in anatomy, a ſpecies of ſymphyſis; being the union of two bones by means of a cartilage, as in the vertebræ.

SYNCHRONISM, *συγχρονισμος*, denotes the happening of ſeveral things in the ſame time: for if in equal times, it is more properly called iſochroniſm. See the article ISOCHRONAL.

SYNCOPATION, in muſic, denotes a ſtriking or beating of time, whereby the diſtinction of the ſeveral times or parts of the meaſure is interrupted.

However, it is more properly uſed for the connecting the laſt note of any meaſure, or bar, with the firſt of the following meaſure; ſo as only to make one note of both.

A ſyncope is ſometimes alſo made in the middle of a meaſure.

Syncopation is alſo uſed when a note of one part ends or terminates on the middle of a note of the other part. This is otherwiſe denominated binding.

It is likewiſe uſed for a driving note; that is, when ſome ſhorter note at the beginning of a meaſure, or half meaſure, is followed by two, three, or more longer notes before another ſhort note occurs, equal to that which occaſioned the driving, to make the number even, *e. gr.* when an odd crotchet comes before two or three minims, or an odd quaver before two, three, or more crotchets.

In ſyncopated or driving notes, the hand or foot is taken up, or put down, while the note is ſounding.

SYNCOPE, FAINTING, in medicine, a deep and ſudden ſwooning, wherein the patient continues without any ſenſible heat, motion, ſenſe, or reſpiration, and is ſeized with a cold ſweat over the whole body, and all the parts turn pale and cold as if dead. See LIPOTHYMIA.

SYNCOPE, in grammar, an eliſion or retrenchment of a letter or ſyllable out of the middle of a word, as *caldus* for *calidus*, *aſpris* for *aſperis*, &c.

SYNDESMUS, in anatomy, a word uſed for a ligament. See LIGAMENT.

In grammar, ſyndeſmus is uſed for a conjunction.

SYNDIC, in government and commerce, an officer in divers countries intruſted with the affairs of a city, or other community, who calls meetings, makes repreſentations and ſolicitations to the miniſtry,

miniſtry, magiſtracy, &c. according to the exigency of the caſe. The ſyndic is appointed to anſwer and account for the conduct of the body, he makes and receives propoſals for the advantage thereof, controuls and corrects the failings of particular perſons of the body, or at leaſt procures their correction at a public meeting. In effect, the ſyndic is at the ſame time both the agent and cenſor of the community. Almoſt all the companies in Paris, as the univerſity, companies of arts and trades, have their ſyndics, and ſo have moſt of the cities of Provence and Languedoc.

Syndic is alſo uſed for a perſon appointed to ſollicit ſome common affair wherein he himſelf has a ſhare, as happens particularly among the ſeveral creditors of the ſame debtor who fails or dies inſolvent. The chief magiſtrate of Geneva is alſo called ſyndic. There are alſo four ſyndics choſen every year, the eldeſt of whom preſides in the council of twenty-five, which is the chief council of the city, wherein all affairs are diſpatched, both civil and political; thus the three other elect cannot all come at the office till the four years end, ſo that the ſyndicate rolls among ſixteen perſons all choſen out of the council of twenty-five.

SYNDROME, a word introduced into medicine by the empirics, who mean by it a concourſe of ſymptoms: thus under a plethora an empiric judges veneſection neceſſary from a ſyndrome of ſymptoms, ſuch as diſtention of the veſſels, a redneſs and gravity of the whole body, an indiſpoſition to motion, tenſions of the limbs, and a ſenſe of an ulcerous laſſitude, beſides a life ſpent in idleneſs, high and full feeding, and a ſuppreſſion of wonted excretions. This is the plethoric ſyndrome of an empiric, and after the ſame manner he forms a ſyndrome or concourſe of ſymptoms in a peripneumony, quinſey, epilepſy, and other diſeaſes. Galen ridicules theſe ſyndromes, becauſe, he ſays, they happen very rarely, and alſo very ſlowly; ſo that ſhould a phyſician wait for a ſyndrome of all the ſymptoms he expects, he might adminiſter his remedies too late.

