MDCCCLXVI.

SIR STEPHEN THEODORE JANSSEN, BARONET,

CHAMBERLAIN OF THE CITY OF LONDON.

SIR,

THE Performance before you being planned upon Principles no Way incompatible with those you have always espoused, I am willing to hope that addressing this Volume to a Gentleman of your distinguished Character will not be unacceptable.

There being contained in this new Edition, and particularly in this Volume, several valuable Commercial Memoirs, with which you have been so kind as to favour me, calls for a grateful public Acknowledgment of the Obligation.

Though this was not the Case; and though I had not many Years had the Honour of your Friendship and Confidence, on whom could I pitch upon with more Propriety to inscribe this commercial Work, than to so zealous and conspicuous a Friend to Trade, and so closely connected with a Corporation the Author so highly venerates?

Had not the worthy Citizens of London lately given you distinguished Marks of their great Regard, and which has obtained the Sanction of public Approbation, your laudable Conduct, as a City Magistrate, or a commercial Patriot, would have been only known to a few, who considered its uncommon Merits.

When you became the happy Instrument of putting a Stop to the general Wear of French Cambrics, and instead of this Nation giving Employment to French Manufacturers, you promoted that of our English Weavers; the Kingdom has ever since been benefited no less than HALF A MILLION PER ANNUM: For before the Year 1744-5, when you procured an Act to prohibit the Wear of French Cambrics, which was enforced afterwards by several others, we paid at least 250,000 *l.* a Year to France for that Commodity: and having saved that Sum, and given Employment to our own Manufacturers of Gauzes and Blonds, and numerous other home-made Wares in their Stead, makes a Difference to the Nation between saving and spending of double the Sum: and the national Gain of half a Million yearly from 1745 to 1765, amounts to TEN MILLIONS OF PRINCIPAL MONEY. Was not this an Object worthy the Patronage of a British Legislature? And is not this Advantage, under a wise Administration, as likely to continue at least as many Years as it has done?

The Consideration of the Difficulties you had to encounter by this Step of public Virtue adds to its Lustre. There was a Duty of Import on French Cambrics, and that was appropriated; and the Annihilation of any Part of the Revenue, generally meets with ministerial Opposition, notwithstanding the national Emolument is demonstrable. This was your Case, Sir; yet your Reasons were urged with such irresistible Weight, that ministerial Authority concurred with your patriotic Design. And had we another JANSSEN to arise, who would obtain the PROHIBITION OF ALL FOREIGN WROUGHT SILKS, though he should meet with the like Obstacles; would not the Nation in the like Number of Years be Gainers thereby many more Millions than it has already been by that of Cambrics? We do not pay for foreign wrought Silks so little as a MILLION a Year, including all smuggled into Great Britain and her Plantations.

Was this saved to the Nation, instead of spent out of it, would it not make a Difference of TWO MILLIONS a Year? Is this Benefit to the Kingdom to be lost, for the Sake of a mortgaged Revenue? Is it not more politic to supply the Revenue Deficiency by all other Ways possible, than to suffer the Nation longer to be deprived of so interesting an Advantage it at present stands in Need of? Can it be proved, that an equivalent Benefit would accrue to the Kingdom, by permitting the Importation of foreign wrought Silk at all? I am persuaded it cannot. For in ten Years might not the Nation save TWENTY MILLIONS by their absolute Prohibition? I could wish this Point was duly considered by the present Patriotic Administration, and that you, Sir, would turn your Thoughts upon supplying any Deficiency in the Revenue, such a wise Measure might occasion. For as the Revenue is already highly indebted to you as a Financier; so it may be in future.

Yours

You have been happily successful in the essential Article of greatly improving the Revenue on Tea : and yet by Means that were judged to have the contrary Effect, when you first started them. Few Ministers are inclined to listen to the lowering of Duties ; yet upon this singular Maxim, you proposed to augment the Revenue. Herein you met with no less Discouragement than in the Cambric Affair. Yet you persevered in maintaining that lowering the EXCISE DUTY ON TEA, would increase the Revenue. So it has to a very considerable Degree, notwithstanding the Opposition your Sentiments met with at first.

Before your Intentions, with regard to Tea, were carried into an Act of Parliament, both the Duties of Excise and Customs thereon, had not for several Years exceeded, *Communibus Annis*, 170,000*l.* and the East India Company had not imported above 1,200,000 Pounds Weight of Tea, *Communibus Annis* : But since passing the Law, which you were instrumental to procure, the Exchequer has received yearly from 4 to 500,000*l.* and for some Years past above 600,000*l.* and even above 700,000*l.* and the East India Company has sold from THREE to FOUR MILLIONS of Pounds Weight annually ; whence it is that the East India Company have imported and sold not less than SIXTY MILLIONS OF POUNDS WEIGHT OF TEA MORE THAN THEY WOULD HAVE DONE, had it not been for the passing the said Act. By which it appears, that if the Company have gained no more than ONE SHILLING *per* Pound Weight, it amounts to THREE MILLIONS STERLING EXTRAORDINARY CLEAR PROFIT TO THAT COMPANY ; of which the Proprietors and the Public Credit have reaped the Benefit : and the Public Revenue has been advantaged by You above SEVEN MILLIONS OF MONEY : and, perhaps, if your Principles of lowering the Duties upon other Articles of general Consumption, were adopted, the Revenue might be so advantaged, as to enable the present Administration likewise to promote the Prohibition of foreign wrought Silks ; thereby save Millions upon Millions of Treasure to the Kingdom, and give full Employ to our industrious Spitalfields Manufacturers. I could wish, I could rejoice, as well for the Honour of the present wise and upright British Ministry, as the Interest of the Kingdom in general, that this national Point could be happily accomplished, in a Manner perfectly consistent with the general Prosperity. If thus reminding you, Sir, of the more extensive Application of your own Principles to advance the Revenue should have so good an Effect, I am persuaded, that any Thing of the kind will be well received by the Ministry, and if practicable, carried into Execution.

There is another Instance of your public Conduct, that has not been less admired than other Parts of it : That I mean is, when you had the Honour to be Lord Mayor of this City in the Year 1755. At which Time, Hostilities being expected to begin against France at the Commencement of the late War, you wrote a Letter to his Grace the Duke of Newcastle and Lord Anson, the former then one of his Majesty's principal Secretaries of State, and the other First Lord Commissioner of the Admiralty, signifying the then State of the French Trade to their Sugar Colonies ; and informing them, from certain Intelligence you had received, " that the French Ships bound to America, " were doubly manned ; which to you appeared an indubitable Proof, that France intended to be at " War with us before the Return of those Ships to Old France : wherefore you submitted to the Administration this Proposition : Whether it might not be an eligible Measure, by Way of Reparation for the many Murders and Incroachments made by the French upon his Majesty's Subjects " in North America, since the Peace of Aix la Chapelle, to make Prizes of their homeward-bound " West India Ships, without a FORMAL DECLARATION OF WAR ; whereby You judged, that we could " not have at once less than EIGHT THOUSAND FRENCH SAILORS PRISONERS IN ENGLAND ; which " would be crippling the French Navy during that whole War.—This was the Proposition you had the " Honour to suggest to his Grace the Duke of Newcastle ; and this very Measure was soon after adopted by the Court of London ; and we actually had, as you prophetically declared before the Close " of the Year 1755, eight Thousand French Sailors Prisoners in this Nation."—And certain it is, that his Grace of Newcastle did you the Justice and Honour to signify in Council, his Acknowledgement that he received the Information and Suggestion from the Lord Mayor of London : nor is it less certain, that no Step of this Kind was taken, or even thought of by the Administration, till this Intimation was given by You.

What Effect this Measure had to render the last War at Sea so successful as it happily proved, is too well known to need expatiating on : and in what Light this Master-stroke of English Policy was then looked on in France by the wisest Men in that Kingdom, is also notorious, and the Event sufficiently indicates their Discernment.

The numerous other publick Services You did, during the two last Wars, by a Series of judicious Intelligence you communicated to the Administration during their whole Course, I am not unapprized of ; and was the whole laid before the Public, it would make an acceptable Volume not less to your Honour than what I have already taken the Liberty to notice : which I have done to animate others to imitate your glorious Example for the public Emolument. And did your public Spirit more abound, Ministers would often be better informed than they are, and the Nation rendered more prosperous ; it being impossible for the ablest and best intentioned Administration at all Times to have all Requisites before them for the Guidance of their Judgment occasionally. In your Intelligence of that

Kind,

DEDICATION.

iii

Kind; and in your several public Plans, you appear to have been very happy and fortunate: and although you have not been so in your private Affairs, and some have unknowingly and uncandidly attributed it to your Attention to those of the Public; yet I can take upon me to declare the contrary, having had the Examination of them, and am at present in Possession of authentic Vouchers to testify the Reverse. However, your late exemplary Conduct, as a Merchant, is at present deservedly in the highest Esteem, by all wise and good Men, as tending to render COMMERCIAL CREDIT SACRED AMONG THE TRADING WORLD; and as such your Example is worthy of constant Imitation, and therefore cannot be too much revered.

I am,

With great Friendship and Regard,

SIR,

Your most Humble

And most Obedient Servant,

Feb. 10, 1766.
Broad Street, London.

LABOUR. The price of the produce of land, and all the commodities which depend upon the mechanical and manufactural arts affecting trade in general, it becomes needful to make some

REMARKS on LABOUR in general, in relation to the natural price thereof.

A labourer's son, from 7 and 12 years of age, becomes an assistant to his father, either in keeping the flocks, or manuring the ground, or in other sorts of country labour, which require no art or skill.

But, if his father puts him to a trade, he is at some expence for it, and loses his assistance besides, during the time of his apprenticeship: and, as the life of a man is commonly calculated but at 10 or 12 years, his wages, as a servant, mechanic, or manufacturer, must exceed his wages as a labourer, in proportion to the expence he is at, and the risque he may run in such servitude. This shews why such servant ought to earn more than a common labourer.

Let it be supposed that two taylors make the cloaths of a village, and that, the one dying, the survivor has more work than usual: this may enhance his price, by giving some preference in point of expedition to others, he may thus continue raising his price, 'till the countryman shall find it more advantageous to go to some taylor of another village, or market-town, or city, to have cloaths made, or 'till some other taylor comes into his own village, to share the business of making cloaths.

If, of two taylors in a village, the one works better than the other, he may have a better price for his work; or, if he cuts his cloaths more fashionably (that is to say, if he pleases better) he shall have a better price.

The same reason will hold good in market-towns and cities; those trades which require more art and capacity to learn, and more time to arrive at perfection in, earn, *cæteris paribus*, a better price.

The arts and employments attended with danger, as sailors, bell-founders, silver-mines, &c. earn more in proportion; and, where there must be capacity, danger, and confidence, they earn still more, as pilots, skippers, &c.

If every labourer in a village breeds up several children, there will be too many hands for the cultivation of the land belonging to the village; and so several adult sons and daughters must go to seek a livelihood elsewhere: and it will probably happen that the inhabitants of this village shall not be more numerous in 500 years than they were at first.

The same may be said of the tradesmen of the village. If a taylor, who makes the cloaths of the whole village, breeds up three sons to the same trade, as there is but work enough for one, he will bring up one of his sons to succeed him, and the other two must seek their livelihood elsewhere.

V O L. II.

If they cannot find employment any where in their trade, they will go to sea, or into the army, or into foreign countries, or turn highwaymen and be hanged. But the number of tradesmen in the village in question will always proportion itself to the demand, or the work there is for them.

It is easy to conceive, in like manner, that the number of labourers and tradesmen proportions itself to the demand for them in market-towns and cities: but this further explication may be added: that, if four taylors in a market-town be able to make all the cloaths of the inhabitants, a fifth taylor may nevertheless find employment there, by the diminution of the work of the other four; and thus it happens that tradesmen often gain a livelihood, though they may not have full occupation.

One acre of land produces more wheat, or feeds more sheep than another acre, and the work of one man is dearer than that of another, according to the occurrences, as we have explained.

If two acres of land are of equal goodness, the wheat or wooll of one is of equal value to that of the other, provided the work be equal that is employed about them.

Let us suppose the wooll produced by one acre to be made into a coarse suit of cloaths, and the wooll of the other to be made into a suit of fine cloth, containing the same quantity of wooll with the coarse cloth: as the fine suit of cloth requires more, and dearer workmanship, it will cost more in making than the coarse suit, and, proportionably to the difference of the work, one suit of fine cloth shall sell for ten times the price of a coarse suit, containing an equal quantity of wooll.

Wherefore the price of any thing, intrinsically, seems to take in the quantity of land with regard to the goodness of the land, and the quantity of the labour, with regard to the dearness of the labour.

A pound of flax wrought into Brussels lace, according to the computation of the different parts of labour it may require, will employ the labour of one person for near 14 years; and thus the quantity of lace, manufactured out of a pound of flax, sells at a price which not only pays the maintenance of a woman for 14 years, or of 14 for one year, but also to yield a profit to the merchant, or principal undertaker of the lace-manufacture.

The steel spring which regulates a good watch, may sell at a price which makes the proportion of the value of the steel to the workmanship as 1 to 1,000,000.

On the other hand, the apples of a tree require so little labour, that their price seems to be proportioned almost to the land only that enters into their production.

The price of a bucket of water at the river is nothing; but, carried at some distance into the street, shall sell for one penny, which seems to be the measure of the labour of the water-carrier.

A

From

From these examples and explanations it seems to appear, that the price of any thing intrinsically is the measure of the land, and the labour that enters into it's production: but it may happen that things which have such an intrinsic value, may not sell accordingly, with regard to the fashions and humours of men. For example: if a gentleman cuts canals, and erects terraces in his garden, the price of them will be intrinsically proportionable to the land and labour thereon employed, because they really cost the gentleman in that proportion; nevertheless it may happen that nobody else will give him one quarter part of that value for them.

Land, which produces all commodities and goods, must necessarily maintain those who give those goods and commodities their form by labour; and the labour itself may be estimated by the quantity of land required to maintain those who labour, as may be further elucidated from what follows:

It does not appear that providence has given the right of the possession of land to one man preferably to another; some of the most ancient titles that we have any knowledge of, came by violence and conquest, and by laws established in consequence of such conquests. The property of the lands in Mexico is vested in Spaniards, and of those at Jerusalem in Turks; but, however people come by the property of land in a state, it naturally falls into the hands of a few*.

* Which way soever a society of men is formed, the property of the lands must be in the hands of few men. If a prince at the head of an army conquered France, and distributed the lands among his officers, or favourites, according to his pleasure, or their merit, he would then establish laws for vesting the said property in them, and their descendants. Each proprietor manages his own estate, or lets it to one or more farmers, as he thinks fit; and the farmer and his assistants must be maintained out of it, and he pays the proprietor the overplus of the produce of the estate; the proprietor pays the prince what he requires, according to the laws of society enacted or agreed upon, for the maintenance of his soldiers, courtiers, armies, &c. The use the land is put to depends upon the humour and fashion of living which the prince and the proprietors follow: if they delight in horses, a proportionable quantity of the land must be turned to pasture and meadow; if they are fond of a great number of servants and dependants, a proportionable quantity of the land must be applied to produce wherewithal to maintain them, &c.

If, upon the first conquest, the lands are divided among all the inhabitants by equal portions, yet they will gradually fall into the hands of a few; one man shall die without issue, and leave his portion to whom he pleases; another shall have several children, and not wherewithal to maintain them, and so they must become dependants on such as have too much land. One man shall be sickly, lazy, or extravagant, and be obliged to sell his portion of land to another, who is frugal and industrious, and this latter shall every year add to his estate.

Of this we have an instance in the first settlement of the Roman state: each citizen had two acres of land, and yet, soon after, the property of the land fell into few hands.

The most ancient accounts we have of the forming societies and states, tell us, that they have been formed by conquest; how they stood in the day of the patriarchs is not very clear.

Let us suppose the proprietor of an estate in land keeps it in his own hands, he will employ slaves, vassals, or servants, to work for him. If he employs slaves in great numbers, he must have overseers to keep them at work; he must have as many labourers and tradesmen, and mechanics, as are necessary to procure him all the conveniences his fancy and inclination lead him to.

In this economy, he must allow these slaves not only what will maintain them, but also their children; he must likewise allow the overseers of the slaves such advantages and rewards as are proportionable to the authority which he gives them. Wherefore the labour of a slave is worth, at least, the quantity of land that serves to maintain him, and about double the quantity of land which serves to breed up a child till he is of age fit for labour; for half the children that are born die before 17; so that two children must be reared up, on an average, in order to have one fit for labour, and even then their lives can be calculated but at 10 to 12 years.

It is true, that the one half of the children who die before 17, die faster in the first years than in the following; but, as the time the mother loses in producing and tending them, seems to make up for this computation, and the females are more chargeable, and less profitable when they grow up, than the males; it appears reasonable to think, that the labour of the meanest slave is equal to double the produce of the land that is required to maintain him.

When the proprietor maintains slaves on his land, if he has more of them than his labour requires, he sells the superfluous hands, as he does his cattle; in which case their value or price ought to answer (*ceteris paribus*) to the quantity of land employed to breed up two slaves to maturity.

But, if the proprietor employs in his service free servants, or vassals, instead of slaves, he may probably maintain them upon a better foot than slaves, according to the usage and

custom of the place he lives in: yet, in this case also, the labour of a day-labourer ought to correspond to about double the quantity of land that is employed to maintain him. If he be married, the surplus goes to the breeding up of his children, his wife being supposed just able to maintain herself by her labour: but, if he be a bachelor, he will probably employ his surplus to live more at his ease: for example, the married labourer will live upon bread and cheese, roots, &c. eat meat, drink strong beer or wine seldom, change cloaths and linen seldom; whereas the unmarried labourer will eat and drink better, and wear better apparel, and consequently (if we suppose their wages equal) he will consume the produce of more land for the maintenance of his own person, than the married man, if he saves nothing.

For the better understanding of this, it is to be observed, that a poor labourer may maintain himself at the lowest computation, upon the produce of an acre and an half of land; whereas, if he allows himself strong beer, meat, and all other conveniences, he may, without gluttony or excess, consume the produce of four to 10 acres of land, of ordinary goodness.

From this may be inferred, that the labour of a working man corresponds to more or less land in different countries, according to the different customs of living used in the said countries; and that, if the labour of a peasant in France be worth the produce of three acres, that of an English countryman, who drinks beer, wears woollen cloth, eats meat pretty often, and consequently consumes the produce of more land, is worth in England from six to eight acres.

It has been already observed, that a mechanic tradesman earns more than a day-labourer, and, consequently, he is able to consume, in the maintenance of his person, the produce of more land, or he may spare his overplus, if he pleases.

The master-tradesmen, and superior undertakers of business, upon the footing that things are managed in Europe, correspond something to the overseers of slaves in other parts, and gain more than the journeyman-tradesmen; and these master-tradesmen know how much work a journeyman can do in a day, and often pay them by the work and piece: this makes them work, for their own interest, as hard as they can, without further inspection.

From what has been said, it seems to be pretty clear, that the par and equation of land and labour are known by the quantity of land, the produce whereof is given for wages to the man who labours. That the labour of a man, who earns the produce of three acres, is equal to three acres, of a man who earns the produce of six acres, to six acres, &c. And it seems that the same proportion allotted for labour differs in several parts of the world, according to the different ways of living.—That, in China, the labour of a peasant may be equal to half an acre of land, since a quarter of an acre may probably maintain him after the Chinese manner.—That, among the Iroquois Indians in America, the labour of a vassal, or slave, may be equal to 20 or 100 acres, since the maintenance of a man may require half that quantity, in regard that they live mostly on wild beasts, which they hunt, and that the beasts one man consumes in a year must have many acres of pasture to feed them; especially since people there have not the knowledge to cut down the woods, and make the land produce as much grass for them as it might; and it seems in this as if nature had no regard to the multiplication of men in particular, but is indifferent whether the land produces grass, corn, or trees, or whether it maintains a great or small number of birds, beasts, or men.

The females commonly consume the produce of less land than the males, or, in other words, spend less; their infancy is not only indeed expence, but, even when they are grown up, they seldom earn more than what barely maintains them. Therefore it should seem that the labour of a peasant ought to exceed twice the quantity of land necessary to maintain him, with regard to the female children that are bred up in a state: but, as most of the day-labourers do not marry till they have saved something, such who are frugal are, by that means, enabled to breed up several children.

So that, if it be allowed reasonable that the labour of a peasant is equal to twice the product of the land that serves to maintain him, the mechanic and tradesman, who earn more, may be said to follow the same proportion.

If we consider to what quantity of land an hundred bushels of wheat correspond in value, we must not only take into consideration the number of acres which produced it, but also the double of the number of acres necessary to maintain the men whose work and labour produced it in that form, during the time they were at work thereupon: and, if the said wheat has been brought from afar, we must also take into consideration the land necessary to maintain the men and beasts employed in the carriage.

Thus, to judge of the intrinsic value of any thing, we must consider the land, and the labour that enters into it's productions; and, since we may pretty nearly determine the par of land and labour, we may look upon land alone, perhaps, to be the principal measure of all values.

But as money is the medium, which finds out the proportion of all values, it is also the best medium to fix the proportion of

of land and labour, in relation to all goods and commodities. If a workman earns half an ounce of silver per diem, and another earns an ounce, it may be judged that the latter has twice the quantity of land to spend, since he earns twice the quantity of money.

This notion of the par of land and labour Sir William Petty looked upon to be one of the most important considerations in political oeconomics, as appears by a MS. of his, written in the year 1685; but the method he has taken to enquire into it, seems to be but very indifferently grounded. But the principles which we have laid down seem to be very plain and natural, and may be applied to the éclaircissement of many political altercations.

Money, for the facility and convenience of commerce, being the medium of all values, the more hard money there is in circulation, the dearer the price of labour, and consequently all commodities in general, will be in a state. See the articles BARTER, CASH, CIRCULATION, MONEY.

That the quantity of the hard circulating money of this kingdom has increased in the like proportion as the price of labour and commodities, no one, we presume, will undertake to prove. In proportion to the increase of our specie, the price of labour may have increased; but, as there are other obvious and apparent causes which have contributed to the increase in the price of labour within this century, it may be necessary to point out the source of those causes, that we may not ascribe certain effects to uncertain and inadequate causes.

This we have done under our article DUTIES, to shew how those DUTIES and TAXES, laid upon commodities in this nation, operated before the last war, when our PUBLIC DEBTS and TAXES were not greatly above one-half of what they are at present; and consequently, what is represented under the article DUTIES, must have much greater weight now, than it had in our former edition of this work, and may be found to deserve, one day, due public attention.

But nothing can be more indubitably apparent, than that the high price of labour, and of all the produce and manufactures of this kingdom, is owing to the immense WEIGHT OF OUR TAXES: and are not these solely owing to the WEIGHT AND INCUMBRANCE OF OUR NATIONAL DEBTS? And, if those taxes were taken off, in consequence of the redemption of the principal national debts, would not the price of labour, and of all our commodities, fall in proportion BY SUCH ANNIHILATION OF OUR TAXES? I believe that no one would be hardy enough to attempt to prove, that, if our taxes were taken off, the price of labour and commodities would not be lessened in the like proportion, as it has been thereby augmented, making allowances for the different values of money now, and before they were imposed. If this be the true state of the case, nothing can more demonstrably prove the necessity of paying off the debts of the nation, by measures every way adequate thereunto. How that may be effectuated, see the article DEBTS [PUBLIC DEBTS] and such other heads to which from thence we refer. There are other causes likewise, which will contribute to the keeping of the price of labour low, and in proportion to that of other neighbouring commercial states, by improvements in the mechanic arts and inventions, as well as in agriculture. See AGRICULTURE, FARMING, HUSBANDRY, MANURE.

In Russia, we are told, they had no other way of making planks, 'till near the end of the last century, but by hewing or chipping away a whole tree to the necessary thickness; notwithstanding which, they could afford to sell them cheaper than their neighbours. Two Russians might possibly, with hard labour, finish a plank in a day in this inartificial way, in the same time two carpenters could with ease saw out 20 good boards. Without troubling ourselves with the loss of timber, if both are sold at a neighbouring port for the same money, 'tis plain, the Russian must work for a twentieth part of the carpenter's wages: if a sawyer in Sweden can get ten pence a day, the Russian must be paid with an halfpenny. This instance may bear a further application; the carpenter, by the contrivance of the long saw, performs as much in a day, as twenty Russians with the axe; but, beyond this, there are in Sweden a kind of mills turned by water, and so contrived, as to take in large trees at the upper side the stream, and deliver them out on the lower, sawed into planks, in a very few minutes. One of these mills will at least make 500 planks, whilst the poor Russians could hew out a single one; so that it performs the business of a thousand Russians, or 50 common fawyers, in a day, with the attendance of a single person*.

* Reflections on various subjects, relating to arts and commerce.

That nation which invents such-like compendious arts of workmanship, will certainly stand the best chance to gain the trade of foreign markets; for, besides that machines generally do the work truer and better than the hand, the labour saved by them is so very great, that, if the materials are equally plentiful, they who use the machine, must undersell the others in a vast disproportion. For, as in this instance, both are supposed to work only to live, provisions can be in no part

of the world dearer than another, in the proportion of 500 to one. A larger quantity wrought in a more compendious manner may call for as many hands, as a less quantity in a way more laborious. These considerations tend to make up their numbers, which will be richer, more improved, and more ingenious, either to defend or acquire; for ingenuity is generally an over-match for strength.

States without commerce regard chiefly the increase of numbers of inhabitants, and their home markets; and commercial states consider wealth alone, and foreign markets. Without prejudice to either, engines may be allowed in the following cases. (1.) When they do such business as cannot be performed by hand at all. Of this kind are pumps, fire-engines, water-engines, looms, wine and oil-presses, hand-mills for grain, and perhaps horse-mills. (2.) Where the commodities wrought by them are such as would not have been used at all, except they were done by the machine, either being not cheap enough, or not good enough for consumption, when prepared by hand. Under this head are the mills for paper, those for forging, drawing, slitting of iron, copper, or lead, fulling of cloths and leather, and making gunpowder.

A people without commerce may safely refuse to admit stocking-looms, sawing-mills, throwing-engines, weaving or spinning-engines, mills for striking files, cutting watch-wheels, making nails, and all the variety of inventions produced by a rivalry amongst nations contending for commerce, and private men for orders.

Commercial states must have their eyes on their neighbours, and, if they design to engross foreign markets, must provide for the cheapness of labour at home. Goods must be made cheap, to render them of general use abroad and at home. Engines for shortening business ought to be rejected, or not admitted in commercial states; when the commodity is not at all sold abroad, when it affects not the price of labour, when the machines would lessen our home markets, more than increase our foreign ones; which is, perhaps, the case with most of the last mentioned ones, many of which tend only to take the bread out of the hands of thousands, and, by a shameful monopoly, to enrich one or two. And, if they were not most of them already admitted, one would not wish to see them in use here.

Of the natural causes of the rise and decay of nations in wealth and power, with regard to the price of labour.

Let us suppose France in a middling state, the land pretty well cultivated, and the proprietors rents pretty well paid; if in these circumstances there happens a civil war, the proprietors will take party, some on one side and some on the other; they will engage and mortgage their estates, to lend money to the chief of their faction to support his quarrel; since, if the opposite chief prevails, their lands and estates will be confiscated, the undertakers will be disheartened, the country rifled, the magazines and warehouses plundered, and labour will be discouraged; so the land will not produce wherewithal to maintain the inhabitants, and to supply necessities for the armies. The chiefs of the parties will be obliged to get stores and other necessities from the neighbouring states which are in peace, and consequently they will send money out of France to pay for them.

This will gradually create a scarcity of money in France; besides that great sums will be buried, and that all barbers in evaluation and credit will be diminished, the uncertainty of the event of war will hinder marriages and multiplication, and the mortality in the war will diminish the inhabitants.

In this situation France will be in a deplorable condition, and in danger of being oppressed by a foreign power. A general plague in France will occasion much the same mischiefs.

Now let us suppose the civil war ended, the proprietors who received little or no rent during the troubles, and whose lands lay waste and uncultivated, will now farm them out at a small rent, as well because the scarcity of money, which makes all commodities cheap, as because they must encourage the farmers, in regard to the decrease of the inhabitants. As the rents are small, they will live without luxury, and consume little or no foreign commodities, which will be dear, since more money circulates on this hypothesis in the neighbouring states, than in France. The labourers and peasants, by reason of the thinness of the inhabitants, will be encouraged, and, as they will consequently find it easy to subsist, they will breed up a great number of children, and so France will become again very populous. The scarcity of money in France will make their commodities so cheap, that they will export great quantities of them, particularly if valuable manufactures are set up in France. So that France will in this case get a yearly balance, and fall naturally into the channels of trade. This will gradually bring great sums of money into France, where it's plenty will begin to raise the price of all things, and where several undertakers will have amassed good sums of money.

Now, since the prices of all things are risen insensibly, the proprietors will raise the price of their estates, the increase of the inhabitants will make them offer to work for less sustenance than at first; and, as there is plenty of money in circulation,

circulation, foreign commodities will come at a cheap price, the exportation of commodities will slacken because of their dearneſs, and the neighbouring nations will be able to ſet up cheaper manufactures; and, as the buſineſs decreaſes in France, ſeveral French traders will go into foreign parts, where there is work for them, and improve the manufactures there. The quantities of money amaffed by the French undertakers in the courſe of their buſineſs, while France gained the balance of trade, will encourage to ſpend more money, and conſume more foreign commodities, than uſual, as they are now cheaper; and the proprietors, with their additional rent, will do the ſame, and ſo luxury will come into faſhion. In the beginning of this turn of affairs, the balance of trade will be pretty equal, France being not yet quite beaten out of the channels of trade, but only beginning to loſe ſome branches of it. In this ſituation France is in it's acmé, or higheſt ſtate of power, having more ready money than the neighbouring ſtates, and conſequently the king can raiſe greater ſums from his ſubjects than at any time. But, as the increaſe of expence and luxury has taken root, 'tis remarkable thoſe who begin it ſeldom lay it aſide 'till they are undone; this will cauſe a continuance of the expence of foreign commodities, and, the exportation ſlackening and decreaſing in proportion, the balance of trade will turn againſt France, and their money will be ſent out annually in payment of the ſurplus of thoſe foreign commodities they conſume: and thus France will decline in it's wealth and power, by the decreaſe of the quantity of actual money, and the thinning of it's inhabitants, which it's luxury and decay of trade and manufactures will neceſſarily occaſion.

This example of France is hiſtorical. After the compoſing of the civil war there about 1652, the prime miniſter of the finances, Mr. Colbert, ſet up and encouraged fine manufactures there, and France lived ſeveral years without luxury, and few coaches were ſeen at Paris.

They gained greatly in the balance of trade, and Lewis the XIVth grew very powerful: money grew very plenty, and, about 1680, the balance of trade grew pretty equal, and luxury began; and then it would have naturally turned againſt France, which muſt have neceſſarily declined in proceſs of time, if that operation had not been haſtened by the expulſion of the Hugonots, which, by the money and inhabitants ſent out of the kingdom, haſtened the decline of France; which nevertheless did not happen viſibly, 'till about the year 1715, when ſhe was in peace.

The riſe and decline of all other kingdoms, naturally and abſtractedly from wars and conqueſts, are owing to cauſes of the like nature; and, when a nation gets a great plenty of money, and increaſes exorbitantly in it's paper circulation, it naturally tends to decline, by the dearneſs that happens of land, labour, and commodities; and the greateſt prudence of a legiſlator ſeems to be, when money and paper circulation are riſing to that plenty, to take methods to clog their circulation, and, if poſſible, to lock great ſums of money gradually and inſenſibly, to encourage the uſe of plate, and take any other methods than thoſe that naturally and commonly happen, which is to ſend it again to foreign parts, in payment of jewels, pictures, and other ornaments of luxury. The next eſſential thing to be done, alſo, is the gradual annihilation of their paper debts, and the taxes thereby occaſioned. If this could be effected, a ſtate would continue, by a reaſonable price of it's commodities, to keep up the channels of trade and exportation; but, where things go on in their natural courſe, the too great plenty of money, or paper credit, by enhancing the price of things, gives other rival nations an opportunity to take the trade into their hands, and to get the money along with it.

There ſeems to be but a limited quantity of trade in Europe: ſuppoſe that in the trade of the woollen manufacture, the quantity of foreign cloth conſumed in Italy, Spain, Portugal, Germany, Turkey, and the North, may amount to 30,000,000 ounces of ſilver, and that the cloth is chiefly ſupplied by England, France, Flanders, Holland, &c. That England is in the channel of exporting and ſupplying to the value of 15 millions; if it ſhould in any year ſupply 20 millions, it muſt be at the expence and diminution of the ſales of the others: and, if France ſhould get into the channel of ſupplying large quantities of woollen manufactures more than uſual, it would be probably ſo much taken away from the Engliſh trade.

Sir William Petty ſeems not to have had any thought of this limitation of conſumption, when he inſinuated, that it would be beſt for England to abandon the manure of the land, and make all the inhabitants turn traders, weavers, &c.

If we ſuppoſe there are 90 millions of inhabitants in Europe, it will not, perhaps, be found that one in 50 of the whole number conſumes yearly foreign manufactures: France and England principally conſume their own; and even the greateſt number of the inhabitants of all other countries are clothed at home.

Let us ſuppoſe the circulating money of England to have been four millions ſterling, and the lands to be farmed out at 12 millions, the yearly produce of the land, according to the method of calculation we have followed, will be 36 millions; if, in proceſs of time, the circulating money of England comes

to ſeven or eight millions, the rents of the land will naturally come to exceed 20 millions, without any other alteration than the increaſe of the quantity of circulating money; and where-as the lands of England might have been worth, at 20 years purchaſe, 240 millions, in the firſt ſuppoſition, they will, in the ſecond, be computed at 400 millions, for no other reaſon than becauſe from three to four millions additional money was introduced into barter, though the ſaid ſum ſhould be due to foreigners, and pays them a yearly intereſt, to the great diſ-advantage of the Engliſh balance of trade.

Now if the ſaid ſum, from three to four millions, ſhould be ſent back to the foreigners, the rents of the lands would fall to 12 millions, as before; and here would appear, on computation, a vaſt decreaſe of the wealth of England, without any real decreaſe in the intrinsic value of the land and labour, and the annual produce of the land.

The more commercial labour there is in a ſtate, the richer the ſtate is eſteemed.

It has been judged, by experience, that the labour of 25 perſons is nearly ſufficient to provide meat, drink, apparel, houſing, and, generally, all the neceſſaries of life for 100 perſons: upon this ſuppoſition, the fare and cloathing are coarſe, but eaſy and plentiful: yet, as above one third of the inhabitants are either too old or too young to work, or ſick, or infirm, and that full one half are neceſſarily idle, or free from common labour: there would be ſtill, on this ſuppoſition, 25 adult working perſons, or thoſe capable of working, who would have nothing to do.

If the moſt part of theſe 25 perſons in 100 are employed to draw metals out of the earth, or to work fine cloth and fine linen, and to refine, by greater labour, the houſes, the utenſils, and other conveniences of life, though they add nothing to the quantity of food of themſelves, nor to the quantity and neceſſary uſes of the cloathing; yet the ſtate will be eſteemed the richer for their labour: labour adds to the reliſh of food and drink, and to the ornament and conveniency of cloathing.

The more labour is employed in a ſuit of cloaths, the dearer it ſells, and the richer it is eſteemed. A knife and fork that are nicely wrought, taking up more labour, are dearer, and eſteemed richer, *cæteris paribus*.

It is true, that, whether the inhabitants wear fine or coarſe cloth, if equally laſting, and eat or drink, and are lodged nicely or coarſely, it is, in one reſpect, much the ſame thing, ſince coarſe and fine food and cloathing are equally conſumed; but, in the general notion, the ſtate that conſumes fine cloathing is eſteemed richer than that which conſumes coarſe, &c.

But when the additional labour of the 25 perſons, we mentioned, produces permanent wealth, as gold, ſilver, copper, &c. to ſerve for a corps of reſerve, whether by exchanging their labours with foreigners for thoſe metals, or digging them out of the ground, the ſtate is not only eſteemed richer, but is in every reſpect ſo; and more particularly if ſuch labour brings in gold or ſilver, for which, on any emergency, the ſtate may have, even from it's enemies, any thing it may ſtand in need of.

Wherefore the more labour there is in a ſtate, the richer it is eſteemed; and, if that labour be well applied, the richer in reality, and the more powerful, a ſtate is. For,

The point, which ſeems to determine the comparative ſtrength and riches of nations, is the corps de reſerve which they have; magazines of all things neceſſary for the uſe of man, exceeding the yearly conſumption, to answer in bad years and wars; or, ſo far as gold and ſilver answer all theſe things, the quantity of gold and ſilver ſeems to determine the comparative wealth and power of ſtates; for thoſe are permanent and laſting riches.

It is very adviſeable to encourage all ſorts of work and labour in a ſtate, ſince a ſtate is eſteemed the richer for it; but the labour which answers beſt, in caſe of war and difficulty, is the moſt to be encouraged. Diogenes, at the ſiege of Corinth, is ſaid to have ſell a rolling his tub, that he might not be idle, when all others were at work. We would not recommend that ſort of labour; but, rather than have a perſon idle in the ſtate, we would recommend the working of toys and trinkets, that have a ſhew of ornament, though little of real uſe.

If all the proprietors of land had but juſt as much of it as they could overſee, and manage by themſelves, or as much as farmers commonly rent and overſee, without under officers to aſſiſt them; if the ſaid proprietors became the undertakers of ſuch their ſmall eſtates, they would keep few or no idle ſervants, few pleaſure horſes; they would live without luxury, and, conſequently, the inhabitants of the ſtate would be more numerous, and more laborious, *cæteris paribus*. This makes it ſenſible, that a great inequality in eſtates is prejudicial to a ſtate, becauſe of the luxury and idleneſs which great eſtates commonly introduce. And whether a convent of 50 monks live on a large eſtate, or a lord with 50 ſervants and horſes, who do nothing but attend him, it ſeems pretty much the ſame thing in time of peace; but, in caſe of war, the lord, indeed, and his ſervants and horſes, may be uſeful, and is always an ornament; whereas the monks ſeem to be of no real uſe in peace or war, on this ſide heaven.

But

But the convents of all Mendicants are baneful in a state; they are not only idle themselves, and live upon the industry of others, but are an hindrance to labour in many respects, by their holy devices: the number of holidays in Roman Catholic countries, and other institutions of devotion, seem to take off nearly one tenth part of the yearly labour of the state.

Before we dismiss this head, it may not be improper to observe, that the French always outdo us in the price of labour: their common people subsist upon roots, cabbage, and other herbage; four of their large provinces live, as it were, intirely upon chefnuts; and the best of them eat bread made of barley, millet, Turkey and black corn: so that their wages used to be small in comparison with ours.

The price of meat and wheat doth little concern the poor manufacturers, as they generally drink nothing but water, and, at best, a sort of liquor which they call beuverage (which is water passed through the husks of grapes, after the wine is drawn off) they save a great deal upon that account, for it is well known that our people spend half of their money in drink.

At Lyons, which next to Paris is the best city in France, they do not pay much above five-pence English money an ell for making lustrings; and the price paid here for making lustrings is above twelve-pence per ell.

In the paper-manufacture abundance of people are employed for sorting rags in the mills, who can earn in France not two-pence a day; and the price paid here for such work is from four-pence to six-pence a day.

The French working thus cheap, it is no wonder if they afford their manufactures at lower rates than their neighbours.

As this nation is our great rival in foreign commerce, it therefore becomes the wisdom of the nation to meditate all reasonable and practicable measures to remove every cause that tends to increase the artificial price of labour, and keeps us upon an inequality in trade with our competitors.

The LAWS of ENGLAND in regard to LABOURERS.

Who may be compelled to work, and how punished on refusal.

He who hath no lands of his own, or is not of some trade or mystery to get a livelihood. Fitz. N. B. 168. b.

The churchwardens and overseers, &c. may set such persons to work; and, if they refuse, one justice may send them to the house of correction: so he may those that refuse to work for reasonable wages.

Persons brought up in husbandry, or in any of the arts or trades, and not able to get a livelihood, if under thirty years of age, and having no visible means to maintain themselves but by labour, may be warned by two justices to get a service by a certain day; and, if they neglect or refuse to be hired for a year, they may be sent to the house of correction, or bound over to the next assizes or sessions, and to be of good behaviour in the mean time. Dalt. 116. 6 Eliz. c. 4.

One justice may put in the stocks, for two days and one night, such as he in his discretion shall think fit to work, and command him to do, if they refuse in the time of harvest. 3 Eliz. c. 4.

Artificers must likewise work in hay-time and harvest, and, if they refuse, the constable shall put them in the stocks for the like time; and the constable therein neglecting forfeits 40s.

In hay-time and harvest, labourers may go into other counties to work, but then they must have a testimonial, under the hand and seal of one justice, to signify that they had not work where they lived the winter before.

2. How long they must continue at work.

If they work by the day, or by the week, they must continue working from five in the morning 'till after seven at night, from the middle of March to the middle of September, and all the rest of the year from twilight to twilight; only from March to September as aforesaid, they are to be allowed two hours for breakfast, dinner, and drinking; and, from the middle of May to the middle of August, half an hour more for sleeping; and all the rest of the year an hour and a half for breakfast and dinner; and, for the absence of every hour, the master may stop one penny out of the wages. 4 Eliz. c. 4.

3. Punishment for departing when they do work by the great.

If they depart before it is finished (except for non-payment of wages agreed on, or with leave of the master, or being taken into the king's service, or for other lawful cause) they are to be committed for a month, without bail, and to forfeit 5l. to the party grieved, to be recovered by action of debt, &c. over and above the costs and damages as by law may be recovered for such offences.

4. For what wages they shall work.

The wages of artificers, labourers, and others, shall yearly be assessed by the sheriff of the county; this by 5 Eliz. c. 4. But the justices of the peace, or the greatest part of them resident in the county, have the like power by stat. Jac. I. cap. 6. in their sessions every Easter, or within six weeks

VOL. II.

after. This assessment, by stat. Eliz. must be certified under their hands and seals to the chancellor, &c. who thereupon sends a proclamation into every county and corporation, before the 1st of September following, which the sheriff, or chief officer, must cause to be proclaimed and enrolled by the clerk of the peace, before Michaelmas ensuing; but, if no alteration is made in the old rates, then there is no need of such proclamation.

Every justice, &c. who shall be absent at the taxing the wages, not being sick, or not having some reasonable excuse, to be proved upon oath, and allowed by the rest of the justices, shall forfeit 10l. one moiety to the king, the other to the informer, to be recovered by action of debt, information, or otherwise.

5. The punishment for giving greater wages than what is allowed.

He who gives more wages, forfeits 5l. and may be committed for 10 days without bail. He who takes more wages, and is convicted before two justices, or a head officer, shall be committed for 20 days; but a master may reward a servant as he pleaseth, so as it be not by way of contract on the retainer.

6. The wages of labourers in the woollen trade.

By the stat. 1 Ann. all payments for work done in the woollen, linen, fustian, cotton, and iron manufactures, must be in current money, and not in cloth, victuals, or other commodities; and all the wooll, delivered to them to be wrought, shall be first weighed, and the true weight thereof declared. The offender, in either of those cases, forfeits to the labourer double the value of what shall be due for his work.

But, if the labourer shall be guilty of any fraud or fault in his work, then he must answer to the owner double the damages by him sustained. Then as to determining the wages, demands, frauds, and deceipts of labourers in woollen, &c. it must be by any two justices of the peace where the controversy doth arise, who may examine witnesses upon oath; but there lies an appeal from the order of the two justices to the next sessions, after notice of the said order, whose judgment shall be final; and, if for the appellee, then they may give costs and charges.

REMARKS.

In a dictionary of trade, we have judged it necessary to introduce the article of LABOUR; in order to observe how, and in what manner, our taxes, as they are at present laid, enhance its price, and thereby augment that of our products and manufactures in general. This was most apparently the case, before the last war; and since we have accumulated, by that war, an additional debt, near equal to that we did, by the THREE PRECEDING GREAT WARS, OUR GENERAL TAXES have multiplied, in proportion as our PUBLIC DEBTS have. To what degree this our additional weight of TAXES affects the price of labour throughout the kingdom in general, and in consequence raises the prices of all our produce and manufacture, as well for foreign as home consumption, is too sensibly felt and experienced to need further proof, or whole commerce and navigation labouring under the oppression. See DUTIES.

LACE-MANUFACTURE, is a work composed of many threads of gold or silver, fine or otherwise, or of silk or linen, interwoven the one with the other, which is worked upon a pillow with spindles, or bones for bone-lace, according to the pattern designed. This is performed by the means of several pins, which are placed and displaced as the spindle is moved, upon which the threads are divided.

The fabric of lace has divers varieties and qualities, as that of net-work-lace, or bone-lace; also some with large, others with small flowers, some in a loose, others in a compact manner; some high-raised, others lower, and some very low-raised; one kind all of gold or silver-thread, or part of gold and part of silver; others of silk of divers colours, and others of linen-thread, extremely white.

The common use thereof is for the embellishment of dresses, in regard to linens, ladies head-dresses, the altar ornament of churches.

In France, the sale of lace makes a part of the mercery business.—The milliners deal only in that of white linen.

The manufacture of gold and silver-lace in France is carried on mostly at Paris, Lyons, and the adjacent villages belonging thereunto.

The finest silk lace is made at Fontenay, Puiffieux, Morgas, and the Louvre; the ordinary sort is manufactured chiefly in France, at St Denis, Montmorency, Villiers le Bel, Carcelle, Ecouan, St Brice, Grolat, Gisors, St Pierre des Champs, Estrepagny, Doumefnil, and in some other places in the neighbourhood of these cities, bourgs, and villages.

At the Louvre they manufacture particularly the greatest part of the raised black silk-lace for womens scarves.

The principal places from whence the fine white lace comes, are Antwerp, Brussels, Malines, Louvain, and Gand, all cities of Spanish Flanders; also Valenciennes, Lisle, and some other places of French Flanders; Charleville, Sedan, Le

B

Comté

Comté de Bourgogne, Lorraine, Liege, Dieppe, Havre de Grace, Honfleur, Harfleur, Pont L'Évêque, Gisors, Fescamp, Caën, and other cities of the province of Normandy; Arras, Bapaume, and other places of the county of Artois; Le Puy in Velay, some places of Auvergne and Picardy, the Louvre in Paris, St Denis in France, Montmorency, Villiers le Bel, &c.

The finest and most beautiful thread-laces are those of the Spanish Flanders, next to which are those of French Flanders; among which are distinguished the true Valenciennes, then those of Dieppe, and next those of Havre and Honfleur: for, with regard to those of other places, they are but ordinary, and of a middling price, although there is no inconsiderable vent for them.

The greatest part of the laces, as well of gold and silver as of silk and thread, which are made in France, are consumed in the kingdom. There is but little except those of silk, and particularly those of the black species abovementioned, whereof they make any considerable export into Spain and Portugal, and into the Spanish Indies, Germany, and Holland.

The French fabricate particularly a sort of white thread-lace, for the commerce of the Spanish West-Indies. It is composed only of large flowers, without net-work, or bars. This kind was formerly greatly in fashion; but, at present, they wear none of it; in Flanders they manufacture the most of this kind.

Of the principal LAWS of France in regard to LACE.

The mark upon thread-laces which come from Flanders, the Low Countries, and England, as likewise that of point from Genoa and Venice, and other foreign countries, was established in France in the year 1660, by royal ordonnance.

In 1664, it was united to the lease of the five grofs farms.—In 1667, by a declaration of the king, a tariff took effect, conformably to which the duties of this mark should be paid; which tariff was afterwards confirmed, and it's execution ordered by the arret of the council of state of 1681, of which we shall speak presently.

To this year the mark upon lace had not been established and practised, except in the jurisdictions of the custom-house of Lyons, for the point, which was imported from divers parts of Italy, particularly from Venice and Genoa.

In 1680, the king's farmer of the revenues, Monf. Boutet, having passed a lease to the Sieurs Joly and Fariol, of the under-farm of the impossi-duties upon thread-laces of Flanders and the Low Countries, was obliged, in order to enable the lessees duly to enjoy it, to present a petition to the royal council, that the declarations, ordonnances, arrets of council, leases of the farms, and tariffs of the king, should be executed according to the form and tenor thereof; to which the king having regard, his majesty ordered, by an arret of the 8th of April, 1681, that all merchants, carriers, and others who brought Flanders lace into the kingdom, should be obliged to pass through the jurisdiction of Peronne, and represent the same to the said jurisdiction, in order to have such lace duly marked, with the farmer of that revenue's mark, at both ends of each piece of the said lace, and to pay the customs due, according to the declaration of his majesty, and the tariff made by the council the 18th of April, 1667; which laces, and the acquittals of the payment of such duties, merchants and others were obliged to lay before the jurisdiction of the said farms established in the city of Paris, to be there viewed and examined, upon pain of confiscation, and a fine of 3000 livres, &c. which was executed as well in the jurisdiction of Peronne, for the laces which passed through there from the time of the said arret, as in * the shops and merchants warehouses for laces, which were before entered into the kingdom.

* This policy, in collecting the duties on foreign imposts, may deserve attention in other nations.

In 1682, the merchants complaining that their merchandize was opened and handled, in the said jurisdiction of Peronne, they having no correspondence there to take the care of them, the merchants and farmers of the revenue unanimously agreed, that the laces should pass only by Peronne, where should be taken security for their passage to Paris, where they shall be marked, and the duties paid, which has been practised ever since.

The duties on importation and exportation out of the kingdom, and the provinces reputed foreign, for all sorts of lace, are paid by weight; and the duties are more or less, according to the different species and qualities, and the places of their fabrication.

Of the principal LAWS of England with regard to LACE.

Gold or silver thread, lace, fringe, or other work made thereof, or any thread, lace, fringe, or other work made of copper, brass, or any other inferior metal, or gold or silver wire or plate, imported, to be forfeited and burnt, and 100 l. paid by the importer, for every parcel so imported. 10 Ann. cap. 26. sect. 65. and 15 Geo. II. 20. 7.

The allowance on gold and silver lace, thread, and fringe, exported.

By 10 Ann. cap. 26. §. 62. from 1 July 1712, for 32 years. By 3 Geo. I. cap. 7. §. 1. thence continued for ever.

Upon sufficient security before shipping, that the goods shall not be re-landed in Great-Britain, and oath before the customer or collector of the port, that they were actually made after the first of July 1712, of the plate-wire spun upon silk, the exporter thereof to foreign parts is to have the following allowances, viz.

Gold lace, thread, or fringe, the pound avoirdupoise weight, 6s. 8d.

Silver lace, thread, or fringe, the pound avoirdupoise weight, 5s.

To be paid out of the duties on gilt and silver wire, by the collector, or the commissioners, by a debenture from the collector of the customs, expressing the kinds and quantities, and the shipping testified by the searcher. 10 Ann. cap. 26. §. 62.

Foreign bone-lace, band-frings, cut work, embroidery, fringe needlework, made of thread or silk, and buttons of all sorts imported, forfeited; the importer liable to 100 l. and the seller to 50 l. 3 Ed. IV. cap. 3. §. 1.—1 Rich. III. cap. 10. §. 1.—19 Hen. VII. cap. 21. §. 1.—5 Eliz. cap. 7. §. 1.—13 and 14 Car. II. cap. 13. §. 2.—4 and 5 W. and M. cap. 10. §. 2.—9 and 10 Will. III. cap. 9. §. 1.—11 and 12 Will. III. cap. 11. §. 1.

Except thread bone-lace not made in the dominions of the French king, or the duke of Anjou. 5 Ann. cap. 17.

Of the form of the custom-house business relating hereunto.

3d of March 1730.—No. 35.

In the Tavistock of London, Daniel Bright master, for Jamaica.

Roger Granger.

Twenty-four pounds one ounce of silver lace, } value at
Twenty-eight pounds ten ounces of gold thread, } 200 l. in
Ten pounds five ounces of gold fringe, } all.

William Brooks [the maker] maketh oath, That the twenty-eight pounds ten ounces of gold thread, twenty-four pounds one ounce of silver lace, and ten pounds five ounces of gold fringe, avoirdupoise weight, above-mentioned, were all made since the first day of July 1712, and were all made of plate-wire spun upon silk.

William Brooks.

Jurat 3 die Martii 1730, coram me

A. B. Collector of the customs.

And, before the said goods are shipped off, sufficient security must be given to the collector of the customs, for the due exportation, in the following manner:

A bond for the exportation of gold and silver lace, thread, or fringe.

Noverint universi, &c.

Whereas the above-bounden Roger Granger hath this day entered outwards in the port of Southampton, on board the Tavistock of London, Daniel Bright master, for Jamaica, twenty-eight pounds ten ounces of gold thread, twenty-four pounds one ounce of silver lace, ten pounds five ounces of gold fringe, avoirdupoise weight, all made since the first day of July 1712, and made of plate-wire spun upon silk: and, whereas the said Roger Granger, upon the exportation of the said gold thread, silver lace, and gold fringe, for foreign parts, is to have an allowance or drawback, according to an act of parliament of the tenth year of the reign of her late majesty queen Anne, on that behalf made:

Now the condition of this obligation is such, That if the said gold thread, silver lace, and gold fringe, and every part thereof, shall be shipped, and really and truly exported into parts beyond the seas, and that the same, or any part thereof, shall not be re-landed, or unshipped with intent to be re-landed, or brought on shore again in any port or ports of Great-Britain: then this obligation to be void, or else to remain and be in full force, effect, and virtue.

Sealed and delivered in the presence of

A. B. Collector.

B. C. Comptroller.

Roger Granger.

Daniel Bright.

A debenture for gold and silver lace, thread, and fringe.

* Roger Granger did enter with us the 3d day of March 1730, in the Tavistock of London, Daniel Bright master, for Jamaica, twenty-eight pounds ten ounces of gold thread, twenty-four pounds one ounce of silver lace, ten pounds five ounces of gold fringe, all made since the first of July 1712, and of plate-wire spun upon silk, as appears by the oath of William Brooks.

A. B. Collector.

B. C. Customer.

C. D. Comptroller.

* 10 Ann. cap. 26. §. 62.

Bond

Bond is taken in the penalty of 38l. that the above-mentioned gold thread, silver-lace, and gold fringe, shall be shipped and exported, and that the same, or any part thereof, shall not be reloaded, or brought again into any part or parts of Great-Britain.

A. B. Collector.
C. D. Comptroller.

The twenty-eight pounds ten ounces of gold thread, twenty-four pounds one ounce of silver lace, ten pounds five ounces of gold fringe above-mentioned, were shipped the 6th of March present. Certified the 19th of March.

D. E. Searcher.
E. F. Surveyor.
F. G. Land-waiter.

REMARKS.

'Tis but few years since England expended, upon foreign lace and linen, not less than two millions yearly. As lace in particular is the manufacture of nuns, our British ladies may as well endow monasteries as wear Flanders lace, for thus Popish nuns are maintained by Protestant contributions. This manufacture, in Flanders, not only employs the hands of nuns and other women, but of great numbers of the country peasantry, who also work at it. The number of people employed all over Flanders in making lace is almost incredible, nor can the value be easily estimated*. This is a branch of trade that we may either do without, or else bring to perfection in time among ourselves, so as, perhaps, to be able to export quantities of it †.

* The most celebrated places for this manufacture, are Antwerp, Brussels, Malines, Louvain, and Ghent; in French Flanders, they make the best at Valenciennes and Lille, and in several places in the province of Normandy. Great quantities of black lace made of silk, are also wrought at those places, and vended in Germany, Spain, the Indies, &c. by the industrious inhabitants.

The manufacture of thread, in Flanders, has been also brought to a most surprising degree of perfection: M. Savary informs us, that they have spun thread, at Malines, so fine as almost to escape the sight, and the action of the very air easily breaks it. Thus, in order to spin it, the greatest precaution is necessary. It was in this town that fine threads were first manufactured for making of lace; but they have, at Lille and other places, come up to those spun at Malines. Thread has been manufactured in these places, from 7 or 8 livres the pound weight, to above 400 livres; so that nothing can well shew the value of industry to a greater degree.

† At Bland, a town on the Stour, between Salisbury and Dorchester, they make the finest lace in England. The author of the Tour through Great-Britain says, they shewed him some so exquisitely fine, that he never saw better in Flanders, and which, they said, was rated at above 30l. sterling per yard.

In Ireland, the Dublin society in particular, have already, by premiums and other attempts, done great service towards exciting a spirit of improvement and industry throughout that kingdom, and, from the encouragement lately given by his most sacred majesty for the same ends, it is to be hoped, that, in a little time, this kingdom may be made happily instrumental to Great-Britain, in vying with her rivals in trade, in many important branches, and, in conjunction with England, in this of lace among the rest. The Cork society also, to their great honour, follow the same steps, and have distinguished themselves of late by the same kind of proceeding: what may we not hope from such a spirit? Several times and places have been famous for the advancement of the sciences, such as that of Philip and Alexander in Greece, the first Cæsars in Rome, the house of Medicis in Florence, and Lewis the XIVth in France. What these persons and ages were to their respective countries, it is to be hoped, the laudable endeavours of the above-mentioned societies, added to the royal bounty, will be to this kingdom.

As all the improvements in the lace manufacture, as well as in the linen in general, depend upon flax, too much care cannot be taken of the cultivation of this article to the last perfection in Great-Britain. See FLAX.

The lace manufacture in England has greatly improved within these few years, and is likely to arrive at as high perfection in this kingdom, as it is in any part of Europe, by the means of the honourable and laudable society of Antiquarians, who have followed the example of the Dublin and Cork societies, in respect to lace; and, by their well-judged premiums, have been lately instrumental to produce lace manufactured in England, to an extraordinary pitch of delicacy*.

* August 7, 1752, six pieces of bone-lace for mens ruffles were produced, the premium of 10l. 10s. adjudged to Mr. William Marriott of Newport-Pagnel, Bucks, for the best piece.—For the second best 5l. 5s. to Mrs Elizabeth Waterman of Salisbury.

May 8, 1753, 14 pair of needle work ruffles, the premium 5l. 5s. adjudged to Mrs Maria Maule of Stonecutter-Street, London.—May 8, 1753, the second best to Miss Wiffendall

from Saxony.—The third best 2l. 2s. to Miss Anne Clarke of Leominster in Herefordshire, 14 years of age.—6 Pair of lady's lappets, the premium 15l. 15s. adjudged to Mrs Lydia Maynard of Honiton.—The second best to Mrs Mary Channon of Lynn Regis Dorsetshire.—The third of 5l. 5s. to Mrs Mary Bere of Lynn Regis Dorsetshire.

GOLD and SILVER LACE. This manufacture depends on the art of GILDING and WIRE-DRAWING. And those arts depend on the ductility of gold and silver.

To give some idea of this extraordinary property, to which we have occasion to refer.

Our gold-beaters and wire-drawers furnish us with abundant proof of this property: they every day reduce gold into lamellæ, or leaves inconceivably thin; yet without the least aperture discoverable, even by the microscope: a single grain of gold may be stretched under the hammer into a leaf that will cover a pretty large house, and yet the leaf remain so compact, as not to transmit the rays of light, nor even to admit of the transudation of the spirit of wine.

Dr Halley took the following method to compute the ductility of gold: he learnt from the wire-drawers, that an ounce of gold is sufficient to gild a silver cylinder of 48 ounces weight; which cylinder may be drawn out into a wire so very fine, that two yards thereof shall only weigh one grain, and consequently 98 yards of the same wire only 49 grains. So that a single grain of gold here gilds 98 yards, and of course the $\frac{1}{100000}$ part of a grain is here above $\frac{1}{4}$ of an inch long. And, since the $\frac{1}{4}$ of an inch is yet capable of being divided into 10 lesser parts, visible to the naked eye, it is evident, that the $\frac{1}{100000}$ part of a grain of gold may be seen without the aid of a microscope. Proceeding in his calculus, he found, that a cube of gold, whose side is the $\frac{1}{100}$ part of an inch, contains 2,433,000,000 visible parts: yet, though the gold wherewith such wire is coated, be stretched to such a degree, that there is not any appearance of the colour of the silver underneath.

Mr Boyle, examining some leaf-gold, found that a grain and a quarter's weight took up an area of 50 square inches: supposing, therefore, the leaf divided by parallel lines $\frac{1}{100}$ of an inch apart, a grain of gold will be divided into 500,000 minute squares, all discernible by a good eye. For the same author shews, that an ounce of gold, drawn out into wire, would reach 155 miles and a half*.

* See Boyle's Abr. Vol. 1. p. 405.

Monf. Reaumur has carried the ductility of gold a greater length: a gold wire, every body knows, is only a silver one gilt. This cylinder of silver, covered with leaf-gold, they draw through the hole of an iron: and the gilding still keeps pace with the wire, stretch it to what length they can. Now M. Reaumur shews, that, in the common way of drawing gold-wire, a cylinder of silver, 22 inches long and 15 lines diameter, is stretched to 1,163,520 feet; or is 634,692 times longer than before, which amounts to above 97 leagues. To wind this thread on silk for use, they first flatten it; in doing which it stretches at least $\frac{1}{4}$ further, so that the 22 inches are now 111 leagues: but, in the flattening, instead of $\frac{1}{4}$ they could stretch it $\frac{1}{2}$, which would bring it to 120 leagues. This appears a prodigious extension, and yet it is little.

The cylinder of silver might have been covered with one ounce of gold only, instead of six, as supposed: the gilding, indeed, in this latter case, will be but thin; still it will be gilding, and no point but will have its coat of gold. On this foundation Reaumur computes, that the thickness of the gold-leaf on the wire is $\frac{1}{100000}$ of a line. He adds, that, as the leaf-gold is not every-where the same thickness, but at least twice as thick in some parts as other, in the thinnest parts it will not be above $\frac{1}{100000}$ part of a line, or the $\frac{1}{6,300,000}$ part of an inch.

Yet this is not the furthest the artist can go: in flattening the wire gently between two wheels, it may be extended to double the breadth hitherto supposed; in which case the thickness of the leaf will be reduced to less than a millionth part of a line, or a twelve millionth of an inch.

Yet after all, putting a piece of this gilt wire in aqua fortis [see AQUA FORTIS] the silver will be dissolved, and the gold left a perfect continuous tube*.

* Mem. de l'Acad. An. 1713.

This force of cohesion in the parts of gold, which appear scarce less than infinite, depends on its being freed from common sulphur: for mix but one single grain of sulphur with 1000 grains of gold, the mass ceases to be malleable, till the sulphur be evaporated. Hence we have a strong presumption, that the less cohesive metals, tin, copper, and iron, contain a large quantity of sulphur.

The immense divisibility of gold is learnt from another experiment.—Take a pound of silver, and fuse it with a single grain of gold; the gold will diffuse itself equally through every minute particle of the silver; so that taking a grain of the mass, and dissolving it in aqua fortis, you will find a quantity of gold fall to the bottom, which bears precisely the same proportion to the grain of gold, as the gold in the mass had in the whole mass.

The

The wire and thread we commonly call gold-thread, &c. which is only silver wire gilt, as before observed, is drawn from a large ingot of silver, usually about 30 pound weight. This they round into a cylinder, or roll about an inch and a half in diameter, and 22 inches long; and cover it over with the leaves prepared by the gold-beaters, laying one over another, 'till the cover is a good deal thicker than that in our ordinary gilding: and yet even then it is very thin, as will be easily conceived from the quantity of gold that goes to gild the 30 pound weight. Two ounces ordinarily do the business, and frequently little more than one. In effect, the full thickness of the gold on the ingot rarely exceeds $\frac{1}{1000}$, or $\frac{1}{1000}$ part, and sometimes not $\frac{1}{1000}$ part of an inch.

But this thin coat of gold must be yet much thinner: the ingot is successively drawn through the holes of several irons, each smaller than other, 'till it be as fine, or finer than a hair. Every new hole lessens it's diameter, but it gains in length what it loses in thickness, and consequently increases in surface. Yet the gold still covers it, that following the silver in all it's extension, and never leaving the minutest part bare, not even to the microscope. Yet, how inconceivably must it be attenuated, while the ingot is drawn into a thread, whose diameter is 9000 times less than that of the ingot.

M. Reaumur, by exactitude of weight and computation, found, that one ounce of the thread was 3232 feet long, and the whole ingot 1,163,520 feet, Paris measure, or 96 French leagues, equal to 1,264,400 English feet, or 240 miles English: an extent, which far surpasses what Father Merienne, Furetier, Dr Halley, &c. ever dreamt of.

Merienne says, that half an ounce of the thread is 100 toises, or fathoms long; on which footing, an ounce would only be 1200 feet; whereas M. Reaumur finds it 3232, &c. according to what has been already observed.

The method of drawing silver is the same with that of gold, except that the latter is gilt or covered with gold, and the other is not.

There are also counterfeit gold or silver wires: the first made of a cylinder of copper silvered over, then covered with gold; and the second of a like cylinder of copper silvered over, and drawn through the iron, after the manner of gold and silver wire, and this again is gilt.

And a great quantity of the French gold and silver lace is certainly made of this sort, which is too often passed upon the world for other. This may deserve the regard of those, who are so mighty fond of French lace, to the detriment of the British gold and silver lace manufacture, which is in general of a far superior quality, wears far preferably, and will fetch more after it is worn out, from the intrinsic value of the gold and silver.

The Laws of England with regard to gold and silver LACE.

No metal inferior to silver shall be spun on silk, under penalty of 5 l. an ounce. Silver wire for making silver thread shall hold at least 11 ounces 15 pennyweights of fine silver upon the pound Troy weight; and all silver gilt, and used in the wire-drawers trade, shall hold at least 11 ounces 8 pennyweights of fine silver, for every pound Troy weight; and shall not have less than four pennyweights four grains of fine gold, without alloy, laid on each pound of silver, on penalty of five pence per ounce. For gold and silver prepared as before said, and reduced into plate, there shall be allowed six ounces of plate to five ounces of silk. A penalty of 2 s. 6 d. per ounce for selling gold and silver lace mixed with any other metal, and 5 s. per ounce for selling by any other than Troy weight: no gold or silver thread, &c. made of copper or other inferior metal, or gold or silver wire or plate, shall be imported, on pain of being forfeited and burnt, and 100 l. on the importer for each parcel.

LADING. See **BILLS OF LADING, CHARTER-PARTIES, FREIGHT.**

LAGAN, or LAGON, in our ancient marine laws, signifies goods shipwrecked, left by the sea, lying on the sand, either ashore, or out at sea. See **FLOTSAM, JETSAM, and WRECK.**

LANCASHIRE in England. This county has Yorkshire on the east, and the Irish Sea on the west, Westmoreland on the north, and Cheshire on the south, and is about 170 miles in circuit.

The air is serene and healthy, and the soil for the most part fruitful, yielding store of wheat, barley, and oats; and the pasture so nourishing, that their cattle are usually of a larger size than in other counties. Here is plenty of timber, coal and cannon coal-pits, with mines of lead, iron, and copper, antimony, black-lead, lapis calaminaris, besides allum, brimstone, and green vitriol, found in some of the coal-pits.

It's chief rivers are the Mersey, Ribble, Wire, Lon, and Ken; all which abound with fish. Another river, called the Irke, is noted for eels, reckoned the fattest in England, and too luscious for common digestion; which is ascribed to the grease and oils from the woollen cloths milled in it.

LANCASTER, the shire town, stands near the mouth of the river Lon. It is a populous thriving corporation, with a tolerable harbour and a custom-house. Vessels of 70 tons go

from hence to America, with hard-ware and woollen manufactures; but the country hereabouts is so thinly peopled, by reason of it's barrenness, that it cannot take off the sugars imported.

PRESTON on the Ribble, may, for it's beauty and bigness, compare with some cities. It is plentifully supplied with fish, coal, and other commodities.

LIVERPOOL is a large and populous town, and the most flourishing sea-port in these parts, pretending to rival, if not to excel Bristol, it's customs being increased eight or ten fold within these forty years past. The inhabitants are universally merchants; and, notwithstanding their out-of-the-way situation, drive an incredible trade, with great success, and very large stocks, to all the northern parts of the world, as to Hamburg, Norway, and the Baltic, to the British colonies in America, to Guinea and Ireland, and also to France, Spain, Portugal, and Italy; so that there is no trade but that of Turkey, Greenland, and the East-Indies, in which they are not concerned. As it imports almost all kind of foreign goods, it has consequently a large inland trade, and shares that to Ireland and Wales with Bristol, as follows: as Bristol trades chiefly to the south and west parts of Ireland, from Dublin in the east to Gallway west; this town has all the trade of the east and north shores, from Dublin to Londonderry: as Bristol has the trade of South Wales, this has great parts of that of North Wales: as Bristol has the fourth west counties of England, and some north of it, as high as Bridgenorth, if not to Shrewsbury, Liverpool has all the north counties, besides what goods it sends to Cheshire and Staffordshire, by the new navigation of the rivers Mersey, Weaver, and Dane, even so near to the Trent, that it's goods are carried by land to Burton. The merchants of Liverpool are also concerned with those of Londonderry, in the fishery on the north coast of Ireland. There is a navigation from hence farther up the Mersey, even for ships of burden, as high almost as Warrington; and also up the south channel, called the river Weaver; but it is chiefly for two things, 1. For rock-salt, which is dug out of the earth, both in this county and Cheshire, and shipped off here in great quantities, not only to neighbouring parts, but to London, Colchester, and several other places in the south of England, where it is dissolved in sea-water, and boiled again into a stronger and finer, as good as that sort called salt upon salt, made by the Dutch of the St Ube's salt, and with which they cure their herrings. 2. For great quantities of Cheshire cheese shipped here.

REMARKS in 1764.

By an authentic account we have from Liverpool this year 1764, there were lying in that port the following vessels; viz. 81 ships, 27 snows, 67 brigs, 6 schooners, 3 doggers or ketches, 141 sloops; and only one ship and four brigs sailed; which reduced the number to 351 vessels lying in this harbour at the same time: an instance not to be equalled by any port belonging to Great-Britain, except the mother-port of London; especially when we consider that none of the merchants ships were accidentally forced into this harbour by contrary winds.

WARRINGTON stands on the Mersey, and is a populous and rich town, full of good country tradesmen, and has a particular market every week for linen, which is generally that called huckaback, the manufacture of it's neighbourhood; and it is said that at least 500 l. worth, and sometimes much more, is sold every market-day.

MANCHESTER, as an inland town, has perhaps the best trade of any in these north parts. The suttan manufactures, called Manchester cottons, for which it hath been famous for almost 150 years, have been very much improved of late, by some inventions of dyeing and printing; which, with the great variety of other manufactures known by the name of Manchester goods, as ticking, tapes, filletting, and linen cloth, in-rich not only the town, but the whole parish, and render the people industrious. The weavers have looms here that work 24 laces at a time, an invention for which they are obliged to the Dutch*.

* How far it may be good policy for a commercial state to make use of machines to lessen the price of labour, see the article **LABOUR**, towards the conclusion, also the article **MACHINE**.

ROCHDALE is another town of good trade, being of late years much improved in the woollen manufacture.

BURY is a town also of good trade. It is the utmost bound of the suttan-manufacture, and drives a considerable trade in coarse goods, called halsticks and kerseys, for which here is a very great market, though the town lies so much out of the way, and at the foot of the mountains, that otherwise it would not be much frequented.

BOLTON is a staple for suttans of divers sorts, especially those called Augsburg and Milan suttans, which are brought to it's fairs and markets from all parts of the county.

ORMSKIRK is a handsome town, with a good inland trade.

HAWKSTEAD has a good trade in cloth, in that part of the county called Fownness, towards Cumberland and Westmoreland.

LANDED INTEREST.

The reason why the decline of foreign trade sinks the value of LAND.

First, By sinking the markets at home. For, the produce of land being rendered excessively dear, from the causes below enumerated*, foreigners will not take it's superfluities; and labour being by the same causes rendered excessively dear too [see the article LABOUR] we cannot manufacture, or improve that produce, nations that can afford cheaper (supplying the markets abroad; so that the produce of the lands, not being carried off as usual, must become a dead stock on the farmers hands, and cause great quantities to be crowded into the markets, where being encouragement but for few buyers, the price naturally falls: as, for instance, the declining demand for our woollen goods abroad falls the price of wool at home.

- * The foreign trade of every country must decline, that
 1. Lays unequal taxes in general on it's people. See the articles LABOUR and TAXES.
 2. That cramps it's commerce, the fountain of riches, by high duties, and impolitic prohibitions. See the articles DUTIES and BONDING of duties at the custom-house, and the article CUSTOMS.
 3. That suffers many monopolies. See the articles COMPANIES and MONOPOLIES.
 4. That oppresses it's people by prohibiting the importation of victuals, under the pretence of raising the value of it's lands. See IRELAND, remarks thereon.
 5. That encourages idleness by bad laws relating to it's poor. See the article POOR.
 6. That tempts foreigners to carry away it's coin for less than it's intrinsic value. See the articles COIN and MONEY.
 7. That makes the obtaining justice chargeable. See the articles CONSULS and MERCHANT [COURT MERCHANT.]
 8. That suffers a heavy national debt, contracted in time of war, to continue unpaid in time of peace. See DEBTS [NATIONAL DEBTS], CREDIT [PUBLIC CREDIT], FUNDS.

Suppose that, in 1669, we exported to Turkey	}	1. 80,000
40,000 cloths, the value of raw wool in each being 2l. amounts to		
Suppose that, in 1738, we exported to Turkey	}	12,000
8000 cloths, the value of raw wool in each being 1l. 10s. amounts to		
The difference of the value of wool exported in those two years		1. 68,000

Wools of this value, lying yearly on hand, must make a glut; the farmers push to sell at market, but in vain, unless at under prices; for the wool-staplers, finding the demand decreases, decrease in number themselves; some break, some leave off trade, some take to other trades; for many sellers, with great stocks on hand, and few buyers, naturally fall the markets; and the landlords pressing the tenants for rent, and threatening to seize if payments are not made, the wool must be sold at any rate to raise money; and there being yearly 68,000l. less money brought into the nation, to be laid out in wool, than in former times, the price must be still lower on that account; the lower the produce falls, the less rent the farmer can give for the land; the worse the markets, the greater arrears of rent the farmer runs into; and taxes, monopolies, &c. making necessities grow dearer, and the decay of foreign trade making the wool sell cheaper, must break him in the end, and then the farm is thrown on the landlord's hands, who, unwilling to fall the rent, keeps it in the management of stewards or bailiffs, whose profits and charges seldom make it pay the old rent, but generally ends in mortgaging the land, or selling it; and, as these cases grow more frequent, more estates will be at market, and, consequently, the less prices they will fetch.

Secondly, By increasing the number of poor, to burden the land.

The poor, wanting employment, must be supported by the land; if foreigners give them work, they give them bread; but, when trade cannot maintain them, land must. When the poor's rates are heavier than the tenant can bear, the landlord must pay them, either by allowance in the rent, or by taking the farm into his own hands; or else by breaking of his tenant, who has paid that money to the poor's rates his landlord should have received.

Suppose, in 1669, the labour of the above	}	40,000 People
40,000 cloths to have given employment to		
Suppose, in 1738, the labour of the above	}	8,000 People
8000 cloths to have given employment to		

The difference is		32,000 People
Suppose these 32,000 people to have earned by their labour formerly, from foreigners, 6l. per annum each, it amounts to	}	1. 192,000
But, wanting employment, they come on the parish, at 1s. 6d. per week each, which, for one year, amounts to		
		124,800

The difference to the landholder, in one year is 1. 316,800

VOL. II.

For as the land, by the decay of foreign trade, receives not the first sum, and is, by the same cause, saddled with the latter, it makes an annual difference of the above sums to the landholders in this single branch of labour, and is the same in proportion for all other decayed branches of trade.

Thirdly, By decreasing the stock of people.

For, as employment lessens, the most industrious, rather than starve here, will fly to other countries, where trade can maintain them; so, the consumption of these being taken away, the demand at market must grow less, and, of course, rents must fall, yet the farmers charges must grow greater; for, the fewer hands, the higher wages are; this must break him in the end, and produce all the consequences following that misfortune, mentioned in the first remark: besides, it is men that trade, and bring in money, therefore, the fewer they are, the less money will be brought; and, the less money, the less rent can be given for land.

Fourthly, By decreasing our riches.

This is a consequence of the above three remarks; for having fewer goods capable of being exported, by reason of their dear price, and our manufactures declining, must in time be lost: therefore the importation of foreign goods must naturally increase, and more money go out to pay for them.

Nations that have no mines of gold and silver, have no means to get them but by foreign trade, and, according to the degree of these metals they possess, the prices of their commodities, and therewith the value of their lands, rise and fall in proportion; which I shall now prove.

The Britannia Linguens, page 12, says, If there were but 500l. in England, an ox could hardly be worth a penny; therefore the rent must bear it's proportion to the riches. This appears by Maitland's History of London; for he says, that, in the year 961, land sold at 1s. per acre. The reason the land then bore so low a price, was, the low price the produce sold at; for he says, that, in the year 1000, an ox sold for 2s. 6d. a cow for 2s. a sheep for 1s. and a swine for 8d. This could be only owing to the little foreign trade the nation then had, and, consequently, to the little quantity of gold and silver, trade had then brought in.

But if it should be asked, What is the reason that, at present, all things are naturally so much advanced in price, to what they were in those days? The answer is, That the quantities of gold and silver brought to Europe since the progress made by the Spaniards and Portuguese in America, have made those metals more common, and of less value than formerly, so that 20s. will hardly purchase what 1s. would before the discovery of the West-Indies*.

- * Let there be added to this consideration, that also the great increase of our national debts and taxes, in consequence thereof, together with the circulation of the interest of the principal money of the public funds, and likewise that great circulation of paper credit in trade, occasioned by notes and bills, in the way of private credit, which is destructive of our trade. See CREDIT [PRIVATE CREDIT.] Also the circulation of property by mortgages, and by means of the public securities in general; for, although one is obliged to take annuities in payment, yet who would refuse them on peculiar occasions? These things all conspire to promote an artificial circulation of property, which raises the price of commodities, and has the appearance, with too many, of the riches of the nation; whereas these things are the characteristics of a declining condition, and that we stand in need of a quantity of real hard money to circulate what trade we have, and are therefore obliged to make use of paper credit, which is only it's representative, and proceeds from our apparent necessities, not from our increase of solid treasure. This is certainly the case, unless it can be proved, that our national debts, and the taxes on labour and commodities occasioned thereby, are blessings, and that, the more we increase our debts, the richer the nation will be. Perhaps too some will attempt to persuade us, that the more mortgages of land there are in the kingdom, and the oftener they are transferred, and the more private paper credit passes in trade, instead of ready cash, the richer the nation is; but these are egregious mistakes, and ought to be vigilantly guarded against; for, upon the annihilation of this shew of artificial wealth, the price of labour and commodities will fall to their natural value; which will be the means of so increasing our trade, that our paper circulation will become realized by solid gold and silver; and then the price of labour and commodities will be reduced to a natural state, according to the real, and not the imaginary riches of the nation. For further confirmation of these principles, see the articles DEBTS [NATIONAL DEBTS], CREDIT [PUBLIC CREDIT], DUTIES, FUNDS, LABOUR, MONEY.

The Spaniards and Portuguese do not throw away their gold and silver for us to pick up; we have no mines of these metals, therefore could not get such quantities as we have, but by our trade to Spain and Portugal, or to those countries that had an overbalance upon them, and were overbalanced by us.

So that the present natural price of land, and it's produce, is the proportion of gold and silver that foreign trade hath brought into, and left in the nation. If the present quantity was to be doubled by foreign trade, the natural price of land, and it's produce, must be so too; for, according to the price the farmer

C

farmer can sell his commodity at market, he can pay for the rent of land, and no otherwise. If our foreign trade decays until the present money in the nation be half swept away, the produce of land must sell for half the natural price it does now, and land must let at half the rent it naturally bears now: but if we should go on declining, until we have no more money left in the nation than there was in 961 or 1000, the prices of land, and its produce, can be no more than they bore in those days, taxes, &c. deducted.

Therefore, if the landed gentlemen have a mind to raise or sink the value of their lands, the encouraging or discouraging our foreign trade is the only means to do either, so closely united are land and trade; their true interests are the same; they must stand or fall together.

The sum of all is this: that

What foreigners take from others, instead of us,	} Sinks the value of lands.
What the poor have given them instead of buying	
The scarcity of people	

The scarcity of money — — — — — }
Taxes, monopolies, ill-judged laws, and national debts, are the causes of the decline of our foreign trade; the decline of foreign trade causes the above calamities, and they sink the value of lands.

Before we conclude this point, we shall observe, that our chief intent, from what has been urged, is to remove that destructive prejudice arising from the false distinction of landing and trading interests, by shewing that there neither is, or can be any difference of interest between them; for whatever clogs trade, must sink the value of lands, and that any benefit to trade, how remote soever it may seem from land, will at last terminate in the increase of its value; therefore we may dare to affirm, that the giving trade the utmost encouragement is the greatest and most solid improvement of the value of lands. It must be evident, says the author of *Britannia Languens*, page 290, that, were our trade eased as our neighbour nations, England would have the superiority, since the same causes must produce greater effects in England, being ingorged with those national advantages which no other nation doth or can enjoy.* See BRITAIN [GREAT-BRITAIN.]

REMARKS.

Of the effects of LAND-TAXES, compared with those upon COMMODITIES.

As the benefit of taxes to the public results only from the nett income, and the evil to individuals extends not only to the gross produce, but to every other expence and loss incident and consequential, that tax is most beneficial to the public, and least injurious to the subject, which produces a large sum through a cheap collection, and which is exempt from every other eventual charge.

To use a familiar instance: he who attends to his own affairs, lives upon his own land, employs but one steward, at a small salary, to receive his rents, and buys at the first hand, may, from a small and compact estate, thus conducted, spend and save more than the lord of an immense rental, widely dispersed, gathered by many hands profusely paid; he living at a distance, and purchasing what he consumes from the fourth or fifth retailer. That a land-tax is attended with the least expence of any other whatsoever, that does produce not any thing near the nett sum annually, is matter of fact.—Quære, therefore, whether LAND-TAXES are not far more beneficial to the public than TAXES ON COMMODITIES? How taxes upon commodities really affect the commerce of the nation, see the article LABOUR. It becomes necessary, however, to expatiate upon this important subject in other lights. As the good of our country should be the only object of such disquisitions, and truth the only medium through which it ought to be attained, advantage shall not be taken of a maxim favourable to the opinion here professed, although it hath been long received, and is supported by the greatest authorities.

The maxim in view is, That taxes, wherever laid, fall ultimately upon land; which with all due deference to those who first established it, and to those who have since adopted, and argued from it, seems to go farther than reason and experience will warrant.

The arguments, by which it has been maintained, seem rather calculated to puzzle than convince; for, although every man cannot answer the premises, yet scarce any will assent to the conclusion, 'That in fact, and in reality, all the taxes in this nation are paid out of its lands.' And strange it were if many agreed in the proposition, for it is certainly false.

When a tax is laid upon any commodity, it becomes a circumstance of expence, of the same nature with any other attending upon it. Therefore no reason seems assignable, why the tax should necessarily fall upon land, that will not equally conclude for every other circumstance, and for settling the whole charge of national expence and consumption upon the same bottom.

But this is impossible: for it is agreed by the best authors of political arithmetic, that the rents of lands, houses, and mines,

are not more than $\frac{1}{4}$ part, and half of the annual expences of the nation.

In Sir William Petty's computation of 7 millions of people in England, who, one with another, expended, for their lodging, feeding, and cloathing, 7l. a head, the annual expence and consumption of the whole people amounted to 49 millions: and Dr. Davenant's calculation of rents does not exceed fourteen.

The quantities are since, no doubt, considerably increased; but, as, most probably, the proportions remain very little unaltered, it is fair to argue upon them, as has been done by the best writers upon these subjects. But, Mr. Locke having treated of a tax upon land, a few extracts may not be improper from that incomparable author, which, with some restrictions, shall be applied to the present purpose.

'A tax laid upon land, says that great man, seems hard to the landholder, because it is so much money going visibly out of his pocket: and, therefore, as an ease to himself, the landholder is always forward to lay it upon commodities. But, if he will thoroughly consider it, and examine the effects, he will find, he buys this seeming ease at a very dear rate; and, though he pays not this tax immediately out of his own purse, yet his purse will find it, by a greater want of money there at the end of the year than that comes to, with the lessening of his rents to boot; which is a settled and a lasting evil, that will stick upon him beyond the present payment.

'To make this clear, let us suppose in the present state of affairs in England, that the rents of England are 12 millions, and that the charge and necessities of the government require a supply of 3 millions from the parliament, which is laid on land.

'Here is $\frac{1}{4}$ part of his yearly income goes immediately out of the landlord and landholder's pocket. This is a burden very apt to be felt. The country gentleman, who actually pays the money out of his pocket, or finds it deducted out of his rent at quarter-day for taxes, fees and very sensibly observes, what goes thus out of his estate: but, though this be a quarter of his yearly income, and, out of an estate of 400l. a year, the public tax now openly takes away one hundred; yet this influences not at all the yearly rent of the land, which the rack-renter, or under-tenant, pays; it being the same thing to him, whether he pays all his rent to the king or his landlord; or half, or a quarter, or none at all, to the king: the ease is all one to him, what hand receives his rent when due: so trade flourishes, and his commodities go off well, he will be able to pay his rent on. This lessens not any more the value of his farm, than an high or low chief rent does, paid out of it to the lord of the fee: the tenant's bargain and profit is the same, whether the land be charged or not charged, with an annuity payable to another man.

'But suppose, to shift off the burden from the land, some country gentlemen should think fit to raise these 3 millions upon commodities, to let the land go free. First, it is to be considered, that since the public wants require 3 millions (for that we suppose for argument sake, let it be 3 millions, or 1 million, that's all one) and so much must go into the king's coffers, or else the necessities of the government will not be supplied; that for raising these 3 millions on commodities, and bringing so much into the Exchequer, there must go a great deal more than 3 millions out of the subjects pockets. For a tax of that nature cannot be levied by officers, to watch every little rivulet of trade, without a great charge, especially at first trial. But, supposing no more charge in raising it than of a land-tax, and that there are only 3 millions to be paid, 'tis evident, that, to do this out of commodities, they must to the consumer be raised a quarter in their price; so that every thing, to him that uses it, must be a quarter dearer.

'Let us see now, who at long-run must pay this quarter, and where it will light. 'Tis plain, the merchant and broker neither will nor can; for, if he pays a quarter more for commodities than he did, he will sell them at a price proportionably raised*. The poor labourer and handicraftsman cannot, for he just lives from hand to mouth already; and, all his food, cloathing, and utensils, costing a quarter more than they did before, either his wages must rise with the price of things to make him live, or else, not being able to maintain himself and family by his labour, he comes to the parish, and then the land bears the burden a heavier way. If the labourer's wages be raised in proportion to the increased rates of things, the farmer, who pays a quarter more for wages, as well as all other things, whilst he sells his corn and wool, either at the same rate, or lower, at the market (since the tax laid upon it makes people less forward to buy) must either have his rent abated, or else break and run away in his landlord's debt, and so the yearly value of the land is brought down. And who then pays the tax at the year's end, but the landlord; when the tenant, not able to raise his rent by his commodities,

* See that charge, and the consequence of duties on commodities, proved under the articles LABOUR and TAXES.

‘either runs away in his landlord’s debt, or cannot be continued in the farm without abatement of rent? For, when the yearly charge in his farm is greater by the increase of the labourer’s wages, and yet his produce sells cheaper, by reason of the tax laid on his commodities, how will the farmer be able to make up his rent at quarter-day? For this may be worth our notice, that any tax, laid on foreign commodities in England, raises their price, and makes the importer get more for his commodities; but, on the contrary, a tax, laid on your native products and home-made commodities, lessens their price, and makes them yield less to the first seller.

‘If, therefore, the laying of taxes upon commodities does, as it is evident, affect the land that is out at rack-rent, it is plain it does equally affect all the other land in England too; and the gentlemen will, but the worst way, increase their own charges; that is, by lessening the yearly value of their estates, if they hope to ease their land by charging commodities. It is in vain, in a country whose fund is land, to hope to lay the public charge of the government on any thing else: there at last it will terminate. The merchant (do what you can) will not bear it, the labourer cannot, and therefore the landholder must: and whether he were best to do it, by laying it directly where it will at last settle, or by letting it come to him by the sinking of his rents, which, when they are once fallen, every one knows, are not easily raised again, let him consider.’

Some passages in the foregoing abstracts seem to be too general, and, possibly, not quite consistent with one another.

For it is not easy to conceive, if ‘taxes laid upon commodities raise the price proportionably to the consumer, why the farmer must sell his corn and wool either at the same rate, or lower at the market;’ or, if the reason assigned be a good one, that ‘the tax, laid upon it, makes people less forward to buy,’ why that reason should not have the same operation upon other commodities, not so indispensably necessary for the use of men; and, why ‘a tax, laid upon our native product and home manufacture, may not make them yield less to others besides the first seller.’

And it certainly often hath this effect. For, as the demand for commodities is proportioned to the quantity of money subsisting in the market, traders must adapt their prices to that quantity; and, if additional taxes be laid, while the money, with which commodities are to be purchased, remains unincreased, they must be contented with smaller gains, or not trade at all. And the first part of the alternative will always be the case, where the profits of a flourishing trade may well support some diminution.

When Mr. Locke says, ‘that the merchant and broker neither will nor can bear a tax; that, if he pays a quarter more for commodities than he did, he will sell them at a price proportionably raised,’ these are propositions which seem too general: and that great matter of reasoning, in a subsequent passage, appears sensible, that they required some qualification; where, after an assertion, that, ‘lay your tax as you please, the traders will shift it off from their own gain,’ he subjoins these words, ‘the merchants will bear the least part of it, and grow poor the last.’ And a little farther he says, ‘a country may thrive, the country gentleman grow rich, and his rents increase (for so it has been here) whilst the land is taxed: but I challenge any one to shew me a country, wherein there is any considerable public charge raised, where the land does not most sensibly feel it, and, in proportion, bear much the greater part of it.’

Wherefore, although it be admitted, that Mr Locke’s first position, taken in it’s full extent, and without any limitation, is generally controvertible, yet it is conclusive as to our present situation; if it be confessed, that the lands of England are, in general, let at too high a rent, and that our trade is injured by the taxes already laid upon it. For then the inference will be plain, what the farmer and trader cannot pay out of their gains, the land-owner must pay out of his lands, or the farmer will fail, and the trader become bankrupt. Whether, therefore, it is better to lay the taxes immediately on land, as Mr. Locke insinuates, since the greatest part of them terminate there, may deserve consideration; because the expence, in collecting of such taxes, bears no comparison to those that are laid upon commodities. For, how greatly the expence of these is enhanced, is proved under the article LABOUR.

Certain it is, that no good to the nation can be produced by taxes upon commodities. They may starve the industrious, but they never will induce the idle and extravagant to labour, and to save for the benefit of his landlord; and the wisdom of such landlords, who, under such pretences, would lighten their own burdens, by laying insupportable weights on their tenants, is of a piece with that economy, which, to swell a large rental, beyond it’s natural size, loses, by a rise of rents, much more in money than it gained upon paper. And it does not require much logic to demonstrate, that, where the tenant is undone, the land must proportionably suffer.

In order to prove the evils arising to our trade from the heavy

taxes with which it is incumbered, it were, perhaps, not just to consult the opinion of actual merchants, who, upon this subject, are prejudiced judges. But,

The testimony of those who have long withdrawn themselves out of trade, hath ever been deemed the best authority; and, as such, the late Sir Matthew Decker cannot be refused.

He tells us in favour of his scheme, that ‘it would set the merchant and shopkeeper free from a multitude of false and vexatious, or frivolous informations, which may now be lodged against them: that the charge upon the revenue is now computed at above one million: that, as the duty upon merchandize imported from abroad, as well as upon our own exciseable goods, amounts, on an average, to about 50 per cent.’ (and, since Sir Matthew wrote, it hath been greatly increased, by a very great additional duty on imports) ‘it would, continues he, enable the merchant, as well as the shop and warehouse-keeper, to trade with half the stock, and make his profit the same, or rather increase it, in proportion to the lesser sum for which he can purchase the same commodity.’

It would also encourage the great merchants, when they buy any goods upon speculation, as they call it, to keep the laid goods at home, and employ their own warehouses; whereas, as the case now stands, they are, in prudence, obliged to ship off such goods, as are intitled to a drawback of 30, 40, and even more per cent. for Holland, or other places; whereby Dutch ships are not only benefited, but we pay commission, warehouse room, and other incidental charges, which our own people might put in their own pockets, and have the goods in their own possession.’

The ingenious Mr. Wood, beside much excellent reasoning upon the same principle, refers us, for farther proof, to the customs, which, says he, ‘since the additional duties and impositions on some species of goods, have not actually produced so much as before.’

It is computed by the British Merchant, that, out of 49,000,000*l.* expended and consumed by our people at home, not more than 4,000,000*l.* are of foreign commodities.

There remains, therefore, 45,000,000*l.* for an annual expence and consumption in home products and manufactures. Of these the land-owner can expend and consume no more than his rents, and they are computed at no more than 14,000,000*l.* therefore, above two parts in three of home products and manufactures are expended and consumed by all other denominations of our people.

Whatever is expended and consumed at home, or exported into other countries, whether of home or foreign commodities, is the fruit of our lands, of the labourer and artificer, or is purchased by these fruits.

In 1713, the British Merchant computed our imports at 5,000,000*l.* and our exports at 7,000,000*l.* Of these one million he supposes to be of foreign commodities. Therefore, even at that time, our own consumption and foreign exportation amounted to 56,000,000*l.*

But, whatever is produced by land, by the labourer and artificer, is paid for by those, who rent lands, and employ labourers and artificers. Therefore, the farmer and trader contribute three parts in four, more than the land-owner can, to the employment of our people, and to the wealth and expences of the nation.

Landed men are, quatenus such, of advantage to the public, only in what they spend: traders are of advantage, by what they spend and by what they gain; and the gains of traders exceed their expences. A rise of rents can only be through an increase of employment, since lands can only rise by an increase of products and manufacture, and these are the fruits of labour and art. But land-owners, as such, can give no increase to employment, without a previous increase of rents.

