SYRINGE, an inſtrument ſerving to imbibe, or ſuck in a quantity of any fluid, and to ſquirt or expel the ſame with violence.

The ſyringe is made of an hollow cylinder A B C D, plate CCLXVI. n° 1. furniſhed with a little tube at the bottom, E F. In this cylinder is an embolus K, made, or at leaſt covered with leather, or ſome other matter, that eaſily imbibes moiſture, and ſo filling the cavity of the cylinder, as that no air or water may paſs between the one and the other. If then the little end of the tube F, be put into water, and the embolus drawn up, the water will aſcend into the cavity left by the embolus, and upon thruſting back the embolus, it will be violently expelled again through the tube E F; and ſtill the greater impetus will the water be expelled withal, and to the greater diſtance, as the embolus is thruſt down with the greater force, or the greater volocity. See the article EMBOLUS.

This aſcent of the water, the antients, who ſuppoſed a plenum, attributed to nature's abhorrence of a vacuum; but the moderns, from repeated experiments, have found it to be owing to the preſſure of the atmoſphere upon the fluid; for by drawing up the embolus, the air left in the cavity of the cylinder, will be exceedingly rarified, ſo that being no longer a counterbalance to the air, incumbent on the ſurface of the fluid, that prevails and forces the water through the little tube into the body of the ſyringe. See the article AIR, &c.

In effect, a ſyringe is only a ſingle pump, and the water aſcends in it on the ſame principle as in the common ſucking pump, whence it follows, that the water will not be raiſed in a ſyringe to any height exceeding thirty-one feet. See the articles PUMP and SUCTION.

Syringes are of conſiderable uſes in ſurgery; by them clyſters are adminiſtered, injections of medicinal waters, &c. made into wounds, &c. They alſo ſerve to inject coloured liquors, melted wax, &c. into the veſſels of the parts of animals, to ſhew the diſpoſition, texture, ramifications, &c. thereof. The moſt conſiderable ſyringes uſed in ſurgery, are theſe following, as repreſented, in pl. *ibid.* where n° 2. is a ſyringe for various uſes, furniſhed with pipes of different ſorts. By the help of this you may not only inject fluids into wounds of the abdomen and thorax, into the fauces, into abſceſſes, ulcers, and to the uterus, but you may alſo, by the aſſiſtance of this inſtrument, draw extravaſed blood from the cavity of the thorax, in which caſe the ſyringe ſhould be twice as large as the mouth: the pipe ſhould be triangular, and about two thumbs breadth: n° 3. is another pipe, with a round mouth, intended for the ſame uſes: n° 4. a ſmaller pipe, which, as well as the reſt, may be ſcrewed on the ſyringe: n° 5. another pipe ſomewhat curved, and perforated on both ſides. This will ſerve to ſuck blood out of the cavity of the thorax, and throw injections into that part, or into the fauces: n° 6. another perforated at the end like a cullender: n° 7. another perforated like the former, but curved, to throw injections into the uterus, and for other uſes: n° 8. repreſents the ſyringe proper for injecting liquors into the urethra of males, and the vagina of females, for various uſes: it ends with an obtuſe point, to prevent the liquor from regurgitating, or flying about.

SYRINGOTOMY, in ſurgery, the operation of cutting for the fiſtula. See the article FISTULA.

SYRINGOTON, the name of an inſtrument to lay open the fiſtula.

SYRUP, or SYROP, in pharmacy, a ſaturated ſolution of ſugar, made in vegetable decoctions, or infuſions. See the article DECOCTION.

Theſe preparations were formerly conſidered as medicines of much greater importance than they are thought to be at preſent. Syrups and diſtilled waters were for ſome ages made uſe of as the great alteratives, inſomuch, that the evacuation of any peccant humour was never attempted, till, by a due courſe of theſe, it had firſt been regularly prepared for expulſion. Hence aroſe the exuberant collection of both, which we meet with in pharmacopœias; and like errors, have prevailed in each. As multitudes of diſtilled waters have been compounded from materials, unfit to give any virtue over the helm, ſo numbers of syrups have been prepared from ingredients which in their form cannot be taken in ſufficient doſes, to exert their virtues; for two-thirds of a ſyrup conſiſt of ſugar, and the greateſt part of the remaining third is an aqueous fluid.

Syrups are at preſent regarded chiefly as convenient vehicles for medicines of greater

greater efficacy, and made uſe of for ſweetening draughts and juleps, for reducing the lighter powders into boluſſes, pills, or electuaries, and other like purpoſes; ſome likewiſe may not improperly be conſidered as medicines themſelves, as thoſe of ſaffron, or buckthornberries.

General rules for preparing SYRUPS. 1. All the rules for making decoctions, are likewiſe to be obſerved in making ſyrups; vegetables both for decoctions and infuſions ought to be dry, unleſs they are expreſsly ordered otherwiſe. 2. In the London Pharmacopœia, only the pureſt, or double refined ſugar, is allowed. In the Edinburgh, the leſs pure, or common white ſugar is employed, and farther purified by the operator. For ſuch ſyrups as are prepared without coction, the ſugar is previouſly diſſolved in water by itſelf, the ſolution clarified with whites of eggs, and boiled down to a thick conſiſtence, the ſcum which ariſes during the boiling being carefully taken off. In the ſyrups prepared by coction, the clarification with whites of eggs is performed after the ſugar has been diſſolved in the decoction of the vegetable, except in the ſyrup of meconium, for which therefore, the pureſt ſugar is directed. The purification of ſugar, by clarification, and deſpumation, is not ſo perfect as might be expected, for after it has undergone this proceſs, the refiners ſtill ſeparate from it a quantity of oily matter, which is diſagreeable to weak ſtomachs. See the articles CLARIFICATION and DESPUMATION.

The clarification of the ſugar along with the vegetable decoction, is likewiſe injurious to the medicine, ſince by this means not only the impurities of the ſugar are diſcharged, but a conſiderable part of what the liquor had before taken up from the other ingredients. It appears therefore moſt eligible to employ fine ſugar for all the ſyrups, even the purgative ones (which have been uſually made with coarſe ſugar, as ſomewhat coinciding with their intention) not excepted; for as purgative medicines are in general ungrateful to the ſtomach, it is certainly improper to employ an addition, which increaſes their offenſiveneſs. 3. Where the weight of the ſugar is not expreſſed, twenty-nine ounces thereof is to be taken to every pint of liquor. The ſugar is to be reduced into powder, and diſſolved in the liquor by the heat of a water-bath, unleſs ordered otherwiſe; although in the formulæ of the ſeveral ſyrups, a double weight of the ſugar to that of the liquor is directed, yet leſs will generally be ſufficient. Firſt, therefore diſſolve in the liquor an equal weight of ſugar, then gradually add ſome more in powder till a little remains undiſſolved at the bottom, which is to be afterwards incorporated by ſetting the ſyrup in a water-bath. The quantity of ſugar ſhould be as much as the liquor is capable of keeping diſſolved in the cold; if there is more, a part of it will ſeparate and concrete into cryſtals, or candy; if leſs, the ſyrup will be ſubject to ferment, eſpecially in warm weather, and change to a vinous or ſour liquor. 4. Copper veſſels, unleſs they are well tinned, ſhould not be employed in the making of acid ſyrups, or ſuch as are compoſed of the juices of fruits. The confectioners, who are the moſt dextrous people at theſe kinds of preparations, to avoid the expence of frequently new tinning their veſſels, rarely make uſe of any other than copper ones untinned in the preparation even of the moſt acid ſyrups, ſuch as that of oranges, lemons, and the like. Nevertheleſs, by taking due care that their coppers be well ſcoured and perfectly clean, and that the ſyrup remain no longer in them than is abſolutely neceſſary, they avoid giving it any ill taſte or quality from the metal. 5. The ſyrup, when made, is to be ſet by till next day: if any ſaccharine cruſt appears upon the ſurface, take it off.

SYSSARCOSIS, in anatomy, a particular ſpecies of the kind of articulation, called alſo ſymphyſis. See the articles ARTICULATION and SYMPHYSIS.

The ſyſſarcoſis is a natural union of two bones by means of fleſh or muſcles, ſuch is that of the os hyoides and omoplate.

Syſſarcoſis is alſo uſed by ſome chirurgical writers to expreſs a method of curing wounds of the head when the cranium is laid bare, and the interſtice between the lips of the wound too wide for a contraction, by means of promoting the granulation or growth of new fleſh.

SYSTEM, *ſyſtema*, in general, denotes an aſſemblage or chain of principles and concluſions, or the whole of any doctrine, the ſeveral parts whereof are bound together, and follow or depend on each other; in which ſenſe we ſay, a ſyſtem of philoſophy, a ſyſtem of divinity, *&c.*

SYSTEM,

SYSTEM, in aſtronomy, denotes an hypotheſis or ſuppoſition of an arrangement of the ſeveral parts of the univerſe, whereby aſtronomers explain all the phænomena or appearances of the heavenly bodies, their motions, changes, &c. This is moreproperly called the ſyſtems of the world. Syſtem and hypotheſis have much the ſame ſignification, unleſs perhaps hypotheſis be a more particular ſyſtem, and ſyſtem a more general hypotheſis. See HYPOTHESIS.

The three moſt celebrated ſyſtems of the world are the copernican, the ptolemaic, and tychonic, the œconomy of each whereof may be ſeen under the articles COPERNICAN, PTOLEMAIC, and TYCHONIC.

SYSTEM, in poetry, denotes a certain hypotheſis, or ſcheme of religion, from which the poet is never to recede: *e. gr.* having made his choice either in the heathen mythology or in chriſtianity, he muſt keep the two apart, and never mix ſuch different ideas in the ſame poem.

SYSTEM, in muſic, denotes a compound interval, or an interval compoſed, or conceived to be compoſed, of ſeveral leſs, ſuch as the octave. See INTERVAL.

The word is borrowed from the antients, who call a ſimple interval, diaſtem; and a compound one, ſyſtem. See the article DIASTEM.

As there is not any interval in the nature of things, ſo we can only conceive any given interval as compoſed of, or equal to, the ſum of ſeveral others: this diviſion of intervals therefore only relates to practice, ſo that a ſyſtem is properly an interval which is actually divided in practice, and where along with the extremes we always conceive ſome intermediate terms. The nature of a ſyſtem will be very plain by conceiving it an interval whoſe terms are in practice taken either in immediate ſucceſſion, or the ſound is made to riſe or fall from one to the other, by touching ſome intermediate degrees, ſo that the whole is a ſyſtem or compoſition of all the intervals between one extreme and another. Syſtems of the ſame magnitude, and conſequently of the ſame degree of concord and diſcord, may yet differ in reſpect of their compoſition, as containing, and being actually divided into more or fewer intervals; and when they are equal in that reſpect, the parts may differ in magnitude. Laſtly, when they conſiſt of the ſame parts or leſſer intervals, they may differ as to the order and diſpoſition thereof between the two extremes.

There are ſeveral diſtinctions of ſyſtems, the moſt remarkable of which are concinnous or inconcinnous. Concinnous ſyſtems are thoſe which conſiſt of ſuch parts as are fit for muſic, and thoſe parts placed in ſuch an order between the extremes, as that the ſucceſſion of ſounds from one extreme to the other, may have a good effect. See CONCINNOUS.

The concinnous ſyſtems, according to Euclid, are diateſſaron, diapente, diapaſon; diapaſon and diateſſaron, diapaſon and diapente, and biſdiapaſon. See the articles DIATESSARON, DIAPENTE, &c.

Inconcinnous ſyſtems are thoſe wherein the ſimple intervals are inconcinnous, or badly diſpoſed between the two extremes. The inconcinnous, that author obſerves, are leſs than the fourth, and all thoſe ſituated between the above-mentioned ones.

A ſyſtem is either particular or univerſal. An univerſal ſyſtem is that which contains all the particular ſyſtems belonging to muſic, and makes what the antients call diagram, and we, the ſcale of muſic. See DIAGRAM, SCALE, GAMUT, &c.

The antients alſo diſtinguiſh ſyſtems into perfect and imperfect. The biſdiapaſon, or double octave, was reckoned a perfect ſyſtem becauſe, within its extremes are contained examples of all the ſimple and original concords, and all the variety of orders wherein their concinnous parts ought to be taken, which variety conſtitutes what they call ſpecies or figures of conſonances. All the ſyſtems leſs than the biſdiapaſon were reckoned imperfect. The double octave was called ſyſtema maximum and immutatum, becauſe they took it to be the greateſt extent or difference of time they could go in making melody, tho' ſome added a fifth to it for the greateſt ſyſtem: but the diapaſon, or ſimple octave, was reckoned the moſt perfect ſyſtem with regard to the agreement of its extremes, ſo that how many octaves ſoever were put into the greateſt ſyſtem, they were all to be conſtituted or ſubdivided the ſame way as the firſt; ſo that when we know how the octave is divided, we know the nature of the diagram or ſcale, the varieties whereof conſtitute the genera melodiæ, which are ſubdivided into ſpecies. See the articles GENUS and SPECIES.

SYSTEMATISTS,

SYSTEMATISTS, in botany, thoſe authors whoſe works in this ſcience are principally employed about the arranging plants into certain orders, claſſes, or genera.

SYSTOLE, in anatomy, the contraction of the heart, whereby the blood is drawn out of its ventricles into the arteries; the oppoſite ſtate to which is called the diaſtole, or dilatation of the heart. See the articles HEART, BLOOD, DIASTOLE, PULSE, *&c.*

The ſyſtole of the heart is well accounted for by Dr. Lower, who ſhews that the heart is a true muſcle, the fibres whereof are acted on like thoſe of other muſcles, by certain branches of the eight pair of nerves inſerted into it, which bring the animal ſpirits from the brain hither. By a flux of theſe ſpirits the muſcular fibres of the heart are inflated and thus ſhortened, the length of the heart diminiſhed, its breadth or thickneſs increaſed, the capacity of the venticles cloſed, the tendinous mouths of the arteries dilated, thoſe of the veins ſhut up by means of their valves, and the contained juice forcibly expreſſed into the orifices of the arteries. See the article MUSCLE, *&c.*

Dr. Drake adds to Dr. Lower's account, that the intercoſtal muſcles and diaphragm contribute to the ſyſtole, by opening the blood a paſſage from the right ventricle of the heart to the left, through the lungs, to which it could not otherwiſe paſs, becauſe the oppoſition the blood contained in that ventricle muſt neceſſarily have made to its conſtriction, is taken off. Both theſe authors make the ſyſtole the natural ſtate, or action of the heart, and the diaſtole the violent one. Boerhaave, on the contrary, makes the ſyſtole the violent, and the diaſtole the natural ſtate. See the articles CIRCULATION, CONTRACTION, ARTERY, *&c.*

SYSTYLE, in architecture, that manner of placing columns where the ſpace between the two fuſts conſiſt of two diameters, or four modules. See the articles COLUMN, DIAMETER, and MODULE.

SYZYGY, *ſyzygia*, in aſtronomy, a term equally uſed for the conjunction and oppoſition of a planet with the ſun. See CONJUNCTION and OPPOSITION.

On the phænomena and circumſtances of the ſyzygies a great part of the lunar theory depends. See MOON.

For, 1. It is ſhewn in the phyſical aſtronomy, that the force which diminiſhes the gravity of the moon in the ſyzygies, is double that which increaſes it in the quadratures: ſo that in the ſyzygies the gravity of the moon from the action of the ſun is diminiſhed by a part which is to the whole gravity as 1 to 89,36: for in the quadratures, the addition of gravity is to the whole gravity as 1 to 178,73. See QUADRATURE.

2. In the ſyzygies, the diſturbing force is directly as the diſtance of the moon from the earth, and inverſely as the cube of the diſtance of the earth from the ſun. And at the ſyzygies the gravity of the moon towards the earth receding from its center is more diminiſhed, than according to the inverſe ratio of the ſquare of the diſtance from that center. Hence, in the motion of the moon from the ſyzygies to the quadratures, the gravity of the moon towards the earth is continually increaſed, and the moon is continually retarded in its motion; and in the motion from the quadratures to the ſyzygies the moon's gravity is continually diminiſhed, and its motion in its orbit accelerated. See GRAVITATION.

3. Further in the ſyzygies the moon's orbit, or circle, round the earth, is more convex than in the quadratures, for which reaſon the moon is leſs diſtant from the earth at the former than the latter.

When the moon is in the ſyzygies, her apſides go backwards, or are retrograde. See the articles ORBIT, APSIS, and RETROGRADATION.

When the moon is in the ſyzygies, the nodes move in antecedentia faſteſt: then ſlower and ſlower, till they become at reſt, when the moon is in the quadratures. See the article NODE.

Laſtly, When the nodes are come to the ſyzygies, the inclination of the plane of the orbit is leaſt of all. See the article INCLINATION.

Add that theſe ſeveral irregularities are not equal in each ſyzygy, but all ſomewhat greater in the conjunction than in the oppoſition.

T

T or t, the nineteenth letter, and fifteenth conſonant of our alphabet, the ſound whereof is formed by a ſtrong expulſion of the breath through the mouth, upon a ſudden drawing back of the tongue from the fore-part of the palate, with the lips at the ſame time open. The proper ſound of this letter is that in *tan, ten, tin, tun, fat, pot, put, &c.* When it comes before *i*, followed by a vowel, it is ſounded like *s*, as in *nation, potion, &c.* When *h* comes after it, it has a two-fold ſound; one clear and acute, as in *thin, thief, &c.* the other more obtuſe and obſcure, as in *then, there, &c.*

In abbreviations, amongſt the roman writers, T. ſtands for Titus, Titius, *&c.* Tab. for Tabularius; Tab. P. H. C. Tabularius provinciæ Hiſpaniæ citerioris; Tar. Tarquinius; Ti. Tiberius; Ti. F. Tiberii filius; Ti. L. Tiberii libertus; Ti. N. Tiberii Nepos; T. J. A V. P. V. D. tempore judicem arbitrumve poſtulat ut det; T M. P. terminum poſuit; T M. D D. terminum dedicavit; Tr. trans, tribunus; Tr. M. or Mil. tribunus militum; T R. PL. DES. tribunus plebis deſignatus; T R. A E R. tribunus ærarii; T R V. C A P. triumviri capitales; T. P. or T R I B. P O T. tribunicia poteſtate; Tul. H. Tullus Hoſtilius.

Amongſt the antients, T. as a numeral, ſtood for one hundred and ſixty; and with a daſh at top, thus $\overline{T}$, it ſignified one hundred and ſixty thouſand. In muſic, T ſtands for tutti, all, or altogether. See the articles TUTTI and NUMERAL.

TABAGO, one of the Caribbee-iſlands in the American-ocean, one hundred and twenty miles ſouth of Barbadoes: weſt long. 59°, north lat. 11° 30′.

It is from this place that tabacco, or tobacco, a well known plant, takes its name. See TOBACCO.

TABARCA, an iſland on the coaſt of Barbary, in Africa, fifty miles weſt of Tunis: eaſt long. 8°, north lat. 36° 30′.

TABASCO, the capital of a province of the ſame name, ſituated on the bay of Campeachy, at the mouth of the river Tabaſco, one hundred and ſixty miles ſouth-weſt of Campeachy: weſt long. 95°, north lat. 18°.

TABBY, in commerce, a kind of rich ſilk which has undergone the operation of tabbying. See the next article.

TABBYING, the paſſing a ſilk or ſtuff under a calender, the rolls of which are made of iron or copper, variouſly engraven, which bearing unequally on the ſtuff renders the ſurface thereof unequal, ſo as to reflect the rays of light differently, making the repreſentation of waves thereon.

TABELLA, TABLET, in pharmacy, is much the ſame with troches and lozenges, being a ſolid preparation formed into a little cake, or maſs, of different figures, intended to diſſolve ſlowly, and generally made agreeable to the palate. This form is moſtly made uſe of for the more commodious exhibition of certain medicines, by fitting them to diſſolve ſlowly in the mouth, ſo as to paſs by degrees into the ſtomach, and hence theſe preparations have generally a conſiderable proportion of ſugar or other ſuch materials. They are calculated for children who are not eaſily prevailed on to take medicines in leſs agreeable forms. There are various kinds of them, as the tabellæ antacidæ, tabellæ anthelminticæ, tabellæ purgantes, *&c.* See TROCHE.

TABELLIO, in the roman law, an officer or ſcrivener, much the ſame with our notaries public, who are often called tabelliones in our antient law books. See the article NOTARY.

TABERNACLE, among the Hebrews, a kind of building, in the form of a tent, ſet up, by expreſs command of God, for the performance of religious worſhip, ſacrifices, *&c.* during the journeying of the Iſraelites in the wilderneſs; and, after their ſettlement in the land of Canaan, made uſe of for the ſame purpoſe till the building of the temple of Jeruſalem. It was divided into two parts, the one covered, and properly called the tabernacle; and the other open, called the court. The curtains which covered the tabernacle were made of linnen, of ſeveral colours, embroidered. There were ten curtains, twenty-eight cubits long and

four in breadth. Five curtains faſtened together made up two coverings, which covered all the tabernacle. Over theſe there were two other coverings; the one of goat-hair, and the other of ſheep-ſkins. The holy of holies was parted from the reſt of the tabernacle by a curtain made faſt to four pillars, ſtanding ten cubits from the end. The length of the whole tabernacle was thirty-two cubits, that is, about fifty feet; and the breadth twelve cubits, or nineteen feet. The court was a ſpot of ground one hundred cubits long, and fifty in breadth, encloſed by twenty columns, each twenty cubits high and ten in breadth, covered with ſilver, and ſtanding on copper baſes, five cubits diſtant from one another; between which, there were curtains drawn, and faſtened with hooks. At the eaſt end was an entrance, twenty cubits wide, covered with a curtain hanging looſe.

Feaſt of TABERNACLES, a ſolemn feſtival of the Hebrews, obſerved after harveſt, on the fifteenth day of the month Tiſri, inſtituted to commemorate the goodneſs of God, who protected the Iſraelites in the wilderneſs, and made them dwell in booths, when they came out of Egypt. On the firſt day of the feaſt, they began to erect booths of the boughs of trees, and in theſe they were obliged to continue ſeven days. The booths were placed in the open air, and were not to be covered with clothes, nor made too cloſe by the thickneſs of the boughs; but ſo looſe that the ſun and the ſtars might be ſeen, and the rain deſcend through them. For further particulars, as to the celebration of this feſtival, ſee Levit. ch. xxiii.

TABERNÆMONTANA, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle infundibuliform petal: the tube is cylindric and long: the baſe and apex are both ventricoſe: the limb is divided into five linear obtuſe ſegments; the fruit is compoſed of two follicles bent horizontally, ventricoſe, and acuminated, formed of one valve, and containing one cell: the ſeeds are numerous, of an oblong oval figure, obtuſe, imbricated, and wrapped up in pulp.

TABES DORSALIS, in medicine, a diſtemper which, according to a late author, is a particular ſpecies of a conſumption, the proximate cauſe of which is a debility of the nerves. See the article CONSUMPTION.

Of the ſeveral kinds of conſumptions incident to human bodies, the tabes dorſalis is the ſloweſt in its progreſs, but the moſt melancholy in its circumſtances; and, unleſs timely obviated, for the moſt part fatal. This diſeaſe is only incident to young men of ſalacious diſpoſitions, and proceeds from too early venery, an immoderate uſe of it, or pollutions. It ſeems therefore to derive its origin from too frequent venereal ſpaſms; and the immoderate loſs of ſeminal fluid has a conſiderable ſhare in producing the effect. The ſymptoms of the tabes dorſalis are involuntary, nocturnal, ſeminal emiſſions, a pain in the back, and often in the head, a formication of the ſpine, an aching pain, rolling and hanging down of the teſticles, a weakneſs of memory and ſight, and a mucous diſcharge from the urethra, eſpecially after ſtraining at the diſcharge of the excrements. The mucous diſcharge here mentioned is called, by Hippocrates, liquidum ſemen, but it is nothing but the mucus of the proſtrate gland. This diſeaſe is farther attended with great melancholy and dejection of mind, and a gutta ſerena often follows. The eyes grow hollow, the viſage meagre and thin, the body emaciated and weak, a palpitation of the heart, and ſhortneſs of breath, ſucceed with a concourſe of hectical complaints, ending in death.

For the cure of this diſtemper a regularity of the non-naturals is of the utmoſt importance. Good air, rather cool than hot, is of great uſe. As to diet, high-ſeaſoned meats, ſpiritous and fermented liquors, ſhould be avoided. No food is ſo beneficial as milk: chocolate is alſo eſteemed good, in ſuch quantities as to ſit eaſy on the ſtomach. Animal food of eaſy digeſtion, at dinner, does no harm. Suppers ſhould be avoided, at leaſt milk only ſhould be then taken, about two hours before going to bed. Sleep muſt be little, and in due ſeaſon; that is, the patient ſhould go to bed and riſe early. Indulgence in bed in a morning is hurtful. The general rule ſhould be to riſe immediately upon waking; which, though irkſome at firſt, will by cuſtom be made familiar and agreeable. Moderate exerciſe, or ſuch as the patient's ſtrength will admit of without wearineſs, ought to be uſed.

Some

Some recommend riding, eſpecially a long journey, by ſuch daily portions as to avoid extraordinary fatigue. The ſecretions of the body, if out of order, ſhould be regulated, and the patient ſhould be entertained with cheerful company. As to the medicines, the claſſes of balſamics and aſtringents are chiefly uſeful. Among the latter, the peruvian bark, either in ſubſtance, extract, or tincture, the acid elixir of vitriol, and the tincture ſaturnia, or antiphthyſica, are the moſt efficacious. Strengthening plaſters may alſo be laid on the loins; and, chief of all, the cold bath ſhould be uſed.

TABLATURE, in anatomy, a diviſion, or parting, of the ſkull into two tables. See the article SKULL.

TABLATURE, *tablatura*, in muſic, is, in general, when, to expreſs the ſounds or notes of a compoſition, we uſe the letters of the alphabet, or any other characters not uſed in the modern muſic.

But, in a ſtricter ſenſe, tablature is the manner of writing a piece for the lute, theorba, guittar, viol, or the like, which is done by writing on ſeveral parallel lines, (each of which repreſents a ſtring of the inſtrument) certain letters of the alphabet, whereof A marks that the ſtring is to be ſtruck open, that is, without putting the finger of the left hand upon the neck; B ſhews that one of the fingers is to be put on the firſt ſtop, C on the ſecond, D on the third, and ſo on through the octave. The tablature of the lute is uſually wrote in letters of the alphabet, and that of the harpſicord in the common notes.

TABLE, *tabula*, a moveable piece of furniture, uſually made of wood or ſtone, and ſupported on pillars, or the like, for the commodious reception of things placed thereon.

TABLE, in architecture, a ſmooth ſimple member, or ornament, of various forms, but moſt uſually in that of a long ſquare. A projecting-table is that which ſtands out from the naked of the wall, pedeſtal, or other matter it adorns. Raked-table, is that which is hollow in the die of a pedeſtal, or elſewhere, and is uſually encompaſſed with a moulding. Razed-table, is an emboſſment in a frontiſpiece for the putting an inſcription, or other ornament, in ſculpture. This is what M. Perrault underſtands by abacus in Vitruvius. Crowned-table, that which is covered with a corniche, and in which a baſſo relievo is cut, or a piece of black marble incruſtated for an inſcription. Ruſticated-table, that which is picked, and whoſe ſurface ſeems rough, as in grottos, *&c.*

TABLE, in perſpective, denotes a plain ſurface, ſuppoſed to be tranſparent, and perpendicular to the horizon. It is always imagined to be placed at a certain diſtance between the eye and the objects, for the objects to be repreſented thereon by means of the viſual rays paſſing from every point thereof through the table to the eye; whence it is called perſpective-plane.

TABLE, in anatomy. The cranium is ſaid to be compoſed of two tables, or laminæ, *i. e.* it is double, as if it conſiſted of two bones laid over one another. See the article SKULL.

TABLE *of Pythagoras*, or *Multiplication*-TABLE. See MULTIPLICATION.

Laws of the twelve TABLES, were the firſt ſet of laws of the Romans, thus called either by reaſon the Romans then wrote with a ſtyle on thin wooden tablets covered with wax, or rather, becauſe they were engraven on tables, or plates of copper, to be expoſed in the moſt noted part of the public forum. After the expulſion of the kings, as the Romans were then without any fixed or certain ſyſtem of law, at leaſt had none ample enough to take in the various caſes that might fall between particular perſons, it was reſolved to adopt the beſt and wiſeſt laws of the Greeks. One Hermodorus was firſt appointed to tranſlate them, and the decemviri afterwards compiled and reduced them into ten tables. After a world of care and application, they were at length enacted and confirmed by the ſenate and an aſſembly of the people, in the year of Rome 303. The following year they found ſomething wanting therein, which they ſupplied from the laws of the former kings of Rome, and from certain cuſtoms which long uſe had authoriſed: all theſe being engraven on two other tables made the law of the twelve tables, ſo famous in the roman juriſprudence, the ſource and foundation of the civil or roman law.

TABLES *of the law*, in jewiſh antiquity, two tables on which were written the decalogue, or ten commandments, given by God to Moſes on Mount Sinai. See the article DECALOGUE.

Many queſtions have been ſtarted about theſe tables, as concerning their matter, form, number, author, and contents. Some ſuppoſe them to have been made of wood, others of precious ſtone. Theſe again are divided; ſome ſuppoſing them to have been of ruby, and others of carbuncle. Some oriental authors pretend they were ten in number, and others ſeven, but the Hebrews acknowledge no more than two. Moſes obſerves, that theſe tables were written on both ſides: many think they were tranſparent, ſo that they might be read through. others are of opinion that the ſame ten commandments were written on each of the two tables: and others, that the ten were divided, five being written on one table and five on the other. Moſes expreſly ſays that theſe tables were written by the hand of God. Some underſtand this literally, others aſcribe it to the miniſtry of an angel, and others explain it by an order of God to Moſes himſelf, to write them. The Mahometans ſay that God commanded the archangel Gabriel to make uſe of the pen, which is the invocation of the name of God, and of the ink which is taken out of the river of light, and therewith to write the tables of the law. When Moſes brought theſe tables down from the mount, and ſaw the idolatry into which the children of Iſrael had fallen, he dropt them out of his hand, and by the fall they were broken to pieces; but this loſs was repaired by the ſecond tables which God gave to Moſes, and in which he commanded him to write down the words of the covenant which he had made with Iſrael. From hence ſome conclude that theſe latter tables were not written by the hand of God, though the firſt were. But Moſes takes expreſs notice that God himſelf wrote them; whence it follows either that they were both written by the finger of God, or that neither of them was ſo written.

New TABLES, *tabulæ novæ*, an edict occaſionally publiſhed in the roman commonwealth, for the aboliſhing all kinds of debts and annulling all obligations.

TABLE, among the jewellers. A table-diamond, or other precious ſtone, is that whoſe upper ſurface is quite flat, and only the ſides cut in angles; in which ſenſe a diamond, cut table-wiſe, is uſed in oppoſition to a roſe-diamond. See the article DIAMOND.

TABLE-GLASS. See GLASS.

TABLE is alſo uſed for an index or repertory put at the beginning or end of a book, to direct the reader to any paſſage he may have occaſion for: thus we ſay table of matters, table of authors quoted, *&c.* Tables of the Bible are called concordances. See the article CONCORDANCE.

TABLE *of houſes*, among aſtrologers, certain tables ready drawn up for the aſſiſtance of practitioners in that art, for the erecting or drawing of figures or ſchemes. See the article HOUSE.

TABLE, in mathematics, ſyſtems of numbers calculated to be ready at hand for the expediting aſtronomical, geometrical, and other operations: thus we ſay tables of the ſtars; tables of ſines, tangents, and ſecants; tables of logarithms, rhumbs, *&c.* ſexagenary tables; loxodromic tables, *&c.* See the articles CANON, CATALOGUE, LOGARITHM, RHUMB, SEXAGENARY, *&c.*

Aſtronomical TABLES, are computations of the motions, places, and other phænomena of the planets, both primary and ſecondary.

The eldeſt aſtronomical tables are thoſe of Ptolomy, found in his Almageſt; but theſe now agree no longer with the heavens. In 1252, Alphonſo XI. king of Caſtile, undertook the correcting them, whence aroſe the alphonſine tables: but the deficiency of theſe was ſoon perceived by Regiomontanus and Purbachius; upon which the former of theſe, and after him Waltherus, and Warnerus, applied themſelves for the further amending them: but died before they finiſhed them. Copernicus calculated tables from his own obſervations and theories, from which Eraſmus Reinholdus afterwards compiled the prutenic tables. From Tycho's theories, Longomontanus calculated tables, now called the Daniſh Tables: and Kepler likewiſe, from the ſame, in 1627, publiſhed the Rudolphine Tables, which are now much eſteemed. Theſe were afterwards, in 1650, turned into another form by Maria Cunitia, whoſe aſtronomical tables, comprehending the effect of Kepler's Phyſical Hypotheſis, are exceedingly eaſy, and ſatisfy all the phænomena without any trouble of calculation, or any mention of logarithms, ſo that the Rudolphine calculus is hereby greatly improved. Other tables are the philolaic tables of Bullialdus;

Bullialdus; the britannic tables of Vincent Wing, calculated on Bullialdus's hypotheſis; the britannic tables of John Newton; the french ones of count de Pagan; the caroline tables of Street, all calculated on Dr. Ward's hypotheſis; and the novalmageſtic tables of Ricciolus. Among theſe laſt, the philolaic and caroline tables are eſteemed the beſt. Among the lateſt tables are the ludovician, publiſhed in 1702, by M. de la Hire, wholly from his own obſervations, and without the aſſiſtance of any hypotheſis; thoſe of Caſſini in 1738; and Dr. Halley laboured to perfect another ſet of tables.

TABLE, in heraldry. Coats, or eſcutcheons containing nothing but the mere colour of the field, and not charged with any bearing or moveable, are called *tables d'attente*, tables of expectation, or *tabulæ raſæ*.

TABLET, *tabella*, in pharmacy. See the article TABELLA.

TABLING *of fines*, the making a table for every county, where his majeſty's writs run, containing the contents of every fine paſſed each term. This is to be done by the chirographer of fines of the court of common pleas, whoſe duty it is every day of the next term, after the ingroſſing of any ſuch fine, to fix theſe tables in ſome open place of the ſaid court, during the time of its ſitting; and he is likewiſe to deliver to the ſheriff of every county, his under-ſheriff, or deputy, fairly wrote in parchment, a perfect copy of the table ſo made for that county, in the term next after the aſſizes, to be ſet up in an open place of that court, and to continue there ſo long as the juſtices ſhall ſit, and in caſe either the ſheriff, or chirographer, fails herein, he is liable to 5 l. penalty.

TABOR, *tabourin*, a ſmall drum. See the article DRUM.

TABORITES, or THABORITES, a branch or ſect of the antient Huſſites. They carried the point of reformation farther than Huſs had done, rejected purgatory, auricular confeſſion, the unction of baptiſm, tranſubſtantiation, &c. They reduced the ſeven ſacraments of the Romaniſts to four, *viz.* baptiſm, the euchariſt, marriage, and ordination.

TABRISTAN, a province of Perſia, ſituated on the northern ſhore of the caſpian ſea, having the province of Aſtrabat on eaſt, and Gilan on the weſt; being part of the antient Hyrcania.

TACAMAHACA, in pharmacy, a ſolid reſin, improperly called a gum, in the ſhops it is of a fragrant and peculiar ſmell, and is of two kinds; the one called the ſhell-tacamahaca, which is the fineſt; the other, which is an inferior kind, being termed rough-tacamahaca, or tacamahaca in grains.

The ſhell-tacamahaca is a concreted reſin, of a fatty appearance, and ſomewhat ſoft, ſo as eaſily to receive an impreſſion from the finger; at leaſt, this is its ſtate, when tolerably freſh. In time it grows hard and friable as common reſin; but it is then to be rejected, as having loſt much of its virtue. It is of a pale, browniſh, white colour, ſometimes with a yelloviſh, ſometimes with a greeniſh caſt. It is moderately heavy, very inflammable, and of a very fragrant ſmell of a peculiar kind, in which ſomething like the aromatic ſcent of lavender, and the perfume of amber greaſe, may be diſtinguiſhed, as mixed with a reſinous flavour. Its taſte is very aromatic and agreeable, though very acrid.

The common or grain-tacamahaca, called alſo coarſe tacamahaca, by way of diſtinction from the former fine kind, which is called tacamahaca ſublimis by ſome, is a dry, but ſomewhat fattiſh reſin, ſent over to us either in looſe granules, or in maſſes formed of ſuch. It is of a whitiſh colour variegated with yelloviſh, reddiſh, or greeniſh ſpots. Some of the granules are ſimply of one or other of theſe colours; others are variegated with two or more of them. It is of a fragrant ſmell, reſembling that of the ſhell-tacamahaca, but leſs perfumed, and is of an acrid, aromatic, bitteriſh taſte.

Tacamahaca is the gum of a tall tree, in the manner of its growth much reſembling the poplar: its leaves are broad and ſerrated at the edges, and terminate in a ſharp point: the flowers have not been yet deſcribed, but it is ſaid to be ſmall and roundiſh, containing a kernel not unlike that of a peach-ſtone.

Some greatly commend tacamahaca in diſorders of the breaſt and lungs; but, at preſent, it is very rarely uſed internally. Externally, however, it is in repute for ſoftening tumours, and mitigating pain and aches. Applied to the navel, it is ſaid to relieve women in hyſteric complaints; and applied in the ſame manner to the region of the ſtomach, it aſſiſts digeſtion, and expels flatuſes: it is alſo

an

an ingredient in ſome of the ſhop-compoſitions.

TACHYGRAPHY, *ταχυγραφια*, the art of writing faſt, or of ſhort-hand; of which authors have invented ſeveral methods. See BRACHYGRAPHY.

TACK, in a ſhip, a great rope having a wale-knot at one end, which is ſeized or faſtened into the clew of the ſail; ſo is reefed firſt through the cheſſe-trees, and then is brought through a hole in the ſhip's ſide. Its uſe is to carry forward the clew of the ſail, and to make it ſtand cloſe by a wind: and whenever the ſails are thus trimmed, the main-tack, the fore-tack, and mizen-tack, are brought cloſe by the board, and haled as much forward on as they can be.

The bowlings alſo are ſo on the weather-ſide; the lee-ſheets are haled cloſe aft, and the lee-braces of all the ſails are likewiſe braced aft. Hence they ſay, a ſhip ſails or ſtands cloſe upon a tack, *i. e.* cloſe by the wind. The words of command are, hale aboard the tacks, *i. e.* bring the tack down cloſe to the cheſſe-trees. Eaſe the tack, *i. e.* ſlacken it, or let it go, or run out. Let riſe the tack, *i. e.* let all go out.

The tacks of a ſhip are uſually belayed to the bitts, or elſe there is a chevil on purpoſe to faſten them.

TACK-ABOUT, in the ſea-language, is to turn the ſhip about, or bring her head about, ſo as to lie the contrary way.

TACKLE, or TACKLING, among ſeamen, denotes all the ropes or cordage of a ſhip, uſed in managing the ſails, *&c.* In a more reſtrained ſenſe, tackles are ſmall ropes running in three parts, having at one end a pendant and a block; and at the other end, a block and hook, to hang goods upon that are to be heaved into the ſhip or out of it. See the article SHIP.

TACTICS, in the art of war, is the method of diſpoſing forces to the beſt advantage in order of battle, and of performing the ſeveral military motions and evolutions.

TADCASTER, a market-town of Yorkſhire, ten miles ſouth-weſt of York.

TADMOR, the ſame with Palmyra. See the article PALMYRA.

TADORNA, in ornithology, a beautiful ſpecies of anas, nearly equal to the gooſe in ſize, and variagated with white, and with a longitudinal ſpot of grey on the belly: it is frequent on the coaſts of Wales and Lancaſhire.

TADPOLE, a young frog, before it has diſengaged itſelf from the membranes that envelope it in its firſt ſtage of life. See the article FROG.

TÆNIA, the TAPE-WORM, in zoology, a genus of worms, the body of which is of an oblong form, and compoſed of evident joints or articulations, in the manner of the links of a chain, or beads of a necklace.

The tape-worm grows frequently to ſeveral ells in length, and its articulations are a third of an inch long each. There is alſo another ſmall ſpecies, which never exceeds two inches in length, and is commonly not more than half an inch.

TÆNIA, in architecture, a member of the doric capital, reſembling a ſquare fillet, or reglet: it ſerves inſtead of a cymatium. See CYMATIUM.

TAFALA, a town of Navarre, in Spain, twenty-two miles ſouth of Pampeluna: weſt long. 1° 40′, north lat. 42° 45′.

TAFFAREL, or TAFFEREL, in a ſhip, the uppermoſt rail or frame, abaft over the poop. See the article SHIP.

TAFFETY, in commerce, a fine ſmooth ſilken ſtuff, remarkably gloſſy. See SILK. There are taffeties of all colours, ſome plain, and others ſtriped with gold, ſilver, *&c.* others chequered, others flowered, *&c.* according to the fancy of the workmen.

TAFILET, a town of Biledulgerid, in Africa, ſituated three hundred miles ſouth-eaſt of Morocco: weſt long. 5°, north lat. 28°.

TAGETES, *French* MARYGOLD, or *African* MARYGOLD, in botany, a genus of the *ſyngeneſia polygamia ſuperflua* claſs of plants, with a compound radiated flower, made up of numerous tubuloſe and ſemiquinquifid hermaphrodite corollulæ on the diſc, and ſeveral ligulated female flowers in the radius or verge: there is a ſingle ſeed ſucceeds each hermaphrodite corollula; all which are contained in the cup, which cloſes for that purpoſe. See plate CCLXVIII. fig. 1.

TAGUS, the largeſt river of Spain, which, taking its riſe on the confines of Arragon, runs ſouth-weſt through the provinces of New Caſtile and Eſtremadura; and paſſing by the cities of Aranjuez, Toledo, and Alcantara, and then croſſing Portugal, forms the harbour of Liſbon, at which city it is about three miles over; and about eight or ten miles below this, it falls into the Atlantic ocean.

TAJACU, the MUSK-HOG, in zoology, a ſpecies of hog, with a cyſt on the back, and no tail: it is a native of Mexico, and is ſmaller than the common hog. On the middle of the head there ariſes a kind of creſt, compoſed of a large cluſter of briſtles; and on the middle of the back there is a kind of cyſt or gland, with an opening at the upper part, in which is ſecreted a perfumed fluid matter, of a mixt ſmell between that of muſk and civet; whence the engliſh name.

TAIL, *cauda*, the train of a beaſt, bird, or fiſh; which, in land animals, ſerves to drive away flies, *&c.* and in birds and fiſhes, to direct their courſe, and aſſiſt them in aſcending or deſcending in the air or water. See the articles QUADRUPED, BIRD, FISH, *&c.*

TAIL *of a comet*, denotes the luminous rays iſſuing from a comet towards that part of the heavens, from whence it ſeems to move. See COMET.

TAIL *of the trenches*, in the art of war, is the poſt or place, where the beſiegers begin to break ground. See TRENCH.

Dragon's TAIL, in aſtronomy, the deſcending node of a planet. See NODE.

Horſe's TAIL, in the cuſtoms of the eaſtern nations, is the enſign, or flag, under which they make war.

TAIL, or FEE-TAIL, in law, is a limited eſtate, or fee; oppoſed to fee-ſimple. See the article FEE.

Fee-tail is an inheritance whereof a perſon is ſeiſed, to him and the heirs of his body, begotten or to be begotten; ſo that the tenant in tail cannot alien, either before or after iſſue had, or forfeit ſuch lands, longer than for his own life: becauſe an eſtate in tail always remains to the iſſue of the donee and his heirs; or, in caſe he has no iſſue, then to the donor and his heirs.

Eſtates-tail of lands are either general or ſpecial. General tail is where lands or tenements are given to a man, or woman, and the heirs of either of their bodies begotten; which is called a general tail, becauſe, however many wives a perſon that holds by this title ſhall have one after another in lawful marriage, his iſſue by them ſeverally are all capable of inheriting in their turns: and if the woman has iſſue by ſeveral huſbands, they may all inherit after each other, as heirs of her body. A tail ſpecial, on the other hand, is when lands, *&c.* are limited to a man and his wife, and the heirs of their two bodies begotten, ſo that the children by a ſecond wife, or former wife, ſtand abſolutely excluded.

Where lands are granted to a man and his heirs-male, or heirs-female, of his body begotten, ſuch male or female iſſue ſhall only inherit purſuant to the limitation: and hence it is, that where a grant is to a man and the heirs male of his body begotten, and he has iſſue a daughter, who has a ſon, this ſon cannot inherit the eſtate, becauſe he cannot prove his deſcent by heirs-male.

Where lands, *&c.* are given to a huſband and wife, and the heirs of their two bodies begotten in ſpecial tail, and one of them dies without iſſue had between them; in ſuch caſe, the ſurvivor ſhall hold the lands for life, as tenant in tail after poſſibility of iſſue extinct, as the lawyers call it.

Nevertheleſs, as great miſchiefs were occaſioned by inheritances being intailed; as defrauding of creditors, *&c.* diſobedience of ſons, when they knew they could not be diſinherited, and the like, the judges found out a way to bar an intailed eſtate with remainders over, by a feigned recovery. See RECOVERY.

TAILLEBOURG, a town of Guienne, in France, thirty miles ſouth-eaſt of Rochelle.

TAILLOIR, in architecture, a term ſometimes uſed for abacus. See ABACUS.

TAINE, a port-town of Roſs-ſhire, in Scotland, ſituated on the ſouth ſide of the frith of Sutherland, ſeven miles north of Cromartie: weſt long. 3° 38′, north lat. 58°

TAINT, in law, ſignifies either a conviction; or the perſon convicted, of ſome treaſon, felony, *&c.* See TREASON and FELONY.

TAITCHEU, a city and port-town of China, ſituated on the coaſt of the Pacific Ocean, in eaſt long. 121°, north lat. 29°.

TALAMONE, a port-town of Tuſcany, fifteen miles north of Orbitello.

TALAVERA, a town of Eſtremadura, in Spain, fourteen miles eaſt of Badajos.

TALC, or TALK, in natural hiſtory, a large claſs of foſſile bodies, compoſed of broad, flat, and ſmooth laminæ or plates, laid evenly and regularly on one another; eaſily fiſſile, according to the ſite of theſe plates, but not all ſo in any other direction; flexile and elaſtic; bright, ſhining, and tranſparent; not giving fire with ſteel, nor fermenting with acid

menſtrua, and ſuſtaining the force of a violent fire without calcining.

Talcs are divided into two orders; the firſt of which are compoſed of plates of great extent, each making ſingly the whole horizontal ſurface of the maſs.

The genera of the firſt order are two: the firſt is of thoſe compoſed of viſibly ſeparate plates of extreme thinneſs; and each fiſſile again into a number of others yet finer: the talcs of this genus are called ſpeculares. See plate CCLXVII. fig. 1.

The ſecond genus is of thoſe which are compoſed of ſeparate plates of conſiderable thickneſs, and thoſe not fiſſile into any thinner. The talcs of this genus are called hyalinæ, *ibid.* fig. 2.

The talcs of the ſecond order are thoſe compoſed of ſmall plates, in form of ſpangles, irregularly diſpoſed, and uſually many of them concurring in different directions, to the formation of one of the ſurfaces of the maſs.

The genera of the ſecond order are alſo two: the firſt is of thoſe compoſed of ſmall plates, in form of ſpangles, each fiſſile into many yet finer and thinner ones: the talcs of this genus are called bractearia. *ibid.* fig. 3, and 4.

The ſecond genus is of thoſe compoſed of ſmall plates in form of ſpangles, which are moderately thick, and are either not fiſſile at all, or are only ſo to a certain degree, or into a ſmall number of others yet thick ones, and thoſe no farther fiſſile: the talcs of this laſt genus are called elaſmides. *ibid.* fig. 5, and 6.

Talcs, though of no manner of uſe in medicine, are nevertheleſs uſed in many arts and manufactures; for a farther account of which, ſee SPECULARIS, *&c.*

Philoſophic TALC, an appellation given by ſome to the flowers of zink. See ZINK.

TALENT, money of account amongſt the antients. See the articles COIN and MONEY.

Amongſt the Jews, a talent in weight was equal to 60 maneh, or 113 lb. 10 oz. 1 dwt. 10 $\frac{2}{7}$ gr.

TALES, in law, a word uſed for a ſupply of men impannelled on a jury, and not appearing; or upon appearance, being challenged for the plaintiff or defendant, as not indifferent; in which caſe the judge, upon motion, of courſe grants a ſupply to be made by the ſheriff, of ſome perſons there preſent, equal in reputation to thoſe that are impanelled. Where a perſon has had one tales, he may have another, but not have the latter to contain ſo many as the former, becauſe the firſt tales muſt be under the number of the principal panel, except in the caſe of appeal; and in like manner every tales is to be leſs than other, until the whole number be made uſe of, are perſons without exception. There are two kinds of tales, the one de circumſtantibus, and the other a decem tales: that of circumſtantibus, is, when a full jury does not appear at the niſi prius, or ſo many are challenged as not to have a full jury; on which motion being made, the judge will grant this tales, which the ſheriff immediately returns into court. A decem tales is when a full jury does not appear at a trial at bar, in which caſe this writ goes out to the ſheriff, commanding him to apponere decem tales.

TALIO, *lex talionis*, a ſpecies of puniſhment in the moſaic law, whereby an evil is returned ſimilar to that committed againſt us by another; hence that expreſſion eye for eye, tooth for tooth. This law was at firſt inſerted in the twelve tables amongſt the Romans, but afterwards ſet aſide, and a power given to the prætor to fix upon a ſum of money for the damage done.

TALISMANS, magical figures cut or engraved with ſuperſtitious obſervations on the characteriſms and configurations of the heavens, to which ſome aſtrologers have attributed wonderful virtues, particularly that of calling down celeſtial influences. The taliſmans of Samothrace, ſo famous of old, were pieces of iron formed into certain images, and ſet in rings; theſe were eſteemed preſervatives againſt all kinds of evils. There were likewiſe taliſmans taken from vegetables, and others from minerals. There is a general diviſion of taliſmans into three kinds. 1. Aſtronomical, which are known by the ſigns or conſtellations of the heavens engraven thereon, with other figures, and ſome unintelligible characters. 2. Magical, which bear very extraordinary figures, with ſuperſtitious words, and names of angels unheard of. 3. Mixt, which conſiſt of ſigns and barbarous names, but without ſuperſtitious ones, or names of angels unknown.

There have been ſome rabbins who maintained, that the brazen ſerpent raiſed by Moſes, was a taliſman.

TALK, or TALC, in natural hiſtory. See the article TALC.

TALLAGE, in law-books, is a general name for all taxes: hence, *tallagium facere*,

TALCS.

Order 1.

Fig. 1 Specularis

Fig. 2 Hyalina

Order 2

Fig. 3. Bractearium.

Fig. 4. Bractearium.

Fig. 5. Elasmis.

Fig. 6. Elasmis

J. Jeffreys sculp.

facere, is to give up accounts into the exchequer, where the method of accounting is by tallies. See TALLY.

TALLARD, a town of Dauphine, in France, ſituated on the river Durance, forty-ſeven miles ſouth of Grenoble.

TALLEMONT, a town of Guienne, in France, ſituated near the mouth of the river Garonne, forty miles ſouth of Rochelle.

TALLOW, in commerce, the fat of certain animals, melted down and clarified, ſo as to be fit for making candles, *&c.* See the article CANDLE.

Tallow, imported from abroad, pays for every hundred weight, a duty of 7s. $10\frac{75}{100}$ d. and draws back, on being exported again, 7 s. 6 d.

TALLOW-TREE, a remarkable tree, growing in great plenty in China; ſo called, from its producing a ſubſtance like tallow, which ſerves for the ſame purpoſe: it is about the height of a cherry-tree, its leaves in form of a heart, of a deep ſhining red colour, and its bark very ſmooth. Its fruit is incloſed in a kind of pod, or cover like a cheſnut, and conſiſts of three round white grains, of the ſize and form of a ſmall nut, each having its peculiar capſula, and within a little ſtone. This ſtone is encompaſſed by a white pulp which has all the properties of true tallow, both as to conſiſtence, colour, and even ſmell; and accordingly the Chineſe make their candles of it; which would doubtleſs be as good as thoſe in Europe, if they knew how to purify their vegetable, as well as we do our animal, tallow.

All the preparation they give it, is to melt it down and mix a little oil with it, to make it ſofter and more pliant. It is true their candles made of it yield a thicker ſmoke, and a dimmer light, than ours; but thoſe defects are owing in a great meaſure to the wicks, which are not of cotton, but only a little rod, of dry light wood covered with the pith of a ruſh wound round it; which, being very porous, ſerves to filtrate the minute parts of the tallow, attracted by the burning ſtick, which by this means is kept alive.

TALLY, in law, a piece of wood cut in two parts, whereon accounts were antiently kept, by means of notches; one part of the tally being kept by the debtor, and the other by the creditor.

As to the tallies of loans, one part thereof is kept in the exchequer, and the other part given to particular perſons in lieu of an obligation for the monies they have lent to the government on acts of parliament. This laſt part is called the ſtock, and the former the counter ſtock, or counter tail.

Tallies of debt, are a kind of acquittance for debt paid to the king, upon the payment of which every debtor receives one of theſe tallies; and on carrying the ſame to the clerk of the pipe-office, has an acquittance there given him, on parchment, for his full diſcharge.

Tallies of reward, were an allowance made to ſheriffs for ſuch ſums as they have caſt upon them in their accounts, but cannot levy.

TALMUD, or THALMUD, among the Jews, a collection of the doctrines of their religion and morality. It is the *corpus juris*, or body of the laws and cuſtoms of the Jews, who eſteem it equal to the ſcriptures themſelves. See CARAITES, RABBI, GEMARA, *&c.*

TALON, in architecture, a kind of moulding, which conſiſts of a cymatium, crowned with a ſquare fillet; frequently found to terminate joiners-work, as thoſe of doors, windows, *&c.*

TALPA, the MOLE, in zoology. See the article MOLE.

TALPA, in ſurgery, a name given to encyſted tumours, when ſituated under the ſcalp.

TALUS, in anatomy, the ſame with the aſtragalus. See ASTRAGALUS.

TALUS, or TALUT, in architecture, the inclination or ſlope of a work; as of the outſide of a wall, when its thickneſs is diminiſhed by degrees, as it riſes in height to make it the firmer.

TALUS, in fortification. Talus of a baſtion, or rampart, is the ſlope or diminution allowed to ſuch a work, whether it be of earth or ſtone, the better to ſupport its weight.

The exterior talus of a work, is its ſlope on the ſide towards the country; which is always made as little as poſſible, to prevent the enemies ſcalado; unleſs the earth be bad, and then it is abſolutely neceſſary to allow a conſiderable talus for its parapet. The interior talus of a work is its ſlope on the inſide towards the place.

TAMALAPATRA, in botany, *&c.* the ſame with the folium indicum. See the article FOLIUM INDICUM.

TAMANDUA, in zoology, the ſame with the myrmecophaga. See the article MYRMECOPHAGA.

TAMAR, a river, which divides Devonſhire from Cornwall, running from north to ſouth.

TAMARIND, *tamarindus*, in botany, a genus of the *triandria-monogynia* claſs of plants, the flower of which conſiſts of three or four ovated and equal petals; and its fruit is a long compreſſed pod, containing three angulated and compreſſed ſeeds.

The pod is made up of a double rind, or membrane, between which is a pulpy matter; which taken in the quantity of two or three drams, or an ounce or more, proves gently laxative or purgative; and at the ſame time, by its acidity, quenches thirſt, and allays immoderate heat. It increaſes the action of the purgative ſweets, caſſia and manna, but weakens that of the reſinous cathartics: ſome have ſuppoſed it capable of abating the virulence of antimonial preparations; but experience ſhews, that it has a contrary effect, and that all vegetable acids augment their power: it is alſo recommended in diarrhœas, and nephritic complaints, and is ſaid to cure the jaundice without the aſſiſtance of any other medicine.

TAMARISK, *tamariſcus*, or *tamarix*, a genus of trees belonging to the *pentandria-trigynia* claſs of plants; its flower is roſaceous, and conſiſts of five ovated, concave and obtuſe, patent petals: the fruit is an oblong and triquetrous capſule, containing a great many very ſmall and pappoſe ſeeds.

The bark and leaves of the tamariſk-tree are moderately aſtringent, but never preſcribed in the preſent practice.

TAMBAC, a mixture of gold and copper, which the people of Siam hold more beautiful, and ſet a greater value on, than gold itſelf.

TAMBOUR, in architecture, a term applied to the corinthian and compoſite capitals, as bearing ſome reſemblance to a drum, which the french call tambour.

TAMBOUR is alſo uſed for a little box of timber-work covered with a ceiling, within-ſide the porch of certain churches, both to prevent the view of perſons paſſing by, and to keep off the wind, &c. by means of folding doors.

TAMBOUR alſo denotes a round courſe of ſtone, ſeveral whereof form the ſhaft of a column, not ſo high as a diameter.

TAME, a market-town of Oxfordſhire, ſituated on the river Tame, ten miles eaſt of Oxford.

TAMNUS, or TAMUS, BLACK BRYONY, in botany, a genus of the *dioecia-hexandria* claſs of plants, without any corolla: the calyx is divided into ſix parts; the fruit is a trilocular berry, ſituated below the calyx, and containing two ſeeds in each cell.

The root of this plant is ſaid to be ſomewhat poiſonous, whence it frequently proves of bad conſequence, when adminiſtered inſtead of the white bryony.

TAMOATA, in ichthyology, the name by which ſome call the callichthys or ſtromateus. See STROMATEUS.

TAMPION, or TOMPION, among gunners, a plug to ſtop the mouths of cannons, mortars, &c. to keep them clean within.

TAMUS, or TAMNUS. See TAMNUS.

TAMWORTH, a borough of Staffordſhire, ſituated twenty miles ſouth-eaſt of Stafford.

It ſends two members to parliament.

TAN, the bark of the oak, chopped and ground, in a tanning-mill, into a coarſe powder, to be uſed in the tanning of leather. See TANNING.

New tan is the moſt eſteemed; for when old and ſtale it loſes a great deal of its effects, which conſiſt in condenſing and cloſing the pores of the ſkin, ſo that the longer the ſkins are kept in tan, the greater ſtrength and firmneſs they acquire. In effect, not only the bark, but every part of the oak-tree, of what age and growth ſoever, and all oaken coppice, &c. cut in barking-time, make good tan, as good at leaſt as the beſt bark. This when got, is to be well dried in the ſun, houſed dry, and kept ſo. When it is to be uſed, the greater wood muſt be ſhaved ſmall, or cut for the tan engine, and the ſmaller bruiſed, or cut ſmall by the engine, after which it muſt be dried on a kiln, &c. See the article TANNING ENGINE.

For the uſe of tan in gardening, ſee the article STOVES.

TANACETUM, in botany, a genus of the *ſyngeneſia-polygamia æqualis* claſs of plants, with a compound, tubuloſe and convex flower, the leſſer corollulæ of which are funnel-faſhioned, and quinquifid at the limb: a ſingle ſeed ſucceeds each leſſer flower, and is contained in the cup. See plate CCLXVIII. fig. 3.

This genus comprehends the common tanzy,

Fig. 1. TAGETES.

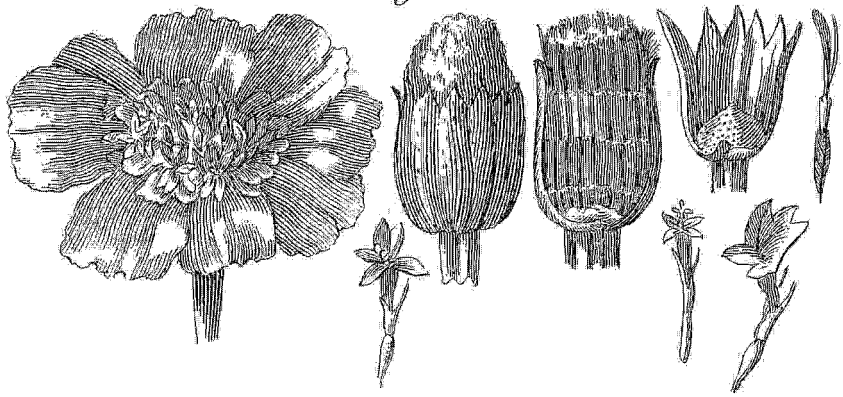

Fig. 2. TANGENT

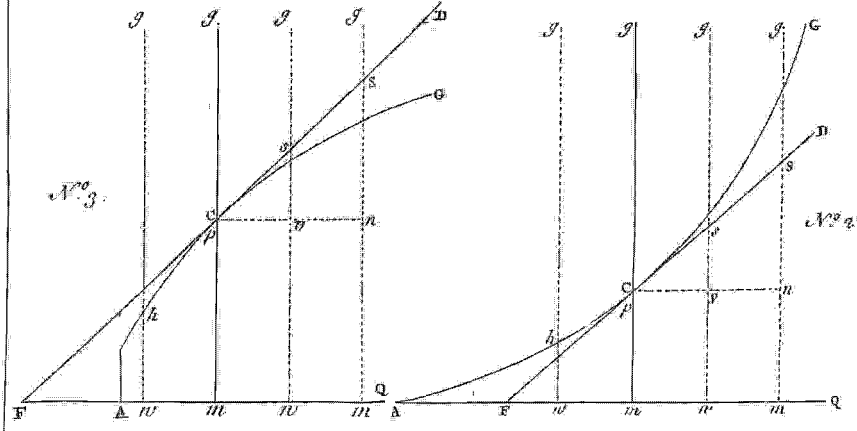

Fig. 3. TANACETUM the TANZY.

tanzy, coſtmary, &c. Tanzy, conſidered as a medicine, is a moderately warm bitter, and is much extolled by ſome in hyſteric complaints, eſpecially if proceeding from a deficiency or ſuppreſſion of the uterine purgations: its ſeeds and leaves have been in conſiderable eſteem as anthelmintics; and are ſaid to be good in colics and flatulencies.

TANAIS, or DON RIVER. See DON.

TANARO, a river of Italy, which riſing in the ſouth of Piedmont, runs north-eaſt by Aſti and Alexandria, and falls into the Po below Valenza.

TANASSERIM, a city of the farther India, and capital of a province of the ſame name, in the kingdom of Siam. eaſt long. 98°, north lat. 12°

TANCOS, a town of Eſtremadura, in Portugal, ſituated on the river Tagus, ſixty miles north-eaſt of Liſbon.

TANDA, a town ſituated on the eaſt ſide of the Ganges, in the province of Bengal: eaſt long. 87°, north lat. 25°.

TANDAYA, one of the moſt eaſterly of of the Philippine iſlands, ſituated in eaſt long. 124°, and north lat. 12°, ſubject to the king of Spain.

TANGENT, in geometry, is defined, in general, to be a right-line, E T (plate CCLXVIII. fig. 2. n° 1.) which touches any arch of a curve, H E in E, in ſuch a manner that no right-line can be drawn through E betwixt the right-line E T and the arch E H, or within the angle H E T that is formed by them.

The tangent of an arch is a right-line drawn perpendicularly from the end of a diameter, paſſing to one extremity of the arch, and terminated by a right-line drawn from the center through the other end of the arch, and called the ſecant. See SECANT and SINE.

And the co-tangent of an arch, is the tangent of the complement of that arch. See the articles ARCH and COMPLEMENT.

The tangent of a curve is a right-line which only touches the curve in one point, but does not cut it.

In order to illuſtrate the method of drawing tangents to curves, let A C G (*ibid.* n° 2.) be a curve of any kind, and C the given point from whence the tangent is to be drawn. Then conceive a right-line, *mg*, to be carried along uniformly, parallel to itſelf, from A towards Q; and let, at the ſame time, a point *p* ſo move in that line, as to deſcribe the given curve A C G: alſo let *mm*, or C*n*, expreſs the fluxion of A*m*, or the velocity wherewith the line *mg* is carried; and let *n* S expreſs the correſponding fluxion of *mp*, in the poſition *m* C*g*, or the velocity of the point *p*, in the line *mg*: moreover, through the point C let the right-line S F be drawn, meeting the axis of the curve, A Q, in F.

Now it is evident, if the motion of *p*, along the line *mg*, was to become equable at C, the point *p* would be at S, when the line itſelf had got into the poſition *m* S *g*; becauſe, by the hypotheſis, C*n* and *n* S expreſſes the diſtances that might be deſcribed by the two uniform motions in the ſame time. And if *w s g* be aſſumed to repreſent any other poſition of that line, and *s* the contemporary poſition of the point *p*, ſtill ſuppoſing an equable velocity of *p*; then the diſtances C*w*, and *ws*, gone over in the ſame time by the two motions, will always be to each other as the velocities, or as C*n* to *n* S. Therefore, ſince C*w* : *w s* :: C*n* : *n* S (which is a known property of ſimilar triangles) the point *s* will always fall in the right-line F C S: *ib.* n° 3. whence it appears, that if the motion of the point *p* along the line *mg* was to become uniform at C, that point would then move in the right-line C S, inſtead of the curve-line C G. Now, ſeeing the motion of *p*, in the deſcription of curves, muſt either be an accelerated or retarded one; let it be firſt conſidered as an accelerated one, in which caſe the arch C G will fall wholly above the right-line C D, as in n°. 2. becauſe the diſtance of the point *p* from the axis A Q, at the end of any given time, is greater than it would be if the acceleration was to ceaſe at C; and if the acceleration had ceaſed at C, the point *p* would have been always found in the ſaid right-line F S. But if the motion of the point *p* be a retarded one, it will appear, by arguing in the ſame manner, that the arch C G will fall wholly below the right-line C D, as in n°. 3.

This being the caſe, let the line *mg*, and the point *p*, along that line, be now ſuppoſed to move back again, towards A and *m*, in the ſame manner they proceeded from thence: then, ſince the velocity of *p* (*ibid.* n° 2.) did before increaſe, it muſt now, on the contrary, decreaſe; and therefore as *p*, at the end of a given time, after repaſſing the point

C, is not ſo near to AQ, as it would have been had the velocity continued the ſame as at C, the arch C*h* (as well as CG) muſt fall wholly above the right-line FCD: and by the ſame method of arguing, the arch C*h*, in the ſecond caſe, will fall wholly below FCD. Therefore FCD, in both caſes, is a tangent to the curve at the point C; whence the triangles F*m*C and C*n*S being ſimilar, it appears that the ſub-tangent *m*F is always a fourth proportional to *n*S the fluxion of the ordinate C*n*, the fluxion of the abſciſs, and C*m* the ordinate; that is, $Sn : nC :: mC : mF$. Hence, if the abſciſs $Am = x$, and the ordinate $mp = y$, we ſhall have $mF = \frac{y\dot{x}}{\dot{y}}$; by means of which general expreſſion, and the equation expreſſing the relation between x and y, the ratio of the fluxions $\dot{x}$ and $\dot{y}$ will be found, and from thence the length of the ſubtangent *m*F, as in the following examples.

Example I. To draw a right-line CT (*ibid.* n° 4.) a tangent to a given circle BCA, in a given point C. Let CS be perpendicular to the diameter AB, and put $AB = a$, $BS = x$, and $SC = y$. Then by the property of the circle, y^2 $(= CS^2) = BS \times AS\ (= x \times a - x) = ax - x^2$; whereof the fluxion being taken, in order to determine the ratio of $\dot{x}$ and $\dot{y}$, we get $2y\dot{y} = a\dot{x} - 2x\dot{x}$; conſequently $\frac{\dot{x}}{\dot{y}} = \frac{2y}{a-2x} = \frac{y}{\frac{1}{2}a-x}$; which, multiplied by y, gives $\frac{y\dot{x}}{\dot{y}} = \frac{y^2}{\frac{1}{2}a-x} =$ the ſubtangent ST. Whence, O being ſuppoſed the center, we have $OS\ (= \frac{1}{2}a - x) : CS\ (= y) :: CS\ (= y) : ST$; which is alſo found to be the caſe from other principles. See the article CIRCLE.

Example II. To draw a tangent to any given point C (*ibid.* n° 5.) of the conical parabola ACG. If the latus rectum of the curve be denoted by a, the ordinate MC by y, and its correſponding abſciſs AM by x; then the known equation, expreſſing the relation of x and y, being $ax = y^2$, we have, in this caſe, the fluxion $a\dot{x} = 2y\dot{y}$; whence $\frac{\dot{x}}{\dot{y}} = \frac{2y}{a}$, and conſequently $\frac{y\dot{x}}{\dot{y}} = \frac{2y^2}{a} = \frac{2ax}{a}, = 2x = MF$. Therefore the ſubtangent is juſt the double of its correſponding abſciſs AM. And ſo for finding the tangents of other ſpecies of curves. See CURVE, PARABOLA, ELLIPSIS, *&c.*

TANGERE, or NOLI ME TANGERE. See the article NOLI.

TANGERMUNDE, a town of Germany, in the circle of Upper Saxony, and marquiſate of Brandenburg, ſituated on the river Elbe, fifty-four miles weſt of Berlin.

TANGIER, a port-town of Africa, in the empire of Morocco and kingdom of Fez, ſituated at the entrance of the ſtraits of Gibraltar, in weſt long. 7°, north lat. 35° 40′. It was the capital of the antient Mauritania Tingitana, and was once in the poſſeſſion of the Engliſh.

TANGUT, a province of chineſian Tartary, ſituated north-weſt of the great wall which divides Tartary from China.

TANJOUR, a city of the hither India, capital of a province of the ſame name, ſituated eaſt long. 79°, north lat. 11° 30′.

TANNER, one who dreſſes hides, *&c.* by tanning them. See the next article.

TANNING, the preparing of ſkins or hides in a pit, with tan and water, after the hair has been firſt taken off, by putting the ſkins into lime-water. See the articles SKIN, HIDE, *&c.*

Method of TANNING *oxen-hides.* The ſkin being flayed off the carcaſe, if it is intended to be kept, is ſalted with ſea-ſalt and alum, or with a coarſe kind of ſalt-petre. If it is not for keeping, the ſalting is ſaved, as being of no uſe but to prevent the hide from corrupting before it can be conveniently carried to the tan-houſe. Whether the hide have been ſalted or not, the tanner begins with taking off the horns, the ears, and the tail, after which it is thrown into a running water for about thirty hours, to waſh off the blood and other impurities adhering to the inſide. This done, it is laid over night in a lime-pit, already uſed, whence it is taken and left to drain three or four days on the edge of the pit. The firſt and ſlighteſt preparation over, it is retained into a ſtrong lime-pit for two days, then taken out for four days more; and thus for ſix weeks alternately, it is taken out and put in twice a week. At the ſix weeks end it is put into a freſh pit, where it continues eight days, and is then taken out for ſo many, and thus alternately for a year or eighteen months, according to the ſtrength of the leather and the weather; for in great heats they put in freſh lime twice a week; and in froſt they

they ſometimes do not touch them for three months. Every freſh lime-pit they throw them into, is ſtronger and ſtronger. At the end of four, five, or ſix weeks, the tanner ſcrapes off the hair on a wooden leg or horſe, with a kind of knife made for that purpoſe. And after a year or eighteen months, when the hair is perfectly gone, he carries it to a river to waſh, pares off the fleſh on the leg with a kind of cutting-knife, and rubs it briſkly with a ſort of whetſtone, to take off any remains of fleſh or of filth on the ſide of the hair. The ſkin is now put into tan, that is, it is covered with tan as it is ſtretched in the pit, and water is let in upon it; if the ſkin is ſtrong, five coverings of tan will be required; for weaker, three or four may ſuffice. When the ſkin has not been kept long enough in lime, or in the tan-pit, upon cutting it in the middle there appears a whitiſh ſtreak, called the horn or crudity of the ſkin, and it is this crudity that is the reaſon why the ſoles of ſhoes, boots, &c. ſtretch ſo eaſily and take water. When the hides are ſufficiently tanned, they are taken out of the pit to be dried, by hanging them in the air; then the tan is cleared off them, and they are put into a place neither too dry nor too moiſt; they are there well ſtretched over one another with weights a-top, to keep them tight and ſtrait; and in this condition are ſold under the denomination of bend-leather. This is the method of tanning bullocks or oxen-hides. Cows, calves, and horſes ſkins are tanned much after the ſame manner of thoſe of oxen, except that they are only kept four months in the lime-pit, and that before they be put in the tan, there is a preparation required thus: cold water is poured into a wooden vat, or tub, wherein the ſkins are put, which are kept ſtirring while ſome other water is warming in a kettle; and as ſoon as that water is little more than luke-warm, it is poured gently into the vat, and upon this is caſt a baſket of tan; during which time the ſkins are ſtill kept turning, that the water and tan may not ſcorch them. After an hour they are taken out and caſt for a day into cold water, then returned to the former vat and the ſame water they had been in before, and here they are left for eight days: which expired, they are put into the tan-pit, and three coverings of tan given them; the firſt of which laſts five weeks, the ſecond ſix, and the third two months. The reſt of the proceſs is the ſame in all reſpects as that delivered above. See TAN, LEATHER, and the next article.

TANNING ENGINES, machines uſed by tanners for beating, cutting, and grinding tan, or the materials uſed in tanning. See TAN, and the preceding article.

The machine for cutting tan, as repreſented in plate CCLXIX. fig. 1. n° 1, 2. conſiſts of a long ſquare wooden block, which is beſt of oak or elm; and of ſome pieces of iron to be faſtened on it, and uſed about it, *viz.* an anvil, a hammer, an iron holding the wood to be bruiſed and cut, and a knife. AB, n° 1. is the length of the block, being about four feet; CD the breadth, which is fifteen or ſixteen inches; EF the depth, eight or ten inches; GHIK a ſquare cavity to receive a plate of iron, ſerving for an anvil to beat and bruiſe the tanning materials upon; this is to be about four inches deep, nine inches broad, and twelve inches long; LMNO the iron for claſping and holding faſt the materials to be bruiſed and cut, which muſt lie croſs the engine, about the middle of the ſaid piece of timber, and may be about three inches broad; PQ are two hooks at one end of it, which are turned upwards, and muſt be hooked into the loops of the two hinges that are let in and faſtened to the ſides of the engine RS, in ſuch a manner that this claſping-piece may be a little raiſed for putting the tanning materials under it. At the ſide T, (*ibid.* n° 2.) is a ſingle hook turned alſo upwards, to hang a weight upon it, whilſt the ſtuff is a bruiſing by the anvil, or a cutting by the knife. The button in n° 1. ſerves to take up this piece by; *aaaa* on the other ſide of the block, n° 2. are the places for the four feet of the engine, which are to be of a convenient height to work upon it. *b* (*ibid.* n° 3.) is the hammer for beating and bruiſing the ſtuff, which may be of ſix pounds weight, and the head about three inches ſquare, to work with both hands; but for one hand, it may be made of three pounds weight, and the head about two inches ſquare: the ſurface of one end of theſe hammers ſhould be ſmooth, but that of the other indented. *cd*, n° 1. the knife for cutting the bruiſed ſtuff, which muſt be eight or nine inches long, and near as much in breadth, made like a tobacco-knife, with a handle, and faſtened to the block at the two oppoſite ſides, that are to be hollowed, with two grooves, *efgh*, n° 2. and *iklm*, n° 1. with

with two pieces of iron fitted in the grooves, to hold and guide the knife in cutting. *nopq*, n° 1. is to be faſtened to the end of the knife *c*, by a pin *r*, paſſing through three holes; and this end is to be ſcrewed into the groove *efgh*, n° 2. by a couple of ſcrew-pins; the other piece, *ſtuxyz*, n° 1. being forked in, is to receive the other end of the knife *d*, and the ſolid ſquare part thereof, IKLM, is to be faſtened in the groove under it by two iron-plates *aa ee*, under which it muſt run in the ſaid groove ſo as to be ſlipped out from under it, and laid by when the machine is not uſed, when alſo the piece at the other end may be unſcrewed and laid up. The long ſquares upon one end of the block, *viz.* 5, 6, 7, 8, n° 1. are two iron plates, to be faſtened where the knife, moving in a fit cavity, is to cut the bruiſed ſtuff between them; and of theſe plates that which lies next the end is to be laid a little lower, the block being there pared accordingly, that ſo the ſtuff may fall off from the end of the machine the quicker, as the left-hand ſupplies the bruiſed materials, whilſt the right-hand cuts them. Let the hollow place where the knife cuts be as near as poſſible, only large enough for the knife to riſe and fall eaſily; and let the block be hollowed under the cutting-hole, and ſloped off at that end, for the ſtuff to fall off, as it is cut by the knife.

The ſtuff being cut ſmall by the engine, is to be well dried again on a kiln, and then ground into a coarſe powder upon the mill, being a large round wooden trough, with a pretty large ſtone ſet on edge in it, and turned round by a horſe, as repreſented *ibid.* n° 4.

TANT, or the LITTLE SCARLET-SPIDER, in the hiſtory of inſects, the red land acarus, with a depreſſed body. See the article ACARUS.

This is a ſmall ſpecies, its body is roundiſh but a little approaching to oval; the back ſomewhat depreſſed; it is of a fine ſcarlet colour, and covered with a velvety down.

TANTALUS's CUP, in hydraulics, a ſiphon ſo adapted to a cup, that the ſhort leg being in the cup, the long leg may go down through the bottom of the cup. See the article SIPHON.

This bended ſiphon is called Tantalus's cup, from the reſemblance of the experiment made with an image in the glaſs, repreſenting Tantalus in the fable, fixed up in the middle of the cup with a ſiphon concealed in his body, beginning in the bottom of his feet, and aſcending to the upper part of his breaſt; there it makes a turn, and deſcends through the other leg, on which he ſtands; and from thence down through the bottom of the cup, where it runs out, and cauſes the water to ſubſide in the cup: as ſoon as it riſes to the height of the ſiphon, or to the chin of the image, which is above S *s*, plate CCLXIX. fig. 2. n° 1. the water will begin to run through the ſiphon concealed in the figure, till the cup is emptied in the manner explained under ſiphon, and repreſented more diſtinctly in *ibid.* n° 2.

Sometimes the Tantalus's cup is made without a figure fixed in it, as *ibid.* n° 3. where the water being up at S *s*, the cup does not run; but as ſoon as the figure, or an apple, or orange, *&c.* is thrown in, the water begins to run out at the foot of the cup, and does not ceaſe till the whole cup is empty. This happens becauſe the body thrown into the cup, raiſes the water's ſurface from S *s* to B C, where being above the upper end S of the pipe S P concealed in the handle, which thereby is made a ſiphon, the water, which is come into the handle at O, runs into the middle pipe at *s*, and ſo out at P, under the foot, ſo long as there is any water above O.

TANTAMOUNT, ſomething that amounts, or is equivalent, to ſome other.

TANTUM DECIES. See the article DECIES TANTUM.

TANZY, *tanacetum*, in botany. See the article TANACETUM.

TAORMINA, a port-town of Sicily, ſituated in the province of Demona, eighteen miles ſouth of Meſſina.

TAP, among hunters, an hare is ſaid to tap or beat, when ſhe makes a particular noiſe at rutting-time.

TAP-ROOT, among gardiners, that part of the root that deſcends ſtraight down.

TAPASSANT, among hunters, denotes lurking or ſquatting.

TAPE-WORM, in the hiſtory of inſects, the flat tænia, frequently growing to the length of ſeveral ells. See TÆNIA.

This creature is found in the human inteſtines, and in thoſe of many other animals, as well fiſh as quadrupeds.

TAPER, TAPERING, is underſtood of a piece of timber, or the like, when broad at one end and gradually diminiſhing to the other, as is the caſe in pyramids, cones, *&c.*

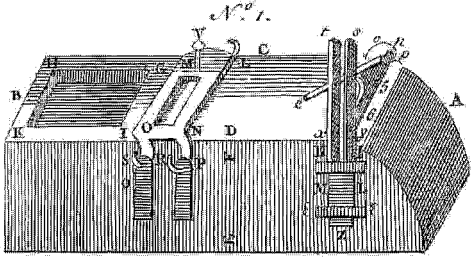

Fig. 1. TANNING-ENGINE and MILL.

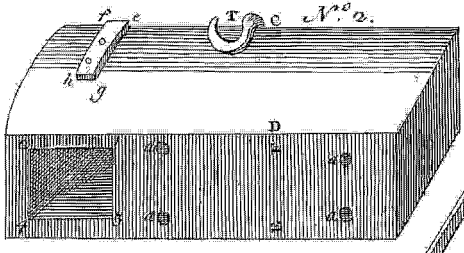

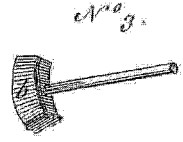

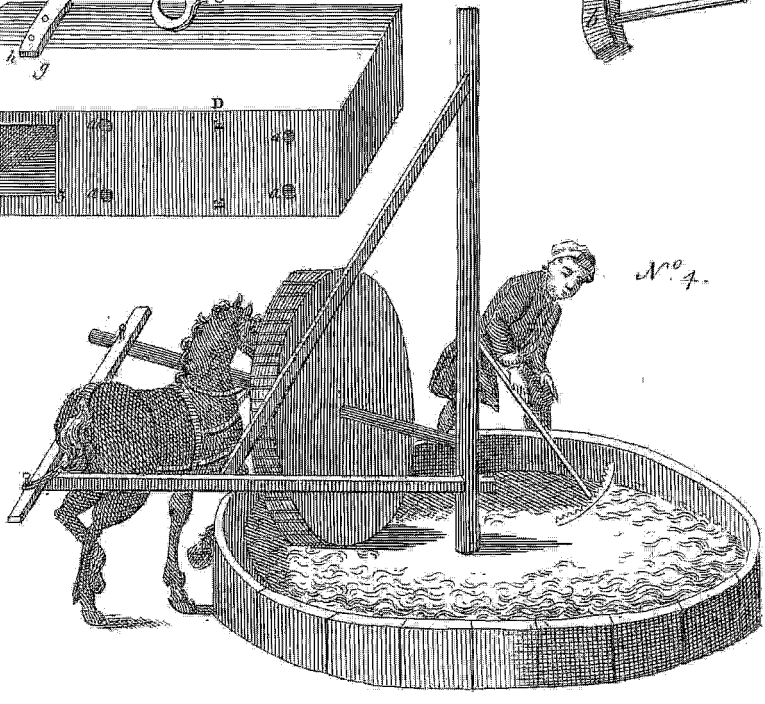

Fig. 2. TANTALUS's CUP

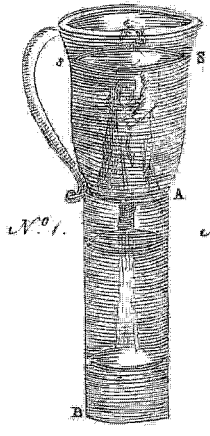

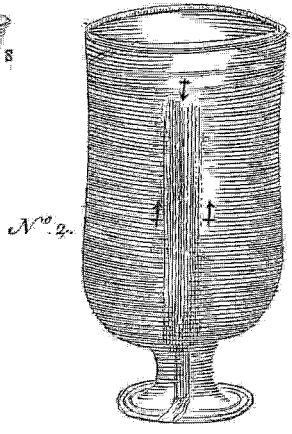

J. Jefferys sculp.

TAPER BORED, is applied to a piece of ordnance when it is wider at the mouth than towards the breech.

TAPER alſo denotes a kind of tall wax-candle placed in a candleſtic, and burnt at funeral proceſſions, and in other church-ſolemnities. Tapers are made of different ſizes; in ſome places, as Italy, *&c.* they are cylindrical, but in moſt other countries, as England, France, *&c.* they are conical or taper; both kinds are pierced at the bottom for a kind of pin in the candleſtic to enter. For the method of making tapers, both by the ladle and by the hand, ſee the articles CANDLE and FLAMBEAU.

Paſchal TAPER, among the romaniſts, a large taper whereon the deacon applies five bits of frankincenſe in holes made for the purpoſe in form of a croſs, and which he lights with new fire in the ceremony of Eaſter-Sunday.

TAPESTRY, or TAPISTRY, a curious kind of manufacture, ſerving to adorn a chamber or other apartment, by covering or lining the walls thereof. It is a kind of woven hangings of wool and ſilk, frequently raiſed and inriched with gold and ſilver, repreſenting figures of men, animals, landſkips, hiſtories, *&c.*

The invention of tapeſtry ſeems to have come to us from the Levant; and this ſeems the more probable, in that the workmen concerned in it were called, at leaſt in France, ſarraſins, or ſorraſinois. It is ſuppoſed that the Engliſh and Flemiſh, who were the firſt that excelled in making tapeſtery, might bring the art with them from ſome of the Croiſades, or expeditions againſt the Saracens. Be this as it will, it is certain that theſe two nations, eſpecially the Engliſh, were the firſt who ſet on foot this noble and rich manufacture in Europe, now one of the fineſt ornaments of palaces, churches, *&c.* and therefore if they may not be allowed the inventors, they have at leaſt the glory of being the reſtorers of this ſo curious and admirable an art, as gives a kind of life to wools and ſilks, in no reſpect inferior to the paintings of the beſt maſters.

Tapeſtry-work is diſtinguiſhed by the workmen into two kinds, *viz.* that of high, and that of low warp; though the difference is rather in the manner of working than in the work itſelf; which is in effect the ſame in both; only the looms, and conſequently the warps, are differently ſituated. Thoſe of the low warp being placed flat and parallel to the horizon, and thoſe, on the contrary, of the high warp erected perpendicularly. The Engliſh antiently excelled all the world in the tapeſtry of the high warp, and they ſtill retain their former reputation, though with ſome little change: their low warps are ſtill admired; but, as for the high ones, they are quite laid aſide by the French. The French have three conſiderable tapeſtry-manufactures beſides that of the Gobelins; the firſt at Aubuſſon in Auvergne, the ſecond is at Felletin in the Upper Marche, and the third at Beauvais. They were all equally eſtabliſhed for the high and the low warp; but they have all laid aſide the high warp, excepting the Gobelins. There are admirable low warps in Flanders, generally exceeding thoſe of France; the chief and almoſt only Flemiſh manufactures are at Bruſſels, Antwerp, Oudenard, Liſle, Tournay, Bruges, and Valenciennes.

The uſual widths of tapeſtries are from two ells to three ells Paris-meaſure.

The manufacture of TAPESTRY *of the high warp.* The loom, whereon it is wrought, is placed perpendicularly: it conſiſts of four principal pieces; two long planks or cheeks of wood, and two thick rollers or beams. The planks are ſet upright, and the beams acroſs them, one at the top, and the other at the bottom, or about a foot diſtance from the ground. They have each their trunnions, by which they are ſuſpended on the planks, and are turned with bars. In each roller is a groove from one end to the other, capable of containing a long round piece of wood, faſtened therein with hooks. The uſe of it is to tie the ends of the warp to. The warp, which is a kind of worſted, or twiſted woollen thread, is wound on the upper roller; and the work, as faſt as wove, is wound on the lower. Within-ſide the planks, which are ſeven or eight feet high, fourteen or fifteen inches broad, and three or four thick, are holes pierced from top to bottom, in which are put thick pieces of iron, with hooks at one end, ſerving to ſuſtain the coat-ſtave: theſe pieces of iron have alſo holes pierced, by putting a pin in which, the ſtave is drawn nearer or ſet further off; and thus the coats or threads are ſtretched or looſened at pleaſure. The coat-ſtave is about three inches diameter, and runs all the length of the loom; on this are fixed the coats or threads, which make the threads of the warp croſs each other. It

has much the ſame effect here, as the ſpring-ſtave and treddles have in the common looms. The coats are little threads faſtened to each thread of the warp with a kind of ſliding knot, which forms a ſort of maſh or ring. They ſerve to keep the warp open for the paſſage of broaches wound with ſilks, woollens, or other matters uſed in the piece of tapeſtry. In the laſt place, there are a number of little ſticks of different lengths, but all about an inch in diameter, which the workman keeps by him in baſkets, to ſerve to make the threads of the warp croſs each other, by paſſing them acroſs: and, that the threads thus croſſed may retain their proper ſituation, a packthread is run among the threads, above the ſtick.

The loom being thus formed, and mounted with its warp, the firſt thing the workman does, is to draw on the threads of this warp, the principal lines and ſtrokes of the deſign to be repreſented on the piece of tapeſtry; which is done by applying cartoons, made from the painting he intends to copy, to the ſide that is to be the wrong ſide of the piece, and then, with a black-lead pencil, following and tracing out the contours thereof on the thread of the right ſide; ſo that the ſtrokes appear equally both before and behind.

As for the original deſign the work is to be finiſhed by, it is hung up behind the workmen, and wound on a long ſtaff from which a piece is unrolled from time to time, as the work proceeds.

Beſides the loom, &c. here deſcribed, there are three other principal inſtruments required for working the ſilk or the wool of the woof within the threads of the warp; theſe are a broach, a reed, and an iron-needle.

The broach is made of a hard wood, ſeven or eight inches long, and two thirds of an inch thick, ending in a point with a little handle. This ſerves as a ſhuttle; the ſilks, woollens, gold, or ſilver to be uſed in the work, being wound on it.

The reed or comb is alſo of wood, eight or nine inches long, and an inch thick on the back, whence it grows leſs and leſs to the extremity of the teeth, which are more or leſs apart, according to the greater or leſs degree of fineneſs of the intended work. Laſtly, the needle is made in form of the common needle, only bigger and longer. Its uſe is to preſs cloſe the wool and ſilks when there is any line or colour that does not ſit well.

All things being prepared for the work, and the workman ready to begin, he places himſelf on the wrong ſide of the piece, with his back towards the deſign; ſo that he works as it were blind-fold, ſeeing nothing of what he does, and being obliged to quit his poſt, and go to the other ſide of the loom, whenever he would view and examine the piece, to correct it with his preſſing-needle. To put ſilk, &c. in the warp, he firſt turns and looks at the deſign, then, taking a broach full of the proper colour, he places it among the threads of the warp, which he brings croſs each other with his fingers, by means of the coats or threads, faſtened to the ſtaff; this he repeats every time he is to change his colour. Having placed the ſilk or wool, he beats it with his reed or comb; and when he has thus wrought in ſeveral rows over each other, he goes to ſee the effects they have, in order to reform the contours with his needle, if there be occaſion. As the work advances, it is rolled upon the lower beam, and they unrol as much warp from the upper beam, as ſuffices them to continue the piece: the like they do of the deſign behind them. When the pieces are wide, ſeveral workmen may be employed at once.

We have but two things to add: the firſt is, that the high-warp tapeſtry goes on much more ſlowly than the low-warp, and takes up almoſt twice the time and trouble. The ſecond is, that all the difference that the eye can perceive between the two kinds, conſiſts in this, that in the low-warp there is a red fillet, about one twelfth of an inch broad, running on each ſide from top to bottom, which is wanting in the high-warp.

But, for the ſatisfaction of our readers, we ſhall here preſent them with a repreſentation of the loom for the manufacture of tapeſtry of the high-warp, or that in a ſituation perpendicular to the horizon. See plate CCLXX. fig. 1. where 1, 1, repreſent the loom-poſts, or the thick planks, which ſupport the rollers. 2, The rollers; the upper end holds the chain, the lower holds the tapeſtry, which is rolled upon it, according as the work goes forward: the threads are faſtened at their ends to a dweet, or thick rod, which is lodged in a groove made on each roller. 3, The two tantoes; one called the great tantoe, for turning the upper roller; the other the little tantoe, for turning the lower roller. 4, The pole of the leiſhes, which runs quite a-croſs the chain, takes

TAPESTRY-WEAVING.

Fig. 1. TAPESTRY-LOOM for the high warp, or that in a perpendicular Situation

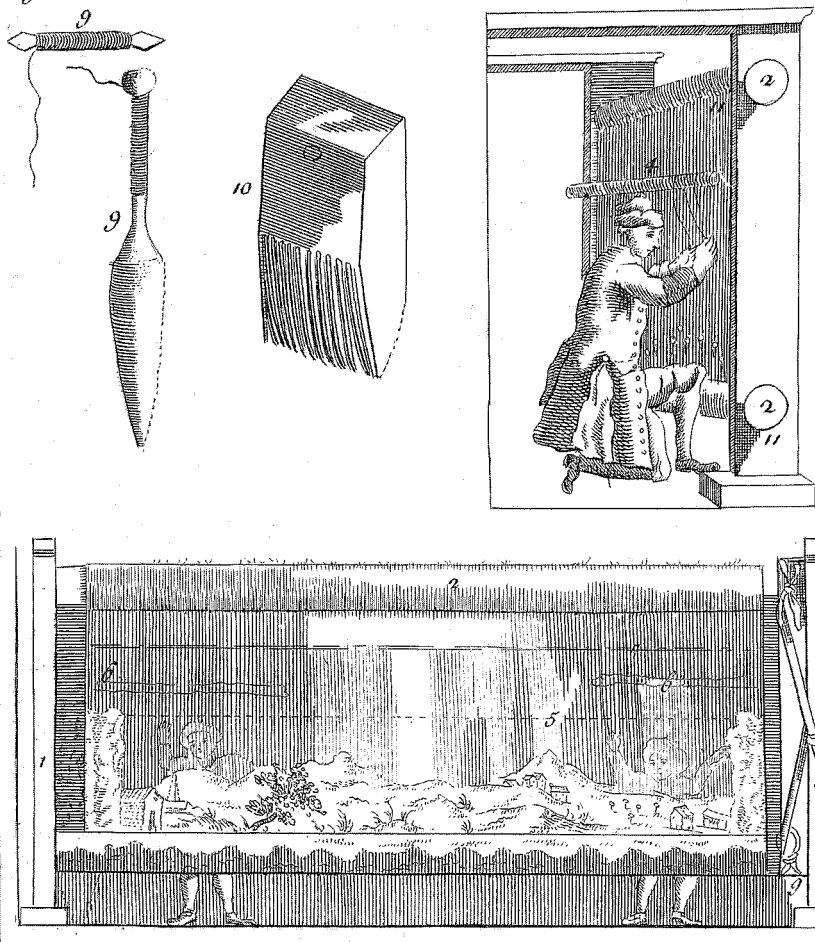

Fig. 2. TAPESTRY-LOOM for the low Warp, or that in an horizontal Situation

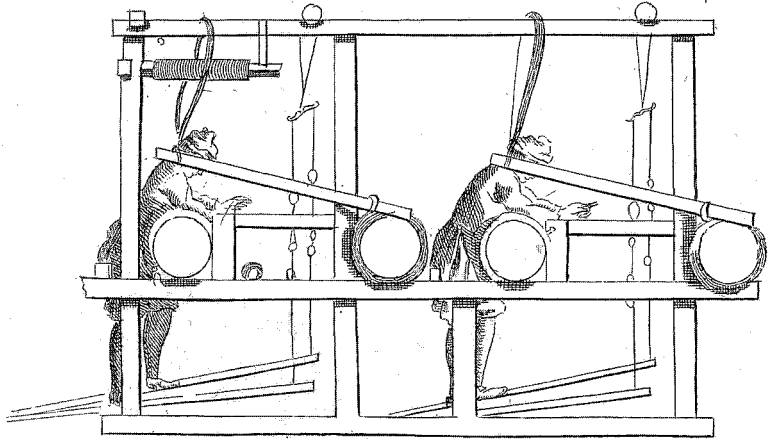


J. Jefferys sculp.

takes up all the leiſhes, and brings them to the workman's hand. Theſe leiſhes are little ſtrings, tied by a ſlip-knot to each thread of the chain, to be raiſed up according as the chain ſinks down: they ſerve to draw the particular thread which the weaver wants: he holds the thread ſeparate from the reſt, and paſſes a ſpindle of ſuch a woof and colour as he thinks proper; then he lets the ſpindle hang down, and hinders the thread from running off, by a ſlip-knot. After having taken one or two threads of the fore-part of the chain by another leiſh, he brings the threads of the oppoſite ſide to him. By this alternative work he conſtantly makes them croſs one another, to take in and ſecure the woof. In order to diſtinguiſh the threads of both ſides, he is aſſiſted by the croſs rod, which is put between two rows of threads. 5, A long tract of dots formed by the ends of the leiſhes, which take hold of the leiſhes of the chain by a ſlip-knot; and on the other hand encompaſs the pole of the leiſhes. 6, The croſs rod. 7, A little chain, each loop of which contains four or five threads of the warp, and keeps them perpendicular. 8, An iron-hook, to ſupport the pole of the leiſhes. 9, 9, 9, The broacher-quill, to paſs the threads of the woof, which is wound on it. 10, The comb, to ſtrike in the work. 11, The end of the dweet let into the roller, in a groove.

When the chain is mounted, the draughtſman traces the principal out-lines of the picture, which is to be wrought, with black chalk on the fore and back ſide of the chain. The weaver in the upright way having prepared a good ſtock of quills, filled with threads of all colours, goes to work, placed on the back part, as in the flat way, or in the manufacture of the low-warp. He has behind him his drawings, on which he frequently looks, that he may from time to time ſee how his work ſucceeds on the right or fore ſide, which the other cannot do.

The manufacture of TAPESTRY *of the low-warp.* The loom or frame wherein the low-warp is wrought, is much like that of the weavers; the principal parts thereof (*ibid.* fig. 2.) are two ſtrong pieces of wood, forming the ſides of the loom, and bearing a beam or roller at each end; they are ſuſtained at bottom with other long pieces of wood, in manner of treſſels: and, to keep them the firmer, are likewiſe faſtened to the floor, with a kind of buttreſſes, which prevent any ſhaking, though there are ſometimes four or five workmen leaning on the beam at once. The rollers have each their trunnions, by which they are ſuſtained; they are turned by large iron-pins, three feet long. Along each beam runs a groove, in which is placed the wich, a piece of wood above two inches diameter, and almoſt the length of the roller. This piece fills the groove intirely, and is faſtened therein, from ſpace to ſpace, by wooden-pins. To the two wiches are faſtened the two extremities of the warp, which is wound on the further roller, and the work, as it advances, on the nearer. Acroſs the two ſides, almoſt in the middle of the loom, paſſes a wooden bar, which ſuſtains little pieces of wood, not unlike the beam of a ballance: to theſe pieces are faſtened ſtrings, which bear certain ſpring-ſtaves, wherewith the workman, by means of two treddles under the loom, on which he ſets his feet, gives a motion to the coats, and makes the threads of the warp riſe and fall alternately. Each loom has more or fewer of theſe ſpring-ſtaves, and each ſtaff more or fewer coats, as the tapeſtry conſiſts of more or fewer threads. The deſign or painting the tapeſtry-man is to follow, is placed underneath the warp, where it is ſuſtained from ſpace to ſpace with ſtrings, by which the deſign is brought nearer to the warp. The loom being mounted, there are two inſtruments uſed in working of it, *viz.* the reed and the flute.

The flute does the office of the weaver's ſhuttle: it is made of a hard poliſhed wood, three or four lines thick at the ends, and ſomewhat more in the middle, and three or four inches long. On it are wound the ſilks, or other matters, to be uſed as the woof of the tapeſtry, repreſented.

The comb, or reed, is of wood or ivory: it has uſually teeth on both ſides; it is about an inch thick in the middle, but diminiſhes each way to the extremity of the teeth; this ſerves to beat the threads of the woof cloſe to each other, as faſt as the workman has paſſed and placed them, with his flute, among the threads of the warp, as repreſented at 10. fig. 1.

The workman is ſeated on a bench before the loom, with his breaſt againſt the beam, only a cuſhion or pillow between them; and in this poſture ſeparating with his fingers the threads of the warp, that

he may see the design underneath; and taking a flute, wound with the proper colour he fastens it among the threads, after having raised or lowered them, by means of the treddles, moving the spring-staves and coats.

Lastly, to press and close the threads of the silk or yarn, &c. thus placed, he strikes each course (*i. e.* what the flute leaves in its passing and coming back again) with the reed.

That which is very remarkable in the manufacture of the low-warp, and which is common to it with the high, is, that it is all wrought on the wrong side; so that the workman cannot see the right side of his tapestry, until the piece is finished, and taken out of the loom.

TAPIA, in botany, same with the crateva. See the article CRATEVA.

TAPPING, in general, the act of piercing an hole in a vessel, and applying a tube or cannula in the aperture, for the commodious drawing off the liquors contained therein.

TAPPING, in agriculture, is the making an incision in the bark of a tree, and letting out the juice. To tap a tree at the root, is to open it round about the root. In the tapping of trees, the juice, taken in from the earth, ascends from the root; and, after it is concocted and assimilated, in the branches, &c. it descends, like a liquor in an alembic, to the orifice or incision, where it issues out. One of the most effectual ways of tapping, so as to obtain the greatest quantity of sap, and that in the shortest time, is not only to pierce the bark, or to cut the body of the tree almost to the pith with a chissel (as some have directed), but to bore through all the circles on both sides the pith, leaving only the outermost circle and the bark on the north-east side unpierced. This hole is to be bored sloping upwards, as large as the largest augre will make; and that also through and under a large arm near the ground; and thus it will not need any stone to keep open the orifice, nor tap to direct the sap into the receiver. This way the tree will, in a short time, afford liquor enough to brew withal: and with some of this sweet sap, one bushel of malt is said to make as good ale as four bushels of malt with ordinary water. The large maple, called the sycamore, is said to yield the best brewing sap, its juice being very sweet and wholesome. It is affirmed that the liquor which may be drawn from a birch, in the spring-time, is equal to the whole weight of the tree, branches, root, and all together.

To preserve the sap for brewing, insolate it by a constant exposure to the sun, in proper vessels, till the rest be gathered and ready, otherwise it will contract an acidity. When there is enough, put into it as much very thin-cut and hard-toasted rye-bread, as will serve to ferment it; and when it works, take out the bread, and bottle up the liquor. A few cloves in each vessel that receives the sap, as it ooses from the tree, will also preserve it a twelvemonth.

TAPPING, in surgery. See the article PARACENTESIS.

TAPTE, a river of the hither India, which runs from east to west, through the province of Cambaya, and falls into the indian ocean, a little below Surat.

TAP-TO. See the article TAT-TO.

TAPUYERS and TAPINAMBES, two numerous tribes which the Portuguese found in Brasil, in south America, when they planted that country.

TAR, a thick, black, unctuous substance, obtained from old pines and fir-trees, by burning them with a close smothering heat: for the method of obtaining which, and the use of it in coating and caulking ships, &c. see the article PITCH.

With regard to the medical uses of tar, it may be observed, that it differs from the native resinous juice of trees, in having received a disagreeable impression from the fire, and containing a portion of the saline and other juices, united with the resinous and oily; by the mediation of these, a part of the terebinthinate oil proves dissoluble in aqueous liquors, which extract little or nothing from the purer turpentines. See TURPENTINE.

Water impregnated with the more soluble parts of tar, proves, in consequence of this hot pungent oil, warm and stimulating: it sensibly raises the pulse, and quickens the circulation. By these qualities, in cold, languid, phlegmatic habits, it strengthens the solids, attenuates viscid juices, opens obstructions of the minuter vessels, and promotes perspiration and the fluid secretions in general; whilst in hot bilious temperaments, it disposes to inflammation, and aggravates the complaints which it has been employed to remove.

Tar-water has lately been recommended to the world as a certain and safe medicine in almost all diseases; a slow, yet effectual

effectual alterative in cachexies, ſcurvies, chlorotic, hyſterical, hypochondriacal, and other chronical complaints; and a ſudden remedy in acute diſtempers, which demand immediate relief, as pleuriſies, peripneumonies, the ſmall-pox, and all kinds of fevers in general. This medicine, though inferior to the character given of it, is, doubtleſs, in many caſes, of conſiderable utility. It ſenſibly raiſes the pulſe, and occaſions ſome conſiderable evacuations, generally by perſpiration or urine, though ſometimes by ſtool or vomit: hence it is ſuppoſed to act by increaſing the vis vitæ, and enabling nature to expel the morbific humours. We ſhall here inſert, from the firſt public recommender of this liquor, biſhop Berkley, ſome obſervations on the manner of uſing it. Tar-water, when right, is not paler than french, nor deeper than ſpaniſh white wine, and full as clear: if there be not a ſpirit very ſenſibly perceived in drinking, you may conclude the tar-water is not good. It may be drank either cold or warm; in colics, it is judged to be beſt warm. As to the quantity, in common chronical indiſpoſitions, a pint a day may ſuffice, taken on an empty ſtomach, at two or four times, to wit, night and morning, and about two hours after dinner and breakfaſt: more may be taken by ſtrong ſtomachs. But thoſe who labour under great and inveterate maladies, muſt drink a greater quantity, at leaſt a quart every twenty-four hours: all of this claſs muſt have patience and perſeverance in the uſe of this, as well as of all other medicines, which, though ſure, muſt yet, in the nature of things, be ſlow in the cure of inveterate and chronical diſorders. In acute caſes, and fevers of all kinds, it muſt be drank in bed, warm, and in great quantity (the fever ſtill enabling the patient to drink), perhaps a pint every hour; which has been known to work ſurpriſing cures. But it works ſo quick, and gives ſuch ſpirits, that the patients often think themſelves cured before the fever hath quite left them.

Ointment of tar is directed in the London Diſpenſatory to be made as follows: take of mutton-ſuet tried, and tar, each equal weights; melt them together, and ſtrain the mixture whilſt hot. This compoſition, with the addition of half its weight of reſin, has long been uſed in the ſhops, as a cheap ſubſtitute to the black baſilicon. See BASILICON.

Tar-pills are directed, in the Edinburgh Diſpenſatory, to be prepared as follows: take of tar any quantity at pleaſure, mix it with as much elecampane-root as will reduce it into a proper thickneſs for being formed into pills. The powder, here mixed with it, though of no great virtue, is, nevertheleſs, a very uſeful addition, not only for procuring it a due conſiſtence for taking, but likewiſe, as it divides the glutinous texture of the tar, and thus prevents its adhering to the inteſtines, and promotes its ſolubility in the animal juices. Each dram of the maſs is formed into twelve pills, ſix of which are taken every morning and evening, in diſorders of the breaſt, phthiſes, ſcurvies, &c. They are far more different in quality from tar-water, than might be at firſt expected; that nauſeous draught has little heat, pungency, and bitterneſs: the water extracting only a ſmall quantity of the hot oil, which becomes ſoluble by the mediation of the acid, produced in the preparation of the tar.

Some have imagined this acid to be the oily ſubſtance that gives virtue to tar-water; and hence have endeavoured to introduce an acid ſpirit, obtained from tar by diſtillation; but the effects of this, and all other acids, are directly contrary to thoſe experienced, either from tar-water, or tar given in ſubſtance.

Barbadoes tar is nearly of the conſiſtence of common tar, and of a reddiſh black colour and diſagreeable ſmell. This bitumen is found in ſeveral of our american iſlands, where it is eſteemed, by the inhabitants, of great ſervice as a ſudorific, and in diſorders of the breaſt and lungs; though in caſes of this kind, attended with inflammation, it is certainly improper. They alſo apply it externally as a diſcutient, for preventing paralytic diſorders. Among us it is rarely uſed, and not often to be met with genuine. The college employ it as a menſtruum for ſulphur, in the barbadoes balſam of ſulphur; and direct an oil to be diſtilled from it.

TARACON, a city of Spain, in the province of Arragon, ſituated on the confines of old Caſtile: weſt lon. 2° 6′, and north lat. 41° 55′.

TARAGON, a city and port-town of Spain, in the province of Catalonia, ſituated on the Mediterranean ſea, in eaſt long. 1° 15′, and north lat. 41° 6′.

TARANTISMUS, in medicine, the diſeaſe or affection of thoſe bit by the tarantula. See the article TARANTULA. The patients under this malady are denominated tarantati.

TARANTO, a port-town of Italy, in the kingdom of Naples, ſituated on the gulph of Otranto, forty-five miles weſt of that city, being the ſee of an archbiſhop.

TARANTULA, in the hiſtory of inſects, a ſpecies of aranea, with an oval hairy body and thick legs. See ARANEA.

This is one of the large ſpiders, but is not the very largeſt known: its body is three quarters of an inch long, and of the thickneſs of one's little finger: it is uſually of an olive brown, variegated with a duſkier colour; but in this it varies greatly: it is covered with a ſhort and ſoft down, or hairineſs; the points of its forceps are very fine and ſharp: this ſpecies is a native of Apulia.

As to the effects of the poiſon they convey into the wound they make, there ſeems yet room for much explanation about it. We are told, that in the ſummer months, eſpecially when the heats are greateſt, as in the dog-days, the tarantula, creeping among the corn in the fields, bites the mowers and paſſengers: that in the winter it lurks in holes, and is ſcarcely ſeen; and that if it bits then, it is not ſo venomous, neither does it induce any ill ſymptoms: but in hot weather, according to Dr. Mead, although the pain of its bite is at firſt no greater than what is cauſed by the ſting of a bee, yet the part is quickly after diſcoloured with a livid, black, or yellowiſh circle, and raiſed to an inflamed ſwelling; the patient within a few hours is ſeized with a violent ſickneſs, difficulty of breathing, univerſal faintneſs, and ſometimes trembling, with a weakneſs in the head; and on being aſked his ailment, with a tremulous voice, and melancholy look, points to his breaſt, as if the heart was moſt affected: the patient grows by degrees more melancholy, ſtupid, and ſtrangely timorous, and in a ſhort time expires, unleſs muſic is called to his aſſiſtance, which alone, without the help of medicines, is ſaid to perform the cure, the uſual alexipharmics and cordial medicines, being of no ſervice: for at the firſt ſound of the muſical inſtrument, although the ſick lie as it were in an apoplectic fit, they begin, by degrees, to move their hands and feet, till at laſt they get up, and fall to dancing, with wonderful vigour at firſt, for three or four hours; then they are put to bed, refreſhed from their ſweating a ſhort time, and repeat their exerciſe, with the ſame vehemence, perceiving no wearineſs or weakneſs from it, but profeſſing that they grow ſtronger and nimbler the more they dance. At this ſport they uſually ſpend twelve hours a day; and it continues three or four days, by which time they are freed from all their ſymptoms; which, nevertheleſs, attack them about the ſame time next year; and if they do not take care to prevent this relapſe by muſic, they fall into the jaundice, want of appetite, univerſal weakneſſes, and ſuch like diſeaſes, which are every year increaſed, if dancing be neglected, till at laſt they prove incurable. As muſic is the common cure, ſo they who are bitten are pleaſed, ſome with one ſort of it, and ſome with another; one is raiſed with a pipe, another with a timbrel, one with a harp, and another with a fiddle; ſo that the muſicians ſometimes make ſeveral eſſays before they can accommodate their art to the venom: but this is conſtant and certain, notwithſtanding this variety, that they all require the quickeſt and briſkeſt tunes; and are never moved by a ſlow dull harmony. While the tarantati are dancing, they loſe in a manner the uſe of all their ſenſes, are like ſo many drunkards, do many ridiculous and fooliſh tricks, talk and act obſcenely and rudely, take great pleaſure in playing with vine-leaves, with naked ſwords, red cloaths, and the like; and, on the other hand, cannot bear the ſight of any thing black, ſo that if any byſtander happen to appear in that colour, he muſt immediately withdraw, otherwiſe they relapſe into their ſymptoms with as much violence as ever. Baglivi, who reſided in Italy, and probably had good opportunities of informing himſelf with reſpect to this inſect, has written a treatiſe expreſly upon the ſubject: and moſt medicinal writers mention the diſtempers ariſing from the bite thereof, as a thing certain.

But, notwithſtanding all theſe great authorities, there is good reaſon to believe the whole ſtory fabulous, and a vulgar error; for it is treated as ſuch by an italian phyſician, in the Philoſ. Tranſact. and a great many gentlemen of unqueſtionable veracity, who reſided at Taranto many months, and during the time in which the bite of a tarantula is ſaid to be moſt pernicious, affirm, that there was not a

phyſician

phyſician in the country, who believed there ever was ſuch a diſtemper, from ſuch a cauſe: that among the vulgar there is a tradition, that diſtempers attended with very extraordinary circumſtances, had been excited by the bite of a tarantula; but that no body ever remembers a ſingle inſtance; and that there is no other ſpider to be found in that country, different from thoſe which are common in moſt warm countries.

TARASCON, a port-town of France, in the province of Provence, ſituated on the river Rhone, eight miles north of Arles.

TARAXACONASTRUM, in botany, the ſame with hyoſeris. See HYOSERIS.

TARAXACONOIDES, in botany, the ſame with the leontodon. See the article LEONTODON.

TARBES, a city of France, in the province of Gaſcony, and territory of Bigorre, ſituated on the river Adour: weſt lon. 3′, and north lat. 43° 16′.

TARCHONANTHUS, in botany, the ſame with the parthenium. See the article PARTHENIUM.

TARE, is an allowance for the outſide package, that contains ſuch goods as cannot be unpacked without detriment; or for the papers, threads, bands, &c. that incloſe or bind any goods imported looſe; or, though imported in caſks, cheſts, &c. yet cannot be unpacked and weighed net. Several ſorts of goods have their tares aſcertained, and thoſe are not to be altered or deviated from, in any caſe, within the port of London; unleſs the merchant thinking himſelf, or the officers of the crown, to be prejudiced by ſuch tares, ſhall deſire that the goods may be unpacked, and the net-weight taken; which may be done either by weighing the goods in each reſpective caſk, &c. net; or (as is practiſed in eaſt-india goods particularly) by picking out ſeveral caſks, &c. of each ſize, and making an average, compute the reſt accordingly. But this muſt not be done without the conſent of two ſurveyors, atteſted by their hands in the landwaiter's books; and in the out-ports, not without the conſent of the collector and ſurveyor. And as to thoſe goods which have not their tares aſcertained, two ſurveyors in London, and the collector and ſurveyor in the out-ports, are to adjuſt and allow the ſame, in like manner. Sometimes the caſks, &c. are weighed beyond ſea, before the goods are put in; and the weight of each reſpective caſk, &c. marked thereon (as is uſual for moſt goods imported from the britiſh plantations), or elſe inſerted in the merchant's invoice; in which caſe, if the real invoice be produced, and the officers have ſatisfied themſelves (by unpacking and weighing ſome of them) that thoſe weights are juſt and true, they do then, after having reduced them to britiſh weight, eſteem them to be the real tares, and paſs them accordingly. But the unpacking goods, and taking the net-weight, being ſuppoſed the juſteſt method, both for the crown and merchant, it is uſually practiſed in the port of London, in all caſes where it can be done with conveniency, and without detriment to the goods.

As the knowledge of tare is of great importance in commerce, we ſhall here add an alphabetical table of ſome principal articles in trade, with their tares, as allowed in the cuſtomhouſe of London.

Alum in caſks, tare 12 per cent.
Antimony in caſks, 6 lb. per cent.
Aſhes, called pot-aſhes, 10 per cent.
Aſhes, called weed-aſhes, 8 lb. per ſack.
Aſſa fœtida, in baſkets, about ¼ Cwt. 3 lb. per baſket.
Barilla in double ſerons, 36 lb. per ſeron.
Beads, called coral beads, in caſes, if covered with rags, 3 per cent. for ſtrings, paper, and rags; but if not covered with rags, then only 2 per cent.
Brimſtone in caſks, 8 lb. per cent.
Bugle, great, in caſks, 3 per cent.
Camphor in tubs about ½ or ¼ Cwt. tare 18 lb.
Canary-ſeeds in barrels of about 2¼ Cwt. at 30 lb. each.
Capers in caſks, tare one third.
Cochineal in cheſts, covered with ſkins, containing about 1½ Cwt. tare 50 lb.
Ditto in barrels, about 1½ Cwt. tare 36 lb.
Ditto in bales of about 200 lb. each 18 lb. per bale.
Ditto in caſks of about 250 lb. each, 42 lb. each.
Coffee in bales, from India, of about 2½ Cwt. 18 lb. per bale.
Ditto in bales, from Turky, of about 3 Cwt. 15 lb. per bale.
Copper-ore in caſks of near 2 Cwt. each, 21 lb. per caſk.
Copperas-green, in caſks of about 10½ Cwt. 10 per cent.
Figs in barrels, 14 lb. per cent.
Flax, undreſſed, in bales or bags about 4¼ Cwt. 6 lb. each.

Galls,

Galls, from Aleppo and Smyrna, in double bags, 7 lb. each.
Gum-arabic in ſacks about 3 Cwt. 10lb. per ſack.
Hemp in fats, 14 lb. per cent.
Hops in bags, 4 lb. per cent.
Indigo in cheſts, covered with ſkins, about 1 ¾ Cwt. 48 lb.
Ditto in bales, with ſkins, about 1½ Cwt. tare 16 lb.
Iron, old buſhel, in caſks about 13 Cwt. 107 lb. each.
Madder, great and ſmall, ſingle and double bags, tare 28 lb.
Pearl barley in caſks of about 4½ Cwt. 45 lb. per caſk.
Pepper, long, from India, in bags about 1 Cwt. 8 lb. per bag.
Pitch, called burgundy-pitch, in ſtands about 2¾ Cwt. tare 56 lb.
Prunelloes in boxes about 14 lb. 3 lb. per box.
Rice in barrels about 4 Cwt. tare as on the caſks.
Sago, from India, in bags about 94 lb. 3 lb. each.
Salt-petre in caſks, 12 lb. per cent.
Smalts, or powder-blue, in caſks, about 4 Cwt. 10 per cent.
Soap, called caſtile-ſoap, in double ſerons about 3 Cwt. 30 lb.
Tallow, from Ruſſia and Ireland, in caſks, 12 lb. per cent.
Turpentine in caſks, tare one fifth part.
Wax, bees-wax in caſks about 10 Cwt. 84 lb. per caſk.
Spaniſh wool in bales, for cloth, about 2 Cwt. tare 28 lb.

TARENTAIS DUTCHY, the ſouth diviſion of Savoy, having Piedmont on the ſouth-eaſt, and Savoy proper on the north-weſt: ſubject to the king of Sardinia.

TARGET, a kind of ſhield or weapon of defence made uſe of by the antients.

TARGOROD, a town of Turky in Europe, in the province of Moldavia, fifty miles ſouth-weſt of Jazy: eaſt longit. 26° 30′, and north lat. 47°.

TARGUM, a name whereby the Jews call the chaldee paraphraſes, or expoſitions, of the Old Teſtament, in the chaldee language. After the captivity, the jewiſh doctors, in order to make the people underſtand the holy ſcripture, which was read in hebrew in their ſynagogues, were obliged to explain the law to them in a language they underſtood, which was the chaldean, or that uſed in Aſſyria. The targums now remaining, were compoſed by different perſons, upon different parts on the part, and both theſe and the reſt of ſcripture, and are eight in number.

TARIF, or TARIFF, a table or catalogue, containing the names of different ſorts of merchandize, with the duties to be paid, as ſettled by authority, amongſt trading nations.

TARIFFA, a port-town of Spain, in the province of Andaluſia, ſituated at the entrance of the ſtreights of Gibraltar, eighteen miles weſt of Gibraltar, and twenty-four miles north of Tangier: weſt longit. 6° 15′, and north lat. 36°.

TARKU, a port-town of Perſia, in the province of Chirvan and territory of Dagiſtan, ſituated on the weſt ſide of the Caſpian ſea, three hundred miles ſouth of Aſtracan: eaſt lon. 51°, north lat. 42°.

TARO, a river of Italy, which riſes in the mountains on the confines of Genoa, and runs, north-eaſt thro' the dutchy of Parma, falling into the Po below Cremona.

TARODANT, a city of Morocco, in Africa, in the territory of Sus, ſituated near the Atlantic ocean, one hundred and twenty miles ſouth of the city of Morocco: weſt long. 10°, and north lat. 30°.

TARPAULIN, a piece of canvas, well tarred over, to keep off the rain from any place. The term is alſo often applied in a burleſque ſenſe to a perſon that has been all his life bred to the ſea.

TARPEIAN, in roman antiquity, an appellation given to a ſteep rock in Rome; whence, by the law of the twelve tables, thoſe guilty of certain crimes were precipitated.

TARPEIAN GAMES, the ſame with thoſe otherwiſe called capitoline. See the article CAPITOLINE.

TARRACE, or TERRACE, a kind of plaſter or mortar. See TERRACE.

TARSO, in the glaſs-trade, a white kind of ſtone, uſed inſtead of ſand, for the fineſt cryſtal-glaſs. See GLASS.

TARSUS, in anatomy, the ſpace between the bones of the leg and the metatarſus, wherein are contained ſeven bones, *viz.* the aſtragalus, calcaneum, os naviculare, os cuboides, and the three oſſa cuneiformia. See ASTRAGALUS, *&c.*

If any of theſe bones happens to be luxated, they ſhould be ſpeedily replaced; for which purpoſe the foot ſhould be extended on an even table, and the ſurgeon is to replace the diſlocated bones with the preſſure of the palms of his hands, adjuſting them alſo with his fingers, where need requires. Compreſſes, dipped in warm ſpirit of wine, are then to be laid

duced bones ſecured in their places, by means of the proper bandages: the patient is then to be enjoined to remain in bed, till the new-ſet bones have acquired a ſufficient ſtrength.

TARSUS is alſo uſed by ſome for the cartilages which terminate the palpebræ, or eyelids, and from which the cilia or hairs ariſe. See the article EYE.

TARSUS, now Teraſſo, once the capital of Cilicia, in the leſſer Aſia, now a province of Aſiatic-Turky, is ſituated on the north ſide of the Levant-Sea: eaſt long. 35°, north lat. 37°.

TARTANE, in naval architecture, a kind of bark, uſed in the Mediterranean, for fiſhing and carriage. It has only a main-maſt and a mizen; its ſails triangular; and when a ſquare ſail is put up, it is called a ſail of fortune.

TARTAR, in natural hiſtory and pharmacy, a hard and almoſt ſtony ſeparation from a vegetable juice, after fermentation. See FERMENTATION.

The common tartar is the produce of wine, being found in large maſſes, adhering to the bottoms and ſides of caſks, in which that liquor has been long kept. We meet with it in large maſſes of an irregular figure, and more or leſs denſe texture, without ſmell, and of a ſubacid taſte.

The common crude tartar is of two kinds, the white and the red; this difference of colour, being owing to that of the wine they are produced from, is of little conſequence in itſelf, but it is an indication of more eſſential differences in the matter. The white tartar is much more pure and clean than the red, and is, though equally hard, conſiderably leſs heavy. We have this principally from Germany, where it is, at times, cleared off from the ſides of very large veſſels, in which they keep their white wines for many years. The red tartar is brought in large quantities from Italy, and ſome parts of France. The white tartar is to be choſen for medicinal uſe, and particularly ſuch as is of a compact texture, not ſpongy or cavernous, when broken, and free from dirt, or other foulneſſes, and ſuch as has a ſort of cryſtallizations on its ſurface. Tartar is, properly ſpeaking, the eſſential ſalt of the grape. Tartar contains a large portion of acid ſalt, and of an oil, in part thin and limpid, in part thick and coarſe. It affords a ſmall portion of a volatile alkali ſalt in diſtillation, and the reſiduum yields a very large proportion of fixed alkali. It is to be obſerved, that both theſe alkalies ſeem, in ſome degree, creatures of the fire; for neither of them manifeſt themſelves either by their taſte or qualities in the tartar, any more than in many other ſubſtances, which yet afford much of them by analyſis, till they have felt the operation of the fire.

Tartar diſſolves in boiling-water, but with great difficulty in cold; and even when purified, and brought to the ſtate of what we call cryſtal, or cream of tartar, it retains the ſame quality. Tartar is ſcarce ever given internally in its crude ſtate. The preparations now in uſe are theſe.

Cryſtals of Tartar. Powder a quantity of white tartar, and boil it in a ſufficient portion of water till it be in a great part diſſolved, the foulneſs only remaining behind. Pour this decoction, while hot, through a flannel-bag, let it ſtand till cold, and there will be cryſtals formed at the ſides of the veſſel; theſe are the cryſtals of tartar. They may be diſſolved by boiling a ſecond time, and ſet to ſhoot again, and by this means they will be rendered the more pure. The French, who prepare great quantities of theſe cryſtals about Montpelier, firſt diſſolve a ſmall quantity of white earth of the nature of chalk, in the water in which they are to be boiled, for the ſecond ſolution. This earth renders the water milky, but the cryſtals ſhoot perfectly clear in it, and whatever foulneſs they carried with them at their firſt ſhooting, will be, by this means, more perfectly ſeparated from them.

It was formerly a cuſtom to ſeparate firſt the ſalt which ſhot to the top of the liquor in form of a thin ſkin or film, and this was ſuppoſed purer than the reſt, and called cream of tartar; but it is wholly the ſame with the cryſtals that ſhoot to the ſides of the veſſel, and nobody now trouble themſelves to keep it ſeparate.

The cryſtals of tartar, or, as we commonly expreſs it, cream of tartar, is a gentle purge; it attenuates and reſolves tough humors, and is good againſt obſtructions of the viſcera, and in cachectic complaints.

Fixed ſalt of TARTAR. Take any quantity of tartar at pleaſure, put it into a crucible, and calcine it for eight hours in an open fire; then pour boiling water on it, and ſet it over the fire till all the ſalt be diſſolved. Filtre the ſolution, and evaporate it to a dryneſs in a ſand-heat; there will remain, at the bottom

of

of the veſſel, a white fixed alkaline ſalt. If it is not ſo pure as it ought to be, diſſolve it in fair-water; filtre the ſolution, and evaporate it to a dryneſs as before; after which it may be calcined for half an hour in a crucible; it will then be perfectly pure, and muſt be kept in a phial cloſe ſtopped, for it eaſily melts if the air comes to it.

If this ſalt be expoſed to a damp air, as in a vault, or other ſuch place, in a flat earthen veſſel, it runs into a heavy liquor, which is to be filtred, to ſeparate it from any foulneſs it may have accidentally contracted, and is the oleum tartari per diliquium.

The fixed ſalt of tartar is very acrid and cauſtic; ſome attribute great virtues to it, as a diuretic; and our apothecaries too frequently uſe it in the place of ſalt of wormwood. They, indeed, buy it as ſuch; and what is yet more unfair in the ſeller, is what he calls by either of theſe names of ſalt of tartar or ſalt of wormwood, as it is more or leſs purified, is often not truly either, but is prepared from the common ruſſia pot-aſh, diſſolved and purified. This fixed alkali is of great uſe in opening the bodies of reſinous and ſulphureous ſubjects, and making them yield a ſtronger tincture to ſpirit of wine, or water, than they otherwiſe would do. It is often mixed alſo with purges to quicken the operation. Caution ought to be taken, when it is given internally, either that it be firſt diſſolved by an acid, as in the ſaline draughts; or elſe blended with a large quantity of liquor, to prevent its proving too acrid as it paſſes the œſophagus.

Tincture of ſalt of TARTAR. Put a quantity of ſalt of tartar into a good crucible; ſet it in an open fire, and calcine it for ſome hours, raiſing the fire, at laſt, to ſuch a degree as to make the ſalt ready to melt; then pour it into a clean marble mortar, grind it ſome time, and while yet hot, put it into a matraſs heated beforehand; pour a quart of rectified ſpirits of wine on four ounces of this calcined ſalt, and let it ſtand in a ſand-heat three or four days, in which time, if the proceſs have been rightly managed, the ſpirit will become of a ſtrong yellowiſh colour, and is then to be filtred off for uſe.

People who make this tincture, find it difficult to give the ſpirit the true colour. This tincture is attenuant and reſolvent, given from ten to thirty drops: it is alſo of great uſe in extracting the tinctures of vegetable and mineral ſubſtances, which would not impart any colour to ſimple ſpirit of wine.

Foliated TARTAR, *or regenerated* TARTAR. Take any quantity of dry ſalt of tartar powdered, put it in a large glaſs veſſel, and pour thereon, by degrees, as much ſpirit of vinegar as will ſaturate the ſalt; filtre the fluid, and evaporate it over a gentle fire to dryneſs, taking great care that the matter does not contract any empyreuma. On the ſalt which remains after this evaporation, pour out as much freſh vinegar as will again ſaturate it; then filtre the fluid, and carefully dry it by evaporation.

This ſalt has a febrifuge and deobſtruent quality. The doſe may be from ten grains to one ſcruple, to be taken in a glaſs of water, and repeated every fourth or ſixth hour, according to the exigence of the caſe.

Emetic TARTAR, a preparation of antimony with tartar. See ANTIMONY.

Soluble TARTAR is thus made: Diſſolve a pound of fixed alkaline ſalt in a gallon of boiling-water, and gradually throw in cryſtals of tartar as long as a freſh addition thereof riſes any efferveſcence, which generally ceaſes before three pounds of the cryſtals have been uſed: then filtre the liquor; and, after due evaporation, ſet it by to cryſtallize. This ſalt has been long eſteemed both as a medicine and a menſtruum: it is aperient, attenuates viſcid juices, promotes the urinary ſecretion, and gently looſens the belly: the doſe is from ten grains to a dram or two, or more. It is alſo uſed as an addition to the reſinous purgatives, as it promotes their action, and at the ſame time prevents their griping quality.

Vitriolated TARTAR is ordered, by the College of London phyſicians, to be made thus: Diſſolve eight ounces of green vitriol in four pints of boiling water; and while the liquor continues boiling, throw into it ſalt of tartar, or any other alkaline ſalt, till no efferveſcence ariſes upon throwing in a freſh addition, which generally happens when four ounces, or a little more of the ſalt have been uſed: filtre the liquor through paper, and after due evaporation ſet it by to cryſtallize.

Vitriolated tartar is aperient, exhibited in ſmall doſes of a ſcruple, or half a dram, attenuates viſcid juices, and promotes the fluid ſecretion. In larger doſes it proves a mild and ſafe cathartic.

TARTARY,

TARTARY, a vaſt country in the northern parts of Aſia, bounded by Siberia on the north and weſt: this is called Great-Tartary. The Tartars who lie ſouth of Moſcovy and Siberia, are thoſe of Aſtracan, Circaſſia, and Dagiſtan, ſituated north-weſt of the Caſpian ſea the calmuc Tartars, who lie between Siberia and the Caſpian-ſea: the uſbec Tartars and Moguls, who lie north of Perſia and India: and, laſtly, thoſe of Tibet, who lie north-weſt of China.

TASSEL, a ſort of pendant ornament at the corners of a cuſhion, or the like.

In building, taſſels denote thoſe pieces of board that lie under the ends of the mantle trees.

TASSO, or THASSUS, a ſmall iſland in the Archipelago, thirty miles north of Lemnos.

TASTE, in phyſiology, a peculiar ſenſation excited by means of the organs of taſte, *viz.* the papillæ on the tongue. See the article TONGUE.

The taſtes of bodies depend on a certain determinate magnitude of their particles, adapted to excite different ſenſations by means of the papillæ of the tongue.

Savours, which are the objects of the taſte in general, proceed chiefly from the ſaline parts, which are found in all matters, whether animal or vegetable, which we take either as food or phyſic. Theſe little angular pungent bodies are fitter than others to penetrate even to the immediate organ, and to make themſelves perceived there: we may judge of them by putting a grain of pure ſalt, of any kind whatever, upon the tongue, where it will make a very ſtrong impreſſion; and their analyſis diſcovers, that, of all mixed bodies, thoſe that affect the organ moſt, are ſuch as abound moſt in ſalts. See SALT.

The moſt ſimple ſavours, and upon which men are more generally agreed, are thoſe wherein the ſalts are the leaſt mitigated by the mixture of other matters. Every one knows what is meant by ſalt, ſour, ſweet, bitter, harſh, *&c.* theſe different ſenſations are ſo remarkable that they are preſently diſtinguiſhed: they are, as it were, the baſis of all others, which become ſo much the more difficult to deſcribe and expreſs, the more they recede from their primary ſimplicity. The bitterneſs of coffee, for example, corrected by the ſweetneſs of ſugar, produces a mixed ſenſation; the juice of fruits, mingled with ſpirit of wine, takes a new taſte: the taſte of victuals changes almoſt entirely, and is diſguiſed a thouſand different ways, by that infinite number of preparations and mixtures, which the preſent age has rendered an important art.

TASTE is alſo uſed, in a figurative ſenſe, for the judgment and diſcernment of the mind.

We conſtantly hear talk of good and bad taſte, without well underſtanding the meaning of theſe terms: in effect, a good taſte ſeems, at bottom, to be little elſe but right reaſon, which we otherwiſe expreſs by the word judgment. Mad. Scudery, and Mad. Dacier, call good taſte a harmony between the mind and reaſon; and according as that harmony is more or leſs juſt, the perſon has more or leſs of this taſte.

TATA, or SINDA, the capital of a province of the ſame name in the hither India, in Aſia, ſituated at the mouth of the Indus: eaſt long. 68°, north lat. 25° 40'.

TATIANITES, in church-hiſtory, chriſtian heretics in the ſecond century; ſo called from their leader Tatian, a diſciple of St. Juſtin.

This hereſiarch took from Valentinus the fable of the Æons, and from Marcion the doctrine of two principles. But what particularly diſtinguiſhed his followers was, their condemning of marriage, and forbidding the eating of fleſh or drinking of wine.

TATTERSHALL, a market-town of Lincolnſhire, eighteen miles ſouth-eaſt of Lincoln.

TAT-TOO, q. d. TAP-TO, a beat of a drum at night, to advertiſe the ſoldiers to retreat or repair to their quarters in their garriſon, or to their tents in a camp.

TAU, or TAW, in heraldry, an ordinary in figure of a T, ſuppoſed to repreſent St. Andrew's croſs, or a croſs potence, the top part cut off. See CROSS.

TAVASTUS, the capital of the province of Tavaſtia, in the territory of Finland, in Sweden, ſituated eighty-four miles north-eaſt of Abo: eaſt long. 24°, north lat. 61° 20'.

TAUBER, a river of Germany, which, riſing in Franconia, paſſes by Mergentheim, and falls into the river Maine at Wertheim.

TAVERNA, a town of the further Calabria, ſituated ſeventy miles north-eaſt of Reggio.

TAUGHT, or TAU'T, in the ſea language, ſignifies the ſame as ſtiff, or faſt: thus, to ſet taught the ſhrowds, or ſtays, is to make them more tight and ſtiff.

TAVIRA, a city of Algarva, in Portugal: weſt long. 8° 32′, north lat. 37°.

TAVISTOCK, a borough of Devonſhire, thirty-two miles weſt of Exeter. It ſends two members to parliament, and gives the title of marquis to the noble family of Ruſſels, dukes of Bedford.

TAUNT, or TAUNT-MASTED, is ſaid of a ſhip whoſe maſts are too tall for her.

TAUNTON, a borough of Somerſetſhire, twenty miles ſouth weſt of Wells. It ſends two members to parliament.

TAURILIA, in roman antiquity, certain religious games, celebrated to appeaſe the infernal gods.

TAURIS, or TABRIS, a city of Perſia, four hundred miles north of Iſpahan: eaſt long. 46° 30′, north lat. 38° 20′.

TAURUS, the BULL, in zoology. See the article BULL.

TAURUS, in aſtronomy, one of the twelve ſigns of the zodiac, the ſecond in order, conſiſting of forty-four ſtars, according to Ptolomy; of forty-one, according to Tycho; and of no leſs than one hundred and thirty-five, according to the britannic catalogue. See ZODIAC.

TAURUS is alſo the name of a ridge of mountains which run through the leſſer Aſia, from weſt to eaſt.

TAUTOLOGY, in rhetoric, a needleſs repetition of the ſame thing in different words.

TAW, or TAU. See the article TAU.

TAWING, the art of dreſſing ſkins in white, ſo as to be fit for divers manufactures, particularly gloves, &c.

All ſkins may be tawed; but thoſe chiefly uſed for this purpoſe are lambs, ſheep, kids, and goats-ſkins.

The method of tawing is this: Having cleared the ſkins of wool or hair, by means of lime, &c. as deſcribed under the article SHAMMY, they are laid in a large vat of wood or ſtone, ſet on the ground full of water, in which quick-lime has been ſlaked, wherein they are allowed to lie a month or ſix weeks, according as the weather is more or leſs hot, or as the ſkins are required to be more or leſs ſoft and pliant.

While they are in the vat, the water and lime is changed twice, and the ſkins are taken out and put in again every day; and when they are taken out for the laſt time, they are laid all night to ſoak in a running water, to get out the greateſt part of the lime; and in the morning are laid together by ſixes one upon another, upon the wooden leg (and are ſcraped ſtoutly one after another, to get the fleſh off from the fleſhy ſide, with a cutting two handled inſtrument called a knife, and then they cut off the legs, if they are not cut off before) and other ſuperfluous parts about the extremes. Then they are laid in a vat or pit with a little water, where they are ſulled with wooden peſtles for the ſpace of a quarter of an hour, and then the vat is filled up with water, and they are rinſed in it.

In the next place, they are thrown on a clean pavement to drain, and afterwards caſt into a freſh pit of water, out of which they rinſe them well, and are laid again on the wooden leg, ſix at a time, with the hair-ſide outermoſt, over which they rub a kind of whetſtone very briſkly to ſoften and fit them to receive four or five more preparations, given them on the leg, both on the fleſh ſide and the hair ſide, with the knife, after the manner above mentioned.

After this they are put into a pit of water and wheaten-bran, and ſtirred about in it with wooden poles, till the bran is perceived to ſtick to them, and then they are left; as they riſe of themſelves to the top of the water by a kind of fermentation, they are plunged down again to the bottom, and at the ſame time fire is ſet to the liquor, which takes as eaſily as if it were brandy, but goes out the moment the ſkins are all covered.

They repeat this operation as often as the ſkins riſe above the water; and when they have done riſing they take them out, lay them on the wooden leg, the fleſhy ſide outwards, and paſs the knife over them to ſcrape off the bran.

Having thus cleared them of the bran, they lay the ſkins in a large baſket, and load them with huge ſtones to promote their draining: and when they have drained ſufficiently, they give them their feeding, which is performed after the manner following:

For one hundred of large ſheep-ſkins, and for ſmaller in proportion, they take eight pounds of alum, and three of ſea-ſalt, and melt the whole with water in a veſſel over the fire, pouring the diſſolution out, while yet luke-warm, into a kind of trough, in which is twenty pounds of the fineſt wheat-flower, with the yolks of eight dozen of eggs; of all

which is formed a kind of paſte, a little thicker than children's pap; which, when done, is put into another veſſel, to be uſed in the following manner:

They pour a quantity of hot water into the trough in which the paſte was prepared, mixing two ſpoonfuls of the paſte with it; to do which they uſe a wooden ſpoon, which contains juſt as much as is required for a dozen of ſkins: and when the whole is well diluted, two dozen of the ſkins are plunged into it; but they take care that the water be not too hot, which would ſpoil the paſte and burn the ſkins.

After they have lain ſome time in the trough, they take them out, one after another, with the hand, and ſtretch them out; this they do twice; and after they have given them all their paſte, they put them into tubs, and there full them afreſh with wooden peſtles.

Then they put them into a vat, where they are ſuffered to lie for five or ſix days, or more; then they take them out in fair weather, and hang them out to dry on cords or racks, and the quicker they are dried the better; for if they be too long a drying, the ſalt and alum within them are apt to make them riſe in a grain, which is an eſſential fault in this kind of dreſſing.

When the ſkins are dry, they are made up into bundles, and juſt dipt in fair water, and taken out and drained; and being thrown into an empty tub, and after having lain ſome time are taken out and trampled under foot.

Then they draw them over a flat iron-inſtrument, the top of which is round like a battledore, and the bottom fixed into a wooden block, to ſtretch and open them; and having been opened, they are hung in the air upon cords to dry: and being dry, they are opened a ſecond time, by paſſing them again over the ſame inſtrument.

In the laſt place they are laid on a table, pulled out, and laid ſmooth, and are then fit for ſale.

After the ſame manner are dreſſed horſes, cows, calves-ſkins, &c. for the ſadlers, harneſs-makers, &c. as alſo thoſe of dogs, wolves, bears, &c. except that in theſe they omit uſing the paſte, ſalt and alum-water being ſufficient.

TAX, a tribute rated upon every town, which formerly was wont to be paid annually into the King's-exchequer, but now not without conſent of parliament; it differs from a ſubſidy in this, that it is always certain, as ſet down in the exchequer-book, and in general levied of every town, and not particularly of every man, &c. The antient way of levying taxes was by tenths and fifteenths, afterwards by ſubſidies and royal aids, and at length by a pound rate; the former of theſe were all upon the perſon and perſonal eſtate, but the laſt upon lands and rents. In the late reigns, a land-tax has been annually granted of two, three, or four ſhillings in the pound, according to preſent exigencies, to be levied by commiſſioners on the ſeveral counties, cities, towns, &c. And in reſpect of this tax, the tenants, or occupiers, of the land are to be charged or aſſeſſed, and the ſame deducted out of the rent due to the landlords: and if any perſons refuſe to pay what they are rated, the collectors in every pariſh may levy it by diſtreſs and ſale of their goods; but in caſe they are over-rated, they may be relieved by an appeal to the commiſſioners, who have power to charge the overplus on others, as they ſhall ſee cauſe; or where there appears to be a deficiency, they may make a re-aſſeſſment, &c. See TRIBUTE, &c.

TAXIS, a term uſed by Vitruvius for what is now called ordonnance, being that which gives every part of a building its juſt dimenſions with reſpect to its uſes. See the article ORDONNANCE.

TAXUS, the YEW-TREE, in botany, a genus of the *dioecia-monadelphia* claſs of plants, without any corolla. The calyx of the male flower is compoſed of three leaves: the ſtamina are numerous: the ſeed is ſingle, and ſurrounded by an undivided baccated calyx: the tree is very ſlow in growing, but there are many very large ones upon ſome barren cold ſoils in divers parts of England: the timber is much eſteemed for many uſes.

TAXUS, in zoology, a name uſed by ſome authors for the meles, or badger. See the article MELES.

TAY, a river of Scotland, riſing from the loch, or lake, of Tay, in Broadalbin, and running eaſt through Athol: it afterwards turns ſouth-eaſt, and dividing the counties of Perth and Angus from Strathern and Fife, falls into the frith of Tay.

TAYVEN, a city of China, in Aſia, in the province of Xanſi, two hundred and forty miles ſouth-weſt of Pekin: eaſt long. 108°, north lat. 38° 30'.

TCHELMINAR. See CHILMINAR.

TEA, *thea*, in botany, a genus of the *polyandria monogynia* class of plants, the corolla of which consists of six large, roundish, hollow, equal petals: the fruit is a capsule, formed of three globular bodies growing together: it contains three cells, in each of which is a single seed, globose, and internally angulated. This shrub grows to five or six feet high, and is very ramose: its root is spreading and fibrous: the leaves are about an inch long, near half an inch broad, serrated, and terminating in a point. The traders in tea distinguish a vast many kinds of it, as they differ in colour, flavour, and the size of the leaf. They are all, however, the leaves of the same tree, only differing according to the seasons when they are gathered, and the manner of drying. To enumerate the several subdistinctions were endless; the general division is into three kinds, the ordinary green-tea, the finer green, and the bohea; to one or other of which all the other kinds may be referred. The common green-tea has somewhat small and crumpled leaves, much convoluted, and closely folded together in the drying. Its colour is a dusky-green, its taste subastringent, and its smell agreeable. It gives the water a strong yellowish-green colour. The fine green has larger leaves, less rumpled and convoluted in the drying, and more lax in their folds; it is of a paler colour, approaching to the blue-green, of an extremely pleasant smell, and has a more astringent, yet more agreeable, taste than the former. It gives a pale-green colour to water. To this kind are to be referred all the higher priced green-teas, the hyson, imperial, &c. The bohea consists of much smaller leaves than either of the other, and those more crumpled and closely folded than in either. It is of a darker colour than the other, often blackish, and is of the smell and taste of the others, but with a mixed sweetness and astringency. The green teas have all somewhat of the violet-flavour; the bohea has naturally somewhat of the rose smell. The leaves when gathered are dried with great caution, partly by the help of heat, partly by the air, and when thoroughly prepared will keep a long time fresh and good. Every parcel, when dried, tho' gathered promiscuously, is separated, according to the largeness and smallness of the leaves, into three or four different kinds, each of which is of a different price, and has its different name. The bohea tea is gathered before the leaves are perfectly opened, and is made to undergo a greater degree of heat in the curing, to which its colour and peculiar flavour is in a great measure owing.

Tea, moderately and properly taken, acts as a gentle astringent and corroborative: it strengthens the stomach and bowels, and is good against nauseas, indigestions, and diarrhœas. It acts also as a diuretic and diaphoretic; but its virtues in these particulars are in a great measure to be attributed to the quantity of warm water drank on the occasion. The good qualities of tea do not prevent its often doing harm. Even in China, where the virtues of tea are so vastly extolled, the people who drink it to great excess are often thrown into diabetes, and die emaciated by it.

Tea, imported from India, for every 100 pound, gross value, at the sale, pays a duty of 18l. 18s. $7\frac{65\frac{3}{4}}{100}$d. And the inland duty for every pound weight, is one shilling; and for every hundred pounds, gross-value, at the sale, twenty-five pounds.

TEAL, or TEALE, in ornithology, the anas, with a green spot on the wing, and a white line both above and below the eyes; being the smallest, most elegant and valuable of all the duck-kind. See ANAS and CIRCIA.

TEARS, *lachrymæ*, a lymph or aqueous humour, which is subtile, limpid, and a little saltish: it is separated from the arterial blood by the lachrymal glands, and small glandulous grains on the inside of the eye-lids. This fluid serves to moisten and deterge the eyes and the eye-lids, after which it tends to the internal angle of the eye, and is absorbed by the puncta lachrymalia, and conveyed to the lachrymal bag, from whence it goes into the nose, by the nasal canal. See LACHRYMALIA.

TEASEL, or TEAZEL, in botany. See the article DIPSACUS.

TEBETH, the tenth month of the jewish ecclesiastical year, and fourth of the civil. It answers to our month of December.

TECKLENBURG, a city of Germany, in the circle of Westphalia, capital of a county of the same name, thirteen miles south-

ſouth-weſt of Oſnabrug, ſubject to its own count: eaſt long. 7° 20′, north lat. 52° 21′.

TECHNICAL expreſſes ſomewhat relating to arts or ſciences: in this ſenſe we ſay technical terms. It is alſo particularly applied to a kind of verſes wherein are contained the rules or precepts of any art, thus digeſted to help the memory to retain them; an example whereof may be ſeen in the article MEMORY.

TECUM DUCES. See DUCES.

TE DEUM, the name of a celebrated hymn, uſed in the chriſtian church, and ſo called becauſe it begins with theſe words, *Te Deum laudamus*; We praiſe thee, O God. It is ſung in the romiſh church, with great pomp and ſolemnity, upon the gaining of a victory, or other happy event.

TEETH. See the article TOOTH.

TEES, a river which riſes on the confines of Cumberland, and running eaſtward divides the county of Durham from Yorkſhire, and falls into the German ſea below Stockton.

TEFLIS, the capital of perſian Georgia, in Aſia, ſituated on the river Kur, or Cyrus, three hundred miles north of Tauris, and as many ſouth of Aſtracan: eaſt long. 47° 20′, north lat. 43°.

TEGAPATAN, a port-town of the hither India, in Aſia, near cape Comorin, eighty miles ſouth of Cochin, and a hundred and ſixty north-weſt of Columbo in Ceylon: eaſt long. 76°, north lat. 8°

TEGUMENT, or INTEGUMENT, any thing that ſurrounds or covers another.

The common teguments of the human body are the cutis, cuticle, and fat. See the article CUTIS, *&c.*

TEHAMA, one of the diviſions of Arabia felix, in Aſia, ſituated on the Red ſea, between the provinces of Mecca and Hadramut.

TEINTS and SEMI-TEINTS, in painting, denotes the ſeveral colours uſed in a picture, conſidered as more or leſs high, bright, deep, thin or weakened, and diminiſhed, *&c.* to give the proper relievo, ſoftneſs, or diſtance, *&c.* of the ſeveral objects.

TEIRCE, or TIERCE. See TIERCE.

TEISSE, or TEYS, a river of Hungary, which riſes in the Carpathian mountains, and running from eaſt to weſt, paſſes by Tockay; then turning ſouth, paſſes by Zolnock and Segedin, and having joined the river Meriſh, falls into the Danube, oppoſite to Salankamen.

TEKUPHÆ, or THEKUPHÆ, in the jewiſh chronology, are the times wherein the ſun proceeds from one cardinal point to the next.

TELAMON, or ATLAS, a name given to thoſe figures or half figures of men ſo commonly uſed inſtead of columns or pilaſters, to ſupport any member in architecture, as a balcony, or the like.

TELEPHIASTRUM, in botany, the ſame with the anacampſeos or orpine. See the article ORPINE.

TELEPHIOIDES, or ANDRACHNE, in botany, a genus of the *monoecia-pentandria* claſs of plants; the corolla of the male-flower is formed of five emarginated ſlender petals, ſhorter than the cup: the female-flower has no corolla; the fruit is a capſule containing three cells, with two obtuſe trigonal ſeeds, roundiſh on the one ſide, and angular on the other.

TELEPHIUM, in botany, a genus of the *pentandria-trigynia* claſs of plants, the corolla of which conſiſts of five erect, oblong, obtuſe petals, narroweſt at the baſe; the fruit is a ſhort triquetrous capſule, formed of three valves, and having only one cell; the receptacle is free, and of about half the length of the capſule; the ſeeds are numerous and roundiſh.

TELESCOPE, an optical inſtrument conſiſting of ſeveral lenſes, by means of which remote objects are ſo magnified as to appear nigh at hand. See LENS.

That the teleſcope is of a modern invention is moſt certain; neither does it appear that microſcopes, or optic glaſſes of any kind, were known to the antients. It is contended, that Alexander de Spina, a native of Piſa, was the firſt that made the uſe of glaſſes known to the world; but our countryman, friar Bacon, who died twenty-one years before him, was, in all probability, acquainted with them firſt; for he wrote a book of perſpective, in which he plainly ſhews that he did not only underſtand the nature of convex and concave glaſſes, but the uſe of them when combined in teleſcopes; though he no where, in that treatiſe, diſcovers the manner in which they are to be put together. The teleſcope, with the concave eye-glaſs, was firſt invented by a mechanic of Middleburgh in Zealand, called Z. Johannides, about the year 1590, though J. Lipperhoy, another Dutchman, is candidate for the ſame diſcovery. From whence this ſort of teleſcope is called tubus batavus.

Franciſcus

Franciſcus Fontana, a Neapolitan, contends, that he was the firſt contriver of the teleſcope compoſed of two convex glaſſes, which is now the common aſtronomical teleſcope; and Rheita pretends to be the firſt that rendered that teleſcope fit for terreſtrial uſes, by adding two eye-glaſſes to it.

The teleſcope is of two ſorts, *viz.* dioptric, or refracting; or cata-dioptric, by reflection and refraction conjointly.

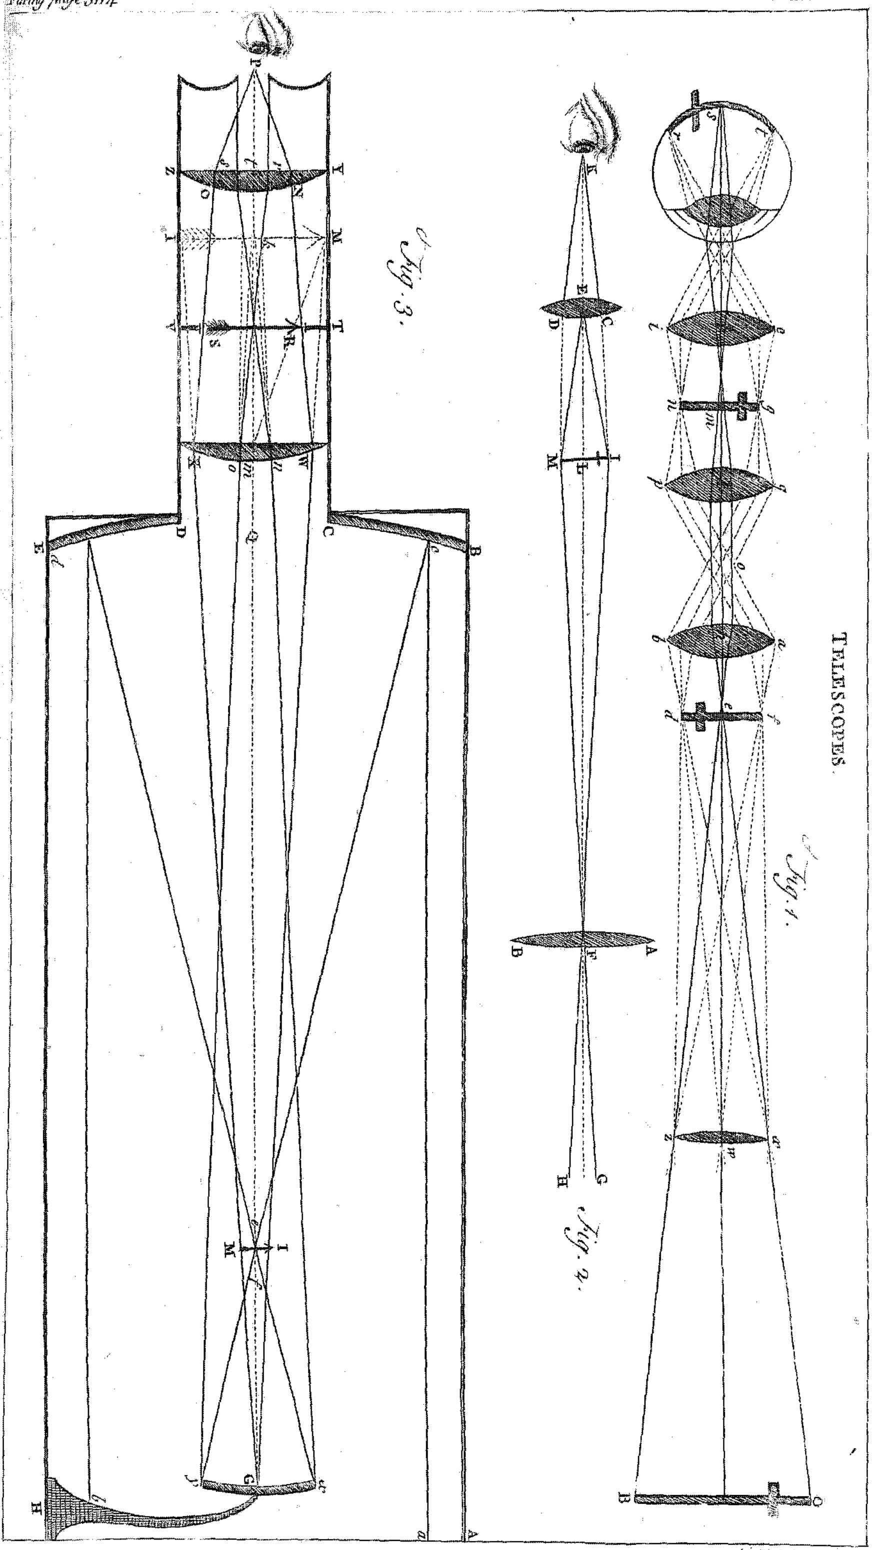
Dioptric or refracting TELESCOPE conſiſts of an object-glaſs *x z* (plate CCLXXI. fig. 1.) by which the image *f d* of an object O B, at a diſtance, is formed in the focus *e* of the ſaid glaſs, and in an inverted poſition. This image may be viewed by a ſingle lens, *a b*, placed at its focal diſtance, as is uſually done for viewing the heavenly bodies, becauſe in them we do not regard the poſition: but for viewing objects near us, whoſe image we would have erect, we muſt, for that purpoſe, add a ſecond lens *p q*, at double its focal diſtance from the other, that the rays which come from *a b* may croſs each other in the focus *o*, in order to erect the image *g n*, which it will form in its own focus *m*, becauſe the rays come parallel from the firſt lens *a b*. Laſtly, a third lens *i c* is added, to view the ſecondary image *g n*. Theſe three lenſes, or eye-glaſſes, are uſually of the ſame ſize and focal length; and the power of magnifying is always as the focal length of the object-glaſs *e w* divided by the focal length of the eye-glaſs *l m* or *h e*: for inſtance, ſuppoſe *e w* = 10 feet or 120 inches, and *h e* or *l m* = 3 inches; then will the object appear to the eye, through ſuch a teleſcope, 40 times bigger than to the naked eye; and its ſurface will be magnified 1600 times, and its bulk or ſolidity 64000 times.

If inſtead of a convex eye-glaſs we ſhould uſe a concave one of the ſame focal length, it would repreſent the object erect, equally magnified, and more diſtinct and bright; but the diſadvantage of this glaſs is, that it admits but of a ſmall area, or field of view, and, therefore, not to be uſed when we would ſee much of an object, or take in a great ſcope; but it is uſed to great advantage in viewing the planets and their ſatellites, ſaturn's ring, jupiter's belts, *&c.*

The magnifying power of a refracting teleſcope is thus eſtimated: let A B (*ibid.* fig. 2.) be the object-glaſs, and C D the eye-glaſs; and let H F I and G F M be two rays coming from the extreme parts of a diſtant object, and croſſing each other in the center F of the glaſs A B. Then is the angle G F H = I F M that under which the object appears to the naked eye; but I E M = C E D is that under which the image appears as magnified by the eye-glaſs C D. But the angle I E M is to the angle I F M, as L F to L E, or as the focal diſtance of the object-glaſs to the focal diſtance of the eye-glaſs; and in that proportion is the object magnified.

There is a defect in all teleſcopes of this kind, not to be remedied by any means whatever, which was thought only to ariſe from hence, *viz.* that ſpherical glaſſes do not collect rays to one and the ſame point; but it was happily diſcovered by Sir Iſaac Newton, that the imperfection of this ſort of teleſcope, ſo far as it ariſes from the ſpherical form of the glaſſes, bears almoſt no proportion to that which is owing to the different refrangibility of light. This diverſity in the refraction of the rays is about a twenty-eighth part of the whole, ſo that the object-glaſs of a teleſcope cannot collect the rays, which flow from any one point in the object, into a leſs room than the circular ſpace whoſe diameter is about the fifty ſixth part of the breadth of the glaſs. Therefore, ſince each point of the object will be repreſented in ſo large a ſpace, and the centers of thoſe ſpaces will be contiguous, becauſe the points in the objects the rays flow from are ſo, it is evident that the image of an object made by ſuch a glaſs muſt be a moſt confuſed repreſentation, though it does not appear ſo when viewed through an eye-glaſs that magnifies in a moderate degree; conſequently, the degree of magnifying in an eye-glaſs muſt not be too great with reſpect to that of the object-glaſs, leſt the confuſion become ſenſible. Notwithſtanding however this imperfection, a dioptrical teleſcope may be made to magnify in any given degree, provided it be of ſufficient length; for, the greater the focal diſtance of the object-glaſs is, the leſs may be the proportion which the focal diſtance of the eye-glaſs may bear to that of the object-glaſs, without rendering the image obſcure. Thus an object-glaſs, whoſe focal diſtance is about four feet, will admit of an eye-glaſs whoſe focal diſtance ſhall be little more than one inch, and, conſequently, will magnify almoſt forty-eight times; but an object-

glaſs



J. Jefferys sculp.

glaſs of forty feet focus, will admit of an eye-glaſs of only four inch focus, and will, therefore, magnify 120 times; and an object-glaſs of an hundred feet focus, will admit of an eye-glaſs of little more than ſix inch focus, and will therefore magnify almoſt 200 times.

The reaſon of this diſproportion, in their ſeveral degrees of magnifying, is to be explained in the following manner: ſince the diameters of the ſpaces, into which rays flowing from the ſeveral points of an object are collected, are as the breadth of the object-glaſs, it is evident, that the degree of confuſedneſs in the image is as the breadth of the glaſs (for the degree of confuſedneſs will only be as the diameters or breadths of thoſe ſpaces, and not as the ſpaces themſelves.) Now the focal length of the eye-glaſs, that is, its power of magnifying, muſt be as that degree; for, if it exceeds it, it will render the confuſedneſs ſenſible; and, therefore, it muſt be as the breadth or diameter of the object-glaſs. The diameter of the object-glaſs, which is as the ſquare root of its aperture or magnitude, muſt be as the ſquare root of the power of magnifying in the teleſcope; for, unleſs the aperture itſelf be as the power of magnifying, the image will want light: the ſquare root of the power of magnifying, will be as the ſquare root of the focal diſtance of the object-glaſs; and, therefore, the focal diſtance of the eye-glaſs muſt be only as the ſquare root of that of the object-glaſs. So that in making uſe of an object-glaſs of a longer focus, ſuppoſe than one that is given, you are not obliged to apply an eye-glaſs of a proportionably longer focus than what would ſuit the given object-glaſs, but ſuch a one only whoſe focal diſtance ſhall be to the focal diſtance of that which will ſuit the given object-glaſs, as the ſquare root of the focal length of the object-glaſs, you make uſe of, is to the ſquare root of the focal length of the given one. And this is the reaſon that longer teleſcopes are capable of magnifying in a greater degree than ſhorter ones, without rendering the object confuſed or coloured.

Cata-dioptric, or *reflecting* TELESCOPE, is the moſt noble and uſeful of all others; the mechaniſm of which is as follows:

ABEH (*bid.* fig. 3.) is the large tube, or body of the inſtrument, in which BE is a large reflecting mirrour, with a hole in the middle CD. This mirrour receives the rays *a c*, *b d*, coming from the object at a diſtance, and reflects them converging to its focus *e*, where they croſs each other, and form the inverted image IM; *xy* is a ſmall concave mirrour, whoſe focus is at *f*, at a ſmall diſtance from the image. By this means the rays coming from the image are reflected back through the central hole CD of the large mirrour, where they fall on the plano-convex lens WX, and are by it converged to a focus, and there form a ſecond image RS, very large and erect, which is viewed by a meniſcus eye-glaſs YZ, by the eye at P, through a very ſmall hole in the end of the eye-piece YCDZ. If the firſt lens WX were taken away, the image would be formed ſomewhat larger at *MI*; but the area or ſcope would be leſs, and therefore the view not ſo pleaſant. At TV is placed a circular piece of braſs, with a hole of a proper ſize to circumſcribe the image, and cut off all ſuperfluous or extraneous rays, that ſo the object may appear as diſtinct as poſſible.

As the image is formed by reflection, the rays of every ſort will be united nearly in one point, and will therefore admit of an eye-glaſs YZ of a deep charge, or ſmall focal diſtance; and ſo the power of magnifying will be proportionally increaſed.

The magnifying power of a reflecting teleſcope is thus computed. The parallel rays KB (plate CCLXXII. fig. 1.) and LE are reflected by the large object ſpeculum AF to its focus *a*, where the image IM is formed; which image is defined by two other rays NQ, PQ, coming from the extreme parts of the object at a remote diſtance, and meeting in the center of the large ſpeculum at Q. Now if *f* be the focus of the ſmall mirrour GH, ſuppoſing the image were formed in the ſaid focus *f* (that is, that both the foci *a* and *f* were coincident) then the rays proceeding from the image IM will proceed parallel after reflection, and produce diſtinct viſion of the image, which will then ſubtend an angle IOM at the center O of the ſpeculum GH, which is to the angle IQM, under which the object appears to the naked eye, as *a*Q to *a*O or *f*O. So that the magnifying power would in this caſe be as $\frac{aQ}{fO}$.

But, to increaſe this magnifying power, the image IM is not placed in the focus

of

of the ſmall ſpeculum, but at a ſmall diſtance beyond it; by which means the rays coming from the image to the ſpeculum GH will be reflected converging to a diſtant focus R, where a ſecondary large image *I M* is formed from the firſt image I M; which image IM is ſeen under the ſame angle *I O M* with the former from the center of the ſpeculum GH: but from the center of the eye-glaſs T V it is ſeen under the large angle *I S M*. But the angle *I S M* is to the angle *I O M* as O R to S R; wherefore the ſecond ratio, or part of the magnifying power, is that of $\frac{OR}{SR}$.

Conſequently, the whole magnifying power of the teleſcope is $\frac{aQ}{aO} \times \frac{OR}{SR}$ (becauſe in this caſe *f* O becomes *a* O.) Or, in other words, the angle N Q P, under which the object appears to the naked eye, is to the angle *I S M*, under which the large magnified ſecondary image *I M* appears to the eye through the eye-glaſs, as $\frac{aQ \times OR}{aO \times SR}$. Such is the theory of the teleſcope firſt contrived by Dr. J. Gregory, and therefore called the gregorian teleſcope; but it received its laſt improvement from the late Mr. Hadley, and is now in common uſe.

The machinery for ſupporting and managing this teleſcope, is thus deſcribed by Dr. Smith, Opt. §. 924. The baſe of the pedeſtal *a b* (*ibid.* fig. 3.) is a thick board *a*, reſting upon four braſs feet; one of which being a pin, *p*, that ſcrews through the board, will make it ſteady upon any uneven plane: *b* is a ſmall upright pillar about a foot long, fixed in the board *a*; and *c d* is a braſs-arm, that ſcrews into it: *d e* is a ſhort braſs-piece that turns round upon the end of the arm *c d*, and is tightened and ſtayed by the ſcrew *d*: *e* is a hollow ſocket, with a round braſs-ball in it, moveable every way: the neck of this ball is fixed to the middle of the braſs-piece *f g*, which is fixed along the ſide of the tube *h i*, by the ſcrews *f* and *g*. The eye-glaſſes are placed in the end *l*, and the tube is adjuſted to various diſtances by means of the wire *h i k*. When this teleſcope is uſed at home, the pedeſtal *a b* may be placed upon a table near a window: but when it is uſed abroad, the pedeſtal may be left at home: for having made a hole in the ſide of a tree by the hand-augre *m*, the wood ſcrew at the end of *c d* may be ſcrewed into it.

A ſmall alteration was made in the ſtructure of this teleſcope by Mr. Caſſegrain, *viz.* in uſing a convex ſpeculum *G H* (*ibid.* fig. 1.) inſtead of the concave one G H. Now if they are equally ſpherical, that is, if they are ſegments of the ſame ſphere, then will *f* be alſo the virtual focus of the convex G H; and, if all other things remain the ſame, the firſt image I M will be virtually the ſame as before, and the laſt image *I M* will be really the ſame; ſo that the magnifying power of this form of the teleſcope is $\frac{aQ \times OR}{aO \times SR}$, which is equal to that of Gregory's form.

Sir Iſaac Newton ordered this teleſcope to be made in a different form or manner, as follows: A B C D (*ibid.* fig. 2.) was a large octogonal tube or caſe; E F a large poliſhed ſpeculum, whoſe focus is at *o*; G H a plane ſpeculum truly concentered, and fixed at half a right angle with the axis of the large one. Then parallel rays *a* E, *b* F, incident on the large ſpeculum E F, inſtead of being reflected to the focus *o*, were intercepted by the ſmall plane ſpeculum G H, and by it reflected towards a hole *c d* in the ſide of the tube, croſſing each other in the point O, which is now the true focal point; and from thence they proceed to an eye-glaſs *e f* placed in that hole, whoſe focal diſtance is very ſmall, and therefore the power of magnifying may be very great in this form of the teleſcope; becauſe the image I M is made by one reflection (for that of the plane ſpeculum only alters the courſe of the rays, and adds nothing to the confuſion of the image) and will, for that reaſon, bear being viewed by a glaſs of a very deep charge, in compariſon of an image formed by differently refrangible rays.

This teleſcope is a very good one, as to its effect or performance, but is not ſo commodious for common uſe as thoſe of the gregorian form, and is therefore now pretty much laid aſide. They who would ſee a larger account hereof, may conſult Sir Iſaac's Optics, and ſeveral Philoſophical Tranſactions, where he deſcribes it at large, and the reaſons which induced him to make choice of this ſtructure rather than that of Dr. Gregory: or ſee a compendious account of the whole in the laſt edition of Dr. Gregory's Elements of Optics.

TELESCOPES.

Solar TELESCOPE. This inſtrument is applied to uſe in the following manner: AB (*ibid.* fig. 4.) repreſents a part of the window-ſhutter of a darkned room, CD the frame, which (by means of a ſcrew) contains the ſcioptric ball EF, placed in a hole of the ſaid ſhutter adapted to its ſize. This ball is perforated with a hole *abcd* through the middle; on the ſide *bc* is ſcrewed into the ſaid hole a piece of wood, and in that is ſcrewed the end of a common refracting teleſcope GH, IK, with its object-glaſs GH, and one eye-glaſs at IK; and the tube is drawn out to ſuch a length, as that the focus of each glaſs may fall near the ſame point.

This being done, the teleſcope and ball are moved about in ſuch a manner as to receive the ſun-beams perpendicularly on the lens GH, through the cylindric hole of the ball; by this glaſs they will be collected all in one circular ſpot *m*, which is the image of the ſun. The lens IK is to be moved nearer to or farther from the ſaid image *m*, as the diſtance at which the ſecondary image of the ſun is to be formed requires, which is done by ſliding the tube IKLM backwards and forwards in the tube LMNO. Then of the firſt image of the ſun *m* will be formed a ſecond image PQ, very large, luminous, and diſtinct.

In this manner the ſun's face is viewed at any time, without offence to weak eyes; and whatever changes happen therein, may be duly obſerved. The ſpots (which make ſo rare an appearance to the naked eye, or through a ſmall teleſcope in the common way) are here all of them conſpicuous, and eaſy to be obſerved under all their circumſtances of beginning to appear, increaſe, diviſion of one into many, the uniting of many into one, the magnitude, decreaſe, abolition, diſappearance behind the ſun's diſk, &c. By the ſolar teleſcope, we alſo view an eclipſe of the ſun to the beſt advantage, as having it in our power by this means to repreſent the ſun's face or diſk as large as we pleaſe, and conſequently the eclipſe proportionably conſpicuous. Alſo the circle of the ſun's diſk may be ſo divided by lines and circles drawn thereon, that the quantity of the eclipſe eſtimated in digits, may this way be moſt exactly determined: alſo the moments of the beginning, middle, and end thereof, for finding the longitude of the place: with ſeveral other things relating thereto. See FACULÆ, MACULÆ, ECLIPSE, LONGITUDE, &c.

The tranſits of mercury and venus over the face of the ſun, are exhibited moſt delightfully by this inſtrument. They will here appear truly round, well defined, and very black; their comparative diameters to that of the ſun may this way be obſerved, the direction of their motion, the times of their ingreſs and egreſs, with other particulars for determining the parallax and diſtance of the ſun, more nicely than has hitherto been done.

By the ſolar teleſcope, you ſee the clouds moſt beautifully paſs before the face of the ſun, exhibiting a curious ſpectacle according to their various degrees of rarity and denſity. But the beautiful colours of the clouds ſurrounding the ſun, and refracting his rays, are beſt ſeen in the picture made by the camera-glaſs. See the article CAMERA.

The fine azure of the ſky, the intenſely ſtrong and various dyes of the margins of clouds, the halo's and corona's, are this way inimitably expreſſed. And ſince the priſmatic colours of clouds, ſo variouſly compounded here, make ſo noble and delightful a phænomenon, it is ſurpriſing that no more regard is had thereto by painters, whoſe clouds (though near the ſun) are ſeldom or never ſeen tinged or variegated with thoſe natural tints and colours. See CLOUD, HALO and CORONA.

Aerial TELESCOPE, is a dioptric teleſcope, uſed without a tube, in a dark night; for the uſe of the tube is not only to direct the glaſſes, but alſo to make the place dark where the images of objects are formed.

Hugenius contrived a teleſcope of this kind for viewing the celeſtial bodies, by fixing the object-glaſs on the top of a long upright pole, and directing its axis towards any object by means of a ſilk line coming from the object-glaſs to the eye-glaſs below.

We ſhall here give the deſcription of one of theſe teleſcopes. On the top of a long pole, or maſt, *ab* (plate CCLXXIII. fig. 1.) is fixed a board moveable up and down in the channel *cd*: *e* is a perpendicular arm fixed to it, and *ff* is a tranſverſe board that ſupports the object-glaſs incloſed in the tube *i*, which is raiſed or lowered by means of the ſilk thread *rl*; *gg* is an endleſs rope, with a weight *h*, whereby the apparatus of the object-glaſs is counterpoiſed; *kl* is a ſtick faſtened to the tube *i*; *m* the ball and ſocket, by

means of which the object-glaſs is moveable every way; and to keep it ſteady there is added a weight *n* ſuſpended by a wire; *l* is a ſhort wire, to which the thread *r l* is tied; *o* is the tube which holds the eye-glaſs; *q* the ſtick fixed to this tube, *s* a leaden bullet, and *t* a ſpool to wind the thread on; *u* is pins for the thread to paſs through; *x* the reſt for the obſerver to lean upon; and *y* the lantern. In this manner, teleſcopes have been conſtructed 123 feet long.

There are ſeveral ways of preparing a pole of a proper height, which every workman can readily employ. But as unexperienced perſons cannot eaſily find out and follow an object with this ſort of teleſcope, we ſhall ſhew how this may be done by means of a ſmall machine placed upon a reſt *a a* (*ibid.* fig. 2.) and a variable rhombus made of braſs plates *b b*, two of whoſe ſides are produced, till they equal the ſides of the rhombus, which is fixed at *g g* to the reſt. From the upper angle of the rhombus, there projects a ſmall axis about half an inch: on this axis is fixed the plate *e*, which upon a very ſmall axis ſupports the ſtick and tube of the eye-glaſs; and the whole is counterpoiſed upon the axis *f* by proper weights *h*, *h*. Things being thus ordered, to whatever place the obſerver ſhall move the object-glaſs, by the handle *d*, there it will remain at reſt.

And for managing the object-glaſs, M. de la Hire contrived the machine repreſented, *ibid.* fig. 3. where E F is an oblong piece of wood, of a convenient magnitude, to the ends of which are fixed two cylindrical ſtaves G H, I K, to ſerve as an axis; then a hole is bored in a line with this axis, for the wooden axis S L M to paſs through, with two nuts S, M. To the upper end, S, is fixed a ſquare board A C, with a circular pole in it to receive the object-glaſs; and to the bottom corners of this board are fixed two wooden rulers, which meet at N, where there is a pin, R; to which the ſilk-thread for moving the object-glaſs is tied, as much below the line C D as the axis G K, which lies upon two tenter-hooks O, P. To keep off the dew from the object-glaſs, the ſame gentleman orders it to be included in a paſteboard-tube, made of ſpungy paper, to ſuck up the humidity of the air: and to find an object more readily, he preſcribes a broad annulus of white paſteboard to be put over the tube that carries the eye-glaſs; upon which the image of the object being painted, an aſſiſtant, that ſees it, may direct the tube of the eye-glaſs into its place: or, that the obſerver himſelf may ſee it, he would have it received upon a ring of tranſparent oiled paper, paſted upon a circular frame inſtead of paſteboard.

TELESCOPE-SHELL, in ichthyology, the conic turbo, with plane, ſtriated, and very numerous ſpires. See TURBO.

Tubes for TELESCOPES. See TUBE.

TELESIN, a province of the kingdom of Algiers, in Africa, ſituated on the confines of the empire of Morocco.

TELGA, a city of Sweden, in the province of Sunderland, ſituated on the ſouth-ſide of the Meller-lake, twenty miles ſouth-weſt of Stockholm.

TELLER, an officer of the exchequer, in antient records called tallier; there are four of theſe officers, whoſe duty is to receive all ſums due to the king, and to give the clerk of the pells a bill to charge him therewith. They likewiſe pay all money due from the king, by warrant from the auditor of the receipt, and make weekly and yearly books, both of their receipts and payments, which they deliver to the lord treaſurer.

TELLONIUM. See THELONIUM.

TELLICHERRY, a port town on the Malabar coaſt, in the hither India, thirty miles north of Callicut: eaſt long. 75° north lat. 12°.

TELLINA, in ichthyology, a name given to thoſe ſpecies of muſcles, which have equal extremities, and are of an oblong plane figure. See the article MYTULUS.

TELLUS. See the article EARTH.

TEMESWAER, the capital city of the Bannat of Temeſwaer, lately annexed to Hungary, ſixty miles north-eaſt of Belgrade: eaſt long. 22°, north lat. 45° 55′.

TEMPERAMENT, among phyſicians, denotes the ſame with conſtitution; or a certain habitude of the humours of the human body, whereby it may be denominated hot, cold, moiſt, dry, bilious, ſanguine, phlegmatic, melancholic, &c. See the article CONSTITUTION.

According to Boerhaave, moiſtening, diluting, and temperating ſubſtances, are a proper diet for perſons of a hot and acrid temperament; and, on the contrary, all heating things are prejudicial to them: whereas, in perſons of a cold and moiſt habit, juſt the reverſe of this obtains. To perſons of a ſanguineous temperament, evacuating and temperating medicines

medicines are beneficial, and heating or drastic stimulating things pernicious. Persons of a melancholy temperament are greatly injured by hot, drying, and acrid substances; whereas moistening, refrigerating, relaxing, emollient substances, and such as gently dissolve without any acrimony, are beneficial to them.

TEMPERAMENT in music, is the rectifying or mending the imperfect concords, by transferring to them part of the beauties of the perfect ones. See the articles CONCORD and INTERVAL.

In order to this, musicians take a medium between the two, which they call a temperament. Supposing then, one tone increased, and the others diminished, by half a comma, we should have our thirds major perfect: but still, it is necessary to examine, what fifths this supposition would give. Now it is evident, that a tone-major added to an octave, makes just too fifths, thus $\frac{2}{1} \times \frac{9}{8} = \frac{9}{4} = \frac{3}{2} \times \frac{3}{2}$. But the tone here added is a tone major, and the tone we have assumed is a temperate tone, deficient from the tone major by half a comma; hence the sum of the two fifths, on this supposition, will fall short of the truth by $\frac{1}{2}$ of a comma, and consequently one fifth will be deficient by $\frac{1}{4}$ of a comma. Which difference, although it be sensible, yet experience shews, that fifths so diminished are tolerable.

This is what is called the common or vulgar temperament, and consists, as has been said, in diminishing the fifth by $\frac{1}{4}$ of a comma, in preserving the third major perfect, and dividing it into two equal tones. Which being supposed, it follows that the fourth must exceed the truth by $\frac{1}{4}$ of a comma; that the third minor will be deficient by the same quantity; that the sixth minor will be perfect, and the sixth major redundant by $\frac{1}{4}$ of a comma; and lastly, that the semitone major will exceed the truth by $\frac{1}{4}$ of a comma. If we introduce chromatic notes, or flats and sharps, the semitone minor will also exceed the truth by $\frac{1}{2}$ of a comma, and consequently the difference between the two semitones, or the diesis enharmonica, will be preserved.

There are also other temperaments proposed by different authors; as that of 31 parts by Mr. Huygens; Mr. Sauver's of 43, Mr. Henfling's of 50, and that of 12.

TEMPERING *of steel and iron*, the rendering them either more compact and hard, or soft and pliant, according as the different uses for which they are wanted may require. See IRON and STEEL.

This operation consists in plunging them, while red-hot, into some liquor prepared for the purpose; sometimes in pure water, as locksmiths, *&c.* which seldom use any other: and sometimes a composition of divers juices, liquors, *&c.* is used; which is various according to the manner and experience of the workman; as vinegar, mouse-ear water, the water oozing from broken glasses, soot, salt, oil, *&c.* To harden and temper english, flemish, and swedish steel, they must have a pretty high heat given them, and then be suddenly quenched in water to make them hard: but spanish and venetian steel will require no more than a blood-red heat before it is quenched.

If the steel be too hard or brittle for an edged tool, *&c.* take it down by rubbing a piece of grind stone or whet-stone hard upon the work, to take off the black scurf; then brighten or heat it in the fire, and as it grows hotter, you will see the colour change by degrees, coming first to a straw or light gold-colour, then to a darker gold-colour, and at last to a blue colour.

Choose such of these colours as the work requires, then quench it suddenly in the water. The light-gold colour is for files, cold chissels, and punches to punch iron and steel: the dark gold-colour, for punches to use on brass, *&c.* the blue colour gives the temper for springs.

The tempering of files and needles is performed after a peculiar manner.

The antients appear to have had some better method of tempering, than any of the moderns are acquainted withal; witness their works in porphyry, a stone so hard, that none of our tools make an impression upon it.

TEMPLARS, or TEMPLERS, a religious order instituted at Jerusalem, about the year 1118. Some religious gentlemen put themselves under the government of the patriarch of Jerusalem, renounced property, made the vow of celibacy and obedience, and lived like canons regular. King Baldwin assigned them an apartment in his palace. They had likewise lands given them by the king, the patriarch, and the nobility, for their maintenance. At first there were but nine of this order, and the two principal persons were Hugo de Paganis, and Geoffry of St. Omers. About nine

years after their inſtitution, a rule was drawn up for them, and a white habit aſſigned them, by pope Honorius II. About twenty years afterwards, in the popedom of Eugenius III. they had red croſſes ſewed upon their cloaks, as a mark of diſtinction; and in a ſhort time they were increaſed to about three hundred, in their convent at Jeruſalem. They took the name of Knights Templars, becauſe their firſt houſe ſtood near the temple dedicated to our Saviour, at Jeruſalem. This order, after having performed many great exploits againſt the infidels, became rich and powerful all over Europe; but the knights, abuſing their wealth and credit, fell into great diſorders and irregularities. Many crimes and enormities being alledged againſt them, they were proſecuted in France, Italy and Spain; and at laſt, the pope, by his bull of the 22d of May, 1312, given in the council of Vienna, pronounced the extinction of the order of Templars, and united their eſtates to the order of St. John of Jeruſalem.

TEMPLE, a general name for places of public worſhip, whether pagan, chriſtian, or otherwiſe. But the word, in a reſtrained ſenſe, is uſed to denote the places, or edifices, in which the pagans offered ſacrifice to their falſe gods. Thus we hear of the Temples of Jupiter, Apollo, Bacchus, &c. They were built and adorned with all poſſible ſplendor and magnificence, partly out of reſpect to the gods, and partly to create an awe and reverence in the worſhippers. They were conſtructed in the manner which was thought moſt agreeable to the gods, to whom they were dedicated. Thus Jupiter, they thought, took moſt delight in pillars of the doric order; Bacchus in the ionic; and Veſta in the corinthian: this rule, however, was not univerſally or conſtantly obſerved. Temples were divided into two parts; the one called Adytum, which was the inmoſt receſs of the building, and deemed ſo ſacred, that none but the prieſts were allowed to enter into it; the other was open, and free to all, who came to pay worſhip. In the middle of the temples ſtood the images of the gods, on pedeſtals, raiſed above the height of the altar, and incloſed with rails.

Temples, according to the number and difference of their columns, were divided into tetraſtyle, proſtyle, amphiproſtyle, periptere, diptere, pſeudo-diptere, hypæthros, and monoptere, temples. See TETRASTYLE, &c.

TEMPLES, in anatomy, a double part of the head, reaching from the forehead and eyes to the two ears. See HEAD.

TEMPORAL, a term generally uſed for ſecular, as a diſtinction from eccleſiaſtical. Thus we ſay temporal lords, and ſpiritual or eccleſiaſtical lords.

TEMPORALIS, in anatomy. See the article CROTAPHITES.

TEMPORALITIES, the temporal revenues of an eccleſiaſtic, ſuch as have been annexed to biſhops-ſees by kings, and other great perſonages of this land, as they are barons and lords of parliament, ſuch as manors, lands, and lay fees.

TEMPORUM OSSA. See the article PETROSA OSSA.

TENAILLE, in fortification, a kind of outwork, reſembling a horn-work, but generally ſomewhat different, for inſtead of two demi-baſtions, it bears only in front a re-entring angle betwixt the ſame wings without flanks; and the ſides are parallel. See the articles FORTIFICATION and HORN-WORK.

Tenaille double or flanked, is a work, whoſe front conſiſts of four faces, making two re-entring angles, and three ſaliant; the wings or ſides of this work being in like manner correſpondent in the front of the gorge. See the article GORGE.

Tenaille ſimple, a work having its front formed by two faces, which make a re-entring angle, the ſides running directly parallel from the head to the gorge.

Tenaille of the place, is that which is comprehended between the points of two neighbouring baſtions; that is to ſay, the curtain, the two flanks that are raiſed on the curtain, and the two ſides of the baſtions which face one another; ſo that it is the ſame with what is otherwiſe called the face of the fortreſs. See the article BASTION, &c.

Tenaille of the foſs, is a low work raiſed before the curtain in the middle of the foſs: it is of three ſorts; the firſt is compoſed of a curtain, two flanks and two faces; the rampart of the curtain, including the parapet and talus, is but five fathom thick, but the rampart of the flanks and faces is ſeven. The ſecond is compoſed only of two faces made on the lines of defence, whoſe rampart and faces are parallel. The third ſort differs from the ſecond, only in this, that its rampart is parallel to the curtain of the place. All three ſorts are good, and cannot be

hurt

hurt by the beſiegers cannon, till they are maſters of the covert way, and have planted their canon there. See FOSS.

All tenailles are defective in this reſpect, that they are not flanked or defended towards their inward or dead angle; becauſe the height of the parapet hinders ſeeing down before the angle, ſo that the enemy can lodge himſelf there under covert: wherefore tenailles are never made but when they want time to make a horn-work.

TENANT, one that holds lands or tenements of ſome lord, or landlord, by rent, fealty, &c. There are ſeveral ſorts of tenants, as tenants in fee, tail, for life, years, or at will. There are alſo joint-tenants, tenants in common. See the article JOINT-TENANT, &c.

Tenant to the præcipe, is the perſon againſt whom the writ of præcipe is to be brought in ſuing out a common recovery. See the article PRÆCIPE.

TENANT, or TENAN, in heraldry. See the article SUPPORTER.

TENAR, in anatomy. See THENAR.

TENBURY, a market-town of Worceſterſhire, fifteen miles north-weſt of Worceſter.

TENBY, a port-town of Pembrokeſhire, ſituated on Briſtol channel: weſt long. 4° 45′, north lat. 51° 40′.

TENCH, in ichthyology, the engliſh name of a ſpecies of the cyprinus, of a purpliſh black colour; with an even tail; its length is generally about ten or eleven inches, its breadth about three, and its thickneſs more than two; but it ſometimes grows to an immoderate large ſize. See the article CYPRINUS.

For the method of fiſhing for tench. See the article FISHING.

TENDE, a town of Piedmont, in Italy, twenty-five miles north-eaſt of Nice.

TENDER, in law, ſignifies carefully to offer, or circumſpectly endeavour the performance of a thing; as to tender rent is to offer it at the time and place when and where it ought to be paid, which is done to ſave the penalty of a bond or obligation, before action is brought thereon. A tender of rent on any part of the land occupied, or at any time of the laſt day of payment, will ſave the proviſo, or condition for that time, whether the landlord does accept of it or not; and yet though the rent be duly tendered, the landlord may afterwards bring action of debt; but he cannot recover any damages, for in that caſe the tenant's tender excuſes the damages, but does not debar the landlord of his rent: but it muſt be obſerved, that a tender of rent made to ſave forfeiture, muſt be of the whole rent due without any deduction, on account of the taxes, &c. unleſs it be ſo agreed betwixt the landlord and tenant; for ſtoppage is no payment in law. Where a tender is of money due on a bond, it muſt be made to the perſon of the obligee on the day appointed; nevertheleſs, if the obligor be afterwards ſued, he muſt ſtill pay the money.

TENDER, a ſmall ſhip, in the ſervice of men of war, for carrying of men, proviſions, or any thing elſe that is neceſſary.

TENDONS, are white, firm, and tenacious parts, continuous to the muſcles, and uſually forming their extremities. When the fibres of which they are compoſed, expand themſelves into a membrane, they are called Aponeuroſes. See the article MUSCLE.

Tendo Achillis, is a large tendon, formed by the union of the tendons of the four exterior muſcles of the foot; it is ſo called, becauſe the fatal wound whereby Achilles is ſaid to have been ſlain, was given there.

TENEBRÆ, an office in the romiſh church, performed on Wedneſday Thurſday, and Friday, in Paſſion Week, at which time, neither flowers nor images are allowed to be ſet upon the altars, but they muſt be covered with purple.

TENEBRIO, *the ſtinking beetle*, in natural hiſtory, a genus of inſects, the antennæ of which are ſlender, oblong, and filiform; the elytra are joined together, and there are no interior wings.

TENEDOS, one of the ſmalleſt iſlands of the Archipelago, ſituated near the coaſt of leſſer Aſia, weſt of the ruins of Troy, eaſt long. 27°, north lat. 39° 30′.

TENEMENT, properly ſignifies a houſe; but in a larger ſenſe it is taken for any houſe, land, rent, or other thing, which a perſon holds of another.

TENEMENTARY LANDS, ſuch as are held by the tenant, diſtinguiſhed by that name from the demeſne land of the lord, called inland.

TENEMENTIS LEGATIS, a writ that antiently lay to the city of London, or any other corporation, where, according to the old cuſtom, men might deviſe tenements, as well as goods and chattels,

by

by their laſt will, for the determining of any controverſy relating thereto, and for rectifying the wrong tenant.

TENENTIBUS IN ASSISA NON ONERANDIS, a writ which lies for the perſon to whom a diſſeiſor has aliened the land, whereof he diſſeiſed another; that he be not arreſted for the damages awarded on the aſſize, if the diſſeiſor has wherewith to ſatisfy them himſelf.

TENERIF, one of the largeſt of the Canary Iſlands, ſituated in the Atlantic Ocean: weſt long. 17°, north lat. 28°, being about 120 miles in circumference. It is a fruitful iſland, abounding in corn, wine and oil, though pretty much incumbered with mountains, of which the moſt remarkable is that called the pico of Tenerif, being one of the higheſt mountains in the world, in the form of a ſugar-loaf, the white top whereof may be ſeen at ſea, upwards of one hundred miles.

TENES, a province of the kingdom of Algiers, in Africa.

TENESMUS, in medicine, a name given by medical writers, to a complaint which is a continual deſire of going to ſtool, but without any ſtool being ready to be voided. This is uſually attended with ſome tumour, ſometimes with a very conſiderable one in the part. This is properly no primary diſeaſe, but merely a ſymptomatic one, and differs in degree according to the diſeaſe on which it is an attendant. Signs of it are a titillation and itching about the anus, attended with a violent burning pain, and a deſire of compreſſing and voiding ſomething, and this attended uſually with no excrement, or only a pulpous or mucous matter, and very often a prolapſus ani, or falling down of the rectum. This diſeaſe happens often to people labouring under hæmorrhoidal diſorders, eſpecially when the diſcharges attending them do not ſucceed regularly, though nature gives all the neceſſary motions for their excretion. It happens alſo to people who are ſubject to void an acrid and bilious matter by ſtool, and not unfrequently to thoſe who have a ſtone in the bladder. Women in the latter part of their time in going with child, have alſo very often terrible fits of it, attended with conſiderable ſwelling; this happens to them from the preſſing of the uterus, with its burden, upon the rectum and hæmorrhoidal veins. The cauſes of a teneſmus, beſides thoſe already mentioned, are the aſcarides, a ſmall ſort of worms, which uſually infeſt the rectum, and occaſion a continual itching and tickling there; the abuſe of reſinous purging medicines. Much riding will alſo ſometimes occaſion it. See PROLAPSUS, HÆMORRHOID, &c.

As the teneſmus is merely a ſymptomatic diſeaſe, the primary diſorder is firſt to be examined, and treated in order to a cure; thus, when it is occaſioned by aſcarides, worm medicines are to be given, and clyſters of a proper kind injected; and when the worms are by this means deſtroyed, the teneſmus, which was no more than a ſymptom, naturally ceaſes. In general, the regimen and method of cure proper in a teneſmus, are the ſame with thoſe preſcribed in a dyſentery; great relief is afforded by a fomentation of warm milk, in which elder flowers have been boiled, as alſo by a clyſter of mutton-broth, or an emollient clyſter, in which earth-worms have been boiled. The medicines, at preſent, generally uſed for the cure of a teneſmus, are theſe following: Take of pulvis ſanctus and rhubarb, each one ſcruple; of the oil of cinnamon, one drop; of london laudanum, half a grain; and of the ſyrup of violets, a ſufficient quantity for making into a bolus, to be taken in the morning, and repeated as the ſituation of the patient requires; at night, a paregoric may be exhibited, and clyſters afterwards uſed; for which purpoſe, take of whey, or mutton-broth, four ounces; of canary wine, two ounces; of gum arabic, half an ounce; of gum tragacanth, one dram; and of crude opium, two grains; make into a clyſter, to be injected twice or thrice a day, afterwards continue the following medicine for ſome time: Take of the confection of Fracaſtorius, without honey, one ſcruple; of ſperma ceti, fifteen grains; of the ſpecies hyacinthæ, japan earth, red coral, and american bole, each eight grains; of the oil of nutmegs, one drop; and ſyrup of red roſes, a ſufficient quantity for making a bolus, to be taken twice a day, in a ſmall quantity of the tincture of red roſes. In a teneſmus, the laſt refuge is to opiates.

TENET, or TENENT, a particular opinion, dogma, or doctrine, profeſſed by ſome divine, philoſopher, &c.

TENNE, TENNY, or TAWNY, in heraldry, a bright colour made of red and yellow mixed; ſometimes alſo called bruſk, and expreſſed in engraving, by thwart, or diagonal ſtrokes or hatches, begin-

beginning from the ſiniſter chief, like purpure, and marked with the letter T. In the coats of all below the degree of nobles, it is called tenny; but in thoſe of nobles, it is called hyacinth; and in princes coats, the dragon's head. See plate CCLXXIV. fig. 3.

TENON, in building, *&c.* the ſquare end of a piece of wood, or metal, diminiſhed by one third of its thickneſs, to be received into an hole in another piece, called a mortiſe, for the jointing or faſtening the two together. It is made in various forms, ſquare, dove-tailed for double mortiſes, and the like.

TENOR, or TENOUR, the purport or content of a writing or inſtrument in law, *&c.* An action of debt brought upon a judgment in an inferior court, where the defendant pleads, *nul tiel record*, no ſuch record, a tenor thereof only ſhall be certified; and it likewiſe is the ſame on certioraris. A tenor of a libel has been held to be a tranſcript of it.

TENOR, or TENORE, in muſic, the firſt mean, or middle part, or that which is the ordinary pitch of the voice, when neither raiſed to a treble, or lowered to a baſs. The tenor is commonly marked in thorough baſs with the letter T. This is that part which almoſt all grown perſons can ſing; but as ſome have a greater compaſs of voice upwards, others downwards, others are confined to a kind of medium, and others can go equally high or low; hence muſicians make a variety of tenors, as a low, a high, a mean, a natural tenor, to which may be added, a violin tenor, *&c.* for inſtruments. The Italians uſually diſtinguiſh two kinds of tenor, *tenore primo*, or 1° or P°, which anſwers to our upper tenor; and *tenore ſecundo*, 2°, or II°, which is our natural tenor, confounding the counter tenors, *&c.* under the name of baritono. See the article BARITONO, *&c.*

TENOR, or TENORISTA, is alſo uſed for a perſon who ſings the tenor part in concert alſo, for any inſtrument proper to play it.

TENORE INDICTAMENTI MITTENDO, in law, a writ for the removing of a record of an indictment, and the proceſs thereon out of another court, into the king's-bench. It is uſual in theſe caſes to certify the record itſelf, except it be from London, by virtue of the city charter.

TENORE PRESENTIUM, *by the tenor of theſe preſents*, in law, is taken for the ſubſtance, true intent and meaning of a deed, or other writing. See DEED, *&c.*

TENSE, TIME, in grammar, an inflection of verbs, whereby they are made to ſignify, or diſtinguiſh the circumſtance of time, in what they affirm. See VERB.

There are only three ſimple tenſes or times; the preſent, as *amo, I love*; the preterit, as *amavi, I have loved*; and the future, as *amabo, I ſhall* or *will love*. See PRESENT, *&c.*

But, as in the preterit, one may ſay, that the thing is but juſt now done; or indefinitely, that it was done; hence, in moſt languages, there are two ſorts of preterits or paſt tenſes; the one definite, which marks the thing to be preciſely done, as *I have ſaid, I have done, I have dined*; the other ſignifies it done indeterminately, and is for that reaſon called indefinite, or aoriſt, as *I wrote, I went, &c.* See AORIST, IMPERFECT, PLUSQUAMPERFECT, *&c.*

TENT, in ſurgery, a roll of lint worked into the ſhape of a nail, with a broad flat head. Tents differ in thickneſs and length, according to the ſize of the wound for which they are intended, as appears by the figures in plate CCLXXIV. fig. 1. at the letters K, L, M, N. Theſe tents are chiefly uſed in deep wounds and ulcers. They are of ſervice, not only in conveying medicines to the moſt intimate receſſes and ſinuſes of the wound, but to prevent the lips of the wound from uniting, before it is healed from the bottom; and by their aſſiſtance grumous blood, ſordes, *&c.* are readily evacuated. They ought to be made extremely ſoft, that the cure of the wound may not be retarded by the pain they would otherwiſe bring on.

There is another kind of tents, made of linnen rags not ſcraped, and worked up into a conical form, to the baſis of which is faſtened a long thread; the apex of this tent muſt be a little unravelled, to make it ſofter, leſt it may become painful: the thread is faſtened to the baſis, that the tent may be recovered with the greater eaſe, if, by any accident, it ſhould be forced into the cavity of the thorax or abdomen (*ibid.* letter O); for the tents we now deſcribe, are chiefly uſed to keep open wounds that penetrate into the cavity of the thorax or abdomen, in order to make way for the proper diſcharge of blood, matter, *&c.*

There is a third ſort of tents, which ſerve not only to keep open, but to enlarge, by degrees, the mouth of any wound or ulcer, which ſhall be thought too ſtrait; that,

that, by this means, a free paſſage may be procured for the blood and matter that were confined, and that proper medicines may find a more ready admittance. Theſe tents are made either of ſponge, prepared in a certain manner; or of dried roots of gentian, calamus aromaticus, &c. for their ſubſtances imbibe the matter which flows to them, and being preſently enlarged, dilate the lips of the wound.

TENTER, a machine uſed in the cloth manufacture, to ſtretch out the pieces of cloth, ſtuff, &c. or only to make them even, and ſet them ſquare.

It is uſually about four feet and a half high, and, for length, exceeds that of the longeſt piece of cloth. It conſiſts of ſeveral long pieces of wood, placed like thoſe which form the barriers of a manege; ſo that the lower croſs-piece of wood may be raiſed or lowered, as is found requiſite, to be fixed at any height, by means of pins. Along the croſs-pieces, both the upper and under one, are hooked nails, called tenter-hooks, driven in from ſpace to ſpace.

TENTERDEN, a market-town of Kent, twenty miles ſouth-weſt of Canterbury.

TENTHREDO, in natural hiſtory, a genus of the hymenoptera claſs of inſects, the female having a ſerrated point or weapon at the tail: the worm produced of the egg has ſeveral feet. The ſpecies of this genus have been generally confounded with the ichneumon. See the article ICHNEUMON.

TENURE, in law, ſignifies the manner whereby lands or tenements are held, or the ſervice that the tenant owes to his lord: it likewiſe denotes the eſtate in the land. Tenures were antiently divided into the following: eſcuage; that is, land held by the ſervice of the ſhield, and thereby the tenant was, at his own expence, obliged to follow his lord into the wars. Knight's ſervice and chivalry; when lands were held of the king, or meſne-lord, to perform ſervice in war. Burgage tenure; land held of the lord of the borough, at a certain rent. Villenage, otherwiſe termed baſe-tenure; whereby the tenant was bound to do all inferior ſervices, commanded by the lord. Grand-ſerjeanty; lands held by honorary ſervices at the king's coronation. Petit-ſerjeanty; lands held of the king, to contribute yearly ſome ſmall thing towards his wars. Frankalmoine; that tenure by which lands were held by eccleſiaſtics, in free and perpetual alms. Socage-tenure; where lands are held by tenants, to plow their lord's land, and perform other offices of huſbandry, at their own expence. But all theſe antient tenures and ſervices are, in general, taken away, and reduced into common and free-ſocage. The uſual tenures at preſent are, fee-ſimple; which is an abſolute tenure of lands to a man and his heirs for ever. Fee-tail; a limited fee, to a perſon and the heirs of his body begotten. Curteſy-tenure; where a man having married a woman ſeiſed in fee, &c. has iſſue born alive by her, in which caſe, after her death, the huſband is tenant by the curteſy of England. Tenure in dower; is where a widow holds, for her life, a third part of her huſband's land, whereof he was ſeiſed in fee at any time during the coverture. There is alſo a tenure for life, or years, when lands are held for thoſe terms on reſerved rents. Copyhold-tenure, is a holding for lives, or in fee, at the will of the lord, according to the cuſtom of the manor.

TEPID, a term uſed by writers on mineral waters, &c. to expreſs ſuch of them as have a leſs ſenſible cold than common water. See MINERAL WATER.

TERAMO, a town of Italy, in the kingdom of Naples, and territory of Abruzzo, forty-two miles ſouth of Loretto: eaſt longit. 15°, and north lat. 42° 40'.

TERCERA, one of the largeſt of the Azores or Weſtern-iſlands, ſituated in the Atlantic ocean: weſt lon. 28°, and north lat. 39°.

TEREBINTHUS, the TURPENTINE-TREE. See the article TURPENTINE.

TERES, in anatomy, a name given to two muſcles of the arm; one is called teres major, and is one of the depreſſor muſcles, which has its origin at the lower angle of the ſcapula, and its termination three fingers below the head of the humerus: the other is called teres minor, being one of the abductor-muſcles, and having its origin at the inferior coſta of the ſcapula; this, together with the infraſpinatus, properly forms one conjunct muſcle, having, at the extremity, only a ſingle tendon, which is inſerted into the poſterior part of the neck of the humerus.

TERGIFOETUS PLANTS, ſuch as bear their ſeeds on the backſides of their leaves: ſuch are all the capillary plants.

TERGOWISCO, the capital of Wallachia, in european Turky, eighty miles ſouth-eaſt of Hermanſtat in Tranſilvania: eaſt long. 26° 30', north lat. 45° 35'.

TERKI, a port-town of Circaſſia, in Aſia, ſituated on a river of the ſame name, near the Caſpian ſea: eaſt lon. 52°, and north lat. 43° 40′.

TERM, *terminus*, in general, ſignifies much the ſame with boundary or limit. See BOUNDARY and LIMIT.

TERM, in law, is generally taken for a limitation of time or eſtate; as a leaſe for term of life, or years, which is deemed a chattel real. See CHATTEL.

Term, however, is more particularly uſed for that time wherein our courts of juſtice are open; in oppoſition to which, the reſt of the year is called vacation. There are four of theſe terms in a year, *viz.* 1. Hilary-term, which begins on Jan. 23. but if that is a Sunday, the next day, and ends on Feb. 12. 2. Eaſter-term, which begins the Wedneſday fortnight after Eaſter-day, and ends the Monday next after Aſcenſion-day. 3. Trinity-term, which begins on the firſt Friday after Trinity-ſunday, and ends the Wedneſday fortnight after. 4. Michaelmas-term, which begins on Nov. 6. and ends the 28th of the ſame month.

It has been held, that courts do not ſit except in term-time, as to giving of judgments, *&c.* and in every term there are four days, thus diſtinguiſhed; that is, the eſſoin-day, the day of exceptions, the day of return of writs, and day of appearance. On the eſſoin-day the term is ſaid to begin, when one judge ſits in each of the courts of Weſtminſter, in order to take and enter eſſoins: but it is not till three days afterwards, that all the judges ſit for the diſpatch of buſineſs. There are likewiſe different returns in different terms, ſome having more, ſome fewer: and as, in the king's bench, all returns are to be made on ſome particular day of the week in each term, care muſt be taken not to make the writs out of that court, returnable on a non-judicial day, as Sunday, All-ſaints, *&c.* See RETURN.

Oxford-TERMS. Hilary, or lent-term, begins on Jan. 14. and ends the Saturday before Palm-ſunday. Eaſter-term begins the tenth day after Eaſter, and ends the Thurſday before Whit-ſunday. Trinity-term begins the Wedneſday after Trinity-ſunday, and ends after the act, ſooner or later, as the vice-chancellor and convocation pleaſe. Michaelmas-term begins on Oct. 10. and ends Dec. 17.

Cambridge TERMS. Lent-term begins on Jan. 13. and ends the Friday before Palm-ſunday. Eaſter term begins the Wedneſday after Eaſter-week, and ends the week before Whit ſunday. Trinity-term begins the Wedneſay after Trinity-ſunday, and ends the Friday after the commencement. Michaelmas-term begins Oct. 10. and ends Dec. 16.

Scottiſh TERMS. In Scotland, Candlemas-term begins Jan. 23. and ends Feb. 12. Whitſuntide-term begins May 25. and ends June 15. Lammas-term begins July 20. and ends Aug. 8. Martinmas-term begins Nov. 3. and ends Nov. 29.

TERM, in grammar, denotes ſome word or expreſſion of a language.

TERM *in the arts*, or TERM *of art*, is a word which, beſides the literal and popular meaning which it has, or may have, in common language, bears a further and peculiar meaning in ſome art or ſcience.

TERM, in logic. A propoſition is ſaid to conſiſt of two terms, *i. e.* two principal and eſſential words, the ſubject, and the attribute. See PROPOSITION.

TERMS *of an equation*, in algebra, are the ſeveral names or members, of which it is compoſed, and ſuch as have the ſame unknown letter, but in different powers or degrees: for if the ſame unknown letter be found in ſeveral members in the ſame degree or power, they ſhall paſs but for one term.

As, in this equation, $xx+ax=bb$; the three terms are xx, ax, and bb.

Moreover, in this, $x^4+x^3+x^2+\frac{a^2b}{cd}x+\frac{fp}{rs}x+yy=0$; the terms are x^4, x^3, x^2, $\frac{ab}{cd}+\frac{fp}{rs}\times x$, and yy. Where $\frac{ab}{cd}x$, and $\frac{fp}{rs}x$, are the ſame terms; and the firſt term in any equation muſt be that where the unknown root hath the higheſt dimenſions; and that term which hath the root in it, of one dimenſion of power lower, is called the ſecond term, and ſo on.

TERMS *of proportion*, in mathematics, are ſuch numbers, letters, or quantities, as are compared one with another.

Thus, if $2.4::8:16$ / $a.b::c:d$, then a, b, c, d, or 2, 4, 8, 16, are called the terms; a being the firſt term, b the ſecond term, *&c.*

TERMS, or COURSES, in medicine, the menſes, or women's monthly purgations. See the articles MENSES.

TERMINALIA, in antiquity, feaſts celebrated by the Romans, in honour of the god Terminus.

Varro is of opinion this feaſt took its name from its being at the term or end of the year: but Feſtus is of a different ſentiment, and derives it from the name of the deity in whoſe honour it was held.

TERMINATION, *terminatio*, in grammar, the ending of a word, or laſt ſyllable thereof. See WORD and SYLLABLE. It is the different termination of one and the ſame words on different occaſions, that conſtitute the different caſes, numbers, tenſes, and moods, *&c.* See CASE, NUMBER, *&c.*

TERMINI, or TERMOLE, a town of the province of Capitanate, in the kingdom of Naples, ſeventy miles north-eaſt of the city of Naples.

TERNATE, the moſt northerly of the Molucca or Clove-iſlands, in the poſſeſſion of the Dutch.

TERNATEA, in botany, a plant, otherwiſe called clitoria. See CLITORIA.

TERNI, a town of Italy, ſubject to the pope, forty-ſix miles north-eaſt of Rome.

TERRA, EARTH, in geography and aſtronomy. See the article EARTH.

TERRA FIRMA, in geography, is ſometimes uſed for a continent, in contradiſtinction to iſlands.

Thus Aſia, the Indies, and ſouth America, are uſually diſtinguiſhed into terra firmas and iſlands.

TERRA A TERRA. Gallies, and other veſſels are ſaid to go terra a terra, when they never go far from the coaſts.

The phraſe is alſo applied, in the manege, to horſes which neither make curvets nor balotades, but run ſmoothly on the ground, on a preſſed gallop, only making little leaps or riſings with the fore feet.

TERRA DEL FOGO, an iſland of ſouth America, from which it is ſeparated by the ſtreights of Magellan.

TERRÆ FILIUS, SON OF THE EARTH, a ſtudent of the univerſity of Oxford, formerly appointed, in public acts, to make jeſting and ſatyrical ſpeeches againſt the members thereof, to tax them with any growing corruptions, *&c.*

TERRACE, or TERRAS, a walk or bank of earth, raiſed in a garden or court, to a due elevation, for a proſpect.

TERRACE is alſo applied to the roofs of houſes that are flat, and whereon one may walk; as alſo to balconies that project.

TERRACINA, a town of the Campania of Rome, in Italy, ſeventeen miles north-weſt of Gaieta.

TERRAQUEOUS, in geography, an appellation given to our globe, becauſe conſiſting of land and water. See the articles EARTH and SEA.

TERRE-PLEIN, in fortification, denotes the horizontal ſuperficies, or top, of the rampart, between the inferior talus and the banquette. It is thus called, as lying nearly level, with only a little ſlope inwardly, to bear the recoil of the cannon. See RAMPART.

TERRE-TENANT, in law, the perſon who hath the actual poſſeſſion of the land: thus, if a freeholder lets out his freehold to another, to be poſſeſſed and occupied by him, this perſon is called the terre-tenant. See the article TENANT.

TERRELLA, *μικρὸν*, an appellation given to a load-ſtone, when turned into a ſpherical figure, and is placed ſo, that its poles and equator, *&c.* correſpond to the poles and equator of the world; as being a juſt repreſentation of the great magnetical globe which we inhabit. See the article MAGNET.

Such a terrella, if nicely poiſed and placed in a meridian, it was imagined, would turn about its axis once in twenty-four hours; but experience has ſhewed this to be a miſtake.

TERRESTRIAL, ſomething partaking of the nature of earth, or belonging to the globe of the earth thus we ſay, the terreſtrial globe, line, *&c.* See the articles GLOBE, EARTH, LINE, *&c.*

TERRIER, a book, or roll, wherein the ſeveral lands, either of a private perſon, or of a town, college, church, *&c.* are deſcribed. It ſhould contain the number of acres, and the ſite, boundaries, tenants names, *&c.* of each piece or parcel.

TERRIER is alſo uſed for a ſmall hound, to hunt the fox or badger; ſo called, becauſe he creeps into the ground, as the ferrets do into the coney-burrows, after the fox, *&c.* See HUNTING.

TERRING, a market-town of Suſſex, ſituated on the Engliſh channel, twenty miles eaſt of Chicheſter.

TERRIS, BONIS, ET CATALLIS RETRAHENDIS, *&c.* a writ which lies for a clerk, to recover his lands, goods, and chattels, formerly ſeiſed, after clearing himſelf of a felony.

TERRIS ET CATALLIS RETENTIS ULTRA DEBITUM LEVATUM, a judicial writ brought for reſtoring of lands or goods to a debtor, that is diſtrained above the amount of the debt due.

TERRIS LIBERANDIS, a writ that lies for a perſon convicted on an attaint, to bring the proceſs before the king, and to

take

take a fine for his imprisonment, to deliver him his lands again, and release him of the strip and waste.

TERRITORY, in geography, denotes an extent or compass of land, within the bounds, or belonging to the jurisdiction, of any state, city or, other subdivision of a country.

TERROUEN, a town of Artois, in the french Netherlands, situated on the river Lis, six miles south of St. Omers.

TERTIAN, in medicine, an ague, or intermitting fever, the fits of which return every third day; that is, there are two fits in three days, the day intervening being without any fit at all.

A regular tertian is attended with the following symptoms: at first, the head aches, the limbs seem weary, there is a pain in the loins about the first vertebræ of the back, which tends towards the epigastrium, with a painful sensation of a tension in the hypochondria, and costiveness: then comes on a coldness of the external parts, especially of the nose and ears, a stretching, yawning, shivering, and shaking, sometimes so much as to make the bed tremble under them; the pulse is small, contracted, and weak; sometimes the patient is troubled with thirst; then follows a nausea, with a fruitless reaching to vomit: and to these symptoms there succeeds an anxious burning and dry heat, which pervades the whole body; the pulse becomes full and quick, the restlessness increases, the breathing is more difficult, and the patient, with his eyes almost closed, begins to talk a little wildly. However, the duration of the fit is uncertain, continuing sometimes ten or eleven hours, and sometimes twenty-four.

As to the method of cure, it differs but little from that recommended for quartans. See the articles QUARTAN and INTERMITTENT.

TERTIATE *a great gun*, in gunnery, is to examine the thickness of the metal at the muzzle, whereby to judge of the strength of the piece, and whether it be sufficiently fortified or not. This is usually done with a pair of calliber-compasses, and if the piece be bore-bored, the diameter less by the height, divided by 2, is the thickness at any place.

TERVEL, a city of Arragon, in Spain, situated on the river Gundalavira, seventy-five miles south of Sarragossa: west long. 1° 20′, north lat. 40° 35′.

TERVERE, a port-town of the united Netherlands, situated on the north-east coast of the island of Walcheren, four miles north-east of Middleburg.

TERUNCIUS, in roman antiquity, a very small brass-coin. See COIN.

TESCHIN, a city of Silesia, twenty-five miles south-east of Troppau: east long. 18°, and north lat. 49°. 50′.

TESSELATED PAVEMENTS, those of rich mosaic work, made of curious square marbles, bricks, or tiles, called tesselæ, from their resembling dice. See MOSAIC.

TESSIN, a river of Italy, which, taking its rise in the Alps, runs through the country of the Grisons and the lake Maggior; and then, turning south-east thro' the Milanese, passes by Pavia, and falls into the Po, a little below that city.

TEST, in metallurgy, a vessel of the nature of the coppel, used for large quantities of metals at once. See COPPEL.

Tests are usually a foot and a half broad, and are made of wood-ashes, not prepared with so much care as for coppel-making, and mixed with finely powdered brick-dust; these are made into the proper shape either by means of an earthen vessel of proper dimensions, or only an iron-ring. To make them in the first manner, an earthen vessel is to be procured, not glazed within, and by its depth and breadth proportioned to the quantity of metal to be worked: the inside of this vessel is to be well moistened with fair water, that the ashes to be put into it may adhere the better. Put into this vessel, thus prepared, the ashes and brick-dust before-mentioned, and first moistened either with water alone, or with water with a little white of an egg mixed in it: let the quantity of this be so much as will half fill the vessel, then press the mass with a wooden indented pestle; or, if not for a very large test, with a wooden cylinder only of an inch thick: when thus pressed down, add fresh ashes, and press them in a second time, as in the making of coppels, and repeat this addition of fresh ashes till the earthen vessel is nearly full; then remove the superfluous ashes with an iron-ruler, and let the inequalities remaining at the border, be smoothed with a wooden ball rolled round about. This done, you are to cut the cavity with a bowed iron, that you may have a broad spherical segment, not very deep: and lastly, by means of a sieve, strew this cavity carefully and regularly over with dry ashes of bones of animals, ground extremely fine, and squeeze these hard in, by the rotation

of the wooden ball. Thus you have a teſt finiſhed, which, together with its earthen pot, muſt be ſet in a dry warm place.

To make the teſts in the other manner, or by means of an iron-ring; let a ring of that metal be filled with aſhes, mixed with brick-duſt, and moiſtened as before-mentioned, in ſuch manner that they may riſe conſiderably above the ring; then preſs them ſtrongly, either with your hands, or with an indented peſtle, and afterwards, with gentle blows of a rammer, preſs the aſhes from the circumference towards the center, in a ſpiral line, and that in ſuch a manner, that, after having been ſufficiently preſſed, they may be a ſmall matter higher than the brink of the ring. If there are now any vacancies in the maſs, empty the ring, and fill it again with more aſhes; for if you ſhould attempt to fill up theſe by adding, were it but ever ſo little aſhes, the ſecond, or additional quantities, will never cohere ſo firmly with the firſt, but that they may probably ſeparate in the operation. This done, turn the ring upſide down, and on the other ſide, or bottom, take out the aſhes to the quantity of one third part of the depth of the ring; and again fill the vacuity with the ſame aſhes, in ſuch a manner that there may remain no ſenſible cavity. When the maſs is thus prepared, cut out a cavity in the larger ſurface of the ring, with a bowed iron, as in the former method.

TEST-LIQUOR, a liquor uſed by dealers in brandies, to prove whether they be genuine, or mixed with home-ſpirits. This liquor is nothing but a green or white vitriol, diſſolved in fair water; for a few drops of it being let fall into a glaſs of old french brandy, will turn the whole to a purple, or fine violet colour; and by the ſtrength or paleneſs of this colour, the dealers judge the brandy to be genuine or mixed, in different proportions, with home-ſpirits.

The people who uſe this liquor, place great confidence in it; but it is really a very vague and uncertain thing; for old french brandy, having long lain in the caſk, takes a dilute tincture of the wood of the caſk, that is, of oak; and this being of the ſame nature with a ſolution or tincture of galls, naturally turns bluiſh or blackiſh with vitriol. A new diſtilled brandy, though wholly foreign, would not give this teſt; and a common malt-ſpirit, with oak-chips infuſed in it, will turn as dark as the fineſt brandy. While our diſtillers, indeed, had nothing in uſe, for the colouring their ſpirits but burnt ſugar, it was poſſible to make ſome gueſs at an adulteration with them, becauſe the brandy, in this caſe, would not become blackiſh in proportion to its former colour, the ſugar colour not turning to ink with the vitriol, like the other: but our diſtillers have of late found a way of uſing an extract of oak, for the colouring of their ſpirits; and, ſince that, this teſt-liquor is of very little uſe, our common ſpirits, of any kind, turning as deep with it as the foreign brandies.

The very beſt way of making this teſt-liquor, is with a calcined vitriol of iron, diſſolved in a dilute or aqueous mineral acid. The liquor, when well made in this manner, is of a fine yellow colour, and will give, for a time, the fineſt blue to any ſpirituous tincture of oak.

TEST-ACT, a ſtatute 25 Car. II. cap. 2. which requires all officers, both civil and military, to take the oaths and teſt, *viz.* the ſacrament, according to the rites and ceremonies of the church of England; for the neglect whereof, a perſon executing any office, mentioned in that ſtatute, forfeits the ſum of 500l. recoverable by action of debt.

TESTACEOUS, in natural hiſtory, an epithet given to a ſpecies of fiſh, which are covered with a ſtrong thick ſhell, as tortoiſes, oyſters, pearl-fiſh, *&c.*

In ſtrictneſs, however, teſtaceous is only applied to fiſh whoſe ſtrong and thick ſhells are entire and of a piece: thoſe which are ſoft, thin, and conſiſt of ſeveral pieces jointed, as the lobſter, *&c.* being called cruſtaceous.

But, in medicine, all preparations of ſhells and ſubſtances of the like kind, are called teſtaceous powders: ſuch are powder of crab's claws and eyes, hartſhorn, pearl, *&c.* Dr. Quincy, and others ſuppoſe the virtue of all teſtaceous medicines to be alike; that they ſeldom or never enter into the lacteals, but that the chief of their action is in the firſt paſſages; in which caſe they are of great uſe in abſorbing acidities.

Hence they become of uſe in fevers, and eſpecially in rectifying the many diſtempers in children, which generally owe their origin to ſuch acidities.

TESTAMENT, *teſtamentum*, in law, a ſolemn and authentic act, whereby a perſon declares his will, as to the diſpoſal of his eſtate, effects, burial, *&c.* See the article WILL.

There

There are two ſorts of teſtaments, *viz.* one in writing, and one in words; which laſt is called a nuncupative teſtament, or will: but this is not good in caſe of lands, which are only deviſeable by a teſtament in writing, executed in the life-time of the teſtator.

TESTATOR, or TESTATRIX, the perſon who makes his or her will and teſtament.

TESTATUM, in law, a writ in perſonal actions, where, if the defendant cannot be arreſted on a capias, in the county where the action is laid, but is returned non eſt inventus by the ſheriff, this writ ſhall be ſent into any other county, where ſuch perſon is thought to be, or have wherewithal to ſatisfy the demand.

It is called teſtatum, becauſe the ſheriff has, before, teſtified that the defendant was not to be found in his bailiwick.

TESTE, in law, a word generally uſed in the concluſion of every writ, wherein the date is contained, and begins with *teſte meipſo, &c.* in caſe it be an original writ; or, if only judicial, then with *teſte*, naming the chief juſtice of the bench whence the writ iſſues.

TESTES, the TESTICLES, in anatomy, See the article TESTICLE.

The teſtes of the brain are two little, round, hard bodies, between the third and fourth ventricle, near the pineal gland. See the article BRAIN.

TESTICLE, *teſtis*, in anatomy, a double part in male animals, ſerving for generation. See GENERATION.

The teſticles are two in number, of an oval or egg-like figure, and are contained in a peculiar bag, called the ſcrotum. See the article SCROTUM.

But beſides this external covering, the teſticles themſelves have their coats or tunics; the firſt of which compoſes the cremaſter-muſcle, the office whereof is to raiſe the teſticle; the ſecond is the vaginalis tunica, formed of a proceſs of the peritonæum, and laxly ſurrounds the teſticle; the third is the tunica albuginea, which is robuſt and ſtrong, and adheres cloſely to the ſubſtance of the teſticle: this laſt receives the ſpermatic veſſels, and conveys them to the teſticle.

The ſubſtance of the teſticles is vaſculous, being compoſed of a great number of extremely minute veſſels, called vaſcula ſeminalia; which are convoluted together in the manner of the inteſtines, and appear beautifully after macerating the teſticles in vinegar. There is alſo a body, called, from the diſcoverer, corpus Highmori, wherein there is a cavity for the reception of the ſemen: this, in human ſubjects, is placed in the back of the teſticle; but in dogs, and many other animals, it is in the middle of the teſticle.

The veſſels of the teſticles are otherwiſe called ſpermatics. See SPERMATIC.

As to the uſe of the teſticles, it is to produce the ſemen maſculinum, for the purpoſe of generation. See SEMEN and GENERATION.

Some alſo give the name female teſticles, teſtes muliebres, to the ovaries of women. See the article OVARIES.

Tumours of the TESTICLES. When theſe happen from any external injury, the beſt application to diſperſe them, ſays Heiſter, are vinegar of litharge, lime-water, ſpirit of wine camphorated, and ceruſs, tutty, or lapis caliminaris mixed in it: but in the night-time, when the applications of fomentations are not ſo convenient, a plaſter of the mercurial kind, doubly ſated with mercury; or, in ſlight caſes, one of ſimple diachylon, may very properly be kept on. Internal medicines, ſuch as nitre, and the thin decoctions of diſcutient medicines, are alſo to be uſed; and, if occaſion call for it, bleeding in the arm is very proper.

This may be the method with tumours of theſe parts, from external injuries; but when they are from venereal cauſes, it is always neceſſary to give briſk purges, with the addition of a proper doſe of calomel to each; and warm and weak drinks ſhould be taken frequently, by which means theſe tumours are often diſperſed. See GONORRHOEA and POX.

But if either remedies are applied too late, or the inflammation is too violent, the tumour generally ends either in a ſuppuration or gangrene. In this caſe the maturating remedies are to be applied, ſuch as warm cataplaſms, and the like; and if the tumour does not break of itſelf at a proper time, from the application of theſe, it muſt be carefully opened with the knife, and the matter being diſcharged, the wound is to be cleanſed by injecting vulnerary decoctions, and afterwards healed with balſam of Peru, or the like.

TESTICULATED, among botaniſts, an appellation given to roots compoſed of two tuberoſe knobs, reſembling teſticles: ſuch are thoſe of orchis, *&c.*

TESTIMONIAL, a kind of certificate, ſigned either by the maſter and a fellow of

the college where the perſon laſt reſided; or by three, at leaſt, reverend divines, who knew him well for three years laſt paſt, giving an account of the virtues, uniformity, and learning of the perſon.

Teſtimonial is alſo a certificate, under the hand of a juſtice of peace, teſtifying the place and time when a ſoldier, or mariner landed, and the place of his dwelling, *&c.* whither he is to paſs.

There is alſo another kind of teſtimonial for the clergy, made by perſons preſent, that a clergyman has in all things complied with the act of uniformity; and to certify, that the clerk has performed what the law requires on his inſtitution and induction.

TESTIMONY, the ſame with evidence. See the articles EVIDENCE, WITNESS, and CERTITUDE.

TESTUDO, in zoology, a genus of amphibious animals, with four legs and a tail, and the body covered with a firm ſhell.

This genus comprehends all thoſe animals known in engliſh by the names of tortoiſes and turtles; of which there are a great many ſpecies, ſome with four toes on each foot; others with five toes on the fore feet, and four on the hinder ones; and others, diſtinguiſhed by other peculiarities, particularly the compartments of their ſhells, ſome being divided into irregular ſpaces, and others beautifully teſſelated. See plate CCLXXIV. fig. 2. n° 1. and 2.

The ſhells of theſe animals are much uſed in ornamental works, under the name of tortoiſe-ſhells; which, on importation, pay a duty of 1 s. $\frac{92\frac{5}{8}}{100}$ d. the pound; and, on exportation, draw back, 11 $\frac{64\frac{3}{8}}{100}$ d.

The turtle, whoſe fleſh is ſo finely flavoured, and ſo much eſteemed at table, is caught in great abundance in the american ſeas; and grows to a vaſt ſize, ſome having been found to weigh 480 pounds.

The Americans find ſo good account in catching turtle, that they have made themſelves very expert at it: they watch them from their neſts on ſhore, in moonlight nights; and, before they reach the ſea, turn them on their backs, and leave them till morning; when they are ſure to find them, ſince they are utterly unable to recover their former poſture: at other times they hunt them in boats, with a peculiar kind of ſpear, ſtriking them with it through the ſhell; and as there is a cord faſtened to the ſpear, they are taken much in the ſame manner as the whales. See the article FISHERY.

TESTUDO, in antiquity, was particularly uſed among the poets, *&c.* for the antient lyre; by reaſon it was originally made by its inventor, Mercury, of the black or hollow ſhell of the teſtudo aquatica, or ſea-tortoiſe, which he accidentally found on the banks of the river Nile. See the article LYRE.

TESTUDO, in the military art of the antients, was a kind of cover or ſcreen which the ſoldiers, *e. gr.* a whole company, made themſelves of their bucklers, by holding them up over their heads, and ſtanding cloſe to each other. This expedient ſerved to ſhelter them from darts, ſtones, *&c.* thrown upon them, eſpecially thoſe thrown from above, when they went to the aſſault.

TESTUDO was alſo a kind of large wooden tower which moved on ſeveral wheels, and was covered with bullocks-hides ſtead, ſerving to ſhelter the ſoldiers when they approached the walls to mine them, or to batter them with rams.

It was called teſtudo, from the ſtrength of its roof, which covered the workmen as the ſhell does the tortoiſe.

TESTUDO *veliformis quadrabilis*, a hemiſpherical vault, or cieling of a church, wherein four windows are ſo contrived, as that the reſt of the vault is quadrable, or may be ſquared. See VAULT.

The determining of thoſe windows was a problem propoſed to the great mathematicians in Europe, particularly the cultivators of the new calculus differentialis, in the Acta Eruditorum Lipſiæ, by Sig. Viviani, under the fictitious name of A. D. pio liſci puſillo geometra, which was the anagram of poſtermo Galilæi diſcipulo.

It was ſolved by ſeveral perſons, particularly Mr. Leibnitz, the very day he ſaw it: and he gave it in the Leipſic acts in an infinity of manners; as alſo did M. Bernoulli, the marquis de l'Hoſpital, Dr. Wallis, and Dr. Gregory.

TETANUS, in medicine, is a convulſive motion that makes any part rigid and inflexible. See CONVULSION.

TETBURY, a market-town, ſixteen miles ſouth of Glouceſter.

TETHYS, in ichthyology, a genus of fiſh of the order of the zoophytæ, the body of which is formed as it were of

Fig. 1. TENTS.

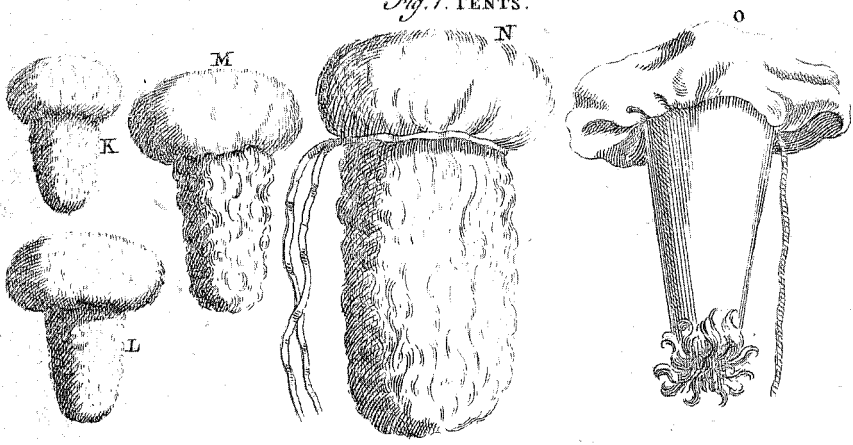

Fig. 2. TESTUDO.

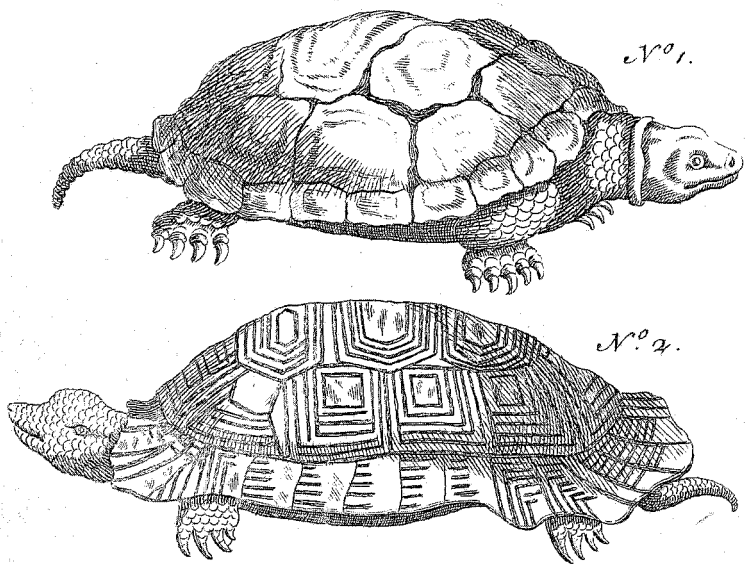

Fig. 4. The Order of the THISTLE.

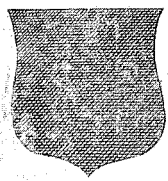
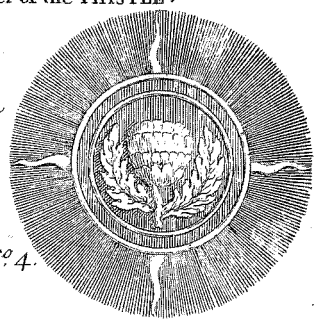
Fig. 3. TENNÉ.





two lips of an oblong cartilaginous body; between them there are four tentacula, which have the form of ears, and two perforations in moſt ſpecies near the tentacula.

TETICACO, a great lake of Peru, more than two hundred miles in circumference: the towns ſituated on this lake are eſteemed the moſt delightful in all ſouth America.

TETRACERA, in botany, a genus of the *polyandria tetragynia* claſs of plants, without any flower petal: the fruit is compoſed of four oval capſules, formed each of a ſingle valve, opening by a ſuture in the upper part, and containing only one cell, with numerous, roundiſh, and covered ſeeds.

TETRACHORD, in the antient muſic, a concord conſiſting of four degrees or intervals, and four terms or ſounds; called alſo by the antients diateſſaron, and by us a fourth. See INTERVAL, DIAGRAM, DIATESSARON, and FOURTH.

This interval had the name tetrachord given it, with reſpect to the lyre and its chords or ſtrings.

TETRADIAPASON, a muſical chord, otherwiſe called a quadruple diapaſon, or eighth. See DIAPASON.

TETRADITÆ, a name given to ſeveral different ſects of heretics. The ſabbathians were called tetraditæ, from their keeping Eaſter-day on the fourth day, or on Wedneſday. The manichees, and others who admitted of a quaternity inſtead of a trinity in the Godhead, were alſo called tetraditæ. The followers of Petrus Fullenſis had the ſame appellation, by reaſon of the addition they made to the triſagion, to ſupport an error they held, that in our Saviour's paſſion it was not any particular perſon of the Godhead that ſuffered, but the whole deity.

TETRADYNAMIA, in botany, a claſs of plants, whoſe flowers have four of their ſtamina of more efficacy than the reſt: theſe are always known by having the four efficacious ſtamina longer than the reſt.

The tetradynamia of Linnæus include thoſe called by Tournefort cruciformes, and by Ray, ſiliquoſæ, and ſiliculoſæ.

The general characters of which are theſe: the perianthium is of an oblong figure, and is compoſed of four leaves, which are oval, oblong, hollow, obtuſe, and converging toward one another, and are gibbous at the baſe; theſe all fall off with the flower, and ſtand in pairs; the oppoſite ones being always equal in length, this cup is properly the nectarium of the plant, and it is on this occaſion that it is gibbous at the baſe. The flower is of that kind, called by Tournefort, cruciform; it conſiſts of four equal petals, which have ungues of the length of the cup, erect, and flat; the petals are broad at the top, and obtuſe, and ſcarce touch one another at the ſides; and the inſertion of the petals and of the ſtamina is in the ſame place.

The ſtamina are ſix ſubulated erect filaments, the two oppoſite ones are of the length of the cup, the other four are ſomething longer, and are of a leſs length however than the petals. The antheræ are oblong and pointed, thick at the baſe and erect, with apices bending ſideways. The nectariferous gland in the different genera of this claſs, is differently ſituated. It uſually, however, is found near the ſtamina, and moſt frequently of all is affixed to ſome ſhort filaments, and ſtands near their baſe. Two of the ſtamina are often curved, that they may not preſs upon this gland; and it is often owing to this, that two are ſhorter than the reſt. The germen of the piſtil is placed above the receptacle, and is every day in its growth raiſed higher and higher. The ſtyle is ſometimes wanting, but in ſuch plants as have it, it is of the length of the longer ſtamina. The ſtigma is always obtuſe.

The fruit or capſule is always a bivalve pod, which often contains two cells; this, when ripe, opens by ſplitting from the apex to the baſe, and it has always a little membranous ſubſtance ſerving within as a ſeptem, when the pod is bilocular; this ſtands out beyond the apex, and is the rudiments of what was before the ſtyle. The ſeeds are roundiſh, and the pod uſually narrow and oblong.

This is a very natural claſs of plants, and has been received as ſuch under whatever name by all the ſyſtematical writers in botany: and the plants contained under it are generally ſuppoſed to be all antiſcorbutics.

It is naturally ſubdivided into two ſeries; the one containing the ſiliculoſe plants, and the other the ſiliquoſe: the firſt have a ſhort pod, the others a long and ſlender one: the firſt pods uſually have more of the remains of the ſtyle than the others.

TETRAEDRON, or TETRAHEDRON, in geometry, one of the five regular or platonic

platonic bodies or ſolids, comprehended under four equilateral and equal triangles. See plate CCLXXV. fig. 3.

It is demonſtrated by mathematicians, that the ſquare of the ſide of a tetraedron is to the ſquare of the diameter of a ſphere, wherein it may be inſcribed, in a ſubſequialteral ratio: whence it follows, that the ſide of a tetraedron is to the diameter of a ſphere it is inſcribed in, as $\sqrt{2}$ to the $\sqrt{3}$, conſequently they are incommenſurable.

TETRAGON, in geometry, a general name for any fourſided figure, as a ſquare, parallelogram, rhombus, or trapezium. See PARALLELOGRAM, *&c.*

TETRAGON, in aſtrology, an aſpect of two planets with regard to the earth, more uſually called quartile. See the article QUARTILE.

TETRAGONIA, in botany, a genus of the *icoſandria-tetragynia* claſs of plants, without any corolla: the fruit is a coriaceous cruſt, formed into a ſort of ſquare figure by four longitudinal alæ, and contains a ſingle oſſeous ſeed with four cells.

TETRAGONOTHECA, in botany, a genus of the *ſyngeneſia-polygamia-ſuperfluua* claſs of plants, with a compound radiated flower, a paleaceous receptacle, and no down to the ſeeds.

TETRAGONIAS, a name given to a meteor, whoſe head is of a quadrangular figure, and its tail or train long, thick, and uniform.

TETRAGONISM, in geometry, a term uſed by ſome for the quadrature of a circle.

TETRAGONUS, in anatomy, a muſcle otherwiſe called quadratus genæ. See the article QUADRATUS.

TETRAGRAMMATON, a denomination given by the Greeks to the hebrew name of God, Jehovah, becauſe conſiſting of four letters.

TETRAMETER, in antient poetry, an iambic verſe, conſiſting of four meaſures, or eight feet. This kind of verſe is only found in the comic poets, as Terence, *&c.* See the article IAMBIC.

TETRANDRIA, in the Linnæan ſyſtem of botany, a claſs of plants, the fourth in order; comprehending all ſuch plants as have hermaphrodite flowers, with four ſtamina, or male-parts, in each. See the article BOTANY.

TETRAO, in ornithology, a genus of birds, of the order of the gallinæ, diſtinguiſhed by having the part of the forehead over the eyes naked and papilloſe.

This genus comprehends the urogallus major, or wood-cock; the urogallus minor, or growſe; the moor-cock, lagopus, *&c.* See UROGALLUS, *&c.*

TETRAPETALOUS, in botany, an epithet given to flowers that conſiſt of four ſingle petala or leaves, placed around the piſtil. See the article PISTIL.

TETRAPHARMACUM, ſignifies any remedy conſiſting of four ingredients.

TETRAPLA, in church hiſtory, a bible diſpoſed by Origen under four columns, in each whereof was a different greek verſion, *viz.* that of Aquila, that of Symmachus, that of the Seventy, and that of Theodotion. See the article BIBLE.

TETRAPTOTE, *tetraptoton*, in grammar, a name given to ſuch defective nouns as have only four caſes; ſuch are *vicis, pecudis, fordis*, &c. as being deprived of the nominative and vocative ſingular.

TETRARCH, *tetrarcha*, a prince who holds and governs a fourth part of a kingdom. Such originally was the import of the title tetrarch; but it was afterwards applied to any petty king or ſovereign, and became ſynonymous with ethnarch.

TETRASTICH, a ſtanza, epigram or poem, conſiſting of four verſes.

TETRASTYLE, in the antient architecture, a building, and particularly a temple, with four columns in its front.

TETRASYLLABICAL, a word conſiſting of four ſyllables.

TETRATONON, in muſic, a name whereby the ſuperfluous fifth is ſometimes called, as containing four tones.

TETUAN, a town of the empire of Morocco, ſituated about eight miles from the bay of that name, juſt within the ſtraits of Gibraltar: weſt long. 6° 35′, north lat. 35° 40′.

TEUCRIUM, in botany, a genus of the *didynamia-gymnoſpermia* claſs of plants, the corolla whereof is ringent, and formed of a ſingle petal: the tube is cylindric and ſhort, and terminates in an incurvated opening: the lower lip is divided into three ſegments; the lateral ones are of the figure of the upper lip, and ſomewhat erect; the middle one is much larger and rounded: there is no pericarpium; the ſeeds are four, roundiſh, and lodged in the baſe of the cup.

This genus comprehends the germander, polium, ſcordium, *&c.* This plant has the

the credit of being a great ſudorific and alexipharmic. It is preſcribed in malignant and peſtilential fevers, and in the plague itſelf, as alſo in obſtructions of the liver and ſpleen; it is ſaid to deſtroy worms externally; it cleanſes ulcers, and is applied by way of cataplaſm to mitigate pain; it is at preſent chiefly uſed in the ſhops as an ingredient in the confectio Fracaſtorii.

TEUTONIC, ſomething belonging to the Teutons, an antient people of Germany, inhabiting chiefly along the coaſts of the German ocean: thus, the teutonic language is the antient language of Germany, which is ranked among the mother tongues. The teutonic is now called the German or Dutch, and is diſtinguiſhed into upper and lower. The upper has two notable dialects, *viz.* 1. The Scandian, Daniſh, or perhaps Gothic; to which belong the languages ſpoken in Denmark, Norway, Sweden, and Iceland. 2. The Saxon, to which belong the ſeveral languages of the Engliſh, Scots, Friſian, and thoſe on the north of the Elbe. To the lower belong the Low Dutch, Flemiſh, *&c.* ſpoken through the Netherlands, *&c.*

TEUTONIC ORDER, a military order of knights, eſtabliſhed towards the cloſe of the twelfth century, and thus called as conſiſting chiefly of Germans or Teutons. The origin, *&c.* of the teutonic order is ſaid to be this. The Chriſtians, under Guy of Luſignan, laying ſiege to Acre, or Acon, a city of Syria, on the borders of the Holy Land, ſome Germans of Bremen and Lubec, touched with compaſſion for the ſick and wounded of the army, who wanted common neceſſaries, ſet on foot a kind of hoſpital under a tent, which they made of a ſhip's ſail, and here betook themſelves to a charitable attendance on them. This ſtarted a thought of eſtabliſhing a third military order, in imitation of the templars and hoſpitalers. The deſign was approved of by the patriarch of Jeruſalem, the archbiſhops and biſhops of the neighbouring places, the king of Jeruſalem, the maſters of the temple and hoſpital, and the german lords and prelates then in the Holy Land, and pope Calixtus III. confirmed it by his bull, and the new order was called the order of teutonic knights of the houſe of St. Mary at Jeruſalem. The pope granted them all the privileges of the templars and hoſpitalers of St. John, excepting that they were to be ſubject to the patriarchs and other prelates, and that they ſhould pay tythe of what they poſſeſſed. Others relate, that the teutonic order was eſtabliſhed at Jeruſalem, before the city of Acre was beſieged. The officers of the teutonic order, while in its ſplendor, were the grand maſter, who reſided at Marienburg; under him were the grand commander; the grand marſhal, who had his reſidence at Koningſberg; the grand hoſpitaler, who reſided at Elbing; the draper, who took care to furniſh the habits; the treaſurer, who lived at the court of the grand maſter, and ſeveral commanders, as thoſe of Thorne, Culme, Brandenburg, Koningſberg, Elbing, *&c.* They had alſo their commanders of particular caſtles and fortreſſes, advocates, proveditors, intendants of mills, proviſions, *&c.* This order is now little more than the ſhadow of what it formerly was, having only three or four commanderies, ſcarce ſufficient for the ordinary ſubſiſtence of the grand maſter and his knights.

TEWKSBURY, a borough-town of Gloceſterſhire, ſituated on the rivern Severn, ten miles north of Gloceſter.

It ſends two members to parliament.

TEXEL, an iſland of Holland, ſituated at the entrance of the Zuyder-ſea, parted from the continent of Holland by a narrow channel, through which moſt ſhips bound to Amſterdam paſs.

TEXT, a relative term, contradiſtinguiſhed to gloſs or commentary, and ſignifying an original diſcourſe excluſive of any note or interpretation. This word is particularly uſed for a certain paſſage of ſcripture, choſen by a preacher to be the ſubject of his ſermon.

A text-book, in ſeveral univerſities, is a claſſic author written very wide by the ſtudents, to give room for an interpretation dictated by the maſter or regent to be inſerted in the interlines. The Spaniards give the name of text to a kind of little poem or ſet of verſes placed at the head of a gloſs, and making the ſubject thereof, each verſe being explained one after another in the courſe of the gloſs. Text, in antient law-authors, is appropriated to the book of the four goſpels by way of eminence.

TEXTUARIES, *textuarii*, a name given the ſect of the caraites among the Jews. See the article CARAITES.

TEXTURE, *textura*, properly denotes the arrangement and coheſion of ſeveral ſlender bodies or threads interwoven or entangled

tangled among each other, as in the webs of ſpiders, or in cloths, ſtuffs, &c.

Texture is alſo uſed in ſpeaking of any union or conſtituent particles of a concrete body, whether by weaving, hooking, knitting, tying, chaining, indenting, intruding, compreſſing, attracting, or any other way. In which ſenſe we ſay, a cloſe compact texture, a lax porous texture, a regular or irregular texture, &c. A great deal depends on the texture of the component parts of a body; hence moſt of its particular properties, its ſpecific gravity, colour, &c.

TEYN, a town of Bohemia, ſituated fifty miles ſouth-weſt of Prague.

THALAMI *nervorum opticorum*, in anatomy, two oblong prominences of the lateral ventricles of the brain, medullary without, but a little cineritious within, being thus called becauſe the optic nerves riſe out of them.

THALIA, in botany, a genus of plants, the characters of which are not perfectly aſcertained: the calyx is an ovato-ſubulated univalve ſpatha. the corolla conſiſts of five ovato-oblong petals, hollowed and undulated at the edge; the two neareſt the ſpatha are ſmall and involute, the others are nearly equal, erect, and concave: the germen is oval: the fruit is an oval unilocular berry: the ſeed is ſingle, oſſeous, and bilocular; the nucleus is ſlender.

THALICTRUM, COMMON MEADOW RUE, in botany, a genus of the *polyandria-polygynia* claſs of plants, the corolla whereof conſiſts of four roundiſh, hollow, obtuſe, deciduous petals. The fruit conſiſts of a carinated, ſulcated bark, containing only one cell: the ſeed is ſingle and oblong.

This plant is an excellent aperient and ſtrengthener of the inteſtines, like rhubarb: but the doſe ought to be triple that of rhubarb. It is commonly ſaid to purge bile; the flowers are effectual in ſpitting of blood, the fluor albus, and other female diſorders; externally they are of ſervice in the ſcabies, all cutaneous diſeaſes, wounds and ulcers.

THAMES, a great navigable river of England, compoſed chiefly of the river Iſis and Thame, of which the Iſis is much the largeſt and runs the longeſt courſe, riſing on the confines of Gloceſterſhire. At Lechlade it becomes navigable, from whence it continues its courſe north-eaſt to Oxford, where it receives the Charwell: from Oxford it runs ſouth-eaſt to Abington, and ſo to Dorcheſter, where it receives the Thame, and continues its courſe ſouth-eaſt to Windſor, and thence runs eaſt to London, and continues the ſame courſe to the ſea; receiving the river Medway near the mouth of it. The Thame is but a ſmall river, which riſing near Tring in Hertfordſhire, croſſes the county of Bucks, and falls into the Iſis at Dorcheſter.

THANE, or THAIN, *thanus*, a name of an antient dignity among the Engliſh and Scots, or Anglo Saxons. Skene makes thane to be a dignity equal to the ſon of an earl. Camden will have it, that thanes were only dignified by the offices they bore. There were two kinds or orders of thanes, the king's thanes, and the ordinary thanes; the firſt were thoſe who attended the king in his courts, and who held lands immediately of the king. The ordinary thanes, or the thani minores, were the lords of the manors, who had particular juriſdiction within their limits, and over their own tenants; theſe changed their names for that of barons, and hence their courts are called courts-baron to this day.

THANE-LANDS, were lands granted by charters of our antient kings to their thanes, with all immunities, except the threefold neceſſity of expedition, repair of caſtles, and mending bridges.

THANET, a little iſland of eaſt Kent, formed by the branches of the Stour and the ſea.

THAPSIA, in botany, a genus of the *pentandria digynia* claſs of plants, the general corolla whereof is uniform: the ſingle flowers conſiſt each of five crooked lanceolated petals: the fruit is naked, oblong, ſurrounded longitudinally with a membrane, and ſeparable into two parts: the ſeeds are two, large, oblong, and convex, pointed at each end, and having on each ſide a plane margin, large and undivided, which is emarginated at top and bottom.

This plant is uſed to provoke the menſes, and other evacuations, and externally it is uſed in ointments for the itch, and the like cutaneous diſorders.

THAUMATURGUS, a worker of miracles, an appellation which the romaniſts give to ſeveral of their ſaints eminent for the number and greatneſs of their miracles.

THAWING, the reſolution of ice into its former fluid ſtate, by the warmth of the air, &c. See FREEZING.

Boerhaave obſerves, that if a ſudden thaw takes place after a long ſharp froſt, which has bound up the rivers, and penetrated the earth's ſurface to a conſiderable depth, it is, uſually, quickly ſucceeded by a multitude of clouds and uncommon heats, and then by thunder and lightening. The reaſon is, that the fat vapours and exhalations raiſed by the ſubterraneous heat, have long remained impriſoned under that covering of the earth, as appears hence, that if the ice of a ditch be broke in the middle of a ſevere froſt, it preſently emits warm vapours, and this the more plentifully, as well as the hotter, by how much the froſt is harder and the ice thicker. As ſoon, therefore, as the exterior frozen turf of earth is ſoftened by warmth, the pent-up vapours immediately eſcape through all the paſſages they can find, and mounting on high, form clouds, which being driven about, and ſometimes illumined by the ſun, produce ſuch effects. Hence theſe violent thunders in Muſcovy, Sweden, and Denmark, after a thaw.

THAXTED, a market-town of Eſſex, ſituated eighteen miles north of Chelmſford.

THEA, TEA, in botany. See TEA.

