Nor should the judicious senator stop here in his enquiries into the MONEY AFFAIRS of the kingdom: he should strictly scrutinize into the RATES laid upon all merchandizes imported, that he may be capacitated to enter into the primitive reason and foundation of these rates, and to know whether the same reasons still subsist, that gave rise to them; and whether our connections with certain foreign countries, may not be so altered, since the time of such rates being laid, as to make it requisite to alter them likewise upon many species of goods. And to make a right judgment of this matter, it is necessary to be acquainted with every specific sort of merchandize imported, and to know to what uses in every branch of trade and commerce such sort of commodities is applied, from their importation to their consumption, or re-exportation, either in their first state of importation, or in a manufactured one. Nor is it enough to know these things; the senator must be knowing in all the subsidies and imposts laid upon such merchandizes, the several discounts to which the merchant is justly intitled, and the computation of the nett duties and drawbacks thereupon; whereby he will become so minutely acquainted with every branch of the public revenue, as to judge rightly when any alteration may be necessary to be made in the rates, or in the subsidies and imposts of any kind; and more especially so, if he takes into his consideration, to what degree the foreign nation, from whence such commodities

commodities are brought, they lay duties upon the British produce or manufactures of a similar nature to those we lay duties on, and whether they inviolably adhere to, or deviate from, those treaties of commerce which subsist between our nation and theirs: for this is the criterion whereby to judge when this nation is treated in their merchandize as we ought to be, and upon an equal footing with those nations that have no right by treaty to be upon more advantageous terms than our own.

‘The prosperity of a trading kingdom depends on a wise regulation of its revenues,’ says a judicious Spanish author. When taxes are not levied in the manner they ought to be, they are the ruin of trade, a moth in a treasury, the universal lamentation of a nation, and the interest and joy of foreigners. But a prudent disposition of them is the soul of a state, the life of the people, glory to a prince, grief and distress to foreigners, and a perpetual fountain of the richest blessings to human life.* See our articles DUTIES, TAXES, LABOUR, REVENUE, and the CONTENTS for the practical business of the custom-house.

Nothing can be of greater concernment to a trading nation than the wise regulation of its duties and customs, and the most vigilant eye over its exports and imports; for the grandeur of a kingdom depends solely upon selling much, and buying little, or upon selling more than is bought. He that is constantly buying more than he sells, let him be a second Cræsus in treasure, must be at length reduced to the unhappy state of a beggar, for his stock is diminished in proportion to the overbalance of goods brought in: but whoever is constantly selling more than he buys, let him be poor as Lazarus, must by such a transaction acquire the happy circumstances of the rich: for, as much as the balance is in favour of the amount of sales, just so much is added to his capital. It is upon this principle the wisest nations discourage the importation of foreign goods into their country*, but leave their gates wide open to let their own manufactures go abroad and bring in riches from every quarter.

* When a great proportion of the public revenue of a nation arises from the money raised by the DUTIES paid by enhancing the price of foreign imports, which exhaust the nation's treasure, the greater those DUTIES and IMPORTS are, the more the nation is drained of its solid wealth; and if the support of the PUBLIC CREDIT depends, in a good measure, on the greatness of the sum raised by such duties of custom, does not such temporary support of the public credit depend on the gradual ruin of the kingdom? Should not this induce the great representative to think of such a gradual change in the constitution of the revenue, that the prosperity of the state may go hand in hand with the height of the revenue, and not rise upon its destruction? And in relation to the other branches of the public revenue, such as EXCISES, &c. do not these demonstrably tend to raise the price of our produce and manufactures, as to enable our foreign competitors in commerce to undersell us at all foreign markets? Is it impossible to fall upon measures whereby these evils may be happily prevented? Is there any thing of this kind insuperable to the wisdom of a British senate? Every impartial man must readily grant, that it is infinitely more for the safeguard and prosperity of an empire, for the good plight and condition of its finances, to consist and harmonize with the prosperity of its commerce, than for the one to counteract the other, and that the money we raise by virtue of our trade should tend gradually to its absolute destruction!

Commerce and navigation are the great supports of our all: and every expedient to uphold the PUBLIC CREDIT that does not arise from the apparent prosperous state and condition of our trade, can be looked upon only as temporary political amusements. The more money is raised both upon foreign and native commodities, the worse is the state of our commerce, the former shewing that we augment our IMPORTS, whilst the latter renders us less able to increase our EXPORTS upon a par with nations which can afford itself cheaper than we. These principles are obvious, and must, at length, terminate in what every man of discernment cannot avoid seeing. The good senator, therefore, will endeavour to bottom the system of our funds upon principles that quadrate with our commercial interest; in which case the PUBLIC CREDIT will stand upon a rock, not to be shaken either by the nefarious arts of stock-jobbing and bubbles, neither by South-Sea nor Mississippi schemes, nor even by rebellions, or insults from foreign courts; for, when other nations know the constitution of our finances to be so wisely and happily framed, the crown of Great-Britain will have infinitely greater weight in Europe, than it can have whilst the state of the public revenue is founded upon principles diametrically opposite to these. Under such circumstances, we should be as little intimidated to declare war against those who offered any dignity to our king and country, as compelled to make a peace any way dishonourable to the nation, or injurious to its trade and navigation: and, till this comes to be our case, and we are enabled gradually to discharge our debts, or to lessen them to such a degree that we may easily support them, it is greatly to be feared our ministers will

daily lose their weight and influence in foreign courts, and, consequently, be disabled from treating with them but upon the most advantageous terms. See our articles CREDIT [PUBLIC CREDIT], DEBTS [NATIONAL DEBTS], FUNDS, INTEREST of MONEY, MONIED INTEREST, DUTIES.

In deliberating on the two great affairs of war and peace, it is first necessary to know what is the present military and naval state of our country, and how numerous its forces are both by sea and land, and how far our finances will admit of their augmentation; of what sort the war is which we are entering upon, and with what enemy we engage. A strict enquiry ought also to be made into the strength of our enemy, and any confederacies against us; whether their forces are disciplined in the same, or a different manner from our own, and whether they have better engineers, generals, and admirals, and whether they are a match for us, or inferior in number and strength, that we may regulate our conduct accordingly, and make peace with those who are too mighty for us, and war with those who are unable to resist us, if they attempt to encroachments upon rights, according to the laws of nations, and to subsisting treaties; and the scheme of the war, when we are obliged to enter into one, and all its operations, ought to be well settled, upon the best principles of prudential foresight and consideration. It may likewise be of use, on these occasions, to look over the historical accounts of former wars, their rise, progress, and event: for similar and parallel instances always explain and illustrate each other.

The occasion of every war, and the justice of it, must also be well weighed and thoroughly scrutinized into; and we must be well assured, after many trials, that the matters in difference cannot be honourably decided, but by the sword: for, as the comedian observes, ‘it is a wise way to try all expedients for an accommodation, before we come to blows: an honourable peace is always preferable to an unjust war.’

And if the debate be upon trade and commerce, and the exports and imports of a country, it is in the first place requisite to enquire, whether any necessities of which the people are in want, do ever go out of the kingdom; whether any thing is exported to foreigners except superfluities, or the residue or what is spent at home. We must also take care to make a just estimate and calculation of the price and value of all commodities, sold to, or exchanged with, foreign countries, and to balance the difference between profit and loss, that the public treasure, or current coin of the commonwealth, may not be diminished [see the articles BALANCE of TRADE, and EXCHANGE]. And we must likewise be strict in prohibiting the importation of all such consumables, as serve to introduce and encourage luxury and effeminacy.

That the knowledge of trade, both practical and political, is not a matter of a light and trivial nature, we are apt to believe will satisfactorily appear to the candid and judicious, who shall do us the honour to peruse these our labours. The subject considered in these lights is, perhaps, not less extensive than most, and requires no less application and ability to become well acquainted with it, than a knowledge of the belles lettres, or any branch of science: it is, indeed, comprehensive of many of the more lucrative arts, as well as sciences. See our article MERCANTILE COLLEGE, and our INDEX.

Lastly, the most consummate prudence is always requisite in the enacting of good laws, for therein consists the very being, as well as happiness of the public. On this occasion, it is necessary we should be well acquainted with the whole state, condition, and circumstances of a nation; the present situation of its affairs, what laws it stands in need of, what will be well received by the people, or more effectually conducive to the preserving and strengthening of the constitution, and securing and promoting the common felicity; for the commonwealth was not made for the law, but the law for the commonwealth. The better to inform ourselves upon this subject of legislation, it will prove of no little use to enquire into the laws of other countries, as well as of our own: whereby we may know how to guard against the evils under which our neighbours labour, and take example by them, in such instances of wisdom for which they are remarkable. It will be of great advantage in all deliberations upon matters of the first consequence, not to depend altogether on our own judgment, but to advise with others, because it is impossible for an individual to have more wisdom than many counsellors.

There are, as Cicero observes,—Three sorts of public things upon which men deliberate, or give or take advice: these are things honest and profitable, and the differences that are between them whenever they are inconsistent with each other.—If in these three points the senator is fully knowing and experienced, he can never be at a loss to make a good judgment on any affair of public life. And where two subjects of the same sort are offered to consideration, it is a characteristic of a sound discernment to decide which of the two is preferable; which is the most honest or profitable to the state.

Sometimes a gentleman in this situation is called upon to give extemporary advice, and is surprized into a necessity of delivering his opinion at the moment it is demanded: but, whenever

whenever this happens to be the case, we must never vary from the cardinal points of profit and honesty; we must always chuse the good, and reject the evil, and of two evils, where both are inevitable, must make choice of the least. The best way of forming good and wholesome counsels, is to keep a steady eye upon the first and greatest good, and to have that always in view, whether we are deliberating on matters of public or private concerns, of what relates to our own or to our country's happiness: for from this first principle all our thoughts and counsels ought to be directed. Unless the public happiness be our chief aim, all our deliberations and advice are vain and fruitless. How can the mariner steer a right course, when he is ignorant of the port to which he is bound? In debating within ourselves what advice is proper, the utmost prudence is required; in giving it to others, the utmost sincerity. We must ever be cautious to leave as little room as possible for fortune to interpose, for chance seldom brings about events that bear the characteristics of wise and rational contrivance: let, therefore, all his counsels be the effects of prudence, goodness, fidelity, mature experience, thorough deliberation, impartiality, and freedom of thought; without the stain of criminal craft and cunning, of temerity, or secret ill-will to the public. Subtle and artful, or daring undertakings, are extremely pleasant and entertaining; they dazzle with a false lustre, but it is hard to prosecute them aright, and they are often fatal in consequence. It is of great use and service to a commonwealth to observe this standing rule, that the senate never enter upon any business within doors, but what has been before thoroughly canvassed without; it being a great folly to imagine, that the most important affairs can be presently dispatched, or require no more consideration than that only of a short hour, or a few transitory moments.

After consultation regularly had and taken, nothing remains but the giving judgement, in any affair of state under consideration: such a judgement is an open declaration of the thoughts and counsels of the mind. There is a judicial faculty implanted in mankind by nature: we often find some men, who have no character for learning or wisdom, are yet greatly to be depended on for their judgement, and in time come to be masters of good sense, great cunning and sagacity, by dint of use and experience. Men of more years than learning are, therefore, much to be relied on for a sound judgement, because age and experience have, in effect, supplied them with a third eye, whereby they take a survey of past transactions and future events, as well as of the present, with so much the more accuracy.

We know nothing of a man 'till we have been witnesses to his conversation; and, 'till a senator has delivered his sentiments, there is no forming a just notion either of his wisdom or prudence. Socrates one day meeting a youth whom he had never seen before, looked for some time earnestly upon him, and at last said to him, Speak, that I may know what you are. The same experiment must be tried, before we can approve the wisdom and gravity of the candidate for this office, or pronounce him duly qualified for so high a station: for speech is the image and representative of the mind, and by this must the senator give proofs of his judgement, and of the force and extent of his capacity.

There are some orators whose speeches are all gloss and false colouring, intended rather to please the ear, and touch the passion, than inform the judgement: their words are all tinsel and feather, and they have more regard to elegance and delicacy, than to plain and solid truth, and close reasoning. Were their speeches taken to pieces, they would appear to be mere froth and emptiness, void of weight and solidity, veracity or sincerity. The senator's rhetoric must never be thus adulterated: he may display his eloquence before the wife and eloquent, but he should speak truth even before fools.

There is another sort of speakers, who are swoln with pride, malice, and jealousy, incensed by private animosity; and, whenever they have an opportunity of speaking in public, lay about them with personal reflection and calumny. These men are of no advantage to the public, and serve only to kindle a fire, infuse jealousies and misunderstandings, and to ruffle the peace of a country, by introducing parties and factions, discord and contention. If they were really good men, they would stifle their private animosities and personal resentments, and make it their choice, as well as think it their duty, not to trouble the commonwealth with them, under pretence of doing it service.

There is a third sort of members, who for want of capacity, for counsel, and abilities in speaking, implicitly give into the sentiments of others, and always tread in their steps. They who behave in this manner are really not to blame, unless they are obliged to it by ignorance and stupidity. It is of use and benefit to a state to have the less able and skilful members of it's council readily complying with the sentiments of their wife and more experienced leaders. Sometimes a senate is unanimous: on which occasion it is much the wisest way to concur in the general opinion, and not to give opposition only for the sake of making a speech, and spin out the time with tedious bombast and fullsome harangues.

Differences in opinion will unavoidably happen, and occasion debates and altercations, whereby this great assembly may be split into opposite parties. In all attempts to compose these differences, and bring such debates to a happy conclusion, we must be careful to avoid indecent language, excess of passion, or personal obloquy, with whatever else may interrupt the course of a deliberate and wise consultation, or ruffle the affections of brethren in the same trust.

The opinions and resolutions of a senate are to be valued by their weight, not by the tale or number of voices: and care must be taken that the best and wisest member of the great council of the nation may not be borne down by the multitude or majority. Aristotle permits a counsellor, deliberating upon any affair of moment, to be twice in doubt; but if, after this, he could not come to any settled resolution, he was for that time to lose his right of giving any opinion at all. Caution should be used not to protract the day, and spend too much time in debating a question, without coming to any resolution: we are guilty of a double fault when we tire both ourselves and others with tedious harangues. A decent brevity is always to be observed in speaking, as also an honest plainness, and an open sincerity. We must not be over eager to speak, or lay snares for others, by mingling low artifices or falacies with what we deliver. Every thing said should have real weight, and carry with it a serious and important meaning, and must be well seasoned with simplicity and truth, and with plain but nervous language; for that takes deep root, and shews the man of business in opposition to the florid babbler, whose words are wind, and leave no impression behind them.

The three rules laid down by Cicero in his laws ought to be duly observed by every member of parliament; (1.) That he constantly give his attendance in the assembly, because a full house gives a greater weight to all it's decrees and resolutions. (2.) That he speak only in his proper turn, or when he is called upon. And (3.) That he speak in such a manner as always to keep close to the subject in debate, without falling into boundless mazes of perplexity and impertinence. That senator who wilfully and carelessly absents himself from the public service without a justifiable cause, ought (as the same author enjoins) to be censured and punished as a criminal.

Neither is it convenient that senators should be permitted to leave the city in which such assemblies are held, and to withdraw themselves into foreign territories, unless they are sent abroad by their sovereign, to take upon them a command of consequence, or to execute an embassy, &c. left, by thinning the senate, some detriment should unhappily befall the commonwealth. The Romans took care to prevent the ill consequence of such a practice, by a law made for that purpose. After all, the fundamental principle which gives rise to, and will ever maintain, the senatorial dignity, and crown the character of so distinguished a personage, is his conformity in his words and actions, and in all the relative capacities and offices of life, to the rules of virtue, by approving himself a just and good man, and adorning his private station with a steady conduct, that will give a sanction to all he says and does in public life. It is not enough that we are wise and prudent, unless we are upright in the whole of our conduct: for prudence without justice and goodness, dwindles into craft and cunning, and is looked upon rather as a vice than a virtue. Wise men are denominated from their wisdom, but it is solid virtue that gives the just, the equitable, and the honest man his proper titles, and makes him in character what he is really called by name; and good men take their title from their virtues, and not from their wisdom. Who then is a truly good man, but such a one as is described by Plato, who well understands what virtue is, who takes it into his bosom and closest embraces, and lives up to it's commands and dictates, and who chuses to die for the sake of his country, and to save her from any imminent danger, or from falling into an abject state of servitude, or from being oppressed by the arbitrary dominion of tyrants and usurpers, or of men remarkable only for their baseness and infamy?—Such truly great and good patriots will endure every thing rather than see the ancient constitution of their native country overturned.

There are some men raised to high stations and dignities in the state, who thrust themselves into public business by a prompt and easy fluency of speaking, and by giving proofs of a lively wit, and more than ordinary sagacity, whilst their hearts are full of deceit and subtilty. When such men as these are engaged in supporting the laws, or in defending the liberties of their country, no orators deliver themselves with a better grace, or with more beauty and elegance, but, when their speeches are sifted to the bottom, they are all sediment and corruption; wrong and injustice are the lees of all their fluency and rhetoric; there is nothing truly great and noble in what they say, for all their pretences to public good are a vizard, and the tongue does not act in concert with the heart.

There is not a greater plague that can infect the body politic than a set of such men, lurking within the bowels of a government, especially if their power and authority are so situated as to be able to distress it. Amongst this class are comprehended

comprehended all those who are of a debauched and licentious character, and set themselves up for men of penetration, artifice and stratagem, by a readiness to commit all manner of oppression and injustice, by promoting tumults and seditions in a state. Bad as these men are, in nothing is their villainy more conspicuous, and at no time more successful, than when they can seduce their countrymen to believe they are really honest, upright, and faithful subjects: for as man in general, when raised to the most exalted dignity and highest attainments of his nature, is the best and noblest of animals; so when he degenerates as far beneath the standard of law and justice, he is, of all the rest of his own species, the most vile and dangerous.

And if public affairs should ever happen to light into such hands, and reduce the state into great disorder and confusion, we must put our chief hopes in the king, at the head of a parliament. While that place contains men of courage and public spirit, matters cannot long proceed amiss: whoever, therefore, undertakes that trust, should continually have before their eyes how much the common welfare depends upon their virtues; but, above all things, they should have disinterested and self-denying minds.

It can hardly be conceived, but by those who have seen it, what reverence is paid, even by his enemies, to a man of steady principles, the tenor of whose words and actions are always the same, who is neither to be bought nor frightened: he is admired and followed; all he says has its due weight; his honest hoary head is dear to all mankind. Whereas, as Dr d'Avenant says, the whiffling prowlers after places, and little busy intriguers, are contemptible to the very men of whom they are the wretched instruments; and, let the ambitious think what they please, that man has most real power in this country, who is believed to be of the most unshaken integrity towards the public; and he who has such a character, enjoys more true greatness than all the vain pomp and honours a court can give.

The employments of England are yet but few, and their profits but inconsiderable, to what they are in several nations; however, small as they seem to be, it is to be feared that some time or other they will be made the engines wherewith bad men will endeavour to subvert this constitution.

It is true, at present, we may be out of such a danger, but if, in future times, we should chance to see all employments reserved for men in one certain station; if the road to preferment should lie but through one passage; when this happens, we shall have cause to be alarmed.

They who feel within themselves abilities to serve the public, are by no means blameable in desiring to be upon the stage of business; on the contrary, that four philosophy which makes some persons at all seasons retire, and abandon the state, is by no means to be commended. They do, according to Tacitus, but *Nomine magnifico, seque otium velare*: if the posture of affairs will possibly admit of it, good men should rather strive to be in power, that the commonwealth may not be ingrossed by corrupt and unskilful hands.

A wise man can easily discern whether the ministers are such, that he may with honour and safety mix in councils with them. If the administration be sound and right, or if he has but a face looking that way, it is a proper season for men of probity, skill, and virtue, to produce their talents, and to push themselves forward, in order more fully to mend things: and, at such a time, they should be ready to assist the state to the utmost of their power, nor should they lazily suffer the perfections of their minds to be useless and inactive. And if among these there be any very eminent, strong in friends, versed in affairs of state, of a deep reach and foresight, who have eloquence to sway assemblies, and courage to resist and overcome popular fury; such ought not to despair of the public, but assist with their wisdom, to redeem a people from their weak hands who shall get into power, when the nation, perhaps, has been in a high ferment, as in boiling liquors the scum will get uppermost; and there is such a reverence paid to those who have a truly great genius, and a good heart, that, when they offer themselves to serve the commonwealth, the weight of the people will bear down all the upstart pretenders, and force them to give way, and make room for merit so superior.

But if it should ever happen, that the administration should be entirely bad and destructive in their measures, then ought good men to have no share nor hand in it; they should withdraw from any participation in the negligence or guilt; they should quit what they cannot honourably hold; they should concern themselves no more in public business, leaving such ministers to govern by themselves, who will not govern well, and be contented to serve their country by defending liberty in one post against any encroachments; they should not make so ill a use of that affection the people may bear them, and of the interest they may have in the nation, as to be a shelter for the crimes or folly of others: nor should they, as it were, lend their countenance, and be the screen, behind which bad men may safely attempt to undermine the constitution.

If the times are good, silent merit will be sought after; but, if they are bad, ill men will be lifted up to the offices and

dignities of the state, by the applause of their adherents, and the faction of their friends; but, at such a season, it is no shame not to be employed. Tacitus speaking of Ælius Læmian says, *Et non permissa provincia dignationem addiderat*.

Great men are often liable to one unfortunate vanity: they believe their parts, dexterity, and wisdom to be such, that they can mend things, give them a new complexion, correct all errors, and at least that they shall preserve themselves sound, though every one else be tainted; and, upon these presumptions, some of the men in best esteem have heretofore engaged with a depraved ministry; but we could never see that they were able to make any converts: on the contrary, instead of changing the court, the court changed them. Courts are but slowly mended, and that not by the authority or example of any single person, except it be of the prince himself, strongly bent to set matters upon a right foot; and yet we have more instances of courts which have spoiled their prince, than of princes that have reformed their courts.

And if it be asked, When is the most proper time for persons of probity and virtue to undertake the management of affairs? it may be answered, It is then seasonable, when things call loudly to be mended, when unskilful pilots have run the ship a-ground, so that she sticks fast, ready to split at the next coming of the waves; when ignorant men are quite bewildered in their errors; when the whole people see and feel the effects of ill government; when the prince grows ashamed of these, whom his subjects hate and fear; when the commonwealth cannot emerge out of its debts and difficulties, without help from abler hands: then is the true time for the best and wisest men to offer themselves to the service of their country. At such a season, honesty will not stand alone, weak, defenceless, and out of countenance, at the sight of prosperous vice. Nor can courts be ever safe till the circumstance and necessity of the times bring thither a party of honest and able men, strong enough to maintain itself against those who are grown great by wicked arts, and conspicuous ignorance in public business.

If Englishmen will be content in this single point, all must of course go well; if they who have noble commands in the country will scorn meanly to depend in town; if they who have brave feats of their own, will despise the crowded antichambers of the great ones here; if they who have plentiful estates, will slight a troublesome, dependent, and precarious employment, they are more happy than a court can make them: if our nobility and gentry would consider how miserable the noblemen of France are, with all their mighty places, they would at no time hereafter desire to wear the livery of bondage. And if they are truly seasoned with these notions, that their liberties are above all price, and (as Sir Benjamin Rudiard was wont to say) That there is nothing worth being a knave for; the head must be very skilful, and the heart very bold, that will undertake to invade our fundamental rights. It is true, what has been here advanced, may seem needless at present, when all things are presumed to go well; but these notions may be of use to after-ages.

The duty which private persons owe to the public lies in a very narrow compass, and, when that is thoroughly performed, a country seldom fails to see a steady course of wisdom and honesty in such as are trusted with the administration. This duty may chiefly consist in the following particulars:

- 1st, That such as represent the people be uncorrupt, unbiassed, and disinterested.
- 2dly, That they diligently attend the nation's service.
- 3dly, That they carefully watch any innovation or encroachments upon the constitution.
- 4thly, That they make provision against future evils.
- 5thly, That they look narrowly into the income and expence of the kingdom, and examine which way immense debts have been contracted, and how that money has been disposed of which the nation has already granted, and how these debts may be gradually lessened and discharged.
- 6thly, That they hold a strong hand over the men of business, calling those to an account who, either through folly, or upon some wicked design, peruse destructive measures.
- 1st. That such as represent the people be uncorrupt, unbiassed, and disinterested. This point we have handled sufficiently; and to what has been already said upon that subject, we shall now only add, that Rome was once free, that France heretofore had the three estates, which were the guardians of its liberty; that Spain had formerly many rights and privileges, of which nothing now but the shadow remains; that Denmark and Sweden had once constitutions something like that of England; and that all these countries have been enslaved by their own corruptions.
- 2dly, That they diligently attend the nation's service; for otherwise they do not discharge that duty to which they are chosen. It has been formerly a matter of great wonder, that gentlemen should even waste their fortunes to be elected representatives in parliament, and yet afterwards never mind that station, which they seemed before so vehemently to court. Cato had many virtues too high for practice, but he may be easily imitated in one good quality he had, of never failing to be

be present in the senate. Such should give way to others, and make room for men of more leisure, who can afford to employ their time in the service of their country. But, above all others, they are to blame who can be drawn from their duty by luxury, laziness, and pleasures. Liberty can be hardly wounded in a full house; the attempts made upon it in former reigns were made when such as had no dependance upon the court were absent about their country business: the ill ministers of those days took that opportunity to promote taxes, which would never pass in a full assembly, to pass dangerous laws, to set a-foot new-invented corporations, which may be fatal in their consequences, and to form projects, either destructive to the nation in general, or ruinous to particular men. All the ill things that were done have been compassed when the negligence of some had made one side strong, and the other weak.

And if, in after-ages, any of the men of business should be so wicked as to proceed by the same councils, and to go by the like measures, they will promote their dark designs in some such juncture, when the best patriots shall be gone away, quite tired out by sessions artificially prolonged.

But it is the duty of all who love England, to defeat, by unwearied patience, such a conspiracy against the people; and to obviate such a mischief, if the ordinary rules cannot do it, extraordinary laws may be thought on to oblige the members to that attendance which they owe their country.

He who does not attend, injures the borough for which he serves; for it may so happen, that in his absence a thing may pass to their ruin who have sent him, and which his presence might have prevented; his electors, therefore, seem to have such a right to his service as in reason no others ought to dispense with, without their consent.

Deferting in this manner the public is a growing evil, upon which account it ought to have a timely remedy. Perhaps it might not be amiss, if a bill were brought in to make it highly penal for any member to be absent from the house above 14 days, without express leave first had under the seal of the borough for which he serves.

3dly, That they carefully watch any innovation or incroachments upon the constitution. There is nothing lulls a people asleep more, than the reign of a good prince, revered for his wisdom, feared for his high courage, beloved for his lenity, and admired for a number of other virtues; whereas, under a bad reign, the subjects are jealous and vigilant, though often to little purpose: however, it is agreed upon by all wise men, that the mild rule of Augustus contributed more to confirm the slavery of Rome, than all the severity and cunning of Tiberius.

The best times likewise produced the worst precedents; for, in good times, the people let many things slip, being then at their ease, not suspicious, and, consequently, not watchful over the government; but, where this supine temper prevails, mixed governments decline immediately into absolute power. The frequent contests that were of old between the senate and the people of Rome, without doubt preserved their freedom: for, where all are of one mind, ill use may be made of that unanimity, by some subtle, eloquent, and ambitious man, who may turn and rule it as he pleases: therefore to preserve constitutions that have a mixture in them of popular government, it is necessary there should be always some division, just enough to keep the minds of men awake, that they may observe what advantages one part of the state gets over the other.

Bad kings provoke many to look into their actions; but when the people have a good prince, they give a favourable interpretation to all he does.

And the best man that ever reigned may be ill served. It is a maxim of our law, That the king can do no wrong, but if an ill be committed in matters of state, the council must answer for it; if in matters of justice, the judges must answer for it. But though the laws exempt our kings from blame, they are not freed from the bad effects of ill conduct in their ministers.

He, therefore, who represents his country, cannot do the nation nor his prince better service, than to see those who sit at the helm do not run the ship upon dangerous rocks. Absolute dominion is a bait with which the greatest minds may be tempted; for they whose goodness is unlimited, may desire that their power should be so too; but no one man ought to think of being omnipotent, unless he could be omniscient and omnipresent. Besides, though princes may desire great power, that they may be able to do great good, such as serve them rarely proceed upon this principle. They often desire their masters should be arbitrary, in order to their own impunity, and to build a large fortune for themselves; for which reason they should be watched in all their windings, and followed in all their dark and subtle mazes.

It seldom happens that the liberties of a country are invaded all at once the steps of power are leisurely and slow; ministers who have it in their thoughts to change the nature of a government, go to work by degrees. At first they make use of the most popular hands they can possibly procure, ordering it so that the people may not perceive who it is that puts their fetters on; but these popular men they shove out, at the

VOL. II.

first convenient season, that all may be of a piece. Their next business is to corrupt such persons as have the clearest fame, whom they discard when sufficiently tainted, and this they do that the people may think all mankind alike, which naturally drives them to follow those only who are in power, and who can do them service. Afterwards, they get from the nation all the money they can, the collecting of which erects new employments, and creates them a number of dependants, who, in one certain place, ate their chief strength and best support: by the distribution of these sums, they likewise make more friends. But being never out of fear of accounting for all at last, their principal aim is to procure their master such a **STANDING REVENUE**, as may make him subsist without the peoples help, without the necessity of a parliament. If they find this impossible or difficult, then by accusations, by exorbitant proceedings without any precedent, and by harassing private persons, either in their fame or fortune, they endeavour to make all the different ranks of the people out of love with their ancient constitution.

It has been often observed of this nation, That we have lost by **TREATIES** what we have gained by **VALOUR**; and indeed it is very evident, that we have been constantly out-witted in the pacts and stipulations we have made with foreign states and princes, as well concerning interest as dominion: they who could never face us in the field have over-reached us in the cabinet, and all along we have seemed stronger in a battle than in council.

It is, perhaps, no wonder that our honest and plain ancestors should not have sufficient skill to deal with the riper heads of warmer climates; but we may admire how it comes to pass that our neighbours the **HOLLANDERS** in all treaties, but chiefly such as respect **COMMERCE**, have been ever too able for us, whom our vices have made crafty enough in other matters.

Their soil does not generally produce better understandings than that of England; learning flourishes with us as much as with them; our people have sharper wits; we are more cunning in a court than they; and yet, when we come to treat with them, they are always too subtle for us.

But the reason of this is apparent to such as examine into the business; for, as Sir **JOSHUA CHILD** has excellently well observed, 'They have in their greatest councils of state and war **TRADING MERCHANTS**, that have lived abroad in most parts of the world, who have not only the **THEORETICAL KNOWLEDGE**, but the **PRACTICAL EXPERIENCE** of **TRADE**, by whom laws and orders are contrived, and peaces with foreign princes projected, to the great advantage of their trade.

And the concerns of commerce being made among them a matter of state (as it should be in this nation particularly) they commit the care of it to the ablest heads they have, by whose assistance and wisdom they have all along got the better of us and other countries.

In the reign of king **JAMES I.** they obtained that the business of **AMBOYNA** should be flurried over; and so they have secured to themselves a firm possession of the **Spice Islands**.

The peace of **Münster** was likewise very advantageous to the Dutch in all matters that had relation to their traffic, but especially in the plate trade from **Cadiz**.

In the reign of king **CHARLES II.** by delays and artifice, they got the taking of **Bantam** passed over in silence, by which, in a manner, they have engrossed to themselves the rich commodity of pepper.

It is likewise said, when the book of rates was compiled, that the French knew how to plant somewhere a great sum very skilfully, by the help of which they procured that the **CUSTOMS** and **DUTIES** upon their product should be light, and heavy upon that of Spain; though apparently we got by one country, and though we were thought to lose by the other in the general balance.

It will not, perhaps, be seasonable to expect any redress as to past injuries, and peradventure some of our former errors are capable of little remedy for the present; but the wisdom of the state will undoubtedly provide, that England shall be better dealt with in future treaties.

Our **LAND-WARS** have plunged us in debt, and incumbered us with taxes unspeakably injurious to our commerce. It is well known our proper business had been to have insisted only upon our **STRENGTH AT SEA**, for a large fleet would have always guarded and secured our traffic, and would have kept that money within the kingdom which has been sent out to pay **LAND-ARMIES IN FOREIGN COUNTRIES**.

But as in pursuing quite a contrary course, we more consulted the direct and immediate concern and interest of others than our own; so, in reason and equity, the peaces which our money and arms have chiefly procured, should have been as advantageous to this kingdom, as convenient to the rest of Europe.

And yet we shall reap but little profit from all our expence of blood and treasure, unless the traffic of England be thereby put upon a safe and equal foot with all it's neighbours.

The protection and care of trade will, therefore, very much consist in the measures that shall be taken in this present juncture, to secure us against our neighbours.

These memento's may possibly have their use, more especially with the younger and less experienced members of that august assembly, from whose wisdom we expect every blessing.

An act of parliament made in the third year of Geo. III. relating to BANKRUPTS, BEING INTITLED TO THE PRIVILEGE OF PARLIAMENT, AND BECOMING INSOLVENT.

Whereas merchants, bankers, brokers, factors, scriveners, and traders, within the description of the statutes, relating to bankrupts, having privilege of parliament, are not compellable to pay their just debts, or to become bankrupts, by reason of the freedom of their persons from arrests upon civil process; and some doubts have also arisen, whether in cases of bankruptcy, a commission can be sued out during the continuance of such privilege: To remedy which inconveniences, and to support the honour and dignity of parliament, and good faith and credit in commercial dealings, which require that in such cases, the laws should have their due course, and that no such merchants, bankers, brokers, factors, scriveners, or traders, in case of actual insolvency, should by any privilege whatever, be exempted from doing equal justice to all their creditors; it is enacted, &c.

That from and after 12 May 1764, it shall be lawful for any single creditor, or two or more creditors, being partners, whose debt or debts shall amount to 100 l. or upwards, and for any two creditors, whose debts shall amount to 150 l. or upwards, or any three or more creditors, whose debts shall amount to 200 l. or upwards, if any person or persons deemed a merchant, banker, broker, factor, scrivener, or trader or traders, within the description of the acts of parliament relating to bankrupts, having privilege of parliament, at any time, upon affidavit or affidavits being made and filed on record in any of his majesty's courts at Westminster, by such creditor or creditors, that such debt or debts is or are justly due to him or them respectively, and that every such debtor, as he or they verily believe, is a merchant, banker, broker, factor, scrivener, or trader, within the description of the statutes relating to bankrupts, to sue out of the same court summons, or an original bill or summons, against such merchant, banker, &c. and serve him with a copy thereof; and if such merchant, banker, &c. shall not within two months after personal service of such summons, (affidavits of the debt or debts having duly been made and filed as aforesaid) pay, secure, or compound for, such debt or debts, to the satisfaction of such creditor or creditors, or enter into a bond in such sum, and with two such sufficient sureties, as any of the judges of that court, out of which such summons shall issue shall approve of, to pay such sum as shall be recovered in such action or actions, together with such costs as shall be given in the same, he shall be accounted and adjudged a bankrupt from the time of the service of such summons; and any creditor or creditors may sue out a commission against any such person, and proceed thereon in the like manner as against other bankrupts.

Provided always, and it is hereby declared, that this act shall not extend, or be deemed or construed to extend, to any such debt or debts as aforesaid contracted, before the eighth day of March 1763, any thing herein contained to the contrary thereof in any wise notwithstanding.

And be it further enacted, That if any merchant, banker, &c. shall, after the last day of this session of parliament, commit any act of bankruptcy, that then, and in such case, any creditor or creditors as aforesaid, may sue out a commission of bankrupt against such merchant, banker, &c. and the commissioners in such commission, and other persons may proceed thereon in like manner as against other bankrupts; any privilege of parliament to the contrary notwithstanding.

Provided nevertheless, and be it enacted, That nothing in this act shall subject any person intitled to privilege of parliament to be arrested, or imprisoned, during the time of such privilege, except in cases made felony by the acts relating to bankrupts, or any of them.

PARTNERSHIPS in trade, are where two or more persons agree to engage in commerce, either in equal shares or otherwise. With respect to domestic partnerships in trade in England, there are various adjudicated cases, which ought not to be disregarded by those who enter into such kind of agreements.

Where there are two joint traders, and one accepts a bill, drawn on both him and partner, it binds both if it concerns the trade; otherwise, if it concerns the acceptor only in a distinct interest and respect. 1 Salk. 126.

A. and B. were partners as woollen drapers, A. received money in the shop of S. S. and gave a note for it signed for himself and partner; A. and B. being both dead, and A. not leaving sufficient assets, it was held on a bill brought by S. S. against the executors of both the partners, that this note being given by one of the partners, it should bind them both; and that though at law it binds only the executor of the sur-

viving partner, yet in equity the creditor may follow the estate of the other, though no proof was made that this money was brought into the stock, or used in trade. 2 Vern. 277.

The act of one partner shall be presumed the act of the other, and shall bind him, unless he can shew a disclaimer, and a refusal to be concerned. 1 Salk. 292.

A. and B. are copartners, and a judgment is had against A. and the goods of both taken in execution; it was held by the court, that the sheriff must seize all, because the moieties are undivided; for if he seize but a moiety and sell that, the other will have a right to a moiety of that moiety; therefore he must seize the whole, and sell a moiety thereof undivided, and the vendee will be tenant in common with the other partner. 1 Salk. 392.

But though a moiety of a joint stock may be taken in execution on judgment against one partner; yet, if copartners become bankrupts, the joint estate is to discharge the joint debts in the first place, and the separate estate to pay the separate debts; and if there be no separate estate, then the residue of the joint estate, after the joint creditors are satisfied, to be applied among the separate creditors, and so vice versa; for the commissioners of bankrupts are intrusted both with a legal and equitable jurisdiction, and may therefore marshal the different effects, and apply them in discharge of the different creditors according to equity and justice. 2 Vern. 293. 706. 2 Chon. Ca. 228.

The plaintiff's husband (to whom she is administratrix) and the defendant were copartners for many years in the trade of a druggist; the plaintiff brought her bill for a discovery of the estate, and her proportion and dividend thereof, &c. the defendant answered, and it appearing that many debts owing to the joint trade stood out, it was moved on behalf of the plaintiff, that an able attorney might be appointed to sue for, and receive those debts; it being alleged in the bill, that the defendant carrying on a distinct trade for himself, with the persons that were debtors to the joint trade, to oblige them, he forbore to call in their debts; it was ordered accordingly, unless the defendant, within a week, would give security to the plaintiff, to answer her moiety of the debts that were standing out. 1 Vern. 118.

For accounts as stated in partnership, according to the most accurate methods of double entry. See our article **MERCANTILE ACCOUNTSHIP**.

For other sorts of **PARTNERSHIPS** in trade, see our article **ANONYMOUS PARTNERSHIPS**.

PARMA, a duchy in Italy, is bounded on the north by the Po, which divides it from the Milanese and Cremonese; on the south it has part of the territory of Genoa, and duchy of Modena; on the east, part of the duchy of Modena; and on the west, the Pavesie.

The parts into which it is commonly divided are, the duchy of Parma strictly so called, that of Placenza, the state of Buffeto, and part of that of the valley of Taro, commonly called Val di Taro. Between Parma and Modena are the states of Pallavicini and Londi, which are commonly distinguished from those duchies, because they anciently formed two separate states from them. The first of them contains the marquisate of Buffeto, and Borgo de san Domino, and wholly belongs to the duke of Parma; and that of Londi is divided between that prince, who hath in it the Val de Taro, and the prince of Doria, who hath that of Bandi.

The revenue of this dukedom is reckoned to amount to 400,000 crowns, and the ordinary forces of it to 5 or 6000 men. The country is very delightful and fertile, producing great plenty of corn of all sorts, excellent wine and oil, and was famous formerly for its fine cheese, which was in high request all over Europe; but they are now much outdone by the city and territory of Lodi. Other manufactures, such as silk, woollen, linen, &c. are likewise carried on here, as in other parts of Italy.

The chief places of this duchy are, Parma, the capital, Placenza, Borgo de Santo Domino, Borgo de Val de Taro, and Ferenzula or Florentiola.

Besides these, there are reckoned above 30 other towns belonging to it, which, for the most part, are considerable for their largeness, or on some other accounts.

PARMA, the famed metropolis of this dukedom, is pleasantly situate on the river of that name, but whether it gave it, or received it from it, is not easy to guess. It has three stately stone bridges over it, by which it keeps a convenient communication with its suburb on the other side of it: and is about four miles in circumference, well-peopled, and seated in the midst of a pleasant fertile soil, which supplies it with plenty of corn, wine, oil, fruits, and every thing it wants for use or delight.

It stands about 10 miles from the Po, on the south side of it, and in the middle way between Modena and Placenza, 35 miles east of the first, and as many west of the other, 73 north-west from Florence, 77 south-east from Milan, and above 200 from Rome, lat. 44. 43. lon. 10. 55. east.

PLACENZA, so called from its most agreeable situation and exquisite beauty, above all other cities of Italy, is seated in the midst of a spacious fertile plain, about 100 yards distant from

from the Po and the Trebia, and watered with a number of small brooks and canals, and sheltered on all sides with pleasant hills, and both they and the plain producing great plenty of corn, wine, oil, fruits, &c. excellent each in their kind. It has likewise very good pasture-grounds, breeds great quantities of cattle, and is famed for making a fine sort of cheese, not inferior to that of Parma and Lodi. Here are likewise in it's neighbourhood some salt springs, from which they make a fine salt, exceeding white, and in great request. The hills about it have iron mines, plenty of wood, timber, warrens, and parks, all which are so inviting and commodious, that the city is always full of inhabitants, especially merchants and tradesmen, who carry on a very considerable commerce; inasmuch that one of their fairs, which begins on the 15th of April, lasts to the end of the month.

PASSPORT, SAFE-CONDUCTS, and PROTECTIONS.

A passport, or safe-conduct, is a security given by the king, under the great seal, to a stranger, for his safe coming into and passing out of the realm, and touching which there are several statutes. A passport signifies a licence granted by any person in authority, for the safe passage of a man, or any ship, &c. from one place or country to another.

As to protections, there are two sorts, a public protection, where a prince takes upon him the defence of another prince or state, for his honour or profit, or a private protection of persons or ships, which is, in effect, no more than a passport for such purpose. By the law of protection, he that is protected owes all respect and honour to his protector, against whom he ought not to conspire, or attempt any thing; and, on the other hand, the protector ought to succour and defend the protected, and use him well, for otherwise he may withdraw himself from the protection, and seek another. The Genoese having put themselves under the protection of the French king, revolted, whereupon he changed their conditions into privileges, to the end it might be in his will to deprive them of them when he should think fit. Molloy, Jur. Marit. 84.

In protections of ships and persons, there is generally great faith kept by the granters thereof; for at this day, if a ship hath the emperor of Barbary's protection, the pirates of that nation, if they seize any ship, will restore it; and if there be no protection, yet, if the ship be taken within sight of their castles, the prize is not absolute; but if resistance is made, and there be a caption, she then becomes the captor's for ever, as the price of blood.

The statute of Magna Charta, 9 Hen. III. cap. 30. ordains, That all merchants strangers shall have safe-conduct of coming into, going out of, and remaining in England, to buy and sell, &c. if they are not openly prohibited, except in time of war, and they are of an enemy's country; and; by 27 Edw. III. cap. 2. safe-conduct is to be granted to merchants strangers, not alien enemies, to come and dwell in this kingdom, and return at their pleasure, as also to sell their goods and commodities, without having them taken from them against their wills.

By the act 15 Hen. VI. cap. 3. it is recited, That whereas the lord the king hath granted his letters of safe-conduct to certain persons to come in and go out of the realms of England and Ireland, with a certain number of ships charged with their merchandizes, and faith and credit should as well be given to the copy called Vidimus, sealed under the authentic seals, and approved, as to the original of the said letters; and that one John de Guntier granted and delivered such copy of the said safe-conduct, to as many persons as he pleased, sealed with the seal of him that called himself king of France, under colour of which, a great navy of enemies was assembled, and took many ships, and the king's liege subjects and victuals to the towns and fortresses of the adversaries carried, to the great damage of the king, and his realm of England, &c.

The said lord the king, at the grievous complaint to him made thereof by the commons in parliament, considering the great inconveniences which might ensue by such evil use of his letters of safe-conduct, doth will and ordain, and hath commanded by the authority aforesaid, to the keepers of his great and privy seal, that they shall not suffer such clause Vidimus to be put in any safe-conduct from henceforth to be granted, unless some great or notable cause move the same lord the king to grant the same in such wise: and willeth also, that in all safe-conducts to be granted for the future to any person or persons, the names of them, of the ships, and of the masters, and the number of the mariners, with the portage of the ships, shall be expressed.

By the 18th of Hen. VI. cap. 8. it is ordained, That merchants aliens may at their pleasure charge ships and vessels of Spain, and other parts enemies of the king, if the masters, owners, or merchants of such vessels and ships, have the king's letters patents of safe-conduct, surety, or safe-guard, for the said ships and merchandizes, making mention of the names of the ships or vessels, and of the masters thereof, as the manner is. And if any such ships charged or laden with any merchandizes of such merchants aforesaid, be taken upon the sea by the king's subjects, not having authentic safe-con-

ducts for them, within the board of such ships or vessels, at the day of the taking, or not being enrolled in the chancery of record, then the takers and possessors of the goods and merchandizes so taken may enjoy and hold the same; and proclamation is to be made of this statute on the sea-coasts, to the intent that the said merchants aliens may have knowledge thereof.

The goods and merchandizes loaded in the said ships and vessels of Spain, and other parts, enemies aforesaid, sometimes by false witnesses, marks, and letters testimonials, contrived before the making of this act, were restored to the said merchants aliens, together with damages and expences, on suit made before the king and his council, or before the chancellor of England, to the great loss of the owners, masters, and mariners, takers of the said ships, &c. and discouragement of the king's liege people to take such ships and vessels, and also the hindrance of the navy of the realm: all which is set forth in the preamble of the said statute.

By 20 Hen. VI. cap. 1. All letters of safe-conduct granted to the king's enemies, or any other persons, shall be enrolled in the chancery of the lord the king, of record, before such letters shall be delivered to them to whom the same shall be granted, or shall be void and of no effect: and if, at any time hereafter, any goods or merchandizes are taken by English subjects upon the sea, or the coasts of the same, laden in any ship or vessel belonging to enemies, and not having sufficient letters of safe-conduct, enrolled in form aforesaid, they which shall so take the same goods shall enjoy them, without any restitution thereof to be made, to whatever persons the said goods or merchandizes, at the time of taking, or before, were belonging.

And the king's subjects taking such ships laden with merchandize, not having or shewing letters of safe-conduct, and bringing them by force to a certain port within the realm, shall not receive damage in their persons or goods for so doing, if they be ready to make full restitution of the same ships and merchandize, within a reasonable time after they shall have knowledge of letters of safe-conduct enrolled in the said chancery of record before the taking of them.

The statute 31 Hen. VI. cap. 4. enacts, That if any subjects offend upon the high seas, or in any port within the kingdom, and do damage to any person or persons being strangers in amity, league, or truce with us, or having the king's safe conduct, and especially in attacking any such strange person, and robbing and spoiling of him, his ship or goods, &c. the chancellor of England for the time being (as well for the deliverance of any such person so attacked, as to make restitution to every person robbed or spoiled of ships or goods, of the value thereof) shall have authority, calling to his assistance one of the judges, upon a bill of complaint to him made in this behalf, to make such process out of the chancery against the offenders, to bring them in there, to answer to the parties grieved as aforesaid, and against any other persons to whose hands any person so attacked, ship or goods shall come, and also for delivery and restitution by them to be made of the same persons, ships, and goods, as shall seem to the said chancellor expedient and necessary.

And upon this process made out, the chancellor shall further proceed, if the case so require, by advice of any such judge, to make to the persons strangers that are grieved, full delivery and restitution of any person attacked, and of all such ships and goods, and likewise all their costs, expences, and losses disbursed and suffered by them, and thereupon to award all manner of execution out of the chancery, as shall be necessary for such delivery and restitution to be had and made as aforesaid.

A late act, 4 Geo. II. cap. 18. recites, That treaties are subsisting between the king and the several subjects of Barbary, by which it is stipulated, that all ships belonging to his Majesty, or his subjects, may pass the seas, and enter into the harbours of the said governments, without any seizure or molestation, upon producing passes of a certain form, under the hand and seal of the commissioners for executing the office lord high-admiral, called Mediterranean passes. It is, therefore, enacted and ordained, That if any person shall, within his Majesty's dominions, or without the same, falsly forge or counterfeit any pass for any ship, commonly called a Mediterranean pass, or shall utter or eraze any pass made out by the commissioners for executing the said office of lord admiral; or shall publish as true, any forged, altered, or erased pass, knowing the same to be forged, &c. every such person being convicted in Great-Britain, Ireland, or his Majesty's plantations where such offence shall be committed, shall be guilty of felony without benefit of clergy.

And the said offences, which shall be committed in any place out of Great-Britain, either within the dominions of his Majesty or without, may be tried and adjudged in any county of England, by virtue of the king's commission of oyer and terminer and goal delivery, or before any court of judicature in Scotland.

By the laws of France, no vessel shall go out of any port of that kingdom to put to sea, without a passport from the admiral, recorded at the admiralty-office, of the place from whence the master departs, and within twenty-four hours after

ter the master's arrival in any port, he shall present his passport, and declare the place and time of his departure, the burthen and lading of his ship, the course he has steered, the hazards he hath run, the disorders happened in his ship, and all the considerable circumstances of his voyage, &c. And by a treaty marine, made by king Charles II. with the king of France [see MARINE TREATIES] in the year 1677, a form of passport (or sea brief) is appointed, to be given by the lord high-admiral of England, or those to whom the exercise of admiralty jurisdiction is ordinarily committed; or by the mayor or other chief magistrate, or the commissioners or other principal officers of the customs, in their respective ports, and places within the dominions of the king of Great-Britain, to ships and vessels, which passport is as follows, viz.

An English passport for shipping.

To all to whom these presents shall come, greeting, Thomas earl of P. lord high admiral of England, &c. or we A. B. C. D. E. F. &c. Esqrs, lords commissioners for executing the office of lord high-admiral. Or we the commissioners, or principal officer of the customs in the city or port of, &c. do testify and make known, That G. H. master or commander of the ship called the Prince Frederic, hath appeared before us, and hath declared by solemn oath, That the said ship or vessel, containing about two hundred tons, of which he is at present master, as aforesaid, doth belong to the inhabitants of &c. within the dominions of the king of England: and in regard that it would be more acceptable to us, that the said master or commander be assisted in his just and lawful affairs, and we hereby request you, and every of you, whosoever the said master or commander shall arrive with his ship, and the goods laden on board and carried in her, that you will please to receive him courteously, and use him kindly; and admit him, upon paying the lawful and usual customs, and other duties, to enter into, remain in, and pass from, your ports, rivers, and dominions, and there to enjoy all kind of right of navigation, traffic, and commerce, in all places where he shall think fit, without any interruption; which we shall most willingly and readily acknowledge, upon all occasions: in testimony and confirmation whereof, we have, with our hands, signed these presents, and caused them to be sealed with our seal. Day the day of, &c. in the year, &c. And the like form of passport (mutatis mutandis) shall be used by the most Christian king of France.

The form of a Dutch passport or certificate, for ships that go from the United Provinces.

To the most serene, most illustrious, most mighty, most honourable, and prudent lords, emperors, kings, commonwealths, princes, dukes, counts, barons, lords, burgomasters, sheriffs, counsellors, judges, officers, justices, and regents of all cities and places, as well ecclesiastical as secular, who shall see or read these presents. We burgo-masters and governors, of the city of &c. do certify, that A. B. ship-master, appearing before us, hath declared by solemn oath, that the ship called, &c. containing about, &c. lasts, of which he is the present master, belongeth to inhabitants of the said United Provinces, so help him God. And as we would willingly see the said ship-master assisted in his just affairs, we do request you and every of you, where the above said master shall arrive with his ship and goods, that you will please to receive him courteously, and use him kindly; admitting him upon paying the usual dues, tolls, and other customs, to enter into, remain in, and pass from your ports, rivers, and territories, and there to trade, deal, and negotiate in any port or place, in such sort and manner as he shall desire, which we shall most readily acknowledge on the like occasion. In witness whereof, we have caused the seal of our city to be hereunto put.

A general maritime passport for a Swedish or other ship to pass the Sound of Denmark.

The consuls and senators of the town of, &c. certify, That the ship, &c. commanded by, &c. belongs to our said town (or some other town) in Sweden, and is laden only with goods belonging to Swedes, and bound for the ocean, as the master and the owners thereof have declared before us in our court, desiring this certificate as a proof of the same; the ship and goods being thereby to be exempted from all taxes and vexations in the passage of the Sound and the Belt, according to the treaties between the two kingdoms. In testimony whereof, we have caused the seal of the town to be put to these presents, which we have likewise caused to be signed by the clerk. Given, &c.

PATENTS. Letters patent are writings of the king, sealed with the great seal of England, whereby a person is enabled to do or enjoy that, which otherwise he could not do; and so called, because they are open with the seal affixed, and ready to be shewn for confirmation of the authority thereby given: and we read of letters patent to make denizens, &c.

The chief LAWS of ENGLAND relating to PATENTS.

A monopoly is an allowance of the king by his grant, commission, or otherwise, to any person or persons, for the sole buying, selling, making, working, or using of any thing, by which other persons are restrained of any freedom or liberty that they had before, or hindered in their lawful trade. Though a monopoly may be more truly defined to be, a kind of commerce in buying, selling, exchanging, or bartering, usurped by a few, and sometimes but by one person, and forestalled from all others, to his or their private gain, and to the hurt and detriment of other men; whereby of course, or by authority, the liberty of trade is restrained, and the monopolist enabled to set what price he pleases on commodities.

These monopolies used in this kingdom, have been distinguished into three parts: first, reasonable, of things and trifles for pleasure, such as cards, lutestrings, tobacco, or the like; secondly, unreasonable, as of flesh, fish, butter, cheese, or other needful things for the sustenance of man, without which he can hardly live: thirdly, indifferent, as of velvets, silks, spices, and other delicacies and curiosities, which are indifferent to be used or not. But all monopolies are contrary to the ancient and fundamental laws of this realm, and are against the freedom of trade, &c. Upon this ground it hath been held, that the king's grant to any corporation of the sole importation of any merchandize by our common law, is void.

Some men are satisfied, if a prohibition of a commodity be made by act of parliament, and they will not call it a monopoly, though it be so in effect; as when a society of private merchants have a privilege to themselves only, to sell certain commodities, or to import them, and all other subjects are excluded, although they were neither the discoverers or first inventors thereof: but if it be done by the king's prerogative, then they take it to be a monopoly. There are others who would have all things at large in the course of traffic, and that there should be no societies or corporations of merchants for any places of trade: for by way of partnership merchants might associate themselves, to make or enterprize any voyages, or in sending any goods or merchandize abroad, without having regard to our companies for carrying on trade, some whereof are of great antiquity. And other persons make a difference between companies or associations, dealing in a joint-stock or a-part, affirming the management of a joint-stock to be within the compass of a monopoly; nevertheless, they would be contented to tolerate the same for the employment outward, but for returns homeward, they would have a particular division of the commodities which they receive.

The learned judge Vaughan says, that if the exportation or importation of a commodity, or the exercise of a trade be prohibited generally by parliament, and no cause expressed of the prohibition, a licence may be granted by the king to one or more persons without limitation to export or import, or to exercise the trade: for by such general restraint, 'the end' of the law is no more than to limit the over-numerous exporters, importers, or traders in that kind, by putting them to the difficulty of procuring licences, and therefore such general licences shall not be accounted monopolies. In these cases, the law implies that the king may license, as well as if the prohibitory law had been, that no such exportation, &c. should be without the king's express licence. Vaugh. Rep. 345.

Here we have given the various opinions of different men, concerning what is a monopoly, or not so; and now we shall take particular notice of the great case of monopolies in the reign of queen Elizabeth, as transmitted down to us by that excellent lawyer Sir Edward Coke. Queen Elizabeth intending that her subjects being able men fit for husbandry, should be exercised therein and not employ themselves in making playing cards, which had not been any ancient manual occupation within this realm; and considering that by making a multitude of cards, card-playing was become more frequent, and especially among servants and apprentices, and poor artificers; and to the end her subjects might apply themselves to more laudable and necessary trades, by her letters patents under the great seal, dated the 13th of June, in the thirtieth year of her reign, granted to R. R. Esq; full power, licence, and authority, by himself, his servants, factors, and deputies, to provide and buy in any parts beyond the sea, all such playing cards as he thought good, and to import them into this kingdom, and to sell them within the same; and that he, his servants, factors, and deputies, should have and enjoy the whole trade, traffic, and merchandize, of all playing cards, to have and to hold for twelve years: and by the same letters patent, the queen charged and commanded, that no person or persons beside the said R. R. &c. should import or bring any cards into this realm, during the said time, nor make buy, or sell, any such playing cards, &c. upon pain of the queen's highest displeasure, and of such fine and punishment as offenders deserve in case of voluntary contempt. On an action of the case brought by the patentee against one for importing and making cards contrary to these letters patent,

tent, notwithstanding the glorious preamble and preterence thereof, it was resolved that this grant was void: for it is a monopoly, and against the common law, and likewise divers acts of parliament; for all trades, as well mechanical as others, which prevent idleness (the bane of the commonwealth) and exercise men and youth, for the maintenance of themselves and their families, and for increase of their substance, to serve the queen when occasion shall require, are profitable to the realm. And the sole trade of any mechanic art, or any other monopoly, is not only a damage and prejudice to those who exercise the same trade, but also to all other subjects, for the end of these monopolies is for the private gain of the patentees: and there are three inseparable incidents to every monopoly, against the commonwealth, i. e. the price of the same commodity will be raised; after the monopoly granted, the commodity is not so good and merchantable as it was before, and it tends to the impoverishment of divers artificers and others, who before, by the labour of their hands in their art or trade, had supported themselves, but now will be idle and in beggary.

And it is evident by the act of 3 Edw. IV. cap. 4. that the importation of foreign cards was prohibited, at the grievous complaint of the poor artificers card-makers, who were not able to live at their trades, if such cards should be imported; and the said act provides remedy for maintaining of the trade of making cards, so far as it maintained many families by their labour and industry; and the like provision is made 1 Rich. III. cap. 12. and persons may not be restrained from exercising any trade, but by parliament. Now when the wisdom of the parliament has made a statute to refrain, for the good of the public, the importation of foreign manufactures, to the intent that the subjects of the realm might be employed in making of the said manufactures, &c. and thereby maintain themselves and their families; to grant the sole importation of them to one for private gain, or to divers without limitation, notwithstanding the said statute, is a monopoly against the common law: and therefore the dispensation or licence to have the sole importation and merchandizing of cards (without any limitation or stint) notwithstanding the act 3 Edw. IV. is utterly against law. Adjudged Trin. 44. Eliz. 11 Co. Rep. 84, 85.

King Edward III. by his letters patents, granted to one John Peche, the sole importation of sweet wines into London, and at a parliament held 50 Edw. III. this grant was declared void. And queen Elizabeth having granted unto certain patentees, the sole coinage and transportation of all the tin in Cornwall and Devonshire for 21 years, under a large yearly rent to be paid at the Exchequer. Adjudged, that this patent was a monopoly, anno 13 Jac. I.

In an action the plaintiff set forth, that in the reign of Hen. IV. there was a society of merchant-adventurers in England, and queen Elizabeth did incorporate them by that name, with privilege to trade to Holland, Brabant, Flanders, &c. prohibiting all others not free of that company from trading thither; and that the defendant not being free of that company, did trade there without their leave, and imported goods to their damage, &c. To which the defendant pleaded the statute 15 Edw. III. That the seas shall be open to all merchants to pass with their merchandize whither they please: the question was here, whether the king had power to restrain his subjects from trading to particular places? This case was not determined; but the better opinion was, that such a grant was void, it agreeing with lord Coke's definition of a monopoly: it is against the statute of Edw. III. which gives liberty to merchants to buy and sell without disturbance; and it is expressly against the statute 21 Jac. I. The case of the East-India company is not like this, because that patent restrained the subject from trading with infidels, without leave; if it had been to restrain them from trading with Christians, it had been void. 3 Mod. Rep. 126.

By the stat. 21 Jac. I. cap. 1. it is enacted and ordained, that all monopolies, commissions, grants, letters patents, and licences, for the sole buying, selling, and making of goods and manufactures within the king's dominions; and all warrants, proclamations, and restraints, &c. for the erecting, strengthening, or countenancing thereof, against the tenor of any law or statute, shall be void: any persons grieved by the putting them in use, shall recover in the courts at Westminster treble damages and double costs, by action on the statute; and if any person shall cause such action to be stayed or delayed before judgement, by any order, warrant, &c. except only of the court where it is depending; or shall, after judgement had, cause or procure the execution to be stayed by colour or means of any such order, or warrant, power, or authority, save only by a writ of error or attain, he or they so offending, shall incur a premunire.

But this act doth not extend to any grants allowed or confirmed by act of parliament, nor to any grant or charter to any corporation, company, or fellowship of any art, trade or mystery, nor to any company or society of merchants for enlargement of trade; nor to grants of new manufactures, made to the inventors thereof by patent for fourteen years, being not contrary to law, or prejudicial to the commonwealth; nor to

VOL. II.

any grant of privilege for printing, or making or compounding of salt-petre for gunpowder; or for casting or making ordnance, &c. and certain patents granted to divers persons, are excepted out of the statute.

And letters patent and grants of privilege heretofore made for 21 years, or under, to the inventors of any new manufactures, where they are not contrary to law or mischievous, by raising the price of commodities at home, or hurt of trade, or generally inconvenient, are saved; so also such patents granted heretofore for more than 21 years from the date thereof, notwithstanding this act.

All matters relating to monopolies, grants, licences, &c. shall be examined, heard, and determined, by and according to the common laws of this realm, and not otherwise; and the making use of or procuring any unlawful monopoly, is punishable by fine and imprisonment at common law. 3 Co. Inst. 181.

It is held, that a new invention to do as much work in a day by an engine, as formerly used to employ many hands, is contrary to the statute; by reason it is inconvenient, in turning so many men to idleness. And concerning inventors of new manufactures, &c. it hath been determined on this statute, that the manufacture in such case must be substantially new, and not barely an improvement of any old one, by any addition, &c. thereto, to be within the statute: it must be such, as no other persons used at the time of granting the letters patent; and no old manufacture in use before can be prohibited in any grant for any new invention. 3 Inst. 184.

A grant of a monopoly may be to the first inventor, by the 21st of Jac. I. and if the invention be new in England, a patent may be granted, though the thing was practised beyond sea before; for the statute mentions new inventions within the realm; so that if they be new here, it is within the act, which intended to encourage new devices useful to the kingdom; and it is the same thing, whether acquired by experience or travel abroad, and so brought hither, or by study at home. 2 Salk. 447.

A person had a grant by letters patent from king Charles II. for the sole printing of blank writs and bonds, &c. for the term of 30 years; and one Dorrel a stationer having printed five hundred blank bonds, action of the case was thereupon brought against him; who pleaded, that the company of stationers for the space of 40 years then last past, before the granting of these letters patents, had constantly printed blank bonds, and so made a general conclusion. It was here argued, that the king hath a prerogative in printing, and may grant it exclusive to others; and that such grants have been made by the kings of England ever since printing was invented, of which several instances were given. Now the statute against monopolies doth not reach to this case, because of the proviso therein to exempt all grants of sole printing; and there being an inherent prerogative in the king, in these cases, whenever he exerts it, all other persons are bound up, who were at liberty before.

To this it was answered and confessed, that the king hath a prerogative to grant the sole printing to a particular person; but then it must be in such cases, where no other persons whatsoever can claim a property in it: on considering printing as an art exclusive from the thing printed, this patent is not so good; for if a man invents a new art, and another learns it before the inventor can obtain a patent, if afterwards granted it is void: and then if this be considered in relation to the blank bonds printed, it is not a new invention, which might have made the grant good, because the stationers company have printed such so long time; and for that reason this patent is void, for where the invention is not new, their trade shall not be restrained. And sole printing is a manufacture, it is an art and skill, which the king cannot restrain; but when it is of publick concern, then the prerogative may interpose.

The court of King's-Bench made a difference in this case, between things of a public use, and those which are public in their nature; and the court inclined, that the patent was not good. 3 Mod. 75. 76. 78. 2 Nelf. Abr. 899.

It is agreeable to our common law, and the fundamental laws of all nations, to grant projectors or inventors of useful things, privileges for twenty-one, fourteen, eleven, or seven years; and as to the time granted, the thing itself ought to make the difference, upon good consideration, and so as not to measure all things alike. But the general intention of all grants by letters patent for manufactures, hath or ought to have relation to set the people on work, to recompense the inventor of the art or science, and that things may, in some respect, be better and cheaper to the subjects.

There may be letters patents granted to reward a projector and the same be not any monopoly, although the public liberty may seem thereby to be restrained; and it may be rather a common distribution than restraint, whenever it brings a general good to the nation. The statutes of the kingdom, restraining from exercising divers crafts, all such as have not served an apprenticeship unto the art which they would exercise, do it to no other end but that those arts might be

brought to better perfection, and the things be good and serviceable for these that buy and use them.

REMARKS in another Light.

When private persons improve an old art, or invent or introduce from abroad a new one, they generally lay claim to the assistance of the public, either by bounty or a patent. A distinction should ever be made in the manner of encouraging a single invention or improvement, and an art capable of being carried into an extensive trade or manufacture. In the frequency of patents this has not always been attended to. No manufacture can be managed with secrecy. If one person only is at liberty to practise it publicly at home, some of the workmen or other person possessed of the secret, will find means to escape and carry it abroad, if it is a new invention. Whenever a new trade arises, the inventor or introducer deserves the honour and reward suitable to his merit; his art should be purchased by the public, and laid open, so that a number of rivals in the country where it is invented or introduced, may carry it expeditiously to a necessary height, and be ready to stock foreign markets as fast as possible. This would prove more nationally advantageous, than any person making a temporary monopoly of his art, and secreting the same to himself. It would be a great injury to the public, that the new-invented cotton-throw, or any of the variety of the new articles daily produced in the weaving counties, should be confined to the inventor; and yet where the FABRIC is quite new, he certainly merits due regard from the public; for want of which, the growth of our manufactures was ever very slow, compared to that of France.

Whenever an ingenious art is introduced from foreign parts, and advances successfully, no encouragement is so effectual as to check the importation of the same manufacture from abroad, not by high duties, which either promotes smuggling, or renders it more desirable, because the more dear and foreign, but by people of distinction, especially those in the legislative capacity, who should effectually prohibit and damn it, by discountenancing the wear at once, and making it unfashionable amongst us.—If this be done too soon, our own artists may not be obliged to exert their talents to excel, and the nation may leave the use of it from its dearth; and if so, we shall stand no chance to come in for a share of the supply of other nations: and if this be delayed too long, the patience and fortune of the ingenious undertakers may be exhausted, and the design given over. Next to knowing the principles of a manufacture, certain compendious methods are necessary to perform it with expedition. It is not enough to execute one piece, as well or better than the imported one; the more important point is to execute them in quantities, and this requires length of time and practice; and 'till this can be brought to bear, some public encouragement should not be refused to the first of our own undertakers.

Among single inventions or secrets, the boasted remedies of the faculties are commonly rewarded by patent. Whether this is for the public interests, see the article QUACKS. However right it may be, that the inventors should keep their secrets to themselves, yet is there not an apparent absurdity in soliciting an exclusive privilege for the sole making of what they say no one can make but themselves; is it not desiring a permission from the king to keep their own secret?

The common argument runs for the preventing counterfeits. And in this light, the general good requires they should be indulged with a patent, that all similar ways of injuring the health of his Majesty's subjects should be restrained to one, which is paid for.

Sometimes the discovery is adjudged to have real merit, and to be useful to the public health. In which case, the parliament, in lieu of a monopoly, has thought proper to honour the inventor with a bounty, and so make a present of the remedy to the public: as we have seen done with relation to Mrs Stephens's cure for the stone, the universal medicine of Dr Ward, and formerly to the inventor of a specific for the gout.

Patents are frequent for books, which often promotes the pirating and printing them abroad, or in Scotland. In works of more experience than invention, and where the printer rather than the author applies to the public, perhaps this is the only practicable method of securing his property. But when the author has done a work evidently useful to the public, and an honour to the nation, it were to be wished he might at least be considered as the inventor of a new manufacture, and that rewards for good books were as common as for medicines. Burnet was honoured with the thanks of both houses of parliament for the History of the Reformation, and Mr Locke with a bounty for his Treatise on Interest and Coin. But nothing is more insecure in this nation than literary property, which we have shewn in our REMARKS under the article BOOK, and also in our REMARKS under the article BOOK-TRADE, and under the article COPIES OF AUTHORS. Nor can any thing be a greater discouragement to men of genius and application, to devote themselves this way to the public service, nor does any thing call for greater attention from the legislature.

In relation to the laborious work wherein I am at present engaged, I have not applied for any patent, although I may presume to say, it is a work new of its kind in this nation, nor did any thing of that comprehensive nature ever before appear in any other state or country. My reasons for it are, that I thought it my duty first to experience the judgment of the public; thinking it something extraordinary, however common, for his Majesty's name to be annexed to a book, before the public or any body else, had ever seen one single sheet of it. However meritorious some books may be that have been thus printed, I cannot but think, in the general, such practices are highly impolitic and deceitful upon the minds of the people, who are weak enough to imagine, that a book with a patent to it has the sanction and authority of his Majesty, or those officers of state, who are delegated to grant such powers and privileges; when the truth is, that neither the attorney or solicitor-general, any more than the secretaries of state, or the public, have ever seen a single sheet of such book; and the king knows no more of the merits thereof, than the emperor of China; nay, it is frequent, if I am rightly informed, to obtain patents for books, before any part of them has been begun to be written. And what is still more extraordinary, there are numbers of books published in this nation, with these words annexed to them, PRINTED AND PUBLISHED ACCORDING TO ACT OF PARLIAMENT, OR BY THE KING'S AUTHORITY: and numbers are made to believe, that the parliament have really made an act to encourage and propagate these works throughout the nation, which are generally in the greatest contempt, and only in esteem by the ignorant and deluded multitude. Do not abuses of this kind require redress? Is the sacred name of MAJESTY itself, and that of the PARLIAMENT of GREAT-BRITAIN also, to be thus prostituted, for the sake of the fees of a common patent?

When a work is finished and approved of in general by men of sense, candour, and impartiality, as a performance of solid and permanent utility to the kingdom, the author has a right not only to a patent, but to some other reward and protection than that will give him, and may with a good grace properly apply for them. But to obtain a patent for a book before any one knows any thing of its contents, and which turns out nothing but a barefaced piracy upon others of allowed merit, is raising a most impolitic and arbitrary tax upon the public; and, what is still more intolerable, under the sanction and authority of the king and parliament, when neither of them know any thing of the matter.

The ingenious improvers of the engine for extinguishing fires, the solar and pocket microscopes, the air-pump, the reflecting telescope, and of other machines of curious structure, were properly indulged with patents. The contrivers of the fire-engine, the importer of the Italian throwing-mill, (see the REMARKS on the article DERBYSHIRE, and the infinite numbers daily inventing machines for shortening business, have generally been recompensed with a patent; and some few, if the machine was highly curious and useful, with a bounty and honours also.

The public can suffer nothing from a temporary monopoly of such machines, since one or two persons may easily supply as many as the nation will require of each, and they are things in their own nature durable, and of use only in particular places. Perhaps there are not more than two or three throwing mills in the kingdom, nor above an hundred fire-engines, or a thousand water-engines (for these are rare, except in towns) and in general the higher machines, like the most perfect animals, are fewest in number; some of them, perhaps, for the same reason as beasts of prey are observed to be so.

Manufactures of moderate expence and quick growth, may, in the general, safely be left to private adventurers, and run the common chance for success; the finer arts will never flourish but under public protection and noble patronage; no encouragements in the hands of private persons are adequate rewards to the man of genius, who studies the universal promotion of these more useful commercial arts, which give daily bread to millions of the human species, support the dignity of crowns, and the magnificence of the great and the wealthy. A noble profusion of honours and bounty raised the Gobelines to its present height; the united influence of these two being generally sufficient to call forth whatever human industry can attain to.

The house was the residence of two brothers, who first brought to Paris the secret of dyeing a curious scarlet, and failed in setting it on foot. The buildings went under the popular name of the folly of the Gobelines for many years, 'till the obloquy was taken off by a ROYAL EDICT, and the name changed by public authority to the more honourable one of the ROYAL MANSION OF THE GOBELINES. The scarlet colour was ordered to be called after the name of the inventors, and the little river Bievre, which runs by the building, receives the same distinction.

These in appearance were trifling matters, but will be sensibly felt by the man of genius. The same year the house was purchased by the king, and intitled the ROYAL MANUFACTURE OF THE CROWN FURNITURE; and provision was made by a ROYAL CHARTER, to render the place a PER-

PERPETUAL SCHOOL and SEMINARY of the curious arts. Here the famous Colbert collected together from all parts of the world, the most able masters and designers, as well as inferior artists in the fine manufactures. Salaries were appointed for the directors, and pensions for life for the workmen; these were tapestry-weavers, engravers in etching and metzotintoes, goldsmiths, jewellers, carvers, and workers in ebony.

In this place was wrought all the magnificent furniture for fourteen ROYAL PALACES, which has since been deservedly the admiration of the world. Particular care was taken that no part should be furnished elsewhere, much less from abroad. All HONORARY PRESENTS to foreign princes and noblemen abroad, and to the ornament of TEMPLES and public buildings at home, were made in the best performances, instead of jewels or money. Many of the superior artists invited from foreign countries were made noble, and all of them had various honorary PRIVILEGES and ROYAL PENSIONS: the whole number, superior and inferior, were comprehended amongst the natives of France, and made free of Paris, with full liberty to practise there respective trades where they pleased, after working for a certain term in the Gobelins. This indulgence extends to all who shall at any time hereafter practise the limited time in this foundation. The whole quarter of the Gobelins was exempted from TAXES and IMPORTS, and had a court of judicature peculiar to itself, under the title of the COURT OF THE ROYAL ARTISTS. See the articles FRANCE, ARTIFICERS, MANUFACTURERS.

Besides these, there are three other academies in Paris for the POLITE ARTS, with various privileges, honours, and pensions to the members, forming the governing part of each society: as the academy of PAINTING and SCULPTURE, that of ARCHITECTURE and the MILITARY one, of late foundation. Precedents inviting our attention and imitation, if the latter may not be said to command it. The two former and the academy of sciences are copied in Spain, and are equally liberal endowments.

In England, the stream of public favour and liberality has turned wholly to the advance of sciences; we have few or no institutions in favour of ARTS, no place of residence but for speculation. The ROYAL SOCIETY are indebted to the public only for their name. The academies for instructing youth in the rudiments of NAVIGATION and ENGINEERING, are mean in their endowments and trifling in their effects.

Amongst the many noble institutions of our times, it seems worthy of the glory of the nation, to make provision for the embellishment, splendor, and ornament of that country, for whose security, strength, and grandeur, they have so amply provided. Whoever recollects the establishment of NOVA SCOTIA, the HERRING FISHERY, the CAMBRIC ACT, the encouraging the manufacture of IRON in the PLANTATIONS, and the endowment of the FOUNDLING-HOSPITAL, may hope for any rational provision in this age.

An academy for the fine arts above-mentioned, under a ROYAL CHARTER, with distinguishing honours and privileges for the higher members, and small pensions for the lower, might give us a prospect of some perfection in the branches of TAPESTRY-WEAVING [see TAPESTRY-WEAVING], PAINTING [see PAINTING], SCULPTURE [see SCULPTURE], &c. and all the lower trades of elegance depending on fine design. Without some such public institution, they never yet were carried to an height in any country; no private fortune can stand out the time necessary to train up hands enough to extend the ART into TRADE: but when once a sufficient number were made perfect in this seminary, private adventurers would be found ready enough to take up the business; for no people ever wanted a trade, that abounded with working hands well instructed therein, and who could sell as cheap as other nations.

However useful upon particular occasions the granting of patents may prove, in the promotion of commercial arts, yet this practice should not absolutely preclude all other measures that may be prudential in the public to take for the like great and wise purpose. What these are, may be gathered from what we have suggested under the articles ARTIFICER, MANUFACTURER, ROYAL SOCIETY.

PEARLS, are little stones almost round, oval, or shaped like pears, compact, hard, smooth, white, shining, and of different sizes, which are formed in certain oysters, whose shells are of different bigness: but there are some of them met with that are three or four times as big as Rouen oysters. They fish for these pearl-oysters in the Eastern and Western Oceans, according to Tavernier. The ancients called these pearls uniones, because they believed there never was but one in an oyster; but they were deceived, for we sometimes find seven in a shell. They are bred from a viscous, or saline glutinous, humour, that is condensed and petrified in several parts of the fish.

Instead of a particular part being assigned for the generation of pearl, they breed indifferently in all the parts of the oy-

ster, but are most commonly found in the largest and best shaped oysters, rather than in others. Sometimes we meet with pearl in muscles, and other shell-fish, as well as in oysters. All pearl is esteemed cordial, proper against infection, to recruit and restore lost spirits; but it's chief virtue is to destroy acids, as other alkies do, and likewise to correct the acrimony of the stomach. Pearl is likewise good against a canine appetite, a flux of the belly, the hemorrhage, &c. the dose from six or ten grains to a drachm.

Some pearls are very white, some inclining to yellow, and others upon the black, which are as it were, of a leaden colour. As to these last, they are met with no where but in America, and their colour comes from the nature of the soil, which is fuller of mud than that of the eastern parts.

In the return of the cargo, says Pomet, which the Sieur du Jardin, the famous Jeweller, had in the Spanish galleons, there were six pearls, perfectly round, but as black as jet, and which, one with another, weighed twelve carats each. He gave me these, among other things, to carry to the East-Indies, and see if I could dispose of them; but I brought them back again, and could meet with nobody that would look upon them. As for the pearls which are inclined to yellow, it proceeds from hence, that the fishermen felling the oysters in heaps, and the merchants staying sometimes fourteen or fifteen days before they open to take out the pearl, some of these oysters during this time lose their liquor, which wastes and stinks, and the pearl becomes yellow from the infection; which is so true, that in all the oysters that keep their liquor or water in them, the pearls are always white; but they wait 'till the oysters open of themselves, because if they should open them by force, as we do ours here, they would endanger the damaging and splitting the pearl. The oysters of the straits of Manar, open naturally five or six days sooner than those of the gulph of Persia; because the heat is much greater there, which is in the tenth degree of northern latitude, than in the isle of Bahren, which is in the twenty-seventh; and therefore among the pearls that come from Manar, there are but few yellow ones. In short, the people of all the eastern countries are much of our minds, in relation to whiteness; for I have always made it my observation, that they love the whitest pearl, the whitest diamonds, the whitest bread, and the fairest women.

And though I have never been in America, yet as well for the reader's satisfaction, as that nothing may be omitted, I shall relate all the parts where the pearl-fishings are, beginning with those of the east. First of all, there is pearl-fishing about the isle of Bahren in the gulph of Persia. This belongs to the king of Persia, and therein is a good fortress that entertains a garrison of three hundred men. The water which they drink in this island, and that of the coast of Persia, is like salt water, and of an ill taste, and what none but those of the country are able to drink. As for strangers, if they will have fresh water, they must pay for it; being only to be had a league or two off, by putting to sea five or six persons in a little vessel, and drawing water with a bottle from the bottom of the sea, where for about two or three feet at the bottom, the water is sweet, and pleasant to drink. When they that dive to the bottom of the sea to draw up this water have filled the vessel and stopped it close, they give a pull to a small cord, which is tied to one of those in the boat, which is the signal to his comrades to pull him up.

During the time that the Portuguese were possessed of Ormus and Mascati, every vessel that went out to fish, was obliged to take from them a passport, that cost fifteen abissis, and they kept always several brigantines to sink such as refused. But since that, the Arabs have retaken Mascati, and the Portuguese have no forces upon the gulph, every man that fishes, pays only to the king of Persia five abissis, whether he has success in his fishery, or catches nothing at all. The merchant also gives some small matter to the king out of every thousand oysters. See ABISSIS.

The second fishery of pearls is opposite to Bahren, on the coast of Arabia Fœlix, near the city of Catifa, which belongs to a prince of the Arabs, with all the country thereabouts. All the pearls taken in those parts are mostly sold in the Indies, because the Indians are not so difficult to be pleased as we, and will take the rough as well as the round.

They likewise carry some to Balfora. Those that go into Persia and Muscovy are sold at Bander Congo, two days journey from Ormus. In all the places I have named, and other places of Asia, they admire the pearl that is upon the yellow water, more than the white; because they say the pearl with that water, retains it's liveliness, and will not fade: but that the white will not last above thirty years, without losing it's lively colour; and not only the heat of the country, but the sweat of the person that wears them, will discolour them with an ugly yellow.

Before we leave the gulph of Ormus, I must beg leave to give an account of that admirable pearl, which the prince of the Arabs had, who took Mascati from the Portuguese, who took then the name of Imenect, prince of Mascati, but was called before that, Auph Aen Ali, prince of Norenvæ. This prince had

had the finest pearl that was in the world, not for its size, for it weighed not above twelve carats, or its perfect roundness, but because it was so clear and transparent, that you might almost see clearly through it.

The most perfect pearls have in all ages been allowed to have been brought from the East-Indies. It is true, they do not at this day fetch so high a price in Europe as they did formerly; but still the Oriental pearls are of considerable value, and are like to continue so, inasmuch as they have all the properties that are requisite to render them fit to be reckoned amongst the most beautiful jewels that can be; neither is their any counterfeits, that at all approach them in their lustre: though people have attained in that art to a degree of perfection, scarce to be expected.

The fish that produces the pearl is a kind of oyster, but much larger than the common sort, or indeed than any that are found in our seas; they are common on the coast of Persia, near Ormus, about Cape Comorin, and on the coast of the island of Ceylon*. The shell-fish which produces them, is called the mother of pearl. The ancients have an opinion that thunder and storms had some effect in producing them, for which we shall be able to give a tolerable account, without admitting of any thing wonderful in the fact. The fishing of pearl was a thing always attended with great hazard and danger, such as were employed in it being often obliged to dive in places 30 fathom deep, where they were exposed to many ravenous monsters, peculiarly thirsting after human blood. They were let down out of the vessel to which they belonged with a weight of stone, fixed either to their side or to their feet, that they might descend the quicker and remain the more steady under water. In their right-hand they had a sharp iron, which they used for removing the oysters from their beds; and on their left arm hung a basket, in which they put the fish when they were caught, and about this arm also a cord was tied, by which they gave notice to those in the ship, when to pull them up by another cord that was about their middle†.

The largest sort of fish were found far in the sea, and if they were at any time driven upon the coast, it was by tempestuous weather. And hence the opinion arose, that great thunders and storms contributed to swell and to increase the pearl. The fact therefore was true, that after tempests the largest pearls were found; but the opinion grounded upon this, that the thunder was the cause of the pearl's increase, seems to have no foundation in reason. So easy a thing it is to mistake effects for causes, and to introduce errors in Natural Philosophy, by reasoning wrong upon facts. When the divers touched the oysters, especially those of the largest size, they clung so strongly to the rock, that, very often, there was no removing them, even with the help of their iron instrument. In the oysters they brought up, when opened, the pearls appeared like little drops of fair water or dew, which hardened by being exposed to the air, and were then carefully taken off the shell. In one oyster there was commonly ten or twelve, in some more, in some less; but the more they were, the smaller; and if there was but one, it was generally of a very considerable size, and of greater value than many small ones, so that these shells were esteemed the richest of all*. The shell itself is also of some value, as having a prodigious lustre, and being extremely fit for in-laying and other uses.

* Plin. Nat. Hist. lib. ix. cap. 35.

Philostatus has a very curious passage in relation to this subject, if his accounts could be absolutely depended upon; but whether they be or be not, what he relates is very remarkable, it deserves at least to be noticed, and then let the reader think for himself: the story, as he tells it, is this: some of the Indian pearl-fishers have a method of obtaining that valuable commodity, without bringing up the oysters at all. In order to this, the divers carry down with them a certain kind of rich perfume, which they hold before the mother of pearl; and while the fish sucks it, which it will do very greedily, they gently open the shell, from whence a liquor distils drop by drop, that presently harden into pearls*. It might be alledged, in support of this story, that both Athenæus and Pliny seem inclined to believe, that pearls are at first liquid; which is, indeed, agreeable enough to their form and to their lustre†.

* Philost. in vit. Apollon. Tyan. lib. iii. cap. 57, Tom. IV. lib. ii. cap. 20, 21.

† Athen. Deipn. lib. iii. p. 93. Plin. lib. ix. cap. 35.

At this day, there are four considerable pearl-fisheries in the east. The first, as observed, is on the coast of the island of Bahren, in the Persian Gulph, of which the Portuguese were

formerly masters, but now this fishery belongs to the Persians. The second is near Catifa, on the coast of Arabia the Happy, over-against Bahren. The pearls taken at these fisheries are most esteemed in the Indies, though of a yellowish cast. A great part of them are carried to Balfora, from whence they are distributed all over the Indies. They fish twice a year; first in the months of March and April, and again in the months of August and September. The depth wherein they fish, is from four to twelve fathoms; and the deeper the oyster is found, the pearls are the brighter, because the water is not so hot there, the sun not being able to penetrate so deep.

The third fishery is on the coast of the island of Ceylon. The pearls found there are of a good water, but small, and the greatest do not surpass two carats; nay, it is seldom that they are found of that weight: but, in recompence of this, there is great quantity of seed-pearl fit to powder. The fourth and last fishing is at Japan; the pearls there are of a water white enough, and heavy, but ill shaped, most of which fall into the hands of the Dutch East-India company, because the Japanese themselves have no esteem for jewels of any kind*. The poor people employed in these fisheries live very meanly, and scarce get a subsistence by them; even those who deal in pearls are far enough from being rich, through the oppression of their princes on one side, and the art of the Dutch on the other; who finding that the bright pearls taken on the coast of Ceylon are most esteemed, and go off on the greatest rate in Europe, employ a brachman to buy them up as they are caught, which he does at a very low rate:

* Tavernier Voyages aux Indes.

The persons concerned in this trade, launching out into greater expences than they can afford, and thereby subject themselves to the dreadful necessity of parting with the fruits of their industry to such as are possessed of money.

* This tempts some of them to a very base practice, which is throwing a poisonous drug into the sea, near the banks where the best fish lie; upon which they immediately remove to another coast, where such as are in the secret, fish for them, and become rich before their roguery is found out†.

* Voyages de la Blun, p. 330.

† Voyage de Thevenot, Tom. III. liv. ii. cap. 112.

There are now several pearl-fisheries established in the West-Indies, and in other parts of the world, as we shall shew in their proper places. But, as the value of those pearls arise from their approaching in their colour and water to the Oriental pearl, this sufficiently shews, that the excellence attributed to them by ancient writers, is not at all prejudiced by the discoveries made in later times, to which the policy of the Indian princes contributes not a little; for, by purchasing the finest pearls at high rates, they keep up their price to the Europeans, so that there never came such numbers into this part of the world as to sink them much in their value: hence it is, that whatever becomes of the pearls of other countries, those of the east still keep up their credit, and a pearl of the weight of four carats, is worth ten or twelve pounds, and of a larger size, and well-shaped, much more*.

OF ARTIFICIAL PEARLS.

The Chinese, according to Monsieur Lambet, pretend to have found the art of making pearls, which are in some sense almost natural. The Chinese ladies of quality set a great value upon true pearls, which they generally use, as ornaments in their dresses. The rivers of the eastern Tartary furnish them with pearls, which, however, are less beautiful than those brought from the Indies, but the value of the artificial pearls bears a proportion to their resemblance to such as are natural.

The small esteem the Chinese have for the counterfeit pearls of Europe, sufficiently shews, that they think them inferior to such as they themselves make, and the advantage they find in this method is, that these pearls are formed, augmented, and perfected under their inspection, and that they catch them in the bosom of the fish, where this substance is formed in the same manner as the true mother of pearl. The secret is as follows:

Take, say they, one of the largest oysters you can find in pure water, put it into a basin half full of limpid water; place this basin in a retired place, in such a manner however, as that it may easily receive the dew of heaven; take care that no woman approach it, nor let the barking of dogs, the crowing of cocks, nor the cackling of hens be heard in the place; (all which means only to take extraordinary care) then take some of the seed of pearls, called yorchus,

chus, used in medicine, and reduce it to an impalpable powder; then after gathering some of the leaves of the tree called che-ta-kong-las (a kind of holy oak) wash them well, express their juice, and with it unite the feed of the pearls.

Of this mafs, form small balls, as large as a pea, which you must cover entirely with a fine powder of the shining pellucula, which is found in the inside of the mother of pearl. In order to make these balls intirely round, roll them on a varnished plate, 'till there remain no more inequalities in them, and 'till they are dry enough not to stick to the fingers; after which, dry them altogether, in a moderate heat of the sun.

When your matter is thus prepared, open the mouth of your oyster, and put the new formed pearl into it, and feed the oyster for an hundred days, in the manner I am about to describe, but take care to give it it's food every day, at the same time precisely, without varying even in a few minutes, and when the hundred days are expired, you will find a pearl of a beautiful water, which you may bore when you please. The author does not forget to specify the materials of which this food is composed, and particularizes the gin-feng, the China, or white esquine, and the peki, which is a root more glutinous than the moth-glue, and the pecho, another medicinal root. We must, according to him, take of each of these, a drachm; and reduce them to a very fine powder, of which, with honey purified over the fire, we form long pills, and divide the whole into a hundred portions for the hundred days.

This receipt is not seemingly without difficulties, which require illustration from the author, if he could be consulted; for how shall we open the oyster without hurting it? or must we wait 'till the oyster opens itself? How must we open the mouth of the oyster to put the prepared pearl into it, or is it sufficient to put it into the shell? In like manner, with respect to the distribution of the food, is it only to be put into the water, whence the oyster will not fail to draw it into it's mouth? All these points seem to require illustration.

It is certain that in China, there are people employed in making these pearls, who certainly would not use the feed of pearls, so much esteemed in medicine, if they were not certain to reap a considerable profit from it. Perhaps also, the Chinese have found from experience, that by the nourishment they give the oyster, there are several small pearls formed, which indemnify them for the expences they have been at, in producing the principle one.

Be this as it will, it is certain that the Chinese have had a good deal of knowledge of the origin of true pearls. The choice they make of the mother of pearl, of a retired place, distant from noise, and harsh peircing sounds, accompanied with a pure air, and exposed to the dew, they long time they require for the formation of the pearl, the aliments they furnish, and whereby they sustain the juices drawn from plants, which the rains, after having enlarged the rivers, carry into the pearl fisheries, and which, as they assure us, render them all fertile, are circumstances that evince, that the Chinese have endeavoured to imitate nature in her operations.

To the secret of forming pearls, in some measure natural, the same author adds some other secrets for restoring their primitive beauty when lost.

When pearls lose their beauty, there is a method of removing the impurities adhering to them, and restoring them to their primitive splendor. For this purpose, let them steep a night in woman's milk, then take the herb y-mont-fao, reduced to ashes, make a lee of it, and receive the water which drops from it through a coarse linen cloth; add a little fine wheat flour; put your pearls into a silken bag, tied at the mouth, and after having plunged the pearls into this liquor, rub them gently with your hand.

If pearls are tarnished, or spoiled with any unctuous matter, take geese and duck's dung, dried in the sun, and reduced to ashes; make a decoction of these, and when the water is settled, put the pearls in a silken bag, and wash them in the manner above directed in this decoction.

The approach of the fire sometimes renders pearls reddish: in this case, take the skin of the hoan-naw-tse, (a foreign fruit of which the bonzes make their beads) boil it in water, into which put the pearls and wash them; or beat turnips or radishes, and after having expressed the juice of them, put the pearls a whole night into it, and they will come out very white.

If the pearls become red of themselves, wash them in the juice expressed from the root of the Indian banana tree; leave them in that juice for a night, and the next morning they will have their first splendor and natural whiteness.

Pearls are sometimes damaged when without reflection they are brought near a dead body. In this case, they are restored to their primitive lustre, by washing and rubbing them in the lee of the plant y-mont-fao, with which a little meal and lime are to be mixed.

The author also advises us not to leave pearls scented with musk, by which means they are so tarnished, as to lose a considerable part of their value.

Further observations on the methods suggested for the making artificial pearls.

The ancients, who wrote on the several sorts of precious stones, ranged pearls among jewels of the first class.

The oriental pearls, as observed, are the finest, on account of their largeness, colour, and beauty, being of a silver white; whereas the occidental or western pearls, seldom exceed the colour of milk.

To imitate fine oriental pearls.

Take of thrice distilled vinegar two pounds, Venice turpentine one pound; mix them together into a mafs, and put them into a cucurbit; fit a head and receiver to it, and after you have luted the joints, set it, when dry, on a sand furnace, to distil the vinegar from it; don't give it too much heat, lest the stuff swell up.

After this, put the vinegar into another glass cucurbit, in which there is a quantity of feed pearl, wrapped in a piece of thin silk, but so as not to touch the vinegar; put a cover or head upon the cucurbit, lute it well, and put it in bal. mariæ, where you may let it remain a fortnight. The heat of the balmæum will raise the fumes of the vinegar, and they will soften the pearls in the silk, and bring them to the consistence of a paste; which being done, take them out, and mould them to what bigness, form, and shape, you please.

Your mould must be of fine silver, the inside gilt; you must also refrain from touching the paste with your fingers, but use silver gilt utensils, with which fill your moulds: when you have moulded them, bore them through with a hog's bristle, or gold wire, and let them dry a little; then thread them again on gold wire, and put them into a glass; close it up, and set them in the sun to dry; after they are thoroughly dry, put them in a glass matrafs into a stream of running water, and leave them there 20 days; by that time they will contract the natural hardness and solidity of pearls. Then take them out of the matrafs and hand them in mercurial water*, where they will moisten, swell, and assume their oriental beauty; after which shift them into a matrafs, hermetically closed up, to prevent any water coming to them, and let it down into a well, to continue there about eight days; then draw the matrafs up, and in opening it, you will find pearls exactly resembling oriental ones.

This method is very excellent, and well worth the trouble, since by experimenting so fine a secret, one will have the satisfaction of seeing the performance answer the direction above expectation.

* Mercurial water is thus prepared. Take plate-tin of Cornwall, calcine it, and let the calx be pure and fine; then with one ounce of the calx, and two ounces of prepared mercury, make an amalgama; wash it with fair water, 'till the water remains insipid and clear; then dry the amalgama thoroughly, put it into a matrafs over the furnace, giving it such a heat as is requisite for sublimation. When the matter is well sublimated, take of the matrafs and let it cool. Take out that sublimate, add one ounce of Venice sublimate to it, and grind it together on a marble; put this into another matrafs, close it well, and set it upside-down in a pail of water, and the whole mafs will dissolve itself in a little time into mercurial water: this done, filtre it into a glass receiver, set it on a gentle ash fire to coagulate, and it will turn into a crystalline substance: this beat in a glass mortar, with a glass pestle, to a fine powder, strain it through a fine sieve, and put it into a matrafs, stop it close up, and place it in bal. mariæ; there let it remain, 'till it resolves again into water; which is the mercurial water, fit for the abovementioned use.

To form large pearls out of small ones, as directed by Korndorffer.

Take of mercurial-water 14 ounces; put two ounces of sulphur solis into a low matrafs, pour the mercurial-water upon it, and let it dissolve and extract. Then take of the whitest small pearls 20 ounces, put them into a proper matrafs, and pour the said water upon it. The pearls will by degrees dissolve, and at last turn to a clear calx, much like dissolved silver calx. Pour off the mercurial-water; boil the calx well out, and dry it; then put it into a clean crucible by itself, and cast it into what form you please. When cold, polish it in the same manner as you do gems or crystals, and you will have your work of the consistence and beauty of the finest and clearest oriental pearl.

To blanch and cleanse pearls.

First soak and cleanse them in bran-water, then in milk-warm water, and last of all steep them in mercurial water; then string and hang them in a glass; close it well, and set them in the sun to dry.

The bran-water is made thus: boil two good handfuls of wheaten bran in a quart of water, 'till all the strength of the bran is drawn out, which use thus: take a new glazed earthen pan in which put your pearls on a string, and pour the third part of the bran-water upon it; when they have soaked, and the water is just warm, rub your pearls gently with your hands, to clean them the better, and continue this 'till the water is cold; throw off that, and pour on another third part of the bran-water that is boiling; proceed with this as you did before, and when cold, throw it away, and pour on the remainder of the water, still proceeding as before; after this, heat fair water, and pour it on your pearls, to refresh them, and to wash away the remains of the bran, by shifting them, and pouring on fresh warm water: this do thrice, without handling your pearls; then lay them on a sheet of clean white paper, and dry them in a shade; after which, dip them into mercurial water, to bring them to perfection.

PEDLAR, a travelling foot-trader. See HAWKER.

R E M A R K S.

Almost all the commodities of Europe are distributed through Spanish America, by a sort of pedlars, or merchants on foot, who come from Panama to Paita by sea, and in their road from the last mentioned port, make Piura their first stage to Lima, disposing of their goods, and lessening their burthens, as they go along. Some take the Road through Caxamarca, others through Tauxillo, along shore from Lima: they take their passage back to Panama by sea, and perhaps carry a little cargo of brandy with them: at Panama they again flock themselves with European goods, returning by sea to Paita, where they are put on shore; there they hire mules, and load them, the Indians going with them, in order to bring them back; and so these traders keep in a continual round, 'till they have got enough to live on.

Their travelling expences are next to nothing; for the Indians are brought under such subjection, that they find lodging for them, and provender for their mules: this every white face may command, being an homage the poor Indians are long accustomed to pay; and some think they have an honour done into the bargain, except, out of generosity, they now and then meet with a small recompence. In the British and French nations, a pedlar is despised, and his employment looked upon as a mean shift to get a living; but it is otherwise here, where the quick return of money is a sufficient excuse for the manner of getting it; and there are many gentlemen in Old Spain, who, when their circumstances in life are declining, send their sons to the Indies to retrieve their fortune this way.

REMARKS ON OUR ARTICLE PEDLAR.

In Poland are very few or no manufactures among themselves: their gentry, who are all called nobility, are infinitely above it, and the commonalty are far below it, the one too proud, the other too slothful. So that there is hardly a suit of cloaths made in the country; but all is either made abroad, or the materials brought from abroad; even the taylors are called merchants, for they travel from one nobleman's house to another to make their cloaths; and even the ladies buy their jewels of the pedlars, who carry them about.

The towns of Dantzic and Elbing, in Poland, being the only sea ports belonging to the kingdom of Poland, that want of sea coast, and the exceeding length of the kingdom of Poland south, occasions that the remotest parts of the kingdom are supplied with their finest goods, not by the warehouse keepers and shop keepers vending their goods from hand to hand, and from the ports to the cities, and from the cities to the market towns, and from those towns to the shop-keepers in the villages by wholesale, and these again to the inhabitants by retail, as in England; but the whole trade is carried on by the travelling merchants, that is, in English, by pedlars and petty chapmen.

They travel from town to town, and from one gentleman's seat to another: and by these the ladies are supplied with fine linen, laces, ribbands, silks, and with all sorts of haberdashery, mercery, and drapery goods; such as come to Dantzic from England, Holland, France, and Italy.

The pedlars travel, some with a horse, some without; some with three, four, or five horses, and 'tis ordinary with them, when they come to a nobleman or gentleman's house, to have a chamber or two assigned them, by the lord or lady of the house, and to stay there three or four days, 'till not only the family have fitted themselves, and are furnished with all they want, but 'till they have sent notice to such of the gentry who live near them, who come, the ladies especially, in their chairs and chariots, to see the wares, and please themselves: all which time the pedlars, who are generally Scotsmen, are entertained freely, and both they and their horses well taken care of, by command of the person whose house it is, and always fully paid for whatever they sell, the Polish ladies making it a point of honour to pay immediately for what they buy; and as the Poles, both men and women, affect to be

extremely gay in their cloaths, they lay out a great deal of money that way. This makes the trade of Dantzic and Elbing very considerable, the pedlars always having recourse thither for their supply of goods, when they have sold off their stocks. These pedlars, who go with many horses, are some of them men of considerable wealth, and carry with them goods to a great value; and yet that is the absolute government of the nobility, and the common people are so entirely subjected to them, even for life, as well as servitude, that the pedlars trade with the utmost safety, never meeting with the least injury from the common people: and if at any time they are apprehensive of danger, the gentlemen will cause the country people to guard them from place to place, and forbid them taking any thing of them for it.

The number of these pedlars is so great in Poland, that if we may believe the story of Sir John Denham and Mr Killigrew, who were sent from England to take the number of them in the reign of king Charles II. there were then reckoned 53,000 of them; and those gentlemen having the king's commission, and the king of Poland's licence to tax them by the poll, brought home 10,000l. sterling, besides the expence of the journey, which must be very considerable.

There is a distinct sort of these pedlars, who are called goldsmiths; they call themselves so, and these generally travel with but one horse; they carry all sorts of small goldsmith's wares, as gold rings, seals cut in gold and silver, and steel, snuff-boxes, and in a word, toys of all kinds, as well in silver and gold, as in steel, iron, and brass, with all that we call cutlery-ware, knives, forks, buckles, buttons, &c. diamond buckles for the hat or cap, which the Polish nobility are never without, and value themselves much upon; but counterfeit jewels too are very much used amongst them.

These chapmen or pedlars buy old plate, and exchange it for new: they buy also jewels and rings, and every thing of that kind, as occasion presents; and being pretty cunning in their trade, they generally gain more in proportion by buying than by selling.

PEGU, a kingdom situate on the east side of the bay of Bengal, [see BENGAL] in the East-Indies, in Asia, bounded by the kingdom of Ava [see AVA] on the north; by the mountains, which separate it from Laos, on the east; by the kingdom of Siam [see SIAM] and the bay of Bengal on the south; and by another part of the bay of Bengal on the west.

Captain Hamilton says the country is very fruitful in corn, fruits, roots, and excellent pulse of several sorts, and produces timber for buildings, elephant's teeth, bees-wax, stick-lack, iron, said to be of so hard a quality, that it is almost a natural steel; tin, oil of earth, wood-oil, the best rubies in the world, small diamonds, sapphires, amethysts, and other precious stones. They have abundance of salt-petre, but it is death to export it; and plenty of lead, which passes all over Pegu dominions for money. About 20 sail of ships find their account in trade for the limited commodities, but the Armenians have got the monopoly of the rubies, which turns to a good account in their trade. Here is abundance of wild game, both quadrupedes and winged; and in September, and October, wild deer are so plentiful, that the captain says he bought one for a goat; but though they are very fleshy, they are not fat. They have many sorts of good fish and swine's flesh, and plenty of good poultry.

They wear little of our European manufacture, except hats and ribbands; so that the gentry will give extravagant prices for fine beaver hats and rich ribbands, flowered with silver and gold; and be the hats never so broad, they are stretched up the crown as far as possible, but without any sort of cock.

Cotton-cloths from Bengal and Coromandel, with some striped silks, are best for their market; and silver of any sort is welcome to them. It pays the king 8 $\frac{1}{2}$ per cent. custom; but in lieu thereof, he indulges the merchants to melt it down, and put what alloy they please in it, and then to pass it off in payments, as high as they can. Rupee silver, without alloy, will bear 28 per cent. of copper alloy, and keep the Pegu touch, which they call flowered silver; and if it flowers, it passes current. They make flowered silver thus: when the silver and copper are mixed and melted together, they put it, while liquid into a shallow mould, and blow on it through a small wooden pipe, which makes the part blown upon appear with the figures of flowers or stars; but if there is too great a mixture of alloy, no figures will appear. The king generally adds 10 per cent. on all silver that comes into his treasury, besides what was put on at first; and though it be not flowered, it must go off in all his payments; but from any body else, it may be refused if it is not flowered.

The chief towns are Syram, or Syrian, whose bar is the only port now open for trade in all Pegu dominions. Some Geographers place it near the mouth of the river Acenam, or Liva; others near the mouth of the river Pegu, and the conflux of those two rivers, almost over against Matiban. It drives a good trade with Armenians, Portuguese, Moors, Gentaws, and some English. Their import is several sorts of Indian goods, as betellas, mulmuls, tanjabs, &c. European hats, and silver; and the customs here, which are about 82 per cent. amount, with other charges, to about 12 in the hundred. The English from fort St George, traffic pretty much with

with this country ; and, besides furs and skins, import from thence rubies, sapphires, and other precious stones.

As soon as foreign ships arrive here, the number of people on board, with their age and sex, is sent to the king, to acquaint him that so many of his slaves are arrived to partake of the glory and happiness of his reign and favour.

PEGU city, Capt. Hamilton says, is about 40 miles to the east of it ; and that the ditches round it, which are now dry, and bear good corn, shew that few cities in the world formerly exceeded it in magnitude, but now is laid in dust, not one twentieth part of it being inhabited, and that only by the lower class of people.—Moll says it lies 20 miles up the river of the same name, which divides it into two towns, the Old and the New. The latter was the seat of it's kings ; the former is still the residence of it's merchants and artificers.

R E M A R K S.

Under the articles EAST-INDIA TRADE, ENGLISH EAST-INDIA COMPANY, DUTCH EAST-INDIA COMPANY, FRENCH EAST-INDIA COMPANY, and OSTEND EAST-INDIA COMPANY, we have so stated the nature of this commerce in it's several lights, that a good judgment may be made, upon the whole, in what manner this trade may be best preserved, and improved to the general advantage of the kingdom ; for the making of extraordinary innovations in the commerce of a nation, may possibly be attended with consequences no less prejudicial to a state, than innovations in it's fundamental constitution. The reader, who has candidly attended to what I have already said in relation to this branch of our commerce, and others, will do me the justice to observe that I am no monopolist, though I have endeavoured to shew how extremely circumspect we ought to be before the East-India company is absolutely annihilated ; which, it seems, is a matter very languinely talked of by some people.

Since we have treated of this subject, under the preceding heads, and others, that may be consulted from the Index, there have appeared some objections against the company which well deserve attention, in order to their being duly canvassed. And as this is the first article in the East-Indies that has given me a natural occasion to touch upon this matter again, I might be judged wanting in impartiality to pass it over in silence, for which I would by no means give the least reason ; and, therefore, I shall submit to consideration what the gentleman has said in his own words ; for if it shall appear to bear the test, it cannot be made too public ; and, if it will not, a refutation will be expected.

* The charter of the East-India company, says our author *, obtained at first for ministerial emoluments, cherished and supported ever since, probably on little better motives, has surmounted and baffled all opposition, though many times attempted : nor has this enormous error in trading policy ever yet been canvassed so far as to have had one solemn hearing and debate, in that august assembly ; from whence this injured, this almost exhausted, nation (of it's real wealth in specie) can only hope for redress.

* Some Thoughts on the Present State of our trade to India. By a Merchant of London, p. 5, & seq.

* To declaim on such an interesting subject, and to pass such severe reflections, without producing some probable facts in support of them, would be presuming too far on the candour of the reader ; the greatest measure of which, by making large allowances for inaccuracy of style and method, is here needful ; nor without it can the author entertain the least hope of being attended to.

* The plan, therefore, proposed for the setting forth this truth, is to draw up a plain account, according to MERCANTILE RULES ; and as arithmetical proofs are the most conclusive of all other incommensurable affairs, so upon these, and only these, let the equitable decision of this question stand or fall.

* In the course of the evidence you will find a set of managers buying considerable quantities of our woollen and other manufactures, hiring of private merchants seventeen fail of fine capital ships, each of five hundred tons burden, and having thirty guns, and one hundred sailors ; employing thereby great numbers of tradesmen of all sorts, and, meeting once or twice a week, do, in their several committees, justly

discharge their duty to their constituents ; and whose characters, in point of integrity, are, and will remain, unimpeached.

* You will also find these gentlemen following, inadvertently, the blind rotation of public office, gradually working destruction to their country, by purchasing immense quantities of gold and silver bullion, near treble the value of their exports in manufactures : all which together compose the cargoes of the several ships outward-bound to India.

* These ships are, in this account, admitted and supposed to be arrived at the respective ports and places of their destination, and to return full freighted, with the commodities of that country, to their moorings in the river of Thames : which is done to evince the fair dealing of the accountant, who will not take hold of the loss of a ship or two, to throw an idea of disadvantage on the trade ; but then, whatever such impartial conduct produces, he hopes will be looked upon as an equitable average, or a true picture of the real circumstances of it, even for any length of time.

* Every one knows, that the commodities returned for this destructive export of useful products, and the yet more necessary ingredient of national safety, it's real and intrinsic wealth, bullion, consists in the following ; the cotton manufactures of India, the silks of China, with their tea, china-ware, and some drugs : whatever other European nations take of us, in the articles, may be reckoned as profitable, because our ships and men were employed in the importation hither.

* On the other hand, whatever of these returns cannot be deemed useful materials of manufactures, &c. or are consumed merely by ourselves, colonies included, may undoubtedly be as justly accounted unprofitable ; and, considering what is sent out for it, to wit, the nerves of war, absolutely worthy of strict enquiry.

* The accountant in order to illustrate what follows, more fully to the candid and unprejudiced reader, thinks it not amiss to lay before him his plan of operation, shewing from whence he draws his materials to work upon.

* It will be looked upon as an attempt extremely ridiculous, especially among accountants, to pretend to form an account of profit and loss on a branch of trade, state a national account thereof, and, what is more, to give a shrewd guess at the identity of a large supposed capital stock, without ever having seen their books, or being in the least matter assisted by any of their clerks ; the public judgment, however, may be suspended, when this particular is remarked : the extracts of their books, that is to say, the several entries at the custom-house, and amount of their cargoes, and declarations for sales, are all printed and published ; to collect from whence, though it be, and really has been, a very laborious and arduous task, yet it is done ; and, according to my motto, the motive makes

Labor ipse voluptas.

* First, on the debit side of the account, he collects his several charges from the bills of entry, printed and published at the custom-house London, which if erroneous, the fault cannot be imputed to him.

* He makes a valuation of the cost of the several articles therein enumerated, such as woollen goods, wrought iron, brass, copper, &c. from the usual market prices, as near as may be, and the articles of gold and silver are specified to a single ounce, and the silver cast up under the present value near 4 per cent. and it must be observed, that nothing can prejudice the justness of this balance, but an over-rating of the several charges on this side of the question.

* So, on the contrary, nothing can prejudice the same on the credit side, but the under valuation of the returns made on the voyage here to be scrutinized.

* Secondly, On the credit, this accountant takes his several materials of discharge from the printed declarations of each ship's cargo, compared with their sales ; wherein he admits their whole amount, as put up and sold at the candle, that the truth may not be disputed by the non-arrival of one or more cargoes, due to the credit thereof.

* Thirdly, he is directed in the true prices of the several species of calicoes, prohibited goods, &c. from the printed accounts published by the most eminent brokers, who constantly attend the sales ; and for the weighable goods, from the sale books, thrown into an average, of which the public are the best judges, whether right or not.

INVOICE

INVOICE of the EXPORTS to INDIA.

Tons of iron.	Ordnance and wrought iron.	Tons of steel.	Tons of nails.	Tons of cordage.	Tons of lead.	Tons of stores.	Brass, pewter, copper.	Tons of gun-powder.	Tons of quicksilver, &c.

Charges

Charges and Discount as follows.

Freight on 8,500 tons of shipping, 10l. per ton	-	-	-	1. 85,000
Wages and provisions for 1700 men at 5 l. per month per man	-	-	-	204,000
Interest on bonds, two years, at 3 per cent.	-	-	-	90,000
Directors, clerks, &c. at 10,000l. per annum	-	-	-	20,000
Warehouses cost 100,000 l. at 8 per cent	-	-	-	16,000
Shipping and landing of 8,500 tons	-	-	-	8,500
				423,500
Discount on 2,875,000l. at 6 1/2 per cent	-	-	-	186,875
				10,35

Nett proceeds do not exceed 1. 1,569,000

Note, That here are 17 ships allowed to be returned, whereas only 14 were really loaded outwards: all which is thrown in to the credit of the account, and no assurance is here charged; so large a scope has the accountant in the support of his sentiment; besides 5 per cent. allowed over the real prices at the candle, which amounts to the small sum of 140,000l. errors excepted. All these, he supposes, may serve to answer whatever may be alledged about the country trade in India of private traders, &c. though they, in fact, have no relation to the company.

Total value, at price free on board	-	-	-	1, 650,000	-	-

Note, The above goods are all bought by the English private merchants, paid for in ready money before delivery, and by them only exported, and dispersed throughout Europe, Africa, and America, those to our plantations being included in this calculation also: the whole undoubtedly over-rated near 100,000 l.

NATIONAL ACCOUNT OF A VOYAGE TO INDIA.

D'	l.	s.	d.	C'	l.	s.	d.
To the export of woollen manufactures	200,000	-	-	By commodities re-exported	650,000	-	-
To ditto of copper, brads, and iron ditto	100,000	-	-	By useful imports	283,344	15	9
To ditto of lead, iron, and stores	374,945	-	-	By national loss for bullion exported, without one valuable return	660,000	-	-
To ditto of silver and gold bullion	828,399	15	9		1, 1,593,344	15	9
To two years interest on 1,500,000l.	90,000	-	-				
	1, 1,593,344	15	9				

'I have thus stated, continues this gentleman, the several accounts: first, that of a given number of ships, fully laden, sailing a long and hazardous voyage to India, arriving, however, in safety, disposing of their cargoes, and returning home the same tedious passage, full freighted with the manufactures and worthless products of that country; ships shattered with frequent storms, their crews one-third dead, many of them sickly, all fatigued, and looking on one another with an evil, instead of a friendly, eye; weary of each other's company in so confined a situation, wishing, as the greatest blessing, for that delightful prospect from the mast-head, their native land, and at length arriving at the desired port in safety: their cargoes printed and published, the goods are landed, Vol. II.

exposed, by fair and just samples, to the inspection of the several buyers, who afterwards meet, according to public notice given, and either by themselves, or agents, the brokers, purchase what they have occasion for, in the fair method of a public auction. The whole being finished, the goods are paid for before they are delivered to the owners, and these allowed a discount of 6 1/2 per cent. for such prompt payment; the several clerks become then employed in casting up the full amount of these sales, according to the gross prices given at the candle, to which they are more immediately obliged, as the customs are calculated and paid thereon ad valorem.

This being completed and settled, I mean the duties for

Nullum tempus aut causa occurret regi,

it is supposed they discharge the several freights agreed on for the hire of ships employed in their service, to the respective owners of them, and all other incidental charges.

A careful and judicious merchant would then proceed to examine and form a balance on the profit or loss accruing from this adventure or voyage to and from India: this he is well enabled to do, by having his several books of account laid before him; and it would be impossible for any other, without the same guides, to have the least idea of it: wherefore, in the several matters here before us, it is not alleged that they are drawn up with the accuracy which books could furnish materials for; but that from those which are, and must necessarily be made known in the carrying on this public trust, the accountant has, with the utmost care, from these rambling papers, extracted an impartial and just balance (equitably considered) of the real state of this branch of trade, both in regard to the nation, their stock, and bond creditors; but yet not giving up the claim and right of mercantile accounts, that of errors being excepted always.

To detect wilful or malicious charges, or unintended errors, he has also the particularized articles; and although the account be at length reduced to one debit and one credit, yet each are anatomized in the pages (10 to 15) and their truth exposed, to be allowed or disallowed by the reader.

By this a profit appears of the sum of 65,655 l. 4 s. 3 d. after paying interest for the money borrowed on bonds. Trade, the Hollanders call, a sick bride, often out of order, but never dies; it will, in general, produce satisfaction, when attended by economy, and soothed by prudence: on the other hand, our expences being large, either through necessity or vanity, do in no wise contribute to the increase of the profits of trade; here our expences are dividends of 8 per cent. per annum; these must be paid; proprietors coming open-mouthed must be satisfied; indulged for years past with a plentiful income, they know not how to retrench: ergo, on 3,200,000 l. at 8 per cent. for two years, is 16 per cent.

	1.	s.	d.
Or the sum for two years to be paid is	512,000	—	—
The profits are the	65,655	4	3
profits on the voyage at			
Three per cent. due from the government	192,000	—	—
	—	—	—
	257,655	4	3
Deficient	—	—	—
	1.	254,344	15 9

This deficiency must be either taken from former profits (which, I believe, were as fully employed as these) or from those which are to come: a happy thought! But put 200 yoke of oxen to draw this load up the hill of gain, it will not avail; the carriage is weak, and the road almost impracticable.

In regard to the account of national gain or loss, may this be attended to, may this be scrutinized, the result amazing, unthought-of, and unexpected! until evinced by this accidental enquiry. However erroneous the others may be, this will stand the test: no gloss, no fallacious arguments of occult mysterious trading, imports of diamonds, gold, and what not? by private traders supposed effects in India (mines of Potosi) can be admitted, until confronted with more bullion carried out (manufactures none permitted) few or no diamonds on the company's account, no gold, but many supposed debts owing, at large interest in India, and many more on bonds at home.

O proceres, censure opus est, an haruspice nobis?

The whole of the debit is formed from the same materials as the voyage-account; but, on the credit, may be seen the total amount of what is re-exported of these Indian commodities to other European nations, the true value of the raw silk, salt-petre, red-wood, and drugs imported; and, though most consumed at home, yet are here called valuable returns, as being materials used in our manufactures.

The true and undoubted loss to the nation of it's bullion, to the amount of 660,000 l. yearly, being hereby proved to demonstration (a prodigious sum in specie!) well may we tremble at every flurry in our paper circulation, since the basis, the rock, the strongest foundation of it's credit, is thus sapied, thus undermined, perhaps through inadvertency, yet equally fatal to our welfare and safety.

Tea, mean dirty drug, established by luxury, is become a necessary of life. Ridiculed by the Chinese, our hardy seamen brave all climates, difficulties, and hazards, to bring them gold and silver, to take in return a few dried herbs and baked earthen wares. Infatuation!

Arguments are vain, tea must be had; but surely not at this rate. Had this fair estate the Indies (more valuable than

the rest of our trade) never been granted in mortmain to this monastery of voluptuous secular priests, but the private English merchant preserved in the rights of his birth, tobacco, or some other product of ours, would have been the sole purchase of tea; weed for weed; not a dollar exported, but for gold in return: which was the trade at first; but the Chinese now hold both for tea. Or, in case this trade be laid open, by compounding for their charter, the government taking the protection of the traders into their own hands, what a fund of wealth, what increase of revenue! equal to the whole of the present: what a new world for trade! The rich, the populous, the luxurious nations of Interior Asia, all histories tell us their extent from Turkey to Japan; these are now shut up from the English merchant, for the sake of this monopoly, admitted by all to be bad, maintained by unjustly obliging a people to buy their goods at one house, and nowhere else, whereby the same tea is sold at Gottenburg 100 per cent. cheaper than at home; alone is a sufficient profit for the smugglers: nay, it is supposed that the revenue does not suffer a less sum yearly by that article than 200,000 l.

Supported by inflicting oaths on their wretched agents, has this bane of our peace and safety reigned a long course of years, bringing poverty upon us by regular gradations: without skill, without industry, and without wealth, have they proceeded in the discouragement of the former, and dissipation of the latter: nor, in 30 years trading, has one ship been added for the benefit of our navigation; no increase but of perjuries.

Hac fonte derivata clades
In patriam populumque fluxit.

But that others may discover clearer evidence of this pernicious trade, the injury done to our public credit already, and likely still to do, by the carrying it on in the manner beforementioned (for no less than the value of 350,000 l. in gold and silver bullion, has been shipped for India since the 1st of January * last) and be convinced of the absolute necessity of putting an immediate stop thereto; or that, at least, it may be limited for a term of three years, and, after that, to be entirely prohibited, and the exportation confined to our manufactures and products only.

* From the 1st of January to the 25th of March 1754.

That these, under the judicious management of the regular-bred merchant, will undoubtedly procure us a constant and more reasonable supply, to say at one half the present monopolized price, though more difficult now than at first, by the taste the Chinese have had of our wise policy.

To appeal to the understanding of the unprejudiced, whether, if the trade be made free and open, according to the just rights of English-born subjects, our private merchants, by whose hands alone is the profit now produced to the nation (or rather the loss mitigated) by Indian commodities re-exported to European countries, could not very shortly employ from 2 to 300 fine capital ships, take off three millions yearly of woolen, linen, and other manufactures, give real business thereby to more than 200,000 families, now preying upon each other, doubling the revenue, or more; the fears of lessening which last, at this necessitous juncture, are weakly urged, in defence of a manifest scourge of providence, almost evincing, that

Quos Deus vult perdere, prius dementat:

To shew that the great products and ingenious manufacturers were blessed with, the extensive credit now diffused throughout the whole kingdom, joined by the skill and industry of our merchants (confessedly superior to all others) may be made subservient to this great and good end: that every other European company, particularly the newly-elected ones, Swedish, Danish, and Prussian, must (though now supported chiefly with English subscriptions, yearly made) undoubtedly sink by these means.

Upon what has been said by this gentleman, we shall make some remarks hereafter, as occasion may offer.

PEMBROKESHIRE, in Wales, is more of a maritime county than any other there, it being encompassed with the Irish sea, except on the east, where it joins to Carmarthenshire, and on the north-east to Cardiganshire. It is the extreme west part of Wales, and lies nearest to Ireland of any of it's counties.

It is 33 miles in length, and 28 in breadth, according to Templeman, who gives it an area of 520 square miles. Others compute the area at 420,000 acres; but make it no more than 26 miles in length, from Cardigan in the north, to St. Gowen's on the south; 20 in breadth, from Lhanbeder Velfray in the east, to St. David's in the west, and but 93 in compass.

The air of this county is better than is common to parts that are so much exposed to the sea, and the soil is fruitful; it's few mountains, which are chiefly in the north-east part, have indifferent good pasture for cattle and sheep; but the parts near

near the sea abound with rich meadows, and good corn. It's other commodities are goats, fish, fowl, falcons particularly excellent, called peregrins, marble, pit-coal, and culm. It affords plenty of wheat, and is well served with sea-fish and foreign wines.

Haverfordwest, stands on the side of a hill, but is a very neat, well-built, populous, and trading town, having a commodious key for ships of burthen and a custom-house.

Pembroke, the county town, stands in the most pleasant part of all Wales, at the innermost and eastern creek of Milford-haven.

St David's, stands on the most western promontory of all, which extends itself considerably into the Irish sea, commonly called St. David's Head.

Tenby, on the fourth coast of this shire, has a good key, which was formerly much frequented by fishermen; enjoyed a great trade, and it's inhabitants were wealthy: it's markets, at present, are well stored with corn, fish, and other provisions; the road for shipping is very good. It has a great fishery for herrings in the season, and a large colliery, from whence great quantities of coals are exported to Ireland.

PENNSYLVANIA, a British colony in America. This province is bounded on the east by Delaware bay and river, and the Atlantic Ocean; on the north and west by Canada, on the south by Maryland. It extends from Cape Henlopen, in latitude 39. 30. above 200 miles northwards, but it is very narrow in the southern parts, up to the 40th degree of latitude, being so pent in on the east by Delaware river, and on the west by the province of Maryland, that in those parts it is not much above 15 miles broad, and in some places less still; but beyond the latitude it is much broader, though we cannot ascertain how far it stretches towards Canada.

As to the climate, Pennsylvania is, by it's latitude, at a like distance from the sun with Naples in Italy, and Montpellier in France; but it must be acknowledged that the climates on the continent of America differ much from those of the same latitude in Europe: it must, however, be owned that the air of Pennsylvania is sweet and clear: the fall, or autumn, begins about the 20th of October, and lasts till the beginning of December, when the winter sets in, which continues till March. Frosty weather, and extreme cold seasons, are frequently known here; but as in most countries where there are such seasons, the air is then dry and healthy. From March to June the spring lasts, but the weather then is more inconstant than in the other seasons. The heats are extraordinary in the summer months, July, August, and September, but mitigated by cool breezes, which make them very tolerable. The wind is south-west during the summer, but generally north-westerly spring, fall, and winter, which blowing from the frosty and snowy mountains and lakes of Canada, is doubtless the main reason of the excessive cold here in winter.

The soil of this province is in some places a yellow or black sand, in others a loamy gravel, in others a fat mould, like the vales in England, especially by inland brooks and rivers, where the lands are mostly three to one richer than those that lie by navigable rivers. There is also found a black hazel mould on a stoney bottom. The earth is fruitful, fat, and easy to be cleared, because the roots of the trees lie almost on the surface of the ground.

Here are trees of all sorts; oak; red, white, and black ash, beech, Spanish chestnut, cypress; the most durable of all are poplar, gum wood, hickory, salisfras; and, as for shrubs, snake-root, saraparilla, salop, spruce, and cranberries.

Wheat, barley, oats, rye, pease, beans, water-melons, musk-melons, apples, pears, cherries, apricots, quinces, carrots, turnips, onions, parsnips, cucumbers, &c. are here in great plenty, as also Indian corn, hemp, flax, &c. It is common for one bushel of corn sowed here to yield 40, often 50, and sometimes 60 bushels. Of living creatures, here are for food and trade, deer, the elk, as big as a small ox, rabbits, racoons, beavers, plenty of oxen, cows, and sheep; of the latter it is common for farmers to have 4 or 500 in a flock. They have also horses, some very good, and handsome enough. Of birds, here are very fine bustards, 40 or 50 pounds weight, pheasants, heath-birds, swans, geese, braindes, duck, teal, and snipe. The fish here are sturgeon, herrings, eels, smelts, perch, oysters, crabs, cockles, and mussels.

As to the trade of Pennsylvania, with respect to Europe and America, the case stands thus: their merchandizes consist of horses, pipe-staves, pork, beef, and fish, salted and barrelled up, skins and furs, all sorts of grain, viz. wheat, rye, pease, oats, barley, buck-wheat, Indian corn, Indian pease and beans, pot-ashes, wax, &c. and, in return for these, they import from the Caribbee Islands, and other places, rum, sugar, molasses, silver, negroes, salt, and wine; and, from Great-Britain, household goods, and clothing of all kinds, hard-ware, tools, and toys.

They have also some rice, but no great quantities, and a little tobacco of the worst sort. Their trade with the Indians consists but in few articles: they receive of the natives chiefly skins, and furs of their wild beasts, for which they give them clothing, arms, ammunition, rum, and other spirits, in return. This, as well as other northern colonies, are said to have also a clandestine trade with the Spaniards upon the coasts

of Terra Firma, &c. furnishing them with European goods and merchandizes, for which they receive chiefly dollars in return [see SPANISH AMERICA]; and they also trade to the bay of Honduras and Campeachy, for logwood [see the article LOGWOOD]. But after all, it must be admitted that Pennsylvania has no staple commodity, nor have the inhabitants yet set up any capital manufacture of their own for exportation.

This province is divided into six counties, viz. Buckingham, Philadelphia, Chester, Newcastle, Kent, and Suffex.

There were here a few English, Dutch, and Swedes, before Mr Penn sent over the first adventurers, under his patent, but they all submitted to the governor he placed over them. Those who went over from England were generally Dissenters, and especially Quakers, whose religion * is established by law in this country.

* Among many good things, in relation to the constitution, and good government of this province, Mr Penn established courts of justice in every county, with proper officers; and, to prevent law-suits and contentions among his passive people, there were three PEACE-MAKERS chosen by every county-court, in the nature of common arbitrators, to hear and determine differences between man and man. In king William's reign, when there were no prosecutions in England, this province began to be settled with people, who came thither to mend their fortunes, and not to enjoy the liberty of conscience, for the toleration gave them that at home. These men being of the church of England, Presbyterians, and Baptists, would have had a militia, but the Quakers, being the majority, were against it, their principles not allowing them the use of arms; but not long after Mr Penn's second voyage, they readily fell in with an armed force: for a ship of theirs being taken by pirates, they hired men, and supplied them with ammunition and fire-arms, to recover her. And, in respect to the militia, such as were of another opinion were allowed to train themselves, and take such military care for their defence as consisted with the peace of the country. However, they have yet had no great occasion for a militia; for it is very remarkable, that this province, ever since it's first establishment, never had any war with their neighbours, Christians or Indians, but have always lived in peace and amity with them all; and how they behaved in the late rebellion is recent in every one's memory. Let who will laugh at their religion and polity, we find, from the apparent effects of them, as his grace the late duke of Argyll justly said in the house of lords, upon a peculiar occasion, that they beat all other sects of people for sound morals, oeconomy, and human prudence: and, as I have had the satisfaction to converse with many of the more sensible men among them, I can speak from experience, that they are as little enthusiasts as the free thinkers of the age, notwithstanding the whimsies of some of their green-apron old women; and perhaps there are old women and fools, as well as knaves, of all sectaries and persuasions, but fewer, I believe, among these people than among any other, on account of their religious principles; nor do any deserve more protection under a free-constituted government: the reasons of which are obvious to all who know any thing of their system of polity among themselves.

It has been above observed, that this province was divided into counties, of which there are six; three upper, and three lower: the former are Buckingham, Philadelphia, and Chester, and make the Pennsylvania so called in king Charles's grant; the latter counties of Newcastle, Kent, and Suffex (called Essex in some maps) are taken out of Nova Belgia, or rather were thus called before the duke of York, afterwards king James II. granted them to Mr Penn.

I. BUCKINGHAM county, is the most northerly of all. **BRISTOL** is reckoned the chief town in this county; it stands 20 miles from Philadelphia, to the north, on the river Delaware, over-against Bridlington, in West New Jersey, and consists of about 70 or 80 houses: it is noted for it's mills of several sorts.

II. PHILADELPHIA county; the first town in it is **FRANKFORT**, as big as Bristol before-mentioned, and as well built.

PHILADELPHIA, the capital city of this province, is esteemed to be one of the best laid-out cities in the world; and were it full of houses and inhabitants, according to the proprietor's plan, it would be a capital fit for a great empire. It is a large city considering it's late foundation, most commodiously situated between two navigable rivers, Delaware and Schuylkill, in north latitude 40. 10. and longitude 75. 8. west from London. Mr Penn designed the town in the form of an oblong square, extending two miles in length, from one river to the other. The long streets, eight in number and two miles in length, he cut at right angles, others a mile in length, and 16 in number, all straight and spacious. He left proper spaces for markets, parades, keys, meeting-houses, schools, hospitals, and other public buildings: and it increases every day in edifices of divers kinds, which are carried on according to the first plan.

The city has two fronts on the water, one on the east side, facing the Schuylkill, and the other on the west, facing the Delaware, which is near two miles broad here. The eastern part is the most populous, on account of the Schuylkill,

Schuylkill, which is navigable 100 miles above Falls. We have observed, that each front of the street was to be two miles from river to river, as it was at first laid out, but we cannot suppose that it is yet finished in that manner. The street that runs along the Schuylkill is three quarters of a mile in length; the houses are stately, the wharfs and warehouses numerous and convenient.

The city flourished so much at first, that there were near 100 houses great and small in it, within less than a year's time; and it has made answerable progress since, the number of houses at this time being above 2000, and, generally speaking, better edifices than in the cities of England, a few excepted, and in those only a few streets. The houses here have large orchards and gardens; the land on which the city stands is high and firm, and the convenience of docks, and springs, very much contribute to the commerce of this place, where many rich merchants now reside; some of whom are so wealthy, that they keep their coaches.

Ships may ride here in six or seven fathom water, with very good anchorage. The land about it is a dry wholesome level. All owners of 1000 acres and upwards, had their houses in the two fronts facing the river, and in the High-street, running from the middle of one front to the middle of the other. Every owner of 1000 acres had also about an acre in front, and the smaller purchasers half an acre in the back streets, by which means the least had room enough for a house, garden, and small orchard. High-street is one hundred feet broad; so is Broad-street, which is in the middle of the city, removing from north to south. In the center is a square of ten acres for the state-house, market-house, and school-house. Several houses on the key are worth four and five thousand pounds, and fifteen ships have been on the stocks at a time, and some hundreds have been built there. The cellars and warehouses on the key are made towards the river three stories high. Here are two fairs a year, and two markets a week. The city sends two members to the assembly.

The inhabitants being at first mostly Quakers, as they still continue, it was some time before there was a church after the manner of England; but as soon as one was built, it was called Christ Church. It had in a few years a very numerous congregation, and king William ordered an allowance of 50 l. a year to the minister, which, with voluntary contributions, make a handsome provision for him. There are above twelve thousand of the inhabitants that are of this congregation. Here are, besides this, several meeting-houses for the Quakers, who are properly the church as by law established, being the original numerous settlers.

According to the plan, there is in each quarter of the city a square of eight acres, intended for the same uses as was Moorfields in London, walks and exercises for the citizens. The great dock is formed by an inlet of the river Delaware, at the fourth corner of the front of the wharfs, and has a bridge over it at the entrance. Several creeks run into the city out of the two rivers; and there is no city in Holland that is more naturally accommodated with fine and commodious canals, than this might be very easily. The key is beautiful, above 200 feet square, to which a ship of 500 tons may lay her broadside. And, as these advantages have already rendered this one of the best trading towns in the British empire out of Europe, so, in all probability, it will continue to increase in commerce, riches, and buildings, 'till for number and magnificence it will have no equal in America. Here are almost all sorts of traders and mechanics, as well as merchants and planters. Here the assemblies and courts of judicature are held, and the business of the province is chiefly managed, as in all capital cities.

At a little distance from Philadelphia, is a pleasant hill, well wooded, on the banks of the Schuylkill, called Fair Mount. Wico, half a mile from the town, is a Swedish settlement, where the people of that nation have a meeting for religion. They have another meeting-house at Tenecum.

ABINGTON and DUBLIN are two pretty towns in Philadelphia county. But the most considerable, next to the city, is German Town, a corporation of High and Low Dutch: there are between two and three hundred houses in it; peach-trees are planted all along before the doors. The town is very pleasant, and well cleared from trees. Within land lies Radnor, finely situated, and well built, containing about fifty families. In this place is a congregation of church of England men. It was at first called Amstel by the Dutch, who began building here, from the name of the river at Amsterdam.

There are several creeks in these two counties, as Derby creek, &c. Amerind lies between that and another nameless creek, from whence passing by Redloyer, we come to III. CHESTER county, so called, because the people who first settled here came from Cheshire. It lies to the south of Philadelphia county.

NEWTON is the first town in it, consisting of between thirty and forty houses.

CHESTER town, the capital of the county, is about 13 miles distant from Philadelphia towards the south-west, in latitude 40, and longitude 75. 17. west from London. It con-

tains about an hundred houses, and here is a very good road for shipping, the Delaware, on which it stands, being here three miles over. This place was also called Upland, and has a church dedicated to St Paul, with a numerous congregation of church of England people.

There is another town called CHICHESTER, as is also the creek on which it stands, which is navigable. It has above an hundred houses. The little town Concord has not so many. The other townships in this county are small, but the land is well planted. Marcus Hook, four miles from Chester, is the boundary of the three upper counties, properly called Pennsylvania. Chester county sends six members to the assembly.

IV. NEWCASTLE county lies to the south of it. In this county below Chichester, is a great creek, where there is room enough to lay up the whole navy royal of England, there being from four to eight fathom water. Below it is Christiana creek, where the Swedes had a town and plantations. They inhabited this and the other side of Delaware river, called La Nouvelle Swede, or New Sweden, by Robbe the French Geographer. It included part of this province and part of Jersey. The creek is large, but the village inconsiderable, though the Swedes had a church here not long ago. Between this and the next creek is Newcastle town, from whence this county takes its name. It is inhabited by English and Dutch, and is the next place for bigness and trade to Philadelphia, containing now between five and six hundred houses well built. Here live and thrive many merchants and tradesmen. The church has a large congregation, mostly Welsh. The Dutch also have a church here.

The lands hereabout are called the Welsh Track, and there are near forty thousand acres planted and laid out by and for Welshmen. It is thick of little towns, as Haverford-west, Merioneth, and others. It is populous, and the inhabitants are very industrious, by which means this part of the country is best cleared. They have many large plantations of corn, and abundance of cattle, so that they are looked upon to be in as thriving a condition as any in the province.

MOUNTJOY is a manor that belonged to a daughter of Mr Penn, and here the first lime-stone was dug, that was ever found in America. This whole county is remarkable for its excellent gravel, very rare to be met with on the continent of America. Ten miles below Newcastle is St George, a pretty village, New Blackbird creek, and over-gainst it is a little island called Rhode Island, in the Delaware, where there is ten fathom water. This county sends six members to the assembly.

V. KENT county lies to the south-east of Newcastle county. Here are Cranebrook, Dover, Murden, and Mispelliven creeks and plantations. Dover was formerly called St John's Town, and consists now of about fifty families. It is looked upon as the capital of the county, which is settled like Virginia, not in townships, but scattered plantations. In this county is a church of England congregation. The land is good, and the county is represented by six member in the assembly.

VI. SUSSEX county lies to the south-east of Kent. The chief town is Lewes, on a creek so called: it is handsome and large, standing on the beautiful banks of a river, between the town and the sea, which makes the harbour. These two last counties lie about Delaware bay, which is there about seven leagues over. Before Lewes is Cape Hinlopen, otherwise called Cape William, and twenty miles below that is Cape James, the furthestmost bound of the province of Pennsylvania. Suffex county, like Kent, is inhabited by planters, whose plantations lie scattering, as suited best to their convenience.

REMARKS ON PENNSYLVANIA before the last war.

It is a point out of dispute, that no country in the world is more proper than Pennsylvania for producing hemp and flax; and with respect to these, we ought seriously to consider, as we have occasionally observed on other of our colonies, that there is nothing plainer than that hemp and flax are so useful in navigation and trade, that we cannot do without them; the first for cordage of all sorts, the latter for making sail-cloth, as well as for the linen manufactures carried on in this kingdom. The necessity we are under for these commodities, ought to put us upon all imaginable care how to provide them, that we may not fall under the same necessity for them that we did in the year 1703 for pitch and tar, [see the article *NATAL STORES*] when the government of Sweden absolutely refused to let us have them for our ready money, otherwise than in their shipping, from their tar monopoly, at their own price, and only in such quantities as they thought fit.

Upon that disappointment, the government, by allowing a considerable encouragement for carrying on the manufactures of pitch and tar, had sufficient quantities from our own plantations, and it is greatly to be wished the like encouragement was given for raising hemp and flax; and as all sorts of naval stores may be raised with so many advantages to this kingdom, it would be unaccountable to leave us dependent, and

at an uncertainty for them. It is very well known, that our land is too dear for hemp and flax, and what does grow here (though it is tough and makes strong linen) neither dresses so kindly, nor whitens so well as that which grows in hotter climates. In Russia, the best hemp and flax grow in the southernmost parts of the empire, where the summer is hot and the air clear, and yet the flax is not accounted so good as that which grows in Egypt or Italy. Egypt has always been esteemed for its linen, and even now supplies Leghorn with large quantities: and the coasts of Syria, Asia Minor, Smyrna, Constantinople, and other great cities, have a supply of hemp and flax from thence.

All our colonies (which run twelve or fourteen hundred miles in length in North America, all the way bordering upon the sea) have very hot summers; the southernmost parts of them lie near the same latitude with Egypt, and the north part much about the same with Ancona or Bologna in Italy, where hemp and flax grow; therefore we have the greatest prospect to receive mighty supplies of hemp and flax from them.

Part of the land in the colonies is very rich, and of so small value, there will be opportunity of breaking up fresh as often as there is occasion to change the ground, which if laid down will recover itself again without the charge of manuring, as we do here, to the very great damage of our ploughing lands. Nothing impoverishes land more than hemp and flax; and though it is manured, that alone will not do so well, for the land ought to be changed after three or four crops, and generally the finest and fattest pieces are converted to that use. Those great conveniences of having land so very cheap and so fine a climate, which we know produces excellent hemp and flax, so commodiously situated along the sea-coasts, with such numbers of large rivers running up the country to the most inland settlements, where provisions may be raised at so small a charge, and where work may be done by the labour of slaves, almost as cheap in India, gives ground to hope, that we may manufacture linens here cheaper, than any part of Europe can import them upon us, and the colonies be as profitable to us, by raising rough materials to enable us to carry on the linen manufacture, as the Suffolk and other downs are, for supplying wool for that manufacture; the profits of which we have valued ourselves so much upon, that we have set the rest of Europe upon being our competitors therein.

And as the woollen manufacture, especially the coarse part, has spread itself of late into several parts of the kingdom, which has exceeded the demand, and caused great stocks to remain on hand, if those rough materials of hemp and flax were prepared in our plantations, the people in North Britain, &c. would soon find the advantage of advancing in that manufacture; the laborious and coarse part being performed abroad, the rest would invite, not only the poor and necessitous, but people of better circumstances to employ their time in it.

If these propositions are sufficiently considered and heartily put in practice, we may hope, that by providing the afore-said rough materials, we shall have the delightful prospect of seeing trade flourish; for as the silk and linen manufactures brought to perfection, are altogether as profitable to those nations as the woollen is to us; and as we increase in our linen manufactures those of Silesia, and all the hereditary countries of the house of Austria, whence we take such quantities, must abate of course; their people also will resort to us, and help to carry them on; for it has always been observed, where new manufactures are set up, the manufacturers will likewise remove. This was the case with the Flemings, when queen Elizabeth gave such great encouragement to have the woollen manufacture remove thither; and ours when we had that inundation of China and India wrought silks, for our weavers went away to Holland, Flanders, France, &c. so that several streets in Spital-fields were left almost desolate; but when these silks were prohibited, the manufacturers returned again.

It is supposed the Russians export to England and all other parts, in hemp and flax, above the value of a million a year. If hemp and flax be so valuable a product for merchandize with them, there seems to be a much greater prospect of its being so to ourselves, by raising them in our plantations, because they will not be subject to any land-carriage, but shipped immediately from the place of growth, because land is much cheaper in our plantations, than in the south parts of Russia. The climate being equal with that in Egypt and Italy, is supposed to produce hemp and flax preferable to theirs.

We have shewn, under other articles which we shall refer to at the conclusion of this, that in the cases of sugar and tobacco, every white man employs four at home; that is to say, finds them work to supply him with utensils requisite for his. If sugar and tobacco employ such a number of hands at home, certainly every person employed in the plantations, in raising and dressing hemp and flax, must by his labour there, return more than twice the advantage that can be produced by sugar and tobacco, for they are manufactured in the plantations: the refining the sugar and cutting the tobacco, with the little quantity that is rolled excepted. Whereas flax and hemp, are materials for employing all idle hands; and

of consequence the poor's rate will soon be abated, and the nation will find in a little time what they save yearly thereby, will be more than sufficient to encourage the people to pursue that employment with indefatigable vigour. And if once we come to be employed with hemp and flax by methods here suggested, every place will be filled with flax-dressers, and the overseers of the poor of every parish where the wool spinning trade is not carried on, may very easily come at hemp and flax, which they will find as profitable to them, as the woollen is to the other; and the more distant the employment is, the better, for many inconveniences have attended one manufacture interfering with another; besides, there will be an intercourse of trade created, by one part of the kingdom supplying the other with their distinct manufactures. This will give full employment to the whole kingdom, and an universal cheerfulness to every body: for the poor are never happier, nor their minds easier, than when they have full employment; and when they are employed, riches are diffused throughout the whole nation.

It is a common opinion, that we have above a million of people in the three nations destitute of work, but if those rough materials (so often mentioned in this work) should come to be raised in our plantations, there need not be one idle person: now suppose one million of people were put upon manufacturing those rough materials, and each person earned but one penny a day, and allowing but three hundred working days in the year, it would amount to 1,250,000 l. A prodigious advantage to the nation, which is still greatly heightened by considering, that these people would be then employed, at least in part, and so far as they were employed, would be the better subjects.

That all this might be brought about with less trouble than has been given the nation by one Baltic or Mediterranean expedition, and the tenth part of the expence of a campaign in Flanders, is a thing will be acknowledged by all who are capable of judging of this subject; and therefore that it ought to be done, is a point that cannot be disputed. We would not mislead our readers by the comparison, into a bad opinion of such expeditions or campaigns that have heretofore been made, that is not our business or our intention; the justice of the comparison turns upon this, that the motives to such expeditions and campaigns have been, comparatively speaking, near and at hand; whereas we are less acquainted, or at least, less affected, by the connection between our interests and those of the plantations: though, from what has been said here, and throughout this work, we think it will plainly appear, that they concern us as much, and as nearly, as any interests can do without the limits of our own island.

That the reader may the more satisfactorily discern the necessity of encouraging our plantations, in the raising of such rough materials as may reciprocally advance the trade of Great Britain, as well as that of the plantations, and keep the latter from interfering with the manufactures of their mother country, we refer him to the following articles, viz. COLONIES, FLAX, HEMP, LINEN, FRENCH AMERICA, FRANCE, SPANISH AMERICA.

REMARKS on this province in another light, before the last war.

The wise conduct of Mr Penn at the first establishment of this province, had so good an effect upon the Indians, that they had him always in the highest veneration; and they still retain the same to his memory, of which the reader will find an exemplary proof in the following speech made to Sir William Keith, governor of this country in 1722; only it may not be amiss to observe, that Onas signifies in the Indian language a pen; and therefore this is the name the Indians have given to our proprietor and all his successors, or representatives.

‘ Brother Onas, you told us how William Penn, that good man did, on the first settlement of the province of Pennsylvania, make leagues of friendship with the Indians, and treated them like brethren; and that, like the same good man, he left it in charge to all his governors who should succeed him, and to all the people in Pennsylvania, that they should always keep the covenant and treaties he had made with the five nations, and treat them with love and kindness. We acknowledge, that his governors and people have always kept the same honestly and truly to this day. So we, on our part, always have kept, and for ever shall keep, peace and friendship with a good heart, to all the people of Pennsylvania. We thankfully receive and approve of all the articles in your proposition to us, and acknowledge them to be good and full of love: we receive and approve of the same with our whole hearts; because they are not only made one people by the covenant chain, but are also people united in one head, one body, and one heart, by the strongest ties of love and friendship. Brother Onas, you desire there may be a perpetual friendship between you and the five nations, and between your children and our children; and that the same may be kept as long as the mountains and rivers endure. All which we like well, and on our parts desire, that the covenant and union made with a true and clean heart between you and us, may

last as long as the sun and moon shall continue to give light. And we will deliver this in charge to our children, that it may be kept in remembrance with their children and children's children, to the last ages: and we desire, that the peace and tranquility that is now established between us, may be as clear as the sun shining in it's lustre, without any cloud or darkness, and that the same may continue for ever.

Brother Onas, we have well considered all you have spoken, and like it well, because it is only the renewing former leagues and treaties, made between the government of Pennsylvania, and us of the five nations, which we always believed we were obliged to keep. And, as to the accident of one of our friends being killed by some of your people, which has happened by misfortune, and against our will; we say, that as we are all in peace, we think it hard that the person who killed our friend and brother should suffer, and we do in the name of all the five nations forgive it; and that the man who did it may be released from prison, and set at liberty to go whither he pleases; and we shall esteem that as a mark of regard and friendship for the five nations, and as a farther confirmation of this treaty.

Upon these principles, which are more likely to be observed in this than in most of our colonies, the friendship of the Indians may be preserved as long as they remain a people; which shews how possible it might have been to have maintained a like correspondence with them in other places, which would not only have saved a great deal of bloodshed, and have contributed to the quick growth of the colonies settled in the countries, inhabited by such Indians, but would have been very useful in many other respects: since it is allowed, where the Indians are treated, as in Pennsylvania, with strict justice and humanity, they are as firm allies as any in the world; and in that quality more capable of doing service, than if reduced to be either slaves or subjects; because, living as they do, they preserve their strength and activity, and enjoy all the liberty they can desire, and are very willing to fight for those under whose protection they enjoy it.

That our readers may be made thoroughly sensible of the absolute and indispensable necessity, under which this nation labours to preserve and maintain an inviolable friendship with the Indian nations in this part of America; he is desired to turn to the following articles, viz. BRITISH AMERICA, CANADA, COLONIES, FLORIDA, LOGWOOD, LOUISIANA, MAP, MEDAL, NAVAL STORES, PLANTATIONS, NORTH CAROLINA.

Philadelphia, May 2, 1754.

As the following extract of a letter, from a gentleman residing in one of the colonies to the northward, contains a more full and exact account of the armament sent by the French last summer from Canada, and of the pernicious consequences that may attend the French settling on Ohio, than any I have as yet seen published, it may be of use to be recorded in this work.

S I R,

— ' I am extremely sorry to hear that the governments of Pennsylvania, and Maryland, have not viewed the encroachments of the French in their proper light; or, if they have, that they won't exert themselves at this time of imminent danger. Should the French once gain a settlement at Ohio, they will then have great advantages over the southern colonies, as must be obvious to every person the least acquainted with their situation. In time of peace between the two crowns, they will continually be spitting on the Indians in their alliance, to murder and scalp the inhabitants of your back counties; in order to prevent the extension of your settlements; and, in time of war, how easy it will be for a number of troops, collected from their several forts, or perhaps sent from Old France for that purpose, to make a descent upon some one or other of the colonies. What then must be the consequence!—Unarmed, and disunited as you are, will you be able to repel the invaders, or prevent their ravaging and laying waste your country, or hinder them from committing their too well known barbarities on such of your inhabitants as may fall within their power? The evil day may a while be put off, but sooner or later it will surely come unless you rouse from the lethargy you seem at present in, and make use of those means to protect yourselves which the Almighty has put in your power; the most proper way of doing which is, to obstruct those incendiaries, the French and their Indians, from settling on your frontiers. By a hearty union of the colonies, and proper management, we might, with little assistance from our mother-country, not only dislodge the French from Ohio, but from Quebec itself. But to send three or four hundred men against five times their number, can answer no other end, than to expose us to the contempt of our Indian allies, who will think themselves obliged to quit the interest of those that seem unable to protect them. You desire me to acquaint you with what I hear that may be depended on, concerning the designs of the French, in sending so large a number of troops from Canada as they did the

last summer. In answer to which I can inform you, that I have lately seen Mr B——, who was at Oswego at the time their forces passed by that fort; who says, he learnt by sundry deserters, and others, that Monsieur Duquesne, the new governor general of Canada, a young gentleman formerly a captain of a man of war, declares he will have a French fort on each of the waters that empty themselves into St Lawrence, or Mississippi; that he believes the late governors of Canada have been all asleep, but that he will make every officer under him know his duty, and do it.—The four or five detachments were, during the last summer, sent from Canada to the Ohio, making in the whole about 2000, besides Indians, under the command of Monsieur Morin (or Morang, as some call him) whose knowledge of the Indians recommended him to the new governor for that office. The detachment that accompanied Morin, consisted of about 40 or 50 large battoes and canoes, many of them supposed to carry more than 30 men; they failed within musket-shot of Oswego, without ever striking their colours, and had their trumpets blowing, drums beating, &c. This was in sight of many of the six nations, and foreign Indians, who could not sufficiently express their surprize at such an armament, and asked whether the English and French were not at peace.—Some of these troops returned to Canada to quarters during the winter, but great part of them were left, as is supposed, at the forts on and near the lakes, to be ready to go down the Ohio early in the spring: those that returned had with them the Pennsylvania Indian traders, so often mentioned to be taken by the French on Ohio; those poor wretches were in irons, and lodged a night within a few miles of Oswego. One of the famous chiefs of the Cahuga nation proposed to some of the traders to attack the French, and recover the prisoners, but they could not muster a sufficient party to do this.—Monsieur Morin built two or three forts, but many disputes arising between him and his officers, together with a severe fit of the gout, made him desire to quit his command; for which purpose, an express was last September sent to Canada, and I suppose the gentleman who writes to governor Dinwiddie was made his successor, who, if he exceeds Morin as much in humanity as he does in politeness and good sense, may be of service to those who have the misfortune of being prisoners in that country.—I saw Morin and his son some years ago in Canada; they have all the vain airs of the French, joined with the savageness of the Indians, without the least of the politeness of the former, or native simplicity and grandeur of the latter. The father commanded when the brave Donahew, captain of one of the Boston sloops, was decoyed ashore and killed; the son was one of his party: as trophies of their victory, the old man shewed me a tobacco-pouch, which he, and the young brute, let me know was made of the skin of poor Donahew's arm: the father had also Donahew's ring, which the son acquainted me he cut the finger off to get, as it would not come off easily. After this, I saw some of Donahew's men who were prisoners, they not only confirmed the above, but assured me the brutish father did himself cut off several pieces of their dead captain's flesh, and threw them into the fire, and encouraged the Indians to do the like; and when they were roasted, the cannibal son, and sundry Indians, tore them with their teeth.—This may serve as a specimen of the neighbours you are like to have.

Your's, &c.'

Further REMARKS before the last War.

Thus we find that the French are determined to raise their interest in America to the highest pitch of power, upon the ruins of that of Great-Britain.—This is a fresh confirmation, of what we have urged in this work, under the preceeding, and various other heads, to which we have referred, in relation to the measures taken by France to aggrandize their power in the new world.

Our accounts also from Philadelphia, July 2, 1754, say, ' That the French have taken the Block-house and Truck-house, erected by the Virginians; cut off all our traders but two, and have taken in goods, furs, and skins, to the amount of 20,000l. at least. A sad stroke to many here: this from the river Ohio, at a place called Log's-Town, about 190 miles from hence due west. How they will be dislodged, time will shew; but the skin-trade is intirely put a stop to, by this enterprize of the French. This account you may rely on, as strictly matter of fact.'

And also our accounts from New-York, of May 16, last, say, that ' We hear from Augustine, by the way of South Carolina, that a vessel of war, belonging to his catholic Majesty, was arrived there from the Havannah, the captain of which reported, the several armed vessels, with men, ammunition, &c. were sailed from thence for Campeachy, to join a fleet that was sitting out there, with a design to attack the Musquetto shore. The above news may be depended upon, as we have it from good authority.'

These things we have foreseen and foretold, for near these three years past, throughout the course of this work; and this any man of plain common sense might easily do, without any pretensions to the gift of prophecy, if he attended

tended to those facts, which we have laid before him in various parts of this performance.

REMARKS ON PENNSYLVANIA, since the last War, and DEFINITIVE TREATY, of 1763.

On perusal of what we have observed under this article of Pennsylvania, before the last war, the reader will perceive from thence, as well as the whole tenour and spirit of this work, interperfed in variety of proper places throughout, that all that we prejudged relative to the last war with France and Spain has come to pass: and as the assembly of this province, upon a dispute with Mr Penn, their present governor, on the 24th of last March, came to twenty-six resolutions, the last whereof is as follows:

'Resolved, that this house will adjoin, in order to consult their constituents, whether an humble address should be drawn up, and transmitted to his majesty, praying that he would be graciously pleased to take the people of this province under his immediate protection and government, by completing the agreement heretofore made with the first proprietor for the state of the government to the crown, or otherwise to his wisdom and goodness shall seem meet': and as it is further said and believed, that now at this time of writing, all public business is at a stand, and neither men nor money are raised for the protection of their frontiers, still miserably harafed by the Indians—See our article INDIANS, FLORIDA, MISSISSIPPI.

The foregoing being the present state of this province, the following observations may not be unacceptable, respecting what is urged by those who are for obtaining a ROYAL GOVERNMENT in exchange for this of the proprietaries.

'Tis unnecessary for us to enter into the merits of the disputes between the proprietaries and the people: 'tis our business only to observe, that in the present conjuncture a perfect union and harmony is absolutely needful as well in this province, as among the whole of our NORTH AMERICAN PROVINCES, for the mutual protection of their common trade and safety against the Indians; who, we experience, at present, give us no less uneasiness here, than the junction of France and Spain in the last war.

At present, Pennsylvania is in a wretched situation. The government that ought to preserve all in order, is itself weak, and has scarce authority enough to keep the common peace. Mobs assemble and kill numbers of innocent people in cold blood, who were under the protection of the government. Proclamations are issued to bring the rioters to justice. Those proclamations are treated with the utmost indignation and contempt. Not a magistrate dares stir towards discovering or apprehending the delinquents. They assemble again, and with arms in their hands, approach the capital.—The government truckles, condescends to cajole them, and drops all prosecutions of their crimes; whilst honest citizens, threatened in their lives and fortunes, fly the province, as having no confidence in the public protection. They are daily threatened with more of these tumults; and the government, which in it's distresses called aloud on the sober inhabitants to come with arms to it's assistance, sees those who afforded that assistance daily libelled, and menaced by its partizans for doing so; whence it has little reason to expect such assistance on another occasion.

If the charge thought of may have the happy effect so indispensably requisite at this time, the sooner it takes place, the better. It does not appear that a change of government can possibly hurt the province; and there may many advantages arise from it. It is only a change of governor, that is, instead of self-interested proprietaries, a gracious king! His majesty, who has no views but the good of his people, will thenceforth appoint governors, who, unshackled with proprietary instructions, will be at liberty to join with the assembly in enacting wholesome laws. At present, when the king requires supplies of his faithful subjects, and they are willing and desirous to grant them, the proprietaries intervene and say, 'unless our private interest on certain particulars are served, nothing shall be done'. This insolent tribunal VETO, has long, too long incumbered all public affairs, and been productive of many mischiefs. By the crown taking the government into it's hands, not even the proprietaries can justly complain of any injury. The being obliged to fulfil a fair contract is no injustice. The crown will be under no difficulty in completing the old contract made with their father, as there needs no application to parliament for the necessary sum, since it seems half the quitrents of the lower counties belong to the king, and the many years arrears in the proprietaries hands, who are the collectors, must vastly exceed what they have a right to demand, or any reason to expect.

If stability in the government of every province does not take immediate place, and a perfect harmony and union is not effectually promoted amongst them all; it is not possible that the good intentions of the British government can ever be answered, relative to our North American interest, pursuant to the DEFINITIVE TREATY; the Savages will ruin our

whole commerce, and render the lives and properties of our colonists ever precarious, and subject this nation to immense expences to keep them in subjection, provided the several colonies do not act powerful in concert for that purpose: and if they do, they may soon secure themselves forever, and rear their commerce and navigation to an amazing height, by raising such materials for the manufactures of their mother-country; such as FLAX, HEMP, SILK, POTASH, IRON, TIMBER, great variety of other estimable products that will equally enrich and aggrandize the plantations with these kingdoms in general. See our articles AMERICA, FLORIDA, MISSISSIPPI, MEXICO, PERU, CANADA, FISHERIES, NORWAY.

PEOPLE. Under the article MONEY, we have shewn, that it is the measure of commerce, but that the spring and original thereof, in all nations, is the natural or artificial product of the country; that is to say, what their land, and what the labour and industry of the people produce.

There is no man that can reasonably dispute this position; and, if granted, it follows from thence, that to know rightly how the ballance of trade stands with any nation, a due inspection must be made into their natural or artificial product; and the courses of foreign exchange must likewise be constantly examined. See the articles BALLANCE OF TRADE, and EXCHANGE.

But this natural or artificial product being most of it in the result of the people's labour and industry, we shall be still in the dark, as to all enquiries of this kind, without maturely considering the numbers of the people.

In these sort of speculations, not only the quantity but quality of the inhabitants must be duly pondered; they must be divided into their several ranks and classes: it must be distinguished, who, by arts, labour, or industry, are increasing; and who, by their expence, poverty, or sloth, are decreasing the kingdom's wealth. These sub-divisions are likewise to be made, of what numbers are employed in the church, in the wars, in the fleets, mercantile and warlike, in the law, in offices, in merchandize, in shop-keeping and traders, in handicrafts; and who, both of the higher and lower degree, are persons living upon their estates, who are freeholders, farmers, labouring people, servants, cottagers, alms-people, and vagrants.

Various have been the conjectures, in relation to the number of people in this and other countries; which being a matter of use in commercial, as well as other political disquisitions, the following observations, which I have lately received from -----, a gentleman of honour in a public character abroad, who is turned for studies of this kind, may not be unacceptable, though his sentiments differ from some others, in regard to the number of people in this kingdom.

'Mr King, says this honourable gentleman, observes, that people alone do not make a government rich; for a multitude of beggars or slothful people renders it poor and weak.'

Wealth alone does not make a government rich; for people may be wanted to manage and propagate a great stock.

To which may be added, that people, and wealth, and industry, will not make a government rich and powerful, unless the ruling ministers of state take pains to give them a proper direction and application, which is extremely difficult to do, without some knowledge of the quantity of each of these ingredients, and how they are employed.

One of the first enquiries then of a patriot minister, will be after the numbers and qualities of those from whom the public revenue is drawn. In which (unless a law was made for some register of the people, or the method hereafter mentioned was taken) one can only be guided by conjectures and calculations.

From such lights as we have at present, it may be reasonably supposed, that the number of people in England was, at the beginning of this century, according to the observations of the famous Mr King, 5,500,000. See Davenant's Essay on Probable Methods, &c. p. 24.

The ratio of increase has been found, by a great variety of good observations, to be, that 100,000 people augment annually, one year with another, to 100,175.

The logarithm of the ratio of increase being multiplied by 50, and added to the logarithm of 5,500,000, will produce a number upwards of 5,995,000, which is near enough to 6 millions to be found any general observations upon, but far enough from the usually supposed number of 8 millions: so that, until it can be shewn us, either that Mr King was wrong, or that the foregoing method of computation, recommended by Mr Kerfeboom, is false, we have reason to reject all conclusions drawn from a principle so erroneous. See Aanmerkinges, p. 12, notes. Quarto edition.

The 6 millions are supposed to be divided in the following manner:

In London	747,985
In the market-towns, and others of above 150 houses	951,091
In the countries	4,300,924
	<hr/>
	6,000,000

Sir

Sir William Petty would have us believe the number of people to be 30 times the number of deaths. The writer of this paper believes it to be about 28 in London, but the safest of all appears to be the adopting Mr Kerseboom's opinion, founded upon very many accurate observations, and agreeing very nearly with Dr Hailey, viz. that the number of children born alive in one year, being multiplied by 35, will give us the sum of the inhabitants. See Meenigte Des Volks*.

* I do not agree with Mr Kerseboom in his calculation of the number of people in London, but I use his method to shew that Mr Maitland was nearer the truth than he.

Thus London may be estimated as follows:

The medium of registered births for 14 years	-	17,639
Ditto of unregistered births, supposing dissenters	3	2,715
of all kinds, as 13, 33 to 86, 66	-	
Ditto of illegitimates, should be about 65 in 100,	3	1,017
but is here rated only at 5 per cent.	-	
Total	-	21,371

Which total, multiplied by 35, produces - 747,985 for the number of inhabitants within the bills of mortality.

If these premises be allowed to be right, it will be very easy for any common arithmetician to form a new for these times, from Mr King's schemes A. B. and C. as reported by Dr Davenant; but the many alterations that have happened since his time, in the scheme D. make it a work of some difficulty: 'till a better can be formed, the following plan for it is proposed.

S C H E M E D.

1750. Number of Families in England.		Heads per family.	Number of persons.
No.			
1. Temporal lords	-	200	40
2. Spiritual ditto	-	26	20
3. Baronets, knights, esquires	4,275	20	85,500
4. Gentlemen	13,073	8	104,584
5. Persons in greater offices	5,500	8	44,000
6. Ditto in lesser offices	8,500	6	51,000
7. Eminent merchants and traders by sea, and some monied persons	2,900	9	26,100
8. Lesser ditto	11,100	6	66,600
9. Law and dependants	15,000	7	105,000
10. Eminent clergymen	2,000	7	14,000
11. Lesser ditto	8,000	5	40,000
12. Freeholds of better sort	27,000	7	189,000
13. Ditto lesser	125,000	5½	687,000
14. Farmers	186,181	5	930,905
15. Persons in liberal arts, &c.	18,000	5	90,000
16. Shopkeepers & tradesmen	59,190	5	295,950
17. Artizans and handicrafts	68,181	4	272,724
18. Naval officers, and some captains of large merchantmen	4,800	4	19,200
19. Military officers	5,500	4	22,000
Total increasing families	564,426		3,052,083
20. Common soldiers	25,575	2	51,150
21. Common seamen	60,000	3	180,000
22. Labouring people, and out-servants	397,000	3½	1,389,500
23. Cottagers and paupers	426,238		1,278,714
Vagrants, Beggars, gipsies, thieves, &c. &c.			48,553
Total decreasing families	908,813		2,947,917
Families increasing as above	564,426		3,052,083
Total together families	1,472,239		6,000,000

If the numbers here set down should be thought any way near the truth, this scheme may be easily compleated with the incomes and expences, according to Mr King: No. 1. should be 800,000l. per. ann. No. 2. 46,462. No. 3. 826,125. There are several variations in this scheme, from Mr King's proportions; the reasons of most of them will be obvious: No. 12, 13, and 14, as they are of the greatest importance towards judging of the political state of the nation, so the most pains has been taken to make them right.

It has been imagined, by all those who have turned their thoughts to these matters, that the number of better sort of freeholders is much lessened within these few years; if it should be thought that I have diminished them too much, let the objector take the number of freeholders in any county where he is well acquainted, and compare them, according to the size of his county, with those that should be in the whole kingdom, and I am persuaded he will find, especially if his county be large, that the proportion here set down is great

enough; but he must remember to deduct those freeholders, viz. clergy, lawyers, merchants, &c. &c. that are here included in other articles: those that will take this pains must, I believe, agree, that we have lost within these 50 years, 13,000 of those valuable families, the ancient yeomen of this kingdom.

As to the great augmentation of No. 17, those who consider the present state of luxury amongst us, will not wonder at a double proportion of increase being given to this class. Hoc genus omne, having propagated very fast of late years in England.

* The people being the first matter of power and wealth, says Dr Davenant, by whose labour and industry a nation must be gainers in the balance of trade, their increase or decrease must be carefully observed by any government that designs to thrive; that is, their increase must be promoted by good conduct and wholesome laws; and if they have been decreased by war, or any other accident, the breach is to be made up as soon as possible, for it is a main in the body politic, affecting all its parts. Almost all countries in the world have been more or less populous, as liberty and property have been there well or ill secured. The first constitution of Rome was no ill-founded government, a kingly power limited by laws; and the people increased so fast, that from a small beginning, in the reign of their sixth king, they were able to send out an army of 80,000 men. And, in the time of the commonwealth, in that invasion which the Gauls made upon Italy, not long before Hannibal came thither, they were grown so numerous, as that their troops consisted of 700,000 foot, and 70,000 horse: it is true, their allies were comprehended in this number, but the ordinary people fit to bear arms, being mustered in Rome and Campania, amounted to 250,000 foot, and 23,000 horse.

Nothing, therefore, can more contribute to the rendering England populous and strong, than to have liberty upon a right footing, and our legal constitution firmly preserved. A nation may be as well called free under a limited kingship, as in a commonwealth; and it is to this good form of our government, that we partly owe that doubling of the people, which has probably happened here in the 435 years last past, according to Davenant.

And if the ambition of some, and the mercenary temper of others, should bring us at any time to alter our constitution, and to give up our antient rights, we shall find our number diminish visibly and fast. For liberty encourages procreation, and not only keeps our inhabitants among us, but invites strangers to come and live under the shelter of our laws.

The Romans, indeed, made use of an advantageous help to enlarge the city, which was by incorporating foreign cities and nations into their commonwealth; but this way is not without it's mischiefs. For the strangers in Rome, by degrees, had grown so numerous, and to have so great a vote in the councils, that the whole government began to totter, and decline from it's old to it's new inhabitants; which Fabius, the censor, observing, he applied a remedy in time, by reducing all the new citizens into four tribes, that being contracted into so narrow a space, they might not have so malignant an influence upon the city.

An act of general naturalization, would likewise probably increase our numbers very fast, and repair what loss we may have suffered in our people by the late war: it is a matter that has been very warmly contended for by many good patriots; but peradventure it carries also it's danger with it, which perhaps would have the less influence by this expedient, namely, if an act of parliament were made, that no heads of families hereafter to be naturalized, for the first generation should have votes in any of our elections. But as the case stands, it seems against the nature of right government, that strangers (who may be spies, and who may have an interest opposite to that of England, and who, at best, ever join in one link of obsequiousness to the ministers) should be suffered to intermeddle in that important business of sending members to parliament. From their sons, indeed, there is less to fear, who by birth and nature may come to have the same interest and inclinations as the natives.

And though the expedient of Fabius Maximus, to contract the strangers into four tribes, might be reasonable, where the affairs of a whole empire were transacted by magistrates chosen in one city, yet the same policy may not hold good in England; foreigners cannot influence elections here, by being dispersed about in the several counties of the kingdom, where they can never come to have any considerable strength. But sometime or other, they may endanger the government, by being suffered to remain such vast numbers of them here in London, where they inhabit, all together, at least 30,000 persons in two quarters of the town, without intermarrying with the English, or learning our language; by which means, for several years to come, they are in a way still to continue foreigners, and, perhaps, may have a foreign interest and foreign inclinations. To permit this, cannot be advisable or safe; it may, therefore, be proper to limit any new acts of naturalization, with such restrictions, as may make the accession of strangers not dangerous to the public.

An accession of strangers, well regulated, may add to our strength and numbers; but then it must be composed of labouring men, artificers, merchants, and other rich men, and not of foreign soldiers, since such fright, and drive away from a nation more people than their troops can well consist of: for if it has been ever seen, that men abound most where there is most freedom: (China excepted, whose climate excels all others, and where the exercise of tyranny is mild and easy) it must follow, that people will in time desert these countries, whose best flower is their liberties, if these liberties are thought precarious or in danger. That foreign soldiers are dangerous to liberty, we may produce examples from all countries and all ages.

The danger of admitting foreign and mercenary troops into the nation, is too well understood to need any animadversion. Indeed, all armies whatsoever, if they are over large, tend to the dispeopling of a country, of which our neighbour nation is a sufficient proof; where, in one of the best climates in Europe men are wanting to till the ground. For children do not proceed from the intemperate pleasures taken loosely and at random, but from a regular way of living, where the father of the family desires to rear up, and provide for the offspring he shall beget.

Securing the liberties of a nation, may be laid down as a fundamental for increasing the numbers of it's people; but there are other policies thereunto conducing, which no wise state has ever neglected.

No race of men did multiply so fast as the Jews, which may be attributed chiefly to the wisdom of Moses, their law-giver, in contriving to promote the state of marriage.

The Romans had the same care, paying no respect to a man childless by his own fault, and giving great immunities and privileges, both in the city and provinces, to those who had such and such a number of children. Encouragements of the like kind are also given in France, to such as enrich the Commonwealth by a large issue.

But we in England have taken another course, laying a fine upon the marriage bed, which seems small to those who only contemplate the pomp and wealth round about them, and in their view; but they who look into all the different ranks of men, are well satisfied that this duty on marriages and births, is a very grievous burthen upon the poorer sort, whose numbers compose the strength and wealth of any nation. This tax was introduced by the necessity of affairs. It is difficult to say what may be the event of a new thing; but if we are to take measures from past wisdom, which exempted prolific families from public duties, we should not lay impositions upon those who find it hard enough to maintain themselves. If this tax be such a weight upon the poor, as to discourage marriage, and hinder propagation, which seems the truth, no doubt it ought to be abolished; and, at a convenient time, we ought to change it for some other duty, if there was only this single reason, that it is so directly opposite to the polity of all ages and all countries.

In order to have hands to carry on labour and manufactures, which must make us gainers in the balance of trade, we ought not to deter, but rather invite men to marry, which is to be done by privileges and exemptions, for such a number of children, and by denying certain offices of trust and dignities to all unmarried persons; and where it is once made a fashion among those of the better sort, it will quickly obtain with the lower degree.

Mr King, in his scheme (for which he has as authentic grounds as perhaps the matter is capable of) lays down, that the annual marriages of England are about 41,000, which is one marriage out of every 134 persons: upon which we observe, that this is not a due proportion, considering how few of our adult males (in comparison with other countries) perish by war, or any other accident; from whence may be inferred, that our polity is some way or other defective, or the marriages would bear a nearer proportion with the gross number of our people; for which defect, if a remedy can be found, there will be so much more strength added to the kingdom.

From the books of assessment on births, marriages, (when this was the case) by the nearest view he can make, he divides the 5,500,000 people into 2,700,000 males, and 2,800,000 females; from whence, (considering the females exceed the males in number, and considering that the men marry later than the women, and that many of the males are of necessity absent in the wars, at sea, and upon other business) it follows, that a large proportion of the females remain unmarried, though at an adult age, which is a dead loss to the nation, every birth being as so much certain treasure; upon which account, such laws must be for the public good, as induce all men to marry, whose circumstances permit it.

From this division of the people, it may be likewise observed, that the near proportion there is between the males and females (which is said to hold also in other places) is an argument (and the strongest that can be produced) against polygamy, and the increase of mankind, which some think might be from thence expected; for if nature had intended

VOL. II.

to one man a plurality of wives, she would have ordered a great many more female births than males, her designments being always right and wise.

The securing the parish for bastard children, is become so small a punishment, and so easily compounded, that it very much hinders marriage. The Dutch compel men of all ranks, to marry the woman whom they have got with child; and, perhaps, it would tend to the further peopling of England, if the common people here, under such a certain degree, were condemned by some new law to suffer the same penalty.

A country that makes provision to increase in inhabitants, whose situation is good, and whose people have a genius adapted to trade, will never fail to be gainers in the balance, provided the labour and industry of their people be well managed and carefully directed.

The more any man contemplates these matters, the more he will come to be of opinion, that England is capable of being rendered one of the strongest nations, and the richest spot of ground in Europe.

It is not extent of territory that makes a country powerful, but numbers of men well employed, convenient ports, a good navy, and soil producing all sorts of commodities.

The materials for all this we have, and so improveable, that if we did but second the gifts of nature with our own industry, we should arrive to a pitch of greatness that would put us at least upon an equal footing with any of our neighbours.

If we had the complement of men, our land can maintain and nourish; if we had as much trade as our stock and knowledge in sea affairs is capable of embracing; if we had such a naval strength, as a trade so extended would easily produce; and, if we had those stores and that wealth, which is the certain result of a large and well governed traffic, what human strength could hurt or invade us? On the contrary, should we not be in a posture not only to resist, but to give law to others? See the article MANURE.

Our neighbouring Commonwealth has not in territory above eight millions of acres, and, perhaps, not much above two millions, two hundred thousand people; and yet, what a figure have they made in Europe for these last hundred years? What wars have they maintained? What forces have they resisted? And to what a height of power are they now come, and all by good order and wise government?

They are liable to frequent invasions; they labour under the inconvenience and danger of bad ports; they consume immense sums every year to defend their land against the sea, all which difficulties they have subdued by an unwearied industry.

We are formed by nature against foreign enemies; our ports are safe; we fear no irruptions of the sea; our land territory at home, is at least 39 millions of acres; we have, in all likelihood, not less than six millions of people; what a nation might we then become, if all these advantages were thoroughly improved, and if a right application were made of all this strength, and of these numbers?

They apprehend the moderate growth of any prince or state, may, perhaps, succeed by beginning first, and by attempting to pull down such a dangerous neighbour; but very often their good designs are disappointed.

In all appearance they proceed more safely, who under such a fear make themselves strong and powerful at home. And this was the course which Philip, king of Macedon, the father of Perseus, took, when he thought to be invaded by the Romans.

In all appearance the best way for a nation, that apprehends the growing power of any neighbour, is to fortify itself within; we do not mean by land-armies, which rather debilitate than strengthen a country, but by potent natives, by thrift in the public treasure, by multiplying the people, and augmenting their trade, and all the other honest and useful arts of peace.

By such an improvement of our native strength, agreeable to the laws, and to the temper of a free nation, England without doubt may be brought to so good a posture and condition of defending itself, as not to apprehend any neighbour, jealous of it's strength, or envious of it's greatness.

And to this end we open these schemes, that a wise government, under which we live, not having any designs to become arbitrary, may see what materials they have to work upon, and how far our native wealth is able to second their good intentions of preserving us a rich and a free people.

Having said something of the number of our inhabitants, we shall proceed to discourse of their different degrees and ranks, and to examine who are a burthen, and who a profit to the public; for by how much every part and member of the Commonwealth can be made useful to the whole, by so much a nation will be more and more a gainer in this balance of trade.

In regard to the ranks, degrees, titles, and qualifications of the people before distinguished, it may be observed:

First, that we may thereby detect their error, who, in the calculations they frame, contemplate nothing but the wealth

5 Y and

and plenty they see in rich cities and great towns, and from thence make a judgment of the kingdom's remaining part; and from this view conclude, that taxes and payments to the public, do mostly arise from the gentry and better sort; by which measures they neither contrive their imposition aright, nor are they able to give a true estimate what it shall produce; but when we have divided the inhabitants of England into their proper classes, it will appear, that the nobility and gentry are but a small part of the whole body of the people.

Believing that taxes fall chiefly upon the better sort, they care not what they lay, as thinking they will not be felt; but when they come to be levied, they either fall short, and so run the public into an immense debt, or they light so heavily upon the poorer sort, as to occasion insufferable clamours; and they whose proper business it was to contrive these matters better, have been so unskilful, that the legislative power has been more than once compelled, for the people's ease, to give new funds, instead of others that had been ill projected.

This may be generally said, that all duties whatsoever, upon the consumption of a large produce, fall with the greatest weight upon the common sort: so that such as think in new duties that they chiefly tax the rich, will find themselves quite mistaken; for either their fund must yield little, or it must arise from the whole body of the people, of which the richer sort are but a small proportion.

And though war, and national debts, and engagements, might heretofore very rationally plead for an excise upon our home consumption; yet, in the time of peace, it is the concern of every man that loves his country, to proceed warily in laying new ones, and to get off those which are already laid, as fast as ever he can.

High customs and high excises both together are incompatible; either of them alone are scarce to be endured, but to have them co-exist is suffered in no well governed nation. If materials of foreign growth were at an easy rate, a high price might be better borne in things of our own produce; but to have both dear at once (and by reason of the duties laid upon them) is ruinous to the inferior rank of men [see the article DUTIES]: and this ought to weigh more with us, when we consider, that even of the common people, a sub-division is to be made, of which one part subsists from their own savings, arts, labour, and industry; and the other part subsists, a little from their own labour, but chiefly from the help and charity of the rank that is above them.

For, according to Mr. King's scheme,

The nobility and gentry, with their families and retainers, the persons in offices, merchants, persons in the law, the clergy, freeholders, farmers, persons in sciences and liberal arts, shop-keepers and tradesmen, handicrafts-men, naval-officers, with the families and dependants upon all those, all together, make up the number of	} 2,675,520
The common seamen, common soldiers, labouring people, and out-servants, cottagers, paupers and their families, with the vagrants, make up the number of	

In all 5,500,520

So that here seems a majority of the people, whose chief dependence and subsistence is from the other part, which majority is much greater, in respect of the number of families, because 500,000 families contribute to the support of 800,500 families.

In contemplation of which, great care should be taken not to lay new duties upon home-consumptions, unless upon the extremest necessities of the state; for though such impositions cannot be said to fall directly upon the lower rank, whose poverty hinders them from consuming such materials, (though there are few excises to which the meanest person does not pay something) yet indirectly, and by unavoidable consequences, they are rather more affected by high duties upon our home consumption, than the wealthier degree of people; and so we shall find the case to be, if we look carefully into all the distinct ranks of men enumerated.

First, As to the nobility and gentry, they must of necessity retrench their families and expences, if excessive impositions are laid upon all sorts of materials for consumption; from whence follows that the degree below them of merchants, shopkeepers, tradesmen, and artisans, must want employment.

Secondly, As to the manufactures, high excises in time of peace, are utterly destructive to that principal part of England's wealth; for if malt, coals, salt, leather, and other things, bear a great price, the wages of servants, workmen, and artificers, will consequently rise, for the income must bear some proportion with the expence; and if such as set the poor to work, find wages for labour, or manufactures advance upon them, they must raise in the price of their commodity, or they cannot live; all which would signify a little, if nothing but our own dealings among one another were

thereby affected; but it has a consequence far more pernicious, in relation to our foreign trade, for it is the exportation of our own produce that must make England rich: to be gainers in the balance of trade, we must carry out of our own produce, what will purchase the things of foreign growth that are needful for our own consumption, with some overplus, either in bullion or goods, to be sold in other countries; which overplus is the profit a nation makes by trade, and it is more or less, according to the natural frugality of the people that export; or, as from the low price of labour and manufacture they can afford the commodity cheap, and at a rate not to be underfold in foreign markets.

The Dutch, whose labour and manufactures are dear, by reason of home excise, can, notwithstanding, sell cheap abroad, because this disadvantage they labour under, is balanced by the parsimonious temper of their people: but in England, where this frugality is hardly to be introduced, if the duties upon our home consumption are so large as to raise considerably the price of labour and manufacture, all our commodities for exportation must by degrees so advance in the prime value, that they cannot be sold at a rate which will give them vent in foreign markets; and we must be every where under-fold by our wise neighbours. The consequence of such duties in times of peace, will fall most heavily upon our woollen manufactures, of which most have more value from the workmanship than the materials; and if the price of this workmanship be enhanced, it will in a short course of time, put a necessity upon those we deal with, of setting up manufactures of their own, such as they can, or of buying goods of the like kind and use, from nations that can afford them cheaper.

And in this point we are to consider, that the bulk of our woollen exports does not consist in draperies made of the fine wool, peculiar to our soil, but it is composed of coarse broad cloths, such as Yorkshire cloths, kerseys, &c. which make a great part of our exports, and may be, and are, made of a coarser wool, which is to be had in other countries; so that we are not singly to value ourselves upon the material, but also upon the manufacture, which we should make as easy as we can, by not laying over-heavy burthens upon the manufacture: and our woollen goods being two thirds of our foreign exports, it ought to be the chief object of the public care, if we expect to be gainers in the balance of trade.

Thirdly, as to the lower rank of all, which we compute at 2,825,000 heads, a majority of the whole people, their principal subsistence is upon the degrees above them; and if those are rendered uneasy, these must share in the calamity; but even of this inferior sort, no small proportion contribute largely to excises, as labourers and out-servants; which likewise affect the common seamen, who must thereupon raise their wages, or they will not have wherewithal to keep their families left at home; and the high wages of seamen is another burthen upon our foreign traffic.

As to the cottagers, who are above a fifth part of the whole people, some duties reach even them, as those upon malt, leather, and salt, but not much, because of their slender consumption; but if the gentry, upon whose woods and gleanings they live, and who employ them in day-labour, and if the manufacturers, for whom they card and spin, are over-burthened with duties, they cannot afford to give them so much for their labour and handy-work, nor to yield them those other reliefs which are their principal subsistence; for want of which, these miserable wretches must perish with cold and hunger.

Thus we see excises, either directly or indirectly, fall upon the whole body of the people; and consequently upon our trade and manufactures.

Our study, therefore, now ought to be how those debts may be speedily cleared off, for which these revenues are the funds, that trade may again move freely, as it did heretofore, without such a heavy clog.

Mr King divides the whole body of the people into two principal classes, viz.

	Heads.
Increasing the wealth of the kingdom	2,675,520
Decreasing the wealth of the kingdom	2,825,000

By which he means, that the first class of the people, from land, arts, and industry, maintain themselves, and add every year something to the nation's general stock; and besides this, out of their superfluity, contribute every year so much to the maintenance of others.

That of the second class, some partly maintain themselves by labour (as the heads of the cottage families); but that the rest, as most of the wives and children of these, sick and impotent people, idle beggars and vagrants, are nourished at the cost of others, and are a yearly burthen to the public, consuming annually so much as would be otherwise added to the nation's general stock.

The bodies of men are, without doubt, the most valuable treasure of a country; and, in their sphere, the ordinary people are as serviceable to the Commonwealth as the rich, if they are employed in honest labour, and useful arts: and such

such being more in number, do more contribute to increase the nation's wealth, than the higher rank.

But a country may be populous, and yet poor (as were the antient Gauls and Scythians); so that numbers, unless they are well employed, make the body politic big, but unwieldy, strong but unactive, as to any uses of good government.

Their's is a wrong opinion, who think all mouths profit a country that consume it's product. And it may be more truly affirmed, that he that does not some way serve the Commonwealth, either by being employed, or by employing others, is not only an useless, but a hurtful member to it.

As it is charity, and what we indeed owe to human kind, to make provision for the aged, the lame, the sick, blind, and impotent: so it is a justice we owe to the Commonwealth, not to suffer such as have health, and who might maintain themselves, to be drones, and live upon the labour of others. The bulk of such as are a burthen to the public, consists in the cottagers and paupers, beggars in great cities and towns, and vagrants.

Upon a survey of the Hearth Book, made at Michaelmas, 1685, it was found, that of the 1,300,000 houses in the whole kingdom, those of one chimney amounted to 554,631; but some of those having land about them, let them be computed 500,000 families. But of these, a large number may get their own livelihood, and are no charge to the parish; for which reason Mr King very judiciously computes his cottagers and paupers, decreasing the wealth of the nation, but at 400,000 families; in which account he includes the poor houses in cities, towns, and villages, besides which he reckons 30,000 vagrants, and all these together, to make up 1,330,000 heads.

This is a very great proportion of the people to be a burthen upon the other part, and is a weight upon the land-interest; of which the landed gentlemen must certainly be very sensible.

If this vast body of men, instead of being expensive, could be rendered beneficial to the Commonwealth, it were a work no doubt highly to be promoted by all who love their country.

It seems evident to such as have considered these matters, and who have observed how they are ordered in nations under a good polity, that the number of such, who through age or impotency, stand in real need of RELIEF, is but SMALL, and might be maintained for very little; and that the POOR RATES are swelled to the EXTRA VAGANT DEGREE we now see them at, by two sorts of people; one of which, by reason of our slack administration, is suffered to remain in sloth; the other, through a defect in our constitution, continue in wretched poverty, for want of employment, though willing enough to undertake it.

All this seems capable of a remedy: the laws may be armed against VOLUNTARY IDLENESS, so as to prevent it; and a way may probably be found out to set those to work, who are desirous to support themselves by their OWN LABOUR: and if this could be brought about, it would not only put a stop to the course of that vice, which is the consequence of an idle life, but it would greatly tend to enrich the commonwealth; for, if the industry of not one half of the people maintains in some degree the other part: and besides, in times of peace, did add every year near two millions and a half to the general stock of England; to what pitch of wealth and greatness might we not be brought, if one limb were not suffered to draw away the nourishment of the other; and if all the members of the body politic were rendered useful to it?

Nature, in her contrivances, has made every part of a living creature, either for ornament or use; the same should be in a politic institution rightly governed.

It may be laid down for an undeniable truth, that where all WORK, NO BODY WILL WANT, and to promote this, would be a GREATER CHARITY, AND MORE MERITORIOUS, THAN TO BUILD HOSPITALS, which very often are but so many monuments of ILL-GOTTEN RICHES, ATTENDED WITH LATE REPENTANCE.

To make as many as possible of these 1,330,000 persons (whereof not above 330,000 are children too young to work) who now live chiefly upon others, get themselves a large share of their maintenance, would be the opening a NEW VEIN OF TREASURE, OF SOME MILLIONS STERLING PER ANNUM; it would be a present ease to every particular man of substance, and a lasting benefit to the whole body of the kingdom: for it would not only nourish, but INCREASE THE NUMBER OF THE PEOPLE, of which many thousands perish every year, by those diseases contracted under a SLOTHFUL POVERTY.

Our laws relating to the poor are very numerous, and this matter has employed the care of every age for a long time, though but with little success, partly through the ill execution, and partly through some defect in the VERY LAWS.

The corruptions of mankind are grown so great, that, now a-days, laws are not much observed which do not in a manner execute themselves; of this nature are those laws which relate to bringing in the prince's revenue, which never fail to be put in execution, because the people must pay, and the prince will be paid; but wherein only one part of the con-

stitution, the people are immediately concerned, as in laws relating to the poor, the highways, assizes, and other civil economy, and good order in the state, those are but slenderly regarded.

The public good being, therefore, very often not a motive strong enough to engage the magistrate to perform his duty, law-givers have many times fortified their laws with penalties, wherein private persons may have a profit, thereby to stir up the people to put the laws in execution.

In countries depraved, nothing proceeds well wherein particular men do not one way or other find their account; and, rather than a public good should not go on at all, without doubt it is better to give private men some interest to set it forward.

For which reason, it may be worth the consideration of such as study the prosperity and welfare of England, whether this great engine of MAINTAINING THE POOR, AND FINDING THEM WORK AND EMPLOYMENT, may not be put in motion by giving some body of undertakers a reasonable gain to put the machine upon it's wheels. See the article POOR.

PERSIA is bounded on the north by part of Russia, by the Caspian Sea, and by the country of the Usbeck and independent Tartars; on the east by the Mogul empire, from which a ridge of mountains and the river Indus divide it; on the south it has the Arabian Sea, which is part of the ocean, and the Persian gulph; and on the west it has Georgia and Aran, or ancient Armenia, from which the rivers Kar and Aros part it, and also the rivers Tigris and Euphrates, which separate it from the Turkish empire in Asia. It's greatest extent, from south to north, is about 19 degrees, from 25. 40. to 44. 40. that is to say, 1140 English miles; and it's greatest extent, from east to west, is about 1280 miles, though in many parts it is much narrower, especially towards the north, where, on the west, it contains but a small track of land between Turkey and the Caspian Sea, and, on the east, it is also pent in between the same sea and the country of the Tartars. It is seated under the fourth, fifth, and sixth climates; so that the longest day, in the north part, is 15 hours and some minutes, and in the south part 13 hours and 45 minutes: and, therefore, the temperature of the air is various, according to the different provinces.

Generally speaking, the soil in Persia cannot be much praised: for though some parts be fruitful, and produce excellent fruits, yet other parts are perfectly barren, being mountainous and sandy; and, as there are here but few rivers, they have only rain, and the dissolved snow, to water the land, which falling from the mountains in small brooks and rivulets, render the vallies fertile.

Some travellers tell us, that their corn ripens expeditiously, and that, in some parts, they have three-fold crops in a year. They have almost all kinds of fruits that are in France, but fairer and better, and, by reason of the dryness of the air, they keep a whole year. They have nine or ten sorts of very good grapes; but they have not the muscadine, says Mr Thevenot. Their wines are white, and made of grapes which they call kismich: they make also wine with other sorts of grapes, but it is neither so good, nor keeps so well. They have also some red wine, but little, and to make it they only put some black grapes into white wine, to give it a colour: for, if it were made all of black grapes, it would not keep. We must except the wine of Shiras, which is red, and very good, and stomachical, but is only brought in bottles, and in little quantity.

They have few trees but what grow in their gardens, and of these the palm-tree is the most carefully cultivated; when it is young, and before it bears fruit, they dig at the foot eight or ten fathom deep in the earth, more or less, until they have found water; they only dig on one side, and then fill up the hole with pigeon's dung, whereof they have always great provision for that purpose, as well as for manuring lands, and to make hot-beds for raising melons.

Mr Thevenot says, he was told by the people of the country, that, if they did not take that course with the palm-trees, they would not bear good fruit. But there is a very curious thing besides to be observed in the cultivating of this tree, which is, that every year, when the palm-trees are in blossom, they take the blossoms of the male palm-tree, and put two or three bunches of them into the matrix of each female palm-tree, when they begin to blow, otherwise they would produce dates without any pulp, and only with skin and stone.

The matrix is that bud which contains the flowers, from which, in process of time, the dates spring; the time of making that impregnation is about the end of November; not but that the male palm-trees also bear fruit, but it is good for nothing, and therefore they take all their blossoms to impregnate the female with. As to dates, it is worth observing, that the use of them is very dangerous during the heats in hot countries, because they make the whole body break out in blotches and boils, and spoil the sight.

Persia produces also every sort of carrots, beet-roots, parsnips, horse-radish, radishes, turnips, potatoes, mushrooms, cauliflowers of an extraordinary size, asparagus, and most sorts of our small salad herbs, with cabbage, lettuce, and Roman lettuce with a long leaf, which is sweet, and very pleasant to the

the taste. They have also small red and white beans, pease, white and grey, small black beans for horses, and green pease of the growth of Europe.

Persia is also productive of all necessaries of life, and abounds particularly with poultry and game. They have plenty of snipes and woodcocks, many sorts of wild ducks, teal, cranes, wood-pigeons, turtles, larks, thrushes, and partridges with red heads: however every sort of deer is here scarce enough; but cattle, especially oxen, abound.

The Persian bread is generally very thin, says Sir John Chardin, and there are several sorts of it; it is generally white and good, and also cheap enough, according to Mr Le Bruyn, who tells us, that they generally give but eight or ten pence for twelve pounds of bread.

A great many Persians use opium; but it is a drug that so enslaves those who are addicted to it, that if a man has once made it customary to himself, and should afterwards forbear to take it, no less than his life would be in danger: if he should go but 10 leagues out of town, and forget to take his opium with him, and find none in the place he comes to, though he should immediately return back again, and make all possible haste, yet he would not get to the town soon enough to save his life, says Mr Thevenot.

The horses in Persia are the finest in all the East: they are higher than the English saddle-horses, straight before, a little head, and legs that are wonderfully thin and fine, exactly proportioned, mighty gentle, good travellers, and very light and sprightly: they are gentle and manageable, easy to feed, and do good service till they are 18 or 20 years old.

Horses are very dear in Persia; the fine ones are valued from 90 to 450 pound sterling: the great exportation of them into Turkey and the Indies is what makes them so dear, though they cannot carry any out of the kingdom without a special permission from the king.

The best and most common way of riding there, after the horse, is the mule; they have very good ones in Persia, that pace well, never fall, and are seldom tired; the highest price of a mule is about 45 pounds. The other beasts of use, after these, are asses, of which they have two kinds in Persia, namely, the asses of the country, which are like ours, slow and heavy; these they employ for nothing but to bear burthens; but they have also a breed of Arabian asses, that are mighty fine beasts, and the best asses in the world; they have smooth shining hair, they carry their heads lofty, their feet are light, and they move them gracefully: these are kept for riding, and their masters love them for their lightness and easy going: some of them are valued at 20 pounds.

The camel is a beast much prized by the eastern people, of which there are two sorts, the northern and southern, as the Persians call them. The latter, which travel from the Persian gulph to Spahan, and no further, are much smaller than the other, and carry but 700 weight, the other 1300 weight; yet they bring their masters as much profit, because they cost little or nothing to keep: they lead them without halter or reins, grazing on the road as they go along, notwithstanding their load. They shed their hair so clean in the spring, that they look like scalded pigs, and then they pitch them all over, to keep the flies from stinging them. The camel's hair is the most profitable fleece of all the tame beasts; they make very fine stuffs of it; and in Europe they make hats of it, with a little beaver mixed with it. They take notice when the camel is in love, that they may increase his load, otherwise he would be ungovernable.

As Persia is very mountainous, it is full of metals and minerals, which they have begun to draw out in the last century much more than in the preceding ages. Sir John Chardin asserts, that their diligence was owing to the great Scha Abas, and that it was the vast quantity of mineral waters, which are here and there to be met with in all parts of the kingdom, that induced him to cause the working of the mines to be prosecuted with vigour.

The metals most usually to be met with in Persia are iron, steel, brass, and lead. They have not as yet found any gold or silver there, though they are well assured there must be some in the mines, it being impossible that so many mountains, which produce all sorts of metals, and sulphur and salt-petre, should not likewise produce those the more precious metals, says Sir John; but, adds he, the Persians are too slothful to make any discoveries. Minerals abound through all Persia: sulphur and salt-petre are extracted out of the mountain of Damavend, which separates Tabristan from Irax.

With regard to the mechanic arts and trades of the Persians, Sir John Chardin gives us the following account: first he observes, that the eastern people are naturally soft and lazy: they work for and only desire necessary things. All those beautiful pieces of painting, carving, turning, and so many others, whose beauty consists in an exact and plain imitation of nature, are not valued among those Asiatics: they think that because those pieces are of no use for the occasions of the body, they do not therefore deserve our notice. In a word, they make no account of the working of good pieces, they take only notice of the matter, which is the reason that their arts

are so little improved: for, as to the rest, they are men of good parts, have a penetrating wit, are patient, and would make very skilful workmen, were they paid liberally.