Therefore they must be indebted for all such augmentations to trade, and to an increase of trade. If Dr. Davenant speaks truth, the whole rental of England, in 1600, did not exceed six millions, and the price of lands was 12 years purchase. In 1688, the rental was 14 millions, and the price of land was 18 years purchase: so that, within this period, the landed interest rose from 72 to 252 millions. And, in so much at that time, it stood indebted to an increase of trade. From the same cause, circulating by industry through innumerable different channels, life, and strength, and spirit, were proportionably derived to the whole: necessities to the poor, ease and comforts to the middle rank, affluence and magnificence to the wealthy and the great.

They who pay for the employment, expence, and consumption of others, pay, in like degree, all taxes laid upon these articles. Therefore, the farmer and trader pay three parts in four more than the land-owner, to the support of government; and mankind is indebted to them, in the same proportion, for all natural and civil enjoyments.

To them, and to their prosperity it is owing, that, since the Revolution, this nation hath been enabled to bear those drains of treasure, which must long since have exhausted their vitals, had she no supply to trust to, but the landlord’s waiving rents, and the tenant’s diminished gains, with some small rivulets of foreign trade stealing in upon her.

Since that happy deliverance, commerce hath produced sums sufficient to maintain armies and fleets, in defence of our liberties, and of that establishment on which they are founded; while the tenant hath been enabled, under an increasing load of taxes, and of rents raised on him, to cultivate and improve the lands of this nation.

But a continuation of public expences in peace, which ought, in a great measure, to have ceased with war, squandered the provision which should have been laid up for the day of danger and trial. That day came, and found the nation incumbered, after above 20 years of peace, with near the same load, that was heaped upon her by two successive wars. And the same bad policy, which lengthened out the expence beyond the occasion, rendered the burden more heavy, by the manner of collecting it. No wonder, if, in these circumstances, trade bleeding at every vein, had not strength, although her growth was miraculous, to support heavier loads, than ever were before laid upon the shoulders of this nation; and that some branches of commerce should droop and decay under the baleful influence of such weighty taxes, while our commercial competitors planted their interests where ours once flourished, and gathered the fruits of wiser management. From the same cause, the tenant can no longer supply an advance of taxes out of his declining stock; and, instead of that good class of men, the ancient strength and glory of this country, the wealthy, industrious, and sturdy yeomen, a race succeeds, of puny, abject wretches, tamed by want and servitude.

With the yeomen, the middling gentry of small estates, seem hastening to annihilation. The few remaining (for they every day decrease) are possibly the most miserable beings amongst us; with nothing left undiminished that belongs to their fathers, but pride and appetites beyond their fortunes. And these taxes, which have near devoured their little substance, have in no inconsiderable degree impaired the possessions of the greatest.

These are the effects of taxes upon commodities; which had they, according to Mr Locke's intimation, been rather raised wholly upon land, how many millions would have been saved to the nation, by the different manner of collection, and how would the landed interest have prospered?

Mistake us not, we are not pleading for land-taxes, but shewing the comparative difference only between them and taxes upon commodities, which must prove destructive of the national trade. See the articles DUTIES, LABOUR, and TAXES. The inequality in laying the land-tax, a circumstance much complained of by some, and justified by others, does not regard the present subject. It may be a proper matter of contest between the owners of lands; and, if it be a grievance upon some of them, sufficient to deserve the redress, the parliament ought to grant that redress, and alter the particular measures by which they are rated.

But, however that matter may stand between the individuals of the landed interest, the proposition remains in full force, 'that a tax upon land is more advantageous to the community in general, and the landed interest in particular, than that upon commodities, and more effectual for those purposes, which render taxes necessary.'

Nor is the inequality, in laying this particular tax, attended with any of those disadvantages to the public, which would arise from the same cause in taxes laid upon commodities; since, in this instance, they who pay more than their share to the land-tax, are the only sufferers; whereas other inequalities fall more diffusively, and may finally center upon the whole landed interest.

It has been objected to this, that through a land-tax the moied men escape, but this is totally devoid of foundation. For, Not to insist upon that share, which some of them really pay in the form of a land-tax, in every tax that affects consumption, they are taxed like other men, in proportion to what they consume. And, on the supposition, that commodities are already taxed as high as they can bear, these men cannot be taxed at more, through this medium.

Were mortgages or the funds to be taxed, matters would not be mended. For, as taxes, wherever placed, can have no tendency to lower the interest of money, they who buy into the funds, would buy so much cheaper as the tax would amount to, and the lender upon mortgages insist upon a higher rate of interest.

Besides, they, who by lending their money upon lower terms, than would be done if the lender were taxed, or by giving a higher price for stocks, enable others the better to pay taxes, contribute, in reality and effect, their share, as much as those who pay them. And, in this sense also, the mortgagee and stockholder are equally taxed with the owners of land.

But, if it be still insisted on, that the actual possessors of the soil are the only payers to the land-tax; this distinction will greatly reduce the importance of those, who are the subject of our present consideration; since a deduction must be made from that landed interest of their interest in land, who, by mortgages, are the legal and absolute proprietors; and also of that share absorbed out of land by every tax, which mediately or immediately affects it.

Lastly, It hath been said, that in distant counties the quantity of circulating money is not sufficient to supply the tax. As in these distant counties, for much the greater part, the land-tax is lower rated than in a nearer neighbourhood to the metropolis; this objection contradicts that which hath been mentioned, and seems, if any thing will, to justify the inequality of the measure, by which the tax is raised.

Yet no argument seems capable of justifying so extraordinary an inequality, in any kind of tax whatever; more especially of a land-tax, that being raised at the least expence of any whatever; and, if that tax is, more or less, to be continued to perpetuity, it ought to be equally raised, since, in that case, it would produce double what it ever has done; and, if the surplusage, from one shilling in the pound to four, should, as shall be required, be applied to the sinking fund, it would put the national debts once more into the parliamentary way of redemption, and thereby pave the way to the annihilation of taxes, upon our native produce and manufacture.

But taxes of all kinds cannot be too equally laid, nor too unexpensively raised. And therefore, that the land, as well as commodities, might be effectually eased of their weighty incumbrances, it becomes the wisdom of the legislature to think seriously of some UNINSHANCEABLE TAXES, that will effectually answer that great end; either that proposed by the late Sir-Matthew Decker, Bart. or one or more something similar thereunto; for taxes of that nature, collected at a small expence, seem to be the grand specific to give succour to our land and our trade, by freeing them from those burthens, which, if multiplied, must prove the inevitable ruin of both. See the articles CREDIT [PUBLIC CREDIT], DEBTS [NATIONAL DEBTS], FUNDS, TAXES.

The landed gentleman being convinced that his interest must rise or fall with trade, and that taxes on native commodities must, at length, prove the ruin thereof, it becomes his interest to study the national benefits of commerce. How this can be done to the purpose, is the next consideration. To which end we submit the following queries.

1. Whether the country gentleman, unacquainted with practical trade, can be presumed capable of making so good a judgment of what may tend to it's national prosperity, as one acquainted therewith?
2. Whether the country gentleman, being equally knowing with the skilful merchant in the ways of conducting trade, and the essential usages among traders, and laws of nations relating thereto, may not be esteemed better qualified to promote the public interest of trade, though not practically engaged therein, than the merchant, who, being interested in any peculiar branch, may be somehow biased in his judgment, in regard to his own peculiar trade?
3. Whether this Dictionary of Commerce may not be instrumental so to inform the country gentleman in the nature of trade, as to enable him to judge properly thereof, in any public capacity, for the benefit of the nation in general?
4. Whether the country gentleman, in any public capacity, from the consul to the ambassador, may not, by means hereof become serviceable to the commercial interests of his country abroad, as well as in any post of honour at home, from the clerk in a public office to the senator?
5. Whether a well grounded knowledge in the practical and political nature of commerce, and the money affairs of the kingdom, may not prove more generally instrumental to the rise and prosperity of country gentlemen, and the male branches of their families, than any other kind of knowledge whatever?
6. Are not the capital debates in parliament mostly upon matters that have relation to commerce, and the money-affairs and public credit of the nation? And are not likewise our concerns and negotiations with foreign courts principally with regard to affairs of trade and navigation?
7. Whether those studies do not require as regular a course of erudition as any other whatever, to arrive at any distinguished degree of discernment therein?
8. Whether the proper establishment of one or more colleges, for purposes so highly beneficial and honourable, would not as well become the wisdom of this nation as any other kind of literary institution whatever?

REMARKS.

The late ingenious Mr. Carey of Bristol, in his Discourse on Trade, where he recommends to the parliament a standing committee of trade, constituted of men well versed therein, to scrutinize into whatever comes before that most honourable assembly, says, 'That, in the management of things of much less moment, we employ such who are supposed to understand what they undertake, and believe they cannot be carried on without them; whilst the general trade of the nation (which is the support of all) lies neglected, as if the cogs that direct it's wheels did not need skill to keep them true: trade requires as much policy as matters of state, and can never be kept in a regular motion by accident; when the frame of

our

our trade is out of order, we know not where to begin to mend it, for want of a set of experienced builders, ready to receive applications, and able to judge where the defect lies.

Such a committee as this will soon appear to be of great use and service, both to the parliament in framing laws relating to trade, and also to the government, in the treaties which they make with foreign nations.

As to the first, it hath sometimes been thought, that, when that great and glorious assembly [the parliament] hath meddled with trade, they have left it worse than they found it; and the reason is, because the laws relating to trade require more time to look into their distant consequences than a session will admit; whereof we have had many instances.—He proceeds to give a few instances in his time.

To begin with the French trade, says he; in the 22d of Car. II. a new impost was laid on wines, viz. 8l. per tun on the French, and 12 l. per tun on Spanish and Portuguese. This difference, with the low subsidies put on their linens by former acts, in respect to those of other places, was a great means of bringing the balance of that trade so much against us, that the parliament, in the 7th and 8th of Will. III. thought fit to make an act, which, in effect, prohibited all trade with that nation for 21 years, by laying a great duty on the importation thence, in order to prevent a correspondence, 'till the trade should be better regulated.

In the 14th of Car. II. logwood was permitted, by act of parliament, to be imported, paying 5 l. per ton duty; the same act repeals two statutes of queen Elizabeth, against importing and using it in dyeing here, and sets forth the ingenuity of our dyers in finding out ways to fix the colours made with it; and yet, at the same time, gave a drawback of 3 l. 15 s. per ton on all that should be exported; whereby foreigners use it so much cheaper in their manufactures than ours here; which proceeded from a too hasty making that law, and being advised, or rather abused, by those who regarded more their own interest than that of the nation.

By an act made 1 Jac. II. an impost of 2 s. 4 d. per cent. was laid on muscovado sugars imported from the plantations, to be drawn back at exportation: the traders to the plantations stirred in this matter, and set forth, that such a duty would discourage the refining them here, by hindering the exportation of refined sugars, which was then considerable, and carry that manufacture to Holland and Flanders; but the commissioners of the customs prevailed against them, and the bill passed; the fatal consequences whereof soon appeared; for, the exporters of muscovado sugars drawing back 2 s. 4 d. per cent. by that act, and 9 d. per cent. by the act of tonnage and poundage, foreign markets were supplied with refined sugars from other places cheaper by about 12 per cent. than we could furnish them hence; by which means we were beat out of that trade: and tho' the duty of 2 s. 4 d. per cent. was not continued on the expiration of that act, by the parliament 2 Will. and Mar. (as they did the 3 d. per pound on tobacco) the bad effects thereof being then apparent, yet it is difficult to retrieve a lost trade, commercial nations being like expert generals, who make advantage of the mistakes of each other, and take care to hold what they get.

By a statute of the 4th and 5th W. and M. 20 s. per ton was laid on lapis calaminaris dug here and exported, on an information given to the house of commons, that it was not to be had any where else; the merchants concerned in exporting that commodity made application, and set forth, that such a duty would bring in nothing to the crown, but be a total bar to it's exportation; yet the act passed, and we were like to have made a fatal experiment; for, 'till the statute of the 7th and 8th of the same king, which reduced the duty to 2 s. per ton, the exportation ceased; and, in the mean time, those places which had been discouraged from digging and calcining it, because we undersold them, set again to work, and supplied the markets where we vended ours.

* Does not this shew the necessity of the legislature, as well as private traders, being well acquainted with trading commodities, and the places of their production or manufacture? This is the great reason for our being so particular in this work in the description of the chief commodities throughout the world.

What injury was done by the act made in the 9th and 10th of Will. III. for the more effectual preventing the importation of foreign bone-lace, &c. doth sufficiently appear by the preamble of that made in the 11th and 12th of the same reign, for repealing it, three months after the prohibition of our woollen manufactures in Flanders (which was occasioned by it) should be there taken off.

I mention these things with great submission to the judgment of that glorious assembly, the wisdom and strength of the nation; to whom I only perfume, with all humility, to offer my thoughts, that it would very much tend to the putting matters of trade into a true light before them, if they were first referred to a body of men, well versed in the

Vol. II.

true principles thereof, and able to see through the sophistical arguments of contending parties, to be by them considered, and well digested, before they received the sanction of a law.

And, as to foreign treaties, I do not think our trade hath been so much bettered by them as it might have been, for want of such a committee; the representations made by private merchants (who generally differ, according as their interests clash with each other) tending rather to distract, than to inform the government; which would not be, if their first applications were made to an experienced committee, who had judgment enough to subtract out of them what was proper to be offered; by which means, our demands might be rendered short and comprehensive.—So far Mr. Carey.

It was said, some time ago, by an honourable person in the House of Commons [Sir J.——B——d] esteemed to be very well acquainted both with the practical and political knowledge of commerce, that 'There cannot be brought before that House any questions more difficult in themselves, more entangled with a multiplicity of relations, or more perplexed with an endless diversity of circumstances, than those which relate to commercial affairs; affairs on which the most experienced often disagree, and on which the most sagacious may deceive themselves with erroneous conjectures. There are no questions which require so much personal knowledge of the subject to which they relate, nor is there any subject with which so few gentlemen in that House had opportunities of being acquainted: there are no questions, which their variety of relations to different persons exposes to be so easily misrepresented, without detection; nor any in which the opposition of particular interests so much incites a false representation. In all these cases, deceit is easy; and there is a strong temptation to deceive.' With more to the like effect.

It is certain that the chief knowledge which the gentry obtain of trade, is derived from the information they receive from traders themselves; and that is not always to be depended upon, especially at those conjunctures when the legislature may scrutinize thoroughly into the nature of any particular branch. But, although traders themselves may be extremely well acquainted with their own peculiar trades, so far as it relates to their private interest, yet they may not always have such a comprehensive view thereof as to discern how the nation is, in all relations, a gainer or loser thereby. It is rare, therefore, that the country gentleman can obtain a satisfactory knowledge from traders.

In order to make a right judgment of any branch of trade, when considered in a national light, it is frequently necessary to survey it's connection with various others; and, if the landed gentleman is not duly informed of these connections, how should he be capable of making suitable enquiries? Besides, nothing is more common than for traders to differ widely among themselves, in regard to measures proper to be taken by the legislature for the due encouragement or regulation of peculiar branches. Whence arise those opposite and contradictory petitions to parliament from traders, which often tend to mislead, and even confound, the legislature itself.

These considerations, without urging more, manifest the necessity of landed gentlemen being well informed in the nature of every branch of the national trade and commerce, if possible, in order to render them capable of judging of the best public measures requisite to be occasionally taken for the benefit of the whole, without regard to the private interest of particulars.

Of the country gentleman's advancement of his LANDED ESTATE.

We will suppose, from what has been here said, and also in divers other parts of this work, that the British landed gentleman cannot avoid discerning that his own private interest is intimately connected with that of the national commerce; and, if so, he is nearly concerned to promote it's benefit and advantage, in every shape possible; and can any thing be more conducive to this great end, besides what has been humbly suggested, than the due improvement of every inch of his land? For, as the prosperity of land depends upon that of trade, so that of trade equally depends upon the culture, and other beneficial management of the land. The more useful and estimable productions the land affords, as articles of merchandizing, the more treasure will the trader be capable of bringing into the kingdom, by vending them in foreign markets.

It is not the cultivating of lands at random, that will best promote the interest of commerce, and of the landholder. These interests are best promoted by cultivating such things as commerce points out to be the most beneficial to both. And how are these specific particulars to be known, but from the knowledge of trade?

The increase of new productions for commerce depends on the farther transplanting and communicating of the several natural commodities of all nations, to other airs and other

D.

soils,

soils, and other ways of cultivation. That this is not yet brought to the ultimate perfection is evident, in that there is no land so well furnished as to produce all the various sorts of things which it's ground and temperature is capable to receive; and also because many of the most fertile countries contain large spaces that are utterly barren. These improvements depend chiefly upon three kinds of endeavours.

The first, by transplanting out of one land into another, of the same situation in respect of the heavens. This may be tried by conveying the eastern spices, and other useful vegetables, into our western plantations. Nor can it be imagined, why they should thrive in one Indies, and not in the other; why the soil should not be as good where the sun sets, as where it rises: seeing there are parts of both, which lie under the same influence of that, and the other celestial bodies, to whose kindly heat and neighbourhood the oriental nations are supposed to owe their advantages.

This also may be attempted in our northern climates. For instance: the flax and hemp which we stand so much in need of, may prosper far more than it does in England, Ireland, and Scotland, in many vast tracts of ground, which lie barren and uncultivated.

Other improvements of this nature are accomplished by carrying and transplanting living creatures, as well as vegetables, from one climate to another. Sometimes the soil and the air, being changed, will give a new force to the new guests; as the Arabian horse, by mingling with our breed, produces a more serviceable race than either of them single. And sometimes the alteration will be for the worse, which must be guarded against; as the vine of France brought into England, and the horses and dogs of England into France, both which are found to degenerate exceedingly: their soil and their sun, it seems, being fitted to produce things of pleasure and delight, and our air and our earth being more proper to beget valour and strength.

The third way of this kind of improvements to be tried, is by removing the plants and the productions of the same country from one part of it into another, and by practising every where all the sorts of husbandry, which are used in some places with success. That this is not enough perfected in England, is manifest to every one that beholds the Kentish orchards, and the Herefordshire hedges, which seem to upbraid the laziness of other counties, whose highways are only fenced with thorns and briars, or, at the best, with hazel; while theirs are beautified with apples, pears, and cherries.

In every one of these transplantations, the chief progress that has hitherto been made has been rather for the collection of curiosities, to adorn cabinets and gardens, than for the solidity of philosophical discoveries: yet there may be a prodigious advantage made in them all, both for the one end and the other. And in this it will be found, as in many other things, that, if men only intend a little curiosity and delight, they will reap not much more by their pains: but, if they regard real use, not only the profit, but a greater delight will also follow thereon.

And, for our encouragement, whatever attempts of this nature have succeeded, they have redounded to the great advantage of the undertakers. The orange of China, being brought into Portugal, has drawn a great revenue every year from London alone. The vine of the Rhine, taking root in the Canaries, has produced a far more delicious juice, and has made the rocks, and the sun-burnt ashes of those islands, one of the richest spots of ground in the world. And, if we can produce silk, hemp, flax, pitch and tar, timber and naval stores of every sort, cocheneal, pot-ash and spices, in the British American colonies, as may now be done since our new acquisitions by the peace of 1763, this kingdom might reap unspeakable benefits thereby. If the silk-worm should at length be brought to thrive there (of which there seems to be no doubt, if the affair was wisely, vigorously, and honestly conducted) the profit on that article alone would be inexpressible: we may happen, if that proves the case, to give hereafter cloaths to a great part of Europe: we may, in some measure, guess at the extraordinary advantages, by considering what number of caravans [see CARAVANS] and how many great cities in Persia are maintained by that manufacture alone, and what mighty income it yearly brings into the saphi's revenue.

To which end, it will be requisite to consult such other distinct articles of merchandizes in our Dictionary, as every climate will admit of under the British dominion.

This being done, the next step is, to consult every art of cultivating those exotics to the best advantage within our own dominions: for which see the articles MANURE, FARMING, HUSBANDRY, HOPS, SOIL; see also CACAO, COCHENEAL, INDICO, HEMP, FLAX, NAVAL STORES, SILK.

Beside, there is scarce any land but what affords something within it's bowels, of a greater or less depth, beneficial to the proprietor if he can make a just judgment of the nature of EARTHS, BOLFS, CLAYS, FOSSILS of all kinds, LOAMS, SANDS: see those distinct articles, and such others to which from them we refer.

These points being duly considered, it then becomes necessary for the country gentlemen to be so far skilled in philosophical chemistry, as to be able to make such experiments upon bodies of all kinds, as may enable him to judge of their worth; otherwise, a gentleman may have more treasure upon his land within the compass of a few acres, than others may have in some thousands. See the articles CHEMISTRY, EARTH, PHILOSOPHY EXPERIMENTAL, and ROYAL SOCIETY.

Were the particulars here intimated made an essential part of the education of the gentry of these kingdoms, they would be as capable of advancing the trade of their country, in these respects, as practical traders do in others; they would be instrumental to supply traders with more valuable commodities, the produce of their lands, to dispose of in foreign countries, than we have at present: and 'to this purpose I will venture to propose, says the learned bishop Spratt, to the consideration of wise men, whether this way of TEACHING, by PRACTICE and experiments, would not at least be as beneficial as the other, by UNIVERSAL RULES; whether it were not as profitable to apply the eyes and the hands of children, to see and to touch all the several kinds of sensible things, as to oblige them to learn, and remember the difficult doctrines of general arts? In a word, whether a mechanical education would not excel the methodical? This certainly is no new device: for it was that which Plato intended, when he enjoined his scholars to begin with geometry; whereby, without question, he designed that his disciples should first handle MATERIAL THINGS, and grow familiar to visible objects, before they entered on the retired speculations of other more abstracted sciences.

According to this counsel of the father of philosophers, it would not be amiss, if, before young scholars be far engaged in the beaten tracks of the schools, the mysteries of manual arts, the names of their instruments, the secrets of their operations, the effects of natural causes, the several kinds of beasts, of birds, of fishes, of plants, of stones, of minerals, of earths, of waters, and all their common virtues and qualities, were proposed to be the subjects of their first thoughts and observations.

It may be here suggested, that the vast number of such particulars will soon overwhelm their tender minds, before they are well established by time and use. But, on the contrary, it is evident that the memories of youth are fitter to retain such sensible images, than those of a fuller age. It is memory that has most vigour in children, and judgment in men: which, if rightly considered, will confirm what I said, that, perhaps, we take a preposterous course in education, by teaching GENERAL RULES before PARTICULAR THINGS; and that therein we have not a sufficient regard to the different advantages of youth and manhood. We load the minds of children with doctrines and precepts, to apprehend which they are most unfit, by reason of the weakness of their understandings: whereas they might, with more profit, be exercised in the consideration of visible and sensible things, of whose impression they are most capable, because of the strength of their memories, and the perfection of their senses.

The country gentleman, thus trained up to know and pursue his own interest, from experiments in regard to his lands, and every production thereof, both above ground and below, will be far more capable of promoting the commercial interests of his country.

And, if ever the English will attain to the mastery of commerce, not only in discourse, but reality, they must begin it by their labours, as well as by their swords; they must do it by awaking their minds, by rousing themselves from this lethargy by action, by trials, by working: unless this be done, they will in vain be victorious; at the end of their wars they will cool again, and lose all the fruits of their valour. The arts of peace, and their improvements, must proceed in equal steps with the success of their arms: the works of our citizens, our ploughmen, our gardeners, our wood-men, our fishers, our diggers in mines, must be equally advanced with the triumphs of our fleets, or else their blood will be shed in vain: they will soon return to the same poverty, and want of trade, which they strove to avoid.—And who are so capable to inspire a national industry like the country gentlemen of this kingdom?

LAND-CARRIAGE OUTWARDS. All foreign goods, sent by land-carriage from one part of this kingdom to another, as the law at present stands, must be accompanied with certificates under the hands of the collector, customer, and comptroller of the port from whence they are sent*; otherwise any officer of the customs may stop them, till due proof be made that the duties have been paid, &c.

* 6 Geo. I. cap. 21. §. 39, 42.

And all brandy, arac, rum, spirits, or strong waters, exceeding the quantity of one gallon, so sent, must be likewise accompanied with a permit, or certificate from an officer of the excise, or customs, expressing the quantity and quality, and

and signifying that the duties have been paid, or that the same has been condemned. 6 Geo. I. cap. 21. §. 18. And, with respect to wool, wool-fells, mortlings, shortlings, yarn made of wool, wooll-flocks, fuller's-earth, fulling-clay, or tobacco-pipe clay, it must be observed, that no packs, facks, bags, or casks thereof, may be loaden on any horse, cart, or other carriage, or be conveyed by land, to or from any place in Great-Britain, within five miles of the sea-coast, but in the day-time, and at seasonable hours, that is, between sun-rising and sun-setting, upon forfeiture thereof, or the value, with the horses, carriages, &c. 14 Car. II. cap. 18. §. 9. and 7 and 8 Will. III. cap. 28. §. 8. For all other regulations relating to wooll, and for the form of a certificate, or let-pafs, see the directions hereafter given ; but, for all other goods, it must be as follows, viz.

A land-carriage certificate, or let-pafs, for any other goods than wooll.

Port of Southampton.

Know ye, that Benjamin Shaw is permitted to pafs three casks, containing four hundred weight and eighteen pounds of raisins folis, in the waggon [coach, * L. S. Customer. * L. S. Comptroller. cart, &c.] of Benjamin Daws, for Bristol. To be in force six days from the date hereof, and no longer. Dated the 12th of January, 1730.

A. B. Collector, B. C. Customer, C. D. Comptroller.

Note, The time these certificates are to be in force, must be limited, in proportion to the distances of the places where the goods are to be sent.

Before a land-carriage certificate is granted for foreign goods, oath must be made on the back, that the duties of the goods therein mentioned have been paid, or that they were bought in a fair and lawful way of trade, &c. or if the goods are to be exported from the port to which they are designed to be sent, and receive the drawback, a particular certificate of the collector, &c. must be granted, as directed at the granting of sufferances for the shipping of foreign goods, to be sent coastways by water.

And, before the certificate be delivered to the merchant, it must be entered in a book to be kept for that purpose, thus :

Land-carriage certificate outwards.

To what place.		Time to be in force.
	12th of January, 1730.	6 Days
	In the waggon, &c. of Benj. Daws.	
	Benjamin Shaw.	
Bristol	3 casks, containing 4 C. 18 lb. raisins folis.	
	A. B. Collector,	
	B. C. Customer,	
	C. D. Comptroller.	

For all goods (but especially wines) in order to secure the London-duty, sent by land-carriage to London, a duplicate of the certificate must be transmitted to the commissioners, the first post after granted, thus :

Port of Southampton.

An account of wines, &c. sent by land-carriage to London, 13th of January, 1730. George White, 3 baskets, containing 18 gallons of French wine, paid duty by E. H. the 18th of November last.

A. B. Collector, B. C. Comptroller.

The foregoing are instructions for, and general rules to be observed, by the officers of the customs, in relation to goods sent from one port or part of Great-Britain to another, either by water or land : but, British wooll being (to prevent exportation) under very particular regulations, it may be proper here to shew the several requisites to be performed, from the time of sheering to the removal to the last place where it is to be consumed or manufactured.

Regulations relating to British wooll.

* British wooll, thorn or housed, laid up or lodged within ten miles of the sea-side, within the counties of Kent and Suffex, must be entered with the officers of the customs, at the next adjoining port, within three days after the sheering, by a certificate under the hand of the proprietor, or owner. † And, in all other counties, British wooll having been carried from the place of sheering to the proprietor's own house, within five miles, or less, of the sea, must, within ten days after sheer-

* 9 and 10 Will. III. cap. 40. §. 3.

† 1 Will. and Mar. cap. 32. §. 3.

ing, be entered with the officer of the customs at the next port, by a certificate under the proprietor's hand.

Which enteries, certificates, or notices, must be in form following :

This is to certify, That I A. B. of C. have thorn two hundred fleeces of sheeps-wooll, and the wooll of one hundred lambs, and have lodged the same at my dwelling-house at C. Witnes my hand this 14th of July, 1730.

A. B.

Note, if through ignorance the wooll be not entered in time, and the proprietors will come and voluntarily enter the same, making oath of their ignorance of the laws, and that the wooll in question is numerically the same, both for quantity and quality, that the owners sheered the last summer, and no part has been since removed, or exported, it may then be registered, &c.

The proprietors having thus entered their wooll, it must be registered in a book for that purpose, by way of charge on such proprietors, and a certificate of the entry granted them in form following, viz.

Port of Southampton.

A. B. of C. hath entered two hundred fleeces of sheeps-wooll, and the wooll of one hundred lambs. Certified the 14th day of July, 1730.

B. C. Collector, C. D. Comptroller.

* And, with respect to the buyers of wooll, it must be observed, that every person residing within 15 miles of the sea in the counties of Kent and Suffex, who intends to become a buyer or dealer in wooll, before he presumes so to do, must, with sufficient sureties, become bound to his majesty in the following manner, viz.

The condition of this obligation is such, That the above-bound B. C. who is a dealer in wooll, shall not again sell any part of the wooll which he shall at any time hereafter buy, to any person or persons residing within 15 miles of the sea in the counties of Kent or Suffex, and shall not transport nor sell the same to any other person, or persons, to be transported, but shall well and truly observe all the acts of parliament made against the transportation of wooll : then this obligation shall be void, or else to remain in full force and virtue.

A. B. *

B. C. *

C. D. *

Sealed and delivered in the presence of

D. E. Collector,
E. F. Comptroller.

* And, when the proprietor has sold the wooll, at least three days before the removal he must certify it to the officers of the customs, upon the back of the aforementioned certificate of entry, mentioning the time when it is to be delivered, thus :

* 1 Will. and Mar. cap. 32. §. 3. 9 and 10 Will. III. cap. 40. §. 3.

This is to certify, that I have sold the wooll within-mentioned, weighing fifty tods eighteen pounds, to B. C. of E. to be delivered here the fifteenth day of September, 1730.

Witnes my hand this seventh of September, 1730.

A. B.

Then, if the intention of removal is regularly certified, a let-pafs (to be in force no longer than the time appointed for the delivery) may be granted for the removal, thus :

Port of Southampton.

Know ye, that B. C. is permitted to pafs by land-carriage *, in the day-time, as the law directs, from the house of A. B. of C, to his own house in E, with two hundred fleeces of sheeps-wooll, and the wooll of one hundred lambs, weighing fifty tods and eighteen pounds ; it being the wooll of the said A. B. entered here the 14th day of July last, and now certified to be sold to B. C. aforesaid. To be in force four days, from the 7th day of this present September, and no longer. Dated at the Custom-House, the 8th day of September, 1730.

C. D. Collector, D. E. Customer, E. F. Comptroller.

* 14 Car. II. cap. 18. §. 9. 7 and 8 Will. III. cap. 28. §. 8.

LAND-CARRIAGE INWARDS. Though foreign goods, carried by land from one port of this kingdom to another, should be accompanied with a certificate, yet, that being only an authority for any officer of the customs * not to stop them, there is no occasion to deliver in such certificate at the custom-house when the goods arrive at the intended port, unless they are intended to be exported from thence, and the duties intended to be drawn-back ; or they are prohibited East-India goods, coffee, tea, cocoa-nuts, or pepper sent from London in order to be exported.

* 6 Geo. I. cap. 21. §. 39. 42.

As to the form and general direction of these certificates inwards, and of the payment of duties for goods to be exported, they are the same as for the dispatches outwards, but, with respect to the following goods, they are under these additional regulations, viz.

I. * Prohibited East-India goods.—When intended to be sent by land-carriage to any out port, to be thence exported to foreign parts, security for the due exportation is taken at London, before they may be delivered out of the warehouses in which they were first lodged: and, on such security, a cocket is granted for the delivery of the goods, and their conveyance to the intended port, in form following, viz.

* 11 and 12 Will. III. cap. 10. §. 2.

A cocket for prohibited East-India goods sent by land-carriage from London.

London.

Know ye that Andrew Bell ind' hath entered twenty taffaties, forty cuttaes, ten phoates, fifteen damaks, twelve pelongs, which paid duty out of time: late unladen, and now by land-carriage to Southampton, and so for exportation.

Dated the 3d of March, 1730, anno quarto Georgii Secundi, &c.

C. D. Collector Outwards,

D. E. Comptroller (Surveyor, or Surveyor-General).

* Loc. Sig.

On the back are to be specified the several packages, with the particular contents of each.

The searcher in London having executed this cocket, it is to be returned to the commissioners, who send it by the post to the collector of the port; and, the goods being likewise directed to him, he is, by virtue of the cocket, to demand them of the carrier, &c. in order to have them lodged in the custom-house warehouse 'till exportation; observing whether the package be agreeable to the indorsement on the cocket, and under the seal of the officers of London: and, if the goods do not arrive within 20 days of the date of the commissioners letter, they are to be acquainted thereof.

And, when the merchant declares his intention of exporting such goods, and has passed an entry at the port, the London cocket is to be delivered to the proper officer, who, before shipping for exportation, is to open and examine the goods, to see if they agree in quantity and quality; and, the next post after the goods are shipped off, the commissioners must be acquainted with the proceedings.

II. * Coffee, tea, cocoa-nuts, and pepper.—When designed to be sent by land-carriage to any out-port, after proper security has been given for the due exportation, a cocket is granted for the delivery out of the warehouse, and conveyance to the intended port, in form following, viz.

* 8 Ann. cap. 7. §. 20. 10 Geo. I. cap. 10. §. 26.

A cocket for coffee, tea, or cocoa-nuts, sent by land-carriage from London.

London.

Know ye, that Andrew Bell ind' hath entered five hundred forty-four pounds weight of tea, by the united East-India company, the 18th of August last: late unladen, and now by land-carriage to Southampton, and so for exportation.

Dated the 3d of March, 1730, anno quarto Georgii Secundi, &c.

C. D. Collector Outwards.

D. E. Comptroller (Surveyor, or Surveyor-General.)

* Loc. Sig.

For the form of a cocket for pepper, see that for prohibited East-India goods. And as to the whole proceedings of sending the coffee, tea, cocoa-nuts, and pepper, with the cockets, to the collector, and the method of shipping them off at the port, they are the same as directed for prohibited East-India goods, remembering, that, at the examination, they must be carefully weighed.

And when any foreign goods intitled to a drawback, which came by land carriage from any other port, have been exported to foreign parts, a debenture must be made out, to be sent to the * port where the duties of such goods had been before paid, at the time of their importation, to intitle the exporter, or his agent to demand the drawback of the collector of such port. See the article CARRIAGE.

* 2d rule of the Book of Rates, p. 177, 178.

LAND-WAITER, an officer of the Custom-House, whose duty is, upon landing any merchandize, to examine, taste, weigh, measure them, &c. and to take an account thereof.—In some ports they also execute the office of a coast waiter.—They are likewise occasionally styled searchers, and are to attend and join with the patent searchers, in the execution of all cockets for the shipping of goods to be exported to foreign

parts: and, in cases where drawbacks or bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent-searchers, are to certify the shipping thereof on the debentures.

In case of SUFFERANCES granted for landing goods at an unlawful key, they are signed by the land waiters and surveyor, collector, customer, and comptroller; also for SUFFERANCES granted for the landing and examining of passengers baggage and wearing apparel.

When the goods are entered, and the warrants, sufferances, &c. granted for the landing and delivering of the same, are produced to the land waiters to whom they are directed (who are to be appointed by the collector, either by noting their names in the margin of the report-book, or in a particular book to be kept for that purpose) they are to accept of the same (provided the contents of the goods are found to be justly represented, and the other requisites duly performed) as an authority for them to permit the landing and delivering; but they may not presume to examine the goods on board, but must order them to be brought on shore at the merchants charge: and, in order thereunto, upon receipt of the warrants, &c. they are to certify the entry to the tidefmen on board the ship, before the said tidefmen may presume to permit any goods to be unladen. The form of which certificate must be as follows:

In the Providence of London, James Bell master, from Rotterdam.

Oliver Rook.

O. R.

No. 1, 2. Two fats
3, 4. Two bags
5 a 44. Forty bolts
45. One box
46. One cask
47. One bale

21st of January, 1730.

To the officers on board the aforesaid ship.

A. B. } Land-waiters.
B. C. }

And, if the SUFFERANCE permits the landing of the goods at any other place than the lawful keys, the same must be mentioned on the aforesaid order, thus:

SUFFERANCE for———

By virtue of the aforesaid order, the tidefmen on board are to suffer the goods to be unladen, and brought on shore, and are to deliver them into the charge of the proper land waiters, who are to attend at the landing of the goods, to examine, taste, weigh, measure, gauge, number, &c. the same, according to the nature thereof, and to take an account of the quantities and qualities, in order to adjust the duties which are to be paid for the same.

That the land-waiter may be duly prepared to take an account of the examination and delivery of the goods, as soon as every ship is reported, a blank book is to be directed and delivered to each of the land waiters, whom the collector shall think fit to appoint, or direct to see such ship discharged. The title of which book must be as follows:

Custom-House, Southampton, 8th day of January, 1730.

This book contains 12 leaves, delivered to Mr. A. B. land-waiter, to take an account of the delivery of the lading of the Providence of London, James Bell master, from Holland, reported the 8th day of January, 1730.

B. C. Collector.

And as to such ships which do not report, &c. every land-waiter must have a general pocket-book delivered to him, wherein he is to enter all warrants directed to him for the delivery of any goods out of such ships, with the particular execution thereof. The title of which book must be as follows:

This book, containing one hundred leaves, delivered to Mr. A. B. land-waiter, to take an account of the delivery of all goods landed out of such ships as do not report.

B. C. Collector.

In the landing, examining, and delivering all goods, and merchandizes, it must be carefully observed,

1. That no goods may be landed or delivered without a proper warrant, and, if any goods are so landed, they are liable to seizure,

2. That no more goods may be delivered than what the land waiters have perfect warrants for; and if, upon examination of such dry goods as pay duty by tale or measure, the importer appears to have entered short, the said goods must be seized, and sent immediately to his majesty's warehouse, in order to be prosecuted: but, in case of short entries upon goods paying duties by weight or gauge, the land waiters must give the merchant an account thereof in writing, that he may make a post-entry for the same, before such goods may

may be permitted to be taken off the keys, unless the quantity short-entered be very small ; and then if the surveyor thinks fit to permit the goods to be carried away before such post-entry be made, one of the land-waiters is to go immediately and enter the same in a book to be kept for that purpose, above-stairs in the Custom-House, that the collector may know the quantity and quality of the goods, in order to demand the duties of the merchant, which the land-waiters are to see posted the next day at the furthest ; though, in strictness, the land-waiters should not give any credit, of which

they are to be frequently admonished : and, in order to prevent their giving credit, the surveyor must, within 14 days after the expiration of every month, deliver to the collector and comptroller a list of all ships cleared in the preceding month, with an account of the post-entries that were standing out six days after the ships were cleared ; who are to enquire into the reasons thereof, and charge the officers concerned in giving such credit to transmit their answers to the commissioners, with their observations thereon.

The form of the aforesaid post-entry book may be as follows :

When posted.

C. D. Land-waiter.

3. That the account of all goods must be taken in the proper books, at the time of examination, &c. and not in any other books or loose papers.

4. That the marks and numbers of all casks, &c. must be carefully observed, and placed to the proper merchant's account ; and that each day's work must be compared with the account taken by the merchant, his servant, cooper, &c.

5. That goods are not to be brought to the warehouse without a bill of lading, or other warrant, or the consent of the surveyor, under his hand, in the land-waiter's book.

6. That, upon any mistake in taking the account of any goods, the land-waiters are not to erase their books, but, having struck the pen through the error, are to insert the true figures, &c. and to write the reason thereof in their books.

7. That the land-surveyor must duly attend at the water-side, and frequently every day inspect the land-waiters in the discharge of goods.

8. That after payment of the new duties, and before the delivery of any hides and skins liable to those duties, the same are to be stamped with a proper mark (being an hammer) which, with some printer's ink, and a little box, have been sent for that purpose ; and, when the said hammer or stamp is not in use, it is to be secured under the separate locks of the collector and comptroller ; but, for using the said stamp, a block is to be prepared, which may be of elm, two feet and one half high, about 10 inches diameter at the top, and hollowed one inch and a half, which is to be filled up with lead, about five inches square, in order to make it solid, and prevent the hammer's rebounding, and to keep the lead from spreading and cracking.

9. That after the payment of new duties, and before the delivery of linens chequered, striped, printed, painted, stained, or dyed, the same are to be stamped with the proper seal and stamp, with printer's ink ; which stamp is to be lodged in the (joint) custody of the collector and comptroller, and not to be delivered thence but to the land-surveyor, and land-waiter appointed to the ship, wherein there are any such linens imported, as are liable to be stamped ; and, after entry and landing, such linens are to be stamped in their presence by a weigher or porter, who is under oath and security ; and the land-waiter is to keep an account thereof in his book, which is to be marked by the land-surveyor : and, when they leave off stamping, the said stamp or seal is to be returned by the surveyor and land-waiter, into the joint custody of the collector and comptroller, to be locked up under two different locks 'till wanted again.

10. That if, upon examination of any goods at the delivery, the merchant appears to have over-entered, either in any particular goods, or upon the whole entry, the following regulations must be observed, in order to procure the repayment of the duties for the goods so over-entered : and though he should be over-entered on some goods, and short-entered on others, yet such short-entry must not be deducted from the over-entry, but a post-entry must be made for what is short, and the over-entry must be obtained by the regulations before-mentioned, being as follows :

1. On the face of the warrant, at the bottom, must be certified the quantity of goods over-entered, thus :

VOL. II.

The merchant is over-entered thirty-three pounds of thrown silk.

B. C. } Land-waiters.
C. D. }

2. On the back of the warrant, the merchant, his servant, or agent, must make oath to the quantity of goods received, and the occasion of the over-entry, thus :

James Crofs maketh oath, That neither himself [and, if the goods were taken up by a servant or agent, there must be likewise added, nor A. B. the proprietor] nor any other person for him, or to his use, did to his knowledge or belief, receive any more than three hundred pounds of the silk within mentioned, nor had any more landed out of the within mentioned ship, and that this over-entry was occasioned by a mistake * in casting up the invoice.

Jurat' 16 die Martii, coram me

D. E. Collector.

Signed James Crofs.

* Or any other occasion, as may be the case.

Underneath which oath must be certified as follows :

Upon examination, as also per affidavit above, we find the merchant is over-entered thirty-three pounds of thrown silk.

Certified the 16th of March 1730.

A. B. Surveyor.

B. C. } Land-waiters.
C. D. }

Whereupon a certificate must be made out, in order to repay the duties for the goods so over-entered, signed by the land-waiters. On the back whereof must be inserted the particular duties to be repaid, with the merchant's receipt for the same.

But, before the duties are repaid, the entry inwards, referred to in the second certificate, must be discharged for so much goods as were over-entered, by writing off the same in the margin of the book : and the whole must be entered in particular books, to be kept by the collector and comptroller for that purpose.

11. That as all goods are to be entered as sound, with regard to damage, &c. therefore, if on examination of poundage goods *, except tobacco, they appear to have received damage by salt-water, &c. whereby the merchant will be prejudiced ; the collector, surveyor, and land-waiters, may make such allowance as they think proper, though no allowance must be made in consideration of the meanness of any goods : but, if the merchant is not satisfied with the allowance made, then the collector, and any other principal officer, may appoint two indifferent merchants, experienced in such goods, on their oath, to adjust the allowance.

* 11th Rule of the book of rates, at the end of letter A.

Whereupon the officers or other persons who have adjusted the damages, are to certify the same on the back of the warrant. —Which allowance for damage, &c. must be made upon the keys, or in the king's warehouse, immediately after landing the goods, and before taken into the merchant's possession : and, in making these allowances, the quantity allow-

E

ed

ed for damage must not be deducted from the quantity short-entered (if any); but a post-entry must be made for such short-entry, and a certificate for the repayment of the duties of the goods allowed for damage, signed by the land waiters. But, before the duties are repaid, the entry inwards, referred to in the said certificate, must be discharged for so much goods as were allowed for damage, by writing off the same in the margin or the book: and the whole certificate must be entered in particular books to be kept for that purpose, by the collector and comptroller.

12. That although no allowance is made to the importers of tobacco, in consideration of any that is damaged or mean, yet, if on delivery, any part appears damaged, and the merchant is not willing to enter and pay, or secure the duties, he may either refuse the whole, or separate the damaged tobacco (but not the stalk from the leaf) by cutting off from the hogheads, &c. so much as he shall refuse to enter, &c. and any three or more of the principal officers may cause such tobacco to be burnt: whereupon a certificate for an allowance, in consideration of the tobacco so destroyed, must be made out, signed by the surveyor and land waiters.

On the back whereof, the merchant must give a receipt for the payment of the aforesaid allowance. See WOOLL. But, before this allowance is paid, the same must be entered, in particular books to be kept for that purpose, by the collector and comptroller.

Land waiters are not to be paid their salaries, 'till a certificate be produced from the surveyor, that they have not any post-entries standing out.—They are to assist at the shipping of corn and other goods, and to certify on debentures.—To examine the ship's contents, and compare them with the merchant's endorsements on the cockpit.—To examine the ships, and discharge the tidemen.—To preserve and enter the warrants outwards.—A book to be kept by them for the outward business.—To assist the coast-waiters in examining foreign goods.

LANERKSHIRE, in Scotland, is bounded on the south with Dumfriesshire; on the south-west with that of Aire; on the north-west with that of Renfrew; on the north with that of Dumbarton; on the north-east with Sterlingshire; and on the east with that of Linlithgow and Mid-Lothian. It is a pleasant fruitful country, and, though mountainous in some places, and woody in others, is very well inhabited, especially near the Clyde. It abounds with coal-pits and lime-stone, and has some profitable lead-mines.

GLASGOW, in this shire, for extent, buildings, trade, and riches, is the chief city of the kingdom, next to Edinburgh. Though the river Clyde, on whose banks it stands, is navigable up to the town for small vessels, yet New Glasgow, at the mouth of the Clyde, is the harbour for those of great burden, where the city obliges the merchants to load and unload, there being a good wharf, and a custom-house for all the coast; and ships are also repaired, laid up, and fitted out here, or at Greenock. There is not only an appearance, but a reality of trade at this city, both as to foreign commerce and domestic manufacture; which, though great before, is very much improved since the union, which more fully answered it's end to this city, than to any other part of Scotland, so that they now send above 80 sail of ships every year to Virginia, and other English colonies in America. They have a very considerable trade in the herring-fishery, which they catch sooner, and cure so much better than the English, that they are reckoned equal to the Dutch. They have also the advantage of situation, lying so convenient for the coasts of Spain and Portugal, that they are often at Cadiz, the Straights mouth, and even at the Canaries, in eight or nine days. Their situation for the American trade is no less advantageous, especially in time of war. They lately purchased a harbour on the Frith, near Alloway, to enable them to reship their sugars and tobacco for Holland, Germany, and the Baltic, without sailing round England or Scotland.

They have a manufacture of plaids and muslins, which last are so good and fine, that great quantities are sent to England, and the British plantations, where they fetch a good price, being generally striped, and much used for aprons by the ladies, and sometimes in head-cloths by the meaner sort.

LANGUEDOC in France. This province is bounded on the north by Quercy and Rouergne, on the east by Auvergne and Lyonnois, on the south it borders on the Mediterranean Sea, and on the west the Garonne separates it from Gascony.

It is esteemed one of the most pleasant and fruitful provinces in France: it's chief commodities are wine, oil, honey, wax, saffron, silk, and salt.

In this province is the famous canal, cut at an immense expence, to make a communication between the ocean and the Mediterranean. 'Twas begun in 1666, and completed in 1687. It cost above thirteen millions of livres, and takes an immense sum yearly to keep it in repair; and yet does not answer the design for which it was chiefly made, namely, to carry the French fleets, which are still obliged to pass through the Straights of Gibraltar. Nor does it seem to be of great use for the inland trade.

'Tis divided into the following districts or divisions, viz.

I. **TOULOUSAIN**, lying between Gascony on the west, Albigeois on the east, and the county of Foix on the south. In it is

TOULOUSE, the capital of the whole province, seated on the river Garonne.

Though this city is very advantageously situated for trade, it has hardly any, the genius of it's inhabitants not being turned that way; so that, though this be one of the greatest cities in France, it is neither rich nor populous.

II. **ALBIGEOIS** is bounded by Rouergne on the north and west, by Toulousain on the south, and by Quercy on the east. The soil about **GAILLAC** is the only part of Albigeois, that produces wine proper to be exported beyond sea. They send it by the river Tarn, which begins here to be navigable to Bourdeaux, where the merchants sell it to the English, this wine being better after it has been transported by sea.

RABASTENS on the Tarn also, is an ancient city, but gone to decay; there is, however, some trade here, particularly of wine, which is very good.

III. **LAURAGAIS** lies on the east of Toulousain, between the rivers Aige and Agout.

CASILENANDARI has a pretty good trade, the plains that surround it producing abundance of corn. It stands on a hill, at the foot of which is a basin of the royal canal of Languedoc.

IV. The district of **NARBONNE** lies between Lauragais and the county of Foix on the west, Roussillon on the south, the sea and the district of Biers on the east, and Toulousain on the north.

Narbonne is commodiously seated in a low country, on a canal cut from the river Aude. It formerly had a good harbour, and drove a vast trade in the Mediterranean, but it has been long since stooped up, the sea having left the coast.

CARCASSONNE is seated on the river Aude. The country round it is much enriched by the manufacture of all sorts of cloth established here, and which afford a constant employment for all the inhabitants.

LIMOUX, a small city on the same river, has likewise a manufacture of cloths and other woollen stuffs. 'Tis also the staple for all the iron that is worked in the neighbouring forges.

V. The district of **BESIERS** is extended between that of Narbonne on the west, Rouergne on the north, the district of Nismes on the east, and the sea on the south.

The soil of this diocese is one of the most fruitful of the whole province; it produces excellent wines, and much more corn than the inhabitants can consume, and a great quantity of oil.

VI. The district of **NISMES** lies between that of Biers on the west, the Mediterranean Sea on the south, Provence on the east, and Sevennes on the north.

Nismes is a large town, well peopled, and has a very good trade, which consists chiefly in woollen stuffs made here.

MONTPELLIER is the capital city of what is termed Lower Languedoc, and the largest and most considerable of the whole province, except Toulouse.

The inhabitants are employed in making treacle, verdegrease, white wax, dimities, silks, and woollen stuffs, and other sorts of manufactures.

BEAUCAIRE, situated on the Rhône, is famous chiefly for the fair kept yearly about the time of St. Magdalen's festival. It had formerly great privileges granted, but, in 1632, they laid a duty on all merchandizes, which amounts yearly to about 25,000 livres; besides another of twenty-pence on every bale that has not been opened, which brings in about 5000 livres more. They carry on in this fair a trade for above six millions of livres. Merchants resort hither from Italy, Germany, Spain, Turkey, Armenia, Smyrne, &c.

SOMMIERES is considerable for it's manufactures of serges, which are sold in this and the adjacent provinces.

VII. **GEVAUDAN** is for the most part a mountainous and barren country; but most of the people follow some trade at home, making serges and other stuffs, which they sell very cheap; and yet those little manufactures bring in above two millions of livres yearly, being exported into Switzerland, Germany, Italy, and even into the Levant.

MARVEJOLS is a pretty populous city, and drives a good trade.

VIII. **VIVARIS** lies between Languedoc, properly so called, on the south, Gevaudan on the west, Forez and Velay on the north, and the river Rhône on the east.

VIVIERS is it's capital, but is not a place of any trade.

IX. **VELAY** is a small county or district, and has Vivarais on the east, Forez on the north, Auvergne on the west, and Gevaudan on the south.

The most considerable place in it is **PUR**, where they make a vast quantity of laces, by which they are much enriched.

LAPIDARY, an artificer who cuts precious stones. The fame is said of those who deal therein, and have a perfect knowledge of gems in general, and of those also who have wrote thereon in French, as Boot, Berguen, Ruæus, Gesner, Durondel, &c.

This art is of great antiquity. The French fell into it late, yet have carried this art to a very great perfection, but not superior to that of the English.

Divers machines are employed in the cutting of precious stones, according to their quality. The diamond which is extremely hard, is cut on a wheel of soft steel, turned by a mill, with diamond-dust, tempered and polished with olive oil.

The oriental ruby, sapphire, and topaz, are cut on a copper-wheel with diamond-dust, tempered with olive oil, and are polished on another copper-wheel with tripoli and water.

The hyacinth, emerald, amethyst, garnets, agates, and other stones not of an equal degree of hardness with the other, are cut on a leaden-wheel with smalt and water, and polished on a tin-wheel with tripoli.

The turquois, of the old and new rock, girasol, and opal, are cut and polished on a wooden-wheel with tripoli also.

The lapidaries of Paris have been a corporation since the year 1290. It is governed by four jurats, who superintend their rights and privileges, visit the master-workmen, take care of the master-piece of workmanship, bind apprentices, and administer the freedom. There are two jurats chosen, every year, by a plurality of voices.

The apprenticeship is for seven years; a master can have but one apprentice at a time; he is permitted, however, to take a second toward the end of the last year of the time of the others.

Apprentices, after the expiration of their servitude, must serve two years as journeymen with masters, in order to perfect them in the art.

Every candidate for the freedom of the corporation, even by the royal recommendation, is obliged to perform a master-piece of workmanship before admission.

Masters may have no more than two wheels, nor more than three mills going.

Foreigners, or aliens, are not allowed to expose to sale either rough or cut precious stones, or even pearls; nor are the masters to purchase any of them, that have not been visited by the jurats.

These merchandizes can only be sold by the master-lapidaries, and the goldsmith-jewellers; all others are forbid to mend or repair them.

Some of these articles have been since new modified and changed.

1. By an arret of the council of May 1613, registered the June following, all merchants, foreigners, strangers, and others, are forbid to carry and sell, in the kingdom, any precious stones and diamonds, cut and fashioned, unless in the fair time, who are then subject to visitation by the jurat-lapidaries.

2. By another arret of the council of December 1614, the preceding is ratified; and yet it is ordered, that the dealing in diamonds, and other rough and cut precious stones, carried by merchant strangers, shall remain free, as well to the goldsmith as the lapidaries, without the latter visiting or dividing the stones by lots among themselves; being also forbid, both the one and the other, to be factors or agents to merchants foreigners.

The parliament of Paris made a decree in February 1740, with regard to a law-suit between the body of trading goldsmith-jewellers, that of the mercers, and that of the other four corporations of merchants of the city of Paris of the one part, and the company of lapidaries on the other: the latter and the goldsmith-jewellers were at law for above 100 years; and this decree of the parliament terminated their differences, and definitively regulated the state of these corporations among themselves; by which decree, the lapidaries are forbidden to vend any sort of precious stones set and adorned by art, under the penalty of a fine and confiscation of the same, and they are restrained to the sale of rough stones, and these cut and polished, but not set and adorned. By an arret of the council of state of January 1673, lapidaries were prohibited, and all others except goldsmiths, selling all precious stones, on pain of 3000 livres penalty, and of all expence, damage, and interest. The foregoing arret of parliament, in consequence thereof, forbids lapidaries from assuming the quality of merchant jewellers, and to give to their jurats the name of wardens, nor permits them to be called only master lapidaries, gravers, and artificers, in all sort of precious stones, fine and natural.

LAPLAND. This country is divided into Danish, Swedish, and Muscovian Lapland. See the articles **NORWAY**, **SWEDEN**, and **RUSSIA**.

LAQUE, or artificial **LACCA**, a name given to a coloured substance, drawn from several flowers; as the yellow from the flower of the juniper, the red from the poppy, and the blue from the iris or violet.

The method of preparing the vegetable colours called laques.

Take a pound of turmeric root, reduced to fine powder, three pints of fair water, and an ounce of salt of tartar; put them into a glazed earthen vessel, and let them boil together gently, over a clear fire, till the water appears richly impregnated with the turmeric, or will stain a piece of white paper beautifully yellow; then filtre the liquor, and gradually add to it a strong aqueous solution of rock-allum, till the yellow

matter is all curdled together, or precipitated: after this, pour the whole into a filtre of paper, where the aqueous part will run off, and leave a yellow matter behind; which being edulcorated, or washed in the filtre, by the repeated affusion of fresh water, till the water comes away insipid, and afterwards dried, it becomes the laque of turmeric, or a beautiful yellow colour for painting.

This experiment shews a general method of obtaining a laque from all the vegetable subjects fitted to afford it: for in the same manner may a red laque be made from madder, brazil, nicaragua, and many other dyeing woods, or tinging vegetables. But, where the colour of the subject depends upon a very subtle texture, mixture, or arrangement of the parts, this method destroys, or at least impairs the colour; as particularly in violets, red roses, carnations, &c. So that it seems applicable only to the tinging vegetables of a somewhat strong and firm texture.

In some cases also, a simple process is sufficient to obtain rich laques; particularly that beautiful red one, emphatically called laque, and from which the name seems to be derived to the rest. This red laque is obtained, barely by boiling stick-lac in water, then filtering the decoction, and evaporating the superfluous humidity: for the beautiful red colour adheres to the outsidings of the sticks broke of the trees, along with the gum-lac, and readily communicates itself to boiling water*. Some of this tinging matter likewise sticking to the gum itself, it is proper to boil them both together: for the gum does not prejudice the colour, nor dissolve in boiling water: so that, after the operation, the gum is as fit for the making of sealing wax, or other uses that do not require the colour, as it was before.

* The tinging matter adhering to the sticks and gums is, perhaps, not a vegetable, but animal substance; somewhat of the nature of cocheneal, and deposited in form of an excrement, by a certain kind of bees in the Indies. See a paper upon this subject in the French Memoirs; see also Mr. Boyle upon human blood, Abridgment, Vol. II. p. 481.

And, much after the same manner, is that extremely rich and beautiful red colour called carmine, prepared from cocheneal, and a solution of tin; for carmine may be conceived as no more than the scarlet, or Bow-dye liquor, concentrated, or reduced to what the painters call a body.

How far the present experiment may be applicable to other parts of the materia tinctoria, seems not hitherto well considered. Doubtless, it might afford a great variety of new colours, by a proper extension and diversification in the menstruum and method. For example: if red saunders be digested warm in spirit of wine, the menstruum acquires a deep red colour; and, if drawn off by distillation, leaves behind it a red, tasteless, and inodorous rosin, that affords no smell even upon burning, nor dissolves in any expressed or essential oil; yet, even in a small proportion, tinges spirit of wine of a full red colour, so as to render it useful for anatomical injections, &c.

In like manner, may a particular gummy red substance, or pigment, be obtained by spirit of wine, from dried red wine lees; and, whether the tinging parts of the more cumbersome dyeing woods and stuffs could not be advantageously extracted at the places of their growth, so as to leave their ponderous bulk behind, and bring away only their concentrated essential colours, might deserve the consideration of the merchant, the dry-falter, the dyer, the callico-printer, &c. It might be tried on logwood, brazil; on madder, safflower, and many other dyeing woods and stuffs*, whose names we seldom meet with but in the bills of entry.

* This is well deserving the consideration of those traders, who are any way concerned in these things.

LAQUERED WARES are peculiar sorts of cabinet-work, varnished, in the nature of japan-work, over with laquer. See **LAQUE**.

A white laquer, or varnish.

Take ten ounces of rectified spirits of wine, and fine pulverized gum-sandarac two ounces, clear Venice turpentine two ounces; put them together into a glass, and cover it close with waxed paper and a bladder; then take a pot with water, put it on a coal fire, and, when it begins to be warm, put some hay under the bottom of the pot, whereon set your glass; let it boil for two or three hours, and the sandarac and turpentine will dissolve and unite with the spirits: then pour your laquer boiling hot through a clean hair-cloth, and put it in a clean phial for use. This is an excellent laquer, fit to be used for light colours.

Another laquer to mix with red or dark colours, and to japan the work over with.

Take rectified spirits, that is, such as, when poured on gunpowder, will fire it; or when a linen rag being dipped into it and lighted, it will consume it one pound; of clean gum lacca a quarter of a pound; grind them fine, and put them into a phial, then pour the spirits over it; let it stand for two days,

days, shaking it once every hour: the third day, hang it over a gentle cool fire 'till it is well dissolved, then strain it through a hair-bag, and put it up for use.

Another laquer varnish.

Take of the best and strongest brandy one quart, calcined tartar one pound; let the brandy stand upon the tartar covered, for one day, in a gentle warmth; pour off the brandy, and filtrate it through paper; of this take one pound, white amber six ounces, sandarac six ounces, gum-lac two ounces, (the amber must be picked out of clear pieces) grind all fine together, put them into a phial or matras, then pour on it three pounds of the filtrated brandy: your phial must be but about half filled; then shake it for about an hour together, keep it in a matras for two days, shaking it once every hour; when settled, pour it through a hair-cloth, and it will be fit for use.

What sediment remains in the phial, may be used in making another such quantity, adding to it but one half the quantity of fresh ingredients.

A fine laquer or varnish, for blue, and other colours, which will make them bright like looking-glasses.

If your table is to be of a blue colour, paint it first with indico and white, ground with oil, with a little turpentine; when dry, you may give it another layer, and heighten it to your liking; and, when this is thoroughly dry, laquer it with the following matter.

Take clear Cyprian turpentine half an ounce, sandarac one ounce, mastic two ounces; grind the sandarac and mastic very fine; then take oil of spike two ounces, oil of turpentine one ounce, put them into a glass cucurbit, to dissolve over a gentle heat: add thereto the pulverized gum, set the glass or matras in a pan with water; let it boil over a slow fire for an hour, and all will be dissolved and incorporated: let it cool, preserve it in a phial well stopped for use.

When used, first wipe your painted table, and clean it from dust; then take some fine and light smalt in a cup, or upon a plate, according to what quantity your piece requires; temper it with the above laque, and, with a large hair-brush pencil, glaze it as quick as you can all over; let it dry in a clean place that is free from dust, which will be in about three hours time, then glaze it over again: the oftener you repeat it, the brighter your table will be: if you chuse to have it of an exceeding fine lustre, glaze it over 12 or 15 times.

A Chinese laquer for all sorts of colours.

Put into a matras a pint of spirits of wine, one ounce of gum-anima, two ounces of mastic, two ounces of sandarac or juniper gum, powdered finely together in a mortar: put them together into a matras, close it up, and hang it in hot weather in the sun for 24 hours, or so long over a fire, 'till the gum is dissolved, and the spirits are tintured therewith: then filter it through a clean cloth, and keep it in a phial closed up: you may mix therewith what colour you please: for red, use vermillion; for black, use lamp-black, or ivory-black; for blue, use indico and white, Prussian blue or smalt, and white lead, &c.

LATITUDE, in geography, the distance of any place from the equator, measured in degrees, minutes, and seconds, upon the meridian of that place; and is either north or south, according as the place is situated, either on the north or south side of the equator. It is found at sea, by having the sun's or any star's declination (by a proper table, and his meridian altitude) and that is found by a quadrant or astrolabe. From the horizon to the zenith being 90° , if from 90° you take the sun's meridian altitude, the remainder will be the sun's distance from the zenith. When, therefore, by observation, the sun's meridian altitude is found, you are to consider, whether the sun hath any declination or not: if he hath none, but moves in the equinoctial that day, then the elevation of the equator will be equal to his meridian altitude; and, consequently, his meridian altitude is the co-latitude: subduct, therefore, that from 90 , the remainder is the latitude of the place, which will be north; if the sun be on the south part of the meridian; and south, when the sun comes to the north of the meridian.

'Tis the same thing with any star in the equator. When the sun or star hath any declination, the zenith distance with that will give the latitude; for, if the meridian altitude and declination be both the same way, i. e. both north, or both south, the difference between them will be the latitude of the place, or the pole's height: only observe, that, if the zenith distance exceeds the declination, the contrary pole will be elevated. If the declination be $23^{\circ} 30'$ N. and the zenith distance $8^{\circ} 30'$ N. the latitude will be 15° N. But, if the zenith distance be $71^{\circ} 30'$ S. and the declination 20° S. the difference will be $51^{\circ} 30'$ = to the latitude, as before; only it will be north, because the zenith distance exceeds the declination.

If the declination be north, and the meridian altitude south, or vice versa, i. e. one contrary to the other, then the sum of the declination and the zenith is the latitude of the place. Indeed, sometimes the sun or star may have two meridian altitudes, as when the altitude and declination being the same way, the latter exceeds the former, and then the sum of the co-declination and the meridian altitude is the height of the pole, towards which the declination is. And you must observe, that, whether the meridian altitude be north or south, if that and the co-declination together be less than 180° , the sun or star will have two meridian altitudes in 24 hours. See the article **LONGITUDE**, with regard to navigation, and also the article **COMMANDERS OF SHIPS**.

L A W. Traders in general are the principal persons who ought to keep out of litigious broils, yet they are the most liable to be plunged into them, by reason of their constant dealings with great variety of people. We have, therefore, endeavoured, throughout this work, not only to give the statute law in miniature which has relation to the chief species of merchandizes, but also the determination, in our courts of common law and equity, of the most curious mercantile cases which have come before them, in order to guard traders against those evils to which they are too frequently liable. Besides the common and statute laws of England, as also the *lex non scripta*, there are in several parts of England certain customs and usages, which have the force of common law among those people to whose property they belong; as borough English, a custom so called, not being in use out of England, where the youngest son, or, for want of sons, the youngest brother, is to inherit, the eldest being supposed to have learned the father's trade, and the youngest the least able to shift for himself.

Besides these, we make use of the civil and maritime law, in regard to divers commercial and naval occurrences; which law is exercised in the high court of admiralty, as corresponding and agreeing with the laws of foreign nations, being suitable to the nature and negotiations of the people that are subject to them. By this law, and the ancient customs thereof, a mutual intercourse of commerce is maintained between nations, and should, in trading states, be precisely and strictly upheld and preserved; yet the rights of the municipal laws of the kingdom should, by no means, be infringed, but each jurisdiction restrained within its proper limits; which will be more advantageous to the trading interests of this nation, than the suffering either of them to inroach upon, and swallow up and devour the other: and that law which is universally regarded in all trading nations, should seem the best calculated to determine all misunderstandings between the trading subjects of those several nations which have relation to traffic, or maritime concerns. Yet, in the leagues that are established between nation and nation, the laws of either kingdom are excepted; and as the English merchants in France, or in any other nation in amity, are subject to the laws of that country where they reside, so must the people of France, or any other country, be subject to the laws of England, when resident here. 19 Hen. VII.

By the common law, merchants were always particularly regarded in this kingdom; but the municipal laws of England, or, indeed, of any realm, are not sufficient for the ordering and determining the affairs of traffic, and matters relating to commerce, merchandizing being so universally extensive, that it is impossible: therefore there is another law, called the law-merchant, which is a kind of special law, differing from the common law of England, proper to merchants, and is become a part of the law of the realm; and all nations take special knowledge of this law; and the common and statute laws of this kingdom leave the causes of merchants, in many cases, to their own peculiar law, which is founded on customs and usages immemorial. On this law, also, we have been pretty copious throughout our whole work.

REMARKS.

There can be nothing more perplexing and vexatious to traders than the being unhappily involved in law-suits. To avoid which, or to prove successful therein, nothing can be more conducive than method and regularity, which is the life of a trader's affairs in general. Thus the due arrangement and methodizing of the original vouchers which relate to a trader's transaction, for immediate reference, should, by no means, be neglected: for, the grand books being of no authority in courts of judicature, without the original vouchers, these ought to be as regularly disposed as the other, in the way they will admit of; neglects of this kind, either by misplacing, or losing those testimonials of a trader's transactions, being productive of great confusion in public business: order and regularity in all things cannot be too early made habitual to the young trader.

And, indeed, if a trader has any misunderstanding or law-suit with others, and has the best cause to defend, and employs the most skilful, as well as most upright council, solicitor or attorney, yet, if he cannot produce authentic vouchers in his vindication, he will lose his cause.

With

With relation particularly to the laws, which concern the various branches of the PUBLIC REVENUE, traders in general should not be remiss in making themselves acquainted with those that may concern themselves, lest they should incur the penalties thereby inflicted, or injured by the officers who may exceed their authority. Thus the merchant should be well informed in the laws, relative to the business of the CUSTOMS; variety of the essential whereof is given in this work, either under the respective articles which they immediately concern; or at the end of every letter, wherein the general BUSINESS OF THE CUSTOMS is concerned. But they are so numerous, that it cannot be expected we should give the whole, and at large, which would be no more than to transcribe the Statutes at large: we have judged it sufficient to give the practical trader such an idea thereof, as may tend to induce him to look into those, wherein his own private interest is concerned.

Those traders, who are liable to the excise laws in any peculiar branch, should not be neglectful to become familiar with those which concern their respective branches of business: as the salt or stamp duties, &c.

The necessity of merchant importers and exporters informing themselves well in the laws relative to the CUSTOMS in particular, will appear under the BUSINESS OF THE CUSTOM-HOUSE, at the conclusion of our letter A, and the end of the subsequent letters of the alphabet.

LEAD, is the heaviest of all metals, next to gold, quicksilver not being ranked in the class of metals. It is the softest of all, and very ductile, though much less so than gold; is very little subject to rust, and the least sonorous, except gold; the most readily fusible of all except tin, and acquires this fluidity long before it changes colour; when melted, it readily calcines into a grey powder, which, if the fire be increased, becomes of a fine florid red, which is the minium of the shops. If the fire be made yet more vehement, it runs into an oleaginous matter, which, as it cools, turns reddish, which is litharge. These several substances, by addition of iron filings over the fire, or only some pieces of charcoal, or any oily matter, become lead again.

The scoriæ of lead in a strong fire vitrify, and in that form escape through all sorts of vessels.

Lead readily amalgamates with mercury, and as readily fuses with all other metals, except iron. Its specific gravity is to that of water as 11,322 to 1000. Exposed to a burning-glass, it in a few moments goes through all the changes already mentioned.

When kept in fusion over a common fire, it throws up all other bodies, except gold; it afterwards vitrifies with the baser metals, carrying them off as scoriæ.

The weakest acids are its best solvents; it dissolves readily in aqua fortis, mixed with water, as also in vinegar, and is corroded with the fumes of the weakest acids, becoming what is called cerusse. It gives a sweetish taste to liquors wherein it is dissolved. If heated 'till it smoaks, and copper in thin plates be put in, it boils up vehemently, and the copper breaks and blends with it. The mixed mass, when cool, is very brittle, resembling cast iron where broken.

Lead is met with in the mines in various forms. The ore is usually of colour easily distinguishable to the eye, being a little darker than lead, bright and glossy where fresh broken, and composed either of cubic pieces, or of small granules, or of long striæ. The first is called potters lead ore, the second steel-grained ore, and the third antimoniated lead ore. These, though apparently different, are in reality very like, when compared with the help of glasses.

There is, besides these ores, a very curious kind, which is green, and of crystalline substance, usually mixed with a kind of calamine: this has not the least appearance of lead, though it contains very much, and some zink.

Lead is more easily separated from its common ores than any other metal, requiring only a common wood-fire and bellows. Such ores as contain earth and stones are first to be powdered and washed, and those which have pyrites, or marcasites, must be roasted two or three times, to burn away the sulphur; then powdered and washed, and finally mixed with the common black flux, if very refractory. If there be occasion to separate lead from copper in the regulus, it is readily done, as the lead will run off in a heat not strong enough to fuse the copper.

As to its medicinal virtues, it seems to be a metal very cautiously to be given, and rather calculated for outward application. Its ore is poisonous: the steam of the furnaces where it is worked infects the grass around about, and kills the animals that feed on it; and its best preparation, the saccharum saturni, is apt to bring on violent cholics, and so many other disorders, that the remedy is often worse than the disease.

The preparations most in use are the following, viz.

MINIUM.

Melt lead in a broad, earthen, unglazed vessel, stirring continually 'till calcined to a grey powder; continue stirring, and

VOL. II.

it will become yellow, and is the masticot used in painting. Then calcine further in a reverberatory furnace, and it will be of a fine red, which is the common minium.

LITHARGE.

This is of two kinds, but differing only in colour, called litharge of gold, and of silver. It is not prepared on purpose, but got from the silver smelting furnaces, or from those where gold and silver are purified with lead; but it is generally run into lead again, to serve for the same uses. The litharge of the shops is from the copper-works. The greatest quantities are brought from Sweden, Germany, and Denmark; Poland furnishes some, as also our own country, but the Dantzic kind is most esteemed. The best is the most calcined, and of the liveliest colour. It is soluble in oil and unctuous substances, making the basis of most of the ointments and plasters of the shops. The best way of preparing it, is to grind it in a mortar with water, which pour off thick, adding fresh to the remainder, 'till all the litharge is washed off, and the faeces only remain. The litharge subsiding from these liquors is to be kept for use, after carefully drying it.

BURNT LEAD.

Cut a quantity of the thinnest milled lead that can be got, into small plates, with which fill an earthen vessel that will bear the fire, and, with powder of brimstone, laid layer upon layer; when the sulphur is burnt away, the lead will be in a blackish powder: five ounces of brimstone suffice for half a pound of lead. Stir the matter while on the fire, and, when cold, wash the powder in three or four waters. It is used externally as the litharge: mixed with lard alone, it makes a good unguent for the piles.

WHITE LEAD, or CERUSSE,

Is a calx of lead, made by the vapour of vinegar. The usual way of making it is by covering an earthen vessel, in which is some sharp vinegar, with a plate of lead, and setting it in a place gently warm; in 10 or 14 days it converts it mostly into this white matter, which separate for use.

But a much better way is recommended by Boerhaave. Cut a glass cucurbit in such a manner as to leave a very large mouth, to which fit a glass helm; put some vinegar in the body, and a number of thin plates of lead in the head, so as they may stand somewhat erect. Set in a gentle sand-heat for 12 hours, and, after letting cool 12 hours more, unlute the vessel; the receiver will contain a sweet and styptic liquor, nauseous and turbid, and the lead will be covered with cerusse.

The same process, used with iron or copper, converts them also into a calx, that of iron being red, and the copper green.

Cerusse is of great use externally, either in unguents, or used dry, sprinkling it on old ulcers, running sores, and many cutaneous diseases.

The finer part of this calx causes, in those who grind and prepare it, violent and incurable asthma, palsies, and other nervous complaints.

Painters use it in great quantities; and, to afford it cheap, it is generally adulterated with common whiting. The English and Dutch cerusse are very bad in this respect; the Venetian ought always to be used by the apothecaries.

SACCHARUM SATURNI.

Put into a large glass cucurbit any quantity of true Venetian cerusse, on which pour twenty times its weight of distilled vinegar; boil three or four hours in a sand-heat; when settled, pour off the clear liquor, and add more vinegar to the remainder: repeat the operation with fresh vinegar, 'till the cerusse is nearly all dissolved. Mix the liquors, and evaporate part, if to be kept under this form. If the salt of lead is to be prepared, inspissate in a sand-heat, to the thickness of oil, and set it in a cool place for the salts to shoot. Pour off the liquor, and dry the cake of salt in a gentle heat.

The vinegar of lead is used by some for pimples: an ointment may also be prepared from it, by mixing with oil of roses, and working together some hours in a leaden mortar. This is called butter of lead, and is an excellent medicine, by way of liniment, for almost all kinds of eruptions.

The sugar of lead is greatly recommended by some internally, in dysenteries and hæmorrhages; but the generality condemn it, as containing all the poisonous qualities of lead in their highest degree.

Externally it has been long famous for many virtues. It is good against inflammations of all kinds, and in collyria for the eyes, and in the erysipelas: it deterges, dries, and cicatrises ulcers, and in gonorrhæas is mixed in injections with great success.

If one ounce of it, and two of oil of turpentine, be set in a sand-heat, 'till the salt is dissolved, the oil turns red, and is called balsam of lead. This is also an external medicine, of great note for it's effects in old and sharp ulcers.

REMARKS.

There are lead-mines in divers parts of England, Wales, Scotland, and Ireland, and the British plantations, and in various other parts of Europe; but Great-Britain has larger plenty than most countries, and exports great quantities. Flintshire and Derbyshire are the two countries in England, which have been long famed for their lead-works; and that of the latter is generally esteemed the best, as being the softest: the reason of which we ascribe to it's being smelted in North Wales with pit-coal fuel, and in Derbyshire with wood fuel. For the method of assaying lead ores, see the article ASSAY.

The method of smelting lead ore at the great works, with pit-coal.

The smelting-houses have large air-furnaces, in the form of ovens, with a kind of hopper in the center at top, wherein to put the ore. At one end is an open fire-place, the breadth of the furnace, with large iron bars, wherein is put the pit-coal; and at the other end is a large chimney-flue, which draws the flame of the pit-coal over the inward part of the furnace, and melts the ore.

To prepare the ore more easily for fusion, they pound it, either with iron stampers, or by hand, and put it into the hopper before-mentioned: and, in order to separate the sparry, or stony and sulphureous matter from the lead, they, for cheapness sake, use burnt lime, in proportion to the quantity of ore to be smelted at a time; for the sulphur of the lead has a natural tendency to vitrify the lime, and the stony or sparry part of the ore, and to precipitate the lead: so that quick lime is esteemed a proper flux [see FLUX] for the generality of lead ores; but, as lead itself hath a tendency to vitrification, there is commonly a quantity of the lead turned into glass, as well as of the lime and spar, &c.—To prevent which, nothing has a better effect than to throw in, after the ore is melted, a small quantity of billet-wood, or charcoal, the salts of whose ashes the vitrified matter will instantly lay hold of, and thereby the greater quantity of lead will be precipitated, than with the mere pit-coal alone; and the lead will also become the purer and the softer, for the addition of a small quantity of wood at the end of the smelting.

When all is thoroughly fused, and the lead as neatly precipitated as it can be in the great work, with these unexpensive fluxes, there is a tap-hole, which is opened; out of which the lead runs, into the form of pigs, or bars, of fixed sizes. And if the lead, by the assay, will yield silver sufficient to pay the expences of refining, and to leave any reasonable profit, the lead is then refined for it's silver, which is performed after the following manner.—A large test is made with bone or fern-ashes, and fixed in an iron ring; which test will contain several tons of lead in fusion: the lead is melted upon this test, with a reverberatory fire, and, when melted, is blown off with a large pair of bellows, that go either by hand or water, into litharge, and, at the same time, the silver is left or precipitated at the bottom of the test; and, if the refinement is carried on to the full extent, the silver will be as fine as silver can possibly be. After the silver is thus extracted from the litharge, that is reduced again into a body of lead, by being put into another furnace for that purpose, and melted down with pit-coal, and a small quantity of wood fuel put into the furnace per contactum with the fused matter; for, the litharge being a kind of half-vitrified lead, the ashes of the fuel hath, as before observed, a natural tendency to unvitrication. And here the reader will please to observe, that, after the lead is thus refined in the great works for it's silver, yet every particle of the litharge lead, when again reduced into a body of lead, contains silver, in an equal proportion; and, indeed, there is scarce any lead but what holds some small proportion of silver, though the produce will not pay the expence of the extracting operation. But if, by any art, the whole quantity of silver, if such a thing is possible, could be extracted in one single, easy, and unexpensive operation, as has been attempted by some, it might probably be of some additional advantage.

The method of smelting lead ore with wood fuel

Is much the same, in point of operation, as the preceding, with this difference, that the furnaces are open, and worked by bellows, instead of mere air, which go by water or by hand, and the fuel is conjoined with, or laid stratum super stratum with the ore. After fusion, it is tapped in the like manner as before described, and the lead is refined also, as before represented, with wood alone instead of pit-coal.

Lead ores, as well as all other kinds of ores, being of different qualities in point of their value, and more or less difficult of fusibility, and in the separation of their respective metals; they require as different methods of treatment in a large way of working, as they do in the assay.

There are very few instances of native lead existing naturally pure and malleable among other metals*.

* Some pure native malleable lead hath been found in New-England. What is commonly taken for native lead, is really a very rich, somewhat malleable, silver ore, of a lead colour. The vitrean silver ore is of an irregular, and altogether unsettled figure: it is very ponderous, easy to be flatted with the hammer, and to be cleft, not much harder than lead, and much of the same colour; it melts presently, and soon grows red-hot. This is what is often taken for native lead. It consists of sulphur and of pure silver, which the regeneration of it, and the chemical analysis shew: it contains above three quarter parts of silver. See the article SILVER.

Gallena tessulata, or the cubic dice-lead ore, is an ore very rich of lead, consisting of a quantity of small equilateral cubes, or of oblong parallelepipeds. But these cubes are, as it were, composed of very thin, well polished lamina's, that shine very bright, and are of a blackish blue colour. However, this ore is very ponderous, soft, and brittle; it is more fusible than a great many other ores, though it requires a much greater fire to be melted than lead itself: the cause of which is, the abundance of sulphur that lies hidden in the lead ore, and constitutes almost one quarter part of it. In a fusion well managed, one hundred pounds weight of pure and solid lead ore, will yield from 65 to 70 pounds weight of lead.

If the foregoing sort of lead ore consists of small, thin, oblong cubes*, when broken, it appears finely striated,

* You will always see this cubical figure in this lead ore; nor was ever any other figure observed in it, except such as had been given it by some external power or resistance; for, even in this case, it has always the same form within. But lead ores are called by different names, according to the various either regular or irregular application of the cubes to each other, agreeably to their magnitude, and their brightness thereon depending, and to their surfaces, whether smooth or rough, and granulated. There is also a difference observed in them as to their colour, some being of a lighter and more bright colour, and others of a dark or blackish dye.

Lazarus Erker, page 161, mentions a red kind of lead ore, which he says is ponderous, and like red clay. But it has been found that this red mineral, which has been mistaken for cinnabar, was nothing more than the lead ore, having here and there larger cubes, easy to be distinguished by the eye, without any help; and an infinite number of very minute ones, not to be seen without a microscope, and lying hidden in a red kind of marly earth: so that it does not constitute a particular species.

The same author mentions another lead ore, resembling a white sandy stone. There are also sandy rocks now and then rich of lead, but, well examined, contain an ore not in the least different from that last described. The rock which is commonly soft, and therefore does not deserve to be called a rock, bears a true lead ore, which is irregular on the outside, looks globular, and is filled, throughout the substance of the rock, with small masses, of various sizes, and not very bright; so that, when the rock is broken, there appears the perfect species of lead ore, the last but one described. Abundance of these are digged out of the mines at Braybach.

The stones that are of a lighter colour, especially the flints, and their like*, when they are mixed with ash or black colour, or only marked here and there with veins and spots of the like dye, thereby shew, that they contain either iron or lead in them.

* Some of them will melt in the greatest heat of a wind-furnace, and are said to be of the vitrifying kind, to which class they are referred.—All minerals hitherto known may be referred to six classes, viz. metals, semi-metals, salts, sulphurs, stones, and earths. See MINERALS.

The green lead ore is very rare, of a yellowish green colour, much varied, and half transparent. It varies it's figures, though it most commonly has that of spade, shooting in form of nitre, but less regular. It is likewise ponderous, not hard, and, at the same time, very rapacious; nevertheless, 100 pounds weight of it yields from 70 to 80 pounds weight of lead. The white and ash-coloured lead ores are looked upon as being like this, and are as rare.

The lead ores, hitherto mentioned, are never rendered refractory by a mixture of iron ore, or of the sulphureous iron pyrites [see PYRITES], as are the other ores [see ORES]: for, unless the ore then contains iron, be naturally associated to the lead ores, the major part of assayers, in order to roast them with greater care and benefit, commonly use an addition of iron, or of it's fusible scoria's, that are still reducible. However, the white arsenical pyrites, if worthy to be classed among ores,

ores, ought, in this case, to be excepted, on account of it's rapaciousness, and it's refractory quality of the abundant caput mortuum that remains of it, after the arsenic has been blown away.

BLACK LEAD, is found in several parts of Europe and America; the wad-mines of Cumberland in England have it in heavy lumps, some of which are hard, stony, and of small worth; others very soft, and of a fine grain and texture.

This mineral hath none of the properties of metal; it will not fuse, but calcine in an intense fire; though there are some fluxes, perhaps, that would melt it. The mechanics, who work in iron, steel, and brass, frequently use it, as well by way of polish as to ease the motion of the finer wheel-work; and quantities of it are wrought into pencils; though the consumption is not very great.

LEAKAGE. There is an allowance of 12 per cent. in the customs, allowed to importers of wine, for the waste and damage it is supposed to have received in the passage: an allowance of two barrels in twenty-two is also made to the brewers of ale and beer, by the excise officers. See the articles **BREWERS** and **WINE**, and the **BUSINESS OF THE CUSTOMS**, at the end of each letter.

LEASE, in law, a demise, or letting of lands, tenements, or hereditaments, unto another for life, term of years, or at will, for a rent reserved.

The party who lets a lease is called the lessor, the party to whom it is lett, the lessee.

The business of leases taking into consideration the calculation of annuities upon lives, and the use of tables of interest computed to answer the variety of cases which may be required upon these occasions; we have been pretty full upon the articles of **ANNUITIES** and **INTEREST**. With regard to the former of these heads, we have built on the foundation laid by the great Dr. Halley in the Philosophical Transactions, No. 196. and the calculus made by the method laid down by the ingenious Mr. Abr. De Moivre, in his Annuities on Lives. In relation also to the latter, we have given accurate tables of interest, both simple and compound, to seven decimal places, for 3, $3\frac{1}{2}$, 4, $4\frac{1}{2}$, and 5 per cent. with examples of the divers cases, to which they are generally applied: these are necessary introductions to what we have to say under this head.

The former of these being algebraically investigated, and therefore not intelligible by those who are unacquainted with that admirable analytic art of reasoning; we shall, on this article, endeavour to accommodate ourselves to the skill of the arithmetician only; though what we have to say is founded on the very same principles, and will be more generally understood.

About 20 years ago, the doctrine of leases was warmly controverted by several ingenious gentlemen. The occasion was some Tables calculated for renewing and purchasing of the leases of cathedral churches and colleges, &c.—With the value of church and college leases considered, &c. said to be wrote by Sir Isaac Newton; but this, by some writers at that time, was denied: how justly I shall not enter into.

From the best judgment that I have been able to form of this delicate subject, I shall give the following state of it for general use, according to the principles whereon they have been calculated, since the time of the learned Dr. Halley.

Our design being to reduce estates of all kinds, as near as may be, to their true value in cash, by comparing them with annuities to continue a certain number of years, it will be necessary to explain what an annuity is: by which we mean a sum of money to be paid yearly; and, if the same is to be continued a determined number of years, then 'tis an annuity for years certain; if it is to be continued as long as one, two, or three persons, or either of them, shall continue in being, then it is an annuity for life, or lives.

As these yearly payments are frequently charged on estates as a security, so they may be incumbered with a part of the assessments on such estates: an estate of 100l. per ann. may be bound for payment of 50 or 60l. a year: with the proviso, that the annuitant allows out of the said annuity, a proportionable part of the taxes, tythes, &c.—In such case, we would reduce these outgoings to a certainty, as near as may be, and deduct the same out of the said gross annuity, calling the remainder only the nett annuity.

The next point to enquire is, whether, by rules certain, we can know how much ready money, at a given rate of interest, will, in the time of the annuity's continuance, amount to an equivalent for the said annuity?

'Tis obvious, that, if a person advances a sum of money, to receive an equivalent for it at one year's end, he must then receive, over and above the sum laid out, one year's interest for the same: now the sum to be received, and the interest expected, being settled, the money to be laid out will easily be found. Again: for the next year, the purchaser must lay out no more for this, than a sum which continued two years at compound interest would amount to the same annuity; and so on for the 3d, 4th, 5th, &c. years, as long as the annuity is to continue. Hence it is plain, that, where the yearly income, the rate of interest, and the number of years are fixed, the value of the annuity in ready money may be easily found; the method of doing which we shall shew hereafter.

Though the method of computing the value of an annuity, when the terms are thus fixed, is easy; yet frequently the fixing of the term is difficult, and not always possible; for in some cases, the yearly income of an estate is hard to be found; in others, the rate of interest that the purchaser ought to be allowed for the money he lays out, is somewhat uncertain: and the term that the purchaser shall enjoy the income, is in some kind of tenures unknown: one or more of these perplexities happen in almost every query of this kind, according to the nature of the tenure by which the purchaser is to hold the estate.

It is scarce possible to give an account of all the tenures that are amongst us; secundum consuetudinem manerii, inserted in the copies of court rolls, refer to customs different in almost every manor: we, therefore, shall only remark those which are general. As 1. Estates in fee. Under this head we may range those held by lease for a long term, under small rents; for, though the nature of the tenure be different, yet is the real value of them near the same, as appears by comparing the present value of an annuity to continue 200 years, with the value of the same in fee, at 4, 5, 6, &c. per cent. interest.

The difficulty in valuing these estates lies, first, in ascertaining the yearly income likely to be produced by them, and the yearly outgoings in rates, taxes, repairs, &c. (assessment on land only excepted, for that is also chargeable on money at interest). And, secondly, the rate of interest that the purchaser may expect for the money he lays out, as the security for the estate and income are better or worse than the common security for money at interest.

2. Another kind are such estates as are held for terms absolute, under divers conditions and reservations of rents, &c.—These are also reduced to annuities as the former, only the reserved rent must be valued as an annuity to be deducted, and at a lower rate of interest than that of the rack-rent, in regard of the security for payment being better than that of the other.

3. Another sort are copyhold lands; under which are included all church, college, dean, and chapter lands; some held for term of years, renewable at certain periods, for stated sums of money; others for life or lives absolute, renewable in like, or different manner with the former.

It is the custom of some manors, that the widow of him that was tenant for life, hath a right of dower during widowhood; sometimes of the whole, sometimes of a moiety, the other moiety of the estate to the son. These and divers other customs there are, which must be well considered, to find the real value of these tenures; and the income, rate of interest, and, in some cases, time of continuance being dubious, must be fixed with judgment, if we would, with any degree of certainty, arrive at the just value.

4. Another kind of tenure is for a term of years, determinable on the death of one, two, or three persons, with reservation of rents, &c. Under this head may be included those that hold by life, or lives absolute; for, though this last be in the nature of a freehold, yet, as to the real value of such estates, there is little difference betwixt that which is held for 99 years, if 1, 2, or 3 lives, or either of them live so long, and that which is held for the same lives absolute: and the cautions, mentioned in copyhold estates for fixing the term, are also to be observed in these.

Under these general heads may be comprized all, or the most part of holdings, in use at present among us; all of which may, with due caution, be reduced to annuities of a known equal value; so may the reversion of a term of years, or a life or lives, after an estate in esse, be computed by the same method.

Mr. De Moivre justly observes, 'that the method of calculating the value of annuities upon lives, was never perfectly understood before Dr. Halley's rules were made public.'

As to estates in fee simple, the vulgar method used, before Dr. Halley's time, for finding their value, is thus: divide 100l. by the rate of interest per annum, and take the quotient for the number of years value of the purchase in ready money: hence, after the yearly income is known (which with them is the rack-rent, exclusive of tythes, without any allowance for outgoings) there is no more to be done, but to multiply this yearly income by the said quotient, and the product is esteemed to be the value in cash.

The fallacy of this way of computation will be obvious, if we consider the consequence: for instance, admit I were to purchase an estate of 100l. per ann. interest of money being at 5 per cent. Both parties can expect no other terms than these, by this method of reckoning: 100 divided by 5, the quotient is 20 years value the fee, which in cash is 2000l. Now, admit that, out of this estate, I must pay 12l. per ann. parochial assessments (exclusive of the king's tax) and 3l. per ann. more for repairs; then it is plain, that I shall receive no more clear than 85l. for the income of my 2000l. To find what rate of interest I have for my money, let the

$$\text{rate be } r; \text{ then } \frac{100}{r} \times 85 = 2000; \text{ consequently } r = \frac{8500}{2000} = \frac{85}{2} = 4,25; \text{ that is, } 4 \text{ and } \frac{1}{4} \text{ per cent.}$$

The common argument for this is, that a man would rather take $4\frac{1}{2}$ per cent. on landed security, than 5 on the common security for money; this is plausible, but it is a wrong way of computing: let us suppose again, that the estate I would purchase were of the same yearly value (100 l.) as before, and that the price at which I must purchase be likewise 2000 l. admit also, that, in this latter, the outgoings be no more than 4 l. a year (as the case may be in different parishes and circumstances): upon this supposition I have 96 l. per ann. income for my 2000 l. which is above 4 l. $\frac{3}{4}$ per cent. that is, 11 s. per cent. more than in the former case. So that upon the whole, by this way of computation, a man may purchase an annuity, in one place, of $\frac{1}{8}$ yearly value more than he can in another, for the same sum of money. And although the difference of these outgoings be sometimes made a ground for cavil in the treaty, yet all that is said about it, amounts to nothing conclusive on either side. But,

2. With respect to such as hold for a certain number of years, the common method, if it be deficient in nothing else, is so in this respect, that no difference is made in the security for the rack-rent, and of that for the reserved rent, rates, taxes, &c. The best of the usual methods, for estimating the value, being to deduct the outgoings, and value the remainder as an annuity, for the number of years that the estate is to continue at legal interest: whereas a man may reasonably expect more interest for laying out his money on such a tenure, because he binds and incumbers the whole estate for the payment of an annuity (for such are the outgoings) thereby taking all casualties upon himself. Thus if a man, for want of opportunity, keeps his money by him, he pays nothing out of what it would bring in, if it were at interest; it is different in this purchase; here the outgoings must be paid, whether the estate brings in any thing or no.

3. The ordinary valuation of copyhold estates was still more fallacious than either of the former; those who held for lives, no regard was had to the probabilities of life (a matter very considerable) neither was there any allowance made for the money paid out in a regular way: to instance some particulars: and, first, in valuing three lives absolute (or 99 years determinable on 3 lives, which is the same to all intents, as to the value) the general rule was formerly, to reckon it as a lease of 21 years certain; which, by the tables for that purpose at 5 per cent. is worth, in ready money, 12,82 years value, and no more, for 3 lives; the first of which they esteemed worth 6 years, the second 4, and the third 2,82; so that to renew 2 lives, in reversion of one, would cost 7 years, or one in reversion of 2, three years value: and this was the constant expectation, what age soever the life or lives in esse were of, at the time of renewing.

This way of computing was corrected by another, which is likewise, in several respects erroneous. For,

By this other method (which is still in practice) a lease for one life may be reckoned equivalent to one of 9, 10, 11, or 12 years, &c.

That for two lives, at 17, 19, 21, or 23 years, &c.
That for three lives, as a lease of 24, 27, 30, or 33 years, &c.