THEATINES, a religious order in the romiſh church, ſo called from their principal founder John Peter Caraffa, then biſhop of Theate, or Chieti, in the kingdom of Naples, and afterwards pope, under the name of Paul IV. The names of the other founders were Gaetan, Boniface, and Conſiglieri. Theſe four pious men deſiring to reform the eccleſiaſtical ſtate, laid the foundation of an order of regular clerks at Rome, in the year 1524. Pope Clement VII. approved the inſtitute, and permitted the brethren to make the three religious vows, to elect a ſuperior every three years, and to draw up ſtatutes for the regulation of the order. They firſt endeavoured, by their example, to revive among the clergy the poverty of the apoſtles and firſt diſciples of our Saviour, and were the firſt who aſſumed the title of regular clerks.

THEATRE, θεατρον, in antiquity, a public edifice for the exhibiting of ſcenic ſpectacles, or ſhews, to the people; comprehending not only the eminence on which the actors appeared, and the action paſſed, but alſo the whole area of the place, common to the actors and ſpectators.

The Romans borrowed the form of their theatres from thoſe of the Greeks, which were generally built in the ſhape of a ſemi-circle, encompaſſed with porticos, and furniſhed with ſeats of ſtone, diſpoſed in ſemi-circles, riſing gradually one above another.

The principal parts of the antient theatres were the ſcena, proſcenium, orcheſtra, and area. See the articles SCENA, PROSCENIUM, &c.

Among the moderns, theatre more peculiarly denotes the ſtage, or place whereon the drama or play is exhibited; anſwering to the proſcenium of the antients. It is alſo uſed, in a more comprehenſive ſenſe, for the whole play-houſe. See the articles DRAMA, PLAY, &c.

THEATRE is alſo uſed in architecture, chiefly among the Italians, for an aſſemblage of ſeveral buildings, which, by a happy diſpoſition and elevation, repreſents an agreeable ſcene to the eye.

Anatomical THEATRE, in a ſchool of medicine and chirurgery, is a hall, with ſeveral rows of ſeats, diſpoſed in the circumference of an amphitheatre; having a table bearing on a pivot, in the middle, for the diſſection of bodies.

THEBAID, *thebais*, a celebrated heroic poem of Statius, the ſubject whereof is the civil war of Thebes, between the two brothers Eteocles and Polynices; or, Thebes taken by Theſeus.

The thebaid is cenſured by the beſt of critics, for a multiplicity of fables and actions; for too much heat and extravagance, and for going beyond the bounds of probability.

THEBES, the name of an antient city in upper Egypt, now in ruins; as alſo an antient city of Achaia, now a province of european Turky.

THEFT, *furtum*, in law, an unlawful felonious taking away another man's moveable and perſonal goods, againſt the owner's will, with intent to ſteal them.

It is divided into theft or larceny, properly ſo called, and petit theft, or petit larceny; the former whereof is of goods above the value of 12d. and is deemed felony; the other, which is of goods under that value, is not felony. See the articles FELONY and LARCENY.

THEFTBOTE, the receiving a man's goods again from a thief, or other amends, by way of compoſition, and to prevent proſecution, that the felon may eſcape unpuniſhed; the puniſhment whereof is

impriſonment, but not the loſs of life or member.

THEISM, or DEISM. See DEISM.

THELIGONUM, in botany, a genus of the *monoecia-polyandria* claſs of plants, having no corolla: the calyx is bifid, and the piſtil ſingle: the fruit is a coriaceous capſule, containing only a ſingle cell, and in it one globoſe ſeed.

THELONIUM, in law-books, is uſed to denote any kind of toll. hence, citizens and other perſons who have a right to be free from toll, may have a writ called breve eſſendi quieti de thelonio.

THEME, in matters of education, denotes the ſubject of an exerciſe, for young ſtudents to write or compoſe on.

THEME, among aſtrologers, denotes the figure repreſenting the ſtate of the heavens for any time required; that is, the places of the ſtars and planets for that time. See the article HOROSCOPE.

THENAR, in anatomy, the abductor-muſcle of the thumb: it has its origin in the tranſverſe ligament that joins the bones of the carpus, and its termination in the firſt and ſecond phalanx the two ſeſamoide bones of the thumb are uſually found lodged in the tendon of this muſcle.

The abductor-muſcle of the great toe, likewiſe called thenar, has its origin from the internal ſide of the calcaneum, and the os naviculare; and its termination at the internal ſide of the great toe, beſide the internal ſeſamoide bone.

THEOBROMA, the CHOCOLATE-NUT-TREE, in botany, a genus of the *polyadelphia-pentandria* claſs of plants, the corolla of which conſiſts of five erecto-patent petals, each of them armed with a bifid ſeta: the nectarium is of a campanulated figure, and erecto-patent: the fruit is a woody cortex, of an unequal ſurface, with five ridges, and has ſeeds lodged in five ſeriesſes within it: theſe are numerous, fleſhy, nearly of an oval figure, and ſerve to make chocolate. See the article CHOCOLATE.

This genus comprehends the cacao of Tournefort, and the guazuma of Plumier; the former of which has a quadrangular pod, lengthened at each extremity; and the latter, a globoſe fruit, covered with tubercles, and its rind perforated in the manner of a ſieve.

THEOCRACY, θεοκρατεια, in matters of government, a ſtate governed by the immediate direction of God alone: ſuch was the antient government of the Jews, before the time of Saul.

THODOLITE, a mathematical inſtrument much uſed in ſurveying, for the taking of angles, diſtances, &c.

It is made variouſly, ſeveral perſons having their ſeveral ways of contriving it, each more ſimple and portable, more accurate and expeditious than others. The common one conſiſts of a braſs-circle about a foot diameter, cut in the form repreſented in plate CCLXXV. fig. 1. n° 1. having its limb divided into 360 degrees, and each degree ſubdivided, either diagonally, or otherwiſe, into minutes.

Underneath, at *c c*, are fixed two little pillars *b b* (*ibid.* n° 2.) which ſupport an axis, whereupon is fixed a teleſcope conſiſting of two glaſſes, in a ſquare braſs-tube, for the viewing of remote objects.

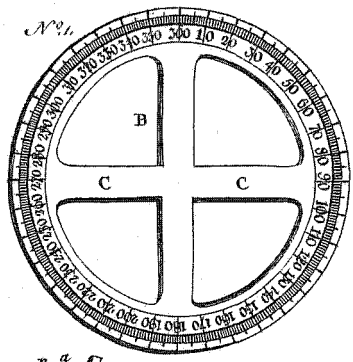
On the center of the circle moves the index C, which is a circular plate, having a compaſs in the middle, whoſe meridian line anſwers to the fiducial line *a a*: at *b b*, are fixed two pillars to ſupport an axis which bears a teleſcope like the former, whoſe line of collimation anſwers to the fiducial line *a a*. At each end of either teleſcope, is fixed a plain ſight for the viewing nearer objects.

The ends of the index *a a* are cut circularly, to fit the diviſions of the limb B; and when that limb is diagonally divided, the fiducial line, at one end of the index, ſhews the degrees and minutes upon the limb. The whole inſtrument is mounted with a ball and ſocket, upon a three-legged ſtaff.

Moſt theodolites have no teleſcopes, but only four plain ſights, two of them faſtened on the limb, and two on the ends of the index.

Mr. Siſſon's improved theodolite being one of the beſt of theſe inſtruments, we ſhall here give its deſcription, *ibid.* n° 3. The three ſtaves, whereby it is ſupported, ſcrew into bell-metal joints by braſs-ferrils at top, which are moveable between braſs-pillars fixed in a ſtrong braſs plate; in which, round the center, is fixed a ſocket with a ball moveable in it, and upon which the four ſcrews preſs that ſet the limb horizontal. Next above is ſuch another plate, through which the ſaid ſcrews paſs, and on which round the cencenter is fixed a fruſtum of a cone of bell-metal, whoſe axis, being connected with the center of the ball, is always penpendicular to the limb, by means of a conical braſs ferril fitted to it, whereon is fixed the compaſs-box, and on it the limb,

Fig. 1. THEODOLITE.



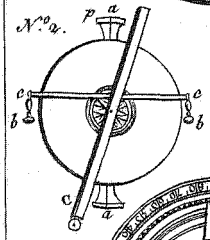


Fig. 3. TETRAEDRON

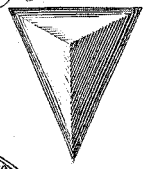

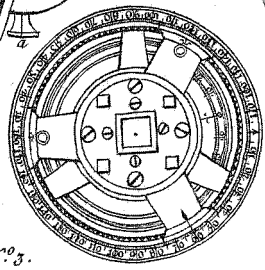

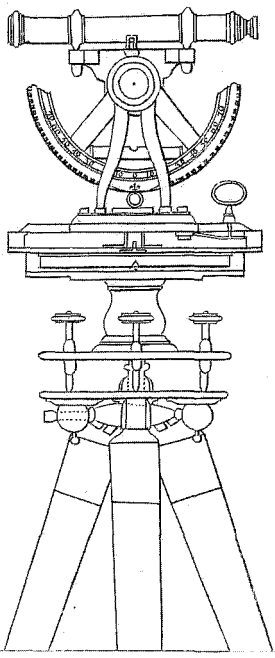

Fig. 2. THERMOMETER.

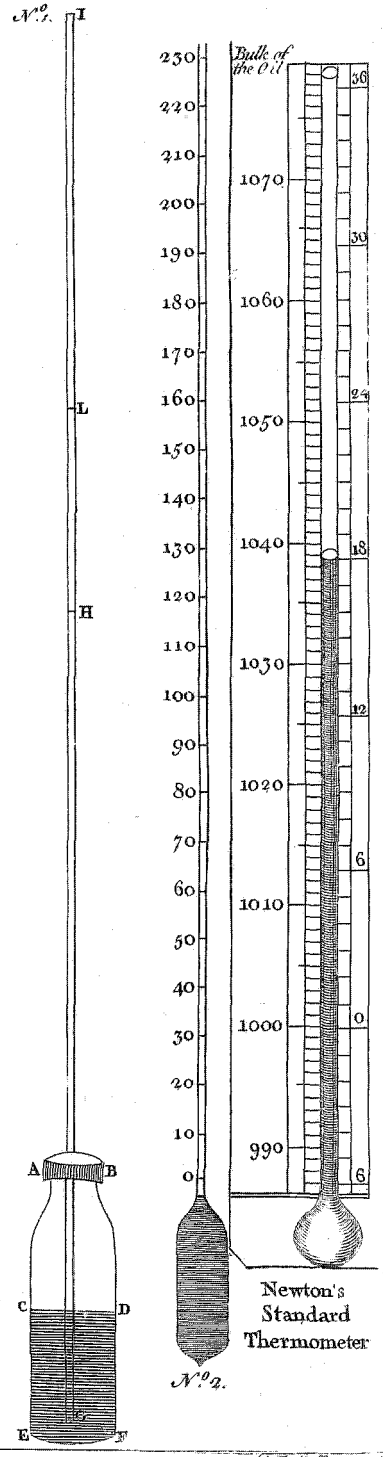


limb, which is a ſtrong bell-metal ring, whereon are moveable three braſs indexes, in whoſe plate are fixed four braſs pillars, that joining at top, hold the center-pin of the bell-metal double ſextant, whoſe double index is fixed in the center of the ſame plate. Within the double ſextant is fixed the ſpirit level, and over it the teleſcope. See LEVEL.

The compaſs box is graved with two diamonds for north and ſouth, and with 20 degrees on both ſides of each, that the needle may be ſet to the variation, and its error alſo known.

The limb has two fleur-de-luces againſt the diamonds in the box, and is curiouſly divided into whole degrees, and numbered to the left-hand at every 10° to twice 180°, having three indexes (with Nonius's diviſions on each for the decimals of a degree) that are moved by a pinion fixed below one of them without moving the limb, and in another is a ſcrew and ſpring under, to fix it to any part of the limb: it has alſo diviſions numbered for taking the quarter girt in round timber; to which a ſhorter index is uſed, having Nonius's diviſions for the decimals of an inch; but an abatement muſt be made for the bark, if not taken off. See RULE.

The double ſextant is divided on one ſide from under its center (when the ſpirit-tube and teleſcope are level) to above 60 degrees each way, and numbered at 10, 20, &c. And the double index (through which it is moveable) ſhews on the ſame ſide the degree and decimal of any altitude or depreſſion to that extent, by Nonius's diviſions; on the other ſide are diviſions numbered for taking the upright height of timber, &c. in feet, when diſtant ten feet, which at 20 muſt be doubled, and at 30 trebled; and alſo the quantities for reducing hypothenuſal lines to horizontal: it is moveable by a pinion fixed in the double index. See the article SURVEYING.

The teleſcope is a little ſhorter than the diameter of the limb, that a fall may not hurt it; yet it will magnify as much, and ſhew a diſtinct object as perfect, as moſt of treble its length: in its focus are very fine croſs wires, whoſe interſection is in the plane of the double ſextant, and this was a whole circle, and turned in a lathe to a true plane, and is fixed at right-angles to the limb; ſo that whenever the limb is ſet horizontal (which is readily done by making the ſpirit-tube level over two ſcrews, and the like over the other two) the double ſextant and teleſcope are moveable in a vertical plane, and then every angle taken on the limb (though the teleſcope be never ſo much elevated or depreſſed) will be an angle in the plane of the horizon, and this is abſolutely neceſſary in the plotting an horizontal plane. See PLOTTING and TELESCOPE.

The uſe of the theodolite is abundantly ſhewn in that of the graphometer, or ſemi-circle, which is only half a theodolite; and in that of the plain table, which is occaſionally made to be uſed as a theodolite. Note, the index and compaſs of a theodolite, likewiſe ſerve for a circumferentor, and are uſed as ſuch. See the articles GRAPHOMETER, PLAIN-TABLE, and CIRCUMFERENTOR.

THEOGONY, that branch of the heathen theology, which taught the genealogy of their gods. See the article GOD.

THEOLOGIUM, in the antient theatre, a kind of little ſtage, above that whereon the ordinary actors appeared; being the place where the machinery of the gods were diſpoſed; whence the name.

THEOLOGY, or DIVINITY, a ſcience which inſtructs us in the knowledge of God, or divine things; or which has God, and the things he has revealed, for its object. See the article GOD.

Hence theology may be diſtinguiſhed into natural, which comprehends the knowledge we have of God from his works, by the light of reaſon alone; and ſupernatural, which contains what we are taught concerning God in revelation.

Theology is again diſtinguiſhed into poſitive, moral, and ſcholaſtic. Poſitive theology is the knowledge of the holy ſcriptures, and of the ſignification thereof, conformably to the opinions of the fathers and councils, without the aſſiſtance of any argumentation. Some will have it, that this ought to be called expoſitive, rather than poſitive. Moral theology, is that which teaches us the divine laws relating to our manners and actions. Scholaſtic, or ſchool theology, is that which proceeds by reaſoning; or that derives the knowledge of ſeveral divine things from certain eſtabliſhed principles of faith.

THEOPHRASTA, in botany, a genus of the *pentandria-monogynia* claſs of plants, with a monopetalous campanulated petal, ſemi-quinquifid at the limb: the fruit is a large, globoſe, unilocular capſule, containing a great many roundiſh ſeeds.

THEORBA,

THEORBA, THIORBA, or TIORBA, a muſical inſtrument made in form of a large lute, except that it has two necks or juga, the ſecond and longer whereof ſuſtains the four laſt rows of chords which are to give the deepeſt ſounds.

THEOREM, a ſpeculative propoſition, demonſtrating the properties of any ſubject.

Theorems are either univerſal, which extend to any quantity, without reſtriction univerſally; as this, that the rectangle of the ſum, and difference of any two quantities, is equal to the difference of their ſquares: or particular, which extend only to a particular quantity; as this, in an equilateral right-lined triangle, each of the angles is 60 degrees.

Theorems are again diſtinguiſhed into negative, local, plane, and ſolid.

A negative theorem is that which expreſſes the impoſſibility of any aſſertion; as that the ſum of two biquadrate numbers cannot make a ſquare number. A local theorem is that which relates to a ſurface; as, that the triangles of the ſame baſe and altitude are equal. A plane theorem is that which either relates to a rectilinear ſurface, or to one terminated by the circumference of a circle; as that all angles in the ſame ſegment of a circle are equal. And a ſolid theorem is that which conſiders a ſpace terminated by a ſolid line; that is, by any of the three conic ſections. *e. gr.* this: that if a right line cut two aſymptotic parabola's, its two parts terminated by them ſhall be equal.

Reciprocal THEOREM, is one whoſe converſe is true; as that, if a triangle have two equal ſides, it muſt have two equal angles; the converſe of which is likewiſe true, that, if it have two equal angles, it muſt have two equal ſides.

THEORETIC, or THEORETICAL, ſomething relating to theory, or that terminates in ſpeculation. See THEORY.

Hence theoretical aſtronomy is that part of aſtronomy, which accounts for the various phænomena of the ſtars and planets. See STAR and PLANET.

THEORY, in general, denotes any doctrine which terminates in ſpeculation alone, without conſidering the practical uſes and application thereof. Thus the theory of chemiſtry, for inſtance, contains all the general truths which the particular experiments of chemiſts have hitherto demonſtrated. Theſe are, on this occaſion, to be taken for granted, and the whole body of ſuch truths makes the univerſal theory of chemiſtry, for chemiſtry is no ſcience formed *a priori*; it is no production of the human mind, or raiſed by reaſoning, but collected *a poſteriori* from experiments it took its riſe from various operations caſually made, and obſerving thoſe that had one and the ſame uniform tendency, without any expectation of what followed; and was only reduced into an art, by collecting and comparing the effects of ſuch uncertain experiments, and noting the tendency thereof: ſo far then as a number of experiments agree to eſtabliſh any unqueſtionable truth; ſo far they may be conſidered as conſtituting the theory of chemiſtry. See CHEMISTRY.

Such a theory is neceſſary to be premiſed to every art; and ſomething equivalent to this is practiſed by every artiſan, in teaching his diſciple how to proceed orderly in the exerciſe of his art; and accordingly it would be impoſſible to teach the practice of chemiſtry to advantage, without having firſt given ſome ſuch theory. Thus it would be to little purpoſe, to give a novice a parcel of roſemary, for inſtance, and bid him, without any addition, diſtil a water from it, which ſhould contain the natural taſte and odour of the plant; unleſs he knew before-hand this general truth, that plants, expoſed to a gentle heat, like that of the ſummer's ſun, do exhale their moſt ſubtle and volatile parts, which, being collected and condenſed by means of proper veſſels, appear in form of water, and are the thing required.

THERAPEUTÆ, a term applied to thoſe who are wholly employed in the ſervice of religion. This general term has been applied to particular ſects of men, concerning whom there have been great diſputes among the learned.

It is generally ſuppoſed, that St. Mark eſtabliſhed a particular ſociety of chriſtians about Alexandria, of whom Philo gives an account, and calls them Therapeutæ. He ſpeaks of them as a particular ſect, retired from the world, who ſpent their time in reading the writings of antient authors, in ſinging hymns and ſongs compoſed by ſome of their own ſect, and in dancing together the whole night. Scaliger maintains, they were Eſſene Jews; but Valeſius rejects this opinion of Scaliger, 1. becauſe Philo never calls them Eſſenes. 2. Becauſe there were

were no Eſſenes but in the holy land; whereas the Therapeutæ were ſpread through Greece, and all the barbarous nations. 3. Becauſe Joſephus, who gives a very ample account of the Eſſenes, does not ſay one word of the Therapeutæ.

THERAPEUTICE, THERAPEUTICS, that part of medicine which acquaints us with the rules that are to be obſerved, and the medicines to be employed in the cure of diſeaſes. See DISEASE.

THERAPHIM, or TERAPHIM, certain images, or ſuperſtitious figures mentioned in ſcripture. Some jewiſh writers tell us, the theraphim were effigies of human heads, placed in niches, and conſulted as oracles. Others ſay, they were taliſmans, or figures of metal, caſt and engraved under certain aſpects of the planets; to which they aſcribed extraordinary effects. All the eaſtern people are much addicted to this ſuperſtition; and the Perſians ſtill call them telefin, a name nearly approaching to theraphim.

The learned Spencer makes the word theraphim to be the ſame as ſeraphim, by change of the S into T: whence it follows, that theſe images were repreſentations of thoſe angels called ſeraphim. M. Jurien ſuppoſes them to have been a ſort of dii penates, or houſhold goods.

THERIACA ANDROMACHI, a compound medicine, made in the form of an electuary, the ingredients of which, according to the college of London phyſicians, are as follows: Take of the troches of ſquills, half a pound; long pepper, opium ſtrained, dried vipers, of each three ounces; cinnamon, balſam of Gilead, or in its ſtead, expreſſed oil of nutmeg, of each two ounces; agaric, the root of florentine orrice, water germander, red roſes, ſeeds of navew, extract of liquorice, of each an ounce and a half; ſpikenard, ſaffron, amomum, myrrh, coſtus, or in its ſtead zedoary, camel's hay, of each an ounce; the root of cinquefoil, rhubarb, ginger, indian leaf, or in its ſtead mace, leaves of dittany of Crete, of hore-hound, and of calamint, french lavender, black pepper, ſeeds of macedonian parſley, olibanum, chio turpentine, root of wild valerian, of each ſix drams; gentian root, celtic-nard, ſpignel, leaves of poley mountain, of St. John's wort, of ground pine, tops of creeping germander, with the ſeed, the fruit of the balſam-tree, or in its ſtead cubebs, aniſeed, the leſſer cardamom ſeeds huſked, ſeeds of biſhop's weed, of hartwort, of treacle muſtard, or mithridate muſtard, juice of the rape of ciſtus, acacia, or in its ſtead japan earth, gum arabic, ſtorax ſtrained, ſagapenum ſtrained, lemnian earth, or in its ſtead bole armenic or french bole, green vitriol calcined, of each half an ounce; root of creeping birthwort, or in its ſtead of the long birthwort, tops of the leſſer centaury, ſeeds of the carrot of Crete, opopanax, galbanum ſtrained, ruſſia caſtor, jew's pitch, or in its ſtead, white amber prepared, root of the ſweet flag, of each two drams; of clarified honey, thrice the weight of all the reſt. The ingredients are to be mixed in the ſame manner as in the mithridate.

The college of Edinburgh have given the following reformation of this compoſition, under the title of Theriaca Edinenſis.

Take of virginian ſnake root, ſix ounces; wild valerian root, contrayerva root, each four ounces; aromatic powder, three ounces; reſin of guaiacum, ruſſia caſtor, myrrh, each two ounces; engliſh ſaffron, opium, each one ounce; clarified honey, thrice the weight of the powders; canary wine, as much as is ſufficient to diſſolve the opium. This compoſition conſiſts of very powerful ingredients, and is doubtleſs capable of anſwering every thing that can be reaſonably expected from the more voluminous theriaca of Andromachus.

THERMÆ, artifical hot baths, much uſed by the Romans. See BATH.

THERMOMETER, an inſtrument for meaſuring the increaſe and decreaſe of the heat and cold of the air, by means of the elaſtic and expanſive power of bodies of the fluid ſort. See the articles AIR, HEAT, COLD, &c.

Many different ways, methods, and forms of conſtructing ſuch an uſeful inſtrument have been thought of, and invented at ſeveral times for this purpoſe; at firſt air, then oil, then ſpirits of wine, and laſtly, quickſilver, have been every way attempted and tortured in this experiment.

The ſpring of air, being ſooner affected by heat and cold than that of any other fluid, was firſt thought upon as the beſt expedient to anſwer this end; and ſo it really would be, were it not that the weight or preſſure of the atmoſphere affects it alſo at the ſame time; and by acting ſometimes with, ſometimes againſt it,

it, renders the effect by heat or cold very uncertain, and, therefore, the inſtrument uſeleſs. For example: the air in the bottle AF (plate CCLXXV. fig. 2. n° 1.) will, by its expanſion, when the air grows warmer, raiſe the water higher in the tube than the point H; and if the air be lighter at this time, it will preſs leſs on the ſurface of the water at H, and ſo will ſuffer it to riſe ſtill higher. But if the air be heavier, it will act againſt the ſpring, and not permit it to raiſe the water ſo high. The ſame may be obſerved with reſpect to its contraction by cold; wherefore ſuch an inſtrument, for common or conſtant uſe, will not do at all, though, perhaps, none is better calculated for ſome extemporaneous uſes, as meaſuring the degree of coldneſs in different cellars, or of warmth in divers rooms upon the ſame floor.

It was upon this account found neceſſary to have recourſe to ſome other fluid, which, ſecured from the preſſure of the air in a tube, hermetically ſealed, might expand and contract ſolely by the heat and coldneſs of the air about it. And, becauſe moſt fluids are ſubject to freeze or thicken in great degrees of cold, it was ſoon conſidered that ſpirits of wine, a little tinged with cochineal, would beſt anſwer the purpoſe, and accordingly thermometers were generally made therewith, and became of common uſe.

Though the ſpirit of wine thermometers would do very well to ſhew the comparative heat of the air, yet this was far ſhort of the virtuoſo's views, who wanted to explore the various and vaſtly different degrees of heat in other bodies, as boiling water, boiling oils, melted metals, and even fire itſelf, and degrees of cold too, beyond what the ſpirit thermometer can ſhew. For ſpirit in a moderate degree of heat will burſt the tube; and in an intenſe degree of cold will freeze, as the french philoſophers found, who went to meaſure a degree upon the ſurface of the earth under the north polar circle.

It having been found by experiment, that linſeed oil required four times the degree of heat to make it boil as water did, it was quickly ſubſtituted inſtead of ſpirits for philoſophic uſes. This Sir Iſaac Newton always uſed, and by it diſcovered the comparative degree of heat which makes water boil, which melts wax, which makes ſpirit of wine boil, and melts tin and lead; beyond which we do not find the oil thermometer has been applied: for which reaſon (as alſo for its ſullying the tube) it has been leſs uſed of late.

The mercurial thermometer, which will ſuſtain any degree of heat or cold, as far as any inſtrument of this kind can be expected to do, was invented by Mr. Farenheit, of Amſterdam; and though ſeveral artificers made them as well as he, yet they ſtill go by his name. Dr. Boerhaave uſed only this thermometer. As the mercury very freely and uniformly expands itſelf from hard froſt to the heat of ſummer, ſo one ſort of thoſe thermometers are contrived with a ſcale, to include thoſe extremes only, and the beginning of the diviſions, or o, is fixed to that altitude of the quickſilver, as is obſerved when water juſt begins to freeze, or ſnow to thaw; for which reaſon that is called the freezing point in the ſcale. This thermometer is ſmall, ſhort, put in a neat frame, and carried in the pocket any where.

But the grand thermometer of Farenheit is graduated after a different manner, as deſtined to a more critical and extenſive uſe. In this the bulb, or large part at the bottom, is not ſpherical, as in common ones; but cylindrical; to the end, that the heat may penetrate and reach the inmoſt parts as ſoon as poſſible, ſo that the whole may expand uniformly together. Hence it is, that in the cylindric bulb the fluid will expand and riſe immediately, whereas in the ſpherical bulb it is ſeen firſt to fall (by the ſudden expanſion of the ball, before the fluid is heated) and then to riſe, by the expanſion of the fluid when heated. We have given a figure, both of Farenheit's mercurial thermometer, and alſo of Sir Iſaac Newton's made with linſeed oil. See plate CCLXXV. fig. 2. n° 2.

Sir Iſaac's ſeems to be the beſt fitted of any for a ſtandard weather thermometer; and even for any degree of heat which the various ſtates of the human body exhibit; and alſo for thoſe different degrees which vegetation requires in the green-houſe, hot-bed, &c. In all which caſes it is neceſſary there ſhould be one common, unerring, and univerſal meaſure, or ſtandard, which at all times, and at every place, will ſhew the ſame degree of heat, by the ſame expanſion of the fluid, according to which the ſcale ſhould be made in every ſtandard thermometer. In order to this, the tube propoſed ſhould be very nicely weighed, when empty,

and then the bulb, and about a tenth part of the length of the tube above it, is to be filled with quickſilver; then it is to be weighed again, and the exceſs of this, above the former weight, will give the weight of the quickſilver poured in; this will give the weight of the 100th part. Let a mark be made with a file upon the tube at the ſurface of the incloſed quickſilver.

Then weigh out nine or ten parcels of quickſilver, each equal to a hundredth part of that firſt put in the tube, and having poured the ſeveral parcels in one after another upon the incloſed quickſilver, and marked the tube ſucceſſively at the ſurface of each parcel, you will have the tube divided into proper intervals, which, if the bore of the tube be everywhere the ſame, will be equal to each other; if not, they will be unequal; and each of theſe intervals is to be divided into ten others, increaſing or decreaſing as the intervals do.

When this is done, the capacity of the tube is divided into thouſandth parts of that of the ball, and the contiguous part of the tube reaching up to the firſt mark. The tube is now to be put into a frame, and by the ſide of it is to be placed a ſcale, divided into thouſandth parts, exactly correſponding to thoſe on the tube; and writing 1000 over-againſt the firſt mark, you write 1010 over-againſt the ſecond, 1020 againſt the third, and ſo on, as you ſee in the figure.

The ſtandard thermometer-tube, and its ſcale, being thus conſtructed, is then to be filled with ſome proper fluid, as linſeed-oil, where great degrees of heat are not propoſed; and mercury is to be uſed, when they are. When the fluid is poured in, it is to be adjuſted in ſuch a quantity, that it may ſtand juſt at the principal point, marked 1000, in water juſt freezing. And here great precaution is to be uſed; for many trials muſt determine this point to which the fluid muſt always riſe by ſlow degrees, and with an uniform motion.

When this point is well ſecured, all the trouble is over, the ball, being then immerſed in boiling water, ſpirits, oils, melted metals, &c. in ſnow, freezing mixtures, &c. the expanſions, by all the various degrees of heat and cold, will be ſhewn by the numbers againſt the heights to which the fluid riſes in the tube, in each caſe, theſe are to be wrote on the ſide of the ſcale; and, ſince the ſame degree of heat will cauſe the ſame expanſion of the ſame fluid at all times, it is evident, if thermometers were everywhere conſtructed in this manner, the obſervations made by them in any part of the world, may be compared together, which cannot otherwiſe be done; whence this part of philoſophy would receive its final perfection.

By one of thoſe ſtandard thermometers well made, many more might ſoon be conſtructed with any expanding fluid, without the trouble of graduating their tubes by equal quantities of quickſilver. For having filled the balls, and a convenient part of the tube, with the propoſed fluid, place them all together in a veſſel of cold water; and while it is warming as gently as poſſible, when the oil in the ſtandard thermometer ſhall arrive ſucceſſively at the ſeveral diviſions of its ſcale, at the ſame inſtant of time mark the new tubes at the ſeveral heights of their fluids, and form a ſcale for every tube, that ſhall correſpond to thoſe marks. Then, while the liquors ſubſide by cooling gently, examine whether they nicely agree at the ſeveral marks. To determine the freezing point in all, they are to ſtand together in the water till it juſt begins to freeze: or, having all the other points duly, that may be deduced very exactly by the rule of proportion.

A thermometer that ſhall vary very ſenſibly by every ſmall variation of heat and cold, as thoſe of the atmoſphere, muſt have a large ball in proportion to the bore of the tube; and, that the heat or cold may ſooner penetrate the innermoſt parts of the liquor, the ball ſhould not be ſpherical, but oblong and flatted like a french flaſk; and the lengths of the tubes ſhould be proportioned to the degrees of heat they are intended to diſcover.

Sir Iſaac Newton gradated his ſtandard thermometer on both ſides, as ſhewn in the figure. Thoſe on the right hand meaſured the heat of the oil; as thoſe on the left meaſured the bulk thereof: but ſince the latter, as well as the former, begins from a cypher at the freezing point, and is regularly continued upwards by the common diviſions 10, 20, 30, 40, &c. it will equally ſerve both purpoſes; ſince the degree of heat will

always be proportioned to the expanſion of the bulk of the fluid above or below the freezing point.

By this diviſion therefore on the left hand, we ſhall expreſs ſome of the principal articles of Sir Iſaac Newton's ſcale of the various degrees of heat, as in the table below.

D. of heat.	
0	Water juſt freezing, and ſnow juſt thawing.
1 to 4	The heats of the air in winter.
4 to 8	The heats of the air in ſpring and autumn.
8 to 12	The heats of the air in ſummer.
13	The greateſt ſummer-heat.
26	The greateſt heat of the external parts of the human body.
31	Water juſt tolerable to the hand at reſt.
36½	Water hardly tolerable to the hand in motion.
43	Melted wax juſt growing ſtiff and opake.
51½	Melted wax juſt before it bubbles or boils.
54	Spirit of wine juſt begins to boil.
72	Water begins to boil.
75	Water boils vehemently.
86	A mixture of $\frac{1}{10}$ of lead, $\frac{2}{5}$ of tin, and $\frac{1}{2}$ biſmuth, melts.
103	A mixture of equal parts of tin and biſmuth melts.
122	A mixture of $\frac{3}{5}$ of tin and $\frac{2}{5}$ of lead melts.
154	The heat which melts tin.
374	The heat which melts biſmuth.
206	The leaſt heat which melts lead.
290	The heat with which burning bodies ſhine in a dark place.
410	The heat of a ſmall coal-fire.
450	The heat of a ſmall wood-fire.

Dr. Hales conſiders the freezing point as one boundary to vegetation, *viz.* on the ſide of cold; and the other boundary he fixes to that degree of heat with which wax will begin to melt, becauſe a greater degree of heat will, inſtead of collecting and aſſimilating the nutritive particles, diſſipate them, even thoſe which are moſt viſcid and glutinous; and therefore the plant will rather fade than vegetate in ſuch degrees of heat.

This ſpace the doctor divided into one hundred equal parts in his thermometers: but his numbers, expreſſed in thoſe of the ſtandard-thermometer, are for ſeveral particulars mentioned by the doctor as follows. For myrtle, 4½; oranges, 6½; ficoides, 7½; indian fig, 8¼; aloe, 10; cereus, 11; euphorbium, 12; piamento, 13; ananas, 14½; melon-thiſtle, 15¼; air under the glaſs of a hot-bed, 17; the hot-bed itſelf, 28. If the hot-bed exceed the heat of 40, or thereabouts, it will ſcorch the plants and kill them. The heat of milk from the cow is 28, that of urine 29, and of blood in a fever nearly 40.

As Farenheit's thermometer is come into ſuch general uſe, we have here placed it by the ſtandard thermometer, that the diviſions on each may be reduced to the other's reſpectively by bare inſpection, and the uſe of both be ſtill preſerved.

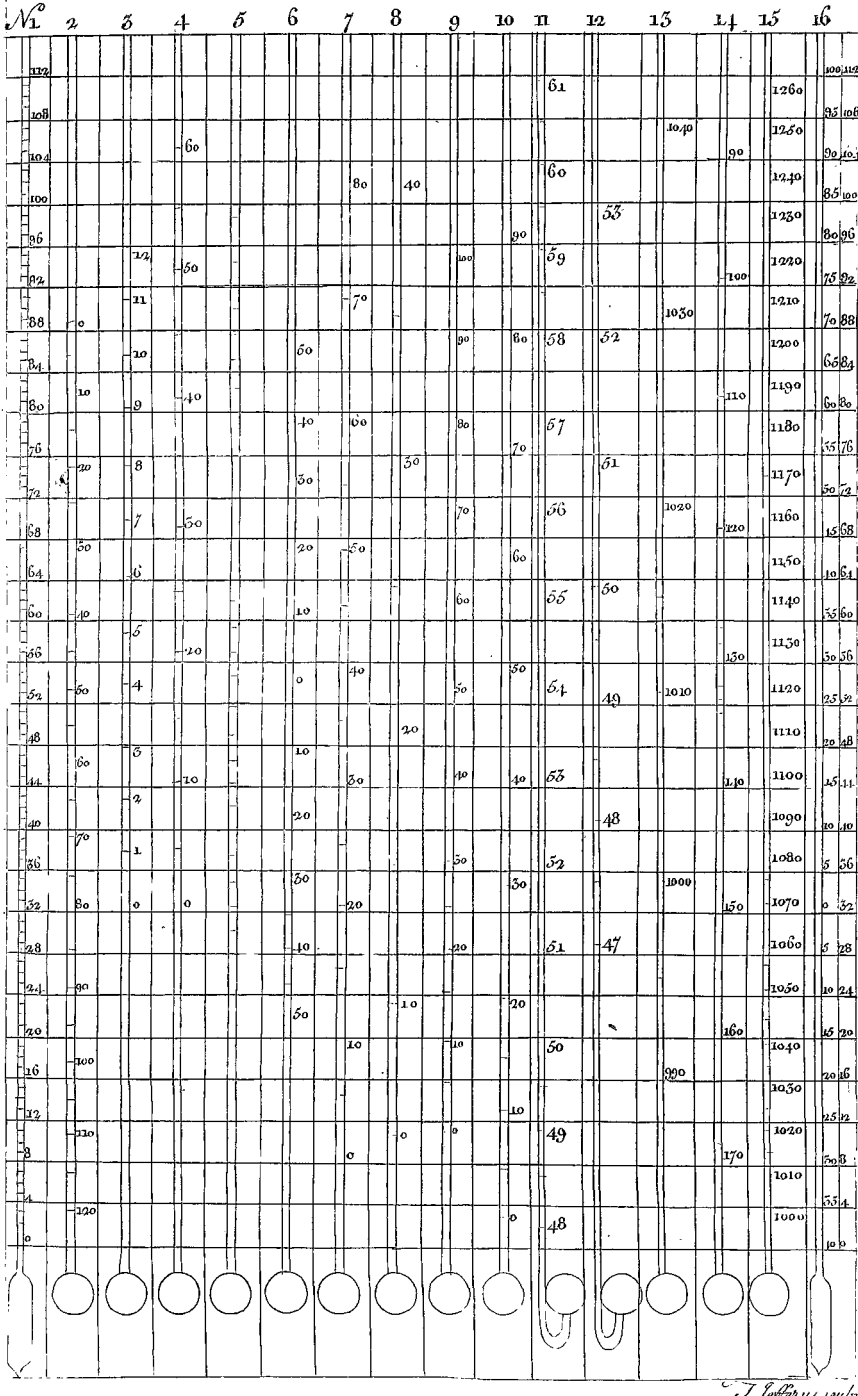
But that the reader may be enabled to form ſome idea of the ſeveral ſorts of thermometers, and the different methods of graduating them, we have given a comparative view of the moſt remarkable ones in plate CCLXXVI. where n° 1. repreſents Farenheit's thermometer; n°2. that of the Royal-ſociety; n° 3. Sir Iſaac Newton's; n° 4. Dr. Hales's; n° 5. that of Edinburgh; n° 6. Fowler's; n° 7. and 8. thoſe of Florence; n° 9. that of Paris; n° 10. De la Hire's; n° 11. Amonton's; n° 12. Poleni's; n° 13. Reaumur's; n° 14. De l' Iſle's; n° 15. Crucquis's, and n° 16. Th. de Lyon's. The reader may alſo conſult Dr. George Martine's treatiſe on this ſubject, where he will find it explained to his ſatisfaction.

THERMOSCOPE, an inſtrument ſhewing the changes happening in the air with reſpect to heat and cold.

The word thermoſcope is generally uſed indifferently with that of thermometer, tho' there is ſome difference in the literal import of the two; the firſt ſignifying an inſtrument that ſhews, or exhibits, the changes of heat, *&c.* to the eye; and the latter an inſtrument that meaſures thoſe changes; on which foundation the thermometer ſhould be a more accurate thermoſcope, *&c.* This difference the excellent Wolfius taking hold of, deſcribes all the thermometers in uſe as thermoſcopes; ſhewing that none of them properly meaſures the heat, *&c.* none of them do more than indicate the ſame. Though their different heights, yeſterday

and

A Comparitive View of the most remarkable THERMOMETERS



and to-day, ſhew a difference of heat, yet, ſince they do not diſcover the ratio of yeſterday's heat to to-day's, they are not ſtrictly thermometers.

THESEA, in antiquity, feaſts celebrated, by the Athenians, in honour of Theſeus, conſiſting of ſports and games, with mirth and banquets: ſuch as were poor and unable to contribute to them were entertained at the public expence.

THESIS, a general poſition which a perſon advances, and offers to maintain. In colleges it is frequent to have placards, containing a number of them, in theology, in medicine, in philoſophy, in law, *&c.*

THESIUM, in botany, a genus of the *pentandria-monogynia* claſs of plants, having no corolla but the calyx, which being coloured on the inſide has paſt for a corolla with ſome: there is no pericarpium: the calyx holds in its bottom a ſingle roundiſh ſeed.

THESSALY, now called Janna, a province of european Turkey, bounded by Macedonia, on the north; by the Archipelago, on the eaſt; by Achaia, or Livadia, on the ſouth; and by Epirus, on the weſt.

THETFORD, the county town of Norfolk, ſituated twenty-five miles ſouth-weſt of Norwich.

It ſends two members to parliament.

THEVETIA, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of an infundibuliform petal: the tube is oblong: the limb large, and divided into five ſegments: the fruit is an orbiculated, unilocular, depreſſed drupe, acuminated on the central part: the ſeed is an ovato-trigonal nut.

THEURGY, a name given to that part of magic called white magic, or the white art. Thoſe who have written of magic have divided it into three kinds; the firſt is theurgy, as operating by divine means: the ſecond, natural magic; performed by the powers of nature: and the third, necromancy; which they imagined proceeded from invoking dæmons. See MAGIC.

THIBET, or TIBET, one of the moſt powerful of the Tartar kingdoms, having China on the eaſt and India on the weſt.

THIGH, *femur*, in anatomy, that part of the body of men, quadrupeds, and birds, between the leg and the trunk. See the article FEMUR.

Fractures and Luxations of the THIGH. The thigh-bone, though the largeſt and ſtouteſt in the whole body, is yet frequently broken, both near its middle and towards its ends or articulation, but more particularly near that part called its neck, near its articulation with the hip-bone; and when this is the caſe it is very difficult to ſet it, and retain it in its place. When the bone is broken in two places at once, which ſometimes happens, the danger is much greater. Sometimes this bone is broken tranſverſely, ſometimes obliquely, and at other times the ends ſlip in a great way over one another, notwithſtanding the utmoſt caution in ſetting it. It is therefore neceſſary in theſe caſes, according to Heiſter, beſides the means that are common to all the fractures, to uſe a more ſtrict and tight bandage in this than in the tranſverſe fracture, to prevent the bones from being eaſily removed. When a fracture of the thigh-bone happens near the middle, or towards its lower head, it is to be extended and replaced with the hands like other fractures, except that the extending force required is very great: and where the hands of a ſtrong aſſiſtant are not enough, ſlings, napkins, or linnen bandages are to be bound round each head of the thigh, whereby the fractured bone may be extended both ways by the ſtrength of three or four perſons at once, while the ſurgeon cautiouſly reduces the fracture with his hands, and ſecures it with a proper bandage and dreſſing: and there are ſometimes caſes where the joint ſtrength of three or four men applied in this manner, is not ſufficient to make the neceſſary extenſion; in which caſe the ſurgeon is obliged to have recourſe to ropes and pullies, by means of which one man will pull more forcibly and equally than ſeveral can without them: but caſes that require this treatment are not common. See the articles FRACTURE and EXTENSION *of fractured limbs*.

When the neck of the thigh-bone is fractured, to which, from its oblique or tranſverſe direction, and ſpongy or brittle ſubſtance, it is very ſubject, it makes a fracture not only difficult to reduce, but ſuch a one as can ſeldom be cured without leaving the limb ſhorter than it was before. The reaſons of which are, that the fragments cannot, but with great difficulty, be preſſed into their right

places, by reaſon of the great thickneſs and ſtrength of the muſcles which cover them; and, that it ſeldom happens that the bones can be retained in their natural poſition after they have been ever ſo well reduced; becauſe the muſcles which paſs over, and are inſerted below, the neck of this bone, draw its lower part upwards: to which may be added, that it is very difficult to diſcover when the neck of the thigh-bone is fractured; this caſe being uſually taken for the head of the bone being ſlipped out of its ſocket. If the fracture of the bone be accompanied with a wound, it makes the caſe very difficult and dangerous; and if theſe accidents happen to be inflicted on the neighbouring joint, death is generally the conſequence, more eſpecially when any of the large veſſels are wounded. See WOUND and HÆMORRHAGE.

The thigh-bone, Heiſter obſerves, is found to be capable of luxation four ways, upwards and downwards, and backwards and forwards; but it is moſt frequently diſlocated downward and inward, towards the large foramen in the os pubis. For beſides that the cartilaginous defence on the lower part of the acetabulum is not ſo high as on the reſt, the ligamentum rotundum is ever found to give way more readily in that part than in any other; and, laſtly, the adjacent muſcles are found to be weakeſt on this part. And there is beſides, a certain eminence in this edge of the acetabulum which prevents the head of the bone from falling back again eaſily into its right place when once it is got this way out of it. But if the head of this bone be diſplaced outwards, it generally ſlips upwards at the ſame time, it being ſcarce poſſible but that the very ſtrong muſcles of the thigh muſt then draw the bone upwards; and there is no eminence in this edge of the acetabulum to reſiſt the head of the bone in that paſſage. See LUXATION.

When the thigh is diſlocated forwards and downwards, which is what moſt uſually is the caſe, the leg hangs ſtradling outward, and is longer than the other; the knee and foot alſo both turn outwards, and the head of the bone itſelf will be felt near the lower part of the inguen and os pubis. Sometimes there is a ſuppreſſion of urine in this caſe, which is occaſioned by ſome nerve which communicates with the bladder being violently compreſſed; in the buttock there alſo may be perceived a cavity from the trochanter major, and the reſt of the bones being diſplaced; and if the thigh-bone be not timely reduced into its acetabulum, the whole limb withers ſoon afterwards. The patient, for this reaſon, can bear little or no ſtreſs upon that limb, but muſt always incline and throw the weight of his body upon the other: when he moves forward, he muſt move that limb in form of a ſemicircle, and ſupport his body by crutches under the arms: though there are not wanting particular caſes where the head of the luxated thigh-bone has grown ſo firmly to the adjacent part, without the acetabulum, as to become, in proceſs of time, ſo ſtrong as to ſupport the body without ſticks, though the perſon could not, in any of the caſes that have been known of this kind, walk without halting.

If the thigh-bone be diſplaced backward, it is uſually drawn upward alſo, as before obſerved, at the ſame time; hence there will be perceived, in this caſe, a cavity behind the inguen, and a tumour upon the buttock, becauſe the head, and trochanter of this bone, will be placed there. The tumour on the buttock being thruſt upward, the limb will become ſhorter than before, and the foot will be inclined to turn inwards. The heel will not touch the ground, but the perſon ſeem to ſtand upon his toes; and laſtly, the luxated limb will be much more eaſily bent than extended.

It is extremely rare that the thigh is luxated forward or backward, without being alſo drawn upward or downward; but if it ſhould ſo happen, it will yet evidently be diſcovered by the rules before given, and by conſidering the nature of the articulation of the bone: as it is, however, at beſt very difficult to diſcover when the thigh-bone is diſlocated, and when it is fractured, either by feeling or inſpecting, becauſe of the great thickneſs of the muſcles and integuments: it is therefore a matter of ſome conſequence to propoſe the ſigns by which one of theſe caſes may be known from the other. There is reaſon to judge the thigh-bone to be luxated when we find the ligaments of the bone have been relaxed by ſome preceding congeſtion of humours, when no external violence has been exerted upon it, when neither violent pain, tumours, nor inflammation

follow;

follow; and laſtly, when the whole limb may be bent, and turned about at the acetabulum, without the ſurgeon's diſcovering any grating or cruſhing of the bones; and the contrary of theſe ſigns, which are what uſually take place, in what have been uſed to be called luxations of this bone, are very ſtrong indications of a fracture.

When the bone is found to be really diſlocated, it is to be reduced in a method agreeable to the nature and direction of the diſlocation. When it is diſplaced forward and downward, the patient is to be laid flat upon his back on a table; then a linen napkin, or ſtrong ſling, is to be made faſt about the groin, over the part affected, ſo that one end of the ſling may come over the belly, and the other over the nates and back, to be both tied together in a knot upon the ſpine of the os ileum, and afterwards either faſtened to a hook fixed in ſome poſt, or held firm by ſome aſſiſtance: in like manner, at the bottom of the thigh, a little above the knee, there muſt be faſtened another napkin or ſling, or elſe the girt of Hildanus, with a compreſs between it and the thigh; both theſe ſlings being drawn tight, the thigh is to be extended, but that not vehemently but only ſo much as is ſufficient to draw the bone out of its ſinus, that it may be replaced into its proper acetabulum by the ſurgeon's hands; to this purpoſe the ſurgeon is, with one hand, to preſs the head of the thigh-bone outward, while the other conducts the knee inward. Or the reduction may be made by napkins faſtened about the thigh near its extremities, in the manner of ſlings, and the limb extended that way, the knee being at the ſame time preſſed inward by the hands.

If theſe methods are not ſufficient, it will be neceſſary to have recourſe to the polyſpaſton, or pulley, well known to the ſurgeons on theſe occaſions. This is to be the method of reduction of the thigh-bone when it is diſlocated forward; but when it is found to be luxated backward, the patient is to be placed flat on a table, with his face downward; the thigh is then to be extended more ſtrongly than in the former caſe, and the reduction is to be performed by the ſurgeon's hand, an aſſiſtant all the while turning the limb ſomewhat inwards; and by this method the head of the thigh-bone generally ſlips very readily from this ſort of diſlocation into its proper place. The limb is then to be ſecured with proper bandages, and the patient to be kept to his bed for three or four weeks.

THIMBLE, an inſtrument made of braſs, ſilver, iron, &c. put on the finger to thruſt a needle through any cloth, ſilk, &c. uſed by all ſeamſtreſſes, taylors, &c. The common thimbles are generally made of ſhruff and old hammered braſs. This they melt, and caſt in a ſort of ſand, with which and red ochre are made moulds and cores. They are caſt in double rows, and when cold taken out, and cut off with greaſy ſhears. Then the cores being taken out, they are put into a barrel, as they do ſhot, and turned round with a horſe till they rub the ſand one from another: from thence they are carried to the mill to be turned firſt on the inſide and afterwards on the outſide: then ſome ſaw-duſt, or filings of horn-combs, are put half way into each thimble, and upon it an iron-punch; and then with one blow againſt a ſtudded ſteel the hollow of the bottom is made: after this, with an engine, the ſides have the hollow made: this done, they are again poliſhed on the inſide: then the rim is turned at one ſtroke: and laſtly, they are turned in a barrel with ſaw-duſt, or bran, to ſcour them very bright. Iron thimbles, the thouſand, pay, on importation, 11 s. $6\frac{60}{100}$ d. and draw back, on exportation, 4 s. $8\frac{25}{100}$ d. Braſs thimbles, the thouſand, pay, on importation, 14 s. $4\frac{35}{100}$ d. and draw back, on exportation, 12 s. $11\frac{25}{100}$ d.

THINKING, a general name for any act or operation of the mind. See MIND.

Chauvinus, with the carteſians, will have thinking to conſiſt in a certain native inherent motion or agitation of the human mind, whereof itſelf is conſcious; for they conceive it to be no other than the very eſſence of the mind itſelf, or at leaſt its principal and eſſential property. All the materials of thinking are by Mr. Locke derived from the two ſources of ſenſation and reflection. See the articles SENSATION and REFLECTION.

The ſchool philoſophers uſually divide thinking into intellectual and volitive. Intellectual is ſubdivided into perception, judgment, reaſoning, and method. Volitive thinking, or volition, admits of infinite different modifications, or new determinations. See PERCEPTION, JUDGMENT, &c.

The

The doctrine of the carteſians, who maintain that thinking is eſſential to the human ſoul, and that there is no time when the ſoul does not think, is overturned by Mr. Locke, who ſhews, that in ſleep, without dreaming, there is an entire ceſſation of all the modes of thinking. See the article IDEA.

THEONVILLE, a city of Luxemburg, ſituated on the river Moſelle: eaſt long. 6°, north lat. 49° 32′.

THIRD, *tertius*. See NUMBER and NUMERATION.

THIRD, in muſic, a concord reſulting from a mixture of two ſounds, containing an interval of two degrees.

It is called third, as containing three terms or ſounds between the extremes. The third, in Italian *terza*, in French *tierce*, in Latin *tertia*, has no general name in the Greek; it is the firſt of the imperfect concords, *i.e.* of ſuch as admit of majority and minority, without ceaſing to be concords. And hence it is diſtinguiſhed into two kinds. The firſt, which the Italians call *ditono*, from the Greek *ditonos*, or *terza maggiore*, and the greater third, is compoſed diatonically of three terms or ſounds, containing two degrees or intervals, one whereof, in the antient ſyſtem, is a greater tone, and the other a leſſer tone; but, in the modern temperate ſyſtem, they are both equal, as *ut, re, mi*; or *ut, mi*. See the articles INTERVAL and CONCORD.

Chromatically it is compoſed of four ſemitones, two whereof are greater, and the third leſs; it takes its form from the ratio ſeſquiquarta, 4:5.

The ſecond third, which the Italians call trihemituono, or ſemi-ditono, or terza minore, and we leſſer third, is compoſed, like the former, of three ſounds or terms, and two degrees or intervals; but theſe degrees, diatonically, are only a greater tone and ſemi-tone.

Chromatically it is compoſed of three tones, two greater and one leſs; as *re, mi, fa*; or *re, fa*.

It takes its form from the ratio ſeſquiquinta, 5:6.

Both theſe thirds are of admirable uſe in melody, and make, as it were, the foundation and life of harmony.

THIRD POINT, or TIERCE POINT, in architecture, the point of ſection in the vertex of an equilateral triangle.

Arches or vaults of the third point, called by the Italians di terzo acuto, are thoſe conſiſting of two arches of a circle meeting in an angle a-top.

THIRDINGS, in the manor of Turfat, in the county of Hereford, is the third part of the corn or grain on the ground, due to the lord for a heriot, on the death of his tenant. See HERIOT.

THIRSK, a borough-town in the north-riding of Yorkſhire, ſituated on the river Swale, ſixteen miles north-weſt of York. It ſends two members to parliament.

THIRST, *ſitis*, an uneaſy ſenſation, ariſing from a deficiency in the ſaliva to moiſten the inward parts of the mouth; hence ariſe a ſtrong deſire for drink: it is a ſymptom generally attending feveriſh diſorders.

THISTLE, *carduus*, in botany. See the article CARDUUS.

Order of the THISTLE, or *of St.* ANDREW, a military order of knighthood in Scotland, the riſe and inſtitution whereof is variouſly related by different authors: Leſley, biſhop of Roſs, reports, that the night before the battle between Athelſtan king of Northumberland, and Hungus king of the Picts, a bright croſs, in form of that whereon St. Andrew (the tutelar ſaint of Scotland) ſuffered martyrdom, appeared to Hungus, who having gained the victory, ever after bore the figure of that croſs on his banners. Others aſſert, that Achaius king of Scotland, firſt inſtituted this order, after having made the famous league offenſive and defenſive with Charlemagne king of France. But although the thiſtle had been acknowledged as the ſymbol of the kingdom of Scotland from the reign of Achaius, yet ſome refer the beginning of this order to the reign of Charles VII. of France. Others place the foundation of it as low as the year 1500.

The chief and principal enſign is a gold collar compoſed of thiſtles and ſprigs of rue interlinked with amulets of gold, having pendent thereunto the image of St. Andrew with his croſs, and the motto, NEMO ME IMPUNE LACESSET. See plate CCLXXIV. fig. 4. n° 1.

The ordinary or common enſign worn by the knights, is a ſtar of four ſilver points, (*ib.* n° 4.) and over them a green circle, bordered and lettered with gold, containing the ſaid motto, and in the center is a thiſtle proper; all which is embroidered on their left breaſt, and worn with the collar, with a green ribband over the left ſhoulder, and brought under the right arm; pendent thereto is the image of St. Andrew, with

with his croſs, in a purple robe, within an oval of gold enamelled vert, with the former motto: but ſometimes they wear, incircled in the ſame manner, a thiſtle crowned.

About the time of the reformation, this order was dropped, till James II. of England reſumed it, by creating eight knights: however, the revolution unſettled it again, and it lay neglected till queen Anne, in 1703. reſtored it to the primitive deſign, of twelve knights of St. Andrew. King George I. in the firſt of his reign, confirmed the ſtatutes ſigned by queen Anne, with the addition of ſeveral more, among which was that of adding rays of glory to ſurround the figure of St. Andrew, which hangs at the collar: and though from the reformation to George I. both elections and inſtallments had been diſpenſed with, his majeſty ordered that chapters of election ſhould, for the future, be held in the royal preſence; to which end he ordered the great wardrobe to provide the knights brethren, and officers, with ſuch mantles as the ſtatutes of the ſaid order appointed.

THLASPI, TREACLE-MUSTARD, in botany, a genus of the *tetradynamia ſiliculoſa* claſs of plants, the corolla whereof conſiſts of four petals, vertically ovated, and diſpoſed in the form of a croſs; the ſtamina are ſix filaments, about half the length of the cup; the fruit conſiſts of a bilocular pod or capſule, narrowed at the baſe, and emarginated, and containing numerous ſeeds, affixed to two ſutures. See plate CCLXXVII. fig. 1.

This genus comprehends the burſa paſtoris of authors.

The ſeeds of the thlaſpi agree in medicinal virtues with the common muſtard. See the article SINAPI.

THLIPSIS, θλῖψις, a compreſſion of the ſtomach from food, which is offenſive only by its quantity, and not endued with any remarkable quality; or from a conflux of humours, void of acrimony, into the part.

THOMÆANS, THOMEANS, THOMISTS, or *Chriſtians of St.* THOMAS, a people of the Eaſt-indies, who, according to tradition, received the Goſpel from St. Thomas. Upon the arrival of the Portugueſe at Calicut, in their firſt voyage to the Indies, they met with antient chriſtians, who pretended to be deſcended from thoſe converted by St. Thomas. The thomæans being informed of a new people arrived among them, who bore a particular veneration for the croſs, ſent embaſſadors to them, to make an alliance with them, and to ſollicit their aſſiſtance againſt the gentile princes, by whom they were greatly oppreſſed. A mixture of opinions, with a total interruption of paſtors, ſometimes for ſeveral years together, occaſioned that horrible chaos their religion was in, at the arrival of the Portugueſe; for a ſpecimen whereof we ſhall add their manner of celebrating the euchariſt: over their altar was a kind of gallery; and while the prieſt was ſaying the beginning of the office below, a cake of flower of rice was frying in oil, or butter, above; when enough, the cake was let down in a baſket upon the altar, where the prieſt conſecrated it: as to the other ſpecies, for wine they uſed a kind of brandy or arrack, variouſly prepared in that country. Nor was their ordination much more regular; the archdeacon, who was ſometimes more reſpected than the biſhop himſelf, frequently ordained prieſts: their other abuſes were infinite. The Portugueſe, for theſe two laſt centuries, have laboured the reformation of this church, and have employed both the eccleſiaſtic and ſecular power therein: for this end they have called the thomæan biſhops to the council at Goa, have inſtructed, charged them, *&c.* and even ſent them for inſtruction to Portugal and Rome; but finding that they were ſtill apt to relapſe at their return, and that no good was like to be done with them, they reſolved to exclude them once for all, and to appoint an european biſhop in their room. Theſe proceedings have rendered the Portugueſe infinitely odious to the thomæans.

St. THOMAS, a city of the hither India, on the coaſt of Cormandel, three miles ſouth of Fort St. George; ſubject to the Portugueſe.

St. THOMAS is alſo an iſland in the Atlantic ocean, ſituated under the equator, in 8° eaſt long.

St. THOMAS is alſo a town of Guiana, in ſouth America, ſituated on the river Oronoko; ſubject to Spain.

St. THOMAS'S DAY, a feſtival of the chriſtian church, obſerved on Dec. 21. in commemoration of St. Thomas the apoſtle.

St. THOMAS *of Canterbury's day*, a feſtival of the romiſh church, obſerved on Dec. 29. in memory of Thomas Becket archbiſhop of Canterbury, who was murdered, or, as the romaniſts ſay, martyred, in the reign of king Henry II.

St.

St. THOMAS'S HOSPITAL. See the article HOSPITAL.

THOMISM, or THOMAISM, the doctrine of St. Thomas Aquinas, and his followers the thomiſts, chiefly with regard to predeſtination and grace. There is ſome doubt what the true genuine thomiſm is, but there are authors who diſtinguiſh the thomiſm of St. Thomas from that of the dominicans. Others again make thomiſm no other than a kind of janſeniſm diſguiſed: but janſeniſm, it is known, has been condemned by the popes, which pure thomiſm never was: in effect, the writings of Alvarez and Lemos, who were appointed by their order to lay down and defend, before the holy ſee, the dogmata of their ſchool, have ſince been reputed the rule of pure thomiſm. The modern ſchool has abandoned many of the antient thomiſts, whoſe ſentiments and expreſſions appeared to Alvarez too hard; and the new thomiſts, who paſs the bounds marked by theſe two doctors, cannot give their opinions for the ſentiments of the ſchool of St. Thomas, which the pope has forbid being cenſured. Thoſe two authors diſtinguiſh four claſſes of thomiſts: the firſt, which they reject, deſtroys or takes away liberty; the ſecond and third do not differ from Molina; the laſt, which Alvares embraces, admits of a phyſical premotion or predeſtination, which is a complement of the active power, whereby it paſſes from the firſt act into the ſecond, that is, from complete and next power to action. The premotion they hold is offered in ſufficient grace, ſufficient grace is given to all men, and that they have a complete independent, next power not to act, and even to reject the moſt efficacious grace.

THOMISTS, a ſect of ſchool-divines, who maintain thomiſm. See the preceding article.

THORACIC, *thoracicus*, a name given to two branches of the axillary artery, on account of their conveying the blood into ſome parts of the thorax. See THORAX. The thoracic arteries are diſtinguiſhed into upper and lower. There are likewiſe thoracic veins, upper and under, deſtined for the reconveyance of the blood from the thorax to the axillary vein.

THORACIC DUCT, or CHYLIFEROUS DUCT, a very ſlender canal, receiving the chyle from the chyliferous veſſels, and the lymph from the lymphatics, and carrying them to the thorax, and uſually through it to the ſubclavian vein. The beginning of this duct is in the reſervoir or receptaculum chyli, which is ſituated in the left ſide of the upper vertebra of the loins, under the aorta, and the veſſels of the left kidney; the reſt of the duct has ſome reſemblance of a ſack or bag, and is larger and more irregular in its figure. Its end is uſually in the ſubclavian vein; ſometimes in the jugular. In dogs, and many other animals, its progreſs is under the aorta; but in the human body it aſcends along the right ſide of the vertebra of the back, and paſſes between the aorta and the vena azygos, ſometimes with a ſimple trunk, ſometimes divided into two: its breadth, where divided, is about that of a wheat-ſtraw. The beſt method of demonſtrating it in animals, is to feed a dog well, and then to ſtrangle him; and as ſoon as the body is opened, to tie it up with a thread in the breaſt, juſt by the ſubclavian; by this means the ciſtern, or receptacle of the chyle, and the chyliferous veſſels and lymphatics are all expoſed evidently to view at once. In a human body they may alſo be obſerved any time after death, by injecting, according to Salzman, wax, or any fluid, or indeed only by inflating the great lymphatic veſſel, which runs by the left emulgent vein; or otherwiſe, if, according to Henninger, an injection, or barely an inflation, be made into a lacteal of the ſecond order, to be traced out in the middle of the meſentery; or, finally, if the pleura be carefully cut between the aorta and the vena azygos, the duct will uſually be eaſily found there. It is compoſed of a fine, thin, and pellucid membrane, and within it there are valves, as in the lacteals and lymphatics, which prevent the reflux of the chyle. There are more of theſe in the human body than in beaſts; and, finally, there is a ſemilunar valve, cloſing its extremity under the ſubclavian.

The uſe of the thoracic duct is to carry the chyle to the blood, through the thorax, as it receives it from the receptacle, and with it the lymph from the lymphatics.

THORAX, in anatomy, that large part of the body ſituated between the abdomen and the neck. See the articles ABDOMEN and NECK.

The parts of the thorax are of two kinds, the continent or containing, and contained: the continent parts, or thoſe which form the cavity, are either common, or proper; the common continent parts of the thorax are the cuticula, the cutis and the pinguedo. See the article CUTICLE, *&c.*

The continent parts proper or peculiar to the thorax, are theſe; the breaſts, the pectoral muſcles, the intercoſtals, the diaphragm, the pleura; and, finally, the bones; of theſe laſt there are twenty-four ribs, the ſternum, and twelve vertebræ. See the articles BREASTS, PECTORALIS, INTERCOSTALS, DIAPHRAGM, &c.

The contents of the cavity formed by theſe, or the parts contained in the thorax, are the mediaſtinum, the lungs, the heart and its pericardium, with the large veſſels ariſing from it, particularly the trunks of the aorta, and the pulmonary artery of the vena cava and pulmonary vein, the thoracic duct, and, finally, the greater part of the œſophagus. See the articles MEDIASTINUM, LUNGS, HEART, PERICARDIUM, &c.

The uſes of the parts of the thorax in general, are their ſerving to reſpiration and the circulation of the blood, in both ſexes; and in women, to the producing milk. See the articles RESPIRATION, CIRCULATION, and MILK.

Wounds of the THORAX, are, by Heiſter, divided into three ſorts. The wound is inflicted either upon the external parts of the thorax; or elſe it penetrates into the cavity of the thorax, without injuring any of its contents; or, laſtly, the contents of the thorax alſo partake of the wound. That the wound terminates in the exterior parts, and does not penetrate into the cavity of the thorax, may be diſcovered by ſeveral methods, as by the ſight, by hearing whether any ſound proceeds from the wound at the time of inſpiration, by feeling whether the finger or probe meets with any reſiſtance in attempting to paſs it into the cavity of the thorax; by injecting warm water, which, in this caſe, will return upon you; by the abſence of bad ſymptoms, which always attend a wound that penetrates. When, by theſe methods, you are fully ſatisfied that it does not penetrate, it may be dreſſed with a digeſtive ointment, or ſome vulnerary balſam, and treated according to the method directed in the cure of ſlight wounds. See the article WOUND.

But when the wound penetrates into the thorax, and a large quantity of blood falls into the cavity thereof, then the office of reſpiration, and the courſe of the blood through the lungs, will certainly be impeded; and the blood, by frequent delays and obſtructions, being entirely inſpiſſated in the lungs, life can no longer be ſupported: but where the quantity of extravaſated blood is not large enough to obſtruct the lungs in their office, the chief danger that the patient labours under, is that the extravaſated blood ſhould putrify by degrees, and corrupt the contents of the thorax, which will bring on very bad ſymptoms, and in a ſhort time death. The following ſymptoms diſcover an extravaſation of blood in the thorax: if there is a great difficulty of breathing except when the patient is placed in an erect poſture; if the patient lies eaſieſt upon his back, or wounded ſide; if he feels a weight upon the diaphragm; if he perceives the undulation of a fluid upon turning the body round; and, laſtly, if there has been little or no diſcharge of blood by the wound. When it appears by theſe ſymptoms that there is a collection of blood in the thorax, the greateſt diligence is required to get it out; therefore when the wound is inflicted upon the middle or lower part of the thorax, and has not a very narrow opening, it will be convenient to lay the patient upon the wounded ſide, adviſing him to fetch his breath as deep as he can, or to cough. If the current of blood is obſtructed by any thick grumous parts, they muſt be removed with a probe or the finger, or drawn out with a ſyringe. If the blood is become too thick to flow out of the wound, attenuating injections muſt be uſed, made of a decoction of barley-water, with the addition of ſome common honey, or honey of roſes, and a ſmall quantity of ſoap; this is to be injected into the cavity of the thorax, and then the patient is to be ſo ſituated as to let it run out again: this operation is to be repeated, till it appears that all the grumous blood is waſhed away. But if the wound is ſo narrow or oblique, that this method cannot be proſecuted, the wound ſhould be enlarged, being careful not to fatigue the patient too much, by endeavouring to diſcharge all the extravaſated blood at one time, keeping the wound open, dreſſing it with proper plaſters and compreſſes, ſecuring the whole with a ſcapulary, and repeating this method of dreſſing, till the diſcharge ſhall entirely ceaſe, and the external wound can be conveniently healed. When a wound is made in the upper part of the breaſt, no poſture will ſatisfy the intention of diſcharging the extravaſated blood, but ſtanding upon the head; an opening ought therefore to be made in the lower part of the thorax, called paracenteſis. See PARACENTESIS.

The cavity of the thorax being thus cleanſed, the wound is to be dreſſed but once every day: each dreſſing ſhould be performed with all poſſible expedition, and the utmoſt diligence ſhould be uſed to guard the contents of the thorax from the external air. At the time of dreſſing, a chaffing-diſh of hot coals ſhould be held near the wound, to warm and thin the air; and if too great a quantity of air is already got into the cavity of the thorax, it muſt be drawn out with a ſyphon. When any of the contents of the thorax are wounded, as the heart, the aorta, the vena cava, the pulmonary artery or vein, the mediaſtinum, or a large portion of the lungs, death comes too ſuddenly to give the ſurgeon room to exerciſe his art. On the other hand, when the lungs are only ſlightly wounded, that is, when only the ſmall ramifications of the pulmonary vein and aſpera arteria are divided, the caſe is very dangerous, but not always mortal; though perſons who recover after wounds of this kind, are more obliged to the ſoundneſs of their conſtitution, than their ſurgeon's ſkill.

THORN, a city of Poland, in the province of regal Pruſſia, ſituated on the river Viſtula eaſt long. 19°, and north lat. 52° 40'.

THORNBACK, in ichthyology, the prickly raia, with tuberculoſe teeth, and a tranſverſe cartilage in the belly. See the article RAIA.

The head and body are very flat and depreſſed; the figure of the body, excluſive of the tail, is nearly ſquare; the tail is long and ſlender, but a little depreſſed or or flatted; the belly is altogether plane; the back in general is plane, but riſes a little in the middle into a convexity; the eyes ſtand on the uppermoſt part of the body, at a conſiderable diſtance from the roſtrum, and are a little protuberant, and covered with a ſimple and naked ſkin; behind each eye there is a ſingle oblong foramen, that runs tranſverſely, and its anterior ſide is ſtriated, and ſerves as a valve to cloſe up almoſt the whole aperture; the mouth is ſituated on the under ſide of the body, and lies in a tranſverſe direction, is very large, and ſtands at the ſame diſtance from the extremity of the roſtrum as the eyes do.

THORNBURY, a market-town of Gloceſterſhire, ſituated twenty miles ſouth-weſt of Gloceſter.

THORNEY-ISLAND, an iſland made by the branches of the Thames formerly, where Weſtminſter-abbey now ſtands.

THORNEY-ISLAND is alſo an iſland ſituated in a bay of the Eaſt channel, between Chicheſter and Portſmouth.

THOUGHT, or SENTIMENT, a general name for all the ideas conſequent on the operations of the mind, and even for the operations themſelves. See the articles IDEA and THINKING.

THOULON, or TOULON, a port-town of Provence, in France, ſituated on a bay of the Mediterranean ſea: eaſt lon. 6°, and north lat. 43° 5'.

THOULOSE, or TOULOSE, a city of France, capital of the province of Languedoc, ſituated on the river Garonne: eaſt long. 1° 5', and north lat. 43° 40'.

THRACE, a province of european Turky, ſituated on the north ſide of the Propontis.

THRASHING, or THRESHING, *flagellatio*, in agriculture, the art of beating the corn out of the ears. See CORN.

There are two ways of ſeparating corn from the ear; the firſt by beating it with a flail, which is properly what is called thraſhing. The other method, ſtill practiſed in ſeveral countries, is to make mules, or horſes, trample on it, backwards and forwards; this is properly what the antients called tritura and trituratio. The Hebrews uſed oxen therein, and ſometimes yoked four together for this purpoſe. Another way among the antients was with a kind of ſledge, made of boards joined together, and loaden with ſtones or iron, upon which a man was mounted, and the whole drawn over the corn by horſes: this inſtrument was called traha, or tribula. It is a rule among huſbandmen, that the ſeaſon for thraſhing, is as ſoon as the corn has ſweated in the heap or mow.

THRAVE, or THREAVE *of corn*, twenty-four ſheaves, or four ſhocks of ſix ſheaves to the ſhock; though, in ſome countries, they only reckon twelve ſhocks to the thravé.

THREE, *Rule of*. See the article RULE.

THRENODY, *threnodia*, a mournful or funeral-ſong.

THRICHECHUS, the SEA-COW, in zoology, a genus of ſea-animals, of the order of the plagiuri, the characters of which are, that it has teeth in both jaws; there is no fin upon the back, and the ſkin is very tough, firm, and hairy.

This

This creature ſeems to be the link uniting the fiſh and the quadruped-tribes, as the bat does the quadrupeds and birds: it grows to fifteen feet, or more, in length, and is conſiderably thick in proportion. The females have, between the pectoral fins, two large, round, and fair breaſts, and both ſexes have the parts of generation and the navel perfectly reſembling thoſe of the human ſpecies: there is no doubt, but all the fables concerning mermaids, mermen, and ſyrens, took their riſe from an imperfect view of this animal.

THRIPS, in the hiſtory of inſects, a genus of the order of ſcleroptera, having the roſtrum obſcure, the body of a linear figure, and the wings four in number, being incumbent on the back, and ſtrait. It is an extremely ſmall inſect, not equal to a flea in ſize.

THROAT, the anterior part of an animal, between the head and the ſhoulders, wherein is the gullet. See the article OESOPHAGUS.

For diſeaſes of the throat, ſee the articles QUINSEY, TONSILS, *&c.*

THROAT, in architecture, fortification, *&c.* See the article GORGE.

THRONE, θρόνος, a royal ſeat, or chair of ſtate, enriched with ornaments of architecture and ſculpture, made of ſome precious matter, raiſed on one or more ſteps, and covered with a kind of canopy. Such are the thrones in the rooms of audience of kings, and other ſovereigns.

THROWSTER, one who prepares raw ſilk for the weaver, by cleanſing and twiſting it.

THRUSH, in ornithology, two ſpecies of turdus, the one called the common thruſh, and the other the miſſel-thruſh. See the article TURDUS.

The common thruſh is the turdus with a white line over the eyes. This is ſmaller than the fieldfare; the head is ſmall and flatted; the eyes are bright, their iris hazel; the ears patulous; the beak about half an inch long, brown, and pointed; the head and back of an olive brown, ſpotted with a dark colour; the breaſt is yellow, the belly whitiſh, and the legs brown.

The other ſpecies of turdus, called the miſſel-thruſh, is of a greyiſh yellow colour with a ſpotted breaſt, being the largeſt of the turdus-kind.

THUIN, a town of the county of Namur, ſituated on the river Sambre, near the confines of Hainault, nine miles ſouth-weſt of Charleroy.

THULE, of the antients, ſuppoſed to be the iſlands of Orcades.

THUMB, *pollex*, in anatomy, one of the parts or extremities of the hand. See the article HAND.

The thumb, conſidered ſeparately, has bones thicker than thoſe of the fingers; the firſt of theſe agree in all reſpects with thoſe of the metacarpus, in figure, ſituation, and articulation; but in its motion it is widely different. The articulation of the firſt with the ſecond, and of the ſecond with the third, are like the articulations and motions of the ſecond and third phalanges of the other fingers. See the articles FINGERS and PHALANX.

THUMMIM, in the ſcripture-learning. See URIM and THUMMIM.

THUNDER, a noiſe in the regions of the air, excited by a ſudden kindling of ſulphureous exhalations.

Thoſe philoſophers who maintain, that vapours are buoyed up in the air by particles of fire adhering to them, account for the phænomena of thunder and lightning in the following manner: they ſuppoſe that from the particles of ſulphur, nitre, and other combuſtible matter, which are exhaled from the earth, and carried into the higher regions of the atmoſphere, together with the aſcending vapours, is formed an inflammable ſubſtance, which, when a ſufficient quantity of fiery particles is ſeparated from the vapours, by the colliſion of two clouds, or otherwiſe, takes fire, and ſhoots out into a train of light, greater or leſs, according to the ſtrength and quantity of the materials. This opinion is certainly falſe; for it is impoſſible the vapours ſhould be attended with ſuch fiery particles as is here ſuppoſed: neither have we occaſion to fly to ſuch an hypotheſis; for as vapours, exhaled from the ſurface of the water, are carried up into the atmoſphere, in like manner the effluvia of ſolid bodies are continually aſcending thither. Now we find, by experiment, that there are ſeveral inflammable bodies, which, being mixed together in due proportion, will kindle into flame by fermentation alone, without the help of any fiery particles. See the articles FERMENTATION, LIGHTNING, *&c.*

Thus, M. Lemery having covered up, in the earth, about fifty pounds of a mixture, compoſed of equal parts of ſulphur and filings of iron, tempered with

water; after eight or nine hours time the earth, where it was laid, vomited up flames. Thus alſo, mix a ſmall quantity of gun-powder with oil of cloves, pour gently upon this mixture two or three times as much ſpirit of nitre, and you will obſerve a bright inflammation ſuddenly ariſing from it. A mixture of the two fluids alone will take fire, the powder is added only to augment the inflammation. When, therefore, there happens to be a mixture of the effluvia of ſuch bodies floating in the air, they ferment, kindle, and, flaſhing like gun-powder, occaſion thoſe exploſions and ſtreams of fire, which we call thunder and lightning.

As to the particular ſpecies of the effluvia, which compoſe this mixture, that cannot be exactly determined: they are thought to be chiefly ſulphureous and nitrous; ſulphureous, becauſe of the ſulphureous ſmell which lightning generally leaves behind and of that ſultry heat in the air, which is commonly the forerunner of it; nitrous, becauſe we do not know of any body liable to ſo ſudden and violent an exploſion as nitre is.

Dr. Liſter is of opinion, that the matter both of thunder and lightning, and alſo of earthquakes, is the effluvia of the pyrites; as he does, that the matter of vulcanos is the pyrites itſelf. This is a mineral that emits copious exhalations, and is exceeding apt to take fire upon the admiſſion of moiſture. See the doctor's defence of his notion in the Phil. Tranſ. n° 157. He thinks this may be the reaſon why England is ſo little troubled with earthquakes, and Italy, and almoſt all places round the Mediterranean ſea, ſo very much, *viz.* becauſe the pyrites are rarely found in England; and, where they are, they lie very thin, in compariſon of what they do in thoſe countries; as the vaſt quantity of ſulphur emitted from the burning mountains there, ſeems to ſhew.

The effects of thunder and lightning are owing to the ſudden and violent agitation the air is put into thereby, together with the force of the exploſion; and not to thunderbolts falling from the clouds, as is ſuppoſed by the vulgar.

Some are inclined to think, that thunderbolts are artificial, and that they were applied by the antients to ſome uſe. What confirms them in their opinion is, that they are found more frequently where ſepulchres have been, than in other places.

The diſtance the thunder is from us, may nearly be eſtimated by the interval of time between our ſeeing the lightning, and hearing the thunder; for as the motion of light is ſo very quick, that the time it takes up in coming to us from the cloud, is not perceptible; and as that of a ſound is about a thouſand feet in a ſecond; allowing a thouſand feet for every ſecond that paſſes between our ſeeing the one, and hearing the other, we have the diſtance of the cloud, pretty nearly, from whence the thunder comes. See the article LIGHT and SOUND.

THURINGIA LANGRAVATE, one of the diviſions of the circle of upper Saxony, in Germany, having the dutchy of Magdeburg on the north, and Franconia on the ſouth.

THURSDAY, the fifth day of the chriſtian week, but the ſixth day of that of the Jews. See DAY and WEEK.

Holy THURSDAY, the ſame with aſcenſion-day. See the article ASCENSION.

Maunday-THURSDAY. See the article MAUNDAY-THURSDAY.

THURSO, a port-town of Cathneſs, in Scotland, ſituated on the Caledonian ocean, fifteen miles ſouth-weſt of Dungſby-head.

THUYA, *arbor vitæ*, in botany, a genus of the *monoecia-monadelphia* claſs of plants, having no corolla; the fruit is an ovato-oblong obtuſe cone, opening longitudinally, with oblong ſquamæ almoſt equal, obtuſe and convex on the outſide.

THYMBRA, in botany, the ſame with the ſatureia. See SATUREIA.

THYMELÆA, in botany, the ſame with daphne. See the article DAPHNE.

THYMUS, in botany, a genus of the *didynamia-gymnoſpermia* claſs of plants, the corolla of which conſiſts of a ſingle ringent petal; the tube is of the length of the cup; the faux is ſmall; the upper lip is ſhort, plane, erect, emarginated, and obtuſe; the lower lip is long, patent, trifid, obtuſe, and broader in the middle laciniæ; there is no pericarpium; the ſeeds are four, ſmall and roundiſh, and are contained in the cup.

This genus, among other ſpecies, comprehends the herb maſtich, the common garden-thyme, the cretic thyme, the common wild thyme, *&c.*

The common thyme has an agreeable aro-

matic

Fig. 2. THYMUS.

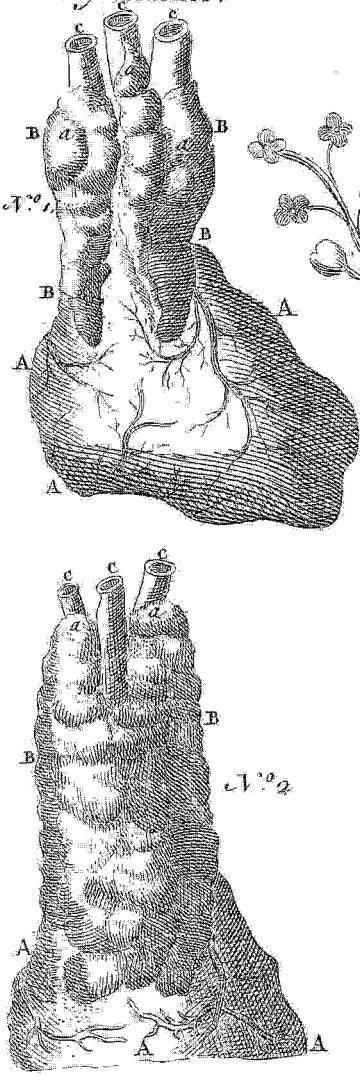


Fig. 1. THLASPI

Fig. 3. The TIGER.

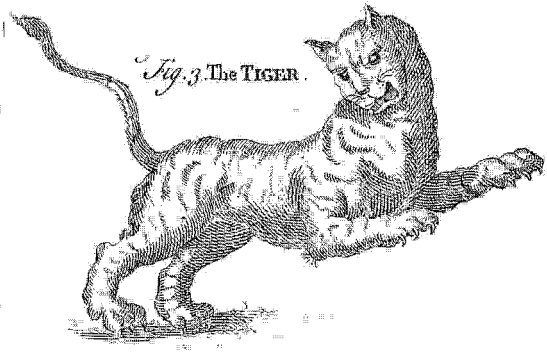

Fig. 4. TILIA.

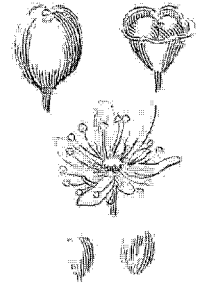

J. Jefferys sculp.

matic ſmell, and a warm pungent taſte, which it imparts by infuſion to rectified ſpirit, and ſends over, in diſtillation with water; along with the water ariſes an eſſential oil, extremely hot and pungent; this diſtilled ſpirit is an agreeable aromatic cordial liquor, not inferior to any thing of this kind.

THYMUS, in anatomy, a gland, which in infants is very remarkable: it is ſituated in the upper part of the thorax, immediately under the ſternum, and lies upon the pericardium, and on the trunk of the aorta, and of the vena cava. It extends itſelf from the pericardium, along the trunk of the aorta, to the beginning of the carotids, ſometimes ſo far as to the thyroide-gland; its figure is irregular and uncertain; its colour in infants is pale red, in adults it is of a duſkier hue: it is much larger in infants newly born, than in ſubjects at any more advanced period. Its length is there no leſs than three fingers breadth, and its diameter two, its thickneſs is about half a finger: it gradually decreaſes from this ſize, as the child grows up; in adults it is very ſmall, and in old people it entirely diſappears. Its ſubſtance is glandulous and conglomerate, and it is ſurrounded by a membrane. It has blood-veſſels ſometimes from the ſubclavians, ſometimes from the mammary, and ſometimes from the mediaſtine ones; and in ſome ſubjects from the carotids and jugulars. Its lymphatics ſometimes run to the thoracic duct, ſometimes to the ſubclavian veins; and they have in general no valves. The nerves of the thymus are from the par vagum, or from the intercoſtals. There is ſometimes a milky juice found in this gland, in new-born ſubjects. It has no excretory duct hitherto diſcovered, and its uſe is therefore not certainly known: poſſibly, according to Heiſter, it ſerves to ſecrete lymph, which it diſcharges into the thoracic duct, for the dilution of the blood and of the chyle, as the glands of the meſentery and of the pancreas do, in regard to the chyle. On this ſuppoſition its uſe is much greater in the fœtus, than at any time after the birth, becauſe the want of reſpiration in that ſtate may well be ſuppoſed to ſubject the blood to be thicker, and to need more dilution than afterwards; nothing tending to attenuate blood ſo much as reſpiration. Bellinger is of opinion, that it prepares a nutritious fluid for the fœtus while in the uterus, and conveys it by particular ducts to its mouth: but it is to be obſerved, that neither Bellinger himſelf, nor any body ſince, have ever been able to find out theſe ducts. See the article FOETUS.

That our readers may be enabled to form a diſtinct idea of this remarkable gland, we have given two views of it, as found in two fœtuſes, juſt born; ſee plate CCLXXVII. fig. 2. n° 1. and 2. where AA is the heart, ſurrounded by its pericardium; BB, the gland thymus, divided in the upper part into two or three portions, *aa*; CCC, the three aſcending branches of the aorta.

THYMUS, in medicine, is uſed for a kind of wart growing on the parts of generation, the fundament, and ſeveral other parts of the body. See CONDYLOMA, WART, WEN, &c.

The ordinary method of curing a thymus, is by ligature and deſiccative lotions, or by cauſtics; and if large, by inciſion, taking care firſt to ſecure the greater veſſels, by tying them.

THYROARYTÆNOIDES, in anatomy, a muſcle of the larynx, which, ariſing and terminating in it, ſerves, together with the arytenoides, to conſtringe it. Theſe two muſcles mutually interſect one another, and ſtraiten the glottis; ſometimes there is but one muſcle; and ſometimes it is different from that deſcribed here.

THYROIDE GLAND, in anatomy, is of a very ſingular figure, reſembling that of the new moon. It adheres by its middle part, which is called by authors its iſthmus, to the upper ring of the trachea, and its points or horns are turned upwards. It adheres on each part to the larynx and œſophagus.

THYROIDE CARTILAGE, one of the five cartilages that principally compoſe the larynx. The thyroide is the firſt of theſe cartilages, and is alſo called the ſcutiform cartilage, being of a quadrangular figure, and ſtanding in the anterior part, where the pomum Adami, as it is uſually called, makes its prominence, and the largeſt of the other five cartilages.

THYRSUS, in antiquity, the ſceptre which the poets put into the hand of Bacchus, and wherewith they furniſhed the menades in their bacchanalia. See the article BACCHANALIA.

The thyrſus was originally a lance or ſpear wrapped up in vine-leaves, wherewith Bacchus is ſaid to have armed himſelf and his ſoldiers in the Indian wars,

to

to amuſe and deceive the unpractiſed Indians, and make them expect no hoſtilities.

Hence, it was afterwards borne in the feaſts and ſacrifices of that god; and as the ſatyrs, who were Bacchus's ſoldiers, were ſuppoſed to have fought with it, it became a cuſtom to repreſent them therewith.

THYSSELINUM, in botany, the ſame with the ſelinum of Linnæus. See the article SELINUM.

TIARA, an ornament or habit wherewith the antient Perſians covered their head, and which the Armenians, and kings of Pontus, ſtill wear on medals; theſe laſt, becauſe deſcended from the Perſians.

TIARA is alſo the name of the pope's triple crown; antiently called regnum.

TIBER, a great river of Italy, which runs through the pope's territories, paſſing by Perugia and Orvietto; and having viſited Rome, falls into the Tuſcan ſea at Oſtia, fifteen miles below that city.

TIBIA, in anatomy, is the inner and bigger bone of the leg, called alſo focile majus: it is hard and firm, with a cavity in its middle; it is almoſt triangular; its fore and ſharp edge is called the ſhin.

In its upper extremity it has two large ſinuſes, tipped with a ſoft and ſubtile cartilage, called cartilago lunata, from its figure. It runs in between the extremities of the two bones, and becomes very thin at its edge, like thoſe in the articulation of the lower jaw. It facilitates a ſmall ſide motion of the knee. The ſinuſes receive the two protuberances of the thigh-bone, and the production which is between the ſinuſes of the tibia, is received in the ſinus, which divides theſe two protuberances of the femur. By bending our knee, we bring our leg, in walking, in a ſtraight line forwards, which, without this articulation, we could not have done: but, like thoſe who have the misfortune to have a wooden leg, we muſt have brought our foot about in a ſemicircle, in going even upon a plain, but more evidently upon a deſcent. On the ſide of this upper end it has a ſmall knob, which is received into a ſmall ſinus of the fibula; and, on its fore part, a little below the patella, it has another, into which the tendons of the extenſors of the leg are inſerted. Its lower extremity, which is much ſmaller than its upper, has a remarkable proceſs which forms the inner ancle, and a pretty large ſinus divided in the middle of a ſmall protuberance; the ſinus receives the convex head of the ſame bone. It has another ſhallow ſinus in the ſide of its lower end, which receives the fibula.

The tibia has four extenſor muſcles, as the rectus, cruralis, vaſtus, &c. and five flexors, *viz.* the gracilis, ſemi-membranoſus, ſemi-nervoſus, biceps, and poplitæus. See the article RECTUS, &c.

TIBIALIS, or TIBIÆUS, in anatomy, the name of two muſcles of the foot, diſtinguiſhed by the epithets anticus and poſticus. The tibialis anticus, one of the flexor muſcles, has its origin from the ſuperior and extenſor ſurface of the tibia, and is terminated at the internal os cuneiforme, and the interior part of the internal metatarſal bone. The tibialis poſticus, or adductor-muſcle of the foot, has its origin in the upper part of the interoſſeous ligament, and its termination in the os naviculare. See the articles FOOT and MUSCLE.

TIBICEN, in ichthyology, the ſame with the lyra, or harp-fiſh, a ſpecies of trigla. See LYRA and TRIGLA.

TIBISCUS, a river otherwiſe called Teiſs. See the article TEISS.

TICK-TACK, a game with dice and tables, wherein all the men are placed on the ace-point.

The great art of this game conſiſts in ſecuring the ſice and cinque-point; which ought never to be broken, unleſs for the advantage of going in, or a hit, which laſt is, when you throw ſuch a caſt that ſome of your men will reach your adverſary's unbound.

Playing cloſe at home is the ſafeſt way; taking care to find your men, and giving your adverſary a ſingle game, when in danger of loſing a double one.

TICKHILL, a market-town in the weſt riding of Yorkſhire, thirty three miles ſouth of York.

TICKLING, ſays M. le Cat, is, in reſpect to the ſenſe of feeling, what an hermaphrodite is in reſpect to ſexes: it partakes equally almoſt of pleaſure and pain; making one laugh, at the ſame time that it is intolerable; and if carried too far, frequently has bad and even fatal effects. In this ſenſation, the organs of feeling are affected with a light tremulous motion, which occaſions all voluptuous ſenſations; but more lively in its degree, and ſmarter, than that which uſually attends on pleaſure: it proceeds from that gentle

TIDES

J. Jefferys sculp

gentle friction, which is diſtinguiſhed from all other impreſſions on the organs, by the name of titillation.

TIDDESWAL, a market-town of Darbyſhire, eighteen miles north-weſt of Darby.

TIDES, two periodical motions of the waters of the ſea, called the flux and reflux, or the flow and ebb.

The cauſe of the tides is the attraction of the ſun and moon, but chiefly of the latter; the waters of the immenſe ocean, forgetful, as it were, of their natural quietus, move and roll in tides, obſequious to the ſtrong attractive power of the moon, and weaker influence of the ſun. See the articles ATTRACTION and GRAVITATION.

To illuſtrate this, let NESQ (plate CCLXXVIII. fig. 1.) repreſent the earth, covered over with water ABDF; NS the axis of the earth, EQ the equator, TR the tropic of cancer, *tr* the tropic of capricorn, M the moon in her orbit, S the ſun in his. Now ſince all bodies are endued with an attracting virtue, the moon will attract all the water in the neareſt hemiſphere FAB, with degrees of force which are inverſely as the ſquares of the diſtances from all parts; and therefore with the ſtrongeſt force where the diſtance is leaſt, *viz.* in the point A, directly under her: and this attraction being in this hemiſphere contrary to that of the earth, the water in all parts from B to F towards A will have its gravity decreaſing, and be higheſt of all at the part A; and conſequently muſt there ſtand higher than at the point F, where being more attracted by the earth, it muſt be heavier and nearer to the center, as is evident from the laws of hydroſtatics. See the article FLUID.

Again, in the hemiſphere FDB, the attraction of the moon conſpires with that of the earth; but decreaſing as the ſquares of the diſtances increaſe, the joint force of attraction will every where decreaſe from F and B towards D, the point oppoſite to the moon; where, again, the waters will be lighteſt, and therefore ſtand higheſt to preſerve the equilibrium. Whence it appears, that by this ſum and difference of the moon's and earth's attraction, there will neceſſarily enſue a protuberance or ſwelling of the waters, which we call tides of flood, in the two points A and D directly under the moon. Alſo in the two points F and B, as the waters are there moſt attracted, ſo they will be heavieſt, and conſequently riſe to the leaſt height from the earth's ſurface, whence they are called tides of ebb, or the ebbing of the water.

If to the power of the moon we add that of the ſun, we ſhall have the tides conſiderably augmented at the conjunction in S, or oppoſition in H, that is, at the new and full moons, which are called the ſpring-tides; as thoſe which happen when the ſun is at O or P, are called neap-tides, the waters at A and D being then loweſt, becauſe the attraction of the moon is then counterballanced by that of the ſun.

It is farther to be obſerved, that of the two tides of flood at A and D, that at A is greateſt to any place T in northern latitude, when the moon is in the northern ſigns, and above the horizon: for the point A is then nearer the zenith of the place G, than the oppoſite point D is to the ſame place at R twelve hours afterwards; and, conſequently, the height of the tide TG is greater than that of the oppoſite tide R*g*. The contrary of this happens, when the moon is in the ſouthern ſigns.

That there are two tides of flood, and two of ebb, ſucceeding each other alternately at about the interval of ſix hours, is obvious from the figure: and that they happen later each day near an hour, is owing to their exact correſpondence to the motion of the moon, which daily culminates ſo much later. That they happen not when the moon is in the meridian, but about three hours after, is owing to the force of the moon being then greater than when in the meridian of any place; as the heat of the day is greater at three o'clock than at twelve; and the heat of the ſummer is greater in Auguſt, than at the 21ſt of June. Laſtly, that the greateſt ſpring-tides happen not at the 21ſt of March, and 23d of September, but in February and October, is becauſe the ſun being neareſt the earth in December, his influence is then ſtrongeſt, and ſo muſt quicken the time of the greateſt vernal tides; and being weakeſt in June, the time of the autumnal tides will neceſſarily be retarded.

The ſum of what has been ſaid is this: if NOPQ (*ibid.* fig. 2.) be the ſurface of the earth, T its center, IFKGLHCE a circle repreſenting the ſpherical ſurface of the waters covering the earth, and affected only by the attractive power of the earth: upon placing an attracting body at S, the waters will no longer

continue

continue their ſpherical figure, but be immediately drawn into the ſpheroidical figure ACBD, in ſuch manner, as to be depreſſed at C and D to M and K, and elevated from L and I to A and B; and the elevation AL or BI, is double the depreſſion CM or DK. That if S be the ſun, then AP—OK=AL+KD =25 inches; or 11½ feet, if S be the moon. That at the points E, F, G, H, (which are called the octants) the water is neither elevated nor depreſſed. That if any other body be placed at O (as the moon) in the ſame right-line TS; then by the joint influence of both S and O, the elevation at A and B will be increaſed, and the depreſſion at C and D likewiſe. Laſtly, if S be in the ſituation *s*, or vertical to the point D, it is plain its action to raiſe the water D will be directly contrary to that of the moon in depreſſing it there; wherefore the depreſſion will not be ſo great as before; for the ſame reaſon the elevation at A and B will be diminiſhed, being now only as the difference of the two forces, whereas before they were as the ſum.

We ſhall now conſider the phænomena of the tides which remain; and firſt, it is evident, that if PN be the axis of the earth, and QO the diameter of the equator, then the moon ſituated at O, over one of the poles, would accumulate the water over each pole, and the ſpheroid would be ſo poſited as to have its longeſt axis AB coinciding with the axis of the earth PN. In this poſition of the ſpheroid, it is plain, there could be no ſuch thing as a tide in any part of the ocean over all the earth; for every ſection of the ſpheroid, parallel to the equator, would be a circle; conſequently in any parallel of latitude, the water would be at an equal diſtance from the earth's ſurface every moment of the diurnal revolution, or natural day.

Suppoſe the moon were removed from the direction of the earth's axis, and poſited at S (*ibid.* fig. 3.) then will the axis of the aqueous ſpheroid AB be turned towards S, and make an angle with the earth's axis, as ATP or BTN. Then we obſerve, that ſince C, D, are the places of loweſt water, that parallel IK which paſſes through the point I on one ſide the equator, and LM which paſſes through M on the other, will divide the earth into three zones, in two of which, *viz.* ENK and LPM, there will be but one tide each day, of the ſame kind; for inſtance, in the parallel EF, a perſon at F will have high water, and at E low water for twelve hours after. Again, in all the zone IKML, there will be two tides of the ſame kind each day, as is evident from the figure. Theſe limits, or the arch QI or OM, is the complement of the moon's declination from the equator.

If the moon at S (*ibid.* fig. 4.) be over the equator, the longer axis of the ſpheroid AB will now coincide with the plane of the equator QO, and the ſhorter axis CD with the axis of the earth NP. Here it is obvious, that in this ſituation of the ſpheroid, the waters in the parts AB, with reſpect to thoſe at CD, will give the greateſt difference of high and low water poſſible to all parts of the earth; and that there is no place but thoſe two at the poles N, P, but what has two tides of flood, and two of ebb every twenty-four hours. And this difference of the flux and reflux will decreaſe from the equator to the poles.

It has been already obſerved, that the greateſt elevation of the waters is not when the luminary is in the meridian, but about three hours after, becauſe the motion communicated to the waters during the arrival of the meridian is not immediately deſtroyed, but remains ſome time, and receives a farther augmentation from that which is impreſſed for about three hours after. For the ſame reaſon, we obſerve, the greateſt and leaſt tides happen not on the day of the ſyzygy, or quadrature, but on the third or fourth after; the ſum or difference of the forces of the luminaries not being till then at a maximum. See the article SYZYGY.

Let SFEG (*ibid.* fig. 5.) be the orbit of the moon about the earth QNOP, which as it is not circular but elliptical, the center of the earth T will not be always at an equal diſtance from the moon; but the moon will be ſometimes neareſt the earth, as when at S, and ſometimes fartheſt off, as at E. The point S is called the perigæum, or perigee; and the point E the apogæum, or apogee. The power of the moon in her perigee is to that in the apogee nearly as TE^3 to TS^3; and conſequently the greateſt tides will be on the day of the perigee, or rather a few days after, for the reaſons above-mentioned. Such would the tides regularly be, if the whole earth were covered with deep ſea; but by reaſon of the ſhoalneſs of ſome places, and the narrowneſs of the ſtreights, by which the tides are, in many places, propa-

propagated, there ariſes a great diverſity in the tides, not to be accounted for without an exact knowledge of all the circumſtances of the ſeveral places where they happen; as of the poſition of the land, the breadth and depth of channels, &c.

That the tides may have their full motion, the ocean in which they are produced ought to be extended from eaſt to weſt 90°, or a quarter of a great circle of the earth, at leaſt; becauſe the places where the moon raiſes moſt, and moſt depreſſes the water, are at that diſtance from one another. Hence it appears, that it is only in the great oceans that ſuch tides can be produced; and why, in the large Pacific ocean, they exceed thoſe in the Atlantic ocean. hence alſo it is obvious, why the tides are not ſo great in the torrid zone, between Africa and America, where the ocean is narrower, as in the temperate zones on either ſide; and from this alſo, we may underſtand why the tides are ſo ſmall in iſlands, that are very far diſtant from the ſhores. It is manifeſt, that, in the Atlantic ocean, the water cannot riſe on one ſhore but by deſcending on the other; ſo that, at the intermediate diſtant iſlands, it muſt continue at about a mean height betwixt its elevation on the one and on the other ſhore.

As the tides paſs over ſhoals, and run through ſtreights into bays of the ſea, their motion becomes more various, and their height depends on a great many circumſtances. The tide, that is produced on the weſtern coaſt of Europe, correſponds to the theory above deſcribed: thus, it is high water on the coaſt of Spain, Portugal, and the weſt of Ireland, about the third hour after the moon has paſſed the meridian: from thence it flows into the adjacent channels, as it finds the eaſieſt paſſage. One current from it, for example, runs up by the ſouth of England, and another comes in by the north of Scotland: they take a conſiderable time to move all this way, and it is high-water ſooner in the places to which they firſt come; and it begins to fall at thoſe places, while the two currents are yet going on to others that are farther in their courſe. As they return, they are not able to raiſe a tide; becauſe the water runs faſter off than it returns, till, by a new tide propagated from the ocean, the return of the current is ſtopped, and the water begins to riſe again. The tide takes twelve hours to come from the ocean to London-bridge, ſo that, when it is high water there, a new tide is already come to its height in the ocean; and, in ſome intermediate place, it muſt be low water at the ſame time. In channels, therefore, and narrow ſeas, the progreſs of the tides may be, in ſome reſpects, compared to the motion of the waves of the ſea. Our author alſo obſerves, that when the tide runs over ſhoals, and flows upon flat ſhores, the water is raiſed to a greater height than in the open and deep oceans that have ſteep banks; becauſe the force of its motion cannot be broke, upon theſe level ſhores, till the water riſes to a greater height.

If a place communicates with two oceans (or two different ways with the ſame ocean, one of which is a readier and eaſier paſſage) two tides may arrive at that place in different times, which, interfering with each other, may produce a great variety of phænomena. An extraordinary inſtance of this kind is mentioned by our author at Bathſha, a port in the kingdom of Tunquin in the Eaſt-Indies, of northern latitude 20° 50′. The day in which the moon paſſes the equator, the water ſtagnates there without any motion: as the moon removes from the equator, the water begins to riſe and fall once a day; and it is high water at the ſetting of the moon, and low water at her riſing. This daily tide increaſes for about ſeven or eight days, and then decreaſes for as many days by the ſame degrees, till this motion ceaſes when the moon has returned to the equator. When ſhe has paſſed the equator, and declines towards the ſouth pole, the water riſes and falls again, as before; but it is high water now at the riſing, and low water at the ſetting, of the moon.

This theory of tides has been extended ſo far, as to eſtimate the tides, or elevations of the waters of the moon, produced by the attraction of the earth: thus, let us ſuppoſe the quantity of matter (Q) in the earth to be to that in the moon (q) as 40 to 1, that is, $Q : q :: 40 : 1$; and let us firſt ſuppoſe the earth and moon of equal bulk, and repreſented by A I K (*ibid.* fig. 6.) and B D E, and the force (F) of the earth, at the ſurface of the moon B, will be to the force (f) of the moon at the ſurface of the earth A, directly as the maſſes of matter in each (becauſe of the equal diſtances T B and L A) that is, $F : f :: Q : q :: 40 : 1$. Again, let L B

be to LC as the diameter of the earth to that of the moon, which is as 365 to 100, then will the force at B be to the force at C as LB to LC, which let be as F to f, then $F : f :: 365 : 100$, whence $F = \frac{365f}{100}$; and above we have $F = 40f$, therefore $4000f = 365f$; and ſo $f : f :: 365 : 4000 :: 1 : 11$ nearly; that is, the power of the earth to raiſe the water at the moon C, is to that of the moon at the earth A as 11 to 1, very nearly.

If the moon can raiſe the water here 10 feet, the earth can raiſe the water there to the height of 110 feet; but becauſe the moon always turns about her axis in the ſame time as ſhe revolves about the earth, the waters (if any there be) will be raiſed on this and the oppoſite ſide, and always continue over the ſame part of the moon's ſurface, ſo that there can be no different heights of water there, and conſequently no tides, except what ſmall ones may happen on account of the ſun's attraction, and her various inequalities of motion, and diſtance from the earth.

The air, which is 860 times lighter than water, muſt yield in proportion more eaſily to the attracting force of the ſun and moon; and therefore the tides will in this profound and vaſt aërial ocean be very conſiderable and importing: but of this the reader may expect a further account under the articles ATMOSPHERE, HEAT, WIND, *&c.*

TIDE-WAITERS, or TIDESMEN, are inferior officers belonging to the cuſtom-houſe, whoſe employment it is to watch or attend upon ſhips, until the cuſtoms be paid: they get this name, from their going on board ſhips, on their arrival in the mouth of the Thames or other port, and ſo come up with the tide.

TIDOR, one of the Molucca iſlands, ſituated in 125° eaſt long. and 1° north lat.

TIERACHE, the moſt eaſterly diviſion of Picardy, in France.

TIERCE, or TEIRCE, a meaſure of liquid things, as wine, oil, *&c.* containing the third part of a pipe, or forty-two gallons. See the article MEASURE.

TIERCE, in gaming, a ſequence of three cards of the ſame colour. See the articles PICQUET and QUADRILLE.

TIERCED, *tiercé*, in heraldry, denotes the ſhield to be divided by any of the partition-lines, as party, coupy, tranchy, or tailly, into three equal parts of different colours or metals.

TIGE, in architecture, a french term for the ſhaft or ſuſt of a column, comprehended between the aſtragal and the capital. See COLUMN and SHAFT.

TIGER, or TYGER, *tigris*, in zoology, an animal belonging to the felis-kind, with an enlongated tail, and virgated ſpots. See the article FELIS.

The tiger is a large and terrible animal, exceeding the lion both in ſize and fierceneſs; being at its full growth of the bigneſs of a ſmall heifer: its head is large, and the teeth enormouſly long: the fore-legs are very thick and ſtrong, and the tail is long: the ground colour in the tiger is a pale tawney, with an admixture of brown; but it is all over variegated with ſtreaks of black. See plate CCLXXVII. fig. 3.

The tiger has its name from its ſuppoſed ſwiftneſs, and has been deſcribed by almoſt all authors as one of the ſwifteſt of all the wild carnivorous animals; but this has been wholly contradicted by ſuch authors as have ſeen the creature, who all declare that it is a ſlow and ſluggiſh animal, and is unable to overtake a man, or almoſt any animal that has an opportunity of running away from it. It will give two or three large leaps; but if it do not ſeize its prey in theſe, is but ill qualified to catch it afterwards.

TIGER-SHELL, a beautiful ſpecies of voluta, of a duſky red colour, ſpotted all over with large irregular blotches of white: it is brought from the Eaſt-Indies, and is about two inches and an half in length, and about an inch in diameter. See plate CCLXXXV. fig. 1.

TIGRIS, a large river of Turky in Aſia, which, riſing in the mountains of Armenia, runs ſouthward, dividing Diarbeck or Meſopotamia, from Curdeſtan or the antient Aſſyria; and having paſſed by Bagdat, joins the Euphrates in Eyraca Arabic, or the antient Chaldea. See the article EUPHRATES.

TILBURY, a fortreſs in the county of Eſſex, ſituated on the river Thames, oppoſite to Graveſend, twenty miles eaſt of London.

TILE, or TYLE, among builders. See the article TYLE.

TILIA, the LIME-TREE, in botany, a genus of the *polyandria-monogynia* claſs of plants, the corolla of which conſiſts of five oblong and obtuſe petals, crenated at the points: the fruit is a coriaceous, globoſe, quinquelocular capſule, containing a ſingle roundiſh ſeed in each. However,

ever, one ſeed only of the five uſually ripens, and the very cells of the others often diſappear, ſo that the fruit ſeems unilocular. See plate CCLXXVII. fig. 4.

The flowers of the lime-tree are eſteemed antepileptic, and a ſpecific in all kinds of ſpaſms and pains: they are uſed in infuſion, like tea.

The timber of the lime-tree is uſed by the carvers, as being a ſoft light wood; alſo by architects, for framing the models of their buildings: the turners likewiſe uſe it for making light bowls, diſhes, &c. but it is too ſoft for any ſtrong purpoſes.

TILLÆA, in botany, a genus of the *triandria trigynia* claſs of plants, the flower of which conſiſts of three ovated, acute, and plane petals; and its fruit of three acuminated and reflex capſules, containing each two oval ſeeds.

TILLANDSIA, in botany, a genus of the *hexandria monogynia* claſs of plants, with a tubulated monopetalous flower, trifid at the limb: the fruit is a long, obtuſely trigonal, and acuminated capſule, formed of three valves, and containing only one cell, with numerous ſeeds affixed to a long capillary plume.

TILLER, in huſbandry, denotes a young tree, left to grow till it be fellable for timber.

TILLER *of a ſhip*, a ſtrong piece of wood faſtened in the head of the rudder, and in ſmall ſhips and boats called the helm. See the article HELM.

In ſhips of war, and other large veſſels, the tiller is faſtened to the rudder in the gun room; and to the other end there are ropes faſtened, which paſs upwards to the quarter-deck, where the ſhip is ſteered by means of a wheel. See the article STEERING.

TILLAGE, in huſbandry, is the opening, breaking, and dividing the ground by the ſpade, the plough, the hoe, or other like inſtruments. See the articles PLOWING, HOEING, &c.

The finer any land is made by tillage, the richer it will become, and the more plants it will maintain; and it has been frequently obſerved, that in a large field, where at ſome time one part of the ground has been better tilled than the reſt, that part of the ground has produced the beſt crops, and been eaſily diſtinguiſhed by it from the reſt of the field, even ſix or ſeven crops after the time of the particular good tillage. A piece of ground being once made finer than the reſt, will a long time ſhew the advantage of it; becauſe the dews have more power to enrich it, they penetrating farther than the ſuperficies, whereby the roots are able to enter. The fine parts of the earth are impregnated throughout their whole ſubſtance with ſome of the riches carried in by the dews, and there repoſited until, by tillage, the inſide of theſe fine parts become ſuperficies; and as the corn drains them, they are again ſupplied as before; but the rough large parts cannot have that benefit, and the dews not penetrating but to their ſurface, they remain poor. The experiments mentioned by Mr. Evelyn prove this beyond conteſt. Take of the moſt barren earth you can find, powder it well, and expoſe it abroad for a year, inceſſantly agitating it; and after this, without any other management, this earth will be the moſt fertile that can be conceived, and will readily receive any plant from the fartheſt Indies: all vegetables will proſper and flouriſh in this once barren earth, and bear their fruit as kindly with us, under a due degree of artificial heat, as in their native climates.

The artificial duſt will entertain plants which refuſe dung and other violent applications, and has a more nutritive power than any artificial dung or compoſt whatſoever: and by this pulveriſing and expoſing, the very nature of a ſoil may be changed, and the tougheſt clay made as light and friable as common light earth, and as fit for the nouriſhment of the tendereſt plants as any other; though, in its natural condition, its pores were too ſmall to give way to their tender roots, and had no communication one with another.

This is a ſort of improvement of land that cannot be practiſed in the large way, in fields, &c. but as it only conſiſts in dividing and breaking the particles of earth, and expoſing them thus broken to the air, it is plain that common tillage approaches more or leſs to it, as more or leſs labour is employed; and the experiment proves, that the farmer need never fear beſtowing too much tillage on any ſort of ground.

TILT-BOAT, a boat covered with a tilt; that is, a cloth or tarpawling, ſuſtained by hoops, for the ſheltering of paſſengers.

TIMAR, a tract or portion of land, which the grand ſeignior grants to a perſon on condition of ſerving him in war on horſe-

back. Hence, thoſe who enjoy ſuch lands, are called timariots; who beſides the above-mentioned ſervice, pay an acknowledgement of one tenth of their revenue.

TIMBER, includes all kinds of felled and ſeaſoned woods. See WOOD.

Of all the different kinds known in Europe, oak is the beſt for building, and even when it lies expoſed to air and water, there is none equal to it. Fir-timber is the next in degree of goodneſs for building, eſpecially in this country, where they build upon leaſes. It differs from oak in this, that it requires not much ſeaſoning, and therefore no great ſtock is required before-hand. Fir is uſed for flooring, wainſcoting, and the ornamental parts of building within doors. Elm is the next in uſe, eſpecially in England and France; it is very tough and pliable, and therefore eaſily worked; it does not readily ſplit; and it bears driving of bolts and nails better than any other wood; for which reaſon it is chiefly uſed by wheel-wrights, and coach-makers for ſhafts, naves, &c. Beech is alſo uſed for many purpoſes; it is very tough and white when young, and of great ſtrength, but liable to warp very much when expoſed to the weather, and to be worm-eaten when uſed within doors; its greateſt uſe is for planks, bedſteads, chairs, and other houſhold goods. Aſh is likewiſe a very uſeful wood, but very ſcarce in moſt parts of Europe; it ſerves in buildings, or for any other uſe, when ſcreened from the weather; handſpikes, and oars are chiefly made of it. Wild cheſnut-timber is by many eſteemed to be as good as oak, and ſeems to have been much uſed in old buildings; but whether theſe trees are more ſcarce at preſent than formerly, or have been found not to anſwer ſo well as was imagined, it is certain this timber is now but little uſed. Walnut-tree is excellent for the joyner's uſe, it being of a more curious brown colour than beech, and not ſo ſubject to the worms. The poplar, abel, and aſpen trees, which are very little different from each other, are much uſed inſtead of fir, they look well, and are tougher and harder. See OAK, FIR, ASH, &c.

The goodneſs of timber not only depends on the ſoil and ſituation in which it ſtands, but likewiſe on the ſeaſon wherein it is felled. In this, people diſagree very much; ſome are for having it felled as ſoon as its fruit is ripe, others in the ſpring, and many in the autumn. But as the ſap and moiſture of timber is certainly the cauſe that it periſhes much ſooner than it otherwiſe would do, it ſeems evident that timber ſhould be felled when there is the leaſt ſap in it, *viz.* from the time that the leaves begin to fall, till the trees begin to bud. This work uſually commences about the end of April in England, becauſe the bark then riſes moſt freely; for where a quantity of timber is to be felled, the ſtatute requires it to be done then, for the advantage of tanning; ſee TANNING.

The antients chiefly regarded the age of the moon in felling their timber; their rule was to fell it in the wain, or four days after the new moon, or ſometimes in the laſt quarter. Pliny adviſes it to be in the very article of the change, which happening to be in the laſt day of the winter ſolſtice, the timber, ſays he, will be incorruptible. Timber ſhould likewiſe be cut when of a proper age; for when it is either too young, or too old, it will not be ſo durable, as when cut at a proper age. It is ſaid, that oak ſhould not be cut under ſixty years old, nor above two huudred. Timber however, ſhould be cut in their prime, when almoſt fully grown, and before they begin to decay; and this will be ſooner or later, according to the dryneſs or moiſtneſs of the ſoil, where the timber grows; as alſo according to the bigneſs of the trees; for there is no fixt rules in felling of timber, experience and judgment muſt direct here as in moſt other caſes.

After timber has been felled and ſawed, it muſt be ſeaſoned: for which purpoſe ſome adviſe it to be laid up in a very dry airy place, yet out of the wind and ſun, or at leaſt free from the extremities of either; and that it may not decay, but dry evenly, they recommend it to be daubed over with cow-dung. It muſt not ſtand upright, but lie all along, one piece over another, only kept apart by ſhort blocks interpoſed, to prevent a certain mouldineſs, which they are otherwiſe apt to contract in ſweating on one another; from which ariſes frequently a kind of fungus, eſpecially if there be any ſappy parts remaining. Others adviſe, the planks of timber to be laid for a few days in ſome pool or running ſtream, in order to extract the ſap, and afterwards to dry them in the ſun or air. By this means, it is ſaid, they will be prevented, from either chopping, caſting,

T. Jefferys sculp.

or cleaving, but againſt ſhrinking there is no remedy. Some again, are for burying them in the earth, others in a heat; and ſome for ſcorching and ſeaſoning them in fire, eſpecially piles, poſts, &c. which are to ſtand in water or earth. The Venetians firſt found out the method of ſeaſoning by fire; which is done after this manner; they put the piece to be ſeaſoned into a ſtrong and violent flame, in this they continually turn it round by means of an engine, and take it out when it is every where covered with a black coaly cruſt; the internal part of the wood is thereby ſo hardened, that neither earth nor water can damage it for a long time afterwards.

After the planks of timber have been well ſeaſoned and fixed in their places, care is to be taken to defend or preſerve them; to which the ſmearing them with linſeed oil, tar, or the like oleaginous matter, contributes much. The antients, particularly Heſiod and Virgil, adviſe the ſmoak-drying of all inſtruments made of wood, by hanging them up in the chimneys where wood fires are uſed. The Dutch preſerve their gates, portcullices, drawbridges, ſluices, &c. by coating them over with a mixture of pitch and tar, whereon they ſtrew ſmall pieces of cockle and other ſhells, beaten almoſt to powder, and mixed with ſea-ſand, which incruſts and arms them wonderfully againſt all aſſaults of wind and weather. When timber is felled before the ſap is perfectly at reſt, it is very ſubject to the worms; but to prevent and cure this, Mr. Evelyn recommends the following remedy, as the moſt approved. Put common ſulphur into a cucurbit, with as much aqua fortis as will cover it three fingers deep; diſtill it to a dryneſs, which is performed by two or three rectifications. Lay the ſulphur that remains at bottom, being of a blackiſh, or ſad red colour, on a marble, or put it in a glaſs, and it will diſſolve into an oil; with this oil anoint the timber which is infected with worms. This, he ſays, will not only prevent worms, but preſerves all kinds of woods, and many other things, as ropes, nets, and maſts, from putrefaction, either in water, air, or ſnow.

To meaſure round timber, let the mean circumference be found in feet and decimals of a foot; ſquare it, multiply this ſquare by the decimal 0.079577, and the product by the length. Ex. Let the mean circumference of a tree be 10.3 feet, and the length 24 feet. Then $10.3 \times 10.3 \times 0.079577 \times 24 = 202.615$, the number of cubical feet in the tree. The foundation of this rule is, that when the circumference of a circle is 1, the area is 0.07957747215, and that the areas of circles are as the ſquares of their circumferences.

But the common way uſed by artificers for meaſuring round timber, differs much from this rule. They call one fourth part of the circumference the girt, which is by them reckoned the ſide of a ſquare, whoſe area is equal to the area of the ſection of the tree; therefore they ſquare the girt, and then multiply by the length of the tree. According to their method, the tree of the laſt example would be computed at 159.13 cubical feet only.

For the method of meaſuring round timber by the ſliding rule, ſee RULE.

For meaſuring hewn or ſquare timber, the cuſtom is, to find the middle of the length of the tree, and there to meaſure its breadth, by clapping two rules to the ſides of the tree, and meaſuring the diſtance betwixt them; in like manner they meaſure the breadth the other way. If the two be found unequal, they are added together, and half their ſum is taken for the true ſide of the ſquare.

As to the ſtrength of timber, Mr. Parent is the firſt who has treated this ſubject in a ſcientific manner, and in order to enforce his demonſtrations, he made ſeveral experiments, with various ſcantlings of oak and fir. Mr. Muller, in his treatiſe on fortification, gives the following problem, to determine the ſtrength of a ſcantling, whoſe dimenſions are given. He ſuppoſes that all the fibres of the wood are ſtraight, and of the ſame ſtrength, even in its weakeſt part, and that the fibres are the ſame in the ſame ſort of wood; and although this may not be ſtrictly true, yet it is ſufficiently near enough in practice, ſo as to cauſe no ſenſible error. Suppoſe the ſcantling A B C (plate CCLXXIX. fig. 1. n° 1.) to be ſupported in the middle D, by the edge of a triangular block R, and two equal bodies, P, Q, to be ſuſpended at A and C, equally diſtant from the middle B, of ſuch a weight as to break the ſcantling. It is evident, that the weights P and Q will cauſe the ſcantling to bend at firſt, ſo as to make a kind of curvilinear angle at B, and then to break in that place, in a ſection B D, perpendicular to either of the

the ſides A C; now as the power or force of theſe weights is more or leſs, according as they are ſuſpended farther from, or nearer to the fixed point D; theſe forces will therefore be in proportion to the products of the weights of each multiplied by its reſpective diſtance from the ſection B D; or becauſe the weights and diſtances are here ſuppoſed equal, twice the product of one of the weights P, multiplied by its diſtance, from the ſection B D, and will expreſs the force of theſe two weights. The force of the weights being thus determined, the reſiſtance or ſtrength of the wood is next to be found, which is done in the following manner. Let *a c b* (*ib.* n° 2.) repreſent the ſection of the ſcantling; it is evident that this area repreſents the ſum of all the fibres to be torn or broken; and as they are all ſuppoſed equal, and of the ſame ſtrength, this area will expreſs the ſum of the ſtrength of all the fibres: but as the point D, or the baſe *a b* of the ſection is fixed; and the directions of the fibres perpendicular to the area *a c b*: the force or reſiſtance of each fibre is equal to the product of its ſtrength, multiplied by its diſtance from the baſe *a b*; and therefore the ſum of all the fibres placed in the ſame line *d f*, parallel to the baſe *a b*, multiplied by their diſtance *a d*, from that baſe *a b*, will expreſs their momentum or reſiſtance. What has been proved in regard to all the fibres placed in the line *d f*, is equally true of all thoſe placed in any other line parallel to the baſe *a b*: and therefore the ſum of all theſe products will expreſs the total ſtrength or reſiſtance of the wood: but by the nature of the center of gravity, the product of the area *a c b*, multiplied by the diſtance of its center of gravity from the baſe *a b*, will expreſs the total ſtrength or reſiſtance of all the fibres, or that of the whole ſcantling; conſequently, having the ſtrength of any ſcantling of the ſame wood determined by experiment, that of any other may be found.

If the ſcantling A C (*ibid.* n° 3.) be ſupported at both ends by the triangular blocks P, Q, and the weight W, hanging in the middle B: then if we ſuppoſe the weight P and Q in the firſt figure, to repreſent the blocks P and Q in this; then as each block ſupports half the weight W; it is evident, that the weight W, multiplied by the diſtance A B or B C, will expreſs its momentum or force. Moreover, ſince the weight W is ſuſpended in the middle betwixt the fixed points, it is evident that each block ſupports exactly half the weight; and as the power or force of this weight on the blocks P, Q, is as the product of half the weight multiplied by the diſtance A B or B C of its direction from the fixed point, it follows, that the whole force of this weight is as twice the product of half the weight W, multiplied by A B or B C; or as the whole weight W multiplied by the diſtance A B or B C.

Hence alſo, if the length A C of the ſcantling between the fixed points A, C, be c; the area of the ſection s; the diſtance of its center of gravity from the baſe d, and the weight W, w; then will $\frac{1}{2} c w$ expreſs the force of the weight W, and $d s$ the ſtrength of the ſcantling: therefore the momentum of the weight is to the momentum of the ſcantling as $\frac{1}{2} c w$ is to $d s$; or as w is to $\frac{2 d s}{c}$, and if this ratio be given $w = \frac{2 d s}{c}$.

From whence may be drawn ſeveral uſeful conſequences. 1. The ſtrengths of two ſcantlings of the ſame wood, and of different dimenſions; or, which is the ſame, the weights they will bear, are to each other as the products of their ſections multiplied by the diſtances of the centers of gravity from the baſe, divided by their lengths. 2. The ſtrengths of two ſcantlings of the ſame wood, which have the ſame length, are as the products of their ſections multiplied by the diſtances of their centers of gravity from the baſe. 3. The ſtrengths of two ſcantlings of the ſame wood, which have equal ſections, are as the diſtances of their centers of gravity divided by their lengths. 4. The ſtrength of ſcantlings of the ſame wood, whoſe diſtances of their centers of gravity of their ſections, from the baſe, are equal, will be to each other as their ſections divided by their lengths.

Again, if the ſection of the ſcantling A C be a rectangle placed flat on one of its ſides, which we call b, and its height or other ſide a; then will $a b$ expreſs the area of the ſection; and the diſtance d of its center of gravity from the upper baſe, will be $\frac{1}{2} a$, therefore the equation already found $w = \frac{2 d s}{c}$ becomes here $w = \frac{a a b}{c}$ which ſhews that the ſtrength of a rectangular ſcantling

ling laying flat on one of its ſides, is as the product of the ſquare of its height multiplied by its baſe, and divided by its length. Hence, a deal board of an inch thick, and ten inches broad, being placed on its flat ſide, and then on its narrow ſide; the force in the firſt caſe will be to the force in the ſecond, as 1 is to 10. For the force in the firſt caſe, will be as 10 multiplied by the ſquare of unity; and in the ſecond, as unity multiplied by the ſquare of 10, that is, as 10 is to 100, or as unity is to 10. So that if it bears 50 pounds when it lies flat, it will bear 500 when it lies on the narrow ſide.

TIMBRE, or TIMMER, in heraldry, denotes the creſt of an armory, or whatever is placed at top of the eſcutcheon, to diſtinguiſh the degree of nobility, either eccleſiaſtical or ſecular.

TIME, *tempus*, a ſucceſſion of phænomena in the univerſe; or a mode of duration, marked by certain periods or meaſures, chiefly by the motion and revolution of the ſun.

The idea of time, in the general, Mr. Locke obſerves, we acquire by conſidering any part of infinite duration as ſet out by periodical meaſures: the idea of any particular time, or length of duration, as a day, an hour, *&c.* we acquire firſt, by obſerving certain appearances at regular, and, ſeemingly, at equidiſtant periods.

Now, by being able to repeat thoſe lengths or meaſures of time, as often as we will, we can imagine duration, where nothing really endures or exiſts; and thus we imagine to-morrow, next year, *&c.*

Some of the latter ſchool-philoſophers define time to be the duration of a thing, whoſe exiſtence is neither without beginning nor end: by which time is diſtinguiſhed from eternity.

Time is diſtinguiſhed into abſolute and relative. Abſolute time, is time conſidered in itſelf, and without any relation to bodies, or their motions. This flows equally, *i. e.* never proceeds faſter or ſlower, but glides on in a conſtant, equable tenor. Relative time, is the ſenſible meaſure of any duration by means of motion. For ſince that equable flux of time does not affect our ſenſes, nor is any way immediately cognizable thereby, there is a neceſſity for calling in the help of ſome nearly equable motion to a ſenſible meaſure, whereby we may determine its quantity, by the correſpondency of the parts of this with thoſe of that.

Hence, as we judge thoſe times to be equal which paſs, while a moving body, proceeding with an equable velocity, paſſes over equal ſpaces; ſo we judge thoſe times to be equal which flow while the ſun, moon, and other luminaries, perform their revolutions, which, to our ſenſes, are equal.

But ſince the flux of time cannot be accelerated, nor retarded, whereas all bodies move ſometimes faſter and ſometimes ſlower, and there is, perhaps, no perfectly equable motion in all nature, it appears hence to follow, that abſolute time ſhould be ſomething truly and really diſtinct from motion. For let us ſuppoſe the heavens and ſtars to have remained without motion from the very creation, does it hence follow, that the courſe of time would have been at a ſtand? Or, rather, would not the duration of that quieſcent ſtate have been equal to the very time now elapſed?

Aſtronomical TIME, is that taken purely from the motion of the heavenly bodies without any other regard.

Civil TIME, is the former time accommodated to civil uſes, and formed and diſtinguiſhed into years, months, days, *&c.*

TIME, in muſic, is an affection of ſound, whereby we denominate it long or ſhort, with regard to its continuance in the ſame degree of time. See SOUND.

Common, or duple time, is of two ſpecies. 1. When every bar or meaſure is equal to a ſemi-breve, or its value, in any combination of notes of a leſſer quantity. 2. When every bar is equal to a minim, or its value, in leſſer notes. The movements of this kind of meaſure are various, but there are three common diſtinctions; the firſt ſlow, ſignified by the mark C; the ſecond briſk, ſignified by ; the third very quick, ſignified by .

For triple time, ſee TRIPLE.

TIME, in fencing. There are three kinds of time; that of the ſword, that of the foot, and that of the whole body. All the times that are perceived out of their meaſure, are only to be conſidered as appeals, or feints, to deceive and amuſe the enemy. See FENCING.

TIMOR, an iſland in the Indian-ocean, ſituated between 122° and 126° of eaſt long.

long. and between 8° and 10° ſouth lat. It is in the poſſeſſion of the Dutch, and ſaid to have gold mines.

TIN, *ſtannum*, ♃, a well-known whitiſh metal, ſofter than ſilver, yet much harder than lead. See the article METAL.

Tin is the lighteſt of all the metals: it is remarkable for a quality that no other of them has, which is, that when bent it makes a crackling noiſe. It is harder than lead, but leſs ſo than any other of the metals: it is malleable in a very remarkable degree, though leſs ſo than lead: it may be eaſily drawn into a coarſe wire, but if this be attempted to be brought to any degree of fineneſs, it ſnaps and breaks under the workman's hands.

Tin is leſs ſuſceptible of ruſt than moſt of the other metals: it is very little elaſtic, and ſcarce at all ſonorous. It melts with a much ſmaller degree of fire than any other metal, a heat but a little greater than boiling-water being ſufficient to fuſe it. It melts before it grows red-hot, like lead: and a degree of heat ſo much leſs even than that requiſite to the running of lead, is neceſſary to the fuſing of this metal, that it may be eaſily ſeparated from the other by eliquation; and if the fire be kept under a mixed maſs of the two, ſo low as to be juſt hot enough to melt the lead, the tin will all run off from it.

Tin amalgamates very readily with mercury, and may be mixed in fuſion with moſt other metals, and as readily ſeparated from them again by the before-mentioned proceſs of eliquation. It is the leaſt ſimple of all the metals, being brought, by a very ſmall degree of fire, to emit ſulphureous fumes: theſe are plainly the abſolute ſulphur of the metal. They do great injury to the people employed to work upon it, rendering them pale, and often abſolutely deſtroy them. The conſequence of the emitting theſe fumes ſo abundantly is, that tin, of all metals, loſes moſt of its weight, and calcines moſt eaſily in the fire. Expoſed to the focus of a great burning-glaſs, it immediately melts, and ſends off a large quantity of thick, white fume; the remaining matter is then a fine cryſtalline or gloſſy matter, in form of needles; theſe, if held ever ſo long in the ſame heat, undergo no farther change, never running into a maſs of glaſs, as the remains of moſt of the metals do under the ſame circumſtances; but, like the glaſſes of the other metals, if expoſed again to the ſame heat, laid on a piece of charcoal, they immediately run into tin again; and the ſame thing happens if it be continued on the tile or coppel it was firſt placed on in the focus, and ſome fat matter, as tallow, or the like, to be added to it. Filings of tin, thrown into the flame of a candle, take fire, and render the flame blue, emitting a viſible fume, and a ſmell of garlic: melted in a crucible, with a mixture of nitre, it deflagrates. Its conſtituent matters, therefore, ſeem to be a cryſtalline earth which melts with great difficulty, and an inflammable ſulphur; in which, from its ſmell, while calcining, and from its poiſonous quality, it is probable there may be ſomething of arſenic mixed.

For the ſpecific gravity of pure tin, ſee the article GRAVITY.

Tin ſo far endures the force of lead and antimony in the refiners teſt, that it is hardly to be ſeparated from them, unleſs by the addition of copper: it adheres to the reſt of the metals with greater eaſe than any other, and hence it is in continual uſe in covering plates of iron, and lining copper, and other metals, to prevent their ruſting, and to ſave the liquids put into them from taking up any bad qualities from thoſe metals, as it is much more difficultly diſſolved by common menſtruums than either of them.

Tin, in many things, greatly approaches to the nature of ſilver. It very readily melts with ſilver, gold, or copper; when the mixture is made with equal, or even a leſs quantity, it renders them extremely brittle: but it is very ſingular, that if it be mixed in a much larger quantity, they ſtill continue pliant and flexile. Ten parts of tin, and one of copper, make a maſs more rigid indeed than tin, yet malleable and ductile. Silver, of all the metals, ſuffers moſt by an admixture of tin, a very ſmall quantity of it ſerving to make that metal as brittle as glaſs; and what is worſe, being very difficultly ſeparated from it again. The addition of about one tenth part of copper to tin makes it fit for the common uſes of life, in veſſels of various kinds, as it becomes, by the mixture, more durable; a little zink, added to this mixture, gives the metal a yellow colour; and, as it is mixed in greater or leſs quantity, makes it fit for caſting of cannon and for bells.

Iron readily mixes with tin, in fuſion, if the fire be briſk, and the iron be heated white hot before the tin be added. Twice the quantity of this metal, added to iron ſo heated, readily runs with it into an odd ſubſtance, which is very white and brittle, and readily anſwers to the magnet. This has been uſed, by ſome, as a pretence of its not being iron, and that that the loadſtone would attract another metal beſide that: but the fallacy is eaſily diſcovered by any one that underſtands any thing of metallurgic analyſis.

Lead bears a conſiderable admixture of tin, without being affected as gold and ſilver are, which are both rendered brittle by it; at leaſt, its effects on this metal are in a much ſmaller degree. The very vapour of tin has the ſame effect with the metal itſelf on ſilver, gold, and copper, rendering them brittle. Many a metallurgiſt has been long plagued by theſe vapours by a piece of tin being accidentally among his charcoal; the conſequence of which has been, that, till it was burned wholly away, theſe metals have been rendered as brittle as glaſs under the hammer, by only being fuſed over theſe coals. It is owing to this property of tin, in making the metals it is mixed with brittle, that it renders them ſonorous. Mr. Boyle has expreſſed a wonder that tin, which is itſelf not much ſonorous, ſhould on mixture with copper render it more ſo; but if we conſider that the ſame ſort of diſpoſition of parts which renders metals rigid and brittle renders them ſonorous, the myſtery is explained.

The proper ſolvent of tin, in its true malleable ſtate, is aqua regia. It will not well diſſolve in any of the other menſtrua of the ſtronger kinds, nor indeed very readily in this. We are not, however, to wonder at this difficulty of ſolution in tin, ſince we find it contains much more ſulphur than any other metal, and ſulphur is not one of thoſe ſubſtances that are to be diſſolved by acids. That this is a fact we find by putting calcined tin, inſtead of common malleable tin, into the menſtruum, for in this caſe even vinegar will diſſolve it. While tin is in its malleable ſtate, the weakeſt acids diſſolve it beſt. Verjuice, and it is ſaid even ſour apples boiled in tin veſſels, acquire a taſte of that metal, though the ſtrongeſt acids, aqua regia excepted, boiled in the ſame veſſels, acquire no flavour from it at all.

Many of the chemical writers have been of opinion, that, if the ſulphur could be thoroughly purged from tin, it would be no longer tin, but ſilver; it is certain that the two metals have many things in common. If diſſolved in aqua regia, tin is bitter, as well as ſilver, in ſolution with the nitrous acid; but the cryſtals which are produced from a ſolution of it in vinegar, after it has been calcined for forty-eight hours together, which is a neceſſary ſtep towards ſuch a ſolution, (and which one would think ſhould bring it nearer to ſilver than before, if the diſſipating its ſulphur were the way to do it,) differ wholly from thoſe of ſilver. We have indeed accounts, in many authors, of tin being made to yield a large quantity of ſilver by peculiar proceſſes; but that careful experimenter, Mr. Boyle, tells us, that all tin is not to be expected to yield thoſe advantages in the ſame manner, for that himſelf had ſeparated pure cryſtals of ſilver from one parcel of tin by a peculiar menſtruum, but that another parcel of the ſame metal would not anſwer in the ſame manner.

Though tin and lead readily unite in fuſion over a gentle fire, if the heat be afterwards raiſed to a violent degree, there is a viſible motion excited in the mixture; and the conſequence is, that both are reduced to a calx, and the lead becomes extremely difficult afterwards to vitrify.

The effect that zink has upon a mixture of tin and copper, the copper being in a larger proportion than has been uſually given in ſuch mixtures, is little known, and ſeems to be a ſecret that the people who are poſſeſſed of it intend to make uſe of to themſelves.

Tin, when it mixes itſelf with cryſtal in the earth, influences both its figure and colour. It gives it a pyramidal form conſiſting of four ſides, ſhort and with a broad baſe, and at the ſame time uſually communicates a yellow colour with an admixture of a duſky brown, which makes it much inferior to the yellow cryſtal made ſo by lead. Even the tin-grains, though very different ſubſtances from the cryſtals we are deſcribing, have ſomething of this yellow colour which appears when they are broke into ſmall pieces, though in the maſs they are opake and blackiſh. In the making of the artificial gems, there is a method of obtaining this colour from tin, and communicating it to glaſſes. It ſeldom ſuc-

ceeds indeed in the common way of doing this by lead: but in vitrifications, where the baſis is borax, the calx of tin properly treated with vinegar yields cryſtals, which will communicate the true colour of the browner topazes to the vitrified maſs.

The ores of tin are very various, as it is found blended with all kinds of ſubſtances, with marcaſitic and ſtony matter, and even with other metals. The Germans have lately talked of finding native tin in the perpendicular fiſſures of ſome of their iron mines; but there ſeems no foundation for the opinion; for this pretended native tin wants the firſt of all the characters of a native metal, malleability. It flies to pieces under the hammer, and on trial in the fire proves to be a marcaſitic ore, very rich indeed in tin, a very ſingular and valuable ſubſtance, but not, as pretended, native tin. This remarkable ore is found in nodules from an ounce to three or four in weight; it is of a bright ſilvery colour, like the white arſenical pyrites, but covered with a coarſe duſky cruſt: when properly worked, it is the richeſt tin-ore to be met with, five drachms of pure tin having been ſeparated from an ounce of it.

The next ore to this in richneſs, and that which has conſequently been uſually accounted the richeſt of all, is the tin-grain, or lapis jovius. This is an ore of tin, of a fine gloſſy black colour on the outſide, but, in thin pieces held up againſt the light, it is tranſparent and yellowiſh: it is the heavieſt of all the metalline ores, and is of a very irregular figure, but in the fineſt pieces it ſeems to approach to the ſhape of thoſe cryſtals which are found joined baſe to baſe, without any intermediate column. In ſize it is of the bigneſs of a large walnut down to that of a pin's head; for of that minuteneſs we meet with ſome perfect tin-grains.

After the tin-grain we ſhall mention a black and very heavy tin-ore, of an irregular figure and metalline appearance; but this, though it promiſes very fairly by its weight, ſeldom yields ſo much as half a drachm of metal from the ounce, in its crude ſtate; if waſhed indeed, and all the foreign matter carried off, it may be reduced almoſt to the purity of the tin-grains before the working.

The tin-ores of Germany uſually contain a very large quantity of iron; ours are free from this admixture, and are greatly the more valued for it. Our other ores of tin, beſides the two above deſcribed, are a browniſh or blackiſh ſtony one, very hard and heavy; this is debaſed by a great quantity of the ſtony matter, and requires careful waſhing before it is brought to the fire; and a yellowiſh or whitiſh ore; which are leſs heavy and more brittle than the others, and contain a large quantity of common ſulphur; and to theſe may be added another, in which the metal is yet more mixed with ſulphur: this is the mundic found in the tin-mines, which is very bright and ſhining, of a ſilver or gold colour, and often contains a large portion of tin, though it is not ſeparated from it without difficulty, becauſe of the abundance of ſulphur in the maſs. We have alſo a red ore of tin, of a ſtony, and ſometimes of an earthy nature, and carrying ſo little of the appearance of an ore of this metal, that it is hard to gueſs what could lead any body to work it in expectation of it. It is however very rich.

Tin-ore is alſo ſometimes found mixed with that of lead, and carrying the external appearance of lead only. Some of theſe ores are neglected in France, where they might turn to a very conſiderable account under proper management. The German ores of tin are uſually ſo much like iron, that, at firſt ſight, it is ſcarce poſſible to diſtinguiſh them. We are alſo finally to add to the number of tin-ores the dodecahedral garnets ſold by our druggiſts; theſe are in general irregularly figured, but the moſt regular of them always conſiſts of twelve ſides; they are of a deep red colour, and in ſize from the bigneſs of the largeſt pea to that of a pin's head. Theſe are truly ores of tin, of the nature of the tin-grains, but not ſo rich. See GARNET, &c.

There is ſomething very ſingular in the great gravity of tin-ore beyond that of the ores of other metals; but it contains ſo much arſenic, and is ſo dangerous to the perſon who works it, that experiments are not expected to be made very frequently on it. The tin ores in general are ſtubborn and refractory in the fire; it is eaſy, however, to find whether an ore does contain this metal or not; for if a piece of it be powdered and waſhed, and afterwards ſprinkled thinly over an iron-plate made white hot on the fire, the tin-ore, in this caſe, if there be any in the maſs, will be found in little parcels of a red

red colour covered with grey flowers of an arſenical ſmell. The various kinds of mundic common in the corniſh mines are not only rejected from the works as ores themſelves, but they are carefully ſeparated from among the other ores of a better kind, as they are apt to be very troubleſome, even in the ſmalleſt quantities, in working the reſt. They then pound and waſh the ore; and when they have thus ſeparated all the lighter impurities, till there is no longer any ſmell of ſulphur or of garlic, they grind it to a tolerably fine powder, and, after waſhing it again, it is carried to the melting-houſes, where it is melted into metal by mixing it with charcoal, and urging the fire to the utmoſt violence by the blaſt of large bellows. There is a cavity at the bottom of the furnace into which the metal runs, as it ſeparates from the ore, and out of which they let it by an aperture cloſed and opened at pleaſure, running it into cakes or pigs, which are the large blocks we ſee it in.

Tin-ore, in general, contains a great quantity of arſenic, which diſcovers itſelf in the roaſting in form of a white cloud, and which it is very material to burn quite away, as it otherwiſe renders the metal brittle. Charcoal alone commonly ſerves for fluxing the ore of tin, but, if any be found very refractory, a little common black pitch is an excellent addition. See FLUX.

The virtues of tin, as a medium, given internally, have been celebrated by many of the antient writers, but it has leſs credit at preſent. We have been told that in diſeaſes of the lungs, and in diſorders of the head and uterus, there is ſcarce any thing equal to it; and that in convulſions, epilepſies, and the madneſs ariſing from the bite of a mad dog, it was a certain remedy. Theſe laſt are the only caſes in which it has any degree of credit at preſent, and that is rather among the vulgar than among phyſicians. In the manufactures it is of great uſe in ſolders, and when amalgamated with mercury, and a little biſmuth added to make it run thin, it ſerves in the ſilvering of looking-glaſſes. By calcination it makes a ſoft powder called putty, of great uſe in poliſhing glaſs and gems, and alſo in making enamels.

The preparations of tin are, 1. Powdered tin, made by pouring melted tin into a wooden box, the inſide of which is chalked all over, and briſkly ſhaking it till cold, when a part of it will be found reduced to powder, which is ſaid to be good for worms, but we have no certain account of its good effects. 2. Salt of tin, obtained by pouring diſtilled vinegar upon calcined tin, heating the ſolution till it near boils, and afterwards evaporating it to a pellicle, and ſetting it in a cool place; then there will ſhoot very pellucid and hard cryſtals, which are recommended in hyſteric caſes, to be given from two to four or five grains at a doſe. 3. The antihectic of Poterius. 4. The aurum muſivum. See the articles ANTIHECTICS and AURUM.

To theſe preparations uſed in medicine, we may add one well known as a coſmetic: it is a magiſtery of tin prepared in the manner of that of biſmuth, by firſt mixing ſix ounces of ſpirit of nitre with one ounce of ſpirit of ſea-ſalt, and then putting tin into this liquor, or aqua regia, till it is capable of holding no more: laſtly, pour the ſolution into ſix or eight quarts of ſpring-water, and the tin will be precipitated in form of a white powder, which ſhould be waſhed ſeveral times, and then dried for the uſe of the ladies in pomatums, to render the ſkin white and ſoft.

TINA, a town of european Turky, on the confines of Dalmatia, ſituated in eaſt long. 18°, north lat. 44° 6′.

TINCA, the TENCH, in ichthyology. See the article TENCH.

TINCTURE, *tinctura*, in pharmacy and chemiſtry, a ſeparation of the finer and more volatile parts of a mixed body, made by means of a proper menſtruum diſſolving and retaining the ſame. See MENSTRUUM and SOLUTION.

Rectified ſpirit of wine diſſolves the volatile oils and reſins of vegetables, whilſt water acts more immediately on their mucilaginous and ſaline matter. Hence, in whatever proportion the ſoluble parts of any vegetable are blended together, a ſpirit may be ſo adjuſted thereto by art, as entirely to diſſolve the whole, and conſequently to extract all the virtues of the ſubject, without any of the uſeleſs or woody parts. Fixed alkaline ſalts deepen the colour of ſpirituous tinctures, but add nothing to the diſſolving power of the menſtruum: nor is the addition of theſe ſalts uſeleſs only, but likewiſe prejudicial, as they injure the flavour of aromatics, and ſuperadd a quality ſometimes contrary to the intention of the medicine. Volatile alkaline ſalts, in

many caſes, promote the action of the ſpirit; but acids, almoſt univerſally, weaken it. See the articles ALKALI and ACID.

As to the method of extracting tinctures, the following general rules may be of uſe in this reſpect. 1. The vegetable ſubſtances ought to be moderately and newly dried, unleſs they are expreſly ordered otherwiſe; they ſhould likewiſe be cut and bruiſed before the menſtruum is poured on them. 2. If the digeſtion is performed in balneo, the whole ſucceſs depends upon a proper management of the fire: it ought to be all along gentle, unleſs the hard texture of the ſubject ſhould require it to be augmented; in which caſe the heat may be ſo increaſed as to make the menſtruum boil a little towards the end of the proceſs. 3. Very large circulatory veſſels ought to be employed for this purpoſe, which ſhould be heated before they are luted together. A commodious circulatory may be compoſed of two long-necked matraſſes or bolt-heads, the mouth of one of which is to be inſerted into that of the other, and the junĉture ſecured by a piece of wet bladder. The uſe of heating the veſſels is, to expel a part of the air; which otherwiſe, rarifying in the proceſs, would endanger burſting them, or blowing off the uppermoſt matraſs. 4. The veſſel is to be frequently ſhaken during the digeſtion. 5. All tinctures ſhould be ſuffered to ſettle before they are committed either to the filter or ſtrainer. 6. In the tinctures, and diſtilled ſpirits likewiſe, deſigned for internal uſe, no other ſpirit, drawn from malt, melaſſes, or other fermented matter, is to be uſed, than that expreſly preſcribed.

Of tinctures there are various ſorts, and for various uſes; cephalic tinctures, antiſcorbutic tinctures, ſtomachic tinctures, anticolic tinctures, and invigorating tinctures; there are tinctures drawn from roſes, from cinnamon, and an infinite number of other ſubſtances, which it would be too tedious to mention.

TINCTURE, in heraldry, the hue or colour of any thing in coat-armour, under which denomination may alſo be included the two metals, or and argent, becauſe they are often repreſented by yellow and white. See COLOUR and METAL.

TINE. There are two rivers of this name, the one called North-Tine, which riſes on the borders of Scotland; and the other South-Tine, which riſes on the confines of Cumberland; the one running ſouth-eaſt, and the other north-eaſt; they unite their waters at Hexham, and continuing to run eaſt, divide the counties of Durham and Northumberland, paſſing by Newcaſtle, and falling into the German ſea at Tinmouth.

TINEA, in medicine, a diſeaſe, the ſame with the achor or cruſta lactea. See ACHOR, CRUSTA, and LACTEA.

TIN-GLASS, a name given by ſome to a mineral matter more commonly called biſmuth. See BISMUTH.

TINMOUTH, a port-town of Northumberland, ſituated on the German-ſea, at the mouth of the river Tine, ſeven miles eaſt of Newcaſtle.

TINNING, the covering or lining any thing with melted tin, or with tin reduced to a very fine leaf. Looking-glaſſes are foliated, or tinned, with thin plates of beaten tin, the whole bigneſs of the glaſs, applied or faſtened thereto by means of quickſilver. See the article FOLIATING.

The plumbers, on ſome occaſions, tin or whiten their ſheets of lead, in order to which they have a tinning-furnace, filled with live coal, at the ſides whereof two men are placed, who hold up the ſheets over the fire to heat; and the tin leaves being laid over them as faſt as the ſheets grow hot, and the tin melts, they ſpread it, and make it take by rubbing it with tow and roſin.

TINNITUS AURIUM, a noiſe or buzzing in the ear, when it receives ſounds which do not exiſt, or at leaſt which are not produced by the motion of the external air; and the ear being filled with a certain ſpecies of ſound, cannot admit other ſounds, unleſs they are very violent. The tinnitus is of two kinds, the one proceeding from a diſtemperature of the organ of hearing, the other from a diſorder of the brain.

The cure, according to Heiſter, is to be performed by temperate diaphoretic powders, and reſolving eſſences, commonly called anticatarrhales; as of amber, the woods, roſemary, together with diaphoretics and alexipharmacs, taken often in a day, with tea of betony, with roſemary-flowers, ſage, or lavender, or or ſaſſafras. In the morning, and at noon, the eſſences are to be taken, and at night the powders. Eſſence of amber may be applied outwardly, either alone or with a few drops of oil of amber, or one or two drops of oil of camomile put into

into the ear with cotton, morning and evening; or a grain or two of amber and muſk, or caſtor, in cotton, either alone or with peruvian-balſam; or carminative oils, ſuch as aniſe, fennel, carraways, or camomile; not neglecting pediluvia, and frequent rubbing of the feet and head. Many have been alſo cured by the vapour of a decoction of lavender-flowers, or roſemary, made with wine, being conveyed to the ear by a funnel. If the diſeaſe is obſtinate and inveterate, the patient muſt bleed in the foot, together with ſcarifications, and frequent purges, for the ſake of revulſion. Etmuller ſays, this noiſe, proceeding from burning fevers, will go away of itſelf; but if it proceeds from chronic diſorders, it is difficult of cure. However, he recommends vapours of ſouthern-wood, wormwood, origanum, eyebright, balm, *&c.* as alſo of amber, or gum-ammoniac; likewiſe oil of peach kernels, and ſpirit of urine, put into the ear with cotton.

The following formula is greatly praiſed. White hellebore and caſtor, take of each two drachms; of coſtmary, one drachm and a half; of rue, two drachms; euphorbium, half a drachm; of bitter-almonds, two drachms and a half: let them be boiled in the oil of rue, and poured warm into the ear. Shaw recommends half an ounce of oil of bitter-almonds, with two drachms of oil of caſtor, externally applied.

TINNUNCULUS, in ornithology, the ſame with keſtril. See KESTRIL.

TINO, an iſland in the Archipelago, ſituated in eaſt long. 26°, north lat. 37° 15'.

TINUS LAURISTINE, in botany, a genus of the *pentandria trigynia* claſs of plants, the corolla whereof conſiſts of a companulated, ſemiquinquifid, obtuſe petal, with ſubcordated laciniæ: the fruit is a roundiſh unilocular berry, umbilicated, with a cloſe calyx: the ſeed is ſingle and globoſe. Some botaniſts make this genus a ſpecies of viburnum. See the article VIBURNUM.

TIPPERARY, a county of Ireland, in the province of Munſter, lying between King's county on the north, and Waterford on the ſouth.

TIPRA, a country of Aſia, ſituated between India and China.

TIPSTAFF, an officer who attends the judges with a kind of ſtaff tipt with ſilver, and takes into his charge all priſoners who are committed or turned over at a judge's chambers.

TIRE, or TEER *of guns*, in the ſea-language, is a row of cannon placed along a ſhip's ſide, either above, upon deck, or below, diſtinguiſhed by the epithets of upper and lower tires.

TIRLEMONT, a town of Brabant, twelve miles ſouth-eaſt of Louvain, and twenty-one north of Namur.

TIROL, a country of Germany, in the circle of Auſtria, about one hundred and twenty miles long, and ſixty broad, ſubject to the houſe of Auſtria: it is bounded by Swabia and Bavaria on the north.

TITANS, in the heathen mythology, the offſpring of Titan, the elder brother of Saturn, upon whom, and his ſon Jupiter, they made war, in order to recover the ſovereignty of which Titan had been deprived. The poets repreſent them as a race of giants, ſprung from the earth, and invading heaven; and tell us, that Jupiter overcame them with thunder, and drove them down to the very bottom of hell.

TITHES, *decimæ*, in law, denote the tenth part of the increaſe that annually ariſes from the profits of lands, and the induſtry of the pariſhioners, which is payable for the maintenance of the parſon of the pariſh.

Tithes, it is obſerved, are of three kinds, predial, perſonal, and mixed. Predial-tithes are ſuch as immediately ariſe from the land, whether it be by manuring or its own nature; as corn, grain, hay, wood, fruit, and herbs, which are ſaid to be due without deducting the coſts. Perſonal-tithes are thoſe which only ariſe from a perſon's labour and induſtry, they being a tenth part of his gains in trade, *&c.* after charges deducted; but this is ſeldom paid in England, and when it is, it is always due by cuſtom, and payable where the party dwells, hears divine ſervice, *&c.* Mixed-tithes are ſuch as ariſe not directly from the ground, but from cattle and other things that receive their nouriſhment from and are maintained thereout; as calves, colts, pigs, wool, lambs, milk, *&c.* Tithes are further divided into great and ſmall; great, are corn, hay, and wood; ſmall comprehend all other predial-tithes beſides corn, *&c.* as likewiſe ſuch tithes as are perſonal and mixed: the great tithes generally belong to the rector, and the ſmall to the vicar.

It has been held, that where land is barren, and not manurable, without extraordinary charge, ſuch land being converted into tillage, ſhall, for the firſt ſeven years after the improvement, be free from paying tithes; but during that ſpace of time it ſhall pay ſmall tithes, as have been uſually paid before, and afterwards the full tithe, according as it is improved: nevertheleſs, if land is ſuffered to be over-run with buſhes, or become unprofitable through want of huſbandry, in that caſe it cannot properly be called barren; and if the ſame be grubbed up, or ploughed and ſowed, it immediately pays tithes.

As to corn it is tithed by the tenth cock, or ſheaf, which if the owner does not ſet out, he is liable to an action upon the ſtatute; likewiſe where a pariſhioner will not ſow the land, the parſon may bring his action againſt him. On the other hand, when the tithes are ſet forth, if the parſon do not carry them away in a reaſonable time, but lets the ſame be too long on the ground, to the prejudice thereof, he may be alſo ſubject to an action.

The treble damages, granted by ſtatute, are recoverable in the temporal courts by action of debt, thoſe damages not being limited where to be recovered; and it is the opinion of ſome, that the double value, or damages, above-mentioned may be recovered in the ſpiritual-court, for this reaſon, that the perſon grieved may ſue in the eccleſiaſtical-court for the tithes themſelves, or a recompence in lieu of the ſame, and may alſo at the ſame time have the double value. Small-tithes that are under the value of forty ſhillings, a parſon may recover before two juſtices of peace, who are no way intereſted in the tithes, within twenty days after demand, and two years after due: and the juſtices may, by diſtreſs, levy the money by them adjudged, upon the party's refuſal to pay it, ten days after notice, *&c.* The juſtices may likewiſe award coſts not above ten ſhillings, but with liberty to appeal to the quarter-ſeſſions, whoſe judgment ſhall be final, unleſs the title to ſuch tithes ſhould come in queſtion, *&c.*

Where a quaker refuſes either to pay or compound for great or ſmall tithes, the two next juſtices of the peace may, on complaint thereof made, ſummon ſuch quaker before them, and after examining the matter of complaint on oath, may, by order under their hands and ſeals, direct the payment in all caſes under ten pounds. And if, after ſuch order made, the quaker refuſes to comply therewith, any one of the juſtices may by warrant order the ſame to be levied by diſtreſs, *&c.* See 7 and 8 Wil. III. c. 34. which, by 1 Geo. I. c. 6. is made perpetual.

Notwithſtanding theſe acts, tithes, if of any conſiderable value, are generally ſued for in the exchequer by engliſh bill, except where the ſuit is founded on the ſtatute of 2 and 3 Ed. VI. for double or treble value, *&c.*

TITHING, in old law-books, the ſame with decennary. See DECENNARY.

TITLE, *titulus*, an appellation of dignity, or quality, given to princes, and other perſons of diſtinction. Thus, the title of his Britannic majeſty, is king of Great-Britain, France, and Ireland; that of the French king, is king of France and Navarre: and ſo of others. The pope aſſumes the title of holineſs, and the cardinals that of eminence, *&c.* See the articles KING, PRINCE, DUKE, POPE, CARDINAL, *&c.*

TITLE, in law, denotes any right which a perſon has to the poſſeſſion of a thing; or an authentic inſtrument, whereby he can prove his right. See the articles RIGHT, PROPERTY, *&c.*

As to the titles of the clergy, they denote certain places wherein they may exerciſe their functions. There are ſeveral reaſons why a church is called titulus; but that which ſeems to be the beſt, is becauſe antiently the name of the ſaint to whom the church was dedicated, was engraved on the porch, as a ſign that the ſaint had a title to that church; and from thence the church itſelf was afterwards called titulus. In this ſenſe a title ſignifies the church to which a clergyman was admitted, and where he is conſtantly to reſide: and by the canons none ſhall be ordained without a title. This is in order to keep out ſuch from the miniſtry who, for want of maintenance, might bring a diſgrace upon the church: can. 31. In ſhort, according to ſome writers, ſuch a title is an aſſurance of being preferred to an eccleſiaſtical benefice; that is to ſay, a certificate that the clerk is provided of ſome church or place, or where the biſhop that ordains him, intends ſhortly to admit him to a benefice or curacy then void.

TITMOUSE, *parus*, in ornithology, a genus of birds, of the order of the paſſeres,

feres, the beak of which is of a ſubulated form, and the point of the tongue truncated.

Of this genus there are many elegant ſpecies, among which the creſted and blue titmouſe are not the leaſt beautiful. See plate CCLXXXV. fig. 6. where n° 1. repreſents the former, and n° 2. the latter.

TITUBATION, or TREPIDATION, a kind of libration, or ſhaking, which the antient aſtronomers attributed to the cryſtalline heavens, in order to account for certain irregularities which they obſerved in the motions of the planets. See PLANET and LIBRATION.

TITUL, a town of Hungary, ſituated on the river Teiſſe, thirty miles north of Belgrade.

TITULAR, denotes a perſon inveſted with a title, in virtue of which he holds an office or benefice, whether he perform the functions thereof or not.

The appellation of titular is frequently alſo given to a perſon who has the title and right of an office or benefice, but without having poſſeſſion, or diſcharging the functions thereof.

TIVERTON, a borough of Devonſhire, ſituated on the river Ex, thirteen miles north of Exeter.

It ſends two members to parliament.

TIVIOT, or CHIVIOT-MOUNTAINS, are high hills on the borders of England and Scotland.

TIVOLI, or TIBUR, a town of Italy, ſituated on the river Tiverone, twenty miles eaſt of Rome.

TLASCALA, a town of Mexico, and capital of a province of the ſame name, about forty-five miles eaſt of the city of Mexico.

TMESIS, τμησις, in grammar, a figure whereby a compound word is ſeparated into two parts, and one or more words placed between them: thus, for *quæcunque*, Virgil ſays, *quæ me cunque vocant terræ*, &c.

TOAD, *rubeta*, in zoology, belongs to the ſame genus with the common frog. See the article FROG.

The toad is larger than the frog, with a thick body, a broad back, and the belly ſwelled and inflated: its ſkin is conſiderably thick, and full of tubercles, of a duſky and blackiſh colour on the back, and ſpotted on the belly: it is naturally a loathſome and diſagreeable object. See plate CCLXXIX. fig. 2.

TOAD-FLAX, *linaria*, in botany. See the article LINARIA.

TOBACCO, *nicotiana*, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla of which conſiſts of a ſingle infundibuliform petal, the limb whereof is patulous, and lightly divided into five ſegments: the fruit is a biloculär capſule, of a nearly oval figure, with a line on each ſide of it, and containing numerous, kidney-ſhaped, and rugoſe ſeeds. See plate CCLXXIX. fig. 3.

Tobacco is a native of the eaſt and weſt Indies, and particularly the iſland Tobago, or Tabago; whence the engliſh name. See TABAGO.

After ſowing tobacco-ſeeds, the ground is watered every day, and in hot weather covered, to prevent its being ſcorched by the ſun; and when the plants are grown to a convenient pitch, they are tranſplanted into a ſoil well prepared for their reception: care is alſo taken to keep this ground clear of weeds, and to pull off the loweſt leaves of the plant, that ten or fifteen of the fineſt leaves may have all the nouriſhment. When theſe leaves are ripe, which is known by their breaking when bent, the ſtalks are cut, and left to dry two or three hours in the ſun; after which they are tied together two and two, and hung on ropes under a ſhade to be dried in the air. And when the leaves are ſufficiently dried, they are pulled from off the ſtalks, and made up in little bundles; which being ſteeped in ſea-water, or, for want thereof, in common water, are twiſted in manner of ropes, and the twiſts formed into rolls, by winding them with a kind of mill around a ſtick: in which condition it is imported into Europe, where it is cut by the tobacconiſts for ſmoaking, formed into ſnuff, and the like. See the article SNUFF.

Beſides the tobacco of the Weſt-Indies, there are conſiderable quantities cultivated in the Levant, the coaſts of Greece and the Archipelago, the iſland of Malta and Italy.

The marks of good twiſt-tobacco, are a fine ſhining cut, an agreeable ſmell, and that it have been well kept. Tobacco is either taken by way of ſnuff, as a ſternutatory, or as a maſticatory, by chewing it in the mouth, or by ſmoaking it in a pipe. It is ſometimes alſo taken in little longiſh pellets put up the noſe, where it is found to produce very good

effects,

effects, to attract a deal of water or pituita, unload the head, resolve catarrhs, and make a free respiration; for the subtile parts of the tobacco in inspiration, are carried into the trachea and lungs, where they loosen the peccant humors adhering thereto, and promote expectoration. Some have left this tobacco in their noses all night; but this is found to occasion vomiting the next morning. Another thing charged on this way of application, is, that it weakens the sight. When taken in great quantities in the way of snuff, it is found to prejudice the smelling, greatly diminishes the appetite, and in time gives rise to a phthisis. That taken in the way of smoak, dries and damages the brain. Borrhi, in a letter to Bartholine, mentions a person who through excess of smoaking had dried his brain to that degree, that after his death there was nothing found in his skull but a little black lump, consisting of mere membranes.

Some people use the infusion of tobacco as an emetic; but it is a very dangerous and unjustifiable practice, and often produces violent vomitings, sickness and stupidity.

Bates and Fuller give some receipts, in which tobacco is an ingredient, with mighty encomiums in asthmatic cases. A strong decoction of tobacco, with proper carminatives and cathartics, given clyster-wise, sometimes proves of good effect in what is usually called the stone-cholic, and also in the iliac passion. A drop or two of the chemical oil of tobacco, being put on the tongue of a cat, produces violent convulsions, and death itself in the space of a minute; yet the same oil used in lint, and applied to the teeth, has been of service in the tooth-ach though it must be to those that have been used to the taking of tobacco, otherwise great sickness, retchings, vomitings, *&c.* happen; and even in no case is the internal use of it warranted by ordinary practice.

A strong decoction of the stalks, with sharp-pointed dock and alum, is said to be of good service, used externally, in cutaneous distempers, especially the itch: some boil them for that purpose in urine. The same is said to be infallible in curing the mange in dogs.

Beat into a mash with vinegar, or brandy, it has been found serviceable for removing hard tumours of the hypochondria.

Tobacco makes a considerable article of commerce; that imported from the british plantations, pays a duty of $5\frac{1}{2}$d. the pound, which is wholly drawn back on exportation: also, if all the duties are paid down at entry, 25 per cent. is allowed in lieu of all former encouragements; or the importer may pay down the old subsidy, which is $\frac{1}{4}$ of a penny per pound, and give bond for the payment of the remaining duties in eighteen months, and only have an allowance of 15 per cent. out of the bondable duties: so that the duties upon a pound of british plantation tobacco, when the bondable duties are secured as above, amount to $6\frac{13\frac{1}{3}}{100}$d. which is drawn back on exportation. But if the importer shall be desirous to discharge his bond, or any part thereof, before the expiration of eighteen months, he shall be abated upon such bond so much as the discount at the rate of 7 per cent. per annum shall amount to, in proportion to the time unexpired. No tobacco can be imported into the kingdom of Great Britain, otherwise than in casks, chests, or cases; each cask, chest, or case, containing 450 lb. weight of neat tobacco at least, under the penalty of the forfeiture of all such tobacco. Also no tobacco unmanufactured shall be exported but in casks, chests, or cases of 425 lb. weight, or more, of neat tobacco, except what is exported by way of samples: and all tobacco must be shipped from the very same port or place, in the original package, and with the same marks, as it was first imported, without any alteration, except necessary cooperage, under the penalty of the forfeiture of all such tobacco.

By an act passed in the twenty-fourth year of his present majesty George II. no tobacco shall be manufactured till an account is given to the chief officer of the customs at the port of importation, of the mark and quantity of the cask so delivered to be manufactured; and if such an account shall not be given in, or is found to be fraudulent, the importer shall forfeit 30 l. for every hogshead, *&c.* And by the same act, no tobacco, or tobacco-stalks, exceeding 24 lb. nor any snuff, exceeding 10 lb. shall be conveyed by land from the place of importation, without a certificate first obtained from the chief custom-house officers in that port, together with the importer's oath thereto,

thereto, that the duties were paid or ſecured at the importation, &c. on pain of forfeiting the tobacco and ſnuff; as alſo the carriage and horſes, and the carrier to be impriſoned for one month: and if any perſon ſhall counterfeit or alter ſuch certificate, or procure the ſame to be done, he ſhall forfeit 50l. for every ſuch offence. Alſo, if any tobacco be conveyed by water, without being duly entered at the cuſtom-houſe, and a certificate as above obtained, it ſhall be forfeited, and the maſter of the veſſel ſhall alſo forfeit 6d. per pound. The penalty for counterfeiting ſuch a certificate is 100l. What has been ſaid of conveying tobacco from the place of importation, holds equally of conveying it from any other place, without a certificate as above.

Tobacco muſt not be cultivated in England, except in phyſic gardens, on forfeiture of 40s. for every rood of ground planted with it. Alſo, if any perſons cut the leaves of walnut-tree, ſo as to reſemble thoſe of tobacco, and ſell the ſame mixed therewith, they ſhall forfeit 5s. per pound.

TOBAGO, a ſmall iſland in the bay of Panama, in ſouth America, ſituated weſt long. 82°, north lat. 8°.

TOBAGO, or TABAGO, is alſo the name of one of the Caribee-Iſlands. See the article TABAGO.

TOBOLSKI, the capital of Siberia, ſituated at the confluence of the rivers Tobal and Irtis: eaſt long. 63°, north lat. 57° 30′.

TOCAT, the capital of Amaſia, in Aſia: eaſt long. 37°, and north lat. 41° 30′.

TOCKAY, a city of Hungary, ſeventy miles north eaſt of Buda, the wines of which are eſteemed the beſt in Europe.

TOD *of wool*, a quantity containing twenty-eight pounds, or two ſtone. See the articles WOOL and WEIGHT.

TODI, a town of Italy, ſituated on the river Tiber, fifty miles north of Rome.

TOES, called by anatomiſts *digiti pedis*, are the extreme diviſions of the feet, anſwering to the fingers of the hands. See the articles FOOT and HAND.

The bones of the toes of both feet are twenty-ſix in number, ſometimes twenty-eight; being much ſlenderer, except that of the great toe, than thoſe of the fingers: they have alſo a much leſs free motion than thoſe of the fingers: the great toe has only two bones, and the reſt three; except the little toe in very old people, in whom the two extreme phalanges of the little toe grow together ſo as to form only one bone; whence we find, in this caſe, fewer bones in each foot than thirteen.

For the ſeſamoide bones of the toes, ſee the article SESAMOIDE.

In caſe of adheſſions of the toes of infants, they ſhould be ſeparated either by cutting out the intermediate ſkin with a pair of ſciſſars, or barely by dividing them with the ſame inſtrument: and when this is done, in order to prevent their cohering again, they ſhould be wrapped up in a ſpiral bandage, dipped in lime-water and ſpirit of wine.

TOFT, in law-books, denotes a parcel of land, or a place where a meſſuage has formerly ſtood.

TOGA, in roman antiquity, a wide woollen gown, or mantle; which ſeems to have been of a ſemi-circular form, without ſleeves; differing both in richneſs and largeneſs, according to the circumſtances of the wearer, and uſed only upon occaſion of appearing in public.

Every body knows that the toga was the diſtinguiſhing mark of a Roman: hence, the jus togæ, or privilege of the toga, was the ſame with the privilege of a roman citizen; *i. e.* the right of wearing a roman habit, and of taking, as they explain it, fire and water through the roman empire.

TOILS, ſnares or nets uſed by hunters for catching wild beaſts, as deer, &c.

TOILET, a fine cloth of linnen, ſilk, or tapeſtry, ſpread over the table in a bedchamber or dreſſing-room, to undreſs and dreſs upon.

TOISE, a french meaſure containing ſix of their feet, or a fathom. See FOOT.

TOISON D'OR, a term, in heraldry, for a golden fleece, which is ſometimes borne in a coat of arms.

TOLEDO, a city of New Caſtile, in Spain; the archbiſhop of which is primate of Spain, &c. and poſſeſſes the largeſt revenue of any archbiſhop in Europe: it is ſituated in weſt long. 4° 12′, and north lat. 39° 45′.

TOLEN, the capital of an iſland of the ſame name, in the province of Zealand, in the United Netherlands, ſituated four miles north weſt of Bergenopzoom.

TOLENTINO, a town of the marquiſate of Ancona, in Italy, twenty-four miles ſouth-weſt of Loretto.

TOLERATION, in matters of religion, is either civil or eccleſiaſtical. Civil toleration,

leration, is an impunity and ſafety granted by the ſtate to every ſect that does not maintain doctrines inconſiſtent with the public peace: and eccleſiaſtical toleration, is the allowance which the church grants to its members to differ in certain opinions, not reputed fundaments.

The term toleration has made a great figure in the diſputes among proteſtants, who have been exceedingly divided about the meaſures of toleration, or the degrees to which heretics and ſchiſmatics are, or are not to be ſuffered.

TOLESBURG, a port-town of Livonia: eaſt long. 26°, north lat. 59°.

TOLHUYS, a town of Guelderland, in the United Netherland, ſituated on the Rhine, nine miles eaſt of Nimeguen.

TOLK, in ornithology, the black, brown, and white mottled tringa. See the article TRINGA.

TOLL, in law, denotes a tax or cuſtom paid for paſſage, or for the liberty of ſelling goods in a market or fair. Hence, toll-booth is a place in a town, where goods are weighed, in order to aſcertain the duties thereon.

TOLMEZZO, a town of Friuli, in Italy eaſt long. 13°, north lat. 47°

TOLNA, a town of Lower Hungary, ſixty miles ſouth of Buda.

TOLOSA, a city of Biſcay, in Spain: weſt long. 2°, and north lat. 43° 30'.

TOLU, a port-town of Terra Firma, ſituated on a bay of the North ſea, an hundred miles ſouth weſt of Carthagena.

TOLUIFERA, in botany, a genus of the *decandria monogynia* claſs of plants, the flower of which is compoſed of five petals, which are inſerted into the cup; four of theſe are ſtrait and equal in ſize, and are a little longer than the cup; but the fifth is twice as large as theſe, and is cordated at the end, and has an unguis of the length of the cup. The fruit and ſeeds are yet unknown. It is ſo called, from its producing the balſam of peru. See the article BALSAM.

TOMAN, or TOUMAN, a kind of imaginary money uſed among the Perſians in the keeping of their books, and to facilitate the reduction of money in the payment of conſiderable ſums. See the article MONEY.

TOMB, includes both the grave or ſepulchre wherein a defunct is interred, and the monument erected to preſerve his memory. See MONUMENT.

TOMBEC, a town of Brabant, ten miles eaſt of Bruſſels.

TOME, in matters of literature, denotes a bound book, or writing that juſt makes a volume. See BOOK and VOLUME.

TOMENTUM, among botaniſts, the downy matter which grows on the leaves of ſome plants.

TOMEUT, a town of Nigritia, in Africa: weſt long. 11°, north lat. 14°.

TONDEREN, or TUNDER, a town of ſouth Jutland, ſituated on a bay of the German ſea, twenty miles ſouth of Rypen.

TONE, or TUNE, in muſic, a property of ſound, whereby it comes under the relation of grave and acute; or it is the degree of elevation any ſound has, from the degree of ſwiftneſs of the vibrations of the parts of ſonorous bodies. See the articles SOUND and TUNE.

Tone is more particularly uſed for a certain degree or interval of tune, whereby a ſound may be either raiſed or lowered from one extreme of a concord to the other, ſo as ſtill to produce true melody. See INTERVAL and CONCORD.

TONGEREN, or TONGERS, a town of the biſhopric of Liege, in Germany, ten miles north weſt of Liege.

TONGUE, *lingua*, in anatomy, the primary organ of taſte and ſpeech; the figure of which approaches, in ſome degree, to pyramidal; its anterior part being called apex, and its poſterior part the baſe or root. The upper ſide is not quite flat, but a little convex, and divided into two lateral halves, by a ſhallow depreſſed line called linea linguæ mediana. The edges are thinner than the other parts, and a little rounded as well as the point. The lower ſide reaches only from the middle of the length of the tongue to the point.

The tongue is principally compoſed of very ſoft fleſhy fibres, intermixed with a peculiar medullary ſubſtance, and diſpoſed in various manners. Many of theſe fibres are confined to the tongue without going any farther; the reſt form ſeparate muſcles which go out from it in different ways, and are inſerted in other parts: all the upper ſide of the tongue is covered by a thick membrane of a papillary texture, upon which lies another very fine membrane like a kind of epidermis, which is likewiſe continued over the loweſt ſide, but without papillæ.

Three ſorts of papillæ may be diſtinguiſhed in the upper ſide of the tongue, capitatæ, ſemi-lenticulares, and villoſæ. Thoſe of the firſt kind are the largeſt, reſembling

reſembling little muſhrooms with ſhort ſtems, or buttons without a neck: they lie on the baſis of the tongue, in ſmall ſuperficial foſſulæ. They reſemble ſmall conglomerate glands ſeated on a very narrow baſis, and each of them has ſometimes a ſmall depreſſion in the middle of their upper convex ſide: they occupy the whole ſurface of the baſis of the tongue, and are ſituated near each other, in ſuch a manner as that the moſt anterior form an angle; they are glandular papillæ, or ſmall ſalival or mucilaginous glands, of the ſame kind with thoſe that are to be deſcribed hereafter.

We often obſerve, about the middle of this part of the tongue, a particular hole of different depths; the inner ſurface of which is intirely glandular, and filled with ſmall papillæ like thoſe of the firſt kind. It is called foramen cæcum Morgagnii, as being firſt deſcribed by that author; ſince that time Vaterus has diſcovered a kind of ſalival ducts belonging to it; and Heiſter found two of theſe ducts very diſtinctly, the orifices of which were in the bottom of the foramen cæcum, near each other. He obſerved the ducts to run backward, divaricating a little from each other; and that one of them terminated in a ſmall oblong veſicle, ſituated on the ſide of the ſmall cornu of the os hyoides.

The papillæ of the ſecond kind, or ſemilenticulares, are ſmall orbicular eminences, only a little convex, their circular edge not being ſeparate from the ſurface of the tongue. When we examine them in a ſound tongue with a good microſcope, we find their convex ſides full of ſmall holes or pores, like the end of a thimble.

They lie chiefly in the middle and anterior portions of the tongue, and are ſometimes moſt viſible on the edges, where they appear to be very ſmooth, and poliſhed even to the naked eye, and ſometimes in living ſubjects. They ſoon loſe their conſiſtence after death, ſo that, by rubbing them ſeveral times, they may be drawn out in form of ſmall ſoft pyramids, inclined to one ſide. The papillæ of the third kind, or villoſæ, are the ſmalleſt and moſt numerous. They fill the whole ſurface of the upper ſide of the tongue, and even the interſtices between the other papillæ. They would be more properly named papillæ conicæ, than villoſæ, from the figure which they appear to have, when examined through a microſcope in clear water. They are naturally ſoftiſh, but become extremely flaccid after death; ſo that by handling them they may be made ſhort and thick, whereas they are naturally long and ſmall.

The fleſhy fibres of which the tongue is compoſed, and which go no further than the tongue, may be termed muſculi linguæ interiores, or the intrinſic muſcles; and they are the ſame with what Spigelius named muſculi linguales. The fibres theſe muſcles conſiſt of are of three general kinds, longitudinal, tranſverſe, and vertical; and each of theſe ſituations admits of different degrees of obliquity. The longitudinal fibres point to the baſis and apex of the tongue, and ſeem partly to be expanſions of the muſculi ſtylogloſſi, hyo-gloſſi, and genio-gloſſi. The vertical fibres ſeem likewiſe to be in part produced by the ſame genio-gloſſi, and the tranſverſe by the mylo gloſſi.

Beſides theſe mixed productions, there is a diſtinct plane of longitudinal fibres, which run near the ſurface of the upper ſide of the tongue, and a diſtinct tranſverſe plane under them. All theſe fibres are partly interwoven, one portion of them terminating at the two edges of the tongue, and the other at the baſis and point, without going to any other part; and they lie immediately above thoſe which belong to the genio gloſſi. To diſcover all theſe different fibres, and their different degrees of direction, we need only cut the tongue longitudinally, after it has been boiled, or long macerated in ſtrong vinegar. The extrinſic muſcles, or muſculi exteriores, are thoſe which by one extremity make a part of the body of the tongue, and are fixed by the other in ſome part without the tongue. Of theſe we reckon four pair, mylo gloſſi, ſtylo-gloſſi, hyo-gloſſi, and genio-gloſſi.

In plate CCLXXIX. fig. 5. n° 1. is repreſented the human tongue, with its three integuments, which anatomiſts in general have omitted to remark. Bourdon, indeed, has figured them, but thicker than the life. A A A is the upper ſuperfices of the tongue, on which are viſible a multitude of papillary and pyramidal eminences. B is a piece of the exterior tunic, or coat of the tongue; in which are diſcernable a vaſt number of nervous papillæ, adhering to its interior ſurface. C C is the ſecond tunic, called the corpus reticulare of Malpighi. D is the corpus reticulare of other writers. E is the

membrane, or corpus papillare nervoſum. FF the glands of the tongue; and G the foramen uſually found in the hinder part of the tongue.

N° 2. *ibid.* exhibits a human tongue, in which Heiſter diſcovered two remarkable ſalival ducts, *b* and *d*, in the foramen cæcum A; *c c* is a veſicle at the extremity of the duct *d*, diſtended with ſaliva; and *e* is the place where this duct diſappeared: *f f* ſhew the courſe and ſituation of theſe ducts. The fabric and ſtructure of the oſcula, expreſſed at *b* and *d*, was ſingular; having the appearance of valves or caruncles, that had collapſed, ſo that they did not appear as repreſented in the figure, unleſs forced open by inflation: *b* is the epiglottis, *i* its anterior ligament, *k* muſcular fibres ariſing from the ſubſtance of the tongue, *l l* two little oſſicles of the os hyoides, *m m* the extremities of the horns of the os hyoides, *n n* glands and papillæ of various ſize, about the middle of the tongue; and *o* the apex of the tongue bent downwards.

TONGUE-TIED, the popular name for a diſtemper of the tongue in children, when it is tied down too cloſe to the bottom of the mouth, by a ligament connected all along its middle, and called its frænulum, which requires to be divided, to give the tongue its proper motion. See the article FRÆNUM.

This is ſometimes the caſe in adults, but oftener in children, who cannot then exert their tongues to ſuck. This is, however, by no means ſo common as the women uſually imagine; not ſo much as one child in a thouſand being afflicted with it; nor is the operation in cutting it of little conſequence, ſince often bad accidents follow it, and ſometimes the loſs of the child's life. When the infant can put its tongue out of its mouth, the frænulum wants no inciſion; but when the tongue cannot be extended beyond the teeth, the operation is neceſſary. To perform this, the end of the tongue ſhould be covered with a linnen-rag, and held with the fingers to prevent its ſlipping, and the ligament of the tongue running between the ranular veins and internal ſalival ducts, is to be divided by a pair of obtuſe-pointed ſciſſars, till it give room enough for ſucking or ſpeaking: but in doing this, great care muſt be taken not to wound the ſalival ducts, or the proper veins and arteries of the tongue; for children have been known to periſh upon the ſpot, from the cutting the ranular veins in this operation. Midwives often tear this ligament with their fingers, as ſoon as the child is born; but this is a dangerous and bad practice.

TONIC, τονικὸς, in medicine, is applied to a certain motion of the muſcles wherein the fibres, being extended, continue their extenſions in ſuch a manner, as that the part ſeems immovable, though in reality it be in motion.

TONNAGE, or TUNNAGE. See the article TUNNAGE.

TONNINGEN, a port-town of ſouth Jutland, ſituated at the mouth of the Eyder, in eaſt long. 8° 40′, north lat. 54° 40′.

TONQUIN, a kingdom of the further India, bounded by the provinces of Yunam and Canton, in China, on the north; by Cochin China, on the ſouth; and by the kingdom of Laos, on the weſt; lying between 101° and 108° eaſt long. and between 17° and 26° north lat. Its capital is Kecelo, or Cachao.

TONSBURG, a port-town of Norway, in the province of Aygerhuys, ſituated on the Scaggerack-ſea, thirty miles weſt of Frederickſtat.

TONSILS, *tonſillæ*, in anatomy, two remarkable glands, ſituated one on each ſide of the mouth, near the uvula, and commonly called almonds of the ears, from their reſembling almonds in figure. Their uſe is to ſecrete a mucous humour for lubricating the paſſages: this they diſcharge by ſeveral irregular but conſpicuous foraminæ into the mouth.

The tonſils are apt to be inflamed from taking cold, for which Heiſter firſt adviſes a gentle purge of tamarinds, ſena, and cream of tartar; and this to be repeated to the third or fourth doſe, if there be occaſion: in the intermediate times, the diaphoretic attemperating and nitrous medicines are to be given in powders, and a large quantity of diluting liquors allowed, which ſhould be gently acidulated, and have a ſmall quantity of nitre diſſolved in them: gargariſms made of decoctions of biſtort-root, red-roſes, and other gentle aſtringents, are alſo to be frequently uſed; and the frequent waſhing the feet in warm water, often has a very remarkable good effect.

If after four or five days the diſtemper is found not to give way to theſe means, but the tumour ſtill remains, there is then but little hopes to be had of its reſolution, and a very different end is to be attempted: emollient gargariſms are now to be uſed, and maturating plaſters externally applied,

applied, ſuch as diachylon with the gums, and the like; and ſuppurating cataplaſms are to be applied to the whole neck and throat: theſe methods are to be continued till the tumour either burſts of itſelf, or is ſo ripe as to be fit for opening by the hand of the ſurgeon. After this has been done, and the matter is diſcharged, gargariſms muſt be uſed of decoctions of ſome vulnerary herb; or common green tea, ſweetened with honey of roſes, may be uſed to ſerve the purpoſe. The mouth and throat are to be frequently waſhed with this till the part is healed. It is to be obſerved, however, that the reſolution of theſe tumours is never to be deſpaired of, not even during the uſe of the ſuppurating medicines, for it is often ſeen that the tumour has been wholly diſcuſſed even during the uſe of theſe means, the reſolution often being extremely ſlow.

This is a very troubleſome complaint, and with ſome perſons is apt to return very frequently; the beſt preſervative againſt it is a moderate diet and bleeding, about the time of the equinoxes, either in the arm or foot. Some have found it neceſſary to open an iſſue in the arm, in this caſe, and have been by this means perfectly cured; but on its drying up have always found the diſeaſe return.

TONSURE, in eccleſiaſtical hiſtory, a particular manner of ſhaving or clipping the hair of eccleſiaſtics or monks.

The antient tonſure of the clergy was nothing more than polling the head, and cutting the hair to a moderate degree, for the ſake of decency and gravity: and the ſame obſervation is true, with reſpect to the tonſure of the antient monks. But the romaniſts have carried the affair of tonſure much farther; the candidate for it kneeling before the biſhop, who cuts his hair in five different parts of the head, *viz.* before, behind, on each ſide, and on the crown.

TOOL, among mechanics, denotes in general any ſmall inſtrument, uſed as well for making other more complex inſtruments and machines, as in moſt operations in the mechanic arts. See the article INSTRUMENT.

The tools of joiners, ſmiths, *&c.* may be ſeen delineated and deſcribed under the articles JOINERY, SMITHERY, *&c.*

TOOTH, *dens*, in anatomy, a little, very hard, and ſmooth bone, fixed in a proper alveolous or ſocket in the jaws, in the manner of a nail; and ſerving to maſticate or chew the food. See FOOD, CHYLE, and CHYLIFICATION.

The natural colour of the teeth, in mankind, is white; and their number from twenty-eight to thirty-two; fourteen, fifteen, or ſixteen being placed in each jaw, if the number be perfect. The teeth are uſually divided into the four inciſores, or fore-teeth; the two canine, eye-teeth, or dog-teeth; the eight molares, or grinders, in each jaw, and two dentes ſapientiæ.

The bodies of the teeth are compoſed of a double ſubſtance, a ſtony or porcelain-like matter, and a medullary one: their roots are ſometimes ſimple, as in the inciſores, canini, and foremoſt of the molares; and ſometimes double, triple, or quadruple, as in the hinder molares.

The cavities of the teeth are covered with a vaſculo-nervous membrane, and the foraminula, or little holes, in the ends of them, ſerve for the ingreſs of the veſſels which afford them nutrition and ſenſation.

The uſes of the teeth are to break our food, to aſſiſt us in ſpeaking, and to add to the beauty of the face.

For the breeding of the teeth, in infants, ſee the article DENTITION.

And as to the cleanſing of foul teeth, ſee the article DENTIFRICE.

TOOTH-ACH, *ὀδοντάλγια*, a very painful diſorder, cauſed by an impure ſerum which corrodes and rends the ligaments and nervo-glandulous coats, by which the teeth are kept firm in their ſockets: its ſeat may alſo be in the cavity or internal parts of the teeth themſelves.

The whole intention of cure, in this diſorder, conſiſts in deriving and diverting the impure ſcorbutic ſerum from the head, and then carrying it off by proper emunctories. This is to be done by ſaline, emollient, and purgative clyſters; by warm pediluvia of rain-water and wheat-bran, with venice-ſoap, uſed juſt before bed-time; by laxatives of manna and caſſia diſſolved in whey or aſſes-milk, or mineral waters: if the patient is plethoric or full of blood, phlebotomy in the foot will be proper, to derive the humours from the head. Sudoriſic remedies are alſo proper, but more eſpecially an electuary made of rob of elder-berries, burnt hart's-horn, diaphoretic antimony, and a few grains of nitre: or, an ounce of the rob may be taken in broth, to promote a diaphoreſis; and it may be uſed externally,

externally, diſſolved in beer, in the manner of a gargle, which will yield immediate relief to the patient.

When the patient is ſubject to catarrhs, is ſcorbutic or cachectic, then mineral waters are moſt proper; and if the patient is of a weak bilious conſtitution, the water ſhould be mixed with aſſes-milk. Outwardly may be applied bags, filled with paregoric and emollient ſpecies; ſuch as elder, melilot, and camomile-flowers, bay and juniper-berries, caraway and millet-ſeeds, and decrepitated ſalt: they muſt be laid on warm, and are very ſafe. A drop or two of oil of cloves or box, applied to a carious tooth with cotton, are medicines not to be deſpiſed; and camphorated ſpirits of wine, mixed with ſaffron, caſtor, and opium made into a liniment, and laid to the gums and hollow tooth, often gives the patient eaſe. When the tooth-ach proceeds from a rotten, hollow tooth, it will be beſt to burn the little nervous cord, which is the ſeat of the pain, with an acute cautery; and then the cavity may be filled up with a mixture of wax and maſtich. But if this cannot be done, the only remedy left is to have the tooth drawn.

Allen adviſes to rub the tooth, that is painful, with the root of the iris lutea, or the yellow fleur-de-luce; or a pill may be made of equal quantities of camphor or opium, and put into the hollow tooth; and, laſtly, ſome greatly recommend a ſmall plaſter of tacamahac, laid on the ſide of the face.

TOOTH-DRAWING, the operation of pulling out a carious, or otherwiſe injured tooth.

This art, according to Cicero, was invented by Æſculapius, in whoſe temple the antients hung up a pair of leaden pullicans, very properly ſignifying that no teeth were fit to be pulled out, but ſuch as might be removed with a leaden forceps; that is, ſuch as were looſe and ready to fall out of themſelves; for they very little conſult their own welfare, who pull out their teeth while firm and ſound: for drawing the teeth is not only a painful operation, but often brings on bad accidents, and ſometimes even hazards the patient's life.

Tooth-drawing, however wrong in many caſes, yet is certainly right and neceſſary in others. 1. In children, for the removing their lacteal or deciduous teeth; for when theſe are left too long in their ſockets, they diſplace the new ones, and turn them awry. 2. In infants it is alſo neceſſary to draw ſuch teeth as grow out of the palate, or out of improper parts of the mouth, and are placed ſo as to impede their ſpeaking or ſucking. 3. In the tooth-ach proceeding from a tooth's being carious, and giving way to no medicines, drawing is the laſt reſort, and is abſolutely neceſſary. 4. Thoſe teeth ought to be drawn which by their irregular figure and poſition lacerate the gums and lips, and cannot be brought into ſhape by the file. And, laſtly, it is ſometimes neceſſary to draw a tooth for the curing a fiſtula, or ulceration of the gums near the roots of the teeth.

The regular method of drawing them is this: if the tooth is in the lower jaw, the patient muſt be ſeated on a low ſeat, or on the floor, and if in the upper jaw, he muſt be placed on a high ſtool or table; then the proper inſtrument is to be ſelected, and the tooth carefully drawn as a nail out of a piece of wood. But this muſt never be done while the gums are inflamed, ſwelled, or otherwiſe diſtempered.

TOPARCHY, a little ſtate or ſeigniory, conſiſting only of a few cities or towns; or a petty country, governed and poſſeſſed by a toparch, or lord. See the article GOVERNMENT.

TOPAZ, in natural hiſtory, a gem called by the antients chryſolite, as being of a gold-golour. See the article GEM.

The topaz, when perfect and free from blemiſhes, is a very beautiful and valuable gem; it is, however, very rare in this ſtate. It is of the number of thoſe gems which are found only in the round or pebble form, there never having been yet ſeen a true and genuine topaz of a columnar figure, though the far greater part of what our jewellers call ſuch, are in that form. The greateſt part of the true topazes are no larger than grains of a coarſe ſeed; among theſe there are, however, ſome met with of the ſize of a pea, and ſome much larger, though thoſe are very rare. It is of a roundiſh or oblong figure in its native or rough ſtate, and uſually is flatted on one ſide, and is generally of a bright and naturally poliſhed ſurface, tolerably tranſparent. They are ever of a fine yellow colour; but they have this, like the other gems, in ſeveral different degrees; the fineſt of all are of a true and perfect gold-colour, but there are ſome much deeper, and others extremely pale, ſo as to appear ſcarce tinged. The ori-

ental topaz is equal to the ruby in hardneſs, and is ſecond only to the diamond in luſtre. The topazes of the other parts of the world fall off greatly from this hardneſs, but the pureſt of the genuine ones are conſiderably harder than cryſtal. The topaz, on being thrown into a charcoal fire, entirely loſes its colour, and when taken out, is a very fine colourleſs ſtone, undiſtinguiſhable from that known by the name of the white ſapphire: upon the whole it appears, that the oriental coloured gems are all much alike in their matter, differing ſcarce at all, except in colour, and that when they are found either naturally colourleſs, or rendered ſo by art, it is not eaſy to diſtinguiſh one of them from the other.

The fineſt topazes in the world are found in the Eaſt-Indies, but they are very rare there of any great ſize: the great mogul, however, at this time, poſſeſſes one, which is ſaid to weigh an hundred and fifty-ſeven carats, and to be worth more than twenty thouſand pounds. The topazes of Peru come next, after theſe, in beauty and in value; the european are principally found in Sileſia and Bohemia, and are generally full of cracks and flaws, and of a browniſh yellow.

Beſides all theſe degrees of value in the genuine topazes, our jewellers keep what they call a kind of them, inferior greatly to the true ones; all theſe are common hexangular cryſtals, coloured to a paler or deeper yellow in mines: theſe they cut into ſtones for rings, and ſell under the name of topazes; and moſt of the ſtones we ſee under that name are ſuch.

The antients have ſaid much of the topaz's virtue: it is ſaid to be a high cordial and ſudorific, and to have been given alſo in hæmorrhages with great ſucceſs. But whatever virtues it may poſſeſs, we are not to expect to find them in the ſtones our druggiſts now keep under the name of topazes, theſe being no other than fragments of a yellowiſh plated ſpar, common in lead mines, and impregnated more or leſs with that metal. The topaz itſelf ſeems to owe its colour to lead, but the quantity it contains of that is ſo very inconſiderable, that it can be of no effect in the body, and may very well be ſuppoſed to leave it in the ſtate of cryſtal; which ſeems as much as we are to imagine really of any of the gems; but this ſpar, ſold in the place of topaz, not only diſcovers that it holds a great deal of lead by its weight, but lead has actually been ſeparated from it, in no leſs quantity than one fifth of its weight.

TOPE, in ichthyology, the ſqualus with the noſtrils near the mouth, and ſmall holes near the eyes. See SQUALUS.

TOPHUS, in medicine, denotes a chalky or ſtony concretion in any part of the body, as the bladder, kidneys, &c. but eſpecially in the joints. See GOUT.

TOPIC, in rhetoric, denotes a probable argument, drawn from the ſeveral circumſtances of a fact, &c. Hence the art of finding and managing ſuch arguments, is called by the antients *topica*, τοπικα. See the article INVENTION.

TOPICS, or TOPICAL MEDICINES, are the ſame with external ones, or thoſe applied outwardly to ſome diſeaſed and painful part: ſuch are plaſters, cataplaſms, unguents, &c. See the articles PLASTER, &c.

TOPOGRAPHY, a deſcription or draught of ſome particular place, or ſmall tract of land, as that of a city or town, manor or tenement, field, garden, houſe, caſtle, or the like; ſuch as ſurveyors ſet out in their plots, or make draughts of, for the information and ſatisfaction of the proprietors.

TOPSHAM, a port-town of Devonſhire, ſituated on the river Ex, about four miles ſouth of Exeter.

TORBAY, a fine bay in the Engliſh channel, a little eaſt of Dartmouth, where the prince of Orange, afterwards king William III. landed, on Nov. 5, 1688.

TORBOLE, a town of the biſhopric of Trent, in Italy, fourteen miles ſouth-weſt of the city of Trent.

TORCELLA, a port-town of Catalonia, in Spain, ſituated at the mouth of the river Ter, in eaſt longit. 2° 50′, and north lat. 42°

TORCELLO, a town and iſland of Italy, ſeven miles north of the city of Venice.

TORCH, *tæda*, a luminary uſed in ſeveral church-ceremonies, funerals, &c. and more uſually called flambeau. See the articles FLAMBEAU and TAPER.

TORCH-THISTLE, *cereus*, or *cactus*, in botany. See the article CACTUS.

TORCULAR, in ſurgery, the ſame with the tournequet. See TOURNEQUET.

TORDESILLAS, a town of Spain, forty miles north-eaſt of Salamanca.

TORDYLIUM, in botany, a genus of umbelliferous plants, belonging to the *pentandria-digynia* claſs: the general flower of which is difform and radiated; the particular ones of the diſc conſiſt of five

five inflexo-cordated and equal petals; the fruit is roundiſh, compreſſed, and ſurrounded longitudinally with dentils; the ſeeds are two, roundiſh, and almoſt plane. This genus comprehends hedge-parſley, candy hart-wort, &c. the ſeeds of which laſt are accounted carminative, and alexipharmic, but are very little uſed in the preſent practice.

TORE, *torus*, in architecture, a large round moulding, uſed in the baſes of columns. See the article MOULDING.

TOREUMATOGRAPHY, a greek term, ſignifying the knowledge or rather deſcription of antient ſculptures and baſſo-relievos.

TOREUTICE, τορευτικη, that part of ſculpture otherwiſe called turning. See the article TURNING.

TORGAW, a town of the dutchy of Saxony, ſituated on the river Elbe, thirty-five miles north-weſt of Dreſden.

TORIES, or TORYS, in the hiſtory of England, a faction or party, oppoſed to the whigs. See the article WHIGS.

The tories are great ſticklers for the prerogative of the crown, as the whigs are for the liberties and privileges of the people: though, in truth, the principles of the moderate people of both parties do not greatly differ.

TORMENTIL, *tormentilla*, in botany, a genus of the *icoſandria-pentagynia* claſs of plants, with a roſaceous flower, conſiſting of four obverſely cordated, plane, and patent petals; the ſtamina are ſixteen ſubulated filaments, about half the length of the cup; the ſeeds are eight in number, oblong, obtuſely acuminated, and contained in the cup, which forms a kind of globoſe capſule.

Tormentil-root has an auſtere ſtyptic taſte, accompanied with an aromatic flavour: it is one of the moſt agreeable and efficacious vegetable aſtringents: there are alſo a tincture and a diſtilled water of it, the former of which poſſeſſes all the virtues of the ſimple.

TORMES, a river of Spain, which runs from ſouth-eaſt to north-weſt, through the province of Leon, paſſes by Salamanca, and afterwards falls into the river Douro in Portugal.

TORMINA, GRIPES, in medicine. See the article COLIC.

TORNADO, or TURNADO, a ſudden and vehement guſt of wind from all points of the compaſs, frequent on the coaſt of Guinea. See the articles HURRICANE, WHIRLWIND, &c.

TORNAW, a town of upper Hungary, ſixty miles north-eaſt of Buda.

TORNE, or TORNEA, the capital of Torne-Lapmark, a province of Sweden, ſituated at the mouth of the river Torne, at the bottom of the Bothnic gulph, upon a little iſland made by the river, four hundred miles north of Stockholm: eaſt lon. 22° 45′, north lat. 65° 45′.

TORNESOL, or TURNESOL. See the article TURNESOL.

TORO, a city of Leon, in Spain, ſituated on the river Douro, thirty-five miles weſt of Valladolid.

TORPEDO, the CRAMP or NUMB-FISH, in ichthyology, a ſpecies of raia, the body of which is perfectly ſmooth, and conſiderably broad in proportion to its length; the roſtrum or ſnout is oblong and ſubacute; the back is ſomewhat gibboſe; the belly is flat, and the ſides are terminated by broad fins; its colour on the back is a duſky greyiſh, and the belly is white. See the article RAIA.

The moſt ſingular property of this fiſh is, that, when out of the water, it affects the hand or other part that touches it, with a ſenſation much like that which we call the cramp; the ſhock is inſtantaneous, and reſembles that given by electricity, only that the effect laſts longer: this is all the fiſh can do; but thoſe who have related it, have raiſed the effects almoſt into miracles. Reaumur has given a long memoir, wherein he endeavours to account for this ſingular phænomenon, which he reſolves into the inſtantaneous action of a vaſt multitude of ſmall muſcles on the ſurface of the body of the fiſh: but there ſeems ſomething more required, in order to the perfectly explaining ſo odd an effect. See plate CCLXXIX. fig. 4.

TORQUATA, in zoology, a name given to the natrix, or water-ſnake, from the remarkable ring it has about its neck. See the article NATRIX.

TORQUE, in heraldry, denotes a round roll of cloth, twiſted and ſtuffed: ſuch is the bandage, frequently ſeen in armories, about the heads of Moors, &c. It is always of the two principal colours of the coat; and is accounted the leaſt honourable decoration worn on the helmet, by way of creſt.

TORREFACTION, in chemiſtry, is the roaſting or ſcorching of a body by the fire, in order to diſcharge a part either unneceſſary or hurtful in another operation; as ſulphur is thus diſcharged from

an

an ore, before the metal can be obtained to advantage. See ROASTING.

TORREJO, a town of New Caſtile, in Spain, fifteen miles ſouth of Madrid.

TORRENT, *torrens*, in geography, denotes a temporary ſtream of water, falling ſuddenly from mountains, whereon there have been great rains, or an extraordinary thaw of ſnow.

TORRES, a port-town of Granada, in Spain, forty-five miles ſouth-weſt of the city of Granada: weſt lon. 4° 26′, north lat. 36° 45′.

TORRICELLIAN EXPERIMENT, a famous experiment made by Torricelli, a diſciple of the great Galileo, which has been already explained under BAROMETER.

TORRID ZONE, among geographers, denotes that tract of the earth lying upon the equator, and on each ſide as far as the two tropics, or 23° 30′ of north and ſouth lat. The torrid zone was believed, by the antients, to be uninhabitable; but is now well known to be not only inhabited by the natives of thoſe hot climates, but even tolerable to the people of the colder climates, towards the north and ſouth; the exceſſive heat of the day being there tempered by the coldneſs of the night. See the article HEAT.

TORRIGLIA, a town of the territory of Genoa, in Italy, ſituated ten miles north-weſt of Genoa.

TORRINGTON, a market-town of Devonſhire, ſituated on the river Towbridge, twenty-ſix miles north-weſt of Exeter.

TORROCK, in ornithology, the larus with a white head, and a black ſpot on each ſide. See the article LARUS.

TORSIL, a town of Sweden, in the province of Sunderland, ſituated on the Mellerlake, forty-three miles weſt of Stockholm.

TORT, in law, a french term, ſignifying wrong or injury.

TORTOISE, *teſtudo*, in zoology. See the article TESTUDO.

TORTONA, a city of Italy, in the dutchy of Milan, ſituated on the ſouth ſide of the Po, thirty-two miles ſouth-weſt of Milan.

TORTOSA, a city of Catalonia in Spain, ſituated on the river Ebro, ninety miles ſouth weſt of Barcelona: eaſt long. 15′, and north lat. 40° 45′.

TORTUGA, an iſland of the Weſt-indies, near the north coaſt of Hiſpaniola.

TORTUGA is alſo an iſland on the coaſt of Terra Firma.

TORTURE, a grievous pain inflicted on a criminal, or perſon accuſed, to make him confeſs the truth.

TOSA, a port-town of Catalonia, in Spain, thirty-ſeven miles north-eaſt of Barcelona.

TOSCANELLA, a town of Italy, thirty-five miles north of Rome.

TOTANUS, or GODWIT, in ornithology, the red-legged tringa, with a black beak, red at the baſe. See TRINGA.

TOTNESS, a borough-town of Devonſhire, twenty-three miles ſouth-weſt of Exeter. It ſends two members to parliament.

TOTTED. A good debt to the king is, by the foreign appoſer, or other officer of the exchequer, noted for ſuch by writing the word *tot*, *q. d. tot pecuniæ regi debentur*; whence it is ſaid to be totted. Alſo that which is paid is to be totted.

TOUCAN, in ornithology, a ſpecies of ramphaſtos, of a middle ſize between our common magpie and the thruſh, but having a beak thicker and longer than its whole body: this beak is hooked at the end, and is of a very thin ſubſtance, not exceeding the thickneſs of a membrane, and very light and hollow, yet bony in ſubſtance, and very bright and ſhining. It has a ſort of toothed edge, which prevents its ſhutting cloſely, and, giving paſſage for the air, enables the bird to live without noſtrils. It is yellowiſh on the outſide and red within, and is covered with a ſort of ſcaly ſubſtance, eaſily ſcraped off with a finger at the edge.

The head of this bird is large in proportion to its body, and is black on the crown; the reſt of it, and the neck and back, are ſlightly variegated with white; its breaſt is of a bright orange-colour, its belly and thighs of a very fine and bright red, and the tail is black but red at the end. See plate CCLXXXI. fig. 3.

TOUCAN, in aſtronomy, a conſtellation of the ſouthern hemiſphere, conſiſting of eight ſmall ſtars, and otherwiſe called anſer americanus.

TOUCH-NEEDLE, among aſſayers, refiners, *&c.* little bars of gold, ſilver, and copper, combined together in all the different proportions and degrees of mixture; the uſe of which is to diſcover the degree of purity of any piece of gold or ſilver, by comparing the mark it leaves on the touch-ſtone, with thoſe of the bars.

The metals uſually tried by the touch-ſtone, are gold, ſilver, and copper, either pure, or mixed with one another in different degrees and proportions, by fuſion. In order to find out the purity or quantity of baſer metal in theſe various admixtures, when they are to be examin-

ed, they are compared with these needles, which are mixed in a known proportion, and prepared for this use. The metals of these needles, both pure and mixed, are all made into laminæ or plates, one twelfth of an inch broad, and of a fourth part of their breadth in thickness, and an inch and half long; these being thus prepared, you are to engrave on each a mark indicating its purity, or the nature and quantity of the admixture in it.

The black rough marbles, the basaltes, or the softer kinds of black pebbles, are the most proper for touch-stones. See MARBLE, BASALTES, &c.

Now the method of using the needles and stone is this: the piece of metal to be tried, ought first to be wiped well with a clean towel, or piece of soft leather, that you may the better see its true colour; for from this alone an experienced person will, in some degree, judge before-hand what the principal metal is, and how, and with what debased.

Then chuse a convenient not over large part of the surface of the metal, and rub it several times very hardly and strongly against the touch-stone, that in case a deceitful coat or crust should have been laid upon it, it may be worn off by that friction: this, however, is more readily done by a grind-stone, or small file, if you have them at hand. Then wipe a flat and very clean part of the touchstone, and rub against it, over and over, the just mentioned part of the surface of the piece of metal, till you have, on the flat surface of the stone, a thin metallic crust, an inch long, and about an eighth of an inch broad: this done, look out the needle that seems most like to the metal under trial, wipe the lower part of this needle very clean, and then rub it against the touch-stone, as you did the metal, by the side of the other line, and in a direction parallel to it. When this is done, if you find no difference between the colours of the two marks, made by your needle and the metal under trial, you may with great probability pronounce that metal and your needle to be of the same alloy, which is immediately known by the mark engraved on your needle. But if you find a difference between the colour of the mark given by the metal, and that by the needle you have tried, choose out another needle, either of a darker or lighter colour than the former, as the difference of the tinge on the touch-stone directs; and by one or more trials of this kind you will be able to determine which of your needles the metal answers, and thence what alloy it is of, by the mark of the needle; or else you will find that the alloy is extraordinary, and not to be determined by the comparison of your needles.

TOUL, a city of Lorrain, twelve miles west of Nancy.

TOULON. } See { THOULON.
TOULOSE. } { THOULOSE.

TOUR, a french term, frequently used for a journey or progress through one or more countries.

TOURN, or TURN, in law. See the article TURN.

TOURNAMENT, or TURNAMENT. See the article TURNAMENT.

TOURINE, a town of the bishopric of Liege, thirteen miles north-east of Namur.

TOURNAY, a city of Flanders, in the austrian Netherlands, situated on the river Scheld, thirteen miles east of Lisle: east lon. 3° 30′, and north lat. 50° 37′.

TOURNEFORTIA, in botany, a genus of the *pentandria-monogynia* class of plants, the flower of which consists of a single petal, in form of an oval tube, longer than the calyx, divided into five slight segments somewhat broad and pointed, and spread open; the fruit is a globose berry, containing two cells; and the seeds are of an oval figure, two in number, and separated by the pulp.

TOURNEQUET, in surgery, an instrument made of rollers, compresses, screws, &c. for compressing any wounded part, so as to stop hæmorrhages. See the article HÆMORRHAGE.

The common tournequet is very simple, consisting only of a roller, which, with the help of a small stick, serves to stop the effusion of blood from large arteries, in amputations, by forcibly tying up the limb. The things necessary for this are a roller, of a thumb's breadth, and of an ell in length, a small cylindrical stick, a conglomerated bandage, two fingers thick and four long, some compresses of a good length and about three or four fingers breadth, to surround the legs and arms, and a square piece of strong paper or leather, about four fingers wide. See plate CCLXXX. fig. 1.

The manner of applying this instrument is this; the rolled bandage is to be applied to the trunk of the wounded artery length-ways, covering it, in a contrary direction, with compresses surrounding the

T. Jefferys sculp.

the foot, leg, or arm, as it were with a ring; the roller muſt be paſſed twice round theſe applications, and faſtened in a knot, but ſo looſely that you may eaſily introduce your hand between it and the part: the leather or thick paper muſt now be nicely placed under it, upon the external part of the leg, and the roller tightened by degrees, by turning round the ſtick, which is to be introduced into the knot; this to be done till the hæmorrhage is entirely ſtopped: the ſtick muſt now be kept in this ſituation till the wound is properly treated, and the return of the hæmorrhage is prevented. When this end is acquired, the tournequet is to be looſened, or entirely taken off, as ſhall be judged moſt convenient; but where it is applied to the arm, the rolled bandage is to be placed near the axilla, in the internal part of the humerus, and the ſtick in this caſe is to be faſtened on the oppoſite ſide, the ſituation of the artery there requiring this poſition: and when it is to be applied to the thighs, the bandage is to be put as the caſe ſhall require, either to the upper part of the thigh, or juſt over the knee.

But beſides the common tournequet, there are other more complex forms of this inſtrument. *Ibid.* fig. 2. is a braſs-tournequet, for ſtopping the hæmorrhages in wounds of large arteries; where AA is a braſs-plate, ſomewhat bent; BB, a ſtrong braſs-ſcrew; C, a round plate, to be fixed upon the wound; D, the button which turns the ſcrew; EE, a ſtrong leather-belt, to ſurround the wounded part; FF, part of the belt pierced with holes, whereby it may be fixed upon the belt GG, and lengthened and ſhortened according to the ſize of the limb.

Ibid. fig. 3. is another braſs-tournequet, after Petit's manner, the uſe and application of which will be eaſily underſtood from the deſcription of fig. 2.

In plate CCLXXXI. fig. 1. n° 1. is delineated a wooden tournequet, where AA is the upper part; BB, the lower part; C, the ſcrew; D, the two ſmall iron-ſcrews, to which a leather or ſilk-belt is to be fixed; E, hooks, on which to faſten the other end of the belt; FF, the ends of the upper and lower parts of the inſtrument, hollowed to receive the belt, and keep it ſteady in its ſituation.

Ibid. n° 2. is another kind of tournequet, made of iron, the parts and uſes of which will be eaſily conceived from what has been already ſaid.

TOURNON, a town of Languedoc, in France, fifty miles ſouth of Lyons.

TOURS, a city of France, ſixty miles ſouth-weſt of Orleans.

TOWAGE, the hawling or drawing of a ſhip, barge, &c. by men or beaſts, or by another ſhip or boat, faſtened to her, in order to make her enter a port, aſcend a river, &c.

TOWER, *turris*, a tall building, conſiſting of ſeveral ſtories, uſually of a round form, though ſometimes ſquare or polygonal.

Towers are built for fortreſſes, priſons, &c. as the Tower of London, the Tower of the Baſtile, &c.

The Tower of London is not only a citadel, to defend and command the city, river, &c. but alſo a royal palace, where our kings, with their courts, have ſometimes lodged; a royal arſenal, wherein are arms and ammunition for ſixty thouſand ſoldiers; a treaſury for the jewels and ornaments of the crown; a mint for coining of money; the great archive, wherein are preſerved all the antient records of the courts of Weſtminſter, &c. and the chief priſon for ſtate criminals.

TOWN, a place inhabited by a conſiderable number of people, being of a middle ſize between a city and village.

Hanſe-TOWNS. See HANSE.

TOXICODENDRON, the POISON-WOOD, in botany, a ſpecies of rhus, or ſumach, with a ſmooth and ſtriated berry, containing a ſulcated and compreſſed nucleus. See the article SUMACH.

Poiſon-wood is ſaid to poiſon two ways, by handling of it, and by the ſmell. The ſcent of it, when cut down in the woods, has poiſoned many people, and many more have ſuffered by it while burning in their fires. People with only handling it have been made blind for ſeveral days; and perſons who ſit near a fire when it is burning, are often ſwelled and choaked up in all parts of the body, in a terrible manner.

TOXICUM, POISON. See POISON.

TOZZIA, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, with a monopetalous ringent flower; the upper lip of which is bifid, and the lower one trifid; the fruit is a globoſe unilocular capſule, containing an ovated ſeed.

TRABEATION, in the antient architecture, the ſame with entablature. See the article ENTABLATURE.

TRACES *of the brain*, among the carteſians, denotes the impreſſions which ſen-

ſible objects make on the fine fibres of the brain, by means of the organs of ſenſe; on which impreſſions memory, imagination, &c. are ſuppoſed, in a great meaſure, to depend. See MEMORY, &c.

TRACHEA, in anatomy, called alſo aſpera arteria, and in engliſh the windpipe, is a tube, or canal, extended from the mouth to the lungs; its ſituation is in the middle and anterior part of the neck; and it is connected with the fauces, the lungs, and the œſophagus. Anatomiſts commonly divide it into two parts, the larynx, and aſpera arteria properly ſo called. See the article LARYNX.

The trachea, or aſpera arteria properly ſo called, is that whole cartilaginous canal, extended from the larynx, which is only its mouth or entrance, to the bronchia or lungs; being, in ſome meaſure, of a conic figure. Its beginning is cylindrical, and capable of admitting a finger; and its other end is ſomewhat narrower. It enters the thorax under the ſternum, and is there divided into two branches, before it enters the lungs: it is compoſed of eighteen or nineteen, ſometimes but ſixteen, ſometimes twenty, cartilaginous rings, and four coats. Theſe rings are imperfect, the hinder part of the trachea being membranaceous. Of the four coats, the exterior is membranaceous, the ſecond glandulous, the third muſcular, and the fourth or internal covering is tendinous and robuſt.

The uſes of the trachea are, to aſſiſt in diglutition, and to be aſſiſtant to the lungs: on the exterior part of it are the thyroide and bronchial glands, which ſecrete an humour to moiſten it: its arteries are from the external carotids, the veins from the jugulars, and the nerves from the recurrent ones of the plexus cervicalis. See the article GLAND, ARTERY, VEIN, &c.

The tracheæ of vegetables are certain air-veſſels, diſcernible in many plants, but in none more diſtinctly than in the melon.

TRACHELIUM, in botany, a genus of the *pentandria-monogynia* claſs of plants, with a funnel-faſhioned flower, divided into five ſegments at the limb; the fruit is a roundiſh obtuſely trilobous capſule, containing a great number of very minute ſeeds.

TRACHENBERG, a town of Sileſia, twenty-five miles north of Breſlaw.

TRACHINUS, in ichthyology, a genus of the acanthopterygeous fiſhes, the operacula of whoſe gills are pointed, and the eyes placed near one another, in the upper part of the head; there are two back-fins, and the firſt very ſhort.

To this genus belong the draco and uranoſcopus. See the article DRACO and URANOSCOPUS.

TRACT, in geography, an extent of ground, or a portion of the earth's ſurface.

TRACT, in matters of literature, denotes a ſmall treatiſe, or written diſcourſe, upon any ſubject.

TRACTION, the act of drawing, whereby a thing is brought nearer to the mover.

TRACTRIX, in geometry, a curve otherwiſe called catenaria. See the article CATENARIA.

TRADE, in general, denotes the ſame with commerce, conſiſting in buying, ſelling, and exchanging of commodities, bills, money, &c. See COMMERCE, COIN, MONEY, COMPANY, &c.

TRADE-WINDS, denote certain regular winds at ſea, blowing either conſtantly the ſame way, or alternately this way and that; thus called from their uſe in navigation, and the indian commerce.

The trade winds are of different kinds, ſome blowing three or ſix months of the year one way, and then the like ſpace of time the oppoſite way; theſe are very common in the indian ſeas, and are called monſoons. See the article MONSOON.

Others blow conſtantly the ſame way; ſuch is that general wind between the tropics, which, off at ſea, is found to blow all day long from eaſt to weſt. For the phænomena of each, with their phyſical cauſes, ſee the article WIND.

TRADESCANTIA, in botany, a genus of the *hexandria-monogynia* claſs of plants, the flower of which conſiſts of three orbiculated, plane, and very patent petals; and its fruit is an oval trilocular capſule, containing a few angulated ſeeds.

TRADITION, among eccleſiaſtical writers, denotes certain regulations regarding the rites, ceremonies, &c. of religion, which we ſuppoſe to have been handed down from the days of the apoſtles, to the preſent time.

Tradition is diſtinguiſhed into written, whereof there are are ſome traces in the writings of the antient fathers; and unwritten, whereof no mention is made in the writers of the firſt ages of chriſtianity.

TRAERBACH

TRAERBACH, a town of Germany, ſituated on the Moſelle, twenty miles north-eaſt of Triers.

TRAFFIC. See the articles TRADE and COMMERCE.

TRAGACANTH, *tragacantha*, in botany, a genus of the *diadelphia-decandria* claſs of plants, with a papilinaceous flower; its fruit is a ſhort bilocular pod, of a roundiſh figure, and containing a few kidney-ſhaped ſeeds.

Gum-tragacanth, or, as ſome call it, gum-adragant, or gum-dragon, is the produce of this ſhrub, which grows to about four feet high, and has a firm and robuſt ſtem, with numerous branches. The gum is brought to us in long and ſlender pieces, of a flatted figure, more or leſs, and theſe not ſtrait, or rarely ſo; but commonly twiſted and contorted various ways, ſo as to reſemble worms. We ſometimes meet with it like the other vegetable exſudations, in roundiſh drops, but theſe are much more rare. It is moderately heavy, of a firm conſiſtence, and, properly ſpeaking, very tough rather than hard, and is extremely difficult to powder, unleſs firſt careſully dried, and the mortar and peſtle kept warm. Its natural colour is a pale whitiſh, and in the cleaneſt pieces it is ſomething tranſparent. It is often, however, met with tinged browniſh, and of other colours, and more opake. It has no ſmell, and very little taſte, but what it has is diſagreeable. Taken into the mouth, it does not grow clammy, and ſtick to the teeth, as the gum-arabic does, but melts into a kind of very ſoft mucilage. It diſſolves in water but ſlowly, and communicates its mucilaginous quality to a great quantity of that fluid. It is by no means ſoluble in oily or ſpirituous liquors, nor is it inflammable. It is brought to us from the iſland of Crete, and from ſeveral parts of Aſia. It is to be choſen in long twiſted pieces, of a whitiſh colour, very clear, and free from all other colours; the brown, and particularly the black, are wholly to be rejected.

Tragacanth has the ſame virtues with gum-arabic, but in a greater degree. It greatly inſpiſſates and obtunds the acrimony of the humours, and is therefore found of vaſt ſervice in inveterate coughs, and other diſorders of the breaſt, ariſing from an acrid phlegm, and in ſtranguries, heat of urine, and all other complaints of that kind. It is uſually given in the compound powder, called the ſpecies diatragacanthi frigidæ, rarely alone. It is alſo, by ſome, eſteemed a very great external remedy for wounds, and in this ſenſe made an ingredient in ſome ſympathetic powders, with vitriol and other things. It is by ſome recommended alone, in form of a powder or ſtrong mucilage, for cracks and chaps in the nipples of women: but it is found, by experience, to be a very troubleſome application in thoſe caſes, and to do more harm than good, as it dries by the heat of the part, and draws the lips of the wound farther aſunder than before.

TRAGEA, in pharmacy, an aromatic powder, groſly beaten and mixed with ſugar, taken by way of carminative.

TRAGEDY, a dramatic poem, repreſenting ſome ſignal action performed by illuſtrious perſons, and which has frequently a fatal iſſue, or end. See DRAMA.

Ariſtotle, more ſcientifically, defines tragedy, the imitation of one grave and entire action, of a juſt length, and which, without the aſſiſtance of narration, by raiſing of terror and compaſſion, refines and purges our paſſions. This definition has given the critics ſome perplexity; and Corneille declares he cannot reconcile Ariſtotle with himſelf: the inſtances Ariſtotle cites, he thinks, ruin his own definition; he even denies the purging our paſſions to be the end of tragedy. Our engliſh authors are more favourable to the definition by the purging our paſſions; they underſtand not the extirpating them, but the reducing them to juſt bounds; for by ſhewing the miſeries that attend a ſubjection to them, it teaches us to watch them more narrowly; and by ſeeing the great misfortunes of others, it leſſens the ſenſe of our own.

Tragedy, in its original, M. Hedelin obſerves, was only a hymn ſung in honour of Bacchus, by ſeveral perſons, who, together, made a chorus of muſic, with dances and inſtruments. As this was long, and might fatigue the ſingers, as well as tire the audience, they bethought themſelves to divide the ſinging of the chorus into ſeveral parts, and to have certain recitations in the intervals. Accordingly Theſpis firſt introduced a perſon upon the ſtage with this view. Æſchylus, finding one perſon inſufficient, introduced a ſecond, to entertain the audience more agreeably, by a kind of dialogue: he alſo cloathed his perſons more decently, and firſt put them on the buſkin. See HYMN, CHORUS, BUSKIN, &c.

The

The perſons who made theſe recitations on the ſcene, were called actors; ſo that tragedy was at firſt without actors. And what they thus rehearſed, being things added to the ſinging of the chorus, whereof they were no neceſſary part, were called epiſodes. See the article EPISODE.

Sophocles found that two perſons were not enough for the variety of incidents, and accordingly introduced a third: and here the Greeks ſeem to have ſtopped; at leaſt, it is very rare that they introduced four ſpeakers in the ſame ſcene.

Tragedy and comedy were, at firſt, confounded with each other, but were afterwards ſeparated; and the poets applied themſelves to the cultivating of tragedy, neglecting comedy. See COMEDY.

When tragedy was got into a better form, they changed the meaſure of its verſe, and endeavoured to bring the action within the compaſs of a day, or of a revolution of the ſun. See the article UNITY.

For the ſeveral parts of tragedy, ſee the articles ACT, SCENE, ACTION, FABLE, CHARACTERS, MANNERS, *&c.*

The Engliſh received the firſt plan of their drama from the French, among whom it had its riſe towards the end of Charles V. under the title of chant-royal, which conſiſted of pieces in verſe, compoſed in honour of the Virgin, or ſome of the ſaints, and ſung on the ſtage: they were called by the title of chant-royal, becauſe the ſubject was given by the king of the year, or the perſon who had borne away the prize the year preceding.

The humour of theſe pieces ran wonderfully among the people, inſomuch that in a little time there were formed ſeveral ſocieties, who began to vie with each other: one of theſe, to engage the town from the reſt, began to intermix various incidents or epiſodes, which they diſtributed into acts, ſcenes, and as many different perſons as were neceſſary for the repreſentation. Their firſt eſſay was in the Bourg St. Maur, and their ſubject the paſſion of our Saviour. The provoſt of Paris prohibiting their continuing it, they made application to court; and to render it the more favourable to them, elected themſelves into a friary or fraternity, under the title of brothers of the paſſion: which title has given ſome occaſion to ſuſpect them to have been an order of religious.

The king, on ſeeing and approving ſome of their pieces, granted them letters of eſtabliſhment, in 1402; upon which they built a theatre, and for an age and a half acted none but grave pieces, which they called moralities; till, the people growing weary of them, they began to intermix farces, or interludes, from prophane ſubjects.

This mixture of farce and religion diſpleaſing many, they were re-eſtabliſhed by an arret of parliament, in 1548, on condition of their acting none but proper, lawful, and decent ſubjects, without intermeddling with any of the myſteries of religion; and thus were the brothers of the paſſion deſpoiled of their religious character: upon which they mounted the ſtage no more in perſon, but brought up a new ſet of comedians, who acted under their direction.

Thus was the drama eſtabliſhed, and on this foundation arrived in England. In proceſs of time, as it was improved, it became divided into two branches, agreeable to the practice of the antients, and the nature of things, *viz.* into tragedy and comedy, properly ſo called; and this laſt again was ſubdivided into pure comedy and farce. See COMEDY and FARCE.

TRAGI-COMEDY, a dramatic piece partaking of the nature both of tragedy and comedy, the event whereof is not bloody or unhappy, and wherein is admitted a mixture of leſs ſerious characters.

The foundation of tragi-comedy is certainly bad; for endeavouring to make us laugh and cry by turns, it endeavours at contrary motions, which the heart can never undergo; every thing that diſpoſes for the one, indiſpoſing for the other: for which reaſon it is at preſent, with great juſtice, diſuſed. However, tragi-comedy is the only way wherein comedy is allowed to introduce kings and heroes.

TRAGIA, in botany, a genus of the *monoecia-tetrandria* claſs of plants, without any flower-petals; its fruit is a very large tricoccous capſule, of a roundiſh figure, containing ſingle and roundiſh ſeeds.

TRAGOPOGON, GOAT'S BEARD, in botany, a genus of the *ſyngeneſia-polygamia* claſs of plants, the compound flower of which is imbricated and uniform, being compoſed of a multitude of ligulated ſemi-floſcules, quinquedentated at the ends, and ſtanding on the embryo-ſeeds, which are enveloped in a covering, and winged with down.

TRAGOSELINUM, in botany, Tournefort's name for the pimpinella of Linnæus, a plant of the *pentandria-digynia* claſs; the

the general corolla of which is uniform, and the partial one conſiſts of five inflexo-cordated, and almoſt equal petals: there is no pericarpium, the fruit is ovato-oblong, and ſeparable in two parts; the ſeeds are two, of an ovato-oblong figure, narrower towards the apex convex, and ſtriated on one ſide, and plane on the other.

TRAGUS, τραγος, in anatomy, one of the protuberances of the auricle, or external ear, called alſo hircus, becauſe uſually hairy. The tragus is that protuberance next the temple: that on the oppoſite ſide, to which the ſoft lobe of the ear is annexed, is called the antitragus. See EAR.

TRAJAN COLUMN, a famous hiſtorical column erected in Rome, in honour of the emperor Trajan. It is of the tuſcan order, though ſomething irregular; its height is eight diameters, and its pedeſtal corinthian: it was built in a large ſquare there, called Forum Romanum. Its baſe conſiſts of twelve ſtones, of an enormous ſize, and it is raiſed on a ſocle, or foot of eight ſteps; within ſide is a ſtair-caſe, illuminated with fourty-four windows. It is 140 feet high, which is thirty-five ſhort of the antonine column, but the workmanſhip of the former is much more valued. It is adorned from top to bottom with baſſo relievo's, repreſenting the great actions of that emperor againſt the Dacæ.

TRAJECTORY *of a comet*, is its path or orbit, or the line it deſcribes in its motion. See the article COMET.

TRAIL BOARD, in a ſhip, a carved board on each ſide of her beak, which reaches from the main ſtem to the figure, or the brackets.

TRAIN, the attendance of a great perſon, or the trail of a gown, or robe of ſtate. In falconry, it denotes the tail of an hawk

TRAIN, is likewiſe uſed for the number of beats which a watch makes in an hour, or any other certain time.

TRAIN, is alſo uſed for a line of gunpowder, laid to give fire to a quantity thereof, in order to do execution by blowing up earth, works, buildings, &c.

TRAIN, or TRAILE OF ARTILLERY, includes the great guns, and other pieces of ordnance belonging to an army in the field. See the article CANNON.

TRAIN-OIL, the oil procured from the blubber of a whale by boiling. See the articles OIL and WHALE.

TRAIN-BANDS, or TRAINED-BANDS, a name given to the militia of England. See the article MILITIA.

TRAINING, or TRACING, in mineralogy, a term uſed by the miners, to expreſs the tracing up the mineral appearances on the ſurface of the earth to their head, or original place, and their finding a mine of the metal they contain. See MINE.

TRAITOR, or TRAYTOR, a perſon guilty of treaſon. See TREASON.

TRALOS-MONTES, a province of Portugal, bounded by Spain on the north-eaſt; by the province of Beira on the ſouth; and by Entreminho Douro on the weſt.

TRAMBLING *of tin ore*, among miners, the waſhing it very clean, which is done in a ſhovel, and in a frame of boards. See the article TIN.

TRAMEL, an inſtrument, or device, ſometimes of leather, more uſually of rope, fitted to a horſe's legs, to regulate his motions, and form him to an amble. It is alſo taken in many places for an iron moveable inſtrument in chimnies to hang pots over the fire.

TRAMEL-NET, is a long net wherewith to take fowl by night in champain countries, much like the net uſed for the low bell, both in ſhape, bigneſs, and maſhes. To uſe it, they ſpread it on the ground, ſo as the nether or farther end fitted with ſmall plumbets, may lie looſe thereon; then the other part being borne up by men placed at the fore ends, it is thus trailed along the ground. At each ſide are carried great blazing lights, by which the birds are raiſed, and as they riſe under the net they are taken.

TRAMONTANE, or TRAMONTAIN, ſomething beyond, or on the farther ſide the mountains, applied particularly by the Italians, to ſuch as live on the other ſide the Alps, *i. e.* all out of Italy, as the Germans, Flemiſh, French, &c.

TRANGLE, in heraldry, the diminutive of a feſs, commonly called a bar. See the article FESS and BAR.

TRANI, a port-town of Italy, in the kingdom of Naples, and territory of Barri, ſituated on the gulph of Venice, twenty miles weſt of Barri.

TRANSACTION, *tranſactio*, in the civil law, an accommodation of ſome buſineſs, or diſpute between two parties, by a mutual and voluntary agreement between them. See ACCOMMODATION.

Philoſophical TRANSACTIONS, a kind of journal of the principal things that come before the Royal Society of London. See the article SOCIETY.

It appears, that the printing of these tranſactions was always, from time to time, the ſingle act of the reſpective ſecretaries of the ſociety, till the publication of the 47th volume, in 1753, notwithſtanding it has been the common opinion, that they were publiſhed by the authority and under the direction of the ſociety itſelf. The truth is, that the ſociety, as a body, never did intereſt themſelves further in their publication, than by occaſionally recommending the revival of them to ſome of their ſecretaries, when, from the particular circumſtances of their affairs, the tranſactions had happened for any length of time to be intermitted, and this ſeems principally to have been done with a view to ſatisfy the public, that their uſual meetings were then continued for the improvement of knowledge and benefit of mankind, the great ends of their firſt inſtitution; but the ſociety being of late years greatly enlarged, and their communications more numerous, they thought it adviſeable, that a committee of their members ſhould be appointed to re conſider the papers read before them, and ſelect out of them ſuch as they ſhould judge proper for publication in the future tranſactions, which was accordingly done upon the 26th of March, 1752.

TRANSCENDENTAL, or TRANSCENDANT, ſomething elevated, or raiſed above other things; which paſſes and tranſcends the nature of other inferior things.

Tranſcendental quantities, among geometricians, are indeterminate ones, or ſuch as cannot be fixed, or expreſſed by any conſtant equation: ſuch are all tranſcendental curves, which cannot be defined by any algebraic equation; or which, when expreſſed by an equation, one of the terms thereof is a variable quantity. Now whereas algebraiſts uſe to aſſume ſome general letters or numbers, for the quantity ſought in theſe tranſcendental problems, Mr. Leibnitz aſſumes general or indefinite equations for the lines ſought; *e. gr.* putting x and y for the abſciſs and ordinate, the equation he uſes for a line ſought is $a+bx+cy+exy+fxx+gyy$&c.$=o$, by the help of which indefinite equation, he ſeeks the tangent; and by comparing the reſult with the given property of tangents, he finds the value of the aſſumed letters a, b, c, d, &c. and thus defines the equation of the line ſought.

If the compariſon above-mentioned, do not proceed, he pronounces the line ſought not to be an algebraical, but a tranſcendal one. This ſuppoſed, he goes on to find the ſpecies of tranſcendency: for ſome tranſcendentals depend on the general diviſion or ſection of a ratio, or upon the logarithms; others, upon the arcs of a circle; and others, on more indefinite and compound enquiries. He therefore, beſides the ſymbols x and y, aſſumes a third, as v, which denotes the tranſcendental quantity; and of theſe three, forms a general equation for the line ſought, from which he finds the tangent, according to the differential method, which ſucceeds even in tranſcendential quantities. The reſult he compares with the given properties of the tangent, and ſo diſcovers, not only the values of a, b, c, d, &c. but alſo the particular nature of the tranſcendental quantity. And though it may ſometimes happen, that the ſeveral tranſcendentals are ſo to be made uſe of, and thoſe of different natures too, one from another; alſo, though there be tranſcendents of tranſcendentals, and a progreſſion of theſe in infinitum: yet we may be ſatisfied with the moſt eaſy and uſeful one; and for the moſt part, may have recourſe to ſome peculiar artifices for ſhortening the calculus, and reducing the problem to as ſimple terms as may be.

This method being applied to the buſineſs of quadratures, or to the invention of quadratrices, in which the property of the tangent is always given, it is manifeſt, not only how it may be diſcovered, whether the indefinite quadrature may be algebraically impoſſible; but alſo, how, when this impoſſibility is diſcovered, a tranſcendental quadratrix may be found, which is a thing not before ſhewn. So that it ſeems, that geometry, by this method, is carried infinitely beyond the bounds to which Vieta and Des Cartes brought it; ſince, by this means, a certain and general analyſis is eſtabliſhed, which extends to all problems of no certain degree, and conſequently not comprehended within algebraical equations.

Again, in order to manage tranſcendental problems, wherever the buſineſs of tangents or quadratures occurs, by a calculus, there is hardly any that can be imagined ſhorter, more advantageous, or more univerſal, than the differential calculus, or analyſis of indiviſibles and infinites.

By

By this method, we may explain the nature of tranſcendental lines, by an equation; *e. gr.* let a be the arch of a circle, and x the verſed ſine; then will $a = \frac{Sdx}{\sqrt{2x-xx}}$; and if the ordinate of the cycloid be y, then will $y = \sqrt{2x-xx} + \frac{Sdx}{\sqrt{2x-xx}}$; which equation perfectly expreſſes the relation between the ordinate y and the abſciſs x, and from it all the properties of the cycloid may be demonſtrated.

Thus is the analytical calculus extended to thoſe lines, which have hitherto been excluded; for no other reaſon, but that they were thought incapable of it.

TRANSCOLATION, in pharmacy, the ſame with filtration, or percolation. See the article FILTRATION.

TRANSCRIPT, a copy of any original writing, particularly that of an act, or inſtrument, inſerted in the body of another.

TRANSFER, in commerce, *&c.* an act whereby a perſon ſurrenders his right, intereſt, or property in any thing moveable or immoveable to another.

The term transfer, is chiefly uſed for the aſſigning and making over ſhares in the ſtocks, or public funds, to ſuch as purchaſe them of the proprietors.

TRANSFUSION, *tranſuſio*, the act of pouring a liquor out of one veſſel into another.

TRANSFUSION *of the blood*, in ſurgery, the conveying the arterial blood of one man or animal, into the veins of another. See the article INJECTION.

Notwithſtanding injections and transfuſions are ſeldom practiſed by our modern ſurgeons, they were highly celebrated, and often performed in the laſt century. The generality of phyſicians, not without reaſon, attribute moſt diſorders of the body to ſome vice in the blood, and therefore, ſome were led to think, that no method could be more ready to remove and correct that vice, than injecting a proper medicine in the veins to mix with the blood itſelf, or the transfuſing the ſound blood of one animal into the veins of another, inſtead of that which is diſeaſed. But notwithſtanding the vaſt expectations which had been formed by phyſicians from this operation, frequently the event turned out worſe than the diſeaſe; for we are told, that almoſt all the patients who have been treated this way, degenerated into a ſtupidity, fooliſhneſs, or a raving, or melancholy madneſs, or have been taken off with a ſudden death, either in, or not long after, the operations.

For the transfuſion of blood into the veins, firſt, a vein is to be opened in the patient's arm, or hand, and then a ſmall tube of ſilver, braſs or ivory, thruſt upward into it: the ſame is to be done with the ſound perſon, only the tube muſt here be inſerted downward, towards the ſmall end of the vein; this done, the ſmalleſt of the tubes is to be inſerted into the other larger one, by which means, as much blood will paſs from the ſound perſon into the patient, as may be thought proper, and then the inciſed veins are to be dreſſed, or bound up, as in bleeding: if the patient does not recover after one transfuſion, the operation ſhould be repeated again, at convenient intervals; but before the patient receives the blood of the ſound perſon, he ought to be bled proportionably, that the new blood laſt received, may have the freer circulation. Sometimes a vein is opened in each arm of the patient at the ſame time, that as much of the vitiated blood may flow out of one oriſice as he receives of the ſound by the other. If the blood is to be transfuſed out of ſome animal into the patient, then a calf or a lamb, for example, is to be ſecured by ligatures, and one of their veins or arteries opened in the neck, leg, or thigh, and the reſt of the operation managed as before.

TRANSGRESSION, *tranſgreſſio*, an offence againſt ſome law, or a breach or violation thereof.

TRANSGRESSIONE, in our law, is a writ uſually called a writ or action of treſpaſs.

TRANSILVANIA, a principality bounded by the Carpathian mountains, which divide it from Poland on the north; by Moldavia on the eaſt; by Walachia, and part of Hungary, on the ſouth; and by another part of Hungary on the north; being about 120 miles long, and almoſt as many broad, and lying between 22 and 25 degrees eaſt long. and between 45 and 48° of north lat.

TRANSIT, *tranſitus*, in aſtronomy, ſignifies the paſſage of any planet, juſt by, or over a fixed ſtar, or the ſun, and of the moon in particular, covering or moving over any planet.

TRANSITION, in muſic, is when a greater note is broken into a leſs, to ſoften the roughneſs of a leap by a gradual paſſage to the next note following; whence it is commonly called the breaking of a note. See NOTE and PASSAGE.

TRANSITION, in rhetoric, is of two ſorts. The firſt is when a ſpeech is introduced abruptly without expreſs notice given of it; as when Milton gives an account of our firſt anceſtor's evening devotions.

Both turned, and under open ſky adored
The God that made both air, ſky, earth and heaven.—
—— Thou alſo mad'ſt the night,
Maker omnipotent, and thou the day!

The ſecond ſort of tranſition is, when a writer ſuddenly leaves the ſubject he is upon, and paſſes unto another, from which it ſeems different at firſt view, but has a relation and connection with it, and ſerves to illuſtrate and enlarge it.

TRANSITIVE, in grammar, an epithet applied to ſuch verbs as ſignify an action which paſſes from the ſubject that does it, to or upon another ſubject which receives it. Under the head of verbs tranſitive, come what we uſually call verbs active and paſſive; other verbs, whoſe action does not paſs out of themſelves, are called neuters, and by ſome grammarians, intranſitives.

TRANSITORY, in common law, ſtands in oppoſition to local; thus actions are ſaid to be tranſitory, which may be laid in any county or place. See LOCAL.

TRANSLATION, the act of transferring or removing a thing from one place to another; we ſay the tranſlation of a biſhop's ſee, a council, a ſeat of juſtice, &c.

TRANSLATION is alſo uſed for the verſion of a book, or writing out of one language into another.

TRANSMARINE, ſomething that comes from, or belongs to, the parts beyond ſea.

TRANSMIGRATION, the removal or tranſlation of a whole people into another country, by the power of a conqueror.

TRANSMIGRATION, is particularly uſed for the paſſage of a ſoul out of one body into another, being the ſame with what we otherwiſe call metemphſychoſis. See the article METEMPHSYCHOSIS.

TRANSMISSION, in optics, &c. the act of a tranſparent body paſſing the rays of light through its ſubſtance, or ſuffering them to paſs; in which ſenſe the word ſtands oppoſed to reflection. Tranſmiſſion is alſo frequently uſed in the ſame ſenſe with refraction, by which moſt bodies, in tranſmitting the rays, do alſo refract them. For the cauſe of tranſmiſſion, or the reaſon why ſome bodies tranſmit, and others reflect the rays, ſee OPACITY and TRANSPARENCY.

The rays of light, Sir Iſaac Newton obſerves, are ſubject to fits of eaſy tranſmiſſion and reflection. See LIGHT.

TRANSMUTATION, the act of tranſforming, or changing one nature into another. Nature, Sir Iſaac Newton obſerves, ſeems delighted with tranſmutations: he goes on, to enumerate ſeveral kinds of natural tranſmutations; groſs bodies, and light, he ſuſpects, may be mutually tranſmuted into each other; and adds, that all bodies receive their active force from the particles of light, which enter their compoſition. For all fixed bodies, when well heated, emit light as long as they continue ſo; and again, light intermingles itſelf, and inheres in bodies, as often as its rays fall on the ſolid particles of thoſe bodies. Again, water, which is a fluid, volatile, taſteleſs ſalt, is by heat, tranſmuted into a vapour, which is a kind of air, and by cold, into ice, which is a cold tranſparent brittle ſtone, eaſily diſſolvable, and this ſtone is convertible again into water by heat, as vapour is by cold. See WATER, VAPOUR, ICE, &c.

Earth, by heat, becomes fire; and by cold, is converted into earth again; denſe bodies, by fermentation, are rarified into various kinds of air; and that air, by fermentation alſo, and ſometimes without, reverts into groſs bodies. Quickſilver ſometimes puts on the form of a fluid metal, ſometimes it appears in ſhape of a pellucid fragile ſalt, called ſublimate; ſometimes of a pellucid volatile white taſteleſs earth, called mercurius dulcis; by diſtillation it becomes vapour, and by agitation in vacuo, it ſhines like fire, &c. See EARTH, MERCURY, &c. All bodies, beaſts, fiſhes, inſects, plants, &c. with all their various parts, grow and increaſe out of water, and aqueous and ſaline tinctures; and by putrefaction, all of them revert into water, or an aqueous liquor again. Farther, water expoſed a while to the open air, puts on a tincture, which, in proceſs of time, has a ſediment and a ſpirit, and before putrefaction, yields nouriſhment both for animals and vegetables.

TRANSMUTATION, in alchemy, denotes the art of changing or exalting imperfect metals into gold or ſilver. This is alſo called the grand operation, and, they ſay, is to be effected with the philoſopher's ſtone. See the article PHILOSOPHER'S STONE.

Some alchemiſts hold, that the tranſmutation ſhould rather be called the perfection of imperfect metals; as holding all metals intended by nature, to arrive equally at the perfection of gold, in as much as they are compoſed of the ſame matter; and that it is only the impurity of their matrices, that is, of the place wherein they are formed by nature, that has prevented their arriving thereat. The elixir being projected on any of theſe metals, it is ſuppoſed to purge and ſeparate the impure parts from the pure, and to join itſelf wholly to the mercury (which is the pureſt part) as being of the ſame nature.

Whether or no metals may be tranſmuted into one another, is a point ſtrongly diſputed among philoſophers; the alchemiſts ſtrenuouſly aſſerting the affirmative. Some metals, it is commonly ſuppoſed, may be changed into others, *e.g.* iron into copper, and lead into tin; but Cardan, and ſome others, deny even this, and argue farther, that though iron and braſs, as being nearly alike in weight and tenacity, *&c.* provided their colour and hardneſs could be changed, might be converted into one another, either really or at leaſt apparently; yet would the tranſmuting or ripening of other metals into gold or ſilver, be ſtill not leſs impoſſible; both as theſe metals are all to be firſt calcined, after which they can never again be brought back to their priſtine purity, and as there is a generation required which is not the work of art but of nature. Cardan, Lemery, Dickenſon, and others, give us accounts of the various impoſtures of adepti in the buſineſs of tranſmutation; ſome, for inſtance, fixing mercury with verdigreaſe, and then heightening the colour with cadmia, *&c.* but this, if tried with the coppel, all goes off in fumes; and, in effect, nothing produced this way ought to be adjudged true gold, unleſs it endure copelling and cementation, purification with antimony, and the depart. Add, that it muſt have the malleability, extreme ductility, and ſpecific gravity of gold. See GOLD, *&c.*

TRANSMUTATION, in geometry, denotes the reduction or change of one figure or body into another of the ſame area or ſolidity, but of a different form; as a triangle into a ſquare, a pyramid into a parallelopiped, *&c.* In the higher geometry, tranſmutation is uſed for the converting a figure into another of the ſame kind and order, whoſe reſpective parts riſe to the ſame dimenſions in an equation, admit of the ſame tangents, *&c.* If a rectilinear figure be tranſmuted into another, it is ſufficient that the interſections of the lines which compoſe it be transferred, and the lines drawn through the ſame in the new figure. If the figure to be tranſmuted be curvelinear, the points, tangents, and other right lines by means whereof the curve line is to be defined, muſt be transferred.

TRANSOM, among builders, denotes the piece that is framed acroſs a double light window. See WINDOW.

TRANSOM, among mathematicians, ſignifies the vane of a croſs-ſtaff, or a wooden number fixed acroſs, with a ſquare whereon it ſlides, *&c.* See CROSS-STAFF.

TRANSOM, in a ſhip, a piece of timber which lies athwart the ſtern, between the two faſhion-pieces, directly under the gun-room-port. See the article SHIP.

TRANSPARENCY, *diaphaneity*, in phyſics, a quality in certain bodies whereby they give paſſage to the rays of light, in contradiſtinction to opacity, or that quality of bodies which renders them impervious to the rays of light. For the doctrine of tranſparency, ſee the article OPACITY.

TRANSPIRATION, the inſenſible, or almoſt inſenſible, paſſage of an excrementitious matter through the pores of the ſkin, called alſo perſpiration. See the article PERSPIRATION.

TRANSPIRATION is alſo uſed by ſome authors for the ingreſs or entrance of the air, vapour, *&c.* through the pores of the ſkin into the body. Cardan, by this kin of tranſpiration, accounts for the prodigy of a woman whoſe daily urine weighed twenty ſeven pounds, though all the food ſhe took, both dry and liquid, did not exceed four pounds. Dr. Baynard alſo ſuſpects ſome ſuch tranſpiration to be the caſe in hydropical perſons.

TRANSPLANTATION, in agriculture and gardening, the act of removing trees or plants from the places where they were

ſowed, or raiſed, and planting them in others. See the article PLANTING.

TRANSPLANTATION, in natural magic, is uſed for a method of curing diſeaſes, by transferring them from one ſubject to another, which was much in vogue among certain chemical or rather ſympathetical phyſicians ſome years ago. A ſubject too whimſical to deſerve further notice.

TRANSPORTATION, the act of conveying or carrying a thing from one place to another.

Tranſportation is a kind of puniſhment, or more properly an alleviation or commutation of puniſhment, for criminals convicted of felony, who for the firſt offence, unleſs it be an extraordinary one, are generally tranſported to the plantations, there to bear hard labour for a term of years; within which, if they return, they are executed without farther trial.

TRANSPORTATION *of plants.* In ſending plants from one country to another, great cautions are neceſſary. The plants ſent from a hotter country to a colder, ſhould be always put on board in the ſpring of the year, that the heat of the ſeaſon may be advancing as they approach the colder climates; and, on the contrary, thoſe which are ſent from a colder country to a hotter, ſhould be ſent in the beginning of winter. The beſt way of packing up plants for a voyage, if they be ſuch as will not bear keeping out of the earth, is to have boxes with handles, filling them with earth, and planting the roots as cloſe together as may be; the plants ſhould be ſet in theſe boxes three weeks before they are to be put on board; and in good weather they ſhould be ſet upon the deck; and in bad removed or covered with a tarpaulin. If they are going from a hotter country to a colder one, they muſt have very little moiſture; if, on the contrary, they are going from a colder to a warmer, they may be allowed water more largely, and being ſhaded from the heat of the ſun, they will come ſafe.

A great many plants, however, will live out of the earth a conſiderable while; as the ſedums, euphorbiums, ficoides, and other ſucculent ones. Theſe need no other care than the packing them up with moſs in a cloſe box; and there ſhould be a little hay put between them, to prevent them from wounding or bruiſing one another, and holes bored in the boxes to keep them from heating and putrefying. In this manner they will come ſafe from a voyage of two or three, or even four or five months. Several trees alſo will come ſafe in the ſame manner; taking them up at a ſeaſon when they have done growing, and packing them up with moſs. Of this ſort are oranges, olives, capers, jaſmines, and pomegranate-trees. Theſe, and many others, are annually brought over to us from Italy; and, though they are three or four months in the paſſage, ſeldom miſcarry. The beſt way of ſending over ſeeds, is in their natural huſks, in a bag, or packed up in a gourd-ſhell, keeping them dry, and out of the way of vermin.

TRANSPOSITION, in algebra, the bringing any term of an equation over to the other ſide. See EQUATION.

TRANSPOSITION, in grammar, a diſturbing or diſlocating of the words in a diſcourſe, or a changing of their natural order of conſtruction, to pleaſe the ear by rendering the contexture more eaſy, ſmooth, and harmonious. A tranſpoſition which renders the ſenſe perplexed, is vicious. The conſtitution of the antient languages, being much more artful than that of the modern ones, allowed of much greater and more frequent tranſpoſitions. The Engliſh, French, &c. ſcarce ever allowed of them but in oratory and poetry, in which caſes they ſerve to give a force and energy to the diſcourſe or the verſe, and to prevent their languiſhing.

TRANSPOSITION, in muſic, is a changing of the notes of a piece of muſic, or the ſhifting a ſong from its former ſituation, to ſet it either higher or lower, or in another octave.