He observes, likewise, that they are not desirous of new inventions and discoveries; they think they enjoy all the necessaries and conveniences of life, and rest contented, chusing rather to buy goods from strangers, than to learn the art of making them. It is well known how much the Turks and Persians lay out in watch-work, yet they do not set about to learn that trade, which they see so profitable; nor paper-making, though absolutely necessary; nor many other such-like trades.

Neither is there in Persia one single native that knows well how to mend a watch. They have desired a hundred times to have printing-houses; they acknowledge their usefulness, and necessity, and yet no body undertakes to set one up.

Sir John's next observation is, that the hot climates enervate the mind as well as the body, and lay the quickness of the fancy necessary for the invention and improvement of arts. In those climates, men are not capable of night-watchings, and of a close application, which brings forth the valuable works of the liberal and of the mechanic arts. It is for the same reason, also, that the knowledge of the Asiatics is so restrained, that it consists only in learning and repeating what is contained in the books of the Ancients, and their industry lies fallow and uncultivated.

Our traveller observes further, concerning the method of the eastern artificers, that they need but few tools about their works. It is certainly an incredible thing in our country to hear how easily and conveniently those workmen set themselves up, and work at their trade. Most of them have neither shop nor shop-bench; they go and work wherever they are sent for; they set on the bare ground, or on an old carpet, in the corner of a room, and in a moment you see the board up, and the workmen at work, sitting on his breech, holding his work with his feet, and working with his hands.

The gold and silversmiths, as well as the rest, go likewise and work at people's houses. The reason why the Persians have their work done at home, is because they will not trust the workmen, and will see whether things be done according to their mind.

As to the polity of the Persian tradesmen, Sir John informs us, that the trades have every one a head to the company, elected out of their body, who is approved by the king; and that is all their government: yet, strictly speaking, they do not form a regular body, for they never assemble together. They have some few customs only, which the head of the trade causes to be observed; as for instance, that there be always a due distance between the shops and tradesmen of the same trade, except in the places which are particularly designed for one sort of work: whoever is about to set up a shop in any trade, goes to the head of the trade, gives his name and place of abode, to be set down in the register, and pays some small fine for it.

The head never inquires of what country the tradesman is, nor who was his master, nor whether he understands his trade. The trades have likewise no restrictions to hinder one from inroaching upon another: a tinker makes silver basons, if they are bespoke; every one undertakes what he pleases, and they never sue one another upon that account. There is, likewise, no binding of apprentices among them, and they learn their trades for nothing; far from paying any money, the boys that are put out apprentices with a master have wages the very first day they go to him: the parents make an agreement between the master and the apprentice, for so much per-day the first year, a half penny or a penny a day, according to the age of the apprentice, and the hardship of the trade; and the wages increase now and then, according to the apprentice's improvement; but this is still without any mutual confinement with respect to time, the master having always the liberty to turn away his apprentice, and the apprentice to leave his master.

There it is, indeed, that knowledge must be stolen; for the master thinking on the profit he may reap by his apprentice, more than on teaching him his trade, does not trouble himself with him in that respect, but employs him only in those things that relate to his advantage. Most trades are bound to the king's average, that is, to do the king's work when they are ordered; and the trades which are not employed in that work, as the shoe-makers, the cap-makers, the drawer makers, pay a tax to the place called Cargh Padeha, i. e. the King's Expence.

The Persians have but indifferent carpenters; the reason of it is, because of the little timber there is in Persia, and the little wood they commonly use in building. It is not so with the joiners, they are very skilful and ingenious in composing all sorts of inlaid and mosaic work, and they make noble ceilings in that kind: they fit them all on the ground, and, when they are done, they raise them up over the top of the building, on the columns that are to bear them up. The joiners sit on the ground at their work; their planes are not like ours, for they thrust the shavings out of the sides, which seems to be a more expeditious way. Their ordinary wood

wood is a white wood, very soft, and without knots, and therefore very easily to be wrought. They have excellent wood, that comes from Hircania (now Tabristan) in long boards, like the Norway deal-boards.

Embroidery is one of the mechanic arts which the Persians are best versed in; they do all sorts of embroidery very well, especially the gold and silver, either in cloth, silk, or leather: they exceed us in that art, and the Turks, likewise, whose stitching and embroidery leather we so much admire. Their leather-seams, and those of horse-trappings among the rest, are so smooth and so neat, that you would take them for embroidery. The gold and silver thread they use is so well twisted, that one would take it for wire when it is wrought, the silk not appearing in the least.

The enamel ware, or China ware, as they call it, is likewise one of the most curious manufactures which they make all over Persia. The earth of which that ware is made, is pure enamel, both within and without, like the China ware. The grain of it is as fine and transparent, as that is, whereby it happens, that one is often deceived in that earthen ware, and cannot distinguish it from China ware. Nay, you meet sometimes with Persian ware, that exceeds the China ware, so beautiful and lively is the varnish of it; but this must be understood of the new China ware, and not of the old. The skilful workmen in enamel ware, ascribe to the water the gloss of the colour, and say, that there are some waters that dissolve the colours and make them spread, whereas there are others that contract and fix them.

The pieces which the Persians make best, are the enamel tiles painted and cut out in imitation of mosaic work. Indeed nothing can be seen livelier and brighter in that kind, or drawn finer, or more regular.

This Persian earthen ware is fire proof, so that they not only boil water in it without breaking, but they even make pillow-pots thereof; it is hard enough also to make mortars to grind colours, and other materials in.

The matter of that fine enamel is glass, and little river pebbles pounded very small, together with a little mould mixed with them. There are some tradesmen in Persia, whose employment is to mend earthen ware and glass; they join the pieces together, and sew them with very small iron wire, and rub the seam over with a kind of Chalk or small lime. A dish so mended holds water as before.

The gold wire-drawers and thread-twiners are very dextrous workmen: they draw an ingot, weighing a miscal or drachm, nine hundred guzes or Persian ells long, each guze being thirty-five inches long. Their thread is the best and smoothest that can be imagined. All the art they use to give it that lively and lasting colour it has, is to gild the wire very fine and very thick.

The next trade in which the Persians excel, is that of tanning hides, and especially of working shagreen, and all sorts of Turkey leather: abundance of these are made in Persia, and exported to the Indies, to Turkey, and to the other neighbouring kingdoms. Shagreen is made of an ass's rump, and of a seed called the seed of casbin: it is black, hard, and bigger than the mustard-seed, which they use for want of the casbin seed. The tanners dress coarse hides with lime; they use no bark, but chiefly salt and gall instead of it, and that is enough in their country, the air being hot and dry.

The turner's trade is also one of the mechanic arts, which the Persians understand very well. They have no frame for turning as we have; their way consists only in a treddle, to which they fasten whatever they intend to turn; a thong that goes twice round the treddle, and which a boy holds with both his hands, and pulling now one end, then the other, turns the piece about. But when they have but small pieces to turn, the workman needs no help, for with one hand he moves the axis with a bow, and with the other hand he holds the piece of wood. They use no wimbles as we do, but they use gimblets of several sizes, which are instead of them, and which they turn with the same instrument as they do wood: it is a piece of iron flat and sharp at the end, shaped like a rib, that it may cut the better, fastened in a round handle filled with lead, to make it weighty, about which they put a strap that goes quite round it; they hold fast the gimblet with the left-hand on the piece of wood they intend to bore, and turn it with the right hand; such is their mechanic way of turning and boring.

They lay on lacquer very neatly, the violent motion of the turning instrument melting it without the help of fire; they spread it with a palm-tree stick, because that wood is porous; and then with a piece of coarse cloth and a little oil, they give to their work a wonderful lustre, which never goes off; that lacquer, likewise, is never subject to scaling.

They turn metals as well as wood, but they are very far from attaining in that respect, to the skill of our workmen; they are likewise unskilful in the turning of an oval; it is a figure, the working of which they are utterly unacquainted with.

The armourers make very good weapons, especially bows and swords. The Persian bows are the most valued of all those in the east. The matter whereof they are made is wood and horn laid over one another, and covered with sinews, and over

that with the bark of a tree very slick and smooth; they paint them afterwards, and varnish them so admirably well, that one may see one's face in those bows, and the colour of them is as bright as possible. The bow-strings are of twisted silk, the bigness of a large quill. The quivers are made of leather embroidered with gold and silk. Their scymitars or sabres, are very well damasked, and exceed all that the Europeans can do; which is, because our steel is not so full of veins as the Indian steel, which they use most commonly. They forge their blades cold, and before they dip them, they rub them with tallow, oil, or butter, to hinder them from breaking. Then they temper them with vinegar and copperas, which being of a corroding nature, show those streaks or veins, which they call damask-works. This is likewise what they call damask steel, because the town of Damascus was the most celebrated place for the manufacture of those curious scymitar-blades.

The Persians make also very well the barrels of fire-arms, and damask them as they do the blades; but they make them very heavy, and cannot avoid it; they bore and scower them with a wheel as we do, and forge and bore them so even that they scarce ever burst. They make them alike strong and thick all along, saying that the mouth of the gun being weak the report shakes it, and communicates the wavering motion to the bullet; which is the reason that if their guns be thicker, they therefore carry the shot farther and straighter. They understand very well how to make locks or springs, those they put to their fire-arms, being very unlike to ours.

The workmen in iron and steel are very well versed in their trade; they hammer both iron and steel cold, and succeed very well in it with respect to several sorts of tools and instruments: for instance, country ovens, which are shaped like two semi-cones, or semi-spheres, cut through the top, and fastened together with iron hooks. The diameter of them is two feet and a half, and the height from three to four feet. There stick out in the inside of these cones large pins about four inches long, and as big, with flat heads, and as broad as half a crown. When they have occasion to warm those ovens, they overcast the inside and outside of them with clay, which sticks to the nail's head, and makes, as it were, a wall of it, to which they stick the bread. The iron and steel tools they make best also, are, among others, saws, which are made of steel, as smooth and as bright as a looking-glass; razors which are but half as big as the handles, yet are as broad at the end, and have very well; scissars which they make hollow in the inside, like gutters, saying that being so shaped, the edges of the two blades join closer and cut better. Almost all their steel looking-glasses are convex, some few are concave like the burning-glasses. The air being very dry in Persia, the brightness of the looking-glasses does not grow dull, and they never rust. The eastern people use likewise glass looking-glasses, and even abundance of them, though not near so many as metal ones, and that they do upon two accounts; the first is, because those metal looking-glasses are more lasting, and do not break with falling; the second reason is, when the glass looking-glasses are once unsilvered, they become useless, the method of silversing glass, being unknown in all the eastern parts; and the quicksilver that is on the back of the looking-glasses coming off easier there than in Europe, by reason of the dryness of the air. They polish their metal glasses with emeral, pounded to powder as fine as dust, they having little or no Venetian tripoly.

The art of dyeing seems to have been more improved in Persia than in Europe. Their colours are much more solid and bright, and do not fade so soon; but the honour of it is not so much to be ascribed to their art, as to their air and climate; which being dry and clear, causes the liveliness of the colours; as also to the strength of the dyeing ingredients, which growing most of them in the country, are used when they are green and full of sap. Their dyeing and painting colours are the bole or red earth, the rounat or opponax, which are two common ingredients in Persia; the Brazil wood, which is imported among them from Europe; the Japan wood, and the Indigo, which they fetch from the Indies. They use, moreover, in dyeing, several herbs and simples, of their own growth, and gums, and bark of trees, and the rinds of fruits, as of wallnuts and pomegranates, and the juice of lemon. The lapis lazuli, which they call lagverd, is got in their neighbourhood, in the country of the Usbecks, but Persia is the general storehouse for it.

There are glass-houses all over Persia, but they do not well understand the art of making glass; most of theirs is full of flaws and bladders, and is greyish: upon the account, doubtless, says Sir John Chardin, that their fire lasts but three or four days, and that their deremne, as they call it, which is a sort of broom that they use to make it, does not bear heat so well as our fewel.

Paper-making is performed very rudely in Persia, because they use nothing but callico, either dyed or painted, therefore their paper is brownish, foul, ragged, and over limber. They use a great deal of European paper, after they have prepared it, but they fetch some from Little Tartary, which they prefer before it. They prepare their paper with a little soap, which they rub over it, then they smooth it with a sleek-

stone, that their ink may run more freely. These are the chief mechanic arts and trades practised in Persia.

We come now to give an account of their manufactures. They have very good manufactures in cotton, in goats and camels hair, in yarn, and especially in silk, that being a plentiful and common commodity in Persia. The natives have addicted themselves particularly to the well working of it; and it is the thing they are best skilled in, and in which they have the most considerable manufactures.

They keep their raw and unwrought silk in damp places, which they water sometimes, to continue the weight of them, because they sell it by the weight, and for the same reason, they keep that which is wound up in leathern bags. We shall pass by several sorts of stuffs of all silk, such as taffeties, tabbies, sattins, &c. and also stuffs mixed with silk and cotton thread, or with camel's or goat's hair, which are made all over Persia: we shall only speak of their brocade.

There is the single brocade, whereof there are a hundred sorts; and the double brocade, which is called *douroye*, i. e. with two faces, because it hath no wrong side, and the machinely *zerbafé*, or gold velvet. They make gold brocades which cost fifty toman the *geze* or ell, which being two feet and half a quarter long, French measure, comes to about thirty crowns the inch, or eleven hundred crowns the ell. No part of the world affords so dear a silk. They employ six men together about the loom to make it, who use about thirty shuttles to weave it. Notwithstanding the extraordinary rate of that precious brocade, the workmen employed in it do not earn above fifteen or sixteen pence a day, for they can make but the thickness of a half-crown piece of it. Those dear brocades are bought for curtains, door-hangings, and cushions, which are the most common furniture of a house.

The gold velvet, which is wrought in Persia, is very charming, especially the curled velvet: all those rich stuffs have such admirable property, that they last or ever, as it were, and the gold and silver does not wear off whilst the work lasts, and keeps still its colour and brightness. The finest looms for these stuffs are at Yezd, at Cashan, and likewise at Ispahan; those for carpets are in the province of Khorman: these are the carpets we commonly call in Europe Turkey carpets, because the merchants brought them through Turkey, before they traded with the Persians by the ocean.

Trading, says Sir John Chardin, is a very honourable profession in the East, as being the best for those that have any stability, and are not so liable to change: nor is it to be wondered at, for it cannot be otherwise in kingdoms, where, on the one hand, there is no title of nobility, and therefore little authority annexed to birth; and, on the other hand, the form of government being altogether despotic and arbitrary, the authority annexed to places and employments cannot last longer than the employments themselves, which are likewise precarious; for which reason trading is much set by in that part of the world, as a lasting and independent station.

Another reason why it is valued, is because the noblemen and even the king profess it: they have their deputies or factors, as merchants have, and under the same denomination. They have most of them their trading ships, and their storehouses. The king of Persia for instance, sells and sends into the neighbouring kingdoms, silks, brocades, and other rich goods, carpets, and precious stones. The name of merchant is a name highly respected in the East, and it is not allowed to shopkeepers, or dealers in trifling goods, nor to those who trade not in foreign countries; it is permitted only to such as employ deputies or factors in the remotest countries: and those men are sometimes raised to the highest rank, and are usually employed in embassies.

There are merchants in Persia, who have deputies in most parts of the world; and when those deputies are returned home, they wait on their masters under no better denomination than that of a servant, standing up always before them, and waiting at table, though some of those deputies are worth above threecore thousand crowns.

In the Indies the laws are still more favourable to traders; for though they are more numerous than in Persia, they are nevertheless more valued. The reason of this additional respect is, because in the Indies, traders are sacred persons, who are never molested, even in time of war, and allowed a free passage, they and their effects, through the middle of armies. It is upon their account especially, that the roads are so safe all over Asia, and especially in Persia. The eastern merchants affect grandeur in trading, notwithstanding they send their deputies into all parts, and stay at home themselves, as in the centre of their chief concern. They make no bargains themselves directly; there is no place of exchange in their towns, the trade is carried on by brokers, who are the subtlest, the most cunning, the sliest, the most complaisant, most patient, and intriguing men of the whole society, having a smooth and insinuating tongue beyond expression.

The Mahometans are not the greatest traders in Asia, though they are dispersed almost in every part of it. Some of them are too effeminate, and some too severe, to apply themselves to trade, especially foreign trade. Wherefore, in Turkey,

the Christians and Jews carry on the main foreign trade; and in Persia, the Christians and the Indian Gentiles.

As to the Persians they trade with their countrymen, one province with another, and most of them trade with the Indians. The Armenians manage alone the whole European trade; the reason of which is, because the Mahometans cannot strictly observe their religion among the Christians, with relation to the outward purity it requires of them; for instance, their law forbids them to eat flesh either killed or dressed by a man of a different religion, and likewise to drink out of the same cup with such a one. It forbids them to call upon God, in a place adorned with figures. It even forbids, in some cases, the touching of persons of a different opinion, all which laws it is almost impossible to keep among the Christians.

Another hindrance there is to the Mahometan improvement of trade, namely, the forbidding usury and interest without any distinction. Mahomet broached his religion in a country, whereof the whole riches and trade consisted in cattle and breeds of horses, where little money was seen, and where the trade was managed by way of barter, as in former times; and it appears from a thousand passages in the Koran, that he did not foresee his religion would be propagated throughout the world, so that he perceived no inconvenience in forbidding to lend money upon interest.

The old commentators of his institution have not explained that prohibition, so that it has remained in force to this day. Thus their law allows no interest, but it allows changes, especially maritime changes, upon any advantage whatsoever, as thirty and forty per cent. profit, or more. As for interest, the parties have their way of evading the law just as they please.

Silk is the staple commodity of Persia. They get some in the provinces of Georgia, of Chorasian, and of Khorman, but especially in Ghilan and Mazanderan. They compute that Persia produces yearly twenty-two thousand bales of silk, each bale weighing two hundred threecore and sixteen pounds weight; and that account increases every year, because silk improves continually.

There are four sorts of silk; the first and the worst is called Chirvani, because it comes from Chirvan, a province near the Caspian Sea; it is a thick and rough silk, and the coarsest thread of the shell, it is that they call *ardafhe* in Europe. The second, which is a size better, is called *carvari*, i. e. an ass-load, to denote that sort of silk which the unskilful buy; they call it *legia* in France, probably from the word *Legian*, the name of a small town in Ghilan on the sea, where none but such a sort of silk is made. The third is called *ketkoqapend*, as though one should say, the citizen sort; which name the Persians give to all things of a middling character. The fourth is called *sharhaffee*, i. e. the brocade silk, because the best silk is used for those rich goods. The abundance of Persian silk exported is well enough known. The Dutch import of it into Europe to the value of near sixty thousand pounds sterling yearly, by the Indian Sea; and all the Europeans who trade in Turkey, import nothing more valuable than the Persian silks, which they buy of the Armenians. The Muscovites import it likewise.

Some foreigners trade with the Persians for camel's hair, and some Europeans for kid's wool; they use it in Europe for making of hats. The best wool of that sort, comes from Khorman and from Casbin, a famous city of Parthia, or Persian Irak. Persia exports into the East-Indies abundance of tobacco, all sorts of fruit dried, pickled in vinegar and preserved, especially dates, marmelades, wines, distilled waters, horses, Persian ware, feathers, Turkey leather of all sorts and colours, a great deal whereof is also exported to Muscovy, and other European countries. They export into Turkey tobacco, galls, thread, coarse goat's hair, stuffs, and all sorts of box-work, with many other things. The exportation of steel and iron is prohibited, but it is exported notwithstanding.

It is not to be supposed, however, that the Persians manage trade with the same method and rule as we do, or with the skill of the Europeans; for instance, trading by commission and the use of bills of exchange, are little known, but every one goes to sell his own goods himself, or sends his deputies or his children to do it. Neither have they any letter-posts in the east, because their trade is not spread far enough, and is not managed with so much activity as in Europe; and also because the towns are at too great a distance from one another, and messengers are hired at a very easy rate; they send an express a thirty days journey for about thirty shillings, and he performs that journey, which amounts to nine hundred English miles, in eighteen or twenty days time, and sometimes in fifteen. When those expresses are hired to go a journey, they run presently from place to place, and give notice of their intended journey, in order to get some letters to carry, which they carry for as little as you please; they will carry a packet of letters of three ounces weight for fifteen pence.

It must be also observed, that in Persia they subscribe no bills, bonds, and other writings, but instead thereof, they write at the top of the paper their own name, and their surname, which is always their father's proper name; and they seal

seal the paper at the bottom, in the presence of witnesses, who attest it also with their seals: in that manner do the merchants make their writings; and although in most cases the contracts made, without due FORM OF LAW, be void, yet amongst merchants they remain in FULL FORCE, and the secular power ratifies them. The use of surities or bails, is also very common amongst them.

The most current money in Persia, as Tavernier, Thevenot, and others inform us, are the abassi's, mahmoudi's, shai's, and casbegio's; the abassi's are of the finest silver, and the officers of the mint dare not coin any single piece, until they have first refined the pialtres, and other pieces of silver, that are appointed for the making of abassi's. And abassi was in Thevenot's time, about eighteen pence French money; and considering there was no great difference then in the value of French and English coin, we may well suppose an abassi to be still worth about sixteen pence of our money. The abassi's, as all the rest of the Persian coin, are stamped with the hammer, and not milled, and there is so great an inequality in their weight, that in great payments they are weighed after this manner: they put twenty-five abassi's in one scale of the balance, and as many in the other; and if the one weigh more or less than the other, they conclude for certain, that there are some false abassi's among them, and fail not to examine them, in which they are never out, for each scale ought most exactly to weigh alike. An abassi is worth two mahmoudi's, a mahmoudi two shai's, and a shai ten single or five double casbegio's. These last pieces are of brass, the three other sorts are all of silver, for gold is not current in trade. They have one brass coin called bistri, worth four casbegio's, but the bistri's are now very scarce. They do not stamp their coin with the king's effigy, nor with his coat of arms; they only stamp on one side of the silver pieces the king's name, in whose name it was coined, and on the other, the name of the town and the year of the hejira.

The brass pieces have on one side a lion, with a rising sun on his back, the emblem of Persia, and on the other the name of the place where it was struck. There is a coin all along the Persian Gulph, called larin, which is the most common in trade. Larin, says Sir John Chardin, signifies coin of Lar, which is the capital of Caramania Deserta (now Laristan). This was a distinct kingdom, before Atlas the Great king of Persia, who conquered it, joined it to his kingdom. That piece of money is of good silver, and is worth about ten pence English. The make of it is very extraordinary, being a round wire, of the bigness of a quill, folded in two, and an inch long, with a small mark on it, which is the prince's stamp. None having been coined since the conquest above-mentioned, is the reason they are now very scarce. They do nevertheless reckon by that coin all along the Persian Gulph, and in the Indies, along the gulph of Cambay, and in the neighbouring ports; they say that formerly it was current throughout all the east. Sir John Chardin does not give us the same account with Tavernier, of the stamp of the money; for he tells us that the stamp of the money, like that of the great seal of the kingdom, represents in the middle of one of the sides the Persian belief in these words, There is no God but God; Mahomet is God's prophet; Aly is God's vicegerent, and the names of the twelve imams, and on the other the name of the king of the place, and of the year of the hejira. Sir John adds, that the charge of coining is greater in Persia than in any other parts of the world, for it amounts to seven and a half per cent. The or is not a real coin, but only a nominal value of money, as a pound sterling is with us, and is used among merchants when they speak only of small sums; an or is worth five abassi's. A toman also is but a certain sum of money, and no coin; it is worth fifty abassi's, and in Persia they generally reckon by tomans.

They have no gold money in Persia, for the pieces of gold stamped with the king's effigy, and coined at his accession to the throne, and on new year's day, which are of the same weight as the German ducats, are not current among the people, any more than counters are in France; besides those pieces of gold have no proper name; the Persians call them commonly tela, i. e. gold pieces; they are called also cherashi's, i. e. nobles, by reason of their value. Tavernier tells us, that the merchants who travel into Persia, carry with them ducats of Germany, the Low Countries, and Venice, but they must carry them to the mint as soon as they enter the kingdom; yet if they can secretly sell them to private persons, they make a greater profit of them. And when they go out of the kingdom, they must declare all the gold coin they take with them, and pay four pence duty to the king's officers for every ducat, if they should endeavour to conceal their gold, and chance to be discovered, they would lose it all.

The common weight in Persia is of two sorts, the civil weight, and the legal or religious weight. The legal weight, which they call cheray, and which is like the weight of the sanctuary, according to the use of the ancient Hebrews, weighs commonly double the civil weight. They have, like us, different weights for medicines and precious stones, from the common weights. The civil weight is also of two sorts,

the king's weight, and the tauris weight as they call it. The king's weight, or the great weight, weighs exactly as much more as the other, they call their common weight man, and also batman. The small weight man comes to five pounds fourteen ounces of Paris weight. Their way of dividing it is as follows: the ratel is the sixth part of a man, and comes near to a pound with us; the derham, or drachm, is the fiftieth part of a pound; muscal is half a derham; the dung is the sixth part of a muscal, and comes to about eight grains of carat weight, and the barley-corn, which is the fourth part of a dung. The eastern weights are all reduced to the barley-corn.

There are two sorts of ells, the royal ell, which is three feet long wanting an inch, and the short ell, or guezemoukesser, as they call it, which is but two thirds of the other. The geometrical measure is called girib; the land is measured by no other measure, and the girib contains a thousand and sixty-six square ells, each ell containing thirty-five royal inches. The carpets that are sold by the ell, are measured also by the square ell, multiplying the length by the breadth, which the Persians call ell by ell. For instance, if a floor carpet is twelve ells long and three broad, they say, three times twelve is thirty-six, for it contains as many square ells. The Persians have no measure for dry goods, as a bushel, &c. because they sell every thing by weight, even liquors. They have no measure for time, neither clocks nor dials. They divide the day into eight parts, most of which the Mahometan priests give notice of in towns, by calling people to prayer.

A summary of the commerce of Persia, according to the judicious Mr Hanway*.

* If we may judge, says this ingenious gentleman, from the duties paid in RESHD, the trade began to flourish on our arrival there; for in 1742 the customs amounted only to 20,000 crowns, but in 1743 they arose to 50,000, and made about the same sum in 1744. The annual produce of GHILAN in good times, I compute to be 30,000 batmans † of raw silk, of which about 6000 are consumed in Persia, 4000 sent to Babylon, and the remainder over the Caspian Sea. SHIRVAN formerly produced a large quantity, but that province is now in a much worse condition than GHILAN. This commodity is brought to market all the year round. They have several kinds of it, the first is called sherbaff, or weaver's silk, they being supposed, particularly in RESHD and CASHAN, to use the best they can procure; but what generally goes for the PERSIAN fabric at CASHAN, is the finest sort, the threads of which are more split; this is usually all white, whereas the other is white and yellow; nor is it wound off so short, so that though finer we do not esteem it so much as sherbaff. There is also a sort called Arabs, from being bought up for the most part by Arabians, who send it into Turkey, where it is afterwards manufactured.

* See an Historical Account of the British Trade over the Caspian Sea.—By Jonas Hanway, merchant.

† 240,000 great pounds.

GHILAN produces the best and greatest quantities of silk; next to this comes SHIRVAN and ERIVAN, then MAZANDERAN, and lastly ASTRABAD; but the latter is vastly inferior, serving only for a manufacture mixed with cotton, of which they make their shirts and drawers. Ghilan silk is sent into Russia and Turkey, and part of it is kept for the Persian manufactures, but that of Mazanderan and Astrabad is seldom or ever exported. From Shirvan they formerly sent all their silk to Turkey and Russia. The peasants of Ghilan perceiving that the English required the sherbaff to be short wound, prepared it in that manner, and the silk proved good, and was much esteemed by our manufacturers. The peasants gave this reason for chusing to have their silk long wound: in moist weather, the silk wound on a large wheel is not so apt to stick or be gummed together, in those parts where it lays on the bars, or divisions of the wheel, where it is often rendered black, and so hard, that it cannot without great difficulty be separated; besides, with a large wheel they make more dispatch; but all this time they did not consider the inconvenience of winding it off to be manufactured. These peasants are extremely tenacious with regard to the price of their silk: their business is usually done by brokers, but the buyer attends to pay the money. They sell it in small quantities, so that a cargo cannot always be collected. Besides this inconvenience, there is that of bad money, for they are often obliged to cut it through, in order to see that it is not copper silvered over. Their jealousy ran so high, that the governor of Ghilan once published an order, that whoever refused any kind of money, except it was manifestly bad, his ears and nose should be cut off, and his estate confiscated: but I never heard that this order was carried into execution.

The silk-worm, as is well known, takes its birth from an egg no bigger than a small pin's head. In the month of March, when the sun is already very warm, I observed the peasants in Ghilan prepare to give life to the eggs, which they had preserved during the winter, carrying them for the most part about them, in the warmest part of their bodies, and particularly

cularly under their arms. In ten or more days, according to the heat it receives, it becomes a maggot and begins to feed: the shrub mulberry-trees which are annually pruned, produce the most tender and proper leaves for their food. In about forty days, the worm arrives to it's maturity, and winds itself by daily gradations into a pod of silk as big as a pigeon's egg. When this egg is completely formed, which is usually known by the silence of the worm within, they suffocate it by covering it with blankets, or by the heat of the sun; unless they wind off the silk immediately, for then warm water answers the same purpose. Some of them, however, must be permitted to live and perforate the pod, for when it breaks from it's inclosure, it casts it's seed or eggs, by means of which the generation is preserved. From the pods thus perforated, the silk cannot be wound off as from the others, but being prepared by pounding, it is spun off like cotton yarn. This silk we call kedge, the remains or refuse of which is so inferior, as to admit only of being milled and made into silk wadding.

The cleanness and clearness of raw silk constitute a great part of it's goodness; inferior silk has many knits and coarse stuff sticking to the threads. The mofs, or head of silk, often appears fair to the eye, when much coarseness is concealed under it; for it is a trick of the peasants of Ghilan, to hide the defects as they wind it off from the pod. The best silk has constantly a gloss or brightness: the white or silver coloured is most esteemed, but in Ghilan the greatest part comes yellow from the worm. White silk that is soiled, is generally found to have lain in a moist place, which hurts it's strength as well as beauty. Silk should be equal, strong, and round as wire, and also clean; the greatest part of it should be in a medium with regard to fineness, for the finest is not the easiest to manufacture to advantage. The threads of silk being thus even, that is, as near as possible of one size, and not coarse and fine intermixed, can be most easily separated in the winding; but otherwise the coarse is apt to tear the fine, and make waste in manufacturing it. The size which we usually most esteem, is wound off 16 or 18 pods or cocoons. A mofs, which is about 60 inches in the round, can be most conveniently reeled off; longer is not approved of, and if shorter it is apt to break by the quick revolutions of the reel, being glued together with it's own gum. It is also to be observed, that there is a vast difference between silk cleaned by combing, and that which remains just as it came from the pod. The former, to an unskilful person, who does not observe the broken threads and the ends of the combings, shall look better than the latter, though it be considerably worse. When the Armenians and Russians pack up their silk, they generally comb the heads of the mofses, to deceive the buyer, but this makes it really worse, because it hurts in the winding off. These people, who were never famed for probity, have long practised the art of false package: hence, at Smyrna and Aleppo, where the Armenians sell their silk to the factors of our Turkey company, as likewise in Russia, it has often been rejected upon that account, especially as they hold it a constant maxim, not to suffer their bales to be broken up except at the heads. The price of silk and Ghilan generally rises in proportion to the advance on foreign goods, except in a very great scarcity, as of late: during the course of the British Caspian trade, we found it vary from 12 to 18 crowns the batman; it was generally about 15, but within these two or three last years the Russians and Armenians have paid from 30 to 40 crowns.

The kinds of European goods which the Russians and Armenians vend in the northern provinces of Persia, with a succinct account of the Persian weights, measures, and coins.

I shall finish this short view of the trade of Persia, by giving a general idea of the different kinds of European goods, which the Russians and Armenians now vend in the northern provinces of that kingdom, with an account of the coins, weights, and measures, according to the best informations I could procure; but I must observe, that there seems to be a great discordance among writers in this particular. The chief demands of European goods, next to Dutch cloth, is for British woollens, such as hair-lift drabs, of 12 to 19 l. per piece of 37 yards in white, which the Persians call maghoot, and consume thereof nine bales in 30. Gloster cloths, of about 9 l. 10 s. to 11 l. 10 s. per piece of 42 yards in white, which the Persians call maghoot, and consume thereof 10 bales in 30. Ordinary Yorkshire cloths, of about 3 s. 6 d. per yard dyed, which the Persians call Londora, and consume thereof 11 bales in 30. Five bales of shalloon, of a middling quality, are ordinarily required in 100 bales of cloth. From Holland they reckon one bale of maghoot, one of shalloons, and one of long ells, to 10 bales of bergrest. English embossed cloth is also demanded; likewise indigo, cocheneal, and, in good times, some rich silks, gold and silver lace, velvets, and other rich manufactures.

The Persians had long been accustomed to Dutch cloths, which were thicker, and, for the most part, better shorn, and of a softer and finer wool; the crimson and scarlet of a finer dye; but they were dearer than ours: however, after two or three years, we improved some of our drabs, so as to be almost equal to the Dutch cloths in substance, and, in my judgment, superior in softness and beauty.

The transit duty in Russia is 3 per cent. on the value, with an agio of 150 per cent. which, with other petty charges, makes it about 8 per cent. only in the custom-house. In Persia the duty on European goods is 5 per cent. on the value.

An ACCOUNT of the MONEY of PERSIA.

The toman, bistie, and denaer, are imaginary, but the other denominations are real; the valuation and currency of silver money, are, viz.

	Value in denaers.	Weight in mufcals.
A toman is ten hazardenaers	10,000	50
It must be observed, that the hazardenaer (which the English call mildenaer, and the Russians a ruble) is computed by Europeans, and accounts kept in hundreds	100	
Consequently, the same in lower denominations, viz. peng fid denaer, or rupie, or nadire	50	2½
Sifid denaer, or shis shahie	30	1½
Abassie	20	1
Sid denaer, or mahmudie	10	
Shahie, or shahie	5	
Bistie	2	
Kasbekie	1	

An english crown melted down in Refhd, produced, at 17 denaers * per mufcal, only 95 denaers; but we always computed the mildenaer, or 100 denaers; equal to an English crown of 5s.

* The common price of silver.

The GOLD COINS current are,

	Value	Wt. in mufcals and mackoot, or karran. 24 = 1 mufcal.
Muhrashreffie, or treble ducat of 6 mildenaers	6	2 9
Ashreffie, or old ducat	1 80	0 18*
Ditto Shan Nadir, or new ducat	1 80	0 18
Ditto of Meshed	1 80	0 18
Ditto Bokhara, current at 2 10	2 20	1
And Fonduckli, Turkish ducat, about	1 80	0 18
Venetian Ducat	1 80	0 17½
The common abassie should be	2 ---	1
Ditto Shah sulthan Hussein	-	1 4
Ditto Shah Suliman	-	1 14
Ditto Shah Seffie	-	1 16

N. B. 80 ¹¹⁰/₁₀₀₀ mufcals = 1 lb. Troy

* Equal in fineness to a Holland ducat.

WEIGHTS.

1200 mufcals, or 1 butman, are avoirdupois lb.	
ordinarily computed 12 ½ lb. English	12 20343
98 ½ ditto	1
1 ditto I have found to be 3 dwts. ½ grain, but nicer calculators call it grains	7 1 1888
1 dunk, or donk	11 8648
1 karrat	2 9662
1 hæbbie	0 9887½
107 mufcals are 1 lb. Hollands.	

The old batman, or manshah, is 1200 mufcals, or 200 drams, by which silk, cocheneal, indigo, kedge, &c. are weighed.

The new batman shah is 1280 mufcals, or 213 ⅔ drams, by which heavy goods are weighed.

At Tavis the batman, called tavizie, contains 640 mufcals; likewise chiefly used at Meshed and Herat, as it is also, more or less through the whole country, for several species of goods. The antient batman of Tavis weighed 600 mufcals.

At Isfahan, at Shamakie, and all through Shirvan, the silk batman contains 48 stils, or 1600 mufcals, and 3 stils are called a shadah, and weigh 100 mufcals; but the batman, by which indigo is weighed, contains only 800 mufcals.

At Tæhiran the batman is called re, and contains 1600 mufcals; rice, wheat, liquors, and provisions, are sold by the batman.

A chærvær, or load of a camel, is 50 batmans.

A load of a mule, 25 batmans, according to the king's computation, but carriers usually load from 30 to 34.

A chærvær of a horse is 20 batmans, but carriers usually load 25. The same load of an afs, according to the common rule of carriers is 15 batmans.

Kæbbie, a handful.

Dizz, or gerib, 1000 rice.

Four batman of Shahi rice, make one kuttie.

Corn and grain, and even liquids, are sold by the batman, but rice, when winnowed, is sold per measure, or jar. The muscal through all Persia is the same: the silversmiths commonly make use of pieces of money instead of weights, especially fifth denars of $1\frac{1}{2}$ muscal in weight. One karrat is three hæbbie. Four karrats, or nockoot are one dunk. Six dunk one muscal. Six muscals one dram.

The MEASURE of RESHD.

Seven horse-hair breadths are one barley-corn. Seven barley-corns are one finger. 24 fingers are half a gæze, or gaz = one cubit. 4000 cubits are one mile. Three miles are one farfang. But the measure in common use is the gæze zerræ, divided into 16 parts, and called gierrie. The foreign and Persian merchants, in buying of woollens, compute the gæze at 40 inches English, but it is only $39\frac{1}{2}$. One ditto is computed to 10 Russian archeens of 28 inches. 105 Smyrna pikes are reckoned equal to 70 Persian gæze. The Mokæfar gæze is $\frac{1}{10}$ less than the Shah gæze, and by the Mokæfar, Persian manufactures, and most part of retale goods are measured. The Tavis gæze is one per cent, longer than the Shah gæze. The account which Mr Van Meirop gave of the import and consumption of Meshed, extracted from the custom-house register of that city, made the quantities very inconsiderable, and the whole was sent by Armenians, Russians, and Greeks, from Reshd, viz.

	Pieces of bergreft.	Pieces of Londora.	Pieces of maghoot.
Meshed, and it's neighbourhood	305	100	700
For the consumption of Bokhara	- 20	50	10
Orange	- 15	30	5
Balkh	- 15	15	5
Anthuy	- 10	15	5

Besides these not distinguished with regard to the place of their consumption, were imported.

1000 Shalloons, } the most part from Kherman, by the way
1500 Long ells, } of the gulph of Persia.

250 batmans of Lahori indigo, brought by the indians, of whom there are a considerable number, who also trade in cloth from Reshd.

500 Batmans of American indico from Reshd, by Armenians; formerly it came from Turkey, where they bought of the French.

300 Batmans of cocheneal from Reshd, brought by Armenians and others.

Though Meshed was under the particular protection of Nadir Shah, it was with difficulty that this gentleman sold to the value of 22000 crowns, during the space of 27 months which he resided there; and great part of this sum was in exchange for Persian manufactures, which no reason but the absolute impossibility of obtaining money induced him to accept; such was the distress of that country.

For my own part, I had the utmost reason to consider this as a military trade, and myself as having made a campaign. The journey, had, however, afforded me an opportunity of seeing Persia, and of enquiring into many circumstances relating to the oriental commerce. The confusion arising from intestine broils must ever give a deep wound to trade, the security of which is founded in the arts of peace, and the execution of civil laws; but the government of Persia was now rendered precarious to a degree that threatened the subversion of that monarchy. The Turks, the Lefgees, the Indians, the Turkumans, and other frontier nations, either favoured these intestine factions, or endeavoured to recover some limb which had been torn from them; so that every imaginable excess was committed, upon no better principle than the power of doing it.

In this situation it was the ill fortune of the Russia company [see RUSSIA TRADE and RUSSIA COMPANY] to find Persia governed by an usurper and a tyrant, whose cruelty had no bounds: and the prospect at this time, in a more particular manner, was overshadowed with a dark cloud, which threatened a storm: the Russia company had already felt some of the difficulties in which they were involved, others they foresaw, but knew not how to provide against them.

The rebellions in Shirvan in 1743, of Shirafs, Aftabad, Hazerjereb in 1744, were suppressed by the slaughter of many thousands, and the almost total ruin of those provinces. It is true that Nadir had enriched his treasures with the plunder of India, yet the heavy taxes he had imposed on his people to support such a continued series of foreign and domestick wars, having reduced them to poverty, and driving them to despair, obliged thousands to seek a voluntary banishment.

I have already observed that Nadir's army had been supported for upwards of four years, by the taxes drawn from his Persian subjects, and that his Indian treasure remained in a great measure untouched; this was one principle cause of their distress; by endeavouring to deprive them of the instruments of

rebellion, he provoked them to rebel, and chastising them he completed their ruin. Could any trade be carried on under these circumstances?

It was computed that Nadir had near 200,000 men in pay, the charge of whom, officers included, was computed at 100 crowns * a year, and, consequently, the expence of maintaining his army was 20 millions of crowns †, exclusive of the contingent expence.

* Twenty-five pounds,
† Five millions sterling.

In good times, the provinces are supposed to bring into the exchequer the following sums:

	Mildenaers.	£.
The conquered provinces in India were said to produce, in 1743, 25 crore*, which make, Persian money	12,500,000	3,125,000
Kandahar and Hærat	1,000,000	250,000
Khorazan	2,000,000	500,000
Aftabad	50,000	12,500
Mazanderan	400,000	100,000
Ghilan, of which a million was once demanded, but is now set at	500,000	125,000
Shirvan, including Georgia and some other parts of Dagestan	1,500,000	375,000
Erivan, and the parts of Armenia subject to Persia	2,000,000	500,000
Irac, including Casbin, Ipahan, and the country extending to the gulph, being the ancient Parthia	1,500,000	375,000
Aderbeitzan, in which Ardevill and Tauris are included †	1,500,000	375,000
	22,950,000	5,737,500

* One crore, or 10 laks, are 500,000 crowns.

† Aderbeitzan is the ancient Media.

The reader will naturally observe, how great a part of the Persian revenue was produced by Nadir's conquest in India: it will also be obvious to him, that the charge of an army is certain, but the revenues to support that army are uncertain, especially if they commit the least violence; and here the whole was a scene of rapine: the consequence was, that, except the conquered provinces in India, and those of Ghilan and Khorasan, the rest of the kingdom was so impoverished, as to be disabled from paying, perhaps, a quarter part of the usual tax. Next to the above-mentioned, Kandahar, Hærat, and Erivan, were said to be the least distressed, but misery reigned in every quarter.

Of these 200,000 men, 60,000 were quartered in Cabul and the adjacent provinces on the western side of the Sind *, which had been conquered and kept by Nadir; and the revenues appear to have much exceeded the expence of supporting that part of the army. If one considers this number of troops, and large revenue, it was not unreasonable to expect a large demand for cloth and other European goods; but we were not then acquainted with the nature of cloathing a Persian army; for indeed not a third part of it wears European cloth,

* Ancient Indus.

With regard to the quantity of goods imported by the Persians over the Caspian Sea, whilst the port of Gambroon was open to the several nations of Europe, the Caspian traders could but ill form an idea of the general consumption in that kingdom. The Russia company were more sanguine in their expectations, from a knowledge that, in the beginning of this century, the factors of the East-India company had extended their trade as far as Tavis, on the western coast of the Caspian, where they sold great quantities of the woollen manufactures of Great-Britain: but when the British factors in Ghilan, whose situation was now so much more advantageous, would have made an experiment of the like nature, they discovered that city and it's confines to be in so ruinous a state, as blasted their hopes of doing any business in those quarters.

When Persia enjoyed repose, the agent of the East-India company of England lived in splendor; the regal government being held in great veneration in that empire, he acted as immediately under the crown of England, and from thence derived an influence which he could not otherwise have possessed: his pompous manner of living had some good effects, but the expence was too considerable to be long grateful to the company.

With regard to the advantages the Russians enjoyed, it must be observed, that besides the Russian minister who attends at the Persian court, generally under the title of resident, the consul of that empire, who is fixed in Ghilan, is considered, in some measure, in a ministerial light, and allowed a company of Russian soldiers as a guard, at the expence of the empress their sovereign.

Hence it was that Mr Elton recommended so strongly, that a commission should be given to one of the British subjects in Ghilan, by which I presume he meant himself, to act as consul;

ful; but the state of things was now changed, and every step that could be taken to establish the interest of the Russia company in Persia, in effect blocked up our passage through Russia into Persia. See *RUSSIA COMPANY*.

The advantages which the East-India company of England enjoyed beyond the Russia company, were such as will hardly admit of a comparison, nor indeed is it material to my present purpose; I shall pass over in silence the trade from Great-Britain to the gulph of Persia, as also that between Persia and India; observing only, that, after the Portuguese had settled themselves in East-India, they took the island of Ormus, and being masters of the sea, carried on the trade between those countries. That great prince Shah Abas thought it his interest to dislodge them from his neighbourhood: for which purpose he entered into a treaty, in 1622, with the agent of the East-India Company, and, by means of their ships, he took Ormus, and demolished the town, bringing the commerce of that island to the continent. This induced that prince to build the town of Bender-Abassi, now called Gambroon, which is reputed the greatest place of trade in all Persia. For these good services Abas made the company a grant of half the customs of the new town, in perpetuity; but his successors have not religiously observed the engagement.

The invasions of the Afghans, in 1722, ruined the company's settlement at Ispahan, in no less a degree than the death of Nadir occasioned the pillage of the Russia company's factors in Reshd, as was the case. Their loss, though very considerable, was not, I believe, superior to that of the Caspian traders, except the long interruption of their trade: in both cases, extortion and plunder were carried to an extreme. The Armenians suffered also*; the Dutch likewise met the common fortune of the times, and being obliged to withdraw the greatest part of their factory from Ispahan, they settled in Gambroon, where they secured themselves, in a great measure, by very strong fortifications: they did not come into Persia till ten years after us, but as they are the only traders in spice, so much in use over all Asia, they have been encouraged to continue their commerce, though with less advantage than in past times.

* See Mr Hanway's History of Revolutions, in vol. iii.

The French first appeared in Persia in 1665, and concluded a treaty with the Shah of Persia in 1674; but the miseries of that country, in consequence of the invasion of the Afghans in 1722, compelled them also to retire from Ispahan.

A very pompous proposal was made by a French projector, in relation to a trade over the Caspian, in the beginning of this century, upon the occasion of an embassy* from Shah Sultan Husein to Lewis XIV. This person imagined that caravans could not be conducted safely through Russia, and, therefore, he proposed to carry merchandize in vessels, by the lakes and rivers with which that country abounds; but, in regard to robbers, he seemed ignorant that this would not mend the matter in the least. He mentioned also several commodities which he proposed to return to France, particularly rhubarb: but this article is monopolized by the Russian government: this scheme never was, and I believe never will be, carried into execution.

* It has been said that this was entirely counterfeit, to amuse Lewis XIV. in his old age; but it appears from several circumstance, as well as the nature of the thing, that this opinion was very ill grounded, if not ridiculous.

But of all the nations who have endeavoured to establish a trade with the north of Persia, the Russians are the most advantageously situated: the intestine broils of that country have not put a stop to their commerce; on the contrary, they have sometimes turned to their advantage; for, besides the ordinary course of their trade to and from Persia, they reap considerable profit by their trading voyages on the Caspian Sea, carrying rice from Ghilan to Baku, Derbends, and sometimes to the southern coast, as I have already mentioned. And as this export of provision sometimes creates a scarcity in Ghilan, it occasions a demand for Russian meal, from which again new benefits are derived. Besides cloth, and other European goods, the Russians also export red leather, furs and linnen, for the northern provinces of Persia, and make their returns in raw silk. Hence arose their jealousy of the British traders; for the Russian merchants, particularly those of Moscow, and the trading towns on the Volga, no sooner observed that the Persian markets were glutted with European goods, by the Russia company of England, than they began to murmur, resolving to make remonstrances to court on the subject.

The Armenians, indeed, have for some years extended their trade to the north of Persia, much beyond the Russians; for, by means of their credit in Holland, joined to their own capitals, they employed in this branch of commerce about 100,000 l. This stock, however, was now insufficient to support them; for the excessive glut of the market in Ghilan, and the terrible oppression of the Persian government, stopped the circulation of their trade, and, consequently, sunk their credit in Holland. At length they were also constrained to abandon Persia, and, in 1745, they retired to

Astracan, to wait with their effects till there should be a fair opportunity of returning thither.

Whilst the Russia company were in security, they could not be insensible of the benefits of buying raw silk immediately of the peasants of Ghilan; but advantages may be over-rated, and indeed cease to be such, when attended with vexations and inconveniences, like those which the Caspian traders experienced. It was not, however, the less ungrateful to observe the Armenians, a people in themselves despicable, and of no consequence to Russia in competition with the British nation, supported and protected in this trade, when measures were to apparently taken to wrest it from us.

The Russians do indeed alledge, that many of these Armenians are subjects of their country; and it is true, in general, that such of them as are engaged in the Caspian trade do put themselves under the protection of that empire; these people are likewise educated in all the servilities of Asia, and understanding how to accommodate themselves to indignities, which the genius of a free nation will hardly submit to, are in some measure the better qualified to carry on a commerce through foreign dominions.

The share which the Russia company enjoyed in this commerce made an éclat, but it was not yet pushed to near the height which the Armenians had carried it; of what consequence it was to the latter, may be easily deduced from hence, that not many years ago they imported into Russia near 1000 bales of raw silk*. Of this the greatest part was sent to Amsterdam; part of the silk was also sent to the German markets, and about 100 bales remained in the city of Moscow, for the use of the Russian manufactures.

* Of 25 batmans, is 300,000 lb. of 16 ounces; whereas all the British trade never amounted to half that quantity.

PERU. This country is bounded on the north by Popayan, which is part of Terra Firma; on the east by the country of the Amazons; on the south by Chili; and on the west it has the South-Sea, or Pacific Ocean. It extends from the 1st degree and about 30 minutes north latitude, to the 25th degree 10 minutes of south latitude: so that it contains 28 degrees from north to south; that is, 560 leagues, or 1680 English miles; but, considering the windings of the coast, and that it does not lie directly north and south, but rather north-west and south-east, we may very well agree with those geographers who make it about 600 leagues, or 1800 miles long. Its greatest breadth is not much above 100, and in some places 130 leagues, from west to east.

Besides the fruit-trees which have been transported hither from Europe, as pears, apples, figs, grapes, olives, &c. there are those of the Caribbee Islands, as ananas, guayvas, patatas, bananas, melons, water-melons, besides other peculiar to Peru; the most valued of the last sort are the chirimbyas, resembling in smell the anana, and pine-apple, being full of a white solid substance, mixed with seeds as big as kidney-beans; the leaf is somewhat like that of the mulberry-tree, and the wood resembles that of the hazel.

In relation to commerce, the Creolians are as sharp and understanding as the Europeans; but being dainty and slothful, and not vouchsafing to deal unless there be a considerable profit, the Biscayners, and other European Spaniards, who are most laborious, grow rich sooner.

This country is divided into three audiences, or jurisdictions, which are, going from south to north, Los Charcas, or La Plata, Lima, or Los Reyes, and Quito.

LOS CHARCAS. This province has Chili and Tucuman on the south; part of Paraguay, and of the country of the Amazons, on the east; the audience of Lima on the north; and the South-Sea on the west. It extends along the sea-coast, from the 25th degree of south latitude, to Rio Tamma, in latitude 17. 10. so that its length is 7 degrees and 50 minutes, that is 570 miles, in a straight line: but, considering the windings of the coast, we may very well reckon it above 600 miles. Its greatest extent, from west to east, as much as we can judge from the best maps, is about 400 miles, though in some places much less.

The climate of this country is but indifferent: on the shore it is excessive hot, and the inland parts of the country partake so much of the other extreme, that it is said the Spanish ladies, when pregnant, are compelled to remove to a warmer climate, before they can be delivered. The soil however is, generally speaking, fruitful; on the coast it is made so by art; but the vallies among the mountains in the inland parts, are from nature luxuriously fertile, being every where sufficiently watered; whereas there are no rivers at all upon the coast. As to the commodities of this country, though it may justly be stiled one of the richest in the world, yet they may be reduced to three, namely, pimento, which grows upon the coast, and is a kind of pepper, little different from what we call Jamaica pepper, and produces to the inhabitants 600,000 pieces of eight per annum.

The other commodities are silver and gold, of which we shall give some account when we come to describe the places where or near which the mines are found.

LA PLATA, otherwise called **CHAQUI,** or **CHAQUICACA,** the capital, lies in south latitude 19. 33. and in longitude 65.

65. 30. west from London; it is about 250 miles distant from the nearest sea-coast to the east, and about 780 from Lima, towards the south-east. It was formerly very considerable on account of the rich mines in its neighbourhood, many of which are now neglected.

POTOFI, a most famous place on account of the rich silver mines in its neighbourhood, is about 60 miles distant from La Plata to the south-east. It stands at the bottom of a hill called the Silver Hill, which is round like a sugar-loaf. The king obliges the neighbouring parishes to send thither a certain number of Indians yearly, to work at the mines. Captain Rogers observes, that there are 1500 or 2000 of them constantly employed in that work; they have two reals a day, and are paid every Sunday. The corregidores, or chief magistrates, cause them to set out on the feast of Corpus Christi; most of them go to that servitude with tears in their eyes, and with the greatest reluctance; however, after a year's duty, there are many who forget their habitations, and continue settled at Potofi, which is the reason why that town is so populous.

This place is said to be very cold: they have great frosts and snows here in May, June, and July. Provisions are very scarce in the town, and they have no firing but charcoal, which is brought from 30 to 50 leagues distance. Knivet in his remarks says, that, in his time, they were well supplied with every thing from the South-Sea, and that the natives of the adjoining country trafficked in gold and precious stones. The mines here were discovered by mere chance, 12 years after the Spaniards had entered the country. In 1545, Villaloele, who was a Spaniard, and an Indian, named Guanea, began with opening two mines: they called one Rica, and the other Diego Centeno. The former was raised above the surface of the earth, in the form of a cock's-comb, about the height of a lance, and was 300 feet in length, by 13 in breadth: this mine was so rich, that almost half of the ore was pure and fine silver, to the depth of 50 or 60 fathoms, where it began to change a little. The third mine, which was called Del Estauo, because of the hardness of the flints, was begun soon after the former two, and the fourth, called Mendieta, was opened in August 1545. Nothing can come up to the riches of those mines: it appears from the royal registers, that, several years after they were discovered, there were brought every Saturday to the licentiate Pol, who was president at Potofi, 150, and sometimes 200,000 pesos, that he might take the fifth part for the king of Spain: and it appears from the accounts of persons who were very well informed, that the king's fifth part amounted to 76 millions. The excellency of these mines will further appear from this particular, that, though they had dug 200 fathoms deep, yet they were not incommoded with any water.

These mines are much decayed in their value, and the mint does not coin one quarter of what they did formerly. There were once 120 mills; and at this time there are only 40, and, for the most part of the year, there is no employment for half of them.

PORCO is about 20 miles to the west of Potofi: it was also famous formerly, for its silver mines, before those of Potofi were discovered, which being richer, and not incommoded by water, drew all the undertakers and workmen from Porco; but since the mines of Potofi are decayed, it is probable those of Porco may be opened again.

A PAZ is seated near the spring-head of a river called Choqueallo, from which this town is also called by that name. It is about 210 miles distant from La Plata to the north-west, and 125 from the sea-coast to the east. It is a small town, but pleasantly situated in a fine plain, full of springs, fruit-trees and fields of maize, with mountains on each side. It has many rich gold mines, and good salt-pits.

RICHA lies in south latitude 18. 27. and in longitude 70. 20. west from London, and above 245 miles from Potofi to the north-west.

league up is the village of **ST MICHAEL DE SAPA**, where they begin to cultivate the agi, that is, Guinea pepper, which is sown throughout all the rest of the vale of Arica. In that little space of the vale, which is very narrow, and not above six leagues long, they sell yearly of it to the value of above 80,000 crowns.

LOS REYES. This province has on the north the audience of Quito, on the east the Cordillera mountains, on the south the audience of Los Charcos, and on the west the South-Sea. Its extent from north to south, is about seven hundred miles; but its breadth is very unequal, both on account of the bending of the coast, and because it is in many places pent in by the mountains.

This country abounds with mines of gold, silver, quicksilver, vermillion, and salt. They have plenty of cattle, fowl, and fish, and all provisions common to us, except butter, instead of which they use lard.

They have oil, wine, and brandy enough though not so good as in Europe. They drink much of the jesuits herb camini brought from Paraguay by land, whence it is also called the herb of Paraguay [see **PARAGUAY**]; for all East-India tea is prohibited. The Spanish writers in general say, that for five hundred leagues in length, from Tumbez to Chili, it never thunders, lightens, nor rains, but the want of

this is supplied by great dews; so that they have as good fruit and corn, particularly wheat, as any in Europe. In the valleys near the sea, the climate is hot, but tempered with breezes from the sea and mountains. In the hilly parts, far into the country, it is winter, and very rainy, when it is summer, in the plains, though in the same latitude. The products, beasts and birds, are much the same with other parts of the South-Sea coast. (Rogers.) Zuratte, the Spanish historian, has given us the natural cause of the perpetual drought there is in this country. He observes, that the south-west winds blow upon the Peruvian coast all the year round, and the ocean here is therefore called Pacific, because these winds never disturb the waters. These easy gales always bear away the vapours from the plains, before they can rise, and form a body sufficient to descend in a shower: but when they are carried farther and higher, they grow more compact, and at length fall by their own weight into rain. (Betagh.)

LIMA, the capital of all this province, and of all Peru, is seated in 12 degrees, 6 minutes, and 28 seconds of south latitude, and in the 77th, 15 minutes of longitude west from London, and five miles east from the port of Callao, which is its harbour. This city is in some sort the repository of all the treasures of Peru. It was computed some years ago, that above six millions of crowns (or 1,200,000 pounds sterling) were expended there, but it must be much abated at present.

For the regulation of trade, there is a consulship, where a prior or chief, and two consuls preside, who are chosen from among the merchants who best understand trade.

CALLAO is the harbour of Lima, from which it is two leagues or six miles distant to the westward: it extends along the sea-coast, so that it is much longer than it is broad.

The town is built on a low, flat point of land on the sea-shore. Its trade is considerable. From Chili they bring cordage, leather, tallow, dried fish, and corn; from Chiloe, cedar planks, woollen manufactures, and particularly carpets, like those of Turkey; from Peru, sugars of Andaguaylas, Guayaquil, and other places; wine and brandy from Lanasco and Pisco; masts, cordage, timber for shipping, cacao of Guayaquil, and the country about it, tobacco, and some little honey of sugar. The cacao is afterwards transported to Mexico: from Mexico, as from Sonfonate, Realejo, and Guatimata, they bring hither pitch and tar, which is only fit for wood, because it burns the cordage; woods for dyeing, sulphur, and balsam, which bears the name of balsam of Peru, but in reality comes from Guatamala. There are two sorts of it, white and brown; the latter is most valued; they put it into cacao-shells, when it is of the consistence of tar, but generally it comes liquid in earthen pots, and then it is liable to be falsified, and mixed with oil to increase the quantity. From the same places they bring fine works, which they call caray, and commodities of China, by the way of Acapulco, though contraband goods. The French had formerly a considerable trade here.

CUSCO lies in the 13th degree, and 15 minutes of south latitude, and 71, 30, of longitude west from London. It is above 326 miles distant from Lima, towards the east. It stands in an uneven country, surrounded with mountains on every side, near the river Yucay and Apurina.

The gold and silver of Peru was brought in great plenty to Cusco, in the neighbourhood of which there are very rich mines, which have been in some manner neglected, because those of Potofi afford much more silver, and with less danger. The mines of Lampa, and those of Cordillera de Cusco, are very considerable, though there be others much richer towards the Moxos, where the Indians have plenty of gold, but they are of a savage and fierce temper. The Spaniards have some little trade with the nations that dwell beyond the mountains of Cusco.

There are in this city, manufactures of bays and cotton cloth, which are some small prejudice to the trade of Europe. They also make some sorts of work in leather, as well for the use of men, as for the furniture of horses and mules. This city is also famous for the vast number of pictures the Indians make there, and wherewith, wretched as they are, they supply the whole kingdom. (Frezier.)

GUAMANCA is 180 miles from Lima towards the east. Its principal trade consists in leather, and boxes of confectionary, pastes, marmelades, jellies, preserved quinces, and other sweetmeats, which are most esteemed in the kingdom, where there is a considerable consumption of them. They also make here pavilions, which serve instead of bed-curtains, whereof there is a famous manufacture here, as there is of several sorts of painted and gilt leather. The town is seated at the foot of a high mountain, in a very healthy country, fruitful in all sorts of provisions. The province abounds with mines of gold, silver, quicksilver, copper, iron, sulphur, and load-stones. About 9 leagues to the north-west of Guamanca, are the famous mines of Guancavelica, from which they take great quantities of quicksilver. The mines of Palcas, in the territory of Guamanca, being discovered, the Spaniards flocked thither to get the quicksilver, which is of great use to extract the silver. They get every year from the mines of Guancavelica, quicksilver to the amount of a million of livres. (De Laet.)

GUANCAVELICA is a small town, but rich, and famous for the vast quantity of quicksilver taken there from a mine, which is forty Spanish yards in front, and alone furnishes all the gold and silver mills in that kingdom, says Frezier; but this must be a mistake, since there are other rich mines of quicksilver, which are worked as well as this. Private persons, adds he, work there at their own expence, and are obliged to deliver up to the king all they get, upon pain of forfeiture of their estates, banishment, and perpetual servitude at Baldivia. His Majesty pays a set price for the same, which is sixty pieces of eight the quintal, or hundred weight, upon the spot, and he sells it for eighty, at the remote mines.

When a sufficient quantity has been taken out, the king causes the mouth of the mine to be stopp'd up, and no man can have any, but what comes from the king's stores. The earth or mineral which contains the quicksilver, is of a whitish red, like ill burnt brick; they pound it, and put it into an earthen furnace, the head or top of which is a vault, like the top of an oven, a little spheroid. They lay it on an iron grate covered with earth, under which they keep a small fire, made of the shrub they call jeho, which is more proper for that purpose, than any other combustible matter; for which reason there is a prohibition to cut it within twenty leagues round. The heat passes through that earth, and so fires the pounded mineral, that the quicksilver flies out volatile in smoke; but the top or covering being close stopp'd, it finds no way out, but only through a little hole, which conveys it to a succession of earthen vessels like gourds, round, and joined by the necks; there the smoke circulates and condenses, by means of a little water there is at the bottom of each gourd, into which the quicksilver falls condensed, and in a well formed liquid.

It is less formed in the first gourds than in the last; and because they grow so hot that they break, care is taken to cool the outsides of them with water. In this town there is another thing peculiar, which is a spring, whose water petrifies so easily, and so quick, that most of the houses in the town are built with it.

TRUXILLO is 250 miles distant from Lima, towards the north-west. It stands near the sea-shore, on the banks of a little river, near some rocky hillocks. There is a great deal of sugar grows in the valley of Chacama, or Chicama, near this town.

It has a great trade for flour, braudy, sugar, wine, and marmelade, of which they export three or four ships-loads every year, with which they supply the city of Panama.

QUITO. This province is bounded on the east by part of the Amazon's country, on the south by the audience of Los Reyes, on the west it hath the South-Sea, and on the north the country called Popayan. Its extent along the sea-coast is from Punta de l'Aguja, or the Needle-Point, in the sixth degree of south latitude, to the river of Emeralds in the fifth degree of north latitude, which is seven degrees, or four hundred and twenty miles. Its breadth, in some places, is three hundred and sixty miles eastward, in others more, and in others less. The Spaniards divide it into three districts, which they call Quito Proper, Los Quixos, and Los Pacafiores. The climate here, says De Laet, is rather cold than hot. The winter continues from October 'till March, during which time they have heavy rains, but without any snow, except in the mountains of Andes. They have abundance of cows and sheep, which multiply wonderfully here. They have a great deal of saltpetre in many places where the soil is marshy, and make very good gunpowder of it. They have also excellent sulphur or brimstone, which is as clear as the saltpetre, and of a gold colour. They gather it out of the veins that are near the gold mines, of which there are several in this country, as well as of silver, quicksilver, and copper. They have also emeralds, and medicinal drugs, says captain Rogers.

QUITO, the capital city of this province, stands in 20 minutes of south latitude, and in the 76th degree, 50 minutes of longitude west from London; about seven hundred and twenty miles distant from Lima, to the north. It is seated in a valley, that is bounded on the north and west by a ridge of very steep mountains, which extend from Porto Vejo, on the South-Sea, to Cartagena on the North-Sea. The soil about the city is very dry and sandy, and a-crofs the city there is in the ground a large opening, over which there are several bridges. Wine, oil, spices, and other European merchandizes, are brought hither from the South-Sea, first by the river of Guayaquil, and then by land-carriage. The Indians also have here their fairs and markets, and sell their wares, not by any certain weight or measure, but by way of barter or exchange. They bring hither fruit, cattle, cheese, of sheep, cows, and goats milk; cloaths made of cotton, all sorts of cloths, caps, cables, wool, flax, and leather. (De Laet.)

TACUNGA is about twenty miles distant from Quito, to the south. It is a very populous town; the inhabitants weave woollen-cloth, in which they drive a great trade.

ZAMORA is about two hundred and ten miles distant from Quito to the south, and a hundred and twenty from the nearest coast of the South Sea to the east. In the neighbourhood of the town of Zamora, there are gold mines, from

which they have taken grains of a prodigious bigness. There are also several springs, some of salt water, of which they make very good salt in great plenty.

GUAYAQUIL is about 185 miles distant from Quito to the south-west, and 565 from Lima towards the south. The town is well seated for trade, and the building of ships, for which they have sheds to cover the workmen from the sun. It may be reckoned one of the chiefest sea-ports in the South-Seas. The commodities that are exported from thence are cacao, hides, tallow, farfaparilla, and other drugs, with woollen cloth, commonly called cloth of Quito, because it is made in that city. This and all other commodities which come from Quito, are shipped off at Guayaquil for other parts, and all imported goods for the city of Quito pass by Guayaquil; by which it may appear, that this is a place of no mean trade. (Dampier.)

General REMARKS on PERU.

There are two sorts of silver mines at Peru, the one where silver is found scattered about in small quantities, the other where it runs in a vein between two rocks; the one excessively hard, and the other much softer; and it is these last which best deserve, and are generally distinguished by the name of the silver mines.

This metal, which is in other countries the standard or measure of riches, is in Peru the riches of the country considered in another light; we mean that of a natural commodity; for, throughout the whole of that vast country, there are almost every where silver mines to be met with of more or less value, according as the ore produces more or less silver, and can be wrought at a greater or less expence.

There are some, but not a great many mines, to the northward of Lima; but to the south they are very numerous. On the back of the Andes there lies a nation of Indians, called Los Plateros, or the Platemens, from the vast quantities they possess of silver; but the Spaniards have very little communication with them. The best part of the mine-countries are to the south of Cusco, from thence to Potosi, and so to the frontiers of Chili; and where for the space of three hundred miles, there is a continued succession of mines; some being discovered, and others deserted every day. It is a common thing for the people here, as well as elsewhere, to complain of the present times, and commend the past, as if heretofore there were infinitely greater quantities of silver dug out of the mines, than at present, and, perhaps, with regard to particular mines, it may be so; but, upon the whole, doubtless the quantities of silver that are annually obtained in the Spanish West-Indies, abundantly exceed what was formerly exported from thence. As to the names of those which have been most remarkable, or are so at present in the country of Peru, they are these, viz. the mines of Loxa and Camora, Cuenca, Puerto Vejo, St Juan del Oro; these are wrought at present: those of Oruro and Titiri are neglected; those of Porco and Plata are filled up.

At Potosi there is a great number of mines, and those of Tomina, Chocaja, Atacuma, Xuxui, the Chalchacues, Guasco, Iquique, &c. are all wrought with more or less profit; and this according to the skill of their proprietors, or of such as have the direction of these works.

It is generally believed, and there seems to be some reason for it, that experience has taught the people here a perfect acquaintance with minerals, and the art of treating them, so as to obtain the largest profit. But, however, when one considers their ignorance in other arts, their going on constantly in the same beaten track in this, together with their vast waste of quicksilver, we are tempted to believe, that our European miners might manage their works to still greater advantage.

This seems the more probable, when we reflect, that this knowledge of theirs is not at all founded upon principles; but is, properly speaking, an art built upon accidental discoveries, in which there is little of accuracy, and abundance of uncertainty; which will be more evident to the reader, when he has perused and considered the following account of the manner in which the silver is extracted from the ore at the mines.

The most perfect silver that comes from thence, is that which the Spaniards call pinnas; that is a lump of silver extremely porous, because it is the remainder of a part made up of silver dust and mercury, and the latter being exhaled, leaves this remainder of the mass spongy and light. It is this kind of silver that is put into different forms by the merchants, in order to cheat the king of his duty; and therefore all silver in this condition, if found any where on the road, or on board any ship, is looked upon as contraband goods, and is liable to seizure.

In regard to the art of refining therefore, we shall shew the progress of the ore, from the mine to this kind of mass or cake. After having broken the stone, taken out of the vein of ore, they grind it in their mills with grindstones, or in the ingenios reales, or royal engines, which consist of hammers, or pounders, like the French plaister mills. They have generally a wheel about twenty-five or thirty feet diameter, where

whose long axletree is set with smooth triangles, which, as they turn, hook or lay hold of the iron hammers, lift them up to a certain height, and from whence they drop at once at every turn; they generally weigh about two hundred weight, and fall so violently, that they reduce the hardest stones to powder. They afterwards sift that powder through iron or copper sieves, to take away the finest, and return the rest to the mill.

When the ore happens to be mixed with some metals, which obstruct it's falling to powder, as copper, &c. they calcine it in an oven, and pound it over again. In the little mines, where they use none but mills with grindstones, they, for the most part grind the ore with water, which makes a liquid mud that runs into a receiver: whereas, when it is ground dry, it must be afterwards steeped, and well moulded together with the feet, for a long time. To this purpose they make a floor, where they dispose that mud in square parcels, about a foot thick, each of them containing half a caxon or chest, that is twenty-five quintals, or hundred weight of ore, and these they call *cuerpos*, that is, bodies.

On each of them they throw about two hundred weight of sea or common salt, more or less, according to the nature of the ore, which they mould and incorporate with the earth, for two or three days. Then they add to it a certain quantity of quicksilver, squeezing a purle made of a skin, wherein they put it to make it fall in drops, with which they sprinkle the *mas*s equally, according to the nature and quality of the ore. They allow to each *mas*, ten, fifteen, or twenty pounds; for the richer it is, the more mercury it requires to draw to it the silver contained: so that they know not the quantity, but by long experience.

An Indian is employed to mould one of these square parcels eight times a day, to the end that the mercury may incorporate with the silver. To that effect, they often mix lime with it, when the ore happens to be greasy, where caution is to be used: for, they say, it sometimes grows so hot, that they neither find mercury or silver in it, which seems incredible.

Sometimes they also strew among it some lead or tin ore, to facilitate the operation of the mercury, which is slower in very cold weather, than when it is very temperate; for which reason, at Potosi and Lipes they are often obliged to mould the ore during a whole month or six weeks; but in more moderate climates, the amalgama is made in eight or ten days. To facilitate the operation of the mercury, they in some places, as at Puno, and elsewhere, make their buiterons, or floors, on arches, under which they keep fire to heat the powder of the ore for twenty-four hours, on a pavement of bricks.

When it is thought that the mercury has attracted all the silver, the assayer takes a little ore from each parcel a-part, which he washes in a small earthen plate, or wooden bowl, and by the colour of the mercury found at the bottom of the bowl, knows whether it has had it's effect; for when it is blackish, the ore is too much heated, and then they add more salt or some other drug. They say that then the mercury *dispara*, that is, shoots, or flies away. If the mercury is white, they put a drop under the thumb, and pressing it hastily, the silver there is amongst it, remains sticking to the thumb, and the mercury slips away in little drops.

In conclusion, when they perceive that all the silver is gathered, they carry the ore to a basin, into which a little stream of water runs to wash it. Much in the same nature as we shall shew they wash gold, excepting that this being only a mud without stones, instead of an hook to stir it, an Indian stirs it with his feet to dissolve it.

From the first basin it falls into a second, where another Indian is, who stirs it again to dissolve it thoroughly and loosen the silver. From the second it passes into a third, where the same is repeated; to the end, that what has not sunk to the bottom of the first and second, may not escape the third. When all has been washed, and the water runs clear, they find at the bottom of the basins, which are lined with leather, the mercury incorporated with the silver, which they call *lapella*. It is put into a woollen bag, hanging up for some of the quicksilver to drain through. They bind, beat, and press it, laying a weight upon it with flat pieces of wood; and when they have got out as much as they can, they put the paste into a mould of wooden planks, which being bound together, generally form the figure of an octagon pyramid cut short, at the bottom whereof is a copper plate full of little holes. There they stir, in order to fasten it; and when they design to make many pinnas, as they call them, that is, lumps of various weights; they divide them with little beds, or layers of earth, which hinder their coming together. To that end, the *pella*, or *mas*s, must be weighed, deducting two thirds for the mercury that is in it, and they know within a small matter what net silver there is.

They then take off the mould, and place the pinna with it's copper base on a trivet, or such like instrument, standing over a great earthen vessel full of water, and cover it with an earthen cap, which they again cover with lighted coals, and they feed the fire for some hours, that the *mas*s may grow violently hot, and the mercury that is in it evaporate in smoke; but that smoke having no passage out, it circulates in the hollow, that is, between the *mas*s and cap, 'till coming down to

V O L. II.

the water that is underneath, it condenses to the bottom again, converted into quicksilver.

Thus little of it is lost, and the same serves several times; but the quantity must be increased, because it grows weak. However, they formerly consumed at Potosi six or seven thousand quintals, or hundred weight, of quicksilver every year, as Acosta writes, by which a judgment may be made of the silver they got. When the mercury is evaporated, there remains nothing but a spongy lump of contiguous grains of silver, very light and almost mouldering, which the Spaniards call *la pinna*, and is observed as a contraband commodity from the mines; because, by the laws of the kingdom, they are obliged to carry it to the king's receipt, or to the mint, to pay the fifth to his majesty there.

Those masses are cast into ingots, on which the arms of the crown are stamped, as also that of the place where they were cast, their weight and quality, with the fineness of the silver. It is always certain, that the ingots which have paid the fifth have no fraud in them; but it is not so with the pinnas or masses not cast: those who make them, often convey into the middle of them, iron, sand, and other things, to increase the weight; so that, in prudence, they ought to be opened, and made red hot at the fire, for the more certainty; for if falsified, the fire will either turn it black or yellow, or melt it more easily.

This trial is also to extract a moisture they contract in places where they are laid, on purpose to make them the heavier. In short, their weight may be increased one third, by dipping them in water when they are red hot, as also by separating the mercury, with which the bottom of the *mas*s is always more impregnated than the top. It also sometimes happens, that this same *mas*s is of different fineness.

The stones taken from the mines, the ore, or, to speak in the language of Peru, the *mineray*, from which the silver is extracted, is not always of the same nature, consistence, or colour.

There are some white and grey, mixed with red or blueish spots, which is called *plata blanca*, or white silver. The mines of Lipes are most of them of this sort. For the most part there appear some little grains of silver, and very often small branches, extending along the layers of the stone. There are some, on the other hand, as black as the dross of iron, in which the silver does not appear, called *oregriño*, that is blackish: sometimes it is black with lead, for which reason it is called *plomo ronco*, that is, coarse lead, in which the silver appears as if scratched with something that is harsh, and it is generally the richest, and got with least charge; because, instead of moulding it with quicksilver, it is melted in furnaces, where the lead evaporates by dint of fire, and leaves the silver pure and clean.

From that sort of mines, the Indians drew their silver; because, having no use of mercury, as the Europeans have, they only wrought those whose ore would melt; and, having but little wood, they heated their furnaces with ylo, and the dung of lamas or sheep, or other beasts, exposing them on the mountains, that the wind might keep the fire fierce. This is all the secret the historians of Peru speak of, as of something wonderful. There is another sort of ore like this, as black, and in which the silver does not appear at all; on the contrary, if it be wetted and rubbed against iron, it turns red; for which reason it is called *rosicler*, signifying the ruddiness of the dawn of the day: this is very rich, and affords the finest silver.

There is some that glitters like talck or isinglass; this yields little silver; the name of it is *zoroché*: the peel, which is of a yellowish red, is very soft and broken in bits, but seldom rich; and the mines of it are wrought on account of the easiness of getting the ore: there is some green not much harder than the last, called *cobrisso*, or copperish; it is very rare: however, though the silver generally appears in it, and it is almost mouldering, it is the hardest to be managed, that is, to have the silver extracted from it; sometimes, after being ground, it must be burnt in the fire, and several other methods used to separate it, doubtless because it is mixed with copper. Lastly, There is another sort of very rare ore, which has been found at Potosi only, in the mine *Cotamiso*, being threads of pure silver, intangled together like burnt lace, so fine that they called it *Arana*, spider, from it's resemblance to a cobweb.

The veins of mines, of what sort soever they be, are generally richer in the middle, than towards the edges; and when two veins happen to cross one another, the place where they meet, is always rich: it is also observed, that those which lie north and south, are richer than those which lie any other way. Those which are new places, where mills can be erected, and that are more commodiously wrought, are often preferable to the richer, that require more expence, which is the reason that at Lipes and Potosi, a chest of ore must yield ten marks, of eight ounces each mark of silver, to pay the charges, and at those of the province of Tarama, five pay them.

When they are rich and sink downwards, they are subject to be flooded, and then they must have recourse to pumps and machines, or else drain them by those they call *cocabones*,

being passages made in the side of the mountain for the water to run out at, which often ruin the owners by the excessive expence they insensibly draw them into.

There are other ways of separating the silver from the stones that confine it, and from the other metals that are mixed with it, by fire or strong separating water, made use of at some mines, where other means fail, and where they make a fort of ingots, which they call *bollas*; but the most general and useful method is to make pinnas or masses, abovementioned, which are preferred to other forms, on account of their easiness in making, and that they save some ingredients, which is a thing of consequence in works of this nature, where to save in the expence, has the same effect as finding the mine.

It is very natural to suppose, that in mines, as well as other things, there happens great variation in their product, and in the value of the product. The mines which very lately yielded most silver, are those of Orura, a little town eighty leagues from Arica: in the year 1712, one so rich was discovered at Ollachea, near Cusco, that it yielded two thousand five hundred marks, of eight ounces each, out of every chest, that is, almost one fifth part of the ore; but it has declined much, and is now reckoned among the ordinary fort. Next to these are those at Lipes, which have had the same fate.

Lastly, Those at Potosi yield but little, and cause a vast expence, by reason of their great depth. But notwithstanding the mines here are far diminished in their product, yet the quantity of ore that has been already wrought, and laid many years upon the surface, is thought capable to yield a second crop; which is a proof that these minerals generate in the earth, like all other inanimate things; and it is likewise certain, from all accounts of the Spaniards, that gold and silver, as well as other metals, are continually growing and forming themselves in the bowels of their natural earths.

This opinion is verified by experience, in the mountain of Potosi, where several mines have fallen in, and buried the workmen with their tools; after some years they have dug the same place, and discovered many bones and pieces of wood, with veins of silver actually running through them. These mines belong to him who first discovers them: he immediately presents a petition to the magistrates, to have such a piece of earth for his own, which is no sooner done than granted. They measure eighty Spanish yards in length, and forty over, which is about twelve hundred feet in length, and one hundred in breadth, and yield it to the discoverer, who chooses what space he thinks fit, and does what he pleases with it. Then they measure just the same quantity for the king, which is sold to the best bidder, there being many who are willing to purchase a treasure which may prove inestimable. If any other person has a mind to work part of the mine himself, he bargains with the proprietor for a particular vein; all that such a one digs out is his own, paying the king's duty, which is, for gold a twentieth part, and for silver a fifth; and some landlords find such an account in letting out their ground and their mills, that they live upon the profit, without any hazard.

At Copiapo there are gold mines just beyond the town, and all about the country likewise, which have brought many purchasers and workmen thither, to the great damage of the Indians; for the Spanish magistrates take away not only their lands but their horses, which they sell to the new proprietors, under pretence of serving the king, and improving their settlements. There is also a great deal of magnet and lapis lazuli, which the Indians know not the value of. And some leagues in the country, there is plenty of salt and saltpetre, which often lies an inch thick on the ground. About an hundred miles east upon the Cordelier mountains, there is a vein of sulphur two feet wide, so fine and pure, that it needs no cleaning.

This part of the country is full of all sorts of mines, but in other respects is so barren, that the natives fetch all their subsistence from Coquimbo; and that way being a mere desert for three hundred miles together, and the earth abounding so much with salt and sulphur, that the mules often perish for want of grass and sweet water. There is but one river in two hundred miles, which the Indians call *ancalalue*, or hypocrite, because it runs only from sun rise to sun set; this is occasioned from the great quantity of snow melted from the Cordeliers in the day time, which freezes again at night, where the cold is often so great, that the peoples features are quite distorted.

Hence Chili takes it's name, the word signifying cold in the Indian language; and we are certainly informed by the Spanish historians, that some of their countrymen and others, who first traded this way, died stiff with cold upon their mules; for which reason, the road is now always lower towards the coast.

We come now to the second point, which is the regular commerce carried on between the inhabitants of the dominions of the crown of Spain in Europe, with those of America. The method in which this trade is carried on, is well enough known in general, but few enter far enough into it's particulars. In order to give as distinct an account of this matter as possible, we shall speak of the galleons, the *flota*, and the

flotilla, register ships, and *guarda costas*, though we have occasionally touched upon these points under several other heads; and when we have done this, the reader will perfectly comprehend the mystery of the Spanish policy in this point. A galleon is, properly speaking, a very large man of war, of three or four decks, built in a manner now altogether out of fashion, except in Spain; and the reason why it is still used there is, that it affords a great deal of room for merchandize, with which the king's ships are generally so much crowded, as to be in no condition of defending themselves.

That fleet which we call the galleons, consists of eight such men of war; of these there are three very large ones, styled *la Capitana*, *la Admirante*, and *il Governo*, two others which are less, *la Patacha*, and *la Margarita*, each of 50 guns, and an advice frigate of forty. The merchantmen which sail with this fleet, and purchase their licences at a very high rate, are in number from twelve to sixteen, and in burthen at least a third part bigger, than is expressed in their respective schedules. These ships are intended to carry all that is necessary, either of warlike stores or merchandize for Peru, and this is the specific difference between this fleet and the *flota*, which is intended for Mexico. See GALLEONS.

In time of peace ('till since that of Aix la Chapelle) the galleons sail regularly once a year from Cadiz, at no set time, but according to the king's pleasure, and the convenience of the merchants. From Cadiz the galleons steer directly for the Canaries, where, if the *flota* sails with them as it sometimes does, they anchor together in the haven at Gomera: thence they bear away for the Antilles, and when they arrive at that height, the *flota* separates, and the galleons bear away for Carthegena. As soon as they double the Cape de la Vela, and appear before the mouth of Rio de la Hacha, advice is sent to all parts, that every thing may be got ready for their reception.

In the harbour of Carthegena they remain a month, and land there all the goods designed for the audience of the Terra Firma; then they sail to Porto Bello, where they continue during the fairs, which last five or six weeks; and having landed the merchandize intended for Peru, and received the treasure and rich commodities sent from thence on board, they sail again to Carthegena, where they remain 'till they return to Spain, which is usually within the space of two years. When they have orders to return, they sail first to the Havannah, and having there joined the *flota*, and what other ships are returning to Europe, they steer through the gulph of Florida, and so to the strait of Carolina, where meeting with the western winds, they shape their course then for the Azores: they take in fresh water and provisions at Tercera, and thence continue their voyage to Cadiz. The *flota* consists, as well as the galleons, of a certain number of men of war, and of a certain number of merchant ships: the former are seldom more than three; *la Capitana*, *la Admirante*, and *la Patacha*: the latter are usually about sixteen, in burthen between five hundred and a thousand tons.

This fleet sails about the month of August, that by the favour of the winds, which prevail about November, they may the more easily pursue the voyage to La Vera Cruz. In their passage they call at Puerto Rico to take in fresh water and provisions, then pass in sight of Hispaniola, Jamaica, and Cuba; and according to the season of the year, and the nature of the winds, pass either by the coast of Yucatan, or higher, through the gulph of La Vera Cruz, which lies at the bottom of it. See FLOTA and MEXICO.

The run of this fleet, according to the course we have mentioned, hath been thus computed: from Cadiz to the Canaries, two hundred and fifty leagues, in about ten days: to the Antilles, eight hundred leagues in twenty days; to the most western point of the isle of Cuba, five hundred leagues in twenty days; to Vera Cruz, two hundred and sixty leagues in twelve days or thereabouts; in all, eighteen hundred and ten leagues, in about sixty-two days.

As the *flota* is designed to furnish not only Mexico, but the Philippine Islands also, in order to supply the trade of Acapulco with European goods, they are obliged to remain there for a considerable space, and, when it is necessary, they winter in that part. The cargo with which they return, is not so rich as that of the galleons; but 'till this method was laid aside, it increased annually in it's value; which must be owing to the progress made in settling what the Spaniards call the kingdom of New Mexico.

It is usually in the month of May that the *flota* leaves La Vera Cruz, though sometimes it is detained in that harbour 'till August. Then the ships that compose it sail for the Havannah, for though the galleons and the *flota* seldom leave Spain at the same time, yet they generally return together. As soon as they are safely arrived at the Havannah, they detach a few of the lightest and cleanest ships to Europe, who, besides money and merchandize, carry also an exact account of the contents both of the galleons and *flota*. These ships are called by the Spaniards with propriety enough the *flotilla*, i. e. the little fleet. The principal reason of sending them in this manner into Spain, is to give the court of Madrid an opportunity of judging what convoy may be necessary, in case of any

any alteration of affairs, to be sent to escort the grand fleet, as also to regulate the *indulto* [see *INDULTO*], which may be levied on the merchants, in proportion to their interest in the galleons and flota: but the reader may possibly incline to enquire, what obliges this great fleet to remain so long at the Havannah? To which two causes may be assigned, viz. waiting for a wind, or for the register ships which they are to convoy home.

A register ship is so called, from its being registered with all the effects embarked in Spain, in the books kept for that purpose in the chamber of Seville. As this general account will not probably appear satisfactory, we shall endeavour to state the matter more fully.

A company of merchants having, as they conceive, just grounds to imagine, that European goods are greatly wanted at some particular ports in the West-Indies, they draw up a memorial or petition, containing these reasons in the clearest and concise terms, and lay it before the council of the Indies [see *INDIA-HOUSE* of Spain]. The prayer of this petition is, that they may have leave to send a ship of three hundred tons burthen, or under, to the port they mention. When leave is obtained, they pay a certain sum to the crown which is generally between thirty and fifty thousand pieces of eight, besides presents, and those no small ones, to the king's officers, from the greatest to the least.

That this, however, may not induce any suspicion of fraud, they register their ship and cargo, that it may appear consistent with their petition and licence; and yet (such a fatality attends on all custom-house cautions) this ship of under three hundred tons, generally carries upwards of six hundred ton of goods, and affords accommodation for passengers besides.

Copies from the register are transmitted to the governor and royal officers at the port, to which the register ship is bound; and such is their diligence, such their integrity, that when the ship comes to an anchor in the port, they make a very narrow enquiry, and yet there is seldom or never any fraud discovered; but, on the contrary, this ship of six or seven hundred ton, returns into Europe with an authentic certificate from all the king of Spain's officers, that she does not carry quite three hundred, together with a bill of lading, in the same strain of computation.

By these register ships there is sometimes a gain of two or three hundred per cent. which enables the owners to pay so bountifully for cheating the king, having first got the money by robbing his subjects.

These register ships go to Buenos-Ayres, St Martha, Porto Cavallo, and other places, to which neither the galleons nor flota come; yet, generally speaking, they return with those fleets as they sometimes go out with them, and so leave them in a certain latitude. The Spanish grandees often interest themselves in procuring such licences; and some people do not stick to say, that they find their account in it.

The profits accruing by this sort of commerce, making those concerned therein extravagantly rich in a short space of time, the English and Dutch in the West-Indies, have heretofore had a strong desire to be dealing this way, without the ceremony of a licence; and for many years they succeeded to their wish, partly by the connivance of the Spanish governors, and partly by employing force.

At length this evil grew so flagrant, that the court of Spain determined to put an end to it; and in order thereto, sent new governors into America with very precise orders on this head, declaring at the same time, that they should be carried fully into execution.

These instructions gave rise to the *guarda costas*, or guard ships, which have since made so much noise in the world, and of which I think it necessary to speak more particularly: it cannot be denied, that there was originally good grounds for equipping them, since the English in some measure, and the Dutch more openly, began to carry on an illicit trade by force.

The Dutch vessels were from twenty to thirty-six guns, and therefore valued nothing the governor of Cartagena could do to prevent their trading on his coast; but when the guard ships were stationed here, they for some time put an end to the evil, for falling in with some of these interlopers, they sunk one and took two, the cargoes of which were worth upwards of an hundred thousand pounds; nay, finding on board them sixteen Spanish merchants, who on a signal given were come off to trade, they hanged them all without mercy. So far all was right; for without question these smugglers, not only prejudiced the king of Spain, but even the fair traders of their own nation, by the clandestine commerce they carried on.

The captains of the guard ships, however, soon altered their conduct, and instead of taking contraband traders, infested the English commerce, and took, without distinction, all they were able, at first under very frivolous pretences, and at last without any pretence at all.

As the Spanish governors reaped a considerable profit from the prizes of these privateers, or rather pirates, brought into their ports, they were ready to send deceitful accounts to the court of Madrid, which produced that spirit of obstinacy, which

brought on, all the world knows, the last war, and may very possibly soon bring on another, unless this matter is very soon happily adjusted between the two crowns. See the article *LOGWOOD*, where I have done myself the honour to propose an expedient for this good purpose.

To return, however, to the point before us, and to collect what by these different methods comes into Spain from her colonies. This account has been with great industry, and, perhaps, without any sensible error stated thus: in gold, of which the galleons bring home between two and three millions, and the flota generally about one; in silver, by the galleons from eighteen to twenty millions, by the flota from ten to twelve: in precious stones by the galleons, in pearls two hundred thousand, in emeralds three hundred thousand, in bezoars, turquoises, amethysts, &c. thirty thousand; and of late by the flota some turquoises, to the amount in the whole of six hundred thousand pieces of eight. In Vigonia wool, by the galleons, fifty thousand pieces of eight, by the flota none.

Quinquina, by the galleons twenty thousand pieces of eight, by the flota as much: in raw hides by the galleons, twenty thousand pieces of eight, by the flota as much. By hides from Buenos-Ayres, in a register ship two hundred thousand pieces of eight; in logwood, by the galleons sixty thousand pieces of eight, by the flota none. In cocheneal, by the flota and register ships, one million of pieces of eight; in indigo, about two hundred thousand pieces of eight; in sugar, tobacco, and other drugs, about two millions of pieces of eight. So that the whole may be computed at thirty-eight millions two hundred and ninety thousand pieces of eight.

We are now arrived at the last point, which is that of discoveries. The Spaniards, beyond doubt, have been long pretty much at a stand; which how strange soever it may appear to us, who see what prodigious advantages have attended all discoveries, and more especially those made by the ancestors of these Spaniards in the two last centuries; yet when we come to reflect coolly upon this matter, we shall find that the great impediment of farther discoveries, has been the vast extent of what is already discovered.

However, not to do the Spaniards wrong, we ought in justice to observe, that they have not been altogether so indolent, careless, or inactive, as is commonly reported. The kingdom of New Mexico lies without the sphere of our present enquiry, [see *MEXICO*] and therefore we shall only say here, that they have not only made great discoveries, but great conquests on this side, even in modern times; inasmuch, that those who have been in these parts, have assured us, THAT THE COMMUNICATION IS OPEN BY THE LAKES, FROM THE NORTH-EAST SPANISH SETTLEMENTS QUITE TO CANADA. See *BRITISH AMERICA*, *CANADA*, *COLONIES*, *MEXICO*, *FLORIDA*.

To keep, however, to the province of Peru. All the discoveries that can be made from thence, must be either by land towards the east, or by the ocean towards the west; we will speak of each of these successively.

The countries which are already in the hands of the Spaniards, are of so great compass, and afford such vast riches, that they have no very strong temptation to make either conquests or discoveries; and as the same thing may be said of the Portuguese settlements in Brazil, so from thence we gather with certainty, that there is a very large country in South America, altogether UNDISCOVERED, or at least UNPOSSESSED BY ANY EUROPEAN NATION.

If any one desires to be more particularly informed concerning this point, let him examine the best maps of South America, which hitherto have been published, and all the credible relations that have come from those parts, and he will find that this undiscovered country of which we speak, must be in length near two thousand miles from east to west, and near a thousand broad from north to south.

The people possessed of these parts, are not only the descendants from their original inhabitants, but also vast numbers of Indians who have fled hither from the cruelties of the Spaniards, and if we consider their multitudes, and the vast advantages they have from the situation of the countries in which they dwell, we shall see no just reason to suppose they ever will be conquered, unless it be by the missionaries, in the manner by which they have subdued the people of Paraguay. [See the article *PARAGUAY*.]

However it be, this unknown country contains a great deal more land, as well as many more people, than all the provinces of the Spanish empire; and there is good reason to believe that it is infinitely more RICH IN SILVER, GOLD, AND JEWELS, as well as in CATTLE, CORN, SUGAR, RICH DRUGS, AND FINE FRUITS.

Of this we can scarce doubt, if we reflect on what the best Spanish writers themselves affirm, that at the time Pizarro made his first eruption into this country of Peru, he found the kitchen utensils in the meanest houses of GOLD, and their roofs covered with TILES OF THE SAME METAL; but there are no such great quantities of gold now to be had, whence we ought to conclude, that this immense plenty of that precious metal, came from the INLAND PARTS, of which we have been speaking.

But this is still farther demonstrated, by what has happened to the Creole Spaniards, who inhabit the frontier provinces, by which we mean, those that lie next to that vast track of unconquered country. As for instance, in the province of POPAYAN, which is so called from a city of the same name, large, populous, and rich, the bishop and his clergy have done more for the crown of Spain, than could have been done by a large garrison, for they have converted many Indians, and by bringing them into the city, and matching them with Creole families, they have introduced a commerce with the free inhabitants of the mountains, which is of infinite service, and may be a means of reducing the whole country.

It is remarked, that the inhabitants of this province are much more active and industrious, as well as much braver, than any of the rest of the natives of New Spain: which is attributed to their continual wars with the free Indians, and their being obliged to make long and hazardous journeys, for the managing their own affairs.

There are in Popayan abundance of large towns, well built, and tolerably fortified; but the open country is much exposed to the inroads of the Indians, who, whenever they have an advantage, use it cruelly enough against the Spaniards, towards whom their hate, with just reason, is implacable. As the northern frontier of this country joins the western isthmus, which is also inhabited by free Indians, the Spaniards are extremely apprehensive of the ENGLISH MAKING SOME ATTEMPT THIS WAY, AND THEREBY SECURING TO THEMSELVES A SETTLEMENT ON BOTH SEAS: and although there may be some difficulties attending an enterprise of this kind, yet it is not impossible, but success may one day attend an attempt of this kind, if the SPANIARDS CONTINUE TO MALTREAT THIS KINGDOM.—But there is a far easier, less hazardous, and less expensive way, to humble Spain than this, if their conduct towards Great-Britain should make it necessary, which does not seem at all unlikely.

In the like manner there is a very beneficial trade carried on by the inhabitants of the city of Concepcion, with the Indians behind them, who though they are not subjects of the crown of Spain, nor have ever negotiated a peace with the Spaniards, yet trade with them, and this in a very particular manner.

These Indians are stiled Peulches, and inhabit the Cordillera, or great chain of mountains at the back of Chili, for a space not certainly known, and who retain exactly the same manners and customs they had before the Spaniards arrived here. When a person goes to trade with them, he addresses himself to the cacique, or chief: no sooner this little prince sees a stranger, than he cries out, What! are ye come? The Spaniard answers, Yes, I am come. The cacique's next question is, Well, what have ye brought me? The merchant answers, a present: to which the prince replies, Then you are welcome. A lodging is instantly provided him, near that of the cacique's, whither all his family go to visit the stranger, in hopes he will make them some presents.

In the mean time a horn is sounded, to give notice to the Indians who are abroad, that the merchant is arrived: upon this they all run to the place where the stranger exhibits his treasure, consisting of knives, scissars, pins, needles, ribbands, small looking-glasses, &c.

All these the Indians carry away without giving any thing for them, only the price is settled, and thus the merchant credits folks he never saw, and whom, for ought he knows, he may never see again.

After a certain time is elapsed, the horn, by the direction of the cacique, is sounded a second time, when immediately the savages return, and exactly perform their respective promises. The goods they deal in are cattle, skins of wild beasts, and some gold, but this they bring only in very small quantities, knowing well how dear the possession of that metal hath cost their neighbours and their ancestors. As for the other Indians, who were formerly subdued, and have now recovered their freedom, they have little or no intercourse with the Spaniards.

In respect to the discoveries that have been made of islands or countries at any distance in the Pacific Ocean, between the continent of Peru and the Philippine Islands, they are not much to be boasted of. The islands of Solomon, indeed, are reported to have been worth the seeking and possessing, as being large and pleasant, having excellent ports, and immense treasures of silver; yet in the space of almost two hundred years, these valuable countries have scarce been seen, and never settled or conquered; nay, some who are desirous of passing for men of superior sense, and not to be led away by flying reports, are inclined to think these islands imaginary; yet if this sort of wisdom had prevailed, in Portugal or Spain, when the first proposals for discovery were made, we might have known as little of the East-Indies and of the West, as we now do of these islands; since the reasons and rumours upon which these discoveries were undertaken, were certainly less clear and cogent, than what has been, or may be offered in respect to the islands of Solomon; and as this is a subject something new, and which has never been treated, at least in a satisfactory manner, the giving the

reader a short and methodical account of it, may be esteemed curious and entertaining; nor is it impossible that it may fall into the hands of some, who may also think it useful.

The islands of Solomon were originally discovered by Alvaro de Mendoza, under the orders of the licentiate Lopez Garcia de Castro, in 1567, and looked upon as a very great thing. But as the Spaniards were always pretty slow in their motions, and, besides, were under a necessity of waiting for orders from Europe, it was ten years before they made any farther progress; but when they were about to have undertaken such an expedition, as they flattered themselves would have put them in possession of a new Indies, they received directions from Spain, not only to lay aside the design for the present, but to suppress, with the utmost care and diligence, all papers, charts, letters, and whatever else might give the least light into the situation of these islands, on account of Sir Francis Drake's expedition, who actually paid a visit to the South-Seas in 1578. As soon as they were recovered from this fright, and were in a condition of thinking of such matters again, the project of discovering the islands of Solomon was revived; but was again defeated before it could be put into execution, by the arrival of commodore Cavendish in the South-Seas, in 1586. However, having taken about nine years time to breathe, Don Alvaro de Miranda was sent with a squadron of four sail of ships upon this discovery. They did not find the islands of Solomon, but they found other islands very near them, of equal, if not of greater value; but they behaved so very ill, that they compelled the natives to have recourse to arms, by whom they were driven out, and obliged to fly for shelter to the Philippines.

In their passage thither, three of their ships were lost, and the only one that escaped, arrived in a shattered condition. This affair, however, had been then prosecuted, if Capt. Richard Hawkins had not arrived in this critical juncture in those seas, as he himself tells us in his curious and excellent account of his Voyage thither.

It is a very mutilated and dark account of this expedition of Don Alvaro de Miranda's, that we have in the fourth volume of Churchill's Collection of Voyages, under the title of a Fragment of the Discovery of the islands of Solomon; and there is a very strange blunder in the date, of 1695 for 1595, which renders the whole account almost unintelligible.

That this is the true state of the matter appears from hence, that in this voyage the Spaniards picked up one of Cavendish's men, in which there is nothing strange, if it was undertaken nine years after, but would be very extraordinary indeed, at the distance of one hundred and nine.

There was one Ferdinand de Guiros who laboured hard to get this project resumed; and some memorials of his are still extant, which were printed at Seville in the year 1610, from which time this affair slept for any thing we know, for near one hundred years.

However, in 1709, when Capt. Woods Rogers was in the South-Seas, there was a vessel fitted out by a Spanish gentleman from Lima, in search of these islands, but having the misfortune to be taken by the English, almost as soon as he had sailed, the business was once more dropped. About ten years after this, while some of the persons who were with Capt. Shelvock, in his expedition, were prisoners at Lima, there came in two ships at a small distance of time from each other, the crews of which reported, that being driven by storms out of their course, they had fallen in with these islands, which they described very circumstantially, with such manifest correspondence in their accounts, that one Mr Thayer, a Frenchman, was sent by the viceroy in a small sloop in search of them; but having only two months provision, he returned without doing any thing: it may be, that Providence has reserved the discovery of these islands, and the southern unknown continent, for some other nation.

PERUVIAN BARK. The quinquina, Peruvian bark, or the bark against fevers, is the external bark of the trunk and branches of a tree, that grows plentifully in Peru, from whence this is brought us by the way of Cadiz.

According to the judicious Mr Bernard, the tree of which the quinquina is the bark, grows in the province of Quito in Peru, upon the mountains near the city of Loxa. This tree is almost the size of a cherry-tree; the leaves are round and indented: it bears a long reddish flower, from whence arises a kind of husk, in which is found a kernel like an almond, flat and white, clothed with a thin rind; that bark which comes from the trees at the bottom of the mountains, is thicker, because it receives more nourishment from the earth: it is smooth, of a whitish yellow without, and of a pale brown within. That which comes from trees on the tops of mountains, is much thinner; it is uneven, browner without, and of a higher colour within; but the trees which grow on the middle of the mountains, have a bark yet browner than the other, and more rugged. All these barks are bitter, but that from the trees at the bottom of the mountains, less than the others.

It follows from hence, that the bark of the least virtue, is that which grows in the lowest places, because it abounds more with earthy and watery parts, than that which grows high, which, for the contrary reason, is better; but the best of all, is that which grows in the middle of the mountains, because it has not too much or too little nourishment. There is another kind of quinquina, which comes from the mountains of Potosi, and is browner, more aromatic, and more bitter, than the former, but abundantly scarcer than any of the rest.

Beside the qualities remarked in this bark, it ought to be heavy, of a firm substance, sound and dry. Beware of such as is rotten, or hurt by wet, and such as flies into dust in breaking, or is dirty and unclean, as it happens to be sometimes: but make choice of such as is in little thin pieces, dark and blackish without, with a little white moss, or some small fern-leaves sticking to it, reddish within, of a bitter and disagreeable taste, and refuse that which is full of threads when broke, and of a russet colour; and take care that there be not several pieces of wood mixed with it, which you have sometimes sticking to the bark. This was brought first into France in the year 1650, by the cardinal Lago a jesuit, who having brought it from Peru, it was had in such vogue in France, as to be sold weight for weight for gold, but the quantities of it soon afterwards brought over, quickly lessened the price.

The use of this bark is for the cure of fevers, especially intermitting, for which purpose it is given in substance, tincture, or infusion; but as it is a medicine some people have an utter aversion to, and as the use of it is of ill effect, unless properly applied, we would advise no body to make use of it without the direction of an able Physician.

To prevent the return of the ague, this method ought to be continued for eight days, three times a day; first, early in the morning, then an hour before dinner; and at night, an hour before supper; but if the ague should return again, as it does, if you purge after it, the use of the bark must be repeated after the same manner as before, and it will not fail to produce the desired effect, which is absolutely to cure the ague. But though the ague seems to be perfectly gone, for several revolutions of fits, yet it is necessary to continue the use of the remedy for twelve days, by which means you will secure the patient against any fresh assault.

It is at the end of the fit that the dose is to be given, and it must be continued 'till the cure is perfected; which in a single and double tertian, commonly happens at the second fit, or at most at the third: the same is to be understood in a single and double quartan, wherein you have two whole days to give the medicine in, without interruption; in which, as in the tertian, the ague is mastered at the third and fourth fit, if not at the very first, which often happens; and to prevent it's return, the use of the bark is to be the longer continued after the cure; for it is the too hasty discontinuance of it which causes the relapse, and puts the patient to a new trouble of running over the same course again.

This medicine ought not to be given at the coming on of the fit, nor yet during the time of it; because then, instead of alleviating the force and violence of the ague, it would be apt, by reason of the febrile ferment, to excite a fiercer conflict, and make the paroxysm the more violent. This method being observed, the medicine will interrupt the course of the disease in it's progress; and being conveyed into the mass of blood by a gentle motion, it purifies it, and destroys the feverish ferment, which would produce a new fit. It ought likewise, to be given at several times, to produce gradually, the wished for effect; and but a small space of time ought to be allowed between each dose, that the second dose may begin it's operation, when the force of the first is over; and the third may begin to act, when the strength of the second is lost. It is given, in like manner, two or three hours after, that thereby it's virtue may the better unite itself with the chyle in the stomach, in order to it's entrance into the mass of blood, to correct, depurate, and renew it. If this course is pursued, the cure is in a manner certain and infallible, and it will hardly be possible for the fit to return again. When the paroxysm is gentle, in a good habit, and a good season of the year, there is no need of giving it above five or six days together, once or twice a day in the intermission; but when the paroxysms are strong, oftner, as before directed. The use of this bark, the Spaniards say, was discovered by accident: an Indian in a fever accidentally drinking the water of a pond, into which several of these trees were fallen, was cured by it; which made people search into the occasion, and so discover this inestimable medicine.

PETTY CUSTOM, or ALIEN'S DUTY. This duty is payable by * merchant-strangers, that is, aliens born, or denizens, on all goods imported liable to the subsidy of poundage (unless where the original old subsidy has been entirely taken away) but not on those liable to the subsidy of tonnage, because an equivalent is included in the old subsidy.

* 12th rule of certain rules, orders, directions, and allowances, for the advancement of trade. See the end of letter A, and our conclusive REMARKS there, relating to the BUSINESS OF THE CUSTOMS.
VOL. II.

† And it is also payable by British, upon the following goods, though of British property, when imported in foreign ships, viz.

Aqua vitæ,
Boards,
Brandy,

Corn, or grain of all sorts, when the old subsidy is taken at the original rate,

Figs,
Flax ||,
Hemp,
Masts,
Olive-oil,
Pitch,
Pot-ashes,

Prunes,
Raisins,
Rofin,
Salt,
Sugar,
Tar,
Timber,

All goods of the growth, production, or manufacture of Muscovy or Russia,

Imported in ships not belonging to the people of Great-Britain or Ireland, and whereof the masters and at least three-fourths, of the mariners, are not British; or in foreign-built ships, altho' owned or manned by British, unless such as are taken as prize.

† 12 Car. II. cap 18. §. 9. 13 and 14 Car. II. cap 11. §. 6.
|| By 4 Geo. II. cap. 27. §. 1. rough or undressed flax may be imported free.

Curants, } Imported in ships not British-built, and where-
Turkey com- } of the master, and at least three-fourths of the
modities, } mariners are not British.

It is to be levied according to the respective rates or values of the goods, as affixed or ascertained for the old subsidy, after the following rates, viz.

* Fish, dried or salted, and cod fish or herring (unless prohibited) not caught in British or Irish vessels, and cured by British or Irish	2 ½ per cent. of the rate, or double petty custom, being ½ part of such rate, or for every 20s. thereof	The duty l. s. d. — — 6
† All other goods chargeable with subsidy of poundage.	1 ½ per cent. of the rate or value, being ¼ part thereof, or for every 20s.	— — 3

* 12 Car. II. cap. 18. §. 5.

† 12th rule, &c. in Vol. I. page 178.

To be paid in ready money, without discount, upon due exportation, as directed for the old subsidy, &c. drawback, or repayment of this duty, must be allowed, as follows, viz.

* Currants, the hundred weight, all but	The drawback l. — — 4 ½
All other goods, nothing.	

* 6th rule. See the Business of the CUSTOM-HOUSE at the End of every Letter.

PEWTER, a factitious metal, used in the making domestic utensils. The common sort is a composition of tin, regulus of antimony, and tin-glass, in several proportions, suitable to the quality of the metal intended to be made. There are other ways of making it, with tin, lead, and copper; but that with any degree of copper is esteemed unwholesome.

To make **PEWTER** hard.

Take one pound, or what quantity you please, of pewter, and let it melt in an iron pan; add to it some salad oil, let it evaporate well, and stir it continually, keeping the flame from it; add to this some fine wheat-flour, and stir it well about; then take all the burnt matter off the top, and to each pound of tin add three or four ounces of plate brass, cut in small pieces, mixed with oil, and a few ounces of pulverized bismuth, or regulus of antimony; stir it all the while, and, when all is melted and incorporated, you will not only have a pewter that is harder and whiter, but also different in it's sound from common pewter. Or,

Melt tin in an iron pan, strew colophony or rosin, with fine wheat flower mixed together, into it, and stir it gently about; this takes off the blackness, and makes it of a fine white colour. If you would have it hard, add to each pound of tin one or two ounces of pulverized regulus of antimony and veneris; this makes it white, hard, and gives it a clear sound.

PHARMACY, that branch of physic which teaches the preparation of medicines. It is ordinarily divided into Galenical and Chemical; the former is called simply pharmacy, and consists in the knowledge and management of the materia medica, in an unchemical way, as it were, and without the torture of bodies, as the art of chemistry instructs.

Pharmaceutical chemistry defines the art of directing and performing the several processes or methods of manual operation, whereby natural substances are reducible to artful medicines.

Thus the whole art consists of the theory and practice: the former is claimed by the Physician, and the latter is assigned to the Apothecary.

A SUCCINCT ACCOUNT OF THE ART OF PHARMACY.

Most of the natural bodies being some way or other employed as subjects of pharmacy, the materia medica is extremely large, and it's operations various. It's materials, in the earliest ages, indeed, were few, and the ways of managing them were

were simple: subjects afterwards multiplied, operations increased, and, at present, we seem abundantly stocked with both simple and compound medicines.

But the history of pharmacy may deserve to be more particularly treated, in order to see by what means it arrived at its present state, and how it may be further advanced.

Diseases must have been early, if the first inhabitants of the world experienced the same changes of seasons, breathed the same kind of air, and used a like diet and regimen of life with ourselves. But soon after a disease afflicts, the patient seeks a remedy: whence we may reasonably suppose, that this was the foundation of pharmacy in various parts of the world.

Experiments being thus multiplied, and the event gradually introducing better methods of preparing the simples, pharmacy would begin to appear in the form of an art: yet, when Hippocrates came to compile a kind of a system of physic, from the observations of antiquity, he described but few, and those were generally simple.

Succeeding physicians enlarged the *materia medica*: Galen considerably swelled the catalogue, which received many additions from the Arabians.

And, when learning began to revive in Europe, the *materia medica* was again enlarged, and great changes wrought upon it by chemistry: whence chemistry at length was generally received, and acknowledged of use in pharmacy.

Both the galenic and chemical parts of this art are now extremely copious. Necessity gave the occasion, nature supplied the materials, and art and observation discovered their preparations, virtues, and uses.

Thus we at present seem provided of a competency of standing medicines; and physicians have, by degrees, acquired a method of prescribing in extemporaneous forms.

The art of pharmacy may be considered under the management of physicians, apothecaries, trading chemists, and druggists.

It is the office of the physician to direct the medicines, or give the rules of extracting, compounding, and managing the simples. If the physician, therefore, should be defective in this part, let the apothecary, the trading chemist, and the druggist, be ever so just, or ever so knowing, the art of pharmacy must fall short of perfection.

To the apothecary belongs the reduction of the *materia medica* into certain forms of medicines, according to the direction of the physician.

But there are two kinds of apothecaries, vulgarly known by the names of wholesale and retail apothecaries. It is the latter alone we are here concerned with: these act by rule, generally follow their standard, and compound with art and care; though they will sometimes substitute quid pro quo, and now and then venture to reverse an order. According to their skill and care, they are more or less liable to be imposed on by the druggist, and the trading chemist, all of them usually selling what they buy; but if the apothecary be here often deceived, how stands it with the patient and physician, or what is the state of pharmacy?

The retail apothecaries, however, deal more in substitution than in sophistication. The prudent physician, therefore, prescribes what is usually kept, and proper to keep, in the shops, or what is otherwise easily obtainable. If there are other abuses committed in this part of pharmacy, they may, perhaps, be chiefly attributed to some want of skill or conduct in the physician.

The design of the trading chemists and druggists is to furnish medicinal matters to the apothecary, who cannot always detect an artificial counterfeit, or a dextrous sophistication: and perhaps many remedies well designed by the physician, have failed or had mischievous effects upon this account.

This is proposed as a short intimation of the present state of pharmacy in England. If the art be found more perfect in other nations, it may, perhaps, be chiefly owing to this, that their physicians are well acquainted not only with the theory, but also the practice thereof; two things which should never be separated, as being, in reality, but one effective thing, consisting of two parts, viz. previous notion, and execution. What useful addition or reformation the *materia medica* is capable of receiving, no one at present can say. If a strict enquiry were made, perhaps it might be found proper to throw out of our present collection a considerable number of materials to make room for others of greater efficacy. But this is no work for private persons: our present business is to see whether any improvements may be made in the ways of preparing the common medicines of the shops.

For the better regulating of our enquiry, it may be of some service to lay down two larger observations, viz. 1. That the design of pharmacy is to separate from bodies the more medicinal parts with which they are naturally endowed, and, upon occasion, to mix such of them together as will best answer the curative intentions. All in the power of art is only to separate and mix, or differently modify, it is nature alone that is able to produce. Pharmacy, therefore, consists in analysis and synthesis.

As it is the perfection of art to copy nature justly; so, by resolving bodies into their principles, we obtain a general rule

for composition, and see the several steps we ought to take in it. Nature shews us, that, in all mixed bodies, there is a basis, or substratum, something to support and envelope the other ingredients. The natural salts are thus diluted with water, the oils with both, and altogether compose one uniform and elegant whole. To prescribe justly, therefore, the physician should imitate nature; but, if we compound without regard to this rule, the ingredients will appear huddled together, as if it were by chance; and, instead of preserving and assisting, they will often clog, incumber and destroy each other.

We now proceed to our experiments, whereby may be illustrated and improved, (1.) The common method of distilling simple waters. (2.) The common method of preparing tinctures. (3.) The method of preparing syrups. (4.) The method of making electuaries; and, (5.) The method of making compound oils, unguents: thus proposing to touch upon the chief articles of the present Galenic pharmacy, as it is vulgarly called, though, in reality, it is something chemical also.

EXPERIMENT I.

The best way of distilling simple waters.

Take as much dried mint, cut small, as will fill two-thirds of a still; then adding a sufficient quantity of rain water to make the plant float commodiously, yet leaving a fourth of the still empty, digested a while with a gentle heat; then work the still, drawing off only so long as the water appears thick or milky, and tastes rich and grateful; whereby you will obtain a simple mint-water, in tolerable perfection.

OBSERVATION.

This experiment, with a few occasional alterations, may shew a general method of obtaining simple waters in their greatest perfection. The subjects best fitted for it are those of the odorous, aromatic, and oily kind; though some others also may, perhaps, communicate particular virtues to the water: among the fittest may, however, be reckoned angelica, aniseed, balm, camomile, cinnamon, cloves, fennel, hyssop, rosemary, tansey, wormwood, &c. but particularly pepper-mint, which affords an extremely aromatic, pungent, and agreeable water, good against the cholick, and many other disorders of the stomach and bowels; whence its use, perhaps, is too little known.

It is a principal caution in this operation, to remove the receivers before the more pellucid, acid, faint, and dead water comes over, as it soon will do, and, if suffered to mix among the rest, is apt to spoil the whole, by giving it a vapid or faint taste, and sometimes a degree of acidity, or vitriolic stypticity, and an emetic virtue: for part of the essential salt of the plant, now rising, usually corrodes the copper head of the still, and carries over with it some particles of the metal: whence those waters should either be distilled with a glass head, or one of pewter, or tinned copper, or else the operation should be carefully watched, that the second running may not mix with the first. The greater care should here be taken, because some patients, more particularly children, and those of a tender habit, have suffered through a neglect herein; by being vomited, purged, and griped by the use of a simple water, contrary to the intention.

The simple waters distilled after the manner of the present experiment, may, in many cases, prove too strong to be used alone; but then it is easy to lower them with common distilled water, to the proper strength: and this is, beyond all comparison, better than to mix such waters with their own faints, or liquor of the second running.

There are two improvements that might be made in this method of obtaining simple waters: the first is, by means of co-botation and digestion; the other, by means of the previous fermentation of the plant. With regard to the first, if the liquor remaining in the still be expressed from the herb, and returned along with all the water that came over upon a fresh quantity of the same subject, and they be digested together, in a gentle heat, for two days, then distilled as before, the water thus obtained will be much richer, and more efficacious than the former: and, if the same process be repeated two or three times, those who have not tried would scarce imagine how rich a simple water may be thus procured. And this method we would particularly recommend for making the simple water of balm, elder-flowers, roses, camomile, and the like subjects, but sparingly furnished with essential oils, for they otherwise make but indifferent waters.

The other way of improving simple waters, is using by a previous imperfect fermentation: this is performed by adding to the plant and water put together, as in the foregoing experiment, a tenth or twelfth part of sugar, or honey, or else a fortieth part of yeast; then setting the whole in a warm place, to ferment for two or three days only, so that the herb may not fall to the bottom, nor the fermentation be above half finished; then the whole being committed to the still, a water may, at one operation, be obtained extremely rich, or impregnated with the full virtue of the plant. And thus may simple waters be made fit for long keeping without spoiling; the

the small proportion of inflammable spirit generated in the fermentation, serving excellently to preserve them. And these two methods seem applicable to the improvement of all those simple waters commonly found in the shops.

We should next proceed to shew the method of perfecting or improving compound waters, if we had not already endeavoured to do it under the article *DISTILLATION*, Vol. I.

EXPERIMENT II.

The best way of making light tinctures and infusions.

Take half an ounce of the rind of Seville orange, shaved thin; half a drachm of gentian-root, thin sliced; a scruple of the tops of Roman wormwood, half a drachm of cardamums, and half a drachm of cocheneal, each of them slightly bruised: these ingredients put to steep, for a night, in a pint of French brandy, and filter the liquor next morning.

OBSERVATION.

This experiment is general, and not proposed for its own sake, but to shew the method of making all kinds of the lighter and finer tinctures and infusions without fire, which would here prove prejudicial: the preparation itself is, however, a good stomachic bitter, of the same general nature with those commonly sold under the name of Stoughton's elixir.

The excellence of these preparations depends not more upon the choice and goodness of the ingredients, than upon the manner of their being infused: for, if suffered to remain too long in the menstruum, or if heat be used in extracting the tincture, the gross, terrestrial, and nauseous parts of the ingredients will be fetched out, and the tincture thus be loaded with a heavy indolent matter, of little virtue. But if the infusion be made in the cold, and the liquor strained off soon, only the finer and more spirituous parts of the ingredients will be imbibed by the menstruum; whence the preparation will not only taste and smell more brisk and agreeable, but also have a much greater virtue and efficacy. But if, through the shortness of their continuance in infusion, the ingredients should not have sufficiently impregnated the liquor, the method is to pour the liquor again upon such fresh ingredients, and again to strain it off, without letting it stay too long upon them, or feeling the heat of the fire. Thus, by repeated effusions of the same impregnated menstruum, upon fresh ingredients, an infusion, or tincture, may be obtained, of almost any degree of strength or richness, without containing the grosser or more concretionary parts of the ingredients, but only what may be called the finer spirit, or quintessence: and this is no inconsiderable secret, both in chemistry and pharmacy, and may deserve the regard of those who desire to procure the full virtues of the simples, unaltered in their nature, yet exalted, or concentrated to such a degree, that a few spoonfuls of the liquor shall contain the spirit, or quintessence of a pound of a plant.

And this is an effect not to be expected from the fire, which almost constantly alters the nature of things committed to it; nor could a valuable essence of violets, jasmin, lilies, borragewaters, and any flower or plant of an extremely fine odorous spirit, be procured by heat, as it readily may by steeping these flowers in cold water, cold vinegar, cold wine, or the like, and frequently pouring the tincture upon fresh flowers, 'till the liquor becomes strongly impregnated.

Apothecaries usually commit the same error in preparing the finer tinctures, that they do in working their cordial waters, and in both cases saturate the liquor with the grosser, more useless, and less spirituous parts of the ingredients; whence the cordial waters of the shops too often abound with a gross, heavy, disagreeable oil; and the tinctures of the shops with a gross heavy earth, or kind of bituminous matter, instead of a brisk, lively, and invigorating spirit, which alone is the thing required in both cases.

This doctrine of tinctures and infusions should be reduced to rule, for the improvement of chemistry; which will never be perfected 'till it can extract, separate, and concentrate the virtues of things unimpaired, or unaltered in their nature. And doubtless it would prove a very serviceable thing in chemistry, medicine, and natural philosophy, to know the best and easiest ways of concentrating the virtues of bodies unaltered: and this may, in some measure, be effected by the present method, and practised with well-adapted menstrua: for, in general, (1.) A quick and cold infusion extracts the spirit of vegetables; but a hot and long one confounds, impairs, or destroys it. (2.) To repute the infusion of a fresh subject quick and cold, in the same impregnated menstruum, seems greatly to collect and concentrate the spirit, that is, the finer and more essential part of bodies. (3.) The proper menstrua for this purpose seem to be such as pure rain-water, vinegar, wine, water mixed with a little fine alcohol, water and a little sugar; and, for certain uses, the common atmospheric air, which is an excellent menstruum to extract the spirit or effluvia of plants, as we remarkably find in spicy groves and gardens, and may, in some cases, be used with good effect.

But, to obtain the saturated tinctures of hard, resinous, or gummy bodies, requires a different treatment, as in the following

EXPERIMENT.

Take two ounces of that hard Indian rosin called gum-lacque, and reduce it into a fine powder, make it into a kind of stiff paste, with oil of tartar per deliquium; set this paste into an open glass to dry, by a gentle heat; then remove it to the open air, that it may relent or grow soft; and after this dry it again, as before: and, by repeating the process once or twice, the hard body of the rosin will at length dissolve into a purple-coloured liquor; which being now gently dried, and reduced to powder, will afford an excellent tincture, by being boiled for two or three hours in a tall glass, with alcohol.

OBSERVATION.

This process is almost general, or may be advantageously used for making the tinctures of myrrh, gum-juniper, dragon's blood, amber, and other hard gummy substances, which will scarce otherwise yield a tincture in spirit of wine. Any improvement in the extracting tinctures with alcohol, may tend considerably to improve the art of pharmacy, because such tinctures are generally found powerful medicines; the spirit of wine appearing greatly to increase the virtue of the subjects. Thus, though the tincture of amber, prepared in this manner, appears to be only a bare solution of the substance of the amber, yet it is found to have such effects as are no way equalled by any fine powder of amber: and, what seems remarkable, though so large a quantity of fixed alkali be used in the preparation of these tinctures, yet they give no manifest signs of containing an alkali; which is therefore changed in the operation, whether by the acid naturally contained in these resinous and gummy bodies, or by being exposed to the air, or both.

There are more methods of extracting the tinctures of these hard gummy bodies; but that delivered appears to be best, though it might, perhaps, be shortened, by using some proper intermediate substance to divide the particles of the subject, so as that the alkaline salt, the air, and the spiritous menstruum, might all come into fuller contact therewith, and act more forcibly thereon. And for this purpose pure virgin earth is recommended, such as is commonly used for the making of tests or cupels; by means whereof spirit of wine will extract a tolerable tincture from myrrh, without the addition of any fixed alkali.

But when tinctures not spirituous, or only aqueous solutions of these hard gummy bodies, are required, the use of the soluble tartar, or tartarum tartarizatum, is proper; for a solution of this salt will readily dissolve myrrh, even in the cold, as water dissolves gum arabic.

EXPERIMENT III.

The best method of making syrups.

Take three ounces of the yellow external rind of fresh oranges, and infuse them in a close vessel, with a gentle heat in balneo marie, for six hours, along with a pint and a half of pure water; then suffer the infusion to cool; filter the liquor, and add to it twice its own weight of hard double-refined sugar, made into a syrup, in a close vessel set in balneo marie.

OBSERVATION.

We would not contrive a general example to fit all syrups, because they differ greatly in the liquors of which they are made; or according as those liquors are infusions, decoctions, natural juices, wines, or vinegars. We chose to give an instance in a syrup made of a liquor by the infusion of an aromatic substance, whose virtue would be almost entirely lost if the syrup were to be prepared by long boiling, as it is sometimes directed, with less than an equal weight of sugar. Dispensatory writers have, perhaps, no where erred more remarkably, than in directing the making of syrups, which seems the more strange, because this part of pharmacy is extremely facile: the misfortune seems to have lain, that great men cannot submit to consider common and ordinary things; whence, however, the credit of a physician may sink in the esteem of those who, by their employ, are led to a knowledge of these ordinary things.

It is judged, that the whole of this business may be reduced to a few easy rules, which we shall here endeavour to lay down, for improving this branch of pharmacy. And, (1.) It is matter of experience, that aqueous infusions, decoctions, or other aqueous liquors, require twice their own weight of dry sugar-candy, to make them into a syrup of a just consistence for keeping, without candying or fermenting.

This rule, by directing the use of sugar-candy, seems to fix the consistence of syrups with exactness; because all salts acquire a determinate proportion of water in crystallizing; so that sugar, in the form of candy, consists of one certain proportion of water, whilst different kinds may hold more or less aqueous matter, according to their manner of refining, the accidents of the weather, &c. Hence, therefore, all such infusions for syrups as are of delicate or destructible colour, which

which is impaired by boiling (for example, violets, clove-july-flowers, &c.) and all such infusions as contain any volatile parts, which would evaporate by a boiling heat (for example, those of nutmeg, cinnamon, orange-peel, citron-peel, &c.) should have twice their own weight of sugar added to them, and be kept close covered, in the gentle heat of a *balneum mariz*, 'till the sugar is dissolved; and, to hasten the solution, the sugar should be first reduced to fine powder.

(2.) The decoctions of such vegetable substances as lose no valuable parts by boiling, may be boiled down to the form of a syrup, along with their own weight of sugar, the two being first clarified together, with whites of eggs, in the ordinary way; but, if the ingredients here contain any unctuous or balsamic parts, whereon their medicinal virtues depend, let the sugar be added from the first, and boiled along with the ingredients, afterwards straining and clarifying the decoction, before it is boiled to near the full consistence of a syrup.

This rule is founded upon that remarkable property which sugar has to dissolve oils, or the finer resinous substances, so as to make them intimately mix with water: whence it may deserve to be considered, whether the syrup of myrtles, comfrey, and diacodium, should not be thus prepared. It must also be observed, that, by boiling the sugar so long with the decoction, the aqueous part exhales and leaves the syrup much stronger than it could have been made without this boiling.

(3.) All vegetable juices are to be thoroughly purified before they are made into syrups. Thus the juices of citrons, lemons, and oranges, are to pass the filter, and then be made into syrups, without boiling, according to the first rule, observing to use no metalline vessel about them. But the juices of fruits, as particularly mulberries, raspberries, &c. will not clarify without beginning fermentation; but, by standing for a day or two, they will begin to ferment and liquify, and may then be commodiously strained through flannel; after which, these also are to be made into syrups, with about an eighth part less than twice their own quantity of sugar, or with two pounds and twelve ounces of sugar to a pint of juice, on account of their being somewhat saccharine themselves.

And this holds also of wines and vinegars, when they come to be made into syrups; for wine contains an inflammable spirit, which does not incorporate with sugar, and also a thick syrupy substance, which is also found in vinegar. And, by a due application of these rules, we apprehend the business of making syrups may be reduced to tolerable perfection.

The best method of making electuaries, by an example in the *sassafras* electuary.

Take two ounces of the best *sassafras*, newly rasped, and half an ounce of cinnamon, finely powdered; boil them together in a tall glass, in a sand-heat, with 10 ounces of water, and 14 ounces of sugar, so as that nothing might evaporate, for two hours; then straining and pressing out the syrup, add to it an ounce of fresh-rasped *sassafras*, a drachm of cinnamon, and 10 grains of nutmeg, all reduced to fine powder, and make the whole into an electuary.

OBSERVATION.

In the common method of making this electuary, the *sassafras* and cinnamon are boiled in the water, whereby a great part of their virtue is lost, or not extracted, whence the medicine comes to be defrauded of it's due: but here, by boiling the ingredients in a tall glass, with a due proportion of sugar and water, to make a syrup (allowing an extraordinary proportion of water for what the *sassafras* will drink up) we obtain the fine aromatic virtues of the ingredients to advantage, without any considerable loss.

To make electuaries in perfection, where a syrup is employed as their basis, (1.) The syrup should be prepared in the manner above delivered, so as that the virtues of the ingredients may be preserved. (2.) The powders, or species employed, should be fresh, and fine ground. (3.) The gums, where any are used, must be well cleaned, and dissolved in their proper menstrua; and, (4.) The whole must be mixed, or thoroughly united into a smooth uniform substance, of a due consistence for keeping, without either candying or running into fermentation.

Where syrups are used in the making of electuaries, care is not only required, that the virtues of the ingredients of the syrups be preserved, as much as the form will allow of, but also that it's consistence be not too high, for this would dispose it to candy in the electuary, and render the medicine unduly mixed, or knotty, the sugar thus concreting together in lumps, or shooting away from the species.

If the syrup be made too thin or aqueous, so as not to suspend and hold the powder together, by a binding consistence, the syrup will of necessity ferment in hot weather, and become somewhat vinous, afterwards sour, and at length corruptive, [see the articles BREWING, DISTILLATION, and VINEGAR-MAKING] so as to change, invert, or destroy

the nature of the medicine; for purgative ingredients, by fermenting, lose their purgative virtues: and all other ingredients, by corrupting, are reduced to an indolent kind of fæces, or *caput mortuum*, very different from the thing intended.—See the article WINES. Hence electuaries that have thus fermented, or changed their nature, may sometimes prove pernicious, instead of salutary.

The electuaries made with the pulp of fruits are less disposed to keep for any considerable time perfect, on account of the greater tendency which such pulpy substances have to fermentation and putrefaction: thus, though the lenitive electuary were made ever so artificially, it will scarce keep many months without altering it's nature, and especially if the consistence was originally too thin: whence such electuaries should be made in small quantities, or fresh as they could be wanted. But this does not hold of the capital electuaries, such as Venice-treacle, or mithridate, which require to lie for some time, that the ingredients may digest or ripen, as it were, and grow mellow together; for the gums and spices that enter their compositions preserve the medicines from alterations for the worse, and the mixture becomes more perfect by time, provided the honey used in their composition does not candy, or the whole become too dry. To keep the honey from candying, some artists mix the spices and gums with it unclarified, taking care only to separate the foul parts that lodge either at the top or bottom. And, if the medicine prove too dry, it is usual at any time to soften, or beat them up in a mortar, with canary: thus these capitals of the shops are supposed to improve by keeping. But diacodium having few of the warm gums in it's composition, is more apt to alter, and lose of it's astringent quality by keeping: for which reason it seems an alteration here for the better, to use a quantity of *saccharum rosatum* instead of honey, or diacodium, as this not only gives a greater compactness to the medicine, but also contributes to preserve it's colour and virtues.

The powder, or species, that enter into the composition of electuaries, should be fresh, because they lose of their virtues by keeping, and they should also be fine ground, because they would not otherwise intimately mix with honey or syrup, nor so readily part with their virtues in the stomach, nor render the medicine so agreeable to the eye. The common method of reducing these powders to a sufficient degree of fineness, by the mortar and searce, is faulty; because this method exposes them too long to the action of the open air, whereby their more volatile and grateful parts are carried off, whilst only the grosser are left behind: whence it might be proper to have a close engine contrived for the purpose, so as to prevent this ill effect.

Some artists grind their powders for electuaries by means of a horse-mill; but the mill-stones here wear off, and communicate a stony matter to the ingredients, so as to prove disagreeable in the mouth, increase the bulk of the medicine, without adding to it's virtues.—Nor is this method of the mill free from the inconveniencies of the latter; for the finer or more spirituous parts of the ingredients also fly off, as is sensibly found by the whole neighbourhood where any large quantity of the ingredients for Venice-treacle, &c. is ground by the common horse-mill.

The better way doubtless is, by the means of iron rollers, moving opposite to each other in a close box, to grind all the ingredients, viz. the purified gums, the roots, herbs, flowers, &c. along with the honey, and wine, after the manner of the chocolate engine: for thus the fine, volatile, and aromatic parts of the ingredients may, as well as the grosser, be entangled with the honey and gums, and all at once be mixed uniformly together, into a smooth mass of a due consistence. But perhaps a much better, though more troublesome method would be in the form of extracts, essential oils, &c. to get out the full virtues of the ingredients, without any of their grosser parts, and mix these oils, extracts, gums, resins, &c. together with a suitable proportion of honey, &c. so as at once to concentrate the medicine, which might, therefore, be given in doses of an agreeable smallness, with all the advantages that can be expected. The same method seems also applicable to the making of pills and troches.

OBSERVATIONS.

1. We learn from the preceeding enquiry, that some part of the salts of plants, as well as their oils, will rise by distillation with water, and give an acid or alkaline nature to the simple waters thus proposed, according to the nature of the plant.
2. That no simple waters should be distilled so low as to bring over any remarkable acid or alkaline liquor from the plant, for fear of mischievous effects, or making such waters prove emetic or purgative, contrary to the intention.
3. That the virtues of simple waters chiefly depend upon their containing the essential oil of the plant.
4. That there are two methods of perfecting simple waters, viz. cohobation and fermentation.
5. That all tinctures and infusions of ingredients, whose principal virtues depend upon their lighter, or more subtile and spirituous parts, should not be made with heat, but in the cold.

6. That

6. That if such tinctures or infusions be required rich and strong, they are to be made so, not by suffering the menstruum to remain long upon the ingredients, or by the use of heat, but by adding fresh ingredients several times to the same liquor, infusing them quick, and each time keeping out the ingredients that have once been used.

7. That the fire is apt to exhale, alter, or consume the more subtle and spirituous parts of vegetables, and, therefore, unfit to be used where these more delicate parts are required.

8. That the business of infusions and tinctures may be greatly improved, by extracting the efficacious, or more spirituous parts of vegetables, unaltered in their nature, yet concentrated, or brought into a moderate compafs.

9. That rich tinctures may be extracted, with spirit of wine, from the hardest refinous and gummy bodies hitherto known, by means of fixed alkalis, properly applied.

10. That even aqueous solutions may be made of the same kind of bodies, by means of the tartarum tartarizatum, or soluble tartar.

11. That the ways in common use for the making of syrups and electuaries are improveable, by the observance of a few easy rules.

12. That, therefore, there are grounds to expect some improvement of the common pharmacy, upon the footing it now stands, or by barely perfecting the methods of preparing the shop-medicines in use, without either retrenching their number, introducing new ones, or reducing the art to a greater simplicity. See CHEMISTRY, and PHILOSOPHY EXPERIMENTAL.

PHILIPPINE ISLANDS. The Philippine Islands, situate in the Pacific Ocean in Asia, are computed at 1200 in number, and extend from North latitude 6 to near 20, and from east longitude 114 to 126, of which 5 or 600 are pretty considerable: they are about 400 leagues to the west of the Ladrões, 120 south of China, and 200 east of Cochin-China. The air here is very hot, with little difference of seasons, but the rains begin generally in May, and last three months. Their chief product is gold, rice, the usual Indian fruits, beasts, fowl, and fish, with good large nutmegs, which they do not cultivate, however, lest it should tempt the Dutch to attack them. The natives neither allow the English nor Dutch to tread hither, lest they should discover their riches and weakness.

Their chief islands are, 1. **MINDANAO**, which lies farthest, both to the east and south of them, all extending from north latitude 6, to 9 $\frac{1}{2}$, and from east longitude 121, to 126, 30. It is the biggest of them all, next to Luconia, being, as Dampier says, 60 miles in length, and 40 or 50 in breadth; but Captain Hamilton makes it, 140 leagues in length, and other 76 in breadth; though, after all, the latter is very unequal, by reason of many harbours for shipping, and abounding, as well as it's navigable rivers, with variety of fish. The soil is fat, the valleys well watered, and abound with rice and other provisions; evergreens, nutmegs, cloves, and good cassia lignum, or bastard cinnamon.

It's chief trade is with the island of Manilla, but partly with Borneo. The Dutch come hither in sloops from Ternate and Tidore, two of the Molucca Islands, and purchase rice, bees-wax, and tobacco, the last of which grows more plentifully in this island, than in any other of these seas, except Manilla, and is an excellent fort; but the people do not manage it to that advantage as the Spaniards do at Manilla. The common rate of the Mindanao gold, is 14 Spanish dollars the English ounce, and 18 dollars the Mindanao ounce; which is the rather observed, because these Spanish dollars are the current coin in all these islands.

It is divided into several principalities of different religions and languages. Those who live in the inland country, among the woods and mountains, are called Stillanoons, and have rich mines of gold ore, and great plenty of bees-wax and tobacco, which they exchange with the coasters for cloathing, calicoes, muslins, china-ware, silk, and other necessaries.

SEHOL, north of the former, towards Mindanao, is but 40 leagues in compass. The soil of it produces no rice, but yields cocoa and divers roots, much cattle and fish, and is rich and gold mines.

MINDORA, which extends from north latitude 12, to 13, and from east longitude 119, to 120; is about 20 leagues long, and 12 broad, and 70 in compass, and lies on the west side of the Philippines, and particularly of Masbate. It produces pepper, has mines of gold, and a town of the same name. It is divided by the straits of Mindora from Manilla.

PHILIPPINA, which being first discovered, gave name to the rest, is also called Tandaya and Samar, lies, betwixt north latitude 12 and 14 $\frac{1}{2}$, and is the pleasantest of them all, fruitful and rich. It is about 130 leagues in compass, and is divided from Manilla, on the north-west, by the straits of that name.

XOLO lies to the south-west of the Philippines. All the ships of Borneo touch here, and it may be called the mart of all the moorish kingdoms in the east. It abounds with rice, and is the only island of the Philippines that breeds elephants. The sea throws up abundance of ambergris on it's shore, and yields pearls; and the soil, pepper and other fruits.

MASBATE, to the west of Tandaya, is 30 leagues in compass, and yields wax, salt, civet, and gold, of which here are rich mines, and the ore rises 22 carats fine, but they are not wrought.

We conclude with the biggest, the richest, and the most northern of all the Philippine Islands, viz.

LUCONIA, which the Portuguese call Manilla, after the name of it's chief town, and the Spaniards New Castille. It extends from north latitude 14, to almost 19, and from east longitude 120, to 124, and is said to be 160 Spanish leagues in length, but unequal in breadth, being in some places twenty, in some thirty, and in others forty leagues over. It affords corn, fruit, and roots in great plenty, as well as wild game and fowl. It produces gold of low touch, and is able to furnish good materials for carrying on a considerable commerce.

MANILLA, lies on a point of land made by a river, which issues from the lake of Batia, and falls into the sea a little lower, at the town of Cavite; where is a spacious harbour, but of difficult entrance, because of rocks and shoals at the mouth of the bay.

This island has the liberty of sending two ships every year to New Spain; but being limited to that number, they therefore build them vastly large. These carry the spices and rich commodities of India to Acapulco, a port in the South-Sea, in the kingdom of Mexico, or New Spain, and bring back the valuable commodities of America and Europe, by which trade the gain is said to be four hundred per cent. See **ACAPULCO**.

PHENICE. This province lies along the Mediterranean coast, being bounded by it on the west, by Syria propria on the north, by Syria Cava, or Cælo Syria, and Batanea on the east, and Palestine on the south, and is at present part of the Beglebergate of Tripoly. It is but a narrow slip of land from east to west.

TRIPOLIS OF SYRIA, to distinguish it from that of Barbary, is pleasantly and commodiously situated, at the foot of Mount Libanus. It's distance from the sea is but about a mile and a half, and hath a commodious haven, which comes up within less than half a mile of the west side of it. As to the port, it is rather an open sea than an inclosed harbour, except that it is in part defended by two small islands, which lie about two leagues from it. (Maundrel.)

The people here spend most of the summer-time in their gardens, where they busy themselves with their silk-worms, which is the greatest manufacture they have.

The air is extremely clear and healthy, and the country round about very rich and fruitful; so that the town is supplied with every thing it wants or can wish for.

BERYTUS is situate on the same coast, about 40 miles south of Tripoly, and about 18 south of Sidon. It's chief commerce, which is very considerable, consists in fine tapestry, silks, camblets, cinnamon, nutmegs, ginger, pepper, cassia, rhubarb, and cocheneal. The sea banks abound with mulberry, pine, lime, and other trees; and with gourds and prodigious quantities of colocynth: some add, that in the neighbouring hills are found a sort of stones, of which some resemble olives. (Moncony & Thevenot.)

SIDON, the antientest city of Phœnicia, is seated in a fertile and delightful soil, between the sea on the west, and Libanus on the east, and about 30 miles south of Berytus.

It is at present but a little town, though formerly the metropolis of Phœnicia, and a place of great trade: one of the chief commodities of the place is that of raisins, which the Basba lets to proper farmers, who are obliged to be moderate in their prices, lest they should stick in hand. Other merchandizes are oil, ashes, Egyptian soap, rice, blue silks, Turkey-leather, cotton, fenna, pistaches, buffaloes skins, &c. Those they import from Europe, are fattins, damasks of Genoa and Lucca, scarlet and light coloured cloth, paper, and some other of less value. Provisions of all sorts are here in great plenty, and very cheap. The silk-worms are kept in little huts under the mulberries, and thrive very well, unless disturbed by violent claps of thunder.

Leaving the sea-coasts, and turning towards the east, at about 82 miles north-east of Aera, stands the famed city of Damascus, situate on a fertile plain, encompassed with hills, and upon the river Barady, which enriches that city and country with all kind of plenty and pleasure.

The city has separate wards for every trade and calling, and these are shut up every night by gates, and by a stout iron chain by day, to keep off beasts of burthen. It hath, in particular, above 20,000 inhabitants employed in making scymitars, sword-blades, and other cutlery work; bridles, and a world of other things in iron and steel; all which are in great request through Turkey, and beyond, on account of the fine temper which their water or art here gives to those metals. Other commodities are wines, raisins, prunes, raw and wrought silk, and all other merchandizes of Turkey, Arabia, and India, most of which are brought hither by caravans, which go and come from Constantinople, Egypt, India, Aleppo, Bagdad, Mecca, &c. As for those which come from Europe, they are mostly brought hither by the Venetians.

DAMASCUS stands about 43 miles distant from the sea, being parted from it by a long chain of mountains, and about 45 almost east from Sidon, and 65 south-east from Tripoly. In latitude 33 degrees, 37 minutes east, longitude 37 degrees, 4 minutes.

PHILOSOPHY EXPERIMENTAL. By philosophy, we understand, the science or knowledge of the nature, causes, properties, and effect of all created Beings, so far as they are capable of being known by reason, discovered by art, or any ways adapted to the human comprehension.—By experimental philosophy, we mean, the art or method of making such experiments upon all material things, as will tend to lead and conduct the human understanding into the true and certain knowledge thereof, and their application to all the useful purposes of life.

REMARKS of general utility to lucrative arts, manufactures, and commerce.

In order to acquire this art of philosophizing, it's scientific elements must be well understood; and it's operation personally viewed, and manually performed: whence it's two parts of theory and practice.

It's theory, in general, is acquired not only by information, axiomatically and demonstratively delivered in the synthetical manner, à priori; but analytically, and à posteriori, in particular. It's practice is acquired by a careful instruction in the proper manual operations; which, in general, are limited by place, time, the subject and suitable means; and, in particular, by the manner of performing. Whence are derived numerous arts, trades, and mechanical employments, and their daily improvement; which has induced us to take notice of an article of this kind. How far this knowledge may be advanced by the means of mathematics, see the article **MATHEMATICS**. How greatly also the knowledge of chemistry may tend to the advancement of philosophy, grounded on indubitable experiments, and consequently of various arts and trades, see the articles **CHEMISTRY**, **AQUA FORTIS**, **AQUA REGIA**, **ASSAY**, **BLACK** [Dyer's Black], **BLEACHING**, **BLUE**, **BOLE**, **BRANDY**, **BREWING**, **CALICO-PRINTING**, **CLAYS**, **COPPER-MINES**, **DISTILLATION**, **DYEING**, **EMERALD**, **ENAMEL**, **FARMING**, **FLUX** [in metallurgy], **GLASS**, and abundance of other articles, which the reader will find in the indexes to both the volumes.

I come now to shew, how Natural Philosophy contributes to afford us the necessities and conveniencies of life; whereby our empire is extended abroad, as a knowledge in physic, secures us at home. And experimentalists in philosophy may greatly reform trade, or improve it; and this equally, if not more, perhaps, than those who are engaged in it, which chiefly lies in the hands of the illiterate. Thus, for instance, the husbandman's skill consists in the knowledge of a few plants and animals, their relation to particular soils, and management, with the influence of the celestial bodies and meteors thereon; all which subjects fall properly under the cognizance of a natural and experimental philosopher.

For he who has attentively considered the nature of generation, nutrition, and accretion, both in plants and animals, and knows how to vary a useful experiment, so as to remedy the inconveniencies, or supply the defects thereof; and can dextrously apply his own, and others observations, may cultivate husbandry to as much advantage, as the ordinary farmer tills his land.

An attentive consideration of the parts that constitute each particular trade, would shew how they all depend upon philosophy, and might be farther improved. Thus, the principal parts of refining are a knowledge of the preparation of aqua fortis, and it's operation, upon silver, copper, and gold, with the means to purge it, that neither gold may be dissolved, nor silver precipitated, when dissolved, thereby; to know what proportion is dissolvable therein, and the quantity of water necessary to weaken the solution; how long copper-plates should lie, to precipitate the silver it contains; how lead is colligated with, and what proportion thereof is requisite to carry off the baser metals upon the test; how cupels are made; and, with these, to draw off lead or antimony from silver or gold; to discern when the metal is sufficiently refined; and, lastly, to know the proper proportion of gold and silver, to make water-gold. This trade, indeed, is understood by few, and not so diffusive and complicated as hundreds of others; yet, if they were all judiciously resolved into their component parts, it would doubtless appear, that most of them are only corollaries, deduced from particular observations in philosophy, or the bare application thereof, to the uses of human life. And if so, it is very probable, that farther discoveries, in the nature of the materials, the subjects of trade, and a knowledge of the laws they observe, may reform or meliorate several of it's branches.

This too is performable, by odd and unsuspected means; so that, perhaps, the chemist's charcoal, may prove an excellent equivalent for manure, if a vegetable salt, as probably it is, be the cause of the land's fertility. For chemical experiments may discover the nature hereof, and thereby afford useful directions towards the melioration of arable, pasture, and wood-

land. From the experiments which have been made upon earths, dungs, and seeds, whereby it hath been found that salts abound in the liquors they yielded; we see reason to wish this enquiry were farther prosecuted, towards the improvement of husbandry. Whoever has observed those many particulars in this art, which caused Sir Francis Bacon to pronounce nitre to be the life of vegetables; and considers how land is improved by pigeon's dung, which impregnates it with saltpetre; and, lastly, knows, that most fat earths, defended from the sun and rain, and left to themselves, will soon abound in nitrous salts; whoever considers these things, will, perhaps, believe a philosophic enquiry into the nature of saltpetre, may be of great use in farming.

Once caused some earth, says Mr Boyle, to be dug up, from under a pigeon-house, and distilling it in a retort, little or no oil, but a considerable quantity of reddish liquor came over, so far unlike spirit of nitre, that it greatly resembled volatile salts; for, without being rectified, it not only turned syrup of violets green, and precipitated a solution of sublimate into a milky substance; but there also came over therewith, into the lower part of the receiver, a dry salt, in taste like the volatile kind, and so far an alkali, that it readily hissed, and caused an ebullition in an acid menstruum. From hence it seems, which is highly remarkable, that a salt, very different from acid, may, by the operation of the earth and air, be so altered, as afterwards, by a slight management, to afford saltpetre, whose spirit is strongly acid. And dropping aqua fortis upon pot-ashes, dissolved in a little fair water, 'till the ebullition and hissing were perfectly ceased; and, having filtered this liquor, and set it in an open vessel to evaporate with a gentle heat, being in two or three days time removed to a cold place, it afforded very pure crystals of saltpetre.

I might add, that the knowledge of the nature and distinctions of saline bodies, may greatly assist to shew the differences of the various saltness that is found in soils; and with what sort each plant or seed is most delighted. By this means many tracks of land, now thought barren, for want of a knowledge hereof, might be rendered useful. A ground may be made to yield much better crops than usual, by being successively sown with a proper variety of seed, agreeable to the nature of the particular salt, at present inherent in the earth; for, by the absence of one kind of salt, it is better prepared to feed those plants that delight in another. And of this the husbandmen have, in some measure, already taken notice, as appears by their sowing turneps in grounds too remote for the convenient carriage of compost, to serve for manure, and fit them for wheat. And I am of opinion, that any land, except mere sand, might, without much culture, be made fertile, were we but well acquainted with the soil, and provided of the various sorts of grain that nature affords in different countries.

There are various soils, both in England and elsewhere, left quite uncultivated, wherein some foreign vegetables might thrive and prosper. Many large tracks of steep and craggy land, exposed to southern sun, lie waste in several hot countries, where grapes are not planted; though in France, Italy, and even on the Alps, such lands are turned into excellent vineyards. An experienced way of causing wheat to grow and prosper, even in clay, where no grain had thriven, was communicated to me by a person who had used it; and the art consisted in steeping the seed, for a determined time, in a certain expressed oil that is not dear: whence it is probable, that without altering the soil, a slight change, properly made in the seed alone, may so fit them for each other, as to yield a large increase. I have also seen in a collection of rarities, an ear or two of corn, not much unlike our common wheat, one grain whereof, in a warm country, from whence this was brought, would afford so vast an increase, that the possessor was almost ashamed to declare, and I am more afraid to repeat it.

An English gentleman, however, assured me, that having sown some of this corn, in land of his own, he found a single grain to produce several hundreds; though that came nothing near what it was said to do, in a more suitable soil and climate.

The learned Acofta affirms, that in several parts of America, where the European wheat will not prosper, the Indian, or Virginia sort, called also maiz, succeeds so well, that though the grain be large and more than one cluster often found upon one stalk, yet, in a single cluster he has counted seven hundred grains. He adds, it is not unusual in that country, to reap three hundred times the quantity sown. This, indeed, seems a little incredible; but I myself have found, even in England, such a multitude of grains, in one of the vast number of ears produced from a single grain, that I am inclined to absolve Acofta.

In some eastern countries, a sort of rice, the chief food of the natives, thrives excellently upon land so watery, that the person is there obliged to wade who sows it. Yet this is less strange than what Martinus tells us, as a practice in some parts of China; where many places, that lie all the year under water, have seed so well appropriated to them, that though thrown in the water, as baits for fish, it shoots up in it's proper season, appears on the surface like a verdant field, and affords a plentiful crop.

To proceed: chemistry and hydrostatics may help to discover the kinds and degrees of saltness, residing in several other bodies,

dies, the husbandman employs. I myself have made surprising discoveries, in working upon some sorts of earth, by chemistry. And as, in particular, the fertility of manure seems to depend upon it's saline-sulphureous parts, a practical enquiry into the differences and various operations of salts, may probably assist to discover various kinds of compost, with the proper manner wherein to multiply, compound, and apply them. See MANURE.

And thus, not only fire, but water, by means of the engines, and contrivances to be learnt from hydrostatics, may be made more serviceable to husbandry than ordinary. Martinus assures us, that in one province of China, they water their rice-fields by means of moveable mills, placed as occasion requires, upon any part of the banks of a river. The wheels here, raise the water in buckets to a great height, above the surface of the river; whence it is afterwards conveyed to the destined places in proper channels. But the art of levelling, or conducting water upon the ground, may be farther serviceable in this case. For soils, suited to this way of culture, are thereby greatly improvable; though it be almost entirely neglected, both in England and elsewhere. Some ground, by being skilfully overflowed, has doubled it's increase. And wild boggy places, have been turned into a good dry and compact soil, by barely trenching and overflowing it equally, six or seven times in a year, between the beginning of October, and the middle of April, with water from a neighbouring spring, that is enriched by no land floods, and rose in a barren and uncultivated place; so that this ground afforded hay, in such plenty, as to become worthy twenty times it's former purchase. Other instances of the like improvement have been made, from skilfully overflowing grounds with common water.

I must here observe, that the more comprehensive any trade is, the more improvements it will admit of from philosophy; because, depending upon many natural productions and operations, there must arise many particulars to be meliorated or reformed, either in the manufacture or profession. Thus corn, in husbandry, renders a knowledge of the whole art of tillage convenient, with the ways to order cattle, the dairy, or orchard; a kitchen garden, wood, flax, hemp, hops, bees, &c. and the particular productions of some of these, as honey, cyder, &c. are capable of improvement, and require skill to manage. In the variety of particulars, therefore, wherewith the husbandman deals, there must be some, wherein the superior knowledge and experience of the philosophers will be serviceable. And, as one of the principal parts of husbandry depends upon preserving cattle from diseases, and the fruits of the earth from putrefaction; natural philosophy, founded on experiments, may conduce to both these ends. He who can accelerate, and delay putrefaction in bodies, may shew the husbandman how to prepare variety of manures; to enrich his ground with the peculiar kind of salt it wants; and also, how to preserve several seeds, flowers, and fruits, beyond their natural duration. Thus many have continued fruits, as quinces, for instance, good almost all the year round, by a pickle made only of water, and the refuse of quinces, or what is easily obtained from them; but cherries have been preserved fresh and juicy for more than a year; and that without salt or sugar, only by a proper spirit of wine, well impregnated with the tincture it drew from the skins of the same kind of fruit.

The great advantage accruing to the Dutch, from the best way of pickling herrings; and to others, from so ordering the flesh of animals as to keep sweet, in passing from Europe to the West-Indies, and sometimes, even 'till it comes back again from thence, may shew what benefit husbandry might receive from discovering means to preserve the production of the earth; but especially if it could be extended to small wines, cyder, perry, &c. that are commonly made in large quantities, but soon decayed at home, and are unfit to be transported to very distant countries. The virtue of sugar, to strengthen vinous liquors, and render them durable; and the method of preserving great variety of fruits, and the juices of plants, without the help of salt, or any thing sharp, give some reason to expect, that very different ways may be found to make substances outlast their natural term of duration*.

* To preserve fruit and flowers for a whole year, take salt-petre one pound, bole-armoniac two pounds, common clean sand three pounds; mix them together, and, in dry weather, take fruit or flowers of any sort, not fully ripe, each with it's stalk, and put them singly into an open glass, 'till it be full; cover it close with oil-cloth, and in a dry cellar, put each of these glasses four fingers deep under ground, so that quite round above, as well as below, there may remain two fingers thick of the mixture. See Philosophical Transactions, No. 237. p. 44.

Again, that great damage the husbandman often sustains, by stubborn and contagious diseases in his cattle, might, in good measure, be prevented by the instructions of the philosopher, especially if skilled in physic. For, as many diseases, so many cures also are analogous in men and brutes; though remedies, for several reasons, usually succeed best in the latter. A gentleman has, for several years, preserved his numerous

flocks in a moist country, when most of his neighbours lost theirs, by the use of Spanish salt. After having bled them a little under the eye, he obliged them to take down a small handful of it, two or three times in a few days, without permitting them to drink any thing for some hours after it. This remedy he employed at that season when there is a suspicion the sheep will begin to be bloated. I might here alledge the virtue of crude antimony, against the foulness of the blood, and leprosy in swine; of quicksilver against the worms in horses; of the remedy of Palmarius, which, he asserts, is infallible against the bite of a mad dog in cattle; of a more probable one also, that serves no less in men, the effect whereof has been experienced of the antimonial cup, for several diseases in horses and sheep; and lastly, of another antimonial medicine, very successfully used to fatten horses after sickness; all these, and many more receipts of medicines, highly esteemed for their efficacy in several distempers, both in men and brutes, might here be set down, were it needful.

Moreover, there are many reasons assignable, why husbandry, with the assistance of philosophy, may be improved by the addition of a therapeutic part, with regard, not only to the animal and vegetable productions it consists in, but also to the various distempers of the ground itself.

For, were the causes of barrenness therein, with it's respective indisposition to nourish particular plants or animals, discovered, many of those defects may doubtless be removed by rational applications, and proper means of cure; as we see in other inanimate bodies, and even metalline ones. And, from a knowledge of the particular cause of a barren soil, fertility may perhaps be procured to it, without much cost.

Some ingenious husbandmen have lately declared themselves satisfied with a way of meliorating two of the most fruitful kinds of land, clay, and sand, that consists only in skilfully mixing them, in a due proportion, according to the use for which it is designed. [See MANURE.] And an ingenious gentleman, to satisfy some curious persons, purposely sowed some corn, near a place which prospered so strangely, that one root yielded sixty odd ears: and, what is more surprising, this wonderful increase depended only upon a philosophical observation; without any thing extraordinary having been done, either to the ground or the seed.

To proceed: not only the necessary trades, but also the pleasurable ones, are improvable by philosophy; for they chiefly consist in the knowledge and application, of some natural productions and operations. And the things, by this means acquired, will, without changing their nature, serve us in different capacities; thus wine quenches thirst, recovers a fainting person, and intoxicates: the same spirit of wine, wherewith the physician draws his tinctures and prepares his extracts for medicinal purposes, will dissolve benjamin for the ladies; which, mixed with water, makes an excellent cosmetic; and the same spirit, when applied to the proper ingredients, produces several kinds of fine varnish; the tincture of benjamin, likewise, is applicable to the same uses, and is, itself, a pretty odoriferous varnish, and good against tetter, they being bathed therewith.

That knowledge and skill may make happy applications, even of unpromising things, to the delight of mankind, appears evidently from musical instruments; for, who would imagine, did he not know it, that a few pieces of wood, joined together, and the guts of cats or lambs, twisted into strings, should, when artificially struck, afford the most ravishing pleasure? We might here go on to instance, in the art of colouring, perfuming, confectionary, and of preparing cosmetics, &c. did we not chuse to recommend philosophy, from the pleasure it affords the reason, rather than from the charm wherewith it bribes the senses. Though what has hitherto been delivered about the usefulness of philosophy to trades, belongs chiefly to those wherein nature herself seems more concerned than the artificer; yet such are not here exempted, wherein art has the greatest share. These, indeed, rather depend upon the manual dexterity of men, than a skilful management of nature's productions, by operating on each other; yet, even here the naturalist may be serviceable.

Many manual trades, especially as exercised in large towns, consist of several parts, and require other trades to prepare and dispose their materials before they can be finished and fitted for sale. And although the finisher performs his part, by means of his hands and tools, yet the subordinate workmen usually stand in need of some observations on the conditions of the body they deal with, or must else employ some physical operation; and herein they may be greatly assisted, by an intelligent philosopher. Thus, stone-cutting, though it seems wholly to consist in shaping it's materials, contains many particulars, wherein might easily be shewn, that experimental philosophy would be beneficial. For unusual methods might be discovered to examine the nature and goodness of marble, alabaster, or other stones. A competent knowledge of the sap found in stones, to be employed in building, is so necessary, that experienced master workmen assure us, that stone dug at one season, will soon moulder away; when the same sort, taken out of the same quarry, at another, will endure the weather for many years, if not ages. The cements

also,

also, and stoppings, as they call them, which are of great use in this trade, may be improved by one who is versed in such kinds of mixtures. I remember I once taught an inquisitive artist a fine cement for rejoining broken statues; who, by the like means, in other cases, could counterfeit marble so well, that though large cavities were filled up with cement, the work would pass for entire, those parts being undistinguished from natural marble. Want of curiosity keeps our stone-cutters, in England, unacquainted with the ways of working upon porphyre; for none of them will undertake, either to cut or polish it. Other countries also, are ignorant herein, though it was in great use among the Romans; and, even now, at Rome, there are few who make a very great advantage of this art. I am not certain what they employ for that purpose, but believe it to be powder of emery; for I have, in England, caused a porphyre to be cut by means of that, steel saws, and water. Not here to mention, that I have an art to stain white marble with durable spots, small or large, and of red or brown colour.

But the art of stone-cutting depending greatly upon the goodness of the steel tools, which they must have from the smith, and the dealers in iron; if these trades were improved, it would tend to the perfection of the other. And that the smith's craft, however manual it appears, may be meliorated by a knowledge of nature, is not difficult to manifest.

The ways of making iron and steel, are not only improveable before they come to the smith's hands, but better expedients may likewise be devised for ordering them, when they come to be fashioned into weapons and tools.

The sword-blades, and other weapons made at Damascus, are every where famed (and that justly, as far as appears from some trials made) for cutting asunder even iron itself; yet it seems to be only the skill of the artificer that gives them this pre-eminence. Their goodness, indeed, might be presumed to proceed from something peculiar in the materials of that place, did not Bellonius inform us, they have no mines of their own, but receive all their iron and steel from other countries, the artists giving them this temper and perfection. In tempering of steel, it is reasonable to suppose, that besides the goodness of the metal, and the particular degree of heat, which is all the workmen regard, the nature of the fluid, or other body, wherein the hot metal is plunged, and other proper methods of ordering it, may greatly contribute to bring it to great perfection. I have met with a graver of so surprizing a temper, that all the known means, both I and others used, could not let it down; though no graver made in England, could have withstood us. This was afterwards affirmed to have been tempered at Damascus. I am acquainted with a way to harden gravers, without quenching them in any liquor, tallow, or unctuous body; and having recommended to another, an uncommon method of tempering them, he brought me one, which, being plunged into a certain cheap mixture, had been hardened and tempered at once. And, what may seem more strange, though ignition and extinction in cold water be the common way to harden steel, yet, by observing one certain moment of time, steel may, by this means, be made surprizingly soft. But farther, a curious maker of steel tools, told me, he observed a difference between pump and river water, in giving their temper, each being fit for it's respective sort. Besides these, there are many other particulars, wherein iron and steel are improveable by the naturalist. And first, the metal may be rendered so soft, as by means of strong moulds to receive variety of figures. This an eminent artificer assured me, he has seen done in iron, with considerable profit. Secondly, it may be rendered fusible, and I myself with a charcoal fire, and a flux powder composed of tartar, sulphur, and arsenic, have run it into an exceeding hard, and very polishable mass. Thirdly, it may be so ordered, as to continue long free from rust; and an ancient virtuoso, who purchased the secret for a great price, used to shew steel so prepared by tempering it in water, impregnated with the bark of a certain tree. In a word, there are various other means, whereby iron and steel, or the trades that use them, may be meliorated; for the naturalist may advance an art or profession, in abundance of respects; as either by discovering variety of materials, or rendering those already in use better conditioned; by detecting and reforming unheeded errors or mistakes, by devising more easy and compendious methods of operation, by improving the auxiliary branches; by instructing the artificer to chuse, examine, and preserve his tools and materials; for lastly, by shewing how to make the ultimate productions sooner, cheaper, easier, and better, applicable to more uses, or more durable than usual, with other services, too numerous here to relate.

But farther, a naturalist may likewise introduce new trades, as well as improve the old ones; and that, either by inventing them originally, or bringing them into request, where they were unknown before: for neither nature nor human invention, is so far exhausted, as not to afford them, were philosophy employed in the search. We may here observe, that a trade in many cases, differs from an experiment, not so much in the nature of the thing, as it's having been accidentally applied to human uses, or made a business by a

company of artificers, in order to their own profit, which are things extrinsecal and accidental to the experiment itself. Thus, for example, the explosion occasioned by a mixture of nitre, sulphur, and charcoal, whilst it passed no farther than the laboratory of the monk, the reputed inventor of gunpowder, was only an experiment; but, when once the great use to be made hereof became more generally known, and people resolved to make a business of improving and applying it, this single experiment at once, gave rise to founders of ordnance, gunsmiths, engineers, and abundance of other trades.

The discovery of the polar virtue in the loadstone, has occasioned a distinct trade, the art of compass-making: and many other instances of the like kind might be produced, especially where mechanical tools and contrivances conspire with the discovery of natural productions; so that frequently, a very few mathematical theorems, or physical observations, reduced to practice by the manual operator, become trades. Thus, two or three dioptrical propositions, falling into mechanical hands, have introduced spectacles, telescopes, and microscopes. Quicksilver being observed to amalgamate with gold, and to be again separable therefrom without diminution, produced the art of gilding; which principally consists in mixing, by means of a proper heat, pure gold with five, six, or seven times it's weight of quicksilver, 'till it become of a consistence fit to spread upon the silver or copper designed. For the gold being by this means evenly overlaid, they can easily by fire force away the mercury; and with a liquor, by workmen called colourish, wherein nitre, verdigrease, sal armoniac, and other saline bodies are dissolved, restore it's lustre to the remaining gold, which they afterwards make bright by polishing.

The slight and obvious remark that a spring, physically considered, was a continual and durable force, with it's corollary, that this force, properly applied, might balance the weight required to move the wheels of a clock, joined to a suitable mechanical contrivance, produced those useful machines called watches, which now afford a handsome subsistence to many dextrous artificers; and which, though custom has rendered them familiar to us, were unknown to the Ancients, and highly prized and admired even in China, when first carried thither.

The discovery that aqua fortis dissolved silver and copper, but would not work upon gold, added to the observation, that lead, melted with either of the noble metals, and then forced from them by fire, will carry off with it any of the baser sort, has, in later ages, produced the art of refining.

The operations of some lixivias, clays, and other common things, upon the juice of the sugar-cane, has not only added to the ancient husbandry the cultivation of these canes, but given birth to the several trades of sugar-boilers, sugar-bakers, refiners of sugar, and confectioners, not to mention the advantage it brings to the apothecary.

But even a very slight contrivance or manual operation, if it prove fortunate, may supply men with a trade, as we see in the art of printing. And the lucky trial made to bore very small holes through broken China cups, with the use of slender wire, instead of thread or silk, to fasten the pieces together, has given being to the exercise hereof, as a vulgar trade in the eastern countries. Their art also of varnishing or japanning as we call it, which depending on a knowledge of some gums and liquors in their country, employs multitudes of tradesmen among them, is, as I am credibly informed, now practised at Paris. And finding from Linchoten, that in China and Japan they made this excellent varnish of gum-lacca, I imitated one of the best sorts of it, by dissolving that gum in highly rectified spirits of wine, giving it a colour, and laying it on in a particular manner. I might farther alledge, the art of cultivating and gathering sugar-canes, with the manner of ordering their juice, as a recent instance of the transplantation of arts and manufactures; for, as I am very credibly informed, a foreigner accidentally bringing some sugar-canes as rarities, from Brazil into Europe, touched at Barbadoes, where an English planter obtained a few of him, with some hints as to their cultivation and use; which, by the curiosity and industry of the English colony there, were soon so well improved, that the island became, and still continues, able to supply great quantities of sugar. I am the more particular in this instance, because it is very remarkable, and shews, how many hands the introduction of a physico-mechanical art may employ: for the negroes, who live as slaves there and at Jamaica, and are almost wholly employed in the sugar-trade, amount to between fifty-five and seventy thousand, according to the Rev. Mr Hughes. Thus then, it appears probable, that experimental philosophy may multiply trades, as well as improve them. Nor do I despair, that among the means of increasing trades, one may be the retrieving of some that were anciently practised, but since lost, of which the learned Pancirollus gives us a catalogue. For, as the skilful diver brings up, not only pearls and coral, but also shipwrecked merchandise, so the experimental philosopher dives into the deep recesses of nature, to recover inventions swallowed up by the injuries of time, as well as to bring to light her hidden riches.

But, still farther, I am inclined to think, there is no profession, condition, or, perhaps, individual person of the species, that may not, one way or other be advantaged or accommodated, were all the truths discovered by natural philosophy, known and applied. So that besides those inventions, which are formed into trades, there may be a multitude of loose particulars, whereby the naturalist might highly gratify and assist mankind. The nature of the thing will scarce permit me to illustrate this assertion, without descending to instances trifling in themselves, if not contemptible; for which, reason, I shall here content myself with a few.

A great lady, lately complaining that she could not write in the common way, without blacking her fingers, I desired her to prepare her paper with a fine powder, made of about three parts of calcined copperas, two of galls, and one of gum arabic; which being fresh mixed and rubbed with a hare's foot into the pores of the paper, when that came to be wrote on with fair water, it would immediately discover black legible letters. Having several times, occasion to make a word or two lately written, appear as if written long before, I lightly moistened them with oil of tartar per deliquium, more or less diluted with fair water, as I desired the ink to appear more or less decayed. Another cleanly way of writing without ink, is by rubbing the fine powder of exquisitely calcined harts-horn, clean tobacco-pipes, or rather mutton-bones, burnt to a perfect whiteness, upon the paper, and then using a silver bodkin or the like, as a pen. A very simple and easy method of making white table books, is a temper pulverized ceruse, with a strong solution of gum arabic in water, which being brought to a thick consistence, must be rubbed over the paper, and suffered to dry. A very ingenious artificer, having contrived an useful engine, a necessary part whereof was a glass filled with fair water and stopped, complaining that frosty weather by freezing the water broke his glass; I advised him to use good spirits of wine, instead of the water, or to save the expence of that, sea-water strengthened with a little salt; or lastly, common spring-water, with a twentieth or tenth part of salt dissolved therein; for I have found none of these, though clear, to freeze in the sharpest of our winters in England. A confection made up with the pulp of floss, accidentally staining a large quantity of new damask from the top to the bottom, by steeping it for some hours in new milk, and afterwards causing it to be carefully washed in more of the same, the damask came out unstained and white. Urine will usually take stains, even those made by ink, out of linnen; and with strong spirit of salt I have done the same; first wetting the spotted places with fair water, whence after washing, no iron-mole has remained. Some ingenious persons who deal much in lixivias and brines, complaining of inconveniences that attend the trial of the strength of saline liquors by means of an egg; for to mention no others, the same egg will, by being kept, grow lighter, and therefore, when stale, they have usually a large cavity at the bigger end; I recommended to them the use of a piece of amber for that purpose, of what magnitude best suited their occasions. Being once in a place where I could not procure some Dantzic vitriol that I wanted, and obtaining therefore some liquor which the rain had washed from green vitriol, or copperas-stones, and adding thereto a proper quantity of copper, I made it serve as a menstruum to work upon the metal; and by exhaling the solution, obtained the blue vitriol I wanted. And the like, I doubt not, may be done with all those common green vitriols made of iron, wherein the saline part is not too much fatiated with the ferruginous.

A great dealer in cyder, expressing a desire to be able to make that liquor stronger, so as to keep longer than ordinary, I told him to infuse, for twenty-four hours, in ten or twelve gallons of the juice of apples, about two bushels of the same kind of fruit, grossly bruised; then gently pressing them, to repeat the infusion, observing not to make it too thick: and this succeeded excellently.

Searching accidentally in a dark place, where stood some chemical glasses I knew nothing of, negligently stopped, and not wrote upon, one happened to fall, and grievously stain a new suit I had on; but judging, from the nature of the stain, that it proceeded from some acid spirit, by searching about, and smelling to the remaining bottles, I found one that I guessed by it's scent, to abound with volatile salt, and with this liquor I bathed the stained parts, which immediately restored them to their former colour. By the like means also, I have presently remedied the discolourations made in garments, by fretting liquors, which would otherwise have been thereby rendered unfit for wearing.

A virtuoso having made a solution of gold, suspected the metal alloyed with copper, and therefore unfit for his purpose; I advised him to precipitate the gold by an urinous spirit, which it did, into a fine calx, while the fluid, remaining highly tinged with blue, betrayed the copper that had been used for alloy.

These trifling instances being more pertinent to my design, than others in themselves of greater value, is the reason I have chose them; nor shall I repent the mention of them, if they serve to shew, that the meanest experiments may sometimes be useful, and better adapted to convince strangers to

philosophy of it's numerous uses, than those of a higher and obtruder nature. As to know the use of a bladder of air, may be more serviceable to a pilot in a shipwreck, than the most hidden properties of the magnet; so in some cases, obvious and slight experiments prove vastly more welcome and useful, than more considerable ones would at another time: so true it is, that 'every thing is beautiful in it's season.' For my part, I cannot but hope, that natural philosophy will prove daily more serviceable both to particular persons, and trades themselves; especially if a farther enquiry be made, and thereby new qualities detected, and unheeded uses of natural and artificial philosophy discovered. For whoever narrowly considers it, will find, that trades at present, deal with but very few of nature's productions, in comparison of those they leave unemployed; and that what they do make use of therein, are their obvious qualities, bating some few more secret properties which chance, or a lucky sagacity, rather than skill and enquiry, have discovered; and, therefore, I scruple not to assert, that if men were thoroughly sensible of their own interest, and would carefully keep their eyes open upon the properties of things, and the application that might be made thereof in human life; they might not only discover new qualities thereby, and so produce NEW TRADES, but even convert them to such uses as the inventor little imagined: and of this I might produce various instances. To these general considerations I must add, with regard to the following, that the reader is not to expect a methodical enumeration of all the grounds and motives I have to expect greater advantages from a future progress in the knowledge of nature, for I chuse to confine myself to what I can render probable by examples, and instances of that which is already acquired, or very likely soon will be. It must not, therefore, be imagined, that I have overlooked all the particulars pertinent to my subjects; nor that I proposed to set down all the inducements that might be brought, to shew the usefulness of experimental philosophy. My design is only to render the expectations of advantages to be received from it probable; to do which, is taking a good step towards the attainment of the things themselves, as Sir Francis Bacon well observes. And I the rather endeavour to heighten mens expectations herein, because many there are, who, being bred up in the vulgar barren philosophy, judge of all philosophy by that; and because some morose authors and depondent persons, who have unsuccessfully attempted to perform things delivered by unfaithful writers, fancy, and would persuade others, that nothing considerable is performable by natural philosophy; our forefathers having, if we credit these persons, had the good luck to hit upon all the profitable inventions which philosophy can afford mankind. It may here also, possibly be expected that I should treat particularly of the principal means whereby a naturalist might advance trades, and assist mankind to recover part of his lost empire over the works of nature. And I confess I have had thoughts of a project to advance experimental philosophy, consisting of such heads as these. A prospect of what may probably be attained to by philosophy, both in theory and practice. A brief account of what is already obtained thereby. The imperfection of our present attainments. What helps we now enjoy. The insufficiency of our present helps. The hinderances and causes of them. And lastly, the means and helps that may be applied. See ROYAL SOCIETY.

PHILOSOPHICAL CHEMISTRY consists of three parts, viz. invention, rationale, and experiment. Whence it might be defined, the particular exercise of the inventive and rational faculties of the mind upon chemical subjects, operations, and effects, leading up to experiments and back again; so as to draw conclusions, account for phenomena, start problems, and attempt their solution in this circle successively*.

* Nec manus nuda, nec intellectus sibi permissus, multum valet: instrumentis & auxiliis res perficitur; quibus opus est non minus ad intellectum quam ad manum. Bacon.

Philosophical chemistry, therefore, is the source and soul of the whole art; as by inventing, reasoning, comparing, and adjusting of things, directing experiments, and concluding from the result, it forms new doctrines, and makes new discoveries, for itself, and all the other branches, to improve and apply.

In the way of invention, this part of chemistry is more particularly applicable: (1.) To the imitation of natural and artificial things: (2.) To the production of new artificial bodies: (3.) To the starting of new arts and trades: and, (4.) To the supplying of desiderata, or defects in the old ones. (1.) As natural bodies may be so dissolved or taken to pieces, as in many cases to discover their constituent parts or ingredients; philosophical chemistry hence forms rules for imitating various productions of nature; which, in some particulars, is done to great exactness; as in the making of cinnabar, vitriol, &c. where the resolution has been found easy; in others less exactly, where, by the common methods, the resolution has hitherto proved more difficult, as in the business of artificial gums and metals, though some well meant attempts have appeared in this way too.

The like also is to be understood of artificial bodies, made in one country and imitated in another; whence the imitation of Venice glass in England, the imitation of porcelain, the Japan varnish, various refinements of foreign drugs, sugar, &c. in Europe: all which were not casual, are of pure chemical extraction: and the proper enquiries into things of this kind, fall under the inventive part of philosophical chemistry.

(2.) New artificial bodies are chemically producible ab origine, either in the act of separation or combination.

In the way of separation, chemistry has invented and produced fermented potable liquors, inflammable spirits, salts, sugar, pot-ash; those vulgarly called chemical preparations, as oils, extracts, spirits, &c. various pigments, and all the pure and unmixed metals: and in the way of combination, it has produced soap, glass, vitriol, gunpowder, all the mixed or artificial metals, &c.

(3.) Arts and trades are the genuine fruits or consequences of the preceding discoveries, in which view inventive chemistry is the purveyor to all the other branches, and has thus struck out a very large number of hints, which are frequently formed in trades. Thus the invention of aqua fortis, for example, has given rise to the scarlet dye, the business of etching, the art of refining, &c.

(4.) And, as inventive chemistry strikes out new arts and new trades, it is no less capable of discovering means to promote them, or supply the defect, which may appear in their first establishment, or retard their farther advancement. Instances of this kind are every where to be met with; particularly in the arts of sugar-baking, soap-boiling, fermenting, distilling, &c. wherein many shorter and better methods of working have been severally discovered.

(5.) In the way of rationale, philosophical chemistry is particularly applicable: (1.) To the accounting for natural and artificial phenomena and effects: (2.) To the explanation of the general and particular properties, or forms and qualities of bodies: (3.) To the discovery of the chemistry of nature: (4.) To the consideration of natural and artificial transmutations: and (5.) To the giving a rational theory of medical matters.

(1.) Philosophical chemistry accounts for many natural and artificial phenomena and effects, as it is often in the power of this art to imitate the same; whence reasoning by just analogy, it may be allowed to give fair and satisfactory solutions. After this manner it endeavours to account for lightening and thunder, with their strange effects; the aurora borealis, earthquakes, volcano's, &c. And much in the same way it solves the phenomena of gunpowder, the phosphori, and various other surprising productions of chemistry itself.

(2.) As this part of philosophical chemistry is used to explain the general and particular properties, or forms and qualities of bodies, it considers heat, cold, light, moisture, dryness, volatility and fixedness, fluidity and firmness, continuity and contiguity, colours, tastes, odours, congelation and congelation, effervescences, fermentations, putrefaction, solution, precipitation, and the various operations of chemistry, with numerous other phenomena; so as to shew how they are produced, effected, altered, or changed in bodies, and thence to make out their general and particular histories.

(3.) Philosophical chemistry finds many reasons for allowing a chemical agency in the production of natural bodies, and their manner of acting upon one another, whence they bring about a kind of true chemical effects. And upon this foundation, the original composition and structure of natural bodies, is rationally accounted for, with the operations and effects of the elements upon each other. Thus water and air may be chemically considered, as two grand menstrua of nature; which, by means of the sun's heat, and the subterranean warmth, are continually at work upon all sublunary bodies, in order to bring forward various changes, regenerations, and transmutations, &c. Whence the origin and appearance of meteors, the generation of hail, snow, rain, metals, minerals, &c. And thus all vegetation, anomalization, and mineralization (if these words are allowable) may be considered and accounted for, as operations or effects of natural chemistry.

(4.) The business of natural and artificial transmutations falls the more particularly under the rationale of chemistry, as little else but consideration and reasoning is required to understand and apply it. These transmutations may be entirely natural, or entirely artificial, or partly natural and partly artificial. Under the entirely natural, come such as those produced by putrefaction, long standing or digesting in the air, water, or any natural fluid: whence animal substances are converted into vegetables, wood into stone, metals into one another, bodies into air, water, fire, &c. and these are again into bodies.

The transmutations effected by the joint concurrence of nature and art, are such as those made by fermentation; where art puts the subjects together, and rightly disposes them, but nature performs the business: so in the making of paper, art stamps the rags, but nature half putrifies the matter, and thus contributes to change it.

The transmutations purely artificial, are such as those made

by triture, mixture, long digestion, and other chemical operations; as in extracting the mercuries of metals, and several other instances in the sublimer metallurgy.

Whether these artificial transmutations be real or only apparent, is not so much the question; those who will not allow them for transmutations, may call them alterations or changes of one form into another: and, perhaps, they may be no more at the bottom; for, if the changed body be not always artificially reducible to its pristine state again (which is supposed the criterion of an artificial transmutation) this may be owing not to any impossibility in the thing, but to the want of a suitable method for doing it.

(5.) A just theory of many medical matters will naturally flow from the foregoing considerations, or from a particular application of the rationale of philosophical chemistry to the human body; with a view to observe its natural state, its disorders, and the effects of remedies. Thus, in particular, it helps to clear up the disputes about animal digestion, chylification, sanguification, nutrition, &c. shews how the blood and humours are altered by heat, cold, motion, attrition, &c. Whence the origin, nature, duration, and phenomena of distempers, and their manner of cure.

(6.) In the way of experiment, philosophical chemistry is universally applicable, and many times absolutely necessary to the farther examination, illustration, and confirmation, of the preceding parts, or the whole theory of the art, which indeed cannot subsist without it. For though some kind of theory might be formed of philosophical matters independent of experiments, yet such theories have usually been found barren, unsound, or useless, so as in no respect to be safely trusted*.

* *Omnem philosophiam ab experientiae radicibus, ex quibus primum pullulavit, & incrementum cepit, avulsam rem mortuam esse.* Bacon.

(7.) It is the peculiar province of this part of philosophical chemistry to bring new inventions and theories to the touchstone; discover their validity or their insufficiency; and when found just and solid, to confirm or stamp them with a character that makes them universally current, and fit to be employed for farther uses.

(8.) Thus, when any hint is started for a new trade, or chemical method invented for the improvement of an old one, before the least attempt is made to apply it in real business, the proper essay or experiment must be performed in miniature; which proving successful upon repeated examination, with due variation of circumstances, may now encourage the application, or advancement of this discovery into an art.

(9.) And thus philosophical chemistry works in miniature to try the truth, and find out the practicability of things; an example or model of which procedure is preserved and particularly retained in the business of assaying [see *Assay*], which before-hand determines the yield of an ore, and sometimes the best way of working it in large, by previous experiments made in miniature.

(10.) By thus confining itself to work in small, or in the way of trial, enquiry or specimen only, philosophical chemistry has the opportunity of fully commanding its subject; which it chuses of a proper size for the external senses to view, and examine on all sides, and observe the phenomena, effects, and relations, without being oppressed with too unwieldy a bulk, or having the mind distracted with too many considerations; which might attend a large work, and retard its advancement to a regular and stated perfection.

(11.) But when thus the experimental part of philosophical chemistry has perfected any discovery in small, with relation to arts or trades, and clearly and solidly shewn how it may be wrought to advantage in large, it has now performed its office; and here leaves the thing, or turns it over to the other branches of chemistry, whose end is advantage, to be carried on in the form of a business. So Cornelius Drebbel, when he had fairly assayed and proved the invention of the scarlet dye, gave it up to those, who afterwards exercised it as a trade. And this appears to have been the general way wherein arts and trades were originally invented, or first brought into use, for it cannot be supposed, that large expensive works should have been set up, before any trial had appeared to encourage them.

(12.) It is a particular happiness in this business of experiments, that when an enquiry is made by their means, a proper set or competent number of them, gone through in due order, will usually give the discovery, or as it were a spontaneous solution of the problem. But to practise this method to advantage, requires a judicious head and a dextrous hand, with a due observance of the rules laid down by the lord Verulam, in his noble work *De Augmentis Scientiarum*, and *Novum Organum*.

(13.) As the several parts of the philosophical chemistry are thus separately applicable to such good purposes, much greater advantage may be reasonably expected from the joint use and mutual assistance which they are capable of affording each other, especially by a precedent management and application. A great deal has been already done in this way, but more remains to be done. The lord Bacon seems to have gone as far as mortal could, without the assistance of new sets of experiments

experiments in all the parts of philosophy, but principally in chemistry, up to which experiments his attachment to nature led him: but at the fiat experimentum he judiciously chose to stop, rather than to advance farther by the help of conjecture, or supposing the event of experiments, which it would require some ages to make. As if the fiat experimentum had been directed to Mr Boyle, he took up philosophical chemistry where the lord Bacon left it; and to what lengths he carried it, the present state thereof may witness.

(14.) But the English philosophers seem, at present, to be got a little out of this chemical vein; and applying closer to other studies, leave the cultivation of chemistry to the philosophers of other nations. We have had our Bacons, our Digby, and our Boyle; men as eminent in chemistry, as in other parts of useful knowledge: but Germany seems more disposed to encourage this art, where every court has it's laboratory, and every mountain it's mine: whence it has been usually well supplied with a competent set of original chemists, such as Agricola, Ercken, Kunckel, Becher, Homberg, and Stahl.

(15.) Hence also their contiguous neighbours the Dutch have derived so much of this art as suits their purpose, and fits them to supply all Europe with commodities of greatest consumption, new fabricated and refined by their industrious hands. Nor has less industry been used of late, to promote the knowledge of this art in their universities: and though it has been there taught with a view to medicine only, yet some have hence took occasion to launch into the ocean of philosophical chemistry; particularly Boerhaave, that late learned and assiduous professor of Leyden.

(16.) But not to leave this business of philosophical chemistry too loose, it may be necessary to restrain it within it's own bounds. It seems sufficiently distinguished from the exercise of arts by that observation already made, as to it's confining itself to work in miniature, by way of trial and specimen only; whereas arts and trades, produce in large, upon a settled discovery, to supply the demands of commerce.

(17.) Though we distinguish this general head by philosophy experimental (under which we comprehend all kinds of experiments that may be of use in arts and trades), yet there is a distinction between philosophical chemistry, and the common experimental philosophy, which lies here; philosophical chemistry, is the business of experimentally examining into the internal structure and composition, not only of natural, but also of artificial bodies; separating their constituent parts, differently combining these again, and thus producing new concretes, and new modifying both the internal or external form of the old ones: whereas the common experimental philosophy is employed in the discovering the more obvious properties, and external uses of natural bodies; the gross integrant parts, or entire aggregates, whereof it experimentally orders, disposes, and applies in their natural form and substance, to the promotion of knowledge, and the uses of life: but this produces no new bodies, nor enters into the substance, structure, and composition of the old ones; nor changes their external and internal forms; nor separates their constituent parts; nor variously combines these afresh; nor regards bodies at all as they are resolvable and combinable, or as they are simples, mixts, compounds, aggregates, or de-compounds: all which is the peculiar business and office of philosophical chemistry.

(18.) Thus again; it is conceived that natural philosophy cannot, with propriety, be said to extract and purify metals, analyze vegetables, animal and mineral substances, tan leather, brew beer, dye cloth, make glass, produce oils, spirits, soaps, &c. but these and all such, are the direct and proper operations of chemistry.—See TANNING, BREWING, DYEING, GLASS, OILS, SPIRITS, SOAP, &c.

So likewise, natural philosophy discovers the obvious, external properties of the air, fire, water, heat, cold, moisture, wind, &c. by means of various experiments, made with the air-pump, and other suitable contrivances; but it is philosophical chemistry, which more essentially examines into the internal nature, composition, relations, and uses of the elements, and other phenomena, and thence finds ways of applying them as engines and instruments of actual business: and thus in a more particular manner, it applies those two grand instruments, heat and cold.

(19.) In short, there seems to be nearly the same difference betwixt chemistry and the present natural philosophy, as there is betwixt art and nature; so that, perhaps, it might not be amiss, if, by way of distinction, UNIVERSAL CHEMISTRY were allowed to pass under the name of ARTIFICIAL PHILOSOPHY.

(20.) This distinction might not only serve to restrain chemistry to it's proper province, and settle it's real extent and immediate business, but contribute also in some measure, to remove the prejudice too commonly affixed to the name, when chemistry is mentioned.

(21.) The immoral practices of many who have assumed the name of chemist, have greatly contributed to bring a disrepute upon the art; whereto the abandoned and dissolute have usually made their pretensions with no more knowledge of it, than would serve them to cheat dextrously under it's appear-

ance. So odious has chemistry been rendered by this means, as to deter many from the due study and exercise thereof, whence it has been too much left in bad hands. But the damage from this quarter is more sensibly perceived in the sublimer metallurgy; whence GOLDEN MOUNTAINS having been too often seriously expected, the indigent and the knavish pretenders to art, have hence been furnished with a fine handle to practise upon the unwary, or such as they found blinded by an immoderate passion for gain. See CHEMISTRY.

(22.) These and the like abuses, are no way justly chargeable upon the art itself, but entirely upon the artist; yet such is the fate of human affairs, that the faults of men are often laid at the door of the arts they profess, as those arts may prove occasional causes of the ill: whence philosophic chemistry, perhaps, gives more occasion of public and private abuses than other arts, as being less generally understood, and attended with the prospect of greater advantages.

(23.) But, as the best things are capable of the greater abuse, this misapplication of chemistry could hardly of itself, have removed it from the care and patronage of the English philosophers, if more tempting studies had not come in the way; particularly the higher geometry, and speculative philosophy, which have employed most of our greater geniuses. But if upon full examination, these more sublime studies shall be found of narrow use, philosophical chemistry may again chance to be cultivated, as an art whose essence is action, and whose end is usefulness in life.

(24.) And, if the genius of the British philosopher should in earnest turn this way, the art itself might thus be nobly rescued from the hands of such as dishonour it; and be set in it's true light, unfulfilled by chicanery or delusion: new improvements would be daily made therein, many valuable secrets discovered, new trades advanced, commerce in general enlarged, and useful knowledge increased. And though our philosophers were to be thus employed for ages yet to come, there is no fear of exhausting this rich mine of philosophy and arts: which may be now dug to greater satisfaction and advantage, as there is no want of mechanical hands in England to execute in large, or bring into works, such discoveries as shall give the encouragement. For as much as the English philosophers excel in contrivance, invention, and accuracy of experiment, so much are our mechanical people allowed to excel in adroitness and truth of work. And since the new openings, draining, and working of mines among us, we seem to be called upon afresh to the exercise and improvement of this art; whence it may in time come to meet with that esteem and application it deserves, in a country so justly famous as ours for it's philosophy and it's trade, and thence one day appear in a due body and form of ARTIFICIAL PHILOSOPHY.

(25.) But such a fabric cannot be erected without a number of hands, set to work upon the several parts; and, indeed, all the assistance that can any way be procured, is little enough for the purpose.

(26.) When a general knowledge is gained in the theory and practice of this art, of experimenting philosophically in all respects, so that it's uses and manner of applying to the purposes of life, are become ready and familiar; it seems principally necessary to it's farther advancement, that there should be a free communication of studies, experiments, and trials, among a select number of persons thus qualified: for as it is naturally impossible that any single man should have a competent knowledge in all arts and sciences, so is it expedient, that as much thereof as can be acquired should be lodged in some few, who may freely draw out of each other as occasion requires. Whence they might be enabled to furnish out not jejune repetitions of things already currently known and practised, but results of new enquiries, real improvements, and methods of supplying the defects of particular arts; or essays well fraught with experimental FACTS and useful discoveries, after the manner of Bacon, of Boyle, of Homberg, and of Stahl and Shaw. Nor will such a select body of men fail of procuring all the assistance that can be had from uncommon books, papers, and accounts of particular facts and experiments. And in this manner philosophical chemistry should be kept continually open, or in a state of improvement; permitting as it advances, that arts and trades be supplied, detached, or drawn from it occasionally. See the articles CHEMISTRY, MUSEUM, and ROYAL SOCIETY OF LONDON.

PICARDY, in France, is bounded on the east by Champagne; on the south by the isle of France; on the west by Normandy and the British Channel; by which also, with the provinces of Artois, Hainaut, and Cambresis, it is bounded on the north. The soil is extremely fertile in corn, and several sorts of fruits, but it affords little or no wine. It is usually divided into three parts, viz. Upper, Middle, and Lower Picardy.

UPPER PICARDY has Hainaut and Cambresis on the north; Champagne on the east, Laonnois on the south, and Vermandois on the west.

At LA FERRE is a powder-mill, in which they make about 120,000 pounds of powder yearly; and at Vermin, a small city on the rivulet Serre, they have a great trade in corn.

MONCORNET,

MONCORNET, near the same river, has a manufactory of coarse serge.

MIDDLE PICARDY comprehends Vermandois, the country of Santerre, and Amienois.

ST QUINTIN, in Vermandois, near the Somme, is a very populous place, and has divers sorts of manufactures, especially of linnen cloth.

PERONNE, in the district of Santerre, on the same river, is also very populous, and they make a vast quantity of linnen cloth in the neighbourhood, of which they sell yearly at Peronne for above 150,000 livres.

AMIENS, the capital of Amienois, stands also on the Somme, which runs through it in three different channels, which unite again below it.

There are here, and in the neighbouring villages, manufactures of ferrets, or woollen ribbands; they also make here a great quantity of black and green soap.

LOWER PICARDY comprehends Ponthieu, Boulenois, and the Pais Reconquis, or the Recovered Country.

ABBEVILLE, in the division of Ponthieu, is situated on the river Somme, and is the most populous town of all Picardy, next to Amiens. In the year 1665, Mr Van Roberts, a Dutchman, set up here a manufactory of woollen, the success of which has been extraordinary. Lewis XIV. granted him and his people several privileges, and, in particular, the liberty of importing all necessaries for his manufactory, without paying any duty. Those cloths are said to be almost as fine as those made in England or Holland. Some years ago one Turner, an Englishman, went thither, and gave Mr Van Roberts all the insight he could; after which he went into Holland, and found a very good reception amongst the manufacturers of Leyden. There is also at Abbeville a manufactory of mocades, and striped stuffs called tripes, the warp of which is thread, and the woof wool, of several colours, for the figures that are to be traced in weaving. They also make here sail and other coarse cloth, and linsens, which being dyed, serve for linings. They have, besides, a considerable manufactory of black and green soap, of which they sell for above 100,000 livres yearly. The musquets and pistols made here are very much esteemed. This city has a good trade, by means of the vessels that come up the river Somme, with all sorts of merchandize, which they exchange for the cloths, linsens, and stuffs made here. See FRANCE.

ST VALERY is a populous sea-port town, at the mouth of the Somme. The entrance is very dangerous, because of the shelves and quick-sands, that shift from place to place; however there is a very great trade here, because all merchandizes are easily carried from hence to Amiens, and from thence into Artois, Champagne, and to Paris. They import here spices from Holland, as also pot-ashes for making soap, cod-fish, herrings, cheese, and a great many other different commodities from several countries, and even from America; and they export into Spain and Portugal the manufactures of Picardy.

BOULOGNE, the capital of the country or division of Boulenois, is situated at the mouth of the little river Liane. The harbour is very incommodious, and the road before it extremely bad, the sea being excessively rough and boisterous with any winds but what blow from the north to the south-east. It is divided into the upper and lower town, which last is the largest and most considerable for its trade.

CALAIS, in the Pais Reconquis, is at present a considerable mart. The port is very happily situated, but yet it has several inconveniences, for no vessel can enter it without running a great danger, whether it comes along the east or west mole, and there is here no road for ships to ride at anchor.

PIEDMONT is bounded on the east by the Duchies of Milan and Monterrat; by the territories of Genoa, and the country of Nice, on the south; by High Dauphiné, and part of Savoy, on the west; and by the duchy of Aoste, and part of the Milanese, on the north. The river Po divides it into two parts. Its length, from north to south, is about 130 miles, and breadth from east to west, where broadest, about 94 miles. It reaches from 43 degrees 25 minutes, to 45 degrees 50 minutes of latitude, and from 7 degrees to 8 degrees 30 minutes east longitude.