SYNECDOCHE, in rhetoric, a kind of figure or rather trope, frequent among orators and poets. There are three kinds of ſynecdoches; by the firſt, a part is taken for the whole, as the point for the ſword, the roof for the houſe, the ſails for the ſhip, &c. By the ſecond, the whole is uſed for a part. By the third, the matter whereof the thing is made is uſed for the thing itſelf; as ſteel for ſword, ſilver for money, &c. To which may be added another kind, when the ſpecies is uſed for the genus, or the genus for the ſpecies.

SYNECDOCHE, in greek and latin grammar, is when the ablative of a part or an adjunct of a ſentence is changed into the accuſative, the greek propoſition κατα, or the latin *ſecundum*, or *quod ad*, being underſtood. Examples of the ablative of the part being changed into the accuſative, are the following from Virgil. *Expleri mentem nequit*, for *quod ad mentem*; and *Deiphobum videt lacerum crudeliter ora*, for *quod ad ora*; and an example of the ablative of the adjunct being changed into the accuſative from the ſame author, is as follows. *Flores inſcripti nomina regum*, for *quod ad nomina regum*.

SYNECPHONESIS, or SYMPHONESIS, in grammar, a coalition whereby two ſyllables are pronounced as one, being much the ſame as the ſynalœpha, or ſynæreſis. See SYNALOEPHA and SYNÆRESIS.

SYNEDRIN, or SYNEDRION. See the article SANHEDRIN.

SYNGENESIA, συγγενεσια, in botany, one of Linnæus's claſſes of plants, the nineteenth in order; ſo called becauſe the ſtamina in theſe plants grow together, or are formed into a ſingle regular congeries.

The general characters of this claſs are theſe: the cup is the crown of the ſeeds, and ſtands on the ſummit of the germen; and the compound flowers are very various, in regard to the nature of the floſcules. 1. Some are compoſed of tubuloſe hermaphrodite flowers in the diſk, and of the ſame ſort of tubulous hermaphrodite flowers in the radius. 2. Others are compoſed of tubuloſe hermaphrodite flowers in the diſk, and of tubulous female flowers in the radius. 3. Some are compoſed of tubulous hermaphrodite flowers in the diſk, and of tubuloſe neutral flowers in the radius. 4. Some have tubuloſe hermaphrodite flowers in the diſk, and ligulated hermaphrodite flowers in the radius. 5. Some are compoſed of tubulous hermaphrodite flowers in the diſk, and of ligulated female flowers in the radius. 6. Some are compoſed of tubulous hermaphrodite flowers in the diſk, and ligulated neutral flowers in the radius. 7. Some are compoſed of tubulous hermaphrodite flowers in the

diſk, and of naked and neutral flowers in the radius. 8. Some are compoſed of tubuloſe male flowers in the diſk, and of naked female flowers in the radius. And, 9. Some are compoſed of ligulated female flowers in the diſk, and ligulated hermaphrodite flowers in the radius.

The ſtamina are five very ſhort and ſlender filaments, inſerted into the tube of the flower. The antheræ are of the ſame number with the ſtamina: they are ſlender, erect, and grow together at their ſides, ſo as to form a tubular cylindric body of the length of the mouth of the flower, and divided into five ſegments at the edge. The germen of the piſtil is oblong, and placed under the receptacle of the flower. The ſtyle is capillary, erect, and of the length of the ſtamina, and goes through the cylinder formed by the antheræ. The ſtigma is divided into two parts, which ſtand open, and bend backwards.