Though this latter method is a little more plausible than the former, by reason of the steward's liberty of chusing which of these proportions he pleases, yet what analogy does this bear to the reason of the thing? For, if the different numbers are to be chosen according to the age or goodness of the lives, or the different value of the outgoings, or both, how do they bear any proportion to each other? At best, it is but groping in the dark; no one can give such a reason for his choice as will weigh with an unprejudiced person, that the value thereby attained is just and reasonable. By this method, at 6 per cent.

One life is worth 6,8, or 7,4, or 7,9, 8,4 years value.

Two lives are worth 10,5—11,2—11,8—12,3 years value.

Three lives are worth 12,5—13,2—13,8—14,3 years value.

This was always the rule, without any regard to the different ages of the lives, or the greater or less burden of the poor, &c. Whence it appears, that, when three lives are valued at 14 years, they value one in reversion of two, at two years, two in reversion of one, at six years, and the one life in possession, at eight years purchase: if ever these numbers agree with the real value, it is by chance; as will more evidently appear, when we consider the probabilities of life, and the value of the chances relating thereto.

Another particular under this head, is that of renewing leases for years, of church or college lands; wherein the advantage of the lessors is very evidently made appear, by an anonymous author, who wrote in the year 1731*, in a letter published to that purpose; at the end of which letter is a table †, for renewing any number of years lapsed in a lease for 21 years.

* This tract is intitled, The Value of Church and College Leases considered: And the advantage of the Lessees made very apparent, dated July the 1st, 1718.

† A T A B L E for the renewing of any number of years lapsed in a lease for 21 years.

The customary method of doing this, is, to deduct the rent reserved out of the rack-rent; and then one year's value is the fine for renewing seven years, now this method, compared with that used by the laity in such cases, will stand thus:

A lease for 7 years, in reversion of another lease of 14 years in church or college lands, is fold for 1 year's value.
A lease for the same term, of other lands, at 6 per cent. is fold for, and is really worth 2½ years value.

Thus it appears, that the former lessors have not above $\frac{2}{3}$ of the value of what they sell. The before-mentioned author hath made it plainly appear, that the tenants in church lands have (when they renew their leases) after the rate of 11 l. 11 s. 8 d. $\frac{1}{4}$ per cent. interest for the money they lay out; which is such a rate, as will fix on them the guilt of extortion in a high degree.

At the first view of this preposterous way of dealing, the public were much at a loss to find what should induce clergymen, fellows of colleges, &c. to give away, what they had so just a title to, from themselves and families. But it seems to be cleared up by what was then urged by Mr. Richards.

The reading the aforementioned letter, says he, confirmed the truth of the matter of fact, but then it gives no light into the reasons of it's being so. The author ingeniously aggravates the guilt and shame of the oppression, but how the landlords should be induced to grant such terms (if it be in their power to advance the fine) he is silent. It is certain, that the keeping the estates in hand would be more advantageous than to lease them out for less than half the value; and as it is as certain, that the tenants would advance at least a part of what is under value, rather than refuse a bargain that would still be better than any the laity would grant them.

To say, that, by following the rules fixed by their predecessors of 180 years ago, they think they do themselves and successors justice, is to brand them with a degree of ignorance they cannot be possessed with. For the statute of 37 Hen. VIII. was made to reduce interest of money to 10 per cent. which shews, that it was higher before that time; and hence, if this was the custom of renewing these leases at this time, it carried reason with it: but why the custom should continue after the reason of it ceased, is still to be accounted for.

In order to explain this seeming paradox, the deans and chapters, fellows of colleges, &c. must be considered in a double capacity: first, as they are a society, and, as such, have a right to divers lands, with power to make and renew leases of these lands for a term of years: but then, secondly, in their private capacity, they have a right to the money brought in by these leases, to be disposed of at their own will and pleasure.

* And now, if it can be made appear, that it is for the worldly advantage of the members of these societies, in regard to their private capacity, to keep the leases filled at this low rate, rather than let them run out, and thereby hazard their never having an opportunity to make any advantage to themselves; I say, if this can be shewn, then I doubt not but every one will suspect, that it is this god of the world, that tempts them to do a thing so prejudicial to themselves as a society.

That the value of renewing or filling up these leases is different with respect to these different circumstances, will appear by the solution of these following queries, viz.

Query 1. What is the value of renewing 7 years lapsed in a lease of 21 years, at 5 per cent.?

The answer will be about three years value.

Query 2. What is the value of renewing 7 years lapsed in a lease of 21, to continue, if one life should so long happen to live, at 6 per cent.?

This to a man of about 50 years of age, by a rational computation deduced from the probabilities of life, is worth no more than one year's value.

Wherefore the man that receives one year's value for renewing such a lapse, receives as much as it is worth on the chance of his own life; (and he can enjoy it no longer, if it falls into his hands): but, as the lease is good for the term absolute, the lessor grants away the right of his successors; these successors do the like by the next, and so on, and have nothing for it. And this they chuse to do only, or chiefly, it seems, because the tenants are obstinate, and will not break through a custom that is so profitable to them, altho' the reason for establishing the custom is ceased long ago.

We shall now proceed to give some farther account of the absurdities in the common method of valuing copyholds; but the customs of manors being so various, it would be endless to run through them all; we shall therefore proceed to the fourth sort of tenures before-mentioned.

4. In these, estates for 99 years, determinable on the death of 1, 2, or 3 lives, the method of valuing is generally the same with those on lives before-mentioned, and is consequently liable to the same mistakes. As this kind of tenure is very common, at least in the western counties, so the most care ought to be taken in adjusting the value, and, if possible, such rules laid down, as may include all the circumstances, viz. all the incumbrances of rates, taxes, repairs, high rents, &c. and all the casualties; which are different, according to the quality and situation of the estate. All these should be duly considered, and a proper allowance made, before the value of the lease can be determined.

That the common way of estimation doth not provide for these differences in any regular manner is evident, and therefore must of necessity be deficient on that account.

Previous to the ascertaining the value of leases, it will be necessary to have a right understanding of the following particulars:

1. The nature of the tenure, and term of continuance (as near as may be) of the estate to be purchased; and whether the lord hath a full, or only a conditional power of granting it for such a term.

2. The casualties, incumbrances, and impositions that go along with the estate, and how far the possessor of the estate is liable to them.

3. The quality of the estate, as to the present condition of repair; what it will cost to put the same in good repair, and how much per ann. afterwards to keep it in that condition, during the term to be purchased.

4. This rate of interest for money, together with the analogy that the common security for money lent bears to the security for the income of the estate to be purchased.

5. The yearly value. Here great care must be taken, that it be not fixed too high nor too low; for it is not always the rent that an estate is lett for, that is the value of it. A landlord may lett out an estate for more or less than it is really worth, according to the necessities or convenience of himself or tenant.

Besides these, there may be other accidental circumstances that attend particular tenures; but these being the principal, we shall take notice of them, and leave the less material to be considered by the parties concerned.

1. As to the nature of the tenure, enough hath been already said: but the continuance of the term, which is often during 1, 2, or 3 lives, is a matter very precarious, because nobody can tell how long these lives will continue in being: wherefore, since the certain knowledge of this is out of our reach, the best we can do is to inform ourselves of the most probable consequences in those respects: and, though, in regard to these uncertainties, the buyer must be said to purchase a chance, yet the real value of chances, as such, may be found to a tolerable degree of certainty: to do which, let the following hypothesis be assumed, viz.

'The probability that a life of any given age will continue in being, 1, 2, 3, 4, &c. years, is exhibited by Dr. Halley's tables, published in the Philos. Trans. No. 196, or may be deduced therefrom.' See the article ANNUITIES.

VOL. II.

Nobody will undertake to prove, that this is mathematically certain: for it is evident, that the nature of the thing will not admit of that degree of certainty. The deficiency that the learned doctor seemed to apprehend in it, was the want of a great number of years experience; but it will, we apprehend, cause but a small error in the result, if the numbers in the doctor's table should, on future experience, be a little varied. To proceed:

If the lord, from whom you purchase, has no more, or will grant no more than a conditional right, then the value of the hazard of such conditions must be computed, whether it depend on a chance, or otherwise, and that sum must be deducted as prudence shall direct.

2. By casualties we understand such unforeseen accidents which an estate is exposed to; as fire and inundation, whereby houses are liable to be consumed, wears, bank, &c. demolished, and cattle destroyed, to which some estates are more liable than others. Beside, is the estate likely to be always tenanted? Will it not be often changing tenants, which always brings a charge? If, on a scrutiny, the hazards that a person runs by the purchase be greater or less than the common hazard in lending money, a purchaser, must be allowed a proportionably greater or less interest for the money he thus lays out.

By the incumbrances and impositions that are inseparably annexed to an estate, must be understood all tythes, rents, rates, taxes, harriots, suits, services, &c. for the payment of which the estate is generally bound; consequently, these must be valued as a rent charge, or clear annuity to be paid out, when, sometimes at least, the income of the estate, as being attended with some uncertainties, &c. must be reckoned at 1 or 2 per cent. more than these outgoings.

3. As to the quality of the estate, in regard to repair: herein the greatest difficulty seems to lie, for the best that can be done is but guess-work, with respect to these disbursements. If it be out of repair at the time you purchase, the best way will be, whether it be fields or houses, or both, to procure men, well skilled in these matters, to compute the charge of putting it into tenatable condition: which charge ought to be deducted out of the value, and reckoned as so much money paid; so far the difficulty is surmounted.

But, as all estates will cost money yearly to keep them in repair, these disbursements also must be computed. Here again the judgment and experience of honest men must be your guide: for repairs of houses, &c. are dearer in one place than another, so are they more exposed to storm, &c. in one place than another. Moreover, old houses, though at first put into repair by the former supposition, are more chargeable in future repairs than those of later building; and houses, at first slightly built, are more chargeable than others of a more substantial structure. Thus sometimes it may be necessary, in estates which consist chiefly of houses, to allow $\frac{1}{2}$, at other times not above $\frac{1}{3}$ part of the annual income towards the repairs of these houses.

If the right to timber-trees, coppice-woods, corn, &c. or the profits of mines, &c. are to be also transferred to the purchaser, then, as to the former of these, they must be estimated at their present worth, and so much money added to the fine. In regard to mines, the clear yearly profit like to arise thereby, and the probable time of their continuance must be considered; and, the chances herein being more hazardous than others, perhaps the person that purchases may reasonably expect a greater rate of interest for the money he lays out in these; therefore they must be separately valued, and this value added to that of the estate before found.

4. We shall now consider the rate of interest and security for money lent, and compare it with money laid out in lands, &c. The legal interest is 5 per cent. per annum. Though a person can lawfully take no more, yet he may lay out his money for less advantage: many who lend money by way of mortgage, or purchase land security, accept of 4 and under.

But, if a man lays out his money on an estate for life only, there is no reason why he should not expect the legal interest, in regard of the uncertainty of the tenure, &c. And, indeed, he may a great deal more, if the estate purchased be houses, or the like, where the calamities are many and great; such as fire, damage by storm, bad tenants, or perhaps none at all: in these cases 6, 7, or even 8 per cent. may be little enough.—Of this more hereafter.

5. Because the value of estates is to be computed from their yearly income, due care must be taken to ascertain that. If the estate has not been lett at a yearly rent, the judgment of skilful honest men in the neighbourhood will be a good guide, as well in that as in regard to the value of all advantages and deficiencies; if it has been lett at a yearly rent, those persons can inform whether that was too much or too little, and why. By these means the value may be ascertained, by which the worth of the fee, or lease for years or lives, may be computed. It is beside necessary to be considered, whether the lessee is bound to pay a harriot or farley, either absolutely of each life, or conditionally, if the liver dies in course. In the first case, the probability of life being known, i.e. how long it is likely each life may continue in being, the value of the money, or

G

harriot,

harriot, then to be paid, may, by the following tables, be found in ready money: and so of each life. In the second case, the probability of the lives dying in course, together with the probability as to the number of years, as before, being found, by the rules and tables hereafter laid down, the value in ready money may thence be found; which sums, so found, must be deducted out of the purchase-money.

Sometimes there is a condition in a lease for a certain sum to be paid for renewing a life, in case one should die within a time prefixed. Here the probability of all the lives living for that time being found, the value of such a privilege to the lessor, or lessee, may be found. If there be any other conditions of this kind, we presume, they may be reduced to some or other of these and the following cases.—Before we proceed to the tables, it may be requisite to say something in general of REVERSION.

By which is meant that right to an estate which is to take place after the determination of a term of years, or lives, during which it is held by some former grant.—The questions that arise, in relation to these estates in posse, are such as these:

1. What is the value of the fee, in reversion of a certain number of years, or of a life or lives in being?
2. What is the value of a term of years, to commence after the expiration of another term of years certain?
3. What is the value of a term of years, or of one, two, or three lives, in reversion for a life or lives in being, to be nominated either now, or at the end of the term in being?
4. Three persons being to enjoy an estate by equal portions, during their joint lives, the remainder to the survivor and survivors, and what is the value of each man's right?

These, and the like, are the queries that will arise about reversions; and the solution of them will appear easy enough, if we consider,

1. That the value of the estate in esse, added to the reversion, is equal to the value of the fee in possession: whence it is plain, that, subtracting the value of the present possessor's right out of the value of the fee simple, the remainder is the value of the reversion in the first query.
2. Find the value of the term of years in esse, and then add the two terms together, and find the value of that whole term; the excess in value of that whole term, above the value of the estate in esse, is the value sought in the second query.

If in the third query, the life, or lives, in reversion, be to be nominated at the time of taking, first find the value of a lease to continue during the term of all the lives, and from that value subtract that of the lives in esse; the remainder is the answer to the first part of the question: but, if the lives are to be nominated at the expiration of the right in esse, find the probable duration of the present estate in years, and also the value of one, two, or three lives, in ready money; then (from the tables for that purpose) find how much this last sum, payable at the end of the years before found, is worth in ready money also, rebate at 5 per cent. for this is the value required.

4. For a solution to the fourth question, note, that each person has a right to one third of the value of their joint lives, and to half the value of the expectation, after the death of either of the other two, and also to the whole value of the expectation, after the death of both the others; which three sums, added together, give the value for each. The value of two or three joint lives is found by the tables for that purpose, which follow.

These tables, for the more easy computing the value of annuities upon lives, are, as before observed, the result of those observations published by Dr. Halley, and are calculated according to the method laid down by Mr. Abraham De Moivre, in his treatise intitled *Annuities upon Lives*, &c.

But, before we proceed to these, it may be proper to give the reader here a table for finding the value of an annuity for years certain, at 4, 5, 6, 7, and 8 per cent.

Though the following tables are calculated some for every 5th, and some but for every 10th year of age; yet, it is presumed, that the common known method of equating will accommodate them, as well to any other year of age, as to any intermediate rate of interest.

TABLE I.

Shewing the value of an annuity, in years and decimal parts, for any number of years not exceeding 100, at the rate of 4, 5, 6, 7, or 8 per cent.

Years of continuance.	4per cent. Value in years.	5per cent. Value in years.	6per cent. Value in years.	7per cent. Value in years.	8per cent. Value in years.
1	0.98	0.95	0.94	0.93	0.92
2	1.88	1.86	1.83	1.81	1.78
3	2.79	2.72	2.67	2.62	2.58

16	11.60	10.84	10.15	9.45	8.85
17	12.15	11.27	10.47	9.76	9.12
18	12.64	11.69	10.83	10.06	9.37
19	13.12	12.08	11.16	10.33	9.60
20	13.57	12.46	11.47	10.59	9.82
21	14.01	12.82	11.76	10.83	10.02
22	14.43	13.16	12.04	11.06	10.20
23	14.84	13.49	12.30	11.27	10.37
24	15.25	13.80	12.55	11.47	10.53
25	15.60	14.09	12.78	11.65	10.67
26	15.96	14.37	13.00	11.83	10.81
27	16.31	14.64	13.21	11.99	10.93
28	16.64	14.90	13.40	12.14	11.05
29	16.97	15.14	13.59	12.28	11.16
30	17.27	15.37	13.76	12.41	11.26
31	17.57	15.59	13.93	12.55	11.35
40	19.78	17.08	15.03	13.39	11.91
50	21.47	18.25	15.67	13.83	12.17
60	22.61	18.93	16.17	14.00	12.34
70	23.39	19.34	16.34	14.11	12.42
80	23.90	19.58	16.50	14.15	12.46
90	24.26	19.75	16.59	14.18	12.47
100	24.50	19.85	16.64	14.20	12.48
The fee sim.	25	20	16.60	14.29	12.50

In this, and the following tables, the numbers at the left-hand of the points are years, and the remaining figures are decimals of a year. I suppose there will be no difficulty to understand the value of these decimal parts; but, if there should, it may be very useful, to such as are wholly unacquainted with decimals, only to take the half of the decimal, and reckon it for so many weeks: thus, against 40 years of continuance, you will find, under 4 per cent. 19.78; the 19 shews so many years, and the half of 78, being 39, shews so many weeks: therefore an annuity for 40 years is worth 19 years 39 weeks, or, rather, 19 years 10 months purchase nearly. See the articles ARITHMETIC and INTEREST.

TABLE II.

Shewing the present value of 1 l. payable at any number of years hence under 100, at 5, 6, 7, or 8 per cent. viz.

Years.	Value at 5 per cent. in parts.	Value at 6 per cent. in parts.	Value at 7 per cent. in parts.	Value at 8 per cent. in parts.

24	.31	.25	.20	.16
25	.29	.23	.18	.15
26	.28	.22	.17	.13
27	.27	.21	.16	.12
28	.25	.19	.15	.11
29	.24	.18	.14	.11
30	.23	.17	.13	.10
35	.18	.13	.09	.07
40	.14	.10	.07	.05
50	.09	.05	.03	.02
60	.05	.03	.02	.01
70	.03	.017	.008	.004
80	.02	.009	.004	.002
90	.012	.005	.002	.001
100	.008	.003	.001	.0004

I suppose that an example or two will render the finding the value of these parts in money very easy.

Thus : against 15 years, and under 5 per cent. is - .48
Multiply these parts by - - - - - 20

In the parts given are two figures at the right-hand of the point, therefore cut off two figures in the product, and the remaining figure to the left-hand is shillings - - - - - 9.60

Again : multiply these parts by - - - - - 12

And cut off, as before, then the figures at the left-hand are pence - - - - - 7.20

Hence the parts 48 is the same with 9 s. 7 d. $\frac{2}{10}$.

Again : opposite to 70 years, under 7 per cent. is - .008
20

00.160

12

1.920

Hence the value in money is 1 d. $\frac{2}{10}$, &c.

TABLE III.

Shewing the value (in years and decimal parts) of annuities to continue 7, 10, 14, or 21 years, if a person of a given age live so long, calculated to every 10th year of age, at 5, 6, 7, and 8 per cent.

Annuity for 7 years on a life.				
Age.	5 per cent. Years.pts.	6 per cent. Years.pts.	7 per cent. Years.pts.	8 per cent. Years.pts.
2	5.11	4.94	4.77	4.62

52	8.42	8.00	7.55	7.12	6.67
62	6.71	6.43	6.15	5.88	5.61
72	4.58	4.45	4.32	4.20	4.09
82	1.44	1.33	1.31	1.29	1.27
One life 32 years old.					
32	9.94	9.41	8.83	8.19	7.49
42	8.97	8.54	8.03	7.53	7.04
52	7.89	7.54	7.19	6.78	6.38
62	6.39	6.14	5.89	5.62	5.35
72	4.43	4.31	4.18	4.03	3.88
82	1.31	1.30	1.28	1.26	1.25
One life 42 years old.					
42	8.21	7.78	7.36	6.94	6.52
52	7.26	6.92	6.58	6.25	5.96
62	5.93	5.71	5.49	5.29	5.09
72	4.27	4.12	3.96	3.81	3.71
82	1.28	1.27	1.25	1.24	1.23
One life 52 years old.					
52	6.52	6.26	6.00	5.75	5.49
62	5.42	5.24	5.06	4.88	4.70
72	3.92	3.83	3.73	3.63	3.50
82	1.25	1.23	1.22	1.20	1.19
One life 62 years old.					
62	4.63	4.53	4.42	4.27	4.10
72	3.46	3.38	3.30	3.21	3.13
82	1.18	1.17	1.16	1.14	1.12
One life 72 years old.					
72	2.73	2.68	2.63	2.58	2.52
82	1.04	1.03	1.03	1.01	1.00
One life 82 years old.					
82	0.55	0.54	0.54	0.53	0.53

The use of the foregoing table is very easy: for, the age of one of the lives being found at the top, and that of the other in the left-hand column (as is usual in such-like tables) right against it, under the proper rate of interest, you will find the value of the annuity, in years and decimal parts; which decimal parts may be reduced to months or weeks, by the foregoing rules laid down under Tab. I.

TABLE VII.

Wherein is shewn the value of an annuity for three joint lives, in years and decimal parts, calculated to every tenth year of either of the ages, at 4, 5, 6, 7, and 8 per cent.

One life 2 years old.					
3d life.	4 per cent.	5 per cent.	6 per cent.	7 per cent.	8 per cent.
2	8.44	7.97	7.49	7.01	6.53
12	9.03	8.60	8.11	7.60	7.11
22	8.69	8.21	7.73	7.26	6.80
32	8.17	7.87	7.50	7.09	6.44
42	7.49	7.25	6.90	6.52	6.04
52	6.69	6.44	6.13	5.85	5.54
62	5.55	5.31	5.06	4.82	4.55
72	3.98	3.89	3.78	3.67	3.53
82	1.25	1.23	1.21	1.20	1.18

One life 2 years old, continued.

3d life.	4 per cent.	5 per cent.	6 per cent.	7 per cent.	8 per cent.
12	9.70	9.23	8.75	8.21	7.58
22	9.31	8.85	8.37	7.85	7.30
32	8.66	8.28	7.89	7.43	6.92
42	7.94	7.60	7.24	6.86	6.46
52	7.04	6.79	6.50	6.28	5.88
62	5.82	5.65	5.46	5.24	4.98
72	4.12	4.04	3.93	3.82	3.68
82	1.28	1.27	1.27	1.26	1.25
22 years old.	4 per cent.	5 per cent.	6 per cent.	7 per cent.	8 per cent.
22	8.94	8.50	8.04	7.58	7.05
32	8.35	8.00	7.61	7.19	6.72

The way of finding the value of lives of any ages, howsoever combined in the foregoing tables, cannot be difficult; for, if the age of any one of the lives be found at the top, then may the age of the other two be met with in the two left-hand columns; and the value of those three joint lives is given in years and decimal parts, in the column under the given rate of interest. How to reduce those decimal parts to weeks or months, hath been already shewn: we shall therefore proceed to the consideration

Of annuities for years absolute, &c.

We shall apply the preceding tables to this purpose, by giving examples in the peculiar cases before-mentioned: in Vol. II.

which we shall be particular in regard to the nature of the disbursements; and to start all objections that may arise on account of the precariousness of the tenure.

Example I. There is an annuity of 40 l. payable to A clear of all outgoings; to continue for 30 years absolute; for the payment of which he has security on lands of a much greater value, what is this worth in ready money, legal interest being 5 per cent.?

For solution to this it must be considered, that in regard the security for payment is better than the common security on money lent, and also that the assignment of 2, 3, or 4 s. in the pound on interest money is hereby saved (the 40 l. per ann. being, by supposition, to be paid clear of all outgoings) the purchaser ought to be contented with less than legal interest, and, perhaps, all things duly weighed, 4. per cent. may be sufficient interest, and agreed on.

This premised, in order to solve the question; look into Table I. for the number of years in the first column, and right against it, under the rate of interest, viz. 4 per cent. you will find 17.27 decimals, which shews, that the annuity is worth so many years value: wherefore, 17.27 being multiplied by 40, the product is 1.690.8 = 16 s. the value fought in ready money.

Suppose the annuitant be to allow his proportion towards the rates and assignments, and that these deductions, exclusive of the land-tax, amount to 2 l. 10 s. a year: in this case, if the annuitant be to pay his share of the land-tax, it is reasonable that he should be allowed 4 l. 10 s. per cent. and the rest of the outgoings being deducted out of the annuity 40 l. the remainder, viz. 37 l. 10 s. must be called the annuity.

Against 30 years in Tab. I. and under 4 per cent. is 17.27 decimals; and in the same table against 30, and under 5 per cent. is 15.37. The mean between these two numbers, viz. 16.32, is the number of years answering to 4½ per cent.; and this number multiplied by 37.5, or 37 l. 10 s. the product 612 is the value of the annuity required in the question.

Example II. Admit the farm of — were to be leased out for a term of 21 years, at the end of which, the tenant to yield it up in as good condition as he finds it.

Suppose the yearly value thereof, at a rack-rent, to be (the landlord paying tythes, and all outgoings, except the king's tax) 76 l. that can be made thereof: suppose also that those tythes, chief rents, rates, and repairs, amount to 11 l. yearly; and suppose further, that the lessor will reserve 10 l. a year rent: now, granting that the casualties, &c. to which it is exposed, make it reasonable that the purchaser should be allowed 6 per cent. for the money he lays out, what fine ought he to pay for the 21 years?

In this case it should be considered, that, though the purchaser may expect 6 per cent. for his money laid out on an estate thus encumbered, and subject to such casualties, yet as to the rates, tythes, chief rent and repairs, it being a tenure of the best kind, and liable to no deductions at all, it may be reasonably reckoned at 4 per cent. and then the reserved rent, being liable to the king's tax only, may be considered as an annuity at 4½ per cent. These things premised, the matter will stand thus:

The rack rent is an annuity of 76 l. per ann. subject to divers incumbrances, casualties, &c. and therefore, 6 per cent. interest, being allowed 21 years continuance, is worth per Tab. I. 11.76 years value, which amounts to 894 l.

Out of this, the parson, the parish, the chief lord, &c. have an annuity paid clear, which (on the best computation that can be made of it) amounts to 11 l. yearly: this at 4 per cent. is worth per Tab. I. 14.01 years value, which in cash amounts to 154 l.

The reserved rent is an annuity of 10 l. yearly, subject to the king's tax only, and therefore to be valued at 4½ per cent. which, per Tab. I. (due equation being made) is worth 13.41 years value, which in cash amounts to 134 l.

Lastly, If these two mentioned sums of 154 l. and 134 l. be deducted out of the whole value, the remainder, or 506 l. is the sum that ought to be paid by the purchaser, for the grant of 21 years in the farm. Our being so very particular in this example will excuse expatiating so largely again.

Example III. An estate in houses containing divers tenements, to be lett for a term of 21 years; the whole yearly rent amounts to 50 l. the charge of putting the houses in repairs is about 40 l. and of keeping them so during the term 7 l. per ann. the outgoings in rates, &c. 4 l. a year, rent reserved 3 l. a year. In regard of the situation, casualties, hazard of bad tenants, or of none at all, &c. the purchaser ought to be allowed 7 l. per cent. Quere, What fine ought he to pay?

An annuity of 50 l. for 21 years at 7 per cent. 1.541 10 0

Out of which deduct

An annuity of 11 l. for the same time, at 4 per cent. 154 0 0

An annuity of 3 l. for 21 years, at 4½ per cent. 40 0 0

The charges of putting the same into repair 40 0 0

The remainder, after these deductions, is the answer to the query 307 10 0

Note, If it be considered that houses are liable to accidents by fire, and that, where the estate (as in this instance) consists of divers tenements, the charge of tenants always brings a charge of repairs with it, and very often loss of rent: these things considered, 7 l. per cent. we apprehend, will be judged little enough to be allowed the purchaser.

Example IV. Out of a lease for 30 years in an estate which is 6 per cent. costs 700 l. there is lapsed 17 years: what must be given at the same rate of interest, to renew the said 17 years?

In Tab. I. against 30, and under 6 per cent. you find 13,76, by which dividing 700, the quotient is 50,85: this is the annuity, which was at first purchased for 700 l.

The value of an annuity of 50 l. 17 s. to continue } 1. 700
30 years at 6 per. cent. is

The value for 13 years at the same rate, by the } 450
same table, is

The remainder, after subtraction, is the sum to be } 250
paid for renewing the 17 years lapsed

Example V. An estate in fields, only worth 70 l. per ann. out of which is issued a chief rent of 1 l. per ann. and the rates and tythes thereof amount (exclusive of the king's tax) to 12 l. a year: what is the fee in reversion of a lease of 40 years worth in ready money, the accidents and casualties very few, or none at all?

Here the nett produce of the estate is 57 l. a year:

And 57 l. per ann. to continue for ever, is equal to } 1. 1267
a fee simple, if it were in possession; which at }
4½ per cent. is

The value of the lease for 40 years, by the tables } 1050
and multiplication, is at 4½ per cent.

This last value, subtracted from the former, leaves } 217
the value of the reversion

In this last example, the security that the purchaser has for the rack-rent, is near as good as that for the payment of the outgoings; on which account, the outgoings are first deducted from the yearly value, and the remainder is reckoned as an annuity: but, generally speaking, it ought to be done otherwise, viz. by reckoning the whole rent as an annuity, to be received at a proper rate of interest, and then to compute the outgoings as near as possible, and to value that sum as an annuity to be paid out; for which, generally, the rate of interest ought to be 10 s. and sometimes 1 l. per cent. less than the legal interest on money.

Having given these cautions, we shall, in all that follows, call this last mentioned annuity, the sum paid out: which shall include all rates, tythes, repairs, or the like disbursements, which go along with the tenure; and which must be judiciously computed, before the just value of the purchase can be obtained.

In the preceding examples, a difference is made in the reserved rent, and other outgoings; for this reason, that, when the reserved rent amounts to 20 s. or upwards, the landlord is to allow the tenant a proportion towards the king's tax, and therefore ½ per cent. more should be reckoned for it, than for clear annuities, such as rates, tythes, repairs, &c.

OF COPYHOLDS.

Method leads us next to shew, how, by the foregoing tables, the value of estates held from deans and chapters, colleges, &c. for terms of years, or for life or lives, renewable at certain periods on fixed conditions, or otherwise, may be found; and, to this purpose, the following examples may be acceptable.

Example I. A tenement of church lands of 30 l. per. ann. rent, to be leased on the condition that the tenant pay at the end of every seven years 30 l. or one year's value for ever; what ought to be paid for the first purchase, the sum paid out yearly 4 l. and the rate of interest to the purchaser 6 per cent.?

Note, Though, perhaps, no bishops, deans, or fellows of colleges, do or can grant their leases on such absolute conditions of renewing; yet, in effect, it is all one to the tenant; for they always think themselves sure of these terms, and the common practice has confirmed it: by this example, therefore, shall be shewn, how much they ought to pay for the first purchase.

The value of the fee at 6 per cent. is, by the foregoing tables, 16½ years purchase } 1. 500
Deduct the value of the sum paid out at 4 per cent. }
25 years

Remainder is the value of the estate in fee - - - 400
For the value of the septennial payment of 30 l. per. Tab. I. an annuity of 1 l. to continue 7 years at 4 per cent. is worth 5,99, and per Tab. II. the present value of 1 l. to be paid at the end of 7 years, is (at 4 per cent.) .760. Wherefore, dividing .760 by 5,99, the quotient .1269, being multiplied by 30, produces 3,84 = 3 l. 16 s. 1 d. ½. This is the sum that may be paid yearly as an equivalent for the 30 l. that is to be paid at the end of every 7 years: consequently, an annuity of that value to continue for ever, must be deducted out of the value of the fee before found.

Thus the value of that annuity at 4 per cent. is } 1. 95
worth 25 years value, or
Hence the remainder, after subtraction, is the sum } 305
that should be paid for the first purchase, viz.
Example II. What is the sum to be paid for renewing of 7 or 14 years lapsed in a lease of 21, in an estate of 40 l. per ann. at 6 per cent. the sum paid out being 6 l. per ann.?

The value of the yearly rent for 21 years, at } 1. 470 00
6 per cent. is
Deduct the value of the sum paid out, at 4 per }
cent.

Remainder is the value of the 21 years - - - 386 00

The value of 14 years at 6 per cent. - - - 371 12
The value of the sum paid out for that time } 63 6

Remains the value of the estate of 14 years in } 308 6
effe

Hence the sum to be paid for the renewing of } 77 14
the 7 years should be

Again:
The value of the 21 years, as above, is - - - 386 00
The value of 7 years, the time in effe, at 6 per } 223 00
cent.

The value of the sum to be paid out for that time } 36 00

Remains the value of the 7 years in effe - - - 187 00

Hence the sum to be paid for the renewing of } 199 00
14 years lapsed should be

And by the like process, may the value of renewing any number of years be found, without any difficulty, by the tables before-mentioned.

Example III. to find the value of a lease of 7, 10, 14, or 21 years, if a person of a given age should so long happen to live.

Let the yearly rent be 50 l. the rate of interest 6 per cent. the sum to be paid out 7 l. per ann. and the person's age 42 years, what is the value?

By Tab. III. the value of the annuity for 7 years } 1. 255
on the given age, at 6 per cent. is 5,10 years, or
Deduct the value of the outgoings taken from the } 39
same table, at 4 per cent. 5,6 years value

Remainder is the sum to be paid for 7 years, on a } 216
life of 42 years old

By the like method of proceeding, the value of 10 } 274
years on the same life is

That for 34 years is worth - - - 329

That for 21 years is worth - - - 286

Example IV. Admit there be 7 years lapsed in the former lease of 21 years, what is the value of renewing the said lapse?

First, The value of a lease of 21 years to a person } 1. 364
of 49 (for that will be now the age) is
Secondly, the value of the lease for 14 years on } 316
the same life of 49 to be deducted

Remainder is the value for renewing 7 years - - - 48

Let there be 10 years lapsed in the same lease, then }
by the like process the value of a lease of 21 years } 353
to a life of 52, at 6 per cent. is

The lease of 11 years in effe is worth - - - 282

The remainder, after subtraction, is the sum to be } 71
paid for renewing

By these examples it is apparent, that the value of renewing 7 years lapsed in the lease of 21, is, to the person that purchases it, absolutely worth almost twice as much, as it is to him that can enjoy it only conditionally, viz. if a person of 42 years of age live so long.

Example V. What is a lease for 7 years absolute, in reversion of a life of 52 years old, worth in ready money, on an estate worth 60 l. per ann. at 5 per cent. interest, the sum paid out being 9 l. per ann. and to be valued at 4 per cent.?

The value of a life of that age, and at that rate of interest, as may be found by Tab. IV. is 9,65 } 1. 579
years purchase, or

This number 9,65 being found in Tab. I. under 5 per cent. against it in the first column (by making due equation) is 13,51, which shews that the life is reckoned to continue in being so many years; to this add 7, the term of the reversion, the sum is 20,51; against which in Tab. I. under 5 per cent. is 12,62, for the year's value of the rent during both terms, which in money is

The remainder, after subtraction, is the value of the rent in reversion, if it were to be paid clear of } 178
outgoings, that is

The value of the sum paid out at 4 per cent. during } 94
the life in effe, is 10,50 years value

The

The number 10,50 found in Tab. I. under 4 per cent. answers to 13,96 years; this added to 7, the years of the reversion, makes 20,96; to which number of years in the same table, answers under 4 per cent. 13,96: that is in money } 1. 128
The difference of these two sums is the value of the sum paid out } 34
This last sum subtracted from the sum before found, viz. the value of the rent, leaves the value of the reversionary lease required } 144

Of leases for one, two, or three lives.

It has been observed before, that the value of a lease for 99 years, determinable on the death of one, two, or three lives, is the same with that of a lease on those lives absolute: so that we shall make no difference, but call them all leases on life, or lives.

Example I. A man of 37 years of age is possessed of an estate for his life of 65l. per ann. the yearly outgoings of which are as follow, viz.

	1. s.
To the lord's rent	3 00
To the church and poor's rates	3 00
To tythes	5 10
To repairs (one year with another)	2 10
How much is the lessee's right worth in ready money at 5 per cent.?	
In Tab. IV. the value of a life of 37 years, at 5 per cent. is 12,10 years in cash	786 10

The value of the same life at 4 per cent. by the same table, is 13,40 years value, which, for the rates, tythes, and repairs, amounts to } 147 00
The value of the same life, at 4½ per cent. is 12,70 years, which for the high rent is } 38 00

The whole sum to be deducted is } 185 00

And hence the value required is } 601 10

Example II. What is the value, in the same estate, of two joint lives, one of which is 12, the other 32 years old, and the estate to be extinct, when one of them dies?

Out of Tab. VI. take the value of the two joint lives at 5 per cent. for the rent which is 10,56 } 1. s.
years, this, multiplied by 65, produces } 686 00
From the same table, the value of the joint lives at 4 per cent. is 11,27 years; which multiplied into 11l. the yearly out goings in rates, tythes, and repairs, produces } 124 00

By the same table, the value at 4½ per cent. is 10,92 years value, which multiplied by 31. the yearly rent to the lord, produces } 33 00

Hence the value of the estate for two joint lives, that is, to continue 'till one of them dies, is } 529 00

Example III. To find the value of three joint lives, on the same estate, one of which is 12, another 22, and the third 42 years old.

From Tab. VII. finding the age of the youngest at the top, the next at the left-hand column, and the other in the second column to the left-hand; under 5 per cent. take out the value of the three joint lives, which is 7,83 years; this drawn into 65, the yearly rent produces } 1. s.
509 00

At the same place (under 4 per cent.) you find 8,15, which multiplied by 11l. the product is } 90 00

Again: In the same table, the number answering to 4½ per cent. is 8,00; this, for the high rent, 31. per ann. is worth } 24 00

These two last sums being subtracted out of the former, the remainder is the value of a lease to continue as long as all three of the lives remain in being } 395 00

Example IV. An Estate of bad houses meanly situated, containing divers small tenements, in all (when full of tenants) of the yearly value of 50l. to be leased for the term of one, two, or three lives, and the longest liver of them, the purchaser to have 6 per cent. for his money: the sum to be paid out in rates, repairs, and high rents (which last is under 20s. per ann. and therefore to be reckoned as a clear annuity, as well as the other disbursements) amounts to 61. a year: what must be paid for the purchase?

First, for one life aged 67 years.

This, for the whole rent, by Tab. IV. is worth, at 1. s.
6 per cent. 5,90 years purchase; which, in cash, } 295 00
at 50l. a year, amounts to

The value of the sum to be paid out at 4 per cent. } 39 00
is 6,53 years, or

The value of a lease for one life } 256 00

Secondly, For the value of two lives, one 67, the other 52, Mr. Abraham De Moivre has demonstrated, [see the article ANNUITIES] that the value of an annuity upon the longest of two lives is the remainder, after subtraction of the va-

lue of those lives jointly taken, from the sum of their values singly taken.

The yearly rent on the life of 67 years was found } 295 00
before to be worth -

That for the life of 52 is worth - } 445 00

The sum is - } 740 00

The value of the same for the joint lives is 4,39 } 220 00
years, or -

Remainder after subtraction is the value on the } 520 00
longest liver of the two

The value of the sum paid out on the first life, at 4 } 39 00
per cent. is 6,53 years, or

The value of the second life is 10,50 years, or } 63 00

The sum - } 102 00

On the two joint lives 4,67 } 28 00

The remainder after subtraction is the value of the } 74 00
outgoings on the longest

The sum being subtracted from the 520l. leaves } 446 00
the value required

Thirdly, Let a third life, aged 22 years; be joined with the two before mentioned, and let the value of the estate on the longest liver of these three be required.

For the } The life 67 years old 5,90 } Years value.
whole } The life 52 years old 8,91 }
rent, } The life 22 years old 12,54 }

Their sum is } 27,35

The value for the three joint }
lives, at the same rate (viz. } 3,99
6 per cent.) is -

The whole sum } 31,34

The before-mentioned ingenious author shews, that the values of the joint lives combined, two and two added together, and the sum subtracted from the foregoing sum, leaves the value of the annuity upon the longest liver of them.

Thus for the purpose:

	Years.
The value of the first and second jointly	4,39
The value of the first and third jointly	5,26
The value of the second and third jointly	7,56

The sum is } 17,21

This last sum being subtracted from the former sum, }
the remainder is 14,13 years for the value of the } 707 1.
longest liver, which in cash is -

We are next to find the value of the sum to be paid out at 4 per cent. in the same manner as the former was found.

The life of 67 years old value in years } 6,53

That of 52 } 10,50

That of 22 } 16,05

The three joint lives } 4,15

The sum of which is } 37,23

The first and second jointly } 4,66

The first and third jointly } 5,67

The second and third jointly } 8,42

The sum of these three } 18,75

Remainder after subtraction } 18,48

This drawn into 6, the yearly outgoings, produces } 111 1.
in money

This sum being subtracted from the value before }
found (viz. 707) leaves the value of the lease } 596
on the longest of the three lives, and at the rate
of interest proposed

The result of the whole operation will appear to be as follows, viz.

One life of 67 years old is worth } 1. 256

Two lives, one 67, the other 52, worth } 446

Three lives, aged 67, 52, and 22, worth } 596

An objection, it may be presumed, will be made to what has been said, by reason of the difference that there is, or seems to be, betwixt this result, and the common way of estimation: for, says the gentleman's steward, it is always reckoned, that one life in possession is as good as two in reversion; and a third life, in reversion of two, is generally reckoned but in two years value: whereas, by this way of computing, the first life amounts but to 5½ years value; and the other two are here worth above 7. And again: the third life in reversion of 2, in the above example, amounts to almost 3 years and an half's value: and how can this be?

In answer to which objection, it has been observed, that, though this be true in the example alledged, yet it is no deviation from reason, notwithstanding it be from the ordinary practice: and that it rather establishes the truth and necessity of this method, than is of real weight against it, will appear by another example, wherein the value of the reversions,

reversions, on account of different ages of the life or lives in possession, will, when found by this method, be thought as much too little, as those are too great.

Example V. Admit the estate to be purchased on lives be worth 40l. per ann. and of such quality, that 6 per cent. is a proper interest for the purchaser: suppose that the rates, tythes, and repairs, be 5l. per ann. and the reserved rent 2l. per ann. let 5 per cent. be allowed for the money to be paid out, and let the ages of the lives to be purchased be,

The first 32 }
The second 22 } Years old.
The third 12 }

What will be the value of one, two, or three of those lives, in the order that they are here placed?

Lives.	Number of years value for 40l. per ann. rent.	No. of years value for the 7l. per ann. paid out.	Value in cash after subtraction.
	At 6l. per cent.	At 5l. per cent.	
1st	11,47 years	12,79 years -	1. 370
2d	12,54 years	14,14 years	402
3d	13,37 years	15,23 years	428
Lives.	The value of the longest liver for the rent	The value of the long- est liver for the mo- ney paid out.	Value of the rem- money.
1st and 2d	14,60	16,84	1. 466
1st and 3d	14,99	17,46	477
2d and 3d	15,40	17,96	490
The value of the longest liver of the three lives for the 40l. per ann.		The value of the long- est liver for the 7l per ann.	Value of the remain- money.
15,83 years.		18,71 years.	1. 502

By the above estimation it appears, that two lives of 22 and 12 years old, in reversion of one of 32, is worth but 132l. which is little more than $\frac{1}{4}$ of the value of the life in possession; and that two of 32 and 22, in reversion of one of 12, is of much less value, viz. no more than 74l.

Again: One of 12 in reversion of two of 32, and 22 years of age, is worth but 36l. that is less than one year's value; and, for one life of 32 in reversion of two of 12 and 22 years old, must be given no more than 12l.

Hence the great difference that arises on account of the age of the lives appears (if this method holds good) to call for a particular regard, and that even when the difference of the age of the lives is not very great, as in this example; how much more then, if the tenant should defer the renewing of his lease, 'till the life or lives in esse arrive to a declining age? Thus we have endeavoured to clear up the affair, as to estates in esse, and given some light in regard to the valuation of reversions; of which we shall now speak more particularly, and shew how to find the value of such in expectancy: to do which, we shall lay down the following general rule. From the value of the sum of the terms in possession and reversion, subtract the value of that in possession, the remainder is the sum to be paid for the reversion.

We have before shewn, how to find the value of the fee in reversion of a term of years absolute; and, from what we have last said, may be easily deduced the value of the fee in reversion of lives, or of one life in reversion of two; of two in reversion of one, by a due application of the above general rule. Something, however, may be requisite to be said of the value of a life in reversion of a term of years, to be nominated at the expiration of the said term; and of a term of years in reversion of another term of a life or lives, or of 2 or 3 joint lives; as also of the right of such two or more, as hold by joint-tenancy and survivorship.

Example I. Let it be required to find how much an estate of 30l. per ann. is worth, during the continuance of a life of 22 years of age; the right to commence, and the life to be nominated, at the expiration of a term of 14 years, allowing the purchaser 6 per cent. and deducting the value of the sum paid out, viz. 4l. a year at 5 per cent.

The value of such a life in possession, for the whole } 1. 376
rent, is by Tab. IV.
The sum paid out is worth - - - 56

Remains the value of the life, if it were to be entered upon immediately } 320

The question then will be, What 320l. payable at the end of 14 years, is worth in ready money at the rate of legal interest, viz. 5 per cent.?

By Tab. II. we find the value of 1 l. payable at the end of 14 years, is .505 decimal parts of a pound; which, being multiplied by 320, gives the value of the reversion, viz. 162l.

By this example may be seen, the method to find the worth of 2 or 3 lives in reversion for a term of years, and also of a term of years in reversion of a term in esse.

If it be required to shew the value of a term of years in reversion of a life or lives; first find the number of years value of the estate in esse, and then, by Tab. I. see how many years it must continue to produce that value; and the value of the estate in posse, payable after the expiration of this

number of years, is the sum to be paid in hand for the expectancy.

If a life is to be nominated at the death of another, the sum to be paid for it may be found, by seeking, in the tables, the number of years of an annuity that is of equal value with each of the lives; and then find, in the table for that purpose, the value of the money that the life in posse will be worth at the death of the other, and the present value of such a sum is the sum required.

Example II. There is, at present, on an estate of 50l. per ann. one life, aged 52; the tenant would purchase another life, to be nominated at the death of the former, viz. one that shall be then 22 years old, allowing the purchaser 6 per cent.; and for the sum paid out, which is 9l. per ann. 5 per cent. what is the value of the life to be purchased?

The life in possession is worth, at 6 per cent. }
(for any rate may be taken for this purpose) } 8,91 years.
by Tab. IV.

This number found under the same rate of interest, in Tab. I. shews in the first column, that the life is as valuable as an annuity } 13,14 years.
certain for the term of

Hence the life that is to succeed, is to be named at the end of 13,14 years.

A life of 22 is worth, by Tab. IV. at 6 per cent. 12,54 years.
And the same at 5 per cent. 14,14

Which being the number of years value that the rent and outgoings will be worth for the second life at the end of 13,14 years, the value of each, in ready money, may be found, by taking out the numbers in Tab. II. answering to the times at 5 per cent. and multiplying that by these numbers of years respectively, the two products will shew the number of years value for the rent, and for the sum paid out, Thus:

The number in Tab. II. under 5 per cent. and against 13,14, by duly equating; is .527. This, multiplied by 12,54, produces 6,61 years; and, multiplied by 14,14, produces 7,45 years.

Hence the value of the rent in money is - - 1. 330
And that of the sum paid out - - - 67

Consequently the sum to be paid is - - 263
By the like process may be found, the value of a third life in succession of two to be named at the death of one or both of these; as of two lives to be named, one at the death of the first, another at the death of the second, or in any other manner: this, doubtless, will be easy enough to the persons concerned, without adding more examples to that purpose.

Example III. A man dying leaves to his three daughters an annuity of 20l. per ann. each, during their lives, payable out of lands of a much greater value; and he so ordered it, that, when either of them should die, her annuity should fall to the other two in equal shares; and, at the death of another of them, the whole is to come to the survivor for life: their ages at the father's death are 32, 22, and 12, what is the right of each worth in ready money at 5 per cent.?

The value of the eldest life is - 12,79, or 256l.
That of the next is - - 14,14, or 283
The youngest worth - 15,25, or 305
The joint lives of the first and second is 10,21
of the first and third is 10,56
of the second and third is 11,41 } Years.
The three joint lives are worth 8,59

For the right of the eldest daughter.
First, 20l. per ann. during her life is worth 1. 256

Secondly, 10l. per ann. in reversion of the youngest, to continue from thence during the joint lives of the other two; found by subtracting the value of the three joint lives from the value of the first and second jointly - - 16

Thirdly, 10l. per ann. in reversion of the second, to continue during the joint lives of the first and third, found by subtracting the value of the three joint lives, from that of the first and third jointly - - 20

Fourthly, 40l. per ann. in reversion of the two youngest lives during her own life, found by subtracting the value of the longest of the second and third, from that of the longest of the three lives, is - - 30

The whole sum of these four values is the eldest daughter's portion, viz. - 321

By the like process, the second daughter's right in the estate will appear - 376

And that of the third, or youngest - 426

The whole value is 1123

And the truth of the work will appear, by finding, according to the method laid down, the value of the whole estate on the survivor of the three lives; which, by the tables, will be found 18,71 years purchase; and this multiplied by 60, the whole yearly value of the three annuities, the product is 1123l. as before.

Thus

Thus have we given examples in most of the useful cases of this subject; by the help whereof, any of the queries that arise about the value of leases in possession or reversion, may be solved.

REMARKS.

We might very well have concluded this article here, but, considering that this work might fall into hands, to whom what we have said on this topic might be useless, on account of the operations for finding the value of the survivorship; to do which, the numbers are required to be taken out of the several tables, and to be added, subtracted, &c. which to some persons may seem such an intricacy, as probably to discourage them from endeavouring to become masters of the subject: for the ease and convenience of such, therefore, we shall add tables of the value on the longest liver of 2 or 3 lives; where the same may be taken out at once for these purposes, and for any ages, howsoever combined, to every tenth year.

We have likewise added two other short tables, the one for finding the value of the decimal parts of a year in months; the other, shewing the value of the decimal parts of a pound in money; so that it is but to find the numbers to the right-hand of the point in the first column of the tables, and, opposite to it in another column, is the value thereof in months in one table, and in money in the other.

TABLE VIII.

Shewing the value of an annuity for two lives, that is to continue 'till both are dead, at 4, 5, 6, 7, and 8 per cent. and to every tenth year of age.

Age.	One life 2 years old.				
	4 per cent.	5 per cent.	6 per cent.	7 per cent.	8 per cent.

Further REMARKS on this article.

The reader will please to observe, that the foundation of these tables are the principles of the learned Dr. Halley and Mr. Abraham De Moivre; whose reputations for this kind of studies have been esteemed superior to all others: and Mr. Richards, in the preceding calculations, has applied their principles to the several uses before represented: but, notwithstanding the authority of great names, the principles, rules, and computations, laid down by these learned gentlemen, have been objected to; and, indeed, with no little colour of reason and plausibility; as appears from the objections made thereto, by that judicious gentleman Weyman Lee, Esq; in his Essay to ascertain the Value of Leases and Annuities for Years and Lives, &c. and also by that ingenious gentleman Mr. Thomas Simpson, in his Tract entitled, The Doctrine of Annuities and Reversions, deduced from general and evident Principles, &c. The latest author, who has obliged the public with something new upon this subject, is Mr. James Hardy, in his book printed in 1753, entitled, A Complete System of Interest and Annuities; founded upon new, easy, and rational principles, &c. which seems to be a work of no less merit than either of them. Upon the whole, however, this subject does not appear to be yet settled upon such a basis, as to obtain in universal practice, according to the sentiments of either of these learned and judicious gentlemen, who have so laudably distinguished themselves therein. See the articles ANNUITIES, LIFE, or LIVES, LOTTERIES, MONEY, MORTALITY [BILLS of MORTALITY]; under which several heads, we shall endeavour to give the substance of what has been said most pertinently upon this subject.

LEATHER

LEATHER, is the skin of several sorts of beasts, dressed and prepared for the use of the various manufacturers, whose business it is to make them up, according to their different employments. The butcher, and others who flay them off the carcasses, dispose of them raw or falted to the tanner and tawyer, they to the shamoy, morocco, and other kind of leather-dressers, who prepare them according to their respective arts, in order to vend them among the curriers, gloves, harness-makers, coach makers, saddlers, breeches-makers, gilt leather-makers, chair-makers, shoe-makers, book-binders, and all in any way concerned in the article of leather.

Leather has divers names, according to the state wherein it is, and according to the different kinds of skins whereof it is prepared, and it's peculiar qualities when so prepared.

(1.) The skin is raw as it comes off of the animal. (2.) Some are falted with sea-salt and allum, or with natron, which is a species of falt-petre, or white falt-wort, to prevent corruption in keeping, or sending to distant tanneries during hot seasons.

Skins dried with the hair on, are commonly those of oxen and cows, or buffaloes, either tame or wild.—Most of those in France come from foreign countries. The places which furnish them with the largest quantity, are Peru, the isle of St. Domingo, Barbary, Cape Verd isles, the river Senegal in Africa, Muscovy, Ireland, the island of Cuba. Those of this latter place are the most esteemed; they are called Havannah skins, from the name of the capital city of that island, whither they are carried, in order to be sent to Spain, and from thence into other parts of Europe.—After these skins are stript of their hair, they are sold to the tanner. See **TANNER**, and **SKINS**.

The three principal assortments of leather are tanned or tawed, and oil and allum leather, all which are dressed in some yards, as they are by Shipton and sons of Watford.

If we reflect on the number of skins of all sorts which this kingdom produces, the prodigious quantity of many kinds that are imported from Spain, Portugal, Ireland, and from our own colonies * in general, under the various denominations of hides, deer-skins, deer-pelts, half-dressed ditto, &c. if this be considered, and also that most, if not all of these are dressed here, many manufactured into a variety of things for our own consumption, and very large quantities of the several sorts of leather wrought and unwrought (tanned in particular) exported; it will be readily granted, that leather is a staple commodity, that may very justly be ranked in the first class of those belonging to this kingdom.

* Our late accounts from South Carolina inform us, that they exported from thence, in about 12 months, no less than 303 hogheads of deer-skins, which, upon a modest computation, is 10,000 skins.

REMARKS.

It may be affirmed, with great truth, that the skins of our own production, and those imported from our **NORTH AMERICAN COLONIES**, when dressed in this kingdom, make the best leather in the world, and therefore is an article of very great importance to the trade of the nation; but, unless some proper regulations are made in relation to this branch of trade, we are in a fair way soon to lose no inconsiderable part of it, as will appear hereafter. For the king of Prussia hath lately established this manufacture in several parts of his dominions, which, with the conduct of France in regard to the same, is likely to do this kingdom no small detriment in this particular.

REMARKS since the last war, and DEFINITIVE TREATY of 1763.

By the large territories ceded to the crown of Great-Britain in **NORTH AMERICA**, by the **DEFINITIVE TREATY**, 'tis to be hoped we shall use every measure to obtain the strict friendship and alliance of the **INDIAN NATIONS** inhabiting there; in which case, we shall not want great plenty of skins to carry on this branch of traffic at the **CHEAPEST RATES**, and thereby to improve in every part relative to the manufacture thereof, in the most extensive manner.

The various trades to which the epithet leather is annexed, are as follow, viz. leather breeches-maker, leather-cutter, leather-dresser, leather-dyer, leather-parer and grounder, leather-feller. We shall speak of these in the order wherein they are mentioned.

LEATHER BREECHES MAKER, is a business sprung from the glover, and is a trade, whose number of artizans has greatly increased within these few years, and employs a great many hands in all parts of the kingdom, there being scarce a market-town or village of any note, but some of this trade may be found therein: and it may be truly observed, that some of the present masters of this business, in the cities of London and Westminster, have brought it to so great perfection, that what was thought to be a garment fit to be worn only by the laborious, is become fashionable, and universally worn, from the tradesmen to those of the first rank in the kingdom; and may, with suitable encouragement, become a very profitable mercantile commodity, when exported to proper markets, the best London made leather breeches be-

ginning to be esteemed, and to be worn in many parts abroad, not excepting even some very hot countries.

The sorts of leather breeches are various; some being made of deer, sheep, and goat-skins; others of calf, lamb, and beaver-skins. The two first sorts are the principal, the consumption whereof is of more consequence than may at first view appear. The deer-skins being chiefly imported from our colonies, and the only commodities (the half dressed ones in particular) the Indians have to exchange with our Indian traders in North America, for what they want of them: and as this commerce with the Indians may increase, the import of deer-skins will do so in the like proportion; consequently the price must fall, if a proper vent be not found; and, in that case, a stop may, in some measure, be put to that branch of our trade.

The consumption of the second sort, i. e. the sheep-skin kind, is, in some degree, an help to the woollen trade; for, if the fell-monger cannot find a market for the pelt, it's value will, of course, enhance the price of wooll.

This being the case, may it not be worth consideration to enquire how the consumption may be effectually supported? In answer to which it may be said, (1.) By the makers taking due care to manufacture them in the best manner, and selling them as low as possible. (2.) By the merchants making trial of a small quantity of those sorts, which are not perishable, nor too low priced; which has been done, and good returns made for them. And, in order to encourage the maker, the exporter, and the foreign markets, (3.) by the parliament's taking off the drawback on undressed deer-skins, and giving such a bounty, or allowing such a drawback on the exportation of buck, doe, and sheep-skin breeches, as may appear nearly adequate to the duties, and the excise which the skins and leather have paid.

As the duties and excise are the great obstruction to the exportation of leather breeches, it may be conducive to the general good, if our superiors would please to consider, that, as this article now stands, our politic rivals, the French, have, and do actually buy our deer-skins undressed, taking the drawback on exportation, and dress and manufacture them at home, and send them in breeches to a foreign market, where they have sold very well (though inferior in many respects to those that are made in London) which seems to be owing to our ill-judged imposts, duties, and excises on leather. See the article **LABOUR**.

LEATHER-CUTTER and CURRIER, is a business in London of large extent, and is generally carried on by those who were originally curriers; between whom and the worshipful company of cordwainers in London, there was some few years since a dispute at law, concerning the right of cutting leather; which, after expending some thousands of pounds, ended with each party's sitting down with their own costs. To curry a skin, is to finish it after it comes from the tanner; the art consisteth in cutting them to a proper ground, waxing, colouring, and making them fit for the use of several manufactures. It is deemed a good employment for master and journeyman, especially as they now cut large quantities of bucks and buffs into soles for shoes and boots, and of calves leather for upper-leathers for shoes and legs for boots; which they sell to many shoemakers in town and country, wholesale and retail, and deal largely in all the sorts of uncut, tanned, and other leather. It is a business, that, in it's present situation, requires a good capital; the tanner selling chiefly for ready money, and the returns generally considerable, with some * very large.

* There is one on Snow-Hill, London, said to return near 40,000l. per ann.

LEATHER-DRESSER. We have before observed, that leather might be divided into three assortments, i. e. tanned or tawed, oil and allum leather; and the dressers into the like number. For the tanned or tawed leather, see **TANNER**. Those who dress in oil and allum come under this article, and are called leather-dressers. The art of dressing skins in oil is a business of large extent, and very beneficial to this kingdom. To describe every process in this art is needless; it may be sufficient to say, that when the skins are put into work, they are first soaked, then thrown into the lime-pit, when taken thence are pulled and delivered to the friezer, then struck with the oil and sent to the mill; when they are milled sufficiently, they are thrown into the drench to be scoured, (then by some scudded) which done, they are hung upon the hooks to dry; after which they are deemed leather, and when the proper officers have weighed and marked them, in order to estimate the excise duty thereon, they are fit for the market, or to be sent to the respective proprietors. The sorts of skins dressed in oil, are deer, sheep, and lamb (some few goat, and others not worth mentioning) of which prodigious quantities are consumed, when wrought into the different manufactures made thereof. It is a flourishing business in most parts of the kingdom; it's professors (those especially who dress their own skins) being men of large fortunes, and dealing for very considerable sums: London, Bristol, and Exeter, are the principal markets for oil-leather *, although there are others, and oil-mills set up within these few years, in several part of the kingdom.

* The oil they use is Newfoundland, i. e. cod's liver oil, of which they consume a great quantity.

Some of this business make from their pieces a large quantity of glue, which is judged to be the best that is; that made by Shipton and sons of Watford in particular.—It may, perhaps, be of service for the farmer to know, that the fleshings and shavings, made by friezing the skins, is a very rich manure.

The allum leather-dresser is one, that understandeth the manner of dressing skins in allum, of which there is a considerable consumption; the art consisteth in properly soaking, limcing, wringing*, and striking them in a liquor composed of water, salt, and allum, then drying them properly; which done, and the excise account taken, they are fit for the market.—The sorts of skins dressed in allum are sheep and lambs and a large quantity of kid.

* Some sorts are not wrung, nor any by some dressers.

LEATHER-DYER. This is an art of which there are but few in the trade; their business is to dye, colour, oil, and allum leather, for the manufacturers; which they do of all colours, some of them to a very great nicety. This profession hath suffered by black ram-skin breeches not being so generally worn now, as they were before the death of her late majesty. The mourning for her occasioning a large demand for black ram lamb-skins, obliged the manufacturers to dye some skins that were not quite proper; and the dyer being pressed to expedite them too fast, were the true causes that many of them did not come up to the character they bore before that time: the consequence of this was (and ever will be in such cases) a decline in their consumption; notwithstanding which, there is not so good or serviceable a commodity of the colour as black ram-skin breeches are, when made as they ought to be. We take notice of this as a caution to all manufacturers, to be careful how they vend an indifferent commodity, for the sake of a present profit; for it will prove in the run of trade to be a future loss, to all concerned in that manufacture; therefore this should never be done, on any consideration whatsoever.

LEATHER-PARER and GROUNDER is an art, by which it's professors give the finishing stroke to all sorts of oil, allum, and some tanned leathers. It consisteth in bringing the oil leather to it's proper face, by pareing off the surface left on it by the dresser, and grounding it with a stone, composed or made of pieces of the pumice-stone; and in washing and grounding the allum and tanned leather, and making all fit for the use of the several manufacturers. It is a laborious art, that affordeth a good maintenance to the master, and good wages to the journeyman.

LEATHER-SELLER is a business that is followed by many in this city, and several other parts of the kingdom. They buy large quantities of undressed deer-skins of the importers: oil, allum, and some sorts of tanned leather of the dressers; all which they sell to the manufacturers.—It is a very genteel business, but their returns being large and slow, (they buying all their undressed deer-skins with ready money, and giving large credit) it requires a very large capital to carry it on. In the city of London they are an incorporated company, &c. and generally have with an apprentice 100 l. frequently more.

The chief laws of England relating to leather.

There shall be paid for all skins and hides, and pieces of skins and hides imported, the duties following, over and above all other customs.

For all deer-skins dressed in oil or allum, or otherwise perfectly dressed and imported, 6 d. per pound.

For all loshee, buffalo, elke, or any other hides dressed in oil, 4 d. per pound.

For Russia hides imported, 2 d. per pound.

For tanned hides and calf-skins imported, 1 d. $\frac{1}{2}$ per pound.

For horse, mare, or gelding's hides, imported and dressed in allum and salt, or meal, or otherwise tawed, 1 s. per hide.

For hides of steers, cows, or any other hides imported, and dressed in allum and salt, or meal, or otherwise tawed, 2 s. for every hide.

For calf-skins and kipps imported, dressed in allum, salt, or meal, or otherwise tawed, 1 d. $\frac{1}{2}$ per pound.

For all flink calf's-skins imported and dressed in allum and salt, or otherwise, with the hair on, 1 d. per pound; if without the hair, $\frac{1}{2}$ d. per pound, and the like $\frac{1}{2}$ d. for dog's skins.

For cordivants, 4 s. per dozen imported.

For goat-skins not usually called cordivants, imported and dressed in oil or allum, salt, meal, or otherwise, 6 d. per lb.

For all kid-skins imported, dressed or undressed, 1 s. per dozen; and, if any of the kid-skins shall be dressed after imported, no farther duty shall be paid.

For all sheep-skins imported and dressed in oil, 1 s. per dozen; and upon all imported sheep-skins and lamb-skins dressed in allum, salt, or meal, or tawed, 6 d. per dozen.

For all hides and skins, and pieces imported, tanned, tawed, or dressed, and not before charged; and for all wares made into manufacture of leather, or whereof the greatest part is leather, a duty after the rate of 15 l. for every 100 l. of the real value, to be paid by the importer.

For hides tanned in England, 1 s. per pound.

For calf's-skins, kipps, hog-skins, and dog-skins, tanned in England, 1 d. per pound.

For goat-skins tanned with sumac, or otherwise in resembling Spanish leather, 2 d. per pound.

For all sheep-skins, which shall be tanned for roanes in England, 1 d. per pound.

For all sheep-skins and lamb-skins tanned in England for gloves and bazils, a half penny per pound.

For all other skins and pieces of skins (not before charged) and tanned in England, a duty after the rate of 15 l. for every 100 l. of the true value, to be paid by the tanners.

For hides of horses, mares, and geldings, dressed in allum, salt, meal, or tawed, in England, 1 s. per hide.

For hides of steers, cows, or any other hides dressed in allum, salt, or meal, 2 s. per hide.

For calf-skins and kipps dressed in allum, salt, or meal in England, 1 d. per pound.

For all flink calf skins dressed with the hair on, 1 s. 6 d. per dozen.

For all buck and doe skins dressed in allum, salt, or meal in England, or tawed, 3 d. per pound.

For all kid-skins, 6 d. per dozen.

For goat-skins, 1 s. 6 d. per dozen.

For sheep-skins and lamb skins, a halfpenny per pound.

And for all other skins and parts of skins, tawed in England, fifteen pounds in the hundred of the true value, and proportionably for greater or lesser quantities; all the duties to be paid by the tawers or makers thereof into leather.

For all hides and skins dressed in oil in England, 4 d. per pound.

For deer-skins, beaver-skins, goat-skins, and calf's-skins, dressed in oil in England, 4 d. per pound.

For sheep-skins dressed in oil, and for lamb-skins, 1 d. per pound.

For all other skins and parts of skins dressed in oil, fifteen pounds for every hundred pounds of the true value, and so proportionably.

Tanned hides are such as are tanned in ooze, made of the bark of trees, or sumac. Hides dressed in oil, are such as are made into leather, in oil or any liquor, of which the chief ingredient is oil; tawed hides are such as are dressed in allum, salt, or meal.

For all vellum and parchment made in England, or imported, after the rate of 1 s. per dozen; for vellum imported, and for parchment imported, 6 d. per dozen; and the same, if made in England, to be paid by the maker.

When the duty is paid on skins imported, the officer of the customs shall mark them, to shew that the duty is paid.

If the raw hide of any ox, bull, steer, or cow, or the skin of a calf, shall wilfully or negligently be gashed or cut in the flaying, or, being gashed, shall be offered to sale by any other butcher, then he who gasheth it, or who offered it to sale, shall forfeit 2 s. 6 d. for every hide, and 1 s. for every calf's-skin, one moiety to the poor where the same shall be offered to sale or found, the other moiety to the informer.

A tanner shaving a hide or calf's-skin before it is thoroughly tanned, so that it is impaired and the duty diminished, the same shall be forfeited, or the value thereof, one moiety to the crown, and the other to the informer.

Tanners, &c. shall not use any place for drying hides or skins, &c. without giving notice to the proper officer of the places for drying and keeping their hides.

Collar-makers, gloves, bridle-cutters, and others who dress skins in allum, &c. and who cut the same into wares, shall be accounted tawers, and subject to the penalties and forfeitures aforesaid, and shall be charged with the duties before the skins be cut and converted into wares.

Where hides or leather manufactures are exported, in such a case, upon shipping them, and upon sufficient security given to the customer, that such hides or wares shall not be reloaded in England, the customer shall give the exporter a certificate in writing of the kinds, qualities, and weight of the hides, calf-skins, and wares exported; and, upon producing that certificate to the collector of the duties at the port where they shall be exported, then he, or in his default the commissioners of the duties, shall repay two-thirds of the duties which were before charged for the said hides, &c. and wares so shipped to be exported.

Wares made of hides or skins, shall have now drawback, as made wares, in respect of being dressed, or carried by a currier.

All sheep-skins and lamb-skins, tanned, tawed, or dressed, which are chargeable with any duties by the act 9 Ann. shall, upon exportation thereof, have a drawback or allowance of two thirds of the duties usual, as upon exportation of hides and calf-skins.

Some other of the laws and regulations in England in regard to leather tanned.

* As manufactures of tanned leather, such as boots, shoes, gloves, or other goods and wares, are, upon exportation, entitled

entitled to a drawback or repayment of the excise duties; therefore, besides making an entry as for other goods, the exporter must, on the bill of entry, give a certificate of the kinds and weights, as a foundation for making out a debenture to obtain the drawback, the form of which certificate must be as in the following example:

* 9 Ann. cap. 11. §. 39. 10 Ann. cap. 26. §. 4.

16th of February 1730.—No. 26.

In the Tavistock of London, Daniel Bright, master, for Jamaica.

William Turner.

Four dozen and an half of mens leather-heel shoes	—	—	} Containing two hundred forty-nine pounds.
Three dozen of womens shoes	—	—	
Fifteen dozen of boys and girls shoes	—	—	

These are to certify, That the shoes above-mentioned, weighing two hundred forty-nine pounds weight, were made of tanned hides and calf-skins, chargeable with a duty of one penny per pound weight, by an act of parliament of the ninth year of her late majesty queen Anne; and an additional duty of one halfpenny per pound weight, by an act of the tenth year of her said late majesty's reign.

William Turner.

And, before the said manufactures of tanned leather are shipped off, sufficient security must be given for the due exportation, in the following manner:

A bond for the exportation of manufactures of tanned leather.

KNOW ALL MEN by these presents,

Whereas the above-bounden William Turner hath this day entered outwards in the port of Southampton, on board the Tavistock of London, Daniel Bright, master, for Jamaica, four dozen and an half of mens leather-heel shoes, three dozen of womens shoes, and fifteen dozen of boys and girls shoes, made of tanned hides and calf skins, weighing two hundred and forty-nine pounds weight, chargeable with a duty of one penny per pound weight, by an act of parliament of the ninth year of the reign of her late majesty queen Anne; and an additional duty of one halfpenny per pound weight, by an act of the tenth year of her said late majesty queen Anne: And whereas the said William Turner, upon the exportation of the said shoes, is to have an allowance or drawback, according to the said acts of parliament on that behalf made:

Now the condition of this obligation is such, That if the said shoes and every part thereof, shall be really and truly exported into parts beyond the seas, and no part thereof be relanded, or unshipped with intent to be relanded, or brought on shore again in any part or parts of Great-Britain; then this obligation to be void, or else to remain and be in full force and virtue.

Sealed and delivered in the presence of
A. B. Collector.
B. C. Comptroller.

William Turner*.
Daniel Bright*.

A debenture for hides and calves-skin leather, tanned, tawed, or dressed, exported.

Port of Southampton,

* These are to certify, That Bartholomew Richardson did enter with us the 16th day of February 1730, in the Diligence of Bristol, Henry Hopkins master, for the Streights, twelve bales of tanned hides and calf-skin leather, containing one hundred and six hundred weight, one quarter, and nine pounds avoirdupois weight; and hath made oath, that all the tanned hides and calf-skins contained in the said twelve bales respectively (weighed as above-mentioned) were marked with the marks and stamps denoting the charging of the duties of one penny and one half-penny per pound, payable for the same by the several acts of parliament made in that behalf, and not with the marks or stamps denoting the charging the duty of one half-penny per pound, as being stock in hand, the 24th day of June 1711. Certified this 19th day of March 1730.

A. B. Collector, B. C. Customer, C. D. Comptroller.

* 9 Ann. cap. 11. §. 39. 10 Ann. cap. 26. §. 4, 5.

Bond is taken in the penalty of one hundred pounds, that all the said tanned hides and calf-skin leather shall be exported into foreign parts, and shall not be relanded or brought on shore again in any port or ports of Great-Britain.

A. B. Collector.
C. D. Comptroller.

The one hundred and six hundred weight, one quarter, and nine pounds of tanned hides and calf-skins above-mentioned, were shipped the 18th of February last. Certified the 22d of March 1730.

E. F. Searcher.
F. G. Surveyor.
G. H. Land-waiter.

VOL. II.

On the back of the aforesaid debenture must be endorsed the duties to be repaid, as follows:

The two-third parts of the old duty payable by the 9th of queen Anne, to be repaid for the tanned hides and calf-skins within mentioned, amount to thirty-three pounds one shilling and seven pence half-penny	—	—	} 33 1 7½
The two-third parts of the additional duty payable by 10 Ann. to be repaid for the said hides and skins, amount to sixteen pounds ten shillings and nine pence half penny	—	—	
The total			49 12 5

A. B. Collector } of the customs.
C. D. Comptroller }

Note, Hides and calf-skins dressed, or curried, are to be allowed one penny per pound weight. 10 Ann. cap. 26. §. 26. Sheep and lamb-skins tanned, tawed, or dressed, are to be allowed two-third parts of the duties formerly paid. 12 Ann. cap. 9. §. 69.

* The debenture being thus executed by the officers of the customs, the same is to be delivered to the exporter, in order to be produced to the collector of the duties on hides and skins at the port of exportation; who is forthwith, out of the monies in his hands arising by the said duties, to repay the two-thirds, (as above) of the duties which were before paid; or in default thereof, the commissioners of the said duties are to repay the same.

* 9 Ann. cap. 11. §. 40. 10 Ann. cap. 26. §. 5.

A debenture for manufactures of tanned leather.

Port of Southampton,

* William Turner did enter with us the 16th of February 1730, in the Tavistock of London, Daniel Bright master, for Jamaica, four dozen and an half of mens leather heel shoes, three dozen of womens shoes, fifteen dozen of boys and girls shoes, made of tanned hides and calf-skins, weighing two hundred forty-nine pounds weight, chargeable with a duty of one penny per pound weight, by an act of parliament of the ninth year of the reign of her late majesty queen Anne, and an additional duty of one halfpenny per pound weight, by an act of parliament of the tenth year of her said late majesty's reign.

A. B. Collector, B. C. Customer, C. D. Comptroller.

* 9 Ann. cap. 11. §. 39. 10 Ann. cap. 26. §. 4.

Bond is taken in the penalty of four pounds, that the shoes above-mentioned, and every part thereof, shall be exported for parts beyond the seas, and not relanded or brought on shore again in any part or parts of Great-Britain.

A. B. Collector.
C. D. Comptroller.

The shoes above-mentioned containing two hundred forty-nine pounds weight, were shipped the 16th of February last. Certified the 20th of March 1730.

D. E. Searcher.
E. F. Surveyor.
F. G. Land-waiter.

On the back of the aforesaid debenture must be endorsed the duties to be repaid, as follow:

The old duty payable by the ninth of Anne, to be repaid for the shoes within mentioned, amounts to one pound and nine pence	—	—	} 1 0 9
The additional duty payable by the tenth of Anne, to be repaid for the said shoes, amounts to ten shillings and four pence half-penny	—	—	
The total			1 11 1

A. B. Collector } of the customs.
C. D. Comptroller }

* The debenture being thus executed by the officers of the customs, the same is to be delivered to the exporter, in order to be produced to the collector of the duties on hides and skins at the port of exportation, or to the commissioners for managing the said duties; who are forthwith, out of the monies arising for the same duties, to repay (as above) one penny half-penny for every pound thereof; although the marks and stamps to denote the payment of the duties do not appear on such shoes [or other wares.] Relanded, forfeited with treble the value.

* 9 Ann. cap. 11. §. 41. 10 Ann. cap. 26. §. 4. 12 Ann. cap. 9. §. 68.

REMARKS on LEATHER-DRESSING in general.

Although there is no little difference between the dressers of shamoy, allum leather, Hungary leather, Morocco leather, the tanner, and parchment-maker; yet the skins which pass through the hands of several workmen, ought to have been, for the most part at least, washed of the blood and impurities in a running water; set to drain; worked with hands, or pounded with wooden pebbles in a vat; put into the pit (made in the ground, and bordered with wood, or stone and mortar) filled with water in which quick lime is dissolved, in order

der to loosen the hair, that it may be easily rubbed off without injuring the skin; drawn out, and set to drain on the edge of the pit; stretched on the leg or horse, in order to have the hair scraped off with a blunt iron knife, or a wooden cylinder; pared off the membranes on the fleshy side, and of the scabs or roughness on the grain side with a sharp knife, rubbed with a whetstone on the same horse, to take off any particles of the lime or other thing, which may occasion hardnesses; thickened by different sorts of powder, whereby they become greater in bulk, and so much lighter, as gradually to rise to the surface of the water; stretched out green or half dried, and piled one over another; or put up separate after dried to a crust; hung out to air upon poles, lines, or any other way: which must be repeatedly done in the dressing of small skins.

This alternate transition from the liquid of the air into that of water, and from water into the air, with the assistance of the lime, salts, and oils, opens the inmost fibres of the skin so effectually, as greatly to facilitate the introduction of substances proper for making them pliant without rendering them thinner.

Natural philosophy would be embarrassed to settle the order and number of these operations, by dint of reason *à priori* alone: but what the most penetrating genius has never been able to invent, frequent handling of the same thing brings a man to practise with ease and success. Common workmen continue to do the same thing scrupulously by habit. One of them, more expert than the rest, and whose experience makes up all his philosophy, oversees the whole, judges of the degree of dryness and moisture, hardness and softness, determines justly; and either repeats, lengthens, or shortens the processes.

These processes, though really the same in the four or five principal dressings of leather, are so different in regard to the manner of executing them, and the time required in them, that the knowledge of all the minute particulars is requisite for him who would understand the trade to perfection.

The allum leather-dresser dresses all sorts of white leather, from the ox-hide to the lamb-skin. He works chiefly for the saddler and glover. For dressing the saddler's leather, he uses bran, sea-salt and allum. For that which the glover uses, after the common preparatives, he first employs bran, and then with salt, allum, fine flour, and yolks of eggs mixed in hot water, he makes a sort of pap, with which the skins are smeared in a trough.

The shamoy dresser soaks in oil*, not only the skins of the true shamoy, which is a wild goat, but likewise those of all other goats, though much inferior to the true, and even sheep-skins, which he dresses like shamoy.

* The shamoy leather-dresser uses fish-oil.

The tanner uses the bark of young oaks, from eighteen to thirty years old, ground in a tanning-mill; in which he soaks skins more or less, according to the different services expected from them, and their chief use is to remain firm and keep out water.

Whereas the tanner's way of dressing leather in lime and tan, takes up two or three years; the Hungary* leather-dresser allows but three or four weeks to that which passes through his hands. He supplies the harness-makers, saddlers, belt-makers, and all other trades that use not only white and allum leather, or oiled and tanned leather, but also skins coloured grey with ink, and dressed in tallow, which is the distinctive work of the Hungarian leather-dresser †.

* The Hungary leather-dresser employs suet or tallow.

† The leather-dressers in England dress this sort of leather to great perfection.

His name (Hongreyeur in French) and method came from Hungary, whither a French workman went, by order of Henry IV. to learn the trade by stealth; and thereby to lower the price of harnesses, and several other things wanting in his armies, made of leather.

The tanner, in certain cases, instead of tan, uses redon, which is a plant cultivated much in Gascony, and very common in Polish Russia.—It serves chiefly for tanning ram and sheep-skins, which the French call *bafanes*: but it is also used in dressing Russia leather, which the Polish Russians make a great mystery of, though there is a very good manufacture of that sort at St. Germain en Laye.

The confit and sumac are little in use but for Morocco leather. The confit, into which goat-skins are put after the common preparations, is a large tub of warm water, wherein they are thrown, after having dissolved therein a very cheap substance taken from the animal kingdom, viz. the sweepings of dog-kennels; for there is nothing in nature, but what the philosophic artist can usefully apply.

The sumac is taken from the vegetable kingdom. It is a dust, which comes on the leaves and small branches of the plant called *rhus*, or *sumac*. It is sumac, with galls and allum, that the Morocco leather-dressers chiefly use; whose intention is to give a grain to goat-skins, and thereby to render them susceptible of the most beautiful colours. They call grain those little wrinkles or furrows, which run all over

the surface of Morocco leather, as also that of calves and cows-leather, which they bring to a resemblance of it, by dint of washing, pounding, wringing, and folding the skins different ways. They use also water tinged with rust of iron, which serves to give a black colour; and laque [see LAQUE] and other substances, which colour the skins red, yellow, &c.

The workmen, who give the grain and the most likely colours to skins of the shamoy, or other goats, and who dress calves and sheep skins in the same manner to imitate Morocco, make a great secret of certain parts of their art, which are the nicest; but the experimental philosopher is rarely at a loss to discover any, which he in earnest attempts.

As the grain and beautiful dyes of goat-skins are the work of the Morocco leather dresser, the last preparations and dyes, given to certain tanned leather, are the business of the currier. So likewise, when skins dressed white by the skinner, are destined for writing or drawing, the parchment-maker puts the finishing hand to them.

Of skins brought from the tan-yard, some are sent in crust to the shoemakers and other tradesmen who employ hard leather, the rest are softened, and sometimes coloured by the currier.

His chief business is to soften and supple cows and calves-skins, which make the upper leathers and quarters of shoes, coverings of coaches, harnesses, and other things; which must keep out water, bear continual jolts, and yet be pliant, either for receiving a handsome shape, or to facilitate motion by their giving way.

First, these skins, after coming from the tanner's yard, having still many fleshy fibres on them, the currier soaks them some time in common water.

Secondly, he takes them out and stretches them on a very even wooden horse. Then with a paring-knife he scrapes off all the superfluous flesh, and puts them into soak again.

Thirdly, he puts them wet on a hurdle, and tramples them with his heels, 'till they begin to become soft and pliant.

Fourthly, he soaks them in train-oil, which, by its unctuousness, is the best liquor for this purpose.

Fifthly, he spreads them on large tables, and fastens them at the ends. These, with the help of an instrument called a pummel, which is a thick piece of wood, the under side whereof is full of furrows crossing each other, he folds, squeezes, and moves them forward and backward several times under the teeth of this instrument, which breaks their too great stiffness. This is what is properly called currying.

The order and number of these operations vary in different places, but the material part is always the same.

Sixthly, after the skins are curried, there may be occasion to make them white or black. In order to whiten them, they are rubbed with lumps of chalk or white lead, and afterwards with a pumice-stone. As calves-leather is generally required to be thin, instead of using the scraping-knife to take off the flesh, the currier makes use of the round paring-knife, which carries a good edge on it's whole circumference, and has a round opening in the center, big enough to let both hands through, in order to manage it with strength. When a calf's-skin is hung on the paring-horse or frame, which has a cross-bar at top and is open at bottom, the workman fastens it on tight, and pulls it down as he thinks fit, by means of a cord that secures both ends of it, and goes round his own body. He then rubs it with chalk, and with the knife he pares off the flesh. He repeats this work as often as is necessary, 'till the skin is as thin and white as he desires.

Seventhly, when a skin is to be made black, after having oiled and dried it, he dips a puff, which is a thick tuft of fringes or hair, in water impregnated with iron. The old iron, which he has let stand some time in this water, together with it's rust, deposits a quantity of salts, and particles of iron, which are known to be the basis of the blackness of ink. After this first wetting, he gives the skin another in a water prepared with foot, vinegar, and gum arabic. These different dyes gradually turn the skin black, and the operations are repeated 'till it is of a shining black. The grain and wrinkles, which contribute to the suppleness of calves and cows-leather, are made by the reiterated folds given to the skin in every direction, and by the care taken to scrape off all hard parts on the coloured side.

The parchment-makers business is more simple. After the skinner has dressed the skins white which he wants, and put them on the paring horse, pared, rubbed them with chalk several times, wetted, pumiced, wetted again, drained, rubbed them again with pumice stone, dusted them with a piece of lamb's-skin with the wool on; the parchment-maker takes those same skins to scrape them dry, and rub them thinner on both sides with an iron instrument.

After he has gathered up the scrapings, for making a thin glue or size, which serves particularly for sizing the warp of several sorts of woollen stuffs, and for making it move easier through the reed; he finishes his work by rubbing the skin with the pumice-stone, and carefully removing all roughness from the surface of it. If it be a sheep-skin, it is called parchment, the principal use of which is to engross acts or deeds that are required to last long.

If

If it be a flink calf or lamb's-skin, it is named vellum; and is used by designers for whatever requires a very smooth ground and great propriety in the execution.

We see the advantage of differently imbibing skins with tallow, mutton-suet, or fish-oil, and of feeding them with some vegetable powders.

Instead of those substances, many of which are brought from very remote places, and are expensive to be got; it is not impossible but we may have some as good, or better at home, which are not taken notice of. We have a number of large feeds and thick barks, which might yield powders or oils fit to supply the places above-mentioned. In costly undertakings, it is prudent to adhere to what has already succeeded: but a more noble concern ought to put our manufacturers upon making daily trials of improvement in little. The same experimental philosophy, which has merited our acknowledgements by its first discoveries, may still gain more glory, by diminishing the tediousness and expence of several works, and, perhaps, even by suppressing some unnecessary rules or operations in the mechanic as well as manufactural arts.

L E D G E R, in regard to accountanship [see ACCOUNTSHIP], is a large book, containing all the transactions of a trader's or gentleman's affairs, methodized in the form of debtor or creditor. The ledger, indeed, is only the waste-book, or the journal so digested, as to exhibit, as it were, at one view, the state of a merchant's, or any other trader's concerns, though they be ever so various and complicated. To methodize every distinct account in a peculiar book, two pages are required, opposite to each other; that on the left hand serving for the debtor side, the other for that of the creditor: and each article consists of five parts, viz. the date, the person whom we credit, or are credited by, the thing for which we are indebted or credited, the page where such counterpart is found, and the sum or amount of the article, so posted into the ledger.

The peculiar nature and form of this grand livre, or most essential book, as the French call it, we have exemplified under the article of **BANKING**; where at the same time that we illustrate the art of accountanship by debtor and creditor, we likewise comprehend the principal business of domestic banking. See **BANKING**.

We shall here take occasion also to illustrate the utility and importance of this book, by transactions drawn from some real foreign mercantile concerns, that happened some years since; which will give a lively idea, not only of foreign mercantile accounts, but of the nature of conducting the business of a trading voyage at the same time.

Those mercantile transactions, as they fell out, are as follow; viz.

Thomas Dale of Leghorn, James Goodman of Barcelona, Peter Winberton of Smyrna, Peter Blaxland of New England, John King, John Kelly, Peter Bradbey of London, James Bradon of Bilbao, James Dixon of Cadiz, and James Corman of Lisbon, correspond and trade with each other: viz.

Thomas Dale of Leghorn buys the Anne galley, and fits her out to sea, to proceed on a voyage from Leghorn to Barcelona, and thence to Smyrna and the Arches, for a lading of wheat for Lisbon, to be confined to the care and disposal of James Corman, who is $\frac{1}{2}$ part concerned therein, and Thomas Dale $\frac{1}{2}$, and who paid for the hull, masts, &c. according to inventory and contract 1600 dollars, and paid all charges of fitting out to sea, as per account, dollars 1589: 12—Insured dollars 3600 on the hull from Leghorn for Barcelona, at 9 per cent. with more, $\frac{1}{2}$ per mill. palace charges—Also insured dollars 6000 on the hull and stock, from Barcelona to Smyrna, the Arches, and to Lisbon, at 28 per cent. with more $\frac{1}{2}$ per mill. palace charges, and reckons his provision on both insurances $\frac{1}{2}$ per cent.—The galley arriving at Barcelona, James Goodman receives the freight of barley and wheat, made by said galley, being dollars 1242: 10—Buys 2000 pieces of eight Spanish money, amounting for cost and charges to dollars 2068: 12: 6—Delivers them to Capt. Barnby commander of the galley, to dispose of in Smyrna, in buying a cargo of wheat—Pays also to said captain dollars 280—Reckons for his commission on said transactions dollars 30: 2: 6, and 15 sols for postage of letters—Draws the balance of account on Thomas Dale of Leghorn, at livres 18 $\frac{1}{4}$ per pistole—The galley arriving at Smyrna, Peter Winberton sells the 2000 pieces of eight, weighing 1951 (mint pillar) one with the other, at 35 per cent.—Paid consular 2 per cent. shroffage, or loss on money, 4 per mill.—Reckons his provision and brokerage at 2 per cent.—Buys a cargo of wheat at sundry prices, viz. 622 kellow's at $\frac{2}{3}$, and at $\frac{1}{4}$ per kellow—659 ditto at $\frac{2}{3}$ —505 kellow's at $\frac{1}{4}$, and at $\frac{1}{8}$ —1800 ditto at $\frac{2}{3}$ —1194 ditto at $\frac{1}{4}$, and at $\frac{1}{8}$ —Pays petty expences, and for boats, &c. dollars 20: 2—For consular 4 per cent.—Brokerage $\frac{1}{8}$ of a dollar per kellow—Reckons his provision at 3 per cent.—Pays to Capt. Barnby dollars 235, and draws the balance on Thomas Dale at 13 per cent.—Thomas Dale draws on James Corman dollars 1506: 18: 7, at 930—

Dollars 406, at 925—Dollars 300, at 930, and the balance of Corman's account current at 930—Having reckoned him $\frac{1}{2}$ per cent. brokerage, and expences of postage of letters at Leghorn, Amsterdam, and London, amounting to dollars 24: 5: 1—The galley arriving at Lisbon, Corman sells the lading of wheat (that was purchased by Winberton) as follows—360 Alquiers at 480 rees per alquier—60 Ditto at 460—358 Ditto at 450—10,494 Ditto at 440—488 Ditto at 430—And, by selling the corn to several persons, it fell short 3 moys of what it first measured aboard—Corman paid measuring aboard of 204 moys, 80 rees per moy—Boat-hire to Bellem on ditto 100 rees per moy—Porterage into the warehouse on ditto, 90 rees per moy—Boat-hire from Bellem to the market on 190 moys, at 120 rees per moy—Porters, landing, cartage, &c. on 190 moys, 210 rees per moy—Measuring into the market on 204 moys, 100 rees per moy—Porterage, cartage, &c. to a private warehouse for sale, on 38 moys, at 380 rees per moy—Hire of empty sacks, 10,300 rees—Gave the health office at Lisbon 48 milrees—Ditto at Bellem, for affixing in unloading 10,300 rees—Guards to watch the boats, with sundry expences, 8500 rees—Warehouse room, and turning, 22,700 rees—Selling in the markets 201 moys, at 600 rees per moy—Brokerage on 201 moys, at 100 rees per moy—His commission 2 $\frac{1}{2}$ per cent. on sales.

Corman buys the ship Jenny for his own account, for 960 milrees—Lades on board her 155 moys of salt, at 3500 rees per moy, and charges, amounting to 576,770 rees—Pays sundry disbursements in fitting her out to sea for New England, Capt. John Walker, amounting to 581,572 rees—He also pays sundries on the Anne galley for her voyage to Algier, to lade corn on freight; viz. To the captain, as per his account of disbursements (allowed) 910,819 rees—To guards and pilot 15,840 rees—For 5 boats of ballast 17,500—For 7 barrels of beef, and 2 frails of fruit, 34 milrees—For 3 casks of butter, containing nett 249lb. at 35 rees per pound—For port charges, as per Tho. Harwood's account, 16 milrees—For a pilot going out 7200 rees—For 25 alquiers of pease, &c. as per bill, 76 milrees—To William Pratt, the ship-chandler, as per his account, 328 milrees—To John Stamp, the sail-maker, as per his account, 93 milrees—For wine and fruit 9600 rees—For 3 cannons 48 milrees—For sundry petty expences 3600 rees—For cash paid Capt. Barnby 14,400 rees, and said Corman reckons 2 $\frac{1}{2}$ per cent. commission—Ship Jenny arriving at Boston in New England, Peter Blaxland sells to James Dudley 210 hogheads of Lisbon salt, at 33s. per hoghead—To John Priestly 30 hogheads of French salt, at 28s. per hoghead—To ditto 121 hogheads ditto, at 25s. per hoghead—To John Pieterfon 78 hogheads ditto, and 20s. per hoghead—Pays lighterage, and porterage of the salt landing and measuring, l. 10: 1: 10—Pays storage for the salt that was landed, 51.—Reckons his commission at 5 per cent.—The Anne galley returns from Algier to Lisbon, and Corman receives of Samuel Bolt for freight (as per charter-party) of 155 tons of corn, and other goods brought from Algier, at 14,500 rees per ton—For 9 boats of ballast (sold at Gibraltar) 18 pieces of eight—For $\frac{2}{3}$ port-charges at Lisbon 25,733 rees—Peter Blaxland, of Boston in New England, buys 200 quintals of dry cod-fish at 21s. per quintal—More 1000 quintals ditto at 22s.—More 294 $\frac{1}{2}$ quintals of dry hack and haddock, at 16s. 6d. per quintal—More, 377 quintals of dry pollock, at 14s. per quintal—Pays boat-hire, cullage, primage, and several extraordinary charges, amounting to l. 29: 7: 10—Reckons his commission on cost and charges at 5 per cent. and lades said fish on board the Jenny for Bilbao, consigned to James Bradford for account of Corman, 1391 quintals, and for his own account 480 $\frac{1}{2}$ quintals—Corman of Lisbon disbursed and allowed sundry sums on the Anne galley for her voyage to Genoa and Leghorn on freight, viz. Pays to Capt. Barnby, as per his account, for mens wages, &c. 637,670 rees—Pays for damage, with porterage and waterage aboard, 2780 rees—For labourers, 10 men for one day and half, at 200 rees—For cooperage and for nails 8400—For sundry provisions, as beef, pork, butter, bread, pease, &c. as per bill, 204,851 rees—For port charges, as per Thomas Harwood's account, 23,900 rees—To the caulker, as per bill, 45,600—To James Leven the mate, 10 pieces of eight due to him, and discharged him—For 10 bolts of canvas at 10,300 rees—For a cable weighing 19 quintals one arroba, and a piece of hawser, 176,175 rees—To William Pratt the ship-chandler, as per bill, 73,794 rees—To John Stamp the sail-maker 31,355 rees—For pilotage out 10,080 rees, and sundry petty expences 9500 rees—For consular at Lisbon, and vice-consular, and charges at Bellem for two voyages, 33 milrees—To Capt. Barnby (as per his account) for expences during the Alger voyage 181 pieces of eight at 800 rees, out of which he deducts 18 pieces of eight, which was charged in a former account of disbursements—Reckons his commission at 2 $\frac{1}{2}$ per cent.—Blaxland of New England pays the ship Jenny's disbursements, and to the captain, as per account and receipt, amounting to l. 437: 8: 4, and to reimburse himself for the affairs done by him (as aforesaid) draws by order of Corman

on John King of London, payable to Samuel Prag at 40 days sight, l. 225 sterl. at 55 per cent.—More on John Kelly of London, payable to Daniel Hooper at 40 days sight, l. 100 sterl. at 50 per cent. and the balance of account, he draws on Peter Bradby of London, payable to John Henschman at 40 days sight, at 50 per cent.