Piedmont, as it is a very rich and fertile country, so it is likewise one of the most pleasant and plentiful in all Italy. It produces great abundance of corn of all sorts, wines, and fruits in great variety; as also hemp, flax, saffron, mulberries to feed great quantities of silk-worms, the silk here being a great manufacture; and affording good store of cattle, some metals, and, in a word, plenty of every thing fit for man's use and delight, and so well peopled, that the Italians used to say the duke of Savoy has but one city in Italy, 300 miles in compass.

This country is divided into Piedmont, properly so called, and French Piedmont.

PIEDMONT, properly so called. This country is bounded with Monterrat on the east; the territory of Genoa on the south; the marquissate of Saluzzo on the west; and that of Susa, and the marquissate of Jurea, on the north.

FOSSANO was so called from some medicinal springs in the neighbourhood of it, not unlike those of our Epom and Tunbridge. It stands upon the river Stura, between Saluzzo to the west,

and Mondovì to the south-west, 27 miles south of Turin, 8 north-east from Coni, and 30 of Pignerol.

FRENCH PIEDMONT. This country scarcely deserves to be made into a separate article, it consisting only of three towns, which lie contiguous to that we have been describing above, and on the west side of it.

R E M A R K S.

No country of its dimensions yields the sovereign so great a revenue as Piedmont does the king of Sardinia: the English alone have taken off the value of, at least, 200,000*l.* of their raw silk annually, for several years; but their crops of silk-worms are sometimes destroyed by storms of hail, called the plague of Piedmont. See SILK-WORMS; SILK.

PILCHARD. The pilchard is a sea fish, bigger than the anchovy, but smaller than the herring.

The pilchard has a gilt head, a white belly, and the back of a sea-green colour, that is, a little whitish. This fish, eaten when it is fresh, and lightly sprinkled with salt, is reckoned exceedingly good; those of Royan, a small town in Xaintonge, are reckoned the best, if we can credit the French.

There are proper seasons for the pilchard-fishery, being as the anchovy and the herring, a passage-fish.

They are dressed and salted in the same manner as anchovies and herrings, with this difference nevertheless, that they leave the head of the one on, and take it off the other. The anchovy is easily distinguished from the pilchard, though this last had its head taken off; the anchovy having a round back, and the pilchard being very fat.

The pilchard-fishery is very considerable in France; it is carried on from the road of Olone Sands, in lower Poitou, as far as the bay of Douarnenez, even to Brest. It commences in the month of June, towards the sand's side of St Giles. This fish, in those places, is sold as soon as caught, to people that salt them, and carry them on horseback to the neighbouring towns; where, at their first coming in, they are much esteemed.

Pilchards commonly follow the shore, and a little while after they appear at the Sands and St Giles, they begin to take them at Belleisle, next at Port Louis, at Crac, and at Quiberon; afterwards at Concarneau, and, lastly, at Douarnenez, Crozon, and Cameret, near Brest. Pilchards have been caught in the bay of Douarnenez at Christmas.

Along the coast of Bretagne, from Belleisle as far as Brest, there is a great trade of pilchards; some are sold salted, or in piles, some in casks, others are dried by the fire, or in smoke, and others are put into little barrels, and are called pickled pilchards.

They do not prepare such quantities, either salted or in piles, as they did formerly, upon the account of the exactness of the custom-officers, who examine them when they come to the custom-house, and take off all the salt, without which they soon putrify.

Those that come in casks, are called pressed, or pickled pilchards, because when they have been in salt for a while, they are well washed and put into casks, in which they are well packed, in order to drain out all the oil which would corrupt them. The casks which they make use of, are a little bigger than half a barrel, and the best are made of beech-tree, pilchards being preserved therein, better than in any other sort of wood. Though these casks be small, they give but four of them to a ton. There are statutes about their quantities, because in all Bretagne they buy them by the ton, always packed in casks.

Towards the end of the fishing time, when pilchards are a little bigger, they pack some in casks of a common size; but those are bought and sold on account, in which the credit of the fishermen is trusted to, who put them in casks, and mark upon the bottom the quantity of pilchards therein contained. Pilchards that are caught in the months of July, August, and September, are not fit for packing, because the great heats rendering this fish soft, it bursts easily on packing; and for this reason, the pilchards which are packed at Belleisle, Port Louis, Crac, and Quiberon, are not much esteemed, the fishing time lasting, in those places, but 'till the month of September; whereas, it does but begin at Concarneau and Douarnenez, when the weather is not too hard, and sometimes lasts 'till Christmas.

It is from those two last places, particularly Douarnenez, that the best pilchards are caught, and best preserved. The Maloians load whole cargoes of them there, to export to different places of the Levant.

In order to have the pilchards of a good quality, they must be well packed, firm, white, and clear; neither burst, nor soft, nor yellow, but of a good bigness, that a cask may contain 6000 of them; for when it contains more, even 10,000, they are too small, and when less, they are too large; for which reason, a little cask should not contain above 2000, or 3000; so that a trader who is obliged to sell them by retail, can get nothing by them.

The dried pilchards are bought and sold on account; when they are not broiled, they are more valued than those packed, and those salted also, are dearer. It is of the last fishing, when

when the pilchards are very firm and big, that they dry them. There is a great sale of these fish at Bourdeaux, Rochelle, and Nantes, as well as in some little harbours in the country of Aunis, and the province of Xaintonge.

Sometimes they send them to Bayonne and Biscay; but they are not dear there, but when the fishing has not been favourable in Spain, where great quantities are caught upon the coasts of Galicia.

The pilchard fishery, in France, employs more than 300 shalloops, and almost all the seamen of the country, in the season, upon the coast of Bretagne; each shallop is commonly of 2 or 3 tons burthen, and has 5 men, and 12 nets, from 20 to 30 fathom.

The barrel is sold from 20 to 50 livres; the greatest consumption of this fish is in Spain, Portugal, Italy, and all the Mediterranean; the fishery is commonly so good, that at Port Louis only, they vend 4000 barrels yearly.

Pilchards which are caught in Languedoc, are transported to Rouffillon, Dauphiné, and the Lyonnais.

The pressed oil of pilchards is put into casks; it serves to burn, and it would have more virtue if it was not salted.

There is so plentiful a fishery of pilchards upon the coasts of Dalmatia, in the months of May and June, near the south of the Isle of Iffa, that it supplies, not only a part of Greece, but also a part of Italy; the Turks take this fish as a medicine, when they are sick.

Pilchards follow the light, and encompass the shallop that carries it in the night, and that contributes very much to their catching. To facilitate which, they make use, upon the coast of France, of cods eggs; those eggs being a kind of bait for pilchards.

A fishing, almost as peculiar to Great-Britain as the herrings, is that of pilchards. The Cornishmen say of the pilchard, that it is the least fish in size, most in number, and greatest for gain, of any fish they take out of the sea.

Their season is chiefly from the beginning of August to All-Hallowtide, as the countrymen call the 1st day of November. They are said to pursue, on the coast of Cornwall in England, a small fish called the brit; and this draws them into the mouths of rivers and havens. They swim so near the surface, that they are discerned by the rippling of the water at a great distance.

There are two ways of fishing for these pilchards, and the fishermen are called drovers or feyners.—The drovers watch the shoals of the fish entering into the mouths of rivers and harbours as above, where they wait with large square nets, placed athwart the tide; and the shoal of pilchards passing by, and over them, all that come in the way of the net are entangled.—The feyners take them in the open sea. These complain that the drovers spoil the fishing, for that those driving nets take but a few, and that they break and scatter the shoals of the fish, driving them from the shores: neither are the fish taken that way so merchantable, being bruised in the meshes of the nets, and in tearing them hastily out.

The feyne is a large net, the same in form with those used in rivers, but far much larger: for, as the river feyne nets are 30 or 40 fathom long, those used in the sea, are sometimes 5 or 600 fathoms; and each feyne is managed by three or four large boats at least, each boat having 6 men. With these boats and feynes, they ply about in the sea, where they expect the fish; and they are directed in their work by a man, or several men, who are placed on the hills, called the balkers or suers. These men standing on a high cliff, can discern the course the fish take, by the rippling of the water: and they give notice by shouting, by waving a flag, or such signal as is agreed on; and accordingly the men in the fishing boats order their matters. At the appointment of these balkers, the men in the boats let down the feyne, and draw it this way or that way, as the shoal of fish lies: then the net being wholly spread, they row round, and coming behind the fish, they beat the water with their oars to drive them into the net: at last, they either close and tuck up the net in the sea, drawing the fish into their boats, or draw it away to land; which, if the shore be free from rocks, and not too steep, is much the surest, and most advantageous way. By this method they sometimes take 2 or 300 tons of fish out of a shoal.

The pilchards are cured by packing and pressing, as the herrings, and sent into the Straights from England, to the several parts of Spain, Italy, and the Levant; where they generally meet with a good market. They formerly cured them by smoaking; but they have many years left off that method in England.

P I L O T. A pilot is he that has the government of a ship, under the master, or who is intrusted with the steering of the same. And it has been usual for pilots not only to direct the ship's course, but also to steer her too themselves, as they are still obliged to do amongst us, when the ship has any dangerous place to pass through, or is so near the shore that a more than ordinary skill is requisite to bring her safe off; but otherwise, such of the other mariners as are most capable of the function are appointed to do it by turns.

By the sea laws of Wisbuy [see **WISBUY LAWS**] every pilot, mate, or mariner, that does not understand his business, shall be obliged to repay to the master whatever wages he had

VOL. II.

advanced him, and besides be bound to pay half as much more as he had promised him. The laws of Denmark punish an ignorant pilot by sentencing him to pass thrice under the ship's keel: and by the laws of Oleron [see **OLERON'S LAWS**] if a pilot undertakes the conduct of a vessel, to bring her to any port, and fail of his duty therein, so as the ship miscarries by reason of his ignorance in what he undertook, and the merchant receives damage thereby, he shall be obliged to make satisfaction for the same, if he have wherewithal; and if he hath not, or where the fault of the pilot is apparently gross, that the ship's crew see an apparent wreck, they may lead him to the hatches, and strike off his head. Sea Laws, 176. Leg. Oleron, 23.

The laws of France ordain, That no person shall be received as pilot, nor perform that function, 'till he has made several voyages, and passed a strict examination as to his knowledge and experience in navigation; and he shall be obliged, for proving his voyages, to produce the journals thereof. The pilot shall provide himself with all maps, books, and instruments necessary for his art: and in long voyages, he shall have two journals, in one of which he is to write the changes of the courses and winds, the days and hours of the changes, the leagues which he believes the ship has sailed in each, also the reductions in latitude and longitude, the variations of the compass, together with the sounds and shores he has discovered; and in the other he shall write out, once in 24 hours, the courses, longitude and latitude reduced, and the latitudes observed, and all other remarkable things discovered during the voyage; and at the return of such long voyages, shall lodge a copy of his journal in the Admiralty, on pain of 50 livres. Sea Laws, 291, 292.

And by the same laws, if a pilot, by ignorance or negligence, occasions the loss of a ship, he shall pay 100 livres fine, and be for ever deprived of the exercise of pilotage; and, if he does it designedly, he shall be punished with death. But no masters of ships shall force pilots to pass through dangerous places, or to steer courses against their will; and, in case there be difference in opinion, they shall be governed by the advice of the most expert mariners.

When a ship comes to a harbour or river, and the master doth not know the coast nor the river, he ought to take a pilot of that country to carry her up the river or harbour; which pilot shall be maintained by the master, and paid by the merchant: also, if it is thought convenient in any river, or off any dangerous coast, to take aboard a pilot of the country, though the merchant opposes it, if the master, the ship's pilot, and the major part of the seamen are for it, he may be hired, and shall be paid by the ship and cargo, as averages are calculated for goods thrown overboard. Leg. Wisb. 44 and 60. Ibid. 185, 188.

The master of the ship generally in charter-parties [see **CHARTER-PARTY**] covenants to find a pilot, and the merchant agrees to pay him his pilotage: though if a ship should be lost coming up the river, under the charge of the pilot, it has been a question, whether the master should answer for the insufficiency of the pilot, or whether the merchant may have his remedy against both? But it has been conceived, that the merchant hath his election to charge either; and, if he charges the master, then the master must have his remedy against the pilot. After the ship is brought into sure harbour, the pilot is no further liable, for then the master is to see to her bed and lying, and hath all the charge upon himself; so that he must answer all danger and hazard, except that of the act of God; but, before she arrives at her place or bed, and while she is under the pilot's care, if she or her goods perish or be spoiled, the pilot shall make good the damage. Leg. Oleron. Molloy, 254, 255.

By statute 3 Geo. I. cap. 13. If any person shall take upon him to conduct and pilot any ship or vessel, by or from Dover, Deal, or the Isle of Thanet, to any place on the rivers Thames or Medway, before he has been examined by the master and wardens of the society of Trinity-House, and shall be approved and admitted into the said society at a court of load-manage, by the lord-warden of the Cinque-Ports, or his deputy, and the said master and wardens: every such person, for the first offence, shall forfeit 10l. for the second 20l. and for every other offence 40l. to be sued for and recovered by any one in the court of admiralty for the Cinque-Ports, if the offending pilot live within the jurisdiction of that court; or else by action of debt, &c. in any of the courts at Westminster, one moiety to go to the informer, and the other to the master and wardens of the society aforesaid, to be distributed among superannuated pilots, and the widows of pilots of the said society.

And the master, and such two wardens of the said society as shall be appointed to examine into the skill and ability of any person on his being admitted as a pilot, shall take the following oath, to be given them by the register of the said court of load-manage, or his deputy, viz.

I A. B. do swear, That I will impartially examine and enquire into the capacity and skill of T. D. of, &c. in the art of pilotage over the flats, and round the long Sand-Head, and the coast of Flanders and Holland, and will make true and speedy return thereof to the lord-warden of the Cinque-Ports

Ports for the time being, or his deputy, without favour, affection, fee, or reward.

So help me God.

The number of such pilots shall not be less than 120, whose names, ages, and places of abode, shall yearly be affixed in some public place at the custom-houses at London and Dover, to which all persons may have recourse; and not returning lists, the master and wardens of the said society shall forfeit 10*l*.

But this act shall not prevent the master or mate of any ship or vessel, or any part owner, residing at Dover or Deal, or the isle of Thanet, from piloting his own ship from any of the said places up the said rivers, nor subject any person, though not of that society, to the penalties before-mentioned, who shall be employed by any master to pilot his vessel from the places aforesaid, when none of the said society shall, within one hour after the arrival of such ship or vessel at any of the said places, be ready to pilot the same. And masters of merchant-ships may make choice of such pilot of the said society as they shall think fit; also no person shall continue in this society who shall not pilot a ship at least twice in one year (unless prevented by sickness) to and from the places above-mentioned. And for preventing any exorbitant demands from these pilots, for conducting any ship or vessel from Dover, Deal, or the isle of Thanet, to any places on the rivers Thames and Medway, the following, and no greater prices, shall be taken or demanded, than are here mentioned, viz. for every ship or vessel drawing seven feet water, 3*l*. 10*s*. for eight feet water, 4*l*. nine feet water, 4*l*. 10*s*. ten feet water, 5*l*. eleven feet water, 5*l*. 10*s*. twelve feet water, 6*l*. thirteen feet water, 6*l*. 10*s*. fourteen feet water, 7*l*. fifteen feet water, 7*l*. 10*s*. sixteen feet water, 8*l*. seventeen feet water, 8*l*. 10*s*. and no allowance to be made for odd inches.

In this act there is likewise a clause, empowering the lord-warden of the Cinque-Ports to nominate three persons there to adjust differences between the master of any ship and others, where ships by bad weather are forced from their anchors and cables, for saving and bringing them ashore: and this act shall not hinder any person from assisting a ship in distress there.

By the 7th of Geo. I. cap. 21. The lord-warden of the Cinque-Ports, with the assent of the commissioners of load-manage, and of the master and wardens of the society of pilots of the Trinity-House, of the Cinque-Ports, at a court of load-manage held by the said lord-warden, or his deputy, may make such rules and ordinances for the better government of the pilots residing at Dover, Deal, and the isle of Thanet, as shall be thought convenient, and may order a sufficient number of the pilots living at Dover, &c. no less than eighteen, to ply constantly at sea, to be ready to conduct such ships up the rivers Thames and Medway as shall have occasion for them: and the said lord-warden, &c. at a court of load-manage, may suspend or deprive any of the said pilots, for breaking the rules or orders; and if any pilot so suspended or deprived, shall undertake to conduct any ship by or from Dover, Deal, &c. to any place in or upon the said river of Thames, &c. he shall be liable to all such pains and penalties as are ordained by the before-mentioned act of 3 Geo. I. against such persons as shall conduct ships from and to the places aforesaid, without being first examined and approved of by the master and wardens of the said society, at the said court, and admitted into the same.

By the statute 5 Geo. II. cap. 20. No person shall undertake the charge of any ship or vessel, as pilot thereof down the river Thames, or through the North Channel, to or by Orfordness, or round the long Sand-Head into the Downs, or down the South Channel into the Downs, or from or by Orfordness, up the North Channel, or the river Thames, or river Medway, but such as shall be licensed to act as a pilot by the master, wardens, and assistants of the Trinity-House of Deptford-Strond, under the common Seal of the corporation, on pain of forfeiting 20*l*. being convicted before two justices of peace for the city of London, or the counties of Middlesex, Essex, Kent, or Surry, within their respective jurisdictions: but masters of ships in the coal-trade, or other coasting trade, are not obliged to employ a pilot.

The pilots to be so admitted and licensed, shall be subject to the government of the said corporation, provided their regulations do not relate to the pilots keeping of turns, or to settling the rates of pilotage, and shall pay the ancient dues, so as the same do not exceed 1*s*. in the pound out of such pilot's hire or wages, for the use of the poor of the said corporation, within ten days after the service of any pilot shall be ended. And in case such pilots shall refuse to take the charge of any of his majesty's ships, when appointed thereto by the corporation, or shall misbehave themselves in the conduct of any ships, or other part of their duty, or if pilots shall refuse to obey any summons of the said corporation, or such orders as they shall make, then the general court of the corporation, upon examination thereof, are required to re-call the warrants granted to such pilots; and if, after notice of it given to them in person, or left at their place of abode, they shall act as pi-

lots within the limits afore-mentioned, they shall be subject to the penalties inflicted on unlicensed pilots.

This statute shall not extend to the impeaching of any of the franchises, nor to take away the sole right of piloting merchant-ships from or by Dover, Deal, and the isle of Thanet, up the rivers Thames and Medway, granted and allowed to the society and fellowship of the master, wardens, and pilots of the Trinity-House of Dover, Deal, and the isle of Thanet, by the statute of 3 Geo. I. cap. 13.

And nothing herein shall impeach any privileges heretofore granted to, or which by ancient usage have been enjoyed by, the pilots of the Trinity-House of Kingston upon Hull, or the Trinity-House of Newcastle upon Tyne.

Nor to prejudice any jurisdiction of the mayor; or of the mayor, commonalty, and citizens of London, upon the river Thames; nor any jurisdictions belonging to the office of lord high admiral.

The act 8 Geo. II. cap. 21. continues the afore-mentioned statutes for regulating pilots.

OF PILOTS IN SPAIN.

1. There are three several principal pilots belonging to the West-India voyage in Spain, viz. the chief pilot of the India-House, instituted to examine and give their degrees to other pilots, and judges of the charts, and other instruments of navigation. The next is the chief pilot of the armada, or navy royal, to secure the trade of the Indies, commonly called the galleons; and the third the chief pilot of the New Spain fleet. These being all employments of great importance, it may be proper to give an account of the nature of them, their duty, qualifications, and the manner of bestowing them.

2. We are first to speak of the chief pilot of the India-House, because he takes place, and ought to be most knowing, as being to chuse the pilots for the India ships, out of which are chosen those for the galleons and floats: though as to seniority, there were chief pilots of the armadas before there were any of the India-House; because those discovering the new world, made way for an India-House, and, consequently, for a chief pilot of it, who ought to be universal in the theory, not only for the voyage to the Firm Land; New Spain, the coasts of those provinces, and the Windward Islands, but for the river of Plate, for which there was once a particular chief pilot.

3. The first chief pilot of the India-House was Americus Vesputius, settled at Seville, to draw charts upon the discoveries of others, and the salary assigned him was 50,000 maravedies; this was in the year 1507, and in the reign of king Ferdinand. Not only the chief, but all others whom the king received as his pilots, had salaries settled on them; and such as were as well skilled in warlike as in sea affairs, were received as sea-captains, which was done with Ferdinand Magallanes, whom we call Magellan, who first discovered the strait of his name, and Ruy Fallerio, his companion, in 1518, assigning each of them, 40,000 maravedis salary; and, in general great encouragement was given to all that were skilful in this profession.

4. The municipal laws of the court of the India-House ordained, That there be in the said house a chief pilot, to be preferred by edict, which is thus: when the place is vacant, the king and the council of the Indies are acquainted with it, and there are edicts, or proclamations, put up in Seville, the universities of Salamanca, Valladolid, and Alcala, and also in those parts where sailing pilots are known to reside, as Cadiz, S. Lucar, Port S. Mary, and Ayamonte; for though it be rare to find among the practical pilots any one so well skilled in the theory as to be fit to carry the place of chief pilot to the India-House, yet they have sometimes been allowed as candidates, and the same may happen again.

When the candidates have made their claims, the court acquaints the king how the parties are qualified, both by their own acts, and the information the president and commissioners have of them, declaring whom they judge most deserving, and what they think of the rest, that the council may advise, and the king decree, as shall be most expedient. The professor of cosmography is made after the same manner; but as for the cosmographer, who is to be an instrument-maker, his skill being of such sort as is not learnt at the universities, the edicts are sent to court, and put up at the council, and in Seville, at the India-House, and Exchange, and the candidates are remitted by the council to manifest their ability before the president and commissioners of the India-House.

5. Though some of the practical pilots have been proposed as candidates, yet none of them have hitherto carried the employment, the council wisely providing, that he who fills this place be the most knowing that can be found, not only in the art of navigation, but in other parts of the mathematics, because he is not only to examine the pilots for the India voyage, but to judge of the professor of cosmography, and the cosmographer instrument-maker, whom he is to examine and censure, as much as he does the mariners that have been his scholars, in order to take the degree of pilots.

Vice-

Vice-admirals have been proposed to fill this post. The design in instituting this chief pilot, was only to examine, and give their degree to the other pilots, forbidding him to teach navigation, or the use of any instruments, upon the penalty assigned, and he that learns of him to be incapable of being examined in two years; which was done to the end that affection for his own scholars might not cause him to wink at their ignorance. For the same reason, he is forbid making any sea-charts or instruments to sell, because it being his business to judge of them used in the voyage to the Indies, he could never see any faults in his own, for no matter will speak ill of his own work. For these reasons, the two employments of chief pilot and cosmographer were never but once conferred upon the same person, and many inconveniences appearing in it then, they were ever since accounted incompatible.

6. When any are to be examined in order to be declared pilots, it is to be done in the India-House, and no other place. The cosmographers and pilots that are then in Seville are to be present, to the number of six at least, being men well skilled in sea affairs; the candidates are to be strictly examined, all the examiners taking an oath to do it fully, and give their votes according to the best of their judgment; and the person so approved is to be declared pilot, and not otherwise, upon forfeiture of 10,000 maravedies.

In the year 1604 it was ordered, That one of the commissioners of the India-House should be present at the examination, and then the act was performed in the chamber of direction, the commissioners, chief pilot, and cosmographers, sitting under the president's canopy; which being thought too great an honour for them, they have since sat in the court of consuls, under a canopy, and the pilots and deputies of the corporation of sailors sit on the said benches, two cosmographers taking place under the canopy, according to seniority.

7. It is to be observed, that one previous circumstance to examination is, that they bring proof they are none of those the law forbids to be admitted as pilots, which proof is to be made before the chief pilot, who, upon all public occasions, takes place of the steward and deputies of the company of sailors; and if they, being summoned by the pilot's messengers, refuse or neglect to appear, he may proceed to take information without them. When either the chief pilot, as a member of the India-House, enjoys all the privileges, and is under all the prohibitions that others are, yet there is a particular ordinance, which forbids him receiving any thing whatsoever of the person that stands to be made a pilot; nor is he to take any fees for the commission or warrant he gives them.

8. There are two cosmographers, as has been said before; the one is professor of cosmography, instituted by king Philip II. in the year 1552, to teach the art of navigation and cosmography, with order that none should be admitted pilot or master who had not learnt under him a year, or thereabouts. This time was afterwards shortened to three months, and at last to two, in order to fit them for examination; and as for reading and writing, it was thought enough if they could read the sailing orders, and write their own names; all which was ordered to be taught as follows: the treatise of the sphere, or at least the first and second book of it: the treatise that teaches how to take the sun's altitude, and the elevation of the pole, with all the rest taught in it: the use of the sea-chart, and how to find out the point where the ship is: the use of instruments, and manner of making them, to discover whether they are faulty, that is, the compass, astrolabe, quadrant, and Jacob's staff, and how to observe the needles, to discover whether they vary east or west, which is a matter of great moment, to keep an exact account when they fail: the use of a general dial for day or night: and the pilots must know, either by memory or by writing, what the age of the moon is any day of the year, that they may know how the tides fall out to enter any rivers or bays, and other matters in continual use. A lesson upon these subjects is to be read every day, at the hours appointed by the president and commissioners of the India-House, that may be most convenient for the learners. There is a great room in the Exchange appointed for this use.

9. The other cosmographer is instrument-maker, the use of which the professor teaches; but the first of these is the ancientest employ. Both the cosmographers are to sit with the chief pilot, upon examining of pilots, and to put questions to them; and the law appoints, that if the cosmographer of the India-House informs the said commissioners that the examination is not duly made, the said commissioners shall take care to see right done.

It is also the duty of the chief pilot and cosmographers to approve of, and mark the sea-charts, and other instruments; and they are to have marks for that purpose, which are to be kept in the India-House, in a chest under two keys, whereof the chief pilot is to keep one, and the younger cosmographer the other, that no instruments may be sold or approved without the consent of all three: to which purpose they meet every Monday, and no instrument is to be sold without the mark, under the forfeiture of thirty ducats. Two practi-

cal pilots were to be appointed by the commissioners of the India-House, to examine instruments, together with the chief pilot and cosmographers; but if the instruments were made by the cosmographer himself, then he was to have no vote in the approbation. If an astrolabe be faulty, it is to be broke and cast again; and a chart, that cannot be mended, must be cut, and left in the treasury-chamber, that it may not be put together again. When the pilot and cosmographers meet, if there are any to be examined for pilots, that is the first thing to be done; what time remained after making instruments, was to be employed in examining the general map, and adding what they think necessary; but all these things are now out of use, there being no further discovery made; and the instruments and sea-charts generally used, being those made by the cosmographer of the India-House, of which he makes some profit, but nothing considerable, nor is he to take any fee for touching the needles to the load-stone.

PITCH and TAR. This is a clear, fat liquor, that flows from the trunks of old pines. When they would kill or destroy the tree, the Swedes and Norwegians cut the bark round the tree, which, instead of yielding a white incense, or resin, yields a black liquor, which is the tar; and presently, as soon as all that is fallen, the trees die, and are good for nothing but to burn.

This may help to undeceive several who believe, as many authors have vouched, that tar is made by burning of the pines; for it is certain, that all the tar we now sell is made as already mentioned, and not by means of the pines that are burnt. That which is found clear, is improperly called oil of pitch, and sold under the name of common or false cade oil. The tar is much used by mariners, farriers, and shepherds, to mark their sheep, as well as to defend them from diseases. Chuse such as is natural and clean, not such as is made with oil and pitch, but the true Stockholm tar.

It is generally brought to us from Denmark, Norway, Finland, and Swedeland; but there is much of it made in New England, Virginia, Carolina, and other parts of Florida. It is the produce of all resinous trees. It was first taken from the cedar, the larch-tree, fir-tree, and pitch-trees, but now chiefly from the pine-trees. It cures all sorts of scabs, itch, tetters, ring-worms, and other vices of the skin.

Tar is better than pitch, because, in boiling, the pitch loses the more subtil and fiery parts; this, therefore, is proper for coughs, phthysicks, hoarseness, and other humours that fall upon the lungs. Tar and bees-wax make a plaster that is discutient and anodyne, good against the gout, and all manner of old aches and pains. The spirit is very diuretic, opens all obstructions, and resists the scurvy.

(What we call lamp black, is made by burning the foul parcels of pitch, resin, &c. and gathering the light foot that they sent up; this is much used by artificers of various kinds.)

R E M A R K.

How importantly useful to shipping and navigation the articles pitch and tar are, need not be said: and how they ought to be encouraged in the British plantations, see **NAVAL STORES. PLANTATIONS.** A plantation, or colony, is a place whither people are sent to dwell, with an allowance of land for their tillage, and immunities for the good of themselves and the state they belong to.

A nation, or people, being expelled out of their own land, may seek wastes in some other country; and such possession creates a property against all persons, but he that hath empire there: and if, before they can reap the fruits of their labour, they are in want of necessities, by the laws of nature they may force a subsistence from a neighbour planter; for subsistence belongs to every man, who hath not merited to lose his life. The written laws are conformable to this; by which, if provisions fail at sea, those who laid in particular stores for the voyage, must produce them for the benefit of all. Our plantations abroad, are the islands in America; and the isles of Jamaica and Barbadoes, with some others, are much frequented by unfortunate persons, who oftentimes become wealthy there. The English plantations in general are, besides these isles, Virginia, Maryland, New England, New York, Carolina, Bermudas, and the Leeward Islands, &c. and the settlement of Georgia.

The islands being originally gotten by conquest, or by some planting themselves there, the king may govern them as he will: but it has been held, that the laws in force before the conquest of them, do bind 'till new laws are given; and even then, some of the old customs may remain, as they do in Barbadoes, &c. But English subjects having found an uninhabited country, all English laws are immediately in force. 3 Mod. Rep. 160. 2 Salk. 411.

The Isle of Man and Ireland, are possessions of the English crown; yet retain their ancient laws: so did Jamaica, 'till new laws were made. In Barbadoes, all freeholds are subject to debts, and esteemed but as chattels, 'till the creditors are satisfied, and then the lands descend to the heir, which is different from the laws here. By the laws of Virginia, negroes are saleable as chattels. 2 Salk. 411. 666. 4 Mod. 226. See stat. 7 & 8 W. III. and 5 Geo. II.

If in an action for rent upon a lease of lands in Jamaica, &c. there be a foreign local issue, it may be tried where the action is laid; and the plaintiff may enrol a suggestion, that such a place in such a county, is next adjacent; and it shall be tried in the King's-Bench, by a jury from such place, according to the laws of that country.

Here, it was said, there may be a law in Jamaica against bonds; but it will not confine the action of debt on bonds made there to that country: an action of false imprisonment has been here brought against a governor, and the laws of the country given in evidence. 2 Salk. 651. Mod. Cafes 195. In the year 1661, the then governor of Jamaica called the first assembly there, and made laws for raising a public revenue by a tax on strong liquors, for upholding the government there, which were indefinite and perpetual. The king empowered another governor to chuse his own council; and, with consent of the major part, to frame general assemblies of freeholders, as in other plantations, and with their consent to make laws suitable to those of England, to be in force for two years; and the assembly granted the like revenue out of strong liquors for two years only. The question here was, whether this last law had totally laid aside the former? It was resolved, that the last council having power to make laws only for two years, it did not repeal the perpetual law made before, but suspended it's power for that time only. Raym. Rep. 397. King Charles II. by letters patents, of October, in the 32d year of his reign appointed Sir Richard Dutton chief governor of Barbadoes, who appointed 12 men to be of the king's council during pleasure; and by their advice established courts, &c. and had authority to make a deputy-governor, &c. and Sir John Witham being so constituted, was charged with mal-administration, and by order of the governor and council was committed to prison; for which having brought an action, it was said for him, that the causes of commitment (if any) were not cognizable by them, but by the king alone, &c. To which it was answered, that being committed by order of council, it ought to be presumed his commitment was legal. Judgment was given in B. R. for the plaintiff, but reversed in the house of lords. 3 Mod. 160, 161.

All governors on their entrance are to take oath, that to their utmost, the acts passed concerning the said colonies be duly observed. And, on failure, complaint being made to the king, such governor to be removed, and forfeit the sum of one thousand pounds. Stat. 12 Car. II. cap. 18. and 7 & 8 W. III. By 11 and 12 W. III. cap. 12. If any governor, deputy-governor, &c. oppress any of the king's subjects under their government, or act any ways contrary to the laws of this realm, or in force with their governments, &c. it shall be determined in the King's-Bench in England: and such like punishments inflicted, as are usual for such offences here in England.

And by 7 & 8 W. III. cap. 22. All laws, customs, &c. practised in any of the plantations, that are repugnant to any laws already here, or to this act, or any other law hereafter to be made, relating to those plantations, are declared null and void. And all places of trust in the courts of law, or relating to the treasury, in any island or colony of England, shall be held by native-born subjects of England, Ireland, or of the said islands. Also persons claiming any right in any of them, shall not dispose of the same to any other than natural born subjects of England, &c. without licence; and all governors appointed by such proprietors, shall be approved by his Majesty, and take the oaths accordingly.

By 12 Car. II. cap. 18. no alien may be a merchant or factor in any English plantation, on pain to lose all his goods: and any governor of the plantations that shall suffer any foreign-built vessel to load or unload, without certificate, that the owners are not aliens, shall be removed.

Goods shall not be imported or exported, in any other but English or Irish ships, &c. and of which the master and three fourths of the mariners are English, on forfeiture of ship and goods. And any abatement or privilege in the book of rates, is to be understood, that the master and three fourths of the mariners be also English.

In the progress of our laws relating to the plantations, no sugars, tobacco, cotton-wool, indigo, ginger, fustic, or other dyeing woods, the growth of any English plantation, were to be transported to any place but some English plantation, or to England, &c. on forfeiture of ship and goods. And for every vessel setting out from England, &c. for any of the said plantations, bond shall be given of 1000l. if the ship be under 100 tons, and of 2000l. if of greater burthen; that if the said vessel load any of the said commodities at such plantations, it shall bring them to some port in England, &c. But these laws were repealed by the acts of the 12th and 20th year of the reign of Geo. II. whereby liberty is given to carry sugars from the British colonies, directly to foreign parts, 'till the year 1757. See also the article RICE.—The progress of the laws follows.

Also for all ships coming from any other port to those plantations, the governor shall take bond as aforesaid. And every ship taking in goods before bond given, or certificate from some custom-house in England, &c. of such bonds being there given, shall be forfeited; and the governors shall twice in

every year return true copies of all such bonds to the officers of the customs at London.

By 15 Car. II. cap. 7. no commodity, the growth or manufacture of Europe, shall be imported into any of the plantations, unless shipped in England, &c. and in English built shipping, legally manned, and carried directly thither, on pain of forfeiture.

But such ships may lade in any part of Europe, salt for the fisheries of New England and Newfoundland; and in the Madeiras and Azores, wines, the growth of those islands; and in Scotland or Ireland may take in servants, or horses, and all victuals, the produce of those places.

All persons importing by land any goods into the said plantation, shall deliver to the governor, or officer by him appointed, within 24 hours, their names, with a true inventory of the goods. And no vessel shall lade or unlade, 'till the master have given due notice of his arrival, &c. and that the ship is English built, and legally navigated, and have delivered an inventory of her lading, &c. on forfeiture of ship and goods.

And any officers of the customs in England, &c. suffering any tobacco, ginger, cotton-wool, indigo, &c. the growth of the aforesaid plantations, to be transported 'till first unladen in some port of England, &c. shall forfeit their places, and the value of such goods.

All persons who shall plant any tobacco in England, &c. forfeit 10l. for every rod of ground planted. And justices, on information, shall cause it to be destroyed; persons resisting the act to forfeit 5l. and be imprisoned.

This act shall not hinder planting tobacco in physic gardens, &c. so it exceed not half a pole in any one garden.

By 22 & 23 Car. II. cap. 26. every vessel lading at any of the English plantations, 'till bond be given, or certificate produced, or carrying the said goods contrary to the tenor of it, was to be forfeited.

But the act 25 Car. II. cap. 7. seems to have taken off these penalties, ordaining, that if bond be not given, several duties are to be answered, payable, as appointed in the said plantations: and if any persons liable have not money, the officers shall take commodities amounting to the value, at the current price in the same plantations.

By 7 and 8 W. III. cap. 22. no goods shall be imported or exported to or from any plantation, or port in the same, England, &c. in any ship but English, &c. or the said plantations, and duly navigated, on forfeiture of ship and goods, &c. as by former statutes.

No ship shall be deemed English, &c. built, or qualified to trade to any of the said plantations, 'till registered by the proprietor, and oath made by the owners, where the ship was built, who the present owners, and that no foreigner, directly or indirectly, hath any interest therein. Which oath being attested by the governor, or custom-house officer before whom it is taken and registered, shall be delivered to the master for security, and a duplicate sent to the commissioners of the customs at London: any vessel trading without such proof, shall be liable to forfeiture as a foreign ship would. And no ship's name registered shall be changed without registering anew, under like penalties; also sale of any share to be mentioned by endorsement on the certificate of the register.

All ships lading or unlading at any of the plantations aforesaid, and the masters of them, shall be subject to the same rules, searches, &c. as in this kingdom by 14 Car. II. cap. 11.

And the officers for collecting the revenue, &c. shall have the same authority as the officers of the customs in England, by the said act 14 Car. II. and to enter houses and warehouses, to search and seize such goods; and all persons assisting in conveying or concealing goods, or resisting the officers in their duty, and the boats, &c. shall be liable to the like penalties, as for prohibited goods in this kingdom; and the officers to the same penalties for frauds, &c. as here.

If the governors or officers of the customs have cause to suspect any certificates to be counterfeit, they may require sufficient security for the discharge of the plantation lading in England, &c. and if they suspect the certificate of having discharged the plantation lading in this kingdom is false, they shall not vacate the security given in the plantations, 'till satisfied from England concerning it. And any person counterfeiting cockpit, certificate, &c. forfeits 500l. and the cockpit, &c. shall be invalid.

The sureties of bonds taken pursuant to the forementioned act, shall be persons of known residence and ability in the plantations; and the conditions of the bonds within eighteen months after the date (danger of the seas excepted) to produce certificates of having landed the goods in England, &c. or the bonds and copies to be in force.

Nor shall it be lawful on any pretence, to land in Ireland any goods the product of the said plantations, unless first landed in England, &c. and the due rates paid, on forfeiture of ship and goods: but if any ship so laden, shall by stress of weather be stranded, or be driven into any port of Ireland, and unable to proceed, her goods may be put on shore, but shall be delivered to the chief officer of the customs there, 'till put on board some other ship, to be sent to some port in England, &c.

Where any question shall arise concerning importation or exportation of any goods, proof shall lie on the owner or claimer: and on any actions, &c. commenced in the said plantations relating to the duties or forfeitures, none shall be of any jury but natives of England or Ireland, or of the plantations; and the offences may be laid to be in any precinct of the said plantations, where they are said to be committed.

By 3 and 4 Anne, cap. 8. Any native of England or Ireland, may ship in any port of Ireland in English built shipping duly manned, any linen cloth the manufacture of Ireland, and transport to any plantation, &c. belonging to England, and there vend the same. But no ship shall break bulk 'till notice be given to the governor, and a true invoice of the lading be delivered him, with a proper certificate from the chief officer of the port in Ireland where laden; and 'till the master hath taken oath before the governor, &c. that the goods are the same that were taken on board, nor 'till the ship be searched. If the master shall break bulk before such notice given, &c. or on search any other manufacture be found, ship and goods shall be forfeited. And ships coming from Ireland to any such plantation, shall be subject to the like rules, searches, and penalties, as ships from England are. If any ship laden in England for the plantations, shall put into any port in Ireland and take on board such Irish linen, the like certificate and oaths shall be made; and the ship, her master, and lading, shall be liable to such searches and penalties, &c. only suits are to be brought in a twelvemonth after discovery of any offence. See the act 3 Geo. I. cap. 21. The act 6 Ann. cap. 30. recites, That her Majesty by proclamation, dated 18 June, 1704, settled the currency of foreign coins in the American colonies, which was as follows:

A PROCLAMATION, for ascertaining the currency of the foreign coins in the PLANTATIONS.

WE having had under our consideration, the different rates at which the same species of foreign coins do pass in our several colonies and plantations in America, and the inconveniences thereof, by the indirect practice of drawing the money from one plantation to another, to the great prejudice of the trade of our subjects; and being sensible the same cannot be otherwise remedied, than by reducing all foreign coins to the same current rate within all our dominions in America: and the principal officers of our mint, having laid before us a table of the value of the several foreign coins which usually pass in payments in our said plantations, according to their weight, and the assays made of them in our mint, thereby shewing the just proportion which each coin ought to have to the other, which is as followeth, viz. Seville pieces of eight, old plate, seventeen pennyweight, twelve grains, four shillings and six pence; Seville pieces of eight, new plate, fourteen pennyweight, three shillings and seven pence farthing; Mexico pieces of eight, seventeen pennyweight twelve grains, four shillings and sixpence: pillar pieces of eight, seventeen pennyweight twelve grains, four shillings and six pence three farthings; Peru pieces of eight, old plate, seventeen pennyweight twelve grains, four shillings and five pence, or thereabouts; cross dollars, eighteen pennyweight, four shillings and four pence three farthings; ducatoons of Flanders, twenty pennyweight and twenty-one grains, five shillings and six pence; ecus of France, or silver Lewis, seventeen pennyweight twelve grains, four shillings and sixpence; crusadoes of Portugal, eleven pennyweight four grains, two shillings and ten pence farthing; three guilder pieces of Holland, twenty pennyweight and seven grains, five shillings and two pence farthing; old rixdollars of the empire, eighteen pennyweight and ten grains, four shillings and sixpence; the halves, quarters, and other parts in proportion to their denominations, and light pieces proportionable to their weight. We have therefore thought fit, for remedying the said inconveniences, by the advice of our council, to publish and declare, that from and after the first day of January next ensuing the date hereof, no Seville, pillar, or Mexico pieces of eight, though of the full weight of seventeen pennyweight and a half, shall be accounted, received, taken, or paid within any of our said colonies or plantations, as well those under proprietors and charters, as under our immediate commission and government, at above the rate of six shillings the piece current money, for the discharge of any contracts or bargains to be made after the time aforesaid; the halves, quarters, and other lesser pieces of the same coins, to be accounted, received, taken, and paid, in the same proportion, and the currency of all pieces of eight of Peru, dollars, and other foreign species of silver coins, whether of the same or baser alloy, shall stand regulated, according to their weight and fineness, in proportion to the rate before limited and set for the pieces of eight of Seville, pillar, and Mexico; so that no foreign silver coin of any sort be permitted to exceed that proportion upon any account whatsoever. And we do hereby require and command, &c. (the observance of the directions herein, &c.) For the better enforcing the due execution of the said proclamation throughout the said colonies, and more effectual

remedying the inconveniences thereby intended to be remedied, it is enacted, That if any person within any of the said plantations, shall, for discharge of any contract to be hereafter made, account, take, or pay, any the species of foreign silver coins mentioned in the above proclamation, at any higher rate, such person shall suffer six months imprisonment without bail, and forfeit 10l. for every offence.

But nothing in this act or proclamation, shall compel any persons to receive any of the said species of foreign silver coin at the rates in the proclamation mentioned: nor any thing herein contained, restrain her Majesty from settling the rates of the said foreign coins in any of the said plantations, as she shall judge necessary by proclamation, or from giving her royal assent to any law hereafter made in any of the plantations, for the same purpose.

By 8 Geo. I. cap. 18. reciting divers acts, by which diverse commodities of the British plantations, are restrained to be imported into this kingdom, or some other plantation, under securities and penalties therein specified, enacts, That copper ore shall be under the like securities, as for other goods enumerated by any former laws.

By 4 Geo. II. cap. 15. All goods not mentioned in any former act, may be imported into Ireland from the American plantations, the act 7 and 8 Will. III. notwithstanding. But the goods shall be in British shipping legally manned.

By 5 Geo. II. cap. 7. All real estates shall be chargeable with all just debts whatsoever, as they are by the law of England liable to satisfaction of debts due by bond, or other speciality; and subject to like remedies and proceedings in any court, in any of the plantations, in the same manner as personal estates are there.

And for more easy recovery of debts in the colonies in any suit brought there, for debt or account, in which any person residing in Great-Britain shall be party, such debts may be proved here on oath before any chief magistrate near where the person shall reside, and being certified under the common seal of the city or town, &c. shall be of the same force, as if the persons had appeared in open court, or upon commission.

By 6 Geo. II. cap. 13. All sugars and panes of the product of any plantations not under his Majesty's dominions, imported into any of his Majesty's plantations, shall pay 5s. for every hundred weight, and for all rum or spirits of foreign produce, 9d. for every gallon; and for molasses 6d. the gallon. And on importation an entry shall be made with the proper officers, &c. and the duties paid down in ready money before landing the goods, on pain of forfeiture; and every such offence may be prosecuted in an admiralty-court in the plantations, or court of record where committed.

By this act, sugars, panes, &c. rum and spirits of America, not the product of the English sugar colonies, are prohibited to be imported into Ireland, but such only as are shipped in Great-Britain, in ships legally navigated, &c.

By 5 Geo. II. cap. 22. No hats or felts shall be exported from one British plantation to another, on penalty of 500l. and forfeiture of the goods; and persons aiding and assisting therein, shall forfeit 40l. Any persons may seize hats and felts found on ship-board, &c. and carry them to the king's warehouse. And commissioners of the customs, &c. in the plantations, permitting entries for exportation forfeit 500l. This statute also regulates the trade of felt-makings, &c. and no person shall retain in the said art any negro, on forfeiture of 5l. for every month.

By 3 Geo. II. cap. 28. Any British ship legally navigated clearing outwards in any port of England for the province of Georgia, may load rice there and carry to any port southward of Cape Finisterre, under restrictions limited in the act. And the officers appointed by the trustees of Georgia, are empowered to do all things there, which may be done by virtue of the said act, by the officers in Carolina. The ships concerning which province, shall proceed directly without carrying rice to any other American plantation; first taking out a licence from the commissioners, on a certificate from the collector and comptroller of the port, that bond is given, that no enumerated goods shall be taken on board at Carolina, or any plantation, unless for necessary provisions in their voyage.

After landing the rice at some port of Europe southward of Cape Finisterre, the ship is to proceed for Great-Britain, and produce a certificate of having landed the said rice, &c. and the master producing the licence to the officers of the port where given, they shall demand the amount of the half subsidy payable for rice shipped in Carolina, which would have remained, had the rice been first imported in Great-Britain, and afterwards re-exported; which not being paid within 30 days, the bond shall be forfeited, &c. At present, rice, as well as sugar, is permitted to be carried to foreign countries from the plantations, without being brought to England.

REMARKS ON PLANTATIONS before the last War.

In the course of this work, we have considered the British plantations in various lights the most nationally interesting to our commercial prosperity. See the articles **BRITISH AMERICA, CANADA, COLONIES, FLORIDA, LOUISIANA,**

MAP, FRANCE, NORTH CAROLINA, PENNSYLVANIA. See likewise our MAP of North America, compared with the French one of Monf. D'Anville, performed by the order and under the patronage of the duke of Orleans, at a very great expence. Under the preceding heads, the reader will find the causes of the present precarious state of our plantations in America, pointed out to him for several years past; and also such measures, as we humbly apprehend, would have effectually protected our possessions from those insults and depredations, to which they seem daily liable, to the concern of all wise and honest men, who wish well to these kingdoms.

By the before-mentioned map it appears, how contiguous the French colonies in North America lie to the British, which are entirely surrounded by them, and that the claims of the French, in many respects, we have shewn to be groundless and unjust.

Several parts which they now claim, were, about the beginning of the reign of king James II. made over and surrendered by the Iroquois Indians and their allies, to the crown of England, the right and possession whereof we have ever since asserted and endeavoured to secure, both by ourselves and the above-said Indians our confederates, who on their parts, on all occasions of difference with the French or their Indians, have for that and other considerations, demanded the good offices and protection of the English; who knowing it their interest, have never failed, if the cause was just, to afford it them: as they did in the year 1696, when the count Frontenac, governor of Canada, with several thousand French and Indians, attacked the Onondages, one of the Five Nations, and ravaged their country; but on the approach of colonel Fletcher, governor of New York, with some regular forces, militia, and Indians, he was forced to retire, not without a considerable loss from these natives, who constantly attended him in his retreat, often fell on his rear, cut off many of his people, and all the stragglers they could meet with.

The Five Nations, when summoned on our two last unfortunate expeditions against Canada, readily joined the English troops under the command of General Nicholson, with about a thousand men, and the rest of them were in motion in different parts; some to discover and observe the posture of the enemy in their own country, others to scout about the rivers and lakes. And they had so great a reliance on the friendship and protection of the English, whom they have heretofore found and acknowledged to be truly just, honest, and punctual, in their treaties and dealings with them; that during queen Anne's war, they not only permitted, but also invited them, to build a fort in the very heart of their country, and on their main river, the gate of which adjoined to, and opened into one of their capital towns or fortifications, inhabited by the Mohawks, the chief and most warlike nation among them. The English garrison being a detachment from the independent companies of New York and Albany, lived with them in the strictest amity, and daily entered their castle as the Indians did our fort, who constantly supplied the soldiers with venison, wild fowl, fish, and other necessaries in their way.

From these Indians of the Five Nations, the English of New York purchase the greatest part of their fur and peltry-trade, and in exchange supply them with duffels, strowds, blankets, guns, powder, shot, and other the manufactures of Great-Britain.

The French knowing and envying the great friendship and commerce the English of New York cultivate and carry on with these Indians, and being sensible of the mighty use and service they are of, not only to that colony, but to all our other colonies to the northward, have on many occasions endeavoured, by all the artifices imaginable, to draw them over to their party and interests, which when they failed in, they have attempted by force or fraud to extirpate or subject them: but that cunning and warlike people, by the advice and assistance of the English, have ever prevented their designs, to whom they continue most incensed and irreconcilable enemies; though as long as the English have peace with them, they are persuaded to continue the same.

Indeed, during the reign of king James II. they had certainly been cut off and exterminated by the French (the English being prohibited to give them the least assistance) had not the happy Revolution of king William intervened, and the war with France soon succeeded.

Nay, even Col. Dungan, a Roman Catholic, made governor of New York by king James, was at that time so very sensible of the ruin intended to the Five Nations our allies, and in consequence to the English plantations, that he ordered the Popish priests, who were by leave come into his government, under pretence of making proselytes, to depart from thence, because he found their designs was to betray our colonies to the French, instead of making converts of the inhabitants.

The French, as is related above, have many ways endeavoured to ruin or distress the Iroquois; but as they are well assured, nothing will affect them so much and nearly, as to deprive them of their fishing and hunting, which is mostly on the borders of, and between the great lakes, and without

which they must starve; therefore they have attempted to build forts on the several narrow passages thereof, and the rivers which empty themselves thereinto, in order to intercept them, either in their going or returning from those places; but the Indians have as often prevented the finishing of them, or otherwise obliged them to demolish or desert them.

But should the French be permitted to establish their projected communication between Cape Breton and the gulph and river of St Lawrence, as far as the Mississippi, and so downwards to the bay of Mexico, which will be a mighty addition and increase of territory, strength, and power to them, it is much to be feared, they will carry their point one time or another, and thereby distress and subject these our allies; the consequence of which will not only be very shocking, but of the utmost concern to the safety of our northern plantations: for if we now, in so great measure, stand in need of, and depend on them as our friends, for the security of our frontiers, what must we expect when that barrier is removed, and they become our enemies? And not only they, but all the rest of our friendly Indians to the southward, which we may of course depend on.

We have heretofore experienced the dismal and tragical consequences attending a defection, of only one or two paucity nations of Indians bordering on Carolina; and though other pretences have been urged as the cause thereof, and were, perhaps, in some measure true; yet the French, since their late settlements on the Mississippi, and the bay of Mexico, have frequently clandestinely fomented and widened the breach, which occasioned the butchering of so many hundreds of the inhabitants of that colony, with the burnings, devastations, and almost entire desolation thereof.

It is well known, that the frontiers of our colonies are large, naked, and open, there being scarce any forts or garrisons to defend them for near two thousand miles. The dwellings of the inhabitants are scattered at a distance from one another; and it is extremely difficult, if not almost impossible, according to the present establishment and situation of our affairs there, from the great number of our colonies independent on each other, their different sorts of governments, views, and interests, to draw any considerable body of forces together on an emergency, though the safety and preservation, not only of any particular colony, but of all the English plantations on the continent, were never so nearly concerned.

For several of these governments, pretending to or enjoying some extraordinary privileges, which the favour of the crown has formerly granted them, exclusive of others, if their assistance is demanded or implored by any of their distressed neighbours, attacked by enemies, perhaps, in the very heart of their settlements, they either by affected delays, insisting on punctilios and niceties, starting unreasonable objections, and making extravagant demands, or other frivolous pretences, purposely elude their just and reasonable expectations; and by an inactive stupidity or indolence, seem insensible of their particular and most deplorable circumstances, as well as regardless of the general or common danger, because they feel not the immediate effects of it; not considering their own security is precarious, since what happens to one colony to-day, may reach another to-morrow. A wise man will not stand with his arms folded when his neighbour's house is on fire.

The only expedient which has been suggested (with the utmost deference to his Majesty and his ministers) to help and obviate these absurdities and inconveniences, and apply a remedy to them, is, That all the colonies appertaining to the crown of Great-Britain on the northern continent of America, be united under a legal, regular, and firm establishment, over which it is proposed a lieutenant-general, or supreme governor, may be constituted, and appointed to preside on the spot, to whom the governors of each colony shall be subordinate.

It is further humbly proposed, That two deputies shall be annually elected by the council and assembly of each province, who are to be in the nature of a great council, or general convention of the estates of the colonies; and by the order, consent, or approbation of the lieutenant, or governor-general, shall meet together, consult, and advise for the good of the whole, settle and appoint particular quotas, or proportions, of money, men, provisions, &c. that each respective government is to raise for their mutual defence and safety, as well as, if necessary, for offence and invasion of their enemies: in all which cases, the governor-general, or lieutenant, is to have a negative, but not to enact any thing without their concurrence, or that of the majority of them.

The quota, or proportion, as above allotted and charged on each colony, may, nevertheless, be levied and raised by its own assembly, in such manner as they shall judge most easy and convenient, and the circumstances of their affairs will permit.

Other jurisdictions, powers, and authorities, respecting the honour of his Majesty, the interest of the plantations, and the liberty and property of the proprietors, traders, planters, and inhabitants in them, may be vested in, and cognizable by, the above-said governor-general, or lieutenant, and grand convention of the estates, according to the laws of England, but

but these points are not thought fit to be touched on or inserted here: this proposal being general, and with all humility submitted to the consideration of our superiors, who may improve, model, or reject it, as they in their wisdom shall judge proper.

A coalition, or union of this nature, tempered with and grounded on prudence, moderation, and justice, and a generous encouragement given to the labour, industry, and good management of all sorts and conditions of persons inhabiting, or any ways concerned or interested in the several colonies above-mentioned, will, in all probability, lay a sure and lasting foundation of dominion, strength, and trade, sufficient not only to secure and promote the prosperity of the plantations, but to revive and greatly increase the flourishing state and condition of Great-Britain, and thereby render it, once more, the envy and admiration of its neighbours.

Let us consider the fall of our ancestors, and grow wise by their misfortunes. If the ancient Britons had been united amongst themselves, the Romans, in all probability, had never become their masters: for, as Cæsar observed of them, *Dum singuli pugnabant, universi vincebantur*; whilst they fought in separate bodies, the whole island was subdued: so if the English colonies in America were consolidated as one body, and joined in one common interest, as they are under one gracious sovereign, and with united forces were ready and willing to act in concert, and assist each other, they would be better enabled to provide for and defend themselves against any troublesome ambitious neighbour or bold invader: for union and concord increase and establish strength and power, whilst division and discord have the contrary effects.

It must seem to every man a very great indignity offered to his Majesty and the nation, that when there are 500,000 British subjects (which are, perhaps, three times more than the French have both in Canada and Louisiana put together) inhabiting the several colonies on the east side of the continent of North America, along the sea-shore, from the gulph of St Lawrence to that of Florida, all contiguous to each other, who, for a century, have established a correspondence, contracted a friendship, and carried on a flourishing trade and commerce with the several nations of Indians lying on their back, to the westward and northward, for furs, skins, &c. a most rich and valuable traffic, the colonies themselves abounding with metals and minerals of copper, iron, lead, &c. producing hemp, flax, pitch, tar, rosin, turpentine, masts, timber, and planks of oak, fir, and all other sorts of naval stores in great abundance, and the best of their kind in the world; besides wheat, beef, pork, tobacco, rice, and other necessary and profitable commodities; with a noble fishery for whales, cod-fish, &c. along the coast and in the bays thereof: I say it seems a great indignity offered to his Majesty and the British nation, that the French should presume to make those incroachments, and commit those ravages and hostilities on our plantations, which are now the subject of daily conversation and surprize; especially since the English have planted and improved them, from the sea-coast almost up to the sources of the largest rivers, by the consent of the natives, whose lands they have actually purchased and paid for, and whose traffic we may be entirely deprived of, if the French do not meet with an effectual check.

Moreover, if the English suffer themselves to be thus straightly cooped up, without stretching their plantations further back into the continent, what will become of their offspring and descendants, the increase of their own and the nation's stock; who claim and demand an habitation and inheritance near their parents, relations, and friends, and have a right to be provided for in the country where they are born, both by the laws of God and man, and which the prudence and policy of the state does likewise require, as convenient and necessary, both for extending our territories, strengthening our hands, and enlarging our trade?

Besides, as the English are not fond of extending their dominions on the continent of Europe, but confine themselves to their islands, being content with their ancient territories and possessions, except what is absolutely necessary to promote and secure their trade and commerce, the very vitals of the state, I cannot apprehend with what reason or justice the French, or any other nation, should incroach upon their claims, colonies, or plantations in America.

We have heretofore likewise been, with just reason, alarmed in Great-Britain by the many letters, memorials, representations, and remonstrances, which have, from time to time, been transmitted from divers of our colonies upon the continent of America, setting forth the danger they have been frequently exposed to from the neighbourhood of the French, if they obtained full possession of the province of Carolina, (which they some years since attempted) and the lands to the northward of it, as far as the five great lakes, which comprehend great part of what they call their Louisiana.

For through these countries many great rivers have their course, proceeding from the back of our colonies of New York, New Jersey, Pennsylvania, Maryland, Virginia, North and South Carolina (their springs being not far distant from the heads of the chief rivers that belong to, and run through

those colonies) most of them navigable without interruption from their fountains, 'till they fall into the Mississippi. And by means of their settlements on that and the other inland rivers and lakes, from the bay of Mexico to the river and bay of St Lawrence, the French are drawing a line of communication, and now endeavouring to surround and straighten all our colonies, from Nova Scotia to South Carolina. Thus are they working out their own grandeur and our destruction! Indeed the French, whom all the world acknowledge to be an enterprising, great, and politic nation, are so sensible of the advantages of foreign colonies, both in reference to empire and trade, that they use all manner of artifices to lull their neighbours asleep, with fine speeches and plausible pretences, whilst they cunningly endeavour to compass their designs by degrees, though at the hazard of encroaching on their friends and allies, and depriving them of their territories and dominions in time of profound peace, and contrary to the most solemn treaties.

For besides their seizing on, and settling the great river Mississippi, and some part of the north side of the bay of Mexico, and the claim they seem clandestinely to make to another of our inhabited southern colonies adjoining thereunto, as I shall in the sequel demonstrate, they in some of their writings boast, that their colony of Louisiana hath no other bounds on the north than the arctic pole, and that its limits on the west and north-west are not known much better, but extend to the South-Sea, Japan, or wherever they shall think fit to fix them, if they can be persuaded to fix any at all; intending one day, if it is in their power, to deprive the British nation of all that vast track of land situate between the gulph of Mexico and Hudson's Bay, which includes the province of Carolina, the aforesaid great lakes, and the whole country of our five indian nations and allies, with the furr, peltry, and other trade thereof.

And what further views and designs they may entertain against the Spanish provinces of New Mexico and New Biscay, may be easily conjectured, since we cannot forget the project framed by Monsieur de la Salle, to visit and seize on the rich mines of St Barbe, &c. which if he thought no difficult task to accomplish with about 200 French, and the assistance of the Indians adjoining to, and in actual war with, the Spaniards at that time; how much more easily will they become masters of them, when with the united strength of Canada and Louisiana, both French and natives, they shall think fit to attack them? And after such an acquisition of the numerous mines of those provinces, with the immense riches thereof, what may not all our colonies on the continent of America apprehend from them?

Besides, Jamaica lying, as it were, locked up between their settlements in the island of Hispaniola, and those on the bay of Mexico, will soon be in danger of falling into their hands; and whether the Havannah itself, and the whole island of Cuba, with the key of Old Mexico, La Vera Cruz, will long remain in the possession of the Spaniards, is very much to be doubted, if the Spaniards should neglect their true interest, and not act in concert with Great-Britain, to curb and restrain such measures: and supposing the best that can happen to us, it will be but Ulysses's fate, to have the favour of being destroyed last.

We are all sensible what clamours were raised at the concessions made to France on the conclusion of the peace of Utrecht. There is scarce a man well versed in the interest of trade and plantations, but blamed the then ministry for not insisting on the surrender of Canada, as well as Nova Scotia and Newfoundland, for the security of our northern colonies on the continent of America, and the traffic thereof: nor ought they to have allowed them the possession of Cape Breton, if they had well considered or understood the nature of the fishery in those seas.

The history of former ages, and the experience of these latter times, have informed us, that the French have ever been troublesome neighbours, wheresoever they were seated: historians asserting, that the natural levity and restlessness of their temper, their enterprising genius, and ambition of extending their dominions and raising the glory and grandeur of their monarchs, contribute in great measure to make them so.

Wherefore it is to be hoped, that the British nation will be so far from continuing idle or indifferent spectators of the unreasonable and unjust usurpations and encroachments of the French on the continent of America, that they will let them know they have too much already of Canada and Cape Breton, and that, in reason and justice, they ought to abandon their new acquisitions on the Mississippi and the Bay of Mexico, that river and the country belonging of right to the crown of Great-Britain.

And if, while they were weak, and in the infancy of their settlement in Louisiana, we had duly asserted and maintained our right, we had a much better chance than at present to have kept them from further encroachments: for since they have had time to augment the number of their inhabitants, corrupt and influence the natives to their interest, strengthen themselves, by securing with forts and garrisons, the passes of the rivers, lakes, and mountains, it will be no easy matter to curb and restrain them from going greater and greater lengths;

lengths; but this must be done, or our plantations will be undone.

And I am apt to think, that prudence and policy will, or ought to prompt us to preserve a balance of power in America, as well as nearer home; and that, as we have, for many years past, found it our interest to check and put a stop to the growing power of France, and set bounds to their dominions here in Europe, we shall not easily be induced to allow them to encroach on, and deprive us of our colonies and plantations in America.

The Spaniards, if they knew their own interest, could not be less jealous and uneasy than we, at the so near neighbourhood of THE FRENCH ON THE MISSISSIPPI; for it is certainly for their security to dispossess them of their settlements there, and on the bay of Mexico, lest, in time, they render themselves SOLE MASTERS OF THE NAVIGATION THEREOF; and, with the assistance of the Indians, make irruptions into the very hearts of THEIR COLONIES, ATTACK THEIR TOWNS, SEIZE THEIR MINES, AND FORTIFY AND MAINTAIN THEMSELVES THEREIN.

And perhaps, if this matter was properly represented to the Spaniards, it is not improbable but they might be induced rather to DIVIDE THIS COUNTRY WITH US, AND SURRENDER ALL THEIR PRETENSIONS TO WHATSOEVER LIES EASTWARD TO THE MISSISSIPPI, except St Augustine, on condition that the French are obliged to remove thence, and retire elsewhere. And indeed nothing seems more proper and reasonable, than for that great river to BE THE SETTLED AND ACKNOWLEDGED BOUNDARY AND PARTITION BETWEEN THE TERRITORIES OF SPAIN AND GREAT-BRITAIN, ON THE NORTHERN CONTINENT OF AMERICA, NATURE SEEMING TO HAVE FORMED IT ALMOST PURPOSELY FOR THAT END, AS WILL BE EVIDENT TO THOSE WHO SHALL GIVE THEMSELVES THE TROUBLE OF VIEWING OUR MAPS; and at the same time they will perceive how the French have wormed themselves into a settlement between the English and the Spanish plantations, on pretence of a vacancy, and, with an assurance scarce to be paralleled, have set bounds to the dominions of both. Whether some proper use may not be made of these suggestions, at this critical conjuncture, at the court of Madrid, is most humbly submitted: if France, indeed, has not brought Spain into their scheme of ———, something of this kind might possibly be brought about.

This is certainly a treatment most unjust and dishonourable to the British nation, which I should not have mentioned, if the duty I owe to my sovereign, and the affection I bear to my country did not forbid me at such a juncture, and on so important an occasion, to be silent and unconcerned.

If we tamely submit to these insults and injuries which are daily committed by the FRENCH IN AMERICA, without being alarmed, and taking the necessary steps towards a speedy and effectual redress of them, shall we not seem infatuated, and wanting to ourselves, be arraigned as *felo de se*, and accounted, with good reason, the eternal bubbles of the French? From what has been said, and the several writings, charts, and maps of the French, it is evident to what a narrow extent of ground they have confined the English plantations, and particularly in L'Isle's, as well as D'Anville's map, the best and most approved of any they have lately published: besides many very remarkables, there is one in L'Isle's which we cannot omit taking notice of, viz. that on the part where they fix Carolina, now and long since inhabited by the English, they have inserted this memorable passage, 'Caroline, ainsi nommez en l'honneur, de Charles IX. par les François, qui la decouvrirent en prirent possession et s'establi-
'rent, l'an 15.'—That is to say, Carolina, so named in honour of Charles the IXth, by the French, who discovered, took possession of, and settled it, in the year 15.—By which the author seems to intimate the right of his nation to that province; who, if they were so bold to put in their claim in so bare-faced and so public a manner, will they not, when they think themselves strong enough, attempt by force to assert it?

But if the French should ever grow so powerful in America, as to be able to intercept or engross the trade with the INDIANS, or ruin or subject our plantations, there is an end of the consumption of our home-produce and manufactures in America, of all our shipping-trade thither, of the duties for goods exported thither, or imported from thence, the increase of our sailors, and the advantages of raising our own naval stores; besides the loss of so large an extent of dominion, and at least 500,000 British subjects therein. We may be likewise assured, that all our ISLANDS IN THE WEST-INDIES will soon undergo the same fate, or be terribly distressed, for want of their usual supplies of fish, lumber, and other necessaries they constantly stand in need of, and receive from our plantations on the continent; which neither Great-Britain nor Ireland can easily assist them with, and which they purchase with their sugar, rum, and molasses, the vent of which will be, in great measure, stopped on the loss of our NORTHERN COLONIES, whereby they will be mightily discouraged and impoverished, so as to become an easy acquisition to any ambitious and powerful invader.

Thus Great-Britain being deprived of its subjects, dominions and trade in and to America, our merchants will be ruined our customs and funds will sink, our manufactures will wane, our lands will fall in value, and, instead of decreasing our debts will increase, without the least prospect of the nation's emerging.

It looks with an aspect something very extraordinary and striking, that both France and Spain should take, almost ever since the late peace of AIX LA CHAPELLE, every measure to increase their MARITIME POWER, and procrastinate, from time to time, the adjustment of all misunderstandings between the court of Great-Britain and theirs. Did we give up CAPI BRETON in America the more effectually to enable the French to maltreat and insult us in that part of the world? Was the ASSIENTO CONTRACT given up to Spain for a song, to encourage them to continue their depredations upon our trade and navigation in America, and France to ruin our African trade? Do not FRANCE AND SPAIN SEEM, AT PRESENT TO ACT IN CONCERT AGAINST GREAT-BRITAIN Does not their conduct shew, that they have something more in view than the humiliation of the piratical states? [See our article MEDITERRANEAN.] This is an easy pretext, and may, like their domestic jars, be contrived only to cover some latent scheme of ———. Be this as it may, we cannot be too much upon our guard; and WITH THIS VIEW AND NO OTHER, ARE THESE THINGS TAKEN NOTICE OF. But how far we may with safety depend upon the faith of a certain power, seems, at present, to be quite forgot: I may, therefore, be useful to remind the nation, and indeed all Europe, thereof, by giving a brief history of the late French king's perfidiousness in the breach of solemn treaties.

Additional REMARKS ON THE CONSTANT PERFDY OF FRANCE, WHICH WE OUGHT NEVER TO FORGET.

Before we come to the facts, it is necessary to take notice that the principles of ambition which led the late French monarch to aspire to the universal monarchy, and the principles of treachery which were needful to be practised towards his obtaining it, were infused into him by those who had the charge of his education, and his conduct gave the world a sufficient proof that he cultivated both to the highest degree.

The bishop of Rhodes, who was appointed his first preceptor gave him for a model of government the designs of his grandfather, Henry IV. as appears by the book which the bishop published on that subject. After that great prince had made good his title to the crown of France, by renouncing the protestant faith, and subduing those who had made the Catholic league against him, he formed a project to cast Europe into a new model, to reduce all the kingdoms and commonwealths of it to a certain number, and to prescribe then such bounds as he should think fit, reserving to himself such a share as might enable him, or his successors, to grasp the universal monarchy, as his predecessor Francis I. intended before him.

To this end he chose his generals, and other great officers, erected vast magazines of ammunition and arms, and laid up prodigious sums of money; but, as he was going to mode his army, he was murdered in his coach by Ravillac.

In pursuance of the like design, Lewis XIV. applied himself in his youth to read the memoirs of the said Henry IV. with those of the present Jeanin and the bishop of Rhodes; but though he copied very well after his grandfather's ambition, he studied nothing of his generous qualifications, which made him the darling of his subjects, and procured him the esteem of the greatest princes and states of Europe: so that he inverted his plan in every thing that carried a shew of equity, and set out upon the foot of making himself an absolute conqueror, and of forcing all Europe to submit to his chains.

In order to this, abundance of mercenary, but able pens, were employed to flatter his ambition, on pretence of making his character glorious: in order to which, they possessed him with the following maxims, 1. That any title was sufficient to take possession by the sword, 2. That the greatest part of Germany was the patrimony and ancient inheritance of the crown of France. 3. That his predecessor Charlemain possessed Germany as king of France, and not as emperor: the writers on those subjects were gratefully rewarded; and one of them dedicated a book to him, intitled, The just pretensions of the King of France to the Empire: wherein, besides the above-mentioned principles, he laid down these following propositions, viz. That the dominions of sovereign princes have always been the dominions and conquests of their estates, and that the dominions and conquests of crowns, can neither be alienated nor prescribed; though, at the same time, there were treaties betwixt the crown of France, the empire, and other princes, directly contrary to these maxims.

But, to come to the treaties, the first we shall take notice of, is that of Munster, which was concluded betwixt the plenipotentiaries of the emperor and empire, and the French plenipotentiaries at that city, the 24th of October, 1648. At

to which, it is fit to observe, that the Empire having desired the assistance of France against the house of Austria, the French, on pretence of that assistance, possessed themselves of several provinces and considerable towns in Spain, Italy, Germany, and the Netherlands; so that the Empire finding themselves to be in as much danger from France, as they had formerly been in from the house of Austria, they willingly came into that peace, and were content to sit down with their losses, rather than trust their French allies any longer. The court of France perceiving that they could not put off the peace of the empire by their usual intrigues, nor hinder the Dutch to make a separate peace with Spain, they found methods to have the treaty of Munster finished, without including the Spaniards, or the duke of Lorraine, in the general peace; and Monsieur de Wicquefort, in his book, intitled, *L'Ambassadeur & ses Fonctions*, lib. ii. and sect. 13. informs us, that cardinal Mazarine endeavoured to prevent the peace all that he could; and though his master's troops pretended to espouse the interest of the protestants, and that the Spanish ministers pressed the imperial court to grant them all their demands, yet underhand he hindered it, that by continuing the war he might unite the Spanish Netherlands to the crown of France; and at the same time he favoured the elector of Bavaria, the chief of the papists, against the elector Palatine, who had been the head of the protestant League in the Empire. By these intrigues, the cardinal, and others of the young French king's governors, not only laid a foundation for a new war, whenever they should think fit, but got all confirmed to them that they had taken from the emperor and empire in a hundred years before, viz. the city of Brisac, the Landgraviate of Upper and Lower Alsace, Suntgow, and the provincial lordship of the ten imperial cities in Alsace, with all their dependencies, to be incorporated with the kingdom of France for ever. They did also obtain a perpetual right to keep a garrison in Philipburgh, and to the sovereignty of the cities and dioceses of Metz, Toul and Verdun, by which they opened their way into the empire on the Moselle, and the Upper and Middle Rhine, whenever they saw occasion; or as soon as their king, who was then about ten years of age, should be in a capacity to practise the ambition and treachery which they bred him up to.

When he came of age, cardinal Mazarine brought on the treaty of the Pyrenees, in order to lay a surer foundation for his master's greatness, and had the satisfaction to see his pupil outdo all the copies of perfidiousness and treachery he had set him. This treaty was concluded by the cardinal for France, and Don Louis Mendez de Haro for Spain; by which a peace was made betwixt the two crowns, on the 7th of November, 1659, when the French king was left in possession,

1. Of all Artois, except Ayre and St Omers, with their dependencies.
2. Of Graveling, the forts Philip, the Sluce, Hannum, Bourbonn, and it's chatellany, and St Venant, in Flanders.
3. In Hainault, he had Landrecy and Quefnoy, with their chattellanies and dependencies.
4. In Luxemburg, Thionville, Montmedy, and D'Anvilliers, with their dependencies, and the provostships of Ivoy, Chavanev, Chateau, and Marville, with all that belonged to them; Marienburgh and Philippeville, on the Maes with all their dependencies; Avennes, on the Sambre with all that belonged to it; Recroy, in the Ardenes; Le Chatelet, at the head of the Scheld, and Linchamp.
5. On the side of Germany, all that had been granted him by the treaty of Munster was confirmed.
6. By this treaty the duke of Lorraine was in a manner sacrificed to him; for Nancy, his capital, was to be demolished, and not to be re fortified; and all the guns, arms, and ammunition to be carried off: he was stripped of the whole duchy of Bar, the county of Clermont, the provostships of Stenay, Dun, and Jametz, Moyenvie, and their dependencies.
7. By this treaty all the French king's pretensions to the kingdom of Navarre, were left statu quo, and his sovereignty over the county of Carolois in Burgundy, was reserved to him, the king of Spain being to hold it in fee, as before the war.
8. On the side of Spain, the county of Rouffillon, the Viguery of Conflans, and part of Cardegna were yielded to him.
9. In Italy, the king of Spain obliged himself to restore Verreil, with it's dependencies, to the duke of Savoy, to withdraw his garrison from Correggio, to pay the duke the arrears of the dower of the infanta Catharina, to restore the duke of Modena to his favour, and allow him a neutrality, to restore the prince Manaco; and, on the French king's intercession, the king of Spain restored Juliers to the duke of Neuburg.

By this means the French king had put into his hands the keys of the Empire, Spain, and the Netherlands; which were necessary for his design, to obtain the universal monarchy that he afterwards discovered.

We cannot suppose the Spaniards, who are a wise people, to have made him such a sacrifice, without a valuable consideration; which was to preserve what they had left intire, that they might be at liberty to recover the kingdom of Portugal, which had newly revolted from them, and to obtain restitution of the duchy of Burgundy, and some places of importance the French had taken from them in Flanders. Besides,

VOL. II.

they had some hopes of tying down this young aspiring prince, by the bonds of love, since they could not do it by force of arms; especially when the hands of the German branch of the house of Austria were tied up from assisting them, by the treaty of Munster, and their own low circumstances. In order to this, a contract of marriage was agreed on betwixt Louis and infanta Maria Theresa, the king of Spain's eldest daughter, on condition that he and she should solemnly renounce all pretensions for themselves and their successors, to the crown of Spain, or any of the dominions thereunto belonging; which was ratified by the 33d article of this treaty, and there called the chief part of it, and the most worthy, as well as the greatest, and most precious earnest of the surety of it's duration.

But that the French court might shew themselves to be still acted by the same maxims of treachery and cruelty; as they made the match betwixt the king of Navarre, afterwards Henry IV. and Margaret of France, a trap to ruin the Protestants, by the infamous massacre of St Bartholomew; so they made the like trap of this match to ruin the family of Austria, and usurp their dominions, which has occasioned so much blood in Europe, and God knows when the current will be stopped.

We come now to the French king's behaviour, at, and after this treaty; which opens such a scene of perjury, atheism, and treachery, as, all circumstances considered, never had it's parallel in the world.

To prove this, we shall bring some instances which make it evident, that the French king swore to the clause of renunciation with a design to break it. The first is from cardinal Mazarine's letter to Monsieur Lionne, of August 5, 1659, where he says, 'We could not suffer ourselves to be persuaded to lose so many advantages, which with justice we might pretend to, without agreeing to the marriage of the king with a princess who might come to be heirs of so great a monarchy as that of Spain.' And in the same letter he says, 'That when M. Piemontel made the overture of the marriage, it was without making mention of the renunciation.'

In his letter to Monsieur le Tellier, of August 23, he gives an account of his conference with Don Lewis de Haro, the Spanish minister, wherein he would have persuaded him to consent to the marriage without the renunciation; but Don Lewis stopped his mouth, by telling him that the emperor had offered, in case he might have the infanta for himself, that he would break with France, and in all things follow the conduct of Spain; which obliged the cardinal to accept the match with the clause of renunciation.

In that same letter he says, that Don Lewis durst not propose the marriage to the court of Spain, without the renunciation, they being so averse to it, that there were none of the council but himself, and one more, who were for the match, even with that clause; for they all maintained, and he himself was of the same opinion, 'That if the king of Spain should lose his two sons, which there was great reason to fear, they could not expect that the king of France would quit his hopes to succeed him, and renounce so great pretensions.' Upon which the cardinal adds his own reflections in the following words: 'I am fully persuaded of the truth of all this, for several very strong and conclusive reasons.' And he subjoins: 'moreover, I very well remember what the queen, his most christian majesty's mother, who likewise made a renunciation when she was married to Lewis XIII. often told me, that when her brother, the king of Spain, had but one son; but, says he, (in a rapture of joy) I was well pleased to hear the same thing from the first minister of Spain, and that their whole council is of the same sentiments.' These letters being wrote for the king's own perusal, the cardinal durst not have presumed to use so much freedom, had he not been persuaded that it agreed with his majesty's intentions.

The second instance is from Monsieur Aubery's *Life of Cardinal Mazarine*, dedicated to the king himself, by the author, who was an advocate of the parliament of Paris, and one of the king's council. He says, in the second tome of Mazarine's life, p. 554. The cardinal acted prudently to sign the contract of marriage, without having any regard to the pretended renunciation; which being manifestly contrary to common right, and to the law and general custom of the state, might be freely contradicted and disavowed.

These are full proofs of the French king's swearing to the treaty of the Pyrenees, with a design to break it: and what aggravates his crime is, that he had the same treacherous intention when he took his marriage oath; which after, according to the religion he professed, he looked upon as a sacrament, is a clear demonstration that he was not to be tied, even by what he himself accounts to be most sacred. The first open breach he made of this treaty, was, that though in the 6th article of the contract of marriage, it was stipulated, that he should make another ratification of the renouncing clause, jointly with his queen, as soon as he should be married, and enregister the same in the parliament of Paris, with other necessary clauses, according to the usual form, yet he would never comply with it; so early had he learned to play fast and loose with oaths and sacraments, and so little

regard or love had he to the honour or person of the infant, whom he could never have obtained without this renunciation.

The second breach was that of the 60th article of the Pyrenean treaty, by which the French king obliged himself to abandon Portugal, and to give that king no assistance, in the following words: "His said majesty shall meddle no more with the said affair, and doth promise and oblige himself upon his honour, and on the faith and word of a king, for himself and his successors, not to give unto the forementioned kingdom of Portugal, neither in general, or to any persons of it in particular, of what dignity, estate, or condition soever, neither now nor hereafter, any aid or assistance, public or private, directly or indirectly, of men, arms, ammunition, victuals, ships, or money, under any pretext; nor of any thing else, either by land or sea, or in any other manner: and that he would not suffer levies to be made in any part of his kingdoms and estates, nor grant free passage to those which may come out of other countries to the assistance of the said realm of Portugal."

But so far was the French king from observing this article, that immediately after the treaty, he sent privately several bodies of troops to Portugal, and encouraged their obstinacy to maintain the duke of Braganza upon the throne, contrary to the house of Austria; which was so much the more gross, because it appears by many places of the cardinal de Mazzarine's letters, that the French king must of necessity have continued the war, and gone without his bride; nor would the Spaniards have abandoned the duke of Lorraine, and the prince of Condé, as they did, in so many material points, but merely on the consideration of the French king's abandoning Portugal. When the Spanish ambassador at Paris complained of this breach to the French king, that prince, to shew how well he was versed in the art of dissimulation, sent orders to all his ports, that no forces should embark there for Portugal, which they did notwithstanding; and when the Spanish minister renewed his complaint, he was told, that this was the marshal de Turenne's particular act, and that the court had no hand in it: though, at the same time, the Spaniards intercepted several letters betwixt Monsieur Leon, the archbishop of Ambrun, and Count Schomberg, which fully proved, that the latter kept a constant correspondence with the French court, and received all his directions from thence for carrying on the war. So early had the French king learned the art of debauching Protestant generals, so far as to concur with him in carrying on his treacherous and tyrannical designs.

The treachery of the French king, in this matter, was still more evident by the letters which the Spaniards intercepted; which made it evident, that soon after the treaty, he hindered the Portuguese from accepting the advantageous proposals made them by the Spaniards, by promises of such assistance, as should enable them, not only to defend themselves, but to carry the war into the heart of Spain. And soon after the close of the treaty, Mr Colbert made several journeys into Portugal to encourage them, and to contract a secret alliance with them: and Monsieur Courtin went to England, at the same time, to move the king of Great-Britain not to abandon the Portuguese: nay, the Spaniards intercepted, in a French vessel coming from Portugal, an account of the expences and succours which France had given, without intermission, to the Portuguese from the close of the treaty; and, among other things, that they had maintained troops there to uphold the war: and all this, at the very time when they offered to the Spaniards to compose the differences betwixt them and Portugal, by their mediation. But, as ill men become more and more hardened in their wickedness, by continuing the practice of it, the French king, in 1667, when he began to form his design of invading the Spanish Netherlands, did openly, in defiance of the Pyrenean treaty, make a league, offensive and defensive, with Portugal, against all nations, England excepted.

By this treaty, all the harbours which the Portuguese should take in Spain, either upon the one or the other Sea, were to be put into the power of France, which was to furnish them with men and money by way of loan; and this treaty was to last for ten years, and the French were not to treat until the Portuguese were intirely satisfied, as we are informed by the author of *The Buckler of State and Justice*.

Having thus treacherously ensnared Spain, by continuing the war of Portugal, the French king dealt in the same manner with the duke of Lorraine; and, contrary to the reservations made for the said duke in the treaty of the Pyrenees, he forced him to sell him his duchy, to the prejudice of his lawful successor: but knowing that the contract was null of itself, the French king obliged him, by force, to put the only place left him into his hands; by means of which he revoked the bargain, and got the thing without paying the price.

The next thing the French king did, was to possess himself of those provinces belonging to the Spaniards, where he was likely to meet with most opposition to his design of making himself master afterwards of the whole Spanish monarchy; either because of their native strength, or because of the interest that neighbouring princes and states were like to take in

their preservation; and these were Flanders, the French county, and Milan.

In 1665, the queen-mother of France, who had made the same renunciation as her son, the French king, had done, told the Spanish ambassador, in a discourse, that she was sensible of the ill advice given her son, the French king, to set up pretensions upon the monarchy of Spain; she was sensible also of his desire of glory, and of the unquiet temper of the French nation, and being afraid that these things might give a disturbance to the peace, of which she looked upon herself to be the author: she therefore desired him to acquaint her brother, the king of Spain, that she thought it necessary, since he had given so much for a peace, to give yet something more for preserving it, and to stop the mouths of those that pushed on the king, her son, to violent resolutions; and that for her part, she would inspire him with all the moderation she could.

But the French king was so far from having any regard to the advice of his mother, or to her honour, that he perfectly gave her the lye, in his letter to the queen-regent of Spain; to whom he wrote, that his mother, in this conference, told the marquis that his pretensions were just, solid, and undeniable.

The Spanish ambassador gave the court an account of what had passed betwixt him and the queen-mother of France; but Philip IV. of Spain dying a little after, they returned no immediate answer, only the ambassador had orders, that if the queen-mother of France should again debate that business, he should inform her fully of the falshood of the French king's pretensions, and that the queen-mother of Spain could do nothing in those things herself, during the regency.

The French king made no complaint of this answer, nor any new proposals upon it: and when he sent the marquis de Bellefonds to Madrid, with a compliment of condolence upon the king of Spain's death, he gave him no orders about his pretensions; but, on the contrary, the archbishop of Ambrun, the French ambassador at Madrid, gave all assurances of his master's intentions to keep the peace, proposed entering into a league with Spain, to compose their differences with Portugal; and reproached those as persons of a seditious and turbulent humour, who would call in question his master's sincerity. Nay the French king himself, when the Spanish ambassador took leave of him to return to Spain, charged him to engage his faith and word to the queen, that he would keep a constant amity with her and her kingdom, without saying one word of his pretensions.

By these false promises he lulled the Spaniards asleep; and, to prevent their making any alliances for their own defence with their neighbours, he declared to the Spaniards, that if they signed any treaty with England, or made a peace or truce with Portugal upon their mediation, he would immediately declare war against them, as appears by Sir William Temple's letter to the earl of Clarendon from Brussels, May 4, 1667.

The French king having also, by his practices and private intrigues with Charles II. king of Great-Britain, raised a war betwixt England and Holland, he continued it by the same arts, because he knew very well that an union betwixt those two powers, would be an effectual curb to his designs upon the Spanish monarchy. Being unwilling, however, to alarm Europe too much, he made his pretensions at first only to the duchy of Brabant, with it's appurtenances; the lordships of Mechin, Antwerp, Upper Guelderland, Namur, Limburg, the united places beyond the Meuse, Hainault, Artois, Cambray, the French county, and part of Flanders; which was expressly contrary to the PYRENEAN TREATY.

The French king having thus abused the credulity of the Spanish court, and prevented their taking necessary measures for their own preservation, he assembled his army on the frontiers of Flanders, on pretence of a general review; and on the 8th of May 1667, he wrote to the queen of Spain, that he was ready to appear at the head of his army to do himself right, and at the same time sent her his manifesto, without having made any other demand of his pretended rights, but what passed in the conference formerly mentioned betwixt his mother and the Spanish ambassador. The queen-mother of Spain returned him an answer the 21st of the same month, wherein with great modesty and reason, she laid open the injustice of his pretensions and proceedings; but told him, since he desired an accommodation, she was willing to agree to it, and desired him to name commissioners, and appoint a place of treaty; but the French king, that his conduct might be all of a piece, did not stay for her answer, went to his army eight days after the date of his letter, and made those surprizing conquests, which at that time alarmed and amazed all Europe: nay, he was so far from standing to his own proposal of an accommodation, that he rejected it with fury, when the Spanish ministry offered to agree to it, and to refer it to the arbitration of neighbouring princes.

All his neighbours being alarmed at his progress in Flanders, and his conquest of the French county, England and Holland clapped up a peace betwixt themselves; and the king of England brought Portugal to a peace with Spain. In 1668, the triple league between England, Holland, and Sweden, was concluded;

concluded; which put a stop to the arms of France, and brought on the treaty of Aix la Chapelle at that time. This treaty saved the remainder of Flanders, and obliged the French king to restore the French county, after demolishing all its strengths; but he still retained and had confirmed to him for ever, Charleroy, Binch, Aeth, Doway, Fort Scarpe, Tournay, Oudenard, Lisle, Armentiers, Courtray, Berges, and Furnes, with all their appurtenances and dependencies. Yet the French king, far from being satisfied with this, and knowing that the triple league was an invincible barrier against his design of grasping the universal monarchy, he resolved to break it; and for that end sent over the dukes of Orleans, who had an interview with her brother king Charles II. at Dover, in 1670, and not only prevailed with that prince to disengage himself from that alliance, but to concert measures with France to carry on a joint war against the Dutch, which broke out in 1672. The reason of his attacking the Dutch was, that he knew they were concerned in interest, as well as obliged by treaty, to prevent his getting any more of the Netherlands into his possession.

The motive which moved our king Charles II. to join with him was, the assurance given him by his sister the duchess of Orleans, in the name of the most Christian king, that he would assist him to attain an absolute authority over his parliament, and to establish popery in his dominions; as we are informed by the History of the War with Holland, printed at Paris in 1682, with the French king's allowance, but afterwards suppressed; and the count de Maiolo who wrote it, was put into the Bastille, upon complaint of the English ambassador, because it discovered the secret transactions betwixt the two courts. The French king likewise engaged the emperor to approve the confederacy against the Dutch, on condition that he should not invade the empire nor the Spanish dominions. And all things being thus prepared, he actually invaded their provinces, and brought that republic to the brink of ruin. His treachery in this was so much the more palpable, that it was not only contrary to treaty, but without any declaration of war, or demand of reparation for any injuries real or supposed: though the States wrote very respectfully to him upon his preparations in 1671, and promised to make him all reasonable satisfaction if they had failed towards him in any thing. King Charles II. of England followed his example in this, and attacked the Dutch East-India ships in their return home, without any declaration of war.

The French king and he published their declarations afterwards, as did the bishops of Cologne and Munster; but all of them so frivolous, that every body perceived that there was something else at bottom than what was pretended in those declarations. The Dutch published answers to them severally, wherein they sufficiently exposed the treachery of all the four, and the falshood of their pretensions. Thus the French king engaged king Charles II. in treachery and perjury with himself. But the English being dissatisfied with the measures of our court and the progress of the French king, it encouraged the Dutch to send deputies to England to solicit a peace. King Charles accordingly sent over four persons of quality to confer with the States and prince of Orange, to whom they pretended that the king designed only to humble, but not to ruin them; and that being alarmed at the progress of France, he was much inclined to their interest. This was nothing in effect but a French artifice, for the same persons renewed a treaty with the French king for three years, and both of them delivered their demands to the Dutch; which were so extravagant, that the States resolved to risk all rather than agree to them, and applied to the empire for assistance. In 1674, the parliament of England being uneasy at the war with Holland, a separate peace was made with the Dutch and Spain, and a great part of the empire declared in their favour; which, together with the admirable conduct of the prince of Orange, retrieved their affairs. The French king continued his war, however, upon the Spaniards, which occasioned a treaty of defensive alliance betwixt the king of England and the Dutch; which was followed by another soon after, and by a third, by which the Spaniards were considerable losers. For instead of Charleroy, Binch, Aeth, Oudenard, and some other parts of his conquests, which the French king restored to Spain, he had the French county, the towns of Besançon, Valenciennes, Bouchain, Condé, Cambray, with the Cambresis, Aire, St Omers, Ypres, Warwick, Warneton, Poperingen, Bailleul, Cassel, Bavay, and Maubeuge, with their dependencies, confirmed to him for ever, as appears by the treaty of NIMEGUEN.—By this means the Spaniards entirely lost the French county, and had but a weak barrier in Flanders: yet the French king not being satisfied with this, did, according to his usual way of observing treaties, presently after the peace, set up claims to several of the most considerable places of Flanders, &c. under the pretence of re-unions, dependencies, &c. but knowing these titles to be weak, he backed them with a powerful army; and, having secured the friendship of our king Charles II. he did not much value any other opposition. He took Luxemburg, put the Spanish provinces under contribution, and miserably harassed them; but being sensible that

he could not be long without opposition in these unjust proceedings, he proposed a separate and advantageous alliance with the Dutch, who rejected it, because they saw the snare laid for them: and king Charles II. of England being uneasy at home, because of the too well-grounded jealousies that the nation had of his popish and arbitrary designs, he proposed by Mr Henry Sidney, afterwards earl of Romney, a treaty of guaranty to enforce that of Nimeguen, refused to settle the limits between him and Spain in the NETHERLANDS, according to that treaty, and forced the king of Spain to renounce his title of duke of Burgundy.

He proceeded in the same treacherous manner against the empire; and contrary to the treaties of WESTPHALIA and NIMEGUEN, continued his troops in the empire, refused to evacuate the places there, which he ought to have done by the treaty of Nimeguen, demanded contributions, obliged the ten towns of ALSACE to swear to him as their sovereign, and the vassals and nobles of the country the like; he erected new courts of appeals there, and forbade appeals to the imperial chamber at Spire. He likewise set up pretensions to the sovereignty of the jurisdictions of Metz, Toul, and Verdun, and to other imperial states and countries; confiscated the revenues of the chapter of Straßburg, made new fortifications at Schlestadt and Huningen, refused to restore Montbelliard, dismounted Duckburgh, took Homburg, Bieich, and raised new pretensions on Straßburg: all which were complained of in the diet of the empire, and represented to the French king, who was so far from thinking himself bound by the most sacred treaties and oaths, that instead of redress, he invaded the Palatinate, surprized Straßburg by treachery; and, in order to grasp the universal monarchy, did all that he could by fraud or force to get the DAUPHIN chosen king of the ROMANS.

Much about the same time, in order to make himself master of Italy, and particularly of the Spanish dominions there, he purchased CASAL from the duke of MANTUA, and by his intrigues with the duchess regent of SAVOY, endeavoured to possess himself of the dominions of her son, then but fourteen years of age, on pretence of sending him to Portugal to be matched with the infanta, and in her right to enjoy that crown. But this design was happily defeated by the nobility of SAVOY.

All these things together brought on the league of AUGSBURG in 1683, by the emperor, the king of Sweden, the states of Holland, and several circles of the empire, of which league the prince of Orange, afterwards king William III. was the main instrument. In 1684, the French king continued his conquests in the SPANISH NETHERLANDS; but, perceiving the vigorous opposition he was like to meet with from the prince of Orange, by virtue of the Augsburg league, he proposed a twenty years truce with the persons concerned in it, and also with the king of Spain: which being accepted, he secured himself of all that he had treacherously taken from the Spaniards, except COURTRAYE and DIXMUDE, which he restored after demolishing the fortifications.

It appeared, however, afterwards, that the French king entered into this twenty years truce, with the same treacherous intentions that he had formerly entered into all his other leagues; and when king James II. came to the crown of Great-Britain, he thought himself sure by his interest and long alliance with that prince, where weakness and bigotry had made him his tool, to accomplish his ambitious designs. He put him upon the same design of subverting the English parliament, and of establishing POPERY in his dominions, as he had done his brother king Charles II. Which England being sensible of, they soon grew discontented, and being unwilling to be brought under the cursed yoke of POPERY and SLAVERY, they made application to the immortal prince of Orange for assistance, to free themselves from the intended bondage, in which the States of Holland cheerfully concurred. The French king perceiving this from their preparations, he ordered the count D'Avaux his minister, in 1688, to acquaint the States that he should look upon their first act of hostility against king James, as a manifest rupture with himself, because of the engagements of friendship and alliance betwixt him and that prince. This was an interpolation which the French king was no ways concerned to make, had it not been for the treacherous alliance he had made with king James, contrary to the twenty years TRUCE and the TREATIES before-mentioned.

The states of Holland were not to be frightened, however, by this memorial of the French ambassador, but came to a resolution to assist the prince of Orange in his expedition to England; upon which occasion, the Dutch take notice of the strict alliance between those two kings to deprive the state of their allies, and to overturn it. This expedition brought on the late happy revolution, which disconcerted the French king's measures; whereupon, contrary to the twenty years truce, he treacherously invaded the empire, and besieged and took PHILIPSBURG, &c.

It is fit to observe here, that this very step discovered his treachery also to king James: since it would have been a much more effectual assistance to him to have invaded the NETHERLANDS, which must needs have hindered the States of

of Holland from lending their army to the prince of Orange, as he might have sent troops to England to assist king James here. But this did not suit with his designs: for he believed, no doubt, that England must needs be engaged in a civil war by that expedition, and he thought it his interest to let Great-Britain be weakened by sheathing their swords in one another's bowels, that they might not be able afterwards, upon the turn of affairs, to put a stop to his ambitious designs of universal monarchy, as they had done several times before: and thus he sacrificed his dear friend and ally king James.

These treacherous proceedings of the French king occasioned declarations of war on both sides, and the allies in theirs charged the French king home with his treacheries. That of the States of Holland charge him, (1.) With invading them in 1672, in a time of profound peace, contrary to solemn treaties then in being, for no other reason, as he expresses himself, but for the increase of his honour and glory. (2.) With the breach of the treaty of Nimeguen in 1678. (3.) With laying exorbitant duties upon their navigation and commerce, contrary to the said treaty. (4.) With disturbing their navigation as well within as without Europe, and attacking their men of war in time of peace, with a manifest design to ruin their trade, and rejecting all their desires of redress with scorn. (5.) That during his persecution of his own protestant subjects, he had also involved their protestant subjects residing in France in the same calamity, and treated them barbarously, contrary to the law of nations and express treaties; parted wives from their husbands, and children from their parents; imprisoned their subjects, refused them leave to withdraw, and barbarously used their consuls. (6.) That he threatened the States for making alliances for their own defence, which, it is allowable to all sovereigns, they had a liberty to do by the treaty of Nimeguen. (7.) That in time of peace, contrary to the said treaties, he had seized the vessels, persons, and goods of their subjects in his dominions; ill used their merchants and traders, clapped them up in prison, and sold their ships, because they would not change their religion. (8.) That his troops had burnt and plundered several places in their dominions, before the war was declared, or at least on the same day, for no other reason, but because they made some extraordinary levies for their own security against his private designs, of which they were too well informed.

The governor of the SPANISH NETHERLANDS, in his declaration of war against France, charges the French king, (1.) With declaring war against the Netherlands in April 1689, for no other reason, but because the king of Spain had entered into an alliance with other princes and states, for his own defence. (2.) With bringing the Turks upon Hungary, and endeavouring to prevent a peace betwixt the emperor and his allies, and the OTTOMAN PORTE.

King William and queen Mary, in their declaration against France, charge him, (1.) With invading the territories of the emperor and empire, their allies, and laying them waste in a barbarous manner, contrary to treaties wherein England was concerned as guarantee. (2.) With many injuries against themselves and their subjects, without giving reparation, though they had not been taken due notice of, for reasons well known to the world. (3.) With invading our trade and settlements in NEWFOUNDLAND, from the governor of which the French did formerly take licence to fish. (4.) With invading our CARIBBEE ISLANDS, and possessing himself of NEW YORK and HUDSON'S BAY in a hostile manner, and treating the inhabitants with the utmost barbarity, while at the same time his ministers were negotiating a treaty in England for a NEUTRALITY and GOOD CORRESPONDENCE in AMERICA. (5.) With his countenancing the seizure of our ships by his privateers; forbidding the importation of a great part of our products, and laying exorbitant customs upon the rest, with a design to destroy our trade and navigation. (6.) With disputing our right to the FLAG, and barbarously persecuting our protestant subjects in his dominions, contrary to the law of nations and express treaties, and forcing them to abjure their religion by unheard-of cruelties; imprisoning and sending to the galleys our merchants, masters of ships, and seamen. (7.) With having promised assistance to overthrow the government of England, and invading the kingdom of Ireland.

During the course of the war, which followed these declarations, he treacherously brought the duke of Savoy to break the alliance, and to enter into a separate peace with him.

We may also take notice here, that during the said war, it appeared plain by the confession of Grandval, and others executed abroad, and by the trial of Sir William Perkins, Charnock, King, and Keys, &c. executed here, that he was engaged with the late king James in several plots to assassinate king William and queen Mary; which is most cruel practice in private persons, but so superlatively vile and abominable in one prince towards another, that the most brutal of human savages have held it in abhorrence and detestation.

The war was at last concluded by the treaty of RYSWIC in 1697. But it soon appeared, that the French king entered into that treaty with no other design than to break it, as soon as he could with safety and advantage: and as the States of

Holland charge him in their manifesto of 1702, he did it with no other view than to induce the confederates to lay down their arms, to disband their troops, and to separate them from one another, in order to weaken and ruin them: for that part of the treaty with the Dutch, which related to traffic and commerce, was scarce well ratified, when he began to invade the trade of their provinces, and openly refused to grant them the tariff stipulated in that treaty, and put their subjects and merchants to numberless troubles on that head, and the States to a tedious and expensive negotiation. After which they were obliged to submit to a disadvantageous tariff, contrary to the tenor of that treaty, rather than hazard a new war: and though it was also stipulated by the said treaty, that the Dutch subjects who settled in France to carry on their trade, should be exempted from the taxes and duties laid upon foreigners; yet he imposed excessive duties upon them, without giving any redress when demanded.

It is also well enough known, how they chicaned and trifled with us about restoring our Hudson's-Bay colony, and would never come to settle a tariff of trade with us. He treated the emperor and empire in the same manner, and broke that treaty, by refusing for a long time to restore the fortresses of Brisac, and by the injuries and damages he did to the house of Montbelliard, and countenancing a treacherous explanation of the fourth article of Ryfswic, by which the protestants of the empire were persecuted: nor was he any thing more punctual, as to what he ought to have restored to the crown of Spain by that treaty. But notwithstanding these new instances of his perfidiousness and treachery, king William and the States-General being willing to secure the peace of Europe, if possible, and to prevent a new war about the succession to the crown of Spain, upon the death of king Charles II. who was then in a languishing condition; they entered first into a treaty of PARTITION with the French king for settling the succession of Spain on the electoral prince of Bavaria, on condition that Naples, Sicily, Guipuscoa, &c. should be granted to the Dauphin, and the duchy of Milan to archduke Charles. But the prince electoral happening to die, they came to a second treaty of partition, by which the Dauphin was to have Naples, Sicily, &c. and the duchies of Lorrain and Bar, for which the duke of Lorrain was to have the duchy of Milan, and all the rest of the Spanish dominions were to be given to the archduke and his heirs for ever. The French king entered into these treaties with all possible protestations of sincerity, and pretended he had no other design in so doing, but to preserve the peace of Europe, and to remove all obstacles that might interrupt the same. That treaty was no sooner concluded, than it manifestly appeared that the French king never intended to keep it; for he immediately used all manner of artifices in the court of Spain, not only to render the emperor odious to the Spaniards, but likewise to oblige king Charles II. to dispose of his succession by will in favour of France.

Here also it is fit to observe his treachery to king James II. his kinsman and ally, whose interest with that of his pretended son and daughter, he sacrificed to the treaty of partition, contrary to solemn treaties, and all the rules of gratitude, since that unfortunate prince had ruined himself by following his measures.

The author of the fable of the LION'S SHARE, verified in the treaty of partition, who was an able writer employed by the imperial court, makes these judicious remarks upon the design of the French king in the treaty of Ryfswic, and those of the partition. (1.) That he sacrificed so many places of importance which he had fortified at a vast charge, besides several provinces that he had conquered, and exposed his own frontiers, by demolishing many strengths, merely that he might have an opportunity of usurping the monarchy of Spain. It was this alone that made the peace of Ryfswic absolutely necessary to him; for it is well known, that when he concluded that treaty, he had the advantage of the allies by arms. (2.) His design by the treaties of partition was, to divide the allies among themselves, and to break the two maritime powers, and the elector of Bavaria, with the house of Austria; who he had reason to think would never agree to it, and could scarce ever enter into a friendship again with the English and Dutch, for abandoning them in this manner, since by the fourth article of the first grand alliance, none of the allies were to conclude a peace, 'till the treaties of Westphalia, Osnaburg, Munster, and the Pyrenees, were vindicated, and all things restored according to the tenor of the same. (3.) Considering the weakness of the house of Austria, and their then circumstances, he made no doubt either to bring them to agree to the treaty, or afterwards to break with the allies and join with himself, upon granting them better terms. (4.) Having by this means engaged the maritime powers to acknowledge the electoral prince of Bavaria's right, notwithstanding the renunciation of his mother the archduchess to all the dominions of Spain upon her marriage with his father, he knew it laid a foundation for the dauphin afterwards to dispute his right to the whole with that prince, notwithstanding the renunciation of his mother the late queen of France; who being a daughter of Spain, he was nearer in blood to that crown than the electoral prince.

That same author adds, That the Spaniards finding themselves deprived of their allies by this treaty, and their monarchy dismembered, it was a powerful argument to induce them rather to accept of a son of France, than to suffer themselves to be torn in pieces, and their monarchy partitioned. He is very modest, however, as to the motives, which he thinks might have induced king William and the States to enter into this treaty; and supposes, that perceiving the French king ready to break out into a war to make good his pretensions to the Spanish monarchy, when England and Holland were not prepared to resist him, he designed, like a wise politician, to charm the storm with a negotiation; and upon that account was not unwilling that the French king should publish the treaty, by which the house of Austria may take the alarm, and enter into proper measures to prevent it.

But be that how it will, when the king of Spain died, the French king, who had secretly broke that treaty before, by procuring a will which settled the whole Spanish monarchy on the duke of Anjou, then publicly avowed it; and by a jesuitical distinction betwixt the spirit and the letter of the treaty, he preferred that will to the treaty of partition, and advanced his grandson to the throne of Spain, not only contrary to all these treaties, but also contrary,

1. To the laws of the kingdom, which do not allow the alienation of that crown, nor that it should be placed on the head of a stranger; the succession being settled by consent of the States on the house of Arragon, from whom the house of Austria is lineally descended.

2. It was contrary to the renunciation made by Lewis XIII. and the infanta Mary-Anne his wife, at the time of their marriage, the validity of which was not then disputed.

3. It was against the renunciation made by the French king and his wife the famous Mary Teresa, at the time of their marriage, and the oaths which both of them swore on the altar.

4. It was against the treaty of the Pyrenees, of which that renunciation was one of the chief articles.

5. It was contrary to the will of Philip IV. pursuant to that renunciation.

6. It was contrary to all the arguments formerly made use of by Lewis XIV. against the renunciations above-mentioned; which made him guilty of the same injustice to the Dauphin and duke of Burgundy, that he himself had charged upon the said renunciations.

7. It was expressly against the civil law, and the decretal of pope Boniface VIII. which says, 'That every renunciation made upon oath by a daughter above 12 years of age, in favour of her father, in order to contract a marriage, by which a sufficient dowry is assigned her, ought to be good in law, though she be then under the jurisdiction of her father.'

As to the pretended will of king Charles II. of Spain, by which the duke of Anjou claims the crown, we may observe, (1.) That it is contrary to the will of his father, which was founded upon a treaty with consent of the States, and the solemn renunciation of two successive kings and queens of France, ratified by the legislative power of France and Spain; which is no great argument of the piety of those that put him upon making it, or rather signing it. (2.) That it was contrary to a will which he made but a little before in favour of the archduke, to his repeated assurances to the emperor, and to his known inclinations. All which make it evident, that it was an imposition upon him when he was struggling with the pangs of death, and in no condition to peruse, much less to compose, such a will.

To return to the treaty of partition; the French king not only broke it, but upbraided king William and the Dutch with it in such a manner, as discovered both his treachery and ingratitude: for in his memorial after the king of Spain's death, he charges the treaty of PARTITION with being productive of infinite troubles and misfortunes common to all Europe: which was a full proof of his wicked design and insincerity, when he solicited the English and Dutch to enter into it. For here he acted the part of the great enemy of mankind, first to tempt, and then to accuse. In that same memorial he reflected upon them, as having no right to those dominions, which were allotted him by the treaty; by which he charges them as usurpers, and meddling where they had nothing to do: though upon the first publication of the partition treaty, he joined with them in their memorials to the other potentates of Europe; wherein it was expected, that the design of the treaty was to preserve the peace of Christendom; and that the partitioning of the Spanish monarchy for that end, was as necessary as the pulling down or blowing up a street or some houses during a fire, to prevent a whole city's being consumed.

He discovered his ingratitude still further, by charging the maritime powers with insincerity, in demanding what they never designed to obtain; and the Dutch in particular, with framing views contrary to the interest of their republic: and that neither we nor they stipulated any advantage to ourselves. The design of this was to infer the subjects of England and Holland against their respective governments, as if they had concerted measures with France, prejudicial to their

trade and liberty: and we know well enough what use the disaffected faction made of this in England, when in parliament they charged the king with having made a felonious treaty, and impeached his ministers for consenting to it.

The French king having thus seized the Spanish monarchy, by virtue of that pretended will, one would have thought he should have piously observed the contents of it; but he was so far from doing so, that, according to his usual treachery, he broke in upon it in many instances, and particularly by sending Frenchmen to possess the chief trusts of the kingdom, and to govern their councils, contrary to the 23d article, by which king Charles II. ordered that each of his kingdoms should be governed by natives, without any innovation.

This treachery and ingratitude of the French king brought on the then confederacy, wherein the late king William III. was the chief instrument, but died before the war was declared. Her majesty queen Anne, who succeeded to his designs at first for the public welfare of Europe, as well as to his crown, published her declaration of war against France on the 4th of May, 1702, which was less than two months after king William's death. Her majesty charges him there with unjust usurpations and encroachments; with keeping possession of a great part of the Spanish dominions; with exercising an absolute authority over all that monarchy; with seizing MILAN and the SPANISH LOW COUNTRIES, and making himself master of the entrance into the MEDITERRANEAN, and of the ports of the SPANISH WEST-INDIES, with a design to invade the liberties of Europe, and to obstruct the freedom of navigation and commerce.

It is fit to be observed here, that, before the death of king William, the French king had declared the pretender to be king of Great-Britain and Ireland, which was directly contrary to the 1st and 4th articles of the treaty of Ryswick, by which he was bound to a perpetual peace and sincere friendship with king William, to promote his interest, honour, and advantage, and tied up from affording any assistance, directly or indirectly, to any enemy or enemies of king William, and in no manner whatsoever to favour the conspiracies and plots which any rebels, or ill-disposed persons, may in any place excite or contrive against the said king; and that he would not assist with arms, or any other way, any person or persons who should hereafter, under any pretence whatsoever, disturb or molest the said king of Great-Britain in the free and full possession of his kingdom, &c.

Upon this her majesty, in her said declaration, takes notice that the French king, instead of giving that satisfaction for his contravention of the above-mentioned treaties, which ought justly to have been expected, not only proceeded to further violence, but added thereto a great affront and indignity to her majesty and her kingdoms, in taking upon him to declare the pretended prince of Wales king of England, Scotland, and Ireland; and had also influenced Spain to concur in the same affront and indignity, as well as in other oppressions.

The States-General, in their manifesto, recapitulate the French king's former breach of treaties, and particularly that of Ryswick; wherein, besides the other infractions already mentioned, they charge him also with breaking the treaty of PARTITION, notwithstanding the repeated protestations he had made never to depart from it: and that he had violated the same, without giving any previous communication of his intention to those with whom he had made it, alleging, for his principal motives, that the SPIRIT and SENSE of the said treaty, and not the LETTER, were to be regarded; and explained that SPIRIT and SENSE in his own way. He threatened them, at the same time, if they did not concur with him, which they justly observed was an uncommon, as well as unheard-of, breach of faith, and a dangerous instance, which tended for the future to undermine and ruin the faith of all PUBLIC TREATIES. They charged him likewise with having possessed himself of the Spanish dominions, contrary to the treaty of PARTITION, without any regard to the emperor's pretensions; which being the foundation of it, the greatest part of the Spanish monarchy was thereby yielded to the archduke. He likewise, contrary to that, and former treaties, had possessed himself of the SPANISH NETHERLANDS, notwithstanding they had garrisons there by the consent of the king of Spain, for the security of the country; by which the French deprived them of the BARRIERS he had settled by former treaties, and particularly by that of the partitions, and had procured an absolute surrender of those provinces from his grandson, whose dominions he governed in as absolute a manner as if France and Spain were one and the same kingdom. He also endeavoured to force the States into a separate treaty, without their allies; and, to compel them to it, seized Liege, and the most considerable places of the electorate of Cologne, that he might invade them on all sides, as in 1672, and for that same end raised a considerable number of troops in the country of Wolfenbuttle. He likewise seized all the harbours of SPAIN, NAPLES, and SICILY, and other islands in the MEDITERRANEAN, and also of the SPANISH NETHERLANDS and the WEST-INDIES, to make himself entire master of the commerce of EUROPE, and to exclude them and other nations

tions from it. He endeavoured likewise to persuade the king of Portugal to deny them his harbours, and sent a squadron to the West-Indies, to seize the *PLATE-FLEET*, in which the subjects of the States, and of other princes and potentates, had so great a share; and at the same time he endeavoured to *AMUSE* them with a treaty for a *GENERAL PEACE*, though he erected a fort in the Netherlands, within cannon-shot of one belonging to the States, contrary to a treaty agreed on with Spain in 1648, contrary to the laws of nations, and those of war.

The emperor, in his declaration, charges the French king with the breach of the treaty of Ryswick, and of the Pyrenees; with seizing several hereditary countries belonging to the house of Austria; with invading the empire, and seizing several of his fiefs; with supporting the elector of Cologne in his disobedience; and his grandson, the duke of Anjou, in usurping several titles, as that of duke of Austria, count of Hapsburg and Tyrol, &c. which belonged to none but the archducal house. In the last place, with seizing the dominions of Spain, on pretence of a will contrived by some bribed Spanish counsellor, according to the direction of the French king, which was offered to the king of Spain when he was so weak in body and mind, as not to be able to read or understand, much less to weigh and examine, as was necessary, the large contents of the said will; which of itself was full of falsities, and incomprehensible contradictions, as well as contrary to the intention of the said king, which he had so often signified to the emperor.

All these things being considered, we may justly say that there was never a prince in the world, and much less any who assumed the title of Christian, whose reign affords so many instances of studied and deliberate perjury, and breach of solemn treaties; nor have we an instance of any prince that ever pretended to the belief of a God, that so frequently profaned his name by the breach of public oaths, or that played fast and loose in such a manner with things that they themselves accounted sacred: so that, like another Pharaoh, he all along bid defiance to the Almighty, and it was the language of his practice, though not of his mouth. Who is the Lord, that I should obey him?

Though the divine vengeance punished him in a remarkable manner, by the defeats of his armies, and desolating judgments upon his dominions, he went on still in his obstinate perjuries and usurpations, and had so chicaned with the Confederates in the business of the preliminaries to the peace of Utrecht, and so egregiously imposed upon the nation in that treaty, and attempted to do so infinitely more than he did, by an infamous treaty of commerce; that we have all imaginable reason ever to distrust the sincerity of a court that has proved so dishonourable, especially if we have sufficient cause to believe, that the same system of disturbing the tranquility of Europe still prevails, in order to aspire at that universal empire which they have so long had in view.—And what advances they have really made thereto in EUROPE, which seem not to be duly noticed, will appear from what we have urged under the article FRANCE, which the reader is desired to refer to: how far, likewise, their system tends to destroy the balance of commerce and empire in AMERICA, the reader is desired to turn to our REMARKS on the article BRITISH AMERICA: see also our articles NORTH CAROLINA, CANADA, LOUISIANA, PENNSYLVANIA, and FRENCH AMERICA, and all others to which we refer from those.—And still to confirm our opinion that we have entertained of the measures of this nation, ever since the last treaty of Aix la Chapelle, we shall conclude this head of Plantations with the two following speeches of governor Shirley, of New England.

REMARKS before the last war.

Whilst I have been drawing up this article, the public have had communicated from Boston in New England, the authentic speech of governor Shirley, which, as it gives an account, that may be depended on, of the conduct of the French in that part of America, we judge it necessary to give the same place in this work.

The speech of his excellency William Shirley, Esq; to the great and general court, or assembly, of the province of the Massachusetts Bay in New England, March 28, 1754.

Gentlemen of the council and house of representatives,

Having received, in the recess of the court, some dispatches, which nearly concern the welfare of the province, I thought it necessary to require a general attendance of the members of both houses at this meeting of the assembly, that the matters contained in them may have as full and speedy a consideration as the importance of them seem to demand.

By account sent from Richmond Fort, and declarations made before me and his Majesty's council, by two of the settlers at Francfort, upon the river Kennebeck, I am informed, that, in the summer before last, a considerable number of French settled themselves on a noted carrying-place, made use of by the several Indian tribes inhabiting that part of the country in their passage to and from Canada, which separates the head of the aforesaid river from that of the river

Chaudiere, which last falls into the great river St Lawrence, at four miles and a half above the city of Quebec.

And I have received further intelligence, that the French are settled very thick for twelve miles on each side of the said river Chaudiere, at about 30 miles distance above the mouth of it, and in the mid-way between the river St Lawrence and the before mentioned carrying-place; and the captain of Richmond Fort, in his letter dated the 23d of last January, informs me, that the Norridgwalk Indians have declared to him, 'That they had given the new French settlers upon the carrying-place liberty to hunt any where in that country, as a recompence for the great service they will be of to them, in a time of war with the English, by supplying them with provisions and military stores.'

The same officer further acquaints me, in another letter, dated February the 11th, that several Indians of the Atrengicook, and some of the Penobscot tribe, amounting, together with the Norridgwalk Indians, to 600 effective men, besides boys capable of bearing arms, were then lately arrived in the neighbourhood of the fort under his command; and that, though they assembled there on pretence of writing a joint letter to me, as they have done, yet he had reason to expect, from their haughty insolent behaviour, the repeated open threats of some of them, and the private warnings from others, that, as soon as the rivers should be free from ice, they would commit hostilities against the English, upon that and neighbouring rivers; in which they intimate, they are to be assisted by a number of French from Canada, disguised like Indians. And in another letter, dated the 10th of March, he acquaints me, that the French priest, missionary to the Indians of the river Kennebeck, appeared to him to be continually using artifices to excite the Indians to prevent our settlements from being extended higher up it, to set them at variance with the English, and dispose them to a war with them this spring.

Most of these accounts are confirmed by the declarations of the before-mentioned settlers at Francfort, with the additional circumstances, that the French priest had been very inquisitive after Roman Catholic families in this settlement, and used endeavours to draw off some of the inhabitants into the service of the French, particularly for building a chapel and a dwelling-house for himself upon that river, about three or four miles above Cushana, and at a distance of 24 from Francfort, and been very industrious to persuade them that it was within the French territories; and the Indians have further declared, that they have been infligated by the governor of Canada, to hinder the English from settling upon any part of the river; which is strongly confirmed by a deposition of Capt. Lithgow, made in August last.

Upon this occasion, gentlemen, I sent as soon as might be, with the advice of his Majesty's council, the necessary reinforcements of men and stores to all the eastern forts, issued commissions for raising six independent companies in the townships and districts next adjacent, with orders for the officers and soldiers to hold themselves in constant readiness to march, upon any alarm, to the succour of any neighbouring fort or settlement which may be attacked, to cut off the enemy in their retreat; and, in case that they should find that the Norridgwalk Indians have committed hostilities, to break up their villages and settlements upon Kennebeck, and to kill or captivate all they can meet with of their tribe: I likewise ordered an officer, commissioned by me for that purpose, to proceed, by the first opportunity, to the supposed place of the new French settlement, in order to discover the certainty and circumstances of it, and to require the French commandant to retire and withdraw the people under his command from that spot, as being under his majesty's dominions, and within the limits of this government.

And I doubt not, gentlemen, from your distinguished zeal for the defence of his Majesty's territories, and the protection of his subjects within this government upon all occasions, but that, upon a refusal of the French to comply with that requisition, you will make sufficient provision for enabling me to compel them, with the armed force of the province, to free us from their encroachments.

The concern, gentlemen, which you expressed in your message to me at our meeting in December last, upon your apprehensions of the imminent danger which the province was in, from the French having fortified themselves upon the river of St John's, close to our borders, leaves me no room to doubt of your being sensible of the fatal consequences in the general that must attend their encroachments, which it seems plain they are now pushing into the heart of the province (as the general court, in a vote passed the 16th of January, 1749, justly call the river Kennebeck) unless they are timely removed.

But it may not be improper for me to observe to you in particular, that it appears from extracts which I have lately caused to be made of some original letters taken among Father Ralle's papers, at the breaking up the Indian settlement at Norridgwalk in 1724, and which passed between him, Father Lauerjat, priest of the Penobscot tribe, and Father La Chasse, superior of the Jesuits at Quebec, during the Indian war in the years 1723 and 1724; that the head of Kennebeck river, near which the Indians have declared the French have made

a new settlement, was the centre of most of the tribes then at war with us, and the general rendezvous of all that came to the eastern parts; the Hurons, the Iroquois of the falls of St Lewis, the tribe of St Francis (or Arefigunticooks) and the Indians of the seignory (as the French call them) of Becancour on the one hand, used to assemble with the Norridgewalks here, from their several settlements; and the Penobscots from their river, on the other: here they held their consultations, and from thence issued out in parties united or separate, as best suited them, against the English; hither they retired after action, and brought their wounded for relief; and here, if they met with provisions, they fared well; if not, they suffered greatly for want of them.

It appears further from these letters, that the several French missionaries chiefly conducted and managed this war; that they had the care of supplying the Indians with the necessary provisions and stores for carrying it on; were employed to make them persevere in it, and to push them on to their boldest enterprises; that they transmitted accounts of their proceedings to the government of Canada, through the hands of the superior of the Jesuits at Quebec, through whom likewise they received their directions from thence, as the governor of Canada seems to have done his, upon this occasion, from the court of France.

And I would further observe, that this route affords the French a shorter passage for making descents from Quebec upon this province, and destroying the whole province of Maine, with the king's woods there, and in the government of New Hampshire, than any other whatever from Canada. These advantages, which the possession of this river would give the French over this province, make it easy to account for their constant endeavours, ever since the treaty of Breda, at which it was determined, in the most solemn manner, between the two crowns, that the river Pentagoet, or Penobscot, was the boundary between New England and Acadia, or Nova Scotia, to extend the limits by claim upon all occasions (as in fact they have done) to the eastern side of the river Kennebeck; though they never attempted, until within these few years, to pass over the river St Lawrence, within the extent of this province.

I am satisfied it is needless for me, gentlemen, to urge any thing more to shew how necessary for the safety of this government it is, that we should secure to ourselves the possession of this important river, against the encroachments of the French, without delay: and I think the present situation of affairs in that country must convince you, how vain a scheme it would now be to have your sole dependence for gaining this point upon making annual presents to Indians, who appear to have entered into an offensive alliance with the French against you, and have shewed evident marks of a disposition to put the river into their power.

How different are such proceedings from those of the French? Whilst we have been suing in vain to a few Indians, for their permission to settle lands within the undoubted limits of this province, and which themselves cannot deny to have been purchased of their ancestors, and have in effect promised them a yearly tribute, to refrain them from committing acts of hostility against us, the French have marched armies into distant countries of numerous and powerful tribes, which, without any colour of right, they have invaded: they have forbid them to make further grants of any of their lands to the English, and have built, and are still building strong forts, with an avowed intent to drive them off from the lands already granted to them, and to exclude them from all commerce with those Indians, whom they have threatened with destruction, if they shall presume to interfere in their favour.

It is time, gentlemen, for you to desist from having your chief dependence upon temporary expedients, which seem rather to have exposed the government to the contempt of these Indians, than to have conciliated their friendship to it; and to take counsel in part from the policy of our neighbours.

Vigorous measures against the French, in case they shall refuse to quit his Majesty's territories within this government, without being compelled to it by force; building a strong fort near the head of the river Kennebeck, above the settlements of the Norridgewalk Indians, and pushing on our settlements upon it in a defensible manner, would effectually rid the province of the encroachments of the former, and either hold the latter in a due dependence upon us, or oblige them to abandon the river.

And further, by making ourselves, through this means, masters of the pass, which was the general place of rendezvous during the Indian war in 1723 and 1724, of all the tribes engaged in it, both in their incursions and retreats, we should have it in our power to curb all those Indians for the future, and in a great measure prevent them from attempting to make depredations in our exposed settlements.

I must further observe to you upon this occasion, gentlemen, how dangerous delays to make suitable preparations for removing the French would be.

How practicable was it, at first, to have put a stop to their proceedings in building their fort, at Crown Point? And you can't but remember what mischievous effects of the neglect

to do that in the beginning, were felt by this and the province of New-York, in the ravages which they suffered from thence during the late war.

A short delay to dislodge them from their encroachments near the river Kennebeck, might give them an opportunity of making themselves masters of that river likewise, in the end; and in that case we may expect soon to see another fort built by them, near the mouth of it, and the French in possession of all the sea-coast between that and the river St John.

Gentlemen of the council and house of representatives.

I hope you will proceed in the consideration of these matters with that unanimity and dispatch which his Majesty's service and the safety of the province requires; and that you gentlemen of the house of representatives will make the necessary supplies.

Council-Chamber,
March 28, 1754.

W. SHIRLEY.

Boston, April 25, 1754.

On the 2d instant his Excellency was pleased to make the following speech to the great and general court, or assembly, then sitting here, viz.

Gentlemen of the council and house of representatives.

The occasion of my speaking to you now, is to acquaint you that I have received a letter from the right honourable the lords commissioners for trade and plantations, signifying to me, that his Majesty has been pleased to order a sum of money to be issued, for presents for the Six Nations of Indians, and to direct the governor of New York to hold an interview with them for delivering those presents, at such place and time as he shall appoint; and I am directed to lay this matter before you, and to recommend to you to make a proper provision for appointing commissioners from this government to meet commissioners of Virginia, Maryland, Pennsylvania, New Jersey, and New Hampshire (to the respective governors of which colonies their lordships have wrote to the same effect) as also for making such presents as have been usual upon the like occasions.

I have likewise to acquaint you, that I find, by a paragraph of their lordships letter upon this occasion to the governor of New York, which his honour lieutenant-governor De Lancey, commander in chief of that province, hath communicated to me, that he is herein directed to take care that all the provinces be, if practicable, comprized in one general treaty, to be made in his Majesty's name.

And that Mr De Lancey hath given me notice, that he hath appointed the said interview to be held at the city of Albany, on the 14th of June next.

I am persuaded, gentlemen, I need not use arguments to convince you, that it is of very great consequence to the interests of his Majesty's colonies upon this continent at all times, that as many of the tribes of Indians inhabiting it as may be (those of the Six Nations more especially) should be kept in friendship with the English, and a dependence upon the crown of Great-Britain; and that as free a commerce and intercourse should be maintained with them as is possible; but I think it my duty, at this time, to enter into a particular detail of these matters.

At the treaty of Utrecht, which is confirmed by that of Aix la Chapelle, these were looked upon to be points of that importance to the British interest in North America, that care was taken in that treaty to have the Indians of the Six Nations acknowledged by France to be subject to the dominion of Great-Britain; and it is herein expressly stipulated, that the French shall give no hindrance, or molestation, either to them or the other natives of America, who were friends to the English: it is also stipulated, that the subjects of both crowns should enjoy full liberty of going or coming (upon this continent) on account of trade; and that the natives of the countries upon it should with the same liberty resort, as they please, to the British and French colonies, for promoting trade on the one side and the other, without any molestation or hindrance either on the part of the British subjects or the French.

With regard to the Indians of the Six Nations in particular, I would observe to you, that, according to an account given by them in an open council at Turpehawkie, at their return from the Indian treaty at Philadelphia in 1742, of the several Indian nations which have been conquered by them, and are now in their alliance, and trade with the English, and which seems to be depended upon, the warriors belonging to those tribes may be computed to amount to 16 or 17,000 at least; and one, who must be a good judge of the strength of the Five Nations themselves, upon being interrogated by me concerning the number of their fighting men, made answer, That he did not know their number, but well knew that they are a numerous people, a terrible body of men, and able to burn all the Indians in Canada.

You

You must be sensible, gentlemen, what frequent attempts the French have made, from time to time, to draw off the Six Nations from the English interest into their own; and from the repeated advices we have received from his Majesty's southern colonies on this continent, what efforts they have lately exerted to win over their allies, together with the other numerous tribes inhabiting the vast countries lying along the great lakes and rivers, and to the westward of the Apalachean Mountains (all which may be reckoned to exceed double the number of the Indians of the Six Nations, and those in their alliance) as also what measures the French are taking to exclude the English from all trade and commerce with those Indians.

To compass this, they have, in manifest violation of the aforesaid treaties, entered the country of these Indians, upon the back of his Majesty's southern colonies, and within the limits of his territories, with large bodies of troops, seized the effects, and captivated the persons of the English, whom they found trading there; absolutely denied their right to traffic with those nations, and erected a line of forts upon the lakes and rivers, from Canada to Mississippi, to cut off all commerce and intercourse between them; they have committed hostilities against some of the tribes in friendship with the English, engaged others to take up the hatchet against them, and threatened those with destruction who shall interfere with their avowed design to drive the English out of that country.

Should the Indians of the Six Nations, at this critical conjuncture, desert our alliance, and go over to the French, how fatal an influence must such an event have upon the British interest? On the other hand, should proper measures be taken to attach them finally to it, how greatly would it disappoint and check the present schemes and enterprizes of our dangerous neighbours?

It is well known how wavering the dispositions of these Indians have of late been, and how visibly they have abated their former enmity to the French; and we can't be at a loss to discover the real causes of it.

Nothing could at this time so effectually reclaim them to their old alliance with us, as the measures directed to by their lordships of the board of trade, one general league of friendship, comprizing all his Majesty's colonies, to be made with them in his Majesty's name, with stipulations to build such forts in their country as they shall chuse, and may be judged necessary for their shelter and protection against the French.

Such a coalition of the colonies for their defence, would be a convincing proof to them that they might safely depend upon his Majesty for protection, and confirm them in their ancient alliance with the English; and how necessary such a confederacy of the colonies for their safe-guard is, may appear to you from the following account, given by an Indian trader, who for more than 20 years had carried on a trade among the different nations of the Indians, some hundred miles west of Philadelphia, the truth of which I have great reason to depend upon, viz. 'That, at the commencement of the late war, he, with sundry other traders of the English, was taken prisoner by some Frenchmen belonging to a fort upon the river Ohio, and from thence was transported from fort to fort to Quebec; by means of which forts and the lakes, the French, he says, have a communication open from Quebec to Mississippi; that they have forts there within 20 or 30 miles distance from each other, with a command of from 10 to 20 men in each; in which, he says, they put the squaws and papooses of the Indians in alliance with them, for protection, whilst the men go out to war, and there keep them until the men return; and he observes, that, by means of these forts, they bid fair, in a little time, to reduce the Indians in alliance with the English, as the English do not afford the same protection to their women and children, whilst the men are gone to war, as the French do.'

I would therefore earnestly recommend to you, gentlemen of the house of representatives, to make suitable provision for sending commissioners on the part of this government, to join in the approaching interview at Albany, duly authorized to concert such measures, in conjunction with the government of New York, and commissioners of the before-mentioned governments, as shall be judged proper to be entered into for cementing a firm league of friendship with the Indians of the Six Nations, and retaining them in the British interest; and to give those commissioners full power to agree with the other governments upon the quota of money and men to be furnished by this province for this service.

I have taken the liberty to propose the same thing to be done by the other governments concerned in this interview, in my letters to his Majesty's governors, and against the present dangerous enterprizes of the French on every side of them.

I have already let you know, gentlemen, his Majesty's orders to me and his other governors upon this point, signified to us in the earl of Holderness's letter of the 18th of August last, and how necessary it is that such an union should be immediately formed in the common cause: whoever takes a survey of the whole extent of the invasions and encroachments

which the French are surrounding his Majesty's territories upon this continent with, from their most eastern to their most western limits, must soon be convinced.

Close on the back of the settlements of his Majesty's southern colonies, they are joining Canada to Mississippi, by a line of forts and settlements along the great lakes and rivers, and cutting off all commerce and intercourse between the English and the numerous powerful tribes of Indians inhabiting that country, whom they are attempting to engage in their interest by all manner of hostilities and artifices: and, at the same time, they are pushing on their encroachments with equal vigour quite round his Majesty's eastern colonies, where they have secured all the Indians in those parts to join them against the English.

Should the French prevail in the former part of their scheme, and gain a general influence and dominion over the Indians behind the Apalachean Mountains, which they must, in the ordinary course of human events, do in a short time; if they are not timely prevented by an union of his Majesty's colonies, they will have, in a few years, a most formidable army of those Indians at their command, maintained without any expence to themselves; but, on the other hand, with great profit arising from an immense furr-trade carried on with them: and what fatal consequences such an army of warriors (a few of which have been found sufficient to keep a large frontier in continual alarm) must have upon all his Majesty's southern colonies, by continually harraffing them, at the direction of the French, and supported by them from Canada on one side, and Mississippi on the other, and covered in their retreat behind the mountains by a strong line of forts, commanding the navigation of all the lakes and rivers, is easy to conceive; especially if the Indians of the Six Nations should desert our alliance, and join the French, which must, in such case, be a decisive blow to the British interest on that part of the continent.

At the same time, if they are not prevented by a coalition of the colonies, from finishing the scheme which it is most manifest they are forming against the eastern provinces, and already far advanced in, they must soon have it in their power equally to distress them likewise; and all the English colonies will be involved together in one general flame. It is true, those colonies are far superior to the French in their number and strength; but if that strength, gentlemen, is not properly exerted, by an union among themselves, how little will it avail? It is not difficult to imagine such a body of troops as the French may soon collect, together with the assistance of all the Indians scattered throughout this continent on the back of the English colonies (as the French settlements likewise are) when under the command of the governor-general of New France, who, upon all emergencies, can direct their force as he pleases, may reduce a number of disunited provinces, many of them very remote from each other, though much superior to them in point of the number of inhabitants.

For forming this general union, gentlemen, there is no time to be lost: the French seem to have advanced further towards making themselves masters of this continent, within these last five or six years, than they have done ever since the first beginning of their settlements upon it: and how determined they are to accomplish their scheme as soon as possible, appears from their breaking through the most solemn recent treaties and agreements made between the two crowns in order to effect it.

Gentlemen,

His Majesty hath given the strongest proof of his paternal care of his colonies, and constant attention to their safety, in directing his governors to promote this union within their respective governments: and I hope you will not be wanting on your parts to contribute all in your power towards effecting it, by improving the opportunity which the approaching interview with the Indians of the Six Nations at Albany happily presents for that purpose: and I doubt not but that you may depend on all reasonable support and protection on the part of his Majesty, against all present and future enterprizes and attempts of the French against you.

Council-Chamber, April 2, 1754.

W. SHIRLEY.

REMARKS on our article PLANTATIONS, since the last war and the DEFINITIVE TREATY OF PEACE, 1763.

From the whole drift and tenour of what we urged under this article, one would be led to think, that we were possessed of the gift of political prophecy; every thing falling out, with respect to the last war with France and Spain, as we had prejudged, though this work was begun just after the peace of Aix la Chappelle: and the revival of the past perfidy of France could not be malapropos, as being intended to rouse and alarm us to guard against the treachery of that state. The precaution, we have all the way suggested, in relation to Spain joining France also, did not prove visionary: we have likewise pointed out what came to pass, in relation to the

the making the Mississippi the boundaries between Great-Britain and Spain; and even suggested the total extirpation of France from the whole American continent: and if it should prove true, that France has actually ceded NEW ORLEANS, and their western parts of the MISSISSIPPI to Spain, it will manifest how far human foresight may reach in matters of a public nature, when a man is governed in his representations by facts and impartiality. See LEEWARD ISLANDS, AMERICA, COLONIES, MEXICO, FLORIDA, BAHAMA ISLANDS, NEWFOUNDLAND.

PODOLIA. This province has Volhinia on the north, the river Niefter on the south, which separates it from Moldavia, Oczrakow, Tartary, on the east, and the palatinate of Lemberg on the west. It is divided into Upper and Lower, and is 250 miles in length, and near 80 in breadth, according to Moll. It is exceeding fruitful, and abounds particularly with wax and honey, and asparagus grows wild in the fields: but the east part of this province, although it be good land, is in a manner a perfect desert, by reason of the frequent invasions and ravages of the Turks, Tartars, and Cossacks, to whose incursions the whole province is very subject. The upper, which is the west part, is populous and fruitful, though mountainous in some parts, and abounds with honey; and the valleys are well watered by rivers. In several places it has fundry forts of marble and alabaster.

CAMINIEC, the chief city of the Upper, and indeed of all Podolia, stands on the river Smotrzick, which about 110 miles below, falls into the Niefter, not above 12 miles from the confines of Moldavia, 98 south-east from Lamberg, 224 east from Cracow, 230 south-east from Warlaw, and 480 north-west from Constantinople.

The **LOWER PODOLIA**, which is the east part, and also called, the palatinate of Bracław, from it's chief town on the river Bog, 40 miles from the confines of Moldavia, and 92 east from Caminiec.

POITOU, in France, is bounded on the east by Touraine, Berry, and La Marche, on the north by Anjou and Britany, on the west by the Ocean, and on the south by Aunis, Saintonge, and Angoumois. It is a large province, and more or less fruitful, according to the different situation of it's several parts.

CHATELLERAUD is situated on the river Vienne. The inhabitants of this place are industrious, and inclined to trade. They make a great quantity of watches, clocks, knives, scissars, and other works of that kind. Their corn and wine they dispose of within the country, but they export some flax and hemp.

PARTENAY, has a pretty considerable trade in cattle and corn.

ST MAIXANT has a manufactory of woollen stockings, caps, and ferges, which they sell within the kingdom and abroad: but their chief trade is in corn and all sorts of grain, and in oxen, sheep, horses, and mules, of which they sell a great many to the merchants of Auvergne, Lyons, Piedmont, and Savoy. They keep two markets weekly, and fix fairs in the year.

FONTENAILLE-COMTE, is a small, but well built city, with a pretty good trade. They make here cloths, and several other woollen stuffs.

NIORT, is situated on the river Sevre. Within the district of this city they drive a great trade in cattle, horses, and mules; and have in the city, manufatures of shamoy-leather, druggets, ferges, and other woollen stuffs.

OLONE, is inhabited by people who apply themselves chiefly to the marine, and are very good seamen.

POLAND, as it is now extended, is bounded on the north with Livonia, Muscovy, and the Baltic; on the south with Upper Hungary, Transylvania, and Valachia; on the east with Moscovy, and Little Tartary; and on the west with Germany. It's extent is from the frontiers of Pomerania on the west, to the frontiers of Tartary on the south-east; about 700 miles; and from the frontiers of Livonia, to the Crapach, or Carpathian mountains, which are the limits of Hungary, on the south, above 600 miles.

By the situation, the climate is temperate, and the air not excessive cold; yet sometimes it's lakes and rivers are so frozen, that coaches and carts pass over them for 5 or 6 months together. The soil also is generally fertile, fit for tillage and pasture, and produces a vast quantity of corn and cattle; even enough to feed the populous nation of Holland, who yearly send vast fleets to Dantzick to buy the corn and oxen, sent down thither from the several parts of Poland.

LITHUANIA, in particular, produces honey, wax, hemp, flax, leather, pot-ashes, salt, wood, saltpetre, vitriol, and quicksilver. With these staple commodities they purchase those of other nations, viz. wines, cloth, stuff, wrought-silks, tapestry, jewels, fabelns, martens, tin, steel, iron ware, brandy, and spices. The country of Poland, in general, produces also all kinds of fruits and herbs, and a good breed of horses; so that their cavalry is numerous, and well mounted. There are vines in many places, whose grapes are grateful to the taste, especially if the summer and harvest be favourable, but the wine generally is very sharp, when drawn off. In the moun-

tains there are mines of lead, silver, copper, and iron; but the most considerable of all, are the salt mines in Lesser Poland, which are the chief riches of the country, and bring most money into the Exchequer. They work in those mines as the colliers do in our coal-pits. The salt is generally of a bluish colour, but some of it white and transparent. When it is dug it has a brackish taste; but when exposed to the air, it becomes brittle and more sweet. They have also some veins of sal-gemma. The woods are well stored with hares, coney, squirrels, deer, foxes, bears, wolves, and boars. The Masovian forests have plenty of elks, wild asses, wild oxen, called uri, and buffaloes, whose flesh when powdered, the Poles esteem a great dainty. In the Ukraine there are wild horses also, whose flesh is equally esteemed by the nobility. The wolf, resembling a hart, or the European lynx, called lupus cervarius, and by the natives ris, with spots on it's belly and legs, affords the best furs in Poland. The quails in Podolia have green legs; it is said their flesh is unwholesome, and, if immoderately eaten, breeds the cramp.

It is a plain flat country, rather inclining to marsh lands; so that no considerable woods or mountains are found here, except those that make the frontiers to Hungary, which is a craggy ridge of 300 miles in length, and called the Crapach, or Carpathian Mountains. The eastern part of the country, indeed, is full of woods, forests, lakes, marshes, and rivers, which affords a delightful prospect to that part of it which is open. As for it's rivers, the most considerable is the Vistula, the Niemen, or Cronus, the Nieper, or Borysthenes, the Niefter, or Tyras, the Bog, or Vagus.

The kingdom of Poland consists of these parts.

- I. Poland, properly so called, in the west.
- II. Prussia on the banks of the Baltic.
- III. The great dukedom of Lithuania in the east.
- IV. Samogitia and Courland, in the north.
- V. Warsovia, Polachia, and Polesia in the centre.
- VI. Red Russia, and Podolia, in the south.
- VII. Volhinia, and the Ukraine, in the east.

The subdivisions whereof are thus:

Poland, properly so called, is divided into the Upper and Lower.

Upper Poland, called also the Lesser Poland, contains the three Palatinates of Cracow, Sendomir, Lublin.

Lower or greater Poland, contains the Palatinates of Pofnania, Kalish, Brezesty, Wladislaw, Lencici, Inowloiz, Sirad, Rava, Ploezko, Dobrizin.

Prussia is divided into Royal, and Ducal.

Lithuania, is divided into the Palatinates of Witna, Troky, Bieslaw, Novogrodeck, Minsky, Mzscislaw, Witeplk, Poloeza, Rosiem.

Samogitia hath these cities, Midnick, Schivende, &c.

Courland is divided into Semigallia, Courland.

Warsovia, otherwise called Maffovia, hath one Palatinate of Czerkrow, and the city of Warlaw.

Polachia, the Palatinate of Bieslk.

Polesia, Bieslici, or Breste.

Red Russia contains three Palatinates, Lemberg, Belcz, Chelm.

Podolia, divided into Upper, wherein is the Palatinate of Caminiec. Lower, wherein is the Palatinate of Bracław.

Volhinia, divided the Upper, which contains the Palatinate of Lufuck. The Lower, which is commonly called the Ukraine, contains the Palatinate of Kiow.

The Upper or Lesser Poland, is situated between the Lower Poland and Warsovia on the north, Hungary on the south, Red Russia on the east, and Silesia on the west, containing in extent, from east to west, near 200 miles, from north to south, about 120, lying between 49 and 51 degrees of latitude. The river Vistula, or Veffel, passes through it; the Warta hath it's source here, and several other rivers water the land, which is reasonably fruitful, but over-run with woods.

It is divided into three Palatinates, wherein are these cities and chief towns, viz.

In the Palatinate of Cracow, being the south-west part of the province, are, Cracow, Novoguria, Severia, Czenzerow, Lelow, Ofwieczin, Zator, Wieliezka, Bochna, Sandecz, Lubowla, Bryecz.

In the Palatinate of Sendomir, which is the middle part, are, Sendomir, Zawicheft, Cunow, Schidlowitz, Radom, Zarnaw, Malogocz, Pikzow, Villickia, Corczin, Polaniez, Pilfno.

In the Palatinate of Lublin, which is the north-east part, are, Lublin, Kafimiers, Piotrowin, Urzendow, Epol, Scudlec.

THE PALATINATE OF CRACOW has Silesia on the west, the palatinate of Sendomir on the east, Hungary on the south, and Siradin on the north. There is a sort of manna in this country, which they gather in May and June, sweep it off the grafs with sieves, together with the dew, and make several dishes of it.

CRACOW, CRACOVIA, the metropolis of this palatinate, and of the kingdom of Poland, is seated on a rocky bank of the river Vistula, about the middle of the Palatinate; 36 miles east from the confines of Silesia, 40 east from Germany, 44,

north from the confines of Upper Hungary, 86 south-west from Sendomir, 120 south-east from Almutz, and 127 from Breslaw, 135 south-west from Warsaw, and 185 north-east from Vienna, 173 north from Buda, 250 south from the Baltic Sea, 680 north-west of Constantinople, and near 720 west of Moscow.

Near this city are salt mines, of which Dr Conner gives this account. They were discovered in 1548, are about 300 geometrical paces in depth, and have so many alleys and passages, that one can scarce go over them all in a week.

They are generally so cold as is scarce to be endured, and the winds are sometimes so furious, that nothing can withstand them: The yearly revenue of these mines is about 400,000 French livres, of which 50,000 go to the king, 10,000 to the queen, and some thousands more to the officers of state; besides which, the proprietor is obliged to make a yearly present to all the cities of Poland, and their starostas.

The salt here is of four kinds; one extreme hard, like crystal; another softer, but clearer; a third white, but brittle: these are all brackish; but the fourth is somewhat fresher. On one side of these mines there is a stream of salt water, and on the other one of fresh.

The other towns of note in this palatinate, are,

ZATOR, on the south side of the Veissel, 22 miles south-west from Cracow, and 20 from the confines of Silesia.

SEVERIA is capital of a large duchy of the same name; in the neighbourhood are mines of silver and lead.

BREEZ, 33 miles south-east of Cracow, is watered by the river Rapa, a branch of the Veissel, of whose froth they make sulphur. This town stands on the confines of the palatinate of Sendomir, and has good mines of vitriol in the neighbourhood.

SANDECZ, 24 miles south-east from Cracow, is noted for trade, the industry of the inhabitants, and some mines of gold and copper.

OSWIECZYN, 30 miles from Cracow, on the south side of the Veissel, near the river Sala, 12 miles from the borders of Silesia, is reckoned the capital of Polish Silesia. This town is a thoroughfare from Cracow to Vienna, and has a great trade in hard salt, of which there are great lumps exposed to sale in the public squares; of from 20 to 30 quintals in weight. It is dug out of the mines near Cracow, to the inhabitants of which, it is sold for 8, 10, or 12 florins each, and the others from 50 to 70.

CZENTOCHOW, 57 miles north-west from Cracow, and 70 east from Breslaw, stands on the river Warta, and the confines of Silesia. It is famous for good beer, transported over the nation and into Germany.

SLACOWEA, 25 miles north-west of Cracow, gives name to a duchy, and is noted for silver mines, which bring great profit to the bishop of Cracow.

PROSZOWICE, 10 miles north of Cracow, on the banks of the river Sozienova. The king has a palace there, in which is kept a provincial dyer.

ILEUSSIA, 20 miles west of Cracow, is a royal town, noted for silver and lead mines, and the best bread and beef in Poland.

WIELIEZ, 25 miles east from Cracow; and Bochnia, another town in the neighbourhood, are noted for quarries of excellent rock-salt, discovered in 1252, of which that of the latter is most transparent. The mines which are below the town, make one of the best branches of the revenue, and employ a thousand men and many horses. Such of them as work underground, grow blind, from the sharpness of the salt. Here are also several springs, the water of which is boiled into salt. Our Philosophical Transactions, N^o. LXI. p. 1099, call them salt-gem mines. Here are three sorts of salt, one coarse and black, another finer and whiter, and the third very white and clear, like crystal. The black salt is cut out into masses of three Polish ells long, and one in thickness. They lay the great pieces before the doors, that the cattle may lick them. These pieces are ground by mills and other engines.

This palatinate is small, exceeds all the rest in mines, except that of Sendomir only: for, beside those already mentioned, there are some, both of copper and gold, at Novoturgus; marble of all colours at Silesia; pit-coal at Tencinum; and iron mines, and glass-houses at Olstina.

The **PALATINATE OF SENDOMIR** has that of Cracow on the west and south-west, Hungary on the south, Mazovia and Great Poland on the north, and Red Russia and the palatinate of Lublin on the east. It is divided into eight districts, and has nine senators, viz. the palatine and castellan of Sendomir, and the castellans of Wislitz, Radom, Zawichost, Zarnow, Malagofh, Polowicz, and Sechow. It abounds with mines of gold, silver, copper, iron, lead, and marble, and has its name from its capital, viz.

SENDOMIR, on the west side of the Veissel, near its confluence with the San, 70 miles north-east of Cracow, and 75 south of Warsaw.

The other towns of any note, are,

KUNOW, 40 miles north of Sendomir, noted for quarries of marble of all sorts and colours.

SYDLOVEEZ, 40 miles north-west of Sendomir, is noted for store of timber, iron, and steel, in its neighbourhood, and plenty of fish.

VIARDEN, a new built town, of good trade much frequented.

ITZA stands on a river that falls into the Veissel, 70 miles north-east of Cracow, and furnishes all Poland with earthen ware.

KIELEZ is famous for mines of copper, and lapis lazuli.

CHENEIN, 12 miles east of Kielez, noted for mines of lead and silver, and quarries of marble.

LAGOVIA is a city famous for making earthen ware.

The **PALATINATE OF LUBLIN** lies north-east from that of Sendomir, out of which it is taken; has Masovia on the north, with Podlachia; is bounded on the east by Lithuania, and the palatinate of Russia. It has two senators, viz. the Palatine and Castellan; and the Veissel and the Viesper are its two chief rivers.

LUBLIN stands at the foot of a hill, near the river Utrizea, 20 miles from the frontier of Red Russia, 35 west of Chelm, 56 north of Sendomir, 55 south-east of Warsaw, and 130 north-east of Cracow. It has a considerable trade, and is frequented by merchants of Turkey, Armenia, Muscovy, Germany, Italy, France, England, &c. at its four annual marts, which last each a month.

The **LOWER or GREAT POLAND**, is bounded on the north by Pomerania and Royal Russia, by the Upper or Lesser Poland on the south, by Silesia and the marquisate of Brandenburg on the west, and on the east by Masovia, or the duchy of Warsaw. It is 165 miles from south-east to north-west, and the like, where broadest, from east to west, according to those geographers who include Masovia in it: but, excluding this, which is rather a boundary than a subdivision of it, it is 200 from east to west, and about 100 from north to south.

It is, in general, a level champaign country, has pleasant rivers, lakes, and ponds, and is well furnished with all manner of fish and fowl. Its hills abound with sheep, and other cattle, and its valleys with corn.

POSNANIA, called by the Germans **POSEN**, is bounded on the north by Pomerania, on the east by Pomerelia, and by the palatinate of Kalish, part of which, together with Silesia, bounds it also on the south; and on the west it is bounded, partly by Silesia, and partly by the marquisate of Brandenburg.

Its capital city of the same name stands in a plain, among several little hills, by the river Varta, or Warta, 28 miles west of Gnesna, 40 north of Wratislaw, 43 north-west of Kalish, 135 south of Dantzick, and 143 west of Warsaw.

There are three very famous commercial fairs kept in this city, much resorted to by the German traders and gentry. The first is kept about the beginning of Lent, and lasts a month; the second and third at Midsummer and Michaelmas, each of which continues five weeks.

The **PALATINATE OF KALIS** lies along the river Warta, between the palatinate of Posnan on the west, Siradia on the south, Sendomir on the south-east, and Cujavia on the east and north-east.

The chief city of this palatinate, is,

GNESNA, which is the capital of the Lower Poland, and was formerly the metropolis of the whole kingdom, and seat of the king. It stands in the middle of the palatinate, in a plain, between hills and lakes, 37 miles north of Kalish, and east of Posnan, 46 south-west of Thorn, 95 north of Breslaw, 118 south of Dantzick, 121 north-west of Warsaw, and 155 north-west of Cracow.

The **PALATINATE OF SIDARIA** lies on the east and west sides of the river Warta, and is divided into four districts, having Silesia on the west, Little Poland and Sendomir on the south and south-east, Kalish on the north, and Lencicia on the east. It has five senators.

The **PALATINATE OF LENCICIA** has that of Rava on the south-east, and Little Poland on the south; is divided into three districts.

The **PALATINATE OF RAVA** lies east from Lencicia, between Lesser Poland, Masovia, and Cujavia, and is separated from Sendomir by the river Piltza.

The two following palatinates are comprehended in the province of Cujavia, which has Royal Russia on the north, Kalish on the west, Lencicia on the south, and Dobrin on the east.

The **PALATINATE OF BREZESTEY**, on the south-side, is fertile in all sorts of grain, of which it exports vast quantities to Dantzick, by several navigable rivers. It is divided into four districts, and has its name from a little town 16 miles west of the river Veissel, 30 miles south-west of Thorn, and west of Ploczko, and 60 east of Gnesna.

VLADISLAW is a palatinate, whose capital city of the same name is built among marshes near the Veissel, in the midway between Ploczko and

THORN, 14 miles north-east of Brezestey, 20 south-east of Thorn, and 75 north-west of Warsaw. Though the adjacent soil is marshy, and so scarce of fuel, that the inhabitants suffer very much for want of it; yet it is fruitful in corn, and sends great quantities to Dantzick.

The

The PALATINATE of INOWLOCK. It extends from the lake of Goplo and the city of Grufwick, to the Veiffel, and the confines of Pomerania; has Pruffia on the north, the Veiffel on the east, Kalifh on the fouth, and lies north-weft from Brezeffey. It is divided into three territories.

DARBIN is by fome made a diftinct palatinate of the province of Mafovia, and by others a territory belonging to that of Brezeffey. It lies on the east of the Veiffel, between Cujavia and Pruffia; abounds with fruits and fifh of all forts. It is divided into three diftricts.

PLOCZKO, on the weft fide of the country, is by fome alfo reckoned a palatinate of Mafovia, from which it lies rather to the east, between the Veiffel and Ducal Pruffia. It is divided into four diftricts

R E M A R K S.

DANTZICK being the chief city of traffic in Poland, we fhall more particularly defcribe that and it's commerce from the beft accounts.

Dantzick, east longitude 19, latitude 54, the capital of Royal Pruffia, in the kingdom of Poland, fituate on the western fhore of the Viftula, which a little below falls into the Baltic Sea. It is an excellent harbour, and has the beft foreign trade of any port within the Baltic. It ftands 140 miles north of Warfaw, and 70 miles fouth-weft of Koningsburg. The town is large, and encompassed with a wall and fortifications of a great extent. The houfes are well built of ftone or brick, fix or feven ftories high, and the grainaries, containing vaft magazines of corn and naval ftores, are ftill higher, to which the fhipping lie clofe, and take in their lading; for the Dutch annually import from hence a great many thoufand tons of corn, timber, and naval ftores, and other nations fome; but the Dutch have the greateft fhare of this trade, paying for their merchandize with pickled herrings, the fpices of India, fugars, brandy, and other produce of the more fouthern countries; whereas, the Englifh and other nations are forced to purchafe thefe things chiefly with treafure. The inhabitants are computed to amount to 200,000 fouls.

The moft confiderable part of the trade of Dantzick confifts in corn, which the Polanders bring down the Viftula in large fruzes or barks, which carry in bulk about 50 tons Englifh. Thefe barks generally come down annually, in very plentiful years to the number of 1600. They reckon by lafts, of 11 Englifh quarters; the grain is fmall, but the red fort often fells for 180 Polifh gilders the laft, and rye about half this value.

As thefe cargoes are often expofed to the weather, it is a cuftom to fpread their fails on the banks of the river, and dry their corn on them. They alfo export bees-wax annually, to near 1000 fchip-pounds, for which they often get the price of 300 gilders per fchip-pound. Narrow linsens, of about 21 inches broad, and facking of different qualities, for bags and imbalage, are alfo exported to a great amount*; alfo pot-afh †, weed-afh ‡, and pearl-afh; this laft is calcined, and takes it's name from it's colour. Pipe-ftaves are alfo a confiderable article, and oak-plank, of which the greateft part is 4 inches thick, 16 to 20 inches broad, and 50 feet long §. This fpecies of timber will not ftand the weather fo well as Englifh oak, but under the water is efteemed equal.

* Some fay near 100,000 l.

† Sold there at 50 f. per fchip-pound.

‡ Sold at 22 ½ f. per barrel of 360 lbs.

§ Of this near 30,000 l. value.

They import iron from Sweden, to the quantity of 1500 or 2000 tons, but of the woollens, and other manufactures of England, an inconfiderable quantity. The laws of commerce are very ftrict to prevent one foreigner from felling to another, or to re-fell to any other burgher than to the perfon he bought of, which muft neceffarily cramp the trade very much. Peter the Great made a law to the fame purpofe for Peterburgh, and yet it is unrepealed; but the government knows very well, that to enforce the execution muft be extremely prejudicial, and contrary to the maxims of all wife ftates. Even in Dantzick, in the time of the fair, all ranks and degrees of people are admitted free, to fell what, and to whom they pleafe.

Poland abounds in Jews, faid to be of the tribe of Benjamin: whatever tribe they are of, they appear as defpicable as any people in the world; yet their acutenefs and induftry have given them an eftablifhment, in which it is the intereft, both of the lords and the clergy, to fupport them; for the trade which they carry on, enables them to pay an intereft of 10 per cent. per annum for large fums.

They keep their accounts here in gilders, grofch, and phen-nigen, a ducat paffing for 8 gilders, 6 grofch.

The Current Money here is,

3 fhillings, or 18 phen-nigen	1 grofch,
3 grofch	1 ditkin,
2 ditkins	1 fixer,
3 fixers	1 tymph,

7 ½ grofch - - - 1 ach de halber,
4 ach de halbers - - - 1 gilder.
A current dollar is 3 gilders, and a fpecie dollar 4 gilders.

Here are alfo half, whole, 2 gilders, and 4 gilders pieces, of which the laft is a French crown of Lewis XIV. efteemed the beft money current, when they have not been in the hands of the Jews. Polifh coin fells from 1 to 2 per cent. advance. The exchange is ufually 280 to 290 grofch per pound Flemifh banco. Koningsburg draws in current money, 1 per mil. according to cuftom, being deducted.

Weight in Dantzick.

32 lote	1 pound,
24 pounds	1 fmall ftone,
34 dittos -	1 large ditto,
120 dittos	1 centner,
320 dittos	1 fchip-pound, or 2 ½ hundreds Englifh.

The weight is there 4 per cent. lighter than the Englifh. A laft of corn is 60 fheffelt, but of malt 90.

Long Meafure.

12 inches -	1 foot.
2 feet -	1 ell.
102 ells Dantzick	make 50 ells Englifh.
6 dittos -	5 Brabant ells.

The whole amount of the trade here, is ordinarily computed twelve millions of current dollars, on which the duties are about 7 or 8 per cent. One half is called the revenues of the crown, the other the property of the city.

This duty is paid in Alberto fix dollars of 4 gilders. HAN-WAY.

Of the General Courfe of Exchange of Dantzick and Koningsberg.

72 rixdollars, more or lefs,	in France,	100 crowns d'or fol.
270 Polifh gros—idem	in Holland,	1 pound gros banco.
100 rixdollars	at Brelaw,	103 rixdollars, more or lefs,
84 Polifh gros, more or lefs,	at Frankfort,	1 rixdollar current.
110 dittos—idem	at Hamburgh,	1 rixdollar banco.
100 rixdollars	at Leipfic,	101 rixdollars, more or lefs, current.
56 Polifh gros, more or lefs,	at Haremberg,	1 florin current money.

London exchanges, with Poland and Pruffia, by the way of Amfterdam and Hamburgh,—See HOLLAND.

R E M A R K S before the laft war between ENGLAND, FRANCE and SPAIN.

It is recent in every one's memory, that the death of king Auguftus of Poland gave rife to a bloody war between the houfes of Austria and Bourbon.

The late emperor Charles VI. was very far from being fatifised with the conduct of king Auguftus, in the latter part of his reign, becaufe he fufpected, not without grounds, that he had fome engagements with the courts of France and Bavaria, not very favourable to the Pragmatic Sanction; for which reafon the imperial intereft was employed in Poland, rather to traverfe than promote the king's views, with refpect to the fucceffion.

But when his Polifh majesty was dead, and the imperial court found his fon, the prefent king, very tractable, with refpect to it's favourite point, the Pragmatic Sanction: this gave a new turn to the councils of the court of Vienna, and engaged them to favour that meafure which they had hitherto impeded.

On the other hand, France, from firft to laft, openly fupported the intereft of king Staniflaus, whose hiftory, from the time of his being driven out of Poland, is, in a few words, this.

His generous friend, the king of Sweden, affigned him his paternal inheritance, the little duchy Deux Ponts for his fubfiftence, which he held fo long as that prince lived; but upon his demife, the next heir took poffeffion, and king Staniflaus was forced to retire to Strafburgh, where he lived on the bounty, as well as under the protection of his moft Chriftian Majesty, who in the year 1723, married the princefs Mary, his daughter; which confequently interefted France extremely in his favour. His great alliances, his many virtues, and his being freer from vices than almoft any prince in his time, had preferved him many friends in Poland; fo that it was no difficult matter for the marquis de Monti, the French ambaffador in that kingdom, at the death of king Auguftus, in conjunction with the primate, to form a great faction in his favour, more efpecially as they were both men of great abilities.

But the electoral prince of Saxony being fupported by the courts of Vienna and Peterfburgh, a double election enfued. King Staniflaus, who paffed into that country immediately after the throne became vacant, went to Warfaw, where he was received and treated as king, but was very foon driven out again by the Ruffian army commanded by count Munich, and obliged to retire to Dantzic, in which he fufained a long fiege, ran great hazards, fuffered many hardfhips, and at laft with infinite difficulty made his efcape to Konigsberg, where he was protected by the late king of Pruffia.

In the mean time, the crowns of France and Spain broke with the emperor, upon pretence of this dispute, and of his having supported king Augustus III. and prosecuted that war with great vigour in Germany and Italy; 'till at last having carried their point, and forced the emperor to a peace, all the care that was taken of king Stanislaus was, that he should enjoy the title of king of Poland and the duchy of Lorrain for life, and on the other hand, France and Spain acknowledged king Augustus.

It was very clear from their whole management of this affair, that the court of Versailles was never in earnest in the support of Stanislaus's title to this crown; but made use of it only as a colour, first for engaging in a war against the house of Austria, and next for obtaining an immediate possession of LORRAIN under his name, which otherwise they could never have gained.

It hath been the constant view of France for many years past, to extend her frontier to THE RHINE; and, upon the breaking out of several wars there, she hath constantly seized great numbers of places, and fortified them at a vast expence. The return of peace hath generally demolished them, and put the French under a necessity of employing large sums again, upon the renewal of every war. The experience of this, and that they may be the more ready upon any occasion, hath convinced them long before now, that LORRAIN, if not the greatest, is at least one of the most considerable acquisitions, that they could possibly gain or desire.

That Lorrain is of great use to the French in the design they have long since laid, of carrying their frontier to the Rhine, hath been sufficiently seen in the great advantages they have received by that country, all the time of their usurpation.

The union of Lorrain with France, advances THEIR FRONTIER FORTY LEAGUES INTO THE EMPIRE; for so many there are, from the extremity of the duchy of Bar to the city of Strasburg; makes them masters of all the country between Queitich, the Saar, and the Moselle; opens a way into the Palatinate, and into the territories of Mentz and Triers. See LORRAIN.

This duchy secures the communication of France with the county of Burgundy, and the two Alsatia's; is situated at the head of the Moselle and the Mease, and therefore cannot but be extremely commodious, as well to preserve their old conquests, as to make new. Here they may assemble their forces, to distribute them in every part; make provision of corn to fill their magazines in Alsatia, and KEEP AN ARMY IN WINTER-QUARTERS, TO BE READY TO ACT UPON THE RHINE, BEFORE THEIR ENEMIES CAN TAKE THE FIELD. It is hard to imagine greater advantages than these; and if we add to all, that out of this country above 30,000 men are raised and paid, we shall find, that the French had good reason to obtain it, as they have done. Thus has France made dupes of all Europe, and gradually pursued their ambitious point towards UNIVERSAL EMPIRE; which is greatly to be feared they may still one day obtain, if they are not effectually checked. To confirm the truth of which, see the articles FRANCE, and PLANTATIONS.

REMARKS on the article POLAND, since the last great war, and the DEFINITIVE TREATY OF PEACE, concluded in 1763.

The immense load of PUBLIC DEBTS and TAXES, with which this kingdom is at length incumbered, and by which our whole commerce and navigation are now oppressed, will, it is to be hoped, be a striking memento to our rulers, that this nation may be as little as possible involved for the future in wars with the continent, which do not immediately concern the interests of Great Britain: for it is certain, that by engaging ourselves in continental, in that most expensive and profuse manner we have done, has been greatly instrumental to entail upon us our tax-incumbrances. However necessary such policy may have been heretofore judged, our own immediate safety will instruct us as readily to relinquish such a system as we have been to embrace it; our wares in general becoming so excessively dear, by one tax-incumbrance after another, that foreigners will not be able to purchase them at all; and if we cannot sell our commodities and manufactures, how can we be able to buy the commodities of other nations? Can any means prove so effectual to the ABSOLUTE RUIN of our whole foreign trade, as to be eternally loading it with more and more taxes? And if once our imports decrease, in proportion as our exports do, will not the revenues both of CUSTOM AND EXCISES be gradually annihilated? and what then must become of the public credit, every wise man will tremble to consider.

The choice of a king of Poland seeming to threaten Europe with a fresh continental war, in the opinion of some, we are willing to hope that this nation will by no means be drawn into it: for such a war may be kindled by certain potentates, with the sole view to that end, that thereby we may more and more incumber and oppress our commerce, that at length they may gain the dominion therein, and by that means re-

cover more than the full value of what they lost in the last war.

The election of a king of Poland being the first occasion that has offered since the last peace, whereby certain powers may try the disposition of the court of London towards another continental war; it will be our present as well as future interest, to convince them, that it is our intention never more to be trappan'd into that DESTRUCTIVE SYSTEM, in the manner we have heretofore been.—That we have sufficiently experienced, that the chief security and prosperity of this nation will depend upon its maritime strength, which we are determined to cultivate to the utmost, and that we are resolved to raise every shilling's worth of NAVAL STORES IN OUR OWN PLANTATIONS; and that whatever we shall expend for the future upon our maritime force, shall be raised WITHIN OURSELVES, and every shilling thereof shall likewise be SPENT AMONG OURSELVES: and to this great end, we are further determined to raise all FUTURE SUPPLIES to carry on our NAVAL WARS WITHIN THE YEAR; in consequence of which, we shall be able to bid our enemies DEFIANCE.—These are the measures that shall be steadily adopted by an English-born king; because these measures, and these only, will constantly promote and advance the prosperity and happiness of his people of Great Britain.

As the foregoing observations were drawing up, and not printed off, we have advice of the choice of a king of Poland; and it is worth remarking, that the election to that crown gives us the most striking instance that we can imagine, of the effect the late war has had, in prejudice to the power of the court of Versailles. If we look back a century past, the retrospection will shew the amazing influence of France in the choice of Polish kings; and if we take the slightest review of the public transactions of a few months in Poland, since the death of Augustus, we shall find that her interest there has actually dwindled into nothing; or that she is determined to avoid future continental wars, and not interfere so much as she hath been wont to do in the wars of other states, but seems determined now to mind more her own affairs; which it is to be hoped will caution other states to pay a due regard to their own interest, and not interpose in the concerns of others so much as they have done.

It is at present currently said, that Prussia desires assistance from the Court of England, against Austria and France, in case of new troubles, which that monarch is apprehensive of, from their jealousy of his influence in Poland; and that a strong memorial has also been presented to the States of Holland, requesting the same, and to have immediate answers to both. And on the other hand, it is said, that Austria and France, in their memorials to our court, complain heavily against Prussia and Russia, and insist on knowing what part England intends to take in the new troubles that threaten Europe.

In answer to which memorials, we are informed, that they have been given to understand, that Great Britain would no ways interfere in the affairs of Poland, as the Poles certainly have a right to chuse their own kings; and that if they had a mind to go to war, they might fight it out among themselves: which wise answer, if persevered in, will preserve the peace of Europe; for if we pay either side, the Germans will soon find an enemy.

POLITICAL ARITHMETIC. By political arithmetic, we mean the art of reasoning by figures, upon things relating to government.

The art itself is undoubtedly very antient, but the application of it to the objects of revenue and trade, is what Sir William Petty first began, who as yet has been followed by very few; he first gave it that name, and brought it into rules and methods; and his excellent discernment would have carried it very far, if he had lived to this time; for his skillful hand did all along want right materials to work upon, with which he might have been furnished, by the variety of new taxes that have been since his time levied in this kingdom.

The foundation of this art is to be laid in some competent knowledge of the numbers of the people; see the article PEOPLE: and in all his enquiries, he took for guides the customs, excise, and hearth-money, but the accounts of these revenues were not fully stated, and their produce was not known, at least to him, when his books were written.

He endeavoured to compute the number of the people from the trade and consumption of the nation, into which the excise and customs were to give him an insight, and where the hearth-money might afford him yet better lights. He was to guess at our strength and wealth, by the general stock employed in trade; and he might see a little into the quantity of money in the nation, by the turnings it made into the Exchequer, in the payments of customs and excise; the number of houses in England shewed him in the number of families, from whence he was to gather how many inhabitants the kingdom might contain.

But his chief schemes were calculated, before the true produce of these three branches was fully known; for as to the excise, 'till the beginning of Mr Vincent's farm, which was anno 1674, the farmers in their several contracts, had never been

been obliged to give in a real state of their accounts, and a true produce of their respective counties. And as to the hearth-money, it's gross produce was likewise kept private 'till Mr Trant's farm (which began anno 1679) who was obliged by his contract to give it in. And we have yet never been able to meet with any true account of what the customs produced, 'till from the year 1674.

So that the very grounds upon which he built his calculations being probably wrong, he must, in many instances, be mistaken in his superstructure; and the true produce of these branches being concealed from him, and indeed from every body else but the parties concerned, in all likelihood, he over-reckoned them in his mind, and was thereby brought to over-rate the inhabitants of England, and to under-rate the numbers, and the strength and wealth of other countries: and this error in a fundamental, has led him into many others, and has misled such as have followed him in these matters.

It is true, Sir William Petty had very much studied the bills of mortality, and the accounts of the births and burials, not only of this kingdom, but of other nations, which did certainly help him to very useful lights.

But, through the whole course of his writings it may be plainly seen, by any observing man, that he was to advance a proposition not quite right in itself, but very grateful to those who governed.

The growth of the French king, and chiefly of his naval power, was a very unpleasing object for the parliament and the people of England to contemplate; and no doubt it did disquiet the mind of king Charles II. But this prince delighting to be soothed in his ease and pleasures, and to have no anxious thoughts, was very glad to see one of Sir William Petty's reports for calculations of this nature affirm*, That France exceeded England very little in point of territory; that we came near them as to the number of men, and that our numbers were as effectual in point of strength; that the people of England had, head for head, thrice as much foreign trade as the people of France; that France was under a natural and perpetual impediment of being powerful at sea; and that the French had not above 15,000 seamen to manage their trade, out of which, not above 10,000 could be spared for a fleet of war.

* Sir William Petty's Political Arithmetic, page 74, 75, 78, 85, 96, 57.

Every good Englishman does undoubtedly with all this had been true; but we have since had manifest proofs, that this great genius was mistaken in all these assertions; for which reason we have ground to suspect, he rather made his court than spoke his mind.

The king was well pleased to be lulled asleep by a flattering council, which suggested, that the power of France was not so formidable, and could never be prejudicial to this kingdom: for it excused his breach of the tripple alliance, and all the other measures which have since proved so pernicious to the interest of England. See the article PLANTATIONS.

But if such as meddled with computations at that time, had truly compared the strength of both kingdoms, and if the ministers themselves had duly weighed the increasing wealth, trade, naval force, and growing greatness of that nation, it might, perhaps, have awakened both the king and parliament from that lethargy, which has since proved so fatal and expensive to us.

The abilities of any minister have always consisted chiefly in this computing faculty; nor can the affairs of war or peace, be well managed without reasoning by figures upon things. As for example, suppose a nation entering into a war, that may have a good event, if they can hold it out longer than the enemy; and a bad one, if they shall be obliged to give back first: in such a case, does not a wise statesman, even in the beginning of the business, compute and compare the power and riches of the adverse party, with the wealth of his own country; and all in order so to husband it's strength, that it may continue to the very last? Does he not sum up the revenues of the enemy, and, at the same time, reckon what may be gathered at home? And does not all this help him to govern wisely his prince's affairs, and to give his master wholesome and safe counsels? Does it not often happen that a nation, which, without any prejudice, may spend three millions a year for a long space of time, may be ruined by the expence of twenty millions in three or four years? For that body which can bare frequent but moderate bleedings, must die, if too great a quantity of blood be drawn from it at once. Great statesmen, therefore, have always taken care, not only to know the exact posture of their own country, but likewise to understand perfectly the power or weakness of other people, with whom they have wars or alliances; and the judgment formed from thence, is political arithmetic.

It was by this computing faculty, that Fabius Maximus found out the way to break the strength of Hannibal, and restore the affairs of Rome. Fabius considered, that the forces of his enemy were not of a repairing nature; that their supplies were to come from a fadious and a distant country; that

Vol. II.

Hannibal was a wary captain, full of stratagems, and not to be surprized himself: that his voluntary troops, composed of different nations, were invincible in battle, and to be waited and wearied out only by a long war, which might consume their numbers. On the contrary, that the Romans were at home, and had recruits ready at hand; he therefore quite changed the manner of the war: and thus, by rightly computing and comparing the Roman and Carthaginian strength, he prevailed more by not fighting, than many consuls and dictators had done with their courage, not so wisely governed and directed.

If it could be clearly stated what the real wealth and stock of a kingdom is, and if it can be known by what degree it grows rich in time of peace, and by what steps it becomes poor at other seasons, some opinion might be formed, and judgment made, how long, and upon what foot a war might be carried on with safety to the public.

In the same manner, if the condition of the enemies affairs can be rightly understood, some guesses may be made how long they can probably hold out, supposing fortune to incline neither way, and to distribute her favours (as she usually does among nations strong and wife alike) with equal hands.

And if a country (engaged in a league with other nations) can be truly apprized of the strength and riches of their allies, they may know whether any of their confederates are not justly to be called upon, and pressed for a larger quota, and to assist with more vigour in the common business.

For these reasons, able statesmen in all ages, have been at a great expence in embassies, or spies in foreign courts, to get intelligence of the posture of affairs in those countries with which they are at war, or with whom they hold alliance.

He that would furnish himself with such skill in foreign affairs, as may make himself useful at home, must begin with an enquiry into the condition of his own country; in which, if he can attain to a competent knowledge, he will more easily find out the posture and state of other places. See the articles *BALANCE OF TRADE*, *BRITAIN* [*GREAT-BRITAIN*], *BRITISH AMERICA*, *CREDIT* [*PUBLIC CREDIT*], *DEBTS* [*NATIONAL DEBTS*], *FUNDS*, *BULLION*, *CASH*, *COIN*, *COLONIES*, *EXCHANGE*, *EXPORTATION*, *IMPORTATION*, *LABOUR*, *LANDED INTEREST*, *MANURE*, *MONEY*, *NAVAL AFFAIRS*, *PEOPLE*, *REVENUE*, *SHIPPING*, *TREATIES OF COMMERCE*.

He must know the laws, constitution, humour, and manners of his own country, with the number of it's inhabitants, and it's annual expence and income from land, [see the article *LAND*] with it's produce from trade, manufactures, and the other business of the kingdom: and mankind in the mass being much alike every where, from a true knowledge of his own country, he may be able to form an idea, which shall prove right enough concerning any other, not very distant people.

As for example, when the number of inhabitants in England is known, by considering the extent of the French territory, their way of living, and their soil, and by comparing both places, and by other circumstances, a near guess may be made how many people France may probably contain. See the article *FRANCE*.

In the same manner he that knows the income of England from trade, by contemplating the frugality and industry of the Dutch, their several sorts of commerce, the places to which they deal, and their quantity of shipping, shall be able to find out what annual profit arises to the Hollanders, from their foreign traffic: See *HOLLAND* and *UNITED PROVINCES*.

And he who knows what taxes [see *TAXES*] and impositions one country can pay, by considering the different humours of the people, their flock and wealth, their territory, their soil and trade, shall be able, by comparison, to form a good conjecture, what revenues can be raised in another nation; and consequently he may make a near guess, how long either kingdom can carry on a war.

In the art of decyphering, it is said, where three or four words, perhaps letters, can be found out, the whole cypher may be discovered: in a great measure, the same holds in the computations we are treating of: and very probable conjectures may be formed, where any certain footing can be found, to fix our reasonings upon.

No commonwealth or monarchy did ever arrive at a very great power, but by methods to be comprehended by the understandings of men; and we read of no great empire ruined, but the seeds of it's destruction may have been observed long before, in the course of it's history; there being a certain degree of wisdom, industry, virtue, and courage, requisite to advance a state; and such a measure of folly and ill conduct, necessary to pull it down.

In the same manner, the ways are evident by which a country grows rich, and the decays in the wealth and substance of a nation, may be likewise foreseen early, by such as bend their study to matters of this nature: for where the causes are apparent, we may judge easily of the effect. A people who keep their expence at home, or who protect their trade, [see the article *COMMERCE*] will not be much wasted by a war. A foreign war must needs drain a kingdom of it's treasure.

6 L

ture. This treasure being the common stock, if it be diminished, must certainly diminish the trade and business of that nation; and by how much the trade and business of a country is lessened, and by how much it's treasure is exported, [see *BALANCE OF TRADE*] by so much that country is grown poorer: indeed, to compute the exact degrees in all this, is difficult; but in so dark a point, conjectures that come somewhat near the truth, may be of service to any statesman.

It is true, that speculations in the closet, which have not been enlightened and assisted by practice and experience, will be very uncertain guides to him who desires to know the state and condition of his country: a statesman, therefore, who would compute with any effect, conducive to the public good, must consult variety of men, and men of different talents; and, in any scheme he is to form, above all things, he must avoid projectors, [see the article *PROJECTORS*] his flatterers or admirers, or those who depend upon him. For the projectors are always too full of their own thoughts and business, to judge rightly of it. His flatterers will always assent; his admirers will be too much biased by his opinions, and, from his dependents, he can never have that contradiction, by which truth must be sifted out.

A great statesman, by consulting all sorts of men, and by contemplating the universal posture of the nation, it's power, strength, trade, wealth, and revenues, in any counsel he is to offer, by summing up the difficulties on either side, and by computing upon the whole, shall be able to form a sound judgment, and to give a right advice, and this is what we mean by political arithmetic. See the article *PARLIAMENT* [MEMBER OF PARLIAMENT.]

He that has such a computing head, will seldom enter into ill measures; he will not put the wars of his prince upon a wrong foot; he will not engage him in weak alliances; he will not propose ill digested schemes and funds for revenues that shall not answer. In any new council he will weigh the event beforehand, and consider how far it may disturb his master's affairs, or affect the nation's credit. Happy are those kingdoms, which abound in statesmen so qualified; but miserable is that country, where the men of business do not reckon right; and where, in matters very important, and on which the whole welfare of a people depends, they are allowed to say, they are mistaken.

This computing faculty may not only be useful to statesmen in the general and higher affairs, but it will likewise help them in the more subordinate and ministerial parts of government. It shall not only contribute to their well guiding and conducting the nation's whole strength and wealth trusted to their care, but if they know rightly how to reason upon things by figures, they shall commit very few errors in relation to their prince's revenues, or to the trade of the kingdom.

There are few places which afford better helps for computation, than England does at present. The excise, the customs, and land-tax, are criteria, by which we may judge, not only of what the people consume, but, in some sort, they let us into a knowledge how their numbers increase or diminish. Those duties are the very pulse of a nation, from which it's health or decays may be observed. And these revenues must be the better guide to computers, because the accounts of them are fairly kept and stated, and because the respective branches have been under so exact a management, that their produce is known and understood.

The wealth of all nations arises from the labour and industry of the people: a right knowledge therefore of their numbers, is necessary to those who will judge of a country's power and strength. See the article *PEOPLE*.

And upon this account undoubtedly, the Romans did so often make the census, that a judgment might from thence be formed, how able the commonwealth was to defend itself, or to invade others.

And the sin David committed in numbering Israel, might be probably this, that it looked like a second proof of rejecting theocracy, to be governed by mortal aids and human wisdom. For without doubt, it must very much help any rules to understand fully that strength which he is to guide and direct; since he may thereby know how many are fit for war, what hands support the commonwealth by their labour and industry, and what sort of men are idle and useless in it.

And this is so far from being a matter of mere speculation, as some think, that very many conclusions may be drawn from thence, useful and reducible to practice.

For if the numbers of the people can be truly stated, if they can be divided into proper ranks and classes, if it can be distinguished who are rich, who are easy, who can barely subsist, and who, by reason of poverty, can contribute little in any tax or aid to the public: if all this can be thoroughly understood, in the laying any kind of tax or imposition, a very near computation may be made, what such a duty should produce to the government, supposing it to be duly collected, and under a good management.

When the different ranks and qualifications of men are divided and stated, when there is a right distinction made, be-

tween the number of solvent and insolvent persons, when it is known how many pay not to church and poor, how many receive alms, and how many are mere vagrants, a very good judgment may be made what any personal or family-tax ought to yield, still supposing it to be well and carefully levied.

The number of the people leads us to know, what the yearly income may be from land, and what from mines, houses, and homesteads, rivers, lakes, meers, ponds; and what from trade, labour, industry, arts, and sciences: for, where a nation contains so many acres of arable land, so many of pasture and meadow, such a quantity of woods and coppices, forests, parks, and commons, heaths, moors, mountains, roads, ways, and barren and waste land; and where the different value of all this is computed, by proper mediums, it is rational to conclude, that such a part of the people's expence is maintained from land, &c. and such a part from mines, houses, &c. and that such a part is maintained from trade, labour, &c. And the poor, exceeding so much the rich in numbers, the common people are the proper medium by which we may judge of this expence.

There is a certain sum requisite to every one for food, raiment, and other necessities; as for example, between 7 and 8l. per annum; but some expending less, and some more, it may not be improper to compute, that the mass of mankind in England, expend one with another, near 8l. per annum: from whence it may be concluded, that an annual income of so many millions is needful for the nourishment of such and such a number of people.

And if land with it's product will not reach this sum, it is rational to infer, that the rest must arise from trade, arts, and manufactures.

And further, when a nation contains such a number of people, skilled in husbandry and the improvement of land, when they have such an extent of territory, and when their acres are, one with another, of such a value, it may be from thence concluded, that the land of this country will produce such and such a sum.

So much of the product of the earth will nourish such a number of the people; and a soil so and so improved, will yield such a product; and if this be above what the people consume, it follows, that there must be such and such a quantity of goods for exportation.

Such a number of men skilled in maritime affairs, versed in traffic, with variety of ports, dealing to many countries, with such and such a native product to export, and such an acquired stock to turn and wind, must gain so and so by trade.

And if land and trade do not reach the expence in question, it follows, that the rest must arise from arts, manufactures, and the other business of a people.

But if land and it's product, with what is done at home, is sufficient to nourish such a number of inhabitants, and that they are besides able to export many commodities and manufactures, and that their stock is such, as to deal in many goods with foreign people; we may infer, that there is superabundance of wealth accruing to such a country by their traffic.

Therefore a right distinction to be made between what part of the people's expence arises from land, &c. and what from trade; and what from arts, labour, &c. must be a good guide to princes and states, in laying any kind of taxes or impositions.

Expence must arise from income, and suppose	
the general income of a nation, from land	44,000,000
trade, arts, &c. should be	-
Suppose of this, land to be	14,000,000
Trade	10,000,000
And arts, labour, &c.	20,000,000
	44,000,000

And where this is the case, can it be reasonable in taxing the people to lay almost the whole weight upon the twenty-four millions, and to let the other twenty millions in a manner escape. And yet this must happen, in countries the whole burthen is generally put upon land and trade.

So that such a political arithmetic, as could distinguish in all the different parts which compose a nation's wealth, must be very useful and of public service.

The eighth penny, raised upon the annual income or expence of England, would have maintained the war of king William a great while, on the foot of five millions a year, if the burthen had been put upon all degrees of men alike, with geometrical proportion; for, in all probability, an EQUAL land-tax, and moderate duties upon the whole consumption, would have produced such a sum: and if this could have been compassed, the landed men had undoubtedly been in a better condition than they are at present, and we had avoided the vast debt, which was a weight upon the king's affairs.

This computing faculty consists in comparing the strength of nations, and in considering their number, power, policies, wealth, trade, shipping, naval force, land armies, and alliances.

But there is in this art a sphere for lower capacities to move in, who can presume no further than to find out and prepare materials, to be made use of by abler hands, and who think it praise enough to them, if they can make tools for skilful artists to work withal.

If general computations had been more studied and improved, those errors relating to the revenues, must probably have been avoided, which have so entangled the public affairs.

If some of the men of business had consulted political arithmetic, the parliament had not been troubled ever session, to make good so many deficient funds, which have loaded England with a heavy debt.

Most undoubtedly a right skill in this art, would be of great use in all considerations relating to the public revenue: for though the number of people could not be certainly fixed, and though the consumption of any commodity could not be truly known; yet he who goes by some rule (though not capable of a mathematical proof) shall seldom err, than he who gropes entirely in the dark, and only follows the suggestions of his fancy.

The projectors of most new funds, have hitherto been generally mistaken two parts in three: that art is therefore to be praised, the rules of which, if rightly followed, will show a priori, within a small difference, what any branch of the revenue shall produce, making allowance for the difference between war and peace, or any other extraordinary occurrences.

In all computations, the number of people is the groundwork; however, that knowledge will be but an uncertain guide, without other helps and directions. For in reckoning what any branch may yield, consideration must be had of the present abilities and condition of the kingdom; of the current cash, and even of the disposition of the people to pay the duty. The nature of the commodity likewise to be charged must be considered, whether it be the proper object of a duty, and not easily concealed and evaded, and whether its collection is to be ascertained by high or easy penalties; and whether it is to be come at by a few or by many officers; and the law itself, which is to give the duty, must principally be weighed; for if it is to be slackly penned, the branch will answer accordingly: by an universal contemplation of these matters, and by making every where proportionable allowance, in all the foregoing, and some other instances, a judgment may be formed, what sum the government may reasonably expect from any new revenue.

And, in computing any new duty, the number of the people will be an uncertain guide to those who do not distinguish rightly, between the rich and the poor of a country: for in most computations, men are led into error, by reckoning and concluding, from what is in view, and just before them. But they who will make a true estimate in things of this nature, must consider the mass of the people together, and not measure the riches of the whole, by that plenty and pomp, which they see among a few.

He who will pretend to compute, must draw his conclusions from many premises; he must not argue from single instances, but from a thorough view of many particulars; and that body of political arithmetic, which is to frame schemes reducible to practice, must be composed of a great variety of members.

He who will arrive at this art, must look into all the public revenues; he must understand something of their management; he must not be a stranger to the product and manufactures of every country and place; he must know what goods we export, and what foreign commodities are imported to us; and only from this general view, he must frame any scheme that may be useful to the public. A contemplation of one object, shall give him light into things, perhaps, quite of a different nature: for as in common arithmetic, one operation proves another, so in this art, variety of speculations are helpful and confirming to each other.

Nor is the faculty of computing less useful in matters relating to trade, than in what concerns the public revenues.

The councils of a country are always inquisitive after truth, but to hide it from them, and to perplex things which have relation to trade, is the interest of so many, that in the greatest deliberations, wise men are often misled by such as in all their actions, consult more their private profit than the common welfare.

There is hardly a society of merchants, that would not have it thought the whole prosperity of the kingdom depends upon their single traffic.

So that at any time, when they come to be consulted, their answers are dark and partial; and when they deliberate themselves in assemblies, it is too frequently with a bias, and a secret eye to their own emolument.

There is hardly a commerce, but the dealers in it will affirm, we lose by all the rest: when, perhaps, in time of established peace, the kingdom gets by trade in general.

A true account of the balance of trade would set all this right, and shew what traffics are hurtful, and what are beneficial to the nation; and the general balance is not to be

accurately found out, but by the aid of political arithmetic, and a skill in the foreign exchange. See *BALANCE of TRADE, and EXCHANGE*.

And, perhaps, this art alone can shew the links and chains by which one business hangs upon another, and the dependance which all our various commercial dealings have each upon the other.

In first appearance, those traffics seem hurtful which export money; but when we come to reason upon things by figures, we find that such trades are often beneficial, when they bring in one way more bullion than they carry out another. See the article *BULLION*, Vol. I. page 397.

We may seem to lose by the balance in one place, but perhaps, that trade may be the cause of another, twice as profitable: so that to object against the motion of one wheel, without knowing and seeing how the whole engine moves, is to no manner of purpose.

He that would, therefore, compute with any good effect in matters relating to trade, must contemplate the wealth, stock, product, consumption, shipping, exportations and importations of his country; and, at the same time, he must consider the state and condition of other places.

In this art, the most deficient point is, to find good materials, and to have a footing probably sure to fix our reasonings upon; for where our premises can be certain, our conclusions shall be almost undeniable.

It is a great guide, in concerns of this nature, to have before us an account of all the exportations from London and the out-ports, to every distinct country; and also of all the importations to London and the out-ports, from every distinct country, and of their values at prime cost, and so downwards. Every commodity should be under a separate head, and the drawbacks upon re-exportation taken due notice of, and the value taken into consideration, where the duty on goods is ad valorem. These materials are very helpful in our computations of this kind.

But it would be a further light into the general balance of trade, if we could form a good judgment of that beneficial trade of buying goods in one place, to sell in another country, and what we gain by the articles of freight. If the true state of these matters could be obtained, it would greatly contribute to our information in regard to the general loss or profit made by commerce.

The general posture of our traffic, as well in time of war as peace, is likewise requisite to be taken into consideration; for by contemplating the various charges in our exports and imports in those different junctures, a judgment may be formed, from political arithmetic, how the balance of trade formerly stood, and how it is like to stand hereafter, with the several countries wherewith England has commercial negotiations.

These are the out-lines of the art of political arithmetic; and how far this work may contribute to give the reader some knowledge of the art itself, can be known only by those who shall peruse our work throughout; whereto they will, perhaps, find more matter, if rightly applied, tending to information of this kind, than those who have not dipped into it may be aware of.

POMERANIA. The ancient Pomerania was of a much larger extent than the modern, for it included Pomerelia, and Cassubia, called Black Pomerania. The modern duchy of Pomerania, taken all together, is a long narrow track, above 200 miles from east to west, and from 50 to 80 from north to south, the breadth being very unequal.

It has Polish Pomerania on the east: the Baltic Sea on the north; the marquisate of Brandenburg on the south; and the duchy of Mecklenburgh on the west. It's air, by reason of it's being the extreme north-east corner of Germany, is reckoned the coldest of any part of it. The soil in many parts is sandy and barren, and their arable lands near the shore are frequently overwhelmed with sand; yet in other parts they have corn enough, both for consumption and export, besides good pastures filled with cattle, and many large woods and forests, which abound with deer, wild boars, bares, foxes, wolves, wild horses, and fowls of all sorts. Here are also beavers, and such plenty of water-fowls, that they reckon 20 sorts of ducks. They have great plenty of salt and fresh-water fish, particularly salmon, and very large lampreys, especially in the bay of Stetin and lake of Laffen. About Gripswald and Rugen they have good herring-fishing; and in the lake Madduje, near Colbatz, there is a large broad fish, called muscum, found nowhere else in Germany. There are many fair and fertile meadows between the branches of the Oder, and has great quantities of fruits of all kinds, as in any province of Germany. They have no wine of their own growth, but excellent mum, and beer of several sorts, particularly the bitter beer of Stetin, the mum of Gripswald, and the stout of Wollin, which mariners transport elsewhere: and as there are scarce any mountains in the country, it has no mines, but some few of iron in the Upper Pomerania. It abounds with amber, especially on the coasts of Brandenburg Pomerania, where it is not only thrown up by the sea, and found among the sea-weeds and sands, but also dug out of the rocks and mines. It is frequently dug out

of the ground, at a great distance from the sea, and many times found by the husbandmen, as they plow their lands. There is a particular lake in this country, that communicates with the sea, where they gather it in nets, when the sea begins to flow, and sometimes haul up pieces as big as one's fist. At first taking up it is soft, but soon hardens, by the air, into a stony substance: it is of several colours, white, yellow, black, and red: the sort found in Pomerania is a dark yellow.

It is well watered by rivers and lakes: among the former are, the Oder, the Pene, the Rega, the Perfant, the Wiper, the Stolp, the Rekenitz, and the Barte. The Rekenitz separates Pomerania from Mecklenburg, forming a large lake near Damgarten, and falling into the Baltic at Dars. The Barte rises near Stalfund, and falls into the sea at Bardt. The Oder, soon after it's entrance into Pomerania, divides into several branches, add after having passed by Garts, Griffenhagen, Schwedt, and Stetin, flows into the Damish lake, and then into Damantzkt, and at last dilates itself into a freshwater lake, or sea, called the Great Frisch-Haff, which is an excellent road for shipping, 30 miles in length, and 10 in breadth, abounds with fish, and falls into the Baltic by three currents, through which ships pass to Stetin. Besides the abovementioned, there are many more rivers in Pomerania, which fall into the Baltic.

The most common division of this country is, into the western, viz. the Upper, or Swedish Pomerania; and the eastern, viz. the Lower, or Brandenburg Pomerania; which latter is also called Ducal Pomerania, or the duchy of Pomerania, because it was given to the ducal house of Brandenburg by the treaty of Munster.

The chief towns of the eastern, or Brandenburg, i. e. Ducal Pomerania, are,

1. **STOLPE**, 22 miles north-east from Rugenwald, 52 east of Colberg, and 64 west of Dantzick.
 2. **RUGENWALD** is the capital of Wenden duchy, on the river Wiper, 18 miles north-east from Collin, and 20 from Carmin.
 3. **COSLIN**, 18 miles north-east of Colberg, is a very pleasant town with a good air. It being but a league from the Baltic, the inhabitants can easily export their coin, and import what commodities they want from abroad. The Frisch-Haff lake is a treasure to them, for they often, in the winter, bring up an hundred tons of fish there, at one draught of the net, if we may credit fume. The adjacent country is fruitful, and interspersed with little hills, on which stood formerly Popish chapels, much frequented by pilgrims. Here are three annual commercial fairs, viz. the Saturday after Lady-Day, the Thursday after the fourth Sunday in Lent, and All-Saints Day.
 4. **CORLIN**, 13 miles east of Colberg, and 12 west of Collin, has two annual fairs, viz. on the Saturday before Palm-Sunday, and on Ascension-Day.
 5. **BELGART** is a little town, with a good trade, five miles south-east of Corlin, 16 from the Baltic, 18 from Colberg, and 56 north-east of Stetin.
 6. **COLBERG** is the capital of that called the duchy of Cassubia, and stands at the mouth of the Perfant, near the Baltic shore, 30 miles north-east from Carmin, and 55 from Stetin. Salt is made here, of which large quantities are sent abroad, to the great enriching both of the town and of the elector of Brandenburg, to whom the town came by the treaty of Munster. It's harbour, which is a good one, though somewhat too narrow, is defended by a strong castle.
 7. **CAMIN** is a small city, which some, however, reckon the capital of Ducal Pomerania, but five miles from the Baltic Sea, 32 north of Stetin, and 33 east of Wolgast: it stands on the mouth of the Oder that is called Druwenow. It has three trading fairs a year, viz. the second Sunday in Lent, on Trinity-Sunday, and Holy-Cross-Day.
- UPPER, or SWEDISH**, called also the **ROYAL POMERANIA**, extends from the Oder to the frontiers of Mecklenburg, and from the marquisate of Brandenburg to the Baltic.
1. **GRIFFENHAGEN** stands on the east side of the Oder, above Stetin, almost opposite to Gartz. It has three fairs in a year, viz. on Thursday after the first Sunday in Lent, on Trinity-Sunday, and on the 28th of October.
 2. **DAM** is a small but strong town, on the east side of the Oder, overagainst Stetin. There are three annual fairs at this place, viz. on the Friday before the first Sunday in Lent, the eve of Palm-Sunday, and Michaelmas-Day.
 3. **STETIN**, the metropolis of this Pomerania, stands on the rising of a small hill, with a fine castle on the west side of the Oder, which runs from thence through the lake called Gros-Haff, into the Baltic, by the ile of Usedom. It is 18 miles from the frontiers of Brandenburg, 73 north of Frankfort 74 north-east of Berlin, 153 west of Dantzick, 170 east of Lubec, and 320 north of Vienna. It's trade was the most considerable of any in these parts, 'till the settlement of the Dutch republic. It was formerly one of the Hanse-Towns, and the rendezvous of the fleets which those towns used to fit out to protect their trade, and secure their privileges. It is 40 miles to the sea, yet ships of good burthen come up to the very walls of the city, where they have a fine key,

though the river itself, which is navigable a great way above the town by lesser vessels, is a sufficient harbour.