Theſe plants have properly no pericarpium, though in ſome few ſpecies there is a coriaceous cruſt placed about the ſeed. The ſeed is ſingle and oblong, often of a quadrangular figure, and ſometimes narrower at the baſe than in any other part. However, in different genera of this claſs, they are of a very different appearance at the ends. Some are crowned with a downy matter, compoſed of a great number of ſingle ſhort filaments, placed circularly, or otherwiſe, on the head of the ſeed. In ſome the downy matter is radiated; in others it is ramoſe, or branched; and in ſome it is ſupported on a pedicle, while in others it ſtands immediately on the ſeed. In ſome genera the ſeeds have no down at all, but have a ſmall corona, formed of what was originally the cup of the flower. This is permanent, and divided uſually into five ſegments. In ſome genera the ſeed is wholly naked, having neither any down nor this crown of a cup.

SYNGNATHUS, in ichthyology, a genus of the malacopterigious claſs of fiſhes, the body of which is long and very ſlender; ſometimes it is rounded, but in moſt of the ſpecies it is angulated; the fins are in ſome ſpecies four, but in others there is only one; the head is of an oblong figure, and compreſſed; the jaws are cloſed together at the ſides, and the mouth has only a ſmall opening, which is quite at the extremity; the coverings of the gills are compoſed each of only one ſimple and very thin bony lamina.

This genus comprehends the ſea-adder, or the rounded bodied ſyngnathus, with no pectoral nor tail-fins; the ſyngnathus with the middle of the body heptangular, and a fin at the tail; the needle-fiſh, being the ſyngnathus with the middle of the body hexangular, and the tail pinnated; and the ſea-horſe, or hippocampus. See HIPPOCAMPUS.

SYNNEUROSIS, in anatomy, a kind of articulation of the bones, performed by the intervention of ligaments. See the article ARTICULATION.

The ſynneuroſis is reckoned a branch of the ſymphyſis, and is, when the bones are connected together by a ligament, as in the os femoris to the os iſchium, and the patella to the tibia. See the article SYMPHYSIS.

SYNOCHUS, or SYNOCHA, in medicine, a continual fever, without any remiſſion. See the article FEVER.

This ſpecies of fever, according to Hoffman, is the firſt in the claſs of inflammatory fevers. It begins without any remarkable cold or ſhivering, and is very violent at the firſt onſet, and continues with little or no remiſſion of the ſymptoms, till the time of the criſis; the pulſe is great and full. See the articles INFLAMMATION and INFLAMMATORY. The diſeaſe generally infeſts one part more than another; if the head, the face will ſwell, the eyes look red and full of tears, the head will ach with an unuſual pulſation of the temporal arteries, there will be a vertigo, a drowſineſs, an inſenſibility, and a raving; if the heart and lungs, a thick difficult reſpiration, anxiety, and palpitation of the heart, with loſs of ſtrength, and a dejection of mind; if the oeſophagus, thirſt, a dryneſs, and blackneſs of the tongue; if the ſtomach, a nauſea, and reaching to vomit, and ſometimes hiccoughing; if the bowels, inflations, coſtiveneſs, or fetid ſtools; if in the veſſels of the meſaraic viens and arteries, a fixed pain about the vertebræ of the loins; if in the membranes of the ſpinal marrow, a tumbling and toſſing, a numbneſs and weakneſs of the joints, and now and then convulſions. It is ſometimes putrid, or malignant, with ſudden loſs of ſtrength, and is not ſeldom attended with duſky or black ſpots, which threaten immediate danger. This fever often terminates ſpontaneouſly on the fourth, ſeventh or eleventh days, generally by a profuſe ſweat, or by a plentiful bleeding at the

the nose; in the malignant kind, by a looseness.

When it is treated rightly, at the beginning, with bleeding, and with cooling and gentle diaphoretic medicines, it often ceases on the fourth day; otherwise, according to Hoffman, it may continue till the fourteenth or seventeenth. Those to whom it turns fatal, generally die of the mortification of some noble part. Bleeding in this disease is highly necessary, and that not sparingly, if the patient's strength will bear it; then a cooling beverage, as the following: Take of spring-water, two pound; of rose-water, and white-sugar, each an ounce; citron-juice, one ounce; or instead thereof, spirit of vitriol, twenty drops: of this mixture, let the patient take frequent draughts. The hartshorn jelly, with sugar, citron-juice, and rose-water, are excellent in this case; as also, whey turned with citron-juice: absorbent diaphoretic powders, are likewise useful, and the body should be kept open with emollient clysters.