The Anne galley arriving at Leghorn, Thomas Dale accounts for freight made from Lisbon to Genoa and Leghorn, viz. for freight (as per manifesto) made good by Alberti Geminiani of Genoa, in l. 5825, at 51. per dollar, less 1 $\frac{1}{2}$ per cent. on 1000 dollars drawn in—For freight received at Leghorn (according to manifesto) 1104 dollars—For freight received for other merchandize, dollars 52 : 15—For average of 5 per cent. received for the owners on dollars 1104—And the said Dale pays fundry charges on said galley, viz. for charges at Pratick, dollars 2 : 5—To the ship-chandler per account, dollars 42 : 4 : 1—To the butcher per account, dollars 17 : 7—For port-charges per account, dollars 22 : 11—To the shipwright per his account, dollars 8 : 10—To the baker for provisions, &c. per his account, dollars 200—For salt provisions, beef, &c. dollars 205—For ballast, dollars 25—For translating the charter-party, dollar 1—To Capt. Barnby for his expences at this port, as per account, dollars 92 : 3 : 4—For charges, entering his consulate, and procure, to recover in the freight, dollars 4 : 10—To Capt. Barnby for his expences at Genoa, l. 529 : 4, at 51. per dollar—For a barrel of tar at Genoa, paid for by Geminiani, 401.—For expences incurred by Geminiani in going to Genoa, as per account, l. 168 : 9 : 4—For expences made by ditto at going from Genoa for Lisbon, l. 326 : 13 : 4—For boat-hire several times for assisting the galley's dispatch, dollars 1 : 10—Reckons his provision 2 per cent. recovering in the freight, and correspondency for her dispatch hence, and at Genoa, dollars 47 : 4 : 9—For postage of letters on this affair, dollars 4 : 11 : 6—The ship Jenny arrives at Bilbao, and there Bradson sells 1640 $\frac{1}{2}$ quintals of fish to fundry persons, as per account, for rials plate 103,811—And delivers for provostage 2 $\frac{1}{2}$ per cent. in specie of fish, and one quintal to the weighers, as usual—Pays for an express to and from Portugal, when the ship arrived with orders to go to Lisbon, rials 13 : 26—To the inquisition-vessel 22 rials, and for refreshment 45 rials—For freight of 12 gabars with fish, up to the keys, at 16 rials vellon per gabar—Unlading at the keys 9 gabars, at 93 rials vellon each—To the oxen, mews, and sledges, carrying the lading of 12 gabars, at 20 rials vellon—Guards to watch the fish at landing, 10 rials plate—To seamen for their due, as customary, on 12 gabars, at 5 rials plate—For removing and piling 9 gabars in small piles, at separating the forts, at rials 22 $\frac{1}{2}$ plate per gabar—Weighing out 9 gabars, at 20 rials plate—Town duties on weights, and new impost, rials 891 plate—Lodge-hire half a rial plate, per quintal on 1122 quintals—Contribution duties one per cent. on sales—National duties $\frac{1}{2}$ per cent.—Primage on 90 tons paid the captain at 2 $\frac{1}{2}$ rials plate—Reckons commission 5 per cent. on sales and returns—Said Bradson buys 300 bundles of chestnut-hoops, at 33 $\frac{1}{2}$ quarts vellon per bundle—200 Bundles ditto at 4 rials vellon per bundle, which he shipped on board the Jenny for Cadiz, consigned to James Dixon of said place, for account of Corman, and pays shipping them

on board two lighters, 2 marvedees vellon per bundle, and boat-hire aboard, rials 21 : 10 plate—The Anne galley arrives at Lisbon, and Corman accounts for freight made by her from Leghorn and Genoa to Lisbon, viz. J. Baptista Thialini, 30 parcels of sewing silk, at 8 dollars per parcel—Lorenzo Geminiani 100 bales of paper, at dollars 2 $\frac{1}{2}$ per bale—Nicolo Lazerogo 1100 bags of rice, containing 3710 quintals, at 700 rees per quintal—Nunez Alvarez 6 bundles of coral, 12 milrees—J. Rodrigues Autunez, 6 parcels of ribbon, 60 milrees—For primage 5 per cent. to the captain on 200 tons, at dollars 15 per ton, which was received of the above people, and passed to the captain's credit. Ship Jenny arrives at Cadiz, and James Dixon sells, for account of Corman aforesaid, 378 bundles of chestnut-hoops to Don Pedro de Tranquello, at 10 rials plate per fiere of 2 bundles—More, 120 bundles ditto to ditto (being damaged) at 4 rials plate per fiere of 2 bundles, and Capt. Walker had the remaining 2 bundles, which he applied to the ship's use—Dixon reckons brokerage one per cent.—For extraordinary charges on sales aboard $\frac{1}{2}$ per cent.—For commission on sales, and returns 5 per cent. of which 1 per cent. is to be charged on remission, remains 4 per cent.—Dixon receives the freight made by the Jenny, Capt. Walker, from Bilbao, viz. for 2194 bars of iron weighing 577 quintals, consigned to Don Juan de Matta Gonfavez, at 6 $\frac{1}{2}$ rials plate new money per quintal—For 1540 bars ditto, weighing 500 quintals, consigned ditto at 6 $\frac{1}{2}$ rials ditto—For 476 bars ditto, weighing 200 quintals ditto, and 8 bundles chapa de fierro, weighing 1369 pounds, together is 208 $\frac{1}{2}$ quintals, at 6 $\frac{1}{2}$ rials ditto, consigned to Don Sebastian dos Lopez—For 250 bars ditto, weighing 100 quintals, consigned to ditto, at 6 $\frac{1}{2}$ rials ditto—For 774 reas de fierro de arar, weighing 61 $\frac{1}{2}$ quintals, consigned to ditto, at 6 $\frac{1}{2}$ rials ditto—For 72 carones de herrage clanos, weighing 140 quintals, consigned to Don Juan Gonfavez Lopez dos Santos, at 6 $\frac{1}{2}$ rials plate—For 500 single bundles of chestnut-hoops, consigned to said Dixon, being for account of the owner of the Jenny, nothing—For the gross average on said freight, occasioned by the ship's losing her bowsprit, deducting the $\frac{1}{2}$ part of the charge to be borne by ship Jenny, and a proportion by the hoops: the remainder was adjusted at $\frac{1}{2}$ a rial plate per ducat, on 750 ducats; what received thereon, was 375 rials plate—Dixon reckons his commission on said freight, and gross average, at 2 $\frac{1}{2}$ per cent.—And by order of Corman, and for his account, sells the ship Jenny, with all her masts, yards, &c. to David Burrows, for 1300 pieces of eight, to pay in 30 days—Charges for boat-hire aboard several times, and other petty charges, 40 rials plate—For the duties of alcala y cientos on the sale, which he has hopes to avoid paying; but, if he should be obliged to it afterwards, he will then charge it to account; in the interim charges nothing—Reckons brokerage 1 per cent.—For commission on sale and returns 5 per cent. of which 1 per cent. is to be charged on remission; remains 4 per cent. which he now charges.

These transactions are stated as follow in the ledger only, according to the method of accountantship by double entry, whereby it will appear, what is due to or from the respective merchants herein concerned; what profit or loss arises to each of them on this trade, and by the exchange or difference in the valuation of monies.

REMARKS.

From the face of the ledger-account of these mercantile negotiations, there arises a double advantage: (1.) The nature of carrying on foreign trade from one country to another, is intelligibly illustrated from facts and realities. (2.) The method of accountancy, as practised by the several merchants therein concerned, is, at the same time, familiarly exemplified; also the nature of foreign accounts, as kept in the monies of different countries, is represented; and those of MY ACCOUNT, HIS ACCOUNT, and COMPANY ACCOUNTS, or those of FACTOR and MERCHANT, as kept in their proper columns, are also set in a clear light: from whence is seen, likewise, in what manner the profit or loss is stated, that may happen by the rise or fall of the prices current of exchange. The conformity, also, amongst these several accounts is manifest; and nothing can give a better idea of mercantile accountancy, than the stating of all the accounts respectively of the several parties who may be concerned in foreign adventures.

By accounts of this kind, the nature of anonymous partnerships in foreign traffic may be judged of, and the reasonableness of what we have said under the article anonymous, which is not incurious. See ANONYMOUS.

These accounts very plainly show the justness and elegance of the art of accountancy by debtor and creditor, according to the true merchant-like method, by double entry; for, if one merchant has dealings with ever so many others in foreign countries, if they are all thoroughly skilled in this admirable art, they can have no misunderstanding in the stating of their accounts, as to the part of charge and discharge; their balances will be all in conformity to their vouchers; and, if there happen to be any mistakes in relation to the arithmetical part, these are easily rectified: whence the reason of the signature of the ordinary phrase of ERRORS EXCEPTED, in the mutual transmission of accounts from trader to trader, is apparent.

And when any errors happen to be committed in the stating of the accounts, as well with respect to their debts and credits in the ledger, as in the journal, or any mistakes of a different kind occur, it is as inconsistent with the character of the fair and honourable trader, as with that of an accountant, to suffer any erasures or obliterations in his books: his business is to acknowledge such mistakes by plain words, and rectify them by writing them off in the ledger, or properly explaining them, if they are of the arithmetical kind, &c.—It is, therefore, we have left here and there an error, as happened in stating the accounts, with design to show how they were wrote off, without rasure or obliteration. For more matter in relation to this excellent method of account-keeping, see the articles BANKING, DEBTOR and CREDITOR, and MERCANTILE ACCOUNTANCY.

LEEWARD-ISLANDS in AMERICA; chiefly those islands that were called the **NEUTRAL-ISLANDS** before the last peace.

The French, after they first became masters of **GUADALOUPE** and **MARTINICO**, as they made no scruple of destroying and expelling the inhabitants, so when that was once done, they under colour of a treaty pretended themselves to be defenders of them in **DOMINICA** and **ST. VINCENT**, that they might hinder England from extending her territories, till they should grow strong enough to occupy these as they had done the rest.

The negotiation last mentioned, was actually depending when the revolution happened. But notwithstanding this, the French thinking the opportunity favourable, broke without ceremony the treaty of **NEUTRALITY**, made November 5, 1686, at Whitehall, by attacking the English quarters in the island of **St. Christopher's**, which was insisted upon by king William and queen Mary, as the grounds of declaring war against the French king in America. From this period, down to the treaty of **AIX LA-CHAPELLE** in 1748, both nations have kept up their claims; and by the last mentioned treaty, things were again reduced to their old situation, by a positive declaration that **ST. LUCIA**, **ST. VINCENT**, and **DOMINICA**, should be esteemed **NEUTRAL**; and considered in that light, not to be settled by other nations.

By that treaty likewise, a fourth island was added, to which the French had never laid any express or direct claim before, and this was **TOBAGO**. Such were the regulations this treaty made, and such the state of things, or at least such the state of things ought to have been, at the opening of the late war. By the 9th article of the peace signed at Paris, February 10, 1763, all the three islands of **DOMINICA**, **ST. VINCENT**, and **TOBAGO**, were yielded in full and perpetual sovereignty to **GREAT-BRITAIN**, the island of **St. Lucia** being ceded by the king of Great-Britain to France, in exchange for the **ISLAND** of **GRANADA**, which by the before mentioned 9th article, with the **GRANADINES** or **GRENADILLAS**, and all their **DEPENDENCIES**, are absolutely and for ever yielded to Great-Britain. We shall describe the three formerly **NEUTRAL**, which are now become **BRITISH ISLANDS**, and these **TWO ISLANDS** that were thus exchanged.

DOMINICA lies, as it were, in the bosom of all the **FRENCH**

ISLES, 8 leagues north-west from **MARTINICO**; about the same distance, south-east from **GUADALOUPE**; having the three small islands called the **Saints**, between them, and at the distance of five leagues south-west from **Marigalante**. **Dominica** lies stretched out from south to north-west. It is a large island, at least twenty-eight English miles in length, and about thirteen in breadth, in circumference about 30 leagues. It is not intersected by large inlets of the seas, as many others, both of the larger and lesser of our own, and the French West-Indian islands are, and of course contains the more land. Some have judged it near twice as large as Barbadoes, and the French esteem it near half the size of **Martinico**. The climate in general is reputed wholesome. After this isle becomes thoroughly cleared, it will be more healthy and agreeable to European constitutions. The face of the country is rough and mountainous towards the sea side especially, and within land, there are many rich and fine vallies, and some spacious and fair plains. The declivities of the hills are commonly gentle, so as to facilitate their cultivation, and the soil in general a deep black mould, and commended for it's fertility, by the Spanish and French, as well as the English. It is well watered, by at least 30 rivers, some of which are spacious and navigable for several miles, the rest commodious for planting, and variety of fish. It abounds in all kinds of timber, that are customary in the West-India isles. Their fruits are superior to those in **Martinico** and **Guadaloupe**. Hogs both wild and tame are in plenty, as well as most sorts of fowl. Ground provisions in general are here as good as in any of the other isles; such as bananas, potatoes, maniac, from which the cassada is made, the common bread of the Indians, Negroes, and even Europeans: their pine apples are reputed large and fine flavoured. The settlements made by the French upon the coast, were esteemed equal, if not superior in produce, to those in their own isles. The Spanish writers, particularly **Oviedo**, say, there are several safe ports and convenient creeks. On the north-west end of the island, there is a deep, sandy, large bay, well defended by the adjacent mountains from most winds, which from prince Rupert's anchoring in it, when in those parts, has received his name, where our armament under the late lord Cathcart, lay very commodiously, and which was of great service to our squadron in the course of the late war. There is a good anchoring ground along all the **LEEWARD COAST**.—The French have acknowledged, that sugar, cotton coffee, cocoa, and indeed every thing, that either they or we have been able to raise, in any of the other islands, may be produced in large quantities as well as in great perfection here.

The Indians may, without prejudice to our people, have convenient districts of land allotted them; in which by good management and mild treatment, they may be rendered very useful to our new colony, in raising stock, and other things, as they have been for a century, to the French in **Martinico**. It may be proper on our first establishment to allot small plantations to such soldiers, and larger to such officers as have families, and are inclined to settle upon the island, and to offer them every kind of encouragement that may increase their number, as those people would then be able to defend their property. Numbers of our countrymen settled in **St. Eustatia**, **St. Croix**, and **Cape Isaquepe**, might be invited to return upon advantageous terms into the territories of their natural sovereign. A form of government upon those of our other islands, guarded against the acquisition by all grasping individuals, of large quantities of unsettled and uncultivated land, with the restrictions, that take place in Barbadoes, for the constant maintenance of a numerous and well disciplined militia, &c. cannot fail of drawing thither a sufficient number of inhabitants, and with the help of regular fortifications, would render the island secure, and they would make it flourishing. This would induce to the discovery of that mine, for which this island has been always famous, which the English believe from tradition to be silver, but what the French well know to be gold; and though it should not be judged expedient to open it, yet the certain knowledge of it could do us no injury, and the very fame of it might invite numbers there, and prove of great benefit.

Nor need apprehension of insecurity intimidate the resort of people thither. Besides the immediate assistance this isle might receive from Barbadoes, while we retain our maritime superiority, a respectable squadron on the first appearance of a rupture might be sent to Prince Rupert's bay, with a force sufficient to quiet the fear of the inhabitants. But if such an event be at any distance, the island in that time may be fully settled, and from it's extent and fortifications, exempt from the danger of any sudden invasion; and in that state would serve as a place of arms, and the rendezvous of our forces, from all parts of the **WEST INDIES**; when from the nature of it's situation the whole of the French commerce in these parts must instantly become precarious, and all their settlements be at our mercy.

The island of **ST. VINCENT** lies between five and six leagues south-west from **ST. LUCIA**, 23 south-west from **Martinico**, 36 south from **DOMINICA**, 30 west by south from Barbadoes, and 17 north-east from **GRANADA**. Being thus situated directly

rectly to the leeward of Barbadoes, it may in a few hours be reached from thence, and is at the same time so seated, as to cover and connect the small islands that lie between it and GRANADA. It is from south to north, about 24 of our miles in length, and about half as many in breadth, sixty, or thereabouts in circumference.—It is rather bigger than Antigua, and if not larger, at least as large as Barbadoes, somewhat smaller than St. Lucia, and much about 2 thirds of the bigness of DOMINICA. The warmth of the climate is so tempered with sea breezes, that it is looked upon as very healthful and agreeable, and on the eminencies that are numerous, the air is rather cool.

The soil in general is extraordinary fertile, tho' the country is hilly, and in some places mountainous. Amongst the former, there are pleasant vallies; at the bottom of the latter, some large and luxuriant plains. No island of the like extent is better watered; from the mountains there descend rivers, and lesser streams run on both sides from almost every hill. There are several fine springs at a small distance from the sea, and the slopes so easy and regular, that there are hardly any marshes, and no standing waters on the isle. There are here large quantities of valuable timber, as well as good fruit-trees, some peculiar to this isle. It abounds with wild sugar-canes, from which the natives make a very pleasant liquor; corn, rice, and all sorts of ground provisions, are raised in plenty, and without great trouble. In the south part of the island, where the French have raised some large and flourishing settlements, they have coffee, indigo, cocoa, anatto, and very fine tobacco.—They have plenty of cattle and poultry, and send some *lignum vitæ*, and some timber to Martinico, where the latter is employed in building houses, and in their fortifications. The rivers are stored with divers sorts of fresh fish, and the sea contiguous to it's coasts abounds with those proper to it's element, and the general nature of the climate. Both land and water fowl are in plenty.

From the specimens above given, we may collect, that when this country comes to be duly well cultivated, according to the invitation it gives, it would, in respect to it's produce, be little, if at all inferior, to any for extent, of the islands we have possessed; especially if we consider that it has many commodious bays, on the north-west and south-west sides, with abundance of convenient creeks, and good anchoring ground on every side. At the southern extremity there is a deep, spacious, sandy bay, called St. Antonio, where ships of large size may lie safely and commodiously; and when the whole comes to be further known, there is little doubt, but other advantages will be experienced, notwithstanding the French have been solicitous to represent the island heretofore, as an insignificant disagreeable desert, when they had a view of engrossing it to themselves.—The French have for several years gone on settling, planting, cutting timber, and raising every kind of West India commodities, except sugar, and carrying on a very lucrative trade to their other islands, in which a number of sloops have been employed.

In relation to the security of this island, there is no doubt, that a competent military force must be sent to protect our first establishments; and as assistance may be derived from Barbadoes, at any time in the space of a few hours, the French can take no advantage of this island, provided care is taken to pacify all misunderstandings between the native Indians and the Negroes, as they shall happen.

From the foregoing brief description of this isle, it appears to be a fine fruitful one; all the ancient, and of course unbiaised relations we have of it by authors of credit of every nation, Spanish, French, and Dutch, as well as our own, concur in this representation. By depriving the French of all the settlements they had made at this island, of the produce thereof, and of the advantages arising from the trade, which was regularly settled between this and their other islands, and throwing them into the British scale of general commerce, may be considered as no despicable acquisition to this nation. It should not be forgot that all our former disputes, too numerous to specify relative hereunto, are by the peace of 1763, brought to a conclusion; this island is now become perpetually and incontestibly ours, we having given an equivalent for this and others, and the French have no colour or pretence for reviving any sort of claim thereto.

By this acquisition of St. VINCENT, Great-Britain has likewise gained an additional check upon the French inland colonies in general, and particularly on that of St. Lucia, which is ceded to that nation. There can be no measure taken there, of which we may not have immediate notice; and if we consider the situation of this island in respect to that and the rest of the French islands, now that GRANADA and all its dependencies are become British, it seems pretty apparent, we may from thence establish a cruize, by which they may be effectually blocked up, or at least deprived of all commerce, in case of a future war.

Should it be objected, that the bays in this island may not be convenient for a large squadron, since our squadrons avoid as much as possible coming into or continuing long in bays however commodious; nor does experience evince that our naval armament have hitherto suffered much from the want of such conveniences in the hurricane months, in which they

are chiefly necessary; but from their dangerous storms, they will have now a constant and safe retreat in the port of GRANADA. It may likewise serve us for a place of arms, by which forces may be transplanted from the other islands, and embarked very conveniently for our future expeditions in this part of the world. It also contributes to cover and connect all our other possessions, that together with it have been acquired by the peace; and from thence, reinforcements and supplies may be sent with equal ease and expedition to DOMINICA.

TOBAGO, the most remote of all our new acquired islands in America, lies near 40 leagues south by west from BARBADOES, about 35 leagues south-east from St. VINCENT, 40 leagues east from GRANADA, 12 leagues north-east from TRINIDAD, and between 30 and 40 leagues north-east from the Spanish main. It is 32 of our miles from south-east to north-west, which is the greatest length; and where broadest, may be about nine miles, from east to west, somewhat more than 70 miles in circumference. It differs not a great deal in bigness from the island of St. VINCENT, is rather larger than Barbadoes, and of consequence than any of our leeward islands. Near the north-east extremity, there lies a small island called LITTLE TOBAGO, which is near two miles in length, and full half a mile broad. The rocks of St. Giles lie to the north, and there are many small rocky islets on the north-west side of it, which though useless, are not however dangerous. The climate, though it lies only 11 degrees and ten minutes north from the equator, is not near so hot as might be expected, the force of the sun's rays being happily tempered by the coolness of the sea breezes. Another favourable circumstance, which may serve to recommend this climate, is, that this island lies out of the track of the HURRICANES, to which our own islands as well as those of the French are exposed, and from which their plantations and shipping suffer frequently very severely.

There are many rising grounds over all the island, but it cannot be properly styled mountainous, except, perhaps, in the north-west extremity, and even there, they are far from being rugged or impassable. The soil is well diversified, being in some places light and sandy, in others mixed with gravel and small flints, but in general it is a deep, rich, black mould. From the extraordinary size of the same sort of trees that grow in the other islands, and from the trials made by the Courlanders and the Dutch, this island is esteemed to be luxuriantly fertile; well suited to the different productions that are raised in the WEST-INDIES, and from the concurrence of various favourable circumstances, may be wrought with ease, and is not liable to the blast, and other accidents, which are so fatal to the most promising crops in some of our LEEWARD ISLANDS.

It is generally agreed, that hardly any country can be better watered than this is. Besides springs that are found in plenty all over the island, there are not fewer than 18 rivulets, that run from the hills into the sea, some on the east, some on the west side. Some of those take a serpentine course through the meadows; others pent up by rocky channels, roll with such rapidity, as renders them very fit for driving mills; but there are very few or no morasses or marshes, or lakes, pools, or collections of standing waters, which of course must render it more healthy, and in all parts of it alike habitable; and from the happy disposition of the running streams and numerous springs, it is almost every where habitable, with the like convenience.

Yet this distribution of fresh water, is not more commodious, than the disposition of the bays and creeks of the sea upon it's coasts. At the south end lies the bay of La Guira, and at a small distance, the lesser and the great Rockley bays. The latter of these, may, with propriety, be filled a harbour, for it is land-locked on every side, and is very secure. It was in this bay the Dutch and French fleets engaged in 1677, and in which engagement the count d'Estree's ship, called the Glorieux of 70 guns, was blown up; which shews that it is capable of receiving as considerable squadrons, and those of as large ships, as are usually sent into those seas. To the northward of these lies Cochon Gras, or Fat Hog bay, and beyond that Grand Rivier bay, Great Hog bay, little Hog bay, L'Ancre Batteau, covered by the island of Little Tobago; and therefore in the Dutch maps called Little Tobago bay. Opposite to this, on the other side of the island, is what the Dutch called John Moore's bay, now Man of War bay, very deep and spacious, with ten fathom water close to the shore, with two fine rivulets running into the bay, where our ships may therefore careen, with the utmost convenience, as well as with the greatest safety; it being surrounded by high hills, that come down close to the shore, by which the vessels lying there, will be effectually sheltered from both wind and weather. There are also several little commodious bays, between this and Great Courland bay, and Sandy Point bay, which brings us again to the southern extremity of the island. Whence it appears, that it is in all respects most convenient for commerce; and though it be true, that having so many places that admit of easy landing, and lying in the neighbourhood of warlike Indians, it must of necessity require proper fortifications; and when this island shall be once well settled,

the

the many obvious and extraordinary advantages thereby afforded to trade, will amply compensate the expence, that may be found necessary to provide for, and to preserve it's security.

This island is covered with all that vast variety of valuable **TIMBER**, that is to be found in most countries in the **WEST-INDIES**, and many of these as extraordinary in their size, as excellent in their nature. The same may be said, with respect to fruit trees, and amongst these, there are some that are peculiar to Tobago. Such for instance as the true **NUTMEG-TREE**, which the Dutch, who of all nations could not in that respect be deceived, affirm to have found here. They indeed say, it is a wild nutmeg, that the mace is less florid, and the taste of the nut itself more pungent, though larger and fairer to the eye, than the spice of the same kind brought from the East-Indies by them. The **CINNAMON-TREE** grows likewise in this island, though the bark is said to have a taste of cloves as well as cinnamon. Here also grows that tree which produces the true **GUM COPAL**, resembling that brought from the continent of America, and very different from what goes by the same name in the rest of the West-Indian islands.

All ground provisions are produced here in great abundance, as well as perfection. Here likewise is plenty of wild hogs and other animals, together with great quantities of fowl, and an amazing variety both of sea and river fish. In the time the Dutch were in possession of this island, which was not many years, they exported large quantities of **TOBACCO**, **SUGAR**, **CASSIA**, **GINGER**, **CINNAMON**, **SASSAFRAS**, **GUM COPAL**, **CACAO**, **ROCOB**, **INDICO**, and **COTTON**; besides rich **WOODS**, materials for **DYEING**, **DRUGS** of different kinds, and several sorts of delicious sweetmeats. Thus, we have not only the probability, arising from the climate, soil, and situation; but likewise the certainty, that all the valuable commodities which the **WEST-INDIAN ISLANDS** produce have been actually, and may consequently be again unquestionably raised in **TOBAGO**.

We may add to what has been said, that tho' the Dutch boasted much of their settlements in, and the valuable cargoes they annually brought from them, yet Sir Josiah Child, within that very period, mentions the defect in their improvement of Tobago, in support of his doctrine, that the Dutch, as a nation, were less successful in **PLANTING** than **COMMERCE**; which is enough to convince us, that in his time, this was considered as an island capable of being made at least as valuable, as any of it's size in the possession of Europeans. As this island in the state it now is, abounds, as before observed, with a vast variety of different sorts of **TIMBER**, all of them allowed to be excellent in their respective kinds; it may deserve consideration in the first settling it, whether proper officers might not be appointed to secure to the public these advantages. It is by no means intended, that the first planters should be deprived of the necessary use of all kinds of timber for buildings and utensils, but that it should be cut in a proper method, and with discretion; because nothing has been more loudly exclaimed against by the sensible men in all our other islands, than the undistinguishing and destructive havoc made amongst the **WOODS**, without any regard to the general interest, or the least respect paid to posterity.

By such a method, the country may be properly and regularly cleared and opened; and as from the nature of the soil and climate, vegetation is extremely quick, a succession of useful trees may be constantly maintained. By this means valuable cargoes will be furnished of **FINE WOODS** for the use of **JOINERS**, **CABINET-MAKERS**, and **TURNERS**; the necessary materials for **DYEING CLOTH**, **SILK**, and **LINEN**, obtained in great perfection, and a prodigious variety of **GUMS**, **BALSAMS**, and other costly and efficacious medicinal **DRUGS** may be procured in their genuine state. By this precaution, very large sums which we now pay to foreigners, will be saved to the nation; the improvement of our manufactures facilitated, and the exportation of these bulky commodities prove a great benefit to our navigation. By putting the direction of these things into skilful hands, new lights will continually arise from experience; and new acquisitions may be here made of valuable plants from the continent of South America, Africa, and even from the East-Indies. The subordinate care of these woods, might furnish employment to the Indians; and the profits arising from the exportation to Europe, might constitute a public revenue for the support of the fortifications and other expences of government; which would be a great ease to the industrious planters, and thereby procure a constant attention in their assemblies to promote a design equally serviceable to their mother-country and themselves: and considered in this light, it might become a useful precedent in the establishment of something of the like kind in other colonies, and could be attended with no inconveniences whatever.

Nor is there any sort of improbability of our being able to produce a great part, if not all the variety of **SPICES** of the **EAST-INDIES**, in this very island. **CINNAMON** is said to grow in some of the other **WEST-INDIAN ISLANDS**; and general Codrington had once an intention to try how much it might be improved, by a regular cultivation in the island of

Barbuda. It is universally allowed, that the bark of what is called the **WILD CINNAMON-TREE** in Tobago, is beyond comparison the best in the **WEST-INDIES**, and even in its present state may be made a commercial article of value. The bark, when cured with care, differs from that in the East-Indies, by being stronger and more acrid while it is fresh, and when kept for some time, it loses that pungency, and acquires the flavour of **CLOVES**. This is precisely the **SPICE** which the Portuguese call **CRAVA DE MARANAHON**, the French **CANELLE GEROFFLEE**, and the Italians **CANELLA GAROFONATA**. There is a very considerable sale of this at **LISBON**, **PARIS**, and over all **ITALY**. This kind of spice, at present, is drawn chiefly from Brazil; and the Portuguese believe that their cinnamon-trees were originally brought from Ceylon, while it was in their possession, but that through the alteration of soil and climate they are degenerated into this sort of spice, and this may probably be true. However, from their size and number it seems to admit of no doubt, that the **CINNAMON-TREES** actually growing in **TOBAGO**, are the natural production of that island; and the point with us is, to know what improvements may be made with respect to these.

It may seem a little new, but we hope to render it highly probable, that the sole difference in cinnamon arises from culture. In the first place it is allowed, both by the Dutch and Portuguese, that there are no less than ten different kinds in the island of **CEYLON**; which is the clearest evidence, that this tree is every where subject to variation from the circumstances of soil and exposition. It is secondly allowed, that even the best, finest, and first sort of cinnamon-tree, does not preserve it's high qualities beyond 17, 18, or at most 20 years. The reason assigned for this by the Dutch, is that the **CAMPFIRE**, as the tree grows older, rises in such quantities as to penetrate the bark, and thereby alter its flavour; which accounts very well for the different trade of the Brazil and Tobago cinnamons, as the trees must be at least five times more than the proper age. It is thirdly allowed, that the fairest and finest cinnamon grows upon young trees, planted in vallies near the sea side, naturally covered with white sand, where they are perfectly unshaded and exposed to the hottest sun; that at five years old they begin to bark the branches; and, that the tree continues to produce fine-flavoured cinnamon for the number of years already mentioned.—They then cut it down to the root, from whence in a year or two it spreads again, and in five or six they begin to bark the young plants. There is one circumstance more necessary to be observed; the true cinnamon is in the inner bark of the branches grown to a proper size, and when taken off and exposed to bedried is of a green colour and has no smell, but as the watery particles are exhaled, and the bark curls in the manner we receive it, the colour changes, and the odour of the cinnamon gradually increases. What then is there to hinder our attempting the cultivation of cinnamon, which nature seems to have produced in as much perfection in **TOBAGO** as in **CEYLON**?

We have mentioned, that the **NUTMEG** as well as the **CINNAMON-TREE**, is a native of **TOBAGO**; and as we have likewise observed, is reported to be defective and inferior in its kind, to the same sort of spice in, or at least as it is brought us from the East-Indies. That the **NUTMEG** naturally grows here, we cannot doubt of the fact; because we find it asserted, in a book addressed to Mr. de Beveren, then governor of **TOBAGO**. The nutmeg tree that naturally grows in Tobago is wild, and may by due care and pains be rendered as valuable a nutmeg as those that grow any where else; for the fact really is, that wherever there are nutmegs, they are wild nutmegs, or as some stile them mountain-nutmegs, which are longer and larger, but much inferior in flavour to the best nutmeg, and are liable to be worm-eaten: the point is, to know how these defects may be remedied, or in other words, wherein the difference consists, between the wild tasteless nutmeg, and that which is the genuine aromatic, and of course a valuable spice.

The nutmegs which the Dutch bring into Europe, grow in the islands of **Bande**, which are six in number; but the Dutch long ago confined the nutmeg plantations to three of them only, and took all the precautions imaginable, to hinder their being cultivated any where else, that they might the better confine the profits arising from this fine spice to their own company. See our article **DUTCH EAST-INDIA COMPANY**. The true nutmeg, is of the size and height of a pear-tree; the wild or mountain nutmeg is a large tree, not so well furnished with branches, but the leaves are broader and longer. The nutmegs are planted in **CLOSES** or **PARKS**, in a regular order, and with much labour and industry are carefully kept free from all weeds and plants that may exhaust their nourishment, and are attended with the same diligence as a cacao walk. Besides this, they are defended on the outside, by one or two rows of trees, taller in size, which secure them from sudden gusts of winds and from the sea air, by both of which they would be otherwise prejudiced.

They afford three harvests in the year, the first is towards the latter end of March and the beginning of April; the product then is but small, consisting only of such as are full ripe or fallen;

fallen; but then these are the finest, both with respect to the true nut and to the mace. The second is the great harvest, in the latter end of July and the beginning of August, when all are gathered that are ripe. The third is in November, and is properly the gleanings, for then they take all that are left upon the tree. When they are thus gathered, they are stripped with a knife of their outer husks, which resemble those of walnuts; the inner coat, which is the MACE, is next taken off, with great care and as whole as it is possible; it is then of a bright crimson colour, but when cautiously dried, becomes of a yellow brown, thin, brittle, shining, oily, and of a pleasing aromatic fragrance. The nut thus deploiled of both coats is exposed to the sun for a day to dry, and this operation is finished in three or four days more, by exposing them though at a convenient distance to the heat of fire. Then the shell, which is thin, and has a very slight pellicle adhering to it, is removed, and the kernel or nutmeg taken out. This is likewise very carefully dried, and when that is done, the nuts are put by small parcels into wicker baskets, in which they are dipped in a strong solution of lime, made with calcined shells, mixed with sea water. The great secret lies in thus curing of them, by which they are hindered from corrupting, from softening by the warm, or losing their virtue by the humidity of the sea air when transported to Europe.

We may reasonably conclude from this account, that the nutmeg-tree being a delicate plant, owes its high aromatic flavour, to its being industriously cultivated, with great caution, and all this in a proper soil. It must be also observed, that even amongst the trees in the nutmeg parks, there are some that produce long and ill shaped nuts, with very little flavour, which are stiled male nutmegs; whereas the round aromatic fruit, which is brought to Europe, is called the female nutmeg. The smallest of the nutmeg parks or closes, does not contain above an English rood of land, but the largest contains three, four, or five times as much. The whole quantity collected in the three harvests, and in a favourable season, seldom amounts to more than three hundred tons of nutmegs, and from seventy to eighty tons of mace.

From this succinct account of the nature and method of cultivating and curing this valuable spice, it will appear, that it may prove successful to make the experiment in our new island of TOBAGO, that we may judge, whether by the same method, the wild nutmeg-tree, as it is called there, may not be reclaimed and improved as gradually to acquire all the virtue and odour of that true spice. There may no doubt many difficulties occur, both with the cultivation and in the curing; but the vigour, the sagacity, the indefatigable diligence of British planters will very probably overcome all these.

We have no account of the tree that produces CLOVES, growing either in this, or in any other island in America. It is not, however, impossible, that when the productions of TOBAGO shall be more attentively examined, by capable persons, we may possibly find, that nature has produced this spice here, as well as the rest. No weight, indeed, at all ought this supposition to have, which is mentioned only, that an enquiry may be made. But if we take it for granted, that the clove does not grow here, we may nevertheless venture to assert, that the nature of the soil and climate considered, together with the size and situation of the isle, the natural production of other spices, and the flavour of cloves, that is said to predominate in these, make it not at all improbable, that if the clove was introduced, it would thrive here. That it may be introduced, and without much difficulty, will appear no unreasonable assertion, when we consider that this plant may be obtained from BORNEO, CERAM, and MINDANAO, without the leave of the Dutch.

The Dutch are at present in the sole possession of the SPICE-TRADE, and this they owe to a very commendable care, indefatigable industry, and constant circumspection. For as on the one hand, they have taken inexpressible pains, in procuring and preserving the perfection of these estimable commodities, by a skilful cultivation; so on the other hand, they have not been less careful to extirpate them, where nature had produced them, where they found it extremely difficult if not impossible to confine their production solely to their own profit. There seems to be no just cause therefore, why we should not imitate them, as far as it is fit, if we are able to do it, for our own benefit.

Those who would have an ample account of this spice, may have recourse to botanical writers, particularly to a work lately published in Holland, where they may meet with every thing they can desire, and be from thence more effectually convinced, that what has been asserted is strictly agreeable to truth.

The clove like the nutmeg-trees, are planted in small closes, and there cultivated with all possible care and attention. The soil and climate are chosen with great skill, and all the ground is kept continually clear of weeds, plants, and bushes. There is no other vegetable suffered to grow in the closes destined for the cloves, because this would deprive them of their due nutriment, and diminish the strength and perfection of the spice, which tho' it derives its form and texture from nature, owes much of its delicate fragrance and flavour, as

VOL. II.

all other spices do, to cultivation and art; and to that assiduous attention that is employed in the planting; preserving; gathering; and curing them, without which they would neither have gained or preserved that degree of excellence which has now substituted for ages.

The harvest of this fruit is annually, notwithstanding what some have otherwise said. They are sometimes very plentiful, and at others not, according as the monsoons set in wet or dry. In the best years, they may produce about 2000 bahars, which is about 550 tons. In a very bad year, not half so much; but as the magazines are always kept well supplied, there comes usually the same quantity to the Europe market, where the Dutch sales, and indeed over all India, the price of spice very rarely alters. The clove retains its vigour, longer than either the cinnamon or the nutmeg, for it continues to bear plentifully, in a good season, for 50 or 60 years; and in the Moluccas they did not reckon a tree old; in less than a 100. The number of bearing trees, in all closes, are computed at 250,000, exclusive of the young plants, that are intended to replace the old trees when they are become past bearing.

We have dwelt a little on this point, by reason of the probable importance that might attend it, though it is not entirely new, for the thought of raising the spices of the East in the West-Indies occurred to us and the French long ago, though it was never attempted, or indeed could be attempted with so fair a prospect of success, as in this island.

In this, if in any of our island colonies, a free port may be opened, with as many apparent advantages, and perhaps fewer inconveniencies than any where else in America. Here is great choice of ports on both sides the island, some that are by nature very secure, others that may be so at a small expence. The fertility of the isle is such, as that with benefit instead of prejudice to its inhabitants, they will always have it in their power, to relieve the wants of those on board ships, resorting thither for a supply of fresh provisions. In one or more settlements here might be erected spacious magazines for the reception of East-India, European, and North-American commodities; all of which would not fail of finding a vent, and thereby producing an advantageous circulation of commerce and money.

The situation of this island is an another advantage, whether we consider its nearness to the Spanish main, or its convenient distance from some other islands, both of which ought to be regarded, in the choice of a FREE PORT. It may also be peculiarly advantageous upon the settling of the island, as by the hopes of immediate profit, it might attract people, create an instantaneous intercourse, and thereby a lucrative commerce with different parts of the world, which must otherwise prove a work of time. It might also open to us a correspondence with the free Indians, who live upon the continent, and who would be glad of having access to a country so near them, to which they might go, and from which they might return at pleasure, without danger to their liberty. On the other hand, our people would be attentive enough to their own interest; and tho' at first they might find it expedient to make them presents of such things as they saw most pleasing to them, yet in a little time they would make them sensible, that in order to obtain a continuance of supplies they must be content to render them useful in return, either by finding goods to barter, or by undertaking themselves some easy kind of labour; which proposition, if made with address, and prosecuted with humanity and justice, would hardly fail of making an impression upon them; and thereby open the means of having at least some kind of cultivation carried on there, by freemen, which would be an acquisition of people, as well as of country. An acquisition not at all the more impracticable, because that hitherto it has never been made. Our planters when they first went to the WEST-INDIES, had as little idea of negroes slaves, as they now have of Indians. In time they may profit as much by the one as by the other. This point has been cautiously spoken to, because some, not without reason, have doubted, whether it might be expedient for us to follow the example of our neighbours in the opening, as they have done, FREE PORTS in America. Certain it is, that the Dutch are very great gainers by those of St. Eustatia and Curaçoa. Should we succeed in the raising of spices, and making other improvements in this island, hitherto un-introduced into any other; the trade of a FREE PORT therein may become very beneficial to its inhabitants, without detriment to the mother-country. On the contrary, great cargoes exported from hence, may be disposed of there, and produce suitable returns. At all events, a free port in this island might be easily settled, and as easily kept, under proper regulations, by which the experiment, which is of no little importance, might be effectually made. If when it is made, the inconveniencies should be found to out-weight the advantages, or any unforeseen mischief should from thence arise, either to the trade of the other colonies, or that of Great-Britain; such a port might be with facility suppressed.

The definitive treaty of 1763 having also annexed the island of GRANADA to the crown of Great-Britain, we shall now briefly consider what benefits may accrue to us from this possession. It lies south west from ST. VINCENT, 17 or 18 leagues;

leagues; south-west from St. Lucia, about 35 leagues; west-south-west from BARBADOES, 50 leagues; south-south-west from MARTINICO, 50 leagues; south south-west from DOMINICA, somewhat more than 60 leagues; west-north-west from TOBAGO, 35 leagues, or according to some charts, 40 leagues; south from St. CHRISTOPHERS, 100 leagues; and north from the SPANISH MAIN, about 30 leagues. It lies in the latitude of 11 degrees, 30 minutes north, the farthest to the south of any of the ANTILLES. We are not able to give it's dimensions with any degree of exactness, as not only authors but maps differ very much in regard thereto. We may, however, without fear of erring much, assert that it is upwards of 30 English miles in length. De Lisle's map makes it near 40; and 15 or 16 in breadth, in some places, though in others much less, and about 25 leagues in circumference.

It appears from hence to betwixt as big as BARBADOES, larger than St. LUCIA, St. VINCENT, or TOBAGO; and if we may take the words of some French memoir writers, contains of cultivable land, near $\frac{1}{2}$ of what is to be found in MARTINICO. These are circumstances of some consequence, though we cannot speak of them as yet with precision. The situation of this island leaves us no room to doubt, that the climate is very warm, which, however, the French writers assure us, is very much moderated by the regular returns of the sea breeze, by which the air is rendered cool and pleasant. We may from the same authority assert, that it is wholesome; for though strangers especially are still liable to what is called the GRANADA fever, yet this is at present far from being so terrible, as it formerly was; proves very rarely mortal, and as it chiefly proceeds from the humidity of the air, occasioned by the thickness of the woods, it will very probably be entirely removed, whenever the country is brought into a thorough state of cultivation; and this we may predict, as the same thing has constantly happened, in our own and in the French islands.

Besides, the climate has some, and those too very peculiar advantages. The seasons, as they are filed in the West-Indies, are remarkably regular, the blast is not hitherto known in this island; the inhabitants are not liable to many diseases, that are epidemic in Martinico and Guadaloupe; and, which is the happiest circumstance of all, it lies out of the track of the hurricanes, which with respect to the safety of the settlements on shore, and the security of navigation is an inestimable benefit in this part of the world.

There are in GRANADA some very high mountains, but the number is small, and the eminencies scattered through it are in general rather hills, or as the French writers stile them MORNES, gentle in their ascent, of no great height, fertile, and very capable of cultivation. Exclusive of these, there are on both sides the island, large tracts of level ground, very fit for improvement, the soil being almost every where deep, rich, mellow, and fertile in the highest degree, so as to be equal in all respects, if not superior to that of any of the islands in the West-Indies, if the concurrent testimony both of French and British planters may be relied on. The former, indeed, have constantly in their applications to the French ministry insisted, that this might be very easily made one of the most valuable colonies belonging to France. This we find asserted at the very opening of the current century, in the memorials addressed to the council of state, confirmed some years afterwards by father Labat, and insisted upon with great zeal and vehemency, in representations drawn up by very capable judges, the last year that it continued to be a French island.

It is perfectly well watered by divers streams of different sizes, and running in different directions, flowing from a large lake on the summit of a high mountain situated very near the center of the isle. There are smaller brooks, running from most of the hills, and very fine springs almost every where, at a small distance from the shore. All these rivers abound with variety of good fish, and are resorted to by multitudes of water fowl. There are likewise in Granada several SALT-PONDS, which have their uses and their value.

The great produce of this country, in its present condition, is a prodigious variety of most sorts of TIMBER that are to be met with in any of the West-India islands; so that whenever this island comes to be tolerably cleared, considerable profits will arise from the timber that may be cut down. There are likewise many rich fruits, valuable gums, dying woods, and several vegetable products, such as oils, resins, balsams, &c. which have always borne a high price here. All the different kinds of ground provisions, which are so requisite to the subsistence of West-India plantations, are here in great quantities, and some kinds of grain ripen very kindly in this, which are not raised at all, or are raised with difficulty in other islands. River and sea fish in great abundance, and in respect to the latter, turtle of the largest size and lamentins, which drew vessels from the other French islands for the sake of fishing. They have plenty of all sorts of fowl, and prodigious quantities of game, ortolans, and a kind of red partridges especially. Besides these, the woods are well furnished with many wild animals, that afford excellent food, and are very rarely met with in the other islands. They have

likewise much cattle, and as their hills yield excellent pasture, if the country was better peopled, might have many more.

But the distinguishing excellency of GRANADA, does not lie simply in its great fertility, or in its fitness for a vast variety of estimable commodities, but in the peculiar quality of its soil, which gives a surprising and incontestible perfection to all its productions. The SUGAR of Granada is of a fine grain, and of course more valuable, than that either of Martinico or Guadaloupe. The INDIGO is the finest in all the West-Indies. While TOBACCO remained the staple commodity, as once it was, of these islands, one pound of GRANADA tobacco was worth two or three that grew in any of the rest. The CACAO and COTTON have an equal degree of pre-eminence; not is this founded simply in the opinion of the French, but is equally known and allowed by the English and Dutch; and in regard to the last mentioned commodity, we may appeal to some of the merchants of this city, on whose authority we may more safely rely.

If credit be due to the memorials of the French officers, who have visited Granada, true CINNAMON, and some NUTMEGS are found there; which, if future experience should verify, all that has been said in respect to TOBAGO, may be as justly applied to GRANADA; and the only reason for insisting on the subject there, was, because we thought the fact better established, from the authority of the Dutch, who, of all nations, are the best acquainted with spices. In respect to situation, and those expositions that are essentially requisite, to the proper culture of those valuable productions, the islands are every way equal, or, if upon making the experiment, GRANADA should be found preferable in TOBAGO, which may probably prove the case, it ought no doubt to be preferred accordingly.

All the writers of our own, as well as of the French nation, have agreed, that there is in general good anchoring ground on all the coasts, and many commodious creeks and bays, both on the east and west sides, which would be infinitely advantageous to commerce, if this country was fully peopled and completely cultivated. But besides these small, there are also two large ports of great excellence, and which deserve particular notice. The first of these is the harbour of CALIVENIE, at the south-east extremity of the island, and is singularly safe and spacious. It consists of an outward and inward port. The former is three quarters of a mile broad at its entrance, but widens as you advance, and becomes above a mile in extent within. As to the entrance of the interior port, it is above a quarter of a mile broad, but presently expands itself on both sides, so as to be very capacious, and has about seven fathom of water, with a soft muddy bottom, from whence seamen will easily judge of its utility. Ships lying here in the utmost safety, may from warehouses take in their lading very conveniently, and may then, with great ease be hauled into the outer port, which has this peculiar advantage, that ships may either come into, or go out of it with the ordinary trade wind. This port, supposing there was no other, is in an island thus situated, and so very capable of being improved, would, in a trading nation, like ours, render it a valuable acquisition.

But the worth of GRANADA must be highly enhanced, when we consider the other harbour, which lies at the north-west end of the island, and is called the CARENAGE, the harbour of PORT ROYAL, or the OLD PORT, which has been always esteemed one of the best harbours in the WEST-INDIES, as possessing almost every advantage that can be desired. It is a full quarter of a mile broad at its entrance, and, when once entered, it is so capacious, as to hold with ease a squadron of twenty-five ships of the line, where they may ride in perfect safety, in respect either to wind or weather. There lies also, at a small distance from this port, a lake of a considerable size, very deep, the water brackish, and which, by cutting through a sand-bank, might be easily joined to the port, and would then be one of the finest basins in the world, and afford all the conveniences that could well be wished, for careening the largest squadron of the largest ships, that are ever employed in this part of the world. The mouth of this port is securable by a tolerable fortress, called FORT ROYAL, where the governor resides, but the situation of it has been censured; and indeed there is no doubt, that by the help of two good fortifications, erected on the promontories, which make the entrance of the harbour, it might be rendered inaccessible, since in case of an attack, ships must warp in, under the fire of both fortresses. The benefits that may be justly expected from such a port as this, in an island so well situated, and producing such a diversity of valuable commodities, are so obvious, that it is needless to enter into a detail of them. In time of war it would give us inexpressible advantages against the Spaniards as well as the French; and if it should happen, that by a multiplicity of services, our naval force should be so divided, as to leave us only an inferior squadron in these ports, the CARENAGE would afford us a safe retreat, without obliging our ships to quit that station. A circumstance certainly worthy of being regarded; and of which, the French availed themselves often, so long as this island remained in their possession.

The

The ingenious father Labat was here in 1705, and made some curious and pertinent remarks. He speaks of the planters as easy in their circumstances, though not very polished in their manners. He clearly discerned, that great improvements might be made in so pleasant and fruitful a country, and regretted that the French refugees from their ruined colony of St. Christophers were not sent hither, where they would quickly have repaired their own losses, and have rendered this colony much more useful to France. He made other judicious reflections. 'If, says he, Barbadoes had a port, as safe, as capacious, as commodious, and as easy to be fortified, it would be indeed an incomparable island; the English know much better than we, how to turn every natural advantage in their islands to the utmost; and if GRANADA had belonged to them, it had before now changed its appearance, it had been long ago a rich and powerful colony; instead of which, we have hitherto reaped little, from those beneficial circumstances from which vast profits might have arisen, since after so many years possession, the country is yet in a manner desert, thinly peopled, without commodities, having little commerce, their habitations or rather cabins mean, ill built, worse furnished; and to say all in a word, in a very little better state, than when Mr. du Parquet bought it from the savages.'

We must admit, that within the half century that has since passed, somewhat more attention has been paid to this island, and its productions have turned within this period much more to the account of France. They had sent thither for some years before it came into our hands, 12,000 hogheads of SUGAR annually, besides COFFEE, CACAO, and a large quantity of excellent COTTON. Yet it is generally allowed, that never one half of the country was settled, nor half the profit drawn from what was settled, that might have been obtained, if the inhabitants had been better planters, and had been better supplied with slaves. The representations made to the French court treat all the improvements made there as very imperfect, as demonstrative rather of the fertility of the soil, and the excellence of the climate, than of the industry of the inhabitants. These representations likewise suggest, that many improvements might have been introduced, and that some lucrative branches of commerce might have been opened from thence. By the accounts of our own people, who have resided there, and the captains of men of war who have visited it; the French have not been extravagant in their accounts, or visionary in their speculations. An English gentleman who had great opportunities of knowing, thinks a much greater quantity of sugar was raised there than found a regular passage to France.

Exclusive of these productions, this island was of great utility to the French, during the course of the last war, when the single ships of force they sent to the West-Indies, with the transports under their care, came regularly hither, with little danger of falling into the hands of cruisers. Here they remained in safety, and from hence they sent supplies of men, ammunition, and provisions, in small vessels, which creeping along the Granadillos, St. Vincent, and St. Lucia, arrived generally speaking safely in the harbour of St. Peter's in Martinico. In this respect, as well as many others, the French will very sensibly feel the loss of this island, as we shall the advantage arising from the possession of it. A British Squadron stationed here will be, as before hinted, a severe check upon the Spaniards as well as the French.

There runs from the southern extremity of the isle of Granada, in the direction of north by east, a long range of little ISLANDS, extending about 20 leagues. These are of different sizes, but all of them, except the round island, very small. The number of these isles is very uncertain; according to our best information, there are about 23 of them, capable of cultivation. The soil being remarkably rich, the climate pleasant, and all the necessaries of life, whenever they shall be settled, will be easily obtained. According to the sentiments of the best judges, large quantities of INDIGO, COFFEE, and COTTON, may be raised upon them, nor are they at all unfit for sugars. In their present situation, they abound with excellent TIMBER. In former times, they were very serviceable to the planters of Barbadoes, who cut great quantities of MILL-TIMBER, which were a great convenience. But for many years past, the French have not only prevented this, as injurious to their property, but by stationing guard-ships upon the coast, made prizes in time of full peace, of all English vessels they found at anchor there, and even of such as appeared in sight of them, which was a great detriment to our navigation. For, if vessels bound to Barbadoes, either through thick weather, or being disabled, missed that island, and ran down the south of it, which was the common rout, they come of course upon these islands, and fell into the hands of the guard-ships; the apprehension of which, made them so cautious, as to render their voyages to that British island longer and more tedious than in former times. But as all these difficulties will be removed for the future, and as the clearing of these isles in order to their cultivation, will be an immediate and considerable advantage to the inhabitants of Barbadoes, these circumstances enhance the value of this acquisition.

There are besides these 5 larger islands. The first of these nearest the line of islets before-mentioned, retains the Indian name of Carrouacou, of a circular figure, about 6 or 7 leagues in compass, lies 5 leagues east from Granada; 14 fourth west from St. Vincent, and about 40 leagues west-fourth-west from Barbadoes. This little isle, is represented by the French, as one of the finest and most fruitful spots in America; and from being pervaded by the sea breeze, the climate equally wholesome and pleasant. It is covered with valuable timber, interspersed with rich fruit-trees, and when settled and cultivated, is capable of more kinds of West-Indian improvements.

But the circumstance by which it is most distinguished, is its having as deep, capacious, and commodious an harbour, as any in these Indies, and on this account has often been recommended to the French government, as a place capable of being made of much superior utility, to islands of far greater extent, and even allowing these to have equal merit, in regard to the value and the variety of their productions.

About a league north-east from Carrouacou, lies L'ISLE DE L'UNION, though in truth there are two, the larger three leagues, the lesser two leagues in length. At the distance of two leagues from these, lies CANNON, so called from the great resort thither of the kind of tortoises, or sea-turtle, which bear that name. This isle is 3 leagues in length, and $1\frac{1}{2}$ broad, and has a small islet at the west of it. At the distance of 2 leagues from this, lies the ISLE DE MOUSTIQUES, or MOSKITO ISLAND; 3 leagues in breadth, and 1 in length. All these islands, are allowed to be pleasant, wholesome, and exceeding fruitful. They are, at present, overgrown with different kinds of TIMBER; some of which are become exceedingly scarce in the other isles, and some also, which bear at present a very high price in Europe.

At the distance of a league from Moskito island, lies Becovya, Bequia, or Bekia, which is but two leagues fourth-west from St. VINCENT. This is the largest of all the islands dependent upon GRANADA, being about 12 leagues in circumference, and consequently somewhat larger than MONSERRAT. The soil is equal if not superior to any of the rest; it has likewise a very safe and convenient port, which is land-locked on every side, easy in its entrance, and very deep and capacious, and in which their small armaments frequently took shelter, during the last war, in proceeding as before intimated, from Granada to port St. Peter's in the island of Martinico; and this circumstance hereafter may possibly merit for it more attention.

The consideration of these islands dependent upon that of GRANADA, led to the question, whether they might not be, all circumstances considered, more proper for the introduction of SPICES, than even that of TOBAGO? The 5 islands of the MOLUCCAS, which are TERNATE, TYDOR, MOTIER, MAQUIEN and BACHAM, were so many separate kingdoms, rich and full of inhabitants, before they were known to the Europeans, lie all in a line like these, and are none of them larger than CARROUACOU. They have small straits of the sea between them like the Granadines, bear the same TREES, HERBS, and ROOTS, are some of them, like these, deficient in fresh water, and produced originally, CINNAMON and NUTMEGS, as well as CLOVES, the uses as well as the method of CULTIVATING and CURING of what were taught them by the CHINESE, as Dr. Angenola, who wrote an excellent history of the MOLUCCA islands, informs us. BANADA, where the NUTMEGS originally grew, is not above half the size of BEQUIA; and AMBOYNA, to which the Dutch seem at present inclined to confine both NUTMEGS and CLOVES, is rather inferior in point of extent to the island of GRANADA.

It should not be forgot that our island of GRANADA, and its DEPENDENCIES the GRANADILLOS, are free from HURRICANES; to which also our island of St. VINCENT is seldom exposed. To judge of the true value, and to ascertain the real importance of these islands, that are altogether now become ours, we must view and contemplate them in their different lights, from which they may every one of them become more or less, immediately or remotely, directly or indirectly, assisting to the interests, increasing the power and the commerce, extending the navigation, and thereby promoting the welfare of Great-Britain; or, in other words, conducing to the industry, the independency, and the happiness, of their fellow citizens, and fellow subjects, who are the inhabitants of this their MOTHER-COUNTRY.

To judge to what degree our new acquisitions in the WEST-INDIES may be likely to answer these desirable purposes, it will be requisite to observe that general arrangement of things, which has since the peace of 1763, taken place in this part of the world. There is not now an island small or great in the West-Indies, the right to as well as the possession of which, is not, pretty clearly ascertained, and this without introducing any new powers into America, which might have proved prejudicial to our interests. By thus adjusting the settlements of different states, an end is put, at least as far as human foresight reaches, to their ambitious views.

In virtue of this adjustment, many of our old plantations will avail themselves of those supplies of TIMBER, from which they

they have been for many years precluded. The run-away Negroes will not be able to shelter themselves any more in uninhabited islands, and those impediments to, and embarrassments of our navigation, which have been often severely felt, and in consequence of which so many frequent and loud complaints have been made to almost every government in our colonies, will be now removed, by the taking away of the caufes.

By this means, illicit commerce will be greatly lessened. It will be a great encouragement to industry, by taking away those temptations to persons of unfettered tempers of roving into islands of no settled government, where of course men were at liberty to pursue their private advantage, at the expense of the public interest. From the same reasons, we may expect that PIRACY, which has so often afflicted the honest planters, mariners, and fair traders in the West-Indies, will not easily revive, as all the ports and places to which these lawless people were wont to resort, will no longer exist, at least in the manner they did; and this as it will be an advantage in common to the colonies of all nations; so it will to our own in particular, from the value and extent of our commerce, which rendered it more frequently a prey to those enemies of mankind.

In virtue of this regulation, we shall have a new and a very considerable province in the West-Indies, composed of islands well situated as well for their correspondence with each other, as for their general intercourse with Great Britain. Those in their infancy, will be sheltered by the force that there is at present in Barbadoes, and in proportion as they become better settled, they will in their turns be enabled to send assistance to that island, or as that is the usual rendezvous of our expeditions, will be in a condition to furnish their respective quotas, when necessary in succeeding times: thus these islands will add mutual strength and benefit to each other. Our old settlements also may gradually disburthen their supernumerary inhabitants on territories belonging to their mother-country, instead of resorting, as it is too notorious that great numbers have done, to DANISH and DUTCH settlements.

By this new distribution of property, we are brought much nearer to the Spanish main; and this in time of peace, may enable us to furnish them with supplies of Negroes and other necessaries, which they have long received from the French and Dutch. In time of war again, we have from these islands, such evident and such effectual means of keeping their fleets in awe; interrupting all correspondence between their settlements, and making descents upon their coasts, as with the experience of their past losses, will very probably discourage that very nation from breaking hastily again, with those who have so much more in their power, and may easily embarrass and interrupt their commerce.

If we advert to the alteration this new distribution has made, in regard to the French in those parts, it appears plain enough from what has been already said, that they will lose the convenience of raising vast quantities of fresh provisions, as well as considerable supplies of valuable commodities, which they constantly received from those that were then styled neutral, but so far as this went, were really French islands. They will likewise lose the advantage of felling TIMBER, and building STOPS, and even larger vessels in DOMINICA and ST. VINCENT, as they were accustomed to do. Besides, they will be deprived of their communication with the Indians in the one, and with the Indians and free Negroes in the other of these islands, from whence they derived by their own confession, such services as were productive of various advantages, exclusive of the check they kept upon us. They will no longer enjoy the turtle and lamentein fishing round the coasts of TOBAGO, which was their annual resort, but will for the future be confined within the bounds, and to the coasts of their own islands.

These consequences, when taken together, will bring very sensible difficulties upon the French planters, by constraining them to employ greater pains, and a larger number of hands for procuring those necessary supplies, which they formerly received in great abundance, with little trouble and very small expense. It will also follow, as all who are acquainted with these countries must know, that from being thus freightened, they will be compelled to the employing more Negroes; and yet even with this increase of slaves, less will be done in their sugar plantations than formerly, when almost all their wants with respect to subsistence, and even with regard to buildings, were supplied upon such easy terms. In this situation likewise as many vessels of different sizes were continually occupied in their intercourse with these isles, with which they can now have no further connection, their navigation must be diminished, and will of course decline.

By parting with GRANADA and its DEPENDENCIES, they have not only lost the produce in sugar, coffee, cotton, &c. of that island, which was not inconsiderable; with all title to those improvements, which as appears from their own authors, they were fully convinced might be made therein; and the advantage of those safe and commodious ports, which have been described, but likewise the facility which they derived from thence, of succouring all their islands, even when

we had superior squadrons in those seas; to which for the future, they must in case of war be inevitably exposed. By the same step, they have deprived themselves, on that side at least, of the intercourse they had with the Spaniards, and must hereafter run much greater hazards than formerly, in receiving, when their necessities require them, supplies of provisions and military stores from the Dutch.

The island of ST. LUCIA left to France by the late definitive treaty, is situated 24 leagues west-north-west from BARBADOS; 8 leagues south from MARTINICO; something more than 7 leagues, north-east from ST. VINCENT; 27 leagues, south from DOMINICA; 70 leagues, south east from ST. CHRISTOPHERS; 45 north-west from TOBAGO, and about 35 north from GRANADA. Thus we see at one view, how this island is disposed, as well with regard to our own as to the French islands, upon which its importance is justly supposed to depend.

By the best accounts we have, and particularly that of Captain Uring, who was very attentive in his examination of this island, when appointed by the late duke of Montague, it is 22 English miles in length, 11 in breadth, and somewhat more than 20 leagues in circumference. It appears, therefore, to be in point of size, somewhat larger than our island of ST. VINCENT; but is inferior in that respect to DOMINICA and to GRANADA. Captain Uring, who landed a considerable number of men, says that the heat being tempered by the breeze from the sea, renders it equally wholesome and pleasant; but then he acknowledges, that in a fortnight's time, his people grew to weak and sickly, as to put it absolutely out of his power to defend himself against the French, even if they had not invaded the island, as they did, with great superiority of numbers. It is also owned by us, as well as all the French writers, that it is as much, or more infested with venomous serpents than Martinico. The appearance of this isle is rugged and mountainous; towards the south-west extremity, there are two high sugar-loaf hills, by which the island is easily known. They are very steep, and the air on their summits very cold. There runs also a long range of mountains, some of which are of great height, along the windward side of the island, but at the bottom of these, there is a fine plain; near 15 miles long, and between 2 and 3 broad; the soil of which is very rich and fruitful. There are besides these already mentioned, several other mountains, with pleasant vallies between them. The soil in general, is much of the same nature, and held to be very little, if at all inferior to that of Martinico; so that there is no doubt if it was equally cultivated, it would yield extraordinary profit, more especially, when the country is effectually cleared, which, a few spots excepted near the sea coast, is at present overgrown with wood. The French have a tradition, which, however, is generally believed that there is a very rich silver mine upon this island, which some even of the inhabitants of our isles think has a foundation in truth, and others apprehend to have been thrown out on political motives.

There are few islands in America, better watered in all respects than this. Many rivulets run from the mountains into the sea on both sides, and in all of them, there is plenty of different kinds of fish. There are others that take a serpentine course through the meadows, and render them very luxurious. Springs of fresh water are common almost every where, and towards the north-west end of the island, there is a large pond or small lake. In some of the vallies, the country is marthy; but, if once fully inhabited, these might be easily drained, which would add to the salubrity of the air.

The produce of this island in its present condition, is chiefly TIMBER of all sorts, in vast plenty and great perfection. There are likewise all kinds of ground provisions, raised wherever there are people. The country abounds with wild hogs, with fowl of all kinds, tame as well as wild; a vast variety of different sorts of fish, and of these also there are a surprising quantity upon the coast. The French many years ago resorted thither chiefly on that account; they then fell to the cutting of timber, for the use of the inhabitants of MARTINICO; after this they began to build boats, barks, and at length ships, inviting and encouraging English and Dutch carpenters to come hither for that purpose; for in those times there were no regular settlers, but the French from Martinico, sent hitherto occasionally such sort of people as were troublesome in that colony, and unwilling to bear the restraint of laws. By degrees a better sort of people chose to try their fortunes there, began to clear considerable spots of ground, on which they gradually raised very profitable plantations. The chief commodities they raised, were CACAO, COTTON and INDIGO, in which they were very successful. This naturally increased their numbers, and the trade between St. Lucia and Martinico, has been for many years, though now and then interrupted, of great value.

The British nation had long entertained an earnest desire of adding St. Lucia to the rest of her possessions in the West-Indies, for which some just, and many plausible reasons were assigned; at the time more especially, when the duke of Montague obtained his grant. It was then alledged, that the island was wonderfully fertile, that it abounded in TIM-

BER, which was much wanted in our islands; that it was excellently watered, had many convenient bays, and at least one very fine port. The object then principally in view, was the planting of CACAO; and it was asserted that this island would produce enough of that commodity to furnish all Europe. All these considerations respected its value; but there were besides these some other, from which it was held to be of still greater consequence. It was judged an advantageous thing, to interpose one of ours between Barbadoes and the French islands; it was thought from the known advantages of its bays and ports to be very commodious for our squadrons, and it is believed that it might in many respects, prove a great check upon the French. It lay to the windward of Martinico, and so near it, that nothing could be done there, without our having immediate intelligence. Descents upon that, and upon the rest of the French islands might have been facilitated thereby, and all their naval operations must have been embarrassed at least, if not totally frustrated, if we were once masters of that isle. All these ideas being placed in the strongest point of light, heightened by the most advantageous representations, and nobody undertaking, what indeed would have been thought an invidious task, to call them to a critical examination, a general opinion from thence prevailed, that among the neutral islands, there was not one comparable to St. Lucia. Some objections, however, have since started, and those too of a nature, that may possibly render them worthy our notice. We now know from experience, that the country is very far from being healthy. It is so full of venomous creatures of different sizes, that the French settled there, were never able to stir abroad but in boots. It is not only very mountainous, but even the flat country, is full of marshes. It lies so immediately within the view, and under the power of the well-settled colony of Martinico, that without being at a great expence in fortifications, and keeping a constant military force there for its defence, we could scarce hope, that it would ever have been thoroughly settled. If even with the assistance of fortifications and a regular force, it had been settled, it might have been found impracticable to secure it, as there are so many landing places in different parts of the island; and as in case of a war, this small settlement would have been immediately exposed to the whole strength of the French islands, so that the inhabitants might have been ruined, before any assistance could have been sent them; and this, if the country had been recovered, or quitted by the enemy, would certainly have discouraged our people from settling it again. As the case now stands, the French are liable to all these inconveniencies; and whoever considers the situation of this island, and of those belonging to us in its neighbourhood, and reflects at the same time, on the superiority of our maritime force, will see, that in time of war, it must be a very precarious possession; more especially, if so thoroughly settled, as to make the conquest of it a matter of much consequence to us.

The French judged Martinico could not be secure without St. Lucia; but they were strangely prepossessed with the notion of St. Lucia, not to discern that we possess in DOMINICA, much more than we could possibly have had, if we had kept St. Lucia. For DOMINICA lies in the very middle of the channel, between MARTINICO and GUADALOUPE; to windward of the last of these islands, and not so much to leeward of the former; but the vessels can easily fetch the road of St. PETER, which is its principal town and port from DOMINICA. We have in that island also to leeward PRINCE RUPERT'S BAY, and to windward, the GREAT BAY; so that having Barbadoes to the windward of all, and ANTIGUA to leeward of GUADALOUPE, it is impossible in time of war, that either trade or supplies should get into those French islands. We have before remarked, that DOMINICA is an island of large extent, very fertile, and of great natural strength; and being once effectually settled, which ought to be, may be defended against any force whatever. Whereas ST. LUCIA is so accessible on every side, that it must of necessity fall to a superior maritime force. It was in this sense that it has been suggested, that the want of PORTS, with which DOMINICA is reproached, is, its situation in the midst of all the French islands considered, so far from being a defect, that it is in reality a convenience; for two ports may be easily fortified and defended; whereas it would be endless, to attempt the securing twenty.

Father LABAT who was not only a very intelligent person, an inquisitive and strict observer, and an eye-witness of all he wrote, but also an engineer, and in that capacity, relied on, for fortifying several places in the French islands, in the first year of the current century.

This ingenious person, after giving us an account of DOMINICA, which he very carefully examined; and according to the custom of the French, in respect to all places not in their possession, having done his utmost to put it in as low and depreciating a light as possible, proceeds thus: 'Though after all, this is an isle of very little importance; the English have notwithstanding made many attempts to establish themselves therein, founded upon certain pretensions which the French have always opposed, not only because they

VOL. II.

were in themselves void of any reasonable foundation, but the rather, BECAUSE IF THIS ISLAND SHOULD BE ONCE IN THEIR HANDS, IT WOULD SERVE TO CUT OFF THE COMMUNICATION BETWEEN MARTINICO AND GUADALOUPE, IN A TIME OF WAR, AND REDUCE THE INHABITANTS OF BOTH ISLES TO THE LAST EXTREMITY.' The proportion between the property, and consequently between the power of Great-Britain and France in the WEST-INDIES, is now extremely altered to what it was before and since the conclusion of the last peace of 1763. Our property in the former period, compared to theirs, was no more than as ONE TO FIVE; whereas it is now almost as TEN TO FIFTEEN; or nearly as TWO TO THREE. If therefore, when we were in so much a weaker state, we were still able to protect even the smallest of our islands, during all the late wars between the two crowns, and in a condition to conquer almost all theirs; shall we have any reason to fear what may hereafter happen; when in consequence of settling our new acquisitions, we shall have acquired, as we necessarily must, so large an accession of force?

Moreover, the situation and disposition of our islands give us, in respect to France, still greater advantages. Our northern islands will remain what they always have been, a perpetual check to them on that side. DOMINICA lies, as shewn, in the very center of their possessions, so as to command and distress the navigation equally of MARTINICO and GUADALOUPE. At the southern extremity again, we have GRANADA, and all the islands belonging to it, connected with ST. VINCENT; from whence we have an easy correspondence with Barbadoes, and a number of safe and commodious ports; to which our FLEETS may at all times resort; all which considerations, taken with their united force, may banish the apprehensions of danger to our old or new colonies, in case of a future rupture with France.

Relative to those benefits that will probably result from these new acquisitions to the present and future ages, it will be necessary to observe, that upon the first view an objection may arise from the smallness of those islands, which are very diminutive, if put in balance with the French; and still more so, if they should be compared with those that the Spaniards possess in the West-Indies. It does not however, follow from thence, that they are either insignificant or inconsiderable. When we come to examine this matter more attentively, we shall find, that this very circumstance which strikes superficial observers in one light, will appear to competent judges in quite another.

In the first place then, they enjoy a purer air, from the sea breeze passing constantly over them, and when cleared of superfluous wood, as they will be for cultivation, continually pervading them. This is a natural effect arising from their size, and must render the climate at once more temperate and more wholesome. The soil too, in these small islands, is more fertile, more capable of being manured, and in many respects more easily cultivated, than in larger islands; they are therefore, capable of being more easily, more speedily, and more completely settled, than if their extent was larger: all of which are incontestible advantages.

Besides, from the vicinity of the sea on every side, and the facility of fishing round the coasts, the inhabitants of such islands derive the means of constantly supplying themselves with a considerable part of their subsistence, with little labour and at an easy expence; with this additional benefit, that the advantages arising from thence, which could not be the case in a large country, are alike common to all the inhabitants. This extent of coast in proportion to that of territory, is also very favourable to commerce, as might be shewn in variety of instances, if it were not too obvious to need animadversion. It is no less apparent, that such islands for the same reason that makes them easier settled, are also easier defended, which is another point of no little consequence to the colony and to the mother country.

The islands of which we are speaking, have besides these general advantages some that are peculiar to themselves, and which also are of no small importance. They are; as appears from the description of each of them, exceedingly well watered, and this by running streams; which will afford their inhabitants the convenience of erecting water-mills, machines that are more useful and less expensive, than either wind-mills, or those in which cattle are employed. The ridges of hills from which these rivulets run, render the seasons more regular in these islands; and there is at least a strong probability, will exempt them, if not totally, yet in a great degree, from short crops, the heaviest of all misfortunes to a planter, and to which the French as well as our islands are very frequently subject.

As these natural benefits of small islands are thus capable of being demonstrated by reason, so the effects that might be expected from them, are justified likewise from experience. If we consider the larger islands in the hands of the French, we shall find that their produce however considerable, is not in proportion to the extent of country, as the French writers themselves acknowledge, and as our countrymen, who have been upon those islands, and who have carefully attended to this particular, likewise admit. The same thing is yet

R

more

more visible, in regard to the Spaniards, who possess at once islands the largest and the least profitable in the West-Indies. The Dutch on the other hand, have found means to render the smallest, and in point of soil and climate, the worst island in the West Indies, by dint of skill and of industry, wonderful flourishing, exceeding populous, and of course highly beneficial.

Yet in this respect, the experience arising from the skill and success of our own planters, goes beyond that of all other nations; and if we consider their early improvements, and the vast extent to which they have been carried; and at the same time reflect, that these have been owing to no one circumstance more than to the smallness of their islands, which for the reasons already given, enabled them to get the start and to keep it so long from the French, will abundantly satisfy every judicious and impartial enquirer, that what we have been laying down, is not more consistent in speculation, than evident from the light of facts.

The new islands taken all together, contain upon the most moderate computation, twice the quantity of ground capable of cultivation, or at least very near it, that there is in Barbadoes, and the rest are all considerably larger. In respect to their soil and climate, they are indisputably to the full as capable of improvement, as any of those that have been improved by our industrious countrymen in so high a degree. Why therefore in a reasonable space of time, may not we, or our posterity at least, expect to derive twice as much from them?

These new colonies, like our old ones in that part of the world, must depend entirely upon us, and draw from hence every necessary, every convenience that they want, either for their own subsistence, or for carrying on their plantations; and how extremely beneficial this is, and so considerable an increase will it be to the mother country, has been explained. It is requisite only to mark, that we shall not be obliged to wait for all, or even the greater parts of the benefits of this commerce, till such time as these islands are fully and completely settled, so as to vie in their productions with our old islands; but on the contrary, our exports to them, and of consequence the profits upon those exports, will very soon commence, and of course we shall immediately reap great advantages from them. The reason of this is obvious; for tho' our old colonies require annually many things, our new ones will require all; and 'tis easy to distinguish the difference that there must be, in supplying the vast variety of things requisite for settling new colonies, and the furnishing the annual subsistence, together with the wear and tear in the old ones.

Nor is there any room to fear, that these new settlers will not find wherewithal to make considerable returns; for though this cannot be at first done in SUGAR, yet in MAHOGANY, COTTON, and a great variety of other articles it may; and the very balance remaining a DEBT, will be a most effectual spur to industry, and compel the new planters to work hard and to live frugally, as the original settlers in our other islands did, in order to procure new supplies with that view, and to maintain and extend their credit.

The intercourse between the new colonies and their mother country, as it must from the causes before-mentioned begin early, so the advantages arising from it will diffuse themselves generally over the whole island of Great-Britain; indeed thro' the whole sphere of the British dominions in Europe, since very large quantities of linens and salt provisions, will be exported for the use of the new settlers and their servants, from Ireland; and in process of time, as they shall become more numerous, we may with great probability hope, their increased demands will, in a great measure, absorb those supplies with which the inhabitants of that island have hitherto furnished the French and Spanish ships, and contributed thereby to their navigation much cheaper than otherwise they could have done.

But it is requisite farther to observe, that exclusive of the benefits flowing from their direct trade with us, they will bring us likewise considerable advantages, by the encouragement they will afford to other branches of our commerce. The African trade, more especially at the beginning, will receive a new spring from their demands, since all that they can do either at present or in future, must arise from the labour of negroes. The supplying them with slaves, therefore, will be both an instantaneous and a continual source of wealth, to such as are employed in that lucrative trade; more especially to those who have the largest share therein, the merchants of London, Bristol, and Liverpool.

We have before seen, how this trade comes to be of such importance to Great-Britain, as it is carried on principally with our own manufactures, and more especially with woollen goods of different kinds, to a large amount; and in all the incidental profits, exclusive of what is produced by slaves, which arise from our correspondence with AFRICA, whether obtained by the purchase of elephants teeth and gold dust, upon the coasts of that country, or from the sale of commodities to foreigners in the West-Indies, finds its way hither. On the winding up of the account, therefore, as the sale of the negroes centers in the West-Indies, the profits arising

from them, and every other accession of gain, centers ultimately here, and becomes the property of the inhabitants of Britain.

This will appear with greater degree of evidence, when we reflect, that more than the moiety of that part of the cargo for the African trade, which is not made up of our own goods, consists of the manufactures of the East-Indies. Besides the quantity of India goods employed on the coast of Africa, there is likewise no small demand for the same commodities in our old SUGAR COLONIES, and of course there will be the like demand in our NEW. We see from hence, how the comprehensive chain of commerce is united, and how the different products of the most distant parts of the world, are carried to and brought from these distant countries in British shipping; and that all the emoluments arising from this extensive navigation, is in the end the reward of the consummate skill, the indefatigable industry, and the perpetual application, of the traders in this happy isle, and how it is to be augmented and supported by our new accession of territory. The prodigious compass of this commercial circulation, would after all be defectively represented, if we should omit mentioning the constant correspondence that subsists between the SUGAR ISLANDS and the NORTHERN COLONIES. A correspondence equally necessary, and reciprocally advantageous to those of our countrymen who are settled in both; and a correspondence, therefore, which will be always maintained, and by which the numerous subjects of Britain who are seated on the continent of America, and those settled in the WEST-INDIAN ISLANDS, in pursuing their own immediate interests, contribute effectually to each of their support.

This is a circumstance, that must fill the breast of every well-meaning man with the highest and most rational pleasure; and engage him to contemplate this subject, with a satisfaction which warms the heart of a parent, when he sees his children assiduous in their application to those methods of providing for their welfare, which have a tendency to promote their common interests, by which their commercial harmony doubles the effects of their mutual industry.

The northern colonies supply the SUGAR-ISLANDS chiefly with lumber and provisions. These are the fruits in a great measure of their indefatigable industry, to the rendering their labour subservient to their prosperity. By this means, they dispose of numerous bulky commodities, derive immense advantages from their fisheries, support an extensive navigation; which is so much the more profitable to them, as it is entirely carried on in ships of their own building; circumstances which, to the eye of a judicious reader, will place this trade, and all its beneficial consequences that attend it, in a very conspicuous and interesting point of view; and convince him, that nothing can be either more convenient for these people, or more to their profit.

On the other hand, the benefits that result to the inhabitants of the SUGAR COLONIES, are not less considerable. They draw all these necessary supplies from the nearest, and consequently from the cheapest markets; markets inexhaustible, and upon which they can always depend. These are brought them by their countrymen to their own doors; which is a circumstance exceedingly suitable to their situation, as it spares them the pains and labour requisite to provide them, which would otherwise be a great drawback on their industry in their own plantations. These supplies they pay for in their own manufactures, which is another great advantage; from all which circumstances taken together, it clearly appears, that the convenience of this correspondence, and the benefits resulting from it, are equally on both sides, and exactly suited to the genius, temper, and situation of the people, by whom it is thus carried on.

By considering attentively this conjunction of interests, we cannot but plainly discern, that by these NEW ACQUISITIONS IN THE WEST-INDIES, new markets are opened, to which our NEW SUBJECTS on the continent may resort. These islands will certainly in time more than replace to the people of CANADA, the trade they formerly carried on to the FRENCH COLONIES; and will at the same time, enable our other settlements upon the CONTINENT, to find new customers for all their commodities, without leaving them that colour of necessity, which was the only excuse they had to plead, for supplying our rivals with the materials essentially requisite to their manufactures, and of course detrimental in the same degree, to those of our fellow-subjects. Besides, as the increase of our SUGAR ISLANDS affords them the increase of commerce, so from their situation they will be a great bar to that ILLEGAL TRADE with the FRENCH, which cannot for the future be carried on with the same facility as before.

As the inhabitants of the SUGAR COLONIES are continual purchasers from such as are settled upon the continent of America, the amount of their purchases constitutes a balance from them in the favour of all those who dispose of them. But on the other hand, the inhabitants of the NORTHERN COLONIES, drawing large and constant supplies of commodities and manufactures from hence, we for the same reason have a like BALANCE in our favour against them. It is evident, therefore, from this deduction, that by their transferring the BALANCE due to them, in satisfaction for that which

which is due from them to us, the whole accumulated profits of these transactions ultimately centers with the inhabitants of Great-Britain. Such are the certain, the perpetual, the prodigious benefits that accrue to us from our PLANTATIONS.

There will be room in these new islands, for attempting many things, and improving more. The planting CACAO walks cannot be considered as impracticable, since we see the French have succeeded in it; and so no doubt might we, at least in a degree sufficient to furnish our own consumption. We have COFFEE already in our islands, but it would certainly turn to more account, if the culture of it was better understood; in order to which, pains should be taken to be thoroughly informed of the manner in which it is managed in ARABIA; since it is not at all improbable, that the FLAVOUR, in which only our coffee is deficient, depends upon the culture, and the method of curing it. TEA, if we may believe the French, is a native of the West as well as of the East-Indies; in respect to which it would be certainly right to make some enquiries, and in consequence of them some experiments; and if from thence it should, if it is not already there, it might easily be carried thither, and a trial made whether it might not be cultivated to advantage.

It has been no difficult matter to introduce black PEPPER. RHUBARB, SENNA, and several other valuable DRUGS, are said to have been raised by curious people in great perfection. If the culture of these and other medicinal plants, were once understood, they might be rendered profitable articles in commerce. The laudable society for promoting arts and manufactures, have given several premiums with respect to SARSAPARILLA, and other things; and it is to be wished, that these endeavours, so well intended, may have good effects; for the increasing the number of our commodities, appears to be a thing of consequence.

The success attending these, or any other experiments of the like kind, might become the means of improving many spots of ground, that would otherwise prove useless; as it is well known, that either lands worn out, or which are utterly unfit for either SUGAR or COTTON, might be employed for COCHINEAL. The raising a variety of commodities, would prevent the losses that ensue from short crops; as seasons unfavourable for some things, might be advantageous to others. Besides, in respect to many things that have been mentioned, the cultivation of them might be carried on with fewer negroes, and yet afford a comfortable subsistence to white families, the increase of which in our colonies, is an object of great importance, and is a matter entirely and constantly attended to by the French. Add to this, that though TEA, COFFEE, and CHOCOLATE, are at present not improperly considered as articles of luxury, they would be much less so, if they only, or even if they principally, came from our own plantations; and the consumption of them, should it become greater than it now is, would likewise promote and increase the consumption of our great staple commodity, SUGAR. In these, and in various other lights, such improvements would be found of great consequence, and are, therefore, extremely well worthy of consideration.

The settlement of these new islands, will be no detriment to our old colonies. It has been generally allowed, that there was a want of more sugar land in the West-Indies; and this being admitted, it is certain that Britain is a great gainer by those acquisitions, which put so large a quantity of land fit for the cultivation of SUGAR into our possession. This was not only an opinion, in respect to the truth of which the best judges agreed, but it was a point also decided from matter of fact; because it is known, that numbers of British subjects resorted to countries in the possession of other powers. No one will deny, that many English subjects are settled in the Danish settlement of ST. CRUZ; that there are many resident in EUSTATIA, and that many more are interested in the Dutch settlements upon the continent of America. It became, therefore, highly necessary to remove this evil, by giving such adventurers an opportunity of exercising their industry, in countries belonging to their mother country; and to these it is reasonable to presume, this opportunity being given them, they will return. Besides, as from these facts it appears, that our old colonies began to be over-stocked, so as to afford little encouragement to new planters, it was incumbent on us to have an eye to this circumstance, to prevent such enterprising people, who were determined to seek their fortunes in those parts, from being driven into foreign settlements; where their labour and industry, instead of benefitting us, would continue to turn to the advantage of our rivals; and foreign markets would have been supplied, for the profit of foreigners, by commodities raised by the skill and pains of British subjects.

We cannot but observe from what has already happened, that people who are indigent here, would go in search of subsistence elsewhere; and we must also be sensible, that by providing countries for such people to resort to, their industry, though not their persons, will still be preserved to Britain. By that increase of trade which their labours abroad will gradually produce at home, the number of our necessitous people here will be greatly lessened. There will be

larger quantities of our commodities and manufactures wanted; that are requisite in our plantations; and to supply these, numbers must be set to work, who are either now idle for want of it, and are subsisted by the poor's rate; or take methods of subsisting them, more injurious to the public, and much less to their own advantage and comfort, than if they betook themselves to honest labour here, or even went abroad to these new islands. See SUGAR COLONIES.

LEICESTERSHIRE, is an inland county in England, having Lincolnshire and Rutlandshire on the east; Northamptonshire on the south; Warwickshire on the west; and Derbyshire and Nottinghamshire on the north; and is in circumference about 100 miles.

The air is very sweet and wholesome, but the soil is very different, according to the several parts, being in some places very rich and fruitful, producing wheat, barley, and oats; in others barren and rocky. It's most natural and plentiful crops are beans, which, in some places, are so luxuriant, that, towards harvest-time, they look like a forest.

There are no manufactures in this county, except it be stockings, which has been of late greatly encouraged.

The great want of fuel, in the inland counties especially, is supplied by a very rich coal-mine, at a place called Cole-Orton, from whence it is sold at good rates to the neighbouring counties.

LEICESTER, the shire-town, is a large and populous place. The inhabitants have greatly improved the manufacture of stockings, vast quantities of which are wove by frames, in this and many other neighbouring towns and villages; and in some years it has returned 60,000 l.

ASHBY DE LA ZOUCH, a very pleasant town, has a plentiful market; and it's fairs, which are held on Whit-Tuesday, the 24th of August, the 18th of October, and on St. Simon and Jude, are famous for being well stocked with young horses of the large breed.

MELTON MOWBRAY, a large well-built town, has a market the most considerable for cattle of any in this part of England.

LEINSTER, a province in Ireland. This province is washed on the south and east by the sea; has Munster and Connaught on the west and south-west; and Ulster on the north; and is about 360 miles in circumference.

It has a temperate clear air, a soil fruitful in corn and pasture, and, though in some parts woody, abounds in general with cattle, fowls, milk, butter, cheese, fish, &c.

It's principal rivers are, the Barrow, Boyne, Liffy, Neur, Slane, and May.

It is divided into the twelve following counties, viz.

I. LOUTH COUNTY, which has St. George's Channel on the east; Monaghan and East Meath on the west; Armagh and Carlingford Bay on the north; and West Meath on the south-east. It is the least county in the kingdom.

CARLINGFORD is one of the best harbours in Ireland, at the mouth of the Neur; but, the town being a little out of the way for business, the trade is not equal to the extent of the harbour. They use the coal trade to Whitehaven, as also the fishing in the season, which is the life of trade on all this side of Ireland, especially north.

DUNDALK is the shire-town, and has a good market, but little or no trade.

DROGHEDA, which stands on a bay of it's own name, has a good harbour, but of difficult entrance. The town is populous, and has some trade to the north parts of England, and is supplied with coals from Whitehaven, which they send to all the country round.

II. The county of EAST MEATH has those of Cavan and Louth on the north and north-east; Kildare on the south-west; West Meath on the west; with Dublin county and the ocean on the east.

TRIM is it's chief, if not only town of note; but is not a place of any trade.

III. WEST MEATH, so called in respect of it's situation from the former, lies between King's county on the south, and Longford on the north and runs west to the Shannon, which parts it from Roscommon. It is well watered with rivers and lakes, but intermixed with bogs.

MOLINGAR, which lies in the center, is the head of the county by act of parliament, and a market-town of considerable note and strength.

IV. The county of LONGFORD has West Meath on the east and south; Cavan on the north; and Roscommon on the west.

V. DUBLIN COUNTY is washed on the east by the Irish Sea; has the county of Kildare on the west; East Meath on the north; and Wicklow on the south.

DUBLIN, the metropolis of the whole kingdom, is pleasantly seated on the Liffy, and is the grand mart, and the center of commerce for Ireland, especially for the communication of trade with England; and though Cork is the chief port for trade to foreign parts, and for exportation of provision to the West-Indies, a trade of great importance to Ireland; yet that of Dublin is greatly superior in this particular, viz. that, by it's great import of all kinds of merchandize from all parts, either directly, or by way of England, it has the chief part of the inland trade. The only misfortune of this city is, the deficiency

deficiency of it's harbour, occasioned by the bar, where such heaps of sand are brought in by the tides, that it is difficult of entrance for laden ships, except at spring-tides, and even then ships of great burthen dare not venture in; nor, when they are in the haven, can any ship come to the quay that draws above seven or eight feet water.

The city is supplied with coals from Whitehaven in Cumberland, and Swansey in Wales, in such great fleets, that it is common to see 200 sail of colliers in the road at a time.

VI. The county of KILDARE has those of Dublin and Wicklow on the east; King's and Queen's counties on the west; Catherlagh on the south; and East Meath on the north.

NAAS is the shire-town, but KILDARE the capital of the county.

VII. KING'S COUNTY has a part of Tipperary on the west; by which, and Queen's county, it is bounded on the south; by Kildare on the east; and West Meath on the north.

BALLY BAY, in this county, is a well-situated thriving plantation, near the center of it.

VIII. QUEEN'S COUNTY has King's county on the north and west; part of Kildare and Catherlagh on the east; and Kilkenny and Catherlagh on the south.

PORT-ARLINGTON, a small town in the north part of the county, on the river Barrow, is reckoned a thriving plantation. But

MOUNTMELLICK, a well-improved town, is said to be the best market in the county.

IX. The county of WICKLOW has St. George's Channel on the east; Kildare and Catherlagh counties on the west; that of Dublin, and part of Kildare, on the north; and Wexford county on the south. A copper mine was discovered here not many years ago, at the expense of Mr. Wayne, and other gentlemen of Bristol, which is like to bring them great profit for their undertaking.

The shire-town is WICKLOW, at the mouth of the river Ltrim; but it has not any trade, except what is managed in small vessels, and chiefly to carry provisions to Dublin, for the haven is good for nothing. It is famous for the best ale in Ireland.

DUNLAVIN is a fine English plantation, and a good market.

X. The county of CATHERLAGH has Wexford on the south; part of Queen's county and Kilkenny on the west; part of Kildare and Wicklow on the north; and part of Wicklow and Wexford on the east.

XI. The county of KILKENNY, is bounded on the west with Tipperary; on the east with Wexford and Catherlagh; on the south with Waterford; and, on the north, with Queen's county. This county is adorned with more towns and castles than any other in the kingdom.

KILKENNY is a large, strong, populous, and wealthy city, with as good a trade as any inland town of that kingdom.

XII. The county of WEXFORD has St. George's Channel on the south and south-west; part of Catherlagh and Kilkenny on the west; and Wicklow on the north.

ROSS, on the borders of Kilkenny, is a town of good trade, by means of it's river, formed by the conjunction of the Neir and Barrow, which brings up ships of very considerable burthen to it's quay.

WEXFORD stands at the mouth of the river Slane: it is a large corporation, as well as the shire town, and has a very good harbour.

LETTER of CREDIT, is where a merchant, or correspondent, writes a letter to another, requesting him to credit the bearer with a certain sum of money.

Form of a LETTER of CREDIT.

Mr. E. F.

S I R,

London, May 10, 1753.

My last to you was of the 15th of March, wherein I wrote what was needful, in answer to your's of the 10th of the same month; and this serves chiefly to desire you to furnish and pay unto Mr. C. D. English gentleman, to the value of two thousand crowns, at one or more times, according as he shall have occasion for it, and request the same of you, taking his receipt, or bills of exchange, for the monies which you shall so furnish him with, and put it to my account; and this my letter of credit shall be your sufficient warrant for so doing.

To Mr. E. F. merchant
at Madrid.

Your's, &c. A. B.

LETTER-FOUNDER. He casts types, or letters, for printers: there are but two in London; 'till very lately we had types from Holland; but that excellent artist Mr. Caslon, having excelled all foreign founders, not only furnishes us at home, but sends great quantities abroad.

LETTER of LICENCE, is an instrument, or writing, made by creditors to a man that hath failed in his trade, allowing him longer time for the payment of his debts, and protecting him from arrests in going about his affairs. These letters of licence give leave to the party to whom granted, to resort freely to his creditors, or any others, and to compound debts, &c. and the creditors covenant, that, if the debtor shall receive any molestation or hindrance from any of them,

he shall be acquitted and discharged of his debt against such creditor, &c.

The form of a LETTER of LICENCE.