Of this there are two kinds, the firſt is with reſpect to the clef, the ſecond with reſpect to the key. Tranſpoſition, with reſpect to the clef, conſiſts in the changing the places or ſeats of the notes or letters among the lines and ſpaces, but ſo as that every note is ſet at the ſame letter. This is done either by removing the ſame clef to another line, or by uſing another clef, but with the ſame ſignature, by reaſon the piece is in the ſame key. See the article CLEF.

The practice is eaſy in either caſe. In the firſt you take the firſt note at the ſame diſtance, either above or below the clef-note, in its new poſition, as before, and all the reſt of the notes in the ſame relations or diſtances from one another, ſo that the notes are all ſet on lines and ſpaces of the ſame name. In the ſecond, or

ſetting

ſetting of the muſic to a different clef, it is to be obſerved the places of the three clef-notes are invariable in the ſcale, and are to one another in theſe relations, the mean a fifth above the baſs, and the treble a fifth above the mean. Now to tranſpoſe a new clef, for example, from the treble to the mean, wherever the new clef is ſet, we ſuppoſe it the ſame individual note in the ſame place of the ſcale, as if the piece were that part in the compoſition to which the new clef is generally appropriated, ſo that it may direct to the ſame notes we had before tranſpoſition. Now from the fixed relations of the three clefs in the ſcale, it will be eaſy to find the ſeat of the firſt tranſpoſed note, and then all the reſt are to be ſet at the ſame mutual diſtances they were at before. See the article SCALE.

Suppoſe, for example, the firſt note of a ſong be *d*, a ſixth above the baſs-clef; wherever that clef is placed, the firſt note muſt be a greater ſecond above it; becauſe a greater ſecond above the mean, is a greater ſixth above the baſs-clef, the relation between the two being a fifth: ſo that the firſt note will ſtill be the ſame individual note *d*. The uſe of this tranſpoſition is, that if a ſong be ſet with a certain clef in a certain poſition, the notes go far above or below the ſyſtem of five lines, they may, by the change of the place of the ſame clef in the particular ſyſtem, or by taking a new clef, be brought more within the compaſs of the lines.

Tranſpoſition from one key to another, is the changing of the key, or a ſetting all the notes of a ſong at different letters, and performing it conſequently in different places upon the inſtrument. See the article KEY.

The deſign hereof is, that a ſong which being begun in one place is too high, too low, or otherwiſe inconvenient for a certain inſtrument, may be begun in another place, and from that carried on through all its juſt degrees. The clef and its poſitions here remain the ſame, and the change is of the notes themſelves, from one letter, and its line or ſpace, to another. In the former tranſpoſition the notes were expreſſed by the ſame letters, but both removed to different lines and ſpaces; in this the letters are unmoved, and the notes of the ſong transferred to or expreſſed by other letters, and conſequently ſet upon different lines and ſpaces, which therefore requires a different ſignature of the clef.

TRANSUBSTANTIATION, *tranſubſtantiatio*, in theology, the converſion or change of the ſubſtance of the bread and wine in the euchariſt, into the body and blood of Jeſus Chriſt, which the romiſh church hold is wrought by the conſecration of the prieſt. This is a main point in the romiſh religion, and is rejected by the proteſtants, the former maintaining the tranſubſtantiation to be real, the latter only figurative; interpreting the text *hoc eſt corpus meum*, "this ſignifies my "body:" but the council of Trent ſtood up ſtrenuouſly for the literal ſenſe of the verb *eſt*, and ſay expreſsly, that in tranſubſtantiation the body and blood of our Lord Jeſus Chriſt are truly, really, and ſubſtantially under the ſpecies of bread and wine. The controverſies about this point, are almoſt innumerable.

TRANSUMPTION, *tranſumptio*, in the ſchools, a ſyllogiſm by conceſſion or agreement, uſed where a queſtion propoſed is transferred to another; with this condition, that the proof of this latter ſhould be admitted for a proof of the former. See the article SYLLOGISM.

TRANSVERSALIS, in anatomy, a name given to ſeveral muſcles, *&c.* in reſpect to their ſituation, progreſs, *&c.* as, 1. The tranſverſalis abdominis, a muſcle which lies under the obliqui, and ariſes from the cartilago xiphoides, from the extremities of the falſe ribs, from the tranſverſe apophyſis of the vertebræ of the loins, is fixed to the innerſide of the ſpine of the ileum, and inſerted in the os pubis and the linea alba. This, with the obliqui, unites its tendons as it approaches the linea alba, and is the only muſcle that is cut in the operation of the bubonocele. It has a fine and thin membrane, that cloſes exactly its ring or hole through which the veſſels paſs. 2. Tranſverſalis colli, is ſaid to be a part of the longiſſimus dorſi. It ariſes from the os ſacrum, and from all the tranſverſe proceſſes of the vertebræ of the loins, back and neck, except the two firſt; and is inſerted by ſo many diſtinct tendons into all the ſuperior ſpines. It moves the whole ſpine obliquely backwards. 3. Tranſverſalis pedis placentini, comes from the bone of the metatarſus that ſuſtains the toe next the little toe, and paſſing acroſs the other bones, is inſerted into the os ſeſamoides of the toe. Its uſe

is

is to bring all the toes close to one another. 4. Transversalis penis, one of the dilators of the urethra, arising from the tubercle of the os ischium on each side, and inserted into the posterior part of the bulb of the urethra; however these muscles are not quite determinate and certain in their origin or insertion, and sometimes they are wholly wanting: when they act, they dilate the urethra in its posterior part. 5. Transversalis is also a name given to a suture of the cranium, because of its traversing or crossing the face from one side to another. See SKULL.

TRANSVERSE, something that goes across another, from corner to corner: thus bends and bars, in heraldry, are transverse pieces or bearings: the diagonals of a parallelogram or a square, are transverse lines: lines which make intersections with perpendiculars, are also called oblique or transverse lines.

For the transverse axis or diameter, called also the first and principal axis, see the articles AXIS, DIAMETER, LATUS *transversum*, ELLIPSIS, *&c.*

TRANSVERSE MUSCLES, in anatomy, are certain muscles arising from the transverse processes of the vertebræ of the loins. See the article TRANSVERSALIS.

TRAPA, in botany, a genus of the *tetrandria monogynia* class of plants, the corolla whereof consists of four petals, vertically ovated, and larger than the cup: the fruit is a hard osseous capsule, of an oblong oval figure, containing only one cell, and armed with four sharp, thick spines, placed oppositely in the middle of the sides, and pointed; these before were the leaves of the calyx: the seed is a covered single nucleus, of an oval figure.

TRAPANO, a city and port-town of Sicily, situated on the most western parts of the island, in east long. 12° 8′, north lat. 38°.

TRAPEZIUM, in geometry, a plane figure contained under four unequal right lines. 1. Any three sides of a trapezium taken together, are greater than the third. 2. The two diagonals of any trapezium, divide it into four proportional triangles. 3. If two sides of a trapezium be parallel, the rectangle under the aggregate of the parallel sides and one half their distance, is equal to that trapezium. 4. If a parallelogram circumscribes a trapezium, so that one of the sides of the parallelogram be parallel to a diagonal of the trapezium, that parallelogram will be the double of the trapezium. 5. If any trapezium has two of its opposite angles, each a right angle, and a diagonal be drawn joining these angles; and if from the other two angles be drawn two perpendiculars to that diagonal, the distances from the feet of these perpendiculars to those right angles, respectively taken, will be equal. 6. If the sides of a trapezium be each bissected, and the points of bissection be joined by four right lines, these lines will form a parallelogram, which will be one half of the trapezium. 7. If the diagonals of a trapezium be bissected, and a right line joins these points, the aggregate of the squares of the sides is equal to the aggregate of the squares of the diagonals, together with four times of the square of the right line joining the point of bissection. 8. In any trapezium, the aggregate of the diagonals is less than the aggregate of four right lines drawn from any point (except the intersection of the diagonals) within the figure.

TRAPEZIUS, in anatomy. See the article CUCULARIS.

TRAPEZOID, is a solid irregular figure, having four sides not parallel to one another.

TRAPEZOND, or TREBISOND, a city and port-town of asiatic Turky, in the province of Amasia, situated on the Black-sea: east long. 42° 20′, north lat. 42° 26′.

TRAVE, a river of Germany, in the circle of Lower Saxony and dutchy of Holstein, which runs from west to east by Lubeck, and falls into the Baltic at Travemund.

TRAVEMUND, a port-town of the dutchy of Holstein, situated on the Baltic-sea, at the mouth of the river Trave: east long. 10° 45′, north lat. 54° 30′.

TRAVERSE, or TRANSVERSE, in general, denotes something that goes athwart another; that is, crosses and cuts it obliquely.

Hence, to traverse a piece of ordnance, among gunners, signifies to turn or point it which way one pleases, upon the platform.

In fortification, traverse denotes a trench with a little parapet, or bank of earth, thrown perpendicularly across the moat, or other work, to prevent the enemy's cannon from raking it. These traverses may be from twelve to eighteen feet, in order to be cannon proof, and their height about six or seven feet, or more, if the place be exposed to any eminence. And to preserve a communication, a pas-

sage

ſage of about five or ſix feet wide muſt be left at one end of the traverſe. The different ways of conſtructing theſe works, are repreſented in plate CCLXXXI. fig. 2. n° 1, 2, 3 and 4.

If any part of a work, thus ſhut in by one or more traverſes, is likely to be defended by the muſketry, it will be proper to add to the traverſes one or more foot-banks within the defence, for the troops to mount on, when they want to fire over the traverſe.

TRAVERSE, in navigation, is a compound courſe, wherein ſeveral different ſucceſſive courſes and diſtances are known.

To work a traverſe, or to reduce a compound courſe to a ſingle one, 1. Make a table of ſix columns, marked courſe, diſtance, N. S. E. W. beginning at the left-hand, and write the given courſes and diſtances in their proper columns. 2. Seek the given courſes and diſtances in the traverſe table, and let the correſponding differences of latitude and departure be wrote in their proper columns in the table made for the queſtion. 3. Add up the columns of northing, ſouthing, eaſting, and weſting; then the difference between the ſums of northing and ſouthing, gives the whole difference of latitude, which is of the ſame name with the greater; and the difference between the ſums of eaſting and weſting will be the whole departure, which is likewiſe of the ſame name with the greater. 4. The whole diff. lat. and depart. to the compound courſe being found, the direct courſe and diſtance will be found by Caſe IV. of plain-ſailing. See the article NAVIGATION.

Example: Suppoſe a ſhip, in the latitude of 4° 10′ north lat. 3° 39′ E. long. ſails S. 11° W. 91 miles, S. W. 120 miles, W. N. W. 130 miles, S. E. 135 miles, S. E. by E. 130 miles, and S. W. by S. 150 miles; required the direct courſe and diſtance ſailed, and the latitude and longitude the ſhip is in?

Geometrically: draw the meridian line $p x$ (plate XL. fig. 5.) and make the the angle $q p 2$ equal to 11° 15′ = 1 point, and draw the right-line $q p$, making it equal to 88 miles, the firſt diſtance ſailed; and let fall the perpendicular $q 2$; then will q be the place of the ſhip, $p 2$ the difference of latitude, and $q 2$ the departure belonging to the firſt courſe: and after the ſame manner muſt the triangles $q 3 r$, $r s 4$, $4 t 5$, $5 u 6$, and $6 7 w$, be projected; then will w be the place of the ſhip at the end of her ſailing, $p x$ the difference of latitude, $w x$ the departure, the angle $x p w$ her direct courſe from her firſt to her laſt ſtation, and $p w$ her direct diſtance; which may be all meaſured by the inſtructions given under the article NAVIGATION.

Arithmetically: the arithmetical ſolution of this problem depends entirely on the firſt and fourth caſes of *Plane* SAILING; for firſt the correſponding difference of latitude and departure muſt be found to each courſe and diſtance, as in the firſt caſe, and placed in a table according to their ſeveral directions: that is, when the ſhip ſails to the northward, the difference of latitude muſt be placed in the north column, but, when to the ſouthward, in the ſouth column; and the departure, if ſhe ſails to the weſtward, in the weſt column, but, if to the eaſtward, in the eaſt column. Then will the totals of the ſeveral columns ſhew the northings, ſouthings, eaſtings, and weſtings the ſhip has made. And, conſequently, if the ſouthings exceed the northings, the ſhip will be to the ſouthward of her firſt ſtation, and juſt as much as is the exceſs, and *vice verſa*; in like manner, if the eaſtings exceed the weſtings, the ſhip will be to the eaſtward of her firſt meridian, but, if the contrary, to the weſtward. Then we ſhall have the whole difference of latitude and departure from the meridian given, to find the courſe and diſtance, as in the fourth caſe. See the following table,

Courſes.	Diſtances.	Diff. of lat. Northings.	Diff. of lat. Southings.	Departure. Eaſtings.	Departure. Weſtings.
S. 11° W.	91		89,3		17,2
S. W.	120		84,8		84,8
W. N. W.	130	49,8			120,1
S. E.	135		95,4	95,4	
S. E. by E.	130		73,3	108,0	
S. W. by S.	150		124,7		83,4
		49,8	467,5	203,4	305,5
			49,8		203,4
		dif.la.	417,7	depa.	102,1

Hence, it appears, that the ſhip is 417,7 miles to the ſouthward of her firſt ſtation, and 102,1 miles to the weſtward of her firſt meridian; whence we may, by the fourth caſe of plane ſailing, find her direct courſe and diſtance, as follows:

1. As

1. As the difference of latitude $px = 417,7 =$ 2.6208645
Is to the radius $= 90° 00' =$ 10.0000000
So is the departure $wx = 102,1 =$ 2.0090257
To the T. of the course or angle $wpx = 13° 44' =$ 9.3881612
Which is south 13° 44′ westerly, or something more than south by west, because the difference of latitude is southerly, and the departure westerly.

2. As the sine of the course $= 13° 44' =$ 9,3760034
Is to the departure $= 102,1 =$ 2,0090257
So is the radius $= 90° 00' =$ 10,0000000
To the distance $= 429,6 =$ 2.6330223

And, because the difference of latitude exceeds the latitude sailed from, d. m.
Therefore, from the difference of lat. $= 417,7 =$ 6 : 57,7
Take the lat. sailed from $= 4 : 10$N.
Remains the lat. the ship is in $= 2 : 47,7$S.

And, because the difference of longitude is westerly, therefore, d. m.
From the long. sailed from $= 3 : 39$E.
Take the difference of longitude $= 102,1 =$ 1 : 42,1W.
Remains the long. the ship is in $= 1 : 47,9$E.

Hence it appears, that the ship is arrived in the latitude of $2° 47,7' = 2° 47' 42''$ south, and $1° 47,9' = 1° 47' 54''$ east longitude; her direct course from her first to her last station being south, 13° 44′ westerly, distant 429,6 miles.

TRAVERSE, in law, denotes the denial of some matter of fact alledged to be done in a declaration, or pleadings; upon which the other side coming and maintaining that it was done, issue is joined for the cause to proceed to trial.

TRAVERSE *of an indictment*, or *presentment*, is the contradicting or denying some chief point of it, and taking issue thereon.

TRAVERSE *of an office*, is the proving that an inquisition made by lands or goods, is defective and untruly made.

TRAVERSE is sometimes also used, in heraldry, for a partition of an escutcheon, of figure represented in plate CCLXXXI. fig. 4. which is blazoned parti per pal traverse, argent and gules.

TRAVESTY, or TRAVESTI, a french term, derived from the verb *travestir*, to disguise one's self, or to appear in masquerade: and hence, travesty is applied to the disfiguring of an author, or the translating him into a style and manner different from his own, by which means it becomes difficult to know him.

TRAUMATICS, the same with vulnerary medicines. See VULNERARY.

TRAW, a port-town of Dalmatia, situated on the gulph of Venice, in east long. 17° 30′ and north lat. 43° 10′.

TRAYGNERA, a town of Valencia, in Spain, near the confines of Catalonia: west long. 15′ and north lat. 40° 32′.

TREACLE, *theriaca*, in pharmacy. See the article THERIACA.

Some also give the name treacle to molasses; and in this sense it is that Dr. Shaw, in his essay on distillery, has endeavoured to bring into use several sorts of treacles, which might be made at home, and would serve very conveniently for the distillation of spirits, or the making of potable liquors. These are the inspissated juices or decoctions of vegetables: such as the sweet juice of the birch, or sycamore, procured by tapping or piercing the trees in spring, and the common wort made from malt, or from other vegetable substances treated in the same manner. These liquors are severally to be boiled down in a copper till they begin to inspissate, and then to be poured into a balneum mariæ, when the remainder of the evaporation may be finished without burning the inspissated juices: thus prepared it may be at any time reduced to the state of wort, only by adding a sufficient quantity of warm water. See TAPPING.

TREASON, in general, signifies betraying; but is more particularly used for the act or crime of infidelity to one's lawful sovereign.

Treason is divided, by lawyers, into high treason, and petty treason. The first of these is an offence committed against the security of the king or kingdom; as to compass, or imagine, the death of the king, queen, or their eldest son and heir; or in case a person does violate or deflower the king's wife, or his eldest daughter unmarried, or the wife of the king's eldest son; or if he levy war against the king within his kingdom, or adhere to his enemies, give them aid or comfort within the realm, or elsewhere; or if he counterfeit the king's great or privy seal, or his money, or bring false money into the kingdom, like to what we have here, and utter the same; if he kill the chancellor, treasurer, justices of either bench, justices of assize, or of oyer and terminer, sitting in judgment and representing

the perſon of the king, in the execution of his office: all theſe caſes are deemed treaſon by 25 Ed. III. c. 2. which ſtatute is made the only ſtandard of high-treaſon; and 1 Mary c. 1. takes away the power of the king and parliament to adjudge any thing elſe to be high-treaſon but what is declared to be ſuch therein: it is true, temporary ſtatutes of late times enacted, have made ſome other offences treaſon, as relating to papiſts and the proteſtant ſucceſſion.

It has been held, that words only, where they are deliberate, and ſhew a direct purpoſe againſt the king's life, will amount to an overt act of compaſſing or imagining his death, and are high-treaſon: for words are the moſt natural way of expreſſing the imagination of the heart, and may be good evidence of it: not only words of perſwaſion to kill the king, but ſuch as are ſpoken in order to draw away the affections of his people, and to ſtir them up againſt him, are tending to the king's death, and therefore treaſon. Likewiſe where a perſon intends by force to preſcribe laws to the king, or to reſtrain him of his royal power, it has been adjudged an intention to deprive him of his crown and life; and in the eye of the law, every rebellion is a treaſonable plot againſt the life of the king, for a rebel would not ſuffer that king to live and reign, who would puniſh his offence.

As to make a crime treaſon, there muſt be always ſome overt-act; a bare conſpiracy, or compaſſing to levy war, is no ſuch act, unleſs it be really levied; in which caſe the conſpirators are all traitors, although they are not in arms: perſons that raiſe forces for any public end or purpoſe, or who make an inſurrection on any account, are ſaid to levy war againſt the king, though perhaps without a direct deſign againſt his perſon; and it extends to the caſe where great numbers forcibly endeavour to remove certain perſons from the king, &c. The adhering to the king's enemies, is taken to be an adherence againſt him, and even out of the realm it is treaſon: and it is ſaid, that cruiſing in a ſhip of war with an intent to deſtroy the king's ſhips, though no act of hoſtility be committed, is an overt-act of adhering, comforting and aiding.

All trials for high-treaſon are to be according to the courſe of the common law; and perſons indicted for this crime, are to have a copy of the indictment five days before their trial, that they may have ſufficient time to adviſe with council; they ſhall likewiſe be permitted to make a full defence by their council learned in the law, and by lawful witneſſes, &c. And in this caſe there muſt be two evidences to the ſame overt-act, or to two acts of the ſame treaſon, produced face to face againſt them. It is alſo ſaid, where a perſon is convicted of treaſon, the omiſſion of any neceſſary part of the judgment will be held to be error, on which he may reverſe the attainder; as the judgment is ſeverer, and more formidable, in caſe of high-treaſon than for any other crime whatever; ſince the offender is to be hanged, drawn, and quartered, and alſo forfeit his lands and goods to the king.

Petty-treaſon, is where a ſervant kills his maſter, a wife her huſband, or a ſecular or religious perſon kills his prelate or ſuperior, to whom he owes faith and obedience; and aiders and abettors, as well as procurers, are within the act. However, ſo ſtrictly is the ſtatute conſtrued, that no caſe not expreſly mentioned therein is puniſhable by it: hence if a ſon kill his father, he ſhall not be tried for petty treaſon, except he ſerved his father for wages, in which caſe he is to be indicted under the name of a ſervant.

Petty-treaſon implies the higheſt degree of murder, and occaſions the forfeiture of lands by eſcheat to the lord of the fee; and the further puniſhment of the criminal is to be hanged, drawn, and quartered for it, and a woman burnt.

TREASURE, in general, denotes a ſtore or ſtock of money in reſerve. See the article MONEY.

Treaſure-trove, in law, is where any treaſure is found buried in the earth, but not lying on the ground, and no man knows to whom it belongs: this, in England, belongs to the king, and to conceal it is puniſhable by fine and impriſonment.

TREASURER, an officer to whom the treaſure of a prince, or corporation, is committed to be kept, and duly diſpoſed of.

The lord high treaſurer of Great Britain, or firſt commiſſioner of the treaſury, when in commiſſion, has under his charge and government all the king's revenue, which is kept in the exchequer. He holds his place during the king's pleaſure, being inſtituted by the delivery of a white ſtaff to him: he has the check of

all the officers employed in collecting the cuſtoms and other royal revenues; and in his gift and diſpoſition are all the offices of the cuſtoms in the ſeveral ports of the kingdom; eſcheators in every county are nominated by him; he alſo makes leaſes of the lands belonging to the crown.

There is, beſides the lord treaſurer, a treaſurer of the king's houſhold, who is of the privy council, and, with the comptroller and ſteward of the marſhalſea, has great power.

To theſe may be added the treaſurer of the navy; as alſo the treaſurer of the king's chamber, and of the wardrobe; and moſt corporations throughout the kingdom have treaſurers, whoſe office is to receive their rents, and diſburſe their common expences.

The treaſurer of the county, is an officer that keeps the county-ſtock, in which office there are two in every county; who are choſen by the major part of the juſtices of the peace at Eaſter-ſeſſions. They ought to have certain eſtates in lands, or to be worth 150l. in perſonal eſtate, and are to continue in their office only for a year, at the end whereof, or within ten days after the expiration of the year, they muſt account to their ſucceſſors, under certain penalties. The county-ſtock which this officer has the keeping of, is raiſed by rating every pariſh annually; and the ſame is from time to time diſpoſed of to charitable uſes, towards the relief of maimed ſoldiers and mariners, priſoners in the county gaols, paying the ſalaries of governors of houſes of correction, and relieving poor alms-houſes, *&c.*

TREASURY, the place wherein the revenues of a prince are received, preſerved, and diſburſed.

In England, the treaſury is part of the exchequer, by ſome called the lower exchequer. See EXCHEQUER.

Lords of the TREASURY. In lieu of one ſingle director and adminiſtrator of his majeſty's revenues under the title of lord high treaſurer, it is at preſent thought proper to put that office in commiſſion, *i. e.* to appoint ſeveral perſons to diſcharge it with equal authority, under the title of lords commiſſioners of the treaſury.

TREATISE, *tractatus*, a ſet diſcourſe in writing on any ſubject. A treatiſe is ſuppoſed more expreſs, formal, and methodical than an eſſay, but leſs ſo than a ſyſtem.

TREATY, a covenant between two or more nations; or the ſeveral articles or conditions ſtipulated and agreed upon between ſovereign powers.

Treaties are of various kinds; as treaties of peace, of alliance, of commerce, *&c.* for the guaranty of which, ſee the article GUARANTY.

TREBIGNA, a town of european Turky, in the province of Dalmatia, near the gulph of Venice: eaſt long. 19°, north lat. 42° 40′.

TREBLE, in muſic, the higheſt or acuteſt of the four parts in ſymphony, or that which is heard the cleareſt and ſhrilleſt in a concert. See the article CLEF.

TREE, *arbor*, the firſt and largeſt of the vegetable kind, conſiſting of a ſingle trunk, out of which ſpring forth branches and leaves.

Standard-trees are ſuch as naturally riſe to a great height, and are not topped.

For the choice of trees of this kind to be tranſplanted out of a nurſery, Quintiney recommends us to ſuch as are ſtraight, ſix feet high at leaſt, and five or ſix inches thick at bottom, and three or four at top; the bark pretty ſmooth and ſhining, as a token of their youth, and of the good ſoil they grew in.

Dwarf-trees are ſuch as are kept low, and never ſuffered to have above half a foot of ſtem. See the article DWARF.

Fruit-TREES. See the article FRUIT.

For the planting, pruning, felling, grafting, *&c.* of trees, ſee PLANTING, PRUNING, *&c.*

TREFOIL, *trifolium*, in botany, a genus of the *diadelphia-decandria* claſs of plants, with a papilionaceous flower: its fruit is a ſhort univalve pod, or capſule, containing a few roundiſh ſeeds.

Trefoil, or clover, is a plant greatly eſteemed by the engliſh farmers, for the great improvement it makes upon land, the goodneſs of its hay, and the value of its ſeed. The great advantage of clover, or trefoil, to the land on which it grows is, that it feeds a vaſt number of cattle at a time; and their dung is ſo rich a manure to the ground, that in two or three years time it becomes fit for corn again, though it had been ever ſo much exhauſted before. Clayey lands, in particular, are greatly improved by it.

There are ſeveral kinds of clover, but the great ſort is eſteemed the beſt, whoſe ſeed is like that of muſtard, except that it is more oblong. The engliſh ſeed is preferable to that of all other places, and

the

the farmer ſhould chooſe ſuch as is of a greeniſh colour, with a caſt of red; that which is black never growing ſo well. An acre of land will require ten pounds of ſeed, ſometimes twelve pounds, and it is better to ſow too much than too little. It delights moſt in a rich warm ſoil, and always thrives beſt in thoſe lands which have been well dunged or manured; but the clay-lands, which are long in acquiring a coat of graſs, or ſwarding, as the farmers expreſs it, and are little ſubject to weeds, are of all others the beſt land for clover; becauſe in thoſe lands, where the common graſs grows ſpeedily, it ſoon eats out the clover.

Marſh-TREFOIL, *trifolium paluſtre*, in botany, *&c.* the ſame with the menyanthes or buckbean. See MENYANTHES.

Shrub-TREFOIL, *cytiſus*, in botany. See the article CYTISUS.

TREFURT, a town of upper-Saxony, twenty-two miles weſt of Saxe-Gotha.

TREGONY, a borough of Cornwal, forty miles ſouth-weſt of Launceſton. It ſends two members to parliament.

TREILEBOURG, a port town of Schonen, in Sweden, ſituated on the Baltic-ſea, thirty miles ſouth-eaſt of Coppenhagen.

TREMELLA, LAVER, in botany, a genus of ſea-plants, of a middle nature, between the alga and conferva, being of a pellucid and membranaceous, and frequently of a gelatinous ſtructure.

TREMOR, or TREMBLING *of the joints*, in medicine, is an involuntary ſhaking, chiefly of the hands and head, ſometimes of the feet, and ſometimes of the tongue and heart. It is a diſorder which frequently attacks perſons advanced in years, and ſometimes the younger ſort. It ſeems to ariſe from a defect of ſpirits, ſometimes from terror, or other violent paſſion, and ſometimes from a plethora. Too much drinking of coffee alſo produces a tremor in ſome perſons, as too plentiful drinking and ſurfeits will in others.

Tremors are often dangerous, as being apt to degenerate into other nervous diſtempers; as ſpaſms, the palſy, lethargy, apoplexy, *&c.*

In the cure, thoſe things ſhould be avoided that promote the diſeaſe, and the patient ſhould drink balm or ſage-tea, or a diet-drink made of china-root; peruvian bark may alſo be taken, in an infuſion of balm or ſage, or ſuccinated ſpirit of hart's-horn, twice or thrice in a day; and in the evening an antiſpaſmodic powder may be taken, eſpecially if the patient is hot, or uſes much wine. Outwardly, the neck and ſpine of the back may be rubbed with the ſpirits of ants, earth-worms, and ſal ammoniac, mixed together; a fourth part of the volatile ſpirits will be ſufficient, or opodeldoc may be uſed in their ſtead. If the patient is plethoric, bleeding is uſeful; and in old perſons, a draught of generous wine at meals: pediluvia, hot-baths, and mineral-waters, may alſo be uſed, but with caution.

As to the medicine commonly uſed in tremors and other nervous diſtempers, under the name of palſy-drops, it is no other than compound ſpirit of lavender; the moſt ſucceſsful way of uſing which is, by taking thirty or forty drops twice or thrice a day, dropped on loaf-ſugar or a little bread. It is ſuppoſed that by this way the moſt ſpirituous and efficacious parts make their way directly by the nerves of the palate, *&c.* without undergoing the courſe of the circulation, as it is ſaid to do when taken in a liquid vehicle.

TRENCHES, in fortification, are ditches cut by the beſiegers, that they may approach more ſecurely to the place attacked; whence they are alſo called lines of approach. The tail of the trench is the place where it was begun, and its head is the place where it ends.

The trenches are uſually opened, or begun, in the night time; ſometimes within muſket-ſhot, and ſometimes within half or whole cannon-ſhot of the place. They are carried on in winding-lines, nearly parallel to the works of the fortreſs, ſo as not to be in the view of the enemy, nor expoſed to the enemy's ſhot. The workmen employed in the trenches are always ſupported by a number of troops, to defend them againſt the ſallies of the beſieged: the pioneers ſometimes work on their knees, and are uſually covered with mantlets or ſauciſſons; and the men who ſupport them lie flat on their faces, in order to avoid the enemy's ſhot.

TRENCHE, or TRANCHE', in heraldry. See the article TRANCHE'.

TRENT BISHOPRIC, a province of Germany, in the circle of Auſtria, ſituated on the Alps, which divides Italy from Germany, and ſometimes reckoned part of Italy; it is bounded by Tyrol on the north, by the territory of Venice on the eaſt and ſouth, and by the country of the Griſons on the weſt, being ſeventy

miles long and fifty broad, ſubject to the houſe of Auſtria. Trent city, the capital of this biſhopric, is ſituated in eaſt long. 11°, north lat. 56° 5′. Here the famous council of Trent was held, which continued, with ſome intermiſſions, from the year 1545 to the year 1563, where the doctrine of the pope's infallibility, tranſubſtantiation, *&c.* were confirmed.

TRENT is alſo the name of one of the largeſt rivers in Great Britain, riſing in the moor-lands of Staffordſhire, and running ſouth-eaſt by Newcaſtle under Line, divides that country almoſt into two equal parts; then entering Darbyſhire, turns about to the north-eaſt; and having run the whole length of Nottinghamſhire, continues its courſe due north, at laſt joining the river Ouſe, and ſeveral others, it changes its name to that of Humber, and falls into the German-ſea below Hull.

TRENTAL, or TRIGINTAL, a romiſh office for the dead, conſiſting of thirty maſſes rehearſed for thirty days ſucceſſively after the party's death. See the article MASS.

TREPAN, *terebra*, *modiolus*, *&c.* in ſurgery, an inſtrument uſed in trepanning. See the next article.

TREPANNING, in ſurgery, a perforation, or opening, made in the bones of the cranium. See SKULL.

This operation was performed by the antients, not only in fractures and depreſſions of the cranium, but alſo in thoſe other obſtinate diſorders of the head and brain, which could not be relieved by internal medicines and the uſe of iſſues upon the coronal ſuture; but the modern ſurgeons never uſe the trepan for internal diſorders of the head, though they ſeldom neglect it in fractures and depreſſions of the cranium. See FRACTURE, FISSURE, DEPRESSION, *&c.*

The trepan is therefore uſeful not only in theſe caſes, to elevate the depreſſed parts of a fractured bone in the cranium, but alſo to diſcharge the extravaſated blood through an aperture made by this inſtrument. See the articles CONTUSION, EXTRAVASATION, CONTRA-FISSURE, *&c.*

The leſs time there is loſt the better before the application of the trepan, but the operation itſelf muſt be conducted ſlowly and carefully; for it is extremely difficult, if not impoſſible, to take out a piece of the cranium by this inſtrument without injuring the ſubjacent dura mater, to which it is moſt intimately attached. For this reaſon Heiſter is induced to condemn the advice of thoſe who direct to trepan the cranium immediately upon every ſlight diſorder of it: he therefore adviſes firſt to try the uſe of other remedies, both external and internal, rather than immediately ſubject the patient to the trepan, before it is abſolutely neceſſary. In general, the place where the fiſſure appears will be the moſt convenient to apply the trepan, if nothing indicates the contrary; but in fractures it will be proper to trepan a little below the injured part, that the extravaſated blood may be more eaſily diſcharged. It muſt be next obſerved, that there are ſeveral places in the cranium which ought not to be in any caſe trepanned; ſuch as, 1. upon the ſutures, eſpecially the ſagittal ſuture; yet in caſes of urgent neceſſity, the trepan may be uſed upon the coronal ſutures, and ſometimes upon the others. 2. It is equally dangerous to trepan the cranium in the middle of the os frontis, eſpecially in that part which forms the fontanel. 3. The trepan muſt not be uſed upon any of the ſinuſes of the os frontis. 4. Nor ought it to be uſed where any large vein or artery ſpreads itſelf. 5. If the fractured part of the bone upon which you fix the trepan is looſe, or carious, you might then injure the brain by this inſtrument. 6. It will be improper to trepan in the lower parts, or baſis, of the cranium, which are inveſted with muſcles. 7. Laſtly, it will be improper to trepan upon the cruciform eminence of the os occipitale. Notwithſtanding theſe cautions, if a violent fracture ſhould happen in or near theſe parts, you ſhould trepan as near them as poſſible; and if the fracture has paſſed acroſs the ſutures, you muſt trepan within a finger's breadth of the ſuture on each ſide. Sometimes it is impoſſible to diſcover the particular part of the cranium which is injured, the patient in the mean time being affected with the moſt dangerous and urgent ſymptoms. In theſe caſes it will be neceſſary to trepan firſt on the right ſide, then on the left, afterwards upon the forehead, and laſtly upon the occiput, and ſo round till you meet with the ſeat of the diſorder.

After having pitched upon the part to be trepanned, your next buſineſs is to ſhave the ſcalp, and make an inciſion through the integuments to lay bare the cranium,

except

TREPANNING INSTRUMENTS

Fig. 6.

Fig. 5.

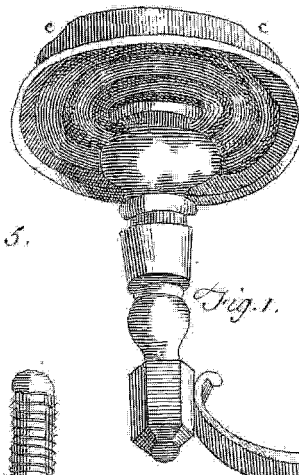

Fig. 1.

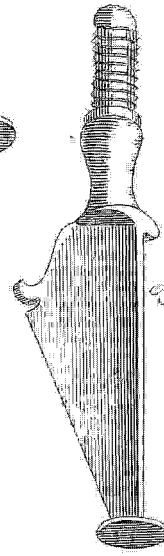

Fig. 4.

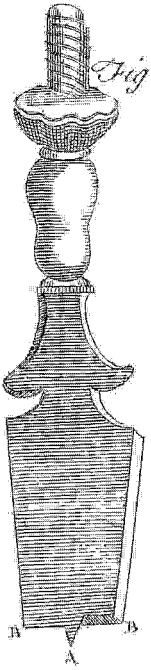

Fig. 7.

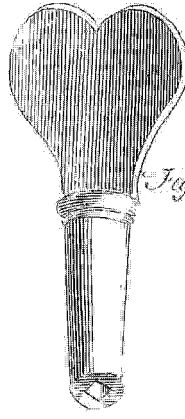

Fig. 3.

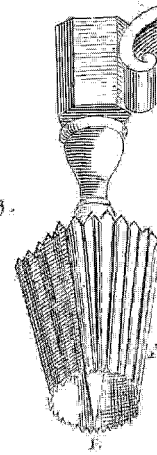

Fig. 2.

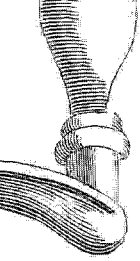

except it be done already by the wound. The inciſion of the integuments may be made in the form of a croſs, or of the letters X, V, or T, large enough to admit the crown of the trepan upon the bone. The wound may be enlarged, and the hæmorrhage ſtopped, after the integuments and periоſteum are ſeparated and elevated from the cranium, by inſerting a large quantity of ſcraped lint. Next a compreſs dipped in warm camphorated ſpirit of wine muſt be applied and retained by the kerchief bandage. Then the patient is to be left, if the diſorder will permit, for a few hours, that the blood may be ſtopped before the trepan is applied. Among the apparatus, or inſtruments and dreſſings, which muſt be provided before the operation is entered upon, the firſt and principal is the trepan with its crown, (pl. CCLXXXII. fig. 1.) made in the ſhape of a common gimblet with a handle turning round. The crown of this inſtrument, marked A, is joined to the lower part of the handle, B, by a ſcrew, ſo that it may be taken off and put on at pleaſure, or elſe that a crown of another ſize may be ſcrewed in its place. The trepan is diſtinguiſhed into male and female; in the firſt of which the crown is furniſhed with a ſharp point E, but when the ſaid point, or pyramid, fig. 2. is taken out by the winch, fig. 3. the trepan is then termed female. You muſt alſo be provided with a ſcalpel of a particular make, with a round and flat head, as repreſented in fig. 4. which is denominated the lenticular ſcalpel; to which is added another inſtrument for gradually depreſſing the dura mater, of the ſhape repreſented in fig. 5. There muſt be alſo a perforating inſtrument provided, fig. 6. which muſt be ſcrewed into the cavity B of the handle, fig. 1. alſo a hair-bruſh and an elevatory. See the article ELEVATORY.

The apparatus of dreſſing and bandage, to be applied after the operation, conſiſts of a doſſil of lint, of an orbicular figure, which muſt be tied round the middle with a piece of thread about a ſpan long; there muſt be pledgits of lint for covering the other dreſſings, and filling up the cavity of the cranium, *&c.*

The apparatus being thus provided, in order to perform the operation with greater readineſs and exactneſs, the patient muſt be diſpoſed in ſuch a convenient poſture that the ſurgeon and aſſiſtants may have free acceſs to perform each their part. Then the dreſſings being removed the wound is to be cleanſed; after which, the head being placed in a convenient manner upon a pillow, the ſurgeon takes the perforating trepan, fig. 6. and adapting it to the handle B, fig. 1. inſtead of the crown A, ſo that by turning round the handle D, he makes a full entrance, or aperture, with his inſtrument, and then applies the male trepan, with a crown A, fig. 1. Upon the top of the handle C C the ſurgeon fixes his left hand, upon which he places his chin or forehead, while with his right he ſlowly and carefully turns round the handle till the crown of the trepan with its ſpindle have made a circular entrance deep enough in the cranium, and then he removes the ſpindle, and continues his work with the crown of the trepan only as long as he ſees convenient; all the ſaw-duſt being firſt bruſhed off from the cranium, and the teeth of his inſtrument, with the bruſhes. He now continues to uſe the trepan till the ſaw-duſt becomes bloody, which denotes that he has penetrated the diploë: however, he may not always meet with this ſign, becauſe in ſome ſkulls the diploë may be wanting in the part trepanned; but when the ſaw-duſt becomes bloody the inſtrument is to be laid aſide: and after waſhing away the blood with a ſponge dipt in ſpirit of wine, he then ſcrews the elevatory, by two or three turns, into the ſmall aperture, in the middle of the trepanned piece of the bone, and takes it out again, making two or three more turns with the crown of his trepan: then he examines with a probe, whether the plates of the cranium are ſufficiently ſawed through, which cannot be better known than by attending to the colour of the circular groove; for when that appears blue or grey, it is a ſign that you have penetrated through the lower plate of the bone, ſo far as to render the dura mater almoſt conſpicuous through it; but if the bony plate appears livid in one part of the circular groove, and white in another, it is a ſign that the trepan has not cut equally through, and therefore it muſt be inclined and preſſed a little harder upon the whiteſt parts, moving round the handle till the ſaw-teeth of the crown have cut deep enough to make the round piece of the bone looſe or moveable. In that caſe it will not be convenient to cut totally through the bone with the ſaw-teeth of the trepan.

Having

Having thus extracted the round piece of the cranium, the blood uſually follows it: which being wiped off, the ſurgeon is to examine whether there be any fragments remaining to be extracted and looſened; for then you muſt ſmooth the rough parts about the lower margin of the aperture, by applying the ſcalpel, fig. 4. to prevent the dura mater from being pricked and injured by any of the ſharp ſplinters. This done, the blood will more readily diſcharge itſelf, but to promote its exit you may gently incline the patient's head to one ſide, and another tenderly preſſing the dura mater itſelf, either by the hand of the ſcalpel or the depreſſor, fig. 5, by which means the patient is no ſooner relieved from the preſſure of the extravaſated blood on his brain, but he inſtantly begins to recover his ſenſes: the ſurgeon ſhould then direct him to fetch a deep breath, or hold it with a ſtrain, like one that has a hard ſtool.

The dreſſings and deligation are to be made with a round pledgit of dry lint laid next the dura mater, with a thread faſtened to it, and hanging out of the aperture, that it may be placed under, and drawn out from beneath, the cranium; upon which pledgit is afterwards poured ſome honey of roſes diluted with a little ſpirit of wine: you then impoſe a like pledgit of lint, furniſhed with a ſtring with other doſſils, till the cavity is replete: and, in the next place, the cranium, and wound itſelf, is to be dreſſed with lint, ſpread with ſome digeſtive ointment, upon which add a ſquare compreſs dipt in warm ſpirit of wine, and then ſecure the whole, without a plaſter, by the head bandage. In the ſubſequent dreſſings, which muſt be repeated once or twice every day, you muſt avoid fat and oily applications. See the article WOUND.

The wound being conſtantly attended, you will have an exfoliation of a thin plate from the trepanned margin of the bones, uſually within forty or fifty days, which ought not to be pulled away by force. The exfoliation being obtained, there will appear new fleſh and callus ſhooting up from the clean bone and dura mater, ſo as at length to fill up the whole cavity.

That inſtrument called the exfoliating-trepan, is ſometimes uſed to pare away a carious part in a bone. It is repreſented in fig. 7, and when uſed is to be ſcrewed into the handle B of fig. 1, in order to be turned round: A is its point: B B the wings, which ſcrape the bone while the inſtrument is turning about. See the article CARIES.

TREPIDATION, in medicine, the ſame with tremor. See the article TREMOR.

TREPIDATION, in the antient aſtronomy, denotes what they called a libration of the eighth ſphere, or a motion which the ptolemaic ſyſtem attributed to the firmament, to account for certain almoſt inſenſible changes and motions obſerved in the axis of the world, by means whereof the latitudes of the fixed ſtars come to be gradually changed, and the ecliptic ſeems to approach reciprocally firſt towards one pole, then towards the other. This motion is called the motion of the firſt libration. See LIBRATION and TITUBATION.

TRESPASS, in law, ſignifies any tranſgreſſion of the law, under treaſon, felony, or miſpriſion of either; but it is moſt commonly uſed for any wrong or damage that is done by one private perſon to another, or to the king in his foreſt, *&c.*

In this ſenſe, treſpaſs is of two ſorts: treſpaſs general, which is called treſpaſs *vi et armis*; and treſpaſs ſpecial, or treſpaſs upon the caſe. Treſpaſſes againſt a man's perſon are ſuch as theſe, *viz.* threatning to hurt him, on aſſaulting or ſetting one to beat him; a battery, which is an actual beating or maiming a man ſo that he loſe the uſe of his limbs; an unlawful impriſonment of another, or illegally reſtraining him of his liberty, *&c.* See ASSAULT, BATTERY, *&c.*

Treſpaſſes committed againſt a man's property may be in ſeveral ways, as againſt his wife, children, or ſervants, or his houſe and goods, *&c.* or againſt his lands, by carrying away the deeds, or other evidences, concerning the ſame; cutting trees, or damaging the graſs therein. An action of treſpaſs, *vi et armis*, lies for a perſon who has the poſſeſſion of goods, or of a houſe, or land, if he be diſturbed in his poſſeſſion, for this reaſon, that ſuch diſturbance, beſides the private damage, is alſo a breach of the peace; and in caſe the defendant be convicted at common law, he is liable to be fined and impriſoned. The difference between this action and treſpaſs on the caſe is, that the one lies where the original act was a wrong in itſelf, and the other where it is conſequential

conſequential to a lawful act. A defendant in treſpaſs ſhall in no caſe be excuſed, unleſs it be upon an unavoidable neceſſity; therefore, where there is only a force in law, as if a perſon enters into another's land, he muſt be requeſted to go out before hands are laid on him, but it is otherwiſe when there is an actual force committed. The defendant in treſpaſs can, by his plea, put the plaintiff to a new aſſignment of the place where, *&c.*

TRESPASSER, denotes a perſon that commits a treſpaſs againſt another, in reſpect of whom it is held, that though the law permits a perſon to enter a tavern, and a landlord to diſtrain on lands, *&c.* yet if he abuſes this liberty by committing any treſpaſs, he will be judged a treſpaſſer *ab initio*.

TRESSURE, in heraldry, a diminutive of an orle, uſually held to be half the breadth thereof. See it repreſented in plate CCLXXXVIII. fig. 2.

TRET, in commerce, an allowance made for the waſte, or the dirt, that may be mixed with any commodity, which is always four pounds in every one hundred and four pounds weight. See TARE.

TREVES, or TRIERS. See TRIERS.

TREVI, a town of Italy, in the pope's territory and province of Umbria, ſituated twenty-three miles ſouth-eaſt of Perugia.

TREVIGIO, or TREVISO, a city of Italy, in the territory of Venice, capital of the province of Trevigiano, ſituated fifteen miles north-weſt of Venice.

TREVOUX, a town of France, in the province of Burgundy, and territory of Bourghen-Breſſe, ſituated on the river Saone, twenty-three miles ſouth-weſt of Bourg.

TREWIA, in botany, a genus of the *polyandria monogynia* claſs of plants, having no corolla beſides the cup: the fruit is a turbinated, triquetrous, coronated, trilocular, trivalvar capſule: the ſeed is ſingle, convex on one ſide, and angular on the other. See plate CCLXXXV. fig. 2.

TREZZO, a town of Italy, in the dutchy of Milan, ſituated on the river Adda, fifteen miles north-eaſt of Milan.

TRIA PRIMA, among chemiſts, the three hypoſtatical principles, *viz.* ſalt, ſulphur, and mercury; of which they hold all bodies to be primarily made, and into which they are all held reſolvable by fire.

TRIAL, in law, the examination of a cauſe, civil or criminal, according to the laws of the land, before a proper judge: or, it is the manner and order obſerved in the hearing and determining of cauſes. There are divers kinds of trials; as thoſe of matters of fact, which muſt be tried by a jury; matters of law, which are only triable by the courts; and matters of record, which are to be tried by the records themſelves. The moſt general rule has been, that the jurymen on a trial ſhall be choſen out of that town or precinct, *&c.* in which the matter of fact is alledged, or the neareſt thereto, for the better cognizance of the matter, and not to leave things to be tried in foreign countries, where the jury are ſtrangers to the whole matter. Where any trial is for murder, it muſt be in the county wherein the fact was committed; but if the aſſault be in one county, and the perſon aſſaulted happens to die in another county, the indictment may be found by a jury of the county where the party died: and by ſpecial commiſſion, when a perſon is indicted in one county he may be tried in another. In all criminal caſes the cuſtom is to aſk the priſoner how he will be tried, which was formerly a very ſignificant queſtion, though it is not ſo now, becauſe anticently there were trials by combat, by ordeal, and by jury; and when the priſoner anſwered, by God and his country, it appeared he made choice to be tried by a jury; which is the only way now uſed for the trial of criminals. See the articles COMBAT, MURDER, *&c.*

The method of proceeding in criminal caſes is this: firſt the bill of indictment againſt the offender is prepared, and the proſecutor and his witneſſes attend on the grand-jury therewith, and there give in their evidence; which being done, the grand inqueſt either find the bill of indictment, or bring it in ignoramus; and if the bill be found, the priſoner is brought to the bar of the court, and the clerk of the arraignment calling him by his name, deſires him to hold up his hand, ſaying, "Thou art indicted by the name of — —, for ſuch a felony, *&c.* (ſetting forth the crime laid in the indictment) How ſayeſt thou, art thou guilty of this felony whereof thou art indicted, or not guilty?" To which the priſoner anſwering, "Not guilty," the clerk ſays, "Culprit, how wilt thou be

tried?"

tried?" whereupon the defendant anſwers, "By God and my country;" which plea of the priſoner the clerk records, and then the panel of the petty-jury is called over. See IGNORAMUS, CULPRIT, JURY, *&c.*

After the jury are ſworn, and the indictment is read over to them, and they are charged, the evidences on both ſides, for and againſt the priſoner, are called, ſworn, and examined in open court; after which the jury bring in their verdict; and if they find the priſoner guilty, their verdict is recorded, and the priſoner is taken from the bar: but if they bring him in not guilty, the priſoner is bid to fall down on his knees, *&c.* On the priſoners being brought in guilty, proclamation is made for all perſons to keep ſilence, upon which the priſoner is again brought to the bar, and the verdict repeated: after which ſentence is paſſed on him, and an order, or warrant, is made for his execution. See the articles FELONY, WARRANT, *&c.*

The methods of trial, in our civil courts, are as follows: *viz.* The declaration is firſt drawn for the plaintiff, and when the appearance of the defendant is entered, it has been uſual to deliver it with an imparlance to the defendant's attorney; and the term following rule is to be given with the ſecondary for the defendant to plead by ſuch a day, or elſe the plaintiff is to have judgment: and the defendant having pleaded, a copy of the iſſue is made by the plaintiff, and delivered to the defendant's attorney, at the ſame time giving him notice of the trial; in order to which the *venire facias* muſt be taken out and returned by the ſheriff; and likewiſe the *habeas corpora*, or *diſtringas*, to bring in the jury; on which the record is made up, and the parties proceed to trial by their council and witneſſes, and the jury give in their verdict, *&c.* But in caſe the defendant neglects to plead, and ſuffers it to go by default, on entering ſuch a judgment, a writ of inquiry of damages is awarded returnable next term; notice of the execution whereof the defendant's attorney is to have, and which being executed, and the damages inſerted in a ſchedule annexed to the writ, a rule is given thereon, and coſts are taxed by the prothonotary, *&c.* See the articles DECLARATION, IMPARLANCE, *&c.*

TRIANDRIA, in the linnæan ſyſtem of botany, a claſs of plants, the third in order; comprehending all ſuch plants as have hermaphrodite flowers, with three ſtamina, or male parts, in each; whence the name.

To this claſs belong the tamarind, valerian, ſaffron, gladiol, iris, *&c.* See the article TAMARIND, *&c.*

TRIANGLE, in geometry, a figure of three ſides and three angles.

Triangles are either plane or ſpherical. A plane triangle is contained under three right lines; and a ſpherical one is a triangle contained under three arches of great circles of the ſphere. See the article SPHERE.

Triangles are denominated, from their angles, right, obtuſe, and acute. A right-angled triangle is that which has one right angle, as ABC, pl. CCLXXXIII. fig. 1. n° 1. An obtuſe-angled triangle is ſuch as has one obtuſe angle; as DEF; *ibid.* n° 2. And an acute-angled triangle is that which has all its angles acute; as *ghi*, GHI, *ibid.* n° 3 and 4. See the article ANGLE.

And here it may not be improper to explain other diſtinctions of triangles. Any triangle that is not right-angled, is called oblique-angled, or amblygonial. An equilateral-triangle is that which has all its ſides equal; as *ghi*, *ibid.* n° 3. An iſoſceles-triangle is one that has only two ſides equal; as GHI, *ibid.* n° 4. And a ſcalenous-triangle is one that has no two ſides equal; as DEF, *ibid.* n° 2.

In every triangle the ſines of the ſides are proportional to the ſines of the oppoſite angles; alſo the ſine of all the three angles is equal to two right ones; and the external angle, made by any ſide produced, is equal to the ſum of the two internal and oppoſite angles: thus ∠*e*ED, (*ibid.* n° 2.) = ∠EFD + FDE. Triangles on the ſame baſe, and having the ſame height, or place, between the ſame parallels, are equal: alſo triangles on equal baſes, and between the ſame parallels, are equal. If a perpendicular be let fall upon the baſe of an oblique-angled triangle, the difference of the ſquares of the ſides is equal to the double-rectangle under the baſe, and the diſtance of the perpendicular from the middle of the baſe. The ſide of an equilateral-triangle, inſcribed in a circle, is in power triple of the radius. The ſides of a triangle are cut proportionably, by a line drawn parallel to its baſe. A whole triangle is to a triangle cut off by a right

line drawn parallel to the baſe, as the rectangle under the cut ſides is to the rectangle of the two other ſides. In a right-angled triangle, a line drawn from the right-angle at the top, perpendicular to the hypothenuſe, divides the triangle into two other right angled triangles, which are ſimilar to the firſt triangle, and to one another. In every right-angled triangle, the ſquare of the hypothenuſe is equal to the ſum of the ſquares of the other two ſides; that is, AC^2 (*ibid.* n° 1.) $= AB^2 + BC^2$.

If any angle of a triangle be biſſected, the biſſecting-line will divide the oppoſite ſide in the ſame proportion as the legs of the angle are to one another.

Every triangle is one half of a parallelogram of the ſame baſe and height.

The area of any triangle may be had by adding all the three ſides together, and taking half the ſum, and from that half ſum ſubtracting each ſide ſeverally, and multiplying that half ſum and the remainder continually into one another, and extracting the ſquare root of the product.

For the ſolving the ſeveral caſes of plane and ſpherical triangles, ſee the article TRIGONOMETRY.

TRIANGULAR *Compaſſes*, are ſuch as have three legs, or feet, whereby to take off any triangle at once; much uſed in the conſtruction of maps, globes, *&c.*

TRIANGULAR *Numbers*, are a kind of polygonal numbers, being the ſums of arithmetical progreſſions, the difference of whoſe terms is 1.

Thus of arithmetical progreſſion, 1 2 3 4 5 6, are formed triangular numbers 1 3 6 10 15 21.

TRIANGULAR *Canon*, the tables of artificial ſines, tangents, ſecants, *&c.*

TRIANGULAR *Quadrant*, is a ſector furniſhed with a looſe piece, whereby to make it an equilateral triangle.

The calendar is graduated thereon, with the ſun's place, declination, and other uſeful lines; and by the help of a ſtring and a plummet, and the diviſions graduated on the looſe piece, it may be made to ſerve for a quadrant.

TRIANGULARIS, in anatomy, a name given to two muſcles of the lips, which ariſe each from the lateral and under part of the lower jaw; from whence they aſcend obliquely to the angle of the orbicularis.

There is alſo a muſcle of the breaſt called triangularis ſterni, which riſes from the lower and interior part of the ſternum, and is inſerted on each ſide into the cartilages of the fourth, fifth, ſixth, and ſeventh true ribs: it is one of the conſtrictor or depreſſor muſcles of the breaſt.

One of the dilatator muſcles of the urethra is alſo called triangularis from its figure: it riſes from the anterior part of the ſphincter of the anus, and is inſerted into the poſterior and lower parts of the accelerators, or elſe into the bulb of the urethra.

TRIARII, in the roman militia, a kind of infantry armed with a pike, a ſhield, a helmet, and a cuiraſs; thus called becauſe they made the third line of battle.

TRIAS HARMONICA, or *the harmonical* TRIAD, in muſic, a compound of three radical ſounds, heard all together, two whereof are a fifth and third above the other, which is a fundamental.

TRIBE, *tribus*, in antiquity, a certain quantity or number of perſons, when a diviſion is made of a city or people into quarters or diſtricts.

The tribes of antient Rome bore a great reſemblance to our wards. See the article WARD.

TRIBRACHYS, in antient poetry, a foot conſiſting of three ſyllables, and thoſe all ſhort; as *melius*.

TRIBULASTRUM, a plant otherwiſe called neurada. See NEURADA.

TRIBULOIDES, in botany, the ſame with trapa. See TRAPA.

TRIBULUS, CALTROP, in botany, a genus of the *decandria-monogynia* claſs of plants, the corolla of which conſiſts of five oblong, obtuſe, and patent petals: its fruit is of a roundiſh figure and aculeated, being compoſed of five capſules, gibbous on one ſide, and armed with three or four points on the other, angulated and convergent; and containing numerous ſeeds, turbinated and oblong.

TRIBUNAL, in general, denotes the ſeat of a judge, called in our courts bench. See the article BENCH.

The word is latin, and takes its origin from the ſeat where the tribune of the roman people was placed to adminiſter juſtice.

The name tribunal was alſo given to the place from whence the people of antient Rome were harangued.

TRIBUNE, *tribunus plebis*, among the antient Romans, a magiſtrate choſen out of the commons, to protect them againſt

the oppreſſions of the great, and to defend the liberty of the people againſt the attempts of the ſenate and conſuls.

The tribunes of the people were firſt eſtabliſhed in the year of Rome 259. The firſt deſign of the creation was to ſhelter the people from the cruelty of uſurers, and to engage them to quit the Aventine mount, whither they had retired in diſpleaſure.

Their number, at firſt, was but two; but the next year, under the conſulate of A. Poſthumus Aruncius and Caſſius Viſcellinus, there were three more added; and this number of five was afterwards increaſed, by L. Trebonius, to ten. The appellation, tribune, was given them, by reaſon they were at firſt choſen out of the tribunes of the army.

Military TRIBUNE, *tribunus militum*, or *militaris*, an officer in the Roman army, who commanded in chief over a body of forces, particularly the diviſion of a legion, much the ſame with our colonel, or the french meſtre de camp.

TRIBUNE was alſo an appellation given to various other officers; as the tribuni ærarii, tribunes of the treaſury. Tribune of the celeres, the officer who commanded them. Tribuni fabricarum, thoſe who had the direction of the making of arms. Tribuni marinorum, tribuni nolanorum, tribuni voluptatum, mentioned in the Theodoſian Code, as intendants of the public ſhews, and other diverſions. The title of tribune, tribunus, was alſo given to the chief of each tribe.

TRIBUTARY, *tributarius*, one who pays tribute to another, in order to live in peace with him, or ſhare in his protection.

TRIBUTE, *tributum*, a tax or impoſt which one prince or ſtate is obliged to pay to another as a token of dependence, or in virtue of a treaty, and as a purchaſe of peace.

The Romans made all the nations they ſubdued pay them tribute. Mahomet laid it down as a fundamental of all his law, that all the world ſhould pay him tribute. In the ſtates of the grand ſeignior chriſtian children are taken by way of tribute. See the article AGEMÖGLANS.

Tribute is ſometimes alſo uſed for a perſonal contribution, which princes lay upon their ſubjects, by way of poll-money.

TRICEPS, in anatomy, the abductor-muſcle of the thigh, having three heads, and as many inſertions: the firſt and ſecond heads of this muſcle ariſe from the os pubis, near the ſynchondroſis; the third, from the tubercle of the iſchium; and it is inſerted into the whole ſpine of the os femoris.

TRICHECUS, or THRICHECHUS. See the article THRICHECHUS.

TRICHERIÆ, a genus of foſſils, naturally and eſſentially ſimple, not inflammable nor ſoluble in water; being fibroſe bodies, not elaſtic, and compoſed of ſtraight and continuous filaments. See the article FIBRARIÆ.

To this genus belongs the gypſum ſtriatum of authors, with ſeveral other ſpecies. See the article GYPSUM.

TRICHIASIS, in ſurgery, an inverſion of the eye-lids, whereby the eye laſhes hurt the eyes.

According to Heiſter, this diſorder is very difficultly remedied; ſince it is hardly poſſible to remove it, ſo as to prevent its returning, without extirpating the offending hairs; and if theſe be cut off cloſe, it will be to no purpoſe, becauſe the rigid ſtumps of the hairs will irritate the eye even worſe than the whole hairs did before. It is a very nice operation alone that can make a cure; here the hairs muſt be pulled up ſingly by the roots, and the places of their inſertion ſingly cauterized with a hot broad pointed needle; but this the patient will ſeldom ſubmit to, and the only remaining method then, is to fill up the ſinus's out of which they were extracted with the lapis infernalis. But in this the greateſt care muſt be taken, that no part of that application get into the eye. The eaſieſt method is the touching the cavities, out of which the hairs have been pulled up, with a pencil-bruſh dipped in a mixture of ſpirit of ſal-armoniac and highly rectified ſpirit of wine, by which means they will cloſe up, and no more hairs will grow from them.

TRICHOMANES, in botany, a genus of the *cryptogamia* claſs of plants, in which there appears a turbinated erect calyx, ſtanding ſingly on the very margin of the leaf, and a ſetaceous ſtyle terminating the capſule.

Trichomanes, or engliſh black maiden-hair, is recommended in diſorders of the breaſt, proceeding from a thickneſs and acrimony of the juices; being uſually directed in infuſion, or decoction, with the addition of a little liquorice: a ſyrup made

made of it frequently ſupplies the place of that made from the adiantum verum. See the article ADIANTUM.

TRICHOSANTHES, in botany, a genus of the *monoecia ſyngeneſia* claſs of plants, the corolla of which is monopetalous, divided into five ſegments, and is ciliated: the ſtamina are three very ſhort filaments: the fruit is an oblong apple. This genus comprehends the anguina of Micheli.

TRICHOSTEMA, in botany, a genus of the *didynamia gymnoſpermia* claſs of plants, with a monopetalous ringent and falcated flower: the ſtamina are four extremely long filaments; and four roundiſh ſeeds are contained in the cup.

TRICUSPIDES VALVÆ, in anatomy, a name given to the mitral valves, placed at the juncture of the right auricle and ventricle of the heart. See HEART.

TRIDAX, in botany, a genus of the *ſyngeneſia-polygamia ſuperflua* claſs of plants, with a radiated flower, and the leſſer hermaphrodite ones of the diſc monopetalous, and funnel-faſhioned: the ſeeds are winged with down, and contained in the cup.

TRIDENT, *tridens*, an attribute of Neptune, being a kind of ſceptre which the painters and poets put into the hands of that god, in form of a ſpear, or fork, with three teeth; whence the word.

TRIDENT, among mathematicians, is uſed for a kind of parabola, by which Des Cartes conſtructed equations of ſix dimenſions.

TRIEMIMERIS, a kind of cæſura in latin verſe, wherein after the firſt foot of the verſe there remains an odd ſyllable, which helps to make up the next foot.

TRIENNIAL, an epithet applied chiefly to offices or employments which laſt for three years.

TRIENS, in antiquity, a copper money of the value of one-third of an as, which on one ſide bore a Janus's head, and on the other a water-rat.

This was the piece of money uſed to be put in the mouths of the deceaſed to pay Charon his fare, for their paſſage into another life.

TRIENTALIS, in botany, a genus of the *heptandria-monogynia* claſs of plants, with a ſtellated monopetalous flower: its fruit is a dry, globoſe and unilocular berry, containing a few angulated ſeeds.

TRIERS, or TREVES, the capital of the electorate of Triers, in Germany, ſituated on the river Moſelle, ſixty miles ſouth of Cologn: eaſt long. 6° 10′, north lat. 49° 55′.

TRIESTE, a port-town of Iſtria, ſituated on the gulph of Venice, ſixty miles north-eaſt of that city.

TRIFOLIUM, TREFOIL, in botany. See the article TREFOIL.

TRIGA, in antiquity, denotes a kind of carr, or chariot, drawn by three horſes; whence the name.

TRIGAMY, a third marriage, or the ſtate of a perſon who has been married three times. See MARRIAGE.

TRIGLA, in ichthyology, a genus of fiſhes, of the order of the acanthopterigii, the characters of which, according to Artedi, are theſe: the branchioſtege membrane contains ſeveral bones; the head is very declivious, from the eyes to the end of the ſnout, and is large, aculeated, and as it were ſquare; the head is the broadeſt part of the fiſh; it thence grows gradually narrower, till it ends in a very ſmall tail: in many of the ſpecies of this fiſh, there are two or three articulated appendices growing under the pectoral fins: the eyes ſtand on the top of the head, and are covered with a ſkin; there are two back fins, the firſt of which is prickly; the pectoral fins in ſome of the ſpecies are very large.

This genus comprehends the mullet, hirundo piſcis, tub-fiſh, gurnard, *&c.* See the article MULLET, *&c.*

TRIGLOCHIN, in botany, a genus of graſſes, belonging to the *hexandria-trigynia* claſs of plants, the flower of which conſiſts of three oval, concave, and obtuſe petals; and its fruit is an oblong capſule of an oval figure, with three cells, in each of which is a ſingle oblong ſeed.

TRIGLYPHS, in architecture, a ſort of ornaments repeated at equal intervals in the doric freeze. See DORIC and FREEZE.

Each triglyph conſiſts of two entire gutters, or channels, cut to a right angle, called glyphes, and ſeparated by three interſtices, called, by Vitruvius, femora, from each other, as well as from two other half channels which are at the ſides.

The ordinary proportion of triglyphs is to be a module broad, and one and a half high. But this proportion, M. le Clerc obſerves, ſometimes occaſions ill-proportioned intercolumnations in porticos; for which reaſon he chuſes to ac-

commodate the proportion of his triglyphs to that of the intercolumns.

TRIGON, τριγωνον, a triangle. See the article TRIANGLE.

In aſtrology, trigon denotes the ſame with trine. See TRINE.

TRIGONELLA, in botany, a genus of the *diadelphia-decandria* claſs of plants, with a papilionaceous tetrapetalous flower: the fruit is an oblong, oval pod, of a compreſſed figure, and containing ſeveral roundiſh ſeeds.

TRIGONOMETRY, that part of geometry, which teaches how to meaſure the ſides and angles of triangles. See the article TRIANGLE.

Trigonometry is either plane or ſpherical, according as the triangles are plane or ſpherical; of each whereof we ſhall treat in order.

Plane TRIGONOMETRY, or that which teaches the menſuration of plane triangles, is commonly divided into rectangular and oblique-angular.

I. And firſt of rectangular plane trigonometry: if in any right-angled triangle, ABC (plate CCLXXXIII. fig. 2. n° 1.) the hypothenuſe be made the radius, and with that a circle be deſcribed on the one end, A, as a center; then, it is plain, that BC will be the ſine of the angle BAC; and if with the ſame diſtance, and on the end B as a center, a circle be deſcribed it is plain that AC will be the ſine of the angle ABC; therefore, in general, if the hypothenuſe of a right angled triangle be made the radius, the two legs will be the ſines of their oppoſite angles. See SINE, RADIUS, &c.

Again, if in a right-angled triangle DEF (*ibid.* n° 2.) one of the legs, as DF, be made the radius, and on the extremity D (at one of the oblique angles, *viz.* that which is formed by the hypothenuſe and the leg made radius) as a center, a circle be deſcribed; it is plain that the other leg, EF, will be the tangent of the angle at D, and the hypothenuſe DE will be the ſecant of the ſame angle. The ſame way, making the leg EF the radius, and on the center E deſcribing a circle, the other leg DF will become the tangent of the angle at E, and the hypothenuſe DE the ſecant of the ſame. See TANGENT and SECANT.

The chord, ſine, tangent, &c. of any arch, or angle, in one circle, is proportionable to the chord, ſine, tangent, &c. of the ſame arch in any other circle; from which, and what has been ſaid above, the ſolutions of the ſeveral caſes of rectangular trigonometry naturally follow. See CHORD, ARCH, &c.

Since trigonometry conſiſts in determining angles and ſides from others given, there ariſes various caſes; which being ſeven in rectangular-trigonometry, are as follows.

Caſe I. The angles, and one of the legs, of a right-angled triangle be given, to find the other leg.

Example. In the triangle ABC (*ibid.* n° 3.) right-angled at B, ſuppoſe the leg AB = 86 equal parts; as feet, yards, miles, &c. and the angle A = 33° 40′; required the other leg BC, in the ſame parts with AB.

1. Geometrically: Draw AB = 86, from any line of equal parts; upon the point B, erect the perpendicular BC; and, laſtly, from the point A, draw the line AC, making with AB an angle of 33° 40′; and that line produced will meet BC in C, and ſo conſtitute the triangle. The length of BC may be found by taking it in your compaſſes, and applying it to the ſame line of equal parts that AB was taken from.

2. By calculation: Firſt, by making the hypothenuſe AC radius, the other two legs will be the ſines of their oppoſite angles, *viz.* AB the ſine of C, and CB the ſine of A. Now ſince the ſine, tangent, &c. of any arch in one circle is proportionable to the ſine, tangent, &c. of the ſame arch in any other circle, it is plain the ſines of the angles A and C in the circle deſcribed by the radius AC, muſt be proportional to the ſine of the ſame arches or angles, in the circle, that the table of artificial ſines, &c. was calculated for; ſo the proportion for finding BC will be

S, C : AB :: S, A : BC.

i. e. As the ſine of the angle C in the tables, is to the length of AB (or ſine of C in the circle whoſe radius is AC) ſo is the ſine of the angle A in the tables, to the length of BC (or ſine of the ſame angle in the circle whoſe radius is AC). Now the angle A being 33°, 40′, the angle C muſt be 56°, 20′; therefore looking in the table of artificial ſines, &c. for the ſines of the two angles, and in the table of logarithms for the logarithm of 86 the given leg, we ſhall find by proceeding according to the foregoing proportion, that the required leg BC, is

57.28;

Fig. 1. Triangles

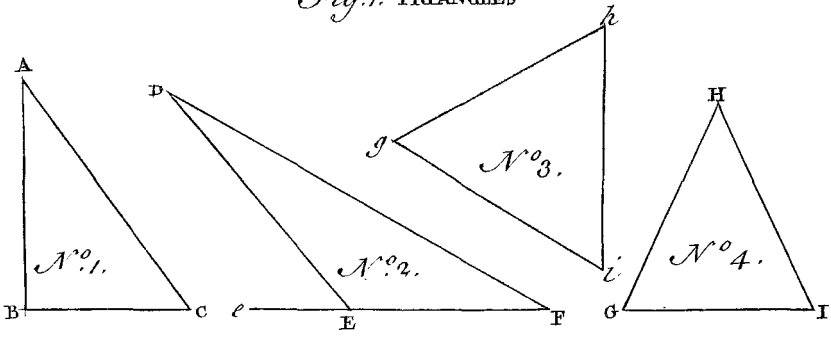

Fig. 2. Rectangular Trigonometry

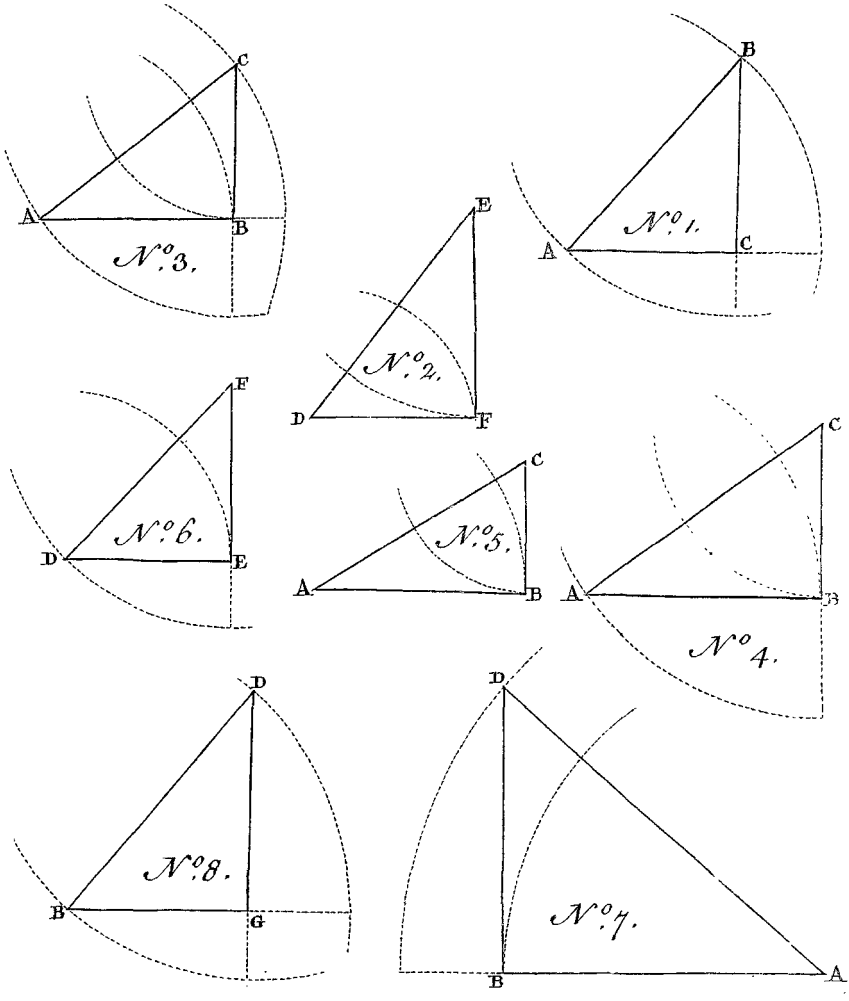

J. Jefferys sculp.

57.28; and the operation will ſtand as follows:

1.93450	A B	86
9.74380	S, A	33°, 40′
11.67830		
9.92027	S, C	56°, 20′
1.75803	B C	57.28

Secondly, Making A B the radius, it is plain B C, the leg required, will be the tangent of the given angle A, and ſo the proportion for finding B C, when A B is made the radius, will be:

R T, A . . A B : B C

i. e. as the radius in the tables, is to the tangent of the angle A in the ſame, ſo the length of B A, or radius in the ſcheme, to the length of B C or tangent of A in the ſcheme; therefore looking in the tables for the parts given in the foregoing proportion, and proceeding with them according to that rule, we ſhall find B C to be 57.28 as before, and the operation will be as follows:

9.82352	T, A	33°, 40′
1.93450	A B	86
11.75802		
10.00000	Rad.	90°
1.75802	B C	57.28

Laſtly, by making B C, the leg required, the radius, it is plain that A B will be the tangent of C, and the proportion for finding B C will be as follows:

T, C : R . : A B : B C

i. e. as the tangent of C	56°, 20′	10.17648
is to radius	90°	10.00000
ſo is the length of A B	86	1.93450
		11.93450
		10.17648
to the length of B C	57.28	1.75802

Caſe II. The angles and one of the legs given, to find the hypothenuſe.

Example: In the triangle A B C, (*ibid.* n° 4.) ſuppoſe A B 124, and the angle A 34°, 20′; conſequently the angle C 55°, 40′ required the hypothenuſe A C, in the ſame parts with A B.

1. Geometrically: this caſe is conſtructed after the ſame manner with the former; and the hypothenuſe, A C, is found, by taking its length in your compaſſes, and applying that to the ſame line of equal parts from which A B was taken.

2. By calculation: firſt, making A C the radius, we ſhall have the following proportion for finding A C, *viz.*

S, C . R : : A B . A C.

i. e. as the ſine of C	55° 40′	9.91686
is to radius -	90°	10.00000
ſo is A B	124	2.09342
to A C	150.2	2.17656

Secondly, making A B the radius, we have this proportion, *viz.*

R: ſec. A: : A B: A C.

i. e. as the radius	90°	10.00000
to the ſecant of A	34° 20′	10.08314
ſo is A B	124	2.09342
to A C -	150.2	2.17656

This may alſo be done, without the help of the ſecants; for ſince R. ſec. : : Co-S. : R; therefore, the former proportion will become,

Co - S, A : R : : A B : A C.

i. e. as the co-ſine of A	34°, 20′	9.91686
is to the radius	90°	10.00000
ſo is A B	124	2.09342
to A C	150.2	2.17656

Thirdly, Making B C the radius, we have the following proportion, *viz.*

T, C : Sec. C : : A B : A C.

i. e. as the tangent of C	55°, 40′	10.16558
is to ſec. C	55°, 40′	10.24872
ſo is A B -	124	2.09342
to A C	150.2	2.17656

This likewiſe may be done without the help of ſecants; for ſince T, : Sec. : S, : R; therefore the former analogy will be reduced to this, *viz.*

S, C : R : A B : A C

where no ſecants do appear, and it coincides with that in the firſt ſuppoſition of this caſe, ſo we ſhall not repeat the operation.

Caſe III. The angles and hypothenuſe given, to find either of the legs.

Example: In the triangle A B C, (*ibid.* n° 4.) ſuppoſe the hypothenuſe A C = 146, and the angle A = 36° 25′; conſequently the angle C = 53° 35′; required the leg A B.

1. Geometrically: draw the line A B at pleaſure, and make the angle B A C equal to 36°, 25′; then take A C equal to 146 from any line equal parts; laſtly, from the point C, let fall the perpendicular C B, on the line A B. So the the triangle is conſtructed, and A B may be meaſured from the line of equal parts.

2. By calculation: firſt, making A C the radius, we ſhall have the following proportion, *viz.*

R : S, C : : A C : A B.

i. e. As radius	90°	10.00000
to the ſine of C	53° 35′	9.90565
ſo is A C	146	2.16435
to A B	117.5	2.07000

Secondly,

Secondly, making A B the radius, we have the following analogy, *viz.*

Sec. A : R : : A C : A B.

i. e. As the secant of A	36° 25′	10.09435
is to radius	90°	10.00000
ſo is A C	146	2.16435
to A B	117.5	2.07000

This may alſo be done without the help of ſecants; for ſince ſec. . R : : R : Co. S, the former proportion may be reduced to this, *viz.*

R : Co-S, A : : A C : A B,

which is the ſame with the proportion in the firſt ſuppoſition.

Thirdly, By ſuppoſing B C the radius, we have the following proportion, *viz.*

Sec. C : T, C : : A C : A B,

i. e. as the ſecant of C	53°, 35′	10.22647
is to the tangent of C	53°, 35′	10.13212
ſo is A C	146	2.16435
to A B	117.5	2.07000

Caſe IV. The two legs being given, to find the angles.

Example: In the triangle A B C, (*ibid.* n° 5.) ſuppoſe A B 94 and B C 56, required the angles A and C.

1. Geometrically: draw A B equal to 94, from any line of equal parts, then from the point B raiſe B C perpendicular to A B, and take B C, from the former line of equal parts equal to 56; laſtly, join the points A and C with the ſtreight line A C, ſo the triangle is conſtructed, and the angles may be meaſured by a line of chords. See SCALE and SECTOR.

2. By calculation: firſt, ſuppoſing A B the radius, we have this analogy, *viz.*

A B : B C : : R : T, A,

i. e. as A B	94	1.97313
is to B C	56	1.74819
ſo is the radius	90°	10.00000
to the tangent of A	30°, 47′	9.77506

Secondly, making B C the radius, we have this proportion, *viz.*

B C : B A : : R : T, C.

i. e. as B C	56	1.74819
is to A B	94	1.97313
ſo is the radius	90°	10.00000
to the tangent of C	59° 13′	10.22494

Caſe V. The hypothenuſe and one of the legs given, to find the angles.

Example: In the triangle D E F, (*ibid.* n° 6.) ſuppoſe the leg D E = 83, and the hypothenuſe D F = 126; required the angles D and F.

1. Geometrically: draw the line D E = 83, from any line of equal parts; and, from the point E, raiſe the perpendicular E F: then take the length of D F = 126, from the ſame line of equal parts; and ſetting one foot of your compaſſes in D, with the other croſs the perpendicular E F in E: Laſtly, join D and F; and the triangle being thus conſtructed, the angles may be meaſured by a line of chords.

2. By calculation: firſt, making D F the radius, we ſhall have this proportion, *viz.* D F : D E : : R : S, F.

i. e. as D F	126	2.10037
is to D E	83	1.91908
ſo is radius	90°	10.00000
to the ſine of F	41° 12′	9.81871

Secondly, by ſuppoſing D E the radius, we have the following analogy, *viz.*

D E : D F : R : Sec. D.

i. e. as D E	83	1.91908
is to D F	126	2.10037
ſo is radius	90°	10.00000
to the ſecant of D	48° 48′	10.18129

This may be done without the help of ſecants; for ſince R : ſec. : : Co-S, : R, the foregoing analogy will become this, *viz.* D F : D E : R : Co-S, D, which gives the ſame anſwer, with that deduced from the firſt ſuppoſition.

Caſe VI. The two legs being given, to find the hypothenuſe.

Example: In the triangle A B D, (*ibid.* n° 7.) ſuppoſe the leg A B = 64, and B D = 56: required the hypothenuſe.

1. Geometrically: the conſtruction of this caſe is performed the ſame way as in the fourth caſe, and the length of the the hypothenuſe is found by taking it in your compaſſes, and applying it to the ſame line of equal parts, that the two legs were taken from.

2. By calculation: this caſe being a compound of the fourth and ſecond caſes, we muſt firſt find the angles by the fourth, thus:

A B . D B : R : T, A.

i. e. as the leg A B	64	1.80618
is to the leg D B	56	1.74819
ſo is the radius	90	10.00000
to the tangent of A	41° 11′	9.94201

Then by the ſecond caſe we find the hypothenuſe required thus:

S, A : R : : B D A D,

i. e. as the ſine of A	41°. 11′	9.81854
is to the radius	90°	10.00000
ſo is the leg B D	56	1.74819
to the hypothe. A D	85.05	1.92965

This caſe may alſo be ſolved after the following manner, *viz.*

From twice the log. of the greater ſide A B	3.61236
ſubtract the log. of the leſſer ſide B D	1.74819
and there remains	1.86417

the

Fig. 1 Oblique-angled TRIGONOMETRY

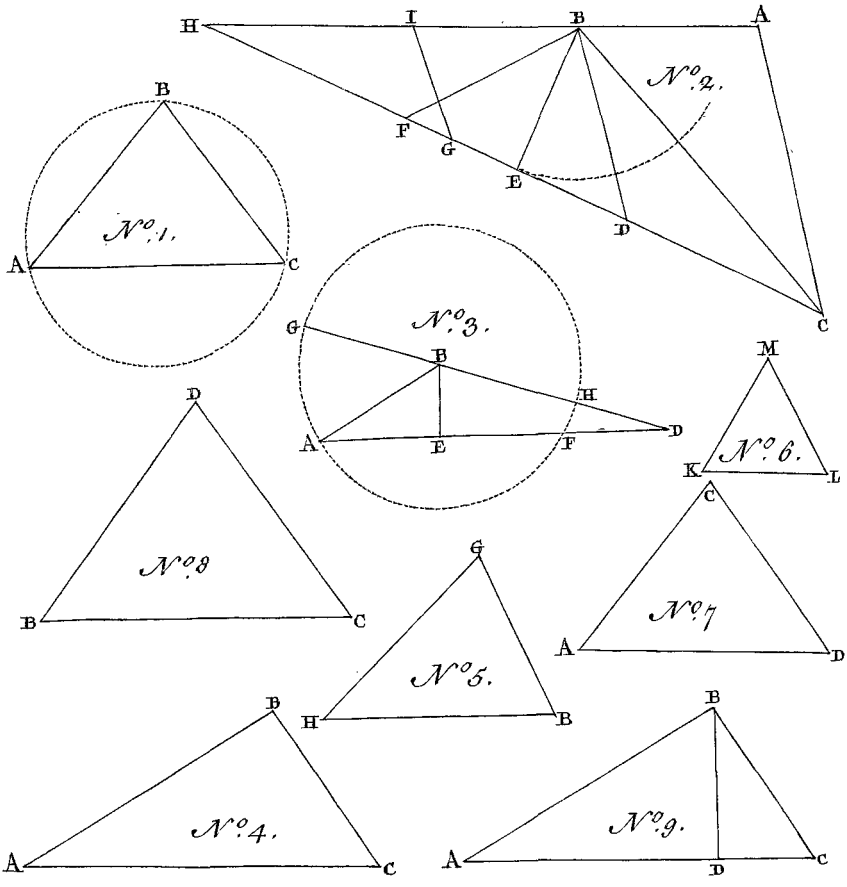

Fig. 2. Spherical TRIGONOMETRY

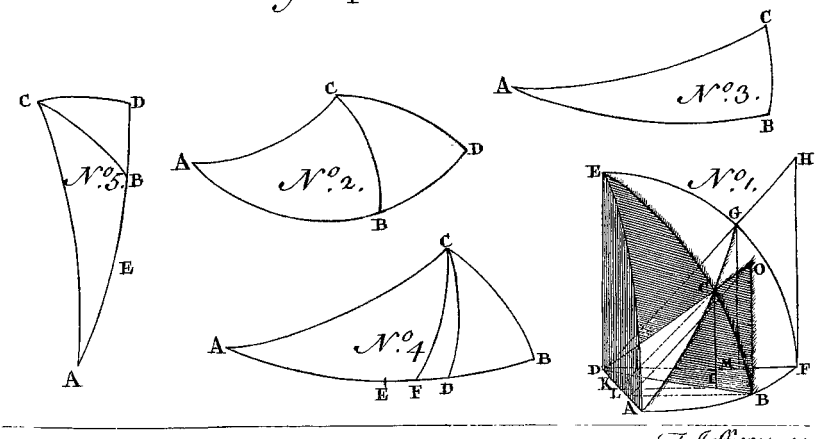


T. Jefferys sculp

the logarithm of 73.15; to which adding the leſſer ſide B D, we ſhall have 189.15 whoſe log. is - 2.11093
to which add the log. of the leſſer ſide B D 1.74819
and the ſum will be 3.85912
the half of which is 1.92956
the logarithm of the hypothenuſe required. See LOGARITHM.

Or it may be done by adding the ſquare of the two ſides together, and taking the logarithm of that ſum, the half of which is the logarithm of the hypothenuſe required: thus, in the preſent caſe,
the ſquare of A B (64) is 4096
the ſquare of B D (56) is 3136
the ſum of theſe ſquares is 7232
the log. of which is 3.85926
the half of which is 1.92963 =
to the logarithm of 85.05, the length of the hypothenuſe required.

Caſe VII. The hypothenuſe and one of the legs being given, to find the other leg.

Example: in the triangle B G D, (*ibid.* n° 8.) ſuppoſe the leg B G = 87, and the hypothenuſe B D = 142; required the leg D G.

1. Geometrically: the conſtruction here is the ſame as in caſe V. the ſame things being given; and the leg D G is found by taking its length in your compaſſes, and applying that to the ſame line of equal parts, the others were taken from.

2. By calculation: the ſolution of this caſe depends upon the 1ſt and 5th, and firſt we muſt find the oblique angles by caſe 5th thus:

D B : B G :: R : S, D.

i. e. as the hypoth. D B	142	2.15229
is to the leg B G	87	1.93952
ſo is radius	90°,	10.00000
to the ſine of D	37°, 47′	9.78723

Then by caſe 1ſt, we find the leg D G required, thus:

R : S, B :: B D : D G,

i. e. as radius	90°	10.00000
is to the ſine of B	52°, 13′	9.89781
ſo is the hypoth. D B	142	2.15229
to the leg D G	112.2	2.05010

The leg D G may alſo be found in the following manner, *viz.*
To the log. of the ſum of the hypothenuſe and given leg, *viz.* 229 - } 2.35984
add the log. of their difference, *viz.* 55 1.74036
and their ſum is 4.10020
the half of that is 2.05010
the log. of 112.2 the leg required.

Or it may be done by taking the ſquare of the given leg from the ſquare of the hypothenuſe, and the ſquare root of the remainder is the leg required; thus, in the preſent caſe.
The ſquare of the hypothenuſe (142) is - 20164
The ſquare of the leg B G (87) is 7569
Their difference is 12595
Whoſe logarithim is 4.10020
The half of which is 2.05010
which anſwers to the natural number 112.2 the leg required.

Thus have we gone through the ſeven caſes of right-angled plane-trigometry; from which we may obſerve; 1. That to find a ſide, when the angles are given, any ſide may be made the radius. 2. To find an angle, one of the given ſides muſt of neceſſity be made the radius.

II. We now proceed to oblique-angled plane trigonometry, in which there are ſix caſes; but before we ſhew their ſolution, it will be proper to premiſe the following theorems.

Theorem 1. In any triangle ABC (plate CCLXXXIV. fig. 1. n° 1.) the ſides are proportional to the ſines of the oppoſite angles: thus, in the triangle A B C, A B : B C :: S, C : S, A, and A B : A C :: S, C : S, B: alſo A C : B C :: S, B : S, A.

Demonſtration: let the triangle A B C be inſcribed in a circle; then, it is plain (from the property of the circle) that the half of each ſide is the ſine of its oppoſite angle: but the ſines of theſe angles, in tabular parts, are proportional to the ſines of the ſame in any other meaſure; therefore, in the triangle A B C, the ſines of the angles will be as the halves of their oppoſite ſides; and ſince the halves are as the wholes, it follows, that the ſines of the angles are as their oppoſite ſides; *i. e.* S, C : S, A :: A B : B C, *&c.*

Theor. 2. In any plane triangle, as A B C (*ibid.* n° 2.) the ſum of the ſides, A B and B C, is to the difference of theſe ſides, as the tangent of half the ſum of the angles B A C, A B C, at the baſe, is to the tangent of half the difference of theſe angles.

Demon. Produce A B; and make B H equal to B C; join H C, and from B let fall the perpendicular B E; through B draw B D parallel to A C, and make H F equal to C D, and join B F; alſo take B I equal to B A, and draw I G parallel to B D or A C.

Then

Then it is plain that AH will be the ſum, and HI the difference of the ſides AB and BC; and ſince HB is equal to BC, and BE perpendicular to HC, therefore HE is equal to EC; and BD being parallel to AC and IG, and AB equal to BI, therefore CD or HF is equal to GD, and conſequently HG is equal to FD, and half HG is equal to half FD or ED. Again, ſince HB is equal to BC, and BE perpendicular to HC, therefore the angle EBC is half the angle HBC; but the angle HBC is equal to the ſum of the angles A and C, conſequently the angle EBC is equal to half the ſum of the angles A and C. Alſo ſince HB is equal BC, and HF equal to CD, and the included angles BHF, BCD equal, it follows that the angle HBF is equal to the angle DBC, which is equal to BCA; and ſince HBD is equal to the angle A, and HBF equal to BCA, therefore FBD is the difference, and EBD half the difference of the two angles A and BCA; ſo making EB the radius, it is plain EC is the tangent of half the ſum, and ED the tangent of half the difference of the two angles at the baſe. Now IG being parallel to AC, the triangles HIG and HAC will be equiangular; conſequently AH : IH :: CH : GH; but the wholes are as their halves, therefore AH : IH :: $\frac{1}{2}$CH : $\frac{1}{2}$GH; and ſince $\frac{1}{2}$CH is equal to EC, and $\frac{1}{2}$GH equal to $\frac{1}{2}$FD = ED, therefore AH : IH :: EC : ED. Now AH is the ſum, and IH the difference of the ſides; alſo EC is the tangent of half the ſum, and ED the tangent of half the difference of the two angles at the baſe; conſequently, in any triangle, as the ſum of the ſides is to their difference, ſo is the tangent of half the ſum of the angles at the baſe to the tangent of half their difference.

Theorem 3. If to half the ſum of two quantities be added half their difference, the ſum will be the greater of them; and if from half their ſum be ſubtracted half their difference, the remainder will be the leaſt of them. Suppoſe the greater quantity to be $x = 8$, and the leſſer $x = 6$; then is their ſum 14, and difference 2: wherefore, adding $\frac{14}{2} = 7$ to $\frac{2}{2} = 1$, we get 8 the greateſt of the two quantities; and, in the ſame manner, $\frac{14}{2} - \frac{2}{2} = 7 - 1 = 6$, the leaſt of the two quantities.

Theor. 4. In any right-lined triangle, ABD (*ibid.* n° 3.) the baſe AD is to the ſum of the ſides AB and BD, as the difference of the ſides is to the difference of the ſegments of the baſe made by the perpendicular BE, *viz.* the difference between AE and ED.

Demon. Produce DB till BG be equal to BA the leſſer leg; and on B as a center with the diſtance BA or BG, deſcribe the circle AGHF, which will cut BD and AD in the points H and F; then it is plain GD is the ſum, and HD the difference of the ſides; alſo ſince AE is equal to EF; therefore FD is the difference of the ſegments of the baſe; but AD : GD :: HD : FD; therefore the baſe is to the ſum of the ſides, *&c.* as was to be proved.

Having eſtabliſhed theſe preliminary theorems, we ſhall now proceed to the ſolution of the ſix caſes of oblique-angled plane trigonometry.

Caſe I. In any oblique-angled plane triangle, two ſides and an angle oppoſite to one of them being given, to find the angle oppoſite to the other.

Example: In the triangle ABC (*ibid.* n° 4.) ſuppoſe AB = 156, BC = 84, and the angle C (oppoſite to AB) = 56° 30′; required the angle A, oppoſite to BC.

1. Geometrically: Draw the line AC, and at any point of it, ſuppoſe C, make the angle C = 56° 30′; then take CB = 84, and with the length of 156 = AB taken in your compaſſes from the ſame ſcale of equal parts, fixing one point in B, with the other croſs AC in A. Laſtly, join A and B; ſo the triangle is conſtructed, and the required angle A may be meaſured by a line of chords.

2. By calculation: We have, by theor. 1. the following proportion for finding the angle A, *viz.*

AB : BC :: S, C : S, A.

i. e. as AB	156	2.19312
To BC	84	1.92428
So is S, C	56° 30′	9.92111
To S, A -	26° 41′ -	9.65227

Caſe II. The angles, and a ſide oppoſite to one of them, being given, to find a ſide oppoſite to another.

Example: In the triangle HBG (*ibid.* n° 5.) ſuppoſe the angle H 46° 15′, and the angle B 54° 22, conſequently the angle G 79° 23′, and the leg HB 125, required HG.

Geometrically: Draw HB 125, from any line of equal parts, and make the angle H 46° 15′, and B 54° 22′, then produce

produce the lines HG and BG till they meet one another in the point G; ſo the triangle is conſtructed, and HG is meaſured by taking its length in your compaſſes, and applying it to the ſame line of equal parts that HB was taken from.

2. By calculation: By the firſt of the preceding theorems, we have this analogy for finding HG, *viz.*

S, G : HB : : S, B : HG.

i. e. As the ſine of G	79° 23′	9.99250
is to the leg HB	125	2.09691
So is the ſine of B	54° 22′	9.90996
to the leg HG -	103.4	2.01437

Caſe III. Two ſides and an angle oppoſite to one of them given, to find the third ſide.

Example: In the triangle KLM (*ibid.* n° 6.) ſuppoſe the ſide KL 126 equal parts, and KM 130 of theſe parts, and the angle L (oppoſite to KM) 63° 20′, required the ſide ML.

1. Geometrically: The conſtruction of this caſe is the ſame with that in Caſe I. (there being the ſame things given in both) and the leg ML may be meaſured by applying it to the ſame line of equal parts that the other two were taken from.

2. By calculation: The ſolution of this caſe depends upon the two preceding ones; and, firſt, we muſt find the other two angles by Caſe I. thus:

MK : S, L : : KL : S, M.

i. e. As the ſide MK -	130	2.11394
To the ſine of L	63° 20′	9.95116
So is the ſide KL	126	2.10037
To the ſine of M	60° 1′	9.93759

Then by Caſe II. we have the required leg ML, thus:

S. L : S. K : : MK : ML.

i. e. As the ſine of L	63° 20′	9.95116
To the ſine of K	53° 39′	9.90602
So is MK	130	2.11394
To ML - -	117.2 -	2.06850

Caſe IV. Two ſides and the contained angle being given, to find the other two angles.

Example: In the triangle ACD (*ibid.* n° 7.) ſuppoſe AC = 103, AD = 126, and the angle A = 54° 30′; required the angles C and D.

1. Geometrically: Draw AD = 126, and make the angle A = 54° 30′; then ſet off 103 equal parts from A to C: laſtly, join C and D; and ſo the triangle is conſtructed, and the angles C and D may be meaſured by a line of chords.

2. By calculation: The ſolution of this caſe depends upon the ſecond and third of the preceding theorems; and firſt we muſt find the ſum and difference of the ſides, and half the ſum of the unknown angles, thus:

The leg AD is -	126
The leg AC is -	103
Their ſum is -	229
And their difference is - -	23
The ſum of the three angles A, D and C is	180°
The angle A is	54° 30′
So the ſum of the angles C and D will be -	125°, 30′
And half their ſum is - -	62° 45′

Then by theor. 2. we have the following proportion, *viz.*

As the ſum of the ſides AD and AC = 229 -		2.35984
To their difference -	23	1.36173
So is the tangent of half the ſum of the unknown angles C and D	62° 45′	10.28816
To tang. of half their difference -	11° 2′	9.29005

Now having half the ſum and half the difference of the two unknown angles C and D, we find the quantity of each of them by theorem 3. thus:

To half the ſum of the angles C and D, *viz.* -	62° 45′
Add half their difference, *viz.*	11° 02′
And the ſum is the greater ang. C	73° 47′
Again, from half their ſum, *viz.*	62° 45′
Take half their difference, *viz.*	11° 02′
And there will remain the leſſer angle D -	= 51° 43′

N. B. The greater angle is always that ſubtended by the greater ſide: thus, in the preſent caſe, the greater angle C, is ſubtended by the greater ſide AD; and the leſſer angle D, is ſubtended by the leſſer ſide AC.

Caſe V Two ſides and the contained angle being given, to find the third ſide.

Example: In the triangle BCD (*ibid.* n° 8.) ſuppoſe BC = 154, BD = 133, and the angle B = 56° 03′; required the ſide CD.

1. Geometrically: The conſtruction of this caſe is the ſame with that of the laſt, and the length of DC is found by taking its length in your compaſſes, and applying it to the ſame line of equal parts that the two legs were taken from.

2. By calculation: The ſolution of this caſe depends upon the ſecond and fourth; and firſt we muſt find the angles by the laſt caſe; thus:

As the ſum of the ſides BD and BC 287	-	2.45788
Is to their difference 21		1.32222
So is the tangent of half the ſum of the angles D and C	61° 58′	10.27372
To the tangent of half their difference 7, 50′	-	9.13806

So by theorem 3. we have the angles D and C thus:

To half the ſum of the angles D and C	-	61° 58′
Add half their difference		7° 50′
And the ſum is the greater angle D		69° 48′
Alſo, from half the ſum		61° 58′
Take half the difference		7° 50′
And there remains the leſſer angle C		54° 08′

Then by Caſe II. we have the following analogy for finding DC the leg required, *viz.*

S, C : BD : : S, B : DC.

i. e. As the ſine of C	54° 08′	9.90869
To BD -	133	2.12385
So is the ſine of B -	56° 03′	9.91883
To DC -	136.2	2.13399

Caſe VI. Three ſides being given, to find the angles.

Example: In the triangle ABC (*ibid.* n° 9.) ſuppoſe AB=156, AC=185.7, and BC=84; required the angles A, B, and C.

1. Geometrically Make AC=185.7 from any line of equal parts; and from the ſame line taking 156=AB in your compaſſes, fix one foot of them in A, and with another ſweep an arch; then take 84=BC in your compaſſes, and fixing one foot in C, with the other ſweep an arch, which will croſs the former in B: laſtly, join the points B and A, and B and C; ſo the triangle will be conſtructed, and the angles may be meaſured by a line of chords.

2. By calculation: Let fall the perpendicular, BD, from the vertex B, upon the baſe AC; which will divide the baſe into two ſegments AD and DC, the lengths whereof may be found by theor. 4. thus:

As the baſe AC	185.7 -	2.26893
To the ſum of the ſides AB and BC 240	-	2.38031
So is the diff. of the ſides	72 -	1.85733
To the difference of the ſegments of the baſe 93	-	1.96871

And having the ſum of the ſegments, *viz.* the whole baſe, and their difference, we find the ſegments themſelves, by theorem 3. thus:

To half the ſum of the ſegments	92.8
Add half their difference	46.5
And the ſum is the greater ſeg. AD	139.3
Alſo from half the ſum of the ſeg.	92.8
Take half their difference -	46.5
The remainder is the leſſer ſeg. DC	46.3

Now the triangle ABC is divided, by the perpendicular DB, into two right-angled triangles, ADB, and DBC; in the firſt of which are given the hypothenuſe AB=156, and the baſe AD=139.3, to find the oblique angles, for which we have (by Caſe V. of rectangular trigonometry) the following analogy, *viz.*

As AB -	156	2.19312
To AD	139.3	2.14395
So is the radius	90°	10.00000
To the co-ſine of the angle A -	26° 40′	9.95083

Alſo the angle C is found by the ſame caſe, thus:

As BC	84	1.92428
To CD -	46.3	1.66558
So is the radius -	90°	10.00000
To the co-ſine of C	56° 30′	9.74130

Having found the two angles A and C, we have the third, B, by taking the ſum of the other two from 180, thus:

The ſum of all the three angles is	180°
The ſum of A and C is	83° 10′
The angle B is	96° 50′

All the proportions uſed for the ſolutions of the ſeveral caſes in plain trigonometry, may be performed by the ſcale and compaſs. On the ſcale there are ſeveral logarithmic lines, *viz.* one of numbers, another of ſines, and one of tangents, *&c.* See the article SCALE.

And the way of working a proportion by theſe is this, *viz.* extend your compaſſes from the firſt term of your proportion, found on the ſcale, to the ſecond, and with that extent, fixing one foot in the third term, the other will reach the fourth term required.

Spherical TRIGONOMETRY, is the art whereby, from three given parts of a ſpherical triangle, we diſcover the reſt; and, like plane trigonometry, is either right-angled, or oblique-angled. But before we give the analogies for the ſolution of the ſeveral caſes in either, it will be proper to premiſe the following theorems.

Theorem 1. In all right-angled ſpherical triangles, the ſine of the hypothenuſe: radius: : ſine of a leg: ſine of its oppoſite angle. And the ſine of a leg: radius

radius : : tangent of the other leg : tangent of its oppoſite angle.

Demonſtration: Let EDAFG (plate CCLXXXIV. fig. 2. n° 1.) repreſent the eighth part of a ſphere, where the quadrantal planes EDFG, EDBC, are both perpendicular to the quadrantal plane ADFB; and the quadrantal plane ADGC is perpendicular to the plane EDFG; and the ſpherical triangle ABC is right-angled at B, where CA is the hypothenuſe, and BA, BC, are the legs.

To the arches GF, CB, draw the tangents HF, OB, and the ſines GM, CI, on the radii DF, DB; alſo draw BL the ſine of the arch AB, and CK the ſine of AC; and then join IK and OL. Now HF, OB, GM, CI, are all perpendicular to the plane ADFB. And HD, GK, OL, lie all in the ſame plane ADGC. Alſo FD, IK, BL, lie all in the ſame plane ADGC. Therefore, the right-angled triangles HFD, CIK, ODL, having the equal angles HDF, CKI, OLB, are ſimilar. And CK: DG : : CI : GM; that is, as the ſine of the hypothenuſe : rad. : : ſine of a leg : ſine of its oppoſite angle. For GM is the ſine of the arc GF, which meaſures the angle CAB. Alſo, LB : DF : : BO : FH; that is, as the ſine of a leg : rad. : : tang. of the other leg : tang. of its oppoſite angle. Q. E. D.

Hence it follows, that the ſines of the angles of any oblique ſpherical triangle ACD (*ibid.* n° 2.) are to one another, directly, as the ſines of the oppoſite ſides.

Hence it alſo follows, that, in right-angled ſpherical triangles, having the ſame perpendicular, the ſines of the baſes will be to each other, inverſely; as the tangents of the angles at the baſes.

Theorem 2. In any right-angled ſpherical triangle ABC (*ibid.* n° 3.) it will be, as radius is to the co-ſine of one leg, ſo is the co-ſine of the other leg to the co-ſine of the hypothenuſe.

Hence, if two right-angled ſpherical triangles ABC, CBD (*ibid.* n° 2.) have the ſame perpendicular BC, the co-ſines of their hypothenuſes will be to each other, directly, as the co-ſines of their baſes.

Theorem 3. In any ſpherical triangle it will be, as radius is to the ſine of either angle, ſo is the co-ſine of the adjacent leg to the co-ſine of the oppoſite angle.

Hence, in right-angled ſpherical triangles, having the ſame perpendicular, the co-ſines of the angles at the baſe will be to each other, directly, as the ſines of the vertical angles.

Theorem 4. In any right-angled ſpherical triangle it will be, as radius is to the co-ſine of the hypothenuſe, ſo is the tangent of either angle to the co-tangent of the other angle.

As the ſum of the ſines of two unequal arches is to their difference, ſo is the tangent of half the ſum of thoſe arches to the tangent of half their difference: and, as the ſum of the co-ſines is to their difference, ſo is the co-tangent of half the ſum of the arches to the tangent of half the difference of the ſame arches.

Theorem 5. In any ſpherical triangle ABC (*ibid.* n° 4. and 5.) it will be, as the co-tangent of half the ſum of the two ſides is to the tangent of half their difference, ſo is the co-tangent of half the baſe to the tangent of the diſtance (DE) of the perpendicular from the middle of the baſe.

Since the laſt proportion, by permutation, becomes co-tang. $\frac{AC+BC}{2}$: co-tang. AE : : tang. $\frac{AC-BC}{2}$: tang. DE, and as the tangents of any two arches are, inverſely, as their co-tangents; it follows, therefore, that tang. AE : tang. $\frac{AC+BC}{2}$: : tang. $\frac{AC-BC}{2}$: tang. DE; or, that the tangent of half the baſe is to the tangent of half the ſum of the ſides, as the tangent of half the difference of the ſides to the tangent of the diſtance of the perpendicular from the middle of the baſe.

Theorem 6. In any ſpherical triangle ABC (*ibid.* n° 4.) it will be, as the co-tangent of half the ſum of the angles at the baſe, is to the tangent of half their difference, ſo is the tangent of half the vertical angle to the tangent of the angle which the perpendicular CD makes with the line CF biſecting the vertical angle.

The Solution of the Cases of right-angled spherical Triangles, (*ibid.* n° 3.)

Case	Given	Sought	Solution
1	The hyp. A C and one angle A	The opposite leg B C	As radius : sine hyp. A C : : sine A : sine B C (by the former part of theor. 1.)
2	The hyp. A C and one angle A	The adjacent leg A B	As radius : co-sine of A : : tang. A C : tang. A B (by the latter part of theo. 1.)
3	The hyp. A C and one angle A	The other angle C	As radius : co-sine of A C : : tang. A : co-tang. C (by theorem 4.)
4	The hyp. A C and one leg A B	The other leg B C	As co-sine A B : radius : : co-sine A C : co-sine B C (by theorem 2.)
5	The hyp. A C and one leg A B	The opposite angle C	As sine A C : radius : : sine A B : sine C (by the former part of theor. 1.)
6	The hyp. A C and one leg A B	The adjacent angle A	As tang. A C : tang. A B : : radius : co-sine A (by theorem 1.)
7	One leg A B and the adjacent angle A	The other leg B C	As radius : sine A B : : tangent A : tangent B C (by theorem 4.)
8	One leg A B and the adjacent angle A	The opposite angle C	As radius : sine A : : co sine of A B : co-sine of C (by theorem 3.)
9	One leg A B and the adjacent angle A	The hyp. A C	As co-sine of A : radius : : tang. A B : tang. A C (by theorem 1.)
10	One leg B C and the opposite angle A	The other leg A B	As tang. A : tang. B C : : radius : sine A B (by theorem 4.)
11	One leg B C and the opposite angle A	The adjacent angle C	As co-sine B C : radius : : co-sine of A : sin. C (by theorem 3.)
12	One leg B C and the opposite angle A	The hyp. A C	As sin. A : sin. B C : : radius : sin. A C (by theorem 1.)
13	Both legs A B and B C	The hyp. A C	As radius : co-sine A B : : co-sine B C : co-sine A C (by theorem 2.)
14	Both legs A B and B C	An angle, suppose A	As sine A B : radius : : tang. B C : tang. A (by theorem 4.)
15	Both angles A and C	A leg, suppose A B	As sine A : co-sine C : : radius : co-sine A B (by theorem 3.)
16	Both angles A and C	The hyp. A C	As tang. A : co-tang. C : : radius : co-sine A C (by theorem 4.)

Note, The 10th, 11th, and 12th cases are ambiguous; since it cannot be determined by the data, whether A B, C, and A C, be greater or less than 90 degrees each.

The Solution of the Cases of oblique spherical Triangles, (*ibid* n° 4 and 5.)

Case	Given	Sought	Solution
1	Two sides A C, B C, and an angle A opposite to one of them.	The angle B opposite to the other	As sine B C : sine A : : sine A C : sine B (by theor. 1.) Note, this case is ambiguous when B C is less than A C; since it cannot be determined from the data whether B be acute or obtuse.
2	Two sides A C, B C, and an angle A opposite to one of them.	The included angle A C B	Upon A B produced (if need be) let fall the perpendicular C D: then (by theor. 4.) rad. : co-sine A C : : tang. A : co-tang. A C D; but (by theor. 1.) as tang. B C : tang. A C : : co sine A C D : co-sine B C D. Whence A C B = A C D ± B C D is known.

Case	Given	Sought	Solution
3	Two ſides A C, B C, and an angle oppoſite to one of them	The other ſide A B	As rad. : co-ſine A : : tang. A C : tang. A D (by theor. 1.) and (by theor. 2.) as co-ſin. A C : co-ſin. B C : : co-ſin. A D : co-ſin. B D. Note, this and the laſt caſe are both ambiguous when the firſt is ſo.
4	Two ſides A C, A B, and the included angle A	The other ſide B C	As rad. : co-ſin. A : : tang. A C : tan. A D (by theor. 1.) whence B D is alſo known : then (by theor. 2.) as co-ſine A D : co-ſine B D : : co-ſine A C : co-ſine B C.
5	Two ſides A C, A B, and the included angle A	Either of the other angles, ſuppoſe B	As rad. : co-ſine A : : tang. A C : tan. A D (by theorem 1.) whence B D is known : then (by theor. 4.) is ſine B D : ſine A D : : tan. A : tan. B.
6	Two angles A, A C B, and the ſide A C betwixt them	The other angle B	As rad. : co-ſine A C : : tang. A : co-tang. A C D (by theor. 4.) whence B C D is alſo known : then (by theor. 3.) as ſine A C D : ſine B C D : : co-ſine A : co-ſine B.
7	Two angles A, A C B, and the ſide A C betwixt them	Either of the other ſides, ſuppoſe B C	As rad. : co-ſine A C : : tang. A : co-tang. A C D (by theo. 4.) whence B C D is alſo known : then, as co-ſine B C D : co ſine A C D : : tang. A C : tang. B C (by theor. 1.)
8	Two angles A, B, and a ſide A C oppoſite to one of them	The ſide B C oppoſite the other	As ſine B : ſine A C : : ſine A . ſine B C (by theorem 1.)
9	Two angles A, B, and a ſide A C oppoſite to one of them	The ſide A B betwixt them	As rad. : co-ſine A : : tang. A C : tan. A D (by theor. 1.) and as : tang. B : tang. A : : ſine A D : ſine B D (by theor. 4.) whence A B is alſo known.
10	Two angles A, B, and a ſide A C oppoſite to one of them	The other angle A C B	As rad. : co-ſine A C : : tang. A : co-tang. A C D (by theor. 4.) and as co-ſine A : co-ſine B : : ſine A C D : ſine B C D (by theor. 3.) whence A C B is alſo known.
11	All the three ſides A B, A C, and B C	An angle, ſuppoſe A	As tang. $\frac{1}{2}$ A B : tang. $\frac{AC+BC}{2}$: tang. $\frac{AC-BC}{2}$: tang. D E, the diſtance of the perpendicular from the middle of the baſe (by theor. 6.) whence A D is known : then, as tang. A C : tang. A D : : rad. : co-ſine A (by theorem 1.)
12	All the three angles A, B, and A C B	A ſide, ſuppoſe A C	As co-tan. $\frac{ABC+A}{2}$: tang. $\frac{ABC-A}{2}$: : tang. $\frac{ACB}{2}$: tang. of the angle included by the perpendicular and a line biſecting the vertical angles ; whence A C D is alſo known : then (by theor. 5.) tang. A : co-tang. A C D : : rad. co-ſine A C.

Note, in letting fall your perpendicular, let it always be from the end of a given ſide, and oppoſite to a given angle.

TRILLION, in arithmetic, a billion of billions. See NUMERATION.

TRILLO, in muſic, the ſame with cadence. See the article CADENCE.

TRIM *of a ſhip*, her beſt poſture, proportion of ballaſt, and hanging of her maſts, *&c.* for ſailing. To find the trim of a ſhip, is to find the beſt way of making her ſail ſwiftly, or how ſhe will ſail beſt. This is done by eaſing of her maſts and ſhrouds; ſome ſhips ſailing much better when they are ſlack, than when they are tautor faſt: but this depends much upon experience and judgment, and the ſeveral trials and obſervations which the commander and other officers may make aboard.

TRIMACRUS, or TRIMACER, a foot, in antient poetry, the ſame with the moloſſus. See MOLOSSUS and FOOT.

TRIMMERS, in architecture, pieces of timber framed at right-angles to the joints, againſt the ways for chimneys, and well-holes for ſtairs.

TRINE, in aſtrology, the aſpect or ſituation of one ſtar with regard to another, when they are diſtant 120 degrees: it is noted with this character △.

TRING, a market-town of Hertfordſhire, twenty-four miles weſt of Hertford.

TRINGA, in ornithology, a genus of birds belonging to the order of the ſcolopaces, the characters of which are theſe: the beak is of a cylindric figure, obtuſe at the extremity, and in length about equal to the toes: the feet have each four toes, and they are connected.

To this genus belongs the ruff, the cinclus, the lapwing, the godwit, the tolk, grey plover, *&c.* See RUFF, CINCLUS, *&c.*

TRINGLE, in architecture, a name common to ſeveral little ſquare members or ornaments, as reglets, liſtels, and plat-bands.

TRINGLE is more particularly uſed for a little member fixed exactly over every triglyph, under the plat-band of the architrave, from whence the guttæ or pendant-drops hang down.

TRINIDAD, or TRINITY-ISLAND, is ſituated in the Atlantic or American ocean, between 60° and 62° of weſt longitude, and between 9° and 11° of north latitude; it is about ninety miles long, and ſixty broad.

TRINADAD, a port-town of Mexico, in America, ſituated in the province of Guatimala, an hundred and twenty miles ſouth-eaſt of the city of Guatimala: weſt long. 94°, north lat. 13°.

TRINITARIANS, thoſe who are orthodox and believe in the trinity: thoſe who do not believe therein, being called anti-trinitarians.

Trinitarians alſo denote an order of religious inſtituted at Rome in the year 1198, under the pontificate of Innocent III. the founders whereof were John de Matha, and Felix de Valois. His holineſs gave them permiſſion to eſtabliſh this order for the deliverance of captives, who groaned under the tyranny of the infidels: he gave them, as a habit, a white gown ornamented with a red and blue croſs. After the death of the two founders, pope Honorius III. continued the order, and their rule was approved by his ſucceſſor Clement IV. in 1267. At firſt they were not permitted to eat fleſh, and, when they travelled, were to ride only upon aſſes. But their rule was corrected and mitigated by the biſhop of Paris, and the abbots of St. Victor and St. Genevieve, who allowed them to eat any kind of food, and to uſe horſes. This order poſſeſſes about two hundred and fifty convents in thirteen different provinces: ſix of which are in France; namely, France, Normandy, Picardy, Champaine, Languedoc, and Provence; three in Spain, *viz.* New Caſtile, Old Caſtile, and Arragon; one is in Italy, and one in Portugal. There was formerly the province of England, where this order had forty-three houſes; that of Scotland, where it had nine; and that of Ireland, where it had fifty-two; beſides a great number of monaſteries in Saxony, Hungary, Bohemia, and other countries. The convent of Cerfroy in France is head of the order.

There are alſo nuns of the trinitarian order eſtabliſhed in Spain, by John de Matha himſelf, who built them a convent in 1201, under the direction of the infanta Conſtantia, daughter of Peter II. king of Arragon, who was the firſt religious, and the firſt ſuperior of that order. And, in 1612, Frances de Romero, daughter of Julian de Romero, lieutenant-general of the ſpaniſh army, founded a convent of barefooted trinitarian-nuns at Madrid.

TRINITY, *trinitas*, in theology, the ineffable myſtery of three perſons in one God; Father, Son, and Holy Spirit. See the article GOD, *&c.*

The doctrine of the trinity, as profeſſed

feſſed in the chriſtian church, is as follows: that there is but one God in three diſtinct perſons, Father, Son, and Holy Ghoſt; *perſon* ſignifying the ſame as *eſſence*, with a particular manner of ſubſiſtence, which the greek fathers call hypoſtaſis, taking it for the incommunicable property that makes a perſon. The Father, Son, and Holy Ghoſt are believed to be three diſtinct perſons in the divine nature, becauſe the ſcriptures, in ſpeaking of theſe three, diſtinguiſh them from one another, as we uſe in common ſpeech to diſtinguiſh three ſeveral perſons. There are many inſtances to this purpoſe; particularly the form of adminiſtring the ſacrament of baptiſm, which runs in the name of the Father, the Son, and the Holy Ghoſt: and that ſolemn benediction, with which St. Paul concludes his ſecond epiſtle to the Corinthians: "The grace of our Lord Jeſus "Chriſt, *&c.*" and the three witneſſes in heaven, mentioned by St. John. Each of theſe three perſons are affirmed to be God, becauſe the names, properties, and operations of God are, in the holy ſcripture, attributed to each of them.

The divinity of the Father is undiſputed. That of the Son is proved from the following texts, among many others. St. John ſays, "The Word was God;" St. Paul, "That God was manifeſted in the fleſh; that Chriſt is over all, God bleſſed for ever." Eternity is attributed to the Son: "the Son hath life in himſelf:" perfection of knowledge: "as the Father knoweth me, ſo know I the Father." And we are commanded, "To honour the Son, as we honour the Father." The divinity of the Holy Ghoſt reſts upon the following proofs, among others: Lying to the Holy Ghoſt, is called "lying to God:" becauſe Chriſtians are the temples of the Holy Ghoſt, they are ſaid to be the "temples of God." "His teaching all things; his guiding into all truth; his telling things to come; his ſearching all things, even the deep things of God, *&c.*" are adduced as plain characters of his divinity. Beſides, he is joined with God the Father, as an object of faith and worſhip, in baptiſm, and the apoſtolical benediction. Many of the heathens ſeem to have had a notion of a trinity in the Godhead; Plato and his followers ſpeak of it in ſuch terms, that the primitive fathers have been accuſed of borrowing the doctrine itſelf from the platonic ſchool. This point is treated at large in Cudworth's Intellectual Syſtem.

The ſeveral anti-trinitarian hereſies may be ſeen under their reſpective articles. See ARIANS, SABELLIANS, SOCINIANS, *&c.*

TRINITY-SUNDAY, a feſtival of the chriſtian church, obſerved on the Sunday next after Whitſunday, in honour of the holy and undivided trinity. The obſervation of this feſtival was firſt enjoined in the council of Arles, *anno* 1260.

TRINITY-HOUSE, a kind of college at Deptford, belonging to a company or corporation of ſeamen, who, by the king's charter, have power to take cognizance of thoſe perſons who deſtroy ſea-marks, and to get reparation of ſuch damages; and to take care of other things belonging to navigation. At preſent, many gentry and ſome nobility are members of that community.

The maſter, wardens, and aſſiſtants of the trinity-houſe, may ſet up beacons, and marks for the ſea, in ſuch places, near the coaſts or forelands, as to them ſhall ſeem meet. By a ſtatute of queen Elizabeth, no ſteeple, trees, or other things ſtanding as ſea marks, ſhall be taken away or cut down, upon pain that every perſon guilty of ſuch offence, ſhall forfeit 100l. and if the perſon offending be not poſſeſſed of the value, he ſhall be deemed convict of outlawry.

Fraternity of the TRINITY, a religious ſociety inſtituted at Rome by St. Philip Neri, in 1548. Theſe religious were appointed to take care of the pilgrims who came to viſit the tombs of St. Peter and St. Paul. The ſociety originally conſiſted of only fifteen religious, who aſſembled on the firſt Sunday of every month, in the church of St. Saviour del Campo, to hear the exhortations of the founder; after whoſe death pope Paul IV. gave the fraternity the church of St. Benedict, near which they have ſince built a large hoſpital, for the reception of pilgrims. The fraternity is one of the moſt conſiderable in Rome, and moſt of the nobility of both ſexes have been members thereof.

TRINOMIAL, or TRINOMIAL ROOT, in mathematics, is a root conſiſting of three parts connected together by the ſigns + or −, as $x+y+z$, or $a+b-c$. See the articles BINOMIAL and ROOT.

TRINQUIMALE, a port town of the iſland of Ceylon, ſituated on the north-eaſt part of the iſland: eaſt long. 80°, north lat. 9°.

TRIO,

TRIO, in muſic, a part of a concert wherein three perſons ſing; or more properly a muſical compoſition conſiſting of three parts. Trios are the fineſt kinds of compoſition, and theſe are what pleaſe moſt in concerts.

TRIOCLITE, in aſtrology, an aſpect or ſituation of two planets with regard to the earth, when they are three octants or eight parts of a circle; *i. e.* 135° diſtant from each other. This aſpect, which ſome call the ſeſquiquadrans, is one of the new aſpects ſuperadded to the old ones by Kepler.

TRIONES, in aſtronomy, a ſort of conſtellation or aſſemblage of ſeveral ſtars in in the urſa minor, commonly called Charles's wain. See the article URSA.

TRIONUM, in botany, a genus of the *monadelphia-polyandria* claſs of plants, the corolla whereof conſiſts of five patent petals, vertically cordated, and united together at the baſe: the fruit is an ovated quinquangular capſule, conſiſting of five cells, and containing five valves the ſeeds are numerous, and kidney ſhaped.

TRIOPTERIS, in botany, a genus of the *decandria-trigynia* claſs of plants, the corolla whereof conſiſts of ſix oval, erecto-patulous, equal and permanent petals, ſurrounded by three others ſmaller than themſelves, but equal to one another: there is no pericarpium: the ſeeds are three, erect and carinulated at the back; each of them has externally at its baſe an ala, and at its apex two; theſe ala are what in the flowering ſtate of the plant appear to be petals, but they are not truly ſuch.

TRIOSTEOSPERMUM, in botany, the ſame with the lanicera. See the article LANICERA.

TRIOURS, in law, are ſuch perſons as are choſen by the court to examine whether a challenge made to the whole panel of jurors, or any part of them, be juſt or not.

TRIP, a ſea term. A ſhip is ſaid to bear her top-ſails at trip, when ſhe carries them hoiſted up to the higheſt.

TRIPARTITE, *tripartitus*, ſomething divided into three parts, or made by three parties, as indenture tripartite, *&c.*

TRIPARTITION, a diviſion by three, or the taking the third part of any number or quantity.

TRIPELAS, in natural hiſtory, earths compoſed of apparently ſimilar particles, naturally dry, and of rough duſty ſurfaces, but ſomewhat more firmly coherent than the ochres, compoſed of fine but hard particles, and not readily diffuſible in water. Of this genus of earths authors make five ſpecies, which may be reduced to the yelloviſh and the reddiſh; for an account of which, ſee the article TRIPOLI.

TRIPHTHONGUE, in grammar, an aſſemblage or concourſe of three vowels in the ſame ſyllable, as *quae*.

TRIPLE, threefold. See RATIO and *Sub-*TRIPLE.

TRIPLE, in muſic, is one of the ſpecies of meaſure or time. See the articles TIME and MEASURE.

Triple-time conſiſts of many different ſpecies, whereof there are in general four, each of which has its varieties. The common name triple is taken hence, that the whole half of the bar is diviſible into three parts, and is beaten accordingly. The firſt ſpecies is called the ſimple triple, wherein the meaſure is equal to three ſemibreves, three minims, three crotchets, three quavers, or three ſemiquavers, which are marked thus, $\frac{3}{1}$ $\frac{3}{2}$ $\frac{3}{4}$ $\frac{3}{8}$ $\frac{3}{16}$, but the laſt is not much uſed, except in church muſic. In all theſe the meaſure is divided into three equal parts or times, called thence triple-time, or the meaſure of three times; whereof two are beat down, and the third up. The ſecond ſpecies is the mixed triple; its meaſure is equal to ſix crotchets, or ſix quavers, or ſix ſemiquavers, and accordingly is marked $\frac{6}{4}$ or $\frac{6}{8}$ or $\frac{6}{16}$; but the laſt is ſeldom uſed. The meaſure here is uſually divided into equal parts or times, whereof one is beat down and one up; but it may alſo be divided into ſix times, whereof the firſt two are beat down and the third up, then the next two down and the laſt up; *i. e.* each half of the meaſure is beat like the ſimple triple (on which account it may be called the compound triple) and becauſe it may be thus divided either into two or ſix times (*i. e.* two triples) it is called mixed, and by ſome the meaſure of ſix times. The third ſpecies is the compound triple, conſiſting of nine crotchets or quavers, or ſemiquavers, marked $\frac{9}{4}$ $\frac{9}{8}$ $\frac{9}{16}$, the firſt and laſt are little uſed; ſome alſo add $\frac{9}{1}$ $\frac{9}{2}$, which are never uſed; ſome add alſo other two, *viz.* ſix ſemibreves and ſix minims, marked $\frac{6}{1}$ or $\frac{6}{2}$, but theſe are not in uſe. This meaſure is divided into three equal parts or times, whereof two are beat down and one up; or each third part may be divided into three

three times, and beat like the ſimple triple, on which account it is called the meaſure of the nine times. The fourth ſpecies is a compound meaſure of the ſecond ſpecies, containing twelve crotchets or quavers, or ſemiquavers, marked $\frac{12}{4}$ $\frac{12}{8}$ $\frac{12}{16}$, to which ſome add $\frac{12}{1}$ and $\frac{12}{2}$, which are never uſed; nor are the firſt and third much uſed, eſpecially the latter. The meaſure here may be divided into two times, and beat one down and one up; or each half may be divided and beat as the ſecond ſpecies, either by two or three, in which caſe it will make in all twelve times; and hence it is called the meaſure of twelve times. The french and italian authors make a great many more ſpecies and diviſions of triple-time, unknown, or at leaſt unregarded, by our engliſh muſicians, and therefore not neceſſary to be dwelt on here.

TRIPLICATE RATIO, the ratio which cubes bear to one another. See CUBE.

This ratio is to be diſtinguiſhed from triple ratio, and may be thus conceived. In the geometrical proportions 2, 4, 8, 16, 32, as the ratio of the firſt term (2) is to the third (8) duplicate of that of the firſt to the ſecond, or of the ſecond to the third, ſo the ratio of the firſt to the fourth is ſaid to be triplicate of the ratio of the firſt to the ſecond, or of that of the ſecond to the third, or of that of the third to the fourth, as being compounded of three equal ratios. See the article RATIO.

TRIPLICATION, *triplicatio*, in the civil law, the ſame with ſur-rejoinder. See the article SUR-REJOINDER.

TRIPLICITY, or TRIGON, among aſtrologers, is a diviſion of the ſigns according to the number of the elements, each diviſion conſiſting of three ſigns. Triplicity is frequently confounded with trine aſpect, though ſtrictly ſpeaking the two are very different things; as triplicity is only uſed with regard to the ſigns, and trine, on the contrary, with regard to the planets. The ſigns of triplicity are thoſe which are of the ſame nature, and not thoſe which are in trine aſpect. Thus leo, ſagittarius, and aries, are ſigns of triplicity, becauſe thoſe ſigns are by theſe writers all ſuppoſed fiery.

TRIPOD, *tripos*, in antiquity, a famed ſacred ſeat or ſtool, ſupported by three feet, whereon the prieſts and ſibyls were placed to render oracles. It was on the tripod that the gods were ſaid to inſpire the Pythians with that divine fury and enthuſiaſm wherewith they were ſeized at the delivery of their predictions.

TRIPOLI, a ſtate of Africa, which including Barca, is bounded by the Mediterranean-ſea on the north, by Egypt on the eaſt, by Nubia and Bildulgerid on the ſouth, and by Tunis on the weſt; extending along the ſhore of the Mediterranean from the north-weſt to the ſouth-eaſt about a thouſand miles, but ſcarce two hundred miles broad in any place. The city of Tripoli, being the capital of this ſtate, is ſurrounded with a wall and other fortifications: eaſt long. 14° 30′, north lat. 33° 30′.

TRIPOLI is alſo a port-town of Syria, ſituated on the Levant, being the chief town of that part of Syria antiently called Phœnicia, ſituated at the foot of mount Libanus: eaſt long. 36° 15′, north lat. 34° 40′.

TRIPOLI, in natural hiſtory, the name of an earthy ſubſtance which is a ſpecies of the tripelas. See TRIPELAS.

This earth is much uſed by the lapidaries to poliſh ſtones, and by the braſiers, and other the like artiſts, to clean metalline veſſels. It is of two kinds, the yellowiſh, and reddiſh-white; the yellowiſh-white kind is called by authors alana gleba, tripolis and terra tripolitana; this is the produce of Germany, Saxony, and France; there is alſo of it in the neighbourhood of Venice, but it is found in greateſt plenty in many parts of Africa. It is found a dry hard earth, of a very pale yellowiſh-white, of a firm texture, and moderately heavy; it is ſometimes found of itſelf, conſtituting a ſtratum; but it is more frequently met with in detached pieces among ſtrata of other matter. It is of a rough, irregular, duſty ſurface; it adheres ſlightly to the tongue, is dry, hard, and harſh to the touch, is not to be broken between the fingers, and ſlightly ſtains the hands: it makes no effervescence with aqua fortis, and makes a ſlight hiſſing noiſe on being thrown into water. The reddiſh tripoli is of our own production, though not peculiar to our country; it is found in great abundance on Mendip-hills in Somerſetſhire, and not leſs plentifully in many parts of Germany. This is well known in the ſhops as a ſubſtance of great uſe in poliſhing braſs, but is not applied to any of the other uſes of the yellowiſh kind: this, like the former, is moſt fre-

quently found in detached maſſes, and while in the earth is tolerably ſoft, and eaſily falls into flakes. When dry it becomes of a conſiderable hardneſs, and is of a fine pale reddiſh-white, of a looſe open texture, compoſed of a multitude of extremely thin plates or flakes laid evenly on one another, and conſiderably heavy; it is of a ſmooth and ſomewhat gloſſy ſurface; it adheres very firmly to the tongue, is dry and harſh to the touch, too hard to be broken between the fingers, and does not ſtain the hands: it makes no efferveſcence with acids, and burns to a paler colour, with ſome additional hardneſs.

TRIPPING, in heraldry, denotes the quick motion of all ſorts of deer, and of ſome other creatures, repreſented with one foot as it were on a trot.

TRIPTOTES, *triptota*, in grammar, defective nouns which have only three caſes; ſuch is *mele*, *tempe*, *grates*, *prece*, &c.

TRIQUIER, a port-town of France, in the province of Britanny, ſituated on the engliſh channel, fifty miles weſt of St. Malo.

TRIQUETROUS, among botaniſts, expreſſes a fruit or leaf that has three ſides or faces all flat. This leaf is uſually ſubulated, or grows gradually ſmaller from the baſe to the point.

TRIREME, or TRIREMIS, in antiquity, a gally with three ranks of oars on a ſide.

TRISECTION, or TRISSECTION, the dividing a thing into three. The term is chiefly uſed in geometry, for the diviſion of an angle into three equal parts. The triſection of an angle geometrically, is one of thoſe great problems whoſe ſolution has been ſo much ſought by mathematicians for theſe two thouſand years, being in this reſpect on a footing with the quadrature of the circle, and the duplicature of the cube angle.

TRISMEGISTUS, an epithet or ſurname given to one of the two Hermeſes, or Mercuries, kings of Thebes in Egypt, who is ſaid to be contemporary with Moſes.

TRISOLYMPIONICA, among the antients, a perſon who had thrice borne away the prize at the olympic games; theſe had great privileges and honours paid them. See OLYMPIC-GAMES.

TRISPAST, *triſpaſton*, in mechanics, a machine with three pullies, or an aſſemblage of three pullies for raiſing of great weights. See the article PULLY.

TRISYLLABLE, or TRISSYLLABLE, in grammar, a word conſiſting of three ſyllables.

TRITE, in muſic, the third muſical chord in the ſyſtem of the antients. See the article CHORD.

TRITICEA, the name whereby ſome authors call the triticum. See the next article.

TRITICUM, in botany, a genus of the *triandria-digynia* claſs of plants, the corolla whereof conſiſts of two valves, nearly equal in ſize, and of the bigneſs of thoſe of the cup. The exterior valve is bellied with an obtuſe end, terminated by a point; the interior valve is plane. The corolla ſerves inſtead of a pericarpium, incloſing the ſeed, which is ſingle, obtuſe, and furrowed on one ſide.

This genus comprehends the common wheat, the ſpelt-corn, and couch-graſs. See the article WHEAT, &c.

TRITON, in ichthyology, a genus of fiſh, the body of which is oblong, the roſtrum at the mouth of a ſpiral form, the tentacula fourteen in number, and twelve of them cheliferous.

TRITON, in poetry, a ſea demi-god, held by the antients to be an officer or trumpeter of Neptune, attending on him, and carrying his orders and commands from ſea to ſea.

The poets repreſent him as a half man, half fiſh, terminating in a dolphin's tail, and bearing in one hand a ſea-ſhell, which ſerves as a trumpet. Some of the antients make him the ſon of Neptune and the nymph Salacia; Heſiod, of Neptune and Amphitrite; Neumenius, in his book de Piſcationibus, makes him the ſon of Oceanus and Tethys; and Lycophron, the ſon of Nereus. But, though Heſiod and the mythologiſts only ſpeak of one Triton, the poets have imagined ſeveral, giving ſome of them for trumpeters to all the ſea-gods, particularly to Neptune and Venus; accordingly they were frequently introduced on the antient theatres, in the Naumachia.

TRITONE, *tritono*, in muſic, a falſe concord conſiſting of three tones, or a greater third and a greater tone.

Its ratio or proportion in numbers is of 45 to 32. In dividing the octave we find on one ſide the falſe fifth, and the tritone on the other.

The tritone is a kind of redundant fourth, conſiſting of three tones, whence its name; or more properly of two tones, with a greater

greater ſemi-tone and a leſſer, as of *ut* to *fa*, ſharp; of *fa* to *ſi*, flat, *&c.* But it is not, as many imagine, a greater fourth, for the fourth is a perfect interval, which does not admit of any majority or minority; nor muſt the tritone be confounded with the falſe fifth, for the tritone only comprehends four degrees, *viz. ut, re, mi, fa*, ſharp; whereas the falſe fifth comprehends five, *viz. fa* ſharp, *ſol, la, ſi, ut*: beſides, that among the ſix ſemi-tones which compoſe the tritone chromatically, there are three greater and three leſſer; whereas, among the ſix ſemi-tones which compoſe the falſe fifth, there are only two leſſer and four greater.

TRITURATION, *tritura*, in pharmacy, the act of reducing a ſolid body into a ſubtile powder; called alſo levigation and pulverization. See LEVIGATION and PULVERIZATION.

This is principally employed to reduce hard ſubſtances to fine powders, either by the mortar, or by way of levigation on a marble: there is little difficulty in this, beſides the labour. Trituration has a great ſhare in ſome inſtances, in raiſing or depreſſing the efficacy of what comes under its management; for in grinding all thoſe bodies, whoſe efficacy conſiſts in the peculiar ſhape and points of their component parts, the more and finer they are broke, the leſs they will operate: thus may calomel be rendered much gentler, and made capable of being given in much larger quantities, only by long rubbing in a glaſs mortar; for the continual triture has the ſame effect upon it, as repeated ſublimation, which is only breaking of the ſaline ſpicula more and more, until it becomes almoſt plain mercury. But in reſinous ſubſtances, particularly thoſe which are purgative, as jalap, ſcammony, *&c.* the finer the powder they are reduced into, the greater their efficacy is likely to be. As the ſenſe which the ſtomach and bowels have of them, is in proportion to their contacts, therefore the more the ſame quantity is divided, the farther will it diffuſe itſelf, and vellicate the fibres; that is, in other words, it will work the more.

TRITURATION is alſo uſed in medicine for the action of the ſtomach on the food, whereby it is fitted for nouriſhment. See the article DIGESTION.

TRIVENTO, a town of Italy, in the kingdom of Naples, and principality of Moliſe, ſituated fifty five miles north eaſt of Naples.

TRIUMFETTA, in botany, a genus of the *polyandria-digynia* claſs of plants, the corolla of which conſiſts of five linear, erect, obtuſe petals, hollowed, deciduous, and bent backwards; the point is prominent below the apex; the fruit is a globoſe capſule, every where ſurrounded with hooked prickles, and contains four cells; the ſeeds are two, convex on one ſide and angular on the other: but only one of the two ſeeds of each cell uſually ripens.

TRIUMPH, in roman antiquity, a public and ſolemn honour conferred by the Romans on a victorious general, by allowing him a magnificent entry into the city. The triumph was of two kinds, the leſſer, and greater, the firſt of which is the ſame with the ovation. See OVATION.

The greater triumph, called alſo curulis, or ſimply the triumph, was decreed by the ſenate to a general, upon the conquering of a province, or gaining a ſignal victory. The day appointed for the ceremony being arrived, ſcaffolds were erected in the forum and circus, and all the other parts of the city, where they could beſt behold the pomp: the ſenate went to meet the conqueror without the gate called capena or triumphalis, and marched back in order to the capitol; the ways being cleared and cleanſed by a number of officers and tipſtaffs, who drove away ſuch as thronged the paſſage, or ſtraggled up and down. The general was clad in a rich purple robe, interwoven with figures of gold, ſetting forth his great exploits; his buſkins were beſet with pearl, and he wore a crown, which at firſt was only laurel, but afterwards gold; in one hand he bore a branch of laurel, and in the other a truncheon. He was drawn in a magnificent chariot, adorned with ivory and plates of gold, drawn uſually by two white horſes; though ſometimes by other animals, as that of Pompey, when he triumphed over Africa, by elephants: that of Marc Antony, by lions; that of Heliogabulus, by tygers; that of Aurelian, by deer, *&c.* His children were at his feet, and ſometimes on the chariot-horſes. The proceſſion was led up by the muſicians, who played triumphal pieces, in praiſe of the general: theſe were followed by young men, who led the victims to the ſacrifice, with their horns gilded, and their heads adorned with ribbands and garlands; next came the cars and waggons, loaded with all the ſpoils taken from the enemy, with their

horſes, chariots, &c. theſe were followed by the kings, princes, and generals, who had been taken captives, loaden with chains: after theſe appeared the triumphal chariot, before which, as it paſſed, they all along ſtrewed flowers, and the people, with loud acclamations, called out *Io triumphe!* The chariot was followed by the ſenate, clad in white robes; and the ſenate by ſuch citizens as had been ſet at liberty or ranſomed: and the proceſſion was cloſed by the prieſts and their officers and utenſils, with a white ox led along, for the chief victim. In this order they proceeded through the triumphal gate, along the via ſacra, to the capitol, where the victims were ſlain. In the mean time all the temples were open, and all the altars loaded with offerings and incenſe; games and combats were celebrated in the public places, and rejoicings appeared every where.

TRIUMVIR, one of three perſons who govern abſolutely, and with equal authority, in a ſtate. It is chiefly applied to the roman government: Cæſar, Pompey, and Craſſus were the firſt triumvirs, who divided the government amongſt them. There were alſo other officers, called triumvirs; as the triumviri or treſviri capitales, who were the keepers of the public goal; they had the office of puniſhing malefactors; for which purpoſe they kept eight lictors under them. There were alſo triumviri monetales, the maſters of the mint; whence the following mark is ſtill extant on many antient coins, III VIRI. Sometimes they were ſtyled triumviri A. A. Æ. F. F. theſe letters ſtanding for auro, argento, ære, flando, feriendo. There were likewiſe nocturnal triumviri, inſtituted to prevent or extinguiſh fires in the night.

TRIUMVIRATE, an abſolute government adminiſtred by three perſons, with equal authority. See the preceding article.

There were two famous triumvirates at Rome; Pompey, Cæſar, and Craſſus, as mentioned in the preceding article, eſtabliſhed the firſt; and Auguſtus, Marc Antony, and Lepidus, the ſecond; which gave the laſt blow to the roman republic, for Auguſtus having vanquiſhed Lepidus and Antony, the triumvirate ſunk into a monarchy.

TROCHAIC VERSE, in the latin poetry, a kind of verſe, ſo called becauſe the trochees chiefly prevail, as the iambus does in the iambic. It generally conſiſts of ſeven feet and a ſyllable; the odd feet, for the moſt part, conſiſt of trochees, though a tribrachys is ſometimes admitted, except in the ſeventh foot: theſe two feet are likewiſe uſed in the other places, as is alſo the ſpondæus, dactylus, and anapæſtus. The following is an example.

1 2 3 4 5 6
Solus | aut rex | aut po|eta | non quot|annis |
7 ½
naſci|tur.

TROCHANTER, in anatomy, a name given to two apophyſes, ſituated in the upper part of the thigh bone: they receive the tendons of moſt of the muſcles of the thigh. See FEMUR.

TROCHE, *trochiſcus*, in pharmacy, a ſort of medicine, made of glutinous ſubſtances, into little cakes, and afterwards exſiccated. The four following rules are to be obſerved in making of them: 1. The ingredients are to be reduced to a powder. 2. If the maſs proves ſo glutinous as to ſtick to the fingers in making up, the hands may be anointed with any convenient ſweet or aromatic oil; or elſe ſprinkled with powder of ſtarch, or with that of liquorice. 3. In order to dry thoroughly the troches, put them on an inverted ſieve, in a ſhady airy place, and frequently turn them. 4. The troches are to be kept in glaſs veſſels, or in earthen ones well glazed. There are troches of various kinds, and for various intentions, as purgative, alterative, aperitive, corroborative, &c. The chief troches now in uſe are thoſe of myrrh and liquorice, and thoſe of the teſtaceous powders for the heart-burn.

TROCHEE, *trochæus*, in the greek and latin poetry, a foot conſiſting of two ſyllables, the firſt long, and the ſecond ſhort, as in the words mūsă and sērvăt.

TROCHILUS, in architecture, a name uſed by the antients for what the moderns call ſcotia. See the article SCOTIA.

TROCHILUS, in ornithology, the purple humming-bird. See HUMMING BIRD.

TROCHITÆ, in natural hiſtory, a name given to the ſeparate joints of the entrochus. See the article ENTROCHUS.

TROCHLEA, one of the mechanical powers, uſually called a pulley. See the article PULLEY.

TROCHLEARES, in anatomy, a name given to the oblique muſcles of the eye. See the article OBLIQUUS.

TROCHOID, in geometry, a curve more generally known by the name of cycloid. See the article CYCLOID.

TROCHUS,

TROCHUS, in the natural hiſtory of ſhell-fiſh, a name given to ſeveral ſpecies of the flat-mouthed cochlæ. See COCHLEA.

Theſe ſhells have got the name trochus, from their reſembling the figure of the top, with which boys play. See plate CCLXXXV. fig. 4. where n° 1. repreſents the rough trochus, n° 2. the wavy trochus, and n° 3. the ſmooth trochus.

TROGLODYTES, in the antient geography, a people of Ethiopia, ſaid to have lived in caves under ground. Pom. Mela gives a ſtrange account of the Troglodytes: he ſays, they did not ſo properly ſpeak as ſhriek, and that they lived on ſerpents.

TROJA, a town of Italy in the kingdom of Naples, and province of the Capitinate, ſituated fifty-five miles north-eaſt of Naples.

TROJA, or TROJAN GAMES, were games ſaid to be inſtituted by Aſcanius, ſon of Æneas, and afterwards kept up by the Romans with great ſolemnity. They were celebrated by companies of boys, neatly dreſſed, and furniſhed with little arms and weapons, who muſtered in the public circus. They were choſen, for the moſt part, out of the nobleſt families of Rome, and the captain of them had the honourable title of princeps juventutis, being ſometimes next heir to the empire, and ſeldom leſs than the ſon of a principal ſenator. A particular account of theſe games may be ſeen in the fifth Æneid of Virgil, beginning at verſe 545.

TROIS RIVIERES, a town of north America, in the province of Canada, ſituated on the river of St. Laurence, fifty miles ſouth of Quebec: weſt long. 75°, and north lat. 46° 45′.

TROKI, a town of Poland, in Lithuania, ſituated on a lake, fifteen miles weſt of Wilna: eaſt lon. 25°, and north lat. 55°.

TRONAGE, an antient cuſtomary toll, paid for weighing of wool. This word is particularly mentioned in a charter granted to the mayor and citizens of London; in which city there is an officer called tronator, whoſe buſineſs it is to weigh the wool that is brought thither.

TRONCONNEE, in heraldry, denotes a croſs, or other thing, cut in pieces and diſmembered, yet ſo as all the pieces keep up the form of a croſs, though ſet at a ſmall diſtance from one another.

TRONE WEIGHT, the ſame with what we now call troy weight. See WEIGHT.

TROOP, a ſmall body of horſe or dragoons, about fifty or ſixty, ſometimes more, ſometimes leſs; commanded by a captain. Each troop, beſides a captain, has a lieutenant, cornet, quarter-maſter, and three corporals, who are the loweſt officers of a troop.

To beat the TROOP, is the ſame as beating the aſſembly. See ASSEMBLY.

TROPÆOLUM, the INDIAN CRESS, in botany, a genus of the *octandria-monogynia* claſs of plants, the flower of which conſiſts of five roundiſh petals inſerted into the diviſions of the cup; the two upper petals are ſeſſile; the three others have very long and barbated ungues; the fruit conſiſts of three convex capſules, ſulcated and ſtriated on one ſide, and angular on the other; the ſeeds are three, gibbous on one ſide, and angulated on the other, but upon the whole ſomewhat roundiſh, and ſtriated deeply. See plate CCLXXXV. fig. 3.

This genus comprehends the cardamindum of authors.

TROPE, in rhetoric, a kind of figure of ſpeech, whereby a word is removed from its firſt and natural ſignification, and applied with advantage to another thing, which it does not originally mean; but only ſtands for it, as it has a relation to, or connexion with it: as in this ſentence, *God is my rock*. Here the trope lies in the word *rock*, which being firm and immoveable, excites in our minds the notion of God's unfailing power, and the ſteady ſupport which good men receive from their dependence upon him. See the article FIGURE.

Tropes are uſed for the ſake of an agreeable variety; they divert the mind, and revive attention, when it begins to flag and be weary. In many caſes there is an abſolutely neceſſity for the writer or ſpeaker to repeat the ſame thing ſeveral times; therefore, to prevent the tireſome repetition of the ſame words, he carefully diverſifies his expreſſions, and judiciouſly intermixes plain and figurative language. Tropes add a wonderful ornament and ſtrength to a diſcourſe, and often give the mind a brighter and ſtronger idea of a thing, than proper words; Thus Virgil calling the two Scipios the *thunder-bolts of war*, repreſents the rapid ſpeed and victorious progreſs of their arms more emphatically, than all the plain terms of the roman language could have done. In order to make uſe of tropes ſeaſonably, and with advantage, the following rules ſhould be obſerved 1. Be ſparing and cautious in the uſe of them,

and omit them when they are not either as plain as proper words, or more expreſſive: tropes are the riches of a language, and it will be an imputation upon a man to laviſh them away without diſcretion. 2. Care muſt be taken, that tropes hold a proportion to the ideas intended to be raiſed by them; there ought to be an eaſy and unforced relation betwixt the trope and the proper word it is put for, or the thing intended to be expreſſed by it: when there is not this ſuitableneſs and relation, the expreſſion at beſt will not only be harſh and unpleaſant, but often ridiculous and barbarous. In order to preſerve this relation, a trope ought not to expreſs more or leſs than the thing requires; and things capable of heightening or ornament ought not to be debaſed nor vilified by low expreſſions; nor ſmall matters over-magnified by pompous and ſwelling words. 3. A trope ought to be obvious and intelligible, and therefore muſt not be fetched from things too remote, ſo as to require much reading and learning to apprehend it.

TROPEA, a town of Italy in the kingdom of Naples, and further Calabria, ſituated on the Tuſcan ſea, forty miles north of Reggio.

TROPES, a port-town of France, in Provence, ſituated on the Mediterranean, thirty miles eaſt of Toulon.

TROPHY, *tropæum*, among the antients, a pile or heap of arms of a vanquiſhed enemy, raiſed by the conqueror in the moſt eminent part of the field of battle. The trophies were uſually dedicated to ſome of the gods, eſpecially Jupiter. The name of the deity to whom they were inſcribed, was generally mentioned, as was that alſo of the conqueror. The ſpoils were at firſt hung upon the trunk of a tree; but inſtead of trees, ſucceeding ages erected pillars of ſtone, or braſs, to continue the memory of their victories. To demoliſh a trophy was looked upon as a kind of ſacrilege, becauſe they were all conſecrated to ſome deity.

The repreſentation of a trophy is often to be met with on medals of the roman emperors, ſtruck on occaſion of victories; wherein, beſides arms and ſpoils, are frequently ſeen one or two captives by the ſides of the trophy.

TROPHY-MONEY, denotes certain money annually raiſed in the ſeveral counties of the kingdom, towards providing harneſs, and maintaining the militia.

TROPICS, in aſtronomy and geography, are two circles ſuppoſed to be drawn on each ſide of the equinoctial, and parallel thereto. That on the north ſide of the line is called the tropic of cancer, and the ſouthern tropic has the name of capricorn, as paſſing through the beginning of thoſe ſigns. They are diſtant from the equinoctial 23° 29′. Two circles drawn at the ſame diſtance from the equator on the terreſtrial globe, have the ſame names in geography, and they include that ſpace or part of the ſphere, which is called the torrid zone, becauſe the ſun is, at one time or other, perpendicular over every part of that zone, and extremely torrifies or heats it. See the article ZONE.

TROPPAW, a city of Sileſia, ſeventy miles ſouth of Breſlaw.

TROVER, in law, an action which a man hath againſt one that, having found any of his goods, refuſeth to deliver them upon demand.

TROUGH *of the ſea*, is the hollow or cavity made between two waves or billows, in a rolling ſea.

TROUSSEQUIN, in the manege, an arch of wood raiſed above the hinder bow of a great ſaddle, in order to keep the bolſters firm.

TROUT, *trutta*, in ichthyology, the engliſh name of ſeveral ſpecies of ſalmo. See the article SALMO.

The common river-trout is, like the ſalmon, an inhabitant of the ſea or rivers indifferently: it is ſpotted with red, and its lower jaw is ſomewhat the largeſt; its tail is not forked, but hollowed in form of an arch of a circle. It is a very beautiful fiſh, and is, with juſtice, greatly eſteemed at our tables.

Beſides this, there are ſpecies of ſalmo, known by the names of ſalmon-trout and lake-trout.

For the method of fiſhing for trout, ſee the article FISHING.

TROWBRIDGE, a market-town of Wiltſhire, eighteen miles north-weſt of Saliſbury.

TROY WEIGHT, in commerce. See the article WEIGHT.

TROYES, a city of Champain, in France, ſituated on the river Seyne, ſeventy miles ſouth-eaſt of Paris. eaſt longit. 4° 5′, and north lat. 48° 15′.

TRUCE, in the art of war, denotes a ſuſpenſion of arms, or a ceſſation of hoſtilities between two armies, in order to ſettle articles of peace, bury the dead, or the like.

TRUCHMAN,

TRUCHMAN, DRAGOMAN, or DROGMAN, in the countries of the Levant, ſignifies an interpreter. See DRAGOMAN.

TRUCKS, among gunners, round pieces of wood, in form of wheels, fixed on the axle-trees of carriages, to move the ordnance at ſea, and ſometimes alſo at land.

TRUE, ſomething agreeable to the reality of things, or to truth.

TRUE *place of a planet*, or *ſtar*, in aſtronomy, is a point of the heavens, ſhewn or pointed out by a right line, drawn from the center of the earth, through the center of the planet or ſtar. See PLANET, *&c.*

TRUEN, or TRON, a town of the biſhopric of Liege, in Germany, twenty miles ſouth-eaſt of Louvain.

TRUFFLES, *tubera terræ*, in natural hiſtory, a kind of ſubterraneous vegetable production, not unlike muſhrooms, being a genus of fungi, which grows under the ſurface of the earth. See FUNGUS.

The truffle is only a fleſhy tubercle, covered with a hard ſort of cruſt, rough, and ſomewhat regularly furrowed, on the ſurface almoſt like the cypreſs-nut. It does not riſe above the ſurface of the earth, but lies concealed about half a foot below it. Great numbers of them are found in the ſame place, of different ſizes: ſome of them are now and then found of a pound weight, or even a pound and a quarter; theſe laſt are but rare, and Pliny only mentions their being of a pound weight.

They grow at the feet and under the ſhades of trees, ſometimes about the roots of ſtones, and ſometimes in clear earth. Their favourite trees are either the white or green oak, as the elm is that of the morellæ. They begin to be found when warm weather firſt ſucceeds the cold, ſooner or later, as the ſeaſon is more or leſs mild; for they have ſometimes been very rare after hard winters. At firſt they appear only like little round peas, red without, and white within. Theſe peas grow larger by degrees; from that time they take out of the ground what they commonly call white truffles; theſe are of themſelves inſipid, and people dry them as an ingredient for ragouts, becauſe they keep better when dried, than marbled ones do. It is a common opinion, that truffles which have been once removed from their places, are never after capable of being nouriſhed, even when put in ſome earth from which they were originally taken: but if one leave them there for a certain ſeaſon, without diſturbing them, they grow inſenſibly larger, their bark becomes black, rough, and unequal, though they always retain their whiteneſs within. Hitherto they have very little ſmell or taſte, and can only be uſed in ragouts: theſe are always called the firſt white truffles, and are not to be made a different ſpecies from the marbled or black ones gathered in the end of autumn, and even in the winter after the froſts are begun.

When the truffles are at maturity, they have a very good ſmell and taſte; and are fit to be dug from the month of October to the end of December; and ſometimes to the end of February and March, when they are even at that time marbled; whereas thoſe, gathered from the month of April till July and Auguſt, are only white. If people neglect to gather the truffles when arrived at a due degree of maturity, they rot; and then we may obſerve the re-production of the truffle; becauſe, after ſome time, we ſee ſeveral bunches of other young truffles filling up the places of the rotten ones. Theſe young truffles are nouriſhed till the firſt colds come on; and if the froſts are not intenſe, they get over the winter, and furniſh us betimes with the freſh green truffles.

As to the virtues of truffles, the common opinion is, that they are hot: Galen, however, according to Matthiolus, looks upon them as indifferent, and the baſis of all other ſeaſoning; and, indeed, it is to this purpoſe that they are uſed in all ragouts. Avicenna ſpeaks of them in a manner quite different, and ſays, they engender thick humours more than any other food; that they are hard of digeſtion, heavy on the ſtomach, and, when much uſed, have a tendency to bring on an apoplexy and palſy. Theſe two authors may be reconciled, if we conſider two qualities in the truffle, which are capable of producing two different effects: firſt, they may prove hot of themſelves, by emitting their volatile ſalts into the ſtomach; or by being mixed with ſalt, pepper, and other ſpices, which they drink up like a ſponge. In the ſecond place, they may prove of hard digeſtion, when eaten immoderately by a perſon of a weak ſtomach. in which caſe they produce bad effects, ſtagnate, and form themſelves into a glareous ſubſtance, which diſorders the ſtomach, and which may be occaſioned by the cold quality aſcribed to them by Galen. As a proof that the truffle is of hard digeſtion, it has this in

common

common with other fruits, that it grows hard in ſpirit of wine, and is with difficulty diſſolved in water.

TRUGILLO, a town of Terra Firma, in ſouth America: weſt lon. 69° 30′, and north lat. 7° 16′.

TRUMPET, a muſical inſtrument, the moſt noble of all portable ones of the wind kind, uſed chiefly in war among the cavalry, to direct them in the ſervice.

Marine TRUMPET, is a muſical inſtrument conſiſting of three tables, which form its triangular body. It has a very long neck, with one ſingle ſtring, very thick, mounted on a bridge, which is firm on one ſide, but tremulous on the other. It is ſtruck by a bow with one hand, and with the other the ſtring is preſſed, or ſtopped, on the neck by the thumb. It is the trembling of the bridge, when ſtruck, that makes it imitate the ſound of a trumpet; which it does to that perfection, that it is ſcarce poſſible to diſtinguiſh the one from the other: and this is what has given it the denomination of marine trumpet; though, in propriety, it is a kind of monochord.

Harmonical TRUMPET, an inſtrument that imitates the ſound of a trumpet; which it reſembles in every thing, excepting that it is longer, and conſiſts of more branches: it is generally called ſackbut.

Speaking TRUMPET, is a tube from ſix to ſixteen feet long, made of tin, perfectly ſtraight, and with a very large aperture; the mouth-piece being big enough to receive both lips.

The ſpeaking-trumpet, or ſtentorophonic tube, as ſome call it, is uſed for magnifying of ſound, particularly that of ſpeech, and thus cauſing it to be heard at a great diſtance: how it does this, will be eaſy to underſtand from the ſtructure thereof, thus illuſtrated by the ingenious Mr. Martin: let ABC (pl. CCLXXXV. fig. 5. n° 1.) be the tube, BD the axis, and B the mouth-piece for conveying the voice to the tube.

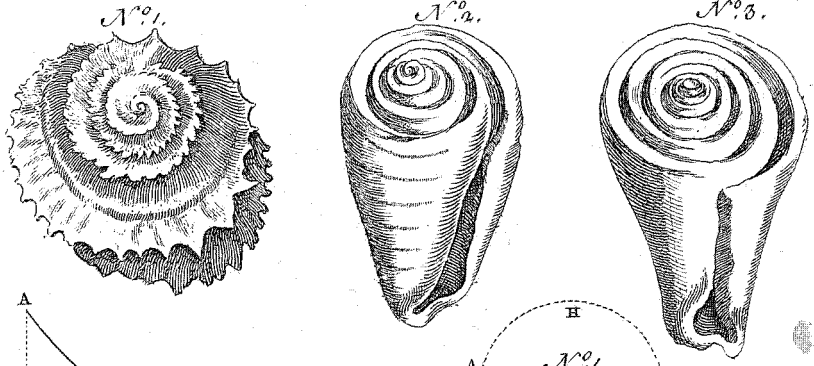
Then it is evident, when a perſon ſpeaks at B, in the trumpet, the whole force of his voice is ſpent upon the air contained in the tube, which will be agitated thro' the whole length of the tube; and by various reflections from the ſide of the tube to the axis, the air along the middle part of the tube will be greatly condenſed, and its momentum proportionably increaſed; ſo that, when it comes to agitate the air at the orifice of the tube AC, its force will be as much greater than what it would have been without the tube, as the ſurface of a ſphere, whoſe radius is equal to the length of the tube, is greater than the ſurface of the ſegment of ſuch a ſphere, whoſe baſe is the orifice of the tube. See SOUND.

For a perſon ſpeaking at B, without the tube, will have the force of his voice ſpent in exciting concentric ſuperficies of air all around the point B; and, when thoſe ſuperficies or pulſes of air are diffuſed as far as D, every way, it is plain the force of the voice will be diffuſed through the whole ſuperficies of a ſphere whoſe radius is BD; but in the trumpet it will be ſo confined, that, at its exit, it will be only diffuſed thro' ſo much of that ſpherical ſurface of air, as correſponds to the orifice of the tube. But, ſince the force is given, its intenſity will be always inverſely, as the number of particles it has to move; and therefore, in the tube, it will be to that without, as the ſuperficies of ſuch a ſphere to the area of the large end of the tube, nearly.

To make this matter yet plainer by calculation, let BD = 5 feet, then will the diameter of the ſphere DE = 10 feet, the ſquare of which is 100, which, multiplied by 0,7854, gives 78,54 ſquare feet for the area of a great circle AHEFC. And, therefore, four times that area, *viz.* 4×78,54 = 314,16 = ſquare feet in the ſuperficies of the aerial ſphere. If now the diameter AC, of the end of a trumpet, be one foot, its area will be 0,7854; but 7854: 314,16 :: 1 : 400, therefore the air at the diſtance of BD, will be agitated by means of the trumpet, with a force 400 times greater than by the bare voice alone. Again, it is farther evident how inſtruments of this form aſſiſt the hearing greatly; for the weak and languid pulſes of the air being received by the large end of the tube, and greatly multiplied and condenſed by the tremulous motion of the parts of the tube, and air agitated by them, are conveyed to the ear by the ſmall end, and ſtrike it with an impetus as much greater than they would have done without it, as the area of the ſmall end at B, is leſs than the area of the large end AC. From what has been ſaid, it is evident the effect of the tube in magnifying ſound, either for ſpeaking or hearing, depends chiefly upon the length of the tube. But yet ſome advantage may be derived from the particular ſhape thereof. Some very eminent philoſophers have propoſed the figure which is made by the revolution of a parabola

Fig. 1. The Tiger-Shell. Fig. 2. Trewia. Fig. 3. Tropæolum

Fig. 4. Trochus



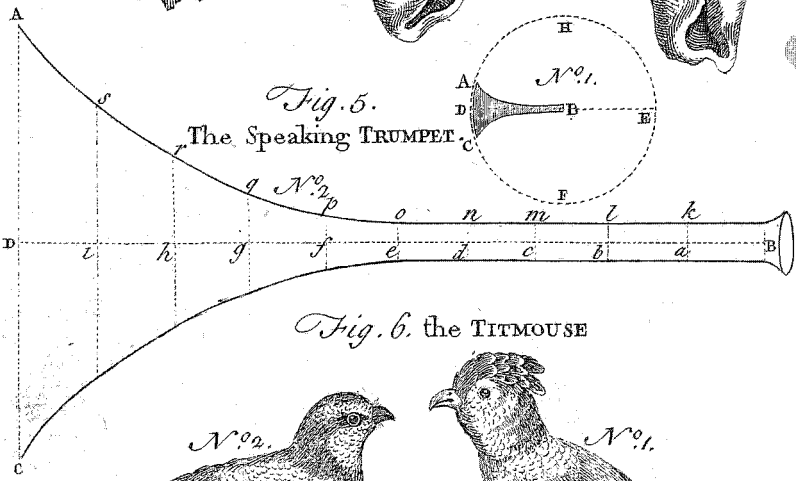


Fig. 5. The Speaking Trumpet.

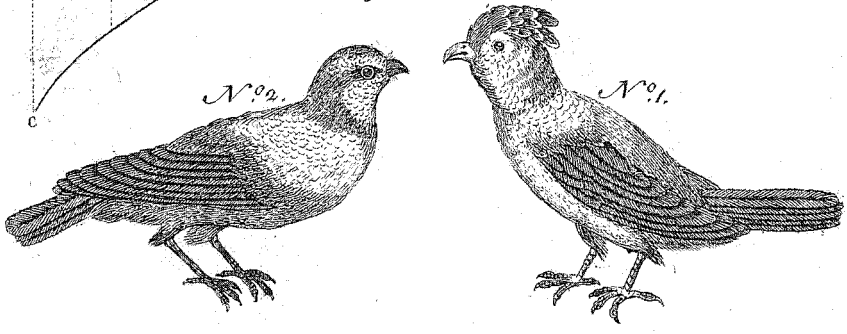
Fig. 6. the Titmouse



J. Jefferys sculp

parabola about its axis, as the beſt of any, where the mouth-piece of the parabola, and, conſequently, the ſonorous rays, will be reflected parallel to the axis of of the tube.

But this parallel reflection ſeems no way eſſential to the magnifying of ſound; on the contrary, it appears rather to hinder ſuch an effect, by preventing the infinite number of reflections and reciprocations of ſound; in which, according to ſir Iſaac Newton, its augmentation doth principally conſiſt. For all reciprocal motion, in every return, is augmented by its generating cauſe, which is here the tremulous motions of the parts of the tube. Therefore, in every repercuſſion from the ſides of the tube, the agitations and pulſes of confined air muſt neceſſarily be increaſed; and, conſequently, this augmentation of the impetus of the pulſes muſt be proportional to the number of ſuch repercuſſions; and, therefore, to the length of the tube, and to ſuch a figure as is moſt productive of them. Whence it appears, that the parabolic trumpet is, of all others, the moſt unfit for this purpoſe, inſtead of being the beſt.

But there is one thing more which contributes to the augmenting of theſe agitations of air in the tube, and that is the proportion which the ſeveral portions of air bear to each other, when divided by tranſverſe ſections, at very ſmall but, equal diſtances, from one end of the tube to the other. Thus, let thoſe ſeveral diviſions be made at the points *a*, *b*, *c*, *d*, *e*, &c. (*ibid.* n° 2.) in which let the right lines *ak*, *bl*, *cm*, *dn*, &c. be taken in geometrical proportion. Then will the portions of air contained between B and *a*, *a* and *b*, *b* and *c*, *c* and *d*, &c. be very nearly in the ſame proportion, as being in the ſame ratio with their baſes, when the points of diviſion are indefinitely near together.

But, when any quantity of motion is communicated to a ſeries of elaſtic bodies, it will receive the greateſt augmentation when thoſe bodies are in geometrical proportion. Therefore, ſince the force of the voice is impreſſed upon, and gradually propagated through, a ſeries of elaſtic portions of air in a geometrical ratio to each other, it ſhall receive the greateſt augmentation poſſible.

Now, ſince by conſtruction it is $Ba = ab = bc = cd$, &c. and alſo $ak : bl :: bl : cm :: cm : dn$, and ſo on; therefore, the points *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, A, will, in this caſe, form that curve line, which is called the logarithmetic curve; conſequently, a trumpet, formed by the revolution of this curve about its axis, will augment the ſound in a greater degree than any other figured tube whatever.

Liſtening, or *Hearing* TRUMPET, an inſtrument to aſſiſt hearing. See the article HEARING.

TRUMPET-FLOWER, *bignonia*, in botany. See the article BIGNONIA.

TRUMPET-SHELL, the engliſh name of the buccinum of authors. See the article BUCCINUM.

TRUNCATED, in general, is an appellation given to ſuch things as have, or ſeem to have, their points cut off: thus we ſay, a truncated cone, pyramid, leaf, &c. See CONE, PYRAMID, &c.

TRUNCHEON, a ſhort ſtaff, or battoon, uſed by kings, generals, and great officers, as a mark of their command.

TRUNDLE, a ſort of carriage with low wheels, whereon heavy and cumberſome burdens are drawn.

TRUNDLE-SHOT. See SHOT.

TRUNK, *truncus*, among botaniſts, denotes the ſtem, or body, of a tree; or, that part between the ground and the place where it divides into branches.

In anatomy, trunk is uſed for the buſto of a human body, excluſive of the head and limbs, comprehending the abdomen and thorax. See the articles ABDOMEN and THORAX.

Trunk is alſo uſed for the main body of an artery, or vein, in contradiſtinction to the branches and ramifications thereof.

Trunk-roots of a plant, are little roots which grow out of the trunks of plants.

Theſe are of two kinds: 1. Such as vegetate by a direct deſcent, the place of their eruption being ſometimes all along the trunk, as in mints, &c. and ſometimes only in the utmoſt point, as in brambles.

2. Such as neither aſcend nor deſcend, but ſhoot forth at right angles to the trunk; which, therefore, though as to their office they are true roots, yet, as to their nature, are a medium between a trunk and a root.

TRUNNIONS, or TRUNIONS *of a piece of ordnance*, are thoſe knobs or bunches of the gun's metal, which bear her up on the cheeks of the carriage: and hence the trunnion-ring is the ring about a cannon, next before the trunnions.

TRURO, a borough of Cornwal, ſituated thirty-two miles north-eaſt of the land's-end.

It ſends two members to parliament.

TRUSS, *truſſa*, a bundle, or certain quantity of hay, ſtraw, *&c.*

A truſs of hay is to contain fifty-ſix pounds, or half an hundred weight; thirty-ſix truſſes make a load. In June and Auguſt the truſs is to weigh ſixty pounds, on forfeiture of eighteen ſhillings per truſs.

A truſs of forage is as much as a trooper can carry on his horſe's crupper.

TRUSS *of flowers*, is uſed, by floriſts, to ſignify many flowers growing together on the head of a ſtalk, as in the cowſlip, auricula, *&c.*

TRUSS is alſo uſed for a ſort of bandage or ligature, made of ſteel, or the like matter, wherewith to keep up the parts, in thoſe who have hernias or ruptures. See the article HERNIA.

In plate CCLXXXVI. are repreſented various kinds of truſſes, to compreſs the parts, and prevent a relapſe of the inteſtine after the rupture has been cured. Some of theſe, as fig. 2, 8, and 9, are made of callicoe, for infants; or of leather, for adults. Others, as fig. 1, 3, 4, and 11, are made of ſteel covered with leather. Some are made of ſteel plates, joined by hinges, ſo as to be flexible and more eaſy, as in fig. 11. Some again are deſigned for ruptures on both ſides; as fig. 4 and 5. Some are for ruptures on the right ſide, as fig. 2 and 3: others for the left, as 1, 9, 10, and 11. Some, again, are faſtened to the body by tagged-laces; as fig. 5, 6, and 9: others by ſtraps and buckles; as fig. 2, 5, and 9: others by hooks and eyes, or hooks and ſtraps; as fig. 1, 3, 4, and 11: and others again by different contrivances; as in fig. 7 and 8.

In all theſe truſſes, A denotes the bolſter, or compreſs, which is applied to the ring of the abdominal muſcles, after the rupture has been reduced: BB, the girdle or belt of the truſs, to be faſtened round the body, either with ſtrings CC, paſſed through the holes DD; or by ſtraps and buckles; as in fig. 2 and 10, marked EE: or with hooks, as in fig. 1, 3, 4, and 11, marked *aa*. In many of theſe truſſes there is a depending girt, beſides that which paſſes round the body, which is to be paſſed between the legs of women, and faſtened to the oppoſite part of the belt: as FF in fig. 1, 2, 6, 7, 8, 9, and 10. In fig. 6 is ſhewn the bolſter *a*; and in fig. 7 may be ſeen a wooden bolſter *cd*, *ee* being the button by which it is faſtened to the truſs, and *d* the convex part by which it is applied to the rupture.

There are a multitude of other truſſes, of various forms, contrived by thoſe who make it their buſineſs; but we have here given figures of the beſt of them, from Heiſter's ſurgery, P. II. p. 71 and 72.

TRUSSES, in a ſhip, are ropes made faſt to the parrels of a yard, either to bind the yard to the maſt when the ſhip rolls, or to hale down the yards in a ſtorm, *&c.*

TRUSSING, in falconry, is a hawk's raiſing any fowl, or prey, aloft; firſt ſoaring up, and then deſcending with it to the ground.

TRUST, in law, ſignifies, in general, that confidence which one perſon repoſes in another; and in caſe of non-performance, or breach of this truſt, the remedy is by bill in equity, as the common-law uſually takes no notice of truſts.

Conveyances made in the way of truſt, which were formerly invented to evade the ſtatute of uſes, are not ſo much favoured as plain and direct deeds. All declarations of truſts of lands, *&c.* are to be in writing, and ſigned by the parties. It has been decreed in chancery, that a fine and recovery of a ceſtuiqui truſt ſhall bar and transfer the eſtate, as they ſhould an eſtate at law, where the ſame were levied or ſuffered on good conſideration. And there is a ſtatute whereby an infant ſeiſed of an eſtate in fee in truſt, is enabled to make any conveyance thereof, by order of the court of chancery.

TRUSTEE, one who has an eſtate, or money, put or truſted in his hands, for the uſe of another.

Where two or more perſons are appointed truſtees, if one of them only receives all or the greateſt part of the profits of the lands, *&c.* and is in arrear, and unable to ſatisfy the perſon to whom he is ſeiſed in truſt, the other, in that caſe, ſhall not be anſwerable for more than comes to his hands.

TRUTH, *veritas*, a term uſed in oppoſition to falſhood, and applied to propoſitions which anſwer, or accord, to the nature and reality of the thing whereof ſomething is affirmed or denied.

Truth, according to Mr. Locke, conſiſts in the joining or ſeparating of ſigns, as the things ſignified by them do agree or diſagree

TRUSSES

diſagree one with another. Now the joining or ſeparating of ſigns is what we call making of propoſitions. Truth then, properly, relates only to propoſitions, whereof there are two ſorts, mental and verbal; as there are two ſorts of ſigns commonly made uſe of, *viz.* ideas and words. See IDEA, WORD, *&c.* Mental propoſitions are thoſe wherein the ideas in our underſtanding are put together, or ſeparated, by the mind perceiving or judging of their agreement or diſagreement.

Verbal propoſitions are words put together, or ſeparated, in affirmative or negative ſentences: ſo that a propoſition conſiſts in joining or ſeparating of ſigns; and truth conſiſts in putting together, or ſeparating thoſe ſigns, according as the things they ſtand for agree or diſagree. See PROPOSITION.

Moral TRUTH, conſiſts in ſpeaking things according to the perſuaſion of our minds, and is called alſo veracity.

Metaphyſical, or *tranſcendental* TRUTH, is nothing but the real exiſtence of things conformable to the ideas which we have annexed to their names.

TRUTINATION, the act of weighing or ballancing a thing. See the article BALLANCE.

TRUXILLO, a town of Eſtremadura, in Spain, one hundred miles ſouth-weſt of Toledo: weſt long. 6°, north lat. 39° 12′.

TRUXILLO is alſo a town of Terra-Firma, ſituated in weſt long. 69°, and north lat. 9° 15′.

TRUXILLO is likewiſe a port-town of Mexico, ſituated on the gulph of Honduras: weſt long. 88° 30′, north lat. 15° 30′.

TRY, in the ſea-language. A ſhip is ſaid to try, or lie a-try, when no ſails are abroad but the main-ſail or mizzen-ſail.

TUB, in commerce, denotes an indeterminate quantity or meaſure: thus, a tub of tea contains about ſixty pounds; and a tub of camphor from fifty-ſix to eighty pounds.

TUBE, *tubus*, in general, pipe, conduit, or canal; a cylinder hollow within-ſide, either of lead, iron, wood, glaſs, or other matter, for the air, or ſome other fluid, to have a free paſſage, or conveyance, through. See PIPE, *&c.*

Small ſilver or leaden tubes are frequently uſed, by ſurgeons, to draw off blood, matter, or water, from the different parts of the body; they are made of various ſizes and ſhapes, as repreſented in plate CCLXXXVII. fig. 1. at the letters P, Q, R, S, T, V, X; the uſes of which will be ſhewn more at large under the articles WOUND, PARACENTESIS, *&c.*

TUBE, in aſtronomy, is ſometimes uſed for a teleſcope, or, more properly, for that part thereof into which the lenſes are fitted, and by which they are directed and uſed. The goodneſs of the tube being of great importance to that of the teleſcope, we ſhall here add its ſtructure.

The conſtruction of a draw TUBE *for a teleſcope.* The chief points to be regarded here are, that the tube be not troubleſome by its weight, nor liable to warp and diſturb the poſition of the glaſſes; ſo that every kind of tube will not ſerve in every caſe. See TELESCOPE.

1. If the tube be ſmall, it is beſt made of thin braſs-plates covered with tin, and formed into pipes or draws, to ſlide within one another.

2. For long tubes, iron would be too heavy, for which reaſon ſome chuſe to make them of paper, thus: A wooden cylinder is turned, of the length of the paper to be uſed, and of a diameter equal to that of the ſmalleſt draw: about this cylinder is rolled paper till it be of a ſufficient thickneſs; when one pipe is dry provide others after the ſame manner, ſtill making the laſt ſerve for a mould to the next, till you have enough for the length of the tube deſired. Laſtly, to the extremes of the draws are to be glewed wooden ferrils, that they may be drawn forth the better.

3. Since paper draws are apt to ſwell with moiſt weather, ſo as to ſpoil their ſliding; and in dry weather to ſhrink, which renders them looſe and tottering; in both which caſes the ſituation of the lens is eaſily diſturbed; the beſt method of making of tubes is as follows: Glue parchment round a wooden cylinder, and let the parchment be coloured black, to prevent the reflecting rays making any confuſion: provide very thin ſlits of beech, and bending them into a cylinder glue them carefully to the parchment; cover this wooden caſe with white parchment, and, about its outer extreme, make a little ring or ferril: after the ſame manner make another draw over the former, and then another, till you have enough for the length of the tube.

To the inner extremes of each draw fit a wooden ferril, that the ſpurious rays, ſtriking againſt the ſides, may be inter-

cepted and loſt. In theſe places where the lenſes are to be put, it will be proper to furniſh the ferrils with female ſcrews. Provide a wooden cover to defend the object-glaſs from the duſt; and, putting the eye-glaſs in its wooden ferril, faſten it by the ſcrew to the tube. Laſtly, provide a little wooden tube of a length equal to the diſtance the eye glaſs is to be from the eye, and fit it to the other extreme of the tube.

TUBE-FISH, the TRIGLA with a prickly-head, and with three appendages at each of the pectoral fins. See the article TRIGLA.

TUBER, or TUBERCLE, in botany, a kind of round turgid root, in form of a knob or turnip.

The plants which produce ſuch roots are hence denominated tuberoſe, or tuberous, plants.

TUBER, or TUBEROSITY, in medicine, is uſed for a knob, or tumour, growing naturally in any part; in oppoſition to tumours, which ariſe accidentally, or from diſeaſe.

TUBERA TERRÆ, TRUFFLES, in botany. See TRUFFLES.

TUBERCLES, among phyſicians, denote little tumours which ſuppurate and diſcharge pus, and are often found in the lungs, eſpecially of conſumptive perſons. See CONSUMPTION and PHTHISIS.

TUBEROUS, or TUBEROSE-ROOTS, in botany. See TUBER.

TUBINGEN, a city of Swabia, in Germany, ſituated on the river Neckar, in the dutchy of Wirtemburg: eaſt long. 8° 55′, north lat. 48° 26′.

TUBIPORA, or TUBULARIA, a genus of ſubmarine plants, belonging to the *cryptogamia* claſs, of the hardneſs of coral, and conſiſting of cylindric tubes riſing from a thin cruſt of the ſame ſort of matter with themſelves.

TUBULI FOSSILES, in natural-hiſtory, the tubules, or caſes of ſea-worms, found buried in the earth. They are met with of various ſizes, ſometimes complete, and buried in the ſtrata of earth or ſtone; ſometimes they are more or leſs perfect, and are immerſed in maſſes of the ludus helmontii or ſeptariæ, and in this ſtate they make one kind of lapis ſyringoides, or pipe-ſtone; but the moſt beautiful ſyringoides, or pipe-ſtones, are the parts of the bottoms of ſhips, or poſts fixed in the ſea, which have been pierced, in their original ſtate of wood, by theſe ſea worms, and afterwards ſtriked with the caſes or tubuli of the worms remaining in them; theſe are uſually of a pale-yellow or whitiſh-wax colour, and the body of the maſs of a browniſh or blackiſh hue, but retaining the ſtructure of the wood: of theſe there are beautiful ſpecimens in great abundance on the ſhore of the iſland Sheppy. We have the very ſame ſubſtances alſo buried in our clay-pits, about London and at Richmond; but in theſe the wood is highly ſaturated with the matter of the common vitriolic pyrites, and the pipes often filled with the ſame ſubſtance. See SYRINGOIDES.

TUBULI LACTIFERI, in anatomy, the ſmall tubes, or veſſels, through which the milk flows to the nipples of women's breaſts. See the article MILK.

TUBULUS MARINUS, or CANALIS, in natural-hiſtory, a genus of univalve ſhells, of an oblong figure, terminating in a point, and hollow within, ſo as to reſemble a tube or horn; and hence have, by ſome old writers, been called dentalia. See DENTALIA.

Of theſe ſhells ſome are ſtriated, ſome ſtraight, ſome bent like a horn, and ſome in form of a creſcent.

TUCANA, the TOUCAN, in ornithology. See the article TOUCAN.

TUCK *of a ſhip*, the truſſing or gathering up the quarter under water; which if ſhe lie deep, makes her have a broad, or, as they call it, fat quarter, and hinders her ſteering, by keeping the water from paſſing ſwiftly to her rudder; and if this truſſing lie too high above the water, ſhe will want bearing for her works behind, unleſs her quarter be very well laid out.

TUCUMAN, the ſouth-weſt diviſion of the province of La Plata, or Paraguay, in ſouth America.

TUCUYO, a town of Terra-Firma: weſt long. 68° 30′, north lat. 7°.

TUDELA, a town of Navarre, in Spain, ſituated on the river Ebro, fifty-five miles ſouth of Pampeluna.

TULIP, *tulipa*, in botany, a genus of the *hexandria-monogynia* claſs of plants, with a campanulated flower, conſiſting of ſix oblong, hollow, and erect petals: the fruit is a triquetrous, and trilocular capſule, containing a great many flat ſeeds ranged in a double order. See plate CCLXXXVII. fig. 2.

The characters of a good tulip are, that the ſtem ſhould be ſtrong and tall; the flower ſhould conſiſt of ſix petals, three within and three without; and the former ſhould

ſhould be larger than the latter: the bottom of the flower ſhould be proportioned to the top, and the ends of the leaves ſhould be rounded, not pointed: the leaves, when opened, ſhould neither turn inward nor bend outward, but ſtand erect; and the whole flower ſhould be of a middling ſize, neither too large nor too ſmall. the ſtripes muſt be ſmall and regular, and ſhould all ariſe from the bottom of the flower: the chives alſo ſhould not be yellow but of a brown colour.

TULIP-TREE, *liriodendrum*, in botany. See the article LIRIODENDRUM.

TULLE, a town of France, in the province of Guienne: eaſt long. 1° 31′, north lat. 45° 23′.

TULN, a town of Germany, fifteen miles weſt of Vienna.

TUMEFACTION, the act of ſwelling or riſing into a tumour. See the next article.

TUMOUR, or TUMOR, in medicine and ſurgery, a preternatural riſing or eminence on any part of the body. Tumour is alſo defined, by phyſicians, a ſolution of continuity ariſing from ſome humour collected in a certain part of the body, which diſjoins the continuous parts, inſinuates itſelf between them, and deſtroys their proper form.

Whether there be any ſuch preternatural riſing or enlargement on any part of the body, may be diſcovered from inſpection, but more particularly by feeling. And, notwithſtanding, it is a general cuſtom to refer excreſcences, as warts, corns, and ſuch as grow in the noſe and pudenda, to the claſs of tumours; yet, becauſe they grow not from beneath, but out of, or upon, the ſkin itſelf, it is thought proper not to comprehend them in the general diviſion of tumors. See EXCRESCENCE, CORN, WART, *&c.*

There are tumours of various kinds, diſtinguiſhed by particular names, according to the different cauſes from whence they proceed, and the particular parts wherein they are ſeated; ſome are called hot, others cold and watry; ſome are termed windy, others ſcirrhous; and ſome are named benign, others malignant: but Heiſter finds fault with theſe diſtinctions. There are ſome tumours which being contained in a proper membrane, are therefore called cyſtic; and if this ſhould be in an artery, it is uſually termed aneuriſm; but when in a vein, a varix. When in the veins of the anus, or rectum, the diſorder is termed hæmorrhoids; but if the tumour be in the ſcrotum, unguen, or at the umbilicus, it is generally called a hernia: if any pus, or matter, is contained in the tumour, it is called an abſceſs; and if the tumour is ſeated in a bone, it is termed exoſtoſis. See the articles CYST, ANEURISM, VARIX, HÆMORRHOIDS, HERNIA, ABSCESS, and EXOSTOSIS.

The forementioned claſs of tumours are all of them ſubdivided into ſeveral other kinds: thus the hot and burning tumours, which are the ſame with inflammations, are generally termed phlegmons when violent and ſeated in the common integuments; but when ſlighter, they are commonly called furuncles. The inflammation which is not fixed deep, but ſpreads only ſuperficially upon the ſkin, is termed an eryſipelas: the inflammatory tumour that ariſes at the finger-ends is termed paronychia: that which fixes in the groin or armpits is called a bubo; and that under the ears a parotis. When an inflammation ſeizes the hands and feet from extreme cold, chilblains ariſe; which tumour is called pernio. See the articles INFLAMMATION, FURUNCLE, ERYSIPELAS, PARONYCHIA, BUBO, PAROTIDES, and PERNIONES.

TUMOURS *of the breaſts*. See the article INFLAMMATIONS *of the breaſts*.

Cancerous TUMOURS. See CANCER.

Encyſted TUMOURS, tumours ariſing in different parts of the body, but contained in certain membranous coats: theſe are ſometimes harder, ſometimes ſofter, of a paliſh colour, and uſually attended with little pain. Theſe tumours ariſe from obſtructions either in the glands, or in the adipoſe membrane, more eſpecially about the face and neck, where they occaſion great deformity. The membranous coat with which theſe tumours are inveſted, is often of a conſiderable thickneſs, and is uſually the coat of the diſordered gland, or ſome of the adipoſe cells. At their beginning they are uſually very ſmall and moveable; but encreaſing by ſlow degrees, they grow ſometimes to an enormous bulk. See the article CYST.

The conſiſtence of ſome of theſe tumours is ſoft and fluctuating, and of others more hard and firm. They are of all ſhapes and ſizes, and ſome of them become hard as a callus, and unmoveable, while others are, for the generality, ſoft and moveable. See CALLUS.

They

They are diſtinguiſhed according to the conſiſtence of their contents; ſome are called atheromata, from their contents reſembling paſte; others, which have them of the conſiſtence of honey, are called meliceres; but if they are of a fatty ſubſtance, like ſuet or lard, they are called ſteatomata. If they happen in a gland which becomes indurated, they are called ſchirrous: and laſtly, when they are of a fleſhy conſiſtence, they are called ſarcomata. Some of theſe tumours have been found alſo full of hair. See ATHEROMA, *&c.*

They are diſtinguiſhed by others according to the places where they are ſituated. Thoſe ſeated under the ſcalp are called talpa, teſtudo, or lupia. Thoſe in the neck, ſtrumæ or ſcrophulæ; and thoſe in the hands and feet, eſpecially if among the tendons, are called ganglions. See the article GANGLIO, *&c.*

There is no general method for the cure of them; but the ſurgeon, according to their different circumſtances, attempts this by diſcuſſion, ſuppuration, or extirpation. See the articles DISPERSION and SUPPURATION.

But if the tumour can neither be diſperſed nor ſuppurated, but continues to enlarge itſelf, it is adviſeable to extirpate it in order to prevent its turning into a cancerous nature. There are ſeveral methods in practice for extirpating theſe tumours according to their nature and ſize: thoſe which are ſmall and hard, or hung by a root as by a ſtalk, are generally beſt removed by ligature, in the manner of warts; by which means they wither and fall off of themſelves in a few days. But the moſt ready and expeditious method is to cut them off with a ſcalpel, and then heal up the wound: but if in removing them this way you divide a conſiderable artery, you may ſtop it by ſome potential, or even the actual, cautery; or elſe, by taking it up with a needle and thread. Laſtly, theſe tumours may be often removed by the application of cauſtic or corroding medicines, retained about the root by means of plaſters, compreſſes, and a bandage; and when you find the root of the tumour almoſt corroded through, the reſt may be divided by the ſcalpel. See the article CAUSTIC.

If the root of the encyſted tumour appears too large for it to be conveniently taken off by ligature, you muſt then remove it either by the knife or by the cauſtics, though the latter is uſually preferred. In order to extirpate it by the knife, you muſt firſt make a longitudinal inciſion upon the tumour; and if that does not appear ſufficient, make another inciſion acroſs the former, till you think the wound large enough for taking out the tumour; in order to which you next dilate the integuments, and ſeparate them from the cyſt of the tumour, which you are to take out whole, if poſſible, either by means of the ſcalpel, a hook, or by paſſing a crooked needle, with a ſtrong thread, croſswiſe under the tumour; but great caution is neceſſary in this operation, leſt any important part that is contiguous to the tumour be injured.

The tumour being thus carefully extracted, if the wound and hæmorrhage be ſmall you may preſs the lips together; and by covering the ſame with lint and compreſſes, retained with a proper bandage, the patient is cured in a few days time; but in caſe of a profuſe hæmorrhage the blood is to be ſtopped either by ligature, aſtringents, or the actual or potential cautery.

Funguous TUMOURS. See FUNGUS.

Inflammatory TUMOURS. See the article INFLAMMATION.

Oedematous TUMOURS. See OEDEMA.

TUMOURS *of the parotid glands.* See the article PAROTIDES.

Peſtilential TUMOURS. See the articles BUBO and CARUNCLE.

Scirrhous TUMOURS. See SCIRRHUS.

TUMOURS *of the teſticles.* See TESTICLES.

TUN, or TON, originally ſignifies a large veſſel or caſk of an oblong form, biggeſt in the middle, and diminiſhing towards its two ends, girt about with hoops, and uſed for ſtowing ſeveral kinds of merchandize, for convenience of carriage; as brandy, oil, ſugar, ſkins, hats, *&c.* This word is alſo uſed for certain veſſels of extraordinary bigneſs, ſerving to keep wine in for ſeveral years.

TUN is alſo a certain meaſure for liquids; as wine, oil, *&c.* See MEASURE.

TUN is alſo a certain weight whereby the burden of ſhips, *&c.* are eſtimated. See the article WEIGHT.

TUNA, in botany, the ſame with the cactus. See the article CACTUS.

TUNBRIDGE, a town of Kent, ſituated thirty-three miles weſt of Canterbury, much reſorted to on account of its excellent waters.

TUNE, or TONE, in muſic, that property of ſounds whereby they come under the relation of acute and grave to one another.

See

See the articles ACUTENESS, GRAVITY, TONE, and SOUND.

Though gravity and acuteneſs are mere terms of relation, the tune of the ſound is ſomething abſolute, every ſound having its own proper tone, which muſt be under ſome determinate meaſure in the nature of the thing.

The only difference then, between one tune and another is in the degrees.

If two or more ſounds be compared together in this relation, they are neither equal or unequal in the degree of tune.

Such as are equal are called uniſons.

The unequal conſtitute what we call an interval, which is the difference of time between two ſounds.

Sonorous bodies we find differ in tune: 1. According to the different kinds of matter; thus a wedge of ſilver ſounds much more acute than a wedge of gold of the ſame ſhape and dimenſions, in which caſe the tones are proportional to the ſpecific gravity. 2. According to the different quantities of the ſame matter in bodies of the ſame figure, a ſolid ſphere of braſs, one foot diameter, ſounds acuter than one of two feet diameter; in which caſe the tunes are proportional to the quantity of matter. Here then are different tunes connected with different ſpecific gravities and quantities of matter, as their immediate cauſe. In effect, the meaſures of tune are only ſought in the relations of the motions that are the cauſe of ſound, which are no way ſo diſcernable as in vibrations of chords. See the article CHORD.

In the general we find that, in two chords, all things being equal, except tenſion, or thickneſs, or length, the tunes are different; there muſt, therefore, be a difference in the vibrations owing to theſe different tenſions, *&c.* which difference can only be in the velocity of the courſes and recourſes of the chords, through the ſpaces wherein they move to and again. Now, upon examining the proportion of the velocity and the things juſt mentioned, wherein it depends, it is found, to a demonſtration, that all the vibrations of the ſame chord are performed in equal times. Hence, as the tone of a ſound depends on the nature of thoſe vibrations, whoſe difference we can conceive no otherwiſe than as having different velocities; and as the ſmall vibrations of the ſame chord are performed in equal times, and it is found true, in fact, that the ſound of any body, ariſing from any individual ſtroke, tho' it grow gradually weaker, yet continues the ſame tone from firſt to laſt: it follows, that the tone is neceſſarily connected with a certain quantity of time, in making every ſingle vibration; or, that a certain number of vibrations, accompliſhed in a given time, conſtitutes a certain determinate tune; for the more frequent thoſe vibrations are, the more acute the tone; and, the ſlower and fewer they are, the more grave the ſound, though performed in the ſame ſpace of time; ſo that any given note of a tune is made by one certain meaſure of velocity of vibrations, *i. e.* ſuch certain courſes and recourſes of a chord or ſtring, in ſuch a certain ſpace of time, conſtitute a determinate tune. See NOTE.

This theory is ſtrongly ſupported by our beſt and lateſt writers on muſic, Dr. Holder, Mr. Malcolm, *&c.* both from reaſon and experience. Dr. Wallis, who holds it very reaſonable, adds that it is evident the degrees of acuteneſs are reciprocally as the lengths of the chords, though, he ſays, he will not poſitively affirm that the degrees of acuteneſs anſwer the number of vibrations as their true cauſe: but this difference ariſes hence, that he doubts whether the thing has been ſufficiently proved by experiment. Indeed, whether the different number of vibrations, in a given time, is the true cauſe on the part of the object of our perceiving a difference of tune, is a thing which, we conceive, does not come within the reach of experiment. It is enough that the hypotheſis is reaſonable. See the articles CONCORD, HARMONY, *&c.*

TUNICA, a kind of waiſtcoat, or undergarment, in uſe amongſt the Romans. They wore it within doors by itſelf, and abroad under the gown. The common people could not afford the toga, and ſo went in their tunics, whence Horace calls them popellus tunicatus. The ſeveral ſorts of the tunic were the palmata, the anguſticlavia, and the laticlavia. The firſt was worn by generals in a triumph, and perhaps always under the toga picta; it had its name either from the great breadth of the clavi, equal to the palm of the hand; or elſe from the figures of palms, embroidered on it. For the other two, ſee the article CLAVUS.

It was by theſe three different ſorts of tunics, that the three different orders of the roman people were diſtinguiſhed in habit.

TUNICA,

TUNICA, *tunic*, in anatomy, is applied to the membranes which inveſt the veſſels, and divers others of the leſs ſolid parts of the body; thus the inteſtines are formed of five tunics, or coats, for which ſee the article INTESTINES.

There are alſo five tunics, or coats, of the eye, for which, ſee the article EYE.

TUNIS, the capital of the kingdom of Tunis, thirty miles ſouth of Carthage-ruins, 300 miles eaſt of Algiers, and 120 ſouth-weſt of Trapano, in Sicily; a populous city, about three miles in circumference: eaſt long. 10° north lat. 36° 20′. The kingdom of Tunis is ſituated on the coaſt of Barbary, in Africa, being bounded by the Mediteranean Sea, on the north. It extends 200 miles in length from eaſt to weſt, along the ſhore of the Mediterranean; the breadth is very unequal.

TUNNAGE is uſed for a cuſtom or impoſt, payable to the crown, for goods and merchandize imported or exported, and is to be paid after a certain rate for every tun thereof. This duty, as well as that of poundage, was firſt granted for life to king Charles II. and has been continued in the ſame manner to his royal ſucceſſors, down to his preſent majeſty king George II.

TUNNEL-NET, a net for taking partridges, which ſhould not exceed fifteen feet in length, nor be leſs than eighteen inches in breadth, or opening for the entrance. See the article NET.

When you have found a covey, fetch a compaſs and pitch the net at a good diſtance from them, ſometimes farther, at other times nearer, according to the ſituation of the ground; ſurround them either with a natural or artificial ſtalking horſe, and gently drive them towards the net, not coming on them in a direct line, but by turnings and windings, and ſometimes ſtanding ſtill, as if the horſe grazed. In caſe they make a ſtand and look up, it is a ſign of fear, and that they intend to take wing; ſtand ſtill therefore, or retreat for a while, and when you find them quiet after a little reſpite, and buſy in ſeeking after meat, you are to move nearer, and if any ſingle partridge lies remote from the reſt, he may be brought in by fetching a compaſs about him. The wing of the tunnel muſt not be pitched in a direct line, but inclining to a ſemi circle. See STALKING.

TUNNING *of ale or beer*, a part of the proceſs of brewing, or rather an operation which is the ſequel thereof. When the beer has worked or fermented in an open vat, as long as is proper, tun it up into ſeaſoned veſſels, that is, ſuch as have had ale or beer in them before; for if it be put into new caſks, it muſt be made ſtronger than ordinary, elſe it will not keep ſo long, becauſe the caſk will imbibe the ſpirits, and the reſt will ſoon become flat and vapid. It is beſt to tun beer juſt when it comes to a due fermentation, and gets a good head; for then it has the moſt ſtrength to clear itſelf in the caſk, and what works over may be put into the ſmall beer, and muſt be ſupplied with freſh beer of the ſame brewing. When the beer is tunned, carry it while it works in the caſk, into a good cellar, or proper place to preſerve it; for if it be ſtirred after it has done working, it will be apt to grow ſtale, ſour, and become alegar, unleſs it be drawn out into another caſk.

TUNNY, *thynnus*, in ichthyology, the ſcomber, with eight or nine pinnules on the hinder part of the back, and a furrow at the belly fins. See SCOMBER.

TURBAN, or TURBANT, the head-dreſs of moſt of the eaſtern nations. It conſiſts of two parts, a cap, and a ſaſh of fine linnen, or taffety, artfully wound in divers plaits about the cap. The Turks call the ſaſh turbent, whence we have formed turban. The cap has no brim, is pretty flat, though roundiſh at top, and quilted with cotton, but does not cover the ears. There is a good deal of art in giving the turban a fine air, and the making of them is a particular trade. The ſaſh of the Turks turban is white linnen; that of the Perſians red woollen. Theſe are the diſtinguiſhing marks of their different religions. Sophi, king of Perſia, being of the ſect of Ali, was the firſt who aſſumed the laſt colour, to diſtinguiſh himſelf from the Turks, who are of the ſect of Omar, and whom the Perſians eſteem heretics. The Emirs, who pretend to be deſcended of the race of Mahomet, wear their turbans quite green, which was the colour wore by that falſe prophet. The grand ſeignior's turban is as big as a buſhel, and ſo exceedingly reſpected by the Turks, that they ſcarce dare touch it. It is adorned with three plumes of feathers, enriched with diamonds and precious ſtones, and he has an officer on purpoſe to look after it. The grand vizier's turban has two plumes; to have thoſe of divers other

officers,

officers, only ſmaller one than another; others have only one, and others none at all. The turban of the officers of the divan is of a peculiar form.

TURBAN-SHELL, in conchyliology, the engliſh name of the roundiſh centronia. See the article CENTRONIA.

TURBARY, denotes a right to dig turfs on another's ground; and it is likewiſe taken for the ground or place where turfs are digged, ſometimes called the turfary.

TURBINATED, is a term applied by naturaliſts, to ſhells, which are ſpiral, or wreathed, conically, from a larger baſis to a kind of apex.

TURBITH, or TURPETH-ROOT, in the materia medica, the cortical part of the root of an indian convolvulus, brought to us in oblong pieces, of a brown or aſh-colour on the outſide, and whitiſh within: the beſt is ponderous, not wrinkled, eaſy to break, and diſcovering a large quantity of reſinous matter to the eye: its taſte is at firſt ſweetiſh; when chewed for a little time, it becomes acid, pungent, and nauſeous. This root is a cathartic, not of the ſafeſt, or moſt certain kind: the reſinous matter in which its virtue reſides, appears to be very unequally diſtributed, inſomuch that ſome pieces, taken from a ſcruple to a dram, purge violently; whilſt others, in larger doſes, have ſcarce any effect at all. An extract made from the root, is more uniform in ſtrength, though not ſuperior, or equal, to purgatives more common in the ſhops.

Turbith pays a duty on each pound imported of 11 $\frac{62\frac{1}{2}}{100}$d. and draws back, for each pound exported, 10 $\frac{2}{100}$d.

TURBITH-MINERAL, a name given by chemiſts, to a yellow precipitate of mercury, prepared after the following manner. Upon purified quickſilver, contained in a glaſs veſſel, pour double its weight of the ſtrong ſpirit or oil of vitriol. Heat the liquor by degrees, ſo as at length to make it boil, till a white maſs remains, which is to be thoroughly dried, with a ſtrong fire. This maſs, on the affuſion of warm water, grows yellowiſh, and falls into powder; which is to be carefully ground with the water in a glaſs mortar: then ſuffer it to ſettle, pour off the water, and waſh the powder in ſeveral parcels of freſh water, until it is ſufficiently dulcified.

This preparation is a ſtrong emetic, and operates the moſt powerfully of all the mercurials that can be ſafely given internally. Its action, however, is not confined to the primæ viæ; it will ſometimes excite a ptyaliſm, if a purgative is not ſoon taken after it. It is uſed chiefly in violent gonorrhæas, and other venereal caſes, where there is a great flux of humours to the parts; the doſe is from two grains, to ſix or eight, though there are ſome conſtitutions, which have been uſed to mercurials, that bear well even the doſe of a ſcruple. This medicine has alſo of late been recommended, as the moſt effectual preſervative againſt the hydrophobia. See HYDROPHOBIA.

The waſhings of turbith mineral are by ſome externally applied for the itch, and other cutaneous foulneſſes; but in theſe caſes, though it often does ſervice, the patient muſt not be too free with it.

TURBO, in natural hiſtory, a genus of univalve ſhells, with a long, wide, and depreſſed mouth, in ſome ſpecies approaching to a round ſhape, and in ſome having teeth, in others not. They all grow narrow toward the baſe, and are auriculated, and terminate in a very long and ſharp point.

Of this genus, there are a great many elegant ſpecies; as the ſlender turbo, with ventricoſe ſpires, and a ſmall round mouth, about five or ſix inches long. (ſee plate CCLXXXIX. fig. 3. n° 1.) The rough ſcrew-ſhell is repreſented, (*ibid.* n° 2.) beſides which, there are numerous other ſpecies, as the caterpillar-ſhell, teleſcope-ſhell, *&c.* all diſtinguiſhed by their different ſpires, and the form of their mouths.

TURBOT, or TURBUT, in ichthyology, the engliſh name of a ſpecies of pleuronectes, with the eyes on the right ſide, and the body ſmooth. See the article PLEURONECTES.

It grows to a conſiderable ſize, and is one of the moſt eſteemed fiſh at table.

TURCOISE, or TURQUOISE, *turcheſia*, in natural hiſtory, an ore of copper, erroneouſly ranked among gems. See the article COPPER.

There are, indeed, two kinds of turcois; the one a true and genuine ore of copper; the other the bones of animals tinged to a beautiful blue colour, by having been buried in places where copper-ore has been near them.

That kind which we uſually diſtinguiſh

by the name of the turquoiſe of the old rock, and which Pliny and the antients called callais, is a true and genuine copper-ore, and is of exactly that kind in regard to this metal, that the hæmatites is to iron; it is found in the perpendicular fiſſures of the ſtrata of ſtone, which contain copper adhering to their ſides in form of a cruſt, and riſing into botryoide efflorescences, which ſometimes ſtand ſingle, and are in bigneſs from the ſize of a pea to that of a walnut; but ſometimes happening to be placed cloſe to one another, they join and form flat cruſts or maſſes, extending, in the manner of cruſts of the hæmatites, to three, four, or more inches in breadth; in theſe the prominent part of every tubercle appearing on the ſurface, the whole ſeems a conjunction of ſemi-circular bodies of a fine blue colour joined by an intermediate ſubſtance of the ſame nature.

This kind of the turquoiſe is of a very cloſe texture and gloſſy ſurface, but very ſoft, and, when broken, ſhews the ſame cruſtated and ſtriated texture with the hæmatites; only that the ſtriæ are uſually finer, and the plates better joined. It ferments with aqua fortis, and may be in great part diſſolved by it; and on calcining, it loſes all its colour, and becomes of a dirty white. This is produced in Perſia, and ſome other parts of the eaſt. The Germans alſo have a botryoide copper-ore, in ſome of their mines; but it is green and much ſofter than the true turquoiſe of this kind, though this has been often produced among us alſo under the name of that gem.

The other turquoiſe is nothing more than the teeth or bones of animals, which have lain in the way of effluvia, in which copper has been contained, and by this means have acquired veins and ſtreaks of a deep blue, which, on the whole being ſlightly calcined, diffuſe themſelves through all the ſubſtance, and give it the fine pale blue we ſo much admire in this gem. If the fire that diffuſes this colour be a little too ſtrong, it ſends it wholly off, and leaves in place of the turquoiſe only a white bone. The turquoiſes of this laſt kind are common in France; there are mines of them there, and the people who work them are perfectly acquainted with the method of diffuſing the colour through them. Theſe are what are now uſually worn, and, when fine, are called, by many of our jewellers, turquoiſes of the old rock, as well as the other. The virtues attributed to this gem are very great, but all we know of it at preſent is, that, like the other bodies that contain copper, it is a violent emetic, and not fit to be received into practice.

TURCOMANIA, a province of aſiatic Turkey, bounded by Perſia on the eaſt, and anſwers to the antient Armenia; its capital is Erzerum. See ERZERUM.

TURDUS, in ornithology, a genus of birds, of the order of the paſſeres, the beak of which is of a conic form, and ſtraight, only ſomewhat bent on the upper part, and has no membrane at the baſe: the tongue is lacerated and emarginated.

Under this genus are comprehended the black-bird, thruſh, red-wing, &c. See the article BLACK-BIRD, &c.

TURDUS, in ichthyology, the name by which authors call the green labrus, with a blue line on each ſide; a very beautiful fiſh, from eight to fourteen inches in length, and conſiderably thick in proportion. See LABRUS.

TURENNE, a town of Guienne, in France: eaſt long. 1° 20′, and north lat. 45° 7′.

TURF, a blackiſh ſulphureous earth, uſed in ſeveral parts of the kingdom as fuel. See FUEL and TURBARY.

TURGESCENCE, or TURGESCENCY, among phyſicians, denotes a ſwelling, or growing bloated.

TURIN, the capital of Piedmont, in Italy, and of the king of Sardinia's dominions, is ſituated at the confluence of the rivers Po and Doria, 100 miles ſouth-weſt of Milan: eaſt long. 7° 16′, and north lat. 44° 50′.

TURIONES, among herbaliſts, denotes the firſt young tender ſhoots, which plants annually put forth.

TURKEY, *meleagris*, in ornithology, a genus of birds, the anterior part of the head of which is covered with a fleſhy pendulous ſubſtance, the ſides of the head alſo, and the throat, are covered with a papillous fleſhy matter, and there is a longitudinal fleſhy creſt, of a reddiſh, bluiſh, or purpliſh colour, and a ſoft ſubſtance. This is a large, but unweildy bird, the head is ſtrangely covered and ornamented with a pendulous, ſoft, fleſhy, ſubſtance, as already obſerved; the eyes are ſmall, but bright and piercing, the wings are moderately long, though not at all formed for ſupporting ſo large a bulk in long flights, they have each twenty-

twenty-eight long feathers; the tail is long and large, the legs moderately long and very robuſt.

There is but one known ſpecies of this genus.

TURKY, a very extenſive empire, comprehending ſome of the richeſt countries in Europe, Aſia, and Africa.

Turky in Europe, comprehends Romania, Bulgaria, Servia, Boſnia, Raguſa, Wallachia, Moldavia, Beſſarabia, Budziac, Crim, and Little Tartary, with Albania, Epirus, Macedonia, Theſſaly, and all the antient Greece, with its numerous iſlands. See ROMANIA, *&c.*

Turky in Aſia, comprehends Natolia, Diarbeck, Syria, Turcomania, and part of Georgia and Arabia. See the article NATOLIA, *&c.*

And Turky in Africa, comprehends the fruitful and extenſive country of Egypt. See the article EGYPT.

TURMERIC, in the materia medica, the root of a plant, called by botaniſts curcuma. See the article CURCUMA.

It is a ſmall root, of an oblong figure, uſually met with in pieces from half an inch to an inch or two in length, and at the utmoſt ſurface the thickneſs of a man's little finger; its ſurface is uneven, and riſes into knobs in many places, and the longer pieces are ſeldom very ſtraight; it is very heavy and hard to break; it is not eaſily cut through with a knife, but, when cut, leaves a gloſſy ſurface. Its colour externally, is a pale whitiſh grey, with ſome faint tinge of yellowneſs, and when broken, is of a fine yellow within; this colour is bright and pale, and without admixture, when the root is freſh; but in keeping it by degrees becomes reddiſh, and at length is much like ſaffron in the cake. Thrown into water, it ſpeedily gives it a fine yellow tinge, and, chewed in the mouth, it gives the ſpittle the ſame colour. It is eaſily powdered in the mortar, and, according to its different age, makes a yellow, an orange colour, or a reddiſh powder. It has a kind of aromatic ſmell, with ſomething of the odour of ginger in it. The taſte is acrid and diſagreeable, and has a conſiderable bitterneſs.

It is brought from the Eaſt-Indies, where they uſe it in ſauces and foods. As a medicine, it is eſteemed aperient and emmenagogue, and of ſingular efficacy in the jaundice.

But beſides theſe uſes, the glovers uſe it for dying their leather, and the turners to give an agreeable yellow to ſeveral of their works, made in the whiter woods.

TURN, in law, a court held twice a year, *viz.* within a month after Eaſter and Michaelmas, reſpectively, by the ſheriff of every county.

By magna charta, ſheriffs were reſtrained from holding pleas of the crown; but they are ſtill judges of record, and may take indictments and preſentments, and inquire of all treaſons and felonies by the common law, as well as the loweſt offences againſt the king; common nuſances, annoyances, purpreſtures, *&c.* Alſo of perſons ſelling corrupt victuals, breaking the aſſiſe of ale and beer, or keeping falſe weights, *&c.* diſturbers of the peace and barretors, *&c.* and may amerce for offences, *&c.*

TURNADO, or TORNADO, a wind which on ſome coaſts blows all night from the ſhore.

TURNAMENT, or TOURNAMENT, a martial ſport, or exerciſe, which the antient cavaliers uſed to perform to ſhew their bravery and addreſs.

TURNEP, *rapa*, in botany, a ſpecies of Braſſica. See the article BRASSICA.

TURNERA, in botany, a genus of the *pentandria-tryginia* claſs of plants, the flower of which conſiſts of five petals obverſely cordated, and ſharp-pointed: the fruit is an oval, unilocular capſule, containing a great many oblong and obtuſe ſeeds.

TURNHOUT, a town of Brabant, twenty-four miles north-eaſt of Antwerp.

TURNING, a branch of ſculpture, being the art of faſhioning hard bodies, as braſs, ivory, wood, *&c.* into a round or oval form, in a lathe.

Turning is performed by putting the ſubſtance to be turned upon two points as an axis, and moving it round on that axis; while an edge-tool, ſet ſteady to the outſide of the ſubſtance in a circumvolution thereof, cuts off all the parts which lie farther off the axis, and makes the outſide of that ſubſtance concentric to the axis. See LATHE.

The invention of turning ſeems to have been very antient. Some, indeed, to do honour to the age, will have it brought to perfection by the moderns; but, if what Pliny and ſome other antient authors relate, be true, that the antients turned thoſe precious vaſes enriched with figures and ornaments in relievo, which we ſtill ſee in the cabinets of the curious, it muſt be owned that all that has been

added in theſe ages, makes but a poor amends for what we loſt of the manner of turning of the antients.

TURNPIKE, a gate ſet up a-croſs a road, watched by an officer for the purpoſe, in order to ſtop travellers, waggons, coaches, *&c.* to take toll of them towards repairing or keeping the roads in repair.

Juſtices of the peace, and other commiſſioners, are authorized to appoint ſurveyors of the roads, and collectors of toll, which is uſually 1s. or 6d. for a coach or waggon, and 1d. for a horſe, *&c.* In caſe any perſons ſhall drive horſes or other cattle through grounds adjoining to the highways, thereby to avoid the toll, they are liable to forfeit 10s. Likewiſe if any one aſſaults a collector of the tolls, or by force paſſes through a turnpike-gate without paying, he forfeits 5 l. leviable by juſtices of peace; and maliciouſly pulling down a turnpike is deemed felony, *&c.* It is alſo enacted; that 20s. ſhall be paid for every hundred that a carriage with its loading weighs above 6000 pound weight, and that engines may be ſet up at turnpikes for weighing ſuch carriages.

TURNPIKE, is alſo uſed in the military art for a beam ſtruck full of ſpikes, to be placed in a gap, a breach, or at the entrance of a camp, to keep off an enemy. See CHEVAUX *de friſe*.

TURNSOLE, or TORNSOLE, in botany, the engliſh name for the croton of Linnæus, and the heliotropium-tricoccum of other authors. See CROTON.

TURPENTINE, a tranſparent ſort of reſin, flowing either naturally or by inciſion from ſeveral unctuous and reſinous trees, as the terebinthus, larch, pine, fir, *&c.*

We diſtinguiſh ſeveral kinds of turpentines; as that of Chio, that of Venice, that of Bourdeaux, that of Cyprus, Straſburg, *&c.*

The turpentine of Chio or Scio, which is the only genuine kind, and that which gives the denomination to all the reſt, is a whitiſh reſin, bordering a little on green, very clear, and a little odoriferous; drawn by inciſion from a tree called terebinthus, very common in that iſland, as alſo in Cyprus, and ſome parts of France and Spain.

The reſin muſt be choſen of a ſolid conſiſtence almoſt without either taſte or ſmell, and not at all tenacious, which diſtinguiſhes it from the falſe turpentine of Venice, commonly ſubſtituted for it, which has a briſker ſmell, a bitter taſte, and ſticks much to the finger. This turpentine of Chio is indiſputably the beſt, but its ſcarcity occaſions it to be little in uſe. The turpentine of Venice is falſely ſo called; for, though there was a turpentine antiently brought from Venice, yet, that now ſo called comes from Dauphine. It is liquid, of the conſiſtence of a thick ſyrup, and whitiſh; and flows either ſpontaneouſly or by inciſion, from the larix or larch-tree chiefly in the wood de Pilatze.

That flowing naturally, called by the peaſants bijon, is a kind of balſam, not inferior in virtue to that of Peru, for which it is frequently ſubſtituted. That drawn by inciſion, after the tree has ceaſed to yield ſpontaneouſly, is of conſiderable uſe in ſeveral arts, and it is even of this that varniſh is chiefly made. It muſt be choſen white and tranſparent, and care be taken that it be not counterfeited with oil of turpentine. The turpentine of Bourdeaux is white, and as thick as honey. It does not ooze from the tree in the manner it is ſent to us, but is properly a compoſition wherein among other ingredients is a white hard ſort of reſin called galipot. See PITCH.

The turpentine of Straſburg, the produce of the abies or ſilver fir, is that moſt commonly uſed among us, and is preferred by our people to that of Venice, which is diſtinguiſhed from it by its green hue, fragrant ſmell, and citron-flavour.

The uſes of turpentine in medicine are innumerable. It is a great vulnerary, and very detergent, and as ſuch is preſcribed in abſceſſes, ulcerations, *&c.* It promotes expectoration, and as ſuch is preſcribed in diſeaſes of the lungs and breaſt; but it is moſt famous for clearing the urinary paſſages, and as ſuch preſcribed in obſtructions of the reins, in gonorrhœas, *&c.*

Oil of TURPENTINE. There are two kinds of oil drawn from turpentine, by diſtillation; the firſt white, the ſecond red, both eſteemed as balſams proper for the cure of wounds, chilblains, *&c.* But they are ſo little uſed among us, that it is not eaſy to procure either of them.

What is commonly ſold under the name of oil of turpentine, or etherial oil, is only a diſtillation of the reſinous juice of the tree, freſh as it is gathered. It is uſed with ſucceſs in the cure of green wounds, as alſo by the painters, farriers, *&c.* To be good, it muſt be clear and pellucid

Fig. 1. The TUSCAN Order

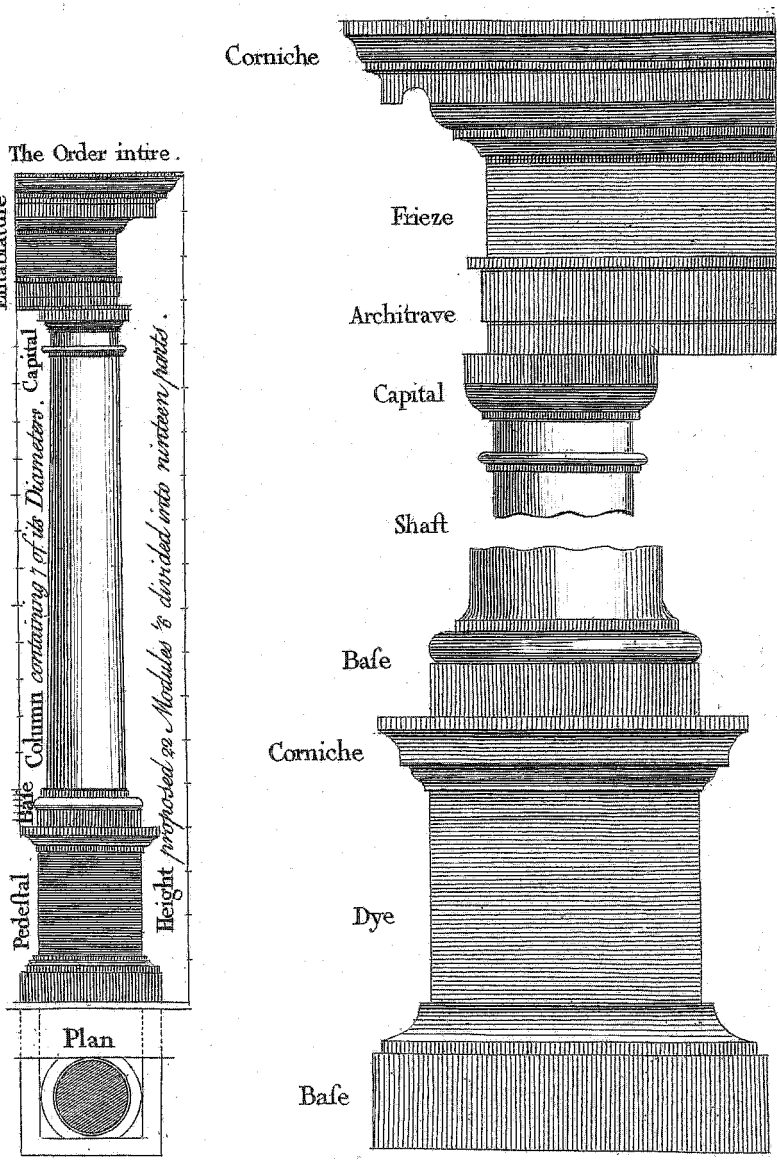

Fig. 2. TRESSURE

Fig. 3. VAIR.

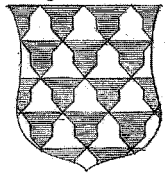

Fig. 4. VAIRY CUPPY.

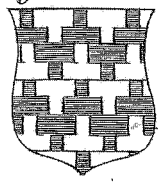

T. Jefferys sculp

pellucid as water, of a ſtrong penetrating ſmell, and very inflammable.

TURPENTINE-TREE, *terebinthus*, in botany, a ſpecies of piſtachia. See the article PISTACHIA.

TURQUOISE, or TURCOISE. See the article TURCOISE.

TURRITIS, TOWER-MUSTARD, in botany, a genus of the *tetradynamia ſiliquoſa* claſs of plants, with a tetrapetalous cruciform flower: its fruit is an extremely long pod, containing numerous ſeeds.

TURSIS, a town of the kingdom of Naples, in Italy, ſituated ten miles north-weſt of the gulph of Taranto: eaſt long. 17° 6′, north lat. 40° 15′.

TURUNDA, in medicine and ſurgery, denotes a tent, pellet, or pencil; or a piece of lint thruſt into a wound, ulcer, &c. See the article TENT.

TURTLE, in ichthyology, a name given to ſome ſpecies of the teſtudo, as the hawk's bill turtle is the teſtudo with acuminated ungues, four on the hinder as well as the fore feet; the green turtle, or the teſtudo, with two ungues on the fore feet, and one on the hinder; and the long headed turtle, or the great oval headed teſtudo. See TESTUDO.

TURTLE-DOVE, is a ſpecies of the columba kept tame. See COLUMBA.

TUSCAN ORDER, in architecture, the firſt, ſimpleſt, and moſt maſſive of the five orders. See pl. CCLXXXVIII. fig. 1. The tuſcan is called the ruſtic order by Vitruvius, and M. de Cambray agrees with him, who in his parallel, ſays, it never ought to be uſed but in country-houſes and palaces. M. Le Clerc adds, that in the manner Vitruvius, Palladio, and ſome others, have ordered it, it does not deſerve to be uſed at all. But in Vignola's manner of compoſition, he allows it a beauty, even in its ſimplicity, and ſuch as makes it proper, not only for private houſes, but even for public buildings, as in the piazzas of ſquares and markets, in the magazines and granaries of cities, and even in the offices and lower apartments of palaces.

The tuſcan has its character and proportions as well as the other orders; but we have no antient monuments to give us any regular tuſcan pillar for a ſtandard. M. Perrault obſerves, that the characters of the tuſcan are nearly the ſame with thoſe of the doric, and adds, that the tuſcan is in effect no more than the doric made ſomewhat ſtronger, by ſhortening the ſhaft of the column; and ſimpler, by the ſmall number, and largeneſs of the mouldings. See DORIC.

Vitruvius makes the whole height of the order fourteen modules, in which he is followed by Vignola, M. Le Clerc, &c. Serlio makes it but twelve. Palladio gives us but one Tuſcan profile much the ſame as that of Vitruvius, and another too rich, on which ſide Scamozzi is likewiſe too faulty. Hence it is, that that of Vignola, who has made the order very regular, is moſt followed by the modern architects.

Of all the orders, the tuſcan is the moſt eaſily executed, as having neither triglyphs nor dentils, nor modillions, to cramp its intercolumns. On this account, the columns of this order may be ranged in any of the five manners of Vitruvius, *viz.* the pycnoſtyle, ſyſtyle, euſtyle, diaſtyle, and araeoſtyle. See the articles PYCNOSTYLE, SYSTYLE, &c.

TUSCAN *order by proportions of equal parts.* The height of the pedeſtal, being two diameters, is divided into 4, giving 1 to the baſe, whoſe plinth is $\frac{2}{3}$ thereof, the other part is divided into three, giving one to the fillet, and two to the hollow. The breadth of the die or naked is one diameter, and $\frac{1}{3}$, and the projection of the baſe is equal to its height, the fillet hath three-fourths thereof. The height of the corniche is half the baſe, being $\frac{1}{8}$ of the whole height, and is divided into 8, giving 2 to the hollow, 1 to the fillet, and 5 to the band; the projection is equal to the baſe, and the fillet hath three of theſe parts. Baſe of the column: the height is one half a diameter, and is divided into ſix parts, giving three to the plinth, 2 and $\frac{1}{2}$ to the torus, and $\frac{1}{2}$ a part to the fillet; the whole projection is $\frac{1}{3}$ of its height. The hollow, or cincture, is one fourth of a circle, in all the orders, and belongs to the ſhaft of the column.

The diminiſhing of this column is $\frac{1}{6}$ of the diameter, and is divided into 9, giving 2 $\frac{1}{2}$ to the frieze of the capital, $\frac{1}{2}$ a part to the fillet, 3 to the ovolo, and 3 to the abacus. The whole projection is $\frac{1}{8}$ of the diameter, being perpendicular to the body of the column below, and the fillet projects equal to its height. The collerino, or necking of all the orders in general, is one of thoſe nine parts in the capital, and the fillet half a part, the projection is 1 and $\frac{1}{4}$ of theſe parts, and the fillet equal to its height. The height of the entablature being one diameter

and

and $\frac{3}{4}$, is divided into 6, giving 2 to the architrave, 1 $\frac{1}{2}$ to the frieze, and 2 $\frac{1}{2}$ to the corniche.

For the members of the architrave, divide the height into ſeven parts, giving 2 $\frac{1}{2}$ to the firſt face, 3 $\frac{1}{2}$ to the ſecond, and 1 to the band at top. The projection is equal to the band, and the ſecond face a third thereof. The firſt face of all the architraves is perpendicular to the naked of the column at the top. For the corniche, divide the height into 9, giving 1 $\frac{1}{2}$ to the hollow, $\frac{1}{2}$ to the fillet, 1 $\frac{1}{2}$ to the ovolo, 2 to the corona, $\frac{1}{2}$ a part to the fillet, 2 to the ſcima recta, and 1 to the fillet. For the projections, the hollow hath 2 of theſe parts, the ovolo 3 $\frac{1}{2}$, the corona 6, the fillet 6 $\frac{1}{2}$, and the whole 9 being equal to the height. See the figure.

TUSCANY, a dutchy of Italy, encompaſſed by the pope's territories on the north-eaſt and ſouth, and bounded by the Tuſcan Sea on the ſouth-weſt, and by the territories of Lucca and Modena on the north-weſt, being 100 miles long, and almoſt as many broad.

TUSCULAN, in matters of literature, a term which frequently occurs in the phraſe *tuſculan queſtions*. Cicero's tuſculan queſtions are diſputations on ſeveral topics in moral philoſophy, which that great author took occaſion to denominate from Tuſculanum, the name of a country-ſeat or villa, where they were compoſed, and where he lays the ſcene of the diſpute. They are compriſed in five books, the firſt on the contempt of death; the ſecond of enduring pain; the third on aſſwaging grief; the fourth on the other perturbations of the mind; and the laſt, to ſhew that virtue is ſufficient to a happy life.

TUSSILAGO, in botany a genus of the *ſyngeneſia-polygamia ſuperflua* claſs of plants, the compound flower of which is various. In ſome there are only tubuloſe hermaphrodite corollulæ: there are no female ones. In others, there are tubuloſe hermaphrodite ones on the diſk; the female ones are ligulated on the verge. In others, there are tubuloſe hermaphrodite flowers on the diſk; the female ones being naked, and mixed with the petal, which is infundibuliform: the limb is quinquifid or quadrifid, acute, bent backwards, and longer than the cup. There is no pericarpium except the cup: the ſeed following the hermaphrodite flower is ſingle, oblong, compreſſed, and by a ſmall thread ſuſtains a hairy pap. If there are any ſeeds following the female flower, they are like the hermaphrodite ones.

This genus comprehends the tuſſilago, or common colt's-foot, the cacalia, and the petaſites, or butter-bur.

The common tuſſilago, or colt's-foot, ſtands recommended in coughs, and other diſorders of the breaſt and lungs; practice, however, ſeems to have almoſt rejected it. The petaſites, or butter-bur, has been given in the doſe of a dram, or more, as an aromatic, and likewiſe as an aperient and deobſtruent; theſe virtues, however, it poſſeſſes in ſo ſmall a degree, as to have loſt its reputation in the ſhops.

TUSSIS, the cough. See COUGH.

TUT, in armory, *&c.* an imperial enſign of a golden globe, with a croſs on it.

TUTBURY, a market-town of Staffordſhire, ſituated eighteen miles eaſt of Stafford.

TUTELARY, *tutelaris*, one who has taken ſomething into his patronage and protection.

TUTOR, in the civil law, is one choſen to look to the perſon and eſtate of children left by their fathers and mothers in their minority. A perſon nominated tutor either by teſtament, or by the relations of the minor, is to decline that office if he have five children alive, if he have any other conſiderable tutorage, if he be under twenty-five years of age, if he be a prieſt, or a regent in an univerſity, or if he have any law-ſuit with the minors, *&c.* The marriage of a pupil, without the conſent of his tutor, is invalid. Tutors may do any thing for their pupils, but nothing againſt them, and the ſame laws which put them under a neceſſity of preſerving the intereſt of the minors, put them under an incapacity of hurting them. See TUTORAGE.

TUTOR, is alſo uſed in our univerſities for a member of ſome college or hall, who takes on him the inſtruction of ſome young ſtudents in the arts or faculties.

TUTORAGE, *tutela*, in the civil law, a term equivalent to guardianſhip in the common law, ſignifying an office impoſed on any one to take care of the effects of one or more minors. See GUARDIANSHIP and TUTOR.

By the roman law, there are three kinds of tutorage; teſtamentary, which is appointed by the father's teſtament; legal, which is given by the law to the neareſt relation; and dative, which is appointed by the magiſtrate. But in all cuſtomary provinces, as France, *&c.* all tutorages are

are dative and elective, and though the father have by teſtament nominated the next relation to his pupil, yet is not that nomination of any force, unleſs the choice be confirmed by that of the magiſtrate, *&c.* By the roman law, tutorage expires at fourteen years of age. See the article CURATOR.

TUTTY, *tutia*, a recrement of mixed metals, in which lapis calaminaris, or zink in its metallic form, is an ingredient, collected in the furnaces where braſs is made from copper and calamine, and where the mixed metals are run. In theſe furnaces they place, under the roof and about the upper parts of the ſides, rods of iron, and ſometimes rolls of dry earth, about which the tutty is afterwards found. Therefore the tutty which we uſe in the ſhops at this time, owes its origin truly and properly to zink, which ſublimes with a very ſmall fire into a kind of flowers, and when fuſed with any other metal, flies from it in abundance under this form, and alſo frequently takes ſome part of that metal, more or leſs, up with it. Hence it is evident, that the tutty or cadmia of the antients, muſt have been wholly different from ours, as they uſed no zink nor any of its ores in the furnace where they collected it See ZINK and CADMIA.

Our tutty then is a hard and heavy ſemimetallic recrement, ſometimes met with in the ſhops in thin flat pieces or flakes, but moſt abundantly in tubular cylindric pieces, reſembling ſegments of the barks of trees puſhed off from the branches without breaking; theſe are of different lengths and diameters. The fineſt tutty is that of a fine deep brown on the outſide, and of a yellowiſh tinge within; the thickeſt, brighteſt, and moſt granulated; the hardeſt to break, and that which has leaſt foulneſs among it.

Tutty is celebrated as an ophthalmic, and frequently employed as ſuch in unguents and collyria. See COLLYRIA.

It is to be prepared for uſe by heating it ſeveral times red hot, and quenching it ſuddenly in roſe or common water; then powdering it in a mortar, and finally levigating it with a little water upon a ſmooth hard marble, till there does not remain the leaſt gritty particle among it. It is then to be dropped upon a chalkſtone, and left to dry.

TUXFORD, a market-town of Nottinghamſhire, twenty miles north-eaſt of Nottingham.

TUY, a town of Spain, in the province of Galicia, ſituated on the river Minho, on the confines of Portugal, twelve miles eaſt of Vigo.

TWA-NIGHTS GESTE, among our anceſtors, was a gueſt that ſtayed at an inn a ſecond night, for whom the hoſt was not anſwerable for any injury done by him, as he was in caſe of a third night-awn hynde.

TWEED, a river of Scotland, which riſes on the confines of the ſhire of Clydeſdale, and running eaſtward through Tweedale, and dividing the ſhire of Mers from Tiviotdale and Northumberland, falls into the German ſea at Berwick.

TWEEDALE, a county of Scotland, bounded by Lothian on the north, by Mers and Tiviotdale on the eaſt, by Annandale on the ſouth, and Clydeſdale on the weſt.

TWEER, a city of Ruſſia, capital of the province of Tweer, ſituated on the river Wolga, ninety miles north of Moſcow, in eaſt long. 30° 37′, north lat. 57° 25′.

TWELF-HINDI, among the engliſh Saxons, was where every perſon was valued at a certain price; and if any injury was done either to a perſon or his goods, a pecuniary mulct was impoſed, and paid in ſatisfaction of that injury, according to the worth and quality of that perſon to whom it was done, in which caſe ſuch as were worth 1200 ſhillings, were called twelf-hindi; and if an injury was done to ſuch perſons, ſatisfaction was to be made accordingly.

TWELFTH-DAY, or TWELFTH-TIDE, the feſtival of the epiphany, or the manifeſtation of Chriſt to the Gentiles; ſo called, as being the twelfth day, excluſive, from the nativity or Chriſtmas-day.

TWELVE MEN, otherwiſe called jury or inqueſt, is a number of twelve perſons, or upwards, as far as twenty-four, by whoſe oath, as to matters of fact, all trials paſs, both in civil and criminal caſes, through all courts of the common law in this realm. See JURY and TRIAL.

TWI-HINDI, among our Saxon anceſtors, were perſons valued at 200 s. theſe men were of the loweſt degree, and if ſuch were killed, the mulct was 30 s. See the article TWELFHINDI.

TWILIGHT, *crepuſculum*, that light, whether in the morning before ſun-riſe, or in the evening after ſun-ſet, ſuppoſed to begin and end when the leaſt ſtars that can be ſeen by the naked eye ceaſe, or begin, to appear, repreſented

in

in plate CCLXXXIX. fig. 1. by that obſcure part comprehended between H O A B, which is neither dark nor light. This is the twilight, the line A B being 18° below the horizon H O; and during the time the ſun paſſeth from H O to A B, in the parallel of any day, his rays are partly refracted by the atmoſphere, and ſo we have ſome faint light till he gets below the limit A B, when we are left in total darkneſs. Or it is twilight, while the ſun is paſſing from X to R, from Y to S, and from Z to M, on the days the ſun deſcribes the parallels T R, Æ Q and V W. By means of the atmoſphere it happens, that though none of the ſun's direct rays can come to us after it is ſet; yet we ſtill enjoy its reflected light for ſome time, and night approaches by degrees. For after the ſun is hid from our eyes, the upper part of our atmoſphere remains for ſome time expoſed to its rays, and from thence the whole is illuminated by reflection. But as the ſun grows lower and lower, that portion of the atmoſphere which is above our horizon, becomes enlightened till the ſun has got eighteen degrees below it; after which it ceaſes to be illuminated thereby, till it has got within as many degrees of the eaſtern ſide of the horizon; at which time it begins to illuminate the atmoſphere again, and in appearance to diffuſe its light throughout the heavens, which continues to increaſe till the ſun be up. See the articles AIR, ATMOSPHERE, REFLECTION, and REFRACTION.

Hence it is, that during that part of the year in which the ſun is never eighteen degrees below our horizon, there is a continued twilight from ſun-ſetting to ſun-riſing. Now that part of the year in the latitude of London, is while the ſun is paſſing from about the fifth degree of gemini to the twelfth of cancer; that is, from about the 26th of May to the 18th of July: for when the ſun deſcribes the parallel T R, that is, the tropic of cancer, there is no dark night at all; for the parallel of that day, T R, doth not touch A B, nor will it for about a month before and after. On the other hand, the ſhorteſt twilight in the year happens about the 14th of October and 4th of March, for then the ſun deſcribes the parallel whoſe diſtance *e o* is the leaſt between H O and A B of any other whatſoever.

As the twilight depends on the quantity of matter in the atmoſphere fit to reflect the ſun's rays, and alſo on the height of it (for the higher the atmoſphere is, the longer will it be, before the upper parts of it will ceaſe to be illuminated) the duration of it will be various. For inſtance, in winter, when the air is condenſed with cold, and the atmoſphere upon that account lower, the twilight will be ſhorter; and in ſummer, when the limits of the atmoſphere are extended by the rarefaction and dilatation of the air, of which it conſiſts, the duration of the twilight will be greater. And for the like reaſon, the morning twilight, the air being at that time condenſed and contracted by the cold of the preceding night, will be ſhorter than the evening one, when the air is more dilated and expanded.

TWINS, two young ones delivered at a birth, by an animal which ordinarily brings forth but one.

TWINS, in aſtronomy, the ſame with gemini. See the article GEMINI.

TWIST *of a rope, cord,* &c. See the article ROPE, *&c.*

TWIST is alſo uſed for the inſide or flat part of a man's thigh, upon which a true horſeman reſts when on horſeback.

To TWIST *an horſe*, is violently to wring or twiſt his teſticles twice about, which cauſes them to dry up, and deprives them of nouriſhment, and reduces the horſe to the ſame ſtate of impotency with a gelding.

TWISTED COLUMN. See COLUMN.

TYCHONIC SYSTEM, or HYPOTHESIS, an order or arrangement of the heavenly bodies, of an intermediate nature between the copernican and ptolemaic, or participating alike of them both. See COPERNICAN and PTOLEMAIC.

This ſyſtem had its name and original from Tycho Brahe, a nobleman of Denmark, who lived in the latter part of the laſt century. This philoſopher, though he approved of the copernican ſyſtem, yet could not reconcile himſelf to the motion of the earth; and being on the other hand convinced the ptolemaic ſcheme could not be true, he contrived one different from either, as repreſented plate CCLXXXIX. fig. 2. In this the earth has no motion allowed it, but the annual and diurnal phænomena are ſolved by the motion of the ſun about the earth, as in the ptolemaic ſcheme; and thoſe of mercury and venus are ſolved by this contrivance, though not in the ſame manner, nor ſo ſimply and naturally as in the copernican ſyſtem. The tychonic

Fig. 1. TWILIGHT.

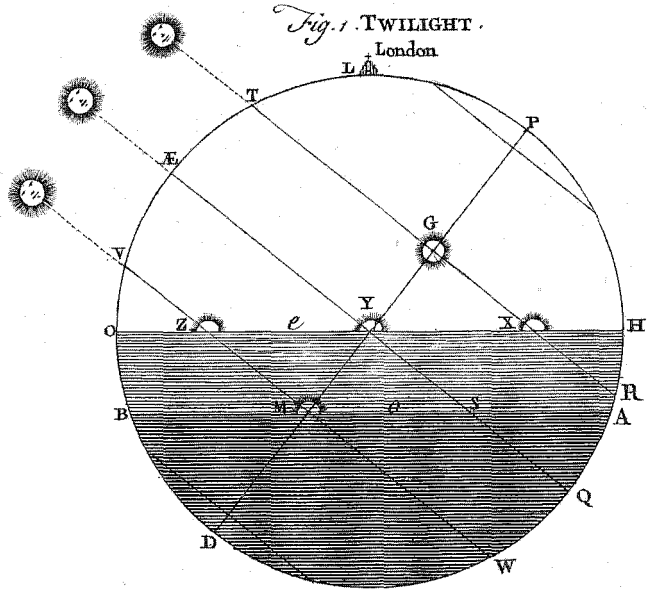

Fig. 2. The TYCHONIC SYSTEM.

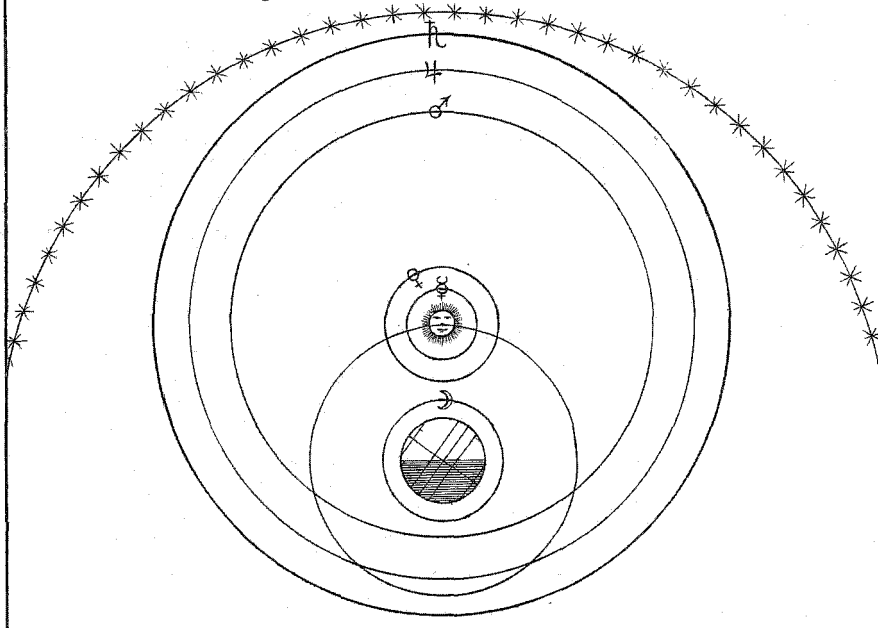

Fig. 3. TURBO.

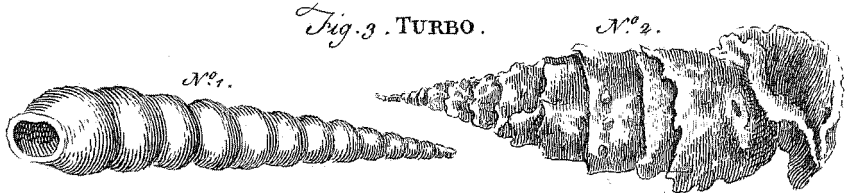

T. Jefferys sculp.

ſyſtem then ſuppoſed the earth in the center of the world, that is, of the firmament of ſtars, and alſo of the orbits of the ſun and moon; but at the ſame time it made the ſun the center of the planetary motions, *viz.* of the orbits of mercury, venus, mars, jupiter and ſaturn. Thus the ſun, with all its planets, was made to revolve about the earth once a year, to ſolve the phænomena ariſing from the annual motion, and every twenty-four hours, to account for thoſe of the diurnal motion. But this hypotheſis is ſo monſtrouſly abſurd, and contrary to the great ſimplicity of nature, and, in ſome reſpects, even contradictory to appearances, that it obtained but little credit, and ſoon gave way to the copernican ſyſtem.

After this ſcheme had been propoſed for ſome time, it received a correction by allowing the earth a motion about its axis to account for the diurnal phænomena of the heavens; and ſo this came to be called the ſemi-tychonic ſyſtem. But this was ſtill void of the truth, and encumbered with ſuch hypotheſes, as the true mathematician and the genuine philoſopher could never reliſh.

TYGER, or TIGER, in zoology. See the article TIGER.

TYLE, or TILE, in building, a ſort of thin, factitious, laminated brick, uſed on the roofs of houſes; or more properly a kind of fat clayey earth, kneaded and moulded, of a juſt thickneſs, dried and burnt in a kiln like a brick, and uſed in the covering and paving of houſes. See the article BRICK.

Tyles are made, ſays Mr. Leybourn, of better earth than brick-earth, and ſomething nearer akin to the potter's earth. According to 17 Edw. IV. the earth for tyles ſhould be caſt up before the firſt of November, ſtirred and turned before the firſt of February, and not made into tyles before the firſt of March; and ſhould likewiſe be tried and ſevered from ſtones, marle, and chalk. For the method of burning them, ſee the article BRICK.

As to the method of applying tyles, ſome lay them dry as they come from the kiln, without mortar or any thing elſe; others lay them in a kind of mortar made of loam and horſe dung. In ſome parts, as in Kent, they lay them in moſs. See the article MORTAR, *&c.*

There are various kinds of tyles, for the various occaſions of building; as plain, thack, ridge, roof, creaſe, gutter, pan, crooked, flemiſh, corner, hip, dormar, ſcallop, aſtragal, traverſe, paving, and dutch tyles.

Plain or thack tyles, are thoſe in ordinary uſe for covering of houſes. They are ſqueezed flat, while yet ſoft, in a mould. They are of an oblong figure, and by 17 Edw. IV. c. 4. are to be $10\frac{1}{2}$ inches long, and $6\frac{1}{4}$ broad, and half an inch and half a quarter thick. But theſe dimenſions are not over ſtrictly kept to.

Ridge, roof or creaſe tyles, are thoſe uſed to cover the ridges of houſes, being made circular breadth-wiſe, like an half cylinder; they are, by the aforeſaid ſtatute, to be 13 inches long, and of the ſame thickneſs with the plain tyles. Hip or corner tyles, are thoſe which lie on the hips or corners of roofs. As to form, they are firſt made flat like plain tyles, but of a quadrangular figure, whoſe two ſides are right lines and two ends arches of circles, one end being a little concave and the other convex. The convex end is to be about ſeven times as broad as the concave end, ſo that they would be triangular but that one corner is taken off; then, before they are burnt, they are bent on a mould breadth-wiſe, like ridge tyles. They have an hole at their narrow end to nail them on by, and are laid with their narrow end upwards; by ſtatute they are to be $10\frac{1}{2}$ inches long, and of a convenient breadth and thickneſs.

Gutter-tiles, are thoſe which lie in gutters or valleys in croſs buildings. They are made like corner tyles, only the corners of the broad end are turned back again with two wings. They have no holes in them, but are laid with the broad end upwards, without any nailing. They are made in the ſame mould as the corner tyles, and have the ſame dimenſions on the convex ſide. Their wings are each four inches broad, and eight long. Pan, crooked, or flemiſh tyles, are uſed in covering of ſheds, lean-to's, and all kinds of flat roof buildings. They are in form of an oblong parallelogram, as plain tyles, but are bent breadth-wiſe forwards and backwards in form of an S, only one of the arches is at leaſt three times as big as the other; which biggeſt arch is always laid uppermoſt, and the leſs arch of another tyle lies over the edge of the great arch of the former. They have no holes for pins, but hang on the laths by a knot of their own earth. They are uſually $14\frac{1}{2}$ inches long, and $10\frac{1}{2}$ broad. By 12 Geo. I. c. 25. they are to be, when

burnt, not leſs than 13½ inches long, and 9½ inches wide, and half an inch thick. Dormar or dorman tyles conſiſt of a plain tyle and a triangular piece of a plain one ſtanding up at right angles to one ſide of the plain tyle, and ſwept with an arch of a circle from the other end, which end terminates in a point. Of theſe tyles there are two kinds, the triangular piece in ſome ſtanding on the right, in others on the left ſide of the plain tyle. And of theſe again there are two kinds, ſome having a plain whole tyle, others but half a plain tyle. But in them all the plain tyle has two holes for the pins at that end where the broad end of the triangular piece ſtands. Their uſe is to be laid in the gutters betwixt the roof and the cheeks or ſides of the dormars, the plain part lying on the roof, and the triangular part ſtanding perpendicularly by the cheek of the dormar; they are excellent to keep out the wet in thoſe places, and yet they are hardly known any where but in Suſſex. The dimenſions of the plain tyle part, are the ſame as thoſe of a plain tyle, and the triangular part is of the ſame length, and its breadth at one end ſeven inches, and at the other nothing. Scallop or aſtragal tyles are in all reſpects like plain tyles, only their lower ends are in form of an aſtragal, *viz.* a ſemicircle with a ſquare on each ſide. They are uſed in ſome places for weather tyling. Tranſverſe tyles, are a kind of irregular plain tyles, having the pin-holes broken out, or one of the lower corners broken off. Theſe are laid with the broken end upwards, upon rafters where pinned tyles cannot hang.

Flemiſh or dutch tyles are of two kinds, antient and modern; the antient were uſed for chimney foot-paces; they were painted with antique figures, and frequently with poſtures of ſoldiers, ſome with compartments, and ſometimes with moreſque devices; but they come much ſhort of the deſign and colours of the modern ones. The modern flemiſh tyles are commonly uſed plaſtered up in the jaumbs of chimneys inſtead of chimney-corner ſtones. Theſe are better glazed, and ſuch as are painted (for ſome are only white) are done with more curious figures and more lively colours than the antient ones. But both kinds ſeem to be made of the ſame whitiſh clay as our white glazed earthen ware; the modern ones are commonly painted with birds, flowers, &c. The antient ones are only five inches and a quarter ſquare, and about three quarters of an inch thick; the modern ones ſix inches and a half ſquare, and three quarters of an inch thick.

TYLER, one that covers or paves with tyles. Tylers and bricklayers were incorporated 10 Eliz. under the name of maſter and wardens of the ſociety of freemen of the myſtery and art of tylers and bricklayers.

TYLWITH, in matters of heraldry and deſcent, is ſometimes uſed for a tribe or family branching out of another, which the modern heralds more uſually call the ſecond or third houſe.

TYMPAN, or TYMPANUM, in architecture, the area of a pediment, being that part which is in a level with the naked of the frieze. Or it is the ſpace included between the three corniches of a triangular pediment, or the two corniches of a circular one.

Sometimes the tympan is cut out, and the part filled with an iron lattice to give light, and ſometimes it is enriched with ſculpture in baſſo-relievo.

TYMPAN, among joiners, is alſo applied to the panels of the doors. See PANEL.

TYMPAN *of an arch*, is a triangular ſpace or table in the corners or ſides of an arch, uſually hollowed, and enriched ſometimes with branches of laurel, olive-tree, or oak, or with trophies, &c. ſometimes with flying figures, as fame, &c. or ſitting figures, as the cardinal virtues.

TYMPAN, among printers, a double frame belonging to the preſs, covered with parchment, on which the blank ſheets are laid in order to be printed off. See the article PTINTING-PRESS.

TYMPANUM, or TYMPAN, in mechanics, a kind of wheel placed round an axis or cylindrical beam, on the top of which are two levers or fixed ſtaves, for the more eaſy turning the axis, in order to raiſe a weight required. The tympanum is much the ſame with the peritrochium, but that the cylinder of the axis of the peritrochium is much ſhorter, and leſs than the cylinder of the tympanum. See AXIS *in peritrochio*.

TYMPANUM *of a machine*, is alſo uſed for an hollow wheel, wherein one or more people, or other animals, walk to turn it; ſuch as that of ſome cranes, calenders, &c. See CRANE, &c.

TYMPANUM, in anatomy, the middle part of the ear. See the article EAR.

TYMPANUM, a drum. See DRUM.

TYMPANY,

TYMPANY, *tympanites*, in medicine, a flatulent tumour or ſwelling of the abdomen or belly, very hard, equable and permanent, whereby the ſkin is ſtretched ſo tight, that when ſtruck it gives a ſound like that of a drum. Hoffman obſerves, that this diſeaſe has been generally accounted, both by the antients and moderns, a ſpecies of dropſy, but very improperly; for though it is often productive of, or complicated with an aſcites, yet it is in itſelf a perfectly diſtinct diſeaſe, and accompanied with no extravaſation of water in the abdomen; perſons who have died of it having been found, on opening the body, with the abdomen as dry as in a ſtate of health; but the ſtomach has been found, in ſome, greatly diſtended with flatulencies, and containing a viſcid humour, though in no great quantity. The inteſtines are alſo uſually found diſtended, and, as it were pellucid, and, on being pricked, they collapſe, without the appearance of any water. And, in ſome caſes, on opening the abdomen, the whole ſwelling has ſubſided, on the excluſion of a groſs flatulence which had diſtended it. The inteſtines have, in ſome ſubjects, been found diſtended to the bigneſs of a man's thigh, in ſome parts, and in others, lower down, ſo contorted and twiſted together, that there could be no paſſage either for the wind or the excrements. It is not uncommon alſo, on diſſection, to find great numbers of worms, of the common long kind, in the inteſtines. See the article DROPSY.