SYNOD, in astronomy, a conjunction, or concourse of two or more stars, or planets, in the same optical place of the heavens.

SYNOD, signifies also a meeting, or assembly of ecclesiastical persons, concerning matters of religion; of these, there are four kinds, *viz.* 1. A general or universal synod, where bishops meet from all nations. 2. A national synod, where those of one nation only meet. 3. A provincial synod, where the clergy of one province assemble together. 4. A diocesan synod, where those only of one diocese assemble. See CONVOCATION.

SYNODALS, or SYNODIES, were pecuniary rents, commonly of two shillings paid to the bishop, or archdeacon, at the time of their Easter visitation, by every parish priest. They were thus called, because usually paid in synods, for that anciently bishops used to visit and hold their diocesan synods at once; for the same reason, they are sometimes denominated synodalica, but more properly procurations.

SYNODALES TESTES, was an appellation anciently given to the urban and rural deans, from their informing against, and attesting, the disorders of the clergy, and the people in the episcopal synods. When these sunk in their authority, in their stead arose another sort of synodal witnesses, who were a kind of impanelled jury, consisting of a priest, and two or three laymen for every parish; though at length two for every diocese were annually chosen, till at last the office came to be devolved on the church-wardens. See CHURCH-WARDENS.

SYNODALE INSTRUMENTUM, a solemn oath, or engagement that these synodal witnesses took, as our church-wardens now are sworn to make just presentments. See the preceding article.

SYNODICAL, something belonging to a synod; thus synodical epistles are circular letters written by the synods to the absent prelates and churches, or even those general ones directed to all the faithful, to inform them of what had passed in the synod. For the synodical month, see the article MONTH.

SYNOECIA, in grecian antiquity, a feast celebrated at Athens, in memory of Theseus's having united all the petty communities of Attica into one single common-wealth, the seat whereof was Athens, where all the assemblies were to be held. This feast was dedicated to Minerva, and according to the scholiast of Thucydides, it was held in the month Metagitnion.

SYNONYMOUS, is applied to a word or term that has the same import or signification with another.

SYNONYMISTS, among botanical writers, such as have employed their care in the collecting the different names or synonyma, used by different authors, and reducing them to one another.

SYNONYMY, in rhetoric, a figure whereby synonyms, or synonymous terms, that is, various words of the same signification, are made use of to amplify the discourse.

SYNOVIA, or SYNONIA, in medicine, a term used by Paracelsus, and his school, for the nutricious juice, proper and peculiar to each part; thus they talk of the synovia of the joints, of the brain, *&c.* The mucilaginous glands of the capsulæ ligamentæ, and the sheaths of the tendons, excrete a mucilaginous liquor called synovia, the use of which is to keep the cartilages supple, and consequently to facilitate the motion of the tendons and joints.

Others use synovia for the gout, and other diseases in the joints, arising from a vice in the nutricious juice. Others restrain the term to the oozing out of the juice through a wounded part, especially at a joint.

SYNTAGMA, *συνταγμα*, the diſpoſing or placing of things in an orderly manner.

SYNTAX, *συνταξις*, in grammar, the proper conſtruction, or due diſpoſition of the words of a language, into ſentences, or phraſes; or, as Buffier more accurately defines it, the manner of conſtructing one word with another, with regard to the different terminations thereof, preſcribed by the rules of grammar. See CONSTRUCTION and SENTENCE.