To all people to whom this present writing shall come, we whose names are here undercribed, and seals affixed, creditors of A. B. of London, merchant, send greeting: whereas the said A. B. on the day of the date of these presents, is indebted unto us, severally, in divers considerable sums of money, which at present he is not able to satisfy unto us, without respite and time to be given unto him for the payment thereof: know ye, therefore, that we the said creditors, for divers good causes and considerations us thereunto moving, have given and granted, and by these presents do give and grant, unto the said A. B. our sure and safe conduct, and free licence, that he the said A. B. shall and may safely come and go, and resort unto us, and every one of us, his said creditors, to compound, and take order with us, and every one of us, for all and every of our said debts, and to go about any other business to any other person or persons whatsoever, without any trouble, suit, arrest, attachment, or other molestation to be offered or done unto him the said A. B. his wares, goods, monies, or other merchandizes whatsoever, by us, or any of us, or by the heirs, executors, administrators, partners, or assigns, or by our, or any of our means and procurement, to be fought or procured to be done, from the day of the date hereof, unto the full end or term of one whole year next ensuing: and we the said creditors, whose names are here underwritten, do hereby covenant and grant, and every one of us, for his own part, his executors and administrators, covenanteth and granteth to and with the said A. B. that if any trouble, wrong, damage, or injury, shall be done unto him the said A. B. either in his body, goods, or chattels, or any of them, within the said term of one year, next coming after the date hereof, by us, or any of us, his said creditors, or by any other person or persons, by or through the procurement, consent, or knowledge of us, or any of us, contrary to the true intent and meaning of this our present writing of safe conduct, that then the said A. B. by virtue of these presents, shall be discharged and acquitted for ever, towards and against him and them, of us, his, and their heirs, executors, administrators, partners, or assigns, and every one of them, by whom, and by whose means, he shall be arrested, troubled, and attached, or damnified of all manner of actions, suits, quarrels, debts and demands, either in law or equity, from the beginning of the world to the day of the date hereof. In witness whereof we have hereunto set our hands and seals, the, &c.

LETTERS of MARQUE, are extraordinary powers, or commissions for reparation to merchants taken and depoyled by strangers at sea, grantable by the secretaries of state, with the approbation of the king and council, and usually in time of war, &c. Lex Mercat. Malin. 173. If a letter of marque wilfully and knowingly take a ship and goods belonging to another nation, not of that state against whom the commission is awarded, but of some other in amity, this amounts to a downright piracy. Roll. Abr. 530.

The goods of others may be taken at sea by letters of marque, but not by any private authority, nor to be granted but where the party damaged has justice denied him, or illegally delayed. This law, or custom, was established by consent of nations; and, without it, licence would be given to commit depredations, especially if only the goods of rulers were liable, who seldom possess any thing the injured can come at for satisfaction.

But princes, by the laws of nations, are answerable for injuries public, and should, by the most prudent ways, prevent those that are private, not suffering even foreigners to receive wrongs; nor should the prince, or person injured, value his misfortune so low, as to deny him letters of request; and, if justice be denied on such request, it is reasonable to arm him with power, to take satisfaction by reprisal. Usually two or three letters of request are sent, before reprisal is awarded, and generally assign a time for reparation. King Charles I. after the massacre at Amboyna, granted letters of request to the states of Holland, for satisfaction within eight months, or letters of reprisal were to follow. King Charles II. on petition of Mess. Goulor and Canham, granted one Lee, letters to the great duke of Tuscany, for redress against the government of Leghorn. In the year 1674, the same prince, issued letters of request to the king of Spain, for satisfaction for the depredation committed on the ship and goods of Mr. Stampe, who was robbed and murdered at the Havanna. He also published a proclamation, promising a reward for apprehending the offenders, dead or alive.

In the prosecution of letters of request and reprisal, there must be,

1. The oath of the party injured, or other good proof of the injury, and of the loss thereby sustained. 2. A proof of due solicitation for redress, in a legal way. 3. The deferring or denial of justice. 4. A complaint to his own prince or state. 5. Requisition of justice by him or them, to the supreme state, where justice in the ordinary course was denied. 6. Persistence in denial of justice. And, after all, letters of reprisal,

prizal, under legal restrictions, and as the special case requires, may issue, both by the civil and by the ancient municipal laws of this kingdom: and the prince of the country must repair the damage out of their effects who caused it, or, if that prove deficient, it should fall as a common debt on his country.

Legal reprisals are of two sorts, ordinary and extraordinary: the first are either within or without the realm, and granted to English merchants that have any wife suffered in their persons or goods, and upon suit, or the king's demanding justice by his ambassadors, &c. cannot obtain redress: who in such case shall have a writ out of chancery to arrest the merchant strangers of that nation, or their goods, here in England: and the lord chancellor has always approbation of the king and council, or both, for so doing.

Those without the realm are always by patent, and not ordinarily revocable, as they immediately vest a national debt in the grantee, to be satisfied as the patents direct, out of the effects of that prince's subjects who refused, or illegally delayed justice. But, if the peace of both states seem to be endangered by attempting the execution of them, it may be respite till a more convenient time; and princes, in granting such letters, are careful to have them made so as they may not be reckoned a breach of the peace; but granting them for particular satisfaction does not, in the ordinary way, amount to a breach.

As to the extraordinary reprisals, they are by letters of marque, for reparation at sea, or out of the kingdom, granted by the secretaries of state, with like approbation of the king and council, but only during the king's pleasure, and generally in war-time.

In king Henry the IVth's reign, on the grievous complaint of the commons for wrongs at sea, contrary to leagues, &c. which were broken by the subjects of other nations, a law was made, that, upon application to the keeper of the privy-seal, he shall sign letters of request for restitution; which, if not made in due time, the lord chancellor shall grant letters of reprisal: and this confirmed by stat 4. Hen. V. cap. 7. and other statutes.

But letters of reprisal were granted long before these statutes, by the kings, nor was their prerogative diminished by them, but remained at common law, to judge when expedient to grant them; nor does the beforementioned act restrain the king's prerogative therein.

The cases where reprisals will or will not lie, are thus stated: on wrong judgment given in prosecution abroad, in matters not doubtful, that might have been redressed, and was perverted or denied, reprisal may be granted: if the matter be doubtful, it is otherwise; for, in such, there is presumption justice was duly administered. If an Englishman prosecutes a person in any legal court beyond sea, and the military governor opposes the suit, and, by his means, the debtor and his goods are conveyed away, but a judgment is obtained, by this the execution is frustrated, and letters of reprisal shall be had.

And yet if a merchant of England commence a suit in the courts of law beyond sea, and judgment pass against him, and is confirmed by the supreme court to which he appeals, though the complainant hath received a judgment contrary to the right of the cause, here he shall not have letters of reprisal; but it may, according to the case, occasion letters of request, to have a rehearing.

If any person be killed, wounded, or any ways damaged in the territories of any potentate to whom letters of request are sent, and no redress be made, letters of reprisal may be issued; but are not to be granted for damages to the goods or persons of those residing in foreign countries in time of war: in this case they must sit down with the loss, for they may relinquish the place on the enemies approach.

It is not the place of any man's nativity, but of his habitation, that subjects him to reprove: if, therefore, letters of reprisal be awarded against the subjects of the duke of Tuscany, and a native of Florence, but living in England, should have a ship on a voyage to Leghorn, it cannot lawfully be made a prize: and certain persons, as well as ships and goods, are exempted, as ambassadors, and their retinue, coming from him who awarded the prize, travellers, ecclesiastical persons, &c. and a merchant of another place than against which reprisals are granted, though his factor be of that place, is not subject to reprisals. Molloy Jur. Mar. 21.

Ships forced into port by stress of weather, are exempted, by common right; but the laws of England say otherwise, unless expressly provided for in the writ: and such ship flying his own country for some fault, and forced in by storm, is lawful prize: but ships may not be seized in any ports but of the prince who awarded the reprisals, or against whom they are issued.

If a ship, having letters of marque or reprisal, carry those she hath legally taken into a neuter port, the owners may there claim and seize her, or the admiral may restore the ship and goods to the owners, and set the captives at liberty. Trin. 17 Car. I. in B. R. Marth's Rep.

If any ship that hath letters of reprove attack a vessel, and she refuse to yield, she may be boarded; and, if any happen to

Vol. II.

be slain, the fault is their own, for hindering execution of a legal authority: but if it be those of another nation, against whom commission is not awarded, this is downright piracy, and punishable accordingly. Rol. Abr. 530.

Though, if such letters of marque be assigned over to another person, who takes any such ship or goods, on a violent presumption that it belonged to the right of him against whom reprisals are granted, here, if the sufferers recover ship and goods, yet the captors are not to be punished criminally, nor the grantees of the patents civilly; the captors are answerable for damages, but the grantees are entirely excusable, unless privy to the caption: it is like the case of an officer arresting a wrong person; he is answerable to the person arrested, but not the person that employed him. Stat. 4. Hen. V. cap. 14. Sea Laws, 470.

A person who had letters of marque in the Dutch war, took, by mistake, an Ostender, and brought her into harbour, and was prosecuted for damages, &c. Another, having taken a French ship, carried her into Africa, and the admiralty there condemned her as prize: having sold her, and, coming into England, he was sued in the admiralty, and sentence given against him, though he appealed for a prohibition, but was denied. 1 Lev. 243. 1 Salk. 32.

A ship being lawfully taken, and brought into port, the captor must exhibit all his ship-papers, and captive mariners, to be examined; and, till the goods are legally condemned, bulk ought not to be broken, nor may the captain permit embezzlement of the lading, or dispose of any part, without commission, for the king hath a share in all prizes: and the common profits are to be equally divided among all the ships present; so that if letters are granted to two ships, and both of them meet a prize, which one of them takes, although the other did nothing, he hath right to an equal share, for the preference of that vessel is a terror, and causes a ship to strike sooner. 3 Eliz. cap. 5. 2 Leon. Rep. 182.

If the caption of any ship be by men of war, the property will be in the captors, except it be lost again, and recovered by the persons from whom taken, or regained in battle. And, by the law of nations, the dominion of things taken with letters of marque becomes the captors, till the original damage, and subsequent charges, are satisfied; which done, the residue is to be restored: and so the Venetians used their equity, having taken the ships of Genoa, they carefully preserved the lading, till the debt was paid, and then made intire restitution. Molloy, 20.

If, during a war between England and Holland, a Dutch man of war take an English merchant-man, which is afterwards retaken; in such case, restitution is commonly made, the owners paying salvage; so where the prize is recovered by a friend, or comes into his ports: and the taking ships and goods by force is so odious, that restitution, where possible, is granted. Ibid. 6, 7.

Where for the fault, perhaps, of a few, a debt becomes national, the goods of the guiltless become liable, if taken, for satisfaction; but such should have contribution, by the law of England. Though, when depredations have happened here to foreign merchants, and complaint hath been made concerning them, our kings have often granted commissions to inquire and award satisfaction: and, on the petition of some merchants of Genoa, against the inhabitants of Guernsey, for detaining goods to a considerable value, out of a ship wrecked near the said isle, a commission was granted to punish the offenders, and make restitution: for, as the English subjects may have their goods as prize, for satisfaction of a debt from foreigners, so they may have benefit of these commissions, to make themselves whole out of the estates of offenders. Pat. 26 Ed. III. See stat. 31 Hen. VI. cap. 4.

But he that will sue to have restitution in England for goods taken at sea, must prove that the sovereign of the party was in amity with England, &c. and letters of reprisal make no war between nations. 22 Ed. III.

A copy of letters patent for especial reprisals, from the king of Great-Britain (under the great seal of England) against the States of Holland, and their subjects. Inrolled in the high court of Chancery, 19 May, 15 Car. II.

CHARLES the Second, &c. Whereas our loving subjects Sir William Courteen, Knt. deceased, and his partners, anno 1643, by the depredation and hostile act of one Gailand, commander in chief of two ships belonging to the East-India company of the Netherlands, was, between Goa and Macas, in the Streights of Malacca, deprived, and most injuriously spoiled, of a certain ship called the Bona Esperanza, and of her tackle, apparel, and furniture, and all the goods and lading in her, upon a very hopeful trading voyage to China, which were carried to Batavia, and there, without any legal process, confiscated: and also, in the same year, another laden ship of our said subject, called the Henry Bonadventure, being come on ground near the island of Mauritius, was there, both ship and goods, seized upon by some of the officers and ministers, and others, under the command of the said East-India company, and utterly detained from the right owners: and whereas the said Sir William Cour-

teen, and his assigns, in his life-time, used all possible endeavours to recover the said ships and goods, and to procure further justice against the malefactors, and yet could obtain no restitution or satisfaction, whereby they came to be much distressed, and utterly undone in their estate and credit: and thereupon, and upon the most humble supplication, and addresses of Francis earl of Shrewsbury, and William Courteen, Esq; grandson and heir of the said Sir William Courteen deceased, Sir John Ayton and Sir William Turner, Knts. and George Carew and Charles Whitaker, Esqrs. (on the behalf of themselves, and divers others interested in the said two ships, Bona Esperanza and Henry Bonadventure, and in the estates of the said Sir William Courteen deceased) Sir Edward Littleton, Bart. and Sir Paul Pindar, Knt. that we would take their case into princely consideration: we, out of a just sense we then had, and still have of their unjust sufferings in that business, both by our own letters, under our sign manual, to the States-General of the United Provinces, and by Sir George Downing, Knt. and Bart. our envoy extraordinary, to whom we gave special command so to do, required satisfaction to be made, according to the rules of justice, and the amity and good correspondence which we then desired to conserve with them firm and inviolable: and whereas, after several addresses made to the States-General by our said envoy, and nothing granted effectual for relief of our said subjects (whom we take ourselves in honour and justice concerned to see satisfied and repaid) we lately commanded the said Sir George Downing to intimate and signify to the said states, that we expected their final answer concerning satisfaction to be made for the said ships and goods, by a time then prefixed, and since elapsed; that we might so govern ourselves thereupon, that our aforesaid subjects might be relieved according to right and justice, and yet no satisfactory answer hath been given; so that we cannot but apprehend it to be not only a fruitless endeavour, but a prostituting our honour and dignity to make a farther application, after so many denials and slights. And whereas John Exton, doctor of laws, judge of our high admiralty court of England, upon our command to certify to us the value of the losses and damages sustained by the said Sir William Courteen and partners, whose interest is now vested in our loving subjects Sir Edmund Turner Knt. and George Carew, Esq; and partners, hath, upon full examination and proof thereof, made by witnesses in our high court of admiralty, reported and certified under his hand, that the same do amount to the sum of one hundred fifty-one thousand six hundred and twelve pounds.

Now know ye, that, for a full restitution to be made to them for their ships, goods, and merchandize, of which the said Sir William Courteen, Knt. and partners, were so depoulted as aforesaid, with all such costs and charges as they shall be at for the recovery of the same: we, by the advice of our privy-council, have thought fit, and by these presents do grant licence and authority, under our great seal of England, unto our said subjects, Sir Edmund Turner and George Carew, their executors, administrators, and assigns, for and on the behalf of themselves, and other persons interested as aforesaid, to equip, victual, furnish, and to set to sea, from time to time, such and so many ships and pinnaces as they shall think fit; provided always, that there be an entry made and recorded, in the admiralty courts, of the names of all ships and vessels, and of their burden and ammunition, and for how long time they are victualled, and also the names of the commanders, before the same or any of them be set forth to sea; and with the said ships and pinnaces by force of arms to set upon, take, and apprehend any of the ships, goods, money, and merchandizes belonging to the states-general, or any of the subjects inhabiting within any of their dominions or territories, wherefoever the same shall be found, and not in any port or harbour in England or Ireland, unless it be the ships and goods of the parties that did the wrong: and the said ships, goods, money, and merchandizes being so taken, and brought into some port of our realms and dominions, an inventory thereof shall be taken, by authority of our court of admiralty, by the judge or judges thereof for the time being, upon proofs made before him or them that the said ships, goods, wares, merchandizes, and money, did belong to the states-general, or any of their subjects as aforesaid, that they shall be lawful prize to the said Sir Edmund Turner and George Carew, their executors, administrators, and assigns, as aforesaid, to retain and keep in their, or any of their possessions, and to make sale and dispose thereof in open market, or howsoever else, to their and every of their best advantage and benefit, in as ample manner as any time heretofore hath been accustomed, by way of reprisal, and to have and enjoy the same as lawful prize, and as their own proper goods: so that neither any captain, master, nor any of their company, that shall serve in person, or shall promote and advance the said enterprise, in manner and form aforesaid, shall, in any manner of wife, be reputed or challenged as an offender against any of our laws: and that it shall be lawful for all manner of persons, as well our subjects as any others, to buy the said ships, goods, and merchandizes, so taken and apprehended by the said captains, masters, and others, and adjudged as aforesaid, without any damage, loss, hindrance, trouble, molestation, or

incumbrance, to befall the said buyer, or any of them, in as ample and lawful manner as if the ships, goods, wares, and merchandizes had been come and gotten by lawful traffic of merchants, or of just prizes in time of war: provided always, that all ships, goods, and merchandize, taken by virtue of this our commission, shall be kept in safety, and no part of them wasted, spoiled, or diminished, or the bulk thereof broken, until judgment hath first passed as aforesaid, that they are the ships and merchandize of the states-general, or some of their subjects as aforesaid: and if, by colour of this our commission, there shall be taken any ships, goods, or merchandizes, of any of our loving subjects, or the subjects of any prince or state in good league or amity with us (except the states-general, or their subjects, as aforesaid) and the goods therein laden sold and embezzled, or diminished, or the bulk thereof broken in any place, before they shall be adjudged to belong to the states-general, or some of their subjects, as aforesaid: that then this commission shall not be of sufficient authority to take the said ships, goods, and merchandizes, or to warrant or save harmless such as shall receive, buy, or intermeddle therein, but that both the prizes so taken, and the said ships of war, shall be confiscated to our use.

And further we do hereby declare, that it is our will and pleasure, that this our commission shall remain in full force and power, to all intents and purposes, until the said Sir Edmund Turner and George Carew, their executors, administrators, and assigns, as aforesaid, shall, by virtue thereof, have by force of arms apprehended, taken, seized, recovered, and received, from the said states-general, or their subjects, one hundred and fifty-one thousand six hundred twelve pounds, according to the appraisement to be made by appraisers upon oath, nominated and authorized in our said court of admiralty, of such ships, goods, wares, or merchandizes, as shall be taken from the said states general, or any of their subjects, by virtue of this commission, or shall otherwise receive satisfaction of the debt aforesaid, by composition to be made between those of the East-India company of the Netherlands and the said Sir Edmund Turner and George Carew, their executors, administrators, and assigns, as aforesaid: notwithstanding the present difference between us and the said states-general, depending upon general reprises, may be agreed and composed; and that, in the interim, a good correspondence may be renewed between us and the said states-general, but only in case of resistance; and that, after, in cold blood, the subjects of the states-general, if hurt or wounded, shall be used with all convenient offices of humanity and kindness, &c.

A proclamation for revoking the foregoing letters of marque and reprisals, published August 3, 1680.

Whereas George Carew, Esq; had formerly granted to him letters of marque against the States-General of the United Provinces, for satisfaction of a certain demand which Sir William Courteen and others had against the said States, and to which the said George Carew was intitled; which said demand has since, by treaty of peace between his Majesty and the said States, been totally abolished and extinguished, and all letters of marque and reprisal by the same treaty discharged accordingly: and whereas his Majesty has since recalled and superseded the said letters of marque: to the end that no person may be misled, under pretence of any letters of marque and reprisal heretofore granted to the said George Carew, and thereby incur the danger of the law, as pirates: his Majesty is pleased, by this, his proclamation, to declare, That the said George Carew has now no authority and commission, by virtue of any such letters of marque, to equip or set out any vessel whatsoever, and that all persons that shall presume to be aiding to him in setting forth any such ship, or serve under him, by colour of any such pretended authority, shall be proceeded against as pirates, according to the utmost severity of the law.

LETTERS PATENT, LITERÆ PATENTES, sometimes called LETTERS OVERT, are writings of the King, sealed with the great seal of England, whereby a person is enabled to do or enjoy that which otherwise he could not, and so called, because they are open, with the seal affixed, and ready to be shewn for the confirmation of the authority thereby given. 19 Hen. VII. cap. 7. And we read of letters patent to make denizens, &c. 32 Hen. VI. cap. 16. 9 Hen. III. cap. 18. Letters patent may be granted by common persons; but, in such case, they are properly patents; yet, for distinction, the king's letters patent have been called letters patent royal. Anno 2 Hen. VI. cap. 10. Letters patent conclude with Teste me ipso, &c. 2 Inst. 78. See PATENTS.

LEVANT TRADE.

Of the first establishment of the Christian nations in the ports of the Levant*, and of their convention and treaties with the Ottoman Port.

* Levant signifies, in geography, any country situated to the east of us, or on the eastern side of any continent or country, or that on which the sun rises.—In matters of commerce,

merce, it is generally restrained to the Mediterranean Sea, or, rather, to the country on the eastern part of it.—Hence our trade thither is called the Levant trade; and a wind that blows from thence out of the Straights mouth, is called a Levant wind.

France was the first nation that made treaties of commerce with the Port. The Sieur de la Foret signed them in 1535, in the name of Francis I. and thereby obtained many privileges in favour of that kingdom, which they alone enjoyed, 'till the Venetians, the English, the Hollanders, and at length the Genoese, likewise obtained particular privileges to themselves.

The chief privileges granted the French, by the conventions made by the Sieur de la Foret, were:

I. The establishment of a court of justice, under the appellation of the consularship, in all the parts or places where the French merchants should reside, in order to do justice between the French merchants, among themselves, and between them and the Turks, with regard both to civil and criminal matters; with prohibition to the officers of the Grand Seigneur to take cognizance thereof, without consent being first had and obtained from the French themselves.

II. The privileges in respect to the consul himself, and other officers of the consularship, were, that they might not be judged in criminal matters by the officers of the places where they shall reside, but be sent to the Port, or to the nearest lieutenant of the Grand Seigneur.

III. That the liberty of their religion shall be granted to the French.

IV. That the permission of trade in all the Grand Seigneur's dominions be granted to the French alone, and that all other nations be prohibited coming thither to trade, but under the French banner.

The Venetians were the first in favour of whom the Port deviated from this last article, which was, says our author, as honourable as beneficial to the French; and when Henry III, in 1580, sent James de Gernigny, baron de Gernelles, to renew the convention, the subjects of the republic of Venice were expressly excepted from the list of those nations who were obliged to navigate under French colours.

In the treaties of 1604, obtained from the sultan Achmet by Monsr. Savary de Breves, ambassador from France to the Port, the English were also excepted from the said list.

These last conventions of the French not being renewed 'till 1673, by reason of the succours which his most Christian majesty sent into Hungary and Candia, the Hollanders, and afterwards the Genoese, availing themselves by this misunderstanding between France and the Port, obtained more favourable treaties; which although, says our author, expressed in terms less honourable than those were with regard to France; (wherein the king is always treated as an emperor, and as the most ancient ally of the Port) yet they contained the most essential article in relation to their commerce; which consists in the liberty of having consuls, and trading in all places of the Levant upon their own footing, independent of France.

It may also be said, that, in a very material point, other nations were more favourably treated than the French, because the duties on importation, and exportation of these other nations were reduced to 3 per cent. while those, which regarded the commodities of the French merchants, continued to pay 5 per cent. as they had always done: but this difference was reduced by the capitulation of 1673.

Of the regulations and polity of France with respect to the trade of the Levant.

As long as the commerce of the Levant remained intirely in the hands of the French, it was so considerable, that the duties thereof, upon the importation and exportation of merchandizes, paid by the French at the custom-house of the Grand Seigneur, amounted to several millions of livres per annum.

The face of things is much changed since that time; the treaties of commerce made between the Port and several other nations, and the civil wars of France in the reigns of Henry II, and his successors, which diverted the administration from pursuing the commercial interests of France, gave the Venetians, and afterwards the English, a favourable occasion to secure to themselves this navigation, upon their own bottom.

Certain it is, that the bad conduct of the nation in other respects also reduced it's trade to a deplorable state, 'till the time of Lewis XIV, who resolved, in 1665, to support and encourage it, and recommended to Monsr. Colbert, his minister and secretary of state, to restore the commerce of the Levant, in some measure, to it's former splendor, if it was not possible to oblige other nations to trade again under the French banner.

The first step this patriot minister took to restore this branch of commerce, was to establish a company, constituted of 20 of the most opulent merchants of Paris, Lyons, and Marseilles. Another point, which then appeared to be no less requisite, was, to put an effectual stop to the complaints of the Turks, respecting the bad quality of the merchandizes which the Marseillians imported there, and to provide against abuses

that had happened in the consularship; and which had greatly discredited the French nation.

In relation to manufactures, that minister made various regulations concerning the fabric of woollen goods destined for the Levant trade, which we shall see under the articles FRANCE, and WOOLLEN MANUFACTURES of France.

The French pieces of money of five sols * being introduced into the trade of the Levant, the Turks were so greatly taken with the beautiful appearance thereof, that they very earnestly coveted them, and gave their merchandizes in exchange for half the price, on condition that they were paid for them in this French specie; which, at length occasioned the Genoese also to introduce them into the Levant trade: but, not satisfied even with the great profit which they thereby experienced, they diminished the standard, or intrinsic value of this coin more than one half, and carried so great a quantity of this counterfeit money to the Levant (and the French also imitating their example, by having the like fabricated at Morgues) that the eyes of the Turks became, at length, opened, and they accused the French of this rogery; against whom they made great complaints, and laid that nation deservedly under great difficulties in it's traffic. To put an end to these complaints, the French ambassador had orders to stem the torrent of such discredit at the Port, by endeavouring to throw a part of the loss upon others, who also were the cause of the deceit.

* This small silver money, whose commerce made so great noise in all parts of the Levant, towards the middle of the seventeenth century, was called by the Turks timmins, or temins.—The impression was so beautiful and elegant, that the Turks would take no other money but this. From the merchants, the infatuation spread itself even among the ladies, whose head-dresses and habits were adorned with them. The French, taking advantage of this frenzy, passed these timmins at first, for 10 sols, which was gaining cent. per cent.: afterwards they lowered them to 7 sols 6 deniers; and at last, in 1670, they were absolutely cried down. The avarice of the European merchants (for the Hollanders, the Genoese, and some other Christian nations, had a share in this traffic as well as the French) was the cause of this disgrace brought upon this species of the French money. Not contented with the immense gain made by passing of good coin, they resolved to counterfeit the same, and carried Louis of 5 sols to the Levant, that were only copper silvered over. Orange, Avignon, Monaco, Florence, and several cities in the states of Genoa, were the places where this infamous merchandize was fabricated, for the last thirteen years that this unjust traffic continued.

To put a stop to this disorder, at least to prevent the French from taking further part therein, the parliament of Provence issued an arrêt, the 22d of December, 1667, forbidding the Levant trade to be carried on otherwise than with the money of France, Spain, Morgues, and Dombes; and under pain of death to transport any Louis of 5 sols to Genoa or Leghorn, or any other places on that coast.—This arrêt put a stop to such detestable traffic in Turkey, which had put the whole empire into great confusion.

The prosperity of the French commerce depending, in a great measure, on the good conduct of the consuls established in the ports of the Levant, and his majesty being informed that the greatest part of those who then filled these places, were either foreigners or obscure persons, in whom it was not safe for his subjects to confide; it was ordained, by an arrêt of council of the 29th of March, 1669, that all the French consuls should directly transmit to Monsr. Colbert their letters of authority whereby they held their consularships.

In consequence of this arrêt it was, that fresh instructions and powers were delivered in the two succeeding years to the ancient consuls, and a number of new ones created in divers other ports of the Levant, where there had been none before.

By a declaration of the same year, registered in the parliament of Provence, it was ordained, that all the oppressions which happened in the ports of the Levant, should be discharged by the ships that should be found in the ports and havens where such oppression had been made; for which purpose there should be an assessment upon the ship's merchandizes.

The 12th of June, in the following year 1670, the execution of the declaration relative to the oppressions was appointed by a new ordonnance; in consequence whereof, all consuls established in the Levant were expressly forbidden to convoe, for the future, any assembly of the body of the nation, under any pretext whatsoever, and this under the penalty of losing their place, and to answer the same in their own persons, the sums that the said assemblies should have attempted to lay upon the whole nation; his majesty injoining his ambassador at the Port to cause these ordonnances to be duly put in execution.

At the same time Monsr. Colbert wrote a circular letter to all the consuls in the ports of the Levant, which consisted of four principal articles of polity.

By the first they were ordered to maintain a regular correspondence with the Marquis of Nointel, the king's ambassador at the Port, in relation to what regarded the commerce of their various ports. The second enjoined them to transmit to him constantly a memorial of whatever they should judge requisite

requisite to the advantage of commerce in their respective places of residence; as also another memorial, attested by the principal merchants of the said ports, containing all the oppressions that the Turks made upon the French. The third article obliged them to send, every six months, to the court, as well as to the ambassador, a list of the French actually inhabiting their several ports; and likewise to give a faithful account of those persons of credit, probity, and good behaviour, as well as of those whose conduct might give the Turks reasons for any contempt towards their nation*.

* Was not this laying a good foundation for constant future esteem towards the French?

The instructions sent to the marquis of Nointel contained also several articles of regulations.

I. The suppression of all the imposts of the consulship, which had been made 'till then by his Catholic majesty's ministers at Constantinople, as well as all those which were allotted to their secretaries and interpreters.

II. That, under any pretence of oppression, no duties in future should be raised, or any thing taken, by way of fee or bribe, upon the commerce of the nation in general.

III. To that end, every kind of assembly that used to be held on these occasions was abolished; and that every one should avoid borrowing money of the Jews, and paying them monthly interest.

IV. That the debts, as well those of the city of Marseilles (for the payment whereof the duty of Cotimo* had been established) as those of the ports of the Levant, should be examined and liquidated, in order to be discharged with the greater ease to trade.

* A term in marine commerce, used in the ports of the Levant.—It is an imposition, or duty, which the consuls lay, either by order of the court, or the consent of the merchants, of so much per cent. upon shipping, either for the payment of some *avaries* (a), or for some other common affairs of the nation.

The arrêt of the council of 1684 ordains, that a cotimo should be settled, at the rate of 2 per cent. upon the first ships that returned from the port of Alexandria, for an indemnification adjudged to the Levant company.

(a) *Avanie* signifies an insult, affront, imposition, a quarrel bred with design, and without cause. This is particularly used in the Levant, and in all the dominions of the Grand Seigneur, to signify the presents, or the fines, that the Turkish bashaws, and the officers of the custom-house, unjustly extort from the Christian merchants under false pretences.—When these *avaries* relate to a particular nation, the ambassador and consuls of the nation regulate them, and appoint the method of levying them among the merchants, and others of such nation; which is commonly done with the advice of the chief persons among them.

V. That no French should inhabit in the ports of the Levant without express permission from the king's minister at the Port.

It was likewise ordained, by an arrêt of council of November 1669, that, in future, the interpreters in the ports of the Levant, residing at Constantinople, Smyrna, and other places, should not act in that city, unless they were natives of France, and appointed by an assembly of the body of the nation in every port, and deposited their oath with the consuls.

In order to be secure of the fidelity of these interpreters, the same arrêt regulates, that there should be sent to the ports of Constantinople and Smyrna, every three years, six young men, to be there instructed in the languages, and to act afterwards in the capacity of interpreters.—To add to the advantage which the nation might derive from this establishment, his majesty ordained, by a second arrêt of October 1670, that six young men should be sent for the three first years, for the purpose of becoming interpreters*.

* An interpreter, or *druggerman*, or *drogman*, as they are called in the Levant, is a person whom the ambassadors of the Christian countries, residing at the Port, have near their persons, to assist them in point of language in treating of public affairs. The consuls likewise make use of these *druggermen*, as well for their private use, as for that of the merchants of their country who traffic in the ports of the Levant, or foreigners who come to trade under the banner of their princes. The assistance of these interpreters being absolutely necessary in the commerce of the Levant, and the good success therein partly depending on their fidelity and ingenuity, induced Lewis the XIVth of France to issue an arrêt of council to provide a number of the natives of France, who were well educated in the language, to officiate in that useful capacity, that the ambassadors and consuls of France should never be liable to imposition by strangers, who might have no attachment to their country.—A wise measure certainly!

The ambassador of France, predecessor to the marquis de Nointel, having greatly loaded commerce with unwarrantable impositions; his majesty, in order to prevent these abuses, strictly forbid the marquis from following their example, under any pretext whatsoever; without first communicating the matter to the merchants and captains who should be in the several ports, for their votes, with all imaginable freedom. The convoys which the king granted for the safety of the commerce of his subjects, more particularly of those who traded to the Levant, not having the success expected, by the

misconduct of those who commanded them, in not joining the merchants in due time, or leaving them before arrival in their intended ports: his majesty issued an ordonnance in May 1671, whereby he commands all chiefs of the Squadron, captains, and other officers of the marine, ordered to convoy merchants ships, either in meeting them on the high seas, or departing from the ports of the kingdom, to convoy them safe to the ports whither they were bound, and on their return into the ports of the kingdom; expressly forbidding them, at the peril of their lives, to abandon them, under any pretence whatever, if not prevented by the violence of the winds; upon condition, notwithstanding, that the masters of such merchantmen shall be ready to sail upon the day appointed by the captains, consuls, and principal merchants interested in the trade.

Before the court had obliged the consuls to lay before them the powers whereby they enjoyed their posts, they were granted during life: some had even obtained the succession for their children, or relations, and there were some made hereditary, and reckoned amongst the patrimonial effects of families. In the new reform of consuls, they were, for the most part, reduced to six years continuance, but they might be continued, and are so in effect.

The rights of consulship are not equal in all the Levant ports, they being in some places 2 per cent. in others 3.

It was by these first regulations that Mons. Colbert began to give another face to the French commerce in the Levant, by thus providing at once for the correction of the chief abuses which were therein committed.

There was afterwards prepared a general regulation of the polity of the consulship, in regard to whatever concerns the assemblies and the trade of the kingdom; to which, from time to time, and almost to the death of Lewis XIV, there were added new articles, as the circumstances of things required. See the article CONSULS.

That the reader may make a right judgment of the polity of the French in regard to the regulation of this branch of trade, we shall give the substance of the principal royal ordinances and arrêts relating thereunto: we shall begin with that of the 18th of March, 1693, which follows, viz.

His majesty judged it requisite to suppress the duties of consulship in the ports of the Levant, for the benefit of his subjects, and having excepted therefrom foreigners who trade under the banner of France, and ordained that those duties in regard to their merchandizes should continue in the accustomed manner, and be appropriated to the chamber of commerce at Marseilles [see the article CHAMBER OF COMMERCE] his majesty being informed that the greatest part of the foreigners, and particularly the Jews, daily make false declarations of the merchandizes which they embark in French bottoms, and oftentimes do not embark any at all, and that the captains and cap-merchants [see CAP-MERCHANTS] of ships, favour foreigners by night in shipping their merchandizes on Turkish bottoms, or even in French vessels, to the prejudice of the French merchant, who lade goods in the same vessels, and who are thereby obliged to bear a more considerable duty than they ought, if the merchandizes of foreigners were faithfully declared: against which grievance it being necessary to provide, his majesty has ordained, that the merchandizes of foreigners, laden on French bottoms, which shall not be justly and truly reported in the Chancery of the said ports of the Levant, with respect both to the quality and quantity thereof, shall be confiscated: that is to say, one half shall go to the benefit of the informer, and the other to the chamber of commerce; which nevertheless shall be appropriated to the public service, with the consent of the intendant charged with the care of the trade. His majesty expressly forbids all captains, masters, and cap-merchants of French ships, to receive by night any merchandizes from any place from whence they may be transported on the penalty of 1500 livres fine, nor to receive any declarations, nor sign any bills of lading of foreigners, which are not conformable to the reports made in the said Chanceries, on pain of the like fine of 1500 livres. His majesty further ordains, that all cap-merchants shall sign a manifesto, conformable to that deposited in the Chancery, and to send a copy thereof to the consuls of those places whither the vessel is bound, that they may testify to the unlading, whether all the merchandizes of foreigners have been faithfully declared. His majesty enjoins all consuls and vice-consuls of the French nation in the ports of the Levant, to see that the present ordonnance be duly executed, &c.

Signed LEWIS,

And underneath PHELYPEAUX.

An arrêt of the king's council of state, ordaining that the French ships trading to the ports of the Levant shall not be liable to those averages [see AVERAGES] which may be necessary to be laid on for the payment of the debts and other charges of the nation, but in proportion to the value of the merchandizes wherewith they shall be loaded, and not according to the tonnage and strength of the shipping. Extracted from the registers of the council of state.

* According to what has been represented to the king in council, that the repartition of the averages laid upon the French

French shipping which navigate in the ports of the Levant, for the payment of the debts, and other charges of the nation, is made, at present, with relation to the strength and kind of the shipping only; which has occasioned a great prejudice to those whose loadings are not judged of by the value of the merchandizes, whereby those whose cargoes pay as much as others of smaller value, whose freight and profits are widely different: which inequality may, in its consequences, lessen the navigation of shipping in the Levant commerce: his majesty, desirous to prevent these evils, and to procure every advantage to his subjects, by extending and rendering this traffic more considerable; and his majesty, being now in council, hath ordained, and doth ordain, that, for the future, all French ships trading to the ports of the Levant, shall not be liable to any average that may be necessary to be imposed for the payment of the debts, and other charges of the nation, but in proportion to the value of the cargoes therein contained, according to the bills of lading, and manifestoes of the loading; which shall be sent to the consuls and vice-consuls of the kingdom in the said ports, by the captains and cap merchants of the said vessels, &c.—Done at the royal council of state, the 6th of October, 1698.

Signed PHELYPEAUX.'

Then follows a proclamation, of the same date, to enforce the said arrêt,

Signed LEWIS.

The next arrêt of the royal council, of any consequence, was of March 1705, in the time of the war, which ordains, That, upon the merchandizes of the Levant arising by the prizes made during the present war, and carried into the port of Toulon, there shall be levied 10 per cent. on the value of the said merchandizes, over and above the ordinary duties paid on importation.—Extracted from the registers of the royal council.

' By reason of the representations made by the mayor, sheriffs, and deputies of the commerce of the city of Marseilles, that the king's ships appointed to cruise from the port of Toulon, on the merchantmen belonging to the enemy, and also the privateers from the same port, frequently bring in prizes, whereby the magazines of the said city are filled with the merchandizes of all ports of the Levant; which hinders the sale of those goods brought in by the trade of the merchants: in order to put all merchandizes of the same sort upon an equality with each other, it would be necessary to impose a duty of 20 per cent. upon the merchandizes of the Levant taken as prize, as well as upon merchandizes which do not come into the kingdom by a direct commerce carried on in the Levant by his majesty's subjects; or at least a duty of 10 per cent. ad valorem of the said merchandizes taken as prize, as was practised in the preceding war: to which his majesty giving attention, and considering the report of the Sieur Chamillart, counsellor in ordinary to the royal council, and comptroller-general of the finances, and being present in council, hath ordained, and doth hereby ordain, that, upon the merchandizes of the Levant taken as prizes during the present war, and brought into the port of Toulon, there shall be raised 10 per cent. ad valorem thereupon, over and above the ordinary duties of importation.—Done at the royal council of state, his majesty being present, held at Versailles the 10th day of March, 1705.

A royal ordonnance, permitting the sheriffs and deputies of the chamber of commerce at Marseilles, to deliver certificates of residence to the children and relations of the merchants of the province, who chuse to settle in the Levant, provided they were 18 years of age; and also to such women and girls whose husbands or fathers are established in the said ports, to live there with them. Of March 1716.—By the king.

' Upon being represented to the king, that the families of merchants trading to the Levant are greatly prejudiced by the ordonnance of November 3, 1700, which forbids the sheriffs and deputies of the chamber of commerce established at Marseilles, to deliver certificates of embarkation, or of residence, to the children or relations of the said merchants, nor to others who would willingly settle themselves in the Levant, before 25 years of age; that, on the contrary, it seemeth necessary that these young people go thither betimes in order to learn the language, customs, and usages of the Turks, and to form themselves to those rules and maxims necessary to the benefit and advantage of commerce; otherwise, those men from the age of 18 to 20 are compelled to apply themselves to professions other than those to which they seem to be born, and bred up by their parents: his majesty being informed, that as well the chamber of commerce at Marseilles, as the French

VOL. II.

consuls in the ports of the Levant and Barbary, make a difficulty in consenting to the passage and residence in Turkey of the wives and daughters whose husbands and fathers are established there, no ordonnance or regulation being made for that purpose: his majesty having considered the deliberations of the sheriffs and deputies of commerce of Marseilles, of the 5th of this month, held in the presence of the Sieur Arnoul, inspector of the said commerce: his majesty, with the advice of Monsr. the duke of Orleans, regent, hath ordained, and doth hereby ordain, that, from the day of the publication of the present ordonnance, it shall be permitted to the said sheriffs and deputies of the chamber of commerce at Marseilles, to grant certificates of residence to the children or relations of such merchants of the province, and others, who would settle in the ports of the Levant; it appearing, by a certificate of their baptism, that they are full 18 years of age; it being understood, nevertheless, that they shall not be admitted into the assembly of the French nation in Turkey, 'till they are 24 years old, nor to have a vote therein 'till 25 years of age: his majesty desiring, that, if any of these young people, so admitted to reside in Turkey for the benefit of trade, shall commit any acts of libertinism, or acts of reproach and scandal, that may bring any dishonour upon the French nation, or draw upon it's subjects any oppression 'on the part of the Turks: if there are any such, they are hereby ordered to be sent back into France, by the first shipping that shall depart from the port, provided it shall be so resolved by the deliberation of the body of merchants, which shall be assembled on these occasions by the consul; to whom his majesty joins the due execution of the resolutions taken in these cases. His majesty permits the wives and daughters whose husbands and fathers are established in the ports of the Levant, to go thither and reside in taking leave of the deputies of the chamber of commerce, &c. notwithstanding the prohibitions heretofore issued to the contrary, &c.—Given at Paris the 17th of March, 1716.

Signed LEWIS,

And underneath PHELYPEAUX.'

The next royal ordonnance that took place was that of August 1716, which excludes from all public trust of administration, and from the assemblies of the body of the French nation in the ports of the Levant, such French merchants who shall there marry maids or widows born in the dominions of the Grand Seigneur; and excludes, likewise, all those who are under 30 years of age, from all public trusts of administration, who shall marry, without the consent of the parents, even any French young woman.

' His majesty being informed that the children of merchants who are permitted to reside in the Levant, in order to train them betimes to the arts of commerce, generally contract improper marriages, either with maids or widows born subjects of the Grand Seigneur, or even with the French, the consequence whereof commonly proves disadvantageous to the families of these young people, as well as to the dishonour of the French nation: which his majesty being desirous to prevent, and considering the deliberation of the sheriffs and deputies of the chamber of commerce of Marseilles, of July last, approved by the Sieur Arnoul, inspector of the said commerce: his majesty, with the advice of Monsr. the duke of Orleans, regent, hath ordained, and doth hereby ordain, that, from the day of the publication of this present ordonnance, the French merchants established in the ports of the Levant, who shall contract marriage with maidens or widows born in the dominions of the Grand Seigneur, shall be rendered incapable of every public trust and administration of the body of the French nation, even from the privilege of admission into their assemblies. His majesty ordains, also, that those of the said merchants who are not 30 years of age, and shall marry, without the consent of their parents, even any French maiden, shall likewise be excluded from all public trusts. His majesty commands the Sieur marquis de Bonnac, his ambassador extraordinary at the Ottoman Port, and the French consuls and vice-consuls in the port of the Levant, duly to observe the execution of the present ordonnance, and that it may be made public, and registered among the archives of the chamber of commerce at Marseilles, and in the Chancery of the several ports of the Levant and Barbary, that no one may be ignorant thereof. Given at Paris the 11th of August, 1716.

Signed LEWIS,

And underneath PHELYPEAUX.'

A royal ordonnance, forbidding all the subjects of France, and others, trading in Turkey under their protection, to purchase any thing taken from the Turks by the Maltese corsairs, or by any other. March 1718.

' His majesty being informed that the Maltese corsairs, and others who are at war with the Grand Seigneur, frequently sell the prizes which they have taken from the Turks to French traders and navigators in the ports of the Levant, and to the end that this kind of traffic may not prove highly injurious in it's consequences, by bringing oppressions upon the body of

T

merchants

merchants of the French nation settled in the Turkish ports: all which his majesty being desirous to prevent, doth thereby, with the advice of the duke of Orleans, his uncle regent, expressly forbid all his subjects, and all other merchants in Turkey under his protection, from buying of the said corsairs, directly or indirectly, any of the effects taken by them from the Turks, on pain of confiscation of the said effects, and a fine of 3000 livres: his majesty commands the Sieur marquis de Bonnac, his ambassador extraordinary at the Ottoman Port, and all consuls of the French nation in the Levant, to make public the present ordonnance, that no one may be ignorant thereof, and to have all due regard to it's execution. Given at Paris the 22d of March, 1718.

Signed LEWIS,
And underneath PHELYPEAUX.*

A royal ordonnance, forbidding all captains of French ships and vessels to embark in the Levant any Frenchman or foreigner, without permission first had and obtained in writing, from the king's ambassador at Constantinople, or the consuls of the ports.—October 24, 1719.

* His Majesty being informed that the captains of French ships and vessels which navigate in the ports of the Levant and Barbary, receive on board Frenchmen and foreigners, who sometimes embark, to avoid the consequences of bankruptcy, or other misconduct of which they may have been guilty in the said ports, which might draw grievances on the French nation, and molest it's commerce: his majesty, judging proper to provide against such-like inconveniencies, doth, by and with the advice of the duke of Orleans, regent, expressly forbid all captains, and masters of French ships and vessels, which navigate to the ports of the Levant and Barbary, to embark on board any persons, under pretence of passage, be they either Frenchmen, or of any other nation, without the consent first had and obtained in writing, from his ambassador at Constantinople, or the consuls of the ports from whence they shall embark, on the penalty of a fine of 500 livres, and also to answer personally for the consequences of such embarkation; desiring that, if any one unknown to them, and without their privacy, should get on board while they are under sail, they should be obliged, under the same penalties, to put such person on shore, and send him to the consul of the place where he might the soonest land; and such consul shall be obliged to apprise him at the port where the escape shall have been made.—His majesty orders his said ambassador and consuls not to grant those permissions except to persons not suspected of the circumstances beforementioned, but not to refuse the same to the French, nor foreigners, without good reasons, whereof they shall inform the council of the marine, and deliver dispatches with charges.—His majesty enjoins and commands the Sieur Bonnac, his ambassador at the Ottoman Port, and the consuls at the ports of the Levant and Barbary, to publish and register the present ordonnance wherever needful, &c. Given at Paris the 24th of October, 1719.

Signed LEWIS,
And underneath FLEURIAU.*

An arrêt of the royal council of state, in relation to the establishment of a duty in favour of the chamber of commerce at Marseilles, laid upon merchandizes coming from the Levant, charged with the payment of the appointments of the consuls.—September 2, 1721.

* The king, being in council, ordains, that the consuls of the ports of the Levant and of Barbary should receive the duties granted to them by the arrêts of the 10th of January, 1718, in the same manner, and as they had enjoyed them before the arrêts of the 21st and 24th of April, 1720; by means of which duties the consuls should be charged with the same expences wherewith they were charged before the said arrêts: his majesty having considered the deliberations of the sheriffs and deputies of the chamber of commerce of Marseilles, in their assembly of the 9th of April, 1721, by which they agreed to petition his majesty to permit them to take upon themselves the government of the consulships, upon the following conditions: That the merchandizes which shall be laden in the ports of the Levant, Morea, and Barbary, for France, and which paid 3 per cent. in some ports, and 2 per cent. in others, shall pay no more after the 1st of May; viz. the first 2 per cent. and the others 1 $\frac{1}{2}$ per cent. which duties of 2 per cent. and 1 $\frac{1}{2}$ per cent. shall be paid in Marseilles, at the chamber of commerce, by the ships and vessels which shall arrive there, according to the value of the said merchandizes, at the time of their arrival.—That the merchandizes for the account of foreigners designed for Italy, and other countries, shall pay the ancient duties of consulage.—That the value shall be ascertained of the merchandizes, by the deputies and French merchants, in presence of the consuls and vice-consuls of every port in the Levant, which shall be loaded there for the account of foreigners designed for the ports of Italy, and other countries, in order to settle the said duty of consulage, paid in the port of departure, into the hands of the proper officers, according to

the form prescribed by the arrêts of the council of the 24th of November, 1691, the 27th of January, and 8th of September, 1694.—The chamber of commerce in every port of the Levant shall keep necessary funds, for the payment of the appointments of the consuls, and other officers, from the 1st of May 1721, and also for the other expences of the consulship; which funds shall be sent to the deputies of each port, and by them converted into current money in the said ports; in which money the appointments shall be paid to the said consuls, and other officers, upon the footing of 156,463 livres per annum.—And, in order to raise the funds requisite for the current expences of the consulships, his majesty permits the chamber of commerce to borrow at Marseilles to the amount of 100,000 livres, at the rate of 5 or 6 per cent. interest at most, with intent to avoid the engagements which might be made in the Levant at a higher rate, the least of which are commonly at 1 per cent. per month: his majesty, judging the said demands and offers of the chamber of commerce of Marseilles consistent with the benefit and prosperity of commerce, and desiring to procure whatever might contribute thereunto; and, being in council, hath ordained, and doth ordain, the following articles, with the advice of Mons. the duke of Orleans, regent, without any regard to the arrêt of the 21st of January, 1721, or to the demands and offers of the chamber of commerce of Marseilles, resolved on in their deliberations of the 9th of April following:

ARTICLE I.

That the merchandizes which shall be laden for France in the ports of the Levant, Morea, and Barbary, and which paid 3 per cent. in some places, and 2 per cent. in others, shall pay no more for the time to come, after the 1st day of January, 1722, than the duties of 2 per cent. in the ports where they paid 3 per cent. and 1 $\frac{1}{2}$ per cent. in those where they paid 2 per cent. which duties shall be paid in Marseilles, at the chamber of commerce, by the vessels which shall arrive there, according to the value of the merchandizes at the time the vessels arrive.

II.

That the same duties shall be paid upon all the merchandizes of the vessels which shall finish their voyages in Italy, or elsewhere, into the hands of the deputies of the nation residing in the ports of the Levant, and according to the value of the merchandize, at the time of their departure.

III.

That the merchandize for the account of foreigners, designed for Italy and other countries, shall pay the ancient duty of consulage.

IV.

That there shall be made, by the deputies and French merchants, in the presence of the consul or vice-consul of each port, an estimation of the merchandizes which shall be laden for the account of foreigners, and designed for the ports of Italy, and other countries, in order to lay the duties of consulage paid in the port at the departure of the vessel, as prescribed by the arrêts of council of the 24th of November, 1691, 27th of January, and 8th of September, 1694.

V.

That the chamber of commerce shall always have in each port competent funds, for the payment of the appointments of consuls, and other officers, from the said 1st of January, 1722, as well as for other expences of the consulage; which funds shall be sent to the deputies of each port, and by them converted into the current money of the said port; in which money they shall pay the said appointments to the consuls, and other officers, by making the computation according to livres Tournois of France: so that, by reason of the equality of the monies, they may receive neither more or less than what is appropriated to them: to which end his majesty revoketh the arrêt of his council, of the 21st of January last.

VI.

His majesty ordains, that, on the said first day of January, 1722, the consuls of the Levant, Morea, and Barbary, shall cease to receive the duties of consulage, as they did from the 1st of May, 1721, and forbids them to demand any till after the said day, on penalty of restoring the sums so received, and of losing their places.

VII.

And, to the end that the said chamber of commerce at Marseilles may be enabled to raise the funds necessary for the expences of the consulship, his majesty permits them to borrow, in the said city of Marseilles, to the amount of 100,000 livres, at the rate of 5 per cent. interest at most, deviating, in this respect, from the former regulation: and all bills necessary to this purpose shall be expedited, in order to avoid engagements in the Levant at a greater rate.—Given at the royal council, his majesty being present, held at Paris the 2d of September, 1721.

Signed FLEURIAU.*

The due execution of this arrêt was enforced the same day, by a proclamation signed by the king.

An arrêt of the royal council of state, of May 1722, laying a penalty upon the captains and owners of ships coming from the Levant to Marseilles, who should misrepresent the weight and quality of the merchandizes wherewith they are loaded, or should not represent them at all.

* It being represented to the king, that the arrêts of council of the 2d of September, and the 28th of April, 1721, by the former of which, to commence the 1st of January last, it is ordained, that the merchandizes which shall be laden in the ports of the Levant, Morea, and Barbary, for France, on the vessels that may arrive at Marseilles, should pay to the chamber of commerce 2 per cent. for those coming from some of the said ports of the Levant, and 1 $\frac{1}{2}$ per cent. for those coming from others, &c.—And by the other arrêt, to commence the 1st of June next, his majesty hath also ordained, that the said merchandizes should pay 3 per cent. for those coming from the said ports, which ought to pay 2 only, and 2 per cent. for those coming from the other ports, that ought to pay but 1 $\frac{1}{2}$; and his majesty understanding that the receipt of the first duties were insufficient to support the expence of the commerce, that the chamber of Marseilles had obliged themselves to pay: his majesty observing, also, that by the said arrêts, there are no penalties inflicted against the captains and owners of the said merchandizes, who shall conceal the quality or the weight, or who should not report them, hath judged it necessary, to prevent the like abuses, to ordain, and doth hereby ordain, that the captains and owners of the merchandize shipped in those vessels coming from the ports of the Levant to Marseilles, who shall have disguised the quality or quantity of their merchandizes, or not reported them, shall pay to the chamber of commerce at Marseilles, instead of the duty of 3 per cent. or 2 per cent. as shall be due, 20 per cent. on the merchandize so misrepresented, and not reported, upon the foot of the valuation that the duty of 3 or 2 per cent. should have been paid, &c.—Given in the council of state, his majesty being present, the 3d of May, 1722, and

Signed FLEURIAU.*

This arret was enforced by a royal declaration of the same date,

Signed LEWIS,

A royal ordonnance, regulating the appointments that the first deputies of the French nation are intitled to in the ports of the Levant and Barbary, if, in case of death or absence of the consuls, they perform the offices of the consular power.—April 1723.

* His majesty having regulated, by his ordonnance of 1681, concerning the marine, the consuls of the French nation in foreign countries, that, the consulship being vacant, the senior of the deputies of the nation who officiates, shall exercise the functions of the consul, according to the provision made for that purpose; and intending to settle the salaries for the first deputy, while he exercises the said office: his majesty doth will and ordain, that the most ancient of the deputies of the nation in the ports of the Levant and Barbary, who executes the consular office in case of the death or absence of the consul, shall enjoy, during that time, two-thirds of the appointments appropriated to the consul of the said port, being subject to the same expence as the consul himself is; and that the other one-third of the appointments shall remain in cash in the chamber of commerce at Marseilles, in order to be employed in the ordinary expences of the said chamber, &c. Given at Versailles the 27th of April, 1723.

Signed LEWIS,
And underneath FLEURIAU.*

A royal ordonnance, revoking those of the years 1789, 1613, and 1719, and the prohibitions therein contained; in consequence whereof it permits all Frenchmen residing in the ports of the Levant, Barbary, and Italy, to load merchandizes for their account upon FOREIGN BOTTOMS.—January 1727.

* His majesty causing to be laid before him the ordonnances made the 7th of January, 1689, the 5th of April, 1713, and the 10th of July, 1719, by which he forbids the French residing in the ports of the Levant, Barbary, and ports of Italy, to lade any merchandizes, either for their own account, or that of other nations, upon foreign shipping, which do not carry French colours, under the penalties therein mentioned: and being informed that the execution of the said ordonnances has occasioned many incidents injurious to the welfare of the commerce of his subjects in the said ports of the Levant; against which judging it requisite to provide, his majesty hereby revoketh the said ordonnances of the 7th of January, 1689, and of the 5th of April, 1713, and of the 10th of July, 1719, and the prohibitions contained therein: and, in consequence thereof, hath permitted, and doth by these presents permit all Frenchmen, his subjects, re-

sident in the ports of the Levant, Barbary, and ports of Italy, to lade merchandizes, either for their own account, or that of other nations, upon foreign bottoms, as they did, or might have done, before the said ordonnances were enacted; which ordonnances shall remain void, and of no effect or authority, after the 1st day of March next ensuing. His majesty enjoins and commands the Sieur viscount D'Andrezel, his ambassador at the Ottoman Port, and the several consuls of the said ports of the Levant, Barbary, and ports of Italy, to make public, and register the present ordonnance, wherever it may be needful. He commands also the officers of the admiralty to make the same public, and register it; and have due regard to it's execution.—Done at Marly the 7th of January, 1727.

Signed LEWIS,
And underneath PHELYPEAUX.*

A royal ordonnance, regulating what should be regarded in the ports of the Levant and Barbary, on the part of the Jews, and other foreigners, who shall enjoy there the protection of France.—February 4, 1727.

* His majesty being informed of the abuses committed in the ports of the Levant and Barbary, to the prejudice of his subjects, by the different manner in which the consuls grant the Jews, and other foreigners, his protection, judges it necessary to make certain and plain regulation for such protection; and, to that end, ordaineth as follows:

ARTICLE I.

That no Jew, or other foreigner, a subject of the Grand Seigneur, or resident in his dominions, shall be received under the protection of France, until he hath requested and obtained the same from the consul, and the body of the French nation assembled with him; which consul shall not deliver his letter of protection to the petitioners, but in consequence of the resolutions taken for that intent.

II.

Those who shall solicit such protection, shall give responsible security to answer for their conduct; and the security received by the consul of the nation shall be recorded in the Chancery of the consulship.

III.

The Jews, and other foreigners, so protected, shall carry on no commerce whatsoever of the Levant into France, either directly or indirectly, on pain of confiscation of their ships and merchandize, and a fine of 3000 livres against the captain.

IV.

His majesty forbids all traders, passengers, captains, and masters of French ships and vessels, to lend their names to the protected and other foreigners, in order to carry on the commerce of the Levant and Barbary in France, under the like pains and penalties, and a fine of 3000 livres.

V.

His majesty likewise forbids all Frenchmen and foreigners residing in the kingdom to receive any merchandize, provisions, or other effects belonging to foreigners residing in the Levant and Barbary, and coming from the said countries, under the penalties before inflicted.

VI.

His majesty also forbids all persons residing in France to send any effects or merchandize to foreigners protected, who reside in the Levant and Barbary, either for their own account or for that of the protected, under the same penalties above inflicted.

VII.

No Jew, or other foreigner, resident in the Levant and Barbary under the protection of France, shall receive the consignments nor commissions of ships and merchandizes coming from France into the Levant, or into Barbary, on pain to such who are not subjects of the Grand Seigneur, but protected by France, of being sent back into their own countries by the consul of France, in virtue of the resolutions of the nation assembled; and in relation to the rajas, or subjects of the Grand Seigneur, of being for ever excluded protection; and, in both cases, the penalty is confiscation of the merchandizes that shall be proved to be so sent and consigned, as aforesaid.

VIII.

The captains, masters, officers, and passengers of marine shipping sent from France to the Levant, or Barbary, shall not be addressed or consigned to the person so protected as aforesaid, resident in the said ports of the Levant, for the commission, barter, or exchange of their merchandize and effects, under a fine of 1500 livres penalty for every such-like contravention.

IX.

His majesty, nevertheless, permits the captains, officers, and passengers of shipping sent from France, to sell to the said protected persons the merchandizes which they have carried for their account, and to purchase or take, in barter or exchange, such other merchandizes as they shall judge proper; on condition, however, that for these sales, barters, or purchases, the said captains, officers, and passengers, shall be obliged to make use of, at their own option, the mediation of a French

French merchant, as their factor, which factor cannot act for them before he has duly informed the consul and the deputies of the nation, nor pretend but to one half of the ordinary commission.

X.

All captains, and masters of ships, who shall go to the Levant or Barbary, and shall not have the commission of the cargo of imports or exports, nor any peculiar address, shall be obliged to apply to a French merchant, who is of the body of the nation, and who shall regard what is prescribed by the preceding article.

XI.

His majesty wills and ordains, that all the confiscations and fines which may happen shall be applied as follow, viz. those incurred in the ports of the Levant and Barbary, one-third to the informer, another third to the redemption of French slaves, and the remaining third to the national expences of the Levant port; and, as to those fines and confiscations which happen in France, one-third shall go to the informer, one-third to the hospital of St. Esprit of Marfeilles, and the other to the profit of the chamber of commerce of the said city.

XII.

His majesty permits Jews and foreigners in the Levant and Barbary to continue, as usual, to send and consign their merchandizes into Italy, and other foreign countries, either in their own name, for their own proper account, to their French or foreign friends residing in the said countries, and to make use of the ships carrying his majesty's colours; whereon the neutral states of Italy, and other foreigners, may also load, in their respective countries, such merchandizes as they think proper, and address them to their correspondents, be they either French, Jews, or other foreigners, established in the Levant or Barbary, under the protection of France.

XIII.

His majesty further wills and ordains, that there shall be no alteration in the peculiar customs and usages which have been observed in certain ports, with respect to the ceremonial, the police, and method of paying the duties to the Grand Seigneur, by the foreigners protected by France. His majesty injoins and commands the Sieur le Bret, counsellor in his councils, first president and intendant of justice, police, and of the finances in Provence, and of the commerce of the Levant; and also the Sieur viscount D'Andrezel, his ambassador at the Ottoman Port, and all the consuls of the ports of the Levant and Barbary, to cause the present ordinance to be published and registered, wherever needful, and to have due regard to the due execution thereof.—Done at Marly the 4th of February, 1727.

Signed LEWIS,
And underneath PHELYPEAUX.

A royal ordinance, excluding from the liberty of trading in France, and from the privilege of the body of the nation, such French who shall marry in the ports of the Levant, and the sons of Frenchmen born in the said ports, whose mothers are foreigners.—August 1728.

“ His majesty causing to be laid before him his ordinances of the 11th of August, 1716, and the 20th of July, 1726, by the former of which it is ordained, that the French merchants established in the ports of the Levant, who should marry with the girls or widows born in the dominions of the Grand Seigneur, shall be excluded from all public trust and administration of the body of the nation; and, by the second, they are prohibited from marrying, without his majesty's permission, with foreigners, subjects or not subjects of the Grand Seigneur, or the states of Barbary, not even with French by extraction, or those born in the said ports, on pain of being sent back to France, with their said wives: it having been found that the penalties inflicted by the said ordinances have not been sufficient to prevent such marriages of the French in the Levant, nor to remedy those inconveniencies which arise therefrom, to the prejudice of the nation and it's commerce: his majesty being informed that those in particular who are born of Frenchmen and the women of the country, continue to marry, without submitting to the regulations which forbid the same; that these same Frenchmen, knowing no other parents than those which they have in that country, take their advice, associate with the protected foreigners, and others, when their fathers are dead; lend their names frequently to the said foreigners to trade in France, and thereby furnish them with the means of evading the prohibitions made by divers regulations, and especially by that of the 4th of February, 1727, of carrying on trade, either directly or indirectly, from the ports of the Levant, into the ports of the kingdom: against which his majesty judging necessary to provide, after having seen the resolution of the chamber of commerce of Marfeilles, and the sentiments of the Sieur le Bret, inspector of the commerce of the Levant, his majesty hath ordained, and doth will and ordain as follows:

A R T I C L E I.

His majesty expressly forbids all Frenchmen, of what quality or condition soever, who shall contract marriage for the future

in the ports of the Levant and Barbary, in violation of his ordinances, to carry on any commerce in France, either directly or indirectly, on pain of confiscation of their merchandize, and a fine of 3000 livres for every such violation, in case of repetition of the same.

II.

His majesty enjoins the same prohibitions and penalties on the sons of Frenchmen born in the said ports of the Levant or Barbary, whose fathers are deceased, and whose mothers are foreigners, not to trade, directly or indirectly, in France, unless they have resided from thence six years; after which they may return to the ports of the Levant, and reside there on the same conditions as the French born in the kingdom.

III.

His majesty ordains that the said French who should marry in future in the said ports of the Levant, in violation of the said ordinances, and the sons of Frenchmen whose fathers are dead, and mothers are foreigners, and who shall not have resided six years in the kingdom of France, shall be excluded the liberty of assisting at the national assemblies, and shall not enjoy any privilege belonging to the body of the nation.—His majesty injoins and commands that the Sieur marquis De Villeneuve, his ambassador extraordinary at the Ottoman Port, also the French consuls, and vice-consuls in the said ports of the Levant and Barbary, and the sheriffs and deputies of the commerce of Marfeilles, have due regard, every one in his peculiar province, to the execution of the present ordinance: and that the same may be made public, and registered in the Chanceries of the said ports, and among the archives of the chamber of commerce at Marfeilles, that no one may be unacquainted therewith.—Done at Fontainebleau, the 25th of August, 1728.

Signed LEWIS,
And underneath PHELYPEAUX.

A royal ordinance, concerning the patent of health that the captains and masters of ships should take, who traffic in the ports of the Levant and Barbary.—September 1730.

“ His majesty being informed that the captains and owners of ships who traffic in the ports of the Levant and Barbary, instead of having duly inspected, in every port where they arrive, the patent of health, which they should take in the first of the said ports where they began their loading, conformably to the ordinance of the 26th of February, 1702, take several patents of health in the different ports into which they put, and do not present to the intendant of health at Marfeilles and Toulon, when they return, only those patents which occasion them to be treated more favourably with respect to their quarantine; which prevents the said intendants from having knowledge of the true state of health in the ports wherein the said ships have had communication, and may thereby bring the plague into the kingdom: to prevent which calamity, his majesty, judging it necessary to extend the regulations of the ordinance of the 26th of February, 1702, hath ordained, and doth ordain as follows:

A R T I C L E I.

All captains and masters of ships, who shall depart from one port of the Levant and Barbary, wherein they have began to take in their loading of merchandize or provisions, embark passengers, or receive their ballast, in order to load elsewhere, shall take their patent of health from the consul or vice-consul, who shall signify the true state and condition of the said port, with respect to it's healthfulness.

II.

The said captains and masters of ships shall not part with the first patent till their arrival in the ports of Marfeilles or Toulon, where they shall be obliged to represent the same to the intendants of health, on pain of six months imprisonment, and being deprived for ever of their freedom and privileges: to which end they shall be blotted out of the registers of captains and masters, and shall not, for the future, serve again in the said capacity, under any pretence whatever.

III.

If, in the course of their voyage, they touch at one or more ports in the Levant, or others of the Mediterranean, they shall return this first patent to the consuls or vice-consuls in the said ports, to be examined, and afterwards given to the said captains and masters, without the said consuls and vice-consuls retaining the same, and oblige them to take out a new one, under any pretence whatever, on pain of their being recalled.

IV.

The patents of health shall be examined by the said consuls and vice-consuls, as soon as ever required by the captains and masters of ships, that their voyage may not be retarded.

V.

The consuls and vice-consuls shall declare, in their visa, the real state and condition of health in the places of their residence, and shall insert therein the intelligence which they have of the distempers that prevail in the other neighbouring places, on pain of being deprived of their post of trust.

VI.

His majesty forbids, under the same penalty, the said consuls and vice-consuls, and their Chanceries, to demand any duties,

ties, or fees, for the visa of the patents of health of those ships which shall be involuntarily obliged to touch at the ports of the Levant and Barbary, without loading there: and with respect to those who, having made a part of their loading in one port, shall touch at other ports, to take in merchandize, provision, or passengers, the captains and masters of ships shall be obliged, in that case only, to pay 30 sols for the visa of their patent of health.

VII.

If after a captain or master of ship, having his patent examined in one port, shall be necessitated to stay there, either by being wind-bound, or from other unforeseen cause, he shall be obliged before his departure, to present his patent of health again to the consul or vice-consul, of the said port, to signify upon the spot, and without expence, the accidents which have happened in the interval with regard to health.

VIII.

His majesty expressly forbids the said captains and masters of ships to present, on their arrival in the ports of Provence, any other patent than that which has been delivered to them at the place of their first departure; on the back of which shall be the visa, which has been endorsed at the places where they have touched during their voyage, under the same penalty of degradation, and six months imprisonment beside.

His majesty enjoins and commands Monsr. the count of Toulouse, admiral of France, to have a strict regard to the execution of the present ordonnance, to cause it to be read, published, and registered, wherever needful; and likewise the Sieur le Bret, counsellor of state, intendants of justice, police, and of the finances, in Provence, and of the commerce of the Levant, and also the sheriffs and deputies of the chamber of commerce at Marseilles, and the intendant of health, to pay due regard hereunto.—The consuls and vice-consuls of the Levant and Barbary are also enjoined to conform to the same.—Done at Versailles, the 6th of September, 1730.

Signed LEWIS,
And underneath PHELYPEAUX.

* The count of Toulouse, admiral of France, having duly attended to the king's ordonnance above addressed to us, with orders to see the same duly executed: we order and command all under our authority to conform thereunto, every one according to his station; and also the officers of the admiralty of Provence to register them among their records.—Done at Rambouillet, the 8th of September, 1730.

Signed L. A. DE BOURBON,
And underneath by his royal highness L'ENFANT.

The king's declaration, signifying that no cabin-boy* shall be left in the ports of the Levant and Barbary.—October the 12th, 1730.

* LEWIS, by the grace of God, king of France, to all whom these presents concern, &c. We having been informed that many cabin-boys, employed in the commerce of the Mediterranean, remain in the Levant and Barbary, by reason of the bad treatment which they have received on board those ships wherein they have been embarked, and that the Musselmens, having found it very easy to seduce them, by reason of their infancy, and to influence them to the religion of the country: his majesty desiring to remedy a grievance that our zeal for religion, and regard to our subjects, do not permit us to suffer: for these and other causes us hereunto moving, of our certain knowledge, full power, and royal authority, we have made, and do make by these presents, signed by our hand, express prohibition to all captains and masters of ships, to maltreat, or suffer to be maltreated by the ship's crew, the cabin-boys who shall have embarked on board the ships which they command, on pain of being punished, according to the exigency of the case: we allow only that these cabin-boys shall submit to the ordinary and usual punishment: we also forbid the said captains and masters to suffer any of the said boys, when in the ports of the Levant, to go on shore, without the guard of an officer or sailor, in whom confidence may be reposed, on the penalty of 300 livres fine for every such boy, who, for want of this precaution, shall be stopped in the said ports. We enjoin and command the consul, vice-consuls, and other persons charged with our affairs in the said ports of the Levant and Barbary, to signify, among the list of the ship's crew, the cabin-boys who shall be there detained, and what occasioned the same, and whether they have been demanded by the said captains and masters, and whether, by the neglect of the said captains and masters in reporting the same in the list of the ship's crew, any have been detained: we will and ordain, that such shall be censured and reputed as having suffered the said boys to go on shore without a person of trust to attend them; and therefore they shall be liable to the said fine of 300 livres penalty: we ordain, likewise, that violations against the present declaration shall be prosecuted at the request of our solicitor of the admiralty, &c.

* Our reason for taking notice of this declaration is, to give an idea how minutely this rival nation watches the meanest
VOL. II.

thing that tends to the security of their commerce, and the brood of their seamen.

A royal ordonnance, concerning the deposits in the Chanceries of the consulships of the Levant and Barbary.—September 11, 1731.

* His majesty being informed that there are deposits in trust in the Chanceries of the consulships of the Levant and Barbary, of different natures, which are not always reclaimed, either by those who have made them, or by their creditors or their heirs; and that some consuls have disposed of their said deposits, instead of keeping them in the manner required by the ordonnance of the 4th of December, 1691.—His majesty, resolving to establish a better order in regard hereunto, ordains as follows:

ARTICLE I.

All sums of money, merchandize, or other effects, which shall be deposited in the Chanceries of the consulships of the Levant and Barbary, shall, conformably to their ordonnance of the 4th of December, 1691, be kept in a place of the consular house, appointed for that purpose, locked up with three different keys, one of which shall remain in the hands of the chancellor, another with the consul, and a third with the principal deputy of the nation, to the end that the said effects shall not be drawn out from the place of deposit, excepting in their presence.

II.

The consuls shall signify, at the end of every year, to the secretary of state for the department of their marine, a state of the deposits which shall remain in their Chanceries, mentioning, in the said state, the day and year when they were so deposited.

III.

His majesty ordains, that all the deposits that shall be found in the chanceries of the consulships of the Levant and Barbary, and which have been there deposited for 10 years, shall be drawn out in one year, reckoning from the day of the publication of the present ordonnance in the several ports of the Levant.

IV.

His majesty also ordains, that those of the said deposits made less than 10 years, and those that shall be afterwards made, shall be also drawn out in 10 years, reckoning from the day that they were deposited.

V.

His majesty ordains that the deposits which shall not have been reclaimed, according to the 3d and 4th articles of the present ordonnance, shall be sent by the consuls of the chamber of commerce at Marseilles, in order to be remitted and divided by the said chamber, one half to the hospitals of St. Esprit and De La Charité, of the city, for the benefit of the poor, upon condition, nevertheless, to deliver up the value thereof to such persons who have a right to reclaim them.

His majesty commands the Sieur Bret, counsellor of state, first president of the parliament of Aix, intendant of justice, of the police, and the finances of Provence, and of the commerce of the Levant, to have strict regard to the execution of the present ordonnance, which shall be read, published, and fixed up wherever needful, that no one may pretend ignorance thereof.—His majesty also commands the Sieur marquis De Villeneuve, counsellor of state, his ambassador at the Ottoman Port, to have strict regard also to the execution of the same.—He enjoins the chamber of commerce at Marseilles, and the consuls of the several ports of the Levant, to conform hereunto.—Done at Marseilles, the 11th of September, 1731.

Signed LEWIS,
And underneath PHELYPEAUX.

Regulations for the imposts of consuls and vice-consuls of the ports of Negropont, Cavalle, Rhodes, Meteline, Scio, Milo, Tine, and Micone.—Of February the 28th, 1732.

* His majesty being informed of the different imposts of the consuls and vice-consuls of the French nation, established in the ports of Negropont, Cavalle, Rhodes, Meteline, Scio, Milo, Tine, and Micone, laid upon the shipping which traffic under his flag; and having been informed that this revenue has not only little proportion to the attendants and expences of the said consuls and vice consuls (some having thereby too great an advantage, and others not sufficiently indemnified) but also that the power of the said consuls and vice consuls to receive such revenue is not sufficient to authorize them, nor intelligible enough for their direction, whereby differences frequently arise from the consuls and vice-consuls, and the captains and merchants of ships liable to such imposts: his majesty, judging necessary to provide against the same, ordains as follows:

NEGROPONT.

The consuls of the French nation established at Negropont shall be intitled to a duty of 2 per cent. on all merchandize.

chandizes and provisions of the growth of the said country, which shall be laden for the account of Frenchmen, or for that of foreigners, upon all ships carrying French colours, let the said merchandize and provisions be destined either for France or any foreign country in Christendom.

All French ships going on any expedition freighted by the subjects of the Grand Seigneur, or other foreigners, if they be laden for the account of the captain or master, shall pay to the said consul a duty of two piaſtres for anchorage, when they embark or debark merchandizes, provisions, or passengers in the ports depending on the said consulship; or when they bring provision of any kind whatsoever, his majesty, forbidding the action of the said duty in any other case whatsoever.

His majesty intends that all the ports, roads, and coasts situated within the extent of the government of the pacha of Negropont, shall be reckoned to belong to the department of the said consul, and that all French ships which shall traffic there shall pay the duties before mentioned.

CAVALLE.

The consul of the French nation established at Cavalle shall also be intitled to a consulage duty of 2 per cent. upon all merchandizes and provisions of the product of the country which shall be laden there for the French account, or for that of foreigners upon ships carrying his majesty's colours, let the said merchandizes and provisions be intended for France, or any foreign country in Christendom.

All ships going on an expedition, which shall embark or debark, in the ports dependent on the said consulship, merchandizes, provisions, or passengers, shall pay also two piaſtres to the consul as a duty for anchorage, whether they are freighted by the subjects of the Grand Seigneur, or other foreigners, or laden for the account of captains or masters.

RHODES.

Ships carrying French colours, which shall go directly from the ports of France to Rhodes, and which shall unlade their merchandizes, or provisions, to which shall embark to carry them to France, or any foreign country of Christendom, shall pay to the consul of the said port a duty of anchorage only; which shall be of seven piaſtres and one half for the ships and vessels with square sails and of five piaſtres for barks, and all other vessels with smack or triangular sails.

The cruizers which shall load or unload in the ports dependent on the said consulship, as before represented, and those which shall carry provisions thither, shall pay to the said consul five piaſtres, without distinction of vessels.

His majesty intends that the said consuls shall receive the same duties on all ships that shall traffic at Stanchio and other ports dependent on the consulships.

METELINE.

French ships which shall load in the isle of Meteline, and its dependencies, merchandizes and provisions, to carry either into France, or into the foreign countries of Christendom, shall pay to the vice-consul of the said port, viz. for the vessels 12 piaſtres, and barks 8 piaſtres.

Cruizers freighted by the subjects of the Grand Seigneur, and other foreigners, or loaded for the account of the captain or master, shall pay to the said vice-consul four piaſtres, without distinction of vessel, when they embark or debark merchandizes, provisions, or passengers in the ports dependent on the said vice-consulship, and when they carry provisions thither.

SCIO.

The duty of anchorage for the ships which, going from the ports of France to Scio, shall unlade there, and those which shall load in their return to France, or the foreign countries of Christendom, shall be paid to the vice-consul of the said port, at the rate of seven piaſtres and a half per vessel, and five piaſtres per bark.

Cruizers freighted by foreigners, or laden at the risk of the captains and masters, as before shewn, shall pay to the said vice-consul five piaſtres, all without distinction of vessel, when they load or unload merchandizes, passengers, or provisions, and not otherwise.

The vice-consul shall continue to have 400 piaſtres paid him annually, by the French nation at the port of Smyrna, to bear those expences with which he is charged.

MIO.

Vessels coming from France, which shall unlade in the ports dependent on the said consulship, and those which shall load there for the ports of France, or others of Christendom; and those cruizers which shall load or unload merchandizes, passengers, or provisions, shall pay to the consul of the said port three piaſtres for all duties, without distinction of vessel.

TINE and MICON.

The consul of Tine and Micon shall receive also three piaſtres for the whole duty, as well of ships which, coming from France, shall unlade in the ports of the department, and those which shall load to return to France, or other countries of Christendom, as of cruizers, which shall take in merchandizes, passengers, or provisions.

GENERAL REGULATIONS for all the said ports.

All the duties before regulated in favour of the consuls and vice-consuls, named in the present regulation, shall be paid once only in the same voyage, even when the vessel shall

load in several ports, in the department of the same consul or vice-consul.

The said consuls and vice-consuls shall enjoy moreover the duties of Chancery, on the foot whereon they have been regulated in July 1692, on condition of providing those with reasonable salaries who shall devote themselves to the business of the Chancery, &c.

In consequence whereof, his majesty forbids the said consuls and vice-consuls, under pain of extortion, and of being deprived of their office, to demand any duty of anchorage, or other, of ships which do not arrive at the ports and roads of their department but by force, and only to touch there, and do not lade or unlade any merchandize or passengers, nor carry thither provisions.

In like manner, and under the same penalties, he forbids the said consuls and vice-consuls to demand any other duties whatever.

His majesty also forbids all captains and masters of French ships, their traders and freighters, to deprive the said consuls and vice-consuls of the duties appropriated by the present regulation; enjoining them to bring with them their acquittal for the same, under pain of four times the sum, and three months imprisonment.

The captains and masters of ships shall continue to pay the Turks the duties established by custom in favour of the officers, and others of the country; of which duties the said consuls and vice-consuls shall keep a table in the said Chanceries. His majesty enjoins and commands Mons. le count of Toulouse, admiral of France, to have strict regard to the execution of the present regulation, and cause the same to be read, published, and registered, wherever needful, &c.—Done at Marly, the 28th of February, 1732.

Signed LEWIS,
And underneath PHELYPEAUX.

The ordonnance of December, 1732, regulates the rank and place that the chancellors of the consulship of the ports of the Levant shall have in the public ceremonies; which we shall pass over.

An arrêt of the council of state, relating to the merchandizes in pacotilles*, as the French term them, which the captains, supercargoes, and passengers carry into the Levant, as well for their own account as for that of the freighters, &c. March 1733.

It having been represented to the king in council, that the French merchants established in the ports of the Levant continue to complain of the infinite prejudice done to the trade of the nation in the ports of the Levant, for the custom of the captains, supercargoes, and passengers carrying merchandizes in pacotilles, either for their account, or that of their freighters to their address: his majesty has judged necessary to cause those memorials to be laid before him that have been sent on this matter, as well by the Sieur marquis de Villeneuve, his ambassador at the Ottoman Port, as by the consuls of the said ports, and the chamber of commerce at Marseilles: among the various methods that have been proposed to his majesty, nothing has appeared more reasonable than to take for the future such precautions, which, without depriving the said captains, supercargoes, and passengers, of the liberty they have of carrying merchandizes in pacotilles into the Levant, may nevertheless prevent the abuses arising therefrom, and put a stop to those complaints that have been long made, and, being willing to explain his intentions upon this occasion, the king being in council hath ordained as follows:

* This is a term in the French marine commerce, signifying a certain weight, or quantity of merchandizes, which the officers and sailors are permitted to carry in their chests, to trade in for their own account.—It pays no freight, either in carrying out or in the returns made. It is rarely mentioned in the contract, it being a particular and verbal agreement, made between the sailors and owners of merchantmen, particularly those designed for foreign trade in long voyages.

A R T I C L E I.

The captains, masters, supercargoes, and passengers of French ships, carrying into the ports of the Levant merchandizes, either for their own account, or that of their freighters, shall be obliged for the future, from the day of the publication of the present arrêt, to sell them to the French nation established in the said ports, and to purchase of them the merchandizes which they shall want in return; his majesty expressly prohibits them from buying or selling any kind of merchandizes in the said ports where there are French merchants established, making a body of the nation, on pain of confiscation of the said merchandizes, and a fine of 500 livres, for every one who shall violate this arrêt: the said captains and masters shall also be disqualified for ever acting in the said capacity again.

II.

The French nation of the several said ports shall be obliged to take for their account, at 10 per cent. under the current price, merchandizes of the said captains and masters, supercargoes, and passengers, and to supply them with the value thereof, either in money or such merchandizes, as they shall require in return, at 4 per cent. above the current price in the said port: his majesty wills and ordains that the profit arising

as well from the diminution of the 10 per cent. on the price of goods imported, as on the augmentation of 4 per cent. upon those merchandizes exported, shall be added to the national cash, to discharge the expences of the port.

III.

Since the merchandizes carried by the said captains, masters, supercargoes, and passengers, shall be paid for by the nation charged therewith, either in money or merchandize, and that, among the said imported merchandizes, there are some who sell them at a distant time, a discount being allowed for prompt payment: his majesty ordains, that, upon the merchandizes imported and so sold, the nation shall retain the usual discount, independent of the 10 per cent. mentioned in the preceding article.

IV.

His majesty also wills and ordains, that, if any one of the said captains, masters, supercargoes, and passengers, buys or sells merchandizes, in violating of the present regulation, the consuls and vice-consuls of the said ports shall cause the said merchandizes to be seized, and order the confiscation thereof, together with the fines to be placed to the national cash, for the use of the port.

V.

His majesty nevertheless ordains, that the said captains, masters, supercargoes, and passengers, shall buy and sell themselves merchandizes, in those ports where there are no French merchants established, making a body of the nation.

VI.

His majesty moreover wills that the chamber of commerce at Marseilles doth continue to take cognizance of all the merchandizes which shall come from the Levant for the account of the captains, masters, supercargoes, and passengers, also of the ordinary duties; even those of the averages of the port, if they have not been discharged, as likewise in the case where the said captains, masters, supercargoes, and passengers, shall carry the merchandizes which they have brought in violation thereof, and unknown to the consuls in the said ports; and where there are French merchants established as a body of the nation, the said chamber of commerce shall have a strict eye upon the violators, to cause them to be condemned in the pains and penalties hereby enacted.

His majesty orders and commands that all officers any way concerned herein have due regard to the execution of this arrêt, &c.—Done at the king's council of state, his majesty being present, held at Versailles the 17th of March, 1733.

Signed LEWIS,
And underneath PHELYPEAUX.

A royal ordonnance, concerning the duties of the consuls and vice-consuls of the ports of Negropont, Cavalle, Rhodes, Meteline, Scio, Milo, Tine, and Micone.—Of May 1733.

‘ The regulations of the 28th of February, 1732, being represented to his majesty, whereby the duties of the consuls and vice-consuls are settled in the ports of Negropont, Cavalle, Rhodes, Meteline, Scio, Milo, Tine, and Micone, without mentioning that which the consuls and vice-consuls usually require at the rate of 4 per cent. on the price of the freight which the captains and masters of French ships make in their ports: and judging that the reduction of this duty, the foundation whereof is the care of the consuls and vice-consuls have with regard to the said freights, and the advantage thereby reaped by the said captains and masters, the receipt thereof shall be made for the mutual advantage of the several parties: his majesty ordains that the consuls and vice-consuls of the said ports, who have not appointments paid them by the chamber of commerce at Marseilles, shall receive for the future 2 per cent. only upon the price of the freights which the captains and masters of the French ships shall make in their respective ports; forbidding the said consuls and vice-consuls to exact the said duty to a higher rate, and the said captains and masters not to defraud the said consuls and vice-consuls thereof, under the pains and penalties enacted in the regulation of the 28th of February, 1732, which his majesty requires shall be executed according to the form and tenor thereof.—His majesty commands all officers concerned herein to see to the due execution hereof.—Done at Versailles, the 27th of May 1733.

And underneath PHELYPEAUX.

A royal ordonnance, forbidding the French merchants to consign, directly or indirectly, merchandizes, fruits, or provisions, to foreigners established in the ports of the Levant.—Of February 1735.

‘ His majesty being informed that the French merchants trading to the Levant make use of the names of strangers established at Marseilles, or in other ports of the kingdom, to cause their merchandizes to be consigned to other strangers settled in the ports of the Levant, who shall be ordered to sell them for the account of the said French merchants, and make the returns to them: his majesty, desirous to prevent an abuse equally prejudicial to the interests of his subjects and to the advantage of the commerce of the Levant, his majesty ex-

pressly forbids all French merchants, and other his subjects trading there, to consign, either directly or indirectly, either by themselves or others, any sort of merchandizes, fruits, or provisions, even in pacotilles, to the commissioners, or foreign merchants, established in the said ports of the Levant, on pain of confiscation of the same, and a fine of 10,000 livres, one half to go to the informer; and, even for the first default, the said French merchants shall be for ever after rendered incapable of following the said commerce of the Levant, and punished also according to the exigencies of the case.

His majesty commands all persons in office to have due regard to the execution hereof.—Done at Versailles, the 2d of February, 1735.

Signed LEWIS,

An arrêt of the council of state, concerning the imposition of a duty of average of 1 per cent. for three years, upon the merchandizes which shall be carried to the ports of the Levant.—Of February, 1736.

‘ The king having permitted the sheriffs and deputies of the chamber of the commerce at Marseilles to borrow, for the term of three years, the sum of 180,000 livres, with stipulations of interest at 5 per cent. to discharge all the debts contracted by the nation at the ports of the Levant, for which the said nation pays a considerable interest, which is a burthen upon commerce: and his majesty desiring to put the said chamber in a condition to reimburse the said sum of 180,000 livres, in the same term of three years, by means of a moderate average-duty on importation, which has been proposed to be laid upon merchandizes which are carried into the ports of the Levant: his majesty having seen the resolution of the assembly held upon that subject by the said chamber, the 23d of January last, and the sentiments of the Sieur Icard, inspector of that commerce; having heard the report, and considered the whole, his majesty, being in council, has ordained as follows:

ARTICLE I.

There shall be raised in every port of the Levant, during the space of three years, reckoning from the day of publication of the present arrêt, 1 per cent. average at importation upon all the merchandizes which shall be carried thither from France and foreign countries, by French ships, or others that carry on that trade under the protection of France.

II.

The ports of Morea and Barbary, and those of the Archipelago.—[see ARCHIPELAGO] of Satalia, and others where there are no French merchants established, making a body of the nation, shall be excepted from the said imposition.

III.

His majesty wills and ordains, that the piastras, sequins, and other foreign species, shall not be liable to the same duty of average at importation; which shall be received on our merchandizes, in conformity to the tariff of the settlement of the price thereof, which shall be raised by the chamber of commerce at Marseilles, and sent by the deputies of the nation for this purpose into the said ports.

IV.

His majesty ordains that the said deputies shall receive the said duty of average at importation, in the same manner as the duty of average is at exportation, and appropriated to the chamber of commerce; and they shall keep a separate account of the product of the said duty, which shall be balanced every six months, in the presence of the consul.

V.

His majesty enjoins all captains and masters of French ships, or foreigners which shall be under the protection of France in the ports of the Levant, to present, within 24 hours after arrival, the policies and manifestoes of their loading, to the consuls and deputies of the nation; and justly and faithfully to declare the quantity of merchandizes with which their vessels are laden, under pain of confiscation of those not so declared, and a fine of 1000 livres.

VI.

If any merchant is found to evade the said duty, be it either in supplying counterfeit manifestoes, or otherwise, his majesty wills and ordains, that, besides the confiscation of the merchandizes, he shall be compelled to pay a fine of 3000 livres; and, if he is a trader resident in the Levant, he shall be sent back into France: the whole to be applied, viz. one-third to the informer, one-third to the chamber of commerce at Marseilles, and the remainder to the hospital of the said city of Marseilles.

VII.

His majesty means and intends that the said duty shall cease before the expiration of the term of three years, for which it is established, if it produce, before that time, wherewith to discharge the sum of 180,000 livres, borrowed by the said chamber of commerce, and the interest of the same, which likewise must be discharged out of the said duty: for which purpose it is ordained, that the said chamber and the consuls shall

shall render an exact account of the receipt which shall be made in the ports of the Levant.

VIII.

His majesty wills and ordains, that the said chamber of commerce shall keep a separate account of the product and application of the said duty; which account shall be annually balanced by the *Sieur Icard*, inspector of this commerce, whom his majesty enjoins to have due regard to the execution of the present arrêt.—Done at the council of state, his majesty being present, held at Versailles the 25th of February, 1736.

Signed PHELYPEAUX.

A royal ordonnance, permitting French ships to be consigned to merchant-strangers established in the ports of the Levant, in case they are entirely freighted by foreigners.—Of April 1737.

His majesty being informed that the merchants of different nations who are settled in the ports of the Levant, would be more induced, than they really are, to freight French ships, by their correspondents in the ports of Italy and other foreign countries, where they find them, if the said ships might be directed and consigned to them: and his majesty's ambassador at Constantinople having also informed him, that such consignment made to foreign merchants, of French ships freighted by foreigners, would not be detrimental to the French merchants established in the said ports of the Levant: his majesty, considering the 31st article of the declaration of the 21st of October, 1727, hath permitted, and doth permit, that the ships of his subjects may be addressed and consigned to foreign merchants established in the ports of the Levant, in the case only when the said ships shall be wholly freighted by foreigners.—His majesty orders and commands *Monf. the count of Toulouze*, admiral of France, and the *Sieur marquis De Villeneuve*, ambassador at Constantinople, to have due regard to the execution of the present ordonnance, which shall be registered in the rolls of the admiralty of Provence and Languedoc, and read, published, and fixed up, wherever needful.—Done at Versailles, the 23d of April, 1737.

Signed LEWIS,
And underneath PHELYPEAUX.

An arrêt of the council of state, establishing, to commence the 1st of April, 1739, that the duty of average at importation, the raising of which was ordained by the arrêt of the 25th of February, 1736, shall be suppressed in all the ports of the Levant.—Of December 1738.

The arrêt of council of the 25th of February, 1736, being laid before the king in his council of state, by which his majesty ordained that there should be raised, in each of the ports of the Levant, during the term of three years, reckoning from the day that the said arrêt should be received and made public, a duty of 1 per cent. average of importation upon all merchandizes which shall be carried thither from France and foreign countries, by French ships, or others carrying on trade under the protection of France: and his majesty having caused the accounts to be examined, which, since the establishment of the said duty, have been given in by the deputies of the nation in the ports of the Levant, and by the chamber of commerce, and settled by the *Sieur Icard*, inspector of the commerce of the Levant, in conformity to the 7th and 8th articles of the said arrêt: and having found that, the said duty being received 'till the 31st of March, 1739, ensuing, the product thereof will be sufficient to reimburse the sum of 180,000 livres, which his majesty had permitted the sheriffs and deputies of the chamber of commerce at Marseilles to borrow, for the said term of three years, in order to discharge all the debts contracted by the nation in the ports of the Levant: his majesty, conformable to the 7th article of the said arrêt, ordaining that the said duty should cease, for the easement of his subjects trading to the Levant, although the said three years, reckoning from the day such receipt of duty commenced, should not be absolutely expired:—Having seen the representation of the *Sieur Icard*, the king, being in council, hath ordained, and doth ordain, that, on the first day of April, in the year ensuing, 1739, the duty of average on importation shall be suppressed in all the ports of the Levant; that the merchandizes which shall be exported thither from France and foreign countries, shall be disencumbered from the payment of the said imposition: his majesty prohibits the consuls and deputies of the nation in the said ports, and all others, from demanding the said duty; and ordains, that the total of the amount of the receipt of the said duty, which shall be made during the six last months of the present year, and 'till the said 31st day of the month of March next, there shall be delivered, by the sheriffs and deputies of the chamber of commerce at Marseilles, a definitive account of the produce and appropriation of the said duty, which shall be balanced by the said *Sieur Icard*.—His majesty commands the *Sieur marquis de Villeneuve*, counsellor of state, his ambassador at the Port, also the *Sieur Icard*, inspector of the commerce of the Levant, and the sheriffs and deputies of the chamber of commerce at Marseilles, to have a strict regard to the execution of the present arrêt: he also enjoins the consuls of the nation, in the ports of the

Levant, to cause the same to be made public, and registered in their Chanceries, and to see the same executed.—Done at the king's council of state, his majesty being present, held at Versailles the 12th of December, 1738.

Signed PHELYPEAUX.

On the 18th of January, 1749, an arrêt was issued for the regulation of policies of assurance passed before the signing the preliminaries of peace, with regard to ships employed in the commerce of the ports of the Levant, and regulating the premiums to be allowed to the insurers, in those cases mentioned in the arrêt of the 12th of July, 1748.—But, this * being too long to insert here, we shall defer it to the article POLICY OF ASSURANCE.

* This arrêt also shews what extraordinary care the French have taken of this branch of trade, in the most minute circumstance.

A royal ordonnance, forbidding all subjects who reside in the ports of the Levant and Barbary to possess themselves of any real estates.—July 1749.

His majesty being informed that, notwithstanding the prohibitions made, none of his subjects resident in the ports of the Levant and Barbary should possess themselves of real estates, many of them are actually in possession of houses, lands, and gardens, which they pretend to have been obliged to accept in payment for debts due to them by the subjects of the Grand Seigneur: and experience having manifested that this kind of property influences their residence in Turkey, prolongs their return into the kingdom at the term fixed for their residence, and gives room to litigations dangerous to the safety and tranquility of the nation: his majesty judges necessary to declare more precisely his intentions upon this subject, and, in consequence thereof, hath ordained, and doth ordain, as follows, viz.