One branch of it's trade is, the exporting of salt and fresh fish, especially those taken in the Gros-Haff, the lake abovementioned, which is about 15 miles below the town; and from thence they also ship off great quantities of naval stores, especially oaken plank, masts, with other wood, both for building and fuel; canvas, linen, yarn, honey, wax, rosin, &c. Many ships come yearly from hence to London: and as the Oder brings down a vast quantity of corn, which comes into it from Poland and Silesia by the river Warta, about 50 miles above the city, here is a very great exportation of it, especially for Sweden, which is sometimes much distressed for want of it. In fine, it is so proper a center for exchanging the commodities of Poland and Germany, with those brought from the Baltic by the conveniency of the river Oder, that it cannot fail of having a great share of trade, and it is now said to be so populous, that many of the inhabitants are obliged to live in cellars and vaults. They have large granaries, store-houses, an arsenal, and a dock for building ships.

4. **TRIPTOW**, a pretty town, defended by a strong castle on the Tollen Sea, or lake, not far from the confines of Mecklenburg, 26 miles south of Gripfswald: it has three fairs a year. There is a town of this name in the Lower Pomerania, near Collin, which is called Triptow on the river Rega, or New Triptow. The townsmen have an opportunity, by their river, of trafficking to sea: it has a fair on St Peter and Paul's-Day.
5. **PASSEWALCK**, anciently **PAZDEWALCK**, stands between Prenzlau and Turgelow, on the west side of the river Ucker, by which the inhabitants send their goods through the Haff to the Baltic.
6. **GARTZ** is another town on the same confines, and is one of the passes of the Oder.
7. **UKERMUNDE** stands where the Uker river falls into the Gros-Haff.
8. **ANKLAM**, on the river Pene, 17 miles south-west from Gripfswald, and 31 north-west of Stetin. It made a good figure once among the Hanse-Towns. It is advantageously situated among good arable lands and excellent pasture, with the conveniency of fishing, and of exporting their commodities abroad by the river Pene.
9. **GUTSKOW** is a town on the river Pene, 8 miles south of Gripfswald, and 10 west of Wolgen, between Anklam and Loytz, and capital of a county of the same name, which formerly included Gripfswald, Loytz, and the abbey of Eldenow.
10. **LOYTZ** stands on the Pene river, between Grotfow and Demail. It has four fairs a year, viz. the Monday before Lent, the Monday before Whitfuntide, a fortnight after Midsummer, and a fortnight after Michaelmas.
11. **WOLGAST** stands very pleasantly, near the mouth of the Oder called Pfin, nine miles south-east from Gripfswald, 27 from Stralsund, and 40 north-west from Stetin. It is a very handsome, well-built, populous, and strong town. The harbour, though 12 miles from the sea, is the best in all this duchy, Stralsund excepted.
12. The **ISLE of USEDOM** lies west from that of Wollin, and is formed by the Pene, where it falls into the Baltic along with the Oder, so that one of the mouths of the Oder, which runs between this and Wollin, is called the swine, and the other, beyond Usedom, the Pfin. Upon the destruction of Wollin, the town of Usedom was reformed to by the Danish and Polish merchants, and became a place of very good trade, being very large, and well fortified; but since 1473, when it was burnt down by an accidental fire, it has been only an inconsiderable sea-port. This island is about six miles in length, abounds with wild boar, deer, and hares, and was the park where the dukes of Pomerania kept their game.
13. **WOLLIN** is the easternmost of the two islands formed by the tree mouths of the Oder: it is 25 miles long, 15 where broadest, and is divided by the Swine from Usedom. The town, which stands at that mouth of it called Drenow, is five or six miles south-east of Rugen, 25 miles north of Stetin, and 25 south-west of Wolgast. It was built out of the ruins of Julinow, once a very famous town, and was one of the largest cities in Europe, and it's greatest mart, next to Constantinople, being inhabited by Danes, Swedes, Russians, Jews, and merchants of all nations, who had their separate streets and houses of exchange; and said to have been so powerful, as singly to maintain a war against Denmark; but having been partly destroyed by lightning, and partly by the arms of Woldemar king of Denmark, it was, in 1170, totally demolished, and has been but an inconsiderable town ever since: it's commerce has been transferred to Lubec and Dantzic. This is the common fate of all places that lose their trade.
14. **GRIPSWALD**, 9 miles north-west of Wolgast, 29 south-east of Stralsund, and 46 north-west of Stetin, which was one of the Hanse-Towns, and formerly imperial, stands within half a league of the Baltic, at the bottom of a small gulph, which they call the sea of Stralsund, over-against the ile of Rugen:

Rugen: and there being another bay in the island just opposite, both together make the passage above 20 miles over. The place is not so big as Stralsund or Stetin, yet it is a considerable town, being well built, well fortified, and has a good trade by sea. The best salt was made here of any place upon the Baltic, but the works have been discontinued for want of fuel, which in this country is scarce. They have abundance of cattle here, and deal much in hides and tallow. Here is a good harbour, and a great many ships belonging to it, which are brought to the quay by means of a canal, that is cut from the gulph to a great lake on the other side of the place.

15. RUGEN is strong both by art and nature, and much celebrated in ancient history for the courage of the Rugii, it's old inhabitants. It is about 30 miles in length, and as much in breadth (though some say the latter is not more than 20): it is so fruitful in corn, that it is called the granary of Stralsund; and in grass, that it is well stocked with horses, black cattle, sheep, and the largest geese in Europe. The seas and lakes here abound with fish; and the Rugenians are not only good fishermen, but reckoned the best pilots in the Baltic, which makes them very useful to the merchants of Stralsund. The forest of Jafund furnishes them with fuel and timber, and the sea, bays, and lakes, with plenty of fish for consumption and export.

16. STRALSUND, the largest and richest town in Pomerania, the sixth in rank of the Hanse-Towns, and a free imperial city, by some reckoned the most considerable in the circle of Upper Saxony, stands near the banks of the sea, over-against the island of Rugen, 19 miles north of Gripswald, 32 miles north-east of Rostock, and 66 north-west of Stetin. It has an excellent haven, where ships come up to the very town, and is so well situated for trade, that it has a very great and lucrative commerce, both by sea and land; for it is to be observed, that here begins the export of those staple commodities which all Europe sends for to the Baltic, as corn and naval stores, viz. hemp, flax, &c. but especially corn, of which great quantities are exported, this being the first city in the Baltic, to which the Dutch trade for it. Here are also great quantities of honey, and wax, tar, pitch, rosin, hides, and tallow, as also of linen, especially canvas, of which a good sort is made here.

POOR. There is certainly no state in which may be found more laws than in ours concerning the poor: laws wiser in appearance, or more humane, more equitable: or so many books and excellent representations on this subject: so many hospitals: or, in short, so great a fund of generosity and charity, as in England: at the same time too, there is not, perhaps, a country in which there are so many poor.

Yet those laws must be intrinsically defective, which being so important as they are to every member of society, have not the force to make themselves be executed, or which one may easily elude.

The poor-rate for England only, which is from two shillings as far as to six and eight shillings in the pound, in some parts, exceeds three millions and a half sterling. If we add to it the private charities, and foundations of hospitals, a sum sufficient to maintain the tenth of the inhabitants.

The charges of the roads, and of the public works, are also immense, and continual resources for such as want employment.

The charity-schools maintain and bring up the twentieth part of the children that are born: nevertheless, in the towns, the streets swarm with poor, some of whom soon after, perhaps, beg on the high-way with a presented pistol in hand.

The abuse of the particular administrations of the poor's revenue, and the insufficiency of the laws, are too glaringly evident, and the consequences of this evil are too dreadful for the administration not to become a national concern.

There is no more effectual method of redress for it, than to appoint a committee of members of Parliament, before whom should be annually laid a state of the sums levied, or applied to the maintenance of the poor, and a list of the poor maintained in every county.

By these circumstantial states and lists, by comparisons and indisputable facts, it would be made manifest,

1st, That some of the principal causes of there being so many poor are, privileges, exclusive rights of freemen, and corporations; the indiscreet, as well as unfaithful, distribution of the parish-alms; the money scattered through towns and country, by the candidates, in the time of elections; the multiplicity of alehouses, taverns, and other infamous snares of idleness, and debauchery.

2dly, That robbers owe their origin not to want, but indiscreet charity. The class of men which has no right to the parish-alms, is far less abundant in robbers than that which has: that right is an encouragement to, and the certain refuge of, idleness, the parent of debauchery and crimes.

In short, it would appear convincingly plain, that the only prompt remedy that can be brought for this urgent evil would be,

Vol. II,

1st, To form a common national aggregate of all the sums levied throughout all the parishes, under the name of the poor's tax, to which should be joined the funds of all the ancient charitable foundations: with reservation, however, of liberty to all future donors to appropriate particularly their charities to whatever counties or parishes they should think fit.

2dly, To take into workhouses, or alms-houses, all beggars, even every person applying to the parish for charity, equally in case either of sickness or of health, without any distinction even of the private poor, that is to say, of such as are ashamed of begging: because there ought to be no poor of that nature in a nation where it is no shame for any one to work.

3dly, To assign to every person so received into these workhouses, that sort of work of which he should be capable, inasmuch that the sick, and such as should be deprived of the use of all their senses, should alone be dispensed with from it.

4thly, To divide these workhouses into two wards, the one for the poor who should work voluntarily, the other for them to be carried to, in cases of necessary correction, and forced to work, should they refuse to submit to it.

5thly, It would also be very necessary to collect together, in one common house, all the children dispersed in the different schools and establishments of each parish. The care of their first years of life, and of breeding them up to work, would be better administered in one common house than by parish-nurses, who inhumanly sacrifice, even in the cradle, so many innocent victims to their barbarous avarice. This is a truth incontestably proved, by a comparison of the number of dead beneath the age of seven years, amongst the children nursed by the parish-nurses, and amongst those brought up in the Foundling-Hospital.

6thly, Every workhouse or alms-house throughout England should render an account of it's administration, attested by the magistrates or officers of each town or parish, to the committee of the nation. These accounts would serve for checks upon one another. The members for every county should be called to the inspection of the account of the general administration, and, upon the report of this general committee, the poor's tax should be settled, and passed by the nation.

From such a form of administration as this, would result the following advantages:

The real misery of the sick and disabled would receive the relief which is due to it.

The malversation of particular administrations would be remedied.

The number of the poor would sensibly diminish: many now receive private alms, who would then resolve to work, rather than receive public ones.

Society would be delivered from beggars, of whom the example and enormities are so much to be dreaded.

The produce of the work of such as should be free to leave the house when they pleased; and the work of the poor under confinement, would be a clear and new profit to the public.

The poor's tax would diminish considerably.

All the recensions of the above-deducted three classes of men, and of their subdivisions, should be draughted and framed in each parish, by it's respective churchwardens, aldermen, overseers of the poor, or the like proper officers. A short enough time, and a great deal of order and method, would suffice to carry them to the requisite perfection for making all the use to be promised from them, without much expence.

Dr D'Avenant's SCHEME for setting the POOR to WORK.

First, That such persons as shall subscribe and pay the sum of 300,000l. as a stock for and towards the better maintaining the impotent poor, and for buying commodities and materials to employ and set at work the other poor, be incorporated and made one body politic, &c. by the name of the governor and company for maintaining and employing the poor of this kingdom.

By all former propositions, it was intended that the parishes should advance several years rates to raise a stock; but, by this proposal, the experiment is to be made by private persons, at their risk; and 300,000l. may be judged a very good stock, which added to the poor's rate for a certain number of years, will be a very good fund for buying commodities and materials for a million of money at any time. This subscription ought to be free for every body; and if the sum were subscribed in the several counties of England and Wales, in proportion to their poor-rates, or the monthly assessment, it would be most convenient; and provision may be made, that no person shall transfer his interest but to one of the same county, which will keep the interest there during the term; and as to it's being one corporation, it is presumed this will be most beneficial to the public. For first, all disputes on removes, which are very chargeable and burthensome, will

be at an end, this propofal intending, that wherever the poor are, they fhall be maintained or employed. Secondly, it will prevent one county which will be diligent, impofing on their neighbours who may be negligent, or getting away their manufatures from them. Thirdly, in cafe of fire, plague, or lofs of manufature, the flock of one county may not be fufficient to fupport the places where fuch calamities may happen; and it is neceffary the whole body fhould fupport every particular member; fo that hereby there will be a general care to adminifter to every place according to their neceffities.

Secondly, That the faid corporation be eftablifhed for the term of 21 years.

The corporation ought to be eftablifhed for 21 years, or otherwife it cannot have the benefit the law gives in cafe of infants, which is their fervice for their education; befides, it will be fome years before a matter of this nature can be brought into practice.

Thirdly, That the faid fum of 300,000l. to be paid in, and laid out for the purpofes aforefaid, to remain as a flock, for and during the faid term of 21 years.

The fubfcription ought to be taken at the paffing of the act, but the corporation to be left at liberty to begin either the Michaelmas or the Lady-Day after, as they fhall think fit; and per cent. to be paid at the fubfcribing, to perfons appointed for that purpofe, and the remainder before they begin to act, but fo as 300,000l. fhall be always in flock during the term, notwithstanding any dividends, or other difpofition: and an account thereof to be exhibited twice in every year, upon oath, before the lord chancellor for the time being.

Fourthly, That the faid corporation do, by themfelves or agents, in every parifh of England, from and after the day of during the faid term of 21 years, provide for the real impotent poor, good and fufficient maintenance and reception, as good, or better, than hath at any time within the fpace of years before the faid day of been provided or allowed to fuch impotent poor; and fo fhall continue to provide for fuch impotent poor, and what other growing impotents fhall happen in the faid parifh during the faid term.

By impotent poor is to be underftood all infants and old decrepit perfons not able to work; alfo perfons who by ficknefs, or any accident, are for the time unable to labour for themfelves or families; and all perfons (not being fit for labour) who were ufually relieved by the money raifed for the ufe of the poor: they fhall have maintenance, &c. as good, or better, as within years they ufed to have.

This does not directly determine what that fhall be, nor is it poffible, by reafon a fhilling in one county is as good as two in another; but it will be the intereft of the corporation that fuch poor be well provided for, by reafon the contrary will occafion all the complaints or clamour that probably can be made againft the corporation.

Fifthly, That the corporation do provide (as well for all fuch poor which on the faid day of fhall be on the poor-books, as for what other growing poor fhall happen in the faid term, who are or fhall be able to labour or do any work) fufficient labour and work proper for fuch perfons to be employed in; and that provision fhall be made for fuch labouring perfons according to their labours, fo as fuch provision doth not exceed $\frac{2}{3}$ parts as much as any other perfon would have paid for fuch labour. And, in cafe they are not employed and fet to work, then fuch perfons fhall, until materials or labour be provided for them, be maintained as impotent poor; but fo as fuch perfons who fhall hereafter enter themfelves on the poor's books, being able to labour, fhall not quit the fervice of the corporation, without leave, for the fpace of fix months.

The corporation are to provide materials and labour for all that can work, and to make provision for them not exceeding $\frac{2}{3}$ parts as much as any other perfon would give for fuch labour. For example: if another perfon would give one of thefe a fhilling, the corporation ought to give but nine-pence. And the reafon is plain; firft, becaufe the corporation will be obliged to maintain them and their families in all exigencies, which others are not obliged to do, and, confequently, they ought not to allow fo much as others. Secondly, in cafe any perfons able to labour fhall come to the corporation, when their agents are not prepared with materials to employ them, by this propofal they are to allow them full provision as impotent poor, until they find them work, which is intirely in favour of the poor. Thirdly, it is neither reafonable nor poffible for the corporation to provide materials upon every occafion for fuch perfons as fhall be entered with them, unlefs they can be fecure of fuch perfons to work up thofe materials; befides, without this provision, all the labouring people of England will play faft and loofe between their employers and the corporation, for, as they are difobliged by one, they will run to the other, and fo neither of them fhall be fure of them.

Sixthly, That no impotent poor fhall be removed out of the parifh where they dwell, but upon notice in writing given to

the churchwardens and overfeers of the faid parifh, to what place of provision he or the is removed.

It is judged the beft method to provide for the impotent poor, is in houfes prepared for that purpofe, where proper provision may be made for feveral, with all neceffaries of care and maintenance: fo that in fome places one houfe will ferve the impotent poor of feveral parifhes, in which cafe the parifh ought to know where to refort, to fee if good provision be made for them.

Seventhly, That, in cafe provision be not made for the poor of each parifh, in manner as aforefaid (upon due notice given to the agents of the corporation) the faid parifh may order their poor to be maintained, and deduct the fum by them expended out of the next payments to be made to the faid corporation by the faid parifh.

In cafe any accident happens in a parifh, either by ficknefs, fall, casualty of fire, or otherways, and that the agent of the corporation is not pretent to provide for them, or having notice doth not immediately do it, the parifh may do it, and deduct fo much out of the next payment; but there muft be provision made for the notice, and in what time the corporation fhall provide for them.

Eighthly, That the faid corporation fhall have and receive, for the faid one and twenty years, that is to fay, from every parifh yearly, fo much as fuch parifh paid in any one year, to be computed by a medium of feven years; namely, from the 25th of March, 1690, to the 25th of March, 1697, and to be paid half yearly; and befides, fhall receive the benefit of the revenues of all donations given to any parifh, or which fhall be given during the faid term, and all forfeitures which the law gives to the ufe of the poor; and to all other fums which were ufually collected by the parifh for the maintenance of the poor.

Whatever was raifed for, or applied to, the ufe of the poor, ought to be paid over to the corporation; and where there are any donations for maintaining the poor, it will anfwer the defign of the donor, by reafon there will be better provision for the maintenance of the poor than ever; and if that maintenance be fo good as to induce further charities, no doubt the corporation ought to be entitled to them: but there are two objections to this article: Firft, That to make a medium by a time of war is unreafonable. Secondly, To continue the whole tax for one and twenty years, does not feem to give any benefit to the kingdom in that time. To the firft, it is true we have a peace, but trade is lower now than at any time during the war, and the charge of the poor greater; and when trade will mend is very uncertain. To the fecond, it is very plain, that although the charge may be the fame to a parifh in the total, yet it will be lefs to particular perfons; becaufe thofe who before received alms, will now be enabled to be contributors; but befides, the turning fo many hundred thoufand pounds a year (which in a manner have hitherto been applied only to fupport idlenefs) into induftry, and the employing fo many other idle vagrants and fturdy beggars, with the product of their labour, will altogether be a prefent benefit to the lands of England, as well in the rents as in the value: and further, the accidental charities in the ftreets, and at doors, is, by a very modelt computation, over and above the poor rates, at leaft 300,000l. per annum, which will be intirely faved by this propofal, and the perfons fet at work; which is a further confideration for it's being well received, fince the corporations are not allowed any thing for this fervice.

The greater the encouragement is, the better the work will be performed; and it will become the wifdom of the parliament, in what they do, to make it effectual; for fhould fuch an undertaking as this prove ineffectual, inftead of remedying it will increafe the mifchief.

Ninthly, That all the laws made for the provision of the poor, and for punifhing idle vagrant perfons be repealed, and one law made to continue fuch parts as are found ufeful, and to add fuch other reftrictions, penalties, and provisions, as may effectually attain the end of this great work.

The laws hereunto relating are numerous, but the judgments and opinions upon them are fo various and contradictory, and differ fo in fundry places, as to be inconfiftant with any one general fcheme of management.

Tenthly, That proper perfons be appointed in every county, to determine all matters and differences which may arife between the corporation and the refpective parifhes.

To prevent any ill ufe, neglect, or cruelty, it will be neceffary to make provision, that the poor may tender their complaints to the officers of the parifh; and that thofe officers having examined the fame, and not finding redrefs, may apply to perfons to be appointed in each county, and each city, for that purpofe, who may be called fupervifors of the poor, and may have allowance made them for their trouble; and their bufinefs may be to examine the truth of fuch complaints; and in cafe either the parifh or corporation judge themfelves aggrieved, by the determination of the faid fupervifors, provision may be made that an appeal lie to the quarter fefions.

Eleventhly,

Eleventhly, That the corporation be obliged to provide for all public beggars, and to put the laws in execution against public beggars, and idle vagrant persons.

Such of the public beggars as can work must be employed, the rest to be maintained as impotent poor; but the laws to be severely put in execution against those who shall ask any public alms.

This proposal, which in most parts of it seems to be very maturely weighed, may be a foundation for those to build upon, who have a public spirit large enough to embrace such a noble undertaking.

But the common obstruction to any thing of this nature, is a malignant temper in some who will not let a public work go on, if private persons are to be gainers by it: when they are to get themselves, they abandon all sense of virtue, but are clothed in their white robe; when they smell profit coming to another, masking themselves with a false zeal to the commonwealth, where their own turn is not to be served. It were better, indeed, that men would serve their country for the praise and honour that follow good actions; but this is not to be expected in a nation, at least leaning towards corruption; and, in such an age, it is as much as we can hope for, if the prospect of some honest gain invites people to do the public faithful service. For which reason, in any undertaking where it can be made apparent, that a great benefit will accrue to the commonwealth in general, we ought not to have an evil eye upon what fair advantages particular men may thereby expect to reap, still taking care to keep their appetite of getting within moderate bounds, laying all just and reasonable restraints upon it, and making due provision that they may not wrong or oppress their fellow subjects.

It is not to be denied, but that if fewer hands were suffered to remain idle, and if the poor had full employment, it would greatly tend to the common welfare, and contribute much towards adding every year to the general stock of England.

Among the methods that we have here proposed of employing the poor, and making the whole body of people useful to the public; we think it our duty to mind those who consider the common welfare of looking with a compassionate eye into the prisons of this kingdom, where many thousands consume their time in vice and idleness, wasting the remainder of their fortunes, or lavishing the substance of their creditors, eating bread and doing no work, which is contrary to good order, and pernicious to the commonwealth.

We cannot, therefore, but recommend the thoughts of some good bill, that may effectually put an end to this mischief, so scandalous in a trading country, which should let no hands remain useless.

It is not at all difficult to contrive such a bill as may relieve and release the debtor, and yet preserve to his creditors all their fair, just, and honest rights and interest.

Thus have we endeavoured to shew, that to preserve and increase the people, and to make their numbers useful, are methods conducing to make us gainers in the balance of trade.

Extract of two letters wrote to the author, from an English gentleman of honour, who some time since resided in Holland, and is now appointed in a public character at a certain court in Europe.

SIR,

'It is easy to answer your question, How are the poor maintained in Holland? But to do it so as to please you, who look farther than the outside of things, would require more than one day or one letter. However, deferring other things to next post, I will be as particular as I am able, upon so short warning, to be upon this subject; sensible that it is of the greatest consequence to us, and that those who have never considered it, will hardly imagine what an IMMENSE PROFIT England might make by setting her poor at work, besides all the advantages of getting quit of all your pickpockets, &c. &c. &c.

I will first give you some extracts of the laws of this country [meaning the UNITED PROVINCES] about the poor, and then an account of their practice.

The earliest law that I find in their statute-books relating to the poor, is a long one of the emperor Charles V. It enacts,*

* 7 October 1531.

ARTICLE IX.

That whereas the poor of our provinces are now much more in number than they formerly used to be, and whereas it is found by experience, that many abuses have arisen from suffering them to beg and ask alms, particularly that it fixes them in IDLENESS (which is the beginning of all evil), and that neither THEY NOR THEIR CHILDREN FOLLOW ANY TRADE OR METHOD OF GETTING THEIR LIVING, but

are thus brought into BASE ACTIONS, AND A BAD MANNER OF LIFE; so that though young, strong, and healthy, they nevertheless extort, by great importunities, what ought to go to the poor and sick; to the impotent, and those who are in danger of starving; and whereas, before our departure, we desire to remedy and regulate these evils, &c. &c. &c.*

* Groot Placart. book 1. B. 20. T.

REMARKS.

It appears by this article, and the following one, and by the end of the 12th, that before this law, every body that had a mind WAS FREE TO BEG IN THESE PROVINCES.

ARTICLE X.

That no one, be it man or woman, from this time forward, shall BEG OR ASK ALMS, BY DAY OR BY NIGHT, SECRETLY OR OPENLY, in the streets, in the churches, nor in or at the houses of our good people, in any manner whatsoever, upon the penalty, that whoever acts contrary to this law shall be put, for the first offence, in PRISON, AND FED WITH BREAD AND WATER, according to the discretion of our officers, judges, and magistrates, who shall be commissioned to execute this our edict, &c. &c. And for the second offence they are to be WHIPPED AND CORRECTED, according to the discretion of our officers, &c. except always the mendicant friers, &c. &c.

ARTICLE XI.

No FOREIGNER, nor outlandish person, shall beg or ask alms, but shall be liable to the same penalties, except pilgrims, &c.

REMARKS.

Upon these two articles I cannot help observing, that the great freedom Holland once enjoyed from beggars, robberies, &c. &c. seems to have been entirely owing to the strict execution of the article enjoining them to be kept upon BREAD AND WATER; this simple circumstance being of the greatest consequence in taming otherwise incorrigible offenders, to whom not death itself is so terrible as LOW LIVING; and this plainly appears by their conduct, for they risk their lives, only for the satisfaction of living LUXURIOUSLY, and therefore abstinence is a more effectual punishment to them than hanging.

ARTICLE XII.

All poor people, who shall remove from one CITY OR VILLAGE TO ANOTHER, there to live or reside, shall be liable to the same penalties and corrections, unless they are reduced by fortune of war, inundation, fire, or other such misfortunes, and that they make this properly appear; in which cases, and not otherwise, it is permitted to let them LODGINGS OR HOUSES; and all the poor residing in our said provinces, and having been there a whole year, must remain in the places where they are settled, and have their share and part of the alms which shall be there ordered them, without going about TO BEG ALMS OR BREAD, openly or secretly, as hitherto.

REMARKS.

This article is quite contrary to our NOTIONS IN ENGLAND, and to the liberty we give our poor, of trying to get their livelihood better in one parish than in another. I shall not venture to decide which of the two nations is in THE RIGHT, where much may be said for both.

ARTICLE XIII.

Whoever shall permit their children, whether great or small, to go and permit any RASCALITY; or to beg and ask alms, shall undergo the aforesaid penalties; and the children shall be whipped with rods, and otherwise corrected, according to the discretion of our officers and magistrates of the places where the offence shall happen.

REMARKS.

The making PARENTS PUNISHABLE in this case for their children (especially if understood to be those under 12 years of age) appears highly reasonable.

ARTICLE XV.

As for the support of the POOR, SICK, AND OTHERS, not able to get their bread, nor having any thing to live upon, in any town or village of our said provinces; we order, that a common purse shall be made of all CHARITIES, POOR-HOUSES, HOSPITALS, BROTHERHOODS, and others having the distribution of the PRODUCT OF ALMS, and that

part

part thereof shall be given to the poor, according to the advice of the masters and governors of the aforesaid CHARITIES, POOR-HOUSES, &c. joined with such of the officers and magistrates of every town, parish, or village, as shall be deputed for that purpose, according to the manner hereafter declared; except that alms founded for ecclesiastics, as well mendicants as others, shall be distributed according to the directions of the founders.

R E M A R K S.

Might not the charities given annually by our COLLEGES, by being put into a common purse, be more usefully employed than now they are?

A R T I C L E X V I.

That, for the future, boxes shall be placed in every PARISH-CHURCH of our provinces, to receive the SECRET ALMS OF GOOD PEOPLE; the said boxes to be locked with three keys, of which the parish priest shall keep one, the magistrates another, and the deputies, who shall be appointed according to the manner hereafter declared, another; which said persons are empowered to take the money out of the said boxes, whenever they shall think good; and farther, the magistrates and officers of each parish shall depute an honest man or two to go round the said churches, once or twice a week, to collect for the poor; and besides, the aforesaid deputies of every parish shall go once a week, or oftener, to every house, in order to BEG ALMS FOR THE SUPPORT OF THE POOR; and all these several committees or deputies, as well those who receive, as those who distribute these contributions, are obliged hereby to give an account, at the end of every month, of what they receive or distribute, before the magistrates or their deputies, IN PUBLIC AND OPEN PLACES, where every body shall be admitted that have a mind to come in.

R E M A R K S.

This last paragraph seems to be a wise provision against MISAPPLICATION OF THE MONEY COLLECTED: as to the manner of collecting, I shall only say, that I have sometimes thought—That one good way of collecting with us, as well as of altering a shameful custom of giving money to SERVANTS BEFORE THEIR MASTERS FACES, would be for every gentleman to hang up a box in his hall, where every visitor might put his VOLUNTARY CONTRIBUTION, and that it should be understood, that at the end of the year this was to be divided, one half to the POOR, and ONE HALF TO THE SERVANTS OF THE FAMILY. By this means no man would be obliged to pay more than he chuses for dining with a lord, and a good use would be made of HALF the vast sum collected in a year from those who visit their friends: besides, servants would be mended by the temptation of staying a year in their places, for the sake of their division.

A R T I C L E X V I I.

In order to regulate and conduct this work of charity, the officer * and magistrates of every town and village are hereby required to chuse out persons RESIDING AMONGST THEM, the best qualified for the said purposes, whom we require and order to take upon them this care, according to their duty to God, and out of a true spirit of charity, and to regulate themselves in it according as is prescribed them by our edict; and the said deputies so chosen, shall appoint themselves a treasurer to keep their particular accounts of the aforesaid alms, and what belongs to them on that account, and shall each in his district, take or cause to be taken, an EXACT LIST OF THE NUMBER, STATE, QUALITY, AND CONDITION OF THE POOR within it, of WHAT TRADE, and of WHAT AGE they are, how they are burthened with children, what they gain or may gain.

* Officer signifies here, the chief magistrate for executing of justice in criminal affairs.

A R T I C L E X V I I I.

The aforesaid committee shall keep a REGISTER IN EVERY PARISH, wherein shall be plainly written the result of their several enquiries, viz. the number of the POOR IN EACH FAMILY or dwelling, and the quantity of MONEY NECESSARY FOR THEM, over and above what they can gain, consideration being had of their abilities, necessities, and burthens.

A R T I C L E X I X.

The alms shall be distributed in every parish, according to the discretion of the said deputies, be it in MONEY, BREAD, FIRING, CLOATHS, or OTHER NECESSARIES, consideration being had of the QUALITY AND CONDITION OF THE AFORESAID POOR PERSONS: to drunkards, idlers, gamesters, and such like, NO MONEY is to be given, but only BREAD, FIRING, CLOATHING, AND OTHER NECESSA-

RIES TO MAINTAIN THEIR FAMILIES; and those that lead idle or roguish lives, and are able, shall be COMPELLED TO WORK, and to bring their GAINS HOME, under the penalty of being deprived of the benefit of the alms-purse, and besides, of being CORRECTED ARBITRARILY by the magistrate.

R E M A R K S.

These three last articles shew how the poor were governed, and the alms distributed, before the Reformed Church, and the offices of elders and deacons were established in these provinces.

A R T I C L E X X.

That SICK AND WEAK PERSONS, who cannot come out of their houses, and women in childbed, shall be visited and assisted by the alms-purse, and provided with linen, sheets, and coverlids, with victuals, with firing, and other necessities; and so likewise, must young orphans and foundlings be maintained out of the said alms-purse.

A R T I C L E X X I.

As to the CHILDREN OF THOSE POOR PEOPLE, who, before the publication of this edict, were idlers living upon roguery, some shall be put to school, and some to trades or to service, and shall, on Holidays and Sundays, be taught the Lord's Prayer, the Creed, and the Commandments, and shall be carried to mass and to vespers every Sunday; and that the said children may be put in a condition to go to TRADES OR SERVICE, the said committee shall have them cleaned from all filth and nastiness, and cloath them in a decent manner.

A R T I C L E X X I I.

The poor that live upon this alms-purse must wear a BADGE.

A R T I C L E X X V.

We forbid all persons, who by themselves or their children, enjoy any share of the distribution of the alms-purse, from henceforth to go into, or converse in TAVERNS, CABARETS, or SUCH LIKE PLACES: we likewise forbid them playing at ninepins, bowls, dice, or other such forbidden games, upon pains of arbitrary punishment; consenting, nevertheless, that they may sometimes drink a pot of beer for their recreation with their wives, but not so as to be drunk. We are now come to the laws made since the Reformation, of which the first is an edict of the States of Holland, the nobility, gentry, and cities of Holland, &c. &c. *

* 19 March 1614.

A R T I C L E I.

That all men and women, who being in health go a begging, or are vagabonds, either in the towns or open countries, shall be obliged, within FOUR DAYS from the publication of this edict, to quit the province of Holland, or to acquaint the officer of the place where they design to get their livelihood, by WORK or BY TRADE, and to give him a declaration who they are, whence they came, what is their business, and likewise inform him where they lodge, and lie at nights, and pray permission to stay in that place, one, two, or three days, engaging themselves not to beg in the mean time.

A R T I C L E I V.

The beggars and vagabonds, who are not able or FIT TO WORK, shall, within two days after the publication of this edict, be sent to the place of their abode, where they must be maintained according to the usage and custom of the place; and from thence they are forbid to wander, or beg in other towns and villages, under the penalty of being, for the first offence, put to diet of BREAD AND WATER, according to the discretion of the magistrates; and, for the second offence, to be WHIPPED AND BANISHED; the third offence, publicly whipped, marked with the burning-iron, and banished again.

A R T I C L E V I I I.

All children forbid to beg, on pain of being put to bread and water, if above 8 years of age.

A R T I C L E I X.

The fathers and lodgers of children, as well above as under 8 years old, are required to take good care that their children do not go a begging, under the penalty of being punished as beggars themselves.

A R T I C L E X I.

For the clearing of the open country, all the drofts are ordered to go about their district every 8 days, and take up all vagabonds

vagabonds and beggars, and to deliver them into the hands of the officer of the place where they are taken, to be proceeded against according to this law. We command likewise the ordinary officers of justice, so often as they can, and at least once a month, to do the same; and the aforesaid droffs are ordered to give an account to the provincial council of state, and the aforesaid ordinary officers to the court of Holland, either by word of mouth or by writing, of what they have done, touching the execution of this article.

ARTICLE XII.

Officers required to search inns, and all suspected places, to find out beggars and apprehend them.

ARTICLE XV.

All carriers, waggoners, &c. &c. are forbid to transport any beggars, from one place to another, under penalty of three gilders for every offence. The last law I shall quote, is one of the States-General, of the United Provinces*.

* Placart 25 June 1649.

ARTICLE IV.

It is likewise enacted, That every TOWN, VILLAGE, OR PARISH, shall maintain its poor out of the income of the charitable foundations and collections, so far as it will go; and, in case that these means shall fall short, then the magistrates shall maintain them at the general expence of the inhabitants, as can most conveniently be done; provided always, that the poor be obliged to WORK AND LABOUR, either for merchants, farmers, &c. &c. according to their strength and abilities, for REASONABLE WAGES. In order that they may, as far as possible, be supported that way; provided also, that they are to be indulged in no idleness nor insolence.

ARTICLE VI.

Forbidding, for the future, all masters of poor-houses, hospitals or charity-houses, masters of inns or taverns, farmers, or any other persons whatsoever, to lodge or harbour, either in their houses, granaries, or stables, or to support with meat or drink, any idlers or vagabonds, foreigners, or others, who are HEALTHY AND SOUND OF THEIR LIMBS, and who nevertheless appear in various forms and manners of beggary and idleness: forbidding also agreements with them to go shares in the profit which they make by such unlawful means, or to attend their rendezvous, or to go with them, or to shew them the way, unless along the common roads, or otherwise to shew them any favour or assistance, on pain of being taken for their accomplice, and being punished as such, as to justice shall appertain.

ARTICLE VII.

Nor shall it be any excuse for the said innkeepers, &c. that these people came by force and against their will to lodge with them, unless it be proved, that the said innkeepers, &c. gave SECRET NOTICE to the officer of the place, that such vagabonds were at his house.

ARTICLE IX.

To the end that the officers of the towns and open country may be better informed and advertised, where such vagabonds and offenders are, we command and require them and their under-officers, to go about all ordinary markets, churches, hospitals, and poor-houses, upon fair-days, upon marriages, and such-like assemblies or feasts, where these offenders are commonly found, to take them up, and proceed against them according to the contents of this edict.

ARTICLE X.

And to provide against the CHEATS that some beggars practise, of appearing to be afflicted with sickness, or otherwise infirm; it is ordered, that beggars suspected of such deceits shall, by order of the magistrates, and at the expence of the place where taken, be visited and examined by sworn physicians and surgeons, that the truth being known, those who have been guilty of such cheats, may be PUNISHED according to the nature of their offence.

ARTICLE XIII.

Charging and commanding all officers of justice in their respective districts, to do their duty, by apprehending all such idlers, wanderers, and vagabonds, on pain of being, not only arbitrarily punished, but of being obliged to pay all the damages which shall happen to any person, through their having neglected to apprehend such offenders.

VOL. II.

ARTICLE XV.

And that no difficulties may be made by SCHEPENS, JUSTICES, or officers of particular places, before whom the said offenders shall be brought, about the JUDGING OF THESE OFFENDERS; we strictly and expressly command, that whoever such offenders are brought before, whether it be high-bailiff or other officer, he shall be obliged to examine, and SENTENCE THEM, upon pain of being not only deprived of his office, but otherwise arbitrarily punished.

REMARKS.

Thus much for their laws; upon which I beg leave to make this observation; that this manner of providing for their poor was not begun at the Reformation, or occasioned by the dissolution of monasteries; but rather was a natural consequence of their increasing in PEOPLE AND TRADE, which brought both busy and idle people amongst them: in the same manner, our law of the 43d of queen Elizabeth was made, upon our having flourished for about the said term of years. The disputes between the archduke Maximilian, and the States of Flanders, which forced a great deal of trade into Holland, having only ended about 1491; and the first of these laws is made just 40 years after, as our law was forty years after the end of queen Mary's persecution, and the beginning of queen Elizabeth's encouragement to trade*.

* See Mr North's Manuscript upon the Poor, § 2.

Now, as to their practice, every town or congregation maintains it's own poor, either out of the collections which are made every Sunday, and church-day, or the ordinary collections which are made four times a year, from house to house, or the extraordinary ones, which are made when necessity requires, which have been frequently four times more. These voluntary contributions are laid up and distributed by the deacons of the several congregations, and the poor are by them, either maintained in their own houses, or lodged with others, according to their circumstances or infirmities. The charity of the people of Holland is such, that the collections suffice, in ordinary years, for the maintenance of the poor; but in extraordinary ones, the magistrates have advanced great sums for that purpose: as for example, in the year 1740, the magistrates of the Hague paid 15,000 gilders, and those of Leyden 30,000 on that account. But the diacony, or treasury of the reformed and established church of Amsterdam, is upon so good a footing, that they did not even in that year, want the aid of the magistrate; they distributed 578,758 gilders, but their income is about 500,000.

The Romish, Lutheran, and other diaconies, are directed in the same manner as those of the established religion, and distributed to about 500, and may keep in houses 6 or 700 old people and children in Amsterdam: the established church to about 1000 or 1200 poor families, besides their three almshouses, where are about 1300 old people and children.

REMARKS.

There are other hospitals and poor-houses, besides these three, of which the great one, that takes in beggars children of all persuasions and foundlings, has about 1500 children. The poor are here, not only free of all excises, but they have an allowance paid of some branches of the excise, and a third part of all fines in criminal cases, computed, goes to the poor-houses, of which there are two sorts where poor children are maintained; one goes by the name of the orphan-house, the other of the poor-house; the former is filled with children of a BETTER RANK than the other, with the children of decayed SHOPKEEPERS, and those who have LIVED WELL, and the latter with those of the LOWEST SORT OF PEOPLE. When a child is taken into either of these houses, the governors possess themselves of whatever little effects they have for the use of the house.

These children are extremely well taken care of; they have masters and mistresses, to teach them reading, writing, and accounts, and the girls plain needle-work. When they are fit to go out, they are put to masters and mistresses by the day to LEARN TRADES, and they come back to these houses to dinner, and in the evening; what they gain during this time, in the poor-house, belongs to the house; but in the orphan-house, the children are allowed a FOURTH OR A FIFTH PART of what they gain for themselves.

When they come to be upwards of 20 years of age, and are able to gain their living, the house CLOATHS THEM WELL, and TURNS THEM OUT; in the orphan-house they return likewise the value of the capital brought in with them, but the interest falls to the house: there are, however, some who, on account of defects in their understanding, or other reasons, are maintained in the house all their days.

These houses have been some of them pious foundations of private persons; some of them have been built or bought by the towns, and afterwards supported from pious legacies and charities, by which some of them are become rich.

6 N

The

The public old mens and womens house in Amsterdam, was founded by the profits of two LOTTERIES, about the year 1600, and is supported by some donations, and by periodical collections, in the old-church, and by one third of the profits of the PLAY-HOUSE, which is from 12 to 15,000 guilders a year; the other two thirds go to the support of the burghers orphan-house.

The direction of these houses is always in the BEST PEOPLE OF THE COUNTRY, and it is esteemed an HONOUR, as well as a PIOUS OFFICE, to assist in looking after them. Thus ladies of the FIRST QUALITY have gone, once in three weeks, or oftener, to see that things are well administered, to examine the childrens linen, cloathing, nourishment, &c. &c. and to inspect the expence and accounts.

As to the Rasf, and Verbetering, or correction-houses for rogues, and those who being able will not work, these are maintained by the respective towns, generally at a small expence, there being a good deal of PROFIT MADE OF THE WORK THAT IS DONE IN THEM: they set the offenders reasonable tasks, and when those are well done, they allow them certain hours TO WORK FOR THEMSELVES: a few years ago the workhouse at Breda cost the burghers a TRIFLE, AND MADE VERY FINE MANUFACTURES: the master, who was put in there, had been a broken CLOTHIER at Leyden, but who, tho' become a bankrupt by misfortunes, understood his business well, and instructed numbers of people in the workhouse to make good cloths, by setting them first to comb wool, and so bringing them by degrees to more difficult branches.

The yearly expence of the Rasf-house at Rotterdam, is from 8 to 10,000 guilders, of which generally about 5 or 6 accrues from the labour of the people, and the remainder is supplied by the magistrates out of the surplus of some of their taxes. There is a kind of Bridewell (called the Vrywillige Rasf-huys) at Amsterdam, which is partly maintained BY AN ADDITIONAL TAX ON ALL THE GIN-SHOPS, PETTY HOUSES FOR SELLING WINE AND BEER, AND LITTLE TOBACCO-SHOPS.

The people in the Rasf-house are employed in two kinds of labour, CHIPPING AND RASPING LOGWOOD: a chipper must chip 3600 pounds in 14 days, Sundays included, for which the house is paid at the rate of 5 stivers per pound. A rasper must rasp 300 pounds nett in 12 working days, and the house is paid for it 30 stivers per 100 pounds. When they perform more than their ALLOTTED TASK, TWO-THIRDS go to themselves. The women are employed in a great many different branches, and contribute in proportion as much towards the GENERAL EXPENCE AS THE MEN.

By more or less allowance of MEAT AND DRINK, as well as by the quality of it, the GOOD ARE ENCOURAGED, and the bad BROUGHT TO REASON: to those who are remarkably obstinate, they use such severity as soon reduces them to order, but it cannot be enough repeated, that the grand secret of reducing ALL ROGUES TO TEMPER AND REASON, is by DIET more than by any other correction; and I am perswaded, if this was ONCE TRIED STEADILY IN ENGLAND, IT WOULD PREVENT ROBBERIES, &c. &c. more than any other method of severity.

In the villages, or open country where there are no HOUSES OF CORRECTION, offenders are sent to the towns who have them, and so much is allowed by those who send them to the towns for their maintenance; and their poor children are taught and taken care of in the villages, by persons appointed by the magistrates of the place.

In general, the administration of the poor here is excellent, tho' their discipline, with regard to foreign beggars, is much relaxed; but there being many CHECKS UPON THE ACCOUNTS OF ALL THEIR CHARITIES, it is difficult to attempt, and rare to hear of any fraud in the RECEIPT OR DISPOSITION OF THEM: the provision of the 16th article of the emperor Charles the Vth's law, enjoining the making up the accounts PUBLICLY, is, perhaps, alone sufficient to guard the poor-money from any notorious mal-administration.

These, Sir, are the informations I proposed to give you relative to the poor of this country, their conduct with regard to them having been often cited as a pattern worthy imitation.

GENERAL REMARKS on the article of POOR.

Let us cast our eyes on the multitude of unfortunate people in this kingdom of reputable families, and of liberal, or at least easy education: some undone by guardians, some by law-suits, some by accidents in commerce, some by stocks and bubbles, and some by suretiship. But all agree in this one circumstance, that they must either be burthen some to their relations, or betake themselves to little shifts for sustenance, which (it is ten to one) do not answer their purposes, and to which a well-educated mind defends with the utmost constraint.

What various misfortunes may reduce the rich, the industrious, to the danger of a prison, to a moral certainty of starving! These are the people that may relieve themselves, and strengthen our plantations, [see COLONIES and PLANTATIONS] by resorting thither, and Great-Britain by their departure. I appeal to the recollection of the reader (though he

be opulent, though he be noble) does not his own sphere of acquaintance? (I may venture to ask) Does not even his own blood, his set of near relations, furnish him with some instances of such persons as have been here described? Must they starve? What honest mind can bare to think it? Must they be fed by the contributions of others? Certainly they must, rather than be suffered to perish. Are these wealth to the nation? Are they not a burthen to themselves, a burthen to their kindred and acquaintance, a burthen to the whole community?

I have heard it said (and it is easy to say so) let them learn to work; let them subdue their pride and descend to mean employments, keep ale-houses or coffee-houses, even sell fruit, or clean shoes for an honest livelihood. But alas! these occupations, and many more like them, are overstocked already by people who know better how to follow them, than they do whom we have been talking of. Half of those who are bred in low life, and well versed in such shifts and expedients, find but a very narrow maintenance by them. As for labouring, I could almost wish that the gentleman or merchant, who thinks that another gentleman or merchant in want, can thresh or dig, to the value of subsistence for his family, or even for himself: I say, I could wish the person who thinks so, were obliged to make trial of it for a week, or (not to be too severe) for only a day: he would find himself to be less than the fourth part of a labourer, and that the fourth part of a labourer's wages could not maintain him.

I have heard it said, that a man may learn to labour by practice; it is admitted: but it must also be admitted, that before he can learn, he may starve. Suppose a gentleman was this day to begin, and with grievous toil found himself able to earn three pence, how many days or months are necessary to form him, that he may deserve a shilling per diem? Men, whose wants are importunate, must try such expedients as will give immediate relief. It is too late for them to begin to learn a trade, when their pressing necessities call for the exercise of it.

Having thus described (I fear, too truly) the pitiable condition of the better sort of the indigent, an objection arises against their removal, upon what is stated of their imbecility for drudgery. It may be asked, if they can't get bread here for their labour, how will their condition be mended in our plantations? The answer is easy, part of it is well attested, and part self-evident. They have land there for nothing, and that land is so fertile, that they receive an hundred fold increase for taking very little pains. Give here in England ten acres of good land to one of those helpless persons, and I doubt not his ability to make it sustain him, and this by his own culture, without letting it to another: but the difference between no rent and rack-rent, is the difference between eating and starving. See the article MANURE.

If I make but 20l. of the produce of a field, and am to pay 20l. rent for it, it is plain I must perish if I have not another fund to support me: but if I pay no rent, the produce of that field will supply the mere necessities of life.

Besides the persons before described, there are others whom it may be proper to send abroad, for reason will also shew at whole expence these other sorts of indigent people ought to be removed. I think it may be laid down for a rule, that we may well spare all those, who having neither income nor industry equal to their necessities, are forced to live upon the fortunes or labours of others; and that they who now are a heavy RENT-CHARGE UPON THE PUBLIC, may be made an IMMENSE REVENUE TO IT, and this by a happy exchange of their poverty for an affluence.

Believing it will be granted that the people before described ought in prudence to go abroad, or have land given them to cultivate at home, and that we are bound in humanity and charity to send them, there arises a question, Whether our aiding their departure be consistent with good policy? I raise this objection on purpose to answer it, because some who mean very well to the public have fancied, that our numbers absolutely taken, WITHOUT A DISTINCTION, ARE REAL WEALTH TO A NATION. Upon a little examination, this will appear to be a mistaken notion. It arises from a misapplication of Sir William Petty's Political Arithmetic, and of Sir William Temple's Observations on the United Netherlands. But when these great men esteem people as the wealth of a nation, surely they can only mean such as labour, and by their industry add yearly to the capital stock of their country, at the same time that they provide the necessities or comforts of life for themselves.

Perhaps the Rasf-houses may be reckoned part of the riches of Holland, because the drones are made to work in them: but is an infirmity of incurable wealth to a community? Or (which is worse, because it is remediable and is not remedied) are hundreds of prisons filled with thousands of English debtors, and are they a glory or a reproach, a benefit or a burthen to the nation? Who can be so absurd as to say, that we should be enriched by the importation of a multitude of cripples, who might not be able, perhaps, to earn a fourth part of what is necessary to sustain them?

If ten thousand of these would be an addition to our wealth, ten millions of them must add a thousand times as much to it. Did the fire of London add to the wealth of the nation? I am sure it gave abundance of employment to the poor, just as people are employed in trade to feed and cloath the inhabitants of prisons. But these are also a slow fire, an hectic fever to consume the vitals of the state.

The true state of national wealth is like that of private wealth, it is comparative. The nation, as well as individuals, must work to save and not to spend. If I work hard all day, and at night give my wages to the next cripple I see, however good it may be judged of in a religious sense, my worldly fortune is in the same condition as if I had stood idle. If the produce of the nation be in moveables, land, and labour, fifty millions in a year, and only forty-eight millions are expended to maintain the people, then has the nation added two millions to its capital: but if it spends fifty-one millions, then is that to be made good by sinking part of the personal estate, or mortgaging the real. And upon a par, plus a million, and minus a million in earning and expences, will operate nothing towards increasing the national wealth: if you proceed in infinitum, it is only impoverishing the RICH TO MAINTAIN THE POOR: it seems, indeed, to have something of levelling in it; to prevent which, I think our men of fortune would act wisely once for all, to put these poor people on a footing of their own, and shake off the perpetual incumbrance by a single act of prudent beneficence.

Some would have Scotland, Ireland, and Wales, sunk under water, but all the people saved and settled in England. Such certainly deceive themselves with a view of the artificial strength of the Dutch, when their fishery was at the highest pitch, and when they were carriers for mankind.

But they have not been able to preserve these branches of trade entire, and their numbers must decrease as do the means of maintaining them *. Therefore, instead of taking it for granted, that numbers of people necessarily create a traffic, we may invert the proposition, and safely hold, that an extensive traffic will infallibly be attended with sufficient numbers of people.

* To illustrate the doctrine laid down in this sentence, take the following part of a description of a neighbouring country by a celebrated author, I met in my day's journey nine cars loaden with old musty shrivelled hides, one car-load of butter, one cow and calf driven by a man and his wife. A colony of one hundred and fifty beggars, all repairing to people our metropolis, and by increasing the number of hands, to increase its wealth: upon the old maxim, That people are the riches of a nation. And, therefore, one thousand mouths with hardly ten pair of hands, or any work to employ them, will infallibly make us a rich and flourishing people. Secondly, Travellers enough, but seven in ten wanting shirts and cravats; nine in ten going barefoot and carrying their brogues and stockings in their hands. One woman in twenty having a pillion, the rest riding bare-backed. Above two hundred horsemen, with four pair of boots amongst them all; seventeen saddles of leather (the rest being made of straw) and most of their garranes only shod before. I went into one of the principal farmer's houses out of curiosity, and his whole furniture consisted of two blocks for stools, a bench on each side the fire-place made of turf, six trenchers, one bowl, a pot, six horn-spoons, three noggins, three blankets (one of which served the man and maid-servant, the other two, the master of the family, his wife and five children) a small churn, a wooden candlestick, a broken stick for a pair of tongs. In the public towns, one third of the inhabitants walking the streets barefoot, &c.

And yet these unhappy people, who are not able to earn above a fourth part of their subsistence at home, and as we have shewn, are a load on the fortunes and industry of others, may in several of our plantations, or by cultivating more land in Great-Britain and Ireland, provide by their labour a decent maintenance, and at the same time enrich their mother-country. See the article MANURE.

Upon what has been said, the reader may be desirous to see a state of the difference (with respect to the interests of the industrious and wealthy part of the nation) between a poor person here, earning but half HIS SUSTENANCE, and the same person settled in a freehold, of a FERTILE SOIL, WITHOUT TYTHES OR TAXES; and in this computation, let us remember, that of the many thousands of poor debtors who fill our prisons, few earn any thing at present; and our colonies are chiefly intended for the UNFORTUNATE, there being no danger of the departure of such as are able to maintain themselves here.

A man who is equal in ability only to the fourth part of a labourer (and many such there are) we will suppose to earn four pence per diem, or five pounds per annum in London; his wife and a child of above seven years old, four pence per diem more: upon a fair supposition (because it is the common case) he has another child too young to earn any thing. These live but wretchedly, at an expence of twenty pounds per annum. To defray which, they earn ten pounds; so that they are a loss to the rich and industrious part of the nation of ten pounds per annum; for there are but three general methods of

supplying the defect of their ability. Whatever they consume more than they earn, must be furnished, first, either by the bounty or charity of others; or, secondly, by frauds, as by running in debt to the ruin of the industrious, &c. or, thirdly, by what our law calls force and felony, as theft and robbery, &c. They must be supplied at some of these rates; therefore, as observed, this family is a loss to the rich and industrious of ten pounds per annum.

REMARKS on the article P O O R.

Since the drawing up the foregoing, I have been informed by a gentleman of great honour and veracity, resident at Ipswich in Suffolk, that their poor there are so wisely managed, as to maintain themselves; which example, if it could be happily reduced to practice as successfully in all other parts of Great Britain, would prove an extraordinary saving to the kingdom: certain it is, that to obtain such easement from the poor rate, and at the same time to add thousands upon thousands of industrious subjects to the community, who are at present a dead weight upon it, well deserves the efforts of every public-spirited man in his parish: and if once we had a few more examples evidencing the practicability of the Ipswich one, it would animate other parishes to imitate it, whereby the same might become universal throughout the nation. The employment of a million of hands, perhaps, amongst the poor, would have a tendency to lower the price of labour in general, and consequently fall the prices of our commodities and manufactures, which is so much wanted at this crisis. See our articles DUTIES, LABOUR, TAXES, WAR, and such other, to which from them we refer.

PORCELAIN, or PURCELAIN, a fine kind of earthen ware made in China, and therefore also called China, or China-ware; but brought into Europe from other parts of the east, as Japan, Siam, Surat, and Persia.

The annals of the city of Feou-lean relate, that since the year 442, the workers in porcelain have always supplied the emperors with it: and that one or two mandarines, sent from the court, had the care of that work. It is, however, probable, that before the year 442, this ware was in use, and that it has been gradually brought to its present perfection. The fine porcelain, which is of a bright and lively white, and of a beautiful sky blue, is all brought from King-te-ching.

There is porcelain made in other parts, but it is very different from this both in colour and fineness. The emperors have brought to Pekin workers in porcelain, and all the materials employed in making it, but their work never succeeded. King-te-ching alone, has the honour of sending porcelain to all the parts of the world. The Japonese come to buy it at China.

The matter of which it is made, is composed of two kinds of earth; one of which is called petunse, and the other kaolin. This last is intermixed with coruscules, which have a kind of splendor, but the other is simply white, and very fine to the touch. At the same time that great numbers of large barques ascend the river of Jao-tcheou to King-te-ching, to be loaded with porcelain, almost as many small ones descend from Kimuen, loaded with petunse and kaolin, reduced to the form of bricks, for King-te-ching produces none of the materials proper for the porcelain.

The petunses, whose grain is so fine, are nothing else but pieces of rocks dug out of quarries, and moulded into this form. All stones are not proper for this purpose, otherwise it would not be necessary to go twenty or thirty leagues, into the other provinces for it.

The Chinese say, that the stone ought to be of a greenish colour. The first step of the preparation is this; they break these pieces of stone with a large bar of iron, after which they put the broken pieces into mortars, and with pestles which have heads of stone covered with iron, they reduce them to a very fine powder. These pestles play continually, either by the labour of men or by water, as the hammers of our paper-mills do. After this they throw the powder into a large urn full of water, and stir it briskly about with an iron pestle. When they allow it to rest some minutes, a kind of cream four or five fingers breadth thick, floats on the surface. This they take off, and pour it into another vessel full of water. Thus they several times agitate the water of the first urn, gathering the cream each time, 'till there remains none but the grosser parts, which subside to the bottom. These are taken out and pounded afresh.

With respect to the second urn, into which they throw what they had collected from the first, they wait 'till a kind of paste is formed at the bottom of it. When the water above this paste appears very clear, they pour it off by inclination, that they may not disturb the sediment, and they throw this paste into large moulds proper to dry it. Before it is quite hard, they divide it into small square pieces, which are sold by the hundred. This figure and its colour have made it get the name of petunse.

The moulds into which this paste is thrown, are a kind of very large and broad cales. The bottom is filled with bricks laid end-ways, so as to make the surface equal. Over this bed

bed of bricks thus ranged, they spread a cloth, as large as the cavity of the mould. Then they pour in the matter, which they cover with another cloth, over which they place a bed of bricks laid flat on each other.

This is done in order to force out the water the sooner, without losing any thing of the matter of the porcelain; which by becoming hard, easily receives the form of bricks. There would be nothing to be added to this labour, if the Chinese were not accustomed to alter their merchandize; but people who roll small grains of paste in pepper, in order to cover them with it, and mix them with genuine pepper, do not care to sell petunse without mixing some sediments with it; for which reason, they are obliged to purify them at King-te-tching, before they make use of them.

The kaolin, which enters the composition of the porcelain, gives less trouble than the petunse, nature having a greater hand in producing it. There are mines of it in the bosom of certain mountains, which are covered eternally with a reddish earth. These mines are pretty deep, and contain the kaolin in lumps, which they cut into squares, in the manner with the petunse. The white earth of Matta, commonly called St Paul's earth, has a great resemblance to the kaolin, though the former has not the little silver grains with which the latter is interperfed.

It is from the kaolin, that the fine porcelain derives all its strength. Thus it is the mixture of a soft earth which gives strength to the petunses, which are taken from the hardest rocks. Some English and Dutch bought some petunse and brought it into their own countries to make porcelain, but their enterprize failed, because they had no kaolin.

Besides the barques loaded with petunse and kaolin, with which the skirts of King-te-tching are covered, we see others full of a whitish liquid substance, and this is the oil which gives the porcelain its whiteness and lustre. This oil or varnish is drawn from the hardest stone, which is not surprising, since it is thought that stones are principally formed of the salts and oils of the earth, which mix and are intimately united with each other. Though the species of stone of which the petunses are made, may be indifferently used to obtain the oil, yet they generally chuse that which is whitest, and has the greenest spots.

Though the History of Feou-learn does not descend into a detail, yet it says, that the good stone for the oil, is that which has spots of a colour of a cypress-leaf, or which has red marks on a brownish ground. This stone must be first well washed, after which it undergoes the same preparations with the petunse. When they have in the second urn the hardest parts they could take from the first, they throw a pound of stone or mineral like allum, upon a hundred pounds or thereabouts of this cream. It must be made red by the fire, and afterwards pounded. This is, as it were, the pressure which gives it consistency, though they take care to keep it always liquid.

This oil of stone is never employed alone. They mix another with it, which is, as it were, the soul of it. The composition is as follows: they take large pieces of quick lime, on which they throw a little water to dissolve and reduce them to pieces. Then they make a bed of dry fern, over which they lay another of slacked lime, of these they put several alternately over each other. After this they set fire to the fern. When the whole is consumed, they spread these ashes on new beds of dry fern.

This is done five or six times, and the oftener they do it the oil is the better. Formerly, says the History of Feou-learn, they used besides the wood of a tree, whose fruit is called se-tse.

If we judge of this tree by the sourness of the fruit before it is ripe, and by its small top, we should take it to be a kind of medlar.

It is no longer used at present, probably because it is become too scarce in that country. Perhaps it is for want of this wood, that the present porcelain is not so beautiful as that of former times: the nature of the quick lime and fern contributed to the goodness of the oil; and it is observable, that what is brought from some parts, is better than what comes from others.

When they have a certain quantity of the ashes of quick lime and fern, they throw them into an urn full of water. Upon an hundred pounds they must dissolve one pound of ke-kaos, stir the mixture well, and allow it to rest, 'till there appears on the surface a cloud of cruff, which they take off, and put into a second urn. This they repeat several times. When a kind of paste is formed at the bottom of the second urn, they pour off the water by inclination, and keep this liquid paste, which is the second oil, to be mixed with the former; for a just mixture of these two depurated oils, they must be equally thick. In order to judge of this, they several times plunge into each of them pieces of petunse, by taking which out, they see upon their surface whether they are equally thick.

This is what relates to the quality of those two oils. As for the quantity, the best way is to mix ten measures of the oil of stone, with one measure of the oil of quick lime and fern. They who are most sparing, never put less than three mea-

asures. If the merchants who sell this oil, have the least inclination to cheat, they can easily augment it's bulk by throwing water into it, and adding a proportional quantity of ke-kaos, to cover this fraud and hinder the oil from being too liquid.

Before I explain the manner of applying this oil, or rather varnish, I shall describe how the porcelain is made. We shall first begin with the work performed in the least frequented parts of King-te-tching. There is an inclosure of walls, within which they build vast piles, one story above another, of a prodigious number of earthen urns. In this inclosure live and work an incredible number of labourers, each of whom has his task set him. Before a piece of porcelain is taken out of this to be carried to the furnace, it passes through more than twenty hands, and that without confusion. They have no doubt found, that by this means the work is much more quickly carried on.

The first labour consists in purifying again the petunse and the kaolin, from the dregs which remain in them when they are sold. They bruise the petunse, and throw it into an urn full of water. Then they dissolve it, by stirring it about with a large spatula. They let it rest some moments, and take off what swims on the surface, and so of the rest, in the manner above explained.

As for the pieces of kaolin, it is not necessary to break them. They only put them into a basket, which they immerse into an urn full of water. The kaolin is easily dissolved of itself; there generally remains a sediment, which must be thrown away. In a year's time the dregs are accumulated, and form great heaps of white sand separated from the kaolin. Thus prepared, there must be a just mixture of them. For fine porcelain, they put in as much kaolin as petunse; for ordinary, they put four parts of kaolin to six of petunse. The least they ever put, are five parts of kaolin to three of petunse.

After this first operation they throw this mass into a large cavity, well paved and cemented every where. Then they tread upon it and knead it 'till it becomes thick.

From this mass thus prepared, they take different pieces, which they extend upon large slates. On these they knead and form them into different shapes, taking care that there be no flaws therein, nor no mixtures of extraneous bodies; for a hair, or a grain of sand, would spoil the whole work; for want of rightly managing this mass, the porcelain splits, cracks, and warps. It is from these first elements, that we have so many beautiful works of porcelain, some of which are made on the wheel, others are only made upon moulds, and afterwards perfected by the chissel.

All the plain or smooth works are in the former manner. A cup, for example, when it comes off the wheel, is no more than a kind of imperfect cavity, almost like the crown of a hat before it is formed on the block. The workman first gives it the diameter and height he wants, and it comes out of his hands almost as soon as he has begun; for he has only three farthings English money for a shell, and every shell contains twenty-six pieces. The foot of the cup is at that time only a piece of earth of the bulk and diameter which it ought to be of, and which is hollowed out with the chissel when the cup is dry, and has acquired consistency; that is, after it has received all its ornaments.

This cup on coming from the wheel, is first received by another workman, who places it upon its bottom. A little after it is given to a third, who applies it to its mould, and gives it the same figure: this mould is a kind of turning-wheel.

A fourth polishes this cup with the chissel, especially near the lips, to render it thin and transparent. He scrapes it several times, moistening it a little with water, if it is too dry, lest it should break. When the cup is taken off the mould, it must be rolled gently on the same mould, without pressing more on one side than another; without which there will either be flaws in it, or it will warp. It is surprising to see with what speed and dexterity one of these cups passes through so many different hands. Some say, that a piece of porcelain has passed through the hands of seventy workmen.

The large pieces of porcelain are made at two different times. One half is raised on the wheel by three or four men, who support it, each on the side next to him, to give it its figure. The other half being almost dry, is applied and united to it, by the matter of the porcelain, diluted in water, which serves as a kind of mortar or cement. When these pieces thus united are entirely dry, they with a knife, scrape the internal and external sides of the part where the union was, which, by means of the varnish with which they cover it, becomes equal to the rest.

It is in this manner, that they apply handles, ears, and other ornaments to vessels. This principally regards the porcelain made upon moulds or by the hands, such as ribbed pieces, or such as are of a whimsical figure; such as animals, idols, or busts, which the Europeans bespeak, or other things of a similar nature. These kinds of moulded works are made in three or four pieces, which they join to each other, and afterwards perfect with instruments proper to hollow, polish, and repair the different parts, which had escaped the mould.

As for their flowers, and other ornaments, which are not raised, but, as it were engraved, they are applied to the porcelain with seals and moulds. They also apply raised work prepared almost in the same manner, that gold lace is sewed on a coat.

When they have the model of the piece of porcelain which is wanted, and which cannot be imitated on the wheel by the hands of the workmen, they apply over the model, earth proper for the moulds. This earth receives the impression, and the mould is made of several pieces, each of which is pretty large. They suffer the mould to become hard, when the figure is imprinted on it. When they want to use it, they place it near the fire for some time; after which they fill it with porcelain, in proportion to the thickness they want to give it: they press with their hands on all parts, and then for a moment, present the mould to the fire. The imprinted figure is forthwith detached from the mould by the action of the fire, which a little consumes the humidity that glued this matter to the mould. The different pieces of the whole drawn separately are afterwards re-united, with the somewhat liquid matter of the porcelain. In this manner they make figures of animals, which are all solid. They leave this mass to harden, give it the figure proposed, perfect it with the chisel, or add the parts formed separately. These kinds of works are made with great care and pains. When the work is finished, they lay on the varnish and bake it. Then if they please, they paint it of various colours and gild it. Afterwards they bake it a second time. Pieces of porcelain thus finished, are sold extremely dear. All these works ought to be defended from the cold; humidity makes them split, when they are not dried equally, for which reason they sometimes keep fires in these laboratories.

These moulds are made of a fat yellow earth, which is found in a place near King-te-tching. This earth is kneaded, and where it is united, and becomes a little hard, they take a quantity of it necessary for the mould, and beat it strongly; when they have given it the desired figure, they dry it, and form it on the wheel.

This kind of work is fold dear. In order speedily to answer a commission, they make a great quantity of moulds, that a vast number of labourers may be employed at once. If these moulds are taken care of, they last a long time. A merchant who has them ready for the porcelain-works, bespoke by an European, may sell his commodity better, and make a much more considerable gain than another who should have them to make. If these moulds should happen to crack, or have their surfaces splintered, they are no longer of any service, except for porcelain of the same figure, but of a smaller size. In this case, they put them on the wheel and smooth them, that they may serve a second time.

They often embellish their porcelain, by making it pass through the hands of painters, who are not much richer than the other workmen. At this we need not be astonished, since, except a few of them, they would only pass in Europe for apprentices, who had been some months at the business. The whole science of these, and of the Chinese painters in general, is founded upon no principles, and only consists in following a certain beaten track, assisted with a narrow and confined imagination; they are ignorant of all the beautiful rules of this art: we must, however, confess that they paint flowers, animals, and landscapes, which are admired on the porcelain, as well as on screens, and the window blinds of fine gauze.

The painting is divided in the same laboratory among a great number of hands. One only forms the first coloured circle near the edges of the china; the other traces the flowers, which a third paints; one is for rivers and mountains, another for birds, and another for animals; human figures are generally most mangled by them. Certain landscapes and plans of cities illuminated, carried from Europe to China, afford us the liberty of laughing at the Chinese method of painting. As for the colours of the Chinese painting, they are of all sorts; the most common in Europe is of lively blue, on a white ground; there are some in which this ground resembles that of a burning-glass: some are entirely red, and among those some are coloured in oil, while others are of a blown red, and intermixed with small points, almost like our water-colours. When these two works succeed to their perfection, which they rarely do, they are accounted extremely valuable, and are sold at a great price.

There is some porcelain in which the landscapes are formed of a mixture of almost all sorts of colours, heightened by the gilding: these are very beautiful, when of the right kind, but the ordinary porcelain of this sort is not comparable to that painted with azure alone.

The annals of King-te-tchin say, that formerly the meaner people only used white porcelain; this probably happened because they had not in the neighbourhood of Joa-tcheou, found a less valuable azure than that used for the finest porcelain, which is brought far, and fold dear.

It is said that a merchant who dealt in porcelain being shipwrecked on a desert coast, found there much greater riches than he had lost: as he wandered on the coast, while the crew were building a small barque of the wrecks of the ship,

he perceived that the stones proper for the most beautiful azure were very common there. He brought a large cargo with him; and it is said that, by that means, there was never so beautiful an azure seen at King-te-tchin. The Chinese merchant in vain attempted to find that coast again, on which he had been thrown by chance. The azure is prepared in the following manner: they bury it in gravel, which is about half a foot high in the furnace; here they bake it 24 hours; then they reduce it to an impalpable powder, as well as the other colours, not upon marble, but in large porcelain mortars, whose bottoms are without varnish, as well as the pestles employed to pound it.

The red colour is produced with copperas: they put a pound of copperas in a crucible, which they lute with another crucible, in the superior end of which is a second aperture, which is covered in such a manner, that it may be easily uncovered, if necessity requires. They surround the whole with a large charcoal fire, and, that they may have the stronger reverberation of the heat, they enclose the whole with bricks. So long as the smoke rises very black, the matter is not duly prepared; but as soon as a small cloud, fine and subtle arises, it is sufficiently done. Then they take a little of this matter, dilute it in water, and make a trial of it upon a piece of board; if a beautiful red is produced by it, they remove the fire which surrounds it, and in part covers the crucible; when the whole is cold, they find a small cake of this red at the bottom of the crucible, but the best red adheres to the superior part of it. A pound of copperas yields four ounces of the red with which they paint the porcelain.

Though the porcelain is naturally white, and rendered still more so by the varnish, yet there are certain figures for which they apply a particular white upon the porcelain, which is painted of several colours. This white is made of the powder of transparent flints, which is calcined in the furnace, in the same manner as the azure. To half an ounce of this powder they add an ounce of cerufs pulverized. For example, to make the green, to one ounce of cerufs, and half an ounce of the powder of flints, they add three ounces of what they call tom-hoa-prien, which, according to all appearances, are the finest scoriae of copper reduced to powder.

The prepared green becomes the matter of the violet, which is made by adding a proper quantity of white: they add more of the prepared green in proportion, as they want the violet more deep. The yellow is made by taking seven drachms of prepared white, to which they add three drachms of copperas. All the colours laid upon the porcelain already baked, after they are varnished, do not appear green, violet, red, or yellow, till they are baked a second time. These different colours are applied with cerufs, salt-petre, and copperas; some say that they only employ cerufs, which is mixed with the colour, when they dissolve it in gum water.

The red colour in oil is produced by mixing the red tom-lon-hum, or even the red I have mentioned, with the ordinary oil of porcelain, and another oil made of white flints, in the same manner with the first species of oil: several trials discover the particular quantity of each to be used; then they leave the porcelain to dry, and bake it in the ordinary furnace: if, after the baking, the red comes out pure and sparkling, without the least stain, they have attained then to the perfection of the art. These kinds of porcelains do not found when they are struck. The other species of blown red is made thus: they have the red prepared; they take a pipe, of which the apertures are covered with fine gauze; they gently apply the lower end of the pipe to the colour laid on the gauze, after which they blow into the pipe against the porcelain, which is, by that means, beautified with red spots. This sort of porcelain is still dearer and rarer than the preceding, because the production of it is more difficult, if the workman observes all the requisite proportion.

The black porcelain has also its beauty and value: it is called oumien. The black is leaded, and resembles that of our burning-glasses; the gold laid upon it renders it still more agreeable. They give this black colour to the porcelain when it is dry; and, for this purpose, they mix an ounce of azure with seven ounces of the ordinary oil of stone: trials exactly teach the proportion of this mixture, according to the deeper or fainter colour they intend to give to the porcelain. When this colour is dry, they bake the porcelain, after which they lay on the gold, and bake it again in a particular furnace.

There is also a kind of porcelain made, which externally is all pierced, like pinking; in the middle is a cup proper to contain the liquor: the cup, however, is but one substance with the pinked work. There are other porcelains, on which the Chinese or Tartar ladies are painted to the life; the drapery, the complexion, and the features, are all preserved: at a distance these works are taken for enamel.

It is to be observed, that, when they lay no other oil on the porcelain than that of white flints, this porcelain is of a particular species, and is called t'ou-t'chi; it is all marbled and crossed in all directions, with an infinite number of veins. The colour which this oil gives is a white, somewhat cineritious. If the porcelain is all azured, and if they lay this oil on it, it will appear both cut and marbled when the colour is dry.

When they apply the gold they pound it, and dissolve it in the bottom of a porcelain vessel, 'till they see under the water, a small canopy of gold. They suffer it to dry, and, when, they want to use it, they dissolve a sufficient quantity of it in gum-water. With thirty parts of gold they incorporate three parts of cerufs, and lay it on the porcelain in the same manner with the other colours.

There is also a species of porcelain made in the following manner: they give it the ordinary varnish, and bake it again; they sometimes designedly delay the painting 'till after the first baking; sometimes, also, they have recourse to the second baking, to conceal the faults of the porcelain, by applying colours to the defective places. This porcelain, which is full of colouring, is agreeable to the taste of a great many people. It generally happens that we feel inequalities on this sort of porcelain, and these have been necessary either to supply the shades of the painting, or cover the defect of the porcelain.

When the painting is dry, as well as the gilding, if there is any, they make piles of the porcelain, and putting the small into the large vessels, place them in the furnace.

These furnaces may be of iron, when they are small, but generally they are of earth. Some of them are as high as a man, and almost as wide as one of our largest hogheads for wine. They are made of several pieces, of the same matter with the cafes for the porcelain; they are large pieces, about an inch thick, a foot high, and a foot and a half long.

Before they bake them, they give them a figure proper for becoming round; they are placed over each other, and well cemented. The bottom of the furnace is raised about a foot and a half above the ground, and placed upon two or three rows of thick, but not very broad bricks. Round the furnace is a well-built inclosure of bricks, which at its bottom has two or three air-holes, which serve as bellows to the fire. This inclosure is a foot and a half distance from the furnace, except in three or four places, which are filled up, and serve as supports to the furnace; they, at the same time, remove the furnace and the inclosure, without which the furnace cannot stand. They fill the furnace with the porcelain they want to bake a second time, piling the small into a large vessel; when this is done, they cover the mouth of the furnace with pieces like those of which its sides are built. These pieces, whose edges are laid over each other, are closely united with mortar, or a kneaded earth fit for that purpose. They only leave an aperture in the middle, in order to observe when the porcelain is baked. They afterwards kindle a quantity of coals under the furnace; they also kindle coals on the covering, whence they throw the ashes into the spaces between the inclosure of bricks and the furnace. The aperture at the top of the furnace is covered with a piece of a broken pot. When the fire is burning, they now and then look through this aperture, and, when the porcelain appears to be shining, and painted with brisk and lively colours, they remove the fire, and take out the porcelain.

There may naturally arise a thought concerning the colours which are incorporated with porcelain already baked and varnished with cerufs, to which, according to the annals of Feouleam, they added salt-petre and copperas: if we employed cerufs in the colours with which we paint the squares of glass, and afterwards give them a second kind of baking, might not this cerufs restore to us the ancient secret of painting glass, without destroying any thing of its transparency? But this is only to be judged of by experience.

The Chinese had formerly the art of painting, on the sides of porcelain vessels, fishes, and other animals, which were only perceptible when the vessel was full of some liquor. They call this species *kia-hin*, that is, azure, is put in press on account of the manner in which the azure is laid on: this is all, that is retained of this secret; perhaps, in Europe, we may conjecture at what the Chinese are ignorant of. The porcelain to be painted thus ought to be very thin; when it is dry, we ought to apply a pretty faint colour, not externally, as is usual, but within on the sides. They paint fish, as most proper to appear when the cup is filled with water.

When the colour is once dry, they lay over it a slight bed of strong but fine glue, made of the same earth as porcelain; this bed incloses the azure between these two laminæ of earth. When the bed is dry they lay the varnish on the inside of the porcelain; some time after they put it on the mould and wheel. As it has received a body in the inside, they render it externally as slender as possible, without penetrating to the colour. Then we must put the outside of the porcelain into the varnish, and, when the whole is dry, they bake it in the common furnace. This labour is extremely nice, and requires a dexterity of which the Chinese are no longer masters; they are, however, every now and then trying to recover the art of this magical painting, but to no purpose.

Be this as it will, we may at present say, that the beautiful azure appears again upon the porcelain, after having disappeared for some time. When it is first applied, it is of a palish black colour; when it is dry, and has received the varnish, it is totally eclipsed, and the porcelain appears white; the colours are then buried under the varnish; the fire makes them blow, almost in the same manner as the natural heat brings

out the most beautiful butterflies, with all their variety of colours. It is to be observed, that, before the varnish is laid upon the porcelain, it is to be polished, and its irregularities removed: for this purpose, they use a pencil made of very fine feathers, which they moisten a little with water, and pass every where with a gentle hand.

Besides, there is great art in the manner of laying the varnish on the porcelain, both in putting on a sufficient quantity, and spreading it equally on all parts. To very thin and slender porcelain they give, at two different times, two slight beds of varnish, for, if these beds were too thick, the weak sides of the cup would not bear them, but bend immediately. These two beds are as good as an ordinary varnish, which they give the fine and strong china: they lay on the one by impression, and the other by immersion. At first they take the cup in one hand, on the outside, and holding it slopingly over the urn where the varnish is, they with the other throw as much into it as is sufficient to varnish it every where; this is done successively to a vast number of cups. When they are dry within, they varnish the outside in the following manner: they hold one hand on the cup, and supporting it with a small stick under the middle of its bottom, they plunge it into the vessel full of varnish, and immediately take it out; it is to be remembered, that the foot of the cup remains solid: in a word, it is not 'till it has received the varnish and becomes dry, that they put it upon the wheel to hollow the bottom; after which, they paint upon it a small circle, and often a Chinese letter. When this painting is dry, they varnish the cavity they have made under the cup, and this is the last hand put to it, since it is forthwith carried from the laboratory to the furnace to be baked.

The place where the furnaces are, presents us with another scene. In a kind of area, or entry, before each furnace, we see heaps of cafes, destined to contain the porcelain: every piece of porcelain, however coarse, as well those which have lids as those which have not, has its cafe. These lids are but weakly attached to the lower part in baking, and are easily disengaged by a small stroke which they give them. As for the small porcelain-ware, such as tea and chocolate-cups, they have a cafe common to many of them. The workman in this imitates nature, who, in order to concoct and maturate fruits, includes them under a common covering, that the heat of the sun may only penetrate them gradually, and that its internal action may not be too much interrupted by the external air, during the cold damps of the night.

These cafes have in the inside a kind of bed of sand, which is covered with the powder of coalin, that the sand may not adhere too much to the foot of the cup, which is placed upon this bed, after having pressed it, and given it the figure of the porcelain, which does not touch the sides of the cafe: the mouth of the cafe has no covering. A second cafe, of the figure of the first, furnished in like manner with porcelain, is so fitted into it, as to cover it intirely, without touching the porcelain below. In this manner they fill the furnace with large piles of earthen cafes, all furnished with porcelain. By means of those thick coverings, the beauty, and, if we may use the expression, the complexion of the porcelain, is not defaced by the fire.

With respect to the small pieces of porcelain, which are contained in large round cafes, each of which is placed upon a supporter of earth, about the thickness of two crowns, and as wide as its foot, the bottoms of these are also covered with the powder of coalin. When these cafes are large, they put no porcelain in the middle, because it would be too far from the sides, by which means, the cafe being destitute of due strength, would break and fall down, and endanger the whole pile. We must observe, that these cafes are the third of a foot in height, and some of them are not baked no more than the porcelain; however, they intirely fill those which have been already baked, and are still fit for use.

We must not forget the manner in which the porcelain is put into these cafes. The workman does not touch it immediately with his hands, for, by that means, he might either break it, or produce irregularities in it; he draws it from off the plate by means of a small cord; this cord is fixed at one end to two somewhat crooked branches of a fork of wood, which he takes in one hand, while with the other he holds the two ends of the cord, crossed and open, according to the bulk of the porcelain. In this manner he surrounds it, raises it gently, and places it on the small pedestal in the cafe. All this is done with incredible expedition.

We have already observed, that the bottom of the furnace is covered with a bed of gravel, a foot and a half thick; this gravel is designed for the more securely placing the piles of porcelain, whose rows, which are in the middle of the furnace, are at least seven feet high. The two cafes at the foot of each pile are empty, because the fire does not act sufficiently below, and because they are in some measure covered by the gravel: for the same reason, the cafe placed at the top of the pile is left empty. In this manner they fill the whole furnace, leaving no vacuity, except at the place which is immediately under the vent.

In the middle of the furnace they place the piles of the finest porcelain, at the bottom such as are coarser, and at the entry such as are of a deeper colour, which are composed of an equal quantity of petunse and kaolin, and on which they have laid a varnish made of the stone which has spots a little black or red, because that oil has a stronger body than the other. All these piles are placed very near each other, and united below, above, and at the middle, with some pieces of earth which they apply to them in such a manner, however, that the flame has a free passage to insinuate itself equally on all sides. This depends on the eye and dexterity of the workman, and is absolutely necessary to succeed in his attempt, and avoid certain accidents, nearly similar to those which arise from obstructions in the animal body.

All earths are not proper for the cases which contain the porcelain. There are three sorts used; the one is yellow, and very common; it is used in the greatest quantity, and constitutes the base. The other is called laotu, that is, a strong earth. The third, which is an oleous earth, is called yeou-tou. These two last earths are in the winter-time taken from very deep mines, where it is not possible to work during the summer: if they were mixed with equal quantities, which would cost a little more, the cases would last longer. They bring these earths ready prepared, from a large village at the foot of the river, about a league from King-te-tching. Before they are baked they are yellowish; but, when baked, they are of a dark red colour: as the workmen are very sparing, they put in most of the yellow earth, which is the reason why the cases do not last above two or three bakings, after which they split altogether; if they are but slightly split, they tie them round with a band of osiers: the band is burned, but the case serves for that time, without doing any harm to the porcelain. They must not fill a furnace with new cases, which have not been used before; the half of them must be such as have been baked before: these are placed at top and bottom; in the middle of the piles they place such as are new made. Formerly, according to the History of Feou-lem, all the cases were baked separately in a furnace, before they were used for baking the porcelain; no doubt, because at that time, they had less regard to the expence than to the perfection of the work: it is not so at present, because the workers in porcelain are multiplied to an incredible number.

We shall now consider the structure of the furnaces. They are placed at the bottom of a pretty long entry, which serves as a bellows to them, and is of the same use as the arch of a glass-founder's. The furnaces are, at present, larger than they were some years ago, since in former times, according to the Chinese books, they were only six feet in breadth and height; at present they are two fathoms high, and almost four fathoms broad. The arch as well as the body of the furnace, is pretty thick, that they may be able to walk upon it, without being incommoded by the fire. This arch, in the inside, is neither flat, nor formed into a point, but runs slanting, and grows narrower in proportion as it approaches the great vent, which is at the extremity, and through which the flames and smoke are discharged. Besides this vent, the furnace has in its top five small apertures, which are, as it were, the eyes of it; they cover them with some broken pots, in such a manner, however, that they assist the air and fire of the furnace; it is by these eyes that they judge whether the porcelain is baked enough: they uncover the eye which is a little before the great vent, and with iron tongs open one of the cases. The porcelain is enough baked when there is a clear fire in the furnace, and when all the cases are red-hot, and when the colours are bright and clear: then they discontinue the fire, and close up the door of the furnace for some time; the furnace having a deep fire all over it. They pass over a plank into the cavity of the furnace, in order to range the porcelain. When they have kindled the fire, they forthwith shut the door, leaving in it an aperture necessary to throw in pieces of wood a foot long, but very small. They first heat the furnace for a day and a night: then two men, who relieve each other, constantly throw wood into it; for one baking they generally burn four-score loads. To judge of this matter by what the Chinese book says, that quantity cannot be sufficient: in it we are assured that they burned 240 loads for this purpose, and 20 more if the weather was rainy, though at that time the furnaces were smaller by one half than those used at present. They at first kept up a gentle fire in them for seven days and seven nights, and on the eighth day made a very strong fire. It is to be observed, that at this time the cases of the small porcelain were baked apart, before they were put into the furnace; it must also be owned, that the ancient porcelain had more substance than the modern.

The old workers also observed one thing, which is neglected at present; when there was no more fire in the furnace, they did not open the door 'till after five days, for the small: at present, indeed, they delay opening the door, and taking out the large porcelain, for some days, for without this precaution they would split; but for the small, if the fire has been extinguished in the evening, they take them out the next day: the design is probably to spare wood for the next

baking. As the porcelain is excessively hot, the workman, in order to lay hold of it, uses long slings hung about his neck.

After having in one day burnt a hundred and four-score loads of wood in the entry of the furnace, it is surprising that the next day no ashes should be found. They who attend these furnaces must be well accustomed to the fire: it is said they put salt into their tea, that they may drink as much of it as they please, without being the worse; but it is not easy to comprehend how this salted liquor allays their thirst.

After what has been said, it is not surprising that porcelain should be so dear in Europe. It is also to be observed, that, besides the great gain of the European merchants, and that which their Chinese commissioners make of them, it is rare that a baking succeeds entirely, that often the whole is lost, and that, on opening the furnace, they find the porcelain and cases reduced to a mass as hard as a rock; and too great a fire, or ill-tempered cases, may destroy the whole; that it is not easy to regulate the fire which ought to be applied; that the nature of the weather instantaneously changes the action of the fire, the quality of the subject on which it acts, and that of the wood which supports it. Thus for one workman who becomes rich, there are an hundred others who ruin themselves, and tempt fortune, from the hopes they have of amassing wherewithal to set up a merchant's shop.

Besides, the porcelain transported into Europe is almost all made upon new models, which are often whimsical, and in which it is difficult to succeed; provided it has but the smallest fault, it is disliked by the Europeans, who will have nothing but what is perfect; for this reason, it remains in the hands of the workman, who cannot sell it to the Chinese, because it is not agreeable to their taste: it is, therefore, necessary, that the pieces sold should defray the expence of such as are rejected.

According to the History of King-te-tching, the gain formerly arising from porcelain was much greater than at present. This can hardly be believed, for there was not at that time so great a vent for porcelain in Europe. This happens because the living is at present dearer than before; because the wood in the neighbouring mountains being exhausted, they are obliged to bring it a great way, and at a vast expence, because the profit is divided among so many different persons; and lastly, because the workmen are less skillful than they were in former times, and consequently less certain in succeeding. This may also proceed from the avarice of the mandarins, who employing a great many workmen, make rich presents to their protectors at court, and pay the labourers ill, which are sufficient reasons why the merchandize should be dear, and the merchant poor.

The difficulty of imitating certain models sent from Europe, is one of the circumstances which augment the price of porcelain; for all the workmen cannot labour upon all the models sent from foreign countries: some of them are impossible to be imitated in China, just as some of their works surprize strangers, and are thought impossible to be done.

The following are some examples of this: we there see a large porcelain lanthorn, through which a flambeau enlightens a whole room. This work had been bespoke by the hereditary prince, who also bespoke several musical instruments, and, among the rest, a kind of small organ, called t-seng, which is near a foot high, and composed of fourteen pipes, whose melody is very agreeable. They succeed perfectly in flutes, flagelets, and another instrument called yun-lo, which is composed of several small, round, and somewhat concave plates, each of which has a particular sound; they suspend nine of them in a square, which corresponds to so many different stages, which are touched with sticks, like the drum: there is a small chime, which agrees with the sound of other instruments, and imitates voices. It is necessary, they say, to make a great many experiments, in order to discover the thickness, and the degree of baking proper for the tones necessary for harmony.

To return to such of the Chinese works as are curious. They succeed principally in grotesque pieces, and the figures of animals. The workmen make ducks and tortoises, which float upon the water; they make cats, painted in the natural manner, which upon their heads carry a small lamp, the flame whereof forms the two eyes of the animal; by this means the rats are frightened in the night-time. They also make a great many statues of Kouan-in, a goddess celebrated in China; they represent her holding an infant in her arms, and she is invoked by barren women who want to have children: she may be compared to the antique statues which we have of Venus and Diana, with this difference, that the statues of Kouan-in are very modest.

There is another kind of porcelain, the making of which is very difficult, and is, therefore, very uncommon. The body of this porcelain is extremely thin, and it's surface very even, both within and without; it has mouldings, however, in it, groups of flowers, for example, and other similar ornaments. It is made in the following manner: when it is taken off the wheel, they put on a mould, on which the figures are engraved, and these are imprinted on the inside; they render it as smooth and fine externally as possible, work-

ing it with the chissel, after which they varnish and bake it in the ordinary furnace.

The European merchants sometimes desire the Chinese workmen to give them plates of china for tables, the seats of chairs, or the frames of pictures; but these cannot be had: the largest and longest plates are about a foot square; if they are made larger, let them be as thick as they will, they warp. For this reason, instead of making these plates thick, they make them with two surfaces, which they unite, leaving the inside hollow: in the two sides they make two apertures, to enshafe them in joiner's works, or in the backs of chairs, where they make an agreeable appearance.

The History of King-te-tching speaks of several works ordered by the emperors, which they in vain attempted to make. The grandfather of this present emperor bespoke urns, almost of the same figure with those pots in which we put orange-trees; these urns he wanted to contain small red, gold, and silver-coloured fish, which are accounted curiosities. Perhaps he also intended to bathe in these vessels, for they were to have been three feet and a half diameter, and two feet and a half high; the bottom was to have been half a foot thick, and the sides a third of a foot in thickness. The workmen laboured three years successively at these vessels, and made two hundred, none of which succeeded. The same emperor ordered plates for the porch of an open gallery; every plate was to be three feet high, two feet and an half broad, and half a foot thick. All these things, say the Annals of King-te-tching, could not be made; for which reason the mandarins of that province petitioned the emperor to have the work discontinued.

As every profession has its idol, and as divinity is there as easily communicated as the quality of count and marquis in Europe, it is not surprising that there should be a god of porcelain. The Pouta, which is the name of this idol, owes its origin to these designs which the workmen cannot execute. It is said, that formerly an emperor would absolutely have porcelain upon a model which he gave. It was represented to him, that the thing was impossible; but all remonstrances only excited his curiosity.

As porcelain has been in great esteem for so many ages, perhaps the reader may want to know wherein that of former times differs from the present, and what the judgment of the Chinese is in this particular. It is not to be doubted but China has its antiquaries, who are prepossessed in favour of their ancient works. Though the Chinese are certainly admirers of antiquity, yet some of them stand up in defence of the modern works. But the porcelain does not, like old medals, give us an acquaintance with remote times.

The old porcelain may be adorned with some Chinese characters, which, however, denote no point of history; so that the curious find nothing in it but the taste and colours, to make them prefer it to that of the present days. It is said in Europe, that porcelain must be long buried in the earth before it arrives at its perfection. This is a false opinion, at which the Chinese laugh. The History of King-te-tching, speaking of the most beautiful porcelain of former times, says, that it was so much sought after, that the furnace was hardly opened, till the merchants were disputing with each other, who should have the first parcel. This by no means supposes that it was buried in the earth.

It is true, in digging in the ruins of old buildings, and especially in cleaning old wells, there are sometimes beautiful pieces of China found, which have been hid during revolutions in the state. This porcelain is beautiful, because the inhabitants only hid what was valuable, that they might find it again when the troubles were at an end. If it is esteemed, it is not because it has acquired any new degree of beauty in the earth, but because it has retained its ancient lustre; and this alone is of great importance in China, where they give large sums for the smallest vessels, which were used under the emperors Yan and Chun, who reigned many ages before the dynasty of Tang, at which time porcelain began to be used by the emperors. All that porcelain acquires by lying long in the earth, is some change in its colouring or complexion, which shews that it is old. The same happens to marbles and ivory, but more speedily; because the varnish hinders the moisture from insinuating itself so easily into the porcelain.

According to the annals of King-te-tching, there were formerly urns sold at fifty-eight, or fifty-nine rael, which amount to more than eighty crowns. What an immense sum must these have been worth in Europe?

Certain mandarins, to their protectors at court, make presents of old porcelain, which they have the talent of making themselves; that is, they have found the art of imitating ancient porcelain, or at least such as is pretty old. The matter of these false koutongs, or counterfeit antiques, is a yellow earth, found near King-te-tching. A plate of this earth weighs as much as ten porcelain ones of the same size. There is nothing particular in making this kind of porcelain, if not that they give it a varnish made of yellow stone, mixed with ordinary oil, which prevails most in the composition. This mixture gives the porcelain a sea-green colour. When

it is baked, they throw it into a very rich broth, of fowls and other victuals, in which it is boiled. After this they put it into the filthiest sink they can find, and there leave it a month or more. When it comes out of this sink, it passes for three or four hundred years old, or at least as old as the dynasty of Ming; when the porcelain of this colour and thickness was much esteemed at court.

These spurious antiques likewise resemble the genuine ones in this, that when they are struck, they do not sound, and when they are applied to the ear, they produce no humming noise.

The natives of China are almost as curious about glasses and crystals which come from Europe, as the Europeans are of the Chinese porcelains; but, whatever esteem the Chinese have for our commodities of this kind, they do not cross the seas for European glasses, finding their own porcelain of more use, because it bears hot liquors.

The method of giving a lustre to the gold laid on porcelain; the different kinds of varnishes and colours given to the porcelain; the method of preparing these varnishes and colours; new designs of porcelain works; manner of embossing porcelain.

As gold laid upon porcelain is, in process of time, effaced, and loses a great deal of its lustre, they restore its splendor by wetting the porcelain with pure water, and rubbing it with an agate-stone; but they must take care to rub the vessel in the same direction, for example, from the right to the left.

The lips of the porcelain are principally subject to scale off. To remedy this inconvenience, they fortify them with a certain quantity of bamboo-coal pounded, which they mix with the varnish that is laid on the porcelain, and which gives it a grey, or cineritious colour. Then, with the pincers, they make a border of this mixture round the porcelain already dry, putting it on the wheel. When it is time, they apply the varnish to the border, as they do to the rest of the porcelain; and when it is baked, the edges are extremely white. As there is no bamboo in Europe, its place may be supplied by willow-coal, or rather that of alder, which more approaches to bamboo.

It is to be observed, First, That, before the bamboo is reduced to coal, its green skin must be taken off, because the ashes of that skin make the porcelain break in the furnace. Secondly, That the workman ought not to touch the porcelain with greasy or oily hands, since by this means the part touched, would infallibly crack in the baking. In blowing the colours of red and blue upon the porcelain, the latter is more easily done. The Chinese workmen agree, that if it was not too expensive, they could blow gold and silver upon porcelain, of a black or blue ground, as they do a red or blue; that is, diffuse gold or silver equally all over it. This sort of porcelain, of a new taste, could not fail to please.

They blow the varnish as well as the red. They have, for the emperor, made works so delicate and fine, and they were obliged to place them on cotton, because they could not handle pieces so tender, without danger of breaking them; and, as it is not possible to plunge them in the varnish, without touching them with the hand, they blow the varnish upon them.

It is to be observed, that in blowing the blue, the workmen take a precaution to preserve the colour which does not fall on the china, and to lose as little of it as possible. This precaution is to place the vessel on a pedestal, posited over a large piece of paper, which serves for some time. When the azure is dry, they take it off, by rubbing the paper with a small brush.

They have likewise found a new substance, proper to enter the composition of porcelain. This is a stone, or species of chalk, called hoache, which the Chinese physicians use in a ptisan, which they say removes weariness, is aperient and refreshing. They take six parts of this stone, and six of liquorice, which they pulverise. They put half a spoonful of this powder into a large draught of fresh water, which they order the patient to drink.

They pretend that this ptisan refreshes the blood, and tempers internal heats. The workers of porcelain have thought fit to employ this stone instead of the kaolin. Perhaps such parts of Europe, where kaolin cannot be found, may furnish the stone hoache. It is called hoach, because it is glutinous, and resembles soap.

The porcelain made of hoache is rare, and much dearer than the other kinds. It has an extremely fine grain; and, with respect to the work of the pencil, if we compare it with the ordinary porcelain, it is almost what vellum is to paper. Besides, this porcelain is extremely light, which surprises a person accustomed to handle other porcelains. It is also more brittle than the common sort, and the true degree of baking it is very hard to be hit upon.

Some workmen do not use the hoache for the body of their work, but make a thin glue of it, in which they dip the porcel-
lain

lain when dry, before it receives the colours and the varnish, by which means it acquires some degree of beauty.

They use the hoache in the following manner. First, When they have taken it from the mine, they wash it with river or rain water, to separate it from the yellow earth which adheres to it. Secondly, They break it, and put it into a vessel to dissolve; after which, they prepare it in the same manner with the kaolin. They affirm, that porcelain may be made of the hoache alone, without any other mixture. Some Chinese workmen, however, say, that to eight parts of hoache, they put two of petunse; and that in other respects they proceed in the same manner as in making ordinary porcelain with petunse and kaolin.

In this new species of porcelain the hoache is in place of the kaolin, but it is much dearer than the other. The load of kaolin costs only twenty pence, whereas that of hoache comes to a crown. Thus it is not surprising, that this should be fold dearer than the common porcelain.

There is another observation to be made on the hoache; when they prepare it, and form it into small squares, like the petunse, they dissolve in water a certain quantity of these squares, of which they form a very clear glue or cement. In this they dip the pencil, and draw various designs on the porcelain; and when it is dry they give it the varnish. When the porcelain is baked, we perceive these designs to be of a different white from the rest. They seem to be a delicate steam spread on the surface. The white of the hoache is called stamyape, or ivory white.

They paint figures on porcelain with chekao, as well as with hoache, which gives it another species of white colour; but the chekao has this peculiar to itself, that before it is prepared like the hoache, it must be toasted on the hearth; after which it is broken, and prepared in the same manner with the hoache. They throw it into a vessel full of water, and agitate it there. They, at different times take off the cream which floats upon it; and when all this is done, they find a pure mass, which they employ in the same manner as the purified hoache. The chekao cannot serve as the body of the porcelain. Hitherto, nothing but the hoache has been found to supply the place of the kaolin, and give solidity to the porcelain. If, according to the Chinese workmen, they were to put more than two parts of the petunse to two parts of the hoache, the porcelain would infallibly be destroyed in baking, because it's parts are not sufficiently united.

We have not as yet spoken of a kind of varnish, called tse-kin-yeou, that is, burnished varnish of gold. We might rather call it varnish of a bronze, or coffee-colour, or of the colour of a withered leaf. This varnish is of a late invention, and in order to make it, they take common yellow earth, and manage it in the same manner they do the petunse. When it is prepared, they employ only the most delicate part of it, which they throw into water, and which forms a glue, as liquid as the ordinary varnish, called peyeou, which is made of pieces of rocks. These two varnishes, the peyeou and the tse-kin, are mixed together, and for this purpose they ought to be rendered equally liquid. Of this they make a trial, by plunging the petunse into both; and if each of the varnishes penetrates it's petunse, they judge them equally liquid, and proper to incorporate with each other. They also mix with the tse-kin, varnish or oil of quick lime, and ashes of fern, and of the same liquidity with the peyeou; but they mix more or less of these varnishes with the tse-kin, according as they want it, deeper or fainter. This may be known by several trials; for example, mix two cupfuls of the tse-kin, with eight of the peyeou; then, to four cupfuls of this mixture, add one cupful of the varnish of lime and fern. It is not long since they found the secret of painting the porcelain with t'foui, which is of a violet colour, and gilding it. They have tried to make a mixture of gold leaf with the varnish and power of flints, which they applied in the same manner as the red, with oil; but this varnish does not succeed, and they have found that the varnish of the tse-kin had more beauty and splendor.

Formerly they made cups, to which they gave the outside a gilded varnish, and the inside the pure white varnish. They afterwards varied, and to a cup or vessel they intended to varnish, they in one or two parts applied a square or circle of paper; and after having laid on the varnish, they raised the paper, and painted the unvarnished space red or blue. When the porcelain was dry, they gave it the usual varnish, whether by blowing or otherwise. Some fill these empty spaces with a ground of blue or black, in order to apply the gilding after the first baking. In this respect we may imagine several combinations, according to our fancy.

They have also invented a new sort of porcelain, which is of an olive colour, and which they call long-tiven. This species was formerly called t'finko, the name of a fruit among them, whose colour resembles that of olives. This colour is given to the porcelain, by mixing 7 cups of the varnish called tse-kin, with four cups of peyeou, two cups, or thereabouts, of the oil of quick lime and fern, and one of t'fouyeou, which is an oil obtained from flint. The t'fouyeou makes a large quantity of veins appear on the porcelain. When they use it alone, the porcelain is brittle, and without found when struck;

but when it is mixed with the other varnishes, it is variegated by beautiful small veins, and neither renders the porcelain less sonorous, nor more brittle than the common sort.

We must not omit one thing, which is, that before they give the varnish to the porcelain, they polish it, and smooth all it's smallest inequalities. This is done by a pencil made of very fine feathers, which they moisten with water, and gently pass it over the whole; but it is principally with the fine china that they use so much pains.

The shining or reflecting black, is given to the porcelain by plunging it in a liquid mixture composed of prepared azure. In this case it is not necessary to employ the finest azure, but the composition must be a little thick, and mixed with the varnish of peyeou and tse-kin, adding a little of the oil of lime, and of the ashes of fern. For example, with ten ounces of azure, pounded in a mortar, we must mix one cup of tse-kin, one cup of peyeou, and two cups of the oil of fern, burnt with quick lime.

This mixture carries it's varnish with it, so that it is not necessary to give it another. When they bake this species of black china, they place it in the middle of the furnace, and not near the vault, where the fire has the greatest force.

It is not true, that the red laid on with oil, called the yeou-ci-hunc, is drawn from the red of coppas, such as that which is employed in painting their baked porcelain red. This red laid on with oil, is made of the grains of red copper, and of the powder of a certain stone or flint of a reddish cast. It is thought that this stone is a kind of allum employed in medicine. The whole is pounded in a mortar, along with the urine of a young man, and the oil of peyeou. This mixture is applied to the porcelain before it is baked, and they give it no other varnish. They must take care, during the baking that the red colour falls not to the bottom of the vessel. The Chinese workmen say, that when they want to give this red to the porcelain, they do not make use of the petunse to form it; but that, in it's stead, they employ, together with the kaolin, a yellow earth, prepared in the same manner with the petunse. It is probable that such an earth is more proper to receive this kind of colour.

Perhaps the reader will be glad to know how the grains of copper are prepared. In China there is no silver coin, since in commerce they use it in lumps, and there are a great many pieces bad. There are, however, certain occasions on which it is necessary to refine these bad pieces, when, for example, taxes or similar contributions are to be paid.

Then they have recourse to workmen, whose only business it is to refine the silver in furnaces made for that purpose, and to separate it from the copper and lead. Before the melted copper is hardened and congealed, they take a small broom, which they dip slightly in water; then, by striking on the handle of the broom, they sprinkle the melted copper with water. A pellicule is formed on the surface, which they take off with iron pincers, and plunge it in cold water, where the grains are formed, and multiplied in proportion as they reiterate the operation. It is evident, that if they employed aqua fortis to dissolve their copper, the powder would be more proper for making the colour of which we speak. But the Chinese are unacquainted with aqua fortis and aqua regia, and their inventions are all extremely simple.

They have executed designs which were thought impracticable. These are urns, as before-mentioned, three feet high and more without the cover, which rise a foot high, like a pyramid. These urns consist of three different pieces, so elegantly joined, that they seem to make but one.

There are also pieces of porcelain, which they call yao-pien, which signifies transmutation. This transmutation is caused either by the defect or excess of the heat, or by other causes, which are not easily discovered.

These pieces, which have not succeeded agreeably to the intention of the workman, and are the pure effects of chance, are not less beautiful and valuable than the others.

A workman intended to make vessels with red flowers blown; a hundred pieces were entirely lost, while only one came out of the furnace, perfectly like a species of agat.

If they would run the risk, and be at the expence of different trials, they might effectually discover the art of making, what chance at that time produced. For this reason, they have thought fit to make porcelain of a shining black, which they call oukom. The caprice of the furnace has determined them to this research, in which they have succeeded.

When they want to give a varnish, which renders porcelain extremely white, they add to thirteen cups of peyeou, one cup of the oil of fern ashes, as liquid as the peyeou. This varnish is strong, and ought not to be given to the porcelain which is to be painted blue; because, after baking, the colour would not appear through the varnish. The porcelain which has got the strongest varnish, may without any dread, be exposed to the greatest heat of the furnace. Thus they bake it all white, either with a view to keep it in that colour, or to gild it, or paint it in different colours, and then bake it a second time. But when they want to paint porcelain blue, with a design that the colour should appear after the baking, they only take seven cups of peyeou, with one cup of varnish, or of the mixture of lime and fern ashes.

It is to be observed in general, that the porcelain, whose varnish contains a great deal of fern ashes, ought to be baked in the most temperate part of the furnace; that is, either after the three first ranks, or at the bottom, about the foot, or a foot and a half high. If it was baked at the top of the furnace, the fern ashes would be fused with precipitation, and fall to the bottom of the porcelain. The case is the same with the red laid on with oil, the blown red, and the long-tfien, on account of the grains of copper contained in these varnishes: on the contrary, in the top of the furnace they bake the porcelain, to which they have only given the tsoui-yeon, which is the varnish that gives the porcelain so many viens, that it seems to consist of pieces joined together.

The red of coppers, laid on the rebaked porcelains, is made in like manner with coppers called tsá-san. But before we give the method of composing this colour, we shall first explain the proportion and measure of the Chinese weights. The kin, or Chinese pound, consists of sixteen ounces, which they call leams or taels.

The leam or tael is a Chinese ounce.

The tsien or mas, is the tenth part of the leam or tael.

The fuen is the tenth part of the tsien or mas.

The by is the tenth part of the fuen.

The hoa is the tenth part of the by.

To a leam or tael of cerufs, they add two mas of this red. They pass the cerufs and the red through a sieve, and mix them together dry; then they incorporate them with water impregnated with common glue, reduced to the consistence of mouth-glue.

This glue fixes the red to the porcelain, and prevents its melting. As the colours, if laid on too thick, would produce inequalities on the surface, they now and then dip the pencil in water, and then in the colour which they intend to use.

In order to obtain a white colour, to a leam of cerufs they add three mas, and three fuen of the powder of the most transparent flint calcined, after having luted them in a vessel of porcelain, which they bury in the sand of the furnace before they heat it. This powder ought to be impalpable. They use simple water, without any mixture of glue, in order to incorporate it with the cerufs.

In order also to make the deep green, they add to one tael of cerufs, three mas and three fuen of the powder of flint, with eight fuen, or near a mas of tom-hoa-pien, to make the green. They must wash it well, and carefully separate the grains of copper which are mixed with it, and which are not proper for the green. They only employ the scoræ, that is to say, the parts of the metal which are separated when they work it.

As for the yellow colour, it is made by adding to a tael of cerufs three mas and three fuen of powder of flint, and one fuen and eight by of red, which has not been mixed with cerufs. To make a beautiful yellow, you must add two fuen and a half of this primitive red.

A tael of cerufs, three mas and three fuen of powder of flint, and two by of azure, form a deep blue of a violet cast. Some workmen add eight by of azure.

The mixture of green and white, for example, one part of green, added to two of white, makes the water green, which is very clear.

The mixture of green and yellow, for example, two cups of deep green, added to one of yellow, produces the colour which resembles a leaf somewhat faded.

In order to produce black, they dilute the azure in water, but the solution must be very thin. They mix with it a little common glue, macerated in lime-water, and boiled to the consistence of mouth-glue. When with this black they have painted the porcelain, which they intend to bake a second time, they cover the black parts with white. In the baking, this white is incorporated with the black, just as the common varnish is with the blue of the common porcelain.

There is another, called tsin, which is prepared of a stone, or mineral, resembling Roman vitriol. It is probable that this substance is taken from some lead mine, and that carrying imperceptible particles of the lead along with it; it insinuates itself into the porcelain, without the help of the cerufs, which is the vehicle of the other colours given to the re-baked porcelain.

It is of this tsin that they make the deep violet. It is found at Canton and at Pekin, but that found at the last of these places is by far the best. It is sold at seven shillings and sixpence a pound. The tsin is fused, and when it is so, silversmiths, by way of enamel, lay it upon silver works. They will put, for instance, a small circle of tsin about a ring, or they will encase it by way of a stone. This species of enamel comes off at last, but they endeavour to prevent this by laying it on a slight ground of mouth or common glue.

The tsin, as well as the other colours we have mentioned, is only used for the re-baked porcelain. The tsin is prepared in the following manner. They do not toast it as they do the azure, but break it, and reduce it to a very fine powder; then they put it into a vessel full of water, which they agitate a little; then they pour out the water, in which there is some nastiness, and keep the crystal which has sunk to the bottom of the vessel. This mas, thus diluted, loses it's

beautiful colour; but the tsin recovers it's violet colour when the porcelain is baked. The tsin may be kept as long as they please. When they want to paint any porcelain vessel with this colour, they must dilute it with water, mixing a little common glue with it; which, by some, is thought unnecessary, but this must be determined by experience.

In order to gild or silverize the porcelain, they add two fuen of cerufs to two mas of dissolved gold or silver leaf. The silver upon the varnish tsé-kin has a beautiful splendor. If they gild some, and silverize others, they do not leave the silverized work so long as the gilt, in the small furnace, otherwise the silver would disappear before the gold obtains the degree of baking necessary to give it it's lustre.

There is another sort of coloured porcelain, which sells dearer than those painted with the colours we have mentioned. Perhaps the account I am to give of it, may be of some use for perfecting the English pottery-ware, though we should not be able to obtain to the perfection of the Chinese porcelain.

To make these kinds of works, it is not necessary that the substance employed should be extremely fine. They take cups that have been already baked in the large furnace, without being varnished, which are consequently all white, and have no lustre. They colour them by plunging them in the vessel, where the colour is prepared, when they want them of the same colour. But if they want them of different colours, such as the works called hoan-tou-houan, which are divided into a kind of squares, some of which are yellow, and others green; they apply these colours with a large pencil. This is all the ornament they give to this species of porcelain, only after the baking, they lay a little vermillion on certain places; as, for example, on the beaks of certain birds; but this colour is not baked, because the fire would destroy it, for which reason it does not last long. When they have applied the other colours, they re-bake the porcelain in the large furnace, with other porcelains which have not been baked before. It must be placed at the bottom of the furnace, and below the air vent, where the fire has less activity; because an intense fire would destroy the colours. The colours proper for this sort of porcelain are prepared in the following manner: in order to make the green, they take tam-hoa-pien, saltpetre, and powder of flint. When they have reduced them separately into an impalpable powder, they dilute, and mix them together with water.

The most common azure, together with saltpetre, and powder of flint, forms the violet.

The yellow is prepared by adding three mas of the red of coppers, to three ounces of the powder of flint, and three ounces of cerufs.

For producing the white, to four mas of the powder of flint, they add a tael of cerufs. All these ingredients are to be diluted in water; and this is the whole of what relates to the colours of this sort of porcelain.

When speaking of the furnaces, where they re-bake the painted porcelain, we have observed, that they make piles of porcelain vessels, putting the smaller into the larger, and thus ranging them in the furnace. Care must be taken, that the vessels do not touch each other in the parts which have been painted; for, in this case, all the vessels would be lost. The foot of one cup may be supported by the bottom of another, though it be painted; because the edges of the bottom of the smaller cup are not painted: but the sides of one cup must not touch those of another. Thus, when they have cups which do not easily enter into each other, such as the long chocolate cups, the Chinese workmen range them in the following manner.

Upon a bed of these porcelains, laid in the bottom of the furnace, they lay a covering, either of plates made of the earth with which the furnaces are built, or of the pieces of cases for the porcelain; for in China every thing is used to the best advantage. Above this covering they lay another bed of these porcelains, and continue to do so to the very top of the furnace.

It is not true, as we have before observed, that they know that the painted or gilt porcelain is sufficiently baked, when they see the gold or colours sparkle with all their lustre. The colours are not distinguished till the re-baked porcelain is become cold. They judge that the porcelain, baked in the small furnace, is ready to be taken out, when, looking through the aperture at the top, they, to the very bottom, see all the porcelains red with the fire; when they distinguish the piled cups from each other; when the porcelain has no longer these inequalities formed by the colours, and when the colours are incorporated in the body of the porcelain, in the same manner that the varnish laid upon the beautiful azure, is incorporated with it by the heat of the large furnace.

As for the porcelain re-baked in the large furnace, they judge that it is sufficiently baked, 1. When the flame which comes out is not of a very red, but rather of a whitish colour. 2. When looking through one of the apertures, they perceive that the cases are all red. 3. When, after having opened a case at the top, and taken a piece of porcelain out of it, they perceive when it is cold, that the varnish and colours are in the condition in which they want them. And, 4. When

looking

looking in at the top of the furnace, they perceive the gravel in it's bottom to be shining. By all these marks, a workman judges whether the porcelain is perfectly baked.

When they would have the blue entirely to cover the vessel, they use leao or azure, prepared and diluted in water to a due consistence, and in this they plunge the vessel. As for the blown blue, called t'fui-tim; they in it use the most beautiful azure, prepared in the manner before-mentioned. They blow it upon the vessel, and when it is dry, they lay on the ordinary varnish, either alone, or mixed with t'foui-yeou, if they would have the porcelain veined.

Some workmen upon this azure, whether blown or otherwise, draw figures with the point of a long needle. The needle removes as many small grains of the dry azure, as is necessary to represent the figure; after which, they lay on the varnish. When the porcelain is baked, the figures appear painted in miniature.

There is not so much labour as may be imagined, in making the porcelains, on which flowers, dragons, and other similar figures are embossed. They first trace them with the graver on the body of the vessel; then they make small incisions round them, which raise them; and, lastly, they apply the varnish.

The following things are to be observed in the manner of preparing the leao, or azure. 1. Before burying it in the gravel of the furnace, where it is to be toasted, it must be well washed, in order to remove the earth which adheres to it. 2. It must be included in a case of porcelain well luted. 3. When it is toasted it must be pounded, and passed through a sieve. Then they put it into a well varnished vessel, and pour boiling water upon it. After having agitated it a little, they take off the froth on the surface, and pour out the water, by inclining the vessel to one side. This preparation of azure, with boiling water, is to be repeated twice. After this they take the azure, thus moist and reduced into a kind of thin paste, and putting it into a mortar, pound it for a considerable time.

The azure is found in the mipes of rock-coal, or in the red earths adjacent to those mines. It sometimes appears on the surface of the ground; and this is an infallible sign, that by digging farther, more of it may be found. In the mine it presents itself in pieces as large as a man's thumb, but flat, and not round. The coarse azure is pretty common, but the fine is very rare, and not easily discerned by the eye; and we must make trial of it before we can judge of it's value.

This trial consists in painting a porcelain vessel with it, and then baking the vessel. If Europe produced beautiful leao, or azure, and fine tin, which is a kind of violet colour; these would, among the Chinese, be commodities of great value, and easily transported: so that we might bring back the most beautiful porcelain in exchange for them. We have already observed, that a pound of tin is sold for a tael and eight mas, that is, for seven shillings and six-pence. For two taels they sell a box of beautiful leao, which contains only six ounces, and this amounts to twenty-pence an ounce.

They have tried to paint some porcelain vessels black, with the finest of the Chinese ink; but this attempt had no success: for when the porcelain was baked, it was found to be very white. As the parts of this black have not a sufficient body, they were dissipated by the action of the fire, or rather the had not force enough to penetrate the bed of varnish, and produce a colour different from it.

Of the SAXON PORCELAIN, according to Mr HANWAY.

Perhaps it may be some indulgence, to a female curiosity at least, to be informed concerning this brittle commodity, which has been so passionately sought after by the fair sex. But can this passion be deemed a folly, when we see even mighty princes * pride themselves in it? Here are a great number of porcelain figures of dogs, squirrels, monkeys, wolves, bears, leopards, &c. some of them as big as the life; also elephants, and rhinoceros's of the size of a large dog; a prodigious variety of birds, as cocks, hens, turkeys, peacocks, pheasants, hawks, eagles; besides parrots, and other foreign birds, and a curious collection of different flowers. The Apostles, near three feet high, are in white porcelain. There is a representation of the crucifixion, four or five feet high, with numerous other curious pieces: these last are intended for the Romish chapel, which is to be furnished with these rare materials. A clock is preparing for the gallery in this palace, whose bells are to be of porcelain: I heard one of them proved, and they are sufficient to form any music; but the hammers must be of wood.

* His Majesty of Prussia sometimes calls his brother of Poland the Porcelain King.

Baron Botgen, about 46 years since, first began to make this porcelain; his first trial was the red, and from thence he proceeded to glazing, and since that, gilding and painting have been carried to an amazing perfection. In order to preserve this art as much as possible a secret, the fabric at Meissen, which is near Dresden, is rendered impenetrable to any

but those who are immediately employed about the work; and the secret of mixing and preparing the materials, is known to very few of them. They are all confined as prisoners, and subject to be arrested if they go without the walls; and consequently a chapel, and every thing necessary is provided within. There are about 700 men employed, most of whom have not above ten German crowns a month, and the highest wages are forty; so that the annual expence is not estimated above 80,000 crowns. This manufacture being entirely for the king's account, he sells yearly to the value of 150,000, and sometimes 200,000 crowns *, besides the magnificent present he occasionally makes, and the great quantity he preserves for his own use. They pretend they cannot execute fast enough the commissions which they receive even from Asia, as well as from all parts of Europe, and are consequently under no necessity of lowering the enormous prices; however, this must be the consequence ere long, if the English and French continue to make such great improvements in this art. It is with great satisfaction that I observe the manufactories of Bow, Chelsea, and Stepney, have made such a considerable progress. On the other hand, it is equally a subject of horror to see so many shops in the streets of London, supplied with the porcelain of Dresden, though it is importable, only under oath of being for private use, and not for sale.

* 35,000l.

R E M A R K S.

The French court seems to have very much at heart the promotion of the new manufacture of porcelain, which has lately been set up in the royal castle of Vincennes, with a view of equalling that of Saxony. The Sieur Charles Adams, the undertaker of it, has, in particular, extraordinary power given him over his workmen, to prevent their engaging with other projectors, to the damage of the said Adams.

What renders the Oriental porcelain so universally estimable is, not only it's general delicacy, but it's general greater cheapness compared to that of Dresden, or any other nation: and till England, France, Holland, or Saxony, can afford this manufacture at as reasonable rates as the Eastern nations do, it can never be expected that any, or indeed all the united European porcelain manufacturers, will vend so large a quantity as is done by the Asiatics in general.

It is certain that the art of pottery, as well in England as in Holland and France, has, within these twenty years, arrived to great perfection. And, if ever this, or any other European nation should advance in the manufacture of China ware, to the degree of perfection that the Eastern countries have done, I am inclinable to think it must depend rather upon art than on the mere productions of nature; for, although in the eastern countries there may be earths of a quality for the purpose, superior to such as may have yet been discovered in any other parts of the world, yet the extraordinary beauty of their earth, we apprehend, is owing chiefly to art: and, if once the Europeans obtain that art, we believe there are earths enough, even in England, from which as good porcelain may be made, as from any that ever came from the East-Indies, or from Dresden, and that it may come as cheap too, as some of our pottery-ware.

PORTO RICO. See ANTILLES ISLANDS.

PORTS, are those places to which the officers of the customs are appropriated, and which include all the privileges and guidance of all members and creeks thereunto allotted.

Members are those places where anciently a custom-house hath been kept, and officers or the deputies attending, and are lawful places of exportation or importation.

Creeks, are places where commonly officers are or have been placed, by way of prevention only, and are not lawful places of exportation or importation, without particular licence from the port or member under which it is placed.

The several ports and members as now they account at the Custom-house, are,

Bridge-house in Southwark	
	} Is only allowed for landing of any kind of corn for the city of London, and not upon any private or particular person's account.

Any person may lade into any ship or vessel on the river of Thames bound over seas, horses, coals, beer, ordinary stones for building: fish taken by any of his Majesty's subjects, corn or grain, the duties being paid, and cockets, &c. duly paid.

So likewise deal-boards, balks, and all sorts of masts and great timber, may be landed at any place between Lime-house and Westminster, the owner first paying or compounding for the customs, and declaring where he will land them, and on licence had, and in the presence of an officer, he may unlade them, otherwise he incurs a forfeiture.

PORTUGAL. This kingdom borders northwards on Galicia in Spain, and is divided from it by the Minho next the sea, and by some small rivers and hills farther up land towards the east. The west and south sides are washed by the ocean, including the little kingdom of Algarve on the south, and on the west, the Guadiana parts the said little kingdom from Andalusia, from whence drawing a line northwards, Portugal borders on Andalusia, Estremadura, and Leon. The whole extent of it from north to south is 300 miles, that is, from 37 to 42 degrees of latitude. From east to west where broadest, which is about the middle, it is about 120 miles, that is, from 7 to 9 degrees west longitude, and where narrowest next Algarve, about 60.

Here are several mineral and medicinal springs, of great virtue, and much resorted to, some of a hot, and others of a cold nature.

The soil here is, perhaps, the very worst in all Spain, yet not universally so. But, upon the whole, it never produces corn enough to maintain it's inhabitants, but must be supplied either from Spain, or, when at war with it, from England, and other northern countries. As to wheat, it has been always observed to come short of what the people require. Pasture is no less scarce, if we except some of the northern parts, as the province called Entre duero e Minho, and along the banks of some of their great rivers, where the best and largest cattle are fed; but on the southern side, is very scarce, small, and lean, though the flesh generally good.

To make amends for this want of corn and pasture, here are vast quantities of wine made, which is indeed the best commodity of this kingdom, and so well known at present to all England, that we need say the less about it. Oil is here likewise, in great abundance, but far inferior to that which we have from other countries, that of Portugal being commonly so strong and foetid, that no one can dispense with it, that hath been ever accustomed to the Spanish and Italian. Lemons and oranges also grow here, and are exported in great quantities, though the acidness of the latter, be nothing near so pleasant as that of those which come from Seville; nor are indeed any of their fruits, raisins, figs, almonds, chestnuts, &c. either so large or well tasted, as those of Spain. Herbs and flowers of all sorts are here commonly very good, and abundance of perfumed waters are distilled from those of the odoriferous kind, which are here in great request, they being

VOL. II.

in some shape or other, used in almost every thing that is eat, drank, or worn. This country produces likewise great quantities of allum, white marble, alabaster, and especially salt, of which immense loads are continually exported hence from the port of Setuval, for most northern nations. The woollen manufactures of this country are of so indifferent and coarse a nature, that they are only worn by the meaner sort, being scarcely fit for any other. Their silks are, in some places, much better, but far inferior, not only in beauty and goodness, but in quantity, to those which are made in Spain.

The country in general is well peopled, and filled with goodly cities, towns, and villages, though not every where alike.— We shall, in the sequel, give an account of the most remarkable ones.

This kingdom is divided into five provinces, to which if we add the little kingdom of Algarve, they will be in all six, of which we shall now speak in due order, beginning at the north, and so descending to the south. They are as follow:

I. Entre Duero e Minho.

II. Tra los Montes.

III. Beira.

IV. Estremadura,

V. Alentejo.

VI. Algarve.

I. The province ENTRE DUERO E MINHO. This province hath the Minho on the north, to divide it from Galicia, and the Duero on the south, which parts it from Beira; on the west it is bounded by the ocean, and on the east by a ridge of mountains, which severs it from the province of Tra los Montes, or over the hills. It is but small, not extending in it's utmost length above 36 miles, and in it's greatest breadth above 30, and where narrowest above 12 or 14. It extends from 41 to a little above 42 degrees of latitude, and within the 8th degree of west longitude; but though so small is the best inhabited, has the greatest number of cities, towns, and villages, of all the rest, in proportion, besides that it is one of the pleasantest and most fertile, though mountainous, having many other rivers besides the two that inclose it, and a vast number of rivulets, and sweet springs to water it, as we have already hinted; which makes it abound in good pasture more than any other parts of Portugal, though inferior, in this respect, to many of the provinces of Spain. Besides these, the plains are every where covered with vines, fruit, and other trees of all sorts, and the country well supplied with every necessary of life, except, as we observed before, that it hath not a sufficient quantity of corn for it's inhabitants.

Braga, and Porto or Oporto, are the chief cities.

Guimaranes, Viana, Caminha, Valenza, Monzao, Barcelos, Ponte de Lima, Villa de Conte, and Amarante, are towns of note.

BRAGA, formerly the metropolitan see of Portugal, is seated on the south side of the river Cavado, about 41 degrees 30 minutes of north latitude, and 8 degrees of west longitude: it is distant about 180 miles north of Lisbon.

PORTO, OPORTO, a famed city and sea-port, on the north side of the Duero, about three miles from the sea, is pleasantly built on a rocky ground, that river washing it's walls. The port, a very commodious one, is so well known and frequented by our nation, that we need say the less of it. The harbour is safe against all winds, but when the floods come down, no anchor can hold the ships; at which times they are forced to squeeze and fasten them to each other along the walls, to avoid the fury of the torrent. The city stands in 41 degrees 10 minutes latitude north, and 8 degrees 30 minutes west longitude. It's distance is 120 miles north from Lisbon.

GUIMARANES is seated upon a hill, and is encompassed by a good wall. It stands about 10 miles east from Braga, and about 150 miles north of Lisbon. The chief manufactures of this place are linen and fine thread, of both which considerable quantities are made and exported.

VIANA DE FEZ DE LIMA, situated on the mouth of the Lima, is a considerable sea-port, encompassed with strong walls. This town is become very considerable for trade, ever since the great consumption of Portuguese wines in England; and is itself famed for a delicate sort of it's own product, which is small, and not unlike the French, nor hardly inferior to it; whereas those that grow in the more southern parts, are heavier and less pleasant. It is distant from Braga about 20 miles south, and about 130 north from Lisbon.

CAMINHA another, but small, sea-port, seated on the mouth of the river Minho.

VALENZA DE MINHO, about 12 miles above the last on the same river.

MONZAO, about six miles above the last on the same river.

BARCELOS stands on the river Cavado, in the territory of Viana.

PONTE DE LIMA stands about 180 miles north of Lisbon.

VILLA DE CONDE is situated on the sea-coast, at the mouth of the river Ave.

AMARANTE stands on the banks of the river Tamada, and has the river of Locia running through the midst of it. It hath a linen manufacture.

II. The province called **TRA LOS MONTES**. This small province is called in Latin *Transmontana*, because seated on the other side of that chain of hills which parts it on the west, from that of *Entre Duero e Minho* we have just described; on the north it borders on Galicia, and eastward on the kingdom of Leon, and on the south the Duero parts it from Beira. It's length from east to west, is at most about 74 miles, and breadth near 60; being situated between the 41st and 42d degrees of latitude, and stretching from 6 degrees 40 minutes, to near 8 degrees west longitude.

This country is but dry and barren, being watered by but few rivers, and none of them of any considerable length or breadth. For this reason the territory has but few corn fields, except rye and some barley, but yields plenty of wine, and fruits of several sorts, and abundance of game.

The cities of this province are Braganza and Miranda.

BRAGANZA is situated on the furthest angle of Portugal, but six miles distant from the borders of Leon, and at near the same distance from those of Galicia. It stands on a spacious plain, watered by the river Fervenza, which runs along it's walls. It is seated in the 42d degree of latitude, 6 degrees 30 minutes west longitude, and about 120 miles northward from Lisbon.

MIRANDA DE DUERO, stands on a rocky eminence, and it's walls are washed by a large pleasant brook, which falls into the Duero a little below it.

III. The province of **BEIRA** is divided on the north from the province *Entre Duero e Minho* by the former of those rivers; it is bounded by the ocean on the west, and by some part of *Estremadura*; on the south by another part of that province, and by the Tagus; and on the east it runs contiguous to the Spanish *Estremadura*, and the kingdom of Leon. The country, though not so rich and fertile as some in this kingdom, is yet capable of producing good corn, wine, and other useful commodities, if rightly cultivated.

COIMBRIA, once the metropolis of Portugal, is still one of the finest cities in this kingdom, and no less celebrated for it's famed university. It is pleasantly seated on the north side of the river Mondego. It stands in 40 and a half degree of latitude, and 8 degrees 20 minutes of west longitude, being about ten miles from the mouth of the river Mondego, and about 90 miles from Lisbon.

AVEIRO is a considerable market-town, commodiously situated in a plain, upon a bay at the mouth of a creek, on the western coast, and made by a small river, which divides the town into two parts, joined by a stately bridge. In this creek, which is pretty large, and forms a kind of haven, is made a vast quantity of salt, which is exported some into other parts of the kingdom, and the rest into foreign countries. It stands in 40 degrees 40 minutes latitude, 8 of west longitude, and about 101 miles from Lisbon.

IV. The province of **ESTAMADURA** is a long narrow slip, running along the sea-coast, and reaching from the mouth of the river Mondego northwardly down, southwardly quite below the town of Setuval; so that it extends from the latter to the former, that is, from south-west to north-east, about 110 miles, or from 38 degrees 30 minutes to 40 degrees 10 minutes of Latitude. In breadth it is scarce 50, and in some places much narrower; and it's utmost verge westward, which is the Cape la Roca, or, as the sailors term it, the rock of Lisbon, lies under 9 degrees 45 minutes west longitude. It is bounded on the north by the Mondego above-mentioned, which parts it from Beira, and the province of Alentejo. It hath again Beira on the east, and the ocean on the west.

The land is here for the most part the very best in Portugal, and the climate very pleasant and mild, by it's being so near the Western or Pacific Ocean. It produces wheat and other grain, in greater plenty than the other provinces, abundance of wine, oil, fruits of all sorts, especially citrons, lemons, oranges, pomegranates, figs, dates, almonds, &c. upon which account the people here live much better, and above want. Here are also greater variety of manufactures carried on, and a much larger share of trade and commerce; all which is owing partly to it's commodious situation and sea-ports, to it's nearness to the city of Lisbon, the metropolis of this province and kingdom; to it's commodious harbour, and to the noble river Tagus, which is navigable a considerable number of leagues inland, and carries a very considerable commerce from that metropolis.

LISBON, the head city of this kingdom, the residence of it's monarchs, the great seat of all the courts of justice, the metropolitan see of Portugal, the most noble and celebrated university of it, an emporium of the world, the receptacle of all the richest merchandizes of the East and West-Indies, and the best sea-port in the whole kingdom. It is situated in 38 degrees 46 minutes of latitude, and about 9 of west longitude, in an excellent air; and though that climate be rather inclinable to be hot, yet is refreshed by the delightful breezes of the sea, and of the river Tagus, on the banks of which it is pleasantly and strongly situated, and which conveys to it all the wealth of Asia and America, as well as the chief commodities of Europe and Africa.

The harbour is one of the most commodious in Europe, it lying upon the Western Ocean, and being capacious enough of itself to contain ten thousand ships, all riding in safety, and without incumbering each other, and carries water enough for the largest vessels to anchor before the windows of the royal palace. The entrance into it is defended by two handsome forts, the first seated on the shore, the other standing opposite to it, on a shelf, in the midst of the water. Besides these, nature has provided it with another defence, which is the bar, very dangerous to pass without pilots belonging to the place. Within this appears a vast capacious bay, which contracts itself as it draws near the city.

SETUVAL is a considerable sea-port on this coast, a little below Lisbon. It is seated on a handsome bay, close to the ocean, where the river Zadao discharges itself, and is much resorted to by most northern nations, especially for the vast quantities of salt that are made here every year.

It stands about 20 miles south of Lisbon, and on the south side of the Tajo, but in the same province with the metropolis, it's latitude is 38 degrees 27 minutes, and longitude about 8 degrees 48 minutes.

SANTAREM is situated on a high hill, close to the Tajo. It hath on the south side a deep valley, with a steep winding ascent to the town, and on the north is a craggy solid rock, altogether inaccessible; but on the west it faces a delightful plain, covered with gardens, orchards, and fertile fields, producing vast quantity of corn, oil, and variety of fruits. The Tajo above-mentioned, which is here very broad and navigable, enriches, moreover, all that country, by little channels that are cut from it; inasmuch that we are told by some Spanish authors, that it yields a prodigious increase of wheat and other grain, but that it is often sown, cut down, and threshed, within the space of two months. The town stands in 39 degrees 12 minutes latitude, 8 degrees 20 seconds west longitude, and about 42 miles north-east from Lisbon.

SINTRA is seated near the sea, at the foot of a ridge of mountains, and by the cape that bears it's name, almost on the utmost western verge of Portugal. The town is justly esteemed the most delightful spot in the whole kingdom, both for the beauty of it's situation and prospect, and for the fruitfulness of it's territory, which produces, among other commodities, plenty of corn and wine, oil, lemons, oranges, and other fruits; and the rock on which it stands, hath a noble quarry of black and white marble, in great request.

ALCAZAR DO SAL, so called, from the great quantities of salt which this territory produces, is situated on the river Zadao. It stands thirty-five miles south-west from Lisbon, on the other side of the river Tajo, and about thirty at it's nearest distance from that river.

V. The province of **ALENTEJO** borders on the north, on part of *Estremadura*, and of the river Tajo; eastward, on the Spanish province of Andalusia and *Estremadura*; on the west it is bounded by the ocean, and part of the Portuguese *Estremadura*; and on the south, by the little kingdom of Algarve. It lies between 37 deg. 30 min. lat. and about 39 degrees west longitude; but so irregular, and runs so much into the adjacent provinces, that it's extent can not be precisely stated. In the whole it runs, where widest, between 90 and 100 miles; and in some places beyond, and in others much less than 80.

The country is reckoned the finest and fertilest in all Portugal; and it's inhabitants, according to Faria, the wealthiest and best bred. The far greater part of these are farmers; and the land here is so rich, so well watered by a number of rivers, which fall either into the Tajo, or Guadiana, which two last great ones, run quite across this province, that they are all wealthy and industrious, and have few poor people among them.

This territory abounds not only with corn of all sorts, wine, oil, fruits, and good pastures, sufficient for it's own inhabitants, but likewise to supply some of the adjacent provinces, which are more barren, or less cultivated: and this exportation is very much facilitated by those rivers, which intersect the country, and run into the great ones above-mentioned, and some into the sea.

EVORA is a very antient and considerable city, seated in the heart of this province, on a pleasant hill, encompassed about with mountains. It stands about 60 miles south-east of Lisbon, and in 38 degrees 30 minutes latitude, and about 7 degrees 25 minutes west longitude.

ELVAS is situated on an eminence, strong by nature, six miles from the frontiers of the Spanish *Estremadura*, where the river Coa divides it from Portugal. The country about is very pleasant and fertile, and produces, in particular, great abundance of oil. The chief trade of this town is in the woollen manufacture.

ESTREMOS is seated on an high hill, on the top of which is a very strong castle. Here is a curious manufacture of red earthen-ware, formerly much admired in England, and brought hence, rather for an ornament to mix among China-ware, than for any other use.

Near the town is a noble spring, which throws up so much water

water in summer, as serves to turn several mills; and, contrary to all others, is dried up all the winter.

The town is about 105 miles distant east from Lisbon, and 15 from Elvas.

VI. The little kingdom of ALGARVE. This is that part of Portugal, called, by some antient authors, Cuneus, or Wedge, being really wedged in by the ocean on the west and south; on the east by the Guadiana, which parts it from Andalusia: on the north, by the mountains called Serra de Algarve, and Serra de Monchique, which divide it from Alentejo; so that it is but 90 miles in length, where longest, and but 28 in breadth, where broadest.

The country, though very mountainous in most parts of it, is yet very fertile. It does not, indeed, abound with any great quantity of corn, but abundance of wine, oil, figs, raisins, dates, almonds, pomegranates, and other fruits. In the main, the country is nothing populous or wealthy, nor their cities and towns remarkable for any great matters.

Of the MONIES, WEIGHTS, and MEASURES of PORTUGAL.

The Portuguese keep their accounts in milreas and reas, 1000 reas making a milrea [see the article LEDGER]; they separate the milreas from the reas thus, 769 \cup 210, which is to say, 769 milreas, and 210 reas.

The GOLD MONIES of PORTUGAL are as follow, viz.

	Sterling money.
The 25 \cup 600 reas piece	1. 7 : 4 : —
The 24 \cup ditto	6 : 15 : —
The 12 \cup 800 reas ditto	3 : 12 : —
The 12 \cup ditto	3 : 7 : 6
The 6 \cup 400 reas ditto	1 : 16 : —
The 4 \cup 800 reas, or moydore stamped	1 : 7 : —
The 3 \cup 200 reas piece	— : 18 : —
The 2 \cup 400 reas ditto, or half moydore	— : 13 : 6
The 1 \cup 600 reas ditto	— : 9 : —
The 1 \cup 200 reas, or quarter-moydore	— : 6 : 9
The 800 reas or tefloon-piece	— : 4 : 6

Their SILVER MONIES are,

The 400 reas, or cruzado, or the exchange- $\frac{2}{3}$ piece not stamped	— : 2 : 3
The 480 reas, or one-tenth moydore-piece stamped in 1643	— : 2 : 8 $\frac{2}{3}$
The 240 reas, or 12 vintin-piece	— : 1 : 6
The 100 reas, or 5 vintin-piece	— : — : 9
The 50 reas, or 2 and a half vintin ditto	— : — : 4 $\frac{1}{2}$

Their COPPER COIN.

The 20 reas, or vintin-piece	— : — : 1 $\frac{1}{2}$
The 10 reas, or half vintin ditto	— : — : — $\frac{1}{2}$
The 5 reas, or quarter vintin ditto	— : — : — $\frac{3}{8}$

Their WEIGHTS

Are but of one kind, and divided thus: 2 drams=1 octave, 8 octaves=1 ounce, 16 ounces=an arrate, or pound, 32 pounds=an arobe, 4 robes=1 quintal, or 128 pounds, half an arobe=16 pounds. They divide the said ounce also into penny-weights and grains, as we do our ounce Troy weight. Their weights are about 3 or 4 per cent. heavier than our English avoirdupois.

Their MEASURES.

Their long measure.—The vare is the length of the ell English, and 81 $\frac{1}{2}$ = 100 yards English. The other measure is the cavada, and is $\frac{1}{3}$ of a yard English.

Their liquid measure.—Their largest is the almuda = 2 cava-das, and half and quarter cava-das; they have other measures, that contain one half and one quarter of a gallon: the almuda = 4 $\frac{1}{2}$ gallons of our Winchester measure.

Corn and salt measure.—60 alquiers = 1 moy = 3 English quarts, 2 $\frac{1}{2}$ alquiers = 1 English bushel.

Of the EXCHANGES of PORTUGAL with the principal places of EUROPE.

Portugal exchanges with London on the milrea, and London gives pence sterling, more or less, for the same, from 60 to 66.

With Holland, and throughout the United Provinces, and with Hamburg, on the cruzado of 400 reas, and gives gros Flemish, more or less, for the same.

With Spain for the Spanish ducat, and gives reas, more or less, for the same.

With France on the exchange-crown, and gives reas, more or less, for the same.

With Florence on the crown of 7 $\frac{1}{2}$ livres, and gives reas more or less.

With Genoa on the scudi, and gives reas more or less.

With Leghorn on the dollar of 6 livres, and gives reas more or less.

Exchanges are frequently made by the way of Amsterdam, Antwerp, or Hamburg.

Suppose I owe the following sums to my correspondents, what will they amount to in the money of their respective countries?

Course of exchange.

	Cruz.	Reas.	
At Paris	560	300	at 490 $\frac{1}{2}$ reas per crown of 60 sols Tournois.
Amsterdam	1120	72	at 44 $\frac{1}{2}$ den. de gros per cruzado of 400 reas.
London	2128	163	at 5s. 6d. sterling per milrea.
Madrid	1250	250	at 830 reas per ducat of 375 marvades.
Genoa	1430	230	at 880 reas per piafre of 5 lire banco.
Leghorn	900	300	at 770 reas per piafre of 20 sols d'or.
Messina	2000	200	at 420 reas per florin of 12 carlins.

Of the EXCHANGE of LISBON upon FRANCE.

E X A M P L E.

To reduce 560 cruzados, 300 reas, of Portugal, into crowns of France, of 60 sols Tournois, the crown of exchange being at 490 reas per crown.

O P E R A T I O N.

Cruz. Reas.	
560 : 300	
400	
490 $\frac{1}{2}$ 224300 reas	(457 crowns, 45 sols, 3 deniers, for which the draught upon Paris ought to be made.

33 60	
) 22200(45	
265	
112	
) 1800(3	

I N S T R U C T I O N.

Multiply the 560 cruzados by 400 reas, the value thereof, and take in the 300, and divide the product, 224,300 reas, by the price of exchange, of 490 reas, and the quotient will give 457 crowns, with a remainder of 370; which multiplied by 60 sols, the value of a crown, and divided by the same divisor, the quotient gives 45 sols, with a remainder of 150; this multiplied by 12 deniers, the value of a sol, and divided by the common divisor, it produces 3 deniers, to be received at Paris for the said cruzados, &c.

Of the EXCHANGE of PORTUGAL upon HOLLAND.

E X A M P L E.

To reduce 1120 cruzados, 72 reas of Portugal, into florins and sols bank money of Amsterdam, the course of exchange being at 44 $\frac{1}{2}$ deniers gros per cruzado.

O P E R A T I O N.

1120 cruzados, 72 reas, to be multiplied	
By 44 $\frac{1}{2}$ deniers gros, the exchange.	
4480	
4480	
280—for $\frac{2}{3}$ = $\frac{1}{3}$	of 1120 cruzados
140—for $\frac{1}{3}$ = $\frac{1}{3}$	
5 $\frac{1}{3}$ for 50 reas = $\frac{1}{3}$	of the exchange-price
2 $\frac{2}{3}$ for 20 reas = $\frac{1}{3}$	
$\frac{1}{3}$ for 2 reas = $\frac{1}{3}$	of 20 reas
410)4970(8 deniers gros.	

1242 florins, 14 sols, bank money, for which the draught on Amsterdam should be made.

I N S T R U C T I O N.

Multiply the sum of the cruzados by the price of exchange, and divide by 40, the deniers in a florin, and there will remain 28, the half of which is 14 sols bank money, to be received at Amsterdam.—For the proof hereof see the article HOLLAND, Vol. I.

Of the EXCHANGE of PORTUGAL upon LONDON.

E X A M P L E.

To reduce 2128 cruzados, 163 reas of Portugal, into pounds, shillings, and pence sterling money of England, the course of exchange being 5s. 6d. sterling per milrea of Portugal.

O P E R A T I O N.

P O R

OPERATION.

By 400
851 1/2 363
And multiply again by 5 : 6, the price of exchange
4255 d.
425 : 6, for the 6d. [price of exchange.
1 : 1, for the 200 reas, the 1/2 of the
0 : 6, for the 100 ditto, the 1/10 of ditto.
0 : 5, for the 63

Shillings ster. 210(468)2 : 6(

1.234 : 2 : 6, sterling money, for which the draught ought to be made upon London.

INSTRUCTION.

Reduce the crusadoes into reas, in multiplying by 400 the value thereof in reas, taking in the 163 odd reas, and the product will be 851 1/2 363 reas, which multiplied by the price of exchange, and the aliquot parts taken as above, and added, make shillings sterling, which divided by 20, give pounds, shillings, and pence sterling.—For the proof hereof, see the article ENGLAND, Vol. I.

Of the EXCHANGE of PORTUGAL upon SPAIN.

EXAMPLE.

To reduce 1250 crusadoes, 250 reas of Portugal, into rials of plate of 16 quartos of Spain, the price of exchange being 830 reas per ducat of Spain of 375 marvadees.

OPERATION.

1250 crusadoes, 250 reas, to be multiplied
By 400 reas
500250 reas, to be multiplied
By 375 marvadees of Spain
2501250
3501750
3501750
Answer.
282210 1875937510 (6647 rials, 18 marvadees of old plate,
16932 ... for which the draught must be made
on Madrid.
18273 Price of exchange.
16932 830 reas
13417 34 marvadees

21295 3320
19754 2490
1541 28220 divisor.
34
6164
4623
52394(18

INSTRUCTION.

Reduce into reas the 1250 crusadoes, 250 reas, in multiplying them by 400, the value of the crusadoe, the product will be 500250 reas; these multiplied by 375 marvadees, the value of the ducat, the product thereof will be 187593750, for a dividend.
Multiply the 830 reas, the price of exchange, by 34 marvadees, the value of a rial, and the product will be 28220, for a divisor.
Carry on the division, and you will have a quotient of 6647 rials, with a remainder of 1541, which being multiplied by 34 marvadees, and divided by the same divisor, it gives 18 marvadees old plate, to be received at Madrid: for the proof of which, see the article SPAIN.

The EXCHANGE of PORTUGAL upon GENOA.

EXAMPLE.

To reduce 1430 crusadoes, 230 reas of Portugal, into piaftres, fols, and deniers d'or, bank money of Genoa, the price of exchange being 880 reas per piaftre of 5 lires of Genoa.

P O R

OPERATION.

1430 crusadoes, 230 reas, to be multiplied
By 400 reas
572230 (to be divided by the price of exch. of 880 reas.
442 (650 piaftres, 15 fols, 2 deniers, bank money,
for which the draught upon Genoa should be made.

INSTRUCTION.

Reduce into reas the 1430 crusadoes, 230 reas, in multiplying them by 400 reas, the value of a crusadoe; divide the product, 572230, by the price of exchange, 880 reas, and you will have a quotient of 650 piaftres, with a remainder of 23: this multiplied by 20 fols, the value of the piaftre, and divided by the same, it will give 5 fols, and 20 for a remainder; which multiplied by 12 deniers, the value of the fol, and divided again by the common divisor, it gives 2 deniers bank money, to be received at Genoa.—For the proof of which, see the article GENOA, Vol. I.

Of the EXCHANGE of PORTUGAL upon LEGHORN.

EXAMPLE.

To reduce 900 crusadoes, 300 reas of Portugal, into piaftres fols, and deniers d'or of Leghorn, the exchange at 770 reas per piaftre of 20 fols d'or.

OPERATION.

900 crusadoes, 300 reas, to be multiplied
By 400
77010 360300 (to be divided by the exchange of 770 reas,
5211 467 piaftres, 18 fols, 5 deniers d'or, for which
67 the draught must be made upon Leghorn.

INSTRUCTION.

Reduce the 900 crusadoes, 300 reas, into reas, in multiplying by 400 reas, the value of the crusadoe; divide the product 360300, by the price of exchange, of 770 reas, and you will have a quotient of 467 piaftres, 18 fols, and 5 deniers d'or to be received at Leghorn; for the proof of which see the article TUSCANY, where you will find the port-town of LEGHORN.
The remainder of the first division must be multiplied by 20 fols d'or, the value of the piaftre, and that of the second by 12 deniers, the value of the fol, and dividing by the same, it will give 18 fols, 5 deniers d'or.

The EXCHANGE of PORTUGAL upon MESSINA.

EXAMPLE.

To reduce 2000 crusadoes, 200 reas of Portugal, into florins, ounces, tarins, grains, and piccioli of Messina, exchange at 420 reas per florin of 12 carlins.

OPERATION.

2000 crusadoes, 200 reas, to be multiplied
By 400 reas
4210 800200 (reas, to be divided by the exchange of 420 reas.
38210 (1/3) 1005 florins, 1 tarin, 8 grains, 3 piccioli.
381 ounces, 1 tarin, 8 grains, 3 piccioli;
for which sum the draught must be made upon Messina.—For the proof of which, see the article SICILY, upon PORTUGAL.

INSTRUCTION.

Reduce into reas the 2000 crusadoes 200 reas, in multiplying by 400 reas, the value of a crusadoe, and divide the product, 800200 reas, by the price of exchange of 420 reas, and the quotient will be 1905 florins, and 10 for a remainder; which multiplied by 6 tarins, the value of a florin, and dividing the product by the same, it gives 1 tarin, with a remainder of 18, which also multiply by 20 grains, the value of the tarin, and dividing by the common divisor, you will have 8 grains, and a remainder of 24; this again multiplied by 6 piccioli, the value of a grain, and being divided by the same, it produces 3 piccioli.
To reduce these florins, &c. take the 1/3 (because the ounce is equal to 30 tarins, and the florin 6 tarins) and you will find that you have to receive at Messina 381 ounces, 1 tarin, 8 grains, and 3 piccioli, for the same.

ADVERTISEMENT.

With relation to negotiating bills of exchange in Portugal, it must be observed, that

Ufance { Of France
Of Holland
Of England
Of Genoa
Of Leghorn
Of Venice } is two months, comprehending the date; and that there are 6 days of grace allowed after the bill becomes due.

Of the ARBITRATION of the FOREIGN EXCHANGE wherein LISBON is concerned.

OPERATION.

Between AMSTERDAM, LONDON, LISBON, and LYONS,

If - - 1 florin banco = 402 deniers gros banco
And 100 den. gros banco = 99 1/2 ditto, provision deduct.
And 12 ditto - - = 1 fol gros banco
And 17 3/4 fols gros banco = 240 pence sterling
And 11 1/2 pence sterling = 99 1/2 d. ster. provision deduct.
And 66 ditto - - = 1000 reas.
And 500 reas - - = 3 livres Tournois, what will 2000 florins banco make?

17 x 11 = 187, the divisor.
9900 1/2 x 20 x 4 = (2 x 2), the dividend.
The quotient will be 4235 livres, 8 fols, answer.

Again,

OPERATION.

Between AMSTERDAM, LONDON, LISBON, LEGHORN, and LYONS.

If - - 1 florin banco = 402 deniers gros banco
And 100 den. gros banco = 99 1/2 ditto, provision deducted
And 12 ditto - - = 1 fol gros banco
And 17 3/4 fols gros banco = 240 pence sterling
And 11 1/2 pence sterling = 1000 reas
And 770 reas - - = 31 fols Tournois for Leg.
And 100 fols Tournois = 99 1/2 ditto, provision deducted
And 60 ditto - - = 3 livres Tournois, what will 2000 flor. banco amount to?

17 x 11 x 77 = 14399, divisor.
985074 1/2 x 31 x 2 = 61074642 1/2, dividend.

Which gives for quotient 4241 livres, 13 fols, the answer, and the product of the circulation upon the above said places.

Another EXAMPLE.

Amsterdam being to remit to London 750l. Flemish, the negotiator first sends it to France, at 12 crowns per pound Flemish; from thence to Venice, at 100 crowns per 100 ducats; from thence to Hamburg, at 100 grots per ducat; from thence to Portugal at 50 grots per crusadoe of 400 reas; and from Portugal to London, at 3000 reas per pound sterling: it passing through so many places, the question is, how much sterling money must be received in London for the above said remittance, exclusive of charges?

1 l. Amsterdam = 3 crowns
Crowns French = ducats of Venice
1 Ducat = 20 grots of Hamburg
Grots of Hamb. = 8 reas of Portugal
Reas of Portugal = 1 l. sterling

3 x 20 x 8 = 480l. sterling, to be received in London.

REMARK.

In order to understand the reason and foundation of the preceding operations, the reader is desired to consult the articles ARBITRATION of EXCHANGES, ENGLAND, GENOA, HOLLAND, SICILY, SPAIN, TUSCANY, VENICE, and UNITED PROVINCES. Under these heads, also, is shewn the application of the foregoing general arbitratinal rule, to the weights and measures, as well as to the monies of foreign countries.

Suppose again that Antecedents. Consequents.
5 l. Amsterdam = 12 French crowns
100 French crowns = 100 ducats of Venice
1 Ducat Venice = 100 grots of Hamb.
50 Grots Hamb. = 400 reas of Portu.
3000 Reas of Portugal = 1 l. sterling
How much sterling at London = to 750l. Flemish?

Now, suppose that you would find out the antecedent of the 400 reas of Portugal belonging to the foregoing question; dispose of the terms as follows, omitting the antecedent 400 reas, after which abridge, as directed under the preceding heads; then multiply and divide, and you will find 50 grots of Hamburg to be the antecedent: thus

5 l. Flemish = 12 crowns
100 Crowns = 100 ducats
1 Ducat = 100 grots
— Grots = 400 reas
3000 Reas = 1 l. sterling
480 l. sterling = 750 l. Flemish

which abridged, will give 25 x 2 = 50 grots of Hamburg, the antecedent required by the question. Let it be proposed to find the antecedent to 1 l. sterling, which must be reas, because the consequent that precedes it is 400 reas.

Antecedents.	Consequents.
5 Amsterdam	= 12 French crowns
100 French crown	= 100 ducats of Venice
1 Ducat of Venice	= 100 grots of Hamburg
50 Grots of Hamburg	= 400 reas of Portugal
Reas of Portugal	= 1 l. sterling
480 l. sterling	= 750 l. of Amsterdam

The above abridged, as directed under the heads referred to, will give 12 x 2 x 5 x 25 = 3000 reas, according to supposition.

Suppose, also, that you would find the consequent of the antecedent of 50 grots of Hamburg, pursue the same method as directed in the last question, and you will find it to be 400 reas; for the terms being properly ranged and abridged, the answer will turn out 50 x 4 x 2 = 400 reas, which answers the question.

The application of this rule to find the just par of monies of exchange, according to the INTRINSIC VALUE of the real monies, by taking this value according to the weight and standard.

EXAMPLE.

To find the par of money of exchange between France and another state or kingdom, by the means of the real silver money, for instance, of the piafre of Spain, of 8 rials of old plate, or 128 quartos, by that of the effective piafre, marked with two globes, we must previously understand, that

170 Quartos is the value of this effective piafre in Spain,	} in France.
506 88/100 Grains is it's weight	
4608 Grains is the number that the mark contains	
529 Grains fine is the standard that the coinage gives to this piafre	
262 Grains fine is that of the French silver crown	
576 Grains is the number that the ounce contains	} in Spain.
277 1/2 Grains is the weight of the crown, 60 fols is now it's value	
128 Quartos is now the value of the piafre of exchange in Spain.	

These preliminaries being known, we must proceed, according to the foregoing conjoint rule, by antecedents and consequents, as follows:

If 170 quartos - - = 1 piafre effective
And 17 such piafres weight = 506 88/100 grains
And 4608 gr. are receiv. for stand. = 259 grains fine
And 262 grains fine - - = 8 oz. of French crowns
And 1 such ounce weight = 576 grains
And 277 1/2 grains of silver - - = 60 fols Tournois, how much are 128 quartos worth?

Answer, 81 fols, 6 deniers Tournois.

OPERATION.

617992 1/2 divisor) 50412224 divid. (81 f. 6 de.
As this fraction produces nothing, is the answer, and the
we suppress it, though if you con- solution of the rule.
6 R vert

vert it into a decimal of $\frac{1}{10}$, for greater precision sake, you may divide by it; yet it will occasion no alteration deserving practical notice.

I N S T R U C T I O N .

Multiply the antecedents together for a divisor, which will give 617992 $\frac{1}{2}$; and the consequents, which will produce 50412224, for a dividend, and the quotient will be 81 fols, with a remainder of 354872, to be multiplied by 12 deniers, the value of a fol, and dividing by the same divisor, it will give 6 deniers: so that the par of the exchange piastre of 8 rials old plate, of 16 quartos each, is in France equal to 81 $\frac{1}{2}$ fols, estimating the standard of the piastre with two globes at 10 deniers 19 grains, as the coinage-office at Lyons receives it; and as they give in evaluation for the French crown of 60 fols, which is it's current value. But if the par of this exchange-piastre is required, according to the standard of which the piastre of two globes is received in the mint of France, instead of 10 deniers 19 grains, or 259 grains, you should substitute, in the course of the operation, 261 $\frac{1}{2}$ grains, and only 56 $\frac{1}{2}$ fols; which is the proportional price of the mark of the said French crowns, paid by the mint instead of 60 fols currency.

In this case, the conjoint rule should be thus constructed :

$$\begin{array}{r} \text{If } 170-506 \frac{1}{100} \\ 4608-261 \frac{1}{2} \\ 262-8 \\ 1-576 \\ 277 \frac{1}{2}-56 \frac{1}{2}-128? \text{ Or, if } 170-506 \frac{1}{100} \\ 4608-261 \frac{1}{2} \\ 262-46 \text{ liv. } 18 \text{ fols}-128? \end{array}$$

The answer to these positions is 77 $\frac{1}{2}$ fols :

To which may be added, for the 4 den. per } 1 $\frac{1}{2}$
livre, given upon 10,000 livres - - -

Then the par of the piastre will be, accord- } 78 $\frac{1}{2}$ fols Tour.
ing to this operation - - -

The 46 livres 18 fols of the last consequent, are the price at which the mark is estimated with the French crown, in the mint of France.

And if you will suppress several proportions, to substitute in their stead the number only of piastres of two globes contained in the French mark, that is to say 9 $\frac{1}{4}$, and the price that is paid in their mints, which is 46 livres 9 fols, you must then form your rule thus :

$$\begin{array}{r} \text{If } 170 \text{ ----- } 1 \text{ piastre} \\ 9 \frac{1}{4} = 46 \text{ livres } 9 \text{ fols} \\ 1 \text{ livre } 20 \text{ fols. How many}-128? \text{ The answer is,} \\ \text{a little less than } 77 \text{ fols,} \\ \text{To which we add as above - - - } 1 \frac{1}{2} \\ \text{The true par, according to this operation - } 78 \frac{1}{2} \text{ fols.} \end{array}$$

You will observe that there is a difference of 6 deniers between the two preceding pars, which is occasioned by reason that the mint pays the mark of the French crown, as if it was of the standard of 11 deniers, or 264 grains; whereas it is in effect but of 10 deniers 22 grains; for if, instead of the antecedent of 262 grains, we had placed the said 264 grains, the two answers would have come out equal.

81 $\frac{1}{2}$ fols is the par of the first operation,
78 $\frac{1}{2}$ fols is that of the last,

3 $\frac{1}{2}$ fols is the difference; which evidently proceeds from this, that the French crown issued by the mint for 60 fols, pays no more than 56 $\frac{1}{2}$: and this difference would be still greater, even 5 $\frac{3}{4}$ fols, if the assay-office, instead of receiving the said effective piastre at the standard of 10 deniers 19 grains, should receive it at the mint at that of 10 deniers 21 $\frac{1}{2}$ grains. This being the case, you will ask, How comes it to pass that any one will carry these to the refiners? The answer is, Because they give in payment ingots which the commerce of Lyons affords, that are worth more than 50 livres the mark of the standard of 10 deniers 20 grains.

Observe that to find the par of the places or countries to which France gives the variable course of exchange, you should place in the proposition the value in such country, of the effective specie, and that also of exchange, as is done in finding the par of the exchange piastre of Spain, by placing to the first antecedent of the rule, 170 quartos, and 128 to it's last term.

But it must not be so for the places or countries to which France gives the certain or invariable money: since in that case, you would find what will be given for the intrinsic value of the French crown, which is composed of fols, and then you must place in the proposition the price in fols that the mint pays for the mark of the said crown: that is to say, at 46 livres 18 fols, or 938 fols, to the first antecedent, and to the last term of

the rule the 56 $\frac{1}{2}$ fols of the crown, according to the course of exchange, and passes current for 60 fols; which is done for England and Holland, France giving the certain and invariable exchange crown for an uncertain price of exchange.

O P E R A T I O N .

If 938 fols, the value of the mark of the French crown, are for 8 ounces,

And 1 ounce contains 576 grains weight,

And 565 grains weight of the English crown are worth there 60 pence sterling, what will 65 $\frac{1}{2}$ fols be worth?—Answer, 29 $\frac{1}{2}$ pence sterling.

Note, The standard of the English crown-piece being the same with that of the French crown, we must only place, in the construction of the rule, it's weight and it's value in the country; and as the 4 deniers per livre are not added to the first consequent, you are not to take notice in the last term of the rule of the 56 $\frac{1}{2}$ fols.

But the standard of Holland being different from that of France, the rule must be thus constructed :

If 938 fols are given for the standard of 262 grains fine, And 245 grains is the standard of the mark, containing 4608 grains weight.

And 536 grains is the weight of the crown of Holland, there worth 100 deniers gros; What will be 56 $\frac{1}{2}$ fols be worth? Answer, 53 deniers gros, and a little more.

R E M A R K .

If the effective piastre should be diminished in Spain to 160 quartos, instead of 170 that it is there worth; the first antecedent of the arbitrational rule being diminished, and the divisor, in consequence thereof, to 581640, it undoubtedly follows, from this diminution, that the quotient must be greater, since, instead of the par of 81 $\frac{1}{2}$ fols, of which we have spoken, it will give 86 $\frac{1}{2}$ fols.

And if the price of the Spanish piastre remaining of the same value in Spain, the price of the French crown should rise to 70 fols, the product of the multiplication of the consequents becoming thereby greater (to 58814208) the divisor being the same, the par, or the quotient, will be greater in the like proportion, that is to say, 90 $\frac{1}{2}$ fols.

If France, by increasing the price of their crown, the par with Spain should only increase, it is not easy to conclude, that, if France diminishes the price of this same crown, the par in question should also diminish in the same proportion; and, if there was both in Spain and France an augmentation of specie, exactly proportioned the one to the other, the par whereof we have treated will be the same, 81 $\frac{1}{2}$ fols; and in like manner, if the augmentation was, at the same time, more considerable, both Spain and France.

Upon these certain principles, in relation to the par between France and Spain, to which France gives the uncertain price, to receive the certain, you may easily fix your point in view, and form your rule of conjunction accordingly, to obtain the par of Holland, &c. &c. to which France gives the certain for the uncertain price of exchange.

General REMARKS upon the whole of this part of EXCHANGE.

1. There is more difficulty, perhaps, in this matter of calculating the par of money between nation and nation, than most people imagine, yet there is no one who has fully discussed it; but since it is what ought to be well understood, as well by persons of quality as by merchants, we shall observe, by way of further illustration, that all foreign coin is esteemed as bullion to us, and ours as bullion to them; so that the extrinsic value regards chiefly the temporary interest of foreign money negotiations, in their commercial, or foreign banking concerns.

2. Another point requisite to be observed, is the fineness of our own coin, and the weight and fineness of the foreign, which we are to receive in exchange; and this knowledge of the foreign must be acquired, either by the experience of some assay-master of allowed repute and accuracy [see the articles ASSAY and COIN], or by the merchant's actual assay, few of whom are at all acquainted with the art of ASSAYING and REFINING, and, therefore, are obliged to depend on the representation of workmen who make it their business, or on the assay-master at the Tower, or Goldsmiths-Hall, on whom it is thought we may more safely depend, than on the ordinary assay-masters, though many of them are very accurate in their assays.

Admit it were required to know how much sterling bullion, or coin may be given for 1000 pieces of eight Seville.

$$\begin{array}{r} \text{The fineness of our coin we know is - - - } 11 : 2 \text{ oz. dwt.} \\ \text{And suppose the fineness of a piece of eight, we } 11 : 3 \\ \text{will suppose to be, though more or less - - - } \\ \text{And it's weight 17 dwts. 12 grains,} \\ \text{Or the weight of 1000 pieces we find to be - - } 875 : 0 \\ 3. \text{ The} \end{array}$$

3. The third particular is, to know how many ounces of silver, 11 oz. 2 dwt. fine, are equal to 875 oz. of 11 oz. 3 dwt. fine; which is found by single indirect proportion thus:
 oz. dwt. oz. dwt. oz.
 11 3 : 875 :: 11 2. to 878,94144 decim. the answer.

Here it is found that we may give 878,94144 oz. of bullion, 11 oz. 2 dwt. fine, for 875 oz. of bullion of 11 oz. 3 dwt. fine (or for 1000 pieces of eight Seville of the aforesaid standard) which if paid in coin, we must, for the 1000 pieces of eight, pay l. 227 : 1 : 2 $\frac{1}{2}$ sterling: for

Grains. Grains.
 1858,0645 : l. 1 sterling :: 421891,89 : l. 227,059 sterling.

That is to say, as 1858,0645 (the grains in l. sterling) are in proportion to l. sterling, so is 421891,8912 (the grains in 878,94144 ounces of bullion, 11 oz. 2 dwt. fine, which are equal in value to the 1000 pieces of eight) to l. 227,059 sterling, or l. 227 : 1 : 2 $\frac{1}{2}$.

4. But so often as I can buy 878,941 ounces of bullion for less than l. 227 : 1 : 2 $\frac{1}{2}$, (which we can always do so often as sterling silver is under 5s. 2d. per ounce) so often we gain by making our exchange in bullion: if, however, we can buy bullion for 5s. 1d. per ounce, at that rate the 878,941 ounces (which we are to give for the 1000 pieces) will stand me in l. 223 : 7 11 $\frac{1}{2}$, which is less than l. 227 : 1 : 2 $\frac{1}{2}$ (the sum we pay in exchanging coin) by l. 3 : 13 : 2 $\frac{1}{2}$, which is my gain by exchanging in bullion: thus in exchange, the par of money and bullion ought to be considered, as well as the par of domestic and foreign coins.

5. Though the foregoing rules, judiciously applied, contain the method of calculating the par of money; yet, since the price of exchange is agreed on in the currency of negotiations by bills of exchange, it is useful to know how much sterling money each of these foreign pieces are worth; for which reason we have, under the article COIN, shewed, according to the assays of Sir Isaac Newton, the intrinsic value of the chief gold and silver coins of Europe; whereby the merchant will know when he may negotiate therein to advantage, and the politician also be informed whether the nation gains or loses in the balance of trade with such nation.

The standard of the gold coin of this kingdom is 22 carats fine, and 2 alloy, per pound of gold; and 11 oz. 2 dwt. fine silver, and 18 dwt. alloy, the standard pound of silver; and the division of the pound of gold is into 44 $\frac{1}{2}$ guineas, and the silver into the usual number of crowns. The guineas have varied in the nominal value several times, rising up to 30 shillings, and declining to 21, the present current value, but never have been reduced again to the level of 20 shillings, nor indeed ought, when compared with the Portugal pieces of 3l. 12s. or 1l. 16s, it appearing to be better worth 21 shillings.

	To the lb. Troy.	l. s. d.
Portugal	l. 3 : 12	13 46 : 16 : 0
English guineas	1 . 1 - 44 $\frac{1}{2}$ -	46 : 14 : 6

And the Portugal standard worse $\frac{1}{4}$ grain - 0 : 1 : 6
 0 : 2 : 6

Total worse in lb. Troy, by standard and tale l. 0 : 4 : 0

This, with the difference in point of exactness in coining, wherein the Portugal is more defective than the English coin, may be good reasons for their being refused in payments in the receipts of the public revenue; but answer very well the purposes of those who benefit by the irregularity in trading with the heavier, and passing off the lighter by tale, and which if they can turn into guineas or heavy silver, make another gain.

A SHORT ACCOUNT of the COMMERCE of PORTUGAL, on a very INTERESTING OCCASION.

The Portuguese themselves, carry on no active commerce of consequence with any other European dominions: the British, French, Germans, Dutch (and those who go under the denomination of Hamburgers), Danes, Swedes, Spaniards, and most of the states of Italy, having consuls and factories settled in Lisbon: and some of them, particularly the English, have the same at Oporto; also a few houses in Viana, Figeira, Faro, and likewise on the island of Madeira. Of these people, the Portuguese merchants purchase the necessary commodities for their India, Guinea, and Brazil commerce; as the town and country dealers do those for their home consumption. And the same merchants purchase of the natives, or take in barter, the several products of their dominions, which they export to the countries proper for their sale.

The native exports of Portugal are wine, lemons, oranges, dried figs, ordinary raisins, almonds, salt, oil, cork, thumac, tunny fish, and other smaller articles. Wool used likewise to be exported in considerable quantities, but the extraction of it from that kingdom is now prohibited. However, there

is reason to believe, that the Dutch get a good deal of it off still under the name of Spanish wool, by the help of forged certificates and false swearing; of which bad practice the Portuguese make as little scruple for gain, as even the worst of our own countrymen.

The commodities the Portuguese bring from their foreign dominions, and sell chiefly at Lisbon, for other European countries, are diamonds of Brazil and India, sugars, tobacco, Brazil-wood of several sorts, cocoa-nuts, coffee, cotton, pepper, several sorts of drugs, some inferior kind of spices, whalebone, raw and tanned hides, elephants teeth, arrac, orchella, citrons, and occasionally China ware, Indian silks, and cotton piece-goods. And here it may be proper to observe, that all their India commerce is going to be made more regular and extensive. To these exports we shall add, silver and gold. The former, as no product of their own, is allowed to be shipped off by entry and licence. The latter is not, except for corn in time of great want, and by stipulation for some articles they receive from Sweden. But in either of those cases, the procuring of the licence would be attended with so much trouble, that it is rarely, if ever, solicited. However, in their exports, gold must be, and is, understood as a COMMODITY, at the exportation of which Portugal ought to wink, or they could not carry on any of their other commerce. But Britain receives as small, or a smaller proportion of gold, than any other nation trading with Portugal, as will be apparent from a general view of their commerce, notwithstanding the weight of that accusation in Portugal is levelled at us, through the folly and ignorance in some, and from a want of spirit, abilities, and resolution in others; for Portugal, of all kingdoms in the world, has the least reason to misuse or affront Great-Britain. The imports in Portugal, for their home and colonies consumptions, are almost all things necessary for the support, convenience, ornament, or luxury of life; of most of which articles we shall give some account, when we come to treat separately of the trade of each country.

The nature of the government of this kingdom, which is entirely absolute, has too strong a tendency to oppressions, destructive of industry, especially in those parts of the country where the climate is an additional encourager of laziness, as well as the promoter of vice. To which may be added, the invincible pride of all noble and genteel families, every branch of whom will absolutely starve, rather than use any sort of employment for their support. But above all, the burthens of priests, friars, nuns, and the superstitious influence they have over the people, as well as an universal litigious disposition in the whole nation, conspire to make every order of the people in that country poor. These, joined to the natural sterility of the soil, the number of soldiers necessary to garrison a country which is almost all frontier, and whose pay is so small as to oblige them to a life of celibacy, the great number of religious orders of all sorts, and the necessary draught of people for their immense extent of territory in America, keeps the mother-country continually weak in people. So that they do, and must always, depend on the succours and supplies of other nations, both for their protection and subsistence.

But the all-wise dispenser of blessings, to supply their deficiency in strength, and the extent of kingdom, as well as of the exterior wealth of the earth, and even industry, has given them a treasure from under it. Their gold and diamond mines in America, have enabled their monarchs of late, to figure amongst the great potentates of Europe, and made them generally respected, from the convenient and necessary commerce carried on to their dominions, greatly beneficial to all. The people of Portugal in general, look on no nation with so evil an eye as Spain: France they have no affection nor esteem for; and always express a just sense of the natural connection they have with Great-Britain in commerce and interest, as well as faith and reliance on our support in times of need.

We shall now return to the state of the commerce; and, for the reasons given above, must observe, the native poverty of Portugal was so great, on the discovery of their gold mines, that they would have found it impossible to have worked them, but from the credit given by other countries, and particularly Great-Britain, in the necessary commodities for that purpose. And as their returns of bullion augmented, their credit from us, and by degrees all other countries, grew greater; and though now considerably enriched themselves, they still work their very mines, and carry on almost all their colony commerce, and much of their home trade, with foreign capitals. For they are credited with all articles of traffic, 'till the returns come round: inasmuch that the merchants of other countries, not only stand the disburse of the cost of their goods, and the charges of transporting them to Portugal, but also of the king's duties there, (which are very high on most of the articles that are re-exported) 'till, as was said before, the returns for them arrive. A custom and confidence so greatly advantageous to the king, as well as the subjects of Portugal, that the foreign merchants settled among them, especially the English, ought to live under the fairest and strongest protection, even had they

they no treaty to exact it; because, on the support of the foreign factories, that necessary credit must depend: for, without such merchants or factors residing in the kingdom, no such credits could with safety be given, nor would it be so at all: and this as strongly behoves every nation, that would preserve it's commerce to that kingdom, to support it's merchants established there; otherwise the trade of that country will go gradually declining, and at last be entirely lost.

The exports from Portugal to the Baltic, are some cargoes of salt, a few lemons and oranges, a little arrac, and a meer trifle of wine; so that the balance paid in specie must be exceeding great.

From Hamburg and other neighbouring ports are imported immense quantities of German linens of all kinds and qualities; and, occasionally, many of the Baltic commodities.

The exports of Hamburg and it's neighbouring ports, are some salt, sugar, and tobacco, whalebone, a little wine and arrac, a few lemons, oranges, and dried figs, some cocoa-nuts, coffee, cork, citrons, a few India goods occasionally, and other trifling articles; the whole of which, however, cannot amount to one quarter of the value of their imports, consequently the balance paid in specie must be very great. It is, notwithstanding, to be acknowledged, the silver imported into Lisbon is chiefly in return for German linens, and ordinary English woollen goods; a trade greatly beneficial to Portugal.

From Holland are imported great quantities of fine thin woollen cloths, hair camblets, linens, spices, cordage, anchors, and all sorts of naval stores, most of the Baltic commodities, all kinds of grain, prodigious quantities of small round cheeses, coach-horses, arms, ammunition, and accoutrements of war, indigo, toys, and other articles.

The exports for Holland are a few lemons, oranges, and dried figs; a small quantity of wines, some candied citrons, orchella, wool (under certificates of it's being Spanish), several cargoes of salt; diamonds, whalebone, a little sugar and tobacco, Brazil-wood, some cocoa-nuts, coffee, Brazil hides, India goods, in considerable quantities, when to be had at public sale; cork, shumac, canes for weavers, and other articles. The balance paid by Portugal to Holland in specie, and absolutely carried over in their own ships, &c. is very great.

The French send to Portugal fine woollen cloths, various kinds of stuff, particularly a sort of black goods called druggets, of which they sell immense quantities for the habits of the clergy (having thereby entirely destroyed the consumption of ENGLISH CRAPES, once a very important article of our trade), wrought silks, a great quantity of linens and cambricks, dressed CALVE-SKINS (another branch taken from us), HATS, SILK-STOCKINGS (both of which articles they are also getting from us every day), all sorts of toys, furniture, ribbands, and most of the ornamental parts of female dress; grain of all kinds, when they have it to spare, and sometimes in immense quantities; claret, champagne and brandy, though prohibited, are smuggled in; as are flowered and figured silks, gold and silver laces, India goods, and other contraband commodities: they likewise import printed books, some ordinary sort of cutlery ware, and an abundance of smaller articles, which it would be too tedious to enumerate.

By the help of wool smuggled from us, the French have made attempts to rival us in Portugal, in our very great article of LONG-BAYS, but hitherto without success. God grant their future endeavours, aided by our inattention, may not bring such a project to bear.

The French take from Portugal some raw hides, a small quantity of fruit, a few cocoa-nuts, and occasionally a little pepper; also some Brazil wood, and orchella. They formerly, likewise, used to receive some Brazil diamonds, but I think they now prohibit the importation of them in France. So that Portugal pays them a very great balance in bullion, and for articles, in general, the least necessary of any they import.

The Portuguese take from Spain immense quantities of cattle, both for labour and slaughter, a great deal of Biscay iron, a vast many cheap wrought silks and velvets (most of which are smuggled, to defraud the king of his duties), many cargoes of a thin strong kind of rushes, for ordinary cordage, and other uses; printed books, some dried raisins, and occasionally corn and oil, and some other commodities.

The Spaniards take from Portugal, cured tunney-fish, some tobacco, a few sugars, some cocoa-nuts, which are smuggled in, as is also a vast quantity of specie; some part of which balance Portugal, however, gets from them again, by the same method, in another part of the world. To this article we must also add, the vast sums of money Portugal pays to Spain for the labour of the people of Galicia, who are the principal ordinary working persons at Lisbon, and in many other cities; they come young into Portugal where they work hard, and fare hard, for a considerable number of years: and then retire with incredible sums, for such people, to their own country.

The Italians import into Portugal immense quantities of wheat, a great deal of barley, and also a good deal of Levant rice, vermicelli, and oil occasionally. They likewise import a prodigious quantity of writing paper, abundance of wrought silks and velvets, coral, and many expensive curiosities; great quantities of glass beads, for their Guinea and home consumption, a great many cotton goods (by special licence from Malta), many toys, and other inferior articles; not to particularize religious traffic, which is very great and public.

The Italians export from Portugal hides, a considerable quantity of sugars and tobaccos, cocoa-nuts, pepper, ordinary spices, elephants teeth, Brazil wood, some drugs, and an immense quantity of bullion. Inasmuch that of late, while gold bore so high a price in England, it has been a drug all over Italy: a circumstance well worthy of British attention.

The exports from England to Portugal are long bays of all kinds, Colchester bays, Spanish, Yorkshire, and some few Gloucester cloths; long-ells, shalloons, says, serges, Spitalfields, Norwich, and Coventry stuffs of various kinds; printed linens, watered tabbies, silk and worsted stockings, hats, great quantities of Birmingham and Sheffield wares, some wrought plate, lead, shot, copper, pewter, tin, coals, corn of all kinds, pulse, flour, biscuit, iron, hoops, toys, watches, arms and accoutrements of war, some cordage, shipchandlery articles; and, in fine, almost every thing produced or made here that is useful, and cheaper than in other countries.

From Scotland they have barley, and a little cured ling.

From Ireland they receive butter in great quantities, salted beef and pork, salted salmon, and some ordinary camblets, barley and potatoes.

From Newfoundland, New England, and Nova Scotia, dried cod-fish, and particularly from the former place, in great quantities.

From Carolina, several cargoes of rice.

From New York, Philadelphia, Virginia, and Maryland, wheat, flour, Indian corn, biscuit, pipe-staves, bees wax, and lumber.

They also buy most of their commercial shipping from us, some river built, by order, but mostly of Old or New England construction, that have been used.

We export from Portugal almost all the wines that are shipped from their whole dominions, including the western islands and Madeira. The fame of lemons and oranges, salt for all our fisheries, and most of our colonies use, in North America; for our fisheries in England and Scotland, and to Ireland prodigious quantities for their fisheries, exported provisions, and the whole national use; dried figs, raisins, almonds, cork, shumac, orchella, citrons, sugars of late, in very great quantities for Ireland, near, if not sufficient, for that kingdom's consumption, and from thence we have heard a great many, when refined, have been run into England; the whole to the great reproach of our colony management, as is also our traffic there in French sugars. Diamonds, both of Brazil and India, Brazil wood, arrac, and occasionally other Indian commodities, which our ships smuggle into many parts of the British dominions; oil when they have it to spare, at a reasonable rate; and sometimes cocoa nuts, elephant's teeth, drugs, a few tobaccos and other articles.

N. B. I have not placed their cotton among the exports for any particular country, as hitherto they have not received great quantities from Marnham, and there are generally bidders upon it of all nations, who send it to those places where it is likely to turn to account, the importation, I think, being prohibited no where.

From this short view of the particulars of the Portugal commerce, it is apparent, that the trade of Great-Britain with Portugal, is the least burthenfome, and disadvantageous to them of any; that in no article do we enjoy any preference, or receive any favour; but, on the contrary, in the branch of fine cloths, a manifest injury.

I shall now recommend a few points, says this judicious patriot merchant, to the immediate consideration of whom they may concern.

And first, I recommend to some substantial fabricant, or public-spirited gentleman, to endeavour in some place where labour is cheap, to set a manufacture on foot that may rival the BLACK FRENCH DRUGGETS; an article which, if it could be brought to bear, would employ every inhabitant of a considerable village*.

* Since this worthy gentleman has suggested this matter, for the public benefit, I have also followed his example, and recommended the same to one of the most ingenious master woollen manufacturers in the kingdom, who resides in a cheap country, and who has assured me, that he will undertake the same, provided I can furnish him with patterns of that species of the French manufacture. Wherefore, I must request the favour of this public-spirited gentleman, to oblige me with patterns of such druggets as he would have our manufacturers imitate; and I hope to be able to give him an acceptable account of the success. They are desired to be directed, in a packet, for me, to be left with Mr Knapton, Bookseller, in London.

NEW REMARKS SINCE THE FOREGOING.

Since the above, I have received patterns of the beforementioned French druggets, and put them into the hands of certain manufacturers, in order that trials might be made thereof in our kingdom; and the trial has succeeded, with respect to the quality of the manufacture, but not in price, by every one who has attempted it. I have been informed, that one of the manufacturers did succeed at PENRYN IN CORNWALL; and it has been affirmed, that they were made so cheap, at the commencement of the last war, as to have been delivered at the Lisbon markets for the same price that the French do theirs.—But it seems, that it so fell out, that this branch of manufacture, which would have been attended with great national advantages, has been put a stop to, and the manufacturer almost ruined, because he voted according to his confidence for members of parliament, at the last general election.

Whether this can be done, since the encrease of our taxes, occasioned by the last war, I have never heard.

These light druggets, commonly called the French druggets, is a kind of cloth greatly esteemed by the Spaniards and Portuguese, for it's being well worked, though at the same time thin, light, and cheap. The French were the first introducers of this manufacture; and are, at this time, the sole vendors thereof in the Lisbon and Spanish markets, to the great detriment of our trade. These druggets are made in France of the best of the Spanish or Turkey wool, which are very well prepared and scuribled; and afterwards spun into the finest yarn that those wools will admit of.—When placed in the loom, the chain and filling, or warp and woof, must be of one quality, and be driven pretty close, as this cloth must not be beat up close after it is wove; (THESE LAST PARTICULARS ARE WHAT THE GENERALITY OF OUR BRITISH MANUFACTURERS HAVE ERRED IN) a yard of this cloth, which is half-ell wide, when finished, should not weigh above four ounces.

The French sell their druggets at Lisbon from 1s. 6d. to 1s. 10d. per yard. The French and Dutch superfine cloths, which they undersell us with, at the Lisbon and Turkey, and other southern markets, are greatly inferior to the superfine cloths which are made in England, for lasting; but this is not the principal quality which the inhabitants of those hot countries desire in their cloth. They desire a cloth, which is thin, and light, and of an inferior price to our superfine cloth; but, at the same time it must be well dyed, and look pleasing to the eye: this is the kind of cloth which the French and Dutch supply them with, and which our manufacturers cannot be brought to manufacture, because they imagine it greatly inferior to our own; but if we expect those people should buy our goods, we must supply them with such as are the most agreeable to them. Both of those branches of manufacture may be carried on in several parts of this kingdom; and, therefore, if the government would give a bounty for the exportation of those cloths, for a few years, till proper manufactures were established, by way of encouragement, and use every measure to annihilate all those taxes, will fall the heaviest upon our manufactures, and duly regulate all the poor of the kingdom, we shall be able to rival, and undersell both the French and Dutch at all the southern markets. See our articles, POOR, TAXES.

Secondly, To some of our northern counties, or to Ireland, I recommend, continues this gentleman, the making the sort of cheese sent by the Dutch to Lisbon; of which many cargoes go in a year: and I cannot think but in our country, they are to be made cheaper.

Thirdly, To whom it concerns, to support and extend our HAT TRADE; chiefly by preventing the sale of beaver to the French, and to encourage the importing of greater quantities of it.

Fourthly, Improving our silk-stocking business as much as possible, in point of cheapness and quality; particularly in gauze fabrics.

Of the extraction of gold from Portugal.

I am now, says this gentleman, to discuss the interesting point, that has puzzled so many weak heads; I mean the extraction of gold from Portugal, which has been ever foolishly represented as an immense evil to that kingdom, suffered, however, out of great kindness and particular favour to us, as is pretended.

Nothing is more evident, than that gold is, in itself, of no other value than for the necessary and convenient uses it can be put to. For example, I will suppose every Portuguese had his house full of that metal, and was at the same time in want (as he must be if he would not part with it) of comfortable food and raiment; might he not, in such a case, with propriety, be said, amidst his useless heaps of shining ore, to be miserable, poor, and wretched? What are individuals, or what is a state the better for dead and useless piles of wealth? It certainly might as well be kept under ground,

as brought above it to no purpose; nay, it had better be kept there, on such principles, than produced to the light; because the care and labour of working the mines would then be avoided.

Should the whole race of Portuguese fall again into their old penurious, and inelegant methods of life; feed upon pulse, or other such ordinary food, and that in a sparing manner, nay, even without cleanliness; when their own corn was exhausted, if they would content themselves with eating chestnuts instead of bread, as the poor, in bad years, yet do in the north part of their kingdom; or with the pods of the locust tree, which often supply the like wants to this day in Algarve: I say, if the people of the metropolis and other affluent parts of their kingdom, could condescend to forego the comforts of grateful food, kick off their shoes and stockings once more, and make, as in times past, an ordinary cloak their cloathing by day, and only bed by night, of what value would gold become? Or, in what shape could they propose to make it serviceable to them? For my part, I see no other use it could possibly be put to, than the buying of themselves, in time of need, a protection obstinately to possess a wretched and comfortless independence. Whereas, on the contrary, by parting with their gold in commerce to other kingdoms [see the article BULLION], they enjoy, not only the comforts, but elegancies of life; make a respectable figure in Europe, and are secure, singly from Great-Britain (while they are so wise as to preserve her friendship), of a fuller and safer protection than they could possibly buy from the hire of all the mercenary troops upon earth.

That Portugal must and does pay a great ballance in bullion to every other nation she trades with, I hope, has been made apparently obvious: but if a further proof thereof is wanting, I appeal to the weekly, nay, I may almost say daily, practice of our buying bills of exchange for those ballances of the several countries to whom they are due.

Such debts of Portugal do we purchase, commonly for ready money, in an exchange business, which seldom gives a profit equal to national interest, and a decent premium for sea risks: and yet is a negotiation more favourable for us than any other nation, on account of our situation, and the number of privileged ships we continually have at Lisbon; as also from the superior characters of our mercantile navigators, to those of Holland and other countries; inasmuch that our ships not only bring the money to England, but are also the general carriers of it, for all nations, to Italy. Thus because our shipping is principally used for the extraction of gold, and our country is made greatly a channel for it's conveyance, both the ignorant of Portugal and of Great-Britain imagine the ballance of our commerce with Portugal immensely greater than it really is; for, as I said before, England is only a channel for the greatest part of the specie our ships bring from Portugal; most of it going out of the kingdom at her eastern ports, as surely as it enters at the western ones; so that our gain on the traffic for the payments Portugal makes to many other nations, by the way of England, including freight, commission, profit, and charges, may be reasonably estimated at from two and an half, to three per cent. and no more. Such is the profit for which we do the business, run the risks, and bear the odium in Portugal, belonging to other countries.

I cannot quit this head without observing, that it is exceeding ill policy in Portugal to make the risk of extracting gold great; because, according to the difficulties, the exchanges will be proportioned more or less against them. And I must add, if we were not the carriers of any, it would nevertheless go, and more to the disadvantage of Portugal: for national ballances, like those of private people, must be paid, ought to be so, and will be, in bullion, let what laws soever be made to hinder it. See BULLION, and BALLANCE of TRADE.

The Portuguese, therefore, as our friends and well-wishers, ought, by all means, to preserve to us the advantage of being the carriers of their bullion. Nay, the late king of Portugal did so, on a patriot principal, after his eyes were once well opened, as they were in Wingfield and Roberts's affair*; for it is well known he ever after discouraged informations and diligences about the extraction of coin, being well satisfied of the absolute necessity there was for it's going out of his kingdom.

* Two English merchants of eminence who were condemned to be hanged in Lisbon for shipping off gold (but not dust, as has been ignorantly imagined), on which his late Britanick Majesty appointed a fleet to be immediately equipped, as was really done; and the very order had it's proper effect, by saving the gentlemen's lives, restoring their effects, and convincing the king of Portugal of his error.

Nothing shews the sense and spirit of the British court better, in regard to this matter, than the speech of the great lord Galway, made in the year 1709, to his late Portuguese Majesty (when that nobleman was general there of the British forces, and ambassador from queen Anne) on a project then in agitation at the court of Lisbon, to prevent the extraction of bullion: of which lord Galway having received infor-

mation, he immediately demanded an audience of the king, to whom he strongly and elegantly delivered his sense on the subject, in the following manner :

‘ Your Majesty cannot be sufficiently commended for the steady attention you have always shewn to the affairs of your government. And the pains you have lately bestowed on examining into the balance of trade, is a new proof of that merit which would entitle you to the crown, had it not descended to you from a long and glorious line of royal ancestors. —But permit me, Sir, to observe, that there is a greater king ; one by whom all kings reign, and whose providence is over all his works. According to his distribution of things, riches belong to some nations, and industry to others ; and by these means the liberality of Heaven is made equal to all. Vain, Sir, are all human councils, when opposed to his wisdom ; and feeble the efforts, even of royal powers, when directed to cross his will. You have forbid gold to be exported out of your dominions, and you would willingly enforce the prohibition : but the thing is impracticable. You may restrain your subjects, but you cannot set bounds to their necessities. But say this was possible : suppose you could defeat the industry of the northern nations ; what would be the consequence ? Their husbandmen, graziers, weavers, and all that infinite train of manufacturers that now labour quietly at home, to cloath and feed your subjects, would then turn soldiers ; and, instead of seeing their marchantsmen in Lisbon, you would hear of their fleets conveying them to BRAZIL, to fetch much more of that gold you now fetch for them. Besides, Sir, if they are gainers by their trade, they thereby become the natural guarantees of your dominions. It is not only their treaty, but interests, that bind them to your services. You have potent enemies, and you require powerful friends. The ambition of France knows no bounds, and the pride of Spain will teach her to keep up a perpetual claim to your territories and crown. You have no recourse to frustrate the views and defeat the endeavours of these potentates, but to the MARITIME POWERS ; and, therefore, let me beseech your Majesty to consider, that every project to distress them, is, in effect, a scheme to destroy yourself.’

This speech had it’s desired effect, as such speeches ever must have in Portugal ; at least while the present systems of power and politics remain as they are in Europe, or the Portuguese preserve their senses, or the governing men their true loyalty to their king, and a generous zeal and patriot love for their country.

Of the privileges to which the British subjects in Portugal are entitled by treaty.

Of these privileges, many were the special grants (doubtless for wise reasons) of several of the kings of Portugal in ancient times, and were mere acts of grace and favour, ’till the celebration of Cromwell’s treaty with John the IVth, when they became our absolute right, by being declared such in the third article thereof.

I shall now mention the particular articles of privileges at present contended for, as well as others that are lost, and shall subjoin a short observation on most of them.

We will begin with a very necessary one, which is the right of having justice duly administered in Portugal : and that certainly ought not to be reckoned a favour in any nation : but it is at present too well known to be the case in Portugal (and I am afraid has been for many ages past the custom there) to regard personal influence more than impartial justice, in judicial determinations ; which, doubtless, occasioned the treaty’s being so very full as it is, of regulations on that head.

The office of judge-conservator is our stipulated right, by the 7th article of the treaty, whose province it is to judge all our causes : but with a right, however, for either party to appeal to a body of judges, who are to give the final sentence within four months : which rule is so far from being observed at present, that law-suits may be kept undetermined for forty years. The judge-conservator is, likewise, to protect the subjects of Great-Britain (not from justice, but) from wicked or vexatious insults. But that authority, like every other, is now taken from him ; and our merchants of the most respectable figure, are thereby subjected to the insolences of the very meanest fellows in office, having many of them been carried by such (unheard, unexamined) both with and without orders from their superiors, to the Newgates and Gatehouses of the kingdom ; and suffered outrages in their houses and properties (as we shall hereafter give examples of) without a possibility of obtaining reparation, or any sort of satisfaction whatever ; even after proving the illegality of the proceedings, and the innocence of the insulted person.

Let every merchant of Great-Britain, every subject of these kingdoms, think seriously of such a situation ; and never venture more to pronounce a valuable body of their country-men blameable for soliciting, may demanding (for it is their right) protection from such unjustifiable violences ; or that their judge-conservator may be restored to his stipulated authority for that purpose.

As to the navigation articles for America, they are all become now of no account : our ships are not allowed, unless in

distress, to go to any of their colonies, except Mazagam and their African islands, and there without preference. The right of having houses of trade in Brazil, and their other settlements, is also entirely taken from us.

The right of a legal navigation and commerce to Portugal, with an equitable security of property, particularly in perishable commodities, and some of them owing no duties to the king, are stipulated to be free from all vexatious embarrassments ; all of which is agreeable to reason, justice, and good policy, for them to allow of ; and yet in most of those articles our merchants are eternally plagued with vexatious obstructions and plunderings, of which several very extraordinary examples shall be produced.

We have also, by stipulation, a right to the wearing of such arms for our defence, as are used by the native : an article which I hope is not thought a favour for us to enjoy, because those nations who have no treaties with them do the same, and ought to do it in every country.

The liberty of professing our religion, likewise, I hope this nation has too much dignity to receive as a favour from any in Europe, especially while the same indulgence is granted to the people of all countries in Great-Britain.

That debts owing to our merchants by persons sequestered by the king or inquisition, should be made good to the creditors, is certainly a very reasonable and necessary stipulation : yet in regard to the king it is not observed, in regard to the inquisition it is.

That the king, or any other power, by arbitrary protections, shall not guard the effects of our debtors from legal executions, is likewise an article of mere justice, yet it is frequently and wantonly violated.

The not protecting our run-away sailors, on a pretence of changing their religion, and the obliging them, when demanded to return to their ships, is an article now not at all regarded by the Portuguese : on the contrary, they are encouraged in unreasonable and insolent prosecution of their captains, seduced from their duty, and supported in their resistance ; debauched in infamous houses, where they are encouraged to run in debt ; for the payment of which, they are afterwards sold like cattle to the Portuguese and others ; such practice being absolutely become a traffic in Lisbon, to the dishonour as well as prejudice of Great-Britain.

The British factory have a right, under the authority of their judge-conservator, to appoint, out of their own body, administrators of the effects of such of their countrymen who die without partners, or intestate : which is certainly, not only a very reasonable, but very necessary article, and can be no evil to Portugal.

Our merchants are exempted from hired or personal military service, as well as their domestics ; and from civil and religious offices, and all church tributes, which in some points are merely reasonable and agreeable to the practice of all nations : in others, most necessary exemptions. They have, moreover, the right of having all necessaries for their houses and persons, and those of their families, duty free, but this privilege is now made of little consequence to them. They have likewise, by royal decrees and the laws of the land, the right of being treated as gentlemen, even in the article of criminal prosecutions ; but it is so far lost to them, that they are continually, even from wanton insolence, treated as slaves : and they have another privilege, which is that of being prisoners at large for debt.