A tympany, without a dropſy, is moſt incident to women after labour, when the lochia have been ſuppreſſed by colds or otherwiſe, or diſcharged in too ſmall quantities; a bad regimen during the lying in, and the omitting to ſwathe the belly properly down, has alſo often a bad effect this way. In caſes of this kind, women find ſoon afterwards the abdomen inflated, with a conſiderable uneaſineſs, a difficulty of breathing, coſtiveneſs, and an unaccountable anxiety. Theſe are the breeding ſymptoms of the approaching tympany; and the ſame often happens after unſkilful treatment in abortions, and after the leaving a part of the lochia behind, or the injuring the uterus in delivery. See DELIVERY.

Children are alſo ſubject to tympanies, when violently afflicted with worms, and ſometimes after the meaſles and ſmall-pox; and if due care is not taken of theſe caſes, at their beginning, the ſuperior parts ſoon become extenuated, and the patients die. Extreme voracity of children alſo, and their eating great quantities of food, at a time when the ſtomach is weak, ſometimes brings on this diſorder.

The tympany is juſtly accounted one of the more dangerous kinds of diſeaſes, ſince the perſons afflicted with it much oftener die than recover. When it is accompanied with a dropſy, it is ſcarce ever cured; and a ſimple tympany in women and children, if neglected at firſt, degenerates into a chronic diſorder, and hardly admits of a cure. Some, indeed, have gone ſo far as to ſay, they never knew a patient, afflicted with a tympany, recover; but this ſeems too raſh a judgment. That diſtention of the abdomen, which is properly called a flatulent colic, is by ſome accounted a ſpecies of tympany; but this is not naturally dangerous, and is eaſily cured, except when it is attended with ſpaſms of the viſcera; in which caſe the medicines given to reſtore the due tone of the inteſtines, are by no means proper in regard to the ſpaſms.

In curing flatulences of the ſtomach and inteſtines, the phyſician's principal intention is to promote a diſcharge of the vapours by the anus, and to attenuate and gently carry off, by ſtool, the tough and viſcid matter which contributes to the generation of the flatulences. For this purpoſe, firſt derivative, diſcutient, and evacuating clyſters are to be uſed, ſuch as thoſe prepared of hyſſop, clary, flowers of common and roman chamomile, tops of yarrow, juniper-berries, and the larger carminative ſeeds, with veal broth, adding a ſufficient quantity of ſal gemmæ, ſal ammoniac, or Epſom ſalt, and the oil of chamomile. But it is to be obſerved, that one or two clyſters are not ſufficient for removing the diſorder, but they are to be frequently repeated. With theſe are to be interpoſed laxatives, poſſeſſed of a carminative, and, at the ſame time, ſomewhat of an anodyne quality. Or, if the patient is ſtrong, and the inflation a real tympanites, two parts of the extractum panchymagogum crollii, with one part of the pilulæ wildeganſi, or of the pilulæ ſtarckii, or pilulæ de ſtyrace, in ſome very ſpirituous carminative water, is to be exhibited. See the article FLATULENCY.

After theſe are to be uſed medicines poſſeſſed of a moderate balſamic principle, and a volatile, oleous, and aromatic ſalt, commonly called carminatives; but the operation of theſe medicines is not to be ſo explained, as if by their ſubtile volatile ſalt they attenuated the matter of the flatulences and rendered it thinner; but rather, becauſe, by invigorating the tone and ſyſtole of the inteſtinal coats, they hinder the ſtagnation of the flatulences, move them from their ſeat, and render them more capable of being eaſily eliminated, or prevent the generation of new flatulences; for, as the deſtroyed periſtaltic motion of the ſtomach and inteſtines is the principal cauſe of flatulences, ſo all medicines which have a remarkable virtue in ſtrengthening theſe parts, are moſt proper for the removal of this diſorder. The beſt and moſt approved of this kind, are powders prepared of the roots of wake-robin, zedoary, and white burnet; the digeſtive ſalt of ſylvius, or vitriolated tartar; cumin ſeeds, the tops of the leſſer centaury, and dried orange-peel, each a drachm, and ſix drops of the genuine oil of chamomile; or of the oil of cedar, or of the oil of orange-peel; to which, if there is a ſuſpicion of an acid lodged in the primæ viæ, we may commodiouſly add crabs eyes.

To this claſs of medicines may be referred the following liquid form: take of the carminative water of Dorncrellius, of the waters of common chamomile and zedoary prepared with wine, each one ounce; of the ſpiritus nitri dulcis, of the pure oil of caraway, eight drops mixed with two drachms of ſugar.

Nor are external remedies, ſuch as liniments applied by way of ointment to the whole epigaſtric region, to be neglected. The principal ingredients of theſe liniments ought to be boiled with oils of chamomile and rue, oil of nutmeg and peruvian balſam, with which may be mixed the oils of juniper, caraway, aniſe, or cumins. But preferable to all others, the liquid balſam of life may be uſed, which when mixed with three parts of Hungary water, and applied by way of ointment to the abdomen, or laid on with a warm linnen-cloth, is found of great efficacy.

TYPE, *typus*, a copy, image, or reſemblance of ſome model. This word is much uſed among divines, to ſignify a ſymbol, ſign, or figure of ſomething to come; in which ſenſe it is commonly uſed with relation to antitype, which is the thing itſelf, whereof the other is a type or figure. See the article ANTITYPE.

TYPE *of Conſtans*, a formulary or model of faith, publiſhed by the emperor Conſtans, who being a favourer of the monothelites, and exaſperated at the little ſucceſs which the ecthеſis of his uncle Heraclius had met with, publiſhed a new formulary in the manner of an edict in 648, forbidding all perſons to make uſe of the expreſſions "one" or "two wills in Jeſus Chriſt." Martin I. condemned the type in the lateran council, *anno* 649, and the ſynod made a canon expreſsly againſt this heretical model; at which the emperor was ſo enraged, that he forced the pope into baniſhment. See ECTHESIS.

TYPE, among letter-founders and printers, the ſame with letter. See the articles LETTER and LETTER-FOUNDERY.

TYPE is alſo uſed to denote the order obſerved in the intenſion and remiſſion of fevers, pulſes, &c.

TYPHA, in botany, a genus of the *monoecia-triandria* claſs of plants, having no corolla: the male flowers are arranged into a cylindric amentum; the female flowers form alſo a cylindric amentum below the male ones; there is no pericarpium, the fruit growing together in great numbers, conſtitutes a cylinder, in each of which there is a ſingle ovated ſeed, furniſhed with a ſtyle, and ſtanding upon a ſeta, which ſeta ſtands on a capillary pappus.

TYPHODES, τύφωδης, or τύφος, in medicine, a kind of ardent or burning fever uſually attending on eryſipelaſes of any of the viſcera. Of this diſorder, according to Hippocrates, there are five ſpecies. The firſt is a legitimate continual fever, which impairs the ſtrength, is accompanied with a pain of the belly, and a preternatural heat of the eyes, hinders the patient from looking ſteadily on any object whatſoever, and renders him unable, in conſequence of the violent pain, to ſpeak. The ſecond ſpecies begins with a tertian or quartan fever. The patient diſcharges a great quantity of ſaliva and worms at his mouth; his eyes are painful, his feet, and ſometimes his whole body, are ſeized with ſoft ſwellings. His breaſt and back are now and then painful; his belly rumbles, his eyes are fierce, he ſpits a great deal, and his ſaliva ſticks to his throat. The third ſpecies is known by intenſe pains in the joints, and ſometimes

over

over all the body; the blood contaminated by the bile, becomes hot, and ſtagnates in the limbs. The fourth ſpecies is known by a violent tenſion, elevation, and heat of the abdomen, ſucceeded by a diarrhœa, which ſometimes ends in a dropſy. The fifth ſpecies is not unlike the firſt. See FEVER.

TYPHOIDEA, in botany, the ſame with phleum. See the article PHLEUM.

TYPHOMANIA, τυφομανια, in medicine, a diſorder of the brain, wherein the patient not being able to ſleep, tho' greatly inclined thereto, lies with his eyes ſhut, talks abſurdly, and flings himſelf this way and that. The typhomania is a kind of combination of a frenzy with a lethargy, and is much the ſame with a coma vigil. See COMA.

TYPOGRAPHY, the art of printing. See the article PRINTING.

TYRANT, *tyrannus*, among the antients, denoted ſimply a king or monarch. But the ill uſe ſeveral perſons inveſted with that ſacred character made of it, has altered the import of the word, and tyrant now carries with it the idea of an unjuſt and cruel prince, who invades the people's liberty, and rules a in more deſpotic manner than the laws of nature or the country do allow of.

TYRE, a port-town of Phœnicia, in Aſiatic Turky, ſituated on the coaſt of the Levant, in eaſt long. 36°, north lat. 32° 32', being antiently the capital of Phœnicia.

TYRNAW, a town of upper Hungary, ſituated thirty-five miles north-eaſt of Preſburg.

TYROCINIUM, a noviciate, or apprenticeſhip, in any art or ſcience.

TYRONE, an iriſh county, in the province of Ulſter; bounded by Londonderry, on the north; by Armagh and Laugh-neagh, on the eaſt; by Monaghan and Fermanagh, on the ſouth; and by Donnagal on the weſt.

TYROSIS, a diſorder of the ſtomach, proceeding from milk coagulated therein.

TYSTED, a town of Denmark, in the province of north Jutland, and territory of Alburg, ſituated on the gulph of Limford, fifty miles weſt of Alburg.

TYTH, or TITHE. See TITHE.

TYTHING. See the article TITHING.

U.

U, or u, the twentieth letter, and fifth vowel, of our alphabet, is formed in the voice by a round configuration of the lips, and a greater extruſion of the under one than in forming the letter o, and the tongue is alſo more cannulated. The ſound is ſhort in *curſt*, *muſt*, *tun*, *tub*; but is lengthened by a final *e*, as in *tune*, *tube*, &c. In ſome words it is rather acute than long; as in *brute*, *flute*, *lute*, &c. It is moſtly long in polyſyllables; as in *union*, *curious*, &c. but in ſome words it is obſcure, as in *nature*, *venture*, &c. This letter in the form V, or v, is properly a conſonant, and as ſuch is placed before all the vowels; as in *vacant*, *venal*, *vibrate*, &c. Though the letters v and u had always two ſounds, they had only the form v till the beginning of the fourth century, when the other form was introduced, the inconvenience of expreſſing two different ſounds by the ſame letter having been obſerved long before. In numerals V ſtands for five; and with a daſh added at top, thus $\overline{V}$, it ſignifies five thouſand.

In abreviations, amongſt the Romans, V. A. ſtood for Veterani aſſignati; V. B. viro bono; V. B. A. viri boni arbitratu; V. B. F. vir bonæ fidei; V. C. vir conſularis; V. C. C. F. vale, conjux chariſſime, feliciter: V. D. D. voto dedicatur; V. G. verbi gratia; Vir. Ve. virgo veſtalis; V L. videlicet; V. N. quinto nonarum.

VABRES, a town of Guienne, in France, fifty-five miles north-eaſt of Toulouſe.

VACANCY, in philoſophy. See the article VACUUM.

VACANCY, in law, a poſt, or benefice, wanting a regular officer or incumbent.

VACANT,

VACANT EFFECTS, *prædia vacata*, or *vacua*, are ſuch as are abandoned for want of an heir, after the death or flight of their former owner. A romiſh benefice is ſaid to be vacant in curia Romana, when the incumbent dies in Rome, or within twenty leagues thereof, though it be only by accident that he was there. The pope nominates to all ſuch benefices.

VACATION, in law, is the whole time betwixt the end of one term and the beginning of another. See TERM.

This word is alſo applied to the time from the death of a biſhop, or other ſpiritual perſon, till the biſhopric, or dignity, is ſupplied with another.

VACCA MARINA, the SEA-COW, in zoology, the ſame with the thrichecus. See the article THRICHECUS.

VACHA, a town of Germany, forty miles ſouth-eaſt of Heſſe-Caſſel.

VACCINIUM, in botany, a genus of the *octandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, of a campanulated form, and divided into four revolute ſegments: at the edge the fruit is a globoſe, umbilicated berry, containing four cells: the ſeeds are few and ſmall.

This genus comprehends the black whortle-berries and the marſh-whortle.

VACUUM, or VACUITY, in philoſophy, denotes a ſpace empty, or devoid, of all matter or body. See the articles BODY and SPACE.

It has been the opinion of ſome philoſophers, particularly the Carteſians, that nature admits not a vacuum, but that the univerſe is entirely full of matter: in conſequence of which opinion they were obliged to aſſert, that if every thing contained in a veſſel could be taken out or annihilated, the ſides of that veſſel, however ſtrong, would come together; but this is contrary to experience, for the greateſt part of the air may be drawn out of a veſſel by means of the air-pump, notwithſtanding which it will remain whole, if its ſides are ſtrong enough to ſupport the weight of the incumbent atmoſphere.

Should it be objected here, that it is impoſſible to extract all the air out of a veſſel, and that there will not be a vacuum on that account; the anſwer is, that ſince a very great part of the air that was in the veſſel may be drawn out, as appears by the more quick deſcent of light bodies in a receiver when exhauſted of its air, there muſt be ſome vacuities between the parts of the remaining air; which is ſufficient to conſtitute a vacuum. Indeed, to this it may be objected by a carteſian, that thoſe vacuities are filled with materia ſubtilis, that paſſes freely through the ſides of the veſſel, and gives no reſiſtance to the falling bodies: but, as the exiſtence of this materia ſubtilis can never be proved, we are not obliged to allow the objection, eſpecially ſince Sir Iſaac Newton has found, that all matter affords a reſiſtance nearly in proportion to its denſity. See the articles PLENUM and CARTESIAN.

There are many other arguments to prove this, particularly the motions of the comets through the heavenly regions, without any ſenſible reſiſtance; the different weight of bodies of the ſame bulk, *&c.*

All the parts of ſpaces, ſays Sir Iſaac Newton, are not equally full; for if they were, the ſpecific gravity of the fluid which would fill the region of the air, could not, by reaſon of the exceeding great denſity of its matter, give way to the ſpecific gravity of quickſilver, gold, or any body, how denſe ſoever: whence neither gold, nor any other body, could deſcend in the air; for no body can deſcend in a fluid, unleſs it be ſpecifically heavier than it. But, if a quantity of matter may, by rarefaction, be diminiſhed in a given ſpace, why may it not diminiſh in infinitum? And if all the ſolid particles of bodies are of the ſame denſity, and cannot be rarified, without leaving pores, there muſt be a vacuum.

VACUUM BOYLEANUM is ſometimes, though improperly, uſed to expreſs the approach to a real vacuum, by means of an air-pump. See the laſt article.

VADA, a port-town of Tuſcany, ten miles ſouth of Leghorn.

VADARI, in the civil-law, denotes a perſon to pledge, undertake, or give ſecurity, in behalf of another, that he ſhall, on a certain day, appear in court to proſecute or anſwer.

VADE-MECUM, or VENI-MECUM, a latin phraſe, uſed, in Engliſh, to expreſs a thing that is very handy and familiar, and which one uſually carries about with them; chiefly applied to ſome favourite book.

VADIMONIUM, in the civil-law, a promiſe, or bond, given for appearance before the judge upon a day appointed.

VADO, a port-town of Italy, belonging to the Genoeſe, thirty-ſix miles ſouth-weſt of Genoa.

VAENA, a town of Andaluſia, in Spain, twenty-five miles ſouth-eaſt of Cordova: weſt long. 4° 6′, north lat. 37° 30′.

VAGABOND, or VAGRANT, in law. See the article VAGRANT.

VAGINA, properly ſignifies a ſheath, or ſcabbard: and the term vagina is uſed, in architecture, for the part of a terminus, becauſe reſembling a ſheath, out of which the ſtatue ſeems to iſſue.

VAGINA, in anatomy, a large canal, formed of a robuſt and ſtrong membrane, and reaching from the external orifice, or os pudendi, in women, to the uterus. See PUDENDUM and UTERUS.

The vagina is uſually about ſix or ſeven fingers breadth long; but is very diſtenſible, and capable of great dilatation; its orifice is narrower than any other part, and cloſed by a ſphincter-muſcle: its ſubſtance is membranaceous, and rugoſe internally, and furniſhed with abundance of nervous papillæ; and to this is owing its quick ſenſation: externally it is muſcular, whereby it is enabled to embrace the penis more cloſely in coitu. The rugæ are largeſt in maids, and eſpecially in the anterior part of the vagina; in married women they are much fainter, and ſeem as if worn down; and in women who have born children, they are almoſt entirely obliterated. Their uſe is to encreaſe the pleaſure in coitu, both to the man and to the woman; and to render the part capable of the neceſſary dilatation in parturition. See DELIVERY.

About the mouth of the vagina are found certain lacunæ, or ſmall orifices, capable of admitting a briſtle: they proceed from the glandulæ ſubſtratæ, and ſerve to ſecrete a liquor for lubricating the vagina, and for ſtimulating to venery. See the article LACUNÆ, &c.

The ſphincter, or contracting muſcle, of the vagina, is compoſed of a ſeries of muſcular fibres, ariſing from the ſphincter of the anus, and ſurrounding the orifice of the vagina, after which it is inſerted under the crura of the clitoris. See the article CLITORIS.

The uſe of the vagina is to receive the penis in coition, to emit from the womb the menſtrual diſcharges, the fœtus, the ſecundines, and lochia. See the articles MENSES, DELIVERY, &c.

VAGINALIS, or ELYTHROIDES, in anatomy. See ELYTHROIDES.

VAGRANTS, in law, are deſcribed to be perſons pretending to be patent-gatherers, or collectors for priſons, and wander about for that end; among which are included all fencers, bear-wards, common players of interludes, minſtrels, juglers; all perſons pretending to be gypſies, or wandering in the habits of ſuch, or pretending ſkill in phyſiognomy, palmeſtry, or the like, or to tell fortunes; all ſuch as uſe any ſubtle craft, unlawful games or plays; or, being able in body, run away, leaving their wives or children to the pariſh; all perſons who cannot otherwiſe maintain themſelves, that loiter about and refuſe to work for the uſual wages; and all other perſons wandering abroad and begging, &c.

It is enacted, that where any ſuch vagrants ſhall be found in a pariſh, the conſtable, or other officer, is immediately to apprehend them, and carry them before ſome juſtice of the peace, who ſhall examine the perſons on oath, as to their condition, and places of abode; and thereupon order them to be ſent by paſs to the place of their laſt legal ſettlement; or if that cannot be known, to the place of their birth. The juſtice is to give the conſtable a certificate aſcertaining how, and in what manner, they ſhall be conveyed, &c. And juſtices of the piece, in their ſeſſions, have power to appoint rates for paſſing of vagrants, at ſo much per mile. All conſtables are to make ſearches for theſe people before every quarter-ſeſſions: and in caſe any perſons permit vagrants to lodge in their houſes, barns, or out-houſes, and do not carry them before the next juſtice, or give notice to ſome conſtable, or other pariſh-officer, ſo to do, they ſhall forfeit a ſum not above 40s. or under 10s. Alſo, if any charge be brought upon any place by means thereof, the ſame may be levied by diſtreſs and ſale of the offender's goods; for want of which he ſhall be committed to the houſe of correction, and there ſet to hard labour for three months.

VAGUM, or PAR VAGUM, in anatomy, the eighth pair of the nerves ariſing from the medulla oblongata. See NERVE.

VAIHINGEN, a town of Swabia, in Germany, ſituated on the river Neckar, twenty-ſix miles ſouth-weſt of Hailbron.

VAIR, in heraldry, a kind of fur, conſiſting of divers little pieces, argent and azure, reſembling a dutch U, or a bell-glaſs. See plate CCLXXXVIII. fig. 3.

Vairs have their point azure oppoſite their point argent, and the baſe argent to the baſe azure.

VAIRY, VAIRE, VERRY, or VARRY, in heraldry, expreſſes a coat, or the bearings of a coat, when charged or chequered with vairs: and hence, vairy-cuppy, or vairy-taſſy, is a bearing compoſed of pieces repreſenting the tops of crutches. See plate CCLXXXVIII. fig. 4.

VAISON, a town of Provence, in France, twenty-nine miles north-eaſt of Avignon.

VALAIS, a territory of Switzerland, being a long valley of an hundred miles extent, lying between the head of the river Rhone and the lake of Geneva.

VALANTIA, CRESS-WORT, in botany, a genus of the *polygamia-monoecia* claſs of plants, the corolla of which is monopetalous, but divided into three or four parts; the ſtamina are either three or four; the pericarpium is coriaceous and compreſſed, and contains a ſingle globoſe ſeed. See plate CCXC. fig. 1.

VALDENSES, in church-hiſtory, the ſame with the albigenſes. See the article ALBIGENSES.

VALDIA, in botany, a plant otherwiſe called ovieda. See OVIEDA.

VALENCE, a town of Dauphine, in France, ſituated at the confluence of the rivers Rhone and Iſere, forty-eight miles ſouth of Lyons.

VALENCIA, the capital of a province of the ſame name, in Spain, ſituated in a fine plain on the river Guadalaviar: weſt lon. 35′, north lat. 39° 20′.

VALENCIA, or VALENZA DE ALCANTARA, a town of Eſtremadura, in Spain, near the frontiers of Portugal: weſt long. 7° 30′, and north lat. 39° 15′.

VALENCIA is alſo a town of Terra Firma: weſt long. 67° 30′, north lat. 10°.

VALENCIENNES, a city of french Hainault, ſituated on the river Schelde, fifteen miles ſouth of Tournay, and eighteen miles ſouth-weſt of Mons.

VALENTINIANS, in church-hiſtory, a ſect of chriſtian heretics, who ſprung up in the IId century, and were ſo called from their leader Valentinus.

The valentinians were only a branch of the gnoſtics, who realized or perſonified the platonic ideas, concerning the deity, whom they called Pleroma, or plenitude. Their ſyſtem was this: the firſt principle is Bythos, *i. e.* depth, which remained many ages unknown, having with it Ennoe, or thought, and Sige, or ſilence; from theſe ſprung the Nous, or intelligence, which is the only ſon, equal to, and alone capable of comprehending, the Bythos; the ſiſter of Nous they called Aletheia, or truth: and theſe conſtituted the firſt quaternity of æons, which were the ſource and original of all the reſt: for Nous and Aletheia produced the World and Life; and from theſe two proceeded Man and the Church. But beſides theſe eight principal æons, there were twenty-two more, the laſt of which, called Sophia, being deſirous to arrive at the knowledge of Bythos, gave herſelf a great deal of uneaſineſs, which created in her Anger and Fear, of which was born Matter. But the Horos, or bounder, ſtopped her, preſerved her in the Pleroma, and reſtored her to perfection. Sophia then produced the Chriſt and the Holy Spirit, which brought the æons to their laſt perfection, and made every one of them contribute their utmoſt to form the Saviour. Her Enthymeſe, or thought, dwelling near the Pleroma, perfected by the Chriſt, produced every thing that is in the world, by its divers paſſions. The Chriſt ſent into it the Saviour, accompanied with angels, who delivered it from its paſſions, without annihilating it: from thence was formed corporeal matter. And in this manner did they romance, concerning God, nature, and the myſteries of the chriſtian religion.

VALENZA, a town of Italy, ſituated on the river Po, forty-three miles ſouth-weſt of Milan.

VALERIAN, *valeriana*, in botany, a genus of the *triandria-monogynia* claſs of plants, the flower of which conſiſts of a ſingle petal, in form of a tube, prominent in its inferior part, and containing a honey-juice, divided into five ſegments at the edge, all which are obtuſe; the fruit is a capſule, that ſplits and falls off; and the ſeeds are ſingle and oblong. Theſe are the characters of the genus; but there is great variation among the different ſpecies.

The valerians may be known, when not in flower, by their roots being ſcented, and their leaves always ſtanding two at a ſtalk. The great garden-valerian is an alexipharmic, ſudorific, and diuretic. The root is the only part of it uſed in medicine: this is to be taken up in September, and carefully dried. It is given in powder, in aſthmas, pleuriſies, coughs, obſtructions of the liver and ſpleen, and in the plague, and all malignant and petechial

Fig. 2. VALLISNERIA.

Fig. 1. VALANTIA.

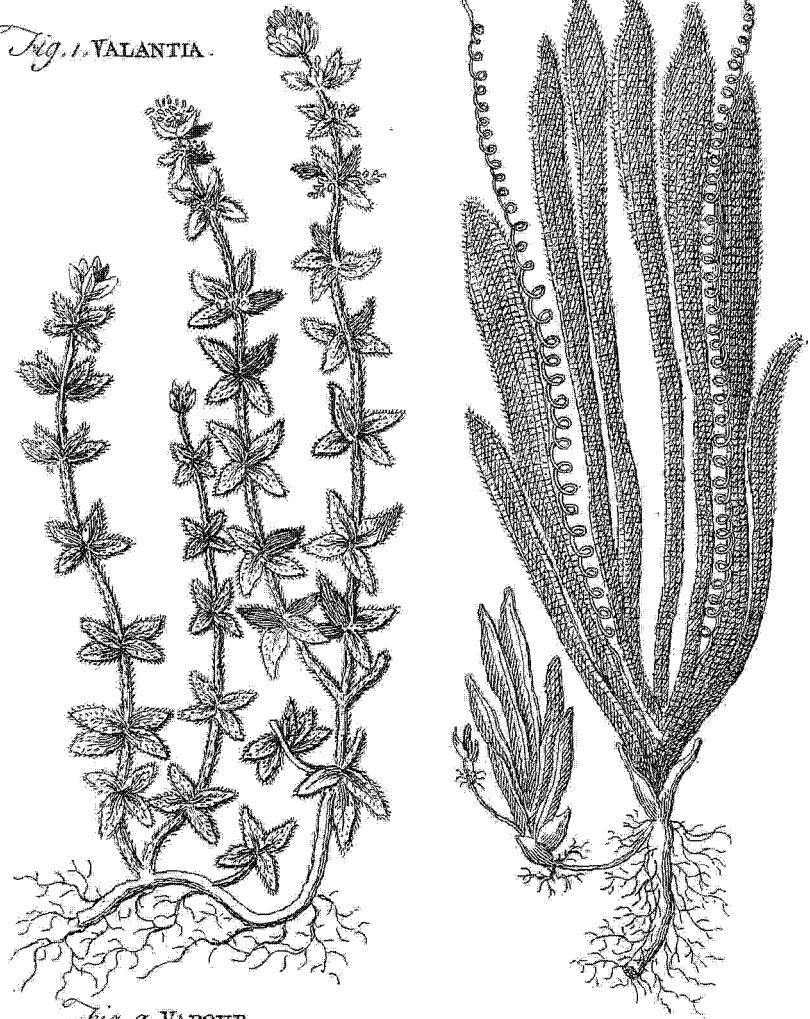

Fig. 3. VAPOUR.

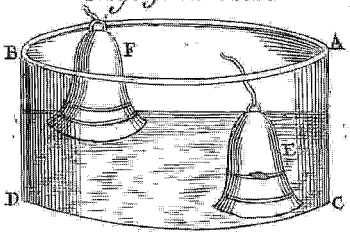

Fig. 4. VERT.

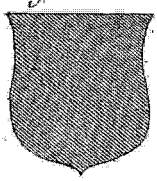

Fig. 5. VERTICAL.

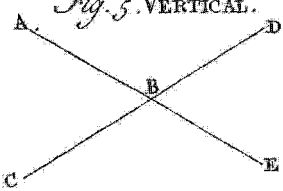

T. Jefferys sculp.

ſtechial fevers. It is alſo recommended by ſome as a vulnerary, and by others as one of the greateſt medicines in the world for weakneſſes of ſight.

The wild valerian-root is much more famous than this, but in a different intention: it is of a ſtrong diſagreeable ſmell, and is given in nervous caſes with very great ſucceſs; there are not wanting inſtances of perſons cured of confirmed epilepſies by it; and in all convulſions it is a very ſucceſsful medicine.

VALET, a french term, uſed as a common name for all domeſtic men ſervants, employed in the more ſervile offices, as grooms, footmen, coachmen, *&c.* But with us, it is only uſed in the phraſe valet de chambre, which is a ſervant whoſe office is to dreſs and undreſs his maſter, *&c.*

VALETUDINARY, *valetudinarius*, among medical writers, denotes a perſon of a weak and ſickly conſtitution, and frequently out of order.

VALID, in law, an appellation given to acts, deeds, tranſactions, *&c.* which are clothed with all the formalities requiſite to their being put into execution, and to their being admitted in a court of juſtice. See ACT, DEED, *&c.*

VALKENBURG, or FAUQUEMONT, a town of the auſtrian Netherlands, nine miles eaſt of Maeſtricht.

VALKOWAR, a town of Sclavonia, ſituated on the Danube, ſixty miles north-weſt of Belgrade.

VALLADOLID, a city of old Caſtile, in Spain, eighty-ſix miles north-weſt of Madrid: weſt lon. 4° 50′, and north lat. 41° 36′.

VALLADOLID is alſo a town of Mexico, ſituated in the province of Honduras: weſt long. 91°, and north lat. 14°.

VALLAR CROWN, *vallaris corona*, in roman antiquity, the ſame with that otherwiſe called caſtrenſis. See CROWN.

VALLENGIN, the capital of a county of the ſame name, in Switzerland, ſituated near the lake of Neufchattel, twenty-five miles north-weſt of Bern.

VALLERY, or *St.* VALLERY, a port-town of Picardy, in France, ſituated on the Engliſh channel, forty-five miles north of Rouen.

VALLISNERIA, in botany, a genus of the *dioecia-diandria* claſs of plants, with a monopetalous tripartite flower; its fruit is a long, cylindraceous, and unilocular capſule, containing numerous oval ſeeds. See plate CCXC. fig 2.

VALOIS, a dutchy of France, ſituated on the three great rivers the Seine, the Marne, and the Oyſe.

VALONA, a port-town of Albania, in european Turky, ſituated on a fine bay of the gulph of Venice: eaſt lon. 20° 5′, and north lat. 41° 6′.

VALPARISA, a port-town of Chili, ſituated on the Pacific ocean, in weſt long. 77°, and ſouth lat. 33°.

VALTELINE, a fine fruitful valley, in the ſouth-eaſt diviſion of the country of the Griſons.

VALUE, *valor*, in commerce, denotes the price or worth of any thing: hence the intrinſic value denotes the real and effective worth of a thing, and is uſed chiefly with regard to money, the popular value whereof may be raiſed and lowered, at the pleaſure of the prince; but its real, or intrinſic value, depending wholly on its weight and fineneſs, is not at all affected by the ſtamp or impreſſion thereon.

Value in bills of exchange, is uſed to ſignify the nature of the thing (as ready money, bills, debts, merchandizes, *&c.*) which is given, as it were, in exchange, for the ſum ſpecified in the bill. From four different manners of expreſſing this value, ſome diſtinguiſh four kinds of bills of exchange. The firſt bears value received, ſimply and purely, which comprehends all kinds of value; the ſecond value received in money or merchandize; the third value of myſelf; and the fourth underſtood. See the article BILL.

VALVE, *valvula*, in hydraulics, pneumatics, *&c.* is a kind of lid, or cover, of a tube or veſſel, ſo contrived as to open one way; but which, the more forcibly it is preſſed the other way, the cloſer it ſhuts the aperture; ſo that it either admits the entrance of a fluid into the tube or veſſel, and prevents its return; or admits its eſcape, and prevents its re-entrance. See the article PUMP.

Mr. Belidor has invented a new kind of valves, the deſcription of which may not be unacceptable to the reader. See plate CCXCI. where fig. 1. repreſents a round plate of braſs, one half of which is chamfered upwards, and the other half downwards. The part C A D, which is greater by one twelfth than the other part B, is tapered on the under ſide from L to A, as is more evident in fig. 5. *ibid.* where the ſame letters are uſed. The part B, is tapered on the upper ſide, as may alſo be ſeen in fig. 7. at B M. On the

upper ſide of this plate, nearer B than the center G, is ſcrewed on an axis EHF, on which the plate turns. Fig. 2. ſhews how this axis is faſtened to the plate. Fig. 3. repreſents the box, or bed, of the valve, chamfered downward on all the ſemi-circular ſide L, to receive the part AL, of fig. 1. and the other part B, quite to AA, where the pivots of the axis reſt, is chamfered upwards, to receive the part B, of fig. 1. coming up againſt it. From theſe chamfered edges on the inſide, this bed of the valve ſpreads into a flat ring, to be pinched between the flaunches of the pipes, which are ſcrewed together, to make all tight. Fig. 4. repreſents the ſection of this bed; OP being its upper part chamfered downwards, to receive GLA, the greater part of the valve of fig. 1. falling upon it; and QR chamfered upwards, receives the ſmalleſt part B, of fig. 1. riſing againſt it as it ſhuts. The valve, thus ſhut in its bed, is repreſented in fig. 5. where it may be obſerved, that the pivots of the axis are kept in their places by ſemi-circular bridles, that go over them at C and D. The ſection of the ſame valve ſhut, may be ſeen in fig. 6. where MBHG, repreſents the lower and leſſer part of the valve ſhut, and applied upwards to the under part of the bed at QR; and LAGH repreſents the greater part of the valve ſhut and applied downwards to the bed at OP. K ſhews one of the bridles pinned, which holds down the pivots, or ends of the axis. Fig. 7. ſhews the valve open, and the manner of its play; where all the paſſage being open between QK and BIL, and between PO and MHA, it is plain that here is the greateſt water-way poſſible. Now when the valve ſhuts, the end BM moves in the direction of the pricked curve line MQ, and the end LA in the direction of the pricked line LO. When the water is coming downwards, it muſt puſh hard on the part GAL, in fig. 1, 5, 6, and 7. and thereby make the part BH to riſe, by which means the valve will be cloſe ſhut. But when the water comes upwards, as it preſſes with moſt force on the ſurface GA, the part HB will come down, and the valve will immediately open.

VALVE, in anatomy, a thin membrane applied on ſeveral cavities and veſſels of the body, to afford a paſſage to certain humours going one way, and prevent their reflux towards the place from whence they came. The veins and lymphatics are furniſhed with valves, which open towards the heart, but keep cloſe towards the extremities of thoſe veſſels; that is, they let the blood and lymph paſs towards the heart, but prevent their returning towards the extreme parts from whence they came. See the article VEIN, HEART, ARTERY, *&c.*

VALVERDE, a town of Portugal, ſituated near the frontiers of ſpaniſh Eſtramadura, twenty-ſeven miles north of Alcantara.

VAN, VANT, or VAUNT, a term derived from the french *avant*, or *avaunt*, ſignifying *before*, or *foremoſt* of any thing: thus we ſay, the van-guard of an army, *&c.* See the article GUARD.

VAN is alſo the name of a city of aſiatic Turky, ſituated on a lake of the ſame name, in the province of Turcomania: eaſt lon. 44° 30′, and north lat. 38° 30′.

VANDALIA, the antient name of the countries of Mecklenburg and Pomerania, in Germany.

VANES, on mathematical inſtruments, are ſights made to move and ſlide upon croſs-ſtaves, fore-ſtaves, quadrants, *&c.* See the article CROSS-STAFF, *&c.*

VANILLA, in botany, the name by which many call the black-flowered and ſweet-podded epidendrum. See EPIDENDRUM.

In commerce, *&c.* the term vanilla is chiefly applied to the pod of this plant, which is brought to us entire, and with the ſeeds in it; being uſually about five or ſix inches long, and half an inch broad, and containing an almoſt innumerable quantity of minute and gloſſy black ſeeds.

Vanilla grows in the warmer parts of America, and that uſually in places where there is water near. The natives diſtinguiſh it into three kinds, which the Spaniards call the pompona, the ley, and the ſimarona. The pods of the pompona-kind are thick and ſhort; thoſe of the kind called ley, are longer and ſlenderer; and thoſe of the ſimarona, which is alſo called baſtard-vanilla, are the ſmalleſt of all the kinds. The ley-kind is the only good vanilla. It ought to be of a good reddiſh brown, neither too black nor too red, and neither too dry, nor too moiſt; when perfect, they always appear full, though dry; and a parcel of fifty in number ought to weigh above five ounces. There is a kind which is larger, fifty pods

Belidor's New VALVE.

Fig. 1

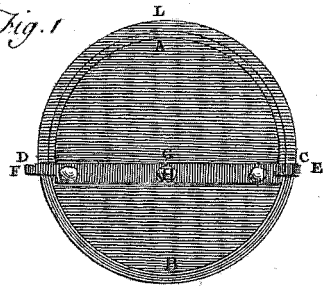

Fig. 3.

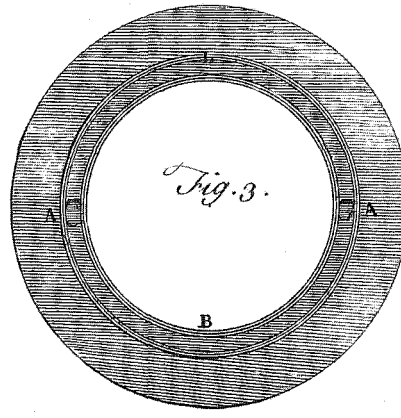

Fig. 2.

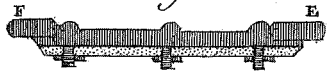

Fig. 4

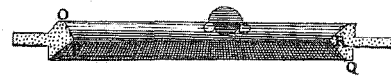

Fig. 5.

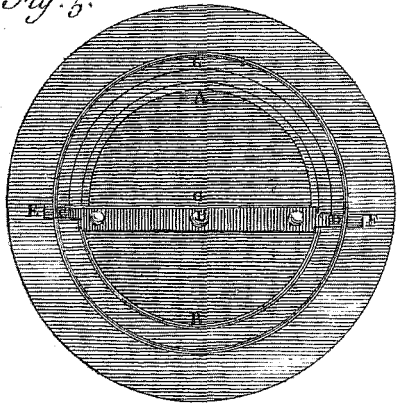

Fig. 7.

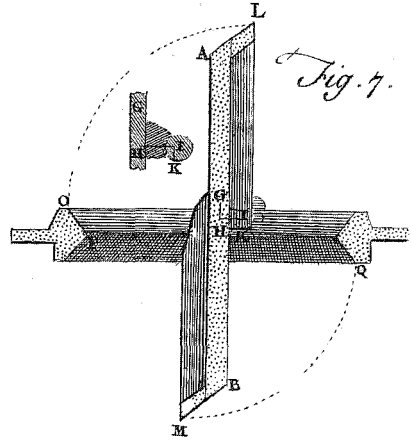

Fig. 6

T. Jeffreys sculp

of which uſually weigh eight ounces; this is called the ſobre buena, and is eſteemed of all others the moſt excellent.

The ſmell of vanillas ought to be penetrating and agreeable. And when the pods are freſh, and in good condition, they are found, when opened, to be full of a blackiſh, oily, balſamic liquor, in which there ſwim a great number of very ſmall black ſeeds. The ſmell, when the pod is freſh opened, is very lively, and in ſome degree intoxicating.

The pompona-vanilla has a ſtronger but leſs agreeable ſmell than the former; and, when taken, gives men violent head-achs, and women diſorders of the womb.

The liquid ſubſtance in the pompona is thinner than in the ley, and the ſeeds much larger, being nearly of the ſize of thoſe of muſtard.

The ſimarona, or baſtard-vanilla, has very little liquor, has few ſeeds in the pod, and has ſcarce any ſmell.

The pompona and ſimarona are no ſaleable commodities, nor ever brought to market, except cunningly by the Indians, who mix them among the pods of the ley, or true kind. It is not yet certainly known, however, whether theſe three kinds are the produce of different ſpecies of plants, or whether they differ only as to age, or the ſoil where the plant grows.

The time of gathering the pods for ſale, is from September to December. They require no other management than to be gathered in a dry ſeaſon, and laid twenty days, to dry away the ſuperfluous humidity, and, at times, preſſing the pods gently with the hands.

Vanillas are accounted cordial, carminative, ſtomachic, and reſtorative; they are alſo ſaid to be diuretic, and to promote the menſes.

VANNES, or VENNES, a city of Britany, in France, ſituated near the bay of Biſcay, fifty miles north-weſt of Nantz.

VAPORARIUM, in chemiſtry, a vapour-bath; wherein the body, containing the ingredients, is ſo placed as to receive the fumes of boiling water. See the articles BATH and HEAT.

VAPOUR, *vapor*, in philoſophy, the moiſt and moſt volatile particles of bodies, ſeparated by heat, and raiſed into the atmoſphere. See the articles EXHALATION and ATMOSPHERE.

That vapours are raiſed from the ſurface of water, and moiſt bodies, by the action of the ſun's heat, is agreed on by all: but the manner in which this is done, continues ſtill a controverted point among philoſophers. If we conſult a carteſian upon this head, he immediately tells us, that ſmall particles of water being formed into hollow ſpheres by the ſun's heat, filled with their materia ſubtilis, and by that means becoming lighter than air, are eaſily buoyed up in it: but as this materia ſubtilis is only a fiction, this ſolution is not to be regarded. See the article VACUUM.

Dr. Nieuwentyt, and ſeveral other philoſophers who maintain, that fire is a particular ſubſtance diſtinct from other matter, account for the formation and aſcent of vapours thus: they ſay, that the rays of the ſun, or particles of fire ſeparated from them, adhering to particles of the water, make up little bodies, lighter than an equal bulk of air; which, therefore, by the laws of hydroſtatics, will aſcend in it, till they come to an height where the air is of the ſame ſpecific gravity with themſelves; and that rain is produced by the ſeparation of the particles of the fire from thoſe of the water; which laſt, being then left without ſupport, can no longer be ſuſtained by the air, but falls down in drops of rain. See RAIN, DEW, *&c.*

This opinion is liable to the following difficulties: firſt, fire has never been yet proved to be a diſtinct element, or a particular ſubſtance; and the change of weight in bodies in chemical preparations, heretofore thought to ariſe from the adheſion of particles of fire, is found to proceed from the adheſion of particles of air. See FIRE and AIR.

Secondly, ſhould the above-mentioned ſuppoſition be allowed, the fiery particles, which are joined to the watery ones to buoy them up, muſt be conſiderably large, or elſe a very great number muſt fix upon a ſingle particle of water; and then a perſon, being on the top of an hill in the cloud, would be ſenſible of the heat, and find the rain, produced from that vapour, much colder than the vapour itſelf: whereas the contrary is evident to our ſenſes; the tops of hills, though in the clouds, being much colder than the rain which falls below.

Beſides, the manner in which the particles of water ſhould be ſeparated from thoſe of the fire, ſo as to fall in rain, is not eaſily to be conceived.

The moſt generally received opinion is, that by the action of the ſun on the ſurface of the water, the aqueous particles

become formed into bubbles, filled with a flatus, or warm air, which renders them ſpecifically lighter than common air, and makes them riſe therein, till they meet with ſuch as is of the ſame ſpecific gravity with themſelves. But Mr. Rowning aſks, Firſt, How comes the air in the bubbles to be ſpecifically lighter than that without, ſince the ſun's rays, which act upon the water from whence they are raiſed, are equally denſe over all its ſurface? Secondly, If it could be poſſible for rarer air to be ſeparated from the denſer ambient air, to form the bubbles (as bubbles of ſoaped water are blown up by warm air from the lungs, whilſt the ambient air is colder and denſer) what would hinder the external air from reducing that, which is incloſed in the bubbles, immediately to the ſame degree of coldneſs and ſpecific gravity with itſelf (cold being readily communicated thro' ſuch thin ſhells of water); by which means, the bubbles would become ſpecifically heavier than the circumambient air, and would no longer be ſupported therein, but fall down, almoſt as ſoon as they were formed?

Thirdly, If we ſhould grant all the reſt of the ſuppoſition, yet the following difficulty will ſtill remain. If clouds are made up of bubbles of water filled with air, why do not theſe bubbles always expand, when the ambient air is rarefied, and preſſes leſs upon them than it did before; and why are they not condenſed, when the ambient air is condenſed by the accumulation of the ſuperior air? But if this condenſation and rarefaction ſhould happen to them, the clouds would always continue at the ſame height, contrary to obſervation; and we ſhould never have any rain.

The two laſt opinions are more largely examined by Dr. Deſaguliers in the Philoſophical Tranſactions, n° 407. After which, he endeavours to eſtabliſh one of his own.

He obſerves, with Sir Iſaac Newton, that, when by heat or fermentation the particles of a body are ſeparated from their contact, their repulſive force grows ſtronger, and the particles exert that force at greater diſtances; ſo that the ſame body ſhould be expanded into a very large ſpace, by becoming fluid; and may ſometimes take up more than a million of times the room it did in a ſolid and incompreſſible ſtate. "Thus, ſays he, if the particles of water are turned into vapour, by repelling each other ſtrongly, and repel air more than they repel each other; aggregates of ſuch particles, made up of vapour and vacuity, may ariſe in air of different denſities, according to their own denſity depending on their degree of heat." He obſerves farther, that heat acts more powerfully on water, than on common air; for that the ſame degree of heat, which rarefies air two-thirds, will rarefy water near fourteen thouſand times, changing it into ſteam or vapour, as it boils it. And in winter, that ſmall degree of heat, which, in reſpect of our bodies, appears cold, will raiſe a ſteam or vapour from water, at the ſame time that it condenſes air. Laſtly, he obſerves, that the denſity and rarity of this vapour depends chiefly on its degree of heat, and but little on the preſſure of the circumambient air. From all which he infers, that the vapour being more rarefied near the ſurface of the earth, than the air is there by the ſame degree of heat, muſt neceſſarily be buoyed up into the atmoſphere; and ſince it does not expand itſelf much, though the preſſure of the incumbent air grows leſs, at length it finds a place where the atmoſphere is of the ſame ſpecific gravity with itſelf, and there floats, till, by ſome accident or other, it is converted again into drops of water, and falls down in rain.

And to ſhew that air is not neceſſary for the formation of ſteam or vapour, he gives us this experiment: A B C D (plate CCXC. fig. 3.) is a pretty large veſſel of water, which muſt be ſet upon the fire to boil. In this veſſel muſt be ſuſpended the glaſs bell E, made heavy enough to ſink in water; but put in, in ſuch a manner, that it be filled with water, when upright, without any bubbles of air at its crown within, the crown being all under water. As the water boils, the bell will, by degrees, be emptied of its water, the water in the bell being preſſed down by the ſteam which riſes from it; but, as that ſteam has the appearance of air, in order to know whether it be air or not, take the veſſel off the fire, and draw up the bell by a ſtring faſtened to its knob or top, till only the mouth remains under water; then, as the ſteam condenſes by the cold air on the outſide of the bell, the water will riſe up into the bell at F, quite to the top, without any bubble above; which ſhews, that the ſteam, which kept out the water, was not air.

VAPOURS, in medicine, a diſeaſe properly called hypo, or the hypochondrical diſeaſe, and in men, particularly, the ſpleen. See HYPOCHONDRIAC PASSION.

VARI, in medicine, little hard and ruddy tumours, which frequently infeſt the faces of young perſons of a hot temperament of body; for curing which cathartics, and a cooling diluting diet are moſt proper.

VARIABLE QUANTITIES, in geometry and analytics, denote ſuch as are either continually increaſing or diminiſhing; in oppoſition to thoſe which are conſtant, remaining always the ſame. See the article QUANTITY and FLUXION.

VARIANCE, in law, is an alteration of ſomething formerly laid in a plea: but where a plea is good in ſubſtance, it is held, that a ſmall variance ſhall not hurt it. Where the defendant pleads variance between a writ and declaration, he muſt crave oyer of the writ before he ſhall take any advantage thereof; and this is becauſe the writ and the declaration are not upon the ſame roll: it is likewiſe obſerved, that if in one roll a declaration is entered as in debt, and in another as in treſpaſs, this is ſuch a variance, that if the plaintiff has judgment it ſhall be reverſed.

By the 16 and 17 Car. II. c. 8. all variances, *&c.* that are not againſt the right of the matter of the ſuit, ſhall be amended.

VARIATION, in geography and navigation, is the deviation of the magnetical needle, in the mariner's compaſs, from the true north-point, towards either the eaſt or weſt; or, it is an arch of the horizon, intercepted between the meridian of the place of obſervation and the magnetic meridian. See NEEDLE.

The cauſe of this variation of the needle has remained hitherto without any demonſtrative diſcovery; yet ſince its declination, and inclination (or dipping) do both of them manifeſtly indicate the cauſe to be ſomewhere in the earth, it has given occaſion to philoſophers to frame hypotheſes for a ſolution, which make the earth a large or general magnet or loadſtone, of which all the leſſer ones are but ſo many parts or fragments, and being poſſeſſed of the ſame virtue, will, when left to move freely, have the ſame diſpoſition and ſimilarity of poſition, and other circumſtances. See EARTH and MAGNET.

The moſt conſiderable of theſe hypotheſes is that of the late ſagacious Dr. Halley, which is this: the globe of the earth is one great magnet, having four magnetical poles or points of attraction, near each pole of the equator two; and that in thoſe parts of the world which lie near adjacent to any one of thoſe magnetical poles, the needle is chiefly governed thereby, the neareſt pole being always predominant over the more remote one. Of the north poles, that which is neareſt to us, he ſuppoſes to be in the meridian of the land's end, which governs the variations in Europe, Tartary, and the North-ſea; the other he places in a meridian paſſing through California, about 15° from the north pole of the world, which governs the needle in north America, and the oceans on either ſide. In like manner he accounts for the variations in the ſouthern hemiſphere. See Philoſ. Tranſ. n° 148.

The variation of the needle from the north and ſouth points of the horizon, not being the ſame, but variable in different years, and in a diverſe manner in different parts of the earth, made the doctor farther conjecture, that two of the magnetic poles were fixed, and two moveable; and in order to make this out, he ſuppoſes the external part of the earth to be a ſhell or cortex, containing within it a magnetic moveable nucleus of a globular form, whoſe center of gravity is the ſame with that of the earth, and moveable about the ſame axis.

Now, if the motions of both the ſhell and nucleus were the ſame, the poles of each would always have the ſame poſition to each other; but he ſuppoſes the motion of the nucleus to be a very ſmall matter leſs than that of the ſhell, which yet is ſcarce ſenſible in 365 revolutions; and, if ſo, the magnetic poles of the nucleus will by ſlow degrees change their diſtance from the magnetic poles of the ſhell, and thus cauſe a variation in that needle's variation, which is governed by the moveable pole of the nucleus, while that variation which reſpects the fixed poles of the magnetic ſhell remains more conſtant; as in Hudſon's-bay the change is not obſerved to be near ſo faſt as in theſe parts of Europe.

What ſeems a little ſtrange is, that the doctor has no where undertook to account for the dipping of the needle by this hypotheſis; though the invention of this (by Mr. Blagrave) was before that of the change of the needle's variation (by Mr. Gellibrand); nor does it appear which way this phænomenon is explicable by it. But we have not yet ſo many

many accurate obſervations of the needle's inclination as we have of its variation, which is its only uſual property. By ſeveral experiments Mr. Graham has very accurately made, it appears, that the quantity of the needle's inclination to the horizontal line, was an angle of about 74 or 75 degrees: that is, ſuppoſe A B (plate CCXCII. fig. 1. n° 1.) a touched needle ſupported on the point C, of the pin C D, it will remain an angle A C H, or B C O, with the horizontal line H O of 74 or 75 degrees.

The variation of the needle has within a century paſt undergone a remarkable alteration; for at London it was obſerved by Mr. Burrows, in the year 1580, to be 11° 15′ eaſt; that is, if N. S. (*ibid.* n° 2.) repreſent the north and ſouth points of the horizon, and E. W. the eaſt and weſt points, the needle then had the ſituation A B, ſo that the arch B N = 11° 15′. After that, in the year 1622, it was obſerved by Mr. Gunter to be but 6° eaſt. In the year 1634, Mr. Gellibrand obſerved it to be 4° 5′ eaſt. In 1657, it was obſerved by Mr. Bond to be nothing at all, that is, the needle placed itſelf in the ſituation S. N. and pointed directly to the north. After this, in the year 1672, Dr. Halley obſerved it to be 2° 30′ weſtward; and again, in the year 1692, he found it 6° weſt. Since then, in the year 1722, Mr. Graham, by moſt accurate experiments, found it to be 14° 13′, and at preſent it is between 15° and 16°; and in ſome places it is found 18° weſtward.

The variation of the declination and inclination of the needle is variable, and ſubject to no regular computation. What the quantity of both ſorts of variation is in the ſeveral parts of the world, is ſhewn in Dr. Halley's map of the world, improved from the obſervations of Mr. Pound.

If the ſun's true amplitude or azimuth, found by calculation, agree with the magnetic amplitude or azimuth, found by obſervation, it is evident there is no variation: but if they diſagree, and the true and obſerved amplitudes, at the riſing or ſetting of the ſun, be both of the ſame name; that is, either both north, or both ſouth, their difference is the variation. whereas, if they be of different names, *i. e.* one north and the other ſouth, their ſum is the variation. Again, if the true and obſerved azimuths be both of the ſame name, *i. e.* both eaſt or both weſt, their difference is the variation; but if they be of different names, their ſum is the variation: and to know whether the variation be eaſterly or weſterly, obſerve the following general rule; let the obſerver's face be turned towards the ſun, then if the true amplitude or azimuth be to the right-hand, the variation is eaſterly; but if to the left, weſterly. To illuſtrate this, let N E S W. (*ibid.* n° 3.) repreſent a compaſs; and ſuppoſe the ſun is really E b S at the time of obſervation, but the obſerver ſees him off the eaſt point of the compaſs, and ſo the true amplitude or azimuth of the ſun is to the right of the magnetic, or obſerved: here it is evident, that the E b S point of the compaſs ought to lie where the eaſt point is, and ſo the north where the N b W is; conſequently the north point of the compaſs is a point too far eaſt, *i. e.* the variation in this caſe is eaſterly. The ſame will hold when the amplitude or azimuth is taken on the weſt ſide of the meridian.

Again, let the true amplitude or azimuth be to the left-hand of the obſerved; thus ſuppoſe the ſun is really E b N at the time of obſervation, but the obſerver ſees him off the eaſt point of the compaſs, and ſo the true amplitude or azimuth to the left of the obſerved: here it is evident, that the E b N point of the compaſs ought to ſtand where the eaſt point is, and ſo the north where the N b E point is; conſequently the north point of the compaſſes lies a point too far weſterly, ſo in this caſe the variation is weſt. The ſame will hold when the ſun is obſerved on the weſt ſide of the meridian.

Suppoſe the ſun's true amplitude at riſing is found to be E. 14°, 20′ N. but by the compaſs it is found to be E. 26°, 12′ N. Required the variation, and which way it is.

Since they are both the ſame way, therefore,

From the magnetic ampl. E. 26°, 12′ N.
take the true amplitude - E. 14°, 20′ N.
and there remains the varia. 11, 52 E.

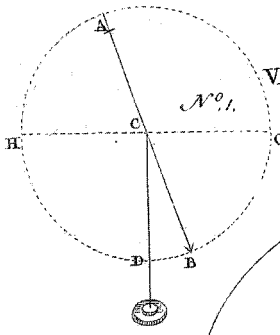
which is eaſterly, becauſe in this caſe the true amplitude is to the right of the obſerved.

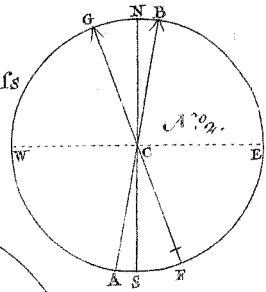
VARIATION *of the moon*, in aſtronomy, is the third inequality obſerved in that planet's motion. See the article MOON.

VARIEGATION,

Fig. 1.

VARIATION of the Compass





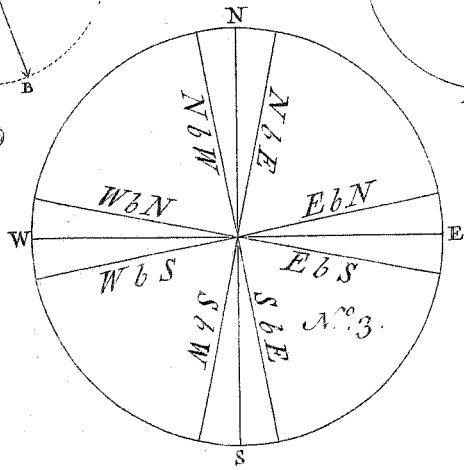


Fig. 2. WEAVING-Loom &c

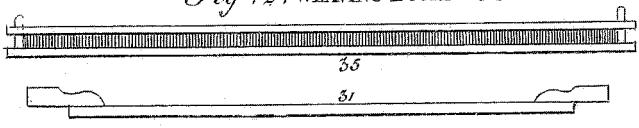
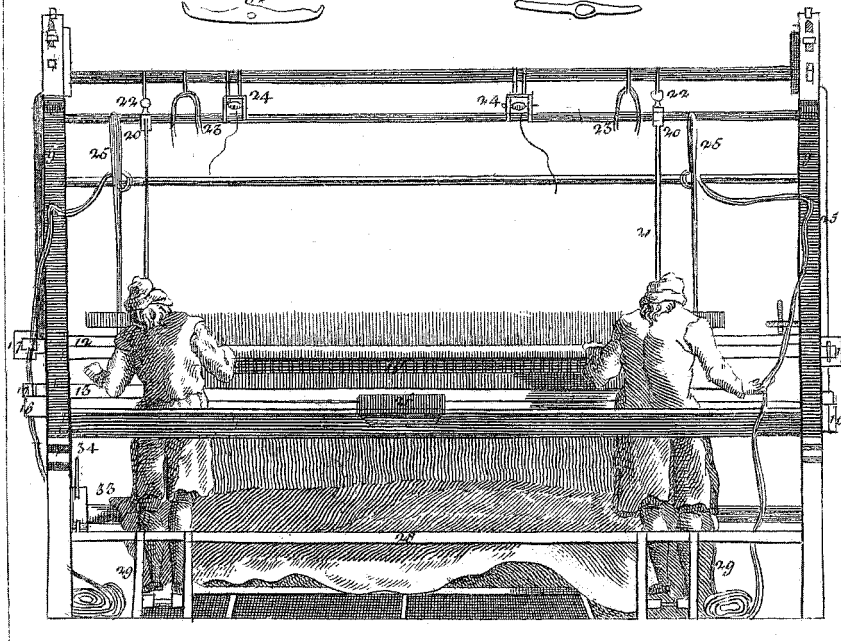




I. Jefferys sculp

VARIEGATION, among botaniſts and floriſts, the act of ſtreaking or diverſifying the leaves, *&c.* of plants and flowers with ſeveral colours.

Variegation is either natural or artificial.

Of natural variegation there are four kinds; the firſt ſhewing itſelf in yellow ſpots here and there, in the leaves of plants called, by gardeners, the yellow bloach. The ſecond kind, called the white bloach, marks the leaves with a great number of white ſpots, or ſtripes; the whiteſt lying next the ſurface of the leaves, uſually accompanied with other marks of a greeniſh white, that lie deeper in the body of the leaves. The third, and moſt beautiful, is where the leaves are edged with white, being owing to ſome diſorder or infection in the juices, which ſtains the natural complexion or verdure of the plant. The fourth kind is that called the yellow edge.

Artificial variegation is performed by inarching or inoculating a ſtriped or variegated plant into a plain one of the ſame ſort; as a variegated common jeſſamin into a plain, common, ſpaniſh, brazil, or indian jeſſamin.

A ſingle bud or eye, Mr. Bradley obſerves, being placed in the eſcutcheon of a diſtempered tree, where it can only receive nouriſhment from the vitiated juices, will become variegated proportionably to the nouriſhment it draws, and will partake more of the white and yellow juice, than if a branch ſhould be inarched, the bud having nothing to nouriſh it but the juices of the plant it is inoculated on; whereas a cyon inarched is fed by the ſtriped plant, and the healthful one.

As to the natural ſtripes or variegations, there are ſome particular circumſtances to be obſerved: 1. That ſome plants only appear variegated or bloached in the ſpring and autumn, the ſtains diſappearing as they gather ſtrength: of this kind are rue, thyme, and marjoram. 2. Some plants are continually bloached in the ſpongy part of their leaves: the ſap-veſſels, all the time, remaining of a healthful green: ſuch are the alternus, orange-mint, *&c.* which, being ſtrengthened by rich manure, or being inarched in healthful plants, throw off the diſtemper. 3. In other plants, the diſeaſe is ſo rooted and inveterate, that it is propagated with the ſeed: ſuch are the archangel, water-betony, bank creſs, borrage, ſtriped cellary, and ſycamore; the ſides of which produce ſtriped plants.

VARIOLÆ, the SMALL-POX, in medicine. See the article POX.

VARIORUM, or *cum notis* VARIORUM, in matters of literature, denotes an edition of a claſſic author, with notes of divers authors thereupon: theſe editions are generally moſt valued.

VARIX, in medicine, the dilatation of a vein, ariſing from the too great abundance or thickneſs of the blood; the cure of which is to be attempted by evacuations, as phlebotomy and cathartics; as alſo by external applications, as diſcutient fomentations, cataplaſms, embrocations, *&c.* or, where the caſe grows dangerous, by inciſion.

VARNA, a town of Bulgaria, in european Turky, ſituated on the weſtern coaſt of the Black-ſea, an hundred and twenty miles north of Conſtantinople.

VARNISH, or VERNISH, a thick, viſcid, ſhining liquor, uſed by painters, gilders, and various other artificers, to give a gloſs and luſtre to their works; as alſo to defend them from the weather, duſt, *&c.*

There are ſeveral kinds of varniſhes in uſe; as the ſiccative or drying varniſh, made of oil of aſpin, turpentine, and ſandarach melted together. White varniſh, called alſo venetian varniſh, made of oil of turpentine, fine turpentine, and maſtic. Spirit of wine varniſh, made of ſandarach, white amber, gum elemi, and maſtic; ſerving to gild leather, picture-frames, *&c.* withal. Alſo the gilt-varniſh, china-varniſh, common varniſh, *&c.*

1. To make the white varniſh: take gum ſandarach, of the cleareſt and whiteſt ſort, eight ounces; gum maſtic, of the cleareſt ſort, half an ounce; of ſarcocolla, the whiteſt, three quarters of an ounce; venice turpentine, an ounce and a half; benzoin, the cleareſt, one quarter of an ounce; white roſin, one quarter of an ounce; gum animæ, three quarters of an ounce: let all theſe be diſſolved, and mixed in the manner following:

Put the ſarcocolla and roſin into a little more ſpirits than will cover them to diſſolve; then add the benzoin, gum animæ, and venice turpentine, into either a glaſs or glazed earthen veſſel, and pour on as much ſpirits as will cover them an inch; then put the gum maſtic into a glaſs or glazed veſſel, and pour ſtrong ſpirits upon it, covering it alſo about an inch thick, to diſſolve it rightly; then put your gum elemi in a diſtinct veſſel

as

as before, and cover it with ſpirits to diſſolve.

For this purpoſe, you need only break the roſin a little, and powder the gum animæ, ſarcocolla, and benzoin.

Let all ſtand three or four days to diſſolve, ſhaking the glaſſes, *&c.* two or three times a day, and afterwards put them all together into a glazed veſſel, ſtirring them well, and ſtrain the liquor and gums gently, beginning with the gums, through a linnen cloth.

Then put it into a bottle, and let it ſtand a week before you uſe it, and pour off as much of the clear only, as you think ſufficient for preſent uſe.

2. The white amber-varniſh is thus made, according to Mr. Boyle: take white roſin four drams, melt it over the fire in a clean glazed pipkin; then put into it two ounces of the whiteſt amber you can get, finely powdered. This is to be put in by a little and a little, gradually, keeping it ſtirring all the while with a ſmall ſtick, over a gentle fire, till it diſſolves, pouring in now and then a little oil of turpentine, as you find it growing ſtiff; and continue ſo to do till all your amber is melted.

But great care muſt be taken not to ſet the houſe on fire, for the very vapours of the oil of turpentine will take fire by heat only; but if it ſhould happen ſo to do, immediately put a flat board or wet blanket over the fiery pot, and by keeping the air from it, you will put it out, or ſuffocate it.

Therefore it will be beſt to melt the roſin, in a glaſs of a cylindric figure, in a bed of hot ſand, after the glaſs has been well annealed, or warmed by degrees in the ſand, under which you muſt keep a gentle fire.

When the varniſh has been thus made, pour it into a coarſe linnen-bag, and preſs it between two hot boards of oak or flat plates of iron; after which it may be uſed with any colours in painting, and alſo for varniſhing them over when painted.

But for covering gold, you muſt uſe the following varniſh: mean time, it is to be obſerved, that when you have varniſhed with white varniſh, you may put the things varniſhed into a declining oven, which will harden the varniſh.

3. A hard varniſh, that will bear the muffle, may be thus made: take of colophony, an ounce; ſet it over the fire in a well-glazed earthen veſſel, till it is melted; then by little and little, ſtrew in two ounces of powder of amber, keeping it ſtirring all the while with a ſtick; and when you perceive it begin to harden or reſiſt the ſtick, then put in a little turpentine oil, which will thin and ſoften it immediately; then put in two ounces of gum copal, finely powdered, ſprinkling it in as you did the amber, now and then pouring in a little oil of turpentine; and when it is done, ſtrain it as before directed.

This is proper to varniſh over gold; and the things done with it muſt be ſet into a declining oven, three or four days ſucceſſively, and then it will reſiſt even the fire itſelf.

4. To make a varniſh for braſs, that will cauſe it to look like gold. Take two quarts of ſpirit of wine, and put it into a retort glaſs; then add to it an ounce of gamboge, two ounces of lacca, and two ounces of maſtic; ſet this in a ſand-heat for ſix days, or elſe near a fire, or you may put the body of the bolt-head frequently into warm water, and ſhake it two or three times a-day; then ſet it over a pan of warm ſaw-duſt. But before this varniſh is laid over the metal, let it be well cleaned.

This is a good varniſh to mix with any colours that incline to red, and the amber-varniſh for mixing with thoſe that are pale.

5. To make a varniſh for gold, or metals made in imitation of gold. Take colophony, and, having melted it, put in two ounces of amber finely powdered, and ſome ſpirit of turpentine, and, as the amber thickens, keep it well ſtirring; then put in an ounce of gum elemi, well pulverized, and more ſpirit of turpentine; conſtantly ſtirring the liquor till all is well mixed and incorporated: but take care, however, to uſe as little turpentine as you can, becauſe, the thicker the varniſh is made, the harder it will be. Let this be done over a ſand-heat, in an open glaſs; then ſtrain it, as is directed for the preceding varniſh. This varniſh is to be uſed alone, firſt warming the veſſels made of paper-paſte; and lay it on with a painting-bruſh before the fire, but not too near, leaſt the fire raiſe it into liſters. After this has been done, harden it three ſeveral times in ovens; firſt with a ſlack heat, the next with a warmer, and the third with a very hot one; and the veſſels will look like poliſhed gold.

And

And as for ſuch veſſels, *&c.* as ſhall be made with ſaw-duſt and gums, the varniſh may be made of the ſame ingredients as above-mentioned, except the gum-elemi; and this will dry in the ſun, or in a gentle warmth.

6. To make a varniſh for any thing covered with leaf-ſilver. Firſt paint the thing over with ſize, and ground chalk or whiting; let them ſtand till they are thoroughly dry, and then do them over with very good gold-ſize, of a bright colour (for there is much difference in the colour of it; ſome being yellow, and others almoſt white; the firſt is moſt proper for gold, and the laſt for ſilver). When this ſize is ſo dry as that it will juſt ſtick a little to the touch, lay on the leaf ſilver, and cloſe it well to the ſize.

7. To make a varniſh for ſilver. Melt, in a well glazed pipkin, ſome fine turpentine, and put in three ounces of white amber, finely powdered (more or leſs, according to the quantity your work will require) put it in by little and little, keeping it continually ſtirring, adding by degrees ſome ſpirit of turpentine, till all the amber is diſſolved; and then add to it an ounce of ſarcocolla well beaten, and an ounce of gum elemi well levigated, adding now and then a little ſpirit of turpentine, till all is diſſolved: do this over a gentle fire, and keep it conſtantly ſtirring.

This varniſh will be as white and ſtrong as the former; and is to be uſed warm, and hardened by degrees in an oven, as varniſhed gold, whereby it will look like poliſhed ſilver.

Laying on of VARNISHES. 1. If you varniſh wood, let your wood be very ſmooth, cloſe-grained, free from greaſe, and rubbed with ruſhes. 2. Lay on your colours as ſmooth as poſſible; and, if the varniſh has any bliſters in it, take them off by a poliſh with ruſhes. 3. While you are varniſhing, keep your work warm, but not too hot. 4. In laying on your varniſh, begin in the middle, and ſtroke the bruſh to the outſide; then to another extreme part, and ſo on till all be covered; for if you begin at the edges, the bruſh will leave blots there, and make the work unequal. 5. In fine works uſe the fineſt tripoli in poliſhing: do not poliſh it at one time only; but, after the firſt time, let it dry for two or three days, and poliſh it again for the laſt time. 6. In the firſt poliſhing you muſt uſe a good deal of tripoli, but in the next a very little will ſerve: when you have done, waſh off your tripoli with a ſponge and water: dry the varniſh with a dry linen-rag; and clear the work, if a white ground, with oil and whiting; or, if black, with oil and lamp-black.

VARNISH alſo ſignifies a ſort of ſhining coat, wherewith potter's ware, delft-ware, china-ware, *&c.* are covered, which gives them a ſmoothneſs and luſtre. Melted lead is generally uſed for the firſt, and ſmalt for the ſecond. See the article GLAZING.

VARNISH, among medaliſts, ſignifies the colours antique medals have acquired in the earth.

The beauty which nature alone is able to give to medals, and art has never yet attained to counterfeit, enhances the value of them; that is, the colour, which certain ſoils, in which they have a long time lain, tinges the metals withal; ſome of which are blue, almoſt as beautiful as the turquoiſe; others with an inimitable vermilion colour; others with a certain ſhining poliſhed brown, vaſtly finer than braſil figures.

The moſt uſual varniſh is a beautiful green, which hangs to the fineſt ſtrokes without effacing them, more accurately than the fineſt enamel does on metals.

No metal but braſs is ſuſceptible of this; for the green ruſt that gathers on ſilver always ſpoils it, and it muſt be got off with vinegar or lemon-juice.

Falſifiers of medals have a falſe or modern varniſh, which they uſe on their counterfeits, to give them the appearance, or air, of being antique. But this may be diſcovered by its ſoftneſs, it being ſofter than the natural varniſh, which is as hard as the metal itſelf.

Some depoſite their ſpurious metals in the earth for a conſiderable time, by which means they contract a ſort of varniſh, which may impoſe upon the leſs knowing; others uſe ſal armoniac, and others burnt paper.

VAS, a veſſel either for mechanical, chemical, culinary, or any other uſes. In anatomy, all the parts which convey a fluid are called veſſels, as the veins, arteries, and lymphatics.

VASA CONCORDIÆ, among hydraulic authors, are two veſſels, ſo conſtructed as that one of them, though full of wine, will not run a drop; unleſs the other, being full of water, do run alſo. Their ſtructure and apparatus may be ſeen in Wolfius Element. Mathef. T. I. Hydraul.

VASCULAR, in anatomy, ſomething conſiſting of divers veſſels; as arteries, veins, nerves, *&c.* See ARTERY, *&c.*

VASCULIFEROUS PLANTS, ſuch whoſe ſeeds are contained in veſſels, which are ſometimes divided into cells.

VASE, a term frequently uſed for antient veſſels dug from under ground, or otherwiſe found, and preſerved in the cabinets of the curious.

In architecture, the appellation vaſe is alſo given to thoſe ornaments placed on corniches, ſocles, or pedeſtals, repreſenting the veſſels of the antients, particularly thoſe uſed in ſacrifice; as incenſe-pots, flower-pots, *&c.* They ſerve to crown or finiſh facades, or frontiſpieces; and hence called acroteria.

The term vaſe, however, is more particularly uſed, in architecture, to ſignify the body of the corinthian and compoſite capital; otherwiſe called the tambour or drum, and ſometimes the campana or bell. See the articles CORINTHIAN and COMPOSITE.

Vaſe is ſometimes alſo uſed, among floriſts, for what is more uſually called the calyx, or cup. See CALYX.

VASSAL, in old law-books, denotes a tenant that held land in fee of his lord, to whom he vowed fidelity and ſervice. See the articles FEALTY, FEE, HOMAGE, *&c.*

VASSERBURG, or WASSERBURG, a town of Bavaria, in Germany, ſituated on the the river Inn, thirty miles eaſt of Munich.

VASTO, in law, a writ that lies for the heir, or him in reverſion or remainder, againſt the tenant for term of life or years, for making waſte. See the article WASTE.

VASTUS, in anatomy, the name of two of the extenſor muſcles of the legs; the one, called vaſtus internus, ariſes from the whole internal ſide of the femur; and the other, called vaſtus externus, takes its riſe from the whole external ſide of femur; and both together, with the cruralis and rectus, form a very robuſt and ſtrong tendon juſt above the knee, to which the patella adheres behind, and which is inſerted below the knee at a tubercle of the tibia. See MUSCLE.

VAT, or FAT, a veſſel for holding wine, ale, beer, cyder, *&c.* in the time of their preparation.

VATERIA, in botany, a genus of the *polyandria-monogynia* claſs of plants, the flower of which conſiſts of five oval and patent petals; and its fruit is a turbinated, coriaceous, and unilocular capſule, containing a ſingle oval ſeed.

VATICAN, a magnificent palace of the pope, in Rome, which is ſaid to conſiſt of ſeveral thouſand rooms: but the parts of it moſt admired are the grand ſtair-caſe, the pope's apartment, and eſpecially the library, which is one of the richeſt in the world, both in printed books and manuſcripts.

VAUDEMONT, the capital of a county of the ſame name in Lorrain, fifteen miles ſouth-weſt of Nancy.

VAUDOIS are certain valleys ſituated north of the marquiſate of Saluzzo, in Italy: the chief town is Lucern. See the article LUCERN.

VAUDREVANGE, a town of Lorrain, ſituated on the river Sare, fifty miles north-eaſt of Nancy.

VAUGE, high mountains of Alſace, in Germany, which ſeparate it from Lorrain on the weſt.

VAULT, *fornix*, in architecture, an arched roof, ſo contrived that the ſtones which form it ſuſtain each other. See ARCH.

Vaults are, on many occaſions, to be preferred to ſoffits or flat ceilings, as they give a greater height and elevation, and are beſides more firm and durable. See CEILING.

Salmaſius obſerves, that the antients had only three kinds of vaults. The firſt was the fornix, made cradle-wiſe; the ſecond a teſtudo, *i. e.* tortoiſe-wiſe, which the French call cul de four, or oven-wiſe; and the third concha, or trumpet-wiſe. But the moderns have ſubdivided theſe three ſorts into many more, to which they have given different names, according to their figures and uſes; ſome of them are circular, and others elliptical. Again, the ſweeps of ſome are larger, others leſs, portions of a ſphere. All ſuch as are above hemiſpheres are called high, or ſurmounted, vaults; and all that are leſs than hemiſpheres, are called low, or ſurbaſed, vaults, or teſtudines. In ſome vaults the height is greater than the diameter; in others it is leſs: others, again, are quite flat, and only made with haunſes; others like ovens, or in the form of a cul de four, *&c.* and others growing wider as they lengthen, like a trumpet.

There are alſo gothic vaults, with ogives, *&c.* See OGIVE, *&c.*

Of vaults ſome again are ſingle, others double, croſs, diagonal, horizontal, aſcending,

aſcending, deſcending, angular, oblique, pendent, &c.

Maſter VAULTS are thoſe that cover the principal parts of buildings, in contradiſtinction to the upper or ſubordinate vaults, which only cover ſome little part, as a paſſage or gate, &c.

Double VAULT is one that is built over another, to make the outer decoration range with the inner; or, to make the beauty and decoration of the inſide conſiſtent with that of the outſide, leaves a ſpace between the concavity of the one and the convexity of the other. Inſtances of which we have in the dome of St. Peter's at Rome, St. Paul's at London, and in that of the invalids at Paris.

VAULTS *with compartments* are ſuch whoſe ſweep, or inner face, is enriched with pannels of ſculpture, ſeparated by platbands. Theſe compartments, which are of different figures, according to the vaults, and uſually gilt on a white ground, are made with ſtone or brick-walls, as in the church of St. Peter at Rome, or with plaiſter on timber vaults.

Theory of VAULTS. A ſemi-circular arch or vault, ſtanding on two piedroits, or impoſts, and all the ſtones that compoſe them, being cut, and placed in ſuch manner as that their joints or beds, being prolonged, do all meet in the center of the vault; it is evident that all the ſtones muſt be in the form of wedges; *i.e.* muſt be wider and bigger at top: by virtue of which they ſuſtain each other, and mutually oppoſe the effort of their weight, which determines them to fall.

The ſtone in the middle of the vaults, which ſtands perpendicular to the horizon, and is called the key of the vault, is ſuſtained on each ſide by two contiguous ſtones, juſt as by two inclined planes; and, conſequently, the effort it makes to fall is not equal to its weight.

But ſtill that effort is the greater, as the inclined planes are leſs inclined; ſo that if they were infinitely little inclined, *i. e.* if they were perpendicular to the horizon as well as the key, it will tend to fall with its whole weight, and would actually fall but for the mortar.

The ſecond ſtone, which is on the right or left of the key-ſtone, is ſuſtained by a third, which, by virtue of the figure of the vault, is neceſſarily more inclined to the ſecond than the ſecond is to the firſt; and conſequently the ſecond, in the effort it makes to fall, employs a leſs part of its weight than the firſt. For the ſame reaſon, the ſtones from the key-ſtone employ ſtill a leſs and leſs part of their weight to the laſt, which, reſting on a horizontal plane, employs no part of its weight; or, which is the ſame thing, makes no effort at all, as being entirely ſupported by the impoſt.

Now, in vaults, a great point to be aimed at is, that all the vouſſoirs, or key-ſtones, make an equal effort towards falling. To effect this, it is viſible, that as each (reckoning from the key to the impoſt) employs ſtill a leſs and leſs part of its whole weight; the firſt, for inſtance, only employing one half; the ſecond, one third; the third, one fourth, &c. There is no other way of making thoſe different parts equal, but by a proportionable augmentation of the whole; *i. e.* the ſecond ſtone muſt be heavier than the firſt, the third than the ſecond, &c. to the laſt; which ſhould be infinitely heavier.

M. de la Hire demonſtrates what that proportion is, in which the weights of the ſtones of a ſemi circular arch muſt be increaſed to be in æquilibrio, or to tend with equal forces to fall, which is the firmeſt diſpoſition a vault can have.

The architects before him had no certain rule to conduct themſelves by, but did all at random. Reckoning the degrees of the quadrant of a circle, from the key-ſtone to the impoſt, the extremity of each ſtone will take up ſo much the greater arch as it is farther from the key.

M. de la Hire's rule is to augment the weight of each ſtone above that of the key-ſtone, as much as the tangent of the arch of the ſtone exceeds the tangent of the arch of half the key. Now the tangent of the laſt ſtone of neceſſity becomes infinite, and of conſequence its weight ſhould be ſo too; but, as infinity has no place in practice, the rule amounts to this, that the laſt ſtones be loaded as much as poſſible, that they may the better reſiſt the effort which the vault makes to ſeparate them; which is called the ſhoot or drift of the vault.

Mr. Parent has ſince determined the curve, or figure, which the extrados, or outſide of a vault, whoſe intrados, or inſide, is ſpherical, muſt have, that all the ſtones may be in æquilibrio.

Key of a VAULT is a ſtone or brick in the middle of the vault, in form of a truncated cone, ſerving to bind or faſten all the reſt. See KEY.

Reins, or fillings up of a VAULT are the ſides which ſuſtain it. See REINS.

Pendentive of a VAULT is the part ſuſpended between the arches or ogives. See PENDENTIVE.

Impoſt of a VAULT is the ſtone whereon the firſt vouſſoir, or arch-ſtone of the vault, is laid. See IMPOST.

VAUR, a town of Languedoc, in France, eighteen miles weſt of Toulouſe.

UBEDA, a city of Andaluſia, in Spain, forty-five miles north-eaſt of Granada. weſt long. 3° 6′, north lat. 38°.

UBERLINGEN, a town of Swabia, in Germany, ten miles north of Conſtance.

UBES, or ST. UBES, a city and port-town of Portugal, ſituated on a fine bay, twenty-one miles ſouth of Liſbon.

UBIQUITARIANS, in church-hiſtory, a ſect of heretics who ſprung up in Germany about the year 1590, and maintained that the body of Jeſus Chriſt is *ubique*, everywhere, or in every place, at the ſame time. However, they were not quite agreed among themſelves; ſome holding, that the body of Jeſus Chriſt, even during his mortal life, was every where; and others dating the ubiquity of his body from the time of his aſcenſion only.

UBIQUITY, omnipreſence; an attribute of the Deity, whereby he is always intimately preſent to all things; gives the eſſe to all things; knows, preſerves, and does all in all things. See GOD.

For, ſince God cannot be ſaid to exiſt in all places, as placed therein (becauſe then he would need ſomething to his exiſtence, *viz.* place; and would have extenſion, parts, *&c.*) he muſt be conceived to be everywhere, or in all things, as a firſt, univerſal, efficient cauſe, in all his effects. See CAUSE, *&c.*

He is preſent therefore to all his creatures, as a pure act or an exerciſe of an active virtue, which knows, preſerves, governs, *&c.* every thing. Nor are even finite minds preſent, otherwiſe than by operation.

UCKERMUND, a town of upper Saxony, and dutchy of Pomerania, ſituated on a bay of the Baltic-Sea, twenty-five miles north weſt of Stetin.

UDDER, *uber*, in comparative anatomy, that part in brutes wherein the milk is prepared, anſwering to the mammæ, or breaſts, in women. See BREASTS.

UDENSKOI, a town of Siberia, ſituated in eaſt long. 96° 30′, north lat. 53°.

UDINA, a town of Friuli, in Italy, twenty-five miles north of Aquileia.

VECHT, a town of Weſtphalia, in Germany, thirty miles north of Oſnabrug.

VECHT is alſo a river in the united Netherlands; which running from eaſt to weſt through the province of Overyſſel, falls into the Zuyder-ſea below Swartſluys.

VECTIS, the LEVER, one of the mechanic powers. See LEVER.

VECTOR, in aſtronomy, a line ſuppoſed to be drawn from any planet moving round a center, or the focus of an ellipſis, to that center or focus.

This, by ſome writers of the new aſtronomy, is called vector, or radius vector, becauſe it is that line by which the planet ſeems to be carried round its center, and with which it deſcribes areas proportional to the times. See the articles PLANET, AREA, *&c.*

VEDETTE, in the military art, a ſentinel on horſeback detached from the main body of the army, to diſcover and give notice of the enemies deſigns.

VEER, a ſea-term variouſly uſed. Thus veering out a rope, denotes the letting it go by hand, or letting it run out of itſelf. It is not uſed for letting out any running rope except the ſheat.

VEER is alſo uſed in reference to the wind; for, when it changes often, they ſay it veers about.

VEGETABLE, *vegetabile*, in phyſiology, a term applied to all plants, conſidered as capable of growth: *i. e.* all natural bodies which have parts organically formed for generation and accretion, but not ſenſation. See PLANT.

VEGETATION, in phyſiology, the act whereby plants receive nouriſhment and grow. See PLANT.

The proceſs of nature, in the vegetation of plants, is very accurately delivered by the excellent Malpighi, to the effect following: The egg, or ſeed, of the plant being excluded out of the ovary, called pod, or huſk, and requiring further foſtering and brooding, is committed to the earth; which having received it into her fertile boſom, not only does the office of incubation, by her own warm vapours and exhalation, joined with the heat of the ſun; but, by degrees, ſupplies what the ſeed requires for its further growth: as abounding everywhere with canals and ſinuſes, wherein the dew and rain-water, impregnated with fertile ſalts, glide, like the chyle and blood in the arteries, *&c.* of animals. This moiſture, meeting with a new depoſited ſeed, is percolated, or ſtrained through the pores or

pipes

pipes of the outer rind, or huſk, correſponding to the ſecundines of the fœtuſes, on the inſide whereof lies one or more, commonly two, thick ſeminal leaves, anſwering to the placenta in women, and the cotyledons in brutes. See EGG, SEED, *&c.*

Theſe ſeed-leaves conſiſt of a great number of little veſiculæ, or bladders, with a tube coreſponding to the navel-ſtring in animals. In theſe veſiculæ is received the moiſture of the earth, ſtrained thro' the rind of the ſeed; which makes a ſlight fermentation with the proper juice before contained therein. This fermented liquor is conveyed by the umbilical veſſel to the trunk of the little plant; and to the gem, or bud, which is contiguous thereto: upon which a vegetation and increaſe of the parts ſucceed.

Such is the procedure in the vegetation of plants; which the illuſtrious author exemplifies in a grain of wheat, as follows: The firſt day the grain is ſown it grows a little turgid; and the ſecundine, or huſk, gapes a little in ſeveral places: and the body of the plant, being continued by the umbilical veſſel to a conglobated leaf (which is called the pulp or fleſh of the ſeed, and is what conſtitutes the flower) ſwells; by which means, not only the gem or ſprout (which is to be the future ſtem) opens, and waxes green, but the roots begin to bunch out; whence the placenta, or ſeed-leaf, becoming looſe, gapes. The ſecond day, the ſecundine, or huſk, being broke through, the ſtem, or top of the future ſtraw, appears on the outſide thereof, and grows upwards by degrees: in the mean time, the ſeed-leaf, guarding the roots, becomes turgid with its veſiculæ, and puts forth a white down. And the leaf being pulled away, you ſee the roots of the plant bare; the future buds, leaves, and reſt of the ſtalk lying hid. Between the roots and the aſcending ſtem the trunk of the plant is knit, by the navel-knot, to the flower-leaf, which is very moiſt, though it ſtill retains its white colour and its natural taſte. The third day, the pulp of the conglobated, or round leaf, becomes turgid with the juice which it received from the earth fermenting with its own.

Thus the plant increaſing in bigneſs, and its bud or ſtem becoming taller, from whitiſh turns greeniſh: the lateral roots alſo break forth greeniſh and pyramidal from the gaping ſheath, which adheres chiefly to the plant; and the lower root grows longer and hairy, with many fibres ſhooting out of the ſame.

Indeed there are hairy fibres hanging all along on all the roots, except on their tips; and theſe fibres are ſeen to wind about the ſaline particles of the ſoil, little lumps of earth, *&c.* like ivy; whence they grow curled. Above the lateral roots there now break out two other little ones.

The fourth day, the ſtem, mounting upwards, makes a right angle with the ſeminal leaf: the laſt roots put forth more; and the other three, growing larger, are cloathed with more hairs, which ſtraitly embrace the lumps of earth; and where they meet with any vacuity, unite into a kind of net-work.

From this time forward the root puſhes with more regularity downward, and the ſtalk upward, than before. There is, however, this great difference in their growth, that the ſtalk and branches find no reſiſtance to their ſhooting up, while the roots find a great deal to their ſhooting downward, by means of the ſolidity of the earth, whence the branches advance much faſter and farther in their growth than the roots; and theſe laſt, often finding the reſiſtance of a tough earth unſurmountable, turn their courſe, and ſhoot almoſt horizontally. See GENERATION.

VEGETATIVE SOUL, among philoſophers, denotes that principle in plants, by virtue of which they vegetate, or receive nouriſhment and grow. See the preceding article.

VEHICLE, *vehiculum*, in general, denotes any thing that carries or bears another along; but is more particularly uſed in pharmacy for any liquid ſerving to dilute ſome medicine, in order that it may be adminiſtered more commodiouſly to the patient.

VEIL, *velum*, a piece of ſtuff, ſerving to cover or hide any thing.

In the romiſh churches, in time of Lent, they have veils or curtains over the altar, crucifix, images of ſaints, *&c.*

A veil of crape is wore on the head by nuns, as a badge of their profeſſion: the novices wear white veils; but thoſe who have made the vows, black ones. See the article NUN.

VEIN, *vena*, in anatomy, is a veſſel which carries the blood from the ſeveral parts of the body to the heart. The veins are compoſed principally of a membranaceous,

branaceous, a vaſculous, and a muſculous tunic: but theſe are vaſtly thinner than in the arteries. See ARTERY.

The veins are only a continuation of the extreme capillary arteries, reflected back again towards the heart, and uniting their channels as they approach it, till at laſt they all form three large and primary veins, *viz.* the cava, which brings the blood back from all parts above and below the heart; the vena portæ, which brings the blood from the liver; and the pulmonary vein. See CAVA, *&c.*

The beſt method of tracing the general courſe of the veins, is to begin with the main trunks, or primary veins, and end with their ramifications and capillary extremities, according to their ſeveral diviſions and ſubdiviſions.

The vena cava ariſes, with a large ſinus, from the right auricle of the heart; ſee plate CCXCIII. fig. 1. and 2. where it is marked 1: and here it ſends out a vein to the heart itſelf, called the coronary vein; and is divided into two trunks, a ſuperior called the cava deſcendens, and marked 2; and an inferior one, called cava aſcendens, and marked 3. From the ſuperior trunk of the vena cava, ariſe the following veins, *viz.* the vena azygos, marked 4; the bronchial vein, which, in ſome ſubjects, indeed, does not riſe ſeparate, but comes from the azygos, and ſometimes from the intercoſtals, and in ſome is altogether wanting; the mediaſtinal vein, which accompanies the mediaſtinal artery; the ſuperior diaphragmatic, which in like manner accompanies the artery of that name; and finally, the ſubclavians, marked 5, 5. From theſe laſt ariſe, on each ſide, the external jugular vein, marked 6, 6, where the right one, in fig. 1. is cut off: the jugular vein in its ſubdiviſions receives different denominations from the parts over which they are diſtributed; as the frontal, temporal, occipital, *&c.* From the ſubclavians likewiſe ariſe the internal jugulars, marked 7, 7: theſe give ramifications to the larynx, pharynx, the muſcles of the os hyoides, and to the tongue: and beſides theſe, its trunk terminates in a ſack, and brings back the blood from the brain and ſinuſes of the dura mater. From the ſame veins likewiſe ariſe the vertebral one, which aſcends to the cranium thro' the tranſverſe apophyſes of the vertebræ of the neck; alſo the intercoſtals, marked 8 (fig. 2.) the mammary veins, marked 9, 9, *ibid.* the ſcapulares and muſculares: and, finally, the axillary veins, marked 10, 10, the exterior branch of which is called the cephalic, marked 11, 11, (fig. 1. and 2.) and extended along the exterior part of the arm towards the thumb; its interior branch, called the baſilic, and marked 12, 12; the vena mediana, formed of the concourſe of the hepatic and baſilic, and marked 13, 13; and finally, that which runs over the back of the hand towards the little finger, is called the ſalvatella. See AZYGOS, *&c.*

The inferior trunk of the vena cava is remarkable for its valves, which ſerve to prevent the blood from returning towards the extremities: it is marked 3.

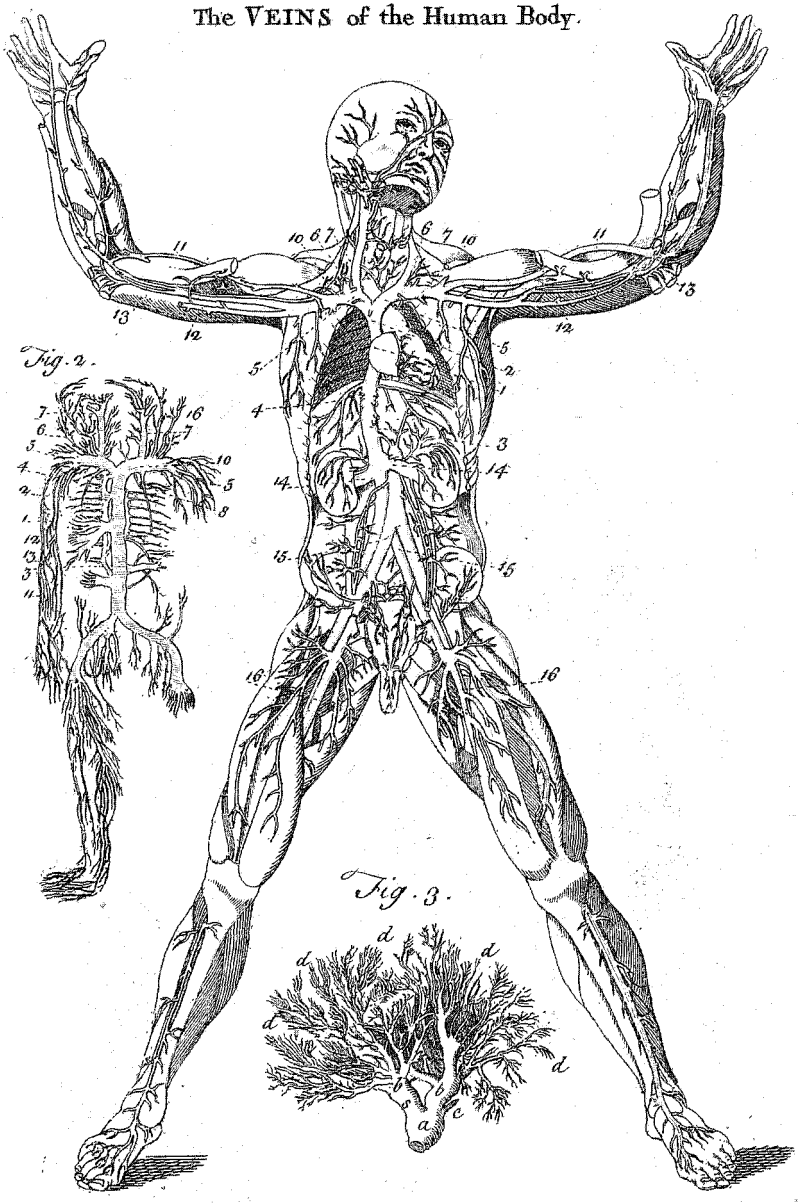
From it ariſe the following veins; *viz.* the diaphragmatic, hepatic, and renal or emulgent veins, which laſt go to the kidnies, and are marked 14, 14; alſo the ſpermatic veins, ſacra and iliacs, which laſt are marked 15, 15; and from theſe, on each ſide, ariſe hypogaſtrics and epigaſtrics, as alſo the crural veins, which go to the feet, and are marked 16, 16; the internal branch of this, toward the internal malleolus, is called the ſaphœna; and its external branch about the knee, the poplitæa; in the leg it is called ſuralis; and about the great toe of each foot, the cephalic vein of the foot. See the article DIAPHRAGMATIC, *&c.*

The vena portæ has ſome kind of reſemblance to a tree in its ſtructure; its roots, or inferior branches, being divided into the right and left. From the right ariſe all the meſeraic veins of the inteſtines, the internal hæmorrhoidal, and the right epiploics: the left is called the ſplenic vein; from which ariſe the gaſtrics, the vaſa brevia, the pancreatic epiploic, and ſometimes alſo the internal hæmorrhoidal vein. The trunk of the vena portæ affords the cyſtic veins, the right gaſtric, duodenal, *&c.* And laſtly, where the trunk begins to explicate, it conſtitutes the ſinus portæ in the liver; and from this it is divided into innumerable branches, diſperſed through the whole ſubſtance of the liver. See LIVER, MESERAIC, *&c.*

The third primary vein is the pulmonary one, which ariſes from the left auricle of the heart, where it firſt forms a ſinus; and is, ſoon afterwards, divided into four branches, and finally into innumerable ramifications, diſtributed through the whole ſubſtance of the lungs (*ib.* fig. 3.) repreſents the pulmonary vein in the time of expiration;

Fig. 1.

The VEINS of the Human Body.



tion; *a* being its trunk, cut close to the base of the heart; *b*, *b*, its divisions to the right and left lobe of the lungs; *c* the canalis arteriosus; *d*, *d*, the extremities of the arteries freed from the vesicles of the lungs, and their inosculations with the pulmonary veins.

VEIN, among miners, is that space which is bounded with woughs, and contains ore, spar, canck, clay, chirt, croil, brownhen, pitcher-chirt, cur, which the philosophers call the mother of metals, and sometimes soil of all colours. When it bears ore, it is called a quick vein; when no ore, a dead vein. See TRACING.

VEJOURS, *visores*, in law, are those sent by the court, to take a view of any place in question for the better decision of the right.

It is also used for those who are sent to view such as essoign themselves de malo lecti, whether in truth they be such as that they cannot appear, or whether they be counterfeit. See ESSOIGN.

VEIT, or *St.* VEIT, the name of two towns in the circle of Austria, in Germany; one in the dutchy of Carniola, and the other in that of Carinthia.

VELA, a remarkable cape on the coast of Terra Firma, in west long. 73° 30′, and north lat. 12°.

VELAMENTUM BOMBYCINUM, a name which some anatomists give to the velvet membrane, or inner skin, of the intestines. See INTESTINES.

VELAY, the north-east division of Languedoc, in France.

VELDENTS, a town in the circle of the Lower Rhine, in Germany, situated on the east side of the river Moselle, fifteen miles east of Triers.

VELEZ, a town of New Castile, fifty miles south-east of Madrid.

VELIRA, a town of Sclavonia, sixty miles north-west of Posega: east long. 17° 31′, north lat. 46° 15′.

VELLA, in botany, a genus of the *tetradynamia siliculosa* class of plants, with a tetrapetalous cruciform flower: the stamina are six filaments, about the length of the cup; and the fruit is a globose, cristated, bilocular pod, containing a few roundish seeds.

VELLETRI, a town of the Campania of Rome, about twenty miles east of that city.

VELLICATION, among physicians, the act of twitching. The word is more particularly applied to a sort of sudden convulsions that happen to the fibres of the muscles.

VELOCITY, swiftness, or that affection of motion whereby a moving body is disposed to run over a certain space in a certain time. See MOTION.

For the velocity of falling bodies, see the article ACCELERATION.

VELOM, a kind of parchment, finer, evener, and whiter than the common sort. See the article PARCHMENT.

VELVET, a rich kind of stuff, all silk, covered on the outside with a close, short, fine, soft shag, the other side being a very strong close tissue.

The nap or shag, called also the velveting, of this stuff, is formed of part of the threads of the warp, which the workman puts on a long narrow-channeled ruler or needle, which he afterwards cuts, by drawing a sharp steel tool along the channel of the needle to the ends of the warp.

The principal and best manufactories of velvet are in France and Italy, particularly in Venice, Milan, Florence, Genoa, and Lucca: there are others in Holland, set up by the french refugees; whereof that at Harlem is the most considerable: but they all come short of the beauty of those in France, and, accordingly, are sold for 10 or 15 *per cent.* less. There are even some brought from China, but they are the worst of all.

There are velvets of various kinds; as plain, that is, uniform and smooth, without either figures or stripes.

Figured velvet, that is, adorned and worked with divers figures, though the ground be the same with the figures; that is, the whole surface velveted.

Ramage or branched velvet, representing long stalks, branches, *&c.* on a sattin ground, which is sometimes of the same colour with the velvet, but more usually of a different one. Sometimes, instead of sattin, they make the ground of gold and silver; whence the denominations of velvets with gold ground, *&c.*

Shorn velvet, is that wherein the threads, that make the velveting, have been ranged in the channeled ruler, but not cut there.

Striped velvet, is that wherein there are stripes of divers colours running along the warp, whether these stripes be partly velvet, and partly sattin, or all velveted.

Cut velvet, is that whereon the ground is a kind of taffety, or gros de tours, and the figures velvet.

Velvets are likewise distinguished, with regard

regard to their different degrees of ſtrength and goodneſs, into velvets of four threads, three threads, two threads, and a thread and a half: the firſt are thoſe where there are eight threads of ſhag, or velveting, to each tooth of the reed; and the ſecond have only ſix, and the reſt four.

In general, all velvets, both worked and cut, ſhorn and flowered, are to have their warp and ſhag of organſin, ſpun and twiſted, or thrown in the mill; and their woof of ſilk well boiled, *&c.* They are all of the ſame breadth.

VENA, VEIN, in anatomy. See the article VEIN.

VENAFRO, a town of Italy, twenty-five miles north of Naples.

VENAISSIN, the territory whereof Avignon is the capital. See AVIGNON.

VENAL, or VENOUS, among anatomiſts, *&c.* ſomething that bears a relation to the veins. See the article VEIN.

This word is alſo uſed for ſomething bought with money, or procured by bribes.

VENANT, or *St.* VENANT, a town of Artois, twenty miles weſt of Liſle.

VENCE, a town of Provence, in France, ſituated on the confines of Piedmont, ten miles weſt of Nice.

VENDEE, in law, ſignifies the perſon to whom a thing is ſold; in oppoſition to vendor, or ſeller.

VENDITIONI EXPONAS, in law, a judicial writ directed to the ſheriff, commanding him to ſell goods, which he had formerly, by command, taken into his hands, for the ſatisfying a judgment given in the king's court.

VENDOSME, a town of Orleanois, in France, ſituated on the river Loire, thirty-ſeven miles weſt of Orleans.

VENEERING, VANEERING, or FINEERING, a kind of marquetry, or inlaying, whereby ſeveral thin ſlices or leaves of fine woods, of different kinds, are applied and faſtened on a ground of ſome common wood. See MARQUETRY.

There are two kinds of inlaying; the one, which is the moſt common and more ordinary, goes no farther than the making of compartments of different woods; the other requires much more art, in repreſenting flowers, birds, and the like figures.

The firſt kind is properly called veneering; the latter is more properly called marquetry.

The wood uſed in veneering is firſt ſawed out into ſlices or leaves about a line in thickneſs; *i. e.* the twelfth part of an inch. In order to ſaw them, the blocks or planks are placed upright, in a kind of ſawing-preſs. See SAWING-MILL.

Theſe ſlices are afterwards cut into narrow ſlips, and faſhioned divers ways, according to the deſign propoſed; then the joints having been exactly and nicely adjuſted, and the pieces brought down to their proper thickneſs, with ſeveral planes for the purpoſe, they are glued down on a ground or block, with good ſtrong engliſh glue.

The pieces being thus jointed and glued, the work, if ſmall, is put in a preſs; if large, 'tis laid on a bench covered with a board, and preſſed down with poles or pieces of wood, one end of which reaches to the ceiling of the room, and the other bears on the board.

When the glue is thoroughly dry, it is taken out of the preſs and finiſhed; firſt with little planes, then with divers ſcrapers, ſome of which reſemble raſps, which take off the dents, *&c.* left by the planes.

After it has been ſufficiently ſcraped, they poliſh it with the ſkin of a ſea-dog, wax and a bruſh, or poliſher of ſhave-graſs; which is the laſt operation.

VENEREAL, ſomething belonging to venery; as the lues venerea, french diſeaſe, or pox. See POX, GONORRHOEA, *&c.*

VENERIS OESTRUM, the ſtimulus or incentive of venery, is an appellation given by ſome anatomiſts to the clitoris.

VENERIS OESTRUM is alſo uſed by others for the tranſport of love, or the utmoſt extacy of deſire, or enjoyment, in coition.

VENERY, is uſed for the the act of copulation, or coition, of the two ſexes. See the article GENERATION.

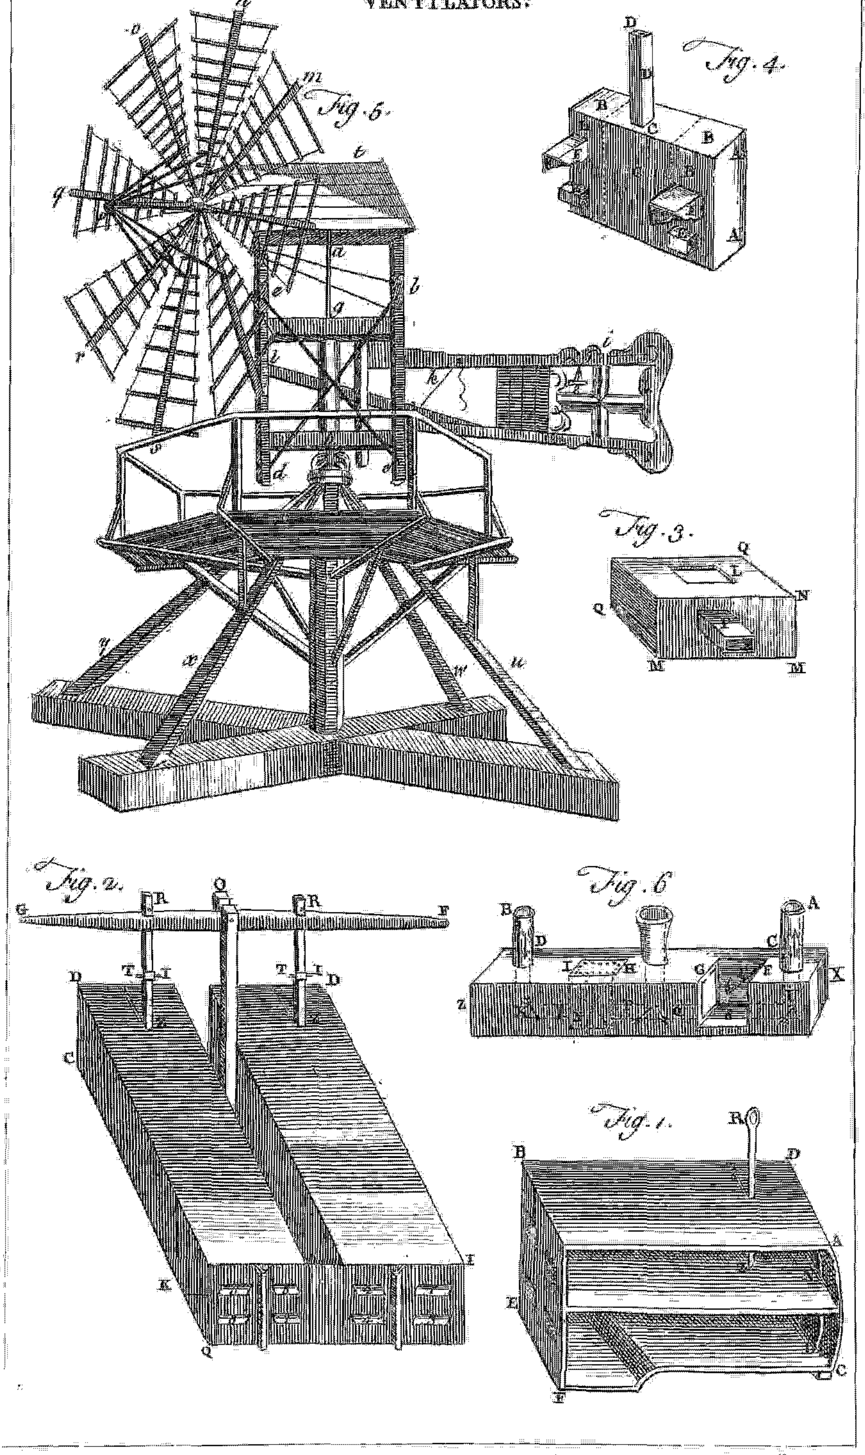
VENERY alſo denotes the act or exerciſe of hunting wild beaſts, which are alſo called beaſts of venery, and beaſts of the foreſt. See the article GAME.

VENESECTION, or PHLEBOTOMY, in ſurgery. See the article PHLEBOTOMY.

VENEZUELA, a province of Terra Firma, lying on the northern ocean, and having new Andaluſia on the eaſt, new Granada on the ſouth, and the river De la Hacha on the weſt.

VENICE, the capital of a republic in Italy, of the ſame name, is ſituated in the Lagunes, or ſmall iſlands, of the gulph of Venice, about five miles from the continent: eaſt longit. 13°, and north lat. 45° 40'.

VENTILATORS.



J. Jefferys sculp.

Venice is ſo happily ſituated, that no army can approach it by land; the avenues to thoſe iſlands being ſo exceeding difficult, that they have not thought it neceſſary to incloſe the city with a wall.

Nothing can appear more beautiful than this city, as we approach it either from the continent or the ſea, with its numerous palaces and lofty towers: its circumference is about ſix miles, and its inhabitants are computed at two hundred thouſand.

VENIRE FACIAS, in law, is a judicial writ lying where two parties plead and come to iſſue; directed to the ſheriff, to cauſe twelve men, of the ſame neighbourhood, to meet, and try the ſame, and to ſay the truth upon the iſſue taken.

VENLO, a town of dutch Gelderland, ſituated on the river Maes, nine miles ſouth of Gelder.

VENOSA, a town of Italy, eighty miles eaſt of Naples.

VENT, VENT-HOLE, or SPIRACLE, a little aperture left in the tubes or pipes of fountains, to facilitate the air's eſcape; or, on occaſion, to give them air, as in froſty weather, *&c.* for want of which they are apt to burſt. See PIPE.

Vent is likewiſe applied to the covers of wind-furnaces, whereby the air enters, which ſerves them for bellows, and which are ſtopped with regiſters or ſluices, according to the degree of heat required, as in the furnaces of glaſs-houſes, aſſayers, *&c.*

VENTA DE CRUZ, a town of Terra Firma, forty miles ſouth of Porto Bello.

VENTER, BELLY, in anatomy, a cavity in the body of an animal, containing viſcera, or other organs neceſſary for the performance of divers functions.

Phyſicians divide the human body into three venters, regions, or cavities; the firſt, the head, containing the brain, *&c.* See the article SKULL, *&c.*

The ſecond, the breaſt, or thorax, as far as the diaphragm, containing the organs of reſpiration. See THORAX.

The third, which is what we call the venter, or belly, is that wherein the inteſtines and organs of generation and digeſtion are contained; called, by anatomiſts, the abdomen. See ABDOMEN.

VENTER is alſo uſed in ſpeaking of a partition of the effects of a father and mother, among children born, or accruing from different marriages.

VENTER is alſo uſed for the children whereof a woman is delivered at one pregnancy: thus, two twins are ſaid to be of the ſame venter.

VENTER, or BELLY *of a muſcle*, is the fleſhy or belly-part thereof, as contradiſtinguiſhed from the two tendons, its extremes, one whereof is called the head, and the other the tail, of the muſcle. See the article MUSCLE.

VENTER DRACONIS, DRAGON'S BELLY, in aſtronomy, denotes the middle of a planet's orbit, or that part moſt remote from the nodes, *i. e.* from the dragon's head and tail; being the part which has the greateſt latitude, or is at the greateſt diſtance from the ecliptic.

VENTIDUCTS, in building, are ſpiracles or ſubterraneous places, where freſh, cool wind being kept, they are made to communicate, by means of tubes, funnels, or vaults, with the chambers or other apartments of a houſe, to cool them in ſultry weather.

VENTILATOR, a machine by which the noxious air of any cloſe place, as an hoſpital, goal, ſhip, chamber, *&c.* may be changed for freſh air. The noxious qualities of bad air have been long known, though not ſufficiently attended to, in practice; but it is to be hoped, that the indefatigable pains taken by Dr. Hales, to ſet the miſchiefs ariſing from foul air in a juſt light, and the remedy he has propoſed by the uſe of his ventilators, will at length prevail over that unaccountable ſloth or obſtinacy, which, where particular intereſts are not concerned, ſeems to poſſeſs the generality of mankind, and which rarely allows them to give due attention to any new diſcovery. The ventilators invented by that ingenious gentleman, conſiſt of a ſquare box, ABCD (plate CCXCIV. fig. 1.) about ten feet long, five wide, and two deep; in the middle of which is placed a broad partition, or midriff, made to move up and down, from A to C, on hinges at the end E, by means of an iron-rod ZR, fixed to the midriff at Z. Another box, of the ſame ſize with the former, having a like midriff, bar, *&c.* is placed near the former, *ibid.* fig. 2. with its rod RZ. Both theſe rods are fixed to a lever FG, moveable on the center O; ſo that by the alternate riſing and depreſſing of the lever FG, the midriffs are alſo raiſed and depreſſed alternately, by which means theſe double bellows are at the ſame time both drawing and pouring out the air. That the midriffs may be rendered lighter, they may be made of four bars lengthwiſe,

and as many placed croſs them, each about three inches broad, and an inch thick, the vacant ſpaces being filled up with thin pannels of fir-board. In order to make the midriffs move with greater eaſe, and without touching the ſides of the boxes, there is an iron-regulator NL, fig. 1. fixed upright to the middle of the end AC of the box. As very little air will eſcape if the edges of the midriff be within one twentieth part of an inch from the ſides of the box, there is no neceſſity for leathern ſides, as in common bellows. The end AC of the box muſt be ſomewhat circular, that it may be the better adapted to the riſing and falling of the midriff; and at the other end of the midriff a ſlip of leather may be nailed over the hinges.

To the ventilators above deſcribed, eight valves are adapted for the air to paſs through; theſe valves are placed at the hinge-end BQ, fig. 2. numbered 1, 2, 3, 4, &c. The valve 1 opens inward, to admit the air to enter, when the midriff is depreſſed at the other end, by means of the lever FG; and at the ſame time the valve 3, in the lower ventilator, is ſhut by the compreſſed air, which paſſes out at the valve 4: but when that midriff is raiſed, the valve 1 ſhuts, and the air paſſes out at the valve 2. The ſame is to be obſerved of the valves 5, 6, 7, 8, of the other box; ſo that when by the motion of the lever FG, the midriffs are alternately riſing and falling, then two of the ventilators are conſtantly drawing in the air, and two of them at the ſame time are blowing it out at their proper valves, the air entering at the valves 1, 3, 6, 8, and paſſing out at the valves 2, 4, 5, 7. To the ventilators, before the valves, is fixed a box QQMM, fig. 3. as a common receptacle for all the air that comes out of theſe valves, which air is conveyed away through the trunk P, paſſing through the wall of a building, &c.

From the foregoing explanation, the nature of ventilators may be eaſily underſtood, and therefore we ſhall be briefer in the following deſcription of thoſe lately erected in Newgate, for exhauſting that priſon of its foul air. In this priſon then there are ſeven ventilators, each nine feet long, and four feet and a half wide; two pair of which are laid on each other: theſe ventilators are worked by means of a wind-mill. The valves of the ventilators open into a large wooden box AB, fig. 4. which is faſtened to the ventilators by the hooks AA: this box is divided into three ſpaces; the middle, or largeſt, CC, receives all the foul air diſcharged by the ventilators, whence it paſſes through a trunk DD, ſixteen inches wide, through the leads into the open air. The outer ſpaces BBBB, receive the foul air through the trunks FF, from the ſeveral wards, from whence it is conveyed into the ventilators, through thoſe valves which open inward, and then diſcharged by the other valves of the ventilators, into the middle partition of the box, and from thence conveyed, by the pipe DD, into the open air. Theſe ventilators are fixed in an upper room of Newgate, in order to be near the leads, where the wind-mill, which works them, is erected; and from each of the outer noſtrils FF, there are trunks, with ſliding ſhutters, paſſing into the ſeveral wards; ſo that by opening theſe trunks, any of the wards may be ventilated, either ſingly, or ſeveral at a time. That the midriffs may not be ſpoiled for want of air, when all the trunks are ſhut, there are two holes cut in the outer noſtrils, at EE, which are covered with boxes twenty inches long, and fourteen wide. In the bottom of each of theſe boxes is a large moveable valve, of ſuch a weight as not to open but when all the other paſſages for the air are ſtopped: by means of theſe valves the ventilators are ſupplied with air, when all the trunks, going into the ſeveral wards, are cloſed, and the midriffs are not in danger of breaking for want of it.

The wind-mill, fig. 5. erected for working the ventilators, is deſigned to move with a ſmall degree of wind, that the ventilators may be the oftener worked. The mill-poſt is fixed on four croſs-trees, and ſupported by the braces *uwxy*. This poſt is hollow, that the iron-rod *a*, may paſs through, the lower end of it being fixed to the lever of the ventilators. The upper end of this rod goes to the iron-axle-tree, which has a crank ſix inches long, and therefore gives a ſtroke of thirteen inches; and the other end being fixed to the lever, at a proper diſtance from the center of its motion, raiſes the midriffs fifteen inches. The iron-axle-tree extends about two feet beyond the face of the ſails, from the extremity of which, *p*, eight iron-braces go to the vanes *m*, *n*, *o*, *p*, *q*, *r*, *s*, &c. The frame turns on the poſt, on friction-wheels, ſo that the

ſails

ſails always face the wind, by means of the vane *i*; *l* is the break-pole, which, by pulling the rope *k*, ſtops the mill: *b*, *d*, *c*, *e*, are iron-braces, faſtened at each end with iron-bolts, to keep the frame from wracking. See WIND-MILL.

Fig. 6. repreſents an inſtrument invented for going with ſafety into damps, and other noxious air. XZ repreſents a ſquare piece of elder, or willow, a foot long, and two inches both in breadth and depth, with a hole, KLQU, five eighths of an inch diameter, bored through it; and, at CD, ſhort foſſets, with like holes bored through them; to which foſſets hollow reed-canes are to be fixed by means of ſhort ſupple leathern pipes, ſo as to be flexible at theſe joints. N, T, S, are ſquare holes, two inches deep, and an inch and three quarters wide, with their leathern covers FG, HI, nailed over them. IN is a broad leathern valve, moving on joints at I, ſo as to open, by the force of the air, which paſſes down the pipe BKL, when the breath is drawn in at the mouth at the middle foſſet, which ſtands five eighths of an inch above GH. GS is another like valve, which ſhuts the hole, at Q, cloſe, while the breath is drawing in, through the middle foſſet; but when, on the contrary, the perſon breathes out through the middle foſſet, the valve IN cloſes the hole L, and the other valve GS opens for the breath to paſs freely off through the pipe UA; by which means the perſon always draws in freſh air. There are two ſtiff wires as T, fixed to prevent the valves opening too far, leſt the force of the breath, which is but ſmall, ſhould not ſhut them. This inſtrument is to be fixed to the mouth by a tape, or cord, tied round the head; and it will be convenient to have cuſhions at the corners C and D, for the cheeks to bear off a part of the preſſure. By the help of this inſtrument a perſon may go into a ſuffocating air, as in ſome mines, *&c.* his noſtrils being ſtopped with cotton, without any danger of ſuffocation.

VENTIMIGLIA, a port-town of Italy, belonging to the Genoeſe, ſituated on the Mediterranean, 100 miles ſouth-weſt of Genoa: eaſt lon. 7° 30′, north lat. 43° 45′.

VENTRICLE, *ventriculus*, properly denotes any little cavity; but is more particularly uſed, by phyſicians and anatomiſts, for the ſtomach. See STOMACH.

For thoſe cavities of the heart and brain, called ventricles, ſee HEART and BRAIN.

VENTRILOQUOUS, an appellation given to the engaſtrimythi. See the article ENGASTRIMYTHI.

VENTURINE, or ADVENTURINE, is ſometimes uſed for the fineſt and ſlendereſt gold-wire uſed by embroiderers. See the article WIRE.

VENUS, in aſtronomy, one of the inferior planets, revolving round the ſun, in an orbit between that of mercury and the earth. See PLANET, ORBIT, *&c.*

According to Mr. Caſſini, the greateſt diſtance of venus from the earth is 38415, the mean diſtance 22000, and the leaſt diſtance 5585, ſemi-diameters of the earth. Her diſtance from the ſun is $\frac{723}{1000}$ of the earth's diſtance from the ſun. her excentricity 5; the inclination of her orbit 3° 23′; and her parallax 3′. See the articles DISTANCE, EXCENTRICITY, INCLINATION, and PARALLAX.

The ſemi-diameter of venus is to that of the earth as 10 to 19; her periodical courſe round the ſun is performed in 224 days, 17 hours; and her motion round her own axis in 23 hours. See the article DIAMETER and PERIOD.

Venus is eaſily diſtinguiſhed by her brightneſs and whiteneſs, which exceeds that of all the other planets, and which is ſo conſiderable, that in a duſky place ſhe projects a ſenſible ſhadow. She conſtantly attends the ſun, and never departs from him above 47°. When ſhe goes before the ſun, that is, riſes before him, ſhe is called phoſphorus, or lucifer, or the morning ſtar; and when ſhe follows him, that is, ſets after him, heſperus, or veſper, or the evening ſtar. See PHOSPHORUS, VESPER, *&c.*

The eye in venus will behold four planets above it, *viz.* our earth, mars, jupiter, and ſaturn; and one below it, which is mercury: and when our earth is in oppoſition to the ſun, it will appear then (in the night) to ſhine with a full orb, and be very bright. The moon will appear always to accompany the earth, and never to be ſeen from her above half a degree. Mercury will never appear to be above 38° diſtant from the ſun.

October 14, 1666, N. S. Caſſini obſerved ſeveral ſpots in the body of this planet, by whoſe motion he judged (though he was not certain) that ſhe moved either by a circulation, or a kind of libration round her axis, in about 23 hours. See the article LIBRATION.

A. D. 1672, and 1686, the ſame aſtronomer, with a teleſcope of 34 feet, believes he ſaw a ſatellite moving round this

planet, and diſtant from it about three fifths of venus's diameter. It had the ſame phaſes with venus, but was without any well defined form, and its diameter ſcarce exceeded one fourth of that of venus.

Dr. Gregory thinks it more than probable, that this was a ſatellite; and ſuppoſes the reaſon why it is not uſually ſeen, to be the unfitneſs of its ſurface to reflect the rays of the ſun's light; as is the caſe of the ſpots in the moon, of which, if the whole diſc of the moon were compoſed, he thinks that the planet could not be ſeen in venus.

Venus, when viewed through a teleſcope, is rarely ſeen to ſhine with a full face, but has phaſes juſt like thoſe of the moon, being now gibbous, now horned, *&c.* and her illumined part conſtantly turned towards the ſun, *i. e.* looks towards the eaſt, when phoſphorus, and towards the weſt, when heſperus. See PHASES.

M. De la Hire, in 1700, through a teleſcope of 16 feet, diſcovered mountains in venus, which he found to be larger than thoſe in the moon, See MOON.

Sometimes ſhe is ſeen in the diſc of the ſun, in form of a dark round ſpot. See the article TRANSIT.

The phænomena of venus evidently ſhew the falſity of the ptolemaic ſyſtem, for that ſyſtem ſuppoſes that venus's orb incloſes the earth. See COPERNICAN SYSTEM.

VENUS, in chemiſtry, the ſame with copper. See the article COPPER.

VERA, a port-town of Spain, in the province of Granada, forty-four miles ſouth-weſt of Carthagena.

VERA CRUZ, a port-town of Mexico, with a ſtrong and commodious harbour, ſituated on the gulph of Mexico, in weſt lon. 100°, north lat. 18° 30′.

VERA PAZ, or COBAN, the capital of a province of the ſame name, in Mexico: weſt long. 93°′, and north lat. 15° 6′.

VERAGUA, a province of Mexico, ſituated on the South ſea, weſtward of the gulph of Panama.

VERATRUM, the WHITE-HELLEBORE, in botany, a genus of the *polygamia-monoecia*, claſs of plants, the hermaphrodite corolla whereof conſiſts of ſix oblong, lanceolated, ſerrated petals; the male corolla is divided into ſix parts; the fruit conſiſts of three oblong, erect, compreſſed capſules, made up of one valve, and containing only one cell; the ſeeds are numerous, compreſſed, and truncated, and more obtuſe upon one extremity. For the virtues of this plant, ſee the article *White* HELLEBORE.

VERB, in grammar, a word ſerving to expreſs what we affirm of any ſubject, or attribute to it; or, according to others, it is a word principally uſed to ſignify the affirmation, and ſhews that the diſcourſe, wherein it is uſed, is that of a man, who not only has a conception of things, but judges or affirms ſomething of them: though it is principally uſed in this ſenſe, yet it is made uſe of alſo to ſignify other motions of the ſoul, as to deſire, to pray, to command; but this it only does by changing the mood or inflexion. The verb, in its primary ſignification, ſhould have no other uſe, but to mark the connexion which we make in the mind, between the two terms of a propoſition: but the *eſſe, to be*, is the only one that has retained this ſimplicity; nor, in ſtrictneſs, has this retained it, but in the third perſon, as *eſt, is*. Men being naturally inclined to ſhorten their expreſſions, to the affirmation they have almoſt always added other ſignifications, in the ſame word, ſo as that two words make a propoſition; as in *Petrus vivit, Peter lives*; where *vivit* includes both the attribute and affirmation; it being the ſame thing to ſay, *Peter lives*, as that *Peter is living*; and hence the great variety of verbs in every language. To conſider ſimply what is eſſential to a verb, the only true definition is, a word ſignifying an affirmation; but if we ſhould chuſe to add its principal accidents, it may be defined thus; a word which ſignifies affirmation, with the deſignation of perſon, number, and time.

Verbs are variouſly divided: with reſpect to the ſubject, they are divided into active, paſſive, neuter, *&c.* with reſpect to their inflexions, into regular, irregular, perſonal, imperſonal, auxiliary, ſubſtantive, *&c.* A verb active is a verb which expreſſes an action that falls on another ſubject or object; ſuch are *I love, I work, &c.* which ſignify the action of loving, working, *&c.* of theſe there are three kinds; the one called tranſitive, where the action paſſes to a ſubject different from the agent; reflected, where the action returns upon the agent; and reciprocal, where the action returns mutually upon the two agents that produced it. A verb paſſive is that which expreſſes a paſſion, or which receives the action of ſome agent; and which is conjugated in the modern tongues, with the auxiliary verb *I am*,

je fuis. A verb neuter, is that which ſignifies an action that has no particular object whereon to fall, but which of itſelf takes up the whole idea of the action, as *I ſleep, thou yawneſt, he ſnores, we walk, you run, they ſtand:* the Latins called them neuters, becauſe they are neither active, nor paſſive, though they have the force and ſignification of both. Of theſe verbs ſome form their tenſes by the auxiliary verb *to have*, as *I have ſlept, you have run*; and they are called neuter actives. There are others which form their compound parts by the auxiliary *to be*, as *I am come*; theſe are called neuters paſſive. A verb ſubſtantive is that which expreſſes the being or exiſtence of a thing, as *I am, thou art*. Auxiliary or helping verbs, are thoſe which ſerve in conjugating active and paſſive verbs, ſuch are *I am, I have, &c.* Verbs in engliſh, and moſt modern tongues, do not change their terminations, as in latin, to expreſs the ſeveral times, modes, *&c.* but they make uſe of auxiliaries, as *have, am, be, do, will, ſhall, &c.* Regular verbs are thoſe which are conjugated after ſome one manner, rule, or analogy. Irregular or anomalous verbs, are ſuch as have ſomething ſingular in the terminations or formations of their tenſes. Verbs impersonal are thoſe which have only the third perſon, as *it behoves, &c.* See IMPERSONAL, *&c.*

VERBAL, ſomething that belongs to verbs, or even to words of any kind ſpoken with the mouth. See VERB and WORD.

Thus, verbal nouns, among grammarians, are thoſe formed of verbs. See the article NOUN.

Again, a verbal contract is one made merely by word of mouth in oppoſition to that made in writing. See the articles CONTRACT and DEED.

VERBASCUM, MULLEIN, in botany, a genus of the *pentandria-monogynia* claſs of plants, the flower of which is monopetalous, with a ſhort cylindraceous tube, and a quinquepartite and rotated limb: the fruit is a roundiſh and bilocular capſule, containing numerous angulated ſeeds.

Mullein-leaves are recommended as emollient, and eſteemed, by the Italians, in conſumptions: its flowers have an agreeable honey-like ſweetneſs; and an extract prepared from them, by rectified ſpirit of wine, taſtes extremely pleaſant.

VERBENA, VERVAIN, in botany, a genus of the *diandria-monoecia* claſs of plants, with a monopetalous flower, ſemiquinquifid at the limb; the ſeeds are two or four, and contained in the cup.

Vervain is quite diſregarded in the preſent practice, as appearing almoſt ſimply herbaceous.

VERBERATION, *ſmiting*, in phyſics, a term uſed to expreſs the cauſe of ſound, which ariſes from a verberation of the air, when ſtruck in divers manners by the ſeveral parts of the ſonorous body firſt put into a vibratory motion.

VERBESINA, in botany, a genus of the *ſyngeneſia-polygamia-ſuperflua* claſs of plants, with a radiated flower, made up of hermaphrodite tubuloſe ones on the diſc, and a few ligulated ones on the verge; the ſeeds are angulated, and contained in the cup.

VERCELLI, a city of Piedmont, in Italy, forty-five miles north-eaſt of Turin.

VERD, or CAPE-VERD, a promontory of Africa, forty miles north-weſt of the mouth of the river Gambia: weſt long. 18°, north lat. 15°.

There are a number of iſlands in the Atlantic ocean, called Cape-Verd-iſlands, from their being ſituated off this cape.

VERDEGREASE, or VERDEGRIS, a kind of ruſt of copper, much uſed by painters as a green colour.

Verdegreaſe is properly no other than copper, diſſolved by a mild acid into the form of an ærugo, or ruſt. After preſſing the grapes for wine, the huſks, ſtones, and other refuſe are laid to be dried in the ſun; they are then moiſtened with the ſtrongeſt wine that can be had, and laid together in veſſels till they begin to ferment; after nine or ten days the matter is preſſed, and worked into balls between the hands, and laid in an orderly manner over the bottom of an earthen veſſel, and as much wine is laid over them as will cover them half way up. The veſſels are then covered with a looſe lid, and ſet in a cellar where the balls are left in the wine about fifteen hours, a perſon turning them four or five times in that ſpace, in order to make the wine ſoak perfectly through them; after this, ſome wooden bars are placed acroſs the veſſel, about half an inch above the ſurface of the wine, and the balls are laid out of the wine upon theſe; the veſſels are then ſhut up, and the whole left in this ſtate for ten days or more: at the end of this time the balls emit a very penetrating ſcent, and are fit for diſſolving copper. They are now to be broke to pieces, and the outſide mixed with

with the internal part, which is moiſter; they are then laid with thin plates of copper, ſtratum ſuper ſtratum, in the ſame veſſels upon the bars, and the whole is left for a week or a fortnight, at the end of which time the plates are found covered with verdegreaſe, which is not taken off immediately: but they are wrapped up in cloths wetted with wine, and laid by a week or more, and then the ærugo or verdegreaſe is taken off for uſe.

This ruſt of copper is rarely uſed internally, nor ought it, unleſs in the moſt deſperate caſes, where an inſtantaneous vomiting is neceſſary. Externally it is much uſed as a detergent or deſiccative: it eats off fungous fleſh in ulcers, and, mixed with honey, is uſed in aphthæ and ulcerations of the mouth. It is the baſis of what is called the egyptian ointment, and of many other compoſitions in the ſame intention. There is a preparation of this ærugo of copper, in ſome uſe at preſent both in medicine and in painting, which ought not to be omitted here: it is called, though very imperfectly, diſtilled verdegreaſe; it is a cryſtallization of verdegreaſe, prepared thus: bruiſe to a coarſe powder ſome fine green verdegreaſe, pour on it diſtilled vinegar; to the remainder continue to do this, till the liquor will no longer extract any colour from the maſs. Evaporate or diſtil theſe liquors, all mixed together, till a pellicle covers the ſurface, then ſet it in a cellar, and it will ſhoot into fine green cryſtals. Evaporate the remainder of the liquor, and ſet it to ſhoot again till no more will be produced. Theſe are the cryſtals of verdegreaſe, improperly called diſtilled verdegreaſe. They are better than the crude ſubſtance, for eating away proud fleſh. A ſolution of them in common water is an excellent detergent for old ulcers; and they are uſed in common eye-waters, to clear away ſpecks and films. Theſe cryſtals, diſtilled in a retort, afford, after an uſeleſs phlegm is come over, a noble acid, the richeſt that can be procured from vinegar. It is, by the chemical writers, called acetum eturiens; it is greatly celebrated for its virtues as a menſtruum, and worthy great praiſe, though not equal to all that is ſaid of it.

VERDERER, or VERDEROR, a judicial officer of the king's foreſt, whoſe buſineſs it is to look to the vert, and ſee it well maintained. See the article VERT.

VERDICT, is the anſwer of the jury given to the court, concerning the matter of fact, in any caſe civil or criminal, committed by the court to their trial and examination. See the article JURY.

A verdict is either general or ſpecial. A general verdict is that which is brought into the court in like general terms as the general iſſue, as, in an action of diſſeiſin, the defendant pleads no wrong, no diſſeiſin. Then the iſſue is general, whether the fact be wrong or not, which being committed to the jury, they, upon conſideration of the evidence, come in and ſay, either for the plaintiff, that it is a wrong diſſeiſin; or for the defendant, that it is no wrong diſſeiſin.

A ſpecial verdict, is, when they ſay at large, that ſuch and ſuch a thing they found to be done by the defendant or tenant; declaring the courſe of the fact, as in their opinion it is proved; and praying the judgment of the court, as to what is law in that caſe.

It is ſaid, that a jury may give a general or ſpecial verdict, in all actions and caſes; and that the court is obliged to receive it, provided it be pertinent to the point in iſſue: alſo if the jury will take upon them to bring in any thing that is matter of law, their verdict ſhall be received.

Verdicts are alſo public and private; public, when the ſame are given in open court; and private, when given out of court, before any of the judges: but a private verdict, in ſtrictneſs, is looked upon to be no verdict.

VERDITER, or VERDETER, a kind of mineral ſubſtance, ſometimes uſed by the painters, &c. for a blue; but more uſually mixed with a yellow for a green colour.

Verditer, according to Savary, ought to be made of the lapis armenus; or at leaſt of an earthy ſubſtance much like it, brought from the mountains of Hungary, &c. only prepared by powdering it, and cleanſing it by lotion.

But this ſtone being very rare, the verditer commonly uſed is not a native, but a factitious, ſubſtance; which ſome ſay is prepared by caſting wine or water upon new copper, as it comes red-hot out of the furnace, and catching the ſteams that riſe from it upon copper-plates: others again ſay, it is prepared by diſſolving copper plates in wine, much after the manner of verdegreaſe.

But the method of making it in England is as follows:

The refiners pour their copper-water into

an

an hundred pound weight of whiting, ſtirring them well together every day for ſome hours, till the water grows pale; then they pour that off, and ſet it by for further uſe, and pour on more of the green water, repeating this till the verditer is made; which they then take out, and lay on large pieces of chalk in the ſun to dry.

The water which is poured off from the verditer, (which remains at the bottom of the tub) is put into a copper, and boiled till it comes to the conſiſtence of water-gruel; now, conſiſting principally of ſalt-petre reduced, moſt of the ſpirit of vitriol being gone with the copper into the verditer; and a diſh full of this being put into the other materials for aqua-fortis, is re-diſtilled, and makes what they call a double water, which is near twice as good as that made without it.

VERDOY, in heraldry, denotes a bordure of a coat of arms, charged with any kinds or parts of flowers, fruits, ſeeds, plants, *&c.*

VERDUN, a city of Lorrain, ſituated on the river Maes, forty miles north-weſt of Nancy.

VERGE, ſignifies the compaſs of the king's court, which bounds the juriſdiction of the lord ſteward of the houſhold; and which is thought to have been twelve miles round.

The term verge is alſo uſed for a ſtick or rod, whereby one is admitted tenant to a copyhold eſtate, by holding it in his hand, and ſwearing fealty to the lord of the manor.

VERGERS, certain officers of the courts of king's-bench and common-pleas, whoſe buſineſs it is to carry white wands before the judges.

There are alſo vergers of cathedrals, who carry a rod tipped with ſilver before the biſhop, dean, *&c.*

VERGETTE, in heraldry, denotes a pallet, or ſmall pale; and hence, a ſhield divided by ſuch pallets, is termed vergette. See the article PALE.

VERGILIÆ, in aſtronomy, a conſtellation the appearance of which denotes the approach of ſpring: it is the ſame with pleiades. See PLEIADES.

VERIFICATION, in general, is the act of proving a thing; but among the french, it only ſignifies the recording of the king's edicts by the parliament.

VERJUICE, a liquor obtained from grapes or apples, unfit for wine or cyder; or from ſweet ones, whilſt yet acid and unripe. Its chief uſe is in ſauces, ragouts, *&c.* though it is alſo an ingredient in ſome medicinal compoſitions, and is uſed by the wax-chandlers to purify their wax.

VERMICELLI, or VERMICHELLY, a compoſition of flour, cheeſe, yolks of eggs, ſugar, and ſaffron, reduced to a paſte, and formed into long ſlender pieces like worms, by forcing it with a piſton through a number of little holes.

It was firſt brought from Italy, where it is in great vogue: it is chiefly uſed in ſoups and pottages, to provoke venery, *&c.*

VERMICULAR, an epithet given to any thing that bears a relation or reſemblance to worms, vermiculi. See WORM.

Anatomiſts particularly apply it to the motion of the inteſtines and certain muſcles of the body.

The vermicular or periſtaltic motion of the inteſtines is performed by the contraction of the fibres thereof, from above downward; as the antiperiſtaltic motion is by their contraction from below upwards.

VERMIFORMIS, in anatomy, a term applied to various parts in the human body, bearing ſome reſemblance to worms. As ſome muſcles, proceſſes, *&c.*

Proceſſus, or *apophyſes* VERMIFORMES, two extremities of the cerebellum, ſituate near the fourth ventricle of the brain. See the article BRAIN.

VERMIFORMES *muſculi*, are the four muſcles in each hand and foot, which bring the fingers and toes towards the thumbs and great toes, called alſo lumbricales. See LUMBRICAL.

VERMILION, a very bright and beautiful red colour, in great eſteem among the antients, under the name of minium.

There are two kinds of it, the one natural, the other factitious. The natural is found in ſome ſilver mines, in the form of a ruddy ſand, which is afterwards prepared and purified by ſeveral lotions and coctions. The artificial is made of mineral cinnabar, ground up with aqua-vitæ and urine, and afterwards dried.

It is alſo made of lead burnt and waſhed, or of ceruſs prepared by fire: but this is not properly called vermilion, but minium, or red-lead. See MINIUM.

Yet this laſt, however, ſeems to be the real vermilion of the antients; and both apothecaries and painters ſtill give it the name, to enhance the price.

We have two kinds of vermilion from Holland, the one of a deep red, the other

other pale; but it is the ſame thing at the bottom. the only difference of colour proceeding from the cinnabar's being more or leſs ground: when the cinnabar is finely ground, the vermilion is pale; and this is preferred before that which is coarſer and redder.

It is of very great uſe with painters in oil and miniature; and among the ladies for a fucus, or paint, to heighten the complexion of ſuch as are too pale.

Some diſapprove of vermilion to be uſed in painting prints, unleſs it be prepared by waſhing, as is directed for minium; and then chiefly for dry painting, except it be by thoſe perſons who can uſe it moderately, and with judgment; for all heavy colours will drown the ſhades or ſtrokes of the engraver.

VERMIN, *vermina*, a collective name including all kinds of little animals, or inſects, which are hurtful or troubleſome to men, beaſts, fruits, *&c.* as worms, lice, fleas caterpillars, ants, flies, *&c.* See the articles WORM, *&c.*

VERMINATION, *verminatio*, the act of breeding worms, and other vermin; particularly bots, in cattle, *&c.*

VERMINATION, is ſometimes alſo uſed, among phyſicians, for a ſort of tormina ventris, or wringing of the guts, wherein the patient is affected, as if worms were gnawing his inteſtines. See GRIPES.

VERMIVOROUS ANIMALS, are ſuch as feed upon worms. See ANIMAL.

VERNACULAR, is applied to any thing that is peculiar to ſome one country.

VERNAL, ſomething belonging to the ſpring ſeaſon. See SPRING.

Hence vernal leaves, are thoſe leaves of plants which come up in the ſpring.

Vernal ſigns, are thoſe which the ſun is in during the ſpring ſeaſon, *viz.* aries, taurus, and gemini. Vernal equinox, is that which happens when the ſun is aſcending from the equator towards the north pole. See LEAF, *&c.*

VERNEVIL, a town of Normandy, forty-three miles ſouth of Rouen.

VERNIER, or NONIUS, among mathematicians, a ſcale of diviſions, ſerving to cut the diviſions of an arch into ſingle minutes.

VERNIX, in botany, the name whereby ſome writers call the rhus. See RHUS.

VERONA, a city of Italy, in the territories of Venice, capital of the Veroneſe, ſituated on the river Adige: eaſt long. 11° 15′, north lat. 45° 20′.

VERONICA, in botany, a genus of the *decandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal; the tube is nearly of the length of the cup; the limb is plain, and divided into four parts; the ſegments are oval, and the lower one is narrower than any of the reſt; the ſegment over-againſt it, is broader than any; the fruit is a capſule of a turbinated cordated figure, with a compreſſed apex, it is compoſed of four valves, and contains two cells, in each whereof are numerous roundiſh ſeeds.

Among the ſpecies of this genus, are the common ſpeedwell, the brooklime, and the wild germander. See the article SPEEDWELL, *&c.*

Theſe and ſeveral other ſpecies of this genus, are famous in medicine; the common ſpeedwell is a good antiſcorbutic, and has lately been celebrated in the gout and rheumatiſm. The water-brooklime is alſo one of the antiſcorbutics of the ſhops, and its juice is alſo made a part of the ſpring juices given againſt thoſe complaints.

VERSAILLES, a town of France, in the province of the iſle of France, ſituated eleven miles weſt of Paris, where ſtands one of the moſt elegant and magnificent palaces in the world, built by Lewis XIV.

VERSE, *verſus*, in poetry, a line or part of a diſcourſe, conſiſting of a number of long and ſhort ſyllables, which run with an agreeable cadence, the like being alſo reiterated in the courſe of the piece. See the article POEM.

This repetition, according to F. Boſſu, is neceſſary to diſtinguiſh the notion of verſe from that of proſe; for in proſe, as well as verſe, each period and member are parts of diſcourſe, conſiſting of a certain number of long and ſhort ſyllables; only proſe is continually diverſifying its meaſures and cadences, and verſe regularly repeating them. This repetition of the poets appears even in the manner of writing; for one verſe being finiſhed, they return to the beginning of another line, to write the verſe following, and it is to this return, that verſe owes its name. See the article PROSE.

To make verſe, it is not enough that the meaſures and quantities of ſyllables be obſerved, and ſix juſt feet put one after another in the ſame line. There are further required, certain agreeable cadences, particular tenſes, moods, regimens, and even ſometimes words unknown in proſe. But what is chiefly required, is an elevated, bold, figurative

manner of diction; this manner is a thing ſo peculiar to this kind of writing, that without it, the moſt exact arrangements of longs and ſhorts does not conſtitute verſe ſo much as a ſort of meaſured proſe. The greek and latin verſes conſiſt of a certain number of feet, diſpoſed in a certain order; and ſome have attempted to make french and engliſh verſes on the ſame foundation, but without ſucceſs. Voſſius is very ſevere on the modern verſe, and makes it altogether unfit for muſic. Our verſes, ſays he, run all as it were upon one foot, without diſtinction of members or parts, and without regard to the natural quantities of ſyllables. We have no rythmus at all, and we mind nothing but to have a certain number of ſyllables in a verſe of whatever nature, and in whatever order. Mr. Malcolm vindicates our verſe from this imputation. It is true, ſays he, we do not follow the metrical compoſition of the antients, yet we have ſuch a mixture of ſtrong and ſoft, long and ſhort, ſyllables, as make our verſes flow ſmooth or rumbling, ſlow or rapid, agreeable to the ſubject. Inſtances of all which we have in the following lines of Pope.

Theſe equal ſyllables alone require,
Tho' oft' the ear the open vowels tire,
While expletives their feeble aid do join,
And ten low words oft creep in one dull line.
Soft is the ſtrain when Zephyr gently blows,
And the ſmooth ſtream in ſmoother numbers flows;
But when loud billows laſh the ſounding ſhore,
The hoarſe rough verſe ſhould like the torrent roar;
When Ajax ſtrives ſome rock's vaſt weight to throw,
The line too labours, and the words move ſlow.
Not ſo when ſwift Camilla ſcours the plain,
Flies o'er th' unbending corn and ſkims along the main.

By making a ſmall change or tranſpoſition of a word in any of theſe verſes, any body who has an ear will find, that we make a great matter of the nature and order of the ſyllables. See NUMBERS.

Voſſius adds, that the antient odes were ſung as to the rhythmus, in the ſame manner as we ſcan them, every pes being a diſtinct bar, or meaſure ſeparated by a diſtinct pauſe, though in reading, that diſtinction was not accurately obſerved. Laſtly, he obſerves, that their odes had a regular return of the ſame kind of verſe, and the ſame quantity of ſyllables, in the ſame place of every verſe; whereas, in the modern odes, to follow the natural quantity of our ſyllables, every ſtanza would be a diſtinct ſong. See ODE.

Verſes are of various kinds, ſome denominated from the number of feet, whereof they are compoſed, as the monometer, dimeter, trimeter, tetrameter, pentameter, hexameter, *&c.* See the article HEXAMETER, *&c.*

Some alſo, from the kinds of feet uſed in them, as the pyrrhichion, proceleuſmatic, iambic, trochaic, *&c.* See the article PYRRHICHION, *&c.*

Sometimes verſes are denominated from the names of the inventors, or the authors who have uſed them with moſt ſucceſs, as the anacreontic, archilochian, aſclepia, alcaic, ſapphic, *&c.* See the articles ANACREONTIC, *&c.*

The moderns have invented heroic or alexandrine verſes; the antients likewiſe invented various kinds of poetical devices in verſe, as centos, echos, *&c.* See the article ALEXANDRINE, *&c.*

VERSE, is alſo uſed for a part of a chapter, ſection, or paragraph, ſubdivided into ſeveral little articles. The whole bible is divided into chapters, and the chapters are ſubdivided into verſes. The diviſion of verſes in the new teſtament was firſt made by one Robert Stephens, with which diviſion many learned men find great fault, and yet it is every where followed.

VERSED *ſine of an arch*, a ſegment of the diameter of a circle, lying between the foot of a right ſine, and the lower extremity of the arch. See SINE.

VERSIFICATION, the art or manner of making verſe; alſo the tune and cadence of verſe. See the article VERSE.

Verſification is properly applied to what the poet does more by labour, art and rule, than by invention, and the genius or furor poeticus. See POETRY, *&c.*

VERSION, a tranſlation of ſome book or writing, out of one language into another.

VERT, in heraldry, the term for a green colour. It is called vert in the blazon of the coats of all under the degree of nobles; but in coats of nobility, it is called emerald; and in thoſe of kings, venus. In engraving, it is expreſſed by diagonals, or lines drawn athwart from

right to left, from the dexter chief corner to the ſiniſter baſe, as repreſented in plate CCXC. fig. 4.

VERT, or GREEN HUE, in foreſt law, any thing that grows and bears a green leaf within the foreſt, that may cover a deer. This is divided into over-vert and nether-vert; over-vert is the great woods which in law books are uſually called hault bois; nether vert is the under woods, otherwiſe called ſub-bois. We ſometimes alſo meet with ſpecial vert, which denotes all trees growing in the king's woods within the foreſt; and thoſe which grow in other men's woods, if they be ſuch trees as bear fruit to feed the deer.

VERTEBRÆ, in anatomy, the twenty-four bones of which the ſpine conſiſts, and on which the ſeveral motions of the trunk of our bodies are performed. See SPINE.

Each of theſe vertebræ is compoſed of its body and proceſſes. The body is the thick, ſpungy, anterior part, which is convex before, concave backwards, horizontal and plain in moſt of them above and below; their anterior and poſterior ſurfaces having ſeveral holes made in their thin external plate, both for the firmer connexion of the ligaments, and for the paſſage of veſſels into their cellular ſubſtance. Between theſe bodies of each two adjoining vertebræ, a ſubſtance between the nature of ligament and cartilage is interpoſed; which is compoſed of concentrical curve fibres, the exterior of which are the moſt ſolid and hard, while thoſe in the centre are very ſoft and full of a glairy liquor; and therefore this ſubſtance was called by the antients ligamentum mucoſum. This is firmly fixed to the horizontal ſurfaces of the bodies of the vertebræ, and therefore not only allows theſe bones to recede from each other, and to be preſt cloſer together without breaking, but ſerves to connect them, in which it is aſſiſted by a ſtrong membranous ligament, which lines all their concave ſurface, and by ſtill a ſtronger ligament that covers all their anterior convex ſurface. It may be obſerved, as a general rule, notwithſtanding ſome exceptions, that the bodies of the vertebræ are ſmaller and more ſolid above, but as we reckon downwards, appear larger and more ſpungy, and that the cartilages between them are thick, and the ſurrounding ligaments ſtrong in proportion to the largeneſs of the vertebræ, and the quantity of motion they are to perform; by which diſpoſition the greater weight is ſupported on the broadeſt beſt ſecured baſe, and the middle of our body is allowed a large and ſecure motion, which is of conſiderable benefit. From each ſide of the body of each vertebra, a bony bridge is produced backwards and to a ſide; from the poſterior extremity of which, one ſlanting proceſs riſes, and another deſcends; the ſmooth, and what is generally the flatteſt ſide of each of theſe four proceſſes, which are called the oblique, is covered with a ſmooth cartilage, and the two inferior oblique proceſſes of each vertebra are fitted to, and articulated with, the two ſuperior or aſcending oblique proceſſes of the vertebra below. From between the ſuperior and inferior oblique proceſs of each ſide, the vertebra is ſtretched out laterally in form of a proceſs, that is univerſally named tranſverſe. From the poſterior roots of the two oblique, and of the tranſverſe proceſs of each ſide, a broad oblique bony plate is extended backwards; where theſe meet, the ſeventh and laſt proceſs of the vertebræ takes its riſe and ſtands out backwards; this being generally ſharp-pointed, and narrow-edged, has therefore been called ſpinal proceſs, from which this whole chain of bones has got the name ſpina. Beſides the common ligament which lines all the interior ſurface of theſe proceſſes as well as of the bodies, there are particular ligaments that connect the proceſſes of each two contiguous vertebræ. The ſubſtance of the proceſſes is conſiderably ſtronger and firmer than that of the bodies of the vertebræ, having a thicker external plate, and without ſo many large holes in it. The ſeven proceſſes conſidered conjunctly, as forming the poſterior ſhares of the vertebræ, are hollow at their anterior middle part; which concavity, joined with that at the poſterior part of the bodies, makes one great foramen, which anſwers to ſuch another in the vertebræ above and below; therefore the foramina of all the vertebræ taken together, form a long great conduit, which is widened or ſtraitened in proportion to the ſize of the medulla ſpinalis, which it contains. See MEDULLA.

In the lateral bridges, which join the bodies to the proceſſes of each vertebra, a ſemicircular notch is obſervable both above and below; which, exactly correſponding with others in the contiguous

ſiguous bones, when the vertebræ are joined, form a round hole in each ſide, between each two vertebræ, through which the nerves that proceed from the medulla ſpinalis and the blood veſſels paſs. The articulations then of theſe true vertebræ are plainly double; for their bodies are joined by ſynchondroſis, and their oblique proceſſes are articulated by the third ſort of ginglymus. Hence it is evident, that their centre of motion is altered in different poſitions of the trunk. For when we bow forwards the ſuperior moved part bears entirely on the bodies of the vertebræ; if we bend back, the oblique proceſſes ſupport the weight; if we recline to one ſide, we reſt upon the oblique proceſſes of that ſide and part of the bodies; if we ſtand erect, all the bodies and oblique proceſſes have their ſhare in our ſupport. See ARTICULATION.

There are in all twenty-four vertebræ: the neck conſiſts of ſeven; and in theſe, as in the others, we are to obſerve ſome things in general; and afterwards, other things in particular. The vertebræ of the neck are ſmaller than thoſe of the back; but they are of a firmer conſiſtence, and harder: their body is more compreſſed than in the others, and is ſinuated on the upper part, and convex below. Moſt of theſe vertebræ have nine apophyſes; the tranſverſe and poſterior ones, called the ſpinoſe apophyſes, are uſually bifurcated: the tranſverſe ones are perforated alſo, for the paſſage of the vertebral veſſels to the head. In the conſideration of the vertebræ of the neck ſingly, we are to obſerve, that the upper one has a peculiar name: it is called atlas. This wants the body and the ſpinoſe apophyſes, and approaches to the figure of a ring: its ſubſtance is more ſolid than that of any other, and it receives both above and below; but it is not received itſelf. The head is articulated at is interior part, and it is by means of this articulation that the head is bent, and extended. The proper foramen is greater in this than in any other vertebra, which ariſes from its wanting the body: the tranverſe proceſſes are alſo longer than in the others. It has alſo a peculiar ſemi-circular ligament, by which it embraces the dentiform proceſs of the ſucceeding vertebra. The ſecond vertebra is called epiſtrophæus, and axis; in which we are to obſerve the dentiform or odontoide proceſs, juſt mentioned; whereby it articulates in the manner of an hinge, with the firſt vertebra, and the rotatory motion of the head is performed by means of it. The third vertebra is alſo called axis by ſome, though it has nothing to warrant ſuch a name; for there is nothing particular to be obſerved in this, or any of the ſucceeding vertebræ of the neck, more than has been already taken notice of them in general. The dorſum, or back, has twelve vertebræ; of which we may remark in general, that they are of a middle ſize between thoſe of the neck, and thoſe of the loins: their ſpinoſe apophyſes are alſo very long, and, except in the two laſt, very much inclinated: the cartilages between the bodies of theſe, are ſmaller than thoſe of the neck: the two tranſverſe apophyſes are thick, and have a depreſſion in them for the articulation with the ribs. The firſt vertebra of the back is called the axillary, or eminent vertebra; and to it is joined the upper rib. See RIBS.

The vertebræ of the loins are five; of which we may obſerve in general, that their bodies, and alſo the intervening cartilages, are very thick; the tranſverſe apophyſes very long, but ſmaller than thoſe of the back; the ſpinoſe apophyſes are thick, ſtraight, and ſet farther aſunder than in the others, to give way to a laxer motion in this part.

Some have given particular names to the vertebræ of the back and loins; but this is not neceſſary, as they are ſufficiently diſtinguiſhed by numbering them. For the luxations, fractures, and other injuries of the vertebræ, ſee the articles SPINE, RIBS, LUXATION, &c.

VERTEX, in anatomy, denotes the crown of the head, or the uppermoſt part ſituated between the ſinciput and occiput. See the article HEAD.

Hence vertex is alſo uſed, figuratively, for the top of other things: thus, the vertex of a cone, pyramid, &c. is the top of any one of theſe figures. See CONE, &c.

The vertex of an angle is the angular point; and thoſe angles, which, being oppoſite to one another, do touch only in the angular point, are called vertical angles: ſuch are the angles A B C and D B E (plate CCXC. fig. 5.) wherein the ſides A B and C B of one of them are only continuations of the legs of the other, B E and B D; and ſuch angles are demonſtrated to be equal.

The vertex of any plane figure, is the

angle oppoſite to the baſe; and the vertex of a curve, is the point from which the diameter is drawn, or the interſection of the diameter and curve.

VERTEX *of a glaſs*, in optics, the ſame with the pole thereof.

VERTEX, is alſo uſed, in aſtronomy, for the point of heaven perpendicularly over our heads, properly called the zenith. See ZENITH.

Path of the VERTEX, the circle deſcribed by the vertical point during one revolution of the earth about its axis.

VERTICAL CIRCLE, in aſtronomy, a great circle of the ſphere paſſing through the zenith and nadir, and cutting the horizon at right angles: it is otherwiſe called azimuth. See AZIMUTH.

Prime VERTICAL, is that vertical circle or azimuth which paſſes throug the poles of the meridian; or which is perpendicular to the meridian, and paſſes through the equinoctial points. See AZIMUTH.

VERTICAL *of the ſun*, is the vertical which paſſes through the center of the ſun at any moment of time.

VERTICAL PLANE, in perſpective, is a plane perpendicular to the geometrical plane, paſſing through the eye, and cutting the perſpective plane at right angles.

VERTICAL PLANE, in conics, is a plane paſſing through the vertex of the cone, and parallel to any conic ſection. See PLANE.

VERTICAL LINE, in conics, is a right line drawn on the vertical plane, and paſſing through the vertex of the cones. See LINE.

VERTICAL DIAL, is a ſun-dial drawn on the plane of a vertical circle, or perpendicular to the horizon. See DIAL.

VERTICAL POINT, in aſtronomy, the ſame with vertex or zenith.

VERTICILLATE PLANTS, are ſuch as have their flowers intermixed with ſmall leaves growing in a kind of whirls about the joints of a ſtalk; as penny-royal, hore-hound, *&c.* See PLANT.

The peculiar characteriſtic of this genus of plants, according to Mr. Ray, is, that their leaves grow in pairs, one juſt againſt another, on the ſtalk; the flower is monopetalous, but uſually grows down with a kind of lip, or turning, ſomething like the form of a helmet; there are four ſeeds after each flower, to which the perianthium of the flower ſerves inſtead of a capſula ſeminalis.

VERTICITY, is that property of the loadſtone, whereby it turns, or directs itſelf to ſome peculiar point. See MAGNET.

VERTIGO, in medicine, a diſeaſe in which the head ſeems to turn round.

This, according to Dr. Willis, is a diſorder in which viſible objects ſeem continually to turn round, whilſt the patients are affected with a perturbation or confuſion of the animal ſpirits in the brain, which hinders their influx into the nerves. Hence it is, that the viſive and locomotive faculties often fail to ſuch a degree, that the patient is ready to drop down, and complains of darkneſs. Etmuller divides it into three kinds; the firſt of which is a ſimple vertigo, in which there is only a tranſient and ſhort-continued gyration of objects. The ſecond is a dark vertigo, or ſcotomia, when the eyes are darkened, or ſo affected, as if ſeveral colours were before them. And the third is the vertigo caduca, in which the patient preſently falls down.

A vertigo may be produced by every cauſe which can diſtend, preſs, or contract the arteries; ſuch as ſudden fear, ſurprize, ebriety, and voracity, by which the regular influx and reflux of the animal ſpirits into the optic nerves and retina are prevented. Sometimes, alſo, it may be produced by an acid, or any peccant humour, lodged in the ſtomach, and vellicating its nerves, which communicate with the retina; for which reaſon the hypochondriac and hyſteric paſſions may produce a vertigo.

With reſpect to the cure, the regimen in general, ought to be the ſame with that in the apoplexy or epilepſy. If the patient is plethoric, a due quantity of blood is to be taken away; and if a naufea, loſs of appetite, or any other diſorder of the ſtomach remain, an emetic is to be preſcribed; then cathartics and ſpecifics are to be ordered. According to Mayerne, calamus aromaticus, in whatever form, is good for a vertigo, and eſteemed a ſecret for that diſorder. The ſame author informs us, that a german phyſician cured a great many of vertigoes, by pills made of ſugar of lead and cypreſs-turpentine; four or five grains of which were to be taken for a doſe, and their uſe perſiſted in for ſome days. Gliſſon, as Bates informs us, after all other medicines had failed, was cured of a ſevere vertigo, of three weeks continuance, by ſhaving his head, and applying to it a plaiſter of the flowers of ſulphur and whites of eggs. Some order a cauſtic, or a ſeton, to be applied to the back part of the neck;

neck; a cautery to the bregma, and Bates's epileptic electuary, or Fuller's peruvian epileptic electuary, to be uſed internally.

Willis informs us, that after he had in vain tried all other medicines, he, with ſucceſs, preſcribed the following powder: Take of the powder of the roots of male piony, two ounces; of the flowers of male piony, one ounce; of peacocks dung, of the whiteſt kind, half a pound; and of white ſugar, two ounces: reduce to a powder, the doſe of which is to be about the quantity of a ſpoonful twice a day, drinking after it a draught of a decoction of ſage and roſemary, impregnated with coffee.

Heiſter orders camphorated ſpirit of wine alone, or mixed with ſpirit of hartſhorn, to be applied to the top of the head and temples. And when the diſorder proceeds from crudities in the ſtomach, he adviſes to prepare and diſſolve them by neutral ſalts, that they may be afterwards evacuated by an emetic, or purge. After this, the patient ſhould uſe ſtomachics and cephalics; as alſo a moderate quantity of wine at meals, which ſhould be ſparing. Pyrmont-water is alſo ſaid to be excellent in this caſe.

VERVAIN, *verbena*, in botany. See the article VERBENA.

VERUE, a town of Piedmont, ſituated on the river Po, twenty miles north-eaſt of Turin.

VERU-MONTANUM, in anatomy, a kind of little valve, in the place wherein the ejaculatory ducts enter the urethra.

Its uſe is to prevent the urine, in paſſing the urethra, from getting in at theſe ducts, and ſo mixing with the ſemen.

VERY LORD, and VERY TENANT, are thoſe that are immediate lord and tenant to one another. See LORD.

VESICA, in anatomy, a bladder, a membranous or ſkinny part in which any humour is contained. See BLADDER.

VESICARIA, in botany, is comprehended under the alyſſum of Linnæus. See the article ALYSSON.

VESICATORY, *veſicatorium*, an external medicine, ſerving to raiſe a bliſter; whence, alſo, it is itſelf, though improperly, called a bliſter.

Veſicatories are unguents, cataplaſms, or plaſters, made of ſharp irritating medicines, which have a faculty of drawing the humors from within, outwards, inflaming and ulcerating the ſkin, and raiſing veſicæ or bladders, whence their denomination veſicatory.

We have veſicatories made of cantharides, euphorbium, figs, ſublimate of mercury, lapis infernalis, muſtard, anacardium, ſquills, briony, vinegar, pepper, leaven, *&c.* which are incorporated and made up with honey, gums, reſins, *&c.* to bring them to the conſiſtence required.

VESICULA, VESICLE, a diminutive of veſica, ſignifying a little bladder.

The lungs conſiſt of veſiculæ, or lobules of veſiculæ, admitting air from the bronchia; and not only air, but alſo duſt, *&c.* There are ſeveral other parts in the body which bear this appellation; as the veſicula fellis, or gall-bladder, veſiculæ ſeminales, *&c.* See GALL, *&c.*

VESPA, the WASP, in zoology. See WASP.

VESPER, or HESPER, in aſtronomy. See the article HESPER.

VESPERS, in the church of Rome, denote the afternoon ſervice, anſwering, in ſome meaſure, to the evening prayers of the church of England. See PRAYER and SERVICE.

VESPERTILIO, the BAT, in zoology, a genus of quadrupeds, of the order of the feræ, the characters of which are theſe: the fore-teeth of the upper jaw are ſix in number, acute, and diſtant from each other; the fore-teeth of the lower jaw are alſo ſix, and acute, but contiguous: the the canine teeth are two both above and below, on each ſide: the feet have each five toes; and the fore-feet have the toes connected by a membrane, and expanded into a ſort of wings, whereby it flies; whence this animal has been generally, but with the utmoſt impropriety, ranged among the birds.

The common bat is about the bigneſs of a mouſe, and very much reſembles it in ſhape and colour. There are ſeveral other ſpecies of this creature, ſome with, and others without, a tail.

VESPERTILIONUM ALÆ, BATS-WINGS in anatomy, a name given to the two broad ligaments which connect the bottom of the uterus to the bones of the ilium. See the article UTERUS.

VESPRIN, a town of lower Hungary, fifty miles ſouth-weſt of Buda.

VESSEL, *vas*, denotes in general any thing for holding liquors: ſuch are our domeſtic cups, pots, *&c.* as alſo the retorts, matraſſes, crucibles, *&c.* of the chemiſts. See RETORT, LABORATORY, *&c.*

In anatomy, all the parts which contain or convey a fluid, are called veſſels; as the veins, arteries, lymphatics, *&c.* See the articles VEIN, ARTERY, *&c.*

Some

Some alſo extend the word veſſel to the nerves, as ſuppoſing them the conduits of the animal ſpirits. See NERVE and ANIMAL SPIRITS.

VESSEL, in navigation, a general name for all ſorts of ſhips. See the article SHIP.

VESTALIA, in roman antiquity, a feſtival celebrated in honour of the goddeſs Veſta, on the fifth of the ides of June; that is, on the ninth of that month.

VESTALS, *veſtales*, among the antient Romans, were prieſteſſes of the goddeſs Veſta, and had the perpetual fire committed to their charge: they were at firſt only four in number, but afterwards increaſed to ſix; and it does not appear, that their number ever exceeded ſix, among whom one was ſuperior to the reſt, and called *veſtalis maxima*.

The veſtals were choſen from ſix to ten years of age, and obliged to ſtrict continency for thirty years; the firſt ten of which were employed in learning the ceremonies of religion, the next ten in the performance of them, and the ten laſt in teaching them to the younger veſtals.

The habit of the veſtals conſiſted of an head-dreſs, called infula, which ſat cloſe to their heads, and from whence hung certain laces called vittæ; a kind of ſurplice made of white linnen, and over it a purple mantle with a long train to it.

VESTIBLE, *veſtibulum*, in architecture, a kind of entrance into a large building; being an open place before the hall, or at the bottom of the ſtair-caſe. Veſtibles, intended for magnificence, are uſually between the court and the garden.

The Romans had veſtibles at the entrance of their houſes, for ſheltering thoſe perſons who were obliged to ſtand at the door; and we have now veſtibles of a like kind in many old churches, houſes, &c. uſually called porches. See the article PORCH.

The term veſtible is ſometimes alſo uſed for a little anti-chamber, before the entrance of an ordinary apartment.

VESTIBLE *of the ear*, in anatomy, a cavity forming the middle part of the labyrinth of the ear. See EAR.

VESTIGIA, a latin term frequently uſed, by engliſh writers, for the traces or footſteps which any thing has left behind it.

VESTRY, a place adjoining to a church, where the veſtments of the miniſter are kept; and alſo a meeting at ſuch place, conſiſting of the miniſter, church-wardens, and chief men of moſt pariſhes, who make a pariſh veſtry or meeting. By cuſtom there are ſelect veſtries, being a certain number of perſons choſen to have the government of the pariſh, make rates, and take the accounts of church-wardens, &c. And it is here to be obſerved, that when any rates are made, the pariſhioners muſt have notice of a veſtry held for that purpoſe; in which caſe all that are abſent ſhall be concluded by a majority of the pariſhioners preſent, who in conſtruction of law are the whole pariſh. Veſtries of pariſhes are to be conſulted by pariſh-officers; and if a pariſhioner, who has a right to be preſent and vote at a veſtry, be ſhut out of the veſtry-room, action of the caſe lies.

VESTURE, or INVESTITURE, in law. See the article INVESTITURE.

VESUVIUS, a famous vulcano, or burning mountain, ſituated only ſix miles eaſt of the city of Naples, in Italy. See the article VULCANO.

VETCH, *vicia*, in botany, a genus of the *diadelphia-decandria* claſs of plants, with a papilionaceous flower; and its fruit is a long, bivalve, and coriaceous pod, containing ſeveral roundiſh ſeeds.

VETCH alſo makes part of the names of other plants; as the bitter vetch, horſeſhoe vetch, &c. See the articles OROBUS and HIPPOCREPIS.

VETERAN, among the antient Romans, an appellation given to a ſoldier who was grown old in the ſervice, or had made a certain number of campaigns.

VETERNUS, or LETHARGY, in medicine. See the article LETHARGY.

VETITUM NAMIUM, in law, imports a forbidden diſtreſs; ſuch, *e. gr.* is that when the bailiff of a lord diſtrains beaſts or goods, and the lord forbids his bailiff to deliver them when the ſheriff comes to replevy them, and to that end drives them to places unknown.

VEXES, or *Ne injuſte* VEXES, in law. See the article NE INJUSTE.

VIA-LACTEA, in aſtronomy, the milky-way, or galaxy. See GALAXY.

VIA-SOLIS, *the ſun's way*, in aſtronomy, is uſed, among ſome aſtronomers, for the ecliptic line, ſo called, becauſe the ſun never goes out of it. See ECLIPTIC.

VIÆ PRIMÆ, firſt paſſages, among phyſicians, are the œſophagus, ſtomach, and guts; including the whole length of the alimentary duct, or canal, from the mouth of the ſphincter ani.

VIALES, in mythology, a name given among the Romans to the gods who had the

the care and guard of the roads and highways.

The dii viales, according to Labeo, were of the number of thoſe gods called dii animales, who were ſuppoſed to be the ſouls of men changed into gods; and were of two kinds, *viz.* the viales and penates. See LARES.

VIANA, a town of Navarre, in Spain, ſituated on the river Ebro, forty-ſix miles ſouth-weſt of Pampeluna.

VIANA is alſo a port-town of Portugal, thirty-ſix miles north of Oporto.

VIANDEN, a town of Luxemburg, twenty miles north of the city of Luxemburg.

VIATICUM, in the church of Rome, an appellation given to the euchariſt, when adminiſtered to perſons at the point of death. See the article EUCHARIST.

VIATOR, in roman antiquity, an appellation given in common to all officers of any of the magiſtrates; as lictors, accenſi, ſcribes, cryers, *&c.* See the article LICTOR, *&c.*

VIBEX, is ſometimes uſed, by phyſicians, for a black and blue ſpot in the ſkin, occaſioned by an afflux or extravaſation of blood.

VIBRATION, in mechanics, a regular, reciprocal motion of a body, as a pendulum, *&c.* which, being freely ſuſpended, ſwings or oſcillates, firſt this way, then that. See the article PENDULUM.

VIBRATION is alſo uſed, in phyſics, for divers other regular alternate motions: thus ſenſation is ſuppoſed to be performed, by means of the vibratory motion of the nerves, begun by external objects, and propagated to the brain.

VIBURNUM, in botany, a genus of the *pentandria-trigynia* claſs of plants, with a monopetalous, campanulated flower, ſemiquinquifid at the limb: the fruit is a roundiſh unilocular berry, containing a ſingle, oſſeous, compreſſed, and ſtriated ſeed.

This genus comprehends the tinus, or lauruſtine; the opulus, or water-elder; and the viburnum of authors, called in engliſh the way-faring-tree.

VICAR, *vicarius*, a perſon appointed, as deputy to another, to perform his functions in his abſence, and under his authority.

VICAR, in the canon law, denotes a prieſt of a pariſh, the predial tithes whereof are impropriated or appropriated; that is, belong either to a chapter, religious houſe, *&c.* or to a layman, who receives them, and only allows the vicar the ſmall tithes or a convenient ſalary, anciently called portio congrua.

VICAR-GENERAL, was a title given by king Henry VIII. to Thomas Cromwell, earl of Eſſex, with full power to overſee the clergy, and regulate all matters relating to church affairs.

VICE, *vitium*, in ethics, is ordinarily defined an elective habit, deviating, either in exceſs, or defect, from the juſt medium wherein virtue is placed. See the articles HABIT, VIRTUE, *&c.*

VICE, in ſmithery, and other arts employed in metals, is a machine, or inſtrument, ſerving to hold faſt any thing they are at work upon, whether it is to be filed, bent, rivetted, *&c.* To file ſquare, it is abſolutely neceſſary that the vice be placed perpendicular with its chaps parallel to the work-bench.

Hand VICE, is a ſmall kind of vice ſerving to hold the leſſer works in, that require often turning about.

Of theſe there are two kinds, the broad-chapped hand-vice, which is that commonly uſed; and the ſquare-noſed hand-vice, ſeldom uſed but for filing ſmall round work. See SMITHERY.

VICE is alſo a machine uſed by the glaziers to turn or draw lead into flat rods, with grooves on each ſide to receive the edges of the glaſs.

VICE is alſo uſed, in the compoſition of divers words, to denote the relation of ſomething that comes inſtead, or in the place, of another; as vice-admiral, vice-chancellor, vice-chamberlain, vice-preſident, *&c.* are officers who take place in the abſence of admirals, *&c.* See the articles ADMIRAL, CHANCELLOR, *&c.*

VICE-ROY, a governor of a kingdom, who commands in the name and ſtead of a king, with full and ſovereign authority. See the article KING.

VICE VERSA, a latin phraſe, importing on the contrary: thus, as the ſun mounts higher and higher above the horizon, the ſhadows of things decreaſe; and *vice verſa*, as he deſcends lower, they increaſe.

VICH, a town of Catalonia, in Spain, thirty miles north of Barcelona.

VICIA, the VETCH, in botany. See the article VETCH.

VICISSITUDE, the regular ſucceſſion of one thing after another; as the viciſſitude of day and night, of the ſeaſons, *&c.*

VICOVARO, a town of Italy, forty miles north-eaſt of Rome.

VICOUNT, in old law-books, ſignifies the ſame with ſheriff. See SHERIFF.

VICOUNT, or VISCOUNT, is alſo a degree of nobility next below a count, or earl, and above a baron. See NOBILITY, EARL, *&c.*

VICOUNTIEL, in law-books, ſomething belonging to, or falling within the ſheriff's juriſdiction: thus writs vicountiels are writs triable in the ſheriff's court; and there are certain vicountiel rents, whereof the ſheriff keeps a particular roll, that uſually comes under the title of firma comitatus.

Alſo vicountiel juriſdiction, is that which belongs to officers of a county; as ſheriff, coroner, eſcheator, *&c.* See the article SHERIFF, *&c.*

VICTIM, *victima*, denotes a bloody ſacrifice offered to ſome deity, of a living creature, as a man or beaſt, which is ſlain to appeaſe his wrath, or obtain ſome favour. See the article SACRIFICE.

VICTORIA, or VITORIA, a town of the province of Biſcay, in Spain, thirty miles ſouth of Bilboa.

VICTORY, *victoria*, the overthrow or defeat of an enemy, in war or combat.

VICTUALS, ſignifies any ſuſtenance, or things neceſſary to live upon, as meat and proviſions; which are to be ſold at a reaſonable price, aſſeſſed by juſtices, *&c.* on pain of forfeiting double the value. By the cuſtom of ſome manors, they chooſe yearly ſurveyors of victuals. See the article ASSISE.

VICTUALLING-OFFICE, for the navy. See the article OFFICE.

VIDAMES, certain officers under the biſhops of France, for the adminiſtration of juſtice, and preſervation of the temporalities of the biſhoprics.

VIDIN, or WIDIN, a town of european Turky, in the province of Servia, ſituated on the river Danube, in eaſt long. 24°, and north lat. 43° 50′.

VIENNA, the capital city of the circle of Auſtria and of the german empire, is ſituated on the Danube, in eaſt long. 16° 20′, and north lat. 48° 20′.

Vienna is an archbiſhop's ſee, and has a celebrated univerſity.

VIENNE, a town of Dauphine, in France, ſituated on the river Rhone, eighteen miles ſouth of Lyons. It is an archbiſhop's ſee.

VI ET ARMIS, in law, are words made uſe of in indictments and actions of treſpaſs, to ſhew the violent commiſſion of any treſpaſs or crime; but in an appeal of death, or where a perſon is killed with a weapon, theſe words are not held neceſſary, becauſe the violence is implied.

VIEW, in law, ſignifies the particular act of viewers; as where a real action is brought, and the tenant does not certainly know what land it is the defendant requires; then he may pray that the jury may view the ſame, that is to ſay, ſee the land that is claimed. But it is held, that in all caſes of viewing, the thing in controverſy is only to be ſhewn to the jurors, and no evidence can be given relating to it on either ſide: and here if waſte be alledged to be done in every room of a houſe, the view of the houſe generally is ſufficient.

VIEW *of frank pledge*, is the office which the ſheriff in his county-court, the ſteward in the leet, or the bailiff in his hundred, performs in looking to the king's peace, and ſeeing that every man be in ſome pledge.

VIGEVANO, a town of the dutchy of Milan, in Italy, ſixteen miles ſouth-weſt of Milan.

VIGILS, in church-hiſtory, are the faſts appointed before certain feſtivals, in order to prepare the mind for a due obſervation of the enſuing ſolemnity.

VIGINTIVIRATE, a tribunal or court among the antient Romans, firſt eſtabliſhed by Cæſar, conſiſting of twenty members, three of whom judged of all criminal matters; three others had the inſpection of the coins; four others had the inſpection of the ſtreets of Rome; and the reſt were judges of civil affairs.

VIGNAMONT, a town of the biſhopric of Liege, in Germany, two miles north of Huy.

VIGO, a port-town of Galicia, in Spain, ſeventy miles ſouth-eaſt of cape Finiſterre: weſt long. 9° 18′, north lat. 42° 15′.

VILLA-BOHIM, a town of Portugal, ten miles ſouth-weſt of Elvas.

VILLA-FRANCA, the name of ſeveral towns, one in Piedmont, three miles eaſt of Nice; another of Catalonia, eighteen miles weſt of Barcelona; a third, the capital of St. Michael, one of the Azores; and a fourth, a town of Eſtremadura, in Spain, fifty-four miles ſouth eaſt of Salamanca.

VILLA-FRANCHE, a town of Orleanois, in France, twelve miles north of Lyons.

VILLACH, a town of Carinthia, in Germany, twenty miles weſt of Clagenfurt.

VILLAGE, an aſſemblage of houſes, inhabited chiefly by peaſants and farmers, and

and having no market, whereby it is diſtinguiſhed from a town. See the articles CITY and TOWN.

Fleta tells us, that the difference made between a manſion, a village, and a manor, is this, *viz.* a manſion may conſiſt of one or more houſes, but muſt be of one dwelling place, and none near it; for if other houſes are contiguous, it is then a village; and a manor conſiſts of ſeveral villages, or of one alone.

Where in legal proceedings a place is named generally, it ſhall be taken for a vill, becauſe as to civil purpoſes the kingdom was firſt divided into vills; yet it has been held, that a vill and a pariſh ſhall be intended the ſame.

VILLAIN, or VILLEIN, *villanus*, in our antient cuſtoms, denotes a man of ſervile and baſe condition, *viz.* a bondman or ſervant: and there were antiently two ſorts of bondmen or villains in England; the one termed a villain in gro's, who was immediately bound to the perſon of his lord and his heirs; the other a villain regardant to a manor, he being bound to his lord as a member belonging and annexed to the manor whereof the lord was owner; and he was properly a pure villain, of whom the lord took redemption to marry his daughter, and to make him free; and whom the lord might put out of his lands and tenements, goods and chattles at his will, and beat and chaſtiſe, but not maim him.

VILLA REAL, the name of two towns, the one in Spain, thirty miles north of Valencia; and the other in Portugal, fifty miles eaſt of Porto.

VILLA DEL REY, a town of Spain, ten miles north of Badajox.

VILLA RICA, a port-town of Mexico, ſituated on the gulph of Mexico, in weſt long. 100°, and north lat. 20°.

VILLA VICIOSA, the name of two towns of Spain, one forty-ſeven miles north-eaſt of Madrid; and the other a port-town of Aſturias, twenty-two miles north-eaſt of Oviedo: weſt long. 6° 6′, north lat. 43°.

VILLENA, a town of New Caſtile, in Spain, forty miles north of Murcia: weſt long. 1° 15′, north lat. 38° 46′.

VILLENAGE, a kind of antient tenure, whereby the tenant was bound to do ſuch ſervices as the lord commanded, or ſuch as were fit for villains or bondmen to perform.

VILLENOUS, or VILLAINOUS JUDGMENT, in law, that which degrades and caſts ſhame and reproach upon the offender; ſo that he ſhall not be of any credit afterwards, nor ſhall it be lawful for him to approach the king's court, *&c.*

VILLI, among botaniſts, a kind of down, like coarſe hair, or the grain or ſhag of pluſh, with which ſome trees abound.

VILLOSE, or VILLOUS, ſomething abounding with villi, or fibres like coarſe hairs: ſuch is one of the coats of the ſtomach. See the article STOMACH.

VILVORDE, a town of Brabant ſeven miles north of Bruſſels.

VINALIA, in roman antiquity, a feſtival on the ninth of the calends of May, in honour both of Jupiter and Venus.

VINCA, the PERIWINKLE, in botany, a genus of the *pentandria monogynia* claſs of plants, the flower of which conſiſts of a ſingle ſaucer-like petal, with an horizontal limb, divided into five ſegments: the pericarpium conſiſts of two erect, cylindric, and long follicles, formed of one valve, and opening longitudinally: the ſeeds are numerous, oblong, cylindric, and ſulcated.

Cape VINCENT, the moſt ſouth-weſt promontory of Portugal: weſt long. 10°, and north lat. 36° 53′.

St. VINCENT, one of the Caribbee-iſlands, ſeventy-five miles weſt of Barbadoes.

St. VINCENT, is alſo a province of Brazil, bounded by the Rio Janiero on the north, by the Atlantic on the eaſt, by the province of del Rey on the ſouth, and by that of the ſpaniſh La Plata on the weſt.

VINCETOXICUM, in botany, the ſame with the aſclepias, or ſwallow-wort. See the article ASCLEPIAS.

The root of this plant is eſteemed ſudorific, emmenagogue, and is frequently preſcribed as an alexipharmic, eſpecially among the Germans: it appears to poſſeſs much the ſame medicinal virtues with valerian, only that this laſt is indiſputably preferable to it. See VALERIAN.

VINCULUM, in mathematics, a character in form of a line, or ſtroke, drawn over a factor, diviſor, or dividend, when compounded of ſeveral letters or quantities, to connect them, and ſhew they are to be multiplied, or divided, *&c.* together by the other term. Thus $d \times \overline{a+b-c}$ ſhews that d is to be multiplied into $a+b-c$.

VINDEMIATING, the gathering of the grapes, or other ripe fruits, as the apples, pears, cherries, *&c.* See VINTAGE.

VINDEMIATRIX, or VINDEMIATOR, a fixed ſtar of the third magnitude in the coſtellation virgo, whoſe latitude is

16° 12′ 34″ north, and longitude 5° 37 40″ of libra, according to Mr. Flamſteed's catalogue.

VINDICATION, or CLAIMING, in the civil law, an action ariſing from the property a perſon has in any thing; or a permiſſion to take or ſeize a thing, as one's own, out of the hands of a perſon, whom the law has doomed not to be the true proprietor.

VINE, *vitis*, a noble plant or ſhrub of the creeping kind, famous for its fruit, or grapes, and for the liquor they afford. See the article WINE.

The vine conſtitutes a genus of the *pentandria-monogynia* claſs of plants, the flower of which conſiſts of five ſmall, deciduous, and rude petals, growing together at their extremities; and its fruit is a large roundiſh berry, containing five oſſeous, ſemiorbicular, and turbinato-cordated ſeeds, narrow at the baſe.

Our gardeners find, that vines are capable of being cultivated in England, ſo as to produce large quantities of grapes; and thoſe ripened to ſuch a degree, as may afford a good ſubſtantial vinous juice. Witneſs the vineyards in Somerſetſhire; particularly that famous one at Bath. In effect, it does not ſeem ſo much owing to the inclemency of our engliſh air, that our grapes are generally inferior to thoſe of France, as to the want of a juſt culture. Thoſe fitted for the engliſh climate, Mr. Mortimer finds to be the black grape, the white muſcadine, parſley-grape, muſcadilla, white and red frontigniac. Mr. Bradley recommends the July-grape, the early ſweet water grape, lately brought from the Canaries, and the Arbois, or french ſweet water grape: all which, if well managed, and the weather favourable, are ripe by the middle of Auguſt. He alſo recommends the claret and burgundy-grapes.

Vines are propagated either by layers, or cuttings; that is, either by laying down the young branches, as ſoon as the fruit is gathered, or by making plantations of ſlips, or cuttings, at that time. Mr. Mortimer ſays, it may be done any time in the winter before January; though Bradley ſays, he has done it, with ſucceſs, in March and April.

For the beſt ſoil for vines, and the method of cultivating them, ſee the article VINEYARD.

VINEGAR, *acetum*, an acid penetrating liquor, prepared from wine, cyder, beer, &c. of conſiderable uſe both as a medicine and ſauce. See the articles WINE CYDER, &c.

The proceſs of turning vegetable matters to vinegar, is thus delivered by Dr. Shaw: take the ſkins of raiſins, after they have been uſed in making wine; and pour three or four times their own quantity of boiling water upon them, ſo as to make a thin aqueous mixture. Then ſet the containing caſk, looſely covered, in a warmer place than is uſed for vinous fermentation; and the liquor, in a few weeks time, will become a clear and ſound vinegar; which being drawn off from its ſediment, and preſerved in another caſk, well ſtopped down, will continue perfect, and fit for uſe.

This experiment ſhews us a cheap and ready way of making vinegar from refuſe materials; ſuch as the huſks of grapes, decayed raiſins, the lees of wine, grounds of ale, beer, &c. which are frequently thrown away as uſeleſs. Thus, in many wine countries, the marc, rape, or dry preſſing of grapes are thrown in heaps, and ſuffered to putrify unregarded; though capable of affording as good vinegar, as the wine itſelf. In ſome places they bury copper-plates in theſe huſks, in order to make verdigreaſe; but this practice ſeems chiefly confined to the ſouthern parts of France. Our preſent experiment ſhews us how to convert them to another uſe; and the direction extends to all the matters that have once undergone, or are fit to undergo, a vinous fermentation, for that all ſuch matters will afford vinegar. Thus all our ſummer-fruits in England, even blackberries; all the refuſe waſhings of a ſugar-houſe, cyder-preſſings, or the like, will make vinegar, by means of water, the open air, and warmth. See the article VERDEGREASE.

The whole proceſs, whereby this change is effected, deſerves to be attentively conſidered. And, firſt, the liquor to be thus changed, being kept warmer than in vinous fermentation, it, in a few days, begins to grow thick, or turbid; and without throwing up bubbles, or making any conſiderable tumult, as happens in vinous fermentation, depoſits a copious ſediment. The effect of this ſeparation begins to appear firſt on the ſurface of the liquor, which gathers a white ſkin, that daily increaſes in thickneſs, till at length it becomes like leather; and now, if continued longer in this ſtate, the ſkin turns blue, or green, and would at laſt grow

grow ſolid, and putrify: therefore, in keeping down this ſkin as it grows, and thruſting it gently down to the bottom of the veſſel, conſiſts much of the art of vinegar-making, eſpecially from malt. For the difference between vinous and acetous fermentation, ſee the article FERMENTATION.

Method of making Cyder-VINEGAR. The cyder (the meaneſt of which will ſerve the purpoſe) is firſt to be drawn off fine into another veſſel, and a quantity of the muſt, or pouz of apples, to be added: the whole is ſet in the ſun, if there be a conveniency for the purpoſe; and, at a week or nine days end, it may be drawn off. See CYDER.

Method of making Beer-VINEGAR. Take a middling ſort of beer, indifferently well hopped; into which, when it has worked well, and is grown fine, put ſome rape, or huſks of grapes, uſually brought home for that purpoſe: maſh them together in a tub; then, letting the rape ſettle, draw off the liquid part, put it into a caſk, and ſet it in the ſun as hot as may be; the bung being only covered with a tile, or ſlate-ſtone: and in about thirty or forty days, it will become a good vinegar, and may paſs in uſe as well as that made of wine, if it be refined, and kept from turning muſty.

Or thus: to every gallon of ſpring-water, add three pounds of Malaga-raiſins; which put into an earthen jar, and place them where they may have the hotteſt ſun from May till Michaelmas: then, preſſing all well, turn the liquor up in a very ſtrong iron-hooped veſſel, to prevent its burſting: it will appear very thick and muddy, when newly preſſed; but will refine in the veſſel, and be as clear as wine. Thus let it remain untouched for three months, before it be drawn off, and it will prove excellent vinegar.

Method of making Wine-VINEGAR. Any ſort of vinous liquor, being mixed with its own fæces, flowers, or ferment, and its tartar firſt reduced to powder; or elſe with the acid and auſtere ſtalks of the vegetable from whence the wine was obtained, which hold a large proportion of tartar: and the whole being kept frequently ſtirring in a veſſel which has formerly held vinegar, or ſet in a warm place full of the ſteams of the ſame, will begin to ferment a-new, conceive heat, grow ſour by degrees, and ſoon after turn into vinegar.

The remote ſubjects of acetous fermentation are the ſame with thoſe of vinous; but the immediate ſubjects of it are all kinds of vegetable juices, after they have once undergone that fermentation which reduces them to wine: for it is abſolutely impoſſible to make vinegar of muſt, the crude juice of grapes, or other ripe fruits, without the previous aſſiſtance of vinous fermentation.

The proper ferments for this operation, whereby vinegar is prepared, are, 1. The fæces of all acid wines. 2. The lees of vinegar. 3. Pulveriſed tartar; eſpecially that of rheniſh wine, or the cream or cryſtals thereof. 4. Vinegar itſelf. 5. A wooden veſſel, well drenched with vinegar, or one that has been long employed to contain it. 6. Wine that has often been mixed with its own fæces. 7. The twigs of vines, and the ſtalks of grapes, currants, cherries, or other vegetables of an acid auſtere taſte. 8. Bakers-leaven, after it is turned acid. 9. All manner of ferments, compounded of thoſe already mentioned.

The French uſe a method of making vinegar different from that above deſcribed. They take two very large oaken veſſels, the larger the better, open at the top; in each whereof they place a wooden grate, within a foot of the bottom: upon theſe grates, they firſt lay twigs, or cuttings of vines, and afterwards the ſtalks of the branches, without the grapes themſelves, or their ſtones; till the whole pile reaches within a foot of the brim of the veſſels: then they fill one of theſe veſſels with wine to the very top, and half fill the other; and with liquor drawn out of the full veſſel, fill up that which was only half full before; daily repeating the ſame operation, and pouring the liquor back from one veſſel to the other; ſo that each of them is full, and half full, by turns.

When this proceſs has been continued for two or three days, a degree of heat will ariſe in the veſſel, which is then but half full, and increaſe for ſeveral days ſucceſſively, without any appearance of the like in the veſſel which happens to be full during thoſe days; the liquor whereof will ſtill remain cool: and as ſoon as the heat ceaſes in the veſſel that is half full, the vinegar is prepared: which, in the ſummer, happens on the fourteen or fifteenth day from the beginning; but in the winter, the fermentation proceeds much ſlower: ſo that they are obliged

to forward it by artificial warmth, or the uſe of ſtoves.

When the weather is exceeding hot, the liquor ought to be poured off from the full veſſel into the other twice a-day: otherwiſe, the liquor would be overheated, and the fermentation prove too ſtrong; whence the ſpirituous parts would fly away, and leave a vapid wine, inſtead of vinegar, behind.

The full veſſel is always to be left open at the top, but the mouth of the other muſt be cloſed with a cover of wood, in order the better to keep down and fix the ſpirit in the body of the liquor; for otherwiſe, it might eaſily fly off in the heat of fermentation. The veſſel that is only half full ſeems to grow hot, rather than the other, becauſe it contains a much greater quantity of the vine-twigs and ſtalks, than that, in proportion to the liquor; above which the pile, riſing to to a conſiderable height, conceives heat the more, and ſo conveys it to the wine below.

Vinegar is a medicine of excellent uſe in all kinds of inflammatory and putrid diſorders, either internal or external: in ardent, bilious fevers, peſtilential, and other malignant diſtempers, it is recommended by Boerhaave as one of the moſt certain ſudorifics. Weakneſs, fainting, vomiting, hyſterical and hypochondriacal complaints have alſo been frequently relieved by vinegar applied to the mouth and noſe, or received into the ſtomach. Diſtilled vinegar has the ſame virtues, only in a ſtronger degree.

There are alſo medicated vinegars, as vinegar of antimony, of elder, litharge, roſes, ſquills, treacle, *&c.* which derive their chief virtues from vinegar.

VINEYARD, *vinetum*, a plantation of vines. See the article VINE.

The beſt ſituation of a vineyard is on the declivity of an hill, lying to the ſouth. See the article EXPOSURE.

For the planting of a vineyard, obſerve the following method. In the month of July, while the outermoſt coat of the earth is very dry and combuſtible, plough up the ſward; denſhire, or burn beat it, according to art, and in January following, ſpread the aſhes. The ground being thus prepared, cut your trenches acroſs the hill from eaſt to weſt, becauſe the vines being thus in ranks, the riſing and ſetting of the ſun will by that means paſs through the intervals, which it would not do if they were ſet in any other poſition, neither would the ſun dart its rays upon the plants during the whole courſe of the day. See the article PLANTING.

Afterwards ſtrain a line, and dig a trench about a foot deep, place your ſetts in it, about three feet diſtance one from another, trim off the ſuperfluous roots, leaving no more than three or four eyes or buds upon that which is above-ground, and plant them near half a foot deep, ſloping, after the manner the quick is commonly ſet, ſo as they may point up the hill. That done, take long dung or ſtraw, and lay it on the trenches in a convenient thickneſs to cover the earth, and preſerve the roots from the dry piercing winds, which would otherwiſe much annoy them, and from the exceſſive ſcorching heats in ſummer; keep them well hoed, and free from weeds, and water them as occaſion ſerves; the beſt time to plant is in January. See the article MANURE.

The firſt pruning of the new-ſet vine ought not to be till January, and then you ſhould cut off all the ſhoots as near as you can, ſparing but one of the moſt thriving, on which you are to leave only two or three buds, and ſo let all reſt till May, the ſecond year after planting. Then take care from time to time to deſtroy the weeds, and be ſure to clear the roots of all ſuckers, which do but rob and draw out the virtue of your ſets. The ſame method is to be followed the third year; then dig your whole vineyard, and lay it very level; taking care in this operation not to cut or wound any of the main roots with your ſpade. As for the younger roots, it is not ſo material, in regard that they will grow but the thicker; and this year you may enjoy ſome of the fruits of your vineyard, which if anſwerable to your expectation, will put you upon providing props for your vines, of about four feet long, which muſt be placed on the north ſide of the plant. In May, rub off ſuch buds as you ſuſpect will produce ſuperfluous branches. When the grapes are about the bigneſs of birding-ſhot, break off the branches with your hand at the ſecond joint above the fruit, and tie the reſt to the prop: here it is moſt adviſeable to break, and not cut your vine; becauſe wounds made with a ſharp inſtrument are not apt to heal, but cauſe the plants to bleed. See the articles PRUNING, LOPPING, *&c.*

The

The fourth year you will be likely to have three or four ſhoots to every plant: and therefore, in December, cut off all the branches except one of the ſtrongeſt and moſt thriving, which leave for a ſtandard about four feet high, paring away the reſt very cloſe to the body of the mother-plant, which tie to your prop till it be big enough to make a ſtandard of itſelf. Neither muſt you ſuffer any ſhoot to break out but ſuch as ſprout at the top, four feet from the ground, all which ſprouts the French uſually prune off every year, and abſolutely truſt to the new ſprouts that are only bearing ſhoots.

In Auguſt, when the fruit begins to ripen, break off ſuch ſhoots as you find too thick; and if you perceive any plant bleed, rub ſome aſhes on it; or, if that will not do, ſear it with a hot iron. When upon ſtirring your vineyard it appears to be poor, prune the vines as before directed, and ſpread good dung, mixed with lime, over the whole ground, letting it lie all the winter to waſh into the earth, mixing about ten buſhels of lime with a load of dung, and if ſome aſhes and ſoot be likewiſe thrown on, it will do well. Turn in this manure, about February, with a ſlight digging, but not too deep, which ſhould be done in a dry ſeaſon, and not in wet weather, leſt it make the ground bind too much and occaſion the growth of rank weeds. But to forward the ripening of grapes, and render them fruitful, the blood of beaſts mixed with lime or ſoot, is very proper; laying it to the roots of the vines in December and July; and if the ſeaſon be very dry, the watering them in Auguſt is a great advantage. See the article DUNGING.

As to the ſoil of a vineyard, it is agreed that nothing can be too dry for it; and as to the ſorts of vines, none but the forward ones ought to be planted in England.

VINOUS, *vinoſus*, ſomething that relates to wine, or that has the taſte and ſmell thereof. See the article WINE.

All vegetables, by a due treatment, afford a vinous liquor, as corn, pulſe, nuts, apples, grapes, *&c.* A ſecond fermentation, duly managed, turns any vinous liquor into an acetous one. The proper character and effect of fermentation are to produce either a vinous or an acetous quality in the body fermented. See the article FERMENTATION.

VINTAGE, a crop of wine, or what is got from the vines each ſeaſon. See VINE, VINEYARD, and WINE.

The word is alſo uſed for the time or ſeaſon of gathering or preſſing the grapes. See GRAPES and *Wine*-PRESS.

VINTIMIGLIA, a port town of Italy, in the territory of Genoa, ſituated on the Mediterranean, ſeventeen miles eaſt of Nice, and one hundred ſouth-weſt of Genoa-city.

VINUM, a liquor or drink, commonly called wine. See WINE.

VINUM, in medicine, *vinum medicatum*, is particularly applied to ſeveral medicated wines, that is, medicinal preparations, whereof wine is the baſis. The original intention of medicated wines, was for exhilirating medicines, which were to be continued for a length of time in the moſt familiar and agreeable form: by this means a courſe of remedies was complied with, notwithſtanding the repugnance and averſion which the ſick often manifeſt to thoſe directly furniſhed from the ſhops; and hence the inferior ſort of people had their medicated ales. Nevertheleſs, as vinous liquors are excellent for extracting the virtues of ſeveral ſimples, and are not fitted for keeping, they have been employed as officinal menſtrua alſo; and ſubſtances of the greateſt efficacy are truſted in this form. The moſt noted of theſe medicated wines to be met with in diſpenſatories, are the vinum aleoticum, or alkaline, aleotic wine: vinum amarum, or bitter wine: vinum antimoniale, or antimonial wine: vinum aromaticum, or aromatic wine: vinum chalybeatum, ſteel wine: vinum croceum, ſaffron wine: vinum emeticum, emetic wine: vinum guaiacum, guaiacum wine: vinum ipecacoanhæ, wine of ipecacoanha: vinum millepedatum, wine of millepedes: vinum peruvianum, wine of peruvian bark: vinum ſcorbuticum, ſcorbutic wine; and vinum viperinum, viper wine.

VIOL, *viola*, a muſical inſtrument of the ſame form with the violin, and ſtruck like that with a bow. See VIOLIN.

There are viols of divers kinds. The firſt and principal, among us, is the baſs-viol, called by the Italians viola digamba, or leg-viol, becauſe held between the legs. It is the largeſt of all, and is mounted with ſix ſtrings: its neck is divided in half notes by ſeven frets fixed thereon: its ſound is very deep, ſoft and agreeable.

The

The tablature, or muſic for the baſs-viol, is laid down on ſix lines or rules. What the Italians call alto viola is the counter-tenor of this; and their tenore viola, the tenor. They ſometimes call it ſimply the viol: ſome authors will have it the lyra, others the cithara, others the chelys, and others the teſtudo of the antients. See LYRA, CITHARA, *&c.*

2. The love-viol, viola d' amore, which is a kind of triple-viol or violin, having ſix braſs or ſteel ſtrings, like thoſe of the harpſichord, ordinarily played with a bow. This yields a kind of ſilver ſound, which is very agreeable. 3. A large viol with forty-four ſtrings, called by the Italians viola di bardone, but little known among us. 4. Viola baſtarda, or baſtard viol of the Italians; not uſed among us. Broſſard takes it to be a kind of baſs-viol mounted with ſix or ſeven ſtrings, and tuned as the common one. 5. What the Italians call viola di braccio, arm-viol, or ſimply braccio, arm, is an inſtrument anſwering to our counter-tenor, treble, and fifth violin. 6. Their viola prima, or firſt viol, is really our counter-tenor violin; at leaſt, they commonly uſe the cliff C *ſol ut* on the firſt line to denote the piece intended for this inſtrument. 7. Viola ſecunda is much the ſame with our tenor-violin, having the cliff of C *ſol ut* on the ſecond line. 8. Viola terza is nearly our fifth violin, the cliff C *ſol ut* on the third line. 9. Viola quarta, or fourth viol, is not known in England or France, though we frequently find it mentioned in the italian compoſitions; the cliff on the fourth line. Laſtly, their violetta, or little viol, is in reality our triple-viol, though ſtrangers frequently confound the term with what has been ſaid of the viola prima, ſecunda, terza, *&c.*

VIOL is alſo a term uſed among mariners when an hawſer, or ſtrand-rope, is bound faſt with nippers to the cable, and brought to the jeer-capſtan for the better weighing of the anchor when the main-capſtan proves inſufficient.

VIOLA, the VIOLET, in botany, a genus of the *ſyngeneſia-polygamia-monogamia* claſs of plants, the corolla whereof is compoſed of five ringent irregular petals, and is corniculated behind: the fruit is a roundiſh, trigonal, obtuſe capſule, formed of three valves, and containing three cells: the ſeeds are numerous, roundiſh, and appendiculated.

The officinal flowers of the violet have a very pleaſant ſmell, and impart a deep purpliſh-blue colour, denominated from them violet. They impart their colour and flavour to aqueous liquors. A ſyrup made from this infuſion has long maintained a place in the ſhops, and proves an agreeable and uſeful laxative to children.

VIOLATION, the act of violating; that is, forcing a woman, or committing a rape upon her. See RAPE.

This term is alſo uſed in a moral ſenſe for a breach or infringement of a law, ordinance, or the like; and it is alſo uſed for profanation. See TRANSGRESSION.

VIOLENT, in the ſchools, a thing done by force. In which ſenſe it ſtands oppoſed to ſpontaneous. See the article SPONTANEOUS.

A thing is ſaid to be violent when effected by ſome external principle, the body that undergoes it contributing nothing thereto, but ſtruggling againſt it. The ſchoolmen allow, that man, as being endued with reaſon, is capable of ſuffering ſuch violence, but brute and inanimate bodies are not.

VIOLET, *viola*, in botany. See the article VIOLA.

VIOLIN, or FIDDLE, a muſical inſtrument mounted with four ſtrings, or guts, and ſtruck, or played, with a bow. The violin, like moſt other inſtruments, conſiſts of three parts, the neck, the table, and the ſound-board. At the ſides are two apertures, and ſometimes a third is added towards the top, ſhaped like an heart. Its bridge, which is below the apertures, bears up the ſtrings which are faſtened to the two extremes of the inſtrument, at one end of them to a ſcrew, which ſtretches or looſens them at pleaſure.

The ſtyle and ſound of the viol is the gayeſt, moſt lively, and ſprightly of all other inſtruments; and hence it is, of all others, the fitteſt for dancing: yet there are ways of touching it which render it grave, ſoft and languiſhing, and fit for church or chamber muſic. It generally makes the treble or higheſt part in concerts. It is tuned by fifths: its play is compoſed of baſs, counter-tenor, tenor, and treble: to which may be added a fifth part: each part has four fifths, which riſe to a greater ſeventeenth. See FIFTH, *&c.*

In compoſitions of muſic the violin is denoted by V; two VV denote two violins.

lins. The word violin, alone, ſtands for treble-violin. When the Italians prefix alto, tenore, or baſſo, it then expreſſes the counter-tenor, tenor, or baſs-violin. In compoſitions, where there are two, three, or more different violins, they make uſe of primo, ſecundo, terzo, or of the characters I°, II°, III°, or 1°, 2°, 3°, *&c.* to denote the difference.

The violin has only four ſtrings, each of a different thickneſs; the ſmalleſt whereof makes the *e ſi mi* of the higheſt octave of the organ; the ſecond, a fifth below the firſt, makes the *a mi la*; the third, a fifth below the ſecond, is *d la re*; laſtly, the fourth, a fifth below the third, is *ge re ſol*. Moſt nations ordinarily uſe the cliff *ge re ſol* on the ſecond line, to denote the muſic for the violin only. In France they uſe the ſame cliff as the firſt line at bottom. The firſt of theſe methods is beſt where the ſong goes very low; the ſecond, where it goes very high.

VIOLONCELLO of the Italians is properly our fifth violin; which is a little baſs violin, half the ſize of the common baſs-violin, and its ſtrings juſt half as thick and half as long, which renders the ſound juſt an octave higher than the ſame. See the article VIOLIN.

VIOLONE, in muſic, a double baſs, almoſt twice as big as the common baſs-violin, and the ſtrings bigger and longer in proportion, and conſequently its ſound an octave lower than that of our baſs-violin, which has a noble effect in great concerts. See the articles CONCERT and VIOLIN.

VIPER, in zoology, a ſpecies of coluber, with the ſcuta of the abdomen an hundred and forty-five, and the ſquammæ of the tail thirty-ſix. See COLUBER.

This is the moſt poiſonous and miſchievous in its bite of all the european ſerpents. It grows to near three feet in length, and to a conſiderable thickneſs in proportion. The principal ground-colour of the body is a duſky grey: all along the back there runs a broad brown line, which is dentated on each ſide; and on each ſide of this there is a kind of continued bluiſh line, formed of a ſeries of ſpots of that colour, one of which is ſituated in the ſpace formed by every denticulation in the back line: the belly is of a bluiſh black, very bright and gloſſy, reſembling the colour of high poliſhed, ſanguined ſteel; and when cloſely examined, there is found a ſmall dot of a deep black at the apex of every ſcale. The head is large and flattiſh: the throat is of a pale colour; and the mouth is large: the edge of the upper lip is whitiſh: the iris of the eye is of a flame colour; the pupil black; and there is a blue ſpace, forming an acute angle, which ſeparates the head from the longitudinal line on the back. The poiſon of this ſerpent is confined to its mouth: at the baſis of the phangs, or long teeth, which it wounds with, is lodged a little bag containing the poiſonous liquid, a very minute portion of which mixed immediately with the blood, proves fatal. Our viper-catchers are ſaid to prevent the miſchiefs otherwiſe following from the bite, by rubbing oil olive warm on the part. The fleſh of the viper is perfectly innocent, and ſtrongly recommended as a medicine of extraordinary ſervice in ſcrophulous, leprous, and other chronical diſorders: its virtues however in theſe caſes, are probably too much exaggerated. The viper is undoubtedly a high nutritious food, and thence, in ſome kinds of weakneſſes and emaciated habits, is not undeſervedly looked on as a good reſtorative. To anſwer any valuable purpoſes, freſh vigorous vipers, not ſuch as have been long kept alive after they are caught, ſhould be liberally uſed as food. The wines and tinctures of them can ſcarce be ſuppoſed to receive any conſiderable virtue from the animal. The dry fleſh brought us from abroad is entirely inſignificant.

VIRAGO, a woman of extraordinary ſtature and courage; and who, with the female ſex, has the mien and air of a man, and performs the actions and exerciſes of men.

VIRGA, a yard. See YARD.

VIRGA is particularly uſed in law for a verge, or rod, ſuch as ſheriffs and bailiffs carry as a badge of their office. See the article VERGE.

VIRGA AUREA, in botany, the ſame with ſolidago. See SOLIDAGO.

VIRGA SANGUINEA, in botany, the ſame with the cornus. See CORNUS.

VIRGÆ, in phyſiology, a meteor called alſo columellæ and funes tentorii; being an aſſemblage of ſeveral ſtreams of light, repreſenting a bundle of rods or ropes. It is ſuppoſed owing to the ſtreaming of the ſun's beams through certain rimulæ, or chinks, at leaſt through the more lax and open parts of a watry cloud, happening chiefly in the morning and even-

ing. There is alſo another kind, conſiſting not of ſtreams of mere white light, but, as it were, painted of various colours like thoſe of the rainbow.

VIRGIN, *virgo*, a female who has had no carnal commerce with man; or more properly, who has ſtill the flos virginis, or maidenhead. In the antient chriſtian church, there were a kind of religious order conſiſting of women who made open and public profeſſion of virginity; and this before the monaſtic life or name was ever known in the world. This appears from the writings of Cyprian and Tertullian, who ſpeaks of virgins dedicating themſelves to Chriſt before there were any monaſteries to receive them. Theſe, for diſtinction's ſake, were ſometimes called eccleſiaſtical virgins and canonicæ, becauſe they were enrolled in the canon or matricula of the church. They differed from the monaſtic virgins chiefly in this, that they lived privately in their fathers houſes, and in caſes of neceſſity were maintained by the church; whereas the others lived in community and upon their own labour. Whether they made any ſolemn vow is not agreed on: and as to their conſecration, it was uſually performed publicly in the church by the biſhop, or ſome preſbyter deputed by him. See MONK, NUN, *&c.*

VIRGIN is alſo applied, by way of eminence, to Mary the mother of our Saviour, as conceiving and bringing him forth without any breach of her chaſtity. Many of the antient fathers, with the modern churches, hold, that the virgin not only conceived but brought forth, or was delivered, without breach of her virginity; and it is even alledged, that ſhe remained a virgin to the end of her life: though, as this is not recorded in holy writ, many have denied it, and held that ſhe had afterwards to do with Joſeph, and bore other children.

Purification, &c. of the holy VIRGIN. See the article PURIFICATION.

VIRGIN is alſo applied figuratively to ſeveral things that retain their abſolute purity, and have never been made uſe of. Thus virgin-wax is that which has never been wrought, but remains as it came out of the hive. Virgin-oil is that which oozes ſpontaneouſly out of the olive, *&c.* without preſſing. Virgin-gold, is that metal ſuch as it is found pure in the mine, without any mixture of allay; in which ſtate it is ſometimes ſo ſoft that it will take the impreſſion of a ſeal. Virgin-copper is a native copper found in the mine, and which has never been melted down. Virgin-quickſilver is that found perfectly formed and fluid in the veins of mines; or at leaſt ſuch as is got from the mineral earth by mere lotion, without fire. Virgin-parchment is that made of the ſkin of an abortive lamb, *&c.* See the articles WAX, OIL, *&c.*

VIRGIN'S-THREAD, a ſort of meteor that flies in the air like ſmall untwiſted ſilk; which falling upon the ground, or upon plants, changes itſelf into a ſubſtance like a ſpider's-web. In theſe northern climates it is moſt frequent in ſummer, the days being then temperately warm, the earth not exceeding dry, nor yet overcharged with moiſture. This has formerly paſſed for a ſort of dew of an earthy ſlimy nature: but naturaliſts are now agreed that the virgin's threads are no other than ſo many ſpider's-webs. See the article SPIDER'S-WEB.

VIRGIN'S-BOWER, in botany, the ſame with clematis. See CLEMATIS.

VIRGIN-ISLANDS, very ſmall iſlands of the Caribees, ſituated in the Atlantic or American-ocean, a little to the eaſtward of Porto-Rico.

VIRGINALE CLAUSTRUM, in anatomy, the ſame with hymen. See the article HYMEN.

VIRGINIA, one of the Britiſh American colonies, ſituated between ſeventy-four and eighty degrees weſt long. and between thirty-ſix and thirty-nine degrees of north lat. bounded by the river Patowmack, which ſeparates it from Maryland, on the north; by the Atlantic-Ocean, on the eaſt; by Carolina, on the ſouth; and may be extended as far weſtward as we think fit.

VIRGINITY, *virginitas*, the teſt or criterion of a virgin, or that which intitles her to the denomination. The phyſicians, both antient and modern, are exceedingly divided upon the ſubject of virginity, ſome holding that there are no certain marks or teſtimonies thereof, and others, that there are. Moſes eſtabliſhed a teſt that was to be concluſive among the Jews. The nuptial ſheets, it ſeems, were to be viewed by the relations on both ſides, and the maid's parents were to preſerve them as a token of her virginity, to be produced in caſe her huſband ſhould ever reproach her on that ſcore. In caſe the token of virginity was not found thereon, ſhe was to be ſtoned to death at her father's door. This teſt of virginity has occaſioned

occaſioned abundance of ſpeculation about the parts concerned; but the niceſt enquiries cannot ſettle any thing certain about them. Dr. Drake ſays expreſly, that whatever might be expected among the Jews, there is not the ſame reaſon to expect thoſe tokens of virginity in theſe countries; for, beſides that the Hebrews married extremely young, as is the cuſtom in all the eaſtern countries, there are ſeveral circumſtances which may here fruſtrate ſuch expectations, even in virgins not vitiated, either by any male contact, or any wantonneſs of their own. In effect, in theſe northern countries, the inclemency of the air expoſes the ſex to ſuch checks of perſpiration, as gives a great turn to the courſe of the humours, and drives ſo much humidity through the parts, as may extraordinarily ſupple and relax thoſe membranes from which the reſiſtance is expected, and from which, in hotter countries, it might more reaſonably be depended on.

What moſt commonly paſſes among us for a teſt of virginity, is the hymen; and yet the moſt curious among the anatomiſts are greatly divided, not only about the figure, ſubſtance, place, and perforations of this membrane, but even about the exiſtence thereof; ſome poſitively affirming, and others as flatly denying it. See the article HYMEN.

VIRGO, in aſtronomy, one of the ſigns or conſtellations of the zodiac, and the ſixth according to order. See ZODIAC. It is marked thus ♍, and in Ptolemy's catalogue conſiſts of 32 ſtars, in Tycho's of 39, and in the Britannic of 89.

VIRGULA DIVINA, or BACULUS DIVINATORIUS, *&c.* a forked branch, in the form of a Y, cut off an hazel-ſtick, by means whereof people have pretended to diſcover mines, ſprings, *&c.* under ground. The method of uſing it is thus: the perſon who bears it, walking very ſlowly over the places where he ſuſpects mines or ſprings may be, the effluvia exhaling from the metals, or vapour from the water, impregnating the wood, makes it dip or incline, which is the ſign of a diſcovery. Some diſpute the matter of fact, and deny it to be poſſible. Others, convinced by the great number of experiments alledged in its behalf, look out for the natural cauſes thereof: the corpuſcles, ſay thoſe authors, riſing from the ſprings or minerals, entering the rod, determine it to bow down, in order to render it parallel to the vertical lines which the effluvia deſcribe in their riſe.

VIRGULTUM, in our antient law-books, is uſed for a holt or plantation of twigs or oſiers.

VIRIDARIO ELIGENDO, a writ that lies for the choice of a verderor. See the article VERDEROR.

VIRILE, ſomething that belongs or is peculiar to a man, or the male ſex: thus the virile member is uſed for the penis; virile age, the ſtrength and vigour of a man's age, *viz.* from thirty to forty-five years, being the age wherein we are equally removed from the extremes of youth and of old age.

VIRILIA, a man's genitals, or privy members, including the penis and teſtes. See the articles PENIS and TESTES.

VIRTSUNGIANUS DUCTUS, in anatomy, a canal uſually called ductus pancreaticus. See the article PANCREAS.

VIRTUAL, or POTENTIAL, ſomething that has a power or virtue of acting or doing. The term is chiefly underſtood of ſomething that acts by a ſecret inviſible cauſe, in oppoſition to actual and ſenſible.

VIRTUAL FOCUS, in optics. See the article FOCUS.

VIRTUALITY, in the ſchools, denotes ſome mode or analogy in an object, which, in reality, is the ſame with ſome other mode, but, out of regard to contradictory predicates, is conſidered as if diſtinct therefrom.

VIRTUALLY, in the ſchools, is applied to a mode of exiſtence. A thing is ſaid to be virtually any where, when it is deemed to be there by ſome virtue, influence, or other effect, produced by it: thus the ſun is virtually on earth, *i. e.* by his light, heat, *&c.* A thing is alſo ſaid to be virtually preſent, when the virtues or properties belonging to it, and iſſuing from it, remain: in which ſenſe the forms of the elements are held to be virtually in mixed bodies. A thing is ſaid to be a cauſe virtually, or a virtual cauſe, and that two ways; the firſt, when there is no real diſtinction between it, and the effect attributed to it, and yet it is conceived by us as if it were really the cauſe thereof: thus immutability in God is the cauſe of eternity. Secondly, when an effect is not of the ſame kind with the cauſe, and yet the cauſe has the power or virtue of producing the effect: thus the ſun is not formally but virtually hot; and

the fire is not contained formally but virtually in heat.

VIRTUE, *virtus*, a term uſed in various ſignifications. In the general it denotes power, or perfection of any thing, whether natural or ſupernatural, animate or inanimate, eſſential or acceſſary. But in its more proper or reſtrained ſenſe, virtue ſignifies an habit, which improves and perfects the poſſeſſor and his actions. See the article HABIT, *&c.*

In this ſenſe virtue is a principle of acting or doing well and readily, and that either infuſed from above, ſuch as are the theological virtues; or acquired by our own application, as the intellectual or moral virtues.

For as there are two things in man, from which all his actions proceed, *viz.* the underſtanding and the will; ſo the virtue by which he is perfected, or whereby he is diſpoſed to do all things rightly, and to live happily, muſt be twofold: the one of the underſtanding, and the other of the will. That which improves the underſtanding is called intellectual, or dianoetic; and that, the will, moral and ethic; for ſince there are two things required, in order to live aright, *viz.* to know what ſhould be done; and, when known, readily to perform it; and ſince man is apt to err various ways in each reſpect, unleſs regulated by diſcipline, *&c.* he alone can deport himſelf rightly in his whole courſe of life, whoſe underſtanding and will have attained their utmoſt perfection. See the article UNDERSTANDING, WILL, ETHICS, MORALITY, *&c.*

Intellectual virtue, then, according to Ariſtotle, is an habit of the reaſonable ſoul, whereby it conceives or ſpeaks the truth, either in affirming or denying. The virtues which come under this claſs are divided into ſpeculative, which are thoſe converſant about neceſſary things, that can only be known or contemplated; and practical, which are converſant about contingent things, that may likewiſe be practiſed. Ariſtotle has another diviſion of intellectual virtues, fetched from the ſubject, as ſome of them are ſeated in the contemplative part, *viz.* thoſe converſant about neceſſary things, as ſcience, wiſdom, intelligence; and others in the practical part, ſuch are thoſe converſant about contingent things, as prudence, art, *&c.* See the article SCIENCE, *&c.*

Moral virtue is defined, by Ariſtotle, to be an elective habit, placed in a mediocrity, determined by reaſon, and as a prudent man would determine. Moraliſts uſually diſtinguiſh four principal, or, as they are vulgarly called, cardinal virtues, *viz.* prudence, juſtice, fortitude, and temperance: the reaſon of which diviſion is founded in this, that for a man to live virtuouſly and honeſtly, it is neceſſary he know what is fit to be done, which is the buſineſs of prudence: that he have a conſtant and firm will to do what he judges beſt; which will perfect the man, either as it reſtrains too violent perturbations, the office of temperance; or as it ſpurs and urges on thoſe that are too ſlow and languid, which is the buſineſs of fortitude; or, laſtly, comparatively with regard to human ſociety, which is the object of juſtice. To theſe four virtues all the reſt are referred, either as parts, or concomitants. See the article PRUDENCE, JUSTICE, *&c.*

VIRTUES, in the celeſtial hierarchy, the third rank or choir of angels, being that in order between the dominations and powers: to theſe is attributed the power of working miracles, and of ſtrengthening and reinforcing the inferior angels in the exerciſe of their functions.

VIRTUOSO, an italian term, lately introduced into engliſh, ſignifying a man of curioſity and learning, or one who loves and promotes the arts and ſciences: but among us the term ſeems to be appropriated to thoſe who apply themſelves to ſome curious and quaint, rather than immediately uſeful, art or ſtudy, as antiquaries, collectors of rarities of any kind, microſcopical obſervers, *&c.*

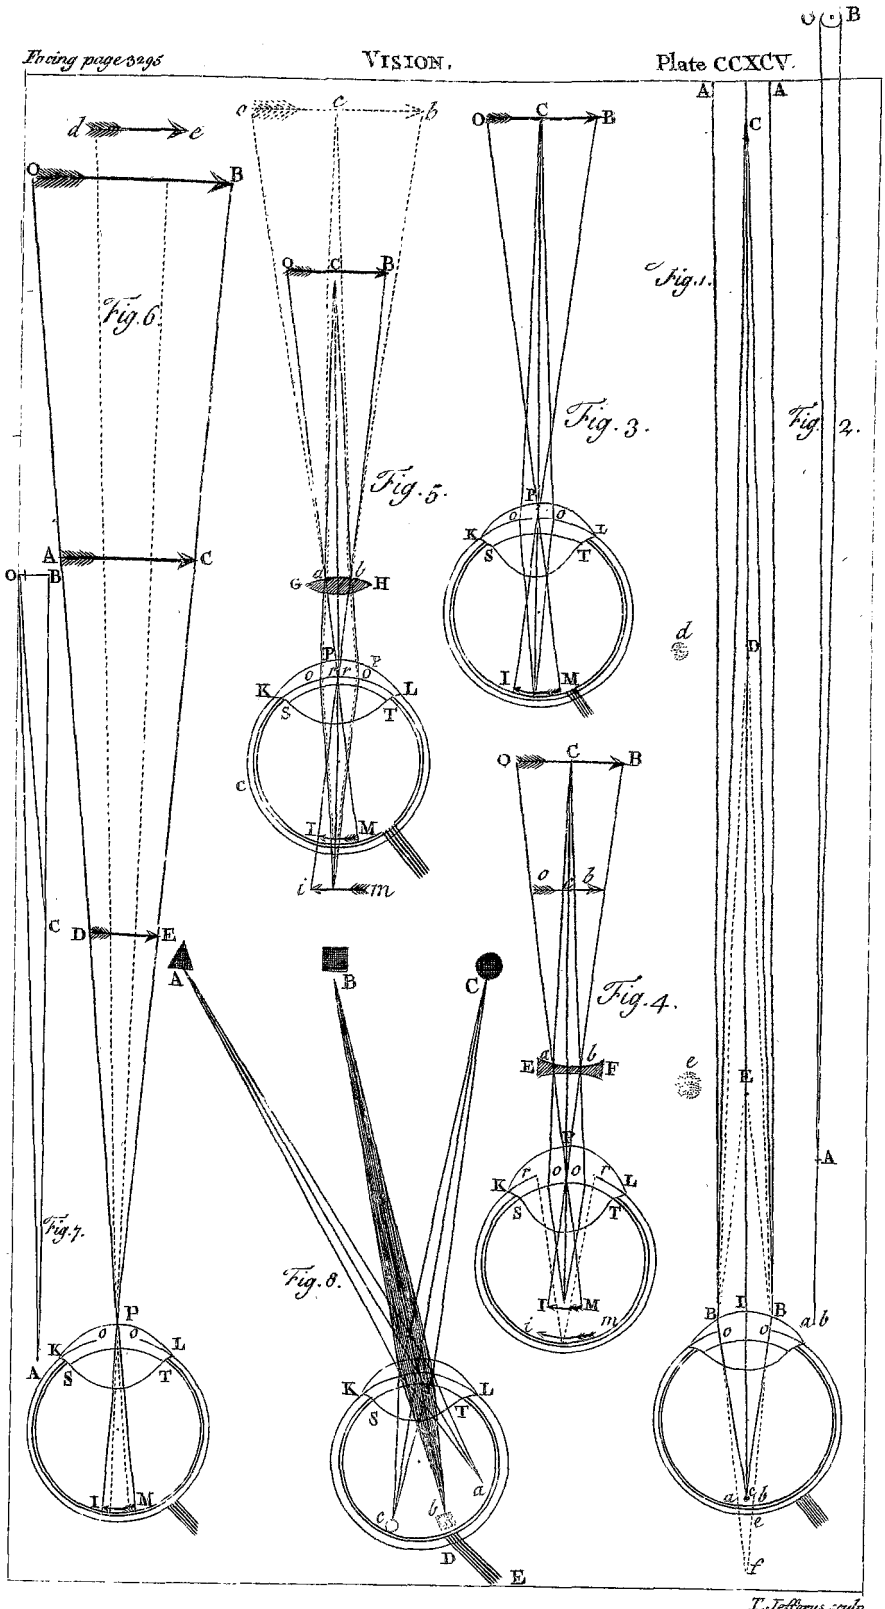
VIRULENT, a term applied to any thing that yields a virus, that is, a contagious or malignant pus. For the virulent gonorrhœa, ſee the article GONORRHOEA.

VIS, a latin word, ſignifying force or power; adopted by phyſical writers to expreſs divers kinds of natural powers or faculties. For the vis inertiæ, ſee the article INERTIÆ, *&c.*

Vis impreſſa is defined, by ſir If. Newton, to be the action exerciſed on any body, to change its ſtate, either in reſiſting or moving uniformly in a right line. This force conſiſts altogether in the action, and has no place in the body, after the action is ceaſed. See PERCUSSION, MOTION, RESISTANCE, PRESSION, CENTRIPETAL, *&c.*

VISCAGO, in botany, the ſame with ſilene. See the article SILENE.

VISCERA, in anatomy, a term ſignifying the ſame with entrails, including the heart,



T. Jefferys sculp

heart, liver, lungs, ſpleen, inteſtines, and other inward parts of the body. See the articles HEART, LIVER, &c.

VISCIDITY, or VISCOSITY, the quality of ſomething that is viſcid or viſcous, that is, glutinous and ſticky, like birdlime, which the Latins call by the name *viſcus*. Viſcid bodies are thoſe which conſiſt of parts ſo implicated within each other, that they reſiſt a long time a complete ſeparation; and rather give way to the violence done them, by ſtretching or extending every way. The too great viſcidity of foods has very ill effects; thus meats or farinæ not fermented, gellies, &c. of animals, tough cheeſe, or curds too much preſſed, produce a weight or oppreſſion in the ſtomach, wind, yawnings, crudities, obſtructions of the minuter veſſels in the inteſtines, &c. Hence an inactivity of the inteſtines themſelves, a ſwelling of the abdomen; and hence a viſcidity of the blood, from the re-union of the viſcid particles; obſtructions of the glands; paleneſs, coldneſs, tremors, &c.

VISCOUNT. See VICOUNT.

VISCUM, MISLETOE, in botany, a genus of the *dioecia-tetrandria* claſs of plants, having no corolla; the fruit is a round ſmooth berry, containing one cell, wherein is a ſingle carnoſe ſeed, obtuſe, compreſſed, and obverſely cordated.

This plant was held in veneration by the ſuperſtition of former ages it was hung about the neck, to prevent witchcraft; and taken internally to expel poiſons. Of late times it has been celebrated as a ſpecific in epilepſies, palſies, &c. virtues which it were greatly to be wiſhed that experience gave any countenance to.

VISET, a town of the auſtrian Netherlands, in the province of Limburg, ſituated on the eaſt ſhore of the river Maes, ſeven miles north of Liege.

VISIAPOUR, a city of the hither peninſula of India, in the province of Decan, ſituated one hundred and thirty miles north-eaſt of Goa: eaſt longit. 75°, and north lat. 16° 45′.

VISIBLE, ſomething that is an object of ſight or viſion, or ſomething whereby the eye is affected, ſo as to produce a ſenſation. See the articles VISION, SIGHT, EYE, &c.

VISION, *viſio*, in optics, the act of ſeeing or perceiving external objects, by means of the organ of ſight, the eye. See the article EYE.

Such is the ſubſtance and form of the humours of the eye, when lodged in their proper receptacles, that rays of light, in paſſing through them, are affected in like manner as in paſſing through a convex lens; and therefore, to underſtand perfectly the nature of viſion, we muſt firſt be acquainted with the doctrine of light and lenſes. See the articles LIGHT and LENS.

Now as the ſeveral pencils of rays flowing from the diſtinct points in the ſurface of an object placed before a lens, are collected into ſo many points at a certain diſtance, on the other ſide of the lens, and form an image there, when received upon white paper; ſo pencils of rays proceeding from an object placed before the eye, at a proper diſtance from it, and being refracted in paſſing through the humours of it, are collected into their reſpective foci upon the retina, where they form a repreſentation of that object; and by their impulſes upon the tender nerves of the retina, an idea of the object is excited in the mind. See REFRACTION.

Viſion is diſtinguiſhed into bright and obſcure, diſtinct and confuſed. It is ſaid to be bright, when a ſufficient number of rays enter the pupil at the ſame time; and obſcure, when too few: it is called diſtinct, when each pencil of rays is collected into a focus, exactly upon the retina; and confuſed, when they meet before they come at it, or when they would paſs it before they meet.

Now ſince parallel rays only have their focus upon, or meet in, the retina, they alone can paint there a diſtinct image of an object, or produce a diſtinct viſion of it. If, therefore, the object be ſo near, that the rays from any particular point come diverging to the pupil, they will neceſſarily require a greater focal diſtance than the retina, or bottom of the eye; whence the rays not being united upon the retina, that point cannot be there diſtinctly repreſented, but will appear confuſed: thus, AB, AB (plate CCXCV. fig. 1.) are two parallel rays falling upon the pupil of the eye; and CB, CB, two other rays, which, though really diverging, yet, by reaſon of the remoteneſs of the point C, whence they proceed, will at the entrance of the eye be ſo nearly coincident with the parallel rays, as to have nearly the ſame focal point on the retina, ſo that the point C will there be diſtinctly repreſented by *c*. But if any other point E, be viewed very near the eye, ſo that the angles EBA, which they contain with the parallel rays, be

very conſiderable, they will, after refraction, tend towards the point f, in the axis of the eye produced, and upon the retina will repreſent only a circular indiſtinct area; like that at e, whoſe breadth is equal to ab, the diſtance of the rays upon the retina. The ſame point at D, will not be quite ſo much dilated, as the rays DB, DB, have a leſs degree of divergence.

It is found by experience, that the neareſt limit of diſtinct viſion is about ſix inches from the eye; for if a book be held nearer to the eye than that, the letters and lines will immediately become confuſed and indiſtinct. Now this cauſe of indiſtinct viſion may be in ſome meaſure remedied, by leſſening the pupils, which we naturally do in looking at near objects, by contracting the annular fibres of the uvea; and artificially, by looking through a ſmall hole made with a pin in a card, &c. for then a ſmall print may be read much nearer than otherwiſe: the reaſon is plain, for the leſs the diameter of the aperture or pupil BB, the leſs will the rays diverge in coming from D or E, or the more nearly will they coincide with parallel rays.

Beſides the contraction of the pupil, nature has furniſhed the eye with a faculty of adapting the conformation of the ſeveral parts to the reſpective poſitions of objects, as they are nigh or more remote; for this purpoſe, the cornea is of an elaſtic yielding ſubſtance, and the cryſtalline is incloſed with a little water in its capſula, that by the contraction and relaxation of the ciliary ligament, the convexity of both the ſurfaces of the capſula may be a little altered, and perhaps the poſition of the cryſtalline; by which means the diſtance from the retina may be fitted and adjuſted to nigh objects, ſo as to have their images very diſtinctly formed upon the retina.

Nigh objects only have been mentioned (by which are meant ſuch as are near the limit of diſtinct viſion, as between ſix and a hundred inches diſtance) becauſe objects more remote require ſcarce any change of the conformation of the eye; the focal diſtance in them varying ſo very little. Thus, ſuppoſe all the refraction of the eye were equivalent to that of a double and equally convex lens, whoſe radius $r = 1$ inch: if then the object were 10 inches diſtant, or $d = 10$, we ſhould have the focal diſtance $f = \frac{dr}{d-r} = \frac{10}{9} = 0.11111$; and if another object be diſtant 100 inches, then $d = 100$, and $f = \frac{dr}{d-r} = \frac{100}{99} = 0.10101$. The difference between theſe two focal diſtances is 0.0101, *viz.* the hundredth part of an inch, which the eye can eaſily provide againſt. If we go beyond this, ſuppoſe to an object 1000 inches diſtant, we have $f = \frac{dr}{d-r} = 0.1001001$, which is only the thouſandth part of an inch leſs than the former, and is therefore inconſiderable.

Now rays proceeding from any point more than 6 inches diſtant from the eye, will, when they enter the pupil, be very nearly coincident with parallel rays; and therefore, to a ſound eye, diſtinct viſion cannot be effected at leſs than 6 or 8 inches diſtance, as may be found by any one who will make the experiment. Six inches, therefore, conſtitutes the limit of diſtinct viſion, for near objects: we ſhall now conſider the limit for remote objects; for objects may appear indiſtinct and confuſed, by being removed too far from the eye, as well as when they are too near it. And in this caſe we find objects will appear diſtinct ſo long as their parts are ſeparate and diſtinct in the image formed on the retina; and thoſe parts will be ſeparate ſo long as the axes of the pencils of rays, which paint them, are ſeparate at their incidence on the retina; that is, ſo long as the angle they contain is not leſs than one tenth of a degree: for it is found, by experience, that objects and their parts become indiſtinct, when the angle they ſubtend at the pupil of the eye is leſs than that quantity.

Thus, ſuppoſe OB (*ibid.* fig. 2.) to be a circle one tenth of an inch in diameter, it will appear diſtinct with its central ſpot, till you recede to the diſtance of 6 feet from it, and then it becomes confuſed; and if it be one fifth of an inch, it will begin to be confuſed at 12 feet diſtance, and ſo on: in which caſes the angle ſubtended at the eye, *viz.* OAB, is about one tenth of a degree, or 6 minutes. And thus all objects, as they are bigger, appear diſtinct at a greater diſtance; a ſmall print will become confuſed at a leſs diſtance than a larger; and in a map of England, the names of places in ſmall letters become firſt indiſtinct, where thoſe in capitals are very plain and legible; at a bigger diſtance theſe become

become confuſed, while the ſeveral counties appear well defined to a much greater diſtance: theſe alſo at laſt become ſo indiſtinct as not to be known one from another, when at the ſame time the whole iſland preſerves its form very diſtinctly, to a very great diſtance; which may be ſo far increaſed, that it alſo, at laſt, will appear but a confuſed and unmeaning ſpot.

We have ſeen the cauſes of indiſtinct viſion in the objects, and ſhall now enquire what may produce the ſame in the eye itſelf. And firſt it is to be obſerved, that there is a proper degree of convexity in the cornea KPL (*ib.* fig. 3.) and cryſtalline ST, for converging parallel rays to a focus on the bottom of the eye, in a ſound ſtate; hence every diſtant object OB, will have its image IM, accurately depicted on the retina, and by that means produce diſtinct viſion.

But if the cornea KPL (*ib.* fig. 4.) or cryſtalline ST, or both, ſhould chance to be a little more convex than juſt, it will cauſe the pencil of rays *o*C*o*, which comes to the pupil *oo*, from any point C in the object OB, to unite in a focus before they arrive at the retina in the bottom of the eye; the image IM, of the object OB, will be formed in the body of the vitreous humour, and will therefore be very confuſed and indiſtinct on the retina at *im*. A perſon having ſuch an eye, is called myops, in alluſion to the eye of a mouſe, by reaſon of its great convexity. To remedy this defect of the eye, a concave lens EF, is applied before it; for by this means the rays C*a*, C*b*, which fall diverging on the lens, will, after reflection through it, be made to proceed ſtill more diverging, *viz.* in the directions *ar*, *br* (inſtead of *ao*, *bo*) as if they came from the point *c*, inſtead of C. Hence it follows, that ſince the rays are made to fall with greater divergence upon the eye, they will require a greater focal diſtance to be united in the axis; and, conſequently, the focus may be made to fall very nicely on the retina, by uſing a lens EF, of a proper degree of concavity; ſo that diſtinct viſion will be effected, in the ſame manner as in an eye of a juſt conformation.

Since the point *c*, is nearer to the eye than the point C, the apparent place of objects ſeen through a concave lens is nearer than the true place; or the object will appear at *OB*, inſtead of OB; and alſo, ſince converging rays O*a*, B*b*, proceed leſs converging after refraction than before, the object appears under a leſs angle; and, therefore, the apparent magnitude of objects, ſeen by a concave lens, is leſs than the true: the object is alſo leſs luminous, or bright, ſeen thro' ſuch a lens, than without it; becauſe the rays being rendered more divergent, a leſs quantity enters the pupil of the eye, than otherwiſe would do: for the picture is always more or leſs bright, according as it is made by a greater or leſs quantity of rays. Laſtly, it appears from what has been ſaid, that when a concave lens EF, cannot be applied, we may ſtill effect diſtinct viſion, by leſſening the diſtance between the object and the eye: for it is plain, if OB be ſituated at *OB*, the image at IM, will recede to *im*, upon the retina, and be diſtinct, in the ſame manner as when made ſo by the lens EF.

On the other hand, when the cornea or cryſtalline is too flat, *&c.* (as often happens by age) an object OB (*ib.* fig. 5.) placed at the ſame diſtance from the eye PC, as before, will have the rays C*o*, C*o*, after refraction in the eye, proceed to a focus beyond the bottom of the eye, in which, if a hole were made (in an eye taken out of the head) the rays would actually go on, and form the image *im*; which image muſt, therefore, be very confuſed and indiſtinct on the retina. To remedy this defect, a convex lens GH, is applied, which cauſes the diverging rays C*a*, C*b*, to fall leſs diverging upon the eye, or as if they came from a point more remote, as *c*; by which means the focal diſtance is ſhortened, and the image duly formed on the retina at IM, by which diſtinct viſion is produced.

Hence the apparent place of the object is at *c*, is more diſtant than the true place at C; and its apparent magnitude *OB* is greater than the true, becauſe the converging rays O*a*, B*b*, are by this lens after refraction made to unite ſooner than before, and ſo to contain an angle *OPB* greater than the true OPB. The object appears through a convex lens brighter than without, becauſe by this means a greater quantity of rays enter the pupil; for the rays *ao*, *bo*, are by the lens made to enter in the directions *ar*, *br*, which are nearer together, and leave room for more to enter the pupil all around between *o* and *r*.

As the image of the object painted on the retina is greater or leſs, ſo will the apparent

apparent magnitude of the object be likewise; or, in other words, the angle IPM (*ibid.* fig. 6.) ſubtended by the image is always equal to the angle OPB ſubtended by the object at the eye, and therefore the image IM will be always proportional to the object OB. Hence it follows, that the angle OPB under which an object appears is the meaſure of its apparent magnitude.

Therefore objects of different magnitudes, as OB, AC, DE, which ſubtend the ſame angle at the eye, have the ſame apparent magnitude, or form an equal image in the bottom of the eye. Hence it is that objects at a great diſtance have their magnitude diminiſhed proportionally: thus the object DE removed to *D E* appears under a leſs angle *D P E*, and makes a leſs image on the retina, as ſhewn by the dotted lines.

The angles of apparent magnitude OAB, OCB, (*ibid.* fig. 7.) when very ſmall, are as their ſines, and therefore as the ſides OC and OA, or BC and BA; that is, the apparent magnitude of the object OB, at the diſtances BC and BA, is inverſely as thoſe diſtances; or its magnitude at C is to that at A as AB to CB.

The more directly any object is ſituated before the eye, the more diſtinctly it will appear; becauſe thoſe rays only which fall upon the eye near its axis can be convened to a point in the bottom of the eye on the retina, and therefore that part of the image only which is formed by the direct pencil of rays can be clear and diſtinct; and we are ſaid to ſee an object by ſuch a pencil of rays, but only to look at it by the others which are oblique. Suppoſe A, B, C, (*ibid.* fig. 8.) repreſent three pieces of paper ſtuck up againſt the wainſcot of a room at the height of the eye; if then a perſon places himſelf ſo before them, and ſhutting his right eye views them with his left, it is very remarkable that the paper B, whoſe pencil of rays falls upon the inſertion D of the optic nerve DE, will immediately vaniſh or diſappear, while the two extreme papers C and A are viſible; and by altering the poſition of the eye, and its diſtance, any of the papers may be made to vaniſh, by cauſing the pencil of rays to fall on the point D. Why the rays of light ſhould not excite the ſenſation of viſion in the point D, where the fibres of the nerves begin to ſeparate and expand every way to form the retina, is not eaſy to ſay. But it is worth notice, that the nerve DE is for that reaſon placed on one ſide of the eye, where only the oblique rays come, the loſs of which is not conſiderable, and no way affects or hinders the perfection of ſight: whereas had it entered in the the middle of the bottom of the eye, it had rendered uſeleſs all the direct rays, by which the moſt perfect and diſtinct viſion is effected; and we could have had only a confuſed and imperfect perception of objects, by oblique collateral rays.

The laws of viſion, brought under mathematical demonſtration, make the ſubject of optics, taken in the greateſt latitude of the word; which is commonly uſed, in a more reſtrained ſenſe, for the doctrine of direct or ſimple viſion, performed by rays paſſing directly, or in a ſtraight line, from the object to the eye. The doctrine of reflected viſion, or that performed by means of rays reflected from mirrours, makes the ſubject of catoptrics; and refracted viſion, or that performed by rays refracted through glaſs lenſes, or other mediums, conſtitutes that branch of optics, called dioptrics. See the articles OPTICS, DIOPTRICS, CATOPTRICS, LENS, MIRROUR, REFLECTION, and REFRACTION.

VISION, among divines, an appearance which God occaſionally ſent his prophets and ſaints, either by way of dream or reality: ſuch were the viſions of Ezekiel, Amos, St. Paul, *&c.*

Beatific VISION, denotes the act whereby the angels and bleſſed ſpirits ſee God in Paradiſe.

VISITATION, in law, an act of juriſdiction, whereby a ſuperior, or proper officer, viſits ſome corporation, college, church, or other public or private houſe, to ſee that the laws and regulations thereof be duely obſerved.

Among us, viſitation is that office performed by the biſhop in every dioceſe once in three years, or by the archdeacon every year, by viſiting the churches and their rectors throughout the whole dioceſe, *&c.* The biſhop's commiſſary alſo holds a court of viſitation, to which he may cite all church-wardens and ſideſmen; and to whom he exhibits his articles, and makes inquiry by them.

VISMATHUM, BISMUTH, in natural hiſtory. See BISMUTH.

VISNAGA, in botany, a ſpecies of daucus. See the article DAUCUS.

VISNE,

VISNE, *viſnetum*, in law books, ſignifies a neighbouring place, or place near at hand.

VISTULA, or WEISEL, a large river of Poland, which, taking its riſe in the mountains ſouth of Sileſia, viſits Cracow, Warſaw, *&c.* and continuing its courſe north, falls into the Baltic Sea below Dantzick.

VISUAL, in general, ſomething belonging to viſion. See the article VISION.

Thus, rays of light, coming from an object to the eye, are called viſual rays; and the viſual point in perſpective is a point in the horizontal line, wherein all the viſual rays unite. See the articles RAY and PERSPECTIVE.

VITAL, in phyſiology, an appellation given to whatever miniſters principally to the conſtituting or maintaining of life in the bodies of animals: thus, the heart, lungs, and brain are called vital parts; and thoſe operations of theſe parts, whereby the life of animals is maintained, are called vital functions. See the article FUNCTION.

VITERBO, a city of Italy, twenty-five miles north of Rome.

VITEX, the CHASTE-TREE, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, with a monopetalous, ringent, and bilabiated flower, each lip of which is trifid: the fruit is a quadrilocular, globoſe berry; containing four ſeeds. See AGNUS CASTUS.

VITICELLA, in botany, a ſpecies of clematis. See CLEMATIS.

VITIS, the VINE, in botany, *&c.* See the article VINE.

VITIS IDÆA, in botany, a ſpecies of vaccinium. See VACCINIUM.

VITREOUS *humour of the eye*, is ſo called from its reſemblance to glaſs in fuſion, being very like a fine clear jelly in appearance: it probably, ſays Heiſter, conſiſts of extremely fine veſicles, containing a limpid and perfectly pellucid humour. It fills the poſterior part of the eye, and is every where contiguous to to the hinder part of the retina, which it ſerves alſo to expand. See EYE.

VITRIFICATION, in chemiſtry, is the converting a body into glaſs, by means of fire. See GLASS.

Of all bodies, fern-aſhes, ſand, pebbles, *&c.* vitrify the moſt readily; and accordingly, it is of theſe that glaſs is principally made.

VITRIOL, in natural hiſtory, a compound body formed of the particles of metals diſſolved by the acid of ſulphur, and that either by the operations of nature, within the earth, or in the chemiſts elaboratory by proper admixtures and aſſiſtances, and afterwards, by the help of water, brought into the form of a ſalt.

The vitriols, therefore, very much approach the nature of metals, and, in ſome inſtances, are found to have taken up other ſubſtances, particularly, ſome of the ſemi-metals among them, as, the white vitriol, which contains zink. See the article ZINK.

The other metals we find diſſolved in this manner in the bowels of the earth, and there formed into vitriols, are iron and copper. Theſe, therefore, are the great baſis of thoſe ſalts; and according as they belong to one or the other of them, are to be divided into the cupreous and the ferrugineous vitriols.

The naturaliſt, who collects for his amuſement, will meet with vitriols containing theſe two metals, in various proportions, in the ſame maſs. The blue-green vitriol of Hungary and Tranſylvania, and many other of the foſſiles of this claſs are of that kind.

We ſhall here only conſider thoſe vitriols fit for the uſe of medicine, and, therefore, treat of the diſtinct and determinate vitriols which contain only the particles of one of theſe metals. Of theſe there are but three kinds, *viz.* 1. Green vitriol. 2. White vitriol. 3. Blue vitriol. To theſe, however, we are to ſubjoin the vitriolic minerals, miſy, ſory, melantina, *&c.* which are all of them, properly, the ores of vitriols. See MISY, SORY, *&c.*

1. Green vitriol has iron wholly for its baſis. It is formed ſolely of that metal, diſſolved by the acid of ſulphur, and by means of water reduced to the form of ſalt. It is of two kinds, natural and factitious; the natural or native kind is known by the name of green vitriol; the common appellation of the other is copperas. See COPPERAS.

It is a tolerably pure and pellucid ſalt, of a compact and regular texture, conſiderably heavy, but friable, and eaſily ſhattering to pieces on the ſmalleſt blow. It is of a fine, pale, graſs-green colour. It will not melt, or wholly run to water in a damp air, but it is very apt to be moiſt on the ſurface; it very readily diſſolves in water, and after evaporation, freely ſhoots again into regular cryſtals, the true figure of which is a thick rhomboid; but they are ſeldom perfect or regular.

regular. Expoſed to the fire, it becomes thin like water, boiling and bubbling up, and emitting a very thick fume. After this it grows thicker, and, finally, calcines to a grey powder; and from this, if the fire be continued and made more violent, to a fine purple matter, called colcothar of vitriol. See COLCOTHAR.

In England, where the greateſt quantity of this vitriol is made, it is formed from the common greeniſh pyrites, with the addition of old iron. The people who collect theſe pyrites, are not at the pains of ſearching it among the ſtrata, but they pick it up on the ſea coaſts of Eſſex, and other places, under cliffs, compoſed of ſtrata of clay, out of which the ſea waſhes it, and leaves it on the ſhore. This pyrites they expoſe to the air in vaſt heaps, and, in conſequence of that, it by degrees begins to ſwell and burſt, and ſhoot out in ſalts. They pile up theſe heaps in a kind of pits lined with clay, now and then turning them when their ſalt begins to appear in a downy efflorescence on the ſurfaces of the pieces they fall into, on breaking; the time of making vitriol being near. Theſe efflorescences diſſolve by the rains and dews, and are, in fine, converted into an acrid liquor, which is conveyed from the bottom of the pits into leaden boilers, into which a quantity of old iron is alſo thrown; the fire is made under theſe, and the liquor is kept boiling for three days, or more, and is all the time ſupplied with freſh parcels of iron, ſo long as it will act upon them. The old iron, picked up by the poor people about our ſtreets, is ſold to the vitriol or copperas makers with this intent. When the liquor is boiled to a proper conſiſtence, it is let out into large coolers, in which there are ſticks placed acroſs, to which, as well as to the ſides of the veſſel, the vitriol adheres in large cryſtals, of the form and texture above deſcribed.

This ſalt, on a chemical analyſis, affords a very ſtrong acid ſpirit; or, as it is uſually, though very improperly, called, oil, which is a ſolvent for many of the metals, and effervesces very violently with an alkali, and even with ſpirit of wine, or common water. Mixed with ſal armoniac, it ferments violently, but the fermentation is attended with great coldneſs, inſtead of the heat uſual on theſe occaſions; and what is very ſingular is, that, while the fermenting mixture itſelf is thus cold, the vapour that ariſes from it is evidently hot to the hand. After the diſtillation of this acid liquor of vitriol, what remains in the retort is a red earth called colcothar; it contains iron, and is a ſtrong aſtringent. See the article ALKALI.

In medicine, this ſpirit is given internally in fevers, and hæmorrhages, and particularly in malignant fevers of the petechial kind; to be taken in all the drink, in ſuch quantity as to give an agreeable acidity to it.

Vitriolated tartar is another very valuable medicine, prepared from green vitriols, which attenuates the humours, reſiſts putrefaction, and opens obſtructions of the viſcera. See TARTAR.

2. White vitriol is a true and genuine, though not a pure, vitriol of iron; the colour of which, that has ſo long perplexed the world to account for, is at length found to be owing to a mixture of zink in it.

The white vitriol, uſed in the ſhops, is all prepared from the native ſalt of the ſame name and colour, by ſolution and evaporation. It is a ſafe, gentle, and expeditious vomit; being given in ſolution, from ten grains to a ſcruple, or more: it is alſo uſed externally in collyriums, intended againſt inflammations of the eyes; and is a very powerful ſtyptic in injections to ſtop the gleet that ſometimes remains after the cure of a gonorrhœa. See GONORRHOEA.

3. Blue vitriol is a vitriol which has copper for its baſis. It is only met with ſuſpended in the waters of certain ſprings, from which it is obtained by means of evaporation and cryſtallization. The water of ſuch ſprings as are found ſtrongly enough impregnated with copper to be worth the working for vitriol, is ſaved in reſervoirs, and evaporated to a proper ſtandard; after which it is let out into coolers, where it ſhoots into the beautiful cryſtals we ſee; which have the ſame qualities with the water, and on ſolution in common water, they make a ziment-water, not to be diſtinguiſhed from the native kind. See ZIMENT.