ARTICLE I.

The consuls, chancellors, interpreters, merchants, artizans, and all other subjects of the king residing in Turkey and Barbary, shall be incapable, for the future, under any pretence whatsoever, to acquire real estate, by the way of purchase, cession, gift, or legacy, either lands, houses, gardens, rents, and other immoveables, under pain of being sent back without delay into France, and the loss of the said properties; which shall be appropriated to the body of the nation, in order to be sold, according to the laws of the country, and the amount to be remitted to the national cash of the port, to be applied to their expences ordinary and extraordinary.

II.

His majesty orders those of his subjects who possess real estates, to get rid of them as soon as possible; and, in order to prevent loss in the sale thereof, his majesty grants them 'till the 1st of January, 1751, after which term the said proprietors, or possessors, shall be liable to the penalties inflicted in the preceding article.

III.

His majesty declares that, in the present prohibition, the dwelling-house of his ambassador residing at Constantinople shall not be included, nor the dwelling-houses of the consuls, the chapels, church-yards, nor the hospital for missionaries; which the nation and the said missionaries shall continue to enjoy as heretofore, in conforming themselves, nevertheless, to what is prescribed, in respect hereunto, by the capitulations made with the Ottoman Port, and the particular orders of his majesty.

IV.

His majesty, notwithstanding, permits the French residing in Turkey and Barbary, in case of death, flight, bankruptcy of their debtors, and in default of payment, to enter their action against the immoveables, and to pursue the sale thereof 'till the absolute payment of their debts; expressly forbidding them to accept and keep such effects by way of mortgage, in order to enjoy their revenues.

V.

His majesty, in like manner, forbids all his subjects from taking a farm, or the administration of lands, houses, or duties of custom belonging to the Grand Seigneur, or his subjects, under any pretext whatsoever: ordaining that those who are encumbered therewith, may rather recede from their agreement, under pain of being sent back, and rigorously punished in France.

VI.

His majesty, however, permits his subjects, but only in case of absolute necessity, to take in payment the harvest, or the produce of one or several years, provided that they do not exceed the number of those fixed for the time of their residence in the Levant.

VII.

His majesty most expressly forbids all religious missionaries, French or foreigners, residing in Turkey under his protection, from making any acquisition or augmentation of house or chapel, without having first obtained the consent of his majesty,

majesty, and the approbation of the Ottoman Port, which shall not be solicited but through the interposition of his ambassador at Constantinople. His majesty enjoins the Sieur Defalleurs, his ambassador at the Ottoman Port, the Sieur Pignon, inspector of the commerce of the Levant, the sheriffs and deputies of the chamber of commerce at Marseilles, and all the consuls of the French nation residing in Turkey and Barbary, to have all due regard to the execution of the present ordonnance, which shall be read, published, fixed up, and registered wherever needful. —Done at Compeigne, the 6th of July, 1749.

Signed LEWIS,
And underneath ROUILLE.

REMARKS.

These are the principal royal arrêts, édits, ordonnances, and declarations, issued from the year 1665, by authority, for the regulation of the Levant trade belonging to the kingdom of France: whence a good judgment may be made from FACTS, to what causes the present flourishing state and condition of that trade may be justly attributed: and, without a distinct and minute knowledge of these measures, it is not possible for any one to have a true idea of the policy of that nation in this respect. A general superficial knowledge that the French take this or that measure alone for the regulation of their Turkey trade, will give no satisfactory idea of that series of policy which they have observed for near this century past; and, without that, we can, perhaps, make no right judgment of the regulations necessary for our own Turkey trade, for want of a true knowledge of the wisdom of France and other nations in managing theirs.

From the tenor of these regulations, the judicious reader will easily discern the necessity of consulting the articles CONSUL, CHAMBER OF COMMERCE, and MARSILLES; to which latter place we more particularly refer under the article PROVENANCE in France, that being the capital city, where the French Levant trade is carried on, and where the regulations are made of the several species of merchandizes for that commerce.

Of the regulations of the Dutch, in regard to their commerce of the Levant.

Smyrna is the principal factory of the Hollanders in the dominions of the Grand Seignior.

The Hollanders have at Smyrna a consul, a treasurer, three assistant judges, and a chancellor. The consul and treasurer may not continue in place above three years; they are, nevertheless, very often continued, when their administration gives content; but they must obtain their confirmation by a new patent.

With respect to the assistant judges, their employ is annual; they are proposed by the three assistants in office, the consul and the treasurer, to the directors of the commerce of the Levant established at Amsterdam, which commonly approve of them, and make choice of one of the three ancients to continue for the following year: he is called the first assistant, and the other two the new assistants.

The ordonnances, regulations, and the instructions of the direction of Amsterdam, which are sent to the Levant, as well as the dispatches of the ambassador of the republic residing at the Port, are always directed to the consul, treasurer, and assistants, but cannot be opened but by the consul in full assembly, and in presence of the other officers, or at least of two assistants, if the third and the treasurer happen to be absent: the same is observed also when any public expence becomes necessary for deliberation, or to subscribe other resolutions taken in relation to commerce, which are thereby authenticated and executed, when they are signed by the consul and two of the said five officers.

When it is requisite to have an assembly of the body of the nation, the chancellor and a druggerman [see DRUGGERMAN] apprise the merchants of it: when assembled, the consul communicates the occasion of their meeting, and the chancellor reads, with a loud voice, the memorials concerning the same; after which, the matter is decided by the plurality of votes; but the execution is referred to the consul and the assistants.

The treasurer should always be present at the assemblies when any disbursements of money are required; and whatever is resolved on this head without him, may not be executed, but is declared null and void.

The differences between merchants are laid before the consul, and are judged of by the plurality of voices, as well by him as by his assistants. Appeals from their judgment are carried before the ambassador residing at Constantinople, from the ambassador to the directors of the commerce of the Levant established at Amsterdam, and from the directors to the states-general; so that there are four degrees of jurisdiction in regard to these commercial decisions.

Ordonnances made by the consul, without the interposition of the assistants, are invalid.

When the consul is called before the cadi, the officers of the customs, the captain-pacha, or other Turkish ministers, be-

VOL. II.

fore they go, they must assemble the nation to deliberate upon the matter in agitation, and take suitable resolutions: afterwards the consul negotiates the affair, 'till it's conclusion. If the consul is cited before the adjudicatory of the country, he goes accompanied with his whole nation, and requires a copy of the demands, in order previously to deliberate thereupon in their assembly.

In case of the consul's death, the ambassador nominates one, but only provisionally. With respect to the employs of the Treasury and Chancery, it is left to the consul and his assistants, to appoint others; but this is in like manner, according to the pleasure of the directors at Amsterdam.

The duty of consulage is due for whatever is laden or unladen, either in merchandizes or ready money; the latter at the rate of 1 per cent. at importation or exportation, the other upon the footing of 2 per cent.

When there is a great deal of money in cash, the duty of consulage is reduced to one half, that is to say, to $\frac{1}{2}$ per cent. for the money, and 1 per cent. for the merchandizes; but that can be done only with the permission of the directors of Amsterdam, according to the representation of the consul, the Treasury, and the assistants, in the name of the whole nation, certifying that the demand of the merchants, in such case, is just.

If, on the contrary, the cash is exhausted by the avanies of the Turks [see the beginning of this article] or by extraordinary expences, which sometimes happen, the duties of consulage are doubled; whereby ready money pays 2 per cent. and the merchandizes 4 per cent.

Foreigners who trade under the banner of Holland, never pay more or less than 2 per cent.

The treasurer, or his deputy, are charged with the recovery of the duty of consulage, which is required in the following manner:

Foreigners pay in white money, viz. in lion-piastres, the duty on merchandizes imported: in relation to ready money, the duty is taken in the same specie.

The quantity of ready money is verified on board the ships, before unladen. The consul, treasurer, and assistants examine the same, bag by bag, whence they take some of the specie, which being found of good standard, they are again put into the bags, that are sealed with the seal of the chancery, and afterwards the debarkation is allowed, which for the money, must be done all at one time. If there is any counterfeit specie, it is sequestered in the chancery.

Foreigners, after the departure of convoy, pay the duty of consulage according to the tariff and bills of lading; copies whereof, after being signed by the captain, must be carried to the Treasury.

The Dutch merchants are obliged, eight days after the departure of the convoy, to give a declaration of the quantity and quality of the merchandizes which they have received and loaded, and pay the consulage-duty thereof in white money. They are generally allowed a discount of 6 per cent. by which they pay 94 only for 100; but, if they do not pay at the time when it is due, that is, in the month, or later, there is added to the 94 one per cent. for as many months as they postpone the payment: they are, however, not permitted to defer payment longer than six months, after which the consul may prosecute, and oblige them to pay, or imprison their persons.

When the duties of consulage are paid at Constantinople, Smyrna, and Chio, there is liberty to send the merchandizes where you will; but, when they go to other places, or come from them, the consulage is due.

The Hollanders, and those under their protection must pay the consulage according to the money there is in cash, as before observed; but they do not pay double, either for exports or imports, on those ships which trade under the protection of other countries, which is called the foreign consulage; they are, nevertheless, obliged to pay, in the same manner, and under the same penalties, as for the merchandizes which are laden upon Dutch ships.

Once a year, the treasurer, his deputy, and the whole nation, go in ceremony to church, where, after sermon and psalm-singing, they all take an oath, according to the formulary, read aloud in the congregation by the chancellor, which is, not to defraud the consular power, either directly or indirectly, of any of the duties of consulage, nor of any thing relating thereunto, on pain of a fine of 1000 crowns, and to be sent away, if found perjured, and even to suffer other pains and penalties, if the states judge proper.

Those who reveal the secrets of the national assembly, are subject to a like chastisement.

Captains, pilots, and cap-merchants, on their arrival at Smyrna, and before their departure, and before they have delivered their manifestoes and declarations to the consul, are obliged to take the same oath, under the same penalties: and, moreover, the captains, found violating, are disqualified for commanding any vessel for six years.

The treasurer keeps possession, in the chancery, of all the money with which he is charged, reserving some for common expences. The chest wherein the cash is kept is of iron, with three keys, one of which is kept by the consul, another by the assistants, and the third by the treasurer.

No one but the treasurer knows what money there is, for which he is not obliged to give account but to the directors of the Levant established at Amsterdam. The assistants of Smyrna examine, nevertheless, all the receipts and expences made, and ascertain the same according to the declarations of the merchants, the manifestoes of captains, and by what has been received or charged by foreigners by every convoy, or otherwise.

The treasurer pays every three months, in money of due weight, with an agio of 10 per cent. viz.

	Piaftres.
To the ambassador per annum, for his maintenance	10,000
To the consul, ditto	4,000
To the treasurer, retained in his hands	1,400
	15,400
Which sum of 15,400 piaftres, with an agio of 10 per cent. makes, in white money, that is to say, in lion or allani piaftres [see ASLANI] which are of the current money of the country	16,940
More to the first druggerman [see DRUGGERMAN]	300
To the second, ditto	300
To the third, ditto	150
To the chancellor	200
To three janissaries, besides three vests of London cloth	240
To the same every new year's day	36
To the druggermen also for new year's gifts	36
In the whole	18,202

The treasurer pays all the expences made at the port and at Constantinople, as well for presents as for the voyages of Adrianople and others, which he reimburses to the ambassador, and at Smyrna to the consul.

The vice-treasurer, who resides at Constantinople, sends to the treasurer at Smyrna an account of expences that he has made, which he reimburses, after having the same examined and approved by the assistants and the nation assembled: this assembly is called the assembly of the assistants.

The ambassador is obliged to pay the rent of his house, where he gives a room to hold the national cash. He is also obliged to pay the chancellor, the druggermen, and the janissaries of Constantinople, and all other expences that regard the maintenance of his house and domestics.

The consul of Smyrna is obliged to the same things, with reserve to the appointments of the chancellor, the minister, the druggermen, and janissaries, who are paid by the treasurer, out of the money in cash.

The directors of the Levant trade arising at Amsterdam are to the number of 17. According to their institution, there should be three from every province; but custom has made it common for some to have only two, and others but one. They hold the quality of ministers, or counsellors, to the States-General, in regard to the commercial affairs of the Levant; and their power is next of kin to sovereign in that case, and yet under the authority of the States. It is a place of honour, but of no profit; and the States-General chuse only the most skilful and honourable merchants into it.

The treasurer of Smyrna sends every year, to the directors, an account of all expences incurred, and another of the receipt of the duties of consular, with the balance of the cash-account. The first account contains the appointments, the advances, the presents, the expence of messengers; in fine, generally speaking, it contains whatever has been expended for the service of the nation, and utility of its commerce. They send also, to the directors, the copy of the manifestoes, or declarations of all the ships, and accounts in particular of the duties of consular, the whole being examined, and certified by the assistant; and, if they find any error to the disadvantage of the cash-account, the treasurer is responsible for the same.

All the money in cash, the expences first acquitted, remains in the hands of the treasurer. The directors have sometimes caused the money to be sent to Amsterdam, and would have established this custom for a constancy; but the body of the merchants in the Levant complaining to the States-General, and remonstrating that the surpluse of the cash ought to be appropriated to their advantage, in lessening the duty of consular, since they were to make the augmentation, when it fell short: the States ordered, that, for the future, the surpluse of the funds should remain in the Levant, to be applied to ease the national expence.

There are at Smyrna eight or ten considerable houses of trade, of which the Dutch factory is constituted, and who uphold the whole traffic.

All the subjects of the United Provinces are permitted to export merchandizes for the Levant, whether the armateurs put themselves under the protection of convoy, or chuse to pursue the voyage alone. The chief thing which they are obliged to observe is, that the ships carry 28 pieces of cannon, and 50 men, as well in time of peace as war.

For the due execution of this regulation, there is a commissary established in the Texel, to visit all ships intended for the Le-

vant trade; and, if their armament is not agreeable to the above-said regulation, the captain, who commands the ship, is mulct in the penalty of 2000 crowns for the first time; and, in case of repetition of the like violation, besides the said fine, the captain is cashiered, and the ship is sequestered till a new captain is provided.

When a convoy departs, the directors of the Levant trade require of the commissioners of the admiralty the number of men of war necessary to convoy the merchantmen, which is always granted, the armament being at the expence of the admiralty, by reason of the duty of 1 per cent. on the value of the loading of the vessels, that they receive from all those who enter into the ports of the State, either under convoy or otherwise.

The convoys that go to the Levant, commonly touch in all the ports of Spain, Genoa, Leghorn, Naples, and Messina, and stay as many days as are necessary to load and unload, which is also regulated.

They follow the same orders when they are at Smyrna; but, if it happens that the merchantmen cannot be ready by the time appointed, which is generally of 90 days in time of peace, in this case the merchants of Smyrna, and the captains of their ships, present a petition to the consul, the treasurer, and the assistants, to prevail on the commandant of the convoy to stay till they are ready; to which he agrees if he thinks proper; though he is sometimes permitted to fail, if he has reasons for so doing.

When the commanding officer of the convoy makes a difficulty of staying for the merchantmen, by reason of the precise orders which he has received from the admiralty, all the nation oblige themselves to indemnify the expence of his extraordinary stay; which otherwise may be thrown upon him, besides the reproach that he may be liable to, on his return to Holland, for disobeying his orders.

At the return of the convoys to Holland, the commandants give the journal of their voyage to the solicitor-general of the admiralty; who, disapproving the days extraordinary of his stay, throws all the expence upon that officer, who is obliged to pay it, provided, as before hinted, he is not indemnified by the body of the nation in the Levant.

It is likewise the business of the solicitor-general of the admiralty to inform against the captains of men of war who have carried on contraband trade; and it is at his requisition that they are condemned in a fine for the violation of the regulations in this respect; which strictly forbid and punish a conduct of this kind. They are, indeed, allowed to take money, either in specie or bars, because that does not encumber the ship in case of an engagement.

As it may happen that the men of war may be separated from the merchantmen, the admiralty have a custom of chusing, among the captains who command the latter, first and second commandants, whom the others are obliged to obey.

Ships of convoy, and generally all those that come to Smyrna under the banner of Holland, pay 80 allani dollars anchorage, which are distributed partly to the cadet and governor of the castle, and partly among the druggermen and janissaries of the nation. There are also some reserved for the slaves, and support of a sermon and church-yard. This distribution is made according to the pleasure of the consul.

The body of the nation forbid the lending of ships to the Turks; and, when they demand them, the captains excuse themselves under some pretext, which frequently disgusts the Turks. It nevertheless sometimes happens, that they take them by force; which must be submitted to, lest greater avanies should follow.

Of the general nature of the Turkey trade in the Levant.

Though the Turks are no traders, but rather discouragers and destroyers of trade, yet, as they possess so great a part of the world, and some of the most fruitful, and productive of the best and choicest merchandizes, it will always induce the European parts of the world to send their merchants amongst the Turks, to traffic with them.

The Turks themselves, by their indolence and haughtiness, despising manufacturing, and not improving the product which they enjoy, in many places, must necessarily be obliged to purchase of other nations the things that they stand in need of; which naturally encourages the merchants of other nations to come among them.

Those that settle among them from the eastern part of the world, are generally Greeks, Jews, Armenians, and Georgians; those from the western parts are chiefly Venetians, English, French, and Dutch, with some Jews also, chiefly Italian. The principal places of trade, on this side the Turkish dominions, respecting Europe, where the said merchants reside, are Constantinople, Smyrna, Aleppo, Alexandretta, or Scanderon, Alexandra, Tripoli, Antioch, and the islands on the coast.

There are some Christian merchants in most of the islands belonging to the Turks, viz. at Cyprus, Candia, Rhodes, Zant, Cephalonia, and in most of the inhabited islands of the Ægean Sea, or Archipelago. [See ARCHIPELAGO].—These merchants are generally French, though there are some Jews.

This

This commercial establishment, by the way of factories, among the Turks, take the same altogether, is, in one general acceptation, called with us the Turkey trade: the manner of which trade is this, viz.

The merchants of England, France, and Holland, chiefly furnish the Turks with fine woollen cloths, dyed scarlet, crimson, purple, blue, and green; the first three in grain, and as rich in colour as possible, which raises their value.

The English, besides their cloth, send block-tin, lead, clock-work and watch-work, both in gold and silver; and, all put together, the value was formerly for upwards of 300,000 l. sterling, one year with another.

The returns which the Franks (for so the European Christian merchants are called in Turkey) make from the Turks, and which are the product of the Turkish and Persian dominions, are as follow, viz.

Raw silk: this, though the chief return of the whole trade, is not all the immediate produce of the Grand Seignior's dominions, but of the Persians also. [See PERSIA.] It is brought from the country where it is produced to Aleppo, and from thence to Scanderoon, where the merchants trade for it.

The silk, thus brought raw in bales from Persia, is sherrbaff, the Persian word for raw silk, or, perhaps, for silk in general. When this sherrbaff silk is landed here, and comes into the hands of our manufacturers, it is called by a name of their own, legee. Besides this, the Levant or Turkey merchants import another sort of raw silk, which they call white silk, and our workmen belladine. This is shipped either at Cyprus or Scanderoon, on board the same Turkey ships that bring the other sort of silk, but is produced in several distant parts of the Turkish dominions, as at Cyprus, at Antioch, and at Tripoli; that is, in the country adjacent to the ancient Syria, and in several of the islands of the Archipelago. The same sort of silk is also shipped off at Smyrna.

This island silk is generally the product of the islands of Andros, Naxos, Zea, Thermia, Syra, Santorini, &c. The quantity of silk imported formerly from these places, and as comprehended under the denomination of the Turkey trade, has been calculated at between 3 and 400,000 lb. weight, one year with another. That we may not speak without book, the reader may take the following account, drawn from our Custom-House books.

Turkey silk imported in the port of London, in the several years 1720, 1722, and 1723.

Anno 1720	- - - - -	399,688 lb.
Anno 1721	{ None imported, the plague being that year in Turkey and France.	lb.
1722	- - - - -	374,401
1723	- - - - -	329,983

Note. Every pound weight in this account contains 24 ounces. The importations for some years after corresponded pretty much with this proportion, except that, upon some occasion, the trade met with an interruption, as in the time of the plague, and on occasion of war. What is the state of the Turkey trade at present, compared with what it has been, we have not room to shew under this head; and, therefore, shall be obliged to refer to the articles ORIENTAL TRADE, and TURKEY TRADE; under which two heads, with what we have here said, will be comprehended whatever is needful, in order to form a right judgment of this commerce, and of what may be further requisite to render it more beneficial to this nation in particular. To proceed.

The other importations are,

2. Wool and yarn. { Carmania wool, and wool of the islands,
Grogam yarn, } that is, goat's hair, spun or
Mohair yarn, } twisted,
Cotton wool, } from almost all the islands of
Cotton yarn, } the Ægean Sea.
3. Gums, such as gum { Dragant,
Sandal,
Seneca,
Arabic,
Sarcocolla.
4. Manufactures. { Persian silks,
Carpets,
Burdets,
Calicoes, from the islands of Siphanto, Paros, &c.
Cordevans,
Shagreen-skins.
Galls from Syria,
Coffee from Mocha, by Alexandria,
Balm,
Natural balsam
Rhubarb, from Persia,
Sal ammoniac,
Turmeric from Persia,
Incense,
Pumices from Santorini,
Starax { Calamita } from Samos,
Scammony, { Liquida }
5. Drugs, dye-stuffs, earths, &c. { Myrrh,
Manna,
Galbanum,
Sena,
Aloes hepatica,
Olibanum,
Zedoary,
Esquineties,
Hypoastris,
Aceatrice,
Okor,
Emery-stone,
Bolus, an earth, } all at Samos,
Adrachne,
Valonia, or velani, from the island of Zea,
Coloquintida,
Euphorbium,
Mirabolans,
Hypococucana, } from Persia and Egypt,
Frankincense,
Mastic, from Scio and Naxos,
Opium, cum aliis.
Vifney,
Arac,
Jallap,
Orange flower-water,
Vermecelli,
Turpentine.
7. Seeds. { Worm-feed,
Clover-feed,
Garden-seeds,
Rice.
8. Fruits. { Figs,
Pistachas,
Raisins of Smyrna,
Pomegranates.
Box-wood,
Cypress-wood,
Fustic,
Ebony,
Walnut-tree.

These are the principal productions with which the merchants of Europe trade among the Turks in this part of Asia: the number of drugs may, perhaps, be greater than what are here mentioned; but these are the most considerable.

The chief articles are the silk, which comes from Georgia and Persia, the wool, the hair, and the galls.

The cotton, as well in wool as in yarn, and also most of the goat's hair, is the product of the islands on the Asian side of the Archipelago; and those also of the European side. Some of the silk likewise comes that way to us, from Zea, Andros, Timor, Paros, Argenter, Naxos, Santorini, Syra, Thermia, and many others. Also from the island of Mycone come some goat's-hair and cordevans.

These serve for the bulk of the trade; the others, perhaps, are equally useful in their kind, but not of equal value in general commerce.

As the Turks have little or no trade but what is, as it were, forced by the Europeans and others, so they have but few ships, compared to the extent of their naval dominions: the chiefest of their shipping is among the Grecian islands, and these are such as belong to the Greeks of those islands, not to the Turks. Also in the Morea and in the Black Sea they have some shipping: but, for the traffic between Egypt and the Port, they generally hire English, Dutch, or Venetian ships upon freight.

The Venetians, indeed, trade with the Turks in Morea, and in the gulph of Thessalonica, and to some of the islands; and, as those countries are full of Greeks, and other Christian inhabitants, they carry them proper manufactures, such as wrought silks, fine linen, bone lace, and all sorts of haberdashery for the women, who delight to go gay, especially in the isles. They carry back in return according to the productions of the place, such as currants, raisins, figs, drugs, rice, corn, oil, wine, cotton, silk, &c.—This is the reason, perhaps, why Venice is the magazine for the scarlet drugs, from whence they are sent over the whole Christian world.

The produce of the islands is exceeding great, and affords the Turks in making returns for the goods they buy of the European merchants: for the Turks are either such strangers to correspondence, or such enemies to all the world but themselves, that they have no such things as exchange; so that, to balance their trade, they are frequently at a great loss, if the balance runs against them. It is true, it may be in their favour in one place, and the contrary in another; whereby they may sometimes bring one part to make good another; but they cultivate no epistolary correspondence, no regular posts going from one place to another, to adjust these things; so that most trade and business is executed by messengers and expresses, such as charoux for the government, or by shipping; and, as for money returned from place to place, it must be carried all in specie.

Much less have they any assurances for the risque of trade, or any of the usual conveniences of commerce that other nations have. But, as we shall have occasion to speak more largely to this hereafter, we are under the necessity of referring to the articles **ORIENTAL TRADE**, **PROVENCE**, for the trade of **Marseilles**, and **TURKEY TRADE**, in order to consider the state of our own branch in particular. See also the article **ARCHIPELAGO**.

R E M A R K S.

From what we have here laid before the reader, in relation to this branch of trade, and what we shall further add, we shall be enabled to make a right judgment, whether our Turkey trade is at present put upon a right footing, and whatever else it may stand in need of further than the late act of parliament, in order to render it of greater emolument to the kingdom in general.

LIEGE, the principality and bishopric thereof. This country is bounded on the west by Brabant; Namur, and part of Hainault on the south; by the forest of Ardennes, and part of Luxemburg, on the east; by Luxemburg also, by Limburg, part of the duchy of Juliers, and by Prussian Guelderland; and, on the north, by Dutch Brabant and part of Guelderland.

The air is very temperate, and the country fruitful; and it's mountains have quarries of marble, and mines of lead, iron, and brimstone, besides pit coal in abundance. It's chief rivers are the Maes, Demer, Jecker, and Weser.

DINANT is seated between a steep rock and the Maes, which makes it enjoy a pretty good trade, particularly in manufactures of brass and iron.

MALMEDI is a small town, mostly inhabited by leather-dressers or woollen-drappers.

STAVELO is another small town, the inhabitants of which drive a pretty good trade in woollen cloth, and other stuffs, and chiefly in a great quantity of leather carried here.

SPA, or **SPA**, is situated on the little river Wese, so surrounded with mountains that you cannot see it till you are almost in it. It is from the Pouxhon, or Pohon spring, in the market-place here, that they draw that prodigious quantity of water that is transported into foreign countries, especially into England and Holland, sealed up in bottles with the town seal. The people of the town employ themselves in making boxes for ladies toilets, snuff and other boxes, varnished after the manner of China wares, which they sell to the company, as they go from the wells.

VERVIERS, on the same river, has a very flourishing manufactory of woollen cloths, said to be nothing inferior to those made in England or Holland; so that their trade extends all over Germany, and even into the north of Europe, Italy, and Turkey.

Near this town stands the borough of **HODIMONT**, where they also make a great quantity of woollen cloths.

LIGHT-HOUSES and **SEA-MARKS**. A light-house, or beacon by sea, erected in any place where required, is of great use to direct and keep mariners in the right course they ought to take to avoid danger: and these are very necessary in those parts where there are bars, or entrances into harbours, that there must be high tide to carry ships over them.

Light-houses and sea-marks of various kinds, as sometimes large trees, or buoys, must be allowed to be proper cautions to strangers and others, that they may not precipitately run on rocks or sands; to their ruin and destruction: and, in the reign of king Charles II, care was taken for erecting light-houses and lanterns, and other special sea-marks; but more especially for the building that most excellent light-house near Goldston by Yarmouth, which, for it's height, curiosity, and form, was then reckoned not inferior to any, but rather excelling all or most in any country whatsoever.

In the fourth and fifth years of queen Anne an act passed for the rebuilding of a light-house on the Edifstone, by the master, wardens, and assistants of the Trinity-house of Deptford Strond; and, after the same is rebuilt, and a useful light put therein, there shall be paid to them, by the masters and owners of English ships and barks passing by the said light-house, except coasting vessels, one penny per ton inward, and one penny a ton if outward bound; of which the merchant is to pay a moiety, and the owner of any ship the other moiety: and, by strangers, two-pence per ton of the burden of the ship or vessel; and every coaster two shillings only, for each time they pass by the said light-house.

The said duties to be received by such person or persons as the said master, wardens, and assistants of the Trinity House shall appoint, and where such ships, barks, or other vessels shall arrive, load, or unload; and on non-payment, to be recovered in any of the courts at Westminster. Stat. 4 and 5 Ann. cap. 20.

By 3 Geo. II. cap. 36. all the powers, liberties, privileges, and authorities granted in letters patent of her majesty queen Anne, bearing date the 13th day of July, in the 13th year of her reign, to William French, Esq; for erecting a light-house on the island or rock called Skerries, lying in the sea near Holyhead, in the county of Anglesea; and the said light-house, with it's rights, members, and appurtenances, shall be valid and effectual, and continue for ever vested in Sutton Morgan,

his heirs and assigns: to the intent that he and they shall keep the light-house in good repair, and, in the night-season, maintain a proper fire therein, so as the trade and navigation in the Channel may be effectually preserved.

And the said Sutton Morgan may demand and receive from the masters and owners of every ship, hoy, bark, catch, vessel, or bottom, passing, crossing, or sailing in or through St. George's Channel, by Holyhead or Wicklow, to or from any foreign port or place, or which shall pass or cross the said Channel, to or from any port, creek, or place in Great-Britain southward of Holyhead from or to Wicklow, or any ports or place northward thereof in the kingdom of Ireland, or that shall pass, cross, or sail from any port, creek, or place northward of Holyhead, either from any foreign or other port, and sail between Holyhead and the Calf of Man, or any way in St. George's Channel, to the southward of Dublin; and likewise from all coasters passing to and from any port, creek, or place in Great-Britain, north of Holyhead, from or to any port, &c. south thereof; one penny per ton coming into, and the like sum going out of the said ports, places, creeks, or harbours, in Great-Britain or Ireland; and double such duties for any foreign ship or vessel, &c. passing, crossing, or sailing in like manner, according to their burthens. But ships loaded with coals, or the greatest part of their loading being coals, passing from England to Ireland, shall only pay one voyage in every year.

And if any master, or other persons, having the command of any ship, &c. shall refuse to pay the duties, the said Sutton Morgan, his heirs, &c. may seize any of the goods, guns, tackle, &c. of any such ship or vessel, and keep the same till the duties aforesaid are paid; and, in case of any delay in payment, for the space of three days after such seizing, he may cause the same to be appraised by two sworn appraisers, and afterwards sell the goods, and therewith satisfy himself for the duties, together with the charge of seizure, &c. rendering the overplus to the owner.

And, in consideration of the frequent and constant benefit the packet-boats sailing between Holyhead and Dublin receive by this light-house, the postmaster-general, or the commissioners for executing that office, shall pay to the said Sutton Morgan the annual sum of 50*l*. by quarterly payment, without any office fees, or deductions. This statute extendeth not to charge any ships of war with the duties before-mentioned.

There are large lanterns ordered by the statute, with duties payable for maintaining them, to be erected at the head of some keys, such as at the harbour of Minehead in Somersetshire, on the river Severn, &c. See 10 Ann. cap. 24.

LIMBURG, in the Austrian Netherlands. This province is bounded on the north and east by the duchy of Juliers; on the south by a small part of the duchy of Luxemburg, and by the country and bishopric of Liege, which surrounds it also on the west.

It has excellent mines of iron, and one of copper; the soil is very fruitful in wheat, fruits and fuel.

The chief rivers are the Maes, Gueule, Wese, and Bowine.

NEAU, called **EUPIN** by the inhabitants, though but a borough, is more considerable than many cities, both for the number of it's inhabitants, which amount to about 4000, and for it's trade. They make here woollen cloths, which are said to be as good and fine as those made in England, especially the scarlet, blue, and black. They have a considerable trade of them throughout the country, and especially in Germany.

LINCOLNSHIRE, is a maritime country, and one of the largest in England, and is bounded on the south by Northamptonshire; on the north by Yorkshire; has the German Ocean on the east; and is bounded on the west with some parts of Yorkshire, Nottinghamshire, Leicestershire, and Rutlandshire; and is computed to be about 180 miles in compass. It is usually divided into three parts, viz. Holland, Kesteven, and Lindsey.

I. HOLLAND is bounded on the south with part of Cambridgeshire; and on the east with the wathes, which are passable at ebb, but overflowed by every tide. The soil of this division produces much more grass than corn.

BOSTON stands on the river Witham, which is navigable to Lincoln, and inclosed here with artificial banks. It is, and long has been, a famous and flourishing town: it is now in a thriving state, with considerable merchants for foreign trade, besides a good inland trade; and others of the inhabitants apply much to grazing.

DUNNINGTON has a port for barges, and is remarkable for large quantities of hemp and hemp-feed bought here, but for nothing else, though it is reckoned a good market-town.

CROWLAND is situated among fens. The people of this place, which is pretty well inhabited, subsist chiefly upon the profit of their fish and wild ducks, which in the month of August are so numerous, being brought hither by decoy-ducks, that they drive 3000 into a net at a time, by dogs trained up to the business.

SPALDING is a neater town, and more populous than would be expected in a place encompassed with lakes, canals, and rivers; for the drains of Boston and Langtoft center, as it were,

were, upon it, and the Welland almost incloses it. Vessels of 50 or 60 tons may come up to it.

II. **KESTIVEN** is bounded on the south-east with Holland division, and on the north with that of Lindsey.

STAMFORD stands upon the river Welland, which is navigable to it by barges: the chief trade of this town is in malt, sea-coal, and free-stone.

SLEAFORD, in a pleasant valley, near the head of a river of its own name, has a considerable trade in corn and cattle, a large market-place, and the markets on the Monday after Epiphany, Easter, and Whitsuntide, are equal to great fairs.

III. **LINDSEY**. This, which is the third and largest division of the county, runs out with a large front into the sea, which washes its shores on the east and north; it is separated from Yorkshire and Nottinghamshire, on the west, by the rivers Trent and Don; and, on the south, is bounded by Kesteven and the Fosse-Dyke, cut between the Witham and Trent, for the convenience of carriage to and from Lincoln; and is parted from the Holland division by Horncastle wapentake.

LINCOLN CITY is in this division; it is built on the side of a hill, at the bottom of which runs the river Witham. It was formerly a very large and flourishing place, and made a staple or mart for wooll, leather, lead, &c. but its trade is gone to decay.

GREAT GRIMSBY, half a mile from the Humber, was also a place of very great trade, before its harbour was choaked up: its chief trade now is in coals and salt, brought by the Humber.

GAINSBOROUGH is a well-built town, of good trade upon the Trent.

LINLITHGOWSHIRE, in Scotland, is bounded on the north with the Forth; with part of Clydesdale on the west; and it is divided from Mid-Lothian on the south and west; and by the waters of Almond and Brick-Water on the east. It abounds with coal, lime-stone, and white salt, besides corn and pasturage.

LINLITHGOW is the chief or shire-town, and is so named from its situation on the side of a lake, which is a mile in length, and a quarter of a mile over, and abounds with perch, and other sorts of fish.

This town has a face of great business, with a good harbour, where there is a large Custom-House built; with other houses for the use of merchants.

Here is a great manufacture for linen, which the water of the lake is reckoned so extraordinary for bleaching, that great quantities are brought hither from other parts of the country for the purpose.

BURROWSTOWNNESS, on the coast, had the greatest trade with Holland of any in Scotland, before the Union, which is now much decayed, though it has still a good export of coals and salt, and the greatest traffic both to Holland and France, except Leith. It is said they have the most shipping, and the best seamen in the Firth, who are very good pilots for the coasts of Norway and the Baltic, as well as Holland.

QUEEN'S-FERRY, at the point of St. Margaret's Bay, is the common passage at all times of tide from Lothian to Fife, to which it is about two miles over, and it is the surest way from all parts of the north to Edinburgh.

LINEN. What linen is needs no definition, it being so well known. There are variety of sorts, the chief materials of which are cotton, flax, and hemp.

It is difficult to say with certainty to whom the invention of this manufacture is owing; perhaps the original idea proceeded from that admiral phenomenon of the spider's-web. To describe the divers sorts, would be as needless as tedious, and would oblige us to leave out matter, which, we apprehend, may be more useful and acceptable.

As introductory to what we would offer in regard to this article, we desire the reader would consult what is said under the articles **BLEACHING**, **CAMBRICS**, **COTTON-TREE**, **FLAX**, **HEMP**, **LINT**, **YARN**, **IRELAND**, and **SCOTLAND**, all which heads contain something tendering to the national advancement of this manufacture.

REMARKS.

We shall now consider this matter in some other lights, not less interesting to Great-Britain than what has been said under those heads beforementioned.

Linen is a commodity of universal use, from the prince to the meanest subject, and a commodity that cannot be supplanted by any thing else near so commodious and agreeable for those uses to which it is applied. The use of the Indian cotton-cloth has been often attempted for shirting, but to no purpose; and muslins for women's head-cloths and ruffles, &c. in place of cambric, but without success. Some ascribe this to a fondness of the English nation for French fashions; a conceit which, in too many instances, is most highly detrimental to the trading prosperity of this nation, and which ought, by all possible means, to be discouraged; but there is found, by long experience, to be a substance and firmness in cambric which gives it a preference to muslins, for variety of uses.

The linen trade of Europe is chiefly in the hands of the Russians, Germans, Swiss, Flemings, Hollanders, and French.

A nation may be drained of its wealth, and undone by foreign trade, if it takes more goods from other nations for home-consumption than it sends out, and pays balances in gold and silver [see **BALANCE OF TRADE**]; and therefore every wise administration will watch carefully over those branches of commerce where the balance is against them, and encourage those where the balance is on their side.

The balance of trade and money transactions between England and those foreign linen countries is against England; and, by reason of the high duties imposed by them upon English woollen goods, and other incumbrances on the importation and sale of them, the balance of trade is greatly in their favour, more especially if the total balances of those linen countries be considered in a conjunctive and aggregate light; because we have not diminished in our imports of foreign linens in the like proportion as those nations have diminished in their imports of our woollen and other merchandizes; and the attempts to establish more and more new manufactures of their own, among the European powers, must inevitably increase the evil upon us, provided we do not take every measure to promote an adequate compensation for the losses in trade with which we are daily threatened, by almost every power of Europe in their turn, as demonstrably appears throughout this work.

It is high time to look into our state of the trade to the North; for it is certain in our own power, by the effectual assistance of our fellow-subjects in our settlements in America, and by the industry of our own people at home (if both were properly employed) to bring the balance of trade with all those countries on our side; not only those linen countries, but also with those which serve us with the bulky trade and naval stores.—See **NAVAL STORES**.

The soil of many parts of Virginia and Maryland is exceeding rich, and fit for raising of hemp and flax. The same hands which hough and dress their tobacco-grounds, and cut and cure their plants, may be employed all the winter in breaking and dressing hemp and flax. These commodities, being imported rough, may be manufactured at home, into cordage, sail-duck, and linen of several sorts, and will serve so far to lessen our demands from Russia and Germany of these goods. Great quantities of hemp and flax, to supply what we cannot produce at home, may also be raised in Pennsylvania, North Carolina, and in several other of our own plantations; and all so near navigable rivers, that, by saving the expence of a long carriage by land, to which those commodities are liable in Muscovy, they may be imported cheaper than they can be had from thence, and possibly too, of a better quality, if once a becoming emulation for that purpose is raised between ourselves and them.

Several parts of these colonies lie in the latitude of Egypt; and as their soil, in some places, is equally fine and rich with the soil of Egypt, where the finest flax in the world is produced, what hinders but our British plantations may be brought to produce such that is no way inferior in quality?

With regard to watering the flax, the dews in those parts are exceedingly rich, and, when the flax is lying on the grass, it is thereby brought to an excellent colour, without impairing its strength in the least, wherein the great art of bleaching consists. See **BLEACHING**.

Effectual measures of this kind would secure the dependence of our plantations upon their mother-country, when they shall be thus closely united to us, by the irrefragable tie of their own interest, and their friendship and affection for their mother-country, cherished by this profitable intercourse, when we thus work, as it were, to each other's hands, and mutually support and enrich one another: for, wherever obligations are reciprocal, the consequences will be so likewise.

We are at present enabled to serve our plantations with all the manufactured goods they use, except linen; and the present situation of our trade with the foreign linen countries calls loudly upon us to improve and extend the manufacture of home-made linen.

Every county, and almost every town in England, is supported, and their poor employed, by some one particular branch of trade. This greatly contributes to bring every article of manufacture to its utmost perfection, to increase the inland commerce, and the dependency of one part of the country on another, and thereby to advance the common interest and wealth of the whole. The coal-trade is the chief business of Northumberland, Cumberland, and Westmorland; and, as this employs their men only, the linen-trade might also be set on foot in those countries, to employ their women and children.

At Darlington some linen is made for inland sale; but it lies too near Leeds, and the other cloth making towns of Yorkshire. Many inconveniences attend the interfering of manufactures: if the same hands come to be employed in linen and woollen, or in any part of both, both must inevitably suffer, by being in danger of falling into discredit, and becoming ruined thereby: wherefore all regard should be had to prevent such interfering.

In Lancashire the linen-trade may be safely carried on, because it does not interfere with the cotton, and that the war:p

of all their fustians, and several other cotton goods, is made of linen-yarn.

Linen is the staple of Scotland; but it was long neglected. The Scots at present are not, however, in so bad a situation in respect to this trade, as the French were in the reign of king Henry IV, or the Irish at the Revolution, where, by the force of public encouragement, it has arrived to an extraordinary pitch, and, it is to be hoped, will daily advance; the Scots have it not to begin, they want only to improve and extend it to the height it will admit.

The linen manufacture may be brought to as great an extent in value as any other business now carried on in Britain, except the woollen; it may employ near as many hands as the woollen does; and the linen-trade of North Britain is of as great consequence to the nation in general, as the woollen in the south, and equally deserves the same care, countenance, and encouragement from the public.

The parliament has, from time to time, upon proper application, passed acts, and given suitable encouragement for the advancing, and preventing the decay of the manufactures of wooll, silk, cotton, mohair, &c. all which have been attended with some good effects.

The act of parliament made in the year 1727, for regulating the linen manufacture of Scotland, and even the small funds then appropriated by parliament for its encouragement, did that nation very important service in this respect: the linen-trade was, in some measure, thereby retrieved, and improved beyond expectation. This enabled the Scots to conquer one of their greatest difficulties; and, when they came to understand the defects, faults, and imperfections under which this manufacture laboured, and the ways and means to cure, correct, and amend them, they have brought this manufacture to a very great excellency and perfection.

In a nation so populous and extensive as this island of Britain is, branches of business might be carried on in different parts, which might lay a foundation for division and strife, through an interfering of different interests. But it is happily otherwise with us; it is no less the interest of England to promote and advance the linen manufacture of Scotland, than it is the interest of Scotland to encourage, by their consumption, &c. the woollen manufacture of England.

England is served with fine linen from Holland, and countries adjacent to it, and with cambrics, and other sorts of linen from Holland and France; and the balance of trade and money transactions with both those countries is against England. England and the British plantations, are served with great quantities of middling and low-priced linens of divers sorts, from Silesia, and other parts in the upper and lower circle of Saxony. Formerly those countries took large quantities of woollen goods from England, and then that trade was profitable to England; but now they have manufactures of woollen in several places of their own, as before intimated, which serves a great part of their consumption of low-priced cloths, and lessens their demands for woollen goods from England, whereby the balance of trade with them is now against us.

The balance of trade betwixt England and Scotland, and England and Ireland, is on the English side; and, so far as England and the plantations can be served with linen from Scotland and Ireland, instead of Holland, France, Germany, and Russia, so far will England be a gainer by this change in the course of trade. The more linen the Scots and Irish can sell in England, the more of the English commodities will they be enabled to purchase; and it may be reasonably supposed, that their demands from England will always increase in proportion to the increase of their people and linen manufactures. It is then evidently the interest of England to promote and advance the manufacture of linen in Scotland and Ireland, and to give them all reasonable advantages in the trade, in preference to foreigners, where the balance of trade is against us; and this seems to be the sense of the nation, since all foreign linen for home consumption pays a duty.

Foreign linen, indeed, exported to the British plantations, draws back the whole duty to a trifle; and this was a necessary measure, when our linen trade was reduced to so low an ebb, and the Irish manufacture but in its infancy; so that neither Scotch nor Irish were able to furnish them with any large quantity: but now that those countries have, in some measure, retrieved that branch, and that the Irish, as well as the Scotch, are daily increasing our quantities of linen goods, they both ought to have all the advantages in the trade, that the interest of England, as well as the interest of Scotland and of Ireland, plainly requires. This may in a great measure be effected, if all foreign linen, when exported to the plantations, should not be allowed to drawback the duty it pays on importation, or such a proportion of it, as may be thought reasonable, to give us a preference in the trade.

When the foreign linen countries took off our woollen and other manufactures, something proportionate in value to the linens we had from them, it might not avail us to think of supplying our own plantations with British-made linen: good policy then dictated the advancing no further in this

manufacture, than an endeavour to supply our own European domestic consumption: but, as the scene is now changed, as those linen countries have established woollen, and other manufactures of their own, and are daily establishing more, that will interfere with the manufactures of these kingdoms, is it not time to retaliate upon them by a similar policy? Had we taken off the drawback on foreign linens upon their exportation to the British plantations, before we were capable, or even likely to supply ourselves and plantations with our home-made linens, and before the foreign linen countries had sent up woollen and other manufactures which interfere with ours, it might and would have been impolitic, and all these apprehensions of the consequences attending such measure, that we had twenty years ago, might be justly grounded. Among other things, it was then urged, 'That, if we should be capable of producing and manufacturing every thing, so that we had no occasion to import any one thing, what should we be gainers of? This would destroy the great band and ligament of all foreign commerce, and in the end the whole nation.'—But this is arguing upon the extreme, and I may as well ask, if we took all our produce and manufactures from foreign nations, how long should we be able to trade at all?

By the industry of England, Scotland, and Ireland, we are now in a condition to supply ourselves and our plantations with linens of our own manufacture; and, if I am rightly informed, several species of them as cheap as we can have foreign linens.—But supposing, not granting, that, as yet, our linen manufacturers have not arrived at every art in making linens so cheap as foreigners, or so good in quality, what then? Are we to give them no encouragement, 'till they are capable of so doing? Is that the way to rouse and animate them to emulate the foreign linen countries? Is discouragement the best policy to enable them to vie with other nations in this universal manufacture? When Lewis the XIVth was informed by his great minister, Colbert, that his subjects would eat herrings, and expended great sums annually therein—Then answered that monarch, They shall catch them themselves or go without; and they have ever since supplied themselves.—So if Britons, either in Europe or America, will wear linens, or use them in any shape, let it be the voice of Great-Britain, that we may manufacture them ourselves or go without.

But, say some, if the drawback is taken off on the exportation of foreign linens to our plantations, will not the foreign linen countries some how avail themselves of such a measure? They have already anticipated us in this respect, by settling woollen and other manufactures of their own, and consequently taking less from us than heretofore; and is it not politic in our turn to retaliate upon them in manner something similar to their own policy? Let us then make our own linens, as the linen countries have begun to make their own woollens, &c. and take off the drawback allowed on the exportation of foreign linens to the plantations, that our's may come as cheap to our own plantations as foreign linens there will. Ah? but, says somebody, that cannot relish this policy, Will not the British plantations, in such case, make their own linens? What inducement can they have to do this, when the linens we shall sell them, may be made of the very materials [HEMP and FLAX] that we shall purchase from these plantations? for that is the footing whereon I have put the matter, to which the reader will please to attend. That trifling attempts have been made in some of our northern colonies upon the linen manufacture, we are no strangers to; but, if our plantations were effectually encouraged in the raising of all raw materials for this manufacture to be carried on in their mother-country, they would cease to go greater lengths in a manufacture, which requires so long time to bring to tolerable perfection; nor would they then scruple to give the preference to British linens, though they came something dearer at first than foreign linens, when they knew such British linens were made of the produce of their own plantations.

Nothing is more common than for us to complain, that our northern colonies begin to interfere with us in our British manufactures, and may in time supply our sugar islands therewith. If this should ever come to pass, may we not thank ourselves? For, if we in time give them such effectual encouragement in planting as we may, and as the state of our commerce apparently requires, they will not easily turn from planting to manufacturing. Planting and agriculture are best understood there, and, if any thing stimulates our colonies to lay this aside for what they do not yet understand to any degree of perfection, it will be the supineness and discouragement of the mother-country to rouse them to the former.

Is it more politic to encourage the importation of foreign linens into our plantations, than to encourage those plantations in the production of such materials, as will enable Great-Britain and Ireland to supply them with home-made linens, as cheap as they can have foreign now? And why should not that be the case, when our plantations can supply us cheaply and plentifully with the materials for that purpose?

Would

Would not due encouragement given to our plantations, in this respect, take away the temptation from our colonies to supply themselves by smuggling foreign linens? When the mother-country took off immense quantities of their planting productions for the linen manufactures, would it not prove unspeakably more for their interest to discourage all smuggling trade of this kind, than to sacrifice their planting interest? In such case, can we imagine them to be so little acquainted with their own happiness and prosperity, as not to make laws every way adequate to the prevention of so destructive an evil, and also vigilantly see to their execution?

It has been said, in opposition to the taking off the bounty on foreign linen, on their being exported to our British plantations, 'That the harbour of Curaçoa, the island of St. Eustatia, the ports of Surinam, and the Berbices, belonging to the Dutch, are always open and free for the English to trade to. The duties on what the English import and sell there, seldom amount to above 5 per cent. I remember but one instance when they exceeded, and that was just upon the peace of Utrecht, when Mons. Carlar, after having plundered Nevis and Montserrat, made the garrison of Curaçoa ransom themselves for 1,200,000 pieces of eight or Spanish dollars, as I have been informed the sum was: and, indeed, for two or three years, they made all foreigners pay 10 per cent. on all the goods they imported and sold there: but, during that time and occasion, which might have, in some measure, excused a tax on their merchandize at exportation, they were not so weak as to do it, well knowing, that nobody would buy goods and merchandize of them that knew where to buy cheaper; nor did they ever, in any instance that I know of, demand any duties on any goods that any one purchased in their harbours, but let him carry them where he would or could, well knowing whatever draws shipping, draws trade, and that draws profit or money, which all trading people want. There is not a port in the world out of Europe, where all sorts of European goods are to be seen in greater plenty than there, in Curaçoa; and, I believe, there has not been a day these twenty years, when there were no English ships to be seen in that harbour, but this is only one port: Surinam and the Berbices lie to windward of Barbadoes, and not above three days sail from it; so that the people of Barbadoes might be supplied from thence very conveniently, and with small risque.'

St. Eustatia lies in sight of our Leeward islands; and, as I will not put all on my own single authority on this occasion, I will transcribe a passage out of a book published some years ago, intitled, *The Importance of the British Plantations in America to this kingdom*, printed for J. Peele, p. 32, 33. where the author says,

I shall take leave, in this place, to mention an affair, for which, if a remedy could be found, it would be of some advantage to us. The island of St. Eustace, which is inhabited by the Dutch, is not above three leagues distant from St. Christopher's; and, with regard to its extent and produce, very considerable: but its road is the place where Dutch interlopers from the coast of Africa seldom fail to call at. In a few days all our Leeward islands are informed of this. In places, such as our islands are, it is not much to be wondered at, if there are persons who run some hazard for the hope of a considerable gain; so that all the ready money which they can advance at any rate, is carried by them on board these ships, where negroes are sold to them frequently 20 per cent. cheaper than our own ships do afford them. This ready money is a great temptation to some planters, who sell their sugars to them at less than the current price; and, under pretence of sending it in sloops to our own shipping, it is sent on board these interlopers, who, by these means get loaded at less expence than our own ships, and carry off more money than a great number of our own ships which trade for three times the value. By this it is evident, that we have really employed a Dutch ship, and have paid her whole freight, out and home, in money, which is just so much lost to the nation: nor is that the only damage; for on board these ships are often great quantities of fine and coarse LINENS, which are sold for ready money only. See *Reflections and Considerations*, occasioned by the petition presented to the honourable House of Commons, for taking off the drawback on foreign linens, printed for T. Cooper, 1738.

So far, then, it seems pretty clear, 'till I hear reasons to change sentiments, that it is for the mutual interest of Great-Britain and her plantations, to promote the manufacture of linens in general; the former in the making them, and the latter in producing the requisites of nature for that purpose. It has been suggested also, 'That, if we take the drawback off foreign linen, to make them dearer to our plantations, in order to introduce our own linens, we must be obliged to take off the same on the exportation of all foreign linens; which will bring them so dear to foreign markets, especially to those of the Spanish West-Indies, that we shall thereby run the hazard of losing that trade, because that those foreign linens make one of the essential assortments of a saleable cargo for Spanish America.—That the productions of many nations and countries are become absolutely necessary to this

end; and that often much more gain and advantage will accrue to the merchant, and consequently to this kingdom, by trading in goods of foreign manufacture than in those of our own.—That in such case, if the British merchant is not at liberty to sort his cargo with such wares as the markets he sends to require, and at as low a rate as others can, who trade to the same market, he must be beaten out by the others, and leave the trade wholly to them,' &c.

This argument, like all of the extreme and general kind, has the fate to prove too much; for, if this is allowed conclusive, it will follow, that we must never presume to think of such an advancement to our linen manufacture, as to come in for any share whatever in the supply for foreign markets.—Had such-like policy prevailed in France, would they ever have had resolution to have attempted to supplant us in the woollen, or any other manufacture, wherein we had the start of them, as they have done? But they would not be lulled to a lethargy by such specious reasoning; that it is in vain for us to think of supplying the Spanish West-Indies, or any other foreign country, with any of our home-made woollen, or linen manufactures; we cannot make up saleable assortments, without the woollen manufactures of England, and the linens of Germany; and therefore, if we presumptuously attempt to make woollens or linens of our own to the taste of the Spaniards, we shall, instead of increasing, lose that share of the Spanish West-India trade we have already obtained! With what contempt would a Colbert have treated such argument? Had he been influenced by it, would it not have prevented every wise measure that he so successfully took for the advancement of manufactures of every kind, in order to force a trade with foreign countries? Hath not the lucrative experience of France, to the unspeakable detriment of England, proved such reasoning frivolous and delusory? Yet this was the principal, if not the only colourable argument urged, some years since, against a petition presented to the honourable House of Commons, setting forth, 'That the manufactures of linen now labour under several discouragements, but more particularly on account of the drawbacks allowed on exportation of foreign linens, threads, and tapes; by means whereof, considerable quantities have been, and still are sent from hence to parts beyond the seas, to the GREAT HINDRANCE of the consumption of our own produce and manufactures; and therefore praying the House to give such relief, as to the House shall seem meet.'

When France first attempted the establishment of the woollen manufactures, they had every difficulty to struggle with, having neither the material, nor the manufactures; yet, a resolute perseverance and sound policy dissipated every difficulty and discouragement [see the article FRANCE]. The first step they took was to supply themselves with woollen goods of their own fabrication, and to stop the importation of the English woollen manufacture, in proportion as they advanced in their own; and although, at their first enterprize, their manufacture was but very indifferent, yet, as the king himself encouraged the wear, the whole nation followed the example. This laid the first foundation for their prosperity in this great manufacture. After which, they exerted every politic art, in the power of human nature to suggest, in order to imitate the English in that perfection to which they had long before arrived.—Thus the most skilful and experienced manufactures in England and Holland were allured by honours and rewards irresistible; and thus the groundwork was laid to vie with the English at foreign markets, in the staple manufacture of the kingdom. But, as the reputation of the English woollen goods was established throughout the whole world, the difficulty lay in convincing foreigners, that they had arrived at as great a perfection in this art as the English; which they did, by propagating that they had the English and Irish wool to work with, and English manufacturers to fabricate it; and what hindered, said the French, but we may make goods in France, equal in quality with those made in England? Whether they have even yet arrived to the perfection of the English, is greatly to be doubted. However, they made their cloths façon d'Angleterre; they imitated their lengths, breadths, and thicknes, and counterfeited the English seals affixed to the same, and thereby craftily insinuated their woollen fabric among foreign nations; and, as they have been able to afford them cheaper, they have gradually made their way, and now share the woollen trade with us in all parts of the world. And, while this was accomplishing, they found ways and means to make up their saleable assortments for the Spanish West-Indies, as well as other foreign markets; whereby the merchant and nation both gained, though not at first to the degree they have been able to do since they have arrived at a greater perfection in these fabrics.

And what hinders that Great-Britain and Ireland should not be able to imitate the perfection of foreign linens, to as great a degree as the French have the English woollen goods? That our people want ingenuity to carry any manufactural art to the last perfection, will not be said; that they wonderfully excel in the linen manufacture in particular, is indisputably true; and that to such a degree, it has been affirmed

firm, that foreign linen manufacturers have been themselves deceived, by taking the British and Irish linens for some of their own. Certain it is, that a very extraordinary progress is now made in this universal manufacture; and, if we pursue the like measure that France has done, in relation to the establishment of their woollen manufactories, why may we not first be able amply to supply ourselves with home-made linen, and then attempt a competition therein with foreign nations? If we cannot raise hemp and flax sufficient for our demands in Great-Britain and Ireland, will not our plantations most amply supply us, with effectual encouragement?

Neither the banks of the Nile, nor the most fruitful plains of Egypt, were ever more capable of producing fine flax (though formerly esteemed the best in the world) than the banks of the Susquehanna, Delaware, Hudson's river, and the rich and fat valleys of the English North America are.—The climate of North America, with regard to the production of most vegetables, particularly as to HEMP and FLAX, is inferior to none in quality in the known world: they have so many sorts of soil, that no place in any climate can shew more than may be seen there in one day's riding.

Notwithstanding those apparent advantages, which may accrue to the public weal from the advancement of this manufacture to its last perfection; and notwithstanding the reasonableness of taking off the drawback upon foreign linen; yet we well know, that courts cannot at every point of time, at every crisis, do what is right and just for their own country, and what they would wish to do. The circumstances of public affairs must be attended to; there is, in the concerns of state, as well as in those of private persons, a season for all things, as the wise man has long since reminded us of; and the wise and upright statesman will watch those seasons, and take the advantage of favourable opportunities.

When we, therefore, occasionally in this work, take the liberty humbly to suggest any measure, which we apprehend may turn to the commercial emolument of the state, we would, by no means, presume to dictate to our superiors the PROPER TIME for the execution of any thing, because that depends upon the real state of public affairs both at home and abroad; and what may be wise and prudent to be done at one time, and may be attended with great national honour and advantage, may be the reverse at other times.—These reflections should make the bulk of the people modest, and less censorious of the public measures in all nations, because in most they cannot know the great wheels and springs of government.—In this happy land of liberty, indeed, we can as little bear with the mysteries of state as of religion; and yet some politicians have told us, that there is a necessity for them in both.—But these things we leave to the divine and the statesman; while we submit to consideration such general principles only, as are deducible from facts, leaving their application to be made, as the exigencies of state may occasionally require.

That nothing may discourage and intimidate Great-Britain and Ireland from carrying the linen manufacture to the perfection that England has done the woollen*, it may be useful to give some calculations relating to the quantity of linen manufactured in Ireland, and of the proportion that the material of flax bears to the manufactured merchandize, by Thomas Prior, Esq; of Dublin: which calculations may in some measure be applied to England and Scotland.

* The reader will please to observe, that, at the beginning of this article, the utmost national care is recommended to prevent any injurious interfering between those staple manufactures, the woollen and the linen; that is to say, our manufacturers engaged in the former must not be drawn off to the latter; nor should the situation of the one be in places too near that of the other, lest the workmen, engaged in the one, should be diverted to the other, and grow less expert and skilful in both, to the detriment of our grand staple the woollen branch, and to the obstruction of the promotion of that of the linen. For, although we have powerful competitors in the woollen, yet we should by no means abate that ardor and zeal, necessary to support that share of this inestimable branch which we still preserve. Times may change; Great-Britain still maintains her weight and dignity at foreign courts; and if her manufactural artists maintain their spirit of industry and ingenuity, and if once the studies of commerce and its dependent arts, considered in all relations become as fashionable as those of the belles lettres and polemical and physiological studies, we may have opportunities of making such treaties of commerce with other nations, as may one day give us full employment in both these general manufactures: new channels of trade may likewise offer themselves to us, which at present, perhaps, can be as little foreseen, as the discovery of the new world was before it happened. See the articles ARTIFICERS, MANUFACTURERS, and MECHANICS.

† It is computed, says this judicious gentleman, that the value of linen, made in Ireland yearly, amounts to a million sterling; and that half thereof is yearly exported, and that the remaining half is consumed at home; reckoning five shillings a head for two millions of people one with another, for all their consumptions in linen.

It is also computed, that the following quantities of rough flax, such as we have from Riga, worth forty shillings the hundred weight, will give employment for a whole year to the following number of persons, one with another, including spinners, hecklers, weavers, bleachers, &c. viz. a hundred weight of flax will employ for a year two hands. A ton, or twenty hundred weight, will employ forty hands. A hundred tons will employ four thousand hands. A thousand tons will employ forty thousand hands. And three thousand one hundred and twenty-five tons will employ one hundred and twenty-five thousand hands.

It is also computed that the following quantities of rough flax, worth forty shillings the hundred weight, when fully manufactured into linen, will, at a medium of coarse and fine, be worth the following sums annexed to them, viz. A hundred weight of flax, when manufactured into linen, will be worth sixteen pounds. A ton, or twenty hundred weight, will be worth three hundred and twenty pounds. A hundred tons will yield thirty-two thousand pounds. And three thousand one hundred and twenty-five tons weight will yield a million sterling.

It is also estimated, that a good acre of flax will produce three, four, five, or six hundred weight of flax; and if we allow four hundred weight, or thirty-two stone, to be raised from every acre one with another in a year, which is a reasonable allowance; on that supposition, the aforesaid three thousand one hundred and twenty-five tons of flax, which are all that are at present supposed to be made use of in our linen manufacture, before estimated to be of the value of a million sterling yearly, may be raised from fifteen thousand six hundred and twenty-five acres only; and if we allow but three hundred weight or twenty-four stone to be raised from every acre one with another, which is a low computation, then it will require about twenty thousand eight hundred and thirty-two acres, to raise the aforesaid quantity of three thousand one hundred and twenty-five tons of flax.

If these computations and estimates are true, or near the truth, as we may reasonably suppose them to be, since they come from persons well skilled in the linen manufacture, they will afford grounds for making the following observations.

It appears from these computations, that we have two millions of people in Ireland, yet no more than a sixteenth part of them, viz. a hundred and twenty-five thousand, are fully employed in the linen manufacture, our staple commodity; that number being sufficient, if employed the whole year round, to make linens to the value of a million sterling, which is computed to be the value of all the linen yearly made at present, allowing eight pounds sterling to each person one with another yearly for their work.

Though Ireland, which contains eleven millions of acres, hath several millions in it fit for the growth of flax, yet we see that there are not above thirteen thousand acres in it employed that way: for, though sixteen thousand acres may be sufficient to supply the three thousand one hundred and twenty-five tons of flax employed in our manufactures, yet, as we import yearly from foreign countries five hundred tons of flax, a deduction ought to be made; and, as it will be found, that we do not raise above two thousand six hundred tons of flax of our own growth yearly, the rest being imported, therefore thirteen thousand acres will be sufficient to produce that quantity, allowing four hundred weight of flax to be raised from each acre.

From hence it evidently follows, that, as we neither want hands nor lands, and may command and employ what number and quantity we please, and yet have a great deal still to spare, it is in our power to double the quantity and value of our linen manufactures, by employing double the quantity of land in raising flax, and double the number of hands in working it up into linen, which would yield a million sterling yearly profit to the nation, more than we make at present; with a great prospect of its continuing still to increase, since we have no reason to apprehend that we shall ever want a vent for all the linens we can make.

It appears from the foregoing calculations, that the nation would receive an additional profit of sixty-four thousand pounds yearly for every thousand acres that should be employed, more than are at present, in raising of flax and working up the same into linen, and thereby employ eight thousand hands more.

This is a motive sufficient to engage our attention, to push forward this improvement as far as it will go, and to lose no time in accomplishing it. And, though it may be practicable to enlarge our linen manufacture to the extent and value before-mentioned, yet will it take a considerable time before we can make any progress, unless we can, by proper encouragements and premiums, give a new and greater spirit to our industry and endeavours.

OBSERVATIONS on the raising of flax, for the effectual establishment of the linen manufacture in Great-Britain and Ireland.

We find, by experience, that all our flax, either of our own growth or imported from abroad, is spun into yarn; that all our yarn is either exported or worked up into cloth at home, and that all our cloth is either consumed at home, or sold at a good market abroad. It is more advantage to the kingdom to raise the flax ourselves * which we make use of, than to import it from abroad: for thereby we save the price of the material imported, and do not depend on other countries for the primum of our staple commodity.

* Herein we include the British plantations as a part of ourselves, and what is said in relation to the raising of good flax may be applied to that of hemp: so that we may stand in need of importing no material from any foreign country, in order to carry this extensive and important manufacture to the height it will admit of.

No manufacture can be increased, beyond what the material of which it is made will allow; but must increase or decrease, in proportion to the plenty or scarcity of the material.

There can be no increase of the linen manufacture without an increase of yarn, nor of yarn without an increase of spinners, nor of spinners without an increase of flax.

We import great quantities of flax yearly from foreign countries, which shews that we do not raise flax enough of our own growth to supply our manufactures. Our chief attention, therefore, should be to increase the number of spinners, and the quantity of flax.

There are as many women and children in this kingdom that do not spin flax, as there are that do; and many of those that are now unemployed, would work, if they could procure the materials.

If we should double the number of our spinners, as it is certainly in our power, and supply them with flax and wheels, we might then make double the value in linen: it is, therefore, our interest to provide sufficient stores of flax to keep our spinners at work.

We find, by experience, that in the best seasons we never raise flax enough for our manufactures, and that, in bad seasons, we greatly fall short of the requisite quantity; we should, therefore, until we can raise flax enough ourselves, import large quantities of foreign flax, that our spinners may be still kept at work, who must otherwise be idle for want of the material.

Though by bad seasons, or other accidents, we should happen to raise but little flax of our own growth, yet in such a case, if we take proper measures to import large quantities of flax from abroad, we should still be able to make great profit by our manufacture, by gaining seven parts in eight of the value of the linen, by the labour employed on the flax. Good flax-seed sowed on poor, ill-cultivated ground, and bad seed sowed on good, well-prepared ground, seldom yield good flax. A due cultivation of proper soil, and good seed, must concur to produce good flax.

One acre of rich, well cultivated, land, sowed with good seed, will produce more and better flax, than two, three, or four acres of poor land, ill cultivated, sowed with bad seed, though the expence by the acre, to the sower, may be nearly equal to both.

Since flax-seed of our own growth sometimes degenerates, by reason of bad seasons and bad husbandry, it would be highly proper, in order to be furnished with good seed, to give some premiums [see the articles MANUFACTURES and PREMIUMS] to merchants who shall, for one or two years to come, import large quantities of flax-seed from the Baltic, or North America.

By this expedient, every person who should be willing to sow good seed, in order to raise good flax and seed, may have it in his choice to make use of the best foreign or home seed he can meet with.

It is found, by experience, that, in all manufactures consisting of different parts, they succeed best, who have particular workmen for every part: each operator, being confined to his own branch, can afford his work cheaper and in greater perfection; by this method, watches and Birmingham ware are offered so cheap, every part being a separate and distinct trade, and confined to a particular sett of workmen; and the master who employs them, puts all their work together, and finishes the whole; whereas one who undertakes several distinct branches at once, will hardly succeed in any to perfection.

In like manner, to succeed in the linen manufacture, one sett of people should be employed, either at home or in our plantations, and confined to the plowing and preparing of the soil, sowing and covering the seed, to the weeding, pulling, rippling, taking care of the new seed, and watering and grafting the flax, until it is lodged at home; others should be concerned in the drying, breaking, scutching, and heckling the flax, to fit it for the spinners; and others at home, in spinning and reeling the same to fit it for the weaver; others should be concerned in taking due care of the weaving, bleaching, beetling, and finishing the cloth for the market. It is reasonable to believe, that, if these several branches of the manufacture were carried on by distinct dealers, the

VOL. II.

several parts would be better executed, and the whole could be afforded cheaper and with greater profit.

Since we find, by experience, that all our flax, yarn, and linen, find a vent, it should therefore be our chief endeavour to increase the quantity of our flax, not only as it is necessary to keep our present spinners fully employed, but as it will be a means of employing many hands, that are now useless for want of it.

We find a general disposition and readiness in all our poor women to get a livelihood by spinning, if they could get flax and wheels to work with.

It would be a great benefit to the whole kingdom, and to every gentleman possessed of lands in particular, if all the labouring women and children on his estate were furnished with flax and wheels; and, though this should be attended with some small expence at first, yet this would be soon made good, by the profit those women and children would make by their yarn, which never fails of a market; and which would enable them to repay, with gratitude, the first expence their kind landlords were at, in putting them in a way of getting an honest livelihood.

Besides the several other articles referred to at the beginning of this, we also refer to those of SCOTLAND and IRELAND.

A SUMMARY of the chief LAWS of ENGLAND, relating to LINENS in general.

I. Stat. 28 Hen. VIII. cap. 4. §. 2. No person, English nor stranger, shall put to sale any whole piece or half piece of dowlas and lockeram, unless there be expressed upon the piece the number of yards or ells contained in such piece, upon pain of forfeiture of the same, not containing the number of yards or ells mentioned upon the piece; one half of such forfeiture to be to the king, and the other half to him that shall seize and will sue for the same by action of debt, &c.

II. Stat. 1 Eliz. cap. 12. §. 1. If any person shall willingly use any means with linen cloth, whereby the same shall be deceitful or worse for use, the cloth shall be forfeited, and the offender punished by one month's imprisonment, and shall pay such fines as shall be assessed for his offence, by the justices before whom he shall be condemned.

III. §. 2. The justices of oyer and terminer, and justices of assizes, and justices of peace, or three of them, whereof one to be of the quorum, shall have power to enquire, hear, and determine, the offences aforesaid in their sessions, by information or indictment.

IV. §. 3. If any person shall seize any such deceitful linen cloth, he shall at the next sessions of the peace, or before two justices of the peace, whereof one to be of the quorum, make information of the offence, and of the seizure of the cloth, or procure the offenders to be indicted; and shall be bound before the justices, to the use of the queen, in such form as the justices shall think meet, to pursue the same matter with effect, and to give evidence, and also to pay the moiety of all that he shall recover, to the sheriff, or other accountant, to the use of the queen; the one half of all the forfeitures and fines to be to the queen, and the other moiety to him that shall make information, or procure indictments of the premises, and follow the same with effect.

V. §. 4. The justices before whom any such offence shall be tried, shall certify the same by their edict into the Exchequer, yearly, at Michaelmas, and the barons of the Exchequer shall have power to make process for so much as shall appertain to the queen.

VI. Stat. 1 Ann. stat. 2. cap. 8. §. 2. All sorts of hemp or flax, and the production thereof, as thread, yarn, and linen, imported into England directly from Ireland, by any natives of England or Ireland, being of the growth and manufacture of Ireland, upon producing such certificates, and making such oath, as in the act 7 Will. III. cap. 39. is required, shall be free from the additional subsidy of poundage, and all customs whatsoever.

VII. Stat. 3 Ann. cap. 8. §. 1. It shall be lawful for any natives of England or Ireland to ship in any port of Ireland in English built shipping, whereof the master and three fourths of the mariners to be English or Irish, any white or brown linen cloth of the manufacture of Ireland, and the same to transport into any of the plantations, the act 15 Car. II. cap. 7. notwithstanding.

VIII. §. 2. Provided that no ship coming to the plantations from Ireland shall break bulk, until the master shall have made known to the governor, or to such officer as shall be by him appointed, the arrival of the said ship, with her name and the name of the master, and shall have delivered a true inventory or invoice of the lading, together with a certificate from the chief officer of the port in Ireland, where such ship shall be laden, expressing the particulars of such lading, with the names and abodes of the exporters, and of two persons, who shall have made oath before such chief officer, that the said goods and linen are, bona fide, of the manufacture of Ireland; and, until the master shall have made oath before such governor or officer, that the said goods are the same that he took on board by virtue of such

Z

certificate,

certificate, nor until such ship shall have been searched by an officer; and, in case the commander of such ship shall break bulk before such notice given and certificate produced, and such oath made, or before such search, or if any goods of woollen manufacture not laden in England (necessary apparel of the commander and mariners excepted) or any linen goods not laden in England, nor of the manufacture of Ireland, shall be found, such ship shall be forfeited, together with all goods imported or found in such ship; one third part to her majesty, one third part to the governor of such plantation, if the ship be there seized or sued for (or otherwise that third part also to her majesty) and the other third part to him who shall sue for the same in her majesty's court in the plantations where the offence shall be committed, or in any of her majesty's courts at Westminster.

IX. §. 3. All ships coming from Ireland to any such plantation, shall be subject to the same rules to which ships coming from England are subject.

X. §. 8. Any person for any seizure made in pursuance of this act may plead the general issue, and shall have double costs.

XI. §. 9. All informations and suits for any offence against this act shall be commenced within twelve months after the discovery of such offence.

XII. §. 10. If any ship laden with goods in England, Wales, or Berwick, for any of the plantations, shall put into any port in Ireland, and shall there take in any white or brown Irish linen, the like certificate and oaths shall be made, that the said linen is of the manufacture of Ireland, as is before directed; and if upon the arrival of such ship in the plantations such certificate be produced, and oaths made, such ship, &c. shall be subject to such rules as they were subject to before the passing of this act, and no other.

XIII. §. 11. This act shall continue eleven years.

Continued by 3 Geo. I. cap. 21.

XIV. Stat. 7 Ann. cap. 7. §. 24. European linens, flitters threads, and tapes or incle, linsed and flax, shall be exempted from the duties called the two third subsidies.

XV. Stat. 10 Ann. cap. 19. §. 66. There shall be paid to her majesty upon all chequered and striped linens, and upon all linens printed, painted, stained, or dyed, after the manufacture, or in the thread or yarn before the manufacture, in foreign parts, which during 32 years shall be imported into Great-Britain, and may lawfully be used there (over and above all other customs) a duty of 15l. for every 100l. value.

XVI. §. 67. The said duty shall be managed and brought into the Exchequer, in the same manner as the duties upon paper.

XVII. §. 68. After the said duties upon chequered, &c. linens imported shall be paid, the commissioners and officers of the customs shall cause every piece to be stamped with a seal, to denote the payment of the duties.

XVIII. §. 69. There shall be paid to her majesty upon all silks, calicoes, linens, and stuffs, which during 32 years shall be printed, stained, painted, or dyed, in Great-Britain (such calicoes, linens, and stuffs, as shall be dyed throughout of one colour only, and stuffs made of woollen, or whereof the greatest part in value shall be woollen, excepted) the duties herein after expressed (over and above the duties payable upon importation) viz. For all silks so printed, stained, or painted, in Great-Britain (silk handkerchiefs excepted) 6d. for every yard in length, reckoning half a yard for the breadth; and for all silk handkerchiefs so printed, &c. in Great-Britain, 3d. for every yard square; upon all calicoes so printed, stained, painted, or dyed, in Great-Britain, 3d. for every yard in length, one yard wide; and upon all linen and stuffs printed, &c. in Great-Britain, three halfpence for every yard in length yard wide.

XIX. §. 70. Such commissioners, as her majesty or the commissioners of the treasury appoint, shall be her majesty's commissioners for the receipt and management of the said duties, who shall have power to appoint receivers-general, collectors, comptrollers, surveyors, and other officers; and the commissioners shall cause all the monies to arise by the same duties to be paid into the receipt of Exchequer in England.

XX. §. 71. Every person who shall print, paint, stain, or dye, any such goods, shall give notice of their names and places of abode, and the rooms where they shall work or dry any such goods, upon pain to forfeit 30l.

XXI. §. 72. All persons who shall print, &c. any silks, &c. shall once in six weeks make entry at the next office of all such silks, &c. printed, &c. within such six weeks; and, if such printer, &c. be not the owner of such goods, he shall specify the names and places of abode of the owners, on pain to forfeit 50l. which entry shall be made upon the oath of the printer, &c. or of his chief workman, to the best of his knowledge or belief, unless a Quaker, and then on his solemn affirmation; and the said oaths and affirmations may be administered by the collector or supervisor, without fee.

XXII. §. 73. Provided that no person, for the making of such entries, be obliged to send further than the next market-town.

XXIII. §. 74. Every person who shall print, &c. any silks, &c. shall, within six weeks after he ought to have made such entry, clear off all the duties, upon pain of forfeiting double the duties; and no such person, after such default in payment, shall deliver or carry out any such printed, &c. goods, until he hath paid his duty, on pain to forfeit double the value of the goods.

XXIV. §. 75. The officers of the said duties shall at all times, by day or by night, and, if in the night, in presence of a constable or other officer of the peace, be permitted, upon request, to enter into the house, or other place belonging to, or used by, any person who shall print, &c. any silks, &c. and to take account thereof, and shall thereof make return in writing to the commissioners, leaving a copy (if demanded) with the printer, &c. and such return shall be a charge upon such printer, &c. and, if the officer neglect to leave a copy of his report, being demanded, he shall forfeit 40s. to such printer, &c.

XXV. §. 76. Every officer, empowered to make such charge, shall first be sworn for the due and faithful execution of his office; and the oath may be administered by the commissioners for the duties, or by any of her majesty's justices of the peace, who shall give such officer a certificate thereof.

XXVI. §. 77. The officers shall be permitted to take account of the quantities of silks, &c. in the custody of any printer, &c. to be printed, &c. and in case such officer shall miss any quantity of such silk, &c. and shall not upon demand receive satisfaction for what is become of the same, it shall be lawful for such officer to charge such printer, &c. with the duties of such silks, &c. as if the same were printed, &c.

XXVII. §. 78. If any person who shall print, &c. any the goods aforesaid, shall obstruct the officers, the offenders shall forfeit 20l.

XXVIII. §. 79. No person shall remove any the silks, &c. by him printed, &c. until the officer shall have taken account of every quantity of such goods, and until every piece be marked with a stamp, denoting the charging of the duty, upon pain of forfeiting 20l. and all the printed, &c. silks, &c. carried away without being marked, and found in the possession of any draper or other trader therein for sale, may be seized, or the value thereof recovered, one moiety for the use of her majesty, and the other moiety to the seizer or informer.

XXIX. §. 80. Upon payment of the duties for any quantity of the said goods, the collector shall give a receipt gratis.

XXX. §. 81. The said printers, &c. shall keep the goods not surveyed by the officers apart from all others of the same kinds, which shall have been surveyed, on pain to forfeit 5l.

XXXI. §. 82. If any of the said printers, &c. shall fraudulently conceal any silk, &c. with intent to deceive her majesty of her duties, the party offending shall forfeit 20l. and all the silks, &c. found in any private place, whereof no notice shall have been given, or the value thereof may be seized and recovered, one moiety to the use of her majesty, and the other moiety to the use of the seizer or informer.

XXXII. §. 83. All utensils and instruments for printing, &c. of such goods, in custody of any such printer, &c. shall be liable to the debts and duties, and also to all penalties incurred by such person, as if the debtor or offender were the true owner.

XXXIII. §. 90. No fee shall be taken by the officers from the said printers or others, for any entries, receipts, or marks, in this act mentioned, under the penalty of 5l. to the party grieved.

XXXIV. §. 91. The powers in 12 Car. II. cap. 24. or any other law of excise, shall be used in levying the duties hereby granted.

XXXV. §. 92. All penalties in relation to the said duties upon silks, &c. printed, &c. in Great-Britain, shall be levied or mitigated, as any penalty by any law of excise, or by action of debt, &c. in her majesty's courts at Westminster, or in the court of session, judiciary, or exchequer, in Scotland; and one moiety of every such penalty (not otherwise appointed by this act) shall be to her majesty, and the other moiety to him that shall sue for the same.

XXXVI. §. 93. The commissioners for the said duties on silks, &c. printed, &c. in England, Wales, and Berwick, shall have the same power as the commissioners of excise.

XXXVII. §. 94. It shall be lawful for any person who shall have paid her majesty's duties for any the said imported linens, or for any silks, &c. printed, &c. in Great-Britain, and any other person who shall be intitled to any such goods from the person who paid her majesty's duties, to export such goods for any foreign parts, giving security that the quantities to be exported shall not be reloaded in Great-Britain; which security the customer or collector of the port of exportation shall take in her majesty's name.

XXXVIII. §. 95. If, after the shipping of any such goods and the giving such security, the same shall be reloaded in Great-Britain, the said goods, or the value thereof, shall be forfeited.

XXXIX. §. 96. Any person who shall export such chequered, striped, printed, painted, stained, or dyed goods, may make proof upon oath, that the duties have been paid or secured (which oath the customer or collector is to administer) and thereupon the customer or collector shall give to the exporter a debenture, expressing the kinds and quantities of the chequered and striped linens, and of the printed, painted, stained, and dyed goods, so exported; and, the exportation thereof being certified by the searcher upon the debenture, the collector of the duties upon such goods, in the place where such exportation was, shall pay the duties received to the persons or agents exporting the same; and, if such collector shall not have money in his hands, the commissioners shall pay the said debenture out of any duties upon chequered and striped linens, printed, painted, stained, and dyed goods; or, if the duty of the goods exported were only secured, the same shall be discharged.

XL. §. 97. The commissioners of the customs shall provide seals, with which the imported linens shall be marked, and the commissioners for the said duties shall provide seals (of another kind) for marking the said silks, &c. printed, &c. in Great Britain; and the officers are required in using the same to do no damage to the goods; and, if any person shall counterfeit any seal provided in pursuance of this act, or the impression of the same, to defraud her majesty of the duties, such person, being thereof convicted, shall be judged a felon without benefit of clergy; and, if any person shall sell any printed, &c. silks, &c. with a counterfeit stamp, knowing the same to be counterfeited, and with an intent to defraud her majesty, such offenders, their aiders, abettors, and assistants (being convicted) shall forfeit to her majesty 100l. and stand in the pillory two hours.

XLI. §. 98. Upon oath made by any credible persons, that they have reason to suspect that any printed, &c. silks, &c. are in the custody of any draper, or other person dealing therein, for sale, without having such marks as are required, it shall be lawful for the commissioners within the bills of mortality, or any two justices of peace in other parts of the kingdom, to issue their warrants, requiring any officer for the same duties (with the assistance of a constable or other officers of the peace) in the day time, to search for the same, and to open doors, chests, and package, and to seize such goods, and bring them to the office next the place where they shall be seized.

XLII. §. 99. All calicoes printed, painted, or stained, which shall be within one eighth of a yard of yard broad, or not exceeding one eighth of a yard of yard broad, shall pay as yard broad.

XLIII. Stat. 12 Ann. stat. 2. cap. 9. §. 6. There shall be paid to her majesty upon all chequered and striped linens, and upon all linens printed, painted, stained, or dyed, after the manufacture, or in the thread and yarn before the manufacture, in any foreign parts (except buckrams, lawns, canvas, barras and Silesia neckcloths) which during 32 years shall be imported into Great-Britain, and may lawfully be used there (over and above all other duties) 15l. for every 100l. value, to be paid by the importers.

XLIV. §. 7. There shall be paid to her majesty upon all silks, calicoes, linens, and stuffs, which during 32 years shall be printed, stained, painted, or dyed in Great-Britain (such calicoes, linens, and stuffs, as shall be dyed throughout of one colour, and stuffs made of woollen, or whereof the greatest part in value shall be woollen, excepted) the duties herein after expressed (over and above all other duties) viz. upon all silks so printed, stained, or painted (silk handkerchiefs excepted) 6d. for every yard in length, reckoning half a yard for the breadth; and for all silk handkerchiefs so printed, &c. 1d. for every yard square; upon all calicoes so printed, stained, painted, or dyed, 3d. for every yard in length, one yard wide; and upon all linen and stuffs printed, stained, painted, or dyed in Great-Britain, 1d. $\frac{1}{2}$ for every yard in length, yard wide, as by 10 Ann. c. 19. The duties upon imported goods to be under the management of the commissioners of the customs.

These duties are made perpetual by 6 Geo. I. cap. 4. and great part of them are subscribed into the South-Sea-Stock, and the residue is mortgaged to the Bank, by 2 Geo. II. cap. 3.

XLV. §. 15. Every person that shall export any silks, calicoes, or linens, that are printed, painted, stained, or dyed, for which a drawback is to be allowed, shall give notice to the officer, appointed by the commissioners of the customs, when and where he will pack up the goods to be exported; and the commissioners of the customs are directed to cause such officer to see that the seals be taken off from every piece to be exported, and the officer shall take account of the kinds and quantities of the goods to be exported, and make a return thereof to the officer appointed to receive the same without fee.

XLVI. Stat. 12 Ann. stat. 2. cap. 19. Lawns, and striped or chequered linens, being all white, and neckcloths striped at the end only, and also barras and packing canvas or buckrams, were not intended to be charged by the act 10 Ann. cap. 19. upon importation, with the duties by the same act granted.

XLVII. Stat. 12 Ann. stat. 2. cap. 21. The exception in the act 7 Ann. cap. 7. in relation to tapes or incles, shall extend to exempt European unwrought incle called short spinnal, as well as wrought incle, from the payment of the two third subsidies.

XLVIII. Stat. 1 Geo. I. cap. 36. §. 21. All persons who shall print, paint, stain, or dye any silks, calicoes, linens, or stuffs, at any other place than the usual place of their residence or exercise of their trade, shall first make a particular entry thereof with the proper officer, and pay down the duties, on forfeiture of 50l. to be recovered as by the laws of excise or action of debt, &c. and such silks, &c. so printed, &c. without entry and payment of the duty, may be seized immediately by such officer; one moiety of such forfeitures to the crown, the other to the prosecutor or informer.

XLIX. Stat. 3 Geo. I. cap. 7. §. 38. It shall be lawful to import linseed without paying any duty.

L. §. 39. It shall be lawful to export all sorts of linen cloth of the manufacture of this kingdom, made of flax or hemp, free from all duties.

LI. Stat. 3 Geo. I. cap. 21. §. 1. The act 3 and 4 Ann. cap. 8. to permit the exportation of Irish linen cloth to the plantations, &c. so far as the same relates to the exportation of Irish linen cloths to the British plantations, shall continue in force so long as the merchants, &c. of Great-Britain are permitted to import into Ireland, free of duties, white and brown British linen cloth made in Great-Britain.

LII. §. 2. All linens made in Ireland, and imported into this kingdom, may be shipped off again for any of his majesty's plantations in America, without paying any duty.

LIII. Stat. 4 Geo. II. cap. 16. §. 1. All persons who shall feloniously steal, or hire any other feloniously to steal, out of any whitening or bleaching croft, or place made use of by any whitener, crofter, bowker, or bleacher, for whitening, bowking, bleaching, or drying any linen, fustian, or cotton cloth, or any thread, linen, or cotton yarn, tape, incle, filleting, laces or goods, exposed to be whitened, bowked, bleached, or dried, to the value of 10s. or who shall buy or receive any such goods, knowing the same to be stolen, shall be adjudged felons without benefit of clergy, unless the court shall think it reasonable that the party offending, instead of suffering death, should be transported to some of his majesty's plantations for seven years.

LIV. §. 2. If any person, ordered to be transported in pursuance of this act, shall refuse so to be, or shall break prison, escape, come on shore, or return into this realm, before the term expired, he shall, being convicted, suffer death.

REMARKS.

The following authentic papers being annexed to the report from the committee appointed to examine and state to the house of commons the matters of fact in the several petitions of the manufacturers of, and traders and dealers in, the LINEN MANUFACTORY; we have thought them useful, to give the reader an insight into the real state and progress of this manufacture in Ireland and Scotland.

PREMIUMS given by the linen-board of Ireland, for the encouragement of that manufactory.

LINEN-B O A R D.

The trustees of the linen manufacture are resolved to continue premiums on coarse linens, with some alterations suited to the present state of that growing manufacture.

They therefore propose to give to such person or persons as shall, after the 1st day of November next, manufacture, or cause to be manufactured, the greatest quantities of sound merchantable linen cloth, of the breadth of 26 inches or upwards, made of cleaned yarn, and not less in value than 6d. by the yard, being such as is fit for the use of the servants and negroes in the British colonies and plantations, and shall cause the same to be exported to Great-Britain, or to any other part of his majesty's dominion in Europe or America, on or before the 25th day of December in the year 1750, the following premiums, on the following conditions; provided that the quantities, so manufactured and exported, be not less than those which correspond to each premium, according to the following table:

	Sums.	No. of yards.
One premium -	1. 300	60,000
One premium -	250	50,000
One premium -	200	40,000
One premium -	150	30,000
Two premiums, each -	100	20,000
Four premiums, each -	50	10,000
Eight premiums, each -	25	5,000
Ten premiums, each -	20	4,000
Twenty premiums, each -	10	2,000
Twenty premiums, each -	5	1,000

C O N D I T I O N S.

I. All cloths for these premiums must be proved, upon oath, to have been made entirely of yarn spun in this kingdom, and,

and, all other things being equal, the preference shall be given to cloths, the yarn of which shall be spun from flax growing in this kingdom.

II. Strong well wrought cloths shall have a preference before a greater quantity of slighter, and not so well wrought cloths, provided that the lesser quantity of better cloths be sufficient to entitle the manufacturers to the premium applied for, according to the above table.

III. All cloths manufactured, in order to obtain any of the above premiums, shall be viewed, examined, and stamped, by an officer appointed by the board, publickly in the Linen-Hall in Dublin, or in some public place in the port towns from whence they are to be exported; and they shall be presented to the said officer, not lapped, but in folds.

IV. All persons who have large quantities of linen to be viewed, shall give 15 days notice to the trustees, or their secretary, of their intention to export any quantity of such linen, not less than 4000 yards, to the end that an officer may be sent to view, examine, and stamp the same, as aforesaid, at that port from whence such linens are to be exported, as aforesaid; and they who have smaller quantities must give the like notice, to the end that their cloths may be viewed, examined, and stamped, at the same time, otherwise they must bring their cloths to the Linen-Hall in Dublin.

V. Indented patterns shall be sent up to the secretary of the linen-board of each piece, and the full breadth of the cloth, marked, and numbered in the piece and pattern alike, before any officer be sent to any port whatsoever, to view, examine, and stamp linens.

VI. No person shall be entitled to more than one premium on those coarse linens; and, therefore,

N. B. All candidates shall be strictly examined upon oath, as to their having really and bona fide manufactured, or caused to be manufactured, the linens by them entered and exported, as aforesaid; particularly, whether any other person be at all concerned or interested in the said cloths; and if, upon such examination, it shall appear, that the said cloths, or any part of them, were manufactured covertly, by or for the use of such person or persons as in their own, or in any other name, have applied for any other premium, all such persons, as well they to whom such cloths are found to belong, as they in whose names they are entered, shall be for that time absolutely incapable of any premium, although, before the discovery of such fraud, they may have appeared or be entitled to it.

VII. Any number of manufacturers, joined in fair partnership previous to the manufacturing these linens, are to be taken as one person.

VIII. Authentic certificates of the exportation must be produced from the collectors of the respective ports, at which the several cloths have been exported.

IX. No person is to be admitted a candidate for any of these premiums, who is under a contract with the linen-board, to make and export any quantity of those cloths, for which these premiums are designed.

All persons may be furnished with samples of cloths which are fit for the use of negroes, &c. at the Linen-Office in the castle of Dublin.

Dublin Castle, the
7th of April, 1749.

Signed by order,

ARTHUR NEWBURGH.

L I N E N - B O A R D .

The trustees of the linen manufacture, to encourage the raising and manufacturing of flax, the produce of this kingdom, have agreed to give the following premiums, viz.

I. That all persons who shall, from the date hereof to the 1st of October, 1752, lodge, in the stores of the trustees of the linen manufacture, any quantity of scutched flax, not less than 800 weight, shall receive 10s. for every 100 of flax so lodged, provided the officers appointed by the trustees shall estimate the said flax to be worth not less than 35s. per 100, and provided the said person produce proper certificates, that he had, under the culture of flax, a quantity of ground, not less than two acres, and provided he makes oath, that the said flax is the produce of the land so certified, and that he has never received the premium for it.

II. That all persons who shall, from and to the time aforesaid, lodge in the stores any quantity not less than the weight aforesaid, shall receive 8s. for every 100 weight so lodged, provided the officers shall estimate the said flax to be worth not less than 30s. per 100, and provided the certificate and oath above-mentioned be also complied with.

III. That all persons who shall, from and to the time aforesaid, lodge, in the stores aforesaid, any quantity not less than the weight aforesaid, shall receive 6s. for every 100 so lodged, provided the officers shall estimate the said flax to be worth not less than 25s. per 800, and provided the certificate and oath above-mentioned be also complied with.

Note, It is required that the quantity of ground on which the flax grew, shall be certified by two credible persons in the neighbourhood, who have viewed the same whilst

the flax was growing thereon; and that the name of the townland, barony, and county, in which the said land lies, shall be specified in the certificate; which certificate shall be signed in the presence of some neighbouring justice of the peace.

That the owner of the flax shall make oath, before two neighbouring justices of the peace, that the said flax is his own property, and is the produce of the land certified and described as above; and that the land was in his own occupation at the time of sowing the flax.

That the person who delivers the flax at the stores shall make oath, that he received the same from the person who has made the above-mentioned oath.

N. B. Such persons who intend to apply for the above premiums, may be supplied with the proper form of the oath and certificate by addressing for the same to Arthur Newburgh, Esq; in the castle of Dublin.

Dublin Castle, the
7th of April, 1749.

Signed by order,

ARTH. NEWBURGH.

L I N E N - B O A R D .

The trustees of the linen manufacture, finding the good effects of the premiums granted upon coarse linens, have resolved to extend them further: they therefore propose to give such persons as shall, after the 1st day of May next, manufacture, or cause to be manufactured, the greatest quantity of found, strong, thick linen cloth, of both, or either of the kinds herein after described, made of high white flaxen yarn, without any mixture of tow-yarn, and thoroughly well bleached, and shall cause the same to be exported to Great-Britain, or any part of his majesty's dominions in Europe or America, between the 1st day of May aforesaid, and the 1st day of November, 1750, the following premiums, on the following conditions, provided that the quantities of each kind, so exported by the respective candidates, be not less than the number of yards corresponding to each premium in the following tables:

Premiums on coarse sheeting, which must be a cloth of 800, or upwards, and of the full breadth of 40 inches and an half, or upwards when bleached.