By the separate and secret article, the regulation of DUTIES on our WOOLLEN GOODS is made ; but to the manifest prejudice both of Great-Britain and Portugal, it is, like most of the others, never regarded.

Such are the British privileges in Portugal, and the substance of the stipulations in our favour of the treaty with that crown, which ignorant persons have thought full of mighty advantage to this nation : whereas the fact is so far otherwise, that if they join Charles the II’d’s treaty, and that of queen Anne to Oliver Cromwell’s, and then take a cool view of our situation, and that of other nations in Portugal, it will be found we are upon much the worst footing with them of any nation, being in nothing favoured in trade, and yet we are the only nation obliged to succour and protect them, as we frequently have done at an immense expence.

The treaty made between queen Anne and Peter the II’d of Portugal, consisting but of two articles (except the preamble and conclusion) and those being short ones, I shall here give them entire to the public.

ARTICLE I.

‘ His sacred royal Majesty of Portugal promises, both in his own name, and that of his successors, to admit for ever hereafter into Portugal, the WOOLLEN CLOTHS and the rest of the WOOLLEN MANUFACTURES of the BRITONS, as was accustomed, ’till they were prohibited by the laws ; nevertheless upon this condition, that is to say,

ARTICLE II.

That her sacred royal Majesty of Great-Britain shall, in her own name, and that of her successors, be obliged, for ever hereafter

hereafter, to admit the WINES of the growth of Portugal into Great-Britain; so that at no time, whether there shall be peace or war between the kingdoms of Britain and France, any thing more shall be demanded for these wines by the name of custom or duty, or by any other title whatsoever, directly or indirectly (whether they shall be imported into Great-Britain in pipes or hogheads, or other casks) than what shall be demanded for the like quantity or measure of French wine, deducting or abating a third part of the custom or duty. But if at any time this deduction or abatement of customs, which is to be made as aforesaid, shall in any manner be attempted and prejudiced, it shall be just and lawful for his said royal Majesty of Portugal, again to prohibit the woollen cloths, and the rest of the British woollen manufactures.

I must here observe, that the cloth trade is not the only article to which we have an exclusive right; because the treaty manifestly gives it for WOOLLEN GOODS IN GENERAL; and such was the right that we accordingly did enjoy, in its full and genuine sense, till the late Dutch consul M. Hesterman, found the means of explaining it away in favour of his nation, who thereupon began introducing Dutch cloths, now increased to a great trade.

And the French have since taken the like advantage of our supineness, to traffic in cloths to Portugal, though in secret; and the better to cover it, their cloths go with ENGLISH MARKS, TICKETS, and PACKAGE, [to confirm the truth of which, see the article FRANCE, Vol. I. page 815] though they are well enough known; and as to any other kinds of FRENCH WOOLLEN GOODS, they are imported into Portugal openly, and in very great quantities.

From the sense of the treaty, enforced by many years practice, it should seem clear, that we have the SOLE EXCLUSIVE RIGHT of importing woollen goods of all kinds into Portugal; and we are the only nation who gave them an equivalent for that right; the conditions whereof, to their advantage, being duly observed by us, surely demands as honourable an observation on their part, of the stipulations made in our favour; and I see no reason for suffering ourselves quietly to be elbowed out of our rightful possessions by any intruders whatever.

In regard to our national dignity, weight, and privileges, I have only to add, as a serious truth, that the Portuguese people laugh, nay, cry shame on us, for given them so tamely and readily up. The French act in all points with a quite different spirit: they have NO TREATY, NO PRIVILEGES, but from favour; and yet, from being better supported, their MERCHANTS gain ground on ours every day.

Of the unjustifiable treatment that our British merchants have lately sustained in Portugal.

Having already explained, that a principal use of the consular office is to protect our merchants from oppressive vexations and persecutions, I shall now, in proof of the ill consequence of that officer's losing his power, mention two recent and very extraordinary imprisonments, that our British merchants have suffered in Portugal.

The first was of a gentleman, who went on board of an English packet boat, on the morning she was to sail, to take leave of a friend, who was coming in her to England. He had been guilty of no transgression; yet, on his return to the shore, he was seized by the officers of a custom-house boat, and without any legal authority, nay even without carrying him before any magistrate whatever, he was, by people of no higher account than tide-waiters, hurried to the most ignominious prison of Lisbon, where he remained a considerable time; and, at last, from the strongest intercession of one of the highest noblemen, both in rank and employment, made to the governing man of the custom-house, he was, reluctantly, by that officer, suffered to become a prisoner at large; and has since left the kingdom, without receiving an entire release, or any sort of satisfaction for the insult.

* The marquis of Mariabua, captain-general of the forces of Portugal, and master of the horse to the king.

The second was of a gentleman, who had a barrel of beer deposited under his charge, about which there was a judicial contention; and there happening to leak out of the cask a trifling quantity of the liquor, the same head officer of the custom-house made the leakage a pretence (to gratify a pique) for committing him of a sudden to the common prison; from whence he, however, soon got released, by the interposition of a lady of very high quality, as no sort of offence could be reasonably alledged in excuse for the violence done him.

* The marchioness of Gouvea, lady to the hereditary lord steward of the king's household.

Biscuit is a commodity that pays no duty to the king of Portugal, nor any fees but a few at the custom-house. Yet the same good director of that office, took it of a sudden into his head to insist, that an English merchant, who had then im-

ported a considerable quantity, should pay a duty on it. The merchant disputed the point: a process ensued, and the biscuit was thereby detained in the custom-house warehouses till it was spoiled: then the health-officers seized and condemned it, nay, laid a fine on the merchant for having bad provisions on hand; whilst his antagonist of the custom-house notified him at his own charge, to throw his biscuit into the river; which he was forced to comply with, and has never been able since to obtain any kind of redress for the wrong.

Also a British house of great figure, that had large warehouses, at a country-seat they hired about a league above Lisbon, on the banks of the river, had a visitation there by the very meanest officers of the custom-house, under a pretence of searching for smuggled goods. The family being in town, and only one servant there, who had not the keys of the warehouses, on their being demanded to be opened, the officers were told by the servant that he would send for his masters and the keys, as he immediately did: but they insolently, and without legal authority, broke open the doors; and finding nothing to seize, left the warehouses exposed to plunder, as the gentlemen found them when they arrived; for they went thither directly with their keys, on receiving the notice that was sent them. For this, like all other violences, no sort of satisfaction could be obtained: and yet if these fellows had carried but a pound of foreign tobacco, snuff, or soap, or a single pack of foreign cards, and then swore they had found them there, this British house of trade would have been confiscated and ruined.

The 17th article of the treaty expressly says, 'If it happens that any controversy does arise between the said king's inspectors, officers, or ministers, and the said merchants, concerning the goodness of fish, or any other sorts of provision whatsoever, which shall be carried to any of the said king's dominions; the same shall be determined by the arbitration of good men, provided they are Portuguese, who shall be equally chosen by the magistrate of the place, and the consul of the English nation, and they shall determine the business in such a manner, that no damage may accrue to the owner in the mean time, while the matter is in dispute.'

Notwithstanding the equitable precautions in this article of the treaty, the health-officers are guilty of such arbitrary insolences and plunderings, as are wicked and infamous to the highest degree. For example, in the summer of the year 1752, a great quantity of foreign grain being then at Lisbon, under false and ridiculous pretences, they exercised such tyrannies as would disgrace, even a Barbary government. They seized on whole warehouses of corn, fined the owners of it, condemned the grain, and threw considerable quantities, at the expence of the owners, into the river. From others they took bribes to be quiet, which was the real end they drove at, and not the safety of the public; for it is well known the people of that office are capable, for money, of suffering the very plague to be imported and sold. With such proceedings it must be concluded, all the holders of grain were greatly terrified; insomuch that the prices of wheat, and especially the English (which is not so fit for keeping as Straights grain at any time, and was that year, from a wet harvest, of an inferior quality) fell 50, 60, nay 70 per cent. in price; so that the whole British commerce did not lose less than 50,000 l. sterling, besides the sums given in bribes to those harpies the health-officers.

On that occasion, the whole Portuguese nation cried shame on such proceedings! However, the spoilers found protection, the merchants were plundered without redress, and the dealers in English grain suffered more in proportion than any others. I must here beg leave to instance one barbarous act of their wanton tyranny, which was as follows:

Two English houses, who had a great deal of our country wheat on hand, finding their corn begin to suffer in quality, from the hot weather and weavel, joined together in a petition to the health-office, for leave to ship it off, under bond-security for producing certificates of it's being landed in other countries; which petition was rejected, under the unwarrantable and improbable pretence, that they might convey it to other parts of Portugal, and obtain forged certificates to cover the fraud: whilst their real motive for the refusal was, not to let a commodity get out of their power, which they had hopes of squeezing gains from. And, as a proof of the iniquity of this proceeding, I can aver, that the corn was afterwards sold for making bread at Lisbon; also, that it made very good bread; and yet it was embarrassed in it's sales by the health-officers, to the great loss of those who had sued for a just and reasonable right, and were refused it.

The hard impositions that even attend the unloading of corn on it's arrival at Lisbon, can be vouched for by almost every master of a ship that uses the trade. It must be easily conceived, that hardly any cargo of corn can be navigated without receiving some little damage, either from heating, or water made by the ship on her passage. The first kind of prejudice is always removed by care in the warehouse, after it is landed; and for the second, any corn damaged by salt-water, it has been customary to sell for what it might be found worth, to feed hogs or other animals with; for corn can hardly be so bad, as not to serve well for some necessary use.

ufe. Yet the health-officers have been so tyrannical of late, as to throw into the river great quantities of grain but little damaged, and sometimes when it was not at all so, merely to extort iniquitous fees for themselves.

It was not long ago that a merchant had a cargo of corn consigned to him, some of which was spoiled by the ship's making water on the voyage; when he heard of it, he ordered the damaged wheat to be thrown overboard: no, says the health-officer, there must be a diligence done, and fees paid: the gentleman replied, there was no necessity for any such diligence, since all he could do was to cause the corn to be thrown away, and he did not want to preserve it: but his remonstrances were in vain, for the pickpocket innovation was insisted on.

Such were the transactions in the corn trade, in the year 1752; and in the last summer, which was the following one, another game was played equally tyrannical and unjust: the harvest had failed in Spain, and the crop also proved very short in Portugal: however, in the latter kingdom there was a very considerable stock of foreign grain on hand; and, though the price of it was raised, yet the merchants went on selling it in their usual manner, without any combination, fraud, or ill practice in their proceedings. They were not molested for a considerable time, that orders might be given for buying up farther great quantities, as was actually done, for a future supply: but in the month of August, just the dangerous time for embarrassments to the stock on hand, misrepresentations having been made, out comes a ROYAL ORDINATION to circumscribe and impede the sales of grain; nay, in effect, to take it, in that critical season, out of the proprietors' hands; or at least, putting it out of their power to use the proper means for its preservation, thereby exposing many people to ruin: nay more, they were made liable to a treatment due only to the vilest of felons, and that, even without the power of being heard in their own defence, for the order expressly directed the president of the corn-market to take out secret informations concerning all transgressors of it, and transmit them to the secretary of state, for the king to determine the punishment in his closet.

Down falls corn on this proceeding, 25 per cent. in its prices, which might make the difference of near another 50,000*l.* sterling on the year's trade; besides the danger to the merchants (from false informations) of sequestration, corporal punishment, and banishment from the kingdom; all against the force of judicial determination, as well as reason and custom; and also against the sanction of a NATIONAL TREATY, in the 10th article of which there is this stipulation: 'And the people of this republic (England) may freely carry arms, corn, fish, and all other sorts of merchandize, into the kingdom, ports, and territories of the king of Portugal, and sell the same at their pleasure, either by RETAIL or WHOLESALE, TO ANY PERSON WHATSOEVER, and for whatever prices they can get; AND THEY SHALL NOT BE PROHIBITED, CIRCUMSCRIBED, OR INCAPACITATED, BY HIS SAID ROYAL MAJESTY, OR HIS MINISTERS, GOVERNORS, FARMERS OF THE REVENUES, or MONOPOLIES, OR BY ANY CHAMBER OF JURISDICTION OF ANY TRIBUNAL, EITHER PUBLIC or PRIVATE.'

Such were the securities under which the merchants had sent for the corn, about which they were treated as before described. I have now only to add on the subject, that foreign grain is, by the very laws of the kingdom, a free trade; owing no kind of duty to the king, nor any fee whatever to his officers, except a trifle for any entry at the corn-table; and, therefore, there was no lawful plea for causing the prejudices our merchants were made to suffer, or the very alarming dangers to which they were so arbitrarily exposed.

The Portuguese unjustifiable treatment of the British merchants in other respects.

Part of the separate or secret article of the treaty between England and Portugal begins thus: 'That the people and inhabitants of England, trading (as has been already mentioned) in the kingdoms, dominions, ports, and territories of the said king, shall not pay more duties and taxes, but only in the manner following, viz. That the English goods, merchandize, and manufactures, shall never exceed 23 per cent. on their valuation, for the payment of the DUTIES; and they shall be favourably VALUED, according to the regimen (or book of rates) of the custom-house, and the ancient laws of the kingdom; and suppose there should be any motive for raising the valuation, by reason of a rise in the real value of goods and merchandize, it shall not be done but by the consent, and in the presence of two English merchants, who reside and dwell in Portugal, and are chosen by the English consul; and, granting that the merchandize should fall from its present or future exact value, the valuation and doubt shall be determined by disinterested persons, who shall be chosen by the English consul and the officers of the custom-house.'

Such are the stipulations by treaty for regulating the duties on our British manufactures in Portugal; but these are at pre-

sent as little attended to in that kingdom as the rest, to our manifest injury, and indeed to that of the Portuguese also.

The great article of CRAPES, which, as before observed, we have now lost, was a commodity that paid a most enormous duty: and at present, LONG ELLS and SHALLOONS, and some other sort of stuffs, pay from 28 to 30, and even upwards per cent. DUTIES on their valuation. The consequences of which are, that these branches greatly decline, and most of the traffic in them becomes clandestine, to the great prejudice of the fair traders, and also of the royal revenue of Portugal. Besides, Spain lies so very convenient for smuggling in her cheap and strong silks, that, if not timely checked, they must infallibly undermine a very great part of our stuff-trade to Portugal, which can only be preferred by a better and juster regulation of the duties these goods are to pay.

It has become a practice of late for the provedors, or chief officers of the custom-house, to act in so capricious and tyrannical a manner, that our merchants can make no certain calculations on hardly any thing they deal in, notwithstanding there is a printed BOOK OF RATES*; and there are also certain officers in the custom-house, whose sole business is to assert the qualities of merchandize; but their determinations are no farther attended to, than as the superior pleases. I shall furnish two instances, out of hundreds that might be produced, of his overbearing and arbitrary management.

* Let any foreign merchant suppose this to be the case in England, upon what a precarious footing would he send the commodities of other countries hither? Were not the duties upon the Portugal wines duly ascertained here, and the treaty in this case inviolably regarded, what would soon become of the vintages in Portugal? If we should be obliged to retaliate in the like manner upon the Portuguese, they would soon feel the calamitous effects of our resentment.

The first was of some English cloths, of a quality often imported by the gentleman those belonged to. The valuers of the goods put them at their usual rate, the director of the custom-house insisted they should pay according to another. The owner remonstrated on the injustice of such a demand: every valuer in the custom-house peremptorily asserted they could not possibly have an higher estimation than their OLD one given, without a manifest injury to the merchant; yet the chief officer persisted in his demand. The merchant appealed to the higher tribunals, his cloths lying all the while (I believe near a twelvemonth) open in the custom-house, but could obtain no redress, and was forced to submit to the imposition.

The second instance I shall produce was concerning printed linens. One English house dispatched in the beginning of a week, some cases of them, at the usual rate of paying duties for such goods, which had always been regular and certain: about the middle of the same week, another English house sent to dispatch some cases of the very same goods, both for kinds and qualities, and the valuers declared the rates for them to be as usual. But Mr chief director peremptorily insisted they should pay more than CENT. PER CENT. higher duties. The owner remonstrated, but in vain; he was obliged to pay the unreasonable exaction; nay, the duties were afterwards raised greatly higher. When that gentleman reproached the custom-house valuers for the imposition, thinking it was their fault, the poor men shrugged up their shoulders, and shaking their heads, replied, 'What, Sir, would you have us to do? We are as badly used as yourself. Since I——T—— came over here and did nothing, you must look upon yourselves as given into the hands of this man, as we are, for him to do what he pleases with.'

Such capricious and unreasonable exactions, made without any the least previous notice, destroy all calculation, and render uncertain every rule by which merchants can, and do regulate their proceedings; and, therefore, are acts of the most barbarous oppression and injustice.

Such were the violences and injuries, that have, from time to time, created uneasiness in the minds of our merchants at Lisbon; and, as they were contrary to stipulated regulations, they were certainly stronger grounds for complaint.

Our merchants were, upon too good grounds, put under an extraordinary apprehension some time ago. A method was taken to quiet their fears on that head, which effectually did it. They were, however, at the same time, promised their grievances should also be redressed, and their just privileges restored; but what has been the event thereof? Reader, thou shalt be impartially informed; for the following novelties have happened within the two years last past.

1st, The few remaining powers of our judge-conservator, for protecting the British merchants, have been entirely taken away, by a public printed decree of his most faithful Majesty's.

2dly, Our corn trade has been made ten times more precarious, and the persons and fortunes of our merchants rendered unsafe, from the worst and most arbitrary violences, warranted by a written ordination of the king of Portugal's, which was stuck upon the doors of the corn-market in Lisbon:

Lisbon: it's whole tenor expressly contrary to the 10th article of the treaty; which they now so effectually annul, as to dispatch no petition about corn, in which a right from that treaty is claimed.*

*By petitions all kinds of applications are made to every office, and all legal processes are likewise formed upon them.

3dly, By a decree of the king of Portugal's, in favour of that righteous officer called the provedor of the custom-house, all cases, wrappers, barrels, and package whatsoever, are made his due, of any merchandize, imported into Portugal, and may be taken by him in specie if he pleases. A most unjust ordination, as well as enormous tax! for the package is certainly as much the merchant's, as the goods it contains; and, in some cases, such as butter, rice, and flour, for example, cannot be separated. In short, never was there a law so unreasonable, or so unjust. That officer's chief pay arose formerly on a duty only on package, which the kings of Portugal might have some grounds for exacting, as it was a light charge to the merchants; but henceforward it may be made, what an arbitrary officer pleases: though, in fact, we ought to pay no sort of duty on package, as by a decree of king Emanuel's, (now incorporated with our rights) we are entitled to import, free of duties, canvas, wrappers, bags, and other necessaries for carrying on our business, provided they are for our use, and not for sale.

4thly, The insecurity of the persons and fortunes of our merchants, from the before-mentioned corn ordination, well deserves the attention of Great-Britain.

The enumerating of these facts are the best and fullest vindication of our merchants at Lisbon, that can, or need to be given for their proceedings, in appealing to their sovereign (through the proper channel of his ministry) for his royal support and protection. They are well known to have hearts filled with zeal, loyalty, duty and affection for their king, and a becoming respect for all who are in authority under him: but they would no longer deserve the name of Britons, if they acted in a manner so unbecoming of themselves, as to forget that justice is their due, and legal liberty their birth-right. There never was a more false and injurious opinion propagated, than that our merchants at Lisbon are either factious, turbulent, or unreasonable; they are not so, but the reverse: and as their cause is just, they trust it must prevail.

Of other disadvantages under which the British traders in Portugal labour.

The first we shall name, is the prejudice which bigotry inspires them with against us, on account of our religion. It must be acknowledged, to the great honour of the Portuguese, that all orders of them are very civil to foreigners, and the better sort are particularly polite: but still they are rigid Roman Catholics, with whom it is a necessary point of faith, to think too severely of those who differ from them in religious principles. And although there are many of the nation who are very obliging in their carriage, nay, that do many kind and friendly actions for our Protestant merchants; yet it is not to be doubted but the very best of them would like us still better, if we professed the same tenets with themselves: and there are others, no doubt, who esteem it a merit to hate us; and who think it a much less crime to deceive, over-reach, and defraud us, than any such as are of their own Church. Besides, the difference in religion does in a great measure prevent a free intercourse with them; and hinders our having that interest with the clergy, in particular, which is often of very great service to the Roman Catholic merchants of other countries.

The next disadvantage our countrymen labour under, is that of having too often improper, or incapable c—s. For example, what service can any man be of, in that office, who goes over advanced in years, unacquainted with the laws, language, and customs of the country, and is withal, totally ignorant of commerce? Such a man, at best, can be of no use to the merchants; and if to the want of these necessary qualifications, are to be joined the possession of some bad ones, such as p—de, ind—ce, ob—n—y, or p—rv—sn—s, he is sure to do them infinite disservice; of which having really happened several times, numberless instances can be given. Whereas, other nations have the most able and experienced resident traders appointed to that office [see our article CONSUL]; men, who have been of the profession themselves, will certainly feel, as well as know how to act, for the merchants. And if the national end is to appoint a consul for the service of commerce, and the same to be the motive for the merchants paying for his support, both are disappointed, both are wronged, by the nomination of any man, who wants affability, assiduity, or abilities: and what, alas! must be the case, when all these, and many more necessary, qualifications are wanting?

The factory of Lisbon had formerly the indulgence of chusing and recommending a consul; but foolishly resigned it, to prevent animosities from growing up among themselves;

V o L. II.

and there are persons yet on the spot who signed the letter for that purpose. Fatal resignation! for thereby, the office is now fallen, amongst thousands of others, to be squabbled for by people who regard it for nothing but for it's profits; and who, without considering consequences, think of little else but making the post as easy as it is profitable to them. Now, rightly considered, I believe it will appear, there is no power can legally oblige one Briton to pay money to another, without an act of the legislature to authorize it: and therefore consular can be considered only as a voluntary gratification for satisfactory services; consequently the merchants have a right to demand reasonable and proper services; or refuse paying any consul his appointments; especially if it is made a resolution of the majority of their body. But as this is a point of law, any able practitioner would greatly oblige the world by impartially discussing it, as a matter in which the prosperity of commerce, and the rights of the subject, are greatly interested.

To the ill execution of the c—r o—ce must be added, that our countrymen labour sometimes under the disadvantage of having the m—st—l functions too, as badly performed. It is well known, that in Portugal, spirit and dignity in a minister, are very essential qualities for preserving a national respect, as the certain consequences of an abject, mean, or pusillanimous behaviour, are it's being slighted, despised, and trampled on. I will suppose, for example, that if our nation should be so unfortunate, at any time, as to have a minister at that court, who, in the face of so very proud a people, could be so mean as to trade, nay, so indiscreet, as even to let his name appear at the head of a composition in a bankruptcy, what figure can it be thought he could make? And how little must he of necessity be respected, either by the natives or his own countrymen? Nay, I will carry my supposition farther, and imagine a Protestant merchant of our factory, prosecuted without a crime, should apply to him, by the direction of the body of merchants, for his protection, and should receive from him this answer, 'I cannot protect you, I come hither for other purposes; if you want protection YOU MUST GO TO A CONVENT FOR IT.' I say, if such a thing as this could possibly happen, what opinion would Portugal have of Great-Britain? How would our merchants there look? How would they be treated by the very meanest of that people? And how long, after such a disgrace, could Portugal be tolerable to a Briton?

A noble negotiator, that, not an age ago, left Lisbon, on terms bad enough with his countrymen, had, (notwithstanding his piques) the wisdom and honour to deliver his true sentiments on the very evening of his departure from thence, in or near the following words: 'Well, after all, the trade of this place is of great consequence to Great-Britain; and there ought to be a MINISTER here of illustrious birth, with a high character, and large appointments (nor is the best nobleman in the kingdom too great for the office) to support properly the dignity of the crown, and the rights of the nation. And there ought to be a CONSUL of sufficient abilities, who should be a merchant; one that could obtain weight and influence in the tribunals of the kingdom, and do all the under parts of business, without troubling the minister, who ought never to appear but in matters of real importance; and, when he does move, he should have such powers as to enable him to act with great weight and dignity: and so I will inform the ministry when I get to London.'

It is to be hoped that so wise and necessary an information was given; and that, to this nation's great benefit as well as honour, a time will come for carrying such prudent counsel into execution.

Were, therefore, the national disadvantages of having bad c—s, and improper m—st—s prevented by wise determination here, most others would thereby be greatly weakened, if not entirely removed. Even the first I mentioned; their prejudice against us, on the score of religion, would a good deal be blunted, or at least many of it's bad effects removed, by a glare of grandeur on one hand, and a steady, wise, and prudent conduct on the other; especially if attended with affability, liberality, and politeness. But from the reverse of these qualities, either in ministers or consuls, I am sure all honest and worthy merchants of Great-Britain will join me in saying, GOOD LORD DELIVER US!

Of the late misunderstandings, said to have arose between the British factory, and the B—h c—l in Portugal, and the ill consequences attending their unhappy differences.

The B—h c—l, in a public debate at a factory-meeting, opposing the whole body of merchants, in points of great concern to the nation, as well as themselves, was so rash as to say, that 'the treaty existing betwixt the two crowns, could not, nor ought to, prevent the king of Portugal from making what laws he pleased in contradiction to it, in his own kingdom.' To which a merchant, deeply interested in point of property in the matter debated, said, in his reply, 'Sir, if you wilfully sacrifice the rights of the nation, you will be a traitor to your king, and an enemy to your country.' There was no explanation demanded of these words, conformable

to the practice of all public assemblies; nor, indeed, was any explanation necessary, as the words if, and will be, made it clearly a supposed case. What followed was, that this officer, whose express duty it was to protect his fellow-subjects from extra judicial violences, applied to the arm of a foreign absolute power, to punish a supposed offender for what had passed in a British national assembly, and of which that court had no sort of right to take any cognizance.

A secret process was formed; the merchant who never was judicially accused, or, of course, allowed to make his defence, was banished (of a sudden and unexpectedly) from his house, at twenty-four hours warning, and from the kingdom of Portugal in five days: nor could then obtain the justice of being heard for himself, or even of making a written representation against so violent an outrage. These are the facts that have been told, and most of them given in a printed narrative of the affair; and the truth of them is vouched for by every one acquainted with the proceedings. The whole of which are so uncommon, so unjustifiable, in respect to the merchant's banishment, that history does not furnish a precedent of the kind.

As to the supposed crime, what was it? A warm expression, uttered in the heat of an entirely legal public debate; and that too, in reply to such a one as may, perhaps, be found to merit a most weighty censure. Is not every speaker on public affairs liable, from human frailty, to say more offensive things than were uttered by this man? Who, it is to be also observed, was not, on the occasion, an officious, idle babbler; but a speaker in behalf of his king, his country, of commerce, of the whole community present, of his own immediate property, and that of his friends entrusted to his care, in a foreign country.

In so very interesting a cause, if he had made a real rash slip, what did it, what could it deserve more than a reprehension? And even that, a gentle and polite one? But for a c——, for such an offence, to drive a man to ruin, ignominy, banishment, and expose, he cared not whom besides, to inconveniences and prejudices, was surely acting so wild, so outrageous a part, as must startle and shudder every humane and honest man to hear of. Can there be produced, from amongst the ablest and coolest speakers in public debates, hardly a man who has not been so much off his guard, as, on some occasions, to let words fall from his tongue, that drew on him the disapprobation of his hearers? Nay, that even himself has not been afterwards sorry for having uttered? Sure I am, that many instances can be given, on the affirmative side, of men who were even celebrated for an uncommon command of their tempers.

The mischiefs that followed the outrage done to this man, are many of them known, and others may be most reasonably supposed. It is not, therefore, a mere restoration, however honourable, that is satisfaction sufficient, either to him or his house of trade: they ought, likewise, to have a full indemnification, a most ample reparation; the voice of equity, the common practice of courts of judicature, the safety of commerce, and the honour of the nation, all demand it.

When a gentleman has been prejudiced in his affairs, and others in theirs through him, is it satisfaction sufficient, that, after a tedious time of suffering, the illegal and unjustifiable embarrassments and evils are merely removed? Surely no: an honest jury, in any court of justice, could not do otherwise than award very high damages; and every man, making the case fairly his own, would think they were undoubtedly his due.

But it may be said, justice is left open against the offender; who, I must say, may, or may not be able to be responsible for the determination; nor do I think it ought to be put on that issue: those who put him in the way of doing such mischief, or those who so unwarrantably did it at his instigation, ought in conscience, in justice, in honour, to stand in his place for the indemnification.

Of some other disadvantages, under which our Portugal merchants have laboured of late years.

Among the many particulars relating to our Portugal commerce, which have lately appeared in public, it has been a matter of surprize, to find that no one has wrote upon the subject of the money lost by our merchants, from on board the prince Frederick packet-boat, which was seized on her homeward voyage from Lisbon by the Algerines, seven years ago, carried into their port, and there plundered, under pretence of her not having a proper pass on board for her protection.

The king's colours, which those packet-boats are authorized to carry, were always thought, 'till that time, a sufficient protection; and the money put on board that vessel by our merchants, was shipped on a full persuasion that such colours were a full security against the plunderings of the Barbary corsairs: however, it has proved to be otherwise; for their money has been seized, divided, and is irrecoverably lost.

Nothing can be more evident, than that the Moorish pleas, urged in defence of this piece of roguery, were all chicanery; trumped up pretences, and temporary evasions of truth,

reason and justice; however, they served their turn, in merely furnishing excuses for keeping of our money; which we thought not worth hazarding the safety of our navigation to quarrel about, and therefore accepted of their proposed expedient of making a new, and more explanatory treaty, which has been done; and the money, so unwarrantably seized, was accepted in lieu of a national present, which it is customary for us to make on such occasions.

Had no treaty been made, or any other national benefit accrued from this unwarrantable action, as the treasure was taken from under the king's colours, it is but reasonable that the royal revenue should be charged with the loss, since the presents to the piratical states must have been made out of that revenue. For if, as a new treaty has been obtained, for the fuller security of respect to our flag, and safety of our mercantile navigation, which that money has expressly paid for, there can be no just reason assigned, why a PUBLIC benefit should be purchased by INDIVIDUALS; and therefore it is an high injustice, that the money mentioned, has not been repaid to the just proprietors of it long ago.

If any man's absolute property, of what kind soever, is made subservient to public utility, by an application of any sort, contrary to his own free disposition, it has been the invariable practice of parliament (or the crown, if done on an emergency) to assign an ample equivalent for the appropriation they take upon them to make. And, therefore, as on the concluding of a national treaty with the Algerines, it is customary to make them an expensive present; and they, sensible of the illegality of this capture, agreed, on the making of a treaty, that it should stand in the place of such a gift; certainly the people, whose property that treasure was, ought to have it made good to them again, and without delay; honour and justice demand it should be done: and no man, no minister, who would be thought to have the interest of trade at heart, ought, for his own credit, or the national honour, to evade or obstruct so clear and necessary an act of justice.

And it must be observed, that public faith and honour were never more necessary to be set in a conspicuous light, than at present, when the French are said to be attacking our distant colonies, and where, for the preservation of them, it may be necessary that particulars should have strong grounds to rely on public honour and justice, for the voluntary disbursements and services that may be of the highest consequence for them to contribute; more especially so, since in those very parts of the world, there were, but a very few years ago, many too just and well-grounded complaints for hard treatment, in proceedings of the utmost service and importance to this nation.

Besides what has been represented, in relation to the conduct of the Portuguese towards our British trading subjects in general, they have begun, like some other of their neighbourhood, to seduce our people into their commercial system, in order still more to insult and maltreat that kingdom which has been their protection. For by late authentic accounts from Lisbon, it appears, that the new EAST-INDIA COMPANY established there, are indefatigable in rendering their trade successful. Not long since five of the ships fitted out for that service, sailed from thence under the conduct of Mr Stevens, who was a lieutenant in the British navy. He was sent from thence to London, to procure persons to go as captains, and returned with three, who are also sent out commanders, upon their being strongly recommended for their great skill in navigation, and their knowledge of the country. And their salaries, which are very considerable, are to be paid by ENGLISH factors, who are principals in this undertaking, and agents for the company.

Nor are British factors only employed in this Portuguese undertaking, but it is very currently said and believed, that British captains, British sailors, and British money, are all employed in advancing the Portuguese East-India traffic, a considerable part of which returns, may very probably be smuggled into the British dominions. Is it not strange insatiation, that Britons should thus encourage a nation in their trade, at the very time such nation is attempting to ruin that of our own country? Is it not requisite, that strict inquiry into this matter should be made on our side? Should not enquiry be made, who invited Mr S----- to Lisbon? Under whose patronage did he live there? From whom did he receive his credit on England, when he came last hither? On whom was that credit given? What are become of the British sailors who navigated the two ships from London to Lisbon, called the King and Queen of Portugal, that were built here for the Portuguese India trade? Who are the British factors gone from Lisbon in the Portuguese service? To what houses of trade there did they belong? What connections have they with any partners in such British houses; and what are the conditions and obligations of their engagements? Will the alluring away our sailors, our merchants, and our money, by some nations; and our manufacturers, artisans, and ship-builders, by others, tend to the advancement of the British trade and navigation? If we have it not in our power to retaliate upon the Portuguese, will not our laws call British subjects to account for practices so highly detrimental to the national

national commerce of our own country? Was the conduct of the Portuguese towards this kingdom, as unexceptionable as it ought to be, practices of this kind should by no means be connived at among ourselves: but when it is otherwise, too much rigour and severity, consistent with the laws, cannot be used to suppress evils of this kind, for if they are suffered with impunity, in regard to one nation, will not our own subjects follow the like example in respect to others? Will not an unrestrained toleration of this nature, render the skill and ingenuity, as well as the capital stocks, of our British merchants, subservient to the aggrandizement of the commerce of other nations instead of our own, under which they are protected?

Did all the Portugal gold that temporarily circulates in this nation, proceed from the advantageous balance of our trade with that kingdom, it would, even in such case, be a high indignity to Great-Britain to suffer such treatment as our merchants have met with in Portugal. Would not this be the natural step to bring us into irrecoverable contempt and ignominy, without due resentment; and would not that soon reduce the balance of trade, as well as sink the honour and glory of the British nation? But when nine tenths of the Portugal gold that makes its appearance among us occasionally, belong to other countries, and England only is the carrier thereof, and the bridge over which it passes, to pay the balances due from Portugal to other nations, that are greater gainers by her, what obligation is there on us to bear with the least insult? Where is the nation that takes so much of their wines and their fruit as Great-Britain does? What state is more highly favoured in the duties laid upon their productions imported into these kingdoms, than Portugal? Is not an hundred pounds worth of our woollen goods worth an hundred pounds worth of their wine, without a pipe of which we can easily do, and yet not drink worse in quality, or less in quantity, as I will one day attempt to demonstrate? And what nation will they then get to take their luxuries off their hands, in the like proportion that Great-Britain does? Is not a thousand pounds worth of our lead or our tin worth a thousand pounds worth of their gold? Cannot Great-Britain find the way to the Brazils as well as the Portuguese, as Lord Galway, in effect, gallantly told the late king of Portugal: and as his late Majesty king George had resolution and magnanimity enough to threaten to send a fleet to bombard the city of Lisbon, may not that be one day done in reality, if that nation should once dare to rouse that lion against them, who has been their great safety and protection? What potentate have the Portuguese to depend upon, in case of need, except Great-Britain? and does wisdom and policy dictate to them to ill treat their best and tried friends!

The natural and dangerous enemy of Portugal is Spain; for as the acquisition of that kingdom would be of such infinite consequence in the points of ease, convenience, and power, to the Spaniards, the Portuguese would be blind and ignorant indeed, not to suppose their ambitious neighbours would miss no opportunity, on any pretence, for seizing on their country. And that such an apprehension does always exist in Portugal, is evident from the alarms constantly taken on any movements or augmentations of troops on the Spanish frontier. The antipathy and hereditary hatred the people of those kingdoms have for each other (putting the Galicians out of the case) are most extremely obvious and strong. From traditions of former sufferings, and a dread of future ones, the Portuguese even abhor Spaniards; they consider them as having been the unwarrantable seizers of their country, and the tyrannical ruiners of it afterwards, to make the acquisition secure: while, on the other side, it may be said as violent a prejudice operates, and almost to an equal degree. The proud Spaniards consider the Portuguese as a province of rebellious and revolted slaves, whom they want to shake their whips at, and constrain to a servile obedience, but cannot; they affect to despise the Portuguese, but, in the manner of expressing their contempt, always manifest an anger, that shews they are most sensibly hurt. Such is the animosity that reigns now, and has for ages reigned betwixt these nations; nor is there the least likelihood of an abatement of it, but, on the contrary, rather an increase: for if the present most Catholic king dies without issue, his successor brings in the neighbourhood of Portugal a specious claim to it's dominions, in right of his mother, heiress of the house of Parma, and, by direct descent, representative of an elder daughter of king Emanuel's of Portugal, than her from whom the house of Braganza inherit the throne. And, as a proof that the king of the Two Sicilies is not insensible of his claim, he wears the arms of Portugal, in an escutcheon of pretence, on his other royal bearings, if I greatly mistake not, even on his very coin: and, therefore, it is probable neither he or his descendants will ever think they are in conscience obliged to acquiesce in the determination of the law of *Lamego, or the nobility's choice at the restoration of Portugal, especially if any favourable opportunity for the exertion of power should offer.

* An ancient and fundamental law of the kingdom, by which it is determined the crown cannot be inherited by a prince

born out of the kingdom; but that law, in other particulars, has been frequently violated.

To such an unlucky and disagreeable situation as this, a new and important affair has happened, which puts Portugal under great difficulties with regard to Spain, and that is, the treaty concluded between his late most faithful Majesty and the present Spanish king, for the former giving up Nova Colonia to the latter, in exchange for other specified territories in South America. An adjustment so disadvantageous, and even dangerous to Portugal, that every subject of that kingdom speaks of the negotiation in the harshest terms, saying it was an imposition on their king, in his very infirm state of mind and body. However, the treaty having been ratified in form, the Spanish court claims it's being duly executed; and Portugal would be put to hard shifts for evasion, did not, by great good luck, the Jesuits intrigue in their favour: those pious fathers, not chusing any other European neighbour too near their own valuable possessions in America, have stirred up the natives of that country ceded to Portugal to oppose the surrender of it; and they accordingly profess a voluntary obedience to the Jesuits, and refuse it to the king of Spain; while the Portuguese, it may be concluded, secretly encourage the opposition, as in the mean time they remain possessors of Nova Colonia, and hope, in the end, to overset the treaty; all which management must be plainly seen, and the purposes understood by the court of Spain, who seem, on their side, determined to carry their point. These are the affairs that have occasioned alarms of late in Portugal, from the military motions and reinforcements on the Spanish frontiers.

Thus having made appear that Portugal does, and always must, want a powerful ally for her support, it is next to be considered who, of all her European neighbours, is the best able, and most to be depended on, for that purpose.

Of the dependency of Portugal on Great-Britain.

France has had, since the treaty of Utrecht, and possibly may have for many ages to come, a most close, but unnatural connection with Spain; I call it unnatural in regard to interest and commerce, for in these points Spain has been greatly and manifestly injured, by the national advantages having been made subservient to the mere family ties, as well as partial ambition of it's sovereigns. The Spaniards, notwithstanding they are become such passive vassals, as, in respect to their crown, to glory in being obedient slaves, are not insensible that their French alliance is hurtful to them, and also, that their nation is not truly interested in providing dominions for the collateral branches of their royal family, or in extending such foreign possessions at any price: a humour, however, that France will probably find her account by encouraging at the court of Madrid: but in the pursuit she must tread warily, for the connection of the nations can never be other than a ministerial one, that of a royal relationship, or the vanity of the Bourbon house: for, as I said above, the subjects of Spain do not think such an alliance for the national interest or honour; and besides, are of manners so very different from the French, that they hate them, and seldom miss an opportunity of expressing an abhorrence even equal to that they have of Moors, since nothing is more common than to hear them to say, in point of religion, That the heretics of other countries are better Christians than the Roman Catholics of France.

In such a situation with Spain, France can never be a safe ally to Portugal: for if ever, on any account, she was to take part with Portugal against Spain, she must lose her interest infallibly with the latter; which would be giving up a greater convenience for a less, both in point of a military and commercial interest, as also be a sure means of causing the last thing France is desirous of seeing, the closer unity of Spain with Great-Britain.

Nor, indeed, is there wanting this speculative influence in Portugal against the French, the people of that nation having no opinion either of French faith, generosity, or honour: they never speak of them with esteem or respect, are open in their ridicule of them, and behave to them, more than to other nations, as impertinent and unwelcome intruders, that come either as spies, or to pick their pockets.

Thus with Spain for an hereditary enemy, and France a friend that she dares not trust, where can Portugal, too weak to defend herself, look for an able and trusty ally? To Italy? No: they have no succours to send, but, on the contrary, live themselves in perpetual need of them from others. Can Holland do the business? Most certainly no: her strength and weight are no more. As for the more northern kingdoms, they are at too great a distance, and too poor, to enter upon, or comply with, such an engagement. Great-Britain, then, is the only nation that ever has been, can, or will be, the safe, the trusty, the generous, the able, supporter of Portugal. If we examine history, from almost the first foundation of their monarchy, it will be found we were always their true and honourable allies. We generally helped them to conquer their country, and have ever protected them in it: for the truth of which I appeal to their own historians, as well

as ours. At the restoration of their monarchy, our Charles the First was one of the first princes that acknowledged their John the Fourth, and entered into a treaty with him: the good effects of which were, however, in some measure prevented, by the unhappy troubles that just then broke out in Britain. If a squabble happened in Oliver's time, it was from an indiscretion of the court of Portugal, that they paid heartily for: and, on their becoming wiser, we became their friends again. Charles the Second was no sooner restored to his dominions, than the interests of Portugal were by him taken to heart. He married their Infanta, in preference to all other princesses, notwithstanding the Spanish king offered to portion higher any other Catholic or Protestant princess that he would chuse. He confirmed all former treaties made betwixt the nations, and made a new and perpetual one with Alphonso the Sixth; by which Great-Britain is to succour them in times of need, and particularly with a naval force adequate to the necessity of their demand. It was under the same king's single and express mediation the treaty was negotiated, by which Spain first acknowledged the independency of Portugal, Charles being guaranty; and by his power did the earl of Sandwich absolutely accomplish and sign the treaty. In consequence of our abovementioned engagement, did Great-Britain, in the year 1735, send them a succour of near thirty ships of the line, so very expeditiously fitted out, that they carried themselves the first public news of their appointment; which fleet remained under the command of Sir John Norris, twenty-two months in the river Tagus, to the cost of above A MILLION STERLING to this nation. And whenever they require another and greater assistance, I hope we shall as readily grant it, on the single condition that Portugal as fully and willingly complies with her obligations to us, in observing those regulations in respect to commerce which the same national treaty confirms and prescribes, and which is not demanding from them any favour, nothing dishonourable to their crown, or disadvantageous to their country; nothing but what impartial justice exacts, and what good policy on their side would readily promote.

R E M A R K.

That Great Britain might be made amends by the court of Portugal for the obligations, under which she lies to her; that court established in the year 1756, a wine company at Oporto; and endowed the same with the following exclusive powers; which by law strikes at the root of the privileges of an Englishman in the kingdoms and dominions of Portugal. See our article TREATIES OF COMMERCE AND NAVIGATION, where is contained THE TREATY OF PEACE concluded by OLIVER CROMWELL, in favour of England: also various other laws, decrees, &c. made at sundry times, and on divers occasions, made by the kings of Portugal, in favour of the ENGLISH NATION. To which is added, the king of Portugal's new law, concerning the diamonds found in the Brazils.

INSTITUTION of the GENERAL COMPANY for the culture of the VINEYARDS of ALTO DOURO, in the kingdom of PORTUGAL.

MOST GRACIOUS SOVEREIGN,

Your majesty's dutiful subjects, the vintagers of Alto Douro, and the good men of the city of Porto, humbly beg leave to represent to your majesty, that, whereas the subsistence of great part of the religious communities, private families, and chief inhabitants of the three provinces of Behira, Minho, and Tralos-montes, depends upon the culture of the vines; this species of agriculture is nevertheless reduced to so great a decadency, and is in so ruinous a state, that besides the detriment occasioned by the circumstance of the wines not yielding a sufficiency wherewith to cultivate the lands which produce them, this loss of capital, to the proprietors in particular, is aggravated by the farther loss of health to the public in general. For, as the number of taverners in the city of Porto is multiplied to an extravagant excess, forbidden by your majesty's laws, as well as by the regulations of the guild of the same city, beyond the possibility of reducing that multitude to rule; it thence follows, that, as the said taverners adulterate the wines, and corrupt them from their native purity, by a multiplicity of mixtures hurtful to human constitutions, they destroy not only the reputation of so important and considerable a species, but also all the commerce which is carried on in that commodity; nay, and the very constitutions of such of your majesty's subjects as make use of the wines which the said taverners vend for home-consumption. Animated therefore by the unparalleled clemency with which your majesty has already afforded relief to your afflicted subjects, even in cases of lighter grievance than the above-mentioned, the petitioners have agreed among themselves to form, under your majesty's royal favour, a company, which, by competently promoting the culture of the vineyards, may at the same time preserve the produce thereof for the advantage

of foreign and domestic commerce, as well as of the health of your majesty's subjects.

S E C T. I.

The said company shall constitute a body politic, having a governor, twelve directors, and a secretary; all of whom shall be qualified such in the manner hereafter declared. Besides the said directors, there shall be six consultors, men well versed in this branch of trade. The said company shall be styled, THE GENERAL COMPANY FOR THE CULTURE OF THE VINEYARDS OF ALTO DOURO. All the authentic papers issuing from it shall be dispatched in name of the governor and directors of the same company, and sealed with its common seal, which shall exhibit the image of St Martha, protectress of the territories of Douro, and underneath it, a scrip, or label, with this device: PROVIDENTIA REGITUR.

S E C T. II.

The said governor and directors shall be either natural-born, or at least naturalised subjects of your majesty, and inhabitants of the city of Porto, or of Alto Douro, who have in the company's funds ten thousand crusados stock, or upwards.

S E C T. III.

The elections of the said governor, directors, and consultors, shall always be made in the common hall, or guild of the company, by a majority of votes of all such proprietors therein as are possessed of three thousand crusados stock, or upwards. Such of them, however, as have not so much capital stock, may unite to make up out of lesser shares one total to the above amount, wherewith to constitute a single vote in the name of several, to be given by whom they shall judge proper to be nominated for that purpose. The first chosen for this establishment shall serve the office for the space of three years, and all others, who shall succeed him, shall serve for the space of two years; provided always, that such as shall have served may not be rechosen in the next election, without having a majority of votes in their favour not less than two thirds, as is more expressly declared in section iv. At the same time, and in the same manner, shall be chosen, from among the said directors, a sub-governor and a substitute, who shall gradually fill the office of governor, in cases of death or hindrance.

S E C T. IV.

The governor, directors, and consultors, shall at the first election be nominated by your majesty, to serve for the space of three years; at the expiration of which they shall produce, in a general court, the accounts of their whole management, and distribute to the proprietors the dividends belonging to them, or such as the court, by a plurality of votes, shall appoint to be made. This done, they shall immediately proceed to the election of the new governor, directors, and consultors: on whom it shall be incumbent first, and before all things, to examine the accounts delivered in by their predecessors, in order to pass to contest them, according to their desert: and the same shall continue to be the practice in future elections, so long as this company shall subsist. Still, in case the proprietors should think fit to re-elect one or more from among the said governor, directors, or consultors, they shall be entitled to admit the same again into office, on condition of their having a majority of votes of at least two thirds in their favour. The judge conservator (or recorder) shall tender to those first, who are to be nominated by your majesty, an oath that they will well and faithfully manage the effects of the company, and maintain its several members in their respective rights: and to those who shall be thenceforward chosen, the same oath shall be tendered at the board of the company, by the governor who quits the office, and registered in a special book he is to set apart for that purpose.

S E C T. V.

The said governor and directors shall be the treasurers of the capital stock, of which this company shall be possessed from its first establishment, and of all interests thence arising, 'till the times of making a dividend of them among the respective proprietors: to which effect they shall keep one or more coffers, as occasion may require, with proper keys to them, of which keys every one shall keep his own, so that each may remain bound for himself, and every one for all, to answer for every deficiency which may be found in the said stock, 'till they deliver up the capital to their successors, and make a dividend of the interests thereof among the several proprietors in the said company.

S E C T. VI.

All affairs, which shall be proposed at the board, shall be decided by a plurality of votes, and all which shall be thereby
thus

thus done, and ordain'd, shall have full credit given to it, and shall be put in its full and due execution, in the same manner as is practised in your majesty's tribunals; provided that at the said boards nothing be disposed in alteration of the established laws and regulations relative to the state of the Brazils, or that be contrary to any other of your majesty's laws, save what is allowed to it in virtue of its present establishment. The said governor and directors shall make choice of what officers they shall deem necessary for the good government of the company, as well in the city of Porto, and within the kingdom, as in foreign parts. They shall have ample jurisdiction over them; to suspend them, put them out, bring them to justice; and provide others in their places: all of them shall continue in their post so long as shall seem meet to the company, which shall have the inspection of their accounts, and pass to them acquittances, sign'd by two of the directors, and sealed with the company's seal, after their said accounts have been revised and examined at the board.

S E C T. VII.

This company shall have a judge conservator (or recorder) who, with privative jurisdiction, and exclusion of all other tribunals, shall hold courts of oyer and terminer for all contentious suits, wherein the governor, directors, conservators, secretary, clerks, managers, and other officers of the company, shall be either plaintiffs or defendants; whether the matter of the said suits be criminal or civil, so long as they are carried on between the said officers of the company, or between them and persons who do not belong to it: which said judge conservator (or recorder) shall call the said suits to his tribunal in the city of Porto by positive decree, and elsewhere by precatories; and shall have a definitive power in himself to the amount of 100 cruzados, without appeal or demur; as well in civil causes, as in the penalties decreed by him: but in all other cases, and in those, which being proved, are capitally criminal, he shall proceed in judgment in the high court of justice, call'd the *relação*, by one sole joint form of process, with the assistants which shall be appointed him by nomination from the chief justice for the time being of the *relação* and king's bench at Porto, or whoever shall serve office. Both the judge conservator (or recorder) and his clerk, as also his marshal, shall be nominated by the said board, and confirmed by your majesty, who shall oblige the ministers, whom the company may chuse to serve the said office; and that notwithstanding the statute, lib. 3. tit. 12. and all other laws hitherto published, relative to the office of conservatory (or recordership); for as the judgment of the said judicature is not recurr'd to, as a voluntary privilege for the molestation or vexation of the parties, but as a weighty contract for the service of your majesty, for the common good of your subjects, and for the good management of the affairs of the company, and the writings which it shall pass in your majesty's royal name; all these motives render the said judge conservator (or recorder) absolutely necessary. Such disputes, however, as may arise between persons interested in the same company, concerning the capital stocks, interests, and the dependences thereof, shall be proposed at the board of administration, and there verbally decided, in mercantile form, by plain dealing, according to the known truth, without form of process, or other allegations than those of simple matter of fact, and those of the rules, usages, and customs of commerce and navigation, commonly received as such, in the presence of the judge conservator (or recorder) and of the attorney-general of the company; which said board, with the approbation of the two aforesaid ministers, shall decide all causes, not exceeding the amount of 300 mil-reis, without appeal or demur: and such as exceed the amount of that sum, where the parties are unwilling to abide by the decision of the said adjudgers, shall be forthwith laid before your majesty, in an humble address from the board, for your majesty to nominate such judges as to your wisdom shall seem meet, who shall determine the same in like form, without intervention of any other ordinary or extraordinary recourse; all other dispositions of law or statutes to the contrary notwithstanding.

S E C T. VIII.

The said conservator (or recorder) shall, by summonses in the royal name of your majesty, dispatch all such orders as shall be forwarded to him by resolution of the company, for the good government of the same; as also for the hiring of carts, and embarkations for the carriage of wines, and for the compulsion of vintagers, coopers, taverners, and all other artists on whom this branch of commerce may depend, to enter into the service of the said company, on condition of its paying them their salaries. And the ministers of your majesty shall not take away, or interrupt their boats, carts, vessels, or any other things whatever, on which the dispatch of their loadings may depend; but rather, having occasion for more, the ministers to whom it may belong shall be required to send them more. And for whatever else may be further necessary towards the good government of the said

company, it shall be empowered to summon such ministers, as do not comply with, and effectually execute its orders, before the *relação*, (or court of king's bench) of the city of Porto, whither they shall repair to answer to the charge, the said judge conservator being first heard, who shall attend the board of the company, whenever he shall receive a message for that purpose, having there a seat suitable to his dignity.

S E C T. IX.

It being indispensably necessary for the company to have sufficient house-room, for its dispatch of business, for the security of its coffers, for the accommodation of its clerks and other officers, and for warehouses wherein to keep their wines, vessels, and other materials thereto necessarily appertaining, your majesty is graciously pleased to grant to it the privilege of settling, so as that their judge conservator (or recorder) may cause dwellings to be assigned over to its use, wherever the company shall judge them to be most for its convenience, without becoming subject to the having the rents, they were valued at before, raised upon that account; which rents the company will pay to the owners; and in case of dispute, the same shall be adjusted to the satisfaction of the parties, by the arbitration of proper persons, your majesty having for this effect abrogated all privileges of settlement, which the persons may be possessed of, from whom such dwellings shall be taken, or who have lodged their effects therein.

S E C T. X.

The main purpose of this company being that of supporting, together with the credit of the wines, the culture of the vineyards, and to promote, at the same time, the advantage of the commerce, which is carried on in this commodity, by fixing such a regular price for it, as may produce a competent profit to the manufacturers of it, and a reciprocal lucre to the traders in it; by avoiding, on one hand, the exorbitant prices, which, rendering its consumption impossible, destroy the species; and not suffering it, on the other hand, to fall to so low an ebb as that the vintagers shall be unable, without loss to themselves, to support the yearly expences of their agriculture; it is necessary for these useful ends to establish certain competent funds: wherefore the capital stock of this company shall be one million two hundred thousand cruzados, divided into actions of four hundred mil-reis each; the half of which may be advanced in competent wines fit for vent, by such as shall be willing to be concerned in the actions; and the other half shall be constituted in absolute cash, that the company may be enabled to fulfil its engagement of supplying the necessities of the vintage, and commerce, in the following manner.

S E C T. XI.

On the strength of the aforesaid fund, the company shall lend to necessitous vintagers, not only the necessaries for the construction and dressing of the vineyards, as well as for the managing of the wines, but also whatever else may be needful to them towards some of those minute expences, which the preservation of human life makes a daily matter of indispensable necessity, without requiring of them, for such loan, any higher interest than at the rate of three per cent. per annum; provided always that the said loans shall not exceed one half the value in general of the wines, which every such vintager is wont to collect: which wines, in consideration of the said loans, shall become and remain, effectively pledged to the company, in such manner as to give it the same preferable right over them as landlords of houses have over the goods therein contain'd, without its having occasion for any other title thereto, or other proof, than that of the said loans being entered in the books of the company, and verified by a writing under the debtors hands, recognized with the signature of some public officer.

S E C T. XII.

The company shall hold in readiness all materials necessary for the making of wine-vessels, not only for the year in which it may make its loadings, but also for the year following, that no deficiency of this kind may occasion either damage to the wines, or a baulk in the provision of them, which they are to furnish the ports of Brazil with, according to your majesty's gracious grant for this commerce.

S E C T. XIII.

And that the said ports of Brazil may not experience any want of this commodity, the company shall, for the present, settle a stock of 10,000 pipes of good wine, and fit for exportation, to enable it the first year to bear any disappointment it may meet with in its first loadings, and to wait for the produce thereof for a competent time.

P O R

S E C T. XIV.

In order to facilitate the purchase of stocks, in favour of the vintagers of the wines of Alto Douro, the company shall take of the purchasers of actions, such wines as are of the best sort, and in their natural perfection, without mixtures or brewings, capable of spoiling them, at the price of 25 mil-reis per pipe of common measure; and such of an inferior sort as are nevertheless fit for navigation, it shall take in like manner at the rate of 20 mil-reis. At the same prices they shall purchase the said wines for the time to come, whether this commodity happen to abound or fall short: wherefore as the company is to pay for their wines at the above rates in the years of plenty, so likewise shall the vintagers be obliged to deliver them at the same rates, without any alteration, in the years of scarcity, or dearth: the respective interests of each party being thus fairly compensated to the advantage of the commodity itself.

S E C T. XV.

And that neither the company may destroy the navigation of the city of Porto, by disappointing it of the lading of wines, which is its principal support, nor the navigation may prejudice the company by omitting to supply it with a competency of shipping for the transport of wines to the states of Brazil: your majesty is graciously pleased to establish, that for the carriage of every pipe of wine, brandy, or vinegar, which the company shall ship from the city of Porto for Rio de Janeiro, it shall pay to such ships ten mil-reis freight, after the manner heretofore practised, without any alteration in this respect whatever, on one side or the other. For such wines, &c. as shall be shipped for Bahia, it shall pay eight mil-reis per pipe as above; and in like manner eight mil two hundred reis per pipe freight, for those it shall send to Pernambuco, which freights shall not be altered in any wise whatsoever, neither by the company nor the proprietors, nor by the captains of ships, on pain, to such as shall act in any wise contrary to this regulation, of paying double the amount of such freights, the whole of which shall be applied, one half to the informer's use, the other half to the use of the hospital of the city of Porto, besides two months imprisonment of the delinquents.

S E C T. XVI.

The wines, brandies, and vinegars, which the company shall send to the Brazils, shall be shipped on board the vessels of the respective squadrons of that city, which shall put up for ladings, dividing them among them, and each of them, in proportion to their allotments; and the said vessels shall be obliged to receive them, without hesitation, in the same manner as is practised with regard to the salt-contract. Nevertheless, if it should happen that the consumption of the said commodities should increase to such excess in the states of Brazil, that the private ships of the trade be not able to convey thither the quantity necessary for daily provision, the company in that case shall be obliged to get ready, and send at its own expence, the ships necessary for such transport, only, however, to that port, for whose use the wines exceed the burthen of the said private ships belonging to the mart of the city of Porto. And in this case, neither such shipping, nor their equipages, nor whatever shall be necessary for their construction and fitting out, shall be seizable to any other uses than those of the said transport and the dependencies of the same company, not even under colour of your majesty's royal service, on pain to the persons acting in opposition thereto of paying to the said company, out of their own effects, all the damage thence resulting to it; to which intent they shall be called to an account before the judge conservator, or recorder, of the same company, and not at any other tribunal whatever, notwithstanding any privileges they may enjoy to the contrary.

S E C T. XVII.

Considering the notorious prejudice which salt, in its nature, does to wines in general, and the absolute necessity there is for that commodity in the states of Brazil, which obliges all the shipping to take competent ladings of it, your majesty is pleased to will, that none of the vessels on board of which the above wines are shipped shall carry any ladings of loose salt, but shall carry the whole in wooden chests, as they ought and are bound to do, stowing them well and close on that side where the wines are put, and placing between the wines and the salt other moist commodities, so as by every possible means to prevent the damage which may result to the wines from their immediate nearness to the salt, on pain to the captain or commander, who shall act contrary, of paying to the company double the value of all the wines which shall be found damaged at their arrival, as also of three months imprisonment for the first offence, and the penalties shall be doubled in proportion to the relapses into the same.

P O R

S E C T. XVIII.

The chief agent and deputies of this company, and the factors or administrators it shall employ in the states of Brazil, for their administration, and the clerks it shall employ in the city of Porto, for their salaries, shall be entitled only to their commission, at the rate of six per cent. to be levied in the following manner: two per cent. on the costs the company shall be at in its several dispatches at Porto; two per cent. on the sales which shall be made in the said harbours of the states of Brazil; and two per cent. on the returns and charges in the city of Porto; which said six per cent. shall be made to suffice for the full payment of the whole administration belonging to the trade, without the company's being liable to any other charges of the like nature; save only that it shall be chargeable with all costs arising from the salaries of such ministers, and other officers, as are to make a part of their body politic and economic, as also with such as may arise from the renting of houses and magazines, all which shall run on the company's account.

S E C T. XIX.

In order that this company may be able to support itself, and be enabled to make such a profit as may compensate the obligations it lays itself under by this establishment, and be a valuable consideration for the advantages thence resulting to the common-weal of the said provinces, your majesty is pleased to grant to it in the four governments within the states of Brazil, of S. Paulo, of Rio de Janeiro, of Bahia, and of Pernambuco, the exclusive commerce of all the wines, brandies, and vinegars which shall be shipped from the city of Porto for the said four governments and their respective harbours; to the intent that no person of any condition whatever shall be qualified to send thither any of the said commodities, except the same company, which shall enjoy the said exclusive privilege in the following manner:

S E C T. XX.

The brandies and vinegars may not be sold by the company in the said harbours for more than fifteen per cent. free to the proprietors of the principal cost, caskage, carriage, freight, customs of import and export, shipping, commission, the one per cent. to the coffer, and of all other charges thereon to be made to the act of sale, which shall wholly run on the account of the buyers; considering, however, the greater danger the wines are in of suffering damage in their quality, and that, on that account, they more immediately threaten some loss to the said company, therefore the said company shall be allowed the liberty of selling their wines at sixteen per cent. free to the said company from all the above-mentioned charges, but not at any higher price.

S E C T. XXI.

And in order to justify its sales, and make appear the exactness with which the company observes the said prices, it shall be obliged to send to its respective factors, or administrators, the accompts of the several cargoes signed in an authentic manner, by all the deputies, and sealed with the seal of the company, in order to be thus made known to the people, that every purchaser may be enabled to examine thereby the true value of the several commodities as may be parcelled out, in which accompts of cargo shall be specified in the most circumstantial manner the prime costs and other charges of each of the said commodities, that there may be no room to suspect the least unfair dealing.

S E C T. XXII.

This, however, is to be understood on supposition, that the said commodities be sold for ready money, or paid for, in case of sale, at the precise term agreed upon; because the debtors, on default of payment, shall incur the penalty of farther paying five per cent. interest, for the whole time of their delay of payment, or so long as the execution shall last, with which they may be served: But if the said wines be trucked in exchange for the goods of those governments, whose value is uncertain, and depends on the free will of the sellers; in that case, the agreement shall be fixed by convention of the parties; as it would not be fair for the inhabitants of that state to raise their goods to such a height as may do hurt to company, nor for the company to undervalue them, so as to discourage their agriculture.

S E C T. XXIII.

And because, likewise, it would not be fair for the company to hurt such persons in those governments, as sell the said commodities by retail, by depriving them of the means of subsistence, the said company shall not be entitled to sell at any time by itself, or its factors, any of the above-mentioned commodities

P O R

commodities by retail, nor dispose of any lesser quantity than one pipe of each of the said commodities; the sale of which shall always be made at the magazines of the said company, and never in shops, or such like private places, on pain to such of its factors as shall act contrary hereto of being chastised for every disorder, which shall thence result; remaining (ipso facto) incapable of serving the company, as also of all and every the offices of justice, or property, besides being condemned in a five years banishment to Angola.

S E C T. XXIV.

No person, whatever be his qualifications or condition, shall be allowed to send, take, or introduce into the said governments of S. Paulo, Rio de Janeiro, Bahia, and Pernambuco, the said wines, vinegars, and brandies, which are to be exported in the squadrons from the city of Porto, or shall be of the product of the lands of Alto Douro, on pain of the forfeiture of them, and as much more of their value amounts to: the whole to be applied, one half in favour of the company, and the other half in favour of the informers, who may give their information publicly, or in secret, (provided their informations be made good, upon corporal apprehension) in this kingdom, before the judge conservator (or recorder) of the company, and in that state before the presiding minister of the house of intendancy, or before any common judges, in places where there are no intendants; all which shall cause the informations to be notified to the company's factors, that they may act as plaintiffs in the matter, being entitled thereby to a fifth part of the value; and they not thus fulfilling their duty, their effects shall be liable to answer the damages thence arising.

S E C T. XXV.

Nevertheless, if it should happen that some of the vintagers do not agree to the prices determined in section xiv, and should have a mind to ship the wines of their own manufacture for the said ports of Brazil, they shall be allow'd so to do by the hands of the directors of the company; who, at the charges and risk of the same vintagers, shall send them to their factors, to be sold in the said state, at the same prices as the company's wines shall be sold at, and by no means at greater; provided always, that the quality thereof be equivalent to the said prices. And for the very reason that any such vintager did not care to content himself with the established prices on one occasion, he shall be excluded the privilege of obliging the company on any other, to take his wines at the said prices; and the company shall reimburse the said vintagers the amount of their product, abating commissions, according to the established rule, and all other expences attending the returns, so soon as the company shall have received the same: it being understood, that all charges attending the said wines, till put on board, shall be paid at the cost of the vintager, and not of the company.

S E C T. XXVI.

If the company should find any advantage in extending it's commerce of wines and brandies to the foreign nations of Europe, it shall be at liberty to do so, on paying the duties already established in the same branch of trade; as also those of entry at the custom-house of the goods it imports in exchange; and for that purpose, the company may retain in it's service the shipping it may stand in need of, which it may dispatch, as it shall think best, without any hindrance, and without being liable to have them, or their crews, disturbed, or taken from it, even under colour of your majesty's royal service.

S E C T. XXVII.

The company shall pay all the duties hitherto wont to be paid on the above commodities, as well in this kingdom, as in the said state of Brazil, in the same manner as has been heretofore practised; and the same shall be observed with the returns it shall make from the same state of Brazil to this kingdom.

S E C T. XXVIII.

Whereas every one knows the grievous prejudice, which has been done to the reputation of the wines of Douro, and consequently to the culture of the same, by the great liberty hitherto taken in the dealing therein, and by the excessive number of taverners, who retail them in the city of Porto, and the neighbouring towns; every one endeavouring to adulterate them from their native purity, with mixtures, and foreign compositions: and whereas the whole is contrary to what remains established by the charter of the 23d of February, 1605, by the act of consulship of the 18th of June, 1655, and by the provision of the board of Dezembro do Paço, (or senate) of the 23d of August of the same year: your majesty, in order to provide against these evils, is graci-

P O R

ously pleased to ordain, that in the city of Porto, and in the neighbouring places, within the distance of three leagues, no wines shall be sold, but on the account of this company, by retail; which said company, for that purpose, shall purchase of the proprietors the quantity of wines necessary, and the governor and directors shall be entitled to no more than one per cent. on the price thereof, and the other charges thereto incidental, on account of carriages, casks, duties, warehouses, and sale, or other trifling expences, by way of commission; out of the product of which they shall pay the factors they may employ in this service; and all the remaining profit shall belong to the several persons interested in the said company, by a liquid balance to be divided among them in the manner above established in sect. iv. And that this regulation may be put in force, without any notable trouble to the parties, regard is to be paid to the following sections.

S E C T. XXIX.

Whereas an entire and absolute separation is to be made of the wines of the coasts of Alto Douro, and it's district, in order to be shipped for America and foreign nations, from all the other wines of such places as only produce a sort fit to be drank in the country, that by this means the inferiority of these wines may not destroy the credit due to those on account of their native excellence; your majesty is graciously pleased to will, that there be made, with the greatest expedition, a map and general survey of the two coasts of the river Douro, north and south, wherein may be described all that territory which produces THE TRUE WINES FOR EXPORTATION, capable of passing forth of the bar of the said river, severally and distinctly specifying the great and small vintages of this peculiar kind, and exhibiting an estimate, by a common supputation or average, according to the produces of the last five foregoing years, of what each of the said vintages is wont to yield, in order that the proprietors thereof may not sell any, without making known to the company what they do sell, nor be enabled to sell to the company, or to foreigners, any greater number of pipes, than that which is allotted to them in the said register or survey, on pain, in case of exceeding the said quantities in their sales, of paying nine times the value of the excess, and remaining incapacitated to sell wines any more out of the kingdom.

S E C T. XXX.

No wine whatever shall be brought from without the limits of the territory above described into the same, unless accompanied with permits, passed by the whole body of the guilds of the places whence the said wines are brought; which permits shall declare the place they are bound to, the use they are designed for, the name of the vintager and vintage where they are received, the persons to whom they are consigned, and the direct road by which they are to be transmitted; which permits, in the above form, shall be exhibited to the commissaries, whom the company shall have nominated in the respective places, to inspect whether, in fact, the use be made of them for which they were designed. All this under the penalty, that the wine which is transmitted without permits, dispatched in the above form, or which shall be found to be out of the direct roads and highways, shall be forfeited in favour of the company; and this, in order to prevent the sorry wines from being mingled with the good, to increase their quantity in prejudice of their credit, and to the detriment of the company, and of foreigners, who are to become purchasers thereof. And if inferior wines should happen to be discovered in houses not approved for their reception by the guilds, with the company's consent, not only the said wines shall be forfeited, but those persons in whose custody they be found, shall be fined the treble of their value to the profit of the same company.

S E C T. XXXI.

In like manner, to prevent the fraudulent introduction of adulterated and sorry mixed wines into those foreign countries, whither the wines which are to be qualified as above are transported, no person, whatever be his state or condition, shall, under the above ordained penalties, be entitled to embark any wines for the city of Porto, but such as come addressed with the domestic manifestos of the vintagers to the board of directors of the company; which, finding them exact, shall order their mark to be put upon them as fit for exportation; finding them to be of another inferior quality, it shall order the proper mark to be put on them as inferior wines, fit only for home consumption on the spot, or within the kingdom; and finding them fit to be shipped for the Brazils, or for foreign countries, licence shall be granted for the sale thereof, and the board of the said company shall be obliged to make out annually a general and particular list of all the pipes of qualified wine which shall be shipped out of the bar of Porto to be navigated as above; putting on every one of them, with a hot iron, the mark of their approbation, and pointing them out with permits, signed by the

P O R

the governor, and all the directors of the company to the several custom-houses to which they are bound; and declaring in the said permits the names of the persons who make the ladings, and the certain number of pipes which every one of the said persons shippeth, though it be but a single pipe, or even but a barrel; to the intent, that if any should have an inclination to introduce into any of the said foreign countries any wines without permits, or in quantities exceeding the number specified in the said permits, on the supposition of their being wines of Alto Douro, the cheat may be instantly discovered in the respective custom-houses of the said foreign countries, as it will be evident in both cases that the wine is of different territories, and subjected to those mixtures and frauds which the company is endeavouring to prevent for the common good. And for a still greater security the company will, at the end of every year, remit to the different ports of America and Europe, to which any wines are exported, a printed general account, and circumstanced as above, with the names of the laders, and with a declaration of how much every one of them shipped, that it may reach the knowledge of every body.

S E C T. XXXII.

For the sale of wine by retail in the city of Porto, no more taverners shall be allowed than the ninety-five established by the charter of the 23d of February 1605. by the act of consulship of the 18th of June, 1655, and by the provision of the board of Dezembargo do Paço (or senate) of the 23d of August of the same year: inasmuch, that neither the number of taverns shall be altered, nor any change made with respect to the places appointed for them; nor shall any taverner be admitted to hold any one of them, who is not approved and licensed for that purpose by the board of the company, on pain of forfeiture to the company's use, of all the wine found in taverns not licensed as above, and of six months imprisonment to such as shall be detected selling therein: this penalty to be doubled and trebled, in cases of relapse, against such taverners or owners of wines as shall be subject thereto.

S E C T. XXXIII.

That the manufacturers of wine, and the purchasers thereof, may be enabled to act upon certain grounds, so as that neither the manufacture may claim, by selling it, such profits as may prove prejudicial to the commerce, nor the commerce be able to ruin the manufacture in it's beginning for the purchases thereof, the company shall unalterably pay for all the wines it may take up for exportation at the rate of twenty-five mil-reis per pipe, according to the two different qualities thereof, in the manner above declared in sect. xiv. so that, in case of there being a great deficiency of the above-said qualified wines, and a great demand for the same, those of the first rank may not exceed the price of thirty mil-reis per pipe, nor those of the second surpass the price of twenty-five mil-reis. Such, however, as may prove unfit for exportation, and yet proper enough for home-consumption, shall also be bought and sold by the same company at certain fixed prices, in the following manner: such as are of the growth of the lands lying between Porto and Arnellas shall be bought at the rate of four mil-reis per pipe, and sold at the rate of ten reis per pint, the company being at all expence and charges thereof: those of the growth of the lands lying between Arnellas and Bayao shall be bought at the rate of five mil-reis per pipe, and sold in the same manner at the rate of twelve reis per quart: those of the growth of Anfede and it's territory, which shall be hereafter described, shall be bought as above at the rate of six mil-reis per pipe, and sold in like manner at the rate of twelve reis and a half per quart: those of the growth of the lands of Barqueiros, of Mazzaofrio, of Barrou, and Penhajoya, shall be bought at the rate of eight mil-reis per pipe, and sold at the rate of fifteen reis per quart: the other ripe wines of the hills beyond douro, lying without the limits described of the lands productive of wines for exportation, shall be sold at the rate of twelve mil-reis per pipe, and sold in like manner at the rate of a vintem (or twenty reis) per quart: and the governor and directors of the company shall cause the said wines to be distributed among the taverns, to be sold at retail in the manner established in section xxviii. with this farther declaration, that for each of the above-said sorts of wine the said company shall provide proper casks, marked with a hot iron, distinguishing their several qualities and prices: and that the taverner who inverts the said orders, either by putting the better sort of wines in the casks of the inferior sort, or by mingling the one with the other, shall for the first offence pay a hundred mil-reis, shall forfeit all the wine he may be found possessed of, in favour of the informer, and have six months imprisonment; for the second, the same penalties shall be doubled; and for the third, he shall be liable to the same, and shall be over and above publicly whipped and transported to the kingdom of Angola. And because there will be some wines of so bad a sort as to be only fit to burn, or make vine-

P O R

gar, the company shall immediately grant licences to the proprietors of such wines for reducing them to brandies or vinegars, and being disposed to make their provisions of these two commodities, they shall purchase the same by mutual agreement of the parties.

S E C T. XXXIV.

If in some years the growth of the wines should be so redundant as to render it impracticable for the company to dispose of it readily, neither for American consumption, nor for that of the city of Porto, the vintagers shall be at liberty to sell the said commodity, for the consumption of any part of the kingdom, where there is no prohibition thereof; and if it is to be convey'd without the bar, the quality thereof shall be marked on the casks it is conveyed in, and the whole shall be accompanied with the company's permit, that the place it is designed for may be known; and that it may not be transmitted to foreign countries, and become productive of the ill consequences before mentioned.

S E C T. XXXV.

Whereas this company is established on the stock and proper substance of the persons therein interested, without any mixture of stock from the royal revenue; and whereas every one is free to dispose of his own effects as to himself may appear the most for his own advantage, the said company and the management shall be under the immediate subjection to the royal person of your majesty, and independent of all the tribunals, as well the greater as the lesser ones, so as that no minister or tribunal of your majesty shall in any case or accident whatever interfere with it or with what belongs to it, nor shall be intitled to hinder or interrupt the same in the management of all which belongs to it, nor demand of it any account of it's proceedings, it being the duty of the directors, who quit their office, to lay before those who succeed them, in the manner laid down already in sect. iv. And this is to be understood with express inhibition to all the said tribunals and ministers, and notwithstanding the right of their respective jurisdictions; for though it may seem that the management of the said company's affairs should be subject to such or such jurisdictions, nevertheless, as they do not interfere with your majesty's royal revenues, but belong wholly to the persons who put their own stock into the said company, it is they who are to have the management thereof entirely to themselves, with that separate and private jurisdiction which your majesty is pleased to grant them. In the case, however, of a tribunal's wanting to be informed by the board of managers of any thing relative to your majesty's royal service, it may order it's secretary to write to the secretary of the said board of managers, who being by him acquainted therewith, will direct him what answer to give. If it should be what the board does not think expedient to comply with, the tribunal which shall have made the enquiry may address your majesty, to the intent that, after the said board has been heard upon the subject, your majesty may take such resolutions as to your great wisdom shall seem meet.

S E C T. XXXVI.

In case the agents and factors of the company in America, or elsewhere, should happen to die, neither the judges for the dead and the absent, nor the judges for orphans, nor any other than the proper judge appointed by the company to take cognizance of it's affairs in the respective places, where such agents or factors shall die, shall interfere in the seizure of the books and effects of the deceased; which said judge, or superintendant of the company's affairs, shall seize the said books and effects, and shall give an account thereof to the board of the company in the city of Porto, that the same may first, and with preference to all other titles, separate what belongs to the company, and then deliver up the remainder to the judges or parties where and to whom it may belong. The same is to be understood with regard to the coffers and superintendents of the city of Porto, with whom the company shall settle accounts in the foregoing manner, down to the hour of death, admitting their heirs to be heard, to whom, however, the right of administering to the deceased is not to be transferred, but must always remain untransferable.

S E C T. XXXVII.

It is your majesty's royal pleasure, that the debts due to this company, which have been contracted from effects of the same, and not of any other nature, be recovered in favour of the company by it's recorder (or judge conservator) or by the ministers every where, who shall be required to recover them, the same as your majesty's royal revenue, notwithstanding any privileges or resolutions which the debtors shall allege to the contrary.

S E C T. XXXVIII.

It is also your majesty's royal pleasure, that all persons concerned in the trade, whatever be their state or condition, and however privileged they be, on being called before the board of the company, for any affair belonging to the management thereof, shall be obliged to attend the same forthwith, and on failure of so doing the recorder (or judge conservator) shall proceed against them as to him shall appear most proper.

S E C T. XXXIX.

All persons who shall enter into this company with six thousand cruzados stock, and thence upward, shall, as long as the said company persists, enjoy the privilege of not being confinable but within their own houses, in those cases in which such privilege is usually granted: and the officers of the same, for the time being, shall be exempt from bearing arms in any companies, whether of horse or foot, and from furnishing recruits, or attending general musters, in virtue of their respective employments. And the trade which shall be carried on in the said company as above, or by means of stocks, or by employments exercised by the board of the company, in the post of governor and directors thereof, shall not only be of detriment to the nobility of the persons, who carry it on, but shall rather be, on the contrary, a proper means towards attaining to acquired nobility; so that the afore-mentioned voting members, constituted by your majesty to serve at this first establishment, shall remain habilitated for being installed in the military orders, without any dispensation on the score of mechanics, and their child shall also, without such dispensation, be qualified to contend for promotion before the senate of Lisbon; on condition, however, that after having exercised the said employment, they do not themselves sell by retail in warehouses or shops, and that they do not take up any business degrading to the said post, after having filled it: this, nevertheless, is to take place upon future elections, only in favour of those persons who shall have filled the posts of governor and sub-governor, after having served at least two years complete, to the satisfaction of the company.

S E C T. XL.

The offences committed against any officer of the company, by deed or word, in matter concerning his office, shall be punished by the recorder (or judge conservator) as if done to your majesty's officers of justice.

S E C T. XLI.

No brokers shall be allowed to interfere in the purchase or sale of the company's effects; and only when the managers thereof shall think fit to make use of them in bargaining upon any affair, they shall be paid for the same; the hire agreed upon between them; which otherwise they shall not be obliged to undertake.

S E C T. XLII.

Though the company be resolved to act in every thing which relates to preparing and dispatching its ladings and shipping with the utmost mildness, and without applying to methods of severity, as nevertheless it may find itself in absolute necessity of having recourse to the assistance of the ministers of justice: it is your majesty's royal pleasure, that, to this effect, the board, by means of its recorder (or judge conservator) may send message to the judges of criminal and to the high bailiffs of the city of Porto, for these to execute the orders which shall be sent them; and your majesty will look upon the good offices done by them on such occasions, as if done for the advantage of the royal service, that they may receive from your majesty the reward thereof in their promotions, on presenting to the said judges for that purpose a certificate from the said board: and on the reverse, if they do not comply with this obligation, it shall be matter of complaint, and be imputed to them as a failure of duty in their residences.

S E C T. XLIII.

Your majesty is graciously pleased to grant to the governor, directors, secretary, and consultants of this company, the special favour, that, while they continue to serve in the said posts, they may not be taken up, or confined, by order of any tribunal, military commander, or minister of justice, in any case civil or criminal (unless it should be in flagrante delicto) without authority therefore from his recorder (or judge conservator.) And that their factors and officers, who shall repair to the provinces, and other places out of the city of Porto, to make purchases and execute the commissions with which they may be charged, may make use of

all forts of steel and fire-arms necessary for the safety of their persons and the capital they have with them; on condition that they carry with them licences for so doing, dispatched by the recorder (or judge conservator) of the company, in your majesty's royal name.

S E C T. XLIV.

Whereas the fund, or joint capital stock of this company consists of one million two hundred thousand cruzados, divided into actions of four hundred mil-reis each, as is already established in sect. x. every proprietor may have one or more actions, as he shall think fit, provided that, on completing the number to the amount of ten thousand cruzados, which is the sufficient share towards qualifying persons possessed of actions for posts in the management thereof, those actions, over and above the said amount, do remain concealed in the books of the company, without being laid down in the public accounts; which are to be distributed among the members, who have a right of voting at general elections.

S E C T. XLV.

The company shall remain open to the reception of the sums competent for the aforesaid actions, to wit, for the city of Porto and the whole kingdom, for the space of five months: for the islands of Agores and Madeira; for seven: and for all the Portuguese dominions in America, for the space of one year: the said terms to commence from the day of publishing the proclamations, that it may reach to every one's knowledge. And after the said terms are ended, or before the expiration thereof, if the abovementioned joint capital stock of one million two hundred thousand cruzados be completed; the company shall be closed, so as to be no more enabled to admit into the same any other person whatever: with this declaration, that for every one who shall enter into this company, it will be sufficient to pay down at his entrance one half the amount of the actions he subscribes for; and for the other half a credit will be given him of six months, reckoning from the day of fixing up the said proclamations to pay in the same, at two different payments, of three, and three months each.

S E C T. XLVI.

The persons who shall enter with the abovesaid actions, whether natives or foreigners, may dispose of the value thereof in that manner, and to that intent, which they shall think best, whether by way of entail, chaplainship, trust temporal or perpetual; deed of gift to the living, or reversion in case of death, or other such methods, making such adoptions, and applying such disposals and clauses as they shall think fit; all which it is your majesty's royal pleasure to approve and confirm, from this instant, of your own free will, certain knowledge, and royal plenary and supreme power, notwithstanding any dispositions to the contrary, though naturally requiring to be especially mentioned, so, and in the same manner, as if the said disposals, adoptions, and clauses had been written in deeds of gift under specious claims, or in last-wills, confirmed by the death of the testators. Forasmuch as, since the right which every one, in virtue of natural liberty, is entitled to of freely disposing of what is his own, authorises donors and testators to contract and dispose as above in favour of private families and persons, much more may the persons entering with the said actions be authorised to act in the same manner; when over and above the onerous titles of the contracts they enter into with the company, and the company with your majesty, they concur to the improvement of the advantages arising from this establishment to your majesty's royal service, to the commonweal of your kingdom, and to the preservation and credit of a commodity, which, though so important, is in so ruinous a situation.

S E C T. XLVII.

The money which shall be thrown into this company shall not be extracted thence, during the time of its continuance, which shall be that of twenty years, reckoned from the day of the departure of the first squadron it shall dispatch; which term of years may nevertheless be renewable for ten more, if the company shall request as much, and your majesty be graciously pleased to grant it the same. However, that the persons who shall enter with their several capitals may have it in their power to make use thereof, they shall be at liberty to sell the whole, or part of the actions they are possessed of, as if they were absolute masters of the same, at the prices they shall agree for, transferring the same actions to the persons who shall be the purchasers, which contracts the board of the company shall be immediately informed of, and the same shall cause the necessary minutes to be taken of the said transfer, without fee or reward on that account, passing new policies in favour of the

new owners of such actions, and entering marginal notes in the old policies of the sellers thereof, whereby the sale they have made of the same may evidently appear, and taking care to fix to the said actions such necessary lights as may serve for a full title to the new proprietors. All which is to be understood, so long as the said company shall remain with a mercantile form of management, and vested with the privileges your majesty is pleased to grant to it as above. For, in case of it's mercantile form of government being changed, or of failure of the accomplishment of the same privileges, every person possessed of actions in it shall be at full liberty to call out immediately the capital of his actions, together with the interest thereof, which till that day shall be found due to him. And your majesty confirms the same, with the same clauses, to be literally and inviolably observed, without interpretation, modification, or any meanings of fact or law, which can or may be alleged to the contrary.

S E C T. XLVIII.

The interests arising from the funds of this company shall be divided for the first time in the month of July, of the third year, to be reckoned from the departure of the first squadron, on board of which the said company shall ship it's goods for the Brazils, and from thenceforward a dividend pro rata of the said interests, shall be annually and successively made in the month of July aforesaid; although the directors should happen to have more than a year to remain in their offices.

S E C T. XLIX.

Such stocks and interests as shall be found after the expiration of the twenty years, which compleat the term of the company's charter, or after the expiration of the farther term for which it may be renewed, having the nature of an entail, of a chaplainship, of a trust temporal or perpetual, or being the property of the absent, shall immediately be passed from the coffers of the company to the general deposit of the court and city of Lisbon, where they shall be laid up with the same security as the said deposit itself is, in order to be disposed of, applied, or delivered up, according to the disposal of the persons who so settled them at the time of putting into the company. But those stocks which are not under any such restrictions, and are perfectly allodial and free, shall require nothing more or less to entitle their proprietors to receive the full value thereof, than the very policy of the same; and the money being paid to the person who produces the said policy, this shall remain in the coffer, to serve as a discharge from the said action or stocks; for the recovery of which no copies shall ever be of use, but the originals themselves shall be always required.

S E C T. L.

All this shall extend to foreigners, and persons residing in foreign countries, whatever quality or condition they be of; and in case, that during the above twenty years term of charter, or the farther renewal thereof, this crown (which heaven avert!) should be at war with any other power whose vassals have thrown their effects into this company, nevertheless no arrest, embarrassment, sequestration, or reprisal, shall affect them, or the interests thence arising to the owners, but rather they shall remain to them as perfectly free, exempt, and secure, as if every one had them in their own hands: a special favour which your majesty is pleased to grant to this company from the motives above-mentioned; and which your majesty, thus on your royal word, promises to fulfil to them.

S E C T. LI.

And because in course of time many things may occur, which cannot at present be expressed for want of reflecting on them, your majesty is graciously pleased to empower the said company, as occasion shall offer, to lay them before your majesty, by means of the secretary of state for the affairs of the kingdom, that your majesty may determine concerning them as your wisdom shall find best for your own royal service, and for the common good of your dutiful subjects and of this company. And the company shall do so accordingly, even in matters relating to it's own advantage, whenever any one of the directors shall insist on a case being laid before your majesty, provided the affairs be of moment, and it's consequences of importance to your royal service, to the common-weal of the kingdom, or to some weighty affair of the company.

S E C T. LII.

Whereas it is of great use to fix a time certain for the departure of the squadrons from the city of Porto to the states of Brazil, as well as that the wines may be navigated at a convenient season, as that the inhabitants of those governments may

make their necessary provisions at a certain period of time: It is your majesty's royal pleasure, that the squadrons, bound for those governments, do precisely set sail in the spring tides of the month of September, or, at the latest, in the first of those of October of every year, on pain, that the ships which do otherwise, shall not be empowered to go out till the like time of the following year; and that leave shall not be granted to them to lade or to sail at any other time.

S E C T. LIII.

And whereas your majesty, after hearing the petitioners, has been graciously pleased to nominate the persons, whose names are hereunder subscribed, to establish and govern this company for the first three years; they, and every one of them, sign this writing in the name of the said vintagers and good men of the city of Porto; personally binding their own effects with which they enter into the company, and also those of the persons in general, who shall enter into the same, so far only as the portions wherewith they enter therein may extend: that your majesty may vouchsafe to confirm the said company with all the clauses, pre-eminence, privileges, and conditions contained in the same writing, and with all the strength and force necessary for it's validity and security. Porto, on the 31st of August, 1756.

I, the king, make known to those who may see this charter of confirmation, that having, and with persons of my royal council, and other ministers learned, experienced, and zealous for the service of God, of myself, and of the common-weal of my subjects, whom I thought fit to consult, maturely weigh the three and fifty chapters and conditions contained in the three and thirty afore written half sheets, marked by Sebastian Joseph de Carvalho e Mello, one of my council, and secretary of state for the affairs of the kingdom, which the principal vintagers of upper Douro, and the good men of the city of Porto, therein mentioned, have made and ordained, with my royal approbation, in order to establish a company, which may competently support the culture of the vineyards of Alto Douro, and at the same time preserve the growths thereof in their natural purity, to the advantage of domestic and foreign trade, as well as of the health of my subjects, without any expence to my revenue, but rather to the improvement of that and of the common-weal of my kingdom: and whereas upon examination of the said conditions, with mature counsel, and prudent deliberation, they have been found not only convenient, as well as the company itself, which is of manifest utility to the said city of Porto, and to the provinces thereto adjoining; but also, that the said company is of singular service in this particular, as also the persons, who thereby contribute to the advancement of commerce and agriculture, by so advantageous and solid an establishment: it is my royal will and pleasure to confirm all the said conditions, and every one in particular, as if they were, word for word, here inserted and declared: and, by this my charter, I confirm to it and them the same, of my own free will, and certain knowledge, royal and absolute power, to the intent that they may be put in execution, and fully observed, according to the tenor and meaning thereof. And it is my royal will that this confirmation, in the whole and for every part thereof, be inviolably observed, and never be repealed, but do always remain in it's full force and vigour, as firm, valid, and perpetual, without diminution; and that no doubts or demurs be raised to obstruct the accomplishment of the same, either in part or in the whole, in judgment or out of it; and that it be understood to be done in the best form, and in the most perfect meaning which can be expressed and understood in favour of the same company, and it's commerce and the support thereof; supplying, and having for supplied, (as if inserted in this charter) all clauses and formalities of law and practice, which may be requisite to give it it's full force; and I repeal, and have for repealed, all and every the laws, statutes, ordinations, decrees of courts, provisions, extravagants, other charters, and opinions of doctors, which by any means, or in any manner whatsoever, may be contrary to the conditions of the said company, or to any one of them, though they should be such as to render it necessary to make herein a special and express recital thereof, word for word,

word, notwithstanding the ordination of the second book, title forty four, which ordains that no ordination shall be deemed to have been by me repealed, unless express mention of the same be made: and for the greater force and irrevocable existence of this confirmation, I promise and give assurance, on my royal word, thus to fulfil it, and to cause it to be fulfilled and maintained, and not to revoke it; but to support the persons interested in the said company in the preservation of that and of it's commerce, in the quality of protector thereof, as I am in fact: and this charter shall have the force of a law, that the confirmation of the conditions and chapters therein contained may always remain in their full vigour without any alteration. Wherefore I command the senate of Lisbon, the courts of requests, the court of exchequer, the ultra-marine-council, the board of conscience, the guild of the city of Porto, and other courts and tribunals, as also all the governors, generals of the Brazils, officers majors, intendants of the revenue, auditors general, and guilds of that state, and all the magistrates, ministers, judges, and justices of my kingdoms and lordships, that they in like manner do fulfil and observe it, and cause the same to be fulfilled and observed, without doubt or demur, of any sort, not admitting any plea which may obstruct, in the whole or in part, the effect of the said conditions, as whatever relates to the company belongs to the board of the same. And it is my pleasure, that this charter have force as an instrument, without passing through the chancery-office, and notwithstanding the ordination, book second, title 39, to the contrary, though it be more than a year before it have it's full effects.

Given at Belem the 10th of
September, 1756.

R E Y.

Sebastião Joseph de Carvalho e Mello.

Charter, by which your majesty is pleased, for the reasons therein alleged, to confirm the fifty-three chapters, and the conditions contained in the thirty three half leaves aforewritten, which the principle vintagers of Alto Douro, and the good men of the city of Porto, have made and ordained, with your majesty's royal approbation, for forming a company, which, maintaining the culture of the vineyards, may preserve the produce thereof in it's natural purity, to the advantage of the vintage, of commerce, and of public health.

For your majesty's inspection,

Done by JOACHIM JOSEPH BERALHO.

Registered in the office of the secretary of state for the affairs of the kingdom, in book I. of the said company, leaf 1. and the following.

The printer, Michael Rodrigues, may print the chapters, and the conditions of the general company for the culture of the vineyards of Alto Douro; I having, by this decree, granted him the necessary licence for that purpose only.

With his majesty's royal signature.

Registered.

REMARKS ON OUR ARTICLE PORTUGAL, since the last war, and the treaty of peace of 1763.

The Portuguese being invaded by the Spaniards in the year 1762, we again succoured them at no less expence than we did before, and they became a contracting party to the DEFINITIVE TREATY of 1763. See AMERICA for the treaty at large. But we have not received or got any grateful returns, suitable to all the obligations which Portugal is notoriously under to Great-Britain; though it has been said, we are in daily expectations to receive such in a commercial way, as will make us an ample compensation for all the expences, which we have been at: but we know there is little gratitude amongst princes, when their turn is served. However, if Portugal only amuses and deceives us again; it is to be hoped, that this nation will never more assist them, without previously consulting her own immediate interest by so doing: we are no longer in a condition to fight the battles of other nations, without receiving advantages, more than equivalent to the expence, and the attention required by the court of England, when engaged in such enterprizes. The largeness of our PUBLIC DEBTS, and the multiplicity of our TAXES, it is to be hoped will be a memento to relinquish such systems, till we have got rid of our national incumbrances, or sufficiently reduced them.

Let any man of candour and impartiality judge, whether the above wine company is not an establishment, calculated to destroy and annihilate all the commercial privileges to which the English are entitled in the kingdom of Portugal: we are persuaded, that he cannot think otherwise, when he compares it with the articles in Oliver's peace, which he will find under our article of TREATIES OF COMMERCE.

However, whether the court of Portugal, will or no think proper not only to ratify and confirm all the ancient privileges of British subjects in that kingdom, but add some fresh one to them, in grateful remembrance of the greatest expence the crown of Great-Britain has been at for the support of that nation, and the distinguished attention this nation has lately given to her preservation; we shall soon hear, his excellency Count de la Lippe being just now charged with a special commission from our court to Portugal, for that purpose, than whom no one could be more acceptable to the court of Portugal, the count having done it such important services, by means of Great-Britain.

PORTUGUEZE AFRICAN TRADE. The Portuguese have a great share of the trade to Africa; and, as the Dutch trade thither for gold rather than for slaves, so the Portuguese trade there rather for slaves than for gold, though they have some share of the gold also, especially on the east coast. But this trading chiefly for slaves has been, in some respect, the safety of the Portuguese commerce: for as the Dutch, who are every where their rivals in trade, have kept the coast where there is most gold, so the Portuguese quietly possess their factories in Congo, Angola, and the south coast of Africa, where there are slaves, but no great quantity of gold.

As the Dutch want but few slaves, because they have but few plantations in America; so the Portuguese want a great number, because their plantations in Brazil are so very great; and they increase their trade upon the coast of Africa, because their colonies in Brazil increase considerably every year. See the articles BRAZIL and PORTUGUEZE AMERICA.

In order to supply themselves with negroes, they have a trade with all the factories upon the coast of Angola, and the whole kingdom of Congo is, as it were, their own; by which they enjoy all that which geographers call the coast of Congo; or the Lower Guinea, from the Portuguese fort on the north of the island Fernando, in the latitude of 7 degrees south, to Cape Negro, in latitude 16 degrees, besides a powerful settlement up the country, at St Salvador.

In this vast extent of country they have a most extensive and advantageous trade, having made very considerable settlements; but the principal, and where their governor or viceroy keeps his residence, is at Loando in Angola, and Cape Palmerhino, where they have strong garrisons, and are able to bring together, for their defence against the natives, 2 or 3000 men at a time, very well armed. See the following particulars of all their settlements in that country; with a brief account of the trade they carry on at all of them respectively: for they have no settlements here like that of the Cape of Good Hope, merely for baiting and refreshing their ships.

The Portuguese settlements on the coast of Africa, with their trade, are as follow:

IN GUINEA PROPER, OR UPPER GUINEA.

ARCHIEM, a fort upon a small river, near Cape Three Points: their trade here is chiefly in elephants-teeth, some gold, but not much.

They once had DEL MINA, a strong castle, and now the biggest and fairest fortification in all Guinea. N. B. This castle was taken from the Portuguese, who built it, by the Dutch, anno 1631, and the Dutch still hold it, and have made it very strong.

WIDDAW: here they have a small settlement, but not much trade; they say they pretend to settle there chiefly for intelligence.

IN CONGO.

FERNANDO Po, an island the farthest north, and near the English factories. Here they obtain some gold and elephants-teeth, with much bees-wax and civet; but the chief trade here is for fresh provisions for the Portuguese ships out-bound for India.

CAPE LOPOS. Here they have such a settlement that the king of the country lives in the fort with them, and they are all confederates; they get here a great many slaves, and some drugs.

LOANGO: it is a kingdom, and has it's proper king; but the Portuguese may be said to be more properly kings of this whole country, especially the sea-coast, which they are fully possessed of for 1100 miles together; and they carry from thence yearly 25,000 slaves, or negroes, for the Brazils, but little or nothing else.

GREAT CASCAIRS, at the mouth of a small nameless river, not navigable.

GOANGO, at the mouth of the river Zaire: here also they get abundance of slaves.

ST SALVADOR, the capital city, above 100 miles within the country.

LOANDO, where the Portuguese governor resides.

In

In ANGOLA.

CAPE PALMERHINO,
CAPE LEHDO,
LIBOLO,
BENGUELAS, or ST PHILIP.
The Dutch have a small
settlement here, but the
Portuguese drive a very
good trade from hence
notwithstanding.
TORTUGA,
ANGRA DE NEGROS.

These are the places where the
bulk of their slaves are col-
lected, and where also they
load their ships with what
other things they find.

Besides all these, they have some small factories on the north-
ern coast, about Cape Verd and Rio Grand.
From these southern parts they carry a very great number of
slaves every year to the Brazils; and as their colony there is
exceeding great and populous, as well as rich, were it not
that they have such extended settlements on the coast of Afri-
ca, for the supply of negroes, they could not be able to carry
on their fugar-works, their mines, and other planting business
in the Brazils, where the slaves are not long-lived.
But this is not all they have to depend upon for supplying the
Brazils: they have several considerable settlements on the east
coast of Africa, as in the territory of Mozambique, and the
whole coast of Zanguebar, a country that takes up the sea-
coast from the Rio de Ladrones, in latitude 27 degrees south
of the Line, where the Portuguese say the government of
Mozambique begins, to Jubo, which lies directly under the
Equator, or within one degree north latitude, and from thence
even to the gulph of Moccha, or the Red Sea.
The Portuguese governor of all this territory resides at Mom-
baza, in the kingdom of Melinda, where the king of Melinda
also resides. They are absolute masters of all these coasts,
where they are never interrupted by the visits of any ships or
company from Europe, except their own, or except they be
ships in distress, in their return from India; for in their go-
ing they steer quite another course.
On this coast of Africa they possess vast dominion, and have
several powerful people, countries, and even kingdoms tribu-
tary to them; of which we must take notice, otherwise their
trade from those places cannot be fully described.

In MONOMOTAPA.

INHAGUA, an island near the mouth of the river St Esprit,
where the Portuguese dominions south of the Line begin.
Here they get abundance of elephants-teeth, and also much
gold: here also they begin to be full of black cattle, and they
furnish great quantities to the Dutch at Cape de Bonne Es-
perance.
ST MARTIN, an island also, in the mouth of the great river
Cumana, where they have a traffic with the natives for Eu-
ropean goods, but bring little away but provisions.
PUADO, an island in a branch of the same river Cumana. By
this river the Portuguese carry on a great commerce with the
Caffres, or inland negroes, exchanging a vast quantity of
European goods for slaves and gold, to their very great
profit.

MOZAMBIQUE, and therein

The coast of ZANGUEBAR, containing two governments:
ST JOHN of MOZAMBIQUE, an island with a city in it,
which is very populous, and full of trade: it is wholly pos-
sessed by the Portuguese as sovereigns. They have a strong
fortress here for protecting their trade, in the nature of a cita-
del, which commands both the country, the city, and the
harbour, which is also very good; and here most of their
ships for Goa and Macao call, as well for trade as to re-
fresh themselves, as they return from China and India. Here
also they drive a very gainful trade, trucking the manufac-
tures of Europe for gold and elephants teeth, but not many
negroes.
MONGALE, an inland town, possessed also by the Portuguese,
and garrisoned, and which is the staple of their European
goods, manufactures, &c. of which they sell great quantities
to the natives, for small bits or lumps of gold, to very great
advantage.
QUILSA: this is a strong fort, built by the Portuguese, but
the country is unhealthy, so that the factory could not hold
it, and they demolished it again: but the king is tributary
to them, and pays for their protection, as they call it, 1500
pounds weight of gold per annum, and a great quantity of
ivory; and, as the people are clothed here also, the Portu-
guese sell them abundance of European goods, manufac-
tures, &c.
MOMBASA, a government and strong fortress, but lost to the
natives in 1631, who took it by storm, and cut all the Por-
tuguese to pieces in it; but the Portuguese returned it, for
they recovered it again, with greater slaughter of the inhabi-
tants, and made it very strong. Here they have also a very
advantageous trade.

MELINDA, a large country; subject to the Portuguese, though
they have a king of their own also. The capital city is called
likewise Melinda, a large populous place, wholly built by the
Portuguese in the latitude of 8 degrees, a sea-port, with a
very good harbour, and a strong citadel, which commands
the entrance into the port. At this city the Portuguese are
so numerous, that they have 17 churches, besides religious
houses. Here they have such large warehouses for all sorts
of European goods, that they supply the whole coast and
country for 1000 leagues within land; and here they yearly
carry off a very great number of slaves, as also gold; horses,
rich gums and drugs, and some oriental pearl.
Adjoining to this country there are five several kingdoms,
all tributary to the Portuguese; so that they have the so-
vereignty of as much land in this country, as the whole king-
doms of Spain and Portugal take up in Europe; and the
merchants of Melinda are immensely rich.
BRAVA: some call it a republic; whether it be so or not mat-
ters not much, they are subject to the Portuguese, and pay
a tribute for carrying the Portugal standard. The Portu-
guese trade here chiefly for ambergrease, elephants-teeth,
and gold; and they take off great quantities of European
goods, because the people go clothed after the Portuguese
manner.
From hence to the Red Sea the Portuguese have the com-
mand of the coast, though no settlement or trade with the
people.
Whoever considers the extent of the Portuguese dominions
on these coasts, and includes the many nations and kingdoms
which are their tributaries, must necessarily allow their trade
to those countries to be exceeding great: and though the
people of many of those nations go almost naked, or with
very little clothing, and, therefore, consume not much
woollen or silken manufactures (the climate being exceeding
hot where most of them live), yet this is greatly supplied by
the infinite number of people, who all make use of some-
what; and the export in the whole, from Portugal to
those places, must be very great. As for their returns, they
are made with great advantage to the merchant, as well as
to the nation in general, for they are in some of the most
precious and valuable things in the world; such as,

Slaves,
Gold-dust,
Elephants-teeth,
Gums of the richest kinds,
Ostrich-feathers,
Bees-wax.

Drugs, { Senna,
Aloes,
Guinea grains,
Civet,
Ambergrease,
Incense,
Frankincense, &c.

Wild beasts and birds, { Lions,
Leopards,
Tygers,
Civet-cats,
Elephants,
Ostriches,
Apes,
Parrots,
Horses, very fine, of the Arab breed, from Magadoxa.

The Portuguese have also several possessions, and a great
trade, in some islands in several parts of the world. For
example,
MADAGASCAR, right against the shore of Mozambique and
Kanguebar, on the coast of Africa, where they get slaves in
considerable numbers, but no gold.
MADEIRAS, a body of islands near the Canaries, and which
carry on a large trade in wine of that dominion also.
TERCERAS, or the AZORES, or WESTWARD ISLES. These
are also a small cluster of islands, seven in number, not far
off from the coast of Africa, and have a small trade with Por-
tugal for European manufactures and corn, but have very lit-
tle returns to make, except corn and cattle: they lie very
convenient for victualling the Brazil ships outward-bound.
See AZORES ISLANDS.
CAPE DE VERDE ISLANDS. From whence they derive their
name is easy to judge, they lying just off Cape de Verde, or,
in English, the Green Cape.
All these islands are possessed by the Portuguese, except that
of Madagascar, and even there they have the people under
such command, that it is all one as if they possessed it. In
all these they have a very considerable trade, but especially to
the Cape de Verde and the Madeiras: the latter, in particu-
lar, is said to send 20,000 pipes of wine a year to the English
and French colonies in the West-Indies, particularly to Ja-
maica, Barbadoes, and Martinico; and the Cape de Verde
islands to furnish salt to New England, and the English colo-
nies on the north of America, for their fishing-trade.

The Portuguese had once begun a trade into the empire of the Abyssines, or Ethiopia; but were given out of it again by the Ethiopians, who fancied they intended to stop the channel of the river Nile, and turn it into the Red Sea, and so cut off their commerce and communication with Egypt. One thing is to be noted of the Portugal trade, viz. that having no manufacture worth naming in trade, with which to carry on their affairs to all these remote settlements, and where they have infinitely more people to supply than their whole country in Europe contains, all their ships therefore go loaded with the product and manufactures of other nations, just as the Spaniards do to New Spain, such as those of England, France, Holland, and Hamburg; and as the English have the greatest opportunity to oblige them, by the treaties made between them in trade, so the greatest quantity of English manufactures have heretofore been sent to them, which they have again exported to all these remote parts of the world.

All these things confirm what is said above, viz. how greatly the trade of Portugal is increased in a few years, upon the occasion of the growth of those colonies, and of their interest in them; inasmuch that it is apparent Portugal alone has taken off more English goods yearly, within the last 40 years, than both Portugal and Spain took off together any year before.

This is chiefly owing to the increase of their colonies in the Brazils, and on the eastern African coast, which are so very much improved of late, and are daily increasing, by the vast number of native Portuguese who go to settle there, and who all grow rich, that it is believed Brazil only, in 40 years more, if it goes on as it has done for 40 years past, will be the greatest colony in America, and have more people in it than are in all Portugal and Algarve in Europe.

R E M A R K S.

From this account of the Portuguese situation in Africa, the following particulars are observable:

1. That as the success of the gold and diamond-mines in Brazil, as well as the sugar-works, belonging to the Portuguese, depends upon the labour of negroes, they constantly take care to obtain a competent number for this purpose, by virtue of their African settlements.
2. That from the greater dominion in sovereignty, as also the greater extent of territory in Africa than any other European power has, they necessarily purchase the productions in this part of the world at cheaper rates than other powers can do: that is to say, they exchange less quantities of the merchandises of Europe for their African slaves, their gold, ivory, &c.
3. That their having brought far more of the natives to cloath in the European manner, than all the rest of the potentates considered together who have settlements there, the general traffic of the Portuguese in Africa is not of less consideration to them, perhaps, than that of all the other powers of Europe unitedly comprehended.
4. That the policy of the Portuguese in Africa points out, and even demonstrates, that it is by no means impracticable for the English in particular, who have such a number of good forts and settlements in Africa [see ENGLISH AFRICAN COMPANY] to make at least as great advancement into the inland commerce of Africa as the Portuguese; and to bring thousands, perhaps millions, of the natives, so to cloath in the European manner, as to add infinitely more to the exports of this nation in that part of the world, than we have ever hitherto done: for, although England has been in possession of forts and settlements in Africa since the time of queen Elizabeth, yet we have never enjoyed any thing but a trifle of the coast-trade; we have never yet entered into the heart of Africa, and, consequently, have not enlarged our commerce there any thing like to the degree it will admit of.—But this, we apprehend, depends upon quite other measures than what they have ever yet been taken. See the article ENGLISH AFRICAN COMPANY, Vol. I. and such other heads to which from hence we have referred.

PORTUGUEZE AMERICA. The territories belonging to Portugal in America, are the Brazils; which for situation, extent, and other advantages derived from nature, have proved unfeignably beneficial to the possessor. We shall not enter farther back into the history hereof, than what may be requisite to our purpose. Among the various contentions amidst several powers for these territories, the Dutch were the last who declared war against Portugal on this occasion; but after five years, they were glad to make a peace, under the mediation of our king Charles II. which was signed in August 1660; and the Portuguese have, since this time, remained in quiet possession of this vast country. See the article BRAZIL.

The trade which the Portuguese carry on to this colony has been so great, that some have thought that to have been the principal cause why they have neglected that of the Indies.—See the article PORTUGUEZE EAST-INDIA TRADE.

The trade of the five northern captainships of Brazil, viz. Paria, Maragnen, Siere, Rio Grande, and Parayba, is carried on in the last mentioned port, which lies on the river of the same name, at five leagues distance from the sea.—It is a pretty fair and populous town, and there are annually about 7 or 8 ships sent thither from Lisbon and Oporto, of about 250 tons burden. Their lading consists chiefly in sugar, of which they make more in these northern captainships, than in the south; especially since the discovery of the gold mines, which has made the inhabitants negligent in respect to this and all other productions and manufactures.

There was a time when the trade of Brazil sugar was superior to that of any in the world; for the Brazil sugar was the first known in Europe, and the Portuguese are said to have set up their sugar-works in this country, about the year 1580; and their long possession has made them more careful and exact in it, than any other nation; so that even at present, the clayed sugars from Brazil are whiter and finer than ours, and yet the method of doing it is no great secret. See the article SUGAR.

Besides sugar, they bring from hence dyeing woods, several sorts of drugs, and other valuable commodities from Parayba, which is the least frequented port in Brazil, though these northern captainships are the best peopled, and the inhabitants are easy in their circumstances, notwithstanding there have been no mines yet wrought in these parts.

TAMARCA, which lies next to Parayba, and the captainship of Pernambuco, carry on their trade from the city of Olinda. It is seated on a hill not far from the sea, which renders the streets uneven and incommodious. The port is but narrow, and entry extremely difficult; yet there is a considerable resort of shipping there from the other parts of Brazil, and from the Canaries; and the annual fleet from Lisbon, consists generally of about 30 sail, escorted by a man of war. These merchantmen are generally about the same size with those sent to Parayba, and their cargoes are composed chiefly of sugar and Brazil wood, which last is said to be the best of its kind in the world. See BRAZIL WOOD.

BAHIA, or the BAY OF ALL SAINTS, is the next captainship of Brazil, is about 12 leagues over, but scarce navigable in several places. There are in this bay several small islands, where there are tobacco and sugar plantations; and they have also very good fisheries on the coast of these islands, and on the banks.

ST SALVADOR city lies in the latitude of 14 degrees south, and is at present the center of the Portuguese trade in this part of the world. Authors differ in the accounts they give of the fleets sent annually hither from Lisbon, some making them double what others report; but the reason of this is, we apprehend, that the one speak of the whole Brazil fleet, which generally assemble in the Bay of All Saints, in order to return together to Europe; and the other of the fleet from Lisbon expressly destined for the Bay, which is about 30 sail escorted by two men of war, about the month of March commonly.

The commodities they carry are wines, brandies, meal, or flour; oil, cheese, cloths, stuffs, linen, iron, rough and wrought; paper, all kinds of kitchen utensils, laces, and most kinds of apparel. On the other hand, they bring from thence the best tobacco in Brazil, so highly esteemed in Europe; also sugar, indigo, balsam capaiva, ipecacuanha, pareira brava, cinnamon, long-pepper, ginger, woods for dyeing, and some for inlaying; ambergrease, and other rich drugs and perfumes: besides these, they also export from hence raw hides, train-oil, and whale-fins, abundance of these creatures being taken upon the coast, and, for above these forty years last past, gold, amethysts, and diamonds. There are likewise some silver mines in Brazil, which, though not wrought to such profit as to allow the exporting much of this metal to Portugal, yet furnish sufficient for home circulation; and of this silver that money is coined at St Salvador, which is current through the whole colony; and which bears on one side the arms of Portugal, and on the other a cross charged with a sphere, with the following motto: Under this sign will I stand.

The rest of the captainships which lie farther to the south, carry on their trade by the Rio Janeiro, so called for its having been discovered in the month of January 1515; and which, from being scarce known 'till of late years, is, at present, become one of the most considerable rivers in the world. The banks of it are as beautiful and pleasant as can be imagined, the climate fine, the soil extremely fertile, producing sugar, indigo, tobacco, and cotton, all in perfection.

It has also been experienced, that European corn will grow here with little trouble and to great perfection; but for the reasons assigned, this, and all other improvements, have been disregarded, though independent of the gold mines, which have been discovered in this and the neighbouring captainships of St Vincent, this might be considered as the richest part of Brazil. The Portuguese settled here are quite a different people from those in the Bay of All Saints; for they are active, industrious, well inclined to foreigners, and suffer the Indians who live among them, to enjoy as much freedom

as themselves, which renders the country a paradise; and it is not easy to imagine, what vast cargoes were brought from the Rio Janeiro, before the gold mines in that country were discovered.

ST SEBASTIAN city is the capital of this country, and stands commodiously in 23 degrees south latitude on the west of the river, about two leagues from the sea. It is the seat of the Portuguese governor, a bishop's see, suffragan to the archbishop of St Salvador, and is well fortified.

There are likewise several other considerable towns on the Rio Janeiro, all of which have a large share of trade, as may appear from the number of ships which compose the fleet sent hither annually from Portugal, and which consists of between 20 and 30 sail of vessels, of 500 tons burden, which are usually escorted by two men of war.

The commodities brought from hence are generally the same with those from the Bay of All Saints, diamonds only excepted.—In regard to the diamond-mines, it is about forty years since, that some precious stones were brought to the city of St Sebastian, taken out of a small river lying westward of that city, which were at first judged to be very fine pebbles, but it was not so soon that they were brought over to Europe. About the close of queen Anne's war, these fine pebbles were found in greater quantities; and we are told, that some rich planters began to employ their slaves in digging the black heavy earth, on the sides of the mountains, from whence this river descended, and then these stones were found in greater plenty: some of them were very large, but most of a black or yellowish cast, which blemished their lustre, and sunk their value; notwithstanding which, many of the yellow stones were brought to Lisbon and sold for topazes. See the article TOPAZ.

After the crown of Portugal interposed, the working of these mines were prohibited; which, however, did not hinder their coming in considerable quantities; for it was sometimes said, they were found in this or that river, and not dug out of any mine; sometimes they had other names given them, and many were sent to St Salvador, and from thence exported to Europe, under pretence of their coming from the East-Indies by the Goa fleet. This involuntary fraud raised their value, and at length the crown of Portugal became convinced, that such a pretended to great skill in stones had deceived them, and that some of these Brazil stones were scarce to be distinguished from Oriental diamonds: upon this the court altered their measures, and it was permitted to send over rough diamonds in the Rio Janeiro fleet, under certain restrictions; which licence rendering the value of those jewels still more and more apparent, the king of Portugal resolved to put this trade under a new regulation. This new order took place in the year 1740, when his Portuguese majesty let these mines to a company at Rio Janeiro, for an annual rent of 138,000 cruzadoes, which is 26,000*l.* of our money, upon condition that they employed no more than 600 slaves at these mines.

These stones coming into Europe, sunk the price of diamonds at first considerably; but this discovery has, notwithstanding, proved highly beneficial to the Portuguese, since it has operated in their favour greatly, with regard to the general balance of their trade; for as they have disposed of these stones to any nation, upon whom they have already a balance, they must bring money into the kingdom; and if, on the other hand, they have sold them to such nations to whom they pay a balance in trade, this has lessened the balance in the favour of such nations, and has prevented the exportation of gold in the like proportion; so that take it either way, the discovery of these diamond mines has been of high consequence, and may prove still of far greater advantage to this nation.

ST VINCENT captainship lies southward from that of Rio Janeiro, which is the richest country in Brazil, perhaps in all South America. It is bounded on the north by the captainship of Rio Janeiro, on the east by the ocean, on the south by that of Del Rey, and on the west by the mountains of La Plata, and countries inhabited by various savage nations: it extends from the latitude of 22 degrees to 27 degrees south, and is in length from north to south about 300 miles, and in breadth from east to west, in some places near 180 miles, but the greatest part of it is not above half so broad.

ST VINCENT town is situated on a fine bay of the Atlantic Ocean, or a kind of peninsula according to some, well fortified: a little to the north-west lies the town of Santos, which some look upon to be the capital of the province; and which has as fine a port as any in the West-Indies, capable of holding the largest ships.

R E M A R K S.

A summary of this trade and possession.

The extent of this colony and government is the greatest at this time in the world, that is administered by one deputy or viceroy: the dominions of the Spaniards in America are, indeed, greater, but then they are divided into separate governments, and under governors independent of one another, though all subject to the same sovereign.

The proper bounds of this colony from north to south, is from the river Amazons to the river Paraguay, or La Plata, [see the article PARAGUAY] above 2200 miles, being from the line, or within half a degree of it, to latitude 37 degrees south, and the breadth above 1000 miles; but of that indeed they possess very little, for the Portuguese are so ill beloved by the natives, and the latter, who are a terrible people, and the most furious and bloody of all savages, are so numerous in the inland parts of the country, that the Portuguese, who are not the bravest men in the world, dare not venture far among them; that is, dare not plant far from the coast. And this is the reason, that though the Brazils are so exceeding large as above, and that the Portuguese are possessed of the whole coast for above 2000 miles, yet they are hardly any where settled above fifty miles from the sea, except in the Bay of All Saints, and on the fourth parts to the banks of the Rio de la Plata; which also may be called a coast, because bounded by the banks of that great river.

The length of the sea-coast entitles them to a great many good ports for trade; and the extent of the land entitles them to many different productions fit for merchandize. As the most northern parts are excessively hot, being under the line, and consequently cannot produce corn or maintain cattle; on the contrary, the southernmost parts produce very good corn and maize, and such an abundance of cattle, that the hides and tallow are very considerable articles in their exportations. The produce of the country in general is as follows.

Rice, corn, maize, sugar, cotton, tobacco, Brazil woods, suttic, hides, tallow. Some valuable stones and metals, as emeralds, jasper, crystal, diamonds, silver, gold: drugs, as balm, lacque, saffron, ambergrease, cassavy.

But the chief produce for merchandize besides the gold and diamonds, are only three of these heads, namely, sugar, tobacco, and hides.

It was many years the Portuguese carried on the trade of this colony, and with success too, without knowing any thing of its subterranean wealth: silver, indeed, they expected, though they found very little at first; and the number of ships sent to the Brazils, was usually but from nine to twelve sail in a fleet, and those fleets once a year; one fleet to the Bay of All Saints, and the other to Fernambuco, then newly recovered from the Dutch.

About the year 1680, they discovered a great deal of gold in the mountains, at some distance from the city of St Salvador; and after that they found the like in several other parts, chiefly in the mountainous country, and remote from the sea: by this their trade has been so enlarged, and the number of their inhabitants so wonderfully increased, multitudes going over every year, tempted by the good fortune of their countrymen, that it is supposed the Portuguese in Brazil will in a few years be richer and more numerous than they are in Portugal itself.

The increase of this commerce may be guessed at by this, that they are said to bring yearly from the Brazils to Portugal, the value of five millions sterling in gold, coined and uncoined, besides a great quantity of sugar, tobacco, and hides.

The tobacco is a very considerable article, it comes all very fine drest, and spun up in great rolls, which sometimes weigh between two and three hundred weight: it is most of it made afterwards into fine snuff, which is somewhat medicinal, and is esteemed the most valuable tobacco in the world.

On the south side of the Brazils, towards the Rio Paraguay, there are such multitudes of cattle running wild, that thousands of them are killed every year for the hides and tallow; and every fleet brings home the hides to Portugal, sometimes from 17 or 18,000, to 20,000 at a time.

In return for all this wealth, the Portuguese send over in every fleet exceeding large quantities of the richest European goods, and especially of British manufactures about 30 years since, of which they made such vast demands in England, that in the year 1722, Portugal took off more English goods in one year, than ever Portugal and Spain together had called for in any year before 1700.

This general trade, as has been shewn, still continues, and is like to continue and increase, among the European powers in general, though it is in a great declension with relation to England in particular, if the flux of gold continues in the country; and, as the Portuguese tell us it is inexhaustible, we may venture to say it will increase; because, as the wealth of the Portuguese in the Brazils shall increase, so also will their numbers of inhabitants: for every fleet carries away multitudes of people, who go thither to plant and settle, so that the colony spreads continually; and as they increase, and their wealth increases, so their expence in living (as it is with all the European nations) will increase every year, and consequently they will make still larger demands of goods from the other European states, and England is entitled to have a share equal to the encouragement she gives to the consumption of the wines and fruit of that kingdom.

It is for the support of this vast colony, and for working in the hills where this treasure is found, that the Portuguese call

for so many negroes from Africa ; and the number is so great which they have now there, that if we may believe the Portuguese, they have above 200,000 in that part only which lies to the south of the Bay of All Saints, and inclusive of the bay and colony adjoining ; besides what they have at Fernambuco, where they may, perhaps, employ one third of the number more.

Nor can it be less, if they carry over 50,000, and more, every year from the eastern coast of Africa, as hath been affirmed to be the case by themselves, when speaking of the Portuguese trade at the city of Melinda on the coast of Mozambique.

The Portuguese had not shewn any great concern, either for extending or improving their territories in Brazil after the expulsion of the Dutch, 'till a certain statesman advised Don Pedro, about the year 1685, to think of improving his American dominions, and more especially the two extremities of Brazil.

That minister suggested, that the climate at the Bay of All Saints, would frustrate whatever endeavours might be used to render the people active and industrious ; but that it was otherwise, both with the northern and southern extremities of Brazil, where a wise government and a little encouragement, might render the country of much greater advantage to the crown of Portugal, than hitherto it had been. This advice was received and followed, which gave birth, on the one hand, to the establishing the Portuguese forts and settlements towards the river of Amazons ; and on the other, to the improvement of the new colony at Santos, which was then but very small.

The method taken for this purpose was singular enough ; most of the persons made choice of were of the mixed herd, or, as the Portuguese call them, Mestices, who married Brazilian women, and the person intrusted with the government of these new plantations, were priests and monks ; but they were sent expressly from Portugal, and care was taken that they should be fit for the purpose. The captain-general of Brazil, and all the officers of the southern captainships, had orders to treat these people kindly, and to give them no disturbance in their measures.

It very soon appeared by the effects, that this plan was very wisely concerted ; for they multiplied prodigiously, and, in the space of about fifteen years, the priests added several hundreds of families to their colony ; extending westward four-score or one hundred miles, farther than the Portuguese had any settlements before that time. By degrees they purchased slaves, more especially the ecclesiasticks, whom they employed in the silver mines ; and, treating the negroes better than most of their neighbours, they soon became very rich ; so that several parish-priests in the captainship of St Vincent were worth from ten to fifteen thousand cruzados ; that is, from fifteen hundred to eight thousand pounds sterling a piece. They paid the king's fifth very regularly, and this was the beginning of the riches drawn from this part of the world. But when it was once known, that so much wealth was to be had in these hitherto uncultivated regions, there began very soon to resort thither abundance of adventurers, of all countries and of all characters ; when we say of all countries, we mean Spaniards as well as Portuguese, free negroes, Mulattoes, and all the different mixtures that are to be met with in Brazil, down to the Caribbees, who are the offspring of Brazilian savages by negro women ; and by different characters, we mean monks as well as laymen, soldiers, mechanics, broken planters ; and, in short, all that sort of men who are ready to go any where, or do any thing to get a living. As these were quite a different race from those of the new colony before-mentioned, it is not to be supposed that they could dwell together, more especially as the former were the quietest and most simple, the latter the most riotous and turbulent, people in the world.

These adventurers, therefore, took care to look out for a new settlement, and they found one of the properest places in the world for their reception, at no great distance. This was the thick and vast forest of Parnabaccaba, which over-spread all the mountains at the back of this captainship, and in which hitherto none but wild beasts took up their dwelling. They soon cleared a part of this wilderness for their habitation, in which they established not only a new town, which they call San Paulo, but a new republic also, in which they lived after the manner they liked best. At first this was overlooked, because the country was judged of no great value, and the adjacent captainships were very well pleased to be rid of those sort of folk, who resorted thither. In the space, however, of a very few years, they grew too strong to be dealt with ; for, receiving, as they did, all sorts of people, they quickly increased from two or three hundred, to as many thousand men ; and being a bold, hardy, enterprising, and daring crew, the governors knew not how to manage them. In the first place they took care to fortify the avenues to their territory, which were naturally strong ; and they seldom ventured abroad, but in bodies of four-score or one hundred men, and in such parties they frequently traversed the whole extent of Brazil. These were the people who first discovered and wrought the gold mines, which must be excessively rich,

since they were able to obtain such vast quantities of metal, without any of those assistances which the Spaniards have in their settlements in Chili.

As this required, however, a great number of hands, they seized upon all the straggling Indians and negroes they could meet with, and compelled them to undergo such fatigues as they thought proper.

This new and extraordinary commonwealth, was denominated, from the place of its situation, Paulists, and they would not suffer any of the Portuguese officers to enter their territories ; yet they acknowledged the sovereignty of the crown of Portugal, and paid regularly what they said was the fifth of the gold they obtained ; which, in the year 1691, amounted to one thousand marks, or eight thousand ounces ; which shews, that at that time they drew annually from the rivers and mountains in their possession, forty thousand ounces of gold : they took care, however, every time they paid the tribute, to declare, they did it freely, and of their own accord, out of respect to the crown of Portugal, and not from any sort of fear or sense of obligation. The tyranny of the governors of Brazil, and the oppression of the Spanish governors in the adjacent provinces, furnished this new state with abundance of members, so that at last it became a very difficult thing to get admittance amongst them, and the method in this respect was singular enough to deserve notice.

They obliged such as presented themselves upon their frontiers, which they never suffered any stranger to enter, to submit to a very strict examination, that they might know whether they were fit for their community, and to be sure they were not spies, or persons who intended to betray them : upon the bare suspicion of which, they made no scruple of beating their brains out : but if, upon this examination, they judged they might prove useful members, they obliged them to bring in two slaves for their support ; assigning them a dwelling and plantation, by which they commenced Paulists, and were to continue so to the end of their lives ; for any attempt to desert, was punished with death without mercy. They made no exception of country or complexion ; a savage was as welcome to them as an European ; and every man after his admission, was at liberty to lead what kind of life he liked best, provided he did not disturb the peace of the society. The Jesuits of Paraguay, either as they pretended out of concern for the souls of the people, or rather moved by the report of their great riches, made several attempts to get amongst them, but to no sort of purpose ; yet they lived upon very fair terms with this strange society ; and the Portuguese shrewdly suspected, that the reverend fathers furnished them with fire-arms and ammunition, because they knew not how they could be furnished any other way. See the article PARAGUAY.

How this little republic was subverted, we do not satisfactorily learn ; but it is certain, that all this country is now in the hands of the Portuguese, and as much under the obedience of the king of Portugal, as any other part of Brazil ; but the city of St Paul is still looked upon as the center of the mines, and a garrison is maintained there for their security. Nor are we well informed, in what manner the gold is wrought or refined there ; but, in all probability, their chief works are lavadero's, since we do not hear of their using quicksilver, as the Spaniards do : but it is very certain, that they are much increased in value, since the king of Portugal's fifth amounts very commonly to about 300,000 l. per annum : and it appears by the latest account, that these mines in particular are continually improving.

DEL REY is the only captainship to the southward of that of St Vincent, extending from the latitude of 28 to 34 degrees 30 minutes south, being about four hundred miles in length, but not above one hundred broad in any part of it. The country is fruitful and pleasant, but the Portuguese absolutely neglected it, 'till the discovery of the mines of St Vincent put them upon planting and securing it, by erecting several forts on the north side the river La Plata, to which the Spaniards formerly pretended, and upon which they are still supposed to cast a jealous eye.

The country in this province is as pleasant and fruitful as any in Brazil, and as capable of improvement ; but as it has not been so long inhabited as the other captainships, it is far from being thoroughly peopled. There are only a few villages upon the sea-coast, and some fortresses upon the river of Plate. The chief advantage which the Portuguese draw at present from this province, is a kind of smuggling trade, which they carry on with the Spaniards whom they furnish with rum and tobacco of their own growth, and with wines, brandy, cloths, silks, and linens from Europe ; which occasion quarrels and disputes between the two nations, though in reality the true ground of their contentions is the thirst of gold in both parties, and the desire that each has of becoming idle possessors of the large ridge of mountains, which are the western boundaries of this province and that of St Vincent, and are supposed to be full of mines.

Some speculative politicians have insinuated, that it is not impossible, that the Spaniards may, some time or other, carry their point ; but if they do, they must begin with the Paraguay Indians who are at present subject only to the Jesuits ; for

for otherwise it is very certain, that they cannot raise men enough to give the Portuguese any uneasiness, who, though they have not people to spare for settling this last district in Brazil, have, however, such numbers in the adjacent captainship of St Vincent, as would very soon repel any invasion from their neighbours, who, after all, it is very certain, are on this side rather weaker than themselves. So that struggles of this nature, if ever this should happen, may be reputed at a great distance; and, if the Portuguese were as free from any apprehension of intestine disorders, it might be affirmed, that scarce any colony is more secure than that of Brazil. But this may one day give some other power an occasion of supplanting the Portuguese, if they especially are weak enough to forfeit the good-will of Great-Britain towards them.

The small country of Portugal, which had hitherto made so inconsiderable a figure among the kingdoms of Europe, began to take the lead of them all; and, from creeping along the coasts of Africa with a few little vessels, her fleets began to stretch to the East-Indies, [see the article PORTUGUESE EAST-INDIA TRADE] and to embrace that trade, which was the object of Alexander's ambition. The East-Indies by the rout of the Cape of Good Hope, was their proper discovery; and, though Columbus had a little the start of them, yet the finding and settling of Brazil, plainly proves that America could not have lain long hid from their researches.

The fruit of these great discoveries and conquests, was a prodigious trade, immense riches, and an amazing naval power, all deduced from a right turn in the government, which established it's power in the extension of that of it's subjects, without exerting a tyrannical authority over them. This created fleets, armies, and a dominion superior to any thing the Europeans had enjoyed, from the destruction of the Roman empire. These are the effects of well chosen colonies! But as a true and laudable ambition raised the Portuguese to such a height, a false and bastard ambition made way for their ruin. Sebastian king of Portugal was a hero, he had all the virtues incident to that character, but they took a wrong turn: he embarked the whole force of Portugal in a war upon the continent for his own glory, and to serve no national purpose whatsoever; there he perished, and all his army with him; which, in itself, was a great misfortune to his subjects, but in it's consequences a much greater; for this threw them under the dominion of Spain, which was the greatest mischief that could befall them; for after this, there appeared no public spirit in the government; all their conquests in the East-Indies were either given to men who had an interest at the court of Spain, or to such as that court desired to get out of their way.

There was no longer any spirit of virtue, generosity, or concern for public good, either left or encouraged; the enriching of private families took place of this, and while a few of these carried their point, the Dutch stripped them of their empire in the East-Indies, and bid fair for making themselves masters of Brazil; which, if they had, Portugal had remained a province of Spain, and not a very considerable province neither.

When the Portuguese recovered their former government, they recovered spirit enough to preserve Brazil; but since that time, the court has been infected with the Spanish policy; and the desire of extending their royal power has, in a great measure, extinguished that spirit which once made them a great people. But, to confine our reflections to Brazil, the great point in the Portuguese councils at present is to secure this trade, or at least the profits of it, to the crown; in order to which, the several fleets destined for Parayba, Fernambuco, the Bay of All Saints, and Rio Janeiro, sail as regularly as the Spanish galleons, and in the very same manner. If this trade had been left more open, the number of ships would have been vastly greater, and there would have been no need of men of war to escort them, or of another squadron being sent to look out for, and bring them home, as is at present the case every year, and yet the Algerines frequently pick up some.

Yet all this policy is far from producing mighty things, as we shall see from a few examples: Brazil-wood is now a royal commodity, that is to say, it is sold for the advantage of the crown only [see BRAZIL-WOOD]; and it produces about 200,000 cruzadoes, which is something better than 30,000l. sterling annually: we have already seen what the diamond-farm brings in: and take the whole of the king's fifth from the gold-mines, and it will never be found to exceed a million of our money.

There was, indeed, a project of quite another kind set on foot, for the improvement, as they call it, of this trade in Portugal, of which we shall give a very short account. In the year 1709, the king of Portugal, perceiving that the vast quantities of gold that came from Brazil did but just touch at Lisbon, and then travelled over all the countries of Europe, directed this matter to be very seriously examined in his council: supposing, that if a method could be found out to prevent this gold from straying, the business would be done, and himself become, at once, the richest prince in

Europe. His council accordingly examined this point very carefully, and they reported that the English and Dutch ran away with all the gold, in consequence of their furnishing the goods and manufactures, which should be prohibited in that colony; and that the people should be content with what could be sent them from Portugal. This was considered as a great stroke of policy, and was on the very point of being put in execution, when it was prevented by the famous lord Galway, as we have before noticed under the article PORTUGAL.

Further OBSERVATIONS on the nature of this TRADE.

'There is not a place in the world, says an ingenious French author, in a voyage to the Brazils in the year 1717, China only excepted, where there is so much trouble to get on shore, or to know how to act when one is on shore, as in Brazil. We came into this bay on the 16th of November, and, when we were within a league of the city of St Salvador, we were restrained from proceeding any further, by a gun fired from a little fort, upon which we came to an anchor, and sent our supercargo ashore in our boat; he was a very sensible man, and withal had a great deal of gravity, a quality of all others the most necessary for one who has any business to transact with the Portuguese. As soon as he came ashore, he was conducted to an audience of the viceroy, who received him with a great deal of state, and yet shewed him, at the same time, as much civility as he could expect. He told his excellency, That he came on behalf of three French ships homeward-bound from the East-Indies, that were in many respects greatly distressed, and had no hopes of performing their voyage, but from his affording them protection and relief.

The viceroy continued for some minutes silent, and then gave him his answer to this effect: That he was very sorry for their misfortune, because his master's orders were very precise against admitting any foreign vessels into any port; and that he was the more concerned to hear that they were French, because it was chiefly on their account that these orders were given, because several vessels of their nation, that had been admitted into the ports of that country upon the very same pretences, had carried on an illegal trade directly contrary to the king's orders, and had shipped great quantities of tobacco. He told him further, That the king's orders were to seize and confiscate, without distinction, whatever foreign vessels entered that port, unless it plainly appeared they were in such a condition as not to be able to keep the sea; that therefore they were to have 24 hours given them to consider whether they would come and anchor under the guns of the fort, in order to be examined, or to put to sea without receiving any relief at all. He added, That if the case was such as our agent represented it, he might very freely enter the port, and, upon examination, all the care should be taken to assist and supply him that he could desire; but that he would do well to remember that the Portuguese were not to be imposed upon.

As our ship was really in such a condition that we had no reason to fear any examination, we made sail immediately on the return of our supercargo, and came to an anchor under the fort. The next day the judge came on board, attended by several secretaries, and other officers, all of them very grave sober-looking people, who examined every thing with all the nicety and strictness of an inquisition. They called for our journals, questioned our pilots, mariners, and even the cabin-boys, particularly as to this point, Whether we had not formed a design of touching at Brazil before we were in such distress? They all answered in the negative; but still we had so little hopes, that every one in the ship, who had it in his power, made them some present or other, which they took indeed, but scarce gave us thanks. At last they took their leave, and sent some carpenters on board, to whom our captain made such an application, that they reported our leaks to be so dangerous, that the crew were very much alarmed, and were afraid of sinking before they got out of the ship.

As soon as this report was made, we had leave to go on shore, which was refused us before, and we had also leave given us to take lodgings where we thought fit in the city, but with strict caution not to attempt any kind of trade on pain of forfeiting both ship and cargo. The officers put on board the vessel talked the same language at first; but seeing the impression it made, and that our people were very exact in that particular, they were so kind as to explain themselves the third day, telling us that this was all a farce; that the judges themselves knew it; that they understood by our presents, we were a good sort of people, and that we should have, every night, boats come off with all sorts of merchandise, and that they would take care we should run no sort of risque, either in buying or selling. The boats came accordingly, and though at first we were a little suspicious, yet, in one week's time, their language was perfectly understood, and trade went on briskly every evening, as soon as it was dark.'

PORTUGUEZE EAST INDIA TRADE.

A SHORT HISTORY thereof.

The Portuguese were once the chief navigators of the world, and the first Europeans who visited the Indian coast from the new way by the Cape of Good Hope.—Upon their arrival, on their first voyage, at Callicut, on the coast of Malabar, they found Zamorin, the king of the country, receiving them kindly, and encouraging his people to trade with them, and offering to enter into a league with the king of Portugal, for settling a further commerce to mutual advantage.

They found in all the ports of India abundance of shipping, of Arabians and Moors: those called Moors were such as Ethiopians or Egyptians, who dwelt on the west border of the Red Sea, and traded by their shipping between the said sea and the coast of India, Malabar, Ceylon, Coromandel, Golconda, Bengal, &c. as also others, who were mere Arabians, from the gulph of Persia.

These traders, when the Portuguese first came, were as civil to them as Zamorin was before: but, when they came to understand that these Portuguese were Europeans, that they had found a way about by long sea, from the coast of Spain and Portugal, into their Indies, and, returning the same way, they would carry the Indian goods directly thither, and without feeling that they were stout ships, of prodigious burthen, and would carry a great quantity of goods, and that also they had more ships (for a second fleet of 13 sail soon arrived), they presently found that all their trade to Suez, and to the Arabian and Persian gulphs (the way whereby it had been carried on before) would be ruined: upon which they turned first the secret, and at last, the open and implacable enemies of the Portuguese, and of their whole commerce; and they shewed it first by provoking Zamorin, the king of Callicut, against them, and making him, from their friend, become their utter enemy.—This was in the year 1499.

The next year Alvarez de Cabrale, another Portuguese admiral, coming again with six ships more, the same people opposed him also, not only by engaging the king against them, but by engrossing all the goods, and forestalling the markets: so that, notwithstanding the king's orders, the Portuguese could buy nothing.

But the Portuguese were not, in those days, so easily mastered as they have been since; for on complaint to the king, and his majesty declaring that it was not with his knowledge, or by his direction, the admiral, Seignior de Cabrale, fell upon the Moors and Arabs ships in the harbour [the Arabians were at that time called Saracens] and soon beating their sailors, they disposed of their cargoes much cheaper and better than they might have had them before. This put the Arabians upon a military revenge: for the Portuguese having taken several houses on shore in the town, the Arabians attacked them in the night, plundered them, and killed several of the Portuguese.

Cabrale applied for satisfaction to the king, concluding, that as he had disowned the Arabians before, he would absolutely renounce them now: but the king appearing partial and cold, and the Portuguese not obtaining the satisfaction which they demanded, their admiral attacked 10 other Arabian ships in the same harbour, killed all the men, and unladed the ships into his own: and, when he had so done, to convince the king that he had not courted his friendship out of fear of his power, he turned his broad-sides upon the city, and furiously battered it for several hours; and, leaving it in that shattered condition, sailed out of the harbour before their faces, for Cochín, where he was kindly received, and all the trading advantages given him that he could desire.

The next voyage the Portuguese made was not to Callicut, but directly to Cochín: but the Arabians, &c. not forgetting the affront offered them before, fell upon them with 20 stout ships in those days; but Vasco de Gama, another Portuguese admiral, gave them so warm a reception, that he intirely overthrew them. From this time the Portuguese grew potent in the Indies, and carried on a prodigious commerce, by means of their forts and settlements.

It was towards the latter end of the sixteenth century that the English and Dutch began to interfere with the Portuguese in these parts; and they very soon, by the assistance of the natives, took from them the most considerable places they possessed, and some of them they abandoned themselves. It would take up a great deal of room, and, perhaps, answer the purpose but indifferently, if we should attempt to give a large history of the manner in which these places were reduced, and therefore we shall rather take them in the course of their situation, by which the reader will clearly perceive how the empire of this nation in the East was dissolved.

Shah Abbas, when monarch of Persia, had an earnest desire to rid himself of the neighbourhood of the Portuguese; but he wanted a maritime force sufficient to accomplish his design, and, therefore, he applied himself to the English, who had likewise suffered much by the pride and avarice of the Portuguese; and, by their assistance, part of his forces were transported into the island of Ormuz (whereof the Portuguese

were possessed) which was attacked both by land and sea, on the 20th of January, 1622. The defendants behaved with great bravery and good conduct, and made a noble resistance; but the English having destroyed their fleet, took the garrison, which ruined the power of the Portuguese on that side. The rich city of Surat, formerly a place of the greatest trade in the Indies, suffered severely from the Portuguese, who burnt it down to the ground, on purpose to favour the commerce of their own city of Diu, which stands at the entry of the gulph of Cambaya, and which they had rendered one of the strongest and finest places in the East, keeping the monarch of that country in absolute subjection. But, notwithstanding their policy in this respect, and that they still remained masters of Diu*, yet the Indian princes in the neighbourhood traded freely with all Europeans; and Surat, which they took so much pains to destroy in 1520, is now in as flourishing a condition as ever, and the Portuguese are almost the only nation that are not benefited by it's traffic.

* This city of Diu stands in the latitude of 21 degrees, 20 minutes, upon an island about a league in length, and not a third part of a league in breadth. The country about it abounds with all the necessaries of life; and the city itself is as well built, and as well fortified, as any in the Indies. At present, the Portuguese are about to establish as well the trade of this city, as of others in the Indies.

On this coast they were possessed of several strong places, down to Goa; of these, Daman is still in their hands, and is a place of pretty good trade; Bacaim is lately fallen into the hands of the Indians. Bombay they yielded to the English, on the marriage of queen Catherine with king Charles II. and has continued in our hands ever since. From Goa to Cape Comorin they had also very considerable settlements, most of which they have been dispossessed of by the Dutch, who in the year 1663 becoming masters of Cranganor, Cochín, and Coulan, soon after deprived them of Cananor, which was the first place they had settled at: and thus was their power greatly reduced on the coast of Malabar.

Doubling this famous cape, and proceeding along the coast of Coromandel, we meet first with the port and fortress of Nagapatan, which, when the Portuguese came first into the Indies, was no more than a village; but they, considering the importance of the place, fortified it with great care, and rendered it in every respect very considerable. But after the Dutch had deprived them of the island of Ceylon, they did not long let them rest here, but, by the assistance of an Indian prince, besieged and became masters of that place, in 1658. From thence all along the coast, quite up to Bengal, the Portuguese have lost all power; and as for settlements, they had none of any great consequence to lose, having, in the time of their greatest power, contented themselves with a small establishment at Meliapour, or St Thomas, restraining all the rest of the coast by their squadrons, which were continually cruising in the bay of Bengal.

On the opposite side of the gulph, the Portuguese had once very great power in the kingdom of Pegu [see PEGU], in consequence of their assisting the monarch of that country against the king of Siam, who had invaded his territories, and would very probably have made him his tributary, if a body of Portuguese had not come to his assistance, by whom he was enabled not only to defend himself effectually against his enemy, but even to pursue him into his own country.

It is very easy to discern what mighty advantages might have accrued to the Portuguese from this favourable turn, if they had known how to improve it; but what might have turned so much to their benefit, proved, by their own ill management, the cause of their ruin, and that in a very short space of time. The king of Pegu, it seems, was so sensible of the service they had done him, in driving the king of Siam out of his country, that, in pure gratitude, he made one Seignior Thomas Pereyra, who commanded the Portuguese in the war, generalissimo of all his forces, which preferment made the Portuguese so insolent, that, in a few years, they became intolerable to all ranks and degrees of persons in Pegu. Both kings grew tired of war, but both were too proud to make advances towards peace; so that, for many years, they had skirmishes with small parties, though not set battles; and wherever the Portuguese arms went, they had victory to accompany them.

The king of Pegu, to have his forces nearer the borders of Siam, settled his court at Martavan, and kept the Portuguese near him, to be ready upon all occasions, either to repel or assault the Siam forces, as opportunity served; and Thomas Pereyra was the great favourite at court: he had his elephants of state, and a guard of his own countrymen to attend him.—But he lost his life, and the Portuguese were all cut off, from an act of violence committed by him on the wife of one of the natives.

The kingdom, or, as some call it, the empire of Siam, lies next to Pegu, and is a country of vast extent, the monarch of which was too powerful for the Portuguese to think of making any great conquest in his dominions, and therefore they chose to live with him upon good terms, for the sake of the vast trade carried on in his dominions, which are ex-

tremely well situated for commerce, having on one side the kingdoms of Laos, Cambôya, and Cochîn-China, and on the other the countries bordering on the gulph of Bengal. Besides, there annually resorted thither a fleet of merchant-ships from China, laden with all the rich goods of that empire. They continued to hold a fair correspondence with this monarch and his subjects, as long as their power subsisted in the Indies; but, by degrees, the Dutch have, in a great measure, excluded them from their influence here since 1630, when they erected their factory here, and have since wrought themselves so effectually into the confidence of this prince, that he has granted them an exclusive privilege of purchasing all the tin in his dominions, which is a branch of commerce of prodigious importance; yet the Portuguese are not wholly ejected, though their trade is greatly fallen from what it was. There are several small principalities on the isthmus, before one comes to the country of Malacca, which were all of them formerly under the power of the Portuguese, as appears by their retaining still a mixture of that language with their own. The chief of these principalities are those of Ligor on one side, and Quedah on the other; but the people are so barbarous and perfidious, that the Europeans carry on scarce any trade on their coasts.

The great peninsula of Malacca, at the time the Portuguese came thither, was subject to the king of Johore; but the viceroys of the crown of Portugal attacked, and made themselves masters of that city. After it came into their hands, it changed its conditions entirely; and from being a place of small account, in a short time became famous all over India and Europe, lying almost in the centre of trade, brought thither by shipping from the rich kingdoms of Japan, China, Formosa, Luconia, Tonquin, Cochîn-China, Cambodia, and Siam, besides what Johore produced, and Sumatra, Java, Borneo, Macassar, Banda, Amboina, and Ternate Islands, that abound in valuable commodities.

After Goa and Ormuz, this was by very far the richest city in the Indies, and a great market for all the different commodities that these countries produced. The whole was encompassed with a strong stone wall, regularly fortified with bastions, the place extremely well peopled, and the garrison numerous, and well supplied, because the Portuguese considered it as the eastern frontier of their dominions.

In 1605, the Dutch [see the article DUTCH EAST-INDIA COMPANY], who were then become very potent in the Indies, attacked and destroyed the fleet of the Portuguese here, consisting of thirty-four sail, on board of which were three thousand men; but they were not able to take the place. The next year, the king of Johore invested it with an army of sixty thousand men, in revenge of what the Portuguese had done against him three years before, when they took and destroyed his capital; however, he was obliged to raise the siege with great loss. But the Dutch well knowing the importance of the place, and the vast advantages accruing to the Portuguese from its situation and commerce, the former affording them an opportunity of levying 10 per cent. upon all vessels passing through the Straights, and the latter producing annually a large revenue, they attacked it in the year 1640, so vigorously, that they became masters of it, after a siege of six months. The walls and fortifications they preserved, and some of the churches, and the great hospital they have turned into a warehouse. In the kingdom of Cambodia, or Cambôia, the Portuguese have still a considerable trade, and they are likewise well received in Tonquin.

The troubles in the Low-Countries, which produced a war between the crown of Spain and the republic of the United Provinces, began about 1570, and England interposing in favour of the States, their power increased to such a degree, that they were not only able to defend themselves against Spain by land, but to give that potent monarchy inexpressible trouble by sea. But this war seems to have no relation to Portugal, and we do not hear of their attacking any but the Portuguese settlements in the East-Indies. In order to resolve this difficulty, we must remember that the crown of Portugal was united to that of Spain in 1579, by which means Philip II. became master of both the Indies, and consequently the States of the United Provinces were as much at war with the Portuguese, who were subjects to the king of Spain, as with any of the rest of his subjects; and consequently this gave them a right to attack the Portuguese settlements, both in the East and West-Indies, which they prosecuted with such vigour, that they bid fair for becoming masters of all that the Portuguese had possessed in either Indies.

We have seen what mighty acquisitions they have made in the East; but it is necessary to our subject to observe likewise, that their West-India company became in that space of time, so powerful, as to make almost an entire conquest of Brazil. It is very evident from hence, that nothing but the union of the crowns of Spain and Portugal could have afforded the Dutch either a pretence for attacking, or an opportunity of reducing these countries, both of which, in a singular degree, they from this accident obtained. For as, on the one hand, his Catholic Majesty had enough to do in defending his hereditary dominions, before this accession of the territories of

Portugal; so he was tempted to apply the revenues of that crown to the immediate wants of the Spanish government, which we may conclude were very great, since on his death-bed he owned, that the wars of the Low-Countries had cost him five hundred and sixty-four millions of ducats, which is upwards of one hundred and twelve millions of our money; whence it is easy to perceive, that he could not spare as much as was requisite for the defence of the Portuguese territories. On the other hand, the Portuguese themselves, though they had always been distinguished for their loyalty to their natural princes, were far enough from shewing so much zeal in the service of the king of Spain; and it is very natural, when the minds of private men are entirely despoiled of public spirit, for the affairs of the state to fall into confusion.

But one would have imagined, that after the separation of Portugal from Spain, which happened in the year 1640, things would have taken another turn; because, with king John IV. the Dutch had no pretence of making war. To give the reader a clear idea of this matter, we must remember that the Dutch had taken Brazil from the king of Spain, or rather from the Portuguese, while they were his subjects; but afterwards, that nation considering this as an injury not to be borne, attempted to drive the Dutch out, notwithstanding the treaty concluded between the States and the king of Portugal, in 1641; which, to say the truth, had been but indifferently observed on both sides*; that is to say, the Dutch had encroached upon the Portuguese in the East-Indies, and they, on the other hand, gave the Dutch little or no respite in Brazil, out of which, in ten years time, they drove them entirely.

* At the time the Portuguese delivered themselves from the Spanish yoke, the Dutch were employed in reducing the island of Ceylon, and made use of abundance of artifices, in order to prosecute the advantages they had gained, notwithstanding the peace concluded between the States-General and the crown of Portugal in Europe; neither did they desist from their hostilities, even after the peace was proclaimed in the Indies, but continued to give the Portuguese almost as much trouble as while the war continued. This they did under pretence of being allies to such Indian princes as were at war with the Portuguese; and where this pretence was wanting, they took care, by their emissaries, to stir up new wars, and, under pretence of restoring the Indians to their freedom, contrived things so as to engage them in long and bloody wars, which had no other end than to oblige them to change their masters, with this difference only; that whereas the Portuguese endeavoured to keep large countries, and to oblige the Indian princes to pay homage to the king of Portugal, the Dutch contented themselves with the sea coasts, and forbidding those princes to trade with any other nation; so that their slavery was equally great, though not always equally apparent, which ever side prevailed.

About this time died king John IV. and left his son Alphonso VI. a minor, which advantage the Dutch took to declare war against the crown of Portugal, from a persuasion that this opportunity of regaining what they had lost in the West, and prosecuting their conquests in the East-Indies, was not to be lost; the rather because Portugal was at that time engaged in a dangerous war with Spain, and the Dutch had lately concluded a peace with that crown.

It was in consequence of this new war, that the Dutch attacked the Portuguese again in the East-Indies, and even endeavoured to deprive them of Goa; but in this they did not succeed: and, on the other hand, the Portuguese found means to traverse all the attempts that the Dutch made to establish a trade in China, as also to raise such a storm, as deprived them of the island of Formosa, which they had conquered, and which was of prodigious consequence to them.

But, in the mean time, the great fleets they sent to the East-Indies, enabled them not only to extend their conquests, but in the year 1661, to defeat the whole naval power of the Portuguese in two general engagements. But while the public suffered excessively from the consequences of this fatal war, some private merchants in Lisbon and in the East-Indies, fitted out so many privateers, and of such strength, that the Dutch suffered excessively in their trade; and therefore both nations began to be weary of the war, and inclined to a negotiation.

The crown of Great-Britain interposed its mediation, in consequence of the marriage between king Charles II. and the Infanta of Portugal, by which peace was brought about in the year 1661, and thereby the Portuguese were left in possession of Brazil, and the Dutch accepted a sum of money as a satisfaction for their pretensions.

In the East-Indies things were to remain as they then stood, and both parties were to keep what, at the conclusion of this peace, should be in their respective possessions; but the Dutch kept this no better than they did the former treaty; on the contrary, in 1663, they attacked all the places which the Portuguese held on the coasts of Malabar, particularly Cochîn, which they had no sooner taken, than they destroyed all the wild, or bastard cinnamon, which, after the loss of Ceylon, had proved an advantageous branch of commerce to the Portuguese. There were high complaints made of this

in Europe, to the States-General, who were either deceived by the plausible accounts given them by their East-India company, or pretended to be deceived, that they might, with a better grace, protract the negotiation relating to this affair, till their subjects in the East-Indies had so fortified the places they had taken, as to put it entirely out of the power of the Portuguese to attempt the recovery of them.*

* The Dutch, though their East-India company gained sufficiently by these practices, suffered very severely, as a state, from the jealousies they excited in their neighbours. The English had some experience of a like disposition towards them; and though the French had not, at that time, any grounds of complaint in the Indies, yet they were far enough from being pleased with the growth of the Dutch naval power; and therefore readily joined in a war to humble them, as they phrased it, which was that of 1672; and how far the causes of that war were connected with the conduct of the Dutch in the Indies, may appear from a fact charged upon them by Mr Tavernier, who, in his Travels, relates, that the Dutch factory of Gambon in Persia, publicly burnt the picture of king Charles II. in a fire partly made of cinnamon, which was such an indignity as that prince never forgot, and which gave a very bad impression of the Dutch to the Persians, who laboured all they could to hinder it.

These proceedings gave the finishing blow to the ruin almost of the Portuguese, who have never since been able to undertake any thing of consequence in the East-Indies; but, on the contrary, have exhausted much of their remaining strength in defending themselves against their Indian neighbours, who, encouraged by the progress of the Dutch, and excited thereto by some of their agents, have been since endeavouring to tear from them the small remains of their possessions in India, and have often kept Goa itself blocked up for many months together.

We have already pointed out many of the causes of the declension of that mighty power, which, in so short a space of time, the crown of Portugal acquired in the East; but as this is, perhaps, the most useful part of the present article, it may not be amiss to add a few farther observations on this subject. One great cause of their ruin was, the circumstances of their government at home; where, for many years together, they were engaged in a long, expensive, and dangerous war against the crown of Spain, in defence of their independency, which at once employed their whole force, and exhausted their whole revenue. It is true, indeed, that this was rather the misfortune, than the fault of the Portuguese, since it was what they could not avoid; but it was, nevertheless, the great cause of their losses in the Indies.

We may add to this, their sending over men of too great quality, as viceroys to Goa, with a view rather to better their fortunes than the public service; which is the reason that, of late years, we hear nothing more of the Gamas, the Albuquerque, the Perreyas, or the Galvanos; but are forced to search for the names of their viceroys in the private registers of the palace, instead of the public records of history: besides, as these men have been, generally speaking, too poor to mind any thing so much as mending their own estates; so they have been too well allied to be called to any account, on their return, for their mal-administration.

When their affairs began first to decline in this part of the world, it was a common thing for a governor of Mosambique, which was esteemed the first viceroyship, and with all the other governors in the power of the viceroy, to become immensely rich. Now, as it is impossible that such exorbitant sums should be made any other way, than by oppressing the Indians, and taking large sums from the merchants, we may easily perceive, that all these private fortunes were made at the expense of the public interest.

The bad examples of the governors, had a bad effect on all the subordinate officers; so that pride, vanity, luxury, and a pompous display of wealth, attained by illicit means, took place of that disinterested public spirit, which enabled their ancestors to lay the foundation of so large an empire, with an inconsiderable part of that power, which was in the possession of those who lost it.

The clergy too followed the example of the laity, and instead of promoting, as at the beginning, the conversion of the natives to the Christian faith, from the pretended view of saving their souls, they now prosecuted that work from the motive of making them subservient to their own purposes, and enabling them to acquire vast riches. FOR THEIR KINGDOM IS OF THIS WORLD. This corruption proceeded so far by degrees, that not only many of the Jesuits at Goa, engaged in trade, contrary to the rules of their order and their duty as missionaries, but even defended so low, as to disguise themselves in the habits of faquires, or Mohammedan monks, that they might have an opportunity of visiting the diamond mines, and purchasing stones there of extraordinary value*.

* We owe this circumstance to the History of Holland, by M. de la Neuville, who tells us, that the Dutch being extremely piqued at the trouble the Jesuits gave them at China, discovered this practice to the governor of the diamond mines at Vifapour, who caught two of the fathers

disguised like faquires, with stones about them to the value of twenty-five thousand pounds, which he took from them, and after whipping them publicly, for profaning the habit of those holy men, took such measures as prevented their carrying on that trade in this shape ever after.

But what most of all contributed to corrupt the inhabitants of the Portuguese settlements, was the little care taken to prevent their leaving all things to the care of their negroes and other slaves, and their intermarrying with the people of the country; practices ever fatal to all European establishments, because it not only effeminates the minds of such as fall into this way of living, but also makes them lose all regard for their country, and inclines them to take such measures, as are most likely to preserve them in the enjoyment of such fertile pleasures.

The Portuguese at Goa have been, for more than a century past, so much addicted to this sensual kind of life, that provided they might enjoy their magnificent houses in the city, and their country palaces in its neighbourhood, they gave themselves no pain about what happened elsewhere, or how great progress the Dutch made in subduing their distant settlements. The natural consequence of this was, that when such settlements were lost, those who were driven from their habitations, instead of repairing to Goa, and taking arms in the king's service, for the recovery of any part of his dominions, went into the territories of some Indian prince, and there, for a pitiful subsistence, entered into his pay, or accepted of some low office in his court; so that while the fleets and armies of Portugal grew thin and contemptible, for want of soldiers and seamen, there were many thousands of that nation scattered all over the Indies, disgracing their country, by the manner in which they got their bread; when, by a proper behaviour, they might have restored the affairs of their prince, as well as their own fortunes.

One may safely affirm, that all these mischiefs were, at the bottom, owing to the want of a right administration in Portugal; where, if a council for the Indies had been settled [see INDIA-HOUSE OF SPAIN], composed of men of real abilities, and competent experience in commercial concerns, who had been intrusted with the sole power of bestowing places in that country, and had been charged to look carefully into the conduct of such as were employed by them, might, before things had gone too far, have restored discipline in their colonies, and recalled such, as from discontent or diffidence in their former governors, had taken refuge in other places.

But their attention to other things, and more especially to their settlements in Brazil, which have, indeed, accidentally compensated, in some measure, their losses on this side, hindered them from thinking of their affairs in the east, till they became almost past recovery.

In this distressed and dejected state they lie at present, which, however, must not excuse us from giving the reader a view of them, even in this condition, because the Portuguese are still considered as having some interest in the Indies, though it be in a manner nothing in comparison of what it was; they are, however, at present, taking measures to revive and establish their trading interest again in this part of the world, and that, as we have before seen, by the means of BRITISH MERCHANTS, BRITISH SAILORS, and BRITISH MONEY.

The dominions at present subject to the Portuguese viceroy of the Indies are very easily described. The city of GOA, of which we have spoken before, is still the capital, the seat of the viceroy, the archbishop, and the inquisition, which are heavy burthens on so exhausted an establishment. In the neighbourhood of this city they preserve the islands of Salfete, Bardes, Augedive, and some others of no great consequence, farther than that they supply the city of Goa plentifully with provisions, which is hard to say whether it be an advantage to that place or not: for as rice comes in great quantities, and very cheap, to Goa, it encourages the citizens to keep a vast number of servants, especially negroes, who are content with one dish of this food at noon, and another at night. If these were kept for any kind of labour or manufactures, there would be no great objection to it; but almost every house-keeper has six, some of them 12, some 30 or 40, that have no other business than carrying their master's palanquin and umbrella; so that, in reality, they are not kept so much for service as for state; and thus they rather exhaust, than increase, the riches of the inhabitants.

DIU, which formerly belonged to the kingdom of Guzarat, is the strongest place they have, and is, indeed, very well situated for commerce. It has a very good port, and, while the Portuguese had any fleets of consequence, they were generally laid up here; and at this city the Moors, and other traders in those seas, were obliged to take out their passports, before they proceeded any farther to the East. At present, almost all the trade which was carried on here is removed to Surat, and what little still remains at Diu, in the hands of the Portuguese, is carried on under Gentile colours; that is to say, the Portuguese think themselves safer under them than

than under the flag of Portugal, formerly so much respected in the Indies.

The port of DAMAN, on the gulph of Cambaya, is yet in tolerable good condition, though nothing in comparison of what it was, the old town being in a manner deserted, and the new not near so well peopled as might be expected from its extent.

There are, however, still some manufactures carried on here, particularly in silk, with which they furnish the market of Goa, and thereby enable the merchants settled to carry on what small commerce they have left. CHAOL stands behind the mountains, on the same coast, and has a very safe and good port.

These are all the places that they have on the Malabar coast; and in other parts of the Indies they have few factories, and no establishments at all, except it be in the islands of Innor and Solor, not far from the Moluccas, which they possess jointly with the Dutch. Once in two or three years they send a ship from Goa to these islands, the chief commodities of which are sandal-wood, much esteemed in China, very good wax, and a sort of medicine called solor-stones, which are very little, if at all, inferior to the best bezoar. On the coast of China they have the island and port of Macao, from whence they carry on a considerable trade to China and the Philippines.

All that remains under the Portuguese dominion, from the Cape of Good Hope in Africa, to the city of Macao in China, is governed by a viceroy, with the title of captain-general, who resides at Goa, as the metropolis of India. There are six, and sometimes eight, desembargadores, or judges, that attend the government as a sovereign court, or council, who wear gowns down to their heels, over a cassock of the same length, the gown with wide sleeves down half way their arms: they wear gorillas, and huge perukes of the French fashion. The chief court these gowmen sit in is called Relacon, which administers justice in civil and criminal cases, having power over all ministers, and tries all appeals brought from all parts of their dominions. The viceroy sits as chief of this court, under a canopy; the gowmen sit on benches placed on the plain floor. The council de Facada is like the court of Exchequer, where one of the gowmen sit as the viceroy's deputy. Thus the pomp and splendor of this government is still kept up, though the extent of it is much lessened, and the power and credit of it in a manner decayed.

There are still as many governments as ever, that is, in title; for otherwise they are of no great consequence; and those on whom they are bestowed have the characters of generals. There is, for instance, a general of the gulph of Ormuz, who has four ships under his command; a general of the north, who directs the small towns on the coast of Malabar; a general of Salsette, who has a territory of about fifteen miles; a general of China, who is, properly speaking, governor of Macao, and an absolute vassal to the Chinese. There is another general in the islands of Timor and Solor, to whom even the Portuguese there scarce pay any obedience, and who lives in a miserable fort, the guns of which are in no condition for service. There is likewise a general of Goa, whose business is to take care of the channels between the islands, and to restrain smugglers*.

* There is a very wide difference between these titular preferments and the governments formerly in the gift of the viceroy of Goa, which were five; the first was that of Mozambique, which is still in their hands, and the only one of the old government that is so; the second was that of Mascate, on the Arabian coast, which was of very great importance, and brought in a large revenue; the third was that of Ormuz, on the coast of Persia; the captain-general of the island of Ceylon was the fourth, and the governor of the important fortress of Malacca was the fifth. Upon each of these general governments there depended many others of less consequence, and of which these generals had the absolute disposal; but those who held them, were continued in them for no longer than three years. And it was for this reason they were guilty of so much extortion, looking upon their governments as leases for so many years, in which they were to make their fortunes.

But the best of all the governments that still belong to the Indies, is that of Mozambique [see PORTUGUESE AFRICAN TRADE], which is an island situated near the coast of Africa, in the latitude of 15° south, within half a league of the continent. They have a strong fort there, with four good bastions, which commands the channel, and in which there are seventy pieces of brass cannon; and here there is always kept a good garrison, and in tolerable order. The governor is honoured with the title of general of the river of Senna, where he has his lieutenant, which employment was worth to him several hundred thousand crowns a year. There are but a few houses about the fort, the inhabitants keeping their effects on the neighbouring continent: but notwithstanding the narrowness of the place, there are monasteries of Jesuits, Dominicans of St John de Dios, besides the chief church and that of the Misericordia. The merchandize

brought to this place by the ships of the company, are bought at a set price by the royal factory, which afterwards sends them to Chelamani; the mouth of the river of Senna running three hundred miles along the coast, in galleys and small vessels, because of the flats from Chelamani; the goods are sent up the river against the stream, in almandies or little boats, which are ten days going up and about five coming down. It is very difficult going up, for those who are not well acquainted with the shallows and windings of the river. The Cafres, or Blacks, resort to this port from provinces and kingdoms three or four months journey distant, to buy or take up goods upon trust for so much gold, which they never fail to bring punctually the next year, unless death prevents them. This trade yields above cent. per cent. so that the Portuguese may be said to have another India in Africa.

SENNA is a little town on the right-hand of the river, inhabited by fifty Portuguese families, who make it populous enough, by the great number of blacks they keep. These till the ground, and dig in the mines, and by that means maintain their masters instead of being kept by them. About fifteen days journey from hence lies Sofala, where the Portuguese have likewise an establishment, subject, however, to the general of Mozambique, and here a prodigious trade is driven on, of which the Portuguese are, or might be, masters. It consists chiefly in gold, of which there are greater quantities here than in any other country in the world, since the annual produce of this market is computed, by the best judges, at forty-six thousand ounces. There are vast quantities of Spanish and Canary wines, oil, silks, linens, cottons, coral, and other European goods sold here, which are carried by the inhabitants of the little kingdom of Sofala, through all the great empire of Monomotapa, which the Portuguese stile the empire of gold, from the prodigious quantities of that precious metal which is brought to them from thence. There are likewise, some other very rich commodities brought hither by the negroes, such as the most excellent ebony in the world, great quantities of ivory, abundance of fine mats, which are much esteemed in the Indies, and a great number of slaves; so that Goa, and all the rest of the Portuguese settlements, are furnished from hence. One may justly wonder, that, considering the value of this settlement, and its convenient situation, the Dutch had not made themselves masters of it long ago, as well as of all the other places belonging to the crown of Portugal on this coast.

In the year 1605, they attempted Mozambique with very little success, which, however, did not discourage them; as it must be allowed, that where there is a prospect of gain, the Dutch are not easily discouraged; and, therefore, in 1607, they attacked it a second time with greater force, but with the same ill-luck as before, except that they made themselves masters of a rich Portuguese fleet, which, in some measure, paid the expence of the expedition. This rich trade, notwithstanding, is much fallen off by the Arabs making themselves masters of Monbaza, and other places which gives them an opportunity of supplying the Africans with European goods, which they purchase in different parts of the Indies.

As for the share which the Portuguese still retain, the gold obtained thereby is sent to Goa and to Diu, where it is coined into small pieces, called St Thomas's, which are not worth above half a crown of our money; and it is observed, that this coin is of a worse touch, that is, of a baser alloy than any other in the Indies [see the article EAST-INDIA TRADE in general] which is another sign of a declining trade; for the Saracens, which were formerly coined at Ormuz, when in the Portuguese hands, were esteemed the best gold in the Indies; but they are now become extremely scarce, and the St Thomas's are coined in less quantities every year.

These possessions are said to produce so little to the king of Portugal, that it has been more than once debated in the council of that prince, whether it would not be for the interest of the crown to abandon them all together withdrawing their artillery and effects; and we are likewise told, that it is not any political, but purely a religious motive, that has hindered this measure from being taken, the priests having suggested that, in such case a multitude of souls would be lost to the Church. We shall the less wonder at this, if we consider, that such are best acquainted with the last India trade assure us, that a single merchant and a single ship of a reasonable burden, may carry on as great a commerce, as what at present subsists between Lisbon and Goa. This matter, however, deserves some explanation. There are yet a great many ships employed from Goa, Diu, and Daman, to the coasts of Persia, Pegu, Manilla, and China, but they are mostly on the account of Indian merchants, there being scarce a Portuguese trader at Goa able to furnish a cargo of the value of 10,000 crowns; and it is very much doubted, whether in the whole of their trade, they employ above two hundred thousand crowns; so that it is not at all strange, that one year with another, there are not above two ships sent directly from Goa to Lisbon, and those not a fourth part so rich as when they annually sent twenty.

Yet there has been a late regulation made at Goa, for the preservation and promotion of trade, which those who understand that subject best, agree completed it's ruin. This is an exclusive company, which has the sole right to the commerce of Mozambique and Macao, which company has taken upon itself the payment of the royal officers, who are also two thirds concerned therein: this has given such a blow to the natural commerce of Goa, that the best part of the Indian merchants that were left, are now retired from thence. To say the truth, it was the great share the viceroys, governors, and other officers, always took in commerce, without contributing any thing thereto, except protecting the merchants from the violence committed by themselves on such as did not admit them to a share in their trade, that first destroyed the extensive commerce they enjoyed. And, upon this subject, the wits of the Indies have framed a very pretty allegory: they say, that when the Portuguese came first there, they had a sword in one hand, and a crucifix in the other; but that they might fill their pockets the faster, they quickly dispensed with the first, and soon after laid down the last, by which they have lost all. But though their power and their commerce are so much declined, their pride is as great as ever, inasmuch, that they refuse the natives of the country, who are called Canarians, the privilege of wearing stockings, though they employ them as physicians, lawyers, and merchants, by which many of them are so rich, that they keep a dozen or fourteen slaves, and are in much better circumstances than the Portuguese themselves. The revenues of the Church have suffered very little by this surprising change in the State; there being hardly a monastery that does not receive four or five thousand crowns out of the treasury, at the same time the soldiers starve and mutiny for want of pay; which is so much the harder upon the government, because the reverend fathers know very well how to take care of themselves, inasmuch that it is affirmed, the Jesuits in Goa have a better revenue than the crown of Portugal. It is not easy to know what becomes of the money these Popish churchmen raise, but it is very evident, that the wealth they possess, together with the establishment of the inquisition at Goa, is such a dead weight on the settlement, as must sooner or later destroy it, unless other measures are soon taken to prevent it.

The wits of the Portuguese in Europe understand this very well, and would be glad to see some proper remedy applied, not from any prejudice against the Church or Churchmen, which is far enough from being the vice of that nation, but out of pure regard to the crown, and to the nation; and one would think, that the Clergy themselves, instead of grasping at more, ought to be willing to part with some proportion of what is already in their hands, in order to render the State more able to protect them in the possession of the remainder. Besides, there is nothing clearer, than that the erecting of religious houses is directly opposite to the very scheme of planting, and must always ruin the settlements where it prevails, and consequently the religious houses themselves, which is certainly an argument that ought to prevail even with Popish princes, to lay some restraint on the missionaries that are sent abroad, unless they prefer the reputation of zeal among such as are no competent judges, not only to maxims of policy and good government, but to the principles of true religion. For, if there be any piety in converting Pagans to the Christian faith, it follows, that there is still greater piety in doing this effectually, and in maintaining for ever the establishments necessary to support them, which reason and experience shews, the building monasteries, and maintaining numbers of idle people in them, will not do, but, on the contrary, will bring on in time the destruction of those colonies, in which this humour is suffered to prevail.

A few years since we had advices from this part of the world, that several Indian princes were driven from before Goa, which they had blocked up with a numerous army, by the powerful succours sent by the present king of Portugal, and by the excellent condition of the late viceroy, who was the count De Laurical, and behaved there with great reputation. Such expeditions, however, are to be considered as expedients only, which may for a time preserve that settlement, but can never restore it, or bring the affairs of this nation in these parts into so good order, as to make them worth the attention of a prince, who has the honour of his crown and the good of his people at heart.

But, it seems, the Portuguese are, at present, determined to take effectual measures for the restoration of their East-India commerce, and they intend to commence the same at the port of Diu; which has been long since observed by M. Tavernier to be well situated for trade, and as capable of improvement, as any in that part of the world, or more so: and, if put under a proper regulation, that is, if made in some measure a free port, as it is said the Portuguese design, it must necessarily come in for a large share of that commerce now carried on at Surat, and, in all probability, retrieve much of the Arabian and Persian traffic that has been so long lost to them. And as the Portuguese have still some factories at Binnagar, and other places on that coast, it would be no difficult matter to re-establish their commerce in the heart

of India, at the same time that the port of Macao would furnish them with the means of supplying the China market as cheap, or cheaper, than any other European nation, because their colony at Mozambique is so situated, as to serve them for the same purposes that the Cape of Good Hope does the Dutch, or the island of St Helena the English.

POSTAGE of LETTERS. Soon after the restoration of king Charles II. an act of parliament passed for erecting a general post-office in England; and in the 1st year of king William III. an act of parliament passed in Scotland, for erecting a post-office in that kingdom; but in the ninth of queen Anne, after the Union, an act of parliament passed for repealing both those statutes, and for uniting both the said post-offices, and for erecting and settling one general post-office throughout all her Majesty's dominions; by which it is enacted, That there shall be one general post-office in London, and one post-master general, who shall have the sole receiving and dispatching all letters within this united realm, and without, &c. except letters which concern goods sent by common carriers, and which shall be delivered with the goods, without any profit for receiving or delivering them; and except merchants letters, and those of masters of ships; so as such letters be delivered to the persons to whom they are directed, without receiving any profit for them; and except provisions, affidavits, writs, &c. and any letters sent by private friends, in their journey, or by any messenger about private affairs or business.

Proviso, That carriers do not receive letters which do not concern goods then in carrying, nor drivers of stage-coaches, nor masters of passage-boats, nor passengers therein, nor watermen or bargemen, though without hire or reward.

The post-master general, and his deputies, and no other person, shall provide horses and furniture for any person riding post, where any post-roads shall be settled, at the rate of 3 d. per mile for every post-horse, and 4 d. for the guide, and shall not charge any thing for carrying a bundle, so as it does not exceed eight pounds.

And for letters he shall take, viz.

For every single letter not coming from, or directed from on ship-board, and to and from any place in England, not distant above 80 miles from London, 3d. and for every double letter 6d. and for the packets of writs, deeds, and other things 12d. per ounce: for every single letter above 80 miles from London, 4d. and for a double letter, 8d. and for other things, 1s. 4d. per ounce; for every single letter from London to Edinburgh, or vice versa, 6d. and a double letter, 12d. and for other parcels, 2s. per ounce; for any letter from Edinburgh, to any place not exceeding 50 miles in Scotland, 2d. and a double letter, 4d. and for other parcels, 8d. per ounce; and if above 50 miles, 3d. and for a double letter, 6d. and for other parcels, 12d. per ounce; if above 80 miles, then for every single letter 4d. and for a double letter, 8d. and for other parcels, 1s. 4d. per ounce: and for the postage of letters and packets directed on board, or brought from any vessel riding or stopping in any port in England, 1d. over and above the said rates; and for the postage of all letters and packets passing and repassing by the penny-post, and to be received and delivered within 10 miles distant from the General Post-Office 1d.

The post-master may erect cross-stages, and he or his deputy may demand and receive the same rates in any such cross-stages, in proportion to the distances of places, as letters to and from London are rated.

He may appoint one to measure the roads by the wheel, except such roads where the stages are already settled; and he who makes such surveys, shall make oath before some justice, &c. in each kingdom respectively, to perform the same according to the best of his skill, and the justice, &c. shall certify the same in writing, to be kept and entered in the General Post-Office, without fee.

Proviso, That merchants accounts, not exceeding one sheet, and all bills of exchange and invoices, and bills of lading, shall be allowed to pass without rate in the price of letters; and likewise the covers of letters, not exceeding one fourth part of a sheet, sent by the way of Vienna, Marfeilles, Venice, or Leghorn, to be sent to or from Turkey.

None other but the post-master general, or his deputies, shall receive, take, or carry letters, either by land or sea, or provide horses for riding post, or collect any letters, or set up any foot-post, horse-post, or packet-boat, or any other conveyance for the carrying or delivering of letters, under the penalty of 5l. for every offence, and also 100l. for every week that the offender shall continue the said offence.

If through the default or neglect of the post-master, any person riding post shall fail of being provided with sufficient horses, after demand, the party offending shall forfeit 5l. one moiety to the crown, the other to the prosecutor, to be recovered in any court of record.

Proviso, That if the mail be carried out of England in any vessel which is not a free ship, and navigated by seamen as by the law is required, that then the post-master-general shall forfeit 100l. one moiety to the crown, the other to him who will sue, to be recovered by bill, plaint, or information.

All money due for letters not exceeding 5l. shall be recovered in the same manner, and under the same rules, as small tithes, by complaint in writing before two justices, who may summon the party complained of, and, on default of appearance, determine the cause, and give allowance and costs, not exceeding 10s.

If the party refuse to pay in 10 days after notice, the constables, &c. are to defray, by warrant from the justices, and the distresses to be sold in three days.

All inland letters must pay at the stage where last delivered, unless they are directed to any ship or vessel, or to any person in the army, or sent by the penny-post, and unless letters going out of Great-Britain, which have usually paid rates in England.

After the 1st of June, 1743, the old rates shall be taken for letters again.

Persons opening, detaining, or delaying any letter, after the same is delivered into the General Post-Office, except by warrant in writing, under the hand of a secretary of state, or unless the person to whom directed refuses to pay the postage, or where the letter shall be returned for want of due or true direction: the person so offending, or embezzling a letter, forfeits 20l. to be recovered in the courts at Westminster, if in England; if in Scotland, in the court of session or exchequer, by such persons who will sue, with full costs, and the offender is disabled, and rendered incapable of any employment in the Post-Office.

Post-master general, and all in any employment relating to the Post-Office, must take the oath following, before one justice of the peace of the county where such person resides.

I A. B. do swear, That I will not wittingly, willingly, or knowingly, open, detain, or delay, or cause, procure, permit, or suffer to be opened, detained, or delayed, any letter or letters, packet or packets, which shall come into my hands, power, or custody, by reason of my employment in, or relating to, the Post-Office, except by consent of the person or persons to whom the same is, or shall be directed, or by an express warrant in writing, under the hand of one of the principal secretaries of state for that purpose; or except in such cases where the party or parties to whom such letter or letters, packet or packets, shall be directed, or who is or are hereby chargeable with the payment of the post or posts thereof, shall refuse or neglect to pay the same; and except such packets or letters as shall be returned for want of due directions, or when the party or parties to whom the same is, or shall be directed, cannot be found; and that I will not any way embezzle any such letter or letters, packet or packets as aforesaid.

It is enacted, by stat. 6. Geo. I. cap. 21. That when bills of exchange are sent wrote on one and the same piece of paper with a letter, as also several letters to several and distinct persons, are sent wrote on one and the same piece of paper, that every such bill, and every such letter, should be rated and paid for as so many several and distinct letters, according to the rates 9 Ann. cap. 19.

And whereas by the act 9 Ann. cap. 19. it is provided, That all bills of exchange, invoices, and bills of lading, shall be understood to be allowed without rate in the price of the letter; and some doubts having been made, touching the said proviso, it is, by the said 6th of king Geo. I. cap. 21. declared and enacted, That it was, and is the intent and meaning of the said act, that the said proviso and allowance shall extend only to such merchants accounts, bills of exchange, invoices, and bills of lading, as shall be sent to or from the General Post-Office in London to any parts beyond the seas not within his Majesty's dominions; and that all other merchants accounts, bills of exchange, invoices, and bills of lading, shall be rated and paid for as so many several letters, according to the rates mentioned in the said act 9 Ann. cap. 19.

By stat. 4 Geo. II. it shall be lawful for any penny-post-man to demand, for every letter originally sent by the Penny-Post, which shall be delivered to, or for any person, at any place out of London, Westminster, or Southwark, and their respective suburbs, one penny besides the penny paid on putting the letter into the said office; and no penny-post-man shall incur any penalty for detaining such letter until the payment thereof.

A letter, in which there were bills of exchange, was delivered at the General Post-Office in London, to one who was appointed by the post-master to receive letters, and there it was opened, and the bills taken out; and, in an action brought against the Post-master, three judges, against Holt, chief justice, held, That it would not lie, because this was an office of intelligence, and not of insurance, or of conveyance of treasure; but the chief justice held, that the action would lie, because the post-master hath a reward, which is the reason that inn-keepers and carriers are to keep goods safely.

By the 26th of Geo. II. every writ is to pay as a distinct letter; and letters inclosing several patterns, not exceeding one ounce weight, to pay only as a double letter.

N. B. The last act in relation to postage of letters, included in the tobacco-act.

A warrant to take a distress for money ordered to be paid, by two justices, for postage.

Essex, ff. Whereas, on complaint this day exhibited, by A. B. of, &c. unto us, W. B. and J. S. Esqrs. two of his Majesty's justices of the peace for the county aforesaid, That L. M. of, &c. has refused to pay the sum of, &c. by him justly due for the postage of letters, and the sum of, &c. which we awarded for costs on his refusal, as aforesaid: upon examining into, and determining the cause of complaint, according to the direction of the statute in that case made: these are therefore to require you to levy the said several sums of, &c. on the goods of the said L. M. by distress and sale, if not redeemed in three days; and, for your so doing, this shall be your sufficient warrant, Given, &c.

POT-ASH, are the lixivious ashes of certain vegetables, used in the making of glass, soap, bleaching, dyeing, &c.

Although pot-ash is a thing daily used, and well known even to the vulgar; yet, as the making of it is a mechanic art, practised only by the vulgar, and neglected and overlooked by the learned, so we have had no satisfactory account of it; and they who understand it, generally keep it a secret, lest others should learn so beneficial an art. But, as it is a commodity that no nation hardly can well be without, either for making soap, glass, dyeing, or bleaching, so the way of making it, is generally understood in most countries except our own. For, in France and other countries, where they make wine, they make a kind of pot-ash, in an easy manner, from the lees of their wine. In those, and other more southern climates, they have many kinds of herbs hereafter mentioned, either spontaneous, or cultivated on purpose, which they as easily convert into pot-ash. In Germany, and other more northern countries, they make great quantities of pot-ash, by extracting the salts of their wood-ashes, in a manner that is well known. But it is only in Russia, Sweden, and other northern nations, where the art of converting their wood-ashes into pot-ash, without the tedious process of elixivation, is either well known to the learned, or practised by the vulgar. By this means, most nations are supplied with this necessary commodity of their own, except the English, who might be supplied with any quantities of it, from the great plenty of otherwise useless wood they have in their colonies, if not at home, if they knew how to make it. But it seems this art is so little understood among us, that many attempts have all proved unsuccessful, merely upon that account, so as to be entirely laid aside. This has put us, for some time, upon enquiring into the ways of making this commodity, of which several have been suggested, from the several trials and informations hereafter mentioned.

It is well known, that the ashes of all kinds of vegetables whatever, afford pot-ash in some measure or other; although some are much more fit for that purpose than others, which may be determined from the experiments of Redi, in the Philos. Transf. No. 243, p. 281. Boerhaave, Merret, and others; so that we need not insist upon them here.

As for the trees and herbs of our colonies in North America, most of those that are common in their woods are known to be fit for this purpose, as the ashes of them all, burnt promiscuously in their houses, make a very strong lye fit for soap. Of these, the fittest for that purpose is their hickory, the most common tree in their woods, which makes the purest and whitest ashes, of the sharpest taste, and strongest lye, of any wood. Their stickweed is said to do the same, which is as common a weed. For this reason, the ashes of both these plants were used by our Indians there, instead of salt, before they learnt the use of common salt from the Europeans. The ashes of tobacco likewise, when damified, or not fit for a market; or it's stalks, stems, and suckers, of which great quantities are thrown away, and rot and perish, are very fit for pot-ash, as they contain a great deal of salts, and are well known to make a strong lye.

On the other hand, pines, firs, sassafras, liquid amber, or sweet gum, or all odoriferous woods, and those that abound with a resin or gum, are unfit for pot-ash, as their ashes are well known, even to our planters, to make a very weak lye, unfit for soap.

Besides these that contain little or no salt, there are some other vegetables that afford a large quantity of it, but make a bad kind of pot-ash, at least for many purposes, on account of a neutral salt with which they abound. This seems to have been the case of the pot-ash made in Africa, in a manufacture of that commodity, set up there by the late African company, which Mr Houston (who was chiefly concerned about it) tells us, in his travels, proved so bad, on account of a neutral salt it contained, that the manufacture was left off on that account; or, perhaps, from their not knowing how to make it right. What those vegetables are, that afford this kind of ash, is not well known, if it be not fern, and some sea-plants.

Whatever vegetables we make our pot-ash of, should be fresh or green, and no ways rotten, dried, or decayed. They should

should likewise be burnt to ashes by a slow fire, or in a close place; otherwise, when they are burnt in the open air, by a strong fire, great quantity of the ashes is consumed in smoke, by the saline and terrestrial parts being carried up in fumes, before they are separated from these exhalable parts, by the action of the fire. For the difference between burning wood in a close place, or the open air, is so great, that the quantity of ashes obtained from one, is more than double the other. This we learn from the experiments of Lundmarck hereafter-mentioned, who tells us, he burnt a quantity of birch in a close stove, from which he obtained five pounds of ashes; whereas, the same quantity of the same wood, burnt in the open air, yielded only two pounds.

It is for this reason, that most people who make pot-ash, burn their wood in kilns, or pits dug in the ground; although the Swedes burn it in the open air, as the author above-mentioned informs us. This first step, or the burning the wood to ashes, seems to be taken, by many, for the whole process of making pot-ash; for they who pretend to have learned this art in Russia, as well as Lemery, and some other authors, hardly give us any other account of it.

But, in order to convert the ashes, prepared in this or any other manner, to what is called pot-ash, there are many different ways practised in different countries, which make as many different kinds of pot-ash, that are all to be found in our markets, and have all their respective uses.

1. The first of these is commonly called pearl-ashes by our people, who import great quantities of it from Germany. This is no other than the lixivial salt of wood-ashes, extracted by making a strong lye of them, and by evaporating it to dryness, in a manner that is well known, and sufficiently explained by Kenkelius, in his art of making glass, Boerhaave, and many others; so that we need not insist upon it here: we shall take a more fit opportunity to explain it, for the use of our people in America.

2. But the art of converting these wood-ashes into pot-ash, without this tedious process of elixivation, is only practised in Russia, Sweden, and other northern countries, where it has been lately disclosed by one Lundmarck, who tells us he had often made it himself, in the manner he now describes. This account is contained in an academical dissertation upon this subject at Aboe, in Sweden, and was communicated to Dr Mitchell, by Dr Linneus, professor of botany at Upsal, as a genuine account of this art; which I think has hitherto been generally unknown.

This author tells us, 'They have many large woods of beech in Smoland, and other parts of Sweden, in want of which they take alder: of these they are allowed to use only the old and decaying trees for this purpose, which they cut to pieces, and pile in a heap, to burn them to ashes upon the ground, by a slow fire. They carefully separate these ashes from the dirt or coals in them, which they call raking them; after which they collect them in baskets of bark, to carry them to a hut built in the woods for this purpose. This they continue to do 'till they have a sufficient quantity of these ashes. Then their whole art follows: for which they chuse a convenient place, and make a paste of these ashes with water, by a little at a time, in the same manner, and with the same instruments, as mortar is commonly made of clay or lime. When this is done, they lay a row of green pine or fir logs on the ground, which they plaster over with this paste of ashes: over this they lay another layer of the same spruce logs of wood, transversely, or across the others, which they plaster over with the ashes in the same manner: thus they continue to erect a pile of these logs of wood, by layer upon layer, and plastering each with their paste of ashes, 'till they are all expended, when their pile is often as high as a house.

This pile they set on fire with dry wood, and burn it as vehemently as they can; increasing the fire from time to time 'till the ashes begin to be red hot, and run in the fire. Then they overset their pile with poles, as quickly as they can; and while the ashes are still hot and melting, they beat and clap them, with large round flexible sticks, made on purpose, so as to incrust the logs of wood with the ashes; but which the ashes concrete into a solid mass as hard as stone, provided the operation has been rightly performed.

This operation they call walla, i.e. dressing. At last they scrape off the salt thus prepared, with iron instruments, and sell it for pot-ash; which is of a bluish dark colour, not unlike the scoriz of iron, with a pure greenish white salt appearing here and there in it.'

All the pot-ash we have from Russia, Sweden, and Dantzick, is exactly like what our author here describes, and seems to be made in this manner. It is, however, generally observed, that the Russian is the best of these, on account of the greater quantity of salt in it. Now if, in the preceding process, we make our paste of ashes with lye, instead of water, it is plain the pot-ash will be impregnated with more salt, and make all the difference there is between these sorts of pot-ash. This then is likely to be the practice in Russia; where their wood may likewise be better for this purpose, and afford more salt. This is well known to be the case of different kinds of wood: so our author above-mentioned tells us, he obtained 2 $\frac{1}{2}$ lb. of salt out of eight cubic ells of po-

plar, which was very sharp and caustic; but the same quantity of birch afforded only one pound of salt, and that not so strong; and fir hardly yielded any at all.

The way of making pot-ash above described, may be the more easily understood by our people in America, for whom this is chiefly intended, as it is the same with their way of making lime of shells, the only lime they use in most places.

These shells they burn to lime between the layers of a pile of wood (instead of a kiln) 'till reduced to ashes, in the same manner as is here directed to be done with ashes, to make pot-ash. The lime thus made, is reckoned very good; but, as it is impregnated with the ashes of the wood, and the marine salt that is often in the shells, it is apt to make the houses that are built with it very damp in moist weather, so that the water often runs down their walls in streams; which cannot but be very unwholesome, in an air that is naturally close and damp: the only way to prevent which, would be to wash and dry their shells frequently, and burn them in dry pine, that afford little or no lixivial salt. But to return to our purpose:

3. There is another way of making pot-ash, practised chiefly in England, where they make it in the following manner.

With their ashes of fern, or wood of any kind, they make a lye, which they reduce to what they call pot-ash, by burning it with straw. To do this, they place a tub full of this lye nigh a clean hearth of a chimney, in which they put a handful of loose straw, so as to take up a quantity of lye with it. The straw thus impregnated with lye, they carry as quick as they can to hold it over a blazing fire on their hearth, which consumes their straw to ashes, and at the same time evaporates the water from the salts of the lye. Over the blaze of the first parcel of straw, they burn another, dipped in lye in the same manner. This they continue to do 'till their lye is all expended. By this means the coals and ashes of the straw, and salts of the lye, are left on the hearth, and concrete together into a hard solid cake, of a greyish black colour, which they scrape off, and sell for pot-ash.

This is an easy way of making pot-ash, in want of proper vessels to extract the salt of the lye by evaporation, or in want of wood to reduce ashes to pot-ash, in the way above-mentioned, for which it seems to be contrived, and for which it is only to be commended. For the pot-ash made in this manner, is full of the coal of the straw, and it's salt is not so strong, as our workmen say, or so sharp and corrosive as the salt of the foreign pot-ash, that is calcined in an open fire; besides other differences hereafter mentioned, which makes this pot-ash unfit for some purposes, and not above half the value of the foreign.

4. They have a very different way in the north of England of reducing their kelp to pot-ash, which they use for making allum. This is made of the different kinds of fuci, or seaweeds, thrown upon the shore, or gathered upon the rocks; which they dry a little in the sun, and afterwards burn in a kiln, built of the stones they find on the shore, in a cylindrical form, and about two feet or less in diameter. In this they first burn a small parcel of the herb, and before it is reduced to ashes they throw on more, 'till the kiln is full, or their materials are expended. This is said to reduce the ashes to a hard and solid cake, by the heat of the kiln, and quantity of salt in the herb, which makes what is commonly called kelp-ashes.

There are some other ways of making pot-ash, suggested by several, both authors and others, which appear to be more easy and ready than any of the above-mentioned; for which reason they are apt to be tried, by those who make attempts of this kind. These are deduced from what they reckon the nature and properties of this production: and there is no doubt, but if that was well understood, it might afford some insight in the way of making it. For this reason we made the following experiments with the best Russian pot-ash, in order to discover it's nature and properties, and how they are most probably communicated to it; that we might see what we are to make, in order to imitate the best, or to make what is accounted good pot-ash.

1. Russian pot-ash, as it is brought to us, is in large lumps, as hard as a stone, and black as a coal, incrustated over with a white salt, that appears in separate spots here and there in it.

2. It has a strong foetid sulphureous smell and taste, as well as a bitter and lixivial taste, which is rather more pungent than other common lixivial salts.

3. A lixivium of it is a dark green colour, with a very foetid sulphureous smell, and bitter sulphureous taste, somewhat like gunpowder, as well as sharp and pungent, like a simple lixivium.

4. Although it is as hard as a stone, when kept in a close place, or in large quantities together in a hoghead; yet, when laid in the open air, it turns soft, and some pieces of it run per deliquium; whilst most other kinds of pot ash only turn friable, and crumble in the open air.

5. It readily dissolves in warm water, but leaves a large sediment of a blackish grey colour like ashes, which is in a fine soft powder, without any dirt or coals in it, that are to be observed in most other kinds of pot-ash.

6. As it is dissolving in water, there has been scummed off from some lumps of it, a dark purple bituminous substance, like

like petroleum or tar, which readily dissolved in the lixivium. 7. This, or any other true pot-ash, or a lixivium made thereof, will presently tinge silver of a dark purple colour, difficult to rub off; whilst a mere lixivial salt has no such effect.

8. Pieces of this pot-ash, boiling in water, make a constant explosion like gunpowder; which was so strong, as not only to throw the water to some height, but to lift up, and almost over-set, a stone cup in which they were boiled. These explosions were owing not so much to the included air, which some perhaps may imagine, as to the sulphureous parts of the composition expanding and flying off: for this boiled lixivium had neither the green colour, nor foetid sulphureous smell and taste; at least, in any degree, like what it has, when made of the same pot-ash, by a simple infusion in warm water.

9. We evaporated some of the green lixivium, made only by infusion, and filtered through a double rag: as soon as it began to boil, a green powder, to which its colour is owing, fell to the bottom, and the lye became pale. After it was evaporated to a pellicle, and set in a cool place, a salt separated from it on the sides of the cup, in angular crystals like tartar. These crystals were soon formed, and in pretty large quantities, but were difficult to separate from the alkaline lye and salt, in which, and the open air, they were apt to dissolve: but from the pellicle, I obtained some pieces of the same salt that would not dissolve in the open air.

10. Oil of vitriol makes a strong effervescence with this green precipitate, with a white fume, and a very strong sulphureous smell. It does the same with these white crystals, although the sulphureous smell is not so strong. But with the pure fixed alkali, there was no such sulphureous smell to be discerned.

From these experiments, we may determine something about the nature and contents of pot-ash. This we are the better enabled to do, from the accurate experiments and reasonings of the learned Mr Geoffroy, on a like substance made of charcoal, and an alkali salt calcined together; in which he observed all the properties and contents of pot-ash above-mentioned, particularly related in the Memoirs of the Royal Academy, for the year 1717. This was made of the same materials, and had all the properties above-related of our pot-ash; particularly a green lixivium, a strong sulphureous smell and taste, a sulphureous green precipitate, crystallized salts, and sulphureous fumes, with oil of vitriol. From hence this learned author concludes, that this substance contained the active sulphureous parts of the wood, blended with more active igneous particles. These united with the alkaline salts, make a kind of soap, or sulphureous saponaceous salt, resembling soap of tartar, or hepar sulphuris. The crystallized salts he attributes to the acid of the wood mixing with the alkaline salts. All these parts of the wood then are contained in our pot-ash; and he observed the same in the common soda, or cineres clavellati, although they are in a less degree in that than in the Russian pot-ash.

Besides these, he shews that pot-ash contains a metallic substance, which affords the Prussian blue [see BLUE, PRUSSIAN BLUE]. We may add further, that the combination of these principles makes many properties in pot-ash, more than what result from them in a state of separation. The most remarkable of these seems to be its explosive quality; which we take to proceed from the crystallized salts approaching to the nature of nitre, and uniting with the sulphur and charcoal; by which they form, from all these ingredients of gunpowder, a kind of that explosive substance, whose parts are highly rarefied in an intense and confined heat, by which they readily explode in boiling lye.