Blue vitriol is not given internally; but is of great uſe in external applications. The blue vitriolic water of the ſhops is made by diſſolving three ounces of blue vitriol, and two ounces of alum, in a pint and a half of boiling water; afterwards add two ounces of ſtrong ſpirit or

oil

oil of vitriol, filtring the whole for uſe. It is an excellent ſtyptic, and particularly ſerviceable in hæmorrhages of the noſe. See HÆMORRHAGE.

VITRIOLATED, among chemiſts, ſomething that has vitriol infuſed in it.

VITRIOLIC, an appellation given to whatever abounds with, or partakes of, the nature of vitriol: thus ſuch foſſile bodies as contain vitriol, are called vitriolic minerals, or ores of vitriol; as the pyrites, chalcites, miſy, ſory, melanteria, marcaſites, &c. See the articles PYRITES, CHALCITES, &c.

VITRIOUS, or VITREOUS *humour of the eye*. See the article VITREOUS.

VITRY, a town of Champaign, in France, forty ſix miles ſouth-eaſt of Rheims.

VITTA, in anatomy, that part of the amnios, which ſticks to an infant's head, when juſt born. See AMNIOS.

VITUS's DANCE, *chorea ſancti viti*, in medicine, a ſort of convulſion, which boys and girls are ſubject to, from the age of ten years, to the time of puberty: it diſcovers itſelf firſt by a kind of lameneſs, or an inſtability of one of the legs, which they draw after them in a ridiculous manner; nor can they hold the arm of the ſame ſide ſtill for a moment; and before they can bring a cup to their mouth, they uſe a thouſand odd geſticulations. In a convulſive paroxyſm, the limbs are ſtrongly agitated; the hands are ſometimes put behind them, and ſoon after they ſeem to be beating the air; and their legs will be drawn hither and thither, as if they were dancing ſome antic dance. See CONVULSION and SPASM.

Dr. Mead thinks this diſorder to be rather paralytic than convulſive, and that it may be cured by the uſe of cold baths, and chalybeate medicines. Sydenham's method of cure is this: firſt, take off ſeven or eight ounces of blood, more or leſs, according to the ſtrength of the patient, from the arm; and the next day, let the patient take a gentle purge of rhubarb, ſena, manna, &c. In the evening of the ſame day, let him take a draught, with a ſcruple of venice-treacle, and eight drops of liquid laudanum mixed in honey and milk-water. This purging and opiate draught is to be repeated at ſome days diſtance; the bleeding is alſo to be repeated to the fourth time; and in the intermediate days, a cordial and nervous electuary is to be given, compoſed of the conſerves of roſemary, orange-peel, and roman wormwood, with venice-treacle, candied nutmeg, and candied ginger; of this, the bigneſs of a nutmeg may be given every morning and afternoon, drinking after it a decoction of piony, maſterwort, and elecampane, and angelica-roots, the leaves of rue, ſage, betony, and other cephalic plants, with orange-peel, and juniper-berries. Spirit of harts-horn may alſo be given every night in ſmall doſes, in a nervous julep, and plaſters of gum caranna may be applied to the ſoles of the feet. According as the cure advances, the patient recovers the uſe of his hand and foot; and his amendment may always be diſcovered by letting him attempt to bring a groſs of any liquor to his mouth in a ſtrait line: though the bleeding ſhould not be repeated beyond the fourth time, yet the alterative and purging medicines ſhould be continued till the patient is quite well; and as people are ſubject to relapſes in this diſorder, it is proper to give the ſame medicines, and to bleed at the return of that ſeaſon of the year.

VIVA VOCE, a latin phraſe frequently uſed in engliſh writers, and literally ſignifying, by word of mouth.

VIVARY, in law books, a term indifferently uſed for a park, warren, or fiſh-pond. See the article PARK, &c.

VIVERRA, the FERRET, in zoology. See the article FERRET.

VIVIERS, a city of Languedoc, in France, ſituated on the river Rhone, twenty miles north of Orange.

VIVIFICATION, in medicine, the art of vivifying; that is, of contributing to the action that gives life, or maintains life.

The chemiſts, alſo, uſe the word in ſpeaking of the new force, vigour, and luſtre, which, by this art, they give to natural bodies; particularly to mercury, which, after having been fixed or amalgamated, they reſtore to its firſt ſtate.

VIVIPAROUS, *viviparus*, in natural hiſtory, an epithet applied to ſuch animals as bring forth their young alive and perfect, in contradiſtinction to them that lay eggs, which are called oviparous animals. See GENERATION.

VIVO, in architecture the ſhaft or fuſt of a column. See COLUMN.

The term is alſo uſed in a more particular ſenſe for the naked of a column, or other part.

VIZIER, or VISIER. See VISIER.

UKRAIN, a province of Muſcovy, lying

northwards of Little Tartary, ſo called as being a frontier againſt Turky.

ULADISLAW, a city of Great Poland, ſituated on the river Boriſthenes, eighty miles north-weſt of Warſaw: eaſt long. 19°, and north lat. 53°.

ULCER, *ulcus*, in ſurgery, is a ſolution of the ſoft parts of our bodies, together with the ſkin, produced by ſome internal cauſe, as an inflammation, abſceſs, or acrimonious humors. But wounds which become inveterate, and even contuſions, when difficult of cure, come within this definition, and paſs, at length, into ulcers, and are commonly ſo called. See the article ABSCESS, WOUND, *&c.*

The proper and uſual ſeat of an ulcer, then, is in any of the ſofter parts of the body, as the ſkin, fat, glands, fleſh, and internal viſcera. For if there be any exulceration or corroſion in the harder parts, as the bones, it comes rather under the notion of a caries, or what is commonly called ſpina ventoſa, than that of an ulcer; though, on account of ſome kind of reſemblance which it has with the ulcer, or eroſion, of the ſofter parts, they are ſometimes treated of in conjunction. See CARIES, *&c.*

Ulcers can by no means be reckoned all of one kind, but are diſtinguiſhed into various ſpecies, on many accounts; as, 1. with reſpect to the different parts of the body in which they are ſeated; for, ſometimes, they infeſt the ſkin, at other times the fat, and ſometimes the glands and fleſh. 2. As to their magnitude; for ſome ulcers are large and extended, others ſmall, and contracted within narrow limits; ſome deep, others ſhallow and more ſuperficial; in particular, ulcers of a conſiderable depth, but narrower, and more eſpecially diſtinguiſhed by the narrowneſs of their orifice or beginning, uſually paſs under the peculiar denomination ſinus or fiſtula. Ulcers differ, 3. With regard to duration; for ſome are recent, others inveterate. 4. On account of their attendant ſymptoms; in which reſpect ſome ulcers are mild and favourable, others malignant, that is, attended with very acute pains, or fœtid, putrid, pinguious, rheumy, or diſcharging much ichor, creeping or ſpreading, cancerous, or inclining to a cancer, callous, fiſtulous, or verminous; there is a difference between them, 5. With reſpect to their cauſes, in which light they aſſume the epithets of ſcorbutic, venereal, carious, cancerous, peſtilential, and ſuch as are ſuppoſed to proceed from faſcination. In the laſt place, ulcers are diſtinguiſhed by the parts in which they are ſeated. Thus, ſome infeſt the noſtrils, others, the fauces, palate, breaſts, and anus; and one ſort has the name of fiſtula lacrymalis. See the articles SINUS, FISTULA, *&c.*

The method of cure in ulcers is extremely various, as adapted to the great variety of the diſeaſe; for when the ulcer is but recent, it is to be healed in the ſame manner as a recent wound or abſceſs. We muſt firſt, then, begin with mundification, or cleanſing the ulcer; after that proceed to incarn, or fill the cavity with new fleſh; and, laſtly, cover and conglutinate the ſame as much as poſſible, with a fair and even cicatrix.

Mundification of an ulcer is, according to Heiſter, uſually performed in the following manner: firſt, the corrupted matter is evacuated; or, when it diſcharges itſelf not ſo freely as it ought, gently expreſſed with the fingers; if there be a deep ſinus belonging to the ulcer, it is to be exterged by ſome proper injections; or, if the place be open enough, by repeated intromiſſions of freſh lint. If there be any pieces of membranes, or other corrupted pinguious parts, left in the ulcer, the beſt way to eject them is, at every dreſſing, to introduce into the place lint moiſtened with ſome digeſtive ointment, and cover it with a plaiſter of diachylon, diapalma, or ſomething of the like nature; and upon that, apply compreſſes, and over the whole a bandage: this method is to be carefully followed till the place be thoroughly cleanſed, or till the bottom of the ulcer appears quite red, and covered with new fleſh.

After due mundification, the next buſineſs is to fill the ulcer with new fleſh, which is performed by the help of ſuch medicines as are commonly called ſarcotics. The beſt and moſt effectual, by many degrees, is the digeſtive ointment; for without ſome extraordinary impediment, this digeſtive is, of itſelf, ſufficient to produce new fleſh. It is, indeed, the manner of almoſt all ſurgeons very gravely to recommend every one his proper balſamics for the procuring of new fleſh; but it is preſumed, there is no neceſſity for them to be ſo careful and ſolicitous in this point, ſince there is, in this very digeſtive, a balſamic virtue; and it ought, beſides, to be conſidered, that this new fleſh owes its generation, not ſo much

much to the aſſiſtance of medicines, as the benefit of nature: for all the care and diligence of the ſurgeon have ſcarce any other effect, than to remove all ſuch things as are hurtful, and may prove impediments to a cure. If any one, however, ſhould think this digeſtive ointment not ſtrong enough for his purpoſe, he may try balſam of arcæus, balſam of Peru, balſam of meccha, balſam of ſulphur, eſſence of myrrh and aloes, oil of myrrh per deliquium, oil of eggs, and other vulnerary balſams of the like kind, which may be uſed in its ſtead; and, by the beſt means he can procure, to accompliſh a perfect conglutination.

When an ulcer has penetrated ſo deep as to have its bottom remote, not only from ſight, but from the reach of medicines, it may ſeem neceſſary in every dreſſing, after expreſſing the corrupted matter collected within, to make an injection of ſome cleanſing and healing liquor; ſuch as a decoction of agrimony and birthwort mixed with honey of roſes, or eſſence of myrrh and aloes, or what Belloſte, in his Hoſpital-ſurgeon, recommends, a decoction of walnut-leaves mixed with ſugar before the place be bound up, till the bottom is conglutinated, and to continue the ſame till the ulcer is filled up. See VULNERARY, &c.

The ulcer being, by ſome means or other, as may ſeem moſt adviſeable, incarned and filled up, the induction of a fit and decent cicatrix muſt be completed; but if by ſuch means you cannot prevent a luxuriancy of fleſh, with a moiſtneſs of the ulcer, it will be proper to ſprinkle on the part ſome drying powders, ſuch as thoſe of maſtic, frankinceſe, ſarcocolla, colophony, lapis calaminaris, and tutty; applying, afterwards, to the place dry lint, and a plaſter accommodated to retain and hold together all the things applied, continuing the ſame till the place be perfectly whole and ſound: but if the luxuriant and fungous fleſh has already elevated itſelf above the reſt, above the ſkin, the beſt way to conſume it, is to rub it with blue vitriol; or, if this be not ſtrong enough, to ſprinkle on it ſome powder of red precipitate and burnt alum, till its growth be entirely ſuppreſſed, and nothing appears prominent. See the articles FUNGUS and CICATRIX.

In the laſt place, it is hardly to be expreſſed how much a prudent regimen in diet and manner of living contributes towards the incarning and conglutination of ulcers: for it has been an old obſervation of the profeſſors of the ſalutary art, that very bad ulcers have been cured by means of a regimen, without any conſiderable aſſiſtance from medicine; and, on the contrary, that the ſlighteſt and moſt contemptible ſores have, by a neglect of the rules of diet, and prepoſterous way of living, degenerated into very bad, and even incurable, ulcers. See the article REGIMEN.

Great care, therefore, is to be taken by every perſon troubled with an ulcer, to avoid ſalt, acrid, and acid food, and ſuch as is too fat or heating, with ſwine's fleſh, and all ſuch as is difficult of concoction.

If a bad habit of body be an impediment to the cure of an ulcer, the advice of a ſkilful phyſician is required, who, by the preſcription of proper internal medicines, may not only prevent an ulcer of a mild and favourable kind from becoming malignant, and perhaps incurable, but as much as poſſible promote and haſten its cure. See DIET.

In callous and fiſtulous ulcers, that have formed variety of ſinuſes, and when either nothing can be done by corroſive medicines, or elſe that they tear and corrode the nerves, and bring on convulſions, and other bad ſymptoms, before they affect the callus; in theſe caſes, the beſt and ſafeſt way is to lay open the ſinus, taking care not to wound the nerves, tendons, and arteries; and, after that, all the calluſes may be eaſily deſtroyed by the common methods. Or, if even this method ſhould not have the deſired effect, and if the patient has a conſiderable ſhare both of ſtrength and courage, and the ſituation of the nerves and arteries is favourable, the callous parts muſt be all either entirely cut out with the knife, or burned away by the actual cautery. See CALLUS.

When ulcers are attended with a large diſcharge, the acrimonious ſerum, wherewith the blood abounds, ſhould be evacuated by cathartic and diuretic medicines. Millepedes, in any form, are very properly preſcribed to be taken internally in theſe, as are alſo the eſſence of amber, myrrh, balſam of Peru, tincture of ſalt of tartar, tartarized tincture of antimony, and the like: large and frequent draughts of ſmall liquors are frequently the cauſe of theſe diſorders, and are therefore moſt carefully to be avoided; ſtrong ale, or old wine, ſhould be drank ſparingly at meals, and nothing between them. Such meats are beſt, on theſe occaſions,

caſions, as have feweſt juices in them, and are very well roaſted; and the external medicines muſt be thoſe which have the greateſt reputation as dryers. The principal of theſe are lime-water, lapis calaminaris, tutty, chalk, maſtic, frankincenſe, colophony, and native cinnabar; and when any of theſe have been ſprinkled in fine powder upon the ulcer, a plaſter of diapompholygos, or the like, is to be laid over it.

For the cleanſing venereal ulcers, Heiſter recommends the phagedenic water; or lime water, impregnated with calomel: either of theſe may be applied often every day, and the parts may alſo, if neceſſary, be touched with the cauſtic; and when they are thoroughly cleanſed, they may very ſucceſsfully be healed, either with an ointment made only of crude mercury mixed with turpentine, or with the following: take of the diapompholygos-ointment and crude mercury, killed with a ſmall quantity of Venice-turpentine, of each equal quantities; mix them in a glaſs-mortar into an ointment: or, take of the amalgama of lead and tin an ounce, of bole armenic two ounces; mix theſe, and make them into an ointment, by mixing with them a ſufficient quantity of ointment of roſes, or any other ſimple ointment, in a glaſs-mortar. If there be at the ſame time a caries of the bone, which is, indeed, too frequently the caſe, this is to be dreſſed with euphorbium, oil of cloves, phagedenic-water, or ſpirit of nitre with quick-ſilver diſſolved in it; or, if it can conveniently and ſafely be done, the actual cautery is of ſignal ſervice. See POX, BUBO, &c.

ULCERATION, or EXULCERATION, in ſurgery, a little hole in the ſkin, cauſed by an ulcer. See the preceding article.

ULEX, in botany, a genus of the *diadelphia-decandria* claſs of plants, with a papilionaceous flower; and an oblong turgid pod for its fruit, containing a few roundiſh and emarginated ſeeds.

This genus comprehends the geniſta ſpinoſa, or furze-buſh, and the geniſta ſparti[illegible] of authors.

ULFELDECK, a town of Brabant, eleven miles ſouth-eaſt of Mechlin.

ULIGINOUS, in agriculture, an appellation given to a moiſt, mooriſh, and fenny ſoil

ULLAGE, in gauging, is ſo much of a caſk, or other veſſel, as it wants of being full. See the article GAUGING.

The ullage of a veſſel, whoſe axis is parallel to the horizon, may be found thus: let AGBH (plate CCXCVI. fig. 1. n° 1.) be the great circle in the middle of the caſk, whoſe ſegment GBH is filled with liquor, the ſegment GAH being empty. The ſegment GBH is known, if the depth EB be known, and EH a mean proportional between the ſegments of the diameter AE and EB; all which are found by a rod or ruler put into the veſſel. Let the baſis of the caſk, at a medium, be found; which ſuppoſe to be the circle CKDL (*ibid.* n° 2.) and let the ſegment KCL be ſimilar to the ſegment GAH (which is either found by the rule of three, becauſe the circle AGBH: the circle CKDL:: the ſegment GAH: the ſegment KCL; or it may be found by the tables of ſegments made by authors) and the product of this ſegment, multiplied by the length of the caſk, will give the liquid content in the caſk; which being ſubtracted from the whole content, leaves the ullage AGH.

ULM, an imperial city of Swabia, in Germany, ninety miles ſouth weſt of Ratiſbon: eaſt long. 10°, north lat. 48° 24′.

ULMARIA, in botany, a ſpecies of filipendula. See the article FILIPENDULA.

ULMEN, a town of Germany, thirty miles north-eaſt of Triers.

ULMUS, the ELM, in botany, a genus of the *pentandria digynia* claſs of plants, without any coroſla: the fruit is a large oval drupe, containing a ſingle, roundiſh, and ſlightly compreſſed ſeed. See ELM.

ULNA, in anatomy, one of the bones of the fore-arm, reaching from the elbow to the wriſt: it is big at its upper extremity, and grows gradually ſmaller towards its lower end. See SKELETON.

This bone is longer than the radius, and has a motion of flexion and extenſion: at is upper extremity, it articulates with the os humeri and the criſta of the radius; and its lower extremity articulates with the carpus, as alſo with the radius by means of a criſta.

ULNA, an ell. See ELL and MEASURE.

ULNARIS, in anatomy, the name of two muſcles of the carpus, or hand; one called ulnaris internus, which is a flexor muſcle terminating in the internal ſiſicle of the carpus; and the other, called ulnaris externus, is an extenſor muſcle, terminating in the metacarpal bone that ſupports the little finger.

ULSTER, the moſt northern province of Ireland, the chief town of which is Londonderry.

ULTERIOR,

Fig. 1. ULLAGE

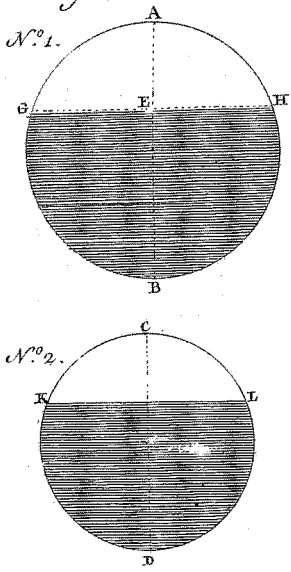


Fig. 2. Operation for the UNGUIS.

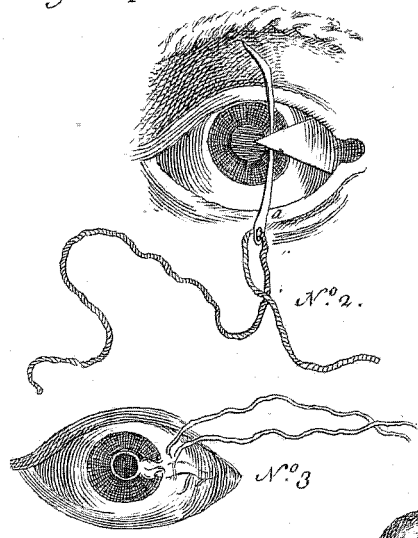

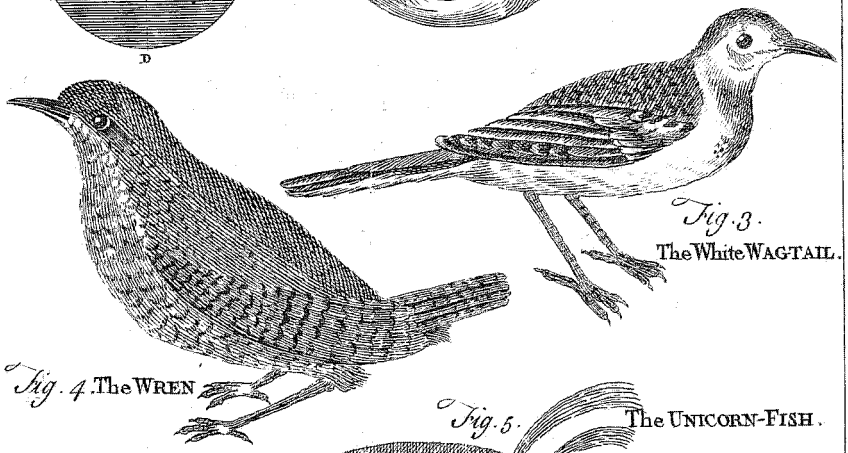

Fig. 3. The White WAG-TAIL.

Fig. 4. The WREN

Fig. 5. The UNICORN-FISH.

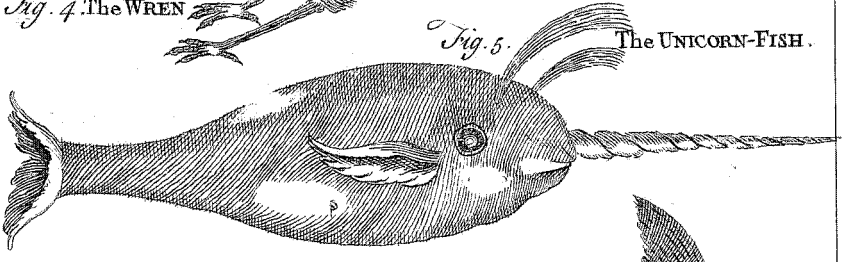

Fig. 6. The URANOSCOPUS

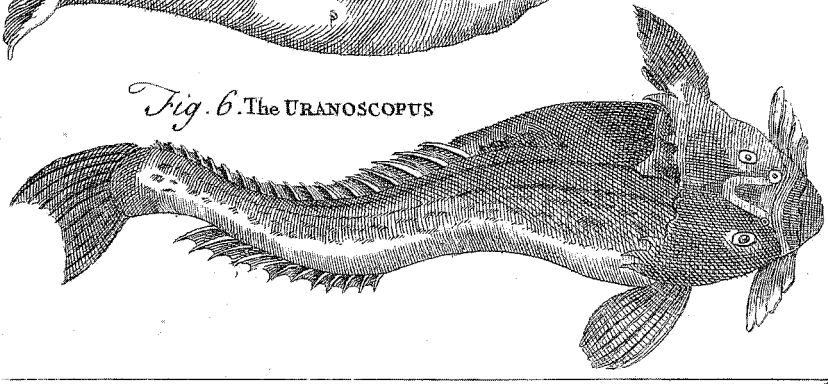

ULTERIOR, in geography, is applied to ſome part of a country or province, which, with regard to the reſt of that country, is ſituated on the farther ſide of the river, mountain, or other boundary, which divides the country into two parts. Thus Africa, with regard to Europe, is divided, by mount Atlas, into citerior and ulterior, *i. e.* into two portions, the one on this ſide mount Atlas, and the other on that.

ULTRAMARINE, *ultramarinum*, a beautiful blue colour uſed by the painters, prepared from lapis lazuli, by calcination. See the article LAZULI.

The german lapis lazuli does not anſwer well in this proceſs, and diſcovers itſelf by its calcining eaſier than the African or Aſiatic, and turning greeniſh. The oriental kind calcines to a finer blue than it naturally has, and retains the colour for ever. After calcining the ſtone in a clear fire of charcoal, they grind it to an impalpable powder on a porphyry, and then mixing it up in a paſte, compoſed of pitch, wax, and oil, they work it about with the hands; and, finally, kneading this in a veſſel of clear water, as the powder ſeparates from the viſcid matter, it ſinks to the bottom: when all that is perfectly fine in this is worked out, they let the water be drained off, and dry the powder for uſe. What remains embodied in the paſte, is afterwards ſeparated, and makes a worſe kind than the former; though even the very meaneſt ultramarine is a very beautiful colour.

Ultramarine muſt be choſen of an high colour, and well ground, which may be known by putting it between the teeth, and if it feel gritty, it is a ſign it has not been well ground.

To know whether it be pure and unmixed, put a little of it into a crucible, and ſo heat it red-hot; and if the powder has not changed its colour after this trial, it is certainly pure; on the contrary, if there be any change, or any black ſpecks in it, then it has been adulterated.

There is alſo a ſpurious ſort, called common or dutch ultramarine; which is only ſmalt well ground and pulverized. See the article SMALT.

ULTRAMONTANE, ſomething beyond the mountains.

The term is principally uſed in relation to Italy and France, which are ſeparated by the mountains of the Alps.

ULTRAMUNDANE, *ultramundanus*, beyond the world; is that part of the univerſe ſuppoſed to be without, or beyond, the limits of our world, or ſyſtem.

ULTZEN, a town of Lower Saxony, in Germany, twenty-five miles ſouth of Lunenburg.

ULVA, in botany, a genus of moſſes, conſiſting of a merely foliaceous ſubſtance, formed into long cylindrical tubes. This genus includes the tubular tremellæ, and with them all the ſmooth confervæ of authors. See the article MOSS.

ULVERSTON, a market-town of Lancaſhire, eleven miles north-weſt of Lancaſter.

ULULA, in ornithology, the grey owl, a ſpecies of ſtrix, with a circle of long feathers, compoſed of two rows, round its face. See OWL and STRIX.

UMA, a town of ſwediſh Lapland, ſituated at the mouth of a river of the ſame name, on the Bothnic gulph, two hundred and eighty miles north of Stockholm.

UMBELLÆ, *umbells*, among botaniſts, the round tufts or heads of certain plants ſet thick together and all of the ſame height.

UMBELLIFEROUS PLANTS, are ſuch as have their tops branched and ſpread out like an umbrella; on each little ſubdiviſion of which there is growing a ſmall flower; ſuch are fennel, dill, *&c.* This flower is always pentapetalous, and is ſucceeded by two naked ſeeds adjoining to each other, which are, according to Ray, the true characteriſtics that diſtinguiſh theſe plants from others.

UMBER, or UMBRE, *umbria*, among painters, *&c.* a kind of dry duſky-coloured earth, which, diluted with water, ſerves to make a dark-brown colour, uſually called with us a hair-colour. It is called umber, from *umbra*, a ſhadow, as ſerving chiefly for the ſhading of objects: or, rather, from Umbria, a country of Italy, whence it uſed to be brought.

UMBER, or GRAYLING, in ichthyology. See the article GRAYLING.

UMBILICAL, among anatomiſts, ſomething relating to the umbilicus, or navel. See NAVEL and ABDOMEN.

The umbilical veſſels are an aſſemblage of two arteries, a vein, and the urachus; which all together conſtitute what we call the funiculus umbilicalis, or navel-ſtring. See the article NAVEL.

The umbilical arteries ariſe from the iliacs, near their diviſion into external and

and internal; and pass thence, on each side of the bladder, through the navel, to the placenta.

The umbilical vein, from innumerable capillaries united into one trunk, descends from the placenta to the liver of the fœtus; where it is partly distributed into the porta, and partly into the cava.

The urachus is only plainly found in brutes; though there is no doubt but it has place, likewise, in mankind. See the article URACHUS, *&c.*

The use of these vessels is to maintain a continuity and communication between the mother and the fœtus. Some authors will have it, that the fœtus receives its food and increase this way, and that it grows like a vegetable from the mother as the root, of which the umbilical vessels are the stem; and the child the head or fruit of this plant animal. See FOETUS.

UMBILICAL POINTS, in mathematics, the same with foci.

UMBILICUS, the NAVEL, in anatomy. See the article NAVEL.

UMBONE, a name used by some for the style or pistil of a flower. See the articles FLOWER and PISTIL.

UMBRA, or SHADOW. See SHADOW.

UMBRA, in ichthyology, the sciæna, with the upper jaw longest, and the under one bearded. See the article SCIÆNA.

This is a large fish, being frequently five feet in length, and its weight sixty pounds: the ground colour is a dusky olive, with a bluish tinge, and variegated all over with a tinge of other colours: the teeth are small and slender, and there are a great many of them in the fauces, besides those in the jaws.

UMBRE, or UMBER, among painters. See the article UMBER.

UMBRINO, in ichthyology, the blackish variegated sciæna, with the belly-fins black. See the article SCIÆNA.

UMBRIATICA, a town of the hither Calabria, in the kingdom of Naples: east long. 17° 35′, north lat. 39° 15′.

UMPIRE, a third person chosen to decide a controversy left to arbitration. See the article ARBITRATION.

UNCASING, among sportsmen, signifies the cutting up, or flaying of a fox. See the article HUNTING.

UNCIA, in general, a latin term denoting the twelfth part of any thing; particularly the twelfth part of a pound, called in english an ounce; or the twelfth part of a foot, called an inch. See the articles MEASURE and WEIGHT.

UNCIÆ, in algebra, the numbers prefixed before the letters of the members of any power produced from a binomial, residual, or multinomial root. Thus, in the fourth power of $a+b$, viz. $a^4+4a^3b+6a^2b^2+4ab^3+b^4$, the unciæ are 4, 6, 4; being the same with what others call co-efficients. See BINOMINAL, INVOLUTION, and CO-EFFICIENT.

UNCIAL, *uncialis*, an epithet which antiquaries give to certain large sized letters or characters, antiently used in inscriptions and epitaphs. The word is formed from the latin *uncia*, the twelfth part of any thing, and which in geometrical measure signified the twelfth part of a foot, *viz.* an inch, which was supposed to be the thickness of the stem of one of those letters.

UNCORE, or UNQUES *prist, still ready*, in law, a plea for the defendant, being sued for a debt due on a bond, *&c.* at a day past, to save the forfeiture of his bond, *&c.* by affirming that he tendered the debt at the time and place, and that there was none to receive it, and that he is yet also ready to pay the same. See the article TENDER.

UNCTION, *unctio*, the act of anointing or rubbing with oil, or other fatty matter. The cure of divers wounds, ulcers, *&c.* greatly depend upon repeated unctions with oil, unguents, cerats, *&c.* For the mercurial unction applied to bring on a salivation, see the article SALIVATION.

UNCTION, in matters of religion, is used for the character conferred on sacred things, by anointing them with oil. Unctions were very frequent among the Hebrews. They anointed both their kings and high-priests at the ceremony of their inauguration. They also anointed the sacred vessels of the tabernacle and temple, to sanctify and consecrate them to the service of God. The unction of kings is supposed to be a ceremony introduced very late among the christian princes. It is said, that none of the emperors were ever anointed before Justinian, or Justin. The emperors of Germany took the practice from those of the eastern empire: king Pepin of France was the first who received the unction. In the antient christian church, unction always accompanied the ceremonies of baptism and confirmation. Extreme unction, or the anointing persons in the article of death, was also practised by the antient christians, in compliance with the precept of St. James, chap. v. 14 and

and 15 verſes; and this extreme unction the romiſh church has advanced to the dignity of a ſacrament. It is adminiſtered to none but ſuch as are afflicted with ſome mortal diſeaſe, or are in a decrepit age. It is refuſed to impenitent perſons, as alſo to criminals. The parts to be anointed are the eyes, the ears, the noſtrils, the mouth, the hands, the feet, and the reins. The laity are anointed in the palms of the hands, but prieſts on the back of it; becauſe the palms of their hands have been already conſecrated by ordination. The parts above-mentioned, are anointed in the form of a croſs. The prieſt begins anointing the ſick perſon's eyes, ſaying, "May God by his holy anointing, pardon you the ſins you have committed by the eyes." In like manner he proceeds to the other parts, varying the words according to the parts he anoints.

UNCUTH, *unknown*, is uſed, in the antient Saxon laws, for him that comes to an inn gueſt-wiſe, and lies there but one night, in which caſe his hoſt is not bound to anſwer for any offence he committed, whereof he was guiltleſs himſelf. See the article HOGENHINE.

UNDECAGON, is a regular polygon, of eleven ſides. See POLYGON.

UNDECEMVIR, a magiſtrate among the antient Athenians, who had ten other collegues or aſſociates joined with him in the ſame commiſſion. The function of the undecemviri at Athens, were much the ſame as thoſe of the prevots de marechauſſe in France: they took care of the apprehending of criminals, ſecured them in the hands of juſtice, and when they were condemned, took them again into cuſtody, that the ſentence might be executed on them. They were choſen by the tribes, each tribe naming its own; and as the number of tribes after Calliſthenes was but ten, which made ten members, a ſcribe or notary was added, which made the number eleven, whence their name οἱ ἕνδεκα, or undecemviri, as Cornelius Nepos calls them in the life of Phocion.

UNDE', UNDEE, or UNDY. See WAVY.

UNDER *the ſea*, in the ſea-language. A ſhip is ſaid to be ſo when ſhe lies ſtill, or waits for ſome other ſhips, with her helm laſhed, or tied up a-lee.

UNDER CURRENTS, currents diſtinct from the upper or apparent currents of the ſeas. Some naturaliſts conclude that there are in divers places under currents which ſet or drive a contrary way from the upper current, whence they ſolve the remarkable phænomena of the ſea's ſetting ſtrongly through the Streights into the Mediterranean, with a conſtant current twenty leagues broad; as alſo, that running from the Euxine through the Boſphorus into the Helleſpont, and thence into the Archipelago: they conjecture, that there is an under current whereby as great a quantity of water is carried out as comes in. To confirm this, it is obſerved, that between the north and ſouth foreland, it is either high or low water upon the ſhore three hours before it is ſo off at ſea; a certain ſign, that though the tide of flood runs aloft, yet the tide of ebb runs under foot, or cloſe by the ground. Yet Dr. Halley ſolves the currents ſetting in at the Streights without overflowing the banks, from the great evaporation, without ſuppoſing any under current. See the article SEA.

UNDER *chamberlain of the exchequer*, an officer that clears the tallies written by the clerk of the tallies, and reads the ſame, in order that the clerk of the pell and the comptrollers thereof may ſee their entries to be true: he likewiſe makes all ſearches for records in the treaſury, and has the cuſtody of domeſday book. See the article EXCHEQUER.

UNDER-SHERIFF, *&c.* See SHERIFF, *&c.*

UNDER *treaſurer of England*, was an officer ſaid to be firſt created by king Henry VII. whoſe duty was to cheſt up the king's treaſure at the end of every term, to note the content of the money in each cheſt, and ſee it carried to the king's treaſury for the eaſe of the lord treaſurer.

UNDERMINING. See SAPPING.

UNDERSTANDING, *intellectus*, is defined by the peripatetics to be a faculty of the reaſonable ſoul, converſant about intelligible things, conſidered as intelligible. They alſo make it twofold, *viz.* active and paſſive. Active underſtanding, they hold that faculty of the ſoul by which the ſpecies and images of intelligible things are framed, on occaſion of the preſence of phantaſms or appearances thereof. For maintaining the intellect to be material, they hold it impoſſible it ſhould be diſpoſed to think by any diſproportionable phantaſms of mere body, and therefore that it is obliged to frame other proportionate ſpecies of itſelf, and hence its denomination active. Paſſive underſtanding, is that which receiving the ſpecies framed by the active underſtanding,

ſtanding, breaks forth into actual knowledge. See the article KNOWLEDGE.

The moderns ſet aſide the peripatetic notion of an active underſtanding. The carteſians define the underſtanding to be that faculty whereby the mind converſing with, and, as it were, intent on itſelf, evidently knows what is true in any thing not exceeding its capacity. The corpuſcular philoſophers define the underſtanding to be a faculty expreſſive of things which ſtrike on the external ſenſes, either by their images or their effects, and ſo enter the mind. Their great doctrine is, *nihil eſſe in intellectu quod non prius fuerit in ſenſu*; and to this doctrine Mr. Locke, and moſt of the lateſt engliſh philoſophers, ſubſcribe. See the article IDEA.

Between the carteſians and corpuſcularians there is this farther difference, that the latter make the judgment to belong to the underſtanding, but the former to the will. Hence, according to the moſt approved opinion of the corpuſcularians, the underſtanding has two offices, *viz.* perception and judgment; according to the carteſians, it has only one, *viz.* perception. See the articles PERCEPTION, JUDGMENT, and WILL.

UNDERSTANDING is alſo uſed for the act, exerciſe, or exertion, of this faculty, or the action whereby the mind knows things, or repreſents them in idea to itſelf.

UNDERTAKERS, were antiently ſuch perſons as were employed by the king's purveyors, and acted as their deputies. At preſent the name is chiefly uſed for upholders, or perſons who furniſh out funerals, and alſo for ſuch as undertake any great work.

UNDERWALD, a canton of Switzerland, bounded by Switz and Lucern on the north, by Uri on the eaſt, and by another part of Lucern on the weſt; being about twenty-five miles long, and as many broad.

UNDERWOOD, *ſub-boſcus*, is coppice, or any wood that is not accounted timber. See COPPICE and TIMBER.

In the cutting the underwood of coppices, when the ſtubbles are great, they ſhould be ſtubbed up; for they only take up a great deal of room, and ſend up few ſhoots, their cracks and holes letting in water, and uſually half killing them. The taking up theſe ſhould be performed in winter, and the ſpaces they leave will be occupied by young trees: if not, a long branch of ſome neighbouring tree may be laid down, which will ſoon ſend up a ſufficient ſupply of ſuckers for the place. In felling the underwood, it is always proper to leave young trees enough, the worſt of which may be taken down the next fall, eſpecially if any of them grow near a great tree that will be fit to fell the next ſeaſon, becauſe they may be ſpoiled by its fall.

UNDULATION, in phyſics, a kind of tremulous motion or vibration obſervable in a liquid, whereby it alternately riſes and falls like the waves of the ſea. See the article WAVE.

This undulatory motion, if the liquid be ſmooth and at reſt, is propagated in concentric circles, as moſt people have obſerved upon throwing a ſtone, or other matter, upon the ſurface of a ſtagnant water, or even upon touching the ſurface of the water lightly with the finger, or the like. The reaſon of theſe circular undulations is, that by touching the ſurface with your finger, there is produced a depreſſion of the water in the place of contact. By this depreſſion, the ſubjacent parts are moved ſucceſſively out of their place, and the other adjacent parts thruſt upwards, which lying ſucceſſively on the deſcending liquid, follow it; and thus the parts of the liquid are alternately raiſed and depreſſed, and that circularly. When a ſtone is thrown into the liquid, the reciprocal vibrations are more conſpicuous: here the water, in the place of immerſion, riſing higher by means of the impulſe, or rebound, till it comes to fall again, gives an impulſe to the adjoining liquid, by which means that is likewiſe raiſed about the place of the ſtone as about a center, and forms the firſt undulous circle; this falling again, gives another impulſe to the fluid next to it, farther from the center, which riſes likewiſe in a circle; and thus ſucceſſively greater and greater circles are produced. See the article IMPULSE.

Undulatory motion is likewiſe applied to a motion in the air, whereby its parts are agitated after the like manner as waves in the ſea; as is ſuppoſed to be the caſe when the ſtring of a muſical inſtrument is ſtruck. This undulatory motion of the air is ſuppoſed the matter or cauſe of ſound. See the article SOUND.

UNGELD, in our antient cuſtoms, a perſon out of the protection of the law: ſo that if he were murdered, no geld or fine was to be paid, in the way of compenſation, by him that killed him.

UNGHWAR, a city of upper Hungary, ſituated near the foot of the Carpathian mountains:

mountains: east long. 21° 30′, north lat. 48° 40′.

UNGUENT, or OINTMENT, *unguentum*, in medicine and surgery, a topical remedy or composition, chiefly used in the dressing of wounds and ulcers. See the articles WOUND and ULCER.

Unguents are divided into simple and compound, though it so happens that some of the former are considerably compounded; and amongst the latter there are some simple unguents, and others very little compounded. Unguents, liniments, and cerates, are external forms applied on divers parts of the body, both to cure, to ease, and to relieve them. These only differ from each other in their consistence; with regard to which, unguents hold the medium, being stiffer than liniments, but softer than cerates. Oils are the bases of all the three, to which are added wax axungia, and several parts of plants, animals, and minerals, both on account of the virtues they furnish, and to give a consistence to the oils, and to keep them longer on the part, that they may have more time to act. See CERATE and LINIMENT.

Any of the officinal plasters, diluted with so much oil as will reduce it to the thickness of stiff honey, forms an ointment; by further increasing the oil it becomes a liniment. See PLASTER.

There are some considerable compositions of this form in the intention of emollients: and amongst the compound unguents there are some which take in a number of very warm aromatic ingredients, and seem designed for paralytic infirmities, and cases that require brisk attenuating applications. At the head of the emollient unguents, is the unguentum dialthææ; and among the attenuating ones, the most in esteem is the unguentum martiatum and nervinum. There are ointments also within the intention of strengtheners; and the next intention of any consequence for which we are provided by this form, and which seems as suitable to it as any, is against cutaneous foulnesses, as the itch, and such like distempers; and this seems to be the reason that there is such a choice of them now given. But though most of these have the reputation of great antiquity, and hold their places in abundance of officinal dispensatories down to the present, yet they are so uncleanly in use, that they are almost altogether fallen into neglect, unless in some of our hospitals; those which contain mercury being much more neat and efficacious for the same purpose. Some other things of this division are little else than oils brought into ointments, by the exchange of oil for lard. Pomatums are also ranked among the number of ungents. See the article POMATUM, *&c.*

UNGUIS, a latin term, signifying a nail of the hand or foot. See NAIL.

UNGUIS, PANNUS, or PTERYGIUM, in medicine and surgery, a preternatural membrane formed upon the coats of the eye, so as to extend itself over the cornea and pupil, and obstruct the sight.

An unguis of the eye happens when the blood-vessels of the tendinous tunic in the corners of the eyes are turgid with blood, through an obstruction or inflammation. When this distemper encreases, there is a sort of carnous web which covers the eye in whole or in part, insomuch that the eyes are offended with the light, and look red sometimes: the web is thin and white, sometimes thicker and more fleshy, rough, obscure and painful; nay, sometimes it becomes cancerous, which is incurable, and ought not to be touched. In the cure, this preternatural coat is to be removed or taken off by abstergent and gently corroding medicines, or by the hand of a surgeon. The medicines in use are sugar-candy, honey, white-wine, bone of the cuttle-fish, burnt hartshorn, and calcined egg-shells; as also water of eye-bright, the great celandine, and the fennel, in which crocus metalorum may be infused: particularly the gall of pike dissolved in a proper water; that is, two ounces to one of the gall. Some recommend a water distilled from the dung of young geese in April. If the disorder be obstinate, the juice of the greater celandine may be used diluted in fennel-water. The following collyrium is proper: Take of prepared lapis hæmatitis, half a scruple; of white-vitriol, twenty-five grains; of myrrh and saffron, each five grains; of white-sugar candied, one scruple. Reduce this mixture to a powder, and then mix it with equal parts of the waters of roses, eye-bright, and fennel, and apply it to the eye with a feather, taking care not to injure the pupil. If these methods are insufficient for destroying the pellicle, it must then be extirpated; in order to which, the patient being in a proper posture, the surgeon takes the small hook (plate CCXCVI. fig. 2. n° 1.)

and endeavours to paſs its point under the thickeſt end looſeſt part of the pellicle; and endeavours, by this means, to elevate it a little. In the next place he takes the needle *a* (*ibid.* n° 2.) armed with a thread, and paſſing it under the pellicle, ties it with a double knot; and then faſtening the two ends in a loop, (*ibid.* n° 3.) he thereby attempts to make a gentle elevation. This done, he endeavours to ſeparate the upper and lower margin of the membrane with a lancet, that he may afterwards cut off the reſt immediately in a ſtraight line near the lacrymal caruncle, by a pair of ſmall and ſtraight ſciſſars: he then draws back the thread and membrane towards the cornea; and if it adheres any where to the eye, frees it by degrees with a ſcalpel or ſciſſars; in doing which he muſt take care not to injure the cornea, and obſerve that no part of the membrane be left adhering to the eye, though it is better to have ſome part of the unguis adhering to the cornea, when the ſeparation is difficult, than to wound the cornea and leave ſcars in it; becauſe any ſmall portion of the membrane left behind may be taken off afterwards by heating the eye with gentle eſcharotics.

UNGUIS, in anatomy, is applied to two bones of the noſe, being as thin as ſcales, and reſembling the nail; whence their name. The ungues are the ſmalleſt bones in the upper jaw, and are ſituated near the great canthus of the eyes. Some authors call them oſſa lacrymalia; others, orbitaria-oſſa. They are contiguous to four other bones, *viz.* the coronal; that of the noſe; the maxillary; and that part of the ethmoides which forms the orbit.

UNGUIS, among botaniſts, the narrow part where the petals are inſerted when ſeveral go to make up the flower, as the broader part towards the end is called bractea.

UNGUIS ODORATUS, the NAIL-LIKE SWEET SHELL, in pharmacy, a medicine famous among the antients; but has, for a long time, been out of credit: and the conſequence of the neglect that has been ſhewn it is the loſing its real hiſtory, and the miſtaking different ſubſtances of the ſame origin and nature, though the produce of different animals, for it. We call what we ſuppoſe to be the unguis odoratus of the antients, blatta byzantia; the truth is, however, that our blatta byzantia, or ſweet-hoof, is not the ſame with the unguis odoratus of the antients, though nearly allied to it. The true unguis odoratus of the antients, is a thin, flat, teſtaceous ſubſtance, of an oblong or oval figure, rounded at both ends, and marked on the ſurface with three or four concentric circles, or oval lines: its colour is a duſky-brown with ſome admixture of the orange, ſometimes of a purpliſh tinge: its uſual ſize is that of a full grown nail of a man's thumb, and its thickneſs about the ſame with that of the nail: it is tough, flexile, and elaſtic; and has no peculiar ſmell or taſte. Beſides this genuine unguis odoratus, they had another ſmaller kind: both are the opercula of ſhells of the murex kind, frequent in the Red-ſea. The blatta byzantia is alſo the operculum or cover of a murex, as well as the unguis odoratus; but it belongs to a different ſpecies of that genus: there are alſo two kinds of the blatta byzantia, which are naturally without ſmell and taſte.

UNGULA, in geometry, the ſection of a cylinder cut off by a plane paſſing obliquely through the plane of the baſe and part of the cylindric ſurface.

UNGULA, in natural hiſtory, the claw or hoof of a quadruped. See HOOF.

UNICORN, *μονοκερως*, an animal, famous among the antients, but looked on by the moderns as fabulous, denominated from its diſtinguiſhing characteriſtic of having one horn only, which is repreſented as five palms long, and growing in the middle of the forehead. It is alſo ſaid to be about the ſize of an horſe: its hair ſhort, and of a darkiſh brown colour, very timorous, and therefore keeping moſtly in the woods. Some will have it an amphibious animal, and its horn moveable at pleaſure. Others make all its ſtrength to conſiſt in its horn; and add, that when purſued by the hunters, it precipitates itſelf from the top of the higheſt rocks, and pitches upon its horn, which ſuſtains the whole effort of its fall, ſo that it receives no damage thereby. It is added, that it is wonderfully fond of chaſte perſons; and therefore, in order to take it, a virgin is placed in its way, whom, when the unicorn ſpies, he lies down by her, lays his head in her lap, and falls aſleep; upon which, the virgin making a ſignal, the hunters come in and take the beaſt; which could never be caught by any other means, becauſe it would either caſt itſelf from a rock or die.

The

The unicorn is one of the ſupporters of the britiſh arms. It is repreſented by heralds paſſant, and ſometimes rampant. When in this laſt action, as in the britiſh arms, it is properly ſaid to be ſaillant. Argent, an unicorn ſejant ſable, armed and unguled, or, borne by the name of harding.

UNICORN-FISH, in ichthyology, a ſpecies of the monodon, or narwal, an extremely ſingular fiſh; the length of a full-grown one being about five and twenty feet, but commonly from ſixteen to twenty: it has only one tooth, remarkably long, which is fixed in the upper jaw, and runs parallel with the length of the fiſh, ſo that it has more the appearance of a horn than a tooth. See the article NARWAL.

The diameter of this fiſh equals, at leaſt, half its length, whence it is very unwieldy: the head is ſmall, and ſhaped like that of a roach: there is no fin on the back; and the fiſtule is in the vertex or uppermoſt part of the head. The tooth grows to ten, or more, feet in length, is about the thickneſs of a man's wriſt towards the baſe, and thence becomes gradually ſmaller all the way to the point. See plate CCXCVI. fig. 5.

UNIFOLIUM, in botany, the ſame with convallaria. See CONVALLARIA.

UNIFORM denotes a thing to be ſimilar, or conſiſtent, either with another thing or with itſelf, in reſpect of figure, ſtructure, proportion, and the like; in which ſenſe it ſtands oppoſed to difform. See the article DIFFORM.

Thus the uniform flowers of plants are ſuch as are of the ſame figure all around, having their fore and back parts, as alſo their right and left parts, exactly alike. For uniform motion, &c. ſee MOTION and EQUABLE.

UNIFORMITY, a ſimiltiude, or reſemblance, between the parts of a whole: ſuch is that we meet with in figures of many ſides, and angles reſpectively equal, and anſwerable to each other.

This term is particularly applied to one and the ſame form of public prayers and adminiſtration of ſacraments, and other rites, &c. of the church of England, preſcribed by the famous ſtat. 1 Eliz. and 14 Car. II. called the act of uniformity.

UNIOLA, in botany, a genus of the *triandria-digynia* claſs of plants, the corolla whereof conſiſts of a bivalve glume: the valves are of a lanceolato-compreſſed figure, like thoſe of the cup: the inner valve appears ſomewhat higher than the outer one: the corolla performs the office of a pericarpium, incloſing the ſeed, which is ſingle, and of an ovated oblong figure.

UNION, a junction, coalition, or aſſemblage of two or more different things in one.

UNION, among painters, expreſſes a ſymmetry and agreement between the ſeveral parts of a painting, when, *e.gr.* there is a great deal of relation and connection between them, both as to the figuring and colouring; ſo that they apparently conſpire to form one thing.

UNION, in architecture, may denote a harmony between the colours in the materials of a building.

UNION, in an eccleſiaſtical ſenſe, denotes a combining or conſolidating of two churches into one. There are two kinds of this union, as when one church is made ſubject to another, and one parſon is made rector of both; and where a conventual church is made a cathedral. In caſe two churches were ſo ſmall as that the tithes did not make a competent proviſion for each of the parſons, they might be united at common law before any act of parliament was made for that purpoſe. By ſtatute there may be an union of two churches where they lie not above a mile diſtant from each other, and where the value of the one exceeds not ſix pounds a year in the king's books of firſt fruits; which is done by the conſent of the biſhop, the patron, and incumbent. Alſo, in cities or corporate towns, it is ordained, that the biſhop, the patron, and the mayors, or chief magiſtrates of the place, &c. may unite pariſh-churches therein: yet, when the income of the church is above one hundred pounds *per annum*, there the major part of the pariſhioners are to agree to the ſame; and after the union, the patrons of thoſe churches ſhall preſent by turns, &c. but notwithſtanding each of the pariſhes continue diſtinct as to rates, charges, &c.

UNION, or the UNION, by way of eminence, is more particularly uſed to expreſs the act whereby the two ſeparate kingdoms of England and Scotland were incorporated into one, under the title of the kingdom of Great-Britain. This happy union, in vain attempted by king James I. was at length effected in the year 1707, by the general conſent of the queen and the eſtates of each realm. The

chief articles of this union are, That the two kingdoms ſhall be united into one kingdom, by the name of Great-Britain: that they, in conſequence thereof, be repreſented by one parliament, of which ſixteen peers and forty-five commoners are to be elected for Scotland, and have the ſame privileges with thoſe of England: that the ſubjects of either nation ſhall have equal freedom of trade, and be liable to the ſame cuſtoms, and the like laws for public government, &c. The kirk, or church of Scotland, is confirmed; and the courts of juſtice are to remain the ſame as they were before the union, yet ſubject to regulation, &c. A court of exchequer is alſo erected in Scotland, to be a court of record, revenue, and judicature, for ever; and barons of the ſaid court are appointed, who ſhall be the judges there, &c. See PEER, PARLIAMENT, &c.

UNISON, in muſic, the effect of two ſounds which are equal in degree of tune, or in point of gravity and acuteneſs. See the article TUNE.

Uniſon may be defined a conſonance of two ſounds produced by two ſtrings, or other bodies, of the ſame matter, length, thickneſs, tenſion, &c. equally ſtruck, and at the ſame time: ſo that they yield the ſame tone or ſound. See the article SOUND.

Uniſon is the firſt and greateſt of concords, and the foundation of all the reſt, according to Ariſtoxenus and moſt of the antients: yet ſome deny it to be any concord at all, maintaining it to be only that in ſounds which unity is in numbers. Others reſtrain the word concord to intervals, and make it include a difference of tune; but this is precarious: for as the word concord ſignifies an agreement of ſounds, it is certainly applicable to uniſons of the firſt degree.

But though uniſonance, or an equality of tune, makes the moſt perfect agreement of ſound, it is not true, that the nearer any two ſounds come to an equality of tune, they are the more agreeable. The mind is delighted with variety; and the reaſon of the agreeableneſs or diſagreeableneſs of two ſounds muſt be aſcribed to ſome other cauſe than the quality or inequality of the number of their vibrations. It is a famed phænomenon in muſic, that an intenſe ſound being raiſed, either with the voice or ſonorous body, another ſonorous body near it, whoſe tune is either uniſon or octave to that ſound, will ſound its proper note, uniſon or octave, to the given note. The experiment is eaſily tried by the ſtrings of two inſtruments, or by a voice and harpſichord; or a bell, or even a drinking-glaſs.

This our philoſophers account for thus; one ſtring being ſtruck, and the air put in motion thereby, every other ſtring, within the reach of that motion, will receive ſome impreſſion therefrom: but each ſtring can only move with a determinate velocity of recourſes or vibrations; and all uniſons proceed from equal or equidiurnal vibrations; and other concords, from other proportions. The uniſon ſtring then, keeping equal pace with the ſounding ſtring, as having the ſame meaſure of vibrations, muſt have its motion continued, and ſtill improved, till its motion become ſenſible, and it gives a diſtinct ſound. Other concording ſtrings have their motion propagated in different degrees, according to the frequency of the coincidence of their vibrations, with thoſe of the ſounded ſtring; the octave, therefore, moſt ſenſibly: then in the fifth; after which the croſſing of the motions prevents any effect.

This they illuſtrate by the pendulum, which, being ſet a moving, the motion may be continued, and ſtill improved, and augmented, by making frequent, light, coincident impulſes; as blowing on it when the vibration is juſt finiſhed: but if it be touched by any croſs or oppoſite motion, and this too frequently, the motion will be interrupted and ceaſe altogether. So of two uniſon-ſtrings, if the one be forcibly ſtruck, it communicates motion by the air to the other: and being equidiurnal in their vibrations, that is, finiſhing them preciſely together, the motion of the other will be improved and heightened by the frequent impulſes received from the vibrations of the firſt; becauſe given preciſely, when that other has finiſhed its vibration and is ready to return: but if the vibration of the chords be unequal in duration, there will be a croſſing of motions leſs or more, according to the proportion of the inequality; by which the motion of the untouched ſtring will be ſo checked as never to be ſenſible. And this, we find, is the caſe in all conſonances, except uniſon, octave, and the fifth.

UNIT,

UNIT, UNITE, or UNITY, in arithmetic, the number one, or one ſingle individual part of diſcrete quantity. See the article NUMBER.

UNITED NETHERLANDS conſiſt of the provinces of Holland, Zealand, Frieſland, Groningen, Overyſſel, Gelderland, with Zutphen and Utrecht; theſe are bounded by the German ſea on the north and weſt; by the circle of Weſtphalia on the eaſt, and by Flanders, Brabant, and the dutchy of Cleves on the ſouth; lying between 3° 20′ and 7° 30′ eaſt longitude, and between 51° 35′ and 52° 40′ north latitude; being about fifty miles long, and as many broad, including the Zuyder-ſea, which takes up a conſiderable ſpace within theſe limits. See NETHERLANDS, PROVINCES, ZEALAND, &c.

UNITY, in poetry. In the drama there are three unities to be obſerved, *viz.* the unity of action, that of time, and that of place. In the epic poem, the great, and almoſt only, unity, is that of the action. Some regard, indeed, ought to be had to that of time; that of place there is no room for. The unity of character is not reckoned among the unities. See EPIC, &c.

The unity of the dramatic action conſiſts of the unity of the intrigue in comedy, and that of the danger in tragedy; and this not only in the plan of the fable, but alſo in the fable extended and filled with epiſodes. See COMEDY, &c.

The epiſodes are to be worked in without corrupting the unity, or forming a double action; and the ſeveral members are to be ſo connected together, as to be conſtent with that continuity of action ſo neceſſary to the body, and which Horace preſcribes, when he ſays,

Sit quodvis ſimplex duntaxat & unum.

See the article EPISODE.

The unity of the epic action, Mr. Dacier obſerves, does not conſiſt in the unity of the hero, or in the unity of his character and manners, though theſe be circumſtances neceſſary thereto. The unity of action requires that there be but one principal action, of which all the reſt are to be incidents or dependencies. See ACTION. F. Boſſu aſſigns three things requiſite thereto; the firſt, that no epiſode be uſed but what is fetched from the plan and ground of the action, and which is a natural member of that body; the ſecond, that the epiſodes and members be well connected with each other; the third, is not to finiſh any epiſode, ſo as it may appear a whole action, but to let each be always ſeen in its quality of member of the body, and an unfiniſhed part.

UNITY *of poſſeſſion*, in law, ſignifies a joint poſſeſſion of two rights by ſeveral titles.

UNIVERSAL, ſomething that is common to many things; or it is one thing belonging to many, or all things.

In logic, univerſal is either complex or incomplex. A complex univerſal is either an univerſal propoſition, as every whole is greater than its part; or whatever raiſes a manifold conception in the mind, as the definition of a reaſonable animal. An incomplex univerſal, is what produces only one conception in the mind, and is a ſimple thing reſpecting many; as human nature, which relates to every individual wherein it is found.

UNIVERSALITY, that quality which denominates a thing univerſal. See the preceding article.

UNIVERSE, a collective name, ſignifying the whole world, or the aſſemblage of heaven and earth, with all things therein. See HEAVEN and EARTH.

As ſpace is, in its own nature, every way infinite, it gives us an idea of the infinity of the univerſe, which can therefore be only in part comprehended by us: and that part of the univerſe which we can have any notion of, is that which is the ſubject of our ſenſes; and of this the eye preſents us with an idea of a vaſt extended proſpect, and the appearance of various ſorts of bodies diſſeminated thro' the ſame.

The infinite abyſs of ſpace, which the Greeks call τὸ κενὸν, the Latins *inane*, and we the univerſe, does undoubtedly comprehend an infinity of ſyſtems of moving bodies round one very large central one, which the Romans called *ſol*, and we the ſun. This collection of bodies is therefore properly called the ſolar ſyſtem, and ſometimes the mundane ſyſtem, from the latin word *mundus*, the world. See the article SYSTEM.

That the univerſe contains as many ſolar ſyſtems or worlds, as there are what we call fixed ſtars, ſeems reaſonable to infer from hence, that our ſun, removed to the diſtance of a ſtar, would appear juſt as a ſtar does, and all the bodies moving about it, would diſappear entirely. Now the reaſon why they diſappear, is because they are opake bodies, and too ſmall to be ſeen at ſo great a diſtance, without an intenſe degree of light; whereas theirs is the weakeſt that can be, as being firſt borrowed,

borrowed, and then reflected to the eye. See the article STAR.

But the ſun, by reaſon of his immenſe bulk and innate light, which is the ſtrongeſt poſſible, will be viſible at an immenſe diſtance; but the greater the diſtance, the leſs bright it will appear, and of a leſſer magnitude: and therefore every ſtar of every magnitude, may probably be a ſun like our own, informing a ſyſtem of planets, or moving bodies, each of which may be inhabited like our earth, with various kinds of animals, and ſtored with vegetable and other ſubſtances.

We can perceive, ſays Mr. Mac Laurin, no bounds of the vaſt expanſe in which natural cauſes operate; nor can we fix any border or termination of the univerſe; and we are equally at a loſs to trace things to their elements, and to diſcover the limits which incloſe the ſubdiviſions of matter. The objects, which we commonly call great, vaniſh when we contemplate the vaſt body of the earth: the terraqueous globe itſelf is ſoon loſt in the ſolar ſyſtem; being in ſome parts ſeen as a planet, or diſtant ſtar; and, in great part of the ſyſtem unknown, or viſible only at rare times to vigilant obſervers, aſſiſted perhaps with inſtruments like our teleſcopes. The ſun itſelf dwindles into a ſtar: ſaturn's vaſt orbit, and the orbits of all the comets, croud into a point, when viewed from numberleſs places between the earth and the neareſt fixed ſtars. Other ſuns illuminate other ſyſtems, where our ſun's rays are unperceived: but all theſe alſo are ſwallowed up in the vaſt expanſe of the univerſe. Even all the ſyſtems of the ſtars that ſparkle in the cleareſt ſky, muſt poſſeſs a ſmall corner only of that ſpace over which ſuch ſyſtems are diſperſed. And after we have riſen ſo high, and left all definite meaſures ſo far behind us, we find ourſelves no nearer to a term or limit; for all this is nothing to what may be diſplayed in the infinite expanſe, beyond the remoteſt ſtars that ever have been diſcovered.

In this view of the univerſe, an auguſt idea ariſes in the mind, worthy of the infinite and wiſe author of nature, who can never be ſuppoſed to have created ſo many glorious orbs, to anſwer ſo trifling a purpoſe as the twinkling to mortals by night now and then; beſides that the far greateſt part of the ſtars are never ſeen by us at all, as has been ſhewn under STAR.

UNIVERSITY, *univerſitas*, a collective term, applied to an aſſemblage of ſeveral colleges, eſtabliſhed in a city, or out town, wherein are profeſſors in the ſeveral ſciences, appointed to teach them to ſtudents; and where degrees or certificates of ſtudy in the divers faculties are taken up. See ART and SCIENCE.

In each univerſity four faculties are uſually taught, theology, medicine, law, and the arts and ſciences. See the article THEOLOGY, *&c.*

They are called univerſities, or univerſal ſchools, by reaſon the four faculties are ſuppoſed to take in the whole compaſs of ſtudy. See FACULTY.

In the eye of the law, an univerſity is held a mere lay body, or community; though, in reality, it be a mixed body, compoſed partly of laymen, and partly of eccleſiaſtics. See COMMUNITY, *&c.*

Univerſities had their firſt riſe in the XIIth and XIIIth centuries. Thoſe of Paris and Bologna pretend to be the firſt that were ſet on foot; but then they were on a different footing from the univerſities among us. See SEMINARY and SCHOOL.

Our own univerſities, of Oxford and Cambridge, ſeem intitled to the greateſt antiquity of any in the world; and Baliol and Merton colleges in Oxford, and St. Peter's in Cambridge, all made colleges in the XIIIth century, may be ſaid to be the firſt regular endowments of this kind in Europe.

For though Univerſity college in Cambridge had been a place for ſtudents ever ſince the year 872, yet this, like many of the other antient colleges beyond ſea, and Leyden to this day, was no proper college; but the ſtudents, without any diſtinction of habit, lived in citizens houſes, having only meeting places to hear lectures and diſpute.

In after-times there were houſes built for the ſtudents to live in ſociety; only each to be at his own charge, as in the inns of courts: theſe, at firſt, were called inns, but now halls. At laſt, plentiful revenues were ſettled on ſeveral of theſe halls, to maintain the ſtudents in diet, apparel, *&c.* and theſe were called colleges. See OXFORD, CAMBRIDGE, and COLLEGE.

The univerſities of Oxford and Cambridge are governed, next under the king, by a chancellor, who is to take care of the government of the whole univerſity, to maintain the liberties thereof, *&c.* Under him is the high-ſteward, whoſe office is to aſſiſt the chancellor, and other officers,

officers, when required, in the execution of their offices, and to hear and determine capital cauſes, according to the laws of the land, and the privileges of the univerſity. The next officer is the vice-chancellor, who officiates for the chancellor in his abſence. There are alſo two proctors, who aſſiſt in the government of the univerſity, particularly in the buſineſs of ſchool-exerciſe, taking up degrees, puniſhing violators of the ſtatutes, *&c.* Add to theſe a public orator, keeper of records, regiſter, beadles, and verger. The univerſities of Scotland are four, *viz.* thoſe of St. Andrews, Aberdeen, Edinburgh, and Glaſgow. See the articles *St.* ANDREW'S, ABERDEEN, *&c.* In Ireland there is only one univerſity, *viz.* that of Dublin. See DUBLIN.

UNIVOCAL, in the ſchools, is applied to two or more names, or terms, that have but one ſignification, in oppoſition to equivocal, which is where one term has two or more ſignifications. See EQUIVOCAL. Our univocal terms are ſuch, whoſe name as well as nature, is the ſame, in oppoſition to equivocals, whoſe names are the ſame, but their natures very different.

The antients believed that all perfect animals were produced by univocal generation; that is, by the ſole union or copulation of a male and female of the ſame ſpecies or denomination; and that inſects were produced by equivocal generation, without any ſeed, and merely of the corruption of the earth, exhaled, and, as it were, impregnated, by the ſun's rays: but this doctrine of inſects is now exploded. See GENERATION.

UNLAWFUL, illegal, ſomething prohibited by, or contrary to, the terms of law, either divine or human. See LAW.

UNLAWFUL ASSEMBLY, the meeting of three or more perſons together, by force to commit ſome unlawful act, as to aſſault any perſon, to enter his houſe or land, *&c.* and thus abiding together, whether they attempt the execution or not. See the article RIOT.

UNLIMITED, or INDETERMINATE PROBLEM, is ſuch a one as is capable of infinite ſolutions. See PROBLEM.

UNMOOR, a term uſed at ſea: when a veſſel which was riding at anchor weighs the ſame, or gets it up, in order to ſail, they ſay ſhe is unmooring.

UNNA, a town of Weſtphalia, thirty-five miles ſouth of Munſter, ſubject to the king of Pruſſia.

UNNA is alſo a river of Boſnia, forming part of the boundary between Chriſtendom and Turky, and falling into the Save.

UNSEELING, in falconry, is the taking away the thread that runs through a hawk's eye-lids, and hinders its ſight.

VOCABULARY, *vocabularium*, in grammar, denotes the collection of the words of a language, with their ſignifications, otherwiſe called a dictionary, lexicon, or nomenclature. See DICTIONARY, *&c.* A vocabulary is properly a leſſer kind of dictionary, which does not enter ſo minutely into the origins and different acceptations of words. See WORD.

VOCAL, ſomething that relates to the voice or ſpeech: thus vocal muſic is that ſet to words, eſpecially verſes, and to be performed by the voice, in contradiſtinction to inſtrumental muſic, compoſed only for inſtruments, without ſinging. See the articles VOICE, VERSE, *&c.*

VOCATIVE, in grammar, the fifth ſtate or caſe of nouns. See the articles NOUN and CASE.

When we name the perſon we are ſpeaking to, or addreſs ourſelves to the thing we are ſpeaking of, as if it were a perſon, the noun, or name, requires a new relation, which the Latins and Greeks expreſs by a new termination, called the vocative; as from *dominus, a lord*, is formed the vocative *domine, o lord.*

In engliſh, and moſt of the modern languages, the vocative is expreſſed in nouns that have an article in the nominative, by omitting that article; as, *the Lord is my hope; Lord, thou art my hope:* though, on many occaſions, we uſe an interjection.

VOGHERA, a town of the dutchy of Milan, in Italy, fifteen miles ſouth-weſt of Pavia.

VOICE, *vox*, a ſound produced in the throat and mouth of an animal, by an apparatus of inſtruments for that purpoſe. See the article SOUND.

Voices are either articulate or inarticulate. Articulate voices are thoſe whereof ſeveral conſpire together to form ſome aſſemblage or little ſyſtem of ſounds; ſuch are the voices expreſſing the letters of an alphabet, numbers of which joined together, form words. Inarticulate voices are ſuch as are not organized, or aſſembled into words; ſuch is the barking of dogs, the braying of aſſes, the hiſſing of ſerpents, the ſinging of birds, *&c.*

The

The formation of the human voice, with all the varieties thereof obſerved in ſpeech, muſic, &c. makes a very curious article of inquiry; and the apparatus and organiſm of the parts adminiſtring thereto, is ſomething exceedingly ſurpriſing. Thoſe parts are the trachea or wind-pipe, through which the air paſſes and repaſſes into the lungs; the larynx, which is a ſhort cylindric canal at the head of the trachea; and the glottis, which is a little oval cleft or chink left between two ſemicircular membranes ſtretched horizontally withinſide the larynx; which membranes, though capable of joining cloſe together, do generally leave an interval, either greater or leſs, between them, called the glottis. A particular deſcription of each part may be ſeen under the articles TRACHEA, LARYNX, and GLOTTIS.

The long canal of the trachea, terminated at top with the glottis, appears ſo like a flute, that the antients made no doubt but the trachea contributed the ſame to the voice, as the body of the flute does to the ſound of that inſtrument. Galen himſelf fell in ſome meaſure into the miſtake; he perceived, indeed, that the principal organ of the voice was the glottis, but he ſtill allowed the trachea a conſiderable ſhare in the production of the ſound. Galen's opinion was followed by all the antients after him, and even by all the moderns before M. Dodart: but that author obſerves, that we do not either ſpeak or ſing when we inſpire or take in the air, but only when we expire or expel it; and that the air coming out of the lungs, paſſes always out of the minuter veſſicles of that part into larger, and at laſt into the trachea itſelf, which is the largeſt of all: that thus its paſſage becoming ſtill more free and eaſy, and thus more than ever in the trachea, it can never undergo ſuch a violence, and acquire ſuch a velocity in that canal, as is required to the production of ſound: but that as the aperture of the glottis is very ſmall, in compariſon with the width of the trachea, the air can never get out of the trachea by the glottis, without a vaſt compreſſion and augmentation of its velocity; and that by this means in paſſing, it communicates a briſk agitation to the minute parts of the two lips of the glottis, and gives them a kind of ſpring, and occaſions them to make vibrations, which communicated to the paſſing air, are what really occaſion the ſound. The ſound thus formed, proceeds into the cavity of the mouth and noſtrils, where it is reflected and refounds; and on this reſonance, M. Dodart ſhews, it is that the agreeableneſs of the voice intirely depends. The different conſiſtences, forms, &c. of the divers parts of the mouth, contribute to the reſonance, each in their way; and from this mixture of ſo many different reſonances in their due proportion, there reſults an harmony in the human voice inimitable by any muſician. Hence it is, that when any of theſe parts are diſordered, *e. g.* when the noſe is ſtopped, the voice becomes diſpleaſing. This reſonance in the cavity of the mouth, does not ſeem to conſiſt in a ſimple reflection, ſuch as that of a vault, &c. but in a reſonance proportionate to the tones of the ſound ſent into the mouth from the glottis; and accordingly we find this cavity to lengthen and ſhorten itſelf, according to the depth or acuteneſs of the tone. See the articles SOUND, TONE, &c.

As the organs that form the voice make a kind of wind inſtrument, one might imagine to find ſome proviſion therein anſwerable to that which produces the difference of tones in ſome other wind-inſtruments. The tone, therefore, muſt be attributed either to the mouth and noſtrils, which occaſion the reſonance, or to the glottis, which produces the ſound: and as all the different tones are produced in man by the ſame inſtrument, it follows, that the part which produces them, muſt be capable of changes anſwerable thereto. The different apertures of the lips of the glottis, it is proved, produce all the different tones in the ſeveral parts of muſic, and the manner is thus. The voice, it is ſhewn, can only be formed by the glottis, but the tones of the voice are modifications of the voice, and theſe can only be produced by the modifications of the glottis. Now the glottis is capable only of one modification, which is the mutual approach or receſs of its lips; it is this, therefore, produces the different tones. Now that modification includes two circumſtances; the firſt and principal is, that the lips are ſtretched more and more from the loweſt tone to the higheſt: the ſecond is, that the more they are ſtretched, the nearer they approach. From the firſt, it follows, that their vibrations will be ſo much the quicker, as they come neareſt their higheſt tone; and that the voice

will

will be juſt, when the two lips are equally ſtretched; and falſe, when unequally; which agrees perfectly well with the nature of ſtring inſtruments. From the ſecond, it follows, that the higher the tones are, the nearer will they approach to each other, which agrees perfectly well with inſtruments governed by reeds or plugs.

The degrees of tenſion of the lips, are the firſt and principal cauſe of tones, but their differences are inſenſible; the degrees of approach are only conſequences of that tenſion, but their differences are more eaſily aſſigned. They are different apertures that produce, or at leaſt that accompany, different tones, both in natural wind-inſtruments, and artificial ones; and the diminution of the aperture, raiſes the tones both of the glottis, and the reed.

VOICE, in grammar, a circumſtance in verbs, whereby they come to be conſidered as either active or paſſive, *i. e.* either expreſſing an action impreſſed on another ſubject, as, *I beat*, or receiving it from another, as, *I am beaten*. See the articles ACTIVE and PASSIVE.

The Greeks have a third voice, called the medial voice, thus denominated, becauſe it has ſometimes an active and ſometimes a paſſive ſignification; though generally it is of an active ſignification. With regard to the termination of this medial voice, it is to be obſerved, that the preſent and imperfect tenſes are the ſame with thoſe of the paſſive voice; or, in other words, when theſe tenſes of the paſſive voice are taken actively, they are then denominated of the medial voice.

VOICE, in matters of election, denotes a vote or ſuffrage. See the article VOTE. In this ſenſe a man is ſaid to have a deliberative voice, when he has a right to give his advice and opinion in a matter of debate, and his ſuffrage is taken. An active voice, when he gives his vote for the election of any one; and a paſſive voice, when the ſuffrages may fall on himſelf to be elected. An excitative voice, when he may act to procure another to be elected. A conſultative voice, when he can only offer reaſons and remonſtrances, whereon the chief or head determines at his own diſcretion.

VOID SPACE, in phyſics. See the article VACUUM, *&c.*

VOID and VOIDABLE, are terms frequently uſed in our law; as a thing that is done contrary to law at the time of the doing, it is ſaid to be void, and no perſon ſhall be bound thereby. But where a thing is only voidable, and not void, though it be what the perſon that did it ought not to have done, yet when it is done, the doer cannot avoid the ſame, notwithſtanding by ſome act in law it may be void in his heir, *&c.* It has been held that the bond of an infant, or one non compos mentis, is void, becauſe the law has not appointed the doing any thing to avoid ſuch bonds. A leaſe for term of life, which is voidable, muſt be made void by re-entry, *&c.* and a deed is generally avoided by ſpecial pleading.

VOIDANCE, or VACANCY, in the canon law, a want of an incumbent upon a benefice, *&c.* See the articles AVOIDANCE and VACANCY.

VOIDED, in heraldry, is underſtood of an ordinary whoſe inner or middle part is cut out, leaving nothing but its edges to ſhew its form, ſo that the field appears through it. Hence it is needleſs to expreſs the colour or metal of the voided part, becauſe it muſt of courſe be that of the field. The croſs voided, differs from the croſs fimbriated, in that the latter does not ſhew the field through it, as the other does; and the ſame obtains in other ordinaries.

VOIDER, in heraldry, one of the ordinaries whoſe figure is much like that of a flaſk or flanch, only that it doth not bend ſo much. See plate CCXCVII. fig. 5.

VOIDING, or EVACUATING, in medicine. See EVACUATION.

VOIR-DIRE, in law, a term uſed where there is a buſy evidence not otherwiſe to be excepted againſt, and it is prayed upon a trial at law that the witneſs may on oath ſpeak the truth, whether he ſhall get or loſe by the matter in controverſy; and in caſe it appears that he is unconcerned and diſintereſted, his teſtimony is allowed, otherwiſe it is not. A witneſs upon a voir-dire, may be examined by the court if he be not a party intereſted in the cauſe, as well as the party for whom he is an evidence, *viz.* the plaintiff or defendant.

VOL, among heralds, ſignifies the two wings of a fowl joined together, borne in armoury, as being the whole that makes the flight. Accordingly, a demi-vol is a ſingle wing.

VOLA, the palm or inſide of the hand, comprehended between the fingers and the wriſt.

VOLANO, or VALONA, a port-town of Italy, in the pope's territory, and dutchy of Ferrara, ſituated on one of the mouths of the Po, on the gulph of Venice, forty miles eaſt of Ferrara.

VOLANT, in heraldry, is when a bird in a coat of arms is drawn flying, or having its wings ſpread out.

VOLATILE, in phyſics, is commonly uſed to denote a mixed body whoſe integral parts are eaſily diſſipated by fire or heat; but it is more properly uſed for bodies whoſe elements or firſt component parts are eaſily ſeparated from each other, and diſperſed in air. For as any mixed body is ſaid to be fixed in a double ſenſe, ſo may it be ſaid to be volatile two ways; whence the ſame body, *e. gr.* mercury, is both volatile and fixed at the ſame time; ſince, as its integral parts, or thoſe which ſtill retain the nature of mercury, are eaſily ſeparable by fire, and readily flies away, it is ſaid to be volatile; and yet as it is very difficult to deſtroy its contexture, and reſolve it by fire, or any other menſtruum, into its firſt elements, it is ſaid to be fixed; the ſame may be ſaid of ſulphur, antimony, *&c.* See FIXED BODIES.

Minerals, for the generality, are leſs volatile than vegetables, and vegetables are leſs ſo than animals. The chemiſts diſtinguiſh greatly between volatile ſalts and fixed ſalts. The capitals of aludels ſtop and collect the volatile parts of ſubſtances in ſublimation, and make what we call flowers. See FLOWERS, SALTS, *&c.*

The particles of fluids which do not cohere very ſtrongly together, ſays Sir Iſaac Newton, and are of ſuch a ſmallneſs as renders them moſt ſuſceptible of thoſe agitations which keep liquors in a fluor, are moſt eaſily ſeparated and rarified into vapour; and, in the language of the chemiſts, they are volatile, rarifying with an eaſy heat, and condenſing with cold. But thoſe which are groſſer, and by that means leſs ſuſceptible of agitation, or cohere by a ſtronger attraction, are not ſeparated without a ſtronger heat, or perhaps not without fermentation; theſe are what the chemiſts call fixed bodies.

When the fire decompounds any mixed body, the parts moſt diſpoſed to receive a great motion are ſooneſt looſened, and riſe up in the order which the differences of that diſpoſition give them, the reſt remaining immoveable at the bottom of the veſſel. Thoſe that riſe firſt, are called volatile parts; ſuch are phlegm, oil, ſpirits and ſalts, both urinous and alkalious. The parts remaining, *viz.* earth and lixivial ſalts, are called fixed. See the articles PHLEGM, OIL, *&c.*

VOLATILISATION, or VOLATILIZATION, the act of rendering fixed bodies volatile, or of reſolving them by fire into a fine ſubtile vapour or ſpirit, which eaſily diſſipates and flies away. All bodies, even the moſt fixed, as gold, may be volatilized; either of themſelves, or with the admixture of ſome volatile ſubſtance, or ſpirit, by diſtillation or ſublimation. See the articles GOLD, DISTILLATION, *&c.*

VOLATILITY. See VOLATILE and SUBLIMATION.

VOLCANO, or VULCANO. See the article VULCANO.

VOLERY, a great bird-cage, ſo large that the birds have room to fly up and down in it.

VOLHINIA, or VOLONIA, a province of Poland, bounded by Poleſia, on the north; by the lower Volhinia, or Ukrain, in the territories of Ruſſia, on the eaſt; by Podolia, on the ſouth; and by the province of Red Ruſſia, on the weſt.

VOLITION, the act of willing. See the article WILLING.

VOLKAMERIA, in botany, a genus of the *didynamia-angioſpermia* claſs of plants, the corolla whereof conſiſts of a ringent, ſingle petal: the tube is cylindric, and twice the length of the cup: the limb is divided into five plane ſegments: the fruit is a roundiſh bilocular capſule; the ſeed is a ſingle bilocular nut.

VOLLEY, a military ſalute, made by diſcharging a great number of fire-arms at the ſame time.

VOLO, in roman antiquity, an appellation given to the ſlaves, who, during the ſecond punic war, offered themſelves to ſerve in the army.

VOLT, or VOLTE, in the manege, a round or circular tread; and hence, by the phraſe, to make volts, is underſtood a gate of two treads, made by a horſe going ſideways round a center, in ſuch a manner, that theſe two treads make parallel tracts, one larger made by the fore feet, and another ſmaller made by the hind feet, the croup approaching towards the center, and the ſhoulders bearing outwards. Sometimes the volt is of one tread; as when a horſe makes volts in corvets, and in caprioles, ſo that the haunches follow the ſhoulders, and move forwards

forwards on the ſame tread. In general, the way and tract of a volt is made ſometimes round, ſometimes oval, and ſometimes ſquare, of four ſtraight lines; ſo that theſe treads, whether round or ſquare, incloſe a terrain, or manege-ground, the middle of which is ſometimes diſtinguiſhed by a pillar, or elſe by an imaginary center, which is there ſuppoſed in order to regulate the diſtances and the juſtneſs of the volt.

A demi-volt is a demi-round of one or two treads, made by the horſe at one of the corners of the volt, or elſe at the end of the line of the paſſade; ſo that being near the end of this line, or one of the corners of the volt, he changes hands, to return by a ſemi-circle.

A renverſed volt, is a tract of two treads, made by the horſe, with his head to the center, and his croup out; ſo that he goes ſide-ways upon a walk, trot, or gallop, and traces out a ſmall circumference with his ſhoulders, and a larger one with his croup.

This different ſituation of the ſhoulders and the croup, with reſpect to the center, gave this volt the name of renverſed, as being oppoſite in ſituation to the former.

VOLTA, a river of Guinea, in Africa, which running from north to ſouth, falls into the ocean eaſt of Acra.

VOLTERRA, a town of Tuſcany, in Italy, twenty-three miles ſouth of Florence.

VOLTURARA, a town of the kingdom of Naples, fifty-five miles north-eaſt of the city of Naples.

VOLTURNO, a river of the kingdom of Naples, which, riſing in the province of Moliſe, runs by Capua, and falls into the gulph of Gaieta.

VOLUBILIS, in botany, a name uſed by Dillenius for a ſpecies of convolvulus. See the article CONVOLVULUS.

VOLUME, *volumen*, in matters of literature, a book, or writing, of a juſt bulk to be bound by itſelf. The name is derived from the Latin *volvere*, to roll up; the antient manner of making up books being in rolls of bark or parchment. See the articles BOOK, TOME, *&c.*

Foreign philoſophers uſe the phraſe, volume of a body, for its bulk, or the ſpace incloſed within its ſuperficies. See the articles BODY, SOLID, *&c.*

VOLUMUS, in law, the firſt word of a clauſe in one ſpecies of the king's writs of protection and letters-patent.

VOLUNT, *voluntas*, in law, is when a tenant holds lands, *&c.* at the will of the leſſor, or lord of the manor. See the article TENURE.

VOLUNTARY, in muſic, a piece played by a muſician extempore, according to his fancy. This is often uſed before he begins to ſet himſelf to play any particular compoſition, to try the inſtrument, and to lead him into the key of the piece he intends to perform.

VOLUTA, in natural hiſtory, a genus of univalve ſhells, with an oblong mouth, a clavicle ſometimes erect and ſometimes depreſſed, and ſometimes coronated at top. To this genus belong the admiral-ſhells, tiger-ſhells, *&c.* See ADMIRAL and TIGER.

VOLUTE, *voluta*, in architecture, a kind of ſpiral ſcroll, uſed in the ionic and compoſite capitals, whereof it makes the principal characteriſtic and ornament. See IONIC and COMPOSITE.

There are ſeveral diverſities practiſed in the volute. In ſome, the liſt or edge, throughout all the circumvolutions, is in the ſame line or plane; ſuch are the antique ionic volutes, and thoſe of Vignola. In others, the ſpires or circumvolutions fall back; in others, project, and ſtand out. Again, in ſome, the circumvolutions are oval, in others, the canal of one circumvolution is detached from the liſt of another by a vacuity or aperture. In others, the rind is parallel to the abacus, and ſprings out from behind the flower thereof. In others, it ſeems to ſpring out of the vaſe from behind the ovum, and riſes to the abacus, as in moſt of the fine compoſite capitals.

VOLVULUS, in medicine, a name which ſome authors give to the iliac paſſion, by others called chordapſus, and by others miſerere mei. See ILIAC.

VOMER, in anatomy, a bone of the upper-jaw, ſituated between the bones of the palate and the ſphenoidal bone, being alſo joined to the proceſs of the ethmoides, and part of the lower jaw, and having its fore-part, which is ſpongy, continued to the middle cartilage of the noſe, and making, in conjunction with it, the ſeptum nari. See NOSE and MAXILLA.

VOMICA, in medicine, is commonly taken for a ſuppurated impoſthume, or an abſceſs with a ſuppuration. See ABSCESS, *&c.* The vomica pulmonum is a latent diſeaſe of the lungs, which often deceives under a ſhew of health. What goes by this name, is a ſmall abſceſs ſeated in ſome part of the lungs, and ſtraitly in-

cloſed within a bag or membrane. This diſorder is moſt incident to thoſe who are afflicted with a tabes, or labour under an anaſtomoſis or ruptuie of a vein in the lungs. In this diſeaſe, the breath ſmells ill long before the vomica breaks; ſometimes blood comes up with coughing, the body is perfectly dull and heavy, and the cough very long and troubleſome, and ſometimes followed by an expectoration of the vomica, in which caſe the patient is ſeized with no ſmall fever, ſucceeded by bloody ſpit, and a vaſt perturbation of body; the conſequence of which circumſtance may poſſibly be a recovery to a good ſtate of health. It has often happened that the vomica, by a ſudden rupture, has diſcharged itſelf into the heart, and occaſioned ſudden and unexpected death. See PHTHISIS.

Nux VOMICA, in pharmacy, a flat, compreſſed round fruit, of the breadth of a ſhilling, or ſomewhat more, and of about the thickneſs of a crown-piece. Its ſurface is not much wrinkled or corrugated, but ſometimes marked with tolerably regular fibres, running from the center to the circumference; it is ſomewhat downy or woolly, and of an extreme firm texture, tough like horn, and of a pale greyiſh-brown colour. It has a ſort of umbilicus on each ſide of the center, and is more prominent on one ſide, and more depreſſed on the other; it is very difficultly cut or broken, and leaves a ſmooth and gloſſy ſurface behind the knife; it is moderately heavy, and is of a ſomewhat paler colour within than on the ſurface; it has no ſmell, but an extremely bitter taſte. We have it only from the Eaſt-Indies, whence it is brought with another drug called the lignum colubrinum. It was held by many to be the root of a plant, and by others to be a fungus or an excrement. But it is in reality the nucleus of a fruit of an Eaſt-Indian tree, the wood of which is the lignum colubrinum of the ſhops. See COLUBRINUM.

Some have preſcribed ſmall doſes of the nux vomica as a ſpecific againſt a gonorrhœa, and others againſt quartan agues. But we have ſo many good and ſafe medicines for all theſe purpoſes, that there ſeems no occaſion for our having recourſe to ſuch as theſe, which ſhew ſo many ſigns of miſchief.

There is another ſpecies of the nux vomica, deſcribed by Breynius, under the name of modira caniram, and nux vomica officinarum vera. Commelin determines this tree, not the former, to afford the true nux vomica, and the true lignum colubrinum of the ſhops; and Herman, on the other hand, is as poſitive as to the other. There is alſo another ſort of nux vomica, which is much ſmaller than the former, very like them, and has all their qualities: it is the fruit of another ſpecies of the ſame genus, which is the tree that furniſhes the true officinal wood.

VOMIT, or EMETIC, in pharmacy. See the article EMETIC.

VOMITING, in medicine, a retrograde ſpaſmodic motion of the muſcular fibres of the oeſophagus, ſtomach, and inteſtines, attended with ſtrong convulſions of the muſcles of the abdomen and diaphragm, which, when gentle, create a nauſea; when violent, a vomiting. Theſe convulſive diſorders proceed from the immoderate quantity, or acrimony of the food; from poiſons; from ſome injury of the brain, as a wound, contuſion, compreſſion, or inflammation of that part; from an inflammation of the diaphragm, ſtomach, inteſtines, ſpleen, liver, kidneys, pancreas, or meſentery; from an irritation of the gula; from a diſorderly motion of the ſpirits, by unaccuſtomed agitations in a coach, ſhip, or otherwiſe, or from the idea of ſomething nauſeous.

The two principal curative indications to be obſerved are, firſt, to quiet and compoſe the convulſive and unruly motion of the ſtomach; and, ſecondly, to oppoſe and ſubdue the material cauſes of the diſorder.

The firſt intention is anſwered by corroborating and antiſpaſmodic medicines, ſuch as ſaffron and caſtor, with the teſtaceous powders, as coral, crabs-claws, and oyſter ſhells; powders compoſed of cinnamon, the leaves of mint, nutmeg, orange-peel, calamus aromaticus, and other ſuch ſimples, are alſo of great ſervice. And if anodynes are found neceſſary, the ſtorax pill, or Sydenham's laudanum, are to be given.

While theſe medicines are taken internally, there may alſo be applied outwardly, to the region of the ſtomach, ſuch things as have power to repreſs its diſorderly motions; of this kind are the oil of mint, nutmeg, and the like, with balſam of Peru: theſe oils may be reduced to a proper conſiſtence, with this balſam, for the ſpreading on leather, and laying on for ſome time. Hungary-water, and other the like ſpirits, are of great uſe alſo, rubbed on with the hand; and to theſe

may be added yeaſt, and the ſtrongeſt wine-vinegar applied hot to the part. Finally, an excellent application is balſam of Peru alone, reduced to the conſiſtence of a cataplaſm, with crumb of bread. The methods to be uſed to remove the material cauſes of the vomiting, are next to be conſidered: if it be of the pituitous kind, and owing to crudities in the primæ viæ, and a viſcid mucus ſticking to them, it is beſt cured by an emetic: if the vomiting of itſelf be found not ſufficient to carry off the ſordes which occaſion it, and the patient continues, after the fits of vomiting, afflicted with a nauſea and heart-burn; in this caſe, a large quantity of warm water, with a little butter, may ſerve the purpoſe; or if this be found inſufficient, a doſe of ipecacuanha is to be given.

VOORN, one of the iſlands of Holland, bounded by the river Maes, which divides it from the continent and the iſland of Iſſelmunde, on the north; by the ſea called the Bies-boſch, on the eaſt; by another branch of the Maes which divides it from the iſlands of Goree and Overflackee, on the ſouth; and by the German-ſea on the weſt; being about twenty-four miles long, and five broad.

VOPISCUS, a latin term uſed, in reſpect of twins in the womb, for that which comes to the perfect birth; the other being before excluded abortive.

VORTEX, in meteorology, a whirlwind, or ſudden, rapid, and violent motion of the air in gyres, or circles.

Vortex is alſo uſed for an eddy or whirlpool; or a body of water, in certain ſeas or rivers, which runs rapidly around, forming a ſort of cavity in the middle.

VORTEX, in the carteſian philoſophy, is a ſyſtem or collection of particles of matter moving the ſame way, and round the ſame axis. See CARTESIAN.

Such vortices are the grand machines, whereby thoſe philoſophers ſolve moſt of the motions and other phænomena of the heavenly bodies. Accordingly, the doctrine of theſe vortices makes a great part of the carteſian philoſophy.

But this doctrine of vortices is at beſt merely hypothetical. It does not pretend to ſhew by what laws and means the celeſtial motions are really effected, ſo much as by what means they poſſibly might, in caſe it ſhould have ſo pleaſed the Creator. But we have another principle which accounts for the ſame phænomena, as well, nay, better, than that of vortices; and which we plainly find has an actual exiſtence in the nature of things; and this is gravity, or the weight of bodies. See GRAVITATION, GRAVITY, &c.

The vortices then ſhould be caſt out of philoſophy, were it only that two different adequate cauſes of the ſame phænomena are inconſiſtent. See *Newtonian* PHILOSOPHY.

But we have other objections againſt it. For, 1. If the bodies of the planets and comets be carried round the ſun in vortices, the bodies of the parts of the vortex immediately inveſting them, muſt move with the ſame velocity, and in the ſame direction; and beſides, muſt have the ſame denſity, or the ſame vis inertiæ. But it is evident that the planets and comets move in the very ſame parts of the heavens, with different velocity and in different directions. It follows, therefore, that theſe parts of the vortex muſt revolve at the ſame time in different directions, and with different velocities; ſince one velocity and direction will be required for the paſſage of the planets, and another for that of comets. 2. If it were granted that ſeveral vortices were contained in the ſame ſpace, do penetrate each other, and revolve with divers motions; ſince thoſe motions muſt be conformable to thoſe of the bodies which are perfectly regular, and performed in conic ſections; it may be aſked, how they ſhould have been preſerved entire ſo many ages, and not diſturbed nor confounded by the adverſe actions and ſhocks of ſo much matter as they meet withal? 3. The number of comets is very great, and their motions perfectly regular, obſerving the ſame laws with the planets, and moving in conical orbits which are exceedingly excentric. Accordingly they move every way, and to all parts of the heavens, freely pervading the planetary regions, and going frequently contrary to the order of the ſigns; which would be impoſſible, unleſs theſe vortices were away. See COMET. 4. If the planets move round the ſun in vortices, thoſe parts of vortices next the planets, we have already obſerved, would be equally denſe with the planets themſelves, conſequently, the vortical matter, contiguous to the perimeter of the earth's orbit, would be as denſe as the earth itſelf; and that between the orbits of the earth and ſaturn, it muſt be as denſe or denſer. For a vortex cannot maintain itſelf, unleſs the more denſe parts be in the center, and the leſs denſe

towards

towards the circumference; and, ſince the periodical times of the planets are in a ſeſquialterate ratio of their diſtances from the ſun, the parts of the vortex muſt be in the ſame ratio. Whence it follows, that the centrifugal force of the parts will be reciprocally as the ſquares of the diſtances. Such, therefore, as are at a greater diſtance from the center, will endeavour to recede therefrom with the leſs force. Accordingly, if they be leſs denſe, they muſt give way to the greater force, whereby the parts nearer the center endeavour to riſe. Thus the more denſe will riſe, and the leſs denſe deſcend; and thus there will be a change of places, till the whole fluid matter of the vortex be ſo adjuſted, as it may reſt in æquilibrio. See PLANET, *&c.*

Thus will the greateſt part of the vortex, without the earth's orbit, have a degree of denſity and inactivity, not leſs than that of the earth itſelf. Whence the comets muſt meet with a very great reſiſtance, contrary to all appearances. See RESISTANCE.

VOTE, the ſuffrage or reſolve of each of the members of an aſſembly, where any affair is to be carried by a majority; but more particularly uſed for the reſolves of the members of either houſe of parliament. See PARLIAMENT.

VOTIVE MEDALS, thoſe on which are expreſſed the vows of the people for the emperors or empreſſes. See MEDAL.

VOUCHER, in law, is a perſon called into court, to make good another's warranty, who is either to defend the right againſt the demandant, or yield him other lands to the value, *&c.* See WARRANTY.

This extends to lands or tenements of freehold or inheritance, but not to any thing perſonal or mixed.

Here he that voucheth is called the voucher, and the perſon that is vouched is called the vouchee. There is alſo a foreign voucher when the tenant impleaded in a particular juriſdiction, voucheth one to warranty in ſome other county, out of the juriſdiction of that court, and prays that he may be ſummoned.

VOUCHER alſo ſignifies a receipt or acquittance in caſes of account.

VOUTENAI, a town of France, in the dutchy of Burgundy, twenty miles ſouth-eaſt of Auxerre.

VOW, a ſolemn and religious promiſe, or oath. See OATH.

The uſe of vows is found in moſt religions. They make up a conſiderable part of the pagan worſhip, being made either in conſequence of ſome deliverance, under ſome preſſing neceſſity, or for the ſucceſs of ſome enterprize. Among the Jews, all vows were to be voluntary, and made by perſons wholly in their own power; and if ſuch perſon made a vow, in any thing lawful and poſſible, he was obliged to fulfil it. If he appointed no particular time for accompliſhing his vow, he was bound to do it inſtantly, leſt by delay he ſhould prove leſs able, or be unwilling, to execute his promiſe. Among the romaniſts, a perſon is conſtituted a religious by taking three vows, that of poverty, chaſtity, and obedience.

VOWS, *vota*, among the Romans, ſignified ſacrifices, offerings, preſents and prayers made for the Cæſars and emperors, particularly for their proſperity and the continuance of their empire. Theſe were at firſt made every five years, then every fifteen, and afterwards every twenty, and were called quinquennalia, decennalia, and vincennalia.

VOWEL, *vocalis*, in grammar, a letter which affords a complete ſound of itſelf, or a letter ſo ſimple as only to need a bare opening of the mouth to make it heard, and to form a diſtinct voice. See the article LETTER.

The vowels are ſix in number, *viz.* A, E, I, O, U. Y, and are called vowels in contradiſtinction to certain other letters, which, depending on a particular application of ſome part of the mouth, as the teeth, lips or palate, can make no perfect ſound without an opening of the mouth, that is, without the addition of a vowel, and are therefore called conſonants. See the article CONSONANT.

Grammarians reckon alſo eight ſemi-vowels, *viz.* F, H, L, M, N, R, S, Z, ſo denominated becauſe they approach nearer a vowel in the pronunciation. Of theſe ſemi-vowels four, *viz.* L, M, N, R, are called liquid. See LIQUID.

VOX, or VOCEM NON HABERE, in law, a phraſe uſed by Bracton to ſignify an infamous perſon.

UPHOLSTER, UPHOLSTERER, or UPHOLDER, a tradeſman that makes beds, and all ſorts of furniture thereunto belonging, *&c.*

Upholſters, in carrying on their trade, are to ſtuff their beds with one ſort of dry pulled feathers, and not mix any other therewith, on pain of forfeiting the ſame, or the value; and their ſtuffing for quilts is to be clean wool, or flocks, without uſing

uſing any horſe hair, &c. therein, under the like pain. See BED, &c.

UPLAND, denotes high ground, or, as ſome call it, terra firma, by which it ſtands oppoſed to ſuch as is mooriſh, marſhy, or low.

The uplands lie either on the tops of hills, or on their ſides, or on the ſlopes of riſing grounds. They ſometimes have a ſandy ſoil, ſometimes a rocky, gravelly, or loamy one; and ſometimes they conſiſt of a tough clay, or a black mould; they are uſed by the farmers, either for grazing or corn, as they happen to be more moiſt or more dry; and this difference depends upon their ſituation and nature. Theſe lands which lie flat upon the tops of hills, are uſually the drieſt, and thoſe which form the ſlopes or ſides, are generally the moiſteſt, becauſe of the wet that is continually oozing through them. The upland meadows have ſome diſadvantage, as they often need mending or feeding, which thoſe that lie lower do not; but then they make amends for this in their hay, which is always much finer and ſweeter that that of the low lands.

UPLAND, a province of Sweden, bounded by the province of Geſtricia on the north-weſt, by the Baltic-ſea on the north eaſt and ſouth-eaſt, and by Sunderland and Weſtmania on the ſouth and weſt.

UPPINGHAM, a market town of England, in the county of Rutland, ſituſated ſix miles ſouth of Okeham.

UPRIGHT, in architecture, a repreſentation or draught of the front of a building, called alſo an elevation or orthography. See ELEVATION, &c.

UPRIGHT, in heraldry, is uſed in reſpect of ſhell fiſhes, as crevices, &c. when ſtanding erect in a coat. Inaſmuch as they want fins, they cannot, according to Guillim, be properly ſaid to be hauriant, that being a term appropriated to ſcaly fiſhes.

UPSAL, a city once the capital of the province of Upland, and of all Sweden, being the only archbiſhop's ſee in Scandinavia, and an univerſity, ſituated in eaſt long. 17° 30', north lat. 60°.

UPTON, a market-town of Worceſterſhire, nine miles ſouth of Worceſter.

UPUPA, the HOOPOE, in ornithology, a genus of birds with the beak arcuated, convex, compreſſed and equal, and having a furrow running along each ſide of it; there is a creſt on the head, which is capable of folding back. This is an extremely ſingular bird, but it is ſo thick covered with feathers, that it appears large in proportion to its weight; the head is large, and ornamented with an elegant creſt; the eyes are ſmall, but very bright and piercing; the tail is between four and five fingers breadth long, in the middle whereof there is an elegant ſpot of white, of the figure of a new moon; the back is variegated with black and white in an elegant manner; the legs are ſhort, and the outer toe is connected to the middle one ſome part of the way down, without the help of a membrane.

URACHUS, in anatomy, a membranous canal in the fœtus of quadrupeds in general, of a pyramidal figure, extended immediately from the fundus of the bladder to the navel, and after paſſing through this, it is by degrees enlarged, and makes its way into the allantois at right-angles each way, or nearly ſo, and conveys the urine from the bladder into the cavity of this membrane. In the human fœtus, the whole urachus is not pervious, or very rarely ſo; it is uſually found ſolid, in form of a ligament. It ſcarce appears probable, therefore, that it ſerves the office of diſcharging the urine from the bladder in this as in the former caſe, and eſpecially as there is no ſuch membrane as the allantois in the human body, nor any cavity formed for the reception of ſo great a quantity of fluid. See the articles FOETUS, ALLANTOIS, &c.

URANBURG, or URANIBURG, a caſtle of Denmark, ſituated on the little iſland of Huen, in the Sound, ſixteen miles north eaſt of Copenhagen. Here was the celebrated obſervatory built by that noble Dane Tycho Brahe, and furniſhed with inſtruments for obſerving the courſe and motions of the heavenly bodies.

URANOSCOPUS, the STAR-GAZER, in ichthyology, a ſpecies of trachinus, with numerous cirri on the under jaw. See the article TRACHINUS.

This fiſh is of an extremely ſingular figure; the body is rounded, a little depreſſed; the back broad, the ſides prominent, and the belly ſomewhat flatted; the head is large and depreſſed; the mouth divided, as it were, into three ſpines under the tongue, and the lower jaw turning upwards; the eyes are large and ſtand near one another, not on the ſides, but on the top of the head; ſo that the fiſh naturally looks ſtraight upward; the iris is of a gold-yellow, the pupil is of a bluiſh-black, the noſtrils have each a double aperture, and are placed at ſome diſtance under the eyes; the whole head, and the

coverings

coverings of the gills, are beſet with a great number of rough and ſharp tubercles; there are two back fins, the firſt has three prickly rays, the ſecond has fourteen; the pectoral fins have each ſixteen rays, the ventral ones have each five, and the pinna ani has thirteen. See plate CCXCVI. fig. 6.

URBINO, a province of Italy, in the pope's territory, bounded by Romania and the gulph of Venice on the north and eaſt, by the marquiſate of Ancona on the ſouth, and by Tuſcany on the weſt, being ſeventy miles long, and from twenty to fifty broad.

Urbino is alſo the capital of this province.

URDE', or URDE'E, in heraldry. A croſs urdé ſeems to be the ſame with what we otherwiſe call cleche, or chlechée. See CHLECHE.

UREDO, the blaſting or blighting of trees or herbs. See BLIGHTING.

It is ſometimes uſed by phyſicians for an itching or burning of the ſkin.

URENA, in botany, a genus of the *monadelphia-polyandria* claſs of plants, the corolla whereof conſiſts of five oblong, obtuſe, connated petals, broader than the apex, and narrower at the baſe; the fruit is a round echinated capſule, with five angles, conſiſting of five cells, and made up of five valves; the ſeeds are ſolitary, roundiſh, and compreſſed.

URETERS, *ουρητηρες*, in anatomy, two membranaceous tubes or pipes, nearly cylindric in figure, and of about the thickneſs of a quill: but their diameter is very uncertain. They ariſe from the kidney, one from each, and terminate in the urinary bladder. See KIDNEY.

At their origin in the kidneys they are expanded into the form of a funnel, and this expanſion makes the pelvis of the kidneys. See the article PELVIS.

At their termination, which is in the hinder and lower part of the bladder, they paſs obliquely in between its membranes, and open into the bladder by very narrow orifices, and can admit nothing into them from the bladder. They are not ſtraight, but ſomewhat bent, ſo as to reſemble the letter *S*; their ſubſtance is membranaceous, and they are compoſed of three coats: the firſt a common one, from the peritonæum; the ſecond, a thin muſcular one; and the third a nervous one, covered with a lubricous humour; and in this there are ſometimes diſcovered glands. The blood-veſſels and nerves come from the adjacent parts.

The uſe of the ureters is to receive the urine ſecreted in the kidneys from the pelvis, and to carry it to the urinary bladder. When theſe are obſtructed, a ſuppreſſion of urine is the conſequence; for there is no other way for the urine to get into the bladder but through them. They are often found of an unnatural ſize, owing to ſtones concreted from among the urine. See BLADDER, URINE, DYSURY, &c.

URETHRA, *ουρηθρα*, in anatomy, a membranaceous tube or canal, of a cylindric figure, ariſing from the neck of the bladder, and continued to the pudendum, ſerving to diſcharge or carry off the urine and ſemen.

The length of the urethra is very different in both ſexes. In man it is twelve or thirteen inches, from the neck of the bladder to the extremity of the glans. It is ſituated in a kind of narrow furrow, formed between the corpora cavernoſa, in the bottom or lower part of the penis. It does not run perfectly ſtraight, but is bent in a very ſingular manner. Its cavity is as large as that of a gooſe-quill. It is compoſed of two robuſt membranes, an exterior and interior; their ſubſtance is thin and tough, and between them there is a ſpongeous or cavernous matter, in which ſome authors pretend to have diſcovered glands, but this is uncertain. The bulb of the urethra is that part of it next to the proſtatæ; it is much thicker than the reſt of the tube, and is about an inch long, and in ſome meaſure reſembles a walnut. It is of a thick and ſpongy texture. The interior ſurface of the urethra, is full of roundiſh and oblong foraminulæ and furrows, out of which there may often be preſſed a thick viſcuous fluid, the uſe of which is to lubricate the urethra, and to defend it from the acrimony of the urine. See the articles PENIS, GLANS, &c.

The urethra or urinary paſſage in women, uſually called meatus urinarius, is ſituated ſtraight under the clitoris, and ſhews itſelf by a little eminence. Its length is about two fingers breadth; its diameter is greater than that in man, but ſomewhat narrower at the end than elſewhere. It is capable of great dilatation. There are in it certain little ducts, which convey to its inner ſurface a mucous humour, for lubricating and defending it from the acrimony of the urine, like thoſe in man; but their origin is uncertain.

URGEL,

URGEL, a town of Spain, in the province of Catalonia, capital of the territory of Urgel, ſituated on the river Segra, ſeventy-five miles north of Barcelona.

URI, one of the cantons of Switzerland; bounded by that of Switz, on the north; by Glaris and the Griſons, on the eaſt; by Underwald, on the ſouth; and by the Canton of Bern, on the weſt.

URIM and THUMMIM, among the antient Hebrews, a certain oracular manner of conſulting God, which was done by the high-prieſt dreſſed in his robes, and having on his pectoral, or breaſt-plate. Various have been the ſentiments of commentators concerning the urim and thummim. Joſephus, and ſeveral others, maintain that it meant the precious ſtones ſet in the high-prieſt's breaſt-plate, which by ſome extraordinary luſtre made known the will of God to thoſe who conſulted him. Spencer believes that the urim and thummim were two little golden figures ſhut up in the pectoral as in a purſe, which gave reſponſes with an articulate voice. In ſhort, there are as many opinions concerning the urim and thummim as there are particular authors that wrote about them. The ſafeſt opinion, according to Broughton, ſeems to be, that the words urim and thummim ſignify ſome divine virtue and power annexed to the breaſt-plate of the high-prieſt, by which an oraculous anſwer was obtained from God when he was conſulted by the high-prieſt; and that this was called urim and thummim to expreſs the clearneſs and perfection which theſe oracular anſwers always carried with them; for urim ſignifies light, and thummim perfection; theſe anſwers not being imperfect and ambiguous, like the heathen oracles, but clear and evident. The uſe made of the urim and thummim was to conſult God in difficult caſes relating to the whole ſtate of Iſrael; and ſometimes in caſes relating to the king, the ſanhedrim, the general of the army, or ſome other great perſonage.

URINAL, in medicine, a veſſel fit to receive and hold urine, and uſed accordingly for the convenience of ſick perſons. It is uſually of glaſs and crooked; and ſometimes it is filled with milk to aſſwage the pain of the gravel. See the articles URINE, STONE, and UROCRITERIUM.

URINAL, in chemiſtry, is an oblong, glaſs-veſſel, cloſed for making ſolutions, and ſo called from its reſemblance to the glaſſes in which urine is ſet to ſettle for the inſpection of the phyſician.

URINARIA FISTULA, or URINARY PASSAGE, the ſame with urethra. See the article URETHRA.

URINE, *urina*, a ſerous and ſaline fluid, of a citron-colour, ſeparated from the blood, and carried by the emulgent arteries to the kidneys, from whence it deſcends to the bladder by the ureters, and is, from time to time, emitted thence by the canal of the urethra. See BLOOD, ARTERY, *&c.*

The urine is therefore the ſerofity of the blood, but not pure, for it is loaded with ſaline, ſulphureous, and terreſtrial particles, of which it is the menſtruum and the vehicle. The ſides of the bladder are guarded by a mucilaginous fluid, excreted by the glands which are between its coats, by which means the urinous ſalts make the leſs impreſſion upon it. This fluid forms the glair which falls to the bottom of the veſſel when a perſon is afflicted with the ſtone. It is obſervable, that there are three ſorts of ſubſtances differently placed in the urine, *viz.* the nubecula, the encœorema, and the hypoſtaſis. The nubecula is a ſort of a pellicle which ſwims on the top of the urine, and conſiſts of the ſaline and fibrous particles of the blood mixed with the ſeroſity. When it is expoſed to the fire it changes to a cruſtaceous ſubſtance. The enæorema, or ſuſpenſion, is a white, light, ſpongious matter which ſwims in the middle of the urine, conſiſting of particles of a different nature. The hypoſtaſis, or ſediment, is a ſaline, ſulphureous, and terreſtrial matter, which precipitates to the bottom of the urine. See NUBECULA, *&c.*

The urine of four-footed beaſts is troubled and muddy, that of men is more clear and limpid. In infants it is more pale and thick than that of middle-aged perſons. In the very old it is more clear, thin, and has not ſo much colour. In hot, bilious conſtitutions, it is more of a ſaffron colour: in the cold and pituitous, pale. Wine drinkers have it of a higher colour, and more thick: in thoſe that uſe much exerciſe it is little and red: in the idle it is pale with a large ſediment. After meals it is copious, inſipid, light, raw, and without ſmell: and after long faſting, it is of a higher colour, acrid, and little. Thoſe that ſweat much make little water, which is more muddy and yellow. Diſeaſes cauſe a remarkable change in

urine. Light, thin, watry urine, ſhews the perſon to be afflicted with internal ſpaſms, the hyſteric paſſion, the hypochondriac pains, the cradialgia, the ſtone or gravel, or convulſive colic. In diſeaſes of the head, ſuch as the vertigo, phrenſy, madneſs, melancholy, and epilepſy, the urine is always thin and light. It is likewiſe the ſame in the more grievous afflictions of the nerves from poiſon or worms. This ſtate of the urine not only happens in the fits, but ſome days before and after. See SPASM, HYSTERIC *paſſion, &c.*

When the urine is thin, aqueous, and always white, it preſages danger in obſtinate diſeaſes if it is copious in the ſtate of fevers, and before the criſis, it portends a phrenſy. In internal inflammations it is always dangerous, the more copious the worſe. After a dyſentery, a ſpotted fever, or the ſmall pox, this kind of urine is common. In a cachexy, leucophlegmatia, enormous bleedings in the beginning of an anaſarca, in the green-ſickneſs, in a ſuppreſſion of the menſes, the urine is crude, turbid, pale, greeniſh, or of a light citron-colour, and copious. In all preternatural febrile heats, the urine is yellow or red, and in ſmall quantities: ſuch kind of urine as is more or leſs red, or thin and light, or thick and heavy, is uſually in intermitting and continual fevers. In the fit, that is, in its exerbation or ſtate, the urine is thin, clear, and without ſediment. In an ardent and bilious fever, the urine is generally pellucid, but of a flame-colour. In intermittents after the fit, and on the well day, it is thick, and depoſits a ſediment. If this happens in continual fevers after the criſis, it ſhews the fever to be ended. If the ſediment is of a roſy or purple-colour, it ſhews the blood is in fault, as is evident in continual fevers. When it is intenſely yellow, it diſcovers that the bile is in fault. When it is brown or black, there is plenty of black bile, as in a ſcorbutic or miliary fever, and in quartans of a dangerous nature. When it is very plentiful, and full of viſcid and crude humours, in replete, obeſe, and ſpongy bodies, it ſhews the obſtinacy of an intermitting fever. See DISEASE, FEVER, *&c.*

As it is a good ſign when the urine is thick and depoſites a ſediment, in fevers; ſo, on the contrary, if there is no ſediment in intermitting fevers, but the urine continues clear, and lets fall no ſediment in the cold fit, it is a very bad ſign. If, after the fit, it has no ſediment, but is pellucid, it is a very bad omen. In all inflammatory fevers, if the urine is clear and of a purple colour, or brown, and of a deep colour, frothy and without ſediment, it is a bad ſign. Likewiſe, it is always obſerved, that in a continual fever, if the urine is turbid, and does not grow clear either by the fire or reſt, nor depoſits a ſediment, it is a very dangerous preſage; it is likewiſe very bad, when in continual fevers, it is thick on the firſt days, and in the remainder, eſpecially the critical days, it is thin and without ſediment. In the decline of catarrhal fevers, and in the ſmall-pox and meaſles, if the urine was clear and aqueous, but is now thick and high-coloured, with a ſediment, it is a certain ſign that the diſeaſe remits. See the article INTERMITTING *Fevers.*

In conſumptions, and all other violent and chronical diſeaſes, if the urine is thick, high-coloured, and a dark red, with a copious ſediment, and a fatneſs ſwims upon the urine, and adheres to the ſides of the urinal, the body at the ſame time waſting away, it is a ſign of a ſlow hectic fever, which is generally fatal. The like danger is threatened when in dropſical perſons the urine is like that of hectics, for its ſcarcity is a ſign that the lympha is extravaſated into ſome cavity or porous ſubſtance; and if the colour is of a deep red, with a groſs ſediment, it ſhews the inteſtine motion and heat diſſolves the blood, that the liver is obſtructed; whence a bilious ſordes is ſeparated therefrom. See the article CONSUMPTION, *&c.*

In chronical diſeaſes, without a fever, when the urine is thick, high-coloured, and of a reddiſh-brown, as well as heavy, as in the confirmed ſcurvy, gout, ſcorbutic palſy, and in extreme old age, as alſo in a nephritic paſſion, when the pains ceaſe, as well as in the yellow and black jaundice, it ſhews a plenty of ſaline and ſulphureous excrementitious parts, wherewith the blood and humours abound, and are not duly ſecreted therefrom, by reaſon of an obſtruction of the liver. Willis has obſerved, that patients dying of the ſcurvy have had their livers almoſt without blood, and like a cow's udder. In ſome the gall-bladder was either empty or full of ſtones, or very bitter filth.

When the urine is thick, of a deep colour, and dyes linnen yellow, it is a

ſign that the bile is obſtructed, or the duct conſtricted with a ſpaſm, whence the paſſage of the bile into the duodenum is hindered; whence it regurgitates by the lymphatic veſſels into the blood and lympha, and produces a jaundice. When the colour is of a browniſh black, it is a ſign of the black jaundice, which proceeds from an impeded ſecretion of the bile in the liver. See JAUNDICE.

Sometimes the urine is imbuted with an oily matter, and is made without noiſe, there are various colours on the ſurface, chiefly bluiſh, and it adheres ſo ſtrongly to the ſides of the urinal, that it cannot be waſhed off with a lixivious liquor. This is a ſign of the colliquation of the fat: it ſhews a conſumption, an atrophy, and an hectic. Sometimes it is obſervable in fevers, and the oleous matter is more plentiful in proportion to the fatneſs of the body. See ATROPHY, *&c.*

When the urine abounds too much with a tartarious matter, which is known by its adhering to the ſides of the chamber-pot, it is a ſign of a diſpoſition to the gravel and ſtone. When there is a ſmall ſand in the urine, it ſhews thoſe diſorders to be actually preſent. Sometimes ſhining yellow cryſtals are ſeen on the ſides of the pot, which is a ſign of arthritic or rheumatic pains. When the urine is bloody or whitiſh, from a mixture of pus loaded with a glutinous, thick, tenacious matter, of a bad ſmell, which ſinks to the bottom, and does not diſſolve by the agitation of the veſſel, it is a certain ſign of an ulcer in the kidneys or bladder. Sometimes, in the ſtone and ulcer of the bladder, it is like the white of an egg, and ſo tenacious that it will not divide, but fall from the veſſel at once. See STONE.

In a chronical and malignant gonorrhœa, not only the proſtatæ, but often the bladder is ulcerated; whence a thick and turbid urine, with a copious ſediment, which when thrown on the coals has a moſt fetid ſmell. Likewiſe, in the ſtone in the bladder, this, or its ſphincter, is ſo eroded that the urine is thick and branny, with ſmall caruncles and filaments, which the vulgar take for worms. In the ſtrangury there is a frequent ſtimulus to make water, which is little and muddy, ſharp and ſalt, with filaments; and then there is ſome ſpaſmodic diſorder affects the ſphincter. If blood is mixed with the urine, like the waſhings of fleſh or red wine, but falls to the bottom of a purple colour, it proceeds from the kidneys; but if it be of a browniſh-black, it comes from the veins of the bladder.

Bloody URINE, or voiding blood by urine. See the article HÆMORRHAGE *of the urinary paſſages.*

Difficulty, or ſuppreſſion, of URINE. See the articles DYSURY, ISCHURY, *&c.*

When the urine of children is ſuppreſſed by viſcid humours which obſtruct the kidneys, or from the relaxed tone of the bladder, or from ſpaſmodic conſtrictions, producing pains, convulſions, and other diſorders, you may give them half a ſcruple of ſome neutral ſalt, ſuch as tartar vitriolate, arcanum duplicatum, and the like; or the ſame quantity of the ſeeds (Ray ſays the flowers) of muſcus clavellatus, lycopodium, or club-moſs, in parſley-water; it being diuretic and antiſpaſmodic. The pubes may likewiſe be anointed with oil of juniper mixed with oil of amber and aniſe-ſeed; and then a cataplaſm of roaſted onions may be laid on hot. Theſe things are likewiſe good when there is ſmall ſtones, which they expel. But if theſe fail, and the ſymptoms are urgent, a catheter muſt be introduced into the bladder; which is much eaſier in girls than boys. See the article STONE.

For the diabetes, or that diſeaſe wherein the urine comes away crude, exceeding the quantity of the liquids drank, ſee the article DIABETES.

URINE, in agriculture, is of excellent uſe as a manure; and for land, trees, *&c.* is preferable to dung; as penetrating better to the roots, and removing divers infirmities of plants.

URINOUS SALTS are the ſame with what we otherwiſe call alkali ſalts, or alkalies. See SALT and ALKALI.

URN, *urna*, a kind of vaſe, of a roundiſh form, but biggeſt in the middle, like the common pitchers, now ſeldom uſed but in the way of ornament over chimney-pieces, in buffets, *&c.* The great uſe of urns among the antients was to preſerve the aſhes of the dead after they were burnt; for which reaſon they were called cinerariæ, and urnæ cinerariæ, and were placed ſometimes under the tomb-ſtone whereon the epitaph was cut; and ſometimes in vaults in their own houſes. Urns were alſo uſed at their ſacrifices to put liquid things in.

URN was alſo a roman meaſure for things liquid. See MEASURE.

UROCRITERIUM, a caſting of water; or giving judgment on diſeaſes by the ſight of the urine. See URINE.

UROGALLUS, in ornithology, a ſpecies of the tetrao. See TETRAO.

The urogallus is of two kinds; the firſt being the urogallus, or tetrao major, with a white ſpot on the baſe of the wing, is otherwiſe called the cock of the mountain, being a very large and noble bird, nearly of the bigneſs of the turkey, and much reſembling it in figure, only that it is not ſo unweildy: the head is large and rounded: the beak is ſhort, a little hooked at the point: the eyes are large, and there is a naked ſpace over them by way of eye-brow, which is of a fine bright ſcarlet.

For the urogallus, or tetrao minor, otherwiſe called grouſe, ſee GROUSE.

URSA, the BEAR, in aſtronomy, a name common to two conſtellations of the northern hemiſphere, near the pole, diſtinguiſhed by major and minor. The urſa major, or the great bear, according to Ptolemy's catalogue, conſiſts of thirty-five ſtars: according to Tycho's, of fifty-ſix: but in the britannic catalogue we have two hundred and fifteen.

The urſa minor, or little bear, called alſo Charles's wain; and by the Greeks cynoſura; by its neighbourhood to the north pole, gives the denomination ἄρκτος, bear, thereto. Ptolemy and Tycho make it to conſiſt of eight ſtars, but Flamſteed of fourteen.

URSULINES, in church hiſtory, an order of nuns, founded originally by St. Angela of Breſcia, in the year fifteen hundred thirty-ſeven, and ſo called from St. Urſula, to whom they were dedicated. They obſerve the rule of St. Auguſtine, and are chiefly noted for taking on them the education and inſtruction of young maids: their monaſteries are a kind of ſchools where young ladies of the beſt families receive their education. The habit of theſe religious is a gown of black ſerge, or other ſtuff, tied about with a girdle of black leather. The urſulines are ſpread chiefly over France and Italy; and their different obſervances in their ſeveral monaſteries make them in truth ſo many diſtinct religious orders.

URSUS, the BEAR, in zoology. See the article BEAR.

URTICA, the ROMAN NETTLE, in botany, a genus of the *monoecia tetrandria* claſs of plants, having neither corolla nor pericarpium: the cup is connivent; the ſeed is ſingle, ovated, obtuſe, compreſſed and ſhining.

URTICA MARINA, the SEA-NETTLE, in ichthyology, a ſpecies of Meduſa, with four cavities on the under ſurface. See the article MEDUSA.

This appears, as floating on the water, to be a mere lifeleſs lump of jelly: it is of a whitiſh colour, with a caſt of bluiſh-grey, and is of an orbiculated figure, elevated into a convexity in the middle on the upper ſide, flat on the under, and furniſhed with a fringe of fine, and ſomewhat rigid, filaments round the edge, reſembling white hairs: on the under ſurface there are four cavities near the center, each of an arcuated figure, and ſurrounded with an opake line formed of about twenty-four parallel points or dots. From the very center of the under ſide there ariſe four crooked appendages, which have each a row of hairy filaments on the exterior edge; and on the upper ſurface there is an appearance of fine veſſels of a pale colour.

USAGE, in law. See PRESCRIPTION and CUSTOM.

USAGE, in language. See LANGUAGE.

USANCE, *uſo*, in commerce, is a determinate time fixed for the payment of bills of exchange, reckoned either from the day of the bills being accepted, or from the day of their date; and thus called becauſe regulated by the uſage and cuſtom of the places whereon they are drawn. See BILL *of exchange*.

Bills of exchange are drawn at one or more uſances, either from ſight or from date. The term is longer or ſhorter, according to the different countries. Uſance from London to any part of France, is thirty days; (this being declared to be a month, in regard to exchanges, in this kingdom) whether the month has more or fewer in it. Uſance from London to Hamburgh, Amſterdam, Rotterdam, Middleburgh, Antwerp, Brabant, Zealand, and Flanders, and from theſe places to London, is one calendar month after the date of the bill. Uſance, from London to Spain and Portugal, and from theſe places to London, is two calendar months after date. Uſance from London to Genoa, Leghorn, Milan, Venice, and Rome, and from theſe places to London, is three months. See the article EXCHANGE.

Uſance of Amſterdam upon Italy, Spain, and Portugal, is two months: upon France, Flanders, Brabant, Geneva, and

and upon any place in the ſeven United Provinces, is one month. Upon Frankfort, Nuremburgh, Vienna, Auſburgh, Cologne, Leipzic, and other places of Germany, as alſo upon Hamburgh and Breſlaw, is fourteen days after ſight; two uſances twenty-eight, and half uſance ſeven.

Uſance from Dantzic, Coningſberg, and Riga, upon Amſterdam, is at one month after ſight; though it is common to draw from the firſt at forty days date, and from the others at forty-one, but oftener at ten and eleven. And from Amſterdam on the ſaid places at a month's date, without mentioning uſance; though ſometimes at forty and forty-one days; and ſometimes on Breſlaw at ſix weeks date.

Moſt nations have generally agreed to allow the acceptor of a bill ſome ſmall time for payment beyond that mentioned in the bill, termed days of grace or reſpite; but they generally diſagree in the number and commencement of them. See the article DAYS *of grace*.

USE, in law, the profit or benefit of lands and tenements; or a truſt and confidence repoſed in a perſon for the holding of lands, *&c.* that he to whoſe uſe the truſt is made ſhall receive the profits.

Uſes may be limited to a perſon and the wife he ſhall marry; and if the parties to a deed agree, and declare, that one of them ſhall make a feoffment, or levy a fine, to the uſe and intent that he ſhall hold the lands for his life, and after his deceaſe another intail, and afterwards a third in fee ſimple, *&c.* the eſtate ſettles according to the uſes in the deed.

The conveyances to uſes are ſaid to be of three ſorts, *viz.* a covenant to ſtand ſeized; a feoffment, fine or recovery to uſes; and a bargain and ſale; which laſt a contingent uſe cannot be ſupported by, though it may by the two firſt.

A ſuperſtitious uſe, is where lands or goods are deviſed to a prieſt to pray for the ſouls of the dead, *&c.* in which caſe they become forfeited to the king: and where ſuch an uſe is void, and the king cannot have the land, it ſhall not reſult to the heir at law; but it may be applied to charity.

USES *and cuſtoms of the ſea*, are certain maxims or rules which form the baſis of the maritime juriſprudence, by which the policy of navigation, and the commerce of the ſea are regulated. See the article NAVY, *&c.*

Theſe uſes and cuſtoms conſiſt of three kinds of regulations: the firſt called the laws or judgments of Oleron; the ſecond, regulations made by the merchants of Wiſbuy, a city in the iſland of Gothland, in the Baltic, antiently much famed for commerce; and the third, a ſet of regulations made at Lubec, by the deputies of the Hanſe towns. See the articles OLERON, HANSE, *&c.*

USEDOM, an iſland of Pomerania, in Germany, ſituated at the mouth of the river Oder, in the Baltic-ſea: ſubject to the king of Pruſſia.

USHANT, an iſland of France, fifteen miles weſt of the coaſt of Britany, at the entrance of the Britiſh-channel.

USHER, an officer, or ſervant, who has the care and direction of the door of a court, hall, chamber, or the like.

In the king's houſhold there are two gentlemen-uſhers of the privy-chamber appointed to attend the door, and give entrance to perſons that have admittance thither; four gentlemen-uſhers, waiters; and eight gentlemen-uſhers, quarter-waiters in ordinary.

USHER alſo ſignifies an officer of the court of Exchequer, of which there are four who attend the barons and chief officers of that court at Weſtminſter, as alſo juries, ſheriffs, *&c.* at the pleaſure of the court. There is alſo an uſher of the court of chancery.

USHER *of the black rod*, the eldeſt of the gentlemen-uſhers, daily waiters at court, whoſe duty is to bear the rod before the king at the feaſt of St. George, and other ſolemnities: he has alſo the keeping of the chapter-houſe door, when a chapter of the order of the garter is ſitting, and in time of parliament attends the houſe of peers, and takes delinquents into cuſtody. He wears a gold-badge embelliſhed with the enſigns of the order of the garter. See *Black* ROD.

USK, a river of Wales, which riſes on the weſt of Brecknockſhire, and runs ſouth-eaſt through that county and Monmouthſhire, falling into the mouth of the Severn.

USNEA, in botany, a genus of moſſes, wholly deſtitute of leaves, and compoſed only of long ſlender filaments or ſtalks, which are uſually ſolid, rigid, and of a cylindric figure. The extremities, or other parts of theſe, are at times furniſhed with a ſort of orbicular bodies, dry and deſtitute of uſe, but ſeeming to ſupply the place of flowers. Theſe are hollow, in form of cups, but have no rim. The whole plants are

fixed

fixed in the manner of miſletoe to the barks of trees. Micheli has given accounts of flowers and ſeeds in theſe plants; but Dillenius ſuſpects the accuracy of this obſervation, and adds, that if there are ſuch, they are too minute to be of any ſervice in the general diſtinctions of the plants.

USQUEBAUGH, a ſtrong compound liquor, chiefly taken by way of dram.

There are ſeveral different methods of making this liquor; but the following is eſteemed one of the beſt: To two gallons of brandy, or other ſpirits, put a pound of ſpaniſh-liquorice, half a pound of raiſins of the ſun, four ounces of currants, and three of ſliced dates; the tops of baum, mint, ſavory, thyme, and the tops of the flowers of roſemary, of each two ounces; cinnamon and mace, well bruiſed, nutmegs, aniſeeds, and coriander-ſeeds, bruiſed likewiſe, of each four ounces; of citron, or lemon and orange-peel, ſcraped, of each an ounce: let all theſe infuſe forty-eight hours in a warm place, often ſhaking them together: then let them ſtand in a cool place for a week: after which the clear liquor is to be decanted off, and to it is to be put an equal quantity of neat white port, and a gallon of canary; after which it is to be ſweetened with a ſufficient quantity of double-refined ſugar.

USTION, in pharmacy, the preparing of certain ſubſtances by burning them.

USTULATION, *uſtulatio*, a word uſed by pharmaceutic writers to expreſs the roaſting or torrefying of humid or moiſt ſubſtances over a gentle fire, ſo as to render them fit for powdering. The ſame word is alſo uſed by ſome for what we call burning of wine.

USUCAPTION, *uſucaptio*, in the civil law, is an acquiſition of the property of a thing, by a poſſeſſion and enjoyment thereof for a certain term of years preſcribed by law.

USUFRUIT, *uſus-fructus*, in the civil law, the uſe or enjoyment of any lands or tenements; or the right of receiving the fruits and profits of an inheritance, or other thing, without a power of alienating or changing the property thereof.

USURER, a perſon charged with a habit or act of uſury. See USURY.

USURIOUS CONTRACT, is any bargain or contract whereby a man is obliged to pay more intereſt for money than the ſtatute allows.

USURPATION, in law, is an injurious uſing or enjoyment, of a thing for continuance of time, that belongs of right to another.

USURY, *uſura*, in the general, denotes a gain or profit which a perſon makes of his money, by lending the ſame; or it is an increaſe of the principal, exacted for the loan thereof; or the price a borrower gives for the uſe of a ſum credited to him by the lender, called, alſo, intereſt; and, in ſome antient ſtatutes, dry-exchange. See the article EXCHANGE.

The word uſury is generally taken in an evil ſenſe, *viz.* for an unlawful profit which a perſon makes of his money; in which ſenſe it is, that uſury is forbidden by the civil and eccleſiaſtical, and even by the law of nature.

By ſtat. 12 Ann. c. 16. which is called The Statute againſt Exceſſive Uſury, it is ordained, that no perſon ſhall take for the loan of any money, or other thing, above the value of five pounds for the forbearance of one hundred pounds for a year; and ſo in proportion for a greater or leſſer ſum: and it is declared, that all bonds, contracts, and aſſurances, made for payment of any principal ſum to be lent on uſury, above that rate, ſhall be void; and that whoſoever ſhall take, accept, or receive, by way of corrupt bargain, loan, *&c.* a greater intereſt than that laſt abovementioned, ſhall forfeit treble the value of the money lent; and alſo, that ſcriveners, ſolicitors, and drivers of bargains, ſhall not take or receive above five ſhillings for the procuring the loan of one hundred pounds for one year, on pain of forfeiting twenty pounds, *&c.*

There can be no uſury without a loan, between which and a bargain the court has diſtinguiſhed: and though a perſon is to pay double the ſum borrowed, *&c.* by way of penalty, for the non-payment of the principal debt, it is not uſury; ſo it alſo is in reſpect to the grant of an annuity for lives, or on condition, where it exceeds the uſual intereſt, and the proportion attending contracts of this kind. Even if one ſecures a large intereſt and principal, and it is at the will of the party who is to pay; or where it happens that both the principal money and extraordinary intereſt are in hazard, or that a perſon may have leſs than his principal; as when a bond is made to pay money upon the return of a ſhip from ſea,

ſea, &c. either of theſe caſes are not held to be uſury.

In an action brought for uſury, the ſtatute made againſt it muſt be pleaded; and in pleading an uſurious contract, as a bar to an action, the whole matter is to be ſet forth ſpecially, becauſe it lies within the party's own privity; yet on an information on the ſtatute for making ſuch contract, it is ſufficient to mention the corrupt bargain generally; becauſe matters of this kind are ſuppoſed to be privily tranſacted; and ſuch information may be brought by a ſtranger. 1 Hawk. P. C. 248. Likewiſe upon an information on the ſtatute againſt uſury, he that borrows the money may be a witneſs, after he has paid the ſame.

UT, in muſic, the firſt of the muſical notes, which, with the reſt, was taken out of the hymn of St. John Baptiſt. *Ut queant laxis*, &c. See SCALE, MUSIC, &c.

UTENSIL, *utenſile*, a little domeſtic moveable, belonging principally to the kitchen: ſuch are pots, pans, &c.

Utenſils are more particularly uſed in war, for the moveables which the hoſt is obliged to furniſh the ſoldiers, quartered with him; which are, a bed with bedclothes, a pot, and a ſpoon.

UTERINE, *uterinus*, ſomething belonging to the uterus, or womb of a woman.

Furor UTERINUS, in medicine, denotes a kind of madneſs, attended by laſcivious ſpeeches and geſtures, and an invincible inclination to venery. See FUROR.

UTERUS, the WOMB, in anatomy, a hollow body, called alſo the matrix, of a form approaching to that of a pear, ſituated between the bladder and the rectum, and deſtined to the office of generation, for the containing the fœtus. It is connected in the anterior part with the vagina, and at its lateral part by the ligaments, lata and rotunda, being looſe in its hinder part.

In women not with child, the length of the uterus is about three inches; its breadth, in the upper part, being about two inches, and in the lower part one. Its thickneſs is about an inch and an half: in virgins, indeed, it is much ſmaller than this; but in women with-child it is of a different ſize, according to the different time of geſtation.

Anatomiſts divide it into two parts; the upper and broader part they call the fundus uteri, and the lower they call the cervix, into which it is that the vagina opens. See the article VAGINA.

The orifice, or, as it is otherwiſe called, the internal mouth of the womb, opens into the vagina, in form of the glans penis in man: it is very ſmall in virgins, but in women who have had children, or who are with-child, it is larger; and in the laſt it is always cloſed up with a glutinous humour: in the time of delivery, it in a wonderful manner expands itſelf, ſo as to give paſſage to the child. See the article DELIVERY.

The ſubſtance of the womb is muſculous, being compoſed of a various plexus of fleſhy fibres, with a great number of veſſels between. In women not with-child it is compact and firm; in thoſe with-child it is ſpongy and ſinuous, and is capable of wonderful dilatation, without any diminution of its thickneſs. It is covered externally with a membrane from the peritonæum; and internally, its cavity is lined with a porous and nervous membrane: this cavity is very ſmall in virgins; and in women with child the inner membrane almoſt entirely diſappears.

The blood-veſſels of the uterus are tortuous, and make a thouſand anaſtomoſes with one another: they open by a number of little mouths into the uterus and vagina, and are the ſources of the menſtrual diſcharge in women. See the article MENSES.

The arteries are of three kinds, *viz.* ſpermatics from the aorta; very large ones from the hypogaſtrics; and others from the hæmorrhoidal arteries. The veins of the uterus are alſo of three kinds, and of the ſame denominations: they have valves, and are greatly larger than the arteries, eſpecially in women with-child. The nerves of the womb are from the intercoſtals, and thoſe of the os ſacrum. The lymphatics have long ſince been diſcovered in brutes; but Morgagni has of late years found them alſo in human ſubjects. See the articles ARTERY, VEIN, NERVE, &c.

UTILE, a latin term, ſignifying profitable, or uſeful; in which ſenſe it is ſometimes uſed by engliſh writers.

UTOXETER, a market-town of Staffordſhire, twelve miles ſouth-eaſt of Stafford.

UTRECHT, the capital of a province of the ſame name, in the united Netherlands, ſituated twenty-three miles ſouth eaſt of Amſterdam.

UTRICULARIA, in botany, a genus of the *diandria-monogynia* claſs of plants, with a ringent, bilabiated, monopetal-

ous

ous flower; and its fruit a large, globoſe, and unilocular capſule, containing a number of ſmall ſeeds.

UVA URSI, in botany, a name uſed by Tournefort for a ſpecies of arbutus. See the article ARBUTUS.

UVEA, in anatomy, the third or outermoſt coat of the eye. See EYE.

VULCANO, or VOLCANO, in natural hiſtory, a burning mountain, or one that vomits forth fire, flame, aſhes, cinders, &c. See MOUNTAIN.

As to the cauſe of vulcanos, it is found by experience, that there are ſeveral inflammable bodies, which, being mixed together in due proportion, will kindle into flame by fermentation alone, without the help of any fiery particles. Thus M. Lemery having covered up in the earth about fifty pounds of a mixture, compoſed of equal parts of ſulphur and filings of iron, tempered with water; after eight or nine hours time, the earth, where it lay, vomited up flames. From this experiment we ſee the true cauſe of the fire of Ætna, Veſuvius, and other burning mountains, which probably are made up of ſulphur and ſome other matter proper to ferment with it, and take fire. See ÆTNA, VESUVIUS, &c.

VULGATE, a very antient latin tranſlation of the bible, and the only one the church of Rome acknowledges authentic. See BIBLE.

The antient vulgate of the Old Teſtament was tranſlated almoſt word for word from the greek of the LXX. The author of the verſion is not known, nor ſo much as gueſſed at.

VULNERARIA, in botany, Tournefort's name for the anthyllis of Linnæus. See the article ANTHYLLIS.

VULNERARY, in medicine, an epithet given to remedies proper for the cure of wounds and ulcers.

All medicines of this intention are ſuppoſed both to cleanſe and heal; that is, incarnate, or fill up with new fleſh, all ulcerations and foulneſſes. Under this head are ranged all ſuch balſamics as are not only ſoftening and adheſive, but alſo, by a peculiar activity, joined with a ſuitable configuration of parts, are apt to abrade and carry along with them what particles they lay hold on in their paſſage.

VULPES, the FOX. See FOX.

VULTUR, a genus of birds, the characters of which are as follow: there are four toes on each foot, and three of theſe are placed forwards; the neck is long, and almoſt bare of feathers; the legs are covered with feathers down to the feet, or nearly ſo; and under the throat there is a ſpace covered with hairs inſtead of feathers; the head alſo, in many ſpecies, is naked, and has at the moſt only a downy matter on it, inſtead of feathers; and the under part of the wings is downy.

This genus comprehends the black vultur, the bœtic vultur, the hare-catcher, the golden-breaſted vultur, the brown vultur, and braſilian vultur.

VULVA, in anatomy, a name given as well to the uterus, or womb, as to the cunnus, or pudendum muliebre. See the articles UTERUS and PUDENDUM.

UVULA, in anatomy, a round, ſoft, ſpongious body, like the end of a child's finger, ſuſpended from the palate, near the foramina of the noſtrils, perpendicularly over the glottis. Its uſe is to break the force of the cold air, and prevent its entering too precipitately into the lungs. It is formed of a duplicature of a membrane of the palate; and is called, by ſome authors, columella, and by others gurgulio.

It is moved by two pair of muſcles, and ſuſpended by as many ligaments.

UVULARIA, in botany, a genus of the *hexandria-monogynia* claſs of plants, the flower of which conſiſts of ſix very long lanceolated petals; and its fruit an ovato-oblong trilocular capſule, containing ſeveral roundiſh and compreſſed ſeeds.

UXBRIDGE, a market-town of Middleſex, ſituated on the river Colne, fifteen miles weſt of London.

UXOR, among chemiſts, ſignifies the mercury of metals. See MERCURY and METAL.

UXORIUM, in antiquity, a fine or forfeit paid by the Romans, for not marrying. See the article MARRIAGE.

UZBECK, or OUSBECK, TARTARY, a large country of Aſia, bounded by Calmuc Tartary on the north, by Tibet on the eaſt, by India and Perſia on the ſouth, and by a great deſart, which ſeparates it from the Caſpian ſea, on the weſt.

UZES, a town of Languedoc, in France, ſixteen miles north of Niſmes.

UZIFIR, UZUFAR, or UZIFUR, in chemiſtry, a name which ſome authors give to cinnabar. See CINNABAR.

W

W, or w, is the twenty-first letter of our alphabet, and is compoſed, as its name implies, of two v's. It was not in uſe among the Hebrews, Greeks, or Romans, but chiefly peculiar to the northern nations, the Teutones, Saxons, Britons, *&c.* But ſtill it is not uſed by the French, Italians, Spaniards, or Portugueſe, except in proper names and other terms borrowed from languages in which it is originally uſed, and even then it is ſounded like the ſingle v. This letter is of an ambiguous nature, being a conſonant at the beginning of words, and a vowel at the end. It may ſtand before all the vowels except *u*, as *water*, *wedge*, *winter*, *wonder*: it may alſo follow the vowels *a*, *e*, *o*, and unites with them into a kind of double vowel, or diphthong, as in *ſaw*, *few*, *cow*, *&c.* It alſo goes before *r*, and follows *s* and *th*, as in *wrath*, *ſwear*, *thwart*; it goes before *h* alſo, though in reality it is ſounded after it, as in *when*, *what*, *&c.* In ſome words it is obſcure, as in *ſhadow*, *widow*, *&c.*

WAAG, a river of Hungary, which riſes in the Carpathian mountains, on the confines of Poland, and running firſt from eaſt to weſt, then turns ſouth, and paſſing by Leopoldſtadt, falls into the Danube, oppoſite to the iſland of Schut.

WAAL, a river of the united Netherlands, being one of the branches of the Rhine, which runs from eaſt to weſt, through the Betue, in the province of Gelderland, paſſing by Nimeguen, Tiel, Bommel, and Gorcum, and, continuing its courſe eaſtward, unites its waters with the Maes, and, paſſing by Dort, falls into the German ſea below the Briel.

WADD, or WADDING, is a ſtopple of paper, hay, ſtraw, or the like, forced into a gun upon the powder, to keep it cloſe in the chamber; or to put up cloſe to the ſhot, to keep it from rolling out. See the article GUN, *&c.*

WAFE. See the article WAIF.

WAFT. To waft a ſhip, is to convoy her ſafe, as men of war do merchant-ſhips. To make a waft, is to hang out ſome coat, ſea-gown, or the like, on the main-ſhrouds of the ſhip, as a ſignal for people to come aboard, and ſignifying that the ſhip is in great diſtreſs.

WAFERS, or *Sealing* WAFERS, are made thus: take very fine flour, mix it with glair of eggs, iſinglaſs, and a little yeaſt; mingle the materials; beat them well together, ſpread the batter, being made thin with gum-water, on even tin-plates, and dry them in a ſtove; then cut them out for uſe.

You may make them of what colours you pleaſe, by tinging the paſte with brazil or vermilion for red; indigo or verditer, *&c.* for blue; ſaffron, turmeric, or gambooge, *&c.* for yellow.

Wafers, on importation, pay a duty of of $4\frac{7\,8\frac{3}{4}}{100}$d. the pound, and draw back on exportation $4\frac{3\,1\frac{1}{2}}{100}$d. the pound.

WAGE, in law, denotes the giving ſecurity for the performance of any thing.

WAGER *of law*, is uſed where an action of debt is brought againſt a perſon, upon a ſimple contract between the parties, without deed or record, and the defendant, in preſence of his compurgators, ſwears in court, that he owes the plaintiff nothing, in form and manner as he has declared: and here the reaſon of waging of law is, becauſe the defendant may have paid to the plaintiff his debt in private, or before witneſſes who may be all dead, and therefore the law allows him to wage his law in his diſcharge; and in that caſe, his oath ſhall be accepted to diſcharge himſelf, rather than the law will ſuffer him to be charged upon the bare allegation of the plaintiff. The method of waging law is this, *viz.* the defendant generally brings ſix compurgators with him into court, and ſtands at the end of the bar towards the right hand of the chief juſtice; the ſecondary aſks him, whether he will wage his law? whereto if he anſwers that he will, the judges admoniſh him to be well adviſed, telling him the danger of taking a falſe oath; and if he ſtill perſiſts, then the ſecondary ſays, and the defendant, who wages his

law, repeats after him, "Hear this, ye juſtices, that I C. D. do not owe to A. B. the ſum of , nor any penny thereof, in manner and form as the ſaid A. B. has declared againſt me: ſo help me God." After the defendant has thus ſworn, and the compurgators given in, upon oath, that they believe he ſwears true, the plaintiff is for ever barred; it being as much as if a verdict had paſſed againſt him.

WAGGON, a vehicle or carriage, of which there are various forms, accommodated to the different uſes they are intended for. The common waggon conſiſts of the ſhafts or rads, being the two pieces which the hind horſe bears up; the welds; the ſlotes, or croſs pieces, which hold the ſhafts together; the bolſter, being that part on which the fore wheels and the axle-tree turn, in wheeling the waggon a-croſs the road; the cheſt, or body of the waggon, having the ſtaves or rails fixed thereon; the bales, or hoops, which compoſe the top; the tilt, the place covered with cloth, at the end of the waggon. For the principles on which this carriage is conſtructed, ſee the article WHEEL-CARRIAGE.

WAGININGEN, a town of the United Provinces, in the province of Gelderland, ſituated on the river Lech, eight miles north weſt of Nimeguen.

WAGRIA, the eaſtern diviſion of the dutchy of Holſtein, in the circle of lower Saxony, in Germany, bounded by the Baltic ſea on the north, eaſt, and ſouth.

WAGTAIL, in ornithology, the name of two different ſpecies of motacilla. See the article MOTACILLA.

The white or common wagtail is the motacilla with a black breaſt. This is a very beautiful bird, much about the ſize of the goldfinch, but the body is longer in proportion, and much better covered with feathers; the head is large and rounded; the eyes are large, and their iris hazel; the beak is ſtrait, ſlender, moderately long and black; the beak and the eyes are ſurrounded with a ſpace of white, which is continued in a broad line down almoſt to the wings; the crown of the head, both ſides of the neck, and back are black, the breaſt and belly are white; the tail is long, and both that and the wings are variegated with black and white. See plate CCXCVI. fig. 3.

The other ſpecies is the yellow wagtail, or the yellow-breaſted motacilla, much reſembling the former, only that the breaſt and belly are yellow; the ſides of the head variegated with ſome ſtrokes of yellow, and the wings with white.

WAIF, or WAFE, in law, a term applied to ſuch goods as a thief having feloniouſly ſtolen, on his being cloſely purſued, are waved or left by the felon, which become forfeited to the king, or lord of the manor: and ſo it alſo is where a felon has the goods in his cuſtody, and apprehending that purſuit is made, he flies, and leaves them behind him. Tho' waif is properly applied to goods that are ſtolen, yet it may be alſo ſaid of goods not ſtolen or taken away, as where a perſon is purſued with hue and cry as a felon, and he flies and leaves his own goods; in this caſe theſe ſhall be forfeited as ſtolen goods, or what are uſually called fugitives goods.

Waif is alſo applied to things loſt, and eſtrays, which, no owner appearing, are forfeited to the lord of the manor, after they have been cried and publiſhed in the markets.

WAIGRATS STRAITS, ſituated between Nova Zembla and Ruſſia, through which the Dutch ſailed to the north, as high as 75°, in order to diſcover a north-eaſt paſſage to China, and the Eaſt-Indies.

WAIN, in aſtronomy. See URSA.

WAINFLEET, a market-town of Lincolnſhire, thirty-five miles eaſt of Lincoln.

WAINSCOT, in building, the timber-work that ſerves to line the walls of a room, being uſually made in pannels, and painted, to ſerve inſtead of hangings. It is uſual even in halls to have wainſcot breaſt high, by reaſon of the natural moiſtneſs of the walls. Some joiners put charcoal behind the pannels, to prevent the ſweat of the ſtone and brick walls from unglueing the joints; others uſe wool for the ſame purpoſe, but the only ſure way is to prime over the back ſides of the joints with white lead, ſpaniſh brown, or linſeed oil.

The wainſcotting with norway oak, according to Neve, the workman finding ſtuff, is valued at 6s. or 7s. per yard ſquare; plain ſquare wainſcotting, the workman finding deal, is valued at 3s. and 3s. 6d. per yard. Ordinary biſſection wainſcotting, the workman finding deal, is worth 3s. and 6d. and 4s. per yard. Large biſſection wainſcotting, with dantzick ſtuff, is valued at 6s. or 7s. per yard.

WAIVE, according to the general acceptation of the word, ſignifies to forſake; but in the law it is eſpecially applied to a woman,

a woman, who, for any crime, for which a man may be outlawed, is termed waive.

WAIVER, in law, denotes the paſſing by of a thing, or a refuſal to accept thereof; and relates ſometimes to an eſtate conveyed to a perſon, and ſometimes to a plea. It is held, where a particular eſtate is granted with a remainder over, in that caſe, he that has it, may not regularly waive it to the damage of him in remainder; though where one has the reverſion it is otherwiſe, for that is not hurt by ſuch waiver.

WAKE *of a ſhip*, is the ſmooth water aſtern when ſhe is under ſail: this ſhews the way ſhe has gone in the ſea, whereby the mariners judge what way ſhe makes. For if the wake be right a-ſtern, they conclude ſhe makes her way forwards; but if the wake be to leeward a point or two, then they conclude ſhe falls to the leeward of her courſe. When one ſhip, giving chaſe to another, is got as far into the wind as ſhe, and ſails directly after her, they ſay, ſhe has got into her wake. A ſhip is ſaid to ſtay to the weather of her wake, when in her ſtaying, ſhe is ſo quick, that ſhe does not fall to leeward upon a tack, but that when ſhe is tacked, her wake is to the leeward; and it is a ſign ſhe feels her helm very well, and is quick of ſteerage.

WAKE, is the eve feaſt of the dedication of churches, which is kept with feaſting and rural diverſions.

WAKEFIELD, a market-town in the weſt-riding of Yorkſhire, ſituated on the river Caulder, twenty four miles ſouth-weſt of York.

WALACHIA, a province of Turkey in Europe, bounded by the Irongate mountains, which ſeparate it from Tranſilvania, on the north-weſt; by Moldavia on the north-eaſt; by the river Danube, which ſeparates it from the province of Bulgaria, on the ſouth-eaſt; and the ſame river ſeparates it from the province of Servia on the ſouth-weſt. It is two hundred miles long, and one hundred broad.

WALCOURT, a town of the biſhopric of Liege, ſituated on the confines of Namur, eight miles ſouth of Charleroy.

WALDEC, a town of Germany, in the circle of the upper Rhine, and landgraviate of Heſſe Caſſel, twenty miles ſouth-weſt of Heſſe Caſſel city.

WALDEN, a market-town of Eſſex, ſituated twenty-five miles north-weſt of Chelmsford.

WALE, or WALES, in a ſhip, thoſe outermoſt timbers in a ſhip's ſide, on which the ſailors ſet their feet in climbing up. They are reckoned from the water, and are called her firſt, ſecond, and third wale, or bend. See SHIP.

WALE KNOT, a round knot or knob made with three ſtrands of a rope, ſo that it cannot ſlip, by which the tacks, top-ſail ſheets, and ſtoppers are made faſt, as alſo ſome other ropes.

WALE REARED, on board a ſhip, a name the ſeamen give to a ſhip, which, after ſhe comes to her bearing, is built ſtrait up this way of building, though it does not look well; nor is, as the ſeamen term it, ſhip ſhapen; yet it has this advantage, that a ſhip is thereby more roomy within board, and becomes thereby a wholeſome ſhip at ſea, eſpecially if her bearing be well laid out.

WALES, a principality in the weſt of England, comprehending twelve counties, bounded by Cheſhire, Shropſhire, Herefordſhire, and Monmouthſhire, on the eaſt, and ſurrounded by the ſea called the Iriſh Channel, on the north, weſt, and ſouth.

New WALES, the ſouth-weſt coaſt of Hudſon's Bay, in north America, ſo called; now poſſeſſed by the engliſh Hudſon's Bay company.

WALKER, the ſame with foreſter, ſee FORESTER.

WALK, in gardening. See ALLEY.

Thoſe made of gravel, ſand, or graſs, are the moſt common in England; but where gravel or ſand cannot be procured, they are ſometimes laid with powdered coal, ſea-coal aſhes, or powdered brick. In order to the laying of gravel walks, it is very proper that the bottom of them be filled with ſome lime-rubbiſh, coarſe gravel, flint-ſtones, or other rocky materials. This bottom ſhould be laid eight or ten inches thick, over which the coat of gravel ſhould be ſix or eight. The common allowance for a gravel walk of five feet breadth, is an inch in the crown; ſo that if a walk be twenty feet wide, according to this proportion, it will be four inches higher in the middle than on each ſide; and a walk of twenty-five feet will be five inches; one of thirty feet ſix inches; and ſo on. In order to lay gravel-walks firm, it will be neceſſary to give them three or four water rollings; that is, they muſt be rolled, when it rains ſo very faſt, that the walks ſwim with water: this will cauſe the gravel to bind.

iron-mould gravel is the beſt for binding; or gravel with a little binding loam amongſt it. The beſt gravel for walks is ſuch as abounds with ſmooth pebbles, which, being mixed with a due proportion of loam, will bind like a rock, and is never injured by wet or dry weather. The width of the walks muſt always be proportioned to their length, and the ſize of the garden. For farther particulars, ſee GRAVEL.

Graſs walks in a garden are both ornamental and delightful. See GRASS.

Sand walks are alſo frequently made in gardens, as being leſs expenſive in the making and keeping, than the former; for as the greateſt part of the walks made in gardens twiſt about in an irregular manner, it would be very difficult to keep them handſome if they were made of gravel; and as the walks are for the moſt part ſhaded with trees, ſo the dripping of the water from their branches in hard rains, would waſh the gravel in holes, and render the walks very unſightly. When the ground is traced out in the manner the walks are deſigned in, the earth ſhould be taken out of the walks, and laid in the quarters. The depth of this ſhould be proportioned to the nature of the ſoil; for where the ground is dry, the walks need not be elevated much above the quarters; ſo the earth ſhould be taken out four or five inches deep in ſuch places: but where the ground is wet, the bottom of the walks need not be more than two inches below the ſurface, that the walks may be raiſed ſo high as to throw off the wet into the quarters. After the earth is taken out, the bottom of the walks ſhould be laid with rubbiſh four or five inches thick, and beaten down as cloſe as poſſible; then the ſand ſhould be laid on about three inches thick; and after treading it down, it ſhould be raked over, to level and ſmooth the ſurface. In doing of this, the whole ſhould be laid a little rounding, to throw off the wet but there will be no neceſſity of obſerving any exactneſs therein; for as the whole ground is to have as little appearance of art as poſſible, the rounding ſhould appear natural, and only ſo contrived, as that the water may have free paſſage off.

WALK, in the manege, is the ſloweſt, and leaſt raiſed of all a horſe's goings. It is performed by the horſe's lifting up his two legs on a ſide, the one after the other, beginning with the hind leg firſt. Thus, if he leads with the legs of the right ſide, then the firſt foot he lifts is the far hind-foot, and in the time he is ſetting it down (which in a ſtep is always ſhort of the tread of his fore-foot on the ſame ſide) he lifts his far fore-foot, and ſets it down before his near fore-foot. Again, juſt as he is ſetting down his far fore-foot, he lifts up his near hind-foot, and ſets it down again juſt ſhort of his near fore-foot; and juſt as he is ſetting it down, he lifts his near fore-foot, and ſets it down beyond his far fore-foot.

WALL, in architecture, the principal part of a building, as ſerving both to incloſe it, and ſupport the roof, floors, &c. See the article BUILDING.

Walls are diſtinguiſhed into various kinds, from the matter whereof they conſiſt, as plaſtered or mud-walls, brick-walls, ſtone-walls, flint, or boulder walls, and boarded walls. In all which theſe general rules are to be regarded. 1. That the right angle therein depending is the true cauſe of all ſtability, both in artificial and natural poſition. 2. That the maſſieſt and heavieſt materials be the loweſt, as fitter to bear than to be borne. 3. That the walls, as they riſe, diminiſh proportionably in thickneſs, for eaſe both of weight and expence. 4. That certain courſes or ledges, of more ſtrength than the reſt, be interlaid, like bones, to ſtrengthen the whole fabrick. See the article HOUSE, &c.

Brick-walls are the moſt important and uſual amongſt us. In theſe, particular care is to be taken about laying of the bricks; that in ſummer they be laid as wet, and in winter as dry, as poſſible, to make them bind the better with the mortar: that in ſummer, as faſt as they are laid, they be covered up, to prevent the mortar, &c. from drying too faſt: that in winter they be covered well to protect them from rain, ſnow, and froſt, which are all enemies to mortar: that they be laid joint on joint in the middle of the walls as ſeldom as may be: but that good bond be made there as well as on the outſide. Care is to be taken that the angles be firmly bound, which are the nerves of the whole edifice. In order to which, in working up the walls of a building, it is not adviſeable to raiſe any wall above eight feet high, before the next adjoining wall be wrought up to it, that ſo good bond may be made in the progreſs of the work: it may be worth notice, that a wall a brick and a half thick, with the

joint, will be in thickneſs fourteen inches, or very near; whence 150 or 160 bricks will lay a yard ſquare meaſured upon the face of the building; and to the ſquare of ten foot are uſually allowed 1700 or 1800 bricks. Flint, or boulder walls are much uſed in ſome parts of Suſſex and Kent, for fence-walls, round courts, gardens, &c. A right and left handed man fits well for this work, as they have a hod of mortar poured down upon the work, which they part between them, each ſpreading it towards himſelf, and ſo they lay in the flints. The mortar for this work muſt be very ſtiff.

WALL, in gardening. Of all materials for building walls for fruit-trees, brick is the beſt; it being not only the handſomeſt, but the warmeſt and kindeſt for the ripening of fruit; and affording the beſt conveniency for nailing, as ſmaller nails will ſerve in brick than will in ſtone-walls, where the joints are larger; and if the walls are caped with free-ſtone, and ſtone pilaſters or columns at proper diſtances, to ſeparate the trees, and break off the force of the winds, they are very beautiful, and the moſt profitable walls of any others. In ſome parts of England there are walls built both of brick and ſtone, which are found very commodious. The bricks of ſome places are not of themſelves ſubſtantial enough for walls; and therefore ſome perſons, that they might have walls both ſubſtantial and wholeſome, have built theſe double, the outſide being of ſtone, and the inſide of brick. but there muſt be great care taken to bond the bricks well into the ſtone, otherwiſe they are very apt to ſeparate one from the other, eſpecially when froſt comes after much wet.

There have been ſeveral trials made of walls built in different forms; ſome of them having been built ſemicircular; others in angles of various ſizes; and projecting more towards the north, to ſcreen off the cold winds: but there has not as yet been any method which has ſucceeded near ſo well as that of making the walls ſtrait, and building them upright. Where perſons are willing to be at the expence, in the building of their walls ſubſtantial, they will find it anſwer much better than thoſe which are ſlightly built, not only in duration, but in warmth: therefore a wall two bricks thick, will be found to anſwer better than that of one brick and a half: and if in building of garden-walls they are grouted with ſoft mortar, to fill and cloſe all the joints, the walls will be much ſtronger, and the air will not ſo eaſily penetrate, as it does through thoſe which are commonly built.

For the aſpect or ſituation of garden-walls, ſee the article EXPOSURE.

WALLINGFORD, a borough town of Berkſhire, ſituated on the river Thames, twelve miles north of Reading.

WALLOONS, the inhabitants of a conſiderable part of the ſpaniſh Netherlands, *viz.* thoſe of Artois, Hainault, Namur, Luxemburgh, and part of Flanders and Brabant.

The walloon language is ſaid to have been that of the antient Gauls or Celts.

WALRUS, in zoology, the engliſh name of the phoca, with the canine teeth exerted. See PHOCA.

This is much larger than the ſea-calf, or phoca, with the canine teeth covered; growing to the ſize of the largeſt ox; the head is very large, and almoſt of a rounded figure; the eyes are large and prominent; there are no ears, but only an aperture on each ſide of the head, of an oblong form, and not very large; the noſe is obtuſe; the noſtrils large, and the creature contracts and dilates them at pleaſure; the mouth is very large, and the upper part of it furniſhed with thick and cartilaginous whiſkers; the tongue is ſhort, the canine teeth of the upper jaw are of an enormous length and ſize, and they hang downwards and forwards toward the breaſt; the creature uſes theſe ſtrange weapons to climb upon the ice, and to hang itſelf to the rocks in its getting on ſhore to ſleep.

WALNUT-TREE, juglans, in botany. See the article JUGLANS.

WALSALL, a market-town of Staffordſhire, thirteen miles ſouth of Stafford.

WALSHAM, a market-town of Norfolk, eleven miles north of Norwich.

WALSINGHAM, a market-town of Norfolk, eighteen miles north-weſt of Norwich.

WALTHAM, a market-town of Leiceſterſhire, ſixteen miles north-eaſt of Leiceſter.

WALTHERIA, in botany, a genus of the *monadelphia pentandria* claſs of plants, the flower of which conſiſts of five petals, vertically cordated and patent: the fruit is an unilocular bivalve capſule, vertically ovated, and the ſeed is ſingle, obtuſe, and broadeſt at top.

WANGEN, a market-town of Germany, in the circle of Suabia, twenty-five miles eaſt of Conſtance.

WANLASS, in hunting. Driving the wanlaſs, is the driving of deer to a ſtand, that the lord may have a ſhoot, which is one of the cuſtomary ſervices of fiefs.

WANTAGE, a market-town of Berkſhire, fifteen miles ſouth of Oxford.

WAPENTAKE (from the Saxon) the ſame with what we call a hundred, and more eſpecially uſed in the northern counties beyond the river Trent. There have been ſeveral conjectures as to the original of the word; one of which is, that antiently muſters were made of the armour and weapons of the inhabitants of every hundred; and from thoſe that could not find ſufficient pledges of their good abearing, their weapons were taken away, and given to others; whence it is ſaid this word is derived. See HUNDRED.

WAR, a conteſt or difference between princes, ſtates, or large bodies of people; which not being determined by the ordinary meaſures of equity and juſtice, is referred to the deciſion of the ſword.

Holy WAR, is that antiently maintained by leagues and croiſades, for the recovery of the holy-land. See CROISADE.

Council of WAR. See COUNCIL.

Man of WAR. See SHIP, RATE, *&c.*

Place of WAR. See PLACE.

WARADIN *little*, a town of Upper Hungary, twenty-three miles eaſt of Tockay, eaſt long. 21° 20′, north lat. 48° 18′.

WARADIN *great*, a town of Upper Hungary, an hundred miles eaſt of Buda: eaſt long. 21° 50′, north lat. 47° 15′.

WARD, in law-books, a word of divers ſignifications: thus, a ward in London, is a part of the city committed to the ſpecial charge of one of the aldermen of the city. There are twenty-ſix wards in London, which are as hundreds, and the pariſhes thereof as towns. A foreſt is alſo divided into wards, and ſo are moſt of our hoſpitals.

WARD, WARDA, or WARDAGIUM, is alſo uſed, in our antient writings, for the cuſtody of a town or caſtle, which the tenants and inhabitants were bound to keep at their own charge.

WARD-HOOK, or WADD-HOOK, in gunnery, a rod or ſtaff with an iron end turned ſerpent-wiſe, or like a ſcrew to draw the wadding out of a gun when it is to be unloaded. See WADD.

WARDA ECCLESIARUM, denotes the guardianſhip of churches; which is in the king, during vacancies, by reaſon of the regalia or temporalities.

WARDEN, or GUARDIAN, one who has the charge or keeping of any perſon, or thing, by office. See GUARDIAN.

Such is the warden of the fleet, the keeper of the fleet-priſon; who has the charge of the priſoners there, eſpecially ſuch as are committed from the court of chancery for contempt.

Warden, in an univerſity, is the head of a college; anſwering to what in other colleges we call the maſter thereof.

Warden, or lord warden of the cinque ports, is the governor of theſe noted havens; who has the authority of an admiral, and ſends out writs in his own name.

Warden of the mint, is an officer whoſe buſineſs it is to receive the gold and ſilver bullion brought in by the merchants to pay them for it, and overſee the other officers. He is called keeper of the exchange and mint.

Church-WARDENS. See CHURCH.

WARDHUYS, a port of Norwegian Lapland, 120 miles ſouth-eaſt of the north-cape: eaſt long. 28°, and north lat. 71°.

WARDMOTE, in London, is a court ſo called which is kept in every ward of the city, anſwering to the curiata comitia in antient Rome. See COURT.

WARDROBE, a cloſet, or little room adjoining to a bed-chamber, ſerving to diſpoſe and keep a perſon's apparel in; or, for a ſervant to lodge in, to be at hand to wait, *&c.*

Wardrobe, in a prince's court, is an apartment wherein his robes, wearing apparel, and other neceſſaries are preſerved under the care and direction of proper officers; as the maſter of the wardrobe, clerk, *&c.* of the wardrobe. See MASTER and CLERK.

WARE, a market-town of Hertfordſhire, under the meridian of London, and twenty miles north of that city.

WAREHAM, a borough of Dorſetſhire, ſeventeen miles eaſt of Dorcheſter.

WARMINSTER, a market-town of Wiltſhire, ſeventeen miles north-weſt of Saliſbury.

WARN, in law, is to ſummon a perſon to appear in a court of juſtice. See the article SUMMONS.

WARNEMUNDE, a town of Lower Saxony, twenty-ſix miles north-eaſt of Wiſmar: eaſt long. 12° 15′, and north lat. 54° 30′.

WARNETON, a town of Flanders, ſeven miles north weſt of Liſle.

WARNING-PIECE, in the military art, is the gun which is fired every night about ſun-ſet, to give notice to the drums and trumpets of the army to beat and ſound a retreat or tattou, which is likewiſe called, ſetting the watch. See the article RETREAT.

WARNING-WHEEL, in a clock, is the third or fourth, according to its diſtance from the firſt wheel. See CLOCK.

WARP, in the manufactures, is the threads, whether of ſilk, wool, linen, hemp, *&c.* that are extended lengthwiſe on the weaver's loom; and a-croſs which the workman by means of his ſhuttle paſſes the threads of the woof, to form a cloth, ribband, fuſtian, or other matter.

For a woollen ſtuff to have the neceſſary qualities, it is required that the threads of the warp be of the ſame kind of wool, and of the ſame fineneſs throughout; that they be ſized with flanders or parchment-ſize, well prepared, and that they be in ſufficient number with regard to the breadth of the ſtuff to be wrought.

To warp a ſhip, is to ſhift her from one place to another, when the wind and tide will permit it without danger.

WARRANT, an act, inſtrument, or obligation, whereby a perſon authoriſes another to do ſomething which he otherwiſe had not a right to do.

Warrant of attorney, is that whereby a man appoints another to do ſomething in his name, and warrants his action. It ſeems to differ from a letter of attorney which paſſes under hand and ſeal of him who makes it, before creditable witneſſes; whereas warrant of attorney, in perſonal, mixed, and ſome real actions, is put in of courſe by the attornies for the plaintiffs or defendants.

WARRANTY, *warrantia*, a promiſe or covenant by deed, made by the bargainer for himſelf and his heirs, to warrant and ſecure the bargainee and his heirs againſt all men for enjoying the thing agreed on between them.

WARRANTIA CHARTÆ, a writ that lies for a perſon who is enfeoffed in lands and tenements, with clauſe of warranty, and is impleaded in an aſſize, or writ of entry, wherein he cannot vouch or call to warranty. See VOUCHER.

WARRANTIA DIEI, a writ which lies in caſe where a man, having a day aſſigned perſonally to appear in court to an action, wherein he is ſued, is, in the mean time, by commandment employed in the king's ſervice; ſo that he cannot come at the day aſſigned. It is directed to the juſtices, ordering them not to find or record him in default.

WARREN, *warrena*, a franchiſe, or placed privileged either by preſcription or grant from the king, to keep beaſts and fowl of warren in; as rabbits, hares, partridges, pheaſants, *&c.*

By a ſtatute 21 Edward III. a warren may lie open, and there is no need of cloſing it in, as there is a park.

In the ſetting up a warren, great caution is to be uſed for the fixing upon a proper place, and a right ſituation. It ſhould always be upon a ſmall aſcent, and expoſed to the eaſt or the ſouth. The ſoil that is moſt ſuitable, is that which is ſandy; for when the ſoil is clayey or tough, the rabbits find greater difficulty in making their burrows, and never do it ſo well; and if the ſoil be boggy or mooriſh, there would be very little advantage from the warren, for wet is very deſtructive of theſe animals.

All due precautions muſt be taken, that the warren be ſo contrived, that the rabbits may habituate themſelves to it with eaſe. Many would have it that warrens ſhould be encloſed with walls; but this is a very expenſive method, and ſeems not neceſſary nor adviſeable; for we find but very few that are ſo, and thoſe do not ſucceed at all the better for it.

WARRINGTON, a market-town of Lancaſhire, ſeventeen miles eaſt of Liverpool.

WARSAW, the capital of Warſovia, and of the kingdom of Poland: eaſt long. 21° 5′, and north lat. 52° 15′.

WARSOVIA, or MASSOVIA, a province of Poland, bounded by Pruſſia, on the north; by Polachia, on the eaſt; by the province of Little Poland on the ſouth; and by that of Great Poland on the weſt.

WART, *verruca*, in ſurgery, a little round hard excreſcence ariſing on the fleſh like a pea.

A wart begins at the cutis, and ſeems to be either an effloreſcence of the ſerum of the blood, which hardening in the ſurface of the ſkin makes a dry tumor; or elſe ſome ſmall luxuriancy of the little arteries of the cutis, which thruſt themſelves out, making a petty ſarcoma, which we call a ſoft wart. See SARCOMA.

According to the variety of the tumor, it is ſometimes whole with a ſmooth ſurface, ſometimes chapped and uneven.

The

The method of cure which deſerves to be firſt mentioned, is by ligature or vincture; this is performed upon ſuch of theſe excreſcences as are ſlender about the roots, and in a manner pendent, by firmly tying about them an horſe-hair, or a ſilken or linen-thread. The warts, being deprived of the juices which nouriſh them through a conſtriction of the veſſels by the ligature, gradually wither and fall away.

Another method of cure, is the ſurgeon's inſtrument, in which the wart is taken up by an hook, or forceps, and then very nicely ſeparated by the ſciſſars. The wound is treated for ſome time with an application of the lapis infernalis, or ſome other corroding medicine, that, if any part of a root ſhould remain, from which a new tubercle might ariſe, it might be conſumed and deſtroyed. See WOUND.

The cure by cauſtics is beſt performed by cutting off the hard upper part of the wart, with a razor or ſciſſars, and then ſurrounding its bottom with a circle of wax, to prevent the ſpreading of the remedies; to touch it daily with oil of tartar, ſpirit of ſalt, aqua-fortis, or butter of antimony. See CAUSTIC.

The cure by cautery is performed by chooſing a cautery of a proper ſize, and with that burning down to the root of the wart. This is the moſt painful of all the methods of extirpating theſe excreſcences; but the pain is but for a moment, and the warts extirpated this way never return again.

The cure by evulſion is performed by anointing them with ſoftening ointment, and then ſeizing them artfully between the thumb and fore-finger, and forcibly wrenching them out. This is a mountebank method, and a bad one; for it is not only very painful, but the warts commonly grow up again.

When warts are found to look livid and blue, it is beſt to let them alone entirely; becauſe when irritated, they frequently degenerate into a cancer. See the article CANCER.

WARTA, a town of Great Poland, ſituated on a river of the ſame name, fifty-ſeven miles ſouth-eaſt of Poſna.

WARTENBURG, a town of Sileſia, twenty miles north eaſt of Breſlaw.

WARWICK, the capital of Warwickſhire, ſituated on the river Avon, eighty miles north-weſt of London: weſt long. 1° 32′, north lat. 52° 20′.

WARWICK, is alſo a town of Flanders, eight miles ſouth-eaſt of Ypres.

WASEIGNE, a town of the auſtrian Netherlands, nine miles north of Namur.

WASH, among diſtillers, the fermentable liquor uſed by the malt-diſtillers. See the article DISTILLERY.

It ſhould be about the ſtrength of the ten ſhilling ſmall-beer; and if the ſpirit be expected fine, it had better be too thin than too thick. It is only made by mixing the water hot with the malt ground into meal. If the water be too hot, the mixture will become gluey; and if too cool, a part of the virtue of the malt will be loſt. Under the right application of the water is to be conſidered the proper manner of agitating the maſs, ſo that all the parts of the aqueous fluid may come fully and freely in contact with the ſoluble particles of the ſubject. When once the water is well ſaturated by ſtanding on the malt a proper time, it muſt be drawn off, and freſh poured on, till at length the whole virtue, or all the ſugary ſweetneſs of the malt is extracted, and nothing but a fixed huſky matter remains behind, incapable of being farther diſſolved by the action of hot or boiling water; or of being advantageouſly waſhed or rinſed out by the bare affuſion of cold. This artificial and external agitation or ſtirring about of the maſs, is neceſſary not only in the common way of brewing for the malt-diſtillery, but alſo in that more expeditious way, now in uſe with ſome, of reducing the operations of brewing and fermenting to one, and grinding the malt to a fine meal, which is to be kept in the waſh during the whole time, and even put into the ſtill with it, and worked together. The ſtirring may be repeated to great advantage more than once in each operation, as at the affuſion of every parcel of freſh water, in the common way, and at any ſhortly diſtant times in the ſhort way, in which it is of greater ſervice.

The action of fermentation works ſuch a change in the body of the tincture or ſolution, called the waſh, as to render it ſeparable by diſtillation, into parcels of matter that are ſpecifically different, and of a nature entirely foreign to what the ſame liquor would have yielded without the fermentation. See the article DISTILLATION.

WASHING, in painting, is when a deſign, drawn with a pen or crayon, has ſome

ſome one colour laid over it with a pencil, as Indian Ink, biſtre, or the like, to make it appear the more natural, by adding the ſhadow of prominences, apertures, &c. and by imitating the particular matters, whereof the thing is ſuppoſed to conſiſt.

Thus they waſh with a pale red to imitate brick and tile; with a pale indian blue, to imitate water and ſlate; with green, for trees and meadows; with ſaffron or french berries, for gold or braſs; and with ſeveral colours for marbles. Theſe waſhes are uſually given in equal teints or degrees throughout; which are afterwards brought down and ſoftened over the lights with fair water, and ſtrengthened with deeper colours for the ſhadows.

Some colours are of ſuch a gritty, ſandy nature, that it is impoſſible to grind them ſo fine as ſome curious works require; therefore, in order to get forth the flour and fineneſs of the colour, it muſt be waſhed, which is done thus: Take what quantity of colour you pleaſe to waſh, and put it into a veſſel of fair water; ſtir it about till the water be all coloured therewith, and if any filth ſwim on the top of the water, ſcum it clean off; and, when you think the groſſeſt of the colour is ſettled at the bottom, then pour off that water into another earthen veſſel, that is large enough to contain the firſt veſſel full of water four or five times; then pour more water into the firſt veſſel, and ſtir the colour that remains till the water be thick; and, after it is a little ſettled, pour the water alſo into the ſecond veſſel, and fill the firſt veſſel again with water, ſtirring it as before; continue to do this till you find all the fineſt of the colour drawn forth, and none but coarſe gritty ſtuff remain in the bottom; then let this water in the ſecond veſſel ſtand to ſettle till it is perfectly clear, and that all the colour be ſunk to the bottom; which when you perceive, then pour the water clear from it, and reſerve the colour in the bottom for uſe, which muſt be perfectly dried before you mix it with oil to work.

The colours thus ordered, are red led, blue and green bice, verditer, blue, green ſmalt, and ſpaniſh brown, when you would cleanſe it well from ſtones for ſome fine work, as alſo yellow oker, when you intend to make gold ſize of it.

WASHING *of ores*, the purifying an ore of any metal, by means of water, from earths and ſtones, which would otherwiſe render it difficult of fuſion; this operation Cramer orders to be done as follows: Break the ore to a coarſe powder in an iron mortar, weigh twenty or thirty docimaſtical centners of it, put them into the waſhing-trough, and pour ſome water upon them, that the ore may be thoroughly moiſt; then have a veſſel full of water, the diameter of which muſt be a little larger than the length of the trough; take the trough with the left-hand, by the top of the hinder part, and dipping it horizontally into the water, move it gently with the right-hand from the fore-part of the trough, which is always to be made the ſhallower part of it, toward the hinder part, which is deeper; then take out the trough, and incline it a little on the fore-part, that the water may run out, and the heavier metallic part remain at the bottom; repeat this ſeveral times till the remains at the bottom of the trough are quite pure. If the ſtone in which the ore is lodged be too hard for powdering in its natural ſtate, as the flinty and debaſed cryſtalline ones commonly are, the whole muſt be calcined, and quenched in cold water ſeveral times over, and afterwards powdered and waſhed in this manner: when it is thus waſhed, aſſay a centner of it, and from the bead of metal this yields, it will be eaſy to eſtimate the value of the ore.

WASHING, or WASHES, among goldſmiths, coiners, &c. are the lotions whereby they recover the particles of gold and ſilver out of the ſweep, *i. e.* aſhes, earths, ſweepings, &c.

This is either performed by ſimply waſhing them again and again, or by putting them in the waſhing-mill.

To make one of theſe waſhes, they not only gather together the aſhes of the furnaces, and ſweepings of the workhouſes, but they alſo break and pound the old earthen crucibles, and the very bricks whereof the furnaces are built; little particles of gold, &c. being found to ſtick to them by the crackling natural to thoſe metals, when in their laſt degree of heat.

Theſe matters, being ground and mixed together, are put in large wooden baſons, where they are waſhed in ſeveral waters, which run off by inclination into troughs underneath; carrying with them the earth, and the inſenſible particles of the

longitude from each other (See plate CCXCVII. fig. 1.) This plate makes an entire revolution in twenty-four hours; and, conſequently, every country thereon paſſes by the ſun, repreſented by A. Round this plate is a circle divided into 24 hours, alſo at reſt; by means of which, when the moveable plate is made to correſpond to the true time, ſhewn by the hands on the common ſide, the time of day or night, at the ſeveral countries ſpecified, is ſhewn by the hour-circle. Round the moveable plate, and between it and the circle of hours above deſcribed, moves a narrow circle, on which is engraved the moon's age; and over 29 ½ is placed an ivory-ball, B, repreſenting the moon: and at right-angles, each way, are placed two pins, C and D, one eaſtward, and the other weſtward; by means of which, the time of the moon's riſing, ſouthing and ſetting, at thoſe different places, is ſhewn in a very entertaining manner. Several other uſeful aſtronomical problems may alſo be ſolved thereby.

Striking WATCH, one which, beſides the common watch-work for meaſuring time, has a clock-part for ſtriking the hours; ſo that, properly ſpeaking, they are pocket-clocks. See CLOCK.

Repeating WATCH, one that by only pulling a ſtring, puſhing in a pin, *&c.* repeats the hour, quarter, or minute, at any time of the day or night.

WATCHING, or WAKEFULNESS, *inſomnia*, in medicine, is produced by too great a determination of the nervous fluid, to the organs of the ſenſes; whereby theſe organs are prepared to receive, readily, any impreſſions from external objects, which they propagate to the brain, and furniſh the ſoul with divers occaſions of thinking. This extraordinary flux of ſpirits may have two cauſes: for, 1. The ſenſible objects may ſtrike the organ with too much force. In which caſe, the animal ſpirits being violently agitated, and thoſe agitations continued by the nerves to the brain, they give a like motion to the brain itſelf; the neceſſary conſequence of which is, that the animal muſt wake. Thus, a loud ſhriek, pains, headach, gripes, coughing, *&c.* cauſe waking. And the ſoul's being oppreſſed with cares, or deeply engaged in thinking, contributes to the ſame, ſince, as it acts by the miniſtry of the ſpirits, any cares or meditations that keep them in motion, muſt produce watchfulneſs. Of this kind are thoſe inveterate wakings of melancholic perſons, ſome of whom have been known to paſs three or four weeks without a wink of ſleep. See SLEEP.

2. The other cauſe is in the ſpirits themſelves, which have ſome extraordinary diſpoſition to receive motion, or to perſiſt in it; as from their too great heat, or that of the brain, in fevers, *&c.* Hence it is, that the diſorder is moſt frequent in ſummer, in the heat of youth, *&c.* See HEAT.

Long faſting has the ſame effect; the want of food ſubtilizing the ſpirits, and drying the brain. The ſame is likewiſe an ordinary ſymptom in old age, by reaſon the pores of the brain and nerves having been much widened by the continual paſſage of ſpirits for a great number of years, the ſpirits now paſs and repaſs through them with too much eaſe, and need not any extraordinary motion to keep the mind awake.

There are inſtances of waking forty-five nights ſucceſſively; and we even read of a melancholy perſon, who never ſlept once in fourteen months. Such watchings uſually degenerate into madneſs.

When the cauſe is known, it muſt be removed, if poſſible, and the irritated ſpirits muſt be appeaſed with emulſions, eſpecially of poppy-ſeeds, or with the thebaic tincture, or theriaca, and other opiates in general, not neglecting the original diſeaſes. In fevers, a moiſt ſoftening diet is beneficial; as alſo preparations of barley, emulſions of poppy-ſeeds and almonds, decoctions of ſcorzonera-roots, almond cream, and winter-flummery uſed as aliment: likewiſe tea made of cowſlip-flowers, and gentle laxatives. When the patient is reſtleſs and wakeful the night before a criſis, no hypnotics ſhould be given. See FEVER.

When there is no other diſeaſe, the patient ſhould ſhun all care and intenſe thinking, eſpecially in the evening: he ſhould alſo uſe exerciſe, and eat light ſuppers. If it is cauſed by pains, they ſhould be appeaſed by antiſpaſmodics, things which temperate, and diaphoretics; and if theſe will not do, mild opiates muſt be added. In old perſons, all care and ſolitude muſt be baniſhed; the mind ſhould be quiet, and the moderate uſe of generous wine may be allowed in the evening; likewiſe medicines of amber and muſk will be proper, and con-

fectio alkermes or theriaca with wine. The drinking of hot water, and principally coffee, muſt be forbid after dinner.

WATER, *aqua*, in phyſiology, a ſimple, fluid, and liquid body, reputed the third of the four vulgar elements. Sir Iſaac Newton defines water to be a fluid ſalt, volatile and void of taſte; but this definition Boerhaave ſets aſide, in as much as water is a menſtruum or diſſolvent of ſalts and ſaline bodies, which does not agree with the notion of its being a ſalt itſelf; for we do not know of any ſalt that diſſolves another. This laſt mentioned philoſopher, therefore, defines water, a very fluid, ſcentleſs, taſteleſs, tranſparent, colourleſs liquor, which turns to ice with a certain degree of cold. See the article FLUID.

Though water be defined a fluid, it is a point controverted among philoſophers whether fluidity be its natural ſtate, or the effect of violence. We ſometimes find it appear in a fluid, and ſometimes in a ſolid form; and as the former, in our warmer climate, is the more uſual, we conclude it the proper one, and aſcribe the other to the extraneous action of cold. Boerhaave, however, aſſerts the contrary, and maintains water to be naturally of the cryſtalline kind; ſince wherever a certain degree of fire is wanting to keep it in fuſion, it readily grows into a hard glebe under the denomination of ice. Mr. Boyle is of the ſame opinion. Ice, he obſerves, is uſually ſaid to be water brought into a preternatural ſtate by cold; but with regard to the nature of things, and ſetting aſide our arbitrary ideas, it might as juſtly be ſaid that water is ice preternaturally thawed by heat. If it be urged, that ice left to itſelf will, upon the removal of the freezing agents, return to water; it may be anſwered, that, not to mention the ſnow and ice which lie all ſummer on the Alps, and other high mountains, even in the torrid zone, we have been aſſured, that in ſome parts of Siberia, the ſurface of the ground continues more months in the year frozen by the natural temperature of the climate, than thawed by the heat of the ſun; and a little below the ſurface of the ground, the water which chances to be lodged in the cavities there, continues in a ſtate of ice all the year round; ſo that when, in the heat of the ſummer, the fields are covered with corn, if you dig a foot or two deep, you ſhall find ice and a frozen ſoil. See the articles ICE, FREEZING, *&c.*

Water is generally divided into ſalt and freſh, with regard to the ocean and rivers. But, according to Dr. Shaw, it ſeems diviſible into as many different ſpecies, as the earth is into beds. Thus there are mineral waters of various kinds, according to the mineral ſubſtance they run over, and become impregnated with; tho' this impregnation ſometimes happens in the way of vapour and exhalation. Water, therefore, in the general, may be as mixed a body as earth, and perhaps neither of them naturally exiſts in any conſiderable purity. See SEA-WATER, MINERAL-WATER, EARTH, VAPOUR, EXHALATION, *&c.*

In a general analyſis of water, the doctor found, 1. That common warm water throws up numerous little bubbles, and explodes, in the exhauſted receiver of the air-pump; for which reaſon water contains what may, by way of diſtinction, be called æther or ſpirit. 2. It contains a merely aqueous part, diſtinct from æther and the ſediment, as appears from diſtilled common water. 3. It contains a dry ſolid matter, which is either earthy or ſaline, as appears upon a full evaporation, and from the inſides of tea kettles, which, after long uſe, are lined with a ſtony matter that beats off in flakes or cruſty pieces. See AIR, DISTILLATION, *&c.*

Water is not only contained in the earth as in a reſervoir, but likewiſe floats in the atmoſphere. In both caſes it is actuated, rarified, and put in motion by heat, ſo as to prove inſtrumental in producing effects. Thus it produces clouds, rains, dews, ſprings and rivers. It refreſhes the earth, recruits vegetables, and is the ſupport of fiſh and other animals by conveying nutriment to all their parts. It is alſo the firſt and immediate inſtrument of fermentation, putrefaction, corruption, and change in all vegetable and animal ſubjects. See ATMOSPHERE, CLOUD, RAIN, DEW, *&c.*

But the nature and uſes of water, will beſt appear from the following experiments. 1. That water is contained in many ſolid bodies, and to appearance in dry bodies, was proved thus: a piece of the hardeſt and drieſt bone being procured, and diſtilled in an earthen retort, with degrees of fire, a very large proportion water, along with much oil and volatile

volatile ſalt, was obtained: whence it appears, that animal matters are reſolvable into the four chemical principles, water, oil, ſalt and earth. This experiment holds true even of the oldeſt hartſhorn, the drieſt and hardeſt woods, earths and pulverized ſtones. Whence it alſo appears, that water may be concealed in ſolid bodies, and make a conſtituent part thereof: for it is not meant that water inſinuates itſelf into the ſuperficial pores of bodies, ſuch as wood, ſkins, &c. ſo as to ſwell them in moiſt weather, and leave them ſhrunk in dry; but that it remains permanently intermixed as an eſſential ingredient, or as a part of ſolid bodies. See BODY.

2. That water may be collected from the drieſt air, or in the hotteſt climate, was proved by the following experiment. Half a pint of common water was put into a cylindrical glaſs wiped perfectly dry on the outſide; then was added to the water two ounces and three quarters of pulverized and dry ſal ammoniac; theſe were ſtirred briſkly together, whereupon the water floating in the external air was, by the coldneſs thus produced, condenſed on the outſide of the glaſs as the ſalt diſſolved within, and trickled down in ſmall veins, into the ſhallow baſon ſet underneath to receive it. This experiment holds in all climates and places of different heights where it has been tried; whence by the law of induction we may make it univerſal, till any contradictory inſtance appears. Thus, therefore, it may hold in the moſt parched countries, and hotteſt ſeaſons, ſo as to afford an agreeable method of cooling potable liquors, and rendering them more refreſhing. For if the containing glaſs of the ſalt and water be ſet in any liquor, the liquor will be cooled thereby; and if any conſiderable improvement could be made in the contrivance, it is obſerved, that it might in ſome meaſure ſerve to ſupply the thirſty traveller in parched deſarts, and the ſailors with freſh water at ſea. See SEA-WATER.

3. To determine the proportion of water contained in an aſſigned portion of the atmoſphere, we are directed by the following experiment. Having by means of the air-pump, and an exact pair of ſcales, found the weight of a certain quantity of air contained in a large glaſs-veſſel, there was included therein a certain known weight of well dried potential cautery, whoſe property it is powerfully to attract the moiſture of the air. This veſſel was kept cloſe ſtopt for ſeveral hours; during which time, the potential cautery was grown wet, in which ſtate being weighed again, it was found conſiderably to increaſe; which muſt be either owing to the water attracted out of the air in the glaſs, or to a condenſation of the air itſelf into an aqueous fluid; for ſuch a fluid might now by diſtillation be obtained from the matter thus run per deliquium. It is obſerved that there is room to ſuſpect, that if this experiment were made in perfection, a weight of water almoſt equal to that of the air included in the veſſel, might be thus obtained, which might prove a very extraordinary diſcovery, and ſhew what ſome have endeavoured to prove, that the matter of common air, is little more than water. See AIR and ATMOSPHERE.

4. That an earthy ſubſtance is naturally contained in water, was proved as follows. Three ſeveral glaſſes were filled with pure rain water, ſpring water, and Thames water, and ſuffered to ſtand, cloſe covered, for ſome days before they were exhibited. There was an earthy ſediment then depoſited in all the three, but moſt in the Thames water, the ſediment whereof was not only larger, but alſo more foul and muddy than in the rain water; though here, alſo, it was dirty, perhaps, becauſe not carefully collected; whereas, in the pump-water, it was white, ſcaly, flaky, and ſhining, like fine ſpangles of talc. This experiment is alſo univerſal, ſo far as it has been tried with care, and holds true of the waters of all ſpecies, and all countries, particularly in thoſe called mineral waters, from which an earthy ſubſtance may uſually be precipitated by art, in a conſiderable proportion. See the article PYRMONT-WATER.

Certain experiments carefully made, and repeated, ſhew that the terreſtrial matter naturally contained in water, has a principal ſhare in the growth and increaſe of vegetables; all the plants that thrive in water appearing to enlarge their bulk in proportion to the earthy matter they draw from the water. Whence pure elementary water, ſeems but a kind of vehicle to convey this nutrimental or ſubſtantial part, and depoſite it in the veſſels through which the water moves, in order to its general exit at the ſurface of vegetables. But we are not here to exclude the inſtrumental efficacy of the two

other

other elements, fire and air. And this appearing to be the general office of water in the whole animal and vegetable kingdoms, *viz.* the conveyance or diſtribution of the alimentary matter to all their parts, it may be proper to conſider its phyſical properties, which would wonderfully fit it for this office. See the article VEGETATION.

The figure of its component parts appears to be ſmooth and ſpherical, like thoſe of quickſilver; whence it becomes extremely moving, and penetrating. Thus it readily enters the pores of wood, leather, ſkins, chords, muſical ſtrings, *&c.* thus likewiſe it becomes capable of moving and agitating particles of matter leſs active than itſelf, and ſo proves the more immediate phyſical agent of fermentation, putrefaction, ſolution, *&c.* and thus it alſo conveys earthy and ſaline matters through our filtres of paper, ſtone, *&c.* and even raiſes ſome proportion of them in diſtillations. Its particles likewiſe appear to be extremely minute, and ſo have a large ſhare of ſurface. Hence water is admirably fitted for a ſolvent, or for readily entering the pores of ſalts, and coming into full contact with all their particles; and thus it will paſs where air cannot, on account of its moiſture, or lubricating power, whereby it faſtens mucilaginous matters, and will therefore ſoak through the cloſe pores of a bladder.

The ſpecific gravity of water, and conſequently is goodneſs by its lightneſs, are to be directly judged of by the hydroſtatical ballance. This experiment is a good ſubſtitute for ſeveral other ways of examining the purity and goodneſs of waters, both common and mineral; for it appears by numerous inſtances, that light waters are, *cæteris paribus*, the beſt, pureſt, and wholeſomeſt. That water is accounted beſt and wholſomeſt which is not only the lighteſt and freeſt from earthy ſediment, but that which is the moſt ſpiritous; and theſe properties are uſually found in pure rain-water; that being naturally diſtilled from the ocean and rivers, or by the heat of the ſun raiſed up into the atmoſphere, from whence it is returned much after the manner of common diſtillation. See *Specific* GRAVITY, HYDROSTATICAL *Ballance*, CHALYBEATE *Water*, &c.

From the preceding, and other experiments of Dr. Shaw, made upon water, he deduces the following axioms and canons. Firſt we have ſeen, That water is naturally contained in ſome of the drieſt and hardeſt bodies, and in the drieſt air. 2. That itſelf naturally contains an earthy ſubſtance. 3. That it is the proper menſtruum of ſalts, diſſolving more of one, and leſs of another. 4. That one good ſign of its purity and wholeſomeneſs is levity. 5. That the ingredients of a mineral water may be diſcovered by chemical expedients: and, 6. That mineral waters are imitable by art from ſuch diſcovery. See MINERAL WATER, PYRMONT-WATER, *&c.*

Secondly, That water is of infinite uſe in all the works both of nature and art, as without it there could be no generation, nutrition, or accretion performed in any of the animal, vegetable, mineral, marine, or atmoſpherical regions. The blood could not flow in the veins, the ſap in the veſſels of vegetables, nor the particles of minerals concrete and grow together, without water. It is this that makes the largeſt part of our blood, our drink, and other aliments. There could be no corruption, fermentation, or diſſolution carried on without it, no brewing, no diſtilling, no wines, no vinegar, no ſpirits, made without it. See the article GENERATION, NUTRITION, ACCRETION, *&c.*

Thirdly, That we meet with water under an infinite variety of forms, and in an infinite variety of bodies, as that of air, vapour, clouds, ſnow, hail, ice, ſap, wines, blood, fleſh, bone, horn, ſtone, *&c.* through all which it ſeems to paſs unaltered, as an agent or inſtrument that ſuffers no alteration by re-action, but remains capable of reſuming the form of water again upon occaſion. See the article SNOW, HAIL, *&c.*

Fourthly, That water in its own common ſtate appears to be a combination of all the elements together, as containing a quantity of fire, which keeps it fluid, a quantity of air, and a quantity of earth; whence it can be no wonder that water alone, as it appears to the ſenſes, ſhould ſuffice for vegetation in ſome caſes, where little earth is wanted, or for ſupporting animal and mineral life, where no great degree of nutriment is required; and hence it proves a gluten, or cement to ſome bodies, and a ſolvent to others; thus it conſolidates brick, plaiſter of Paris, ſtone, bone, *&c.* but diſſolves

ſalts,

ſalts, and ſubtile earths approaching to ſalts, and becomes the inſtrumental cauſe of their action. See ELEMENT, &c.

Fifthly, That water conveys nouriſhment, or a more fixed and ſolid matter to the parts of vegetables, where having depoſited it, the finer fluid perſpires into the atmoſphere, which gives us the phyſical cauſe of the dampneſs and unwholeſomeneſs of woody countries, as they remarkably find in America. For all large vegetables act after the manner of forcing pumps, and continually draw in large quantities of water at their roots, and diſcharge it at their leaves, which intimates a method of collecting water in dry countries, and likewiſe of making ſalt-water freſh. See the article VEGETATION, SEA-WATER, &c.

Sixthly, That the water in paſſing thro' plants, after having depoſited its more terreſtrial part, does not always go off pure, but impregnated with the finer effluvia, or more ſubtile particles of the vegetable; thus making an atmoſphere round every plant, according to its nature odoriferous or otherwiſe, which ſupplies us with a rule for procuring the odoriferous waters of vegetables by diſtillation.

Seventhly, That the particles, not fine enough to go off thus along with the water, are left behind upon the ſurface of the leaves and flowers of plants, being now thickened or ſtrained from their moiſter parts, and remaining in the form of honey, manna, gums, balſams, &c. according to the nature of the vegetable. And hence appears the phyſical cauſe of plants proving more odoriferous and ſweet when the weather is both warm and moiſt, as immediately after a ſummer's ſhower. See the articles HONEY, MANNA, GUM, &c.

Eighthly, That the chemical operator ſhould form to himſelf an hygrometer for the ſervice of his laboratory to determine the proportion of water at all times contained in the air, which continually mixes with his preparations, differently augments their weight, and promotes or hinders many of his operations. See LABORATORY and HYGROMETER.

Ninthly, That pure water makes the largeſt part of mineral waters, where it is impregnated as a menſtruum, with ſeveral ingredients that it diſſolves or drinks up in its paſſage through the earth.

Tenthly and laſtly, The preceding enquiry affords conſiderable light for diſcovering practicable ways of making ſea water freſh and potable, and of preparing waters by art, ſo as to render them fitter for the common œconomical uſes, and the ſervice of many particular arts, as medicine, pharmacy, chemiſtry, brewing, diſtilling, &c.

Water is of the utmoſt uſe in divers of the mechanical arts and occaſions of life, as in the motion of mills, engines, fountains, and other machines, the conſtruction of all which, ſubſervient thereto, or founded thereon, as ſiphons, pumps, &c. make the ſubject of hydraulics. See the articles MILL, ENGINE, FOUNTAIN, MACHINE, HYDRAULICS, &c.

The laws, properties, &c. of this fluid, with reſpect to the foreſaid uſes, as its motion, gravitation, preſſion, elevation, action, momenta and velocities, &c. which make the ſubject of hydroſtatics, may be ſeen under the article FLUID and HYDROSTATICS.

For the water-poiſe, or that inſtrument which ſerves to meaſure the gravity, denſity, velocity, &c. of water, ſee the article HYDROMETER.

For the aſcent of water in capillary tubes, ſee the article CAPILLARY.

For an account of the water-clock, the water-level, the water-organ, &c. See CLEPSYDRA, LEVEL, ORGAN, &c.

WATER, in hydrography, and geography, is a common or general name, applied to all liquid tranſparent bodies, gliding or flowing on the earth, in which ſenſe water and earth are ſaid to conſtitute our terraqueous globe. See EARTH.

In this ſenſe, water is diſtinguiſhed with regard to the places where it is found, into ſea-water, rain-water, ſpring-water, well-water, ciſtern-water, lake-water, moraſs-water, &c. See the articles SEA, RAIN, RIVER, SPRING, WELL, &c.

For the periodical changes to which the water of the ſea is liable, ſee the articles TIDES, FLUX, EBB, &c.

WATER, in medicine, pharmacy, &c. called alſo, artificial and medicated waters, are a kind of liquors procured or prepared by art from divers bodies, principally of the vegetable tribe, having various properties, and ſerving for various purpoſes. Theſe waters are either ſimple, or compound; ſimple-waters are thoſe procured from ſome one vegetable body, the intention of which is to draw out the

virtues of the herb, ſeed, flower, root, or the like, ſo as it may be more conveniently given in that form than any other. The means whereby this ſeparation is effected, are either evaporation, infuſion, decoction, or diſtillation. See EVAPORATION, INFUSION, &c.

The ſimple-waters of chief virtue are the following ones, *viz.* dill-water, angelica-water, mint-water, roſemary-water, orange-flower-water, black-cherry-water, parſley-water, camomile-water, peny-royal-water, fennel-water, damaſk roſe-water, hyſſop-water, rue-water, juniper-water, elder-water, lovage-water, carminative-water, &c. for the virtues of each whereof we refer the reader to thoſe aſcribed to the ſeveral plants, or other bodies from whence the water is procured, which may be found under their proper heads in the courſe of this work.

Compound-waters, or thoſe wherein ſeveral ingredients are uſed, are very numerous, and make a large article in commerce; ſome prepared by the apothecaries, according to the diſpenſatory preſcripts, for medicinal uſes; others by the diſtillers, to be drank by way of dram; and others by the perfumers, &c. They are diſtinguiſhed by different epithets, &c. in reſpect either of the ſpecific virtues of the waters, or the parts of the body for the cure whereof they are intended, or the diſeaſes they are good againſt, or the ingredients they are compounded of, or their different uſes, &c.

The moſt conſiderable among the claſs of compound waters, are alexipharmic or alexiterial-waters, ſuch as treacle-water, plague-water, milk-water, poppy-water, &c. alum-water, angelica-water, anniſeed-water, apricot-water, aromatic-water, arthritic water, bryony-water, carduus-water, water of ſeparation, or depart, cauſtic-water, cephalic-water, chalybeat-water, cinnamon-water, clary-water, clove-water, cordial-water, coſmetic-water, gentian-water, gum-water, hepatic-water, honey-water, hungary-water, hyſteric-water, iced or frozen-water, imperial-water, lime-water, aqua-mirabilis, or the wonderful-water, nephritic-water, ophthalmic water, orange-water, peach-water, poppy-water, pyony-water, roſe-water, ſcordium-water, ſpecific-water, ſplenetic-water, ſtomachic-water, ſtyptic-water, treacle-water, vulnerary-water, &c.

The uſes and preparations of moſt of theſe, and ſeveral others, may be ſeen as they are arranged under their reſpective names throughout the courſe of this work; but as theſe waters are exceeding numerous, and the manner of making them, is not always the ſame, we muſt refer the chemical or medical reader to the diſpenſatories, wherein he will find, that every one gives his own method as the beſt one.

We have only three general remarks to add, with regard to thoſe intended for drinking. 1. That ſuch wherein any thing is infuſed, as bruiſed fruits, pounded herbs, &c. or ground ſpices, muſt be always paſſed through a filtre, to make them finer and purer. 2. That thoſe made with brandy, or ſpirit of wine, are uſually diſtilled after mixing their ingredients, which renders thoſe liquors exceeding ſtrong and dangerous. 3. That the waters which take their name from particular things, as cinnamon, &c. have often ſome other ingredients, joined with them, according to the taſte or ſmell required.

WATER, in anatomy, is applied to divers liquors or humours in the human body, ſuch is the aqua phlegmatica, which is a ſoft ſerous humour, contained in the pericardium, and wherein the heart ſwims. See PERICARDIUM.

Holy WATER, a water prepared every Sunday in the romiſh church, with divers prayers, exorciſms, &c. uſed by the people to croſs themſelves withal at their entrance to and going out of, church; and pretended to have the virtue of waſhing away venial ſins, driving away devils, preſerving from thunder, diſſolving charms, ſecuring from, or curing diſeaſes, &c. Many of the reformed take the uſe of holy-water to have been borrowed from the luſtral water of the antient Romans. See LUSTRATION.

WATER ORDEAL, or TRIAL, among our anceſtors, was of two kinds, by hot, and by cold, water. Trial or purgation, by boiling or hot water, was a way of proving crimes, by immerging the body, or the arm, in hot water, with divers religious ceremonies. In the judgment by boiling water, the accuſed, or he who perſonated the accuſed, was obliged to put his naked arm into a caldron full of boiling water, and to draw out a ſtone thence placed at a greater or leſs depth, according to the quality of the crime. This done, the arm was wrapped up, and the judge ſet his ſeal on the cloth, and at the end of three days they return-

ed to view it, when if it were found without any ſcald, the accuſed was declared innocent. The nobles or great perſonages purged themſelves thus, by hot water, and the populace, by cold water. The trial, or purgation, by cold water, was thus: after certain prayers and other ceremonies, the accuſed was ſwaddled, or tied up, all in a pelotoon or lump, and thus caſt into a river, lake, or veſſel, of cold water, where if he ſunk he was held criminal, if he floated, innocent.

In the levitical law, we find mention made of water which ſerved to prove, whether or no a woman was an adultereſs; the formula, as it was perſormed by the prieſt, may be ſeen in the fifth chapter of the book of Numbers.

WATER, among jewelers, is properly the colour or luſtre of diamonds and pearls. The term, though leſs properly, is ſometimes uſed for the hue or colour of other ſtones. See DIAMOND and PEARL.

WATER-BAILIFF, is an officer in ſea-port towns, appointed for the ſearching of ſhips; and in London, the water-bailiff hath the ſuperviſing and ſearch of fiſh, brought thither; and the gathering of the toll ariſing from the Thames; his office is likewiſe to arreſt men for debt, *&c.* or other perſonal or criminal matters upon the river Thames.

WATER BORNE, in the ſea-language. A ſhip is ſaid to be water-borne, when ſhe is, where there is no more water than will barely bear her from the ground; or when lying even with the ground, ſhe firſt begins to float or ſwim.

WATER-COLOURS, in painting, are ſuch colours as are only diluted and mixed up with gum-water, in contradiſtinction to oil-colours.

The uſe of water-colours makes what we call limning, as that of oil-colours does painting, properly ſo called. See the articles COLOUR and LIMNING.

Dead-WATER, in the ſea-language, is the eddy-water that follows the ſtern of a ſhip, not paſſing away ſo faſt as that which ſlides by her ſides.

WATER, or SEA-GAGE. See *GAGE*.

WATER-GANG, a channel cut to drain a place by carrying off a ſtream of water.

WATER-LINE *of a ſhip*, a line which diſtinguiſhes that part of her under water from that above, when ſhe is duly laden.

WATER-MEASURE. Salt, ſea-coal, *&c.* while aboard veſſels in the pool or river, are meaſured with the corn-buſhel heaped up; or elſe five ſtriked pecks are allowed to the buſhel. This is called water-meaſure. See the article MEASURE.

WATER-MEN, as ſuch as row in boats, or ply on the river Thames, in the government of whom the lord-mayor of London, and court of aldermen there, had always great power. They ſtill have the appointing of their fares, the taking more than which, makes them liable to a fine of 40s. and half a year's impriſonment. The fares aſſeſſed are, from London-bridge to Limehouſe, Ratcliff-croſs, *&c.* oars, 1s. ſcullers, 6d. to Wapping-dock, Rotherhith-church-ſtairs, *&c.* oars, 6d. ſcullers 3d. from either ſide of the water above the Bridge to Lambeth, and Vaux-hall, oars, 1s. ſcullers, 6d. all the ſtairs between London-bridge and Weſtminſter, oars, 6d. ſcullers, 3d. Watermens boats ought to be twelve feet and a half in length, andfour and a half in breadth; and no apprentice to any waterman ſhall take upon him the care of a boat till he is ſixteen years of age, if a waterman's ſon; and ſeventeen, if a landman's ſon, unleſs he has worked with ſome able waterman two years, *&c.* No tilt-boat, or row barge, *&c.* may take in above thirty-ſeven paſſengers, or three more by the way; nor any boat above eight paſſengers, and two by the way, elſe they forfeit 5l. for the firſt offence, and 10l. for the ſecond, *&c.* and if any perſon be drowned when a greater number are taken in, the waterman is declared guilty of felony, and may be tranſported, *&c.*

WATER-SHOOT, a young ſprig which ſprings out of the root or ſtock of a tree.

WATER-SHOT, in the ſea-language, a ſort of riding at anchor when a ſhip is moored neither croſs the tide, nor right up and down; but quartering betwixt both.

WATER-TABLE, in architecture, a ſort of ledge left in ſtone, or brick walls, about eighteen or twenty inches from the ground, from which place the thickneſs of the wall begins to abate. See WALL.

WATER-WAY, in a ſhip, is a ſmall ledge of timber, lying fore and aft on the deck, cloſe by her ſides, to keep the water from running down there.

WATER-WHEEL, an engine for raiſing water in great quantity out of a deep well. See *Perſian* WHEEL.

WATER-WORKS, in general, denote all manner of machines moved by, or employed in raiſing or ſuſtaining water; in which ſenſe, water-mills of all kinds, ſluices,

London-Bridge WATER-WORKS

T. Jeffreys sculp.

ſluices, aquæducts, &c. may be called water-works. See MILL, &c.

The term water-works, however, is more particularly uſed for ſuch machines as are employed only in raiſing water.

We ſhall begin with the deſcription of that at London-bridge, which is moved by the common tide-water of the river Thames. A B (plate CCXCVIII.) the axle-tree of the water-wheel, is nineteen, feet long, three feet diameter, in which C, D, E, F, are four ſets of arms, eight in each place, on which are fixed G, G, G, G, four rings, or ſets of felloes, in diameter twenty feet; and the floats H, H, H, fourteen feet long, and eighteen inches deep, being about twenty-ſix in number.

The wheel lies with its two gudgeons, or center-pins A B, upon two braſſes in the pieces M N, which are two great levers, whoſe fulcrum, or prop, is an arched piece of timber L; the levers being made circular on their lower ſides to an arch of the radius M O, and kept in their places by two arching ſtuds fixed in the ſtock L, through two mortiſes in the lever M N. The wheel is, by theſe levers, made to riſe and fall with the tide, which is performed in this manner: the levers M N are ſixteen feet long; from M, the fulcrum of the lever, to O the gudgeon of the water-wheel, ſix feet; and from O to the arch at N, ten feet. To the bottom of the arch N is fixed a ſtrong triple chain P, made after the faſhion of a watch-chain, but the links arched to a circle of one foot diameter, having notches, or teeth, to take hold of the leaves of a pinion of caſt iron Q, ten inches diameter, with eight teeth in it moving on an axis. The other looſe end of this chain has a large weight hanging at it, to help to counterpoiſe the wheel, and preſerve the chain from ſliding on the pinion. On the ſame axis is fixed a cog-wheel R, 6 feet diameter, with 48 cogs. To this is applied a trundle, or pinion S, of ſix rounds, or teeth; and upon the ſame axis is fixed T, a cog-wheel of fifty-one cogs, into which the trundle V, of ſix rounds, works; on whoſe axis is a winch or windlaſs W, by which one man, with the two windlaſſes, raiſes or lets down the wheel, as there is occaſion. And becauſe the fulcrums of theſe levers M N are in the axis of the trundle K, *viz.* at M or X, in what ſituation ſoever the wheel is raiſed or let down, the cog-wheel I, I, is always equidiſtant from M, and works or geers truly.

By means of this machine the ſtrength of an ordinary man will raiſe about fifty ton weight.

I, I, is a cog-wheel fixed near the end of the great axis, eight feet diameter, and 44 cogs working into a trundle K, of $4\frac{1}{2}$ feet diameter, and 20 rounds, whoſe axis or ſpindle is of caſt iron 4 inches in diameter, lying in braſſes at each end, as at X.

Z Z is a quadruple crank of caſt iron, the metal being ſix inches ſquare, each of the necks being turned one foot from the center, which is fixed in braſſes at each end in two head-ſtocks faſtened down by caps. One end of this crank at Y is placed cloſe abutting to the end of the axle-tree X, where they are at thoſe ends ſix inches diameter, each having a ſlit in the ends, where an iron wedge is put, one half into the end X, the other half into Y, by means of which the axis X turns about the crank Z Z.

The four necks of the crank have each an iron ſpear, or rod, fixed at their upper ends to the reſpective libra, or lever, *a* 1, 2, 3, 4, within three feet of the end. Theſe levers are twenty-four feet long, moving on centers in the frame *b b b b*; at the end of which, at *c* 1, 2, 3, 4, are jointed four rods with their forcing plugs working into *d* 1, 2, 3, 4, four caſt iron cylinders four feet three quarters long, ſeven inches bore above, and nine below where the valves lie, faſtened by ſcrewed flanches over the four holes of a hollow trunk of caſt iron, having four valves in it juſt over *e e e e*, at the joining on at the bottom of the barrels, or cylinders, and at one end a ſucking pipe or grate *f*, going into the water, which ſupplies all the four cylinders alternately.

From the lower part of the cylinders *d* 1, *d* 2, *d* 3, *d* 4, come out necks turning upward arch-wiſe, as *g g g g*, whoſe upper parts are caſt with flanches to ſcrew up to the trunk *h h h h*; which necks have bores of ſeven inches diameter, and holes in the trunk above communicating with them, at which joining are placed four valves. The trunk is caſt with four boſſes, or protuberances, ſtanding out againſt the valves to give room for their opening and ſhutting; and on the upper ſide are four holes ſtopped with plugs, to take out on occaſion, to clean

the valves. One end of this trunk is ſtopped by a plug *i*. To the other iron pipes are joined, as *i* 2, by flanches, through which the water is forced up to any height or place required.

Beſides theſe four forces, there are four more placed at the other ends of the libræ, or levers (not ſhewn here to avoid confuſion, but to be ſeen on the left hand) the rods being fixed at *a* 1, 2, 3, 4, working in four cylinders, with their parts *d d*, &c. *e e*, *f*, *g g*, and *i*, as before deſcribed, ſtanding near *k k*.

At the other end of the wheel (at B) is placed all the ſame ſort of work as at the end A is deſcribed, *viz.*

The cog-wheel I.
The trundle K.
The ſpindle X.
The crank Y, Z.
The ſucking pipes *f*.
The four levers *ac*, *ac*, *&c.*
Eight forcing rods, *ad*, *ad*, *&c.*
Eight cylinders, *de*, *de*, *&c.*
Four trunks, ſuch as *ee*, *bb*.
Two forcing pipes, as *i*.
So that one ſingle wheel works 16 pumps.
All which work could not be drawn in one perſpective view, without making it very much confuſed.

A calculation of the quantity of water raiſed by the engines at London bridge.

In the firſt arch next the city is one wheel with double work of 16 forcers.

In the third arch { First wheel double work at one end, and ſingle at the other 12
Second wheel in the middle 8
Third wheel 16

In all 52 forcers.

One revolution of a wheel makes in every forcer $2\frac{1}{5}$ ſtrokes.

So that one turn of the four wheels makes 114 ſtrokes.

When the river is at beſt, the wheels go ſix times round in a minute, and but $4\frac{1}{2}$ at middle water } 6

The number of ſtrokes in a minute 684

The ſtroke is $2\frac{1}{2}$ feet in a 7 inch bore, raiſes 3

They raiſe per minute 2052 } ale gallons.

That is, 123120 gallons = 1954 hogſheads per hour, and at the rate of 46896 hogſheads in a day, to the height of 120 feet.

This is the utmoſt quantity they can raiſe, ſuppoſing there were no imperfections or loſs at all.

But it is certain, from the conſiderations following, that no engine can raiſe ſo much as will anſwer the quantity of water the cylinder contains in the length of the forces, or piſton's motion. For,

Firſt, opening and ſhutting of the valves loſe nearly ſo much of that column, as the height they riſe and fall.

Secondly, no leather is ſtrong enough for the piſton, but there muſt continually ſlip, or ſqueeze by, ſome water, when it is raiſed to a great height; and, when the column is ſhort, it will not preſs the leather enough to the cylinder, or barrel: but, eſpecially at the beginning or firſt moving of the piſton, there is ſo little weight on it, that, before the leather can expand, there is ſome loſs.

Thirdly, and this loſs is more or leſs, as the piſtons are looſer or ſtraiter leathered.

Fourthly, when the leathers grow too ſoft, they are not capable of ſuſtaining the pillar to be raiſed.

Fifthly, if they are leathered very tight, ſo as to loſe no water, then a great part of the engine's force is deſtroyed by friction.

By ſome experiments accurately made on engines, whoſe parts are large and excellently performed, they will loſe one fifth and ſometimes one fourth of the calculated quantity.

However, the perfections or errors of engines are to be compared together, by the calculated quantities or forces; for as they differ in thoſe, they will proportionably differ in their actual performances.

The power by which the wheels are moved.

The weight of the pillar of water on a forcer 7 inches diameter and 120 feet high.

$7 \times 7 = 49$ lb. The pounds avoirdupoiſe in a yard, nearly.

40 yards high.

1960 lb. on one forcer.

8 forcers always lifting.

The whole weight 15680 lb. = 140 Cwt. = 7 ton weight on the engine at once.

WATER-WORKS.

Fig. 1.

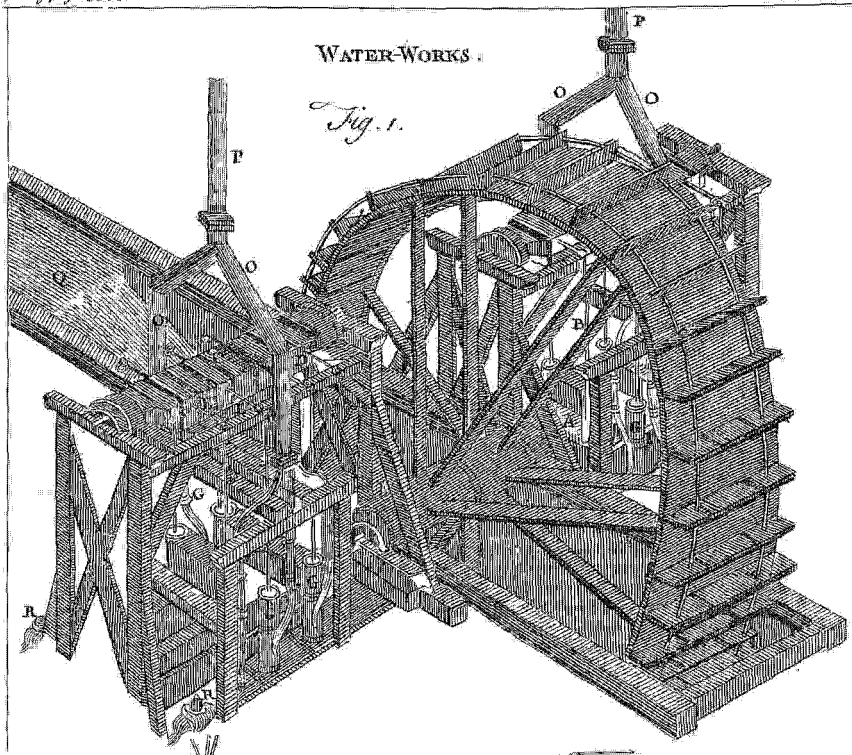

Fig. 3.

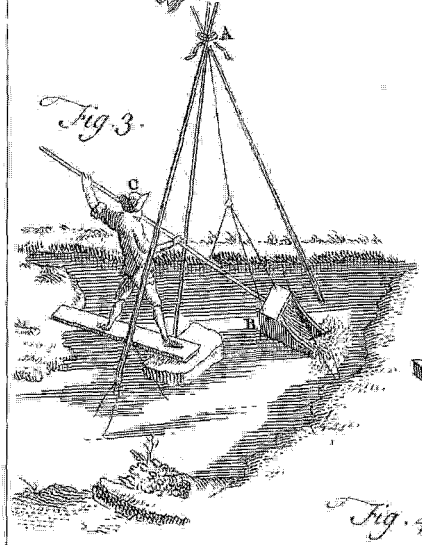

Fig. 2.

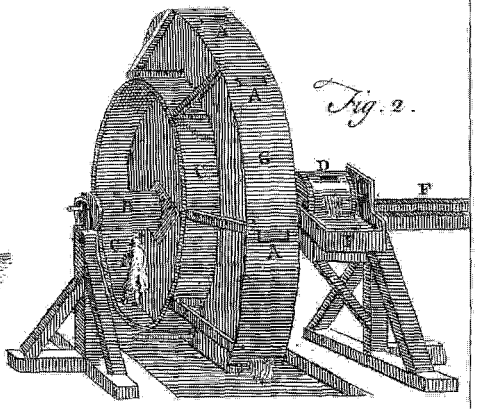

Fig. 4.

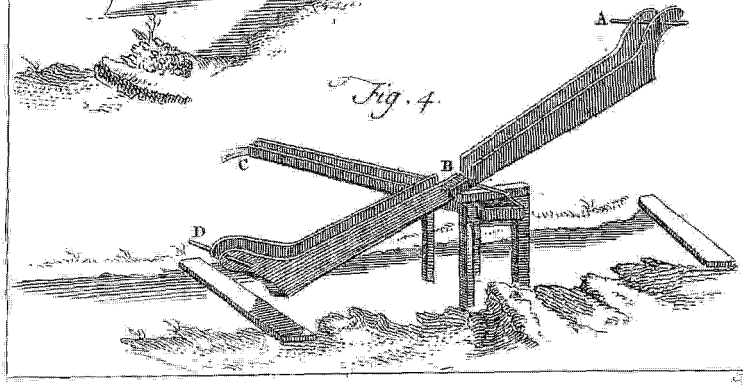

Then the crank pulls the libra 3 feet from the forcer, and 8,3 feet from the center,

7 ton
×11.3
8,3)79.1(9,5. ton on the crank.

Wallower - 2,2)9,5(4,3 ton on trundle.
The ſpur-wheel - 4
Radius of the great wheel 10)17,2(1,72 ton.
20
34,40 Cwt.

The force on the floats 18 Cwt. 40 lb.
But to allow for friction and velocity, may be reckoned 1 ton ½.
The ladles, or paddles, 14 feet long, 18 inches deep, = 22,4 ſquare feet.
The fall of water is at a mean - 2 feet.
44,8
6 gallons in a cubic foot.
268,8
10, lb. in a gallon.
112) 2688 (24 hundred.

The velocity of the water, 4 feet in 21″ of time.
21″ — 4 feet :: — 60″ : = 685 feet *per* minute.
The velocity of the wheel = 310 feet *per* minute.
Quantity expended on the wheel, according to the velocity of the ſtream, 1433 hogſheads *per* ſecond.
But at the velocity of the wheel 645 hogſheads *per* ſecond.
The velocity of the wheel to the velocity of the water, as 1 to 2, 2.

Fig. 1. plate CCXCIX. repreſents a curious machine for raiſing water, executed at Nynphenbourg, by the count de Whal, maſter of the works to the elector of Bavaria. It raiſes water ſixty feet high into a reſervoir, for the uſe of the elector's gardens.

The water of the canal, falling down the inclined plane at Q, turns the large wheel repreſented in the figure, the circumference of which, by cogs, moves the arbor D, and the ſame on the other ſide; to thoſe are faſtened the piſtons of ſixteen forcing pumps G, four on each ſide the arbor, as repreſented in the figure.

From each of theſe pumps is a tube, through which the water is forced into the pipe O, and from thence through the pipe P, which conveys it into the reſervoir. Theſe pumps are faſtened together by pieces of timber, with iron clamps, to make them firm, as may be ſeen in the figure.

This is a very good machine, and deſerves to be imitated, either in whole or in part, when water is to be raiſed.

We ſhall conclude this account of waterworks with a deſcription of two machines much uſed in Holland.

Fig. 2. *ibid.* repreſents another machine for raiſing water: it is moved by the man C, walking in the wheel C, as is plain from the figure. The large wheel A, A, G, has ſeven ſquare holes in its circumference, as A, A, A, which run in a ſpiral form to the axis B. The water, by the motion of the wheel whoſe circumference is conſtantly immerſed in it, runs along theſe ſpiral tubes to the axis; from whence it is conveyed to D, where it is diſcharged, and by means of the trough and ſpout F, F, conveyed to the reſervoir deſtined to receive it.

Fig. 3. *ibid.* repreſents a machine uſed by the Dutch for freeing their dykes of water. It conſiſts of five pieces of board, forming a kind of ſcoop, as B; the handle C is ſuſpended by a rope faſtened to three poles placed triangularly, and faſtened together at A, as is plain from the figure. As the working of this machine conſiſts in balancing it, and directing it ſo that, after having filled it with water, it may throw it on the other ſide of the dam, we ſhall only obſerve that the labourer at two ſtrokes can draw only half a cubic foot of water in four ſeconds, which amounts to four hundred cubic feet in an hour.

Fig. 4. *ibid.* is another machine of the ſame kind with that above deſcribed. The figure ſufficiently explains its uſe. It is worked by two men, one at A, and another at D. The machine moves on the center B, and each end is immerſed alternately in the water; by which means it flows into each end of the machine, where

where there is a valve, to prevent its returning; and, by the alternate motion of the machine, the water ſo taken up is conveyed to B, and from thence, by the ſpout C, over the dam.

WATERFORD, a port-town of Ireland, capital of the county of Waterford, ſituated on the river Sure, eight miles north of the ſea: weſt long. 7°, north lat. 52° 12′.

It is one of the largeſt cities in Ireland, and has a good foreign trade.

WATERING, in the manufactures, is to give a luſtre to ſtuffs, &c. by wetting them lightly with gum-water, and then paſſing them through the preſs, or calender, whether hot or cold.

The gum-water ought to be pure, thin, and clear, otherwiſe the folds of the ſtuff will ſtick together: the operation muſt alſo be performed when the water is very hot, that it may penetrate.

WATLINGTON, a market-town of Oxfordſhire, ſituated twelve miles ſouth-eaſt of Oxford.

WATTON, a market town of Norfolk, ſixteen miles ſouth-weſt of Norwich.

WAVE, *unda*, in philoſophy, a cavity in the ſurface of water, or other fluid, with an elevation aſide thereof. See the article FLUID.

Sir Iſaac Newton explains the nature of waves in water after the following manner: Let AB and CD (*pl.* CCXCVII. fig. 2. n° 1.) be the ſurface of water quieſcent in the upright leg KL, MN, of a received tube. And if the water be put into motion, and aſcends in the leg KL to EF, it will deſcend in the leg MN to GH; ſo that EA = DH. Again, let PV be a pendulum vibrating in the cycloid RPS, its length VP, from the point of ſuſpenſion to the center of oſcillation, is equal to half the length of the water in the tube; let P be the loweſt point, and PQ an arch of the cycloid, equal to the altitude AE.

The force by which the water is alternately accelerated and retarded in its motion in the tube, is the exceſs of the weight of water in either leg above the weight in the other; and, therefore, when the water in the leg KL aſcends to EF, and in the other leg deſcends to GH, that force is equal to the weight of the two equal quantities of water AEFB + CGHD = 2AEFB; and, therefore, is to the weight of the whole water, as EA to VP, or as PQ to PR; becauſe the ſemi-cycloid PR is equal to the length of the pendulum which deſcribes it, from the nature of the curve.

All the power by which the weight P is in any point Q accelerated or retarded in the cycloid, is, to its whole weight, as the diſtance PQ from the loweſt point P, to the length of the ſemi-cycloid PR. Wherefore, as the moving forces of the water and pendulum are at firſt quieſcent, thoſe powers will move them equally in equal times, and cauſe that they go forwards and backwards together with a reciprocal motion: all which is eaſily deduced from what has been ſaid of the nature of the cycloid, the motion of heavy bodies, and the forces of bodies in motion.

Hence it follows, that, whether the diſtance AE be great or ſmall, the reciprocations of the water will all be performed in equal times. Alſo, it follows, that if the whole length of the water be 78,4 inches, each reciprocation, or aſcent and deſcent of the water, will be performed in one ſecond of time; becauſe a pendulum of half that length vibrates in that time. Laſtly, if the length of the aqueous canal be increaſed or diminiſhed, the time of each reciprocation will be increaſed or diminiſhed in the ſubduplicate ratio of the length.

When the nature of waves in water is conſidered, it will be found to agree very nearly with the motion of the water in the tube abovementioned; and, conſequently, their motion will be ſimilar to that of a pendulum. For let EFG (*ibid.* n° 2.) repreſent the level ſurface of water when it is not agitated ſo as to produce waves; when it is thus agitated, let ABCD repreſent the wavy ſurface, AC the higheſt parts of the waves, and BD the loweſt or concave part. Then it is evident, the weight of the water at A above EG will cauſe it to deſcend as far below the level to B; and with the motion acquired by that deſcent, it will again aſcend to the ſame height C, and ſo produce a conſtant ſucceſſion of waves in the watery ſurface, after the ſame manner as was ſhewn in the tube.

Hence it follows, that becauſe the length of the whole water to be moved is from the higheſt point A to the loweſt point B, if the length of a pendulum be half AB, it will oſcillate once while the water deſcends from A to B; and in another oſcillation, it will aſcend from B to C; and ſo on. So that a wave will paſs

through

through its whole length in the time of two oſcillations; and, therefore, in the time of one oſcillations of a pendulum four times as long, or equal to ABC.

Whence, becauſe ABC, in very large and wide waves, is nearly equal to the breadth AC; therefore, when the waves are 39,2 inches broad, they will undulate in one ſecond of time; and, conſequently, ſince the times of all the undulations are equal, there will be $39,2 + 60 = 2352$ inches, or 196 feet, run through by a wave in one minute; which is 11760 feet *per* hour. Hence, alſo, the velocity of greater or leſſer waves will be increaſed or diminiſhed in the ſubduplicate proportion of their breadth: that is, if V = velocity of the greater waves ABCD, and v = velocity of the leſſer waves *a. b. c. d. e. f.* &c then it will be $V : v :: \sqrt{AC} : \sqrt{ac}$. Becauſe the velocities and times of bodies, moved in any manner by gravity, are proportional to the ſquare roots of the perpendicular altitudes, and thoſe altitudes are as the lengths of pendulums; and, therefore, as the breadth of waves.

The waves of the ſea are of two kinds, natural and accidental. The natural waves are thoſe which are exactly proportioned in ſize to the ſtrength of the wind, whoſe blowing gives origin to them. The accidental waves are thoſe occaſioned by the wind's reacting upon itſelf by repercuſſion from hills and mountains, or high ſhores, and by the waſhing of the waves themſelves, otherwiſe of the natural kind, againſt rocks and ſhoals: all theſe caſes give the waves an elevation, which they can never have in their natural ſtate.

Mr. Boyle has proved, by numerous experiments, that the moſt violent wind never penetrates deeper than ſix feet into the water; and it ſhould ſeem a natural conſequence of this, that the water moved by it can only be elevated to the ſame height of ſix feet from the level of the ſurface in a calm: and this ſix feet of elevation being added to the ſix of excavation, in the part whence that water ſo elevated was raiſed, ſhould give twelve feet for the utmoſt elevation of a wave. This is a calculation that does great honour to its author; for count Marſigli meaſured carefully the elevation of the waves near Provence, and found that, in a very violent tempeſt, they aroſe only to ſeven feet above the natural level of the ſea, and this additional foot in height he eaſily reſolved into the accidental ſhocks of the water againſt the bottom, which was, in the place he meaſured them in, not ſo deep as to be out of the way of affecting the waves; and he allows that the addition of one ſixth of the height of a wave, from ſuch a diſturbance from the bottom, is a very moderate alteration from what would have been its height in a deep ſea; and concludes, that Mr. Boyle's calculation holds perfectly right in deep ſeas, where the waves are purely natural, and have no accidental cauſes to render them larger than their juſt proportion. In deep water, under the high ſhores of the ſame part of France, this author found the natural elevation of the waves to be only five feet; but he found alſo, that their breaking againſt rocks, and other accidents to which they were liable in this place, often raiſed them to eight feet high.

We are not to ſuppoſe, from this calculation, that no wave of the ſea can riſe more than ſix feet above its natural level in open and deep water; for waves immenſely higher than theſe are formed, in violent tempeſts, in the great ſeas. Theſe, however, are not to be accounted waves in their natural ſtate, but they are ſingle waves formed of many others; for in theſe wide plains of water, when one wave is raiſed by the wind, and would elevate itſelf up to the exact height of ſix feet, and no more, the motion of the water is ſo great, and the ſucceſſion of the waves ſo quick, that, during the time this is riſing, it receives into it ſeveral other waves, each of which would have been at the ſame height with itſelf; theſe run into the firſt wave, one after another, as it is riſing: by this means its riſe is continued much longer than it naturally would have been, and it becomes terribly great. A number of theſe complex waves ariſing together, and being continued in a long ſucceſſion by the continuation of the ſtorm, make the waves ſo dangerous to ſhips, which the ſailors in their phraſe call mountains high.

WAVE-OFFERING, in jewiſh antiquity, a ſacrifice offered by agitation, or waving, towards the four cardinal points of the compaſs. See the article SACRIFICE.

WAVED, WAVY, or WAVEY, in heraldry, is ſaid of a bordure, or any ordinary, or charge, in a coat of arms, having its out-lines indented, in manner of the riſing and falling of waves: it is uſed

uſed to denote, that the firſt of the family in whoſe arms it ſtands, acquired its honours for ſea-ſervice.

WAVING, in the ſea-language, is the making ſigns to a veſſel to come near or keep off.

WAVREN, or GAVEREN. See the article GAVEREN.

WAX, or *Bees*-WAX, in natural-hiſtory, a firm and ſolid ſubſtance, moderately heavy, and of a fine yellow colour, formed by the bees from the farina of flowers, which they work up and compreſs into a maſs, or ſort of cake, and of which they form their honey-combs; from whence it is obtained by heating and ſtraining them through a linnen cloth, or by preſſing them betwixt iron-plates, *&c.* The beſt ſort is that of a lively yellow colour, and an agreeable ſmell, ſomewhat like that of honey: when new it is toughiſh, yet eaſy to break; but by age it becomes harder and more brittle, loſes its fine colour, and in a great meaſure its ſmell. See the article HONEY-COMB.

From the common yellow wax, by the mere effect of ſun and air, or by what is called bleeching, is formed what we term white-wax, and ſome, very improperly, virgin-wax. As the greater the ſurface is in proportion to the quantity, the ſooner and more perfectly this operation is perſormed. The uſual way is to melt the wax in hot water; when melted, they preſs it through a ſtrainer of tolerably fine linen, and pour it into round and very ſhallow moulds. When hardened by cooling, it is taken out and expoſed to the ſun and air, ſprinkling it now and then with water, and often turning it: by this means it ſoon becomes white. The beſt ſort is of a clear and almoſt tranſparent whiteneſs, dry, hard, brittle, and of an agreeable ſmell, like that of the yellow wax, but much weaker.

The common yellow wax is of very great uſe both in medicine and in many of the arts and manufactures. It is ſometimes given internally, as in dyſenteries, and other eroſions of the inteſtines; but its great uſe is in the making ointments and plaſters for external uſe, and the greater part of thoſe of the ſhops owe their conſiſtence to it. The white wax is alſo an ingredient in ſome of the cerates and ointments of the ſhops; and is uſed in making candles, and in many of the nicer arts and manufactures, where wax is required.

Bees-wax, on being imported, pays a duty of 9 s. $6\frac{9}{100}$ d. the hundred weight, and draws back, on exportation, 8 s. $7\frac{1}{2}$ d.

Preparations of WAX. The butter and oil of wax are thus prepared: Cut the wax in pieces and put them into a retort, which muſt be half filled with theſe pieces; and the reſt of the retort being filled with ſand, it muſt be placed in a ſand furnace. At firſt an acid ſpirit ariſes, and afterwards a thick oil, called the butter of wax, ſticks in the neck of the retort, unleſs it be heated by applying a live coal. This may be rectified into a thin oil, by diſtilling it ſeveral times, without addition, in a ſand-heat. The butter is an extremely ſoft and anodyne unguent; highly emollient and relaxing; agreeable to the nerves; and, when rubbed on contracted limbs, proves of great benefit to them. It is an excellent liniment for the piles, and takes off the pain attending them in a very ſudden and ſurprizing manner. It alſo keeps the ſkin ſoft, and is one of the beſt things known to keep it from cracking or chopping in the winter.

The oil of wax, has alſo a very ſingular virtue in curing contracted tendons and reſtoring flexibility to the parts. It cures chapped nipples in women who give ſuck beyond any other application, and is as ſucceſsful againſt chapped lips, and the cracking of the ſkin of the hands, only rubbing them once in three or four days with it. It is alſo of great uſe in diſcuſſing cold tumours ariſing on the face, and thoſe on the fingers in winter.

Sealing-WAX is made in the following manner: Take one pound of bees-wax; three ounces of fine turpentine; olive-oil, and roſin, finely powdered, of each one ounce: when they are well melted, and the droſs taken off, put in an ounce and a half of vermillion, or red-lead, finely ground, and ſtir them together till they are well incorporated: and when this mixture grows a little cool roll it into ſticks, or in any other form. If you would have it black, inſtead of vermillion, or red-lead, put in lamp-black. The ſoft, red, and green wax, uſed in large ſeals to ſome of our law-writings, are thus made: Melt bees-wax over a gentle heat, with ſuch a proportion of venice-turpentine as, when cold, will give it the due conſiſtence: this is determined by repeated trials, firſt putting in but little turpentine, and afterwards

more and more, till by dropping a piece upon a marble to cool, it is found of the true conſiſtence. They then colour it with red-lead, or vermilion, or with verditer, or whatever colours they pleaſe; the mixture in this ſtate receiving any.

Grafting-WAX, a compoſition ſerving to bind the graft to the cleft of the ſtock. For the manner of making which, ſee *Methods of* GRAFTING.

To imitate fruit in WAX. Take the fruit and bury it half way in clay; oil its edges, and that part of the fruit which is uncovered; then nimbly throw on it tempered alabaſter or plaſter of Paris, to a conſiderable thickneſs. When this is grown dry and hard, it makes the half mould; the ſecond half of which may be obtained in the ſame manner. The two parts of the mould being joined together, a little bees-wax melted and brought to a due heat, being poured through a hole made in a convenient part of the mould, and preſently ſhook therein, will repreſent the original fruit.

WAX-WORK, the repreſentation of the faces, *&c.* of perſons living or dead; made by applying plaſter of Paris in a kind of paſte, and thus forming a mould containing the exact repreſentation of the features. Into this mould melted wax is poured, and thus a kind of maſks are formed; which being painted and ſet with glaſs eyes, and the figures dreſſed in their proper habits, they bear ſuch a reſemblance that it is difficult to diſtinguiſh between the copy and the original.

WAXING, in chemiſtry, the preparation of any matter to render it fit and diſpoſed to liquify, or melt, which of itſelf it was not.

This is frequently done to enable things to penetrate into metals and other ſolid bodies.

WAY, a paſſage or road. See ROAD.

The roman ways are divided into conſular, prætorian, military, and public; and of theſe we have four remarkable ones in England the firſt, Watling-ſtreet, or Watheling-ſtreet, leading from Dover to London, Dunſtable, Touceſter, Atterſton, and the Severn extending as far as Angleſea in Wales. The ſecond, called Hikenild, or Ikenild ſtreet, ſtretches from Southampton over the river Iſis at Newbridge; thence by Camden and Lichfield; then paſſes the Derwent, near Derby, and ends at Tinmouth. The third, called Foſſe-way, becauſe in ſome places it was never perfected, but lies as a large ditch, leads from Cornwal thro' Devonſhire, by Tethbury, near Stow in the Wolds; and beſide Coventry to Leiceſter, Newark, and ſo to Lincoln. The fourth, called Erming, or Erminage-ſtreet, extends from St. David's, in Wales, to Southampton.

High-WAY. See HIGH-WAY.

Milky-WAY. See GALAXY.

WAY *of a ſhip*, is ſometimes the ſame as her rake, or run forward or backward: but this term is moſt commonly underſtood of her ſailing. Thus when ſhe goes a-pace, it is ſaid that ſhe hath a good way, or makes a freſh way. So when an account is kept how faſt ſhe fails by the log, it is called keeping an account of her way; and becauſe moſt ſhips are apt to fall a little to leeward of their true courſe, they always in caſting up the log-board, allow ſomething for her leeward way.

WAY *of the rounds*, in fortification, is a ſpace left for the paſſage of the rounds between the rampart and the wall of a fortified town. This is not now much in uſe; becauſe the parapet, not being above a foot thick, is ſoon overthrown by the enemy's cannon.

WAY-WISER, an inſtrument otherwiſe called perambulator. See the article PERAMBULATOR.

WAY-WODE, a title given to the governors of the chief places in the empire of Muſcovy, as alſo in Poland.

WEAR, or WEER, a great ſtank or dam in a river, fitted for the taking of fiſh, or for conveying the ſtream to a mill.

New wears are not to be made, or others altered, to the nuſance of the public, under a certain penalty.

WEASEL, in zoology, a ſpecies of Muſtela, with the tip of the tail black. See the article MUSTELA.

This is a ſmaller animal than the polecat: the head is ſmall, of an ovated form, and ſharp at the ſnout: the ears are ſmall, ſhort and patulous: the eyes of a fierce aſpect: the mouth well furniſhed with teeth: the upper jaw longer than the under: the body is about eight inches long, and ſlender: the tail is a third part the length of the body the legs are ſhort and ſlender: the feet have five toes armed with ſharp claws: the whole body is covered with a fine and tolerably long fur: the back is of a darkiſh colour, and the belly is white.

WEATHER, the ſtate or diſpoſition of the atmoſphere with regard to heat, cold, wind, rain, froſt, &c.

As it is in the atmoſphere that all plants and animals live, and as that appears to be the great principle of moſt animal and vegetable productions, alterations, &c. there does not ſeem any thing, in all philoſophy, of more immediate concernment to us than the ſtate of the weather, and a knowledge of the great influence it has on our bodies. What vaſt, but regular, alterations a little turn of weather makes in a tube filled with mercury, or ſpirits of wine, or in a piece of ſtring, &c. every body knows, in the common inſtance of barometers, thermometers, &c. and it is owing partly to our inattention, and partly to our unequal and intemperate courſe of living, that we do not feel as great and regular ones in the tubes, chords, and fibres of our own bodies.

WEATHER-COCK, or WEATHER-VANE, a moveable vane in form of a cock, or other ſhape, placed on high, to be turned round according to the direction of the wind, and point out what quarter the wind blows from. See WIND.

WEATHER-GLASSES, are inſtruments contrived to indicate the ſtate or diſpoſition of the atmoſphere, and the various alterations in the weather: ſuch are barometers, thermometers, hygrometers, &c. See the articles BAROMETER, THERMOMETER, &c.

WEATHER-GAGE, in the ſea-language. See the article GAGE.

WEATHERING, among ſailors, ſignifies the doubling, or ſailing by a headland, or other place.

WEAVING, the art of working a web of cloth, ſilk, or other ſtuff, in a loom with a ſhuttle. For the manner of performing which ſee the article CLOTH, &c.

WEAVING-LOOM, a machine for weaving cloth, ſilk, &c. by raiſing the threads of the warp in order to throw in the ſhoot, and ſtrike it cloſe. Of theſe there are various kinds, diſtinguiſhed by the different ſorts of cloths, ſtuffs, ſilks, &c. in which they are employed, and which are chiefly diſtinguiſhed by the number and variety of the threads they raiſe in order to work the warp, either plain or in figures, by making more or leſs of the woof or ſhoot appear through the warp. In order to give a general idea of weaving we ſhall here deſcribe the parts of the common weaver's loom. See plate CCXCII. fig. 2. in which 9, 9, are the loom-poſts: 10. the croſs-bars: 11. the batten; which ſerves to ſtrike in, and cloſe more or leſs the threads of the woof: 12. the cap of the batten, or a long bar, which the weaver takes hold of in one hand and then in the other: 13. The block, or under part of the ſame, containing the reed within the lower bar: 14. the croſs-piece, or burdon and pin, which helps to make the batten moveable: 15. the gallows; a piece of wood ſuſpending the pully, on which the cord moves that is tied to the two lams: 16. the breaſt-bar; a flat ſquare piece of wood, with an opening in it to let the ſtuff through, which is rolled on the knee-roll: 17. the cane-roll, which the warp is turned on at the other end of the loom: 18. the reed: 20. pullies, upon which the cords roll that are faſtened to the lams: 21. the tumbler; which is a cord that paſſes from one lam to the other over the pully 20, and cauſes the working of the lams by its aſcending and deſcending: 22. the muffle in which the pully acts: 23. a ſkain, or leiſh, cut into proper lengths, to mend the leiſhes of the harneſs that happen to break: 24. a bobbin of the warp, to mend the threads of the warp that occaſionally break: 25. lizier thread, to mend thoſe of the lizier that happen to break; and which, eſpecially in cloth, are very different from the warp: 26. the box to hold the quills: 28. the foot-bar: 29. the trundles, or moveable bars, tied with two cords to the lower virgee of each lam. When the foot preſſes a treadle, the lam that is faſtened to it ſinks, and the other riſes by the help of the tumbler: 30. the foot-ſtep: 31. the temple; a double flat ruler, having ſmall teeth at the extremities; it may be lengthened or ſhortened by the help of a catch that is in one of the rulers, and introduced in a groove in the other ruler. The teeth in the extremities are faſtened in the lizier of the work, by which means it is kept of an equal breadth; and as the work advances the temple is moved forwards: 32. the ſhuttle ſeen in front and profile: 33. the knee-roll, on which the work is rolled as it is wove: 34. the tantow; an iron leaver to turn the knee-roll: 35. the reed ſeen ſeparate.

WEB, a ſort of tiſſue, or texture formed of threads interwoven with each other; ſome whereof are extended in length, and called the warp; and others drawn acroſs, and called the woof. See the articles CLOTH, WARP, *&c.*

Spider's WEB, or COBWEB. See the article COBWEB.

WEDGE, *cuneus*, one of the mechanical powers, as they are called. See POWER.

The wedge is a triangular priſm, whoſe baſes are equilateral acute-angled triangles. See PRISM, *&c.*

The power of the wedge A C B H (plate CCXCVII. fig. 3.) is evident from its conſiſting of two equal inclined planes, A H C and B H C: but as it is chiefly uſed to ſeparate the adhering parts of wood, the coheſion of which is every where variable and uncertain, there can be no regular calculation of the actual effect of the wedge, in this caſe. But if we ſuppoſe the power of coheſion in the wood A D E B to be uniform, or to make every where an equal reſiſtance to the wedge A B C, dividing its parts A F and B G; then the power of the wedge would be to the reſiſtance of the wood, as their velocities inverſely, that is, as the ſpaces moved through in the ſame time, that is, as the height of the wedge H C to half its width A H.

WEED, a common name for all rank and wild herbs, that grow of themſelves, to the detriment of other uſeful herbs they grow among.

WEED, in the miners-language, denotes the degeneracy of a load or vein of fine metal into an uſeleſs marcaſite.

WEEK, *ſeptimana*, *hebdomada*, in chronology, a diviſion of time compriſing ſeven days.

The origin of this diviſion of weeks, or of computing time by ſevenths, is greatly controverted. Some will have it to take its riſe from the four quarters or intervals of the moon, between her changes or phaſes, which, being about ſeven days diſtant, gave occaſion to the diviſion.

Be this as it will, the diviſion is certainly very antient. The Syrians, Egyptians, and moſt of the oriental nations, appear to have uſed it from all antiquity: though it did not get footing in the weſt till Chriſtianity brought it in: the Romans reckoned their days not by ſevenths but by ninths, and the antient Greeks by decads or tenths.

Indeed, the Jews divided their time by Weeks, but it was upon a different principle from the eaſtern nations. God himſelf appointing them to work ſix days, and to reſt the ſabbath, in order to keep up the ſenſe and remembrance of the creation; which being effected in ſix days, he reſted the ſeventh.

Paſſion WEEK, or the *Holy* WEEK, is the laſt week in Lent, wherein the church celebrates the myſtery of our Saviour's death and paſſion.

WEEK, or WYCK, in geography, a parliament and port-town of Scotland, in the ſhire of Cathneſs: weſt long. 2° 45′, north lat. 58° 40′.

WEEN, or HUEN, a little iſland in the ſound, at the entrance into the Baltic, ſixteen miles north of Copenhagen.

WEEVER, in ichthyology, the trachinus with the lower jaw longeſt, and without beards. See TRACHINUS.

It grows to ſix or eight inches in length, and is thick in proportion: the head is large and compreſſed, the eyes ſtand near one another at the top of it; the iris is of a gold yellow, the body is compreſſed, the lateral line ſtraight; there is on each ſide at the opercula a large and robuſt ſpine; the tail is ſcarce at all forked; the firſt back fin has five prickly rays; the ſecond has thirty-one; the pectoral fins have each ſixteen rays, and the pinna ani has thirty-two.

WEIDEN, a town of Bavaria, ſituated on the river Nab, fifteen miles north of Amberg.

WEIGH, WAY, or WEY, *waga*, a weight of cheeſe, wool, *&c.* containing 256 pounds avoirdupoiſe. Of corn, the weigh contains forty buſhels; of barley or malt, ſix quarters. In ſome places, as Eſſex, the weigh of cheeſe is 300 pounds.

WEIGHER, an officer in divers cities appointed to weigh the commodities bought or ſold in a public ballance.

WEIGHING, the act of examining a body in the ballance to find its weight.

WEIGHING-CHAIR, a machine contrived, by Sanctorius, to determine the quantity of food taken at a meal, and to warn the feeder when he had his quantum.

WEIGHING-ANCHOR, is the drawing it out of the ground it had been caſt into, in order to ſet ſail, or quit a port, road, or the like.

WEIGHT, GRAVITY, *pondus*, in phyſics, a quality in natural bodies whereby they tend downwards, towards the center of the earth. Or, weight may be defined, in a leſs limited manner, to be a power

inherent in all bodies whereby they tend to ſome common point, called the center of gravity; and that with a greater or leſs velocity, as they are more or leſs denſe, or as the medium they paſs through is more or leſs rare.

In the common uſe of language, weight and gravity are conſidered as one and the ſame thing. Some authors, however, make a difference between them; and hold gravity only to expreſs a nitus or endeavour to deſcend, but weight an actual deſcent. But there is room for a better diſtinction. In effect, one may conceive gravity to be the quality as inherent in the body; and weight the ſame quality, exerting itſelf either againſt an obſtacle, or otherwiſe. Hence, weight may be diſtinguiſhed, like gravity, into abſolute and ſpecific. See GRAVITY.

Sir Iſaac Newton demonſtrates, that the weights of all bodies, at equal diſtances from the center of the earth, are proportionable to the quantities of matter each contains. Whence it follows, that the weights of bodies have not any dependence on their forms, or textures; and that all ſpaces are not equally full of matter. Hence, alſo, it follows, that the weight of the ſame body is different, on the ſurface of different parts of the earth; by reaſon its figure is not a ſphere, but a ſpheroid. See EARTH.