	Sums.	No. of yards.
One premium	1. 300	30,000
One premium	250	25,000
One premium	200	20,000
Two premiums, each	150	15,000
Two premiums, each	100	10,000
Five premiums, each	50	5,000

Premiums on finer sheeting, which must be a cloth of 1200, or upwards, and of the full breadth of one ell, or upwards, when bleached.

	Sums.	No. of yards.
One premium	1. 300	18,000
One premium	250	15,000
One premium	200	12,000
Two premiums, each	150	9,000
Two premiums, each	100	6,000
Five premiums, each	50	3,000

C O N D I T I O N S .

I. All cloths entered and exported, in order to entitle the persons entering and exporting to any of the above premiums, must be thoroughly bleached, without using rubbing-boards or rubbing-milns: and, to this and every other point that shall be thought necessary, the respective candidates shall be examined strictly upon oath.

II. All cloths, as aforesaid, must be brought to the Linen-Hall in Dublin (not lapped, but in the folds) to be there viewed, examined, and stamped, by an officer appointed by the trustees for that purpose; and this view, examination, and stamping, shall be public in the Linen-Hall.

III. All thin, ill woven, or ill-bleached goods, and all that shall be found deficient in breadth, or to have the least mixture of tow-yarn, shall be absolutely rejected.

IV. Thick, strong, close, well-wrought cloths, shall entitle the candidate to a premium preferably to a greater quantity of cloth, less thick and strong, and not so well woven, provided the smaller quantity of better cloth be such as intitles the candidate to the premium applied for, according to the above tables.

V. The same person may entitle himself to one premium on the coarser sheeting, and to another on the finer: but no person shall be qualified to demand or receive more than one premium on a manufacture of the same kind: and therefore

N. B. All candidates shall be strictly examined upon oath, as to their having, really and bona fide, manufactured, or caused to be manufactured, the linens by them entered and exported, as above, particularly whether any other person be at all concerned or interested in the said cloths; and if, upon examination, it shall appear that the said cloths, or any part of them, were manufactured covertly, by or for the use of such person or persons, as in

in their own or any other name have applied for any other premium, all such persons, as well they to whom such cloths are found to belong, as they in whose names they are entered, shall be, for that time, absolutely incapable of any premium, although, before the discovery of such fraud, they may have appeared entitled to it.

VI. Any number of manufacturers joined in fair partnership previous to the manufacturing these linens, are to be taken as one person.

VII. It is expected that all candidates shall mark, in the weaving, the hundreds and beares in each piece.

VIII. Authentic certificates of the exportation must be produced from the collectors of the respective ports, at which the several cloths have been exported. Such persons as intend to apply for any of the above premiums, may be furnished at the Linen-Office, in the castle of Dublin, with samples of the several sorts of cloths which are fit for sheeting of either kind, and for which sorts only the above premiums are intended.

Dublin-Castle, the
7th of April, 1749.

Signed by order,
ARTH. NEWBURGH.

An account of the quantity and duty of statutable and unstatutable linen-yarn, exported out of Ireland to Great-Britain, for twenty years, ending the 25th of March, 1750, each year diffinguihed.

	Linen-yarn.				Duty.	
	Statutable.	Unstatutable.				
1731	13,734 3 28	11 0 8	3,439	5	7	
1732	15,309 1 22	34 0 24	3,844	9	2

1738	15,944 2 3	1 1 0	3,986	15	1½	
1739	18,182 2 16	17 3 0	4,554	10	8	
1740	18,519 0 4	23 3 4	4,641	13	0	
1741	21,640 0 2	16 3 12	5,418	8	7	
1742	16,329 2 28	00 3 24	4,082	18	2	
1743	14,130 2 13	38 2 27	3,552	0	3½	
1744	17,816 0 17	194 3 14	4,551	9	4½	
1745	21,687 0 3	379 1 22	5,611	9	5½	
1746	27,624 0 12	117 3 8	6,964	18	8	
1747	28,900 2 22	09 3 28	7,230	3	3	
1748	19,399 0 14	18 3 16	4,859	4	5	
1749	21,579 2 23	114 1 27	5,452	3	2½	
1750	22,231 1 20	141 2 15	5,628	13	4	

The value chargeable by the Book of Rates is, 5l. for statutable, and 10l. a hundred for unstatutable, at 120lb. to the hundred weight.

The ports from whence linen-yarn is chiefly exported, are, Londonderry, Belfast, Newry, Drogheda, and, in a less degree, Dublin, Dundalk, and Colerain.—The port to which such yarn is exported is Liverpool.

The 5l. per cent. is by the act of customs, anno 1661.—The additional 5l. per cent. by an act of 2 George I. 1717. T. Lill. Exr. Cust.

An account of the nett quantities of cotton-wool imported into Great-Britain for seven years, after a deduction of the quantities exported; drawn from the accounts produced before the committee.

	1,327,367	

Which, on a medium of these last four years, amounts to 2,568,894l. per annum.

The report for the year 1734.

It cannot escape your majesty's observation, that the increase in the number of yards is not in this last year so considerable as in the former: but then your trustees apprehend, that is, in a great measure, to be imputed to a very large exportation of linen-yarn, which bears hard upon the weavers: but as, according to your trustees information, 40 or 50,000l. worth of the yarn, so carried from this part of the kingdom, is brought into England, and employed in the manufactures that are carried on there, they cannot suffer themselves to think of any expedient for preventing it, especially since the demand for their yarn increases the spinning, though it is some mortification to them, that parcels of their yarn are bought up, and exported beyond the seas.

Report for 1736.

The chief cause of the decrease they impute to the great export of their linen-yarn to Manchester, and other parts of the north of England, to be wrought up with cottons there; which they can hardly complain of, because it encourages their spinning, and is a benefit to the united kingdom, by preventing the purchasing of linen-yarn from abroad.

Report for 1738.

One, and indeed the principal cause why the making of linen-cloth for sale is not more rapidly extended, is, that very great quantities of linen-yarn are bought up every year in Scotland, to be wrought up with cotton, and other ways in England, which produces a scarcity of the very materials out of which lincloth is made in this country; inasmuch that the quantity of yarn, which was usually purchased in Scotland for about 2s. 4d. two or three years ago, cannot be now bought under 2s. 7d. or 2s. 8d. and this proves so great a drawback on the manufacture of cloth in this country, that, did not the benefit of it redound to the other part of this your majesty's kingdom, your trustees would find themselves under a necessity of applying to your majesty for a remedy, by act of parliament, to this inconvenience. But, as the finding yarn fit for their purpose in this part of the island, may be a convenience to your majesty's subjects in the other, and as the demand for yarn from hence must tend to propagate spinning here, your trustees have laid aside all thought of asking for any such remedy.

Another cause why the manufacturing yarn into linen does not make such progress as were to be wished, is, that great quantities of yarn, especially of the finer sort, are converted into thread for foreign, as well as for our own markets: and, as the thread-manufacture of this country gains considerable reputation, your trustees humbly think it ought rather to be promoted than discouraged.

It being therefore, in your trustees apprehension, improper to attempt to remove any of those causes which drain our mercats of yarn, and raise the price of it, whereby the working up larger quantities of linen is prevented, the only thing remains for them to do, is, to try to increase the quantity of yarn, so as, if possible, to answer all demands, by encouraging the spinning of flax, where that art is least known, and consequently most neglected.

Royal Sign Manual.

G E O R G E R.

Trusty and well-beloved, we greet you well. Having taken under our royal consideration your report made to us last Christmas, and the proposition therein contained of publishing and establishing for three years, from the said Christmas, a plan for distributing the monies applicable to improvements, in manner following, viz.

Item, For premiums, after the rate of 15s. per acre, for 2000 acres of ground to be sown with lint-seed and hemp-seed, according to rules and conditions to be established	1500	0	0
For a salary to a foreign-flax raiser, at 30l. per annum	30	0	0
For defraying the maintenance of four young men, instructing to raise and break flax, at Mr. Hope of Ranelagh's lint-mill	50	0	0
For salaries to 12 young men instructed, or to be instructed in raising flax, to be stationed in different parts of the country, at 7l. 10s. per annum	90	0	0
For erecting two heckleries, for heckling flax, at 20l. per annum each	40	0	0
For instructing four young men in the art of heckling, at 4l. per annum each	16	0	0
For purchasing four sets of heckles, to be given to these young men when instructed, at 6l. 10s. each set	26	0	0
For a salary to a person skilled in the raising, dressing, and heckling of flax, for surveying and examining the raisers, dressers, and hecklers, at the places where they shall be stationed	60	0	0
For encouraging spinning-schools, for teaching the spinning of flax	46	0	0
For prizes to those that shall spin the best yarn	50	0	0
For encouraging four Dutch weavers, to perfect journeymen-weavers, at 40l. per annum each	160	0	0
For purchasing Dutch looms, with complete tackle, to be given to such journeymen completed	190	0	0
For salaries to 55 lappers and stamp-masters, at 10l. per annum each	550	0	0
For prizes to be given at such stations as the trustees shall appoint, to such persons as shall work the best webs of coarse linen-cloth, of the qualities and sizes by the trustees to be limited	212	0	0
For salaries to two general riding-officers, at 125l. per annum each	250	0	0
For a salary to a skilful person, who shall visit the several manufacturing counties, and there instruct the stamp-masters, as well as the weavers, in the best method of washing, sorting, slaying, and weaving of their yarn	130	0	0
For a salary to the warehouse-keeper of the cambric	100	0	0
For defraying the expence of carrying on prosecutions against such as transgress the laws concerning the linen and hempen manufactures	100	0	0
For procuring models of the best looms, and other instruments, for improving the linen and hempen manufactures	50	0	0
Making, in the whole, for the linen and hempen manufacture	3650	0	0

We are graciously pleased to approve of your purpose of publishing the aforesaid plan for distribution of the monies intended for improvements, to continue and endure for three years from Christmas last: and we are also graciously pleased to approve of the propositions aforesaid, for employing 1205 l. part of the savings in your cashier's hands: and do hereby authorize and empower you to issue your precepts to your cashier, to pay, out of the monies in his hands, the several sums above-mentioned, to the several uses and purposes aforesaid: and this, together with your precepts to follow there-

upon, and the receipts of the persons to whom the precepts shall severally be made payable, shall be to you, and your cashier, a sufficient authority and exoneration. And we do further will and direct, that, in your next annual report, you do lay before us a particular account of the monies that shall be so issued by you for these services. Severally given at our court at St. James's the 12th day of May, 1740, in the 13th year of our reign.

By his MAJESTY's Command.

So signed, R. WALPOLE,

GEO. DODDINGTON,

SUNDON.

Prices of raw linen-yarn in Germany, as imported by De Ponthieu and Egerton, for twelve years last past, exclusive of charges and duty here.

The duty upon yarn here, from 1739 to 1747, was 2d. $\frac{1}{2}$ per pound weight: and, from 1748 to 1750, 2d. $\frac{1}{8}$, besides charges and freight, which, on coarse linen-yarn, comes to near $\frac{1}{4}$ per pound.

Irish premiums, as published in the Daily Gazetteer of Tuesday, February 25, 1746.

I R E L A N D.

A bounty of 1d. $\frac{1}{2}$ per yard being granted by the British parliament on all British or Irish linens, made of flax or hemp of the value of 6d. per yard, and not exceeding 12d. per yard, that shall be exported out of Great-Britain to the plantations, &c.—The Linen-Board have agreed to give the following premiums, viz.

1st. 500l. To such person or persons as shall manufacture, or cause to be manufactured, the greatest quantity

tity of sound merchantable linen-cloth, of 26 inches breadth, or upwards, made of cleaned yarn, not less in value than 6 d. per yard, nor more than 10 d. being such as is fit for the use of the servants and negroes in the British colonies and plantations; and shall cause the same to be exported to Great-Britain between the 1st of May, 1746, and the 1st of May, 1747, provided the quantity so exported be not less than 50,000 yards.

- 2d. 400l. On the like conditions, to such as have not obtained the first premium, and to export not less than 40,000 yards.
- 3d. 300l. On the like conditions, to such as have not obtained the first or second premiums, and to export not less than 30,000 yards.
- 4th. 200l. To such as have not obtained the first, second, or third premiums, and to export not less than 20,000 yards.
- 5th. 100l. To such as have not obtained the first, second, third, and fourth premiums, and to export not less than 10,000 yards.

For exporting 150,000 yards is 2d. $\frac{4}{5}$ of a penny each yard, over-and-above 1 d. $\frac{1}{2}$ per yard, given by the English parliament.

N. B. The Irish give all utensils for the linen manufactory, as looms, reeds, hatchels, wheels, and salaries to a foreman and a whittler, besides seed to sow hemp and flax.

Dublin Castle, March 7, 1745.

The trustees of the linen manufacture of Ireland give notice, that they will give considerable encouragement to such flax-dressers (to be approved of by the trustees) as shall come from any parts beyond the seas, into, and settle and carry on their trade in that kingdom.

Proposals to be addressed to Arthur Newburgh, Esq; at the castle of Dublin.

Signed by order,

ARTHUR NEWBURGH.

Premiums given by the Linen-Board of Ireland, for manufacturing, or causing to be manufactured, great quantities of coarse linen, between the 1st of May, 1747, and the 1st of August, 1748, fit for the use of servants and negroes in the British colonies and plantations.

	Yards.	1.
Messieurs Jebb, who manufactured —	275,643	500
Mr. William Lefanu — — —	253,606	400
Mr. Ellis Price — — —	135,011	300
Mr. Lewis Laurent — — —	71,594	200
Mr. John Pemberton — — —	53,882	100
Mr. Thomas Reed — — —	37,475	50
Mr. Jonah Tanner — — —	31,604	50
Mr. Daniel Dickenson — — —	19,236	25
Mr. William Willan — — —	11,165	25
Mr. John Starkey — — —	9,271	25
Mr. Henry Dempfy — — —	3,777	20
Mr. Thomas Gamble — — —	2,146	20
Mr. John Crofs — — —	1,902	10
Mr. George Holmes — — —	1,538	10
Mr. Richard Dillon — — —	869	5
Mr. John Newett — — —	621	5

1745

Extracted from the Gentleman and Citizen's Almanac, for the year 1751.

Premiums on coarse Linens, for the year ending the 1st of November, 1749, were paid by the Linen-Board to the following persons, viz.

Mr. Richard Jebb, who caused to be manufactured and exported the greatest quantity, viz.	Yards.	1.
Mr. William Lefanu — — —	208,873	500
Mr. Ellis Price — — —	180,345	400
Mr. Lewis Laurent — — —	142,140	300
Mr. Abraham Cheborn — — —	62,406	200
Messieurs Jonathan Tanner and John Starkey each 50l.	37,817	100
Richard Diston, Thomas Gamble, Dan. Dickinson, George Holmes, each 25l.	—	100
Thomas Read, Henry Dempfy, John Newett, Benjamin Robertson, Frank Taylor, each 20l.	—	100
John Duff, Samuel Greenwood, George Booth, John Pemberton, Richard Bryington, James White, Jonathan Newett, John Holmes, Andrew Hartford, each 10l.	—	90

Jonathan Tanner of Bandon, who distinguished himself as a useful manufacturer in that part of the kingdom, had an additional premium of — 40

In all 1,930

The other premiums promised by the Linen-Board were not due in October 1750.

REMARKS on the LINEN MANUFACTURE in general.

From the state of the case of the linen manufacture, as before given, the necessity of its utmost advancement manifestly appears; and that not only amply to supply ourselves and our plantations, but to put ourselves in a condition to participate in the supply of foreign countries. And what weighty and conclusive objections can be made against the probability of so doing? Is not Great-Britain, in conjunction with Ireland, and the aid of her plantations, as capable of supplying themselves with all flaxes and hempen linens, as France heretofore was to supply themselves with the woollen manufactures? Do we not labour under far less difficulties and discouragements in the one respect, than that nation did in the other? If we are once arrived to the pitch of being able fully to furnish ourselves, what hinders that we cannot exclude the wear of foreign linens, as France has that of foreign woollen goods? There was a time, when it might, perhaps, be our interest, in some degree, to import foreign linen; it was so when those foreign linen countries took an equal value, or more, of our woollen, or any other manufactures, than we did of their linens: but no one, I believe, will undertake to demonstrate that the case is so at present.

On the contrary, the balance of trade is greatly in our disfavour with the foreign linen countries in general; and, before the evil further increases, is it not prudent to think of a remedy? When disadvantages of this kind grow to a certain height, they frequently become irremediable, without coming to an open rupture with such foreign countries wherewith we are so circumstanced: but, if we are wise enough gradually to decline purchasing of their produce and manufacture, in the like proportion as they do ours, we shall not only save the national treasure, but preserve peace and tranquillity with those very nations.—And, when this general manufacture shall be brought to a height sufficient to supply ourselves and plantations with a commodity as cheap and good in quality as foreign linens, what hinders but we may cast about for foreign markets for the vent of our linens, as the French have done for their woollens? But, if we never put ourselves into a condition of supplying ourselves, how can we ever expect to have any share in the supply of other nations?

Should it be said, as has been, that the ineffectuality of the late cambric act shews the improbability, if not the impossibility of preventing the smuggling importation of foreign linens, and, therefore, it is in vain to attempt the advancement of our linen trade.—That the resemblance between cambrics and other fine linens, both foreign and British, is such, that very few, and those only of the greatest experience, can pretend to distinguish them.—That, this distinction being principally grounded on circumstances capable of being easily varied or disguised, such as length, breadth, bleach, dress, and package, the most experienced dealer cannot determine with any degree of certainty, because he can never be sure that he sees the goods in their original or customary form: and upon this principle it is, that the most skilful give up all remnants and washed linens, as utterly undistinguishable.—Whence it follows, say these objectors to the prohibition of foreign linens, that it can never be made to affect the wearer thereof; and, if so, it may from experience in other instances be concluded, that no penalties will be found sufficient to deter the seller, though it should be much easier to detect and convict him than from the nature of the thing is possible.—Should this, and much more, be urged in the like strain, ought this to discourage us from attempting to go greater lengths in this lucrative manufacture? Does not the successful example of France in the woollen manufacture shew the experimental invalidity of all arguments of this kind?

In relation to the resemblance between foreign linens imported into this kingdom of the favoured nations, and that whose linens are intended to be excluded, it is to be feared that the latter can never be effected without the former is so too; and since our British and Irish linens do, in many respects, nearly resemble the foreign linens at present, and are so daily improving, that no doubt can be made of their arriving at the like degree of perfection, if due encouragement is not wanting among ourselves: since this is the case, our own linens can never take general place in the kingdom, 'till all foreign linens whatever are absolutely excluded, because those of the favoured foreign nations cover, conceal, and increase the smuggling of the other. To lay the axe to the root of the evil, therefore, what expedient can be more natural and effectual than to prevent the importation of either, as we become capable to supply ourselves? These were the measures which the French successfully took with regard to the establishment of their woollen manufactory; for, when they ceased to

take the English woollen goods, Holland attempted to supply them, but they were resolute, and excluded all foreign woollen manufacture, and contented themselves with the wear of their own, though very coarse and indifferent at their first attempt, rather than not gain the victory in trade which they so wisely aimed at.

If this, on impartial examination, should be found the best policy that Great-Britain and Ireland can pursue, in order to the successful establishment of the linen manufacture in general, what can be a more natural introduction to this desirable end, than to take off the drawback upon foreign linens, and to encourage the production of flax and hemp in our own plantations to the utmost? And, when once these general manufactories, by our own consumption and that of our plantations, are brought to a pitch of perfection no way inferior to those of the foreign linen countries, have we not as good chance to partake of the supply of such foreign nations as want them, as the French had in the woollen manufactory? Cannot the British and Irish linen manufactures imitate the lengths, breadths, bleach, drefs, and package of foreign linens, as well as the French did with respect to the English woollen goods? See the article FRANCE.

If then, upon the whole, it shall appear to be right commercial policy to advance our linen manufactories to their full extent, upon those principles which we have humbly suggested, can it be wrong policy to use every endeavour to prevent the importation of French cambrics, which swept away 200,000 l. a year of our ready * cash? If the end has not hitherto been so effectually answered as could be wished by every true friend to his country, is it prudential to slacken in our endeavours? Does it not more become the wisdom of the nation to try every expedient, 'till the great end shall be answered, than to give up a point of such national importance? Can any thing be insuperable to the superlative wisdom and resolution of a British parliament? The unspeakable advantage which Scotland and Ireland have already received from the linen manufacture, should fill every Briton with the warmest zeal for its utmost encouragement in these kingdoms.—What immortal honour is deservedly due to the great earl of Strafford, who first introduced the linen manufacture into Ireland, by sowing great quantities of flax-seed, and setting up several looms at his own expence, to invite the Irish to follow that trade, without prejudice to England, which has proved, and is, at this day, their greatest benefit and support†? Is there not infinitely more glory in being the founder of a manufacture which has given bread to millions, than to have been the greatest conqueror upon earth? See SCOTLAND and IRELAND, and the several other articles before referred to under this.

- * While the French, at the beginning of the war, in 1742, were secretly assisting the Spaniards, before hostilities commenced between the English and French, alderman Janssen most zealously endeavoured to put the nation upon distressing the latter, by preventing the importation of their cambrics.—Among other measures taken by this gentleman, he was, as I am informed, at the expence of inserting, for several months together, in the Daily Advertiser, which contributed not a little to open the eyes of the kingdom, 'That two hundred thousand pounds sterling, paid annually to France for its CAMBRICS, amount (from the time of the peace of Utrecht) to above SIX MILLIONS.'—To this the author thereof subjoined the following very natural query, 'Whether our having furnished the French with so immense a sum may not have greatly forwarded their destructive schemes, and partly have been the occasion of this expensive war, which we, consequently, are the less able (by the above-mentioned sum of six millions) to carry on, &c.'—Though the judicious efforts of this worthy gentleman have not hitherto answered the national expectation, yet it may prove a good step towards it, if measures adequate to the evil are taken by the parliament.—If one expedient will not do, should we ever cease trying 'till we fall upon what will?

Though this gentleman's good intentions to serve his country, in this respect, have not hitherto so effectually answered as could be wished, yet many of his endeavours have been successful.—He attacked smuggling in general, and particularly that of teas and French brandies, as being the chief basis of this detestable practice. He published several judicious pieces on this occasion, and particularly a PLAN for reducing the excise on teas; which being afterwards adopted by the honourable House of Commons, an act passed in 1745, which took place at Midsummer the same year; whereby the excise upon tea was reduced from 4 s. to 2 s. per pound, to prevent smuggling: by which wise measure the revenue was immediately doubled, and has continued to encrease ever since.—See our article TEA. In consequence of the eyes of the nation being opened, an act passed in the year 1743-4 for prohibiting the wear of FRENCH CAMBRICS, which not proving effectual, several other acts passed afterwards to enforce this prohibition, which at length, had the desired effect; inasmuch that at this day 1764, the manufacture of cambric in FRANCE is almost entirely broke up; and the ladies here wear nothing but plain flowered, and striped MUSLINS, from the EAST-INDIES, with GAUSES, BLONDS, &c. &c. of BRITISH FABRIC. He was elected member of parliament for the city of London in the year 1747; and this worthy representative has also been success-

ful in various other of his public-spirited attempts. At the breaking out of the late war, a memorial was drawn up, in order for it's being presented to the duke of Newcastle, setting forth reasons for the packets being continued between Dover and Calais; which memorial was begun to be signed by some merchants. Of this the alderman getting early intelligence, he drew up a counter-memorial to his grace, to which, in three days time, he obtained the signature of near 300 of the principal merchants of the city of London. This had so good an effect, that the injurious correspondence by that channel was interrupted during the whole war.—Mr. Janssen was likewise principally concerned at a most critical point of time (that of the rebellion 1745) in that capital measure for preserving the public credit of the kingdom, by obtaining a subscription of the principal merchants and traders of the city of London, to take banknotes in payment; for which the alderman had the thanks of his late royal highness the prince of Wales, together with his picture, and those likewise of the then prime minister.—He first set on foot, at a great expence, the revival of the herring-fishery in these kingdoms, in the year 1750, by which 20,000 persons, at one time, have been employed in it's different branches; and it is to be hoped, that it will prove as inexhaustible a mine of treasure to Britain as it has done to a neighbouring nation.—These things I mention in honour to this meritorious gentleman, not only to the end that such virtues may never be forgot, but to inspire others with the like public spirited principles; for, the more examples we have of this kind, the more will our commercial prosperity be advanced.—This is my only motive, having never exchanged a single expression with that gentleman in my life.

† See the earl of Strafford's Letters and Dispatches, &c.—By the Rev. Mr. Knowler.—Dedication to the earl of Malton.

L I N T, in regard to the linen manufacture. This manufacture can never arrive in England, Scotland, and Ireland, to that perfection it has done in foreign countries, unless every part of the whole operation, from the raising the flax to the completion of the intire manufacture, be vigilantly attended to.—The best flax-dresser [see FLAX] when he does his utmost, cannot finish of the best lint (for bad and unripe lint, or lint not fully watered, or spoiled in the watering, will not bear the expence of dressing, and is indeed not worth dressing, nor ought it to be dressed) above 12 pounds weight in a day; and a well-contrived lint-mill will dress, at the rate of every hand employed in it, 16 pounds in a day. The cheapest that good lint can be dressed by the hand, is at least one third more than it costs by the mill.—A farmer where our linen manufactures are established, and who is in the practice of summer-fallowing his ground, cannot, perhaps, do a thing more for his advantage than to send in an able-bodied young man to be bred to the Flanders way of flax-dressing, and to sow annually an acre or more, of the richest fallow ground with lint, to keep this servant constantly employed in managing and dressing it; if his farm lies within a few miles of a lint-mill, he may raise as much flax as can be dressed by this servant, and the help of the mill, and send it, from time to time, to the market in small parcels for sale, so soon as it is ready for the first heckle.

There must be at every such lint-mill, besides the boys that attend the breaking and the scutching of the mill, at least two or three skilful flax-dressers, to finish the flax by the hand, and to pull and draw it in, in which they are careful never to put the root and feed-end together, as is too often done, through inadvertency, in Scotland and Ireland, but keep it always carefully in the same way it grew, to the very last operation, whether it be heckled or dressed for spinning by brushes, as the fine lint is; and, in spinning, the thread is always drawn from the root-end, and not by the bucht from the middle, according to the practice of some ordinary spinners. There is a lint-mill in Scotland, upon the water of Eden, a little above Cowpar in Fife, which is said to be brought to the greatest perfection, and is a compleat pattern to be followed by all who intend to erect lint-mills, and to follow this useful and beneficial trade.—At the same mill the proprietor carries on another branch also, viz. the keeping heckles and skilful hecklers, for dressing the lint for spinning.

R E M A R K S.

The woollen manufacture of England never came to it's perfection till the business of the woollstapler came to be a trade; and it must be the same with the linen.—Here is a fine branch of business for any gentleman who has the conveniency of water for erecting a lint-mill; he may either raise lint himself, or buy it in the boon from others, and dress it by his mill for the heckle; he may have his heckles in a convenient house near to it, for dressing and stapling the lint by proper heckles, into fine dressed flax, fine dressed tow, common tow, backings and beards, for the service of the country spinners.

L I T H U A N I A, the great duchy, in Poland. This large country has Greater Poland and Prussia on the west; part of Muscovy on the east; Livonia, the Baltic Sea, and part of Muscovy, on the north; Red Russia, Volhinia, and Podolia, on the south; and the Ukrain on the south-east. It's chief rivers are the Borythneses, or Nieper, Dwina, and Niemen.

The

The air is generally thick and foggy, because of it's many woods and lakes; that it is not near so fruitful as Poland, yet has plenty of wax, honey, mead, pitch, tar, and timber, and abounds with black cattle, sheep, ermins, fables, and all manner of furs. But their greatest trade of export is to Holland, &c. with their pitch, tar, and timber, for which they receive woollen cloth, salt, and wines.

VILNA, the capital of a palatinate so called, is a large populous town, with a good trade, but chiefly carried on by foreigners, the natives being poor and lazy.

GRODNO stands partly on a hill, by the river Niemen. Some reckon it the metropolis of Lithuania. The houses are generally of wood and very mean; but it has a good trade, the merchandizes of several parts of Lithuania being transported from hence to Dantzic.

KOWNO, near the influx of the river Niemen into the Wilna, is a well-built town, and much frequented by German merchants.

MOHILOW, seated on the Nieper, is a large, well-built, and populous city: it's market is much frequented by the Muscovites, who transmit their furs from hence into Poland and Germany.

LIVES [ANNUITIES upon LIVES.] Under the article **LEASES** we were obliged to enter into the doctrine of annuities upon lives, which are computed upon the principles of the learned Dr. Halley and Mr. Abraham De Moivre, and tables formed therefrom by Mr. Richards, applicable to great variety of cases. But, since the time that these great men wrote, there have been other ingenious gentlemen, who have entered into the rationale of their principles, and have made such objections thereto that deserve attention; for, when the intelligent reader has the substance impartially laid before him that has been urged on all sides, he will be the better able to discern where the truth lies. This I shall do with all the brevity and perspicuity that I can. See the article **ANNUITIES**. The principal gentleman that dissented from those eminent mathematicians, with any sort of reputation, is Weyman Lee, Esq;—‘I am sensible, says this ingenious author, that a man ought to go on good grounds when he presumes to attack calculations made by so great a master of those things as Dr. Halley, &c.’—With much more in the gentleman-like strain, which becomes all men of science. ‘The chief exception, continues he, which I take to the doctor's table, is, that, where the value of an annuity for a life in one period of it is computed with the value of an annuity for a life in another period of it, the term to which such value in one period is equal, does not vary by a proportional degree of decrease from the term to which such value in another period is equal.—In consequence whereof, the chance of the duration of the annuity does not sink by the same degrees as the chance of vitality decreases: nor does the value of the annuity itself, could it be considered even abstractedly from the dependent life, decrease, from one period of life to another, in a just proportion.

The meaning hereof will best appear by the following tables. An example, however, may be useful.—An annuity for the life of a person between the age of 15 and 20, is in value 13—33, which is equal to a term of 26—2—61; and an annuity for the life of a person between the age of 20 and 25, is in value 12—78, which is equal to a term of 25—0—00 according to the doctor's table; and, if we deduct 12—78 out of 13—33, the remainder will be 00—55, and this is the decrease in the value; and, if we deduct 25—0—00 out of 27—2—61, the remainder will be 2—2—61, and this is the difference in the term in those two periods.

This will be more obvious if expressed thus: a person of the age between 15 and 20 has a chance to live 27 years, 2 quarters and 61 days; and one of the age between 20 and 25 has a chance to live 25 years; that is, less than a person of the precedent age 2 years, 2 quarters, and 61 days: this is what is called the difference of the term of years from one period of life to another: and, since the decrease in value will always correspond to the difference in the term, the value of the annuity in the second period is less than that in the first period by 00—15 in decimals, which is equal to a term of 2—2—61 in reversion, after a term of 25—0—00.—So that the doctor's table does not preserve a just proportion in this instance; that is, such a proportion as can be justified by any bills of mortality, or be accounted for by any **FACTS** that ever happen in nature.

To shew this defect the clearer, I have inserted the doctor's table in No. III. following; and, since the same exception lies against Mr. Hayes's, Mr. Richards's, and Mr. Morris's tables for the value of annuities on a life, I have inserted a part of them likewise, in the tables No. IV, V, and VI; and to each of them I have added three calculations of my own: the first column of which contains an account of the term of years, and parts of a year, to which every life is equal, as it corresponds to the value on the tables respectively: the second gives the several differences in the term of years, and the third the decreases in the value of the annuity, from one period of life to another, as they come out on the several tables respectively.—In my own table, No. II. I have inserted solely the term to which a life is equal, because the value of the annuity will

Vo L. II.

of course attend on, and be equal to the term; and to this a third column is added, which gives this difference in the term, according to such tables, and the decrease in the value will be in the very same proportion: from whence, and by an inspection into the several tables, and a comparison of them together, we may discern which of them best preserves that proportional difference in the term and decrease in the value which ought to be observed in this case.

Since then these tables are all of them more or less defective in this material point, I shall confine my reflections solely to Dr. Halley's tables, though my reasoning in general is applicable to all of them equally.

The particular periods of life, which are defective in this respect, are 20 and 40: in the first of which the difference in the term is much too great, and in the latter too small. In the first column of this table, which contains the ages of persons, we have 20, which is the period including the lives from 20 to 25; and against it, in the fourth column, which gives the difference between the term in that period, and the term in the preceding, we find the difference to be 2—2—61: and, in the same fourth column, we see the difference for the preceding period to be 00—2—30, and that of the subsequent one to be 2—0—46: and this difference 2—2—61, compared with such the precedent and subsequent difference, is such a proportion as cannot be maintained by any bills of mortality, at least any that ever I saw, or by any reason in the nature of the thing.

If we consult the modern bills of mortality for London, where the ages of persons dying are distinguished in periods from 10 years to 10 years; and, in the extract added in the following tables, it appears that the number of persons dying in the period between 20 and 30 is less than the number dying between 30 and 40; and, if we should suppose, of those dying between 20 and 30, one half were of the age between 20 and 25, and the other half between 25 and 30, which is a more favourable supposition than there are just grounds to make, yet, since the difference in the intermediate period, viz. between 20 and 25, ought to bear a proportion to the precedent and subsequent one, it should therefore be something greater than the precedent, and something less than the subsequent one: whereas, in this intermediate period, the difference is 2—0—31 more than in the precedent one, which is an extravagant decrease; and it is also more than the subsequent one by 00—2—15, when the subsequent difference, if there were any variation, ought undoubtedly to be the greater, for that fewer persons, out of an equal number, die between 20 and 25, than between 25 and 30; and if we should suppose, as before, that the number of persons dying of the age between 20 and 25, and between 25 and 30, was the same; yet the number co-existing in the first of the two periods must be greater than in the second, and, consequently, the chance of mortality in the latter period must be greater than in the former, the same number dying out of a less number living: and, therefore, the difference in the latter ought to be greater.

At the time, indeed, when the doctor composed this table, the bills of mortality for London were not published with the distinction of the ages of the several persons dying, so that these bills could be no guide to him. But then the Breslaw table was before him when he wrote; and if this be the standard, whereby to try this table for the value of annuities for life, my objection of the want of a proportionable difference in the term and decrease in the value is stronger upon an inspection into that table, than in any other light whatever. If then we consult the Breslaw table, which we have inserted among the following, it will appear that the number of persons dying in a year between 15 and 20 is 30, the number between 20 and 25 is 31, and between 25 and 30 is 36. Upon which it may be observed, though the number co-existing in the first of these periods is greater than that in the second; yet that the number dying in the first is less than the number in the second, and the same observation holds good in comparing the second with the third period: whence it follows, that the difference in the term ought to be in proportion correspondent, or, in other words, such difference in the term ought to bear a proportion answering to the increase in the chance of mortality: and, if the Breslaw table be a rule for the increase of the chance of mortality, it must be a rule for the difference in the term, and yet, for this difference in the term, we see that the proper proportion is directly contradicted, or unreserved.

Many have a notion, that the age of 30 is the best age on which to have an annuity depending, for that those under this age are exposed to more casualties than those arrived to some maturity of age and discretion; and, therefore, that the chance of vitality in the younger part of life is more uncertain than at the age of 30, or thereabouts. But Dr. Halley discovered no such thing in the bills of mortality for Breslaw, nor can any one discover it in the Breslaw tables, which he formed from thence; for there the number of persons dying in the period from 10 to 20 is 63, from 20 to 30 is 67, and from 30 to 40 is 86. If we look into the modern bills of mortality for London, and my extract from thence, there we find the case to be the same in the main, though not in the same proportion, and that the number of those dying in

B b the

the older period of life greatly exceeds the number in the younger : and the account there stands thus. Out of every 1000 persons dying, there die of the age between 10 and 20, 30 ; of the age between 20 and 30, 72 : and, of the age between 30 and 40, 93 : and from hence it appears evidently, that this notion of the best age of life is not a just one.

But, if there was a better foundation for the notion than there appears to be, and if there was room for a latitude in the calculation of the chances of mortality for the age between 10 and 30, this can avail nothing in the age of 40 or thereabouts ; and yet in the period of 40 we have an improper proportion in the difference of the term, for that it is too small, when compared with the difference in the periods on both sides of it. In this instance, indeed, the deviation is not great ; but, if any difference were made, it should have been greater in this than in the precedent, and less than in the subsequent period ; that is, it should grow greater and greater gradually, as the age of life advances : whereas the difference is less in this period, than in the periods on either side. And, since all that has been urged against the want of proportion by an over-difference, is equally applicable to this case of an under-difference ; I shall only add, that I believe no bills of mortality whatever or any thing in nature do, and that I am very sure the bills of mortality for Breslaw or for London do not, warrant the one or the other.

These are the single articles in this table which are most exceptionable ; but, in truth, this defect goes through the whole performance, which I will shew by an instance that demonstrates the defect. The doctor, on the bills of mortality for Breslaw, observes, and I believe all mankind will agree it to be true in the rest of the world as well as there, that, out of a certain number of persons in the decline of life, more die in a year, or any determinate number of years, than those do out of an equal number of persons in the youth and vigour of life : and he has himself given us the Breslaw table, as a scheme of the increase of mortality, according to the advance in age. Now, if the chance of mortality increases, and the chance of vitality decreases, in proportion to the advance in age ; and, if the value of an annuity for a life, or the number of years to which a life is equal, which differs in nothing but the manner of expression, does depend on the chance of the vitality of the life, and on nothing else, as most certainly it does, it evidently follows, that the value of an annuity for a life, or the number of years to which a life is equal, must decrease faster, and by greater degrees in the older than in the younger stages of life, and in the same proportion as the chance of vitality decreases.

Let us see now how this difference or decrease in the term will stand, if we put together the whole of the decreases for the four periods of younger life, of middle life, and of the oldest life. The whole then for the first set is a term of 7—1—46, for the second 7—0—15, and for the third 7—1—00 : which, we see, is directly contrary to the rule laid down, and almost inverts the proportion. If we would know what is the right and just proportion to be observed, and might depend on the Breslaw tables as giving us such proportion, and this author's table for the value of annuities was framed from those tables ; on a computation from thence, the case, as between the persons of the youngest and the oldest period of life, stands thus. The number of persons co-existing above the age of 10, and under 30, which contains the four periods of younger life, consisting of 20 years, is in all 11875 ; and the number of persons dying out of them in one year is 130 ; that is, one in 91, or thereabouts. The number of persons existing above the age of 55, and under 75, which contains the four periods of older life, consisting likewise of 20 years, in all 3726 ; and the number of persons dying out of them is 204, that is one in 18, or thereabouts. The proportion here then is plainly five to one : that is, of an equal number of persons of each stage of life, the number of the older stage of life dying a year will be five, and of the younger stage one only : or, if one person only be nominated of each stage of life, the chance of mortality on the side of the person of the older stage of life against the person of the younger stage is five to one.

Whether this proportion of the increase of mortality, as it arises from a computation on the Breslaw table, be a just one, I neither affirm nor deny ; but, be it right or wrong, this author's table for the value of annuities for a life was framed from thence ; and, therefore, the difference or decrease in the term, from one period of life to another, and between the periods of younger and elder life, should bear such a proportion to one another on the table for the value of annuities, as the increase of the chance of vitality in one period of life bears to that increase in another period, according to the Breslaw table : and I may appeal to the doctor's own calculation, whether the decreases given in one table are conformable to the decreases in the other table, or are agreeable to any rule, which arises from the nature of the life of man.

I might rest the matter here ; but since it may be urged, although the proportional decrease contended for is not pre-

served, when we compare it, as we have hitherto done, with the scheme of the difference of the term ; yet if we compare it with a scheme of the decrease of the value, and the table of annuities is framed by a computation from the value and not from the term, there possibly the proper proportion may be well enough preserved. For this reason I made the calculation inserted in the fifth column of the table No. III. which contains an account of the decrease of the value of an annuity from one period of life to another, computed by the values only ; and we find the very same defects here as we had before, and in the very same instances : and, indeed, it must of necessity so come out, since the value and the term do always reciprocally correspond.

The single periods of life which we found fault with, according to the scheme in the terms, were 20 and 40 ; and in these two articles the same error occurs upon this scheme as we met with on the former. On the period 20 we objected, that the decrease, when compared with the precedent and subsequent one, was too great ; and here the several decreases of these three periods being, as stated decimally, 11,55,51, it appears plainly on the face of them that the middle one, viz. that for the period 20, is greater than the precedent one by a difference much too large, and also greater than the subsequent one, when undoubtedly it ought to be something less. And as for the period 40, to avoid repetitions, I would refer you to the scheme itself ; an inspection into which does plainly enough discover the defect ; for the decrease in that period is less than in either of those on each side, and therefore cannot possibly be in a proper proportion to both of them.

These, indeed, are not very great mistakes, or however, by a small variation might be rectified ; but, if they were set right, yet the grand error will still remain, viz. want of proportion through the whole scheme. The decrease in the four first stages of life is, indeed, in value, computed by way of decimals, 1—7 ; and in the latter stages is 3—91 ; notwithstanding which, in reality, there is no great difference in these two decreases, and what difference there is lies on the wrong side, viz. on the side of 1—72, that being the greater decrease of the two. To say that 1—72 value in decimals, is something greater than 3—91 value in decimals, seems to be a paradox, and, if said of them simply and singly taken, is manifestly a contradiction : but then they may be so placed with reference to something else, or may be considered as part of, or taken out of, something else in such a manner, as that the first shall be a value greater than the second. For instance, 1, simply taken and by itself is certainly not so much as 2 so taken, but 1 considered as part of 10, or as drawn out of 10, is something greater than 2, considered as part of 40, or as drawn out of 40 ; for the one is a tenth, and the other a twentieth part only of the thing to which it stands related : and that this is the case here will appear from hence.

A term for 90 years, interest computed at 6 per cent. is in value 16—58 ; and the proportion inverted is a true one ; 16—58 in value is equal to a term of 90 years : now, if out of 16—58 we draw 41 decimals, the remainder will be 16—17, and 16—17 is equal to a term of 60 years, and no more ; so that a subtraction of 41 decimals only lessens the term here 30 years. A term for 21 years, at the same rate of interest, is in value 11—76 ; and, if we draw out of this 41 decimals, the remainder will be 11—35, and 11—35 is equal to a term of 12—2—30 : so that the subtraction of 41 decimals out of the shorter term lessens that term only one year and an half, or little more ; whereas a subtraction of 41 decimals out of the longer term lessens that term 30 years. From hence it is plainly seen, that one and the same value in decimals, drawn out of a greater given value in decimals, and out of the longer term to which such given value is equal, lessens the term out of which it is subtracted in a much greater degree, than the same value in decimals, drawn out of a less given value in decimals, and out of the shorter term to which such given value is equal, lessens the term out of which that is subtracted. Therefore it may be true, that 1—72 value in decimals, though not half so great a value as 3—91, drawn out of one value, shall lessen the term out of which it is subtracted as much, or more, than 3—91 value in decimals, though more than double the value of the other, drawn out of another value, shall lessen the term out of which that is subtracted.

If we examine out of what these two values 1—72, and 3—91, are respectively drawn, it appears that 1—72 is drawn out of the value 13—44, which is equal to a term of 28—1—00 ; that is, out of the greater given value, and the longer term corresponding : and 3—91 is drawn out of the value 9—21, which is equal to a term of 13—3—30, that is, out of the less given value and the shorter term corresponding. If we proceed in the computation, and apply this, it stands thus. The value 1—72, subtracted from 13—44, leaves a value 11—72 : the value 11—72 is equal to a term of 20—3—45 : a term of 20—3—45 subtracted from a term of 28—1—00 leaves a term of 7—1—46 ; and this is the decrease in the term for the four periods of younger life. The value 3—91, subtracted from 9—27, leaves a value

lue 5—30; the value 5—30 is equal to a term of 6—2—30; a term of 6—2—30, subtracted from a term of 13—3—30, leaves a term of 7—1—00; and this is the decrease in the term for the four periods of older life. Therefore, upon the whole, whether the decrease here be taken immediately from the term, or be computed from the value, and so to the term, this decrease in the term comes out to be one and the same; that is, the decrease of the term in the stages of younger life is greater than in the stages of older life: and, consequently, the gradual decrease of the chance of vitality, in proportion to the increase of age, is not preserved: which was the thing to be demonstrated, and I think is fully done. Again: By Dr. Halley's table for the value of annuities for lives, the life of a person aged 10 is equal to a term of 28—1—00; the life of the same person, when aged 30, is equal to a term of 20—3—45: the difference between these two terms is evidently 7—1—46: that is, in 20 years time the life of this person, whilst in the younger periods of life, is decreased or grown less in computation a term of 7—1—46. The life of this person, when aged 30, is equal, as noted before, to a term of 20—3—45: the life of the same person, when aged 50, is equal to a term of 13—3—30; the difference between these two terms is 7—0—15; that is, in these 20 years time the life of this person, in these middle periods of life, is impaired or grown less, upon an estimate, a term of 7—0—15. The life of this person, when aged 50, is equal, as noted before, to a term 13—3—30; the life of the same person, when aged 70, is equal to a term of 6—2—30; the difference between these two terms is 7—1—00; that is, in 20 years time in the oldest periods of life, the life of this person is grown worse and diminished, upon the chance, a term of 7—1—00: so that the difference or decreases in the term will stand thus; for the 20 years in youngest life 7—1—46, for the 20 years in middle life 7—0—15, and in the oldest of all 7—1—00.

Now, since this table for the value of annuities is constructed on the foundation of the table of mortality for Breslaw, it ought to agree with, and be conformable to that table, or there is a defect in the structure; but, on looking into this latter table, it appears that the number of persons dying in the first period, that is, between 10 and 31, is 138; in the second period, between 30 and 51, the number is 196; and in the last period, between 50 and 71, the number is 215; and yet the number of persons co-existing is greater in the younger than in the older period of life, and gradually decreases as age increases: from whence it is plainly seen in this calculation, as well as in the former, that the table of annuities has no sort of conformity with the table of mortality, though the one be built, in the main, on the foundation of the other. And, as this want of conformity between these two tables, in a proportionable decrease, runs through the whole, so I cannot forbear observing the foul error that it makes in one particular instance, such as most certainly overthrows the justice of this table for annuities, and of the rule too by which it was framed.

The value of an annuity for a life of 10 years of age is by this table 13—44, which is equal to a term of 28—1—00: and the value of an annuity for a life of 70 is 5—32, which is equal to a term of six years and two thirds. If we consult the Breslaw table, the even chance of the duration of the life of 10 years of age is 41 years and over, and the chance of the duration of the life of 70 is six years, and about two-thirds of a year. Now, that an annuity for the life of a person aged 10 years should be in value 13—44, that is, should be equal only to a term of 28—1—00, when his life, on the even chance, is equal only to six years and two thirds: I say, that the chance of the duration of the annuity in one case should fall short of the chance of the duration of the life, and so much as thirteen years; and in the other case, that the chance of the duration of the annuity and of the life should be so near an equality, or the very same, has something in it so much of the absurd, that I cannot reconcile it to my understanding. And yet, if we compute the value of an annuity for a life of 80, and make use of the rule which the doctor prescribes and made use of in framing his table for such value, we shall discover something still more extraordinary, viz. that an annuity for such a life will be in value 3—84, which is equal to a term of four years and an half, when on the Breslaw table, the even chance of the duration of such a life is not full four years; which I think is so palpable a contradiction to common sense, that nothing can maintain the rule by which it was produced.

A second objection lies against Mr. Hayes's and Mr. Richards's tables, viz. that, being computed for the several rates of 4, 5, 6, 7, and 8 per cent. they give us such a value of an annuity for a life, as that one and the same life is equal to different terms for each rate of interest. There is no room for this defect in Dr. Halley's or Mr. Morris's tables, they being computed for a single rate of interest only; but, in truth, the objection does lie against the doctor's rule for forming these tables; for that any table drawn by this rule, and for more rates of interest than one, will have the same defect. This appears plainly enough by Mr. Richards's tables, which were constructed by this rule; and that this of necessity must be

the case in all tables for variety of interests drawn by the rule, will appear, when I come to speak to the rule itself. As to Mr. Hayes's and Mr. Richards's tables, that these two tables for every rate of interest gives us such a value of an annuity for a life, as does in fact make one and the same life equal to a different term of years, and what that variance is on each of them, may be best and most plainly seen by the short schemes in tables No. VII. and No. VIII. The first of these gives us the value of an annuity for a life of 30 years of age, and the term to which such value is equal at the several rates of interest, as stated by Mr. Hayes himself; and it is marvellous to me how he could make the computation, and not see the absurdity of the supposition on which it must be grounded: and the other gives the value of an annuity for a life of 12 years of age, at the like several rates of interest, as stated by Mr. Richards, and the term to which such value is equal, as I compute the same.

Now I say, that the values stated in these two tables, thus corresponding to, and producing a different term of years to which one and the same life is equal, according to the several rates of interest at which the calculation are made, undoubtedly are, and necessarily must be wrong for that reason, because they produce such different terms. This being the case on both these tables, and since Mr. Hayes has not acquainted us what rule he made use of in forming his table, and Mr. Richards informs us that he built on Dr. Halley's hypothesis, and it is evident he did so: and, since one and the same defect goes through both tables, I shall apply myself chiefly to Mr. Richards's table, and the rule by which that was constructed: only I take notice here, that my observations on one of them, in most instances, and especially in that which I have before-mentioned, will equally affect and be applicable to the other, whatever was the rule by which it was framed.

I suppose no one will controvert those points: that he who has an annuity for the life of a person, has an annuity for such a term of years as such a person in fact shall live; and when he buys it, the term of years to which any person's life shall be prolonged being uncertain, that he buys it for such a time as there is a chance or reasonable probability that the person may live whose life is nominated: and I am sure it is possible, that five several annuities, at the five several rates of interest in these tables, may be granted on one and the same life, as well as on different ones. To say then, that in case of one annuity there is a chance or probability that the person on whose life the annuity depends may live for 30 years, or near it; in case of a second annuity, that he may live for 29 years, or thereabouts; and on a third, on a fourth, and on a fifth annuity, or each of them, that he can, and probably may, live for a different term of years, is RIDICULOUS AND ABSURD TO THE LAST DEGREE*.

* Nor does the learned Mr. Lee stand alone in judgment upon this occasion; the ingenious Mr. Hardy, who very lately wrote a treatise, entitled, *A complete System of Interest and Annuities*; founded upon new, easy, and rational principles, &c. says in his preface, 'That having occasion, some years ago, to compute the value of annuities on lives, I had recourse to the rules delivered by Dr. Halley and Mr. De Moivre; when observing, that the purchaseable term to be paid for, or the probable time that the same person should live, was made to depend upon, and varied according to the RATE OF INTEREST, which, having no connection with the probability of living, put me upon considering those purchases in an intire new light, and upon considering to find easy and universal rules for approximating their values.'—What this gentleman's rules are, and the foundation of them, we cannot enter into under this head, but refer what he and the judicious Mr. Simpson have said upon this occasion, to the article MORTALITY [BILLS OF MORTALITY], and such other articles to which we have referred.

And, if we take a particular instance, and suppose two annuities only, at the two different rates of 4 and 81. per cent. to be granted to two distinct persons on the life of one and the same nominee; to say, with regard to the annuitant who purchases at 8 per cent. that the nominee, on whose life the annuity depends, may or has an even chance to die in 25 years; but, with regard to the annuitant who purchases at 4 per cent. that the same individual person may probably live, or has a chance to live 30 years, is a flat contradiction; and is, in effect, to assert, either that one of the annuities will continue after the nominee is dead on whose life it depends, or that the other will cease whilst the nominee is living for whose life it is to continue; when the annuities must both determine at one and the same time, on the death of the nominee.

Now, if Mr. Richards's tables were the result of Dr. Halley's observations, and were calculated by the method prescribed by him, or by Mr. De Moivre, as I believe they were; yet if the error I have mentioned proceeds from the foundation or the method, as most certainly it does, I apprehend it will prove, that the one or the other of them is wrong, much more strongly, than the foundation or the method will prove that the calculations are right, notwithstanding the great authority of the inventors of them: and, therefore, since the

the operations upon them have produced such absurd effects, I don't see they are of any significance, except to have demonstrated that the instructions are wrong. I must confess I do not know any method, and very much question whether there be any, to adjust the value of an annuity for a life, but by computing for what term there is a chance or probability such life shall continue; and, when that is done, the common tables, which give us the value of any term of years at a stated interest, give us at the same time the value of an annuity for the life sought after at that rate of interest. But, since Dr. Halley has found out and published another rule for this purpose, we will consider it.

The rule then which he prescribes, and which he and Mr. Richards made use of, to form these their tables for the value of annuities on a single life, is grounded on the Breslaw table, and some propositions deduced from thence. The Breslaw table exhibits the whole number of people supposed to be living in that city at a certain time, and the supposed current age of them all, from the birth to the age of 84: and at present I will suppose, though I do by no means grant, that this table gives a true account of the persons living there, and their several ages. To ascertain the different degrees of vitality in all ages of life, this author advances this proposition: 'If the number of persons of any age remaining after one year, be divided by the difference between that and the number of the age proposed, it shows the odds that there is, that a person of that age does not die in one year. For instance, a person of 25 years of age has the odds of 560 to 7, or 80 to 1, that he does not die in a year: because that of 567 living, of 25 years of age, there do die no more than 7 in a year, leaving 560 of 26 years old.'

Here I have given the author's proposition and inference in his own words; but, if I may beg leave to express my meaning of them in my way, which, perhaps, may tend to explain and illustrate them, I should say: That the number of persons living of any age proposed was the number of chances belonging to a person of that age; that the number of persons living of any subsequent age, supposed at one year's, at ten years, or at twenty years distance, was the number of chances with him, or the number of chances that he had to live to such subsequent age; and that the difference between the number of persons living of the age proposed, and the number of persons living of the subsequent age, that is, the number of persons dying in that time was the number of chances against him, as the chances that he would die within that time, or before he arrived at such subsequent age.—In the instance here given, a person of the age of 25 has 567 chances, so many persons being living of that age; of the age of 26, which is the next year, there are 560 persons living, and within the compass of that year, there have died seven persons, so that, on the life of a person of 25, there are 560 chances with him that he lives to the end of one year, so many being living at the end of that year, and there are seven chances against him that he dies within that time, so many being dead in that time.—This method, if pursued, gives the chances for him and against him in like manner, for any other subsequent year. For instance; the number of persons living of the said age of 25 is 567, the number of persons living at ten years end, or of the age of 35, is 490; the difference between these two numbers, or the number of persons dying in that time, is 77; therefore the chances with him, or the chances that the person lives to ten years end, are 490; and the chances against him, or the chances that he dies within that time, are 77.

I have here avoided the use of the word odds, because it is an equivocal term, and may mean the odds in the number of chances, or the odds in the value of these chances; and instead thereof I make use of the expression, chances with him, or chances against him, and shall do so hereafter. And, I am afraid, we shall find that the doctor, or Mr. de Moivre, or both, in the computation of the value of annuities for lives, have, in some instances, brought to account more chances of vitality on lives than belong to them; in other instances, have inserted such chances as do not and cannot belong to them; and in some cases have assigned wrong values to right chances: and, where any of these mistakes are committed, all the algebra in the universe will never prove that the sum total of the values arising on such computations will be the true value of the annuities enquired after.

The doctor having deduced his proposition from the Breslaw table, and asserted, that the valuation of annuities for lives depends on it; and having laid it down for a maxim, that a purchaser of an annuity on a life ought to pay for such parts only of the value of the annuity as he has chances that his nominee is living, which is undoubtedly true; and having told us how the present value of a sum of money, payable at any future time, and at any rate of interest, may be known: and given us a scheme for that purpose, at the rate of 6 per cent. interest; he assumes, from the foregoing proposition, 'That, as the number of persons living after a year, or after any number of years, are to the number of persons dead within that time, so are the number of chances with him to the number of chances against him, that the per-

son nominated is then living;' in consequence of which, the rule for ascertaining the value of an annuity for a given life will be this: 'As a number of persons living of an age proposed is to the number living after one year, or after any number of years; so the present value of the sum payable at the end of one year, or at the end of the given number of years, is to the sum which ought to be paid for the chance which the person has to enjoy his annuity for that one year, or the given number of years.' And, in the conclusion he adds: 'If this operation be repeated for every year of the person's life, that the sum of all the present values of these chances is the true value of an annuity for such person's life;' and that by this rule he framed the table he gives us, which is for the value of annuities on a single life at 6 per cent. interest.

I will not positively say, that the author, in forming his table, did not himself observe his own rule, because he says he used some compendia in forming it; and in seeking a shorter way he might possibly miss the right way.—The rule, in short, is this: we are, in the first place, to compute what is the value of an annuity for one year of the life, beginning at the age of the person nominated, looking upon it as an absolute annuity for one year, allowing out of it a value proportionate to the chance of mortality arising in that year, and this is done by the first part of the rule: and then we are to proceed in the same manner for every year of such nominee's life; and it is asserted, that all these values, put together, are the value of the annuity on such a life. But then the latter part of the rule, where it directs that this operation must be repeated for every year of the nominee's life, does not expressly say for what number of years this computation must be made: but I cannot find out that it is capable of any other meaning than one of these two; either that it must be made for so many years as the nominee has an even chance to live, or for so many years as he has any chance at all, or a possibility to live. However, let the computation be made, in which way of the two he pleases, it produces a value different from what this table gives; one of them a value much under, and the other a value little over, the value exhibited in the table, and this is the case in more instances than one.

The value exhibited in the table for an annuity on a life of ten years old, interest computed at 6 per cent. is 13—44; and, if an annuity be granted for 10,000l. per ann. supposed on the life of A of ten years old, the total value of it will be 130:400l. To show that this is not the true value of such an annuity, even on a computation made according to the rule here laid down, I have made a calculation pursuant to that rule, for every year of such a person's life, from the age of his life when nominated, that is, from ten years old, to the extremity of old age, that is, to 100 years old, and have set it forth in table No. IX. following. In this table, and in the second column, we have the present value of such an annuity, payable at the end of each year for 90 years on an absolute term, transcribed from this author; and, in the sixth and last column, we have the present value of such an annuity, payable at the end of each year for 90 years, on the chance of mortality on the life of a person of ten years of age, formed exactly, I think, by the rule given. And, because the chance of mortality is calculated by the Breslaw table, I have inserted that likewise in table No. X. with an additional computation for 16 years, from the age eighty-four to the age of an hundred, omitted in the former table.

REMARKS.

We have judged it necessary to enter so far into this delicate subject, and the objections made to the long embraced hypothesis of the learned Dr. Halley, and the foundation built thereupon by Mr. De Moivre and others (for the objections against the latter are not less weighty than those against the former, though we have not room fully to consider them here) in order to shew the reader, who is desirous to go to the root of this matter, that the works of the learned Weyman Lee, Esq; are well deserving his attentive perusal.—There have, indeed, been some objections made to Mr. Lee's essay, but whoever compares them candidly and impartially with the reply that he has made to them, will hardly think, I am at present inclined to believe, that the fundamentals of his reasoning are at all invalidated. However, those who may still be of opinion, that what Dr. Halley, Mr. De Moivre, and Mr. Richards have said, will stand the test, will find the substance thereof in this work, under the articles ANNUITIES and LEASES; and the chief objections that have been made against them, under the articles LIVES, and MORTALITY [BILLS OF MORTALITY.]

For the reader's further satisfaction, the following is the connected substance that Mr. Lee endeavours to prove, in opposition to Dr. Halley, Mr. De Moivre, Mr. Richards, and others, on LEASES and LIFE-ANNUITIES.

PART I.

That there is no sure rule extant before his for valuing leases:—The method of valuing leases for lives by much the most erroneous

erroneous.—A variety in the value of these estates arises from the difference of the land-tax, and in the quantity and quality of the buildings on them.—To ascertain the value of leases, that they be reduced to annuities free from all reprises, and that money be computed at 1 per cent. above the legal rate.—To do this, the rent, and all payments certain, to be deducted.—As also the land-tax, repairs, and incidental charges.—The author of a treatise called, *The Value of Church and College Leases* considered, charges these articles to the lessee's account.—His reason for this assertion invalid.—His insinuations that leaseholders, in purchasing and renewing their estates, make 6 per cent. of their money, not true.—Of the great difference between the value of lands of inheritance and leaseholds, in the purchase, on any variation of the interest of money.—A rise in the purchase of lands, of no service to owners of leases, or of fee-simple lands, any farther than they have power to sell their estates.—The reverend author, in stating his case, kept a reserve of some money, to raise his tenant's fine for renewing; and therein acted cunningly, but not very fairly.—This fund will do very little, if any thing, more than raise the fine, and make the income of each purchaser the same.—If interest of money sinks, and fines are raised, the income of the leaseholder must sink in proportion to both of them.—The true state of the comparison between the purchasers of one estate and the other, is, What is the natural produce of each, and how it will arise.—If the land-tax, repairs, and incidental charges, are to come out of the lessee's estate; the owner, though the interest of his money reserved comes in aid, will have only 3l. 10s. per cent. for his money.—Mr. Richards, in his treatise on this subject, admits a tenant to be considered for the two last articles; but not for the land-tax, for a reason very singular.—The author contends, that he ought to be considered on all the articles.—This assertion proved, from the case given by the reverend author, otherwise such a purchaser will not have 3 per cent. for his money so laid out.—The same proved from the reason and the justice of the thing.—The way to adjust the quantum of the land-tax for a term, stated at 10 per cent. per ann. at a medium.—The same on repairs, and stated at the same sum in common cases.—On this article, many exceptions to be made out of the general rule.—On houses in particular, 20 per cent. might be little enough.—The common method, in case of houses, viz. to compute the money laid out at a higher rate of interest, not a safe one, and compared with the author's in an instance.—The article for charges and accidental losses the author divides into two; one for managing the estate, the other for assuring it, and paying the rent in all events; and states each at 5 per cent.—The deductions, the same as supposed by the reverend author, to be going out of a fee-simple estate, viz. 30 per cent.—Instead of these two allowances of 5 per cent, Mr. Richards, in stating the value of leases, computes the tenant's annuity at one rate of interest, and the outgoings in rent at another.—The method not right; the reasons why not, and the absurd consequences shewn.—The objections of no weight, that tenants, especially in public leases, covenant to pay their rents free from taxes and reprises.—Money, laid out in these estates, to be computed at 6 per cent.—That a purchaser, so valuing his money, will make 6 per cent. a vulgar error.—Shown, how money laid out in such purchases is to be reimbursed, and computed what part is to arise from the surplusage of the rents, what from the simple, and what from the compound interest of such surplusage.—This computation demonstrates, that the lessee is not to be charged with the land-tax, &c.—Though these estates are reduced to absolute annuities, yet not so valuable as such.—The author's method of computing the fine to be paid on renewals.—This compared with the common one, and a new one by Mr. Richards, and the difference shewn by instances.—A particular absurdity following from Mr. Richards's method.—Where one year's rent only may be a just fine for renewing seven.—Mr. Richards states the fine on such renewal higher than his own rule admits.—He professes here to have no consideration of the land tax; and yet in some cases, in effect, he does, or must consider it.—The author doubts the truth of the fact alledged, that the laity, in renewing 7 years, generally take $2\frac{1}{2}$ years value.—The reason for raising fines above the old price of one year's value, considered; with observations on Æcroid's tables.—The censure of tenants as imposing on landlords in their fines, and landlords as submitting to them, not well grounded.—Where churchmen and colleges can't get fines to the value of their estates, the remedy proposed, by letting the leases expired, considered, and the success of it doubted.—Such a procedure not an act of prudence, and a law to oblige them to it unreasonable.—That they are not obliged to do it, either as a point of duty or justice to their successors, as the law now stands.—Churchmen and colleges, now and then, to sink a fine and augment the small livings in their gift; a better project for promoting the interest of the Church of England and the universities, than taking their estates into their own hands.—What influence the decrease in the value of money, and the increase in the price of the

Vol. II.

necessaries of life, have in this matter, considered.—Of the nature and use of the tables for purchasing annuities or leases, for years, or in renewing them.

PART II.

To estimate the chance of the duration of a life, and to ascertain the value of leases and annuities for life, &c.—Leases for life, as well as for years, must be reduced to absolute annuities.—The necessity of making such computation, to put a right value on such interests.—The author's table exhibits the term to which any single life, therein mentioned, is equal.—Dr. Halley's table, for the value of annuities for a life, which were constructed by a different rule, not a right one.—The author's exception to it, viz. that it does not preserve a proper decrease in the value of an annuity, or in the terms to which such value is equal, from one period of life to another.—The same exception lies against Mr. Hayes's, Mr. Richards's, and Mr. Morris's tables, for the like annuities.—The author confines himself to Dr. Halley's table, and shows the defect in two remarkable instances, quoad the decrease in the term.—The age of 30 not the best age of life whereon to have an annuity, occasionally shewn.—This defect goes through the whole table.—This shown to be the case in the decrease of the value of the annuity, as well as in the term, in single instances, and through the whole table.—The table, in this particular, in no sort conformable to the Breslaw table, though said to be constructed from thence.—Objections to Mr. Hayes's and Mr. Richards's tables, that the value of the annuities there given is such, that one and the same life is equal to a different term as the RATE OF INTEREST varies.—Dr. Halley's rule for valuing these annuities considered.—The value of an annuity for a life of 10 years of age, given in his table, not the true value, as it arises on a calculation made by this rule, and the calculus set forth.—That the value of such an annuity, where rightly computed by the rule, is not the true one, proved by positions of the doctor's.—The fallacy of the rule shown from hence, for that it produces such sums as cannot be the value of such annuities, proved by instances.—Shown wherein the error of the rule lies.—These proofs destroy the foundations of Dr. Halley's and Mr. De Moivre's rule.—The chance of the duration of a life, the sole measure of the value of the annuity depending thereon.—The author's method of forming his tables of the chances of vitality.—This table drawn chiefly from the bills of mortality of London.—Observations on a treatise, called, *A true Estimate of the Value of Leasehold Estates*; in which a life of 30 years of age is stated as the best, and equal only to a term of 14 years, and other lives in proportion.—Observations on the bills of mortality for London; also on a certain society known to the author, and on the nominees in the government annuities on survivorship.

PART III.

To estimate the chance of the duration of two or more lives, and to ascertain the value of annuities and leases for such lives, &c.—This the most difficult part of the work, and most weakly performed by all writers on this subject.—The method of computing the value of these annuities prescribed by the author, to whose tables Sir Isaac Newton's name is prefixed, a very bad one.—Mr. Hayes's method worse than the former.—Mr. Morris's the same with Mr. De Moivre's, and considered with it.—Mr. Richards's tables, formed by Mr. de Moivre's rule, do not give the true value of these annuities.—These tables wrong, because his tables for the value of annuities for a single life are wrong.—A case stated by the author, which shews these tables to be false throughout.—Mr. de Moivre's rule for valuing these annuities considered, and shown to be false.—The doctor's and Mr. de Moivre's method, for ascertaining the value of annuities for two or for three lives and the survivor, not the same.—The doctor's hypothesis, for adjusting the chance of the duration of two lives, not right, shown by lines and figures.—The error of this hypothesis, and Mr. De Moivre's method, shown by Mr. Richards's tables constructed from thence.—Mr. Richards's tables for the value of annuities for three lives, proved erroneous.—That the term, to which the value of annuities for one or more lives is equal, should vary as the RATE OF INTEREST varies, which is a necessary consequence of the hypothesis, greatly absurd.—Mr. De Moivre's rule for valuing these annuities shown to be false.—That his rule does not agree with the doctor's rule for calculating the value of annuities either for two or three lives.—The author's rule for valuing annuities for two or more lives, by computing the chance of the duration of the given lives.—Compared with Mr. De Moivre's rule.—The justice of the author's method shown, and proved from Dr. Halley's own way of reasoning.—A comparison of the chance of the duration of two or three lives, where the computation is made in Dr. Halley's or Mr. De Moivre's method, and when in the author's.—The author's tables,

80, &c. —	1 —	— —

From this, and the precedent table, is readily seen the value of an annuity for any life, given at any rate of interest: for this table gives the term to which the life is equal, and the

precedent table gives the value, or years purchase, to which such term is equal, that is the value of the annuity.

T A B L E III.

Shewing, in the first column, the age of persons; in the second, the value of annuities for every fifth year of age, from the 10th to the 70th year of man's life, as stated by Dr. Halley, interest computed at 6 per cent.: to which I have added, in the third column, the years, quarters, and days, to which such value corresponds; in the fourth column the difference, or decrease in the term, from one period to another; and, in the fifth, the difference or decrease in the value, in the same manner.

TABLE IV.

Shewing the value of annuities for life, at the ages mentioned, interest computed at 4 per cent, as stated in Mr. Hayes's tables; with the same additions as in the precedent tables.

Ages of persons.	Years value, or purchase.	Term to which such value is equal.	Decrease in the term.	Decrease in the value.
30	15 54	24 3 23	0 0 —	0 —
35	14 51	22 0 55	2 2 68	1 03
40	13 49	19 3 28	2 1 27	1 02

62	07 08	09 2 —	1 3 76	1 03
67	05 90	07 2 —	2 0 —	1 18
72	04 78	05 3 11	1 2 80	1 12
77	03 29	03 3 11	2 0 —	1 49
82	01 36	01 1 80	2 1 22	1 93

TABLE VI.

Shewing the value of annuities for a life, at the ages mentioned, interest computed at 4 per cent. as stated by Mr. Morris; with the same additions as in the precedent tables.

Ages of persons.	Years value, or purchase.	Term to which such value is equal.	Decrease in the term.	Decrease in the value.
10	16 72	28 0 68	0 0 —	0 —
15	16 53	27 2 68	0 2 —	0 19
20	15 62	25 0 22	2 2 46	0 91
25	14 80	22 3 68	2 0 45	0 82
30	13 96	20 3 45	2 0 23	0 84
35	13 08	18 3 60	1 3 75	0 88
40	12 29	17 1 15	1 2 45	0 76
45	11 39	15 2 30	1 2 75	0 90
50	10 45	13 3 15	1 3 15	0 94
55	09 55	12 1 18	1 1 88	0 90
60	08 40	10 2 —	1 3 18	1 15
65	07 12	08 2 50	1 3 31	1 28
70	05 70	06 2 45	2 0 05	1 42

TABLE VII.

Shewing, in the first column, the rate of interest; in the second, the value of an annuity for a life of 12 years of age transcribed from Mr. Richards's tables: to which I have added, in the third column, the term of years to which such value corresponds, as I calculate the same.

Interest.	Value.	Term of years.
4	17 20	29 3 —
5	15 23	29 1 44
6	13 36	27 3 —
7	11 72	25 1 23
8	10 67	25 0 —

TABLE VIII.

Shewing, in the first column, the rate of interest; in the second, the value of an annuity for a life of 30 years of age, extracted from Mr. Hayes's tables: to which I have added, in the third column, the term of years to which such value corresponds, as stated by Mr. Hayes himself.

Interest.	Value.	Term of years.
4	15 54	25
5	13 12	22
6	11 27	20
7	09 83	18
8	08 68	16

Mr. Hayes seems to me, in this table, first to have stated to what term of life of 30, or any other age, is equal, and from thence to have computed the values: now, in what way of thinking, or on what grounds, he could, in the first instance suppose that one and the same life could be equal only to a term of 16 years, and, at the same time, be equal to a term of 25 years, I confess exceeds my comprehension.

TABLE IX.

Exhibiting a computus of the value of an annuity of 10,000l. per annum, for a life of ten years of age, made according to Dr. Halley's rule, for every year of life to an hundred years of age.

Age.	Multiplied.	By.	Produces.	Integrals. Fract.
1	9 434	053	0 160 402	9 319—543
2	8 900	646	5 749 400	8 698—022

76	85	16	2 016	3—033
77	80	14	1 764	2—442
78	75	12	1 512	2—190
79	70	10	1 260	1—599
80	65	8	752	1—091

This last sum, divided by 661, leaves a remainder.

TABLE IX. continued.

Age.	Multiplied.	By	Produces.	Integrals. Fractions.
81	94	7	658	—658
82	94	6	564	—564
83	94	5	470	—470
84	94	4	376	—376
85	71	3	213	—213
86	71	2	142	—142
87	71	1	71	—071
88	71		35	—035
89	71		17	—017
90	53		13	—013
Totals	167 728	89 253 482	135 027—635	

N. B. Where this computation is carried on for 41 years only, the produce is 130—265—347
 Where carried on for 58 years, the produce is 134—486—512
 Where carried on for 90 years, the produce, as above, is 135—027—635
 That is, in the first case, the value is 13—02
 In the second case, the value is 13—44
 In the last case, the value is 13—50

From whence it is apparent, where the value of such an annuity is stated at 13—44 only, as in Dr. Halley's table, that there is an omission of 32 years in making the calculation.

TABLE X.

Shewing the number of persons living in the city of Breslau in Silesia, and their ages current respectively, from 1 to 84 years of age.

Age current.	Persons living.	Age current.	Persons living.
1	1000	6	710
2	855	7	692
3	798	8	680
4	760	9	670
5	732	10	661

The rest of this table is inserted in the third column of the precedent table, and need not be here repeated : and I have there added the age current, and persons living from 84, where Dr. Halley breaks off, to age an hundred; and the table, with these additions, makes the total number of persons there living to be the same as supposed by the doctor, viz. 34,000.

TABLE XI.

An extract of, and some calculations on, the BILLS of MORTALITY for LONDON, including only those born alive.

The several years.	1730.	1731.	1732.	1733.	1734.	1735.	Totals.	Medium.	in 1000

LIVONIA, in Sweden, has the gulph of Finland on the north, that of Riga on the west, Muscovy and Ingria on the east, and part of Lithuania on the south. Though in some parts it is marshy, yet it is very fruitful, generally speaking, yielding corn, pasture, and honey in abundance. It is divided into two parts, viz.

I. ESTONIA, the most northern part of this country, bounded on the south by Letten, on the east by Muscovy; on the north it has the gulph of Finland, and on the west the gulph Riga, or of Livonia.

REVEL, the capital of this division, stands on the coast of the gulph of Finland, 225 miles east from Stockholm. It was not reckoned a town of great trade till about 1477, when it could easily preserve its commerce with Muscovy, and other places, on account of its advantageous situation and commodious harbour. It broke off its union with the Hanse-towns in 1550, and its trade was removed to Narva by the Czar : but the Muscovites, having taken it in 1711, have restored its trade, which they now are very careful to preserve. See HANSE-TOWNS.

NARVA, stands on a river of the same. This city enjoyed for a long time the privilege of the Hanse-Towns; but the wars between Sweden and Muscovy had so ruined its trade, that it could not recover it in many years, nor did it last, but at the expence of Revel. The war between the English and Dutch proved advantageous to it, the Archangel trade being then interrupted.

PARNAW, on the gulph of Riga, is a small city, but a place of good trade, a great quantity of corn, especially, being shipped hence for the Netherlands.

II. LETTEN, has the Baltic on the west, Estonia on the north, Muscovy on the east, and the river Dwina on the south and south-west.

RIGA, the capital, not only of Letten, but of all Livonia, is situated in a large plain on the western bank of the river Dwina, 6 miles from the mouth of it, which makes a commodious harbour called the gulph of Riga.

The trade which this city drives with England, Holland, Muscovy, and the towns of the Baltic, renders it extremely populous and very considerable. There are in the town almost as many shops as houses. Above a thousand vessels arrive here yearly laden with corn, hemp, flax, pitch, tar, planks, furs, and skins of all sorts. Russian leather, affes to make soap and glass, &c. all which are transported to England, France, Germany, Holland, and other countries, and exchanged for the commodities of the more southern climates. They reckon that above 200 merchantmen arrive every year in the port of Riga.

LOADMANAGE, is the hire, sometimes so called, which the pilot of a ship receives of the master, for conducting the ship up the river, or into port.

PETTY-LOADMANAGE, and primage is due; to the master and mariners for the use of his cables and ropes to discharge the goods, and to the mariners for loading and unloading of the ship or vessel; it is commonly about 12 d. per ton. 32 Hen. VIII. 14.

If the ropes break in hoisting of goods out of the ship into the lighter or boat, the master must answer if the goods be damaged or lost. Leg. Oleron, cap. 10. See OLERON'S LAWS.

But, if the ropes break at the crane in taking them out of the lighter (although, till they are landed, they are not out of the master's custody) yet the wharfinger shall answer.

LODESMAN, a kind of pilot established for the safe-conduct of vessels in and out of harbour, or up and down navigable rivers.

With

With regard to France, in places where it is found necessary to establish pilots and lodemen to conduct vessels into, and out of the entries of ports and navigable rivers, their number shall be regulated by the officers of the admiralty, with the advice of the aldermen and most eminent merchants of the place.

II. No person shall exercise that function 'till he is arrived to the age of 25, and received before the officers of the admiralty, after having been examined in their presence, and in that of two aldermen, or eminent merchants, and two ancient pilots, with the like number of ancient masters of ships.

III. The pilots, lodemen, shall be examined in the knowledge and experience they ought to have of the fabric and working of ships, and of the courses of the tide, of the sand banks, currents, shelves, rocks, and other impediments, that may render difficult the entry of the rivers, ports, and harbours, in which they are established.

IV. They shall be obliged to have their shallops always provided with anchors and oars, and to be in a condition to go to succour ships upon the first order or signal, under pain of ten livres, and a greater penalty, according to the exigency of the case.

V. We forbid, under pain of corporal punishment, all mariners, not being received pilots, lodemen, to offer themselves to conduct ships into, or out of ports or rivers.

VI. However, the masters of ships, for want of pilots, may make use of fishermen to conduct them.

VII. If a pilot comes aboard a ship, where there is already a fisherman, before she be past the dangerous places, the pilot shall be received, but the fisherman's hire shall be deducted from his.

VIII. A pilot, undertaking to conduct a vessel while he is drunk, shall be fined in five livres, and shall not exert the function of pilot during one month.

IX. We enjoin the pilots to conduct first the ships that first require their service; and we forbid them to prefer the most remote to the nearest, under pain of 25 livres.

X. We likewise forbid them to go farther than to the roads, to meet vessels coming into ports or harbours, to go aboard of ships without the master's consent, and to leave the ships they bring in, 'till they are come to an anchor and moored in the port; and those they carry out, 'till they are in the high sea, under pain of the loss of their wages, and a fine of 30 livres.

XI. The master of the ship shall be obliged, as soon as the pilot gets aboard, to tell him how much his vessel draws, under pain of 25 livres fine, to the benefit of the pilot, for every foot concealed.

XII. In every port shall be made, at the suit of our attorney, with the advice of the magistrates or two eminent merchants, a regulation for the wages of pilots; which shall be inserted in a public writing, and a copy of which shall be left in the admiralty-office, and another affixed upon the key.

XIII. The pilots and mariners shall not exact greater sums than those specified by the regulation, under pain of corporal punishment, except in time of a storm and imminent danger; in which case the officers of the admiralty, with the advice of two merchants, may tax their wages higher, having regard to the work they have done, and the danger they have run.

XIV. We declare null all promises made to pilots and mariners while in danger of shipwreck.

XV. We enjoin the pilots daily to view the roads of the places where they are established, to hoist the anchors left there, and, within 24 hours afterwards, to make their declarations to the officers of the admiralty.

XVI. If they discover any alteration in the channel, and ordinary passage of ships, or that the buoys and sea-marks are not right placed, they shall be obliged, under pain of ten livres, to acquaint the officers of the admiralty, and the master of the key therewith.

XVII. It shall be free for the masters and captains of French or foreign ships to take such pilots as they please to conduct them into the ports and harbours, without being obliged to make use of the same to conduct them out again.

XVIII. A pilot that ignorantly runs a ship aground, shall be whipped by the hand of the hangman, and for ever deprived of his employment; and as for such as maliciously and designedly run a ship upon a rock, bank, or shore, he shall be punished with death, and his body hung up upon a mast planted near the place of the shipwreck.

For the laws by which pilots are regulated, see the article PILOTS.

LOGWOOD, or CAMPEACHY-WOOD, as some call it, is called also **BRASILETTO**, or **JAMAICA-WOOD**; and is, says Pomet, the heart of the trunk of a large tree, which grows plentifully in Campeachy and Jamaica, and in Santa Cruz in America, where there are whole forests of it. And, according to Lemery, it grows in several other parts of the West-Indies.

The tree is bigger or less, according to the soil that produces it; it rises with a trunk thick and strait, covered with a thin

Vol. II.

bark plain and smooth, of a silver grey or yellowish colour; the leaves are like those of the bay, and, held in the mouth, afford a scent like the clove, which has made it to be oftener taken for the clove-tree than any other, by reason of the delicate flavour, which has given it the name of the Indian aromatic laurel. Among the leaves comes a small fruit, adhering to the branches by a little stalk like the cubeb, and has at the other end a small crown; the fruit is of a dun colour, the taste sharp and piquant, but agreeable enough, tasting like a clove, and therefore called mostly clove-berry; it contains three small kernels like musk-feed.

We may observe here, that it affords three sorts of commodities very good and saleable; the first is the wood, which should be chosen firm and undecayed; and cut, not sawed at the ends. This wood chiefly employs the dyers, who use it to dye blue and black. The second commodity is the leaf, which may be used instead of malabathrum, where that is ordered, as this leaf has more virtues than that; the Americans use them for fomentations, to cure the palsy, and other diseases proceeding from cold causes. The third is the fruit, which the French use in imitation of the English, as being a very strong aromatic, and proper on several occasions: as this has been known but of late years, the French have had but little commerce therein, besides what their privateers of St. Maloes in time of war have taken from England. The grocers in France call it clove-berry, from its likeness to that spice in smell and taste, and it is called with us all-spice, as having analogy to cinnamon, cloves, mace, and nutmegs, and is very much used in all sauces. Lemery thinks it possesses all the several properties, qualities, and virtues of those spices, though possibly not in so large a measure, in respect to its body; for that it consists of more earthy parts than any of them, except cinnamon; but the tincture, or oil of it, extracted from its feculent part, are not much inferior to what may be extracted from those: so that we must allow this drug to be stomachic, cephalic, cardiac, uterine, nephritic, and arthritic; it is alexipharmic and diuretic, comforts the brain and nervous parts, refreshes and strengthens the whole animal economy, and restores the natural functions of life where weakened.

It has been long known among the dyers, for the dyeing of blacks and blues, as intimated, but it is only of late that it has been introduced into medicine: it is found to be chiefly an excellent astringent, and is given in form of an extract in diarrhoeas with great success.

A representation from the honourable board of trade to his late majesty king George I. asserting and proving the right of the subjects of Great-Britain to cut logwood in the bay of Campeachy, September 25, 1717.

To the king's most excellent majesty.

May it please your majesty,

The right honourable Paul Methuen, Esq; one of your majesty's principal secretaries of state, having transmitted to us on the 15th of November last, by order of his royal highness, a letter or memorial he had received from the marquis de Monteleone, ambassador extraordinary from his Catholic majesty, relating to the trade carrying on in the West-Indies, and to the settlement made by your majesty's subjects on the island of Trist, and on or near the lake or marsh de Terminos, in the province of Jucatan: in which parts he represents, 'That they employ themselves in cutting of log-wood, or (as the Spaniards call it) Campeachy-wood; and that the Spanish viceroy and governor had proposed to dislodge them from thence, but that his said Catholic majesty would not send his orders before he had given your majesty notice of it, not doubting, but that according to all the treaties of peace, and particularly that made at Utrecht, your majesty would oblige your said subjects to leave the aforesaid lake de Terminos, and give positive orders to your governors at Jamaica, and of the other islands, not to suffer the least trade to be carried on for Campeachy-wood, and to declare, that if, in the space of eight months, they do not leave the said place, they shall be looked upon and deemed as pirates.'

We beg leave to represent to your majesty, that, although we did humbly propose such methods as we esteemed proper and necessary to support the cutting of logwood in the West-Indies, when the said Mr. Methuen was on his departure for Madrid; yet on this occasion, when a trade of so great importance to our navigation and the American colonies is in danger of being lost, we have again carefully perused the books and papers in our office, and received from the merchants and others the fullest information we can hope to obtain, which hath taken up much time: and we do now humbly crave leave to lay before your majesty the past and present state of this trade, with the arguments that formerly engaged your majesty's royal predecessors to protect and support the same; to which we shall add some observations, and the reasons that induce us to conclude your majesty's subjects have now as full and ample right to this trade, as to any other liberty or privilege that has been allowed by the crown of

D d Spain,

Spain, and enjoyed by them, by virtue of any treaty whatsoever.

In the first place, therefore, it must be observed, that logwood is one of the products of the province of Yucatan, which extends itself into the north sea in form of a peninsula, about 100 leagues in length. The Spaniards are possessed of San Francisco de Campeachy, its capital town and port, which has been thrice taken by the English; and, besides, they have two other inland towns, Merida and Valladolid, of no great importance, having few inhabitants; but the rest of the province, before the logwood-cutters were settled, was in a manner wholly desolate and uninhabited. Nevertheless, it must be allowed, that the Spaniards had, from time to time, cut wood in several places near their own settlements; but, during the hostilities that were committed in the West-Indies before the year 1667, they deserted that employment, being frequently interrupted by the privateers, both by sea and land, who by degrees became acquainted with the coast, and with those parts where the wood grew, that were most remote from the Spaniards, they at last fell into the trade, and laid the foundation of their future establishment.

Their first settlements were near to Cape Catoche: but upon (if not before) the publication of the treaty concluded at Madrid in 1667, by the earl of Sandwich, they likewise settled near Suma Sunta, adjacent to the Laguna de Terminos, and to Trist and Beef Islands, which being the most convenient place for cutting of wood, and a tolerable harbour for their ships and vessels, the whole trade soon centered there. For, notwithstanding the aforesaid treaty was principally intended to settle and adjust our commerce with his Catholic majesty's dominions in Europe, yet, 'a general, firm, and perfect amity, confederation, and peace, being thereby agreed and concluded (as in the first article) between the two crowns, to be observed inviolably, as well by land as by sea and fresh waters, and between the countries, kingdoms, dominions, and territories belonging unto, or under the obedience of either of them, &c.' It was concluded, that the peace extended to America as well as Europe; whereupon many of the British privateers that had before used those seas, to the great interruption of commerce, were then induced to quit their former course, and to settle with the logwood-cutters in the Laguna de Terminos; so that, in the year 1669, their numbers were considerably increased, and great quantities of wood were transported both to Jamaica and New England.

The American treaty for restraining depredations in those parts, being afterwards concluded by Sir William Godolphin in July 1670, added to their strength, by encouraging several others of the privateers, or seamen, to fall in with this employment of cutting wood, to which it was now generally supposed they had a right by the said treaty.

And, as the logwood-trade was of the greatest importance to Jamaica, on the 10th of March 1671, Sir Thomas Lynch, then governor of that island, not having received any orders how to govern himself in this affair, transmitted to the lords of the council the reasons that induced him to encourage the same under proper regulations.

- 1st, That the English had done so divers years.
- 2dly, It was in desolate and uninhabited places.
- 3dly, That this seems a possession granted by the American treaty.
- 4thly, It might give a right to exclude the Dutch and the French, if we should break with Spain.
- 5thly, The Spaniards had not, to that time, made any complaints of it.
- 6thly, This employ makes the reducing of the privateers more easy. And,
- 7thly, That it will employ 100 sail annually, and bring in more to his majesty's customs and the nation's trade, than any colony the king hath.

While these arguments were under consideration, the earl of Arlington laid, before the lords of the committee, a letter from Sir Thomas Modyford, the late governor of Jamaica, dated the 16th of May 1672, wherein, after he had given an account of the great extent or compass of the country, in which the logwood grows; how meanly the Spanish towns on the foresaid tract of land were peopled, and of the places frequented by the English; he adds,

That they have used this trade for three years past, at first finding it by the sea side, but afterwards, being forced to go four or five miles up into the country for their refreshment, they had planted Indian provisions, and built houses there to keep themselves and their provisions from the sun and rain: that, in general, they had affirmed to him, never to have seen any Spaniards or other person, in all the time of their working, although they had gone six or seven miles farther into the country to kill deer, &c. This possession, he says, in the West Indies, is held the strongest that can be, viz. selling of wood, building of houses, and clearing and planting the ground.

Sir Thomas Lynch, to confirm what he had before asserted, and to justify his proceedings, in November 1672, sends home the copies of several depositions he had taken from the

masters of ships, and others concerned in the logwood-trade, and a proclamation he had issued out for the better regulation and security thereof, importing,

That whereas he was informed, by the oaths of many credible witnesses, that his majesty's subjects have used to hunt, fish, and cut wood in divers bays, islands, and parts of the continent, not frequented or possessed by any of the subjects of his Catholic majesty, and had, for some years, peaceably done the same without any molestation; nevertheless, divers vessels having been seized at anchor and under sail, by some pirates and fugitives of this island, and being in danger of being so surprized again, therefore he orders and appoints all vessels sailing out of Port Royal, for the aforesaid lawful employments, to go out together in small squadrons, four at least in company, and to give bond to keep company with, and to obey him, whom he should make commander for the voyage, and their mutual defence, and what they should lawfully do in their own defence, and for the preservation of his majesty's subjects, their ships and goods, be authorized and warranted, &c.

In January following, the secretary to the lords of the committee, by their order, advises the said Sir Thomas Lynch, that he had acquainted him with their lordship's pleasure fully, concerning cutting of logwood, and that they did altogether allow of the same, provided those rules were observed, which they had formerly directed, and which were agreeable to what the said governor himself had already mentioned.

This allowance of carrying on the trade, as aforesaid, gave fresh vigour to those engaged in it, though about this time the Spaniards began to interrupt them in the prosecution thereof, and to dispute their right to that liberty they had so long quietly enjoyed.

For we must insist on it, as an undoubted and uncontested fact, that from the publication of the treaty of 1667, until about two years after the conclusion of the American treaty, the logwood-cutters had never been in the least disturbed or molested in their employment, either directly or indirectly; nor does it appear that the Spanish governors took any umbrage at it, or made any complaint about it; much less did they pretend to an exclusive right, or that it was contrary to the laws of their commerce.

Nay, so far were they from expressing any resentment on this account, or making it a pretence to justify the first hostilities they committed, in violation of the treaties both of 1667 and 1670; that when Sir Thomas Lynch sent to Don Fernando Francisco Descaveado, the governor of St. Francisco de Campeachy, to demand satisfaction for two English ships, which had logwood on board, and were taken by some Spanish men of war; in his answer to that charge on the 6th of April 1672, he takes no notice of our cutting logwood, or that those ships had any on board, or that we had settled on the Laguna de Terminos; nor had he any other complaint to make by way of retaliation, save that an English vessel had taken a Spanish bark at the Laguna de Terminos bound to Tobasco; which is the more remarkable, because the said Laguna was, at that time, and had been several years actually in our possession.

It must likewise be farther urged, that before the queen-regent of Spain had published a royal cedula, bearing date the 22d of June 1672, which orders, 'That such as should make invasion, or trade without licence in the ports of the Indies, should be proceeded against as pirates, &c.' It does not appear that cutting of logwood was esteemed by the Spaniards to be an invasion, and trading without licence; but, by virtue of this cedula, it was at length carried to that height, that, if our ships had but any logwood on board, they were confiscated without remedy.

Upon this subject, the earl of Arlington, on the 19th of March 1674, wrote to Sir William Godolphin, then ambassador at Madrid, as follows:

'In a word, his majesty is so sensible of the sufferings of his subjects in this particular, that you must endeavour, by all the skill you have, to procure some liberty for the cutting of logwood, in those remote parts, where the Spaniards have none, and his majesty's subjects have had long abode and residence; and the rather, for that we find, by all the replies we have seen, they justify themselves by that single point of cutting logwood, nay, even of finding it on board, our vessels, which to us appears very unreasonable.'

And Sir Lionel Jenkins, the judge of the admiralty, in his report to his late majesty king Charles II. of the 8th of October 1675, intimated, 'That the American treaty does require a farther elucidation and adjustment between your majesty and the crown of Spain; for it appears by the judgment of the queen in the matter of Campeachy, and by their cedulas reales, that they affix a new interpretation upon that treaty, in declaring what shall be private or not private, prize or not prize, without communicating, it seems, with your majesty, and without publication, that may reach your majesty's subjects.'

Thus by a Spanish auto, or a decree of that court, which was inconsistent with, and made (ex post facto) after the ratifications of a public and solemn treaty, it was manifestly intended, not only to debar the British subjects of that li-

berty

erty they enjoyed before the said treaty was made, but, in some measure, to deprive them of their common right of all nations; whereas, if your majesty's subjects did actually hold and possess the Laguna de Terminos, and the parts adjacent, at the time of the conclusion of the American treaty, as hath been already proved, the last clause of the 7th article will determine to whom the same belongs, viz.

Moreover it is agreed, that the most serene king of Great-Britain, his heirs and successors, shall have, hold, and keep, and always possess, in full right of sovereignty, feignity, possession, and propriety, all the lands, countries, islands, colonies, and other places, be they what they will, lying and situate in the West-Indies, or in any part of America, which the said king of Great-Britain and his subjects now hold and possess, inasmuch that they neither can nor ought hereafter to be contested or called in question for them, upon any account, or under any pretence whatsoever.

And, as long as the 8th article of the same treaty subsists, it will appear very extraordinary, that the Spaniards should pretend to any dominion or power in the ports or havens where they neither had fortifications nor magazines, or in those places which were not possessed by them, because these descriptions are undoubtedly laid down by the treaty, as the sole and distinguishing marks of the sovereignty of the crown of Spain in those parts and places, which only we were to forbear sailing to and trafficking in, while all other ports and places were left open and free.

But, notwithstanding the said treaty was so strong in our favour, the Spaniards having thereby compassed the two main ends they proposed to themselves, viz.

1st, The securing their West-India trade to themselves, by excluding us, and consequently all other nations, from trafficking with them: a point which could never be before obtained, though it was strenuously insisted on in the reign of king James I. and afterwards in 1630.

2dly, The dispersion of the privateers, who had long miserably harrassed and distressed the Spaniard's settlements, and notably checked the increase both of their power and trade in those parts, but are now entirely reduced, by the great care of the English governors, and by their entering into the logwood-trade.

Yet the only advantages Great-Britain aimed at by the treaty, viz. that her subjects might carry on their trade without interruption, and peaceably enjoy those places they then held and possessed, were, in a great measure, absolutely defeated.