Hence the office of ſyntax is to conſider the natural ſuitableneſs of words with reſpect to one another, in order to make them agree in gender, number, perſon, mood, *&c.* To offend in any of theſe points, is called, to offend againſt ſyntax; and ſuch kind of offence, when groſs, is called a ſoleciſm, and when more ſlight, a barbariſm. See GENDER, *&c.*

Syntax is generally divided into two parts, *viz.* concord, wherein the words are to agree in gender, number, caſe and perſon; and regimen or government, wherein one word governs another, and occaſions ſome variations therein. See CONCORD and REGIMEN.

SYNTEXIS, in medicine, an attenuation, or colliquation of the ſolids of the body, ſuch as frequently happens in atrophies, inflammations of the bowels, colliquative fevers, wherein a fatty and uligenous matter is voided with the excrements by ſtool. See COLLIQUATION, *&c.*

SYNTHESIS, the putting of ſeveral things together, as making a compound medicine of ſeveral ſimple ingredients, *&c.* See the article COMPOSITION.

SYNTHESIS, in logic, denotes a branch of method oppoſite to analyſis, called the ſynthetic method. See METHOD.

SYNTHESIS in grammar. See SYLLEPSIS.

SYNTHESIS in ſurgery, is an operation whereby divided parts are re-united, as in wounds, fractures, luxations, *&c.* See the article WOUND, *&c.*

SYNTHETIC, ſomething relating to ſyntheſis. See the preceding article.

SYNTHETIC, or SYNTHETICAL, is, according to Dr. Shaw, a term given to that part of chemiſtry, which, after the analytical chemiſtry has taken bodies to pieces, or reduced them to their principles, can, from theſe ſeparated principles, either recompound the ſame body again, or, from the mixtures of the principles of one or more bodies in various manners, form a large ſet of new productions, which would have been unknown to the world but for this art: ſuch productions are brandy, ſoap, glaſs, and the like. Synthetical chemiſtry, taken in the ſtrict ſenſe for the recompoſition of bodies from their own principles, is rather of philoſophical than of ordinary uſe. This, however, is not eaſy, except in a few caſes, nor are we to imagine, becauſe it has been done in ſome, that nature has taken this way to compoſe them; her method of compoſition of bodies are a new ſubject, and worthy a diligent inquiry.

SYNUSIASTS, a ſect of heretics, who maintained, that there was but one nature, and one ſingle ſubſtance in Jeſus Chriſt. The ſynuſiaſts denied, that the word aſſumed a body in the womb of the virgin, but held, that a part of the divine word being detached from the reſt, was there changed into fleſh and blood. Thus they taught, that Jeſus Chriſt was conſubſtantial to the father, not only as to his divinity, but even as to his humanity and very body.

SYPHON, or SIPHON. See SIPHON.

SYRACUSE, a city and port-town of Sicily, in the province of Val de Noto, ſituated on a fine bay of the Mediterranean Sea, on the eaſt coaſt of the iſland, in eaſt long. 15° 5′, north lat. 37° 25′.

SYREN, or SIREN, in antiquity. See the article SIREN.