By this we may perceive, that the difficulty in making pot-ash a-right is, first, to reduce the materials to cinders and ashes, and at the same time to preserve their volatile, sulphureous, and exhalable acid parts, that are totally destroyed in such a degree of heat; and, secondly, to calcine these ashes still further, so as to flux their salts, and vitrify their terrestrial parts, and at the same time to keep them separate from each other, or prevent their running into an indissoluble glass. To give pot-ash some of these properties, seems plainly to require a degree of heat that will totally deprive it of others.

The most likely way by which it comes to receive all these properties, is from the way of making it in Sweden above described. In that process, the green fir in which the ashes are burnt, impregnates them with the acid saline parts of the wood or tar, which is well known to be in pretty large quantities, and is absorbed and fixed by the alkaline salts, and porous terrestrial parts of the ashes in this process; so that, besides the fixed alkaline salts of the ashes, the pot-ash thus made, must likewise contain the more volatile salts of the pine, which are exhaled in smoke, by burning the pine alone in the open air. Besides these, it likewise contains the resinous parts, and sulphureous fumes of the pine, that are hindered from exhaling by the heap of the mass.

At the same time the alkaline salts are fluxed in the open fire, and in a manner vitrified with the terrestrial parts of the ashes, which gives them their hard and solid consistence; whilst the sulphureous and acid parts of the green wood hin-

der them from turning to a perfect glass, or inert calx. All these parts united together in the fire, make that saponaceous substance we find in the pot-ash thus made, which further hinders the vitrification of the mass, and endows it with many of its most peculiar and active properties.

From hence we may see how difficult it is to make a substance, endowed with all these properties, in any other manner. This is the reason why we could never before make pot-ash equal to that of Russia, and the other northern countries, although we have much greater plenty of materials, and perhaps better: for this way of making it has never before been thought of by the learned, or practised any where else.

Somewhat of the same qualities are communicated to the English pot-ash, by the way of making it above described; but in a degree as much inferior, as dry straw, used for that purpose, is to green wood: accordingly our workmen find that pot-ash is much inferior to the foreign, for many purposes.

From this account of the contents and qualities of pot-ash, and the way of making it, we may form some judgment of the other ways of making it, proposed by authors, and suggested by many. Thus Lemery and others tell us, pot-ash is made in Russia, and all the northern countries, only by calcining the ashes in pits bricked within, and sprinkling them well with lye, 'till they become hard and solid. But such a calcination of ashes with a lixivial salt, must render them whiter instead of black, and must further destroy the active sulphureous parts of the wood, which we find in pot-ash rightly made. So that this only leaves the ashes in the state they were at first, or turns them into a kind of indissoluble glass, as we have found upon trial.

This, and the like mistakes, about the way of making pot-ash, seem to proceed from a general error concerning the nature of it; for it is commonly supposed to be only a kind of inert calx, impregnated with nothing but a lixivial salt. Some such mistakes seem to have frustrated all the attempts hitherto made of making pot-ash in America; for, upon trial, what they have made there, was found to be no better than common ashes.

But the most general mistake about the way of making pot-ash, seems to proceed from the accounts we have of making it, from glass-wort, and some marine plants, which are said to be easily converted to this kind of substance, in the manner above-mentioned. But we apprehend, the way of making it from wood must be very different: for these herbs are easily reduced to ashes by a small fire, that does not intirely consume their sulphureous parts, which wood is not. These ashes abound with a great quantity of alkaline and some neutral salts, that readily convert them to a hard and solid consistence, which wood does not. They have likewise few or no terrestrial parts, to run them into an indissoluble glass, when fluxed in the fire, as happens in wood ashes. Besides, these herbs have few or no sulphureous or acid parts, like most woods; and the pot-ash made of them has few of these principles in it, like what is made of wood.

It is, however, generally said, if we burn our wood in a close place, as a kiln in which we burn lime, or make charcoal, or a pit dug in the ground, we may impregnate the ashes with the sulphureous fumes and acid parts of the wood, only by the closeness of the place, or by smothering the fire in it. If at the same time, we impregnate them with a greater quantity of lixivial salt, it will flux the whole mass, and make it run into a solid hard consistence like pot-ash. This is commonly directed to be done, by throwing fresh or green wood or herbs upon the others, as they are burning, before they are quite reduced to ashes; or by smothering the fire, as in making charcoal; and at the same time to sprinkle the ashes, thus burnt with a strong lye, from time to time, in the manner commonly practised with glass-wort.

This would be a more ready way of making pot-ash than any of the above-mentioned; but as those who give their advice about it, have neither tried it, nor seen it done; and those who have tried this or any other way, find more difficulty in it, than at first imagined, we shall suspend our judgment about it, 'till we see it fairly tried, lest we should deter some from making useful experiments of it, or lead others into fruitless and expensive attempts.

By the various ways of making pot-ash above-mentioned, and the different materials it is made of, there appear to be many different kinds of it, that have as different qualities. It would lead us too far beyond our present design, to give a particular account of each of these; but as they are used in many of our manufactures, it seems worthy of enquiry, to know what sorts are generally used, and what are the fittest to be used in them.

The workmen in England make two general kinds of it, which they distinguish by the names of pearl-ash and pot-ash. The first is a mere lixivial salt, which is supposed to be the only ingredient of any efficacy in pot-ash; but, upon trial, there is found to be a great difference between them, especially in making soap. The salt is so weak in the pearl-ash, that it does not entirely dissolve and unite with the fat. The reason seems to be, that these salts are dissolved in water, in order

order to extract them; by which they lose many of their caustic igneous parts; whereas in pot-ash the salts are calcined, and fluxed in an open fire, with the ignited terrestrial parts of the ashes, which makes them more sharp and corrosive; they are likewise incorporated with the coal and fuliginous parts of the vegetables they are made of, or with the resinous parts of fir, which gives them the sulphureous quality above-mentioned, and makes a kind of soap of tartar, or hep-*par sulphuris*, in all pot-ash; which makes these salts so ready to dissolve, and incorporate with oil, or other pinguious substances.

This is, perhaps, the reason why the *Cineres Ruffici* are ordered for this purpose, instead of a mere *lixivial salt*, by the College of Physicians, in their late Dispensatory. The soap made of them must be impregnated with their heating sulphureous quality, which will make it more aperient and detergent, but not so mild and soft as some others; by which it may be more fit for obstinate and indurated obstructions, but will be more offensive to the stomach; which is much complained of by some people, who take large quantities of the sharper kinds of soap.

But, to consider pot-ash as a commodity in trade and manufactures, which is its chief use; it appears that the people in England not only have it at a dear rate, but the worst sorts of it, at least for most purposes; which cannot but have a proportional influence on their manufactures: for it is generally of as great, and some sorts of a greater value in their markets, than a pure *lixivial salt*; notwithstanding the small quantity of such salt in ashes, and the trouble and expence of extracting it; which seems to be occasioned by their not knowing how to convert ashes into this commodity; for in Sweden, where the art is known, *Lundmarck* tells us, pot-ash is sold for little more than a farthing a pound, which cost our workmen nigh sixpence.

But this is not the only inconvenience we labour under for want of this commodity; the sorts we are chiefly supplied with, are perhaps the worst of any, and unfit for many purposes for which pot-ash is used. The only pot-ash almost to be met with here, comes from Russia, Sweden, and Dantzick, or is made in England. These are all made either of wood or fern-ashes, whose salts are never so pure and white at the best, as some others: but, by the way of making them and the experiments on them above-mentioned, they appear to be impregnated with coal, smoke, and soot, which renders them still more foul and impure, makes them of a black, brown, or green colour, and of a peculiar sulphureous quality. On this account they are entirely unfit for making white glass: they make a very coarse and strong kind of soap; they are too foul, sharp, and corrosive for bleaching, and are as unfit for dyeing, at least many colours.

It is, perhaps, for this reason, that the workmen here make all their white glass with saltpetre; which must not only be more costly, but *Neri*, *Merret*, and others, tell us it is not so good, at least for the better sort of glass, as a sharper *lixivial salt*. See GLASS. It is said they use the volatile alkali of urine; but the French pot-ash, made of the lees of wine, is generally allowed to be the best for that purpose. So likewise the *Alicant* pot-ash is reckoned much the best for bleaching, and making of soap; as the Syrian and Egyptian is for making of glass.

These purer kinds of pot-ash are all made of herbs, that grow only in the more southern climates, whose salts are finer and whiter, and less acrid and corrosive than the salts of wood, or most other vegetables; and by the way of extracting them by calcination in a more open fire, they are more free of coal, smoke, and soot, or any other heterogeneous mixture. On this account they are much better for the purposes above-mentioned, than the coarse and foul kinds of pot-ash that our people are supplied with.

All we have of these kinds of pot-ash, it seems, comes only from Spain; for which reason our people were obliged to petition, to allow the importation of pot-ash from thence, during the late war; as appears by an order of the king and council, of the 24th of June, 1742, since they could not do without it in many manufactures: so that it may be worth our enquiry, to know what it is that produces so necessary a commodity.

This kind of pot-ash is commonly called *barrilha*, from an herb of the same name in Spain that produces it. The first account we have of this *barrilha*, is from *Amatus Lusitanus*, who leaves us much in the dark about it. It is generally said in England, to be a plant pretty well known to the Botanists, by the name of *Ficoides Neapolitana*, *flore candido*. Hort. Ludg. Bat. but for what reason I cannot say. We have as little reason to believe with *John Bauhine*, that it is what he calls *Kali vulgare*; for *Monfieur de Jussieu* has shewn us, that the true *barrilha* is a different plant from any of these, from his own observations of it in Spain, where it is cultivated; of which he has given us a particular account of them, anno 1717, p. 93.

The pot-ash made of this plant, he tells us, makes the best soap, the finest glass, and is the best for bleaching of any other; for which reason it is much sought after in all countries, where they value themselves for these manufactures.

See BLEACHING. But I question very much, whether our workmen have it either pure and genuine, or in sufficient quantities for these purposes. All the use I find made of it among them, is to make hard soap; although they say what they have of it spoils their soft soap, by making it curdle. This is well known to be the effects of sea-salt; and *Monfieur de Jussieu* and others tell us, that the true *barrilha* is often adulterated with sea-weeds, which contain such a marine salt: so that it is probably only this adulterated sort that they have. Accordingly, all the *barrilha* we have found here, was of a dark brown colour, and very foul and ponderous; whereas, the true sort is said, by all who know it, to be more porous, pure, and of a bluish colour. It is for this reason, in all probability, that notwithstanding all the *barrilha* our workmen have at so dear a rate from Spain, yet they have not been able, 'till very lately, to make so good soap as what comes from thence, and some other places; which is now done as I am informed, by captain *Marchant*, at his soap manufacture near *Stepney*.

The only way then, by which we are likely to have this commodity, either pure and genuine, or in sufficient quantities at a reasonable rate, is from the herb itself that produces it. Whether or not it would grow in England, is not known; as I believe it has never been tried: but there is no doubt but it would grow very well in our colonies in America, as I am certainly informed it does in the Spanish colonies there, where they have great plenty of it; and a sort that is indigenous, particularly in Peru, which might probably be found in our colonies, if sought for by those who knew it. But wherever it will grow in any of the English dominions, there is no doubt but it would be a considerable improvement, where pot-ash of all kinds is so valuable a commodity, and so much wanted; for it grows on the same ground with corn of any kind, which it does no harm to, as it is a small annual herb, that does not spread 'till the corn is ripe, or off of the ground.

There are some other plants that are known to make a kind of pot-ash, commonly called *rochetta*, which is said to be even preferable to the *barrilha*, especially for making glass. These are the first and second kinds of *kali*, described by *Prosper Alpinus*, in his account of the plants of Egypt. The first of which is the above-mentioned *ficoides* that grows in Italy, and all over the Levant, but the other is peculiar to Egypt. These would be fit improvements for our colonies in America, where we seem to want nothing more than some proper productions for the vast tracts of land we are possessed of there. But these plants alone afford a commodity, which *Prosper Alpinus*, and *Rauwolfius* tell us they saw many large ships yearly loaded with in Egypt, and which gives the excellency to the glass and soap that are made at Venice.

It would be worth while then, at least to make a trial of a production, that is likely to improve both our trade abroad and our manufactures at home.

REMARKS on Pot-ash since the last war, and the DEFINITIVE TREATY OF PEACE, 1763.

In our remarks on the article NORWAY, we have shewn the national emolument that would accrue from supplying ourselves, from North America, with every species of TIMBER our colonies will admit of, as well for every sort of house building, as that of shipping, that we may stand in need of. It was too long before the legislature could be prevailed on, to admit of the importation of sow and pig iron from America, and but very lately bar; we were so wise as to give the preference to foreign iron, as we do still for Norway timber, than give our own people in our plantations due encouragement to attempt those articles. Herein daily experience evinces our egregious impolicy. It has been the same by pitch and tar, and continues to be so, with regard to other NAVAL STORES, to the great loss of the nation, all which might have been long since prevented.

In regard to the article of pot-ash, which we have two long also taken from Russia, as well as HEMP and IRON, we may amply furnish ourselves with this ingredient in the manufacture of SOAP; for as these colonies abound with timber of a great variety of qualities, and all proper measures are taken for the felling of timber, and saw mills erected for the cutting the same into boards for every kind of use, the very saw dust, and the underwood, and topping will furnish plenty of material for making pot-ash, if skilful people are employed, who are masters of the process, to instruct our people in the best manner of making it; and, when our nation is highly loaded with public debts and taxes, it is necessary to make every national saving, the better to enable us to lessen our weighty incumbrances. We can now have no excuse for neglecting the production of every possible material in North America, since we have no body to oppose us, except the Savages, who will soon be reduced. See INDIAN AFFAIRS.

POTTERY, the art of making earthen pots, and other vessels, or the manufacture of earthen ware.

The perfection of this art consists chiefly in the choice of proper earth, and the right management thereof, so as to afford the most beautiful matter for vessels.

The delicacy of this art should seem to depend, rather upon the peculiar preparation of certain kinds of earth, than upon the use of them as they are produced by nature: thus we find, that the Dresden and the Chelsea porcelain exceed the ware of China, although it is allowed, that no part of the world produces earths so good for the purpose, as that of the eastern nations; and yet we do not find that any of the oriental earths are imported into Europe for the works of Dresden, &c.—If this be the case, and Europe affords no earths that will naturally produce wares so beautiful as those of the East; the Europeans who excel herein, must do that by art, which the Chinese do chiefly by virtue of the natural excellency of some particular earths.

The end of this art is to produce a matter that will not vitrify and turn into glass by fire, and yet will be as beautiful and transparent, by proper management, almost as glass itself. Now nature affords divers materials, that seem to admit of these properties; as oyster and cockle shells, and various other the shells of fish; which bid fair to answer this intent, by due calcination and purification, and by composition with other suitable materials. Pebbles, bones, pipe-clay, spars, and talc, and divers other fossils, may, in some shapes be advantageously applied to several kinds of pottery wares: but the due preparation hereof, depends upon the philosophical application of the active and passive principles of nature. By the active principles of nature, in this respect, we not only understand fire, air, and water, but some peculiar kind of fossil productions; which will easily work a great change upon certain bodies, but the success of such things depends upon a series of experiments, made with judgment, upon bodies that seem proper subjects, for the intention, with regard as well to the active, as to the passive natures.

For the improvement of the art of pottery many good hints may, perhaps, be derived from what we have said, under the articles PORCELAIN, EARTH, CLAYS, BOLES, and FOSSELS in general; for many of those things, judiciously prepared, will afford earthen wares, perhaps, little inferior to those of China; and why we may not, one day, fall upon some compositions that will produce a porcelain, as cheap and as good as the Indian in general, we see no reason to despair of.

And if we can once obtain the fit materials for the purpose, our potters are already so expert in the art of moulding, and management of the fire, that there will be no obstruction on that account to the improvement of the art of pottery in this kingdom to its last perfection.

The art of glazing and painting on fine earthen ware.

Potters who paint with colours on earthen ware, may be ranged in the same class with painters upon glass, since they use almost the same materials, and, in many respects, the same method.

To prepare a white glazing.

Take of lead two pounds, tin one pound, calcine them to ashes, and melt them together. Of this take two parts, calcined flint or pebble one part, salt one part; mix them well together, and melt them in a cake.

The Rotterdam fine shining white.

Take of clean tin ashes two pounds, lead ashes ten pounds, fine Venice glass two pounds, tartar half a pound, and melt them to a cake. Or, Lead ashes eight pounds, tin ashes three pounds, fine clear calcined flint or pebble six pounds, salt four pounds, melt them into a cake. Or, Calcine eight pounds of lead and four pounds of tin into ashes; of these take one quart, salt and pebble of each one pound, and melt them into a cake.

Another fine white for earthen ware.

Calcine six pounds of lead, and three pounds of tin to ashes; whereof take two parts, salt three parts, pebble or flint three parts, and melt them into a cake.

Another white.

Take eight pounds of lead, and four pounds of tin ashes, among which mix six pounds of Venice glass and a handful of rock salt; melt them into a cake.

A Saltzburg white.

Take three parts of lead, six parts of tin; or six parts of lead, and three parts of tin, salt three parts, tartar one part, and pebble five parts, &c. Or, Take five pounds of lead, one pound of tin, three pounds of flint, three pounds of salt, &c. Or,

Take six pounds of lead, one pound of tin; melt and burn them to ashes, whereof take twelve spoonfuls, twelve of flint, and twelve of fine wood ashes.

To lay a ground upon earthen ware, on which the white glass will better spread.

Take calcined tartar one pint, flint and salt of each one pint; mix them together, and use them for a layer or ground over your earthen wares, before you glaze them.

The right Dutch mastirat for white porcelain.

Take calcined pebble, flint or sand, 100 pounds, soda 40 pounds, wood ashes 30 pounds. This mixture is by the Dutch called mastirat; of this take 100 pounds, tin and lead ashes together 80 pounds, common salt 10 pounds, and melt them three times in a cake. The tin and lead ashes are made of 100 pounds of lead, and 30 pounds of tin.

The common ware is thus glazed.

Take 40 pounds of clear sand, 75 pounds of litharge or lead ashes, 26 pounds of pot-ashes, and ten pounds of salt; melt them three times into a cake, quenching it each time in clear cold water. Or,

Take clean sand 50 pounds, lead ashes 70 pounds, wood ashes 30 pounds, salt 12 pounds; melt them to a cake. With this mixture they glaze fine and coarse ware and set it in an earthen glazing pan, which is round; the ware is set on them upon three cornered bars, that go through the like holes in the pan, and the ware is kept asunder from touching one another.

The opening before, is only left in the figure to see how the wares stand, otherwise the pan must be entirely closed up.

Of several colours for potter's glazed-work.

A fine yellow.

Take red lead three pints, antimony and tin of each two pounds; melt into a cake; grind it fine, and melt it again. Repeat this several times, and you will have a good yellow. Or,

Take 15 parts of lead ore, three parts of litharge of silver, and 15 parts of sand. Or, Take eight parts of litharge, nine parts of calcined flint, one part antimony, and a little iron filings; calcine and melt them to a cake.

Fine citron yellow.

Take six parts of red lead, seven parts of fine red brick dust, two parts of antimony; melt them to a cake.

A green colour.

Take eight parts of litharge, eight parts of Venice glass, four parts of brass-dust; melt them for use. Or, Take ten parts of litharge, twelve parts of flint, or pebble, one part of æsustum, or copper-ashes.

Blue colour.

Take lead-ashes one pound; clear sand, or pebble, salt two pounds; white calcined tartar, one pound; Venice, or other glass, 16 pounds; zaffer half a pound: mix them well together, and melt them; quench them in water, and melt them again; repeat this several times: but, if you will have it fine and good, it will be proper to put the mixture in a glass-house furnace for a day or two. Or, Take litharge four pounds; clear sand two pounds; zaffer one pound; calcine and melt it together.

Take 12 pounds of lead, one pound of tin, and one pound of zaffer, five pounds of sand, and three pounds of salt, tartar and glass one pound; calcine and melt it into a cake. Or,

Take two pounds of litharge, a quarter of a pound of sand, one pound of zaffer, and one pound of salt; melt them. Or, One part of tartar, one part of lead-ashes, one part of zaffer, one part of sand, and two parts of salt; melt it as before.

A brown colour.

Take of common glass and manganese, or brown stone, of each one part, lead-glass twelve parts.

A flesh colour.

Take twelve parts of lead-ashes, and one of white glass.

Purple brown.

Take lead-ashes 15 parts, clear sand 18 parts, manganese one part, white glass 15 measures, and one measure of zaffer.

Iron grey.

Take 15 parts of lead-ashes, 14 parts of white sand, five parts of copper-ashes, one of manganese, one of zaffer, and one of iron filings.

A black.

Take lead-ashes 18 measures, iron-filings three, copper-ashes three, zaffer two measures; this, when melted, will make a brown black; but if you would have it blacker, put some more zaffer to it.

Brown on white.

Manganese two parts, red-lead and white glass one part; melt them well together.

A fine red.

Take antimony two pounds, litharge three pounds, rust of iron calcined one pound; grind it to a fine powder.

To glaze with Venice glass.

When your ware is well dried, and ready to bake, strike it all over with white-wine lees; then lay on the Venice glass (ground fine, and mixed with salt of tartar and litharge) and bake it as directed.

A green.

Take copper-dust two parts, yellow glass two parts; melt them twice. Or, Two parts of copper-filings, one of lead-ashes, and one of white glass; melt them to a cake.

Yellow.

Menning three parts, brick-dust two parts, lead-ashes two parts, antimony two parts, sand one part, of the above white glass one part, well calcined and melted. Or, Red-lead four ounces, antimony two ounces; melt them to a cake.

Gold yellow.

Take of antimony, red-lead, and sand, an equal quantity, and melt it to a cake.

A fine blue glass to paint with.

Take lead-ashes one pound, clear sand two pounds, salt two pounds, white calcined tartar one pound, flint-glass half a pound, zaffer half a pound; melt them together, and quench them in water; then melt them again, and repeat this several times.

Zaffer finely ground by itself makes good blue, to paint white glazed earthen ware.

A liver colour.

Take twelve parts of litharge, eight of salt, six of pebble, or flint, and one of manganese.

A sea-green.

Take five pounds of lead-ashes, one pound of tin-ashes, three pounds of flint, three quarters of a pound of salt, half a pound of tartar, and half a pound of copper dust.

To lay gold, silver, or copper, on earthen ware, so as to resemble either of these metals.

Make an utensil of fine potter's earth, form and shape it thin, neat, and silver-fashion; then bake it, and, when baked, glaze it: but before you bake it again, if you will silver, gild, or copper it, take a regulus of antimony, melt your metal with it, and beat it to a powder; grind it with water very fine, and glaze it therewith; then bake it, and, when done, the whole utensil will look like silver; for, when it comes into the fire, the antimony evaporates, and leaves the silver, &c. behind. But if you will silver or gild it only for ornament-fake, and keep it from any wet, then you may lay on the gold or silver leaves with brandy, and afterwards polish and finish it in the best manner, after the common method.

REMARK.

In regard to the glazing of the earthen or porcelain ware, on the insides, we would, by all means, recommend to the workmen the leaving out of lead and it's litharge, acids dissolving them, and their nature being insalubrious and sometimes poisonous: and this we conceive, may be easily done, by proper experiments.

PRINTING, the art of taking impressions with ink, from certain types, or characters, upon paper, parchment, vellum, or the like matter.

It's ORIGIN and PROGRESS, especially in EUROPE.

1. At Haerlem I obtained, says the judicious Mr Ellis, the sight of the first book printed by Costerus: it was not Donatus, as the Inscriptions Hollandicæ say; nor Virgil, nor Tully's Offices, as others have acquainted the world; but a Dutch piece of Theology, printed on one side only of the paper; and after this is a single page of Latin, intitled, Liber Vitæ Alexandri Magni, which made some believe it to be Q. Curtius, but it is a monkish Latin of that time. This and the theology were printed in the year 1430; whereas the Inscriptions, and some other authors, have told us, from Costerus's picture, that printing was by him invented but anno 1440; but a picture of Costerus before another Dutch piece (bound up in the same volume, and printed 1432) bears the date of 1430; under which picture is the inscription mentioned by Mr Ray (only the date is ten years sooner) and the tetralich which is transcribed by the author of the Inscriptions, from an effigies of Costerus, which was then extant in a garden at Haerlem, but is not now to be found.

2. What Mr Ellis says about the books printed at Haerlem by Laur. Coster, agreeing so well with the account given by Theodore Schrevelius and others, leaves us little or no room to doubt (who must needs take it for granted, that his observation is accurate, and the dates to be true) whether the honour of the invention be due to this or the other cities, whose writers have so eagerly contended for it, since none of them have pretended to shew any book printed so soon as A. D. 1430, or 1432, or near that time. But the difficulty lies either in shewing why the practice of this art should be at a stand from A. D. 1432, to the noted reviving of it at Mentz, by John Fust and Peter Schoeffer, who, as it has been vulgarly, but erroneously said, did print the first printed book there, A. D. 1465, namely, Tully's Offices; or else, in giving any tolerable account of the progress of this invention during an interval of above 30 years.

Boxhornius (as I remember) as well as Schrevelius, and other authors, do expressly say (and, if they had not, it might well be imagined) that Coster could not advance this invention so far as to print so large a work as the Speculum Salutis, without gradual improvements, and that his first essays were on loose and small leaves of paper, before he attempted whole books; these being loose and single, are supposed to be all lost; but I once observed a loose leaf of paper in octavo, lying in an old MS. breviary in her Majesty's royal library at St James's which I then thought (and am still of the same opinion) that it was one of Coster's first pieces, done when he had attained to some experience in the art, and to get money. It is a little rude wooden cut, of the five wounds of our blessed Saviour, and the instruments of his passion, with a Latin inscription at the bottom, to this purport, That those who should say so many Ave Maria's before it, should have so many thousand years of pardon. In this cut, or print, the ink which made it was writing-ink, and it was all black, without those other colours with which Coster seems afterwards to have adorned his books.

In the abovementioned Boxhornius's book de Origine Artis Typographicæ, it is said, That Hadrianus Junius had a book printed by Coster, and like that kept in the chest at Haerlem: now amongst those bequeathed to the Bodleian library at Oxford, by Mr Francis Junius (who was a kinsman of Hadrianus's) there is a thin book in small folio (numbered 31) which may probably be the same, and which Mr Foss, a learned and curious Danish gentleman, did assure me was very like to that of Haerlem. This contains the sum of the history of the Old Testament, all represented in rude wooden cuts, coloured with divers colours without shadows, like to our cards (which, with sheet-ballads, are remains of the old manner of printing) and stamped upon one side only; the white side of two leaves being pasted together, the black both in the pictures and inscriptions, which shew the meaning of them, being writing-ink* (as the aforesaid leaf) inartificially spread upon the wooden block, here thick, there thin, spreading and yellowish; the letters extremely rude, and altogether manifestly shewing that art was yet in it's infancy. The stamping of this book on one side only, was not (as some think) because the printer did not know how to dispose the pages in such manner as might be proper and easy for the bookbinder's use, for it has it's signatures all along, in minute letters (set in the middle of the page, which is remarkable) but because it was thought that the paper would not bear a second impression on the backside; just as the book-writers of those times (when paper began to be cheap, and to be made up into books) would yet have the first and last leaf of each quarterion, senio, &c. to be of parchment,

* It is to be wished that Mr Ellis, when he had Coster's books in his hands, had observed whether the black ink was printing ink or not; whether Coster's picture was ancient, and coloured or not; or if there were more in either of the books: whether the whole was cut upon wood, or composed with printing-letters; whether there were signatures for the bookbinders, &c.

for strength sake. This book (as I remember) is imperfect, and has no date now appearing, and perhaps never had any; neither has such another book as this, which contains the history of St John, and the Apocalypse, in such like wooden coloured pictures and inscriptions: this is inscribed LAUDE 65, in the same Bodleian library, and has its signatures also in majuscule letters (as indeed I have observed signatures in many MSS. of different ages, as high as a thousand years ago, and upwards, expressed either by letters or numbers); this book, though printed on one side, and pafsed as the former, is yet more elegant, and shews that the art was much improved.

And here it may not be impertinent to observe, that in the same library (Arch B. Bodl. 88.) is an antient MS. with the same figures and inscriptions, though the habits of the figures be different, those of the MS. being of the older fashion; and it is very likely there is another copy of this book in the emperor's library at Vienna; for Lambecius, *Comment. de Biblioth. Cæs. lib. xi. page 772*, reckons amongst those which he brought away from the archducal library at Inspruck, a book of which he gives this account, *Apocalypsis S. Joannis apostoli & evangelistæ, Latino-Germanica, charactera in folio, una cum vita ipsius, & multis figuris ligno incisus quæ propter vetustatem suam spectatu sunt dignissimæ; and in this book at Oxford, besides the printed cuts, also a commentary upon the Apocalypse, in High Dutch. Besides these two most antient printed books, Mr Bagford told me, That in the manuscript library of Corpus Christi, or Bennet College, in Cambridge, he saw a third, containing the history of our Saviour, printed on one side only of the paper, with such like wooden cuts, but yet more neatly than either of the former which I had before shewn him at Oxford. And these three books being, as is aforesaid, stamped but on one side of the leaf, the whole wrought or cut upon wood, not set or composed with printing-letters, and printed with writing-ink, do sufficiently demonstrate, that the art was as yet in it's infancy, and may, though they bear no workman's name, be very reasonably ascribed to Coster, not only because no body else lays claim to them, but because, in divers circumstances, they agree with the history of the man, and with what remains of his workmanship.*

If it be asked, Why Coster did not set his name and the year to these books, as well as to that at Haerlem, mentioned by Mr Ellis? it may be answered, That Schrevelius tells us, that Coster bound Fust abovementioned by oath of secrecy, and not to betray the art to any person whatsoever; wherein it is likely that his design was not so much to let the world think that he had a new way of multiplying the copy of a book much quicker than the quickest penman, but that he had designed to impose upon the world, by selling his printed books for new written copies, whereby the book-writer and illuminator must (as he might well pretend) be so paid for their work as to maintain themselves and families. This trick might be long undiscovered in and about Haerlem, because there was no other printing whereby this might be condemned; but at length, as Boxhornius and Schrevelius write, Fust ran away with all his master's tools and materials, and, in process of time, set up a printer's shop at Mentz, being assisted by his servant Peter Schoeffer (a young man of a good genius) who afterwards married his daughter, and became his partner in the business.

The story goes, that this John Fust went to Paris (but whether before or after his settling at Mentz I cannot tell) and that he there offered a great number of printed Bibles to sale, as if they were manuscripts. But the French were not to be so caught; they considered the number of these books, and their exact conformity to one another throughout the whole, to a line, a word, a letter, a point, and that the best of book-writers could not be thus exact; and, therefore, by indicting him of diabolical magic (or threatening him with it) they at once gave birth to the story of Dr Faustus, and caused him to discover the art. And I doubt not but about this time very many books were printed and sold for manuscripts, I have seen divers such books without dates, which looked rather older than any I have seen with them. I speak now of those that are set, or composed of letters, which, with printing-ink of lamp-black and oil, and the printing-press, is said to be the improvement of Schoeffer abovementioned, though Schrevelius, with less reason, ascribes the two former to his countryman Coster.

When Fust and Schoeffer began first to work at Mentz is uncertain; but the first mention I find of him, as a printer at Mentz, is in Schrevelius, *Haerlem, p. 272*. where he says, That this Fust (or Faustus as he calls him) published *Alexandri Doctrinale, cum Petri Hispani tractatibus, A. D. 1442*; but this, and some other books mentioned by writers on this subject, are never said to be extant in any particular place, in order to be consulted upon occasion, and, therefore their titles and dates are not so much to be relied upon. But another date, which, though not so old, is more authentic, may be found in the above-cited book of Lambecius, *p. 989*, where he says, he brought away from Inspruck, amongst other choice volumes, and placed in the imperial library at Vienna, a Plalter printed upon parchment, with

this inscription at the end: *Præfens Psalmodum codex venustate capitalium decoratus, rubricationibusque sufficientur distinctus, ad inventionem artificiosam impendi ac characterizandi, absque calami ulla exaratione sic effugiatus, & ad Eusebium Dei industria est consummatus per Johannem Fust, civem Moguntium, & Petrum Schoeffer, de Gernzheim, Anno. Dom. Millesimo CCCCLVII. in vigilia Assumptionis*. From this time there are constant remains of the industry of those men; and I can mention more books printed by them than the Durandus (in the library of Basil in Switzerland) printed (as a gentleman who saw it told me) *A. D. 1458*. Joannes Joannensis's *Catholicon* (in her Majesty's and the lord bishop of Norwich's libraries) printed 1460; the Latin Bible of 1462, yet extant in the French king's library, and in divers monasteries beyond the seas, and perhaps in England; the Tully's Offices, printed both in 1465 and 1466 (if both these be not the same edition, the last sheet or leaf being composed afresh): so on 'till Schoeffer worked for himself, after the death of Fust, and Schoeffer's posterity after him.

I add also, that upon the first discovery of the art by Fust at Paris, or at his first settlement or public profession of it at Mentz, it quickly spread over the best parts of Europe†, and was commonly used in other countries before it was known in England (notwithstanding what some writers do affirm to the contrary) the first book that we pretend to have been printed here being Hierom (or rather Rufinus) on the Creed, printed at Oxford, *A. D. 1468*.

† From these places, and from books, or parts of books, where, or wherein such sorts of letter were used, the printers do still call their letter *Italic*, *Roman*, *English*, &c. *austrian*, *canon*, *pica*, *primer*, *brevier*, &c.

To prove this in some measure (not to mention the progress of printing in other countries) I instance in Italy, and particularly Rome. Here, not to insist on the large catalogue of printed books described in an epistle to pope Xystus IV. published at the beginning of the fifth tome of the Bible, printed, with Lyra's commentaries, at Rome, *A. D. 1472*, and transcribed by Boxhornius, I shall only relate the sum of what I meet with in Bernard Montfaucon's *Diarium Italicum*, tom. i. *p. 255, 256*; it is, That Joannes Alericensis, in a flattering epistle to pope Paul II. (who was elected *A. D. 1464*) congratulates him because printing was first used at Rome under his pontificate: which, if spoken of the very first practise of the art at Rome, and not of an established imprimerie, seems to be false, because this learned monk, in the same place, says he saw a Lactantius in the museum (or study) of Monsi. de la Thuliere, which has these words at the end: *Lactantii firmiani institutiones causæ in venerabili monasterio Sublacensi, anno 1461, antepenultima Octobris*. Now unless a man will suppose printing to be invented in this monastery, he must believe it to be brought hither from Rome, which is but about 20 miles distant from it; and the same author says, That Floravantes Martinellus, in his *Roma Sacra*, affirms, that printing was practised at Rome, in the palace of the Maximi, *A. D. 1455*, under pope Nicolaus V. by Conrad Sweeneyheim and Arnold Parnartz, who were both Germans, and continued printers there for many years after.

The custom of putting the dates of printed books at the end of them, was taken up in imitation of divers of the middle-aged and recenter manuscripts (for I never saw or heard of any ancient manuscript in capital letters, either Greek or Latin, which has a professed date written in the first hand); but here the inspector ought to be cautious, lest he be led into an error, for several manuscripts at the end have a date, which may be by some understood of the time when those individual copies were written, when as they only notify the time when the author finished his work; and some of these dates, being printed from the manuscripts, have deceived many curious men: for example, the first edition of Lynwood, *Paulus à Sancta Maria*, and others which I could name; besides some dates in ancient printed books, being not corrected are false: such as a book printed in the beginning of the 16th century, in the library belonging to the Ashmolean museum at Oxford, which thus pretends to 400 or 500 years of age: Julius Hyginus, once shewed to me by Mr Millington the bookeller, printed at Paris (as there put down) *Ann. Dom. MCCCCXII*, instead of *MCCCCXII*; for the printer is mentioned as then living in *L'Origine de l'Imprimerie de Paris*. I have indeed a book, wherein, amongst other tracts, is one of an old print, at the end of which there seems to be such a mistake, though not so easily rectified as the former: the words are these, *Explicit opusculum Enee Sylvii de duobus amantibus in civitate Leydeni, Anno Domini Millesimo CCCquadragesimo tertio Leien*. Now though Leyden seems to be the place where it was printed, yet 1443 cannot be the time when: for just before Sylvius says himself, *Vale, ex Vienna quinto nonas Julius Mo CCCquadragesimo quarto*. Sylvius was elected pope by the name of Pius I. *A. D. 1458*, and died *A. D. 1464*: now it may seem probable, that, if this tract was printed after his election (as suppose *A. D. 1463*) or even after his decease, his

papal dignity might have been remembered; if it be judged to have been printed before his election, I know of none that will allow of printing at Leyden (or even in Lyons) so very early.

One objection may be urged against what is said of Coffer's or the old printed books abovementioned, being printed upon paper about A. D. 1430, or soon after: for some authors are of opinion, that paper made of linen rags was first made at Basil, by some Greeks who fled out of their country after the sackage of Constantinople, A. D. 1452, in imitation of the cotton paper, commonly used in the Levant. But this can have no force, our paper being much older: for I have a piece, the writing upon which seems to be about 350 years old, and agrees very well with a charter which I have seen of Thomas Beauchamp earl of Warwick, bearing date, A. D. 1358, and 32 Edward III. In the archives of the library belonging to the R. R. dean and chapter of Canterbury, I saw an inventory of the goods of Henry, prior of Christ's Church there, taken upon his decease (as I remember) the 20th year of king Edward the IIIrd, and this is written upon paper in the Cottonian library, though searching after other matters, I could not but observe several writings upon our paper, in the time of most of our kings and queens, as high as the 15th of king Edward IIIrd, and I doubt not but there are others more antient in the same place. But in the East the use of cotton paper is much more ancient; and I have, in the Bodleian library, seen an Arabic manuscript (amongst those which the university bought out of Di Huntingdon's) written in the 427th year of the Heigra, A. D. 1049; and others in the same place, without dates, seem older.

The proximity of the subject causes me here to take notice, that, though the invention of the rolling-press is commonly ascribed to Lippius, yet it seems older than his time, from a printed book in the Bodleian library, placed Laudi D. 138. this is a *Missale secundum usum ecclesie Herbipolenfis* (i. e. Wurtzburgh in Germany): Rodolfus, archbishop of that church, sets forth, in an instrument at the beginning of the book, the reasons why he caused this Missal to be published, which instrument bears date the 8th of November, 1481; by which time he orders all the copies to be finished by Jorius Ryfer, his printer, who seems to have done so, since his name, and this year 1481, is written at the end of the book.

Instead of a seal to this instrument, is an engraven print, being the arms of the see, supported by two angels, and St Kilian (it's first bishop and protector) behind; as also this prelate's own arms, with those of the see, in another escutcheon, and a very fine mantling. This is extremely well engraved for the time, and equals the performances of some of our best workmen at present. The evident marks of pressure by the plate, with some touches of ink at the edges, the roughness of the print, and other circumstances concurring, I thought this must needs be wrought off at the rolling-press: but being unwilling to rely too far upon my own judgment, I shewed it to divers very knowing and curious gentlemen, to several printers, engravers, and others working constantly at the rolling-press, who all concurred (though at different times, one not knowing what another had said) that it was not only excellently well engraved (and this before Albert Durer's time) but that it was certainly pulled from the rolling-press, and could be done no other way. And that this print was not done after that time, appears from several notes written here and there in the book: one of them specifies that William Keuth, vicar of Bartholomew's church in Wurtzburgh, bought this book the same year 1481, paying 18 florins for the parchment, printing, rubrication, illumination, and binding. By another it appears, that he gave it to his church for ever; and by some others it appears, that it remained there during the time of his several successors, 'till the last age, when, as I suppose, the Swedes under Gustavus Adolphus, plundered the church, and brought it out.

3. The antiquity of printing, and the first inventors, having been treated of by many authors, I shall now only give a short account of the observations I have made in many years, from old books of several sorts and kinds. The general notion of most authors is, that we had the hint from the Chinese; but I am not in the least inclined to be of that opinion, for, at that time of day, we had no knowledge of them. I think we might more probably take it from the ancient Romans, their medals, seals, and the marks, or names, at the bottom of their sacrificing-pots, which antiquities we had amongst ourselves in Europe, rather than fetch it so far.

But if it be certain, that cards are as old as our king Henry the VIIIth, nothing, that I have seen or considered of, seems to give so fair a hint for printing as the making of cards; as is evident by the first specimen of printing at Haerlem, and by some books in the Bodleian library at Oxford, one in Junius's collection, another in archbishop Laud's, and a third in the same, being the lives of the Russian saints, in a thin folio: the leaves are not pasted together, as the former two, but cut on wooden blocks, and illuminated. There is also another rare specimen of the first, in that valuable collection of archbishop Parker, in Bennet college library at Cam-

VOL. II.

bridge, bound up with a MS. book: This was shewn me at first by Mr. Bullord, and differs very much from them at Oxford; it is the life of Christ, in figures, or rather the types, of the Old and New Testament. They have not so many specimens of the first printing at Haerlem, as we have in England; and I am apt to believe, that, if some curious persons had the liberty of looking over the libraries in both universities, and that of the Royal Society, there might be found other specimens of the ancient printing, the aforementioned books being taken notice of but of late.

The cutting of the moulds or blocks for making our playing cards, is after the same manner as those of the books printed at Haerlem. They lay a sheet of moist or wet paper on the form or block, being first lightly brushed over with ink, made of lamp-black mixed with starch and water; then they rub it off with a round list with their hand, which is done with great expedition: this is for picture or court cards: after which they paste them together threefold, the coarsest in the middle. They colour them by the help of several patterns or stencils, as they call them; they are card-paper cut through with a penknife, for every colour, as red, &c. (for at the first printing the card has only a mere out-line:) these patterns are painted with oil-colours, to keep them from wearing out with the brushes; they lay it upon the picture, and by sliding a brush that is full and loose gently over the pattern, it fixes the colour into the cut holes, and leaves it on the print that is to be a card, and so goes through all the colours you see on cards; but this cannot be so well understood by a description, as by seeing them perform it. This I humbly conceive to be their way of printing first at Haerlem, and those books abovementioned. This, methinks, might have been considered before now, if they would have put themselves to the trouble of inspecting the old manuscripts 900 years old; for the great letters are done by the illuminators, the same way as card-making.

The next form of printing at Haerlem was by cutting whole forms in wood from manuscripts exactly written, and without pictures: such I take the Donatus to be, mentioned in Histories; and this might bear date in 1450, some say 1440. This may be as plainly demonstrated as the former, from copy-books which we have seen printed at Rome, Venice, Switzerland, and England, as high as 1500; and, if I mistake not, there is a block cut in box in the collection of the Museum of the Royal Society. This writing is harder to perform than either the Roman, Italic, or any other letters used in printed books.

The third way of printing was with single types made of wood, but to whom the honour of the invention is due, is not very evident; it was then esteemed so great a rarity, that the printers carried their letters in bags at their backs, and got money at great mens houses, by printing the names of the family, epitaphs, songs, and other small pamphlets.

The fourth improvement of this noble art, was the invention of single types made of metal. Here we must entirely give the honour to Peter Schœffer of Genschen, servant, and afterwards son-in-law, to Faust, who entertained him to work in his house at Mentz: he observing how industrious his master was every day to improve this art, undertook it himself, and with much study and industry brought it to perfection. After he had made several essays, at last he shews it to his master Faust, who having tried some experiments with his new invented single types, finding that it would answer his expectation, was so transported with joy, that, for his reward, he promised he should marry his daughter, whose name was Christian, which some time after he performed; and continued together improving this art with great secrecy, 'till it became known, and spread itself over all Europe. Sometimes you have their names to the books they printed at the end, and sometimes not; sometimes with dates as high as the year 1457, as the Psalms printed by them, now in the emperor's library, which Lamberius mentions in his Bibliotheca, and as low as the year 1490; and for this we have the authority of Erasmus, in a preface to Livy, printed at Basil by Froben, in 1500.

As for John Guttenburgh, though by abundance of authors he is said to be the first inventor of printing, we cannot find one book with his name and printing.

We may rationally conjecture, that printing with plates of pewter, brass, or iron, either graved, or eat with aqua fortis, was first practised by the working goldsmiths; for they have a way of taking off the impression of their work by the smoke of a lamp, which, perhaps, gave the hint to the graving on brass. We have a dark story of it in some authors.

Having treated of printing, to satisfy the curious, I shall say something of the several advances and improvements it hath received.

The Haerlem printing at first was a book with pictures; they took off the impression with a list coiled up, as the card-makers use the same to this day.

But when they came to use single types, they made use of stronger paper, with vellum and parchment: then they made use of a press, although they afterwards contrived and made it more useful.

Neither was their ink for printing brought to the perfection it is at the first, but improved by degrees.

Rolling-press printing was not used in England, 'till king James I. and then brought from Antwerp by our industrious John Speed.

Now, as printing itself is but another way of writing, and brought to perfection by degrees, as other arts; and as pictures either painted, cut in wood, or graved, were called the laymens books, for every one could read a picture, and say this is an house, and that a tree; so I may say, that the pictures or drawings of the Antients, gave the first hint of printing: and if the scribes in process of time, had not brought their art of writing into the decorum and uniformity, and rule in their several volumes, the printers could not have followed them so exactly in the imitation of their letters and pages of their books. Pictures first were those of devotion; then the making of cards was another introduction to the invention of printing: the making of cards I take to be very ancient.

For the first specimen of printing was on one side only, as that at Bennet College, most in figures, with some few words only on the side in labels, like that at Oxford.

The next step is that book at Haerlem; the designs of the prints are better performed; and then they came to have not only lines, but whole pages of words, besides the pictures on a page.

The next step was ballad-printing, with the like pictures, and them but on one side.

The next improvement of this noble art, was the cutting of whole pages on wooden blocks or moulds, and printing on both sides of the page; and the first specimen of this nature was a Donatus, and, as authors say, was printed at Haerlem and at Mentz, although some say a Bible was printed the same way 1457.

Since arts and sciences, especially statuary and sculpture, were arrived at so great perfection, when the Roman empire was in it's glory, as the many beautiful statues, the exquisite intaglias, and fine medals, which time hath handed down to us, do sufficiently evince; it is much to be wondered at, that they never hit upon the method of printing books.

The dies they made for their coins, and the stamping them on the metal, was in reality printing on metal; their seals cut in cornelians and agates, and their pressing them on dough and soft wax, was another sort of printing; and a third sort was their making their earthen vessels, while the clay was soft, with the name of the potter, or the owner the vessel was made for. These being of a larger size, were properly called signa; the seals cut in stone were called sigilla; sigillum being a diminutive of signum, as tigillum is of tignum: but the later and more barbarous Latinists, have formed the diminutive of signum into signetum; and if a very small pocket-seal, they have called it signaculum.*

* See Joh. Mich. Heinecius de Sigillis. Francof. 1709. fol. p. 16, & seq. Vol. IX. Part. IV.

Montfaucon, in his *Antiquité expliquée*, Tom. III. part 2. chap. 12. gives us the figures and descriptions of several of these larger sigilla or signa, whereon he saith, the names were all cut in hollow in capital letters, Domini patronique nomen majusculis literis incusculptum, which he expresses in French, imprimé en creux; and he imagines their use to have been to mark earthen vessels, particularly those great earthen jars, wherein the Romans used to keep their wines. If any of them had occurred to him with the letters excisæ, excusculptæ, protuberant or standing out, as the types in our modern way of printing are made, so accurate a describer of antiquities could not have passed such an one over, without having mentioned it, and that the rather, because of it's being a greater rarity: though several lumps of terra cocta are stamped with letters impressed or hollow, from such protuberant letters as in the following described stamp, but the greater number have the letters raised, or standing out.

The last sort of stamps, where the letters are excusculptæ or protuberant, as is likewise the edge or border round the whole stamp, is made of the true ancient brass, and is covered over with a green scale or coat, such as is usually seen on ancient medals. There was one found in or near Rome. On the back is fastened a ring, whereof the hole is $\frac{3}{8}$ of an English inch one way, and $\frac{2}{3}$ the other way; the plate itself is two inches long, wanting $\frac{1}{16}$, and it's breadth exactly $\frac{1}{8}$ of an inch: the sides are parallel to one another, and the ends are likewise parallel to each other, but they are not upon an exact square with the sides, varying about one degree and an half from an exact rectangle. On the under side stand two lines or rows of letters $\frac{7}{8}$ of an inch in height, and well formed Roman capitals: the faces of them stand up all upon an exact level with one another, and with the edge or border of the stamp; their protuberance or height above the ground is different, the ground being cut uneven; for close to most of the letters the ground is cut away only $\frac{1}{16}$, close to some near $\frac{1}{8}$, and close to the edges full $\frac{1}{4}$. The first line contains these letters, C I C A E C I L I, with a stop or leaf to fill up the line; in the second line, H E R M I A E S N. which is judged

to be read Caii Julii Cæcilii, Hermiæ Signum. Who this Caius Julius Cæcilius was, we cannot find, he being probably a man in a private station, and so his name hath not been handed down to us in any monuments, but only accidentally in this stamp. In Gruter occur two of the name of Hermias, and several of the Cæcilii, but none with these two names joined together.

The use of this stamp seems to have been for the signature of the above-mentioned private man, to save him the trouble of writing his name, as some people have now a-days. It was certainly used on paper or membranes, being first dipped into ink, or some sort of paint, because of the protuberance of the letters, the hollow letters being fitter for soft substances, on which they leave the impression standing up, and consequently more eligible. Another argument that this stamp was not to be used on any soft substance, into which it might be pressed quite down to the ground, is the unevenness and roughness with which the ground is finished; which, was it to have made part of the impression, the workman would have finished it with more accuracy; but he, knowing that the surface of the letters was to perform the whole work required, was only attentive to finish them with that accurate evenness that these have.

Mr Mattaire, in his *Annales Typographici*, Hægæ 1719, in 4to, p. 4. concludes from the best authors, that our modern art of printing was first thought of about the year 1440. A copy of the book he mentions, ib. p. 13. called *Speculum nostræ salutis*, being pictures of stories out of the Bible, with the verses underneath in Dutch, is to be seen in the Stadthouze at Haerlem. Each page was printed from a block of wood, like a forry wooden cut; and this was the first essay of printing, which hint was taken from engraving, and is what he means, p. 4. by typi fixi; after which they soon improved to use separate types, as we now do, which he terms, ibid. typi mobiles. This stamp is, in reality, a small frame of fixed types and prints, with our modern printer's ink, which is only a sort of black paint, as readily as any set of letters, cut in the rude manner these are, can be expected to perform.

By the foregoing described stamp of two lines, we may see that the very essence of printing was known to the Romans, and they had nothing to do but to have made a stamp with lines three or four times as long, and containing twenty instead of two lines, to have formed a frame of types that would have printed a whole page, as well as Cofter's wooden blocks, which he used in printing the *Speculum Salutis*, which we have in his history.

In the first volume of a Collection of several pieces of Mr John Toland, printed London 1726, in 8vo, p. 297. is a small tract of his, entituled, *Conjectura verosimilis de primæ Typographiæ Inventione*, which is founded upon the following passage in Cicero, in cap. 20. lib. ii. *De Natura Deorum*; where Balbus the Stoic uses the following words in an argument against Velleius an Epicurean.

Hic ego non miror esse aliquem, qui sibi persuadeat, corpora quædam solida atque individua vi & gravitate ferri; mundumque effici ornatissimum & pulcherrimum, ex eorum concursione sortita? Hoc qui existimet fieri potuisse, non intelligo cur non idem putet, si innumerabiles unius & viginti formæ literarum (vel aureæ vel quales libet) aliquo conjiciantur; posse ex his in terram excussis annales Ennii, ut deinceps legi possint, effici; quod nescio anne in uno quidem versu possit tantum valere fortuna.

He conjectures, that this very passage gave the first hint to the inventors of printing, about the year 1445, because they retained even Cicero's name for their types, calling them formæ literarum, and made them of metal, as he says, aureæ vel quales libet. Moreover, in cap. 10. lib. iii. *De Divinatione*, Cicero hath the very phrase imprimere literas. Brands for making cattle were in use in Virgil's time, Georg. lib. iii. ver. 158. where he says,

Continuoque notas, & nomina gentis inurunt.

Procopius, in his *Historia Arcana*, says, the emperor Justinus, not being able to write his name, had a thin smooth piece of board, through which were cut holes in form of the four letters J U S T. which, laid on the paper, served to direct the point of his pen; which being dipped in red ink, and put in his hand, his hand was guided by another. Possibly this may likewise have given the hint to the first of our card-makers, who paint their cards in the same manner, by plates of pewter or copper, or only pasteboards, with slits in them in form of the figures that are to be painted on the cards.

The advantage of printing above writing, has prevailed with the Grand Seigneur to permit a printing-press to be set up at Constantinople. It was obtained upon a memorial presented to him by the Grand Vizier, with the consent of the Musti: the privilege was first granted to Zaid, the son of Mehemet Effendi, ambassador in France, above 20 years since, and Ibrahim Mutafarrica, the author of a small tract. The licence extended to the printing all sorts of books written in the oriental languages, except such as treated of the Mahomedan

medan religion: this book seems to be one of the first that ever was printed there. For, though Gianbauri's Arabic Dictionary translated into Turkish, was what the Turks designed, for particular reasons, to begin withal, yet the manuscript from which they printed off the first sheets, was found to be so incorrect, that the Grand Seigneur ordered the printing of it to be stopp'd, 'till a more correct copy could be procured.

During this stop, the book I am to give a brief account of was printed, containing about 150 leaves. The language of it is not Arabic, as was supposed, but Turkish, though it has several words and some sentences that are so.

The title, or what may serve as such, is *TUHHEAT ILKIBAR*, or, *A PRESENT TO THE GREAT*, containing an account of several engagements at sea. The author is Hagi-Caliba, styled Chelebi Almurhum, i. e. A gentleman who has obtained mercy or deceased. It consists of two tracts, a large, and a very small one. The latter is done by the publisher, Ibrahim Mutfarrica; Mutfarrica is a title of honour, signifying a horse-foldier, obliged to go to the wars when the Grand Seigneur goes in person, but not else. It is a short account of geographical measures of distances, &c. particularly of the circumference of the earth. The principal treatise is partly historical, and partly geographical; the latter treats of the nature of the terrestrial globe, the use of maps, and situation of places, particularly of Venice, Corfu, Albania, &c. and such as border upon the Turkish dominions. The historical part is an account of several naval expeditions and battles between the Turks and Christians, especially during the Holy War in the Mediterranean Sea, with their conquest of the islands and places of note upon the sea-coasts. It is an abridgment of the history of their admirals, from the taking of Constantinople to the year 1653; gives a description of the Grand Seigneur's arsenal at the Porte, with the charges of maintaining it, and concludes with some directions to the Turkish officers.

Besides a general map of the world, there are three others; one of the Mediterranean, or White Sea, as the Turks call it; another of the Archipelago, and the third of the Venetian Gulph: they have each scales of Turkish, French, and Italian miles annexed; but what is something surprizing, these maps have the degrees of latitude, but not of longitude, marked upon the sides. The last plate has two mariner's compasses, the one containing the Turkish names of the several points, the other, besides the Turkish, has the Arabic names, which are taken from certain stars supposed to rise and set upon or near these points.

The book ends with words to this sense: this treatise was done by the persons employed in the business of printing, at the printing-house erected in the noble month of Dulkadad, in the year 1141 (i. e. 1728) in the good city of Constantinople. May God, &c. I forgot to observe, it has the imprimature or commendations of a Turkish divine, and three effendies, prefixed; and at the end an index of the errata, with their emendations, in three pages. The whole is done upon shining or gummed paper, stamped with three crescents in pale and an imperial crown, proper to the Turks.

Those who would enter into the history of printing in England, may consult the *TYPOGRAPHICAL ANTIQUITIES*: Being an Historical Account of Printing in England: With some Memoirs of the Antient Printers, &c. By the curious and judicious Mr Joseph Ames, F. R. S. and Secretary to the Society of Antiquaries.

The method of printing with metallic types, is so well described by others, and so generally understood, that we shall not dwell upon this matter. The art, at present, is brought to as great perfection in England, as in any part of Europe.

PRINTING OF CALLIGRAPHY. See *CALLIGRAPHY-PRINTING*.

PRINTING FROM COPPER-PLATES.—The ink being duly prepared, they take a small quantity of it on a rubber, made of linen rags, strongly bound about one another; and therewith smear the whole face of the plate, as it lies on a grate over a charcoal fire. The plate being sufficiently inked, they first wipe it coarsely over with a foul rag, then with the palms of the hand; and to dry the hand, and forward the wiping, rub it from time to time on whiting, which is no advantage to the beauty of the work.

In cleansing the plate well, yet without taking the ink out of the engraving, consists a good part of the addeffs of the workmen. The French printers use no whiting, as being detrimental to the colour of the ink; nor do they lay the plate on the grate to warm, 'till after inking and wiping it.

The plate thus prepared, is laid on a thick paper, fitted upon the plank of the press: over the plate is laid the paper, first moistened to receive the impression; and, over the paper, two or three folds of blanketing, smoothly laid.

Thus disposed, the arms of the press are pulled; and, by that means, the plate, with its furniture, passed through between the rollers; which pinching very strongly, yet equally, presses the moistened paper into the strokes of the engraving, whence it licks out the ink. See the articles *ENGRAVING*, *DESIGN*, and *PAINTING*.

Some works require being passed twice through the press, others only once, according as the graving is more or less deep, or the greater or less degree of blackness the print is required to have.

It must be observed, that the stronger and thicker the ink is, the stronger must the rollers pinch the plate: this tempts many of the workmen to use a thinner oil, in order to save labour; which proves prejudicial to the impression.

The wetting of the paper ought to be done two or three days before printing it, to render it the more supple and mellow; as the prints are drawn off, they are hung up to dry.

After the number of prints desired have been wrought off from the plate, they rub it over with olive oil, to prevent it's rusting, and set it by against a new impression. If the strokes of the graving be perceived full of ink, hardened therein in the course of the printing, they boil it well in lye, before the oil be applied.

Plain instructions for limning and colouring prints, maps, &c. with water colours

Of the colours generally used in that art.

For	1 White lead.		1 Yellow oaker.
White,	2 Flake white.		2 Masticot.
use,	3 Muffel silver.		3 Pale masticot.
	1 Indigo.	Yellow	4 Dutch pink.
	2 Blue lake.		5 Gamboge.
	3 Blue verditer.		6 Naples yellow.
Blue	4 Smalt.		7 Shell gold.
	5 Ultramarine.		1 Brown oaker.
	6 Latinus.	Brown	2 Chimney foot of a wood fire.
	7 Prussian blue.		3 Cologne earth.
	1 Vermillion.		4 Umber.
Red	2 Red lead.		1 Lamp black.
	3 Red oaker.	Black	2 Ivory black.
	4 Lake.		3 Sea-coal black.
	5 Carmine.		4 Indian ink.
	1 Sap green.		
Green	2 Verdigrase.		
	3 Terra verde.		

Out of these colours you may temper all the rest which your work may require.

Some colours are to be washed and ground; as for instance. 1. White lead. 2. Brown oaker. 3. Dutch pink. 4. Umber. 5. Cologne earth. 6. Ivory black.

Some are only to be washed, which are, 1. Red lead. 2. Masticot. 3. Blue bife. 4. Smalt. 5. Ultramarine. 6. Vermillion.

Others are only steeped in fair water; as, 1. Gamboge. 2. French yellow, to which you must add a little allum. 3. Sap green. 4. Blue lake. And 5. Latinus.

And others again are only ground, viz. 1. Flake white. 2. Indigo. 3. Lake. 4. Distilled Verdigrase.

Grind all your colours with fair water, on a hard stone, or on a piece of looking-glass, which fix with white pitch and rosin upon a flat board, having also a muller of that kind.

Of the colours (after you have ground them very fine) you may take as much as will serve your present occasion, and temper them in a gallipot, or shell, with gum water, in which you have also dissolved some sugar-candy. You must observe, that colours which are very dry, require a stronger gum-water; in others it must be used very sparingly.

If your colours will not flick, or the paper or print be greasy, mix a very little ear-wax, or a little drop of fish or ox gall amongst your colour; you may dry your fish or ox gall, and dilute it when you have occasion for it, with a little brandy. If your paper or print sinks, then with clean size and a sponge wipe it over, after you have fastened the edges round upon a board, and let it dry.

You should be provided always with phials, containing the following liquids, which are very necessary and useful in painting or colouring with water colours.

1. A phial with water, in which allum had been dissolved. This you use in wiping over the table, parchment, or paper, before you begin to lay on your colours; it will cause them to lay smooth, and with greater a lustre.

2. A phial with lime-water; you dissolve or slacken some quick lime with fair water, then take the water from off the settled lime, and put it up for service; this is of great use in tempering of sap green and litmus, which colours being apt to turn yellow, are preserved thereby.

3. Gum-water is made of gum-arabic dissolved in fair water; if you add a little white sugar-candy to it, that will keep the colours from cracking, and flying off the parchment or paper.

4. Ox gall, or the gall of eels, boiled up in a little water, and scummed, then put up in a phial; this is of great use in painting of water colours, where the parchment or paper happens to be greasy, by only touching the point of your pencil, to touch it therewith, and to temper it with your colour.

5. White

5. White wine vinegar ; this is of use in grinding of distilled verdigrease, as preserving that colour from changing upon the yellow.

6. A little phial of spirit of hartshorn, a little drop whereof, mixed among the carmine, adds to the beauty thereof. You must chuse pencils of several sizes, agreeable to the work you are to use them for ; as for laying on a ground, a sky, or clouds, chuse a larger size than those that you use for drapery, trees, &c. wherein you must follow your own reason : those pencils of which the hairs, after you have wetted them between your lips, and turned them upon your hand, keep close together, are the best.

To paint or colour a clear sky.

Take clear blue verditer, mixed with a little white : with this begin at the top of your landscape or picture, and having laid on the blue for some space, break it with a little lake or purple, working it with a clean pencil, one colour imperceptibly into another ; apply more white and masticot, in order to make it fainter and fainter towards the horizon, working all the while the colours imperceptibly one into another, from the horizon to the blue sky ; after which, you may lay some stronger strokes of purple over the light, so as to make them appear like clouds at a distance.

For a fiery red sky, use red lead, and a little white instead of the purple streaks or clouds, working them, according to art, imperceptibly one into another.

Clouds you are to lay on with white and black, sometimes mix a little purple therewith ; but the best and surest direction you can have, is from nature herself.

To lay a ground for walls of chambers, halls, &c.

You must use for a common wall, which is of reddish hue, brown, red, and white, and temper your colour according as it is old or new ; shade it with brown or red, only mixed with a little bistre or foot.

Other walls lay on with black and white, and shade it with the same colours ; sometimes mix a little purple with it, and then you shade it with black and lake.

For wanifcoting, that is embellished with carved mouldings, and figures, you must use one colour, for both the plain and the carved work, shading and heightening it with judgment and care.

To paint a fore ground, in imitation of sand or clay, lay on the darker parts with brown oaker ; to what is in their distance, add a little white, and so on in proportion, shading it with brown oaker, and the strong shades with foot.

Of carnation, or flesh colour.

In carnation, or flesh colour, use for young women and children flake white, burnt oaker, and a little vermilion ; some add a little lake, but that must be but sparingly : having laid on the colour for the carnation, you shade the lips, cheeks, chin, knees, and toes, with fine lake and vermilion, and the naked parts, with sea-coal and a little lake, or brown red, or with brown oaker and lake, or else with Indian ink or lake ; for a brownish complexion, mix a little brown oaker among the carnation colour.

Some artists lay the dead colouring of the carnation for young women on with white ; they shade it with paper black, and bring in the carnation colour where it is required.

The paper black is made in the following manner.

Take the paper in which the leaves of gold have lain, burn them quick one after another, and let them drop into a basin of clean water ; then take them out and grind them on a stone to a fine paste, form it into little tents, and let it dry ; when you use it, temper it with gum-water as you see meet.

For ancient people use vermilion, brown oaker, and white ; shade it with bistre and lake.

A dead corpse of a young person, paint with flake white, brown oaker, and a little indigo, or sea-coal, and shade it with bistre or sea-coal.

For an old dead corpse, leave out the indigo, but shade it as before.

For dead bones, take white lead, mixed with a little bistre or chimney foot, with which you shade and heighten it with white lead.

For the hair of young women and children, lay them with light oaker, shade them with deep oaker, and heighten them with masticot and white.

Grey hair, lay on with black and white ; shade them with black, and heighten them with white ; and thus proceed in painting any other coloured hair.

Drops of blood, lay on with red lead, shade it behind, where the light falls, with carmine and lake.

Trees are laid on, some white, black, and bistre, shaded with brown oaker, and heightened with the same colour, with more white in it. Those that stand at a distance, are

laid on with indigo blue, brown oaker and white, and shaded with indigo and brown oaker. Those that are further distant lay on faint, and shadow them but slightly ; which order you must observe in colouring of ships, houses, and other buildings.

In thatched houses, paint the thatch or straw, when new, with Dutch pink, and shade it with brown oaker ; and, to heighten the straw, use masticot and white. Old straw, lay on with brown oaker, sometimes mixed with black and white ; heighten the straw with brown oaker and white.

In colouring cities, castles, or ruins, you must observe nature, for no rules can well be given ; however, to give a little light to a young practitioner, it must be observed, that those houses which lie nearest the fore ground, are coloured with vermilion, white, and a little brown oaker, shading it with that and some bistre ; the heightenings are done with more vermilion, and more white.

Houses further distant, are laid on with lake, and a little blue and white, shaded with blue and lake, and heightened with adding more white.

Such buildings as lie still further, are laid on with a faint purple, and a little blue, shaded softly with blue, and heightened with white ; and the further they are off, the fainter and lighter must be your colour.

Flames and smoke, are laid on with a pale yellow ; shade the smoke with paper black, or foot ; the flames shade with red lead, or vermilion, and heighten them with Naples yellow.

In colouring of rocks, hills, &c. that are at a great distance, observe the same rule. Such as lay nearer the fore ground, you are to imitate according to nature. Trees that are upon the fore ground, you paint with several sorts of greens, the better to distinguish one from the other ; such as are on distant hills, must be done with the same colour as the hills.

Of a fine collection of prints.

A collection of this kind may be divided into historical and moral subjects, the progress of arts, and mixed subjects.

The historical will contain the history of the world, according to it's ages, monarchies, and nations, represented by maps, battle-pieces, medals, statues, bas-reliefs, portraits, &c.

The moral part will comprehend emblems, devices, enigmas, of the religion, manners, and politics of different nations, with representations of their virtues and vices.

R E M A R K.

I have often thought that it would prove greatly serviceable to the cause of liberty and protestantism, if some of our best artists for design and engraving, would oblige the world with a set of curious prints, representing the progress of POPERY and SLAVERY, in all it's various lights. Nothing, we are inclined to think, could have a more general and happy tendency to discountenance, and indeed, in time, eradicate, if possible, those destructive principles, from among mankind. The Papists we know, study every delusive art to captivate, by their paintings and idolatrous images, the minds of the vulgar, and instigate them to become bigots in their cause : and will it not well become the Protestant interest, to baffle the wiles of such deceivers, with artillery of the like universal power and prevalence ? Certain I am, that something of this kind, executed in a masterly manner, would greatly contribute to root out of the minds of the mass of the people, those detestable notions, and not only strengthen the British constitution in particular, both in Church and State, but tend to the universal propagation of the Protestant interest throughout the world.—Such prints would also be of great use among our Indian allies in North America, and give them, in general, a more lively idea of the happiness which attends living in constant friendship with the friends to liberty, than with those of slavery and arbitrary power.

The progress of arts, will take in the different styles ; by comparing the antique remains with the works of the Gothic ages, and of those eminent masters who have flourished within these 250 years ; in order to observe their original increase and declension, and their re-establishment, to the degree of excellency to which they are now arrived.

The mixed subjects may contain volumes of portraits of celebrated personages, hunting-pieces, and grotesque subjects, &c.

In relation to the history of the world, the 1st, should contain the account thereof, as given us in the Pentateuch.—The 2d, ought to be the sequel of the sacred history, as we find it in Joshua, Judges, Kings, &c.—The 3d, the remainder of the history of the Old Testament, according to Esdras, Tobit, &c.—The 4th, may exhibit an abridgment of nature, according to the ancient poets and philosophers.—The 5th, should shew the fabulous history of the Heathen Deities.—The 6th, the history of the heroic times, the voyage of Argonauts, the war of Thebes, and also Ovid's Metamorphoses ; the wars of Troy, voyages of Eneas and Ulysses, with the last

last acts of the heroic ages.—The 7th, should contain maps and actions of the first and second monarchies of the Assyrians and Persians, with other Asiatic, Egyptian, and African histories.—The 8th, the third monarchy of the Macedonians, comprehending the acts of Alexander the Great, and his successors.—The 9th, the commencement of the 4th monarchy of the Romans; the reign of their 7 kings: under Numa Pompilius may be ranged, those peices which relate to their religion, sacrifices, ceremonies, and burials of the Romans: under Tullius Hostilius, every thing that relates to their militia: under Tarquinius Priscus, whatever gives an idea of their habits, ornaments, magnificence and triumphs, with the pomp of their public spectacles, feasts, and baths.—The 10th, may take in part of the transactions of the Roman republic, from the expulsion of their kings, under their consuls and dictators, 'till the time of Julius Cæsar; to which should be added, a collection of medals, and other monuments of the ancient Roman families.—The 11th, may contain what we have of the reigns of their emperors, Julius Cæsar and Augustus.—The 12th, might shew the manner of the wars of the Greeks, Romans, and antient barbarians.

From the Christian Æra, should be shewn, 1. The subjects of the birth, life, and miracles of our Saviour, who appeared in the 42d year of the Roman Empire, under the reign of Augustus: also the death and sufferings of Christ, and a collection of holy parables.—2. The reigns of the emperors Tiberius, Caligula, and Claudius; under which will be included the history and purity of the infant Christian Church.—3. What passed under Nero and his successors, to the end of the reign of Trajan, with regard both to sacred and profane history.—4. The history of the Dacian war, as represented in the column of Trajan.—5. The ages and reigns of the emperors, from Adrian to the government of Alexander, the son of Mammæa.—6. The emperors, from Alexander to the time of Constantine the Great.—7. The empire of Constantine and his children, to the end of Theodosius's reign, which may be called the last period of the Roman grandeur; at the end of which volume should be placed, the ecclesiastical geography of the patriarchates.—8. The disposition of the division of the Roman Empire, which began to be usurped by the barbarous nations in the times of Arcadius and Honorius, and ended in the East, by the taking of Constantinople, in the year 1453.—9. The dreadful conclusion of the eastern affairs in Africa, by the conquests of Mahomed, and other Ottoman emperors, by the sophies of Persia, and the kams of Tartary.—10. Should be a series of Mahomedan princes, and Egyptian sultans; the sherifs of Morocco, and kings of Barbary: with which may be connected, a collection of historical pieces to this third part of the globe; the Assyrians, the kingdoms of Congo, and several others.—11. Should contain the habits and ornaments of the Christian Greeks, and other subjects of the Grand Signor, with those of the Turks and Romans; of the Tartars, and other barbarous nations: also a collection of some cruelties, and executions.—12. Should be the commencement of the religious orders, which were instituted in the East; such as those of St Anthony, St Basil, the Cross-Bearers, the Jeronites, and the Carmelites.—13. Some historical pieces of the knights of Malta.—14. The institution of the western religious orders, as those of St Augustin and St Bennet.—15. The different orders that have flourished in the East, since St Bennet, to the time of St Dominic and St Francis; i. e. of the Carthusians, Premonstratenses, of the Shady-Valley, the Mathurins, and of the order of the Cistercians.—16. The order of the Dominicans, and historical pieces of the Holy Rosary; a collection of the images of the Virgin Mary, held in veneration by Papists.—17. Whatever can give an idea of the life of St Francis, and of the most remarkable male and female saints, of his three orders: also a description of his desert of Avesne.—18. Should be the sequel of the order of St Francis, with some pieces relating to the order of the Capuchins.—19. Whatever relates to the religious confraternities that have arose in the Romish Church since St Francis and St Dominic, to the present time.—20. A collection of all the whimsical habits and ornaments of ecclesiastical persons, and of the orders of monks and nuns.—21. The representations of religious ceremonies, and of the magnificence of the court of Rome.—22. The ceremonies practised at the interment of Christians, and of the ancient Pagans, and barbarous nations.—23. Public rejoicings, entries, triumphs, tournaments, fire-works, comedies, dances, and masquerades.

1. Of the chronological history of the Papacy, divided into centuries, from the time of Leo III. to the present Pontificate.—2. The sequel of the history of the West, containing a description of the modern city of Rome, it's churches, palaces, public buildings, villas, ornaments, and monuments of it's ancient grandeur.—3. Of the temporal state of the Popes, as now within and out of Italy.—4. Of the sovereign States of Italy, wherein should be a collection of what chiefly relates to the Republics of Venice, Genoa, Lucca, Ragusa, and St Morino.—5. The sequel of Italy, including the dominions of the kings of the Two Sicilies and Sardinia, the grand duke of Tuscany, duke of Modena, and of the house

VOL. II.

of Austria, and other princes in Italy, and those of New Spain, and all that relates to America.—6. The historical subjects relating to the kingdom of Old Spain.—7. Those of the kingdom of Portugal.—8. Historical pieces relating to the house of Austria in the Low Countries.—9. The dominions of the king of Spain in Asia; under which should be comprized what relates to the East-Indies, China, Japan, India Proper, and the rest of the Indian princes.—10. A collection of what concerns the republic of the United Provinces.—11. An historical collection of whatever regards the kingdoms of England and Ireland, to the end of the reign of queen Elizabeth.—12. What relates to the kingdom of Scotland, and to the three kingdoms of England, Scotland, and Ireland, since the union of those crowns in the person of king James the VIth of Scotland, and Ith of England, with a description of this monarchy.—13. What regards the northern States, as Russia, Poland, Sweden, Denmark, and other northern countries.—14. Should contain the state of the kingdoms of Bohemia and Hungary, the archduchy of Austria, the county of Tirol, and other hereditary dominions of the house of Austria.—15. Historical subjects concerning the emperors of Germany, from Conrad, duke of Franconia, who transferred the empire from the French to the Germans, to the late emperor.—16. What relates to the several electors of the empire, as well the ecclesiastical as secular.—17. What concerns the other German princes.—18. Of the free cities of the empire.—19. What relates to the Republics of Switzerland, Geneva, the Grisons, the principality of Neuchâtel, and the other allies and subjects of the Switzers.—20. What concerns the duchies of Burgundy, Normandy, Lorraine, and Britany, before they were united to the French monarchy.—21. The antiquities of the Gauls, and portraits of their illustrious persons, before the coming of the Franks, under their first king Pharamond.—22. What regards the history of the French, during the first race of their kings, after their arrival in Gaul, under the conduct of Pharamond.—23. What regards the second race of their kings, from Pepin to Louis the Vth.—24. Should begin with the third race of their kings, and contain all materials that relates to them, from Hugh Caput, to the end of the reign of Charles the Fair, where the right line of the eldest branch ended.—25. What concerns their kings of the third race, from Philip of Valois, to the death of Louis XI.—The reigns of their kings Charles the VIIth, Louis the XIIth, Francis the Ith, and Henry the II; and as by the marriage of Mary of Burgundy with Maximilian, Europe has been divided into the two families of Austria and Bourbon, to avoid confusion, those pieces relating to the foreign wars of the French, with the portraits of the eminent men who have been either their allies or enemies, may be put under the reigns of their kings.—26. May contain the reigns of their kings, Francis the II, Charles the IXth, and Henry the III.—27. What relates to the order of the Holy Ghost, instituted by Henry the III: here may be added the names and arms of all the commanders and knights of the order, from it's first institution to the last creation.—28. What relates to the reign of Henry the IVth.—29. May contain the beginning of the reign of Louis XIII. his portrait, those of the queen, the princes and princesses of the blood, with the arms and portraits of the cardinals, bishops, and great officers of the crown.—30. The arms and portraits of distinguished ecclesiastics, religious, and seculars, who lived during the reign of Louis the XIIIth; to which may be joined Vandyke's portraits.—31. Pieces of the magnificent ceremonies, rejoicings, and other festivals that passed in France, during the reign of Louis the XIIIth.—32. What passed of the same kind in foreign countries, in this reign.—33. Pieces representing the warlike exploits of the French nation, from the beginning of the reign of Louis the XIIIth, to the year 1629, when all the cautionary towns of the Protestants were reduced to his obedience.—34. The military actions that passed in Europe, from the time of Louis the XIIIth, to the rupture of the peace with Spain, in the year 1635.—35. The military actions of the treaty of peace at Treves, to the death of Louis the XIIIth.—36. May contain the habits and ornaments of the ancient and modern French, from the establishment of that monarchy to the present time; to which may be added, those of the conquered provinces, with the cries of Paris, Callot's beggars, and the rural sports of the French.—37. A series of the military actions during the reign of Louis the XIVth, the regency of the duke of Orleans, and the reign of Louis the XVth, now living.—38. A series of the magnificent ceremonies, festivals, public rejoicings, fire-works, &c. during the same period.—39. Geographical description of the French monarchy, as divided into provinces, parliaments, generalities, &c. to which may be added, charts of the coasts, plans, or profiles, of the fortified towns and fortresses, of the principal churches, royal palaces, and public buildings, &c.—40. Maps of the States and Provinces, with plans, or profiles, of the principal towns and fortresses which have been added to the French monarchy, from the beginning of the reign of Louis the XIIIth, to the present time.—[This would convince all Europe of the strides of the French to UNIVERSAL EMPIRE.]—See our article FRANCE.—41. Suitable representations of the

unchangeable treachery and perfidiousness of the French, in regard to treaties, down to the present times.—[See our article PLANTATIONS.]—42. Portraits of all the eminent men in the kingdom of France, either for arts or arms, since the reign of Louis the XIIIth, to the present time; to which may be added, those of Flanders and other countries.—43. Portraits of those people who ought to be avoided; such as the authors of different sects of religion, of men noted for impiety or libertinism, &c. to which may be added, the representations of monsters in the brute creation, by way of contrast.—44. Portraits of saints and martyrs, and their persecutors, with representations of the various tortures inflicted on them, to the present time.

Pieces which illustrate the fine arts of painting, sculpture, and engraving, and curious matters of antiquity, will compose many volumes.—The first may contain the origin of the art of painting, in the Egyptian hieroglyphics, some bas-reliefs, trophies, rings, cameos, vases, urns, ornaments of architecture, ancient inscriptions and epitaphs.—2. Pieces relating to the ancient Hebrews, with a collection of festivals, medals, and antique statues.—3. May regard the two books of the marquis Justiniani's gallery, which are full of antique pieces, and the Trajan column, the most entire piece of antiquity extant.—4. May shew the decline of painting and sculpture, during 1100 years, that the empire was on the decline, from Constantine to the end of the fifteenth century; which should be composed of pieces in the Grecian, Egyptian, and Gothic styles, taken from the old paintings, tombs, medals, seals, and tapestry.—5. May be the books intitled *Roma Subterranea*, filled with pieces in the decline of the empire, of the Gothic style.—6. Should be the sequel of the decay of arts, with several pieces from wooden plates, which shew the rudeness of their designs, since the invention of printing.—7. May be the origin of the art of engraving, about the year 1490, containing pieces of the most ancient artists; as of Israel and Martin Tederco, the master of Albert Durer; of Daniel and Jerom Hopfer, and others.—8. The works of Albert Durer, the restorer of painting, and great perfecter of engraving, in Germany and the Low-Countries, about the year 1520.—9. A sequel for the works of the German and the Low-Country masters, containing pieces of Lucas of Leyden.—10. May be filled with pieces engraven on wood, done in Germany since 1500, to this time, as well by Lucas Cranach, Jacob Pens, Holbeins, Hans Schanflig, as others.—11. May be a series for Germany and the Low-Countries, containing pieces of the lesser masters, such as George Pentz, Aldegraef, Lebalde, John D'Hispanien, &c.—12. Should be composed of the works of Francis Flora, who is called the Flemish Raphael, and those of Martin Hemskirk.—13. A sequel for Germany and the Low-Countries, containing some pieces of Lambert Serave, Lambert Lambert; of Peter Brughel, John Mabuse, M. Quintin, George Behan, Gilles Massart, and Gilles Coignet; of Otho Venius, Cornelius Cort, and Theodore Bernard, of Amsterdam; of Francis Klein, a Dane, and of John Strada.—14. Should be still a sequel for Germany and the Low-Countries, containing some pieces of Charles Mander and Francis Pourbus, of Diterlin, and Lambert Lenoir, H. Utouch, Denis Calvaert, Abraham Janfens; of Paul Morelser, Nicholas Hoey, Geldorp, Goltzius, Joshua of Monpre, John Hæfnaghel, Gerard of Groningen, Cornelius Vanficchem, John Bol, David Van Boons, and Peter Vander Borcht.—15. Should contain some of the works of Henry Hubert, and James Julius Goltzius.—16. The works of William and Crispin de Pas of Magdalen and Barbara de Pas, and of several others of that name.—17. A suit for Germany and the Low-Countries, comprising some of the works of Nicholas le Bruyn, of Theodore de Bry, and of James de Gehin.—18. The works of John, Raphael, Justus, and Gilles Sadalaer, and also those of Martin de Vas.—19. A suit for Germany and the Low-Countries, and to contain some pieces of Anthony and Jerom Wierx, of Lucas Vesterman, Valder, John Saenredam; of John and Herman Muller, James Mathan, Simon Phrygius, Bartholemew Dolende of Mireuelt, and the Balwert's; of Michael Synders, Baptist Urintz, Hans Bel, Peter and Gerard de Sade; of Assuerus Londerfeel, and of Adrian Collaert.—20. Another suit of masters that flourished in Germany and the Low-Countries, in the beginning of the seventeenth century, viz. of Joseph Heintz, John of Vingth, John Abhac, John Rottenhamer; of M. Kager, Peter Candide, and Dominic Cufos; of Christopher Schuarts, John Speccard, and Gerard Seghers; of Bartholemew Sprangers, Abraham Bloemaert, Anthony Van Dyck; of Abraham Brower, Gerard Hontherft, James Jordeans, and of Robert prince Palatine.—21. Should be the works of Sir Peter Paul Rubens, a famous painter of the Low-Countries.—22. The representations of night, and other dark gloomy pieces, of various masters of all nations: as of L. Gent, J. Velde, Wittembrouck, Rembrandt, Vanuliet, and others.—23. A collection of divers landscapes, done by masters of different nations; that is to say, of Paul and Matthew Bril, of the Sadalaers, Peter Stephano, Cornelius Corneli, Roeland Savery of Monperche, Claude of Lorrain; of Fouquieres, Perrelles; of Frederic Scaberge, Som, and the Nains, and several

others; to which may be added, the pieces of ruins of Henry of Cleves, Michael Colyns, and Newland; with some seapieces and maritime prospects.—24. Should be another suit of different landscapes, viz. by Peter and John Brughel, Londerfeel, J. Velde, Tobit Verdach, Vanderboons, Merian, and others.—25. In order to see the re-establishment of the art of sculpture and engraving, should contain some pieces of the first painters and engravers, as of Anthony Pollarolo, Andrew and Benedict Montegna; of Dominic Campagnola, John of Brescia, and James of Verona; as also of several ancient engravers, whose pieces are only known by their marks: as the masters of the name of Jesus, Mercury, the crab-fish, the bird, the star, and several others; to which may be added some pieces of the first Italian painters, as of Giotto, Chirlandaio, or Hercules of Ferrara; of Peter of Perugia, the master of Raphael, and of Giorgione, the master of Titian.—26. Should be a suit of the Italian masters, containing only some of the works of Raphael of Urbino, and those engraven only by Mark Antonio, and Augustine of Venice.—27. A suit of the works of Raphael, engraven by the ancient masters, from 1530 to 1560; that is to say, by Julius Bonafone, Sylvestre, and Mark of Ravenna, Beatrix of Lorrain, and others.—28. Should contain some pieces of Michael Angelo.—29. Another suit of the works of the Italian masters, containing some pieces of Anthony of Correggio, Francis Matzuolo, surnamed Parmigiano, and Polydore of Caravaggio.—30. The works of Titian.—31. Should contain the works of Julio Romano, the Caracci, and Perin del Vaga, engraven by John B. of Mantua, and Diana his daughter, as also by Theodore Ghisi, and George Julius of Mantua.—32. The works of the painters and sculptors that were contemporaries of Raphael and Michael Angelo, to the end of the sixteenth century, viz. of Baccio Bandinelle, the Salviati; of Balthazar of Peruzzi, Dominico Beccafumi; of Sodom of Sienna, Pordenone, Marcellus Venusto, and Baptist, a monk of the order of Camaldoli.—33. Should contain some pieces of Thaddeus and Frederick Zuccherro, of Daniel of Volaterra, Mark of Sienna, and Baptist del Moro.—34. Some pieces of Paul of Verona, Paul Farinate, the Bassani; of Tintoret, Baptist Franco of Mutiano, and the elder and younger Palma.—35. Some pieces of those who flourished between the year 1550 and the end of the sixteenth century, viz. of Aeneas Vico, Martin Rota, and Reverdino; of Camillo Proccacini, Baptist Fontaner; of Cornelius Cort, Pafaro, and Sebastian of Venice.—36. A suit of the works of the Italian engravers who flourished towards the latter end of the sixteenth, and the beginning of the seventeenth century; that is to say, of Cherubino Alberto, Villamena, of Raphael Shiaminosa, and the Tomasini.—37. Should contain the pieces of Francis Vanius, Ventura, Salembeni; of Civoli, Michael Angelo, Caravaggio, and the three Caracci.—38. Should be a suit of the works of the Italian painters of the seventeenth century, viz. of the Capuchin friars, Piazzo, and Cosmo of Castel Franco; of Hippolitus Scarszeln of Schiavone, Cangiage Borgan, Charles of Venice, Pasqualin of Verona, Alexander Cesalini, Bernard Castello, Vespasian Strada, Anastasius Fontebuono, Francis of Viterbo, Luke Ciamberlani, Andrew of Ancona; of Anthony Pomerange, of Matthew and Frederic Greuter; of Philip of Naples, and Stephen Dellabella.—39. A suit also of the works of the painters and sculptors that flourished during the seventeenth century, viz. of Cavalier Jusefino, Guercino, Cirano, Francis the Fleming, and Marcel of Provence, the restorer of mosaic painting; of Gentilique, Valentin, Edward Fialetti; of Peter Beretino of Cortona, Dominichino and Guido Rheni.—40. Should be to shew the re-establishment of painting in France, and contain some pieces of René, king of Sicily, of Leonard da Vinci, Andrew del Sarto, and Rosso.—41. A suit of some of Primaticcio's works, engraven by Leo of Avesennes, and Anthony Jantus, his engravers; as also some pieces of Jeffrey of Montiers, Leonard of Limogues, Stephen of Lofne, René Boivin, Luke Penis, Dominic of Florence, and Leonard Thury.—42. May be filled with the works of John Courfin, John Genet, of Swiss, of Little Bernard, Peter of Latour, Laurence the glazier, Justus of Egmont, and of several others engraven in France since the commencement of the sixteenth century.—43. Should contain some pieces of those masters who flourished at the latter end of the sixteenth century, and during the reign of Henry the IVth and Mary of Medicis, viz. of Freminet de Breuil, Burnet, Caron, du Bois Lallemand, Thomas de Leu, Leonard Gaultier, and others.—44. The works of those masters who flourished about the middle of the seventeenth century, that is to say, of James Blanchard, de Rabel, Ferdinand, Isaias Fournier, John Lis Faber, and Mallerac; of Ruelle, Bellango, and James Calot.—45. Should also be composed of the works of James L'Homme, of Little Francis, Vanmol, Mellin, Quefnel, St Igny, Josselin, Rouffellet, and Peter Brebiette.—46. May be filled with the works of the best French engravers, viz. Claudius Mellan, Gregory Huret, Peter Daret, Gilles Rouffellet, Michael Lafne, and many others.—47. With the works of the most eminent French painters; that is to say, of Simon Vouet, Nicholas Poussin, James Stella, Champagne Bourbon,

Bourdon, de la Hire, Vignen, Loir, Charles de Brun, and Peter Mignard, engraved by the best masters.—48. May be filled with the finest pieces of the most celebrated engravers of the seventeenth century.—49, 50, &c. may contain a collection of pieces of different masters of all nations, who have been either omitted or forgotten in the preceding account, or have flourished since the end of the seventeenth century, as well as of others now living, whose names we shall not specify, having an equal veneration for them all.

The subjects of morality will also form several volumes, viz.

1. May contain some emblems of the Christian worship.—
2. May be the representations of the virtues and the vices, with their symbols.—
3. A collection of different emblems, fables, and enigmas.—
4. A collection of devices of popes, king's, prelates, princes, noblemen, and others.—
5. May be composed of a collection of historical emblems, devices, and enigmas, relating to love and death.

The mixed subjects will compose some volumes, viz. 1. May be a collection of the remarkable women mentioned in the Old and New Testaments.—2. Of holy virgins, martyrs, female saints, beatified nuns, &c.—3, 4. May also be collections of Christian empresses, queens, and illustrious women of different nations.—5. The representations of Roman ladies, taken from the antique statues, busto's, bas-relievo's, &c.—6. A collection of the goddesses of the ancient pagans, with some illustrious Egyptian, Grecian, Asiatic, Persian and Mahometan ladies.—7. May be filled with the portraits of women, both ancient and modern, who were either imperfect, mad, or prostitutes.—8. May comprehend a collection of all sorts of hunting, fishing, and fowling-pieces; to which may be added, a collection of remarkable animals that are treated of in the aforesaid pieces.—9. May be filled with a number of grotesque pieces; to which may be added, a collection of all sorts of masquerades.

REMARKS.

Our principal reason for enumerating the preceding particulars is, with a view to give the reader a general idea how extensive a subject the article of prints may be rendered, whose scope there is for the genius of the greatest artists, and how considerable a branch of trade is derivable therefrom. See our articles DESIGN, ENGRAVING, and PAINTING. For these reasons, it is certainly good policy to give all reasonable public encouragement to all our own subjects who shall excel herein, that the catalogue may be swelled as well with the names of Britons as of foreigners; for, in that case, we may become exporters as well of the productions of our own celebrated masters, as importers of those of other countries. Besides, to excel in the refined arts in general, gives a reputation and dignity to a nation in all its commercial concerns; and, indeed, where these arts do not flourish, commerce can never arrive to that height it will do in nations where they do, they being the foundation of multitudes of other dependent trades.

It is needless to say a word in favour of an art so apparently useful in other respects, it tending to communicate an universal knowledge of nature and history, men and things, in general, in the most familiar manner, and greatly to aid and assist the memory in the retention of what we may have read for the embellishment of the mind, and the improvement of the understanding.

The elegancies of life, to a polite and wealthy people, become necessities; the very natural wants of a refined Briton and a savage Indian are not the same. Artificial desires, by long habit, work themselves into our constitution, and in the next generation become, as it were, innate. A new refinement creates a new desire, as importunate as any of the immediate calls of nature, when we once perceive the gratification within the reach of a little more industry.

Hence a peculiar passion arises, useful, like all the rest, under proper regulation, and productive of much social good, serving both to excite our own industry and that of others, to carry the standard of genius, and rational invention still higher, and to find endless employment for an increasing people. Luxury, if the name were not in ill repute, might be distinguished into virtuous and vicious: so far as it partakes of invention, and discovers the application of the higher gifts of God in the creation, it is virtuous; and grows vicious only, when we are tempted by it to an abuse of these improvements.

The lower branches of manufacture, wherein the price is paid chiefly to labour, contribute most to the increase of labouring hands. The trades of refinement are no ways comparable to these, for the number they employ. The arts of elegance are in next esteem, wherein we are an age behind our neighbours; what these may want in merit, as to increase of numbers, they make up in that of wealth, the price of art rising above labour, in proportion as genius is a scarcer commodity than strength.

There is nothing incompatible in the arts of ingenuity and

those of labour; and all the plainer trades may be retained, notwithstanding the higher arts are introduced, in which case we should be both a richer and a greater people.

This art is the parent of many others: it is the parent of DESIGN in general, and that is the great parent of numberless useful and elegant arts and trades. An academy for the fine arts under a royal charter has been long talked of in this nation, and why it should be so long neglected is matter of concern.

In the liberal sciences in the knowledge of nature, and the means of conveying it, we are not inferior to any other nation in Europe. He that designs, as well as he that writes, must find his advantage in this; since the learning of the historian, poet, and philosopher, are as requisite to the accomplished painter, as to him that is distinguished by either of those particular appellations. At least, the painter cannot universally excel without a tincture of all those sciences, in which the professors of literature are severally and distinctly excellent.

But the greatest pre-requisite, the most essentially necessary of all qualifications, is skill in drawing. Without this, neither the genius nor learning of the designer, painter, or sculptor, can be displayed to advantage. It is the sine qua non, after all other accomplishments are obtained.

Monsieur de Voltaire observes, that the Italians, on the revival of the liberal arts and sciences, gave them the name of Virtue. From this word was derived the term Virtuoso, which has been accepted throughout Europe, and is of daily use in England. Should not this appellation intimate, to those who assume it to themselves, that the study of what is beautiful, in nature or art, ought to render them more virtuous than other men?

That these studies have really such a tendency, when not perverted to lascivious or immoral purposes, is undeniable: and whether, when thus perverted, they ought to be ranked among the ornaments of life, I very much doubt. We are certain that the poets, artists, and philosophers, who have acquired the highest feats in the temple of Fame, are not those who prostituted their genius or skill to the gratification of the sensual and culpable passions.

The painter, the sculptor, the architect, (who, with the musician, are properly distinguished from other artists by the epithet liberal added to their professions) have so near an affinity with the poet, the philosopher, the orator, and the geometrician, that there needs no apology for the frequent parallel we have made betwixt them. A noble and admired author, no less an one than the earl of Shaftesbury, has done the same; and whilst he prefers the artist of genius, to the mere scholar by profession, gives such reasons for it, as I should do myself an injury not to transcribe.

‘Hardly can I forbear, says his lordship, making some apology for my present recourse to the rules of common artists, to the masters of exercises, to the academies of painters, statuary, and the rest of the virtuoso tribe. But in this I am so fully satisfied I have reason on my side, that, let custom be ever so strong against me, I had rather repair to these inferior schools to search for truth and nature, than to some other places, where higher arts and sciences are professed.

I am persuaded that to be a virtuoso (so far as befits a gentleman) is a higher step towards the becoming a man of virtue and good sense, than the being what in this age we call a scholar; for even mere nature itself in its primitive simplicity, is a better guide to judgment, than improved sophistry and pedantic learning. The facient, nã, intelligendo, ut nihil intelligunt, will be ever applied by men of discernment and free thought to such logic, such principles, such forms and rudiments of knowledge, as are established in certain schools of literature and science. The case is sufficiently understood, even by those who are unwilling to confess the truth of it. Effects betray their causes. And the known turn and figure of those understandings, which spring from nurseries of this kind, give a plain idea of what is judged on this occasion.

To imitate nature agreeably, is undoubtedly the perfection of art; but this can be done only by a good eye, which makes a beautiful choice among the objects that nature presents. This is well explained by the same noble author, whose thought, attentively considered, might reconcile those who dispute concerning the propriety and just extent of that imitation.

‘A painter, says his lordship again, if he has any genius, understands the truth and unity of design; and knows he is even then unnatural, when he follows nature too close, and strictly copies life. For his art allows him not to bring all nature into his piece, but a part only. However, his piece, if it be beautiful and carries truth, must be a whole by itself, complete, independent, and withal, as great and comprehensive as he can make it. So that particulars, on this occasion, must yield to the general design, and all things be subservient to that which is principal. In order to form a certain easiness of sight, a simple, clear, and united view, which would be broken and disturbed by the expression of any thing peculiar or distinct.’

An act for the encouragement of the arts of designing, engraving, and etching historical and other prints, by vesting the properties thereof in the inventors and engravers, during the time therein mentioned.

Whereas divers persons have by their own genius, industry, pains, and expence, invented and engraved, or worked in mezzotinto, or chiaro oscuro, sets of historical and other prints, in hopes to have reaped the sole benefit of their labours: and whereas printfellers, and other persons have of late, without the consent of the inventors, designers, and proprietors of such prints, frequently taken the liberty of copying, engraving, and publishing, or causing to be copied, engraved, and published, base copies of such works, designs, and prints, to the very great prejudice and detriment of the inventors, designers, and proprietors thereof; for remedy thereof, and for preventing such practices for the future, may it please your Majesty that it may be enacted, and be it enacted by the king's most excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, That from and after the twenty-fourth day of June, which shall be in the year of our Lord 1735, every person who shall invent and design, engrave, etch, or work in mezzotinto, or chiaro oscuro, or, from his own works and invention, shall cause to be designed and engraved, etched, or worked in mezzotinto or chiaro oscuro, any historical or other print or prints, shall have the sole right and liberty of printing and reprinting the same for the term of fourteen years, to commence from the day of the first publishing thereof; which shall be truly engraved with the name of the proprietor on each plate, and printed on every such print or prints; and that if any printfeller, or other person whatsoever, from and after the said 24th day of June, 1735, within the time limited by this act, shall engrave, etch, or work, as aforesaid, or in any other manner copy and sell, or cause to be engraved, etched, or copied and sold, in the whole or in part, by varying, adding to, or diminishing from the main design, or shall print, reprint, or import for sale, or cause to be printed, reprinted, or imported for sale, any such print or prints, or any parts thereof, without the consent of the proprietor or proprietors thereof first had and obtained in writing, signed by him or them respectively, in the presence of two or more credible witnesses, or, knowing the same to be so printed or reprinted without the consent of the proprietor or proprietors, shall publish, sell, or expose to sale, or otherwise, or in any other manner dispose of, or cause to be published, sold, or exposed to sale or otherwise, or in any other manner disposed of, any such print or prints, without such consent first had and obtained, as aforesaid; then such offender or offenders shall forfeit the plate or plates on which such print or prints are or shall be copied, and all and every sheet or sheets (being part of, or whereon such print or prints are or shall be so copied or printed) to the proprietor or proprietors of such original print or prints, who shall forthwith destroy and damask the same; and further, that every such offender or offenders shall forfeit 5s. for every print which shall be found in his, her, or their custody, either printed or published, and exposed to sale, or otherwise disposed of contrary to the true intent and meaning of this act; the one moiety thereof to the king's most excellent Majesty, his heirs and successors, and the other moiety thereof to any person or persons that shall sue for the same, to be recovered in any of his Majesty's courts of record at Westminster, by action of debt, bill, plaint, or information, in which no wager of law, essoin, privilege, or protection, or more than one imparlance shall be allowed.

Provided nevertheless, That it shall and may be lawful for any person or persons, who shall hereafter purchase any plate or plates for printing from the original proprietors thereof, to print and reprint from the said plates, without incurring any of the penalties in this act mentioned.

And be it further enacted by the authority aforesaid, That if any action or suit shall be commenced or brought against any person or persons whatsoever, for doing or causing to be done any thing in pursuance of this act; the same shall be brought within the space of three months after so doing; and the defendant and defendants, in such action or suit, shall or may plead the general issue, and give the special matter in evidence; and if upon such action or suit a verdict shall be given for the defendant or defendants, or if the plaintiff or plaintiffs become nonsuited, or discontinue his, her, or their action or actions, then the defendant or defendants shall have and recover full costs, for the recovery whereof he shall have the same remedy, as any other defendant or defendants in any other case hath or have by law.

Provided always, and be it further enacted by the authority aforesaid, That if any action or suit shall be commenced or brought against any person or persons, for any offence committed against this act, the same shall be brought within the space of three months after the discovery of every such offence, and not afterwards; any thing in this act contained to the contrary notwithstanding.

And whereas John Pine of London, engraver, doth propose

to engrave and publish a set of prints copied from several pieces of tapestry in the house of lords, and his majesty's wardrobe, and other drawings relating to the Spanish invasion, in the year of our Lord 1588; be it further enacted by the authority aforesaid, That the said John Pine shall be intitled to the benefit of this act, to all intents and purposes whatsoever, in the same manner as if the said John Pine had been the inventor and designer of the said prints.

And be it further enacted by the authority aforesaid, that this act shall be deemed, adjudged, and taken to be a public act, and be judicially taken notice of as such by all judges, justices, and other persons whatsoever, without specially pleading the same.

R E M A R K S.

This act has given some little encouragement to those artists, but is no way equivalent to the difficulties and discouragements under which they have long laboured, by printfellers and others, as I could instance, though it is apparent that they have manifested talents no way inferior to the artists of any other nation: so great is this merit, that they stand in need of nothing but the effectual patronage of the great to render them superior to any other artists in all Europe. See the articles ENGRAVING and DESIGN.

P R I S A G E and B U T L E R A G E.

I. * Prifage is a certain taking or purveyance of wines to the king's use, out of every ship bringing in wines, belonging to the natives of England, except those particularly hereafter exempted, being the only duty or custom that was anciently payable for the same to the kings of England: † and that the king's butler might not take more than was really necessary for the king's use, the steward of the king's house, and treasurer of the wardrobe, were to send the certain quantity to all the ports of England, the which he was to take within ten days.

* 40 Hen. III. 28 Edw. I. 6 Edw. III. 20 Rich. II.

† 20 Edw. III. cap. 21. 43 Edw. III. cap. 3.

This duty is not due 'till the unlading or breaking of bulk, for the words are, *De qualibet nave importante vina & disonerante inde*, so that the breaking of bulk, or the landing of any part of the cargo, subjects the ship to the whole duty, according to the quantity on board, though there be not more than one ton landed; therefore, when there are any wines on board, designed for foreign parts, the master should distinguish them in his report, from those which are to be landed in England: and when prifage is taken at any one port, and the ship proceeds to another, the collector of that port should be acquainted thereof, by noting it on the back of the master's report, which he is to carry with him, to prevent it's being taken again.

This duty is either single or double.

Single prifage is one ton, and is due in kind, when the quantity imported amounts to, or exceeds, 10 tons, but is under 20 tons: for if under ten tons, there is not any prifage due.

Double prifage is two tons, and is due in kind, when the quantity imported amounts to, or exceeds, twenty tons, which is the most due out of any one ship: one ton to be taken before the mast, and the other behind the mast, at the pleasure of the king's butler or prifage-master; who may taste the whole cargo, and chuse the best wines, and fill up the vessels, or chuse those that are the fullest, and take them away, allowing only * 20s. per ton for freight; or if the owners had rather, he may compound with them for the whole quantity at a certain price, as is the practice in London, and most other ports.

* 28 Edw. I. cap. 2.

But note, if any merchant brings in, to the quantity of above nine or nineteen tons, be it but a tierce or upwards, whereby to evade the payment of prifage, he is liable to the same, as if the full quantities of ten or twenty tons had been imported; or if any ship brings into the quantity of prifage at several times within the compass of the same vintage, this duty is due as if all those quantities had been imported all together; or if any merchant enters any quantity of wines in several bottoms at the same time, or at several times within the compass of the same vintage, in the whole quantity amounting to prifage, the same is due, as if imported in one bottom, and at one time.

But king Edward III. by his charter, dated 6 Martii, anno regno primo, granted a discharge from prifage to the mayor, commonalty, and citizens of London, in hæc verba, *quod de vinis civium, nulla prifa fiat, sed perpetuo inde essent quieti, &c.* which was afterwards allowed in the Exchequer. Though it is not every citizen that is capable of this exemption, but only those that are resident within the city, being freemen and housekeepers, paying scot and lot; for he that would

would claim the benefit of this discharge, ought to be civis & incola commorans: for upon complaint that the lord mayor of London made strangers citizens, it was declared by an act of the 4th of Henry VI. (a private act) that the discharge from priſage ſhould not extend to ſuch citizens as were donati, made free, but only to ſuch as commorant, incolar, and are reſident in the city: and not only the merchants of London, but alſo of the Cinque Ports, Southampton, and Cheſter, are exempted from priſage by particular charters; yet if an inhabitant of any other place, ſhould conſign wines to be delivered and landed at any of thoſe places, the bare diſcharge of the goods will not acquit the importer; for it is not the party's importation, but his domicile that exempts him. II. * Butlerage is a duty of two ſhillings for every ton of wines, for which freight is to be paid, brought into this realm by merchant-ſtrangers; being a compoſition (in lieu of the duty of priſage payable in kind by Engliſh only, and from which ſtrangers were exempted) in conſideration of the liberties and freedoms firſt granted by king John, and afterwards by king Edward the 1ſt, to all merchant-ſtrangers by theſe words, in a charter called † charta mercatoria; Conceſſerunt de quo libet dolco vini quod adducunt, vel adduci facerent, infra regnum, &c. ſolvent nobis & hæredibus noſtris, nominæ cuſtomæ, duos ſolidos, &c.

* Book of Rates referred to by 12 Car. II. cap. 4.
† 31 Edw. I. cap. 1 & 2. 27 Edw. III. cap. 26.

With regard to thoſe duties of priſage and butlerage, it muſt be obſerved, That if * wines are entered in another man's name, in order to defraud the king of the duty, the penalty is double the value of the priſage, and all the offender's goods and chattels perſonal for ever, provided the proſecution be within three years: and that the † collector, comptroller, and ſurveyor, are not to take any man's entry of wine, 'till he hath produced the butler's or his deputy's bill, teſtifying that he hath ſeen the fame.

* 1 Hen. VIII. cap. 5. §. 6, 7. 2 & 3 Edw. VI. cap. 22.
§. 3, 4, 5. 1 Eliz. cap. 11. §. 6.
† In Rot. Scac. Term. Sanct. Hil.—7 Eliz.

And though by the * act of tonnage and poundage, a ſubſidy and additional duty were laid upon all ſorts of wines imported, yet as the priſage of wines, or priſe wines were exempted from thoſe duties, the duties of priſage and butlerage were ſtill continued and confirmed to be paid in like manner as before.

* 12 Car. II. cap. 4. §. 15.
† 12 and 27 Rules of the Book of Rates.

Though priſage and butlerage (which were originally the only duties due upon the importation of wines) were taken and received for the proper uſe of the crown; yet for many years paſt, the kings of England have been pleaſed to grant the ſame to ſome nobleman, who by virtue of his patent or grant, is to enjoy the full benefit and advantage thereof, and may cauſe the ſame to be levied and collected in the ſame manner as the kings themſelves might, and were formerly wont to do, and under the ſame pains and penalties.

The patentee or proprietor of theſe duties, appoints a deputy in every port (uſually the collector of the cuſtoms) to levy and collect the ſame for him, in the beſt manner he can, by taking the priſage either in kind, or by making a compoſition, the latter whereof is the moſt uſual method.

And when priſage is compounded, it is by paying a certain rate per ton, according to agreement made with the priſage-maſter, for all the wines on board each ſhip, liable to this duty: but as there is a difference in favour of the priſage-maſter between the cuſtoms and other duties due to the crown, which are to be paid by him and the merchant; ſo that if the merchant compounds, and enters the quantity for priſage, which, if taken in kind, muſt have been entred by the priſage-maſter, he will pay leſs duty to the king for the ſaid quantity; therefore, in this caſe, over and above the compoſition aforeſaid, ſuch difference in the duties muſt be allowed to the priſage-maſter, unleſs the compoſition be at ſuch an high rate as ſhall be equivalent.

Some law caſes relating thereto.

King Edward I. having laid ſome impoſitions on the merchants, which in the twenty-fifth year of his reign were taken away, with promiſe that neither he nor his ſucceſſors ſhould do the like, without aſſent of parliament, in the 31ſt year of that king they granted him an increaſe of cuſtoms: in lieu of which, he granted to ſome places divers immunities, as releaſe of priſage, &c. And king Edward III. by his charter, dated the 6th of March, in the firſt year of his reign, granted to the mayor, commonality, and citizens of London, that they ſhould be for ever diſcharged from priſage of wine; which charter was afterwards allowed in the Exchequer. 44 Eliz. It has been held, that it is not every citizen of London that is capable of this privilege, but only thoſe citizens that are

Vol. II.

reſident within the city; ſo it was ruled in the caſe of one Knowles, who being a citizen and free grocer of London, removed with his houſhold to Briſtol, where he dwelt, but yet kept his ſhop in London; and a ſhip of his arriving with wines at London, and being unladed, the priſage was demanded: he claimed the benefit of diſcharge as a citizen, theſe being his own proper goods. It was adjudged he was not intitled to the ſame; for he who claims the benefit of his exemption, ought to be a citizen and inhabitant there. In this caſe, it was ſaid for the defendant Knowles, that if a perſon unlade his wines before priſage paid, then the king's officer cannot have his election. Trin. 4. Hen. VI.

If a ſhip bound for the port of London, ſhould by ſtreſs of weather or otherwiſe, be forced into any other port, in ſuch caſe the citizens are to enjoy their privilege, as well as if the ſhip had arrived at London. Hardr. 311. In caſe ſeveral ſhips of burden import wine into a port in ſmall parcels, as where only nine tons and three hogheads were imported in each veſſel; this was held to be fraud, and that priſage ſhould be paid for them: and, in equity, it hath been the uſual cuſtom to cauſe ſingle priſage to be paid for nine tons and a half; but not if it be only nine tons imported. Hardr. Rep. 218, 477.

The king granted to a Venetian merchant, that he ſhould be quit of all cuſtoms, ſubſidies, and impoſitions, and all other ſums of money, debts and payments, for any merchandizes whatſoever imported, and that he ſhould be as free as the citizens of London; notwithstanding theſe particular words in the grant, it was reſolved in the Exchequer, that by that grant he was not diſcharged from priſage, becauſe the priſage is not ſpecially expreſſed therein, although the city of London were, by a ſpecial charter, free of priſage. The lord mayor of London cannot make ſtrangers-citizens to be diſcharged from payment of priſage. Davis's Rep. Hil. 43 Eliz. B. R.

Priſage is not due and demandable 'till the bulk is broken: but if a foreigner brings a ſhip, laden with wines, to a port with intent to unlade, and before the goods are entered, or bulk broke, he ſells them to a citizen, priſage ſhall be paid; for the king's grant ſhall not diſcharge any citizen in ſuch a manner. If the king, by grant, diſcharges a certain ſhip of A. being at ſea, particularly naming the ſame, from paying priſage, and the owner dies before the ſhip arrives, no duty can be demanded; it is otherwiſe if a particular perſon has a grant to him to be diſcharged of his goods, and he dies before the arrival there, the duty ſhall be paid. Hil. 13. Jac. I.

An information being brought by Sir Thomas Waller, chief butler to king James I. againſt Frances Hanger, widow, for detaining eight tons of wine due for priſage, ſetting forth that two ſhips laden with wines, belonging to George Hanger, came to the port of London, and afterwards two more, in which four ſhips there were 124 tons of wine, whereof eight tons were due to the king, and that the defendant, who was the widow of the ſaid George Hanger, reſuſed to deliver them: the defendant confeſſed that the four ſhips did arrive in the port of London; two in the life time of her huſband, and two after his death, and that he was poſſeſſed of the ſaid wines ut de bonis propriis; and being ſo poſſeſſed thereof, made her his executrix, and died: that ſhe proved her huſband's will, and took upon her the executoſhip, and did unlade thoſe two ſhips which arrived after the death of her huſband; then ſhe pleaded the grant, Old 3. unto the mayor, &c. of London, quod de vinis civium, of citizens wine, no priſage ſhall be taken, but that 'they ſhall for ever be diſcharged of the ſame, and denied that theſe wines were her goods; for that ſhe had nothing in them, but as executrix to her huſband, and that he was a freeman and citizen of London. Upon this plea, it was a queſtion, whether priſage was due for thoſe wines, and adjudged, that the huſband was a citizen of London at the time of his death, and that the wines were bona civi, and ſo within the grant; and by conſequence diſcharged from the payment of priſage in the hands of the executrix, who repreſented his perſon. Trin. 11. Jac. Bridgm. 1, 2. Buſt. 250.

This great caſe was ſeveral terms, and in divers courts depending, wherein there was a diverſity of opinions among the judges; ſome inſiſted, that priſage ought here to be paid unto the king, eſpecially for the two laſt ſhips, for the widow and executrix has the wines in another's right. And as to the privilege of diſcharge, the difference ought to be, where the goods are attached in the life of the huſband, and where after his death; when it is in his life-time, and he dies the ſame day, yet the diſcharge ſhall continue; but here the ſame was after his death: and theſe are not the wines of George Hanger now, for that he is dead, and he hath no goods, nor is he now a citizen; and the diſcharge here ſhould go only to the perſon of a citizen. But the lord chief juſtice Coke held, that this privilege, to be exempt from priſage, is not ſo much tied to the perſon, but alſo to the wines of citizens, and the charter itſelf goeth unto them; and the diſcharge is of wines as of a chattel, and then a repreſentative ſhall be within the compaſs of a grant; alſo an executor ſhall not forfeit the goods which he hath as executor; and the reaſon is, becauſe they ſtill are the goods of the dead: here George

Hanger was a complete citizen in every respect, and so continued 'till his death; and these wines, in the hands of his executrix, are bona civium, and therefore within the extent of this grant, to be freed from prifrage. 3 Bullst. 2, 23, 26. By the act of tonnage and poundage, 12 Car. II. c. 4. it is declared, that the prifrage of wines ought not to pay tonnage or custom, and shall not be charged with the payment of any custom, subsidy, or sum of money, imposed upon wines by this statute, or any thing therein contained. But in the 1 Jac. II. c. 3. there is a proviso, that no merchant shall be charged with any duty granted by this act for the prifrage of wine, which he imports in any ship or vessel; but that it shall be received and taken from the person who hath the benefit of the said prifrage wine, who is hereby appointed to pay the same. And by a late * act, which makes allowances to merchants importers, out of the several duties laid on wines for such wine as is damaged; it is enacted, That the said allowances shall be made, not only to the merchant at importation, but also to the prifrage-master, or proprietor of the duties of prifrage: though it is here declared, that any thing in this act contained, or to be done in execution thereof, shall not extend to diminish or lessen the duties of prifrage and butlerage of wine, due upon the importation of the same; but that the said duties shall be collected and received, in the same manner as if this act had never been made.

* The statute 6 Geo. I. c. 12. §. 2 & 7.

In a late case, where an action was brought for money received to the use of the plaintiff, a special verdict was found by the jury; that king Charles I. gave to J. S. and his heirs, the duty of prifrage of all wines imported, to hold the same, discharged of all aids and taxes; and the question was, Whether the grantee should pay tonnage or not? It was here observed, that the duty of tonnage was first imposed by 12 Car. II. viz. 4l. 10s. on all French wine; then comes 1 Jac. II. c. 3. and imposes 8l. per ton on French wines, with a clause, that the grantee of prifrage should pay the duty: after this the 7 and 8 W. III. c. 20. imposes 25l. a ton; and then comes 9 & 10 W. III. c. 23. which grants an additional duty of 4l. 10s. per ton, to be levied as by the statute 12 Car. II. On this remarkable cause in the court of exchequer, it was there adjudged, that the said grantee of the prifrage wine should not pay the duty of tonnage: but, upon this, a writ of error was brought in the Exchequer Chamber, and the judgment was there reversed. Hil. Term 8 Ann. Paul against Shaw.

It was argued, that the grantee of prifrage was an antient and royal revenue, and if the crown had not granted it away, tonnage could not be due to the queen, for she could not pay that duty out of her own prifrage; therefore the grantee claiming under the crown, ought to have the same privilege and exemption, and the rather, because it was granted to him with this immunity. To this it was answered, and accordingly resolved, that tonnage should be paid for prifrage wines, by the grantee of prifrage; because, immediately on importation, this duty attaches upon the wines, and therefore, whatever part the grantee receives for prifrage, he takes it charged with the duty; otherwise it would be raised on the people to enrich a private man, which could never be the intent of the law-makers: it is true, the queen could not be charged with a duty to herself, but the duty revives when prifrage comes to a subject; and as to the covenants of discharge, in this grant of Charles I. they could only extend to the tonnage then in being, and which he then had, and not to what he had not, or might afterwards be given to his successors. 2 Salk. Rep. 617. 1 Nelf. Abr. 585. See the end of every letter relative to the BUSINESS OF THE CUSTOM-HOUSE.

PRIVATEERS AND PRIZES. A privateer is a kind of a private man of war, though the commission be not reckoned very honourable: the use of them is not very antient, and some persons account those but one remove from pirates; who, without any respect to the cause, or having any immediate injury done them, or not being so much as hired for the service, spoil men and goods, and innocent traders, making a traffic of it, amidst the calamities of a war.

That privateers in general are lawful when under right conduct, there is no room to question; for if a war be entered into on a just foundation, they cannot be unjust: all ways of bringing an enemy to reason, which are not against the laws of nations, are allowed; and it is no matter whether a person so commissioned is paid by the prince, or content to pay himself out of the spoils of the enemy; or if he acts for no pay at all, but out of love to his country, and loyalty to his prince.

It has therefore been customary, since the trade of Europe hath been so extensive, for princes and states, in case of a rupture with other princes, to issue forth commissions to private men, to equip ships of war; and the persons concerned in privateers, administer at their own costs a part of a war, by providing ships of force, and all other military utensils, to endamage the enemy; and they have, instead of pay,

leave granted to keep what they can take from an enemy, allowing the admiral his share, &c.

Besides the common private commissions, there is mention of special commissions granted to persons that take pay, who are under discipline; and if they do not obey orders, may be punished with death. And the wars in later ages, have generally given occasion for the issuing commissions to annoy the enemies in their commerce, and hinder such supplies as might strengthen them, or lengthen out the war; and likewise to prevent the separation of ships of greater force from their fleet.

By a law made in the 6th year of queen Anne, the lord high admiral, or commissioners of the admiralty, during the war, were empowered to grant commissions to commanders of British ships (on their giving security as usual, upon granting such commissions, except for payment of the tenths to the lord admiral) for the seizing and taking ships and goods belonging to enemies, in any sea or river in America, &c. and persons serving on board privateers, &c. are not to be impressed by any ship of war, under 20l. penalty.

Privateers may not attempt any thing against the law of nations; as to assault an enemy in a port or haven, under the protection of any prince or republic, be he friend, ally, or neuter; for the peace of such places must be kept inviolably. When these private commissions are granted, there is always great care to be had and taken, by caution to preserve the leagues of our allies, neutrals and friends, according to their several treaties; and therefore, by a marine treaty, between king Charles II. and the states of Holland [see the article MARINE TREATY], made at London in the year 1674, before a commission shall be granted to any privateer or caper, the commander is to give security in 1500 l. and if such ships have above one hundred and fifty men, then in 3000 l. &c. that they will make satisfaction for all damages, which they shall commit in their courses at sea, contrary to treaties with that State; upon pain of forfeiting their commissions, and answering such damage, for which the ship is made liable.

By other articles in the said treaty, if torture, cruelty, or any barbarous usage, after a capture, be done to the person taken in the prize, the same shall discharge such prize, although the was lawful; and the captains shall lose their commissions, also both they and the offenders be subject to punishment. This agreement between the English and Dutch, is fit to be a standard to all nations whatsoever; and by the treaty of Utrecht, there is an article with France to the same purpose.

Ships carrying powder, shot, and other warlike instruments and provisions of armature for sea or land, bound for an enemy from a neuter nation, or a state in amity with both the warring states, shall be taken as prize, and so may money, victuals, &c. But this must be in a time of necessity, when the war is so bad, that a prince cannot possibly defend himself or damage the enemy, without intercepting of such things. And, according to some treaties, those goods which may be used out of war as in war, (except ships) shall not be called prohibited, nor liable to condemnation, unless carried to places besieged: and goods made use of for pleasure and luxury only, are free, and not reckoned among such as are prizeable in neutral ships. Molloy Jur. Marit. 29.

If a part of the cargo of a ship, taken by a privateer, be prohibited goods, and the other part not prohibited; but such as, according to the necessity of the war, shall be so deemed, that may draw on a consequential condemnation of the ship as well as lading.

In case part of the lading is prohibited, and the other part merely for pleasure, the goods prohibited only shall be adjudged prize, and the ship, and the rest of the cargo be discharged; which may proceed in the voyage, on delivering up the other goods, without being brought into port; but if a ship be wholly laden with contraband goods, both the ship and goods may be made prize. Ibid. 30.

If any such ships shall be attacked, in order to be examined, on their refusing to submit they may be assaulted; and if the persons on board do not surrender themselves, the ships may be entered by force, and the persons resisting be slain. But where a commander of a privateer wilfully commits any spoils on the ships or friends of neutrals, or on the ships of their fellow subjects, according as the circumstances of the crime are more or less heinous, he is liable to punishment by death or otherwise, and the ship to be forfeited. Trin. 3 Jac. in B. R.

The owners of privateers are not to convert any part of their captures to their own use, until they are condemned as prize: and whether a ship be prize or not shall be tried in the admiralty, and no prohibition shall be granted: as was resolved, where in time of war between us and Denmark, a privateer belonging to Scotland took a Danish ship, and she was condemned by the admiralty of Scotland, and sold; whereupon a person suggested in the admiralty of England, that she was not a Danish vessel, but a ship of London, which belonged to an English merchant, and being to dispute the property, it was insisted, could not be tried there: the court held that the defendant

defendant had no property but by the sale, and the only question was, prize or no prize; therefore they would stay nothing, nor award a prohibition. 2 Keb. Rep. 158, 176. In an action of trover for a ship, tackle and furniture, whereof a Dutchman born, but a denizen of England, was the owner; it appeared, that in the war between France and Holland she was taken as a Dutch prize, and condemned in the court of admiralty in France, and there sold to the plaintiff: after which, the defendant, as servant to the owner, took her from the plaintiff to whom she was sold: it was here adjudged, that the sentence of the admiralty of France should not be examined in this action, and the plaintiff had judgment. Raym. 473.

Our laws take not much notice of privateers; but the diligence of enemies hath, times past, obliged us to be also diligent in this way, and therefore some acts of parliament have been made for the encouragement of privateers, and ordering of prizes; as particularly the statute 4 & 5 W. & M. cap. 25, which enacted, that all vessels with their loadings, and all goods and merchandizes that shall be taken and seized as prize, shall be brought into some ports of this kingdom; and, before breaking of bulk, put into the possession of the commissioners of prizes, or their agents, who, with two or more persons, as the officers and mariners of the respective ships shall intrust, and such as shall be appointed by the commissioners of the customs, are to preserve the same, 'till they shall be adjudged prize, except where it shall appear to the judge of the admiralty, that the goods are perishable; in which case bail shall be taken for them, yet so as to be subject to sale and distribution, as provided by this act.

After such goods and merchandize so taken, shall be adjudged prize, they shall, as soon as conveniently it may be done, be sold by the commissioners for prizes, &c. in the presence of persons entrusted by the commissioners of the customs, and the owners, officers, and mariners of the ships of war, publicly by inch of candle, notice being given fourteen days before, of the quantity and quality of the things to be sold, and of the time and place of sale; and the proceed of such sale, after the custom duties are paid and deducted, in case such prize were taken by a private man of war, shall be divided into five parts; four parts whereof to be answered to the persons interested in the privateer, and the fifth to their Majesties; and the ship, with its furniture, is to be enjoyed by the persons interested in the privateer.

And if the prize be taken by any of the king's ships, the nett proceed shall be divided into three parts; one third to be answered to the commander, officers, and mariners, taking the same, according to the custom of the sea for sharing prizes, &c. (a third of which is to be distributed among the ship's crew) one third part to be paid to the treasurer of the navy, for the relief of sick and wounded mariners, and the widows, children, and impotent parents, of persons slain at sea, in their Majesties service, and the other third part to the use of their Majesties: and in case a prize be taken by a merchant's ship, employed in the service of the crown, the proceed thereof shall be divided in like manner, as ships taken by men of war.

If any persons, who shall take such prize or prizes, shall embezzle or conceal any parts of the goods or merchandize, or put the same on shore, in any other place than their Majesties warehouses, they shall forfeit their share of such goods, upon proof made of it by one or more witnesses upon oath before the commissioners of the customs in the port of London, if the offence be committed within the said port; and before the chief magistrate of the place, in the presence of the chief officer of the port, in any other ports; one moiety whereof to be to the use of the informer, and the other to their Majesties; and seamen, and others concerned in prizes, shall be permitted to see and peruse the accounts of any prize. Where any ships or goods shall be taken by any privateer, by collusion, on proof made thereof in the court of Exchequer, or court of admiralty, they shall be adjudged lawful prize, and one moiety shall be to their Majesties, and the other to him that shall discover the same; and the bond given by the captain of such privateer is declared to be forfeited; and if such ships or goods shall be taken by collusion, by any man of war, the commander shall forfeit 1000*l.* also his command or employment, and be incapable of any office under their Majesties during seven years.

In all cases where such prize shall not be taken by any private men of war, one-tenth part, after deduction of their Majesties customs, and before any division is made of the proceed thereof, shall be paid to the treasurer of the navy, and by him kept apart, to be disposed of by warrant from the commissioners of the admiralty, or lord high admiral, for medals, and other rewards for officers and seamen, who shall do any extraordinary service. And if any man of war, or privateer, shall take or destroy any French man of war, or privateer, they shall receive for every piece of ordnance, in any ship so taken or destroyed, 10*l.* reward, to be paid by the commissioners for the prizes, out of their Majesties share of prizes. And if the commissioners do not pay the same, or give a bill for it, payable out of the first monies that shall come to their hands, within three days after the same ought to be paid,

and demand thereof made, the said commissioners shall be incapable to hold any office in their Majesties service for the future. And, by another clause in this act, if the commissioners for prizes, or of the customs, shall detain the shares belonging to persons interested in privateers, two days after they ought to be paid, &c. free from all deductions, except for warehouse-room, and 2*l.* per cent. for all other charges, they shall forfeit double the sum so detained.

When any vessel shall be taken as prize by a privateer, having no goods on board of the growth and manufacture of France, the persons interested in such privateer shall have the whole in their own use, after condemnation and payment of customs, and other duties, without deduction for tenths, or any other parts to their Majesties, or the lord high admiral. If any ship, whereupon wool is laden to be transported, contrary to law, be taken by any privateer, on proof thereof in the Exchequer, the persons concerned in the privateer shall have a moiety of the ship and goods, and their Majesties the other moiety. But where any vessel shall be taken within any of their Majesties ports, rivers, or havens, by any privateer, such prize shall belong to their Majesties, as a perquisite of the admiralty of England, and the captors to have only such a part as their Majesties shall think fit to allow, by way of encouragement.

If any ship or vessel taken as prize, or any goods therein, shall appear to belong to any of their Majesties subjects, continuing under their protection and obedience, which were before taken by their Majesties enemies, and now retaken, such vessels and goods, and every part thereof shall be restored, by decree of the court of admiralty, to the former owners, they paying in lieu of salvage, if retaken by a man of war, an eighth part of the value, which shall be answered to the captains, officers, and seamen in the said man of war, to be divided as in this act is directed, touching the share of prizes belonging to them, where such prizes are taken by any of their Majesties ships of war: and, if taken by a privateer, or other ship, after having been in possession of the enemy twenty-four hours, an eighth part of the value shall be paid; if above twenty-four hours, and under forty-eight, a fifth part; if above forty-eight hours, and under ninety-six, a third part; and, if above ninety-six hours, a moiety; all which payment to be made without any deduction. And if such retaken ship appears to have been set forth by the enemy as a man of war, the former proprietors shall pay the full moiety of the value.

The lord high admiral, or commissioners of the admiralty, shall express all things by this act directed to be observed concerning prizes, &c. in the instructions by them to be given to captains and commanders of their Majesties ships of war, and to commanders of privateers.

An order of council to release ships, and exempt them from molestation by men of war and privateers.

At the court at Windsor, August 13, 1705.

Present the Queen's most excellent Majesty in council.

Her Majesty is graciously pleased this day to order, that all ships belonging to the subjects of the States-General of the United Provinces, which have been taken by any of her Majesty's ships of war, or privateers, or which are now under arrest in any of her Majesty's ports, together with their loadings, be forthwith released; and that, for the future, no ships having passes from the said States-General to trade with France, be taken or molested in their voyage, by any of her Majesty's said ships of war, or privateers, her Majesty having already opened the trade with the dominions of Spain, for the advantage of her own subjects. And her Majesty is pleased further to declare and order, that the instruction be now given for the future to the commanders of her Majesty's ships of war and privateers, not to bring up or molest either the ships of her own subjects, or those of the subjects of the States-General, furnished with proper passes from her Majesty or the said States respectively, so as they do not carry any goods or merchandize which are contraband. And all commanders of her Majesty's ships of war, as well as privateers or merchant-ships, having letters of marque, are to conform themselves hereunto, notwithstanding any commissions or instructions heretofore given to the contrary. And for their more particular direction for the future, his royal highness the lord high admiral is forthwith to order such instructions to be prepared, as may be proper for the commanders of ships of war and privateers in this behalf, to be delivered to them as soon as may be.

CHRISTOPHER MUSGRAVE.

By the statute 6 Ann. cap. 37. for encouragement of the trade to America, all prize-offices are suppressed and taken away, and the flag, and other officers and seamen of every ship of war, shall have the whole interest in ships and goods they shall take there (being first adjudged prize in any of the courts of admiralty) subject to the duties to her Majesty for such goods, and to be divided as her Majesty and successors shall direct.

The

The judge of the admiralty shall, in five days after request, finish the preparatory examinations, in order to enquire of prizes, and the usual monition shall, on request, be executed in three days; and, in case no claim be made and attested on oath, giving twenty days notice after execution of such monition, &c. then the judge of the admiralty, upon producing the said examination, or copies thereof, and also all papers and writings taken in or with the capture, upon oath (or oath that no such papers were found) shall immediately proceed to sentence, either to acquit or condemn the same.

If claim shall be made, and security given by the claimant, to pay double costs to the captors, in case the ship or goods be adjudged prize, and there shall appear no occasion to examine witnesses, other than such as are near the court, then the judge shall cause such witnesses to be examined, and, in ten days after such claim and security given, proceed to sentence. But if it appears doubtful whether it be lawful prize, and it is necessary to have an examination of witnesses remote, and if it be desired, the said judge shall cause the same to be forthwith appraised, by persons named on the captor's part, and shall, after the appraisal, and in fourteen days after claim, take security for the claimants to pay the captors the value of the appraisal, if the same be adjudged lawful prize; and, after such security taken, the judge shall order the releasing or delivering the same to the claimants. And in case any claimant refuse to give the said security, the said judge is to require security from the captors, to be approved by the claimant, to pay the value of the appraisal, in case such capture shall not be adjudged prize, and thereupon the said judge shall make an order to release and deliver the same to the captors, or their agents.

There shall not be paid to the judge and officers of the court of admiralty, for condemning of captures as prize, above 10*l.* if the prize be above 100 tons, nor above 15*l.* if of greater burthen. And if any judge, or officer, shall delay proceeding relating to the condemning, discharging, releasing, or delivering of prizes, as aforesaid, within the time limited, or as soon as the same ought to be done by this act, he shall forfeit 500*l.* one moiety to the queen, and the other to the informer.

The parties may appeal to her Majesty and council, so as it be made in fourteen days after sentence, and security be given to prosecute the appeal, answer the condemnation, and pay treble costs, in case the sentence be affirmed; and so as execution be not suspended by such appeal.

By statute 9 Ann. cap. 27. all prize goods and merchandizes taken by ships of war, and imported into Great-Britain, &c. shall be liable to the payment of the said customs and duties as those goods would have been had they not been prize.

PRIZES.

The LAWS of ENGLAND relating to PRIZES.

The officers and seamen of the king's ships, and of other British ships having letters of marque, are intitled to the sole interest and property of all ships and goods by them taken, and adjudged lawful prizes by the court of admiralty. Stat. 13 Geo. II. cap. 4. §. 1 and 2.

The prize is to be divided among the officers and seamen of the king's ships, as he shall appoint by proclamation. Among privateers, the division is according to the agreement between the owners. *Ibid.*

The court of admiralty are to finish the examination of the persons to be examined, to prove the lawfulness of the prize, in five days after request for that purpose made: the monition is to be executed in three days. And in case no claim of the capture be duly entered, giving twenty days notice after the execution of the monition; or if there be a claim, after the claimant does not give sufficient security to pay double costs to the captors, if the prize be adjudged lawful, then the court are to proceed to sentence in ten days. *Ibid.* §. 3.

In case of doubt, or of writings being remote, the court may release the prize, on the claimant's giving good security to the captor for the payment of the full appraised value, in case the prize be adjudged lawful. *Ib.* §. 3. fin.

Judges and officers, on failure of their duty in respect to the condemnation of prizes, forfeit 500*l.* with full cost of suit, one moiety to the king, and the other to the informer. *Ib.* §. 6.

The judges and officers of the court of admiralty in the king's plantations or dominions abroad, shall not receive above 10*l.* in case the prize be under an hundred tons burthen; not above 15*l.* if it be of greater burthen. *Ib.* §. 7.

Commissioners of appeals, in causes of prizes, are to be appointed under the great seal, and appeals may be made to them within fourteen days after sentence. *Ib.* §. 8.

Agents for prizes are to be chosen by the captors. *Ib.* §. 10. The treasurer of the navy is to pay to the officers and seamen on board ships of war, or privateers, in an action where any ship of war, or privateer, shall have been taken from the enemy or destroyed, 5*l.* for every man on board such prize or ship destroyed in the beginning of the engagement. *Ib.* §. 15.

The captures of flota ships, or galleons, or register-ships,

bound from Buenos-Ayres, or Honduras, can be tried only in the high court of admiralty. *Ib.* §. 17.

This statute enacts several penalties and forfeitures for taking prizes by collusion. Privateers forfeit the prize, half to the king, and half to the informer; and the commander of a man of war forfeits 1000*l.* to be divided between the king and the informer. *Ib.* §. 19. See PRIVATEERS.

PRIZE-SHIPS. The duty of poundage is also payable (after the rate of 5 per cent. of the value upon oath) for ships taken as prize, and regularly condemned in the court of admiralty: but it is the practice not to charge them with any other duty whatsoever.

No goods to be imported into, or exported from thence, in any other but ships of the built of Great-Britain, Ireland, or the said plantations, wholly owned by the people thereof, and whereof the master, and at least three-fourths of the mariners, are of the said places (except ships taken as PRIZES, and legally condemned, navigated by the master and three-fourths of the mariners British, or of the said plantations, and owned by British) upon forfeiture of the ship and goods, one-third to his Majesty, one-third to the governor, one-third to the seizer and informer.

Prize-goods not to be exempted from duties, &c. but the goods may be unladen and brought on shore, in the presence of the officers of the customs, and secured in proper warehouses, under the separate locks of the collector, comptroller, and agent of the captors, 'till they are appraised and sold; and after they are sold, before delivery to the buyer they are to pay the customs and excise. 6 Ann. cap. 13. §. 9.

Prize-goods of the growth and product of foreign plantations, condemned in, and imported from, the British plantations in America, are, upon proper certificates and oaths, to pay the same duties as if the produce of the said British plantations. 10 Ann. cap. 22. §. 2. and 15 and 16 Geo. II. cap. 31. §. 6.

Foreign-built ships, or such not built in any of his Majesty's dominions of Asia, Africa, or America, are not to enjoy the privilege of ships belonging to Great-Britain or Ireland, although owned or manned by British (except such ships as are taken at sea by letters of marque or reprisal, [see MARQUE LETTERS OF MARQUE, and REPRISAL] and condemned as lawful prize in the court of admiralty) but are to be deemed aliens ships, and to be liable to aliens duties. See the article PRIVATEER.

The LAWS of FRANCE relating to PRIZES.

Art. I. No person shall fit out a ship for war without a commission from the admiralty.

II. Such as obtain commissions for equipping ships for war, shall be obliged to cause it to be recorded at the admiralty-office where the ship is fitted out, and to give security for the sum of 15,000 livres, which shall be received by the lieutenant, in preference of our attorney.

III. We forbid our subjects to take commissions from any foreign kings, princes, states, to arm ships for war, and sail under their flags, except it be by our order, under pain of being treated as pirates.

IV. All vessels belonging to our enemies, or commanded by pirates, buccaneers, and others, sailing without the commission of any sovereign prince or state, shall be good prize.

V. All vessels fighting under another flag than that of the nation whose commission they carry, or having commission from two different princes or states, shall likewise be good prize; and, if they be armed for war, the captains and officers shall be punished as pirates.

VI. All vessels, and their lading, in which there are no charter-parties, bills of lading, nor invoices, shall be likewise good-prize: and we forbid our captains, officers, and seamen of ships taking them, to divert them, under pain of corporal punishment.

VII. All ships having effects on board belonging to our enemies, and the goods of our subjects or allies on board of enemies ships, shall likewise be good prize.

VIII. If any of our subjects ships be retaken from our enemies, after having been four-and-twenty hours in their hands, they shall be good prize; and, if it is before four-and-twenty hours, they shall be restored to the owners, with all that is in them, and one-third shall be given to the ship that retakes them.

IX. If the ships, without being retaken, be abandoned by the enemy, or if by tempest, or any other accident, they return into the possession of our subjects, before they have been carried into any enemy's ports, they shall be restored to the owner, who shall reclaim them within the year and day, though they have been more than four-and-twenty hours in the enemy's possession.

X. The ships and effects of our subjects and allies, retaken from pirates, and reclaimed within a year and a day after the declaration made to the admiralty, shall be restored to the owners, they paying one-third of the value for the charges of the retaking.

XI. The

XI. The arms, powder, ball, and other munitions of war, even the horse and furniture, transported for the service of our enemies, shall be confiscated, in whatever vessels they be found, and to whosoever they belong, whether they be our subjects or our allies.

XII. All vessels refusing to strike and bring to, upon the summons of our ships, or those of our subjects armed for war, may be compelled thereto by artillery, or otherwise; and, in case they refit and fight, they shall be good prize.

XIII. We forbid all captains of vessels armed for war to detain those of our subjects or allies who have brought to, and shewed their bills of lading and charter-parties, or to take, or suffer any thing to be taken from them, under pain of death.

XIV. No vessel taken by foreigners may remain above four-and-twenty hours in our harbours, except they be detained there by tempest, or be taken from our enemies.

XV. If in the prizes brought into our ports by foreigners, here be found goods belonging to our subjects or allies, those belonging to the former shall be restored, and those of the latter shall not be put in warehouses, nor bought by any person, under any pretence whatsoever.

XVI. As soon as the captains of armed vessels shall render themselves masters of any ships, they shall seize their licences, passports, sea-letters, charter-parties, bills of lading, and all other papers concerning their lading and voyage, together with the keys of their chests, trunks, and chambers, and shall cause to be shut the hatches, and other places where there is any goods.

XVII. We enjoin all captains that take prizes, to bring or send them, with the prisoners, to the ports where they are armed, under pain of losing their rights, and of an arbitrary fine, except they be obliged, by tempest or enemies, to put into some other port, in which case, they shall forthwith acquaint the concerned.

XVIII. We forbid, under pain of death, all captains, soldiers, and seamen, to sink the ships they take, and put ashore the prisoners upon remote coasts or islands, in order to conceal the prize.

XIX. And where the takers are not in a condition to take the charge of the ship taken, and of the prisoners, and only take out the goods, or agree for a ransom, they shall be obliged to seize the papers, and bring with them at least the two principal officers of the prize, under pain of being deprived of what may belong to them therein, and of corporal punishment, &c.

XX. We forbid them to open any chests, bales, sacks, pipes, barrels, casks, or trunks, or to transport or sell any goods of the prize; and we likewise forbid all persons to buy them, before the prize be condemned, or till it be ordained by authority, under pain of restitution of four-fold, and corporal punishment.

XXI. As soon as the prize is brought into any road or port of our kingdom, the captain that has taken her, if he be there, and, in his absence, the person that is intrusted with her, shall be obliged to make his declaration to the officers of the admiralty, to surrender into their hands the papers and the prisoners, and declare to them the day and hour, place and degree of latitude, in which the vessel was taken, whether the captain refused to shew his commission or his passport; whether he attacked, or only defended himself; what flag he bore; and all the other circumstances of the taking and voyage.

XXII. After the delivery of the declaration, the officers of the admiralty shall immediately go aboard of the prize, whether she be in the road or in the port, and shall draw up a verbal process of the quantity and quality of the goods, and of the condition in which they find the cabins, trunks, hatches, and hold; which they shall afterwards cause to be shut, and sealed with the seal of the admiralty; and they shall then establish a watch, to take care of what they have sealed, and prevent the embezzlement of the effects.

XXIII. The officers of the admiralty shall make their verbal process in presence of the captain, or master of the prize, and, in his absence, before the two principal officers and seamen belonging to him, together with the captain or other principal officers of the ship that took the prize; and likewise in presence of the reclaimers, if any be.

XXIV. They shall hear, concerning the matter of the prize, the master or commander thereof, and the principal men of his company, and likewise some of the officers and seamen of the ship that took her.

XXV. If the ship be brought in without prisoners, charter-party, or bill of lading, the officers, soldiers, and seamen of the ship that took her, shall be examined separately upon the circumstances of the prize, and how the ship came to be brought in without prisoners; and the ship and goods shall discover, if possible, to what nation they did belong.

XXVI. If by the deposition (or oath) of the company, and the search and view of the ship and goods it cannot be discovered of whom they have been taken, an inventory shall be taken of the whole, and it shall be appraised, and put into safe custody, to be restored to whomsoever it may belong, if reclaimed within a year and a day; and if otherwise, it shall

VOL. II.

be divided as a wreck between us, the admiral, and the * armateur.

* Armateur is the designation given in France to merchants or others concerned as owners, in the arming of privateers &c.

XXVII. If it be necessary before the condemnation of a prize to take the goods out of a ship, to prevent their being damaged, an inventory shall be made in presence of our attorney, and of the parties concerned, who shall sign it if they can write; and afterwards the goods shall be delivered into the hands of some sufficient person, or in warehouses locked with three different keys; of which one shall be given to the armateur, another to the receiver of the admiral, and the third to the claimer, if any be; and if none, to our attorney.

XXVIII. Goods which cannot be kept, shall be sold at the desire of the parties concerned, and adjudged to the fairest offerer, in the presence of our attorney, at the shutting up of the court, after three delays of the sale, from three days to three days; the port sales, or publication being duly made beforehand, and the placards affixed in the usual places.

XXIX. The price of the sales shall be consigned in the hands of a sufficient merchant, to be delivered after the adjudication of the prize, to whom it shall belong.

XXX. We enjoin the officers of the admiralty to proceed incessantly to the execution of decrees and sentences given concerning prizes; and to cause the vessels, goods, and effects, for which a replevy shall be ordained, to be delivered immediately, and without delay, under pain of interdiction of a fine of five hundred livres, and of all costs, charges, and damages.

XXXI. Before the repartition, the charges of the unlading, and of the keeping of the ship and goods, shall be deducted, according to the account which shall be stated by the lieutenant of the admiralty, in the presence of our attorney and the parties concerned.

XXXII. After the aforesaid deduction, the tenth of the price shall be delivered to the admiral, and the charges of the court shall be taken out of the remainder; which shall be afterwards divided amongst the parties concerned, according to the conditions of their partnership.

XXXIII. If there be no contract of partnership, two-thirds shall belong to them that have furnished the vessel, with munitions, arms, and provisions; and the other to the officers, seamen, and * soldiers.

* By soldiers, in this and several other articles of the French marine, is only meant such land-men as enter themselves on board of privateers, only for fighting; and those go for the most part, no purchase no pay; for they have no regular and disciplined troops on board their privateers in France, no more than elsewhere.

XXXIV. We forbid the officers of the admiralty to become directly or indirectly the parties to whom vessels, goods, or effects, belonging to prizes are adjudged, under pain of confiscation, a fine of fifteen hundred livres, and interdiction of their offices.

PRIZES, under what regulations in SPAIN.

Of the manner of disposing of prizes taken by the armada's or flota's trading to the West-Indies.

I. The instructions given to Peter Arias Davila in the year 1513, when he was sent governor and captain-general of the province of the FIRM LAND, which was then that of DARIEN, and the country about, spoke to the matter thus: That of whatsoever he should take with the fleet he went over in, of which the ships and provisions were his Majesty's besides the fifth, two parts should come to the king, the one for his ship and the other for his provisions; but if there went with the fleet any ship belonging to private persons, and upon their own charge, and they should take any prize, his Majesty should have only his fifth, and the rest be divided among all the fleet, because it was to be supposed the prize had been taken by the assistance of it, and the distribution ought to be according to every man's pay and allowance.

2. The emperor Charles V. afterwards declared, That though when any prince was taken in war, his ransom and moveables were his Majesty's undoubted right, yet in consideration of the great fatigues his subjects endured in the conquest of the Indies, he required only the sixth part of the ransom of any cazique taken, or the treasures belonging to him, and all the rest, after deducting the king's fifth, to belong to the conquerors; but if the cazique were slain in the battle, his Majesty should have one half of his treasure, and the other half, after deducting the fifth, be equally distributed.

3. In 1558, the admiral Peter de Roelas having taken a French ship, and recovered a Spaniard taken by that privateer, it was ordered, that the admiral should have the king's fifth of what belonged to the Frenchman, and the rest of it to be divided for that time between the said admiral and his

men; and as for the ship retaken, the one half should be for the admiral and men, and the other restored to the owners. In 1570, some doubts arising between two prizes taken, the king decided the controversy thus, That the admiral should have the fifth belonging to his Majesty, and all the rest to be divided betwixt the officers, soldiers, and sailors, belonging to the fleet: but if any ships coming from the Indies were retaken from pirates, they should be restored entire to the owners.

4. If there arise any controversy about prizes taken, the court of the India-House is to decide it; but if it be above 600,000 maravedies value, there lies an appeal from it to the committee of war for the Indies, as was practised in the year 1649, in the case of an English ship, which, though taken in time of peace, was condemned as lawful prize, because it had West-India commodities aboard. D. Francis de Sotomajor coming from Potofi by the way of Buenos-Ayres, was taken by the Dutch, and carried to Baia de Todos os Santos in Brazil, which place being recovered by D. Frederic de Toledo, D. Francis pretended, that as much of his plate and goods as could be found ought to be restored him; because the war pirates make being unjust, they could not deprive him of the just dominion over what was his own, though it had been above 24 hours in their hands, and he had judgment given for him. In the year 1584, orders were given to all the commanders in the Indies, that when prizes were taken from pirates, if there were any goods found belonging to his Majesty's subjects, they should be delivered as they were found, without diminishing, to the owners.

PROJECTOR, one who contrives, schemes, or forms any public design.

REMARKS.

Man is the worst of all God's creatures to shift for himself; no other animal is ever starved to death; nature without, has provided them both food and cloaths; and nature within, has placed an instinct that never fails to direct them to proper means for a supply: but man must either work or starve, slave or die; he has, indeed, reason given him to direct him, and few who follow the dictates of that reason come to such unhappy exigencies; but when by the errors of a man's youth he has reduced himself to such a degree of distress, as to be absolutely without three things, money, friends, and health, he dies in an hospital.

Ten thousand ways there are to bring a man to this, and but very few to bring him out again. Death is the universal deliverer, and therefore some who want courage to bear what they see before them, hang themselves for fear; for certainly self-destruction is the effect of cowardice in the highest extreme.

Others break the bounds of laws to satisfy that general law of nature, and turn open thieves, house-breakers, highwaymen, clippers, coiners, &c. 'till they run the length of the gallows, and get a deliverance the nearest way at St Tyburn.

Others, being masters of more cunning than their neighbours, turn their thoughts to private methods of trick and cheat, a modern way of thieving, every jot as criminal, and in some degree worse than the other, by which honest men are gulled with fair pretences to part from their money, and then left to take their course with the author, who sculks behind the curtain of a protection, or in the Mint, or Friars, and bids defiance as well to honesty as the law.

Others, yet urged by the same necessity, turn their thoughts to honest invention, founded upon the platform of ingenuity and integrity. These two last sorts are those we call Projectors; and as there were always more geese than swans, the number of the latter are very inconsiderable, in comparison of the former; and, as the greater number predominates the less, the just contempt we have of the former sort, befalls the other, who, like cuckolds, bear the reproach of other people's crimes.

A mere projector then is a contemptible thing, driven by his own desperate fortune to such a straight, that he must be delivered by a miracle or starve; and when he has beat his brains for some such miracle in vain, he finds no remedy but to paint up some bauble or other, as players make puppets talk big, to show like a strange thing, and then cry it up for a new invention, gets a patent for it, divides it into shares, and they must be sold; ways and means are not wanting to swell the new whim to a vast magnitude; thousands, and hundreds of thousands are the least of his discourse, and sometimes millions; 'till the ambition of some honest cockcomb is wheedled to part with his money for it, and then

— — — Nascitur ridiculus mus.

The adventurer is left to carry on the project, and the projector laughs at him. The diver shall walk at the bottom of the Thames; the salt-petre-maker shall erect a dunghill into a palace; the engineers build models and windmills to draw water, 'till funds are raised to carry it on, by men who have more money than brains, and then good night Mr Patent and Invention; the projector has done his business, and is gone. But the upright and honourable projector is he, who having

by fair and plain principles of sense, honesty, and ingenuity, brought any contrivance to a suitable perfection, makes out what he pretends to, picks no body's pocket, carries his project in execution, and contents himself with the real produce of his useful invention.

Necessity has so violently agitated the wits of men within half a century past, that it seems not at all improper, by way of distinction, to call it the projecting age. For though in times of war and public confusions, the like humour of invention has seemed to stir, yet, without being particular to the present, it is, I think, no injury to say, the past ages have never come up to the degree of projecting and inventing, as it refers to matters of negoce and methods of civil polity, which we see this age arrived to.

For the improvement of the destructive art of war, there has been project after project; especially in conducting armies, and in offensive engines; witness the new ways of mines, saggades, entrenchments, attacks, clodgments, and a long et cetera of new inventions, which want names, practised in sieges and encampments; witness the new forts of bombs and unheard-of mortars, of seven to ten and twenty tons weight, with which our fleets standing two or three miles off at sea, can, in some degree, imitate the supreme Being himself, and rain fire and brimstone out of heaven, as it were, upon towns built on the firm land: witness also our new invented child of hell, the machine which carries the thunder, lightning, and earthquakes in it's bowels, and tears up the most impregnable fortifications.

But if we should search for a cause, from whence it comes to pass that this age swarms with such a multitude of projectors more than usual, who, besides the innumerable conceptions which die in the bringing forth, and (like abortions of the brain) only come into the air and dissolve, do really every day produce new contrivances, engines, and projects to get money never before thought of: if I say, we would examine whence this comes to pass, it must be thus:

The losses and depredations which wars occasion will not only fall upon private traders, but bring incumbrances on the nation in general; and these have prompted men by necessity, to rack their wits for new contrivances, new inventions, new trades, stocks, projects, and any thing, to retrieve the desperate credit of their private fortunes, and support the credit of the nation. That this is probable to have been the cause, will appear further; thus, France has, without question, felt it's share of losses by war as well as Great-Britain; but the poverty there falling chiefly on the poorer sort of people, they have not been so fruitful in inventions and practices of this nature, 'till the Mississippi affair [see MISSISSIPPI], their genius being quite of another strain. As for the gentry and more capable sort, the first thing a Frenchman flies to in his distress is the army; and he seldom comes back from thence to get an estate by painful industry, but either has his brains knocked out, or makes his fortune there.

If industry be in any business rewarded with success, it is in the MERCHANDIZING PART OF THE WORLD, who indeed may MORE TRULY BE SAID TO LIVE BY THEIR WITS, THAN ANY PEOPLE WHATSOEVER. All foreign negoce, though to some it is a plain road by the help of custom, yet it is in it's beginning ALL PROJECT, CONTRIVANCE, AND INVENTION. Every new voyage the merchant schemes, is a project; and ships are sent from port to port, as markets and merchandize differ, by the help of strange and universal intelligence; wherein some are so exquisite, so swift, and so exact, that a merchant sitting at home in his counting-house, at once converses with all parts of the known world. This and travel, MAKE A TRUE BRED MERCHANT, THE MOST INTELLIGENT MAN IN THE WORLD, and consequently the most capable, when urged by necessity, to contrive new ways to live: and from hence we conceive, may be very properly derived the variety of projects wherewith we have abounded.

And from this sort of men, it is easy to trace the origin of BANKS, STOCKS, STOCK-JOBBER, ASSURANCES, FRIENDLY SOCIETIES, LOTTERIES, AND THE LIKE. To which may be added likewise, the long ANNUAL ENQUIRY of the house of commons FOR WAYS AND MEANS, which has been a particular movement to set all the heads of the nation at work. And I appeal, with submission, to the gentlemen of that honourable house, if the greatest part of the best ways and means to raise public money, out of the common road of land-taxes, polls, and the like, have not been handed to them from the MERCHANT.

Projects of this nature have been doubtless in general of public advantage, as they have tended to the improvement of TRADE, AND EMPLOYMENT OF THE POOR, AND THE CIRCULATION AND INCREASE OF THE PUBLIC STOCK OF THE KINGDOM; but this is supposed of such as are built on the honest basis of ingenuity and improvement; in which though I'll allow the author to aim primarily at his OWN ADVANTAGE, yet with the circumstances of PUBLIC BENEFIT added.

Wherefore it is necessary to distinguish among the projects of the present times, between the honest and the dishonest.

There

There are many fair pretences of fine discoveries, new inventions, engines, and I know not what, which having been advanced in notion, and talked up for great things to be performed, when such and such sums of money shall be advanced, and such and such engines are made, that have raised the fancies of credulous people to such a height, that merely on the shadow of expectation, they have formed companies, chose committees, appointed officers, shares, and books, raised great stocks, and cried up an empty notion to such degree, that people have been betrayed to part with their money for shares in a NEW NOTHING: and when the inventors have carried on the jest, 'till they have sold their own interest, they have left the cloud to vanish of itself, and the poor purchasers to quarrel with one another, and go to law about settlements, transferrings, and some bone or other thrown among them by the subtlety of the authors, to lay the blame of the miscarriage upon those, who have been their bubbles. Thus the shares at first begin to fall by degrees, and happy is he that sells in time, 'till like brass money it will go at last for nothing at all. So have I seen shares in JOINT STOCKS, PATENTS, ENGINES, AND UNDERTAKINGS, blown up by the air of great words, and the name of some man of credit concerned, to 100*l.* for a 500th part or share, some more, and at last dwindle away, 'till it has been stock-jobbed down to 12, 10, 9, 8*l.* a share, and at last there has been no buyer; that is, in short, the fine new word for nothing worth, and many families ruined by the purchase. If we should name linen manufactures, saltpetre-works, copper-mines, diving-engines, and the like, for instances, we should do no wrong to truth, or to some persons that have been too visibly guilty of forming such like deceitful projects.

We might go on upon this subject to expose the FRAUDS AND TRICKS OF STOCK-JOBBERs, PATENTEES, COMMITTEES, WITH THOSE MOUNTBANKS WE VERY PROPERLY CALL STOCK BROKERS; but we have not gall enough for such a work: as a general rule of caution to those who would not be tricked out of their estates by such pretenders to enrich others, let them observe, that all such people who may be suspected of design, have assuredly this in their proposals, to get a ROUND SUM to themselves, before any one else can hope to GET ANY THING.

But this is no reason why inventions upon honest foundations and to fair purposes, should not be encouraged; no, nor why the author of any such fair contrivances should not reap the harvest of his own ingenuity: our acts of parliament for granting patents to FIRST INVENTORS FOR FOURTEEN YEARS, is a sufficient acknowledgment of the due regard which ought to be had to such as find out anything which may be of public advantage, new discoveries in trade, in arts and mysteries, of manufacturing goods, or improving of land, are, without question, of as great benefit, as any discoveries made in the works of nature, by the several academies and royal societies in the world.

There is, it is true, a great difference between new inventions and projects, for the improvement of manufactures or lands, which tend to the immediate benefit of the public, and employing of the poor, and those framed by subtle heads, with a sort of a deceptio visus and legerdemain, to bring people to run needlessly or unusual hazards: and we give a due preference to the first, and yet success has so sanctified some of those other sorts of projects, that it would be a kind of blasphemy against fortune to disallow them; witness Sir William Phipps's voyage to the wreck; it was a mere project, a lottery of a hundred thousand to one odds; a hazard, which if it had failed, every body would have been ashamed to have owned themselves concerned in: a voyage that would have been as much ridiculed as Don Quixote's adventure upon the windmill. Bless us! that folks should go three thousand miles to angle in the open sea for pieces of eight! why they would have made ballads of it, and the merchants would have said of every unlikely adventure, it was like Phipps's wreck voyage: but it had success, and who reflects upon the project?

However, this sort of projects comes under no reflection as to their honesty, save that there is a kind of honesty a man owes to himself and to his family, that prohibits him throwing away his estate in improbable and impracticable adventures; but still some hit even of the most unlikely, of which this was one of Sir William Phipps's, who brought home a cargo of silver of near two hundred thousand pounds sterling, in pieces of eight, fished up out of the open sea remote from any shore, from an old Spanish ship which had been sunk above forty years.

REMARKS on our Article PROJECTOR.

A short history of some remarkable projects.

The invention of arts with engines and handicraft instruments for their improvement, requires a chronology as far back as the eldest son of Adam, and has to this day afforded some new discovery in every age.

The building of the ark by Noah, so far as you will allow it a human work, was the first project we read of; and no

question seemed so ridiculous to the graver heads of that wife, though wicked age, that poor Noah was sufficiently bantered for it; and had he not been set on work by a very peculiar direction from heaven, the good old man would certainly have been laughed out of it, as a most senseless and ridiculous project.

The building of Babel was a right project; for, indeed, the true definition of a project, according to modern acceptance, is a vast undertaking, too big to be managed, and therefore likely enough to come to nothing; and yet as great as they are, it is certainly true of them all, even as to the projectors proposal; that according to the old tale, if so many eggs are hatched, there will be so many chickens, &c. Thus it was most certainly true, that if the people of the old world could have built a house up to heaven, they would never have been drowned again on earth, and they only had forgot to measure the height; that is, as in other projects, it only miscarried, or else it would have succeeded.

And yet when all is done, that very building, and the incredible height to which it was carried, is a demonstration of the vast knowledge, of that infant part of the world, which had no advantage of the experiments or invention of any before themselves.

A very diverting account might, perhaps, be given of this, but I shall not attempt it. Some are apt to say with Solomon, No new thing happens under the sun, but what is, or has been; yet I made no question, but some considerable discoveries have been made in their later ages, and inventions of human original produced, which the world was ever without before, either in whole or in part; and I refer only to two cardinal points, the use of the load-stone at sea, and the use of gun-powder and guns; both which, as to the inventing part, I believe the world owes as absolutely to those particular ages, as it does the working in brass and iron to Tubal Cain, or the inventing of music to Jubal his brother.

As to engines and instruments for handicraft men, this age, I dare say, can shew such as never were so much as thought of, much less imitated before; for that is not a real invention, which has something before done like it, it is more properly an improvement. For handicraft instruments, I know none owes more to true genuine contrivance, without borrowing from any former use, than a mechanic engine contrived in our time, called a knitting-frame, which being contrived with admirable symmetry, works really with a very happy success, and may be observed by the curious to have a more than ordinary composition, for which I refer to the engine itself, to be seen in every stocking-weaver's work-shop. I shall trace the original of the projecting humour that has reigned more particularly in England, and some other parts of Europe, no farther back than the year 1680, dating its birth as a monster then, though it had indeed something of life in the time of the late civil war. We allow, no age has been altogether without something of this nature: and some very happy projects are left to us as a taste of their success, such are the water-houses for supplying of the city of London with water, and since that, the New-River, both very considerable undertakings, and perfect projects, adventured on the risk of success.

In the reign of King Charles the First, infinite projects were set on foot for raising money without a parliament; oppressing by monopolies and privy seals; but these are excluded our scheme, as irregularities: for thus the French are as fruitful in projects as we, and these are rather expedients or stratagems than projects.

After the fire of London, the contrivance of an engine to quench fires, was a project the author was said to get well by, and we have found to be very useful. But about the year 1680, the art and mystery of projecting began visibly to creep into the world. Prince Rupert, uncle to king Charles II. gave great encouragement to that part of it which respects engines, and mechanical motions; and bishop Wilkins added as much of the theory to it, as writing a book could do: the prince has left us a metal called by his name, and the first project upon that was casting of guns of that metal, and boring them; done both by a peculiar method of his own, and which died with him, to the great loss of the undertaker; who, to that purpose, had, with no small charge, erected a water-mill at Hackney-marsh, known by the name of the Temple-mill, which mill very happily performed all parts of the work: and there were of these guns on board the Royal Charles, a first rate ship, being of a reddish colour, different either from brass or copper. There might be some reasons of state, for laying that project aside. After this there was a floating machine set on foot, to be wrought with horses for the towing of great ships, both against wind and tide; and another for the raising of ballast, which, as unperforming engines, had the honour of being made, exposed, tried, and laid by, before the prince died.

If thus we introduce it into the world under the conduct of that prince, when he died, it was left a hopeless brat, and had hardly any hand to own it, 'till the wreck voyage before noted, performed so happily by Capt. Phipps, afterwards Sir William; whose strange performance set a great many heads at work, to contrive something for themselves; he was immediately

mediately followed by my lord Mordaunt, Sir John Narborough, and others from several parts, whose success made them soon weary of the work.

The project of the penny-post, so well known, and still practised, I cannot omit; nor the contriver, Mr Dockwra, who had the honour to have the injury done him in that affair repaired, in some measure, by the public justice of parliament. And the experiment proving it to be a noble and useful design, the author must be remembered, to his great reputation.

It was, no question, a great hardship for a man to be master of so fine a thought, that had both the essential ends of a project in it, public good and private advantage; and that the public should reap the benefit, and the author be left out; the injustice of which, no doubt, discouraged many a good design; but since an alteration in public circumstances recovered the lost attribute of justice, the like, we hope, is not to be feared in future. Mr Dockwra had the satisfaction to see the former injury disowned, and an honourable return made, even by them who did not the injury, in bare respect to his ingenuity.

A while after this, several people, under the patronage of some great persons, had engaged in planting of foreign colonies; as William Penn, the lord Shaftsbury, Dr Cox, and others, in Pensilvania, Carolina, East and West Jersey, and the like places; which we do not call projects, because it was only prosecuting what had been formerly begun; but here began the forming of public joint stocks, which, together with the East-India, African, and Hudson's-Bay companies, before established, begat a new trade, which we call by the new name of STOCK-JOBING; which was at first only the simple occasional transferring of interest and shares from one to another, as persons alienated their estates; but, by the industry of the STOCK-BROKERS, who got the business into their hands, it became a trade; and one, perhaps, which has been managed with the greatest intrigue, artifice, and trick, that ever any thing which appeared with a face of honesty could be handled with; for, while the brokers HELD THE BOX, they made the whole exchange THE GAMESTERS, and raised and lowered the prices of stocks as they pleased; and always had both buyers and sellers, who stood ready, innocently to commit their money to the mercy of their mercenary tongues. This upstart of a trade having tasted the sweetness of success, which generally attends a naval proposal, introduced the illegitimate wandering object I speak of, as a proper engine to find work for the brokers. Thus stock jobbing nursed projecting, and projecting in return has very diligently pimped for its foster parent, till both are arrived to be public grievances; and, indeed, are now almost grown scandalous to the nation.

Ever since the superlative art of fund-projection hath been cherished in this kingdom, we have had PROJECT UPON PROJECT, AND BUBBLE UPON BUBBLE, IN ORDER TO RUN US INTO DEBT, AND MULTIPLY OUR TAXES THE FASTER; whereby the millions upon millions that we have gained by SOLID COMMERCE AND NAVIGATION, HAVE BEEN TRANSFERRED TO FOREIGNERS FOR THE PAYMENT OF INTEREST OF OUR NATIONAL INCUMBRANCES, AND OTHERWISE SQUANDERED AMONG USURERS AND MONEY-MONGERS, WHO HAVE INDOLENTLY SUBSISTED ON THEIR INCOME FROM THE EXCHEQUER, instead of employing their capital IN TRADE, for the employment of the INDIGENT, FOR THE SUBSTANTIAL RICHES OF THE STATE, and the permanent support of the PUBLIC CREDIT. To such a pitch of projecting have these measures brought the nation, that in the year 1720, the whole kingdom became PROJECTORS AND BUBBLE-MONGERS, OUR COMMERCE SUSTAINED AN UNIVERSAL TEMPORARY STAGNATION, AND THE PUBLIC CREDIT WAS SUNK TO AN EBB ALMOST PAST RECOVERY. This has already once proved the fatal effect of fund-projects: and as the harpies of those times were for a time successful, in this their most superlative scheme of iniquity, with intent to draw all the TREASURE OF THE NATION into those FEW HANDS, who were in the SECRET; so tribes of inferior projectors afterwards broached scheme after scheme, in order to plunder the public of what little the South-Sea blood-suckers had left them possessed of. See our articles ACTIONS, and BUBBLES, and SOUTH SEA COMPANY.

After the blessed æra of 1720, and the dreadful wound which the nation had received from that detestable South-Sea project, was skinned over, we had another cardinal project offered to the nation, for the payment of the NATIONAL DEBTS, and the infallible support of the PUBLIC CREDIT: this was the establishment of a SINKING FUND, in order gradually to sink or diminish the public debts: and this was to be the SOVEREIGN SPECIFIC to cure the nation of all its maladies; but what has been the end of this project? Why truly, instead, of this SACRED FUND being inviolably applied to the gradual payment of our PRINCIPAL MONEY-DEBT, it has been made subservient to the increase thereof, from 50 to 80 MILLIONS! and from 80 to 140 MILLIONS! See the articles INTEREST OF MONEY, CREDIT [PUBLIC CREDIT], DEBTS, [NATIONAL DEBTS], FUNDS.

And although it cost the nation several millions of money in

the public accounts, to bring the IRREDEEMABLE public debts into a state of REDEMPTION, in order to amuse the public with a notion of the gradual payment thereof; yet have we not had project after project since, to render our debts again IRREDEEMABLE? Are not these retrograde measures a certain indication and proof, that our funds have hitherto been only tampered with by SUPERFICIAL PROJECTS, which have swelled instead of lessened the NATIONAL INCUMBRANCES? Has the reduction of interest in the public funds hitherto proved any thing more than a TEMPORARY EXPEDIENT (which is no better than a TEMPORARY PROJECT) to raise a fund to pay INTEREST-MONEY FOR MORE AND MORE PUBLIC DEBTS; and the more these national incumbrances increase, will not the whole property of the MONEYED-INTEREST become more and more PRECARIOUS? And what may one day be the inevitable consequence of such fund-bubbles, see our article MONEYED-INTEREST.

The grand project upon which the credit of our funds seems to be bottomed at present, is that only of the continued REDUCTION OF INTEREST, 'TILL THE PRINCIPAL MONEY-DEBT SHALL AT LENGTH BECOME TO BE WORTH NOTHING; and if this project is our only resource in times of exigency, must not the property of the public creditors be reduced to an interest of 2 per cent. and at length to one, and from thence may not this reducing project absolutely annihilate the whole 140 millions of money now due to the public creditors?

But if this scheme of reduction, carried to extremity, is to be the nation's whole dependence, must it not, in the end, defeat itself; for what is it that supports these funds, whose surplusses constitute the SINKING FUND, but the SPENDING-MONEY of the nation, which supports the whole public revenue? And if the SPENDING-MONEY, or the INTEREST-MONEY of the FUND PROPRIETORS is once reduced to little or nothing, what will become of the AGGREGATE FUND, THE SOUTH-SEA FUND, AND THE GENERAL FUND, the surplusses of which constitute so great a proportion of the Sinking fund? Does not this consideration alone, demonstrate the truth of what we have endeavoured to shew in many other lights, viz. that the PRESENT CONSTITUTION OF THE PUBLIC REVENUE OF THIS KINGDOM, IS NOT FOUNDLED ON A NATIONAL BASIS, and that the PUBLIC CREDIT, and the COMMERCE of the kingdom, cannot be upheld, and advanced by such PROJECTING EXPEDIENTS? For really they are no better, the effects thereof having hitherto proved it beyond contradiction, however plausible and artfully some people may attempt to shew the contrary, to answer such temporary purposes only, as will tend to plunge the nation into greater and greater debts and difficulties, instead of extricating it from those under which it manifestly labours.

Does not this state to which the public revenue is now reduced, prove the rectitude of that measure, THAT THE ANNUAL EXPENCE OUGHT NEVER TO EXCEED THE ANNUAL REVENUE; and that, consequently, when an increase of the former becomes necessary for securing or vindicating the honour or rights of a nation, the latter ought to be increased in proportion, if necessary, even to the utmost the people can spare from their daily subsistence?

For such honest and honourable projects, that will solidly and permanently support and uphold the true interest, and the honour and glory of the kingdom, see our articles ARTIFICER, DUTIES, MANUFACTURER, LABOUR, LAND, MERCANTILE COLLEGE, MUSEUM, PARLIAMENT, [MEMBER OF PARLIAMENT], PHILOSOPHY EXPERIMENTAL, POOR, ROYAL SOCIETY, REVENUE, SOUTH-SEA COMPANY, TAXES, WAR.

PROVENCE, in France, is bounded on the north by Dauphine, on the east by the Alps, and the river Var parts it from the dominions of the duke of Savoy; on the south it has the Mediterranean Sea, and on the west it incloses the state of Avignon, and is separated from Languedoc by the Rhône.

The trade of this province is very considerable, for almost all the trade of France to Italy, Spain, and especially the Levant, is carried on at Marseilles; and if we may credit an account published some time ago, they send into Italy for above three millions and fifty thousand livres of merchandise, viz. of cloth and other woollen stuffs manufactured in Dauphiné, Languedoc, and Provence, to the value of two millions of livres; almonds, plums, figs, honey, capers, olives, anchovies, oil, brandy, cotton, linen, &c. all which articles amount to above a million more.—They take in return, hemp, wheat, rice, sulphur, manna, and silk. Their trade to Spain is more considerable still, since it amounts to nine millions, one hundred and seventy thousand livres. The merchandizes are all sorts of linens made in France, gold and silver lace, fine silks, manufactured at Avignon, hats, toys, cottons, all sorts of drugs, &c.

They drive also a considerable trade to the Levant, whither they send above one hundred vessels of more or less burden, viz. to Constantinople, Smyrna, Candi, Aleppo, Cairo, Alexandria, &c. [See the article LEVANT TRADE.]

The climate and soil is not the same over all Provence. In the upper part the air is temperate, and the country abounds in pastures and cattle, and produces corn, apples, pears, and very little wine, but what there is of it, is very good. In Lower Provence the air is excessive hot, and would be more so along the sea-coast, were it not for the wind that blows generally from ten in the morning 'till nine at night. The north-westerly wind also cools this part of the country, and sometimes dries the ground prodigiously. This part of the country does not produce half the quantity of corn necessary for the use of the inhabitants, and it's dry and sandy ground is covered with pomegranates, orange, lemon, and olive-trees, cypress-trees, palm-trees, fig-trees, and several others peculiar to the country. There is here a great deal of wine, but it is strong, heady, and sweet. The fish they take in the Mediterranean, is not by a great deal so good as that of the ocean.

It is believed that there are in this country, especially in an estate belonging to the marquis de Luc, mines of gold, silver, copper, and lead: and, notwithstanding the excessive heat of this country, there are here many woods, which afford a great quantity of timber for shipping and other uses. In the wood of the county of Salt, there are several glass-houses.

There are no considerable rivers in this province; those of some note are the Durance, the Sorgue, the Largens, the Lore, the Verdon, the Hubaye, the Baune or Weaume, and the Var.

Provence is usually divided into Upper, Middle, and Lower. We shall, however, enlarge only on the chief places of commerce in this country.

AIX, the metropolis of Provence. There is here a parliament, which judges, in the last resort, all the causes of the province; a court of aids and finances, a court or chamber of accounts, a generality, an office of treasurers of France, and a court of the mint. The other considerable places in this diocese, are St Maximine, Brignole, and Barjols.

RIEZ, situated on the rivulet Auvestre, about 9 leagues from Aix to the north-west, in a pleasant country, which abounds in excellent wines, and most sorts of fruit.

SENEZ, situated in a cold and barren country amongst mountains.

COLMARS, in the Alps, on the river Verdun, on the borders of the county of Nice. They make here a great quantity of coarse cloth, which they sell to the inhabitants of the mountains of Provence and Piedmont.

CASTELLANE, situated in a fruitful and agreeable vale.

ARLES, situated on the eastern bank of the river Rhône, over which, it has a timber bridge. The city was formerly the capital of the kingdom of Burgundy, and is at present a fair and spacious city, dignified with a metropolitan see, and an academy of men of letters, known by the name of The Royal Academy of Sciences and Languages.

MARSEILLES, one of the richest, most populous, and most ancient cities of France; was founded, they say, 500 years before Christ, by a colony of merchants from Phocis in Ionia. They flourished in the time of Julius Cæsar, when they lived under a republican government, and had a famous academy, much frequented by the young gentlemen of France, and even of Rome. But as they followed Pompey's party, against Cæsar, they were subdued by the latter. Having thus lost their power, they applied themselves to get riches, and even gave themselves up to pleasure, to such a degree, that the manners of the Marseillians became a common proverb, to express all kind of luxury and dissoluteness, as we learn from Athenæus. However, they had acquired much reputation in former times, on account of their learning and courtousness, according to the testimony of Cicero: they now excel chiefly in the knowledge of maritime affairs, for the capital galleys of France are laid up here, and it is the usual rendezvous of all the Levantine ships, and the whole Turkey trade of France. See **LEVANT TRADE**, with regard to the regulations made thereof in France, as the same respect this city.

The city is situated on a little hill, and has a very capacious and safe harbour on the coasts of the Mediterranean Sea, at the distance of about seven leagues from Aix to the south, and fourteen from Arles to the south-east. The port, which is defended on one side by a fortress, and the abbey of St Victor, is flanked on the other with a wall above 1300 paces long, its mouth being shut up with a chain, lying at a certain distance, on three pillars of stone, leaving a space open for the passage only of one large vessel. This harbour is very long, and runs far into the land, taking in almost the whole length of the city, but is not very broad, nor deep enough for the largest vessels. The city itself enjoys at present great privileges, and is one of the finest in France, since it has been enlarged by Lewis XIV, so that it's citadels, new streets, public places, stately edifices, magnificent churches, monasteries, colleges, seminaries, hospitals, courts of judicature, havens, arsenals, galleys, &c. are well worth a stranger's particular observation.

TOULON is extremely well situated, being open to the south,

and sheltered on the north by very high mountains, which render it's port one of the largest and safest in the world.

The city is pretty large, but very dirty almost every where; it is distant about ten leagues east from Marseilles, twenty-four from Nice to the south-west, and thirty from the borders of Dauphiné to the south, and about 125 from Paris. It is a strong city, adorned with several churches, monasteries, and other public edifices. King Henry IV. fortified it with strong walls, and built two large moles, each whereof is 700 paces long, inclosing almost the whole port; near them is also erected an arsenal, furnished with all sorts of naval stores, whence the largest ships of the royal fleet of France are usually fitted out; and for their security, the fortifications have been very much increased by Lewis XIV. On two sides of the city, viz. north-east and south-east, at a very small distance, lie very steep and inaccessible hills: that of St Anne's, on the north-east, perfectly commands the town, and sinks with a declivity on that side, but on the country side it is a perpendicular rock. On the sea-side it is extremely well defended by batteries of cannon flanking all the avenues. In the mouth of the haven lies a stockade or boom, between which and a little neck of land, there is a pass of good deep water; but that is secured by a great tower, whereon are mounted 30 guns, which carry 24 pound balls. This tower our fleet, under Sir Cloudeley Shovel, endeavoured to gain, and had in effect done it, if an unlucky shot had not blown up the magazine of gunpowder in fort St Laurence.

The port is one of the finest in Europe: you enter first into a large and very safe road, defended by several batteries and forts. At one of the extremities of this road lies the port, the entrance of which is so narrow, that the ships cannot enter it, but one by one, and it is defended by several batteries well mounted with guns.

The diocese of Toulon is of a very small extent, comprehending in all but 25 parishes. One of the principal places in this bishopric, is the city of

HIÈRES, which was formerly a considerable place, being a seaport town; but the harbour is at present filled up, and the sea retired above 2000 paces from this place. The soil here is very good and fruitful, and produces excellent fruit. This place gives the name to the island of Hieres.

FREJUS, or **FREJULS**. There is here a small harbour, at the mouth of the river Argens, from which this city is a league distant; it is 14 leagues from Toulon to the north-east, 10 from Antibes to the north-west, and 20 from Aix to the east.

PRUSSIA. This country is divided into Prussia Royal and Ducal; extends from 52, 50, to the 56th degree of north latitude, and from 16, 50, to 23, 54 degrees of east longitude. It is bounded by the Baltic Sea on the north, by Lithuania and Samogitia on the east, by Poland Proper and Mafovia on the south, and Pomerania on the west. It is about 1250 miles in length, and in breadth above 140 in the west part, and in the east part more than 170; though some extend it 30 miles more, both in length and breadth. It contains a vast number of fine trading towns, besides many populous villages equal to some cities, has the most inland navigation of any country in Europe of it's bigness, except the Netherlands, and is said to be the richest soil, and the most plentiful in produce.

It abounds with cattle, wild beasts, and fruits of all sorts, and is said to be watered with above 2030 rivers and lakes, which supply the inhabitants with all kinds of fish. It has a considerable trade by many convenient ports, towards the Baltic, as well as by the Veissel, which falls into the Baltic at Dantzic, after having divided itself into several branches, and made the three islands called the Werder: so that the inhabitants are richer, and live better than in any other province of Poland. It's woods furnish plenty of venison, and it's sea-coasts a great quantity of amber, which is transported all over Europe. It flows on the sea like oil, and after being exposed to the air, grows hard. The people take it up with hose-nets, fastened to long poles, when the tide flows, and sometimes catch pieces as big as one's fist.

A great deal of glass is made in this country, of the ashes of wood, and largest sort of pebbles: these they boil twelve hours, before they will vitrify. When they would have their glass clearer than ordinary, they mix a certain earth with the ashes, of the colour and hardness of tartar; which renders the glass of different colours, according to the quantity of this earth which is mixed with it. See **GLASS**.

Though the eastern part of this country, which was all along called Ducal, to distinguish it from the Royal, or Polish Prussia, is now also termed Royal, since his present Prussian Majesty's grandfather first took on him the title of king of Prussia, and was recognized as such by the rest of the powers of Europe; we shall, nevertheless, treat of it according to the ancient division of it, by geographers, into the Royal and Ducal.

The **ROYAL**, or **POLISH PRUSSIA**, which is the west part, and subject to the king of Poland, has Ducal Prussia on the east, Brandenburg and Pomerania on the west, Poland on the south, and the Baltic on the north, and is 130 miles from

east to west, and 110, where broadest, from south to north. It is divided into the four palatinates of Pomerellia, or Polish Pomerania, Culm, Marienburg, and Pomerania, and the castellans of Elbing and Dantzic.

The palatinate of POMERELLIA, or POLISH POMERANIA, has Brandenburg Pomerania on the west, the river Veissel on the east, the Baltic on the north, and Great Poland on the south.

DANTZIC stands on a branch of the Veissel, about four miles above where it falls into the Baltic Sea, 24 miles north-west of Marienburg, 35 west from Elbing, 84 north from Thorn, 175 east from Stetin, and north from Gnesna, 154, north-west from Warsaw, and 256 north from Cracow. It is a free imperial city, and one of the Hans-Towns. [See the article HANS-TOWNS.] In the 9th century it was reckoned the chief place in the world for fishing up amber.

This city is now the chief staple of Poland for import and export, the greatest emporium of the Baltic Sea, and perhaps one of the greatest granaries in Europe; it being such a famous mart, that vast fleets of ships come hither every year from Holland to fetch corn, there being little else used, either in the province of Holland or Zealand. In short, if we only except London and Amsterdam, it may be said to equal, if not to excel, any other city in those parts of Europe. The chief export of the place is in corn brought from Poland: it is computed that 730,000 tons, or 365,000 lasts of wheat are shipped from hence one year with another. The citizens have the sole privilege of buying up the corn, as soon as it enters the harbour. The magistrates set a price upon it, but that the country people, who are the sellers, may not be imposed upon, and delayed, the citizens are obliged to buy up the whole quantity which the boats bring in, let it be what it will.

Though this city takes off a great quantity of the woollen manufactures of Great-Britain, yet the Dutch sending so many ships for corn to Dantzic, which must return empty if they have no goods to carry, the freight thereby costing them nothing, have the chief trade of course. Also all the heavy goods of Great-Britain, such as tobacco, sugar, rice, &c. are supplied much cheaper by the Dutch; so that, in a word, the English trade to this city is much less profitable than formerly; and yet the English goods are imported to Dantzic, and sent up into Poland, as much, and perhaps, more, than ever. Dantzic is the chief market to which the Dutch, and also the Scots send their pickled herrings; which are so good a merchandize in Poland, that, it is said, the Dutch sell at Dantzic, Elbing, and Koningsberg, 14000 tons or lasts of herrings every year, besides the great quantities which Scotland also send thither.

The Dutch also send juniper spirits hither, together with salt, sulphur, whale-fins, and train-oil; and would send more of the latter, were it not for the great quantities of oil which the Dantzickers raise from the smaller sort of sturgeon, and other fish, and from linseed, rape-seed, &c. Besides corn, of which there is not such quantity exported any where as here, the Dantzickers export pot-ashes, sturgeon, Polish linen, sail cloth, and great quantities of spruce canvas, which is used for sails for small shipping in England, and even in Spain and Italy. See the article CANVAS.

The Dutch, who bring herrings hither, besides their East-India goods, fetch great quantities of Polish sheeps-wool from hence, which is the best in all the northern world, the English and Irish only excepted, and which they employ in their cloth manufacture. The French also bring some of it away, and would bring more, if they did not find means to get it upon easy terms from England and Ireland. The Polish wool is also exported to Germany and Sweden.

The Dantzickers have a wine of that sort they call tockay, but it is no other than the Polish wines of the mountains of Cracow and Podolia.

Some of the best East-country plank, as we call it, or oaken plank for building ships, is brought from this city, as well as Koningsberg and Stetin, and comes down the Vistula and Oder, out of the Great Poland. The Dutch cargoes, besides those already mentioned, generally consist of English woollen manufactures, and the sugar and tobacco of the English colonies, with the French silks, wines, and brandy. The harbour is not deep, so that large ships can scarce come up to the city.

They have no men of war, but abundance of merchant-ships, of 300 tons, and 30 or 40 guns a-piece. They have 200 soldiers in pay, can easily maintain 12,000, and have sometimes had an army of 60,000 men.

There is an inland sea, or bay here, called the Frischaff, which lies parallel with the Baltic coast for 60 miles in length, but is of an uneven breadth, being from 5 to 10 miles over. It begins at the territory of Dantzic, where is a very large inlet from the Dantzic branch of the Vistula, and which makes the port of Elbing, just opposite to the mouth of the river Elbing, standing on another entrance of it, a little farther east. This bay is famous for sturgeon, a vast quantity of which is taken here, cured at Koningsberg and Dantzic, and sent to all the trading ports of Europe, especially England and Holland.

CULM, the second palatinate of Royal Prussia, lies on the east side of the Veissel, betwixt that river, Great Poland, and Ducal Prussia.

The city of this name is 23 miles north of Thorn, 60 south of Dantzic, and 43 north-west of Uladisslaus. It is pleasantly situated on a hill, at the foot of which runs the Veissel, and has still the name of a Hanse-Town, but has lost it's trade.

THORN, 24 miles south of Culm, 72 from Marienburg, 84 from Dantzic, 20 north-east from Uladisslaus, 60 north from Lencicla, and 93 north-west from Warsaw. It is a Hanse-Town, divided by the Veissel into two parts: it is the finest and best built in all Royal Prussia, the streets being much broader, and the houses statelier, than at Dantzic. Cluevrius says it was a famous mart long before Dantzic.

MARIENBURGH, the third palatinate of Polish Prussia, on the east side of the Veissel, and north of Thorn. It is bounded on the north partly by the Baltic and the Frischaff, and on the west by the palatinate of Pomerellia. It is a champaign level country, like Holland, as fruitful as that province is, and as populous as any part of it, Amsterdam excepted.

MARIENBURGH stands on the Nogat, a branch of the Veissel, 18 miles south-west of Elbing, 25 south-east of Dantzic, and near 72 north of Thorn. The adjacent soil is fruitful and well cultivated, as is the neighbouring island of the same name, formed by the river.

ELBING, on a river of the same name, that rises out of the lake Draufen, and falls here into the Frischaff, is four or five miles from the Veissel, 18 miles to the north-east of Marienburg, 35 east of Dantzic, 95 north of Uladisslaus, and 133 north-west of Warsaw. It is the metropolis of the palatinate, the chief town of Hockerland, and the only port, except Dantzic, in all Polish Prussia. It is a fair, neat, rich, strong, well-built, and populous city, in a delightful situation, and a place of great trade, the inhabitants being wholly addicted to business and commerce. It's principal trade is in sturgeon, butter, cheese, mead, and corn.

WARMIA, the fourth palatinate of this country, which joins to that of Marienburg, and lies north-east from Elbing, being surrounded in a manner by the Ducal Prussia and the Frischaff.

The chief town of this palatinate is BRAUNSBURG, or BRAUNSLAW, on the river Passar, near the bay of Frischaff, 25 miles north-east of Elbing, and 50 east of Dantzic. It is a populous place, much frequented and esteemed, and is noted for a good trade.

The DUCAL PRUSSIA has Polish Prussia on the west; Lithuania on the east; Samogitia, and the bay of Courland, on the north; and the palatinate of Warsaw on the south. It is about 130 miles from north to south, where longest, and 120 from east to west, where broadest; so that it is much larger than Polish Prussia, but not so fruitful, nor considerable for trade and towns. It is divided into the three following circles, or provinces.

The province of SMALZAND; the capital of which, and indeed of the whole kingdom of Prussia, is

KONINGSBERG, at the mouth of the river Pregel, where it falls into the Frischaff, 55 miles north-east from Elbing, 84 from Dantzic, and 153 from Warsaw. It is a Hanse-Town, large, well built, and divided into three parts by the river; one part, called Lebenicht, is defended by a strong castle, that commands the harbour, and makes it a great emporium of trade, which is chiefly in yellow amber, found on the coast, honey and wax, corn, naval stores, sturgeon, train-oil, linen-yarn, cordage, and several other things, of such universal use, that this, like Dantzic, is always full of ships, from most parts of the trading world, even from Spain and Portugal. In short, it is a rich city, and a place of vast business, the exportation here being the same as it is upon all this coast from Stralsund on the west, to Narva on the east.

PILAW, a very safe port on the Baltic, at the mouth of the Frischaff, 30 miles west of Koningsberg, is noted for sturgeon-fishing.

Of the EXCHANGES of DANTZIC and KONINGSBERG.

Usage of Dantzic for Germany is as for Koningsberg, at 15 days sight; for Amsterdam, at 40 days after date, or a month after sight; and at Koningsberg 41 days. In both these places there are allowed 10 days of grace after the expiration of the time mentioned in the bill of exchange. They keep their accounts in rixdollars, gros, and senings; or in florins, gros, and senings. The rixdollar=3 florins, or 90 gros, the florin=30 gros, the gros=18 senings.

DANTZIC and KONINGSBERG

Gives	To receive	
72 rixdollars, more or less,	in France,	100 crowns d'or sol.
270 gros Poland,—idem	in Holland,	1 livre gros banco.
100 rixdollars	at Breslaw,	100 rixdollars, more or less.
84 gros Poland, more or less,	at Frankfort,	1 rixdollar current.
110 ditto,—idem	at Hamburg,	1 rixdollar banco.
100 rixdollars	at Leipzig,	101 rixdollars, more or less, current
56 gros Poland more or less,	at Nuremberg,	1 florin current money.

REMARKS

REMARKS on the article PRUSSIA before the last war.

The Prussian monarch has great forces, large revenues, a genius capable of conducting both, and a moderation that will restrain him from attempts superior to these. He knows perfectly well, that the grandeur of the sovereign must be established upon the welfare of the subject, and this has excited him to shew the same regard for the happiness of his people, as for the extension of his own power; or rather has induced him to make the latter always subservient to the former. He is known to have an inclination to become a maritime power, or which is the same thing in other words, to enable his subjects to encrease their wealth by their industry, through the channels of foreign trade.

Now though there are many, and, amongst them, some statesmen, who treat this as a chimera, yet we are told the direct contrary, and are inclined to think that this monarch, and his successors, will actually carry that point; and we think so, because there is no great improbability in supposing that they may be, some time or other, masters of a sea-coast four or five hundred miles in extent. It would require more time and room than we have at present to bestow, to endeavour the explanation of this, so as to bring it within the reach of every capacity: but whoever will consult the maps, consider the present state of things, and the vast improvements in the power of an absolute monarch to make, who knows what he is doing, and what is to be done, in carrying a favourite point, which is at the same time, his people's point, as well as his own: I say, whoever will reflect upon these things, will not consider what we have advanced as a visionary delusion.

His views might certainly have been altered, his measures changed, and his designs otherwise directed than they have been. But then this did not depend intirely upon him, there must have been a concurrence in other powers to have brought this about; for, to manage a wise prince, true to his own interests, he must be shewn, that those who desire to have him for a friend and ally, have no intention to restrain, no inclination to defeat, the measures he takes for that purpose, while they are not destructive or dangerous to themselves.

To manifest a disposition contrary to this, is sufficient to give another bias to his councils; and, when we see a prince of the king of Prussia's turn continue, as it were, always armed at an immense expence, we must conclude that he has some great enterprize in view, which whenever time shall disclose, it will also discover that he took proper measures for carrying that point, whatever it is, which those armaments have been intended to compass.

The situation of his present Majesty's territories is such, as obliges him to have a constant eye to the affairs of the North, where no power was ever predominant, but his predecessors suffered for it, and their dominions and estates. With respect to the dukes of Courland, they have been, generally speaking, closely allied to the house of Brandenburg by marriage, which, as it shews the antient connection of their interests, discovers also the reason why this prince is still so attentive to the choice which the Courlanders may make of a new duke.

The province of Samogitia in Poland, with the duchy of Courland, divide the Ducal Prussia from the territories of the Czarina; and, therefore, in the present state of things, it is but natural that the king of Prussia should desire to see the hands of the Poles strengthened, and the inhabitants of Courland set entirely free; because he might then flatter himself, that, in case at any time hereafter the troubles of Germany should revive, his territories would be safe from any sudden invasion by the Russians, with which he was threatened but a few years ago, when his concerns were in a very critical posture.

It is also very likely, that he would be glad to annex what the Swedes still retain in Pomerania: to the rest of that country which is already in his possession, not from any jealousy of the Swedes, or from a desire of aggrandizing himself at the expence of his neighbours and allies, but on the score of

convenience, and the better connection of his estates. We may from thence infer, that he will never seek to procure this in any other than an amicable way, and with the consent of the Swedes, in consideration of some kind of equivalent or other. It may be, this acquisition is still at a great distance; and it may be, also, that the measures which this great monarch has concerted in reference to the affairs of the North, will bring this about sooner than is generally imagined. But be that as it will, there is no question that, whenever it is effected, the power of Prussia will be very much augmented thereby, and the liberties of the Empire will then stand in need of no guardian without the limits of Germany.

While these designs attract the thoughts, and employ the hands of this active prince, he will certainly maintain a good correspondence with all those powers that are neighbours to him, in respect to the rest of his dominions, which will leave the inhabitants of the United Provinces at full liberty to redress their own grievances in their own manner, and to recover the antient strength and vigour of their government, in consequence of restoring that form under which it was first constituted, and for a long series of years happily flourished.

But whenever those struggles for power which have embarrassed and distracted the potentates of the North, shall be by negotiation or otherwise composed, we have very little room to doubt that his Majesty of Prussia will again turn his views towards the countries of Cleves and Guelders, and the principality of EAST FRIESLAND, where he has the very important and commodious port of EMBDEN, to facilitate the schemes he may form in favour of the commerce of his subjects, to which he seems to apply himself with equal industry and spirit, as that he has no reason to suspect his neighbours may force him suddenly into a war, while his councils are wholly taken up in cultivating the arts of peace and traffic.

He will by that time have served himself to the utmost, of whatever assistance France may have found it her interest to give them, for more than that she will never give; and his sense of this will engage him not to persist any longer in the prosecution of measures acceptable to the court of Versailles, than they are conducive to the extension or establishment of his power and influence. He will then see that independency, and being at the HEAD OF THE PROTESTANT INTEREST IN GERMANY, is sufficient to gratify his utmost ambition, and to raise him to the highest point of authority, by making him courted and respected by all his neighbours, and, as occasions offer, the umpire of all their differences.

These are, indeed but suppositions, but then they are built upon solid and rational foundations; whereas those who fancy that he will, some time or other, be swallowed up by a confederacy of powerful neighbours, or despoiled of a great part of his territories, are not able to offer either facts or arguments to counsel their opinion, since hitherto we have never seen him attempt beyond his strength; nor has it appeared in all his military regulations, fresh establishments, new discipline, &c. that the power most concerned, or which thinks herself most concerned to traverse the designs of Prussia, has been able to do it with any great effect, even in conjunction with a very useful ally, who, after being once sacrificed, will most certainly take care to prevent being involved again in the like quarrel.

REMARKS on our article PRUSSIA, since the last war and peace.

Besides his Prussian majesty giving all encouragement to trade, useful arts, and sciences, we have recent accounts that his majesty proposes to render the DUCHY OF CLEVES, and the other places he possesses in it's neighbourhood, the flourishing receptacles of industrious persons of all nations; in order to which, all the fortifications, except those of WESSEL, are to be entirely demolished, no troops are to be quartered in them, the TAXES REDUCED, all the high roads improved, as well as repaired, several new canals made, and every encouragement given, that may invite manufacturers to settle in those countries.

The BUSINESS of the CUSTOMS continued, from the end of LETTER O.

With respect to the PLANTATIONS in general.

PLANTATIONS, British, in Asia, Africa, or America.

—No goods to be imported into, or exported from thence, in any other but ships of the built of Great-Britain, Ireland, or the said plantations, wholly owned by the people thereof, and whereof the master, or at least three-fourths of the mariners, are of the said places (except ships taken as prize, and legally condemned, navigated by the master, and three-fourths of the mariners British, or of the said plantations, and owned by British) upon forfeiture of the ship and goods,

one-third to his majesty, one-third to the governor, one-third to the seizer and informer, 12 Car. II. cap. 18. §. 1. and 7 and 8 Will. III. cap. 22. §. 2, 3.

—Admirals and other commanders of ships of war, are to seize as prize all ships offending, and to deliver them to the court of Admiralty, 12 Car. II. cap. 18. §. 1.

—Ships not to be deemed or pass as of the built of Great-Britain, Ireland, Guernsey, Jersey, or the British plantations, so as to be qualified to trade, 'till registered by the owners, and proof of the built and property be made upon oath of one or more of them, before the collector and comptroller of the port of Great-Britain or Ireland, to which they then belong,

Of the B U S I N E S S of the C U S T O M S, continued.

long, or before the governor and principal officers of the revenue in the plantations, Guernsey or Jersey, if the ship belongs to those places, 7 and 8 Will. III. cap. 22. §. 17.

Such oath to be registered by the persons who administered it, and attested under their hands, and seals, and then delivered to the master, and a duplicate thereof immediately transmitted to the commissioners of the Customs, 7 and 8 Will. III. cap. 22. §. 18.

For want of such proof, ships trading thither are liable to forfeiture, as if they were foreign ships, 7 and 8 Will. III. cap. 22. §. 18.

But prize ships legally condemned must be specially registered, mentioning the capture and condemnation, instead of the time and place of building; with proof upon oath, that the entire property is British, 7 and 8 Will. III. cap. 22. §. 19.