WEIGHT, *pondus*, in mechanics, is any thing to be raiſed, ſuſtained, or moved by a machine, or any thing that in any manner reſiſts the motion to be produced.

WEIGHT, in commerce, denotes a body of a known weight, appointed to be put in the ballance againſt other bodies, whoſe weight is required.

The ſecurity of commerce depending, in good meaſure, on the juſtneſs of weights, which are uſually of lead, iron, or braſs, moſt nations have taken care to prevent the falſification thereof, by ſtamping or marking them by proper officers, after being adjuſted by ſome original ſtandard. Thus, in England, the ſtandard of weights is kept in the exchequer, by a particular officer called the clerk of the market. See the article CLERK.

Weights may be diſtinguiſhed into antient and modern, foreign and domeſtic.

Antient WEIGHTS, 1. Thoſe of the antient Jews, reduced to the Engliſh troy weights, will ſtand as in the following table:

					lb.	oz.	dwt.	gr.
Shekel					00	00	09	$02\frac{4}{7}$
60	Maneh				02	03	06	$10\frac{2}{7}$
3000	50	Talent			113	10	01	$10\frac{2}{7}$

2. Grecian and Roman weights, reduced to engliſh troy weight, will ſtand as in the following table:

							oz.	dwt.	gr.
Lentes							00	00	$\frac{85}{112}$
4	Siliquæ						00	00	$03\frac{1}{28}$
12	3	Obolus					00	00	$09\frac{3}{28}$
24	6	2	Scriptulum				00	00	$18\frac{3}{14}$
72	18	6	3	Drachma			00	02	$06\frac{9}{14}$
96	24	8	4	$1\frac{1}{3}$	Sextula		00	03	$00\frac{6}{7}$
144	56	12	6	2	$1\frac{1}{2}$	Sicilicus	00	04	$13\frac{2}{7}$
192	48	16	8	$2\frac{2}{3}$	2	$1\frac{1}{3}$ Duella	00	06	$01\frac{5}{7}$
576	144	48	24	8	6	4 3	Uncia	00	18	$05\frac{1}{7}$
6912	1728	576	288	96	72	48	36	12	Libra	10	18	$13\frac{5}{7}$

The roman ounce is the engliſh avoirdupois-ounce, which they divided into ſeven denarii, as well as eight drachms; and ſince they reckoned their denarius equal to the attic drachm, this will make the attic weights one eighth heavier than the correſponding roman weights.

Modern European WEIGHTS. 1. Engliſh weights: By the twenty-ſeventh chapter of magna charta, the weights all over England are to be the ſame; but for different commodities, there are two different ſorts, *viz.* Troy weight and avoirdupoiſe weight. The origin from which they

they are both raiſed, is a grain of wheat gathered in the middle of the ear.

In troy weight, twenty-four of theſe grains make a penny-weight ſterling; twenty penny-weights make one ounce; and twelve ounces one pound. See TROY.

By this weight we weigh gold, ſilver, jewels, grains, and liquors. The apothecaries alſo uſe the troy pound, ounce, and grain; but they differ from the reſt in the intermediate diviſions. They divide the ounce into eight drachms; the drachm into three ſcruples, and the ſcruple into twenty grains.

In avoirdupoiſe weight, the pound contains ſixteen ounces, but the ounce is leſs by near one-twelfth than the troy ounce; this latter containing 490 grains, and the former only 448. The ounce contains 16 drachms. 80 ounces avoirdupoiſe are only equal to 73 ounces troy; and 17 pounds troy equal to 14 pounds avoirdupoiſe. See AVOIRDUPOISE.

By avoirdupoiſe weight are weighed mercury, and grocery wares, baſe metals, wool, tallow, hemp, drugs, bread, *&c.*

Table of Troy Weight as uſed by the

Goldſmiths.

Grains.

24		Penny-weight.
480	20	Ounce.

384	128	16	Pound.	
43008	14336	1792	112	Quintal, or Hundred.
860160	286720	35840	2240	20 Ton.

The moneyers, jewellers, *&c.* have a particular claſs of weights, for gold and precious ſtones, *viz.* carat and grain; and for ſilver, the penny-weight and grain. See the article CARACT.

The moneyers have alſo a peculiar ſubdiviſion of the grain troy: Thus,

The { Grain, Mite, Droit, Perit } into { 20 Mites. 24 Droits. 20 Perits. 24 Blanks. }

The dealers in wool have likewiſe a particular ſet of weights, *viz.* the ſack, weigh, tod, ſtone, and clove.

2. French weights: The common or Paris pound is 16 ounces; which they divide two ways: the firſt diviſion is into 2 marcs; the marc into 8 ounces; the ounce into 8 gros; the gros into 3 penny-weights; the penny-weight into 24 grains; the grain equivalent to a grain of wheat. The ſecond diviſion of the pound is into 2 half-pounds; the half-pound into 2 quarters; the quarter into 2 half-quarters; the half-quarter into two ounces; and the ounce into two half-ounces.

The weights of the firſt diviſion are uſed to weigh gold, ſilver, and the richer commodities: and the weights of the ſecond diviſion, for commodities of leſs value.

32	16	8	4	2	Pound.
3200	1600	800	400	200	100 Quintal.

But

But the pound is not the ſame throughout France. At Lyons, e. gr. the city pound is only 14 ounces: So that 100 Lyons pounds make only 88 Paris pounds. But beſide the city pound, they have another at Lyons for ſilk, containing 16 ounces. At Tholouſe, and throughout the Upper-Languedoc, the pound is 13 ounces and a half of Paris weight. At Marſeilles, and throughout Provence, the pound is 13 ounces of Paris weight. At Rouen, beſide the common Paris pound and marc, they have the weight of the vicomte; which is 16 ounces, a half, and five-ſixths of the Paris weight. The weights, enumerated under the two articles of engliſh and french weights, are the ſame that are uſed throughout the greateſt part of Europe; only under ſomewhat different names, diviſions and proportions.

Particular nations have alſo certain weights peculiar to themſelves: thus, Spain has its arrobas, containing 25 ſpaniſh pounds, or one-fourth of the common quintal: its quintal macho, containing 150 pounds, or one-half common quintal, or 6 arrobas: its adarme, containing one-ſixteenth of its ounce. And for gold, it has its caſtillan, or one-hundredth of a pound. Its tomin, containing 12 grains, or one-eighth of a caſtillan. The ſame are in uſe in the Spaniſh Weſt-Indies.

Portugal has its arroba, containing 32 Liſbon arratels, or pounds: Savary alſo mentions its faratelle, containing 2 Liſbon pounds: and its rottoli, containing about 12 pounds. And for gold, its chego, containing four carats. The ſame are uſed in the Portugueſe Eaſt-Indies.

Italy, and particularly Venice, have their migliaro, containing four mirres; the mirre containing 30 Venice pounds: The ſaggio, containing a ſixth part of an ounce. Genoa has five kinds of weights, *viz.* large weights, whereby all merchandizes are weighed at the cuſtom-houſe: caſh weights for piaſtres, and other ſpecies: the cantara, or quintal, for the coarſeſt commodities: the large ballance for raw ſilks; and the ſmall ballance for the finer commodities. Sicily has its rottolo, 32 and a half pounds of Meſſina.

Germany, Flanders, Holland, the Hanſe towns, Sweden, Denmark, Poland, *&c.* have their ſchippondt, which at Antwerp and Hamburgh, is 300 pounds; at Lubeck, 320; and at Coningſberg, 400 pounds. In Sweden, the ſchippondt for copper is 320 pounds; and the ſchippondt for proviſions 400 pounds. At Riga and Revel, the ſchippondt is 400 pounds; at Dantzic, 340 pounds; in Norway, 300 pounds; at Amſterdam, 300; containing 20 lyſpondts, each weighing 15 pounds.

In Muſcovy, they weigh their large commodities by the bercheroct, or berkewits, containing 400 of their pounds. They have alſo the poet, or poede, containing 40 pounds, or one-tenth of the bercheroct.

In order to ſhew the proportion of the ſeveral weights uſed throughout Europe, we ſhall add a reduction of them to one ſtandard, *viz.* the London and Amſterdam-pound.

1. Proportion of the weights of the principal places of Europe.

The 100 ℔. of England, Scotland, and Ireland are equal to

℔	oz.	
91	8	of Amſterdam, Paris, *&c.*
96	8	of Antwerp or Brabant.
88	0	of Rouen, the viſcounty weight.
106	0	of Lyons, the city weight.
90	9	of Rochelle.
107	11	of Toulouſe and upper Languedoc.
113	0	of Marſeilles or Provence.
81	7	of Geneva.
93	5	of Hamburgh.
89	7	of Francfort, *&c.*
96	1	of Leipſick, *&c.*
137	4	of Genoa.
132	11	of Leghorn.
153	11	of Milan.
152	0	of Venice.
154	10	of Naples.
97	0	of Seville, Cadiz, *&c.*
104	13	of Portugal.
96	5	of Leige.
112	$\frac{2}{3}$	of Ruſſia.
107	$\frac{1}{3\frac{1}{4}}$	of Sweden.
89	$\frac{1}{2}$	of Denmark.

2. Proportion of the weights of the chief cities in Europe, to thoſe of Amſterdam.

An 100 pounds of Amſterdam are equal to ℔

108 of Alicant.
105 of Antwerp.
120 of Archangel, or 3 poedes.
105 of Arſchot.
120 of Avignon.

lb
98 of Basil in Switzerland.

105 of Brussels.
105 of Cadiz.
105 of Cologne.
125 of Coningsberg.
107½ of Copenhagen.
87 rottos of Constantinople.
113½ of Dantzic.
100 of Dort.
97 of Dublin.
97 of Edinburgh.
143 of Florence.
98 Francfort on the Maine.
105 of Gaunt.
89 of Geneva.
163 of Genoa, cash weight.
102 of Hamburgh.
106 of Leyden.
105 of Leipsic.
105 ½ of Liege.
114 of Lisle.
143 of Leghorn.
106 ½ of Lisbon.
109 of London, avordupoise weight.
105 of Lovaine.
105 of Lubec.
141 ½ of Lucca, light weight.
116 of Lyons, city weight.
114 of Madrid.
105 of Marlines.
123 ½ of Marseilles.
154 of Messina, light weight
168 of Milan.
120 of Montpelier.
125 bercheroets of Muscovy.
100 of Nantes.
106 of Nancy.
169 of Naples.
98 of Nuremberg.
100 of Paris.
112½ of Revel.
109 of Riga.
100 of Rochelle.
146 of Rome.
100 of Rotterdam.

lb
96 of Rouen, viscounty weight.
100 of St. Malo.
100 of St. Sebastian.
158½ of Saragosa.
106 of Seville.
114 of Smyrna.
110 of Stetin.
81 of Tholouse and upper Languedoc.
151 of Turin.
158 ½ of Valencia.
182 of Venice, small weight.

WEIGHTS, *used in the several parts of Asia, the East-Indies, China, Persia, &c.* In Turky, at Smyrna, *&c.* they use the batman, or battemant, containing six occos; the occo weighing three pounds four-fifths English. They have another batman much less, consisting, as the former, of six occos: but the occo only containing fifteen ounces english: 44 occos of the first kind make the turkish quintal. At Cairo, Alexandretta, Aleppo, and Alexandria, they use the rotto, rotton, or rottoli. The rottoli at Cairo, and other parts of Egypt, is 144 drachms; being somewhat over an english pound. At Aleppo there are three sorts of rottos; the first 720 drachms, making about seven pounds english, and serving to weigh cottons, galls, and other large commodities: the second is 624 drachms, used for all silks but white ones, which are weighed by the third rotto of 700 drachms. At Seyda the rotto is 600 drachms.

The other ports of the Levant, not named here, use some of these weights; particularly the occo, or occqua, the rottoli, and rotto.

The chinese weights are the piece, for large commodities; it is divided into 100 catis, or cattis; though some say into 125; the cati into 16 taels, or tales; each tael equivalent to 1 ⅓ of an ounce english, or the weight of one rial and $\frac{1}{12}$, and containing twelve mas, or masses, and each mas 10 condrins. So that the Chinese piece amounts to 137 pounds english avoirdupois, and the cadi to 1 pound 8 ounces. The picol for silk containing 66 catis and ¾, the bahar, bakaire, or barr, containing 300 catis.

Tonquin has also the same weights, measures, *&c.* as China. Japan has only one weight, *viz.* the cati; which, however, is different from that of China, as containing 20 taels. At Surat, Agra, and throughout the states of the great mogul,

mogul, they uſe the man, or maund, whereof they have two kinds; the king's man, or king's weight; and the man ſimply; the firſt uſed for the weighing of common proviſions, containing 40 ſeers, or ſerres; and each ſeer a juſt Paris pound. The common man, uſed in the weighing of merchandize, conſiſts likewiſe of 40 ſeers, but each ſeer is only eſtimated at 12 Paris ounces, or $\frac{3}{4}$ of the other ſeer.

The man may be looked on as the common weight of the Eaſt-Indies, though under ſome difference of name, or rather of pronunciation; it being called mao at Cambaya, and in other places mein, and maun. The ſeer is properly the Indian pound, and of univerſal uſe; the like may be ſaid of the bahar, tael, and catti above-mentioned.

The weights of Siam, are the piece containing two ſhans, or cattis; but the Siameſe catti is only half the Japoneſe, the latter containing 20 taels, and the former only 10; though ſome make the Chineſe catti only 16 taels, and the Siameſe 8. The tael contains 4 baats or ticals; each about a Paris ounce; the baat 4 ſelings, or mayons; the mayon 2 fouangs; the fouang 4 payes; the paye 2 clams; the ſompaye half a fouang.

It is to be obſerved, that thoſe are the names of their coins as well as weights; ſilver and gold being commodities there ſold, as other things, by their weights.

In the iſle of Java, and particularly at Bantam, they uſe the gantan, which amounts to near three dutch pounds. In Golconda, at Viſapour, and Goa, they have the ſuratelle containing 1 pound 14 ounces engliſh; the mangalis or mangelin for weighing diamonds and precious ſtones, weighing at Goa 5 grains, at Golconda, &c. 5 $\frac{1}{2}$ grains. They have alſo the rotolo containing 14 $\frac{1}{2}$ ounces engliſh; the metricol containing the ſixth part of an ounce; the wall for piaſters and ducats, containing the 73d part of a rial.

In Perſia they uſe two kinds of batmans or mans, the one called cahi or cheray, which is the king's weight; and the other batman of Tauris. The firſt weighs 13 pounds 10 ounces engliſh; the ſecond, 6 pounds $\frac{1}{2}$. Its diviſions are the ratel, or a 16th; the derhem or drachm, which is the 50th; the meſchal, which is half the derhem; the dung, which is the 6th part of the meſchal, being equivalent to ſix carat-grains; and, laſtly, the grain which is the fourth part of the dung. They have alſo the vakie, which exceeds a little our ounce; the ſah-cheray, equal to the 1170th part of the derhem; and the toman uſed to weigh our large payments of money, without telling; its weight is that of 50 abaſſis.

African and American weights. We have little to ſay as to the weights of America: the ſeveral european colonies there making uſe of the weights of the ſtates or kingdoms of Europe they belong to. For, as to the aroue of Peru, which weighs 27 pounds, it is evidently no other than the ſpaniſh arroba with a little difference in the name.

As to the weights of Africa, there are few places that have any, except Egypt, and the countries bordering on the Mediterranean; whoſe weights have been already enumerated among thoſe of the ports of the Levant. The iſland of Madagaſcar indeed has weights, but none that exceed the drachm, nor are they uſed for any thing but gold and ſilver.

WEIGHT *of the air*. See AIR.

WEIL, or WEYL, an imperial city of Germany, in the circle of Swabia, and dutchy of Wirtemburg: eaſt long. 8° 40′, north lat. 48° 40′.

WEILBURG, a town of Germany, in the territory of Weteravia, and county of Naſſaw, twenty-ſix miles north of Franckfort.

WEIMAR, a city of Germany, in the circle of Upper Saxony, the capital of the dutchy of Weimar: eaſt long. 11° 25′, north lat. 51°

WEINGARTEN, a town of Germany, in the palatinate of the Rhine, twenty-five miles ſouth-weſt of Heidelburg.

WEINHEIM, a town of Germany, in the palatinate of the Rhine, ten miles north of Heidelburg.

WEISCHELMUNDE, or MUNDE, a fort of poliſh Pruſſia, at the mouth of the Viſtula, which defends the harbour of Dantzick.

WEISEL, a river of Poland, and the ſame with the Viſtula. See VISTULA.

WEISSENBURG, or CRONWEISSENBURG, a town of Germany, in the circle of the upper Rhine, and Landgravate of Alſace, twenty miles ſouth-weſt of Philipſburg.

WEISSENBURG, or STULWEISSENBURG, a city of Lower Hungary, ſituated near the eaſt end of the Platten Sea, thirty-ſix miles ſouth-weſt of Buda.

WEISSENBURG, a town of Tranſilvania, thirty miles weſt of Hermanſtat.

WEISSENBURG, a town of Germany, in the circle of Franconia, twenty miles north-weſt of Ingolſtat.

WEISSENFELD, a town of Germany, in the circle of Upper Saxony, and marquiſate of Miſnia, ſeventeen miles ſouth-weſt of Leipſick.

WELCHPOLE, a maket-town of Montgomeryſhire, ſituated ſix miles north of Montgomery.

WELD, or WOLD, *luteola*, in botany, the ſame with the reſeda of Linnæus. See the article RESEDA.

WELDING HEAT, in ſmithery, a degree of heat given to iron, *&c.* ſufficient only for bending, or doubling it up. See the articles FORGING and HEAT.

WELL, a hole under ground, uſually of a cylindrical figure, and walled with ſtone and mortar: its uſe is to collect the water of the ſtrata around it.

WELL, in the military art, a depth which the miner ſinks under ground, with branches or galleries running out from it; either to prepare a mine, or to diſcover and diſappoint the enemy's mine.

WELL-HOLE, in building, is the hole left in a floor for the ſtairs to come up through. See the article STAIRS.

WELLS, a city of Somerſetſhire, ſituated ſixteen miles ſouth-weſt of the city of Bath, both which cities have but one biſhop.

This is alſo the name of a town of Germany, in the circle of Auſtria, ſituated eleven miles ſouth of Lintz.

WELLAND, a river which riſing in Leiceſterſhire, and running eaſtward between the counties of Rutland and Northampton, and afterwards north-eaſt by Stamford, falls into a bay of the German Sea, which divides the counties of Lincoln and Norfolk.

WELLINGBOROUGH, a market-town of Northamptonſhire, ſituated on the river Nen, ten miles north-eaſt of Northampton.

WELLINGTON, a market town of Shropſhire, ſituated ten miles eaſt of Shrewſbury.

WEM, a market town of Shropſhire, ſituated eight miles north of Shrewſbury.

WEN, a tumour or excreſcence that ariſes on different parts of the body, and contains a cyſtus, or bag filled with ſome peculiar matter, of which phyſicians reckon three kinds, *viz.* when this matter is ſoft, reſembling pulp, the wen is called atheroma; if like honey, meliceris; and if like ſuet, ſteatoma. See the articles TUMOUR, ATHEROMA, *&c.*

WENDOVER, a borough-town of Bucks, ſix miles ſouth of Aileſbury; which ſends two members to parliament.

WENER, a lake in Sweden, in the province of Gothland, ſeventy miles in length, and fifty in breadth.

WENLOCK, a borough-town of Shropſhire, ten miles ſouth-eaſt of Shrewſbury; which ſends two members to parliament.

WENSUSSEL, the north diviſion of Jutland, in Denmark, having the Categate-Sea on the north; the Schaggerrack Sea, on the eaſt; the province of Wiburg on the ſouth; and the German Sea on the weſt.

WEOBLEY, a borough-town of Herefordſhire; twelve miles north-weſt of Hereford; which ſends two members to parliament.

WERCHTEREN, a town of the auſtrian Netherlands, in the province of Brabant, nine miles eaſt of Mechlin.

WERDEN, a town of Germany, in the circle of Weſtphalia, ten miles north-eaſt of Duſſeldorp.

WERE, in our old law-books, denotes a ſum paid for killing a perſon, when ſuch crimes were puniſhed with pecuniary mulcts, and not death.

WERELADA, among our ſaxon anceſtors, the denying an homicide on oath, in order to be quit of the fine called WERE.

WERGILD, or WEREGELD, in our antient cuſtoms, the price of a man's head, a part of which was paid to the king, for the loſs of his ſubject, a part to the lord whoſe vaſſal he was, and a part to the neareſt relation of the perſon ſlain.

WERMELAND, a province of Sweden, lying between the province of Dalecarlia, on the north, and the lake Wener on the ſouth.

WESEL, a city of Germany, in the dutchy of Cleves: eaſt long. 6° 5′, north lat. 51° 37′.

WEISEL, a river of Poland, alſo called the Viſtula. See VISTULA.

WESER, a river of Germany, which riſes in the Landgravate of Heſſe, runs between the circles of Weſtphalia and lower Saxony, and falls into the German Sea below Carlſtat.

WEST, in coſmography, one of the cardinal points of the horizon, diametrically oppoſite to the eaſt; and ſtrictly defined, the interſection of the prime verti-

cal with the horizon, on that ſide the ſun ſets in. See HORIZON, &c.

In aſtronomy, weſt is chiefly uſed for the place in, or towards which, the ſun or ſtars ſink under the horizon. Thus we ſay, the ſun, mars, &c. are in the weſt. The point the ſun ſets in, when in the equator, is particularly called, the equinoctial weſt, or point of true weſt. See the article EQUINOCTIAL.

In geography, weſt and weſtern, are applied to ſeveral countries, &c. ſituate towards the point of ſun-ſetting, with reſpect to certain others. Thus the roman empire was antiently, and the german empire is at preſent, called the empire of the weſt, or the weſtern empire, in oppoſition to that of Conſtantinople, which is called the eaſtern empire. The roman church is called the weſtern church, in oppoſition to the greek church. The The Italians, French, Spaniards, &c. are called weſtern nations, in reſpect to the Aſiatics; and part of America, the Weſt-Indies, in reſpect to the Eaſt-Indies.

WESTBURY, a borough-town of Wiltſhire, twenty miles north-weſt of Saliſbury; which ſends two members to parliament.

WESTERN ISLES. See AZORES and HEBRIDES.

WESTLOW, a borough-town of Cornwal, twenty-three miles ſouth-weſt of Launceſton; which ſends two members to parliament.

WESTMANIA, a province of Sweden, having Upland on the eaſt, and Wermeland on the weſt.

WESTMEATH, a county of Ireland, in the province of Leinſter, bounded by Longford and Cavan on the north; by Eaſtmeath, on the eaſt; by King's County, on the ſouth; and by the river Shannon, which divides it from Roſcommon, on the weſt.

WESTMINSTER, a city which forms the weſt part of the town which goes by the general name of London; but is under a diſtinct government; the dean and chapter appointing the high ſteward, high bailiff, and other officers, who have the government of the city. Here are the king's palaces, and the houſes of moſt of the nobility, the high court of parliament, and the ſupreme courts of juſtice; but there is no biſhop of this city. It elects two members of Parliament. See the article LONDON.

WESTMORELAND, an engliſh county bounded by Cumberland, on the north; by Yorkſhire on the eaſt; by Lancaſhire, on the ſouth; and by the Iriſh Channel on the weſt.

WESTPHALIA, the north-weſt circle of the empire of Germany, bounded by the german ocean, on the north; by the circle of Lower Saxony, on the eaſt; by the Landgravate of Heſſe, the Palatinate of the Rhine, and the electorate of Triers, on the ſouth; and by the Netherlands on the weſt; being 200 miles in length, and from 150 to 200 in breadth.

WESTRAM, a market-town of Kent, under the meridian of London, 44 miles weſt of Canterbury.

WETER, a ſwediſh Lake, in the province of Gothland, ninety miles long.

WETTERAVIA, or WETTERAW, the ſouthern diviſion of the Landgravate of Heſſe, in Germany, lying along the northern bank of the river Maine, comprehending the counties of Hanau and Naſſau.

WETZLAR, an imperial city of Germany, in the circle of the upper Rhine and territory of Wetteravia, ſituated on the river Lohn, eaſt long. 8° 15′, north lat. 50° 30′.

WEXFORD, a county of Ireland, in the province of Munſter, bounded by the county of Wicklow, on the north; by the ocean on the eaſt and ſouth; and by Kilkenny and Waterford on the weſt. Wexford, the capital of this county, is ſituated at the mouth of the river Slaney, ſixty five miles ſouth of Dublin.

WEYMOUTH, a port-town of Dorſetſhire, ſituated on a fine bay of the engliſh channel, ſeven miles ſouth of Dorcheſter. It ſends two members to parliament.

WHALE, *balæna*, in ichthyology. See the article BALÆNA.

The balæna, with the fiſtula in the middle of the head, and the back ridged toward the tail, is the fiſh determinately and properly called the whale, though the phyſeter, as well that with the upper jaw longeſt, and with a long ſpine on the back, as that with the back fin very tall, and the ſummit of the teeth plane, is the former called the crooked toothed whale, and the latter the plane toothed whale; as is alſo that phyſeter which is a ſpecies of the balæna. See PHYSETER.

The balæna, or the whale properly ſo called, grows to a monſtruous ſize; the head is extremely large, and of an irregular figure, the lower jaw is much larger than the upper, and covers it at the ſides; the upper is narrow and oblong, the fiſtua is double, or has two

diſtinct apertures, and is ſituated in the middle of the head, between the eyes; the eyes are very ſmall in proportion to the enormous bulk of the head, and are placed a great diſtance from one another; the whole head is ſomewhat depreſſed, and has ſeveral irregularities on its ſurface; the body is very thick, and ſomewhat rounded, but towards the extremity of the back, there is a ſubacute angle, extending itſelf longitudinally to the tail; the tail is ſomewhat forked, very large, and in its horizontal ſituation makes a very ſingular figure. This is an inhabitant of the moſt northern ſeas, the principal object of the Greenland fiſhery, and the firſt known ſpecies.

For the manner of fiſhing for the whale, ſee the article FISHERY.

WHALE-BONE, or as it is otherwiſe called, whale-fins, in commerce, a commodity procured from the whale, uſed as ſtiffening in ſtays, fans, buſks, ſkreens, &c. What we call whale-bone, or fins, is a horny laminæ in the upper jaw of the balæna, which ſupply the place of teeth, but there are none ſuch in the lower jaw. Theſe laminæ are commonly called whiſkers, which, ſplit and faſhioned, are the whale-bone. The pizzle, or gential member of the animal ſerves likewiſe for the ſame purpoſe. Whale-bone cut, is prohibited to be imported.

Whale-fins of Newfoundland, or any of the britiſh colonies, or plantations, caught and imported in ſhips belonging to Great Britain, pay the pound, on importation, 2 $\frac{81\frac{1}{4}}{100}$ d. and draw back, on exportation, 2 $\frac{81\frac{1}{4}}{100}$ d. Whale-fins of any of the britiſh colonies, caught in ſhips belonging to thoſe parts, but imported in ſhips belonging to Great Britain, pay the ton on importation, 28l. 13s. 9d. and on exportation, draw back 28l. 1s. 10 $\frac{50}{100}$ d. Whale-fins of any of the britiſh colonies, caught and imported in ſhips belonging to thoſe parts, pay the ton, on importation, 31 l. 2s. 6d. and on exportation, draw back 29 l. 18s. 9d. Whale-fins of foreign fiſhing, the ton, pay on importation, 97l. 2s. and on exportation, draw back 88 l. 11 s. For the whale-fins, train oil, and blubber of whales, caught in the Greenland Seas, or St. David's Straights, or any parts of the ſeas adjoining, &c. See the article OIL.

WHARF, a ſpace on the banks of a haven, creek, or hithe, provided for the convenient loading and unloading of veſſels upon. See HAVEN, HITHE, &c.

The fee paid for the landing of goods on a wharf, or for ſhipping them off, is called wharfage, and the perſon who has the direction and overſight of the wharf, receives wharfage, &c. is called the wharfinger. See the article KEY.

WHEAT, *triticum*, in botany. See the article TRITICUM.

It has been very juſtly obſerved by the antients, as well as moderns, that wheat will grow in almoſt any part of the world, and that, as it is the plant moſt neceſſary to mankind, ſo it is the moſt general and the moſt fruitful. It grows well not only in the temperate climates, but in the very hot and very cold ones; and when ſown in places where it never grew ſpontaneouſly, ſucceeds as well as where it has been always common.

Mr. Tull obſerves, that when wheat is planted early, leſs ſeed is required to an acre than when it is planted late, becauſe leſs of it will die; and poor land ſhould always be allowed more ſeed than rich, becauſe a greater number of the plants will periſh on this land than on the other. The leaſt quantity yet of ſeed is neceſſary for rich land, that is planted early: for in this caſe very few of the ſeeds will fail to produce a plant that will live and flouriſh. The uſe of the hoe cauſes every plant to ſend out a great number of ſtalks from the ſame root; and in theſe, more than in the number of plants, conſiſts the richneſs of a crop, as the ears on theſe are always largeſt and fulleſt. See HOEING and HUSBANDRY.

Another thing to be conſidered, in order to find the proper quantity of ſeed to plant, is, that ſome wheat of the ſame ſpecies has its grains twice as large as others: in this caſe, a buſhel containing but half the number of grains that it does in the ſmall grained wheat, one buſhel of the ſmall-grained will plant juſt as much as two buſhels of this; not the meaſure of the ſeeds, but the number of the grains being the thing to be conſidered in regard to the ſowing.

It is a very natural thing to ſuppoſe that a large-grained wheat will produce larger and finer plants, and larger grain than a ſmall-grained one; but experiments have proved, that there is nothing in this; for the ſmalleſt-grained wheat produces fully as large plants as the

largeſt, and thoſe with as great ears, and as big ſeeds; but the young plants appear ſmaller and poorer. Six gallons of middle-ſized ſeed is the uſual quantity drilled upon an acre; but on rich lands, planted early, four gallons will ſuffice; becauſe then the wheat will have roots at the top of the ground before winter, and tiller very much, without danger of the worms, and many other accidents, which the late planted wheat is liable to. If it be drilled too thin, it will be in danger of falling, and if too thick, it may happen to tiller ſo late in the ſpring, that ſome of the ears may be blighted; a medium therefore is beſt. See the article DRILLING.

The depth to plant it at, is from half an inch to three inches; for if planted too deep, there is more danger of its being eaten off by worms between the grain and the blade. A wheat-plant that was not ſown early, ſends out no root above the grain, before the ſpring, and is nouriſhed all the winter by a ſingle thread, proceeding from the grain up to the ſurface of the ground: this is the thread of life to the plant during the winter, and the longer that is, the greater danger there is of the worm, that creature much more eaſily finding a thread that extends by its length to five or ſix inches deep, than one which reaches but one inch; beſide, the worms in winter do not inhabit very near the ſurface of the ground, and therefore they never naturally come in the way of the ſhort threads, though the long ones are always in their reach.

It is very neceſſary to take care againſt the rooks, juſt at the time when the wheat is ſhooting up. Theſe miſchievous birds perceiving it beginning to ſprout, before the farmer can ſee any thing of it, and are led by the ſhoot to pick it up; they muſt be careſully kept off the ground for a week or ten days at this ſeaſon; for at the end of that time the blade will be grown up, and the grain ſo exhauſted of its flour, that it will be of no value to them, nor will they give themſelves any trouble about ſtealing it.

There are four ways of augmenting the crops of wheat not only in the number of the plants, but in the ſtalks, ears, and grains. The firſt is by increaſing the number of ſtalks from one, two, or three, to thirty or forty in each plant, in ordinary field land; and the crop is augmented by bringing up all theſe ſtalks into ear, which is the ſecond way; for if it be diligently obſerved, it will be found that not one half of the ſtalks of wheat, ſown in the common way, ever come to ear at all: nay, if a ſquare yard of ſown-wheat be marked out, and the ſtalks thereon numbered in the ſpring, it will be found that no leſs than nine parts in ten of them are wanting at the harveſt-time.

An experiment of the advantage of this augmentation was made by Mr. Tull in rows of wheat that were equally poor; one of theſe rows was increaſed ſo much, as to produce more grains than ten of the other, by bringing up more of its ſtalks into ears; and alſo by augmenting the ears to a much greater bigneſs, which is the third way: for it very certain that the ears will be much larger or much ſmaller, according to the quantity of nouriſhment that is given them.

The fourth and laſt way of increaſing the crops of wheat, is by cauſing the grain to be much larger in the ears. This can no way be done ſo effectually as by late hoeing, eſpecially if it be done juſt after the wheat is gone out of the bloſſom; by this means the grains will weigh twice as much as thoſe produced in the ſame ſort of wheat, when this late hoeing has been omitted; their number, at the ſame time, is the ſame in the ear; and as the wheat is ſold not by tale, but by meaſure, the farmer's gain is double in this caſe; the wheat meaſuring juſt twice as much as it would otherwiſe have done.

Thus, by increaſing the number of the ſtalks, bringing more of them up into the ear, making the ears larger, and the grains larger, plumper, and fuller in every ear; the method of horſe-hoeing, by which alone this can be effected, makes a larger crop out of the tenth part of the number of plants, than in the common way: but all theſe advantages will be loſt by thoſe who, though they give into the horſe-hoeing-way, yet will not allow the ſix feet intervals between the rows; for it is owing to this great ſpace of ground alone, that as much nouriſhment may be given to the wheat as the farmer pleaſes.

Poor light land, in the common way of huſbandry, muſt be extremely well manured, in order to the maintaining wheat a year, which is the uſual time that it is in it; and if it be ſown late, the greater part of it uſually periſhes, not being able to ſurvive the winter while ſo poor, and

and on ſuch land; and if it be ſown very early on ſtrong land, though rich, well tilled, and dunged, the crop will be worſe than on poor light land ſown early. The new method of horſe-hoeing gives both to ſtrong and to light land all the advantages neceſſary, and takes off all the diſadvantages of both. By this method the ſtrong land may be planted with wheat as early as the light, if plowed dry; and the hoe-plough, if rightly applied, will be able to give it nouriſhment equal to that of dung in both ſorts of land.

The tops of the ridges for the drilling of wheat muſt not be left quite ſo narrow and ſharp as they are for drilling of turneps; wheat being generally to be ſowed in treble rows, and the turnep only in ſingle ones. In reaping the wheat thus ſown, it is to be cut as near to the ground as poſſible, and this is eaſier done in this than in wheat ſown in the common way, becauſe in this drilled method the ſtalks all ſtand cloſe together. When the wheat is cut thus low in the reaping, the ſtubble is no great impediment to the preparing the land for the ſucceeding crops.

As ſoon as conveniently may be, after the carrying off a crop of wheat, if the trench in the middle of each wide interval be left deep enough by the laſt hoeing, the farmer is to go as near as he can to the ſtubble with a common plough, and turn two large furrows into the middle of the intervals which will make a ridge over the place where the trench was; but if the trench be not deep enough, it is beſt to go firſt in the middle of it with one furrow; this, with two more taken from the ridges, will be three furrows, in each interval; this plowing is to be continued as long as the dry weather laſts, and then the whole is to be finiſhed by turning the partitions on which the laſt wheat grew up to the new ridges, which is uſually done at two great furrows; theſe laſt furrows, which complete the ridges, may be plowed in wet weather. By this ſort of management, the wheat being planted in rows, at ſix feet intervals, the ſame piece of ground will produce every year a new crop of wheat in the intervals, without any fallowing or manure, only by means of the ſufficiently breaking the ſurface with plowing and horſe-hoeing.

Buck WHEAT. This is a plant very advantageous to the farmers of England, who have barren lands in poſſeſſion. It is to be ſown in May. One buſhel of ſeed will ſow an acre, and it will grow on any ſoil. It ripens late in autumn, and, when mowed, it muſt lie upon the ground till the ſtalks, which are naturally hard, grow ſoft; it will not ſhed the ſeed in lying, nor will it get any damage by the rain. It yields a very conſiderable increaſe, and if the land be tolerable, ſometimes no leſs than fifty or ſixty buſhels from an acre.

It is excellent food for hogs, poultry, and other animals. The flour of it is very white, and, mixed with wheat-flour, is uſed for food by the country people in ſome places. The ſtraw is good fodder for cattle, and the grain is good to give to horſes among their oats; but it muſt be broken in a mill, otherwiſe it will paſs through them whole.

White-Cone WHEAT, a term uſed by our huſbandmen to expreſs a peculiar kind of wheat, which is very ſtrong, and has a large ear.

It is the beſt kind for ſowing in fields ſubject to the blight; for the ſtalks of it being, for the moſt part, ſolid or full of pith like a ruſh, not hollow like thoſe of common wheat; the inſects that cauſe the blight ſeizing on the ſtalks of other wheat, does this no injury, even though they ſhould attack it; the ſtalks of this kind being often found full of black ſpecks, which are always the marks of that inſect having been there, and yet the ear full, and the grain good.

This wheat makes very good bread, if the miller does not grind it too ſmall, or the baker make his dough too hard; it requiring to be ſomewhat larger than other wheat-flour, and ſomewhat ſofter in the dough. A buſhel of white-cone-wheat will make conſiderably more bread than a buſhel of lammas wheat; but it gives it ſomewhat a yellowiſh caſt.

Smyrna-WHEAT, a peculiar kind of wheat that has an extremely large ear, with many leſſer or collateral ears coming all round the bottom of the great one.

As this is the largeſt of all ſorts of wheat, ſo it will diſpenſe with the nouriſhment of a garden, without being overfed, and requires more nouriſhment than common huſbandry in the large way can give it. In the common way its ears grow not much larger than thoſe of our common wheat.

This

This ſort of wheat ſeems, of all others, the moſt proper for the new method of horſe-hoeing huſbandry, as that method ſeems capable of giving as much nouriſhment as the farmer pleaſes, by often repeating the hoeing. Next to this, the white-cone wheat is beſt for this ſort of huſbandry; then the grey-cone wheat.

WHEAT, a common article of our food, is more glutinous and nutritious than moſt other kinds of grain. The flour, or the ſtarch, prepared from it, form with water a ſoft viſcid ſubſtance, which has been taken with good ſucceſs in diarrhœas and dyſenteries. Bran contains, beſides the huſks or ſhells of the wheat, a portion of farinaceous matter: this is leſs glutinous than the finer flour, and is ſuppoſed to have a detergent quality. See BRAN.

For the bounties upon wheat, ſee CORN.

For the manner of preſerving wheat, ſee the articles CORN and GRANARY.

For the manner of grinding, *&c.* wheat, ſee GRINDING, MILL, FLOUR, *&c.*

WHEAT-EAR, in ornithology, the engliſh name of a ſpecies of motacilla, with a grey, black, and white forehead. See MOTACILLA.

WHEEL, *rota*, in mechanics, a ſimple machine, conſiſting of a round piece of wood, metal, or other matter, which revolves on an axis. The wheel is one of the principal mechanic powers: it has place in moſt engines; in effect, it is of an aſſemblage of wheels that moſt of our engines are compoſed. For the theory of this mechanic power, called axis and wheel, ſee AXIS *in peritrochio*.

For the theory of clock-wheels, watch-wheels, mill-wheels, *&c.* ſee the articles CLOCK, MILL, *&c.*

With regard to the wheels of coaches, waggons, *&c.* otherwiſe called wheel-carriages, the whole doctrine thereof may be reduced to the following particulars; *viz.* 1. Wheel-carriages meet with leſs reſiſtance then any other. 2. The larger the wheel the eaſier is the draught of the carriage. 3. A carriage upon four wheels of equal ſize, is drawn with leſs force than with two of thoſe wheels and two of a leſſer ſize. 4. If the load be laid on the axle of the larger wheels, it will be drawn with leſs force than if it had laid on the axis of the leſſer wheels, contrary to the common notion of loading carriages before. 5. The carriage goes with much leſs force on friction-wheels than in the common way: all which will be confirmed by experiments. The wheels of carriages muſt be exactly round, and the fellies ſhould be at right angles to the naves, according to the inclination of the ſpokes: that is, the plane of the curvature of the wheel ſhould cut the nave at right angles, though it need not paſs through the ſpace where the ſpokes are inſerted into the nave.

1. It is a general rule in all caſes that the wheels be exactly round; for if they were not ſo, but like EFGH (plate CCC. fig. 1.) and the nave out of the center, it is certain, that ſuch a wheel, in turning, would be affected in the ſame manner upon plane ground as other wheels are when they riſe and fall, and would not be in equilibrio; the wheel turning towards H would move with as much difficulty as if there was a riſe to aſcend; and that height being paſſed, it would fall on a ſudden, as if a ſquare ſtone was rolled along, and the jolts of the wheel would precipitate and puſh the horſes at one time, and immediately increaſe their difficulty of drawing the next moment; and that in proportion to the wheels being out of round: yet if the nave ſhould not be in the middle, the ſhorteſt part, as F, being on the ground; when ſuch a wheel begins to turn, the weight muſt be raiſed in the ſame manner as when another carriage is going up an hill: and from F to D, or quite to G, the wheel would act like a wedge: and at D, or G, it would fall and drive on the horſes as in a ſteep deſcent.

2. The fellies muſt not croſs wind, but be at right angles with the naves, according to the inclination of the ſpokes; for otherwiſe the wheel in turning would find inequalities, as it happens when the hole of the nave is too big, and the wheel moves from ſide to ſide; which comes to the ſame purpoſe as if the wheel was out of round; and then the inequality of the ſpokes, which would be too leaning or too ſtrait, upon the nave deſcending into an hole, or riſing upon an eminence, oppoſite to their inclination, would cauſe them, or the fellies, to break.

3. The ſpokes muſt be inclined to the naves, that the wheels may be diſhing or concave. If the wheels always turned upon ſmooth and even ground, it is certain that the ſpokes ought to be ſtraight upon the naves; that is, at right angles to their axes, becauſe then they would bear perpendicularly, like the ſpoke B, (*ibid.* fig.

WHEEL-CARRIAGES.

Fig. 1.

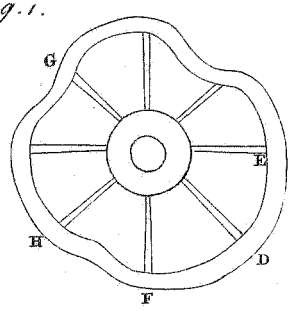

Fig. 6.

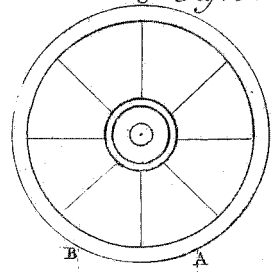

Fig. 2.

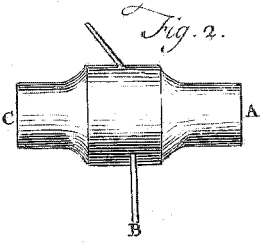

Fig. 7.

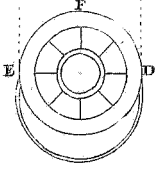

Fig. 3.

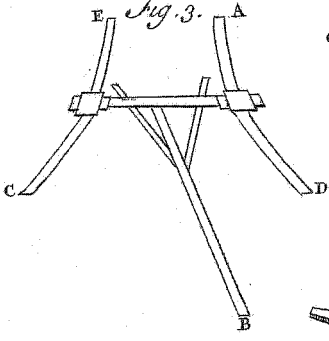

Fig. 8.

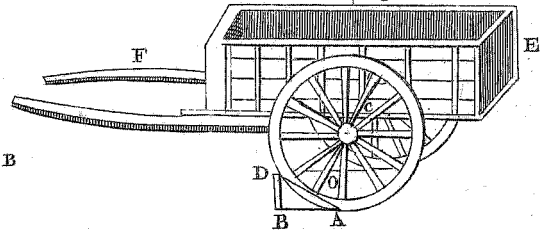

Fig. 4.

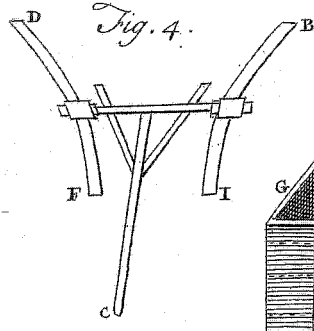

Fig. 9.

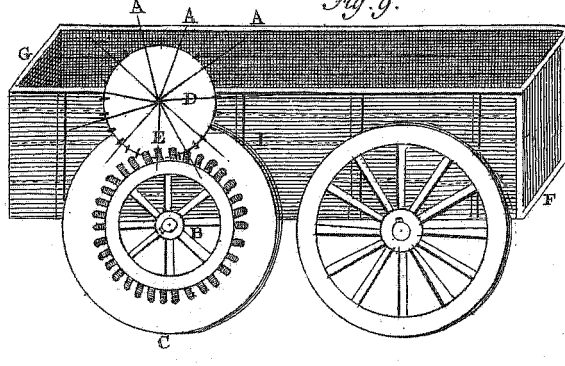

Fig. 5.

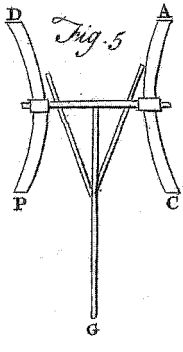

Fig. 10.

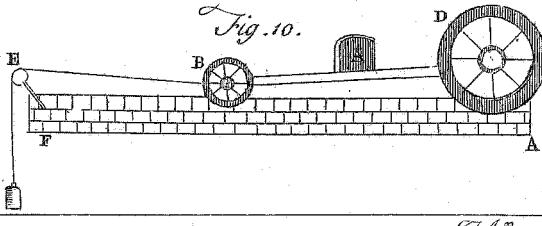

fig. 2.) of the nave AC, which is the ſtrongeſt way for wood. But becauſe the ground is unequal, and when the wheels fall into the ruts, that wheel which is in the rut bears a greater part of the weight than the other, becauſe it is lower: in ſuch a caſe the ſpokes of a diſhing-wheel become perpendicular in the rut, and therefore have the greateſt ſtrength; whilſt the oppoſite wheel, being upon higher ground, bears a leſs part of the weight; and, conſequently, the ſpokes need not be at their full ſtrength, and ſo will have a ſufficient force, though that force be leſs than what they have upon even ground.

4. The axle-tree muſt be ſtreight in all reſpects, and at right angles to the ſhafts or to the pole. In the motion of all bodies there is one way of moving which is the eaſieſt of all the reſt, and happens here when the axle-tree is every way ſtraight; for if its ends ſhould bend backwards, ſo as to bring the wheels nearer together behind, as AE, *ibid.* fig. 3. and ſpread them much before, as DC, it is certain that they could not go into the ruts, nor turn in going forward, or at leaſt with great difficulty, dragging inſtead of rolling. There would be the ſame inconveniences in bending the axle-tree forward, ſo as to bring them nearer the pole as IF, fig. 4. and make them ſpread behind, as at BD. The leſs the axle-tree is bent, the leſs the inconveniency: but there will always be ſome, when the wheels are not parallel; and there will be no inconveniency when the axle is ſtraight, and the wheels are in the ſituation CP and AD, fig. 5. The axle muſt alſo be at right angles to the pole or ſhaft; for if the pole or ſhafts were on one ſide, as at B, fig. 3. or C, fig. 4. the coach or carriage would be drawn on one ſide, and almoſt all the weight would bear upon one horſe; but it muſt be at right angles like the pole G, fig. 5.

5. Great wheels are always more advantageous for rolling than little ones, in any caſe, or upon any ground whatſoever. The wheels of carriages are conſidered according to the velocity and friction they have upon the axle-tree, and likewiſe according to their reſiſtance, or ſinking in upon the ground. If we conſider them according to the friction, it is certain, that a wheel whoſe diameter is double that of another, will make but one turn, whilſt the little one makes two for the ſame length of way; the circumference, which is in proportion to the diameter, being double. Therefore, in reſpect to friction, a wheel of double the diameter will have a double advantage, there being but one turn inſtead of two, which doubles the friction in the ſmall wheel. The wheel ABC, being twice as big as the wheel DEF, (*ibid.* fig. 6. and 7.) will have twice the advantage in reſpect of the friction, the holes of the nave and the axles being equal. See the articles FRICTION, CIRCUMFERENCE, *&c.*

If we conſider the wheels according as they ſink into the earth, or fall into holes, there will be the ſame advantage for the one and inconveniency for the other. If we conſider the bearing, it is double in the great wheel; therefore it will ſink but half the way: and if we conſider hollows, it will give the ſame advantage in ſome caſes; but then in others, as, for example, where the holes are deep, the little wheel will have much more diſadvantage: for if it ſhould fall into a great hole, as DE, fig, 6, 7, and 8. of a diameter, equal to that of the wheel, it would wholly ſink in whilſt the great wheel would only fall in the depth of its ſegment AB, which would not be half the wheel, as may be ſeen from the parallel lines AD and BE. We may ſuppoſe the ſame to happen in marſhy grounds, where a little wheel would ſink wholly in the ſame hole that the great one would ſink but in part. EF, *ibid.* fig. 8. is a cart, or carriage: BD a rub for the wheel CAD to paſs over, AB the horizontal plane; DB, AC, perpendicular, and OD parallel, to AB, C the centre of the wheel. Then the horizontal force required to pull the wheel over the rub BD, is as $\frac{DO}{CO}$ and the difficulty of going over rubs increaſes in a greater ratio than that of their heights. Alſo the higher the wheels, the more eaſily they paſs over them; but then they are the more apt to to overturn.

To draw the cart with the leaſt power over the rub BD, it ſhould not be drawn in the horizontal direction AB or OD, but in the direction AD. The advantage then of high wheels is, that they paſs the rubs moſt eaſily, have the leſs friction, ſink leſs in the dirt, and more eaſily preſs down an obſtacle: and their diſadvantage is, that they eaſily overturn, and make cattle draw too high; for they can apply their ſtrength beſt when

when they draw low and upwards in the direction AD, which is the advantage of low wheels: yet if the wheels are high they may be made to draw low, by fixing the limmers or traces as far below the axle as you will, which will then be an equal advantage with low wheels. For the power not pulling at the wheel, but at the carriage, may draw from any part of it. There is another advantage in ſmall wheels, which is, that they are better to turn with. A waggon with four wheels is more advantageous than a cart with two wheels, eſpecially on ſand, clay, *&c.* Narrow wheels and narrow plates are a diſadvantage.

Suppoſe the waggon FG, fig. 9. is moved forward by a power acting within it, which power turns the wheel DE by the ſpokes AD, AD, *&c.* and DE turns the wheel IC, which carries the waggon. Let the power at A be 1, then the force acting at E will be $\frac{DA}{DE}$: alſo, if the power at E be 1, the force at C, by which the waggon is moved, will be $\frac{BE}{BC}$: therefore the power at A, to the force with which the waggon can be moved, is as 1 to $\frac{DA \times BE}{DE \times BC}$; or the power is to that force, as $DE \times BC$, to $DA \times BE$. It will be the ſame thing if, inſtead of teeth, the wheel DE carries EB by a chain going round them. You muſt ſuppoſe the like wheels on the oppoſite ſide. Hence, if the abſolute force to move the waggon without, be 1, the force within applied at A to move it will be $\frac{DE \times BC}{BE \times DA}$.

6. It would be much more advantageous to make the four wheels of a coach or waggon large, and nearly of a height, than to make the fore wheels of only half the diameter of the hind wheels, as is uſual in many places, which the following experiment will confirm.

Let us make uſe of a little waggon, or model, of an inch to a foot (repreſented *ibid.* fig. 10.) with the four wheels of five inches and nine lines; and ſo contrived that one may put on wheels of different diameters: as, for example, four of five inches, two of two inches three lines, two others of three inches, and let them have naves, ſpokes, and fellies, in proportion, to repreſent the wheels of a coach or waggon: let them be changed one after another, the waggon DB being always loaded with the ſame weight, A, of five pounds, and drawn by means of a ſilken thread running over a pulley, with a little bag, or ſcale of a ballance, to put in balls for the different wheels, according as they are to run upon even ground, upon earth, ſand, or pavement. The board AF muſt be of oak, three feet long, plained on one ſide, and carved on the other, to imitate the pavements and the channels of ſtreets. The paving-ſtones muſt be of ſeven or eight lines inſtead of ſeven or eight inches, reducing them from inches to lines, as the wheels are reduced from feet to inches. It muſt be ſo contrived that the pulley may be turned to either ſide of the board. The whole being ſo diſpoſed, the ſeveral experiments will anſwer a table, for which we refer the reader to Deſagulier's Courſe of Experimental Philoſophy, vol. i. page 223.

WHEEL is alſo the name of a kind of puniſhment which great criminals are put to in divers countries. In France, their aſſaſſins, parricides, and robbers on the highway, are condemned to the wheel; *i. e.* to have their bones firſt broken with an iron-bar on a ſcaffold, and then to be expoſed and left to expire on the circumference of a wheel. In Germany they break their bones on the wheel itſelf.

WHEEL, in the military art, is the word of command, when a battalion or ſquadron is to alter its front either one way or the other. To wheel to the right, directs the man in the right angle to turn very ſlowly, and every one to wheel from the left to the right, regarding him as their center; and *vice verſa*, when they are to wheel to the left. When a diviſion of men are on the march, if the word be to wheel to the right or to the left, then the right or left hand man keeps his ground; only turning on his heel, and the reſt of the rank move about quick till they make an even line with the ſaid right or left hand man.

WHEEL-ANIMALS, *brachionus*, a genus of animalcules which have an apparatus of arms for taking their prey. This apparatus has been ſuppoſed, by microſcopical writers, to be a kind of wheels; and thence named the creatures that are poſſeſſed of it wheel-animals.

This is one of the ſmaller animalcules; and is, by Dr. Hill, deſcribed to be, when in a ſtate of reſt, of a plain ſmooth body,

body, of a conic figure, obtuſe at the poſterior extremity, and open at the anterior, of a duſky olive colour, and ſemitranſparent. When it puts itſelf in motion, it protrudes, from the open extremity, a part of its naked body; to the whole of which this outer conic body ſeems to be but a caſe, or ſheath; from the extremity of this exerted part of the body, the creature ſoon after thruſts out two protuberances, which give it the appearance of a double head; and in each of theſe is diſcovered an apparatus in a continual motion, appearing a rotatory one, but in reality a vibratory one very quick repeated. Each of theſe protruded bodies has ſix arms inſerted into it, and theſe it continually ſhuts and opens over one another. Each of theſe arms is furniſhed with a double ſeries of fibres at its edge, which being expanded cauſe it to ſpread to a conſiderable breadth. There are ſeveral ſpecies of this genus of animalcules.

WHETSTONE, *cos*, a ſtone which ſerves for the whetting of knives and other tools upon. See Cos.

WHEY, the ſerum, or watry part, of milk. See the article Milk.

WHIFFLER of a company, in London, a young freeman who goes before, and waits on the company on public ſolemnities.

WHIG, a party in England, oppoſite to the tories, from whom they differ chiefly in their political principles. See Tories. The names of whig and tory were not known till about the middle of the reign of Charles II. when theſe were given as party diſtinctions. Theſe parties may be conſidered either with regard to the ſtate, or to religion. The ſtate tories are either violent or moderate: the firſt would have the king to be abſolute, and therefore plead for paſſive obedience, non-reſiſtance, and the hereditary right of the houſe of Steuart. The moderate tories would not ſuffer the king to loſe any of his prerogative; but then they would not ſacrifice thoſe of the people. The ſtate whigs are either ſtrong republicans or moderate ones. The firſt, ſays Rapin, are the remains of the party of the long parliament, who attempted to change the monarchy to a commonwealth: but theſe make ſo ſlender a figure, that they only ſerve to ſtrengthen the party of the other whigs. The tories would perſuade the world, that all the whigs are of this kind; as the whigs would make us believe that all the tories are violent. The moderate ſtate whigs are much in the ſame ſentiments with the moderate tories, and deſire that the government may be maintained on the antient foundation: all the difference is, that the firſt bear a little more to the parliament and people, and the latter to that of the king. In ſhort, the old whigs were always jealous of the incroachments of the royal prerogative, and watchful over the preſervation of the liberties and properties of the people. In regard to religion, the whigs have always been for limiting the power of the biſhops, and aboliſhing the convocation.

WHINE, an hunting term, uſed for the cry of an otter.

WHIP, or WHIP-STAFF, in a ſhip, a piece of timber, in form of a ſtrong ſtaff, faſtened into the helm, for the ſteerſman, in ſmall ſhips, to hold in his hand, in order to move the rudder and direct the ſhip.

Whip-grafting. See Grafting.

WHIPPING, in angling, is the faſtening a line to the hook or to the rod. It is alſo uſed for the caſting in of the hook, and drawing it gently on the water.

WHIPT SYLLABUB. See Syllabub.

WHIRL-POOL, an eddy, vortex, or gulph, where the water is continually turning round. See the articles Gulph, Eddy, Vortex, *&c.*

Theſe in rivers are very common, from various accidents, and are uſually very trivial, and of little conſequence. In the ſea they are more rare, but more dangerous. Sibbald has related the effects of a very remarkable marine whirlpool among the Orcades, which would prove very dangerous to ſtrangers, though it is of no conſequence to the people who are uſed to it. This is not fixed to any particular place, but appears in various parts of the limits of the ſea among thoſe iſlands. Wherever it appears it is very furious; and boats, *&c.* would inevitably be drawn in and periſh with it; but the people who navigate them are prepared for it, and always carry an empty veſſel, a log of wood, or large bundle of ſtraw, or ſome ſuch thing, in the boat with them; as ſoon as they perceive the whirlpool, they toſs this within its vortex, keeping themſelves out: this ſubſtance, whatever it be, is immediately received into the centre and carried under water; and as ſoon as this is done, the

ſurface of the place where the whirpool was becomes ſmooth, and they row over it with ſafety; and in about an hour they ſee the vortex begin again in ſome other place, uſually at about a mile diſtance from the firſt.

WHIRL-WIND, a wind that riſes ſuddenly, is exceeding rapid and impetuous when riſen, but is ſoon ſpent. See the articles WIND and HURRICANE.

There are divers ſorts of whirl-winds, diſtinguiſhed by their peculiar names; as the preſter, typho, turbo, exhydria, and ecnephias. The preſter is a violent wind, breaking forth with flaſhes of lightning. This is rarely obſerved; ſcarce ever without the ecnephias. Seneca ſays it is a typho or turbo kindled or ignited in the air. See the article PRESTER.

The ecnephias is a ſudden and impetuous wind, breaking out of ſome cloud, frequent in the Ethiopic-ſea, particularly about the cape of Good Hope. The ſeamen call them travados. The exhydria is a wind burſting out of a cloud with a great quantity of water. This only ſeems to differ in degree from the ecnephias, which is frequently attended with ſhowers. A typho, or vortex, moſt properly called whirl-wind, or hurricane, is an impetuous wind, turning rapidly every way, and ſweeping all round the place. It uſually deſcends from on high. It is frequent in the Eaſtern-ocean, chiefly about Siam, China, &c. and renders the navigation of thoſe parts exceeding dangerous. See the articles VORTEX, SPOUT, &c.

WHISPERING. See the articles HEARING, ATTENTION, &c.

WHISPERING-PLACES depend upon this principle. If the vibrations of the tremulous body are propagated through a long tube, they will be continually reverberated from the ſides of the tube into its axis, and by that means prevented from ſpreading, till they get out of it; whereby they will be exceedingly increaſed, and the ſound rendered much louder than it would otherwiſe be. See the article SOUND.

Hence it is, that ſound is conveyed from one ſide of a whiſpering-gallery to the oppoſite one, without being perceived by thoſe who ſtand in the middle. The form of a whiſpering-gallery is that of a ſegment of a ſphere, or the like arched figure; and the progreſs of the ſound through it may be illuſtrated in the following manner: Let ABC (plate CCXCVII. fig. 4.) repreſent the ſegment of a ſphere; and ſuppoſe a low voice uttered at D, the vibrations expanding themſelves every way, ſome will impinge upon the points E, E, &c. and from thence be reflected to the points F, from thence to G, and ſo on till they all meet in C, and, by their union there, cauſe a much ſtronger ſound than in any part of the ſegment whatever, even at D, the point from whence they came. Accordingly, all the contrivance in whiſpering places is, that near the perſon who whiſpers there may be a ſmooth wall, arched either cylindrically or elliptically. A circular arch will do, but not ſo well. See ARCH, ECHO, PHONICS, &c.

The moſt conſiderable whiſpering places in England are, the whiſpering-gallery in the dome of St. Paul's, London, where the ticking of a watch may be heard from ſide to ſide, and a very eaſy whiſper be ſent all round the dome. The famous whiſpering place in Glouceſter cathedral, is no other than a gallery above the eaſt end of the choir, leading from one ſide thereof to the other. It conſiſts of five angles and ſix ſides, the middlemoſt of which is a naked window, yet two whiſperers hear each other at the diſtance of twenty-five yards.

WHIST, a well-known game at cards; ſo called from the ſilence obſerved during the play, which is like that of honours and ruff. See HONOURS *and ruff*.

However, as there are many ways of cheating practiſed at this game, we ſhall only mention a few, to put the unwary upon their guard. Some by winking, ſhutting their eyes, placing their fingers, or other ſigns, find means to let their partners know what honours they have got: others have a way of cutting honours either to their partners or themſelves: the dealer is often crafty enough to conceal ſome honours for himſelf: but the beſt way of rooking is by means of breef-cards; for all the honours being ſomewhat broader than the reſt, your adverſary muſt always cut you an honour.

WHISTLE-FISH, the cirrated gadus, with a furrow at the firſt back fin, being a ſmall ſpecies, uſually about eight inches long, and its thickneſs not great in proportion. See the article GADUS.

WHITBY, a port-town of the north riding of Yorkſhire, ſituated on the German ſea, thirty-eight miles north-eaſt of York.

WHITCHURCH, a borough-town of Hampſhire, ſituated ten miles north of Wincheſter.

It ſends two members to parliament.

WHITE, one of the colours of natural bodies. See COLOUR.

White is not ſo properly ſaid to be any one colour, as a compoſition of all colours; for it is demonſtrated by Sir Iſaac Newton, that thoſe bodies only appear white, which reflect all the kinds of coloured rays alike. See WHITENESS.

WHITE, in painting in miniature, *&c.* The beſt white for painting in water-colours, is flake white, which is better than white lead; and if it be pure, far exceeds it in beauty; becauſe white lead is apt to turn blackiſh, eſpecially if it be uſed in a hard water: but if you uſe white lead, firſt rectify it with white wine vinegar in the following manner: grind well the fineſt white lead upon a porphery with vinegar; then put it into a glaſs of water, ſtir it about, and preſently pour off the water, while it is white, into ſome other clean glaſs or veſſel; let it ſettle, and then pour off the water from it, and it will be exceeding fine. When this white is ſettled put to it gum-water, to bind it and give it a glaze.

Some recommend a white made of the whiter part of oiſter-ſhells, reduced into an impalpable powder; this is called pearl-white, and will mix with any colour. Some alſo recommend the powder of egg ſhells of the brighteſt colour, and well cleaned and waſhed, ground with gum-water, to which may be added about a twentieth part of white ſugar-candy: the egg-ſhells ſhould be ground to an impalpable powder. Experience proves, that egg-ſhell powder is of very great ſervice as a white in water-colours, and both that and the powder of oiſter-ſhells, well rectified and mixed with the white of an egg well beaten, will make an extraordinary mixture in other colours, and will correct them from changing or altering their qualities.

WHITE *of the eye*, denotes the firſt tunic or coat of the eye, called albuginea and conjunctiva, becauſe it ſerves to bind together, or incloſe, the reſt. See EYE.

WHITE-FRIARS, a name common to ſeveral orders of monks, from their being clothed in a white habit. See MONK.

WHITE-HART *ſilver*, a mulct or tribute paid into the exchequer, out of certain lands in or near the foreſt of White-hart in Dorſetſhire; impoſed by Henry III. upon Thomas de la Linde, for killing a beautiful white hart which that prince had before ſpared in hunting.

WHITE-HORSE, in ichthyology, the prickly backed raia, with two ſeries of prickles on the tail, and one ſeries over each eye. See the article RAIA.

This is a ſingular ſpecies, the body is conſiderably broad in proportion to its length, but it is alſo thick; the back is ſomewhat gibboſe, but the belly is more flat; the roſtrum is oblong and acute, the eyes are prominent, and there is an aperture behind each; the mouth is tranſverſe and large, and furniſhed with a number of ſharp teeth; the apertures of the gills run down from it on each ſide along the breaſt, they are ſmall, and there are five of them on each ſide.

WHITE LEAD, alſo called ceruſe. See the article CERUSE.

WHITE-LINE, among printers, a void ſpace of the depth or breadth of a line. See the article PRINTING.

WHITE MEATS, include milk, butter, cheeſe, white-pots, cuſtards, and other kinds of food made of milk or eggs. Some alſo add chickens, veal, and fiſh.

WHITE-POT, milk or cream beat up with the yolks of eggs, mixed with ſugar and ſpice, and baked in an earthen diſh, with ſlices of bread in it.

The cooks furniſh us with a variety of diſhes under this denomination; as the rice white-pot, Weſtminſter white-pot, Norfolk white-pot, *&c.*

WHITE RENT, a rent or duty of 8 d. paid annually by every tinner in the county of Devon, to the duke of Cornwall.

WHITE-SEA, in geography, a bay of the frozen ocean, in the north of Muſcovy, between ruſſian Lapland, and Samoieda.

Spaniſh-WHITE, a kind of fucus uſed by ladies to heighten the complexion, and hide its defects.

It is made of tin-glaſs diſſolved in ſpirit of nitre, and precipitated into a very fine powder by means of ſalt-water.

WHITE-WINE, wine of a bright tranſparent colour, bordering on white, thus called to diſtinguiſh it from the red wines. See WINE.

The generality of white-wines are made from white grapes; though there are ſome from black ones, only the ſkins are kept from tinging them.

WHITEHAVEN, a port-town of Cumberland, ſituated on the Iriſh chann l: weſt long. 3° 16′, north lat. 54° 30′.

WHITENESS, *albedo*, the quality which denominates a body white. See the articles WHITE and COLOUR.

Sir Iſaac Newton ſhews, that whiteneſs conſiſts in a mixture of all the colours; and that the light of the ſun is only white, becauſe conſiſting of rays of all colours. See the article RAY.

From the multitude of rings of colours which appear upon compreſſing two priſms or object-glaſſes of teleſcopes together, it is manifeſt that theſe do ſo interfere and mingle with one another at laſt, as, after eight or nine reflections, to dilute one another wholly, and conſtitute an even and uniform whiteneſs; whence, as well as from other experiments, it appears, that whiteneſs is certainly a mixture of all colours, and that the light which conveys it to the eye, is a mixture of rays endued with all thoſe colours. See the article LIGHT.

The ſame author ſhews, that whiteneſs, if it be moſt ſtrong and luminous, is to be reckoned of the firſt order of colours; but if leſs, as a mixture of the colours of ſeveral orders. Of the former ſort he reckons white metals, and of the laſter, the whiteneſs of froth, paper, linnen, and moſt other white ſubſtances. And as the white of the firſt order is the ſtrongeſt that can be made by plates of tranſparent ſubſtances, ſo it ought to be ſtronger in the denſer ſubſtances of metals than in the rarer ones of air, water, and glaſs. Gold or copper mixed either by fuſion, or amalgamation with a very little mercury, with ſilver, tin, or regulus of antimony, becomes white, which ſhews both that the particles of white metals have much more ſurface, and therefore are ſmaller than thoſe of gold and copper; and alſo that they are ſo opake, as not to ſuffer the particles of gold or copper to ſhine through them. And as that author doubts not but that the colours of gold and copper are of the ſecond and third order, therefore the particles of white metals cannot be much bigger than is requiſite to make them reflect the white of the firſt order. See PARTICLE.

WHITING, in ichthyology, the engliſh name for the white gadus with no beard, and with three fins on the back, and the upper jaw longeſt. See GADUS.

The head and body of this ſpecies is compreſſed, the back is convex, the anus is at a great diſtance from the tail, and is, indeed, very near the head; the colour of the whole fiſh is a ſilvery white, except that on the back there is an admixture of a blackiſh tinge; the ſcales are very ſmall, roundiſh and white; the noſtrils have each a double aperture, and are placed high; the eyes are very large, the iris ſilvery, and the pupil large and blue; the teeth are very numerous; the pectoral fins have each twenty ones rays, and the ventral fins have each ſix rays; the pinnæ ani are two, and have, the firſt thirty-three, and the ſecond twenty-two rays. This ſpecies is frequent in our ſeas, and much eſteemed at our tables.

WHITING-POLLOCK, in ichthyology, a ſpecies of gadus with three back fins, the lower jaw longeſt, and the lateral line crooked. See GADUS.

The uſual length of this fiſh is from eight to thirteen inches; it is conſiderably thick in proportion, and in moſt other reſpects reſembles the common whiting.

WHITES, in medicine, the ſame with fluor albus. See FLUOR ALBUS.

WHITLOW, in medicine. See the article PARONYCHIA.

WHITSUNDAY, a ſolemn feſtival of the chriſtian church, obſerved on the fiftieth day after Eaſter, in memory of the deſcent of the Holy Ghoſt upon the apoſtles in the viſible appearance of fiery cloven tongues, and of thoſe miraculous powers which were then conferred upon them.

It is called Whitſunday, or White-ſunday, becauſe this being one of the ſtated times for baptiſm in the antient church, thoſe who were baptized put on white garments, as types of that ſpiritual purity they received in baptiſm. As the deſcent of the Holy Ghoſt upon the apoſtles happened upon the day which the Jews called pentecoſt, this feſtival retained the name of pentecoſt among the chriſtians.

WHOODINGS, or HOODINGS, a ſea-term, uſed for planks joined and faſtened along the ſhip's ſides into the ſtem.

WHORE, a woman who proſtitutes herſelf for hire. See the articles CONCUBINE, COURTESAN, and HARLOT.

WHORLBAT, or HURLBAT, a kind of gauntlet, or leathern ſtrap, loaden with plummets; uſed by the antient Romans in their ſolemn games and exerciſes, and by them called cæſtus. See CÆSTUS.

WHUR, in falconry, denotes the fluttering of patridges or pheaſants, as they riſe.

WIBURG, the capital of the territory of the ſame name in Jutland: eaſt long. 9° 16′, north lat. 56° 20′.

WIBURG, a city and port-town of ruſſian Finland, ſituated on the gulph of Finland: eaſt long. 29°, north lat. 61°.

WIC, a place on the ſea ſhore, or on the bank of a river: though it properly ſignifies a town, village, or dwelling place; and ſometimes a machine.

WICCOMB CHIPPING, a borough town of Bucks, twelve miles ſouth of Ailesbury. It ſends two members to parliament.

WICK DE DUERSTEDE, a town of the United Netherlands, in the province of Utrecht, fifteen miles ſouth-eaſt of the city of Utrecht.

WICKER, a twig of the oſier ſhrub, ſingle or wrought.

WICKET, a ſmall door in the gate of a fortified place, &c. or a hole in a door, through which to view what paſſes without.

WICKLIFFISTS, or WICKLIFFITES, a religious ſect which ſprung up in England in the reign of Edward III. and took its name from John Wickliff, doctor and profeſſor of divinity in the univerſity of Oxford, who maintained that the ſubſtance of the ſacramental bread and wine remained unaltered after conſecration; and oppoſed the doctrine of purgatory, indulgences, auricular confeſſion, the invocation of ſaints, and the worſhip of images. He maintained, that the children of the religious may be ſaved without being baptized; that prieſts may adminiſter confirmation; that there ought to be only two orders in the church, that of prieſts, and that of deacons. He made an engliſh verſion of the Bible, and compoſed two volumes, called Aletheia, that is Truth, from which John Huſſe learned moſt of his doctrines. In ſhort, to this reformer we owe the firſt hint of the reformation, which was effected about two hundred years after.

WICKLOW, a county of Ireland, in the province of Leinſter, bounded by the county of Dublin, on the north; by the Iriſh channel, on the eaſt; by Wexford, on the ſouth; and by Kildare and Katerlagh, on the weſt.

WICKWARE, a market-town of Gloceſterſhire, ſituated twenty miles ſouth of Gloceſter.

WIDGEON, in ornithology, the anas with a brown head, white front, and a tail black underneath. See ANAS.

WIDOW, a woman who has loſt her huſband.

In London, a freeman's widow may exerciſe her huſband's trade, as long as ſhe continues ſuch.

Marriage with a widow, in the eye of the canon law, is a kind of bigamy.

WIDOW *of the king*, was ſhe who after her huſband's death, being the king's tenant in capite, could not marry again without the king's conſent.

WIFE, a married woman, or one joined with, and under the protection of, an huſband. See HUSBAND.

A wife, in our engliſh law, is termed feme covert; and in the judgment of the law is reputed to have no will, as being ſuppoſed intirely under, and ſubject to, that of her huſband. See COVERTURE and BARON and FEME.

The wife can make no contract without the huſband's conſent; and if any goods or chattels be given her, they all immediately become her huſband's: even neceſſary apparel is not her's in property. All her perſonal chattels, which ſhe held at her marriage, are ſo much her huſband's, that after his death they ſhall not return to her, but go to the executor or adminiſtrator of her huſband, except only her paraphernalia. See the article PARAPHERNALIA.

The wife partakes of the honour and condition of her huſband; but none of her dignities come by marriage to her huſband; and as the law ſuppoſes the huſband to have the full power over his wife, he is obliged to anſwer for all her faults and treſpaſſes. If a wife bring forth a child begot by a former huſband, or any other, before marriage, but born after marriage with another man; this latter muſt own the child; and that child ſhall be his heir at law: and if a wife bring forth a child during her huſband's abſence, though it be of many years; yet if he lived all the time within the iſland, he muſt father the child, and the child, if firſt born, ſhall inherit. If the wife has a jointure, and during her marriage is made pregnant by her huſband, which muſt appear by the child's being born alive, the huſband ſhall have all his wife's lands for life; but if the wife have no jointure ſettled before marriage, ſhe may, after her huſband's death, challenge the third part of his yearly rents of land, during her life.

WIGGAN, a borough town of Lancaſhire, twenty-nine miles ſouth of Lancaſter.

It ſends two members to parliament.

Iſle

Iſle of WIGHT, part of the county of Southampton, and ſeparated from it by a narrow channel, is about twenty miles long, and twelve broad. The chief town is Newport.

WIGTOWN, a borough and port-town of Scotland, in the ſhire of Galloway, ſituated on a bay of the Iriſh channel, ninety miles ſouth-weſt of Edinburgh.

WIHITSCH, a frontier town of Boſnia, in european Turky: eaſt long. 16° 40′, north lat. 45° 30′.

WILDERNESS, in gardening, a kind of grove of large trees, in a ſpacious garden, in which the walks are commonly made either to interſect each other in angles, or have the appearance of meanders and labyrinths. See the articles GROVE and LABYRINTH.

Wilderneſſes, ſays Mr. Miller, ſhould always be proportioned to the extent of the gardens in which they are made; for it is very ridiculous to ſee a large wilderneſs planted with tall trees in a ſmall ſpot of ground; and, on the other hand, nothing can be more abſurd, than to ſee little paltry ſquares, or quarters of wilderneſs work, in a magnificent large garden. As to the ſituation of wilderneſſes, they ſhould never be placed too near the habitation, nor ſo as to obſtruct any diſtant proſpect of the country; there being nothing ſo agreeable as an unconfined proſpect; but where, from the ſituation of the place, the ſight is confined within the limits of the garden, nothing can ſo agreeably terminate the proſpect, as a beautiful ſcene of the various kinds of trees judiciouſly planted; and if it is ſo contrived, that the termination is planted circularly, with the concave towards the ſight, it will have a much better effect, than if it end in ſtrait lines or angles. The plants ſhould always be adapted to the ſize of the plantation; for it is very abſurd for tall trees to be planted in the ſmall ſquares of a little garden; and in large deſigns ſmall ſhrubs will have a mean appearance. It ſhould alſo be obſerved, never to plant ever-greens amongſt deciduous trees; but always to place the ever-greens in a wilderneſs in a ſeparate part by themſelves, and that chiefly in ſight.

As to the walks, thoſe that have the appearance of meanders, where the eye cannot diſcover more than twenty or thirty yards in length, are generally preferable to all others, and theſe ſhould now and then lead into an open circular piece of graſs; in the center of which may be placed either an obeliſk, ſtatue, or fountain; and, if in the middle of the wilderneſs there be contrived a large opening, in the center of which may be erected a dome or banquetting-houſe, ſurrounded with a green plot of graſs, it will be a conſiderable addition to the beauty of the whole. From the ſides of the walks and openings, the trees ſhould riſe gradually one above another to the middle of the quarters, where ſhould always be planted the largeſt growing trees, ſo that the heads of all the trees may appear to view, while their ſtems will be hid from the ſight. Thus in thoſe parts which are planted with deciduous trees, roſes, honey-ſuckles, ſpiræa frutex, and other kinds of low-flowering ſhrubs, may be planted next the walks and openings; and at their feet, near the ſides of the walks, may be planted primroſes, violets, daffodils, *&c.* not in a ſtrait line, but ſo as to appear accidental, as in a natural wood. Behind the firſt row of ſhrubs ſhould be planted ſyringas, althæa frutex, mezereons, and other flowering ſhrubs of a middle growth; and theſe may be backed with many other ſorts of trees, riſing gradually to the middle of the quarters.

The part planted with ever-greens, may be diſpoſed in the following manner, *viz.* in the firſt line next the great walks, may be placed the laurus-tinus, boxes, ſpurge-laurel, juniper, ſavin, and other dwarf ever greens. Behind theſe may be placed laurels, hollies, arbutuſes, and other ever-greens of a larger growth. Next to theſe may be planted alaternuſes, phyllireas, yews, cypreſſes, virginian cedars, and other trees of the ſame growth; behind theſe may be planted Norway and ſilver firs, the true pine, and other ſorts of the fir growth; and in the middle ſhould be planted Scotch pines, pinaſter, and other of the larger growing ever-greens, which will afford a moſt delightful proſpect, if the different ſhades of the greens are curiouſly intermixed.

But beſide the grand walks and openings (which ſhould always be laid with turf, and kept well mowed) there ſhould be ſome ſmaller ſerpentine-walks through the middle of the quarters, where perſons may retire for privacy; and by the ſides of theſe private walks may alſo be ſcattered ſome wood flowers and plants, which if artfully planted, will have a very good effect.

In

In the general deſign for theſe wilderneſſes, there ſhould not be a ſtudied and ſtiff correſpondency between the ſeveral parts; for the greater diverſity there is in the diſtribution of theſe, the more pleaſure they will afford.

WILKOMERS, a city of Poland, in the dutchy of Lithuania: eaſt long. 25°, north lat. 55° 30′.

WILL, or *laſt* WILL, in law, ſignifies the declaration of a man's mind and intent relating to the diſpoſition of his lands, goods, or other eſtate, or of what he would have done after his death.

In the common law, there is a diſtinction made between a will and a teſtament; as that is called a will, where lands or tenements are given; and when the diſpoſition concerns goods and chattles alone, it is termed a teſtament. See the article TESTAMENT.

A will, though it has no force till after the teſtator's deceaſe, does then, without any other grant, or livery, *&c.* give and transfer eſtates, and alter the property either of lands or goods, as effectually as any deed or conveyance executed in a perſon's life-time, and thereby diſcents may be prevented, eſtates in fee, tail, for life, or for years, be made, and he that takes lands by deviſe is in the nature of a purchaſer. Formerly a perſon could not give away by will thoſe lands that he had by diſcent, though he might ſuch as he enjoyed by way of purchaſe; but by 34 and 35 of Hen. VIII. c. 5. all perſons that have a ſole eſtate in fee-ſimple of any lands, tenements, *&c.* may deviſe the ſame by will at their pleaſure, to whom they think fit; and this extends to perſons ſeiſed in coparcenary, or as tenants in common; but lands intailed are not deviſable, only thoſe held in fee, and goods and chattels: but wills made by infants or feme coverts, ideots, and perſons not of ſound memory, are deemed not good in law. The 29 Car. II. c. 23. has enacted, that all wills and deviſes of lands, *&c.* ſhall be in writing, ſigned by the deviſor, or ſome other by his expreſs directions, in the preſence of at leaſt three credible witneſſes; and no will made in writing ſhall be revoked, but by another will, or cancelling the ſame by the teſtator himſelf, or by his direction.

In the making of a will there are theſe ſeveral rules to be obſerved, *viz.* 1. That it be done while the teſtator is of ſound mind and memory. 2. That there be two parts thereof, the one to remain in the hands of the party that made it; and the other in the cuſtody of ſome friend, in order to render it leſs liable to be ſuppreſſed after the teſtator's death. 3. That the whole be written in one hand writing, and, if poſſible, in one ſheet of paper or parchment. 4. In caſe there be more ſheets than one, that the teſtator ſign and ſeal every ſheet, before the witneſſes preſent at the execution. For the manner of proving a will, ſee the article PROBATE.

WILL *with a wiſp*, or *Jack with a lanthorn*, a meteor known among the people under theſe names, but more uſually among authors under that of ignis fatuus. See the article METEOR.

This meteor is chiefly ſeen in ſummer-nights, frequenting meadows, marſhes, and other moiſt places. It ſeems to ariſe from a viſcuous exhalation, which being kindled in the air, reflects a ſort of thin flame in the dark, without any ſenſible heat. See HEAT and PHOSPHORUS.

It is often found flying along rivers, hedges, *&c.* by reaſon it there meets with a ſtream of air to direct it. The ignis fatuus, ſays Sir Iſaac Newton, is a vapour ſhining without heat; and there is the ſame difference between this vapour and flame, as between rotten wood ſhining without heat and burning coals of fire. See LIGHT, *&c.*

WILLIAMSBURG, capital of the colony of Virginia, ſituated in James-county, between James-river and York-river: weſt long. 76° 30′, north lat. 37° 20′.

WILLIAM's FORT, a fort belonging to the engliſh Eaſt-India company, ſituated on the weſtern branch of the river Ganges, in the province of Bengal: eaſt long. 87°, north lat. 22° 45′.

WILLIAMSTAT, a port-town of Holland, ſituated on the ſea called Hollands-Deep, fourteen miles ſouth of Rotterdam.

WILLOW, *ſalix*, in botany. See the article SALIX.

WILNA, a city of Poland, capital of the great dutchy of Lithuania, ſituated on a river of the ſame name: eaſt long. 25° 15′, north lat. 55°.

WILTON, a borough-town of Wiltſhire, ſituated on the river Willey, ſix miles northweſt of Saliſbury.

It ſends two members to parliament.

WILTSHIRE, a county of England, bounded by Glocesterſhire and Oxfordſhire, on the north; by Berkſhire and Hamp-

Hampſhire, on the eaſt; by Dorſetſhire, on the ſouth; and by Somerſetſhire, on the weſt.

WIMPFEN, a town of Germany, in the palatinate of the Rhine, ſituated on the river Neckar, twenty miles eaſt of Heidelburg.

WIMPLE, a muffler or plaited linnen-cloth, which nuns wear to cover their neck and breaſts. The word is ſometimes uſed for a ſtreamer or flag. See FLAG.

WIN, in the beginning or end of the names of places, ſignifies that ſome great battle was fought, or a victory gained there.

WINCHELSEA, a borough and port-town of Suſſex, ſituated on a bay of the Engliſh channel, thirty miles eaſt of Lewis.

It ſends two members to parliament.

WINCHESTER, the capital city of Hampſhire, ſituated on the river Itching, ſixty-five miles ſouth-weſt of London.

WIND, *ventus*, in phyſiology, a ſtream of air, flowing out of one place, or region, into another, See AIR.

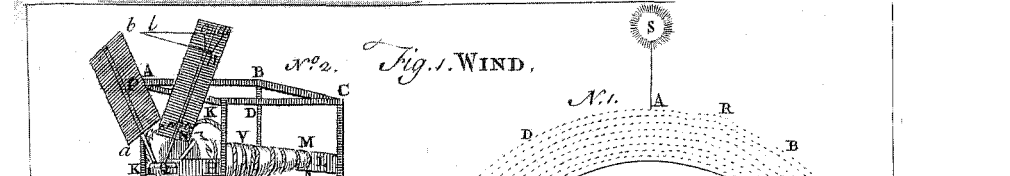
As the air is a fluid, its natural ſtate is that of reſt, which it endeavours always to keep or retrieve by an univerſal equilibrium of all its parts. When, therefore, this natural equilibrium of the atmoſphere happens by any means to be deſtroyed in any part, there neceſſarily follows a motion of all the circumjacent air towards that part, to reſtore it; and this motion of the air is what we call wind. See ATMOSPHERE.

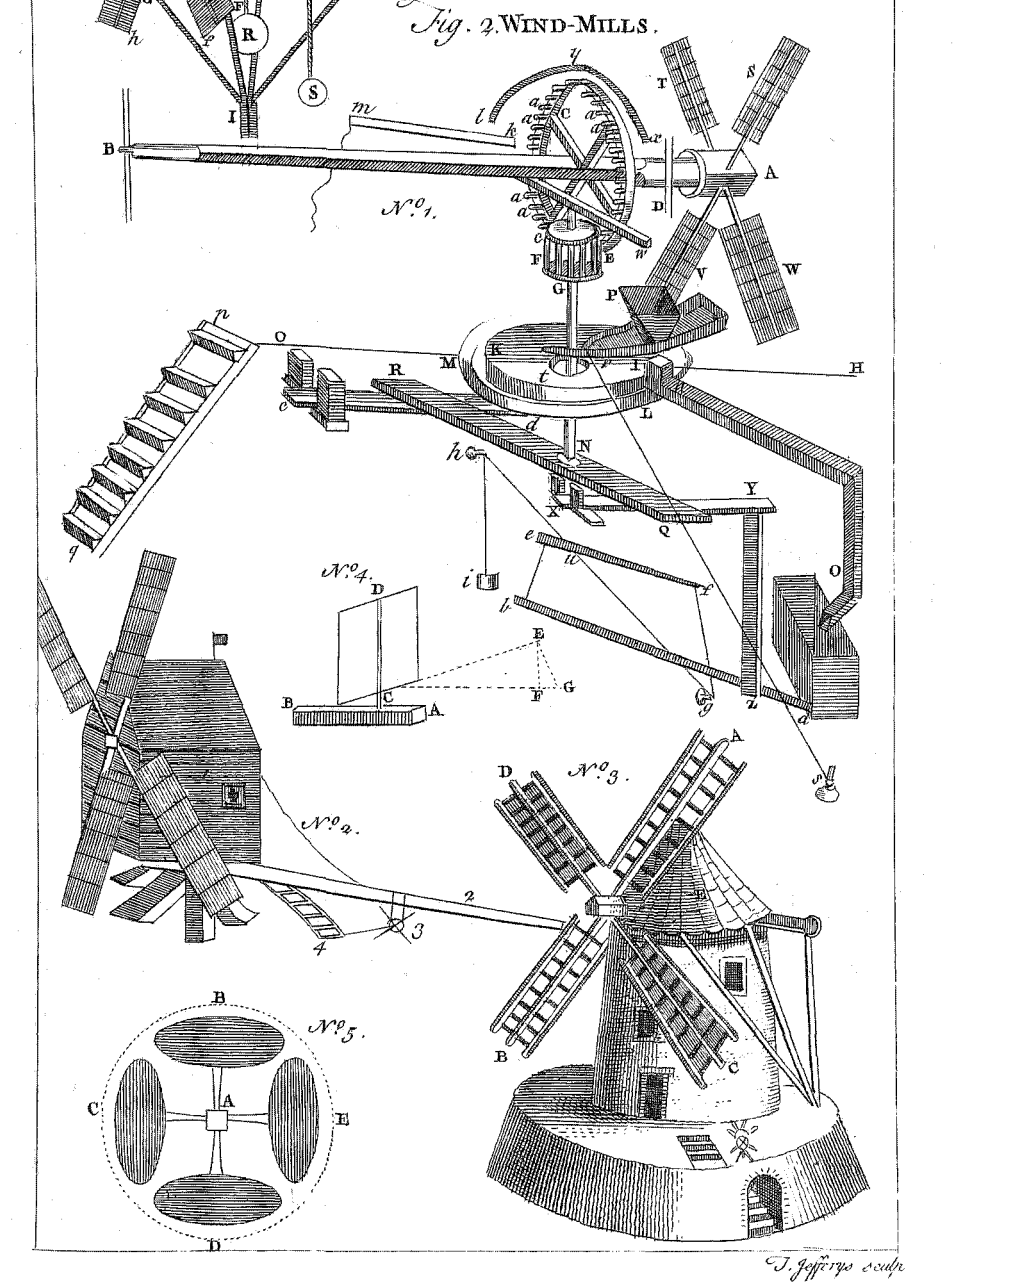
Hence, with reſpect to that place where the equilibrium of the air is diſturbed, we ſee the wind may blow from every point of the compaſs at the ſame time; and thoſe who live northwards of that point, have a north wind; thoſe who live ſouthwards, a ſouth wind; and ſo of the reſt: but thoſe who live on the ſpot, where all theſe winds meet and interfere, are oppreſſed with turbulent and boiſterous weather, whirl-winds, and hurricanes; with rain, tempeſt, lightning, thunder, *&c.* For ſulphureous exhalations from the ſouth, torrents of nitre from the north, and aqueous vapours from every part, are there confuſedly huddled, and violently blended together, and rarely fail to produce the phænomena above-mentioned. See RAIN, LIGHTNING, *&c.*

Many are the particular cauſes which produce wind by interrupting the equipoiſe of the atmoſphere; but the moſt general cauſes are two, *viz.* heat, which, by rarifying the air, makes it lighter in ſome places than it is in others; and cold, which, by condenſing it, makes it heavier. Hence it is, that in all parts over the torrid zone, the air being more rarified by a greater quantity of the ſolar rays, is much lighter than in the other parts of the atmoſphere, and moſt of all over the equatorial parts of the earth. And ſince the parts at the equator are moſt rarified, which are near the ſun; and thoſe parts are, by the earth's diurnal rotation eaſtward, continually ſhifting to the weſt; it follows, that the parts of the air which lie on the weſt ſide of the point of the greateſt rarefaction, and, by flowing towards it, meet it, have leſs motion than thoſe parts on the eaſt ſide of the ſaid point, which follow it; and therefore the motion of the eaſtern air would prevail againſt that of the weſtern air, and ſo generate a continual eaſt-wind, if this were all the effect of that rarefaction. But we are to conſider, that as all the parts of the atmoſphere are ſo greatly rarified over the equator, and all about the poles greatly condenſed by extreme cold, this heavier air from either poles is conſtantly flowing towards the equator, to reſtore the ballance deſtroyed by the rarefaction and levity of the air over thoſe regions: hence, in this reſpect alone, a conſtant north and ſouth wind would be generated.

We find by experience, that people in general have but an obſcure idea or confuſed notion of the cauſe of this perpetual current of air from eaſt to weſt, or of a conſtant eaſt wind under the equator. Therefore, in order to elucidate this matter, we ſhall explain it by a figure. Let CBADE (plate CCCI. fig. 1. n° 1.) be part of a ſection of the atmoſphere over the equator, C the eaſt, E the weſt, A the point to which the ſun S is vertical, and R the point of greateſt rarefaction, or that where the air is moſt of all heated, and, conſequently, lighteſt. That this point R is on the eaſtern ſide of the point A, is not difficult to be conceived, when what is ſaid under the article TIDE, is well conſidered. And, becauſe the air at R is by ſuppoſition lighter than where it is colder at C and D, it is plain that in order to obtain an equilibrium (which is neceſſary in a fluid body) the air by its greater weight will have a tendency from C and D towards R, and riſe to a height there greater than at C or D, in proportion as its denſity is leſs.

Now





J. Jeffreys sculp.

Now this being the caſe, it is evident, the ſun, being always between the points R and D, will be heating the air on that part; and thoſe regions between R and C, having been deſerted by the ſun, will grow cold: conſequently, the air between C and R, as it is colder, will likewiſe be heavier than that between R and D which is hotter, and ſo will have a greater momentum, or quantity of motion, towards the point R; and ſince this point R is conſtantly moving after the point A weſtward, the motion of the weſtern air towards it, will be in part diminiſhed by that means; and being alſo inferior in quantity to the motion of the eaſtern air, the latter will prevail over it, and be conſtantly following the ſaid point R from eaſt to weſt, and thus produce a continual eaſt wind.

It may, perhaps, be here ſaid, that tho' the motion of the air be leſs from D to R, yet it is ſomething, and ſo there ought to be a weſtern wind, at leaſt in ſome degree, and to ſome diſtance weſtward of the point R. To which we anſwer, that the nature of a fluid will not permit two contrary motions to reſtore or ſuſtain an equilibrium (we mean in regard of the whole body of it) for wherever one part of the fluid is determined to move, all the reſt muſt neceſſarily follow it; otherwiſe the equilibrium of the air would be deſtroyed in one part to make it good in another, a defect which nature cannot be guilty of. Thus, we ſee the tides of the ocean always follow the courſe of the moon from eaſt to weſt, without any motion of the waters from the weſt towards the moon, in the open oceans; and the point R can only be conſidered as the aerial tide, or flood of high air; and has nearly the ſame phænomena with aqueous tides. See the article TIDES.

This being clearly underſtood, all the reſt is eaſy; for no one can find it difficult to conceive how the cold air from each pole muſt neceſſarily ſet in towards the equator directly, where meeting and interfering with the eaſtern current, it does with that compound a new direction for the moving air which lies between both the former, *viz.* a north eaſt current on the north ſide, and a ſouth-eaſt on the ſouth ſide: all which naturally reſults from the doctrine of the compoſition of oblique forces. See FORCE.

And this we find to be verified in the general trade-winds, which conſtantly blow from the north-eaſt and ſouth-eaſt, to about thirty degrees on each ſide the equator, where thoſe parts are over the open ocean, and not affected with the reflection of the ſun beams from the heated ſurface of the land; for in this caſe the wind will always ſet in upon the land, as on the coaſt of Guinea, and other parts of the torrid zone, we know it does.

Velocity and force of the WIND. As the motion of the air has a greater or leſſer velocity, the wind is ſtronger or weaker; and it is found from obſervation, that the velocity of the wind is various, from the rate of 1 to 50 or 60 miles per hour. The beſt way to prove this, is to chuſe a free open place, where the wind or current of air is not at all interrupted, but flows uniformly, or as much ſo as the undulatory ſtate of the atmoſphere will admit: in ſuch a place, a feather, or other very light body, is to be let go in the wind; and then, by a half ſecond watch, or pendulum, you muſt obſerve nicely to what diſtance it is carried in any number of half ſeconds, or in how many half ſeconds it has paſſed over a given or meaſured ſpace. This will give the rate of velocity in the wind per ſecond, and of courſe per hour; which has been found, at a medium, to be 12 or 15 miles per hour: even the moſt vehement wind does not fly above 50 or 60 miles per hour; and ſometimes the wind is ſo ſlow as not to exceed the velocity of a perſon riding or walking in it; and in that caſe, if the perſon goes with the wind, he finds no wind at all, becauſe there is no difference of velocity, or no relative wind, which is that only which we are ſenſible of, whilſt in motion.

The beſt method to eſtimate the force of the wind, is by means of the following anemometer. ABCDEFGHI (*ibid.* n° 2.) is an open frame of wood, firmly ſupported by the ſhaft or poſtern I. In the croſs-pieces HK, LM, is moved an horizontal axis QM, by means of the four ſails *ab*, *cd*, *ef*, *gh*, in a proper manner expoſed to the wind. Upon this axis is fixed a cone of wood MNO, upon which, as the ſails move round, a weight S, is raiſed, by a ſtring on its ſuperficies, proceeding from the ſmall to the largeſt end NO. Upon the great end or baſe of the cone is fixed a ratchet-wheel *ik*, in whoſe teeth falls the click X, to prevent any retrograde motion from the depending weight.

From the ſtructure of this machine, it is eaſy to underſtand, that it may be accommodated to eſtimate the variable force of the wind, becauſe the force of the weight will continually increaſe, as the ſtring advances on the conical ſurface, by acting at a greater diſtance from the axis. And therefore, if ſuch a weight be put on, on the ſmalleſt part at M, as will juſt keep the machine in equilibrio with the weakeſt wind; then, as the wind becomes ſtronger, the weight will be raiſed in proportion, and the diameter of the baſe of the cone NO, may be ſo large in compariſon of that of the ſmaller end or axis at M, that the ſtrongeſt wind ſhall but juſt raiſe the weight to the great end.

Thus, for example, let the diameter of the axis be to that of the baſe of the cone NO, as 1 to 28, then if S be a weight of 1 pound at M, on the axis, it will be equivalent to 28 pounds, or $\frac{1}{4}$ of an hundred, when raiſed to the greateſt end. If, therefore, when the wind is weakeſt, it ſupports 1 pound on the axis, it muſt be 28 times as ſtrong to raiſe the weight to the baſe of the cone. Thus may a line of 28 equal parts be drawn on the ſide of the cone, and the ſtrength of the wind will be indicated by that number on which the ſtring ſhall at any time hang.

The ſtring may alſo be of ſuch a ſize, and the cone of ſuch a length, that there may be ſixteen revolutions of the ſtring betwixt each diviſion of the ſcale on the cone, whence the ſtrength of the wind will be expreſſed in pounds and ounces. And if greater exactneſs be required, let the periphery of the cone's baſe be divided into 16 equal parts; then, whenever the equilibrium happens, the ſtring will leave the conic ſurface againſt one of thoſe diviſions, and thus ſhew the force of the wind to a dram avoirdupoiſe weight.

Cardinal WINDS, are theſe which blow from the eaſt, weſt, north, and ſouth, which are called cardinal points.

Collateral WINDS, are thoſe which blow between the cardinal points. The number of theſe is infinite, as the number of points they blow from are; a few of them only are conſidered in practice, and theſe have names compounded of the cardinal points between which they blow. See the article COMPASS.

WIND-GUN, or AIR-GUN. See AIR-GUN.

WIND-MILL, a kind of mill, the internal parts of which are much the ſame with thoſe of a water mill; from which however it differs, in being moved by the impulſe of the wind upon its vanes, or ſails, which are to be conſidered as a wheel on the axle. See the articles MILL, and AXIS.

A deſcription of the mechaniſm of this uſeful engine, will, no doubt, be acceptable to our readers. AHO (pl. CCCI. fig. 2. n° 1.) is the upper room; HOZ, the under one; AB, the axle-tree, going quite through the mill; STVW, the ſails, covered with canvas, ſet obliquely to the wind, and going about in the order STVW; CD, the cog-wheel, of about 48 cogs, *a*, *a*, *a*, *&c.* which carry round the lantern EF, of 8 or 9 roundles *c*, *c*, *c*, *&c.* together with its axis GN. IK is the upper mill-ſtone; and LM, the lower one. QR is the bridge, ſupporting the axis or ſpindle GN: this bridge is ſupported by the beams *cd*, XY, wedged up at *c*, *d*, and X. ZY is the lifting-tree, which ſtands upright; *ab*, *ef*, are levers, whoſe centers of motion are Z and *e*; *fghi* is a cord, with a ſtone *i*, going about the pins *g* and *h*, and ſerving as a ballance or counterpoiſe. The ſpindle *t*N is fixed to the upper mill-ſtone IK, by a piece of iron called the rind, and fixed in the under ſide of the ſtone; which is the only one that turns about, and its whole weight reſts upon a hard ſtone, fixed in the bridge QR, at N. The trundle EF, and axis G*t*, may be taken away; for it fixes on the lower part at *t*, by a ſquare ſocket, and the top runs in the edge of the beam *w*. Putting down the end *f*, of the lever *fe*, raiſes *b*, which raiſes ZY, which raiſes YX, and this raiſes the bridge QR, with the axis NG, and the upper ſtone IK; and thus the ſtones are ſet at any diſtance. The lower immoveable ſtone is fixed upon ſtrong beams, and is broader than the upper one. The flour is conveyed through the tunnel *no*, down into a cheſt. P is the hopper, into which is put the corn, which runs along the ſpout *r*, into the hole *t*, and ſo falls between the ſtones, where it is ground. The axis G*t* is ſquare, which ſhaking the ſpout *r*, as it goes round, makes the corn run out: *rs* is a ſtring going about the pin *s*, and ſerving to move the ſpout nearer or farther from the axis, ſo as to make the corn run faſter or ſlower, according to the velocity and force of the wind. And when the wind is great, the ſails S, T, V, W, are only part, or one ſide of them, covered; or perhaps

haps only a half of two oppoſite ſails. Towards the end B, of the axle-tree is placed another cog-wheel, trundle, and mill-ſtones, with exactly the ſame apparatus; ſo that the ſame axle tree carries two ſtones at once: and when only one pair is to grind, the trundle EF, and axis G*t* is taken out from the other. *xyl* is a girt of pliable wood, fixed at the end *x*; and the other end *l*, tied to the lever *km*, moveable about *k*. And the end *m* being put down, draws the girt *xyl* cloſe to the cog-wheel; whereby the motion of the mill is ſtopped at pleaſure: *pq* is a ladder going into the higher part of the mill; and the corn is drawn up by means of a rope, rolled about the axis AB, when the mill is going.

In mills built of wood, the whole body of the mill turns round to the wind, on a tampin, or perpendicular poſt; but in thoſe of ſtone, only the upper part turns in this manner. See the mill-houſe repreſented *ibid.* n° 2. where 1 is the houſe itſelf, which is turned about to the wind by a man, with the help of the lever or beam 2: 3, is a roller to hoiſt up the ſteps 4.

In thoſe built of ſtone, only the roof E (*ibid.* n° 3.) together with axis and ſails AB, CD, turn round; in order to which, the roof is built turret-wiſe, the turret being encompaſſed with a wooden ring, in which is a groove, at the bottom of which a number of braſs-truckles are placed at certain diſtances; and within this groove is another ring, upon which the whole turret ſtands. To the upper or moveable ring are connected beams with a rope, by means of which, and a windlaſs below, the top of the machine, together with the ſails, may be turned round, and put in the direction required.

Poſition of, and force of the WIND, *upon the ſails.* As to the poſition of the ſails, we muſt conſider, that if they are placed direct to the wind, or at right angles to the axis of the mill, they will receive the whole force of the wind, which in this caſe will tend to blow them forward, and conſequently to blow down the mill; which poſition of courſe cannot be admitted.

If the ſails are ſet right to the wind, or parallel with the axis of the mill, it is plain that in that poſition the wind cannot act upon them at all, and therefore they cannot be turned round, nor the mill put in motion; which poſition of the ſails muſt likewiſe be rejected.

Since neither the direct nor right poſition of the ſails will do, an oblique poſition muſt, as there can be no other. Now to ſhew that an oblique poſition of the ſails will turn the mill, let AB (*ibid.* n° 4.) be the axis, CD a ſail, and its angle of obliquity (*viz.* that which it makes with the axis) be ECG; then if GC be the force of the wind in the direct poſition of the ſail, GE will be the force of the wind in its oblique poſition (as being the ſine of the angle of incidence GCE.) But the force GE is reſolvable into two others, EF and GF; of which the latter, being parallel to the axis, avails nothing in turning the ſail about it; but the other, EF, being perpendicular thereto, is wholly ſpent in compelling the ſail to turn round: which was the thing to be ſhewn.

The force of the wind on the ſail will be as the ſquare of the ſine of incidence, or as $\overline{GE}^2$; for the force of each ſingle particle of air will be as the ſine GE; and it will be alſo as the number of particles which ſtrike at the ſame time, which number of particles is alſo as the ſine of incidence GE. For let CD repreſent the ſection of the ſail in a direct poſition, and CG the ſame in an oblique poſition, it is plain the number of particles ſtriking it in the former caſe, will be to the number ſtriking it in the latter, as CD to CF, which is equal to GE, the ſine of incidence; for all the particles between AD and BF, will not come upon the ſail in the oblique poſition CG. Since then the force of the wind on the ſail is on two accounts as GE, it will be as the ſquare of the ſaid line GE.

If we ſuppoſe the velocity of the wind to vary, the force thereof will be as the ſquare of the velocity; for the greater the velocity, the greater will be the ſtroke of each ſingle particle, and alſo the greater will be the number of particles coming upon the ſail in the ſame time; the force will be therefore as the ſquares of the velocity.

Again, if the area of the ſail be variable, the force of the wind will be directly as the area or ſuperficies of the ſail; becauſe the number of particles of the air coming upon it, will always be proportional thereto, and conſequently the force with which they ſtrike it. Hence, if A, S, and V repreſent the area, ſine of incidence, and velocity of the wind on one ſail; and *a*, *s*, and *v*, thoſe on another: the force compelling the former to turn round, will be to that compelling

the latter, as $A \times S^2 \times V^2$ to $a \times s^2 \times v^2$.

When the area of the ſail and its poſition in reſpect of the wind, continue the ſame, the force which turns the ſail will be as the ſquares of the velocity; and ſince the wind ſcarce ever blows with one uniform velocity, but varies with almoſt every blaſt, the force upon the ſail will be much more variable and unequal; and therefore the action or working of a wind-mill cannot be ſo equal, uniform, and ſteady as that of a water-mill, whoſe power is always of the ſame tenor, while the jet of water is ſo.

If the area of the ſail and the velocity of the wind be ſuppoſed conſtant, the force of the wind in the direct poſition will be to that in the oblique one as $\overline{GC}^2$ to $\overline{GE}^2$, as we have before ſhewn; and it has been alſo ſhewn that that part of the force which turns the ſail is repreſented by EF, when GE is the whole force: but $GE : EF (:: GC : CE) :: \overline{GE}^2 : \frac{CE \times \overline{GE}^2}{GC} =$ to the force which turns the ſail, when the whole force is repreſented by $\overline{GE}^2$, as is here the proper expreſſion of it.

This expreſſion $\frac{CE \times \overline{GE}^2}{GC}$ begins from nothing, when the angle of incidence begins to be oblique, and increaſes with the obliquity of the ſaid angle to a certain number of degrees; becauſe that part of the force which is parallel to the axis becomes leſſer in proportion to that which is perpendicular to it: but after it has paſſed this limit, it again decreaſes, and becomes nothing, when the angle of incidence vaniſhes; as is eaſy to underſtand, by conſidering that the quantity of wind on the ſail does in this caſe continually decreaſe.

There is therefore one certain poſition of the ſail, in which the force of the wind is greateſt of all upon it, or a maximum; and to find it, put radius $GC = a$, $EC = x$, and we have $\overline{GE}^2 = aa - xx$, and conſequently the force $\frac{CE \times \overline{GE}^2}{GC} = \frac{aax - xxx}{a}$, which muſt be a maximum: therefore its fluxion $aa\dot{x} - 3xx\dot{x} = 0$; whence $aa = 3xx$, and ſo $x = \sqrt{\frac{aa}{3}}$ which in logarithms is $\frac{20,000000 - 0,477121}{2} = 9,761439$, which is the logarithm ſine of the angle $35^\circ 16' =$ the angle CGE; and therefore the angle ECG is equal to $54^\circ 44'$, when the force of the wind is a maximum, as required.

The angle now found, is only that which gives the wind the greateſt force to put the ſail in motion, but not the angle which gives the force of the wind a maximum upon the ſail when in motion. What this angle is, Mr. Mac Laurin has ſhewn in his book of Fluxions, to which we refer the reader.

Mr. Parent has alſo ſhewn, that an elliptic form of the ſails is better than the parallelogram, or long ſquare; and that the beſt poſition of the ſail is not that which is common, *viz.* with its longeſt ſide or diameter parallel to the axis of the ſail; but, on the contrary, it ought to be perpendicular to it; that is, they ought to be of ſuch a form, and placed in ſuch a manner, as repreſented *ibid.* n° 5. and after the four ſails B, C, D, E, are thus placed on the axis or arm A, they are then to be turned about, and fixed under the proper angle of obliquity abovementioned.

There are three things yet wanting to the perfection of a wind-mill. 1. Some contrivance in the nature of a fly, to regulate the motion of the train, under the irregular and unequal impulſe of the wind. 2. Some other contrivance to ſupply the hopper, or ſtones, with more or leſs corn, in proportion to the greater or leſs ſtrength of the wind. 3. A method of altering the angle of the ſail's obliquity, from its maximum of $54^\circ 44'$, at the beginning of the motion, to its minimum, when in motion.

WIND, in the menage. A horſe that carries in the wind, is one that toſſes his noſe as high as his ears, and does not carry handſomely. The difference between carrying in the wind, and beating upon the hand, is, that the horſe who beats upon the hand, ſhakes his head, and reſiſts the bridle; but he who carries in the wind, puts up his head without ſhaking, and only ſometimes beats upon the hand. The oppoſite to carrying in the wind, is arming and carrying low.

WIND FLOWER, *anemone*, in botany, a genus of the *polyandria-polygynia* claſs of plants, the corolla whereof conſiſts of two or three orders of petals, three in each

each order or ſeries; they are of an oval figure, and erecto-patent: there is no pericarpium; the receptacle is globoſe or oblong, and attenuated and punctated; the ſeeds are numerous, acuminated, and have the ſtyles affixed to them.

WIND-GALL, a name given by our farriers to a diſtemperature of horſes. In this caſe there are bladders full of a corrupt jelly, which, when let out, is thick, and of the colour of the yolk of an egg. They vary in ſize, but are more uſually ſmall than large. Their place is about the fetloc-joint, and they grow indifferently on all four legs, and are often ſo painful, eſpecially in the ſummer ſeaſon, when the weather is hot, and the ground dry and hard, that they make the creature frequently ſtumble, or even fall down. The general method of cure is to open the ſwelling, about the length of a bean, and to preſs out the jelly: when this is done, they apply a mixture of the oil of bays, and the white of an egg, covering it with tow. Another method is, after the jelly is all ſqueezed out, to wrap round the part a wet woolen-cloth, and then applying a taylor's hot iron, this is to be rubbed over till the moiſture is carried away; it is then to be daubed all over with pitch, maſtich, and reſin, boiled together, laying tow in plenty over all. The wind-galls that are ſituated near the ſinews, are much the moſt painful of all, and ſooneſt make the horſe lame.

The general cauſe of wind-galls is ſuppoſed to be extreme work or exerciſe in hot weather; but it is to be obſerved, that thoſe horſes which have long joints, will be wind-galled if they work never ſo little. The worſt wind-galls are thoſe of the hinder legs; all the above-mentioned methods will frequently miſs of ſucceſs in theſe, and nothing but fire will cure them.

WIND-HATCH, in mining, a term uſed to expreſs the place at which the ore is taken out of the mines.

WIND-SAILS, in a ſhip, are made of the common ſail-cloth, and are uſually between twenty-five and thirty feet long, according to the ſize of the ſhip, and are of the form of a cone ending obtuſely: when they are made uſe of, they are hoiſted by ropes to about two thirds or more of their height, with their baſis diſtended circularly by hoops, and their apex hanging downwards in the hatch-ways of the ſhip; above each of theſe, one of the common ſails is ſo diſpoſed, that the greateſt part of the air ruſhing againſt it, is directed into the wind-ſail, and conveyed, as through a funnel, into the upper parts of the body of the ſhip.

WIND-SHOCK, a name given by our farmers to a diſtemperature to which fruit-trees, and ſometimes timber-trees, are ſubject. Mortimer is of opinion that the wind-ſhock is a ſort of bruiſe and ſhiver throughout the whole ſubſtance of the tree; but that the bark being often not affected by it, it is not ſeen on the outſide, while the inſide is twiſted round, and greatly injured. It is by ſome ſuppoſed to be occaſioned by high winds; but others attribute it to lightening. Thoſe trees are moſt uſually affected by it, whoſe boughs grow more out on one ſide than on the other.

The beſt way of preventing this in valuable trees, is to take care, in the plantation, that they are ſheltered well, and to cut them frequently in a regular manner, while young. The winds not only twiſt trees in this manner, but they often throw them wholly down: in this caſe the common method is to cut up the tree for firing, or other uſes; but if it be a tree that is worth preſerving, and it be not broken, but only torn up by the roots, it may be proper to raiſe it again, by the following method. let a hole be dug deep enough to receive its roots, in the place where they before were: let the ſtraggling roots be cut off, and ſome of the branches, and part of the head of the tree; then let it be raiſed; and when the torn-up roots are replaced in the earth, in their natural ſituation, let them be well covered, and the hole filled up with rammed earth; the tree will, in this caſe, grow as well, and perhaps better, than before. If nature be left to herſelf, and the tree be not very large, the pulling off the roots will raiſe it.

WIND-TACKLE-BLOCKS, in a ſhip, are the main double blocks, which being made faſt to the end of a ſmall cable, ſerve for hoiſting of goods into the ſhip, &c. See the articles BLOCK, TACKLE, &c.

To WIND, or WEND *a ſhip*, ſignifies to bring her head about. *How winds or wends the ſhip?* is a queſtion aſked by mariners, concerning a ſhip under ſail; ſignifying as much as, upon what point of the compaſs does ſhe lie with her head?

WIND-TAUGHT, a ſea-term, ſignifying as much as ſtiff in the wind. See the article TAUGHT.

Too much rigging, high maſts, or any thing catching or holding wind aloft, is ſaid to hold a ſhip wind-taught; by which they mean, that ſhe ſtoops too much in her ſailing in a ſtiff gale of wind. Again, when a ſhip rides in a main ſtreſs of wind and weather, they ſtrike down her top-maſts, and bring her yards down, which otherwiſe would hold too much wind, or be too much diſtended, or wind-taught.

WIND-WARD, in the ſea-language, denotes any thing towards that point from whence the wind blows, in reſpect of a ſhip: thus windward-tide, is the tide which runs againſt the wind. See the articles TIDE, *&c.*

Large WIND. In the ſea-language, to ſail with a large wind, is the ſame as with a fair wind.

Side WIND, at ſea, that which blows on the ſide of the ſhip.

WINDAGE *of a gun*, the difference between the diameter of the bore, and the diameter of the ball. See the article GUN.

WINDASS, WANDASS, or WANLASS, an antient term in hunting: thus, to drive the windaſs, ſignifies the chaſing a deer to a ſtand where one is ready, with a bow or gun, to ſhoot. See the article HUNTING.

WINDER-MEB, in ornithology, the grey and white larus, with a yellow beak. See the article LARUS.

This bird is of the ſize of our widgeon, and at a diſtance appears to be all over white; the head is remarkably large, and rounded; the ears are large, as alſo are the eyes, the iris of which is of a beautiful gold yellow, and the pupil black as jet; the beak is about an inch and a quarter long, conſiderably thick, very much arched and hooked, and pointed at the extremity; the chap is entirely yellow, and has a large protuberance; the legs are very ſlender and yellow; the thighs are naked half the way up; and the feet are webbed.

WINDERS *of wool*. See the article WOOL-WINDERS.

WINDING STAIRS. See STAIRS.

WINDLASS, or WINDLACE, a machine uſed to raiſe huge weights withal, as guns, ſtones, anchors, *&c.* See MACHINE.

It is very ſimple, conſiſting only of an axis, or roller, ſupported horizontally at the two ends, by two pieces of wood and a pully: the two pieces of wood meet at top, being placed diagonally, ſo as to prop each other; the axis, or roller, goes through the two pieces, and turns in them. The pully is faſtened at top where the pieces join. Laſtly, there are two ſtaves or handſpikes go through the roller, whereby it is turned, and the rope which comes over the pully is wound off and on the ſame.

WINDLASS, in a ſhip, is an inſtrument in ſmall ſhips, placed upon the deck, juſt abaft the foremaſt. It is made of a piece of timber ſix or eight feet ſquare, in form of an axle-tree, whoſe length is placed horizontally upon two pieces of wood at the ends thereof, and upon which it is turned about by the help of handſpikes put into holes made for that purpoſe. This inſtrument ſerves for weighing anchors, or hoiſting of any weight, in or out of the ſhip, and will purchaſe much more than any capſtan, and that without any danger to thoſe that heave; for if in heaving the windlaſs about, any of the handſpikes ſhould happen to break, the windlaſs would pall of itſelf.

WINDOW, *q. d.* wind-door, an aperture or open place in the wall of a houſe, to let in the wind and light. See the article HOUSE.

We have various forms of windows, as, arched windows, circular windows, elliptical windows, ſquare and flat windows, round windows, oval windows, gothic windows, regular windows, ruſtic windows, and ſky-lights.

The chief rules in regard to windows, are, 1. That they be as few in number, and as moderate in dimenſions, as may conſiſt with other due reſpects; inaſmuch as all openings are weakenings. 2. That they be placed at a convenient diſtance from the angles, or corners of the building; becauſe that part ought not to be enfeebled, whoſe office is to ſupport and faſten all the reſt of the building. 3. That care be taken that the windows are all equal one with another, in their rank and order; ſo that thoſe on the right hand may anſwer to thoſe on the left, and thoſe above be right over thoſe below; for this ſituation of windows will not only be handſome and uniform, but alſo the void being upon the void, and the full upon the full, it will be a great ſtrengthening to the whole fabric. As to their dimenſions, care is to be taken not to give them more or leſs light than

is

is needful; that is, to make them no bigger, nor leſs, than is convenient; therefore, regard is to be had to the bigneſs of the rooms which are to receive the light: it is evident, that a great room needs more light, and, conſequently, a greater window than a little room, and *è contra*. The apertures of windows, in middle-ſized houſes, may be four and a half, or five feet, between the jaumbs, and in greater buildings ſix and a half, or ſeven feet, and their height may be double their length at the leaſt. But in high rooms, or larger buildings, their height may be a third, a fourth, or half a breadth more than double their length. Theſe are the proportions of the windows for the firſt ſtory; and according to theſe muſt the upper ſtories be for breadth; but, as for height, they muſt diminiſh: the ſecond ſtory may be one-third part lower than the firſt, and the third one-fourth part lower than the ſecond. See the article BUILDING.

For architrave windows, dormer windows, tranſom windows, ſee the articles ARCHITRAVE, DORMER, *&c.*

For the ſcenography of windows, ſee the article SCENOGRAPHY.

WINDSOR, a borough-town of Berkſhire, twenty miles weſt of London, moſt remarkable for the magnificent palace or caſtle ſituated there on an eminence, which commands the adjacent country for many miles, the river Thames running at the foot of the hill. The knights of the garter are inſtalled in the royal chapel here.

It ſends two members to parliament.

WINDY TUMOURS. See TUMOUR.

WINE, *vinum*, a briſk, agreeable, ſpirituous and cordial liquor, drawn from vegetable bodies and fermented. See the articles VEGETABLE and FERMENTATION.

The character of a wine, according to Boerhaave, is, that the firſt thing it affords by diſtillation, be a thin, oily, inflammable fluid called a ſpirit. See the article SPIRIT.

This diſtinguiſhes wines from another claſs of fermented vegetable juices, *viz.* vinegar, which inſtead of ſuch ſpirit, yields, for the firſt thing, an acid uninflammable matter. See VINEGAR.

All ſorts of vegetables, fruits, ſeeds, roots, *&c.* afford wine; as grapes, currants, mulberries, elder-berries, cherries, apples, pulſe, beans, peaſe, turneps, radiſhes, and even graſs itſelf. Hence under the claſs of wines, or vinous liquors, come not only wines abſolutely ſo called, but alſo ale, cyder, *&c.* See VINOUS, MALT-LIQUOR, ALE, CYDER, *&c.*

WINE is, in a more peculiar manner, appropriated to that which is drawn from the fruit of the vine, by ſtamping its grapes in a vat, or cruſhing and expreſſing the juice out of them in a preſs, and then fermenting, *&c.* See the articles VINE, VINEYARD, GRAPE, PRESS, *&c.*

The goodneſs of wine conſiſts in its being neat, dry, fine, bright, and briſk, without any taſte of the ſoil, of a clean ſteddy colour, having a ſtrength without being heady, a body without being ſour, and keeping without growing hard or eager. The difference of flavour, taſte, colour, and body, in wines, is, perhaps, as much owing to the different manner and time of preſſing, gathering, fermenting, *&c.* the grape, as to any difference of the grape itſelf. In Hungary, whence tockay and ſome of the richeſt and higheſt flavoured wines come, they are extremely curious in theſe reſpects: for their prime and moſt delicate wines, the grape is ſuffered to continue upon the vine, till it is half dried by the heat of the ſun; and, if the ſun's heat ſhould not prove ſufficient, they are dried by the gentle heat of a furnace, and then picked one by one from the ſtalks; the juice of this grape, when preſſed out, is of a fine flavour, and ſweet as ſugar: this, after due fermentation, is kept for a year, and then racked from the lees, when it proves a generous, oily, rich wine, and is ſold at a very high rate. The Hungarians prepare a ſecond ſort of wine, by collecting together the better kind of grapes, carefully picking the fruit from the ſtalks, and then preſſing out the juice: this is extremely ſweet, and is made richer by infuſing in it, after it has fermented for ſome days, a ſufficient quantity of half dried grapes. This wine is very ſweet, oily, of a grateful taſte, and retains theſe qualities for a long time. There is a third ſort made from the pure juice of the ſame kind of grape, without any addition. This is a more briſk and lively wine, and far leſs ſweet. They likewiſe prepare a fourth ſort, from grapes of different goodneſs mixed together; this, though not ſo generous, is nevertheleſs an excellent wine. Theſe hungarian wines are remarkable for preſerving their ſweetneſs, and for the delicacy of their taſte and ſmell; they, likewiſe, do not

grow

grow eaſily vapid, and may be kept in perfection for many years.

Wine being a liquor moſtly of foreign produce, the divers names, forms, kinds, diſtinctions, &c. thereof, are borrowed from the countries where it is produced; the principal whereof, at this day, is France, to wines of which country, a good part of what we have to ſay of this noble liquor, will more immediately belong.

Wine in France is diſtinguiſhed from the ſeveral degrees and ſteps of its preparation, into, 1. *Mere goutte*, mother drop, which is the virgin wine, or that which runs of itſelf out at the top of the vat wherein the grapes are laid, before the vintager enters to tread or ſtamp the grapes. 2. Muſt, ſurmuſt, or ſtum, which is the wine or liquor in the vat, after the grapes have been trod or ſtamped. 3. Preſſed wine, being that ſqueezed with a preſs out of the grapes half bruiſed by the treading. The huſks left of the grapes are called rope, murk, or mark, by throwing water upon which, and preſſing them afreſh, they make a liquor for ſervants uſe, anſwerable to our cyderkin, and called *boiſſon*, which is of ſome uſe in medicine, in the cure of diſorders occaſioned by viſcid humours. 4. Sweet wine, is that which has not yet worked nor fermented. 5. Bouru, that which has been prevented working by caſting in cold water. 6. Worked wine, that which has been let work in the vat, to give it a colour. 7. Boiled wine, that which has had a boiling before it worked, and which by that means ſtill retains its native ſweetneſs. 8. Strained wine, that made by ſteeping dry grapes in water, and letting it ferment of itſelf.

Wines are alſo diſtinguiſhed with regard to their colour into white wine, red wine, claret wine, pale wine, roſe, or black wine; and with regard to their country, or the ſoil that produces them, into french wines, ſpaniſh wines, rhenish wines, hungary wines, greek wines, canary wines, &c. and more particularly into port wine, madeira wine, burgundy wine, champain wine, faſerman wine, tockay wine, ſchiras wine, &c.

Method of making, fining, &c. WINE. In the ſouthern parts of France, their way is with red wines to tread or ſqueeze the grapes between the hands, and to let the whole ſtand, juice and huſks, till the tincture be to their liking; after which they preſs it. But for white wines, they preſs the grapes immediately; when preſſed, they tun the muſt and ſtop up the veſſel, only leaving the depth of a foot or more to give room for it to work. At the end of ten days they fill this ſpace with ſome other proper wine, that will not provoke it to work again. This they repeat from time to time, new wine ſpending itſelf a little before it comes to perfection.

The uſual method of fining down wines, ſo as to render them expeditiouſly bright, clear, and fit for uſe, is this. Take an ounce of iſinglaſs, beat it into thin ſhreads with a hammer, and diſſolve it, by boiling, in a pint of water; this, when cold, becomes a ſtiff jelly. Whiſk up ſome of this jelly into a froth with a little of the wine intended to be fined, then ſtir it well among the reſt in the caſk, and bung it down tight; by this means the wine will become bright in eight or ten days. This method, however, is found to be beſt ſuited to the white wines; for the red ones, the wine-coopers commonly uſe the whites of eggs beat up to a froth, and mixed in the ſame manner with their wines.

They fine it down alſo by putting the ſhavings of green beech into the veſſel, having firſt taken off all the rind, and boiled them an hour in water to extract their rankneſs, and afterwards dried them in the ſun, or in an oven. A buſhel of theſe ſerve for a tun of wine; and being maſhed, they ſerve again and again, till almoſt quite conſumed.

For engliſh wine, the method recommended by Mortimer, is firſt to gather the grapes when very dry, to pick them from the ſtalks, then to preſs them, and let the juice ſtand twenty-four hours in a vat covered. Afterwards to draw it off from the groſs lees, and then put it up in a caſk, and to add a pint or quart of ſtrong red or white port to every gallon of juice, and let the whole work, bunging it up cloſe, and letting it ſtand till January; then bottle it in dry weather. Bradley chuſes to have the liquor, when preſſed, ſtand with the huſks, ſtalks, and all in the vat, to ferment for fifteen days. The method of converting white-wine into red, ſo much practiſed by the modern wine coopers, Dr. Shaw obſerves, is this. Put four ounces of turneſole rags into an earthen veſſel, and pour upon them a pint of boiling water; cover the veſſel cloſe, and leave it to cool; ſtrain off the liquor, which will be of a fine deep red, inclining to purple. A ſmall

portion of this colours a large quantity of wine. This tincture might be either made in brandy, or mixed with it, or elſe made into a ſyrup, with ſugar, for keeping. A common way with the wine-coopers is to infuſe the rags cold in wine for a night or more, and then wring them out with their hands; but the inconveniency of this method is, that it gives the wine a diſagreeable taſte; or what is commonly called the taſte of the rag; whence the wines, thus coloured, uſually paſs among judges for preſſed wines, which have all this taſte from the canvas rags in which the lees are preſſed. The way of extracting the tincture, as here directed, is not attended with this inconvenience; but it loads the wine with water; and if made into a ſyrup, or mixed in brandy, it would load the wine with things not wanted, ſince the colour alone is required. Hence the colouring of wines has always its inconveniencies.

In thoſe countries which do not produce the tinging grape, which affords a blood-red juice, wherewith the wines of France are often ſtained, in defect of this, the juice of elder-berries is uſed, and ſometimes logwood is uſed at Oporto.

The colour afforded by the method here propoſed, gives wine the tinge of the Bourdeaux-red, not the port; whence the foreign coopers are often diſtreſſed for want of a proper colouring for red wines in bad years. This might, perhaps, be ſupplied by an extract made by boiling ſtick-lack in water. The ſkins of tinging grapes might alſo be uſed, and the matter of the turneſole procured in a ſolid form, not imbibed in rags.

Stahl obſerves, that it is a common accident, and a diſeaſe in wines, to be kept too hot; which is not eaſy to cure when it has been of any long continuance, otherwiſe it may be cured by introducing a ſmall artificial fermentation, that new ranges the parts of the wine, or rather recovers their former texture: but the actual expoſing of wine to the fire, or the ſun, preſently diſpoſes it to turn eager; and the making it boiling hot, is one of the quickeſt ways of expediting the proceſs of making of vinegar.

On the other hand, wine kept in a cool vault, and well ſecured from the external air, will preſerve its texture entire in all the conſtituent parts, and ſufficiently ſtrong for many years, as appears not only from old wines, but other foreign fermented liquors, particularly thoſe of China, prepared from a decoction of rice, which being well cloſed down in a veſſel, and buried deep under ground, will continue, for a long ſeries of years, rich, generous, and good, as the hiſtories of that country univerſally agree in aſſuring us.

The moſt general remedy hitherto known for all the diſeaſes of wines, is a prudent uſe of tartarized ſpirit of wine, which not only enriches, but diſpoſes all ordinary wines to grow fine.

If either by fraud or accident a larger portion of water is mixed with wine than is proper for its conſiſtence, and no way neceſſary or eſſential, this ſuperfluous water does not only deprave the taſte, and ſpoil the excellence of the wine, but alſo renders it leſs durable; for humidity in general, and much more a ſuperfluous aqueous humidity, is the primary and reſtleſs inſtrument of all the changes that are brought on by fermentation. It may doubtleſs, therefore, be uſeful, and ſometimes abſolutely neceſſary, to take away this ſuperfluous water from the other part which ſtrictly and properly conſtitutes the wine. This has been agreed upon on all hands as a thing proper; but the manner of doing it has not been well agreed on; ſome have propoſed the effecting it by means of heat and evaporation, others by percolation, and others by various other methods, all found unſucceſsful when brought to the trial; but the way propoſed by Dr. Shaw from Stahl, is the moſt certain and commodious; this is done by a concentration of the wine, not by means of heat, but of cold.

If any kind of wine, but particularly ſuch as has never been adulterated, be in a ſufficient quantity, as that of a gallon or more, expoſed to a ſufficient degree of cold in froſty weather, or be put into any place where ice continues all the year, as in our ice-houſes, and there ſuffered to freeze, the ſuperfluous water that was originally contained in the wine, will be frozen into ice, and will leave the proper and truly eſſential part of the wine unfrozen, unleſs the degree of cold ſhould be very intenſe, or the wine but weak and poor. This is the principle on which Stahl founds his whole ſyſtem of condenſing wines by cold. When the froſt is moderate, the experiment has no difficulty, becauſe not above a third or a fourth part of the ſuperfluous water will be froze in a whole night; but if

the cold be very intenſe, the beſt way is, at the end of a few hours, when a tolerable quantity of ice is formed, to pour out the remaining fluid liquor, and ſet it in another veſſel to freeze again by itſelf. If the veſſel, that thus by degrees receives the ſeveral parcels of the condenſed wine, be ſuffered to ſtand in the cold freezing place where the operation is performed, the quantity lying thin in the pouring out, or otherwiſe, will be very apt to freeze anew; and if it be ſet in a warm place, ſome of this aqueous part thaws again, and ſo weakens the reſt. The condenſed wine, therefore, ſhould be emptied in ſome place of a moderate degree as to cold or heat, where neither the ice may diſſolve, nor the vinous ſubſtance mixed among it be congealed. But the beſt expedient of all is to perform the operation with a large quantity of wine, or that of ſeveral gallons, where the utmoſt exactneſs, or the danger of a trifling waſte, need not be regarded.

By this method, when properly performed, there firſt freezes about one third part of the whole liquor; and this is properly the more purely aqueous part of it, inſomuch that when all the vinous fluid is poured off, to be again expoſed to a concentration, the ice remaining behind, from this firſt freezing, being ſet to thaw in a warm place, diſſolves into a pure and taſteleſs water. The frozen part, or ice, conſiſts only of the watery part of the wine, and may be thrown away, and the liquid part retains all the ſtrength, and is to be preſerved. This will never grow ſour, muſty, or mouldy afterwards, and may at any time be reduced to wine of the common kind again, by adding to it as much water as will make it up to the quantity that it was before.

Wines in general may by this method be reduced to any degree of vinoſity or perfection.

The benefit and advantage of this method of congelation, if reduced to practice in the large way, in the wine countries, muſt be evident to every body. Concentrated wines, in this manner, might be ſent into foreign countries, inſtead of wine and water, which is what is uſually now ſent, the wines they export being loaded, and in danger of being ſpoiled by three or four times their own quantity of unneceſſary, ſuperfluous, and prejudicial water.

An eaſy method of recovering pricked wines, may be learned from the following experiment: take a bottle of red port that is pricked, add to it half an ounce of tartarized ſpirit of wine, ſhake the liquor well together, and ſet it by for a few days, and it will be found very remarkably altered for the better.

This experiment depends upon the uſeful doctrine of acids and alkalies. All perfect wines have naturally ſome acidity, and when this acidity prevails too much, the wine is ſaid to be pricked, which is truly a ſtate of the wine tending to vinegar: but the introduction of a fine alkaline ſalt, ſuch as that of tartar, imbibed by ſpirit of wine, has a direct power of taking off the acidity, and the ſpirit of wine alſo contributes to this, as a great preſervative in general of wines. If this operation be dexterouſly performed, pricked wines may be abſolutely recovered by it, and remain ſaleable for ſome time: and the ſame method may be uſed to malt liquors juſt turned ſour.

The age of wine is properly reckoned by leaves; thus they ſay wine of two, four, or ſix leaves, to ſignify wine of two, four, or ſix years old; taking each new leaf put forth by the vine, ſince the wine was made, for a year.

The net duties to be paid on importation of all wines into the port of London, and repaid on exportation, are as follows.

Wines imported by Britiſh for ſale. Rheniſh, german, or hungary wines, the ton, filled in caſks, pay, on importation, 35l. 2s. $\frac{72}{100}$d. and, on exportation, draw back 26l. 13s. $8\frac{88}{100}$d. in bottles, on importation, 35l. 15s. $3\frac{12}{100}$d. and draw back, on exportation, 27l. 5s. $4\frac{8}{100}$d. Portugal or madeira wine, the ton filled in caſks, pays, on importation, 28l. 8s. $3\frac{12}{100}$d. and, on exportation, draws back 20l. 6s. $4\frac{8}{100}$d. in bottles, on importation, 31l. 5s. $3\frac{12}{100}$d. and, on exportation, draws back 22l. 15s. $4\frac{8}{100}$d. French wine, the ton filled in caſk, on importation, pays 60l. 16s. $4\frac{8}{100}$d. and, on exportation, draws back, 26l. 2s. $11\frac{12}{100}$d. in bottles, on importation, 64l. 5s. $4\frac{8}{100}$d. and, on exportation, draws back 27l. 18s. $8\frac{72}{100}$d. Levant and all other wines, the ton filled in caſks pays, on importation, 29l. 4s. $9\frac{12}{100}$d. and, on exportation, draws back 21l. 2s. $10\frac{8}{100}$d. in bottles, on impor-

importation, pays 32l. 3s. $9\frac{12}{100}$d. and, on exportation, draws back, 23l. 13s. $10\frac{8}{100}$d. Wines imported by Britiſh for private uſe. Rheniſh, german, or hungary wine, the ton filled in caſks, pays, on importation, 36l. $3\frac{60}{100}$d. and, on exportation, draws back 27l. 5s. $10\frac{80}{100}$d. in bottles, on importation, the ton pays 36l. 13s. 6d. and, on exportation, draws back 27l. 17s. 6d. Portugal or madeira wine, the ton filled in caſks, on importation, pays 29l. 6s. 6d. and, on exportation, draws back 20l. 18s. 6d. in bottles, on importation, 32l. 3s. 6d. and, on exportation, draws back 23l. 7s. 6d. French wine, the ton filled in caſks, pays, on importation, 61l. 8s. 6d. and, on exportation, draws back 26l. 11s. $\frac{40}{100}$d. in bottles, on importation, 64l. 17s. 6d. and, on exportation, draws back 28l. 6s. 10d. Levant and all other wines, the ton filled in caſks, pays, on importation, 30l. 3s. and, on exportation, draws back 21l. 15s. in bottles, on importation, 33l. 2s. and, on exportation, draws back 24l. 6s. And beſides the afore-mentioned duties, all wines imported into the port of London, are to pay to the uſe of the orphans of the ſaid city, for every ton, 4s.

Wines imported by foreigners are to pay, beſides the aforeſaid duties, the undermentioned, which muſt be added reſpectively to the duties payable by Britiſh. Rheniſh, german or hungary wines, the ton filled in caſks, on importation, pays 4l. 8s. $2\frac{40}{100}$d. and, on exportation, draws back 4l. 3s. $2\frac{40}{100}$. in bottles, on importation, 4l. 10s. and, on exportation, draws back 4l. 5s. French wine, the ton in caſks, pays, on importation, 4l. 4s. $7\frac{20}{100}$d. and, on exportation, draws back 3l. 19s. $7\frac{20}{100}$d. in bottles, on importation, 4l. 10s. and, on exportation, draws back 4l. 5s. Levant and all other wines, filled in caſks, the ton pays, on importation, 4l. 1s. and, on exportation, draws back 3l. 16s. in bottles, on importation, 4l. 10s. and, on exportation, draws back 4l. 5s. And beſides thoſe duties, all wines of the growth of the Levant, imported into any port by foreigners, are to pay to the uſe of the town of Southampton, for every butt or pipe, 10s.

WINE is alſo a denomination applied in medicine and pharmacy to divers mixtures and compoſitions wherein the juice of the grape is a principal ingredient. See the article VINUM.

With regard to the medical uſes of wines, it is obſerved, that among the great variety of wines in common uſe among us, five are employed in the ſhops as menſtrua for medicinal ſimples; that is, the vinum album hiſpanicum, or mountain wine; the vinum album gallicum, or french white wine; the canary wine, or ſack; the rheniſh wine; and the red port. The effects of theſe liquors on the human body, are to chear the ſpirits, warm the habit, promote perſpiration, render the veſſels full and turgid, raiſe the pulſe, and quicken the circulation. The effects of the full bodied wines are much more durable than thoſe of the thinner; all ſweet wines, as canary, abound with a glutinous, nutritious ſubſtance, whilſt the others are not nutrimental, or only accidentally ſo, by ſtrengthening the organs employed in digeſtion. Sweet wines, in general, do not paſs off freely by urine; and they heat the conſtitution more than an equal quantity of any other, though containing full as much ſpirit: red port, and moſt of the red wines, have an aſtringent quality, by which they ſtrengthen the tone of the ſtomach, and thus prove ſerviceable for reſtraining immoderate ſecretions; thoſe which are of an acid nature, as rheniſh, paſs freely by the kidneys, and gently looſen the belly. It is ſuppoſed that theſe laſt exaſperate and occaſion gouty calculous diſorders, and that new wines of every kind have this effect.

WINE-SPIRIT, a term uſed by our diſtillers, and which may ſeem to mean the ſame thing with the phraſe of ſpirit of wine; but they are taken in very different ſenſes in the trade.

Spirit of wine is the name given to the common malt ſpirit, when reduced to an alcohol, or totally inflammable ſtate; but the phraſe wine-ſpirit is uſed to expreſs a very clean and fine ſpirit, of the ordinary proof ſtrength, and made in England from wines of foreign growth.

The way of producing it is by ſimple diſtillation, and it is never rectified any higher than common bubble proof. The ſeveral wines of different natures, yield very different proportions of ſpirit; but, in general, the ſtrongeſt yield one fourth, the weakeſt in ſpirits one eighth part of proof-ſpirit; that is, they contain from

a ſixteenth to an eighth part of their quantity of pure alcohol.

Wines that are a little ſour, ſerve not at all the worſe for the purpoſes of the diſtiller, they rather give a greater vinoſity to the produce. This vinoſity is a thing of great uſe in the wine-ſpirit, whoſe principal uſe is to mix with another that is tartarized, or with a malt-ſpirit, rendered alkaline by the common method of rectification. All the wine-ſpirits made in England, even thoſe from the french wines, appear very greatly different from the common french brandy; and this has given our diſtillers a notion that there is ſome ſecret art practiſed in France, for the giving the agreeable flavour to that ſpirit; but this is without foundation. WING, *ala*, that part of a bird, inſect, *&c.* whereby it is enabled to fly. See the articles FLYING, FEATHER, *&c.*

Willughby obſerves, that all birds whatſoever have wings, or rudiments of wings, which anſwer to the fore legs in quadrupeds. Among land-fowl he obſerves, that the oſtrich, caſſowary, and dodo; and among water-fowl, the penguin, have wings altogether uſeleſs and unfit for flight. See the articles ORNITHOLOGY, OSTRICH, *&c.*

Inſects, indeed, have wings, and ſo have bats, but of a different kind from thoſe of birds; the former being membranaceous, and the latter cutaneous: birds only have wings made up of feathers.

All birds, towards the extremity of their wings, have a certain finger-like appendix, which is commonly called the ſecundary or baſtard-wing. It is made up of four or five ſmall feathers. Beſides this under the wing, or on the inſide of the wing, ſome birds, eſpecially water-fowl, have a row of feathers growing, called interior baſtard wing, which in moſt birds is of a white colour. See the articles INSECT, BAT, *&c.*

Reaumur obſerves, that wings among the fly-claſs, afford ſeveral ſubordinate diſtinctions of the genera of thoſe animals, under the antient general claſſes. Several ſpecies of flies, while they are in a ſtate of reſt, or only walking, ſhew ſeveral regularly diſtinct manners of carrying their wings. The much greater number, however, carry them in a parallel or plain poſition. Among thoſe who carry them thus, ſome have them in form of a ſort of ores, their direction being perpendicular to the length of the body, which is not at all covered by them. Others carry their wings in this manner, ſo as that they cover a part of the body, without at all covering one another. The wings of others croſs one another on the body of the creature, and the degrees in which they cover one another, give occaſion to ſeveral other ſub-diſtinctions; for ſome of them over-hang on each ſide the body of the animal, while others croſs one another, in ſuch a manner as not to cover the body of the fly entirely, but leave a rim of it viſible and uncovered on each ſide of them. Some of the flies bred of water-worms, have their wings in this manner. Others have their wings thus diſpoſed, but croſſing one another only in a part of their ſurface, and that at their extremities; ſo that though they there cover the body of the fly, they leave a portion of the anterior part of the body naked. See the article FLY.

The beautiful wings of butterflies are diſtinguiſhed from thoſe of the fly-kind, by their not being thin and tranſparent, like them, but thicker and opake. This opacity in them is only owing to the duſt which comes off them, and ſticks to the fingers in handling them; and it is alſo to this duſt that they owe all their beautiful variety of colours. The earlier naturaliſts, for this reaſon, diſtinguiſhed theſe inſects by the appellation of ſuch as had farinaceous wings.

The wings of gnats are of a very curious ſtructure, and well worthy the uſe of the microſcope, to ſee them diſtinctly. It is well known, that on touching the wings of butterflies, a coloured powder is left on the fingers, which, though to the naked eye it appears a mere ſhapeleſs duſt, yet when examined by the microſcope, it is found to be very regularly figured beautiful bodies, in form of feathers and ſcales: theſe are of various figures, and all of them very elegant. The generality of flies have nothing of this kind; but the cloſe examination of the wings of the gnat will ſhew, that they are not wholly deſtitute of them: they

are

are much more ſparingly beſtowed, indeed, upon the gnat than on the butterfly; but then they are arranged with great regularity.

WINGS, in heraldry, are borne ſometimes ſingle, ſometimes in pairs; in which caſe they are called conjoined. When the points are downward, they are ſaid to be inverted; when up, elevated. See VOL.

WING, in botany, the angle formed between the ſtem and the leaves or pedicles of the leaves of a plant. See the article LEAF, *&c.*

WINGS, *alæ*, in military affairs, are the two flanks or extremes of an army, ranged in form of battle; being the right and left ſides thereof. See the articles ARMY, BATTALION, *&c.*

WINGS, in fortification, denote the longer ſides of horn-works, crown-works, tenailles, and the like out-works; including the ramparts and parapets, with which they are bounded on the right and left, from their gorge to their front.

WINGED, in botany, a term applied to ſuch ſtems of plants as are furniſhed all their length with a ſort of membraneous leaves, as the thiſtle, *&c.*

Winged leaves, are ſuch as conſiſt of divers little leaves, ranged in the ſame direction, ſo as to appear only as the ſame leaf. Such are the leaves of agrimony, acacia, aſh, *&c.* See LEAF.

Winged ſeeds, are ſuch as have down or hairs on them, which, by the help of the wind, are carried to a diſtance. See the article SEED.

WINNOW, ſignifies to fan or ſeparate corn from the chaff by the wind.

WINOXBERG, a town of the french Netherlands, in the province of Flanders, ſituated on the river Colme, five miles ſouth of Dunkirk.

WINSCHOTEN, a town of the United Provinces, in the province of Groningen, ſituated ſixteen miles ſouth eaſt of Groningen.

WINSEN, a town of Germany, in the circle of Lower Saxony, and dutchy of Lunenburg, ſituated at the confluence of the river Elbe and Ilmenau, fifteen miles north-weſt of Lunenburg.

WINSLOW, a market-town of Bucks, ſix miles north of Aileſbury.

WINSTER, a market-town of Darbyſhire, ſituated ten miles north of Darby.

WINTER, one of the four ſeaſons or quarters of the year. See SEASON, *&c.*

Winter commences on the day when the ſun's diſtance from the zenith of the place is greateſt, and ends on the day when its diſtance is at a mean between the greateſt and leaſt. See the articles SUN and EARTH.

Notwithſtanding the coldneſs of the ſeaſon, it is proved by aſtronomers, that the ſun is really nearer the earth in winter than in ſummer; the reaſon of the decay of heat, and the truth of this propoſition, ſee explained under the articles HEAT, LIGHT, EARTH, *&c.*

Under the equator, the winter as well as other ſeaſons, return twice every year; but all other places have only one winter in the year, which in the northern hemiſphere begins when the ſun is in the tropic of capricorn, and in the ſouthern hemiſphere when in the tropic of cancer; ſo that all places in the ſame hemiſphere have their winter at the ſame time. See the article TROPIC.

WINTER, among printers, that part of the printing-preſs ſerving to ſuſtain the carriage. See PRINTING-PRESS.

WINTER'S BARK, *cortex winteranus*, in botany, a name given to the bark of the white or wild cinnamon tree. See the article CINNAMON.

The winter's bark is a thick and firm bark, though we have a different thing ſometimes under its name: it comes to us rolled up in the manner of the common cinnamon, into a kind of tubes or pipes; but they are uſually thicker, and always ſhorter than the fine tubes of cinnamon. It is externally of a greyiſh colour, and of a reddiſh brown within; it is properly, indeed, a double bark, the outer and inner of the ſame tree, not the inner bark alone, ſeparated from the other, as the cinnamon and caſſia are. The outer rind is of an uneven ſurface and of a looſe texture, very brittle and eaſily powdered. The inner bark, which has the principal virtue, is hard, and of a duſky reddiſh brown. The outer one is often craked and open in ſeveral places, the inner one never in any. It is of an extremely fragrant and aromatic ſmell, and of a ſharp, pungent, and aromatic taſte, much hotter than cinnamon in the mouth, and leaving a more laſting flavour in it.

It is to be choſen in pieces not too large, with the inner or brown part ſound and firm, and of a very ſharp taſte. It is apt to be worm-eaten; but in that caſe it is wholly to be rejected, as having loſt the far greater part of its virtue.

The

The cortex winteranus was wholly unknown to the antients; the diſcovery of it among us is owing to captain Winter, who, in the year 1567, going as far as the ſtreights of Magellan with Sir Francis Drake, found this bark on that coaſt, and bringing a large quantity of it with him in his return to England, it became uſed in medicine, and was ever after called by his name. It is not, however, peculiar to the place he found it in, but is frequent in many parts of America.

The virtues of this bark were diſcovered by the engliſh ſailors on board captain Winter's ſhip; they firſt uſed it by way of ſpice to their foods, and afterwards for the ſcurvy. It is alſo good in palſies and rheumatiſms; and a decoction of the leaves is good by way of fomentation, for the parts externally affected by the ſcurvy. The engliſh ſailors made it famous for its virtues againſt the poiſon of a certain fiſh, common about the Magellanic ſea, and which they called the ſea-lion. They eat the fleſh of this fiſh, and fell into many illneſſes by it, among which was one attended with a peeling off the ſkin of their whole bodies, not without exceſſive pain; this they remedied by the cortex winteranus; but by the accounts we have of the effects of eating this fiſh, as it is called, they were rather ſymptoms of an inveterate ſcurvy, and, therefore, it is no wonder this bark did them great ſervice.

WINTER-QUARTERS. See QUARTERS.

WINTER-RIG, among huſbandmen, ſignifies to fallow or till the land in winter. See the article FALLOW.

WINTER SOLSTICE. See SOLSTICE.

WINTERTONNESSE, the north cape of the county of Norfolk, four miles north of Yarmouth.

WINTSHEIM, a town of Germany, in the circle of Franconia, and marquiſate of Anſpach, ſituated fifteen miles north of Anſpach.

WIRE, WIAR, WIER, or WYRE, a piece of metal drawn through the hole of an iron into a thread of a fineneſs anſwerable to the hole it paſſed through.

Wires are frequently drawn ſo fine, as to be wrought along with other threads of ſilk, wool, flax, &c.

The metals moſt commonly drawn into wire, are gold, ſilver, copper, and iron.

Gold-wire is made of cylindrical ingots of ſilver, covered over with a ſkin of gold, and thus drawn ſucceſſively through a vaſt number of holes, each ſmaller and ſmaller; till at laſt it is brought to a fineneſs exceeding that of a hair. That admirable ductility which makes one of the diſtinguiſhing characters of gold, is no where more conſpicuous, than in this gilt wire. A cylinder of forty-eight ounces of ſilver, covered with a coat of gold, only weighing one ounce, as Dr. Halley informs us, is uſually drawn into a wire, two yards of which weigh no more than one grain; whence ninety-eight yards of the wire weigh no more than forty-nine grains, and one ſingle grain of gold covers the ninety-eight yards; ſo that the ten-thouſandth part of a grain is above one-eighth of an inch long. The ſame author, computing the thickneſs of the ſkin of gold, found it to be $\frac{1}{134500}$ part of an inch. Yet ſo perfectly does it cover the ſilver, that even a microſcope does not diſcover any appearance of the ſilver underneath. M. Rohault likewiſe obſerves, that a like cylinder of ſilver, covered with gold, two feet eight inches long, and two inches nine lines in circumference, is drawn into a wire 307200 feet long, *i. e.* into 115200 times its former length. Mr. Boyle relates, that eight grains of gold, covering a cylinder of ſilver, is commonly drawn into a wire 13000 feet long. See the articles GOLD and DUCTILITY.

Silver-wire is the ſame with gold-wire, except that the latter is gilt, or covered with gold, and the other is not.

There are alſo counterfeit gold and ſilver-wires; the firſt made of a cylinder of copper, ſilvered over, and then covered with gold; and the ſecond of a like cylinder of copper, ſilvered over, and drawn through the iron, after the ſame manner as gold and ſilver-wire.

Braſs-wire is drawn after the ſame manner as the former. Of this there are divers ſizes, ſuited to the different kinds of works. The fineſt is uſed for the ſtrings of muſical inſtruments, as ſpinets, harpſichords, manichords, &c. See the article SPINET, &c.

The pin-makers, likewiſe, uſe vaſt quantities of braſs-wire, to make their pins of.

Iron-wire is drawn of various ſizes, from half an inch to one tenth of an inch diameter.

The firſt iron that runs from the ſtone, when melting, being the ſofteſt and tougheſt, is preſerved to make wire of.

Iron-wire is made from ſmall bars of iron called eſleom-iron, which are firſt drawn

out

out to a greater length, and to about the thickneſs of ones little finger, at a furnace, with a hammer gently moved by water. Theſe thinner pieces are bored round, and put into a furnace to aneal for twelve hours. A pretty ſtrong fire is uſed for this operation. After this they are laid under water for three or four months, the longer the better; then they are delivered to the workmen, called rippers, who draw them into wire thro' two or three holes. After this they aneal them again for ſix hours, and water them a ſecond time for about a week, and they are then delivered again to the rippers, who draw them into wire of the thickneſs of a large packthread. They are then aneal'd a third time, and then watered for a week longer, and delivered to the ſmall wire-drawers, called over-houſe-men.

In the mill where this work is performed, there are ſeveral barrels hooped with iron, which have two hooks on their upper ſides, on each whereof hang two links, which ſtand acroſs, and are faſtened to the two ends of the tongs, which catch hold of the wire, and draw it through the hole. The axis on which the barrel moves does not run through the center, but is placed on one ſide, which is that on which the hooks are placed; and underneath there is faſtened to the barrel a ſpoke of wood, which they call a ſwingle, which is drawn back a good way by the cogs in the axis of the wheel, and draws back the barrel, which falls to again by its own weight. The tongs hanging on the hooks of the barrel, are by the workmen faſtened to the end of the wire, and by the force of the wheel, the hooks being pulled back, draw the wire through the holes. The plate in which the holes are, is iron on the outſide, and ſteel on the inſide; and the wire is anointed with train-oil, to make it run the eaſier.

WIRE *of Lapland*. The inhabitants of Lapland have a ſort of ſhining ſlender ſubſtance in uſe among them on ſeveral occaſions, which is much of the thickneſs and appearance of our ſilver-wire, and is therefore called, by thoſe who do not examine its ſtructure or ſubſtance, lapland-wire. It is made of the ſinews of the reindeer, which being carefully ſeparated in the eating, are, by the women, after ſoaking in water, and beating, ſpun into a ſort of thread, of admirable fineneſs and ſtrength, when wrought to the ſmalleſt filaments; but when larger, is very ſtrong, and fit for the purpoſes of ſtrength and force. Their wire, as it is called, is made of the fineſt of theſe threads, covered with tin. The women do this buſineſs, and the way they take is to melt a piece of tin, and placing at the edge of it a horn with a hole through it, they draw theſe ſinewy threads, covered with the tin, through the hole, which prevents their coming out too thick covered. This drawing is performed with their teeth; and there is a ſmall piece of bone placed at the top of the hole, where the wire is made flat, ſo that we always find it rounded on all ſides but one, where it is flat.

This wire they uſe in embroidering their cloaths as we do gold and ſilver; they often ſell it to ſtrangers, under the notion of its having certain magical virtues.

WIRKSWORTH, a market-town of Darbyſhire, ſituated ſix miles north of Darby.

WISBEACH, a market-town of the iſle of Ely, in Cambridgeſhire, ſituated fifteen miles north of Ely.

WISLEY, a port-town of Sweden, ſituated on the weſt coaſt of the iſland of Gothland, one hundred and ten miles ſouth of Stockholm.

WISDOM, *ſapientia*, uſually denotes a higher and more refined notion of things immediately preſented to the mind, as it were, by intuition, without the aſſiſtance of ratiocination. See UNDERSTANDING, REASON, KNOWLEDGE, *&c.*

In this ſenſe wiſdom may be ſaid to be a faculty of the mind, or at leaſt a modification and habit thereof. See FACULTY, MODIFICATION, HABIT, *&c.*

Sometimes the word is more immediately uſed, in a moral ſenſe, for what we call prudence, or diſcretion, which conſiſts in the ſoundneſs of the judgment, and a conduct anſwerable thereto.

WISMAR, a town of Germany, in the circle of lower Saxony, and dutchy of Mecklenburg, ſituated on a bay of the Baltic-ſea, twelve miles north of Swerin.

WISSELOCK, a town of Germany, in the palatinate of the Rhine, ſituated ſeven miles ſouth of Heidelburg.

WISTON, a market-town of Pembrokeſhire, ſituated ten miles north of Pembroke.

WIT, a faculty of the mind, conſiſting, according to Mr. Locke, in the aſſembling

ling and putting together of thoſe ideas, with quickneſs and variety, in which any reſemblance or congruity can be found, in order to form pleaſant pictures and agreeable viſions to the fancy. This faculty, the ſame author obſerves, is juſt the contrary of judgment, which conſiſts in the ſeparating carefully from one another, ſuch ideas wherein can be found the leaſt difference, thereby to avoid being miſled by ſimilitude and affinity, to take one thing for another. It is the metaphor and alluſion, wherein, for the moſt part, lies the entertainment and pleaſantry of wit, which ſtrikes ſo lively on the fancy, and is therefore ſo acceptable to all people, becauſe its beauty appears at firſt ſight, and there is required no labour of thought to examine what truth or reaſon there is in it. The mind, without looking any farther, reſts ſatisfied with the agreeableneſs of the picture, and the gaiety of the imagination; and it is a kind of affront to go about to examine it by the ſevere rules of truth or reaſon. See the article IMAGINATION, *&c.*

Wit is alſo an appellation given to the perſon poſſeſſed of this faculty; and here the true wit muſt have a quick ſucceſſion of pertinent ideas, and the ability of arranging and expreſſing them in a lively and entertaining manner; he muſt at the ſame time have a great deal of energy and delicacy in his ſentiments; his imagination muſt be ſprightly and agreeable, without any thing of parade or vanity in his diſcourſe: but it is not, however, eſſential to the character of a wit, to be ever hunting after the brilliant, ſtudying ſprightly turns, and affecting to ſay nothing but what may ſtrike and ſurprize. See the article FACULTY, *&c.*

WITCHCRAFT, a kind of ſorcery, eſpecially in women, in which it is ridiculouſly ſuppoſed that an old woman, by entering into a contract with the devil, is enabled, in many inſtances, to change the courſe of nature; to raiſe winds; perform actions that require more than human ſtrength; and to afflict thoſe who offend them with the ſharpeſt pains, *&c.* In the times of ignorance and ſuperſtition, many ſevere laws were made againſt witches, by which great numbers of innocent perſons, diſtreſſed with poverty and age, were brought to a violent death; but theſe are now happily repealed.

WITENA-MOT, or WITENA-GEMOT, among our ſaxon anceſtors, was a term which literally ſignified the aſſembly of the wiſe men, and was applied to the great council of the nation, of latter days called the parliament.

WITEPSKI, the capital of the palatinate of the ſame name, in the dutchy of Lithuania, in Poland: eaſt long. 30°, north lat. 56°.

WITHAM, a market-town of Eſſex, ten miles north eaſt of Chelmsford.

WITHERNAM, in law, a writ that lies where a diſtreſs is driven out of the county, and the ſheriff cannot make deliverance to the party diſtrained; in that caſe this writ is directed to the ſheriff, commanding him to take as many of the beaſts, or goods, of the party into his keeping, till he make deliverance of the firſt diſtreſs.

WITHERS of a horſe, the juncture of the ſhoulder-bones at the bottom of the neck and main, towards the upper part of the ſhoulder.

WITNESS, in law, a perſon who gives evidence in any cauſe, and is ſworn to ſpeak the truth, the whole truth, and nothing but the truth.

A witneſs ought to be indifferent with reſpect to each party; for if he will be a gainer or loſer by the ſuit, he is not ſworn as a witneſs. See EVIDENCE.

Falſe witneſſes, ſuborners of witneſſes, *&c.* are in England puniſhed with the pillory; in ſeveral other countries with death. See the articles PERJURY, SUBORDINATION, *&c.*

WITNEY, a market-town of Oxfordſhire, ſeven miles weſt of Oxford. Here is the greateſt manufacture of blankets in England.

WITTENBURG, a city of Germany, in the circle of upper Saxony, fifty miles north of Dreſden.

WITTENBURG, is alſo a town of Germany, in the marquiſate of Brandenburg, ſixty miles north of the city of Brandenburg.

WITTLESEYMERE, a lake in the iſle of Ely, on the confines of Huntingdonſhire, ſix miles long and three broad.

WITTIMUND, a town of Germany, in the circle of Weſtphalia, fifteen miles north of Embden.

WIVELSCOMB, a market-town of Somerſetſhire, ſituated twenty-ſeven miles ſouth weſt of Wells.

WOAD, *iſatis*, in botany. See ISATIS. This is a drug uſed by the dyers to give a blue colour. It ariſes from ſeed ſown annually in the ſpring, which puts forth leaves reſembling thoſe of rib-wort plantain.

tain. These plants have usually three, four, or five crops of leaves every year, of which the first is the best, and the rest in their order. When the leaves are ripe, they gather them, and carry them to a woad-mill to grind them small; after which they are laid eight or ten days on heaps, and are at length made into a kind of balls, which are laid in the shade on hurdles to dry. This done, they break or grind them to powder; which is then spread on a floor and watered. Here they let it smoak and heat, till by torrifying it every day it becomes quite dry.

A woad-blue is a very deep blue, almost black; and is the base of so many sorts of colours, that the dyers have a scale by which they compose the several casts or degrees of woad, from the brightest to the deepest.

WOBURN, a market-town of Bedfordshire, ten miles south of Bedford.

WOERDEN, a town of the United Provinces, in the province of Holland, eighteen miles south of Amsterdam.

WOLAW, the capital of a dutchy of the same name, in Bohemia: east long. 16° 38′, north lat. 51° 22′.

WOLD, signifies a plain down, or open champain ground, hilly and void of wood.

WOLD, or WELD, among dyers. See the article WELD.

WOLF, *lupus*, in zoology, the canis, with the tail bending inward. See the article CANIS.

The wolf is a very large and a very fierce animal, being equal to the biggest mastiff in size, and having much of the general appearance of that creature: the head is large and fleshy: the eyes are large and prominent, and their iris hazel: the ears are short, patulous, and erect: the teeth are very large, and the animal has a way of shewing them in a frightful manner, by grinning: the neck is robust and thick: the body is large, and the back broad: the legs are very robust: the tail is long and bushy: the natural colour is black, but there are some tawny; and in some places they are in winter perfectly white. The wolf is a very mischievous creature, destroying cattle; and in hard winters attacking houses and villages in whole troops.

Sea-WOLF, in ichthyology. See the article LUPUS.

WOLFEMBUTTLE, a city of Germany, in the circle of lower Saxony, and dutchy of Brunswick: east long. 10° 32′, north lat. 52° 20′.

WOLFERDYKE, an island of the united Netherlands, in the province of Zealand, situated between the islands of north Beveland and south Beveland.

WOLFESHEAD, or WOLFERHEFOD, denoted the condition of such persons as were outlawed in the time of the Saxons; who, if they could not be taken alive, so as to be brought to justice, might be slain, and their heads brought to the king; for the head of one of these was no more accounted of than a wolf's head. See OUTLAWRY.

WOLGA, a large river of Russia, which rising in the north of that empire, runs south-east till it falls into the Caspian sea, about fifty miles below Astracan, after its having run a course of between two and three thousand miles.

WOLGAST, a city and port-town of Germany, in the circle of upper Saxony, and dutchy of Pomerania, subject to Sweden: east long 14° 5′, north lat. 54° 12′.

WOLKOWSKA, a city of Poland, in the dutchy of Lithuania, and palatinate of Novogrodeck: east long. 24°, north lat. 53°.

WOLLIN, a town and island of Pomerania, situated in the Baltic sea, at the mouth of the river Oder, subject to the king of Prussia.

WOLODOMIR, the capital of a province of the same name in Russia: east long. 30° 5′, north lat. 57° 40′.

WOLOGDA, the capital of a province of the same name in Russia, situated on the river Dwina: east long. 42° 20′, north lat. 59°.

WOLVERHAMPTON, a market-town of Staffordshire, eleven miles south of Stafford.

WOLVES TEETH, of an horse, are overgrown grinders, the points of which being higher than the rest, prick his tongue and gums in feeding, so as to hinder his chewing. They are seldom met with in any besides young horses; but if they be not daily worn by chewing, they will grow up even to pierce the roof of the mouth.

WOMAN, *fœmina*, in zoology, the female of man. See MAN.

Women, from the very frame and constitution of their bodies, are liable to several diseases, which are peculiar to that sex, arising from a suppression or immoderate flux of the menses, from preg-

nancy, delivery, their milk, &c. all which may be found under their ſeveral articles; as MENSES, FLUOR ALBUS, ABORTION, MILK, &c.

For the engliſh laws in relation to women, ſee the articles COVERTURE, BARON *and feme*, PARAPHERNALIA, WIFE, &c.

WOMB, *uterus*. See UTERUS.

WONDER. See the article MIRACLE.

The ſeven wonders of the world, as they are popularly called, were the egyptian pyramids; the mauſoleum erected by Artemiſia; the temple of Diana, at Epheſus; the walls and hanging gardens of the city of Babylon; the coloſſus, or brazen image of the ſun, at Rhodes; the ſtatue of Jupiter Olympius; and the pharos, or watch-tower, of Ptolemy Philadelphus. See the articles PYRAMID, MAUSOLEUM, COLOSSUS, PHAROS, &c.

WOOD, *lignum*, a ſolid ſubſtance, whereof the trunks and branches of trees conſiſt. See the articles TREE, TRUNK, BRANCH, UNDERWOOD, &c.

The wood is all that part of a tree included betwen the bark and the pith. See the article BARK.

Dr. Grew, in his Anatomy of Plants, has diſcovered, by means of the microſcope, that what we call wood in a vegetable, notwithſtanding all its ſolidity, is only an aſſemblage of infinite minute canals, or hollow fibres, ſome of which riſe from the root upwards, and are diſpoſed in form of a circle; and the others, which he calls inſertions, tend horizontally from the ſurface to the center; ſo that they croſs each other, and are interwoven like the threads of a weaver's-web. See the articles VEGETATION, SAP, &c.

Notwithſtanding this, M. Buffon obſerves, that the organization of wood is yet unknown in all its parts; and that, though the world is greatly indebted to the obſervations of Grew, Malpighi, and Hales, yet when he entered on the ſubject, he found there was much more unknown than known; and determined to obſerve, from its firſt ſtate, the growth of trees, and the formation of their woody part. For this ingenious author's expoſition of the texture, &c. of wood, and thence his calculation of the force and ſtrength of timber uſed in building, we muſt refer the reader to his paper upon that ſubject, as publiſhed in the Memoirs Acad. Par. for the year 1740, and to what has been ſaid under the article TIMBER.

Mortimer obſerves that all kinds of wood are to be preſerved from the worm, and from many other occaſions of decay, by oily ſubſtances, particularly the eſſential oils of vegetables. Oil of ſpike is excellent; and oil of juniper, turpentine, or any other of this kind, will ſerve the purpoſe; theſe will preſerve tables, inſtruments, &c. from being eaten to pieces by theſe vermin; and linſeed oil will ſerve, in many caſes, to the ſame purpoſe; probably nut-oil will do alſo, and this is a ſweeter oil, and a better varniſh for wood.

Some of the weſt indian trees afford a ſort of timber which, if it would anſwer in point of ſize, would have great advantages over any of the european wood in ſhip building for the merchant ſervice, no worm ever touching this timber. The acajou, or tree which produces the caſhew nut, is of this kind; and there is a tree of Jamaica, known by the name of the white-wood, which has exactly the ſame property; and ſo have many other of their trees.

To ſeaſon wood expeditiouſly for ſea-ſervice, Mr. Boyle obſerves, that it has been uſual to bake it in ovens.

The art of moulding wood is mentioned by Mr. Boyle as a deſideratum in the art of carving. He ſays, he had been credibly informed of its having been practiſed at the Hague; and ſuſpects that it might have been performed by ſome menſtruum that ſoftens the wood, and afterwards allows it to harden again, in the manner that tortoiſe-ſhell is moulded: or, perhaps, by reducing the wood into a powder, and then uniting it into a maſs with ſtrong but thin glue. And he adds, that, having mixed ſaw-duſt with a fine glue made of iſing glaſs, ſlightly ſtraining out what was ſuperfluous through a piece of linnen, the remainder, formed into a ball and dried, became ſo hard as to rebound when thrown againſt the floor.

The people who work much in wood, and that about ſmall works, find a very ſurpriſing difference in it, according to the different ſeaſons at which the tree was cut down, and that not regularly the ſame in regard to all ſpecies, but different in regard to each. The button mould makers find that the wood of the pear-tree, cut in ſummer, works toughеſt; holly, on the contrary, works toughеſt when

when cut in winter; box is melloweſt when it has been cut in ſummer, but hardeſt when cut about Eaſter; haw-thorn works meſſow when cut about October, and the ſervice is always tough, if cut in ſummer.

Wood uſed for fuel is required of various kinds, in regard to the various works to be performed by it.

Neri every where commends oak for the wood to be burnt in the glaſs-houſes, as the propereſt wood for making a ſtrong and durable fire with a good flame.

Imperato, on the contrary, commends aſh on the ſame occaſion; becauſe, as he ſays, it gives a ſubſtantial, rather than a great flame: and Camerarius deſervedly commends juniper wood, as affording a laſting, ſtrong, and ſweet fire, could plenty of it be had. Among the antients, Pliny commends light dry wood; and Plutarch, the tameriſk in particular, for making the glaſs-houſe fires; but glaſs-making requires ſo great a fire as cannot be eaſily made from ſuch wood. Nor can aſh be proper, becauſe, though it gives a good fire, it ſoon decays.

Woods are diſtinguiſhed into divers kinds, with regard to their nature, properties, virtues, and uſes. Of wood, conſidered according to its qualities, whether uſeful, curious, medicinal, &c. the principal is called timber, uſed in building houſes, laying floors, roofs, ma hines, &c. See TIMBER.

Woods valued on account of their curioſity are cedar, ebony, box, calambo, &c. which by reaſon of their extraordinary hardneſs, agreeable ſmell, or beautiful poliſh, are made into tables, combs, beads, &c. See EBONY, &c.

The medicinal woods are guaiacum, aloes, ſaſſafras, nephriticum, ſantal, ſarſaparilla, aſpalathum, &c. See the articles GUAIACUM, ALOES, SASSAFRAS, &c.

Woods uſed in dying are the indian-wood, brazil wood, campechy wood, &c. See BRAZIL, &c.

Foſſile WOOD. Foſſile wood, or whole trees, or parts of them, are very frequently found buried in the earth, and that in different ſtrata; ſometimes in ſtone, but more uſually in earth; and ſometimes in ſmall pieces looſe among gravel. Theſe, according to the time they have lain in the earth, or the matter they have lain among, and in the way of, are found differently altered from their original ſtate; ſome of them having ſuffered very little change, and others being ſo highly impregnated with cryſtalline, ſparry, pyritical, or other extraneous matter, as to appear mere maſſes of ſtone, or lumps of the common matter of the pyrites, &c. of the dimenſions, and, more or leſs, of the internal figure of the vegetable bodies into the pores of which they have made their way.

The foſſile-wood, which we find at this day, are, according to theſe differences, arranged, by Dr. Hill, into three kinds; 1. the leſs altered: 2. the pyritical: and, 3. the petrified.

Of the trees, or parts of them, leſs altered from their original ſtate, the greateſt ſtore is found in digging to ſmall depths in bogs, and among what is called peat or turf-earth, a ſubſtance uſed in many parts of the kingdom for fuel. In digging among this, uſually very near the ſurface, they find immenſe quantities of vegetable matter buried, and that of various kinds: in ſome places there are whole trees ſcarce altered, except in colour; the oaks in particular being uſually turned to a jetty black; the pines and firs, which are alſo very frequent, are leſs altered, and are as inflammable as ever, and often contain, between the bark and wood, a black reſin. Large parts of trees have alſo been not unfrequently met with unaltered in beds of another kind, and at much greater depths, as in the ſtrata of clay and loam, among gravel, and ſometimes even in ſolid ſtone.

Beſide theſe harder parts of trees, there are frequently found alſo in the peat-earth, vaſt quantities of the leaves and fruit, and catkins of the hazel, and the like trees: theſe are uſually intermixed among the ſedge and roots of graſs, and are ſcarce at all altered from their uſual texture. The moſt common of theſe are hazel nuts; but there are frequently found alſo the twigs and leaves of the white poplar; and a little deeper uſually there lies a cracked and ſhattered wood, the crevices of which are full of a bituminous black matter; and among this the ſtones of plumbs, and other ſtone-fruits, are ſometimes found, but that more rarely.

It is idle to imagine, that theſe have been thus buried either at the creation; or, as many are fond of believing, at the univerſal deluge: at the firſt of theſe times the ſtrata muſt have been formed

before the trees were yet in being; and the peat-wood is ſo far from being of antediluvian date, that much of it is well known to have been growing within theſe three hundred years, in the very places where it is now found buried.

In this ſtate, that is little altered from their original condition, it is, that the fruits, and larger parts of trees are uſually found: what we find of them more altered, are ſometimes large and long, ſometimes ſmaller and ſhorter, branches of trees; ſometimes ſmall fragments of branches, and more frequently ſmall ſhapeleſs pieces of wood. The larger and longer branches are uſually found bedded in the ſtrata of ſtone, and are more or leſs altered into the nature of the ſtratum they lie in; the ſhorter and ſmaller branches are found in vaſt variety in the ſtrata of blue clay, uſed for making tiles in the neighbourhood of London; theſe are prodigiouſly plentiful in all the clay-pits of this kind, and uſually carry the whole external reſemblance of what they once were, but nothing of the inner ſtructure; their pores being wholly filled, and undiſtinguiſhably cloſed by the matter of the common vitriolic pyrites, ſo as to appear mere ſimple maſſes of that matter. Theſe fall to pieces on being long expoſed to a moiſture, and are ſo pregnant in vitriol that they are what is principally uſed for making the green vitriol or copperas at Deptford, and other places. See VITRIOL and COPPERAS.

The irregular maſſes or fragments of wood, are principally of oak, and are moſt uſually found among gravel; tho' ſometimes in other ſtrata. Theſe are variouſly altered by the inſinuation of cryſtalline and ſtony particles, and make a very beautiful figure when cut and poliſhed, as they uſually keep the regular grain of the wood, and ſhew exactly the ſeveral circles which mark the different years growth. Theſe, according to the different matter which has filled their pores, aſſume various colours, and the appearance of the various foſſils that have impregnated them; ſome are perfectly white, and but moderately hard; others of a browniſh black, or perfectly black, and much harder; others of a reddiſh black, others yellowiſh, and others greyiſh, and ſome of a ferrugineous colour. They are of different weights alſo and hardneſſes, according to the nature and quantity of the ſtony particles they contain; of theſe ſome pieces have been found with every pore filled with pure pellucid cryſtal; and others in large maſſes, part of which is wholly petrified and ſeems mere ſtone, while the reſt is crumbly and is unaltered wood. That this alteration is made in wood, even at this time, is alſo abundantly proved by the inſtances of wood being put into the hollows of mines, as props and ſupports to the roofs, which is found after a number of years as truly petrified as that which is dug up from the natural ſtrata of the earth. In the pieces of petrified wood found in Germany, there are frequently veins of ſpar or of pure cryſtal, ſometimes of earthy ſubſtances, and often of the matter of the common pebbles: theſe fragments of wood ſometimes have the appearance of parts of the branches of trees in their natural ſtate; but more frequently they reſemble pieces of broken boards; theſe are uſually capable of a high and elegant poliſh.

Many ſubſtances, it is certain, have been preſerved in the cabinets of collectors, under the title of petrified wood, which have very little right to that name. But where the whole outer figure of the wood, the exact lineaments of the bark, or the fibroſe and fillular texture of the ſtriæ, and the veſtiges of the utriculi and tracheæ, or air-veſſels, are yet remaining, and the ſeveral circles yet viſible, which denoted the ſeveral years growth of the tree, none can deny theſe ſubſtances to be real foſſil-wood.

Cord of WOOD. See CORD *of Wood.*

Cutting in WOOD. See CUTTING.

Meaſure of WOOD. See MEASURE.

Painting on WOOD, *&c.* See the article PAINTING, *&c.*

WOOD, *ſylva*, in geography, a multitude of trees extended over a large continued track of land, and propagated without culture. The generality of woods only conſiſt of trees of one kind.

The ancient Saxons had ſuch a veneration for woods, that they made them ſanctuaries.

It is ordained, that none ſhall deſtroy any wood, by turning it into tillage or paſture, *&c.* where there are two acres or more in quantity, on pain of forfeiting 40 s. an acre, by 35 Hen. VIII. *c.* 17. All woods that are felled at fourteen years growth, are to be preſerved from deſtruction for eight years; and no cattle put into the ground till five years after the felling thereof, *&c.* 13 Eliz. *c.* 25. The burning of woods, or under-

wood,

wood, is declared to be felony; alſo thoſe perſons that maliciouſly cut or ſpoil timber-trees, or any fruit-trees, *&c.* ſhall be ſent to the houſe of correction, there to be kept three months, and whipt once a month.

WOODBRIDGE, a market-town of Suffolk, ſituated twenty-ſix miles ſouth-eaſt of Bury.

WOOD-COCK, *ſcolopax*, in ornithology. See the article SCOLOPAX.

WOOD-COCK-SHELL, in natural hiſtory, the variegated yellowiſh purpura, with tubercles, and a long beak; and the thorny wood-cock-ſhell is the yellow long beaked purpura, with long and crooked ſpines. See PURPURA.

WOOD-CORN, is ſaid to be corn given by the tenants of ſome manors to the lords for the liberty to gather up wood, and the feeding of cattle, there.

WOOD-COPPICE. See COPPICE.

WOOD and WOOD, in the ſea-language, is when two pieces of timber are ſo let into each other, that the wood of the one joins cloſe to the other.

WOOD GELD, or WOODGELDUM, in our antient cuſtoms, the gathering or cutting of wood within the foreſt; or it may denote the money paid for the ſame to the foreſters. Sometimes it alſo ſeems to ſignify an immunity from this payment by the king's grant.

WOOD-HAY, an antient cuſtom at Exeter, whereby a log out of every ſeam of wood over Ex-bridge is taken, towards the reparation of that bridge.

WOOD-LOUSE, in zoology a name given to ſeveral ſpecies of oniſcus. See the article ONISCUS.

The common wood-louſe, or millepes, is the oniſcus with a blunt forked tail. See the article MILLEPES.

The black wood-louſe is the oniſcus with an obtuſe unidivided tail, growing to an inch in length, and being of an oval figure; and the ſea-wood-louſe is the oniſcus, with a ſubulated tail, appendiculated on each ſide.

WOOD MOTE, the antient name of that foreſt-court, now called the court of attachment. See ATTACHMENT and FOREST.

WOOD-PLEA COURT, a court held twice a year in the foreſt of Clun, in Shropſhire, for determining all matters relating to wood.

WOOD-PECKER, *Picus*, in ornithology, a genus of birds with the beak ſtraight, of a polyhedral or many-ſided figure, and with its point formed in the manner of a wedge; the tongue is rounded and very long, it reſembles in form a worm, or ſome other ſuch inſect; the toes, in all but one ſpecies, ſtand two before and two behind, as in the parrot. This genus comprehends the great black wood-pecker, with a ſcarlet head, in ſize ſomewhat larger than that of a fieldfare; the green wood-pecker, with a ſcarlet crown; the great ſpotted wood-pecker, with a black head, and ſome of the tail-feathers white; the leſſer ſpotted wood-pecker, with three lateral rectrices, variegated with white at top; the middle ſpotted wood-pecker, with three lateral rectrices, half black; the three toed wood-pecker, with only three toes; the braſilian wood-pecker, or ipecu, with a ſcarlet creſted head; and the golden wood-pecker, or the yellow picus. There are various other ſpecies of wood-peckers, as the brown picus, ſpotted with yellow; the black picus, with the wings and tail yellow, *&c.*

WOODSTOCK, a borough-town of Oxfordſhire, ſituated ſeven miles north of Oxford.

It ſends two members to parliament.

WOODWARD, an officer of the foreſt, whoſe function it is to look after the woods, and obſerve any offences either in vert or in veniſon, committed within his charge, and to preſent the ſame; and in caſe any deer are found killed, or hurt, to inform the verderer thereof, and to preſent them at the next court of the foreſt. See FOREST.

WOOF, among manufacturers, the threads which the weavers ſhoot acroſs with an inſtrument called the ſhuttle. See the articles SHUTTLE, WARP, WEB, WEAVING, CLOTH, *&c.*

The woof is of different matter, according to the piece to be wrought. In taffety, both woof and warp are ſilk. See the article TAFFETY.

In mohairs, the woof is uſually wool, and the warp ſilk. In ſattins, the warp is frequently flax, and the woof ſilk. See SERGE, SATTIN, VELVET, *&c.*

WOOL, the covering of ſheep. See the article SHEEP.

Each fleece conſiſts of wool of ſeveral qualities and degrees of fineneſs, which the dealers therein take care to ſeparate. The Engliſh and French uſually ſeparate each fleece into three principal ſorts, *viz.*

1. Mother-

1. Mother-wool, which is that of the back and neck. 2. The wool of the tails and legs. 3. That of the breaſt and under the belly. The wool moſt eſteemed is the Engliſh, chiefly that about Leominſter, Cotswold, and the Iſle of Wight; the Spaniſh, principally that about Segovia; and the French, about Berry.

The fineneſs and plenty of our wool is owing in a great meaſure to the ſhort ſweet graſs in many of our paſtures and downs; though the advantage of our ſheeps feeding on this graſs all the year, without being obliged to be ſhut up under cover during the winter, or to ſecure them from wolves at other times, contributes not a little to it.

Antiently, the principal commerce of the nation conſiſted in wool unmanufactured; which foreigners, eſpecially the French, Dutch, and Flemiſh, bought of us, inſomuch, that the cuſtoms paid on wool exported in the reign of Edward III. amounted, at 50s. a pack, to 250,000l. per annum. An immenſe ſum in thoſe days! But as wool is now accounted a ſtaple commodity, the employment of an infinite number of people at home, and our moſt beneficial trade abroad, depending upon it, very ſevere laws have been made to prevent its being exported, and perſons that export wool beyond the ſeas, are liable to a forfeiture of the ſhips or veſſels in which it is found, with treble the value, and the perſons aiding and aſſiſting in it ſhall ſuffer three years impriſonment. It is alſo enacted, that no ſheep ſhall be carried on board any ſhip with intent to be exported, upon forfeiture of 20s. for every ſheep; that the owners knowing thereof, are to forfeit their intereſt therein; that if they be aliens, or natural born ſubjects not inhabiting this kingdom, ſuch ſhips ſhall be wholly forfeited; that the maſters and mariners knowing thereof, and aſſiſting therein, are to forfeit all their goods and chattels, and to ſuffer three months impriſonment; and that the exporter, beſides other penalties, ſhall be rendered incapable of ſuing for any debt, &c. As to the importation of wool, Iriſh wool, combed or uncombed, Spaniſh and Poliſh wool may be imported duty to free.

WOOL, is alſo uſed for the ſoft hair growing on ſeveral wild beaſts, the ſkins of which are diſtinguiſhed by the name of furrs. See the article FURR.

Theſe kinds of wool, on being imported, pay the following duties: bever-wool, cut and combed, 14s. $\frac{3}{4}$d. the pound the whole of which is drawn back on exportation: but if this wool be combed in Ruſſia, and imported from thence in britiſh ſhips, it is free. Coney-wool, the pound, 1 $\frac{43\frac{5}{8}}{100}$d. draw back 1 $\frac{29\frac{3}{8}}{100}$d. Eſtridge wool, imported in britiſh-built ſhips, free; but if imported in thoſe that are foreign built, it pays 6s. $8\frac{43}{100}$d. the 112 pounds: draw back, 6s. $\frac{45}{100}$d. Stanes-wool, the pound $7\frac{13}{16}$d. draw back $6\frac{11}{16}$d.

For the divers preparations of wool, ſee CARDING, COMBING, SPINNING, WEAVING, FULLING, CLOTH, &c.

Cotton-WOOL. See the article COTTON.

WOOL-STAPLE, denotes a city or town where wool uſed to be ſold. See the article STAPLE.

WOOL-WINDERS, are perſons employed in winding up fleeces of wool into bundles to be packed and ſold by weight. Thoſe are ſworn to do it truly between the owner and the merchant.

Pocket of WOOL. See POCKET.

Salplar of WOOL. See SALPLAR.

WOOLEN MANUFACTORY, includes the ſeveral ſorts of commodities into which wool is wrought, as broad cloth, long and ſhort kerſeys, bays, ſerges, flannel, perpetuanas, ſays, ſtuffs, frize, penniſtones, ſtockings, caps, rugs, &c. See the article CLOTH, &c.

WOOLSTED. See the article WORSTED.

WOOLWICH, a market town of Kent, ſituated on the river Thames, ſix miles eaſt of London.

WORCESTER, the capital city of Worceſterſhire, ſituated on the river Severn, 110 miles north-weſt of London: weſt long. 2° 15′, north lat. 52° 5′.

WORCUM, a town of Holland, ſituated on the river Waal, twenty-three miles eaſt of Rotterdam. This is alſo the name of a port-town of the united Netherlands, ſituated in the province of Friezland, on the Zuyder-Sea, twenty miles ſouth-weſt of Lewarden.

WORD, in language, an articulate ſound deſigned to repreſent ſome idea. See SOUND, VOICE, SIGN, IDEA, &c.

The port-royaliſts define words to be diſtinct articulate ſounds, agreed on by mankind

mankind to convey their thoughts and ſentiments by. See LANGUAGE.

Word, in writing, is defined to be an aſſemblage of ſeveral letters forming one or more ſyllables, and expreſſing the name, quality, or manner of a thing. See the articles LETTER, SYLLABLE, QUALITY, *&c.*

Etymology and ſyntax being the two parts of grammar converſant about words, the firſt of theſe explains the nature and propriety of words, and the other treats of the right compoſition of words in diſcourſe. See GRAMMAR, ETYMOLOGY, *&c.*

The moſt remarkable thing in the pronouncing of words, is the accent, or the elevation of the voice, on ſome particular ſyllable of the word, which elevation is neceſſarily followed by a depreſſion of the voice. See the article ACCENT.

Grammarians generally divide words into eight claſſes, called parts of ſpeech. See SPEECH, and PARTS *of Speech.*

Words are again divided into primitives and derivatives, ſimple and compound, ſynonymous and equivocal. See the article PRIMITIVE, *&c.*

With regard to their ſyllables, words are farther divided into monoſyllables and polyſyllables. See MONOSYLLABLE and POLYSYLLABLE.

The grammatical figures of words which occaſion changes in the form, *&c.* thereof are proſthetis, aphæreſis, ſyncope, epentheſis, apocope, paragoge, craſis, diæreſis, metatheſis, and antitheſis. See PROSTHESIS, *&c.*

The uſe of words, we have obſerved, is to ſerve as ſenſible ſigns of our ideas; and the ideas they ſtand for in the mind of the perſon that ſpeaks, are their proper ſignifications. See the articles SIGN, SEMEIOTICA, SCIENCE, *&c.*

Simple and primitive words have no natural connection with the things they ſignify, whence there is no rationale to be given of them; it is by mere arbitrary inſtitution and agreement of men, that they come to ſignify any thing. Certain words have no natural propriety or aptitude to expreſs certain thoughts more than others; were that the caſe there could have been but one language. But in derivative, and compound words the caſe is ſomewhat different. In the forming of theſe, we ſee regard is had to agreement, relation, and analogy; thus moſt words that have the ſame ending, have one common and general way of denoting or ſignifying things; and thoſe compounded with the ſame prepoſitions, have a ſimilar manner of expreſſing and ſignifying ſimilar ideas, in all the learned languages where they occur.

For the perfection of language, it is not enough, Mr. Locke obſerves, that ſounds can be made ſigns of ideas, unleſs theſe can be made uſe of ſo as to comprehend ſeveral particular things; for the multiplication of words would have perplexed their uſe, had every particular thing needed a diſtinct name to be ſignified by. To remedy this inconvenience, language had a further improvement in the uſe of general terms, whereby one word was made to mark a multitude of particular exiſtences; which advantageous uſe of ſounds was obtained by the difference of the ideas they were made ſigns of, thoſe names becoming general which are made to ſtand for general ideas, and thoſe remaining particular, where the ideas they are uſed for are particular. See the articles TERMS, GENERAL, ABSTRACT, *&c.*

It is obſervable, that the words which ſtand for actions and notions, quite removed from ſenſe, are borrowed from ſenſible ideas; as to imagine, apprehend, comprehend, underſtand, adhere, conceive, inſtil, diſguſt, diſturbance, tranquillity, *&c.* which are all taken from the operations of things ſenſible, and applied to modes of thinking. Spirit, in its original ſignification, is no more than breath; angel, a meſſenger. By which we may gueſs what kind of notions they were, and whence derived, which filled the minds of the firſt beginners of languages; and how nature, even in the naming of things unawares, ſuggeſted to men the originals of all their knowledge: whilſt to give names that might make known to thers any operations they felt in themſelves, or any other ideas that came not under their ſenſes, they were forced to borrow words from the ordinary and known ideas of ſenſation. See SENSATION, PERCEPTION, *&c.*

The ends of language, in our diſcourſe with others, are chiefly three; firſt, to make our thoughts or ideas known one to another. This we fail in, 1. when we uſe names without clear and diſtinct ideas in our mind. 2. When we apply received names to ideas, to which the common uſe of that language doth not apply them. 3. When we apply them unſteadily, making them ſtand now for one,

one, and anon for another idea. Secondly, to make known our thoughts with as much eaſe and quickneſs as poſſible. This men fail in, when they have complex ideas, without having diſtinct names for them, which may happen either through the defect of a language which has none, or the fault of the man who has not yet learned them. Thirdly, to convey the knowledge of things. This cannot be done but when our ideas agree to the reality of things. He that has names without ideas, wants meaning in his words, and ſpeaks only empty ſounds. He that has complex ideas without names for them, wants diſpatch in his expreſſion. He that uſes his words looſely and unſteadily, will either not be minded or not underſtood. He that applies names to ideas, different from the common uſe, wants propriety in his language, and ſpeaks gibberiſh; and he that has ideas of ſubſtances diſagreeing with the real exiſtence of things, ſo far, wants the materials of true knowledge. See the articles IDEA and KNOWLEDGE.

WORD, or *Watch*-WORD, in an army or garriſon, is ſome peculiar word or ſentence, by which the ſoldiers know and diſtinguiſh one another in the night, *&c.* and by which ſpies and deſigning perſons are diſcovered. It is uſed alſo to prevent ſurprizes. The word is given out in an army every night to the lieutenant, or major-general of the day, who gives it to the majors of the brigades, and they to the adjutants; who give it firſt to the field-officers, and afterwards to a ſerjeant of each company, who carry it to the ſubalterns. In garriſons it is given after the gate is ſhut to the town-major, who gives it to the adjutants, and they to the ſerjeants. See ROUNDS.

WORD, in heraldry, *&c.* See MOTTO.

WORDS, in law, which may be taken in a common ſenſe, ſhould not receive a ſtrained or unuſual conſtruction; and ſuch as are ambiguous, are to be conſtrued ſo as to make them ſtand with law and equity, neither may they be wreſted to do wrong: nevertheleſs the different placing of the ſame words, may cauſe them to have a different meaning; alſo where words are either ſenſeleſs or needleſs in a deed, they ſhall do no hurt, if the ſame is good and perfect without thoſe words.

WORK, in the manege. To work a horſe, is to exerciſe him at pace, trot, or gallop, and ride him at the manege. To work a horſe upon volts, or head and haunches in or between two heels, is to paſſage him, or make him go ſide-ways upon two parallel lines.

WORK-HOUSE. See *Work*-HOUSE.

WORKS, *opera*, in fortification, the ſeveral lines, trenches, ditches, *&c.* made round a place or army, or the like, to fortify and defend it. See FORTIFICATION, LINE, TRENCH, *&c.*

For the ſeveral ſorts of works, as clock-work, fire work, fret-work, horn work, ruſtic-work, wax-work, *&c.* See the articles CLOCK-*work*, FIRE-*work*, &c.

WORKSOP, a market-town of Nottinghamſhire, ſituated twenty miles north of Nottingham.

WORLD, *mundus*, the aſſemblage of parts which compoſe the univerſe. See the article UNIVERSE.

The duration of the world is a thing which has been greatly diſputed. Plato, after Ocellus Lucanus, held it to be eternal, and to have flowed from God as rays flow from the ſun. Ariſtotle was much of the ſame mind; he aſſerts, that the world was not generated ſo as to begin to be a world, which before was none: he lays down a pre-exiſting and eternal matter as a principle, and thence argues the world eternal. His arguments amount to this, that it is impoſſible an eternal agent, having an eternal paſſive ſubject, ſhould continue long without action. His opinion was generally followed, as ſeeming to be the fitteſt to end the diſpute among ſo many ſects about the firſt cauſe. See the articles MATTER, CAUSE, and PERIPATETIC *Philoſophy*.

Epicurus, however, though he makes matter eternal, yet ſhews the world to be but a new thing formed out of a fortuitous concourſe of atoms. See the articles ATOMICAL and EPICUREAN.

Some of the modern philoſophers refute the imaginary eternity of the world by this argument, that if it be *ab eterno*, there muſt have been a generation of individuals in a continual ſucceſſion from all eternity, ſince no cauſe can be aſſigned why they ſhould not be generated, *viz.* one from another. Therefore to conſider the origin of things, and the ſeries of cauſes, we muſt go back in infinitum, *i.e.* there muſt have been an infinite number of men and other individuals already generated, which ſubverts the very notion of number. And if the cauſe which

which now generates has been produced by an infinite ſeries of cauſes, how ſhall an infinite ſeries be finite? Dr. Halley ſuggeſts a new method of finding the age of the world from the degree of the ſaltneſs of the ocean. See SEA.

Syſtem of the WORLD. See SYSTEM.

WORMS, in the linnæan ſyſtem of nature, a claſs of inſects of the order of the apteria, and of the claſs of the anarthra. See APTERIA and ANARTHRA.

The diſtinguiſhing character of this claſs is, that they have the muſcles of their body affixed to a ſolid baſis. The ſeveral ſpecies of worms are very numerous; as to the chætia, or the hair worm, called alſo the guinea-worm; the aſcaris, the lumbricus, or earth-worm; and ſea-worm; the tænia or tape-worm; the ſicyania or gourd-worm; the iulus or gally-worm, *&c.* See CHÆTIA, *&c.*

WORMS, in huſbandry, are very prejudicial to corn-fields, eating up the roots of the young corn, and deſtroying great quantities of the crop. Sea-ſalt is the beſt of all things for deſtroying them. Sea-water is proper to ſprinkle on the land, where it can be had; where the ſalt-ſprings are, their water will do; and where neither are at hand, a little common or bay-ſalt does as well. Soot will deſtroy them in ſome lands, but is not to be depended upon, for it does not always ſucceed. Some farmers ſtrew on their lands a mixture of chalk and lime; and others truſt wholly to their winter-fallowing to do it, if this is done in a wet ſeaſon, when they come up to the ſurface of the ground, and ſome nails with ſharp heads be driven into the bottom of the plough. If they are troubleſome in gardens, the refuſe brine of ſalted meat will ſerve the purpoſe, or ſome walnut leaves ſteeped in a ciſtern of water for a fortnight or three weeks, will give it ſuch a bitterneſs that it will be a certain poiſon to them. A decoction of wood-aſhes, ſprinkled on the ground, will anſwer the ſame purpoſe; and any particular plant may be ſecured both from worms and ſnails by ſtrewing a mixture of lime and aſhes about its roots. It is a general caution among the farmers to ſow their corn as ſhallow as they can, where the field is very ſubject to worms.

Generation of WORMS. See the article GENERATION.

WORMS, in medicine, a diſeaſe ariſing from ſome of theſe reptiles being engendered in the body, particularly in the ſtomach and inteſtines.

When children begin to uſe crude aliments, ſummer fruits, fleſh, cheeſe, and other things of the like kind, they are frequently troubled with the worms, occaſioned by the eggs of inſects, which either float in the air, or live on the earth, and which being caſually ſwallowed, are not digeſtible by their tender ſtomachs. For theſe, the inteſtinal or gaſtric pituit, afford a neſt in which they reſide, are nouriſhed, breed, and increaſe in bulk. Hence they are not ſo common in adults, except in the dull and ſluggiſh, and in the leuco-phlegmatic.

There are three ſpecies of worms, moſt frequent in the human body; the lumbrici, the aſcarides, and the tænia. The lumbrici are found in the ilion, and are thus called, becauſe they are generally broad and long, and roll themſelves up in a ſtrange manner. The aſcarides have their ſeat chiefly in the groſs inteſtines, and are more plentiful in the rectum; they are round and ſmall, and are thrown out in large quantities. The broad worm called tænia, is like a ſwathe, commonly two ells long, but ſometimes much longer, and divided through the whole length with croſs joints or knots. This is ſaid to be always ſingle; and lies variouſly convoluted, being ſometimes as long as all the guts, and ſometimes even vaſtly exceeding that length. Heiſter obſerves, that there are other kinds of inſects, or worms, generated in an human body, which phyſicians have not placed in any particular claſs, but have looked upon them as uncommon productions.

Worms by their irritation, create nauſeas, vomitings, looſeneſſes, faintings; a ſlender, deficient, intermitting pulſe; itching of the noſe, and epileptic fits. By the conſumption of the chyle, they produce hunger, paleneſs, weakneſs, and coſtiveneſs; whence ariſes a tumour of the abdomen, eructations, and rumbling of the inteſtines.

A child may be known to have the worms from his age, cold temperament, paleneſs of the countenance, livid eyelids, hollow eyes, itching of the noſe, voracity, ſtartings, and grinding the teeth in ſleep; and more eſpecially by a ſingular ſtinking breath; but when they are voided by the mouth, or anus, there remains no manner of doubt.

The cure is to be performed chiefly by deſtroying their neſts, which is to be at-

tempted by alkalious ſalts; gums which purge phlegm, mercurials, antimonials, and bitter aromatics.

Guinea-WORMS, *dracunculi*. See the article DRACUNCULI.

WORM, in gunnery, a ſcrew of iron, to be fixed on the end of a rammer, to pull out the wad of a fire-lock, carabine, or piſtol, being the ſame with the wad-hook, only the one is more proper for ſmall arms, and the other for cannon.

WORM, in chemiſtry, is a long, winding, pewter pipe, placed in a tub of water, to cool and condenſe the vapours in the diſtillation of ſpirits.

WORM, a *cable*, or *hawſer*, in the ſea-language, is to ſtrengthen it by winding a ſmall line, or rope, all along between the ſtrands.

WORMS, in geography, an imperial city of Germany, in the palatinate of the Rhine: eaſt long. 8° 5′, north lat. 49° 38′.

WORM-SEED, *ſemen ſantonicum*, is the ſeed of a ſpecies of worm-wood, which grows in the Levant, from whence we have the ſeed, which is there produced in great plenty, without the trouble of ſowing; this plant growing wild in the fields. See WORMWOOD.

The ſeed of this plant is light and chaffy, envenopled with a vaſt many thin membranes, that have the ſame virtue with the ſeed itſelf, and are uſed with it under its name. It is a ſmall and light ſeed, of a pale yellowiſh brown colour, with ſome admixture of greeniſh in it, of an oblong form, ſomewhat larger at the baſe, and tapering to a point at the ſummit. It is of a friable texture, eaſily beat to powder. It has not much ſmell, but is of a bitter taſte. Worm-ſeed is to be choſen large, freſh and clean, not duſty or decayed, or hanging together in cluſters, which is a ſign of inſects being, or having been among it.

Its great virtue is that of deſtroying worms in children; but as it is too bitter to be eaſily ſwallowed by them either in powder or decoction; it is therefore beſt taken by way of comfit covered over with ſugar.

Wormſeed, on being imported, pays a duty of $7\frac{3}{4}$ d. the pound, and draws back, $6\frac{80}{100}$ d.

WORMWOOD, *abſinthium*, in botany. See the article ABSINTHIUM.

Wormwood, beſides the virtues attributed to it under its generical name, is prepared into an oil, and fixed ſalt, the former of which is uſed externally to the belly, to deſtroy worms in the inteſtines, and the latter is a famous febrifuge and ſtomachic.

WORONETS, or VERONESE, a city of Ruſſia, in the province of Belgorod, ſituated on the river Veroneſe, near its confluence with the Don: eaſt long. 40°, north lat. 52°.

WORSHIP *of God*, the offering up of adoration, prayer, praiſe, thankſgiving and confeſſion to God, as our creator, benefactor, law-giver and judge.

Internal piety, or the worſhip of the mind, is that which flows from the heart in devout aſpirations addreſſed to the deity without the uſe of verbal expreſſions uttered in an audible manner. External worſhip is founded on the ſame principles as the internal, and is either private or public. A worſhip that is purely intellectual, is too ſpiritual and abſtracted for the bulk of mankind. The operations of their minds, eſpecially ſuch as are employed on the moſt ſublime objects, muſt be aſſiſted by their outward organs, otherwiſe they will be ſoon diſſipated by ſenſible impreſſions, or grow tireſome if too long continued: for ideas are ſuch fleeting things, that they muſt be fixed; and ſo ſubtle, that they muſt be expreſſed and delineated, as it were, by ſenſible marks and images, otherwiſe we cannot long attend to them. Hence ariſes the neceſſity of external worſhip, which by ſtated acts of devotion, fixes our attention, compoſes and enlivens our thoughts, impreſſes us more deeply with a ſenſe of the awful preſence in which we are, and tends to heighten our devout affections. This holds true in the caſe of public worſhip; for as God is the parent and head of the ſocial ſyſtem, and has formed us for a ſocial ſtate; as there are public bleſſings, and crimes in which we have all, in ſome degree, a ſhare; and public wants and dangers, to which all are expoſed; it is therefore evident, that ſolemn offices of public worſhip are duties of indiſpenſible moral obligation, among the beſt cements of ſociety, the firmeſt prop of government, and the faireſt ornament of both.

WORSTED, a kind of woollen thread, which, in the ſpinning, is twiſted harder than ordinary. It is chiefly uſed either wove or knit into ſtockings, caps, gloves, or the like.

WORSTED, a market-town of Norfolk, ſituated ſeven miles north of Norwich.

WOTTON, a market-town of Glouceſter-

ſhire, ſituated ſeventeen miles ſouth of Glouceſter.

WOTTEN-BASSET a borough-town of Wiltſhire, twenty-five miles north of Saliſbury; which ſends two members to parliament.

WOULDING, a ſea-term for the winding of ropes, round a maſt or yard of a ſhip, that has been ſtrengthened by a piece of timber nailed to it.

WOUND, *vulnus*, in medicine and ſurgery, is frequently defined to be a violent ſolution of the continuity of the ſoft external parts of the body made by ſome inſtrument. Others take a greater latitude in defining it, and call every external hurt of the body, by what cauſe ſoever produced, a wound. On the other hand, ſome are of opinion, that unleſs the injured parts of the body are divided by ſome ſharp inſtrument, as by a ſword or knife, it is by no means to be called a wound; but notwithſtanding, it is certain that thoſe wounds which are produced by blunt inſtruments may properly enough be called wounds, whence Heiſter diſtinguiſhes two different kinds of wounds, the one made by acute, the other by blunt inſtruments.

Wounds are generally inflicted upon the ſofter parts of the human body, ſuch as the ſkin, fat, muſcular fleſh, ligaments, blood-veſſels, and nerves, and parts that are compoſed of theſe, as the viſcera and inteſtines; yet the more ſolid parts of the body are by no means to be here excluded, as the bones, whence the parts that are ſubject to thoſe injuries will afford two diſtinctions of wounds; one, wounds of the ſoft parts, the other, wounds of the bones.

As cauſes of wounds, all inſtruments of what kind ſoever, whether blunt or ſharp, may properly be reckoned, provided they are of ſuch a nature, that upon the violent external application of them, they are capable of producing a ſolution of continuity in the parts of the body upon which they are inflicted; for a ſolution of the external parts, from an internal cauſe, is not called a wound, but rather an abſceſs, or ulcer; ſo when the harder parts of the body, to wit, the bones, are broken by a fall, or a violent blow received from a blunt inſtrument, it is termed a fracture. See the articles ABSCESS, ULCER, FRACTURE, and CONTUSION.

The effects which are produced by wounds, beſides the diviſion of the ſofter parts, are generally profuſions of blood; though they are ſometimes attended with much greater miſchiefs than theſe, for it can ſcarcely happen, but that the divided parts muſt, in ſome meaſure, if not totally, loſe their natural functions, according to the different uſes for which the part is intended, and according to the different degrees of injury that it receives. The greater number of uſes a part is intended for by nature, the worſe will be the conſequences of a wound upon that part; this principle is ſo extenſive, that it is the conſtant guide in forming a prognoſtic, whether the wound will prove mortal or not. He therefore, who is beſt ſkilled in anatomy, that is, beſt inſtructed in the ſituation of the parts, and their uſes, will be enabled to form the moſt accurate judgment of the conſequence that will neceſſarily attend a wound upon any particular part.

What has been ſaid of the different ſituations and cauſes of wounds, ſufficiently demonſtrates, that there are many different kinds of wounds, ſome brought on by a puncture, ſome by a ſtab, and ſome again by a blow; ſome are curable, others incurable; ſome are made with ſharp inſtruments, others with blunt ones; with regard to their figure, ſome form a right line, others are curved, tranſverſe, or oblique; with reſpect to their ſituation, ſome are placed in the head, others in the neck, thorax, or abdomen; and of theſe ſome are internal, others external; variety of different wounds ariſe from the great diverſity of condition that wounds are left in, for in ſome wounds, the inflicting inſtrument, or part of it, remains; for inſtance, a leaden bullet, a piece of glaſs, or of a granade; the points of ſwords or arrows: but in ſome wounds, nothing of this kind is left: ſometimes fractures of the bones accompany wounds, which is generally the caſe in gun-ſhot wounds: ſome wounds are alſo attended with poiſon, as thoſe which are made with poiſoned arrows; under this head may be ranked the bites of animals, but more particularly of mad or venomous animals. Some are of opinion, that wounds which are made with copper, or ſilver inſtruments, ſhould be reckoned in this claſs, the poiſon of which, if there is any, is owing to the vitriol that is mixed with theſe metals. See the articles PUNCTURE, STAB, BLOW, NECK, THORAX, ABDOMEN, *Gun-ſhot-wounds*, POISON, &c.

In ſlight wounds, where no conſiderable artery, nerve, or tendon is concerned, the following appearances are uſually remarkable; at firſt ſight the wound appears as a red line drawn upon the part: but upon being dilated, the blood inſtantly guſhes out in greater or ſmaller quantities, according to the ſize and number of the blood veſſels that are injured. The hæmorrhage, after a ſhort continuance, ſtops of its own accord, and the blood concreting in the wound, forms a cruſt; the lips of the wound now begin to look red, and ſwell, and are attended with ſome degree of pain and inflammation; if it is a large wound, a fever, that is to ſay, an univerſal heat and quickneſs of pulſe, almoſt always enſue upon the third or fourth day; ſooner or later, a whitiſh glutinous humour, not unlike white oil, appears, and this is known by the name of pus, or matter; upon the appearance of matter, the redneſs, tumour, pain, inflammation, and fever, diſappear entirely, or at leaſt are abated; and theſe are the ſigns of a wound inclining to heal; for under the matter new fleſh ſprings up from the wounded veſſels, which having by degrees filled the wound, dries upon its upper part, and forms a cicatrix. See the articles VEIN, ARTERY, NERVE, TENDON, HÆMORRHAGE, PUS, TUMOUR, INFLAMMATION, and CICATRIX.

In dangerous wounds, that is, where any conſiderable blood-veſſel is wounded or divided, there generally enſues ſo violent a hæmorrhage, that the wounded perſon is in an inſtant ſenſible of great loſs of ſpirits, and weakneſs, and faints away; and when the larger arteries are wounded, whether they are internal or external, he dies upon the ſpot; although ſomewhat leſs danger is apprehended from wounds that are inflicted upon the veſſels which are ſituated upon the external parts of the body (ſome few excepted) becauſe they will admit of the ligature, and other means of reſtraining the violence of the hæmorrhage.

There is nothing will give a truer light into the nature and conſequence of a deep wound, than a due conſideration of what natural actions of the body are impeded thereby. For inſtance, in wounds of the breaſt, when the patient draws his breath with ſhortneſs and difficulty, and is at the ſame time attended with an hæmoptyſis and hiccoughs, it may be rationally conjectured that the lungs, or the diaphragm are wounded; ſo in wounds of the abdomen, when chyle is voided, it is a plain indication that the ſtomach, ſmall guts, or lacteals, are wounded: when excrements paſs by the wound, the great guts are wounded. In the ſame manner, bilious blood ſhews the liver or gall-bladder to be divided: if urine paſſes by the wound, the urinary bladder, or elſe the ureters, are wounded; and bloody urine denotes a blow on the kidneys, or a wound of the bladder; but when there are large profuſions of blood this way, it is a ſign that ſome of the larger blood-veſſels are wounded: vomiting of blood, declares the ſtomach to be the injured organ: violent pains, attended with convulſive twitches, ſhew that a nerve is wounded, or elſe that ſome foreign ſubſtance is left in the wound. Whenever the ſenſes are diſordered after a wound received on the head, a concuſſion of the brain is much to be feared. Difficulty of breathing, pains in the breaſt, and hiccoughing, are ſymptoms of a wound in the diaphragm. It is of bad conſequence for a wound, to be attended with a large tumour; but it is of the laſt conſequence if it is attended with no degree of tumour at all; the firſt is an indication of great inflammation, the laſt of mortification; ſome degree of tumour is always therefore beſt in wounds.

In order to inquire what wounds admit of a cure, and what are incurable, Heiſter divides wounds into three ſorts. 1. Some wounds are abſolutely of themſelves mortal. 2. Others are in their own nature mortal, if not relieved by timely aſſiſtance. And, 3. Others become mortal by accident or imprudent treatment, though they were otherwiſe cureable.

1. We properly ſtyle thoſe wounds mortal which are not to be remedied by all the art and induſtry of man. Thus, wounds are of this kind which are attended with ſo violent an hæmorrhage, as to produce inſtant death: of this ſort are reckoned wounds that penetrate the cavities of the heart, and all thoſe wounds of the viſcera, where the large blood-veſſels are opened; ſuch are large wounds of the lungs, liver, ſpleen, kidneys, ſtomach, inteſtines, meſentery, pancreas, uterus; of the aorta, of the iliac, cœliac, renal, meſenteric, and carotid arteries; eſpecially if they

are

are wounded near their origin; of the ſubclavian alſo, or vertebral; of the vena cava, the iliac vein, the internal jugular, vertebral, renal, meſenteric; of the vena porta, and of the larger veins that lie deep in the body, becauſe their ſituation will not admit of proper applications to reſtrain the flux of blood. Heiſter therefore reckons, very juſtly, theſe among the wounds that are abſolutely incurable, ſince they are not remediable either by aſtringents, ligature, or fire.

Thoſe wounds alſo are not leſs mortal than the former, which obſtruct, or entirely cut off the paſſage of the animal ſpirits to the heart; ſuch are wounds of the cerebellum, of the medulla oblongata, and ſome violent ſtrokes of the brain itſelf. There is reaſon to apprehend very great danger, when the ſmall veins or arteries, which are contained in the cranium, are injured; for the blood flowing from them into the internal ſinuſes of the brain, either produces too great a preſſure upon thoſe very tender parts of the brain, and ſo obſtructs the courſe of the blood and ſpirits; or elſe, being corrupted, it putrifies the brain itſelf, if it cannot be evacuated by the aſſiſtance of the trepan; which is the caſe when this accident happens at the lower part of the cranium, or in the ſinuſes of the brain; nor is there leſs danger where the nerves, which tend to the heart, are wounded, or entirely divided; for, after this, it is impoſſible for the heart to continue its motion. See the articles TREPAN, HEART, *&c.*

To this claſs are to be referred alſo all wounds which entirely deprive the animal of the faculty of breathing: there is therefore great danger where the aſpera arteria is intirely divided; for where it is only divided in part, it may be healed again by the aſſiſtance of an expert ſurgeon: to this place alſo belong violent ſhocks of the bronchia, mediaſtinum, and diaphragm, eſpecially the tendinous part of it. See ASPERA ARTERIA, *&c.*

Thoſe wounds alſo which interrupt the courſe of the chyle to the heart, are no leſs incurable than the former; ſuch are wounds of the ſtomach, inteſtines, receptacle of the chyle, thoracic duct, and larger lacteals; to which may be alſo added wounds of the œſophagus, if they are large; though death is not ſo ſudden an attendant on theſe wounds; but, for want of nouriſhment, the perſons afflicted by them are weakened by degrees, and at length die conſumptive. See the articles STOMACH, INTESTINE, *&c.*

In this account thoſe wounds alſo are not to be omitted, which are inflicted upon membranous parts, that are ſituated in the abdomen, and contain ſome ſecreted fluid, as on the bladder, either of the bile or urine, the ſtomach, inteſtines, receptacle of the chyle, and lacteal veſſels. The fluids contained in theſe parts, when once they are let looſe into the cavity of the abdomen, cannot be properly diſcharged, and therefore eaſily corrode the internal parts of the body; and the membranes that contained them are generally ſo fine, that they will not admit of agglutination, eſpecially ſince no medicine from without can be applied. A few indeed have recovered after ſlight wounds in theſe parts; but ſince the number of theſe inſtances is but few, and the cure in them has been accidental, and not performed by the ſurgeon's art, theſe may very juſtly be added to the liſt of mortal wounds. See ABDOMEN, *&c.*

2. Many wounds there are which though the experienced ſurgeon could remedy, yet prove fatal, if neglected, or left to nature: of this number are thoſe which produce inſtant death, unleſs relieved by preſent aſſiſtance; ſuch are wounds of the larger external blood-veſſels, which might be remedied by ligature, by the application of aſtringent medicines, or the actual cautery. Of this kind are wounds of the brachial, or crural artery, unleſs they are too near the trunk of the body; wounds in the large arteries of the cubit, or tibia; of the branches of the external carotid, or temporal artery; to theſe alſo may be added wounds of the jugular and other veins, ſituated upon the external parts of the body; but in theſe caſes no help can be given, unleſs the ſurgeon be brought before there has been a vaſt profuſion of blood. See the article CRURAL ARTERY, *&c.*

3. Wounds are properly ſaid to become mortal by accident, where the patient's death, from them, is occaſioned either by the ill conduct of the patient himſelf, or by the neglect or ignorance of his ſurgeon; the wound itſelf being of the number of thoſe deemed curable by the judicious practiſer. Under this head are to be reckoned, 1. Thoſe wounds which the ſurgeon has neglected to cleanſe ſufficiently, though he had it in his power

to

to do it; as when ſome foreign body, which might eaſily have been extracted, is left in the wound, and produces inflammations, hæmorrhages, convulſions, and finally death itſelf; ſo in wounds of the thorax and abdomen, if the ſurgeon does not uſe his utmoſt diligence to evacuate the grumous blood, it will corrupt there, and by drawing the neighbouring parts into conſent, will expoſe the patient to death: great care muſt alſo be taken that the lips of the wound do not cloſe till the blood that is collected in the cavity of the body be all evacuated if poſſible, which will be eaſily perceived by the difficulty of breathing, and other bad ſymptoms going off; but if any of the larger internal veſſels are wounded, then all attempts to diſcharge the blood are vain, for the violence of the hæmorrhage takes off the patient. 2. Wounds are alſo to be accounted mortal by accident, which are treated or ſearched in too rough a manner by the ſurgeon; for if wounds are handled roughly, which are full of nervous parts, or of large blood-veſſels, there is great danger of bringing on hæmorrhages, convulſions, inflammations, gangrenes, and finally death itſelf. The caſe is alſo the ſame, 3. in external wounds, which are ſlight of themſelves, but under which the patient is loſt by the inflammation, which is increaſed and brought on by the ſurgeon's injudicious treatment; or, 4. when any one is taken off by the violence of the hæmorrhage from a wound of the hand or foot; for in this caſe, the ſurgeon might eaſily have ſtopped the blood by the application of proper remedies, or by ligature; or, 5. when the patient is guilty of any intemperance in eating or drinking, or of any exceſs of paſſion, of expoſing himſelf to the cold air, or of uſing violent exerciſe. For by theſe means, wounds, more eſpecially thoſe of the head, by being liable to freſh hæmorrhages, and other dangerous accidents, frequently become mortal, notwithſtanding they naturally would not prove ſo, and though the ſurgeon uſes his utmoſt care and ſkill. 6. Among theſe alſo are to be accounted thoſe wounds of the head, where the patient is loſt by the vaſt quantity of blood, which is extravaſated in the cavity of the cranium, and confined there; but where he might have been relieved if the trepan had been applied in time; for though wounds of this kind generally prove incurable, yet, as there is at leaſt a poſſibility of ſaving a perſon in theſe circumſtances, by the uſe of the trepan, this may properly be reckoned among the doubtful caſes, and not deemed abſolutely mortal. 7. And laſtly, a bad habit of body prevents the cure of wounds, which would admit of an eaſy cure in healthy ſubjects; ſo we often ſee the ſlighteſt puncture in the hand or foot of an hydropical, conſumptive, or ſcorbutic perſon, ſhall produce a gangrene, and prove mortal; though the ſurgeon ſpares no care nor application to prevent it. See GANGRENE, EXTRAVASATION, DROPSY, SCURVY, *&c.*

Cure of WOUNDS. Since a wound is a ſolution of the continuity of the parts of the body, the reunion of thoſe parts ſeems to be the principal intention; but ſince wounds are of very different kinds, ſome ſlight, and others of great conſequence, in proportion to this difference, ſo will the manner of proſecuting this intention differ.

The cure of ſlight wounds is generally performed with great eaſe, by applying a ſmall portion of lint to the part, well ſaturated with ſpirit of wine, oil of eggs, turpentine, baſilicon, the balſam of Arcæus, of Peru, *&c.* ſecuring the dreſſings with a plaſter, and renewing them once in a day or two: by this means, the lips of the wound will preſently agglutinate.

Wounds which are attended with ſome danger, are to be treated as follows: in the firſt place, the wound is to be cleanſed from all extravaſated blood, ſordes, *&c.* in the next place, if a bullet, the point of a ſword, any part of the clothing, a piece of glaſs, or any other foreign body, ſhall remain in the wound, it is to be removed with the fingers, or with proper inſtruments, as has been already explained under the articles EXTRACTION, and GUN-SHOT WOUNDS. The hæmorrhage is to be ſtopped at the firſt dreſſing; the divided parts are to be brought as near each other as poſſible, and their ſituation is to be ſo maintained, that the cicatrix which is left may appear even. See HÆMORRHAGE, BANDAGE, and CICATRIX.

Among the number of the moſt ſimple wounds are reckoned thoſe which are made by puncture, or ſtabbing upon the external parts, and not penetrating deep, the

the method of treating which has been given under the article PUNCTURE.

The method of treating a cut, or ſuch a wound as is made by a cutting inſtrument, where no part of the fleſh is taken off, and the accident happens to the external parts of the body, and does not penetrate deep, after the wound is cleanſed, it ſhould be dreſſed with the ſame vulnerary balſam, and the lips of the wound ſhould be cloſed, and kept in that ſituation. This is done after different methods, according to the difference of the wound. 1. It is to be done by placing the wounded part in a proper poſture, that is, as ſoon as the wound is dreſſed, the part ſhould be placed in ſuch a ſituation, that the divided parts may be moſt likely to keep in conſtant contact. 2. By a proper bandage, tying up the parts ſo that the lips may meet, and thereby eaſily unite. 3. By a proper ſuture, which differs according to the difference of the wound, but may be generally divided into the dry and bloody ſuture; the dry, or as ſome call it, the baſtard ſuture, is the application of ſticking plaſters, to keep the lips of the wound united; the bloody, or true ſuture, is performing the ſame thing with a needle and thread; the nature and method of each of which has been already treated of under the article SUTURE.

If the wound heals by the aſſiſtance of the ſuture, the threads or ligatures are to be cut near the knots; the lower lip of the wound is to be ſuſpended with one hand, while the threads are gently drawn out by the other; the punctures that are left will eaſily heal by the application of a vulnerary water, called by the french *l'eau d' arquebuſade*, or by injecting aqua calcis, or ſpirit of wine, and laying on compreſſes, dipped in the ſame liquors; but larger wounds are to be dreſſed with the balſam of arcæus, or balſam of capivi, *&c.* and the lips kept firm together, with ſome ſticking plaſter, till a firm cicatrix is formed.

Where there is a loſs of ſubſtance, the wound will not unite either by the help of plaſter, or ſuture, till it is filled up with new fleſh. For this purpoſe, you will find lint dipped in oil, or ſpread with ſome vulnerary balſam, or ointment, and applied to the bottom of the wound, very ſerviceable, covering it with a plaſter, compreſs and proper bandages, and this dreſſing is to be repeated daily. As hot or cold air is very hurtful to wounds, ſo it muſt by all means be kept from them, for which reaſon the ſurgeon ſhould be careful not to remove the old dreſſings till the freſh ones are got ready, and to be as expeditious as poſſible in applying them. After this, when a white, even, thick matter appears in the wound, it ſhould be dreſſed as you ſee occaſion, every day, or every other day; the ſuperfluous matter ſhould be wiped away with a very light hand; and it is better to leave ſome behind, than to treat the wound roughly; theſe rules being obſerved, the fleſh will ſpring up preſently, and the wound unite; and in order to perfect the cure of the wound, an even cicatrix ſhould, if poſſible, be procured, for the method of obtaining which, ſee the article PUS, *&c.*

When any uncleanneſs or foulneſs is perceived in a wound, that is, if the fleſh is putrid, fungous, black or livid, it muſt be well cleanſed before any attempt is made to heal it, for which purpoſe apply a digeſtive ointment, made with turpentine, yolk of eggs, and honey of roſes; and where this is not ſtrong enough, ſubſtitute the egyptian ointment, or ſpirit of wine diluted; or if you require more ſtrength, uſe red precipitate mercury. Applications of this kind are to be continued till the wound is intirely clean; after which, recourſe is to be had to the methods already preſcribed. If the new fleſh ſhould be luxuriant, and riſe up ſo as to prevent the formation of an even cicatrix, it muſt be taken down with green vitriol, or a powder compoſed of burnt alum, and red precipitate mercury; at the ſame time making a proper preſſure, with the plaſters, compreſſes, and bandages, till the parts are even. See the article FUNGUS.

The patient ſhould obſerve a ſtrict regimen with regard to his diet and manner of life, as nothing forwards the cure ſo much as a good habit of body, which may be procured by obſerving a ſtrict regularity with regard to diet, air, keeping the paſſions under, and indulging neither too much ſleep, nor ſuffering too great watchfulneſs; and it is to be obſerved, that the greater tendency there is in a patient to a diſeaſed ſtate of body, ſo much the ſtricter courſe of life ought he to obſerve. See the articles DIET, REGIMEN, AIR, SLEEP, WATCHFULNESS, PASSIONS and DISEASE.

The

The bowels ſhould by all means be kept open, eſpecially in thoſe who have received a wound in the head; however, it is to be obſerved, that ſtrong cathartic medicines are to be avoided; but it is not only ſafe but adviſeable to eat and drink thoſe things that may at the ſame time nouriſh and keep the body open. To this end the patient may drink plentifully of tea or coffee, may eat ſtewed prunes, roaſted apples: but hard meats of all kinds are forbid: where the patient is ſo bound up, that a diet of this kind has no effect, it will be neceſſary to have recourſe to medicines, but then thoſe muſt be of the mildeſt kind; here a gentle clyſter may be given, a ſuppoſitory may be uſed, or an ounce or two of manna, or ſome purging ſalts in warm broth may be preſcribed: whenever the violence of the wound, or the ill habit of the patient require the uſe of internal remedies, vulnerary drinks will be found to be of the greateſt conſequence, in compoſing which, the conſtitution of the patient, and the nature of the complaint ſhould be diligently conſulted; for if the patient is of a phlegmatic habit of body, cold, pale, or naturally ſubject to tumours, then the vulnerary decoction ſhould be compoſed of herbs that attenuate and divide the blood. See ATTENUANTS.

If the patient has a thin ſharp blood, then decoctions of viſcous and glutinous plants will be proper; but if he is vexed with great pain or wakefulneſs, then ſome opiates muſt be adminiſtred. If he ſhould be troubled with an acidity, abſorbents are proper; and when a quickneſs of pulſe, and an extraordinary heat are perceived, they are ſure ſigns of a ſymptomatical fever. See AGGLUTINANTS, OPIATES, ABSORBENTS, and FEVER.

For the diſorders accompanying wounds, commonly called the ſymptoms of wounds, as hæmorrhages, pains, ſpaſms, convulſions, &c. See HÆMORRHAGE, &c.

For wounds in the neck, and wounds in the eyes. See NECK and EYE.

For wounds in the abdomen, inteſtines, &c. ſee ABDOMEN, GASTRORAPHY, INTESTINES, &c.

For wounds of the thorax, ſee the article THORAX.

For wounds of the head, ſee the articles SKULL, FISSURE, CONTRA-FISSURE, EXTRAVASATION, CONTUSION, FRACTURE, TREPAN, &c.

For gun-ſhot wounds, &c. ſee the article GUN-SHOT *wounds*, &c.

For the treatment of ſuch wounds as the patient undergoes in the ſeverer operations of ſurgery, ſuch as lithotomy, trepanning, amputation of a limb, or large tumour, extirpation of the breaſt, the cæſarean ſection, &c. See LITHOTOMY, TREPANNING, &c.

WOUNDS *in horſes*. The moſt terrible wounds theſe creatures are ſubject to, are thoſe got in the field of battle. The farriers that attend camps, have a coarſe way of curing theſe; but it is a very expeditious and effectual one. If the bullet be within reach, they take it out with a pair of forceps; but if it lie too deep to be come at, they leave it behind, and dreſs up the wound in the ſame manner as if it were not there. They firſt drop in ſome varniſh from the end of a feather, and when the bottom is thus wetted with it, they dip a pledget of tow in the ſame varniſh, which they put into the wound, and then cover the whole with the following charge: take a quarter of a pound of powder of bole armenic, half a pound of linſeed-oil, and three eggs, ſhells and all; add to theſe four ounces of bean-flour, a quart of vinegar, and five ounces of turpentine; this is all to be mixed over the fire, and the wound covered with it. This application is to be continued four or five days; then the tent put into the wound is to be dipped in a mixture of turpentine and hogs-lard; by this means a laudable matter will be diſcharged, inſtead of the thin ſharp water that was at firſt. Then the cure is to be compleated by dreſſing it with an ointment made of turpentine, firſt well waſhed, and then diſſolved in yolks of eggs, and a little ſaffron added to it.

This is the practice in deep wounds that do not go through the part; but in caſes where the bullet has gone quite through, they take a few weaver's linnen-thrumbs, made very knotty; theſe they make up into a kind of link, and dipping it in varniſh, they draw it through the wound, leaving the ends hanging out at each ſide; by means of theſe they move the link or ſkain three or four times a day, always wetting the new part that is to be drawn into the wound with freſh varniſh. They put on a charge of the bole armenic, &c. as before deſcribed, on each ſide of the wounded part, and continue this as long as the wound diſcharges thin watery

watery matter, or the ſides continue ſwelled. After this they dreſs it with the ointment of turpentine, yolks of eggs, and ſaffron, till it is perfectly cured.

The other methods are the dreſſing the wound with an ointment made of wax, turpentine, and lard, and covering it with linnen-rags wetted with cream; or the dreſſing, with a mixture of yolks of egg, honey, and ſaffron, and covering it up with cream and baum-leaves beaten together.

When the wound is ſo dangerous as to require the aſſiſtance of internal medicines, they give the following pills: take aſſa fœtida, bay-berries, and native cinnabar, of each a pound; beat up the whole into a maſs with brandy, and roll it into pills of fourteen drams weight each. Theſe are to be laid in a ſhady place to dry, after which they will keep ever ſo long without any damage. The horſe is to take two of theſe every other day, or, if neceſſary, every day, till he has taken eight or ten of them; and he is to ſtand bridled two hours before and after the taking of them.

When the wound ſeems at a ſtand, not appearing foul, and yet not gathering new fleſh, there muſt be recourſe had to the following powder, whoſe effect in bringing new fleſh is wonderful: take dragon's blood and bole-armenic, of each two ounces; maſtic, olibanum, and ſarcocolla, of each three drams; aloes, round birth-wort, and common iris-root, of each one dram and a half; make the whole into a fine powder. This is ſometimes uſed dry, ſprinkling it on the wound; but ſometimes it is mixed with turpentine, ſometimes with juice of wormwood, and ſometimes with honey of roſes, and either way does very well.

When the wound grows foul, and requires a detergent to cleanſe it, the common liquor for this purpoſe is a phagedenic water, which they make of lime-water and ſublimate, in this manner: take two pounds and a half of newly made and unſlacked lime, put it into a pewter-veſſel, and pour on it five quarts of boiling water: when the bubbling is over, let it ſtand to reſt two or three days, ſtirring it often with a ſtick, then pour it clear off, after a due time, for the lime to ſettle; and filtre it through ſome whited brown paper, made for the lining of funnels on this occaſion. To a quart of the clear lime-water thus prepared, add eight ounces of ſpirit of wine, and one ounce of ſpirit of vitriol; when theſe are well mixed by ſhaking them together, then add an ounce of corroſive ſublimate in fine powder: mix all well together, and keep the whole in a bottle to be uſed for the cleanſing of theſe foul wounds, and on any other occaſion where there may be a detergent of this powerful kind neceſſary. It will keep good many years. If this water will not thoroughly cleanſe the wound, but there ſtill will remain a quantity of foul matter in it, and there is danger of a gangrene, they add to it as much arſenic, in fine powder, as there was of the corroſive ſublimate; that is, at the rate of an ounce to a quart and half a pint.

WRACK, or WRECK. See WRECK.

WREATH, in heraldry, a roll of fine linnen or ſilk (like that of a turkiſh turbant) conſiſting of the colours borne in the eſcutcheon, placed in an atchievement between the helmet and the creſt, and immediately ſupporting the creſt. See the article CREST, *&c.*

WRECK, called alſo *ſhip*-WRECK, or *ſhip*-WRACK, in law, is when a ſhip periſhes on the ſea, and no perſon eſcapes alive out of it.

In this caſe, if the ſhip ſo periſhed, or any part thereof, or the goods of the ſhip come to the land of any lord, and are left there, the lord ſhall have the ſame, as being a wreck of the ſea: but if any ſingle perſon, or even a dog, or other living creature, eſcape alive out of the ſhip, the party to whom the goods belong, may come within a year and a day, and proving the goods to be his, he ſhall have them again. And it is held that they are no wrecks, ſo long as they remain at ſea, within the juriſdiction of the admiralty. The year and day that ſhall ſubject the goods to be forfeited, muſt be computed from the time of ſeizure; in which time, if the owner of the goods die, his executors or adminiſtrators may make proof; but when the goods are bona peritura, the ſheriff may ſell them within the year, provided he diſpoſes of the ſame to the beſt advantage, and accounts for them. In caſe any goods ſhipwrecked are ſeized by any perſon having no authority to do it, the owner may bring an action againſt him for ſo doing. It is enacted by 12 Ann. c. 18. that if any wreck happen by any fault or negligence of maſter or mariners, the maſter muſt make good the loſs; but if the ſame was occaſioned by tem-

peſt, enemies, &c. he ſhall be excuſed: making holes in ſhips, or doing any thing wilfully tending to the loſs thereof, is by that ſtatute declared felony; and by this act juſtices of the peace are required to command aſſiſtance for preſerving ſhips in danger of wreck on the coaſts; and officers of men of war, and other ſhips, are to be aiding and aſſiſting in the preſerving ſuch veſſels, under the penalty of 100l. And, further, no perſon ſhall enter ſuch veſſel without leave of her commander, or a conſtable, &c. and perſons carrying away goods from ſuch ſhips, ſhall pay treble value; but the perſons giving aſſiſtance, ſhall be paid by the maſter a reaſonable reward for ſalvage, &c.

WRECK, in metallurgy, a veſſel in which the third waſhing is given to the ores of metals.

WREN, in ornithology, the cheſnut-coloured motacilla, with the wings variegated with white and grey. See the article MOTACILLA.

This is a very minute bird; we have not any in Europe that is ſmaller: the head is large and round, the eyes dark, and the beak ſlender and brown; the tail is ſhort, and generally carried erect; the head, neck, and back are of a duſky cheſnut-brown; the throat is of a paliſh white colour, the middle of the breaſt is ſtill whiter, and the lower part of it is variegated with obſcure and tranſverſe lines of black. See plate CCXCVI. fig. 4.

WRESTLING, a kind of combat or engagement between two perſons unarmed, body to body, to prove their ſtrength and dexterity, and try which can throw his opponent to the ground. See the articles EXERCISE, GAMES, &c.

Wreſtling, *palæſtra*, is an exerciſe of very great antiquity and fame. It was in uſe in the heroic age; witneſs Hercules, who wreſtled with Antæus. See the articles PALÆSTRA and GYMNASTICS.

It continued a long time in the higheſt repute, and had conſiderable rewards and honours aſſigned it at the olympic games. It was the cuſtom for the athletæ to anoint their bodies with oil, to give the leſs hold to their antagoniſt. See ATHLETÆ, &c. Lycurgus ordered the ſpartan maids to wreſtle in public, quite naked, in order, as it is obſerved, to break them of their too much delicacy and niceneſs, to make them appear more robuſt, and to familiarize the people, &c. to ſuch nudities.

WREXHAM, a market-town of Denbighſhire, in Wales, ſituated twenty-three miles ſouth-eaſt of St. Aſaph.

WRINTON, a market-town of Somerſetſhire, ſituated ſeven miles north of Wells.

WRIST, *carpus*, in anatomy, a part of the hand conſiſting of eight ſmall, unequal, and irregular bones, all which taken together, repreſent a ſort of grotto of an irregular quadrangular figure, and connected principally with the baſis of the radius. Conſidered in this manner, the whole connection of them has two ſides and four edges; one of the ſides is convex and external, the other concave and internal. The convexity of the outſide is pretty regular and even; but the concavity of the inſide has four eminences, one at each corner. One of the four edges touches the fore-arm, and is as it were the head of the carpus; another of the edges touches the metacarpus, and may be called the baſis; the third is toward the point of the radius, and the fourth toward the point of the ulna; the firſt of theſe latter two may be called the ſmall edge, the latter the larger. See HAND.

The bones of the carpus are divided into two rows, the firſt of which lies next the fore-arm, the ſecond next the metacarpus; each row conſiſts of four bones; but the fourth of the firſt row lies in a manner out of its rank. Each bone has ſeveral cartilaginous ſurfaces for their mutual articulations, and, in ſome of them, for their articulations with the radius, and bones of the metacarpus and thumb. It is to no purpoſe to diſtinguiſh the three ordinary dimenſions in any of theſe bones, except one; but in moſt of them we may conſider ſix ſides, one external, turned towards the convex ſurface of the carpus; one internal, toward the concave ſurface; one toward the fore-arm, which may properly be called the brachial ſide; one toward the fingers, to be called the digital ſide; one toward the point of the radius, or the radial ſide, and one toward the point of the ulna, or the cubical ſide. The articulation of the bones of the carpus is triple: 1. with one another: 2. with the bones of the metacarpus, and, 3. with the cubitus.

The muſcles of the carpus are ſix, three of which are flexors, and three extenſors. The three flexors all ariſe from the internal condyle of the humerus; they are the radiæus internus, the ulnaris internus,

nus, and the palmaris. See the articles MUSCLE, FLEXOR, RADIÆUS, *&c.*

The three extenſors all ariſe from the external condyle of the humerus; they are, 1. the radiæus externus: 2. the longus and brevis, called by others bicornus, and, 3. the ulnaris externus. See the article EXTENSOR, *&c.*

WRIST LUXATED. See *Luxation of the* HAND.

WRIST FRACTURED. The bones of the wriſt are very ſeldom ſubject to fracture, on account of their ſmallneſs. And when they are fractured, there is but little hopes of a cure; for the ligaments and tendons are here ſo numerous, and the bones ſo very ſmall, that it is ſcarce poſſible to reduce them to their places, or to make them grow together again.

On this account the joint of the hand generally becomes ſtiff and immoveable after theſe accidents, or elſe abſceſſes, ſuppurations, fiſtulæ, and caries of the bones follow them; and theſe, on account of the ſoftneſs of the bones, and the difficulty of diſcharging the matter, are ſeldom remedied, but by amputating the hand.

What can be done, however, toward the curing a fracture in this part, is this; the aſſiſtant muſt lay hold of the hand above the wriſt and below it, and extend them as far as is neceſſary in oppoſite directions; the ſurgeon is, while this is doing, to replace the bones with his fingers, and when they are all replaced, to bind the hand up with a proper bandage.

WRIST, in the manege. The bridle-wriſt, is that of the cavalier's left hand. A horſeman's wriſt and his elbow ſhould be equally raiſed, and the wriſt ſhould be two or three fingers above the pummel of the ſaddle. To ride a horſe from hand to hand, *i. e.* to change hands upon one tread, you need only to turn your wriſt to that ſide you would have the horſe to turn to, without advancing your hand. But if your horſe ſtops, you muſt make uſe of both your legs. See the articles HAND and LEG.

WRIT, in law, ſignifies, in general, the king's precept in writing under ſeal, iſſuing out of ſome court, directed to the ſheriff, or other officer, and commanding ſomething to be done in relation to a ſuit or action, or giving commiſſion to have the ſame done. And, according to Fitzherbert, a writ is ſaid to be a formal letter of the king in parchment, ſealed with his ſeal, and directed to ſome judge, officer, or miniſter, *&c.* at the ſuit of a ſubject, for the cauſe briefly expreſſed, which is to be determined in the proper court according to law. See the articles BREVE, PRECEPT, *&c.*

Writs, in civil actions, are either original or judicial: original, are ſuch as are iſſued out of the court of chancery, for the ſummoning of a defendant to appear, and are granted before the ſuit is commenced, in order to begin the ſame; and judicial writs iſſue out of the court where the original is returned, after the ſuit is begun. The originals bear date in the king's name; but judicials bear teſte in the name of the chief juſtice or chief baron: and a writ without a teſte is not held to be good, for the time may be material when it was taken out, and the ſame is proved thereby; alſo in caſe it iſſue out of the common law courts, the writ muſt be dated ſome day in term; but in chancery, writs may be iſſued in vacation, that court being always open: where a ſuit is by original, there muſt be fifteen days at leaſt between the teſte and return of all writs; yet by 13 Car. II. c. 2. delays in actions by reaſon of fifteen days between the teſte and return of writs in perſonal actions and ejectments, are remedied. See RETURN, TESTE, *&c.*

As in actions, ſo writs are likewiſe real, that concern the poſſeſſion of lands, called writs of entry, or of right which relate to the property, *&c.* and perſonal, relating to goods, chattels, and perſonal injuries: though the moſt common writs in uſe are in debt, detinue, treſpaſs, action upon the caſe, account and covenant, *&c.* See ACTION, DETINUE, and TRESPASS.

After an action is fixed for any wrong done, or a debt or right detained, there muſt be a writ taken out that is ſuitable to the action, and on which it is grounded; though in ſome caſes the writ may be general, and the declaration thereon ſpecial: likewiſe four defendants can be included in one writ, but there muſt be ſeveral warrants from the ſheriff to execute the ſame. See WARRANT.

All the uſual writs are to be returned and filed in due time, thereby to avoid poſt terminums; and it is filing that makes them the warranty for the proceedings. Writs cannot be denied to any one, but may be abated in ſeveral caſes. See ARRESTS, FILING, *&c.*

WRIT *of aſſiſtance*, is a warrant that iſſues out of the exchequer to authorize perſons to take a conſtable, or other public offi-

cer, to ſeiſe goods or merchandizes prohibited and uncuſtomed, &c. by virtue of which writ any perſon may, in the day-time, and in the preſence of ſuch conſtable, &c. break open doors, cheſts, warehouſes, and other places, to ſearch for and ſeiſe uncuſtomed goods. There is alſo a writ of this name that is uſed to give poſſeſſion of land; and likewiſe for the general aſſiſtance of ſheriffs, &c.

WRIT *of inquiry and damages*, a judicial writ that iſſues out to the ſheriff upon a judgment by default, in action of the caſe, covenant, treſpaſs, trover, &c. commanding him to ſummon a jury to enquire what damages the plaintiff hath ſuſtained, occaſione præmiſſorum; and when this is returned with the inquiſition, the rule for judgment is given upon it; and if nothing be ſaid to the contrary, judgment is thereupon entered.

WRIT *of rebellion*, is a writ iſſuing out of the court of chancery or exchequer, againſt a perſon who is in contempt for not appearing in one of theſe courts, &c. See COMMISSION *of rebellion*.

WRITER *of the tallies*, an officer of the exchequer, being clerk to the auditor of the receipt, who writes, upon the tallies, the whole letters of the teller's bill. See TALLY, EXCHEQUER, &c.

WRITING, *ſcriptura*, the art or act of ſignifying and conveying our ideas to others, by letters, or characters, viſible to the eye. See CHARACTER, LETTER, WORD, &c.

Writing is now chiefly practiſed among us by means of pen, ink, and paper; though the antients had other methods. See the articles PEN, INK, PAPER, and BOOK, BARK, STYLE, &c.

To write without blacking the fingers, Mr. Boyle directs us as follows. Prepare the paper with a fine powder made of three parts of calcined copperas, two of galls, and one of gum arabic; thoſe being freſh mixed, rub them with a hare's foot into the pores of the paper, and write with fair water, and the black letters will immediately appear.

To make new writing appear old, the ſame author directs to moiſten it well with oil of tartar per deliquium, more or leſs diluted with water, as you deſire the ink to appear more or leſs decayed.

We may write without ink or its materials. For this purpoſe take a fine powder of calcined hartſhorn, of clean tobacco-pipes, or rather of mutton-bones burnt to a perfect whiteneſs, and rub it upon the paper, and then write with a ſilver bodkin, or the like.

WRONG, in a logical ſenſe. See ERROR, FALSHOOD, TRUTH, &c.

WRONG, in a legal ſenſe, the ſame with injury, or tort. See the articles INJURY, JUSTICE, TORT, RIGHT, &c.

WROTHAM, a market town of Kent, ſituated ten miles weſt of Maidſtone.

WRY-NECK, *jynx*, in ornithology. See the article JYNX.

WRY NECKED. See the article NECK.

WURTEMBURG, or WIRTENBURG DUTCHY, in Germany, is the north part of the circle of Swabia, bounded by the palatinate of the Rhine and Franconia, on the north; by Oetingen and the biſhopric of Auſburg, on the eaſt; by the territories of Ulm and Furſtemburg, on the ſouth; and by the territories of Baden, on the weſt; being ſeventy miles long, and almoſt as much in breadth.

WURTZBURG, a city of Germany, in the circle of Franconia, capital of the biſhopric of that name, ſituated on the river Maine, in eaſt long. 9° 50′, north lat. 49° 46′.

WYCH-HOUSE, a houſe in which ſalt is boiled. See SALT.

WYDRAUGHT, a water-courſe, or water paſſage, to carry off the filth of a houſe, properly a ſink, or common ſhore. See SEWER and CLOACA.

WYE, a market town of Kent, ſituated twenty miles ſouth eaſt of Maidſtone.

WYE is alſo a river of Wales, which, riſing on the confines of Cardiganſhire, and running ſouth-eaſt, divides the counties of Radnor and Brecknock; then croſſing Herefordſhire it turns ſouth, and falls into the mouth of the Severn at Chepſtow.

WYKE, antiently ſignified a farm, hamlet, or little village. See FARM, HAMLET, and VILLAGE.

WYNENDALE, a town of the auſtrian Netherlands, in the province of Flanders, ſituated eleven miles ſouth-weſt of Bruges.

WYTE, or WITE, in our antient cuſtoms, a pecuniary penalty or mulct. The Saxons had two kinds of puniſhments, were and wyte; the firſt for the more grievous offences. See WERE.

The wyte was for the leſs heinous ones. It was not fixed to any certain ſum, but left at liberty to be varied according to the nature of the caſe. Hence alſo wyte, or wittree, one of the terms of privilege granted to our ſportſmen, ſignifying a freedom or immunity from fines or amerciaments.

X.

X, or x, is the twenty-ſecond letter of our alphabet, and a double conſonant. It was not uſed by the Hebrews or antient Greeks; for as it is a compound letter, the antients, who uſed great ſimplicity in their writings, made uſe of, and expreſſed, this letter by its component letters *c s*. Neither have the Italians this letter, but expreſs it by *ſſ*. X begins no word in our language, but ſuch as are of greek original, and is in few others, but what are of latin derivation, as *perplex*, *reflexion*, *defluxion*, *&c.* We often expreſs this ſound by ſingle letters, as *cks* in *backs*, *necks*; by *ks*, in *books*, *breaks*; by *cc*, in *acceſs*, *accident*; by *ct*, in *action*, *unction*, *&c.* The Engliſh and French pronounce it like *cs* or *ks*; the Spaniards like *c* before *a*, *viz. Alexandro*, as if it were *Alecandro*. In numerals it expreſſeth 10, whence in old roman manuſcripts it is uſed for *denarius*; and as ſuch ſeems to be made of two V's placed one over the other. When a daſh is added over it, thus $\overline{X}$, it ſignifies ten thouſand.

XACA, a port-town of Sicily in the province of Mazara, forty miles ſouth of Palermo: eaſt lon. 13°, north lat. 37°.

XALISCO, a city of Mexico, in America, ſituated near the Pacific ocean, four hundred miles weſt of the capital city of Mexico: weſt longit. 110°, and north lat. 22° 20′.

XANSI, a province of China, bounded by the province of Peking on the eaſt, by the great wall on the north; by the province of Honan on the ſouth, and by the river Crocei, which divides it from the province of Xenſi, on the weſt.

XANTHICA, in antiquity, a macedonian feſtival, ſo called becauſe it was obſerved in the month Xanthus, which, as Suidas tells us, was the ſame with April. At this time the army was purified by a ſolemn luſtration, in the following manner: they divided a bitch into two halves, one of which, together with the entrails, was placed upon the right hand, the other upon the left; between theſe the army marched in this order; after the arms of the macedonian kings came the firſt part of the army; theſe were followed by the king and his children, after whom went the life-guards, and the reſt of the army. This done, the army was divided into two parts, one of which being ſet in array againſt the other, there followed a ſhort encounter, in imitation of a fight.

XANTHIUM, the LESSER BUR-DOCK, in botany, a genus of the *monoecia-pentandria* claſs of plants, the compound flower of which is uniform, tubulous, equal, and diſpoſed in the form of a hemiſphere; the partial flower is monopetalous, tubulous, funnel-faſhioned, erect, and quinquifid; the fruit is a dry, ovato-oblong, bilocular berry, bifid at the apex, hairy, and covered over with hooked prickles; the ſeed is ſingle, oblong, convex on one ſide, and plane on the other.

XANTUM, a province of China, in Aſia, bounded by the Kang ſea on the north, by the gulph of Nankin on the eaſt, by the province of Nankin on the ſouth, and by the province of Peking on the weſt.

St. XAVIER, a town of the province of La Plata, or Guayra, in ſouth America, ſituated on the confines of Braſil, two hundred miles weſt of Rio Janeiro: weſt long. 50°, ſouth lat. 24°.

XENODOCHUS, an eccleſiaſtical officer in the greek church, the ſame with hoſpitaller; or a perſon who takes care of the reception and entertainment of ſtrangers.

XENSI, a province of China, bounded by the great wall on the north, by the province of Xanſi on the eaſt, by the province of Suchuen on the ſouth, and by Tibet on the weſt.

XERANTHEMUM, or XERANTHEMOIDES, the AUSTRIAN SNEEZEWORT, in botany, a genus of the *ſyngeneſia-polygamia-ſuperfluua* claſs of plants; the compound flower of which is unequal, and conſiſts of many tubulous hermaphrodite floſcules placed on the diſc, and alſo a few female tubulated ones on the verge; the ſeeds are oblong, coronated, and contained in the cup.

XEREZ DE LA FRONTIERA, a town of Spain, in the province of Andaluſia, twenty miles north of Cadiz.

XEREZ DE GUADIANA, a town of Spain, in the province of Andaluſia, ſituated on the river Guadiana: weſt long. 8° 14′, north lat. 37° 15′.

XEROPHAGIA, in church-hiſtory, the eating of dried foods: ſo the antient chriſtians called certain faſt-days, on which they eat nothing but bread and ſalt, and drank only water: ſometimes they added pulſe, herbs, and fruits. This ſort of faſting was obſerved chiefly in the holy-week, out of devotion, and not by obligation.

XESTA, an attic meaſure of capacity. See the article MEASURE.

XIMENIA, in botany, a genus of plants, the characters of which are not perfectly aſcertained: the calyx is a perianthium, compoſed of three ſmall, cordated, and deciduous leaves; the corolla is formed of a ſingle petal, of a campanulated figure, divided at the edge into three erect, oblong, obtuſe ſegments; the germen is ſmall, and of a ſuboval figure; the fruit is an oval drupe, containing one cell; the ſeed is oval, unilocular, and ſmooth.

XICHU, a city of China, in the province of Huguam: eaſt lon. 112°, north lat. 27°.

XINYAN, or CHINIAN, a city of Aſia, in the province of Laotung: eaſt lon. 120°, north lat. 31°.

XIPHIAS, the SWORD-FISH, in ichthyology, a genus of the acanthopterigious claſs of fiſhes. The roſtrum, or extremity of the head of the xiphias, is continued forward, with an extremely long point, of a depreſſed, or ſomewhat flated figure, reſembling the blade of a ſword, and of a bony ſtructure; the lower jaw is acute, and of ſomewhat a triangular figure; the body is oblong, and of a rounded figure, and is conſiderably thick in proportion to its length; the back is convex, and the ſides are rounded; there are no belly-fins, and on the back there is only one fin, which is very long, and loweſt in the middle; the branchioſtege membrane, on each ſide, contains only eight bones. About fifteen feet in length is the ſize of a moderately large one, but not unfrequently is it met with much bigger. See plate CCCII. fig. 4.

XIPHIAS is alſo a fiery meteor, in form of a ſword. It differs from the acontias in this, that the latter is longer, and more like a dart; and the former ſhorter and broader in the middle.

XIPHIUM, in botany, a name given by ſome to a plant otherwiſe called iris. See the article IRIS.

XIPHOIDES, in anatomy, a cartilage adhering to the ſternum; called alſo cartilago enſiformis. See STERNUM.

XUCAR, a river of Spain, which riſes in New Caſtile, and, having run through that province, croſſes the province of Valencia, and falls into the Mediterranean, twenty miles ſouth of the city of Valencia.