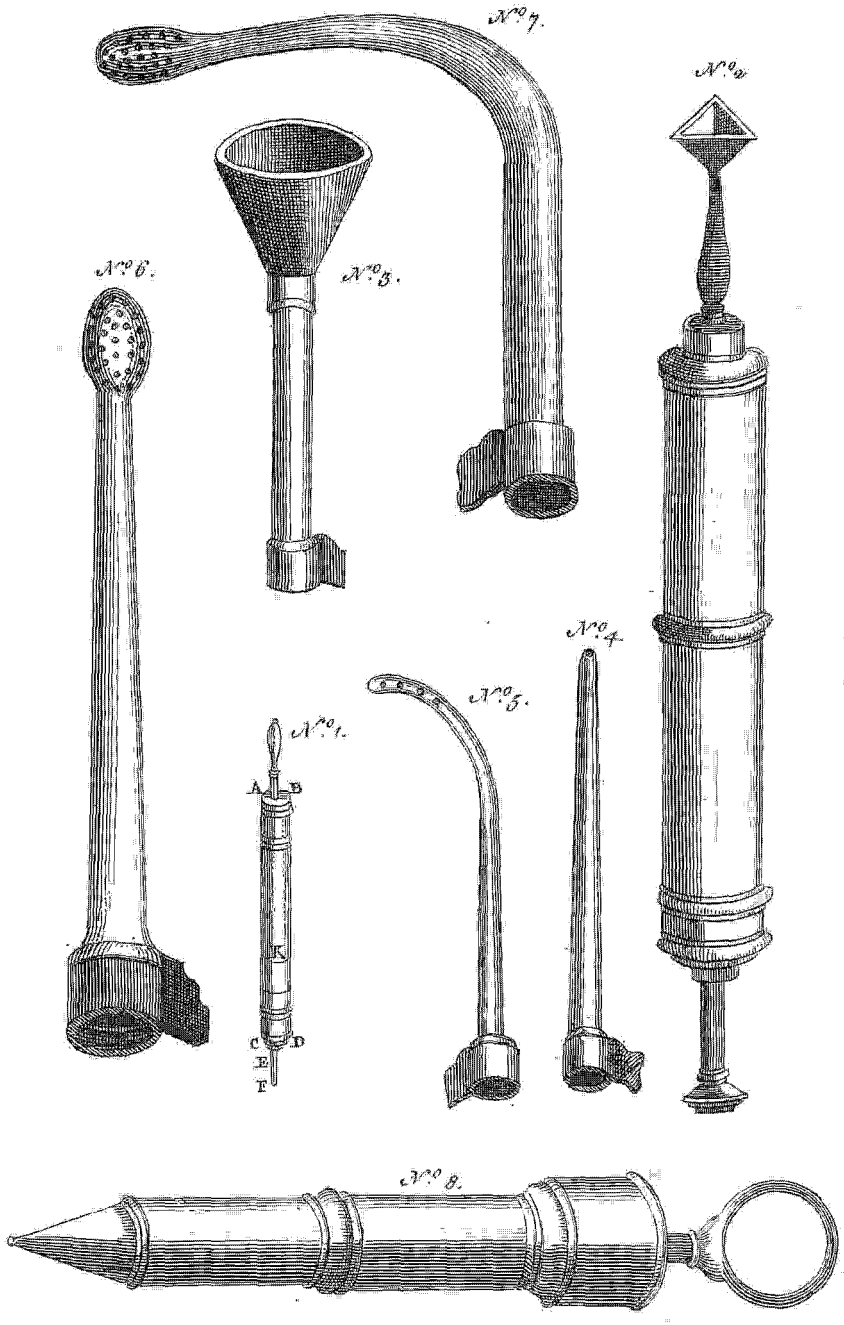
SYRIA, a part of aſiatic Turky, bounded by Natolia and Turcomania, on the north; by Diarbec or Meſopotamia on the eaſt; by Arabia and Paleſtine on the ſouth; and by the Levant-Sea on the weſt. The Turks divide Syria into three beglerbeglies, or vice-royalties, *viz.* Thoſe of Aleppo, Tripoli, and Damaſcus, or Scham, the ſeats of the reſpective viceroys.

SYRIAN YEAR, *&c.* See YEAR, *&c.*

SYRINGA, the PIPE-TREE, in botany, a genus of the *diandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, the tube is cylindric, and very long, the limb is divided into four ſegments of a linear figure, hollow and obtuſely pointed; the fruit is an oblong compreſſed acuminated capſule, formed of two valves, and containing two cells. The ſeeds are ſingle, oblong, and compreſſed, pointed at each end, and furniſhed with a membranaceous margin. This genus comprehends the lilac of Tournefort.

The branches of this tree, when the pith is taken out, ſerve for pipes in ſyringes.

SYRINGES.



J. Jefferys sculp.

SYRINGA, is alſo a name for the plant, otherwiſe called philadelphus. See the article PHILADELPHUS.