The name of a ship changed after registering, or the property transferred to another port, such ship to be registered de novo, and the former certificate thereof to be cancelled; and if the property be altered in the same port by the sale of any share, it must be acknowledged by indorsement on the certificate of the register before two witnesses, 7 and 8 Will. III. cap. 22. §. 21.

British, in Asia, Africa, or America.—Ships lading and unlading any goods there, and the master and their lading are subject to the same rules, visitations, searches, penalties, and forfeitures, as in Great-Britain (except under the regulations in the sequel) 7 and 8 Will. III. cap. 22. §. 6.

Sugar, tobacco, cotton, wool, indigo, ginger, fustick or other dying wood, rice (except under the subsequent regulations) melasses, hemp, copper-ore, beaver-skins or other furs, pitch, tar, turpentine, masts, yards and bowsprits of the growth, production and manufacture of any of the British plantations in America, Asia, or Africa, may not be carried from thence, unless to some other British plantations, or to the kingdom of Great-Britain only, to be there landed, upon forfeiture of the said goods, or their value, with the ship and furniture, 12 Car. II. cap. 18. §. 18. 22 and 23 Car. II. cap. 26. §. 10, 11. 25 Car. II. cap. 7. §. 3. and 3 and 4 Ann. cap. 5. §. 12. and cap. 10. §. 7. and 12 Ann. cap. 9. §. 1. and 8 Geo. I. cap. 15. §. 25. and cap. 18. §. 22. and 11 Geo. I. cap. 29. §. 4. and 2 Geo. II. cap. 28. §. 6. and cap. 35. §. 17. and 3 Geo. II. cap. 28. §. 1.

And if upon any pretence whatsoever, any goods of the British plantations in America be landed in Ireland, without being first landed in Great-Britain, and the duties thereof there paid, they are forfeited with the ship, three fourths without composition to his majesty, and one fourth to the fuer; unless stranded or driven in by leakiness, &c. in which case, the goods must be delivered into the custody of the chief officer of the port, there to remain till re-shipped for Great-Britain, for which good security must be taken, 7 and 8 Will. III. cap. 28. §. 14, 15.

N.B. Now to extend only to sugars, tobacco, cotton-wool, indigo, ginger, speckle-wood, or Jamaica-wood, fustick or other dying wood, rice, melasses, beaver-skins, and other furs, copper-ore, pitch, tar, turpentine, masts, yards, and bowsprits of the growth product, or manufacture of the said plantations. All other goods of the growth, product, and manufacture of any of the said plantations, may be imported from thence into Ireland (except hops, which are to continue under the regulations of 9 Ann. cap. 12. and 1 Geo. I. cap. 12.) provided it be in British shipping, whereof the master and at least three fourths of the mariners are British, 4 Geo. II. cap. 15. §. 1, 2. and 5 Geo. II. cap. 9. §. 1.

But rice may be shipped in Carolina, or Georgia in America, by British subjects, on board any ship built in Great-Britain, or belonging to British subjects residing in Great Britain, and legally navigated, that has cleared outwards, in any port of Great-Britain, for Carolina or Georgia; and may be carried directly to any part of Europe, lying southward of CAPE FINISTERRE, without being first carried to any other British plantations, or to Great-Britain, provided the master before clearing takes out a licence, under the hands of the commissioners of the customs, or any three of them, for the loading and carrying of the rice accordingly; which licence must be granted upon a certificate of the collector and comptroller of the port, that bond has been given, that none of the other enumerated goods shall be taken on board, at any British plantation, unless for the ship's use, and that the ship shall proceed directly with the rice according to the licence, and there land it, and then proceed to Great-Britain, before she returns to any British plantation, 3 Geo. II. cap. 28. §. 1, 2, 6. and 27 Geo. II. cap. 18. §. 3.

The master, within four months after arrival, not producing a certificate of the regular discharge of such rice, under the hand and seal of the British consul, or of two known British merchants, the bond must be put in suit, 3 Geo. II. cap. 18. §. 1, 2, 6. and 27 Geo. II. cap. 18. §. 3.

Before rice may be shipped in Carolina or Georgia, the licence and certificate of bond being given, must be produced to the collector; and before the master's departure, he must make oath in writing, whether he intends to load any rice, and to what place bound, 3 Geo. II. cap. 28. §. 3. and 27 Geo. II. cap. 18. §. 3.

Before rice may be shipped in Carolina or Georgia, the exporter must make entry thereof with the collector, comptroller, and naval-officer, and take out a cockpit, whereon he must indorse, before shipping, the true quantity intended to be shipped, mentioning the marks, numbers, and contents of each cask, and deliver the same to the searcher, 3 Geo. II. cap. 28. §. 4. and 27 Geo. II. cap. 18. §. 3.

If upon weighing and examining of the rice by the searcher, either before or after the shipping, the quantity be found to exceed the indorsement, or the rice be laden before entry, &c. it is forfeited, with treble the value, besides the vessel, one third whereof to the king, one third to the governor, and one third to the informer, 3 Geo. II. cap. 28. §. 4. and 27 Geo. II. cap. 18. §. 3.

Before the ship's departure, the master is to receive back the licence, with the marks, numbers, and contents of each cask, indorsed thereon by the collector, comptroller, and naval-officer, who are to make two copies of such licence and indorsement; which are to be attested by the master, and left with the officers, 3 Geo. II. cap. 28. §. 4. and 27 Geo. II. cap. 18. §. 3.

The master, on his return to Great-Britain, must produce the licence so indorsed, to the officer of the port where bond was given, and likewise a certificate of the consul or of two British merchants, testifying the due landing of the rice, and that they verily believe that no other enumerated goods have been there landed 3 Geo. II. cap. 28. §. 4. and 27 Geo. II. cap. 18. §. 3.

Officers in Carolina or Georgia must transmit one of the copies of the indorsement, to the commissioners of the Customs; and upon receipt thereof, or of the indorsed licence, and the half subsidy for the rice shipped in Carolina or Georgia, must be demanded of the person who gave the bond; and in case of non-payment within thirty days, the bond must be put in suit, 3 Geo. II. cap. 28. §. 5. and 27 Geo. II. cap. 18. §. 3.

British, in Asia, Africa, or America.—For every ship bound to the said plantations, sailing from Great-Britain or Ireland, sufficient bond must be there given, with one surety, to the chief officer of the customs, to the value of 1000*l*. if under 100 tons, and to 2000*l*. if above that burthen, that if any of the aforesaid enumerated goods are taken on board, they shall, by the said ship, be brought to some port in Great-Britain, and there landed; and for all ships coming to the said plantations from any other place, before they begin to load any of the said enumerated goods, the like bond must be given to the governor, that such goods shall be carried to some other British plantation, or to Great-Britain: the condition of such bond to be, to produce a certificate, within eighteen months, of the legal discharge of the goods; and the surety in such bond named must be of known residence and ability, 12 Car. II. cap. 18. §. 19. and 22 and 23 Car. II. cap. 26. §. 11. and 7 and 8 Will. III. cap. 22. §. 13.

Ships taking in goods, before a certificate of bond being given in Great-Britain, is produced, or bond be given in the plantations, or carrying the goods contrary to the tenor of the bond, are forfeited, 12 Car. II. cap. 18. §. 19. and 22 and 23 Car. II. cap. 26. §. 11. and 7 and 8 Will. III. cap. 22. §. 13.

Governors are to return yearly, at least, a list of all ships, which have taken in any of the aforesaid goods, and also true copies of all the bonds by them taken, to the chief officers of the Customs in London, 12 Car. II. cap. 18. §. 19. and 22 and 23 Car. II. cap. 26. §. 12.

British, in Asia, Africa, or America.—Ships belonging to the said plantations, landing any of the aforesaid enumerated goods in any place in Europe, except Great-Britain, are forfeited with their furniture, &c. 22 Car. II. cap. 26. §. 12.

Such ships may be prosecuted by any person in any court of admiralty in Great-Britain, 22 Car. II. cap. 26. §. 13.

Ships coming to the said plantations to take in any of the following enumerated goods, with intent to carry the same to some other British plantation, bond not having been first given to bring the same to Great-Britain, only there must be paid for such goods the following duties, viz.

	l.	s.	d.
Sugar, white, the hundred weight	-	-	0 : 5 : 0
Sugar, brown, and muscovadoes, the hundred weight	-	-	0 : 1 : 6
Tobacco, the pound	-	-	0 : 0 : 1
Cotton-wool, the pound	-	-	0 : 0 : 0½
Indigo, the pound	-	-	0 : 0 : 2
Ginger, the hundred weight	-	-	0 : 1 : 0
Logwood the hundred weight	-	-	5 : 0 : 0
Fustick and all other dying wood the hundred weight	-	-	0 : 0 : 6
Cocoanuts, the pound	-	-	0 : 0 : 1

And security must be taken to carry them to such plantations, or to Great-Britain, 25 Car. II. cap. 7. §. 3. and 7 and 8 Will. and Mary, cap. 22. §. 8. and 1 Geo. I. cap. 12. §. 4.

But if the proprietor has not money to pay the said duties, the officers may take such a proportion of the goods as will amount to the value of the duties, 25 Car. II. cap. 7. §. 5.

----- The

Of the BUSINESS of the CUSTOMS, continued.

— The aforefaid duties to be under the management and direction of the commissioners of the customs, 25 Car. II. cap. 7. §. 4.

— British, in Asia, Africa, or America. Prosecutions for the breach or non-performance of the conditions of bonds, to bring the enumerated goods to Great Britain, or to some other plantations, not commenced within three years after their date, or judgment not obtained within two years after the commencement of the prosecution, the said bonds are void, and must be delivered up to be cancelled, 8 Ann. cap. 13. §. 23, 25.

— Officers, upon demand, refusing or neglecting to deliver up such bonds to be cancelled, are to answer to the party grieved all his damages, with treble costs of suit, 8 Ann. cap. 13. §. 23, 25.

— Ships from Ireland may not break bulk, 'till the master has signified his arrival, and delivered a true inventory or invoice of the lading, to the governor, with a certificate from the chief officer of the port in Ireland, expressing the particulars of the loadings, &c. and has made oath that the goods are the same which he took on board by virtue of such certificate, and the ship be visited and searched by an officer, upon forfeiture thereof, and of all woollen manufactures found on board, not having been laden in Great Britain, and of any linen goods, not laden in Great Britain, nor of the manufacture of Ireland; one-third to his majesty, one-third to the governor (if they are seized, or sued for, otherwise that third also to his majesty) and one-third to the fuer, 3 and 4 Ann. cap. 8. §. 2, 3, and 3 Geo. I. cap. 21. §. 1.

— But such ships to be subject to the same rules, searches, penalties, forfeitures, &c. as ships coming from Great Britain to the said colonies, 3 and 4 Ann. cap. 8. §. 2, 3, and 3 Geo. I. cap. 21. §. 1.

— Ships coming to any British plantations, &c. may not lade or unlade any goods, 'till the master has declared his arrival to the governor, with his own and vessel's names, and has shewn him that his vessel is British built, or was taken as prize, and is navigated with a British master, and at least three-fourths of the mariners British men, and has delivered him a true and perfect inventory or invoice of the lading, with the places where taken in, upon forfeiture of the ship, &c. and all the European goods that were not laden in Great Britain, 15 Car. II. cap. 7. §. 8. and 7 and 8 Will. III. cap. 22. §. 2.

— No goods of the product of Europe may be imported there, unless shipped in Great Britain, and carried directly from thence in British built shipping, or ships taken as prize, whereof the master, and at least three-fourths of the mariners are British, upon forfeiture of ship and goods; one-third to his majesty, one-third to the governor (if seized or sued for there, otherwise that third also to his majesty), and one-third to the seizer or informer, 15 Car. II. cap. 7. §. 6. and 7 and 8 Will. III. cap. 22. §. 2.

Except { Salt from Europe for the fisheries of New-England, Newfoundland, Pensilvania, and New-York, wines of and from the Madeiras and Azores, and horses and victuals of and from Ireland, by British, and in British ships, 15 Car. II. cap. 7. §. 1. and 13 Geo. I. cap. 5. §. 1. and 3 Geo. II. cap. 12. §. 1.

Except { Irish linen cloth from Ireland, by British or Irish, so long as British linen is permitted to be imported into Ireland duty free, 3 and 4 Ann. cap. 8. §. 1. and 3 Geo. I. cap. 21. §. 1.

— British, in Asia, Africa, or America. Wool, woolfells, shortlings, mortlings, woollocks, worsted, bays, or woollen yarn, cloth, serge, bays, kerseys, sayes, frezes, druggets, cloth, serges, shalloons, or any other drapery, stuffs or woollen manufactures of the product or manufacture of the British plantations in America, may not be there laden on board any ship, nor upon any horse, &c. with intent to be exported, upon forfeiture of the ship and goods, and 500 l. 10 and 11 Will. III. cap. 10. §. 2, 19.

— The treasury and the commissioners of the customs, may appoint officers of the customs in any port of the British plantations, 7 and 8 Will. III. cap. 22. §. 11.

— The officers of the revenue there are to have the same powers and authorities, and to be subject to the same penalties and forfeitures, and to have the like assistance, as the officers of the customs in Great Britain, 7 and 8 Will. III. cap. 22. §. 6. and cap. 8. §. 3.

— Naval-officers, within two months after entrance, or as soon as conveniently they can, are to give sufficient security to the commissioners of the customs, for the faithful performance of their duties, upon pain of disability to execute their employments, 7 and 8 Will. III. cap. 22. §. 5.

— Governors there, before entrance upon their governments, or within six months after, are to take a solemn oath to do their utmost, that every thing enjoined by these acts shall be observed, 12 Car. II. cap. 18. 15 Car. II. cap. 7. and 7 and 8 Will. III. cap. 22. and 8 and 9 Will. III. cap. 20. §. 69.

— Neglecting their duty accordingly, are to be removed, rendered incapable of any other government, and to forfeit 1000 l. 12 Car. II. cap. 18. §. 2. and 15 Car. II. cap. 7. §. 8. and 7 and 8 Will. III. cap. 22. §. 4.

VOL. II.

— Aliens, or persons not born within his majesty's allegiance, or naturalized, or made free denizens, may not be merchants, or factors there, upon forfeiture of all their goods and chattels; one-third to the king, one-third to the governor, and one-third to the informer, 12 Car. II. cap. 18. §. 2.

— British, in Asia, Africa, or America. Wharfingers, lightermen, bargemen, watermen, porters, &c. and the boats, vessels, &c. are subject to the same pains, penalties, and forfeitures, for any frauds or offences, as in Great Britain, 7 and 8 Will. III. cap. 22. §. 6. and 3 and 4 Ann. cap. 8. §. 3.

— Laws, by-laws, usages, or customs, in force or practice in the plantations, repugnant to the laws of Great-Britain, are null and void, 7 and 8 Will. III. cap. 22. §. 9.

— Upon actions, suits, and informations upon laws concerning his majesty's duties, or ships or goods to be forfeited for unlawful importation, or exportation, the jury to consist only of natives of Great Britain or Ireland, or persons born in the plantations, 7 and 8 Will. III. cap. 22. §. 11.

— Penalties and forfeitures by this act, not particularly disposed of, are to be, one-third to the king, one-third to the governor, and one-third to the fuer, 7 and 8 Will. cap. 22. §. 7.

— Certificates of having given bond in Great Britain or Ireland, suspected to be false or counterfeit, the governor, or officers of the customs, may take sufficient security there, for the due discharge of the lading in Great Britain; and if certificates of the discharge of any such lading are suspected, the bond there given may not be cancelled, 'till they are informed of the truth of such certificate from the commissioners of the customs, 7 and 8 Will. III. cap. 22. §. 10.

— Certificates, cockets, returns, or permits counterfeited, razed or falsified, or afterwards knowingly so used, the offender to forfeit 500 l. 7 and 8 W. III. cap. 22. §. 10.

— Hats or felts are not to be shipped on board any vessel, or loaded on any horse, cart, or other carriage, in order to be conveyed out of any of the British plantations, to any other of the British plantations, or to any other place whatsoever, upon forfeiture of the hats or felts, and also 500 l. by every offender for every such offence, 5 Geo. II. cap. 22. §. 1, 2.

— Any master of a vessel, mariner, porter, carrier, waggoner, boatman, or other person, knowingly aiding and assisting in such offence, forfeits 40 l. 5 Geo. II. cap. 22. §. 1, 2.

— No commissioner, or officer of the customs, or farmer of the customs in the British plantations, is to take any entry outwards, or sign any cocket, &c. for the exporting any hats or felts, or knowingly permit, or contrive the same to be done, upon forfeiture of his office, and also 500 l. 5 Geo. II. cap. 22. §. 4.

— Any person may seize and convey to his majesty's next warehouse all such hats and felts, which he shall find in any ship or boat, or laid on, or near the shore, or in any navigable river, or upon any horse or carriage, with intent to be exported and conveyed as above, 5 Geo. II. cap. 12. §. 5.

— Every offence committed against this act, may be tried in any place in Great Britain, or the plantations, either where the offence was committed, or the offender or goods are found, 5 Geo. II. cap. 22. §. 5.

— British, in Asia, Africa, or America.—Rum or spirits, molasses or syrups, sugars or panneles of the product of any plantation in America, not in the possession of his majesty, imported into any British plantations in America, are to pay the following duties, in money of Great Britain, according to the value of 5 s. 6 d. per ounce in silver, viz.

	l.	s.	d.
Rum or spirits, the gallon	-	-	0 : 0 : 9
Molasses or syrups, the gallon	-	-	0 : 0 : 6
Sugars and panneles, the hundred weight	0	5	0
and so in proportion for a greater or lesser quantity, to be paid down in ready money before landing,	6 Geo. II. cap. 13.	§. 1, 2.	

— Any of the said goods landed before due entry and payment of the duty, or without warrant from the proper officer, are forfeited, and may be seized by the governor, or any person authorized by him, or by warrant of a justice, or other magistrate, or by any custom, impost, or excise officer, or their assistants, 6 Geo. II. cap. 13. §. 3.

— Any person assisting in the unlawful landing, or receiving into their custody any of the aforefaid goods so landed, are to forfeit treble the value; and for molesting the officer in the execution of his duty, 50 l. and to suffer three months imprisonment, 6 Geo. II. cap. 13. §. 5, 6.

— Officers conniving at the said offence are to forfeit 50 l. and be rendered incapable of holding any employment under his majesty, 6 Geo. II. cap. 13. §. 5, 6.

— Masters of ships, being his majesty's subjects, receiving on board any of the aforefaid goods, in order to land the same contrary to the true intent of this act, are to forfeit 100 l. 6 Geo. II. cap. 13. §. 7.

— Such offences and forfeitures may be prosecuted, within two years after the offence, in any court of admiralty, or record, in his majesty's plantations where the offence was committed;

Of the BUSINESS of the CUSTOMS, continued.

committed; and the forfeiture is to be divided, one third to his majesty, which (the expences of prosecution being first paid thereof) is to be applied for the support of the government of the colony where it shall be recovered) one third to the governor, and one third to the informer, or prosecutor, 6 Geo. II. cap. 13. §. 3, 11, 12.

— In all such prosecutions for illegal landing the said goods, the onus probandi is to lie on the claimer, or owner thereof, 6 Geo. II. cap. 13. §. 8.

— British, in Asia, Africa, or America. Any of his majesty's subjects in any vessel built in Great Britain, and belonging to his majesty's subjects, of which the major part reside in Great Britain, and the residue either in Great Britain, or in some of his majesty's sugar colonies in America, or in any vessel belonging to his majesty's subjects residing in Great Britain, and navigated according to law, that shall clear outwards from Great Britain to any of the said colonies, may ship sugars of the growth, produce, or manufacture of the said colonies, to carry to any foreign part of Europe, provided a licence be first taken out for that purpose, under the hands of three of the commissioners of the customs, subject to the regulations, and on the conditions following, viz. 12 Geo. II. cap. 30. §. 2. and 14 Geo. II. cap. 57. §. 7.

— The master or owner of the vessel must give notice in writing to the customer, or collector and comptroller of the port where the vessel lies, of his intention to proceed to the said colonies to lade sugars, for some other part of Europe than Great Britain, and enter into bond, with one or more sufficient securities, in the sum of 1000*l.* if the ship be of less burthen than 100 tons, and 2000*l.* if she be of that, or a greater burthen, on condition that, if a licence be granted, the ship shall proceed to the said colonies; that he shall deliver the licence to the collector, comptroller, and naval-officer there, if he intends to make use of the liberty granted by it, which he shall declare in writing to them, before he takes any goods on board; and that no tobacco, molasses, ginger, cotton, wool, indigo, fustick, or other dyeing wood; tar, pitch, turpentine, hemp, maff, yards, bowspits, copper-ore, beaver-skins, or other furs of the growth, production, or manufacture of any of the British plantations in America, shall be taken on board, unless for necessary provisions in the voyage; that, before the vessel proceeds to any foreign part, she shall touch at some port in Great Britain, and that the master shall deliver to the customer, or collector, and comptroller, a true manifest, attested upon oath, of the whole lading, with the marks, numbers, package, and contents, and produce the licence, with a certificate of the marks, numbers, package, and contents, and sorts of sugar on board, that the vessel shall return to Great Britain, within eight months after delivering the lading in any foreign part, and before the returns to any of the plantations in America; and that, if she takes any goods on board before her return to Great Britain, they shall be entered and landed as other ships are obliged to do by the laws of the customs. Then a licence is to be granted for that voyage only, to load and carry sugars of the growth and production of his majesty's sugar colonies in America, to any foreign part, according to the purport and intention of this act; provided the master makes oath as prescribed 12 Geo. II. cap. 30. §. 2, 3, and 24 Geo. II. cap. 57. §. 7.

— Sugars, or other goods put on board any vessel licensed by this act, being the property of any other person than some of his majesty's subjects, and such as shall be laden on their proper risk and account, to be carried to foreign parts, are forfeited, 12 Geo. II. cap. 30. §. 4. and 12 Geo. II. cap. 57. §. 7.

— Before any sugars are taken on board, the master is to deliver to the collector of the port where the vessel is to take in her lading, the licence, with a certificate of bond, having been given in Great Britain; and to declare in writing, whether he intends to load sugars pursuant to the licence, otherwise the licence is invalid, 12 Geo. II. cap. 30. §. 5. and 24 Geo. II. cap. 57. §. 7.

— The exporter of the sugars, or other goods not enumerated, before they are put on board, is to make an entry of them in writing with the collector, comptroller, and naval-officer, expressing the name of the ship and master, and where she lies, and the place where they are to be laden, or first water-born, must be such only, where an officer is appointed to attend; or such as is mentioned in the warrant to be taken out for that purpose from the collector and comptroller, whereon is to be indorsed by the exporter the marks, numbers, and contents, sorts, and proper denominations of the sugars, 12 Geo. II. cap. 30. §. 5. and 24 Geo. II. cap. 57. §. 7.

— The warrant so indorsed is to be delivered to the officer appointed to examine and ship the same; and the sugars are to be shipped in the presence of the officer, or at the place mentioned in the warrant, that the officer may attend, 12 Geo. II. cap. 30. §. 5. and 24 Geo. II. cap. 57. §. 7.

— The officer is to examine the same before shipped, and if the number of casks is greater than is indorsed on the warrant, or if there be found any other sugar than what is indorsed, or any goods before enumerated; or if any enumerated goods, except sugar, have been put on board, or brought, or put into any lighter or other vessel in order to be put on board

before entry, &c. contrary to the directions of this act, the said sugars, or other goods, are forfeited, together with the lighter or vessel, employed in shipping or attempting to ship the said enumerated goods, and the ship or vessel on which they are laden; and the owner to forfeit double the value, to be recovered in the court of vice-admiralty, or any court of record in the plantations, at the election of the informer or prosecutor; one-third to his majesty, one-third to the governor of the colony, and one-third to the informer or prosecutor, 12 Geo. II. cap. 30. §. 5. and 24 Geo. II. cap. 57. §. 7.

— The master of the vessel before he departs, is to receive the said licence from the collector, comptroller, and naval-officer, with a certificate under their seals of office, and signed by them, containing an account of the marks, numbers, contents, and sorts of each cask of sugar so shipped. Two copies are to be taken of the said licence and certificate, and attested under the hand of the master of the vessel before he receives back his licence, and to be left with the collector, comptroller, and naval-officer, who are to transmit one of them to the commissioners of the customs in Great Britain, 12 Geo. II. cap. 30. §. 5. and 24 Geo. II. cap. 57. §. 7.

— The master of the vessel must proceed directly to Great Britain, without putting into any other place, except by stress of weather (unless he is bound to the south of CAPE FINISTERRE), and upon his return, is to deliver his licence, with the certificate, to the commissioners of the customs, or the collector and comptroller of the port, where he arrives, and also a manifest, attested upon oath, of the marks, and numbers, with the tale, and sorts of casks, of all his lading, and make an entry of the quantity and sorts of all the sugars, which were laden and then remaining on board, and declare upon oath to what foreign part he is bound (the entry to be passed by the collector and comptroller without receiving any custom or duty for the sugars, mentioning in their accounts that it was passed by virtue of this act). Then the master to proceed, taking with him his licences and a certificate under the seals of office, from the collector and comptroller, that he had touched at such a port, and in all respects complied with the directions of this act, 12 Geo. II. cap. 30. §. 5. and 24 Geo. II. cap. 57. §. 7.

— If any such vessel proceeds to foreign parts without touching at some port in Great Britain (except as before) and complying with the directions of this act, and having the same certified as above; or if any goods before enumerated, are found on board, or carried to foreign parts, the liberty granted by this licence is void, and the vessel, master, and all others concerned, are liable to the same penalties and forfeitures, as if this act had not been made, 12 Geo. II. cap. 30. §. 5. and 24 Geo. II. cap. 57. §. 7.

— If upon information upon oath there is reason to suspect, that any enumerated goods, besides sugars, are on board, any officer of the customs, or person employed by them, may enter on board and unlade the vessel, as far as they shall judge necessary, to enable them to examine any part of her, and the goods on board, and detain her as long as is necessary, and open cabbins, lockers, and any concealment, and seize all goods found on board not mentioned in the master's manifest, which are forfeited, 12 Geo. II. cap. 30. §. 6. and 24 Geo. II. cap. 57. §. 7.

— If no other goods are found on board, the officer is to be at the charge of damage done by landing, unloading, or unpacking, but not for demurrage, or on any other account. But if other goods are found on board (except necessary provisions for the voyage), the master is to be at all charge, 12 Geo. II. cap. 30. §. 6. and 24 Geo. II. cap. 57. §. 7.

— If the owners are desirous to enter and pay the duty, and land any goods out of such vessel, they may do it; the master first making report of his whole lading, as required by law before this act, 12 Geo. II. cap. 30. §. 7. and 24 Geo. II. cap. 57. §. 7.

— The master, upon his return to Great Britain, after landing his sugars in foreign parts, is to deliver to the commissioners, or the collector, or comptroller of the port where he arrives, the licence, with a certificate, from the consul, or two known British merchants of good credit, of the place where they are landed, of the landing thereof, with the number of casks of sugar there landed, the marks, numbers, and contents of each cask, with the name of the ship, and master, and that no tobacco, or other goods before enumerated, except sugars, have been landed out of her, 12 Geo. II. cap. 30. §. 9. and 24 Geo. II. cap. 57. §. 7.

— British, in Asia, Africa, or America. If a master of a vessel, who has taken out a licence as above, shall, upon his arrival in the sugar colonies, deliver it to the collector, comptroller, and naval-officer, with the certificate of bond having been given in Great Britain; and before he lades any goods, declare in writing upon oath, that the sugars he intends to load are to be carried to some place southward of CAPE FINISTERRE, he may, in case he has complied with the directions of this act, proceed thither directly, without touching at Great Britain, taking with him the licence, and oath indorsed thereon, together with an account of the marks, numbers, package, contents, and sorts of sugars taken on board, and

Of the BUSINESS of the CUSTOMS, continued.

and may there land the same, 12 Geo. II. cap. 30. §. 8. and 24 Geo. II. cap. 57. §. 7.

— In such case the master, within eight months after landing his sugars, and before he goes again to the plantations, is to return to Great Britain, and deliver his licence as before directed, with the oath indorsed thereon, and an account of the lading, together with a certificate from the consul, or two known British merchants of good credit, of the place where the sugars were landed, of the landing thereof, with the number of casks of sugar landed, and the mark, number, and contents of each cask, with the name of the ship, and master; and that they verily believe no tobacco, or other goods before enumerated, have been there landed out of her; and the master to make oath of the truth of the certificate, and that none of the goods before enumerated, except sugars, were taken on board at the colonies, or landed at the place mentioned in the certificate. The master also is to make an entry with the collector, and comptroller, of all the sugars taken on board, and landed as above, on forfeiture of 100*l.* which entry is to be passed by them without receiving any custom, or duty for it, mentioning in there accounts that it was passed by virtue of this act, 12 Geo. II. cap. 30. §. 8, 9. and 24 Geo. II. cap. 57. §. 7.

— British, in Asia, Africa, or America. Upon performing the requisites abovementioned, the bond is to be discharged, and delivered up, 12 Geo. II. cap. 30. §. 9. and 24 Geo. II. cap. 57. §. 7.

— If any such ships, after unloading her sugars, takes on board other goods before her return, all remaining on board at her arrival in Great Britain, are to be entered and landed before her departure from thence, 12 Geo. II. cap. 30. §. 9. and 24 Geo. II. cap. 57. §. 7.

— This act not to excuse ships being registered according to 7 and 8 Will. III. cap. 22. 12 Geo. II. cap. 30. §. 12. and 24 Geo. II. cap. 57. §. 7.

— The master, or owner of such vessel, may not advance to the seamen, or mariners, while in parts beyond the seas, any money or effects, on account of wages, more than one moiety of their wages due from their departure, to their return to Great Britain, on forfeiture of double the money so advanced, 12 Geo. II. cap. 30. §. 12. and 24 Geo. II. cap. 57. §. 7.

— Granting a false certificate, or counterfeiting, forging, or altering any licence, oath, or certificate, made pursuant to this act, the penalty is 500*l.* forfeit, and the licence, oath, or certificate, rendered invalid, 12 Geo. II. cap. 30. §. 15. and 24 Geo. II. cap. 57. §. 7.

— This act not to extend to granting a liberty to carry any sugars from the sugar colonies to Ireland, 12 Geo. II. cap. 30. §. 16. and 24 Geo. II. cap. 57. §. 7.

— No ship, required to be registered by 7 and 8 Will. III. cap. 22. may be permitted to trade, or deemed qualified for that purpose, within the intent of the said act, until the master make oath, before the governor, or collector of the customs of the plantation where he arrives, as prescribed by act of parliament, 15 and 16 Geo. II. cap. 31. §. 1.

— Any ship loading, or unloading, any goods in the plantations, before such proof, is forfeited, and may be prosecuted, recovered, and divided in like manner, as if she had not been registered, 15 and 16 Geo. II. cap. 31. §. 2.

— British in Asia, Africa, or America. Any ship duly qualified to trade to, from, and in his majesty's plantations in America, being there, and the certificate of the register lost or mislaid, the master is to make oath before the governor, or collector of the customs where she is, as prescribed by act of parliament, 15 and 16 Geo. II. cap. 31. §. 3.

— And to give 500*l.* security if the ship be 100 tons burthen, or under, and so in proportion, if of a greater burthen, with condition, that the ship has been duly registered, and that the certificate of the register, if found, shall be delivered up to the commissioners of the customs to be cancelled, and no illegal use has been, or shall be made thereof; and that it has not, nor shall be fraudulently disposed of; and that the ship does wholly belong to his majesty's British subjects,

and that no foreigner has any share, property, or interest therein. And then the governor, and collector of the customs are to give the master a certificate under their hands and seals, of his having given such bond, and made such oath; and thereupon the ship is to have liberty to trade for that voyage only. The officer, who takes the bond and oath, is to transmit an account thereof to the commissioners of the customs, 15 and 16 Geo. II. cap. 31. §. 3.

— British, in Asia, in Africa, or America. The certificate of the register being lost, the ship may be registered *de novo*, upon the master and one of the owners making proof upon oath (before the commissioners of the customs, if any of the owners reside in Great Britain, Ireland, Guernsey, or Jersey, or before the governor, and collector of the customs residing in the plantations in America, if she was registered there, and none of the owners reside as above), of the loss, and likewise of the name, burthen, built, property, and other particulars, required by 7 and 8 Will. III. cap. 22. before the same persons, and in the same manner, as required upon original registers, and giving 500*l.* security, if the vessel be of the burthen of 100 tons, and in proportion for ships of greater burthen, to the collector of the port to which she belongs, that the certificate has not been, nor shall be, fraudulently disposed of, or used contrary to law; and that when found, it shall be delivered to the commissioners of the customs to be cancelled; and a certificate of the register is to be delivered to the owner by the proper officer, as directed by the said act of 7 and 8 Will. III. mentioning the name by which she was former registered, and that this certificate is granted in pursuance of this act, instead of the former certificate, which appears, by such proof as this act requires, to be lost, 15 and 16 Geo. II. cap. 31. §. 4.

— A duplicate of the certificate is to be transmitted, by the officer who granted it, to the commissioners of the customs, 15 and 16 Geo. II. cap. 31. §. 4.

— All bonds, commonly called plantation bonds, taken in Great Britain (in pursuance of 7 and 8 Will. III. cap. 22. or any other law), whereby the goods therein enumerated are to be brought to Great Britain, are to be with condition, that within eighteen months from the date (the danger of the seas excepted), a certificate shall be produced from the collector and comptroller of the port where the goods are delivered, that they have been there landed and discharged; otherwise the bond to be forfeited, 15 and 16 Geo. II. cap. 31. §. 5.

— But not to extend to bonds given to ships which take rice at Carolina, or Georgia, pursuant to 3 Geo. II. cap. 28. or which take sugars in any of the sugar colonies in America, pursuant to 12 Geo. II. cap. 30. 15 and 16 Geo. II. cap. 31. §. 5.

— British, in Asia, Africa, or America. --- No mariner or person serving on board any privateer or trading vessel, employed in any of the British sugar colonies in America, or being on shore there, or at sea in any of those parts, shall be liable to be impressed by any officer belonging to a man of war (unless such mariner shall have deserted from such ship of war) under the penalty of 50*l.* 29 Geo. II. cap. 30. §. 1.

— Every master of a trading vessel or privateer in those parts, before he receives any mariners into his service, is to make diligent enquiry, whether such mariner hath deserted from any of his majesty's ships of war; any master receiving a mariner, who hath deserted, without reasonable endeavourment to discover the same, to forfeit 50*l.* 29 Geo. II. cap. 30. §. 2.

— Every master of such trading vessel or privateer before departure from any port in the said sugar colonies, is to deliver, to the chief officer of the customs an exact list of all his men, containing names, ages, and description of persons: on neglect thereof; the master to forfeit 10*l.* for each man so omitted; the officer of the customs to return to the said master an attested copy of such list: on the death or alteration of any seaman, such list to be immediately altered accordingly, and delivered to the naval-officer or chief officer of the customs in any port where the ship may arrive. All such lists to be produced and shewn to the captains and other officers of his majesty's navy, 29 Geo. II. cap. 30. §. 3, 4.

Q.

Q U A

QUACK, a bold and confident pretender to the practice of the art of medicine.

A SHORT ANTIDOTE AGAINST GENERAL QUACKERY.

Every one of common sense will allow, that he who is best acquainted with the structure and use of any machine, will be best able to repair it's disorders; and that he who ignorantly goes about to rectify any disorder therein, will make but a contemptible work, in comparison with one who has made it the business of his life to be well acquainted with all the parts, and various uses of it's motions and springs: and the more exquisite this machine is, the greater degree of skill will be required for the rectifying it's disorders. This is plain to the meanest apprehension. Who, in his right senses, would send for a bricklayer to mend a clock?

I. The human body, may be properly considered, as a most perfect and noble machine, whose parts are extremely well configurated, whose symmetry is most beautiful, and whose actions resulting from these admirable compages are reciprocally carried on by solids and fluids, of which the whole is constituted. And as many of it's motions are easily demonstrated by the consequences of it's structure, so it's diseases, are only the irregular motions or disorders of this complicated machine: nor is the case the least altered, by our having a principle within us, not subject in itself to the laws of motion.

II. It is, therefore, incumbent on every one, who would attain the due knowledge of the art of healing, that he make himself very well acquainted with this admirable piece of mechanism. That knowing well the part, the natural actions, and secretions of the human body, he may be enabled to judge, when and how these natural actions are perverted. All the symptoms of diseases, being the necessary consequences of the alteration of the animal œconomy; and without the knowledge of the secretion, we cannot understand the nature of diseases, that principle being the great spring of all the animal functions.

III. It is a maxim universally received among physicians, That medicine should begin where philosophy ends. It is, undoubtedly, a necessary qualification in a physician to be knowing in philosophy; and the natural actions and secretions of the human body, is that part of philosophy, which is more especially conducive to the knowledge of the practice of physic, and therefore ought carefully to be studied by every physician. And he is a true physician, who moreover attends, as much as may be, to all possible consequences, who does not heal one disease, by procuring a worse, but restores such a life as a man can enjoy.

The human spirits and blood, are the principal seats of health as well as disease. As to those parts of the body designed for strength and motion, they indeed fall not improperly under a surgeon's skill. But the humours, spirits, and blood, which are the seats of life, these and the animal secretions are peculiarly under the consideration of physicians; but are not yet so perfectly understood, even by the most learned, as we could wish; and until they are, there will be one fundamental deficiency in physic.

IV. Experience is doubtless of great use in promoting the art of curing diseases, if directed by a knowledge in the parts of the human body and the animal secretions; forasmuch as it is only by a just reasoning on experience, that we can come at the full knowledge of any phenomenon of nature. So that experience, or the knowledge of the histories of diseases, added to that of the animal œconomy, is what can only make a physician; and, wherever the history of a disease is exactly known, if the right method of curing it cannot be deduced, it must be, because the knowledge of the parts of the human body, of their use, and of the animal secretion, are not sufficiently understood: for the skill of physicians in curing diseases, whose histories are exactly known, is, for the most part, proportional to their knowledge of the animal œconomy: for in order to find out the seat and nature of a distemper, and from thence to deduce a right method of cure, it will be absolutely necessary to reason on those histories; which we

Q U A

cannot do as we ought, if we are ignorant of the structure, use, and disorders of the machine we are about to rectify.

V. Descriptions and diagnostic signs of diseases, are the proper business of observation and experience; but indications of cure, arise from reasoning upon those observations. Diagnostics are properly a collection of particular symptoms only, but indications are those conclusions, which our knowledge of the parts of the body and their use, enables us to make on these observations and descriptions. So that the histories of diseases, and the knowledge of the parts of the body and their use, must always go hand in hand, in order to the obtaining the due knowledge of the practice of physic. He therefore, who is sufficiently knowing in philosophy and the animal œconomy, and makes a proper use of this knowledge, by reasoning on **REAL FACTS**, grounded on repeated experience and observation, may justly be said to use his philosophy aright; and may then reasonably hope for success, in finding out the genuine indications of cure, in which the practice of physic chiefly consists. And without this caution, our reasonings will certainly be to very little purpose; for what is not deduced from genuine appearances, is mere hypothesis.

VI. The great Hippocrates has this assertion, That nature cures diseases. The truth of it physicians of this day may experience, if they will carefully keep up to his excellent directions and method; it being his only aim to relieve nature when oppressed, in the very way and manner he observed her endeavouring to expel diseases. And it was by a constant diligence of this kind, joined to his superlative sagacity, that he arrived to that high degree of perfection in the knowledge of physic. Hence he perceived, that nature herself judges diseases; and, indeed, does all, being properly assisted; nay, and sometimes without any assistance.

VII. Hippocrates also informs us, and experience cannot but confirm it, that those people who have fevers, and are left to themselves, and take no medicines, if they do recover, get rid of their fevers by sweating, a looseness, an hæmorrhage, diabetes, or the like. Hence Hippocrates, and the ancient practitioners in physic, took their first intimation to provoke sweat and the other evacuations. And from their repeated observations and successes, they have formed a most rational method of cure. This affords a very strong confirmation of the necessity of a careful and diligent observance of the tendencies of nature in all her disorders, and the method she takes to get rid of diseases, when left to herself; and also a very good caution, not to be over hasty, or too busy in the administration of remedies, lest we should be found to ruffle and disturb, rather than assist nature, with the untimely use or multitude of medicines. The ne quid nimis in the practice of physic, is a matter of no small consequence: he therefore is most likely to prove the best, most prudent, and rational physician, who most diligently observes, and constantly follows, the motions and dictates of nature herself.

VIII. The many accurate and charming descriptions of distempers, delivered down to us by Hippocrates, in his Histories of Diseases, wherein the phenomena of each distemper, even in it's minutest circumstances, are observed, present us with an exquisite delineation of nature: and, if duly attended, will always be found of the greatest service for advancing the progress in the art of healing. Because, from his diagnostics in particular, though not excluding others of the Ancients, nor such among the Moderns, who have closely copied after his manner, we readily discover the nature of the disease. And as, whenever we arrive at the exact history of any distemper, we may, at all times, by the right application of the method of investigating diseases, most likely discover the immediate cause; so may we likewise, on those principles, easily come at the nature of the disease; when, having that given, it will be no difficult matter to find out remedies to cure, in all curable cases, and to administer relief, even in those which are incurable.

IX. This unwearied diligence in observation on nature, in the sagacious Hippocrates, and others of the Ancients, might probably be heightened in them, from the scantiness of their

Matéria

Materia Medica, and the exceeding severity of the then known remedies, however much to our benefit; since the excellent descriptions of diseases they had given us, cannot only never be exceeded, but will always remain invariably true, while human nature continues what she is. And had those of later ages, which have been so happily provided with a more copious and salutary Materia Medica, and which, it must be allowed, have been greatly improved in the knowledge of the animal oeconomy: had these constantly persevered in the use of Hippocrates's great diligence and manner of observation, they might, doubtless, long ago, have brought the practice of physic to a considerable degree of perfection, though they had not been blest with his extraordinary skill: for that, indeed, is a peculiar happiness, and the lot of very few; in which particular, we may, perhaps, say of the physician, as is commonly done of the poet, *Nascitur, non fit*. X. Should we of this age, flushed with our superior knowledge in the animal oeconomy, and the variety of our Materia Medica, neglect to make use of that prudence and diligence, which are necessary in attending the motions of nature, and instead of endeavouring to assist her on these principles, when oppressed, become too precipitate, in the administration of medicines; the consequence will inevitably be, that we shall only obscure the disease, by multiplying, rather than taking off, the symptoms; and this to the personal confusion of physicians, the manifest injury of their patients, and the great disrepute of the profession. Whereas, would we consult the true and proper use of the many happy improvements of our own age, it cannot be done more effectually, than by keeping close to that most skilful leader Hippocrates, together with the other ancient practitioners in physic, in their manner of observing, and in their method of healing; founded upon the knowledge of the conjunct cause of distempers, from whence alone, the curative indications are to be taken. And by a careful perseverance in these methods, we may reasonably hope for the greatest success; and may, perhaps, in a few ages, arrive at the highest perfection in the practice of physic, that human nature is capable of attaining.

XI. In order to cure any disease, it is necessary to have a thorough knowledge of the disease itself, and of the remedy peculiarly adapted to it; it being impossible to cure a disease according to art, if the nature of the disease be hid from the artist. And for want of this knowledge, the care and pains of many physicians have proved ineffectual. These physicians, making little other use of the diagnostic symptoms than the mere naming the distemper only, have injudiciously taken their indications of cure from secondary and casual symptoms: whereas the true nature of a disease is ever best found out, from the diagnostic signs or marks alone; and from thence also, the true indications of cure must always be drawn, in order to the best and most effectual method of treating the disease. And as these indications wholly arise from our reasoning upon the observations we make of the appearance of nature; therefore, the greater our knowledge of the parts of the body and their use is, the better we shall be enabled to find out the nature of the disease. For it is this knowledge which must enable us, by reasoning upon the causes, signs, and symptoms of diseases, to find out their nature, and to deduce true and just indications of cure.

XII. Thus far in general. But now more expressly, to come at the true method of investigating and finding out the nature of all diseases incident to the human body, and from thence proceed to the most effectual methods of treating and curing them, the following particulars are absolutely requisite, viz. that we be well acquainted with,

1. The next and ever concomitant cause of the disease.
2. The seat and part affected.
3. The ways and passages through which the evil takes it's course.
4. The inseparable signs of the distemper.
5. The symptoms which commonly accompany the disease. And
6. That the symptoms of the disease are rightly distinguished. If the physician errs not in these essential points, he may be judged to be in the right way of arriving to an happy cure of the disease.

XIII. It is very necessary at all times, carefully to distinguish between the disease itself, and the symptom. An inadvertence in this article, has been the stumbling-stone of some, even learned men, in all ages. Since it is to be imputed to the want of this distinction, as a principal (if not the only) obstacle, that physicians have been so much at a loss for the true cause of the disease, and have therefore so often taken the symptom for the disease itself: not rightly distinguishing the next and immediate conjunct cause, from it's symptoms or accident; which may not be occasioned by the next and always accompanying cause of the disease, but by some other symptom; and what is so far from being the mark of the disease, that it is a symptom of a symptom only.

XIV. In the common malady of the tooth-ach, for example, when it does not proceed from a caries or rottenness, the genuine essence of this disease is, the violent distention or stretching of the periosteum, by some sort of humour; by which

means this membrane, being forced out of it's natural form and situation, excites a most exquisite pain; which pain is not the disease, but the true mark of the disease; and the humour occasioning this pain, the cause of the disease. The inflammation, fever, swelled face, &c. which may succeed, are none of them the true marks, but proceed from the pain, which is the true diagnostic, sign, or mark of the disease, each of the above-mentioned being the symptom of a symptom only.

XV. The true marks or signs of a disease are such, as are present from the beginning, and, as it were, born with the disorder; they grow up therewith to it's height, abate also and vanish with it. These are the only sure marks or signs. Other signs or symptoms which do not immediately follow the disease, nor any proper effects of it, and which do not always appear in the disease, are therefore deceitful signs, and not to be trusted to; though such as have inadvertently misled some sagacious men.

These deceitful signs are not to be reckoned among the proper symptoms of the disease, being only such as proceed from some proper symptom of the disease; and are, indeed, symptoms of symptoms only. For the true and proper diagnostic marks or signs of the disease, must always begin, grow up, decline, and vanish with the disease itself; and from such marks only, we must ever draw our indications of cure.

XVI. As to the symptoms of any disease, the first business is to distinguish the symptoms in general from the disease itself, and then to make a distinction between the symptoms themselves: that is, the symptoms which arise and vanish with the disease, are to be distinguished from those which are bred, not from the disease itself, but from the symptoms of the disease: and the symptoms as we before observed, which immediately accompany the disease, and are born and die with it, are the only sure marks or signs of the disease.

XVII. To illustrate this by our former familiar instance of the tooth-ach: here the pain is the chief and most grievous symptom, but is neither the disease itself, nor the cause of the disease; nor yet is it a simple symptom only, forasmuch as it is the cause of other symptoms which succeed; as the fever, inflammation, swelled face, &c. especially when the pain is violent. These several accidents now mentioned, are caused only by the raging pain of the tooth-ach (the true mark of the disease) and are symptoms of a symptom only. And farther, these accidents of fever, inflammation, swelled face, &c. are neither in whole nor in part the cause of the tooth-ach; neither are they inseparable companions of the tooth-ach; for the tooth-ach may be, and often is, where these never appear: as to the swelled face in particular, that neither begins nor ends with the disease, nor does it always accompany it; nor is it of the same nature with the humour occasioning that violent pain, but is merely a symptom of the tooth-ach, being raised by the pain, and bred by consent of parts from an afflux of humours.

XVIII. Thus we see plainly the method of finding out the nature and causes of a disease, it's seat and part affected, it's diagnostic and casual symptoms, and the necessity of distinguishing these latter, not only from the disease itself, but also from one another: all which will make way to judge the better of a fit remedy to cure the disease, for we cannot reasonably hope for a cure, before the disease be thoroughly understood. And in this manner we must come at the nature, cause, and cure, of all diseases.

XIX. From this method also of finding out the distemper, is discovered, at the same time, the only way of making a right and true prognostic, which is no more than a declaration of a physician's expectation in curing a sick person. And this expectation can no otherwise be truly framed, than from the nature of the disease, the quantity and intenseness of it, the natural strength of the sick, and the power of medicines conjunctly. The knowledge, therefore, of prognostics is not otherwise to be acquired, than by rightly investigating the diagnostic marks of a disease, whereby it's nature is discovered, with that of the quantity of the disease, and the strength of the patient, at the same time: and as by this method, we are also led into the nature and power of medicines themselves; so here again, the very medicine reflects light, and, in some measure, confirms the knowledge of the disease: as Hippocrates well observes — *Medicina indicat morbum*.

XX. This then is the method, by which the nature of all diseases, to which human bodies are or may be liable, is discovered. And should ever any altogether new and unheard-of disease, at any time appear amongst mankind, this will be found the sure way of coming at it's nature, by only thus carefully recollecting, examining, and distinguishing it's symptoms. This will of consequence direct to the most proper method of curing, the knowledge of a disease being the first step towards it's cure.

'All the difficulty of philosophy,' says the great Sir Isaac Newton, 'seems to consist in this, from the phenomena of motions to investigate the forces of nature; and then, from these forces, to demonstrate the other phenomena.' Agreeable to which, we observe, that the symptoms of any disease being given, it's nature may readily be discovered.

XXI. The method of curing diseases, by drawing indications from the evident and conjunct causes, has always met with approbation, as from the best, so from the body of the most learned physicians in general. And as to the knowledge of these causes, it is allowed, that can only be attained by a close and assiduous observation of all the appearances in the several stages of the distemper. Whoever, therefore, has obtained an exact knowledge of the histories of diseases, if he has also due regard to the diagnostics, as by the method directed, may readily investigate their nature.

Natural philosophy and the history of diseases, as we observed above, must always contribute their joint-assistance in improving the art of healing; it not being possible to make any use of the latter, without a degree of knowledge in the former: and the greater our knowledge is of the parts of the human body, of their use, and of the animal secretions, the better the nature of diseases will be known.

XXII. We said before, that the symptoms of any disease being given, its nature may be discovered.

Now the symptoms of every disease are no other than the effects of some cause, or causes, which pervert and overturn the natural actions of one or more parts; for which reason, by explaining these symptoms, we become apprized of the perverted action, or discover the disease: for nothing can be the cause of a disease, that does not produce the symptoms, in which the nature of the disease consists.

XXIII. Wherefore, the symptoms of any disease being given, its nature may thence be discovered; and the nature of a disease being assigned, we have also the methods of curing it. Farther, having the nature and causes of any disease, we shall be able to determine how far the disease is curable or incurable; the probabilities of curing any distemper, and the methods and medicines proper to be used in attempting it.

XXIV. The Ancients, as before observed, have most accurately described the diagnostic signs and marks of diseases, together with their most natural and simple appearances. Whoever, therefore, is thoroughly acquainted with the histories, as delivered down to us by them, and is well versed in the structure and nature of the fluids and solids of the human body, may, from their diagnostic signs, be able to discover the nature and seat of the disease, and the productive cause of it. By the same means also, he will have it in his power to shew in what manner the symptoms, attending the disease, flow from its nature, thus found out from its symptoms; and likewise be capable of perceiving how these symptoms are cured, by changing the distempered condition of the parts affected.

XXV. But, in this examination of the nature of the disease from its symptoms, we must be most careful, that every casual and foreign symptom be separated from those which are constant and permanent, in the manner the method more at large directs; it being easy, by observing the rule there laid down, to distinguish the constant and inseparable symptoms from those, which are merely casual and secondary.

XXVI. The principal symptoms are, for the most part, easy to be explained. The false symptoms are most commonly found among the secondary sort, and are the symptoms of symptoms only; for which reason they ought to be rejected from the number of symptoms properly belonging to the disease.

XXVII. Indications of cure must be drawn from the nature of the disease, and not from their precarious supposed causes, nor from their adventitious and casual symptoms: and there must run an uninterrupted chain, from the diagnostic signs of the disease, through its nature and causes, 'till it ends in a rational method of cure.

XXVIII. Thus we see, that in order to cure any disease, the natural and practical way, is first to collect the most constant symptoms and effects of the disease. But in doing this, we must always remember, that our utmost diligence will be necessary, rightly to distinguish the symptoms: that in our collecting the genuine diagnostic signs of any disease, we never suffer the secondary signs or symptoms of symptoms, to creep into the number of the genuine diagnostic signs; for if we do, we shall certainly render our enquiries into the true nature of the disease, almost fruitless and impracticable; whereas, by strictly observing this caution, we shall readily discover the disease and its symptoms, together with the causes of both. And if we can come at the nature of the disease we are about to cure, there remains no difficulty as to the way of curing, be the appearances of the symptoms never so complicated.

XXIX. The direct method of cure being thus obvious, the probabilities of success must be, as the nature of the distemper we come to cure, and the efficacy of the medicines we administer, respectively. And if we already discover by reason and practice, the peculiar ways in which the medicines made use of will act, we shall be thereby instructed, when medicines are most properly administered, and why they must be continued or laid aside, which is the sum and substance of physic.

The application of these sentiments to the public benefit.

XXX. In consequence of what has been urged by the most

learned physicians, it must appear to every man of common sense, to be a sad mistake, that has at present seized on many people, to imagine, That, if they are but well furnished with books of recipes, or are possessed of a powerful medicine, they have every qualification fit for commencing Doctor; because in these books and these medicines, as they think agreeable to the common saying, they are sure to find a salve for every sore. But, alas! these base empirical books, recipes, and medicines, the pest of the present age, will greatly deceive them. They are by no means to be confided in, but, on the contrary, are to be looked upon as very injurious, forasmuch as they only furnish all sorts of people with great opportunities of destroying each others health.

XXXI. And should any person pretend to set up to practice physic on this deceitful foundation, he would soon find himself miserably misled, to the manifest injury of himself, as well as of his patients. For it is most certain, that every medicine, be it never so good, must always be administered in the most proper dose, and at the most proper times of the disease, to make it of any advantage to the patient. This knowledge can no otherwise be come at, than in the arduous and diligent manner of studying above-mentioned, joined with the method of investigating the nature of diseases. Nor is this the sole advantage which follows on the doctrine of investigation, since it not only leads us into the true nature of the disease, and the certain method of cure, but also, at the same time, into the very nature and power of medicines themselves, if rightly attended to and applied. For the virtue of any medicine, is no other than its power of eradicating the immediate cause of the disease; which effect is discovered, from knowing first the nature of the disease, and the different powers of medicine, are but the degrees of the same virtue thus discovered: from whence we have consequently the direct and indirect actions of medicines, with their positive and comparative powers. And were it possible, even to find out an universal remedy for all distempers, it must still be subject to the true dosing and timing: the accurate knowledge of which can no otherwise be obtained, than by the manner and method here laid down. And this, indeed, is the only true ARCANUM in the practice of physic. All your PANACEAS, NOSTRUMS, SPECIFICS, and the like, without this perfect knowledge of administering them in the most proper dose, and at the most proper times of the disease, will, for the most part, prove very mischievous. And, indeed, these remedies can only, by the greatest hazard and chance imaginable, ever prove of good effect, in any disease of consequence. It is true, that in many cases, let the medicine given be ever so improper in itself, or ever so unseasonably administered, the strength of nature may sometimes get the better of both, and the patient by that means luckily escape: but this is by no means curing, nor can nature's successful effort be any excuse for ignorance and quackery.

XXXII. From what has been advanced, it is natural to conclude, that it is no easy matter to become a skilful physician. Much reading, much thought and pains, will really be required: many things are necessary to be learnt, much diligence in enquiry, and much assiduity in observation, are to be used, before any one can be duly qualified (either with peace of mind to himself, or relief to his patients) to undertake a trust, in which the lives of his fellow-creatures are so nearly concerned.

XXXIII. If this be a just state of the case, what shall we say of those persons, who boldly take upon them the practice of physic, without the least previous knowledge of the requisites absolutely necessary for the regular discharge of this important office! Certainly, it can be no other than the highest presumption, for those to expect success, or hope for a blessing on their endeavours, who are altogether ignorant of the province in which they engage. Would such persons but seriously consider the great consequence of physic, in the practical part of it, where life itself is so immediately at stake, if they had any compassion for their fellow-creatures, they would not thus rashly venture to administer medicines, before they had acquired the proper and necessary qualifications. But at present, by melancholy experience, it is too well known, that this nation swarms with remorseless and cruel destroyers, who daily delude and impose on weak and credulous people, with their never failing remedies, for every body, every case, and at all times, alike; to the infinite damage of the PUBLIC HEALTH. And were the same art and industry used to discover the real mischief done by this practice, as are used to publish an accidental success, the balance, on the whole, would appear formidable. But who can expect, that the crafty should bewray and ruin their own craft? These, indeed, are wise in their generation: but, that the suffering patients should zealously support these deceivers, to cover their own folly, is a strange infatuation; yet so it is. No wonder, therefore, that a few accidental cures should be so much noised abroad, when the deceivers and the deceived join in the cry to propagate the fatal delusion.

XXXIV. In order to qualify the physician to collect the symptoms of diseases from his patients, in a judicious and useful manner, it will be absolutely necessary, besides an accurate

rate acquaintance with the structure of the human body, that he be also well read in the histories of diseases, delivered down to us by the Antients: for the great difficulty of collecting signs and symptoms from the sick patients; such, we mean, as shall direct to the nature of the disease; arises not barely, either from want of personal sagacity, or ignorance in the animal economy; but more especially, from being but superficially acquainted with the learning of the Antients in the particulars above: and, it is greatly to be feared, whenever the physician fails in distinguishing one disease from another, and the disease itself from their symptoms in their patients; it is from their not being sufficiently acquainted with that most perfect knowledge, which results from the admirable descriptions of antient physicians.

XXXV. This method, therefore, of investigating the nature of diseases, taken from the best and most antient physicians, and leading to the most successful ways of curing all curable diseases, and relieving the incurable, being the most natural and certain rule of attaining the above-mentioned extensive knowledge; we think it may not improperly be esteemed the very master-key to the judicious, and most successful practice of the art of physic. And, if thoroughly understood, and properly applied, together with the knowledge of the great improvements made in our own times, with regard to the animal economy and *Materia Medica*, it will safely conduct the physician from the threshold of medicine, to its consummation; and that with much greater expedition and success, than any other hitherto known method. As what has been suggested on this argument will be of uncommon service to the beginner, so likewise will it continue to be the most useful and necessary companion we can associate withal, through the whole course of medicinal practice, by a right application in all the diseases, and the varieties of them, which may at any time be met with in authors, or observed from experience, whereby practitioners may most likely come at the cause and cure of diseases.

XXXVI. But here it may be objected; why all this pains-taking; why all this great diligence in enquiry, and great assiduity in observation; when the generality of mankind are so weak as to prefer every bold pretender, before the regular physician? This, indeed, at first view, seems very discouraging, and somewhat astonishing too! But then, let us consider, whether the physicians be not blameable as well as the people, that QUACKERY is at present so much in fashion; for, if the physician neglects the necessary qualifications, and fails of success among his patients, for want of proper knowledge and observation, which can only be acquired by the constant and diligent pains-taking above-mentioned; is it to be wondered at, that his patients should seek elsewhere for assistance, and thereby become a prey to every pretender and nostrum-monger? Whereas, when due care is taken that the physician be properly qualified, a reasonable success will, for the most part, attend his practice; and, in that case, the patient would be much less liable to fall into the hands of impostors and quacks. But alas! at present it is our great misfortune, through want of proper regulations, to have in this nation many more Doctors than Physicians; and which is, indeed, one main reason of the great increase of quackery amongst us; for, was the practice of those who called themselves doctors, attended with any reasonable success, their patients would not so readily apply to quacks and pretenders, in preference to the accomplished physician: in all times, indeed, there has not been wanting a fatal fondness, more or less, among weak and ignorant persons, in favour of nostrums and infallibility; but that disorder in these present times is so increased, that it calls loudly for the utmost care and compassion of our legislature.

XXXVII. Many medicines given as nostrums, and advertised as infallible, we very well know, are taken from the prescriptions of EMINENT AND LEARNED PHYSICIANS; which the quacks, those destroyers of health, in some measure disguise, and then call them after their own names, in order to deceive the people into an opinion of their skill, and to intitle themselves to patents and rewards. But who sees not, that these remedies, excellent, and of great efficacy in the cure of diseases, if judiciously administered; may yet prove (by a promiscuous and unskilful use) of the very utmost hurt and damage to mankind? Thus are the instruments of health wickedly wrested out of the physician's hands: and what was contrived and designed by them for the public good, by this great abuse, becomes a public mischief, and a salutary remedy is turned into a poison, by the random use and improper application of it. Now if medicine has ever been, or can be brought to be of real use to mankind, it is most likely to become so, when in the hands of discreet and learned physicians; and a very little reflection, cannot but convince every man of common sense and humanity, that to suffer an unskilful and promiscuous use of medicines, must needs be of dangerous consequences to the public, and productive of great evil. But against this great evil, the prudent physician has no other remedy, than the duly qualifying himself and others, to the best of his power, for that important office, the practice of physic; and it is only from the wisdom of the legislature, that an effectual redress of so

pernicious a disorder, as the quackery now reigning among the weaker sort of people, must be expected; if such a one can be found out. Nor can it be doubted, that the weakest among the people have a just right to all that protection and preservation, which the guardians of their lives and properties can equitably procure them: and would the legislature, at the same time, be pleased not to suffer any person to administer medicines, until they had given proper testimonials of their qualifications for that important office, the benefit of his majesty's subjects, from such a regulation, would be unspeakable.

REMARKS.

QUACKERY having in our days become a branch of traffic in this nation, of as pernicious and dangerous a tendency to the lives of his Majesty's subjects as a general plague; we have thought proper to take notice of it, hoping that some effectual remedy may one day be taken by the parliament, to prevent a destructive trade, that strikes at the root of all others.

QUARANTINE, i. e. forty, a denying entrance into a healthful place for 40 days, to those persons that are supposed to come from any infected place.

The LAWS of ENGLAND relating thereto.

An act to oblige ships more effectually to perform their quarantine; and for the better preventing the plague being brought from foreign parts into Great Britain or Ireland, or the isles of Guernsey, Jersey, Alderney, Sark, or Man.

Whereas it is necessary that some provision be made by parliament, for obliging ships and persons coming from places infected with, or frequently subject to, the plague, to perform quarantine in such manner as hath been, or shall be, ordered by his Majesty, his heirs, or successors; and for punishing offenders therein, in a more expeditious manner, than can be done by the ordinary methods of law; be it enacted, by the king's most excellent Majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in parliament assembled, and by the authority of the same, That all ships and vessels arriving, and all persons, goods, and merchandizes whatsoever, coming, or imported into any port or place within Great Britain or Ireland, or the isles of Guernsey, Jersey, Alderney, Sark, or Man, from any place from whence his Majesty, his heirs, or successors, by and with the advice of his or their privy council, shall judge it probable that the infection may be brought, shall be obliged to make their quarantine in such place and places, for such time, and in such manner, as hath been, or shall, from time to time, be directed by his Majesty, his heirs, or successors, by his or their order or orders, made in his or their privy council, and notified by proclamation, or published in the London Gazette; and that until such ships, vessels, persons, goods, and merchandizes, shall have respectively performed, and be discharged from such quarantine, no such person, goods, or merchandizes, or any of them, shall be brought on shore, or be put on board any other ship or vessel, in any place within his Majesty's dominions, unless in such manner, and in such cases, and by such licence, as shall be directed or permitted by such order or orders made by his Majesty, &c. in council as aforesaid; and that all such ships and vessels, and the persons or goods imported in, or being put on board the same, and all ships, vessels, boats, and persons, receiving any goods or persons out of the same, shall be subject to such orders, rules, and directions, concerning quarantine, and the prevention of infection, as have been, or shall be made by his Majesty, &c. in council, and notified by proclamation, or published in the London Gazette as aforesaid.

And it is hereby further enacted by the authority aforesaid, That if the plague shall appear on board any ship, being to the northward of Cape Finisterre, the master, commander, or other person having charge thereof, shall immediately proceed to the harbour of New Grimsby in the islands of Scilly, where being arrived, he shall make known his case to some officer of the customs there, who shall immediately acquaint some custom-house officer of some near port of England thereof; and the said custom-house officer shall, with all possible speed, send up the intelligence thereof to one of his Majesty's Principal Secretaries of State, that such measures may be taken for the comfort and support of the crew of such ship so infected, and such precautions used to prevent the spreading of the infection, as the case shall require; and the said ship shall remain at the said islands of Scilly, 'till his Majesty's pleasure be known; nor shall any of her crew go on shore; but in case the said master, commander, or other person having charge of the said ship so infected, shall not be able to make the said islands of Scilly, or shall be forced by stress of weather, or otherwise, to go up either of the channels, he shall not presume to enter with such ship into any port, but shall remain in some open road, 'till he receives orders from his Majesty, or his privy council, and shall take care to prevent any of his ship's company from going out of his ship, and to avoid all intercourse with other ships or persons;

Yons; and the said master, or any other person on board such ship as aforesaid, who shall be disobedient herein, shall be adjudged guilty of felony, and shall suffer death as in cases of felony, without benefit of clergy; and every such offence so made felony, shall, and may be enquired of, heard, and determined, in the county where the offence shall be committed, or else in the county where the offender shall be apprehended.

And to the end that it may be better known whether any ship or vessel be actually infected with the plague, or whether such ship or vessel, or the mariners or cargo coming and imported in the same, are liable to any orders touching quarantine; be it further enacted by the authority aforesaid, That when any country or place is, or shall be, infected with the plague; or when any order or orders is, are, or shall be made by his Majesty, his heirs, or successors, concerning quarantine, and the prevention of infection, as aforesaid, as often as any ship or vessel shall attempt to enter into any port or place in Great Britain or Ireland, or of the isles of Guernsey, Jersey, Alderney, Sark, or Man, the principal officer of his Majesty's customs in such port or place, or such person as shall be authorized to see quarantine duly performed, shall go off, or cause some other person, to be by him appointed for that purpose, to go off to such ship or vessel; and such officer, or other person authorized to see quarantine performed, as aforesaid, or the person so by him appointed for that purpose, shall, at a convenient distance from such ship or vessel, demand of the commander, master, or other person having charge of such ship or vessel; and such commander, master, or other person having charge of such ship or vessel, shall, upon such demand, give a true account of the following particulars: that is to say, the name of such ship or vessel: the name of the commander, or person having charge thereof; at what place or places the cargo was taken on board; what place or places the ship or vessel touched at in her voyage; whether such places, or any, and which of them were infected with the plague; how long such ship or vessel had been in her passage; how many persons were on board when the said ship or vessel set sail; whether any, and what persons, during that voyage on board such ship or vessel, had been, or shall be then infected with the plague; how many died in the voyage, and of what distemper; what ships or vessels he, or any of his ship's company, with his privy, went on board, or had any of their company come on board his ship or vessel in the voyage; and to what place such ships or vessels belonged; and also the true contents of his lading, to the best of his knowledge: and in case it shall appear upon such examination, or otherwise, that any person then on board such ship or vessel shall at the time of such examination be actually infected with the plague, or that such ship is obliged to perform quarantine, in such case it shall and may be lawful to and for the officers of any of his Majesty's ships of war, or any of his Majesty's forts or garrisons, and all other his Majesty's officers whom it may concern, upon notice thereof given to them, or any of them respectively, and to and for any other person or persons whom they shall call to their aid and assistance, and they are hereby required to oblige such ship or vessel to go and repair to such places as has been, or shall be appointed for performance of quarantine, and to use all necessary means for that purpose, be it by firing of guns upon such ship or vessel, or any other kind of force or violence whatsoever; and in case any such ship or vessel shall come from any place visited with the plague, or have any person on board actually infected, and the commander, master, or other person having charge of such ship or vessel, shall conceal the same, such commander, master, or other person having charge of such ship or vessel, shall be adjudged guilty of felony, and shall suffer death as in cases of felony, without benefit of clergy; and in case such commander, master, or other person having charge of such ship or vessel, shall upon such demand made, as aforesaid, not make a true discovery in any other of the particulars aforesaid, such commander, master, or other person having charge of such ship or vessel, for every such offence shall forfeit the sum of 200 l. one moiety thereof to the king, and the other to him or them who shall sue for the same, by action of debt, bill, plaint, or information, in any of his Majesty's courts of record at Westminster, Edinburgh, Dublin, or in the proper courts, of the isles of Guernsey, Jersey, Alderney, Sark, or Man, respectively.

And be it further enacted, That every master, commander, or other person having charge of any ship or vessel, which shall be ordered to perform quarantine as aforesaid, shall, after his arrival at the place appointed for the performance of his quarantine, deliver on demand to the chief officer appointed to see quarantine duly performed there, such bill of health, and manifest, as he shall have received from any British consul during his voyage, together with his log-book and journal, under penalty of forfeiting 500 l. one moiety thereof to the king, the other moiety to him or them who shall sue for the same, by action of debt, bill, plaint, or information, in any of his Majesty's courts of record at Westminster, Edinburgh, Dublin, or in the proper courts of the isles of Guernsey, Jersey, Alderney, Sark, or Man, respectively.

And be it further enacted, That if any commander, master, or other person having charge of any ship or vessel liable to perform quarantine, having notice thereof, shall himself quit, or shall knowingly permit or suffer any seamen or passenger coming in such ship or vessel, to quit such ship or vessel, by going on shore, or by going on board any other ship, boat, or vessel, before such quarantine shall be fully performed, unless in such cases, and by such proper licence, as shall be directed or permitted by such order or orders made, or to be made, concerning quarantine, and the prevention of infection, as aforesaid; or in case any commander, master, or other person having charge of such ship or vessel, shall not, within convenient time, after due notice given for that purpose by the proper officer, cause such ship or vessel, and the lading thereof, to be conveyed into the place or places appointed for such ship, vessel, and lading, to perform quarantine respectively; then, and in every such case, every such commander, master, or other person having charge of such ship or vessel, for every such offence shall forfeit 500 l. one moiety thereof to the king, his heirs, and successors, and the other moiety to him or them who will sue for the same; and also if any person shall so quit such ship or vessel, by going on shore, or by going on board any other ship or vessel, contrary to the true meaning of this act, it shall and may be lawful for all persons whatsoever, by any kind of force and violence, to compel such person to return on board such ship or vessel; and every such person so quitting such ship or vessel shall, for every such offence, suffer imprisonment for the space of six months, and shall also forfeit the sum of 200 l. one moiety to the king, his heirs, and successors, the other moiety to him or them that will sue for the same; the same respective penalties and forfeitures to be recovered by action of debt, bill, plaint, or information, in any of his Majesty's courts of record at Westminster, Edinburgh, Dublin, or in the proper courts of the isles of Guernsey, Jersey, Alderney, Sark, or Man, respectively.

And be it further enacted, That, whenever his Majesty, his heirs, and successors, by and with the advice and consent of parliament, shall direct houses or lazarets to be provided for the receiving and entertaining of persons obliged to perform quarantine, or for the depositing, opening, and airing of goods and merchandizes liable to perform quarantine as aforesaid, it shall and may be lawful to erect the same, either in any waste ground or commons, or where such waste ground or commons are not sufficient, in the several grounds of any person or persons whatsoever, not being a house, park, garden, orchard, yard, or planted walk, or avenue to a house, paying such rate, rent, or consideration for the same, to the person interested therein respectively, according to their several interests in the same, as shall be agreed on between the persons so interested, their guardians or trustees, and any two persons to be appointed for that purpose by his Majesty, his heirs, or successors, under his or their sign manual; and in case of any difference concerning such rate, rent, or consideration, between the persons so interested, their guardians, or trustees, and such persons so to be appointed by his Majesty, his heirs, or successors, as aforesaid; then, and in such cases, the said persons so to be appointed by his Majesty, his heirs, and successors, may, and are hereby authorized, thirty clear days before any general quarter sessions of the peace to be holden for the respective counties or divisions where such grounds shall respectively lie, as aforesaid, to give, or cause to be given, to the occupier or occupiers of such several grounds, or to be left at their last places of abode respectively, a notice in writing, describing the quantity of ground so directed by his Majesty, his heirs, and successors, by and with the advice and consent of parliament, for the purposes aforesaid, and purporting that the rent or consideration of such ground will be adjusted and settled by a jury of the said sessions; and the justices at their said sessions, upon proof to them made that such notices have been given, shall, and are hereby authorized and required to charge the jury which shall attend at the said sessions, or some other jury of twelve honest and substantial men (to be then and there impanelled and returned by the sheriff of the county, without fee or reward) and cause to be sworn, well and truly on their oath, to assess the value of the ground comprized in the said notices, and the rent or consideration to be given for the same to the respective owner or owners thereof, according to their respective interests therein; which oath the said justices are hereby required to administer to the said jury, and to which said jury the said persons to be appointed by his Majesty, his heirs, and successors, and the parties interested in such ground, shall have their lawful challenges; and the said jury being so sworn and charged as aforesaid, after proper evidence on oath given to them, shall by their verdict assess the rent or consideration to be given for such ground to the respective owner or owners thereof, according to their respective interests therein; which verdict of the said jury, and judgment of the said justices thereupon, shall be conclusive and finally bind all parties; and that from and after such verdict and judgment, his Majesty, his heirs, and successors, shall and may hold and enjoy such ground, for and during all such time and terms as his Majesty, his heirs, and successors, shall judge necessary for the

the purposes aforesaid, paying for the same such rate, rent, or other consideration, as shall be agreed upon, or assessed and adjudged, as aforesaid.

And be it further enacted, by the authority aforesaid, That the proper officers authorized to put in execution such orders made, or to be made, as aforesaid, shall, and they are hereby empowered and required to cause and compel all persons obliged to perform quarantine, as aforesaid, and all goods and merchandizes comprized within any such orders made, or to be made, as aforesaid, respectively to repair, or be conveyed to some of the said houses, or lazarets, or to such other places as shall be provided for the reception of such persons, goods, or merchandizes, or for the opening and airing of such goods and merchandizes, according to such order or orders made, or to be made, as aforesaid.

And be it further enacted, That if any person obliged to perform quarantine, as aforesaid, shall wilfully refuse or neglect to repair, within convenient time after due notice for that purpose given to him, her, or them, by the proper officer, to the house, lazaret, or other place duly appointed for him, her, or them, or, having been placed in such house or lazaret, or other place, shall escape, or attempt to escape out of the same, before quarantine be fully performed, it shall and may be lawful to and for the watchmen, and other persons appointed to see quarantine performed, by such force as the case shall require, to compel every such person so refusing or neglecting as aforesaid, and every such person so escaping, or attempting to escape, as aforesaid, to repair or return into such house, lazaret, or other place so appointed for him or her, as aforesaid; and every such person so refusing or neglecting to repair, within convenient time after such notice, as aforesaid, into such house, lazaret, or other place appointed for him or her, as aforesaid; and also every person actually escaping, as aforesaid, shall be adjudged guilty of felony, and shall suffer death as a felon, without benefit of clergy.

And whereas disobedience, or refractory behaviour in persons under quarantine, may be attended with great danger and inconvenience, be it further enacted, by the authority aforesaid, That all persons liable to perform quarantine, whether in ships, lazarets, or elsewhere, shall be subject, during the said quarantine, to such orders as they shall receive from the proper officers authorized to see it duly performed; and the said officers are hereby impowered and required to enforce all necessary obedience to their said orders, and may, in case of necessity, call in others to their assistance, and all persons so called are hereby required to assist accordingly.

And be it further enacted, That if any person, not infected with the plague, nor liable to perform quarantine, shall enter any house, lazaret, or other place so appointed, as aforesaid, whilst any person or persons infected with the plague, or being under quarantine, shall be therein, and shall return, or attempt to return from thence, unless in such cases, and by such licence as shall be directed, or permitted by such order or orders, made or to be made, as aforesaid, it shall, and may be lawful to and for the watchmen, or other persons appointed to guard or secure such house, lazaret, or other place so appointed as aforesaid, by such force as the case shall require, to compel such person so returning, or attempting to return, to repair into such house, lazaret, or other place so appointed as aforesaid, there to continue and perform quarantine; and, in case such person shall actually escape out of such house, lazaret, or other place, where he or she shall be so placed for performance of quarantine, before he or she shall have fully performed the same, he or she shall be adjudged guilty of felony, and shall suffer death as a felon, without benefit of clergy.

And it is hereby further enacted, That if any officer or officers of his Majesty's customs, or any other officer or officers, person or persons whatsoever, to whom it doth or shall appertain to execute any order or orders made, or to be made, concerning quarantine, or the prevention of infection, and notified as aforesaid, or to see the same put in execution, shall be guilty of any wilful breach or neglect of his or their duty in that behalf, every such officer and person so offending, shall forfeit his office or employment in the customs, or any other office or employment, and shall become from thenceforth incapable to hold or enjoy the same, or to take a new grant thereof, and forfeit the sum of one hundred pounds, one moiety thereof to the king, his heirs, and successors, and the other moiety to him or them who shall or will sue for the same, by action of debt, bill, plaint, or information, in any of his Majesty's courts of record at Westminster, Edinburgh, Dublin, or in the proper courts of the isles of Guernsey, Jersey, Alderney, Sark, or Man, respectively, and if any such officer or person shall embezzle, or shall knowingly and willingly damage any goods performing quarantine under his direction, he shall be liable to pay treble damages, and full costs of suit.

And whereas certain species of goods and merchandizes are more especially liable to retain infection, and may be brought from places infected into other countries, and from thence imported into his Majesty's dominions in ships not obliged to perform quarantine, be it enacted by the authority aforesaid,

Vol. II.

That all such goods and merchandizes as are or shall be particularly specified for that purpose, in any order or orders made or to be made concerning quarantine, and the prevention of infection, as aforesaid, which shall be imported into any of his Majesty's dominions from any foreign country or place, in any ship or vessel whatsoever, shall be subject and liable to such order or orders made or to be made, concerning quarantine, and the prevention of infection as aforesaid.

And it is hereby further enacted, That, after quarantine shall have been duly performed by any ship or vessel, person or persons, obliged to perform quarantine, according to such order or orders made as aforesaid, and the act, and upon proof to be made upon the oaths of the master, or other person having charge of such ship or vessel, and of two of the persons belonging to such ship or vessel, or upon proof to be made by the oaths of two or more credible witnesses, before the customer, comptroller, or collector of the port where such quarantine shall be performed, or the next port thereunto, or before any of their deputies, or any justice of the peace living near to such port, or where such quarantine shall have been performed, within any of the said isles of Guernsey, Jersey, Alderney, Sark, or Man, before any two jurats or magistrates of any of the said isles respectively (which persons are hereby authorized and required to administer such oath) that such ship or vessel, and all and every such person and persons respectively, have duly performed quarantine as aforesaid; and that the ship or vessel, and all and every such person and persons, are free from infection; and after producing a certificate to that purpose, signed by the chief officer who superintended the quarantine of the said ship: then, and in the said respective cases, such customer, comptroller, or collector, or any of their deputies, together with the said justice of the peace, or such jurats or magistrates as aforesaid respectively, are hereby required to give a certificate thereof; and thereupon such ship or vessel, and all and every such person and persons, so having performed quarantine, shall be liable to no further restraint or detention upon the same account for which such ship or vessel, person or persons, shall have performed quarantine as aforesaid.

And it is hereby further enacted, That the officer before whom such oath shall be made, and by whom such certificate shall be given, shall, for such respective oath and certificate, demand or take no fee or reward whatsoever.

Provided nevertheless, and it is hereby enacted, That all goods, wares, and merchandizes, liable to quarantine, as aforesaid, shall be opened and aired in such place or places, and for such time, and in such manner, as shall be directed by his Majesty, by such order or orders to be made as aforesaid; and after such orders shall have been duly complied with, and a certificate thereof given by the chief officer appointed to superintend the quarantine and airing of such goods, wares, and merchandizes, and proof shall be made thereof, by the oaths of two or more credible witnesses, before the customer, comptroller, or collector of the port lying next to such place or places where such goods, wares, or merchandizes, shall have been opened and aired as aforesaid, or any of their deputies, or any justice of the peace living near the same, or before any two jurats, or magistrates of the said isles of Guernsey, Jersey, Alderney, Sark, or Man, respectively (who are hereby authorized and required to administer such oath) upon certificate and return of such proof by such customer, comptroller, or collector, or any of their deputies, or such two jurats, or magistrates, as aforesaid (who are hereby respectively required to make such certificate and return to the commissioners appointed for the management of the customs of Great Britain or Ireland, or to the governor or commander in chief, being upon the place, in the isles of Guernsey, Jersey, Alderney, Sark, or Man, respectively) such goods, wares, and merchandizes, shall be forthwith discharged from any restraint or detention upon the same account, by order of the said commissioners, or any two of them, or of the said governor or commander in chief of any of the said isles as aforesaid, respectively; for every of which oath, certificate, and order, no fee or reward whatsoever shall be demanded or taken.

Provided always, and be it enacted, That if any officer, or other person, shall demand or take any fee or reward whatsoever for any such oath, orders, or certificate, to be administered or made in pursuance of this act, every person so offending shall forfeit the sum of one hundred pounds, one moiety whereof to his Majesty, and the other to him or them who shall sue for the same, by action of debt, bill, plaint, or information, in any of his Majesty's courts of record at Westminster, Edinburgh, Dublin, or in the proper courts of Guernsey, Jersey, Alderney, Sark, or Man, respectively; in which case treble costs shall be allowed to either party, as in other cases.

And be it further enacted, &c. That if any officer, or other person appointed to see quarantine duly performed, or any person placed or appointed as a watchman upon any house, lazaret, ship, or other place for performance of quarantine, in pursuance of this act, shall desert from their duty, when employed on the same business of quarantine, or shall know-

ingly and willingly permit or suffer any person, ship, goods, or merchandizes, to depart or be conveyed out of such house, lazaret, ship, or other place respectively appointed for performance of quarantine, unless in such cases, and by such licence, as are or shall be directed or permitted, by some order or orders made, or to be made, as aforesaid; or if any person, directed as aforesaid to give a certificate of a ship's having duly performed her quarantine, or airing, shall knowingly give a false certificate, then, and in every of the said cases, every such officer and persons so offending, shall suffer death, as in cases of felony, without benefit of clergy.

And be it further enacted, &c. That if any person or persons shall knowingly or wilfully conceal from the officers of quarantine, or shall clandestinely convey any letters, goods, wares, or merchandize, from any ship under quarantine, or liable to perform quarantine, by any such order to be made as aforesaid, or from any lazaret, or other places where goods shall be performing quarantine, every such person so offending, shall suffer death, as in cases of felony, without benefit of clergy.

And whereas it is notorious that, notwithstanding the many good laws made to prevent the clandestine importation of customable and prohibited goods and merchandizes, a pernicious trade of that kind is still carried on, for the most part in open boats or vessels, of small burthen, which privately, and in the night, put into creeks and secret places on the coast, thereby eluding the observation of the officers of the customs, which practices may prove highly detrimental to the safety of these kingdoms during a time of infection; for prevention thereof, be it enacted, by the authority aforesaid, That, when any part of Great Britain, Ireland, or the islands of Guernsey, Jersey, Alderney, Sark, or Man, or France, Spain, Portugal, or the Low-Countries, shall be infected with the plague, it shall and may be lawful to and for his Majesty, &c. by his or their proclamation, to prohibit and restrain all small boats and vessels, under the burthen of 20 tons, from sailing or passing out of any port or place of Great Britain or Ireland, or the isles of Guernsey, Jersey, Alderney, Sark, or Man, or any of them, until security be first given by the master of every such boat or vessel respectively, to the satisfaction of the principal officers of the customs, or the chief magistrate of the port or place from whence such boat or vessel shall sail, by bond taken to the king, his heirs or successors, with sufficient sureties, in the penalty of 300 l. with condition, that if such boat or vessel shall not go to, or touch at, any country, port, or place, to be mentioned for that purpose in such proclamation, and if the master, or other person having charge of such boat or vessel, and all and every mariner and mariners, passenger and passengers, going in such boat or vessel, shall, during the time aforesaid, not go on board any other ship or vessel at sea; and if such master, or other person, having charge of such boat or vessel, shall not permit or suffer any person or persons to come on board such boat or vessel at sea, from any other ship or vessel, and shall not, during the time aforesaid, receive any goods and merchandizes whatsoever out of any other ship or vessel, then such bond shall be void, or to such effect; for the making of which bond, no fee or reward whatsoever shall be taken; and in case any boat or vessel for which such security shall be required by such proclamation, shall set sail, or pass out of any port or place of Great Britain or Ireland, or the islands of Guernsey, Jersey, Alderney, Sark, and Man, or any of them respectively, before such security be given as aforesaid, every such boat or vessel, so sailing, or passing out of any port or place, contrary to the true intent and meaning of this act, together with her tackle, apparel, and furniture, shall be forfeited to the king, &c. and shall and may be seized, sued for, and recovered in his Majesty's court of Exchequer at Westminster, Edinburgh, or Dublin, or in the proper courts of the isles of Guernsey, Jersey, Alderney, Sark, or Man, respectively, to the use of his Majesty, &c. and the master of, and every mariner sailing in any such boat or vessel, being thereof lawfully convicted, upon his or their appearance or default, upon the oath or oaths of one or more credible witnesses or witnesses, by one or more justice or justices of the peace, where such offender shall be found (which oath such justice or justices of the peace are hereby empowered and required to administer) shall forfeit the sum of 20 l. one moiety thereof to the informer, and the other moiety to the poor of the parish where such offender shall be found, the same to be levied by distress and sale of the offender's goods, by warrant under the hand and seal, or the hands and seals of such justice or justices before whom such offender shall be convicted, as aforesaid; and, for want of sufficient distress, every such offender shall, by such justice or justices, be committed to prison, there to remain, without bail or mainprize, for the space of three months; and, in case any such offender shall be found in any of the said isles of Guernsey, Jersey, Alderney, Sark, or Man, and shall be lawfully convicted of such offence, in any action or suit to be founded on this act, in the proper court of any of the said isles where he shall be so found, such offender shall forfeit the sum of 20 l. one moiety thereof to the informer, and the other moiety to the poor of the parish or place where such offender shall be found; and, in default of paying such

penalty, shall suffer imprisonment, without bail or mainprize, for the space of three months.

And, to the end that all persons may know how to demean themselves in the premises, be it further enacted, by the authority aforesaid, That when and as often as his Majesty, his heirs or successors, shall make any order or orders concerning quarantine, and the prevention of infection, and notify the same by proclamation, or cause the same to be published in the London Gazette, as aforesaid, such proclamation, or order or orders in council, as aforesaid, shall be publicly read upon the next Sunday on which divine service shall be performed after the receipt of the same, and the first Sunday in every month afterwards (during the time such orders shall continue in force) immediately after the prayers, in all parish churches, and other places set apart for divine worship, within such counties and places as shall be specified for that purpose in such proclamation or orders respectively.

And be it further enacted, by the authority aforesaid, That if any action or suit shall be commenced against any person or persons, for any thing done in pursuance of this act, the defendant or defendants in such action or suit, may plead the general issue, and give this act, and the special matter in evidence, at any trial to be had thereupon, and that the same was done in pursuance, and by the authority of the said act; and if it shall appear so to have been done, then the jury shall find for the defendant or defendants; and if the plaintiff shall be nonsuited, or discontinue his action, after the defendant or defendants shall have appeared, or if judgment shall have been given, upon any verdict or demurrer, against the plaintiff, the defendant or defendants shall and may recover treble costs, and have the like remedy for the same, as the defendant or defendants hath or have in other cases by law.

Provided always, and it is hereby enacted, That no attainder of felony, by virtue of this act, shall extend to work any corruption of blood, or forfeiture of any goods, chattels, lands, tenements, or hereditaments.

And it is hereby further enacted, by the authority aforesaid, That this act, and the several clauses and provisions therein contained, shall commence and take effect from and after the 1st day of March, 1754.

QUARRY, a subterranean place, from whence are dug free-stones marble, slate, lime-stone, &c. proper for building. In the digging of quarries of free-stone, they first open a hole in the manner of a well, but considerably bigger in diameter, and the rubbish is drawn out with a windlass, in baskets. As the hole increases, and their common ladder becomes too short, they apply a larger for the purpose.—When they have got through the rubbish, and are arrived at the first stratum*, they apply their windlafs and baskets to discharge the stones, as fast as they dig through them.

* Strata, in Natural History, are the several beds, or layers, of different matters, whereof the body of the earth is composed. It has been supposed by some, that the strata lie in the earth according to the laws of gravitation; but experience hath proved the contrary, it having been observed by Dr Leigh, in his Natural History of Lancashire, speaking of the coal-pits, that the strata there are first a bed of marle, then free stone, next iron-stone, then coal, or channel mire, then some other strata, then coal again, &c.—And Mr Hauksbee was ordered by the Royal Society, to try the strata of a coal-pit, which he did to the depth of 30 strata: the thickness and specific gravity of each whereof, he gives us in the Philosophical Transactions; and from the whole makes this inference, that it evidently appears the gravities of the several strata are in no manner of order, but purely casual, as if mixed by chance.

They usually find seven of these different strata of stones, of different heights, and serving for different purposes, though the number, as well as order wherein they follow, is various.

As to the extracting of the stone from the bed wherein it lies, they find that common stones, particularly the softer kinds, as they lie, have two grains, a cleaving grain, running parallel with the horizon, and a breaking grain, perpendicular thereto.—After clearing the earth from off it, they observe by the grain where the stone will cleave, and there drive in a number of wedges, 'till they have thus cleft it from the rest of the rock.

This done, they proceed to break it: in order to which, applying the rules at both ends, 10 or 12 inches apart, according to the uses for which the stone is intended, they strike a line, and by this cut a little channel with their stone-ax, and in the channel set five or six wedges (supposing the stone three or four feet) driving them in very carefully, with gentle blows, and still keeping them equally forward.—Having thus broke the stone in length (which they are able to do to half an inch of any size) applying a square to the straight side, they strike a line, and proceed as before, to break it in breadths.

This method of drawing is found greatly preferable to that of breaking the stones at random; but this cleaving grain being generally wanting in the harder stones, to break up these, they have great heavy stone axes, wherewith they work down a deep channel into the stone, and into this channel, at top, lay two iron bars, driving their iron wedges between those bars.

Some in drawing of stone, especially the very hard kind, make use of gun-powder with good effect, in the nature of blasting in Mineralogy. In order to which, making a small perforation pretty deep into the body of the rock, so as to have that thickness of rock over it judged proper to be blown up at once; at the further end of the perforation they dispose a convenient quantity of gun-powder, filling up all the rest with rubbish, strongly rammed in, except a little space for the train.—By this means the rock is blown in several pieces, most of them not too unwieldy for a workman to manage.

For free-stone, that dug in the peninsula of Portland, and thence called Portland stone, is much used in buildings, being softer and whiter than Purbeck stone, and is commonly raised out of the quarries in bigger blocks than that.

Some also call Ryegate, or fire-stone, free-stone. Mr Boyle observes, that a competent knowledge of the nature of the sap, or juice, found in stones used in building, is of the last importance; the same stone, dug out of the same quarry at one season, being found to moulder away in a few winters, which dug out at another season, will brave the weather for many ages: and there are others, which, though dug at the proper season, yet make but ruinous buildings, if used at an improper season.

The same author adds, that, as there are some sort of stones which will decay in a few years, there are others will not have attained their full hardness in 30 or 40 years, or even much more.

In regard to quarries of marble, there are a great variety of sorts of this kind of stone, and these are usually denominated either from their colour, their country, their grain, their degree of hardness, their weight, or their defects: some are of one simple colour, as white or black; others streaked, or variegated with stains, clouds, waves, veins, &c. but all opaque, excepting the white, which, when cut into thin slices, becomes transparent.

Ancient marbles are those whose quarries are judged to be lost, or inaccessible, and whereof we have only some samples remaining.—Modern marbles are those whose quarries are still open, and out of which blocks continue to be dug.—African marble is either of a reddish brown, streaked with veins of white, or of a carnation, with veins of green.—English white marble is veined with red.—Derbyshire marble is diversified with colours of brown, red, yellow, &c.—Marble of Auvergne in France is of a pale red, mingled with violet, green, and yellow.—Marble of Brabant, in Hainault, is black, veined with white.—Marble of Bresse, in Italy, is yellow, with spots of white.—Brocatella marble is mingled with little shades of Isabella yellow, pale, and grey; it comes from Tortosa, in Spain, where it is dug out of an ancient quarry: there is also another kind of ancient brocatella, dug near Adrianople.—Marble of Carrara, on the coasts of Genoa, is very white, and the fittest of all others for works of sculpture.—Marble of Champagne resembles the brocatella, being mixed with blue, in round stains like partridges eyes.—Cipollino, or Cipollin marble, is of a sea-green colour, mixed with large waves, or clouds of white or pale green.—Scamozzi takes this to be the same with that which the Ancients called Augustum & Tiberium marmor, because discovered in Egypt in the times of Augustus and Tiberius.—Marble of Dinan, near Liege, is of a pure black, very beautiful, and very common.—Marble of Guachenet, near Dinan, is of a reddish brown, with white spots and veins.—Marble of Languedoc, is of a vivid red, with large white veins, or stains, and is very common; there is some, whose white borders pretty much upon the blue, but this is of less value.—Lumachelle marble is so called, because mingled with spots brown, black, and white, wreathed somewhat like periwinkle-shells: this is ancient, and it's quarry is lost.—Marble of Margosia, in the Milanese, has a white ground, with brownish veins, resembling the colour of iron rust: this is very common, and extremely hard.—Marble of Lavé, in Maine, has a black ground, with little narrow veins of white; there is another kind of it red, with veins of a dirty white.—Marble of Namur is black, like that of Dinan, but less beautiful, as inclining a little to the blue, and traversed with little streaks of grey: this is very common, and is frequently used in paving.—Parian marble is antique, and much celebrated in authors; it is of a beautiful white: the greatest part of the Grecian statues were made of it: Varro calls it lychnites, because the workmen dug it out of the quarry by lamp-light.—Marble of Porta Santa, at Rome called Sama, is mingled with large clouds and veins of red, yellow, and grey.—Portor marble has a black ground, with clouds and veins of yellow: it is dug out of the foot of the Alps, towards Carrara.—Marble of Rance, in Hainault, is of a dirty red, mixed with blue and white clouds and veins: this is pretty common, but is different in degree of beauty.—Marble of Savoy is a deep red, mixed with other colours, each piece whereof seems cemented on to the rest.—Marble of Sicily is a brownish red, stained with oblong squares of white and Isabella, like striped taffety: the ancient has very vivid colours, and the modern comes pretty near it.—Marble of Signam, in the Pyrenees, is ordinarily of a greenish brown, with red stains, though this is somewhat various in it's colours.—Marble of Theu,

near Namur in Liege, is a pure black, soft, and easy to work, and receives a more beautiful polish than those of Namur and Dinan.—Marble Bigio Nero, or black-grey, is antique.—White veined marble has large veins, with grey and blue stains, on a white ground: it comes from Carrara.—White marble; that dug out of the Pyrenees, on the side of Bayonne, is inferior to that of Carrara, it's grain being coarser, and shining like a kind of salt; it is something like the ancient white Greek marble, whereof their statues were made, but is not so hard or beautiful.—Ancient black and white marble is now very rare, it's quarries being intirely lost; it is divided between a pure white and a bright black, in laminae.—Blue Turquin marble is mixed with a dirty kind of white, and comes from the coast of Genoa.—Marble Fior di Perica, comes from Italy, consists of red and white stains, somewhat yellowish.—Yellow marble is a kind of yellow Isabella, without veins; it is antique, and now very rare.—Black antique marble is of a pure black, without stains, and softer than the modern black: there was some of it brought from Greece, called mamor luculeum, but not so much prized as that from Ethiopia.—There are divers other sorts, needless to enumerate.—Porphyr also is a precious kind of marble, of a brownish red colour, often interspersed with stains, brought formerly from Egypt, and exceeding all other kinds of stone in hardness; yet Dr Huntingdon assures us, that there is no quarry or rock of such stone in all the lower parts of Egypt, so far as the Nile overflows being perfect soil.

R E M A R K S.

There are three different ways of petrification that we are acquainted with, which being easily observable and conceivable by us, may assist us in making a pretty exact discovery how all others are performed.

Of the first kind is the stalactites, or the cylindrical conge-lation which is formed in the shape of an icicle, in the perpendicular fissures of vaults and caverns, out of the sparry, sandy, and other matter that is drained out of the strata, by the water passing through them into those fissures*, and these do gradually increase, in proportion as they are covered with fresh coats of the same matter.

* See Woodward on Fossils, page 18.

Of the second sort of petrification are those crusts of stone which the water of certain springs leaves sticking to the pipes it passes through, as is observable in those which convey the water from Bongis and Arcueil to Paris. Now it is very plain that this petrified matter, of what nature soever it be, is impelled by the water towards the sides of the pipe: the reason of it's incrustating in irregular lumps, or clods, one upon another, is the irregular action of the water upon this stony matter, which it casts sideways from the center of it's course, to force itself a free passage.

Of the third kind of petrification that we are thoroughly acquainted with, are those pieces of wood, shells, and other substances, which are found petrified under-ground, or in certain fountains, still retaining their natural figure and lineaments. Now the manner in which these three different petrifications are performed, we will suppose to be thus: the first by thin leaves or teguments, the second by little lumps, the third by infiltration.

We have no acquaintance with any other elements than those of water, salt, oily juices, sand, loam, and clay. The water itself is no ingredient in the composition of stones, but is only that which brings together and mixes the materials of which they are composed. The natural formation of stones is performed nearly in the same manner with the artificial structure of houses, in which the water serves to unite and fix the materials, after which they harden, and consolidate as the water dissipates. Our walls are composed of hard masses of matter and cement; the cement of itself would never form a durable firm wall, and the masses, whether of brick or stone, laid one upon another, without any mortar between them, would easily be shaken down, whereas the interposition of the cement produces these two effects; first, by filling up the interstices between the masses, it keeps them fixed in their places; and secondly, by insinuating itself into the pores of those masses, it incorporates with them, so as to constitute, when thoroughly dry, one intire compacted body. So likewise our three different ways of petrification are performed by little masses, and a very fine cement: the masses to be joined together are the sand, the clay, and the loam; the strongest cement are the salts, and the different sorts of bitumen: sometimes the salt and clay serve as a cement to the sand, sometimes either the clay or loam does of itself constitute the mass, and, from the different quantities and proportions of these matters, differently mixed together, results an almost infinite variety of productions; but then it is the water that performs all the several offices of collecting, conveying, and associating all the different particles of matter, which afterwards condense into aggregates of a hard durable nature.

QUA

Under the first kind of petrification may be ranged the talcs, flates, the amianthus, and plafter.

Crystal is nothing else but an aggregate of sand, either of a pyramidal or triangular figure, which the water incrustates successively upon one another, by a cement of salt and very fine loamy earth: and this appears the more probable, for that, when crystal is resolved by fire into it's constituent parts, we can discover nothing but a calcined sand together with a little earth and salt. Nor is it at all to be wondered at, that such a beautiful transparent mass should be formed out of sand, seeing the particles of the sand itself, when viewed through a microscope, appear like so many pellucid crystals: the reason of their not being bright and clear in their natural state, like the diamond, is because of the earth that is mixed with them. See the article *STONE*.

QUARTATION, a peculiar method of separating gold from silver.

Make a mixed mass of gold and silver, and melt it along with three or four times it's own weight of pure silver; beat the whole lump, when cold, into a thin plate; put it into a glass of proof aqua fortis, and set the same in warm sand, whereby the silver will soon dissolve, and the gold fall in a black powder to the bottom.

Pour off carefully the solution of silver, and use a somewhat stronger heat than before, in order to dissolve any remains of silver in the gold powder. Then the aqua fortis [see the article *AQUA FORTIS*] being again decanted, wash the gold well, in several parcels of fair water. And put the gold-powder into a little say-cup [see the article *ASSAY*] and place it under the muffle in the testing-furnace, 'till it becomes yellow. You may otherwise melt it with borax, which will bring it to it's true colour and form. Weigh the gold, to determine the proportion it bears to the silver. Lastly, Precipitate the silver out of the aqua fortis, by suspending a copper-plate therein; then wash the calx, and reduce it to it's metalline form, in the same manner.

OBSERVATION.

The reason for adding three or four times the quantity of silver, in proportion to the mixed mass is, for fear the mass should contain too much gold to be fit for the operation; or to spread the gold contained in the mass, and diffuse it so thinly, that it may not defend the silver, as it otherwise would do, from the action of the aqua fortis. And upon account of this addition it seems to be, that the operation is called *QUARTATION*.

This method of separating gold and silver was unknown to the Ancients, who therefore separated silver from gold by calcination, and so lost all the silver that was mixed with the

QUI

gold. And, indeed, the method by quartation is expensive and laborious, so as not to be very advantageously practised in the large way of business; though the whole has been divided into such a number of hands, as to make the several parts come cheap: some operators being wholly employed in making the aqua fortis; others in purifying it, or bringing it to proof; others in laminating the silver, and dissolving it; others in separating and reducing the calx of the gold; others in precipitating the silver with copper; and others again in separating the copper from the aqua fortis. And hence the whole operation has been found to answer the trouble, so long as they can recover about a drachm of gold from a pound of silver.

But there are certain ingenious workmen, who have the method of separating gold from silver to much greater profit, without the use of aqua fortis, or aqua regia, and barely by a dextrous application or management of the *FIRE*, at least without any costly additions. This method is kept as a secret, but may, perhaps, be no other, than that published by M. Homberg; which consists in fluxing the mixed mass of gold and silver with equal parts of rough nitre and decrepitated salt, placed at the bottom of the melting-pot; whereby the operation in the large way, may be finished in a quarter of an hour; the gold thus falling to the bottom, and leaving the silver suspended in the salts.

Another way of effecting this separation may depend upon a dextrous use of common sulphur, which has the power of making silver melt away from a metalline mixture almost as easy as lead.

But, to obtain either gold or silver in absolute purity, is no easy task. For the common uses, indeed, the methods above delivered may serve; but for the more curious chemical and philosophical purposes, better ways than are commonly known and practised should be discovered.

To refine gold by melting and testing it with antimony, or glass of antimony, is generally, and even by the metallurgical chemists, thought a perfect way; but M. Homberg has shewn, that even this criterion, as also quartation, cupelling with lead, fluxing with borax, &c. may fail, in case the gold be mixed with emery, or possibly some other things.

When gold is eager, as the workmen call it, that is, brittle, they hold it as a secret to melt it with mercury sublimate. But, perhaps, no gold can be proved to be perfectly pure, 'till it has gone through all the trials hitherto known; or even some of a more curious nature, particularly melting with crude antimony, and afterwards cupelling the regulus with lead; and, at last, fusing it with borax. Which process we recommend to those who require gold in absolute purity for any standard, or curious operation.

QUICKSILVER, see *MERCURY*.

Of the BUSINESS of the CUSTOMS, continued.

With regard to the *QUAKERS*.

QUAKERS. Their affirmation and declaration, allowed by the 7 and 8 Will. III. cap. 34. and 13 and 14 Will. III. cap. 4. to be accepted instead of an oath, in all cases where by law an oath is required, 1 Geo. I. cap. 6. §. 1, and 2. The affirmation or declaration to be in these words,

I, A. B. do solemnly, sincerely, and truly declare and affirm, That, &c. 8 Geo. I. cap. 6. §. 2. Such solemn affirmation or declaration is to be adjudged to be of the same force and effect in all cases, as if an oath had been taken in the usual form. Convicted of a wilful, false, and corrupt affirmation or declaration, are to suffer as for wilful and corrupt perjury, 7 and 8 Will. III. cap. 34. §. 3.

QUARANTINE. See that article at large.

R.

R A I

RADNORSHIRE, in Wales, is bounded on the east with Shropshire and Herefordshire, with Brecknockshire and Cardiganshire on the south and west, and with Montgomeryshire on the north. It is, according to some, about 29 miles in length and 18 in breadth, and has an area of 385 square miles. Others make it 90 miles in circumference, containing 310,000 acres, four market-towns, six hundreds, fifty-two parishes, and about 3200 houses, with 19,000 inhabitants, thirteen rivers, five castles, and three forests, all in the diocese of Hereford and St David's.

The air is sharp and piercing. The east and south parts are well cultivated, and pretty fruitful in corn; but the soil elsewhere, especially in the north and west parts, is so rocky and mountainous, that it is only fit to feed cattle and sheep, though it is well stored with woods, and watered with rivulets, and in some places standing lakes.

The chief commodities are cheese and horses. The river Wye, which divides it from Brecknockshire, crosses the west angle of the county, and in its rapid course through the rocks, forms several cataracts, and receives the Ithon, Weyerly, and other streams. It is parted from Shropshire by the river Tern, but the river which it has peculiar to itself, is the Ithon, into which run the Dulas, the Clowdick, and the Cameran. It rises among the hills in the north side of the shire, and forming its course southward, falls into the river Wye, a little below Dyffart, on the Llanhadem: it winds about so short, that it runs near six miles in a mile and a half distance from that town. In these rivers are plenty of salmon and other fish. It sends two members to parliament, one for the county, and one for the chief town, viz.

NEW RADNOR, a very ancient borough by prescription, from whence the county takes its name.

PRESTEIN, or **PRESTAIQN**, or **ST ANDREW'S**, stands on the river Lug, in a rich and pleasant valley, near its entrance into Herefordshire, and is the place where the assizes and the county gaol are kept, on which account it is pretty populous, and well frequented. Here is a very good market for grain, especially barley, of which they make good store of malt.

KNIGHTON, the only town of note in the hundred of its own name. It stands in a valley on the river Teme, over which it has a bridge. It is a well built borough, of good trade and resort, and its market is well served with cattle, corn, iron ware, hops, salt, linnen and woollen cloth, and other commodities.

RAISINS making a considerable article in traffic, we must not omit it.

They are the fruit of the vine, suffered to remain on the tree till perfectly ripened, and then dried, either in the sun, or by the additional heat of an oven. Grapes of every kind preserved in this manner are called raisins, and are distinguished into several kinds, according to the species of grape. What we have at present differ, as they are better or worse dried, and are all called raisins under different appellations, except the small kind, which are called currants.

The difference between raisins dried in the sun, and those dried in ovens, is considerable and obvious. The former are sweet and pleasant, the others have a whiteness and a latent acidity with the sweetness, that renders them much less agreeable. The raisins of the sun, of what we call jar raisins, from their being imported in earthen jars, are of the former kind, all dried by the sun's heat only.

The finest and best raisins, are those called in some places Damascus and Jube raisins; these are the fruit of the vitis Damascena, and are distinguishable from the others by their largeness and figure; they are flat and wrinkled on the surface, soft and juicy within, near an inch long, and semipellucid when held against a good light: they have a sweet, agreeable, and vinous taste, and when fresh and growing on the bunch, are of the size and shape of the large olive.

The common raisins are the fruit of several species of grape, which are better or worse, according as they have been more or less carefully cured.

VOL. II.

R A I

The common way of drying grapes for raisins at present, is to tie two or three bunches of them firmly together, while yet on the vine, and dip them into a hot lixivium of wood-ashes with a little oil olive in it. This disposes them to shrink and wrinkle, and after this they are left on the vine three or four days, separated on sticks in an horizontal situation, and then dried in the sun at leisure, after cut from the tree.

The currants are the fruit of a vine differing from the common kinds, in the smallness of its grapes, and in the largeness of its leaves, which also have fewer and lighter divisions than those of any other kind. They are gathered in when ripe, and spread thin upon a floor till tolerably dried; they are then put up in parcels where their own weight and remaining humidity form them into cakes, that are hardly to be broken without some instrument. They are not produced now in the place where they originally were, but in the islands of Zant and Cephalonia, where the vines that produce them are cultivated in great abundance, and to considerable advantage. They are packed up in casks and trod firmly down, and if the air be kept out, will remain good a long time in them.

All the kinds of raisins have much the same virtues, they are nutritive and balsamic, but they are very subject to fermentation with juices of any kind; and hence, when eaten immoderately, they often bring on cholics. They are allowed to be attenuant, and are given in cases where the humours are too thick and viscid, and they are said to be very good in nephritic complaints; they are, however, too familiar in our foods, to be much regarded at present as a medicine. They are an ingredient, indeed, in our pectoral decoctions, and in some other medicines of that intention; in which cases, as also in all others where astringency is not required of them, they should have the stones carefully taken out. They are used in some compositions, rather with an intent of taking off the nauseous taste of other ingredients, than of doing any extraordinary service themselves.

Of wine made with raisins.

EXPERIMENT I.

Take a quarter of a hundred of whole or unbruised Malaga raisins, and put to them seven gallons of cold spring-water, in a wooden vessel or cask, which set loosely covered in a warm place, that the contents may ferment for some weeks. The water you will find soaked through the skins of the raisins, and their internal sweet or saccharine substance dissolved, and will become impregnated therewith as a menstruum; the liquor will manifest an inward struggle and commotion of its particles, throwing up numerous small bubbles to the surface, with a considerable hissing noise; and after the fermentation is finished, the liquor will become an actual new wine; as will appear by the taste, smell, and effects, and deposit a large quantity of gross, earthy sediment, called lees, at the bottom, different from the husks, or skins, and stones of the raisins.

The application of this experiment.

This experiment is universal, and shews the general manner of making wines, and indeed all other spirituous potable liquors, by fermentation. For, with a slight change of circumstances, it is applicable to the brewing of beer from mead or methueglin, and hydromel from honey [see the article BEES]; cyder and perry, from apples and pears respectively; artificial or made wines, as they are vulgarly called, from cherries, gooseberries, currants, elder-berries, black-berries, plums, oranges, or other fruit: also from the tappings of certain trees, as the birch, the maple, the sycamore, &c. and more eminently from the juice of the sugar-cane, treacle, or direct sugar and water: [see the articles SUGAR and WINE.] For any of these vegetable juices, being duly fermented and judiciously prepared, afford as real and perfect wine, according to their several natures, as the richest grapes of the best wine countries.

8 A

OBSER-

OBSERVATION.

To bring any of these juices into a sound wine, the rule is, to evaporate them, if they are naturally too thin, 'till they become of equal richness with the juice of the grape in wine countries, and good wine years. This may be commodiously done, by means of the common water-poise*, which shews the strength or richness of solutions to the eye. And in general, any vegetable juice or solution, is accounted sufficiently rich for making a strong wine, when it will support a new-laid egg on its surface.

* A water-poise is an instrument made of ivory, glass, &c. hollow-bellied, so as to float, higher or lower, in liquids, according as the specific gravity thereof is more or less: which instrument being graduated or divided by lines on the stem, readily shews to the eye, the difference betwixt the specific gravities of any liquids proposed, though not with the utmost accuracy.

The wines made in England, lie under a disrepute; the reason whereof seems chiefly owing, (1.) To the artificial manner wherein they are usually prepared; and (2.) To a certain rumour spread about them, as if they were unwholesome, crude, indigestible, too luscious, too tart or griping, and apt to occasion the head-ach, &c.

Those who have never been in wine-countries, nor otherwise made themselves acquainted with the nature and common preparation of wines, proceed in their judgment of them according to report and popular notion. Thus, for instance, red-port wines, to please the common palate, must be bright, deep coloured, rough, rich, and racy, two or three years old, &c. and when this, or any other notion comes once to be established as the criterion of wine, the cooper is thence directed how to hit the general taste, and make a saleable commodity.

Upon the same foundation philosophical chemistry [see the article PHILOSOPHICAL CHEMISTRY], instructs us to imitate the wine-cooper, and from almost any sweet and tart vegetable juice, to make saleable wines; even canaries, mountains, sherries, or ports: all which, by the way, are usually mixed liquors, though the basis of them all is the juice of the grape.

This juice of the grape being chemically examined, proves to be no more than a large proportion of real sugar dissolved in water, with an addition only of a certain flavour in the juice of the grape, according to the nature of the vine. Whence we may lay it down as an axiom, and the result of a careful enquiry, that a saccharine substance is the basis of wines. For sugar is not peculiar to the sugar-cane, but obtainable, as we have observed, also from grapes; and accordingly, we often find large grains thereof in dried raisins; particularly those of Malaga, that have laid for some time, and sweat together, whereby they run into candy, a saccharine efflorescence, and actual grains of sugar. So again, it is customary in France to evaporate the juice of the grape, 'till it becomes coagulable in the cold, and in this state to use it as a moist sugar, under the name of *refiné*. The same thing is to be understood as practicable in malt or wort, and the sweet juices of all vegetables that afford a wine by fermentation. See the articles BREWING, DISTILLATION, ELÆOSACCHARUM, SUGAR, WINE.

Hence we may derive a set of rules, for boiling down, or otherwise procuring the essential matter of wines in a small bulk, and preserving it sound and serviceable for many years, in order to the making of all kinds of wines, vinegars, and brandies, even in countries where no vines grow. This discovery likewise affords great light into the true nature and uses of vinous and acetous fermentation.

And so much for the use of the preceding experiment, with regard to trade and economy; its philosophical uses are no less considerable [see our article PHILOSOPHY EXPERIMENTAL]. And first, it shews that the proper fermenting matter of every fermentable subject is but small, compared with the quantity of wine it affords. Thus, for example, four pounds of raisins may be diluted and fermented with eight pounds of water, into what is accounted a tolerably strong wine. Yet even raisins themselves contain a large proportion of water, besides their direct saccharine substance, which is reducible to a dry form, as we find in sugar.

And whoever would thoroughly enquire into the nature, the uses, and means of improving vinous and acetous fermentation, cannot, perhaps, do better, than to chuse sugar for his subject; a chemical analysis whereof, will shew the principles necessarily required in this operation; which appear to be an acid salt, an oil, and earth so united together, as to be capable of dissolving perfectly in water.

This experiment also shews the cause of vegetable matters running into a fermenting state, as raisins do by the addition of water. Nor do all fermentible bodies require ferments, to begin their motion of fermentation. Raisins we see require none, much less does the fresh expressed juice of the grape, or other vegetable juices, in the summer-season, or in a warm air. But all sweet vegetable juices, that have felt much of the fire, as treacle or wort high boiled, rob of malt,

rob of alder, or the like, usually require a considerable proportion of a vinous ferment, to make them work. And, in general, ferments are no more than matters already in the act of fermentation, or that soon run into this state: of the first kind are the flowers of wine, yeast, fermenting beer, or fermenting wine, &c.—Of the second kind are the new expressed vegetable juices of summer-fruits, &c.

Water, we find, is absolutely necessary to begin and procure a fermentative motion in vegetable substances: for raisins or sugar being kept dry, will never ferment. And this holds universally, of all the subjects of vinous and acetous fermentation. Whence water is an instrument that must be necessarily employed in these kinds of fermentation, whether natural or artificial.

As the water, which naturally and in large quantities perspires from the surface of vegetables, especially in hot climates, does not go off pure, but carries along with it a considerable proportion of fermentable matter into the atmosphere; there may be an actually vinous fermentation, begun and carried on in certain parts of that region, especially where the winds are still, or the air stagnant. At Schiedam in Holland, a larger quantity of inflammable spirit is said to be obtained from malt, than in any other place where there are fewer malt-distillers. This is probably owing to the air of that place being impregnated with the fermenting vapours, that continually exhale from their numerous fermenting bakes and stills. The same is found to hold proportionably of wines fermented in large vaults or cellars, where many casks of wine are at once, or somewhat successively set to work. Wherefore it should seem, that artificial wines set to work in large quantities, is the best way to produce them of a good quality, and with greater expedition.

Warmth, with the free admission of the external air, is necessary to expedite the action of fermentation; for if our raisins and water were to stand either in a very cold place, or be kept entirely from the access of the common atmosphere, either no fermentation, or a very small and slow one would ensue, as has been experienced.

The lees remaining at the bottom of the cask in our present experiment, are, if used fresh, a true kind of ferment, and will set any less fermentable subject at work, and determine its fermentation for the vinous kind. They contain a large proportion of essential oil, and some tartar. Hence we see, that vinous fermentation consists, (1.) In an intestine struggle, or commotion of the fluid; and (2.) In a separation of a grosser part, which did not appear in that form before.

EXPERIMENT II.

Take the skins of the raisins, and the sediment left behind, after a wine is made in the manner of the preceding experiment, and pour three or four times their own quantity of boiling water upon them, so as to make a thin aqueous mixture. Then set the containing cask, loosely covered, in a warmer place than was used for the wine, and you will, in few weeks time, find the liquor become a clear and sound vinegar; which being drawn from off its sediments, and preserved in another cask, well stopped down, will long continue perfect, and fit for use.

OBSERVATIONS.

(1.) This experiment shews us a cheap and ready way of making vinegar from refuse materials; such as the husks of grapes, decayed raisins, the lees of wine, grounds of ale, beer, &c. which are frequently thrown away as useless. Thus in many wine countries, the marc, rape, or dry pressings of the grapes are thrown in heaps, and suffered to putrefy unregarded, though capable of affording as good vinegar as the wine itself. In some places, they bury copper-plates in these husks, in order to make verdigrease, but this practice seems chiefly confined to the southern parts of France. Our present experiment shews us how to convert them to another use, and the direction extends to all the matters that have once undergone, or are fit to undergo, a vinous fermentation, for that all such matters will afford vinegar. From the same principle, all our summer fruits in England, even blackberries, all the refuse washings of a sugar-house, cyder-pressings, or the like, will make vinegar by means of water, the open air, and warmth. See the article VINEGAR.

(2.) The whole process, whereby this change is effected, deserves to be attentively considered. And first, the liquor to be thus changed, being kept warmer than in vinous fermentation, it in a few days begins to grow turbid, and without throwing up bubbles, or making any considerable tumult, as happens in vinous fermentation, deposits a copious sediment. The effect of this separation begins to appear first on the surface of the liquor, which gathers a white skin, that daily increases in thickness, 'till at length it becomes like leather; and now, if continued longer in this state, the skin turns blue or green, and would at last grow solid and putrefy: therefore, in keeping down this skin as it grows, and thrusting it gently down to the bottom of the vessel, consists much of the art of vinegar-making, especially from malt.

(3.) It is to be particularly observed, that if the wine of our first experiment were not bunged down when arrived at its vinous state, but suffered still to remain open and exposed to a warm air, it would spontaneously become vinegar; and the sooner, if a somewhat greater degree of heat than served for the making of wine, were employed. Whence we might have used the wine of our first experiment for this purpose, as well as have added water to the husks and sediment, or lees; but we chose the latter way, to shew that even such refuse matters will afford vinegar; and again, to intimate how far the art of vinegar-making may be still improved, both in England, where they brew a wort from malt for it, and in some wine countries, where they frequently make their best wines into vinegars.

(4.) What we would chiefly remark for the present is, that acetous fermentation requires a stronger heat than the vinous; and that wines having once finished their fermentation, as wines, do not naturally stop there, but unless prevented by the care of the operator, proceed directly to vinegars; where again they make no stop, but unless prevented here also, spontaneously go on to rapidity, ropiness, mouldiness, and putrefaction. From which larger observation we would deduce this axiom, that, to speak philosophically, The intention or tendency of nature, is to proceed from the very beginning of vinous fermentation, directly, in one continued series, to putrefaction, and thence again to a new generation: which appears to be the **GRAND CIRCLE, WHEREIN ALL NATURAL THINGS ARE MOVED, AND ALL THE PHYSICAL, OR RATHER CHEMICAL, PHÆNOMENA OF THE GLOBE PRODUCED.**

(5.) Hence we see, by the interposition of the sagacity of man, how this general process of the uniform law of nature may be stopped at different times, with different views, so as to procure to ourselves wines, vinegars, and, as will appear hereafter in the Experiments VI. and VII. particularly salts and oils.

(6.) Another corollary, deducible from the larger observation above laid down, is, that the word Fermentation has been usually applied to signify only a small part of this grand operation of nature: thus one limits the word to the production of wines; another, to the production of wines and vinegars; and some would distinguish it from putrefaction: whereas either the term **FERMENTATION**, or some other, should be made general, and denote the **GENUS**, or **UNIVERSAL FERMENTATION**, whereof vinification, acetification, and putrefaction, are only **SPECIES**. At least, we should thus attempt to follow and express nature in the **FACTS** that are observed, and not proceed, in an arbitrary, narrow, or inadequate manner, to impose words, and dress out nature according to particular hypotheses and conceits. But the observation itself, whereon this doctrine is founded, being of moment to the right understanding of the whole affair of fermentation and putrefaction, upon which the advancement of many parts of **PRACTICAL COMMERCIAL PHILOSOPHY** doth depend; we shall proceed to illustrate and confirm the last part of it by an experiment, as the two former parts have been already by Experiments I. and II.

EXPERIMENT III.

That wines and vinegars, or all fermented vegetable juices, have a natural tendency to putrefaction.

(1.) Take a gallon of thick muddy vinegar, produced after the manner of the second experiment; letting it stand open, in a hotter place than was required to make it vinegar, it will become, in a few days, a rapid, nauseous, and putrefied liquor, throwing up a large quantity of a dry powdery substance to the top, and depositing a less quantity of a grosser matter at the bottom; soon after which, the body of the liquor will become clear again.

(2.) We might shorten the present experiment, or save the trouble of making either a wine or a vinegar to shew it: for, if a quantity of **MUST** * were set in an open vessel, in a hot service-room, where the air had free access, the work would soon be performed, and the putrefied liquor be produced almost at once, without stopping at the state either of wine or vinegar, according to the larger observation delivered above.

* **MUST** is the unfermented juice of the grape, or any other liquid fermentable substance, before it enters the act of fermentation; and **STRUM** is **MUST** clarified by standing and racking, and then put up into matched casks, that is, casks impregnated with the fume of burning brimstone, so as to be preferred found in an intermediate state.

OBSERVATIONS.

(1.) This latter experiment has a considerable philosophical use; and, (1.) It gives us the physical reason why wines and vinegars, unless made exceeding strong, will not keep, but corrupt and putrefy in hot countries: for the heat being there so great, as to keep the lighter feculent parts of those liquors suspended for some time in the body of the liquor, corruption (which proceeds from a tumultuary motion of all the different parts of a compound body together) necessarily ensues *.

* See §. (1.) of the last experiment, and hereafter Experiments VI. and VII.

(2.) Hence we learn also the physical reason why wines and vinegars require to be racked from their lees, in order to preserve them sound, or keep them from running into putrefaction, to which we find they are strongly inclined, the tendency of nature being ever constant in urging them to that state; and the case appears to be much the same in animal, and even in mineral substances, as we shall see hereafter.

(3.) This experiment, therefore, furnishes us with a rule for preserving vegetable liquors from the last stage of fermentation, that is, putrefaction, or corruption; viz. by first clarifying, and afterwards securing and defending them from the open air, and too much heat. Thus, for example, we can preserve the natural juices of quinces, oranges, lemons, plants, &c. sound and uncorrupt, by first clearing them of their grosser parts by the filter, or, in some cases, by boiling and common straining, then putting them up in common glasses, pouring oil on the top, and setting them in a cool place. In the same manner we find some of the more delicate and curious wines are long preserved sound and sprightly: for, the grosser feculencies being first removed, the oil poured on the top prevents the external air from entering, and, by keeping the glasses from the sun, or day, too much heat does not come at them.

(4.) It is also remarkable, what a large quantity of solid earthy matter is naturally contained in all fermentable liquors. Thus, though a pellucid solution of the finest sugar in water were exposed to vinous fermentation, it soon grows turbid, throws an earthy skin to the top, and deposits much terrestrial matter at the bottom, in the form of lees. If the wine be now drawn off clear, and exposed to acetous fermentation, here again it throws off much terrestrial matter, both in the form of a skin at top, and lees at the bottom. Thirdly, If transparent vinegar be exposed to putrefactive fermentation, here again it separates a considerable quantity of earth, both at the bottom and top; which shews that the separation of a gross matter is essential to these several kinds of fermentation, and that a copious earth may lie concealed in fermentable juices and transparent fluids, 'till it finds an occasion of manifesting itself to the senses.

(5.) The change wrought upon vegetable subjects by vinous and acetous fermentation, will appear by comparing **MUST**, or a bare solution of raisins in water, with the wine and vinegar which the same **MUST**, or raisins in water, afford, in vinification and acetification; and in this light they may be compared by the direct use of the senses: but the internal and essential differences will better appear by a chemical analysis, or distillation.

(6.) **MUST**, or a solution of raisins and water only, which makes a kind of must, corresponding to the natural juice of the grape, is a sweet, clammy, and somewhat odorous fluid, which, when committed to distillation, affords not the least inflammable spirit; but, after having passed through the state of vinous fermentation, it acquires several properties it had not before. For example: it is more transparent and thin, loses of its sweetness, has some degree of acidity and roughness, proves more odorous, and affords a large proportion of **INFLAMMABLE SPIRIT**; as appears by the following

EXPERIMENT IV.

That vinous fermentation produces an inflammable spirit.

Take three gallons of new wine, procured from raisins and water, in the manner of the first experiment, and commit it to the alembic or still; which being made to work gently, 'till the liquor that comes over being thrown upon the hot still-head will no longer take fire, by applying the flame of a candle to the rising vapour; you will thus obtain a considerable proportion of brandy, and a weaker spirit. See the article **BRANDY**.

OBSERVATIONS.

(1.) This experiment shews the common method of making brandies in wine countries, or a spirit, from malt, melasses, cyder, &c. in others; for the finest French and Rhenish brandies, the rums and the arracs of the Indies, are obtained in the manner of this plain experiment, all of them being usually distilled a second time over, and made up, as they call it, with water, or the weak aqueous liquor of the second running, as in the present experiment, to a certain strength, or supposed standard, termed saleable-proof.

(2.) The philosophical use of the experiment is to shew, that an inflammable spirit is produced, by the action of vinous fermentation, from a vegetable subject and water, wherein no signs of any such spirit before appeared: inasmuch, that this may be justly esteemed the criterion, or inseparable effect of vinous fermentation.

(3.) This spirit being redistilled, to deprive it totally of its aqueous parts, is the spirit of wine, or alcohol; and this method is the only one that is known of procuring it: for no subjects but those of the vegetable kingdom are found to afford it, and that only by means of a previous vinous fermentation.

(4.) It should likewise be observed, that this alcohol is one of the most essential parts of wine, so that, when absent, the wine loses its nature, as we see by the remains of the present experiment:

experiment: and, when properly used, it is a certain remedy for most diseases incident to wines, as keeping them sound, and free from corruption: whence we have another rule for preserving vegetable and animal substances from putrefaction; for this liquor proves a kind of balsam to them all, and is accordingly used, with success, for preserving even animal substances, as we see in anatomical preparations, &c.

EXPERIMENT V.

That acetous fermentation abolishes the inflammable spirit produced by vinous fermentation.

Put a quart of sharp vinegar into a glass retort; distil in a sand-heat, with degrees of fire [see DISTILLATION] into a glass receiver, and you will not find the least inflammable spirit come over; there will arise only an acid aqueous liquor, commonly called distilled vinegar, which, instead of burning, quenches fire.

OBSERVATIONS.

(1.) Hence it appears, that acetous fermentation has a very different effect from the vinous, and that the inflammable spirit produced in the former is either concealed, altered, exhaled, destroyed, or some way abolished, in the latter. A part of this spirit is unquestionably exhaled by the heat employed in acetification, yet part also remains behind, under a different modification, so as to be recovered by art, in an inflammable form, as we find by distilling the sugar of lead, which is only lead dissolved in spirit of vinegar. See the article LEAD, Vol. II. page 23.

(2.) This experiment affords a criterion of acetous fermentation, as before we had of the vinous: for if an acid uninflam- mable liquor comes first by distillation over from a vegetable subject, after fermentation, this will determine that fermenta- tion to have been of the acetous kind.

(3.) Thus, therefore, we are plainly led to allow of two very different kinds of fermentation, in the same vegetable subject; and we conceive that some other species may be found, upon due enquiry.

EXPERIMENT VI.

Take a large quantity of fresh and green cabbage leaves, press them hard down with weights in an open tub, bored full of holes on the sides, and set in a warm place. By standing in this state for some days, the leaves will conceive a heat in the middle, which will spread to the more external parts, till, at length, nearly the whole will be converted into a pappy putrefied substance, whose consistence will not well suffer it to separate into a thicker and a thinner part.

OBSERVATIONS.

(1.) This experiment is general, and succeeds alike in all tender, juicy, vegetable substances, so that both the acid and alkaline tribe of plants, the sweet and the bitter, the astringent and emollient, &c. resolve into this same pappy putrefied substance: we observe it also in hay that is stacked wet, in horse-litter thrown in heaps, in the grape-busks, or apple-pumice, after pressing for wine or cyder; and the larger the heap, and the greater the weight the matter it sustains, the greater the heat, provided the access of the air be not prevented.

(2.) Hence we see the way employed by nature for changing all vegetable into animal substances, or of reducing the matters of both kingdoms to a similarity, so that the one may be used for several purposes, instead of the other. Thus nature annually makes large quantities of compost from the refuse weeds, leaves, trash of fields, woods, and gardens; [see the article MANURE] for this vegetable matter thus putrefying, and becoming soft and pulpy, is easily diluted by the falling rains, and thence dispersed over the face of a field, and carried into the pores of the earth. Thus the chemist, from such putrefied vegetable subjects, may, by distillation, procure volatile salts and volatile spirits, hardly to be distinguished from those of hart's-horn, &c. at least, the volatile salt and spirit so obtained, might serve for the making of sal-armo- niac, along with sea-salt: for it appears, that the matter of the fixed salt in vegetables is by this operation truly volatilized [see the article VEGETABLES]; whence not a grain of fixed salt can be procured from the largest quantity of this putrefied matter, provided the operation were completely performed.

(3.) This experiment has various uses, not only in trades, but in Natural Philosophy and Medicine. And first, it shews an artificial, as well as natural method of converting any, or all of the different subjects of the vegetable tribe into the same undistinguishable substance, thus totally destroying all the specific differences which before discriminated that great variety. The same observation reaches also to animal bodies, as we shall see presently.

(4.) The principle of fermentation leads to an extensive enquiry into many things of nature, from whence important hints may be derived, for the advancement of useful philosophy; wherefore since we are upon that subject, we shall here just take notice only of another experiment, as having an affinity with some things that we shall have occasion to refer to,

as being no way repugnant to the spirit of our subject, which is far more extensive than many have been wont to imagine.

EXPERIMENT VII.

If any large animal body, as that of a horse or a dog, for example, be exposed, in a dead state, to the open air and the summer's sun, it, in a few days, begins to swell, purge, and emit a nauseous stench: at length the form of the carcass is destroyed by the commotion, and resolved into a putrid, fetid, stercoraceous matter, a large part, in the mean time, flying off into the air, so as to leave but a small proportion of a mucilaginous pappy substance, which soon grows dry, or turns to a kind of earth. But if a quantity of this matter were to be collected before it grows dry, and distilled, it is said to afford the burning phosphorus, as putrefied urine, and many other things, are known to do.

OBSERVATIONS.

(1.) This experiment will be found universal, and holds equally in relation to all animal natures. And this putrefied animal matter appears to be in itself a kind of poison, infecting the air wherein it spreads, so as to occasion pestilential diseases near the places where great battles have been fought: whence this seems to be another particular SPECIES of fermentation, and from whence, perhaps, may be derived many more useful discoveries into the works of nature, than seem yet ever to have been duly attended to.

(2.) Whence it should seem that there is a proper species of fermentation peculiar to the animal subjects, as there is one peculiar to the vegetables; and if so, we should not lay down vegetable fermentation as the test and standard of fermentation in general, and judge of all other kinds according as they approach to, or recede from, this standard. But, perhaps, were the enquiry into fermentation prosecuted in its full latitude, and not arbitrarily confined to any single species, many natural and artificial operations would prove to be actual fermentations, and exhibit such phenomena as few imagine.

EXPERIMENT VIII.

That there may be a kind of fermentation in mineral and metallic bodies.

Take an ounce of lead, and as much bismuth, and melt them together in an iron ladle; then heating two ounces of quick-silver in another ladle, mix the three metallic matters together, as an amalgama; which, when cold, will appear perfectly uniform, or homogeneous, and totally pass through the pores of leather, in a running form. This mixture being suffered to cool, and stand quiet for some hours, a gross matter will separate from it by degrees, and float upon the rest, which will be left so thin and fluid, as to pass through leather, and leave the gross metallic matter behind.

OBSERVATIONS.

(1.) Hence it should seem, that even metallic matters may have their peculiar fermentation, as well as vegetable and animal subjects: for, when this experiment comes to be carefully considered, it appears to have all the requisites of fermentation. For here is, (1.) A fluid form. (2.) An uniform matter.

(3.) An intestine motion; and, (4.) An actual separation of a grosser matter, leaving a thinner behind. All which particulars we have found to hold in the several species of fermentation above considered.

(3.) There are many more instances of an apparent fermentation in mineral bodies, one or two whereof it may be proper to mention. Thus, if an aqueous solution of the common green vitriol be, in summer-time, exposed to the air, and kept supplied with fresh water, as the former exhales, the grosser metallic part of the vitriol will subside, and the rest gradually shoot upwards all round the vessel, in form of an unctuous crusty matter, till the whole body of the vitriol is thus successively altered; so as that the part shot into the crusty unctuous form will never become vitriol again, nor corrode any fresh metal; and, in all other respects, it appears a different thing from vitriol. Hence seem to proceed the complaints of the makers of vitriol, that in rainy, windy, and cloudy weather, their vitriol stones, which lie open to the air, will not sometimes yield a solid crystalline vitriol, but only an unctuous matter. This may, therefore, appear to be a fermentation in all its forms, as being attended with a spontaneous intestine motion, a spontaneous separation of constituent parts, and a remarkable alteration of the subject. It also makes to the present purpose, that solid and hard pyrites, [see PYRITES] or vitriol-stones, being exposed to the air, and moistened with water, will, like a vegetable subject*, grow hot, fume, and even take fire, and afterwards afford vitriol, a thing very different from the stones themselves [see VITRIOL]: so that, upon the whole, we may conclude, that, in a proper sense, there is an actual fermentation exercised, not only in the vegetable and animal, but also in the mineral kingdom. From what has been observed, may be deduced the following principles:

* See above, Experiment VI.

1. All the instances being duly considered, and a large view of things taken in, we may define fermentation, in general, a sensible internal motion of the constituent particles of a moist, fluid, mixed, or compound body; by the continuance of which motion, these particles are gradually removed from their former situation, or combination, and, again, after some visible separation is made, joined together, in a different arrangement. And thus the whole process of fermentation consists of two different operations, viz. an analytical one, whereby the particles are resolved, and a synthetical one, whereby they are now ranged and conjoined; and that, whenever these two different effects are found to be produced, in direct sequence, with the circumstances above described, we need not scruple to call the operation by the name of fermentation*.

* See Experiments I, and VI.

2. That all separable, mixed, or compound bodies, may be the subjects of this general operation; but that the easier they are separable by means of water, air, and heat, the more readily they ferment. Thus the sweet or saccharine part of malt, more readily dissolving in warm water, ferments easier than unmalted corn, which is more clammy, and will not dissolve so soon. And hence the flesh of animal bodies putrefies sooner than the bones; and this appears to hold in all instances*.

* See Experiments I, VI, and VII.

3. That this general fermentation is divisible into many distinct species, particularly into vegetable, animal, and mineral: the vegetable kind again into vinous, acetous, and putrefactive; the vinous again into mucilaginous, mealy, and putrefactive; and so of the acetous, &c. Whence we may deduce a rule for adjusting all the different species of fermentation; which being once done, might put an end to infinite hypothetical disputes upon this subject, and lead to farther discoveries, both in nature and art.

4. That it is in the power of man to prevent, stop, and regulate these natural operations, at any point of time assigned. For it is thus we come by our wines and vinegars; it is thus that men have discovered the art of embalming; it is thus we preserve many vegetable and animal juices in their natural or unfermented states; it is thus we preserve yeast and wine-les, subjects extremely apt to putrefy; it is thus we can at any time stop the course of vinous fermentation, and produce a sweet or half-fermented wine; [see the articles WINE and YEAST]; it is thus we cure the frettings or other diseases of wines; and thus that we stop mortifications in the body, and caries in the bones: and most of the artifices employed for these purposes depend upon a knowledge and regulation of the physical causes and instruments that produce that change; which causes and instruments, as we have above discovered, are chiefly heat, moisture, and the external air.

5. That a saccharine matter is the basis of wines, vinegars, and inflammable spirits.

6. That a great variety of sound, perfect, and wholesome wines may be made, in countries that do not naturally afford grapes, by a prudent use of sugar, or raisins and water*.

* See Experiment I.

7. That the matters called ferments are of use in beginning, regulating, and determining the species of fermentation*. Thus fresh yeast determines the fermentation of wheat-flour, to make our common bread, which would prove of another kind, with the flowers or lees of vinegar: and thus specific or determinate ferments have their correspondent effects. If sugar, honey, manna, treacle, or new wine, be added to vinegar, themselves are soon changed into vinegar, without stopping to make wine, because the acetous ferment, or vinegar, over-rules them. And so vinegar is soonest made in a cask that has before contained the same liquor. And if the best wine were put into a cask that had held putrefied vinegar, the wine would not now make vinegar, but immediately run into corruption: so great over-ruling a power have specific ferments; the use whereof is therefore evident, and may afford considerable rules in chemistry, practical philosophy, and commercial arts.

* See Experiment I.

8. That the degrees of fermentation differ with the degrees of heat employed*. Thus we have seen that vinous fermentation requires a less degree of heat than the acetous, the acetous a less than the putrefactive, which latter may even consist with a degree of ignition†.

* See Experiments I, II, III, IV, and VI.

† See Experiment VI.

9. That a particular kind of fermentation may be carried on in the living bodies of animals and vegetables, which are largely supplied with the requisite instruments of fermentation, viz. water, air, and heat; and, in fact, both vegetables and animals appear to have an intestine motion in all their circulating fluids, which continually deposit a grosser matter in the canals and parts they move through. Whence,

VOL. II.

by our definition of fermentation, this natural act may be accounted a species of fermentation, producing a change in the nutrimental matter of vegetables and animals, and converting it into their own substance.

10. That when vegetables or animals die, there soon begins a different kind of fermentation in all their parts, tending not now to the repair, but to the intire destruction, of their organical vessels, the confused mixture of their solid parts and juices, and a volatilization of their whole substance*.

* See Experiments V and VI.

11. That dry or solid bodies cannot, in that state, undergo a proper fermentation: for though they may, in that state, be separated into minute particles, yet they cannot range themselves together in any new order, nor deposit a grosser part, without being agitated by some fluid, or for some time suspended therein. And hence, in over-heated mines, the ore is thus analytically destroyed, and cannot range itself into a metalline, or any other regular order again, for want of the requisite moisture or fluidity; whence the matter appears like a heap of rotten earth, or what the miners call dead metal*, of which we have a remarkable instance in the over-heated or fired mixture of sulphur and iron filings.

* See Experiment VIII.

12. And that, in imitation of nature, by a thorough knowledge of the natural agents that produce these grand effects, art likewise may produce extraordinary changes in bodies. RASBERRY, a well-known fruit, of a delicate flavour.

OF RASBERRY WINE.

For the method of making, see the article RAISINS.

Of the usefulness of this wine.

Of all our made wines, those of strawberries and raspberries are most delicious to the taste; they lightly and pleasantly stimulate the nerves of the mouth and nose with a most agreeable smell and taste, which proceeds from a mixture of their essential salt and fine oil, for the principles of both those berries are very near the same, only raspberries contain more fine oil, and the other more phlegm; therefore we shall briefly consider their qualities promiscuously.

These wines are very proper and reviving in syncope, faintings, or swoonings, because they gently and pleasantly tickle the nerves; their mature and attenuated oil, and essential salt, being by fermentation reduced to a subtle spirit, pierce the interstices of the vessels, raise the spirits, afford speedy supply of some nervous juice, which invigorates their springs. In those disorders, the use of these purify and sweeten the blood, dilute or obtund its salts, give the fibres a better tension to promote a due mixture of the juices.

In nephritic pains, they sweetly stimulate the secretory ducts of the renal glands, lightly prick the membranes of the small renal basons, whereby they being excited and invigorated, shake off their stagnating, attracting, and cohering load, and free the parts from pain; the phlegm of the wine, at the same time, has no small share in diluting and attenuating the stasis of sand in the kidneys.

In rawness, weakness, and indigestion of the stomach, the agreeable titillation of these wines gives its coats a better tension, elevates their spring, and fortifies it. Their slight astringency, together with their sweetly warming spirit, make them proper in loosenesses, and too great discharge of the menses. They are more cooling and moistening than other wine, therefore are they preferable in thirst. As they are cordial and cooling, they and water mixed make a good reviving draught in ardent fevers; as they cool and moisten, they are very proper for warm weather, young people, bilious constitutions, in too sharp a state of the blood, or where the animal juices are too much agitated. They have no bad effects, except they be drank to excess, which is rarely the case in drinking of made wines; but here we would be understood as speaking only of small wines of this sort.

RATEEN, or RATTEN, in commerce, a thick woollen stuff, quilled, wove on a loom with four treadles like serges and other stuffs that have the whale or quilling.—There are some prepared like cloths, others left simply in the hair, and others where the hair or nap is frized.

REFINING, the art of purifying a thing, or of rendering it finer and purer.

Refining is chiefly applied in speaking to the art of rendering the more precious metals so pure, as to answer the purposes of traffic and gain made by the refiner.—In relation to the refining metals, we shall speak first to that of gold.—See the articles GOLD and ASSAY, METALS and METALLURGY, MINERALOGY and ORES.

The refining of gold is chiefly performed three ways; either with antimony [see the article ANTIMONY, Vol. I.] with sublimate [see the article MERCURY] or with aqua fortis [see the article AQUA FORTIS].

Refining of gold with antimony.—To this intent they use a wind-furnace, and crucibles of sizes suitable to the quantity

of gold to be refined, observing that the gold and antimony together do not above half fill it, when in fusion.

The gold being melted, the antimony in powder is then gradually thrown in. The proportion of the antimony to gold, is about a pound to eight ounces, if the gold be between 22 and 16 carats fine: if it be under 16 carats fine [see CARAT], they use about a pound and a quarter to eight ounces of gold of such a degree of fineness: the coarser the gold, the greater the quantity of antimony is requisite. See ANTIMONY.

So soon as the antimony and gold are in the crucible, the crucible is covered with an earthen cover that will stand the fire without cracking.—Then the furnace is properly charged with charcoal, and the matter continues in fusion 'till the crucible is left quite bare: then the cover being taken off, and the crucible left to cool in the furnace, it is taken out and broke to get out the calot, which is a mass of fine gold remaining at the bottom, with the fæces of the antimony, the silver and copper alloy, and sometimes small particles of gold over it.

Though the gold thus prepared, by a due degree and continuance of fusion be very fine, yet it is brittle or eager, as workmen term it; and its perfect toughness and malleability must be restored by fusion, with saltpetre and borax. See SALTPETRE and BORAX.

For this operation, the refiner prepares coppels or tests, made of the earth of crucibles that have long sustained the fire, ground to a powder, and made up for the purpose; for these will not imbibe so much as those made of fern and bone-ashes mixed, which are used by some.

Such tests being sufficiently nealed, as the workmen call it, in the refining-furnace, they put the brittle gold therein, and cover it with charcoal.—As soon as the gold is in fusion, as it will soon be by means of the adhesive antimony, they blow it with bellows to evaporate the antimony, in the manner they do for the refinement of lead for its silver. [See the article LEAD.] After which they add a competent quantity of saltpetre and borax in powder, which imbibe the remaining impurities, and fix the gold on the test: and, to render it quite pure, it is melted afresh in a crucible, with an addition of saltpetre and borax; and as soon as it ceases to fume, the mass is cast into ingots, which upon trial is found to be above 23 carats fine gold. See GOLD.

As to the particles of gold, which may have been left behind with the alloy in the fæces of the antimony, they disentangle and purify them, with the same meltings and ingredients as have been used in the former operations.—And when they are assured by the assay [see ASSAY] of the share of gold that matter contains, they refine it to separate the copper, and afterwards make the depart.

With regard to the gold that may adhere to the coppels, tests, or crucibles, wherein it has been melted, it is got out by pulverizing them and washing them in the manner as they manage their sweeps, which is as follows.

To make one of these washes, the refiners not only pound at proper times their coppels, tests, and pots, but also collect together the ashes of their furnaces, the sweepings of their workhouses, and the very bricks whereof their furnaces are built, little particles of gold, &c. being found to stick to them, by the crackling natural to those metals, when in their last degree of fusion and purification.

These matters being well ground and mixed together, are put in large wooden bowls, wherein they are several times washed, and in several waters, which run off by inclination into troughs underneath, carrying with them the earths, and the insensible particles of the metals, leaving only behind the larger and more considerable ones, which are visible to the eye, and taken out with the hand without much trouble.

To get out the finer particles gone off with the earth, they use quicksilver and a washing-mill. The mill consists of a large wooden trough, at bottom of which are two metalline parts, serving as grind-stones; the lower being convex, and the upper, which is in form of a cross, concave.

At top is a winch, placed horizontally, which turns the upper piece round; and at bottom a bung, to let out the water and earth, when sufficiently ground. To have a general wash, the tub is filled with common water; into which they cast 30 or 40 pounds of quicksilver, and two or three gallons of the matter remaining from the lotion.—Then turning the winch, they give motion to the upper grind-stone; which grinding the matter and the quicksilver violently together, the particles of gold and silver become the more easily amalgamated therewith: this work they continue some hours, when opening the bung, the water and earth run out, and a fresh quantity is put in. See the article AMALGAMATION.

The earths are usually thus passed through the mill three times, and the same quantity of mercury usually serves all the three times.—When there is nothing left in the mill but the mercury, united with the gold or silver which it has amalgamated, they take it out, and washing it in divers waters, they put it in a ticken-bag, and lay it in a press to squeeze out the water and the loose quicksilver: the remaining quicksilver they evaporate by fire, in a retort or an alem-

bic. The metal which remains is refined with lead, or parted with aqua fortis.

Of the REFINING of GOLD by aqua regia. [See the article AQUA REGIA.]

Ercher, from considering that aqua regia does not dissolve silver, is of opinion that gold may be refined to the greatest perfection, by being dissolved in that menstruum. What led him to be of this opinion, was doubtless the common persuasion, that all the kinds of aqua fortis, howsoever prepared, did still leave some silver along with the gold; as antimony on the other hand, when used in the refining of gold, commonly steals away, as is supposed, a small quantity thereof. And as something of moment seems to be concealed in this affair, it deserves to be carefully examined.

The leading or fundamental questions of the enquiry are these. (1.) Does the aqua fortis in reality leave any silver yet mixed with the gold? (2.) Would it not prove too expensive, thus to refine gold with aqua regia? (3.) In what sense can antimony be said to steal away gold?

The first question is resolved in the affirmative, by Falschius*, in treating of the sediment of depart waters; where he says, that if gold by quartation be mixed with silver [see the article QUARTATION], and again separated from it by aqua fortis, it will constantly be found to have increased its weight. Which increase he attributes to the silver adhering to the gold: but it still remains for experiment to decide, whether this additional weight be truly owing to the silver, or whether it be an increase of real gold†.

* See Prober Buchlein, page 64. Ed. 1678.

† It is an old tradition, that the red colour which spirit of nitre manifests in its distillation, proceeds from the sulphur of nitre; and Becher endeavours to exhibit this sulphureous substance to the eye (a), where he treats of the soul of nitre. And this substance Becher still further attempts to render profitable, and to demonstrate its metallic increment; where he recommends the digestion of a solution of silver, made with spirit of nitre, from whence a small portion of the contained silver will daily be deposited, in form of a black calx, or almost golden substance (b). But as a particularly prepared spirit of nitre is required for this purpose, and also a particular purification thereof, it is proper to consult the several places of the author, where these things are mentioned (c), and what Falschius says in his Treatise of Affaying.

(a) Phycis. Subterr. lib. V. cap. 2. §. 118, 119, &c.

(b) See Miner. Arenar. page 877.

(c) See Concord. Chem. page 418, 723, 726, 736, 737, 739, 741.

With regard to the second question, it is to be observed, that such a method of refining gold by aqua regia, is scarce practicable in the larger work, on account of the great charge that would attend it. Nor is so rigorous a proof of gold at any time required, as not to admit of the least particle of silver. But in the small work, or the business of assaying, it cannot be admitted for two reasons, viz. (1.) Because so much of the gold is easily dissipated by the aqua regia, or so much of the substance of this menstruum remains fixed to the calx, even after ignition, as may cause errors in both cases. (2.) Because aqua regia, on account of the great sharpness and violence wherewith it grossly dissolves the gold, at the same time tears away more particles of the silver, than the aqua fortis leaves among the gold. A proper experiment or proof, might, however, after this manner, be made with great care, in order to determine whether the above-mentioned increase of weight proceeds from the aqua fortis, or not.

The solution of the third question is principally to be derived from an examination of the fused antimony upon its cooling, because it is easy for antimony, in its frothy ebullition, to tear away a few grains of the substance of the gold, whilst detained in thin fusion, and lodge them in the form of bubbles.

REFINING of GOLD by means of sublimate.

The process is begun like that with antimony, i. e. in the same furnace, with the same coal, the same fire, and the same crucibles.—The gold being melted, they cast in the sublimate unpulverized, and only broken in pieces.—To 8 ounces of gold to be refined, they put from an ounce to two ounces if the gold be 22 carats, 3 ounces if 20 carats, and 4 or 6 ounces if it be only 18 or 20 carats fine. In which latter case, they part the sublimate into two, putting half at a time with the gold into a new crucible, which, when the operation is over, leaves the gold from 18 to 23 carats, according to its fineness before.—After this, they raise it farther by the fire, as follows:

The broken sublimate being put into the crucible with the melted gold, the crucible is immediately covered up, to smother the mineral: which done, the furnace is filled with charcoal, and the head put on.—A quarter of an hour afterwards they take off the head, lay the crucible bare, and blow off all the ashes, and other impurities that may be floating on the liquid gold, with a pair of bellows, whose nozzle is crooked.

This they repeat again and again, 'till all the impurities of the gold being carried off, by virtue of the sublimate, it be found of a bright glittering colour: after which, the gold is cast from the crucible into an ingot.

The method of refining by sublimate, is both more complete, and indeed cheaper than that by antimony or aqua regia; but they are all dangerous, by reason of their sulphureous and arsenical exhalations.

REFINING OF SILVER.

There are two ways of refining silver, the one with lead, the other with saltpetre. The best and cheapest is that with lead; but both the one and the other of these methods are tedious and troublesome, when performed on large quantities. This occasioned M. Homberg to endeavour to shorten the operation, which he effected with good success.—His method is, to calcine the silver with half its weight of common sulphur, and after melting the whole together, to cast a quantity of steel filings upon it at several times: upon this the sulphur quits the silver, and joins itself to the iron, and both are converted into scoria, which swim on the silver, and the metal itself is found pure at the bottom of the crucible.

The assay of silver is also made by the coppel or small test, in the same manner as in the refining by lead. See LEAD. When gold and silver are mixed together, see the article QUARTATION for their separation and refining. Aqua fortis, or the spirit of nitre, is the menstruum for silver. See AQUA FORTIS and SILVER.

EXAMPLE.

Take two drachms, we'll suppose of the finest silver reduced into filings, and pour upon it twice its weight of proof aqua fortis, then set the containing glass in a soft heat under a chimney, 'till the solution is perfectly made.

Note, the aqua fortis for the solution of silver should be made proof, that is, it should be capable of dissolving half a grain, or a grain of silver immediately, without growing in the least turbid; as it would do, if it contained any sea-salt, in which case it is a kind of aqua regia. See those articles. Refining with saltpetre is performed in a wind furnace.—The silver to be refined being granulated into the size of pease, by pouring it, when melted, in a circular motion, pretty briskly, into a tub of common water, and it is heated over again in a boiler.—After this they put it in a crucible, and along with it, to every eight ounces of metal, two of saltpetre.—The crucible being now covered with a lid of earth that will stand the fire, in the form of a dome, well luted, which lid must have an aperture in the middle.—The crucible being securely placed in the furnace, and covered with charcoal, the operator gradually gives the matter the full force of fire, in order to put the metal into a state of fusion. This is successively repeated, at the interval of about a quarter of an hour.—After the third fire, the furnace is uncovered, and the crucible cools; at length it is broke to get out the silver, which is found collected to the bottom, and proves with skilful management to be fine silver; and the top is mixed with the scæces of the saltpetre and the alloy of the silver, and generally with particles of fine silver.

The bottom being separated from the impurities, is melted in a crucible, and into the dissolution is thrown charcoal-dust, and the whole briskly worked together. Then the crucible being covered again, and the furnace charged with coal, a second fire is given it.—This done, the impurities are blown from the top of the metal, 'till it appear as clear as a looking-glass, and then about an ounce of borax in pieces is gradually thrown upon it.—Lastly, the crucible being covered up again, they give it the last fire; after which it is cast into ingots, which are found with dexterous management, 11 penny-weights and about 16 grains fine.—To recover the silver that may be left in the scoria, they give the same repeated lotion in fresh water, as we have described before, in relation to the refining of gold.

OBSERVATION.

If the silver, employed in the solution with aqua fortis, as before described, were absolutely pure, the liquor will be pellucid: but if any alloy or copper remain mixed therewith, the solution will have a bluish or greenish cast. If a solution of perfectly pure silver be diluted with fair water, it will still remain pellucid, without letting any thing precipitate. But if any saline matter be contained in the water, the whole will now turn thick or milky.

The solution of fine silver has an intolerable bitter taste, though by the eye it be not distinguishable from fair water. Whence we have an eminent instance how metals may lie concealed from the sight, or remain lodged in unsuspected liquors, and thence be introduced invisibly into other substances. Whence the greater caution is to be used, with all pretenders to the melioration and transmutation of metals.

This solution of silver is the foundation of several medicinal and chemical preparations, as the vitriol of silver, the lunar caustic, the silver pill, &c.

The silver is recoverable from this solution, barely by suspending copper-plates therein: for copper being more easily dissolved by aqua fortis than silver, the silver is therefore precipitated to the bottom, in the form of a powder; and being washed and melted, comes into a metalline lump again. And this also is to be understood of the solution of gold.

The methods of obtaining silver in purity are various, and differ according to the metal wherewith the silver is mixed or alloyed. If copper be the alloy, the best and cheapest way to purify the silver is, to calcine it with half its weight of common sulphur, according to the method before prescribed by M. Homberg.

Thus much for the refining of the superior metals, which is the business of him who is called the REFINER.

REFINING of copper is performed by repeated fusions, with well-adapted fluxes. See the articles COPPER and FLUX.

REFINING of tin is managed much after the same manner as that of copper. See TIN.

REFINING of iron begins likewise with the fusion of it into cast iron from the ore. See IRON.

Steel is only iron refined to a greater degree by heating it, with some other ingredients, which close up the pores and soften its grain.

REFINING of lead. See LEAD.

REFINING of sugar. See SUGAR.

REFINING of saltpetre. See SALTPETRE.

REGISTER SHIPS of Spain.

Of the register or entries, loading and delivery of the fleets, and ships trading to the West-Indies, and of goods run and seizures, in relation to the commerce of Spain.

(1.) As it was requisite for the support of navigation, according to the Spanish polity, that there should be builders of ships, and others to take the dimensions, and gauge them to know their content, either to man them for war, or load them for merchants; and as it was convenient to prescribe rules for the freight, and to know the bulk of the commodities, so it is necessary, that the loading may be according to the laws and ordinances, that there be registers or entries, with respect to these particulars. The law of Spain gives this definition of the register, that it is a written memorandum of what passes every year; but as to what concerns this book, it is so to be understood, that the register or entry is a memorial of what is put aboard every fleet, as shall be made out. These registers, or entries, are carefully preserved in the office of the contador or comptroller of the India-House [see INDIA-HOUSE of Spain]; and it is to be observed, that every particular man's entry goes under the same name, as well as the total that is made of all the goods aboard a ship.

(2.) There are two sorts of registers or entries used in the trade to the Spanish Indies; the one is of all that is carried out of Spain to those provinces and islands; the other of all the silver, gold, pearls, emeralds, and other commodities, brought from thence. The difference between them is, that those brought from the Indies are authentic copies, of the original instruments made there by the masters of plate, or of ships, before the proper notaries, specifying the commodity, quantity, quality, and freight it is to pay, and person or persons to whom to be delivered. But those made at Seville and at Cadiz, when part of the fleet is loaded there, are plain notes, though upon sealed paper, the content of them being to this effect, That N. made entry that he has put aboard such a ship, which is one of such a fleet, commanded by admiral O. whereof P. is master, the commodities hereafter specified, naming to whom they are consigned, where they are to be delivered, upon whose account and hazard they go. After this preamble, he underwrites the number of bales, chests, or any other sort of parcel, and places also their marks in the margin, and having paid the duty for convoys, custom, and other taxes, payable at the custom-house, he delivers in this paper to the proper officer of the contador or comptroller of the India-House, without being signed by him that delivers it, or the master or owner of the ship, or any other person whatsoever, but only the officers that received the duty; so that it appears, this instrument was rather contrived to secure the payment of the duties, than for any advantage of the parties concerned; for besides these the masters sign bills of lading, upon sight whereof they are to deliver the goods to the ports they are consigned for; but, though there were none of these bills of lading, the registers or entries ought to be a sufficient authority to demand of the masters the goods therein contained; for it being requisite for the getting of cockets in the India House, that the master gives a note under his hand, to answer that those commodities he gives the same for, shall be duly entered, the entries being compared, when made, with those notes, and then tacked to the rest that belong to the ship; this certifies that the master had signed bills of lading [see BILLS of LADING]; and all the entries together have the authority of the president and commissioners, to the end that there should be no doubt but they are legal instruments, to oblige the masters to deliver what they carry, and the factors to pay the freight. See the article FACTOR.

Of these two sorts of registers, one only is in being at present, which are those of all that is sent from Spain to the Indies, but what is brought from thence is free from this incumbrance ever since the year 1660: it is necessary, however, to shew what the practice was, in order to compare it with the other.

The Spanish law directs, that all goods shipped for the Indies be entered in the India-House, upon forfeiture of the goods, the third part to the informer, and the rest to the king: the same was in practice as to all commodities brought from the Indies.

It being so difficult a matter to prove the frauds committed in bringing gold or silver that is not entered, or carrying it out of the kingdom, it was therefore ordered, that witnesses of 14 years of age should be allowed of in this case, and the transgressors to enjoy no privilege they might be entitled to. Afterwards it was added, that the informations of persons in public employments, that deserve to be credited, should be sufficient evidence for the judges upon such trial to convict the persons accused, and subject them to the ordinary or extraordinary penalties, according to the evidence and circumstances relating thereto.

The captain or other officer that brought over any commodity not entered, was to lose his employment for four years, and if it were any mean person that brought goods concealed, to be condemned to the galleys for four years. The owner of commodities not entered forfeited them, and his own goods; if a mean person, he was condemned to the galleys for ten years, and if of any quality, banished the Indies, and excluded that trade for ever. Officers and commanders that are concerned therein forfeit their employments; but he that informs, if he be the owner, to be free; if any other, besides impunity, to be intitled to one third part of the value. The master, mate, boatwain, or purser, that brings any thing unregistered, to be sent to the galleys for ten years, forfeit all goods, and be excluded for ever sailing to the Indies; but this is not to be understood of such commodities as may serve for ballast, and lie in the bottom of the hold, which may be put on board with leave from the admiral, vice-admiral, chief pilot, and master, all together.

As for the form of making the entries, it is ordered, that the bulk be specified, whether it be bale, chest, or any other parcel, as also the custom it paid proportionably to the said bulk. Nor may the entry be made at St Lucar, or any other place but at Seville, upon forfeiture of the goods. Gold and silver, and all other commodities, are forbid to be entered under any name but the right owners, upon penalty of forfeiting the whole, and four times its value, and being looked upon as a robber of the public. It was also ordained, that the merchants, before the general register or entry was made, should give in particulars of their loading to the comptroller, time enough for them to go aboard the fleets, upon forfeiture of the goods; these particulars to be signed, specifying the ship, and to whom the goods are consigned, and that the comptroller receive and place them to the general entry. That registers or entries be perfect and correct, the comptroller of the India-House [see INDIA-HOUSE OF SPAIN], or such person as shall have the care of the books of licences for loading at Seville or Cadiz, shall cast up with every merchant what that entry makes, and deliver a copy to the commissioners, to be sent to the Indies, for the officers there to see whether the cargo and entry agree. It was enacted also, that the admirals should have copies given them of the registers, or entries, to the end they might seize all goods they found not mentioned in them, which they were to deliver as forfeited, without disposing thereof, to the king's officers at the port they went to, and to charge them with it, and bring certificates that they had so done. But this has been out of use, it not being practicable for the admiral to search into the hold, and examine what goods were entered, what not. So that now the entries are sent sealed, and there is only a copy of the last visit, or search open, for the admiral to compare when he makes his at sea. Several laws direct, that only the king's officers break open the registers or entries, with a prohibition to the governors, admirals, veeadores [i. e. overseer, inspector, or comptroller] masters of ships, or the court of Panama.

The registers or entries of gold, silver, or other commodities, were to be made in the ports they came from, and if any were taken not entered, though going but to Callao, to Panama, or from Nombre de Dios to New Spain, it was all forfeited; but afterwards, all that was declared forfeited which was not entered before it came to the Havannah. All the entries of ships coming from the Indies, are to be made before the king's officers, and the escrivano or notary, whose business it is; and they are charged to be very particular in mentioning the several commodities and their species, particularly in cocheneal [see COCHENEAL], the value set upon that of Mesteca being 41,250 maravedies [see the article SPAIN], that of Elascala 37,500, and the wild at 8000; and if any that was fine came as wild, it should be forfeited. Every ship was ordered to bring two registers or entries, that is, its own, and that of another ship, to prevent the confusion that happened when any ship was cast away, or taken

by pirates, that the owners might upon these registers, either come upon the insurers [see the article ASSURANCE], or if any part was saved, know whose it was, yet this ordinance has not been executed. The registers or entries of masters of plate, are brought into a chest with three locks, the admiral to keep one key, the veeador another, and the master the third, to prevent falsification.

The kings of Spain have at all times been pretty favourable to their subjects in dispensing with the rigour of the laws in these cases, forgiving the forfeiture of goods, which for want of being duly entered, were already his Majesty's right, upon the owners making the discovery themselves; and several times seizures already made have been restored, only laying a small mulct on the owners. In 1560, there was a general pardon for all that was brought that year in the fleet not entered, provided the owners came in and declared it, and for all that came before, though it had been sent to foreign nations, provided it were brought back within the term of four months; but for the future, it was made death and forfeiture of goods, to carry gold, plate, pearls, or precious stones, out of the kingdom, or bring them unregistered. Yet for several years after, there were still fresh orders to suspend the rigour of the law, upon the owners discovering their goods, till in 1618, this repeated goodness not availing, it was ordained, that the laws should be severely put in execution; notwithstanding which, mercy was still exercised towards delinquents, either receiving the owner's declarations, or taking off all by indulto's. See the article INDULTO.

To instance in the case of goods run and seizures made, king Philip II. ordered a considerable parcel of cocheneal and hides to be restored to the owners, upon paying a fourth part over and above the usual duties, and the same in another seizure of plate, he being used to say, That those persons who had goods seized, must be treated like robbers of their own. King Philip III. ordered 176 bars of silver seized, to be restored, the owner paying 16,000 pieces of eight penalty above the duty; but for 2578 marks brought over, which had not paid his fifth in the Indies, that he directed to be confiscated. Another time a seizure of 400,000 ducats of plate being made, he ordered the one half to be restored, and the other to be forfeited. In 1563, the solicitor of the India-House searched a boat, in which was the admiral Peter Menendez his equipage, and took out three bars he brought not entered, for which the said admiral was brought prisoner from Madrid to the India-House. In 1585, 519 pipes of wine, besides a great number of jars of wine, oil, and olives, were taken from aboard the admiral and vice-admiral of the New-Spain fleet. The same has been done upon other occasions. Whosoever makes the seizure of India goods, it belongs to the commissioners of the India-House to take cognizance of the matter, and condemn them. In 1648, it was ordered, That when the officers of the India-House made a seizure, they should not be obliged to carry it to the India-House, but to such storehouse as they think fit, paying the custom; and that those made by the officers of the custom-house pay the duty for convoys. Hereupon there was an officer created to take care that nothing be exported without paying the said duty, and to take bond of merchants that they will make entry, and pay the said duty.

9. There are several laws concerning the disposal of seizures, one, that they be sold by public outcry for their full value, which is to be paid in to the king: that the owners be not entrusted with the custody of such goods: that the king's officers be obliged to prosecute in case the informers should not: that two-thirds of the forfeiture go to the king, the other between the judge and the informer: that the king's duties be first deducted out of seizures, before the informer's part: that the king's officers in the Indies acquaint the governors with what suits there are depending about seizures: that all the ports of the Indies follow the same rule that is observed at Carthagea: that the seizure be not put into the owners hands, though it be upon security: that the produce of seizures in the Indies be put into the hands of the king's officers, and not of treasurers or trustees: that when information is made of things of great value, and only notice of them given, the informer's share be retrenched, and what is cut off added to the revenue: that the courts of the Indies do not assume to themselves the decision of causes depending before the king's officers: that in trials of seizures of slaves, or other goods made in the ports of the Indies, the governor and king's officers, act jointly, and not apart, though it be upon pretence of having been first in the seizure; and that the part of the fine the law allows the judges, be equally divided among them all, upon penalty of forfeiting their employments, and being subject to other fines, besides the profit of what they have defrauded.

10. Besides, in the common ordinances of the India-House, it is expressed, That any gold or silver wrought, or in bars or ingots, brought from the Indies, that has not the king's mark, be forfeited, and the bringer fined four times the value to the king, the third part to be given to the informer, and that the offender be banished the kingdom for ever. But as for jewels, pearls, or precious stones, which cannot be marked,

marked, that he be obliged to bring a certificate from the officers in the Indies, that he entered and paid the fifth, specifying what they were valued at, their shape, weight, and marks. Another ordinance directs, That no slaves, men or women, be carried over to the Indies, without the king's licence exhibited before the commissioners, upon pain of forfeiting such slave, to the king; and if the slave be of the coast of Barbary, or of the race of Moors, Jews, or Mulattoes, that he be brought back into Spain, at his expence who carried him over; and he that carries a slave of Moorish race, be fined 1000 pieces of eight of gold, to be equally divided between the king, the judge, and the informer; or if he be a mean person, to receive 100 lashes. If the commissioners of the India House, in the execution of their office, discover what is not entered, the fifth part of the forfeiture shall be their own. Of what is put aboard after the register, or general entry is sealed, three fourth parts are for the king, the other for the informer, or if there be none, for the visitor; or if the commissioner of the India House find it, there is no doubt but the fourth part belongs to him.

11. The last order concerning the disposal of seizures directs, that the third part be laid aside for the informer, and the third part of that deducted for the judge, before whom the information is given, so he be no commissioner or judge of the India House; the same to be done as to the private informers, giving them their due without exposing their names, or making any further delay than securing the effects. But this does not cut off the commissioners of the India House from their fourth or fifth parts, in the cases before-mentioned.

12. Passengers are also to be registered, and their ages and marks set down, but they may be admitted after the register or entry of the merchandize is sealed. If the admiral take up any money of the master of plate, his bill shall stand good to make up the sum entered upon the register. The commissioners of the India House are directed to discharge the king's plate that is upon the registers, as private persons do theirs. The registers in the Indies for ships that go from the Canaries, or carry slaves, are to mention how many they carried, and to certify their being visited: and if the ship be sold there, he that buys it is obliged to bring back the same register the ship carried, and the king's officers to send a memorandum apart of the men, and an account who it was sold to. The gold and silver sent to Spain from the South Sea, is to be twice registered, once in that sea, and the other time at Porto bello, or else it is forfeited; and all that is sent from port to port in the Indies, either in the North or South Sea, is to be registered under the same penalty. Among the laws concerning registers, there is one that declares ships or merchandize, coming to the Indies by the way of Guinea, forfeited. Any goods entered upon the register, though they cannot be found, are to pay the duties, unless it be made appear they were thrown overboard in streis of weather, and of things broken or damaged, only the custom is to be received proportionably to their value, when they come to the ports in the Indies; and of such goods as are carried from St Domingo to other ports, the remaining part of the custom is to be received, which is due in the place they go to, more than is paid at St Domingo.

13. All that remains concerning this subject, is of the loading and unloading of ships, that nothing be landed without leave, and that all be carried to the custom, or India House; but this, as has been said, is taken off all things brought from the Indies by the indulto. That no goods be landed in the river Chagre but only at Panama. One of the king's officers at Panama is to receive the Firmland fleet at Portobello. If the New Spain fleet happens to touch at Ocoa, a port in the island of Hispaniola, one of the king's officers is immediately to repair thither. The ships that put into the river of Tabasco, are forbid landing their goods on its banks, but they are all to be carried from the vessel directly to the warehouses. It is a general rule, that the ships which are to return to Spain, be unloaded before those that are to remain in the Indies, and the king's officers are commanded to assist in lading the gold and silver aboard the armada's and flota's. To conclude, All that comes from the Indies, consigned to private persons, is to be delivered immediately to the owner, he putting his hand to the register; or else one of the commissioners of the India House, in the presence of one of the escriyano's or notaries of the said India House; and if it were requisite for delivery of any parcel, that the

party concerned should give security, he being a stranger in Seville, such as he should give in his own country, with the approbation of the magistrates should be admitted, because giving it at Seville, they used to leave that money in the sureties hands, or spend a considerable part of it to find any.

REMITTANCE, the traffic or return of money from one place to another, by bills of exchange, orders, or the like. See the articles BILLS of EXCHANGE, and EXCHANGE. A remittance is properly a bill of exchange, sent to a correspondent, and the contents thereof to be received by him of some other person, on whom such bill is drawn. We say that such a merchant has remitted, or made a remittance of so many thousand pounds, in bank notes to his correspondent at London. — I will remit you; or make you a remittance of, 1200 crowns, in three bills of exchange, of 400 crowns each, drawn on A. B. banker, in your city, payable at sight, at 20 days after sight, or at usance, &c. By means of remittances by the circulation of bills of exchange, prodigious sums of money are returned, not only from one city to another in a trading nation, without danger, and without carriage, but immense sums are thereby perpetually circulating throughout all the European states.

R E M A R K S.

Remittances of money to distant parts, by the means of bills of exchange, necessarily imply a correspondence at those parts, and the authority of drawing upon some person, by whom such remittance must be discharged, to the person to whom the bill is made payable.

The nature of draughts and remittances, and the manner whereby such kind of negotiations are carried on, cannot be better explained and illustrated, than by exhibiting the outlines of the accountantship requisite to be observed on such occasions, by the parties therein concerned. And as money remittances are either of a domestic or of a foreign kind, we shall state the case familiarly in both lights, with relation to real practical business.

I. With regard to domestic remittances, or such as are carried on through the several trading towns and cities in the same state or empire.

Suppose C. D. of London, for example, is a trader, and has dealings with other traders of Bristol, Liverpool, and Exeter, and that he hath occasion to remit 200l. to his correspondent, E. F. of Bristol. — For this purpose he is presumed to have some correspondent, suppose G. H. of Bristol, who is indebted to C. D. of London 500l. in the way of traffickable, or any other concerns; — and that, by virtue thereof, he, the said C. D. hath the liberty to draw upon G. H. to the amount of 500l. for the discharge of the said debts. — Now, if G. H. is indebted to C. D. 500l. G. H. stands in his book indebted for the said sum, to some proper account, suitable to the occasion on which the said debt was contracted. — Upon which he (C. D.) draws, in the following manner and form; upon G. H. 200l. payable to C. D.

London, September 1, 1754.

One month after date pay to E. F. or order, the sum of 200 l. and place it per advice to the account of

To Mr G. H. merchant of Bristol. Sir, Your humble servant, C. D.

This draught of 200l. thus made by C. D. of London, on his correspondent G. H. of Bristol, payable to E. F. of Bristol, one month after date, is sent inclosed in a letter to E. F. who sends it, on receipt thereof, to G. H. of Bristol, for acceptance; which if he does not refuse, and duly pays; this draught thus made upon G. H. is a remittance made, at the same time, to E. F. in discharge of the 200l. due by C. D. of London, to E. F. of Bristol.

As G. H. stood a debtor in the books of C. D. for what he owed him, so E. F. was a creditor in the accounts of C. D. for what the latter owed him. Quere, In what manner ought the several parties herein concerned state this transaction in their respective books, according to the true principles of accountantship, by the Italian method of double entry? We will state the accounts of C. D. of London, which are supposed to stand thus in his ledger (in regard to this affair) previously to the commencement thereof.

L E D G E R.

		l.	s.	d.		Cr.	l.	s.	d.
(1)	G. H. of Bristol				(3)	By E. F. for draught on E. F. remitted G. H.	200	—	—
	To cash, if money lent, &c.	500	—	—					
(2)	CASH				(1)	By G. H. for money lent	500	—	—
	To E. F. money borrowed	200	—	—					
(3)	E. F. of Bristol				(2)	By cash, money borrowed, or otherwise, &c.	200	—	—
	To G. H. for draught remitted him	200	—	—					

EXPLANATION.

The foregoing is the practical state of the case in the ledger of C. D.

1. The reader will observe, that G. H. stands debtor for the 500 l. to CASH, on supposition it was money lent, and CASH a creditor for the same, which exhibits these two accounts in their right state: if the money had been due on a legacy, G. H. must have been made debtor to CAPITAL STOCK, and CAPITAL STOCK creditor by G. H. in which case, also, those accounts would appear in their just light; but, if the money had been due upon any other occasion, the credit must have been adapted accordingly. See the ar-

L E D G E R.

	C. D. of London	-	D ^r	l.	s.	d.
(2)	To E. F. for the draught accepted			1200	—	—
	CASH	-	-			
(1)	To C. D. money borrowed		D ^r	500	—	—
	E. F.	-	-			
(3)	To cash, paid him C. D's draught of		D ^r	200	—	—

(1)	By cash, money borrowed of him	C ^r	l.	s.	d.
			500	—	—
(3)	By E. F. paid C. D. draught of — day	C ^r	200	—	—
(2)	By C. D. for draught accepted	C ^r	200	—	—

EXPLANATION.

1. CASH is debtor, and C. D. creditor by CASH, for what G. H. owes him.—When C. D. draws on him, in order to make a remittance to E. F. then he makes C. D. debtor to E. F. and credits E. F. 'till paid.—When he pays E. F. then E. F. is made debtor to CASH, and CASH creditor by E. F. By which method of charge and discharge, according to the way of double-entry accountanthip, every distinct account is preserved in its true state.

Many who deal any thing considerably in draughts and remittances, keep distinct INTERMEDIATE ACCOUNTS

L E D G E R.

	CASH	-	-	D ^r	l.	s.	d.
(1)	To C. D. of London, borrowed of him				200	—	—
	C. D. of London	-	-	D ^r			
(2)	To G. H. a draught payable to G. H. of				200	—	—
	G. H.	-	-	D ^r			
(3)	To cash, paid C. D's draught, when due, of				200	—	—

(3)	By G. H. paid C. D's draught of	C ^r	l.	s.	d.
			200	—	—
(1)	By cash borrowed of him	C ^r	200	—	—
(2)	By C. D's draught, payable to G. H.	C ^r	200	—	—

But if C. D. of London had no one at Bristol that owed him money, in order to conveniently discharge his creditor E. F. at that city, E. F. must either have drawn upon C. D. of London, or C. D. of London must have paid the money in London, and procured a bill, payable to E. F. in Bristol, and sent him the same, which would have answered the end equally as well.—Or, if it had been convenient for E. F. to have the said sum paid to his order in Exeter, or elsewhere, and it had suited C. D. so to have returned the same, by a draught upon any correspondent, in this way likewise the money may be paid to the order of E. F. Hence we find, that the transaction of money-concerns, by the means of draughts and remittances, is infinitely more facilitated than can be by the perpetual sending of specie backwards and forwards, at a great hazard and expence: and, with regard to bills of Exchange that are not payable at sight, the robbing of the mail does not, in this respect, affect them in the manner that it does bank-bills. There is, indeed, frequently hazard run by taking bills that may be protested, and this proves a great disappointment to the principal parties: this induces many rather to transact their inland affairs by the means of bank bills, than by that of bills of exchange. Nor is the trading interest only thus accommodated in their draughts and remittances, by the means of paper circulation, but the landed men also; and the public revenue itself is commodiously remitted to the exchequer, by virtue thereof: whereby this method of drawing and remitting money, proves of no less ease and advantage to the government, than to the subjects in general.

There are many bankers, and others who are not professedly so, that make a very handsome income, at $\frac{1}{4}$ per cent, &c. by accommodating people with bills for their returns of monies.

EXPLANATION.

Whoever discerns the reason of what has been already said, will need no farther explication in relation to the accounts of E. F. which he will observe are in conformity with the preceding. The whole of the matter, in a word, lies here: if a merchant of London has owing to him 500 l. by one in Bristol, and he owes 200 l. also to one in Bristol, he orders his debtor there to pay the same to his creditor; which order being executed in the manner before represented, is called a DRAUGHT made upon his debtor, and a REMITTANCE to his creditor; and the method of stating the accounts by the persons concerned, shews the essential points

articles ACCOUNTANTSHIP, BANKING, BOOK-KEEPING, LEDGER, MERCANTILE ACCOUNTANTSHIP.

2. Upon making the draught on G. H. payable to E. F. E. F. is made debtor to G. H. and G. H. creditor by E. F. which debiting the one, and crediting the other, keeps the accounts of C. D. in an equitable state, and shews how draughts and remittances are adjusted, in conformity to the nature of the transaction.

II. Let us now take a view of the accounts of G. H. As G. H. stands a debtor in the books of C. D. for what he owes him, so must C. D. stand a creditor for the same in the books of G. H. Thus:

of DRAUGHTS and REMITTANCES, or a BILL-BOOK, wherein are entered all bills payable and receivable; by the means of which intermediate accounts of BILLS RECEIVABLE, and BILLS PAYABLE, the personal accounts of all with whom you have transactions by way of draught or remittances, are adjusted.

III. We shall now see how the accounts of E. F. will stand in regard to this transaction.

As E. F. in the books of C. D. stands creditor, by CASH, for money C. D. borrowed of him; so CASH must stand debtor, and C. D. creditor, in the books of E. F. for the same. Thus:

of the accountanthip necessary to be performed by the several parties therein concerned.

These plain principles being well understood, in relation to the nature of domestic draughts and remittances, the same will be easily applied to those in foreign countries, and in foreign monies.

EXAMPLE I.

Suppose Mess. Clifford and sons, merchants of Amsterdam, are indebted to Mess. Henry and Peter Muilman, of London, merchants, 5000 guilders, bank money of Amsterdam, and that said Clifford and sons remit the same to said Muilmans, by a bill of exchange, drawn at usance, on John Gore, merchant of London, who is indebted to them, exchange at 34 : 6. Quere, how must this transaction be stated in the books of the several persons therein concerned, according to the principles of accountanthip, as practised by those eminent traders?

I. With regard to the accounts of CLIFFORD and SONS OF AMSTERDAM.

If they are indebted to Mess. Muilman a balance of 5000 florins, banco of Amsterdam, Mess. Muilman will of course have credit in their books for that sum; and, when they remit the same to said Muilmans of London, the transaction is managed in the following manner: as Clifford and sons owe money in London to some persons, so we may presume, in the course of their transactions, they may have monies due to them from Mr Gore, in the same trading city: in which case, they make a draught upon their debtor, payable to their creditors, and thereby make the remittance required, and state their accounts by way of debtor and creditor, according to the principles before given in the domestic transaction: taking care to distinguish the different monies of the two countries, and what they may gain or lose by the exchange. These great remitters always have an open account in their ledger of DRAUGHTS and of REMITTANCES, and are extremely accurate in distinguishing MY ACCOUNT from HIS ACCOUNT, as well as their COMPANY ACCOUNTS from their PROPER ACCOUNTS. See our article LEDGER. But if it so fall out that Clifford and sons of Amsterdam have no MONIES due to them in London, and yet are obliged to pay the said sum to Muilman and Co. within a certain time, the affair may be managed in one or the other of the following ways: either Muilman and Co. may draw upon Clifford and Co. or Clifford and Co. must purchase a bill, or bills of exchange,

exchange, on the Bourse of Amsterdam, of those who may have monies due to them in London, or any other trading city in England; and this bill, or these bills of exchange, are sent over by the packet to the said Muilman and Co.

Suppose such bill of exchange be furnished to Clifford and Co. by the house of PELTZ and Sons of Amsterdam, drawn upon SIR JOSHUA VANECK, BART. and Co. merchants of London, payable at usance, or two usance, to Mess. Cliffords: in this case, Cliffords indorse the said bill of exchange, and send it over to Mess. Muilman, who present the bill for acceptance, and receive the contents of Sir Joshua Vaneck and Co. according to the tenor thereof. If the transaction be thus conducted, and if Mess. Clifford immediately pay for the bill furnished them by Mess. Peltz, they may make **BILLS OF EXCHANGE, or REMITTANCES**, debtor to CASH for the money so paid; and when they hear of Mess. Muilman's receipt of the bill in England, and that it is accepted, they then debit MESS. MULMAN to REMITTANCES, for the amount thereof. This method of stating the accounts in the books of Clifford of Amsterdam, will keep their account of cash right, as well as their account with Mess. Muilman.

What is a remittance to Mess. Muilman, is a draught upon Sir Joshua Vaneck and Co. by Mess. Peltz; and, upon the receipt of money by Peltz and Co. of Cliffords, for the said draught of Sir Joshua Vaneck and Co. the said Peltz debits their account of cash, and credit Sir Joshua Vaneck and Co. for the said draught.

And Sir Joshua Vaneck and Co. in order to keep his accounts in conformity with those of Peltz and Co. do, upon the acceptance of the draught aforesaid, debit Peltz and Co. in their proper account, which gave birth to the occasion, and credit Mess. Muilman for their said remittance; for, upon Sir Joshua and Co's acceptance of the bill, they, from that time, become debtor to Mess. Muilman for the same: but if Sir Joshua chuses so to have his books kept, that his intermediate account of DRAUGHTS may manifest all draughts that have been made upon him, then he debits Peltz and son to the account of DRAUGHTS, and, when he pays such draught, according to the tenor of the bill, he then debits draught, and credits his account of cash; which is the method that most great remitters practise.

In the like manner, with regard to the remittance made to Mess. Muilman, he debits the account of REMITTANCES to Mess. Clifford, and credits Mess. Clifford for the same, in conformity: and, when Mess. Muilman receive in money the amount of the said bill, of Sir Joshua Vaneck, he debits his account of cash, and credits that of remittances; whereby the accounts of Muilman are kept in conformity with those of Cliffords of Amsterdam.

But as our remitters, or merchants of consideration, keep their cash either with the bank of England, or with bankers of eminence, the business of receiving or paying bills is made mighty easy to them; for the bills receivable being deposited either in the bank, or the bankers hands, their runners receive them when due, the merchant having the receipt thereof acknowledged in his bank-book: and, when such merchants have bills to pay, they draw upon the Bank or bankers for the same, which sums are wrote off in their bank-book accordingly.

Upon the whole, the reader will easily observe, that any bill of exchange whatsoever is properly a DRAUGHT, with regard to the drawer, and to the person upon whom the same is drawn, and who is to pay the contents; and, at the same time, it is properly a REMITTANCE, with regard to the person who buys the bill, and pays the value, as well as to the person to whom the bill is sent, or remitted, and who consequently receives the contents.

In relation to the general laws, customs, and usages, which concern bills of exchange, see the article **BILLS OF EXCHANGE**; and, with respect to the method of stating accounts of this nature, see the articles **BANKING, BOOK-KEEPING, DEBTOR and CREDITOR, LEDGER, and MERCANTILE ACCOUNTANTSHIP**; under which several heads will he find very ample instructions whereby to capacitate him for the stating of any kind of accounts whatsoever, be they either of a foreign or domestic concernment.

Further REMARKS upon this article of REMITTANCES and DRAUGHTS.

As in inland trafficable affairs it may, as we have observed, frequently suit the convenience of the parties to remit money in one city, payable to the order of a correspondent who resides in another at a considerable distance in the same country; so it often happens, especially among the general and more skilful merchants, that they order a correspondent of London to draw upon their correspondent of Paris, who may be debtor to him in Amsterdam, for their account, instead of drawing upon him of Amsterdam: and so in divers other places. For if A of Amsterdam be indebted to B of London, and C of Paris be also indebted to A of Amsterdam; and if A of Amsterdam orders B of London to draw upon C of Paris, instead of himself of Amsterdam, it may, and often does, not only prove mutually agreeable and convenient, but sometimes an additional advantage is the mo-

tive, either to the one, if not both, so to do; and what these advantages may be at such conjuncture, is judged of by the course of exchange between Amsterdam and London, Amsterdam and Paris, and London and Paris; and the method whereby such business is transacted, by the means of draughts and remittances, with a view to profit to be made by the exchange, is called the arbitration of the foreign exchange. See the article **ARBITRATION** in matters of the foreign exchange; see also the articles **ENGLAND, HAMBURGH, HOLLAND**, and the chief trading cities of Europe, under their respective provinces.

REPRIZALS, a right, according to the civil law and that of nations, which princes have to retake from their enemies such things as they unjustly detain from them, or other things equivalent thereto. — It is used also for a permission given by a prince sometimes to a subject, upon a full cognizance of the cause, authorizing him to retake, from the first person he meets with of the adverse party, as many effects as make an equivalent to what have been violently forced from him, and for which the opposite prince has refused to do him justice.

These permissions are also called letters of mark, mart, or marque. — Thus we say, This merchant has seized the effects of the Spaniard Don —, by way of reprisal, because the Spaniard has seized his, and no redress could be had at the court of Madrid.

Under the articles **MARQUE, [LETTERS OF MARQUE], PRIVATEERS, PRIZES**, we have given the principal laws relating thereto: as they have some affinity with the present subject, we shall here give what may be further necessary, according to the laws of England, in particular, to the understanding what else may have a connection with the preceding subjects.

A copy of letters patent for especial reprisals, from the king of Great-Britain (under the great seal of England) against the States of Holland, and their subjects; inrolled in the high court of Chancery, 19 May, 15 Car. II.

Charles the Second, &c. Whereas our loving subjects, Sir William Courteen, Knt. deceased, and his partners, anno 1643, by the depredation and hostile act of one Gailard, commander in chief of two ships belonging to the East-India company of the Netherlands, was, between Goa and Macao, in the freights of Malacca, deprived and most injuriously spoiled of a certain ship called the Bona Esperanza, and of her tackle, apparel, and furniture, and all the goods and lading in her, upon a very hopeful trading voyage to China; which were carried to Batavia, and there all de facto, without due process of law, confiscated. And also in the same year, another laden ship of our said subject, called the Henry Bonadventure, being come on ground near the island of Mauritius, was there, both ship and goods, seized upon by some of the officers and ministers, and others under the command of the said East-India company, and utterly detained from the right owners. And whereas the said Sir William Courteen, and his assigns, in his life-time, used all possible endeavours to recover the said ships and goods, and to procure further justice against the malefactors, and yet could obtain no restitution or satisfaction; whereby they came to be much distressed, and utterly undone in their estate and credit: and thereupon, and upon the most humble supplication and addresses of Francis earl of Shrewsbury, and William Courteen, Esq; grandson and heir of the said Sir William, deceased, Sir John Ayton, and Sir William Turner, Knts. and George Carew, and Charles Whitaker, Esqrs. (on the behalf of themselves, and divers others interested in the said two ships, Bona Esperanza, and Henry Bonadventure, and in the estates of the said Sir William Courteen, deceased) Sir Edward Littleton, Bart. and Sir Paul Pindar, Knt. that we would take their case into our princely consideration: we, out of a just sense we then had, and still have, of their unjust sufferings in that business, both by our own letters, under our sign manual, to the States General of the United Provinces, and by Sir George Downing, Knt. and Bart. our envoy extraordinary, to whom we gave special command so to do, required satisfaction to be made for the said ships and goods, and the amity and good correspondence which we then desired to conferve with them firm and inviolable. And whereas, after several addresses made to the States General by our said envoy, and nothing granted effectual for the relief of our said subjects (whom we take ourselves, in honour and justice, concerned to see satisfied and repaid) we lately commanded the said Sir George Downing to intimate, and signify to the said States, that we expected their final answer, concerning satisfaction to be made for the said ships and goods, by a time then prefixed, and since elapsed, that we might so govern ourselves thereupon, that our aforesaid subjects might be relieved according to right and justice; and yet no satisfactory answer hath been given; so that we cannot but apprehend it to be, not only a fruitless endeavour, but a prostituting of our honour and dignity, to make further application, after so many denials and slights. And whereas John Exton, doctor of laws, judge of our high admiralty court of England, upon our command to certify to us

the value of the losses and damages sustained by the said Sir William Courteen, and partners, whose interest is now vested in our loving subjects Sir Edmund Turner, Knt. and George Carew, Esq; and partners, hath, upon full examination and proof thereof, made by witnesses in our high court of admiralty, reported and certified under his hand, that the same do amount to the sum of One hundred fifty-one thousand, six hundred, and twelve pounds.

Now KNOW YE, That for a full restitution to be made to them for their ships, goods, and merchandizes, of which the said Sir William Courteen, Knt. and partners, were so despoiled as aforesaid, with all such costs and charges as they shall be at for the recovery of the same: we, by the advice of our privy council, have thought fit, and by these presents do grant licence and authority, under our great seal of England, unto our said subjects, Sir Edmund Turner and George Carew, their executors, administrators and assigns, for and on the behalf of themselves and other persons interested, as aforesaid, to equip, victual, furnish, and to set to sea, from time to time, such and so many ships and pinnaces as they shall think fit; provided always, that there be an entry made and recorded in the admiralty courts, of the names of all ships and vessels, and of their burthen and ammunition, and for how long time they are victualled, and also the names of the commanders thereof, before the same or any of them be set forth to sea; and with the said ships and pinnaces by force of arms to set upon, take, and apprehend any of the ships, goods, money, and merchandizes belonging to the States-General, or any of the subjects inhabiting within any of their dominions or territories, wheresoever the same shall be found, and not in any port or harbour in England or Ireland, unless it be the ships and goods of the parties that did the wrong. And the said ships, goods, money and merchandizes, being so taken, and brought into some port of our realms and dominions, an inventory thereof shall be taken, by authority of our court of admiralty, by the judge or judges thereof for the time being, upon proofs made before him or them that the said ships, goods, wares, merchandizes, or money, did belong to the States General, or any of their subjects, as aforesaid: that they shall be lawful prize to the said Sir Edmund Turner and George Carew, their executors, administrators, and assigns, as aforesaid, to retain and keep in their or any of their possessions, and to make sale and dispose thereof in open market, or howsoever else, to their and every of their best advantage and benefit, in as ample manner as at any time heretofore hath been accustomed by way of reprisal, and to have and enjoy the same as lawful prize, and as their own proper goods: so that neither any captain, master, nor any of their company, that shall serve in person, or shall promote and advance the said enterprise, in manner and form aforesaid, shall in any manner or wife be reputed or challenged as an offender against any of our laws. And that it shall be lawful for all manner of persons, as well our subjects as any others, to buy the said ships, goods, and merchandizes, so taken and apprehended by the said captains, masters, and others, and adjudged as aforesaid, without any damage, loss, hindrance, trouble, molestation, or incumbrance to befall the said buyers, or any of them, in as ample and lawful manner as if the ships, goods, wares, and merchandizes, had been come and gotten by lawful traffic of merchants, or of just prizes in time of war. Provided always, that all ships, goods, and merchandize, taken by virtue of this our commission, shall be kept in safety; and no part of them wasted, spoiled, or diminished, or the bulk thereof broken, until judgment hath first passed as aforesaid, that they are the ships and merchandize of the States General, or some of their subjects, as aforesaid. And if, by colour of this our commission, there shall be taken any ships, goods, or merchandizes, of any of our loving subjects, or the subjects of any prince or state in good league or amity with (except the States General, or their subjects, as aforesaid) and the goods therein laden, sold and embezzled, or diminished, or the bulk thereof broken in any place, before they shall be adjudged to belong to the States General, or some of their subjects, as aforesaid, that then this commission shall not be of sufficient authority to take the said ships, goods, and merchandizes, or to warrant or save harmless such as shall receive, buy, or intermeddle therein; but that both the prizes so taken, and the said ships of war, shall be confiscated to our use.

And further we do hereby declare, That it is our will and pleasure that this our commission shall remain in full force and power to all intents and purposes, until the said Sir Edmund Turner and George Carew, their executors, administrators, and assigns, as aforesaid, shall, by virtue thereof, have by force of arms apprehended, taken, seized, recovered, and received from the said States General, or their subjects, One hundred fifty-one thousand, six hundred and twelve pounds, according to the appraisement to be made, by appraisers upon oath, nominated and authorized in our said court of admiralty, of such ships, goods, wares, or merchandizes, as shall be taken from the said States General, or any of their subjects, by virtue of this commission, or shall otherwise receive satisfaction of the debt aforesaid, by composition to be

made between those of the East-India company of the Netherlands, and the said Sir Edmund Turner and George Carew, their executors, administrators, and assigns, as aforesaid: notwithstanding the present difference between us and the said States General, depending upon general reprises, may be agreed and composed, and that, in the interim, a good correspondence may be renewed between us and the said States General: in which case, nevertheless, it is our will and pleasure, that, in the execution of this our commission, no violence shall be done to the persons of the said subjects of the said States General, but only in case of resistance; and that after in cold blood, the subjects of the States General, if hurt or wounded, shall be used with all convenient offices of humanity and kindness, &c.

A proclamation for revoking the foregoing letters of marque and reprisals, published August 30, 1680.

Whereas George Carew, Esq; had formerly granted to him letters of marque against the States General of the United Provinces, for satisfaction of a certain demand which Sir William Courteen and others had against the said States, and to which the said George Carew was intitled, which said demand has since, by treaty of peace between his Majesty and the said States, been totally abolished and extinguished, and all letters of marque and reprisals by the same treaty discharged accordingly: and whereas his majesty has since recalled and suspended the said letters of marque, to the end that no person may be misled, under pretence of any letters of marque and reprisal heretofore granted to the said George Carew, and thereby incur the danger of the law as pirates, his Majesty is pleased, by this his proclamation to declare, that the said George Carew has now no authority and commission, by virtue of any such letters of marque, to equip or set out any vessel whatsoever; and that all persons that shall presume to be aiding to him in setting forth any such ship, or serve under him, by colour of any such pretended authority, shall be proceeded against as pirates, according to the utmost severity of the law.

REVENUE, [PUBLIC REVENUE]. REVENUE, in its ordinary acceptation, is the yearly rent, or profits, arising to a man from his lands, possessions, &c. The public revenue of this kingdom is the yearly income, or sums raised, at present, by the authority of king, lords, and commons, for the support of the state.

The success of a kingdom, says a judicious writer, depends upon a wise regulation of its REVENUES. When taxes are not levied in the manner they ought to be, they are the ruin of the subject, a moth in the treasury, the universal lamentation of a kingdom, and the interest and joy of foreigners. But a prudent disposition of them is the soul of a state, the life of the people, glory to a prince, grief and distress to foreigners, and a perpetual fountain of the richest blessings to human life.

As not only the interest of trade, but the maintenance of the liberties of these kingdoms, will ever consist in keeping princes dependent on the parliament for the money that shall be exacted from the people; it may be useful to give a short history how the public money has been levied, from the Conquest to the Revolution in 1688, and from that æra to the present time.

KING WILLIAM I.