XYLARIA, in botany, a genus of funguſſes, conſiſting of branches or ſtalks, of a woody ſtructure, tough, firm, and hard, and of an uneven ſurface. Theſe fungi produce ſeparate male and female flowers: the male flowers conſiſt only of antheræ of an oblong figure, ſupported on very ſhort ſtamina, and placed only on the upper parts of the plant. The female flowers are lodged in cavities, or cells, in the lower parts of the plant, and conſiſt of placentæ, of a roundiſh figure, and gelatinous ſubſtance, to which are affixed great numbers of roundiſh ſeeds.

XYLO-ALOES, or ALOE-WOOD, in pharmacy. See ALOE.

This drug is diſtinguiſhed into three ſorts, the calambac, the common lignum aloes, and calambour.

The calambac, or fineſt aloes-wood, called by authors lignum aloes præſtantiſſimum, and by the Chineſe ſukhiang, is the moſt reſinous of all the woods we are acquainted with: it is of a light ſpongy texture, very porous, and its pores ſo filled up with a ſoft and fragrant reſin, that the whole may be preſſed and dented by the fingers like wax, or moulded about by chewing in the mouth, in the manner of maſtich. This kind, laid on the fire, melts in great part like reſin, and burns away in a few moments, with a bright flame and perfumed ſmell. Its ſcent, while in the maſs, is very fragrant and agreeable; and its taſte acrid and bitteriſh, but very aromatic and agreeable: it is ſo variable in its colour, that ſome have divided it into three kinds, the one variegated with black and purple; the ſecond, with the ſame black, but with yellowiſh inſtead of purple; and the third, yellow alone, like the yolk of an egg: this laſt is the leaſt ſcented of the three; the ſubſtance, however, in them all, is the ſame in every reſpect, except their colour. It is brought from Cochinchina.

The lignum aloes vulgare is the ſecond in value. This is of a more denſe and compact texture, and conſequently leſs reſinous than the other: there is ſome of it, however, that is ſpongy, and has the

Fig. 1. ZEBRA

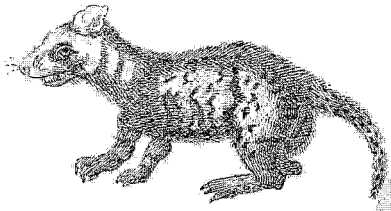

Fig. 6 XERANTHEMUM

Fig. 4. XIPHIAS

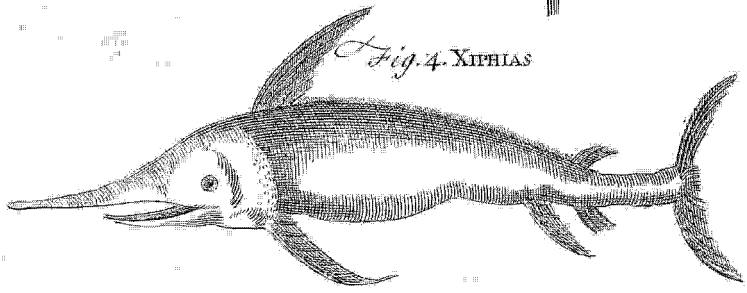

Fig. 5. ZYGÆNA

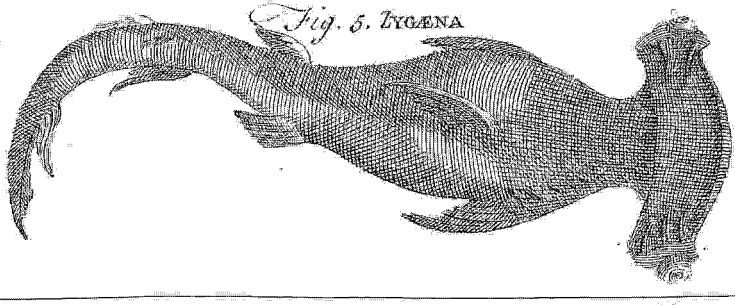

J. Jeffreys sculp.

the holes filled up with the right reſinous matter; and all of it, when good, has veins of the ſame reſin in it. We meet with it in ſmall fragments, which have been cut and ſplit from larger; theſe are of a tolerably denſe texture, in the more ſolid pieces, and of a duſky brown colour, variegated with reſinous black veins. It is in this ſtate very heavy, and leſs fragrant than in thoſe pieces which ſhew a multitude of little holes, filled up with the ſame blackiſh matter that forms the veins in others. The woody part of theſe laſt pieces is ſomewhat darker than the other, and is not unfrequently purpliſh, or even blackiſh. The ſmell of the common aloe-wood is very agreeable, but not ſo ſtrongly perfumed as the former. Its taſte is ſomewhat bitter and acrid, but very aromatic. This wood is alſo brought from Cochinchina, and ſometimes from Sumatra.

The calambour, or, as ſome write it, calambouc, is alſo called agallochum ſylveſtre, and lignum aloes mexicanum. It is a light and friable wood, of a duſky and often mottled colour, between a duſky green black, and a deep brown. Its ſmell is fragrant and agreeable, but much leſs ſweet than that of either of the others; and its taſte bitteriſh, but not ſo much acrid or aromatic as either of the two former. We meet with this very frequent, and in large logs, and theſe ſometimes entire, ſometimes only the heart of the tree, the cortical part being ſeparated. This is brought from the iſland of Timor, and is the aloe-wood uſed by the cabinet-makers and inlayers.

The Indians uſe the calambac by way of incenſe, burning ſmall pieces of it in the temples of their gods; and ſometimes their great people burn it in their houſes, in times of feaſting. It is eſteemed a cordial, taken inwardly; and they ſometimes give it in diſorders of the ſtomach and bowels, and to deſtroy worms. A very fragrant oil may be procured from it, by diſtillation, which is recommended in paralytic caſes, from five to fifteen drops. It is at preſent, however, but little uſed, and would ſcarce be met with any where in the ſhops, but that it is an ingredient in ſome of the old compoſitions.

XYLO-BALSAMUM, a name which naturaliſts give to the wood of the tree which yields that precious gum known to the Latins by the name of opobalſamum, and to us by the balm of gilead. See the article BALSAM.

We have branches of this tree brought us from Cairo; they are very ſtrait, brittle, unequal, and full of knots; their bark reddiſh without, and greeniſh within. The xylo-balſamum is reputed good to ſtrengthen the brain and ſtomach, and to expel poiſon.

XYLOCASIA, in the materia medica, the ſame with the caſſia lignea. See the article CASSIA.

XYLON, the PRICKLY COTTON-TREE, in botany, a genus of the *polyandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, divided into five oval, hollow, patent ſegments; the fruit is a large, oblong, turbinated capſule, formed of five woody valves, and containing five cells; the ſeeds are roundiſh, and fixed to a columnar pentagonal receptacle, and have a quantity of fine down, or cotton, adhering to them.

XYLON is alſo a name given to the goſſypium. See GOSSYPIUM and COTTON.

XYLOSTEUM, in botany, a name given by Tournefort to the lonicera of Linnæus. See the article LONICERA.

XYNOECIA, in grecian antiquity, an anniverſary feaſt, obſerved by the Athenians, in honour of Minerva, upon the ſixteenth of Hecatombæon, in memory that, by the perſuaſion of Theſeus, they left their country-ſeats, in which they lay diſperſed here and there in Attica, and united together in one body.

XYRIS, in botany, a genus of the *triandria-monogynia* claſs of plants, the flower of which conſiſts of three plain, patent, large, crenated petals, with narrow ungues, of the length of the cup; The fruit is a roundiſh, trilocular, trivalvar capſule, within the cup, with a great number of very ſmall ſeeds.

XYSTARCHA, in antiquity, the maſter or director of the xyſtus. In the greek gymnaſium, the xyſtarcha was the ſecond officer, and the gymnaſiarcha the firſt; the former was his lieutenant, and preſided over the two xyſti, and all exerciſes of the athletæ therein.

XYSTUS, among the Greeks, was a long portico, open or covered at the top, where the athletæ practiſed wreſtling and running: the gladiators who practiſed therein, were called xyſtici.

Among the Romans, the xyſtus was only an alley, or double row of trees, meeting like an arbour, and forming a ſhade to walk under.

Y.

Y, or y, the twenty-third letter of our alphabet: its ſound is formed by expreſſing the breath with a ſudden expanſion of the lips from that configuration by which we expreſs the vowel *u*. It is one of the ambigenial letters, being a conſonant in the beginning of words, and placed before all vowels, as in *yard*, *yield*, *young*, *&c.* but before no conſonant. At the end of words it is a vowel, and is ſubſtituted for the ſound of *i*, as in *try*, *deſcry*, *&c.* In the middle of words it is not uſed ſo frequently as *i* is, unleſs in words derived from the greek, as in *chyle*, *empyreal*, *&c.* though it is admitted into the middle of ſome pure engliſh words, as in *dying*, *flying*, *&c.* The Romans had no capital of this letter, but uſed the ſmall one in the middle and laſt ſyllables of words, as in *coryambus*, *onyx*, *martyr*. Y is alſo a numeral, ſignifying 150, or, according to Baronius, 159; and with a daſh a-top, as $\overline{Y}$, it ſignified 150,000.

YACHT, or YATCH, a veſſel with one deck, carrying from four to twelve guns. See the article SHIP.

YARD, a meaſure of length uſed in England and Spain, chiefly to meaſure cloth, ſtuffs, *&c.* See MEASURE.

YARD, in anatomy. See PENIS.

YARD-LAND is taken to ſignify a certain quantity of land, in ſome counties being fifteen acres, and in others twenty; in ſome twenty-four, and in others thirty and forty acres.

YARDS *of a ſhip*, are thoſe long pieces of timber which are made a little tapering at each end, and are fitted each athwart its proper maſt, with the ſails made faſt to them, ſo as to be hoiſted up, or lowered down, as occaſion ſerves. They have their names from the maſts unto which they belong. As for the length of the main-yard, it is uſually five ſixths of the length of the keel, or ſix ſevenths of the length of the main-maſt. Their thickneſs is commonly $\frac{1}{4}$ of an inch for every yard in length. The length of the main-top-yard is two fifths of the main-yard; and the fore-yard four fifths thereof. The ſprit-ſail-yard, and croſs jack-yard are half the mizzen-yard; and the thickneſs of the mizzen-yard and ſprit-ſail yard is half an inch for every yard in length. All ſmall yards are half the great yards from cleat to cleat. When a yard is down a portlaſt, it gives the length of all top-ſail-ſheets, lifts, ties, and bunt-lines, as alſo of the leech-lines and halliards, meaſuring from the hounds to the deck: and when it is hoiſted, it gives the length of clew-lines, clew-garnets, braces, tackles, ſheets, and bow-lines.

There are ſeveral ſea-terms relating to the management of the yards; as, ſquare the yards; that is, ſee that they hang right a-croſs the ſhip, and no yard-arm traverſed more than another: top the yards, that is, make them ſtand even. To top the main and fore-yards, the clew-lines are the moſt proper; but when the top-ſails are ſtowed, then the top-ſail-ſheets will top them.

YARD-ARM is that half of the yard that is on either ſide of the maſt, when it lies athwart the ſhip.

YARDS alſo denotes places belonging to the navy, where the ſhips of war, *&c.* are laid up in harbour. There are, belonging to his majeſty's navy, ſix great yards, *viz.* Chatham, Deptford, Woolwich, Portſmouth, Sheerneſs, and Plymouth; theſe yards are fitted with ſeveral docks, wharfs, lanches, and graving places, for the building, repairing, and cleaning of his majeſty's ſhips; and therein are lodged great quantities of timber, maſts, planks, anchors, and other materials there are alſo convenient ſtore-houſes in each yard, in which are laid up vaſt quantities of cables, rigging, ſails, blocks, and all other ſorts of ſtores, needful for the royal navy.

YARE, among ſailors, implies ready or quick: as, be yare at the helm; that is, be quick, ready, and expeditious at the helm. It is ſometimes alſo uſed for bright by ſeamen: as, to keep his arms yare; that is, to keep them clean and bright.

YARE, a river of Norfolk, which runs from weſt to eaſt, through that county, paſſing by Norwich, and falling into the German ſea at Yarmouth.

YARMOUTH,

YARMOUTH, a borough and port-town of Norfolk, ſituated on the German ſea, at the mouth of the river Yare, twenty miles eaſt of Norwich.

It ſends two members to parliament.

YARMOUTH, is alſo a borough-town of the Iſle of Wight, in Hampſhire, ſituated on the north-weſt coaſt of the iſland, ſix miles weſt of Newport.

It ſends two members to parliament.

YARN, wool or flax, ſpun into thread, of which they weave cloth. See the articles CLOTH, WOOL, &c.

Yarn is ordered after the following manner: after it has been ſpun upon ſpindles, ſpools, or the like, they reel it upon reels, which are hardly two feet in length, and have but two contrary croſs-bars, being the beſt, and the leaſt liable to ravelling. In reeling of fine yarn, the better to keep it from ravelling, you muſt, as it is reeled, with a tye-band of big twiſt, divide the ſlipping or ſkain into ſeveral leys, allowing to every ley eighty threads, and twenty leys to every ſlipping, if the yarn is very fine; otherwiſe leſs of both kinds. The yarn being ſpun, reeled, and in the ſlippings, the next thing is to ſcour it. In order to fetch out the ſpots, it ſhould be laid in lukewarm water for three or four days, each day ſhifting it once, wringing it out, and laying it in another water of the ſame nature: then carry it to a well or brook, and rinſe it till nothing comes from it but pure clean water: that done, take a bucking-tub, and cover the bottom thereof with very fine aſhen aſhes; and then having opened and ſpread the ſlippings, lay them on thoſe aſhes, and put more aſhes above, and lay in more ſlippings, covering them with aſhes as before; and thus lay one upon another, till all the yarn be put in: afterwards cover the uppermoſt yarn with a bucking cloth, and, in proportion to the bigneſs of the tub, lay therein a peck or two more of aſhes: this done, pour upon the uppermoſt cloth a great deal of warm water, till the tub can receive no more, and let it ſtand ſo all night. Next morning you are to ſet a kettle of clean water on the fire; and when it is warm, pull out the ſpiggot of the bucking tub, to let the water run out of it, into another clean veſſel; as the bucking-tub waſtes, fill it up again with the warm water on the fire: and as the water on the fire waſtes, ſo likewiſe fill that up with the lye that comes from the bucking-tub; ever obſerving to make the lye hotter and hotter, till it boils: then you muſt, as before, ply it with the boiling lye at leaſt four hours together, which is called the driving of a buck of yarn.

All this being done, for the whitning of it, you muſt take off the bucking-cloth; then putting the yarn with the lye-aſhes into large tubs, with your hands labour the yarn, aſhes, and lye pretty well together; afterwards carry it to a well, or river, and rinſe it clean; then hang it upon poles in the air all day, and in the evening take the ſlippings down, and lay them in water all night; the next day hang them up again, and throw water upon them as they dry, obſerving to turn that ſide outmoſt which whitens ſloweſt. After having done this for a week together, put all the yarn again into a bucking-tub, without aſhes, covering it as before with a bucking-cloth; lay thereon good ſtore of freſh aſhes, and drive that buck, as before, with very ſtrong boiling lye, for half a day, or more; then take it out, and rinſe it, hanging it up, as before, in the day-time, to dry, and laying it in water at night, another week: laſtly, waſh it over in fair water, and ſo dry it up. Your yarn being thus ſcoured and whitened, wind it up into round balls of a moderate ſize. See REEL.

Cable-yarn pays, on importation, for the hundred weight 7 s. $3\frac{5}{100}$ d. there is no drawback on exportation. Camel or mohair-yarn pays on importation for the hundred weight $5\frac{77\frac{1}{2}}{100}$ d. and draws back $5\frac{6\frac{1}{4}}{100}$ d. Cotton-yarn, not of the Eaſt-indies, on importation, pays per pound $2\frac{87\frac{1}{4}}{100}$ d. and on exportation draws back $2\frac{58\frac{3}{4}}{100}$ d. Cotton-yarn of the Eaſt-indies, on importation, pays per pound $4\frac{56}{100}$ d. and on exportation draws back $4\frac{27\frac{1}{2}}{100}$ d. Grogram-yarn, on importation, pays per pound $6\frac{93}{100}$ d. and on exportation draws back $6\frac{7\frac{1}{2}}{100}$ d. Iriſh yarn, in packs containing four hundred weight, at ſix ſcore pound to the hundred, if by certificate, is free from any duty on importation. Sail-yarn, on importation, pays per pound $1\frac{4\frac{5}{8}}{100}$ d. and on exportation draws

back 1 $\frac{29\frac{3}{8}}{100}$ d. For every pound weight of french, dutch, muſcovia or ſpruce, and all other raw linnen-yarn, there is a duty of 1 d. on importation; and no draw-back on exportation. Wick-yarn on importation, pays, the dozen pound, 2s. 1 $\frac{85\frac{1}{4}}{100}$ d. and on exportation draws back 1 s. 11 $\frac{28\frac{3}{4}}{100}$ d. Woollen or bay-yarn, on importation, pays the hundred 12 s. 10 d. and on exportation draws back 11 s. 3 d. Worſted-yarn, being two or more threads twiſted or thrown, on importation, pays the pound 2 $\frac{87\frac{1}{4}}{100}$ d. and on exportation draws back 2 $\frac{58\frac{3}{4}}{100}$ d.

YARRINGLE, a kind of inſtrument, or reel, on which hanks of yarn are wound, to clues or balls. See REEL.

YARUM, a market-town of the north riding of Yorkſhire, ſituated on the river Tees, thirty miles north of York.

YAWS, in the ſea-language. A ſhip is ſaid to make yaws, when ſhe does not ſteer ſteady, but goes in and out when there is a ſtiff gale.

YAWS, a diſtemper endemial to Guinea and the hotter climates in Africa. It makes its firſt appearance in little ſpots on the cuticle, not bigger than a pin's point, which increaſe daily, and become protuberant, like pimples. Soon after, the cuticle frets off, and then, inſtead of pus or ichor, there appears white ſloughs or ſordes, under which is a ſmall red fungus. Theſe increaſe gradually, ſome to the ſize of a ſmall wood ſtrawberry, others to that of a raſpberry, others again exceed the largeſt mulberry, which in ſhape they very much reſemble. In the mean time the black hair growing in the yaws turns to a tranſparent white. It is not eaſy to determine the exact time which the yaws take in going through their different ſtages. Luſty well fed negroes have had ſeveral yaws as big as a mulberry in a month's time, whereas the low in fleſh, with a ſcanty allowance have paſſed three months without their growing to the ſize of a ſtrawberry. They appear in all parts of the body, but are moſt plentiful, and of the largeſt ſize, about the groin, privy parts, anus, armpits, and face: they are largeſt when feweſt in number, and *vice verſa*. They are not painful, unleſs handled roughly, nor cauſe a loſs of appetite. They continue long without any ſenſible alteration; and ſome are of opinion, that as ſoon as the funguſes become dry, the infection is exhauſted.

The yaws are not dangerous, if the cure is ſkillfully managed at a proper time. But if the patient has been once ſalivated, or has taken any quantity of mercury, and his ſkin once cleared thereby, the cure will be very difficult, if not impracticable. The following form of medicine is recommended as a cure: take of flowers of ſulphur, one ſcruple; of camphor diſſolved in ſpirits of wine, five grains; of theriaca andromachi, one dram; and as much of ſyrup of ſaffron as will make a bolus. Let the bolus be taken at going to reſt, which muſt be repeated for a fortnight or three weeks, till the yaws come to the height. Then throw the patient into a gentle ſalivation, with calomel given in ſmall doſes, without farther preparation. After ſalivation, ſweat the patient twice or thrice, on a frame or chair, with ſpirit of wine, and give the following electuary, *viz.* of æthiops mineral, one ounce and a half, of gum guaiacum, half an ounce; theriaca andromachi, and conſerve of red roſes, of each one ounce; oil of ſaſſafras, twenty drops; and as much of ſyrup of ſaffron as is requiſite for an electuary. Of this let two drams be taken in the morning and at night. He may likewiſe drink the decoction of guaiacum and ſaſſafras, fermented with molaſſes, for his conſtant drink, while the electuary is taking, and a week or a fortnight after the electuary is ſpent. Sometimes there remains one large yaw, high and knobed, red and moiſt; this is called the maſter-yaw. This muſt be conſumed an eighth or a tenth part of an inch below the ſkin, with corroſive red mercury, and burnt alum, of each an equal quantity, and digeſted with one ounce of yellow baſilicon, and one dram of red corroſive mercury, and cicatrized with lint preſſed out of ſpirit of wine, and with the vitriol-ſtone.

YAXLEY, a market-town of Huntingtonſhire, twelve miles north of Huntington.

YEAR, *annus*, the time the ſun takes to go thro' the twelve ſigns of the zodiac. See ZODIAC and EARTH.

This is properly the natural or tropical year, and contains 365 days, 5 hours, and 49 minutes. As for the gregorian, the civil, the ſolar or aſtronomical, the biſſextile, and

and the platonic years, ſee them under the articles GREGORIAN, CIVIL, &c.

The julian year derives both its name and inſtitution from Julius Cæſar the dictator; for before his time the form of the roman year was ſo corrupted by the indiſcretion of the pontiffs, in whoſe hands the power of intercalation was lodged, that the winter-months fell back to the autumn, and thoſe of autumn to the ſummer. To remedy theſe inconveniences, the dictator not only added to that year, in which he ſet about the reformation of the kalendar, the common intercalation of 23 days, between the 23d and 24th days of February, purſuant to Numa Pompilius's inſtitution, but likewiſe 67 days more between November and December, ſo that this year contained 445 days. This done, he inſtituted a ſolar year of 365 days and 6 hours, purſuant to what he had learned from the Egyptians, and every fourth year he ordered a day to be added. See GREGORIAN, BISSEXTILE, and EMBOLISMIC.

The Arabs, Saracens, and Turks count their year by the motion of the moon, making it conſiſt of 12 moons or months, whereof ſome have 30, and ſome 29 days, alternately; and theſe altogether make 354 days, and conſtitute a common lunar year; and 354 days, 8 hours, 48 minutes, 38 ſeconds, 12 thirds, conſtitute what is called a lunar aſtronomical year.

The Greeks counted their year by the motion of both ſun and moon; and finding that there was 11 days difference between the lunar and ſolar years, at firſt they added an intercalary month every two years, containing 22 days. Afterwards conſidering the 6 hours alſo, they put their emboliſm off 4 years, and then making the three firſt years to contain 354 days each, this made the fourth year to have 399 days: and to make this intercalation the more remarkable, they inſtituted the olympic games on every ſuch fourth year, whence came the computation by olympiads. See the article OLYMPIAD.

The Egyptians had two ſorts of years, the erratic and the fixed, or actiac: the erratic was called the nabonaſſarean, from the epocha which takes its riſe from Nabonaſſar king of the Chaldees. As it neglects the 6 hours, which in the julian form make a leap day once in four years, its beginning anticipates the julian every fourth year by a day, and therefore it is juſtly called erratic. The anticipation of one day in four years gains of the julian years one in 1460, ſo that 1461 nabonaſſarean years make but 1460 julian years. The fixed egyptian year obſerves the julian form of 365 days and 6 hours, making a leap-day of the ſix hours once in four years. It differs from the julian in this, that its months are the ſame with thoſe of the nabonaſſarean, that it begins on Aug. 29, inſtead of January 1; or on Aug. 30, if it be a leap-year; that it takes in the leap-day, not in February, but at the end of the year. See EPOCHA and INTERCALARY.

The perſian erratic year goes by the name yezdegerdic, by reaſon that the perſian epocha commences from the death of Yezdegird, the laſt perſian king, who was killed by the Saracens. It conſiſts of twelve months, containing thirty days each, and five ſupernumerary ones; ſo that it differs from the nabonaſſarean only in the names of the months, and the commencement of the epocha. See MONTH.

The gelalean year, us'd alſo by the Perſians, is very well adapted to the ſolar motions. It takes in a leap-day every fourth year, but every ſixth or ſeventh turn it throws it forward to the fifth year, by which means the equinoxes and ſolſtices are fixed to almoſt the ſame days of the months.

The ſyriac year conſiſts of 365 days and 6 hours, being divided into 12 months of equal extent with thoſe of the julian year, to which they correſpond: this year begins October 1, ſo that the month called Tiſhrim, agrees with our October.

The aſtronomical year is two-fold, *viz.* the tropical and ſidereal: by the latter is meant that ſpace of time which the ſun takes in departing from a fixed ſtar, and returning to the ſame again. This year conſiſts of 365 days, 6 hours, and 10 minutes.

As the form of the year is various among different nations, ſo likewiſe is the beginning: the Jews began their eccleſiaſtical year with the new moon of that month whoſe full moon happens next after the vernal equinox; and every ſeventh year they kept as a ſabbatic year, during which they let their land lie at reſt. The antient jewiſh year was made to agree with the ſolar year, by the adding of 11, and ſometimes of 12 days, at the end of the year, or by an emboliſmic month.

The beginning of the athenian or attic year was reckoned from that new moon, the full moon of which comes next after the ſummer ſolſtice. The macedonian lunar year agrees with the athenian, excepting

that the former takes its beginning, not from the ſummer-ſolſtice, but from the autumnal equinox. The ethiopic year is a ſolar year, agreeing with the actiac or fixed egyptian year, except in this, that the names of the months are different, and that it commences, with the egyptian year, on Aug. 29, of the julian year. The arabian or mahometan year is called alſo that of the hegira, becauſe the calculation of theſe years runs from the epocha of the hegira, when Mahomet fled from Mecca to Medina they had twelve civil months in a year, which contained 29 and 30 days, by turns, abating for their leap-years, in which the month Dulheggia has always 30. See HEGRIA.

The mahometans begin their year when the ſun enters aries; the Perſians, in the month anſwering to our June; the Chineſe, and moſt of the Indians, begin it with the firſt moon in March: at Rome there are two ways of computing the year, the one begining at the nativity of our Lord, which the notaries uſe; the other in March, on occaſion of the incarnation, and it is from this the bulls are dated. The civil or legal year, in England, as well as the hiſtorical year, commences Jan. 1, by the late act for the alteration of the ſtyle: the church, as to her ſolemn ſervice, begins the year on the firſt Sunday in Advent, which is always that next St. Andrew's day.

YEAR AND DAY, in law, ſignifies a certain time that by law determines a right, or works preſcription in divers caſes; as in the caſe of an eſtray, if the owner do not challenge it within that time, it becomes forfeited to the lord; ſo of a wreck, &c. The like time is given to proſecute appeals in; and where a perſon wounded, dies in a year and a day after the wound received, it makes the offender guilty of murder. See ESTRAY, &c.

There is alſo year and day and waſte, which is taken to be part of the king's prerogative, whereby he challenges the profits of the lands and tenements for a year and a day, of thoſe that are attainted of petty treaſon or felony; and the king may cauſe waſte to be made on the lands, &c. by deſtroying the houſes, ploughing up the meadows and paſtures, rooting up the woods, &c. unleſs the lord of the fee agrees with him for the redemption of ſuch waſte.

YEARN, in hunting, ſignifies to bark as beagles properly do at their prey.

YELLOW, one of the original colours of light. See COLOUR and LIGHT.

YELLOW, in dying, is one of the five ſimple and mother colours. See the articles COLOUR and DYING.

For the fineſt yellows, they firſt boil the cloth or ſtuff in alum or pot-aſhes, and give the colour with weld or wold.

Likewiſe turmeric gives a good yellow, though not the beſt.

There is alſo an indian wood, that gives a yellow colour bordering on gold. There is another ſort of yellow, made of ſavory; but this is inferior to them all.

With yellow, red of madder, and that of goat's hair prepared with madder, are made the gold yellow, aurora, thought-colour, macarate, iſabella, chamoiſe-colour, which are all caſts or ſhades of yellow.

Painters or enammellers make their yellow of maſticote, which is ceruſs raiſed to a yellow colour by the fire, or with oker. Limners and colourers make it with ſaffron, french berries, orcanette, &c. Mr. Boyle tells us a moſt beautiful yellow may be procured by taking good quick-ſilver, and three or four times its weight of oil of vitriol, and drawing off, in a glaſs-retort, the ſaline menſtruum from the metalline liquor, till there remains a dry ſnow-white calx at the bottom: on pouring a large quantity of fair-water on this, the colour changes to an excellent light yellow.

He ſays, he fears this colour is too coſtly to be uſed by painters; and he does not know how it would agree with every pigment, eſpecially oil-colours.

YELLOWS, a diſeaſe in a horſe, much the ſame with that called the jaundice in man. See the article JAUNDICE.

There are two kinds of it, the yellow and the black. The yellow is a very frequent diſorder, ſay the farriers, ariſing from obſtructions in the gall-pipe, or the little ducts opening into the ſame, occaſioned by viſcid or gritty matter lodged therein, or a plenitude and compreſſion of the neighbouring blood-veſſels, by means whereof the matter that ſhould be turned into gall, is taken up by the vein, and carried into the maſs of blood, which it tinctures yellow, ſo that the eyes, inſide of the lips, and other parts of the mouth capable of ſhewing the colour, appear yellow. The effect whereof is, that a horſe will be dull, heavy, and low-ſpirited, eaſily jaded by the leaſt labour or exerciſe, &c. The black is known by other ſymptoms: the whites of the eyes, mouth, and lips turn to a duſky colour, and not ſo clear and ſanguine

guine as before. For the cure of this diſeaſe, we are directed to diſſolve an ounce of mithridate in a quart of ale, or beer, and to give it the horſe lukewarm; or inſtead of mithridate, two ounces of venice-treacle; and if that is not to be had, three ſpoonfuls of common treacle.

This diſtemper is alſo incident to black cattle. The cure is, to bleed them in the ears, eyes, and in the tail; to put ſalt into their ears, and to rub them between your hands: and being blooded, give them two handfuls of ſalt down their throats, dry over night. In the morning let them have fenugreek, turmeric, long pepper, anniſe-ſeed, and liquorice, but two penny-worth in all, made into a powder, and given in a quart of ale milk-warm.

YELLOW-HAMMER, in ornithology, a ſpecies of frangilla, with a yellow head and a greyiſh yellow body. See the article FRANGILLA.

This is ſomewhat larger than the common ſparrow, and is an extremely beautiful bird: the head is large, the eyes have a hazel-coloured iris, the ears are patulous, the beak is robuſt and conic, and the ſides of the under chap of it are compreſſed, and of a ſingular form; the throat and belly is yellow, the breaſt has a rediſh tinge mixed with that colour, the ſhoulders are of a mixed green and grey, and the feathers which cover the body are black in their middle, but their edges have a tinge of green.

YEOMAN, the firſt or higheſt degree among the plebeians of England, next in order to the gentry. See the articles GENTLEMAN and COMMONS.

The yeomen are properly freeholders, who having land of their own, live on good huſbandry.

YEOMAN is alſo a title of office in the king's houſhold, of a middle place or rank between an uſher and a groom. See the articles USHER and GROOM.

YEOMEN *of the guard* were antiently two hundred and fifty men of the beſt rank under gentry, and of larger ſtature than ordinary, each being required to be ſix feet high.

At preſent there are but one hundred yeomen in conſtant duty, and ſeventy more not in duty; and as any of the hundred dies, his place is ſupplied out of the ſeventy.

They go dreſſed after the manner of king Henry VIII's time. They formerly had diet as well as wages, when in waiting, but this was taken off in the reign of queen Anne.

YEOVIL, a market town of Somerſetſhire, ſituated eighteen miles ſouth of Wells.

YERKING, in the manege, is when a horſe ſtrikes with his hind-legs, or flings and kicks back with his whole hind-quarters, ſtretching out the two legs nearly together, and even to their full extent. See AIR and LEAP.

YEST, YEAST, or BARM, a head, or ſcum, riſing upon beer or ale, while working or fermenting in the vat. See BREWING, MALT-LIQUORS, *&c.*

It is uſed for a leven or ferment in the baking of bread, as ſerving to ſwell or puff it up very conſiderably in a little time, and to make it much lighter, ſofter, and more delicate. When there is too much of it, it renders the bread bitter. See the articles BAKING and BREAD.

The faculty of medicine of Paris, by a decree of March 24, 1688, ſolemnly maintained it noxious to the health of the people: yet could not that prevent its progreſs.

YEW, *taxus*, in botany See TAXUS.

YEW, is alſo a term uſed by the ſalt-workers of Limington, and ſome other parts of England, to expreſs the firſt riſing of a ſcum upon the brine in boiling.

In the places where they uſe this term, they add no clariſying mixtures to the brine, for it ferments in the ciſterns, and all its foulneſs ſinks to the bottom, in form of a thin mud; they admit only the clear liquor into the pan, and boil this briſkly till it yews, that is, till a thin ſkin of ſalt appears upon its ſurface; they then damp the fire, and carefully ſkim off this film, and clear only the ſcratch, or calcareous earth, which ſeparates to the bottom.

They do not collect this into ſcratch-pans, as at many of the other works, but they rake it up to one ſide of the pan, and take it out; they then add a piece of butter, and continue the fire moderately ſtrong till the ſalt is granulated. They keep a briſker fire on this occaſion at Limington than in moſt of the other works, ſo that they will work three pans in twenty-four hours. See SALT.

YIELD, or SLACK *the hand*, in the manege, is to ſlack the bridle, and give the horſe head. See SLACK.

YLA, one of the weſtern iſlands of Scotland ſituated in the Iriſh ſea, weſt of Cantire.

YNCA, or INCA, an appellation antiently given

given to the kings of Peru, and the princes of their blood; the word literally ſignifying lord, king, emperor, and royal blood.

YOAK, or YOKE, in agriculture, a frame of wood, fitted over the necks of oxen, whereby they are coupled together, and harneſſed to the plough. See PLOUGH. It conſiſts of ſeveral parts, as the yoke, properly ſo called, which is a thick piece of wood, lying over the neck; the bow, which compaſſes the neck about; the ſtitchings and wreathings, which hold the bow faſt in the yoke; and the yoke-ring and ox-chain.

The Romans made the enemies they ſubdued, paſs under the yoke, which they called *ſub jugum mittere*, that is, they made them paſs under a ſort of *furcæ patibulares*, or gallows, conſiſting of a pike, or other weapon, laid acroſs two others, planted upright, in the ground. See the article FURCA.

YOAK *of Land*, *jugata terræ*, in our antient cuſtoms, was the ſpace which a yoke of oxen, that is, two oxen, may plow in one day. See HIDE and YARD-LAND.

Sea-YOAK. When the ſea is ſo rough, that the helm cannot be governed by the hands, the ſeamen make a yoak to ſteer by, that is, they fix two blocks to the end of the helm, and reeving two ſmall ropes thro' them, which they call falls, by having ſome men at each tackle, they govern the helm by direction. They have another way of making a ſea-yoak, by taking a double turn about the end of the helm with a ſingle rope, the ends being laid to the ſhip ſides, by means whereof they guide the helm. See HELM.

YOANGFU, a city of China, in the province of Huguam, ſituated on the river Kiam, eaſt long. 114°, north lat. 30° 40′

YOLK, or YELK, *vitellus*, the yellow part in the middle of an egg. See EGG.

YONNE, a river of France, which riſing in Burgundy, and running north through Nivernois and Champain, falls into the Seyne at Monterau ſur Yonne.

YORK, the capital city of Yorkſhire, ſituated on the river Ouſe, 180 miles north of London: weſt long. 50′, north lat. 54°. It is a large city, and has ſome good buildings in it, particularly the Cathedral, which is a gothic pile, equal to any thing of the kind in England. It is the ſee of an archbiſhop, and ſends two members to parliament.

New-YORK, one of the britiſh colonies in north America, which comprehending the Jerſeys, that frequently have the ſame governor, is ſituated between 72° and 74° of weſt long, and between 41° and 44° of north lat. bounded by Canada on the north; New-England on the eaſt; the american Sea on the ſouth; and Penſilvania, and the country of the Iroquois on the weſt.

New-YORK, the capital city of this province, is ſituated on an iſland in the mouth of Hudſon's river, in weſt long. 72° 30′, north lat. 41°.

YOUTH. See the article ADOLESCENCE. The renovation of youth has been much ſought after by chemical adepts; and many of them pretended to various ſecrets, for this purpoſe But unluckily, the death of the pretenders proved a ſufficient refutation of their doctrine. Paracelſus talks of the mighty things he could do with his *ens primum*; and even Mr. Boyle tells us ſome ſtrange things about the *ens primum* of balm. See the article ENS.

YOUTH, *juventus*, in the Pagan theology, a goddeſs worſhipped among the Romans, who, together with the gods Mars and Terminus, kept her place in the capitol along with Jupiter, when the other deities were turned out. Whence the Romans drew a lucky omen for the durableneſs of their empire.

YPRES, a ſtrong city of the auſtrian Netherlands, ſituated eaſt long. 2° 46′, north lat. 50° 54′.

YPSILOIDES, in anatomy, the third genuine ſuture of the cranium, thus called from its reſembling a greek υ or ypſilon. See SUTURE and SKULL.

YUCCA, the *Indian bread-plant*, in botany, a genus of the *hexandria monogynia* claſs of plants, the corolla whereof is of a campanulated ſhape, and formed of ſix large oval petals, cohering at the baſe; or of a ſingle petal, divided almoſt to the baſe into ſo many ſegments; the fruit is an oblong, obtuſely triangular capſule, with three furrows, formed of three valves, and containing three cells; the ſeeds are numerous, and incumbent in a double order. The yucca approaches very near to the aloe, but is a diſtinct genus. A kind of bread is made from the dried root of this plant by the indians, which much reſembles that made from the root of the caſſida or ſcutellaria of Linnæus. See the article SCUTELLARIA.

YVICA, a ſpaniſh iſland, ſituated in the Mediterranean Sea, between the province of Valencia, in Spain, and the iſland of Majorca: in 1° eaſt long. north lat. 39°, being about thirty miles long, and twenty-four broad.

Z.

Z, or z, the twenty-fourth and laſt letter, and the nineteenth conſonant of our alphabet; the ſound of which is formed by a motion of the tongue from the palate downwards and upwards to it again, with a ſhutting and opening of the teeth at the ſame time. This letter has been reputed a double conſonant, having the ſound *d s*; but ſome think with very little reaſon; and, as if we thought otherwiſe, we often double it, as in *puzzle*, *muzzle*, &c. Among the antients, Z was a numeral letter, ſignifying two thouſand, and with a daſh added a-top, $\overline{Z}$ ſignified two thouſand times two thouſand, or four millions.

In abbreviations this letter formerly ſtood as a mark for ſeveral ſorts of weights; ſometimes it ſignified an ounce and a half, and very frequently it ſtood for half an ounce; ſometimes for the eighth part of an ounce, or a dram troy weight; and it has in earlier times been uſed to expreſs the third part of an ounce, or eight ſcruples. ZZ were uſed by ſome of the antient phyſicians to expreſs myrrh, and at preſent they are often uſed to ſignify zinziber, or ginger.

ZAARA, or SARRA, one of the diviſions of Africa, ſituated under the tropic of cancer, is bounded by Bildulgerid, on the north; by the unknown parts of Africa, on the eaſt; by Nigritia, or Negroland, on the ſouth; and by the Atlantic ocean, on the weſt. This is a barren deſart, and ſo deſtitute of water, that the camels which paſs over it from Morocco to traffic with Negroland, are half loaded with water and proviſions.

ZABAC SEA, or PALUS MEOTIS. See the article MEOTIS.

ZACINTHA, STELLATED HAWK-WEED, in botany, the lapſona of Linnæus, a plant of the *ſyngeneſia-polygamia-æqualis* claſs, the compound flower of which is imbricated with about ſixteen equal and uniform hermaphrodite corollulæ; the partial corolla is monopetalous, ligulated, truncated, and quinquedentated; there is no pericarpium; the ſeed is ſingle, oblong, and cylindrically trigonal; the receptacle is naked and plain.

This genus comprehends the lampſana, hedypnois, zacintha, and rhagadiolus, or rhagadioloides of authors. In the lampſana the ſeeds are all naked, not ſurrounded by the ſquamæ of the cup. In the rhagadiolus, every ſquama of the cup incloſes a ſingle ſeed. In the zacintha, the marginal ſeeds are each ſurrounded by a ſquama of the cup, and the central ones are coronated with a ſhort ſimple down. In the hedypnois the marginal ſeeds are each ſurrounded in a ſquama of the cup, and the central ones are coronated with a cup divided into five denticles.

ZAFFER, or ZAFFRE, in chemiſtry, the name of a blue ſubſtance, of the hardneſs and form of a ſtone; and generally ſuppoſed to be a native foſſil.

It is in reality, however, a preparation of cobalt; the calx of that mineral being mixed with powdered flints and wetted with water to bring it into this form. See the article COBALT.

To prepare this for uſe in the glaſs-trade, put it in groſs pieces into earthen pans, and let it ſtand half a day in the furnace; then put it into an iron-ladle to be heated red hot in the furnace; take it out while thus hot, and ſprinkle it with ſtrong vinegar; and when cold, grind it on a porphyry to an impalpable powder; then throw this into water in glazed earthen pans; and when it has been well ſtirred about, let it ſettle, and pour off the water: repeat this waſhing often, and the foulneſs of the zaffre will be thus wholly ſeparated: dry the powder, and keep it for uſe.

ZAIM, a portion of land allotted for the ſubſiſtance of a horſeman in the turkiſh militia, called alſo timar. See the article TIMAR.

ZAIRAGIA, a kind of divination in uſe among the Arabs, performed by means of divers wheels or circles placed concentric to one another, and noted with ſeveral letters which are brought to anſwer to each other by moving the circles according

cording to certain rules. See the article DIVINATION.

ZAMORA, a city of Spain, in the province of Leon, ſituated on the river Douro, thirty-two miles north of Salamanca: weſt long. 6°, north lat. 41° 30′.

ZAMOSKI, a town of Poland, in the province of Red Ruſſia, and palatinate of Beltz, ſituated an hundred and ten miles north-eaſt of Cracow.

ZANGUEBAR, a country on the eaſt coaſt of Africa, ſituated in ſouthern latitude between the equator and the tropic of capricorn, being bounded by the country of Anian, on the north; by the Indian ocean, on the eaſt; by Caffraria, on the ſouth, and by the unknown parts of Africa, on the weſt.

ZANNICHELLIA, in botany, a genus of the *monoecia-monandria* claſs of plants, the male-flower of which conſiſts only of a ſingle ſtamen; it has neither calyx nor corolla. In the female-flower the calyx is compoſed of a ſingle leaf; there is no corolla; the germina are about four; the ſeeds, which are oblong and accuminated on both ſides, are as many.

ZANONIA, in botany, a genus of the *dioecia-pentandria* claſs of plants; the calyx of the male-flower is formed of three leaves; the corolla is formed of a ſingle petal, divided into five parts. The calyx of the female-flower is alſo compoſed of three leaves, and the corolla formed of a ſingle petal, divided into five ſegments; the fruit is a long, very large, truncated berry, attenuated at the baſe; it contains three cells, placed under the receptacle: there are two plane-oblongo-roundiſh ſeeds in each cell.

ZANONIA, in botany, is alſo Plumier's name for the commelina of Linnæus. See the article COMMELINA.

ZANTE, an iſland in the Mediterranean-ſea, ſituated eaſt long. 21° 30′, north lat. 37° 50′, being about twenty-four miles long, and twelve broad. The chief town is Zant, and is ſituated on the eaſt ſide of the iſland, being well fortified and defended by a caſtle.

ZAPATA, or SAPATA, a kind of feaſt or ceremony held in Italy, in the courts of certain princes, on St. Nicholas's day; wherein people hide preſents in the ſhoes or flippers of thoſe they would do honour to, in ſuch a manner as may ſurprize them on the morrow, when they come to dreſs; being done in imitation of the practice of St. Nicholas, who uſed, in the night-time, to throw purſes of money in at the windows, to marry poor maids withal.

ZARA, a city of Dalmatia, ſituated on the gulph of Venice: eaſt long. 17°, north lat. 44°.

ZARNICH, in natural hiſtory, the name of a genus of foſſils; the characters of which are theſe: they are inflammable ſubſtances, not compoſed of plates or flakes, but of a plain, ſimple, and uniform ſtructure, not flexile nor elaſtic, ſoluble in ore, and burning with a whitiſh flame, and noxious ſmell like garlic. Of this genus there are four known ſpecies: 1. A red one, which is the true ſandarach. See the article SANDARACH. 2. A yellow one, found in great abundance in the mines of Germany, and frequently brought over to us among, and under the name of, orpiment. 3. A greeniſh one, very common in the mines of Germany, and ſold in our colour-ſhops under the name of a coarſe orpiment. This is alſo found in our own country among the tin mines of Cornwall. And, 4. A whitiſh one, a very remarkable ſubſtance, which has the property of turning black ink into a fine florid red. This is common in the mines of Germany, but is of little value. See ORPIMENT.

ZARNAW, a city of Poland, in the province of little Poland and palatinate of Sandomir, ſituated eaſt long. 20°, north lat. 51° 30′.

ZATMAR, a town of Hungary, ſituated forty-five miles eaſt of Tockay.

ZATOR, a town of Poland, ſituated on the river Viſtula, fourteen miles weſt of Cracow.

ZEA, INDIAN CORN, in botany, a genus of the *monoecia triandria* claſs of plants. In the male-flower the calyx is a biflorous glume, and has no ariſtæ, or awns; the corolla is alſo a glume without awns. In the female-flower the calyx is a glume formed of two valves; the corolla is alſo a glume formed of two valves; the ſtyle is ſimple, filiform, and pendulous; the ſeeds are ſingle, and are immerſed in a long receptacle.

ZEAL, ζηλος, the exerciſe of a warm animated affection, or paſſion, for any thing. See the article PASSION.

The greek philoſophers make three ſpecies of zeal. The firſt of envy, the ſecond of emulation or imitation, the third of piety or devotion, which laſt makes what the divines call a religious zeal. See ENVY and EMULATION.

ZEALAND,

ZEALAND, the chief of the daniſh iſlands, is ſituated at the entrance of the Baltic-ſea, bounded by the Schaggerrac-ſea, on the north; by the Sound, which ſeparates it from Schonen, on the eaſt; by the Baltic-ſea, on the ſouth; and by the ſtrait called the great Belt, which ſeparates it from the iſland of Funen, on the weſt; being of a round figure, near two hundred miles in circumference: the chief town is Copenhagen.

ZEALAND, is alſo a province of the United Netherlands, conſiſting of eight iſlands, which lie in the mouth of the river Scheld, bounded by the province of Holland, from which they are ſeparated by a narrow channel, on the north; by Brabant, on the eaſt; by Flanders, from which they are ſeparated by one of the branches of the Scheld, on the ſouth; and by the German-ocean, on the weſt.

ZEALOTS, an antient ſect of the Jews, ſo called from their pretended zeal for God's laws, and the honour of religion. The zealots were a moſt outrageous and ungovernable people; and on pretence of aſſerting God's laws, and the ſtrictneſs and purity of religion, aſſumed a liberty of queſtioning notorious offenders without ſtaying for the ordinary formalities of law. Nay, when they thought fit, they executed capital puniſhments upon them with their own hands. They looked upon themſelves as the true ſucceſſors of Phineas, who out of a great zeal for the honour of God, did immediate execution upon Zimri and Cozbi; which action was ſo pleaſing to God, that he made with him and his ſeed after him the covenant of an everlaſting prieſthood.

ZEBLICIUM *marmor*, in natural hiſtory, a name given by ſeveral authors to a ſoft green marble variegated with black and white; and though the authors who have deſcribed it have not obſerved it, yet it no way differs from the white ophites of the antients. See the articles MARBLE and OPHITES.

ZEBRA, the WILD ASS, in zoology, a ſpecies of equus, tranſverſly ſtriated. See HORSE and ASS.

This is an extremely beautiful animal, and though in colouring ſo much different from all other kinds and varieties of equus, agrees with it in all other reſpects: it is about equal to the common aſs in ſize, but of a much more elegant figure; the head is ſmall and ſhort, the ears are long, the eyes are large and bright, and the mouth conſiderably large; the neck is long and ſlender, but elegantly turned; the body is rounded, and ſmall in compariſon of that of the common aſs; the legs are long and ſlender, the tail long and beautiful, but hairy only at the end. See plate CCCII. fig. 1.

The whole animal is party-coloured, or beautifully ſtriped in a tranſverſe direction, with long and broad ſtreaks, alternately of a deep, gloſſy, and ſhining browniſh and whitiſh, with ſome abſolutely black. It is a native of many parts of the Eaſt.

ZECHARIAH, a canonical book of the Old Teſtament, containing the predictions of Zechariah, the ſon of Barachia, and grandſon of Iddo. He is the eleventh of the twelve leſſer prophets. Zechariah entered upon the prophetic office at the ſame time with Haggai, and was ſent to the Jews upon the ſame meſſage, to reprove them for their backwardneſs in erecting the temple, and reſtoring divine worſhip; but eſpecially for the diſorder of their lives and manners, which could not but derive a curſe upon them. By ſeveral notable viſions and types, he endeavours to confirm their faith, and eſtabliſh their aſſurance concerning God's providence with them, and care over them; and as a proof and demonſtration of this, he interſperſes the moſt comfortable promiſes of the coming of the kingdom, the temple, the prieſthood, the victory, the glory of Chriſt the branch. Nor does he forget to aſſure them of the ruin of Babylon, their moſt implacable enemy. This prophet is the longeſt and moſt obſcure of all the leſſer prophets, his ſtyle being interrupted and without connection.

ZEDOARY, in the materia medica, a root, the ſeveral pieces of which differ ſo much from one another in ſhape, that they have been divided into two kinds, as if two different things, under the names of the long and round zedoary, being only the ſeveral parts of the ſame root.

The long pieces of zedoary are of a very ſingular figure; they are not of the nature of the common long roots of plants, but are, themſelves, properly tubera or glandules, as well as the round ones, differing from them in nothing but their oblong figure: they are two, three, or four inches in length, and of the thickneſs of a man's finger; not large at one end and tapering away to the other, but thickeſt in the middle, and growing gra-

dually ſmaller to each end, where they terminate in an obtuſe point each way: they are of a tolerable ſmooth ſurface, except that they have ſome little protuberances in ſeveral parts from which fibres have originally grown: they are of a very cloſe and compact texture, conſiderably heavy, and very hard; they will not cut eaſily with a knife; when cut, they ſhew a fine, ſmooth, and gloſſy ſurface; they are of a pale greyiſh colour on the outſide, with a faint mixture of brown in it, and are of a dead whitiſh hue within: they are not eaſily powdered in the mortar; their ſmell, while bruiſing, is very remarkable, and is highly aromatic, and of a bitteriſh taſte. The round zedoary has all the ſame characters with this, and differs only in figure, being ſhort and roundiſh, of the ſize of a ſmall walnut, ſmooth on the ſurface, except where the bundles of fibres have adhered, and generally running into a ſharp point at the end.

Zedoary is to be choſen freſh, ſound, and hard, in large pieces; it matters not as to ſhape, whether long or round; of a ſmooth ſurface, and of a ſort of fatty appearance within, too hard to be bitten by the teeth, and of the briſkeſt ſmell that may be; ſuch as is friable, duſty, and worm-eaten, is to be rejected.

The antient Greeks were wholly unacquainted with zedoary; there is no mention of any ſuch drug in the works of Dioſcorides or Galen. The Arabians, however, were well acquainted with it; they mention it ſometimes under the name of zedoary, and ſometimes under that of zerumbeth, but are ſo ſhort in their deſcriptions, and ſo at variance among one another, that it is not eaſy to aſcertain their meaning, as to the diſtinction, if they originally meant any, between the ſubſtances expreſſed by theſe two names.

Serapio and Rhazes uſe the words zedoaria and zerumbeth as ſynonymous, and declare both to mean only the ſame root. Avicenna, on the contrary, diſtinguiſhes the zedoary and zerumbeth, and even talks of two kinds of zedoary. Others of them make the zarnab they ſpeak of different both from the zedoary and zerumbeth; but Serapio, an author as much to be depended upon for his accuracy as any of them, declares zedoary, zerumbeth, and zarnab, all to be the ſame thing.

Zedoary, both of the long and round kind, is brought us from China; and we find by the Arabians, that they alſo had it from the ſame place. The round tubera are leſs frequent than the long, and ſome of them have, therefore, ſuppoſed them the produce of a different and more rare plant; but this is not ſo probable as that the general form of the root is long, and the round tubera are only luſus naturæ, and leſs frequent in it.

The plant which produces it, is one of the claſs of the herbæ bulboſis affines of Mr. Ray. It is deſcribed, in the Hortus Malabaricus, under the name of the malan kua. Zedoary, diſtilled with common water, affords a thick and denſe eſſential oil, which ſoon concretes of itſelf into a kind of camphor, and on this oil its virtues principally depend. It is a ſudorific, and is much recommended by ſome in fevers, eſpecially of the malignant kinds. It is alſo given with ſucceſs as an expectorant in all diſorders of the breaſt, ariſing from a tough phlegm, which it powerfully incides and attenuates; it is alſo good againſt flatulencies, and in the cholic; it ſtrengthens the ſtomach, and aſſiſts digeſtion; and, finally, is given with ſucceſs in nervous caſes of all kinds. It is not an ingredient in any of our ſhop-compoſitions. It was in the Philonium Romanum of the late London Diſpenſatory, but it is now omitted in the Philonium Londinenſe of this: in extemporaneous perſcriptions it is ſeldom given ſingly, but is a common ingredient in reſtorative powders and infuſions. Its doſe is from five to ten grains in powder, and from a drachm to two drachms to the pint in infuſion.

ZEIGINHEIM, a town of Germany, in the landgraviate of Heſſe-Caſſel, ſituated thirty miles ſouth of Heſſe-Caſſel city.

ZEITS, a town of Germany, in the circle of Upper Saxony, ſituated twenty-four miles ſouth-weſt of Leipſic.

ZELL, a city of Germany, in the circle of Lower Saxony, capital of the dutchies of Zell and Lunenburg, ſituated at the confluence of the rivers Aller and Fuhſe, thirty miles north of Hanover, and forty ſouth of Lunenburg: eaſt long. 10°, north lat. 52° 52′.

ZEMBLA NOVA. See NOVA-ZEMBLA.

ZEND, or ZENDAVESTA, a book containing the religion of the magians, or worſhip-

worſhippers of fire, who were diſciples of the famous Zoroaſter. See MAGI.

This book was compoſed by Zoroaſter during his retirement in a cave, and contained all the pretended revelations of that impoſtor. The firſt part contains the liturgy of the magi, which is uſed among them in all their oratories and fire-temples to this day; they reverence it as the chriſtians do the bible, and the mahometans the koran. There are found many things in the zend taken out of the ſcriptures of the Old Teſtament, which Dr. Prideaux thinks is an argument that Zoroaſter was originally a Jew. Great part of the pſalms of David are inſerted: he makes Adam and Eve to have been the firſt parents of mankind, and gives the ſame hiſtory of the creation and deluge as Moſes does, and commands the ſame obſervances about clean and unclean beaſts, the ſame law of paying tythes to the ſacerdotal order, with many other inſtitutions of jewiſh extraction. The reſt of its contents are an hiſtorical account of the life, actions, and prophecies of its author, with rules and exhortations to moral living. The mahometans have a ſect which they call zendikites, who are ſaid to be the ſadducees of mahometaniſm, denying providence and the reſurrection, believing the tranſmigration of ſouls, and following the zend of the magi.

ZENITH, in aſtronomy, the vertical point; or a point in the heavens directly over our heads. See NADIR, VERTEX, and VERTICAL.

The zenith is called the pole of the horizon, becauſe it is ninety degrees diſtant from every point of that circle. See the articles POLE and HORIZON.

ZENITH-DISTANCE, is the complement of the meridian altitude of any heavenly object; or it is the remainder, when the meridian altitude is ſubtracted from ninety degrees. See COMPLEMENT and ALTITUDE.

ZENSUS, in arithmetic, a name given to a ſquare number, or the ſecond power, by ſome authors. See SQUARE and POWER.

ZEPHANIAH, a canonical book of the Old Teſtament, containing the predictions of Zephaniah the ſon of Cuſhi, and grandſon of Gedaliah; being the ninth of the twelve leſſer prophets. He propheſied in the time of king Joſiah, a little after the captivity of the ten tribes, and before that of Judah; ſo that he was contemporary with Jeremiah. He freely publiſhes to the Jews, that what increaſed the divine wrath againſt them, was their contempt of God's ſervice, their apoſtacy, their treachery, their idolatry, their violence and rapine, and other enormities: ſuch high provocations as theſe, rendered their deſtruction terrible, univerſal, and unavoidable: and then, as moſt of the prophets do, he mingles exhortations with repentance, as the only expedient in theſe circumſtances.

ZEPHYR, *zephyrus*, the weſt-wind; or that which blows from the cardinal point of the horizon oppoſite to the eaſt. See WIND, WEST, and COMPASS.

ZEST, the woody thick ſkin, quartering the kernel of a walnut; preſcribed by ſome phyſicians, when dried and taken with white wine, as a remedy againſt the gravel.

Zeſt is alſo uſed for a chip of orange or lemon-peel; ſuch as is uſually ſqueezed into ale, wine, &c. to give it a flavour; or the fine ethereal oil which ſpurts out of that peel on ſqueezing it.

ZETETIC METHOD, in mathematics, the method made uſe of to inveſtigate or ſolve a problem.

ZEUGMA, a figure in grammar, whereby an adjective or verb which agrees with a nearer word, is alſo, by way of ſupplement, referred to another more remote.

ZEUS, in ichthyology, a genus of the acanthopterygious order of fiſhes, the characters of which are as follow: the body is very broad, thin, and compreſſed; the ſcales are rough; there is only one fin on the back, but it is very long, and cut in ſo deeply near the anterior part, that it appears to be two fins; the branchioſtege membranes do not conſiſt of parallel bones, as in other fiſh, but have a number of oſſicles of various figures, ſome of them placed longitudinally, ſome tranſverſely, and ſome obliquely.

To this genus belong the doree, the indian doree, and the aper or riondo. See the articles DOREE and RIONDO.

ZIBETHICUS, ZIBETHICUM ANIMAL, the CIVET CAT, in zoology, the grey meles, with uniform claws. See the article MELES.

It was long before the form of this creature, to whom we owe the civet, was known, and long after this before it could be determined to what genus of quadrupeds it belonged: it was firſt ſup-

poſed of the cat, and afterwards of the dog-kind; but it is truly one of the badger ſpecies. It is a large and fierce animal; (See plate CCCII. fig. 2.) its ſize is that of the common badger, but its body is not ſo bulky; the head is large, oblong, and conſiderably thick; the forehead is depreſſed; the ſnout is rounded and thick; the noſe turns up a little; the mouth is wide, and is furniſhed in a very formidable manner, with teeth; and there are a few rigid but very long whiſkers placed about it; the eyes are ſmall, the ears large, obtuſe, and patulous; the neck is long, rigid, and thick; the tail long, and reſembling that of the common cat; it is covered with hair, and there runs a ridge of the ſame hair all along the top of the back. The whole animal is of a light ſilvery colour, variegated in a beautiful manner, with large ſpots of black; the legs are very robuſt, almoſt intirely black, the feet are armed with very long and ſharp claws; under the tail is ſituated the bag, in which is contained the perfume we call civet; and its ſituation is the ſame with that which contains the white ſebaceous matter in the badger. See BADGER and CIVET.

ZIBETHUM, *civet*. See CIVET.

ZINC, or ZINK. See the article ZINK.

ZINGIBER, or ZINZIBER, *ginger*, in botany and pharmacy, *&c.* See the article ZINZIBER and GINGER.

ZINK, or ZINC, or ZINCK, in natural hiſtory, the name of a very remarkable foſſile ſubſtance, reſembling biſmuth in appearance, but of a bluer colour. See the article BISMUTH.

It is a very remarkable mineral, and one that has never been well underſtood as to its origin, till of late; for though the world well knew of a long time both zink and lapis calaminaris, and knew that both of them had the remarkable property of turning copper into braſs, which one would think might have given a hint to the diſcovery of a natural alliance between them; yet have they been ever treated of as two different ſubſtances, by the writers on theſe ſubjects; and Dr. Lawſon was the firſt who ever publicly declared, and proved, lapis calaminaris to be the ore of zink. See the article CALAMINARIS *Lapis*.

Zink is generally confounded with biſmuth, though in reality a very different body; but the regulus of theſe two minerals having a very great external reſemblance, the vulgar have not diſtinguiſhed them; and hence we hear of many ores of zink in the leſs accurate writers, all which are truly the ores of biſmuth.

The lapis calaminaris is the true and general ore of zink, yet that mineral is not confined to this ore alone, but is mixed in great abundance in its diſſeminated particles among the matter of the ores of other metals, particularly of lead.

Our artificers have long been acquainted with zink, under the name of ſpelter; but none of them till of late have ever been able to make any gueſs as to its origin. We have much zink brought to us from the Eaſt-Indies, under the name of tutenag; yet no body ever knew from what, or how it was produced there; and all that was heretofore known of it was, that among that ſtrange mixture of ores which the great mine yields at Goſſelaer in Saxony, when they were fuſed for other metals, a large quantity of zink was produced; but Dr. Lawſon obſerving, that the flowers of zink and of lapis calaminaris were the ſame, and that their effects on copper were the ſame, never ceaſed his inquiries till he found the method of ſeparating zink from it.

The pure zink is a ſolid metal-like body, of a bluiſh white, and ſomewhat leſs brittle than biſmuth, eſpecially when gently heated, and moſt, of all the metallic minerals, approaches to malleability: it melts in a very ſmall fire, and in a ſtrong one takes fire, burning with a bluiſh-green flame, and ſubliming into white flowers, which are with difficulty reducible again into the form of zink: in an open fierce fire, it wholly flies off in vapour.

There is great reaſon to believe, that all the zink or tutenag brought from the Eaſt-Indies, is procured from calamine; and we have now on foot at home, a work eſtabliſhed by the diſcoverer of this ore, which will probably make it very ſoon unneceſſary to bring any zink into England, as we have great plenty of the calamine.

The manner of extracting zink from the lapis calaminaris, is this: the lapis calaminaris muſt be finely pulverized, and well mixed with an eighth part of charcoal-duſt, and put into a cloſe retort to prevent the acceſs of the air, which would

would inflame the zink as it rifes. The retort is to be placed on a violent fire, fufficient to melt copper. After fome time the zink rifes, and appears in the form of metallic drops within the neck of the retort. When the veffel is cool, it muft be taken out, by breaking off the neck of the retort.

Flowers of ZINK. The flowers of zink are a fubftance famous in the writings of the chemifts, who have led their followers into a thoufand errors by the names by which they have called them.

Some have called them talc, and a folution of them in vinegar, oil of talc; to which they have attributed very extraordinary qualities. Some have fet the ignorant upon a fruitlefs attempt of extracting an oil from venetian talc, to do all the things they have commemorated of this oil. Others have called thefe flowers the fericum: others the aqua ficca philofophorum; and others the philofophic cotton.

The moft fimple and eafy way of obtaining the flowers of zink pure and white, is this: melt the zink in a tall crucible inclined in the furnace in an angle of 45 degrees, or thereabouts; let the fire be moderate, little ftronger than would be neceffary for the melting of lead. If the zink is left in this ftate without being ftirred, it forms a grey cruft upon its furface, and becomes calcined by degrees under it into a granulofe white fubftance; but to have the flowers, the matter muft be ftirred from time to time with an iron rod, and this cruft broken as often as it arifes; there will then, after fome time, appear a bright white flame, and about two inches above it there will be found a very thick fmoak, and with this there will arife a quantity of very white flowers, which will fix themfelves to the fides of the crucible in the form of fine cotton.

Thefe flowers are to be feparated at times, and by careful management there may be collected from the zink a greater weight of flowers than its own weight, when put into the fire. In working four pounds of zink in this manner, there will be only about an ounce of a calcined earthy matter left at the bottom of the crucible, and the quantity of flowers will be about two drams and a half in each pound, more than the quantity of zink; befide that, it is eafy to conceive from the manner of making them, that a great quantity muft have been carried away with the fmoak. And this is not to be prevented, fince if the veffel be clofed to keep in the fumes, the external air being denied free acceſs, the fublimation immediately ceafes, and no more flowers can be obtained, till the veffel is again opened, and the air admitted.

The fumes of zink have a ftrong fmell of garlic, and are very noxious to the lungs. The reducing zink into thefe flowers, is the deftroying it abfolutely as to its metallic form; for none of the methods ufed by chemifts to bring back metals to their original ftate, are able to bring thefe flowers to zink again.

ZINZIBER, or ZINGIBER, GINGER, in botany, the naked ftalked oval fpiked amomum. See the articles AMOMUM and GINGER.

ZIRICKSEE, a port-town of the united Netherlands, in the province of Zealand, fituated on the fouth fide of the ifland of Schowen, fifteen miles north-eaft of Middleburg.

ZITTAU, a town of Germany, in the circle of upper Saxony, and marquifate of Lufatia, fituated on the river Niefs, fifty-five miles eaft of Dreſden.

ZIZANIA, in botany, a genus of the *monoecia hexandria* claſs of plants; the male corolla whereof is a glume formed of two valves; the female corolla is a glume formed of a fingle valve, of a cuculated form, and terminated by an ariſta or awn; there is no calyx in either the male or female flowers; the feed is fingle, and placed in the bottom of the corolla, which opens horizontally to let it out.

ZIZIPHORA, the AMETHYSTEA, in botany, a genus of the *diandria-monogynia* claſs of plants, the corolla whereof is formed of a fingle ringent petal; the tube is cylindric, and of the length of the cup; the limb is very fmooth, the upper lip is ovated, erect, emarginated, and obtufe, the lower lip is broad and patent, and is divided into three equal rounded fegments; there is no pericarpium, but the cup contains four feeds which are oblong and obtufe, gibbous on one fide, and angular on the other.

ZIZIPHUS, in botany, a name whereby fome authors call the rhamnus. See the article RHAMNUS.

ZOCCO, ZOCCOLO, ZOCLE, or SOCLE, in architecture, a kind of ftand or pedeſtal,

deſtal, being a low ſquare piece, or member, ſerving to ſupport a buſto, ſtatue, pedeſtal, or the like thing that needs to be raiſed. See the article SOCLE.

ZODIAC, *zodiacus*, in aſtronomy, a faſcia or broad circle, whoſe middle is the ecliptic, and its extremes two circles, parallel thereto, at ſuch a diſtance from it, as to bound or comprehend the excurſions of the ſun and planets. See ECLIPTIC, EARTH, PLANET and SUN.

The ſun never deviates from the middle of the zodiac, *i. e.* from the ecliptic, but the planets all do more or leſs. Their greateſt deviations, called latitudes, are the meaſure of the breadth of the zodiac, which is broader or narrower, as the greateſt latitude of the planets is made more or leſs; accordingly ſome make it ſixteen, ſome eighteen, and ſome twenty degrees broad. See LATITUDE.

The zodiac, cutting the equator obliquely, makes an angle therewith, of 23° and a half, or more preciſely of 23° 29′, which is what we call the obliquity of the zodiac, and is the ſun's greateſt declination. See the articles OBLIQUITY and DECLINATION.

The zodiac is divided into twelve portions, called ſigns, and thoſe diviſions or ſigns are denominated from the conſtellations which antiently poſſeſſed each part; but the zodiac being immoveable, and the ſtars having a motion from weſt to eaſt, thoſe conſtellations no longer correſpond to their proper ſigns, whence ariſes what we call the preceſſion of the equinoxes. See the articles SIGN, CONSTELLATION, and PRECESSION.

When a ſtar therefore is ſaid to be in ſuch a ſign of the zodiac, it is not to be underſtood of that ſign or conſtellation of the firmament, but only of that twelfth part of the zodiac, or dodecatemory thereof. See the article STAR and DODECATEMORY.

Caſſini has alſo obſerved a track in the heavens, within whoſe bounds moſt of the comets, though not all of them, are obſerved to keep, which for this reaſon he calls the zodiac of the comets. See the article COMET.

This he makes as broad as the other zodiac, and marks it with ſigns and conſtellations like that, as Antinous, Pegaſus, Andromeda, Taurus, Orion, the leſſer Dog, Hydra, the Centaur, Scorpion, and Sagittary.

ZOLLERN, or HOENZOLLERN, a city of Germany, in the circle of Swabia, capital of the county of Zollern, and ſubject to its count, ſituated eaſt long. 8° 55′, north lat. 48° 18′.

ZOLNOCK, a town of upper Hungary, ſituated on the river Teyeſſe, fifty-five miles eaſt of Buda.

ZONE, Ζωνη, in geography and aſtronomy, a diviſion of the terraqueous globe, with reſpect to the different degree of heat found in the different parts thereof. See EARTH and HEAT.

A zone is the fifth part of the ſurface of the earth, contained between two parallels. See PARALLEL.

The zones are denominated torrid, frigid and temperate.

The torrid zone is a faſcia, or band ſurrounding the terraqueous globe, and terminated by the two tropics. Its breadth is 46° 58′. The equator, running thro' the middle of it, divides it into two equal parts, each containing 23° 29′. The antients imagined the torrid zone uninhabitable. See TROPIC and TORRID.

The temperate zones are two faſciæ, or bands, environing the globe, and contained between the tropics and the polar circles, the breadth of each is 43° 2′. See the article TEMPERATE.

The frigid zones are ſegments of the ſurface of the earth, terminated, one by the antarctic, and the other by the artic circle. The breadth of each is 46° 58′. See ARCTIC and ANTARCTIC.

ZONNAR, a kind of belt, or girdle of black leather, which the Chriſtians and Jews of the Levant, particularly thoſe in Aſia, and the territories of the grand ſeignior, are obliged to wear to diſtinguiſh them from the mahometans.

ZOOLOGY, Ζωολογια, the ſcience of animals. Artedi obſerves, that this makes one of the three kingdoms, as they are called, of natural hiſtory; the vegetable and the mineral being the two others: in theſe, however, there is this difference made by writers, that while vegetables and minerals are treated of together, as all of a piece in each, the ſubjects of zoology are divided; and it is made to compoſe, as it were, ſeveral kingdoms. Whoever is to write on plants and minerals, calls his work a treatiſe of botany, or mineralogy; and we have no words to expreſs any ſubdiviſion of them into kingdoms: but, in zoology, we treat as different ſubjects, the different parts of

of it; and the hiſtory of birds is ſeparated by ſome from the reſt under the name of ornithology; that of quadrupeds under the name of tetrapodology; and we have for the reſt, the words entomology, amphibiology, and the like, expreſſing theſe things which are properly but the parts of zoology, as ſo many diſtinct and ſeparate ſtudies. See the articles BOTANY and MINERALOGY.

The ſame author obſerves, that this may eaſily be amended, by our conſidering the animal world as we do the vegetable and mineral, and dividing it, as we do the others, into its proper families; it will then be found that theſe are no better diſtinctions than thoſe of the families of theſe things, and that the authors may as well ſet up ſeparate ſtudies under the names of bulbology, umbelliferology, and the like, as thoſe.

A natural diviſion of the ſubjects of zoology, on this principle, will afford ſix ſeveral families of its ſubjects. 1. The hairy quadrupeds. 2. The birds. 3. The amphibious animals, ſuch as ſerpents, lizards, frogs, and tortoiſes. 4. The fiſhes. 5. The inſects. And ſixthly, thoſe loweſt order of animated beings the zoophytes. See the articles QUADRUPED, BIRD, FISH, ORNITHOLOGY, ICHTHYOLOGY, *&c.*

ZOOPHORIC, or ZOOPHORIC COLUMN, is a ſtatuary column, or a column that bears and ſupports the figure of an animal. See COLUMN.

ZOOPHORUS, or ZOPHORUS, in the antient architecture, the ſame thing with frieze in the modern. See the article FRIEZE.

ZOOPHYTON, or ZOOPHITE, in natural hiſtory, a kind of intermediate body, partaking both of the nature of a ſenſitive, and a vegetable. See the article SENSITIVE *Plant*.

ZOOTOMY, the art of diſſecting animals, or living creatures, being the ſame with anatomy, or rather comparative anatomy. See the articles DISSECTION and ANATOMY.

ZOPISSA, *naval pitch*, a kind of mixture of pitch and tar, ſcraped off ſhips that have been a long time at ſea.

This matter by being gradually penetrated by the ſalt of the ſea, becomes partaker of its qualities, and being applied to the body externally, is found to be reſolutive and deſiccative.

ZUG, one of the cantons of Switzerland, is ſurrounded by the cantons of Lucern, Zurich and Switz, and is eighteen miles miles long, and ſeven broad.

ZUINGLIANS, a branch of the antient chriſtian reformers, or proteſtants, ſo called, from their author Huldric Zuinglius, a divine of Switzerland, who ſoon after Luther had declared againſt the church of Rome; and being then miniſter of the church at Zurich, fell in with him, and preached openly againſt indulgences, the maſs, the celibacy of the clergy, *&c.* What he differed from Luther in, concerned the euchariſt: for interpreting *hoc eſt corpus meum*, by *hoc ſignificat corpus meum*, he maintained, that the bread and wine were only ſignifications of the body and blood of Jeſus Chriſt; whereas Luther held a conſubſtantiation. As to the matter of grace, Zuinglius ſeemed inclined to Pelagianiſm, in which he differed from Calvin.

ZURICH, a canton of Switzerland, bounded by the canton of Schaffhauſen, on the north; by the canton of Appenzel on the eaſt; by Zug and Switz on the ſouth; and by Bern and Lucern on the weſt, being fifty miles long, and forty broad. Zurich is alſo the name of the capital city of this canton, ſituated eaſt long. 8° 30′, and north lat. 47° 52′. It is likewiſe the name of a lake, twenty-four miles long, and three broad; at the ſouth end of which the city of Zurich ſtands.

ZUTPHEN, a city of a county of the ſame name, in Gelderland, ſituated on the river Yſſel, ſixteen miles north-eaſt of Arnheim: eaſt long. 6°, north lat. 52° 15′.

ZUYDERSEE, a great bay of the german Ocean, which lies in the middle of the United Provinces, having the iſlands of Texel, Flie, and Schelling, at the entrance of it, on the north; the provinces of Friezland, Overyſſel and Gelderland on the eaſt; Utrecht, and part of Holland on the ſouth; and another part of Holland on the weſt. The chief town is Amſterdam.

ZWEIBRUGGEN, a county of the palatinate of the Rhine, in Germany, ſubject to the duke of Deuxponts.

ZWICKOW, a town of the circle of upper Saxony, and territory of Voightland, ſituated on the river Muldaw, forty-ſix miles ſouth-weſt of Dreſden.

ZWINGENBURG, or SWINGENBURG, a town of Germany, in the circle of the upper Rhine, and land of Heſſe Darmſtat, twelve miles north-eaſt of Worms.

ZYGÆ-

ZYGÆNA, or BALLANCE-FISH, in ichthyology, a ſpecies of ſqualus, with a very broad tranſverſe hammer-like head. See the article SQUALUS.

This is one of the moſt extraordinary fiſh in the world; in its form the general ſize is five or ſix feet, but it grows to be much larger; the head is the moſt extraordinary figure of that of any fiſh. It is not oblong, and running in a line with that of the body, but is placed tranſverſely, and has the appearance of the head of a hammer faſtened to its handle; the eyes are large, and placed at the two extremities; the mouth is a tranſverſe cut on the lower part of the head, and furniſhed with three or four rows of ſharp teeth; the noſtrils are ſmall and not very conſpicuous, and the foramina at the eyes are oblong and large; the body is oblong and moderately thick; there are two back fins, and a pinna ani; the apertures of the gills are ten oblong ſlits, five on each ſide, running from juſt below the head towards the roots of the pectoral fins; the tail is divided into two parts, and the upper of theſe is much longer than the under. See plate CCCII. fig. 5.

ZYGOMA, in anatomy, a bone of the head, otherwiſe called os jugale, being no ſingle bone, but an union or aſſemblage of two proceſſes, or eminences of bones; the one from the os temporis, the other from the os malæ; theſe proceſſes are hence termed the zygomatic proceſſes, and the ſuture that joins them together, is denominated the zygomatic ſuture. See the articles PETROSA and SUTURE.

ZYGOMATICUS, in anatomy, a muſcle of the head, ariſing from the os zygoma, whence its name, and terminating at the angle of the lips. This muſcle, though uſually ſingle, is ſometimes double throughout; at other times it has a double head; ſometimes its tail only is bifid, and it is variouſly interwoven with the adjoining ones. See the preceding article.

ZYGOPHYLLUM, *bean-capers*, in botany, a genus of the *decandria-monogynia* claſs of plants, the corolla whereof is compoſed of five petals broadeſt at the top; obtuſe, emarginated and larger than the cup; the nectarium conſiſts of ten convergent leaves, and includes the germen; the fruit is an oval pentagonal capſule, formed of five valves, containing five cells, with ſepta adhering to the valves; the ſeeds are numerous, roundiſh, and compreſſed; the figure of the fruit is ſubject to variation, and there is a ſpecies in which the parts of fructification are a fifth leſs. This genus comprehends the fabago of Tournefort.

ZYMOLOGY, in chemiſtry, is a term uſed by ſome writers, to expreſs a treatiſe on fermentation, or the doctrine of fermentation in general. And,

ZYMOSIMETER is an inſtrument propoſed by Swammerdam, wherewith to meaſure the degree of fermentation occaſioned by the mixture of different matters, and the degree of heat which thoſe matters acquire in fermenting; as alſo the heat or temperament of the blood of animals. See the articles FERMENTATION, HEAT, *&c.*

ZYTHOGALA, *beer-poſſet*, a drink recommended by Sydenham, as good to be taken after a vomit, for allaying the acrimonious and diſagreeable taſte the vomit has occaſioned, as well as to prevent gripes.

ARTI-

ARTICLES OMITTED;

AND

OTHERS (marked *Dict.*) further explained, or improved.

ACC

ABRUCKBANIA, or ABROBANIA, a town of Tranſilvania, ſituated on the river Ompay, near Clauſenburg.

ACALYPHA, in botany, a genus of the *monoecia polyandria* claſs of plants; the calyx of the male flowers conſiſts of four, ſmall, roundiſh, concave, and equal petals; there is no corolla: in the female flower the calyx is compoſed of three leaves, and there is no corolla; the fruit is a roundiſh, triſulcated, trilocular capſule, with a large, ſingle, roundiſh ſeed in each cell.

ACCELERATING FORCE, being the ſecond ſort of centripetal force, is expreſſed by that velocity, generated in a given time, with which bodies (conſidered as phyſical points) move towards the central body attracting them by its abſolute force. This accelerating force is greater or leſs, according to the diſtance of the center of the force, in a reciprocal duplicate proportion.

Thus is the gravity, that makes bodies tend towards the center of the earth, greater in vallies than on the tops of high mountains; greater at the poles than at the equator, which is ſeventeen miles higher; and greater at the equator than at greater diſtances from the center of the earth; for the ſame body, which, near the ſurface of the earth, falls ſixteen feet in the firſt ſecond of its fall, would fall but four in the ſame time, if it began at the height of four thouſand miles from the ſurface of the earth, or two ſemidiameters diſtance from its center. At equal diſtances the accelerating force is the ſame every where, becauſe all bodies, large or ſmall, heavier or lighter, abſtracting from the reſiſtance of the air, are equally accelerated in their fall. See the articles FORCE, CENTRIPETAL FORCE, MOTION, GRAVITATION,

ADH

EARTH, ACCELERATION, and DESCENT.

ACHYRANTHES, or ACHYRACANTHA, in botany, a genus of the *pentandria-monogynia* claſs of plants, having no corolla; the calyx is a perianthium, compoſed of five lanceolated, acute, rigid, pungent, and permanent dry leaves; there is no pericarpium; the ſeed is ſingle, roundiſh, and compreſſed.

ACT. (*Dict.*) ACT *of Grace.* See the article GRACE.

ACTÆA, in botany, the name whereby Linnæus calls the chriſtophoriana of Tournefort. See CHRISTOPHORIANA.

ACTINIA, in the hiſtory of inſects, a genus of ſea-animals, of the order of the gymnarthria, naturally of a cylindric ſhape, but variable figure; the tentacula are very numerous, and are ranged in ſeveral ſeries about the mouth, which is placed at one of the extremities of the body; theſe are in a continual vibratory motion, and by that means draw ſmall animals into its mouth for food. The whole animal is equally thick in all parts, and about half an inch long; its tail is divided into three parts; or terminated, as it were, by three points: it is of a pale fleſh colour, except the tentacula, which have a beautiful variety of colours, red, yellow, blue, and many others: it lodges itſelf in little cavities of rocks, and of the larger ſea-plants of the ſtony kind, and is found on the coaſts of the american iſlands.

There are a variety of ſpecies, differing from each other in figure, colour, *&c.* two whereof are repreſented plate V. fig. 6, n° 1 and 2.

ADHAL, or ADBIL, a town of India, ſituated near the mouth of the river Indus, in the province of Tata.

ÆGILOPS, (*Dict.*) in botany, a genus of the *polygamia-monoecia* class of plants; the corolla of the hermaphrodite flower consists of a bivalve glume, terminated by a double or triple arista or awn; the seed is single and oblong; the corolla of the male flower is also a bivalve aristated glume, as in the hermaphrodite flower.

ÆGOPODIUM, GOUT-WEED, in botany, a genus of the *pentandria-digynia* class of plants; the general corolla whereof is uniform; the single flowers consist each of five, oval, concave, and nearly equal petals; the fruit is naked, ovato-oblong, striated, and separable into two parts; the seeds are two, ovato-oblong and striated, convex on one side, and on the other.

This plant is commonly known in the shops under the name of angelica: for the medicinal vertues whereof, see the article ANGELICA.

ÆSCHYNOMENE, in botany, a genus of the *diadelphia-decandria* class of plants; the corolla whereof is papilionaceous; the fruit consists of a long compresso-plane, articulated, unilocular pod, containing a single kidney-shaped seed.

AGARIC, (*Dict.*) FEMALE AGARIC, the agaricus pedis equini facie of Tournefort, called from its being very easily inflammable, touchwood or spunk, is a fungus frequently met with on different kinds of trees in England, and has been sometimes brought into the shops mixed with the true agaric of the larch. From this it is easy distinguishable, by its greater weight, dusky colour, and mucilaginous taste, void of bitterness. The medullary part of this fungus, beat soft, and applied externally has been of late greatly celebrated as a styptic, and said to restrain not only venal, but arterial hæmorrhages, without the use of ligatures. See the articles STYPTIC and HÆMORRHAGE.

AIR, (*Dict.*) The air is generally esteemed a fluid, but yet differs from the general nature of fluids in three particulars; *viz.* 1. In that it is compressible, which property no other fluid has. 2. It cannot be congealed, nor any how fixed, as all other fluids may. 3. It is of a different density in every part, decreasing from the earth's surface upwards; whereas other fluids are of an uniform density throughout. The air is therefore a fluid *sui generis*, if it be properly any fluid at all. See the articles FLUID, COMPRESSION, CONDENSATION, CONDENSER, CONGELATION, DENSITY *of the air*, and ATMOSPHERE.

That the air was created at first with the earth itself is not to be doubted; and that ever since, there has been a constant generation of particles of air by the mutual action of bodies upon each other, as in fermentation, and all kinds of natural and artificial chemistry, sir Isaac Newton thinks very reasonable to suppose; and Mr. Boyle has given numerous experiments relating to the production of artificial or factitious air. See FERMENTATION, DISTILLATION, *&c.*

If we examine into the manner in which nature operates according to the laws which the great creator has ordained, we shall plainly discover that this air is the grand, efficacious, and necessary instrument which nature universally employs in almost all the operations she is perpetually engaged in. For in this, bodies of all kinds are placed; in this they move; and in this they perform all their actions, as well those which proceed from their particular and private natures, as those which depend upon their relation to other bodies. There is scarcely any liquid, as appears by experiment, which has not air intermixed with it; scarcely any solid out of which it may not be extracted by art. So that it is scarce possible to specify any operation of nature, which happens without the assistance of air, or utterly exclusive of it: the operations of fire, the loadstone, gravity, and the particular attraction and repulsion of corpuscles, may perhaps be alone excepted, as capable of being performed without it; to all others it is absolutely necessary. All the operations of chemistry, without any exception, are performed in the air.

It is very certain, that fire, which puts all things in motion, can neither be collected, preserved, directed, increased, or moderated, without air. Hence, then, if air is necessary to fire, air is also necessary to every operation of fire; so that without it, fire would cease to operate, nor could it be applied to other bodies. The fire here meant, is that which is excited and supported by inflammable fuel, by the means of which both art and nature execute their principal purposes.

Whoever has leisure and inclination to take a view of the more general classes of natural bodies, will find, that the air is every where required to their vitality,

growth,

growth, vigour, and action; for if their lives conſiſt in a circulation of humours through proper veſſels, and by a peculiar power converting the extraneous juices they receive into their own nature, or, at leaſt, by a ſingular virtue applying them to their ſubſtance, and thus increaſing in their magnitude, it ſeems utterly impoſſible that one of theſe functions can be performed without the perpetual aſſiſtance of air.

The weight or gravity of the air is proved by a great variety of curious experiments upon the air-pump; the principal of which are as follow. 1. By actually weighing it in a nice balance, where we ſhall ſee, that one gallon of air will weigh a dram very nearly. 2. By filling a glaſs tube with mercury, and inverting it in a baſon of the ſame fluid, where it will appear, that a column will be ſupported in the tube, by the ſole weight or preſſure of the air, to upwards of the height of twenty-eight inches. 3. By taking the air off the ſurface of the quickſilver in the gage of the air-pump, which then immediately riſes by the preſſure of the external air. 4. By exhauſting a receiver placed over the hole of the braſs plate on the pump, which will then be kept faſt by the preſſure of the incumbent air. Or, 5. More demonſtratively, by exhauſting a ſmall receiver under one larger, and letting in the air at once upon it, which will then be faſtened to the plate as before, though not placed over the hole. 6. By placing the hand on the open receiver, and exhauſting, the weight of the air on the hand, will be extremely ſenſible. 7. By placing a piece of thin glaſs or a bladder on the ſaid open receiver, which, when the air is a little exhauſted, will be broke into pieces by the weight of the incumbent air. 8. The air, exhauſted from a thin bottle under a receiver, and then ſuddenly let in, will, by its weight, inſtantly reduce it to very ſmall pieces. 9. By putting a piece of wood under quickſilver in the receiver, and then exhauſting the air, and letting it in again, it will, by its weight, force the quickſilver into the pores of the wood, and very ſenſibly increaſe its weight. 10. The exhauſted braſs hemiſpheres prove not only the prodigious weight of the air, but alſo the quantity thereof very exactly. 11. By exhauſting glaſs-bubbles, ſwimming in water, and letting the air in again, it will force the water into the bubbles, and make them ſink. 12. The ſyringe, with its weight deſcending in vacuo, and aſcending again upon the admiſſion of air, does very prettily prove the preſſure of the air, and the rationale of ſyringes in general. See the articles SYRINGE, GRAVITY, &c.

That water riſes in pumps, ſiphons, and all kinds of water engines, by the preſſure of the air only, is made evident by taking off the ſaid preſſure in the exhauſted receiver from a baſon of mercury, which then will not riſe in the pipe of the ſyringe on drawing up the piſton, as it will in the open air. See PUMP, SIPHON, FOUNTAIN, and ENGINE.

The ſpring or elaſticity of the air is alſo demonſtrable from various experiments of the like kind. 1. By the great expanſion of a ſmall quantity of air in an emptied bladder, when the air is taken off from the external parts in the receiver. 2. By the extruſion of a fluid out of a glaſs-bubble, by the expanſion of the bubble of air contained therein. 3. By the expulſion of the white and yolk of an egg through a ſmall hole in the little end, by the expanſion of the air contained in the great end, and alſo by raiſing up the ſkin of the egg, (after the yolk is taken away, and one half of the ſhell) by the expanſion of the ſaid included bubble of air, ſo as almoſt to fill the half ſhell. 4. Glaſs-bubbles and images, filled with water, ſo as to make them juſt ſink in water, will, upon exhauſting the air from the ſurface, riſe to the top of the veſſel. 5. Alſo a bladder, filled with air, and juſt made to ſink with a weight, will, upon exhauſtion, ſoon riſe by the expanſion of the contained air. 6. Beer, cyder, water, and porous bodies do emit great quantities of air under the exhauſted receiver. 7. Fiſhes are made ſo light or buoyant, by increaſing the ſpring of the air in their bladders, that they riſe to the top of the water, and cannot again deſcend to the bottom. 8. But that curious experiment, which ſhews the force of the ſpring of the air to be equal to its weight or preſſure, is by raiſing the mercury by the expanſion of a ſmall quantity of confined air to the ſame height in an exhauſted tube above the air-pump, as that which it is raiſed to in the mercurial gage by the preſſure of the atmoſphere below it.

The great action of animal life, *viz.* breathing, by inſpiration and expiration of air, is owing to the preſſure and ſpring of the air conjointly, as is evident by

the contraction and expanſion of a bladder in a ſmall receiver, with a bladder tied on at the bottom to repreſent the diaphragm. See RESPIRATION.

That air, paſſing through the fire and heated braſs tube, is unfit for animal reſpiration, is ſhewn by the ſudden death of any animal put into a receiver filled therewith. Alſo candles and live coals, put into this aduſt air, immediately go out. Hence the noxious and peſtilential qualities of damps and ſuffocating exhalations, ſo fatally experienced in mines and other ſubterranean places. See DAMP, EXHALATION, and MINE.

That the different velocities, with which heavy and light bodies deſcend in the air, is owing to the air's reſiſtance only, is manifeſt from the equal velocity or ſwiftneſs with which all bodies deſcend in the receiver, as is ſhewn in the experiment of a guinea and a feather. See DESCENT.

That fermentation, putrefaction, &c. depend on the air, and are promoted by it, is ſhewn by preſerving fruit in their natural bloom and perfection through the winter in an exhauſted glaſs. See FERMENTATION, PUTREFACTION, &c.

The uſe of the diving-bell depends upon the ſpring and force of the air; for ſince the ſpace, which the air takes up, is reciprocally as the power compreſſing it, it is evident, that, at the depth of thirty-three feet of water, where the preſſure of the atmoſphere is doubled, the bell will be half filled with water; at the depth of ſixty-ſix feet, it will be two-thirds filled; at the depth of ninety-nine feet, it will be three-fourths filled; and ſo on. See the article DIVING-BELL.

The ſpring of the air is moſt evidently concerned in that chirurgical operation, called cupping; for when a vacuum is made by a ſyringe in the cupping-glaſs applied to that part, the ſpring of the air in the fleſh under the glaſs does ſtrongly act, and by that means cauſes the fleſh to diſtend and ſwell into the glaſs, while the preſſure of the air, on the parts without the glaſs, accelerates the motion of the blood and fluids towards the part where it is diminiſhed or taken off by the glaſs. See the article CUPPING.

From this account of the air, and its properties, many curious appearances may be underſtood.

1. Air, as a fluid body, is the vehicle of the effluvia of all odorous bodies to the organs of ſmelling; and, as a ponderous fluid, it preſſes them on the nerves of thoſe organs, with a force ſufficient to make them ſenſible. It alſo impreſſes ſapid ſubſtances upon the organs of taſte, and renders them obſervable by the ſenſes. It is alſo the inſtrument of ſound; for the undulations, cauſed in it by bodies moved by various directions, ſtrike upon the external ear, which, by a ſingular mechaniſm, communicates this notice to the nerves expanded upon the internal ear. This weight of the air alſo, by preſſing upon the ſurface of animals and vegetables, prevents a rupture of their veſſels, from the force neceſſary to circulate their juices, to which it is, as it were, a counter-balance. All theſe things are evident, becauſe, on the tops of high mountains, where the air is very rare, the ſenſes of ſmelling, taſting, and hearing are very languid. On the tops of mountains alſo the blood-veſſels are very ſubject to burſt, whence frequent hæmorrhages happen to thoſe who travel to their ſummits. See the articles SMELLING, TASTING, HEARING, &c.

2. The air, by its elaſticity, contributes greatly to the ſolution of the aliment in the ſtomachs of animals. For, when that which is contained in every part of the food is rarified and expanded by the heat it meets with in the ſtomach, it deſtroys the coheſion of the component particles, and aſſiſts in reducing it to a ſtate of fluidity. At the ſame time, as it is confined in the ſtomach, all its action muſt be determined to the aliment, which it muſt therefore act upon with great force in this rarified ſtate. See STOMACH, RAREFACTION, DIGESTION, &c.

3. Reſpiration, ſo neceſſary to the continuance of the animal life, is performed by means of the air. For, when the air is expelled out of the lungs, the pulmonary veſſels, through which the blood circulates from the right ventricle of the heart, and by which it is returned to the left auricle, collapſe, and are no longer pervious, till the air, ruſhing into the branches of the aſpera arteria upon the elevation of the breaſt, diſtends the lungs, and thereby opens not only the air-veſſels, but alſo the branches of the pulmonary vein and artery, which accompany every where thoſe of the aſpera arteria. Here the air, as a heavy fluid, acts upon, compreſſes, and comminutes the blood; and, as it is elaſtic, and dilatable by heat, the action of it upon the blood in the lungs is, by this property, rendered greater. See RESPIRATION, CIRCULATION, &c.

4. If

4. If we conſider the air in all lights, we ſhall find, that every alteration it undergoes muſt induce ſome great change on the animal machine. Thus when it is very heavy, it muſt preſs upon the ſurface of our bodies, and the internal part of the lungs, with a greater force than when it is light. It has been proved by curious obſervations, that the difference of weight, with which our bodies are preſſed by the atmoſphere, in the greateſt degree of its natural gravity, from that which we ſuſtain when it is lighteſt, amounts to 398 ½ pounds troy-weight. Now as this difference is very great, the effects of it muſt alſo be conſiderable. See the article ATMOSPHERE.

5. The different degrees of heat and elaſticity in the air muſt have effects proportionable to the cauſes upon the bodies of animals. The various contents alſo of the air muſt of courſe induce great changes, as it ſome way or other finds means to communicate the qualities it borrows from them to the blood and juices of animals. Hence it becomes the vehicle of contagion, and the propagator of diſeaſes, both epidemical and endemial, which admit of infinite variety, becauſe the alterations of the air, with reſpect to its properties, and to the innumerable combinations of bodies contained in it, are infinite. However, we may venture to conclude, that the moſt healthful is that which is ſerene and dry, and conſequently ponderous, and replete with the acid vital ſpirit.

6. It is the phyſical office and uſe of the air, to aſſiſt in raiſing the vapours and exhalations of the earth, and to ſerve as a general matrix for them; wherein they are all blended together, and fermented, or ſome way changed in their nature, ſo as to perform new offices, or recruit the vegetable, animal, and mineral kingdoms, when ſuch enriched vapours fall back again in rain or dew to the earth. See VAPOUR, RAIN, and DEW.

7. Hence may be conceived in general how all the changes and phænomena, as meteors, exploſions, thunder, lightning, the aurora borealis, &c. happen in this great chaos of the atmoſphere, *viz.* according as floating particles of different kinds chance to meet, ſo as to form conſiderable aggregates or collections; and according as they are favoured by the requiſite degrees of heat, cold, dryneſs, or moiſture. See the articles METEOR, EXPLOSION, THUNDER, &c.

The various degrees of the heat and cold in the air is indicated by the thermometer: its different weight, by the barometer; and its moiſture and dryneſs is ſhewn by the hygrometer. See the articles THERMOMETER, BAROMETER, and HYGROMETER.

Having conſidered the properties of the air, it is neceſſary to conſider alſo what corpuſcles are blended and contained in this heterogeneous fluid. And theſe are in reality almoſt infinite, of various natures, and entirely different in different parts of the atmoſphere. We may therefore conſider it as an univerſal chaos, in which corpuſcles of almoſt every kind, being confounded together, make up a compoſition conſiſting of the moſt different parts. For, 1. There is always, and every where, fire contained in the common air. See the article FIRE.

2. There is water contained always in the air, and in every part of it, and that in ſuch a manner, that it does not appear poſſible, by any known methods, to ſeparate the water entirely from it. Water is every moment perſpiring from every perſon in health, in an inviſible vapour. Sanctorius computes, that, in twenty-four hours time, there exhales from ſuch a perſon nearly the weight of five pounds, much the greateſt part of which is water. A vaſt quantity of aqueous ſteams muſt therefore be continually exhaling from animals of all kinds ſcattered all over the earth; and that all plants likewiſe ſend forth a dewy aqueous vapour, is a thing which has been long confirmed by obſervations; but the learned and induſtrious Dr. Hales has, in his curious treatiſe of vegetable ſtatics, reduced the vaſt quantity of aqueous vapours exhaling from plants to calculation. Dr. Halley, from obſervations made with the greateſt care and accuracy, has made it appear, that from the ſurface of the Mediterranean alone, in one ſummer's day, there exhales, by the heat of the ſeaſon only, without any aſſiſtance from the wind, 52,800,000,000 tons of water. Hence the origin of ſprings and rivers. See the articles WATER, PERSPIRATION, SPRINGS, SEA, &c.

3. All the parts that we can obſerve in vegetables, are continually changing, and diſperſed throughout the atmoſphere. That the ſpirits of vegetables do always, and every where, exhale, and fill the air with a continual fragance, no body can diſpute. And it is very certain, that the odour

odour of plants, diſperſed through the vaſt tracks of air, often inform the mariners, before they diſcover land, of their approach to the ſhore. Hence then it follows, that whatever odoriferous ſpirits are at any time by nature produced in plants, all theſe are certainly, at length, contained in the air alone. See the articles PLANT, ODOUR, *&c.*

4. If we enquire whether the parts of animals are contained alſo in the air, we ſhall find there is a great quantity of exhaling ſpirits; and thoſe wholly peculiar to every animal that are continually diſſipated and carried into the air from living animals, and adhere to other bodies; and by means of theſe ſpirits it is, that dogs, which purſue by ſcent, diſtinguiſh ſo accurately the animals from which they exhale; and how full the air is frequently of effluvia, exhaling from animals, appears evident from the infection too often obſervable in contagious diſtempers.

5. Foſſils are likewiſe diſcoverable in the air; for all foſſile-ſalts, however fixed, at laſt fly off in the air, if they are diſſolved in water, (eſpecially in that which they attract from the air) and are afterwards digeſted for a long time in a putrifying heat, then diſtilled with a great degree of fire, their reſiduum calcined in a ſtrong open fire, and then diſſolved in the air again. Do not the chemiſts convert, by different methods, many thouſand pounds weight of ſuch ſalt into acid volatile fumes, which they call ſpirit? And does not every ſuch chemical operation infect the very air? With regard to the principles, which are termed ſulphurs, theſe, whenever the foſſils are burnt, are entirely carried into the air, and, being intermixed with it, diſappear, the ſaline acid part changing into a ſuffocating fume, and the oleaginous part being attenuated by the action of the flame, and flying off in an inviſible or ſooty black vapour. It is very certain, that hardly any thing at all of theſe parts remains in the earth. Sulphur now itſelf, when alone, is carried into the air in form of an impalpable powder, and is there diſperſed about. See the articles FOSSILS, SULPHUR, *&c.*

6. Metals themſelves have been found to be ſo far changed, that even thoſe, under a new form of a volatile fume, have been elevated and ſcattered in the air. This is univerſally known to be true of mercury, which, agitated only by a fire of 600 degrees, flies off, and becomes inviſible. And if the air, impregnated with it, ſurrounds, and is applied to a human body, how wonderfully does it penetrate it, and how quickly does it raiſe a ſalivation! But beſides, while it thus flies off, it carries up and bears away with it ſome part of certain metals; as appears from the diſtillation of lead and tin with mercury. See METALS, MERCURY, *&c.*

AIR-PUMP. (*Dict.*) *Smeaton's* AIR-PUMP. See the article PUMP.

AIRA, in botany, a genus of the *triandria digynia* claſs of plants, the corolla whereof is compoſed of two valves, extremely reſembling thoſe of the cup; one of theſe often produces an ariſta, near twice as long as the flower; the corolla ſerves the office of a pericarpium, and incloſes the ſeed, which is ſingle, and of an oval figure.

There are ſome ſpecies of this genus, in which male flowers are mixed with the hermaphrodite ones under the ſame common cup: in this caſe, the male flower produces an ariſta, whereas the female does not.

AKANIS, or ACANES, the name of a kingdom and town of Guinea, ſituated on the golden coaſt.

ALCHIMILLA, in botany. See plate XII. fig. 2.

ALCOHOL, (*Dict.*) ALCOHOL *martis*, filings of ſteel reduced to an impalpable powder, by turning it into ruſt with urine, then levigating it, and mixing it with a large quantity of water, that is, about a gallon, to two pounds and a half of filings. After it has ſtood a quarter of an hour, the upper part of the water is to be poured off, and evaporated to a dryneſs. The powder at the bottom is to be put into a paper, in the form of a ſugar-loaf, and waſhed, by gradually pouring in hot water, till it is freed from the urinous ſalts: with regard to the remaining groſs powder, the ſame proceſs is to be repeated over again.

To bring the gout back from the noble parts to the joints, Mulgrave has a great opinion of this remedy: he preſcribes it thus; take of alcohol martis from five to ten grains, theriaca andromachi from half a ſcruple to one dram, mix theſe with as much ſyrup of clove-july-floweras is ſufficient to make a bolus. See GOUT.

ALDERAIMIN, in aſtronomy, a ſtar of the third magnitude, on the right ſhoulder of cepheus. See CEPHEUS.

ALMANAC. (*Dict.*) For the duties upon almanacs, ſee STAMP-DUTIES.

ALPINIA,

ALPINIA, in botany, a genus of the *monandria-monogynia* claſs of plants, the corolla whereof is monopetalous, unequal, and as it were double; the exterior one is trifid, the upper ſegment is hollow, the two ſide ones flat, and it has a tube; the interior is ſhort, its edge is trifid, and the lower ſegment of the three hangs out beyond the lateral parts of the exterior corolla, the other two are emarginated, and the baſe is ventricoſe; the fruit is a fleſhy capſule, of an ovated figure, compoſed of three valves, and containing three cells; the ſeeds are numerous, of an ovated figure, with a prominent but truncated apex, and a caudated baſe.

ALSINELLA, the name by which Dillenius calls the plant ſagina. See the article SAGINA.

AMARYLLIS, in botany, genus of the *hexandria-monogynia* claſs of plants, the corolla whereof conſiſts of ſix lanceolated petals; the fruit is an oval or nearly oval capſule, formed of three valves, and containing three cells; the ſeeds are numerous; the inflection of the petals, ſtamina and piſtil in this genus is very different in the various ſpecies.

This genus comprehends the lilio-narciſſus of Tournefort and Dillenius, and the Guernſey-lilly.

AMMODYTES, (*Dict.*) the SAND-EEL or GRIG. The characters of this genus of fiſhes are as follow: the body is oblong and ſlender, and is of a rounded but ſomewhat depreſſed figure; there are no belly-fins, the head is of a depreſſed form, and the branchioſtege membrane on each ſide contains ſeven bones, but they are in great part covered by the opercula of the gills. The head of the ammodytes is ſmall, much narrower than the body, of a compreſſed figure, and acute at the forepart; the lower jaw projects a great way beyond the upper, and the opening at the mouth is large; the noſtrils have each a double aperture, and ſtand in the middle between the eyes and the extremity of the roſtrum; the eyes are large, and the iris of a ſilvery colour; the ſcales are extremely ſmall on the back, and are of a greyiſh colour, and the belly is of a ſilvery-white.

AMMOSCHISTUM, in natural hiſtory, the name of a genus of foſſils, conſiſting of ſlate ſtone, compoſed only of ſparry and cryſtalline particles, or of talcy, ſparry and cryſtalline particles. See SLATE.

AMOMUM, (*Dict*) AMOMUM, in botany, a genus of the *monandria monogynia* claſs of plants, the corolla whereof is monopetalous, conſiſting of a ſhort tube, and a limb divided into three oblong ſegments, the middle ſegment is larger then the reſt, and the ſinus oppoſite to it more open; the nectarium is monophyllous, and inſerted into the large ſinus juſt mentioned; it ſcarce at all appears above the ſegments of the corolla; the fruit is coriaceous, of an oval figure, but ſomewhat three cornered, it is compoſed of three valves forming as many cells; the ſeeds are numerous and ſmall. The amomum comprehends the plant called zinziber by authors; for the uſes and characters whereof, ſee GINGER and ZINZIBER.

AMOS, or *the prophecy of* AMOS, a canonical book of the Old Teſtament. This prophet boldly remonſtrates againſt the crying ſins that prevailed among the Iſraelites, ſuch as idolatry, oppreſſion, wantonneſs and obſtinacy, and reproves the people of Judah for their carnal ſecurity, ſenſuality and injuſtice. He terrifies them both with frequent threatnings, and pronounces that their ſins will at laſt end in the ruin of Judah and Iſrael, which he illuſtrates by the viſions of a plumb line and a baſket of ſummer-fruits. He begins with denunciations of judgment and deſtruction againſt the enemies of the Jews, and concludes with promiſes of reſtoring the tabernacle of David, and erecting the kingdom of Chriſt.

ANABLATUM. or SQUAMARIA, in botany. See SQUAMARIA.

ANACYCLUS, in botany, a genus of plants of the *ſyngeneſia-polygamia-ſuperflua* of Linnæus, being the ſame with the ſantolinoides of other authors. See the article SANTOLINOIDES.

ANALEMMA, (*Dict.*) ANALEMMA in geometry. See *Orthographic projection of* MAPS *on the plane of the meridian*.

ANATOMY (*Dict.*) With regard to the antiquity of anatomy, it ſeems ſcarcely poſſible, but that the ſlaughter of beaſts for the uſe of man, caſualties, murders, and the accidents of war, muſt have furniſhed mankind with a general knowledge of the ſtructure of the parts, in very early ages of the world. But it is not very certain at what period it began to be cultivated as a ſcience. This, however, muſt have been very early, eſpecially if we pay any regard to Manetho, the famous Egyptian writer, who, according to Euſebius, relates, that Athotis, an Egyptian king, wrote ſome treatiſes of

anatomy.

anatomy. This king, if the Egyptian chronology was to be depended upon, lived many ages before Adam. This, however, falſe with regard to time, tends to prove the great antiquity of the ſcience. However this be, it is certain that before, or, at leaſt, in the days of Homer, anatomy was much cultivated, ſince this author appears to have had a competent knowledge of the parts, and to have been well verſed in the renunciation of wounds, ſo as to give an accurate account of their effects in almoſt all parts of the body. But Hippocrates is the firſt author, at leaſt extant, who treated of anatomy ſcientifically. This great writer, conſcious of his noble and exalted genius, publiſhed many anatomical obſervations, which, though disjointed, and ſcattered here and there in his works, yet make up almoſt an entire body of anatomy, when collected together. He was followed by Democritus, Empedocles, Alcmæon of Crotona, Ariſtotle, Galen, &c. Anatomy however made but ſlow, and almoſt imperceptible advances towards perfection, till the time of Andreas Veſalius, who was born at Bruſſels in the year 1514. His ſuperior genius, in conjunction with his indefatigable application and induſtry, ſoon raiſed him to ſuch a pitch of anatomical knowledge, as rendered him at once the ornament of his own, and the admiration of future ages. This accurate anatomiſt was followed by Stephanus, Vicary, Gemini, Sylvius, Servetus, Columbus, Fabricius, Riolanus, Libavius, &c. who all contributed to the improvement of anatomy. In 1622, Caſpar Aſellius, profeſſor of anatomy at Pavia, obſerved the lacteal veſſels in the meſentery, which he deſcribes as conveying the chyle to a large gland, ſeated in the center of the inteſtines. He however modeſtly declines the honour of this diſcovery, becauſe he ſays theſe lacteals were known to Hippocrates, Eraſiſtratus, and Galen. The celebrated Harvey, in the year 1628, publiſhed his diſcovery of the circulation of the blood, which was of the moſt importance to phyſic of any that was ever made, and acquired him an immortal name. Pecquet, in the year 1651, diſcovered the reſervoir of the chyle, and the thoracic duct. And Rudbecks and Bartholine in 1650, and 1651, diſcovered the lymphatic veſſels. Wharton, in 1655, diſcovered the lower ſalival ducts; and Steno the upper ſalival ducts, thoſe of the palate, noſtrils, and eyes, in 1661. Willis ſucceeded him, and publiſhed an accurate anatomy of the brain and nerves.

Anatomy is alſo greatly indebted to the accurate obſervations of Malpighius, who died in 1694. This great anatomiſt made a vaſt number of diſcoveries in the lungs, brain, liver, ſpleen, glands, lymphatics, &c. by the help of the microſcope. The celebrated Ruyſch has happily elucidated the finer and more intricate part of the human machine, by means of injections. Other more late writers upon anatomy are Maurice, Hoffman, Cowper, Ridley, Bartholine, Keill, How, Morgagni, Valſalva, Pacchionus, Drake, Vercellonius, Santorini, Cheſelden, Monro, Douglas, Heiſter, Winſlow, &c.

ANCLE (*Dict.*) ANCLE *luxated*, in ſurgery. The ancle is ſubject to be luxated, either in running, in jumping, or even in walking; and that in all four directions, either inward or outward, backward or forward. When the ancle is luxated inward, the bottom of the foot is turned outward; and on the contrary, when it is luxated outward, the bottom of the foot is turned inward, which latter caſe is indeed much more frequent than the others. If it is diſlocated forward, the heel becomes ſhorter, and the foot longer than it ſhould be; and if backward, the contrary ſigns to theſe will appear. The ancle however can ſcarce poſſibly be luxated outwards, unleſs the fibula be ſeparated from the tibia, or elſe quite broken, which may happen to the external ancle; nor is it at all uncommon for a luxation of the ancle to be attended with very grievous ſymptoms, eſpecially when occaſioned by ſome great external violence; nor can it indeed well happen otherwiſe in this caſe, ſince the diſtortion of the foot muſt neceſſarily overſtrain the adjacent tendons, ligaments, and nerves, and thence excite very violent pains, and other bad ſymptoms; or the veins and arteries may alſo be very eaſily lacerated, which will occaſion a large extravaſation of blood about the whole foot, which too often gives riſe to a gangrene. It is however neceſſary to obſerve, that the ancle is not always luxated, after it has been violently ſtrained by leaping or turning the foot on one ſide; for it ſometimes happens, that the ancle is not diſlocated on

theſe occaſions, but only the parts are violently contuſed and ſtrained. The ancle, when truly luxated, is more or leſs difficult to be reduced, according to the violence of the force by which the accident was occaſioned. The moſt ready way, however, of reducing a luxation of the ancle, according to Heiſter, is, to place the patient upon a bed, ſeat, or table, leting the leg and foot be extended in oppoſite directions by two aſſiſtants, while the ſurgeon replaces the bones with his hands and fingers in their proper ſituation. When the foot is by this means reſtored to its proper poſition, it is to be well bathed with oxycrate and ſalt, and then carefully bound up with a proper bandage. The patient muſt be enjoined to keep his bed for a conſiderable time, till the bad ſymptoms are gone, and the Ancle has recovered its ſtrength ſo far, as to bear the weight of the body, without any uneaſineſs or danger.

ANEMOMETER, (*Dict.*) for the deſcription, conſtruction and repreſentation, whereof, ſee *Velocity and force of the* WIND.

ANGELICA, (*Dict.*) in botany, Tournefort's name for the ægopodium of Linnæus. See the article ÆGOPODIUM.

ANGER, (*Dict.*) Mr. Hutcheſon, having defined anger, a propenſity to occaſion evil to another, ariſing upon apprehenſion of an injury done by him, obſerves, that this violent propenſity is attended generally, when the injury is not very ſudden, with ſorrow for the injury ſuſtained, or threatned, and deſire of repelling it, and making the author of it repent of his attempt, or repair the damage.

But beſides theſe conditions, which are good, in ſome ſort intended by men when they are calm, as well as during the paſſion, there is in the angry perſon a propenſity to occaſion miſery to the offender, a determination to violence, even where there is no intention of any good to be obtained or evil avoided by this violence. And it is principally this propenſity which we denote by the name anger, though other deſires often accompany it.

ANGLE, (*Dict.*) *Plain* ANGLE in geometry. See the article PLAIN.

ANONIS, REST-HARROW, (*Dict.*) in botany, Tournefort's name for the ononis of Linnæus; for the virtues, and a repreſentation whereof, ſee the article ONONIS, and plate XVIII. fig. 5.

ANOREXY, (*Dict.*) the cauſe and cure whereof, ſee under the article NAUSEA.

ANTHEMIS, in botany, the name whereby Linnæus calls the chamæmelum of Tournefort. See CHAMÆMILE.

This is alſo a name whereby ſome writers call the buphthalmum, or ox-eye. See BUPHTHALMUM.

ANTHYLLIS, the BLADDER LOTUS, in botany, a genus of the *diadelphia-decandria* claſs of plants, the corolla whereof is papilionaceous; the fruit is a ſmall roundiſh legume, compoſed of two valves, and containing one or two ſeeds. This genus comprehends the vulneraria of Tournefort and others.

ANVIL, (*Dict.*) in mechanics, for a repreſentation, *&c.* whereof, ſee plate CCLIII. fig. 2, and the article SMITHERY.

APLUSTRE, APLUSTRÆ, or AMPLUSTRÆ, in the naval architecture of the antients, an ornament reſembling a ſhield fixed in the poop of a ſhip, in which caſe it differed from the acroſtolium. See the article ACROSTOLIUM.

APPELLATIVE, (*Dict.*) See NAME and GENERAL TERMS.

APPROBATION, is defined by Mr. Hutcheſon, a ſtate or diſpoſition of the mind wherein we put a value upon, or become pleaſed with ſome perſon or thing.

Moraliſts are divided on the principle of approbation, or the motive which determines us to approve and diſapprove. The Epicureans will have it to be only ſelf-intereſt; according to them, that which determines any agent to approve his own action, is its apparent tendency to his private happineſs; and even the approbation of another's action flows from no other cauſe but an opinion of its tendency to the happineſs of the approver, either immediately or remotely. Others reſolve approbation into a moral ſenſe, or a principle of benevolence by which we are determined to approve every kind affection either in ourſelves or others, and all publickly uſeful actions, which we imagine to flow from ſuch affection, without any view therein to our own private happineſs.

ARÆOMETER, (*Dict.*) See the article HYDROMETER.

ARGONAUTIC EXPEDITION. See the article EPOCHA.

ARGUMENT, (*Dict.*) In reaſoning, Mr. Locke obſerves, that men ordinarily uſe four ſorts of arguments. The firſt

is to alledge the opinions of men, whoſe parts and learning, eminency, power, or ſome other cauſe, has gained a name, and ſettled their reputation in the common eſteem with ſome kind of authority; this may be called *argumentum ad verecundiam*. Secondly, another way is to require the adverſaries to admit what they alledge as a proof, or to aſſign a better; this he calls *argumentum ad ignorantiam*. A third way is, to preſs a man with conſequences, drawn from his own principles or conceſſions; this is known by the name of *argumentum ad hominem*. Fourthly, the uſing proofs drawn from any of the foundations of knowledge or probability; this he calls *argumentum ad judicium*; and obſerves, that it is the only one of all the four, that brings true inſtruction with it, and advances us in our way to knowledge. For, 1. It argues not another man's opinion to be right, becauſe I, out of reſpect, or any other conſideration, but that of conviction, will not contradict him. 2. It proves not another man to be in the right way, nor that I ought to take the ſame with him, becauſe I know not a better. 3. Nor does it follow, that another man is in the right way, becauſe he has ſhewn me, that I am in the wrong: this may diſpoſe me, perhaps, for the reception of truth, but helps me not to it; that muſt come from proofs and arguments, and light ariſing from the nature of things themſelves, not from my ſhamefacedneſs, ignorance or error. See REASON and REASONING.

ARGUMENT *of the moon's menſtrual longitude*, or *menſtrual* ARGUMENT *of the longitude*, is an arch of the excentric circle of the moon, intercepted between her true place, once equated, and a right line drawn through the center of the excentric parallel to the menſtrual line of the apſides. See APSIS and MOON.

ARM. (*Dict.*) For fractures and luxations of the arm, ſee the articles HUMERUS and CUBITUS.

ART. (*Dict.*) *Angelic* or *angelical* ART, or the art of ſpirits, is defined to be a method of attaining to the knowledge of any thing deſired, by means of angels, or rather of dæmons: under this come the arts of magic, ſorcery, witchcraft, *&c.* See the article MAGIC, *&c.*

ARTERY. (*Dict.*) In plate XXII. (*by miſtake numbered* XXI.) fig. 1.

3, 9. Point out the neighbouring muſcles of the temporal arteries, the hairy ſcalp, and forehead.

10, 10. Trunks which ſend blood to the foramina narium.

12, 12. Arteries which carry blood to the ſauces, gargareon, and muſcles of of thoſe parts.

14, 14. Thoſe parts of the carotids, where they paſs by each ſide of the ſella turcica, where divers ſmall branches ariſe from them, to compoſe the rete mirabile.

17, 17. The communicant branches between the carotid and cervical artery.

20, 20. Other arteries of the larynx, which convey the blood to the muſcles of the neck and ſcapula.

22, 22. The arteries of the muſcles of the os humeri, and ſome of thoſe of of the ſcapula.

30. A ſmall artery ſpringing from the fore-part of the aorta deſcendens, paſſing to the gula.

42. Two ſmall arteries going to the upper part of the duodenum and pancreas.

48. Thoſe of the rectum.

50. The vertebral arteries of the loins.

63. The penis diſtended with wind, and dried.

64. The glans penis.

65. The upper-part of the dorſum penis, cut from the body of the penis, and raiſed to the corpora cavernoſa penis.

66, 66. Corpora cavernoſa penis freed from the oſſa pubis, and tied after inflation.

67. The two arteries of the penis, as they appear injected with wax in each cavernous body of the penis.

68. The capſula and ſeptum of the corpora cavernoſa penis.

71. That part of the crural artery that paſſes the ham.

Wounds of the ARTERIES. When any conſiderable artery is wounded or divided, there generally enſues ſo violent an hæmorrhage, that the wounded party is in an inſtant ſenſible of a great weakneſs and a loſs of ſpirits, and faints away; and when any of the larger arteries are divided, whether they are external or internal, he dies upon the ſpot. Although ſomewhat leſs danger is apprehended from wounds that are inflicted upon the arteries, which are ſituated upon the external parts of the body, ſome few excepted, becauſe they will admit of the ligature, and other means for reſtraining the violence of the hæmorrhage; nevertheleſs, in the opinion of Heiſter, it is impoſſible

to

to prevent the limbs, which lie below the diviſion of the artery, and are uſed to receive their nouriſhment by that channel, from becoming paralytic; nay, ſometimes from mortifying: this is almoſt conſtantly the caſe, when the trunk of the brachial or crural artery is divided. See WOUND and HÆMORRHAGE.

Theſe being the conſequences which follow the total diviſion of a conſiderable artery, it now remains to conſider what will follow a partial diviſion of them. Whenever a large artery is wounded, and not entirely divided, the wounded fibres inſtantly contract themſelves; by this means they dilate the orifice of the wound, and render it difficult to ſtop the flux of the blood; and though the hæmorrhage be ſtopped for a little time, yet it will burſt out again on a ſudden violently, or, at leaſt, produce an aneuriſm: this will frequently be the caſe, when only the external coat of the artery is wounded; for by this means, the internal coat is left to ſuſtain the whole impetus of the pulſe, which it being unequal to, is forced by degrees into a tumour like a bag, which frequently brings on great miſchiefs. See TUMOUR and ANEURISM.

The various methods for ſtopping the profuſion of blood, attending injuries of the arteries, have been already treated of under the article hæmorrhage; but it may be here obſerved, that in dangerous wounds of the large arteries, ſuch as the crural and axillary, and in amputations of the limbs, the ſafeſt method is that of making a ligature round the veſſels: if this is performed by paſſing a ſtrong waxed thread under the artery, by the help of a crooked needle, the blood is preſently ſtopped, and the orifices of the artery coaleſce.

ARTHRONIA, in zoology, a name given by Dr. Hill to that claſs of animalcules, which have viſible limbs; ſuch as the ſcelaſius, brachionus or wheel-animals, *&c.* See the article SCELASIUS, *&c.*

ASCLEPIAS, (*Dict.*) or VINCETOXICUM, in botany; for the medicinal virtues whereof, ſee VINCETOXICUM.

ASPALATH, (*Dict.*) or RHODIAN WOOD. See RHODIUM LIGNUM.

ASSAYING. (*Dict.*) In order to the aſſaying of gold-ores, it muſt be obſerved, that the method varies according to the nature and diſpoſition of the mineral matters, along with which the metals happen to be mixed, whether it be ſtony, earthy, ſulphureous, arſenical, *&c.* The art of making aſſays with diſpatch upon gold and ſilver ores depends upon the ſcorification or vitrification of thoſe heterogeneous foſſile ſubſtances, which may be incorporated therewith: lead and the glaſs of lead, and antimony and its glaſs, being great ſcorificators or vitrifiers, they become the natural agents upon ſuch occaſions. See SCORIFICATION, VITRIFICATION, and QUARTATION.

The ultimate refinement of gold is thought to be that procured by fuſing it thin along with thrice its own weight of antimony, wherein the antimony tears away, and imbibes the ſubſtance of all the other metals, but leaves the gold untouched, which therefore, as the heavier body, falls like a regulus to the bottom of the melting cone. See the article ANTIMONY.

In caſe there is a ſmall or fine gold-ſand to aſſay, or a very rich and delicate ſlud, both the proof by a ſmall aſſay, and the extraction in the large way, are ſometimes effected by amalgamation. Thus a certain parcel of it being weighed out, it is mixed with a determinate proportion of mercury, eight or ten times its quantity, and a quantity either of ſimple or ſalt water poured warm to them in a ſtone-mortar; let them be ground togegether, for ſome time, with a wooden peſtle; then the ſand is dilated by the addition of a little more water, that the mercurial particles may firſt ſubſide, which being now connected into one maſs, the ſand, in a little baſon, is eaſily waſhed off; then the mercury, being ſqueezed through leather, the particles of gold, that were collected and imbibed by it, remain behind, mixed with about one third part of the mercury in the form of a ſoft maſs or amalgam, which being expoſed in a little glazed diſh to a gentle fire, the mercury is thus evaporated, and leaves the gold in powder, which may now be weighed, to ſhew in what proportion the ſandy or fluddy ore contains it. The like method of management will ſerve for the aſſaying of ſilver-ores. See AMALGAMATION and SILVER.

Accurate aſſays upon the ores of the inferior metals, as lead, tin, copper, and iron, require proper furnaces, the due applications of fire, and ſuitable fluxes adapted to the reſpective ores; and indeed ores of the ſame kind frequently require different methods of aſſaying, as well as ſmelting. See the articles FLUX, SMELTING, FURNACE, TIN, *&c.*

In order to the due ſeparation of metals from metals, or of a conſuſed mixture of metals, ſuch as thoſe commonly called electrums, or ſuch as the corinthian braſs of old was ſuppoſed to be, we muſt obſerve, that experience has taught us a certain effect of lead, which could not be well conceived *a priori*: this is more effectually and ſooner done by a proper glaſs of antimony, *viz.* that, by fuſion upon the coppel, it reſolves all the imperfect metals, without exception, into their ſmalleſt atoms, and partly throws them up into its furnace, in the form of a half vitrified powdery ſubſtance, in part ſinks along with them into the coppel, and in part converts them into glaſs, ſo as to leave nothing behind, but pure gold and ſilver.

ASSIGNMENT. (*Dict.*) *Novel* ASSIGNMENT. See NOVEL *Aſſignment*.

ASTROLABE. (*Dict.*) The aſtrolabe is otherwiſe called a planiſphere. See the article PLANISPHERE.

ATMOSPHERE. (*Dict.*) The reaſon why this body of air is ſo tranſparent, as to be inviſible, is owing to the great poroſity thereof; the pores and interſtices of air being ſo very great and large, it admits the light not only in right lines, but in ſuch great and plentiful rays, that the brightneſs and univerſal luſtre thereof not only renders the air diaphanous, but entirely hinders the opacity of the very ſmall particles of air from being at all ſeen; and therefore the whole body of air muſt conſequently be inviſible. See the article OPACITY.

Since the air, ſays ſir Iſaac Newton, is compreſſed by the weight of the incumbent atmoſphere, and the denſity of the air is proportionable to the force compreſſing it, it follows, by computation, that at the height of about 7 engliſh miles from the earth, the air is four times rarer than at the ſurface; and at the height of 14 miles, it is 16 times rarer than at the ſurface; and at the height of 21, 28, or 35 miles, it is reſpectively 64, 256, or 1024 times rarer; and at the height of 70, 140, and 210 miles, it is about 1000000, 1000000000000, or 1000000000000000000 times rarer; and ſo on in a geometrical proportion of rarity, compared with the arithmetical proportion of its height. See the article AIR.

The weight of the atmoſphere, which preſſes upon every body, being equal to ſo many fifteen pounds, as the ſurface of the body contains ſquare inches, the reaſon may be aſked, why men, beaſts, houſes, *&c.* are not cruſhed to pieces by ſuch a prodigious weight of air? This is owing to the equilibrium of the internal air, or the air included in all bodies, which, though it be ſmall, can, by its reaction, counterpoiſe and reſiſt the preſſure of the external air, how great ſoever it be, as is proved by ſeveral experiments upon the air-pump, already mentioned under the article AIR. See ACTION and REACTION.

If it be required to find the weight of the whole atmoſphere upon the earth's ſurface, we may proceed thus: ſuppoſe the earth's diameter in round numbers 8000 miles, the area of a great circle will be $8000 \times 8000 \times 3.7854 = 50266400$ ſquare miles, which multiplied by 4 gives 201065600 ſquare miles for the ſurface of the earth; but, becauſe we took the diameter a little too large, we may take 200,000,000 for the number of ſquare miles in the earth's ſurface; in one ſquare mile are $(5280 \times 5280 =)$ 27878400 ſquare feet, therefore on the earth's ſurface we have 5575680000000000 ſquare feet, which multiplied by 2660 (the preſſure on each ſquare foot) gives 14831308800000000000 pounds troy for the whole preſſure.

The atmoſphere is not only admirably fitted for the reſpiration and nouriſhment of animals, to the growth of vegetables, the production and propagation of ſounds, *&c.* but helps alſo to make our habitable earth that beautiful ſcene of variety which it now is. If it were not for the atmoſphere, the ſun and ſtars would give us no light, but juſt when we turn our eyes upon them: the brightneſs of the ſun would indeed be greater than it is; but, if we turned our eyes from him towards any other part of the heaven, it would appear as dark and full of ſtars as in a bright ſtar-light in winter. As for the various bodies, which are upon the earth, they would all, without the atmoſphere, appear to us as dark as at midnight, except only thoſe parts of them which happened to be in ſuch a poſition, that the rays of the ſun, falling upon them, were reflected to our eyes. It is eaſy to imagine how much of the beauty of the viſible creation would be loſt in theſe circumſtances, beſides the inſupportable prejudice to the eyes of all creatures, by paſſing ſo ſuddenly from pitchy darkneſs to exceſſive light. The numberleſs

berleſs ſmall particles of various kinds, which float in the air, receive the light from the ſun, and, like ſo many ſmall ſpecula or looking glaſſes, reflect and ſcatter it through the air, and this occaſions that light, which we ſee in the day-time, by which our eyes are affected ſo ſtrongly, as to render the fainter light of the ſtars inſenſible. By this means the ſtars are illuminated all round us by the ſun, not only whilſt he is above our horizon, but alſo for ſome time before his riſing, and after his ſetting, ſo long as any of his rays can either directly, or by refraction, reach any part of the atmoſphere within our viſible horizon; for the air, as well as all other mediums which tranſmit light, refracts or bends the rays of it, if they come into it from a different medium; this property of the air is exceedingly beneficial to the inhabitants of the earth, as it lengthens the days by the addition of the twilight; but it gives aſtronomers ſome trouble, as it changes a little the places of all the heavenly bodies, and makes them appear higher than they really are, and muſt therefore be taken into the account, if we would be exact. The ancients were not well acquainted with the refraction of the air, which renders many of their obſervations of the heavenly bodies, eſpecially near the horizon, liable to uncertainty. See LIGHT, REFLECTION, REFRACTION, TWILIGHT, STARS, *&c.*

ATRIUM, or PORCH, in architecture. See the article PORCH.

ATTRACTION. (*Dict.*) Attraction and repulſion differ in no other reſpects than this, that the attractive virtue, in the firſt caſe, carries bodies towards the attracting body; and, in the latter, it carries them from it. In each caſe, the particles are moved in the ſame manner among themſelves by the attracting, electric, or magnetic power. See REPULSION, ELECTRICITY, and MAGNETISM.

That the attraction of gravitation and coheſion is the act of an immaterial cauſe, in virtue whereof inactive matter performs the offices for which it was deſigned; or that theſe diſpoſitions in bodies are not the reſult of any mechanical cauſe whatever; that is, ſuch as may ariſe from the effluvia of bodies, or the action of any other material ſubſtance; Mr. Rowning demonſtrates as follows:

In the firſt place, it is well known, that, if gravity acts upon bodies with the ſame degree of intenſeneſs, whether they be in motion or at reſt, it may be demonſtrated, that bodies, when projected, will deſcribe parabolas; and that, when vibrating in cycloids, their vibrations will be iſochronous, *&c.* In the next place, it is well known, that bodies, when projected, do deſcribe parabolas, and that, when vibrating in cycloids, their vibrations are iſochronous, *&c.* From which two properties it demonſtratively follows, that if gravity be the cauſe of the two above-mentioned effects, it muſt act upon bodies with the ſame force, whether they be in motion or at reſt. Again, it is well known, that if attraction of coheſion acts upon rays of light with the ſame degree of intenſeneſs, whatever be the velocity they move with, it may be demonſtrated, that the ratio of the ſine of the angle of incidence to the ſine of the angle of refraction will be given. But in refraction of light, the ratio of theſe ſines is given in fact; if, therefore, attraction of coheſion be the cauſe of the refraction of light, it muſt act upon rays of light with the ſame intenſeneſs, whatever velocity they move with. See the articles LIGHT, REFRACTION, *&c.*

But no effluvia of bodies, no material ſubſtance, and, in ſhort, no material cauſe whatever, can act with the ſame intenſeneſs, or have the ſame effect upon a body in motion, as upon the ſame body at reſt; becauſe body can only act upon body, according to the ſum or difference of their motions. It remains therefore, that the two diſpoſitions herein mentioned are not the reſult of any material cauſe whatever. See the article MOTION.

Under the articles FLUID and CAPILLARY TUBES, may be ſeen how any fluid will aſcend above the common ſurface in capillary tubes, *&c.* by means of attraction; but the moſt notable and obvious motion of fluids, ariſing from attraction, is that of the tides; the theory of which we have explained at large under the article TIDES.

AURES MARINÆ, EAR-SHELLS, in natural hiſtory, a name given to different ſpecies of the haliotis. See the articles AURIS MARINA, HALIOTIS, and plate XXIV. fig. 3.

B.

BALEARES, the ancient name for the iſlands of Majorca, Minorca, and Ivica. See MAJORCA, *&c.*

BARRACOL, in ichthyology, the engliſh name of the ſmooth raja, with ſpines about the eyes, and three rows of them at the tail. See the article RAJA.

BARRERIA, in botany, a genus of the *pentandria-tetragynia* claſs of plants, the corolla whereof is compoſed of five oval petals, with very long filiform ungues; the antheræ are ſimple; the germen is rude, immerſed in the cup, and quinquifid; the ſtyles are five, they are filiform, and of the length of the ſtamina; the ſtigmata are obtuſe.

BASS, (*Dict.*) among gardeners, a ſoft kind of ſedge or ruſh uſed in binding plants, *&c.*

BEAR'S BREECH, *acanthus*, in botany. See the article ACANTHUS.

BENCH, (*Dict.*) *King's* BENCH. See the article KING'S BENCH.

BERNACLE, or CLAKIS, in ornithology, the anas with the head and neck black. See the article ANAS.

This is a very ſingular bird: it is conſiderably ſmaller than the common gooſe, but larger than the duck; the head is large and rounded; the eyes are large; the beak is black, and much ſmaller than in the common gooſe, though broader in proportion to its length; the under-part of the body is white, with ſomewhat of an admixture of grey; the back is variegated with black and grey, and the covering feathers of the tail are part white, and part black; the tail is black, and the covering feathers of the wings are very elegantly variegated with black, grey, and white.

This is the bird which Gerard, and ſome other authors, have declared to be produced from a peculiar ſpecies of ſhell-fiſh, called the bernacle-ſhell, found on decayed wood that lies about the ſea-ſhores. The love of wonderful obſervations raiſed this firſt account of the bird's being produced from a ſhell-fiſh, that uſually adhered to old wood, into the ſtory of that ſhell's growing upon a tree in manner of its fruit. The whole matter that gave origin to this ſtory is, that the ſhell-fiſh, ſuppoſed to have this wonderful production, uſually adhere to old wood, and that they have a kind of fibrils hanging out of them, which, in ſome degree, reſemble feathers of ſome bird; from which aroſe a ſtory, that they contained real birds.

BETHLEHEM, or BEDLAM-HOSPITAL. See the article HOSPITAL.

BIOTA, in zoology, a genus of ſea-inſects, of a cylindric, but variable figure, with the tentacula arranged in a ſingle ſeries round the aperture of the mouth, at the extremity of the body.

Among the ſeveral other ſpecies of this genus is the polype. See POLYPE.

BIRD'S NEST, in botany, the engliſh name of the neottia. See NEOTTIA.

BIRDS-NESTS, in cookery, the neſts of a ſmall indian ſwallow, very delicately taſted, and frequently mixed among ſoups. On the ſea-coaſts of China, at certain ſeaſons of the year, there are ſeen vaſt numbers of theſe birds; they leave the inland country at their breeding-time, and come to build in the rocks, and faſhion their neſts out of a ſpumous matter, which they find on the ſhore waſhed thither by the waves. They are of a hemiſpheric figure, and of the ſize of a gooſe's egg, and, in ſubſtance, much reſemble the ichthyocolla or iſinglaſs. The Chineſe gather theſe neſts, and ſell them to all parts of the world; they diſſolve in broths, *&c.* and make a kind of jelly of a very delicious flavour.

BITE, (*Dict.*) in ſurgery. Heiſter obſerves, that the bites of enraged animals, though they were not mad at the time they inflicted them, are uſually attended with very grievous conſequences. If the wound is ſlight, the diſcharge of blood from the part is to be encouraged by preſſing it with the fingers, ſucking it in the mouth, or by the application of cupping-glaſſes, or enlarging it with a lancet. It is afterwards to be waſhed with warm ſpirit of wine, and bolſters dipped in the ſame liquor, are to be applied to it, repeating the application every three or four hours, till all danger of inflammation is gone off. If the wound be conſiderably deep, it is always neceſſary to enlarge it with the knife, unleſs it have already a very large opening; and, after applying ſpirit of wine for the firſt days, to prevent the bad ſymptoms, it may be eaſily healed with honey, or ſome digeſtive

digeſtive ointment, and afterwards with a vulnerary balſam, as uſual in other wounds. See the articles HYDROPHOBIA and WOUND.

BLUE. (*Dict.*) *Pruſſian* BLUE. See the article PRUSSIAN BLUE.

BOB, (*Dict.*) in ringing, denotes a peal conſiſting of ſeveral courſes or ſets of changes.

BOLT-HEAD, among chemiſts, the ſame with cucurbit. See CUCURBIT.

BONE. (*Dict.*) *Neper's* BONES. See the article NEPER'S BONES.

BOREA, in natural hiſtory, the name whereby the antients called the bluiſh, green, ſofter, and dull jaſper. See the article JASPER.

This ſtone is generally accounted of the malachites kind, but improperly, as it is much ſofter than that; and ſome have imagined the variety of this ſpecies to be the turquoiſe of the moderns, but erroneouſly. It is conſiderably heavy, and though but moderately hard, is yet capable of a very elegant poliſh.

BREEDING, (*Dict.*) in a moral ſenſe, denotes a perſon's deportment or behaviour in the external offices and decorums of ſocial life. In this ſenſe, we ſay, well-bred, ill-bred, a man of breeding, *&c.* Good breeding is hard to be defined; and none can underſtand the ſpeculation, but thoſe who have the practice. Good breeding amounts to much the ſame with what is otherwiſe called politeneſs, and, among the antient Romans, urbanity. Good breeding is near to virtue, and will of itſelf lead a man a great part of the way towards the ſame; it teaches him to rejoice in acts of civility, to ſeek out objects of compaſſion, and be pleaſed with every occaſion of doing good offices. Lord Shaftesbury compares the well-bred man with the real philoſopher: both characters aim at what is excellent, aſpire to a juſt taſte, and carry in view the model of what is beautiful and becoming. The conduct and manners of the one is formed according to the moſt perfect eaſe and good entertainment of company; of the other, according to the ſtricteſt intereſt of mankind; the one according to his rank and quality in his private ſtation; the other, according to his rank and dignity in nature. Horace ſeems to have united both characters,

Quid verum atque decens curo & rogo, & omnis in hoc ſum.

BREEMING, in ſea-language, denotes the burning off the weeds, filth, *&c.* which a ſhip contracts under water, with furze, faggots or reeds, before her bottom is caulked and graved; and is to be done when in the dock, on the careen, or on the ground aſhore.

BROOKLIME (*Dict.*) is alſo the engliſh name of the lateral cluſter-flowered veronica, with oval leaves and creeping ſtalks. See the article VERONICA.

C.

CÆMENTATION. (*Dict.*) For the method of making ſteel by cæmentation, ſee the article STEEL.

CAKE, a finer ſort of bread, denominated from its flat round figure. See the article BREAD.

We meet with divers compoſitions under the name of cakes; as ſeed-cakes, made of flour, butter, cream, ſugar, coriander and caraway ſeeds, mace, and other ſpices and perfumes, baked in the oven; plumb-cake, made much after the ſame manner, only with fewer ſeeds, and the addition of currants; pan-cakes, made of a mixture of flour, eggs, *&c.* fried; cheeſe-cakes, made of cream, eggs, and flour, with, or without cheeſe-curd, butter, almonds, *&c.* oat-cakes, made of fine oaten-flower, mixed with yeſt, rolled thin, and laid on an iron or ſtone to bake over a ſlow fire; ſugar-cakes, made of fine ſugar beaten and ſearced with the fineſt flour, adding butter, roſe-water, and ſpices: roſe-cakes, placentæ roſaceæ, are leaves of roſes dried and preſſed into a maſs, ſold in the ſhops for epithems.

CALABASH, (*Dict.*) in commerce, a light kind of veſſel made of the ſhell of a gourd, emptied and dried, ſerving for a caſe to put divers kinds of goods in; as pitch, roſin, and the like. The Indians alſo, both of the north and ſouth ſea, put the pearls they have fiſhed in calabaſhes; and the negroes, on the coaſt of Africa, do the ſame by their gold duſt.

The

The ſmaller calabaſhes are alſo frequently uſed by theſe people as a meaſure, by which they ſell theſe precious commodities to the Europeans. The ſame veſſels likewiſe ſerve for putting in liquors, and do the office of cups as well as of bottles for ſoldiers, pilgrims, *&c.*

CALENTES, in logics, a ſort of ſyllogiſm in the fourth, commonly called galenical, figure, wherein the major propoſition is univerſal and affirmative; and the ſecond or minor, as well as the concluſion, univerſal and negative.

This is intimated by the letters it is compoſed of, where the A ſignifies an univerſal affirmative, and the two E's as many univerſal negatives. *Ex. gr.*

CA. Every affliction in this world is only for a time.

lEn. No affliction, which is only for a time, ought to diſturb us.

tEs. No affliction ought to diſturb us, which happens in this world.

The Ariſtotelians, not allowing the fourth figure of ſyllogiſms, turn this word into CElAntEs, and make it only an indirect mood of the firſt figure. See the article CELANTES.

CALIGA, in roman antiquity, was the proper ſoldier's ſhoe, made in the ſandal-faſhion, without upper-leather to cover the ſuperior part of the foot, though otherwiſe reaching to the middle of the leg, and faſtened with thongs. The ſole of the caliga was of wood, like the ſabot of the french peaſants, and its bottom ſtuck full of nails, which clavi are ſuppoſed to have been very long in the ſhoes of the ſcouts and ſentinels; whence theſe were called by way of diſtinction, caligæ ſpeculatoriæ, as if, by mounting the wearer to a higher pitch, they gave a greater advantage to the ſight. The others will have the caligæ ſpeculatoriæ to have been made ſoft and woolly, to prevent their making a noiſe.

CAMOMILE, or CHAMÆMILE, *chamæmilum*, in botany. See the article CHAMÆMILE.

CAMPHORATED. (*Dict.*) CAMPHORATED JULEP. See the article JULEP.

CANNIBAL, or CANIBAL, is uſed by modern writers for an anthropophagus, or man-eater, more eſpecially of the Weſt-Indies. See ANTHROPOPHAGY.

CAOLIN, or KAOLIN. See KAOLIN.

CARACARA, (*Dict.*) for a repreſentation of which, ſee plate XXXVI. fig. 6.

CARICA (*Dict.*) is alſo a name uſed by medical writers for the fruit of the fig-tree. See the articles FIG and FICUS.

CARVER, a cutter of figures or other devices in wood. See CUTTING *in wood*. This is alſo the name of an officer of the table, whoſe buſineſs is to cut up the meat, and diſtribute it to the gueſts.

CASI, in the perſian policy, one of the two judges under the nadab, who decide all religious matters, grant all divorces, and are preſent at all public acts, having deputies in all the cities of the kingdom. See the article NADAB.

CATERPILLAR. (*Dict.*) For a view of three ſeveral ſpecies, ſee plate XXXVIII. fig. 6.

CHALCEDON, or CALCEDON, a city of Bythinia, in the leſſer Aſia, once the capital of the country, ſtood on the Aſian ſide of the Boſphorus, or ſtrait of Conſtantinople, oppoſite to that city, and near the place where the ſeraglio or palace of Scutari now ſtands: eaſt long. 29°, north lat. 41° 30′.

CHALK. (*Dict.*) CHALK JULEP. See the article JULEP.

CHATTER, or STONE-CHATTER, in ornithology. See STONE.

CHEIRI, WALL-FLOWER, in botany, the name whereby moſt writers call the leucoium luteum vulgare. See LEUCOIUM.

The flowers of this plant are ſaid to be cordial, anodyne, aperient, and emmenagogue.

CHEMISTRY. (*Dict.*) Dr. Shaw divides chemiſtry in general into philoſophical, technical, commercial, and œconomical.

Philoſophical CHEMISTRY he defines a rational art of dividing, or reſolving, all the bodies within our power, by means of all the inſtruments we can procure, as well into integrant as conſtituent parts; and joining theſe parts together again, ſo as to diſcover the principles, relations, and changes of bodies; make various reſolutions, mixtures, and compoſitions; find out the phyſical cauſe of phyſical effects: and hence improve the ſtate of natural knowledge, and the arts thereon depending. See THEORY.

Philoſophical Chemiſtry conſiſts of three parts, *viz* invention, rationale, and experiment; whence it is otherwiſe defined, a particular exercile of the rational and inventive faculties of the mind, leading to experiments, and thence to the diſcovery of cauſes, ſo as to form axioms that ſhall rationally account for phænomena, and diſcover rules of practice for producing

ducing uſeful effects: thus philoſophical chemiſtry is not only a key to all the other parts, but of itſelf diſcovers the cauſes of many natural phænomena, as particularly earthquakes, vulcanos, vegetation, the growth of minerals, &c. See the articles EARTHQUAKE, VULCANO, VEGETATION, &c.

This branch of chemiſtry alſo explains the general forms and qualities of bodies, whereon their properties and effects depend; as volatility and fixedneſs, fluidity and firmneſs, colours, taſtes, odours, effervescences, fermentation, precipitation, congelation, extraction, and the like. See VOLATILITY, FIXEDNESS, COLOUR, TASTE, ODOUR, &c.

From the firſt definition of philoſophical chemiſtry, it follows that the objects of this art are all the bodies within our power, and are therefore taken from the three larger maſſes or regions of the globe, *viz.* the earth, water, and atmoſphere. See LABORATORY, EARTH, &c.

It alſo follows, that the inſtruments of chemiſtry are all thoſe we can any way procure: there are ſeveral inſtruments continually at work in the three larger maſſes, or kingdoms of the globe, *viz.* the earth, water, and atmoſphere, for the immediate production of effects. We evidently find, that metals and minerals are formed within the earth; vegetables on its ſurface, ſhooting into the air; meteors in the atmoſphere; and men, beaſts, and birds, in the confines of the two: the phyſical cauſe of all which, are to be generally ſought as ſo many rules of practice. The principal phyſical agents in nature appear to be, 1. heat, 2. cold, 3. air, or the integrant parts of the atmoſphere, 4. water, and 5. proper beds or matrices. This is matter of direct obſervation; and might occaſion the eſtabliſhing the four elements, fire, air, water, and earth. See the articles HEAT, COLD, AIR, and WATER.

Proper beds or matrices appear to have an inſtrumental agency in the production of natural bodies: Every ſubject of an operation, is neceſſarily contained in ſomething that may, 1. afford it a lodgement, 2. make ſome reſiſtance, and 3. convey heat, cold, water, or air to it, or determine their actions upon it. Thus in vegetation, the matrix earth ſupports the ſeed, reſiſts its ſwelling, and conveys a ſtrained or prepared moiſture to it.

The matrices of gems and ores, not only afford a proper lodgement to the ſubject-matter, but alſo reſiſt its growth, by the preſſure of their ſides: which, however, give way a little, and at the ſame time ſtrain and convey ſuitable juices to the ſubject: and ſomething of this kind is obſerved of the fœtus in utero, the hatching of eggs, &c. inſomuch that cloſeneſs, moderate reſiſtance, or a ſlow-yielding of the ſides of the matrix, and a ſtraining of the juices through them (unleſs ſupplied from within) ſeem requiſite for the formation and production of all vegetable, animal, and mineral ſubſtances. Whence we are furniſhed with a capital rule for the improvement of chemiſtry, natural philoſophy, and arts; and taught that, in order to imitate nature, chemiſtry muſt not be confined to the ſole uſe of fire, as its inſtrument, but occaſionally employ water, cold, air, earth, and proper matrices or veſſels. See VEGETATION, GENERATION, FOETUS, HATCHING, EXPERIMENTAL PHILOSOPHY, &c.

But beſides the natural inſtruments, there is a great variety of artificial ones belonging to chemiſtry, which ſeems to raiſe the power of this art, in ſome reſpects, above the power of nature: thus by means of particular menſtruums, it performs operations which nature of herſelf does not. For inſtance, of all the metals only iron and copper are found naturally converted into vitriol; whereas chemiſtry makes vitriols even of gold, ſilver, tin, and lead. And hence the productions of art may be much more numerous than the productions of nature, or enlarged at pleaſure, to the great enrichment of arts, and the enlargement of the kingdom of man. In which light the numerous productions of the chemical trades may be conſidered, as by fermentation, diſtillation, dying, ſoap-making, the art of glaſs, metallurgy, &c. See the articles MENSTRUUM, FERMENTATION, DISTILLATION, &c.

Another ſet of inſtruments belonging to chemiſtry, are veſſels, furnaces, and utenſils, of which there is a great variety for various purpoſes, and capable of producing numerous changes in bodies, as by amalgamation, cæmentation, effuſion, fermentation, putrefaction, reduction, &c. See the articles LABORATORY, FURNACE, AMALGAMATION, CÆMENTATION, FUSION, &c.

To the above-mentioned, Dr. Shaw adds a new ſet, *viz.* the air-pump, conden-

ſer, digeſtor, microſcopes, burning concaves, priſms, lenſes, portable furnaces, and every other inſtrument that can be invented, or procured, of advantage to the art. See the articles AIR-PUMP, CONDENSER, DIGESTOR, MICROSCOPE, BURNING-GLASS, PRISM, LENS, and FURNACE.

There are two capital ways wherein chemiſtry divides its objects, by the ſeveral inſtruments above-mentioned, *viz.* into integrant parts, and into conſtituent parts. By integrant parts we underſtand ſimilar parts, or parts of the ſame nature with the whole, as filings of iron have the ſame nature and properties as bars of iron. Under this general operation fall thoſe particular ones of triture, limitation, ſolution, amalgamation, ſublimation, *&c.* And by conſtituent parts we mean diſſimilar parts, or parts of a different nature from the whole, as when artificial cinnabar is divided into the quickſilver and ſulphur; and under this general operation come all kinds of reſolutions. See TRITURE, LIMITATION, SOLUTION, *&c.*

Theſe two general operations of chemiſtry bear relation to two general ſtructures of bodies, *viz.* the aggregate, and the mixt. Aggregates, in their reſolution, conſtantly retain their mixture in every the ſmalleſt part or atom; but when mixts are reſolved, the mixture is deſtroyed, and two or more new aggregates are produced; thus when brandy is reſolved, ſpirit of wine, or alcohol, and water are produced. Every ſenſible mixt, or aggregate, is compoſed of many inſenſible ones. Before gold can become ſenſible to us, there muſt be a collection of numerous parts that are ſeparately inſenſible, tho' all of them perfect gold. The minuteſt grain of cinnabar has two different parts, ſulphur and quickſilver. The minuteſt grain of ſalt contains ſand and fixed ſalt; and when quickſilver is diſſolved in aquafortis, the leaſt aſſignable portion of the menſtruum contains a proportionable quantity of mercury to the whole. See ANALYSIS, ALCOHL, GOLD, CINNABAR, SULPHUR, *&c.*

Either the integrant, or the conſtituent parts of bodies being once divided or reſolved, various occaſions in chemiſtry require them to be joined together again, for compoſing a whole like the original ſubject. This operation is the converſe of the former; thus by ſimple mixture we recompoſe brandy from alcohol and water, and by precipitation with a copper-plate, collect the quickſilver diſperſed in aquafortis. See SYNTHETIC *Chemiſtry.*

The reſolutions, mixtures, and compoſitions made by chemiſty are extremely numerous, and may be increaſed *ad infinitum.* Brandy gently diſtilled by the balneum mariæ, as was ſaid before, is reſolved into ſpirit of wine and water. And to this claſs of reſolutions are referrable all kinds of depurations, purifications, ſeparations, clarifications, *&c.* See DEPURATION, PURIFICATION, SEPARATION, CLARIFICATION, *&c.*

By mixture we produce all the artificial vitriols, ſoaps, glaſſes, *&c.* and can compound theſe again, in an almoſt infinite variety; ſo that of the reſolutions, mixtures, compoſitions, and recompoſitions, in chemiſtry, there ſeems to be no bounds; whence great room is left for the making of new chemical diſcoveries.

Philoſophical chemiſtry being, in the definition given by our learned author, a rational art; by which is meant, that it may be conducted by rule, and need not be left to accidental trial and caſual experiment, he endeavours to comprize the rules for conducting it under the following three.

Rule I. When a body is offered in order to have new properties diſcovered in it, different from thoſe general ones offigure, gravity, elaſticity, *&c.* which come under mathematical conſideration, let the body be reſolved by degrees into the ſimpleſt conſtituent parts it is any way capable of, by the inſtruments pointed out above; and let trial be made with each ſeparate part, on a variety of bodies, according to ſome analogy of a previous chemical knowledge, leading from one thing to another, in a ſure or probable method of ratiocination.

Rule II. Let the ſeveral parts obtained by the preceding analyſis be reunited, beginning with two, and proceeding gradually to the whole number; uſing at firſt the gentleſt degree, then the intermediate, and at laſt the higheſt degrees of heat and cold. Thus for example, join the fixed ſalt and oil of a plant together; firſt by ſimple digeſtion, and afterwards by boiling, which affords a third production, diſſimilar to all the reſt, and known by the name of ſoap; ſo again melt the ſame fixed ſalt with the earth of a plant, and this will afford glaſs. Let the laſt attempt be to reunite all the ſeparated parts of the body, in order, if poſſible,

ſible, to form the original ſubſtance again.

Rule III. In every operation performed, let the greateſt diligence and exactneſs of obſervation be uſed, with regard to all the principal phænomena and effects produced. Let the phænomena be duly regiſtred, tabled, conſidered, and compared together, after the ſtrict geometrical manner; the reſult whereof, if there be no conſiderable errors committed, will lead to a knowledge of the ſecret ſprings, motions, inſtruments, and means made uſe of by nature for producing effects. And thus, with the proper care and application, juſt canons or rules of practice may be formed. The following are what the Doctor calls imperfect axioms and canons, deduced from a number of experiments, and the preceding enquiry, for directing farther diſcoveries and improvements in chemical and natural knowledge.

1. We may learn that a true chemiſtry (as it may perhaps be juſtly called) is exerciſed by nature, in the vegetable, animal, mineral, marine, and atmoſpherical regions, and that by it all bodies are produced, converted, renovated, repaired, and maintained; and that in the exact diſcovery, imitation, and controul of this natural chemiſtry, conſiſts the perfection of the artificial. 2. That neither the eye, nor all the ſenſes together, can give us any information of the latent properties of bodies, their natures, and uſes; but only particular trials and experiments, well attended to and conſidered. 3. That experiments are but a kind of dead things, unleſs they have a direct uſe in life, or tend to the raiſing axioms and canons for improving our knowledge, and extending our power over the works of nature. 4. That he who can chuſe fit ſubjects, and place them in proper matrices or including veſſels, ſupply them duly with air and water, heat and cold, may probably produce great effects in imitation of nature. 5. That nature points out three ways of producing phyſical effects, different in fineneſs, *viz.* in beds of earth, beds of water, and beds of atmoſphere; beds of earth for minerals, of water for fiſh, and of atmoſphere for birds, meteors, *&c.* the confines of theſe two for plants and animals, and a rarefied mixture of all matters for meteors. 6. That men may make uſe of the ſame inſtruments as nature does, *viz.* fire, air, water, and earth, and conſequently produce the ſame kind of effects, if ſkill, that is knowledge, be not wanting: whence, to improve in knowledge, is to improve in arts. 7. That chemiſtry is not confined to the uſe of fire only, but, in imitation of nature, may employ cold, air, water, and earth, upon matter, in various degrees of ſimplicity, combination, and mixture, which ſhews an extenſive method of enlarging the bounds of the art. 8. That fire is not only an analyſis in ſome caſes, but alſo a mixer of bodies in others, and this to the advantage of chemiſtry. For if it only ſeparated, it could produce but few effects, in compariſon of that infinite variety it now produces, both by mixture and ſeparation. 9. That it might be proper to try the reciprocation of heat and cold in chemical operations, after the manner of nature in day and night, ſummer and and winter. 10. That body in all its forms is the object of chemiſtry, not conſidered mathematically nor mechanically, but operatively and effectively. 11. That the atoms, or primary ſmall compoſitions of bodies, are inſenſible to us. Thus the firſt particles of gold, ſalts, metals, and minerals, may float in the air, and not be perceived by us till they aggregate or collect together, and make a ſenſible maſs, or produce a ſenſible effect. 12. That ſome operation of the mind is requiſite to digeſt, methodize, and regiſter chemical experiments and obſervations, without which we cannot underſtand the laws obſerved by nature in phyſical operations, nor be able to imitate them; the chemiſtry or regular proceſſes of the mind, being here as neceſſary as the corporeal operations themſelves.

Technical CHEMISTRY is defined to be the application of philoſophical chemiſtry to the immediate ſervice of an art, ſo as to invent, form, aſſiſt, promote, or perfect it in the large way of buſineſs. This branch of chemiſtry is, for the ſake of uſe and commodiouſneſs, divided by our author into four parts, as it relates to ſubjects of the animal, vegetable, and mineral kingdoms, or to ſeveral of them at once. Thus under animal arts comes the art of preparing ſize and glue, tanning, ivory-ſtaining, the dying in wool, ſilk, *&c.* Under vegetable arts comes the art of timber, or the ways of preſerving it ſound againſt the injuries of the weather, the ſea, *&c.* the art of making roſin, pitch, oil of turpentine, charcoal, potaſh, *&c.* the art of brewing and fermenting for wines, vinegars, *&c.* the art of ſugar-making and refining, the

art of ſoap-making, &c. Under mineral arts come the arts of ſalt, copperas, vitriol, borax, pottery, metals, foundery, ſmithery, &c. And laſtly, under mixed arts come the art of paper, the art of ink, the art of japanning, the art of glaſs, the art of pigments, the art of pharmacy, the art of fireworks, &c. all which are proper chemical arts, that fall under technical chemiſtry. See SIZE, GLUE, &c.

Commercial CHEMISTRY is the application of both philoſophical and technical chemiſtry, to the eſtabliſhing, ſupporting, and improving any branch of trade and commerce. Commercial chemiſtry conſiſts of three parts, *viz.* 1. The exerciſe of all the chemical arts in a large manner, ſo as to ſupply more than the demands of a ſingle country, and afford a ſurplus of commodities for exportation and foreign conſumption. 2. The various ways of condenſing, curing, preparing, ſecuring, and fitting natural and artificial commodities for carriage and tranſportation. And 3. The ways of ſupplying the chemical neceſſaries to voyagers and travellers, for founding, ſupporting, and improving trade, traffic, and commerce, in different countries.

It is by means of technical and commercial chemiſtry together, that different countries are ſupplied with lead, tin, iron, ſilver, oil, tallow, tanned hides, pitch, roſin, brimſtone, wax, wines, brandies, ſalt, ſugars, treacle, paper, &c. whereby all trades, traffic, and commerce is ſupported. And to diſcover this kind of contrivances or reductions, is the office of commercial chemiſtry; thus inſtead of importing many tuns of a foreign dying-wood, we are taught to extract its tinging parts, and bring them away in the quantity of a few pounds. It affords the neceſſaries for long trading voyages; it directs to the certain rules of diſcovering the ſophiſtications practiſed in wines, brandies, vinegars, arracks, gold-ſand, gold-bars or ingots, counterfeit gems, &c. and to the way of aſſaying pot-aſh, tincal, ambergreaſe, muſk, and all the drugs, &c. See IRON, SILVER, OIL, &c.

Oeconomical CHEMISTRY is the application of philoſophical, technical, and commercial chemiſtry, to the ſervice and accommodation of a family, being of great uſe and extent, ſo as to be capable of improving all the reſt. This branch is divided with regard to the ſeveral offices of a houſe, wherein, as in ſo many different laboratories, it may be commodiouſly practiſed; for inſtance, in the brew-houſe, the ſtore-room, the kitchen, the dairy, the laundry, and the cellar. Thus by means of œconomical chemiſtry, we are inſtructed in the beſt ways of procuring and brewing with malt, treacle, honey, ſugar, or other vegetable juices; the beſt ways of raiſing and of preſerving yeaſt or wine-lees, for baking or brewing, and of imitating the natural wines of foreign growth. This art directs us how to procure the ſimple and compound waters of vegetables in their greateſt perfection, and to make a ſet of brandies or cordial waters, even from the groſs lees, ſediments, or bottoms of our wine or ale-caſks. Hence alſo we learn the method of preſerving fruits in ſugar, and ſeveral vegetable productions in the way of pickle, &c. and the art of cookery is alſo improveable by this means. See the article BREWING, &c.

Analytical CHEMISTRY, that part of chemiſtry which teaches the art of analyſing vegetable, animal, and mineral ſubſtances, and reſolving them into different parts or principles. See ANALYSIS.

Synthetic or *Synthetical* CHEMISTRY. See the article SYNTHETIC.

CLADONIA, in botany, a genus of moſſes conſiſting of a firm, tough, and flexible matter, formed into ſtalks of a roundiſh figure, ſometimes almoſt ſimple, ſometimes more ramified, and in many of the ſpecies reſembling ſmall ſhrubs.

There are four ſpecies of this genus, *viz.* the forked cladonia, the branched, hollow cladonia, the ſolid, branched cladonia, and the tophaceous cladonia, otherwiſe called the orcelle or canary-weed.

COCCUS. (*Dict.*) in botany, a genus of plants, the characters of which are not perfectly aſcertained. There are male, hermaphrodite flowers, and female ones, diſtinct on the ſeveral parts of the ſame ſpadix; the general ſpatha is compoſite, and the ſpadix ramoſe. In the hermaphrodite flowers, the coralla is divided into three oval, acute ſegments; the ſtamina are ſix ſimple filaments, of the length of the corolla. The female flower has the corolla very minute, but divided alſo into three ſegments; the fruit is large, coriaceous, round, and obtuſely trigonal; the ſeed is a large nut, of an oval figure, acuminated, formed of three valves, obtuſely trigonal, and marked with three holes at the baſe.

COEMETERY, or CEMETERY, (*Dict.*) a dormitory or place ſet apart or conſecrated for the burial of the dead. See BURIAL, SEPULCHRE, &c.

Antiently none were buried in churches or church-yards: it was even unlawful to inter in cities; inſtead of which they had coemeteries without the walls. Theſe were held in great veneration among the primitive chriſtians. The council of Elvira prohibited the burning of torches or tapers, in the day time, in coemeteries. The practice of conſecrating coemeteries is of ſome antiquity: the biſhop walked round it in proceſſion, with the crozier, or paſtoral ſtaff, in his hand, the holy water-pot being carried before, out of which aſperſions were made. In the early ages, the chriſtians held their aſſemblies in the coemeteries, as we learn from Euſebius and Tertullian, the latter of whom calls thoſe *coemeteries* where they met to pray, areæ. Valerian ſeems to have confiſcated the coemeteries, and places deſtined for divine worſhip, which were reſtored again to the chriſtians by Gallian: in the reſcript of that emperor, which is preſerved by Euſebius, coemeteries and places of worſhip are uſed as ſynonymous terms. It being here the martyrs were buried, the chriſtians choſe thoſe places to have churches in, when leave was given them by Conſtantine to build. And hence ſome derive that rule which ſtill obtains in the church of Rome, never to conſecrate an altar, without putting under it the relicks of ſome ſaint.

COLLEGE. (*Dict.*) *Royal* COLLEGE *of Phyſicians*, is alſo a corporation of phyſicians in Edinburgh, erected by king Charles II. granting them, by patent under the great-ſeal, an ample juriſdiction within this city and liberties, commanding the courts of juſtice to aſſiſt them in the execution of their orders. Theſe have the ſole faculty of profeſſing phyſic here, and hold conferences once a month for the improvement of medicine. This college conſiſts of a preſident, two cenſors, a ſecretary, and the ordinary ſociety of fellows, who, upon St. Andrew's day, if it falls on a thurſday, if not on the firſt thurſday after, elect ſeven counſellors, who chuſe the preſident and the other officers for the enſuing year. By their charter the preſident and cenſors have power to convene before them all perſons that preſume to practice phyſic within the city of Edinburgh, or the liberties thereof, without the licence of the college; and to fine them in five pound ſterling. They are alſo impowered to viſit apothecaries-ſhops, and examine apothecaries themſelves; with ſeveral other rights and privileges.

COLLEGE *of Heralds* in Scotland. The principal perſon in the Scottiſh court of honour is lyon king at arms, who has ſix heralds and ſix purſuivants, and a great number of meſſengers at arms under him, who, together, make up the college of heralds. The lyon is obliged to hold two peremptory courts in the year, at Edinburgh, on the 6th of May and the 6th of November, and to call officers of arms and their cautioners before him upon complaints; and if found culpable upon trial, to deprive and fine them and their cautioners. Lyon and his brethren the heralds have power to viſit the arms of noblemen and gentlemen, and to diſtinguiſh them with differences, to regiſter them in their books, as alſo to inhibit ſuch to bear arms as by the law of arms ought not to bear them, under the pain of eſcheating to the king the thing whereon the arms are found, and of a hundred marks Scots to lyon and his brethren; or of impriſonment during lyon's pleaſure. The college of heralds are the judges of the malverſation of meſſengers, whoſe buſineſs is to execute ſummonſes and letters of diligence for civil debt real, or perſonal. See the article HERALD and MESSENGER.

COLLEMA in botany, a genus of moſſes, conſiſting merely of a gelatinous matter, reſembling boiled glue or ſize. This is ſometimes diſpoſed in form of filaments, ſometimes of membranes, and ſometimes of neither, but perfectly ſhapeleſs. No part of fructification has ever yet been diſtinguiſhed in any of the ſpecies of this genus.

COLOURING, (*Dict.*) COLOURING *of leather*. See LEATHER.

COLOURING *of marble*. See MARBLE.

COMB, (*Dict.*) HONEY-COMB. See the article HONEY-COMB.

COPPER, (*Dict.*) In a pamphlet lately publiſhed, intituled, *Serious reflections on the manifold dangers attending the uſe of Copper-veſſels*; the author after obſerving, that copper-utenſils are now employed in almoſt every kitchen in the kingdom, endeavours to ſhew from the very nature of the metal, that theſe utenſils throw out a poiſonous matter, more or leſs, which, mixing with our food, renders it in a greater or leſs degree pernicious. It muſt be obſerved, that the

pernicious

pernicious effects of copper are ſometimes evident, at other times latent. In the firſt caſe it ſtands ſelf-condemned by undeniable facts; in the other, though we cannot ſo certainly demonſtrate its deſtructive properties, yet the preſumption againſt it is very ſtrong. Let us ſuppoſe firſt, that we have a copper-utenſil perfectly new, for inſtance, a preſerving pan, not tinned; if it ſtands quite unuſed but for a ſhort time, the very air, eſpecially a moiſt one, will affect it; there is a foulneſs on the pan acquired we know not how, which if rubbed off with a warm hand, has an extremely diſagreeable ſmell, if we apply it to the tongue, it has a nauſeous taſte. Now if the air alone has power to extract a degree of poiſonous matter from copper, what may we not fear from the many ways theſe utenſils are employed? Secondly, if a little cold water be put into this pan, though perfectly clean, and left to ſtand a few days, the pan is viſibly corroded, as appears by the verdegreaſe all round the ſpot where the water ſettled; water therefore, it is evident, will extract this poiſonous matter from the copper. Now if air and cold water affect this metal, there is much more to be apprehended than from theſe ſimple powers; for ſurely copper when heated muſt have much more force to throw out pernicious particles, than when cold. Therefore, thirdly, if water be long boiled in ſuch a pan, it will be ſo tainted as to become more or leſs diſagreeable both in ſmell and taſte, though even this will be in a different degree, according to the quality of the water ſo boiled. Fourthly, if milk be boiled in this pan, it will acquire ſo nauſeous a taſte as ſcarce to be borne. Fifthly, if vinegar be boiled in it, it will alſo contract a nauſeous taſte, tho' that nauſeouſneſs will be partly moderated by the power of the acid; but that it is impregnated with a portion of verdegreaſe is evident, not only from the taſte of the vinegar, but from its having left every part of the pan which it touched, brighter and clearer, if poſſible, then when it came out of the brazier's ſhop. Sixthly, if ſalt be put into the ſame pan, whether heated or not, and left to ſtand ſome time, it is tinged in different places of a greeniſh hue, which is verdegreaſe exſudated from the pan, tainting thoſe parts of the ſalt which were neareſt to it. Seventhly, it will have the ſame effect upon ſuet, or any other fat ſubſtance melted in it, and left to ſtand for any time; and will not only give that a nauſeous taſte, but will communicate a more nauſeous one to butter melted in it than that which it is apt to give milk. Laſtly, ſugar is alſo capable of extracting the verdegreaſe from copper, but with this too the nauſeous taſte is in part concealed, as well as with the vinegar, by the power of the acid inherent in both. And if from theſe few remarks on the effects that copper has on the ſimple part of our food, we have occaſion to fear its effects, what may we not fear when a multiplicity of ingredients are combined?

Next, the ſame author endeavours to prove, that if verdegreaſe is capable of being exſudated from copper, by water, ſalt, vinegar, and other materials daily uſed in cookery, and that this verdegreaſe, being received into the ſtomac, is capable of affecting our health; not all the methods that have hitherto been uſed to defend us from their poiſon, can juſtify the continuing the uſe of theſe utenſils. For beſides theſe ſmaller veſſels for the purpoſes of preſerving, and ſome other particular uſes, it is well known that thoſe larger ones, called in general coppers, which in thouſands of families ſerve for waſhing, are alſo made uſe of to boil a ham, a large piece of beef, or any other great joint of meat; perhaps too when it is cankered with ſoap, and conſequently rendered ſtill more dangerous. Beſides, tinning though in ſome degree a fence, yet is too weak a one to be depended on, for unleſs we can confide, which in general it is impoſſible to do, that our ſauce-pans, ſtew-pans, &c. will always be kept well tinned, we cannot uſe them with any degree of ſafety.

CORN, (*Dict.*) *Sharping-Corn.* See SHARPING-*Corn.*

CORONATION, the public and ſolemn confirming the title, and acknowledging the right of governing to a king or queen; at which time the prince ſwears reciprocally to the people, to obſerve the laws, cuſtoms and privileges of the kingdom, and to act and do all things conformable thereto. See the articles KING, *&c.*

CORRIGIOLA, (*Dict.*) CORRIGIOLA, in the linnæan ſyſtem of botany, a genus of the *pentandria-trigynia* claſs of plants, the corolla whereof conſiſts of five, oval, patent petals, ſcarce bigger than the cup; there is no pericarpium but the cayx, which cloſing, ſerves in the place of one; the ſeed is ſingle and ovato-triquetrous.

COUNTRY,

COUNTRY, (*Dict.*) FAST COUNTRY *or* SHELF. See SHELF.

CRAW, or CROP *of birds*, *ingluvies*. See INGLUVIES.

CRICKET, the name of an exerciſe or game with bats and balls. The laws of this game, as ſettled by the cricket-club in 1744, and played at the artillery-ground, London, are as follow.

The pitching the firſt wicket is to be determined by the caſt of a piece of money. When the firſt wicket is pitched, and the popping-creaſe cut, which muſt be exactly three feet ten inches from the wicket, the other wicket is to be pitched directly oppoſite at twenty-two yards diſtance, and the other popping-creaſe cut three feet ten inches before it. The bowling-creaſes muſt be cut in a direct line from each ſtump. The ſtumps muſt be twenty-two inches long, and the bail ſix inches. The ball muſt weigh between five and ſix ounces. When the wickets are both pitched, and all the creaſes cut, the party that wins the toſs up may order which ſide ſhall go in firſt, at his option.

The laws for the bowlers. Four balls and over. The bowler muſt deliver the ball with one foot behind the creaſe, even with the wicket, and when he has bowled one ball, or more, ſhall bowl to the number four before he changes wickets; and he ſhall change but once in the ſame innings. He may order the player that is in at his wicket to ſtand on which ſide of it he pleaſes at a reaſonable diſtance. If he delivers the ball with his hinder foot over the bowling-creaſe, the umpire ſhall call no ball, though ſhe be ſtruck, or the player is bowled out, which he ſhall do without being aſked, and no perſon ſhall have any right to aſk him.

Laws for the ſtrikers, or thoſe that are in. If the wicket is bowled down, it is out. If he ſtrikes or treads down, or he falls himſelf upon the wicket in ſtriking, but not in over-running, it is out. A ſtroke or nip over or under his bat, or upon his hands, but not arms, if the ball be held before ſhe touches ground, though ſhe be hugged to the body, it is out. If in ſtriking, both his feet are over the popping-creaſe, and his wicket put down, except his bat is down within, it is out. If he runs out of his ground to hinder a catch, it is out. If a ball is nipped up, and he ſtrikes her again wilfully before ſhe come to the wicket, it is out. If the players have croſſed each other, he that runs for the wicket that is put down, is out; if they are not croſſed, he that returns is out. If in running a notch, the wicket is ſtruck down by a throw before his foot, hand, or bat is over, the popping-creaſe, or a ſtump hit by the ball, though the bail was down, it is out. But if the bail is down before, he that catches the ball muſt ſtrike a ſtump out of the ground-ball in hand, then it is out. If the ſtriker touches or takes up the ball before ſhe is lain quite ſtill, unleſs aſked by the bowler or wicket-keeper, it is out.

Ball, foot, or hand over the creaſe. When the ball has been in hand by one of the keepers or ſtoppers, and the player has been at home, he may go where he pleaſes till the next ball is bowled. If either of the ſtrikers is croſſed in his running ground deſignedly, which deſign muſt be determined by the umpires. *N. B.* The umpires may order that notch to be ſcored. When the ball is hit up, either of the ſtrikers may hinder the catch in his running ground, or if ſhe is hit directly acroſs the wickets, the other player may place his body any where within the ſwing of the bat, ſo as to hinder the bowler from catching her: but, he muſt neither ſtrike at her, nor touch her with his hands. If a ſtriker nips a ball up juſt before him, he may fall before his wicket, or pop down his bat before ſhe comes to it, to ſave it. The bail hanging on one ſtump, though the bail hit the wicket, it is not out.

Laws for the wicket-keepers. The wicket-keepers ſhall ſtand at a reaſonable diſtance behind the wicket, and ſhall not move till the ball is out of the bowler's hand, and ſhall not by any noiſe incommode the ſtriker; and if his hands, knees, foot, or head be over, or before the wicket, though the ball hit it, it ſhall not be out.

Laws for the umpires. To allow two minutes for each man to come in when one is out, and ten minutes between each hand. To mark the ball that it may not be changed. They are ſole judges of all outs and ins, of all fair or unfair play, of all frivolous delays, of all hurts, whether real or pretended, and are diſcretionally to allow what time they think proper before the game goes on again. In caſe of a real hurt to a ſtriker, they are to allow another to remain, and the perſon hurt to come in again; but are not to allow a freſh man to play on either

ſide

ſide on any account. They are ſole judges of all hindrances, croſſing the players in running, and ſtanding unfair to ſtrike; and, in caſe of hindrance, may order a notch to be ſcored. They are not to order any man out, unleſs appealed to by one of the players. Thoſe laws are to the umpires jointly.

Each umpire is the ſole judge of all nips and catches, ins and outs, good or bad runs, at his own wicket, and his determination ſhall be abſolute, and he ſhall not be changed for another umpire without the conſent of both ſides. When the four balls are bowled, he is to call over. Theſe laws are ſeparately.

When both umpires call play three times, it is at the peril of giving the game from them that refuſe to play.

CROP, the collection of corn, hay, *&c.* that any piece of ground affords.

CROP, or CRAW *of birds*, *ingluvies*. See the article INGLUVIES.

CUBITUS (*Dict.*) is alſo a name whereby anatomiſts call the lower-part of the arm, or that more commonly called the fore-arm. See the article ARM.

Fractured CUBITUS. The lower-part of the arm, which is called the cubitus, contains two bones, the radius and ulna: fractures of this part, therefore, ſometimes happen only to one, ſometimes to both theſe bones, and that ſometimes near their extremities, but oftener toward their middle; but, when they are both broke together, the bones are not only very eaſily diſtorted from each other, but they are not to be replaced without very great difficulty alſo: if one only ſhould, on the contrary, be broken, while the other remains whole, the fractured parts do not much recede out of their places, nor are they very difficult to reduce and retain; for the bone remaining ſound, is found, in this caſe, to be a better direction and ſupport than either ſplints or bandages. When the fracture happens toward the lower head, near the pronator quadratus muſcle, the fractured part is ſtrongly drawn by that muſcle, and the intervening ligament that is extended between the radius and ulna, toward the ſound bone; and this makes it more difficult to replace. If the radius is to be replaced, whoſe fragment is contracted towards the ulna, an aſſiſtant muſt hold the arm, while the ſurgeon inclines the patient's hand towards the ulna, to draw back the contracted part of the radius. When this is done, he muſt carefully reduce them by compreſſion on both ſides with his hands, ſo as to reſtore the compreſſed muſcle between the radius and ulna, and the fragments of the radius, to their proper places. In this caſe, Heiſter directs, that the arm be bound up with the proper bandage, and the limb be afterwards placed in a ſort of caſe made of paſteboard, or light wood, to be ſuſpended in a ſling put about the neck.

In ſetting a fracture of the ulna, the whole method muſt be the ſame with this of the radius, except that in the extenſion, the hand muſt be bent toward the thumb, and radius, before the diſtorted part of the ulna can be compreſſed into its proper place. When both bones of the cubitus are broken, the method of cure is much the ſame with that uſed to each of them, when broken ſingly; but there is required more ſtrength and circumſpection, both in the replacing them, and a great deal of caution in applying the bandage to retain them. Care muſt alſo be taken, that, while the arm continues in this caſe a great while, without motion, the mucilage of the joints does not harden, or the ligament become ſtiff, and the arm, or cubitus, be thereby rendered immoveable. To guard againſt this, it will be proper to unbind the arm once in two or three days, and to move it a little carefully and gently, backwards and forwards; and ſometimes to foment it with warm water or oil, by which means its motion will be preſerved.

Luxated CUBITUS. The cubitus conſiſting of two bones, the ulna and radius, is articulated by a gynglymus; and the connection of theſe bones is ſuch, that the ulna, or cubitus, as being the largeſt bone, and ſeated in the lower part of the arm, does of itſelf perform the whole flexion and extenſion of the arm, yet it cannot perform thoſe motions without carrying the radius along with it; but, on the other hand, the radius may be turned along with the hand both inward and outward, without at all moving or bending the ulna, as when the pronation and ſupination of the hand are made thereby. Both theſe bones of the cubitus are ſo articulated with the lower head of the os humeri, that large protuberances are received into deep cavities or grooves, and the whole inveſted and faſtened with exceeding ſtrong ligaments; ſo that, notwithſtanding the cubitus may be luxated in all four directions, outward

or inward, backward or forward, yet it is but ſeldom that it ſuffers a perfect or entire diſlocation, unleſs the upper part of the ulna be broken, or the ligaments of the cubitus much weakened by ſome great external violence. The ſlighter and more recent luxations of this kind are, the more eaſy is the reduction of them. Be the caſe better or worſe, however, the patient muſt be placed in a chair, and both parts of the limb, the humerus and the cubitus, muſt be extended in oppoſite or contrary directions, by two ſtrong aſſiſtants, till the muſcles are found pretty tight, with a free ſpace between the bones; then the luxated bone muſt be replaced, either with the ſurgeon's hands alone, or with the aſſiſtance of bandages, that the proceſſes may fall into their ſinuſes; and when that is done, the cubitus muſt be ſuddenly bent. But if the tendons and ligaments are ſo violently ſtrained, that they can ſcarce perform their office, it will be proper to anoint them with emollient oils, ointments, and the fat of animals; or to apply emollient cataplaſms and fomentations. As ſoon as the reduction has been effected, the articulation muſt be bound up with a proper bandage, and the arm afterwards ſuſpended in a ſling hung about the neck. But care muſt be taken that the bandage is not kept on too long, nor the arm kept entirely without motion all the time, leſt the mucilage of the joint ſhould become inſpiſſated, and the articulation rendered, by that means, ſtiff, or the motion of the part be entirely loſt. To prevent this, it will be proper to undo the bandage every other day, and gently to bend, and extend the limb; afterwards compreſſes dipped in warm wine may be applied, and held on with the bandage.

CUPRESSUS. (*Dict.*) NUX CUPRESSI. See the article NUX.

CURVE. (*Dict.*) *Mechanical* CURVE. See the article MECHANICAL.

CUSHION, a ſoft, handſome pillow for perſons to ſit, or lean on.

D.

DACQS, DAX, or ACQS, a city in France, capital of the territories of les Landes, in the province of Gaſcony, ſituated on the river Adour, weſt long. 1° north lat. 43° 45'.

DANIEL, *or book of* DANIEL, a canonical book of the old teſtament, ſo denominated from its author Daniel, who was a very extraordinary perſon, and was favoured of God, and honoured of men, beyond any that had lived in his time. His prophecies concerning the coming of the Meſſiah, and the other great events of after times, are ſo clear and explicit, that Porphyry objected to them, that they muſt have been written after the facts were done. The ſtyle of Daniel is not ſo lofty and figurative as that of the other prophets; it is clear and conciſe, and his narrations and deſcriptions ſimple and natural; and, in ſhort, he writes more like an hiſtorian than a prophet.

The Jews do not reckon Daniel among the prophets; part of his book, that is from the 4th verſe of the 2d chapter to the end of the 7th chapter, was originally written in the chaldee language, the reaſon of which was, that in that part he treats of the chaldean or babyloniſh affairs; all the reſt of the book is in hebrew. The ſix firſt chapters of the book of Daniel are an hiſtory of the kings of Babylon, and what befel the Jews under their government. In the ſix laſt, he is altogether prophetical, foretelling not only what ſhould happen to his own church and nation, but events in which foreign princes and kingdoms were concerned.

DARTUS, or DARTOS, in anatomy, the inner coat of the ſcrotum, compoſed of a great number of muſcular or fleſhy fibres, whence ſome conſider it as a cutaneous muſcle. It is by means hereof, that the ſcrotum is contracted, or corrugated, which is eſteemed a ſign of health. See the article SCROTUM.

DAY, (*Dict.*) LADY-DAY. See LADY. *Quarter*-DAY. See the article QUARTER. *Stationary* DAYS. See STATIONARY.

DECUMANA, in antiquity, a kind of very large ſhields, otherwiſe called albeſia, uſed by the Albenſes, a nation of the Marſi.

DEMIVOLT, in the menage. See the article VOLT.

DENTICLE, or DENTILE, in architecture. See the article DENTILES.

DEW. (*Dict.*) *Mill*-DEW, *rubigo*. See the article RUBIGO.

DIAGONAL, (*Dict.*) DIAGONAL-SCALE. See the article SCALE.

DIPTERA, in the hiſtory of inſects, that order of inſects which have only two wings, and under each of them a ſtyle or oblong body, terminated by a protuberance, or head, and called a balancer.

DISTANCE, (*Dict.*) Dr. Berkely, in his eſſay on viſion, maintains that diſtance cannot of itſelf and immediately be ſeen, for diſtance being a line directed endwiſe to the eye, it projects only one point in the fund of the eye, which point remains invariably the ſame, whether the diſtance be longer or ſhorter. But Mr. Mac Laurin obſerves, that the diſtance here ſpoken of, is diſtance from the eye; and that what is ſaid of it muſt not be applied to diſtance in general. The apparent diſtance of two ſtars is capable of the ſame variations as any other quantity or magnitude. Viſible magnitudes conſiſt of parts into which they may be reſolved as well as tangible magnitudes, and the proportions of the former may be aſſigned as well as thoſe of the latter; ſo that it is going too far to tell us, that viſible magnitudes are no more to be accounted the object of geometry than words; and that the ideas of ſpace, outneſs, and things placed at a diſtance, are not, ſtrictly ſpeaking, the object of ſight; and are not otherwiſe perceived by the eye than by the ear.

DOG, (*Dict.*) SETTING-DOG. See the article SETTING DOG.

DOR-MOUSE, a ſpecies of mus with a long hairy tail, and a white throat. See the article MUS.

This is a very pretty creature, of the bigneſs of the common mouſe; the head is ſmall, and not ſharp at the ſnout, as in many ſpecies: the ears are broad and ſhort; the eyes are large, bluiſh, bright, and very prominent; the head is of a reddiſh brown, very bright and ſhining; the back is of a duſkiſh brown, with a tinge of orange-colour; the belly is of the ſame colour, but ſtill paler; we have it in our fields and gardens, and call it the dor-mouſe, or ſleeper, from its naturally ſleeping all the winter-part of the year.

DORNOCH, a royal borough, and port town, of the county of Sutherland, in Scotland, ſituated on a firth of the ſame name, oppoſite to Taine, in weſt long. 3° 53, north lat. 58°.

DREAMS. According to Wolfius every dream takes its riſe from ſome ſenſation, and is continued by the ſucceſſion of phantaſms in the mind. His reaſons are, that when we dream we imagine ſomething, or the mind produces phantaſms; but no phantaſm can ariſe in the mind, without a previous ſenſation: hence neither can a dream ariſe without ſome previous ſenſation. He obſerves farther, that tho' it be certain a priori, from the nature of the imagination, that dreams muſt begin by ſome ſenſation, yet that it is not eaſy to confirm this by experience; it being often difficult to diſtinguiſh thoſe ſlight ſenſations, which give riſe to dreams from phantaſms or objects of imagination. Yet this is not impoſſible in ſome caſes, as when the weak ſenſation ſufficient to give riſe to a dream gradually becomes ſtronger, ſo as to put an end to it, as it often happens in uneaſy and painful ſenſations.

The ſeries of phantaſms, or objects of imagination which conſtitute a dream, ſeem to be ſufficiently accounted for, from the law of imagination, or of aſſociation; tho' it may be extremely difficult to aſſign the cauſe of every minute difference, not only in different ſubjects, but in the ſame, at different times, and in different circumſtances. We have an eſſay on this ſubject by M. Formey, in the Mem. de l' Acad. de Berlin. tom. 2. p. 316. He expreſsly adopts Wolfius's propoſition above-mentioned, that every dream begins by a ſenſation, and is continued by a ſeries of acts of imagination, or of phantaſms: and that the cauſe of this ſeries is to be found in the law of the imagination.

Hence he concludes thoſe dreams to be ſupernatural, which either do not begin by ſenſation, or are not continued by the aw of the imagination.

A learned author has lately aſſerted, that our dreams are prompted by ſeparate immaterial beings. He contends, that the phantaſm, or what is properly called the viſion, is not the work of the ſoul itſelf, and that it cannot be the effect of mechanical cauſes; and therefore ſeems to conclude, they muſt be the work of ſeparate ſpirits acting on our minds, and giving us ideas while we ſleep. We muſt refer to the author of this extraordinary hypotheſis,

theſis, for a farther account of it. See eſſay on the phænomenon of dreaming, in the 2d vol. of the enquiry into the nature of the human ſoul, 3d edit. Lond. 1745.

Lord Bacon laments that Ariſtotle dropt the conſideration of what he calls the ſecond art of prediction and impreſſion, or the interpretation of natural dreams, which, from the agitation of the mind, diſcovers the ſtate and diſpoſitions of the body, as he honoured phyſiognomy, or the firſt of theſe arts, with an enquiry: though this has indeed been done by Hippocrates; and he obſerves that though later ages have debaſed theſe arts with ſuperſtitious and fantaſtical mixtures, yet that when purged and truly reſtored, they have a ſolid foundation in nature, and uſe in life. See PHYSIOGNOMONICS. Bacon further obſerves, that the interpretation of natural dreams has been much laboured, but mixed with numerous extravagancies, and adds that, at preſent, it ſtands not upon its beſt foundation, which is, that where the ſame thing happens from an internal cauſe, as alſo uſually happens from an external one, there the external action paſſes into a dream. Thus the ſtomach may be oppreſſed by a groſs internal vapour, as well as by an external weight, whence thoſe that have the night-mare dream that a weight is laid upon them, with a great concurrence of circumſtances: ſo again the viſcera being equally toſſed by the agitation of the waves at ſea, as by a collection of wind in the hypochondria; hence melancholy perſons frequently dream of ſailing and toſſing upon the waters; and inſtances of this kind are numerous.

The phyſicians who have accurately examined the ſtate of their patients in every particular circumſtance, have not omitted at times, to enquire into their dreams in thoſe hours of ſleep which their ill ſtate allows them; and partly from experience, partly from reaſon and analogy, have found, that there are many preſages of diſeaſes to come, and many indications of ſuch as are preſent, but unperceived, at leaſt not ſeen in their full extent, to be had from what the ſenſes ſuffer in dreams. Indeed if dreams are different from what might be expected from the buſineſs of the day, or the turn of thought before, they may always be looked upon as ſigns of a more or leſs diſtempered ſtate of body, and the true condition of that ſtate may often be better learned from them, than from any other means. What has been obſerved by phyſicians in regard to the prognoſtics from dreams, may be ſummed up in the following manner; to dream of fire indicates a redundance of yellow bile; to dream of fogs or ſmoak indicates a predominancy of black bile; to dream of ſeeing a fall of rain or ſnow, or a great quantity of ice, ſhews that there is a redundance of phlegm in the body; he who fancies himſelf converſant among ſtinks, may be aſſured that he harbours ſome putrid matter in his body; to have red things repreſented before you in ſleep, denotes a redundance of blood; if the patient dreams of ſeeing the ſun, moon, and ſtars, hurry on with prodigious ſwiftneſs, it indicates an approaching delirium; to dream of a turbid ſea, indicates diſorders of the belly, and to dream of ſeeing the earth overflowed with water, or of being immerged in a pond or river, indicates a redundance of watery humours in the body; to dream of ſeeing the earth burnt or parched up, is a ſign of great heat and dryneſs; the appearance of monſters and frightful enemies, indicates deliriums in diſeaſes; and to dream often of being thrown down from ſome very high place, threatens an approaching vertigo, or ſome other diſorder of the head, as an epilepſy, apoplexy, or the like. Theſe and a great many others are the obſervations of Hippocrates on the dreams of his patients. From thoſe and from ſome farther aſſiſtances, Lomnius has carried the ſubject to a very great length, and given many rules of judging from them.

DRYPIS, a genus of the *decandria-trigynia* claſs of plants, the corolla whereof conſiſts of five petals, their ungues are of the length of the cup, and narrow; the limb is plane; the bracteæ are divided into two linear obtuſe ſegments; the fruit is a ſmall, globoſe, covered capſule, with only one cell, in which is a ſingle kidney-ſhaped ſeed.

DUAL *number*. See the article NUMBER.

DYING, *(Dict.)* DYING *of leather*. See LEATHER.

E.

EAR. (*Dict.*) *Wounds of the* EAR. Wounds of the external ear are eaſily united by ſticking-plaiſters, unleſs the cartilage is entirely divided, and then it will require the help of the needle, and the application of vulnerary balſams, with the proper compreſſes and bandages. When the ear is wounded in the neighbourhood of the meatus auditorius, great care muſt be taken to prevent the diſcharge of blood and matter into that paſſage, which would do great miſchief to the tympanum; but this may be done only by filling the internal ear with lint or cotton.

EAR SHELLS, *aures marinæ*. See the article AURES.

EARTH. *Figure of the* EARTH. (*Dict.*) From the theory, already given, of the earth, it appears, that, in its ſpheroidical figure, the degrees of latitude increaſe from the equator to the pole; ſo that if, in the equator, a degree conſiſts of ſixty miles in the ſeveral latitudes the miles will be as below:

Lat.	0.	10°.	20°.	30°.	40°.	50°.
M. in a Deg.	60.	59,5.	59,57.	59,67.	59,8.	59,93.
Lat.	60°.	70°	80°.	90°.		
M. in a Deg.	60,06.	60,16.	60,235.	60,26.		

EGLECOPALA, in the hiſtory of foſſils, a name whereby ſome authors call the ſtony bluiſh marle. See MARLE.

ELASTICITY. (*Dict.*) For the elaſticity of the air, ſee AIR.

ELDER-TREE, *ſambucus*, in botany. See the article SAMBUCUS.

ELIXIR. (*Dict.*) *Proprietatis* ELIXIR. See PROPRIETATIS ELIXIR.

ELOHIM, ELOHI, or ELOI, in ſcripture language, one of the names of God. See the article GOD.

Angels, princes, great men, judges, and even falſe gods are ſometimes called by this name. The ſequel of the diſcourſe, Calmet obſerves, is what aſſiſts us in judging rightly concerning the true meaning of this word. It is the ſame as Eloha; one is the ſingular, the other the plural. Nevertheleſs, Elohim is often conſtrued in the ſingular number, particularly when the true God is ſpoken of; but when falſe gods is ſpoken of, it is conſtrued rather in the plural.

ENCYSTED TUMOUR. See the articles TUMOUR and CYST.

ENGINE. (*Dict.*) *Tanning*-ENGINE. See the article TANNING-ENGINE.

EPHESUS, an antient city of Ionia in the leſſer Aſia, ſituated, eaſt long. 27° 40′, north lat. 37° 5′, near the ſea, on the mouth of the river Cauſtrus, which formed a commodious harbour. It was the capital of Aſia during the roman government; and here ſtood the ſo much celebrated temple of Diana.

EQUATION. (*Dict.*) *Transformation of* EQUATIONS. See TRANSFORMATION.

ERINUS, in botany, a genus of the *didynamia-angioſpermia* claſs of plants; the corolla whereof conſiſts of a ſingle, unequal petal; the tube is ovato-cylindric, of the length of the cup, and reflected; and the limb is plane, and divided into five ſegments; the fruit conſiſts of bilocular capſules, ſurrounded by the cup; the ſeeds are numerous and ſmall.

EXTRAORDINARII, in roman antiquity, a body of forces conſiſting of a third part of the horſe and a fifth part of the foot, which was ſeparated from the reſt, with great policy and caution, to prevent any deſign that they might poſſibly entertain againſt the natural forces. A ſelect body of ſoldiers, choſen from among the extraordinarii, were thoſe called ablecti. See ABLECTI.

F

FALLING STAR, in meteorology. See the article STAR.

FEMUR, the THIGH. (*Dict.*) For fractures and luxations of the femur, or thigh-bone, ſee the article THIGH.

FIBULA. (*Dict.*) *Fractures of the* FIBULA. See the article FRACTURE.

Luxation of the FIBULA. Sometimes the fibula is ſeparated by external violence from the thigh-bone, and is then diſtorted either upwards or downwards; this generally happens, when the foot has been luxated outwards. Whenever this happens, the bone is to be firſt reſtored to its natural place, and then properly bound up, and left to the aſſiſtance of nature and

and reſt, till it be grown firm again to the tibia and leg. Heiſter directs, that the patient, in this and the like caſes, be always ſtrictly cautioned not to uſe or bear any ſtreſs upon the diſordered leg too ſoon; the conſequence of which may be worſe than the firſt misfortune. For the reſt of the treatment, ſee the article LUXATION.

FINEERING, or VENEERING. See the article VENEERING.

FINGERS. (*Dict.*) *Superfluous* FINGERS. Infants are often born with ſuperfluous, or ſupra-numerary fingers, which are uſually miſhapen and miſplaced: ſome of theſe are found to have nails and bones like other fingers; others have nothing of this, but are mere maſſes of fleſh. Heiſter is opinion, that theſe ſhould always be amputated in the infancy of the child, but if they are many in number, and the child but weakly, it may be better not to take them all off at one time, but to ſtay ſome time between each amputation, that one may be near well, before another is taken off. They are to be cut off with the ſcalpel or ſciſſars, and the hæmorrhage ſtopped either with dry lint, or with the ſame dipped in ſpirit of wine, and afterwards healed, as common wounds, with vulnerary balſams.

Carious FINGERS. The fingers, when carious or affected by a ſpina ventoſa, are, according to Heiſter, to be amputated three ways. 1. By a pair of ſtrong ſciſſars, or ſharp-edged pincers. 2. By a chizzel ſtruck by a leaden mallet, by which they are ſeparated at one blow: or laſtly, by dividing the next ſound joint with a ſcalpel, and drawing back a part of the ſkin to wrap over the ſtump, that it may heal the ſooner; and this is the beſt method of all, as by this you are in no fear about any ſplinters of the bone being left.

Fractured FINGERS. When one or more of the bones in the fingers are broke, the ſurgeon's buſineſs is carefully to replace what has been removed, and to roll up the finger a little way with a narrow bandage, and then to bind it firmly to the next ſound finger. But it is much more proper, when the finger is maſhed, ſo as to give no hope of a good cure, to take it off at once. See FRACTURE.

Luxated FINGERS. The bones of the fingers and thumbs are liable to luxations of each of their articulations, and that in ſeveral directions; but theſe are accidents not only eaſily diſcovered, but very eaſily remedied alſo; for the ligaments being not very robuſt, the fat and muſcles thin, and the ſinuſes of the articulations ſhallow, the extenſion is very eaſy, and the reduction of them into their former places not leſs ſo. The beſt method is to extend ſufficiently the finger with one hand, and to replace the luxated bone at the ſame time with the other, and to retain it ſo by a proper bandage.

FIRE. (*Dict.*) *Extinguiſhing of* FIRES. The world has long been of an opinion, that a more ready way, than that in general uſe, might be found for extinguiſhing fires in buildings; and it has been generally attempted upon the doctrine of exploſion. Zachary Greyl was the firſt perſon who put this plan into execution with any tolerable degree of ſucceſs. He contrived certain engines, eaſily manageable, which he proved before ſome perſons of the firſt rank, to be of ſufficient efficacy, and offered to diſcover the ſecret by which they were contrived, for a large premium, given either from the crown, or raiſed by a ſubſcription of private perſons. But this ſcheme meeting with no better ſucceſs than things of this nature uſually do, he died without making the diſcovery. Two years after this, the perſon, who had his papers, found the method, and it was ſhewn before the king of Poland and a great concourſe of nobility at Dreſden, and the ſecret purchaſed at a very conſiderable price. After this, the ſame perſon carried the invention to Paris and many other places, and practiſed it every where with ſucceſs. The ſecret was this: A wooden veſſel was provided holding a very conſiderable quantity of water: in the center of this was fixed a caſe made of iron-plates, and filled with gun powder; from this veſſel, to the head of the larger veſſel containing the water, there was conveyed a tube or pipe, which might convey the fire very readily through the water to the gun-powder contained in the inner veſſel. This tube was filled with a preparation eaſily taking fire, and quickly burning away; and the manner of uſing the thing was, to convey it into the room or building where the fire was, with the powder in the tube lighted. The conſequence of this was, that the powder in the inner caſe ſoon took fire, and with a great exploſion burſt the veſſel to pieces, and diſperſed the water every way; thus was the fire put out in an inſtant, though the room was flaming before in all parts at once. The advantage

vantage of this invention was, that, at a ſmall expence, and with the help of a few people, a fire in its beginning might be extinguiſhed; but the thing was not ſo general as it was at firſt expected that it would prove, for though of certain efficacy in a chamber or cloſe building, where a fire had but newly begun, yet when the miſchief had increaſed ſo far that the houſe was fallen in, or the top open, the machine had no effect. This was the thing firſt diſcovered by Greyl, and from which our chemiſt Godfrey took the hint of the machine, which he called the water-bomb, and would fain have brought into uſe in England.

FLOOD. (*Dict.*) *Sand* FLOOD. See SAND.

FORNAGE, *fornagium*, in our old writers, ſignifies the fee taken by a lord from his tenants, bound to bake in the lord's oven, or for a permiſſion to uſe their own: this was uſual in the northern parts of England.

FOUNTAIN. (*Dict.*) FOUNTAIN-*pen*. See the article PEN.

FRIDAY, the ſixth day of the week, ſo called from Friga, a goddeſs worſhipped by the Saxons on this day.

Every Friday throughout the year, in the church of England, is a faſt, (except Chriſtmas-day, which, even though it happen on a Friday, is always a feſtival,) in compliance with the cuſtom of the primitive church, which always obſerved this as a faſt, in commemoration of our Saviour's crucifixion. It was one of their ſtationary days, when they uſually forbore eating till three o'clock in the afternoon.

Good-FRIDAY, a faſt of the chriſtian church, in memory of the ſufferings and death of Jeſus Chriſt, obſerved on the holy, or paſſion-week, and called good, by way of eminence, becauſe of the bleſſed effects of our Saviour's ſufferings, which were a propitiatory and expiating ſacrifice for the ſins of the world. See the article PASSION-WEEK.

On Good-Friday the pope ſits on a plain form, and after ſervice is ended, when the cardinals wait on him back to his chamber, they are obliged to keep a deep ſilence as a teſtimony of their ſorrow. In the night of Good-Friday, the Greeks perform the obſequies of our Saviour round a great crucifix laid on a bed of ſtate adorned with flowers; theſe the biſhops diſtribute among the aſſiſtants, when the office is ended. The Armenians, on this day, ſet open a holy ſepulchre, in imitation of that on mount Calvary.

FUSION. (*Dict.*) For the manner of making ſteel by fuſion, ſee STEEL.

G.

GALEGA, GOAT'S RUE, in botany. See the article RUTA.

GALENIA, in botany, a genus of the *octandria digynia* claſs of plants, having no corolla; the calyx is a very ſmall, hollow perianthium, divided into four oblong ſegments; the antheræ are didymous; and the fruit a roundiſh, bilocular capſule, containing two oblong and angulated ſeeds.

GALEOPSIS, HEMP-LEAVED DEAD-NETTLE, in botany, a genus of the *didynamia-gymnoſpermia* claſs of plants; the corolla whereof conſiſts of a ſingle ringent petal; the tube is ſhort, and the limb dehiſcent; there is no pericarpium; the cup is rigid, and contains in its bottom four, triquetrous, truncated ſeeds.

GALLERY. (*Dict.*) *Whiſpering* GALLERY. See WHISPERING.

GAOL. (*Dict.*) GAOL-FEVER, the ſame with that termed the hoſpital or camp-fever. See HOSPITAL-FEVER.

GARLIC, *allium*, in botany, a genus of the *hexandria-monogynia* claſs of plants; the corolla whereof conſiſts of ſix, oblong, concave, erect petals; the fruit is a very ſhort, broad capſule, of a trilobated figure, conſiſting of three valves, and containing three cells; the ſeeds are numerous, and of a roundiſh figure.

This genus comprehends the common garlic, the yellow moly, the onion, the leek, and the long onion.

The ſeveral ſpecies of this genus agree in medicinal virtues with the cepa, or onion. See the article CEPA.

GENERATION. (*Dict.*) *Equivocal* GENERATION. See EQUIVOCAL.

GENE-

GENERICAL. (*Dict.*) GENERICAL NAME, in natural hiſtory, the word uſed to ſignify all ſpecies of natural bodies, which agree in certain eſſential and peculiar characters, and therefore all of the ſame family or kind; ſo that the word uſed as the generical name, equally expreſſes every one of them, and ſome other words expreſſive of the peculiar qualities or figures of each are added, in order to denote them ſingly, and make up what is called the ſpecific name. Thus the word roſa, or roſe, is the generical name of the whole ſeries of flowers of that kind, which are diſtinguiſhed by the ſpecific names of the red roſe, the white roſe, the apple-roſe, *&c.* The ignorance of former ages in the true principles of natural hiſtory, has occaſioned the bodies, which are the objects of it, to be arranged into very unnatural ſeries under the name of genera; and theſe have been called by names as improper, as the characters they were diſtinguiſhed by. Linnæus has done a great deal in the exploding the bad generical names in botany, and Artedi has applied his rules about the formation of theſe names with very little difference to the ſubjects of ichthyology. See the articles BOTANY and ICHTHYOLOGY.

GEODES, in natural hiſtory, a genus of ſiderochita, conſiſting of cruſtated bodies, incloſing a ſmall quantity of earthy or arenaceous matter. See SIDEROCHITA. Of this genus are the following known ſpecies. 1. The cracked geodes, with ferrugineous, brown, and yellow cruſts. 2. The wrinkled geodes, with ferrugineous, reddiſh, brown, and gold-yellow cruſts. 3. The ſparkling geodes, with ferrugineous, purpuliſh, and orange-coloured cruſts. 4. The long ſcabrous geodes, with a ſingle purpuliſh cruſt. And 5. The long geodes, with a ſingle blackiſh cruſt.

GERMANDER. (*Dict.*) *Wild* GERMANDER, in botany, a ſpecies of veronica. See the article VERONICA.

GIBBOUS. (*Dict.*) Gibboſity is a preternatural incurvation of the ſpina dorſi either backward, or on one ſide. Infants are more ſubject to this diſorder than adults, and it often proceeds from external, than from internal cauſes. A fall, blow, or the like violence frequently thus diſtorts the tender bones of infants. When it proceeds from an internal cauſe, it is generally from a relaxation of the ligaments that ſuſtain the ſpine, or a caries of its vertebræ; though the ſpine may be reflected forward, and the back thrown out, by a too ſtrong and repeated action of the abdominal muſcles; and this, if not timely redreſſed, uſually grows up and fixes as the bones harden, till in adults it is totally irretrievable; but when the diſorder is recent, and the perſon young, there are ſome hopes of a cure. The common method is by a machine of paſtboard, wood, or ſteel, which is made to preſs principally upon the gibbous part, and this by long wearing may ſet all right. The ſurgeons however have a different inſtrument, which they call a croſs, much more efficacious, though not quite ſo convenient in the wearing; by the uſe of this, the parts are always prevented from growing any worſe, and are often cured. During the application of theſe aſſiſtances, Heiſter orders the parts to be at times rubbed with hungary water, ſpirit of lavender, and the like, and defended with a ſtrengthening plaſter of oxycroceum, opodeldoc, or the like.

GLAND. (*Dict.*) *Indurations of the* GLANDS. Indurated ſwellings of the glands from viſcid humours, which at length turn callous and cancerous, ariſe from an obſtruction of the veſſels, eſpecially in the glands, and from thick groſs humours. They are known from hard tumours, which are generally moveable and indolent: in this ſtate they are called indurated glands; and if they do not digeſt and ſuppurate in a ſhort time, they grow harder, and are called ſcirrhous glands; and if theſe, eſpecially in the breaſts, begin to corrode and are painful, they are termed carcinomata, or incipient occult cancers. See the articles SCIRRHUS and CANCER.

The indurated glands of the neck in boys proceed from voracity and a bad diet, which, according to Heiſter, are to be cured by correcting the corrupt humours, by external exerciſe, by the force of nature, and a length of time: when this is not performed, and they increaſe and multiply, they become ſcrophulous, and are called the king's evil; when they are large, they are called ſtrumæ: but theſe are ſeldom indurated glands, but rather tunicated humours, which contain various bad humours in bags, and increaſe to a wonderful ſize, inducing different grievous evils. See the articles DIET, EXERCISE, SCROPHULA, CYST, TUMOUR, *&c.*

It is cuſtomary to attempt the cure by various external remedies, but theſe are ſcarcely ſufficient, without correcting the intemperies of the humours; for otherwiſe they generally grow worſe. The remedies for indurated glands are emollients and diſſolvents; ſuch as the infuſions and decoctions of reſolving roots, woods, and herbs, taken twice or thrice a day; ſuch as the roots of ſarſaparilla, with guaiacum; of the roots of ſarſaparilla, china, and ſaſſafras-wood; or of the roots of ſcrophularia or vincetoxicum; likewiſe a decoction of guaiacum with liquorice-root, with the infuſion and decoction of roſemary with ſugar. See the articles EMOLLIENTS, DISSOLVENTS, *&c.*

Beſides theſe, ſuch powders as attenuate the viſcid blood, ſuch as the pulvis ad ſtrumas, of the auguſtan diſpenſatory, to which may be added a grain of cinnabar or mercurius dulcis; likewiſe the crude powder of antimony, eſpecially with a grain of mercurius dulcis in every doſe, which is very uſeful in diſſolving the glands in the neck of boys. The powder of millepedes, from half a ſcruple to a ſcruple, with a grain of mercurius dulcis, is an approved remedy in this caſe, and in hard tumours of the viſcera. Some greatly praiſe ethiops mineral: which remedies are to be continued a long while. As to diet, all auſtere, crude, groſs, flatulent aliment is to be avoided; winter pot-herbs, pulſe, and the like. The quantity of food ſhould likewiſe be leſſened, cold unwholeſome air avoided, as well as ſadneſs and reſt: externally, ſimple ſpirit of wine applied hot, or camphorated with a little ſaffron; likewiſe reſolvent plaſters with mercury, as alſo digeſtive bags of fragrant herbs and flowers. Dedier greatly commends hot ſea-ſand applied to ſcirrhous breaſts. Some commend oil of bricks and the balſam of ſulphur of Rulandus, if rubbed often in a day therewith; in the room of which may be applied a diſtilled oil of ſoap, petroleum, dog's fat, and the martial ointment; after which a plaſter of gum-ammoniac, or ſoap, or melilot, or ſperma ceti muſt be laid thereon; when the tumour is ſoftened, a plaſter of oxycroceum may be properly uſed.

But when the ſalival, maxillary, or parotid glands are indurated, and the ſeveral remedies already mentioned prove unſucceſsful, in order to preſerve the patient from otherwiſe inevitable deſtruction, the dangerous operation of extirpating theſe glands muſt be attempted, in which great care and attention is required, as they adhere to conſiderable branches of the carotid artery; and that, in extirpating them, the patient may bleed to death, if not prevented by the hand of a ſkilful operator. For the operation Heiſter directs, that the ſurgeon be firſt provided with a good ſtyptic-liquor, with a large quantity of lint, linen-rags, a puff-ball, as alſo ſome thick compreſſes, each larger than the other, and a roller of about ſix ells long: theſe being provided, the patient is to be ſeated in a proper light, with his head and hands ſecured by aſſiſtants; then the ſurgeon opens the integuments by a longitudinal inciſion, and, freeing them carefully from the tumour, divides their connecting arteries; hereupon the blood ruſhes forth ſo impetuouſly, that near a pound will be loſt, before the ſurgeon can lay down his knife, and apply the dreſſings; therefore, to ſave the patient, and ſuppreſs the hæmorrhage, he muſt conſtantly apply a bundle of the linen-rags, dipped in ſtyptic, and preſs them cloſe upon the divided arteries: the remaining cavity of the wound muſt be well filled with dry lint and rags, preſſed cloſe with his fingers, over which muſt be impoſed a large piece of puff-ball, with three or four compreſſes, each larger than the other; the whole being at laſt ſecured by the faſcia nodoſa, commonly uſed for arteriotomy in the temples: laſtly, it is to be obſerved, that when the tumour is uncommonly large, it may be more convenient to make a cruciform inciſion thro' the integuments, by which the tumour may be extracted more eaſily than by a longitudinal one. See STYPTIC, BANDAGE, CYST, TUMOUR, *&c.*

For the treatment of the wound. See the article WOUND.

GLOBE-FISH, *orbis*. See ORBIS.

GLOBULAR-SAILING. See SAILING.

GOAT'S BLOOD, *ſanguis hirci*. See the article SANGUIS.

GODWIT, *totanus*, in ornithology. See the article TOTANUS.

GULO, in zoology, a ſpecies of muſtela, of a reddiſh brown colour, with the middle of the back black. See the article MUSTELA.

This is of the ſize of our common cat; the head is ſmall, and of a kind of oval figure, ſlender at the ſnout, and rounded at the crown; the eyes are prominent, though

though not very large; the iris is of a deep hazel; the ears are ſhort and patulous; the noſtrils are large; the mouth is wide, and well furniſhed with teeth.

GUM-BOILS, *parulides*, in ſurgery and medicine. See PARULIDES.

GUNDELIA, in botany, a genus of the *ſyngeneſia - polygamia - æqualis* claſs of plants, the compound flower of which is tubulated and uniform, with the hermaphrodite corollulæ equal; the partial flower is monopetalous and clavated, with a ventricoſe, quinquifid, erect limb; there is no pericarpium; the ſeeds, which are ſolitary, roundiſh, acuminated, and coronated with an obſolete margin, are perfectly immerſed and hid in the receptacle: the common receptacle is conic, and covered every where with partial ones, divided with tricuſpidated paleæ; the partial receptacle is conico-obtuſe, quadrangular, and truncated.

GYMNARTHRIA, in zoology, a name given that order of inſects which have ſoft naked bodies, furniſhed with limbs. See the article INSECT.

GYPSIES, or EGYPTIANS, are, in our ſtatutes, termed a counterfeit kind of rogues, who, diſguiſing themſelves both in their ſpeech and apparel, wander up and down the country, pretending to tell fortunes, cure diſeaſes, *&c.* under which pretence, they abuſe the ignorant, common people, by ſtealing and pilfering from them every thing that is portable, and which they may carry off undiſcovered. In order to ſuppreſs theſe impoſtors, ſeveral ſtatutes have been made; for by 28 H. 8. c. 10. Egyptians coming into England are to depart the realm in fifteen days, or may be impriſoned; and if they continue here above a month, ſhall be deemed guilty of felony. 5 Eliz. c. 20. Probably they might be ſo called from the ancient Egyptians, who had the character of great cheats, whence the name might afterwards paſs proverbially into other languages, as it did into the Greek and Latin; or elſe the ancient Egyptians being much verſed in aſtronomy, or rather aſtrology, the name was afterwards aſſumed by theſe modern fortune-tellers. Be that as it will, there is ſcarce any country in Europe without its gypſies. The Latins call them Egyptii: the Italians, Cingari and Cingani; the French, Bohemiens; others, Saracens, Tartars, *&c.* The firſt time we heard of them in England was in 1563.

H.

HAAM, AAM, or AUME, a liquid meaſure in uſe at Amſterdam, containing about ſixty-three pounds averdupois-weight. See the articles AUME and MEASURE.

HABIT. (*Dict.*) *Angelic* HABIT or GARMENT, among our anceſtors, was a monkiſh garment, which laymen put on a little before their death, that they might have the benefit of the prayers of the monks. It was from them called angelic, becauſe they were called *angeli*, who, by theſe prayers, *animæ ſaluti ſuccurabant*.

HÆMORRHUS, the BLOOD-SNAKE, the name of a peculiar ſpecies of ſerpent; ſo called, becauſe it was ſuppoſed, that, on a perſon's being bit by it, the blood flowed out of every part of the body. It is a ſmall ſerpent, ſeldom arriving to more than a foot long; its eyes are remarkably vivid, bright, and ſparkling; its ſkin is very gloſſy, and its back variegated with a great number of black and white ſpots; its neck is very ſlender; its tail extremely ſharp; and it has a ſort of ſmall horn placed over its eyes: it is found in Egypt. There is alſo an american kind of this ſerpent found in the ſouthern parts of that continent, and called by the natives ahucyatli, which is larger than the other, and reſembles the rattle-ſnake in many particulars, but wants the diſtinguiſhing character of the rattle in the tail. See the articles SERPENT and RATTLE-SNAKE.

HAG-BOAT, a kind of ſhip. See SHIP.

HAGIASMA, or AGIASMA, among antient writers, is ſometimes uſed for the whole church, and ſometimes for the more ſacred part thereof.

HALI, HALY, or *powder of* HALI. See the article POWDER.

HAMMA, or AMMA, a name whereby ſome chirurgical writers call a girdle or truſs, uſed in ruptures. See TRUSS.

It is ſometimes uſed alſo for a knot to faſten a bandage.

HAMMER. (*Dict.*) *Yellow*-HAMMER, in ornithology. See YELLOW-HAMMER.

HAMMER-HEADED SHARK, in ichthyology, the ſame with the zygæna. See the article ZYGÆNA.

HAMMON, or AMMON, in antiquity, a name given to Jupiter in Libya, where was a celebrated temple of that deity.

HARAM, in the turkiſh ſeraglio. See the article SERAGLIO.

HARP. (*Dict.*) HARP-SHELL, in ichthyology, the elliptic, longitudinally coſtated dolium. See DOLIUM.

This is one of the moſt beautiful ſhells of this genus: it is about two inches and a half long, and a little more than an inch and a half in diameter; the clavicle has five volutions; the whole ſurface of the body of the ſhell is ornamented with large and elevated ribs, and the colour is a deep brown, variegated in a beautiful manner with a paler brown.

HEART. (*Dict.*) HEART-BURN, *cardialgia*, in medicine, See the article CARDIALGIA and SODA.

HEART, in the manege. A horſe that works in the manege with conſtraint and irreſolution, and cannot be brought to conſent to it, is ſaid to be a horſe of two hearts.

HEART-SHELL, a name given to two different ſpecies of the cardia. Thus 1. The elegant, compreſſed, and marginated heart-ſhell, or heart-cockle is an extremely tender and delicate ſpecies, about an inch and a quarter in length, and an inch in diameter. 2. The ſharp-backed cardia, with elegant variegations, commonly called the Venus heart-ſhell, much of the ſame ſtructure, delicacy, and variety of colouring with the former. See the article CARDIA.

HEDGE. (*Dict.*) *Plaſhing of quickſet*-HEDGES. See the article PLASHING.

HEDGE-HOG. See HEDGE-HOG.

HEDGE-SPARROW, the brown motacilla, white underneath, and with a grey ſpot behind the eyes. See MOTACILLA.

This is of the bigneſs of the red-breaſt; the head is large and rounded; the eyes ſmall, and their iris hazel; the beak is ſlender; the ears are large and patulous.

HEDYPNOIS, in botany, a ſpecies of lapſana or zacintha. See ZACINTHA.

HELENA, in aſtronomy. See the article CASTOR.

HEN. (*Dict.*) HEN-HARRIER, in ornithology, the falco, with a brown back, and a variegated, black, and brown tail. See the article FALCO.

This is a conſiderably large ſpecies, and is equal to a well grown pullet in ſize: the head is ſmall, and ſomewhat flatted at the top; the beak is large, and very robuſt; it is broad and thick at the baſe, very much hooked, and extremely ſharp at the point; the baſe of it is covered with a thick yellow membrane, in which are ſituated the noſtrils, and there are a kind of black hairs reſembling whiſkers.

HERMINIUM, the MUSK-ORCHIS, in botany, a genus of the *gynandria-diandria* claſs of plants; the corolla whereof conſiſts of five, ovato-oblong, erecto-patulous, and connivent petals; the fruit is an oval, vertical, obtuſely trigonal capſule, armed with three carinæ, trivalvar, unilocular, and dehiſcent underneath the carinæ; the ſeeds, which are numerous, are ſcobiform; the receptacle is linear, and affixed to each valve of the pericarpium.

This genus comprehends the monorchis of Micheli.

HERMIT, in zoology, the long-tailed ſquilla, with a ſoft tail, and the right claw the largeſt. See SQUILLA.

This grows to two inches and a half in length; the legs are ſlender and long, and the anterior ones have claws on them like the common crabs.

HETEROPYRÆ, in natural hiſtory, a genus of foſſils, of the claſs of the ſiderochita, compoſed of various cruſts, ſurrounding a nucleus of a different ſubſtance from themſelves, and often looſe and rattling in them. See the article SIDEROCHITA.

Of this genus Dr. Hill reckons ſeven ſpecies. 1. The hard heteropyra, with brown and purpliſh cruſts, and a whitiſh green nucleus, being a very beautiful foſſil of a ſmooth equal texture, conſiderably compact and cloſe, generally determinate and regular in ſhape and ſize, in form of an oblong-oval figure, and about an inch in length, and half an inch in diameter. 2. The rough purpliſh heteropyra, containing a large nucleus of a very light earth. 3. The miſhapen heteropyra, with ferrugineous, red, and duſky, yellow cruſts, and a greeniſh, white nucleus. 4. The yellow, brown, and black-cruſted heteropyra, with a whitiſh nucleus, being about four inches in length, and three in breadth, and two and a half in thickneſs, of an oblong form, a cloſe compact texture,

and very heavy. 5. The yellow, ferrugineous, and purpliſh-cruſted heteropyra, with a pale yellow nucleus, from four to twelve inches in length, and about the third of its length in breadth, and nearly the ſame in thickneſs. 6. The coarſe, yellow, and brown heteropyra, with a browniſh yellow nucleus of an orbicular form, and between one and two inches in diameter. 7. The coarſe heteropyra, with brown, black, and orange-coloured cruſts, and a yellow nucleus, being of an oblong form, and about an inch and a half in length.

HEXÆDROSTYLA, in natural hiſtory, a genus of foſſils conſiſting of cryſtalliform columnar ſpars, terminated at their ſummit by a pyramid, but adhering irregularly to ſome other body at their baſe. See the article SPAR.

There are three ſpecies of this genus of foſſils. 1. The ſlender hexædroſtylum, with a long pyramid, being ſo pure and clear a ſpar, and ſo much of the ordinary figure of the hexangular cryſtal, that there is no doubt but it has often been miſtaken for cryſtal: its moſt frequent ſize is nearly two inches in length, and a third of an inch in thickneſs, the pyramid being about one fourth of that length. 2. The hexædroſtylum, with a long irregular pyramid, being of a moderately equal, but ſomewhat coarſe and impure texture, and ſubject to ſpots of various earths and minerals, and often ſo altered by them, as not to be known, but by its figure, which it ever keeps regularly to: it is naturally of a duſky white, but moderately tranſparent, conſiderably heavy, and very ſoft. 3. The hexædroſtylum, with a very ſhort pyramid, being uſually of a very pure, clear, and fine texture, but ſometimes ſo debaſed by earthy admixtures, that it becomes very coarſe, and frequently ſpotted, flawed and blemiſhed: it is of various ſizes, but about an inch and a half is its moſt frequent length, and with that the uſual proportion is about half an inch in thickneſs, and the pyramid ſeldom takes up more than one eighth of the length.

HIPPARCHUS's PERIOD, in chronology. See the article PERIOD.

Sanguis HIRCI. See SANGUIS.

HOACTLI, in zoology, the name of an american bird deſcribed by Nieremberg: it is of the ſize of a common hen, the legs and neck are long; its head is black, and is ornamented with a beautiful creſt of the ſame colour; its whole body is of a fine white, but its tail is grey, as are alſo the upper ſides of its wings; the wings have a greeniſh caſt, and the back ſometimes has many black feathers; its feet are not webbed, its legs are of a pale whitiſh colour; it has a circle of white, beginning at the eyes, and going round the head: it is common on the lakes of Mexico, and builds among reeds and ſedge. It bites very deſperately.

HOE. (*Dict.*) *Prong*-HOE. See PRONG.

HOG. (*Dict.*) HEDGE-HOG, *erinaceus*, in zoology, a genus of quadrupeds, the lateral fore-teeth of which are ſhorter than the others; the noſtrils are criſtated; and the body, inſtead of hairs, is clothed, in the manner of that of the porcupine, with ſpines. See the articles QUADRUPED and PORCUPINE.

Of this genus there are two ſpecies. 1. The erinaceus, with larger ears, or the common hedge-hog, being a little animal, conſiderably thick in proportion to its length, and which, when it draws itſelf together at the approach of danger, appears of an oval figure. The length of this creature is about ſeven inches; its head ſmall and oblong, broad towards the upper-part, and growing ſmaller towards the noſe; the mouth is formed very much like that of the badger; the eyes are ſmall, black, and protuberant; the ears are ſhort and broad; the neck is ſhort; the back broad and prominent; the legs ſhort and robuſt; the feet formed like thoſe of the dog; there are five toes on each, and one is ſhorter than the reſt, in manner of a thumb. The other ſpecies is the white erinaceus, with very ſmall ears, being larger than the common hedge-hog, but very like it in form.

Muſk-HOG, *tajacu*, in zoology. See the article TAJACU.

HOITLALLOTL, in zoology, the name of an american bird, deſcribed by Nieremberg, and called by him *avis longa*. It is very remarkable for the ſwiftneſs of its running, and is of a very long ſhape, having alſo a long tail. its beak is alſo very long, black above, and grey underneath: its tail is green, and has all the ſplendor and beauty of the peacock's: its whole body is of a whitiſh yellow, and, near the tail, of a blackiſh yellow; but the ſhoulders are black, with white ſpots. It does not fly high, nor very well, but runs ſo ſwiftly as is ſcarce to be conceived. It is but an ill taſted bird.

HOLOSTEUM, in botany, a genus of the *pentandria-trigynia* claſs of plants, the corolla whereof is compoſed of five plane, patent, tridentated petals, broadeſt towards the ends; the fruit is a cylindrico-conic capſule; the receptacle is free, obſoletely triquetrous, and has very ſhort hairs; the ſeeds are numerous and triquetrous. There is a ſpecies of this genus, in which the ſtamina are only four inſtead of five.

HOMER, OMER, CORUS, or CHOMER, in jewiſh antiquities, a meaſure containing ten baths, or ſeventy-five gallons, and five pints, as a meaſure for things liquid; and thirty-two pecks and one pint, as a meaſure for things dry. The homer was moſt commonly a meaſure for things dry, and the greateſt that was uſed among the Jews: it contained, according to the Rabbins, ten ephahs, or thirty ſata or ſeahs. Corus is the moſt uſual term in the hiſtorical writers, and homer, omer, or chomer, among the prophets.

HOMOCHROA, in natural hiſtory, a genus of foſſils, conſiſting of ſtones compoſed of a cryſtalline matter, conſiderably debaſed by earth, and this of various kinds in the different ſpecies; but ever of one kind only in the ſame ſtone, which is thence always of one plain and ſimple colour, and never ſubject to veins or other variegations.

Of this genus authors reckon five ſpecies. 1. The white homochroum, from half an inch in diameter, to ſeven or eight inches. 2. The red homochroum, from one inch or leſs in diameter, to two or three. 3. The yellow homochroum of various ſizes, from one inch or leſs in diameter, to ſix or ſeven. 4. The bluiſh homochroum, whoſe general ſize is two inches in diameter. And 5. The greeniſh homochroum, from half an inch to two inches in diameter.

All theſe ſpecies are of an orbicular form, a compact and a cloſe texture, and freely give fire with ſteel.

HOOPOE, *upupa*, in ornithology. See the article UPUPA.

HORSE. (*Dict.*) *Stone*-HORSE, or STALLION. See the article STALLION.

Maſter of the HORSE. See MASTER.

HOUND-FISH, the engliſh name of two different ſpecies of the ſqualus. See the article SQUALUS.

1. The ſmooth hound fiſh is the ſmooth ſkinned ſqualus, with obtuſe teeth: this is a large fiſh; the head is of a depreſſed form; the roſtrum is obtuſe; the mouth large; and the teeth are numerous, but ſhort, thick, obtuſe, and granulous; the noſtrils have each two apertures; the eyes are large, and ſtand pretty high on the head; the body is oblong, and of a rounded form; toward the head there are five apertures to the gills on each ſide, they ſtand in a line, running from the head to the pectoral fins; there are two back fins; the pinna ani is but one; the tail is forked or divided into two parts, and the upper portion is much longer than the other.

2. The ſqualus, with a rounded body, and with no pinna ani, is alſo called the hound-fiſh; the head is large, of a depreſſed figure, and ſubacute; the roſtrum, toward the extremity, is pellucid: this fiſh grows to about two yards in length.

HUEN, or WEEN, in geography. See the article WEEN.

HUMETTY, or *Croſs*-HUMETTY, in heraldry, is defined to be a plain croſs of an equal length every way. See CROSS.

HUNDRED. (*Dict.*) HUNDRED WEIGHT. See the article WEIGHT.

HYÆNA, in zoology, a ſpecies of canis, with the hairs of the neck long and erect. See the article CANIS.

This is a very ſingular and a very ugly animal; it is of the bigneſs of a bull-dog; the head is large and ſhort; the noſe obtuſe; the mouth wide, and furniſhed with a terrible armature of teeth; the eyes are large, black, and of a very fierce aſpect; the ears are ſhort, broad, and erect; the neck is very thick, and covered with a kind of briſtles inſtead of hairs, which naturally ſtand erect, and give a very formidable appearance to the creature; the body is bulky and rounded, and the ſhape not unlike that of a pig; the legs are moderately long, and very robuſt; the general colour is a very duſky-olive, approaching to black; the legs are darker, and the face paler, than the reſt: it is a native of many parts of the eaſt, and is an extremely fierce and voracious animal: it is not very ſwift, but is continually lying in wait for other creatures, and ſcarce any thing that comes in its way eſcapes it: its voice is ſhrill, and has a mournful ſound.

HYALINA, in natural hiſtory, a genus of foſſils, conſiſting of talcs, compoſed of very broad and ſingle flakes, each of conſiderable thickneſs, reſembling plates of glaſs, and not fiſſile into thinner ones. Of this genus there is only one known

ſpecies,

ſpecies, *viz.* the brown hyalina, being an extremely pure and very regularly formed body, of a moſt equally laminated ſtructure, and found in maſſes from three to twenty-four inches in diameter; theſe are always flat, very ſmooth, and polite, as if newly ſplit on their horizontal ſurfaces; and very rugged, notched, and chopped on their lateral ones; it ſeldom exceeds four or five inches in thickneſs, even in the largeſt maſſes. See TALCS.

HYBRIS, in grecian antiquity, a denomination given to a ſilver ſtool placed in the aræopagus, on which the plaintiff or accuſer ſtood; as that on which the defendant or perſon accuſed ſtood, was called anædeia. See ANÆDEIA.

Here the plaintiff propoſed three queſtions to the party accuſed, to which poſitive anſwers were to be given. The firſt was, are you guilty of this fact? The ſecond, how did you commit the fact? The third, who were your accomplices?

HYMENOPTERA, in the hiſtory of inſects, a name given to thoſe inſects, which have four wings, and thoſe all entirely membranaceous. See INSECT.

HYOSERIS, SWINE'S SUCCORY, in botany, a genus of the *ſyngeneſia polygamia-æqualis* claſs of plants; the compound flower of which is uniform, with ten hermaphrodite corollulæ diſpoſed into one or more orbs; the partial one is monopetalous, ligulated, linear, truncated, and quinquedentated; the ſtamina are five capillary, very ſhort filaments; there is no pericarpium beſides the cup; the ſeed is ſingle, oblong, compreſſed, of the length of the cup, coronated with a peculiar calyculum and a ſmall capillary down; the receptacle is naked.

This genus comprehends the taraxacona-ſtrum of Vaillant, and the leontodon-toides of Micheli.

I.

JACK. (*Dict.*) *Smoke*-JACK. See the article SMOKE-JACK.

JACK-WAMBASIUM, in our old writers, a kind of defenſive coat-armour, worn by horſemen in war, not made of ſolid iron, but of many plates faſtened together, which ſome perſons by tenure were bound to find upon any invaſion.

JAIL, or GAOL. See the article GAOL.

JANNA, a town of european Turky, the capital of a province of the ſame name, being the antient Theſſaly, ſituated eaſt long. 22°, north lat. 39°.

JANUARY. (*Dict.*) This month contains thirty-one days, and was introduced into the year by NumaPompilius, Romulus's year beginning in the month of March. The chriſtians heretofore faſted on the firſt day of January, by way of oppoſition to the ſuperſtition of the heathens, who, in honour of Janus, obſerved this day with feaſtings, dancings, maſquerades, *&c.* See YEAR.

JASIONE, in botany, a genus of the *ſyngeneſia-polygamia-monogamia* claſs of plants; the partial corolla whereof conſiſts of five lanceolated erect petals, connected at the baſe; the fruit is a roundiſh capſule, bilocular, and coronated with a proper calyx; the ſeeds are ſmall,

JAY, in ornithology, the variegated corvus, with the covering feathers of the wings blue, variegated with black and white. See the article CORVUS.

JEREMIAH, *the prophecy of*, a canonical book of the old teſtament. This divine writer was of the race of the prieſts, the ſon of Hilkiah of Anathoth, in the tribe of Benjamin. He was called to the prophetic office when very young, about the thirteenth of Joſiah, and continued in the diſcharge of it above forty years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the deſolation of his country. He was afterwards a priſoner in Egypt with his diſciple Baruch, where it is ſuppoſed he died in a very advanced age. Some of the chriſtian fathers tell us, he was ſtoned to death by the Jews, for preaching againſt their idolatry; and ſome ſay, he was put to death by Pharoh Hophra, becauſe of his prophecy againſt him. Part of the prophecy of Jeremiah relates to the time after the captivity of Iſrael, and before that of Judah, from the firſt chapter to the forty-fourth; and part of it was in the time of the latter captivity, from the forty fourth chapter to the end. The prophet lays open the ſins of Judah with

with great freedom and boldneſs, and reminds them of the ſevere judgments, which had befallen the ten tribes for the ſame offences. He paſſionately laments their misfortune, and recommends a ſpeedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the ſeventy years captivity in Chaldæa. He likewiſe foretells their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews ſhould meet with in due time. There are likewiſe ſeveral intimations in this prophecy concerning the kingdom of the Meſſiah; alſo ſeveral remarkable viſions, and types, and hiſtorical paſſages relating to thoſe times. The fifty-ſecond chapter does not belong to the prophecy of Jeremiah, which probably was added by Ezra, and contains a narrative of the taking of Jeruſalem, and of what happened during the captivity of the Jews, to the death of Jechonias. St. Jerom has obſerved upon this prophet, that his ſtile is more eaſy than that of Iſaiah and Hoſea; that he retains ſomething of the ruſticity of the village where he was born; but that he is very learned, and majeſtic, and equal to thoſe two prophets in the ſenſe of his prophecy.

JESUITES. (*Dict.*) JESUITES-POWDER. See POWDER.

ILLECEBRUM, in botany, a genus of the *pentandria-digynia* claſs of plants, having no corolla; the fruit is a capſule approaching to a roundiſh figure, but pointed at each end, formed of five valves, containing only one cell, and covered by the calyx; the ſeed is ſingle, large, roundiſh, and pointed at each end.

INAMBLUCIÆ, in natural hiſtory, a genus of ſelenitæ, of a columnar, abrupt, and ſeemingly fibroſe texture. See SELENITÆ.

There are only two known ſpecies of this genus, *viz.* the inamblucia, with very fine filaments, and that with whitiſh and black filaments.

INDENTURE, in law, a deed or writing, wherein is contained ſome article, covenant, contract, or conveyance made between two or more perſons; and which is indented or tallied at the top thereof, anſwerable to another part of the ſame deed, *&c.* and having the ſame contents. It differs from a deed-poll, in that this laſt is a ſingle deed, and unindented. See DEED.

INDUCTION. (*Dict.*) INDUCTION, in logics, a conſequence drawn from principles firſt laid down. See the article CONSEQUENCE.

Thus the concluſion of a ſyllogiſm, is an induction made from the premiſes. See SYLLOGISM, CONCLUSION, *&c.*

Induction is alſo uſed for a kind of ſyllogiſm itſelf, being a medium between an enthymeme and a gradation, in regard it wants a propoſition (which however is underſtood) as in the enthymeme, and abounds in aſſumptions (which yet are collateral, or of the ſame degree) which is the caſe in a gradation. See REASONING, ENTHYMEME, and GRADATION.

There are reckoned three kinds of Induction, 1. That which concludes ſome general propoſition from an enumeration of all the particulars of a kind, which is called dialectic induction. In this way of reaſoning, if one part of the enumeration be wanting, it deſtroys the whole. The ſecond kind proceeds by interrogation, and concludes with a probability: This is called παραγωγὴ, and was what Socrates ordinarily made uſe of. The third kind of induction is properly rhetorical, being a concluſion drawn from ſome example or authority.

For a full account of that ſpecies of reaſoning called induction, ſee the article REASONING.

INFERENCE, in matters of literature, a corollary, concluſion, argument, or induction drawn from ſomething that went before. See CONCLUSION, *&c.*

INFLAMMATION, (*Dict.*) INFLAMMATION *of the Tonſils.* See TONSILS.

INK. (*Dict.*) INK-FISH, *ſepia.* See SEPIA.

INTAIL, or TAIL. See the article TAIL.

INTRANSITIVE, a grammatical term for ſuch verbs as are otherwiſe called neuter verbs. See VERB.

INVENTION. (*Dict.*) For the method of invention, ſee the article METHOD.

JOEL, or *the Prophecy of* JOEL, a canonical book of the old teſtament. Joel was the ſon of Pethuel, and the ſecond of the twelve leſſer prophets. The ſtyle of this prophet is figurative, ſtrong, and expreſſive. He upbraids the Iſraelites for their idolatry, and foretells the calamities they ſhould ſuffer, as a puniſhment of that ſin; but he endeavours to ſupport them with the comfort that their miſeries ſhould have an end, upon their reformation and repentance.

JOZO, in ichthyology, the gobius with the ventral-fins blue, and the rays of the back-fin aſſurgent. See GOBIUS.

This fiſh grows to ſix or eight inches in length, and to about an inch in diameter; the head is thick but ſomewhat compreſſed, the body rounded, the eyes large, and their iris of a ſilvery white.

IPECU, or the *Braſilian* WOOD-PECKER, in ornithology, a ſpecies of picus, with a ſcarlet creſted head. See PICUS and WOOD-PECKER.

IRBIL, or ARBELA, a town ſituated on the river Lycus, in a fine plain in the province of Aſſyria, now Curdeſtan, eaſt long. 44°, north lat. 35° 15′, where Alexander fought the third and laſt deciſive battle with Darius.

IRON, (*Dict.*) *Mill for* IRON-work. See the article SMITHERY.

IRREDUCIBLE *Caſe*, in algebra, is uſed for that caſe of cubic equations where the root, according to Cardan's rule, appears under an impoſſible or imaginary form, and yet is real. Thus in the equation, $x^3 - 90x - 100 = 0$, the root, according to Cardan's rule, will be $x = \sqrt[3]{50 + \sqrt{-24500}} + \sqrt[3]{50 - \sqrt{-24500}}$, which is an impoſſible expreſſion, and yet one root is equal to 10; and the other two roots of the equation are alſo real. Algebraiſts, for two centuries, have in vain endeavoured to reſolve this caſe, and bring it under a real form; and the queſtion is not leſs famous among them, than the ſquaring of the circle is among geometers. See EQUATION.

It is to be obſerved, that as in ſome other caſes of cubic equations, the value of the root, tho' rational, is found under an irrational or ſurd-form; becauſe the root in this caſe is compounded of two equal ſurds with contrary ſigns, which deſtroy each other; as if $x = 5 + \sqrt{5} + 5 - \sqrt{5}$; then $x = 10$; in like manner, in the *irreducible* caſe, when the root is rational, there are two equal imaginary quantities, with contrary ſigns, joined to real quantities; ſo that the imaginary quantities deſtroy each other. Thus the expreſſion: $\sqrt[3]{50 + \sqrt{-24500}} = 5 + \sqrt{-5}$; and $\sqrt[3]{50 - \sqrt{-24500}} = 5 - \sqrt{-5}$. But $5 + \sqrt{-5} + 5 - \sqrt{-5} = 10 = x$, the root of the propoſed equation.

Dr. Wallis ſeems to have intended to ſhew, that there is no caſe of cubic equations irreducible, or impracticable, as he calls it, notwithſtanding the common opinion to the contrary.

Thus in the equation $r^3 - 63r = 162$, where the value of the root, according to Cardan's rule, is, $r = \sqrt[3]{81 + \sqrt{-2700}} + \sqrt[3]{81 - \sqrt{-2700}}$, the doctor ſays, that the cubic root of $81 + \sqrt{-2700}$, may be extracted by another impoſſible binomial, *viz.* by $\frac{9}{2} + \frac{1}{2}\sqrt{-3}$; and in the ſame manner, that the cubic root of $81 - \sqrt{-2700}$ may be extracted, and is equal to $\frac{9}{2} - \frac{1}{2}\sqrt{-3}$; from whence he infers, that $\frac{9}{2} + \frac{1}{2}\sqrt{-3} + \frac{9}{2} - \frac{1}{2}\sqrt{-3} = 9$, is one of the roots of the equation propoſed. And this is true: But thoſe who will conſult his algebra, p. 190, 191, will find that the rule he gives is nothing but a trial, both in determining that part of the root which is without a radical ſign, and that part which is within and if the original equation had been ſuch as to have its roots irrational, his trial would never have ſucceeded. Beſides, it is certain, that the extracting the cube root of $81 + \sqrt{-2700}$, is of the ſame degree of difficulty, as the extracting the root of the original equation $r^3 - 63r = 162$; and that both require the triſection of an angle for a perfect ſolution. See M. de Moivre in the appendix to Saunderſon's algebra, p. 744, ſeq.

For Cardan's rule, ſee *Solution of cubic* EQUATIONS.

IRREDUCTIBLE *Caſe*, in algebra. See the article IRREDUCIBLE.

ISAMBLUCES, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ; but of the columnar, not the rhomboidal, kind. See the article SELENITÆ.

This word expreſſes a body in form of an obtuſe or blunt column, the ſides of which are all equal to one another. This diſtinguiſhes it from the genus of the iſchnambluces, or thin columnar ſelenitæ, two of the ſides of which being broader than the others, make it of a flatted form. The ſelenitæ of this genus conſiſt of ſix ſides, and two obtuſe or abrupt ends; and all their ſides being very nearly of the ſame breadth, they much reſemble broken pieces of the columns of ſprig chryſtal. See CRYSTAL, and the next article.

The bodies of this genus, as well as the reſt of the calumnar ſelenitæ, are ſubject to a longitudinal crack, which ſometimes admitting

admitting a ſmall quantity of clay, ſhapes it into the figure of an ear of graſs. Of this genus there are only two known ſpecies; 1. a whitiſh one, very much reſembling a broken ſprig of cryſtal, found among the white tobacco-pipe clay, near Northampton. And, 2. a ſhort and pellucid one, with ſlender filaments: this is found in the ſtrata of yellow clay in Yorkſhire, and ſometimes lying on the ſurface of the earth.

ISCHNAMBLUCES, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ; but one of thoſe which are of a columnar form, not of the common rhomboidal one. See the article SELENITÆ.

This word expreſſes a body in form of a thin or flatted column, with obtuſe ends. The characters of this genus are, that the bodies of it are of a flatted columnar form, and octohedral in figure, conſiſting of ſix long planes, and about two abrupt or broken ends: the whole being of a flatted figure. The top and bottom planes are much broader than the reſt; the four other planes, called the ſides, are narrower than theſe, but are uſually of very nearly the ſame breadth with one another, as are alſo theſe tops and bottoms, ſo that the whole figure comes very near an hexhedral priſm. The bodies of this genus very frequently have a long crack reaching their whole length; and clay often getting into this, ſpreads itſelf into the form of an ear of ſome of the graſſes, and has been miſtaken for a real ear of graſs. Of this genus there are only four known ſpecies. 1. A flat, broad, and pellucid kind, found in Northamptonſhire, Leiceſterſhire, and Yorkſhire, at conſiderably great depths in blue clay. 2. A dull rough-ſurfaced and thicker kind, found in many parts of Kent, and in great plenty in the cliffs of Sheppey-iſland. 3. A dull longitudinally ſtriated kind, found in the clay pits of Yorkſhire and elſewhere, and frequently marked in the middle with the figure of an ear of graſs. And 4. a thick, rough, and ſcaly kind, frequent on the ſhores of Sheppey-iſland, and both in the clay-pits and on the ſhores of Yorkſhire. This alſo has frequently the repreſentation of an ear of graſs.

ISINGLASS. (*Dict.*) ISINGLASS, in natural hiſtory, a name given to the white ſhining ſpecularis, with large and broad leaves; otherwiſe called muſcovy-glaſs. See SPECULARIS.

ISINGLASS FISH, the ſame with the huſo. See HUSO.

ISLAND. (*Dict.*) ISLAND or ICELAND, in geography, an iſland of Denmark, ſituated between 10 and 26 degrees weſt long. and between 64 and 67 north lat. being about 300 miles in length from eaſt to weſt; and 150 in breadth from north to ſouth.

ISLAND-*Cryſtal*, a body famous among the writers of optics, for its property of a double refraction; but very improperly called by that name, as it has none of the diſtinguiſhing characters of cryſtal, and is plainly a body of another claſs. Dr. Hill has reduced it to its proper claſs, and determined it to be of a genus of ſpars, which he has called, from their figure, parallelopipedia, and of which he has deſcribed ſeveral ſpecies, all of which, as well as ſome other bodies of a different genus, have the ſame properties. Bartholine, Huygens, and Sir Iſaac Newton, have deſcribed the body at large, but have accounted it either a cryſtal or a talc; errors which could not have happened, had the criterions of foſſils been at that time fixed; ſince Sir Iſaac Newton has recorded its property of making an ebullition with aqua fortis, which alone muſt prove that it is neither talc nor cryſtal, both thoſe bodies being wholly unaffected by that menſtruum. See the articles PARALLELOPIPEDIA, CRYSTAL and TALC.

It is always found in form of an oblique parallelopiped, with ſix ſides, and is found of various ſizes, from a quarter of an inch to three inches or more in diameter. It is pellucid, and not much leſs bright than the pureſt cryſtal, and its planes are all tolerably ſmooth, though, when nicely viewed, they are found to be moved with crooked lines, made by the edges of imperfect plates. What appears very ſingular in the ſtructure of this body, is, that all the ſurfaces are placed in the ſame manner, and conſequently it will ſplit off into thin plates, either horizontally or perpendicularly; but this is found on a microſcopic examination, to be owing to the regularity of figure, ſmoothneſs of ſurface, and nice joining of the ſeveral ſmall parallelopiped concretions, of which the whole is compoſed; and to the ſame cauſe is probably owing its remarkable property in refraction. See REFRACTION.

It is very ſoft, and eaſily ſcratched with the point of a pin; it will not give fire on

on being ſtruck againſt ſteel, and ferments, and is perfectly diſſolved in aqua fortis. It is found in Iſland, from whence it has its name; and in France, Germany, and many other places. In England fragments of other ſpars are very often miſtaken for it, many of them having in ſome degree the ſame property. See ANOMORHOMBOIDA.

ITCH. (*Dict.*) ITCH-ANIMAL, or ITCH-ACARUS, in the hiſtory of inſects, a very ſmall ſpecies of acarus, the body of which approaches to an oval and lobated figure; the head is ſmall and pointed; its colour is whitiſh, but it has two duſky, ſemicircular lines on the back; the legs are ſhort, and of a browniſh colour, and are harder than the reſt of the body, and as it were cruſtaceous. It is found in the puſtules of the itch, and is by many thought to cauſe that diſeaſe, though it is ſuppoſed if this were the caſe, it would be found more univerſally in thoſe puſtules. It is thought therefore more probable, that theſe puſtules only make a proper nidus for it. See ACARUS and ITCH.

ITEA, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof is compoſed of five long, lanceolated, acute, patent petals; the fruit is an oval capſule, of many times the length of the cup, mucronated with the ſtyle, and formed of two valves, cohering at the points; the cell is ſingle, and the ſeeds numerous and ſmall.

JUGLANS, the WALNUT-TREE, in botany, a genus of the *monoecia-polyandria* claſs of plants, the male corolla whereof being divided into ſix parts, is elliptic, equal, and plane; the female one is divided into four ſegments, acute, erect, and a little greater than the cup; the fruit is a large, dry, oval, unilocular berry, with a ſulcated kernel.

This tree grows to a very conſiderable height, and is very ramoſe, and diffuſe, from a third of its height upwards; the leaves are pinnated, and the pinnæ are obſcurely ſerrated. We have it every where in our gardens. The kernel of the walnut is ſimilar in quality to almonds; the ſhell is aſtringent, and as ſuch is made uſe of by the dyers; but neither are employed in medicine. There is an oil expreſſed from the walnut, which poſſeſſes the ſame quality with that expreſſed from linſeed and muſtard, all agreeing in one common emollient virtue. It ſoftens and relaxes the ſolids, and obtunds acrimonious humours; and thus becomes ſerviceable, internally, in pains, inflammations, heat of urine, hoarſeneſs, coughs, *&c.* in glyſters, for lubricating the inteſtines, and promoting the ejection of indurated feces; and in external applications, for tenſions, and rigidity of particular parts. It is given inwardly, from half an ounce to three ounces, or more.

JUNCO, the *reed ſparrow*, in ornithology. See SPARROW.

JUNE, the ſixth month of the year, during which the ſun enters the ſign of Cancer. See MONTH and YEAR.

In this month is the ſummer ſolſtice. See SOLSTICE.

JUSSIÆA, or JUSSIEUA, the *Catalonian Jaſmine*, in botany, a genus of the *decandria-monogynia* claſs of plants, the corolla whereof conſiſts of five roundiſh, patent petals; the fruit is oblong, thick, coronated, and opens longitudinally; the ſeeds are numerous, and diſpoſed in ſeries.

K.

KARATAS, or CARATAS, in botany, the name whereby Plumier calls the ananas. See ANANAS.

KESHITAH, in antiquity, the name of a jewiſh coin, otherwiſe called gerah. See the article COIN.

KESWICK, a market-town of Cumberland, twenty-five miles ſouth weſt of Carliſle.

KETTERING, (*Dict.*) KETTERING-STONE, in the hiſtory of foſſils, the friable pſadurium, with a round gritt, being the ſubſtance ſo much talked of in the world under this name, though it is an erroneous one, it not being found about Kettering in Northamptonſhire, but about Ketton, a ſmall town in Rutland. See STONE.

It is a very remarkable and beautiful ſtone, of a lax texture, and appears where broken of a cavernous or porous ſtructure; but this is not really the caſe, the cavities ſeen there being not originally in the ſtone, but made by falling out of the inner part of its gritt, which is uſually looſe, and falls out as ſoon as its containing ſhell is broken. It is of a duſky browniſh white colour, and is compoſed of a roundiſh gritt laid very cloſely together, and ſurrounded with a cementitious matter of a terrene ſpar. It is not only found about Ketton, but in many other parts of the kingdom; and is uſed in many places in building. See PORTLAND-STONE.

KETTON-STONE. See KETTERING-STONE.

KIDWELLY, a market-town of Caermarthen, in ſouth Wales; ſituated on the Briſtol-channel, ſeven miles ſouth of Caermarthen.

KIEL, a city of the dutchy of Holſtein, in Germany, ſituated on a bay of the Baltic ſea, fifty miles north of Hamburg, eaſt-long. 10°, north-lat. 54° 32′.

KILGARREN, a market-town of Pembrokeſhire, in ſouth Wales; ſituated twenty-five miles north of Pembroke.

KILHAM, a market-town of the eaſt riding of Yorkſhire, thirty miles north eaſt of York.

KING. (*Dict.*) KING *at arms*, or *of arms*, an officer who directs the heralds, preſides at their chapters, and has the juriſdiction of armory. See HERALD and ARMS.

There are three kings of arms in England, namely, garter, clarencieux, and norroy.

Garter principal KING *at arms*. He, among other privileges, marſhals the ſolemnities at the funerals of the prime nobility, and carries the garter to kings and princes beyond ſea, being joined in commiſſion with ſome peer of the kingdom. See the article GARTER.

Clarencieux KING *at arms*, ſo called from the duke of Clarence to whom he firſt belonged. He marſhals the funerals of baronets, knights, eſquires, and gentlemen on the ſouth ſide of the Trent. See the article CLARENCIEUX.

Norroy KING *at arms*, does the ſame on the north ſide of Trent; and theſe two laſt are called provincial heralds, as dividing the kingdom between them into two provinces.

Theſe, by charter, have power to ſet down noblemens pedigrees, diſtinguiſh their arms, appoint perſons their arms, and, with garter, direct the other heralds.

Latterly the earl marſhal of England, by ſpecial commiſſion, to perſonate the king, creates the kings at arms.

Lyon KING *at arms*, for Scotland, is the ſecond king at arms for Great-Britain; he is inveſted and ſolemnly crowned. He publiſhes the king's proclamations, marſhals funerals, reverſes arms, appoints meſſengers at arms, *&c.* See the article COLLEGE *of Heralds*.

KING *of the Romans*. See ROMAN.

KING'S EVIL, *ſcrophula* in medicine. See SCROPHULA.

KING'S SILVER, the money due to the king in the court of common-pleas, *pro licentia concordandi*, in reſpect of a licence there granted to any man, for levying a fine of lands or tenements to another perſon. See the article FINE.

KINGDOM, among chemiſts and writers of natural hiſtory, a term which they apply to each of the three orders or claſſes of natural bodies: animal, vegetable, and mineral. See BODY, ANIMAL, VEGETABLE and FOSSIL.

KNAPWEED, *Jacea*, in botany, a ſpecies of Centauria. See CENTAURIA.

KNOWLEDGE, (*Dict.*) may be uſefully diſtinguiſhed, according to Wolfius, into three kinds; hiſtorical, philoſophical, and mathematical.

Hiſtorical knowledge is merely the knowledge of facts, or of what is or happens in the material world, or within our own minds. Thus, that the ſun riſes and ſets, that trees bud in the ſpring, that we remember, will, *&c.* are inſtances of hiſtorical knowledge. Philoſophical knowledge is the knowledge of the reaſons of things, or of what is or happens. Thus he has a philoſophical knowledge of the motion of rivers, who can explain how it ariſes from the declivity of the bottom, and from the preſſure which the lower part of the water ſuſtains from the upper. So likewiſe the ſhewing how, and by what reaſon, deſire or appetite ariſes from the perception or imagination of its object, would be philoſophical knowledge. Mathematical knowledge is the knowledge of the quantity of things, that is, of their proportions or ratios to ſome given meaſure. Thus he who knows the proportion of the meridian heat of the ſun at the

the ſummer ſolſtice to its meridian heat at the winter ſolſtice, might ſo far be ſaid to have a mathematical knowledge of the ſun's heat. So likewiſe he has a mathematical knowledge of the motion of a planet in its orbit, who can diſtinctly ſhew, how, from the quantity of the impreſſed and centripetal force, the velocity of the planet is produced; and how from the action of this double force, the elliptical figure of the orbit ariſes.

Theſe three kinds of knowledge differ evidently, it being one thing to know that a thing is; another, the reaſon why it is; and a third, to know its quantity or meaſure. It is alſo evident, that hiſtorical knowledge, though extenſively uſeful, and the foundation of the reſt, is the loweſt degree of human knowledge. Thoſe who aim at the greateſt certainty ought to join mathematical with philoſophical knowledge. Nothing can more evidently ſhew that an effect ariſes from a certain cauſe, than the knowledge that the quantity of the effect is proportional to the force of the cauſe. Beſides, there are many things in nature, the reaſons of which, depending on certain figures or quantities, are not aſſignable but from mathematical principles.

Philoſophical knowledge is attended with advantages not to be expected from mere hiſtory. See PHILOSOPHY.

KOBAN-TARTARY, a part of Circaſſian Tartary, eaſtward of the ſtreights of Caffa.

KODDA-PAIL, a plant called by Linnæus piſtia. See PISTIA.

KOLA, the capital of Ruſſian Lapland, ſituated eaſt long. 32° 35′ and north lat. 69°.

KOLDING, or COLDING, a port town of Denmark, in the province of Jutland, ſituated on a bay of the little Belt, eaſt long. 9° 45′ and north-lat. 55° 30′.

KOM, or COM, a large populous city of Perſia, one hundred miles north of Iſpahan.

KOMORRA, a city of Hungary, ſituated on the Danube, at the eaſt end of the iſland Schut, eaſt long. 18° 12′, north lat. 48° 10′.

KONGEL, a port town of Sweden, in the province of Gothland, ſituated on the Categate-ſea, 12 miles north of Gottenburg.

KONINGSBURG, a city of Poland, capital of Ducal Pruſſia, and of the king of Pruſſia's Poliſh dominions, ſituated on the river Pregel, near a bay of the baltic ſea, eaſt long. 21°, north lat. 54° 40′.

KONINGSGRATZ, a city of Bohemia, ſituated on the river Elbe, eaſt long. 15° 25′, north lat. 50° 15′.

KOPPING, a town of Sweden in the province of Weſtmania, ſituated on the Meller-Lake, 54 miles weſt of Stockholm.

KOWNO, a city of Poland, in the dutchy of Lithuania, and palatinate of Troki, ſituated on the rivers Wilia and Niemen, eaſt long. 24° north lat. 55° 5′.

KUFFSTAIN, a city of Germany, in the circle of Auſtria and county of Tyrol, ſituated on the river Inn, eaſt long. 12° 12′, north lat. 47°, 32′.

KYPHONISM, in antiquity, a kind of puniſhment, otherwiſe called cyphoniſm. See CYPHONISM.

This puniſhment was inflicted three different ways; ſometimes the criminal was only tied to a ſtake; ſometimes hoiſted up into the air, and ſuſpended in a baſket; and at other times, ſtretched out on the ground. But before expoſing him, he was always ſmeared over with honey, that the gnats and flies might torment him.

KYSTIS, or CYSTIS, in anatomy. See the articles CYST and CYSTIS.

L.

LACERTA, the lizard, in zoology. See the article LIZARD.

LACINIATED-LEAF, among botaniſts, expreſſes a leaf which has ſeveral ſinuſes down to the middle, and the lobes which ſeparate theſe not ſmooth but notched, or indented at the edges. See LEAF.

LANDGRAVE, the german name for a count or earl, that has the government of a province, country, or large tract of land.

LANDGRAVIATE, or LANDGRAVATE, the office, authority, jurisdiction, or territory of a landgrave.

LAPIS. (*Dict.*) LAPIS AMPELITES. See AMPELITES.

LAPIS OBSIDIANUS, or the obsidian stone, or chian marble, of the antients, the dull, smooth, hard, black marble. See the article MARBLE.

LAPSANA in the linnæan system of botany, a plant, otherwise called zacintha. See the article ZACINTHA.

LAPWING, VANELLUS, in ornithology. See VANELLUS.

LAVATERA, in botany, a genus of the *monadelphia-polyandria* class of plants; the corolla whereof consists of five plane, patent, vertically cordated petals, growing together at the base; the fruit consists of a number of capsules; the receptacle is columnar, and affixed to the capsules; the seed is single and kidney-shaped.

LAURUS, in botany, a genus of the *enneandria-monogynia* class of plants, the corolla whereof consists of six ovato-acuminated, concave, and erect petals. The nectarium is composed of three coloured, acuminated tubercles, terminating in two hairs, and standing round the germen; the fruit is a drupe of an oval, acuminated figure, containing only one cell, and contained in the corolla; the seed is a single, ovato-acuminated nut, and its kernel is of the same figure.

This genus comprehends the laurus, or bay-tree, the cinnamon-tree, the camphire-tree, the benjamin-tree, and the sassafras-tree. See the articles CINNAMON, CAMPHOR, BENJAMIN, and SASSAFRAS.

The leaves and berries of the bay-tree, or common laurus, are only used in medicine, and are warm carminatives, and sometimes exhibited in this intention against flatulent colics; and likewise in hysterical disorders. Their principal use, in the present practice, is in glysters, and some external applications. The leaves enter our common fomentation, and the berries the plaster and cataplasm of cumin; they also give name to an electuary, which is little otherwise used than in glysters.

LAW. (*Dict.*) LAWS *of Nature*, or *Motion*, in physics, are axioms, or general rules of motion and rest, observed by all natural bodies in their actions upon one another. Of these Sir Isaac Newton has established three, which may be seen under the article MOTION.

Salic LAW. See SALIC.

LAWSONIA, in botany, a genus of the *octandria-monogynia* class of plants; the corolla whereof consists of four, plane, ovato-lanceolated, patent petals; the fruit is a globose capsule, terminating in a point, and containing four cells; the seeds are numerous, angular and acuminated.

LAWYER signifies a counsellor, or one that is learned or skilled in the law.

LEATHER. (*Dict.*) *Colouring of* LEATHER. To colour white leather, the best way. Hang the skins in chalk or lime-water, till they are grown supple, that the hair or wool may be stripped off; stretch them on tenters, or by means of lines, and smooth them over: then brush them over with alum-water very warm, and colour them with the colour you would have them, and dry them in the sun, or in some warm house, and they will be useful on sundry occasions, without any farther trouble.

To colour black-leather the German way. Take of the bark of elder two pounds, of the filings or rust of iron the same quantity; put them into two gallons of rain-water, and stop them up close in a cask or vessel, and let them stand for the space of two months: then add to that the liquid part of a pound of nut-galls, beaten to powder, and a quarter of a pound of copperas, heating them over the fire, and suffering them to stand twenty-four hours after; and then use the liquor with a brush till the skin has taken a fine black.

To colour leather a fair red. First rub the leather well in alum-water, or alum it; boil stale urine, scum it, till half of it is wasted: then put in an ounce of the finest lake, the like quantity of brazil in powder, one ounce of alum, and half an ounce of sal-armoniac; mix them well, and keep them stirring over a gentle fire about two hours, and so use the liquid part, to colour or tinge the skins.

To colour leather of a curious French yellow. Take one part of chalk, and another of wood-ashes, and make of them a good lye; then strain out the fine liquor, and set it in a vessel over the fire, and put into it turmeric in powder, and a little saffron; and let it simmer, till it becomes pretty thick; then set it a cooling, to be used as occasion requires.

To make white leather blue. Take a quart of elder-berries, strain out the juice, and boil it with an ounce of powder of alum, and half an ounce of indigo,

digo, or ſmalt-blue, and bruſh over the leather with a fine bruſh dipped in it three times, ſuffering it to dry between whiles, and the buſineſs will be effected.

To colour Spaniſh leather, *&c.* Take that which the Dutch call pomplemelch, warm it, and rub the leather with it; then take of venice tot appelen, and having pounded it ſmall, put a quantity of water to it, and let it ſoften over a gentle fire; then preſs out the water, and rub or waſh out the ſkin in it; repeating the ſame ſeveral times; and after that, take the fineſt ſhoemakers black, and rub the ſkin over with it, having in the melting added a little vitriol or copperas, and letting it dry, take gooſe or hog's greaſe, and with a woollen cloth rub the ſkin over for a good while, where there is a good fire to ſupple it, and afterwards rub it over with your hands, till it diſappear; or inſtead of greaſe, you may uſe linſeed or train-oil, and ſo in caſe of any other colour, according to the colours you deſign.

Dying of LEATHER. To dye leather of a reddiſh colour. Firſt waſh the ſkins in water, and wring them out well, and afterwards wet them with a ſolution of tartar and bay-ſalt in fair water, and wring them out again: then to the former diſſolutiou add aſhes of crab ſhells, and rub the ſkins very well with this: afterwards, waſh them in common water, and wring them out; then waſh them with tincture of madder in the ſolution of tartar and alum and the crab-ſhell aſhes; and if they prove not red enough after all, waſh them with the tincture of brazil.

To dye leather of a pure yellow. Take of fine aloes two ounces, of linſeed-oil four pounds; diſſolve or melt them; then ſtrain the liquor, and beſmear the ſkins with it, and being dry, varniſh them over.

To dye ſkins of an orange. Boil ſuſtic-berries in alum-water: but for a deep orange, uſe turmerick-root.

To dye leather blue. Boil elder-berries, or dwarf-elder in water; then ſmear or waſh the ſkins with it; wring them out: then boil the berries as before in a ſolution of alum-water, and wet the ſkins in the ſame water once or twice; dry them, and they will be very blue.

To dye leather of a pure ſky-colour. For each ſkin take indigo one ounce, put it into boiling water, let it ſtand one night; then warm it a little, and with a bruſh-pencil beſmear the ſkin twice over.

To dye leather purple. Diſſolve rock-alum in warm water, wet the ſkins with it, dry them; then boil raſped brazil well in water; let it ſtand to cool: do this three times, and afterwards rub the dye over the ſkins with your hand, and when they are dry, poliſh them.

To dye leather green. Take ſap-green and alum-water, of each a ſufficient quantity; mix and boil them a little; if you would have the colour darker, add a little indigo.

Gilding of LEATHER. Take glair of the whites of eggs or gum-water, and, with a bruſh, rub over the leather with either of them; then lay on the gold or ſilver, and letting them dry, burniſh them. See the article GILDING and BURNISHING.

To dreſs or cover leather with ſilver or gold. Take brown red, grind or move it on a ſtone with a muller, adding water and chalk, and when the latter is diſſolved, rub or lightly dawb the leather over with it, till it looks a little whitiſh, and then lay on the leaf, ſilver or gold, before the leather is quite dry, laying the leaves a little over each other, that there may not be the leaſt part uncovered; and when they have well cloſed with the leather, and are ſufficiently dried on, and hardened, rub them over with an ivory poliſher, or the fore-tooth of a horſe.

For the duties on LEATHER, ſee the articles HIDES, SKINS, *&c.*

LEDUM, the *Marſh-Ciſtus*, in botany, a genus of the *decandria-monogynia* claſs of plants, the corolla whereof conſiſts of five hollow, patent, oval petals; the fruit is a roundiſh capſule, containing five cells and opening in five places at the baſe; the ſeeds are numerous, oblong, narrow pointed at each end, and very ſlender.

LEEK. (*Dict.*) *Great-houſe* LEEK, and *tree-houſe* LEEK in botany, the Engliſh names of two different ſpecies of the ſempervivum. See SEMPERVIVUM.

LEMING, in zoology, the ſhort tailed mus, with the body variegated with black and tawny, being the ſame with the Norway-rat. See NORWAY and MUS.

LENÆA, Ληναια, in antiquity, a feſtival of Bacchus, ſurnamed Lenæus from ληνος, i. e. a vine-preſs. Beſides the uſual ceremonies at feaſts ſacred to this god, it was remarkable for poetical contentions, and tragedies acted at this time.

LEPIUM, in natural hiſtory, a genus of foſſils of the harder gypſum, compoſed of very ſmall particles, and of a leſs glittering hue. See GYPSUM.

There is only one ſpecies of this genus, being one of the leaſt valuable and moſt impure of the claſs of gypſums. It is of an extremely rude, irregular, coarſe and unequal ſtructure; a little ſoft to the touch, of a very dull appearance, and of different degrees of a greyiſh white. It is burnt in plaiſter for the coarſer works; it calcines very ſlowly and unequally, and makes but a very coarſe and ordinary plaiſter.

LEPTODECORHOMBES, in natural hiſtory, a genus of foſſils of the order of the ſelenitæ; conſiſting of ten planes, each ſo nearly equal to that oppoſite to it as very much to approach to a decahedral parallelopiped, though never truly or regularly ſo. Two of the planes in this genus, which may properly enough be called the top and bottom are ever broader and flatter than the reſt, and theſe, tho' not regularly equal, uſually anſwer one another very nearly, as do alſo the other eight in two ſets of fours. There are four ſhorter planes meeting in ſomewhat acute angles, two and two, from the ends, or two ſhorter edges of the two flat and broad rhomboidal planes, called the top and bottom; and four longer meeting in more obtuſe angles from the ſides, or longer edges of the ſame rhomboidal planes. As the broader and flatter planes, or the top and bottom, in this genus are not regularly equal to each other, ſo neither are the eight narrower to their oppoſites, but there are uſually differences both in their angles, and in the breadth of them. See the article SELENITÆ.

Of this genus there are only five known ſpecies. 1. A thin, fine, pellucid, and ſlender ſtreaked one, with tranſverſe ſtriæ, found in conſiderable quantities in the ſtrata of clay in moſt parts of England, particularly near Heddington in Oxfordſhire. 2. A thin, dull-looking, opake, and ſlender ſtreaked one, more ſcarce than the former, and found principally in Leiceſterſhire and Staffordſhire. 3. A thin fine ſtreaked one with longitudinal ſtriæ, found in the clay-pits at Richmond, and generally lying at great depths. This has often on its top and bottom a very elegant ſmaller rhomboide, deſcribed by four regular lines. 4. A rough kind with thick tranſverſe ſtriæ, and a ſcabrous ſurface, very common in Leiceſterſhire and Yorkſhire. And, 5. a very ſhort kind, with thick plates, common in the clay-pits of Northamptonſhire and Yorkſhire.

LEPTOPOLYGINGLIMI, in natural hiſtory, a name which Dr. Hill gives to a genus of foſſil-ſhells, diſtinguiſhed by a number of minute teeth at the cardo; whereof we find great numbers at Harwich-cliff, and in the marle-pits of Suſſex.

LEPTURA, in zoology, a genus of winged inſects, the antennæ whereof are oblong, ſlender and ſetaceous, the exterior wings are truncated at their extremity, and the thorax is of a ſubcylindric figure. See INSECT.

LERNEA, *the Sea-Hare*, in zoology, a ſea-inſect of the order of the gymnarthria, the body of which is of an oblong cylindric figure, and is perforated in the forehead; the tentacula reſemble ears. See GYMNARTHRIA.

LETTUCE, *lactuca*, in botany, a genus of the *ſyngeneſia-polygamia-æqualis* claſs of plants, the compound flower of which is imbricated and uniform, with numbers of equal hermaphrodite-corollulæ ſhorter than the cup; the partial corolla is monopetalous, ligulated, truncated, and quadri or quinquedentated; it has no pericarpium; the cup is connivent and ovato-cylindric; the ſeed is ſingle, ovated, acuminated and compreſſed.

The common lettuce is generally ſown for cutting very young, to mix with other ſalad herbs in ſpring; the cabbage lettuce is only this mended by culture: it may be ſown at all times of the year; but in the hot months requires to be ſown in ſhady borders. The cabbage-lettuce may alſo be ſown at different ſeaſons, to have a continuation of it through the ſummer. The firſt crop ſhould be ſown in February, in an open ſituation; the others, at three weeks diſtance, and the later ones under covert, but not under the dripping of trees. The ſileſia, imperial, royal, black, white and upright cos-lettuces, may be ſown firſt in the latter end of February or the beginning of March, on a warm light ſoil, and in an open ſituation: when the plants are come up, they muſt be thinned to fifteen inches diſtance every way; they will then require no farther care, than the keeping them clear of weeds; and the black cos, as it grows large, ſhould

have its leaves tied together, to whiten the inner part. Succeeding crops of theſe ſhould be ſown in April, May, and June, and toward the latter end of Auguſt they may be ſowed for a winter-crop, to be preſerved under glaſſes, or in a bed arched over with hoops and covered with mats.

The moſt valuable of all the Engliſh lettuces, are the white cos, or the Verſailles, the Sileſia, and the black cos. The brown Dutch and the green capuchin are very hardy, and may be ſown late, under walls, where they will ſtand the winter, and be valuable, when no others are to be had. The red capuchin Roman, and prince-lettuces, are very early kinds, and are ſown for variety, as are alſo the Aleppo-ones for the beauty of their ſpotted leaves.

The milk of the common garden-lettuces is hypnotic, while the root of the plant is cooling, diluent and nouriſhing.

LEUCOIUM, (*Dict.*) the name whereby Tournefort calls the cheiranthus of Linnæus. See CHEIRANTHUS.

LIGNICENSIS *terra*, in the materia medica, the name of a fine yellow bole, dug in many parts of Germany, particularly about Emeric in the circle of Weſtphalia, and uſed in cordial and aſtringent compoſitions. It is a common ſuccedaneum for the yellow ſileſian bole, where that is not to be had, and is generally eſteemed very nearly, if not abſolutely, equal to it in its virtues. It is moderately heavy, naturally of a ſmooth ſurface, and of a beautiful gold-colour. It eaſily breaks between the fingers, and does not ſtain the ſkin in handling, and melts freely in the mouth, but generally leaves a little grittineſs between the teeth. It makes no efferveſcence with acids; and burns not to a red, but to a pale brown, and almoſt to a ſtone hardneſs. Charlton ſays it is more frequently known by the name of terra ſigillata golthergenſis.

LINARIA, the LINNET, in ornithology. See LINNET.

LIQUIDAMBER, in botany, a genus of the *monoecia-polyandria* claſs of plants, having no corolla; the ſtamina are very numerous ſhort filaments; the calyces of the female flower are collected into a kind of globe, each conſiſting of four leaves; there is no corolla; the ſtyles are two; the fruit is compoſed of a number of oblong, bivalve unilocular capſules, formed into a globular body; the ſeeds are numerous and oblong.

This tree, which grows to a vaſt ſize, is a native of America, where a very fragrant reſin is obtained from it in great abundance.

LITHIDIA, in natural hiſtory, the name of a large claſs of foſſils, including the flint and pebble kinds. See the articles FLINT and PEBBLE.

The lithidia are defined to be ſtones of a debaſed cryſtalline matter, covered by, and ſurrounded with, an opake cruſt, and frequently of great beauty, and conſiderable brightneſs within, though of but a ſlight degree of tranſparency, approaching to the nature of the ſemi-pellucid gems, and like them found in not very large maſſes. See GEM.

The bodies of this claſs are divided into two general orders, and under thoſe into three genera. The firſt order of the lithidia contains thoſe compoſed of a cryſtalline matter, but ſlightly debaſed, and that ever by one and the ſame earth, tho' diffuſed through them in different degrees, and always free from veins. The ſecond order is of thoſe of a more debaſed cryſtalline matter, blended with different portions of differently coloured earths. Of the firſt of theſe orders there is only one genus, which is that of the common flint. Of the ſecond order there are two genera. 1. The homochroa, which are of one plain and ſimple colour; and, 2. The calculi, which are compoſed of cruſts of ſeveral different colours. Both theſe genera are compriſed under the common Engliſh name of pebbles.

LITHOGENESIA, a term uſed by ſome authors, for the formation of ſtones. See STONE.

Henkel has thrown together ſome very ingenious thoughts on this abſtruſe ſubject, in a treatiſe publiſhed in the year 1734. where he builds no opinion on any other baſis than that of facts, obſervations of nature, and experiments. He ſuppoſes that the earth was at firſt every where ſoft on the ſurface, and that this ſoft matter, by degrees, hardened, and formed ſtones of ſeveral kinds. He ſeems to imagine, that the ſurface of the earth was a ſecond time all reduced to this ſoft ſtate by the univerſal deluge at the time of Noah, and that this matter, afterwards hardening into ſtones of various kinds, included the ſhells of ſea-fiſhes, and other animal-remains of the produce of the ſeas, in flints, in lime-ſtone, or in whatever other ſubſtance the matter among which they lay chanced to harden,

den. Thus may the ſea-ſhells, found ſingly in the middle of hard flints, or lodged in vaſt numbers in the ſtrata of earth, limeſtone, or marble, be accounted for. Waters of other kinds we are very ſenſible may carry particles of ſtony matter, and lodge them ſo in other bodies, as to form complete, hard and ſolid ſtones: this is frequently done at this day in the common petrifactions of wood, and in the ſtones generated in the bladders of animals. If this be allowed a property common to ſeveral fluids, and to water in ſeveral ſtates, there is no reaſon why it ſhould be denied to have exiſted in that of the univerſal deluge; and if that be acknowledged to have had a power of forming ſtones of various kinds, there is no wonder that ſtones of various kinds ſhould be found in the ſtrata, and on the ſurface of this earth, which was all covered by that water; or that the ſtones formed in that immenſe body of water ſhould ſhew, as they do in many inſtances, the ſeveral cruſts or coats laid one upon another, by the ſucceſſive applications of the matter of which they were formed. If we conſider alſo the immenſe quantity of animal and vegetable-bodies; ſome entire, others only ſeparated into parts, which muſt have been mixed with, floating among, or lying upon the bottom of this immenſe bed of water; and that ſtones were continually forming out of this water at this time; we cannot wonder that theſe ſtones ſhould take up theſe parts of plants or animals, or concrete about them, or that we ſhould find ſhells and teeth of fiſhes, or pieces of wood, or leaves of plants preſerved in them. Nor is water alone the agent that may have made theſe changes in the once ſoft parts of the earth's ſurface; we can by fire reduce the pooreſt earths into a ſort of glaſs, a hard tranſparent body, not a little reſembling the nature of flint or the other ſemi-pellucid ſtones. Fire has a power to do great things in the bowels of the earth, and the way to learn what changes it may there make in ſtones, is to try its effects upon the ſeveral different kinds of ſtones and earths here. By experiments of this kind we learn, that of the ſeveral ſpecies of ſtones in their preſent ſtate, ſome are reduced to a friable maſs, and finally to powder, by the force of fire, others are hardened by it, others are melted, and become a kind of glaſs: and by experiments on the other foſſile-ſubſtances, it appears, that the original matter of all ſtones has been earth, either of the nature of chalk, marle, or clay; and that many of them have been greatly altered by receiving metallic or other mineral matter into their earthy matter, at the time of their formation; and all ſeem to have owed their change into their hard ſtate, either to fire alone, or to ſaline, oily, metallic, or ſaline ſulphureous matters, either conjunctly with the force of this agent, or alone.

Thoſe ſtones, which were formed in their preſent ſtate, immediately out of fluids, have been produced either by congelation, a rude coalition, or cryſtallization; and that all the gems have been once fluid, is plain from their imperfections in certain inſtances, as from their containing grains of ſand, or the like extraneons ſubſtances, firmly embodied in them. If theſe, the hardeſt of all ſtones, have been once fluid, there is no reaſon to diſpute, but that all the other kinds may have been ſo, which are leſs hard and leſs perfect.

LITHOMANTIA, Λιθομαντεια, in antiquity, a ſpecies of divination performed with ſtones. Sometimes the ſtone, called ſiderites, was uſed: this they waſhed in ſpring-water, in the night, by candle-light; the perſon that conſulted it was to be purified from all manner of pollution, and to have his face covered: this done, he repeated divers prayers, and placed certain characters in an appointed order; and then the ſtone moved of itſelf, and in a ſoft, gentle, murmur, (or as ſome ſay) in a voice like that of a child, returned an anſwer. By a ſtone of this nature, Helena is reported to have foretold the deſtruction of Troy.

LITHOMARGA, *Stone marle*, a name given by ſome authors to a ſparry ſubſtance highly debaſed by earth, which is found in great plenty in the caves of the Hart's foreſt in Germany, and uſed there in medicine, under the name of the unicornu foſſile, or foſſile unicorn's horn, from it's ſometimes emulating that figure. See the article MARLE and UNICORNU.

LITHOSTROTION, in natural hiſtory, the name of a ſpecies of foſſile-coral, compoſed of a great number of long and ſlender columns, ſometimes round, ſometimes angular, jointed nicely to one another, and of a ſtarry or radiated ſurface at their tops. Theſe are found in conſiderable quantities in the northern and weſtern parts of this kingdom, ſometimes in ſingle, ſometimes in complex ſpecimens. See the article CORAL.

LI-

LITHOXYLUM, in botany, a term uſed by Linnæus, to expreſs a heterogeneous ſubſtance on ſea-plants, which has fructifications in impreſſed points.

LITHOZUGIA, in natural hiſtory, a genus of foſſils, of the claſs of the ſcrupi, compoſed of a ſimply ſtony matter, making a kind of cement, and holding firmly together ſmall pebbles, &c, embodied in it. See the article SCRUPI.

There are two kinds of the lithozugia. 1. That of a cryſtalline baſis and purer texture, approaching to the nature of flint, called by the engliſh lapidaries the pudding-ſtone; of this kind are reckoned four ſpecies; the yellowiſh white lithozugium, the greyiſh white lithozugium, the red lithozugium, and the browniſh lithozugium, all filled with pebbles. 2. The lithozugia of a coarſer texture, approaching to the nature of quarry-ſtone: of this kind there are alſo reckoned four ſpecies, *viz.* the freſh-coloured lithozugium, filled with reddiſh, impure, cryſtalline nodules; the bluiſh, glittering lithozugium, filled with white, impure, cryſtalline nodules; the whitiſh, green, elegant lithozugium, filled with cryſtalline nodules; and the friable, pale, red lithozugium, variegated with white veins and red nodules.

LIVONICA TERRA, in the materia medica, a kind of fine bole uſed in the ſhops of Germany and Italy, of which there are two ſpecies, the yellow, and the red; the diſtinguiſhing characters of which are theſe: the yellow livonian earth is a pure and perfectly fine bole, of a ſhattery, friable texture, conſiderably heavy, and of a dull, duſky yellow, which has uſually ſome faint bluſh of reddiſhneſs in it: it is of a ſmooth ſurface, and does not ſtain the hands; it adheres firmly to the tongue, and melts freely in the mouth, leaving no grittineſs between the teeth, and does not ferment with acid menſtrua. The red livonian earth is an impure bole, of a looſe texture, and of a pale red: it is of a ſmooth ſurface, breaks eaſily between the fingers, and does not at all ſtain the hands; it melts freely in the mouth, has a very ſtrongly aſtringent taſte, but leaves a grittineſs between the teeth, and does not ferment with acid menſtrua. Theſe earths are both dug out of the ſame pit, in the place from whence they have their name, and in ſome other parts of the world. They are gene ally brought to us made up into little cakes, and ſealed with the impreſſion of a church, and an eſcutcheon with two croſs keys. In Spain and Portugal they are much uſed, ſometimes ſingly, ſometimes mixed together, and are good in fevers and in fluxes of all kinds. The red is the more powerful aſtringent. The Spaniards and Portugueze make alſo a light kind of earthen ware of them.

LOCATELLUS's BALSAM, in pharmacy, a celebrated balſam, the preparation whereof is directed in the London diſpenſatory as follows: Take of oil-olive, one pint; Straſburg turpentine and yellow wax, each half a pound; red ſaunders, ſix drams; melt the wax over a gentle fire, with ſome part of the oil; then add the reſt of the oil and the turpentine; afterwards mix in the ſaunders, and keep them ſtirring together until the mixture is grown cold. The Edinburgh diſpenſatory directs it to be made thus: Take of yellow wax, one pound; oil-olive, a pint and a half; Venice-turpentine, a pound and a half; balſam of Peru, two ounces; dragon's blood, one ounce; melt the wax in the oil over a gentle fire; then add the turpentine, and having taken them from the fire, mix in the balſam of Peru and dragon's blood, keeping them continually ſtirring till grown cold.

This balſam is uſed in internal bruiſes and hæmorrhages, eroſions of the inteſtines, ulcerations of the lungs, dyſenteries, and in ſome coughs and aſthmas; the doſe is from two ſcruples to two drams; it may be commodiouſly exhibited along with about double its weight of conſerve of roſes: ſome have likewiſe applied it externally, for deterging and incarnating recent wounds and ulcers.

LOGARITHMIC CURVE. (*Dict.*) For which ſee plate CLXII. fig. 4.

LONGITUDE. (*Dict.*) For the method of correcting the longitude found by the dead reckoning, ſee RECKONING.

Argument of LONGITUDE. See the article ARGUMENT.

LORANTHUS, in botany, a genus of the *hexandria-monogynia* claſs of plants; the corolla whereof is formed of a ſingle leaf of a ſexangular figure, and divided into ſix nearly equal, linear, revolute ſegments; the fruit is a roundiſh unilocular berry; the ſeeds are ſix, convex on one ſide and angular on the other.

LOT, *ſors*, a portion, ſhare, or part of a thing, parcel of goods, or cargo, divided into many; alſo the condition, chance, or fortune of a perſon. See the article SORTILEGE.

LOT and SCOT. See SCOT.

LOT, or LOTH, in mining, the thirteenth diſh, meaſure, or part of the miner's ore, which the bar-maſter takes up for the king, or the farmer.

LOW-BELLS, or LOW-BELLERS, in our ſtatute-books, are perſons who go in the night-time with a light and a bell, by the ſight and noiſe whereof birds, ſitting on the ground, become ſtupefied, and ſo are covered with a net and taken.

LUMME, in ornithology, a ſpecies of colymbus, with palmated undivided feet. See the article COLYMBUS.

This is a very beautiful bird, and is extremely common in ſome particular parts of the north of Europe, though wholly unknown elſewhere: it is about equal to our common wild-duck in ſize; the head is large, and rounded at the ſides, but ſomewhat depreſſed on the crown; the eyes are large, ſharp, and piercing, and their iris of a fine pale hazel; the beak is about an inch and three quarters in length, and towards the baſe pretty thick, and of a deep gloſſy black; as are alſo the legs, which are very robuſt; the head and neck are grey; the back and wings black, but beautifully variegated with ſquare ſpots of white; and the breaſt and belly are white.

LUMP-FISH, *cyclopterus*. See the article CYCLOPTERUS.

LUNARIA, HONESTY, in botany, a genus of the *tetradynamia-ſiliculoſa* claſs of plants; the corolla whereof conſiſts of four cruciform, entire, obtuſe, large petals of the length of the cup, and ending in ungues of the ſame length; the fruit conſiſts of an elliptic, plano-compreſſed, erect, and very large pod, ſtanding upon a pedicle, terminated by a ſtyle, conſiſting of two valves, and containing two cells; the ſeeds are few, kidney-ſhaped, compreſſed, marginated, and placed in the middle of the pod.

This plant is famous in ſome parts of the kingdom for its medicinal virtues, though it has not the fortune to be received in the ſhops. The people in the northern countries dry the whole plant in the oven, and give as much as will lie on a ſhilling for a doſe, twice a day, in hæmorrhages of all kinds, particularly in the too abundant flowing of the menſes, and this with great ſucceſs. The Welſh, among whom it is not uncommon, Dr. Needham informs us, make an ointment of it, which they uſe externally, and pretend it cures dyſenteries.

LUTEOLA, in botany, the name whereby ſome authors call the reſeda of Linnæus. See the article RESEDA.

LYON, or LION, *king at arms*. See the articles KING *at arms* and COLLEGE *of heralds*.

M.

MACHLIS, or ACHLIS, in zoology, the rein-deer. See the article REIN-DEER.

MACROCERCI, in zoology, a name given to that claſs of animalcules, with tails longer than their bodies. See the article ANIMALCULE.

MACROPYRENIUM, in natural hiſtory, a genus of foſſils, conſiſting of cruſtated ſeptariæ, with a long nucleus ſtanding out at each end of the maſs. See the article SEPTARIÆ.

Of this genus there is only one known ſpecies. This is one of the moſt ſingular and extraordinary bodies of the mineral kingdom: it is of a cloſe, compact, and firm texture, of a very rugged and unequal ſurface, ever of a determinate and very ſingular ſhape, which is an oblong and cylindric figure: in ſize, it is one of the moſt determinate and regular of all the native foſſils: its length is between ſeven and eight inches, and its diameter, in the center or thickeſt part, three inches; when broken, we find it compoſed of a central nucleus, of a ferrugineous colour, naturally hollow, but commonly filled up with an earthy matter; this is incloſed in a thin cruſt of a browniſh matter, of almoſt equal hardneſs; theſe are ſurrounded with a ſingle, double, or, in ſome ſpecimens, a triple circular ſeptum, of an elegant columnar ſpar, which is again environed by two thick cruſts of a browniſh matter of the kind of the reſt of the ſeptariæ; this makes the body of the maſs, and is divided by four or five other ſepta, parting like rays from the circular

one, and making ſtraight towards the circumference of the ſtone; and the whole of this is ſurrounded with a rugged and unequal, white, browniſh coat of about one third of an inch in diameter; the cavity of the central nucleus is of half an inch diameter, and the nucleus itſelf is a very heavy body, of great hardneſs, and capable of a fine poliſh.

MACROTELOSTYLA, in natural hiſtory, a name of a genus of cryſtals, which are compoſed of two pyramids, joined to the end of a column; both the pyramids, as alſo the column, being hexangular, and the whole body conſequently compoſed of eighteen planes. See the article CRYSTAL.

MAGNITUDE. (*Dict.*) Mr. Mac Laurin obſerves, that geometrical magnitudes may be uſefully conſidered as generated or produced by motion. Thus, lines may be conceived as generated by the motion of points; ſurfaces, by the motion of lines; ſolids, by the motion of ſurfaces; angles may be ſuppoſed to be generated by the rotation of their ſides. Geometrical magnitude is always underſtood to conſiſt of parts; and to have no parts, or to have no magnitude, are conſidered as equivalent in this ſcience. There is, however, no neceſſity for conſidering magnitude as made up of an infinite number of ſmall parts; it is ſufficient that no quantity can be ſuppoſed to be ſo ſmall, but it may be conceived to be farther diminiſhed; and it is obvious, that we are not to eſtimate the number of parts that may be conceived in a given magnitude, by thoſe which, in particular determinate circumſtances, may be actually perceived in it by ſenſe, ſince a greater number of parts become ſenſible, by varying the circumſtances in which it is perceived.

For the different magnitudes of the fixed ſtars, ſee the article STAR.

MAGPY, in ornithology, a ſpecies of corvus, with a cuneiform tail. See the article CORVUS.

This is a very well-known bird, and when in full feather, and in its wild ſtate, has a great deal of beauty; the ſize is about that of the jack-daw; but its variegated wings and length of tail make it ſeem longer.

MANIS, the SCALY LIZARD, in zoology, a genus of quadrupeds, of the order of the agriæ; the body of which is covered with a kind of ſcales, and it has no ears: there is but one known ſpecies of this genus, which has been confounded with the lizards: this is an animal of great beauty, and perhaps one of the moſt ſingular in the world; its aſpect has a great ſhew of terror, but it is the moſt inoffenſive creature imaginable: its form is ſomewhat like the lizard: it is about four feet in length, and its body, in the broadeſt part, which is towards the hinder legs, is about ten inches in breadth; it is of a rounded figure on the back; the legs are ſhort, and ſtand about a foot diſtance; the reſt of the creature, from the hinder part to the extremity, is a tail, broad, thin, and between two and three feet in length; it is not connected to the hinder-part of the body, but is continuous with it: the whole upper ſurface of this creature, the back, and the outſides of the legs are covered with an armature of ſcales; the belly and inſides of the legs are naked; the ſcales are of a firm ſubſtance, and have very much the appearance of tortoiſe-ſhell; they are on the body two inches in length, and more than an inch in breadth, of an oval figure, and each terminating in a kind of ſpine; the head is ſmall, of a conic figure, about three inches in diameter at the baſe, and thence gradually growing ſmaller to the ſnout, which is ſharp and naked; the head is covered with the ſame ſort of ſcales with that of the body, only they are ſmaller; there are no teeth in the mouth, but the tongue is ten inches or more in length; the whole creature is of a brown colour; the ſtriated parts of the ſcales is of a red, duſky brown; the the ſmooth, poliſhed part has an admixture of yellow; the ſides of the body, and thoſe of the tail, are of a ſerrated form, the ſcales terminating one over another at ſome diſtance; the legs are robuſt, and the claws very ſtrong and thick; it is a native of the Eaſt-Indies and South America, lives in the woods, and feeds on inſects, as the ant-bear does, thruſting out its tongue till covered with them, and then drawing it in loaded with the food.

MARBLE. (*Dict.*) *Colouring of* MARBLE. The colouring of marbles is a nice art, and in order to ſucceed in it, the pieces of marble, on which the experiments are tried, muſt be well poliſhed, and clear from the leaſt ſpot or vein. The harder the marble is, the better it will bear the heat neceſſary in the operation; therefore

alabaſter, and the common ſoft, white marble, are very improper to perform theſe operations upon.

Heat is always neceſſary for the opening the pores of the marble, ſo as to render it fit to receive the the colours; but it muſt never be made red hot, for then the texture of the marble itſelf is injured, and the colours are burnt, and loſe their beauty. Too ſmall a degree of heat is as bad as too great; for, in this caſe, though the marble receive the colour, it will not be fixed in it, nor ſtrike deep enough. Some colours will ſtrike, even cold, but they are never ſo well ſunk in as when a juſt degree of heat is uſed. The proper degree is that which, without making the marble red, will make the liquor boil upon its ſurface. The menſtruums uſed to ſtrike in the colours muſt be varied according to the nature of the colour to be uſed. A lixivium made with horſe's or dog's urine, with four parts quick-lime, and one part pot-aſhes, is excellent for ſome colours; common lye of wood-aſhes does very well for others: for ſome, ſpirit of wine is beſt; and finally, for others, oily liquors, or common white-wine.

The colours which have been found to ſucceed beſt with the peculiar menſtruums, are theſe: Stone-blue diſſolved in ſix times the quantity of ſpirit of wine, or of the urinous lixivium; and that colour which the painters call litmouſe, diſſolved in common lye of wood-aſhes. An extract of ſaffron, and that colour made of buckthorn-berries, and called by the painters ſap-green, both ſucceed well diſſolved in urine and quick-lime, and tolerably well in ſpirit of wine. Vermillion, and a fine powder of cochineal, ſucceed alſo very well in the ſame liquors. Dragon's blood ſucceeds very well in ſpirit of wine, as does alſo a tincture of logwood in the ſame ſpirit. Alkanet-root gives a fine colour, but the only menſtruum to be uſed for this is oil of turpentine; for neither ſpirit of wine, nor any lixivium, will do with it. There is another kind of ſanguis draconis, called dragon's blood in tears, which, mixed with urine alone, gives a very elegant colour. Beſide theſe mixtures of colours and menſtruums, there are ſome colours which are to be laid on dry and unmixed. Theſe are dragon's blood, of the pureſt kind, for a red; gamboge for a yellow; green wax for a green; common brimſtone, pitch and turpentine for a brown colour.

The marble, for theſe experiments, muſt be made conſiderably hot, and then the colours are to be rubbed on dry in the lump. Some of theſe colours, when once given, remain immutable; others are eaſily changed or deſtroyed. Thus the red colour given by dragon's blood, or by a decoction of logwood, will be wholly taken away by oil of tartar, and the poliſh of the marble not hurt by it.

A fine gold-colour is given in the following manner: Take crude ſal armoniac, vitriol and verdegreaſe, of each equal quantities; white vitriol ſucceeds beſt, and all muſt be thoroughly mixed in fine powder.

The ſtaining of marble to all the degrees of red or yellow, by ſolutions of dragon's blood or gamboge, may be done by reducing theſe gums to powder, and grinding them, with the ſpirit of wine, in a glaſs mortar; but for ſmaller attempts, no method is ſo good as the mixing a little of either of theſe powders with ſpirit of wine in a ſilver-ſpoon, and holding it over burning charcoal. By this means a fine tincture will be extracted, and with a pencil dipped in this, the fineſt traces may be made on the marble, while cold, which, on the heating it afterwards, either on ſand, or in a baker's oven, will all ſink very deep, and remain perfectly diſtinct in the ſtone.

It is very eaſy to make the ground-colour of the marble red or yellow by this means, and leave white veins in it. This is to be done by covering the places where the whiteneſs is to remain with ſome white paint, or even with two or three doubles only of paper, either of which will prevent the colour from penetrating in that part. All the degrees of red are to be given to marble by means of this gum alone; a ſlight tincture of it, without the aſſiſtance of heat to the marble, gives only a pale fleſh colour, but the ſtronger tinctures give it yet deeper; to this the aſſiſtance of heat adds yet greatly; and finally, the addition of a little pitch to the tincture gives it a tendency to blackneſs, or any degree of deep red that is deſired.

A blue colour may be given alſo to marble by diſſolving turnſol in a lixivium of lime and urine, or in the volatile ſpirit of urine; but this has always a tendency to purple, whether made by the one or the other of theſe ways. A better blue, and uſed in an eaſier manner, is furniſhed by the canary-turnſol, a ſubſtance well

known

known among the dyers: this needs only to be diſſolved in water, and drawn on the place with a pencil; this penetrates very deep into the marble, and the colour may be increaſed by drawing the pencil wetted afreſh ſeveral times over the ſame lines. This colour is ſubject to ſpread and diffuſe itſelf irregularly; but it may be kept in regular bounds, by circumſcribing its lines with beds of wax, or any other ſuch ſubſtance.

MARTES, the MARTIN, in zoology. See the article MARTIN.

MASTER. (*Dict.*) *Quarter*-MASTER. See the article QUARTER.

MEAN. (*Dict.*) MEAN ANOMALY, in aſtronomy. See the article ANOMALY.

MEAN { CONJUNCTION, / OPPOSITION, } in aſtronomy, is when the mean place of the ſun is in { conjunction, / oppoſition, } with the the mean place of the moon in the ecliptic. See the articles CONJUNCTION and OPPOSITION.

MEAN *diſtance of a planet from the ſun*, in aſtronomy, is the right line drawn from the ſun, to the extremity of the conjugate axis of the ellipſis the planet moves in; and this is equal to the ſemitranſverſe axis, and is ſo called, becauſe it is a mean between the planet's greateſt and leaſt diſtance from the ſun. See DISTANCE.

MEAN MOTION, in aſtronomy, that motion by a planet is ſuppoſed to move equally in its orbit, and is always proportional to the time. See the article MOTION.

MEDAL. (*Dict.*) *Impreſſions of* MEDALS. A very eaſy and elegant way of taking the impreſſions of medals and coins, not generally known, is thus directed by Dr. Shaw: Melt a little iſinglaſs-glue made with brandy, and pour it thinly over the medal, ſo as to cover its whole ſurface; let it remain on for a day or two, till it is thoroughly dry and hardened, and then taking it off, it will be fine, clear, and hard, as a piece of muſcovy-glaſs, and will have a very elegant impreſſion of the coin.

Another eaſy method is as follows: Take a perfect and ſharp impreſſion in the fineſt black ſealing-wax, of the coin or medal you deſire. Cut away the wax round the edges of the impreſſion; then with a preparation of gum-water, of the colour you would have the picture, ſpread the paint upon the wax-impreſſion with a ſmall hair-pencil, obſerving to work it into all the ſinking or hollow places, theſe being the riſing parts of the medal; and the colouring muſt be carefully taken from the other parts with a wet finger. Then take a piece of very thin poſt-paper, a little larger than the medal, and moiſten it quite through. Place it on the wax-impreſſion, and on the back of the paper lay three or four pieces of thick woollen cloth or flannel, of about the ſame ſize. The impreſſion, with its coverings, ſhould be placed between two ſmooth iron plates, about two inches ſquare, and one tenth of an inch thick. Theſe muſt be carefully put into a ſmall preſs, made of two plates of iron, about five inches and a half long, one inch and a half wide, and half an inch in thickneſs, having a couple of long male ſcrews running thro' them, with a turning female ſcrew on each, to force the plates together. Theſe being brought evenly together, by means of the ſcrews, will take off a true and fair picture of the medal; which, if any deficiences ſhould appear, may eaſily be repaired with a hair-pencil, or pen, dipped in the colour made uſe of.

If a relievo only be deſired, nothing is neceſſary, but to take a piece of card, or white paſte-board, well ſoaked in water, then placing it on the wax-mould, without any colouring, and letting it remain in the preſs for a few minutes, a good figure will be obtained.

This method of taking off medals, *&c.* is convenient, and ſeems much more ſo than the ſeveral inventions uſually practiſed in ſulphur, plaſter of Paris, paper, *&c.* wherein a mould muſt be formed, either of clay, horn, plaſter, or other materials, which requires a good deal of time and trouble.

MEDICINES. (*Dict.*) *Mechanical operation of* MEDICINES. To account for the operations of medicines mechanically, ſeems to have been the favourite ſcheme of phyſicians and phyſiologers of the laſt and preſent century. Stahl and his diſciples reject theſe accounts, and think them ſufficiently refuted by the operation of opium, and of aſtringents. One grain of opium, properly taken, will, for a time, aſſuage pains all over the body. A very few grains of crocus martis aſtringens ſometimes ſtop an hæmoptyſis, before they can be ſuppoſed to have entered into the humours of the body. Is it not paſt all belief, ſay they, that ſo few grains, mixed with ſo many pounds of fluids, ſhould retain any mechanical force, eſpecially as it is well known, that aſtringents loſe their force

by

by dilution. They farther urge, that the various effects of the ſame medicine are a refutation of the mechanical hypotheſis; thus emetics ſometimes purge, and *vice verſa*; aſtringents encreaſe hæmorrhages; opium excites alacrity in ſome, inſtead of ſtupifying. Again, the ſight, or even bare imagination of ſome medicines, will produce a ſenſible effect on the body, without any contact. Stahl and his followers therefore hold, that medicines operate chiefly by exciting the vital ſenſe; and that this is the chief effect of medicines, even where they ſeem moſt to act mechanically.

Hoffman, Heiſter, and others, have attacked the hypotheſis of Stahl. We ſhall not pretend to give any farther account of the controverſy. Perhaps in this, as in others, there may be a good deal of logomachy. Strictly ſpeaking, mechanical principles muſt be inſufficient to account for the operation of medicines, as this ſometimes undoubtedly depends (in the primæ viæ at leaſt) on chemical principles; and no body has hitherto been able to account mechanically for the phænomena of chemiſtry. The laws of the minima naturæ have not hitherto been reduced to thoſe of the preſſure and impulſe of large ſenſible maſſes. And perhaps when the laws, that obtain in the minute parts of matter, have been found, we ſhall ſtill be at a loſs to account for all the phænomena of animated bodies, particularly the human.

MELINUM, in natural hiſtory, the name of an earth, famous in the earlieſt ages of painting, being the only white of the great painters of antiquity; and, according to Pliny's account, one of the three colours with which alone they performed all their works. It is a fine, white, marly earth, of a very compact texture, yet remarkably light; a ſort of texture which muſt render any earth fit for the painter's uſe, that is of a proper colour. It is frequently found forming a ſtratum in the earth, lying immediately under the vegetable mould. It is of a very ſmooth, but not gloſſy ſurface, is very ſoft to the touch, adheres firmly to the tongue, is eaſily broken between the fingers, and ſtains the ſkin in handling. It melts readily in the mouth, and is perfectly fine, leaving not the leaſt grittineſs between the teeth. Thrown into water, it makes a great bubbling and loud hiſſing noiſe, and moulders away into a fine powder. It does not ferment with acids, and ſuffers no change in the fire. Theſe are the characters by which the melinum of the antients is diſtinguiſhed from all the other white earths. It is ſtill found in the ſame place from whence the painters of old had it, which is that from whence it has its name, the iſland of Milo, called Melos by the Greeks, and is common in moſt of the adjacent iſlands. It has been of late tried here as a paint, and is found not to make ſo bright a white as the other ſubſtances now in uſe among the painters, but ſeems not liable, like them, to turn yellow; and if ſo, would be worth the conſideration of perſons in the colour trade, eſpecially as it may be had in any quantities for carriage.

MELITENSIS TERRA, *earth of Malta*, in the materia medica, an earth of which there are two very different kinds, the one of the genus of the boles, the other of the marles. The latter is that known by medicinal authors under this name; the former is the Malta earth now in uſe: but both being brought from the ſame place, are confuſedly called by the ſame name. The malteſe marle, which is the terra melitenſis of medicinal authors, is a looſe, crumbly, and very light earth, of an unequal and irregular texture, and when expoſed to the weather, ſoon falls into fine ſoft powder; but when preſerved and dried, it becomes a looſe, light maſs, of a dirty white colour, with a greyiſh caſt: it is rough to the touch, adheres firmly to the tongue, is very eaſily crumbled to powder between the fingers, and ſtains the hands. Thrown into water it ſwells, and afterwards moulders away into a fine powder. It ferments very violently with acid menſtruums.

Both kinds are found in great abundance in the iſland of Malta, and the latter has been much eſteemed as a remedy againſt the bites of venomous animals, but with how much juſtice we cannot ſay. The other has ſupplied its place in the german ſhops, and is uſed there as a cordial, a ſudorific, and aſtringent. See BOLE.

MELOE, the OIL-BEETLE, in zoology, a genus of inſects, of the order of the coleoptera; the antennæ of which are ſlender and filiform; the exterior wings are dimidiated, and there are no interior ones. See INSECT and SCARABÆUS.

MELOTHRIA, in botany, a genus of the *triandria-monogynia* claſs of plants, the corolla whereof is compoſed of a ſingle rotated petal; the tube is of the length

length of the cup, and every where grows to it; the limb is plane, and is divided into five very obtuſe ſegments, broadeſt towards the edge; the fruit is an oval, oblong body, divided within into three parts, and containing a number of oblong, compreſſed ſeeds.

In Canada, Virginia, and Jamaica, where this fruit commonly grows, it is pickled for the table.

MELTING-CONE, in aſſaying, is defined by Cramer to be a ſmall veſſel made of copper or braſs, of a conic figure, and of a nicely poliſhed ſurface within; the uſe of which is to receive melted metals, and ſerve for their precipitation, which is effected, when two bodies melted together, and yet not mixing perfectly with one another in the fuſion, ſeparate in the cooling into two ſtrata, on account of their different ſpecific gravity. See the article PRECIPITATION.

This precipitation might be made in the ſame veſſel in which the fuſion is performed; but then the melting-pot or crucible muſt be broken every time to get it out, whereas the conic ſhape, and poliſhed ſurface of this veſſel, makes it eaſily got out without any violence. The ſhape of this veſſel is alſo of another uſe in the operation; for, by means of it, the heavy matter, ſubſiding to a point, is formed into a perfect and ſeparate regulus, even where the whole quantity, as is very frequently the caſe, has been but very ſmall. When the quantity of the melted matter is great, it is common to uſe, inſtead of this cone, a large braſs or iron-mortar, or any other conveniently ſhaped braſs or iron-veſſel. It is neceſſary, when the cone is of braſs, to be cautious that it be not made too hot; for the brittleneſs of that metal, when hot, makes it eaſily break, on the ſtriking with any force on that occaſion, to make the melted maſs fall out.

Theſe, and all other moulds for the receiving melted metals, muſt always be well heated before the maſs is poured into them, leſt they ſhould have contracted a moiſture from the air, or have been wetted by accident; in which caſe the melted metal will be thrown out of them with great violence and danger. They ought alſo to be ſmeared over with tallow on their inſide, that the regulus may be the more eaſily taken out of them, and the ſurface of the mould not corroded by the melted maſs poured in. If a very large quantity of a metal is, however, to be received into them, and eſpecially, if any thing ſulphureous have place among it, this caution of tallowing the moulds does not prove ſufficient; for the large quantity of the maſs makes it continue hot ſo long, that this becomes but a ſlight defence to the ſurface of the mould. In this caſe the aſſayer has recourſe to a lute, reduced to a thin pap with water, which being applied in form of a very thin cruſt, all over the inſide of the cone, or mould, ſoon dries up indeed, but always preſerves the ſides of the veſſel from the corroſion of the maſs.

MEMBER, in architecture, denotes any part of a building; as, a frieze, corniche, or the like. This word is alſo ſometimes uſed for the moulding. See the article MOULDING.

MEMBER, in grammar, is applied to the parts of a period or ſentence. See the articles PERIOD, SENTENCE, &c.

MEMBERS, in anatomy, the exterior parts ariſing from the trunk or body of an animal.

MEMBERED, or MEMBRED, in heraldry, is where the legs or feet of an eagle, griffin, or other bird, are of a different colour from the reſt of the body.

MENISPERMUM, VIRGINIAN IVY, in botany, a genus of the *hexandria-trigynia* claſs of plants, the corolla whereof conſiſts of ſix ovato-oblong, obtuſe, hollow, erecto-patent petals; the fruit is compoſed of three oval berries, each containing a ſingle cell, and in it a large, ſingle, lunated, compreſſed ſeed.

It is to be obſerved, that the parts of fructification vary extremely in this genus.

MERGANSER, in ornithology, a ſpecies of mergus. See the article MERGUS.

MESEMBRYANTHEMUM, in botany, a genus of the *polyandria-pentagynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, with a multitude of petals of a lanceolated, narrow figure, formed into ſeveral ſeries a little longer than the cup, and cohering juſt at the baſe by their ungues; the fruit is a fleſhy, roundiſh capſule, with a radiated umbilicus, and with a number of cells equal to that of the ſtyles; the ſeeds are numerous and roundiſh. The number of ſtyles is ſometimes ten, and ſometimes they, and the ſegments of the calyx, are only four.

This genus comprehends the ice-plant, and the flowering-kali.

MESOPTERYGIOUS, in ichthyology, a term applied to ſuch fiſhes as have only one back fin, and that ſituated in the middle

middle of the back. See the article ICHTHYOLOGY.

MESSENGERS. (*Dict.*) MESSENGERS *at arms*, in the ſcottiſh polity, officers whoſe buſineſs it is to execute ſummons and letters of diligence for civil debt, real or perſonal; thus called from the impreſs of the king's arms on their blazon, being a piece of braſs or ſilver fixed upon the meſſenger's breaſt, to diſcover his warrant and authority, when he diſcharges the duty of his office; and the reſiſting him therein, is a crime, in the law of Scotland, called deforcement. See the article DEFORCEMENT.

The meſſengers at arms, of whom there are a great number, are among the officers under the lyon, who, together with his brethren the heralds, is the judge of the malverſation of meſſengers. See COLLEGE *of Heralds*, KING *at Arms*, &c.

MESUA, in botany, a genus of the *polyandria-monogynia* claſs of plants, the corolla whereof conſiſts of four large, hollow, rounded petals; the fruit is a coriaceous capſule, of a roundiſh, acuminated figure, formed of four valves, and marked with as many elate ſutures running longitudinally; the ſeeds are four, large and fleſhy, of a turbinated, triquetrous and obtuſe form.

METACARPUS, in anatomy, that part of the hand between the wriſt and the fingers. See HAND and WRIST.

The metacarpus conſiſts of four bones, which anſwer to the four fingers, whereof that which ſuſtains the fore-finger is the biggeſt and longeſt. They are all round and long, a little convex towards the back of the hand, and concave and plain towards the palm. They are hollow in the middle, and full of marrow; they touch one another only at their extremities, having ſpaces in the middle, in which lie the muſculi interoſſei. See INTEROSSEUS.

In their upper end there is a ſinus, which receives the bones of the wriſt; their lower extremity is round, and is received into the ſinus of the firſt bones of the fingers. See FINGER.

The inner part of the metacarpus is called the palm, and the other the back of the hand. See PALM.

For fractures and luxations of the metacarpus, ſee HAND, WRIST, FRACTURE, and LUXATION.

METACARPUS, ſignifies, alſo, a ſmall, very fleſhy muſcle, ſituated obliquely between the large internal annular or tranſverſe ligament of the carpus, and the whole inſide of the fourth metacarpal bone.

It is fixed by a ſmall, ſhort tendon to the os orbiculare, and to the neighbouring part of the large ligament of the carpus. From thence its fibres run more or leſs obliquely, towards the inſide of the fourth metacarpal bone; the fibres of this muſcle are of unequal lengths, and extend all the way to the articulation of the firſt phalanx of the little finger with the fourth metacarpal bone, but have no manner of relation to that finger. This muſcle ſerves to turn the fourth bone of the metacarpus towards the thumb, and at the ſame time to increaſe the convexity of the back of the hand, which is called making Diogenes's cup. The fourth bone, thus moved, carries the third along with it, by reaſon of their connexion, which ſtill augments the hollow on one ſide, and the convexity on the other.

METALLIC, or METALLINE, an adjective applied to ſomething that bears a relation to metals. See METAL and METALLURGY.

METHODISTS, a name at firſt given to a ſociety of religious young men at Oxford, and now applied to all thoſe who adhere to the doctrine of the church of England as taught by Whitefield, Weſley, *&c.* They are ſaid to be, in general, plain well-meaning people, who do not diſſent from the eſtabliſhed church; but profeſs to live with great purity, according to her articles. At their firſt appearance their teachers were charged, in the heat of their zeal, with ſeveral irregularities, and many expreſſions in their preaching which were not altogether unexceptionable; but as the civil government, with a moderation and wiſdom peculiar to the preſent time, thought fit to overlook their behaviour, they have ſince honeſtly acknowledged wherein they were miſtaken; and, in conſequence of the perfect liberty of conſcience they enjoy, have ſubſided into a more regular and peaceable conduct, agreeable to the genuine ſpirit of chriſtianity.

METHODISTS, *Methodici*, is alſo an appellation given a ſect of antient phyſicians, who reduced the whole healing art to a few common principles or appearances. See PHYSICIANS.

They were alſo called Theſſalici, as being the followers of Theſſalus. Galen ſtrenuouſly oppoſed them, and ſcrupled

not

not to affert that the methodical hereby ruined every thing good in the art of phyfic.

METHODISTS, among botanifts, Linnæus defines to be thofe perfons who have attempted the ftudy of botany upon certain principles, and have beftowed their labours upon the difpofition and arrangement of plants, and allotting them proper and diftinctive names.

MIDAS-EAR-SHELL, the fmooth ovato-oblong buccinum, with an oblong and very narrow mouth. It confifts of fix volutions, but the lower one alone makes up almoft the whole fhell. See BUCCINUM.

MILDEW, *rubigo*, a difeafe happening to plants, caufed by a dewy moifture, fuppofed by fome to be a fpecies of blight, though others make them very different. See BLIGHT.

The mildew, properly fo called, fometimes refts upon the leaves of trees in form of a fatty juice, and fometimes on the ears of corn; it is tough and vifcous to the touch, and the fun's heat drying it up, it becomes yet more vifcous and hard, and fo daubs over the young grains in the ear, that they can never after expand themfelves properly, nor grow to their due fize or weight. Bearded wheat is lefs fubject to the mildew, than the common fort; and it is obferved, that newly dunged lands are more fubject to the mildew, than others. The moft happy remedy for this is out of the farmer's power, but often happens naturally; this is a fmart fhower of rain, and immediately afterwards a brifk wind. This wholly difperfes it.

If the mildew is feen before the fun has any power, it has been recommended by many, to fend two men into the field with a long cord, each holding one end, and drawing this along through the ears, the dew will be diflodged from them before the fun's heat is able to dry it to that vifcous ftate in which it does the mifchief. Some alfo fay, that lands which have for many years been fubject to mildews, have been cured of it by fowing foot with the corn, or immediately after it.

MILK. (*Dict.*) MILK of *fulphur*. See SULPHUR.

MILL. (*Dict.*) MILL *for iron-work*. See the article SMITHERY.

Tanning-MILL. See TANNING-MILL.

MITRE-SHELL, the fmooth and flender buccinum, with a fplit roftrum. See BUCCINUM.

MOLE-CRICKET, the fame with the gryllo-talpa. See GRYLLO TALPA.

MOLYBDIA, in natural hiftory, the name of a genus of cryftals, of a cubic form, or compofed of fix faces, at right angles, like a die. See the article CRYSTAL.

Of this genus there are three known fpecies. 1. A colourlefs one, compofed of extremely fine cruits. This is found in many parts, both of this and other kingdoms, where there are lead-mines; and tho' naturally colourlefs, is fometimes tinged with a red, green, or blue. 2. A dull one with thicker cruits, fometimes whitifh, and fometimes coloured to a yellowifh or other hue. This is found in the lead-mines of Yorkfhire, and fome other places. And 3. A dull-bluifh white one, with very thick cruits. This is very frequent in the lead-mines in Derbyfhire, and is generally found in large clufters.

MONK. (*Dict.*) MONK-FISH, *fquatina*. See SQUATINA.

MORAVIANS, a fect of proteftants, who have been fettled for a confiderable time paft at Hernhuth in Germany, and have of late years fpread themfelves over moft of our American colonies, as well as in feveral parts of England, where they are permitted to fettle by a late act of parliament. They have a kind of church-government peculiar to themfelves, and are commonly known by the name of *Unitas Fratrum*, or *The Brethren*. They profefs the utmoft veneration for our bleffed Saviour, whom they conlider as their immediate Head and Director, enjoin the moft implicit obedience to the rulers of their church, and are faid to practice much brotherly love amongft one another. In fhort, they feem to be a meek, peaceable, and induftrious kind of people. They have nevertheleis been lately accufed of feveral erroneous principles and practices, to which accufations they have either been totally filent, or given partial and unfatisfactory anfwers: but as thefe may proceed more from the weaknefs and enthufiafm of particular members than the conftitution of their church itfelf, they perhaps think themfelves lefs obliged to take notice of them. It were to be wifhed, however, that they would publifh fuch a plain and diftinct account of their œconomy both in civil and religious matters, as might effectually clear them of all fufpicion of aiming at any thing inconfiftent with the

principles of the pureſt profeſſors of chriſtianity.

MORDELLA, in zoology, a genus of the coleoptera claſs of inſects, the antennæ whereof are ſlender, and have the laſt joint globoſe; moſt of the ſpecies have alſo legs, which ſerve them for leaping.

MORGAY, in ichthyology, the ſqualus with a variegated back, and with the belly-fins concreted. See SQUALUS.

The head of this ſpecies is large, and of a depreſſed form; the eyes are large, and ſtand pretty high on the ſides of the head; the noſtrils are very conſpicuous, they have each a double aperture; the mouth is on the under part of the roſtrum, and opens tranſverſely; the apertures of the gills are five, oblique, or nearly tranſverſe openings on each ſide below the heads, and reaching to the pectoral fins.

MORMYLUS, in ichthyology, the ſparus with the upper jaw longeſt, and with twelve parallel tranſverſe black lines on each ſide. See SPARUS.

MOSCHATELLINA, the *tuberous moſchatel*, in botany, Tournefort's name for the adoxa of Linnæus, a genus of the *octandria-tetragynia* claſs of plants, the corolla whereof is plain, and conſiſts of a ſingle petal, divided into four oval, acute ſegments, longer than the cup; the fruit is a globoſe berry, ſituated between the calyx and corolla; the calyx adheres to its under part; the berry is umbilicated, and contains four cells; the ſeeds are ſingle and compreſſed. This is the fructification of the terminatory flower; the lateral ones all add a fifth to the number of the parts.

MOSCHUS, the MUSK-ANIMAL, a genus of quadrupeds of the order of the pecora, having no horns; the canine teeth of the upper jaw are exerted. Of this genus there is only one known ſpecies, which is the animal that produces the perfume from which it is named. See MUSK.

This creature when full grown is three feet in length, from the tip of the noſe to the rump; the head is oblong, and the anterior part much like the greyhound; the ears are large and erect, they reſemble thoſe of the rabbit, and are equal in length to the diameter of the forehead; the tail is not more than two inches in length, and the creature always carries it erect; the body is tolerably fleſhy, and rounded; the legs about a foot in length, and very robuſt; the feet deeply divided, each into two claws in the anterior part, and as many heels behind. The fur on the head and that on the legs is about half an inch long, that on the belly is an inch and a half, and that which grows on the back three inches; theſe hairs are thicker than in any other known animal, and are variegated, from the baſe to the extremity, with diſtinct ſpaces of brown and white: the veſſel or bag in which the perfume called muſk is contained, is three inches long and two broad, and hangs under the belly, protuberating near three quarters of an inch beyond the ſurface.

MULCH, a term uſed by gardeners for rotten dung, or the like, thrown upon beds of young plants, to preſerve them from the bad effects of cold or drought.

MULTIVALVES, in natural hiſtory, the name of a general claſs of ſhell-fiſh diſtinguiſhed from the univalves, which conſiſt of only one ſhell, and the bivalves, which conſiſt of two, by their conſiſting of three or more ſhells. See SHELL, UNIVALVES, and BIVALVES.

Of theſe there are much fewer ſpecies, than either of the univalve or bivalve claſs. A late accurate French author has ranked all the ſpecies under ſix genera, which are theſe: 1. The *echini* or ſea-eggs. 2. The *vermiculi* or ſea-worms. 3. *Balani* or center-ſhells. 4. The *pollipicides* or thumb-ſhells. 5. The *conchæ anatiferæ* or gooſe-ſhells. And 6. The *pholades*.

MUNTINGIA, in botany, a genus of the *polyandria-monogynia* claſs of plants, the corolla whereof conſiſts of five roundiſh petals, of the length of the cup; they are patent, and are inſerted in the cup; the fruit is a round unilocular berry, umbilicated with the ſtigma; the ſeeds are numerous, roundiſh, and ſmall.

MURÆNA, in ichthyology, a genus of the malacopterigious claſs of fiſhes, the body of which is long, ſlender, and rounded; or ſubcylindric in ſome ſpecies: the fins are three, in others they are four, and in ſome again there is only one; at the very extremity of the roſtrum there are two ſhort tubes or foramina, one on each ſide, and theſe are the anterior apertures of the noſtrils; the branchioſtege membrane on each ſide contains ten ſlender and crooked bones, but the ſkin of the fleſh is thick and firm; ſo that till it is taken off, they are not eaſily diſcovered.

This

This genus contains the common eel, and the conger or ſea-eel. See EEL.

The other ſpecies of this genus are the ſea-ſerpent, the flat-tailed ſea-ſerpent, the ſpotted ſea-ſerpent, and the muræna ſimply ſo called. The ſea-ſerpent is the cylindric muræna, with the tail naked and acute, and has vaſtly the appearance of the ſerpent kind; it grows to five feet in length, and to the thickneſs of a man's wriſt; the head is ſmall and the roſtrum acute, but the opening of the mouth is very large, and furniſhed with a vaſt number of very ſharp and ſtrong teeth, of unequal ſizes; the eyes are ſmall, their iris of a gold-yellow, and the pupil round and black; the pectoral fins ſtand juſt at the opening of the gills, are very ſmall, and have each ſixteen rays.

The flat-headed ſea-ſerpent is the muræna, with the ſnout ſharp and ſpotted with white, and with the edge of the back-fin black; this has much the general reſemblance of the common eel, it grows to between three and four feet in length, and as thick as a man's wriſt.

The ſpotted ſea-ſerpent is the ſlender ſpotted muræna, with a pointed naked tail, growing to four feet in length, and not thicker than an eel of but two and a half. The muræna ſimply ſo called, is that with no pectoral fins, being a ſingular ſpecies, having only one fin, which is the pinna dorſi, ſurrounding the tail and running up to the anus; it grows to two feet in length, and to the thickneſs of an eel of the ſame length.

MUSCOVY-GLASS, in natural hiſtory, the white ſhining ſpecularis with large and broad leaves, otherwiſe called iſing-glaſs. See SPECULARIS.

MUSK. (*Dict.*) MUSK-HOG, *tajacu*. See TAJACU.

MUSK-ANIMAL, *Moſchus*. See the article MOSCHUS.

MUSK-*ſeed*, in botany, the Engliſh name of that ſpecies of hibiſcus, called by botaniſts the abelmoſch. See HIBISCUS.

MUSTARD, *ſinapi*, in botany. See the article SINAPI.

MUSTELA, in zoology, a genus of quadrupeds of the order of the feræ, the upper foreteeth of which are ſtraight, diſtinct, and acute; the foreteeth of the lower jaw are obtuſe and cluſtered, two of them ſtand inward; the feet are made for climbing.

This genus comprehends the gulo, the martin, the pole-cat, the weaſel, the ferret, the ermin, the ſable, the genet, the tabbied mungo, and the brown mungo. See GULO, *&c.*

MUSTELA, or the FOSSILE MUSTELA, in ichthyology, is alſo the name of the blue cobitis, with five longitudinal black lines on each ſide. See the article COBITIS.

This is a ſpecies very ſingular in its manner of living, as well as in its figure; it is five inches long, and ſomewhat more than half an inch in diameter; the head is ſhort, broad, and obtuſe; the belly is ſmooth, and of a bluiſh colour, with ten longitudinal lines running down it, five on each ſide of the back; about the mouth are placed a number of whitiſh ſlender ciiri or beards; the pectoral fins have each eleven rays, the ventral ones five, the dorſal and the pinna ani ſeven. Where the ſhores are ſandy, it will work its way under the ſand to a great diſtance from the water, and is there dug up.

MYTULUS, the *muſcle*, in natural hiſtory. See MUSCLE.

N.

NAMUR-*marble*, a name given by our artificers to a ſpecies of black marble, which is very hard, and capable of a good poliſh, but has no variegations of any other colour. It is common in Italy, France, and Germany, and is the ſpecies called the lucullean marble by the Romans. See MARBLE.

NAPLES-YELLOW, the common name in the colour-ſhops of London, and among our painters, for the ochre called Giallolino. See GIALLOLINO.

NASTURTIUM, in botany, the ſame with the lepidium. See the article LEPIDIUM.

NASUS, in ichthyology, the cyprinus with a naſiform ſnout, and fourteen rays in the pinna ani. See CYPRINUS.

NECYDALIS, in zoology, a genus of the coleoptera claſs of inſects, the antennæ of which are ſetaceous; the exterior wings are dimidiated, and there are interior or membranaceous ones.

NEEDLE. (*Dict.*) NEEDLE-FISH, a ſpecies of ſyngnathus, with the middle of the body hexangular, and the tail pinnated. See SYNGNATHUS.

The males and females of this ſpecies, as well as of the ſea-adder, another ſpecies of the ſyngnathus, are eaſily diſtinguiſhed; the females carrying a kind of long bag, reaching from the anus halfway to the tail; there are numerous eggs in this, at the proper ſeaſon they are full, of the ſize of rape-ſeed, and of a whitiſh colour; they neither are ſo numerous, nor at all reſemble in their arrangement or diſpoſition the eggs of the generality of the other fiſhes of this claſs; this may indeed be in ſome degree ſaid to be viviparous, for the rudiment of the fœtus is in ſome meaſure animated before it is diſcharged from the veſica or bag.

NEEDLE-SHELL, in natural hiſtory, the ſlender turbo, with ventricoſe ſpires, and a ſmall round mouth. See TURBO.

NEPA. (*Dict.*) NEPA, the WATER SCORPION, in zoology, a genus of four winged inſects, the roſtrum whereof is inflected, the antennæ formed into a kind of claws; the wings cruciated, and the legs four in number. This is a large inſect, near an inch in length, and about half its length in breadth; its body is a kind of elliptic form, very flat and thin, and its tail long and pointed; the body is compoſed of ſeveral joints, and the anus is remarkably large.

NEPETA, the *tall white ſideritis*, or *catmint*, in botany, a genus of the *didynamia-gymnoſpermia* claſs of plants; the corolla whereof conſiſts of a ſingle ringent petal, the tube is cylindric and incurvated, and the limb dehiſcent; the faux is patent, cordated and terminating in two ſhort ſegments; the upper lip is erect, roundiſh and emarginated; the lower one is a roundiſh, concave, large, entire and ſerrated; there is no pericarpium, but the ſeeds, which are roundiſh, and four in number, are contained in the cup.

Catmint has been greatly recommended as an uterine and nervous medicine. The people in the country ſtill frequently uſe it in form of an infuſion for theſe purpoſes, but in the ſhops it is only kept as an ingredient in ſome compoſitions.

NEREIS, in the hiſtory of ſhell-fiſh, the ſame with the ſtomatia. See STOMATIA.

NEREIS, in the hiſtory of inſects, a genus of inſects of the order of the gymnarthria, the body of which is of a cylindric figure, and the tentacula four in number, but two of them are uſually very ſhort, and often ſcarce perceptible.

NERIUM, the ROSE-BAY, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle infundibuliform petal; the tube is cylindric, and ſhorter than the cup; the limb is very large and divided into five broad, obtuſe, oblique ſegments; the fruit conſiſts of two cylindric, acuminated, long, erect follicles, formed each of one valve, and opening longitudinally; the ſeeds are numerous, oblong, coronated with a downy matter, and placed in an imbricated manner.

NERVE. (*Dict.*) The antients found, that by cutting, tying or compreſſing any nerve, or any other way intercepting its communication with the brain, the parts to which it belonged were immediately deprived of all ſenſe and motion. One remarkable inſtance of this is, the making an animal dumb by tying the nerves near the wind-pipe. We read in Galen, of a boy who became quite dumb by having both the recurrent nerves divided. The experiment of cutting theſe nerves in brute animals, was repeated and confirmed by Veſalius; and Dr. Martin aſſures us, he tried it ſucceſsfully on a pig; nor did the animal recover its voice, as ſome have ſuſpected it might. As the voice depends on a proper aperture of the glottis, it ſeems likely that, when the recurrent nerves are cut, the glottis will always ſtand open, and be incapacitated from being ſhut at the will of the animal. An anonymous phyſician offers what he calls an experimentum crucis, in proof of the nerves being compoſed of cylindrical canals, containing a fluid: it is the demonſtration of the optic nerve inflated and dried, which appears canular to the naked eye. See the article EXPERIMENTUM CRUCIS.

Wounds of the NERVES. Upon the diviſion of a nerve, Heiſter obſerves, that the limb to which that nerve was extended becomes inſtantly rigid, void of ſenſation, and withers: ſo that it is no wonder that a man inſtantly expires, upon the diviſion of thoſe nerves which are ſent to the heart

or

or diaphragm: a wound alſo is attended with great danger where the nerve is only partially wounded, and not entirely divided; for the wounded fibres contract themſelves, and thoſe which remain undivided ſuffer too great an extenſion, which will bring on moſt violent pains, ſpaſms, convulſions, inflammations, and gangrenes, and ſometimes death itſelf.

NEUROPTERA, in the hiſtory of inſects, a name given to that claſs of inſects, which have membranaceous wings, with nerves and veins diſpoſed in a reliculated form in them.

NIGELLA, in botany, a genus of the *polyandria-pentagynia* claſs of plants; the corolla whereof conſiſts of five plane, oval, obtuſe, patent petals, narroweſt towards the baſe; the fruit conſiſts of as many capſules, as there were germina; which in ſome ſpecies are five, and in others ten, theſe capſules are oblong, compreſſed, acuminated, joined by an internal future, and open upwards and inwards; the ſeeds are numerous, angular and rough.

NIGHTINGALE, *luſcinia*, in ornithology, the browniſh-grey motacilla, with the annules of the knees grey. See the article MOTACILLA.

This bird is more eminent for the ſweetneſs of its note, than for its beauty; it is of the ſize of the linnet, but in ſhape it more reſembles the red-breaſt; the head is ſmall, the eyes are large, and their iris pale; the beak is duſky, ſlender, and moderately long; the head, neck and back are of a greyiſh-brown; the upper parts of the wings, and about the tail, have a tinge of reddiſh mixt with this; and the throat, breaſt and belly are of a pale whitiſh grey.

NIGHT-WALKERS, *Noctambuli*. See the article NOCTAMBULI.

NIGRICA FABRILIS, the ſame with plumbago. See PLUMBAGO.

NIPPLES. (*Dict.*) The nipples of women, in their firſt lying in, are frequently ſo ſmall, and ſunk into their breaſts, that the infant cannot get at them to ſuck its nouriſhment. Heiſter obſerves that the readieſt method in this caſe is to apply an infant ſomewhat older, and which can draw ſtronger; or, if this does not ſucceed, to let a woman who has been practiſed in the art, attempt to ſuck. When theſe do not ſucceed, it is common to have recourſe to a glaſs pipe, and the poorer people in ſome places uſually make a tobacco pipe ſerve the turn. Others apply a ſmall cucurbite made of ivory in the form of a hat, which they ſuck ſtrongly in their mouth. The common ſucking-glaſs is alſo, when properly applied, of very ſignal ſervice. To do this, the ſmall hole at the ſide is to be ſtopped with wax, and the glaſs heated with warm water; or, by holding it before the fire, ſo as to rarify, and in part, expel the air. It is then to be applied to the nipple, which, in this caſe, will not only be pulled out, but will diſcharge a large quantity of milk, ſo as to take down the inflammation and tumor in the breaſt. When the ſucking power of the glaſs is grown weak, the hole at the ſide is to be opened, and the milk poured out; the glaſs is then to be heated again, and, the hole being ſtopped again, is to be a ſecond time applied, and ſo on, till the intention is fully anſwered.

NOMOPHYLACES, Νομοφυλακες, among the Athenians, magiſtrates who were to ſee the laws executed, being not unlike to our ſheriffs. They had the execution of criminals committed to their care, as alſo the charge of ſuch as were confined priſoners. They had alſo power to ſeize thieves, kidnappers, and highwaymen, upon ſuſpicion; and, if they confeſſed the fact, to put them to death; if not, they were obliged to proſecute them in a judicial way.

NONAGESIMAL, in aſtronomy, the 90th degree of the ecliptic, reckoned from the eaſtern term, or point. See the article ECLIPTIC, *&c.*

The altitude of the nonageſimal is equal to the angle of the eaſt, and, if continued, paſſes through the poles of the ecliptic; whence the altitude of the nonageſimal, at a given time, under a given elevation of the pole is eaſily found. If the altitude of the nonageſimal be ſubſtracted from 90°, the remainder is the diſtance of the nonageſimal from the vertex. See the article ALTITUDE.

NOOSE, a name given by ſportſmen to a ſort of horſe-hair ſpringe, made to take woodcocks, and very ſucceſsful when the proper precautions are taken. The nooſe is made of ſeveral long and ſtrong hairs twiſted together, with a running nooſe at one end, and a large knot at the other, which is to be paſſed through the ſlit of a cleft ſtick, to prevent the nooſe from being pulled away when the bird is caught in it.

NORMAL, in geometry, ſignifies the ſame with a perpendicular, and is uſed

for a line or plane that interſects another perpendicularly. See the article PERPENDICULAR, SUBNORMAL, LINE and PLANE.

NORTH. (*Dict.*) NORTH-WEST *paſſage*. A north-weſt paſſage by Hudſon's bay, into the pacific ocean, has been more than once attempted of late years, but, hitherto, without ſucceſs. Some greatly doubt of the practicableneſs of ſuch an enterprize, and think the obſervations made by the Ruſſians give us ſmall hopes. But, as they have not yet publiſhed the particulars of their diſcoveries, little can be ſaid about them. Some general things may be ſeen in the Phil. Tranſ. N° 482. ſect. 14. It appears from thence, that the Ruſſians have paſſed between the land of Nova Zembla, and the coaſt of Aſia; and, as the Dutch did formerly diſcover the northern coaſts of Nova Zembla, we may now be well aſſured, that that country is really an iſland.

NOSTRILS, *Nares*, in anatomy, the two apertures or cavities of the noſe, through which the air paſſes, and which ſerve to convey odours, and to carry off the pituita ſeparated in the ſinuſes of the baſe of the cranium. See NOSE.

NOTONECTA, the BOAT-FLY, in the hiſtory of inſects, a genus of inſects of the claſs of the ſcleroptera, the roſtrum or ſnout of which is inflected, the antennæ are very ſhort; the wings, which are four in number, are cruciated, and the legs are formed for ſwimming.

NUBECULA. (*Dict.*) is alſo uſed for a matter in form of a cloud ſuſpended in the middle of the urine. See the article URINE.

NUDIPEDALIA, among the antients, a feſtival in which all were obliged to walk bare-footed. This was done on account of ſome public calamity; as the plague, famine, an intenſe drought and the like. It was likewiſe uſual for the Roman matrons, when any ſupplication and vows were to be made to the goddeſs Veſta, to walk in proceſſion to her temple bare-footed.

NUMB-FISH, the ſame with the torpedo or cramp-fiſh. See the article TORPEDO.

NUMENIUS, in ornithology, a genus of birds of the order of the ſcolopaces; the beak of which is of a figure approaching to a cylindric one, it is obtuſe at the point, and is longer than the toes, the feet have each four toes connected together.

This genus comprehends the curlew, the woodcock, the great plover, and the ſnipe. See the article CURLEW, *&c.*

NUTRITION. (*Dict.*) *Defect of* NUTRITION, or ATROPHY in medicine. See the article ATROPHY.

O.

OBSIDIANUS *Lapis*, the OBSIDIAN-STONE. See the article LAPIS.

OFFENCE, *delictum*, in law, an act committed againſt the law, or omitted where the law requires it.

Offences are diſtinguiſhed into two kinds, *viz.* ſuch as are capital, and ſuch as are not. Capital offences are thoſe for which the offender is to loſe his life. Thoſe not capital, where the offender may forfeit his lands, and goods; be fined, or ſuffer corporal puniſhment, or both, but not loſe his life. Under capital offences are comprehended high-treaſon, petit-treaſon, and felony: and offences not capital include the remaining part of the pleas of the crown, and come under the title of miſdemeanours. Some offences are puniſhable by the common law, but moſt of them by ſtatutes.

OFFICE. (*Dict.*) VICTUALLING-OFFICE, an office kept on Tower-hill, London, for the furniſhing his majeſty's navy with victuals. See NAVY.

It is managed by ſeven commiſſioners who have their inferior officers, as ſecretaries, clerks, *&c.* beſides agents in divers parts of Great Britain, Ireland, *&c.* See the article COMMISSIONERS, *&c.*

OIL. (*Dict.*) OIL-BEETLE, *Meloe*, in zoology. See MELOE.

OLD-WIFE-FISH, the name of a ſpecies of the baliſtes, with three ſpines on the back, and a forked tail. See BALISTES.

OLD WIFE, or WRASSE. See the article WRASSE.

OLI-

OLIGAEDRA, in natural hiſtory, the name of a genus of cryſtals, and expreſſes that which is compoſed of only a few planes. See the article CRYSTAL. The bodies of this claſs are cryſtals of the imperfect kind, being compoſed of columns affixed irregularly to ſome ſolid body at one end, and at the other terminated by a pyramid; but the column and pyramid being both pentangular, the whole conſiſts only of ten planes, and not, as the common kind, of twelve. Of this genus there are only three known ſpecies; 1. A whitiſh one, with a ſhort pyramid, found principally in Germany, and ſometimes brought over to us, among parcels of common cryſtal. 2. A bright and colourleſs one, with a longer pyramid. This is found in Germany, and in ſome parts of England, as in the tin mines of Cornwal, and on Mendip-hills. And, 3. A brown one, with a ſcabrous cruſt. This is produced only in the Eaſt Indies, and is well known by our lapidaries by its rough coat, and is eſteemed the fineſt of all brown cryſtals.

OMENTUM. (*Dict.*) *Falling down of the* OMENTUM. On large wounds of the abdomen, the omentum will frequently protrude itſelf through the wound, either alone, or with ſome portion of the inteſtines. When this is the caſe, the firſt buſineſs is to enquire whether the protruded part preſerves its heat, moiſture, and natural colour: if it is not found faulty in any of theſe circumſtances, it muſt be gently returned; but when the ſtraitneſs of the wound forbids this, the protruded part muſt be taken off cloſe to the wound, and the wound healed according to the common form. The omentum in this caſe will adhere to the internal part of the wound, without bringing on any diſorder, or inconvenience to the patient. But where the inteſtines fall out at the ſame time, the omentum is to be fomented, by an aſſiſtant, with warm milk and water, till the inteſtines are returned. See the article INTESTINES.

If any part of the protruded omentum be cold, dry, livid, putrid, or corrupted, the mortified part muſt be entirely cut off before the reſt is returned, leſt the neighbouring parts ſhould be brought into conſent, which would inevitably prove fatal to the patient. Heiſter directs that the corrupted part be taken off in this manner: paſs a waxed thread two or three times round the ſound part of the omentum, near the place where it is injured, and faſten it with a knot, to prevent any hæmorrhage from enſuing after the reduction of it; when you have made a ſecure ligature, take off the corrupted part with the knife, or ſciſſars, and return what is ſound, leaving, at leaſt, the length of a foot of the ligature hanging out of the wound of the abdomen, till it ſlips off from the ſound part of the omentum. The wound muſt be dreſſed in the common way, the depending part of it being kept open by a large tent: and, at every dreſſing, the ligature muſt be pulled a little gently forward, till it has, at length, entirely ſlipped off from the ſound part of the omentum.

OOZY, or OAZY *Ground*, a name given by the ſeamen to ſoft, ſlimy or muddy ground.

OPHIDION, in ichthyology, a genus of the acanthopterygious claſs of fiſhes, the body of which is long, ſubcylindric, and has three fins; the branchioſtege-membrane contains ſeven bones, they are oblong, ſlender, and ſomewhat crooked, and are with great difficulty diſtinguiſhed, unleſs the fiſh have the ſkin firſt taken off. Of this genus there are two ſpecies, *viz.* the ophidion with four beards on the lower jaw, growing to the ſize of a large eel; and the ophidion without beards, growing to about a foot and a half long.

OPHIDION, is alſo the name whereby ſome authors call that ſpecies of the ſyngnathus, commonly termed the ſea-adder.

OPHIOMANCY, Ὀφιομαντεια, in antiquity, the art of making predictions from ſerpents. Thus Calchas, on ſeeing a ſerpent devour eight ſparrows with their dam, foretold the duration of the ſiege of Troy. And the ſeven quoils of a ſerpent that was ſeen on Anchiſes's tomb, were interpeted to mean the ſeven years that Æneas wandered from place to place before he arrived in Latium. Thus, Virgil, Æn. l. 5. v. 85.

Septem enim gyros, ſeptena volumina traxit.

ORCELLE, or CANARY-WEED, in botany, a ſpecies of cladonia. See the article CLADONIA.

ORPHUS, in ichthyology, the ſparus with the tail not forked, and with a black ſpot near it. See SPARUS.

ORTY-

ORTYGOMETRA, in ornithology, a genus of birds, of the order of the ſcolopaces, the beak of which is ſhorter than the toes: it is of a compreſſed figure, and terminates in a kind of point; both the chaps are equal in length. There is but one ſpecies of this genus: it is of the ſize of our common magpye, and is a ſingular and elegant bird; the head is ſmall and oblong; the eyes are large, and their iris reddiſh, the pupil is black; the head, neck, back, and tail are of a bright and elegant brown, variegated in a beautiful manner with ſpots of black; the throat is of a pale, whitiſh grey, as are alſo the breaſt and belly.

OS. (*Dict.*) For the os calcis, os femoris, os frontis, *&c.* ſee CALCIS os, *&c.*

OSCINES, among the Romans, an appellation given to ſuch birds, from whoſe chattering or notes, omens and predictions were drawn; in which ſenſe they ſtood contra-diſtinguiſhed from the alites, or ſuch birds as afforded matters for auguries by their flight. See ALITES.

OSCITATION. See YAWNING.

OSMERUS, in ichthyology, a genus of the malacopterygious claſs of fiſhes, the back and belly fins whereof are placed at the ſame diſtance from the head; the teeth are large and ſtrong, and placed in both jaws, and alſo on the tongue and palate; the branchioſtege-membrane on each ſide has ſeven or eight rays.

This genus comprehends the ſmelt and tarantola-fiſh. See the articles SMELT and TARANTOLA.

OSMUNDA, in botany, a genus of the *cryptogamia filicum* claſs of plants, of which no part of the fructification is viſible, except the fruit: this is a globoſe, diſtinct capſule, many of which are arranged together in cluſters, and which, when mature, open horizontally, and are found to contain a great number of very minute ſeeds of an ovated ſhape.

This genus comprehends the oſmund-royal, and the moonwort.

OSTEOSPERMUM, in botany, a genus of the *ſyngeneſia-polygamia-neceſſaria* claſs of plants, the compound flower of which is radiated; the hermaphrodite corollulæ are numerous in the diſc; the female ones are about ten in the radius; there is no other pericarpium but the cup; the hermaphrodite ſeeds are abortive; the female ones are ſolitary, globoſe, coloured, and at length indurated, including a nucleus; the receptacle is naked and plane.

OTIS, the BUSTARD, in ornithology, a genus of birds, of the order of the gallinæ, the feet of which are each compoſed of three toes, all turned forward; the head is naked, or has no comb. There is but one known ſpecies of this genus: it is of the ſize of the common peacock; the head is large, as alſo the eyes; the beak is ſhort and very robuſt, and is exactly of the form of that of the common turkey; the head and neck are of a beautiful, grey colour; the back is variegated with tranſverſe ſtreaks, brown and black; the wings are ſmall, in proportion to the bulk of the body, and their principal uſe is to aſſiſt in running.

OTUS, in ornithology, a name whereby ſome writers call the leſſer horn-owl. See the articles STRIX and OWL.

OUZEL, or the *Water*-OUZEL, in ornithology, the motacilla, with a black body and white breaſt. See MOTACILLA.

OWL, in ornithology, the engliſh name of ſeveral ſpecies of the ſtrix. See STRIX. The ſeveral ſpecies of ſtrix, that fall under this denomination, are very numerous. 1. For the great horn-owl, or eagle-owl, ſee the article BUBO. 2. The black and white horn-owl, or the white aurited ſtrix, is a beautiful bird, equal to a turkey in ſize, of a ſnow-white colour, elegantly variegated with ſpots and lines of black; the head is large, round, ſhort, and decorated in a very beautiful manner, with a pair of ears or horns, as they are uſually called, being tufts of erect feathers, having their origin from the verges of the apertures of the ears. 3. The leſſer horn owl, being the ſtrix with the head aurited with ſix feathers, is another very beautiful bird, equal to a large pigeon in ſize, with very large wings; the wings are reddiſh, as is alſo the lower part of the belly and back. 4. The grey-owl, or the brown ſtrix, with a ſmooth head, with black eyes, and the primary wing-feathers ſerrated. 5. The yellow-owl, with a ſmooth head. 6. The hazel-owl, or the brown ſtrix, with a ſmooth head, and the eyes brown. 7. The yellow-eyed-owl, or the brown ſmooth-headed ſtrix, with the iris of the eyes yellow. 8. The variegated tailed owl, or the brown ſmooth-headed ſtrix, ſpotted with white, and with white faſciæ on the tail. 9. The little owl, or the brown ſtrix, with a ſmooth head, and five ſeries of ſpots on the wing feathers. This is an extremely pretty little bird, and ſo ſmall, that it appears

appears ſingular to ſee the marks of this genus on it. It is about the bigneſs of the black-bird, and its wings are very long. 10. The white-owl, or the white ſtrix, with a ſmooth head, being nearly equal to a gooſe in bigneſs. 11. The common brown-owl, or jay-owl, being the brown ſmooth-headed ſtrix, with the third of the wing-feathers longeſt, and about the ſize of a pigeon. 12. The german horn-owl, or the horn-owl with a long tail. 13. The church-owl, or the leſſer horn-owl, being the variegated-backed, ſmooth-headed ſtrix. 14. The white-beaked owl, or the ſmooth headed ſtrix, with a bluiſh, grey back, and a whitiſh beak. And, 16. The yellow-beaked american owl, or the yellow-beaked ſtrix, with a brown body, variegated with white.

OX. (*Dict.*) When theſe creatures are intended to breed, the better the land is, the larger ſort of beaſts are to be choſen, and the greater will be the profit. But of whatever ſort the breed is, the bull ſhould always be of the ſame country with the cow, otherwiſe it never ſucceeds ſo well. See BULL and COW.

The largeſt oxen are to be choſen for work, and for feeding, but then it muſt be where there is land rich enough to maintain them. When they are to draw, care muſt be taken to match them well, both for height and ſtrength; for if one be ſtronger than the other, the weakeſt will ſoon be deſtroyed. They muſt never be driven beyond their natural pace, for the beating them throws them into ſurfeits, and many other diſeaſes. The time of putting oxen to work, is at three years old; they muſt be worked gently the firſt year, eſpecially in hot weather, and fed with a large quantity of hay: this will enable them to bear their labour better than graſs; and they ſhould be always kept in a middle ſtate, neither too fat nor too lean. They may be worked till they are ten or twelve years old, and then ſold.

Diſeaſes of OXEN. As ſcarce any creature is more uſeful to man than the ox kind, nothing is more worthy conſideration than the nature and origin of their diſeaſes, and the remedies for them. The ſame diſtemper that has of late years carried off ſuch vaſt numbers of theſe cattle with us and elſewhere, has at other times raged in Italy. In the year 1710, and the ſucceeding one, there was a great mortality amongſt the horned cattle there, and the occaſion of it was evidently the unnatural ſeaſon preceding. The whole autumn before had been wet, and at the time of the winter ſolſtice there were continual cold winds, and ſmall, but laſting rains. The ſpring that ſucceeded was alſo cold and rainy, and the defect of heat, and abundance of moiſture, made a change in the whole face of nature: the medicinal ſprings had not their wonted effect; and the fruits of the earth could not appear at their proper ſeaſons, nor in their due perfection. The graſs was injured by this, and the ground rendered continually damp and unwholeſome; and to this was evidently owing the malignant and contagious diſeaſe that raged among the cattle afterwards. It was ſuppoſed at that time with them, as of late with us and elſewhere, that the contagion was brought in among their oxen by ſtrange cattle coming from infected places, but this proved to be an error; for if an ox was removed to ever ſo diſtant a paſture, he never eſcaped the better for it: the whole earth and its productions were vitiated throughout the country, and there was no ſafety in any part of it.

The uſe of this obſervation muſt be, the keeping the cattle in ſucceeding years out of the way of thoſe things which occaſion their ſickneſſes in ſuch as theſe. If the autumn or winter be extremely cold and wet, remove the cattle out of the low grounds, and put them to feed in ſandy, dry ſoils, on the high grounds; give them water from ſuch places where the ſun has moſt power, and it is leſs chilling cold than in others; and in caſes of imminent danger, always mix ſome ſalt in it. If the bad weather continues, let them always have clean ſtraw to lie on, and a dry covering; and in caſes where the contagion is already begun, the fumigating the houſes where they are kept with bay-leaves and eleutherian bark, is judged convenient. As to remedies, when they are once ſeized with the diſtemper, it is hard to underſtand what intention to preſcribe in, and how to aſcertain the doſes; and as the late practice, in attempting to cure, has been of very little ſervice, the cautions for preventing the diſeaſe ought to be redoubled, to avoid an almoſt incurable misfortune.

OXUCIÆ, in natural hiſtory, the name of a genus of foſſils of the claſs of the

ſelenitæ, but of the columnar, not the rhomboidal kind. The ſelenitæ of this genus conſiſt of ſix equal planes, having their top or bottom no broader or more depreſſed than the others; and in this differing from the iſchnambluces, or flatted columnar ſelenitæ, as they do from the iſambluces or cryſtaliform, but broken ended ones, by having their ends naturally tapering off to a point. The bodies of this genus, like thoſe of the other genera of the columnar ſelenitæ, are liable to a longitudinal crack in their middle; and this ſometimes includes a little clay, in form of an ear of graſs. See the article SELENITÆ.

Of this genus there are only two known ſpecies. 1. A fine kind, with thin flakes and tranſverſe filaments, found in the clayey banks of the river Neu, near Peterborough, in Northamptonſhire; and, 2. A dull kind, with thick plates and longitudinal filaments. This is not uncommon in Yorkſhire, and lies ſometimes in a yellow, ſometimes in a blue clay.

P

PACHODECARHOMBIS, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ, expreſſing a thick rhomboidal body, compoſed of ten planes. See SELENITÆ.

The characters of this genus are, that the ſelenitæ of it conſiſt of ten planes; but as the top and bottom in the leptodecarhombes, or moſt common kind of the ſelenitæ, are broader and larger planes than any of the reſt, the great thickneſs of this genus, on the contrary, make its four longer planes in all the bodies of it, meeting in an obtuſe angle from its ſides, its largeſt planes. Of this genus there are only four known ſpecies. 1. A very pellucid one, with ſlender tranſverſe ſtriæ. This is frequent in the clay-pits of Northamptonſhire, and ſome other countries; and the common people have an opinion, that it is good to ſtop hæmorrhages; whence it has acquired among them the common name of ſtaunch. 2. A dull-looking kind, with very fine tranſverſe filaments. This is found in the clay-pits of Northamptonſhire, Staffordſhire, and Yorkſhire. 3. A fine and beautiful kind, with very ſlender longitudinal filaments. This is common in Yorkſhire, and ſeems almoſt peculiar to that country; it is not only found there in digging, but frequently lies on the ſurface of the earth. And, 4. A brown pellucid kind, found very frequently in Germany, and ſometimes in England.

PALATE. (*Dict.*) Wounds of the palate, and other parts of the mouth, are only to be healed by being anointed with honey of roſes, either alone, or mixed with balſam of Peru, or with oil of myrrh per deliquium.

PALLET. (*Dict.*) PALLET, in ſhip-building, is a room within the hold, cloſely parted from it, in which, by laying ſome pigs of lead, *&c.* a ſhip may be ſufficiently ballaſted, without loſing room in the hold; which, therefore, will ſerve for the ſtowing the more goods.

PANGONIA, in natural hiſtory, the name of a genus of cryſtal, conſiſting of ſuch as are compoſed of many angles. See the article CRYSTAL.

The bodies of this genus are ſingle-pointed, or imperfect cryſtals, compoſed of dodecangular or twelve-planed columns, terminated by twelve-planed pyramids, and the whole body, therefore, made up of twenty-four planes. Of this genus there are only three known ſpecies. 1. A browniſh-white one, with a long pyramid. This is found in Sileſia and Bohemia; ſometimes in mountains, and ſometimes on the ſides of rivers, and is eſteemed a very valuable cryſtal. 2. A yellowiſh-brown one, with a ſhort pyramid. This is often brought over to us under the name of ſaxon topaz, among the other cryſtals commonly known by that name. And, 3. A clear colourleſs one, with a very ſhort pyramid. This is a very valuable cryſtal, and is produced in the Eaſt-Indies, being often brought over among the indian ballaſt.

PANORPA, the SCORPION-FLY, in zoology, a genus of inſects, with membranaceous wings, the roſtrum or trunk whereof

whereof is cylindric, and of a horny ſtructure, and there is a weapon of the cheliform kind at the tail; the antennæ are ſetaceous, black, and compoſed of no leſs than thirty articulations; the back is brown; the ſides are yellow; and the wings are white.

PARABOLIC. (*Dict.*) PARABOLIC ASYMPTOTE, in geometry, is uſed for a parabolic line approaching to a curve, ſo that they never meet; yet, by producing both indefinitely, their diſtance from each other becomes leſs than any given line. Mac Laurin obſerves, that there may be as many different kinds of theſe aſymptotes as there are parabolas of different orders. See the articles PARABOLA and ASYMPTOTE.

When a curve has a common parabola for its aſymptote, the ratio of the ſubtangent to the abſciſs approaches continually to the ratio of two to one, when the axis of the parabola coincides with the baſe; but this ratio of the ſubtangent to the abſciſs approaches to that of one to two, when the axis is perpendicular to the baſe. And by obſerving the limit to which the ratio of the ſubtangent and abſciſs approaches, parabolic aſymptotes of various kinds may be diſcovered.

PARALLELOPIPEDIA, in natural hiſtory, the name of a genus of ſpars, thus called, becauſe regularly of a parallelopiped form. See the article SPAR.

They are pellucid cryſtaline ſpars, externally of a determinate and regular figure, always found looſe, detached, and ſeparate from all other bodies, and in form of an oblique parallelopiped, with ſix parallelogram ſides and eight ſolid angles, eaſily fiſſile, either in an horizontal or perpendicular direction, being compoſed of numbers of thin plates, and thoſe of very elegantly and regularly arranged bodies, each of the ſame form with the whole maſs, except that they are thinner in proportion to their horizontal planes; and naturally fall into theſe and no other figures, on being broken with a ſlight blow. Of this genus there are four known ſpecies. 1. The hard, pellucid, and colourleſs one, called the iſland-cryſtal of authors. See the article ISLAND-CRYSTAL.

2. A dull and whitiſh kind, found in France, Germany, and England, particularly in the Derbyſhire and Yorkſhire lead-mines, and about Scarborough. This has the ſame property with the former, of giving a double refraction; but it is ſo dull and opake, that it does not ſhew it ſo elegantly. 3. A ſoft, whitiſh, and very bright one, found principally in the lead-mines of Yorkſhire, and about the ſea-ſhores of that country. And, 4. A dull, hard, and pale-brown one: this is found in the lead-mines of the ſame country, and in ſome parts of Ireland. All theſe ſpecies have the ſame power of double refraction with the firſt, but are too opake to ſhew it ſo beautifully, and often have not tranſparency enough to make it at all diſtinguiſhable.

PARAMECIA, in natural hiſtory, a name given to ſuch animalcules as have no viſible limbs or tails, and are of an irregularly oblong figure. See the article ANIMALCULE.

PAREMBOLE, Παρεμβολη, in rhetoric, a figure wherein ſomething relating to the ſubject is inſerted in the middle of a period. All the difference between the parembole and parentheſis, according to Voſſius, is, that the former relates to the ſubject in hand, whereas the latter is foreign to it. An example of each we have in Virgil; and firſt of the parembole.

Æneas (neque enim patrius conſiſtere mentem
Paſſus amor) rapidum ad naves præmittit Achatem.

The following is an inſtance of the parentheſis:

——ipſique ſuos jam morte ſub ægrâ
(Di meliora piis, erroremque hoſtibus illum)
Diſciſſos nudis laniabant dentibus artus.

See the article PARENTHESIS.

PARETONIUM, in natural hiſtory, the name of an earth antiently found on the ſhores of Egypt, Cyrene, and the iſland of Crete, and uſed by the antients in painting. There has been ſome difference among the earlier writers about the nature and origin of this ſubſtance, and of late we have been taught to think it loſt; but it is ſtill common on the ſhores of moſt of the iſlands of the Archipelago, though not obſerved or regarded; and is truly a very heavy and tough clay, of a fine white colour, found in maſſes of different ſizes, generally as ſoft as the ſofter clays within the ſtrata; and by rolling about on the beech in this ſtate, it gathers up the ſand, ſmall ſhells, and other foulneſſes we always find about it. It is moſt probable, that there are

ſtrata of it fine and pure in the cliffs there, and that the ſea waſhes off maſſes of them in ſtorms and high tides, which are what we find.

PARTITION. (*Dict.*) PARTITION, in rhetoric, the ſame with diviſion. See the article DIVISION.

PARTITION, in muſic, the diſpoſition of the ſeveral parts of a ſong ſet on the ſame leaf, ſo as upon the uppermoſt ranges of lines are found the treble; in another, the baſs; in another, the tenor, *&c.* that they may be all ſung or played, either jointly or ſeparately. See the articles PART, MUSIC, *&c.*

PARTITION, in architecture, that which divides or ſeparates one room from another. See the article BUILDING.

PARTITION, in heraldry. See the article QUARTERING.

PARTITIONE FACIENDA, in law, a writ which lies for thoſe who hold lands or tenements pro indiviſo, and would ſever to every one his part, againſt them that refuſe to join in partition, as co-partners.

PARTNER. (*Dict.*) PARTNERS, in a ſhip, are ſtrong pieces of timber bolted to the beams incircling the maſts, to keep them ſteady in their ſteps, and alſo keep them from rolling, that is, falling over the ſhip's ſides. There are alſo of theſe partners at the ſecond deck, to the ſame end; only the mizzen-maſt hath but one pair of partners, in which that maſt is wedged ſo firm that it cannot move. Some ſhips do not ſail well, unleſs their maſts are looſe, and have leave to play in the partners; but in a ſtorm this is dangerous, leſt the partners ſhould be wronged, (as they ſay) *i. e.* forced out of their places; for then there is no help but to cut the maſt by the board.

PARUS, the TITMOUSE, in ornithology. See the article TITMOUSE,

PATELLA, (*Dict.*) in anatomy. *Fracture of the* PATELLA. The patella, or knee-pan, is much more ſubject to a tranſverſe fracture than to one in any other direction. The longitudinal fracture of this bone happens more rarely, but when it does, is much more eaſily cured; becauſe the fragments of the bone, in this caſe, generally keep in their right places, but when the bone is broken not only tranſverſely, but into ſeveral pieces, the caſe is yet more difficult and dangerous. The cure of this fracture, according to Heiſter, muſt be attempted in this manner: in a longitudinal or perpendicular fracture, the patient muſt be laid upon his back, and, extending the foot, the ſurgeon muſt replace the fragments on both ſides with the preſſure of his hands, binding them up carefully with the uniting bandage; which muſt be applied in this caſe in the ſame manner with that uſed in large wounds in the belly or forehead. But when the patella is broken tranſverſely, or into ſeveral pieces, the patient being laid in the ſame poſture, and extending his foot as before, the ſurgeon is with great care to endeavour with the palms of both his hands, aſſiſted by his fingers and thumbs, to bring together and replace the fragments in their natural ſituation; and when that is done, they muſt be retained firmly together, by means of a plaſter made in form of a half moon, or properly perforated, and then the foot and leg are to be bound up, and placed ſo that they cannot be eaſily moved: but to prevent the bone from being diſplaced again, the patient muſt not uſe his leg till after the ninth or tenth week. See the article FRACTURE.

PATELLA *luxated.* The patella is moſt uſually luxated either on the internal or external ſide of the joint, though phyſicians give accounts of its being ſometimes luxated both above and below it. Whenever the knee itſelf is perfectly luxated, the patella can ſcarce avoid being diſplaced at the ſame time, becauſe of its ſtrong connection to the thigh and to the tibia. See the article KNEE.

The reduction of a luxated patella is uſually no great difficulty. The patient is to be laid flat on his back upon a table or bed, or upon an even floor, ſo that his leg may be pulled out ſtraight by an aſſiſtant; when this is ſufficiently extended, the ſurgeon muſt graſp the patella with his fingers, and afterwards, by the aſſiſtance of his hand, preſs it ſtrongly into its proper place. This may be alſo poſſibly effected while the patient ſtands upright: when this is done, there remains nothing but carefully to bind up the part, and let the patient reſt for ſome days; ſometimes gently binding and extending his leg in the mean while, that it may not become ſtiff.

PEBBLES, (*Dict.*) the name of a genus of foſſils, diſtinguiſhed from the flints and homochroa, by their having a variety of colours. Theſe are defined to be ſtones, compoſed of a cryſtalline matter, debaſed

debaſed by earths of various kinds in the ſame ſpecies, and then ſubject to veins, clouds, and other variegations; uſually formed by incruſtations round a central nucleus, but ſometimes the effect of a ſimple concretion, and veined like the agates, by the diſpoſition the motion of the fluid they were formed in gave their differently coloured ſubſtances. Dr. Hill obſerves, that the variety of pebbles, were it of England alone, is ſo great, that a haſty deſcriber would be apt to make almoſt as many ſpecies as he ſaw ſpecimens. A careful examination will teach us, however, to diſtinguiſh them into a certain number of eſſentially different ſpecies, to which all the reſt may be referred, as accidental variations. When we find the ſame ſubſtances and the ſame colours, or thoſe reſulting from a mixture of the ſame, ſuch as nature frequently makes in a number of ſtones, we ſhall eaſily be able to determine, that theſe are all of the ſame ſpecies, though in different appearances; and that whether matter be diſpoſed in one or two, or in twenty cruſts, laid regularly round a central nucleus, or thrown without a nucleus into irregular lines, or, finally, blended into a ſort of uniform maſs.

Theſe are the three ſtates in which we are liable to find every ſpecies of pebble; for if it have been moſt naturally and regularly formed by incruſtation round a central nucleus, we find that ever the ſame in the ſame ſpecies, and the cruſts not leſs regular and certain. If the whole have been more haſtily formed, and have been the reſult only of one ſimple concretion, if that has happened while its different ſubſtances were all moiſt and thin, they have blended together and made a mixed maſs of the joint-colour of them all; but if they have been ſomething harder when this has happened, and too far concreted to diffuſe wholly among one another, they are found thrown together in irregular veins. Theſe are the natural differences of all the pebbles; and having regard to theſe in the ſeveral variegations, all the known pebbles may be reduced to thirty-four ſpecies; for an account of each, we refer the curious to Hill's hiſtory of foſſils, p. 512, ſeq.

There are many people of opinion, that the ſwallowing of pebbles is very beneficial to health, in helping the ſtomach to digeſt its food; and a pebble-poſſet is an old woman's medicine in the colic in many parts of England. They uſually order the ſmall white-ſtones to be picked up out of gravel-walks for this purpoſe, and eat them in large quantities in ſome ſort of ſpoon-meat, of which milk is an ingredient: however this cuſtom may ſtill prevail, we have no phyſician's practice to warrant it, and could produce inſtances of much miſchief reſulting from ſwallowing of pebbles; a remarkable one whereof the reader may find recorded in the philoſophical tranſactions, n° 253.

PEEVIT, or BLACK-CAP, in ornithology, the grey larus, with a black head. See the article LARUS.

This is a very elegant ſpecies: its ſize is about that of the common tame pigeon; the head is ſmall; and the eyes bright, their iris is of a pale, hazel colour; the verges of the eye-lids are red, and they are ſurrounded with a fine, white plumage; the beak is nearly an inch in length, it is of a fine, bright ſcarlet, and is a little bent downwards; the legs are ſlender; their colour is a blood-red; the claws are black, and the toe behind is very ſhort and ſmall.

PENTAEDROSTYLA, in natural hiſtory, the name of a genus of ſpars. See the article SPAR.

The bodies of this genus are ſpars, in form of pentangular columns, terminated by pentangular pyramids at one end, and irregularly affixed at the other to ſome ſolid body.

Of this genus there are three known ſpecies. 1. One with a very long pyramid. This is found in the mines on Mendip-hills. 2. One with a thick column, and a very ſhort and large pyramid. This is found in the Hartz-foreſt in Germany, and in Cumberland. And, 3. One with a broad depreſſed pyramid. This is found, ſo far as it is yet known, only in the mines at Rammelſberg in the Hartz-foreſt in Germany.

PENTELASMIS, in the hiſtory of ſhell-fiſh, a genus of animals, compoſed of a fleſhy body, affixed to a fleſhy and ſoft pedicle; the body is compoſed of five valves, and the pedicle is ſometimes ſhort, and in other ſpecies conſiderably long. The animal, inhabiting the ſhell-body of this genus, is a triton. See the article TRITON.

This genus comprehends the gooſe-ſhell, or barnacle, being a tender, brittle ſhell, about an inch long, and three quarters of

of an inch in diameter. See the article CONCHA ANATIFERA.

PEPPER. (*Dict.*) PEPPER-EEL, in the hiſtory of animalcules, a ſpecies of enchelis, found in pepper-water and other vegetable infuſions. See ENCHELIS and PEPPER-WATER.

PERSPICUITY, *perſpicuitas*, in rhetoric, is a principal virtue of ſtyle, to which all the ornaments and beauties of ſpeech ought to give way. See STYLE.

Voſſius obſerves, that a diſcourſe is obſcured by too much conciſeneſs and profuſeneſs; ſeveral rhetorical figures are likewiſe deſtructive of perſpicuity.

PETRIDIA, in natural hiſtory, a genus of ſcrupi, of a plane, uniform ſtructure, of no great variety of colours, and emulating the external form of pebbles. See the article SCRUPI.

Dr. Hill deſcribes no leſs than twelve ſpecies of this genus. 1. The various-ſized, pellucid, colourleſs, cryſtalliform petridium, commonly called the pebble-cryſtal. 2. The purple, ſemipellucid, cryſtalline petridium. 3. The ſnow-white, opake, cryſtalline petridium. 4. The opake, whitiſh, reddiſh, or yellowiſh, cryſtalline petridium, commonly called red, white, and yellow, ſparry pebbles. 5. Yellowiſh, white, pumicoſe, or ſpungy petridium. 6. Hard, porous, whitiſh, cryſtalline petridium. 7. Greyiſh, white, opake, ſtony petridium. 8. Friable, ſhining, white, arenaceous petridium. 9. White, cryſtalline petridium, ſpotted with ſmall yellow dots. 10. Whitiſh-brown, dull petridium. 11. Bluiſh, white, hard, cryſtalline petridium. And, 12. Browniſh, white, hard, ſhining petridium.

PETTREL, in ornithology, a name for the procellaria, or ſtorm-bird. See the article PROCELLARIA.

PHALÆNA, in the hiſtory of inſects, a genus of inſects, of the order of the lepidoptera, the antennæ whereof are attenuated to the point, not clavated: the ſpecies of this genus are very numerous; ſome of them have the antennæ of a priſmatic form; ſome have them pectinated, or made in faſhion of a comb, and of theſe laſt, ſome have no tongue, and others have a ſpiral one; ſome have the antennæ pectinated, and ſit with the wings flat or plane; others ſit with the wings plane and patent, and have ſimple antennæ and a ſpiral tongue; ſome have the antennæ ſimple, and the tongue ſpiral, but do not ſit with the wings plane, and of theſe ſome have the forehead prominent, others not; others again have the antennæ ſimple, and have no tongue.

PHASIANUS, the PHEASANT, in ornithology. See PHEASANT.

PHASSACHATES, in natural hiſtory, the name of a ſpecies of agate, which the antients, in its different appearances, ſometimes called alſo leucachates and perileucos. See the article AGATE.

The ſame agate, from the various proportion or manner of admixture of its particles in different ſpecimens, often makes a very different figure; but no ſpecies is ſo liable to remarkable diverſities of this kind as this. It is but of a ſmall variety of colours, yet is often very beautiful: its ground or baſis is always a pale, bluiſh grey, approaching to what we call a lead-colour or dove-colour. Sometimes it is equally and evenly of this colour, thro' the whole maſs: but often alſo it is variegated within with veins of a deep black, and of a pure and clear white: theſe ſometimes approach the ſurface of the ſtone, but more uſually they are only near the center; and they are almoſt always diſpoſed in concentrical, but irregular circles, round one, two, or more points. The pieces of this ſtone, cut where there are many of theſe veins, much reſemble parts of onyxes.

It is found in the Eaſt-Indies, and in Bohemia, and ſome other parts of Europe. When the whole matter of the veins and baſis of this ſtone are all blended together into one equal maſs, as is frequently the caſe both with this and many other of the naturally veined ſtones, the whole becomes of a deeper greyiſh blue, or a dove-colour, and is then the phaſſachates; when the veins are kept diſtinct and clear, it is the leucachates and perileucos, agreeing with all the deſcriptions of the antients.

PHILYCA, in botany, a genus of the *pentandria-monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle, imperforated, erect petal, rude upon the outſide; the tube is of a conic form, and of the length of the perianthium; and the limb is quinquefid, erect, and ſmall; the fruit conſiſts of a roundiſh, trilobous, trilocular, and trivalvar capſule; and the ſeed is ſingle, roundiſh, gibbous on one ſide, and angulated on the other.

PHLEBOTOMY. (*Dict.*) In bleeding in the eyes, there are ſeveral ways of perform-

performing the operation, but the beſt, in Heiſter's opinion, is the following. The patient being ſeated on a chair, and his head held in a proper poſture, a tranſverſe inciſion is to be made, with a fine lancet, upon the turgid ſmall veins in the corners of the eye, ſo as to open them or cut them quite aſunder. The eye-lids muſt be held apart with one hand, whilſt the veins are opened with the other; and ſome uſe a pair of fine ſciſſars for this purpoſe, inſtead of a lancet, and others elevate the veins with a crooked needle before they divide them; but in this operation the better way would be to make the needles with edges, that when the veins were thus elevated, they might divide them without the help of any other inſtrument. When the inciſion is made, the diſcharge of blood muſt be promoted by means of fomentation, with a ſponge dipped in warm water; and if the diſcharge is not ſufficient, the inciſion may be repeated two or three times: but few patients can be brought to ſuffer this, and there is no practiſing it at all upon infants, becauſe they will not keep the eye ſteady.

PHRENITIS, or PHRENSY, in medicine. See the article PHRENSY.

PHRYGANEA, in zoology, a genus of inſects of the order of the neuroptera, the palate whereof is prominent, with two tentacula on each ſide; the wings are incumbent; and the worm of it lives under water in a kind of caſe.

PHYSETER, (*Dict.*) in ichthyology, is alſo the name of a genus of fiſhes of the order of the plagiuri, having teeth only in the lower jaw that are crooked; on the back there is a fin, or a large and tall ſpine; and the opening or fiſtula for the diſcharge of the water is in the front part of the head. See PLAGIURI.

This genus comprehends the crooked-toothed whale, and the plane-toothed whale. See the article WHALE.

PIACE, SE PIACE, or AD LIBITUM, in the italian muſic, ſignifies, that the part it is joined to may be repeated or not, at pleaſure.

PICÆ, in ornithology, a claſs of birds, which have the beak convex and compreſſed.

This claſs comprehends ſeveral genera; as, the ramphaſtos, buceros, corvus, picus, *&c.* See RAMPHOSTOS, *&c.*

PICRIS, *langue de beuf*, in botany, a genus of the *ſyngeneſia-polygamia-æqualis* claſs of plants, the compound flower of which is imbricated and uniform, with equal and numerous hermaphrodite corollulæ; the partial flower is monopetalous, ligulated, lineated, truncated, and quinquedentated; there is no pericarpium; the ſeed, which is contained in the cup, is ſingle, ventricoſe, obtuſe, and crowned with a plumoſe pap.

PICUS, the WOOD-PECKER, in ornithology. See the article WOOD-PECKER.

PINACIA, *πινακια*, among the Athenians, tablets of braſs, whereon the names of all the perſons in each tribe duly qualified, and willing to be judges or ſenators of the areopagus, being ſeverally written, they were caſt into a veſſel provided on purpoſe; and into another veſſel were caſt the ſame number of beans, an hundred of which were white, and all the reſt black. Then the names of the candidates and the beans were drawn one by one; and thoſe, whoſe names were drawn out together with the white beans, were received into the ſenate. See the article AREOPAGUS.

PIPER. (*Dict.*) PIPER, in ichthyology, a ſpecies of trigla, with a bifid roſtrum, and tubuloſe noſtrils. See TRIGLA.

The head of this ſpecies is very large in proportion to the body; the mouth is remarkably wide; the eyes are large, and ſtand at a very ſmall diſtance from each other at the top of the head, and are covered with a ſkin; the bony covering of the head is angulated, and terminates in two horns at the hinder part; the roſtrum is formed into ſpines, and at the upper part of the orbits of the eyes there is alſo a robuſt and crooked ſpine; the body is ſomewhat rounded, and of a conic figure, very large towards the head, and extremely ſmall at the tail; over each of the pectoral fins there ſtands a very robuſt and ſharp thorn, and there are on each ſide three articulated appendages: this fiſh grows to more than a foot in length; and, when caught, it makes a ſingular and loud noiſe.

PIT *of a theatre*, all that ſpace between the amphitheatre or galleries, and theatre or ſtage, called by the antients orcheſtra. See the article ORCHESTRA.

Brine-PITS, the name given by the people of Worceſterſhire and Cheſhire to the wells or pits affording ſalt water, out of which they extract the ſalt. See SALT.

PLACAGNOSCIERIA, in natural hiſtory, the name of a genus of ſpars. See SPAR.

The

The bodies of this genus are dull and opake, cryſtalline, terrene ſpars, formed into cruſts, and of an irregular and not ſtriated texture within. Of this genus there are three known ſpecies. 1. A hard, whitiſh-brown one, found very frequently on the roofs and ſides of caverns on Mendip hills, and in other parts of England. 2. A dull, crumbly, whitiſh one, found in many parts of England, encruſting the ſides of caverns, and of fiſſures of ſtone. And, 3. A dull, pale-brown one, of a very coarſe texture. This is the moſt common of all the bodies of this genus, and is found in variety of forms; among others, encruſting the ſides and bottoms of our tea-kettles, and other veſſels, in which water is frequently boiled.

PLACENTA. (*Dict.*) The placenta has generally been looked upon as an original part among the ſecundines; but according to Dr. Thomas Simſon of St. Andrews, it ſeems to have no place in the ovarium, nor in the uterus, till once the ovum becomes contiguous to the fundus, and then every contiguous part becomes really a placenta. He thinks the fundus uteri a place peculiarly fitted for the growth of the placenta, as proper ſoils encourage the growth of the roots of trees and ſhrubs, many of which are propagated by the branches however placed: ſo that every part of them ſeems equally fitted to be root or branch. Hence he thinks extra-uterine conceptions can have no placenta; and he ſays, there are no inſtances in authors to contradict his opinion. The placenta, according to Dr. Monro of Edinburgh, does not increaſe in the ſame proportion which the fœtus does; for the ſmaller the fœtus is, the placenta is proportionally larger. The placenta generally adheres to, or near, the fundus of the womb, and is covered on the ſide next to the womb, with a fine membranous continuation of the chorion. The ſeparation of the placenta from the womb muſt produce abortions, and this may be occaſioned by different cauſes operating in various manners, and requires very different treatment to prevent the loſs of the fœtus.

PLANE-TREE, *platanus*, in botany, a genus of the *monoecia-polyandria* claſs of plants, the male corolla whereof is ſcarce viſible: the female one conſiſts of ſeveral concave, oblong, and clavated petals: there is no pericarpium, ſeveral of the fruits conſtituting a round, rough ball; the ſeed, which ſtands upon a ſetaceous ſtyle, is roundiſh, and is terminated by a ſubulated ſtyle, and there is a capillary down adhering to its baſe.

This tree grows to a very conſiderable ſize, and is ramoſe and ſpreading; the bark is ſmooth; the wood firm, and pale-coloured; and the leaves are very large, of a palmated figure, and divided into ſix or ſeven parts at the edge.

PLECTRONITÆ, in natural hiſtory, the ſame with the conicthyodontes. See the article CONICTHYODONTES.

PLUME, a ſet or bunch of oſtrich-feathers pulled out of the tail and wings, and made up to ſerve for ornaments in funerals, *&c.*

Among ſportſmen, plume is the general colour or mixture of the feathers of a hawk, which ſhews her conſtitution. See the article HAWK.

PLUME, or PLUMULE, in botany, a little membrane of the grain or ſeed of a plant, being that which, in the growth of the plant, becomes the ſtem or trunk thereof. See the article SEED, *&c.*

POCHARD, in ornithology, the anas, with grey wings and a black rump. See the article ANAS.

POLAEDRASTYLA, in natural hiſtory, the name of a genus of cryſtals, compoſed of many planes, and having no column. See the article CRYSTAL.

The bodies of this genus are cryſtals compoſed of two octangular pyramids, joined baſe to baſe, and conſequently the whole body conſiſting of ſixteen planes. Of this genus there are only two known ſpecies. 1. A brown kind, with ſhort pyramids, found in conſiderable plenty in Virginia on the ſides of hills. And, 2. A colourleſs one, with longer pyramids. This has yet been found only in one place, which is the great mine at Goſſelaer, in Saxony, and there uſually lies at great depths.

POLLACK, in ichthyology, the name of two different ſpecies of gadus; *viz.* the cole-fiſh or raw-pollack, and the whiting-pollack. See GADUS, COLE-FISH, and WHITING.

POOR. (*Dict.*) POOR, in ichthyology, a name given to the inch and a half gadus, with the anus in the middle of the body. See the article GADUS.

POPE. (*Dict.*) POPE, in ornithology, a ſpecies of alca, with four furrows on the beak,

beak, and with the ſides of the head white. See the article ALCA.

This is a very ſingular bird, ſomewhat larger than the widgeon; the head is large, and rounded; the eyes are ſmall; the beak ſhort; the toes are three, placed forward, and connected by a firm membrane; and the wings are very ſhort, and compoſed of but few feathers, and not intended for high flights.

PORTATE, or a *Croſs*. PORTATE. (*Dict.*) For a view whereof, ſee plate CCV. fig. 4.

PORTUGALLICA TERRA, *earth of Portugal*, in the materia medica, the name of a fine aſtringent bole, dug in great plenty in the northern parts of Portugal, and eſteemed a remedy againſt poiſons and venomous bites, and good in malignant fevers. Whatever may be its virtues of this kind, however, it is manifeſtly an aſtringent of the very firſt claſs, and is uſed with great ſucceſs in fluxes of all kinds. It is well known in ſome parts of the world, beſide the kingdom where it is produced; but is not known in the engliſh ſhops. The cheapneſs of our ſophiſticated bole-armenic, having excluded this whole valuable claſs of medicines from our practice. See the article BOLE.

The characters by which the portugueſe earth is known from the other red boles, are theſe: It is of a cloſe, compact, and regular texture, conſiderably heavy, and of a fine florid red, of a ſmooth and ſhining ſurface, eaſily breaking between the fingers, and a little ſtaining the hands. It adheres firmly to the tongue, melts freely and readily in the mouth, and has a ſtrongly aſtringent taſte, but leaves a little grittineſs between the teeth. It does not ferment with acids, and ſuffers ſcarce any change of colour in the fire.

POROUS, (*Dict.*) in natural hiſtory, a name given by authors to a peculiar kind of foſſile coral, of which there are many different ſpecies; theſe are all of a beautifully laminated ſtructure, and ſeem allied to the mycetitæ or fungitæ; they are ſeldom found looſe, but uſually bedded in hard marble, and with their pores filled up with ſparry or mineral matter. See the article CORAL.

POSSUM, or OPOSSUM, in ichthyology. See the article OPOSSUM.

POTTERS-WARE. See POTTERY.

PRÆADAMITES, or PREADAMITES. See the article PREADAMITE.

PRÆTOR, or PRETOR. See PRETOR.

PREFIX, or AFFIX, in grammar, a particle added at the beginning of a word, either to diverſify its form, or to alter its ſignification.

PRESENCE, *præſentia*, a term of relation uſed in oppoſition to abſence, and ſignifying the exiſtence of a perſon in a certain place, or the ſtate of a perſon conſidered as co-exiſting with another. In this ſenſe, an obligation is ſaid to be paſſed in preſence of a notary and witneſſes. At the breaking open the ſeal of a minor or abſent perſon, the preſence of a ſubſtitute is neceſſary: where a ſuperior magiſtrate is preſent, it ſometimes takes away the power of an inferior. It has been held, that the preſence of one feoffee may ſerve for all the reſt.

PROSECUTION. To make men liable to criminal proſecutions by the law of England, it is required, that they have the uſe of reaſon, and that they be *ſui juris*. On the firſt account, the law indulges infants under the age of diſcretion, idiots, and lunatics, whatever the nature of the fact may be; and even againſt the perſon of the king, as it has been held of late; neither will it ſuffer one who becomes *non compos*, after he has committed a capital offence, to be either arraigned or executed. See the articles LUNATIC, INFANT, and IDIOT.

PTERARIA, in the hiſtory of inſects, a name given to that ſeries of inſects, which have wings. See INSECT.

Of the inſects of this ſeries, ſome have only two wings, others have four; they are hence naturally arranged into the two orders of the diptera and the tetraptera. See DIPTERA and TETRAPTERA.

PTERIS, in botany, a genus of the *cryptogamia-filicum* claſs of plants, in which the fructifications are diſpoſed in form of a line, ſurrounding the edges of the lower ſide of the leaves.

This genus comprehends the female fern and the rough ſpleenwort.

PULEX, the FLEA, in zoology. See the article FLEA.

PURSLAIN, *portulaca*, in botany, a genus of the *polyandria-monogynia* claſs of plants, the corolla whereof conſiſts of five plane, erect, obtuſe, emarginated petals, larger than the cup; the fruit is an oval, covered capſule, containing only one cell, and opening horizontally at the middle; the ſeeds are numerous, ſmall, and roundiſh.

This plant is cultivated in gardens for culinary uſes; the ſeeds are ranked

among the leſſer cold ſeeds, and have ſometimes been employed in emulſions, and the like, along with others of that claſs.

PUTORIUS the POLE-CAT, in zoology, the yellowiſh black muſtela, with a white mouth and a yellow collar. See the article MUSTELA.

This creature is ſomewhat ſmaller than the martin; the head is ſmall, oblong, pointed at the extremity, and rounded on the ſummit; the ears are ſhort, broad, patulous, and white at the edges; the eyes are large, black, and piercing in their aſpect; the mouth is wide, and well furniſhed with teeth; the neck is ſhort and thick; the body is long and ſlender; and the legs are ſhort, and not very robuſt.

PUTTOCKS, or PUTTOCK *ſhrouds*, in a ſhip, are ſmall ſhrouds which go from the ſhrouds of the main-maſt, fore-maſt, and mizen-maſt, to the top-maſt ſhrouds; and if there be any top-gallant maſts, there are puttocks to go from the top-maſt ſhrouds into theſe. Theſe puttocks are at the bottom ſeized to a ſtaff, or to ſome rope which is ſeized to a plate of iron, or to a dead-man's eyes, to which the lanniards of the fore-maſt ſhrouds do come.

PYE, or SEA-PYE, *hæmatopus*. See the article HÆMATOPUS.

PYGARGUS, in ornithology, the falco with a yellow cera, and with the tail-feathers white and black at the end. See the article FALCO.

This is a very large bird, it at leaſt equals a peacock in ſize; the wings are very large; the beak is ſhort, but robuſt and hooked, and the bent part of the upper-mandible reaches a finger's breadth beyond the lower; the eyes are very large, and a little ſunk in the head; the iris is hazel, the legs and feet are very ſtrong and robuſt, the claws are very large, and the hinder one not leſs than an inch in length.

PYRICUBIUM, in natural hiſtory, the name of a genus of foſſil bodies, uſually comprehended, with many others of very different figure and ſtructure, under the general name of pyrites. See the article PYRITES.

The diſtinguiſhing characters of the pyricubia are theſe: they are compound, inflammable, metallic bodies, of a cubic figure, or reſembling a die, being compoſed of ſix ſides. Of this genus there are only two known ſpecies: 1. The great pyricubium, of a foliaceous ſtructure; and, 2. The ſmaller ſolid pyricubium. The firſt of theſe is a very elegant foſſil, and is ſo regularly ſhaped, and ſo highly poliſhed by nature, that it has been often ſuppoſed to be wrought by art. It is but moderately hard, but is very heavy, and is of a foliaceous ſtructure. The moſt common ſpecimens of it are about a third of an inch in diameter; but it is found much larger, even to three inches, and ſo ſmall as to the tenth of an inch. It is perfectly poliſhed and ſmooth on all its ſurfaces, and is of a very beautiful whitiſh green, with a faint admixture of yellow. It is found in the German and Hungarian mines, and in the Eaſt-Indies. The ſecond ſort, or the ſmall ſolid pyricubium, is a foſſil of much leſs beauty, tho' equally regular in its ſhape and appearance. It is very heavy, and extremely firm and hard, and is not of a foliaceous or flaky ſtructure, but of one regular and uniform maſs, and when broken appears very bright and gloſſy. Its uſual ſize is about the eighth of an inch diameter, but it is found ſmaller than a pin's head, and ſometimes ſo large as to be near an inch. It is perfectly ſmooth on all its ſurfaces, and is naturally of a pale yellowiſh green, and as bright on the outſide as within; but very often it is found of a ferrugineous or duſky ſurface, owing to a ſort of ruſting, which is an accident to which the ſeveral ſpecies of naturally bright pyrites are moſt of them alſo ſubject. It is very common in Germany and Italy, and in ſome parts of America, as alſo in our own country.

PYRIPLACIS, in natural hiſtory, the name of a genus of pyrites, the characters of which are theſe: they are compound, inflammable, metallic bodies, found in looſe detached maſſes, of a ſimple and uniform, not ſtriated, internal ſtructure, and are covered with an inveſtient coat or cruſt. See PYRITES.

Of this genus of foſſils there are three known ſpecies: 1. A flatted kind, with a ſcabrous coat. 2. A globoſe one, with a cracked and furrowed coat. And 3. A flatted one, with a very thick browniſh-white cruſt. The firſt of theſe is a duſky browniſh green maſs, ſurrounded and every way covered by a ferrugineous coat, of the thickneſs of a ſhilling or more, which is rendered very rough and ſcabrous, by having received multitudes of ſmall pebbles and particles of ſand into its

its ſubſtance while yet moiſt, which are become firmly bedded in it, and make a part of its ſubſtance. This is common in the gravel-pits about London. The ſecond is of an orbicular figure, and is of a very coarſe ſtructure, being compoſed of viſible granules, and is of a pale yet duſky green colour. It is covered with a browniſh yellow or ferrugineous coat, of the thickneſs of half a crown, or ſometimes much more. This ſpecies is found of all the intermediate ſizes between an ounce and eight or ten pounds in weight. It is very common in the chalk-pits of Kent, and in many other parts of the kingdom. The third is a very ſingular ſpecies. It is very hard, and moderately heavy, and is uſually of a flatted, orbicular, or oval figure; and its moſt frequent ſize is between two and three inches in diameter. It is of an irregular, uneven, and rough ſurface, full of ſmall prominences, very harſh and rough to the touch, and looks merely like a lump of greyiſh hard clay. When broken, it is found, however, to conſiſt of a nucleus of the ſame ſhape with the whole body, and every way equally ſurrounded with a cruſt of a thickneſs equal to its whole diameter, or nearly ſo. The nucleus is of a deep and duſky browniſh-green colour, and of a plain ſimple ſtructure; being compoſed of no viſible moleculæ. The cruſt is of a pale, greyiſh-brown, earthy ſubſtance, appearing like an indurated earth, and glittering in ſome few places with ſmall gloſſy particles. This is found in great plenty in ſome of the clay-pits about London.

PYRIPOLYGONIUM, in natural hiſtory, the name of a genus of foſſils, the characters of which are, that they are compound, metallic bodies, of a regular figure, conſiſting of twelve planes.

There is only one known ſpecies of this genus, tho' ſubject to great varieties in its appearance; and this has been by authors hitherto confounded, with many other bodies of very different nature and figure, under the general name pyrites. The pyripolygonium, when perfect, is an extremely elegant and beautiful foſſil; but this is a ſtate it is very rarely found in. It is moderately firm, of a compact texture, and very heavy; tho' its natural figure be a regular body, compoſed of twelve planes, yet it is ſubject to great imperfections and irregularities. It is found from the twentieth part of an inch, to four inches in diameter; but its moſt common ſize is about a third of an inch. It is naturally of a poliſhed and ſhining ſurface, and of a pale whitiſh yellow; but ſometimes it is browniſh, or of an iron-colour. It is not unfrequent in Cornwall and Devonſhire; but is much more common in Germany.

PYRITRICHIPHYLLUM, in natural hiſtory, the name of a genus of foſſils of the claſs of the pyrites, the characters of which are theſe: they are compound, inflammable, metallic bodies, found in looſe maſſes, not of any regularly angular figure, and of a ſtriated texture, with foliaceous ends to the ſtriæ, appearing on the ſurface or within the maſs. See PYRITES.

Of this genus there are only two known ſpecies; one having the foliaceous ends of the ſtriæ on the outer ſurface of the maſs, and the other having a ſmooth external ſurface, and the foliaceous ends of the ſtriæ covering the ſides of internal hollows. The firſt is a foſſil of great beauty, of a very firm texture, remarkably heavy, and uſually found in large maſſes of an orbicular or oblong figure: theſe maſſes are ſometimes compoſed wholly of the matter of the pyrites, and in others they are only coats of that ſubſtance ſurrounding ſtones. The ſecond is a foſſil of equal beauty with the former, tho' of a very different appearance; it is very hard and very heavy, and is always found in detached maſſes; but theſe of a very ſingular kind, for they are always more or leſs hollow. Theſe maſſes are of various figures and appearances, ſometimes round and like pebbles, but more frequently full of odd protuberances, like the flints in our chalk-pits; and ſometimes the maſſes of it are found running over the ſurfaces of ſtones in form of cruſts, which are variouſly protuberant in different parts, and riſe into frequent beautiful tho' irregular tubercles.

PYRITRICHUM, in natural hiſtory, the name of a genus of pyrites, the characters of which are theſe: they are compound, inflammable, metallic foſſils, always found in detatched maſſes of no regularly angular figure, and of a ſimply ſtriated internal ſtructure. See the article PYRITES.

Of this genus of pyrites there are three known ſpecies, 1. A globoſe one, with an irregular ſurface. 2. A globoſe one, covered with angular tubercles. 3. A ſilver-coloured globoſe one, with a ſmooth

ſurface. The firſt is conſiderably hard, and very remarkably heavy, and is uſually of a roundiſh form, tho' ſometimes oblong; ſometimes it is full of irregular prominences on the ſurface, and ſometimes is a complex maſs, conſiſting of a great number of roundiſh maſſes of ſmoother or rougher ſurfaces joined together. It is very various in ſize; the more common ſpecimens of it are of ſix or eight ounces weight, tho' there are others of leſs than an ounce, and ſome of ſeveral pounds. The ſecond is a very firm and hard body, uſually of an orbicular figure, and ſometimes, tho' rarely, oblong; it is of a very remarkable rough ſurface, being covered with pyramidal tubercles, with very obtuſe ends. The third is an extremely elegant and beautiful ſpecies, it is but moderately hard, tho' remarkably heavy, and is uſually of a regularly orbicular form, tho' ſometimes it varies from that like the other pyrites. Its moſt frequent ſize is about an inch and half in diameter; but it is ſometimes found as ſmall as a nut, or a ſchool-boy's marble, and ſometimes of more than two pounds weight. Its ſurface is uſually ſmooth and even, and it is never covered with any coat or cruſt. It is of a very regularly ſtriated internal ſtructure, and of a beautiful ſilvery green colour: the ſtriæ are moderately broad, and run very evenly from the center to the circumference; and very often there is a ſmall and firm central nucleus, which is much harder than the reſt of the maſs, and is of a plain not ſtriated ſtructure. All the three ſpecies are found plentifully in different parts of the kingdom: the firſt in all ſorts of ſtrata, and often looſe on the ground; the ſecond, principally in the chalk-pits of Kent and Suſſex; and the laſt in Eſſex and Hampſhire, and very frequently in the German mines.

PYROCTOGONIUM, in natural hiſtory the name given by Dr. Hill to a genus of foſſils comprehended by authors, with many other bodies, under the general name pyrites. See PYRITES.

The characters of the pyroctognium are theſe: it is a compound, inflammable, metallic body, of a regular octohaedral figure, or compoſed of eight planes. There is only one known ſpecies of this genus, which is a very ſingular and elegant foſſil, being compoſed of eight triangular planes; theſe being the ſides of two quadrilateral pyramids with broad baſes, which being joined baſe to baſe, conſtitute the pyroctogonium.

R.

RAISINS. (*Dict.*) RAISIN-*brandy*, a name given by our diſtillers to a very clear and pure ſpirit, procured from raiſins, fermented only with water. Thus treated, they yield a ſpirit ſcarce at all diſtinguiſhable from ſome of the wine-ſpirits; for there are as many kinds of wine-ſpirits, as there are of grapes. The coarſer the operation of diſtilling is performed in this caſe, the nearer will be the reſemblance of the wine-ſpirit; that is, there will be moſt of this flavour in the ſpirit, when as much as can be of the oil is thrown up with a galloping heat. Dr. Shaw obſerves, that the diſtillers are very fond of the wine-ſpirit, with which they hide and diſguiſe the taſte of their nauſeous malt, and other ſpirits; and in defect of that ſpirit, this of raiſins, made in this coarſe manner, will go almoſt as far. It is indeed ſurpriſing how extenſive the uſe of theſe flavouring ſpirits is, ten gallons of raiſin-ſpirit, or ſomewhat leſs of the wine-ſpirit, being often ſufficient for a whole piece of malt-ſpirit, to take off its native flavour, and give it an agreeable vinoſity. It is no wonder therefore, that the diſtillers and ordinary rectifiers are ſo fond of this, as it is a good cloak for the defects and imperfection of their proceſſes. When raiſin-brandy is intended for common uſe, the fire ſhould be kept ſlower and more regular in the diſtillation, and the ſpirit, though it hath leſs of the high flavour of the grape, will be more pleaſant and more pure.

RECTIFIER, (*Dict.*) in the diſtillery, the perſon whoſe employment it is to take the coarſe malt-ſpirit of the malt-ſtiller, and re-diſtil it to a finer and better liquor. The art of the rectifier, according

cording to Dr. Shaw, might be entirely ſet aſide, if the malt-ſtiller could make his ſpirit perfect at the ſecond operation; which ſeems very practicable, if the malt-ſtillers could be got to forſake their old track. The great things to be recommended for the improvement of their art, would be firſt the brewing in perfection, and ſecondly the keeping their waſh after the manner of ſtale beer, till it has entirely loſt its malt-flavour, and acquired a pungent, acid vinoſity; and then, thirdly, leaving out the lees, to diſtill with a well regulated fire. It is ſcarce to be thought how pure a ſpirit is to be obtained from malt this way: but the great art would be, the finding a way to make malt liquors artificially ſtale, bright, and flavourleſs, though otherwiſe vinous.

RELL-MOUSE, in zoology, the white bellied mus, with a blackiſh back and a long body. See MUS.

This creature is not ſo thick in the body as the common rat, but is longer, and approaches in ſome degree to the form of the weaſel; the head is oblong, large at the upper part, but very ſlender at the ſnout; both the jaws are equal in length, and the upper lip is ſplit, as in the hare; the teeth are long, ſlender, and ſharp; the eyes are black and prominent; the ears are ſhort, naked, and obtuſe; the tail is ſhort and hairy; and the legs are ſhort, eſpecially the anterior pair.

RHOMBOIDIA, in natural hiſtory, the name of a genus of ſpars, given them from their being of a rhomboidal form. They owe this figure to an admixture of particles of iron, and conſiſt of ſix planes. Of this genus there are only two known ſpecies. 1. A white, thin one, with very thin cruſts; and 2. A whitiſh brown thick one, with thicker cruſts. Theſe are both found in the foreſt of Dean in Glouceſterſhire, and in other places where there are iron-ores.

RICHARDIA, in botany, a genus of the *hexandria monogynia* claſs of plants, the corolla whereof conſiſts of a ſingle petal, of an infundibuliform ſhape; the limb is divided into ſix parts, erect and acute; there is no pericarpium; the ſeeds are three, roundiſh, angular on one ſide, broadeſt upwards, and gibbous.

ROCK, *rupes*, a large maſs or block of hard ſtone rooted in the ground. See STONE.

ROCK-*alum*. See ALUM.

ROCK-*cryſtal*, otherwiſe called ſprig-cryſtal, in natural hiſtory, a name given to the third order of cryſtals, from their being affixed to a rock, or other ſolid body.

This kind of cryſtal is the moſt common of all others, and is what the generality of authors deſcribe under the name of cryſtal of the ſhops, being that kept for medicinal purpoſes. See CRYSTAL.

The cleareſt, pureſt, and moſt tranſparent that can be had, ought to be choſen; and to prove its genuineneſs, it may be tried with aqua fortis, true cryſtal making no efferveſcence with that menſtruum.

ROCK-*fiſh*, a common engliſh name for the gobius marinus, or ſea gudgeon.

ROCK-*oil*. See PETROLEUM.

ROCK-*ſalt*. See SALT.

ROYAL. (*Dict.*) ROYAL-EXCHANGE, the burſe or meeting-place of the merchants in London. See EXCHANGE.

It was built in 1566, at the charge of Sir Thomas Greſham, and in a ſolemn manner, by herald with ſound of Trumpet, in preſence of queen Elizabeth, proclaimed the royal exchange. Till that time the merchants met in Lombard-ſtreet. It was built of brick, yet then eſteemed the moſt ſplendid burſe in Europe. An hundred years after its building, at the great fire, it was burnt down; but ſoon raiſed again in a ſtill more magnificent manner, the expence thereof amounting to £. 50,000. One half of this ſum was diſburſed by the chamber of London, the other by the company of mercers, who, to reimburſe themſeves, let to hire 190 ſhops above ſtairs, at £. 20 each, which, with other ſhops, &c. on the ground, yield a yearly rent of above £. 4000; yet the ground it ſtands on does not exceed three-fourths of an acre, whence it is obſerved to be much the richeſt ſpot of ground in the world. It is built quadrangular, with walks around, wherein the merchants of the reſpective countries aſſociate themſelves. In the middle of the area or court is a fine marble-ſtatue of king Charles II. in the habit of a roman Cæſar, erected by the ſociety of merchant-adventurers. Around are the ſtatues of the ſeveral kings ſince the Norman conqueſt, ranged.

ROYAL-*oak*, a fair ſpreading tree at Boſcobel, in the pariſh of Donnington in Staffordſhire, the boughs whereof were once covered with ivy; in the thick of which king Charles II. ſat in the day-time with colonel Careleſs, and in the night lodged in Boſcobel-houſe; ſo that they are miſtaken who ſpeak of it as an

old

old hollow oak, it being then a gay flouriſhing tree, ſurrounded with many more. The poor remains thereof are now fenced in with a handſome wall, with this inſcription over the gate in gold-letters. *Fœliciſſimam arborem quam in aſylum potentiſſimi regis* Caroli II. *Deus op. max. per quem reges regnant, hic creſcere voluit*, &c.

ROYAL-*ſociety*. See SOCIETY.

RUNGS, in a ſhip, the ſame with the floor or ground timbers, being the timbers which conſtitute her floor, and are bolted to the keel, whoſe ends are rung-heads.

RUNG-*heads*, in a ſhip, are made a little bending, to direct the ſweep or mold of the futtocks and naval timbers: for here the lines, which make the compaſs and bearing of a ſhip, do begin.

RUNNING. (*Dict.*) RUNNING, in antiquity, made one of the exerciſes performed in the pentathlon or quinquertium. See PENTATHLON.

This exerciſe was in ſo great eſteem among the antient Greeks, that ſuch as prepared themſelves for it, thought it worth their while to burn or parch their ſpleen, becauſe it was believed to be an hindrance to them. Indeed, all thoſe exerciſes, that conduced to fit men for war, were more eſpecially valued; and that ſwiftneſs was eſteemed ſuch in an eminent degree, appears from Homer's giving his hero the epithet of ποδας ωκυς Αχιλλευς.

RUPERT's DROPS, a ſort of glaſs-drops with long and ſlender tails, which burſt to pieces on the breaking off thoſe tails in any parts, ſaid to have been invented by prince Rupert, and therefore called after his name. This ſurpriſing phænomenon is ſuppoſed to riſe from hence, that while the glaſs is in fuſion, or in a melted ſtate, the particles of it are in a ſtate of repulſion; but being dropped into cold water, it ſo condenſes the particles in the external parts of their ſuperficies, that they are eaſily reduced within the power of each others attraction, and by that means they form a ſort of hard caſe, which keeps confined the beforementioned particles in their repulſive ſtate; but when this outer-caſe is broke, by breaking off the tail of the drop, the ſaid confined particles have then a liberty to exert their force, which they do by burſting the body of the drop, and reducing it to a very peculiar form of powder.

Book of RUTH, a canonical book of the Old Teſtament, being a kind of appendix to the book of judges, and an introduction to thoſe of Samuel; and having its title from the perſon whoſe ſtory is here principally related. In this ſtory are obſervable the antient rights of kindred and redemption, and the manner of buying the inheritance of the deceaſed, with other particulars of great note and antiquity.

S.

SABOT, a kind of wooden ſhoe, much wore by the peaſants in France. See the article CALIGA.

SAL. (*Dict.*) SAL CIRCULATUM, in chemiſtry, a term uſed by Paracelſus for a preparation of ſea-ſalt, of which he diſtinguiſhes two kinds, under the name of the circulatum minus, and the circulatum majus. Theſe ſeem to have a great affinity with the famous alkaheſt, or univerſal ſolvent, ſo much talked of in the works of this author and his ſucceſſor Van Helmont. See ALKAHEST.

SALINE, a name given to a preparation of ſea-ſalt, procured from the froth of the ſea, hardened by the ſun in hot countries. It is called by ſome authors pilatro de Levante, and is uſed in glaſs-making; and in the making the fine purple-colour from cochineal, by boiling it in a ſmall quantity, with the bran and fœnugreek, of which the magiſtery is made for that purpoſe.

SALINE is alſo the name given by authors to ſprings of ſalt-water, called by us ſalt-wells, ſalt-ſprings, and brine-pits.

SALINE *principle*, a term uſed by the chemical writers, to expreſs a conſtituent part of ſeveral mixt bodies, on which their exiſtence in that form depends; and which, though always exiſtent in them, and always ſeparable by art, is yet not per-

perceivable in many of them in the complex.

SALINE *earths*. The chemiſts under this, as a general head, reckon all thoſe ſaline and earthy ſubſtances, which are calcined or burnt in the fire: as all the kinds of lime, pot-aſhes, ſoot, and the like; theſe being ſo many mixtures of ſalt and earth; and all ſalts appearing to them, indeed, on a rigorous examination, to be only earths of different natures, which when reduced to a certain degree of ſubtilty or fineneſs of parts, ſo as permanently to diſſolve in water, are then emphatically denominated ſalts.

Books of SAMUEL, two canonical books of the Old Teſtament, ſo called, as being uſually aſcribed to the prophet Samuel. The books of Samuel, and the books of Kings are a continued hiſtory of the reigns of the kings of Iſrael and Judah; for which reaſon the books of Samuel are likewiſe ſtyled the firſt and ſecond books of Kings. Since the firſt twenty-four chapters contain all that relates to the hiſtory of Samuel, and that the latter part of the firſt book, and all the ſecond, include the relation of events that happened after the death of that prophet, it has been ſuppoſed that Samuel was author only of the firſt twenty-four chapters, and that the prophets Gad and Nathan finiſhed the work. The firſt book of Samuel comprehends the tranſactions under the government of Eli, and Samuel; and under Saul, the firſt king; and alſo the acts of David, whilſt he lived under Saul; and is ſuppoſed to include the ſpace of an hundred and one years. The ſecond book contains the hiſtory of about forty years, and is wholly ſpent in relating the tranſactions of kind David's reign.

SANIDIUM, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ, but neither of the rhomboidal nor columnar kinds, nor any other way diſtinguiſhable by its external figure, being made up of ſeveral plain, flat plates. See the article SELENITÆ. The ſelenitæ of this genus are of no determinate form, nor conſiſt of any regular number of planes or angles, but are merely flat, broad, and thin plates or tables, compoſed of other yet thinner plates, like the talcs, but diſtinguiſhed from thoſe bodies by this, that theſe plates are made up of arangements of ſlender fibres, diſpoſed obliquely, but in uninterrupted lines acroſs the body. Of this genus there are only two known ſpecies, the one colourleſs and pellucid, the other whitiſh and opake. The firſt is found pretty frequently about Oxford, as alſo in Northamptonſhire, Yorkſhire, and other counties; the other is very common in all parts of Germany, and is found alſo in Leiceſterſhire, and ſome other parts of England, but with us about London it is not common.

SAPHENA, in anatomy, a vein which ariſing over the malleolus internus up along the leg and the inner-part of the thigh, diſcharges itſelf near the groin into the crural vein. It is this vein they uſually open when they bleed in the foot for ſuppreſſions of the menſes. See the article PHLEBOTOMY.

SAPHETA, in architecture, is the board over the top of a window, placed parallel and oppoſite to the window ſtool at the bottom.

SAPIENTIAL, an epithet applied to certain books of ſcripture, calculated for our inſtruction and improvement in prudence or moral wiſdom, thus called in contradiſtinction to the hiſtorical and prophetical books. See BIBLE, *&c.* The ſapiential books are Proverbs, Canticles, Eccleſiaſtes, the Pſalms, and Job; though ſome reckon this laſt among the hiſtorical books. See the articles HAGIOGRAPHER, CANTICLES, *&c.*

SAPIENTIÆ *dentes*, in anatomy, the two laſt or inmoſt of the dentes molares of the upper-jaw, one on each ſide, thus called becauſe they appear not till perſons are grown. See the article TOOTH.

SAPIENZA, an iſland and cape in the mediterranean ſea, on the ſouth-weſt point of the Morea, eaſt long. 21° 15′. north lat. 36° 45′.

SAPPHIC, in poetry, a kind of verſe much uſed by the Greeks and Latins, denominated from the inventreſs Sappho. The ſapphic verſe conſiſts of five feet, whereof the firſt, fourth and fifth are trochees, the ſecond a ſpondee, and the third a dactyl; as in

1	2	3	4	5
Aure-	*am quiſ-*	*quis medi-*	*ocri-*	*tatem*
Dili-	*git, tu-*	*tus caret*	*obſo-*	*leti*
Sordi-	*bus te-*	*cti, caret*	*invi-*	*denda.*

and after every three ſapphic verſes, there is generally ſubjoined an adonic verſe, as

Sobrius aulâ.

See the article ADONIC.

SCAL-

SCALPRA *dentalia*, inſtruments uſed by the ſurgeons to take off thoſe black, livid, or yellow cruſts, which infeſt the teeth, and not only looſen and deſtroy them, but taint the breath. According to the varieties of the occaſion, the ſurgeon has theſe inſtruments of various ſhapes and ſizes; ſome are pointed, and narrow at the end; others are broader pointed, and have edges, others are hooked, or falciform, but theſe are uſually, for convenience of carriage, all adapted to one handle. The manner of uſing them is to begin near the gums, ſupporting the blade with the left-hand, and ſcraping all along the tooth, till the cruſt is taken off, taking care not to wound the gums, or diſplace the teeth.

SCANSORIUM, in Roman antiquity, an engine whereby people were raiſed aloft, that they might ſee more conveniently about them. The ſcanſorium amounted to the ſame with what was called the acrobatica among the Greeks. Authors are divided as to the office of this engine. Turnebus and Barbarus, take it to have been of the military kind, raiſed by beſiegers, high enough to over-look the walls, and diſcover the ſtate of things on the other ſide. Baldus rather ſuppoſes it a kind of moveable ſcaffold, or cradle contrived for raiſing painters, plaiſterers, and other workmen, to the tops of houſes, trees, *&c.* Some ſuſpect that it might have been uſed for both purpoſes.

SCAPULA. (*Dict.*) *Fracture of the* SCAPULA. The ſcapula is uſually fractured either near its acromion, or head where it joins the clavicle, or in ſome more diſtant part. If the fracture happens in the proceſs of the acromion, the reduction will be eaſily made, by lifting up the arm to relax the deltoid-muſcle, and puſhing the arm evenly upwards, making the fractured parts meet together with the fingers: but notwithſtanding their reduction is ſo eaſy, they eaſily ſlip away again from any ſlight cauſe, and ſo are difficultly agglutinated. They are in particular very eaſily ſeparated by the weight and motion of the arm, and by the contraction of the deltoid-muſcle, inſomuch that there is ſcarce ever an inſtance of a fractured acromion being ſo perfectly cured, as to admit afterwards of a free motion of the arm upwards: all means muſt, however, be uſed to endeavour to keep the replaced bones in their proper ſituation. A compreſs, wet with ſpirit of wine, is to be applied to the fracture, a ball is to be put under the arm-pit to ſupport it; the whole is to be bound up with the bandage commonly called ſpica, and the arm is to be ſuſpended in a ſaſh or ſling hung about the neck. But if the neck of the ſcapula, which lies under the acromion, or its acetabulum, ſhould be fractured, which is a caſe that indeed very ſeldom happens, and when it does is very difficult to diſcover, it is a hundred to one but from the vicinity of the articulation, the tendons, muſcles, ligaments, nerves, and large veins and arteries, there will follow a ſtiffneſs and loſs of motion in the joint; great inflammation is alſo to be apprehended, and abſceſſes with the worſt ſymptoms, and ſometimes death itſelf.

SCARBOROUGH. (*Dict.*) SCARBOROUGH *water*. The water of this medicinal ſpring has been the ſubject of great conteſts and diſputes among the phyſical people; all allowing it conſiderable virtues, but ſome attributing them to one ingredient, others to another.

SCATCH-MOUTH, in the manege, a bit-mouth, differing from a canon-mouth in this, that the cannon is round, whereas a ſcatch is more upon the oval. That part of the ſcatch-mouth that joins the bit-mouth to the branch, is likewiſe different; a cannon being ſtayed upon the branch by a fonceau, and a ſcatch by a chaperon, which ſurrounds the banquet. The effect of the ſcatch-mouth is ſomewhat greater than that of the canon-mouth, and keeps the mouth more in ſubjection. Commonly ſnaffles are ſcatch-mouths.

SCLEROPTERA, in natural hiſtory, the name of that claſs of inſects which have four wings, the exterior flexile, and the interior membranaceous; and which have the aperture of the mouth bent under the breaſt.

SCORE. (*Dict.*) SCORE in muſic, denotes partition, or the original draught of the whole compoſition, wherein the ſeveral parts, *viz.* treble, ſecond treble, baſs, *&c.* are diſtinctly ſcored and marked. See PARTITION and MUSIC.

SCOT, *ſcotta*, a cuſtomary contribution laid upon all ſubjects according to their abilities. Whoever were aſſeſſed to any contribution, though not by equal portions were ſaid to pay ſcot and lot. See the article LOT.

SCOTIA,

SCOTIA, in architecture, a ſemicircular cavity or channel between the tores, in the baſes of columns. See the articles COLUMN and BASE.

The Scotia has an effect juſt oppoſite to that of the quarter-round. Our workmen frequently call it the caſement.

It is alſo called trochilus, partly from its form. See TROCHILUS, *&c.*

In the ionic and corinthian baſe, there are two ſcotias, the upper whereof is the ſmaller. See IONIC and CORINTHIAN.

According to Felibien, the cavetto is a fourth part of the ſcotia. See the article CAVETTO.

SCOTISTS, a ſect of ſchool-divines and philoſophers, thus called from their founder J. Duns Scotus, a Scotiſh, or as others ſay, an Iriſh cordelier, who maintained the immaculate conception of the virgin, or that ſhe was born without original ſin, in oppoſition to Thomas Aquinas and the Thomiſts. See THOMISM.

As to philoſophy, the Scotiſts were like the Thomiſts, only diſtinguiſhed by this, that in each being, as many different qualities as it had, ſo many different formalities did they diſtinguiſh, all diſtinct from the body itſelf, and making as it were ſo many different entities, only thoſe metaphyſical, and as it were ſuperadded to the being.

SCOTOMIA, or SCOTOMA, in medicine, a dizzineſs or ſwimming in the head, wherein the animal ſpirits are ſo whirled about, that external objects ſeem to turn round. See the article VERTIGO.

SCRATCH, in the language of the ſalt-workers of our country, the name of a calcarious, earthy, or ſtony ſubſtance, which ſeparates from ſea-water in boiling it for ſalt. This forms a thick cruſt, in a few days, on the ſides and bottoms of the pans, which they are forced to be at the pains of taking off once in a week, or ten days, otherwiſe the pans burn away and are deſtroyed. See SALT.

SCRATCH-PANS, in the Engliſh ſalt-works, a name given to certain leaden pans, which are uſually made about a foot and half long, a foot broad, and three inches deep, and have a bow, or circular handle of iron, by which they may be drawn out with a hook, when the liquor in the pan is boiling, See the article SALT.

The uſe of theſe pans is to receive a calcarious earth, of the nature of that which incruſts our tea-kettles, which ſeparates from the water in boiling; this ſubſtance they call ſcratch; and theſe pans, being placed at the corners of the ſalt-pan, where the heat is leaſt violent, catch it as it ſubſides there.

SCRATCH-WORK, *ſgraffiata*, a way of painting in freſco, by preparing a black ground, on which is laid a white plaiſter, which white being taken off with an iron bodkin, the black appears through the holes, and ſerves for ſhadows. See the article SGRAFFIT.

This kind of work is laſting, but, being very rough, is unpleaſant to the ſight.

SCRATCHES, among farriers, a diſtemper incident to horſes, conſiſting of dry ſcabs, chops, or rifts, that breed between the heel and the paſtern-joint. There are various kinds of ſcratches, diſtinguiſhed by various names, as crepances, rats-tails, mules, kibes, pains, *&c.* which are all ſo many ſpecies of the ſame malady, engendered from ſome dry humour falling on the legs, or from the fumes of the beaſts own dung lying under his heels, eſpecially after a journey from over-hard riding, *&c.* This diſorder begins firſt with dry ſcabs in the paſtern-joint in ſeveral forms. It is known by the ſtaring, dividing and curling of the hair on the ſpot.

SCRUPI, in natural hiſtory, a claſs of foſſils, formed into large detached maſſes without cruſts, and compoſed of a variouſly debaſed cryſtalline matter. Of this claſs there are two orders, and under thoſe four genera, *viz.* the firſt order comprehends thoſe ſcrupi, of a more rude and irregular ſtructure in the maſs, as the telaugia; and the ſecond order comprehends thoſe of a more equal and regular conſtitution, as the petridia and the jaſpides. See TELAUGIA, *&c.*

SECOMIÆ, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſeptariæ, the characters of which are; that they are bodies of a duſky hue, didided by ſepta, or partitions of a ſparry matter, into ſeveral more or leſs regular portions, of a moderately firm texture, not giving fire with ſteel, but fermenting with acid menſtrua, and eaſily calcining. See SEPTARIÆ.

The ſeptariæ of this genus are, of all others, the moſt common, and are what have been known by the little expreſſive, or miſtaken names of the waxen vein, or ludus helmontii. We have many ſpecies of theſe bodies common among us.

us. Of the whitiſh or browniſh kinds we have thirteen; of the yellowiſh five, and of the ferrugineous ones four.

SECOND. (*Dict.*) SECOND *deliverance, ſecunda deliberatione*, a judicial writ that lies after nonſuit of the plaintiff in replevin, and a returno habendo of the cattle replevied, adjudged to him that diſtrained them; commanding the ſheriff to replevy the ſame cattle again, upon ſecurity given by the plaintiff in the replevin for a redelivery of them, if the diſtreſs be juſtified. It is a ſecond writ of replevin, *&c.*

SECTA *ad curiam*, in law, a writ which lieth againſt him who refuſeth to perform his ſuit to the county-court, or court-baron.

SECTA *curiæ*, in our old writers, ſuits and ſervice done by the tenants at the court of their lord.

SECTA *facienda per illam quæ habet æniciam partem*, a writ to compel the heir that hath the elder's part among coheirs, to perform ſervice for all the coparceners.

SECTA *molendini*, a writ lying where a man by uſage, time out of mind, *&c.* has ground his corn at the mill of a certain perſon, and afterwards goes to another mill with his corn, thereby withdrawing his ſuit to the former. And this writ lies eſpecially for the lord againſt his tenants, who hold of him to do ſuit at his mill.

SECTA *regalis*, a ſuit by which all perſons were bound twice in a year to attend the ſheriff's tourn, and was called regalis, becauſe the ſheriff's tourn was the king's leet; wherein the people were to be obliged by oath to bear true allegiance to the king, *&c.*

SECTA *unica tantum faciendo pro pluribus hæreditatibus*, a writ that lies for an heir who is diſtrained by the lord to do more ſuits than one, in reſpect of the land of divers heirs deſcended to him.

SECTINEUS, in anatomy, a ſmall, flat, and pretty long muſcle, broad at the upper part, and narrow at the lower; ſituated obliquely between the os pubis, and the upper part of the os femoris. It is commonly a ſingle muſcle, but is ſometimes found double. It is fixed above by fleſhy fibres to all the ſharp ridge, or criſta of the os pubis, and to a ſmall part of the oblong notch, or depreſſion on the fore ſide of the criſta, in which the upper extremity of this muſcle is lodged; from thence it runs down obliquely towards the little trochanter, under, and a little behind which, it is inſerted obliquely by a flat tendon between the ſuperior inſertion of the vaſtus internus, and inferior inſertion of the triceps ſecundus, with which it is united.

SECTION. (*Dict.*) *Cæſarean* SECTION. See the article CÆSAREAN SECTION.

SEDITION, among civilians, is uſed for an irregular commotion of the people, or an aſſembly of a number of citizens without lawful authority, tending to diſturb the peace and order of the ſociety. This offence is of different kinds: ſome *ſeditions* more immediately threatening the ſupreme power, and the ſubverſion of the preſent conſtitution of the ſtate; others tending only towards the redreſs of private grievances. Among the Romans, therefore, it was variouſly puniſhed, according as its end and tendency threatened greater miſchief. In the puniſhment, the authors and ringleaders were juſtly diſtinguiſhed from thoſe, who with leſs wicked intention joined, and made part of the multitude. The ſame diſtinction holds in the law of England, and in that of Scotland. Some kinds of ſedition in England amount to high-treaſon, and come within the ſtat. 25 Edw. III. as levying war againſt the king. And ſeveral ſeditions are mentioned in the Scotch acts of parliament as treaſonable. The law of Scotland makes riotous and tumultuous aſſemblies a ſpecies of ſedition. But the law there, as well as in England, is now chiefly regulated by the riot act, made 1 Geo. I. only it is to be obſerved, that the proper officers in Scotland, to make the proclamation thereby enacted, are ſheriffs, ſtewards, and bailies of regalities, or their deputies; magiſtrates of royal burroughs, and all other inferior judges and magiſtrates; high and petty conſtables, or other officers of the peace in any county, ſtewartry, city or town. And in that part of the iſland, the puniſhment of the offence is death and confiſcation of moveables: in England it is felony. See the article RIOT.

SELTZER-*water*, the name of a mineral-water of Germany, which ariſes near Neider Seltz, and is now uſed in England and many other countries. We called it ſeltz, or ſaltzer-water, and the phyſicians preſcribe it in many caſes, as ſcurvies, ſpaſmodic affections, and in conſumptions; in the laſt caſe, mixing it with aſſe's milk.

SHEW-

SHEW-BREAD, among the Hebrews, the name given to thoſe loaves of bread which the prieſts placed every ſabbath-day upon the golden table in the ſanctuary. The ſhew-bread conſiſted of twelve loaves, according to the number of the tribes; theſe were ſerved up hot on the ſabbath-day, and at the ſame time the ſtale ones which had been expoſed all the week were taken away. It was not lawful for any one to eat of thoſe loaves but the prieſts only: this offering was accompanied with ſalt and frankincenſe, which was burnt upon the table at the time they ſet on freſh loaves.

SIDERIA, in natural hiſtory, the name of a genus of cryſtal, uſed to expreſs thoſe altered in their figure by particles of iron. Theſe are of a rhomboidal form, and compoſed only of ſix planes. Of this genus there are four known ſpecies: 1. A colourleſs, pellucid, and thin one, found in conſiderable quantities among the iron-ores of the foreſt of Dean in Glouceſterſhire, and in other the like places. 2. A dull, thick, and brown one, not uncommon in the ſame places with the former. And 3. A black and very gloſſy kind, a foſſil of very great beauty, found in the ſame place with the others, as alſo in Leiceſterſhire and Suſſex. See the article CRYSTAL.

SIDEROCHITA, in natural hiſtory, a name which Dr. Hill gives to a claſs of foſſils of a moderately firm and compact texture, and cruſtated ſtructure, compoſed of ferrugineous, mixed with earthy matter, and formed of repeated incruſtations, making ſo many coats or cruſts round a ſofter or harder nucleus; or round looſe earths, or an aqueous fluid. Of this claſs there are two orders, and under theſe four genera. The firſt order is of thoſe ſiderochita which contain regular and ſolid nuclei, and comprehends the empherepyra, and the heteropyra. The ſecond order is of thoſe ſiderochita, which contain no ſolid nucleus but looſe earthy matter, in form of powder, or an aqueous fluid, and comprehends the godes and the enhydrie. See the article EMPHEREPYRA, &c.

SIGN. (*Dict.*) SIGN in algebra, denotes a ſymbol or character. See CHARACTER. Mr. Mac Laurin obſerves, that the uſe of the negative ſign, in algebra, is attended with ſeveral conſequences that at firſt ſight are admitted with difficulty, and has ſometimes given occaſion to notions that ſeem to have no real foundation. This ſign implies that the real value of the quantity repreſented by the letter to which it is prefixed, is to be ſubſtracted; and it ſerves with the poſitive ſign, to keep in view what elements or parts enter into the compoſition of quantities, and in what manner, whether as increments, or decrements, (that is, whether by addition or ſubſtraction) which is, of the greateſt uſe in this art. See the article POSITIVE.

In conſequence of this, it ſerves to expreſs a quantity of an oppoſite quality to the poſitive, as a line in a contrary poſition; a motion with an oppoſite direction; or a centrifugal force in oppoſition to gravity; and thus often ſaves the trouble of diſtinguiſhing, and demonſtrating ſeparately, the various caſes of proportions, and preſerves their analogy in view. But as the proportion of lines depends on their magnitude only, without regard to their poſition; and motions, and forces, are ſaid to be equal, or unequal, in any given ratio, without regard to their directions: and, in general, the proportion of quantities relates to their magnitude only, without determining whether they are to be conſidered as increments or decrements; ſo there is no ground to imagine any other proportion of $-b$ and $+a$, (or of -1 and 1) than that of the real magnitudes of the quantities repreſented by b and a, whether theſe quantities are, in any particular caſe, to be added, or ſubſtracted. It is the ſame thing to ſubſtract a decrement as to add an equal increment, or to ſubſtract $-b$ from $a-b$, as to add $+b$ to it. and becauſe multiplying a quantity by a *negative* number implies only a repeated ſubſtraction of it, the multiplying $-b$ by $-n$, is ſubſtracting $-b$ as often as there are units in n; and is therefore equivalent to adding $+b$ ſo many times, or the ſame as adding $+nb$. But if we infer from this, that 1 is to $-n$ as $-b$ to nb, according to the rule, that unit is to one of the factors as the other factor is to the product, there is no ground to imagine that there is any myſtery in this, or any other meaning than that the real magnitudes repreſented by 1, n, b, and nb are proportional. For that rule relates only to the magnitude of the factors and product, without determining whether any factor, or the product, is to be added, or ſubtracted. But this

this likewiſe muſt be determined in algebraic computations; and this is the proper uſe of the rules concerning the ſigns, without which the operation could not proceed. Becauſe a quantity to be ſubſtracted is never produced in compoſition, by any repeated addition of a poſitive, or repeated ſubſtraction of a negative, a negative ſquare-number is never produced by compoſition from the root. Hence $\sqrt{-1}$, or the ſquare root of a negative, implies an imaginary quantity; and, in reſolution, is a mark or character of the impoſſible caſes of a problem, unleſs it is compenſated by another imaginary ſymbol, or ſuppoſition, when the whole expreſſion may have a real ſignification. Thus $1+\sqrt{-1}$, and $1-\sqrt{-1}$ taken ſeparately, are imaginary, but their ſum is 2; as the conditions that ſeparately would render the ſolution of a problem impoſſible, in ſome caſes deſtroy each other's effect, when conjoined. In the purſuit of general concluſions, and of ſimple forms for repreſenting them, expreſſions of this kind muſt ſometimes ariſe where the imaginary ſymbol is compenſated in a manner that is not always ſo obvious. See QUANTITY, POWER, &c.

By proper ſubſtitutions, however, the expreſſion may be transformed into another, wherein each particular term may have a real ſignification, as well as the whole expreſſion. The theorems that are ſometimes briefly diſcovered by the uſe of this ſymbol, may be demonſtrated without it, by the inverſe operation, or ſome other way; and though ſuch ſymbols are of ſome uſe in the computations by the method of fluxions, its evidence cannot be ſaid to depend upon arts of this kind.

SILESIAN-EARTH, *terra ſileſiaca*, in the materia medica, a fine aſtringent bole, called by ſome authors axungia ſolis. It is very heavy, of a firm compact texture, and in colour of a browniſh yellow. It breaks eaſily between the fingers, and does not ſtain the hands, is naturally of a ſmooth ſurface, and is readily diffuſible in water, and melts freely into a butter-like ſubſtance in the mouth. It leaves no grittineſs between the teeth, and does not ferment with acid menſtrua. Theſe are the characters by which it is known from all other earths of a like colour. It is found in the perpendicular fiſſures of rocks near the gold-mines at Strigonium in Hungary, and is ſuppoſed to be impregnated with the ſulphur of that metal. It is, however that be, a good aſtringent, and better than moſt of the boles in uſe.

Montanus gives us a high character of its virtues, and ſays, it is gold tranſmuted by nature into an admirable medicine. Sennertus commends it as excellent againſt malignant fevers, diarrhœas, &c. Agricola tells us, that the ſpirit of this earth diſſolves gold, as well as aqua regia, though more ſlowly, into a red ſolution; which, in a few days, precipitates the gold in fine powder. He alſo mentions another earth found at Weſterwald, preferable to this Sileſian earth.

SILEX, the *flint*, in natural hiſtory. See the article FLINT.

SINOPICA *terra*, in natural hiſtory, the name of a red earth of the ochre-kind, called alſo rubrica ſinopica, and by ſome authors ſinopis. It is a very cloſe, compact, and weighty earth, of a fine glowing purple colour, but in ſome ſpecimens much deeper than in others, and in ſome degenerating into paleneſs; but even in its worſt condition, it is a very fine colour. It is of a pure texture, but not very hard, and of an even, but duſty ſurface. It adheres firmly to the tongue, is perfectly fine and ſmooth to the touch, does not crumble eaſily between the fingers, and ſtains the hands. It melts very ſlowly in the mouth, and is perfectly pure and fine, and of a very auſtere aſtringent taſte, and ferments very violently with aqua fortis. It was dug in Cappadocia, and carried for ſale to the city Sinope, whence it had its name. It is now found in plenty in the New Jerſeys in America, and is called by the people there blood-ſtone, from its ſtaining the hands to a blood-colour, and may probably be had in many other places; and this deſerves thoroughly enquiring into, ſince there ſeems not one among the earths more worthy notice. Its fine texture and body, with its high florid colour, muſt make it very valuable to painters, and its powerful aſtringency equally ſo in medicine. The antients were well acquainted with it in fluxes and hæmorrhages, and experience ſhews it poſſeſſes the ſame virtues at this time. The deepeſt coloured is ever the moſt aſtringent.

SKINK, or ALSCHARCUR, in zoology, and the materia medica, a ſmall animal of the lizard kind, brought to us dry from

from Egypt, and recommended as a great reſtorative. See the article LIZARD. Whatever virtues this medicine may have freſh, as uſed by the Egyptians, it is obſerved, that it has none as it comes to us, and ſerves uſeleſsly to increaſe the articles of the mithridate. See MITHRIDATE.

SPINE. (*Dict.*) SPINES *of echini*, in natural hiſtory. Theſe in their foſſile ſtate make a great appearance in the cabinets of the curious, and in the works of the learned, and are of an almoſt infinite variety of kinds; and many of them are of the ſame figures and dimenſions with thoſe of the echini now living in our own and other ſeas, and well known to us. But beſide theſe, there are an almoſt infinite variety of others, which though allowed on all hands to be truly ſpines of ſome echini or other, yet evidently differ from thoſe of all the known recent fiſh of that name, and have certainly belonged to ſpecies of it, which we have not yet the leaſt knowledge of. Theſe, however different in ſhape from one another, yet all agree in their texture and conſtituent matter, both with one another, and with the foſſile remains that ſupply the places of the ſhells of the other ſpecies ſo common in our chalk-pits, all being compoſed of a plated, or tabulated ſpar. Both theſe ſhells and the ſpines, though they retain every outer lineament of the bodies they owe their form to, yet have they nothing of their interior texture, nor any the leaſt reſemblance of it, but are compoſed of plates ſet edgewiſe, or aſlant, in the ſhells, and in the ſpines always obliquely to the axis of the body; ſo that all the foſſile ſpines of echini break regularly in an oblique direction, and always ſhew on each part a perfectly ſmooth, and gloſſy, ſlanting ſurface.

Of the foſſile ſpines of echini ſome are long and ſlender, tapering from a broader baſis to a fine point, and ſometimes from a thick part, at or near the middle, to an obtuſe point at each end: theſe are uſually ſtriated, ridged, or furrowed, and often elegantly granulated, though ſometimes they are ſmooth. Theſe moſt reſemble the ſpines of the more common ſpecies of recent or living echini we are acquainted with; others of them are of the ſame length with the common long ones, but are very flat, and are ridged more or leſs high, or covered with tubercles of different ſhapes; others are ragged, and variouſly jagged, and knotted like a rough branch of fir, ſtript of its leaves, or that ſort of fucus called the ſea-ragged-ſtaff. The ſpines themſelves are uſually bedded in the ſtrata of chalk, though ſometimes they are found in the ſtone-quarries, and ſometimes, but that moſt rarely, bedded in clay, or looſe among gravel.

STALACTOCIBDELA, in natural hiſtory, the name of a genus of ſpars, formed by the dropping of water from the roofs of ſubterranean caverns; being the coarſer kinds of what authors have called ſtalactitæ. Theſe are cryſtallino-terrene ſpars, formed into oblong bodies, and found hanging from the roofs of caverns and grottos. See SPAR.

Of this genus there are only two known ſpecies. 1. A browniſh, friable one, common in our ſubterranean caverns, and even on the inſides of new-built ſtone-arches, as thoſe of the new bridge at Weſtminſter. And, 2. A ſnow-white, friable one, found in ſubterranean caverns in England and Germany, and even on modern-built brick-arches, as has of late been found on opening the vault under the terrace at Windſor. This, and the preceding inſtance, give us unqueſtionable evidence of the preſent, and daily formation of theſe bodies.

STALAGMITÆ. See the article STALAGMOSCIERIA.

STALAGMODIAUGIA, in natural hiſtory, the name of a genus of ſpars, being the purer kinds of what authors call ſtalagmitæ, or drop-ſtones. See SPAR.

Theſe are ſpars found in form of ſmall balls, each compoſed of numerous cruſts, and conſiderably pellucid and cryſtalline. Of this genus there are three known ſpecies. 1. A white one, with numerous, thin cruſts, and a ſmooth ſurface, found in many parts of Germany, and in England. 2. A greyiſh, white one, with thicker cruſts, and a rougher ſurface. And, 3. A yellow, thin-cruſted one, with an echinated ſurface. Theſe are both found in the ſubterranean caverns of England, and many other places, and the former of them is the confetti di tivoli of the Italians.

STALAGMOSCIERIA, in natural hiſtory, the name of a genus of opake ſpars, which have received their form from the dropping of water. See SPAR.

The bodies of this genus are the coarſer kinds

kinds of what are called by authors ſtalagmitæ, and are ſmall round maſſes, compoſed of numerous, thin cruſts, and of an opake and coarſe ſtructure. Of this genus we have only two known ſpecies. 1. A ſmall, browniſh, white one, with a ſmooth coat, found in Saxony, and ſome parts of England. And, 2. A ſmall, browniſh, white one, with thin cruſts, and a large nucleus. This is found in ſmall maſſes in Yorkſhire, and is the ſubſtance of which the famous Ketton-ſtone of Rutland is compoſed. Scotland affords a vaſt variety of the ſtalagmitæ. One cave, about eight miles diſtant from Aberdeen, on the ſea-ſide, has its whole roof cruſted over with ſtalactitæ, of a foot in length, hanging down like the fringe of a bed. The floor alſo is as deep covered with congeries of ſtalagmitæ. The upper coat, both of theſe and the ſtalactites, is of a ſea-colour, but the inner parts are as white as ſal prunellæ. The water, which drops from theſe, is of a very peculiar nature; for it is ſo acrimonious, that if it touch the ſkin but ever ſo ſlightly, it makes it ſmart. Near this cave there is another hollow rock, in which the ſtalactitæ make a very beautiful figure: they are all formed into long and thick columns, and ſtand perpendicularly, ſo that they repreſent the pipes of an organ; when broken, they are all found to be hollow within. The rock, and all the ſtone thereabouts, is of the lime-ſtone kind.

STANNUM, TIN. See the article TIN.

STAPHYLOMA, in ſurgery, the name of a diſtemperature of the eye, which is of two kinds: in one, the cornea is more than uſually protuberant; and in the other, the uvea breaks forth, and forms an unſightly tumour on the cornea, either from internal cauſes, or from ſome wounding inſtrument forced through the coat; in which laſt caſe, the ſight of the eye is uſually deſtroyed. This is a very dangerous diſorder, as it not only deforms the face, and deſtroys the ſight of the eye, but very often it induces violent inflammations, head-achs, reſtleſneſs, abſceſſes, and ſometimes a cancer in thoſe parts. In the cure of this diſorder, the tumour and deformity are to be relieved, according to Heiſter, by the application of compreſſes dipped in alum-water, together with a plate of lead and a bandage, or ſome proper inſtrument. If the uvea protrudes itſelf thro' a wound in the cornea, it ſhould be returned with a probe: the patient muſt be ordered to lie in a ſupine poſture; and the wound muſt conſtantly be dreſſed with the white of an egg, and a mucilage of quince-ſeeds, till it is healed; by this means the ſight is often reſtored.

If this diſorder is become inveterate and inflexible to all remedies, a needle, armed with a double thread, muſt be paſſed through the middle of the tumour, and the two ends of the thread are then to be tied on a knot, firſt on one ſide, and then on the other, by which means the tumour will gradually wither, and fall off along with the threads; but as this method occaſions a continued pain, and from thence ſometimes ariſe inflammations, it is better ſtill to cut off the tumour with a ſcalpel, or ſciſſors.

STEATITES, in the hiſtory of foſſils, a name given by late authors to a ſubſtance called, in Engliſh, ſoap-earth, and which, though the authors on theſe ſubjects had not taken notice of that circumſtance, was the very ſubſtance called cimolia purpuraſcens, or purple earth of Cimolus, by the antients. The later ages, finding the purple cimolian earth of the old writers to be wholly different from their white kind, have given that name (though it is not eaſy to gueſs why) to the common fuller's earth, which has no tinge of purple in its whole ſubſtance. This earth however, called by us ſoap-earth, and ſteatites, is well worth enquiring after, as a ſubſtance for imitating the fine porcelain ware of China. Dr. Woodward much recommends it on this account, and repeated trials have been made of it ſince his time, and ſome of them very lately; in all which it has afforded the fineſt earthen-ware ever made with us, and promiſes fair, with good management, for the equaling any in the world. It is dug in many parts of Devonſhire and Cornwall, and the neighbouring counties; the cliff of the Lizard-point is almoſt wholly compoſed of it, and the adjacent little iſlands abound with it; and from all theſe places it might be brought, at ſmall expence, in any quantities. It is known from all other earths by theſe characters: it is compoſed of extremely fine particles, and is of a firm, equal, and regular texture, and great weight. It is very firm and hard as it lies in the earth, but when it has been ſome time expoſed to the air, it becomes almoſt of a ſtony hardneſs.

It

It is of a perfectly fine, ſmooth, and gloſſy ſurface, ſofter to the touch than any other ſpecies of earth, and does not at all adhere to the tongue, or ſtain the fingers in handling; but drawn along a rough ſurface, as a piece of cloth, or the like, it marks it with a fine and even white line. In colour it is a clear white, veined and variegated very beautifully with purple of different degrees of deepneſs, and is of ſo fine a ſtructure of parts, that when cut into thin pieces it is in ſome degree tranſparent. It makes no effervescence with acids, and burns to a pure white, even in its purple parts.

STEGANIUM, SLATE, in foſſile hiſtory. See the article SLATE.

STING. (*Dict.*) Heiſter aſſures us, that the beſt cure for the ſting of bees or waſps is to anoint the part with vinegar mixed with theriaca; or theriaca mixed with ſpirit of wine; or armenian bole with vinegar.

STINT, in zoology, the name of a ſmall bird common about the ſea-ſhores in many counties of England, and ſeeming to be the ſame with the cinclus prior of Aldrovand, and the ſchæniclos, or junco of Bellonius, called by the French *alouette de mer*, the ſea-lark. See ALAUDA.

It is ſomewhat ſmaller than the common lark, and in ſhape reſembles the ſmaller ſnipe. Its beak is black, ſlender, and ſtrait; its feet of a greeniſh, or browniſh black; its back is grey, variegated with oblong, black ſpots, and its wings ſomewhat of a reddiſh brown; its neck is grey, and its head variegated with black and a reddiſh brown; its wings are long, and when folded reach beyond the end of the tail; and its rump is ſomewhat reddiſh, with black ſtreaks.

STOCKS. (*Dict.*) STOCKS in commerce. See STOCK-JOBBING and CAPITAL.

STRENGTH. (*Dict.*) Notwithſtanding the ſtrengths of the ſame animal at different times, or of different animals of the ſame ſpecies, are in proportion to the quantities of the maſs of their blood, yet the quantity of the blood may be increaſed in ſuch circumſtances, as to abate the ſtrength. The equilibrium between the blood and the veſſels being deſtroyed, wonderfully leſſens the ſtrength. The ſudden ſuppreſſion of perſpiration, tho' it increaſes the quantity of the blood, as it moſt conſiderably does by Sanctorius's calculation, yet it leſſens the ſtrength, becauſe the retained matter, being what ought to be evacuated, ſo alters the texture of the blood, as to make it unfit for muſcular motion. See the article PERSPIRATION, *&c.*

Bellini proves, that if the blood be ſo vitiated, as to increaſe or diminiſh ſtrength, it amounts to the ſame, as if the blood were in a natural ſtate, but its quantity increaſed or diminiſhed in the ſame proportion; ſo that the blood, when vitiated, may ſo impair the ſtrength of the muſcles, as even to ſpoil digeſtion; and yet, in ſome caſes, it may be ſo vitiated, as to help digeſtion, and increaſe ſtrength. See BLOOD, MUSCLE, *&c.*

M. de la Hire, in a calculation of the ſtrength of a man in drawing and bearing, ſhews, that the ſtrength of an ordinary man, walking in an horizontal direction, and with his body inclining forwards, is only equal to twenty-ſeven pounds, which is much leſs than one would have imagined. He adds, that this force would be much greater, if the man were to walk backwards; and that it is for this reaſon, the watermen fetch their oars from before backwards. It is known, by experience, that a horſe draws horizontally as much as ſeven men, conſequently his ſtrength muſt be 189 pounds. A horſe, as to puſhing forwards, has a great advantage over a man, both in the ſtrength of its muſcles, and the diſpoſition of its whole body; but the man has the advantage over the horſe in aſcending. M. de la Hire ſhews, that three men, laden with 100 pounds a-piece, will aſcend a pretty ſteep hill with more eaſe and expedition than a horſe laden with 300 pounds.

Dr. Deſaguliers ſhews, from a variety of experiments, that pretended feats of ſtrength is wholly owing to art, and accounts for them as not exceeding the power of any man of moderate ſtrength. See Deſagulier's Experimental Philoſophy, vol. I. page 265, ſeq.

For the manner of calculating the ſtrength of timber, ſee TIMBER.

For the ſtrength of ſpirits, ſee the articles PROOF, BRANDY, *&c.*

STRIGONENSIS TERRA, *earth of Strigonium*, in the materia medica, a red earth, of the bole kind, found about the gold-mines at Strigonium in Hungary, and uſed in ſome places as an aſtringent and ſudorific. See the article BOLE.

The characters by which it is known from the other earths are theſe: It is but of a coarſe and impure texture, and lighter than moſt of the boles in colour; it is of a ſtrong, but dull red, and is of

a tolerably ſmooth ſurface; it is apt to crumble to pieces between the fingers, and ſtains the ſkin in handling; it melts freely in the mouth, and has a remarkable ſmoothneſs, but very little aſtringency in its taſte, and leaves a ſenſible grittineſs between the teeth; it is ſometimes veined and ſpotted with ſmall moleculæ of an earth, like the whitiſh variegations of the red french bole.

SYMPEXIUM, in natural hiſtory, a genus of ſtones, of a fine, cloſe, compact, and firm texture, and of a plain, uniform ſtructure, ſplitting with equal eaſe in any direction. See the article STONE. Of this genus there are four different kinds, under each of which are reckoned ſeveral ſpecies. 1. The white, or whitiſh rock-ſtone comprehends the denſe, dull-looking, whitiſh ſympexium; the hard, greyiſh, white, dull ſympexium; the hard, porous ſympexium; the hard, bright, grey ſympexium; the hard, bright, browniſh, white ſympexium; the dull, yellowiſh, white, hard ſympexium; the dull, hard, browniſh, white ſympexium; the whitiſh, grey, marbly ſympexium; the yellowiſh, white, flinty ſympexium; and the browniſh, white, flinty ſympexium. 2. The bluiſh ſympexium comprehends the bluiſh, flinty ſympexium; the hard, bluiſh ſympexium; and the browniſh, blue, dull, hard ſympexium. 3. The reddiſh comprehends the dull, pale, red ſympexium; the hard, ſhining, red ſympexium; and the green and red, variegated ſympexium. 4. The black comprehending the hard, black, dull ſympexium; the hard, black, ſhining ſympexium; and the ſoft, dull, black ſympexium.

T.

TAPLINGS, in the engliſh ſalt-works, the name given to certain bars of iron, which ſupport the bottom of the pan in which the brine is boiled. See the article SALT.

Theſe pans are very large, and cover a wide furnace; but as their width would make them apt to bend in the middle, which would ſpoil the working of the ſalt, there is a ſort of wall made of brick carried along the middle of the furnace, and on the top of this are placed theſe taplings; they are about eight inches high, and from four to ſix in thickneſs, being ſmalleſt at the top. Theſe are placed at about three foot diſtance one from another, and the wall which ſupports them, and which is called the midfeather, is broad at the baſe, and ſo narrow at the top, as barely to give room for the baſes of the taplings.

TARANTOLA-FISH, a ſpecies of oſmerus, with eleven rays in the pinna ani. See the article OSMERUS.

This fiſh is of the ſize of the ſmelt, or larger; the body is rounded, and the belly flat; its thickneſs is about that of a man's thumb, when its length is ſeven inches; the belly is white, the head is flatted, and there is a little furrow between the eyes; the opening of the mouth is very large, and the roſtrum acute; there is in each jaw a ſingle ſeries of long teeth on each ſide of the palate; the back fin has twelve rays, and there is towards the extremity of the back a membranous appendage of the appearance of a fin, but without any rays: the pectoral fins have each thirteen rays.

TARRAGON, *dracunculus*, in botany, the engliſh name of the linear-leaved artemiſia. See the article ARTEMISIA.

TEETH. (*Dict.*) Foſſile teeth of fiſhes are known by three names; the gloſſopetræ, the bufonitæ, and the plectronitæ, See the article GLOSSOPETRÆ, *&c.*

TELAUGIA, in natural hiſtory, a genus of ſcrupi, of a glittering appearance, uſually containing flakes of talc, and emulating the ſtructure of the granites. See the article SCRUPI.

Of this genus Dr. Hill reckons no leſs than twelve ſpecies. 1. The hard, ſhining, black, and white telaugium. 2. The hard, ſhining, red, and white telaugium. 3. The red telaugium, variegated with white and black. 4. The hard, heavy telaugium, of a greyiſh-black, variegated with white. 5. The browniſh, red telaugium, variegated with white and yellowiſh. 6. The reddiſh, white telaugium, variegated with black and

and a gold colour. 7. The hard, white telaugium, variegated with brown. 8. The bluiſh, white, brittle telaugium. 9. The brown, friable telaugium, variegated with yellow. 10. The hard, purpliſh, brown telaugium, variegated with white and yellow. 11. The heavy, red telaugium, variegated with black and white. And, 12. The hard, bluiſh, green telaugium, variegated with white.

TEMACHIS, in natural hiſtory, the name of a genus of foſſils, of the claſs of the gypſums, the characters of which are theſe: It is of a ſofter ſubſtance than many of the other genera, and of a very bright and glittering hue. See the article GYPSUM.

The bodies of this genus are compoſed of an aſſemblage of multitudes of irregular, flaky fragments, as are all the gypſums; but no genus of them ſo viſibly ſo as this. There are but three known ſpecies of this genus. 1. A ſoft, ſhining, green one. 2. A ſoft, white one, of a marbly appearance. And, 3. A pale, brown, gloſſy one. The firſt is found in great plenty on the ſhores of rivers in the Eaſt-Indies; and though not known as a ſubſtance that would make a plaſter by burning, is given internally in nephritic caſes, being powdered without calcination. The ſecond is found in many parts of Derbyſhire, and is uſed for burning into plaſter for ſtuccoing of rooms, and caſting ſtatues, *&c.* And the third is found in Germany; and, beſide its common uſes in ſtuccoing and caſting, is in great eſteem among the metallurgiſts and aſſayers, for the making either ſingly or in mixture with bone-aſhes, their teſts. See the article TEST.

We have not this ſpecies in England ſo far as is yet known.

TETRADECARHOMBIS, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ, expreſſing a rhomboidal body, conſiſting of fourteen planes. See the article SELENITÆ.

The characters of this genus are, that the bodies of it are exactly of the ſame form with the common ſelenitæ; but that in theſe each of the end-planes is divided into two, and there are, by this means, eight of theſe planes inſtead of four. Of this genus there are only three known ſpecies. 1. A thin, pellucid one, with tranſverſe filaments, which is frequent in the clay-pits of Northamptonſhire, and ſome other counties. 2. A dull, thicker kind, with very ſlender, tranſverſe filaments: this is a very rare ſpecies, and found, as far as is yet known, only in Leiceſterſhire in the yellow brick-clay, and at ſmall depths. And, 3. A large ſcaly kind, conſiderably long, and of a very rough ſurface: this is found in Yorkſhire, and that ſometimes looſe, on the ſides of the hills, but more frequently buried in the ſtrata of clay.

TETRAPTERA, in the hiſtory of inſects, a name given to that order of inſects, which have four wings. See the article INSECT.

The inſects of this order are very numerous, and have certain evident diſtinctions in the ſtructure of their wings, and are thence arranged under five claſſes; *viz.* the coleoptera, ſcleroptera, neuroptera, lepidoptera, and hyrnenoptera. See article COLEOPTERA, *&c.*

TETRAPYRAMIDIA, in natural hiſtory, the name of a genus of ſpars, influenced in their ſhape by an admixture of particles of tin, and found in form of broad-bottomed pyramids of four ſides. See the article SPAR.

Of this genus there is only one known ſpecies, which is uſually of a browniſh colour, and found in Saxony, as alſo in Devonſhire, Cornwall, and other counties of England, where there is tin.

THERIACA. (*Dict.*) The theriaca andromachi is a reform of mithridate, made by Andromachus, phyſician to Nero; for the virtues whereof, ſee the article MITHRIDATE.

THRAUSTOMICTHES, in natural hiſtory, the name of a genus of compound earths, the bodies of which are loams compoſed of ſand and a leſs viſcid clay, and are therefore of a friable or crumbly texture. See the article EARTH.

The earths of this genus are generally uſed to make bricks, and there are ſeveral ſpecies of them. 1. A whitiſh one, dug in great plenty in Staffordſhire, and ſome other counties. 2. A browniſh white one, very plentiful about London. 3. A pale yellow one, common in moſt parts of England, at ſmall depths, 4. A ſharp rough one, of a deep yellow, dug near the town of Hedgerley, near Windſor, and commonly called Windſor-loam; it is not found in any other place, and is of great value; it makes the bricks uſed for the iron-furnaces, and ſerves at the glaſs-houſes; and among the chemiſts, as a very ſtrong and valuable lute; and is not only uſed in England, but carried to Holland and Germany,

many, and many other parts of the world. 5. A deep, dusky, yellow one, dug in most parts of England, near the surface. 6. A hard, brown one, found at some depth in Buckinghamshire, and usually found full of small shells; it is used for covering the ridges of barns, and copings of walls; and makes very firm and durable barn-floors. 7. A light, pale, brown one, the loosest and most friable of all the species, used in many places for making the bell-founders moulds. 8. A yellowish, brown one: this is common in most parts of the kingdom, and makes the fine red bricks, used for ornamenting buildings.

THRUPTOMICTHES, in natural history, a genus of earths, consisting of moulds of a lax, friable texture. See the articles EARTH and MOULD.

Of this genus there are only two species. 1. The red thruptomicthes, frequent in many counties; but no where more plentifully than about Rowel, in Northamptonshire: it is accounted a very fertile, good land, and, particularly, succeeds with crops of rye, barley, or pease. 2. The friable, brown thruptomicthes, frequent in Suffex, and in many other parts of the kingdom, and is generally accounted a poor, barren land.

THUNDERING LEGION, *legio fulminans*, was a legion in the roman army, consisting of christian soldiers, who, in the expedition of the emperor Marcus Aurelius against the Sarmatæ, Quadi, and Marcomanni, saved the whole army then ready to perish of thirst, by procuring, with their prayers, a very plentiful shower thereon, and at the same time a furious hail, mixed with lightening and thunder-bolts, on the enemy. See the article LEGION.

This is the account commonly given by ecclesiastical historians, and the whole history is engraven in bass-relievo's on the antonine column. And hence arose the denomination thunderers, tho' some say, that the legion, those christians were of, was called the thundering legion before.

THYITES, in the materia medica, the same with the lapis morochthus. See the article LAPIS.

THYROSTAPHYLINUS, in anatomy, the name of a muscle of the uvula, which, arising from the lateral part of the thyroide cartilage, and ascending towards the uva, becomes larger and is inserted in manner of an arch, in the side of the velum palatinum.

TICKLISH, in the manege. A horse is said to be tickliſh, that is too tender upon the spur, and too sensible; that does not freely fly the spurs, but in some measure resists them, throwing himself up, when they come near and prick his skin. A tickliſh horse has somewhat of the ramingues, *i. e.* the kickers against the spurs; but with this difference, that the latter put back, leap and kick, and yerk out behind, in disobeying the spurs; whereas a tickliſh horse only resists for some time, and afterwards obeys, and goes much better, through the fear of a vigorous ham, when he finds the horseman stretch his leg, than he does upon being actually pricked.

TILE, or TYLE, (*Dict.*) in assaying, a small flat piece of dried earth, used to cover the vessels in which metals are in fusion. Cramer directs, that these be made of a mixture of clay and sand, or powder of flints, or broken crucibles, formed into a paste, and spread thin with a rolling-pin on a table, or flat stone. From these cakes or plates, pieces are to be cut with a knife, to the shape and size of the mouths of the vessels to be closed. It is best then to pare away the borders of the under surface of the piece thus cut off, that this surface may immediately touch all the way the edge of the mouth of the vessel, leaving a prominent rim, by which means the tile sits close upon the vessel, and is not so easily displaced by accidents, as a touch of the poker, or of the coals put on to mend the fire, as it otherwise would be. Finally, put on the middle of the outer surface a small bit of the same matter, which serves as a kind of handle, by means of which it may be conveniently managed by the tongs, and easily taken off and put on again at pleasure.

TINGING *of marble*. The art of doing this has, in several peoples hands, been a very lucrative secret, though there is scarce any thing in it that has not at one time or other been published. Kircher has the honour of being one of the first, who published any thing practicable about it. This author, meeting with stones in some cabinets supposed to be natural, but having figures too nice and particular, to be supposed of nature's making, and these not only on the surface, but sunk through the whole body of the stones,

was at the pains of finding out the artiſt, who did the buſineſs; and on his refuſing to part with the ſecret on any terms, this author, with Albert Gunter, a Saxon, endeavoured to find it out; in which they ſucceeded at length very well. The method is this: Take aqua fortis and aqua regia of each two ounces, ſal armoniac one ounce, ſpirit of wine two drams, about twenty-ſix grains of gold, and two drams of pure ſilver; let the ſilver be calcined and put into a vial, and pour upon it the aqua fortis; let this ſtand ſome time, then evaporate it, and the remainder will firſt appear of a blue and afterwards of a black colour. Then put the gold into another vial, pour the aqua regia upon it, and when it is diſſolved, evaporate it as the former. Then put the ſpirit of wine upon the ſal armoniac, and let it be evaporated in the ſame manner. All the remainders, and many others made in the ſame manner from other metals, diſſolved in their proper acid menſtrua, are to be kept ſeparate, and uſed with a pencil on the marble. Theſe will penetrate without the leaſt aſſiſtance of heat, and the figure being traced with a pencil on the marble, the ſeveral parts are to be touched over with the proper colours, and this renewed daily till the colours have penetrated to the deſired depth into the ſtone. After this, the maſs may be cut into thin plates, and every one of them will have the figure exactly repreſented on both ſurfaces, the colours never ſpreading. The niceſt method of applying theſe, or the other tinging ſubſtances, to marble, that is to be wrought into any ornamental works, and where the back is not expoſed to view, is to apply the colours behind, and renew them ſo often till the figure is ſufficiently ſeen through the ſurface on the front, though it does not quite extend to it. This is the method that, of all others, brings the ſtone to a nearer reſemblance of natural veins of this kind.

TOLLENON, among the Romans, a warlike machine, formed in this manner: one beam was fixed very deep in the earth, and on the top of it another, more than twice as long, and moveable upon a center; on one end of this croſs-beam were placed a covering of hurdles or planks, within which a few ſoldiers were put, and by pulling down the other end with ropes, theſe were raiſed above the walls of a beſieged town.

TRACHEOTOMY, in ſurgery, the name of an operation otherwiſe called bronchotomy. See BRONCHOTOMY.

TRACING, or TRAINING, in mineralogy. See the article TRAINING.

TRANSFORMATION, in general, denotes a change of form, or the aſſuming a new form different from a former one. The chemiſts have been for a long time ſeeking the transformation of metals; that is, their tranſmutation, or the manner of changing them into gold. See the article TRANSMUTATION.

TRANSFORMATION *of equations*. The doctrine of the transformation of equations, and of exterminating their intermediate terms, is thus taught by Mr. Mac Laurin. The affirmative roots of an equation are changed into negative roots of the ſame value, and the negative roots into affirmative, by only changing the ſigns of the terms alternately, beginning with the ſecond. Thus, the roots of the equation $x^4 - x^3 - 19x^2 + 49x - 30 = 0$ are $+1, +2, +3, -5$; whereas the roots of the ſame equation having only the ſigns of the ſecond and fourth terms changed, *viz.* $x^4 + x^3 - 19x^2 - 49x - 30 = 0$, are $-1, -2, -3, +5$.

To underſtand the reaſon of this rule, let us aſſume an equation, as $\overline{x-a} \times \overline{x-b} \times \overline{x-c} \times \overline{x-d} \times \overline{x-e}$, &c. $= 0$, whoſe roots are $+a, +b, +c, +d, +e$, &c. and another having its roots of the ſame value, but affected with contrary ſigns, as $\overline{x+a} \times \overline{x+b} \times \overline{x+c} \times \overline{x+d} \times \overline{x+e}$, &c. $= 0$. It is plain, that the terms taken alternately, beginning from the firſt, are the ſame in both equations, and have the ſame ſign, being products of an even number of the roots; the product of any two roots having the ſame ſign as their product when both their ſigns are changed; as $+a \times -b = -a \times +b$.

But the ſecond terms and all taken alternately from them, becauſe their coefficients involve always the products of an odd number of the roots, will have contrary ſigns in the two equations. For example, the product of four, viz. $abcd$, having the ſame ſign in both, and one equation in the fifth term having $abcd \times +e$, and the other $abcd \times -e$, it follows, that their product $abcde$ muſt have contrary ſigns in the two equations: Theſe two equations, therefore, that have the ſame roots, but with contrary ſigns,

have nothing different but the ſigns of the alternate terms, beginning with the ſecond. From which it follows, that if any equation is given, and you change the ſigns of the alternate terms, beginning with the ſecond, the new equation will have roots of the ſame value, but with contrary ſigns. See EQUATION.

It is often very uſeful to transform an equation into another that ſhall have its roots greater or leſs than the roots of the propoſed equation by ſome given difference.

Let the equation propoſed be the cubic $x^3 - px^2 + qx - r = 0$. And let it be required to transform it into another equation, whoſe roots ſhall be leſs than the roots of this equation by the given difference (e); that is, ſuppoſe $y = x - e$, and, conſequently, $x = y + e$; then, inſtead of x, and its powers, ſubſtitute $y + e$, and its powers, there will ariſe this new equation:

$$(A)\ \left.\begin{array}{r} y^3 + 3ey^2 + 3e^2y + e^3 \\ - py^2 - 2pey - pe^2 \\ + qy + qe \\ - r \end{array}\right\} = 0$$

whoſe roots are leſs than the roots of the preceding equation by the difference (e).

If it had been required to find an equation whoſe roots ſhould be greater than thoſe of the propoſed equation by the quantity (e), then we muſt have ſuppoſed $y = x + e$, and, conſequently, $x = y - e$, and then the other equation would have had this form:

$$(B)\ \left.\begin{array}{r} y^3 - 3ey^2 + 3e^2y - e^3 \\ - py^2 + 2pey - pe^2 \\ + qy - qe \\ - r \end{array}\right\} = 0$$

If the propoſed equation be in this form, $x^3 + px^2 + qx + r = 0$, then, by ſuppoſing $x + e = y$, there will ariſe an equation agreeing, in all reſpects, with the equation (A), but that the ſecond and fourth terms will have contrary ſigns.

And by ſuppoſing $x - e = y$, there will ariſe an equation agreeing with (B), in all reſpects; but that the ſecond and fourth terms will have contrary ſigns to what they have in (B).

The firſt of theſe ſuppoſitions gives this equation,

$$(C)\ \left.\begin{array}{r} y^3 - 3ey^2 + 3e^2y - e^3 \\ + py^2 - 2pey + pe^2 \\ + qy - qe \\ + r \end{array}\right\} = 0$$

The ſecond ſuppoſition gives the equation,

$$(D)\ \left.\begin{array}{r} y^3 + 3ey^2 + 3e^2y + e^3 \\ + py^2 + 2epy + pe^2 \\ + qy + qe \\ + r \end{array}\right\} = 0$$

The firſt uſe of this transformation of equations is to ſhew how the ſecond (or other intermediate) term may be taken away out of an equation.

It is plain, that in the equation (A), whoſe ſecond term is $3e - p \times y^2$, if you ſuppoſe $e = \frac{1}{3}p$, and conſequently, $3e - p = 0$, then the ſecond term will vaniſh.

In the equation (C), whoſe ſecond term is $-3e + p \times y^2$, ſuppoſing $e = \frac{1}{3}p$, the ſecond term alſo vaniſhes.

Now the equation (A) was deduced from $x^3 - px^2 + qx - r = 0$, by ſuppoſing $y = x - e$: and the equation (C) was deduced from $x^3 + px^2 + qx + r = 0$, by ſuppoſing $y = x + e$. From which this rule may eaſily be deduced for exterminating the ſecond term out of any cubic equation.

Rule. Add to the unknown quantity of the given equation the third part of the coefficient of the ſecond term, with its proper ſign, *viz.* $\mp \frac{1}{3}p$, and ſuppoſe this aggregate equal to a new unknown quantity (y). From this value of y, find a value of x by tranſpoſition, and ſubſtitute this value of x, and its powers, in the given equation, and there will ariſe a new equation that ſhall want the ſecond term.

Example. Let it be required to exterminate the ſecond term out of this equation, $x^3 - 9x^2 + 26x - 34 = 0$, ſuppoſe $x - 3 = y$, or $y + 3 = x$; and ſubſtituting according to the rule, you will find

$$\left.\begin{array}{r} y^3 + 9y^2 + 27y + 27 \\ - 9y^2 - 54y - 81 \\ + 26y + 78 \\ - 34 \end{array}\right\} = 0$$

$$y^{3*} \quad - \quad y - 10 \quad = 0$$

In which there is no term where y is of two dimenſions, and an aſteriſk is placed in the room of the ſecond term, to ſhew it is wanting.

Let the equation propoſed be of any number of dimenſions repreſented by (n); and let the coefficient of the ſecond term, with its ſign prefixed, be $-p$; then ſuppoſing $x - \frac{p}{n} = y$, and, conſequently, $x = y + \frac{p}{n}$, and, ſubſtituting this va-

lue

lue for x in the given equation, there will arise a new equation that shall want the second term.

It is plain, that the sum of the roots of the proposed equation is $+p$; and since we suppose $y = x - \frac{p}{n}$, it follows, that in the new equation, each value of y will be less than the respective value of x by $\frac{p}{n}$; and since the number of the roots is n, it follows, that the sum of the values of y will be less than $+p$, the sum of the values of x, by $n \times \frac{p}{n}$, the difference of any two roots; that is, by $+p$: therefore, the sum of the values of y will be $+p-p=0$.

But the coefficient of the second term of the equation of y is the sum of the values of y, viz. $+p-p$, and, therefore, that coefficient is equal to nothing; and, consequently, in the equation of y, the second term vanishes. It follows then, that the second term may be exterminated out of any given equation by the following

Rule. Divide the coefficient of the second term of the proposed equation by the number of dimensions of the equation; and assuming a new unknown quantity y, add to it the quotient, having its sign changed. Then suppose this aggregate equal to x, the unknown quantity in the proposed equation; and for x, and its powers, substitute the aggregate and its powers, so shall the new equation, that arises, want its second term.

If the proposed equation is a quadratic, as $x^2 - px + q = 0$, then, according to the rule, suppose $y + \frac{1}{2}p = x$, and, substituting this value for x, you will find

$$\left.\begin{array}{r} y^2 + py + \frac{1}{4}p^2 \\ -py - \frac{1}{2}p^2 \\ + \quad q \end{array}\right\} = 0$$

$$y^2 \quad * - \tfrac{1}{4}p^2 + q = 0$$

And, from this example, the use of exterminating the second term appears: for, commonly, the solution of the equation, that wants the second term, is more easy. And, if you can find the value of y from this new equation, it is easy to find the value of x by means of the equation $y + \frac{1}{2}p = x$. For example, Since $y^2 + q - \frac{1}{4}p^2 = 0$, it follows, that $y^2 = \frac{1}{4}p^2 - q$, and $y = \pm\sqrt{\frac{1}{4}p^2 - q}$, so that $x = y + \frac{1}{2}p = \frac{1}{2}p \pm \sqrt{\frac{1}{4}p^2 - q}$.

If the proposed equation is a biquadratic, as $x^4 - px^3 + qx^2 - rx + s = 0$, then by supposing $x - \frac{1}{4}p = y$, or $x = y + \frac{1}{4}p$, an equation shall arise having no second term. And if the proposed is of five dimensions, then you must suppose $x = y \pm \frac{1}{5}p$. And so on.

When the second term in any equation is wanting, it follows, that the equation has both affirmative and negative roots, and that the sum of the affirmative roots is equal to the sum of the negative roots: by which means, the coefficient of the second term, which is the sum of all the roots of both sorts, vanishes, and makes the second term vanish.

In general, the coefficient of the second term is the difference between the sum of the affirmative roots and the sum of the negative roots: and the operations we have given serve only to diminish all the roots, when the sum of the affirmative is greatest, or increase the roots when the sum of the negative is greatest, so as to balance them, and reduce them to an equality.

It is obvious, that, in a quadratic equation that wants a second term, there must be one root affirmative, and one negative; and these must be equal to one another.

In a cubic equation that wants the second term, there must be either two affirmative roots equal, taken together, to a third root that must be negative; or, two negative equal to a third that must be positive.

Let an equation $x^3 - px^2 + qx - r = 0$ be proposed, and let it be now required to exterminate the third term.

By supposing $y = x - e$, the coefficient of the third term in the equation of y is found (see equation A) to be $3e^2 - 2pe + q$. Suppose that coefficient equal to nothing, and by resolving the quadratic equation $3e^2 - 2pe + q = 0$, you will find the value of e, which, substituted for it in the equation $y = x - e$, will shew how to transform the proposed equation into one that shall want the third term.

The quadratic $3e^2 - 2pe + q = 0$ gives $e = \frac{p \pm \sqrt{p^2 - 3q}}{3}$.

So that the proposed cubic will be transformed into an equation wanting the 3d term, by supposing $y = x - \frac{p - \sqrt{p^2 - 3q}}{3}$, or $y = x - \frac{p + \sqrt{p^2 - 3q}}{3}$.

If

If the propoſed equation is of n dimenſions, the value of e, by which the third term may be taken away, is had by reſolving the quadratic equation $e^2 + \frac{2p}{n} \times e + \frac{2q}{n \times n-1} = 0$, ſuppoſing $-p$ and $+q$ to be the coefficients of the ſecond and third terms of the propoſed equation.

The fourth term of any equation may be taken away by ſolving a cubic equation, which is the coefficient of the fourth term in the equation when transformed. The fifth term may be taken away by ſolving a biquadratic; and, after the ſame manner, the other terms can be exterminated, if there are any.

TRICHESTRUM, in natural hiſtory, the name of a genus of foſſils, of the claſs of the ſelenitæ, but differing extremely in figure and ſtructure from the common kinds. See the article SELENITÆ.

The ſelenitæ of this genus are compoſed of filaments ſcarce any where viſibly arranged into plates or ſcales, but diſpoſed in form of a radiated ſtar, made of a number of diſjunct ſtriæ.

TRIEDROSTYLA, in natural hiſtory, the name of a genus of ſpars, in form of trigonal columns, adhering by one end to ſome ſolid body, and terminated at the other by a trigonal pyramid. See SPAR. Of this genus there are four known ſpecies. 1. A ſlender one, with a long, obtuſe pyramid: this is one of the moſt common of all the ſpars, and is found in almoſt all parts of the world, ſometimes in ſingle and large ſpecimens, but more frequently in large congeries, coating over the fiſſures of ſtone, in form of cruſts. 2. One with ſhort, but pointed pyramids, common on Mendip-hills, and found in ſome other parts of England. 3. A thick one, with a longer pyramid, found in Northamptonſhire, and ſome other parts of the kingdom, encruſting the fiſſures of ſtone. And, 4. One with a very ſhort column, and a long, obtuſe pyramid: this is frequent in the mines of Germany, and not leſs ſo in thoſe of England, particularly in Derbyſhire.

TRIEXAHÆDRIA, in natural hiſtory, the name of a genus of perfect and pellucid, cryſtalliform ſpars, conſiſting of thrice ſix planes, being compoſed of an hexangular column, terminated at each end by an hexangular pyramid. Of this genus there are three known ſpecies. 1. A clear one, with narrow and oblong pyramids: this is found in the mountains of Germany and in North-Wales; but with us it is ſmall and coarſe. 2. One with ſhort pyramids, and a long column: this is found in the mines at Goſſelaer, in Saxony. And, 3. One with ſhort pyramids, and a thick and ſhort column, found with us in the lead-mines of Yorkſhire. See the article SPAR.

TRIPENTAHÆDRIA, in natural hiſtory, the name of a genus of ſpars, compoſed of thrice five planes, being made of a pentangular column, terminated at each end by a pentangular pyramid. Of this genus we have only one ſpecies: this has a moderately long column, and very ſhort and broad pyramids; it is found in Derbyſhire, Yorkſhire, and Cornwall, and is frequent about Goſſelaer, in Saxony.

TROT, in the manege, one of the natural paces of a horſe performed with two legs in the air, and two on the ground at the ſame time croſs-wiſe, like St. Andrew's croſs, and continuing ſo alternately to raiſe the hind-leg of the one ſide, and the fore-leg of the other ſide at once, leaving the other hind and fore-leg upon the ground, till the former come down. In this motion, the nearer the horſe takes his limbs from the ground, the opener, the evener, and ſhorter his trot will be. If he takes up his feet ſlovenly, it is a ſign of ſtumbling and lameneſs; if he treads narrow or croſs, it betokens interfering or failing; if he tread long, it ſhews over-reaching; if he ſteps uneven, it beſpeaks toil and wearineſs.

TUBULARIA FOSSILIS, in natural hiſtory, the name of a ſpecies of coral found very often foſſile in Germany and Italy, and compoſed of a great number of tubes, or longitudinal pipes, often reſembling ſo many worms ranged perpendicularly in the maſs. They are uſually found either in maſſes of a lax-ſtone, or in ſingle tubules in thoſe of the harder and firmer texture. In theſe two ſtates, this foſſil makes two very different appearances; and, according to the different directions in the maſs, or the different views of them that the ſections of it place them in, they make a number of very elegant figures.

TURCICA TERRA, TURKY-EARTH, in the materia medica, a very fine bole or medicinal earth, dug in great plenty in the neighbourhood of Adrianople, and uſed

uſed by the Turks as a ſudorific and aſtringent; and famous among them in peſtilential diſeaſes. It is ſometimes brought over to us alſo made up into flattiſh, orbicular maſſes of two or three drams-weight, and ſealed with ſome turkiſh characters. This earth is of a ſomewhat lax and friable texture, yet conſiderably heavy, of a greyiſh, red colour, but always redder on the ſurface than within; extremely ſoft, and naturally of a ſmooth ſurface: it melts freely in the mouth, with a conſiderably ſtrong, aſtringent taſte. See the article BOLES.

TURKY. (*Dict.*) TURKY-EARTH. See the article TURCICA TERRA.

TURNING. (*Dict.*) TURNING-EVIL, in cattle, a diſeaſe that cauſes them frequently to turn round in the ſame place. It is alſo called the ſturdy. The common remedy, recommended by Mr. Markham, is to throw the beaſt down, and bind him; then to open his ſkull, and take out a little bladder, filled with water and blood, which uſually lies near the membrance of the brain, and then gradually heal the wound.

TUSCAN-EARTH, in the materia medica, a yellowiſh, white, pure bole, conſiderably heavy, of a very ſmooth ſurface, not eaſily breaking between the fingers, but adhering ſlightly to the tongue, and melting very readily in the mouth. It is dug in many parts of Italy, particularly about Florence, where there is a ſtratum of it eight or ten feet thick, at the depth of five or ſix from the ſurface. It is given as a ſudorific, and eſteemed a great medicine in fevers, attended with diarrhœas. See BOLES.

V.

VALET. (*Dict.*) VALET, in the manege, a ſtick armed at one end with a blunted point of iron, to prick and aid a leaping horſe.

VALVE, (*Dict.*) in anatomy. The upper and, as it were, the lid of the iſthmus, between the teſtes and the firſt vermicular proceſs of the cerebellum, is called the valvula magna, or the great valve of the brain. Its uſe is to prevent the lymph from falling on the nerves, at the baſe of the cranium. See the article BRAIN.

The colon has a thick valve to prevent the excrements from paſſing into the ilion, and ſeveral other valves to retard the deſcent of the excrements. See the articles COLON and EXCREMENTS.

For the valve of the pyloris, ſee the article STOMACH.

For the ſemilunar valves, ſee the article SEMILUNAR.

For that remarkable valve in a fœtus, called by Cheſelden the valvula nobilis, ſee the article FOETUS.

For the connivent valves, ſee the article CONNIVENT.

VANELLUS, the LAPWING, in ornithology, the black-breaſted tringa, with a hanging creſt. See the article TRINGA. This ſpecies is about the ſize of the common pigeon; the head is ſmall, but very beautiful, a little depreſſed on the crown, but not at all on the ſides; the eyes are bright and piercing; the head is elegantly variegated, and is ornamented with a beautiful creſt hanging over the hinder part of the neck.

VARIATION. (*Dict.*) VARIATION *of the variation*, is the change in the declination of the needle, obſerved at different times in the ſame place.

VARIATION *of quantities*, in algebra. See the article COMBINATION.

VARIATION *of curvature*, in geometry, is uſed for that inequality or change, which happens in the curvature of all curves, except the circle; and this variation or inequality conſtitutes the quality of the curvature of any line. See the article CURVE.

Sir Iſaac Newton makes the index of the inequality or variation of curvature to be the ratio of the fluxion of the radius of curvature to the fluxion of the curve; and Mr. Mac Laurin, to avoid the perplexity that different notions, connected with the ſame terms, occaſion to learners, has adapted the ſame definition; but he ſuggeſts, that this ratio gives rather the variation of the ray of curvature, and that it might have been proper to have meaſured the variation of curvature, rather by the ratio of the fluxion of curvature itſelf to the fluxion of the curve; ſo that

that the curvature being inverſely as the radius of the curvature, and conſequently its fluxion as the fluxion of the radius itſelf directly, and the ſquare of the radius inverſely, its variation would have been directly, as the meaſure of it, according to Sir Iſaac's definition, and inverſely, as the ſquare of the radius of curvature.

VARIATION, in muſic, is underſtood of the different manners of playing or ſinging a tune or ſong, whether by ſubdividing the notes into ſeveral others of leſſer value, or by adding graces, *&c.* in ſuch manner, however, as that one may ſtill diſcern the ground of the tune through all the enrichments; which are called embroideries.

VARICIFORMES PARASTATÆ, in anatomy, a name which ſome authors give to two veſſels near the bladder, by reaſon of their many turnings, ſerving to work and prepare the the ſeed the better. See PARASTATÆ and DEFERENTIA VASA.

VARICOSUM CORPUS, in anatomy, the ſame as corpus pyramidale. See the article PYRAMIDALIA CORPORA.

VEGETABLE. (*Dict.*) Vegetables, according to the analyſes made of them by chemiſtry, are diſtinguiſhable into two grand tribes, the acid and the alkaline; the firſt affording a volatile acid, and the ſecond a volatile alkali, upon a dry diſtillation: thus guaiacum, cedar, box, cinnamon, cloves, ſorrel, mint, balm, *&c.* afford an acid; but garlic, leeks, onions, horſe-radiſh, ſcurvy-graſs, muſtard, *&c.* afford an alkali, which, when rectified, is hardly diſtinguiſhable from that of animal ſubſtances, ſo as nearly to reſemble the ſpirit and ſalt of hartſhorn.

VELARIUS, in antiquity, an officer in the court of the Roman emperors, being a kind of uſher, whoſe poſt was behind the curtain in the prince's apartments; as that of the chancellors was at the entry of the baluſtrade, and that of the oſtiarii at the door. The velarii had a ſuperior of the ſame denomination who commanded them.

VELITES, in the Roman army, a kind of antient ſoldiery, who were armed lightly with a javelin, a caſk, cuiraſſe and ſhield.

VELLEITY, *velleitas*, in the ſchool-philoſophy, is uſually defined a languid, cold, and remiſs will. Others ſay, it implies an impotency of obtaining what we require. Others will have it a ſlight deſire for ſomething which a perſon does not matter much, or is too indolent to ſeek. See the article WILL, *&c.*

VELOCITY. (*Dict.*) In the doctrine of fluxions it is uſual to conſider the velocity with which magnitudes flow, or are generated. Thus, the velority with which a line flows, is the ſame as that of the point, which is ſuppoſed to deſcribe or generate the line. The velocity with which a ſurface flows, is the ſame as the velocity of a given right line, that, by moving parallel to itſelf, is ſuppoſed to generate a rectangle, always equal to the ſurface. The velocity with which a ſolid flows, may be meaſured by the velocity of a given plain ſurface that, by moving parallel to itſelf, is ſuppoſed to generate an erect priſm, or cylinder, always equal to the ſolid. The velocity with which an angle flows, is meaſured by the velocity of a point, ſuppoſed to deſcribe the arc of a given circle, which ſubtends the angle, and meaſures it. All theſe velocities are meaſured at any term of the time of the motion, by the ſpaces which would be deſcribed in a given time, by theſe points, lines, or ſurfaces, with their motions continued uniformly from that term.

The velocity with which a quantity flows, at any term of the time, while it is ſuppoſed to be generated, is called its fluxion. See the artile FLUXION.

VENETA *bolus*, the *Venetian bole*, a fine red earth uſed in painting, and called in the colour-ſhops venetian red. It is improperly denominated a bole, being a genuine ſpecies of red ochre. It is of a fine bright, and not very deep red, approaching, in ſome degree, to the colour of minium, or red-lead, and is moderately heavy, and of an even and ſmooth texture, yet very friable, and of a duſty ſurface: it adheres firmly to the tongue, is very ſmooth, and ſoft to the touch, eaſily crumbles to pieces between the fingers, and very much ſtains the ſkin in handling. It has a ſlight aſtringent taſte, and makes no fermentation with acids. It is dug in Carinthia, and ſent from Venice to all parts of the world, being an excellent colour, and very cheap; our colour-men however find many ways of adulterating it.

VENIAL, in the Romiſh theology, a term applied to ſlight ſins, and ſuch as eaſily obtain pardon. In confeſſing to the prieſts, people are not obliged to accuſe themſelves of all their venial ſins. The thing that gives the greateſt embarras to the Romiſh caſuiſts, is to diſtinguiſh be-

tween

tween venial and mortal ſins. The reformed reject this diſtinction of venial and mortal ſins, and maintain, that all ſins, how grievous ſoever are venial, and all ſins, how ſlight ſoever, are mortal. And the reaſon they urge is, that all ſins, though of their own nature mortal, yet become venial or pardonable, by virtue of our Saviour's paſſion, to all ſuch as fulfil the conditions on which it is offered in the goſpel. To which the romaniſts anſwer, that the chief of theſe conditions is confeſſion. See CONFESSION and ABSOLUTION.

VICTIMARIUS, in antiquity, a miniſter or ſervant of the prieſt, whoſe office was to bind the victims, and prepare the water, knife, and other things neceſſary for the ſacrifice. See SACRIFICE.

To the victimarii it alſo belonged to knock down and kill the victims, in order to which they ſtood cloſe by the altar naked to the waiſt, but crowned with laurel; and holding a hatchet or a knife up, aſked the prieſt leave to ſtrike; ſaying, *agone?* whence they were called agones and cultellarii. See AGON.

When the victim was killed, they opened it, and after viewing the entrails, took them away, waſhed the carcaſe, ſprinkled the flour on it, *&c.* The ſame victimarii lighted the fire wherein books were condemned to be burnt.

VISCERA. (*Dict.*) *Wounds of the* VISCERA. If any of the viſcera ſituated in the abdomen, as the liver, ſpleen, or kidney, has received a wound from a ſharp inſtrument, at the firſt dreſſing the wound muſt be filled as tenderly as poſſible with lint well ſaturated with highly rectified ſpirit of wine, or ſpirit of turpentine, ſecuring the dreſſings with compreſſes and a bandage; by this means the hæmorrhage will be ſtopped, if no large veſſel is divided. When this part is gained, the wound muſt be treated in the common manner, and the patient kept very low; bleeding him, if of a plethoric habit, and giving daily two or three doſes of Locatellus's balſam; for balſams of this kind are of great ſervice in healing internal wounds. This is the method to be taken with wounds of the viſcera, which may be diſcovered by the eye or touch. But in ſuch of them as are hidden, and not to be thus diſcovered, all that can be done is to inject vulnerary decoctions, and keep a paſſage open for the evacuation of ſordes, or grumous blood. See WOUND, *&c.*

VISIER, or VIZIER, an officer or dignitary in the ottoman empire, whereof there are two kinds; the firſt, called by the Turks viſier-azem, that is, grand viſier, is the prime miniſter of ſtate of the whole empire. He commands the army in chief, and preſides in the divan or great council. Next to him are ſix other ſubordinate viſiers, called viſiers of the bench, who officiate as his counſellors, or aſſeſſors in the divan.

VIVIPAROUS. (*Dict.*) The females of all the quadruped claſs are viviparous, and thoſe of the bird-claſs are all oviparous. The laws of nature in the larger animals, are therefore, in a great meaſure, fixed and certain; but it is not ſo in the inſect tribes, nor in the fiſhes; for of theſe ſome are viviparous, and others oviparous; and thoſe of genera nearly allied to one another. Among inſects, the much greater number are oviparous; but there are many which are not ſo, as the pucerons, progallinſects, cochineal, &c. The millepedes and ſcorpions are alſo well known to be ſo; all the females of the butterfly, and of ſome other claſſes, lay only eggs: but the moſt ſingular and remarkable inconſtancy in nature, if we may be allowed the expreſſion, is that in the fly-kingdom; the ſame claſs of inſects, and even the ſame genus, will furniſh us with ſome which are viviparous, and others which are oviparous; the two-winged flies give us inſtances of this; but theſe are not ſingle in that reſpect; for among the reptile world, there are other creatures which are ſubject to the ſame varieties; and Swammerdam has obſerved a viviparous ſnail. The two-winged viviparous flies bring forth worms, in all reſpects the ſame with thoſe hatched from their eggs in the other ſpecies.

UNICORNU FOSSILE, *Foſſil unicorn's horn*, the name of a ſubſtance much uſed in medicine in ſome parts of the world, and, which ſeems to have been very little underſtood by many who have written of it; but is now determined to be no other than a terrene, cruſtaceous ſpar, not very different from the oſteocolla and other bodies of that genus called the cibdeloplacium. See OSTEOCOLLA and CIBDELOPLACIA.

It is eſteemed as a ſudorific and aſtringent, and is given in fevers attended with diarrhœas, with great ſucceſs.

UNITY. (*Dict.*) It is to be obſerved in algebra, that unity itſelf has three dif-

ferent expreſſions of its cube-root, one real, and the other two impoſſible or imaginary. Thus the three cube-roots of 1, are 1, $\frac{-1+\sqrt{-3}}{2}$ and $\frac{-1-\sqrt{-3}}{2}$

This is ſometimes of uſe in finding the cube-roots of quantities, appearing under impoſſible expreſſions. The two impoſſible expreſſions, according to Mr. Mac Laurin, of $\sqrt[3]{}$ may be found thus: Let $x = 1$ then $x^3 = 1$ or $x^3 - 1 = 0$ and $x - 1 = 0$. Divide $x^3 - 1$ by $x - 1$, the quotient is $xx + x + 1 = 0$, or $xx + x = -1$; reſolve this quadratic equation, by adding $\frac{1}{4}$ to both ſides. Then $xx + x + \frac{1}{4} = -\frac{3}{4}$, and extracting the ſquare-root, $x + \frac{1}{2} = \sqrt{-\frac{3}{4}} = \frac{\sqrt{-3}}{2}$.

Therefore $x = -\frac{1}{2} \pm \sqrt{-\frac{3}{4}} = \frac{-1 \pm \sqrt{-3}}{2}$.

That is, $x = \frac{-1+\sqrt{-3}}{2}$ and $x = \frac{-1-\sqrt{-3}}{2}$.

UNIVALVE *Shells*, in natural hiſtory, a term uſed to expreſs one of the three general claſſes of ſhell fiſh; the other two being the bivalves and multivalves. See SHELL, BIVALVES, and MULTIVALVES. The univalve ſhells are thoſe which conſiſt only of one piece, not of two or more joined together. Of theſe univalve ſhells, nature affords a very great variety; ſo that they are aptly diſtributed by a late French author into fifteen diſtinct genera. Theſe are, 1. The patellæ, or limpets. 2. The patellæ planæ, called alſo auris marina, the ear-ſhell. 3. The canales, or tubuli marini, the ſea-tubes. 4. The lunar cochleæ, or round-mouthed ſnails. 5. The cochleæ ſemilunares, or ſnails with ſemicircular mouths. 6. The cochleæ ore depreſſo, or flat-mouthed ſnails. 7. The naviculæ or boat-ſhells, commonly called nautili or nautilus. 8. The buccina, or trumpet-ſhells. 9. The turbines. 10. The volutæ. 11. The rhombi. 12. The murices. 13. The purpuræ. 14. The conchæ globoſæ. And 15. The porcellanæ, each of which ſee under its proper head, PATELLA, AURIS *Marina*, *&c.* Hiſt. Nat. Eclairc. part II. p. 235.

VOLUNTEERS, in the military art, perſons who of their own accord, and at their own expence, ſerve in the army.

VOLVULA, in natural hiſtory, the name of an extraneous foſſil body, nearly allied to the entrochus, being compoſed of the ſame ſubſtance, and being like that of a cylindric column, made up of ſeveral joints; the commiſſures of the joints are, however, much leſs viſible in the volvulæ than in the entrochi, and they are not ſtriated, as in the entrochus, from the center to the circumference. See the article ENTROCHUS.

The volvulæ are of various figures; ſome reſemble in ſhape a little bottle, and are called volvulæ utriculatæ, and of theſe ſome have, and others have not, a ſtar marked on their bottom; others of them ſwell out in the middle, and taper a little toward each end; and theſe, from their reſemblance in ſhape to a little barrel, are called dolioli, or volvulæ doliatæ. There is great reaſon, from the analogy theſe bear to the entrochi, and other foſſils which owe their form to animal remains, to ſuppoſe theſe of the ſame origin; but we yet know not to what animal it is that they have belonged.

VOMITING. (*Dict.*) VOMITINGS *in Infants*. See the article INFANT.

VOMITING *of blood*, *vomitus cruentus*, a very dangerous kind of hæmorrhage, conſiſting in a bringing up by vomit of pure and unmixed blood from the ſtomach, and being a method, uſed by nature to throw off a portion of the blood, which moleſts the whole in the vena porta, and by that means to facilitate the circulation of the reſt of the maſs. See the article HÆMORRHAGE.

This diſtemper ſometimes ariſes from internal cauſes, and is regularly periodical, obſerving the ſtated times of the eruptions of the menſes, or other natural diſcharges; ſometimes it ariſes from accidents, ſuch as the giving of violent purging or emetic medicines, or corroſive ones. Among the preceding ſigns of this diſorder, are to be reckoned a ſenſation of ſtraitneſs and anxiety in the præcordia, with tenſion, and involuntary ſighs; with a naufea or ſickneſs of the ſtomach, and a ſtraining to vomit; which is more violent than in vomiting on any other occaſion; after this the blood is thrown up pure, and the vomiting then ceaſes, till, after a plain ſenſation of more blood being collected in the ſtomach, the efforts to diſcharge it in the ſame manner are again renewed. The quicker the blood is thrown up, after its being diſcharged into the ſtomach, the more fluid and more florid it appears; the longer it is detained there, the blacker and thicker it appears.

pears. A vomiting of blood is but an uncommon diſorder. It more frequently attacks women than men; among the female ſex it is principally ſeen in thoſe whom the menſes have left too early in life, or who have had violent ſuppreſſions of them for a long time. In men, this diſtemper ſeldom ſeizes any but thoſe who have been uſed to periodical diſcharges from the hæmorrhoidal veſſels, and who have had them ſuddenly ſtopped; and they are then uſually firſt attacked with violent pains in the left hypochondrium. People of ſcorbutic habits, and ſuch as have had quartan agues of long ſtanding, have been ſometimes thus affected. And, beſide theſe natural cauſes, people of all ages and ſexes may vomit blood, from external injuries.

A vomiting of blood is ever a dangerous diſorder; for though the quantity of blood thrown up is ſeldom ſo great as to occaſion immediate death, yet it generally degenerates into a tabes in men, and into a cachectic habit in women. It is leſs dangerous to young women, than to any other perſons; and when it is periodical, eſpecially when it obſerves the times of the menſtrual diſcharges, is much leſs dangerous than under any other circumſtances. During the paroxyſm, the proper medicines are powders of nitre, cinnabar, and the abſorbent ſubſtances, ſuch as crabs-eyes, or the like, and afterwards bleeding, cupping, and gentle purges; and diaphoretics are to be given for ſome time.

URINE. (*Diet.*) *Incontinence of* URINE. This is a term uſed by medical writers to expreſs an involuntary excretion of this liquor, whether it be inceſſantly, or in larger quantities at different intervals. This is of two kinds; in the one it is only in the night, in the time of ſleep; and this ariſes merely from careleſſneſs, and a bad habit: in the other, it depends on a paralytic affection of the ſphincter of the bladder; and in this caſe it drops away continually from the patient; and this is therefore called by ſome a ſtillicidium. Authors alſo divide an incontinence of urine into the idiopathic and ſymptomatic: the idiopathic is a diſeaſe in itſelf, and depends upon the preceding cauſes; the ſymptomatic happens to different perſons on different occaſions, as a ſymptom of other complaints. It is common to dying perſons; it is alſo very frequent to women who are big with child, and ſometimes happens from violent ſneezing, coughing, or laughing. The voiding of the urine involuntarily, and in the ſleep, in infants, is not to be accounted a diſeaſe; but when this cuſtom continues with them as they grow up, from idleneſs, or ill habit, it is at length to be conſidered as a diſeaſe, as they are by no means able to help it. Women who have ſuffered much in childbirth are often ſubject to an incontinence of urine afterwards, eſpecially perſons who have had their firſt child at an advanced age. People in years, who are ſubject to paralytic complaints, are alſo often afflicted with this troubleſome complaint; and many who have been cut for the ſtone by perſons not ſufficiently ſkilled in the operation. Perſons ſubject to the piles alſo ſometimes fall into it, from the ſuppreſſions of their uſual diſcharges, and ſometimes from the tumors becoming fiſtulous, and reaching to the neck of the bladder. Impoſthumes of the bladder will alſo occaſion it, and violent external injuries.

An incontinence of Urine, which happens only in the night, and is merely cauſed by a bad habit, and not of long ſtanding, uſually admits of a cure; but the ſtillicidiums of urine, from paralytic diſorders of the ſphincter of the bladder, are very rarely cured, eſpecially when they have been fixed ſome time upon the perſon. The involuntary voiding the urine in the night, in children, is to be cured, in a great meaſure, with puniſhment for the neglect, and by denying them much liquids after dinner-time; by a proper diet; the avoiding all diuretics, and the making water immediately before going to bed; and when it has gone ſo far, that the tone of the parts is injured, the uſual ſtrengthening medicines are to be given, as in the following caſes. When the incontinence of urine is occaſioned by a paralytic weakneſs of the ſphincter, nervous and ſtrengthening medicines are the proper method of curing; in this caſe, maſtic, amber, nutmeg, and cinnabar, are found to be of great ſervice, and pills or powders compounded of them, are an excellent general remedy to be given in ſmall doſes, two or three times a day. Externally, it is very proper to uſe by way of fomentation, decoctions of roſemary, ſage, ſerpyllum, marjoram, and the like warm herbs in red wine. When the diſeaſe is occaſioned by an impoſthume or ulcer in the neck of the bladder, balſamics are to be given,

as maſtic, gum-juniper, and boiled turpentine; but when it is owing to injuries received in child-birth, the manual operation of the ſurgeon is uſually to be preferred to all internal medicines.

UT. (*Dict.*) A latin term ſignifying literally *as*, much uſed in ſtating of ratios and proportions. See the article RATIO and PROPORTION.

Sir Iſaac Newton aſſigns its uſe thus: if indeterminate quantities of divers kinds be compared together, and one of them be ſaid to be *ut*, *as*, any other directly or inverſely, the meaning is, that the firſt is increaſed or diminiſhed in the ſame ratio as the latter: and if one of them be ſaid to be *ut*, *as*, two or more others directly, or inverſely, the meaning is, that the firſt is increaſed or diminiſhed in a ratio compounded of the ratios, in which the others are increaſed or diminiſhed. Thus, if A be ſaid to be *as*, B directly, and *as* C directly, and *as* D inverſely, the meaning is, it is increaſed or diminiſhed in the ſame ratio with $B \times C \times \frac{1}{D}$, that is, A and $\frac{BC}{D}$ are to each other in a given ratio.

VULGATE. (*Dict.*) VULGATE *of the New Teſtament*. This the romaniſts generally hold preferable to the common greek text, in regard it is this alone, and not the greek text, that the council of Trent had declared authentic. Accordingly that church has, as it were, adopted that edition. The prieſts read no other at the altar, the preachers quote no other in the pulpit, nor the divines in the ſchools.

UVULA. (*Dict.*) *Prolapſus* UVULÆ. See the article PROLAPSUS.

W.

WAGGON. (*Dict.*) WAGGON-*maſter general*, in the military art, is he who has the ordering and marching of the baggage of the army. On a day of march he meets the baggage at the place appointed in the orders, and marſhals it according to the rank of the brigade or regiment each waggon belongs to, which is ſometimes in one column, ſometimes in two; ſometimes after the artillery; and ſometimes the baggage of each column follows their reſpective column.

WATCH. (*Dict.*) A perſon poſted as a ſpy in any place, to have an eye thereto, and to give notice of what paſſes. A watch is properly intended for the apprehending of rogues in the night, as ward is for the like purpoſe in the day time; and for default to watch and ward, the townſhip, *&c.* is puniſhable. It is ordained, that in all towns between Michaelmas day and the day of Aſcenſion, there ſhall be night-watches kept in each city, with ſix men at every gate, and ſix or four in a town. Alſo every borough is to have twelve men to watch therein, or otherwiſe in proportion to the number of the inhabitants in the place, from ſun-ſet to ſun-riſing, who are to arreſt ſtrangers ſuſpected, and diſturbers of the peace, *&c.* and may juſtify the detaining of them till the morning; or they may deliver them to the conſtable, in order to be carried before a juſtice.

WATER. (*Dict.*) WATER-*Beetle*, *Dytiſcus*, in zoology. See DYTISCUS.

WATER-SCORPION, *nepa*, in zoology. See the article NEPA.

WEDNESDAY, the fourth day of the week, ſo called from a ſaxon idol named Woden, ſuppoſed to be Mars, worſhipped on this day.

Aſh-WEDNESDAY, the firſt day of Lent, ſo called from the cuſtom obſerved in the antient chriſtian church of penitents expreſſing their humiliation at this time, by appearing in ſack-cloth and aſhes. The want of this diſcipline is at preſent ſupplied, by reading publickly on aſh-wedneſday the curſes denounced in ſcripture againſt the ſeveral ſorts of ſins, the people repeating after each curſe, Amen.

WHEEZING, the name of a diſtemperature in horſes, accounted by the generality of people to be the ſame with that called purſiveneſs. See PURSIVENESS.

WHELP, the young of a dog, fox, lion, or any wild beaſt. Nothing is more eſſential to the having a good pack of hounds, than a proper care of the whelps, and of the parents from which they are to be

be bred. The bitches in particular ſhould be carefully choſen, and ſhould be ſuch as are ſtrong and well proportioned; they muſt alſo have large ribs and flanks. See the articles DOG and HOUND.

The whelps muſt have good freſh ſtraw to lie in, and it muſt be often changed; they are to be kept in a place where neither the rain nor ſunſhine can be troubleſome to them, and once a week it will be proper to anoint them all over with a little nut-oil, with ſome ſaffron infuſed in it. This will prevent the flies from annoying them ſo much as they otherwiſe would, and will kill worms of all kinds. When they are fifteen days old, it is the cuſtom to worm them, and a week after, one joint of their ſtern ſhould be twiſted off. As ſoon as they can ſee, they ſhould have milk given them to lap; and at two months old, they ſhould be weaned, keeping them wholly from the bitch. They muſt at this time be well kept, but not too high fed; and it is proper to put ſome cummin-ſeed into their food, to keep the wind out of their bellies.

WHELPS, in a ſhip, the ſea-man's term for thoſe brackets which are ſet up on the capſtan cloſe under the bars; they give the ſweep to it, and are ſo contrived that the cable winding about them may not ſurge ſo much as it might otherwiſe do, if the body of the capſtan were quite round and ſmooth.

WILDS, a term uſed by our farmers to expreſs that part of a plough by which the whole is drawn forwards. See PLOUGH.

WORM. (*Dict.*) EARTH-WORM, *lumbricus*, a genus of inſects of the claſs of the anarthra, of a rounded ſhape, and covered with a ſoft and tender ſkin, marked with annular ridges and furrows. This inſect, when full grown, is often ten inches in length, and more than a third of an inch in diameter; its colour is a duſky red, and its ſkin is formed into rings, but is ſmooth and ſoft to the touch.

Sea WORM, is the rough lumbricus, growing to a foot, or more in length, and to the thickneſs of a man's finger.

WRASSE, or OLD WIFE, in ichthyology, a ſpecies of labrus, with the roſtrum turning upward, and the tail circular at the end. See the article LABRUS.

This is a very beautiful fiſh; its uſual ſize is about ten inches in length, and conſiderably thick in proportion; the back-fin has twenty-ſix rays, fifteen of which are prickly; the pectoral fins have fourteen rays each; the ventral ones only ſix; the pinna ani has thirteen, and three of theſe are prickly; the tail is large, and is ſemicircular at the extremity.

X.

XERANTHEMUM. (*Dict.*) See plate CCCII. fig. 6.

XYRIS. (*Dict.*) See plate CCCII. fig. 3.

Y

YAWNING, *oſcitatio*, an involuntary opening of the mouth, occaſioned by a vapour or ventoſity endeavouring to eſcape, and generally witneſſing an irkſome wearineſs, or an inclination to ſleep. Yawning, according to Boerhaave, is performed by expanding at one and the ſame time all the muſcles capable of ſpontaneous motion; by greatly extending the lungs; by drawing in gradually and ſlowly a large quantity of air; and gradually and ſlowly breathing it out, after it has been retained for ſome time, and rarefied; and then reſtoring the muſcles to their natural ſtate. Hence the effect of yawning is to move, accelerate, and equally

equally diſtribute all the humours thro' all the veſſels of the body, and conſequently to qualify the muſcles and organs of ſenſation for their various functions. Sanctorius obſerves, that a great deal is inſenſibly diſcharged, when nature endeavours to get rid of the retained perſpirable matter, by yawning and ſtretching of the limbs. To theſe a perſon is moſt inclined juſt after ſleep, becauſe, a greater quantity going off by the pores of the ſkin, than at other times, whenſoever a perſon wakes, the increaſed contraction that then happens, cloſes a great deal of the perſpirable matter in the cutaneous paſſages, which will continually give ſuch irritations, as excite yawning and ſtretching; and ſuch motions, by ſhaking the membranes of the whole body, and ſhifting the contacts of their fibres, and the incloſed matter, by degrees throw it off. Hence we ſee the reaſon, why healthful, ſtrong people are moſt inclined to ſuch motions, becauſe they perſpire moſt in time of ſleep, and therefore have more of the perſpirable matter to lodge in the pores, and greater irritations thereunto.

Z.

ZIMENT-WATER, or COPPER-WATER, in natural hiſtory, the name by which ſome have called water found in places where there are copper-mines, and lightly impregnated with particles of that metal. See the articles COPPER and VITRIOL.

The moſt famous ſpring of this kind is about a mile diſtant from Newſol, in Hungary, in a great copper-mine, where the water is found at different depths, and is received into different baſons, for the purpoſe of ſeparating the copper from it. In ſome of theſe it is much more highly ſated with this metal than in others, and will make the ſuppoſed change of iron into that metal much ſooner. The moſt common pieces of iron uſed in the experiments, are horſe-ſhoes, nails, and the like; they are found very little altered in ſhape after the operation, except that their ſurfaces are more raiſed. The water which performs this wonderful operation appears greeniſh in the baſons where it ſtands; but if a glaſs of it be taken up, it looks clear as cryſtal; it has no ſmell, but has a very ſtrong vitriolic and aſtringent taſte, inſomuch, that the lips and tongue are bliſtered and ſcorched on taſting it. The miners uſe this water as a medicine; and whatever ſickneſs they are ſeized with, they firſt attempt its cure by large doſes of the water, which uſually both vomits and purges them briſkly; they alſo uſe it in diſorders of the eyes. The copper produced from theſe waters is valued by the people much beyond any other copper, as being more ductile, and running eaſier in the fire. And from the ſeveral experiments made upon the water, the true nature of it may be eaſily underſtood. It contains a large quantity of the vitriol of copper, which it probably owes to a ſolution of that metal, by means of the acid of the common pyrites and water. When this is known the effects are not difficult to be accounted for; there being no real change of one metal into another, but the true ſtate of the caſe being that the particles of one metal are diſſolved and carried away, and thoſe of another metal depoſited in their place; a water thus impregnated is a menſtruum capable of diſſolving iron, and in the ſolution of that metal becomes ſo weakened as to let go the copper it before contained in ſmall parcels.

ZONA, or ZONA IGNEA, the *ſhingles*, in medicine, a ſpecies of herpes. See the article HERPES.

THE END.