Having conquered England, his WILL became a law, and he looked upon all the land and treasure of the nation as his own. He distributed the greatest part of the English lands among his NORMANS, and others, who helped him in the conquest; whereby he secured their attachment, and effectually depressed the natives.—He also divides the lands into baronies and knights' fees.—He causes an exact survey to be taken of all the lands; by which he knew distinctly every acre of arable, meadow, pasture, common, wood, marsh, and every other sort, and taxed them all to their value.—He rated, in like manner, all towns, cities, boroughs, and villages.—This survey is preserved in the Exchequer, in the Domesday-Book.—He established the duty of Danegeld, on account of pirates, but exempted the church from the payment of it, yet he caused all the monasteries to be plundered of their money.—He brings under military servitude all the bishoprics and abbeys that held baronies.—Makes inquiry in every county how many acres were sufficient yearly for one plough, &c.—Causes inquiry to be made what assessment each city, castle, &c. paid yearly.—Takes 6s. of each plough-land, or hide, throughout the kingdom, and extorts immense sums from all people promiscuously.

R E M A R K S.

What all these incomes of the Conqueror might amount to is not possible to be known, there being no estimates extant even of those sums which he raised by way of tax; nor can there be any account of all the other profits he made by the several ways above mentioned.—He stood not in need of parliaments to supply his wants, who had it in his power to take all that his subjects possessed.—However arbitrary and lawless this absolute monarch and conqueror was, yet, it has been said, that he did not absolutely abolish the rights, laws, and

customs

customs of the English people, but submitted himself, in some measure, to those contained in the *Doomsday-Book*. After the Saxons were settled in England, their silver coins were generally all of size, and ill-minted, which they called pennies, worth about three-pence of our money, and also half-pennies and farthings, and half-farthings, called *fica's*. After the Norman conquest, a pound of gold being divided into 24 carats, and every carat into 4 grains, the old sterling, as it was afterwards called; or right standard of gold, consisted of 23 carats and 3 grains and a half of fine gold, and half a grain of alloy of copper or silver. Also, a pound of silver being divided into 12 ounces, and every ounce into 20 pennyweights, and every pennyweight into 24 grains, a pound weight of old sterling consisted then, as it does at present, of 11 ounces 2 pennyweights of fine silver, and 18 pennyweights of alloy.

KING WILLIAM RUFUS,

Son and successor to the Conqueror, spared no manner of rapine or simony.—Holds most of the church-lands in his own hands, and farms them out to the laity.—Extorts 5000 marks from the cathedral of Lincoln.—Exact 10s. a man from 20,000 foot.—Seizes all the effects of the archbishop and church of Canterbury.—Demands Danegeld of all the barons.—Draws the wealth of the church into his own treasury.—In short, he slays the people with taxes and exactions in every shape; and having oppressed and ruined his subjects, he was snatched away with a violent death.

REMARKS.

This prince not only governed as his father had done, in a despotic manner, as inheriting all that he did, and, consequently, had the same property in all the lands and all his revenues; but he oppressed both clergy and laity without mercy, laying the most unreasonableness on their lands, houses, and effects of every kind, inasmuch that no man could call any thing his own; and in this manner he reigned, or raged, for the space of near 13 years.—At the time of his death, this king held in his own hands the archbishopric of Canterbury, the bishoprics of Winchester and Salisbury, and 12 abbeys, which he was wont to sell, or let out to farm, or keep them to himself: he had all the vices of his father without his virtues.—Ranulph Flambert, a man of oppressive principles and mean birth, was his treasurer, and the projector of most of the unjustifiable ways practised by the king to extort money from his subjects.

The two first kings after the Conquest coined only pennies: they agree, as near as can be judged, in weight and goodness, with the pennies of the Saxon kings, their immediate predecessors. It is therefore reasonable to think that king William introduced no new weight into his mints; but that the same weight used there for some ages after, and called the pound of the Tower of London, was the old pound of the Saxon monies before the Conquest. This pound was lighter than the Troy pound by three quarters of an ounce Troy, and did not very sensibly differ from 12 ounces of the weight still used in the money affairs of Germany, and there known by the name of the Colonia weight. And whereas the present standard of England, of 11 ounces 2 pennyweights fine, to 18 pennyweights of alloy, is called, in the oldest accounts of the Mint extant, the old standard, or the standard of the old sterling, it is most probable that these pennies were of that standard, and that the pound of the Tower of such standard silver was then cut into 240 of these pennies: whence the weight of the penny will be found 22 Troy grains and a half; and the intrinsic value of 20 shillings, or of 240 such pennies of full weight, was the same as the value 58 shillings and one-penny half-penny of our present coined money.

Of the payment of the king's revenue in those ancient times.

At first, the tenants of knights fees answered to their lords by military services; and the tenants of socage lands and demesnes, in great measure, by work and provisions: afterwards, the revenue of the crown was answered in gold and silver, and sometimes in horses, dogs, and birds of game, and the like, and sometimes in both together. When a man paid money into the Exchequer, it was said, in *The sauro liberavit* so much; and the same phrase continueth to this day. These payments were made *Ad scalam* & *ad pensum*, and in blank silver and numero, by tale. *Ad scalam* was by paying six-pence over and above each pound, or 20 shillings, which at first was thought sufficient to make good the weight; *ad pensum* was the person's making good the deficiencies of weight, though it was more than six-pence per 20 shillings. But as the money might be deficient in fineness, as well as weight, a third way of payment was by melting down part of the money paid in, and reducing it to plate of a due fineness; when the ferm was melted down, it was said to be dealbated, or blanched. As suppose a ferm of a hundred pounds was paid into the Exchequer, after the melting, as before observed, it was said to be a hundred pounds blank: frequently the twentieth part of one shilling was accepted in lieu of melting, to save trouble and charges. The payment

VOL. II.

by numero, or tale, needs no explanation. Payments, or at least computations, were made by marks and half marks, ounces and half ounces of gold; and in pounds, marks, half marks, shillings, pence, &c. of silver. The mark of gold was equal to 120 shillings of silver; the ounce of gold was equivalent to 15 shillings of silver; the pound of silver by tale was 20 shillings; the mark 13 shillings and four-pence; and the shilling consisted of 12 pence; and a penny was the twentieth part of an ounce, equal to our three-pence.

KING HENRY I.

Succeeds his brother William in the fulness of the sovereign prerogative. The first imposition he laid was three shillings on every hide of land, to marry his daughters.—Anno Dom. 1104, he exacted a prodigious sum of money of this kingdom, and the land lay under grievous and exorbitant oppressions, the discord being revived between him and his brother Robert, earl of Normandy.—He also seizes the archbishopric of Canterbury into his own hands, and left 100,000l. at his death, besides plate and jewels.—The charter this prince granted the nation upon his accession to the crown, is one of the most remarkable particulars of his reign, during which England enjoyed a prodigious plenty of all things: for a shilling; at this time, might be bought as much corn as would serve 100 men a day; and for a groat, which was also the price of a sheep; as much hay and oats as 20 horses could eat in the same time. This was owing to the scarcity of money.

The coined pennies of this prince, the first Henry, were like those of his father and brother, to which, as the historians very particularly tell us, he added half-pennies also.

The manner of paying in and computing the king's money being shewn at the end of William Rufus's reign, it may not be amiss briefly to shew here how the royal revenue was levied; and the manner of issuing it. (1.) As to the levying, the person principally intrusted was the sheriff of each county, who, in those days, was an officer of great authority; however, there were several other rated collectors and accountants, namely, the escheators, the farmers, (or custodes of such towns and burghs as were not within the sheriff's receipt) the custodes *camarii*, or customs, the keepers of the wardrobe, and, in general, all persons who held bailiwicks from the king, or received any of his treasure or revenue by *imprest*, or otherwise, were obliged to render an account thereof, and, in succeeding times, the collectors of tallages, dimes, quinzimes, &c. But, in case these officers could not enforce the king's debtors to make payment, the sheriff was armed with sufficient power to do it: The most ancient process made use of was the *summon* of the Exchequer, which issued twice a year into all the counties of England, and was returnable against the times of holding the *Duo scaccaria*, namely, the *Scaccarium Pasche*, or Exchequer of Easter, and the *Scaccarium St Michaelis*, or Exchequer of Michaelmas, which were the general terms for the sheriffs and other accountants, to pay in their farms or rents, and other issues of their bailiwicks. This was the ordinary process; but, upon urgent occasions, the king sometimes issued special writs to the sheriff, and others concerned in collecting the revenue, commanding them to levy debts, &c. with all speed.

(2.) As to the manner of issuing the king's money: this was done several ways. Whilst the money remained in the hands of the sheriffs, farmers, or others, it was usual for the king, his chief justices, great officers of his court, treasurer, or barons of the Exchequer, to order them by writ to make provisions and payments out of the money in their hands. This writ was sometimes called the sheriff's warrant; for, upon producing it, he had allowance made to him *de tanto* upon his account. Sometimes the king's money was issued by way of *prest*, or *imprest*, either out of the receipt of Exchequer, the wardrobe, or other the king's treasuries. *Imprest* seems to have been of the nature of a *concreditum*, or *accommodatum*, and when a man had money *imprest* to him, he became accountable to the crown for the same. In the 5th year of king Stephen, an account was rendered at the Exchequer of certain monies *imprest* to the accountant, when the *empres* came into England. Mag. Rot. 5 Steph. According to ancient usage, the king's treasure was to be issued, by virtue of a writ or mandate, under the great and privy seal, and directed sometimes to the justices and barons of the Exchequer, but commonly to the treasurers and chamberlain of the receipt; and the writ was founded upon a bill or certificate from the Exchequer, or Wardrobe, or other matter of record. But the usual writ for issuing of the king's money out of the Exchequer was the *Liberate* (so called from that word used in it) directed to the treasurer and chamberlain. This writ was of two sorts: a *liberate* for paying a sum *hac vice* only, and a *liberate current*, or *dormant*, for paying in continuance, or more than once. The reader may see instances of these things in Madox's History of the Exchequer, ch. 6, 10.

KING STEPHEN

Imposes no regular taxes, but raises all monies by plundering and robbing.—Seizes on all his predecessor's, king Henry's, treasure.

treasure.—Raïses Danegeld, contrary to his solemn promise; and seizes on the treasures left by the bishop of Salisbury.

R E M A R K S.

The whole time that Stephen held the crown was one continued scene of blood and devastation; the government being quite unninged, and all brought into confusion, the sword decided all controversies, and taxes in general were raised by lawless oppression.

I. Having shewn, in the former reigns, how the money was paid in, and issued out of the Exchequer, it may not be amiss now to represent the particular branches of the royal revenue, namely, 1. The demesns of the crown. 2. Escheats. 3. Feudal and other profits, arising out of the demesns and escheats. 4. The yearly farms of counties and towns. 5. Fines and amerciaments. 6. Aids, scutages, tallages and customs. 7. Casual profits of divers kinds.

These particulars give great light to several parts of the English history. First, of the ancient demesns of the crown, it appears, at the time of the Conquest, and afterwards, the demesns lands were considerable for extent and income. Doom-day-Book shews what they were in the reign of Edward the Confessor, and serves to distinguish the king's demesns from his escheats, and other lands, and from the lands of other men.

II. The second branch of the revenue arose by escheats, under which term are comprehended not only those lands most properly so called, but those also which at sundry times after the Conquest became vested in the crown, either by devolution, forfeiture, seizure, or, perhaps, by some other title.

By the revenue-rolls of the Pipe of the reigns of Stephen and Henry II. (which, next to Doom-day, are the most ancient rolls of records now extant) and likewise by those of the next succeeding kings, we find the crown then in possession of several great honours, baronies, and lands, of that sort which are usually stiled honor, baronia, or terra of such a one, with the addition sometimes of *Quæ est in manu regis*, without expressing by what title they became vested in the crown. These great escheats were anciently committed usually, by the king to certain persons in ferm, or custody, who answered at the Exchequer yearly for the issues, or ferm thereof. Besides the greater fees, the lands of lower persons, and sometimes of hereditary offices and serjeantries, with the lands appertaining thereto, became forfeited to the crown.

As the king had the full dominion in all these escheats, after they had been long vested in the crown, they were hardly to be distinguished from the king's ancient demesns. About the latter end of king Henry the Second's reign, they began to form an escheatry, which, in subsequent times, was managed by officers called at first custodes escheatriæ, and afterwards escators: however some of the smaller escheats were usually holden by the sheriffs. When escheats came to the crown, the justices itinerant took care, within their several circuits, to have them seized to the crown, and put in charge to the sheriffs, and other officers, to the king's profit.

III. Some revenues likewise accrued to the crown from vacant bishoprics, and abbeys of royal foundation and patronage: for in ancient times, when such bishop or abbot happened to die, the king used to seize the temporalities into his hands, and receive the profits till the vacancy was filled.

KING HENRY II.

Lays a tax called escauge, or scutage.—Imposes scutage again, in the 5th year of his reign, and again in the 7th instant.—Obliges the Jews to pay a tallage or donum.—Lays two-pence in the pound upon all arable lands and wines; as also upon goods, houses, and employments, one year.—Lays a penny in the pound for four years after.—Raïses an aid for marrying his daughter, of one mark for each knight's fee throughout England.—Lays another scutage in his 18th year, and another in the 33d year.—Takes of the Jews a fourth part of their chattels, by way of tallage.—Levies a tenth throughout all his dominions.—Levies a tenth of all moveables in his 35th year.—Keeps the bishopric of Lincoln vacant 17 years, and six others for a long time, as well as 12 abbeys.—Keeps also the archbishopric of York vacant 10 years, and leaves behind him 900,000l.

R E M A R K S.

1. The two first branches of the royal revenue being spoken of already, namely the demesns of the crown and escheats, the third branch is the feudal, and other profits arising from thence, as reliefs; upon the death of his ancestor, every heir that held his lands by barony, or knights service, was obliged to pay a sum of money to the king, on his taking possession of the inheritance. These reliefs were at first uncertain, till Magna Charta, when an earl paid an hundred pounds, a baron one hundred marks, a knight, for one fee, five pounds.

Here it must be observed, that some baronies were much larger than others, and so of the knights fees. This difference

arose from the respective charters of the feoffment; for, if the king enfeoffed a man of forty knights fees, to hold by barony, or ten knights fees, to hold by barony, the tenure was barony in each case. So, also, if the king enfeoffed a man of twenty carucs of land, to hold by the service of one knight, or forty carucs, to hold by the service of one knight, the feoffee had, in each case, one knight's fee. For this reason, at certain times, a distinction was made between the baronies and fees of the old, and those of the new feoffment, the old being commonly larger than those of the new; notwithstanding this difference, the relief of the barony, or fee, whether it was greater or lesser, was the same. But when two baronies came to be vested in one man, he was charged with a relief for each.

IV. Another feudal profit was wardship and marriage. During the nonage of the heirs of the king's tenants in capite, the king could dispose of the custody and marriage of them to whom he pleased, which raised him a great revenue.

A fourth branch of the revenue, was the yearly farms of the counties. From the reign of king William I. the king used to let out the several counties, upon a yearly ferm or rent, or commit them to custody. The fermor, or committee, was usually stiled sheriff. Most, if not all the counties, as appears by the revenue-rolls, were thus lett at ferm in king Stephen's reign. When a county was lett for more than formerly, the improvement was called cremenentum, the increment; which was sometimes answered in palfreys, hawks, &c.

2. The yearly farms of the towns, burghs, and gilds. It is to be remembered, that from the time of the Conquest, the cities and towns were invested either in the crown, or the clergy, or the baronage. Some of these towns the king was possessed of, as part of the original inheritance of the crown, others by ancient escheat, just as his other lands. When the king was seized of a city or town in demesns, he was lord of the soil, viz. of all the land within the site and precinct thereof, of all the burgage-houses, sheds, stalls, and buildings, herbage, profits of fairs and markets, pleas and perquisites of courts; in a word, of all issues, profits, and appurtenances, of the city or town, of any kind, that was not alienated by himself or ancestors. For sometimes the crown thought fit to grant some part, or profit, to a private person or monastery.

Such a city or town was commonly stiled *civitas regis*, *villa regis*, *burgus regis*; and the men *homines* or *burgenses regis*. The yearly profit made by the king of his cities and towns, was paid him several ways. The issues of some were included in the general farms of the county where they lay, and were answered by the sheriff. Sometimes the king committed them to fermers, or custodes, distinct from the sheriffs. In a word, sometimes the king lett his town to the townsmen, at ferm for years, or in fee-ferm, that is, perpetual ferm for ever: since feodum, fee, was used in England, to signify a perpetual estate; it has been used to denote perpetuity in office and in rent. Thus inheritable offices have been rendered offices in fee.

When a town was put to fee-ferm, the tenure was burgage, particular burgage, tenements lying in the town, as well as the town itself, were said to be so holden. In process of time, most of the towns and burghs came to be lett to the respective townsmen or burgesses, at fee-ferm.

To the farms of the towns, may be referred the farms or yearly payments to the crown, by the gilds and mesters. The word gild signifies a company, society, brotherhood, by which last name the religious gilds were called, that were founded for devotion and almsdeeds, as the secular gilds were chiefly for trade and almsdeeds. These gilds could not be set up without the king's warrant. The gilds of goldsmiths, bochers, and others, were amerced in London to the crown as adulterine, in the reign of Henry II.

There was also in former times a secular gild, called *gilda mercatoria*, a merchant gild. From these gilds, perhaps, sprung the practice of gildating or embodying whole towns. In time, the several gilds of goldsmiths, salters, &c. were stiled corporations, or companies. All these gilds paid a yearly ferm to the king. As for the mesters, it is to be observed that this word has no relation to the word mystery, as if there was, it is vulgarly said, some mystery in every trade. For though mystery has been used for many years past for a craft, or occupation, the true derivation is from the Gallic *mistiera*, *mestera*, or *mestier*, signifying a trade. Thus we find in Edward III. the mistere of taylors, armourers, and others. The other three remaining branches of the revenue, will be given in the succeeding reign.

The pennies of the second Henry were the same in value as the foregoing, and they were also of different forms; such a regularity in this particular, as afterwards took place, not being yet established in the mints.

KING RICHARD I.

Levies a land-tax, in order for his expedition to the Holy Land.—Raïses money by fining severely those who were convicted of corruption.—Sells the whole county of Durham to the bishop for an immense sum.—Takes 1000 marks of the same bishop, to make him chief justice.—He raises a large sum

sum of the citizens of London; which was the price of their liberties, which he granted them at that time.—He makes a new GREAT SEAL, and raises money by renewing of old grants.—Imposes a tax of a fourth part of the revenues of all persons, both ecclesiastical and secular, for one year; and likewise a fourth part of all their moveables, and 20s. of every knight's fee, besides all the wools of the Cistercians, &c. and abundance of church plate.—He reassumes all his grants, and levies a tax of 2l. on every hide of land.—Raises 5s. on every hide of land.—Takes 2s. on every carucate of land, and raises 1,100,000 marks by his chief justice the archbishop of Canterbury, in two years.

R E M A R K S.

This sum of 1,100,000 marks is the only positive sum we hear of raised in this king's reign, all the others being nowhere expressed. The 1,100,000 marks amount to 753,332l. for the two years, that is, 376,666l. per ann. a sum then thought very grievous.

The next great branch of the revenue was, V. Fines, oblatas, and amerciaments of many kinds, in civil and criminal cases, and for the forests. It is surprising to see, how numerous the fines and amerciaments, appearing upon the revenue-rolls of the ancient times, were. As to fines for the profit, it suffices to observe, that by the revenue-rolls of Henry II. and Richard I. and king John, an ancient revenue was raised, by trespasses, defaults, purprestures, &c.

As to the fines in civil and criminal cases, they may be reduced to these three general heads; fines for liberties, fines in law proceedings, and fines of a mixed nature: But first, it may be observed, after a fine was preferred and accepted, if the party could not have the thing for which he was fined, he was then acquitted of the fine, in such like words, Sed non debet inde summoneri quia non habuit rectum nec habere potuit. However, a small fine was sometimes paid for such acquittal. When the party obtained the thing for which he fined, he was wont to have the king's charter made to him. If the party fining failed in payment of his fine, he could not have his charter for the thing desired.

When a fine was preferred and refused, if the party offered an addition, it was called *crementum finis*. 1. As for fines of the first sort, for grants and confirmations of liberties, franchises, and exemptions, there are numberless instances on the revenue-rolls. 2. The fines in law proceedings were likewise very numerous, and brought in a very considerable revenue. The several instances may be reduced to these heads: fines to have justice and right, fines for writs, pleas, trials, and judgments; fines for expedition, or speeding their right; fines for stopping, or delay of pleas, trials and judgments.

Sometimes the parties litigant preferred the crown a certain portion out of the debts which they recovered. Moderate fines for having justice were constantly paid, as well after the great charter as before. 3. Fines of a mixed nature. Many were made to hold or quit certain offices or bailiwicks, for divers licences, especially to marry, &c. Many fines were laid relating to trade or merchandize. Hither refer the fines and dimes, paid by merchants upon several occasions, of which hereafter. Besides fines for licences, there were others of divers kinds: as for the concord of a duel, for opening a mine, &c.—There were also fines for the king's favour, and to remit his displeasure.—For his protection and aid.—To obtain his mediation in his subjects affairs.—To have seizure or restitution of their lands or chattels, and that they might not be disseized.—That men might be discharged out of prison, or bailed to the custody of lawful men.—For acquittals in divers cases.—Concurrent fines were when the parties fined to obtain the same thing: counter fines, when they fined, the one for a thing, the other against it.—For respite of knighthood.

And, as it was usual to set amerciaments for not taking knighthood after summons, so the king often seized the lands of military tenants for the same reason.—The revenue arising from misericordia's or amerciaments, which in ancient times are scarce to be distinguished from fines. It is likely, however, there was some difference between them. For instance, it was called an amercement, after it was reduced to a certain sum, and a misericordia, both before and afterwards. When a misericordia was reduced to a certain sum, it was said to be admeasured or asseered, e. g. Warnius de quedic debet C. Marcas de misericordia, sed postea ammenfuratus fuit per iudiciarium et baronos ad LX marcas. Mag. Rot. 9 Joh.

By Magna Charta, earls and barons are not to be amerced, unless by their peers, and according to their trespass. It was frequent for some persons to be amerced for the defaults of others.—When general amerciaments were set upon hundreds, towns, &c. for murders, or the like, so much thereof as was charged upon lands, within the said hundred, &c. which the king held in demesne, was charged of course. Lands holden by the queen, and by several barons and lords of seigneuries, were free from common amercement. Barons of the Exchequer were exempt here from fees for their lands and tenants. Ecclesiastical fees were likewise exempt from the

same, and other persons by virtue of charters. Divers lords of seigneuries were, by charter, entitled to have to their own use the amerciaments arising within their seignury. However, the lords were to claim the same at the Exchequer, which is frequently done to this day. See Madox's History of the Exchequer, &c.

The next great branch of the revenue was, VI. Aid; scutages tallages, and customs. In former times the payments to the king were called by the names of danegelt, aid, donum, scutage, tallage, &c. and in succeeding times, subsidy, quinzime, vintime, &c. several of the former then continuing in use.—There were three sorts of aids due to the crown of common right, or by reason of seignury.—Aid to make the king's eldest son a knight, to marry his eldest daughter, and to ransom his person when taken in war. These aids were rendered by all persons, who held of the king in capite.—All the king's tenants were to pay aid, whether they held of the king immediately, by barony, or knight's service, or by serjeantry, with knight's service annexed; and by persons who held of the king immediately, either by rent service, socage, or other service, that was not military, whether they lived on the lands that were ancient demesne, or on honours and lands escheated to the king, and on lands of his wardships and purchases. King William I. took 6s. of each hide through England, king Henry I. 3s. as aid pur fille marier. But, for want of requisite notices concerning these aids, nothing distinctly can be learnt of their produce.

The first that gives any insight into these matters, is an aid levied by Henry II. for marriage of his daughter Maud, to the duke of Saxony, namely one mark per fee. It was paid by the several barons and knights, holding in capite, according to the number of their respective fees. For the due levying this aid, the barons and tenants in capite were commanded to certify to the king what fees they had, how many of the old, and how many of the new feoffment, and of whom the same were holden.—The fees of the new feoffment were small, and paid by 12s. per fee, when those of the old paid 20s. Several ecclesiastical persons, besides the aid for their fees rendered a farther sum, under the terms de promissione sua. Madox observes the same was paid also by laics, and therefore thinks, when paid by them it was a donum; and when by ecclesiastics, donum prelaturum. The vacant bishoprics and abbeys of royal foundation rendered aid, being reckoned among the escheats. It was also paid by the towns and manors, or lands, which the king held in demesne, and was assessed by the justices itinerant, or with their approbation.

King Richard I. levied an aid for the ransom of his person. It was paid by the tenants in capite, under the name of scutage, at the rate of 20s. per fee. Another part of this aid was answered at the Exchequer, by the name of hidage, or an aid charged on lands holden by other service, than that of the shield. The carucage paid for the same ransom, is also called an aid. Henry III. had an aid to make his son a knight, 40s. of every knight's fee. This aid was paid by tenants in capite, and to the king's tenants in capite, by such as so held of them, by knight's service. When tenants in capite paid aid to the king, he granted that they might receive aid pro rata of their tenants in capite.—The aid to make a son a knight, or for marrying a daughter, was not demandable from lands held either in frankalmoigne or socage. Besides these three noted aids, there were others. In the 5th of Stephen an aid was paid to the crown by the burghs and towns. This seems to have been a yearly payment. An aid of the like kind was rendered at this time also, as it seems, by the counties, assessed by the justices itinerant. Richard I. took 5s. out of every caruc, or hide of land, through all England. In process of time the word aid came to be used in a large indefinite sense, and there came into use a new word, subsidium, which was rarely used in the more ancient times. A subsidy was granted to Edward II. for his war with Scotland. It is called a donum. The city of London paid 2000 marks. Besides the general aids, or those extending through the whole kingdom, there were certain ones imposed upon the denesne, escheats, &c. of particular counties and places, for certain purposes relating thereto. An aid by way of hidage, was laid on Devon and Cornwall, for the siege of the isle of William de Marisco. Inferior lords of seigneuries had their tenants, the three notable aids, to make his son a knight, marry his eldest daughter, and to ransom his person. They had also of their tenants other occasional aids, as to enable them to pay their relief for feizin, or other fine, and also to pay their debts. This was done by the king's letters patent, directed to the tenants. But these were only letters of request. For it is provided by king John's charter, that the king should not, for the future, grant leave to take an aid of his freemen, save in the three cases above-mentioned.

As king Richard I. reigned almost ten years, it can hardly be doubted but he must have coined some money in that time, and that it was of the same sort and value as that of his predecessors, and of his immediate successor. It is reasonable also to think, that the king's long absence out of England, his expedition to the Holy Land, his captivity, and the large

furns paid abroad for his ransom *, together with his wars in France after his release, must have occasioned great scarcity of money at home, and small coinages during all the time of his reign.

* King Richard's ransom to the emperor, was settled at 150,000 marks of silver, after the Colonia weight; and of these 100,000, being all he could then get raised, were carried over by the queen-mother in person, and at once paid down before he could obtain his liberty. An immense sum for that age, amounting to no less than 194,000 l. sterling of our present silver money.

KING JOHN

Takes a seventh part of the moveables of all his subjects.—Raises two marks and a half on every knight's fee.—Seizes on all the temporalities of the clergy.—Tortures the Jews in order to extort money from them.—Takes an escuage of two marks per fee.—Has an aid from the prelates.—Fines the city of London in 1000 l.—Lays a tallage upon the Jews of Bristol.—And lays new exactions upon the people every year of his reign, but three.

REMARKS.

Having spoken under the preceding reign, of the revenue arising from AID, we proceed to scutages and tallages. Escuage, or scutage, was a service arising out of baronies and knights fees. It denoted the service of the shield, and was rendered for every knight's fee, the service of one knight; for every half fee, the service of half a knight; and so in proportion. Baronies were charged after the like manner, according to the number of knights fees whereby the barony, by its original enfeoffment, did consist. This service of scutage was performed either personally in the king's army, or by pecuniary commutation.—These escuages, pro exercitu, were wont to be paid by the king's tenants in capite, by knights service.—A man might hold of the king in capite, either by barony or by knights service, or by serjeantry, socage, or fee-farm; consequently, it is a mistake made by some great men, that a baron and a tenant in capite was all one: for though every baron, properly so called, was a tenant in capite, yet every tenant in capite (there being some of half, or quarter, or a tenth part of a knight's fee) was not a baron. The first scutage, says Alexander de Swereford, was assessed 2 Henry II, for the army of Wales, 20 shillings for each knight's fee, and only upon those prelates who were bound to military service.—The second scutage, says he, was for the same, 5 Henry II, but assessed not only upon the prelates, but others, according to the number of their fees: this scutage is intitled de dono. He observes, that the donum of the prelates makes a sum answerable to the number of fees held of the king in capite, and therefore a real scutage: this was two marks per fee.—In the 18th of Henry II, the escuage of Ireland came to be put in charge. To this several are charged under this title, as the escuage of knights who did not go into Ireland, nor send any knights or money.

As escuage was rendered for fees holden of the king in capite by knights service, ut de corona, so it was rendered for fees holden of honours, and escheats, which were in the king's hands, and for fees holden of the lands purchased by the king, and for fees holden of the king's wards: for the tenants holding of the king's wardships and escheats, were immediate tenants of the king, whilst they rested in him. It is to be understood, that in general, escuage was paid according to the sum that was assessed; suppose at the rate of one, two, or three marks for each fee. Yet it was something doubtful of how many knights fees a man or his ancestors were enfeoffed, consequently, what sum he was to pay for escuage.—This frequently happened in the case of ecclesiastical persons, by reason of the antiquity of their endowments, so that the form of their enfeoffment could not be easily known in succeeding times, and because it was many times doubtful whether they held some of their lands by barony and military service, or in frank-almoigne.—In the case of other persons, some honours or baronies consisted of more knights fees than others did, and some fees were larger than others; inasmuch that it was doubtful, whether a man held by barony, or knight's service, whether by the service of one knight's fee, or of more, or of how many knights fees.—On the other hand, some knights fees were remarkably small; such were the fees of the honour of Moreton. As escuage was paid out of knights fees, so there were also some serjeantries paid the same. Escuage-money was in lieu of personal service: but personal service was required more strictly, if not solely of the tenants holding by knights service in capite ut de corona.

If the barons and knights holding in capite did not go in person with the king in his army, they sometimes sent knights in their stead, and sometimes made fine with the king. As the lord who held of the king in capite by knights service, paid escuage for his knight's fee, so the servants of such lord who held the same fees by knights service, paid escuage to their lord, according to the quantity of their tenure. The tenant paid escuage to their lord, to enable him to pay escuage to the king, or reimburse him when he paid it.

Having thus given a general idea of escuage, we shall briefly speak of Danegeld, which was different from either aid, escuage, or tallage. It was first set on foot in the Anglo-Saxon times: however, it continued many years after the Conquest. In the reign of Henry I, in the year 1114, it was paid throughout the kingdom. In Stephen's reign it was accounted for in every county, as if it were a settled yearly revenue, which, however, is matter of doubt.—The famous author of the Dialogue concerning the Exchequer, seems to have thought it a yearly revenue before, but not after the Conquest. It may be traced by the rolls to the reign of Henry II, though it does not appear to be paid in the latter part of his reign, nor in those of Richard I. and John.

Tallage and custom we shall describe in the succeeding reign.

Pennies, half-pennies, and farthings, were coined by king John in Ireland, where it should seem his principal mint was.

KING HENRY III.

Levies 15 scutages, and innumerable other taxes.—Takes a fifteenth of all moveables.—Levies a scutage of three marks per fee on all baronies, and a fourth of all moveables.—Seizes the treasure of his late chief-justice Hubert.—Levies a thirtieth of all moveables.—Raises 20,000 marks of the Jews at one time, and another heavy ransom soon afterwards; inasmuch that, to omit others, Aaron of York alone paid 4 marks of gold, and 4000 marks of silver. The king received the gold of every Jew, whether man or woman, with his own hand; the silver was received by others.—He also extorted gifts from the abbots and priors, in such manner, that, if what they offered did not please him, he rejected it, and they were obliged to enhance their offering, rather than incur his displeasure.—Anno Dom. 1244, the lords spiritual and temporal (for no mention is yet found of any commons) granted to the king, for marrying of his eldest daughter, 20 shillings scutage of all that hold of the king in capite.—Extorts by his own authority, from the Londoners, 15,000 marks.—Fines all that had incroached upon his forests.—Again compels the Londoners to pay 1000 marks tallage, and demands further new years gifts of all the wealthy citizens.—He fines Walter Clifford 1000 marks.—He compels the Londoners again to pay 1000 marks.—The clergy grant the king a tenth of all the church revenues for 13 years, for his journey to the Holy Land.—They again grant him 42,000 marks.—He arbitrarily fines the citizens of London.—Imposes tallages on the Jews, the one of 20,000, another of 60,000 marks, raises an aid for maintaining his eldest daughter.—Receives divers sums for their knights fees, of several bishops.—Has a vintisme granted him.—Has an aid to marry his sister.—Likewise another to make his son a knight.—Levies a scutage of two marks upon each knight's fee.—Has two shillings on every carucate in England.—Levies a tax of the fifteenth of all moveables and chattels.—Levies the same again the ensuing year.—Again extorts from the Jews a third of all they have.—Compels the Jews again to ransom themselves at 20,000 marks.—Takes a tenth of all the church revenues for three years.—Takes away forcibly the money deposited at Durham.—The Londoners again compelled to purchase their peace, at the price of 20,000 marks.—A thirtieth penny levied through all England, for the prince's expedition to the Holy Land.

REMARKS.

There were two sorts of tallage, one paid to the king, the other to a subordinate lord. That raised to the king was on his demesns, escheats, and wardships, and on the burghs and towns of the realm. When it was paid out of knights fees, it was scutage; when by towns and burghs, tallage; when out of lands not of military tenure, it signified hidage. So that the general word donum signified, according as it was applied, either aid, scutage, or tallage.

Tallage was called assissa, as well as donum, the former signifying, among other things, an assessment. Those manors were properly talliable to the king which he had of his own hands. Hence tallages are stiled, commonly, Tallagies maneriorum & terrarum regis quæ tunc erant in manu ejus, Tallagi à dominicorum, and the like. Under the terms Quæ erant in manu ejus, were comprehended the king's escheats and wardships, the king holding them tanquam in dominico. In fact, the king's escheats and wardships were wont to be tallaged, when tallage was assessed upon his demesns. Some serjeantries, also, of an inferior kind, and such as had no military service annexed to them, were wont to be tallaged with the king's demesns; but the king's serjeantries were not to be tallaged without a special precept. Those who were not the king's immediate tenants were tallageable, not to the king, but to their immediate lord. When a town was tallaged, the same was raised upon the men of the town who belonged to the gild, and made merchandize in the town. If the king granted away a demesne manor or town (that was wont to be tallaged) una cum tallagis hominum, then such manor or town became tallageable to the grantee.

To the head of tallage (or to that of aid) may be referred the none, disme, quinzime, vintisme, trentisme; which were so called

called from the quantity or proportion of the payment, as their names import. The form of taxes, and levying the nones, &c. with the oaths taken by the taxers, and the commissions of the collectors, are to be seen upon the revenue-rolls. In thescaves, the goods of the chief taxers were to be taxed by the treasurer and barons of the Exchequer, and the robes and sociates of the citizens and burgesses were not usually taxed with their other goods and moveables. Tallage was wont to be assessed upon the men of the demesns and towns, sometimes in gross, in communi; sometimes by poll, per capita, or per singulos; at other times partly one of those ways, and partly the other. If the assessors of tallage over-rated any man, he used to obtain a writ formed upon his case, directed to the barons of the Exchequer, who, by virtue thereof, would relieve him, according to equity. Sometimes men were admitted to compound for the tallage imposed on them, by a fine to the king. As the king had tallage of his demesn-men, so some subordinate lords had tallage of theirs. These latter tallages were most seigneurial. — As the king had divers ways of raising money upon his demesn-men, so inferior lords dealt with their demesn-men after the like manner.

We proceed to the revenue arising by customs. — It was anciently called *consuetudo & custuma*: the former signified regal, episcopal, and other ecclesiastical dues, or payments, and exactions of many kinds. There was a custom or duty paid to the king for wines, called *prifa*, and *recta prifa*: the proportion was one dolium before the mast, and another behind it. *Prife*, indeed, sometimes signified captures taken in war, sometimes for purveyance, impost, or capture of other kinds. In ancient times, the duty for wines called *prifa*, was received for the king's use by divers officers. Besides the custom paid the king for wines, there were other duties payable to him by merchants, or traders, for their merchandizes imported or exported, and for commodities conveyed along the river Thames. The duties paid by merchants were anciently called *disme*, *quinzime*, &c. the duty paid for trafficking along the Thames, at least one fort of that duty, was called *avalagium Thamisiæ*. In the 6th of king John, William de Wrotham, and others, accounted for the quinzime of merchants at the several ports of England, except Len. The quinzime of London was 836 l. &c. of Boston, 780 l. &c. of Len, 651 l. &c. of Southampton, 712 l. &c. *Avalage* was a sort of toll. To these may be added, the duties paid to the king's chamberlain of London, for his use, the duties arising at Billingsgate, and by tonnage, &c. The 9th of Henry III, Andrew Buckeral and John Travers had *Ripa Reginæ*, or *Queen-Hithe*, in ferm, at 40 l. per annum. In process of time, the king's customs came to be generally called *custuma*. The 26th of Edward I, there was payable to the king for customs, for every sack of wool exported from Len, half a mark, for every 300 pelles lanute half a mark, and for every last of leather one mark. Customs were appointed for Len, and other parts, as Newcastle, Kingston upon Hull, Bristol, London, &c. If merchants defrauded the king of his customs, they forfeited their goods uncustomed. — The VIIth branch of the royal revenue was the casual revenue, which accrued to the king several ways: of this sort were treasure-trove, waif, wreck, chattels of fugitives and felons, of outlaws, usurers, recreants, persons executed, &c. The king had, in some cases, the lands of persons condemned, for a year and a day after condemnation. If felons died after the fact, and before conviction, his chattels were not, by the common law, forfeited to the king. By the ancient revenue-rolls it appears, that, in those times, many branches of the king's revenue were embraced with alms for pious uses; to which may be added the *decimæ constitutæ*. These the accountant constantly paid out of the revenue. Divers orders of monks had these yearly alms, or *decimæ*. Several petitions also were wont to be paid to certain of the king's servants, when disabled by age or sickness, viz. a penny, three halfpence, two pence a day.

When persons made fine to the king, they paid to the queen, besides, a duty called *aurum reginæ*, which her majesty sometimes respited, or discharged the debt, at pleasure: for every 100 marks paid the king, the queen had one more of gold.

Having thus touched upon the several branches of the royal revenue, we shall conclude this reign with a succinct account of the exchequer of the Jews. The king of England was wont to draw a considerable revenue from these people residing in this realm, by tallage, and fines relating to law-proceedings, by amerciaments for misdemeanors, and by fines, ransoms, compositions, which they were forced to pay for the king's protection, for licence to trade, for discharges, for imprisonment, and the like. He would tallage the whole body at pleasure, and compel them to answer the tallage for one another. The king seemed to be absolute lord of their estates and effects; of their persons, their wives and children. They were a numerous body (being settled chiefly in the great towns of the realm) and by traffic, usury, and mortgages, they became very wealthy, both in money and land; but, as they sinned the subjects, so the king sinned them. The

VOL. II.

place appointed for the management of the revenue of Judaism, was a part of the great Exchequer, where they had their records, wherein the writs and proceedings of the Judaism were entered; and summonses were issued out of the exchequer of the Jews for the king's debts, like as out of the great Exchequer. There was also a wardrobe of the Judaism, near the exchequer of the Jews. Certain persons were assigned to be curators of this revenue, who were usually styled *custodes & iusticiarii Judæorum*. The Jewish characters, as those of other men, were called *chartæ* and *chirographa*; some of which were a kind of releases, others obligations to the Jews by others. The chirographers were, in ancient times, commonly Christians and Jews, acting together, though afterwards Christians only, and were planted in towns where there was a considerable number of Jews, as at London, Oxford, &c. If a charter made to a Jew was lost, or could not be found in the chest at the Exchequer, it was usual for the Jew to whom it was made, when he was satisfied the money was due upon it, to make an acknowledgement in the Exchequer, by way of release to the party. The having one part of the Jewish chirographs deposited in the king's treasury, was chiefly to prevent the falsity of the Jews, and to enable the king to recover the estates and credits of the Jews, and to get them into his coffers, whenever they should become, as they often did, forfeited, or devolute to the crown.

By the assize of the Judaism, the Jews might have a moiety of the lands, rents, and chattels of their Christian creditors in execution, till they were satisfied for the debt due to them. The Jews paid relief for their lands and for their chattels. A Jew's wife might have dower, or thirds, out of her husband's credits and chattels. In the 37th of Henry III. it was provided, that no Jews should remain in England without doing the king some service: that there should be no school for Jews in England, except in places where such schools were wont to be in king John's reign: that every Jew should be answerable to the rector of his parish for all parochial dues chargeable on his house: that no Christian should suckle the child of a Jew, nor any Christian man or woman serve any Jew or Jewess, nor eat with them, or abide in their house: that no Jew should have secret familiarity with a Christian woman, nor any Christian man with a Jewess: that no Jew or Jewess should eat or buy fish in Lent: that every Jew should wear a badge upon his breast: that no Jew should enter into any church or chapel, unless in passing to and fro: that no Jew should hinder another, who was willing to turn Christian: and that no Jew should be suffered to abide in any town without the king's licence, except in such where Jews were formerly wont to reside. — These articles were to be observed by the Jews, under pain of forfeiting their goods. Clause 77 Hen. III. m. 18.

Though the exchequer of the Jews was, to some purposes, distinct from the great Exchequer, yet both the exchequer of the Jews, and the acts and proceedings of the justices and chirographers of the Jews, were subject to the controul of the chief justiciary, and treasurer and baron of the Exchequer. The debts due from Christians to Jews were subject to such orders as the king thought fit to make. Sometimes the king would grant respite for the payment of such debts, and sometimes would discharge the debts thereof. In general, the king was wont to use the Jews with great severity when refractory, and shewed them favour when obedient.

King John, in the second year of his reign, granted a charter of liberties to the Jews of England and Normandy, which the curious reader may see in Madox's History of the Exchequer, page 74. Henry III, for the support of such Jews as embraced the Christian religion, and were destitute of livelihood, founded a house at London, called *Domus Conversorum*, and endowed it with a competent revenue.

Although the Jews were permitted to settle in several populous towns, they were not welcome to the inhabitants. In the year 1290 (18 Edward I.) the growing or renewing revenue of Judaism, and the exchequer of the Jews, ceased, the Jews being, about that time, expelled out of England; but, by their expulsion, many estates, both of lands and chattels, came into the king's hands.

KING EDWARD I.

Edward, Henry III's son, succeeding to the crown, imposed the first year a tallage per capita, appointing commissioners to see it levied. — The next he took a tenth from the clergy, exiling all usurers, under confiscation of goods, and corporal imprisonment. — Of the Jews he levied for tallage 5000 marks, the year succeeding. — In the fourth year he taxed his subjects at one-fifteenth, and the Jews at 5 d. per head a tallage. — A tallage through Wales he assessed the sixth year, and 40 s. scutage the next. Communia 7 Edward I, 40 s. he took of every knight's fee. — On the Jews he again imposed 12,000 marks for redemption of their usury. — The next year he searched all the religious houses, and took to his use the money and plate. — The lords by themselves, without the commons, assessed for the king, the 18th year, such a levy as king Henry III. raised for marriage of his daughter. — In the 12th the king charges the clergy with a tenth, for six succeeding

succeeding years.—The abbies are again seached in the 22d, and the lands of the priors aliens seized into the king's hands.—The nobility grant him the fifteenth penny.—The Jews are obliged to pay yearly 3d. poll-money.—A tenth is granted throughout England, for the relief of the Holy Land.—He forces Lewellyn, prince of Wales, to buy his peace at 50,000l. in silver, and 1000 marks a year.—Takes 40s. upon each fee scutage.—Quits all claim to Normandy for 30 Parisian livres a year, &c.—A fifteenth of spiritual goods are granted to him by the clergy.—He takes up money by way of loan, for his war against the Welch.—He takes 50 marks for each knight's service.—Has the thirtieth penny granted by the people, upon all moveables, horses, armour, treasure, and apparel excepted.—Seizes on the treasure granted for relief of the Holy Land.—Takes 40s. scutage upon every knight's fee.—Imprisons all the Jews till they pay him 12,000l. Seizes on all the money deposited in monasteries.—Has an aid granted him for his wars in Gascony.—Has a tenth of all spiritual profits granted for one year.—The fifteenth penny granted for expelling the Jews.—A fifteenth of all goods granted for the relief of the Holy Land.—The tenth of all the temporals of religious persons granted by the pope.—The fifteenth of all temporals and spirituals granted.—Causes all the money in monasteries to be brought to London, &c.—Seizes into his hands all religious houses that were subordinate to foreign chapters.—Compels all the English prelates to pay him half of their spiritualities and temporalities.—The laity grant him a tenth of all their goods.—The bishop of Bath and Wells obliged to buy his peace, by paying 2000l.—Receives the seventh penny of his boroughs and demesns, for carrying on his wars.—The common fort of the laity grant him the twelfth penny of their estates, and the burgesses the seventh penny.—The clergy refuse him any aid, on pretence of an order from the pope to the contrary.—He seizes the temporalities of the clergy.—They grant him a tenth of their spiritualities and temporalities the next year. Has the fifteenth penny granted by the laity, for sealing Magna Charta.—Has the thirtieth penny granted by the clergy and laity.—Has a subsidy of a twentieth granted to him.—Has a thirtieth granted by the laity, and a twentieth by the clergy.—Banishes the Jews, and seizes their effects.—Receives the ninth penny of the people, the tenth of the clergy of the province of Canterbury, and the fifth of those of York, for confirming MAGNA CHARTA and CHARTA FORESTA.—Receives divers advantages from certain silver mines found in Devonshire.

R E M A R K S.

The reader is to observe, that the history of the royal revenue under the foregoing reigns is all matter of fact, taken from the revenue-rolls, and other records, and confirmed by Mr Madox, in his History of the Exchequer, and other good authorities.

The Exchequer was a court greatly concerned in the conservation of the prerogatives, as well as of the revenue of the crown. The authority and dignity of this court was esteemed so great, that the acts thereof were not to be examined or controuled in any other of the king's ordinary courts of justice. The Exchequer was a great repository of the king's records. Edward I. is supposed to be the first of our kings that perfectly fixed the standard of our coin. In the third year of his reign, the matter was thus ordered by Gregory Rockley, then mayor of London, and mint-master, That in a pound of money there should be 11 two-pence farthings, pure leaf-silver, and only seventeen pence half-penny farthing alloy; and this pound was to weigh 20 shillings and three-pence in account, each ounce two-pence, and every penny 24 grains and a half.

In 28 Edward I. an indented trial-piece, of the goodness of old sterling, was lodged in the Exchequer; and every pound weight Troy of such silver was to be shorn at 20 shillings and three-pence; according to which, the value of the silver in the coin was one shilling and eight-pence farthing an ounce. The king sent for foreign mint-masters, in the 18th year of his reign, to inform him of the manner of making and forging money. For the coining this money, the mint-masters had 30 furnaces in London, eight at Canterbury (besides three the archbishop had there) 12 at Bristol, 12 at York, and more in other great towns; in all which places the same hammered money of silver, supplied by the king's changers, who, according to certain rites prescribed them, took in the clipped, rounded, and counterfeited monies, to be recoined, and bought gold and silver of the merchants, to be fabricated into new monies; at the same time it was ordained, 'Quod proclāmetur per totum regnum quod nulla fiat confusa de nova moneta sub periculo vitæ & membrorum, & amissionis omnium terrarum & tenementorum, &c.'

This hammered money continued through all the reigns of succeeding kings and queens, till about the year 1663. There are no indentures with the mint-masters, by which one can certainly judge of the proportion of the fineness and alloy, to be observed in the fabrication of the monies till the reign of Edward III, as will be seen hereafter.

The pennies, half-pennies, and farthings of Edward the 1st are pretty common.—In his 7th year he made a great reformation in the money, and several new regulations, as we have seen, for the better trying and preserving of his coin. It was now made more uniform than it had been, the names of the several monies were omitted, and only the name of the town or city where coined, preserved on the reverse.—In his 28th year, as observed, an indented trial-piece, of the goodness of the old standard, was lodged in the Exchequer; and every pound weight of the Tower of such silver was then to be shorn at 20 shillings and three-pence; whereby the weight of the penny was to be somewhat less than 22 Troy grains and a quarter, and 240 such pennies of full weight, making 20 shillings, or a pound sterling in tale, were to contain as much silver as, in our present coin, is of the value of 57s. 5d. nearly. See a table of English silver coins, by Martin Folkes, Esq; 1745.

KING EDWARD II.

Has two subsidies granted him.—Imposes two shillings over and above the ancient custom.—Has a tenth granted him by the pope of church revenues for one year.—Has a great subsidy granted him by the temporality, and 5d. in the mark of the clergy of the province of Canterbury, and 4d. of those of York.

R E M A R K S.

The further account of the business of the Exchequer may be disposed under three general heads: 1. Affairs of the revenue. 2. Causes. 3. Business of various kinds. Under the first of these may be included fines imposed of divers kinds, and amerciaments. It was the business of the treasurer and barons to speed the levying and getting in the king's debts, and manage the crown revenue to the best advantage.—Under the second head we take in pleas and causes. After the separation of the Common Pleas from the king's court, it was forbidden, by the great charter, and a subsequent ordinance, to hold common pleas in the Exchequer: yet some were, and the king gave leave sometimes for particular persons to bring their suits there; in which the king granted preference to one person, that he should be paid, in the adjudication, before other creditors. Under the third head, of business of various kinds, may be placed conventions and recognitions made in the Exchequer, and the admission of officers. See Madox for these particulars.

We come now to the accounts of the Exchequer. As the sheriffs were the most considerable accountants to the crown, the method of accounts at the Exchequer may be best learned from them. The sheriffs generally accounted from Michaelmas to Michaelmas. Edward I. ordered, that the sheriffs should be escheators in their respective counties; the stated accounts were rendered regularly in course every year. In general, accountants were obliged to come in person, to render their accounts; if by attorney, it was by the king's leave, and afterwards by warrant from the treasurer, chancellor, or barons, or one of them. Accounts were rendered upon oath, or by their faith or allegiance. Where one was indebted to the king, and also to another person, the former was to be preferred in payment. No debtor to the crown could make a will, to dispose of his chattels to the king's prejudice.—If doubtful whether the deceased's effects would satisfy the crown debt, the king seized the chattels.—If the debtor was unable, to satisfy the debt, the king betook himself to those who were indebted to his debtor. The heir of the king's debtor was not to be distrained for the debt, in case the chattels of the debtor were sufficient to answer it.—The widow of the king's debtor was not to be distrained by her dower, to answer the debt, in case the heir could answer it: neither were sureties to be distrained, so long as the principal debtor had wherewithal to answer the debt.—By ancient usage the king's debtors, or accountants, were wont to have writs of aid to recover debts of such as were indebted to them, to enable them to answer the king's debts.

If an accountant did not render his accounts, or in due manner, he was punished by seizure of land, and amerciaments, or committed to the Marshalsea or Fleet Prison, or the Tower of London.—When the Chancery was separated from the Exchequer, and the charters, writs, and precepts of the great seal came to be entered by themselves in the charter-rolls, patent-rolls, &c. about the beginning of king John's reign, then commenced the method of sending estreats from the Chancery to the Exchequer. If these estreats were not brought in due time, writs were issued to the persons or justices before whom they lay, to bring them in.

Tallies were of a great and constant use in the Exchequer: the word is French, and signifies cutting. These tallies were pieces of wood, cut in correspondence. A stick, or rod of hazel, or other wood, well seasoned, was cut square and uniform at each end; and in the shaft, the sum of money which it bore was cut in notches in the wood, by the tally-utter, and likewise written upon two sides of it. The tally was cleft in the middle by the deputy chamberlains, thro' the shaft and the notches: a notch of such a largeness signified

fied Ml. of another largeness Cl. &c. It being thus divided, one part of it was called a tally; the other a counter-tally, or a tally and a foil: however, these were in effect one tally, or two parts of one thing: and, if they were genuine, they fitted exactly: their use was to prevent fraud: they had a superscription for what purpose given.

Counters were sometimes used at the Exchequer, in the way of computation: in which case they were laid in rows upon the several distinctures of the chequered cloth, viz. one row for pounds, another for shillings, &c.

The principal officers of the superior Exchequer were, the two remembrancers, the engrossers of the great roll, the usher, the constable, the marshal, the auditors, the clerks of the estreats. See Madox for a description of their respective duties.—We shall conclude with a few instances only of the allowance made to several ministers of the receipt of Exchequer for their liveries and corrodies, and other necessaries. In 9 Hen. III. the liveries of the ministers of the Exchequer for fourscore days, from the feast of St Michael, 'till Monday next after the feast of St Lucius, were: to three scribes, c.s. to the two knights of the chamberlains, viii marks; to John de Windefore, liii l. to John the fufor, or melter, ii marks and a half; to Simon Druel, ii marks and a half; to the four tellers, liii l. to the vigil, and for light, x s. for a hutch to lay up the memoranda, vii d. for rods for the tallies, v s. for parchment for the use of the chamberlains, and the chief-justice's clerk, liii s. for ink, during the whole year, iii s. for litter for the chamber of the barons, and house of receipt, xii d. for necessaries for the said chambers, xx d. for ten dozen of hutches, xx s. for wax, ii s. for leather for the tallies, ix d. for a hutch to put the inquisitions in, ii d. for the marshal's hutch, xii d. for a sack to put the allowed tallies in, xliii d. for carrying and recarrying the hutches, v s. for a tonel to put in the d marks, fods to the king at Oxford by R. bishop of Chichester, xii d. for locks, bolts, and other small expences, liii s. Total, xxiv l. xliii s. viii d. Ex pelle recepte de anno 9 Hen. III. Kot. ult. indorfo pen. Thef. & Camer.

King Edward the III's pennies, halfpennies, and farthings, were the same with those of the king his father, and are not with certainty to be distinguished from them. The common opinion, which gives those pieces with EDW. to the first Edward, and all those with EDWA. or EDWAR. to the second, is at most but a probable conjecture; and should it be allowed that all those of the first sort, which are by far the most plentiful, were really struck by the first king of the name, who certainly coined a great deal more money than his son, we should still be at a loss for arguments to prove, that he did not coin some of the others also: to which I shall only add, that I have seen some of these pennies of the last sort, upon which the letters were braced into one another, much like those on the pennies of king Henry III. and which therefore seem to have been minted but little after his time.

KING EDWARD III.

Imposes tallage through all his domains.—The people grant him the fifteenth penny, and the cities, boroughs, and clergy, one tenth.—Has 40 s. of English merchants for every sack of wool, and 60 s. of strangers.—Seizes on all the effects of the merchants of Lombardy, then in London.—The laity grant him one half of their wool.—The lords in parliament grant him the tenth sheaf of corn of their demesns, the tenth fleece of wool, and the tenth lamb for two years.—The commons give him 30,000 sacks of wool.—The parliament grant him the ninth of all grain, of wool, and of lambs.—They again confirm the said grant.—The clergy grant him a dime for three years.—Two fifteenths given him, and 40 s. of every knight's fee.—The parliament grants three fifteenths, to be paid in three years.—Has the subsidy of wool granted for three years.—The same granted for six years, at 50 s. the sack.—They grant 26 s. 8 d. for three years on every sack of wool.—They grant 36 s. 8 d. for two years on every wool-pack.—They grant 43 s. 4 d. for three years, &c.—The king seizes the lands of religious aliens.—The clergy grant him 50,000 l. and the laity as much.—Has two fifteenths granted him.—The parliament again grant the subsidy of wool for three years.—The lords and commons grant him a poll-tax, of 4 d. per head for every one above 15, beggars excepted.—The king borrows great sums of the clergy, and of every county in England.

R E M A R K S.

By a charter-mint to the abbot of Reading, it seems that there was not any greater piece of money coined, 'till after the 12th year of Edward III. than a penny. The first pennies, halfpennies, and farthings, of king Edward III. were the same as those coined by his grandfather and his father; and we know of no alteration that he made in the coin, 'till his 18th year, when 22 s. 2 d. and his 20th year, when 22 s. 6 d. were ordered to be coined out of the pound Tower of old sterling silver; by which last regulation the weight of the penny was brought down to 20 Troy grains, and the pound

sterling or 240 such pence of full weight, contained as much silver as is now coined into 51 s. and 8 d.

In the 27th year of this king, were first coined groffes or groats, running for four pence each, with half groffes, and sterlings or pennies, 75 of those groffes being coined out of the pound Tower: from whence the weight of the groffe appears to have been 72 Troy grains; and the silver contained in 20 s. or in 60 such groffes of full weight, was the same in quantity, as what is now contained in 46 s. and 6 d. of our present money.

KING RICHARD II.

Has two tenths granted him for one year.—Has a mark granted him on every sack of wool for one year.—Has a subsidy granted him to be laid on the great men of the land, that the commons might be spared.—Has another subsidy granted him,—and another, which occasions Wat Tyler's rebellion.—Has 2 s. granted him upon every ton of wine.—Has a subsidy granted him by the merchants.—Has a moiety of one fifteenth granted him by the temporality, and soon after a moiety of a tenth by the clergy.—Has another half of one fifteenth of the laity, and a half of one tenth of the clergy.—Has one tenth of the clergy, and one fifteenth of the laity.—The parliament gives him 40 s. on every sack of wool.—One half of one tenth, and half of one fifteenth, given to defray the charges of an embassy.—The king would borrow 1000 l. of the Londoners, but was refused.—Again half of one tenth and half of one fifteenth given to defray the charges of an embassy.—The clergy give the king one tenth conditionally.—The clergy again give a tenth, and the laity one fifteenth.—The king obtains half of one tenth of the clergy.—Borrows great sums of the chief of the clergy, and the laity.—Two fifteenths and two tenths granted him.—A subsidy of wools and staple were granted him.—Another subsidy granted him.—One fifteenth and a half granted out of cities, &c. and a dime and a half within.—The subsidy of wools and staple wares again granted conditionally.—One fifteenth and one tenth granted by the lords and commons.—The same granted by the laity.—Two fifteenths granted conditionally.—Half of one tenth, and half of one fifteenth granted.—A subsidy of wool-fkins, wool-fells, &c. granted.—Subsidies granted for three years conditionally.—A dime, and half, and one fifteenth and a half, granted conditionally.—A subsidy granted for three years, with half a dime, and half a fifteenth.—The lords and commons grant the king a subsidy of all staple ware during life, with one dime and a half, and one fifteenth and a half.

R E M A R K S.

In the 18th of Richard II. a pound weight of gold of the old standard was to make by tale 45 nobles, amounting to 15 l. or a proportionable number of half or quarter nobles: and a pound weight of silver of the old sterling, to make by tale 75 groffes or groats, amounting to 25 s. or 150 half groffes, or two pence a-piece, or 300 sterlings at a penny a-piece, or 600 half sterlings: he coined groffes, half groffes, sterlings, and half sterlings, together with farthings also.

KING HENRY IV.

Receives an aid of the moiety of all fees, &c.—Receives subsidies for kerfies.—The lords and commons grant one dime, and one fifteenth, &c.—A subsidy of wools, &c. granted for three years.—Two dimes, and two fifteenths, &c. granted conditionally.—One dime and one fifteenth, &c. granted conditionally.—One dime and half, with one fifteenth, &c. granted conditionally.—The same subsidies granted again conditionally.—The king receives a tenth of the clergy.—He receives a subsidy of 20 s. on every knight's fee.—Exacts half a mark of every stipendiary priest and friar mendicant.—Imposes tonnage and poundage every year of his reign but two.

R E M A R K S.

Henry the IVth coined groffes, half groffes, sterlings, and half sterlings, or mailles; the same as those of his predecessor, as also farthings. By an act of parliament in his third year, it was ordered, 'That one third part of the money of silver that should be brought to the bullion should be made into halfpennies and farthings:' and by another act in his 13th year, it was directed, 'That by reason of the great scarcity of money at that time in the realm of England, the pound Tower might from the feast of Easter then next following be coined into 30 s. by tale.' By which regulation the weight of the groat was brought down to 60 Troy grains, and the pound sterling, consisting of 60 such groats, was to contain so much silver only, as in our present coined money is of the value of 38 s. and 9 d.

This new money being of the same weight as that of the two following reigns, is probably so blended amongst it, as not to be now distinguished: nor are we indeed certain, that we rightly know the coins of Henry V. and Henry VI. from each other.

Henry IV. by the indenture of his third year, contracted, That

REV

That a pound weight of gold of the old standard was to make by tale 45 nobles, amounting to 15 l. or a proportionable number of half or quarter nobles: and a pound weight of silver of the old sterling, to make by tale 75 groffes, or groats, amounting to 25 s. or 150 half groffes, going for two pence a-piece; or 300 sterlings, going for pence a-piece; or 600 half sterlings, or halfpence, called here mailles.

KING HENRY V.

Receives tonnage and poundage all his life.—Has a subsidy granted him.—Has two tenths granted by the clergy.—Has another tenth granted by the clergy, and a fifteenth by the laity.—Has six times whole tenths and fifteenths.—Has two tenths from the clergy, and one from the laity.—Pawns his jewels, even those of the crown.

REMARKS.

King Henry V. and VI. coined groffes, half groffes, sterlings, mailles, and farthings; the same as the last of king Henry IV. the groffes weighing, as has been before said, 60 Troy grains each.

In the 9th of Henry V. a pound weight of gold of the old standard, was to make by tale 50 nobles, or 100 half nobles, or 200 quarter nobles, amounting to 16 l. 13 s. and 14 d. in tale. And a pound weight of the same old standard, was to make by tale, 90 groffes or groats, or 180 half groats, or 360 sterlings, or 720 mailles, or 1440 farthings, amounting to 30 s.

KING HENRY VI.

Receives a subsidy of staple ware, with tonnage and poundage, &c.—He again receives tonnage and poundage.—Has one tenth and one fifteenth.—Again, he has one tenth and one fifteenth, and one third part of both.—Has half one tenth, and half of one fifteenth granted.—A subsidy of 6 d. in the pound on all lands and offices.—Also one tenth and one fifteenth and a half.—One tenth and a half of one fifteenth, excepting 2000 l. to certain poor towns; and the same excepting 6000 l. to relieve certain wasted towns.—A subsidy of wools granted, 33 s. 4 d. the sack of denizens, and 53 s. 4 d. of aliens.—Half of one tenth, and half of one fifteenth of the laity, &c.—A subsidy of 12 d. in the pound on all freeholds, copyholds, and offices, under 2000 l. and 2 s. for all above the sum.—One tenth and one fifteenth, with tonnage and poundage, and a subsidy of wools, &c. during the king's life.

REMARKS.

In the first year of Henry VI. a pound weight of gold of the old standard, was coined into 45 rials of 10 s. or a proportionable number of half rials, and quarters, or farthing rials, at 5 s. and 2 s. 6 d. By the same indenture, instead of nobles and half nobles, were coined 67½ to the pound, angels, at 6 s. 8 d. or a proportionable number of angelets, at 3 s. 4 d. Consequently, the pound Troy was coined into 22 l. 10 s. by tale.—By the indenture of the same first year of Henry VI. the silver money was of the old standard, 112 groats to the pound, making in tale 37 s. 6 d. as a proportionable number of half groats, sterlings, halfpence, and farthings.—They were most coined at London, but there were other mints at York, Bristol, and Dunwich, Dublin, Canterbury, and at York, with the keys.—By indenture, the 4th of this reign, the value of gold was brought down again to 16 l. 13 s. 4 d. and the silver to 30 s.—By another indenture of the last year of this reign, it was raised again to 37 s. 6 d. and so continued for near 50 years.

KING EDWARD IV.

Refuses the grants of former kings.—Gains an immense sum by attainders.—Has an aid of 37000 l. granted out of counties, cities, &c.—Has two tenths and two fifteenths from the laity, except 12,000 l.—Has another tenth and fifteenth, except 6000 l.—Has a tenth and one fifteenth, and 51,117 l. for the pay of archers, &c.—Has a tenth and one fifteenth of the laity, except 6000 l.—Has a yearly subsidy upon all strangers, granted by parliament.—Has a benevolence of the clergy, and another of his people.

REMARKS.

By an indenture of the 4th of Edward IV. a pound weight of gold of the old standard, was to make by tale 20 l. 16 s. 8 d. and a pound weight of silver old sterling, was to make 37 s. 6 d. By other indentures of the 5th, 8th, 11th, 16th, and 22d of the same king, a pound weight of gold of the old standard, was to make 45 nobles, going for 10 s. a piece, or 90 half nobles, or 180 quarter nobles, or 67½ of the pieces impressed with angels, going for 6 s. 8 d. each, and consequently was coined into 22 l. 10 s. by tale; and the silver monies were shorn at 37 s. 6 d. the pound weight Troy.

KING EDWARD V.

Has no taxes raised in his name.

REV

KING RICHARD III.

Levies but one tax, which was a tenth, granted by the clergy of both provinces.

REMARKS.

That Richard III. coined money, appears by an indenture, whereby he contracts for the coinage both of gold and silver, of the same value and denomination with the money of the 5th of Edward IV.

KING HENRY VII.

Refuses the grants of most offices made by Richard III.—Assesses one aid upon land.—Has the one tenth penny out of goods and lands.—Has three tenths and five fifteenths, besides one tenth and one fifteenth, arising to 120,000 l.—Takes three subsidies, whereof the last was not above 36,000 l. and one benevolence, the proportion of every alderman being 300 l. and the entire sum of the city of London 9688 l. 17 s. 4 d.—Has twice the tenth of the clergy, and 25,000 l. by way of subsidy, and of them and the commons two loans, the city of London rated at 6000 l. the other not definite in proportion, but so assessed as the commissioners and the lenders could agree.—Has two tenths and one fifteenth, and a subsidy.—Advances the tonnage to 3 s. and the poundage to 12 d.—Has a voluntary gift* of all his subjects in his 7th year, and imposes an aid at the pope's request.—Raises an immense sum, by putting the penal† laws in execution.

* The way of free gift, or benevolence, we have seen practised before, and particularly by king Edward IV.; and though it appears, as it were, voluntary, yet it always carried with it some sort of compulsion, either through fear of being ill looked upon, and the more severely treated upon any occasion that should offer, or in hopes of finding favour in pretension; for fear and hope are the two prevailing inducements to do those things, which otherwise we are not inclined to. Many at this time were very generous in supplying the crown at the expence of others, not out of any affection, or because they thought it necessary, but because they were, in some shape, well paid for oppressing their neighbours.

† Henry VII. being excessively avaritious, his advisers, Empson and Dudley, practised every art of oppression of this kind to satiate his thirst after money. It appeared that many penal laws and pecuniary statutes, had long lain unregarded and disused, and thought obsolete, though not repealed, and still in the same force as they had ever been. When enquiry came to be made into the observation of such laws, it appeared that there were very few considerable persons but what had some way transgressed against them, and consequently were liable to the fines and mulcts imposed by them. When first this course was taken, it went on smooth enough, small penalties being imposed; which being legal and not too heavy, made little noise. Soon after the tweets hereof appearing, those offences were more narrowly looked into, and more grievously fined; by which means, together with the sale of offices, and dispensing with the laws, he raised an immense sum to the unspeakable detriment of his subjects.

REMARKS.

King Henry VII. coined the same pieces, and of the same weight, as those of Edward IV. and Richard III. He first placed upon his money the arched or imperial crown, with a globe and cross on the arch, like that used by our princes at this day. This king did also, about the 18th and 19th year of his reign, make a great alteration in the form of his coin, upon which his head was now represented crowned, but in profile, and with a good resemblance of his other pictures: whereas the heads of all our former kings had constantly been drawn in front upon their money, ever since the time of king John.

It appears, by an indenture of the 9th of Henry VII. that a pound weight of gold of the old standard, was coined into as many, and the same pieces, as in the 5th of Edward IV. The gold coins of Henry VII. were a sovereign, half sovereign, rial, half rial, and quarter rial, angel, and half angel. His silver money was groats, half groffes, or two-penny pieces, pennies, halfpennies, and farthings.

KING HENRY VIII.

Takes, within the compass of 34 years, three tenths, four fifteenths, and six subsidies of the commons, whereof that anno 4 amounted to 160,000 l. and that in anno 7, to 110,000 l.—Tonnage he had, and poundage once for a year, and afterwards for term of life.—Of the clergy he takes seven tenths, four tenths by one grant, and three by several, every of them not less than 25,084 l.—Of subsidies, he had one of the province of Canterbury, another of both; the stipendiary ministers thereto being taxed according to the rates of their wages.—Anno 22, they granted a moiety of all their goods and lands, payable by equal portions in five years, every part arising to 95,000 l.—Adds 150,000 l. a year to the revenues of the crown by the ruin of popish monasteries and charities, &c.—Has divers benevolences and loans from the clergy and commons.—Demands a contribution from his people

people, which he calls an annual grant.—He obtains a large revenue by the dissolution of popish monasteries, abbeys, and the alienation of the church-lands, belonging to that system of ecclesiastical tyranny and oppression; which, 'till this period, made the princes as well as the people too subservient to their dominion. This laid the foundation of Protestantism, and that liberty, which we at present enjoy in this kingdom, and which is the most invaluable of all terrestrial blessings, if Britons are but wise enough not to abuse so glorious a privilege, which myriads of the human species are deprived of, by the wiles and artifices of designing priests, who act in concert with the civil tyrants of the earth to enslave mankind, and keep them in ignorance of their true spiritual as well as their temporal interests. The favourers of ecclesiastical dominion have thought this cost the church too dear: but can any price be too great, for what is inestimable?

R E M A R K S.

The first silver coins of king Henry VIII. were groats and half groats, of the same weight and form as the last pieces of those denominations coined by the king his father. By indenture of the 1st and 23d of Henry VIII. a pound weight of gold of the old standard, was to be coined into 27l. by tale; viz. into 24 sovereigns, at 22s. 6d. a-piece, or 48 rials at 11s. 3d. a-piece, or 72 angels at 7s. 6d. a-piece, or 81 George nobles at 6s. 8d. a-piece, or 162 forty-penny pieces at 3s. 4d. a-piece; and a pound weight of gold, of the finest of 22 carats only, was to be coined into 100 crowns and a half of the double rose, or 201 half-crowns, making by tale 25l. 2s. 6d.; and a pound weight of silver of the old sterling, was coined into 135 groats, or 270 half-groats, or 540 sterlings (or pence), or 1080 halfpence, or 2160 farthings; so that every pound weight of sterling silver was coined into 45s. by tale.—In the 34th of this reign, a pound weight of gold, of 23 carats fine, and one carat allay, was coined into 28l. 16s. by tale; by which indenture there were coined sovereigns at 20s. a-piece, half sovereigns at 10s. angels at 8s. and quarter angels at 2s. a-piece; and a pound weight of silver of 10 ounces fine, and 2 ounces allay, was coined into 48s. by tale, viz. into testoons, which were 12d. a-piece, groats, half groats, pence, halfpence, and farthings.—In the 36th of this reign, a pound weight of gold, of 22 carats fine, and 2 carats allay, was coined into 30l. by tale, viz. into 30 sovereigns at 20s. a-piece, or 60 half-sovereigns at 10s. a-piece, or 120 crowns at 5s. or 240 half-crowns: and the king had 2 carats of fine gold for coinage, which yielded him 50s. Silver was coined by the same indenture 6 ounces fine and 6 ounces allay, into 48s. by tale. It was coined into testoons, groats, half groats, pence, halfpence, and farthings.—In the 37th of this reign, a pound weight of gold of 20 carats fine and 4 carats allay, was coined into 30l. by tale, as in the last; and the king had 4 carats, which yielded him 51. 2s. And a pound weight of silver, of 4 ounces fine and eight ounces allay, was coined into 48s. by tale; which raised the pound weight of fine gold to 36l. and the pound weight of fine silver to 71. 4s. The gold coins of Henry VIII. are sovereigns, rials, half sovereigns, angels, George nobles, half and quarter angels, 40-penny pieces, crowns, and half-crowns: and the silver coins, testoons, groats, half groats, sterlings, halfpence, farthings; to which may be added crown pieces of silver, which were coined by this king.

KING EDWARD VI.

Has an aid granted by parliament of 12d. in the pound for three years, on the goods of his natural born subjects, and 2s. in the pound of strangers.—Has 3d. granted on every ewe, and 2d. on every wether kept in pastures, also 1d. on every sheep on the common.—Has 8d. in the pound on all woollen cloth for three years.—Has a subsidy and two fifteenths.—Has tonnage and poundage for life.—Has six fifteenths of his lay subjects, and three subsidies of both clergy and laity.

R E M A R K S.

The tonnage and poundage said above to have been given to this king for life, was thus: of every ton of wine 3s. Of every ton of sweet wine 3s. over and above the aforesaid 3s. that is in all 6s. Of every aulne of Rhenish wine 12d. The poundage was 12d. in the pound of the value of all goods imported or exported; and 12d. in the pound over and above the aforesaid 12d. to be paid by merchants aliens, for all tin and pewter by them exported: excepting out of this subsidy all manner of woollen cloth of English make to be exported, and all manner of wool, wool fells, and hides, and backs of leather exported, and all manner of wines, fresh fish, and cattle imported.

The subsidy from wool was 33s. 4d. of every sack of wool, and for every 240 of wool-fells, 33s. 4d. and for every last of hides and backs 3l. 6s. 8d. For every sack of wool exported by strangers, 3l. 6s. 8d. and for every 240 of wool-fells, 3l. 6s. 8d. and for every last of hides and backs, 3l. 13s. 4d.

The subsidy granted by the clergy in the second year of this

V O L. II.

king's reign, was of 6s. in the pound, according to the value of every spiritual promotion.

The relief granted by the laity in his third year, to continue for the space of three years, was, of every person worth ten pounds or upwards, in money, goods, cattle, &c. 12d. in the pound. And of every alien worth 20s. and under 10l. 12d. for every pound.

Thus it appears, that this king, though he took as much as he could from churches of what his father had left, yet the kingdom saved nothing by it, the taxes being laid every year of his reign, and for his life.

By indentures of the 1st and 2d of Edward VI. a pound weight of gold of 20 carats fine and 4 carats allay, was coined into 30l. by tale, out of which the king had a great profit; and a pound of silver, of four ounces fine and eight ounces allay, was coined into 48s. after which rate, every pound of fine silver made in current money 71. 4s. and the king's profit on every pound weight was 4l. 4s.—In the 3d year of this king, a pound weight of gold 22 carats fine, and two carats allay, was to be coined into 34l. by tale, into sovereigns 20s. a-piece, half sovereigns at 10s. a-piece, crowns at 5s. and half-crowns at 2s. 6d. a-piece: and a pound weight of silver, six ounces fine and six ounces allay, was to be coined into 72s. which were to go for 12d. a-piece by tale; of which the merchant, for every pound weight of fine silver, received 3l. 4s. and the king above 4l. gain.—In the 4th year of this reign a pound weight of gold of the old standard, of 22 carats and 3 grains and a half fine, was coined into 28l. 16s. by tale, viz. into sovereigns at 24s. a-piece, half sovereigns at 12s. angels at 8s. and half angels at 4s. a-piece.—In the 5th of this reign, a pound weight of silver of 3 ounces fine, and 9 ounces allay, was coined into 72s. at 12 a-piece; and the merchant received, for every ounce of fine silver which he should bring to the mint, 10s. of such money; by which means, 12 ounces of fine silver was exorbitantly raised to 14l. 18s.—In the 6th of this reign, a pound weight of gold, of the old standard aforesaid, was coined into 36l. by tale, viz. 24 sovereigns at 30s. a-piece, 72 angels at 10s. a-piece, or 144 half angels: and a pound weight of crown gold of 22 carats fine and 2 carats allay, was coined into 33l. by tale, viz. 33 sovereigns at 20s. a-piece, or 66 half sovereigns at 10s. a-piece, or 132 crowns, or 264 half crowns: and a pound weight of silver, consisting of 11 ounces one pennyweight fine, and 19 pennyweights allay, was coined into 3l. by tale, viz. 12 crowns, or 24 half-crowns, or 60 shillings, or 120 sixpences, or 240 three-pences, or 720 pence, or 1440 halfpence, or 2880 farthings.

In king Edward the VIth's journal, still preserved in the Cotton library, written with the king's own hand, and printed at large by bishop Burnet in his History of the Reformation, is the following passage. '1551, 6 Sept. Deliberation concerning the coin. Memorandum, that there were diverse standards, nine ounces fine, a few, eight ounces fine, as ill as four, because, although that was fine, yet a shilling was reckoned for 2 shillings, 6 ounces, very many 4 ounces, many also 3 ounces, 130,000l. now of late.' From which words I collect, that in this reign, besides the monies of four ounces fine, 6 ounces fine, and 3 ounces fine, which are all that are mentioned in the indentures and commissions that we know of; there were also some others of 8 ounces and 9 ounces fine; and that in the monies of 8 ounces fine in particular, one shilling was of no more value than another only of four ounces fine, as being of only half the weight, though it was as fine again. Now as the shillings of four ounces fine were, by the table of the weight of 120 grains each, the others of 9 ounces fine and 8 ounces fine, and which were of the same value, must have weighed 53 grains and one third, and 60 grains respectively. If therefore, among the shillings we have of the first five years of this reign, there are really such found as agree sufficiently with these weights, we may reasonably conclude, that such shillings are of the standards above mentioned, and that they are some of the above pieces to which the king alludes in the above-cited passage of his journal.

It was found by experience in this reign, that gold and silver had, by the common consent of all people throughout the civilized parts of the world, acquired certain real and proper values: and that in such a nation as this, not destitute even then of all commerce with strangers, it was impossible that the arbitrary value set upon pieces of base metal could, for any considerable time, supply the want of the silver that used to be contained in the pieces of the same denominations.

Whatever names were given to these pieces of base metal, or by whatever authority their imaginary value was supported, the people would either not bring their provisions at all to the markets to exchange them for such money, or would there sell them at much higher rates than before; as the nominal sums they received for their goods would not now purchase them the same conveniences elsewhere, as the same nominal sums of better money had formerly done. It was therefore judged absolutely necessary, to reform and amend the coin; the affair was very seriously considered, and the work was undertaken and carried on with so much diligence

and vigour, that within a few months a reformation of the money was brought about, truly memorable, and no less remarkable than the former abuses of it had been: for the new pieces that were coined before the end of this year, 1551, were of more than four times the value of those of the same denominations, that had been coined in the former months of the same.

It is observable from the king's journal, that on the 6th of May this year, 'the teftoon was cried down from 12d. to 9d. &c.' And this seems to have been the first step that was taken towards the amendment of the evil: by which I should only understand, that it was that day resolved to make such a reduction in the value of present money, without either then carrying it into immediate effect, or even fixing the day when that intended reduction should first take place. For we find that it was not 'till the 2d of July following, that 'there was a proclamation signed for shortening of the fall of the money to that day; in which it should be proclaimed and devised, that it should be in all places of the realm within one day proclaimed:' and accordingly we read, that there was, on the 9th of the same month, 'proclamation made, that a teftoon should go at 9d. and a groat at 3d. in all places of the realm at once.' The same particular is also recorded by Mr Stowe in his Chronicle, who tells us, 'That on the 9th of July, the base monies coined in the time of king Henry VIII. and king Edward VI. were proclaimed, the shilling to go for 9d. the groat for 3d. which took effect immediately after the proclamation made:' which cannot, however, be properly understood of all the base monies of king Henry VIII. but of those only of his 37th year, and which were of the same value as those of the first four years of king Edward VI. Although this reduction of the coin was necessary, and that it proved in the end beneficial, yet were very many great sufferers by it at the time. The people naturally looked upon it as the real loss of a full fourth part of whatever cash they had by them*; and, indeed, the price of things to be bought, could not immediately follow the new rate of the money. They were also greatly apprehensive of the further changes that might still be intended, and of the manner in which they might yet further be affected by such changes: in much that upon their discontents it was thought necessary to have, on the 19th of the same month of July, 'another proclamation made for punishment of them, that would blow rumours of abating and enhancing of the coin, to make things dear withal.

- * Bishop Fleetwood, in his *Chronicon Preciosum*, p. 57. observes, that he had then by him, 'an account of that time, wherein, by the first proclamation, dated July 9, a college lost out of 118l. 6s. 11d. 29l. 11s. 8d. ob. q. And by the second proclamation, dated August 17, immediately following, out of 45l. 3s. the college lost 15l. 1s. which was a 4th and a 3d part of every one's cash, in the space of two months.'

There was, however, a further reduction of it within a month; for on the 17th of the following August, 'the teftoon was cried down from 9d. to 6d. the groat from 3d. to 2d. the 2d. to 1d. the 1d. to an halfpenny, the halfpenny to a farthing:' and this second reduction is also taken notice of by Mr Stowe in his Chronicle, where he says, that on the same 17th of August, 'the shilling which of late was called down to 9d. was called down to 6d. the groat to 2d. the half groat to one penny, the penny to one halfpenny.'

About this time also proposals were made to the king and council concerning the new money to be from henceforward coined: and it seems to have been agreed on the 6th of September, that the new pieces should be minted of silver ten ounces in the pound weight fine, which it was thought might then be done without any further great loss, as the teftoons were already reduced to the value of only six pennies each. For it was judged that a pound weight of teftoons, 6 ounces in the pound fine, added to another pound weight of those four ounces fine, would together furnish a pound of bullion ten ounces fine: and again, that a pound weight of the teftoons of 8 ounces fine, together with two ninth parts of a pound weight of those of 9 ounces fine, and which were fewer in number than the others, would, in like manner, without further loss, furnish a pound of bullion also ten ounces fine. But it was further intended that the new pennies, halfpennies, and farthings, should still be coined of silver, only four ounces in the pound fine: and that, as it was apprehended, there would arise a considerable profit to the king; that profit would serve to pay the extraordinary charges of this recoinage, and to make good the loss that might arise from the want of a sufficient number of the teftoons of nine ounces fine, as also the loss upon such of the coins, particularly upon many of those of six ounces fine, as were supposed to have been really made baser than their appointed standards.

We learn also from the king's journal, that the lords of the council having had all the several sorts of the base money assayed before them at London, on the 20th of the same Sep-

tember, the king himself being then at Windsor, they had found that the several sorts of teftoons, which were apprehended to have been coined baser than even the several indentures and commissions allowed, were really better than was expected, and that they had severally answered to their respective valuations: and that further, upon taking of the several pieces mixed together as they run, they had found that 400 pounds in tale, reckoning the teftoon at six pennies, did truly contain as much silver as was sufficient to coin 400l. in tale of new money, as heavy, or heavier, than the last, and of the goodness of 11 ounces fine in the pound weight*. Whereupon they reported the same to the king, on the 22d, and then it was concluded that the teftoon should be 11 ounces fine, the proportion of the pieces according to the gold; so that 5s. of silver should be worth five of gold.

- * The lords at London having tried all sorts of stamping, both of the fineness of 9, 8, 6, 4, and 3, proved that, without any loss but sufferable, the coin might be brought to 11 ounces fine: for whereas it was thought before that the teftoon was, through ill officers and ministers, corrupted, it was tried that it had the valuation, just by eight sundry kinds of melting; and 400l. of sterling money, a teftoon being but 6d. made 400l. 11 ounces fine, of money sterling. King's Journal of the 20th of September, 1551.

On the 24th of the same month it was 'agreed, that the stamp of the shilling and the six-pence should be, on one side, a king painted to the shoulder, in parliament robes, with the chain of the order. Five shillings of silver, and half five shillings, should be a king on horseback, armed with a naked sword, held to his breast. As also, that the fine monies should be coined at the mints in the Tower, and in Southwark; and the small pieces of a baser standard, at Canterbury and York.'

On the 1st of the next month of October, 'The commission for the making of five shillings, half five shillings, groats, and six-pences, 11 ounces fine; and pence, with half-pence and farthings, four ounces fine, was followed and signed.' So far the king: and we further learn from Mr Stowe, that the pieces themselves were accordingly published and proclaimed on the 30th of the same month. But by the indentures made immediately after with the masters and workers of the several mints, it appears that these finer coins were really 11 oz. 1 dwt. fine, or only 1 dwt. worse than the old standard; and that the pound weight Troy of such silver was then agreed to be cut into three pounds by tale, in crowns, or pieces of 5s. half-crowns, shillings, half-shillings, quarter-shillings, pennies, half-pennies, and farthings: according to which regulation, the crown-piece was to weigh an ounce Troy, and the shilling 96 grains: and the pound sterling, consisting of four of these crowns, or 20 of these shillings, was to be intrinsically worth about 6d. $\frac{2}{3}$ more than 20s. of our present coin.

In this indenture, fine silver is valued at 5s. 5d. the ounce nearly; and whereas, in the gold coin directed by the same, fine gold is valued at 3l. the ounce, it follows that what was then thought the true proportion of the value of gold to that of silver, was the proportion of 11 to 1. See GOLD.

QUEEN MARY

Has tonnage and poundage for life.—[The subsidy of tonnage was thus: of every ton of wine coming, or that shall or is come into this your realm by way of merchandize, the sum of 3s. and so after that rate. And of every ton of sweet wine, as well Malmsey as other, 3s. over and above the 3s. afore-granted; and of every auline of Rhenish wine, 12d. The other subsidy, called poundage, was of all manner of goods and merchandizes of every merchant, denizen, and alien carried out of the realm, or brought into the same, by way of merchandize, of the value of every 20s. of the same goods and merchandizes, 12d. and of every 20s. in value of tin, and pewter vessels, carried out of the realm by any and every merchant alien, 12d. over and above the 12d. afore said.] Out of this act of subsidy is excepted all woollen cloth made in England, and all wool, wool-fells, and hides and backs of leather, carried out, and all wines, and fresh fish and bestial, coming into the realm.—At the same time was granted another subsidy, of all manner of wool, wool-fells, and leather, carried out of the realm; that is, of every merchant denizen, for every sack of wool, 33s. 4d. and for every 240 wool-fells, 33s. 4d. and for every last of hides and backs, of every merchant denizen, 3l. 4s. 8d. and also of every merchant stranger, as well as those already made denizens, or that shall be made denizens, for every sack of wool, 3l. 6s. 8d. and for every 240 wool-fells 3l. 6s. 8d. and also for every last of hides and backs, 3l. 13s. 4d.—She has also a subsidy of 6s. in the pound granted by the clergy, in consideration of what the had given up to the church before. The universities of Oxford and Cambridge were exempted from this subsidy.—Has 8d. in the pound granted by the temporalities, with certain exceptions.—Has a subsidy of 8s. in the pound, granted by the clergy

clergy of the province of Canterbury, to be levied in four years, that is, at 2s. in the pound every year.—Has a subsidy granted by the temporalities.—Has a subsidy granted of 2 s. 8 d. in the pound, on every person spiritual and temporal, worth 5 l. and 5 s. 4 d. of every alien.—She has likewise 4 s. in the pound on the lands and real effects of natives, and 8 s. of aliens.—This bigoted, cruel, and vindictive queen, attempted to undo all that had been done towards the Reformation.

REMARKS.

By an indenture of the first of Queen Mary, a pound weight of gold, of the old standard, was coined into 36 l. and a pound weight of silver, 11 ounces fine, was coined into 3 l. by tale. The gold coins of this queen are, sovereigns, at 30 s. half-sovereigns, at 15 s. angels, at 10 s. and half-angels, at 5 s. a piece.

QUEEN ELIZABETH

Has likewise the first-fruits and tenths invested in the crown.—Has 2 s. 8 d. in the pound granted by parliament on moveable goods, and 4 s. on land.—Seizes on several religious houses.—Has tonnage and poundage granted for life.—Has a subsidy and two-fifteenths from the temporality.—Has 6 s. in the pound granted by the clergy.—Has a subsidy and two-fifteenths from the temporality.—Has a subsidy of 4 s. in the pound from the clergy.—Has 1 subsidy, 1 fifteenth, and 1 tenth, from the temporality.—Has a subsidy of 6 s. in the pound from the clergy.—Has two-fifteenths, and 1 tenth, and a subsidy, from the temporality.—Has 6 s. in the pound from the spirituality.—Has three-fifteenths and tenths, and one subsidy, from the temporality.—Has 6 s. 8 d. in the pound granted by the clergy.—Has another subsidy and two-fifteenths from the temporality.—Another subsidy of 6 s. in the pound from the temporality.—Two subsidies of 6 s. in the pound from the clergy.—Two subsidies and four-fifteenths from the temporality.—A tax laid on every parish, for the relief of sick, wounded, and maimed soldiers.—Has two subsidies of 4 s. in the pound granted by the clergy.—Has three subsidies, six-fifteenths and tenths from the temporality.—Another tax for the relief of soldiers and mariners.—Three subsidies granted by the clergy. Three subsidies, and six-fifteenths and tenths, granted by the temporality.—Another tax for the relief of the poor.—Four subsidies of 4 s. in the pound granted by the clergy.—Four entire subsidies, eight-fifteenths and tenths, by the temporality.

REMARKS.

By an indenture of the 2d of Elizabeth, a pound weight of gold, of the old standard of 23 carats 3 grains and a half fine, was coined into 36 l. by tale: namely, into 24 sovereigns, at 30 s. a piece, or 48 rials, at 15 s. or 72 angels, at 10 s. a piece, or 144 half-angels, at 5 s. a piece. And a pound weight of crown gold, of 22 carats fine, and 2 carats alloy, was coined into 33 l. by tale: namely, 33 sovereigns, at 20 s. a piece, or 66 half-sovereigns, at 10 s. a piece, or 132 crowns, at 5 s. a piece, or 264 half-crowns. And a pound weight of the old sterling silver, viz. 11 oz. 2 dwts. fine, and 18 dwts. alloy, was coined into 3 l. by tale, of half-shillings, groats, quarter-shillings, half-groats, three-half-penny pieces, pence, and farthings.—In the 19th of her reign, a pound weight of gold of the old standard was coined into 72 angels, at 10 s. a piece, 144 half-angels at 5 s. a piece, or 288 quarter-angels, amounting in tale to 36 l. And a pound of old sterling silver into half-shillings, three-pences, three-half-penny, or three-farthing pieces, to make 3 l. by tale.—And in the 25th, into 60 s. or into 3 l. by tale.—In the 26th, a pound Troy of old standard gold was coined into 48 nobles, at 15 s. a piece, or 24 double-nobles, at 30 s. a piece, making 36 l.—In the 35th year of this reign, a pound weight of gold, of 22 carats fine and 2 carats alloy, was coined into 33 sovereigns, at 20 s. a piece, or 66 half-sovereigns, or 132 crowns, or 264 half-crowns, making 33 l. by tale.—In the 43d, the pound weight of old standard gold was coined into 73 angels, at 10 s. a piece, or 146 half-angels, or 292 quarter-angels, making 36 l. 10 s. in tale; and the pound weight of gold, of 22 carats fine, and 2 carats alloy, into 33 sovereigns and an half, at 20 s. a piece, or 67 half-sovereigns, or 134 crowns, or 268 half-crowns, making 33 l. 10 s. in tale; and the pound weight of old standard silver into 3 l. 2 s. by tale; viz. into crowns, half-crowns, shillings, six-pences, two-pences, pence, and half-pence.

The corruptions which the last year of Henry VIII. had brought into the English money, were not quite rooted out till queen Elizabeth's reign; but her first business was to mark all the best pieces either with a greyhound, portcullis, lion, harp, rose, or fleur-de-lis. Her gold coins, as appears from the foregoing indentures, were sovereigns, half-sovereigns, or rials, nobles, double-nobles, angels, half-angels, pieces of an angel and a half, and three angels, crowns, and half-crowns.

An account of all the monies of gold and silver coined in the time of queen Elizabeth, with the true value thereof in current money.

Coined in sterling silver money in the mint in the tower of London, from the year 1558 to the year 1572, in the time of Tho. Stanley and T. Fleetwood, undertreasurers, in weight 549,644 lb. 18 dwts. making, at 3 l. the pound weight	1,648,932 2 6
More from 1572 to 1581, in the time of John Lonifor, master and worker, in weight 255,338 lb. 2 oz. 8 dwts. 7 grs. making, at the same rate	766,014 12 0 1/2
More from 1581 to 1601, in the time of Sir Richard Martyn, master and worker, in weight 670,331 lb. 2 oz. 10 dwts. making, at the same rate	2,010,993 12 6
More from Septem. 1601, to 31 March, 1603, in the time of the same masters, in weight 63,860 lb. 7 oz. making, at 3 l. 2 s. the pound weight	198,060 16 2
Coined in March 3 Eliz. in Irish monies, of 11 oz. fine, in weight 2977 lb. making, at 3 l. the pound weight	8,931 0 0

The whole sum of sterling silver coined in the queen's time, was in weight 1,542,181 lb. 8 dwts. 7 grs. making, in money 4,632,932 3 0 1/2

Coined in base Irish money, in March 3 Eliz. of 3 oz. fine silver, and 9 oz. of alloy, in weight 19,828 lb. worth, in sterling money 15,541 10 3 1/2

More of the like base money, in the time of Sir Richard Martyn, in weight 89,844 lb. 10 oz. 15 dwts. worth, in sterling money 70,105 9 2 1/2

So that the whole value of the silver money coined in the queen's time, amounted to 4,718,579 2 8 1/2

Coined in fine gold money, in the mint in the Tower of London, from 1558 to 1601, in weight 12,201 lb. 8 oz. 22 gr. which made in current money, at the rate of 36 l. the pound weight 439,260 2 9

More from 1601 to 1603, in weight 35 lb. 4 oz. 17 dwts. 8 grs. which made in current money, at 36 l. 10 s. the pound weight 1,292 6 0 1/2

The sum total of all the fine gold coined in the queen's time, was in weight 12,237 lb. 18 dwts. 6 grs. and made in current money 440,552 8 9 1/2

Coined in crown-gold money in the mint in the Tower of London, from 1558 to 1601, in weight 10,086 lb. 3 oz. 18 dwts. 17 grs. which made in current money, at 33 l. the pound weight 332,848 16 5 1/2

More from 1601 to 1603, in weight 643 lb. 10 oz. 8 dwts. 21 grs. which made in current money, at 33 l. 10 s. the pound weight 21,737 3 1 1/2

The sum total of all the crown-gold coined in the queen's time, was in weight 10,730 lb. 2 oz. 7 dwts. 14 grs. and made in current money 354,585 19 7

And the true value of all the gold and silver money coined in the time of queen Elizabeth, amounted to 5,513,717 11 1 1/2

REMARKS.

Queen Elizabeth is celebrated by our historians for the restoring of the old standard of the coin in her silver monies, and no less for the abolishing and recoinage of the base monies minted in the times of her father and brother; in which, however, she can only be said, with truth, to have given the last finishing to a work already brought near its perfection: for king Edward, as we have observed, had reduced the base money nearly to the intrinsic value, and coined down the greatest part of it, into money very little inferior in goodness, and not at all inferior in weight, to any that has been minted since.

We shall here give an account of this matter in the words of the old chronicle of Raphael Hollinshed, with whom Stowe and Camden perfectly agree.

‘The queen's majesty, by advice of her most honourable council, meaning to abolish all corrupt, base, and copper monies then current in the realm of England, coined in the times and reigns of king Henry VIII. and king Edward VI. to the great hindrance and decay of the commonwealth of this realm, and therewith to restore to all her subjects fine and pure sterling monies, both of gold and silver, to the great

great honour and benefit of the whole realm; published a proclamation on Michaelmas even before noon, that the trestoon, coined for twelve-pence, should now forthwith, that of the best sort marked with a port-cullis, be current for four-pence half-penny; the second, marked with the grey-hound, for two-pence farthing; the third and worst sort, not marked as afore, not to be current at all, nor received for any value: the groat to be current for two-pence, the former piece of two-pence for a penny, &c. It was not long after this, but that her grace restoring to her subjects fine sterling money, called all the said base and corrupt coins into her majesty's mint, allowing to them therefore, after the rate before mentioned, so much of the said fine monies as they brought in of the said base monies.

The following proclamation also shews what care was taken of the coin in this reign.

A proclamation issued at Richmond, the 12th of October, 29 Eliz. intitled, A proclamation for reforming the deceits in diminishing the value of the coins of gold: current within the queen's Majesty's dominions, and for remedying the losses that might grow by receiving thereof, being diminished. The former part of which ran as followeth:

Forasmuch as great part of our monies of gold of our realm of England, and such gold of foreign countries which now are current within our said realm, are, by the snifter and unlawful doings of wicked persons, not only carried out of our realm to foreign parts, and there, by divers means, diminished of their value, and from thence returned hither, and paid, in lieu of lawful coin, for the commodities of our countries, and some other of them embased, by clipping, fothering, or other unlawful practices, of their due fineness, so that both the one sort and the other, by the means aforesaid, are brought much inferior to their first and true value and goodness: but besides that, many false pieces lie counterfeited in foreign parts, of the said coins, whereby great and intolerable loss and diminution of the riches of our realm doth daily grow and increase: wherefore we minding, as necessity requireth, the speedy remedy of the premises, do straightly forbid, charge, and command, that no manner of person or persons within this our realm of England, from and after the proclamation hereof in any county of our realm, do take or receive, or deliver in payment, any false counterfeit pieces of any coin of gold current within our said realm, or any piece of the same coin being fothered, or otherwise unlawfully embased, or lacking of the just weight thereof, over the remedies and abatements severally expressed, and to be allowed in that behalf. And if any such piece of coin, lacking of its true weight above the remedies and abatements hereafter expressed: and if any such counterfeit piece as is aforesaid, or any piece of coin of gold fothered, or unlawfully embased, shall be offered in payment: we will that it shall be lawful to every person and persons to whom such offer in payment shall be made, not only to refuse to take the same in payment, but also to strike a hole, at his pleasure, in every of the said pieces so offered in payment, which shall be fothered or unlawfully embased, or which shall lack of their just weight above the remedies hereafter following, and to cut every of the said counterfeits into pieces; rendering those so stricken through, and the pieces of the others so cut in sunder, then presently afterwards to the owners thereof again. And if any controversy shall happen to arise betwixt the parties, or any of their friends or favourers then present, in or about such striking through, or in cutting in pieces any of the premises, that then forthwith he that shall offer any of the said unlawful and forbidden monies in payment, and he that shall receive the same, shall peaceably repair together to our next justice of the peace, mayor, bailiff, or other chief officer of that place, who then without delay, taking one other assistant of knowledge unto him, shall judge of the monies in controversy, and shall allow of those that are allowable, and, on the contrary, shall presently execute that which is here above appointed.

The remaining part of the proclamation contains directions for ballances and weights, to be provided by the warden of the Mint, for the use of such as should have occasion to examine the coins before spoken of.

KING JAMES I.

The parliament grants him tonnage and poundage for life.—The tonnage is 3 s. for every ton of wine imported, and 3 s. more for every ton of sweet wines, as well Malmsey as other, imported by aliens; and 12 d. in the pound of the value of all goods imported or exported, excepting woollen cloths, &c. as in the former reigns.—Has four subsidies granted by the clergy of 4 s. in the pound each.—The temporality grant three intire subsidies, and six fifteenths and tenths.—Also another subsidy of 6 s. in the pound, granted by the clergy.—One intire subsidy, and one fifteenth and tenth, by the temporality.—Three intire subsidies granted by the spirituality, and two by the temporality.—Four intire subsidies again granted by the spirituality.—Three intire subsidies, and three fifteenths and tenths, by the temporality.—The king borrows

money of some of the wealthiest citizens of London, and the customs of all goods imported and exported were raised and let out to farm.—Raifes large sums of money by fining several in the Star-Chamber.—Levies an aid for making his eldest son a knight.—Has a benevolence throughout the realm, which occasioned a general discontent.—Raifes further sums, by instituting the order of baronets.

R E M A R K S.

By an indenture of the 1st of James I. a pound weight of gold, 22 carats fine and 2 carats allay, were coined into 44 l. 10 s. by tale; namely, into 10 s. 20 s. 40 s. and 5 l. pieces. And a pound weight of silver, of the old standard, into 62 s. by tale; namely, into crowns, half crowns, shillings, six-pences, groats, two-pences, and pence: which standard, both for gold and silver, hath continued ever since.

The scarcity of silver, during that reign, was the subject of much consideration and enquiry at the time: several proclamations were issued against the exportation of it, and several schemes were proposed for drawing it into the mint. It was particularly advised, that the weight of the money should be lessened: and this proceeded so far, that directions were actually given to the attorney-general, the 21st of February 1619, to prepare new indentures of the mint, whereby the pound weight Troy of standard silver should be coined into 66 s. But these directions were soon after recalled, and the designed alteration of the silver coin was ordered to be suspended for twelve months, upon a report made to the council, the 25th of the following April, by several eminent merchants, whose advice had been desired in a consultation with the ministers on that occasion. This intended alteration does not appear after this, to have been thought of any more: and, indeed, silver about the same time began to come again to the mint, in greater plenty than it had done for some years * before.

* It does not appear what was the occasion of this change, but the fact was this: that in the four years from the 1st of April, 1617, to the 4th of February, 1620, there was only coined at the Tower in silver money to the sum of 1070 l. 15 s. 4 d. and that in the four following years to the 31st of March, 1625, there was coined the sum of 205,500 l. 16 s. 2 d. This last sum is, however, little more than was coined in the last year and a half of queen Elizabeth: during whose whole reign, there was coined in silver above 100,000 l. a year, one year with another.

There was a good quantity of money coined in this reign, of the silver refined from the lead of the mines in the principality of Wales: and all the pieces of this money, of which I have seen the crown, the half-crown, and the shilling, were severally distinguished by the representation of the Welsh feathers, placed over the royal arms on their respective reverses; as those were also that were coined of this silver, during the first twelve years of the following reign before the mint was purposely set up for the coinage of the same †.

† The whole quantity of the money coined in the reign of king James the 1st, cannot, as Mr. Lowndes has observed in his Essay, be known directly from the books of the mint; by reason that many of the records and papers of that office having been destroyed or embezzled during the time of the great rebellion, the memorials of all transactions there, older than the restoration of king Charles the 1st, are now either lost, or remain in a very imperfect condition. Yet may a tolerable account be collected of this matter, by the assistance of other materials: and I have accordingly drawn out a memorandum, which will, I hope, be found sufficiently exact; partly from a paper of archbishop Williams, wherein an account is given of the coinage during the first 13 years of the king; partly from a certificate delivered to the council the 27th of November, 1618, in which is contained an account of the weight of the gold and silver coined in the several years from his 9th to his 15th; and partly from some extracts of the comptroller's accounts of his later years, communicated to me formerly by the late John Conduit, Esq; then master and worker of his Majesty's mint. By which several particulars it appears, that there was coined from the 31st of May, 1603, to the 31st of March, 1625,

In angel gold, at the several rates of	l.	s.	d.

REV

And the total value of all the gold and silver monies coined in the reign of king James, exclusive of some base monies coined for Ireland, and of which I have seen no account, amounted to the value of

Martin Folkes, Esq;

KING CHARLES I.

Has three entire subsidies granted him by the spirituality, and two by the temporality, and double from the Roman catholics.—In his third year, five subsidies from the spirituality, and as many from the temporality.—Has tonnage and poundage granted him, as also money for disbanding the armies.—Borrows money by way of loan.—Obliges all who were possessed of a knight's fee, to take upon them the order of knighthood, or to fine for avoiding.—Raises ship-money without the consent of parliament.—Demands aid of the clergy, and of the Roman catholics.—Obliges the several counties to raise an army against the Scots.—Makes void all grants of monopolies.—Again raises ship-money.—Obliges the northern counties to raise a considerable number of forces.—The parliament grant him a poll-tax, and 300,000*l.* to pay the Scots.

REMARKS.

By an indenture, in the 2d year of king Charles I. a pound weight of gold of the old standard, of 23 carats, 23 grains and a half fine, and half a grain alloy, was coined into 44*l.* 10*s.* by tale; namely, into rose-rials at 30*s.* a-piece, spurrials at 15*s.* a-piece, and angels at 10*s.* a-piece. And a pound weight of crown gold, of 22 carats fine, and 2 carats alloy, into 41*l.* by tale; namely, into unites at 20*s.* double crowns at 10*s.* or British crowns at 5*s.* a-piece. And a pound of silver of the old standard, of 11 ounces 2 dwts. fine, and 18 dwts. alloy, into 62*s.* by tale; namely, into crowns, half-crowns, shillings, half-shillings, two-pences, pence, and half-pence.

The gold coins of this king (as appears by the indenture above) are, rose-rials, angels, unites, double and British crowns.

By an account which Mr Lowndes has published in his Essay, the silver money coined in the reign of king Charles the 1st, and by which we must only understant the silver money regularly coined in the Tower of London, amounted to the sum of 8,776,544*l.* 10*s.* 3*d.* But of the gold there also coined during the said time, I am not able to give so exact an account. All I can say is, that, by a paper I saw in the hands of the late Mr Conduitt, the weight of the angel gold coined from the beginning of the king's reign to the 25th of November 1642, and which was coined into angels only, was that of 284*lb.* 5*oz.* 9 dwts. 9 gr. which made in money then current, at the rate of 44*l.* 10*s.* the pound weight, the sum of 12,658*l.* 5*s.* 9*d.* ob. And it appears by the accounts of the pix, that there has been no angel gold coined in England since that time. It also further appeared by the same paper, that there was coined in crown gold from the king's accession to the 31st of March 1641, in weight, 68,832*lb.* 11*oz.* 11 dwts. 4 gr. and by two other papers purporting to be the accounts of Sir Ralph Freeman and Sir Thomas Aylebury, from the 1st of August 1641, to the 5th of May 1643, and of Sir Robert Harley, from the 6th of May 1643, to the 31st of March 1646, that there was coined during that time in crown gold, the weight of 7052*lb.* 2*oz.* 11 dwts. 1 gr. To which last weight, if we add proportionally for the four months elapsed between the 31st of March and the 1st of August 1641, and for the 34 months between the end of these accounts and the 30th of January 1648, we cannot very greatly mistake in supposing the weight of the crown gold, coined from the 1st of April 1641, to the time of the king's death, to have been of about 11,826*lb.* Which added to the former quantity, will make, for the whole weight of the crown gold coined in this reign, about 80,659*lb.* and which, reduced into money, at the rate of 41*l.* to the pound weight, produces of the same 3,307,019*l.* To which if we add the value before given of the angel gold, and of the silver coined in the same time, we shall find that the whole sum in gold and silver coined in the Tower of London, during the reign of king Charles the 1st, did not in current money amount to less than about 12,096,220*l.* sterling. Folkes.

The Commonwealth of England, OLIVER CROMWELL, Protector.

The city of London give their money and plate, even to the servant-maids bodkins and thimbles, towards carrying on the good old cause, as some called it.—An account of the several sums of money raised by the long parliament, is as follows, viz.

VOL. II.

REV

A general abstract of money raised in England by the Long Parliament, from Nov. 3, 1640, to Nov. 1659.

	l.	s.	d.
Subsidies	600,000	0	0
The armies	32,780,721	13	0
Tonnage and poundage	5,700,000	0	0
Captives	102,000	0	0
Sale of Irish lands	1,322,500	0	0
Contributions for Irish Protestants	180,000	0	0
Forces for defence of particular counties	4,141,088	8	0
Excises	10,260,000	0	0
Duty on coals	850,000	0	0
Ditto on currants	51,000	0	0
Sequestrations of estates	6,044,924	17	0
Postage of letters	301,000	0	0
Wine licences	312,200	0	0
Composition for court of wards	1,000,000	0	0
Offices to public service	850,000	0	0
Vintners delinquency	4,000	0	0
Compositions for estates	1,277,226	0	0
Sale of English lands	25,380,687	3	11½
Settled out of gentlemen's estates, to } pay P. Palatine }	85,000	0	0
Compound with Irish delinquents	1,000,000	0	0
Charge of justice, 6 years	1,200,000	0	0
To the house of commons 14 years, } comes to }	754,472	0	0
Free gifts to the saints, viz. in money	679,800	0	0
In offices	306,110	0	0
In estates per annum	189,365	0	0
Total	95,312,095	1	11½

Mr. Walker, no less concerned in the usurpation than those he rails at in his History of Independency, having run through all the rebellion with them, 'till they turned him off, and therefore well acquainted with their methods of raising money, and the amount thereof, sums up the same after this manner:

Nor is it a small artifice to raise money by so many several and confused taxes, whereas one or two ways would have done the work: 1. Royal subsidy of 300,000*l.* 2. Poll-money. 3. The free loans and contributions upon the public faith, amounted to a vast incredible sum of money, plate, horses, arms, &c. 4. Irish adventure for the sale of lands, the first and second time. 5. The weekly meal. 6. The city loan after the rate of fifty subsidies. 7. The assessment for bringing in the Scots. 8. The five and twentieth part. 9. The weekly assessment for my lord general's army. 10. The weekly or monthly assessment for Sir Thomas Fairfax's army. 11. The weekly assessment for the Scots army. 12. The weekly assessment for the British army in Ireland. 13. The weekly assessment for my lord of Manchester's army. 14. Free quarter (at least) connived at by the state; because the soldiers having for a time subsistence that way, are the less craving for their pay, whereby their arrears growing stale, will at last either be frustrated by a tedious committee of accounts, or forgotten; in the mean time the grand committee of accounts discount it out of the commander's arrears, whereby the state saves it. 15. The king's revenue. 16. Sequestrations and plunder by committees, which, if well answered to the state, would have carried on the work, which thus I demonstrate: one half of all the goods and chattels, and (at least) one half of all the lands, rents, and revenues of the kingdom have been sequestered; and who can imagine, that one half of the profits and goods of the land will not maintain any forces, that can be kept and fed in England for the defence thereof? 17. Excise upon all things. This alone, if well managed, would maintain the war: the Low-Countries make it almost the only support. 18. Fortification money, &c. By these several ways and taxes, about 40 millions in money and money-worth, have been milked from the people. A vast treasure, and so excessive, as nothing but a long peace could import, and nothing but much fraud and many follies could dissipate; and we ought not to wonder if it be accounted inter arcana novissimi imperii, to be always making, yet never finishing an account thereof.

It is here to be observed, that the 40 millions he here speaks of, were only to the year 1647, so that they had not been above five years raising and expending them. Nor is it less remarkable, that Walker had gone hand in hand in the parliament with the extorters and consumers of all this treasure, being himself as deep concerned as any other in the villainy, and yet never saw into it, 'till the Independents thrust him and his party from having any share in the cheat.

REMARKS.

The parliament, on April 25, 1649, agreed upon a new sort of coin, whereof there were coined, crowns, half-crowns, shillings, six-pences, pence and half-pence.

In the year 1656, Oliver Cromwell, who had on the 16th day of December 1653, been invested with the title of Lord Protector of the Commonwealth of England, Scotland, and Ireland,

Ireland, and who was every day acquiring new powers, adventured to coin money with his own head and style. But whether the monies of this sort were, either then or afterwards, ever published, as true, lawful, and current monies of England, I have not been able to learn. All his 20 s. pieces of gold that I have seen are of this date, and so are a very few of his silver half-crowns, one of which is in the valuable collection of the worthy Robert Bootle, Esq; one of the directors of the East-India company: but in general the silver coins which we have with the head and style of the protector, do not bear an earlier date than that of the year 1658. I have also been informed, by my very ingenious friend Mr George Vertue, who has examined all the works of Simon, chief engraver to the mint, with the exactness of an artist; and from whom we may expect an accurate account of the same, when he shall have leisure to publish the curious collections he has made upon that subject, that he has observed half-crowns of this sort, where the last figure of the date had been altered from a 6 to an 8 upon the die: which would lead one to conjecture, that those dies, though prepared in 1656, were not really used before the year 1658, and after the second solemn inauguration of the protector, which was on the 26th of May 1657*. When it is even probable that the pieces coined, were rather looked upon as proofs, and given away as medals or counters among his friends, than publicly dispersed as common money throughout the kingdom.

* There was, I find, a trial of the pix, on the 3d of December 1657, which is said, in the books of the mint, to have been of the monies coined in the Tower, from the 9th day of November 1649, to that time: and that the money then tried consisted of unites, double crowns and crowns, of new standard gold; and of crowns, half-crowns, shillings, half-shillings, two-penny pieces, pennies, and half-pennies, of old sterling silver; all marked with the sun, and agreeable to the indenture made with Aaron Guerdien, M. E. master and worker, the 27th of July 1649, whereby it appears, that this trial was of monies of the Commonwealth only. The trial was made before the commissioners of the great seal, and the commissioners of the treasury, by virtue of a warrant from the lord protector: which warrant I shall here transcribe a copy of, as the same is inserted in the book from whence I took these particulars, and as it was in all probability the only one of the sort.

OLIVER P.

Whereas amongst other weighty affairs of the Commonwealth, the care of the assaying and trying of the monies thereof by the standard of England, according to the ancient custom of the realm, is not the least: we judging it necessary, that the trial and assay of the said money and coin be forthwith made, do therefore hereby signify such our will and pleasure to be; commanding you forthwith to cause a trial and assay to be made of the pix now being in the mint within the Tower of London, by a jury of goldsmiths of our said city of London, of integrity and experience, to be impanelled and sworn on a day certain, to be by you in that behalf appointed, in the place accustomed within our palace of Westminster: and that the lords commissioners of our treasury, the justices of the several benches, and barons of the Exchequer, or some of them, be then there present, and counselling and assisting you in the due execution of this our service.

Given at Whitehall this 9th day of November, 1657.

To our trusty and well-beloved Nathaniel Fiennes and John Lisle, lords commissioners of our great seal of England.

The trial of the pix last preceding this, was made on the 9th of November 1649, before the lord president of the council of state, the commissioners of the great seal, and others of the council of state, and committee of revenues; by virtue of an act of the 7th of the said month of November 1649, to try the monies coined from the 15th day of February 1646. These monies are said to have been marked with a scepter, and were therefore all coined before the king's death. This was consequently that same trial of the pix that is mentioned from Whitlocke, in the 95th page of these papers, and that was ordered to be made at the charge of Sir Robert Harley, when he was put out of his place: and Dr Guerdien's pix was therefore not opened, before the above-mentioned 3d of December 1657. What quantity was coined in all of this money of the Commonwealth, I have never been able to learn. All the papers I have seen relating to that subject, were only some extracts Mr Conduit had of Dr Guerdien's accounts, for about four years and a half elapsed between the 16th day of May 1649, when he entered upon his office, and the 30th day of November 1653. By which it appeared, that there was coined at the Tower during that time, in crown gold, the weight of 1768 lb. 7 oz. 17 dwts. 16 gr. making in tale, at 41 l. the pound weight, the sum of 72,514 l. 18 s. 8 d. $\frac{1}{2}$; and in sterling silver, the weight of 123,644 lb. 1 oz. 8 dwts. 12 gr. making in tale, at 3 l. 2 s. the pound weight, the sum of 383,294 l. 15 s. 4 d. $\frac{1}{2}$: so that the whole coinage, both in gold and silver, during the said time, amounted to the value of 455,809 l. 14 s. 0 d. $\frac{1}{2}$ Folkes.

KING CHARLES II.

Has a subsidy granted him of tonnage and poundage, &c.—Has poll-money granted to pay off the armies and navy.—Has 140,000 l. more granted for the compleat disbanding the army.—Has the grant of an excise upon beer, ale, &c. during life.—Passes an act for erecting, and establishing a post-office.—Has a grant of 1,260,000 l.—Has a grant of chimney-money.—Has four entire subsidies granted by the temporality, and as many by the clergy, for carrying on the war against the Dutch.—Has 2,477,500 l. granted for the same.—Has a supply of 1,250,000 l. granted him at Oxford.—Raises 1,256,347 l. 13 s. by a poll-tax.—Raises 316,000 l. by an excise upon wine and other liquors.—Has another imposition granted upon all wines and vinegar imported for a certain term of years.—Sells his fee-farm rent.—Has a land-tax granted him.—Has a grant of an additional excise upon beer, ale, &c.—Passes an act for laying impositions on proceedings at law.—Passes an act for raising the sum of 1,238,750 l.—Passes an act for raising 584,978 l. 2 s. 2 d. $\frac{1}{2}$, and an act for an additional excise on beer, &c. for three years.—Passes an act for raising money by a poll, &c.—Passes an act for a supply of 619,380 l. 11 s. 9 d. for disbanding the army.—Has a grant of a farther supply of 260,462 l. 17 s. 3 d. for the same use.

REMARKS:

By an indenture in the 12th of Charles II. gold and silver monies were coined into the same pieces, and at the same rates, as in the 2d of Charles I. By another indenture in the 22d of king Charles II. crown gold, 22 carats fine and 2 carats allay, was coined into 44 l. 10 s. by tale; namely, into pieces to go for 10 s. 20 s. 40 s. or 5 l. a-piece; and a pound of silver of the old standard, into 3 l. 2 s. by tale; namely, into crowns, half-crowns, shillings, six-pences, groats, three-pences, two-pences, and pence.

The money of king Charles II. was of three sorts: the hammered, which was the only current coin 'till 1665; the milled upon the side; and that with the graining or letters upon the edge.—The first money that bore the name of this king, was coined at Pontefract-Castle.

By the duplicates and attested copies of the controllment-rolls and other books remaining in his majesty's mint, it appears, that there were coined in the Tower of London, during the reign of king Charles the II. d, and after his restoration, the several sums mentioned in the following account: that is to say,

	l.	s.	d.
In crown gold, of 22 carats fine and 2 carats of allay, from the 20th day of July 1660, to the 31st day of December 1662, the weight of 918 lb. 8 oz. 3 dwts. the which, being coined into unites, commonly called broad-pieces, double crowns, and British crowns, and into milled unites of the same weight as the others, made in money then current, at the rate of 41 l. the pound weight, the value of	37,665	16	11
In like gold from the 1st of January 1662, to the 6th day of February 1664, the weight of 93,024 lb. 8 dwts. 13 gr. the which, being coined into 20 s. pieces, commonly called guineas, pieces of 10 s. 40 s. and 5 l. made in money then and still current, at 44 l. 10 s. the pound weight, the value of	4,139,588	2	6
Tot. of gold in weight, 93,943 lb. 10 oz. 11 dwts. 13 gr. making in money	4,177,253	12	5

Note, That although the warrant for the cutting the pound weight of gold into 44 guineas and a half, was not signed until the 24th of December 1663, yet the weight of 27 lb. 8 oz. coined some time before, and which was the only gold minted since the last day of the preceding December, was really coined into guineas; and as such delivered, on the 31st of the following December 1663.

	l.	s.	d.
In sterling silver, of 11 oz. 2 dwts. fine, and 18 dwts. of allay, from the 20th day of July 1660, to the 5th day of February 1662, the weight of 175,691 lb. 2 oz. 10 dwts. the which being coined into hammered money, at 3 l. 2 s. the pound weight, made, in the coin then current, the sum of	544,642	14	11

In

In like silver, from the 6th of Feb. 1662, to the 6th of Feb. 1684, the weight of 1,025,012 lb. 0 oz. 14 dwts. 14 gr. the which being coined into milled money, at the same rate of 3 l. 2 s. the pound weight, made in the coins, then and still current, the sum of	l.	s.	d.
	3,177,537	7	9½
Total of the silver in weight 1,200,703 lb. 3 oz. 4 dwts. 14 gr. making in money	3,722,180	2	8½
And the total value of all the monies both of gold and silver coined in this reign, according to the foregoing rates, amounted to the sum of	7,899,434	2	1½

It may here be noted, that part of the silver above mentioned was the produce of 1,500,000 French crowns, or 4,500,000 livres Tournois, received for the sale of Dunkirk; which produced in standard silver the weight of 108,636 lb. 9 oz. 3 dwts. 2 gr. and made in coined English money by tale 336,773 l. 3 s. 9 d. ½. As also, that other part of the same silver was the produce of what were called the crown and harp money, which Sir Thomas Vynar, Knt. and Bart. Francis Mervell, Esq; then sheriff of London, and Edward Buckwell, Esq; contracted with his Majesty on the 6th of December 1661, to take in by tale, and to coin with all convenient expedition, at their own charge, into English current monies: receiving for the same a consideration of 1 l. 10 s. for every 100 l. in tale, in lieu of want of weight and expence of coinage. Upon which there was accordingly re-coined of the said cross and harp monies, the sum of about 500,000 l. in tale.

KING JAMES II.

Passes an act for settling the same revenue on himself for life, which was settled on his brother for his life.—Has an imposition granted upon all wines and vinegar imported for a certain term of years.—Has an imposition granted upon all tobacco and sugar imported for a certain term of years.—Has the grant of an imposition on all French and East-India linsens, &c.

REMARKS.

By an indenture in the first of James II. a pound weight of gold, 22 carats fine and 2 carats alloy, was coined into 44 l. 10 s. by tale, namely, into 10 s. 20 s. 40 s. and 5 l. pieces; and a pound weight of silver of the old standard into 62 s. by tale, namely, into crowns, half-crowns, shillings, six-pences, groats, three-pences, two-pences, and pence; which standard, both for gold and silver, hath continued ever since. There was coined in the Tower of London, during the reign of king James II. that is to say, from the 7th day of February 1684, to the 13th day of February 1688;

In crown gold; the weight of 47,497 lb. 6 oz. 1 dwt. which being coined into 20 s. pieces called guineas, &c. made at the rate of 44 l. 10 s. the pound weight, the value of	l.	s.	d.
	2,113,638	18	8½
In sterl. silver, the weight of 167,198 lb. 10 oz. 6 dwts. 20 gr. making in money at the rate of 3 l. 2 s. the pound weight, the sum of	518,316	9	5½

Total value of both the gold and the silver 2,631,955 8 1½

The king landing with French forces at Kinsale in Ireland on the 12th of the following March, the greatest part of that kingdom submitted to him, and he made his entry into Dublin on the 24th of the same month: He there by proclamation raised, for his present occasions, the value of all the coins both of gold and silver, that were then current in Ireland; but his wants a few months after greatly encreasing, he was reduced to such distress, that he was forced to coin old brass guns and other utensils of base metal into pieces of money, made also current for half-crowns, shillings, and half-shillings, by proclamation of the 18th of June 1689.

General REMARKS on this article of the PUBLIC REVENUE, from the Conquest to the end of the Reign of king JAMES II. in relation as well to the state of the CIVIL and RELIGIOUS LIBERTIES of the nation, as to its TRADE and COMMERCE.

I. Of liberty, both civil and religious.

Let men make ever so slight reflections on the manner in which this kingdom has been governed from the Conquest to this day, let them but run through the dynasties of the English kings, and sum up the account of the annals of each reign, and then let any candid and judicious commentator say whether liberty was ever at any former period of time more amply exercised and enjoyed, than at the present hour.

'Till the Restoration there was no such thing as liberty: that after the Restoration was nothing, compared to the strength it gained at the Revolution; and the strength it then acquired, is so far, in my opinion of things, from being now impaired, that it never flourished in such full vigour as in the reign of his present most gracious Majesty, king George II.

From the Restoration let any one cast their eye backward to the Conquest, and they will find whatever changes happened in the government, those changes were nothing more than from one tyrant, or one kind of tyranny, to another. With regard to the persons of tyrants, there were glorious and inglorious, slothful and active, successful and unsuccessful tyrants, but there never was a cessation from one sort or other. With regard to the form of tyranny, there was only the same melancholy vicissitude in the manner of oppressing the people, without any suspension of the thing itself; sometimes it was the regal tyranny of the prince, sometimes the aristocratic tyranny of the barons; sometimes (as in the reigns of Harry the II and queen Mary the Ist) the ecclesiastical tyranny of the clergy; and sometimes all together, in their different jurisdictions. By which means, between monarchical, oligarchical, or hierarchial oppression, there was no change but from this tyrant to that, or from one to many; and so little appearance of liberty of any kind among the people, that to recur to what I have already said, I never hear any body harangue with enthusiastic encomiums on the liberty of Old England, that I am not either ashamed of my ancestors for deserving those encomiums so little, or of my contemporaries for bestowing them so ignorantly.

As to the liberty of this country during the domination of the Norman line, every body knows it was none; the right of conquest, the apprehensions of the conqueror, and the depression of the conquered, made him eager to secure and fix his title, and the other too much weakened with intestine disputes, not to submit to any thing rather than re-expose themselves to the recent mischiefs of struggling: this disposition of both made tyranny easy to be exercised by the masters, and hard to be resisted by the slaves; their purses, we have seen, were drained, as also their numbers thinned, and their spirits broken: foreign families were called in to lord it over the natives; and whatever was imposed or required, the people were unable to dispute, or afraid to refuse.

From William the Ist to Harry the II, the crown was worn by three successive kings, who had no other pretence to the crown, than the having a mind to wear it, and finding means to obtain it: during these reigns, it was force only prevailed, and the people enjoyed their right, no more than the lawful prince did his.

It is true, that every one of these three princes did successively promise the people, in order to make them acquiesce under this usurpation, that they would re-establish the Saxon form of government, and restore all those privileges and immunities to the people, which were enjoyed before the Conquest; but as they all three made this promise to facilitate and plan their way to the throne; so they all three broke it when they were seated and fixed there.

During the reign of Henry the II (the first king of the Plantagenet line) it is true, the crown was less powerful, but the people were not more free; their condition was not better for their king's being worse; ecclesiastical disputes and family quarrels broke and bounded his power, without enlarging his subjects privileges; and whilst he mourned the loss of the one, they still groaned under the privation of the other.

To him that royal Don Quixote, and warlike enthusiast, Richard the Ist succeeded, who exhausted the treasure of his kingdom, to raise his fame upon earth, and spilt the blood of his subjects, to purchase glory in heaven.

In the next reign, a struggle for liberty was again made, but not for the liberty of the people; the struggle lay between a king who had a mind to be sole tyrant, and the barons who had long tyrannized in their particular districts over their inferiors, and now wanted to tyrannize over their superior too. During the long subsequent reign of Harry the III (that is, after the king was of age, and the regency of the earl of Pembroke determined) the contest was the same as in the preceding reign; and though by the conduct of the earl of Leicester, the people afterward seemed to have got some ground, by chusing representatives who were instituted with a pretence of taking care of their rights, yet this was but a seeming acquisition, and no real advantage in present gained; for whilst the pretence of this institution was only the security of the rights, liberties, and privileges of the people, the true reason of their institution was only like the popular affectation of patriotism, that prevailed a few years ago in this kingdom: the great abuse of which, has proved so detrimental to the state, that the attempts of others since, to shew the real spirit of patriotism, have been stifled, misrepresented, or ridiculed; for the people having been so often made the dupes of a party instead of a patriot spirit, it is no wonder they distrust all pretensions of that kind, 'till they have incontestible conviction of uprightness and public spirit. Of this weak and corrupt ministers may make no little advantage to support their power; for if all attempts to manifest a real concern for the public weal are to be laughed at,

at, no one will have resolution to oppose the worst designs; and therefore the abuse of the spirit of liberty will render it of no use when we stand most in need of it. Thus false patriots pave the way to slavery, under pretext of contending for liberty.

The long reign of Harry the III^d was a shifting scene of various turns, some in favour of an oppressive king, others of a turbulent nobility, or one ambitious man; but for the people, whatever spoke of this wheel was uppermost, their liberties, like the earth, were always beneath its revolutions, and crushed by its weight.

To Henry III. succeeded Edward I. a great man, and a great king; but though his people grew more considerable under him, they became not more free: the conquest of Wales, and the progress the English arms made in Scotland, increased the consideration of the English nation, but it restored no privileges to the people; and, though the national boundaries of the English dominions were stretched, the limits of English freedom were still unenlarged, the gates of liberty were as closely shut, and as strongly barred as ever; and the only comfort of the people in this reign was, not that the power of the crown was bounded, but that it was not abused.

As no body will say the reign of his weak and unfortunate son, Edward II. was a reign of liberty, and as I mention no reign but with regard to that single point, I shall pass it over without any farther comment.

King Edward III. and his son, who never was king, were both of them great and able men, great in action, and able in council; England too was great under them, but not free; and even its grandeur under these princes, as well as under Harry the Fourth and Fifth, was a dangerous grandeur, which, though it raised the reputation of this country in present, would, if it had gone on a little longer, ended in its ruin: for the only difference ultimately between France being conquered by England, or England conquered by France, must be, whether an English or a French king should rule both; since, in either case, the seat of empire would have been in France, and England, consequently, in either, would have become a province to France, as in two possessions under the same prince, the lesser must always be a province to the greater. In the beginning of Richard the Second's tyrannical and simple reign, one tumultuous mob, indeed, under a rash intoxicated leader, made a shew of struggling for liberty; but the subsequent part of his reign was confusion and oppression, which ended in his deposition, and the establishment of as able a tyrant as ever sat on this throne.

The gentler disposition of this sagacious usurper's great and wise son, Harry the Fifth, the success of his arms abroad, and the calmer situation of his subjects at home, less irritated by domestic oppression, and less torn by intestine divisions, made the people more happy, but made them in no one particular more free: for, though the expences of his rapid and extensive conquests were defrayed with less charge than such achievements usually are, yet this was entirely owing to the wife frugality of his own oeconomy, to the bounds he himself set to his demands, and not the limits the people prescribed to his disbursements, or to their donations.

In the subsequent reign began the fatal disputes between the houses of York and Lancaster, which terminated, after four reigns, and about 60 years, in the establishment of Harry VII. During all this contest, the people were so far from enjoying any freedom, that they never so much as grasped at it; they fought not for liberty, but for a master, and never aimed at striking off one chain, but in order to put on another; as if it were material, in chains of equal weight and strength, whose name was engraved on the rivets by which they were fastened.

Harry VII, a prince not wanting understanding, but wanting many good qualities, biased by the utmost oppressions, and meanest cruelties, found a disposition in his people to bear them patiently; he knew they would submit to almost any thing he would impose upon them, rather than venture, by new resistance, to open those wounds again which were yet hardly skinned: and having sense enough to discern this to be their case, without benevolence or justice, he chose, instead of making himself safe in their affections, to try how far they would suffer, and, by a series of rapacious and cruel acts of injustice, violence, and treachery, made his reign as uneasy to himself as it was oppressive to his subjects.

This man, however, by a little dirty cunning shewn in squeezing the rich, and deceiving every body that trusted him, got the title of the English Solomon; to have called him the English David would have been more apposite, as he died much more like the one, than he lived like the other, by ordering his son, on his death-bed, to do by the unfortunate earl of Suffolk as David ordered his son to do by Shimei, when after having promised to spare his life, he commanded it, by an unjust and cruel equivocation, to be taken from him by another.

In Harry VIII. centered the two different claims of York and Lancaster to the crown; and as he had of course an indisputable right, by this union of the two claims, to ascend the throne; so he seemed to think he had an equal privilege to do whatever he thought fit, when he was placed there,

and that the people in general had no more right to object to any violence his caprice and cruelty put him upon acting as king, than any particular person had to object to his behaving so.

As his father and mother conveyed to him the titles both of the York and Lancaster families, so he seemed likewise to inherit, through them, all the vices of both those houses; he had all the dissoluteness and luxury of his mother's family, in the early days of his reign, and, in the more advanced part of it, all the rapaciousness and cruelty of his father.

During the reign of this butcher of his wives, this terror of the nobility, this dupe abroad, and tyrant at home, there was in England neither civil nor religious liberty, neither liberty of acting, speaking, or thinking; intimidated servile parliaments were often the proxies of his tyranny, but never checks to it; they made and unmade, enacted and abrogated laws backward and forward, just as his fluctuating disposition and lawless will (under the appearance of law) dictated and ordained.

In religious matters his conduct was not less desultory and tyrannical than in regard to the succession; resentment to the power of Rome produced such meddly work in his councils, that notwithstanding a disposition in the people, through fear, to embrace any opinion which he had a mind to recommend, and profess any belief he wished to impose upon them; yet his ordinances were often so contradictory and unintelligible, that many miserable wretches were put to death for saying they believed, and many for saying they disbelieved the same thing, whilst others were burnt for professing, contrary to his will, what they had only professed because they thought those professions conformable to it.

During the short reign of his son Edward VI, the pride and weakness of the protector Somerset, and the ambition and wickedness of Dudley duke of Northumberland, successively harassed the kingdom with all the calamities attending a people squeezed by oppressive taxes, and forced into civil wars: and though the bad conduct of these two aspiring men ended in their own mutual ruin, yet the cessation of their sway gave not to the people any relief from those miseries caused by their authority whilst it lasted.

It is true, we owe, in a great measure, the benefits we at this day enjoy from the Reformation, to the duke of Somerset: but that this country should owe such a benefit originally to one of the worst kings, and, secondly, to one of the weakest ministers that ever governed it, is a reflection that makes one wonder at the very beneficial effects sometimes collaterally produced from very unrespectable causes, but gives us very little reverence for such casual benefactors.

To Edward VI. succeeded his sister Mary, a devout but execrable sovereign; for the cruel piety of that holy tyrant exposed this kingdom to as many misfortunes, under a bigoted woman, as it ever felt under the worst man; her whole authority was assigned to the hands of ecclesiastical governors, who embued them every day in the blood of her unhappy subjects: the usurpation of the lady Jane Grey, and the subsequent rebellion of Wyatt, made, perhaps, some executions necessary to secure queen Mary on the throne; but to these many more, very unnecessary, were added, by the inexorable spirit of persecuting Churchmen, who sacrificed, like the most barbarous idolators, whole heracombs of Protestant victims to their edible god, and his infallible ambassador.

Christians, professing charity, inflicted on Christians all those cruelties which the early followers of Christ complained of receiving at the afflictive hand of the most hardened infidels.

In a reign then where absolute power both in Church and State, urged by revenge and enthusiasm, under the mask of loyalty and devotion, persecuted and condemned the offenders against an injured queen, and what they called an injured God; in such a reign, what privileges and freedom were allowed to the people, even those who are most unacquainted with the history of these times may easily imagine, from the nature of such circumstances.

At the conclusion of this bloody melancholy scene (which closed not 'till the death of the weak bigot that opened it) came queen Elizabeth, a woman as different from her sister and predecessor in understanding as in religion; and one whose great and glorious reign can never be unjustly extolled, but when it is called a reign where the people enjoyed the least shadow of liberty. Every step she took tended to the public welfare, the honour of the nation, and the interest of the collective body of her people; but was taken as absolutely without their consent, as the most prejudicial measures of any of her most arbitrary predecessors or successors.

She often sent for the speaker of the House of Commons, and told him not only what she would and would not suffer to be done, but also what she would or would not allow to be said; told him she wanted money, and would have it, and that Yea or Nay should only be uttered when it was proposed to be given; that the Commons understood not state affairs; that state affairs were not their business; and that it behoved them only to meddle with what was properly within their province. She, by her lord chancellor, told the speaker, and by the speaker told the Commons, that they had no right to judge

of returns in elections, but that her lord chancellor should be the sole judge, and determine in those cases. She imprisoned members of parliament merely by her own authority, forbid some bills to be read in the House, others to be debated there, and refused the royal assent twice to above 20 bills each time, that had passed both Houses. Never were the reins of prerogative held with a stricter hand, or the yoke of slavery faster bound upon the people's necks, than at this period of time; and though the people were driven where they ought to have chosen to go, yet they were still driven; and the same power that forced them into foreign glory and domestic prosperity, might, in the hands of a less skilful, or worse-disposed driver, have forced them into the paths of contempt abroad, and destruction at home; the same method of government pursued in the subsequent reign, and the effects of that method, on different maxims and policy, verify this assertion. All, therefore, that can be said with regard to the liberty enjoyed in the reign of queen Elizabeth, is, that she who allowed her subjects none, knew their interest so well, and pursued it so steadily, that under her they possessed every good, but that of being able to make the good they possessed, the effects of their own election. To queen Elizabeth succeeded the original of that unhappy race of Stuarts, king James I. His reign and his son's were one continued series of folly and injustice; for these princes imagining they had a right to keep up the prerogative at the mark they found it, thought of nothing but their prerogative, and vainly imagined the nation would submit to the same stretch of the prerogative, when exercised to their infamy and ruin, under which it had acquiesced when employed for their glory and prosperity. In like manner did these proud, vain, ambitious, weak kings, endeavour to tread the paths of queen Elizabeth, without either her head to conduct them in such paths, or such ministers as she made use of to assist them. I shall enter into no particular detail of the oppression and despotism of these two reigns, the notoriety of the facts makes it needless; and with regard to the struggle made for liberty, when the people could bear no longer the lawless oppressive conduct of king Charles I, though that struggle freed them from his tyranny, it was far from procuring them that freedom for which it commenced: their deliverer became their undoer, and an absolute stratocracy was the only exchange they made for an absolute monarchy. I cannot help here observing, that when the patriot reformers of those days, called Levellers, posted up their declaration at Banbury, three of the four articles of which, according to Whitlocke, that declaration consisted, were these: First, Against the present parliament, and their proceedings. Secondly, Against the council of state. Thirdly, Against the council of the army. I must add too, that this declaration was made just after these Levellers, in modelling the government, had agreed that no excise should subsist above four months after the commencement of the next parliament. No public officers of salary should be capable of being chosen at the next election. No members of one representative to be chosen of the next. The next and future parliament to be annual. Not to depend longer on the uncertain inclination of parliament. Tythes not to continue longer than the next representative. Every parish to chuse their own minister, and no parish to be forced to pay him. And no one to be exempted from offices on account of religion. How little liberty such contenders for liberty procured for this country, is too well known to need animadversion; we shall therefore conclude our remarks on the well-known events of these times, by saying, that those who pretended at first only to reduce and bound the power of the Crown, and to curb him who had abused it, became themselves, after they had destroyed the King, such intolerable oppressors of the people, that they straightened every chain they pretended to loose, and doubled every evil they pretended to cure; and thus (according to Rapin) one may with great truth affirm that England was never less free than during the long parliament, and the administration of Cromwell; and how profusely the public money was exacted at that time, we have seen. Such excesses brought the affairs of this country into the utmost confusion, and that confusion ended in recalling from long banishment the Son of that oppressor whom these patriots had deposed. Upon this restoration of king Charles II, all the grievances complained of in his father's reign (or at least the source of them, which was arbitrary power) were by miracle only prevented from being again established in this country, and even by law. For had it not been for that great and upright minister, lord Clarendon, that faithful servant to an ungrateful Master, that true patriot and real benefactor to an unthankful people, the form of this government had been entirely altered, the English had been, for some time at least, as absolute slaves as the Turks or the Persians; for the King had two millions a year fettered upon him, to defray all the expences necessary

V O L. II.

for the support of his government; parliaments had been made useless, and consequently laid aside, whilst the regal authority had been the sole legislative, as well as principal executive power in this country. That this opposition of lord Clarendon to the servile schemes of the Tory restoration men of this era, was no proof of his love to his Master, though it was a great one of his zeal for the public, was the way of reasoning which the enemies of this great man made use of to destroy him, and which prevailed at last with his unfeeling, blinded, and cruel Master, to give him up and discard him. But, in truth, this conduct of lord Clarendon was as much for the real interest of the King, as the people: he thought, and thought rightly, that it was the interest of the King to have his government established on that foot which the bent of the nation would quickly submit to, and not such as they would be tempted afterwards to resist, from the same motives that had before provoked resistance; he imagined, from the examples of Charles I, Richard II, Edward II, and Harry III, who had been ruined by grasping at absolute power in this country, that it was much more prudent for a king here to content himself with a bounded authority, which he might make permanent and secure, than to make his whole authority precarious, by trying to extend it beyond its proper limits, which had in all times made the people so uneasy whenever it was attempted, that rebellion and civil wars had generally been the consequence of such weak and impolitic measures. When the Ephori were established in Sparta, by the consent of Theopompus, who then reigned there, his wife asked him; If he should not be ashamed to leave the regal authority to his sons in a worse condition than he found it! To which he answered, He should leave it in a better, as it would be more secure, in being more tolerable, and more permanent, from being liable to fewer abuses. Had lord Clarendon been reproached for suffering any boundary to be put to the power of his master, I dare say he would have returned just such an answer. And that this way of arguing in lord Clarendon was salutary for the king, as well as becoming a lover of his country, the effect of different reasonings and measures in the next reign plainly shewed. But to return to the account proposed to be given of the state of liberty, we acknowledge there was, by the upright conduct of lord Clarendon on the Restoration, for some time, the dawning appearance of liberty, in some wise and beneficial laws that were then made; but this dawning was soon overcast, other measures were pursued; this witty man and silly king was governed by his still more silly brother; and not only the liberty, but the religion of the people, were struck at and invaded. To these domestic grievances was added the infamous management of our foreign affairs; the parliament grew refractory on account of both; and though, for some time, the duke of York and the parliament got the better alternately, yet, at last, the duke's scale prevailed, and the king, for the three last years of his reign, governed without calling any parliament at all. Had king Charles lived much longer, it is hardly to be doubted, from the circumstances in which we then were, but that the government, by degrees, had sunk into the most abject state, and, in all probability, into absolute slavery. A vicious court, a corrupt king, a profligate nobility, no House of Commons, the growth of Popery, and the decay of spirit among the people, were symptoms that seemed to preface the end of all sort of freedom being near at hand. But his weak, bigotted, impetuous brother, not contented to let our liberties die gradually of that chronic malady under which he found them languishing, and by which they must at last have expired, grew in haste for their dissolution, and by endeavouring to precipitate their ruin drew on his own. Nay, had he been satisfied with the total subversion of our civil liberties, even that, perhaps, he might have obtained; to that also, possibly, he might subsequently have added the subversion of our religious rights: but nothing would content this hot injudicious man, but doing both at once; and, by aiming at both, he was prevented from accomplishing either. And as simple people will always do simple things, and in a simple manner, so the recent example of king Charles I. before his eyes proved no warning to deter king James from the like practices: he proceeded to the same violence, without dreading the same fate, and the incautious son split on that very rock by which the father had been shipwrecked. For as king Charles I. had certainly carried all the contested points of his prerogative, had it not been for the injudicious step he took with regard to the liturgy in Scotland, which commenced a rebellion there, that soon spread its contagious nature here: so king James, had he suffered the change he had a mind to make in our religion to be postponed 'till what he contended for in prerogative had been settled, I fear, by degrees, he had been able to compleat his whole scheme; but, by endeavouring to execute it all at once, he ruined himself, and involuntarily saved the constitution, which he had otherwise destroyed. From king James the II'd's banishment, abdication, deposition, or whatever people please to call it, we may date the

birth of real liberty in this kingdom, or at least the establishment, if not the commencement, of every valuable privilege we now enjoy. The bill of rights ascertained all those disputable points of prerogative and liberty that had hitherto been insisted on, either by the crown or the people, just as the power of the one or the other, at different æras, had prevailed.

For notwithstanding the Great Charter, 'till this explanatory renewal of it, or rather 'till this supplemental engraftment on the Great Charter, the bounds of liberty and prerogative were so indistinctly marked out, and so indeterminately known, that the names of liberty and prerogative were made use of both by prince and people, just as opportunity favoured the arbitrary views of the one, or the licentious disposition of the other.

No body knew the just degrees of either; tyranny often wore the plausible title of the one, and rebellion as often took the specious form of the other, according as occasion offered, and as the temper and circumstances of the times gave handle and colour to favour the schemes and pretensions of one or the other of these excesses.

On the one hand, the prince had called every thing his prerogative that his ambition induced him to wish was so; every thing that his resolution made him attempt, or his strength enabled him to acquire; every thing that either the weakness of his people was obliged to submit to, or their fervility was ready to allow.

On the other hand, whatever encroachments were made by the people on the prerogative, went under the denomination of maintaining their liberties; every point they gained on the crown, stimulated by their own spirit and vigour, or encouraged by the indolence and supineness of their prince, was only called reviving former rights, and asserting ancient privileges: and thus both king and people were ever acting like those two parties described by Davila, who, jealous of each other, and mutually fearing encroachments might be made upon them, if they continued quiet, were always guilty of injustice themselves, to avoid suffering it from others; Come false sempre necessario o offendere o essere offeso; as if it was always necessary to injure, or be injured.

The prince and people in this country were, by these means, formerly just in the same situation in which Livy describes the patricians and plebeians of Rome, who, says he, instead of being joint supports to the commonwealth, thought of nothing but how to impair the strength of one another, 'till their mutual jealousies of each other, and their immoderate desire of preserving their rights, was the cause that, when either party was prevalent, it employed its whole power to oppress the other.

The greatest misfortune, therefore, that can happen to a country that is under a mixed government, like ours, is to have the districts of the chief parts of that government so indistinctly known, that those who should be joint-administrators of the good of the whole, are more concerned about having the power to administer it, than about the good itself, and are striving for the one, when they should be promoting the other.

To such sort of contention, says Machiavel, is owing the ruin of most states; Perche fra gli huomini, parte desiderando havere di piu, parte temendo di perdere Pacquittato, si viene alle inimicitie, alle contenzione, & alle guerra, della qual nasce la rouina di quella provincia; because one party desiring to gain, and another fearing to lose what it has gained, enmities are bred, contention ensues, and then civil war, by which the country is undone.

Upon the whole, it is apparent that, as this nation enjoyed neither civil nor religious liberty 'till the Revolution; to the whole property of the people was either at the mercy of princes or priests, or both; the public revenue was raised in an arbitrary and oppressive manner, and what the civil power could not wrest from the nation, the ecclesiastical did, as we shall see by the following state of the REVENUES OF THE CHURCH before the Reformation was settled.

As far as we can collect, says Burnet, the religious houses in England and Wales are, in all, to the number of 1041; of these, only 653 are of known values, while there remain 388 of which we have no estimate. The only fair method of computing the value of the latter, will be by considering the proportion they bear to the former in number. Common arithmetic will inform us, that, if 653 houses were estimated at 171,314 l. 18 s. 1 d. then 388 houses may reasonably amount to the sum of 101,792 l. 0 s. 2 d. $\frac{1}{2}$, which added together, make 273,106 l. 18 s. 3 d. $\frac{1}{2}$. Now one penny, in those days, was equivalent to a shilling at present, as doth undoubtedly appear from the observations that may be made upon the proportion that labourers wages*, the price of wheat†, and the sub-

* The wages of an hay-maker, in the reign of Henry the VIIth, was settled at one penny, and, in the reign of Henry the VIIIth, never exceeded three half-pence: whereas twelve-pence now is their lowest daily hire. Vid. stat. 11 Hen. VII. and stat. 6 Hen. VIII. concerning artificers.

† We have no direct account of the price of corn in Henry the

the VIIIth's time, but we may suppose it the same as it was in that of his predecessor and successor. In the 24 year of Henry the VIIth, wheat was sold for three shillings the quarter; in his seventh year, when a terrible dearth happened, it did not rise to above twenty-pence the bushel; and in his tenth and fifteenth years, was sold for four shillings the quarter. In the reign of queen Mary, unless in time of famine, wheat was commonly sold for five shillings the quarter in London, and for four shillings the quarter in the country. So that we may fairly compute the price of wheat, in Henry the VIIIth's time, to have been four shillings the quarter; which, multiplied by twelve, amounts to two pounds eight shillings, which is but a reasonable price for wheat at this day. Vid. Baker's Chron. Vit. Hen. VII. and queen Mary I.

Subsidies* granted in parliament then, bear to those of our time. For this reason, you ought to multiply the above-mentioned sum of 273,106 l. 18 s. 3 d. $\frac{1}{2}$, by 12, which will give you the real value at this day, and amounts to the sum of 3,277,282 l. 19 s. 6 d. Now although this may appear to be almost an incredible sum, yet we are not to imagine that it was the only income of these religious houses: for it was only the reserved rent of their manors, and the yearly produce of their demesns, without computing fines, heriots, renewals, deadlands, &c. which would have, perhaps, amounted to twice as much. But, to be more exact in our calculations, let us, from this yearly income of the monastic houses, deduct a sixth part for demesns, and then the remainder will be merely their reserved rents: if, therefore, from 3,277,282 l. 19 s. 6 d. you will subtract 546,213 l. 6 s. 7 d. there will exactly remain, for their rents, 2,731,069 l. 12 s. 11 d. Now the reserved rent being, in all church tenures, at least a fifth part of the estate, it will follow, that the lands which the monks had out upon lives, in all amounted to the sum of 13,655,345 l. 4 s. 7 d. and if to this you add their demesns, we may fairly affirm that the whole land which the monks were lords of, came to 14,101,558 l. 11 s. 2 d. How great a part of our land this must be, you may learn from the following calculation. The land-tax is paid so unequally, that when it is nominally four shillings in the pound, though in the midland counties they are kept up to the rigour, yet in the north and in the west, in many districts, only one and a half, in others two, but in almost no place above two and a half is paid. We may therefore fairly affirm, that, when the land-tax is assessed for four, it brings in but full two shillings in the pound, or a tenth part of the income of our estates, reckoning one place with another. The land-tax is supposed, one year with another, to bring in two millions, and this may be accounted, when multiplied by 10, to be the value of all the lands in England, which is 20 millions per annum; of which only 14,101,558 l. 11 s. 2 d. was dependent on our poor and humble clergy; which is, in other words, that the monks were masters of above fourteen parts out of twenty of the whole kingdom; and out of the six parts which were thus kindly left dependent on king, lords, and commons, were the four numerous orders of Mendicants to be maintained, against whom no gate could be shut, to whom no provision could be denied, and from whom no secret could be concealed.

* In the 10th year of king Henry the VIIth, 120,000 l. was granted by parliament for the Scotch wars, which was looked upon to be so exorbitant a tax, that 16,000 men rose in rebellion to oppose its being levied. This aid (which was granted but 38 years before the dissolution of the abbies) were we to multiply it by 12, would make but a trifling sum, compared with the subsidies that have been yearly raised for the late wars. Vid. lord Verulam's History of Hen. VII. page 163, 164.

† Gregory King's calculations, published by Dr. D'Avenant, compute the whole rents of lands in England to be but 14 millions; and Sir William Petty's calculations, which were much older, do only compute them at eight millions a year. The latter of these wrote in the middle of the reign of king Charles the IIId. and the former in the reign of king William; and the vast difference between them as to the annual value of all the lands and houses in England, we may chiefly attribute to our trade, the increase of which has, in half a century, much more than doubled the rents of our estates in this nation.

If this calculation should appear greater than what our reader can easily give credit to, we must advise him to look into Popish countries, where he will discover that their clergy are to the full as rich in proportion as ever ours were here. A flagrant instance of which we have from a calculation taken by the Great Duke of Tuscany himself, in his own dominions, wherein the priesthood were found to enjoy seventeen parts in twenty of the whole land; which, had it not been for that seasonable statute of mortmain, they would soon have possessed here. See A Summary of all the Religious Houses in England and Wales, &c. printed in 1717.

OF the STATE of the TRADE of ENGLAND, from the CONQUEST, to the time of the REVOLUTION in the reign of king WILLIAM III.

The English nation remained much in the same state respecting trade and navigation, from the time of William the Conqueror to the accession of queen Elizabeth to the crown of England, which then consisted chiefly in transporting tin, lead, wool, some leather, iron, and other productions sufficient to purchase what foreign commodities they wanted. King Edward the IIIrd was the first prince from the Conquest to his time, that we find took any notice of trade; for in the parliament held at Westminster, in 1338, the transportation of wool out of the kingdom was prohibited; and, for the encouragement of foreign clothworkers and other manufacturers to come and settle here, a great many privileges were granted, and an allowance from the king till they were fixed in a competent way of living: and it was enacted, That no subject should wear any foreign cloth for the future. From his reign to the accession of queen Elizabeth, we do not find any one prince, during that space of time, had much regard for trade, except what was done by Henry the VIIth, which looks rather like policy of state for crushing Perkin Warbeck; for though he removed the mart from Antwerp to Calais, yet two years after the prohibition was taken off, and the trade was again opened to Antwerp, as formerly. About ten years after a law was made, prohibiting the importation of manufactures of silk wrought by itself, or mixed with any other thread. 'This,' says the lord Bacon, 'points at a true principle, viz. where foreign materials are but superfluities, foreign manufactures should be prohibited, for that will either banish the superfluity, or gain the manufacture.' In queen Elizabeth's time, many and great advantages were added to trade. In the year 1579, a Turkey * company was established: the same year Sir Francis Drake returned to England, after three years voyage round the world, and many wonderful adventures and discoveries, he arrived at Plymouth, bringing with him a vast quantity of gold and silver taken from the Spaniards. In her reign, also, a treaty was settled with the duke of Muscovy, for a trade to Archangel, in which several advantages were granted to the English nation.

* However unnecessary, and even detrimental to the state, many may judge some of our trading companies at present; yet we should be wanting in candour and impartiality if we should suggest that their primary establishment was useless and prejudicial to our general trade; for certainly joint stock trading companies were the first means of cutting out many of the most considerable branches of the commerce we at present enjoy: notwithstanding which, it may one day prove as good policy to lay them aside, as it was first to incorporate them. But, methinks, before companies are absolutely laid aside and dissolved, they should be rendered as beneficial to ourselves as they will admit of; for, if they are regulated upon national principles, some may, perhaps, be still made no less instrumental to advance our present trade, than they were, at their first institution, to promote and extend it. Therefore we should be certain, before we annihilate companies, to reap all the advantage that we promise ourselves thereby, lest our policy should irrecoverably turn the channel of some trades into the hands of our competitors, instead of cutting them deeper in our own favour in general. See our articles COMPANIES, ENGLISH AFRICAN COMPANY, EAST-INDIA COMPANY, and all the principal trading companies of Europe, by the Index, and our other references.

Sir Walter Raleigh, and others in her reign, discovered the plantations; and though the first planters met with almost insuperable difficulties, and were often forced to quit what they had already settled; yet the greatness of their souls surmounted all difficulties, and, though often baffled in their attempts, they renewed them again with indefatigable zeal and industry, till at last tobacco and sugar came to be planted, a great many ships built, and, in a short time, not only supplied ourselves with sugar and tobacco from America, but with very large quantities to send abroad, and supplied the Baltic, Germany, Holland, Flanders, and France, with those commodities, which brought in very great riches to us, and, by degrees, beat the Portuguese out of the trade of those parts of Europe.

We do not find that her successor, king James the Ist, concerned himself much in trade; yet in imitation of Henry the IVth of France (who was wonderful assiduous in promoting all sorts of manufactures, and, amongst the rest, that of planting mulberry-trees, and raising silk) made some essays towards such a design here; and he and his courtiers seemed to be very fond of the undertaking, and letters were writ to Virginia, to promote that manufacture. Some small progress was made there, and letters passed between the planters and gentlemen here; but, as soon as they thought they had engaged the planters to begin upon it, instead of promoting it heartily, and sending some able and skilful persons to direct the undertaking, they threw all upon the planters, and that noble design came to nothing: whereas that in France succeeded, to the immense profit of that kingdom.

King Charles the Ist had too many things upon his hands, to concern himself with trade: as he was unacquainted there-

with, he was easily imposed on; the consequences of which make us labour under many inconveniencies at this day; one of which was, his giving leave to the French to fish upon the banks of Newfoundland, to supply an English convent in France in time of Lent. See our article BRITISH AMERICA.

Cromwell and the Rump had some excellent notions of trade; they settled the act of navigation, beat the Dutch, forced them to a treaty, in which they were to deliver up the island of Pellarone, and to pay large sums for the violences exercised upon the English at Amboyna; but, upon the restoration of King Charles the IIrd, the Dutch thought themselves secure enough, and since have never made any satisfaction. They took Jamaica with vast expence, which has been repaid since with interest. The favour granted by king Charles the Ist to the French, to fish upon the banks of Newfoundland, by length of time, and afterwards by the easier temper of king Charles the IIrd, gave them an opportunity of claiming a right to that part they had seized. It is said king James II, shewed great uneasiness upon that occasion, but nothing was done, in order to obtain satisfaction. The short time he reigned, and his other views for establishing the Popish religion, did not give him time to do any thing for trade.

In a word, from the time of the Conquest to the Revolution under king William III, the public revenue was, in the general, raised in an arbitrary and lawless manner; and scarce any other trade went on, till the reign of queen Elizabeth, than that between the church and the civil power, to the end that the one might the more effectually fleece and plunder the people, and get all the lands of the kingdom into their hands, as we have seen, and the remaining share of property so settled upon the crown, that there might be no occasion for parliaments. Thus was there, in the general, a combination between the regal and ecclesiastical power, to become not only absolute masters of all the property in the nation, but masters over the understandings and consciences of the people, that they might be ruled with a rod of iron, forged by the united tyranny of princes and priests.

REMARKS in another light.

We have not room, under this head, to trace the state of the public revenue down from the Revolution to the present time; we shall, therefore, refer the remainder till we come to the article TAXES.

Our reason for taking notice in every reign of the state and the intrinsic value of the coin, is because this matter has so close a connection with the sums of money levied upon the people, that we can make no right judgment either of the state of trade, or of the public revenue, without them; for the proper application of these facts will occasionally tend to elucidate many difficulties in our reasoning upon things of this nature. At present, I shall make a few observations relative to this point, the application of which may be made, by the judicious reader, as well prior, as subsequent to the PROTESTANT REVOLUTION.

As to the necessities of life, it will be admitted that many of them are greatly advanced in their price since former times, even since the days of king Charles the IIrd, but every body knows, who is not wilfully blind, that such additional price is, in a great measure, to be attributed to the modern DUTIES OF EXCISE AND CUSTOMS [see our articles DUTIES, LABOUR]; but such of those things which are the direct and immediate produce of land, and which are exempt from those duties, it is not true that their price is generally enhanced; and if it were true, the necessary consequence of such advance would be, that the lands which produce them would yield a better annual rent; and yet this certainly is not generally the case, unless the lands have received some improvements.

But if by former times we mean those of two hundred or three hundred years ago, every one, who has at all looked into things of this nature, knows, that in the times of Henry the IVth, or about three hundred years ago, a pound of silver money in tale was an actual and effective pound of silver, wanting a few shillings, and allowing a small matter for alloy; a solid, or shilling, or what was so denominated in accounts, was a twentieth part of a pound, and a penny a twelfth part of a shilling. From hence, without doubt, was introduced the method of reckoning by pounds, shillings, and pence; meaning thereby, such quantities of silver: and we continue still to make our accounts by pounds, shillings, and pence; though it is now merely a fiction, and subsists no where but in imagination; for a pound in money, as now called, does certainly contain no more than a third part of the ancient pound, which was a pound in weight as well as in tale. It is known too, equally well, that 15 pounds in silver, whether in coin or in bullion, they being both the same or near it, were equal to one pound weight in gold: and a pound of silver in weight being now cut into 31. 2 s. or 62 s. fifteen such pounds make now 46 l. 10 s. in silver money in tale; and a pound of gold is now cut into 44 guineas and an half, which makes in gold money in tale 46 l. 14 s. 6 d. each guinea reckoned at 1 l. 1 s. So that gold and silver in our days bears the

the same, or very near the same proportion to one another, as they did in former days.

How the state of the silver coin stood about 200 years ago, or in the times of Henry the VIIIth, is not so easy to fix without distinguishing the times; however, it may be sufficient here to say in general, that in the beginning of his reign a pound of silver made 2 l. 5 s. in tale, and at the latter end 7 l. 4 s. so great was the debasement of the coin then by the mixture of alloy: and yet once, in the time of his son and successor Edward VI. this coin was made much worse, a pound of silver fine making 14 l. 8 s. in tale.

I cannot forbear observing here, that many authors, amongst others bishop Fleetwood, in his *Chronicon Preciosum*, takes notice of this debasement of the coin, and complains of it as a great grievance to the nation, as undoubtedly it was; but asserts, that an advancement of money in the denomination [see the article COIN], where the standard of which it is made remains the same, is no prejudice to the public: nay, some carry it so far, as to contend it would be of advantage; whereas an advancement and a debasement, most certainly are an equal mischief, where made in an equal degree.

If the silver species now in being was all called in and re-coined, half of silver and half of alloy, the grievance of this is readily seen and admitted; but if a crown-piece were called an angel, and made to go for ten shillings, and the rest of the silver pieces in proportion, in this, say they, there is no harm, the change is merely nominal.

As to sales and bargains to be made in future, such change in general is merely nominal; because the parties selling or contracting will have regard, not to the denomination solely, but to the real quantity of silver or gold which is known, or supposed to be contained in the money in which such contracts are presumed to be paid and performed; and therefore the owners of goods would then expect to have double the quantity of money in pounds, shillings, and pence, for the same commodities which they would now sell for the single quantity: so that, in these instances, there would be neither prejudice nor benefit accruing to either party. But would not the case be the same, and the change be merely nominal, if the money were debased in an equal proportion? Exactly the very same, and for the same reason: for there would be the like right, the like opportunity, and the like method, of persons helping themselves, viz. by taking then a double quantity of money, in monies numbered, instead of a single one which they now take.

But besides those transactions of buying and selling, and contracts in future, there are other money-matters which are to be regarded, and where this exchange will produce an effect which shall be more than names and mere words. There are such things as old and unalterable rents, annuities perpetual and certain, debts subsisting, and contracts in being, both of a public and private nature, where the sums are fixed and determinate, to the value of many millions, perhaps not much short of a moiety of the value of the estate of the whole kingdom; the proprietors of all which necessarily must lose just as much as the money is nominally advanced, for that they will receive just so much in silver less, and in gold proportionably, as is equal to the supposed increase in the denomination of the money. With regard therefore to these persons, an increase in the nominal value of money, and a decrease in the intrinsic value, supposing them to be in one and the same proportion, will have one and the same mischievous effect; that is, the one or the other will sink a moiety of their substance. Whether such a project as this might not pass in a neighbouring kingdom for a reasonably good way of discharging PUBLIC DEBTS, I cannot tell; but I believe he who should advise it, and put it in practice in England, in most people's opinion, would deserve an Ax or a HALTER.

And for the advantages which are surmised would arise from hence to the public, viz. that such a scheme would make the species of silver more plentiful, and prevent its being melted down and exported, they are both of them vain and groundless expectations. If the silver coin, supposing there are now SIX MILLIONS of that species in the kingdom, were advanced to double the present nominal value, we might, indeed, say then, that we had TWELVE MILLIONS of that species: but this same silver species, when called twelve millions, will operate in trade, or any business of the nation, just so far and no farther, than the same species now does; which is called only six millions: for that, after such alteration, there can be no money-transactions in which silver is made use of, let the transaction be in a greater or a less sum, but we must necessarily then make use of double the quantity of that money in tale, or the same quantity in weight, which we now make use of, in any case whatever, excepting that of paying OLD DEBTS, and making good PREVIOUS CONTRACTS. To say otherwise, or that the same quantity of silver in coin, when called twelve millions, would be of more use than when called six millions, has no more sense or truth in it, than there would be in saying, if a piece of cloth of 5 yards long were cut into ten pieces, and those pieces were called yards, that then it would go farther in making a suit of cloaths, than it would do if those pieces

were called, as they really are, half yards only. Just in the same manner, if a pound of silver, which is cut into 62 pieces, and which are now called shillings, should hereafter be called solids, or by any other new name, and made to pass for two shillings; yet a pound of silver, whether the 62 pieces of which it is made, are called shillings, or solids, is one and the same thing, and of one and the same value; and an old shilling will go as far at the market as a new solid. On this account, and for the same reason, any such scheme as this, whether it be by increasing the nominal value of money by giving it a new name, or by decreasing its real value by debasing it, will have no sort of effect tending to the interests of trade, or preventing the exportation of our coin, either of gold or silver. Traders and merchants, especially those who deal in foreign commodities, will not have regard to the pounds, shillings, and pence in tale, to which so many pieces of silver or gold coin may amount, but to the pounds, ounces, and grains, which those pieces will make in weight at the scale; and therefore, for a parcel of goods, the same in quantity and quality, they will then expect, and in fact will receive, silver or gold in exchange, the same in quantity and quality which they now do: and consequently, may export silver or gold, with the same ease and equal profit, whatever the state of the coin shall be: and if they can do it to advantage, I suppose they will do it; and, perhaps, there is no unanswerable reason why they should be prohibited.

What was the interest of money, or of silver and gold of which it consisted, or the price given for it on loan, two or three hundred years ago, I confess I have not been able to discover, so as to fix it with any certainty. Thus far, however, we may safely go, and perhaps that may be sufficient for our purpose, as to affirm, that about two hundred years ago, it was at least as high as 10 per cent. per annum, there being an act of parliament made at the latter end of the reign of Henry the VIIIth, that it should not exceed that rate; so that it is a very fair conjecture, that it had been before that time higher: and in the time of Henry IV. possibly as high as 15 per cent. And every body knows, that the interest or price of it now is no more than 5 per cent. setting it at the highest rate it can be legally let at.

From these premises, I mean from the different states of the silver coin, which generally govern that of the gold coin, and from the different rates of interest in any periods, and in the present periods of time, these deductions may be made: that when a pound of money in tale was an effective pound of silver in weight, and the interest or price of money was at 10 per cent. if we compare the price of commodities in England now, with the price of them at those times, the price now should be in the proportion of 6 to 1; and if the price or interest of money was at 15 per cent. and the like comparison were made, the proportion now should be as 9 to 1. Our notion in this matter is, that the price of things at one time will bear that proportion to the price of them at another time, which the effective silver in the nominal pound at one time, bears to the effective silver in the nominal pound at another time, and the interest or price of such pounds on loan at the different given times, computation being made upon both those heads.

From hence we infer, if in the times of Henry the VIIIth, a pound of silver was cut into 40 or 45 s. and now into 60 or 62, that the price of any commodity which then was two, must now be three pounds, on the account of that difference only; and if the interest or price of money was then 10 per cent. which is now only 5, the price on that account must be farther doubled, and in all be 6 l. that is, the present price must be three times as much as in that reign. In like manner, if in the times of Henry the VIth, a pound of silver was cut into 30 and now into 62 shillings, from thence only the price of things now must be double the price of them then; and if the interest of money then was at 15 per cent. as very probably it might, that difference from the interest now will make an addition of a treble price, and the whole be as 6 to one. So in the time of Henry the IVth, when a pound of money in tale was a pound of silver in weight, and the interest was 15 per cent, which is treble the value and treble the price of each now, we must treble the price on each account, and the price now will be as 9 to 1.

To show this I will make use of a familiar instance. A farmer or merchant, in the times when a pound of money in tale was an effective pound of silver in weight, and the price of it on loan was 10 per cent. is possessed of a parcel of sheep, oxen, wool, corn, or other necessaries of life, to the value of 100 l. at the market-price, when he sells them at that rate, will receive 100 l. in silver in weight as well as in tale, or in gold proportionably. A farmer or merchant in these times, therefore, must have 300 l. in money for a like parcel of goods, or else he will not have the same quantity of silver or gold in weight, though the goods sold are in quantity and quality the same; that is, the present owner must have three times the price, in money as now sold, as the ancient owner had, for the same things: that this is the fact in the instance of gold, as a commodity, is evident; for that a pound of gold in Henry the IVth's time was sold for 15 l. or thereabouts, in money in tale, and now it sells for

45 l. and something over, in the like money in tale, that is, at three times the price.

To pass on to the difference in the rate of interest now and formerly. If these merchants have not present occasion for these several sums in their way of trade and business, or are desirous to let them out at interest; the merchant of old times, on the loan of his 100 l. at the end of the year will receive 10 l. in silver, in weight as well as in tale, supposing interest to have been at 10 l. per cent; but the merchant of these times for the interest of his 300 l. will have no more than 15 l. in tale, which is equal only to 5 l. in weight: therefore, that the one and the other may have equal advantage from the same parcel of goods, the modern merchant must sell his goods at 600 l. for no less sum than that will yield him 10 l. of silver in weight for interest by the end of the year; that is, he must sell them at six times the price: or otherwise these two persons, at the end of such year, will not be in equal circumstances, though they were so at the beginning, when they were possessed of their goods.

If these merchants should invest their money in lands of inheritance, instead of putting it out at interest, the case will still come out the same. When money is at 10 per cent. the price of estates in fee-simple is 10 years value: so that 100 l. in old times, would have purchased an estate of 10 l. per ann. and a rent of 10 l. per ann. was a rent of 10 many pounds weight in silver, or near it, and of gold in proportion.

If a man were now to purchase an estate of equal goodness, he must pay for it 300 l. even though interest were supposed to be the same now as formerly, and there were no advance in the years purchase; for no rent less than 30 l. per ann. will produce 10 pounds in silver in weight, or proportionably in gold. And when we take into the account the difference of interest, it is plain, that the fall of interest to one half, makes a rise of land in the purchase to a double price: and therefore, now legal interest is no more than 5 l. per cent. he must and does pay 600 l. for an estate of 30 l. per ann. that is, for an estate of equal goodness, and which shall yield an equal quantity of real silver or gold, which might have been bought 300 years ago for 100 l. he must now pay just six times as much.

Or take the matter in this light. The sum of 100 l. in former ages, if laid out in lands, or lett out at interest, would, in a year's time, produce to the owner ten pounds weight of silver, or a proportionable quantity of gold; the sum of 200 l. now, if laid out in lands, or lett out at interest, would in a year's time produce to the owner 10 pounds in money, as now counted: but 10 pounds in money, as formerly counted, had three times as much silver or gold in it, as ten pounds in money, as now counted: therefore, to produce as much silver or gold, within the year as formerly, three times 200 l. or 600 l. as money is now counted, must be laid out in land, or put out at interest; that is, six times the money must now be employed to produce the same quantity of silver or gold as was produced formerly by 100 l. only. The consequence of this is, that the necessities and conveniences of life, which are the things out of which money is to arise, when they come to a market, must now be sold at six times the price, or six times the pounds, shillings, and pence, which they were formerly sold at; or the very same things will not answer the same purposes of life now, which they would have done three hundred years ago.

It will be needless to repeat here this reasoning, and show that it is applicable to the case, which I have supposed possible, that the interest of money has been in some times at 15 per cent. and that the price of goods between those times and these should be in the proportion of 9 to 1. It may suffice to say in general, that it will hold good in that instance, and in any other which may be supposed; so that wherever the quantity of real silver in a nominal pound, and the current interest of money can be known and determined, there the price of things may be known and determined likewise. My notion is here, that the real and intrinsic value of the absolute necessities of life, such as food and raiment, were always, and always will be, much one and the same, except where an accidental plenty or scarcity makes a temporary variation; but if we compute the value of these necessities by a third thing as a common measure between them, the price, or nominal value so measured, must vary as such measure itself varies. If silver be made that medium, as for many ages it has been in these parts of the world; and if in former times a real pound of silver was called a pound, a twentieth part of a pound was called a shilling, and the twelfth part of a shilling a penny; if in times subsequent the measure itself be varied, and a third part of a pound of silver be denominated a pound, and shillings and pence in the like proportion, the price or nominal value of the necessities of life will and must vary with it. A quarter of wheat or malt, a pound of beef, or a yard of cloth, are now of the same real value as heretofore; for they will go as far towards the support of human life now as they did 500 or 1000 years ago, and no farther; but their price or nominal value, as measured by the current coin of the kingdom, must vary as the coin itself varies; and this we must admit to be the case in silver itself, or we must be forced to say, that one third part

VOL. II.

of a pound of silver, supposing no more than a third part of a pound of silver to be in a present nominal pound, is of equal value with a whole pound. For if we consider silver, not as a measure of traffic only, but as a necessary or convenience of life, and as a merchandizable commodity, as we certainly may and do; one pound of silver is of the same value as another, and of the same value at one time as at another, greater or less plenty excepted; but the price or nominal value was formerly one pound only, but now we see it is three pounds and above in silver, as a measure: and we may rightly say, that it ceases to be one and the same measure, when it ceases to be one and the same thing in its weight and value.

From hence we plainly discern one reason, why money now is not at the same value as it was two or three hundred years ago, viz. because the silver of which it consists in any given sum in tale is now only a moiety, or a third part of the quantity, which was formerly in the like sum in tale; and it being a convenience of life and a saleable commodity, the real quantity of silver in the money is the true measure of its value. But, besides this decrease in the value of money arising from the variation in the species, we find another in the interest, or annual premium for it. This, to be sure, has proceeded from another cause; and has arisen, as I apprehend, from the great increase of the moveable and easily transferable estate in the kingdom, which for some time has been growing upon us, and of late has been so vastly enlarged by the PUBLIC FUNDS, and not from the INCREASE of gold and silver in the kingdom, either in coin or bullion, any otherwise than as they constitute a part of such moveable estates.

For the further application of these principles, see the article TAXES, and such other heads as we shall from thence refer to.

RHODIAN LAWS, OF COMMERCE AND NAVIGATION.

Of the naval laws and statutes of the RHODIANS.

Rhodes is the capital city of a renowned island of that name, of about 120 miles in circumference, situate in that part of the Mediterranean called the Carpathian Sea, overagainst Caria, and near the south-west point of the Lesser Asia, having Cyprus to the east, Egypt to the south, and Candia to the west; its longitude being 58 degrees, and latitude 37 degrees and 50 minutes. It was besieged and taken by the Turkish emperor Solymán in the year 1522, and has ever since been subject to the Ottoman empire. Rhodes, amongst other things, is famous for the huge statue or image of the sun, which is said to shine there at least once every day in the year; the weather it seems never being so cloudy as to deprive the inhabitants of that place, for a whole day together, of the glorious appearance of that luminous body: this statue was seventy cubits high, and one of the wonders of the world.

Though the maritime dominion of the Rhodians was once very mighty, yet they did not render themselves so famous by their naval strength as by their naval laws; to which even the wife and victorious Romans themselves paid so great a deference and respect, that, to the immortal glory of their authors, they were honoured with the singular approbation of the Roman emperors, as well as of their senate, and they being delivered to us by Peckius, in his commentaries De Re Nautica (of maritime affairs) in two different fragments, the first of which, he says, had obtained the sanction of the emperors Tiberius, Adrian, Antoninus, and several others; and the last is to be found in the 11th book of the Digests of the Roman Laws, where it was inserted by the emperor Justinian, of which the following is a translation.

But, as the customs of the Rhodian and Roman navigators were different from ours, we have judged it convenient to illustrate, with notes and explanations, what might otherwise seem obscure to those that are not pretty well acquainted with the naval polity of the Ancients.

SECTION I.

Containing the first fragment of the NAVAL LAWS of the Rhodians, as they were ratified by several of the Roman emperors.

ARTICLE I.

Of the owners of ships.

The wages of the owners shall be a double portion.

ILLUSTRATION.

Though now the masters are not frequently the owners of their ships, it is probable that they generally were amongst the Rhodians as well as Romans. For the Latin word exercitor corresponds with *Ναύκληρ*, which is the original term in the Greek, implies the owner of a hired ship, being a term synonymous with those of *navicularius* and *navicator*; so that probably the owner, being likewise the master or commander of the ship, was to have besides the hire or freight

for the ship itself, a double portion for his own wages; that is to say, twice as much as was allowed the other mariners: but how much that portion was, is not determined, nor is it of any great importance to us to know it, since the wages we now give our sea-officers and mariners, depend upon events that render that precedent useless to us.

ARTICLE II.

Of the pilots.

The wages of the pilot shall be a portion and a half.

ILLUSTRATION.

The Greek term κυβερνήτης, which is most properly answered in Latin by the word gubernator (signifying governor) is nevertheless explained by a circumlocution, viz. Ille qui clavum tenet (he that steers the helm, or governs the stern of the ship) by which it appears, That then it was usual for the pilot not only to direct the ship's course, but steer her too themselves, as indeed they are still obliged to do amongst us, when the ship has any dangerous place to pass through, or is so near any shore that a more than ordinary skill is requisite to bring her safe off; but otherwise, such of the other mariners as are most capable of that function, are appointed to do it by turns.

ARTICLE III.

Of the boatwain.

The wages of the boatwain shall be a portion and a half.

ILLUSTRATION.

The words both in the Greek and Latin, implying that officer which rules the prow or fore part of the ship, we thought they could not be more naturally rendered, than by the term of the boatwain, whose office is much the same amongst the English mariners.

ARTICLE IV.

Of the carpenter.

The carpenter's wages shall be a portion and a half.

ILLUSTRATION.

The word naupagus, which the Latins have derived from the Grecians, being in effect the same with fabricator navium, or navis artifex, does properly signify a ship-builder, and is the same with what the Venetians call, in imitation of the modern Greeks, califatte, which is rendered by the French charpentier, and by us properly called shipwright, or ship-carpenter.

ARTICLE V.

Of the coxswain's wages.

The wages of the coxswain shall be one portion.

ILLUSTRATION.

Carabus, by several of the Ancients, is taken for a sort of a storeship, attending men of war and other great vessels, such as these to which we now give the name of tenders. But the officer here termed carabita, being spoken of as one that remains on board of the principal ship, it is very probable, that thereby is meant the mariner that has the charge and management of the ship's boat, which is all the tender that small merchant-ships are provided with; whence we judge, that inferior officer must be the same, who by the French is called patron de la chaloupe, and by us coxswain.

ARTICLE VI.

Of the mariners.

The wages of each mariner shall be one portion.
This article needs no illustration.

ARTICLE VII.

Of the drudge or kitchen boy.

The wages of the kitchen-boy shall be half a portion.

ILLUSTRATION.

The word here used in the original, implying one that takes care of the fire, or lights it, &c. wanting a proper term in English to correspond exactly with Παρὰκτίριος, I thought it could not be more aptly rendered, than by the term of a drudge or kitchen-boy, &c. which is usual enough in England.

ARTICLE VIII.

Of the merchant.

The merchant may have two boys in the ship, paying for their passage.

ILLUSTRATION.

By this article it is provided, that a merchant freighting any ship, and embarking himself with his goods, as a supercargo,

may likewise carry along with him two boys or servants, he paying a reasonable allowance for their passage.
The six following articles treating only of passengers and their privileges, and duty aboard of ships, after inserting them in order, we shall explain what may seem obscure in any of them together.

ARTICLE IX.

A passenger's place shall be three cubits in length and one in breadth.

ARTICLE X.

A passenger shall not himself fry fish in the ship, nor shall the master allow him to do it.

ARTICLE XI.

No passenger shall cleave wood on shipboard, and the master shall hinder such as attempt it.

ARTICLE XII.

Passengers shall receive water on shipboard by measure.

ARTICLE XIII.

A woman passenger shall have a place of one cubit assigned her, and a boy only one half of a cubit.

ARTICLE XIV.

If any passenger carries money aboard of a ship, let him deposit it into the hands of the master; which if he fails to do, and afterwards pretends to have lost either gold or silver, his oath shall not be valid against the master, because it was not deposited in his hands.

ILLUSTRATION of the six preceding ARTICLES.

Though the word vector (which we here render passenger) be by some taken for those that transport, as well as for the persons that are transported; and though Porphyrius, in questionibus Homericis, makes that term signify marine foldiers, it is plain by the sense and connection, that by it is here meant passengers, or persons embarking in a ship to be transported from the port where they embark to some other, upon a certain valuable consideration to be paid by them for such transportation, upon their arrival at the aforesaid port.

And as to the place three cubits long and one cubit broad, mentioned in the ninth article, it is probable to be that in which they were to lie; though it must be confessed, that the length of three cubits and a half (which is here expressly specified, and amounts to no more than four feet and a half of our measure) does not seem to be sufficient for a man of good size to lie in, or at least, he must not pretend to stretch out in his bed. But since we cannot conceive for what other use this room should be assigned a passenger, we are of opinion that it is for a bed; nor will the shortness thereof surprize such, as consider the general small burthen of the ancient ships, in comparison with that of those we now use; nor are the conveniences for lodging at this time very great in little doggers, or other such ships of 40, 50, or 60 tons; and yet I believe they are a great deal better than they were in ships of the like or of greater burthen amongst the Ancients.

With respect to the injunction contained in the 10th article, by which passengers are prohibited to fry fish on shipboard, and the master forbid to allow any that liberty, we conceive what might give occasion to that law, was the consideration that passengers, not being supposed to be very well acquainted with sea affairs, should not be allowed to use the fire upon any account, which is a good preservative against unlucky accidents.

By the 11th article, passengers are in the same manner forbid to cleave wood on shipboard, and the master also commanded to deny that privilege (as the former) to such as would attempt it; which law has probably been intended for the preventing of any damage that might otherwise occur to the ship or goods, by the practice of that violent exercise by passengers, who possibly might do mischief without knowing it.

The 12th article contains a very seasonable regulation for obliging passengers to content themselves with a moderate quantity of fresh water, which they must receive by measure whilst on shipboard; for otherwise the fresh water, which at sea is very precious, might be squandered away to the great detriment of the passengers themselves, as well as of all the ship's company, in cases of pressing necessity.

By the 13th article it is ordained, That a woman passenger shall have a place to lie in, of a cubit in breadth; and though the length be not mentioned, we are reasonably to suppose it not to have been intended any less than allowed to a man. But as for a boy (by which must certainly be meant any child, whether male or female) there is only allowed one half of that breadth, a convenient length being naturally supposed.

The

The 14th article contains a very just and reasonable statute, by which passengers are enjoined to deposit their money in the hands of the master of the ship; and withal acquaints them, that if they fail in that, they are not to expect any reparation at his hands, in case it be stolen or otherwise lost.

ARTICLE XV.

Of a mutual oath to be taken by masters, mariners, and passengers.

The masters, mariners, and passengers, that fail together, shall take an evangelical oath.

ILLUSTRATION.

The word evangelical has been added by the Christians to this law; for the ancient Rhodians at the time that their sea-laws were compiled, were heathens and idolaters. What the nature and intent of this oath was, is not here expressed. The word in the Greek is, *Ἀναμνηστικόν*, which Peckius renders in Latin, *jusjurandum irrecusable*; which words imply an oath that is undeniable, or that cannot be refused, and may likewise signify, that cannot be gainfraid, retracted, or recalled, so that it is probable, it was a sort of mutual engagement, or oath of fidelity, which persons navigating together were obliged to take. But of whatever nature that oath was, it is of no very great importance for us to trouble ourselves about it.

ARTICLE XVI.

Of the estimation of the Rhodian ships.

The estimation of a ship (containing a thousand measures) with all its tackle, shall be fifty nobles, and so it shall come into contribution; and the estimation of an old ship shall be thirty nobles, out of which deducting one third, it shall likewise come into contribution.

ILLUSTRATION.

This article seems difficult to be understood, nor shall we depend on our own judgment thereon.

As to the measure spoken of, some take it to have been that which is called both in the Greek and Latin amphora, and was a square vessel containing about nine gallons; so that a ship carrying a thousand of them, must not have been of a very great burden. And as for the piece of money, which we have rendered in the English a noble, it is called in the Latin translation *solidus*, and in the annotations upon that aureus, both which I find to come to much the same thing in English; for though by *solidus* be now ordinarily meant a shilling, it was formerly taken, as aureus, for an ancient piece of gold of the value of 6 s. 8 d. or thereabouts, and known to us by the name of a noble.

So that upon the whole, it seems probable, That the Rhodian legislators did by this article intend to fix the estimation of their merchant-ships in proportion to their burthen, to the end that according to that estimation they might be taxed, in cases of contribution for damages at sea, or perhaps in other things, in which ships might be liable to pay, in foreign and domestic ports, according to their burthen, such as pilotage, anchorage, &c.

ARTICLES XVII, and XVIII.

Of loans and interests by sea and land.

ARTICLE XVII.

The law thus commands that things which are intrusted to seafaring persons upon surety, and without risque of the lender, shall not be put into writing; or if a writing be made, according to the Rhodian law, it shall not be valid: but such things as are given upon credit to persons that travel by land, though with a surety and without any risque, shall be reduced into writing.

ARTICLE XVIII.

If any person taking up money upon use, and paying for several years the lawful interest, then befalls him, after eight years, any loss or damage by fire, or by the irruption of the Barbarians, or otherwise, the transaction concerning the interest shall be made according to the laws of the Rhodians: but if the former interests were not paid, the contents of the first agreement shall be observed according to the instrument.

ILLUSTRATION.

For the better understanding of what is above, it is fit to know, That amongst the Romans there was a great difference, not only in the value of the interest paid for money lent at sea, and for money lent at land, but likewise in the manner of conditioning and taking security for such sums. There was, it seems, no interest due for money lent on land, except an instrument was produced in due form by the lender, in which all things agreed upon between him and the borrower were plainly and expressly stipulated; which seems to infer, that the interest at land was various; perhaps accord-

ing to the security given, or the time which the money was to remain in the hands of the borrower, or some such circumstance.

And as to the interest of money lent to mariners and other sea-faring persons, it is evident that that was of two sorts: the ordinary interest for money lent to mariners upon security, and without any risque on the part of the lender, they called simply *foenus* or *usura*; but the extraordinary interest agreed to be paid by mariners, together with the principal, upon condition that the lender should run the hazard of the sea, and that the mariner should make restitution only in case he performed happily his voyage, and not otherwise; that was called by the Ancients *foenus nauticum*, or *NAVAL INTEREST*, importing that the lender took upon himself the hazards of the sea; and that was deservedly allowed to be much more considerable than the ordinary interest, for that it was not only lent without security, but likewise in a manner so insured by the lender, that the borrower was in no danger of sustaining any loss. See *BOTTOMRY*.

The 18th article is a favourable statute for such as having borrowed money, after punctually paying the interest during the space of eight years, should suffer any loss; in which case the laws of Rhodes (to which this statute appeals) allow a certain mitigation of the interest for the time to come, which is not obscure enough to want any further illustration.

ARTICLES XIX, and XX.

Of masters and mariners.

ARTICLE XIX.

Masters shall not be answerable for the contracts of their mariners, but they may be detained for their crimes.

ARTICLE XX.

Masters shall be obliged to deliver and restore whatever they receive, but none can compel them to receive any things, which they have from the beginning refused to receive.

ILLUSTRATION.

As to the 19th article, in which it is said, that masters may be detained for the faults or crimes of their mariners, but not for their debts; we presume that the meaning is this, viz. That in case a mariner commits a crime, the ship may be stopped from pursuing her voyage, having the criminal aboard; and, in a word, that the master cannot protect such a mariner from justice: for it is not to be imagined, that a master of a ship could be bound to answer personally for the offence of his mariners, that being against all reason and law whatsoever. And as to the matter of debts, it is not reasonable, if people imprudently trust seamen with money or things, that the master should be obliged, either to pay the money or surrender the debtors; for then his voyage might be obstructed for want of hands to man his ships, and so he and the merchants would innocently suffer for other people's folly; and therefore by this law it is wisely provided, that if money or goods are given to seamen, the givers must look to their own security themselves; by which, innumerable inconveniences that otherwise might occur, are prevented. The 20th article concerns only goods received by, or offered to masters of ships upon freight.

ARTICLE XXI.

Of money taken up by masters for the use of the ships, &c.

When masters of ships, that are proprietors of one third of the lading, have taken up money for the voyage, whether for the outward or homeward bound, or both, all transactions shall pass according to the writings drawn up between the master and the lender, and the latter shall put a man on board the ship to take care of his loan.

Note. This last article is gnawed out in the copy of the Rhodian sea-laws in the Vatican, and in several others it is entirely left out.

The second fragment of the *NAVAL LAWS* of the Rhodians, as extracted out of the 11th book of the Digests of the Roman Laws.

ARTICLES I, II, III, and IV.

Of stealing anchors and other things.

ARTICLE I.

If a ship touching at any port or shore, be robbed of her anchors, the thief being taken and convicted, the law condemns him to the torture, and to pay double damages.

ARTICLE II.

If with the consent of the master, the seamen of any ship rob another ship in the port of her anchors, and thence the loss of the ship so robbed ensue, that being duly proved, the master who permitted the robbery, shall make good to a farthing, the damage happened to the lost ship, and to them that

that were in it. And if any thing else of the ship's tackle, such as the cables, ship's boat, sails, canvas, or any other thing of that nature be stolen, the thief being taken and convicted, shall restore double.

ARTICLE III.

If any mariner, by the command of the master, steal any thing of a merchant, or other passenger, and be surprized in the fact, the master shall make good the double to the owners, and the mariner that committed the fact shall receive a hundred blows of a cudgel. But if the mariner alone be accessory to the theft, he shall be grievously tortured (especially if it was gold that he stole) and shall make restitution to the owner.

ARTICLE IV.

If a master steer his course through any place obnoxious to pirates, after being informed of the danger thereof by the passengers, and thereupon they happen to be spoiled, the master shall make good the loss. And if the passengers carry the ship through a dangerous place, after being acquainted with the danger by the master, and any mischief happen, then they shall sustain the damage. The four preceding articles are in themselves so plain, that they need no illustration.

ARTICLES V, VI, VII.

Of quarrelling, fighting, and striking.

ARTICLE V.

If the mariners quarrel, let it only be in words, and let them not strike one another. And if any giving another a blow on the head, wound him, or hurt him, in any other manner, he that gave the blow shall pay the doctor's fees and all other charges, and shall likewise pay his hire for the last time, and tend the hurt person during the cure.

ARTICLE VI.

If the mariners quarrel, and one of them strike another with a stone or cudgel, and he returns the blow to him from whom he received it, that shall be deemed to have been *se defendendo* [in his own defence]: and though the person last struck does thereupon die, it being proved by witnesses that the deceased did first strike the survivor, either with a stone, with a stick, or with any iron, he that struck and killed the other, shall be free from all danger, for that the deceased suffered himself, only what he would have made another suffer.

ARTICLE VII.

If any master, merchant, or mariner, strike a man with his fist and blind him, or if by kicking him, he bursts his belly, besides the doctor's fees, he shall pay twelve nobles to the person for the loss of the eye, and ten nobles for the causing of a rupture; and if the person so struck die, the aggressor shall be punished with death.

The three preceding articles are in themselves so clear, that they don't want any further explication.

ARTICLE VIII.

Of masters and mariners running away with ships.

If a master to whom a ship is intrusted, with the consent of the mariners, run away with her into a foreign country, all their goods, moveable and immovable, and whatsoever they possess in any manner, shall be seized; and being sold, if their price does not equal the value of the ship, trouble and time, the aforesaid master and mariners shall be hired out, 'till they have made ample satisfaction for the damage by them caused.

ILLUSTRATION.

For the better understanding of this article, it is proper to observe, that in some cases it was customary among the Ancients, to adjudge the persons of offenders to be disposed of, or hired out by masters, 'till by their labour they should make satisfaction for damages by them caused, which they were not otherwise able to repair; and such it seems was, amongst the Rhodians, the condition of those who, running away with ships into foreign countries, had not effects sufficient to refund the value of the ships, with damages and charges; it being by this law provided, That such offenders (returning into their dominions, or being apprehended, and brought within the limits of their jurisdiction) should be hired to work as servants or bondsmen, 'till they had made ample satisfaction for such offences.

ARTICLE IX.

Of lightening of ships in a tempest, &c.

If a master consult about lightening of a ship, let him enquire of the passengers what money they have in the ship, and a just calculation being made, the money shall pay proportionally towards the contribution: and the beds and wearing clothes and instruments, shall likewise be taxed. And if an ejection be made, the master shall not be rated at more

than one pound, the pilot and boatswain half a pound, and the mariners three scruples. And if there be servants or any other persons that are not to part from the ship, they shall be taxed at three mina's; but if they be to leave the ship, at two mina's. And in the same manner shall they contribute, if they are robbed of money or other things belonging to the mariners in general, by pirates. And if there intervene some private articles of partnership concerning profits, a just computation being made of the ship and every thing in it, the partners shall bear their proportion of the contribution to be paid for damages.

ILLUSTRATION.

This article is the most important of the whole fragments, and treats of lightening of ships in time of a storm, &c. and of the manner in which that is to be done. One may easily imagine, that when a ship is in distress and in danger of sinking, the law of nature will oblige the persons that are in her to use all possible means for their own preservation; and ships being frequently laden so full, in hopes of fair weather, that in case of a storm, they are not well able to live at sea, without being disburthened of a part of their lading; it is in that case allowable for the master and company to throw overboard as much of the lading as is requisite for enabling the ship to bear out against the tempest. Nor does that only happen when ships are overburthened: for frequently they may by stormy weather be reduced to such a pass, that though their lading be not extravagant, it may be necessary to part with some of it, in order to preserve the rest; and in that case, if the owner of the goods be in the ship, it is positively required, first to consult him; and in his absence, the consent of the company is a sufficient warrant for the master to disburthen the ship: but the merchant or his supercargo, or any other person being present for him, it is requisite that such an ejection should not be undertaken without his consent. And thence it became customary, not only amongst the Rhodians and Romans, but generally amongst all other navigators, that the owner of the goods being present, should, with his own hand, begin to disburthen a distressed ship, by throwing something overboard himself; after which the seamen and others were to follow his example, and throw over as much of the lading as might put the ship into a condition to resist the storm.

And because it seldom happens that the whole lading of a ship belongs to one merchant, it is very justly provided, that the person whose goods are cast overboard shall not be the only loser, but that the owners of such goods as have been saved, shall contribute towards the loss of those that were thrown overboard. So that even silver, gold, and precious stones (though these cannot be well supposed to endanger a ship by their burthen) must pay proportionably with other goods; and that not according to their bulk, but their value: nor is the owner of the ship at all exempted from paying his proportion, according to the value of the ship, because the throwing over of the goods contributes to the common security of the ship, and all that is in it: and as every one is obliged to bear his proportion of the loss, all endeavour to be as careful as possible to throw over the goods that are least valuable; for otherwise it might happen, that the master and mariners, out of spite and revenge, might occasion considerable damage to merchants, against whom they might have some private pique and resentment.

Nor are in some cases the clothes, beds, and personal necessities, nor even the persons of the masters, merchants, passengers, and mariners themselves, free from contributing towards the damage sustained by such ejections.

When it happens that goods have been thus thrown overboard to lighten a ship, the contribution is made in this manner. In the first place an account is given only of the prime cost of the goods that are lost, and then estimation being made of them that are preserved, not according to what they cost, but according to the price they'll probably yield at the port whither the ship is bound; they are all charged in proportion to their value, and must pay accordingly.

And in the same manner it is ordained, to make an equal contribution for damages sustained by rovers and pirates; the good design of which law is to excite every individual mariner, and other person in the ship to his duty, to which the consideration and apprehension of his own particular risk, will not a little contribute.

This article concludes with a very reasonable clause, obliging all persons, though not on shipboard themselves, concerned by partnership in any part of the contribution to be paid out of the ship's cargo, to allow their share of the contribution to be paid out of the goods that are preserved, towards the price of those that are lost; which certainly is very just, since it is not those who are entitled to any share of the profit, should decline to bear the proportion of the loss, except by some separate agreement the contrary be provided.

ARTICLE X.

Of shipwreck and other damages.

If by the negligence of master and mariners, any damage or shipwreck happen, they shall be answerable for it. And likewise

wife, if by the fault of the merchant the ship and cargo perish, he shall sustain the loss. But if a shipwreck happen merely by misfortune, without any failure on either side, what can be saved of the ship and lading, shall be prized and brought to a contribution.

This article is too plain to need any explication.

ARTICLE XI.

Of old and unsound ships.

Let not merchants nor passengers put heavy and precious goods in an old ship: if they do, and the ship setting sail, the goods be spoiled or damaged, they must blame themselves. But when merchants hire ships, let them diligently enquire of others who have formerly failed in them, whether they be well provided with all necessary instruments, tackle, good sails, yards, canvas, anchors, ropes, convenient rudders, good boats, and able, skilful, and sufficient mainers, and whether the ship's sides be sound: and, in fine, to comprehend all in one word, let them enquire about the ship's sufficiency in every thing, and accordingly venture their goods. This article requires no illustration.

ARTICLE XII.

Of a depositum or trust by sea and land.

If a person deposit any thing either in a ship or house, though in the hands of a known and reputable man, let it be done in the presence of three witnesses. But if the matter be of consequence, let a writing be drawn up upon it. And if the person in whose custody it is left, pretend that it is lost, he must show the place where the house has been broke, or make it appear how the theft was committed, and make oath, that he is no way accessory to it. Which if he cannot do, he must make good the thing deposited as he received it.

ILLUSTRATION.