For, after the publication of the aforesaid royal cedula, many of our ships were made prizes under that pretence, sometimes by Spanish men of war, at other times by English pirates, seduced by the governors into the service of Spain, and afterwards by the Bilcayneers, that were sent to cruize on those seas.

And, upon the same pretence, in April 1680, several ships under the command of Don Philippo de Vareda Villegas, arrived at the island of Trift and the Laguna de Terminos, attacked our logwood-cutters, while separated from one another, and dislodged them from thence.

Moreover, the Spanish governors encouraged by this success, and little regarding the just right of your majesty, or your subjects, even to plantations still more distant from their dominions, did soon resolve upon another expedition, and, in 1682, surprized New Providence, one of the Bahama Islands.

But these places were again soon re-peopled, and the trade from Trift and the Laguna, in 1682, was greater than ever. The rise and progress of the logwood-trade, from about the year 1667 to the year 1682, being thus stated, and laid before your majesty, we presume it would be too tedious, and not very material to the point in question, to enter into the particulars, how, and in what manner, it was afterwards constantly carried on; and how it has been from time to time interrupted and supported until the year 1713, when the adjustment and settlement thereof was again under consideration, both at Madrid and Utrecht.

But since the Spanish ambassador insists on it, that by the treaty of peace made at Utrecht, in which (he says) it is stipulated, 'That the lands or other places, which had been taken in the Indies during the war, should be evacuated; your majesty is engaged to oblige your subjects who are come to the lake de Terminos, to leave it immediately.'

We most humbly take leave to represent farther to your majesty:

That if his excellency would hereby insinuate, that your majesty's subjects are but lately, and during the war, come to the Laguna de Terminos, that is a mistake in fact; for it appears by the aforementioned depositions, sent by Sir Thomas Lynch and Sir Thomas Modyford, that they were there in 1669, and for some time, or years before; and it is well known to the Spaniards, that they have been ever since possessed of that part of the country, except for two or three months after the aforesaid assault in 1680.

Neither will what the said ambassador asserts from the treaty, answer the end for which it was produced.

By the 8th article it is, indeed, agreed by his Catholic ma-

jefty, 'not to alienate any of his territories in the West-Indies, to the French or any other nation; and upon this condition her late majesty engages, that she will endeavour and give assistance to the Spaniards, that the ancient limits of their dominions in America be restored, &c. if it shall appear that they have in any manner been broken into, and lessened in any part, since the death of king Charles II.'

But to argue from hence, that the Laguna de Terminos, in possession of the English before the year 1670, must be evacuated, when this treaty has only reference to what has passed since the demise of the said king Charles II. is very extraordinary.

But, if the ambassador refers to the memorial on the affairs of commerce, that was signed at Madrid the 13th of July 1713, by the lord Lexington and the marquis de Bedmar, we must confess, that the article relating to the logwood-trade, proposed therein by his lordship, had not then its effect: but we are assured it was from thence, among other things, referred to the discussion of the plenipotentiaries at Utrecht.

What passed particularly on this affair at Utrecht, doth not appear to us; but by the treaty of commerce concluded the 28th of November following (of which the said ambassador takes no notice in this memorial) and wherein the several interests of the two crowns and their subjects, with respect to commerce, were more particularly under consideration, it is manifest, that the rights and liberties, insisted on by the British subjects in the West-Indies, were adjusted by the lords plenipotentiaries; and that a clause in the treaty, which determines this contest relating to the cutting of logwood, beyond all possibility of dispute for the future, was then agreed upon and concluded; it being expressly stipulated in the first article after the confirmation and ratification of the American treaty in 1670, as follows: 'Without any prejudice, however, to any LIBERTY, or POWER, which the subjects of Great-Britain enjoyed before, either through RIGHT, SUFFERANCE, or INDULGENCE.'

If therefore this comprehensive clause (which relates only to the West-Indies) confirms, secures, and re-establishes those liberties, which the subjects of Great-Britain enjoyed in America before the treaty in 1670, it necessarily follows:

That they having then enjoyed the liberty of cutting logwood, without any interruption (as hath been fully proved) either through RIGHT, SUFFERANCE, or INDULGENCE, they are again entitled by this treaty, to the same liberty, in as plain and express words as can be used or imagined.

And, that your majesty may be more fully apprized of the importance of this trade, the same will be effectually demonstrated by the following account of the quantities of logwood imported since the war, viz.

	T.	C.	Q.	lb.
In 1713 - - - -	2189	15	3	22
1714 - - - -	4878	14	3	24
1715 - - - -	5863	12	1	14
1716 - - - -	2032	17	2	9
In four years,	14965	00	3	49

That is, communibus annis, tons 3741, which cannot be computed at less than 60,000l. per ann. though the price is at present reduced from 40l. to 16l. per ton, whereas, before your majesty's subject were settled there, it was worth 100l. the ton.

Nor is this trade less necessary than beneficial to your majesty's dominions, by reason of the great encouragement it gives to our seamen and shipping, which at all times require a particular attention, but now especially, when it is daily observed, that very many British mariners, either through defect of the laws, for want of employment at home, or in hopes of greater advantage abroad, enter themselves into foreign service.

Upon the whole, therefore, we are humbly of opinion, That the subjects of this your majesty's kingdom, for some years before, as well as after the conclusion of the American treaty in 1670, did enjoy an uninterrupted liberty of cutting logwood in the Laguna de Terminos, and in other places not inhabited by the Spaniards in the province of Yucatan, either through right, sufferance, or indulgence.

That the said American treaty did establish a right in the crown of Great-Britain to the Laguna de Terminos and the parts adjacent, those places at the time of the treaty, and for some years before, being actually in the possession of the British subjects.

That the royal cedula, issued out by the court of Spain, was a violation of the aforesaid treaty, so far as the carrying on the trade to the Laguna de Terminos was thereby interpreted an invasion, and the logwood-cutters accounted pirates.

And that your majesty's subjects having been (at least) suffered to enjoy the liberty of cutting logwood as aforesaid, before the conclusion of the American treaty (although your majesty should not insist on your said right to the Laguna de Terminos) yet that the same liberty is absolutely granted and confirmed by the treaty of commerce made at Utrecht.

And we do farther think it our duty to represent to your majesty, that, although the said Spanish ambassador seems to declare, in his memorial, that no attempt should be made to dislodge your subjects settled on the Laguna de Terminos, in a less time than eight months from the date of his said memorial; yet they were dislodged and taken prisoners in the same month the memorial was delivered, as appears by several affidavits sent to this board by general Hamilton, your majesty's governor of the Leeward Islands. All which is most humbly submitted.

Whitehall, Sept.
25, 1717.

SUFFOLK,
J. CHETWYND,
CHARLES COOKE,
J. MOLESWORTH,

M. BLADEN.

REMARKS.

We find, by the foregoing representation, that the logwood-trade, as carried on by us in the bay of Campeachy, came to be considered with the utmost care and circumspection by the Board of Trade and Plantations, in the year 1717, who solemnly reported to his late majesty George I. that we had an undoubted right to that trade, in which the subjects of the crown of England had been maintained and supported by former kings, his majesty's predecessors.

This logwood-trade having been a bone of contention between England and Spain, ever since the American treaty of 1670, and the principal, if not the only cause of the late war with Spain, which hath cost the two nations so much blood and treasure, and being not yet settled, may possibly be the cause of another war between us and Spain, wherein all Europe may be involved; I shall take leave, with all humble submission, to suggest an expedient, in the sequel, to public consideration, which may probably prove happily instrumental to prevent the calamities and miseries of war, in future, upon the like occasion. Previous to which, I shall briefly state the origin and nature of this commerce, as it has been carried on by the English in the bay of Campeachy; which may serve to elucidate some parts of the foregoing representation made by the lords of trade to the late king.

Campeachy is situated within the great bay of Mexico; yet the bay of Campeachy itself is a pretty large bay: it extends from Cape Confedelo, on the east point, to St. Martin's, on the west, which is about 120 leagues: it bends into the southward something in the form of an half-moon. The east part of this bay is in the province of Yucatan. Campeachy is the only sea-port of this province, and is situate on the south-east of the bay; Merida is the capital, and many other towns lie further up the country. The land hereabouts is sandy, and not very fruitful; the inhabitants make a coarse sort of cotton cloth, and gather salt-petre and salt, with which they supply the neighbouring places.

Near the bottom of this bay is a tract of land that was long in possession of the subjects of the crown of England, who carried on the logwood trade from thence to Jamaica, and our northern colonies. This tract of land includes the islands called Port-Royal, Trist, and Beef-Island; which form a sound between them and the main land, about three or four leagues wide. Into this sound stream various rivers and creeks, which run far into the country; and, upon the banks of these rivers and creeks, are produced groves of logwood-trees. These three islands, and the land within them, comprehend all that the English possessed after the conquest of Jamaica, and are in length no more than about 20 leagues, but not quite so much in breadth, including the space of water in the harbours and sound. The chief town and harbour where the English resided, was Trist, in latitude 18° north, and longitude 101° west of London.

The origin of this logwood-settlement was thus: after the conquest of Jamaica, the privateers frequently cruized in the bay of Campeachy for prizes, which they often met with: and some of these, having logwood only on board, the privateers destroyed, as being ignorant of its value at that time of day. At length one Capt. James brought a Spanish capture laden with this wood to England; which, proving a good prize, first taught the worth of this commodity; and, before the war was over, the privateer's men, having learned where this wood grew, settled themselves in the before-said places, and employed their time in cutting of this wood honestly, and preparing it for sale, and carrying the same to Jamaica and New England; from whence the logwood-traders imported supplies of what they wanted. At length the knowledge of this trade reaching England, upwards of 200 sail of ships were employed in it in a season: so considerable a trade was once carried on by the English in the bay of Campeachy; and the same might have been continued uninterruptedly to this day, had it not been for an unpardonable neglect in the government of England at that time. For had advantage been taken to have established the English government at this settlement, when there were above 1700 of the subjects of the crown of England then; and had proper fortifications been raised for

the security of this trade and settlers, we should have had no disputes, perhaps, at this time of day with Spain, about our right of trade and possession.

At the time we are speaking of, others of the British logwood-cutters and traders had settled themselves within the bay of Honduras, upon a large river, called the river Bellefe, which abounds also with logwood, and where the bulk of the logwood that has come to England for several years past has been cut: and this river has been uninterruptedly, to this day, in the possession of the British logwood-cutters and traders, and their slaves. And, about 42 miles up this river, the subjects of the crown of England have built a large town, with palmets and onabrigs, and hoisted English colours, as a testimony of their dependency on these kingdoms, and of their trading under the banner of Great-Britain.

During the possession of this settlement by the subjects of the crown of England, they have cut and exported large quantities of logwood to Europe, and imported whatever they had occasion for; and this sometimes in British bottoms, and sometimes in ships belonging to the inhabitants, many of whom have been men of worth, even from 10 to 30,000 l. sterling.

By a letter which I received, dated March 20, 1740-1, from a merchant of South Carolina, a man of known veracity, who had himself, as a captain of a merchantman, used the logwood-trade to this river for above twenty years, and thereby acquired a fortune competent to commence merchant; I was informed that the logwood-traders had, at their own expence, fortified, in some measure, the mouth of this river; and, as the British government had not been pleased to take such notice of them as they judged the importance of the trade required, they had also constituted a kind of government among themselves, and established a governor to their fort, whose name was ——— Sharpe, and him also they made the factor-general for their logwood, allowing him good commission for acting in this capacity, as also a handsome salary as governor of the fort: all which, I have good reason to believe, was done at the instigation, and by the advice and direction of my correspondent, who was not a little beloved by the logwood-traders at this river.

At the first settlement of this logwood colony in the river Bellefe, which was at the time when that of Campeachy was, the English were assisted by the Mosketoe Indians, who acknowledge the sovereignty of the crown of Great-Britain, and pay homage, and take the oaths to every new governor of Jamaica, on his first arrival: and these Indians have ever since been steady and faithful friends and allies to those traders, in the support and preservation of this colony. In 1718, the Spaniards of Patent attempted to dispossess the British logwood traders from the town and river of Bellefe; but his excellency governor Shute, of the province of Massachusetts, having commissioned to their protection Capt. William Wier, of the ship King George, together with the assistance of their old friends and allies, the Mosketoe Indians, they repulsed the Spaniards; and the English have remained in possession of this logwood settlement ever since; and, from a possession equal in time to that of the bay of Campeachy, from the felling of wood, clearing and planting the ground, and building of houses where no Spaniards were ever known to inhabit, they judge they have as good a right to this colony as any of the British planters have to their estates in America; such acts as these being deemed, in the West-Indies, to give the strongest right and title to such plantations. Moreover, this river, and the land circumadjacent thereto, has been claimed, from time immemorial, by the Mosketoe Indians, who being the original natives of this place, and of the lands hereabouts, and having never been conquered by the Spaniards, nor submitted to their dominion, but have long been faithful friends and allies to the English nation; they have, by virtue of submitting to the sovereignty of the crown of England, and that crown's acceptance of such their submission, put themselves and all their lands and territories under the dominion of the British government; and, therefore, in consequence hereof, this river, and land adjoining thereto, claimed by the British logwood-cutters and traders, became annexed to the crown of England, from our first possession of the same. This gives England even a much stronger right and title to this logwood colony, than the lords commissioners of Trade and Plantations assert, in the preceding representation to his late majesty, we have to that of Campeachy. And although this identical river, and lands adjoining thereto, are not expressly mentioned by the lords of Trade and Plantations, yet they are necessary implied in the *UTI POSSIDENTIS*, and also under these express terms, where their lordships say, 'Whereas, if your majesty's subjects did actually hold and possess the Laguna de Terminos, and the PARTS ADJACENT, at the time of the conclusion of the American treaty, as hath been already proved, the last clause of the seventh article will determine to whom the same belongs, &c.'—For this river Bellefe, and the lands adjoining thereto, inhabited by the British logwood-traders, are the parts adjacent to the Laguna de Terminos, this river, though in the bay of Honduras, stretching itself to the Laguna de Terminos within a few leagues, through morasses and impassable land, and therefore, may as justly be said to be PARTS ADJACENT to the

fact

said Laguna de Terminos, as Trift and Beef-Island in the bay of Campeachy may. And, when the Spaniards dispossessed the subjects of the crown of England from the Laguna de Terminos, and Trift and Beef-Island in the bay of Campeachy, many of those logwood-traders joined their brethren on this river Bellefe, by the way of Honduras Bay, they not being able to come at the same by the way of the Laguna de Terminos in the bay of Campeachy.

When we hear of ships being taken in the bay of Honduras with logwood, I do not ever remember to have heard, in any of our public accounts, the particular place specified from whence the subjects of the crown of England got their logwood; which has occasioned an egregious mistake, many imagining that no British vessel has any right to go into the bay of Honduras at all, and, therefore, that whatever ships are found there must certainly have been engaged in the illicit trade, and, consequently, such ships are legal captures to the Spaniards: whereas the case may be, and generally is, quite otherwise; for those vessels go from Jamaica to this British logwood colony that has been so long settled on the river Bellefe, and which, to the best of my recollection, lies near to Ascension Bay*; about two degrees and a quarter to the northward of the gulph of Honduras; for I never yet saw it in any map whatever.

- * From the minute intelligence which I received from the beforementioned captain of a merchantman, who had used the logwood-trade to this river above twenty years, I drew two maps of this river, upon a large sheet of vellum; the one I presented to Sir Robert Walpole, late lord Orford, in the year 1738, and the other I have somehow lost; but, as that which I presented to the late Orford, may very probably be still in the hands of some body belonging to that noble family; I shall be greatly obliged if they would be pleased to favour me with the same, in order to have it engraved for this work, and the original shall be returned. If they should be so kind, let them please to send the map to Messrs. John and Paul Knapton, booksellers in Ludgate-Street, or to my house at Brompton, near Kenfigton.

The island of Ratan, in the bay of Honduras, was taken possession of in order to secure the logwood-trade of the river Bellefe; and I have some reason to believe, in consequence of what I did myself the honour to lay before Sir Robert Walpole, in relation thereto; for the possession of this island, and the aid of the Moketoe Indians, would have always protected the logwood-trade of this part.

But as this logwood colony, as well as that in the bay of Campeachy, gives such umbrage and jealousy to the Spaniards, that this trade is carried on chiefly to cover and promote an illicit commerce with their colonies, where we have no more right to trade directly to, than other nations have to the British colonies: as the situation of these colonies are likely ever to create misunderstandings and heart-burnings between the crowns of England and Spain, it would be happy for both nations if some reasonable and moderate expedient could be thought of, to prevent any future rupture, upon this occasion, between the two kingdoms. To which end I crave leave, with all humble submission, to suggest the following measures, viz.

1. That although it is apparent we have an undoubted right to the logwood-trade in the bay of Campeachy, as represented by the honourable the lords of Trade and Plantations; and also the same right to this trade in the aforesaid river Bellefe, in the bay of Honduras; yet, in order to convince his Catholic majesty, and the whole world, that the British nation is desirous to maintain a strict and inviolable amity with Spain, let the crown of Great-Britain absolutely give up and renounce their right to the logwood-trade in the one or the other of these places; and let the renunciation of the one, and the right of the other, be ratified and confirmed by a new and explicit convention, as shall be agreed upon between the two crowns.—And as the absolute right to the whole of the Campeachy settlement may be judged by the court of Spain to be of more consequence to them, and the logwood-trade carried on there by the British nation more likely to cover an illicit trade than the settlement on the river Bellefe, in the bay of Honduras; let Great-Britain absolutely give up and renounce, by such convention, her right to the logwood-trade in the bay of Campeachy, upon express condition only, that her absolute right to the logwood-trade upon the said river Bellefe be also ratified and confirmed by the said logwood convention.

2. That all the logwood, cut by the Spaniards in the bay of Campeachy, shall be carried in Spanish bottoms to Jamaica, and there sold to the British subjects, at such a fixed price as shall be stipulated in the said new convention.

3. That the subjects of all other powers whatsoever shall be excluded from the cutting of logwood in the bay of Campeachy, or the purchase of logwood at first hand of the Spaniards, in any part of the said bay of Campeachy.

4. That the subjects of the crown of England shall have the free and uninterrupted liberty of trade and navigation to the said river Bellefe, in the bay of Honduras, and to fortify the same in such a manner as they shall judge proper for their security.

5. That logwood on board of any British ship shall not be deemed contraband goods, nor shall any British ship whatever be searched by the Spaniards upon the high seas.

VOL. II.

6. That all British ships caught in the ports of New Spain, save in the logwood port at Bellefe river, and except drove thither by storms of weather, &c. as agreed by subsisting treaties, shall be liable to be taken, with their cargoes, and confiscated by the Spaniards to their sole use.

These are the outlines of what I would humbly submit to public consideration, in order to prevent any future broils between the crowns of Great-Britain and Spain, in regard to this branch of commerce; leaving such additions and alterations to be made as shall be judged requisite to answer the end proposed.—If the Spaniards should not acquiesce to some measures of this, or some other kind, in order to regulate the logwood-trade, it is apparent that they have no intention to keep friendship with this nation.

Further REMARKS, on the unreasonableness of the Spaniards to insist upon the search of British ships upon the high seas of America.

That Great-Britain does not insist upon this point of NO SEARCH of their ships upon the open seas, from any chicaning motive or view, to cover an illicit trade to the Spanish colonies in America, but from an upright and honourable intention, to secure and maintain an uninterrupted freedom of navigation to and from her own colonies in America; will appear, it is humbly presumed, from the clearest evidence and conviction, that the court of Spain can reasonably desire or expect. For,

1. The course of the winds in those seas between the tropics, it must be observed, is generally between the east and north-east, which are distinguished commonly by the name of trade-winds; and, close to the coasts of the great islands of Cuba, Hispaniola, Jamaica, and Porto-Rico, there are also alternate land and sea-winds. The land-winds blow right off from the islands, on which side soever you are; they begin about sun-set, and blow sometimes till eight or nine o'clock in the morning, and are succeeded by sea-breezes.

2. There is likewise a strong rapid current to the westward, along the south side of all these beforementioned islands; and this is occasioned by the trade-winds blowing from the Canary islands over all the Atlantic Ocean. This current forces the sea very violently upon the coast of Guiana, which turns it through between the islands of Trinidad and Barbadoes: this rapid current is confined between the continent and the islands of Porto-Rico, Hispaniola, Jamaica, and Cuba, and continues it's force to Cape Gracias Dios, being all the way accelerated in it's violent rapidity by the wind that still follows it.

3. At Cape Gracias Dios the same current bends it's course to the northward; and, as it passes between Cape Catoche, on the isthmus of Yucatan and the west end of Cuba, becomes still far more rapid and violent than any where else. These things premised, the necessity, the absolute and indispensable necessity British ships are under, for security of their navigation only, of keeping as close as they possibly can to the Spanish coast, will appear obvious and indisputable. For,

The nearest course of our ships from Great-Britain, or from our northern colonies to Jamaica, is, either along the fourth side of Porto-Rico and Hispaniola, or directly between those two islands, or between Hispaniola and the island of Cuba. It is very true, indeed, upon a bare survey of the map, it does not appear, to the theorist and unexperienced land-man, that British ships are under the absolute necessity of approaching very near to the Spanish coasts; but those who have been experienced in the navigation of those seas, well know, that, even in the greatest calms, they are continually forced extremely near; nay, so near as within pistol-shot of the Spanish coasts, and are sometimes forced full upon the Spanish shore, to the immediate destruction of their vessels: and this is occasioned by the incessant rapidity of the beforementioned current, and the chopping seas our ships meet with between these islands, even after a calm; for it must be observed, that the dying winds, after any thing of tempestuous weather, always leave a strong sea running to the westward: so that our outward-bound ships, not from any view to an illicit trade, are necessitated, for the security of their navigation only, to keep as near to the Spanish shore as they possibly can, with safety from the shore itself, for the benefit of the land-winds, and to avoid the dangerous and often fatal effects of the rapid current, and the chopping seas.

And, with regard to those ships which are homeward-bound from Jamaica, there is still a far greater necessity for their sailing as close to the Spanish coast as, with safety, they possibly can. For those ships which load at King's-Town or Spanish-Town in Jamaica, or any where to the eastward thereof, frequently attempt to return to England and our northern colonies thro' the Windward Passage, between Cuba and Hispaniola, where they are always certain of meeting with the wind and current against them from the eastward, except they haul close over upon the coast of Cuba, for the benefit of a land-wind, as before observed, and to avoid the violence of the current, which runs against them.

Without our ships keeping thus close to the Spanish coast, it is absolutely impossible to sail to the eastward at all, through

the Windward Passage: and, notwithstanding they do keep as close to the shore as they can, and take all imaginable advantage of the shelter of the land, and of the land-winds; yet, in spite of all the assistance they can thus receive, they frequently lie beating there for several weeks together; and, after all their endeavours, are at last too frequently compelled to bear away round cape St. Anthony, at the west end of the island of Cuba, from whence they steer their course through the gulph of Florida: and this course most of our ships which load to the westward of King's-Town, or Port-Royal, chuse, as being the quickest passage.

And, in the passage of British ships from Jamaica, through the gulph, we are also under the same necessity of keeping as close to the south-west part of Cuba, and as close to the west and north-west part, as the shoal of the Collarado will, with security, admit: for, if our ships do not keep close to the land in this critical place, the north-west current is here so excessively strong, violent, and rapid, that it forces our ships often 50 or 60 leagues, or more, to the westward; and, when they are at such a distance from the land in this place, it is with the greatest difficulty they are able to recover it again; but, if they do, it may be several months first, which is certainly no little injury to our trade and navigation.

We have a memorable instance of the danger of this north-west current, in the late confederate war of queen Anne. A considerable fleet of merchantmen, under the convoy of a large squadron of men of war, made this mistake of keeping too wide of the land, upon doubling the west end of Cuba, and stretched so far to the north that they judged themselves out of the fight of Cuba, and plied the wind in that latitude till they thought themselves the height of the gulph of Florida; then stood to the northward accordingly, till they imagined themselves quite clear of the gulph, and congratulated the admiral upon the occasion, whose name at present I do not recollect, but I think it was admiral Benbow. After which, crowding full sail with a brisk gale of wind in the night, to their great astonishment, saw the land right a-head, which proved to be in the very bottom of the bay of Apalache. This was occasioned by the rapidity of the north-west current; and, had not the whole fleet immediately changed their course, this mistake would certainly have proved fatal to them. There are numberless instances of merchantmen, which, by not keeping as close to the Spanish coast as they possibly could, with safety from the shore, in this place have met with this current; which has either proved the loss of their vessels, or several months retarded their voyage.

Should it be objected, by the Spanish ministry, that the current, all the way taken notice of, does not always set strong to the westward, but that it sometimes changes, and sets to the eastward. To this it is answered, That, although, it is certain the main current does sometimes set to the eastward; yet this is but very seldom, and never of any long continuance on that point: besides, the time of such changes is altogether uncertain, and, therefore, our ships cannot take the advantage of setting out when the current should happen to favour them.

Unless, therefore, the English nation can make the winds and the currents to obey them in the seas of America, they cannot, consistent with their natural rights of navigation, submit to have their ships searched, under any colour or pretence whatsoever; nor can they submit to any limitation of course or distance whatever, in failing by the Spanish coasts, so as to preserve and maintain a freedom and safety of navigation to and from their own plantations.

I have dwelt the longer upon this point, judging it of the last importance to our navigation in America; and never having heard this point, in all the debates that have been, for above these 20 years about it, stated in it's clear and full light, I hope it will not prove an unacceptable service to my country to make this public, having had the same confirmed to me for several years past, by a great number of skilful and experienced captains of merchantmen, who, I am persuaded, could have no view to deceive me in my enquiries.

Of the illicit, or contraband trade, said by the Spaniards to be carried on by the English, and other nations, in Spanish America.

The subject on which I am at present engaged, naturally leading to the consideration of that part of the trade of the Spanish West-Indies which is commonly called illicit, or contraband, it may not be useless to take some notice of it, in this place; and, first, it may be necessary to be informed of the sentiments of the Spaniards themselves in relation to this matter; which we find in the works of the learned Spaniard Don Geronymo de Uztaiz*.

* See vol. I. cap. 29.

In a treatise already mentioned, says this great statesman, entitled, The Interest of England ill understood; in the war which was carried on in the year 1704, we have a detail of the various sorts of merchandize brought from England to Spain and Portugal, of which the principal is fish, with a remark that three parts are for Spain, and the fourth for Portugal; but that the profits are very different. The returns from

Portugal are made in commodities and fruits exported, such as tobacco, wine, sugar, spices, and salt; while those of Spain are much more advantageous to the English, as they principally consist of bullion, and bars of silver: for the wine, wool, and other commodities they take back, are far from being a balance for the goods brought into Spain.

In the same book it is also said, That one of the principal branches of commerce which the English possess in America, consists of an illicit traffic with his majesty's provinces, by introducing their merchandize by way of Jamaica; and the return is usually in bullion, wood, and cocheneal; and they estimate their gain by this single traffic at six millions of dollars yearly, and draw even more money from the Spanish dominions by way of Jamaica than Cadiz: nor ought this to be strange, since, in the month of August 1722, there arrived in England 30 vessels freighted from Jamaica; and, if we consider the barrenness of that island, one must be convinced that a principal part of their loading had been drawn from Spanish America: and the case is the same with the other numerous and frequent convoys that pass backwards and forwards from England to Jamaica, where, for the reason given above, and the few inhabitants of that island, a small part of the numerous goods carried over will be consumed there; and, therefore, they dispose of the rest to the Spaniards, as the English themselves confess. Moreover, the same book mentions the danger this branch of their commerce will be exposed to in the course of a war*, they had unjustly declared against us, since we could put a stop to it with six frigates, stationed to scour those seas.

* However good an opinion the learned Spaniard may entertain of this English writer, yet the advantage reaped in the late war, as well as in that of queen Anne, in Jamaica, by means of the Spanish West-India trade carried on from thence, shews that this author was much out in that foresight to which he pretended. Some years since I met with this author, translated into French; and, if I remember right, the original was reputed to have been wrote by a noted English Jesuit, who resided in the city of London, and who, of course, was no friend to the Protestant interest; and, therefore, with ed success to the Popish confederacy at that time, and wrote that treatise then to spirit up the Spaniards and French against England and her allies. But if foreigners form their judgment of the commerce and power of this kingdom, from the party writings of either side, with which we abound, it is not to be admired that they are frequently misled in regard to some very essential points.—And some of those writers, who would be thought very zealous in their country's interest, have been the instruments of doing her the greatest mischief. We would by no means be understood to restrain the liberty of the press in any degree, while a becoming decency, and the character of the gentleman is preserved, that privilege being the great palladium of all our liberties: but I would observe, that our own people at home, as well as foreigners abroad, are too often egregiously imposed upon by the party writings of all sides. This many wise and good men have lamented; and, I am willing to flatter myself, that this work wherein I am engaged will, in relation to commercial affairs, prevent evils of this nature; for party artifice has too often a great share in those concerns; having endeavoured, to the utmost of my ability, to guard against every thing of that kind; for the grand pole-star by which I have endeavoured to conduct myself, is the general prosperity and happiness of Great-Britain in particular; and that without any intention whatever to injure any other nation, unless the routing of my countrymen to beat them in honest industry, art, and ingenuity, will be said to be so.

That an illicit and contraband trade hath sometimes been carried on by the subjects of the crown of England, from Jamaica to the Spanish West-Indies, will hardly be denied; and so it hath been, and daily is, by the subjects of other nations. This, however, is no palliation of what is wrong in itself. Such is the ineffectuality both of divine and human laws, that no trading nation can absolutely prevent the smuggling and contraband trade, even within their own dominions, much less are they able to prevent their subjects from practising the like in foreign countries. No nation is more sensible of these things than that of Spain; for, although their laws are very rigorous and severe against smuggling in Spanish America: though they erected a gallows at Panama, to put a stop to it: yet they have not hitherto been able to do it. And, while their own subjects will carry on an illicit trade with foreigners, it is no wonder that the latter will run the hazard likewise.

Every nation has a right to enact what laws they judge proper for the regulation, as well of the trade and navigation of their respective colonies and plantations, as of the mother-state. But these laws and regulations should never interfere with subsisting public treaties, nor with the laws of nations, which give every state a right and freedom of navigation to and from their several colonies and plantations: for such laws and regulations which interfere with public treaties, and the laws of nations, must tend to destroy all amity with such nations who make them.

If the ships of Spain, in their navigation to and from their American colonies, sail near to any of the English or French colonies, would not the Spaniards highly resent it, if the Eng-

lish

lish or French should detain and search their ships on the high seas, upon the pretence of their having been concerned in an illicit and contraband trade? But if the English or the French, or any other nation, caught the ships of Spain in the ports of any of their colonies and plantations, carrying on an illicit and contraband trade, Spain neither could or would complain, if such of their ships and cargoes were seized and confiscated: Spain would not think this any infraction of treaties, or any violation of the law of nations; it would be using smugglers as they deserve.—So whenever the Spanish officers in America have really caught either the English, French, or Dutch ships or vessels, in any of the Spanish ports, carrying on an illicit and contraband traffic, those courts never have, or ever will complain, if the Spaniards seize and confiscate such ships and vessels; nor will the captures themselves ever have the confidence to complain, whenever this is the case: all states, on these occasions, must submit to the laws of nations for the reciprocal security of their commerce and their revenues.

This seems to be the natural and right light wherein the Spaniards, if unbiassed by self-partiality, should consider this matter; they should, as England, and every wise trading nation must and will, enact the most salutary laws for the government of their colonies and plantations, to prevent evils of this nature; and have such upright governors and active and vigilant officers, as will suppress, instead of promote and encourage, for private interest, this infamous traffic. What difficulties has not the government of England had to suppress smuggling, and yet has not been able to eradicate it; though it is certain, that, from the vigilance, vigour, and resolution of the administration, the knot is broke of the most notorious and enormous villains of this stamp; whereby this detestable commerce is greatly decreased. But every trading nation has these mal-practices to bear with more or less: and, would the court of Spain take the like measures that England has been obliged to do, and hang up those of their own subjects, whom they find any way concerned in, and in any respect encouraging a contraband trade, they might soon, perhaps, put a stop to it, notwithstanding the great extent of their coasts; and, in such case, the subjects of England, France, and Holland, must of course cease to be concerned therein.

But, if the Spaniards are really in earnest to suppress this illicit traffic in their American dominions, and do not suffer the same to be countenanced with a view to make a handle of; should they not let their subjects in those parts have a constant and full supply of such assortments of merchandizes, by the legal way of Old Spain, wherein they know they stand in need? If this is not regularly and effectually done, how can it be expected that the subjects of the crown of Spain, in any part of America, will want such merchandizes wherein they stand in need, if there is a possibility of coming at them in any shape? If then the principal cause of the illicit and contraband trade carried on in Spanish America by the subjects of the several other states of Europe, as well as by the subjects of the crown of Great-Britain, may be ascribed to the deficiency of the laws of Spain, or to the bad execution of their laws in New Spain; if the commerce from Old Spain to New is not so wisely regulated by the due sailing of their galleons and register-ships, &c. as it might be, to afford their subjects in America such a constant supply of merchandize as they must and will have, does not the fault in this respect lie in the court of Spain itself?

When the South Sea company possessed and exercised the Assiento contract, Spain was incessantly complaining of the illicit commerce carried on by the means, and under the cover of the exercise of that contract: that is now at an end; and, if there was any truth in these suggestions of the crown of Spain, all illicit trade occasioned thereby has ceased with the Assiento itself.

There may be probably enough still some degree of illicit trade carried on as well by the subjects of the crown of England in Spanish America, as by the subjects of other powers: but, will a mere suspicion of this in the crown of Spain justify their detention and search of British or any other ships, indeed, upon the high seas? We have seen the apparent and inevitable necessity under which our British ships in particular lie, to sail as near as possibly they can, with safety, to the Spanish coasts, in their lawful navigation to and from the British colonies and plantations; without which, our people are frequently liable either to lose their lives and ships, by reason of the winds and currents, or to have their voyage some months retarded: we have seen likewise the foundation of our right, by treaties, to the logwood-trade in the bays of Campeachy and Honduras; and the unreasonableness of the Spaniards, in presuming to detain and search our ships upon the high seas, in their navigation to and from our logwood or other colonies, under the pretext of having been engaged in illicit trade: we have also seen, that logwood, the produce of those places which have been particularized in the bays of Campeachy and Honduras, is as much a British commodity, as sugar, rice, and tobacco are British commodities, in any of our other colonies; and that the Spaniards have not the least foundation to condemn any British

vessel for having logwood on board; for that such conduct is an apparent violation of subsisting treaties.

With respect to the article of cacao-nuts, that may be on board British ships, it is well known that they likewise are the product of our own settlements in America; so that all the dispute between Great-Britain and Spain is reduced to the simple point of pieces of eight, which is the current coin of the Spanish West-Indies. To which we would observe, this is a specie, that all the European nations which trade in a lawful manner by way of Old Spain to New, have in return together with other commodities from Spanish America, for the merchandizes which they send thither; and it is well known, that Spanish pieces of eight are looked upon in the light of a commodity, by all those nations who traffic with Spain, and is accordingly bought and sold among them; and, indeed, so are the foreign coins, more or less, of the principal trading nations of Europe: nay, the chief current coins of Europe are, in some degree, in a perpetual circulation over the whole traffickable world. And these pieces of eight, which the other European nations receive from Old Spain, are again carried back to America, and disseminated among all the colonies and plantations belonging to the several potentates therein interested: in the French, Dutch, and Portuguese colonies, there are Spanish pieces of eight to be seen in the way of traffic, and so there are guineas and louis d'ors, &c. Our northern colonies trade with the French islands, and our islands frequently trade with the Dutch in America, whereby, in the currency of trade, Spanish pieces of eight, as well as divers other foreign coins, are constantly passing from colony to colony; but this will not prove that, when such Spanish pieces of eight are found on board British, or any other vessels belonging to these European nations who have settlements in America, these vessels have been carrying on an illicit and contraband trade with the Spaniards in the Spanish West-Indies; these identical pieces of eight might come into their hands, in consequence of the legal commerce of Old Spain; and, if they are afterwards carried to circulate among all the colonies in America, which is frequently the case; will this justify the Spaniards in searching, much less in taking or condemning the ships of any European power, for having such specie on board, who have any right to trade in America? This will justify them the least of any, in taking British ships on the high seas of America; because these ships often take out this specie with them, wherewith to facilitate their commerce among the British colonies in general; and are obliged, as we have seen, to navigate even within gun-shot of the Spanish coast, merely for security of their lives, their ships, and their cargoes.

Such was the situation of the English and Spanish interests in America, before the year 1667, that the latter attempted an express prohibition of trade to all other nations, to the Spanish West-Indies; this they laboured long but ineffectually to procure; they met with constant opposition to any stipulation of this kind in their favour, in the reigns both of queen Elizabeth and king James; and this was thought to be one of the principal causes that brought the brave Sir Walter Raleigh to the block.

In the reign of Charles the first, the Spaniards renewed their solicitations for a clause of this nature in the treaty, then concluded between Spain and England, and offered a considerable sum of money to procure it, but they were still unsuccessful; nor could all the honours and favour they heaped upon Charles II. during his exile, prevail with him to grant them any promise for that purpose, in case he was restored to the crown. In consequence of this being the state of the case, at the time we are speaking of, between England and Spain, the Spanish governors were absolutely restrained, by orders from the court of Madrid, from permitting any other nation to trade with the Spanish West-Indies. Nay, we endeavoured to have this liberty explicitly confirmed by treaty to us; but this being contrary to maxims, which, by long usage, had acquired the strength of fundamental laws in that monarchy, we could never obtain it. This was the intent of the embassy of Sir Richard Fanshawe in the year 1664. However, in later days we have been more moderate: Great-Britain seems, at present, to require nothing of the crown of Spain, in order to preserve an inviolable friendship with that nation, but what is her indisputable right; and that she certainly has to the cutting of logwood in such parts of the bays of Campeachy and Honduras, as have been before represented. She also has an indisputable right to a free and uninterrupted navigation to and from her own colonies in America, as well as the Spaniards have to theirs; and that without any detention or search of their ships whatsoever upon the high seas, by Spanish guarda costas or others, under pretence of suspecting them to have contraband goods on board.

REMARKS upon the whole of this article of LOGWOOD, before the last war.

It is too notorious to need proof, that the late war was occasioned by the depredations, which were committed by the Spaniards upon British ships trading to and from our logwood and other British colonies in America; and it is well enough

enough known to the whole world, that the long forbearance of the court of Great-Britain to come to an open rupture with the crown of Spain, upon this occasion, is scarce to be paralleled in history: and, if the accounts we have of late received from Jamaica and the northern colonies be true, there is too much reason to believe, that the Spaniards are about to act the like scene over again, that occasioned the war. If this should be the case, as I hope it will not, I have humbly submitted an expedient to public consideration, to prevent those evils with regard to the logwood-trade, that is as much calculated for the interest of Spain as that of Great-Britain. In what has been urged in relation to that point, and the search of British ships upon the high seas of America, I have not shewed the least partiality towards my own country; I have stated only the naked facts without exaggeration, which generally eclipses the truth. It is to be wished, that our logwood settlements were situated elsewhere, that might give no umbrage or jealousy to the Spaniards; it is therefore I have proposed the ascertaining our right to that colony in the RIVER BELLESE; in failing to and from which, our British traders can give no cause of suspicion that they intend an illicit and contraband trade, under colour of the logwood-trade: and every impartial Spaniard must allow, that it is condescension enough in the crown of England to give up their right to the logwood trade, in Campeachy, upon the conditions suggested, in case the British right is explicitly ascertained, by treaty, to that small river Bellese. But, if the court of Spain should not acquiesce in so fair and equitable a proposition, which I have done myself the honour humbly to submit to consideration; it will demonstrate that the crown of Spain is determined to break with Great Britain at all events, if they should continue to take our ships in the manner they did before the late war, in 1741. And, if this should prove to be the real disposition of that court, if we were even to give up the whole logwood-trade, they would nevertheless take our ships in failing to and from our other colonies; so that there would be no end of concession upon concession. If this should ever come to be the case, the regulations of the logwood-trade, proposed by Sir Thomas Lynch governor of Jamaica, may, perhaps, be first necessary to be settled, viz. that all ships trading to our logwood colonies should sail together in small squadrons, as is taken notice of in the representation of the lords commissioners of trade before quoted. In a word, every prudential measure should be tried to settle this point in an amicable manner between the two crowns, if there is a possibility of so doing.—But the most effectual pacific measures to be taken, we humbly apprehend, should be in such a commercial way, as would pinch the Spaniard in the most tender point.—Whatever could be thought of in this shape should be essayed, before the sword is again drawn upon the like occasion; and, if every endeavour of this kind in the court of Great Britain proves fruitless, then all imaginable weight and dignity should be given to the administration by unanimity at home, that such alliances with foreign powers might be made, and such effectual measures taken by the parliament, as would bring the Spaniards to terms of reason and justice with a nation, by which they gain more than by any other whatsoever, and in whose power it may one day be to do them more mischief than another state whatever*.—But nothing can be a greater folly, we conceive, than for a trading nation to go to war, 'till every measure, possible to be thought of, is tried to prevent it; and yet every wise measure taken previously to prepare for it, before we ever attempt to strike the blow again, that, when do strike, we may do it with such secrecy and effectuality, as may make the Spaniards repent their maltreatment of a nation that has bore so much to preserve peace with them: and, if once, as I heard a great man say, previously to a declaration of war with Spain, it was the sense of a British parliament to address the throne, that they would grant supplies to carry on a war against Spain, upon condition only that Great-Britain should HOLD WHAT POSSESSIONS THEY GOT IN THE WAR, this would be no ill-judged step to prevent one; but, if we had one, it would occasion our whole strength to be levelled, where it would be most sensibly felt.

* Did not the Spaniards experience this, by our taking the Havannah in the last war?

REMARKS.

The foregoing was the state of our LOGWOOD article, before the last war; but by the DEFINITIVE TREATY of 1763, that point is settled as follows, in the XVIIth article of the said treaty, "His Britannic majesty shall cause to be demolished all the FORTIFICATIONS which his subjects shall have erected in the BAY OF HONDURAS, and OTHER PLACES of the territory of Spain in that part of the world, four months after the ratification of the present treaty: And his Catholic majesty shall not permit his Britannic majesty's subjects, or their workmen, to be disturbed, or molested, under any pretence whatsoever, in the SAID PLACES, in their occupation of CUTTING, LOADING, and CARRYING AWAY LOGWOOD. And for this purpose,

"they may build without hindrance, and occupy without interruption, the houses and magazines which are necessary for them, for their families, and for their effects: And his Catholic majesty assures to them, by this article, the full enjoyment of those advantages and powers on the Spanish coasts and territories, as above stipulated, immediately after the ratifications of the present treaty."

We find that, at length, this long contested point, respecting the LOGWOOD TRADE, is settled by treaty, which it never was explicitly before. For the Spaniards would never before acknowledge, that we had any right to cut logwood in the BAY OF HONDURAS; but by the said article, the subjects of his Britannic majesty are permitted to CUT, LOAD, and CARRY AWAY logwood from the said bay, and wherever else they had erected fortifications, upon condition only of their demolishing such fortifications.

But since the said DEFINITIVE TREATY has been made between the crowns of Great-Britain and Spain, the following accounts having been reported to be transmitted to the court of London, it will be necessary to record the same in this work; though we are willing to hope, that the court of Spain will disavow what follows, or it may possibly be attended with a fresh war; for the consequences of which, see our article NEW MEXICO.

Philadelphia, May 10. By the Olive Branch, captain Robinson, from Honduras bay, we have advice, that the Spaniards had forbid the English from cutting wood in the bay; upon which they had sent an express to Jamaica for assistance. The following is a translation of a letter from the Spanish general to the commanding officer in the bay.

SIR,

The king, my master, having appointed me to the employment of governor and captain-general of this province, with especial order to comply entirely with what his majesty granted to the crown of England, and stipulated in the 17th article of the definitive treaty of peace, signed at Paris the 10th day of February, this year, commanding me likewise that with all possible dispatch, I should proceed on my voyage, which I could not do so soon as I desired, for various disappointments which happened. I arrived at Campeachy the 7th instant, and having taken possession the 24th, I was informed of your arrival at Balis in the month of April, also five vessels, and that immediately the people were dispersed as far as Rio Hondo, practising from that time the cutting of logwood, by virtue of the treaty of peace. You did not present the royal schedule that my sovereign expedited for this end, nor the licence of the king of England for the aforesaid effect.

This being granted, I am obliged by the king, my lord, in his royal confidence of the government of this province, and to comply entirely with the said 17th article of the definitive treaty of peace, as I said before, to dispatch the commandant of the fort of Bacalar, don Joseph Rosado, with this, requiring you, that in consideration of the want of instruments for your introduction, and having extended yourselves, gathering fruits as in your own country, without waiting to settle the limits with the necessary solemnity that should have secured your establishment, you will be pleased, with all speed, to give the necessary advice to all your community that are in Rio Hondo, to retire to Balis; and I expect you will present me with the royal schedule, that the king, my master, dispatched to this end, or with orders from the king of Great-Britain for this effect; and there is no doubt but I shall then attend to it with that care and equity I am commanded; issuing for that purpose the necessary orders to all the commandants, cabos, military and judiciary of all the districts in their jurisdiction; by which means the suspicion of the fatal consequences will cease, which will be inevitable if such conduct is continued, sufficient to destroy the good harmony between the two nations, and happy tranquillity we enjoy, if the remedy is not occurred to in time, and our sovereign will manifestly see how we interest ourselves, that their just and laudable intentions take effect, for which I am so ready on my part, as is manifest by my toleration, that you and all your nation remain at Balis, and I promise myself the same on your parts, protesting always that for the result of what may happen by such irregular introduction and excess of cutting logwood, those who commit, or do not remedy them, will be responsible after all. I hope you will favour me with an answer by hand of the said commandant of Bacalar, and other commands most to your satisfaction, to manifest to you the desire I have to serve you. God guard you many years, as he can, and I desire. Your most humble servant, kisses your hands,

PHILIPPE REMIRES DE ESTINOS.

Marida, in Jucatan, 29th of December, 1763.
Seir Don JOSEPH MAUD.

Don Joseph Rosado, lieutenant of infantry in the battalion of Castilia, and commandant of this garrison and royal fort of St Philip, of Bacalar, and its jurisdictions.

Notwithstanding that the serjeant Dionisius Chavaria, who is detached to the look-out of St. Anthony, has the necessary

fary orders, that the English logwood cutters of Rio Hondo, do retreat to Balis, without permitting them to make any demur, because that since the 4th instant, when the order of the governor and captain-general was by me intimated to them, they have had competent time to evacuate the river, carrying away the utensils of their houses. I order and command the said serjeant, that he receive eleven foldiers of this garrison, well armed, which, with four there before, completes the number of fifteen, to remain at the said look-out; that with them he is not to permit any English vessel, under any pretext, to enter the mouth of this river; on the contrary, if any flats remain in the river, they are to go out, with the utensils of their houses, with so much brevity, as not to permit them to stop any where, but retire totally; as likewise those from the New River; because in the order intimated to them, it is expressed, that the retreat shall be to Balis, and no other part; and to act on the contrary, they expose themselves to evident danger, as by their disobedience they lose their negroes, and find themselves under a violent arrest. This order he shall manifest to as many as are not yet gone out, that by this means it arrive at the notice of all the baymen, and at no time they may plead ignorance. And all that is done on the subject by the said serjeant, he shall give me punctual advice; as also of what may occur, to advise his excellency the governor and captain-general, from whom I have orders to execute what may be needful;—in case of contumacy, disobedience, or rebellion, laying to the charge of the baymen, all the results that may happen between the sovereigns, for not executing what they are ordered, and that it appear to the said serjeant what is hereby ordered; and that he fulfil his obligation with that zeal, love and conduct he ought. This order is given in this garrison and royal fort of St. Philip, Bacalar, this 22d of February, 1764.

JOSEPH ROSADO.

I, the serjeant Dionisius Chavaria, certify, that the above is a true copy of the order I received this day from the commandant don Joseph Rosada,

JO. MAUD,
JA. GRANT,
STEPHEN ARCHHOLD.

DIONISIUS CHAVARIA.

To his excellency William Henry Littleton, Esq; governor and captain-general of the island of Jamaica, and other the territories thereunto belonging, chancellor and vice-admiral of the same, &c. the humble petition of the principal settlers on the Bay of Honduras, for cutting of logwood, and the commanders of vessels now lying there to load,

Humbly sheweth,

That your petitioners by virtue of the preliminary treaty of peace (in the 17th article whereof it is stipulated, that the subjects of his Britannic majesty shall have the privilege of cutting and carrying away logwood in the Bay of Honduras; with liberty to build houses and magazines, necessary for themselves and families) in the month of April 1763, came down here for the aforesaid purpose of cutting logwood; and on their first arrival, dispatched a letter to the commandant of Bacalar, being the nearest Spanish settlement; who returned for answer, that he would transmit it to the governor and captain-general of the province of Yucatan; whose orders on the subject, he, the said commandant, communicated to your petitioners, which was to comply entirely with the 16th article of the preliminary treaty of peace.

That afterwards, by virtue of a letter from the said governor of Yucatan, No. 1, in the answer to a letter from Joseph Maud, one of your petitioners, a copy of which is No. 2, several of your petitioners went into Rio Hondo, to cut logwood; and from that time unmolested followed their occupations, till the 4th of this instant February, in good harmony and correspondence with the Spaniards, by frequent letters from the governor of Yucatan, and answers by Joseph Maud, one of your petitioners, all hereunto annexed, at which time don Joseph Rosado, commandant of Bacalar, delivered the said Joseph Maud, one of your petitioners, the letter from the governor of Yucatan aforesaid, No. 3, ordering your petitioners to retreat to Balis, 'till they produce either a schedule from his Catholic majesty, or orders from the king of Great-Britain, to authorize them to cut logwood. In consequence whereof, your petitioners, with all possible dispatch, endeavoured to withdraw their effects to the New River and Balis, in both which rivers your petitioners had formerly settlements. But on the 23d instant they were again disturbed, by an order from the commandant of Bacalar, directed to the serjeant of the guard at the mouth of Rio Hondo, an authentic copy of which is likewise annexed, No. 4, by which your petitioners are ordered to evacuate every river except Balis, where it is admitted them to stay a little while, but; as your petitioners believe, not to have the privilege of cutting logwood even there; that your petitioners are hereby driven to the greatest distress, not having any plantations to maintain themselves and families; that by means of so total a stagnation of business,

VOL. II.

many of your petitioners, and commanders of vessels, that have lain for some time here, are in the greatest danger of wanting provisions; that they have disposed of their cargoes to your petitioners, the settlers, who, by reason of being driven from their occupations, are incapable of paying for them; and that the vessels lately arrived, not seeing any prospect of immediate payment, refuse to sell their provisions. These are the miseries your petitioners experience from the inhumanity of the Spaniards.

And your petitioners likewise humbly represent to your excellency, that not having any legal authority for settling disputes with each other, they find themselves reduced to a state of anarchy and confusion, nor have the injured any method to seek redress; that your petitioners humbly apprehend, that without order it is impossible for any community long to subsist.

Your petitioners therefore humbly pray, that your excellency will be pleased to grant them such relief as their own distressed circumstances require, and your great wisdom shall direct; and your petitioners shall ever pray.

Further REMARKS.

In answer to the said petition of the logwood-cutters to governor Littleton, it has been observed, that it is evident, from the said petition, that from the month of April 1763, to the 4th day of February 1764, the logwood-cutters had remained undisturbed in the occupation and possession of all that had been stipulated by the treaty of peace; and that the suspension of their logwood cutting, had been in consequence of a letter of the 29th of December 1763, written to Joseph Maud, by Philippe Remires de Eñinos, captain-general of Yucatan, who had arrived at Campeachy the 7th of the same month. Before the arrival of this Spaniard, the letter of the 17th article had been strictly observed on the part of his countrymen in America: but as something relative to securing this trade to the English, and preventing the Spaniards from being imposed on by PRETENDERS TO THE RIGHTS OF BRITISH SUBJECTS, had been foreseen to be absolutely necessary to be established, that stipulation had been agreed on between the crowns of Great-Britain and Spain, and, according to don Remires's words, it consisted in obliging the logwood-cutters, either to be furnished with the ROYAL SCHEDULE WHICH SPAIN HAD EXPEDITED TO THIS END, OR WITH THE LICENCE OF THE KING OF ENGLAND, FOR THE AFORESAID EFFECT, and which was unknown before his arrival.

It appears, that it had been foreseen by the contracting parties, that the merchants of Holland, France, and of all the maritime powers, would discern the advantages that might be derived from the above article of the treaty of peace; and from such view, that ships would be fitted out in those countries, and navigated by English seamen, would undoubtedly be sent to the BAY OF HONDURAS, to possess themselves of those advantageous stipulations, which were intended for Great-Britain only.

And the late war having destined such numbers of the English to the sea-service, more than peace can employ, and by that means forced the English sailors into foreign service, sailors for the above purpose could not be wanting. Whence it should seem, it became absolutely necessary, that either the above-mentioned SCHEDULE or LICENCE should be found in the hands of those who were cutting logwood, as the best preservative both of THE ENGLISH AND SPANISH RIGHTS, from the invasion of others by fallacious means, and a mutual benefit to both nations.

That the want of those authorities is the chief reason for the suspension of the logwood-cutting, seems evident from the words of don Philip Remires, that in consideration of the want of instruments for your introduction, &c. "And I expect you will present me with the royal schedule that the king my master dispatched to this end, or orders from the king of Great-Britain for this effect; and there is no doubt but I shall then attend to it with the care and equity I am commanded, issuing for that purpose the necessary orders to all the commanders, cabos, military and judiciary of all the districts of their jurisdiction, &c."

By the 17th article of the treaty, the English are entitled to the cutting of logwood only: but it seems by the words of Remires, uncontradicted by the petitioners to governor Littleton, that they had extended themselves, gathering fruits as in their own country, and without waiting to settle the limits with the necessary solemnity that should have secured their establishment.

That some proper measures are necessary to restrain the privilege of cutting, loading, and carrying away logwood from the Bay of Honduras, to the subjects of Great-Britain only, and to preclude the subjects of all other states and empires from the like privileges, was certainly what was intended by their Britannic and Catholic majesties: but if foreign merchants, by the means of English sailors in their service, shall invade the rights of British subjects, and reap in part, or in whole, those advantages that were intended for the subjects of Great-Britain only, this is an injury to the mercantile subjects of England, as well as detrimental to Spain; and ought to be prevented for their mutual benefit.

F f

And

And it seeming by DON REMIRES's conduct, that a SCHEDULE or a LICENCE is to be the touchstone signifying such British right and privilege, by both courts, it should be complied with: and it is a pity that this point was not explicitly stipulated by the treaty; but if the disadvantages on both sides were not foreseen till experienced, and the matter has since the treaty took effect, been agreed on by both crowns as Don Remires has represented, it shews that a good harmony subsists between them, and that the expedient intimated is to be exercised in future to strengthen that desirable harmony. And certain it is, that the indiscriminate permission of all who shall call themselves Englishmen, to this beneficial right of cutting logwood, would, in a great measure, defeat the advantages which are fixed by treaty to the subjects and merchants of this island: and if the resident logwood-cutters at Honduras, and the British merchants who send ships thither to trade with British logwood-cutters, are both duly authorized by schedule or royal licence, it will prevent foreign interlopers from partaking of those British rights, under the mark of being English merchants, because they have a few English sailors on ship-board to countenance them in their unjustifiable logwood traffic.—And if the measures mentioned, or any other that may prove still more effectual to answer the end proposed should do so, then England will enjoy the exclusive right and privilege of cutting, loading, and carrying away logwood, which may prove a greater benefit to us, than was perhaps apprehended to arise from the logwood article in the DEFINITIVE TREATY.

To this it has been observed, that if a schedule from the court of Spain, or a licence from the court of England had been agreed on, or known to be necessary for our logwood-cutters to have carried with them to the coast of Honduras, why has this nation been kept so long in ignorance thereof? Why were not the governors of our colonies, and particularly of Jamaica, duly furnished with them, in order to give the requisite authority to those who engaged in that business? But it appears, our governors were no way apprized that such authorities were needful, and therefore were furnished with no such to distribute, nor knew how to act upon discovery of the conduct of Spain towards the logwood-cutters; they could only transmit accounts thereof to the court of England, while the poor people were ruining, by expences and loss of time, occasioned by Spanish chicanery.

But if the care of our logwood-trade might not have been entrusted to our self-interested traders, who would hardly fail to discover all illicit intruders, for the sake of not being interfered with in what so nearly concerns themselves; it was certainly necessary to prevent any misunderstanding between the contracting crowns, to have had it EXPRESSLY STIPULATED IN THE DEFINITIVE TREATY, that such royal schedules and licences were the authorities required by treaty to entitle British subjects to their right in the logwood-trade in the Bay of Honduras; and then none, we may presume, would have attempted the trade, without being furnished with such: and if this has been an oversight in the treaty, it may easily be supplied, without drawing the sword again upon this account, provided the Spaniards are not insincere; if they are, they may soon rue it, perhaps. See our article MEXICO, our last REMARKS thereon.

While this work is printing, we find the following paragraph in the LONDON GAZETTE. ST. JAMES'S, July 21, 1764.—‘In answer to the representations made by his majesty's ambassador at the court of Madrid, upon the late transactions of the governor of Yucatan, and his proceedings towards the British subjects employed in cutting Logwood in the BAY OF HONDURAS, the Spanish ministry have replied, That they have not received any advices from that governor relative to this affair; but that it is certain the Catholic king has given positive orders to the governor of Yucatan to abide by, and observe the XVIIth article of the last treaty of peace, and that he will not approve of the conduct of his subjects who act in contravention to it. That it is the intention of his Catholic majesty, that no one shall impede the English in their cutting Logwood in the stipulated places; and he will disapprove of the governors and ministers whenever they act to the contrary, and renew the most strict orders to that effect.’

LONGITUDE, as it regards navigation, to which our work has an affinity, is the distance of a ship or place, east or west from another, computed in degrees of the equator. This distance being reckoned in leagues or miles, or in degrees of the meridian, and not in those proper to the parallel of latitude, is usually called departure*.

* Departure, in navigation, signifies the easting or westing of a ship, with respect to the meridian (a) it departed or failed from. Or, it is the difference of longitude, either east or west, between the present meridian the ship is under, and that where the last reckoning or observation was made.—This departure any where, but under the equator, must be accounted according to the number of miles in a degree, proper to the parallel the ship is under.

(a) The meridian is an imaginary circle supposed to pass through the poles of the earth, and any given place. So that the plane of the terrestrial meridian is in the plane of the celestial one. Hence,

1. As the meridian intersects the whole earth, there are several places situated under the same meridian. 2. As it is noon-tide whenever the center of the sun is in the meridian of the heavens, and as the meridian of the earth is in the plane of the former, it follows, that it is noon at the same time, in all places situate under the same meridian. 3. There are as many meridians on the earth, as there are points conceived in the equator. In effect, the meridians always change, as you change the longitude of the place; and may be said to be infinite, each place from east to west having it's several meridians.

To discover the longitude at sea is a problem that has hitherto perplexed all mathematicians; although, for the solution thereof, great rewards have been publicly offered by the English, French, Dutch, Spaniards, and other nations: this being the only thing wanting to render navigation perfect. Various are the attempts that authors have made for this purpose, and various the methods they have proposed, but without success, so that the palm is still unascertained. The methods taken to arrive at this point are different. What most of them aim at, is a method of determining the difference of time between any two points on the earth: for every 15 degrees of the equator answering to an hour, i. e. one degree to 4 minutes of time, and one minute of a degree to 15 seconds of time; the difference of time being known, and turned into degrees, will give the longitude, and vice versa. This some have pretended to effect, by chronometers and automata of various kinds, but always in vain; no time-keeper, excepting a pendulum (which cannot be applied at sea) being sufficiently exact for the purpose.

Others search for a means to find the longitude in the heavens: for, if the exact times of any celestial appearance be known for two places, the difference for those times gives that of the longitude of those places. Now, in the ephemerides*, we have the motions of the planets, and the times of the celestial phenomena; as the beginning and ending of eclipses, conjunctions of the moon with other planets, it's entrance into the ecliptic, &c. accurately calculated for some one place. Therefore, if the hour and minute be known, wherein any of the same phenomena are observed in an unknown place, the difference between the hour and minute of that place, and that other to which the tables are computed, and consequently the difference of their meridians and their longitude from each other, are known also.

* Ephemerides in astronomy, signifies tables calculated by astronomers, shewing the present state of the heavens for every day at noon; that is, the place wherein all the planets are found at that time.—It is from these tables, that the eclipses, conjunctions, and aspects of the planets are determined, and horoscopes, or celestial schemes, constructed, &c.

The difficulty here, does not consist in the exact finding of the time, which is easily had from the sun's altitude or azimuth, but the defect lies in the fewness of proper celestial appearances capable of being thus observed: for all slow motions (v. gr. that of Saturn) are excluded, as shewing but a little difference in a considerable space of time; and it being required in this case, that the phenomenon be sensibly varied in two minutes time, an error of two minutes in time produces another of thirty miles in the longitude.—Now there are no phenomena in the heavens that have these requisites, excepting the several stages of an eclipse of the moon, her longitude, or place in the zodiac; her distance from the fixed stars, or appulse to them; her ingress into the ecliptic, or the points of her orbit, where that cuts the ecliptic; and the conjunction, distance, and eclipses of Jupiter's satellites.

1. The method by the eclipses of the moon is easy, and sufficiently accurate, were these eclipses every night. At the moment wherein we see the beginning or middle of a lunar eclipse by a telescope, we have nothing to do but take the altitude or azimuth of some fixed star, from which the hour and minute are easily found; or without the altitude, if the star be in the meridian.—This hour and minute, therefore, thus found, and compared with that expressed in the tables, gives the longitude.

2. The moon's place in the zodiac is a phenomenon more frequent than that of her eclipses; but then the observation thereof is difficult, the calculus complicated, by reason of two parallaxes, so that it is scarce practicable at sea, in general, to any tolerable degree of accuracy.—Indeed, by waiting till the moon comes into the meridian of the place, and then taking the altitude of some remarkable star (the altitude being supposed to be first known) from this altitude and the latitude, we shall be able to find the time pretty accurately, though it will be better to do it by some star in the meridian.

—Now, the time being found, it will be easy to find what point of the ecliptic is then in the meridians or mid heaven.—Thus we shall have the moon's place in the zodiac, corresponding to the time of our place.—Then, in the ephemeris, we find what hour it is in the meridian of the ephemeris, when the moon is in that part of the zodiac: thus we shall have the hour and minute of the two places for the same time, the difference of which will give the difference of longitude.

3. In regard there are many times when the moon cannot be observed in the meridian, there is therefore another still more frequent

frequent phenomenon, from which the longitude is sought, viz. the moon's appulse and recess from the fixed stars: for from thence the moon's true place may be investigated for the given time of observation.—But this method, by reason of the parallaxes, and the solution of oblique spherical triangles, and the various cases, is so difficult and perplexed, that mariners will scarce ever be able to make use of it.

4. To find the longitude by the moon's ingress into the ecliptic, observe the moment of that ingress: then, in the ephemeris, see what hour it is in the meridian of the ephemeris, when that ingress happens.—The difference between these times gives the difference of longitude.

5. The phenomena of Jupiter's satellites are generally preferred to those of the moon, for finding the longitude; by reason the former are less liable to parallaxes, and do further afford a very commodious observation, in every situation of that planet above the horizon.—Their motion is very swift, and must be calculated for every hour, and for that reason are not found in the common ephemerides.—Now, to find the longitude by means of these satellites, with a good telescope, observe a conjunction of two of them, or of one of them with Jupiter, or any other the like appearance: and, at the same time find the hour and minute from the meridian altitude of some star; then, consulting tables of the satellites, observe the hour and minute wherein such appearance happens in the meridian of the place to which the tables are calculated.—This difference of time, as before, will give the longitude.

All methods, which depend on the phenomena of the heavens having this one defect, that they cannot be observed at all times; and being, besides, difficult of application at sea, by reason of the motion of the ship; there are some, who leaving the moon and the satellites, have recourse to clocks, and other automata; which, could they be made perfectly just and regular, so as to move with the sun, without either gaining or losing, and without being affected with the change of air and of climates, the longitude would be had with all the ease and accuracy imaginable: nothing more being required, but to set the machine by the sun at the time of departure, and when the longitude of any place is desired, to find the hour and minute from the heavens (which is done at night by the stars, and in the day by the sun;) for the difference between the time thus observed, and that of the machine, gives the longitude.—But no such machine has been yet discovered, wherefore recourse has been still further had to other methods.

Mr. Whifton and Mr. Ditton have proposed a method of determining the longitude by the flash and report of great guns.—Sounds, it is known, move pretty equably in all their stages: if then a mortar or great gun be exploded at a place whose longitude is known, the difference, it was judged, between the time wherein the flash (which moves, as it were, instantaneously) is seen, and the sound, which moves at the rate of four seconds in a mile, is heard, will give the distance of those places from each other; whence, if their latitudes be known, the difference of longitude will be likewise known. Moreover,

If the hour and minute of the explosion be known, say they, (for the place where it is made) by observing the hour and minute from the sun and stars, at the place whose longitude is required; the difference between those times will give the difference of longitude. And,

If the said mortar be loaded with an iron-shell full of combustible matter, and hoisted perpendicularly, it will carry the same a mile high, which will be seen near an hundred miles; if therefore neither the sound should be heard, nor the flash seen, the distance of any remote place from that of the mortar may be determined from the altitude of the shell above the horizon of the place unknown: and, the distance and latitude known, the longitude is easily found.

According to this scheme, it was proposed to have such mortars fixed at proper distances and at known stations, on all the frequented coasts, islands, capes, &c. and to be exploded at certain hours, for the observation of mariners.

This method, however, plausible in theory, has the fate of all the rest, and is found useless in the practice, as being extremely troublesome, and yet precarious.—It supposes that sounds may be heard 40, 50, or 60 miles: of which, it is true, we have instances, but they are very rare: and, ordinarily, the report of a cannon is not heard above half so far, and sometimes much less.—It supposes sound to move always with equal velocity; whereas, in fact, it's velocity is increased or diminished as it moves with or against the wind.—It supposes also, the strength of powder uniform, and that the same quantity carries the same range: the contrary whereof is known to every gunner.—We say nothing of thick cloudy nights, when no lights can be seen; nor of stormy nights, when no sound can be heard, even at inconsiderable distances.

We have another method of finding the longitude, proposed by the same Mr. Whifton, viz. by the inclinatory, or DIPPING NEEDLE. This dipping, or inclinatory-needle, is a magnetical needle so hung, as that, instead of playing horizontally, and pointing out north and south, one end dips, or inclines to the horizon, and the other points to a certain degree of elevation above it. Or,

A dipping-needle may be defined to be a long straight piece of steel, every way equally poised on it's center, and afterwards touched with a load-stone, but so contrived, as not to play on the point of a pin, as does the common horizontal needle, but to swing in a vertical plane, about an axis parallel to the horizon: and this in order to discover the exact tendency of the power of magnetism.

The inventor of the dipping-needle was an Englishman, Robert Norman, a compass-maker for mariners, in Wapping, near the city of London, about the year 1576. The occasion of the discovery he himself relates, viz. that it being his custom to finish and hang the needles of his compasses, before he touched them, he always found that, immediately after the touch, the north point would bend, or decline downwards, under the horizon: inasmuch that, to balance the needle again, he was always forced to put a piece of wax on the south end, as a counterpoise.

The constancy of this effect led him, at length, to observe the precise quantity of the Dips, or to measure the greatest angle which the needle would make with the horizon. This, in the year 1576, he found at London to be $71^{\circ} 50'$; but the dip varies, as well as the horizontal direction.

Burrows, Gilbert, Ridley, Bond, &c. endeavoured to apply this discovery to the finding of the latitude; and the last author, going farther, proposed likewise the finding of the longitude thereby: but, for want of observations and experiments, he could go no length.

Mr. Whifton, being furnished with the further observations of Col. Windham, Dr. Halley, Mr. Pound, Mr. Cunningham, Pere Noel, Pere Feuillée, and his own, has improved greatly on the doctrine and use of this needle, brought it to more certain rules, and endeavoured to find the longitude thereby.

In order to this he observes, 1st, That the true tendency of the north or south ends of every magnetic needle is not to that point in the horizon to which the horizontal needle points, but towards another directly under it, in the same vertical, and in different degrees under it, in different ages, and at different places.

2^{dly}, That the power by which a horizontal needle is governed, and all our navigation ordinarily directed, is proved to be but one quarter of the power, by which the dipping-needle is moved; which should render the latter far the more effectual and accurate instrument.

3^{dly}, That a dipping-needle, a foot long, will plainly shew an alteration of the angle of inclination, in these parts of the world, in half a quarter of a degree, or $7\frac{1}{2}$ geographical miles; i. e. supposing that distance taken along, or near a meridian; and a needle of four feet, in two or three miles.

4^{thly}, A dipping-needle, four feet long, in these parts of the world, will shew an equal alteration along a parallel; as one of a foot long will shew along a meridian, i. e. this will, with equal exactness, shew the longitude, as that the latitude.

This depends on the position of the lines of equal dip, in these parts of the world, which are found to lie about 14 or 15 degrees from the parallels.

Hence he argues, that, as we can have needles of 5, 6, 7, 8, or more feet long, which will move with strength sufficient for exact observation; and since microscopes may be applied to the viewing of the smallest divisions of degrees on the limb of the instrument; it is evident the longitude at land may be found thereby, to less than four miles.

And, as there have been many observations made at sea with the same instrument, by Noel, Feuillée, &c. which have determined the dip usually within a degree, sometimes within half, or a third of a degree, and this with small needles of five or six, or, at the most, nine inches long; it is evident, the longitude may be found even at sea, to less than half a quarter of a degree. Thus much premised, the observation itself follows:

To find the longitude or latitude by the dipping-needle.—If the lines of equal dip below the horizon be drawn on maps, or sea-charts, for good observations, it will be easy, from the longitude known, to find the latitude; and, from the latitude known to find the longitude, either at sea or land.

Suppose, e. gr. you were travelling, or sailing, along the meridian of London, and found the angle of dip, with a needle of one foot, to be 75° ; the chart will shew, that this meridian, and the time of dip, meet in the latitude of $50^{\circ} 11'$; which, therefore, is the latitude sought. Or,

Suppose you was travelling, or sailing, along the parallel of London, i. e. in $51^{\circ} 32'$ north latitude, and you found the angle of the dip to be 74° ; this parallel, and the line of this dip, will meet in the map in $1^{\circ} 46'$ of east longitude from London; which is, therefore, the longitude sought: yet this scheme also, has proved impracticable and unsuccessful in it's application.

Since every method which hath been hitherto attempted, hath proved abortive, and the discovery of the longitude at sea remains still the great desideratum in navigation; it is imprudent to depend longer upon any one of those methods which have been yet tried; the difficulties in each being palpable; and, perhaps, absolutely insuperable.

Another method, lately started, whereby this important discovery has been attempted, is, by A NEW AND UNIVERSAL PROBLEM, BY WHICH THE LONGITUDE AT SEA, IN THE DEAD-RECKONING, AND THE DISTANCE OF THE SHIP'S RUN, ARE SAID TO BE CORRECTED BY THE SAME OBSERVATION THAT THE LATITUDE IS, AND TO THE SAME CERTAINTY, WITHOUT ANY REGARD TO LEE-WAY, CURRENT OF THE SEA, OR VARIATION OF THE COMPASS. By the Rev. Richard Locke, an Englishman. As this is a problem, said by the reverend author to be entirely new, and the truth thereof to be not only founded upon geometrical demonstration, but experimental practice at sea, where he affirms he has tried the same; it seems to deserve due public notice and attention.

That the public might be informed of this discovery, the author first printed and published the fact, as he declares, the 24th of January, 1751, in the London Evening-Post. After which he was advised to publish the problem, and the demonstration thereof, in a pamphlet; which he has done, within the compass of 14 pages, addressed to the honourable the COMMISSIONERS appointed to inspect the longitude, and to the PUBLIC in general. Which being sent to me the last year, and recommended by several worthy gentlemen, as a matter consistent with a Dictionary of Commerce, and necessary to be published therein; I was prevailed upon to give the same a place in this work, under the first head that occurred, where I could do it with any sort of propriety: and the reader will find the whole under the article COMMANDERS OF SHIPS; with an address to them, as requested to try the same experimentally at sea. But,

As those gentlemen, without disparagement to their high importance and utility to the state, are, in the general, better acquainted with the ordinary practical rules of navigation*, as they are commonly taught them by rote, and not by reason and demonstration, they may be presumed not to be competent judges of the demonstrative part, which, Mr. Locke says, he has given, and, therefore, may not as yet be attentive to the experimental trial and practice of what that gentleman has offered for their service: wherefore, the author has thought proper to reduce his discovery, for the benefit of all practical navigators, to the few following plain rules and precepts; which, he says, are the result of his demonstration. See the article COMMANDERS OF SHIPS, for the whole of what he has communicated.

* An objection that some have made against the study of mathematical learning is, that we see, in the ordinary business of life, these affairs are carried on and managed by such as are no great mathematicians, as sea men, ship-wrights, engineers, mill-wrights, surveyors, gaugers, clock-makers, glass-grinders, &c. and that the mathematicians are commonly speculative, retired, studious men, that are not for an active life and business, but content themselves to sit in their studies, and pore over a scheme or a calculation. To which there is this plain and easy answer: The mathematicians have not only invented and ordered all the arts above-mentioned, and most others by which these grand affairs are managed, but have laid down precepts, contrived instruments and abridgments so plainly, that common artificers are capable of practising by them, though they understand not a title of the grounds on which the precepts are built: and in this they have consulted the good and necessities of mankind.

Those affairs demand so great a number of people to manage them, that it is impossible to breed so many good, or even tolerable mathematicians. The only thing then to be done was, to make their precepts so plain, that they might be understood and practised by a multitude of men. This will best appear by examples. Nothing is more ordinary than dispatch of business by common arithmetic, by the tables of simple and compound interest, annuities, &c. yet how few men of business understand the reasons of the rules given in common arithmetic, or the construction of those tables that are made, but securely rely on them as true. They were the good and the thorough mathematicians, that gave these precepts so plain, and calculated these tables, that facilitate the practice so much. Nothing is more universally necessary than the measuring of planes and solids: and it is impossible to breed so many good mathematicians, as that there may be one that understands all the geometry requisite for surveying, and measuring of prisms and pyramids, and their parts, and measuring frustums of conoids and spheroids, in every market-town, where such work is necessary.

The mathematicians, therefore, have inscribed such lines on their common rulers, and sliding-rules, and adapted so plain precepts to them, that every country carpenter and gauger can do the business accurately enough, though he knows no more of the rationale of those instruments, tables, and precepts he makes use of, than a hobby-horse. So, in navigation, it is impossible to breed so many good mathematicians as would be necessary to sail the hundredth part of the ships of the nation. But the mathematicians have laid down so plain and distinct precepts, calculated necessary tables, and contrived convenient instruments, so that a seaman, that knows not the truths on which his precepts and tables depend, may practise safely by them. They resolve triangles every day, that know not the reason of any one of their operations. Seamen, in their calculations, make

use of artificial numbers, or logarithms, that know nothing of their contrivance: and, indeed, all those great inventions of the most famous mathematicians had been almost useless for those common and great affairs, had not the practice of them been made easy to those who cannot understand them. From hence it is plain, that it is to those speculative retired men we owe the rules, the instruments, the precepts for using them, and the tables which facilitate the dispatch of so many great affairs, and supply mankind with so many conveniences of life. They were the men that taught the world to apply arithmetic, astronomy, and geometry to sailing, without which the needle would be still useless. Just the same way, in the other parts of mathematics, the precepts that are practised by multitudes, without being understood, were contrived by some few great mathematicians.

The rules as given by Mr. Locke, for the use of practical navigators, are as follow: which I am requested to add to what has been said under the preceding article of COMMANDERS OF SHIPS; and, if they should prove to be true, it will be very extraordinary that the most essential part of the practical art of navigation should be reducible to a quarter of a sheet of paper.

TO ALL GENTLEMEN SEAMEN, MARINERS, AND OTHERS, OF ALL NATIONS, WHO ARE ANY WAY CONCERNED IN PRACTICAL NAVIGATION:

A plain, easy, and practical method to discover the LONGITUDE AT SEA, for the safety and preservation of shipping. By RICHARD LOCKE, an ENGLISHMAN.

The two principal things to be regarded, to obtain the true longitude at sea, are, to measure as correct a distance of the ship's run as can be, by the half-minute glass and log-line, and to make a true observation of latitude.

And, when you cast up the day's work, or traverse, to find the longitude and latitude in the common way, take their courses as entered on the log-board, without making any allowance for lee-way, variation, or currents; and, if you find the latitude in the traverse to be more than the latitude in the observation, take, or subtract, the difference from the latitude in the traverse, and add it to the longitude.—But, if you find it less in the traverse than in the observation, take the difference from the longitude, and add it to the latitude; always remembering, that the latitude in the traverse must be made equal to the latitude in the observation; and, what is more or less, to add to, or subtract from the longitude.—This is to be done every time you make an observation; and when you have got the miles of sailing or westing, if they are in the same latitude, divide them by the miles of one degree in that latitude.—If of different latitudes, divide them by the miles of the middle latitude, between the two observations.—And this will give the longitude in degrees, as mentioned in my book, or it may be found by the following easy table. By these instructions, carefully observed, any island or place, whose longitude and latitude are known, may be hit upon a meridian, as near as you can make your observation of latitude.

A TABLE of the geometrical miles of one degree of LONGITUDE for every degree of latitude.

Lat.	Miles.	Lat.	Miles.	Lat.	Miles.
1	59.8	31	51.0	61	29
2	59.6	32	50.5	62	28
3	59.4	33	50.0	63	27
4	59.2	34	49.5	64	26
5	59.0	35	49.0	65	25
6	58.8	36	48.5	66	24
7	58.6	37	48.0	67	23
8	58.4	38	47.5	68	22
9	58.2	39	47.0	69	21
10	58.0	40	46.5	70	20
11	57.8	41	46.0	71	19
12	57.6	42	45.5	72	18
13	57.4	43	45.0	73	17
14	57.2	44	44.5	74	16
15	57.0	45	44.0	75	15
16	56.6	46	43.5	76	14
17	56.3	47	43.0	77	13
18	56.0	48	42	78	12
19	55.6	49	41	79	11
20	55.3	50	40	80	10
21	55.0	51	39	81	9
22	54.6	52	38	82	8
23	54.3	53	37	83	7
24	54.0	54	36	84	6
25	53.6	55	35	85	5
26	53.3	56	34	86	4
27	53.0	57	33	87	3
28	52.5	58	32	88	2
29	52.0	59	31	89	1
30	51.5	60	30	90	0

N. B. To find the middle latitude by this table, add the miles of the two observed latitudes together, and divide the sum by 2, which gives the middle latitude.

RICHARD LOCKE.
RE-

REMARKS.

This gentleman, Mr. Locke, appears to be very sanguine with regard to the truth of his discovery; and therefore has, in his before-mentioned book, given a general challenge to all the mathematicians in the world to confute it, or shew any other method of discovering the longitude at sea, that may be depended upon.—The cause of this challenge, it seems, was, if I am rightly informed, by reason of some personal maltreatment that the author thinks he met with, from some mathematicians in England, upon the publication of the first edition of his pamphlet.—How this matter stands between those gentlemen, I am no otherwise acquainted than by hearsay.—It is pity that men of science should have any rancour towards each other.—Time and experience will shew whether the problem is true or false, in the application made of it to the discovery of the longitude at sea.

There is one thing I would beg leave to observe, before I dismiss this matter; that, as Mr. Locke has generously communicated his problem to the public, so that every body now may be masters of it, and put the same in practice at sea, without any difficulty or expence; it is necessary that the public should be put upon their guard, and not be imposed upon by granting rewards to such who may pretend to discover the longitude at sea, by other ways and means, when they really make use of Mr. Locke's discovery for that purpose.

OBSERVATIONS, since the above, upon the article LONGITUDE.

Under the article of COMMANDERS OF MERCHANTS SHIPS, is contained the whole of Mr. Locke's new problem for the discovery of the LONGITUDE AT SEA; which the author was requested to insert several years ago, in the first edition of this work, as a record, (if the demonstration therein said to be given, should be found to be true, as well from experience as theory) to ascertain Mr. Locke's right to the reward promised, to the discoverer of a matter of such importance. The same was also inserted in the second edition of this work; and the same is requested to be continued in this the third edition of this work, made in the present year 1765, by the executors of Mr. Locke, who has several years since been dead, in going to America, to make a further trial of the truth of his new problem; of which he had often declared he was thoroughly convinced, by what he had experienced at sea: but, he was desirous to have repeated and incontestible evidence and conviction thereof, before he made proper application to the British parliament, as was his intention. In consequence of the death of Mr. Locke, it is requested that ALL GENTLEMEN, who are thorough judges of the said new problem, and are of opinion that the same is demonstrably true, and is actually the discovery of THE LONGITUDE AT SEA; or has been any way conducive to the discovery thereof; and any COMMANDERS or MASTERS OF SHIPS, who shall have tried and experienced the truth of Mr. Locke's discovery, would apply to MR. POSTLETHWAYT, the author of this Dictionary, AT HIS HOUSE IN PINNERS-COURT, NEAR THE PAY-OFFICE, IN BROAD-STREET, NEAR THE ROYAL-EXCHANGE, LONDON; and if they prove any way instrumental to obtain any public reward for Mr. Locke's discovery, Mr. Postlethwayt is authorized by the executors of Mr. Locke, to treat with them upon the occasion.

The ACTS of PARLIAMENT relating to the discovery of the LONGITUDE AT SEA.

An act for providing a public reward for such person or persons as shall discover the longitude at sea, in the 12th of queen Anne.

Whereas it is well known, by all that are acquainted with the art of navigation, that nothing is so much wanted and desired at sea, as the discovery of the longitude, for the safety and quickness of voyages, the preservation of ships, and the lives of men: and whereas, in the judgment of able mathematicians and navigators, several methods have already been discovered, true in theory, though very difficult in practice, some of which (there is reason to expect) may be capable of improvement, some already discovered may be proposed to the public, and others may be invented hereafter: and whereas such a discovery would be of particular advantage to the trade of Great-Britain, and very much for the honour of this kingdom; but, besides the great difficulty of the thing itself, partly for the want of some public reward, to be settled as an encouragement for so useful and beneficial a work, and partly for want of money for trials and experiments necessary thereto, no such inventions or proposals, hitherto made, have been brought to perfection: be it therefore enacted, by the queen's most excellent majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in parliament assembled, and by the authority of the same, That the lord high admiral of Great Britain, or the first commissioner of the admiralty, the speaker of the honourable house of commons, the first commissioner of the navy, the first

commissioner of trade, the admirals of the red, white, and blue squadrons, the master of the Trinity-House, the president of the Royal Society, the royal astronomer of Greenwich, the Savilian, Lucasian, and Plumian professors of the mathematics in Oxford and Cambridge, all for the time being; the right honourable Thomas earl of Pembroke and Montgomery, Philip lord bishop of Hereford, George lord bishop of Bristol, Thomas lord Trevor, the honourable Sir Thomas Hanmer, Bart. speaker of the honourable house of commons, the honourable Francis Roberts, Esq; James Stanhope, Esq; William Clayton, Esq; and William Lowndes, Esq; be constituted, and they are hereby constituted commissioners for the discovery of the longitude at sea, and for examining, trying, and judging of all proposals, experiments, and improvements relating to the same; and that the said commissioners, or any five or more of them, have full power to hear and receive any proposal or proposals that shall be made to them for discovering the said longitude; and in case the said commissioners, or any five or more of them, shall be so far satisfied of the probability of any such discovery, as to think it proper to make experiments thereof, they shall certify the same, under their hands and seals, to the commissioners of the navy for the time being, together with the persons names who are the authors of such proposals; and, upon producing such certificate, the said commissioners are hereby authorized and required to make out a bill or bills for any such sum or sums of money, not exceeding two thousand pounds, as the said commissioners for the discovery of the said longitude, or any five or more of them, shall think necessary for making the experiments, payable by the treasurer of the navy: which sum or sums the treasurer of the navy is hereby required to pay immediately to such person or persons as shall be appointed by the commissioners for the discovery of the said longitude, to make those experiments, out of any money that shall be in his hands, unapplied for the use of the navy.

And be it further enacted, by the authority aforesaid, That, after experiments made of any proposal or proposals for the discovery of the said longitude, the commissioners appointed by this act, or the major part of them, shall declare and determine how far the same is found practicable, and to what degree of exactness.

And, for a due and sufficient encouragement to any such person or persons as shall discover a proper method for finding the said longitude, be it enacted, by the authority aforesaid, That the first author or authors, discoverer or discoverers, of any such method, his or their executors, administrators, or assigns, shall be intitled to, and have such reward as herein after is mentioned; that is to say, to a reward, or sum of ten thousand pounds, if it determines the said longitude to one degree of a great circle, or sixty geographical miles; to fifteen thousand pounds, if it determines the same to two thirds of that distance; and to twenty thousand pounds, if it determines the same to one half of the same distance; and that one moiety, or half-part of such reward, or sum, shall be due and paid, when the said commissioners, or the major part of them, do agree that any such method extends to the security of ships within eighty geographical miles of the shores, which are places of the greatest danger; and the other moiety, or half-part, when a ship, by the appointment of the said commissioners, or the major part of them, shall thereby actually sail over the ocean, from Great-Britain to any such port of the West-Indies, as those commissioners, or the major part of them, shall chuse or nominate for the experiment, without losing their longitude beyond the limits before mentioned.

And be it further enacted, by the authority aforesaid, That, as soon as such method for the discovery of the said longitude shall have been tried and found practicable and useful at sea, within any of the degrees aforesaid, that the said commissioners, or the major part of them, shall certify the same accordingly, under their hands and seals, to the commissioners of the navy for the time being, together with the person or persons names who are the authors of such proposal; and, upon such certificate, the said commissioners are hereby authorized and required to make out a bill or bills for the respective sum or sums of money, to which the author or authors of such proposal, their executors, administrators, or assigns, shall be intitled, by virtue of this act; which sum or sums the treasurer of the navy is hereby required to pay to the said author or authors, their executors, administrators, or assigns, out of any money that shall be in his hands, unapplied to the use of the navy, according to the true intent and meaning of this act.

And it is hereby further enacted, by the authority aforesaid, That if any such proposal shall not, on trial, be found of so great use as afore-mentioned, yet if the same, on trial, in the judgment of the said commissioners, or the major part of them, be found of considerable use to the public, that then, in such case, the said author or authors, their executors, administrators, or assigns, shall have and receive such less reward therefore, as the said commissioners, or the major part of them, shall think reasonable, to be paid by the treasurer of the navy on such certificate, as aforesaid.

An act to render more effectual an act made in the twelfth year of the reign of her late majesty queen Anne, intitled, An act for providing a public reward for such person or persons as shall discover the longitude at sea; with regard to the making experiments of proposals made for discovering the longitude; and to enlarge the number of commissioners for putting in execution the said act, in the 26th of George II.

Whereas by an act of parliament made in the twelfth year of the reign of her late majesty queen Anne, intitled, An act for providing a public reward for such person or persons as shall discover the longitude at sea; the commissioners therein and thereby named and constituted, or any five or more of them, have full power to hear and receive any proposal or proposals that shall be made to them for discovering the said longitude; and, in case the said commissioners, or any five or more of them, shall be so far satisfied of the probability of any such discovery, as to think it proper to make experiment thereof, they shall certify the same, under their hands and seals, to the commissioners of the navy for the time being, together with the persons names who are authors of such proposals; and, upon producing such certificate, the said commissioners are thereby authorized and required to make out a bill or bills for any such sum or sums of money not exceeding two thousand pounds, as the said commissioners for the discovery of the said longitude, or any five or more of them, shall think necessary for making the experiments, payable by the treasurer of the navy; which sum or sums the treasurer of the navy is, by the said act, required to pay immediately to such person or persons as shall be appointed by the commissioners for discovery of the said longitude to make those experiments, out of any money that shall be in his hands unapplied for the use of the navy: and whereas, for a due and sufficient encouragement to any such person or persons as shall discover a proper method for finding the said longitude, it is likewise enacted by the said act, That the first author or authors, discoverer or discoverers, of any such method, his or their executors, administrators, or assigns, shall be intitled to and have such reward, as in the said act is particularly mentioned: and whereas, by another act of parliament made in the fourteenth year of the reign of his present majesty, intitled, An act for surveying the chief ports and head-lands on the coasts of Great-Britain and Ireland, and the islands and plantations thereto belonging, in order to the more exact determination of the longitude and latitude thereof; reciting in part of the said act of parliament, made in the twelfth year of the reign of her said late majesty queen Anne; and also reciting that it was absolutely necessary, for making the discovery useful at sea, and for the security of ships approaching near the shores, that the chief ports and head-lands on the coasts of Great-Britain and Ireland, and the islands and plantations thereto belonging, should be first surveyed, and the longitude and latitude of such places determined more exactly than had then been done; and likewise reciting that some doubts had arisen, whether, by the words of the said act of parliament made in the twelfth year of queen Anne, the said sum of two thousand pounds appointed for making such experiments, or any part thereof, could be applied for such survey, or fixing the longitude or latitude of such places, it was enacted by the said act made in the fourteenth year of the reign of his present majesty, That the said commissioners for discovering the longitude, or any five or more of them, should have full power to apply such part of the said sum of two thousand pounds, mentioned in the said first recited act, as had not then been laid out in experiments, as they shall think necessary for the making such survey, and determining the longitude and latitude of the chief ports and head-lands, on the coasts of Great-Britain and Ireland, and the islands and plantations thereto belonging; and that such sum or sums, part of the said two thousand pounds, which the said commissioners, or any five or more of them, should think necessary, should be paid immediately by the treasurer of the navy, to such person or persons as should be appointed by the said commissioners for the discovery of the longitude, to make such survey, and determine such longitude and latitude, out of the money that should be in the hands of such treasurer unapplied for the use of the navy; and whereas a competent number of the said commissioners for the discovery of the said longitude, have (by virtue of the powers vested in them, by the said act made in the twelfth year of the reign of queen Anne) heard and received several proposals made to them at different times, for discovering the said longitude, and were so far satisfied of the probabilities of such discoveries, that they thought it proper to make experiments thereof, and accordingly certified the same, from time to time, to the commissioners of the navy for the time being, together with the name of master John Harrison, who was author of the said proposals; whereupon bills were made out for several sums of money, amounting in the whole to one thousand two hundred and fifty pounds, all which respective sums were paid to the said John Harrison by the treasurer of the navy, pursuant to the directions of the said last mentioned act of parliament, as parts of the said two thousand pounds therein mentioned; which the said commissioners for discovering

the said longitude thought necessary for making the said experiment: and whereas a like competent number of the said commissioners for the discovery of the said longitude did (by virtue and in pursuance of the powers vested in them by the said several above-mentioned acts of parliament) appoint master William Whiston to survey and determine the longitude and latitude of the chief ports and head-lands on the coasts of Great-Britain and Ireland, and the islands and plantations thereto belonging; and did also apply the further sum of five hundred pounds (other part of the said sum of two thousand pounds mentioned in the said act made in the twelfth year of the reign of queen Anne (which they thought necessary for the making such survey, and determining the said last mentioned longitude and latitude, and which said sum of five hundred pounds was paid to the said William Whiston accordingly by the treasurer of the navy: and whereas by reason of the several payments made by the treasurer of the navy to the said John Harrison and William Whiston respectively, as aforesaid, amounting in the whole to one thousand seven hundred and fifty pounds, the said commissioners for discovering the said longitude have at present, by virtue of the said acts of parliament, power only to apply the sum of two hundred and fifty pounds and no more (being the remainder of the said two thousand pounds) towards making any further experiments which they may think proper and necessary to be made, in order to discover the longitude: and whereas, from the experiments which have already been made in pursuance of the powers vested in the said commissioners as aforesaid, there is great reason to expect, that by continuing to encourage ingenious persons to invent and make further improvements and experiments, in order to discover the said longitude, such discoveries may at length be produced as will effectually answer that end, and thereby contribute very much to the advantage of the trade and honour of this kingdom: therefore, for enabling the said commissioners to cause such further experiments to be made as they shall think proper for the purposes aforesaid, be it enacted by the king's most excellent majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, That the said commissioners constituted by the said act of parliament made in the twelfth year of the reign of the late queen Anne, for the discovery of the longitude at sea, and for examining, trying, and judging of all proposals, experiments, and improvements, relating to the same, or any five or more of them, have full power to hear and receive any proposal or proposals that have been or shall hereafter be made to them for discovering the longitude at sea; and in case the said commissioners, or any five or more of them, shall be so far satisfied of the probability of any such proposal or discovery, as to think it proper to make experiment thereof, they shall certify the same under their hands and seals to the commissioners of the navy for the time being, together with the persons names who shall be the authors of such proposals; and, upon producing such certificate, the said commissioners of the navy are hereby authorized and required to make out a bill or bills for any such sum or sums of money, not exceeding two thousand pounds, over and above the aforesaid sum of two hundred and fifty pounds, being the remainder of the two thousand pounds mentioned in the said act made in the twelfth year of the reign of the late queen Anne, as the said commissioners for the discovery of the said longitude, or any five or more of them, shall think necessary for making any experiments in pursuance of this act, or either of the said former acts above-mentioned, payable by the treasurer of the navy; which sum or sums the treasurer of the navy for the time being is hereby required to pay immediately to such person or persons as shall be appointed by the commissioners for the discovery of the said longitude to make those experiments, out of any money that shall be in his the said treasurer's hands unapplied for the use of the navy. And whereas many of the commissioners, appointed by the said act made in the twelfth year of the reign of her late majesty queen Anne, are deceased; be it therefore enacted by the authority aforesaid, That the governor of the royal hospital for seamen at Greenwich for the time being, the judge of the high court of admiralty for the time being, the secretaries of the treasury for the time being, the secretary of the admiralty for the time being, and the comptroller of the navy for the time being, shall be, and they are hereby added to, and joined with, such of the commissioners appointed by the said act for discovering the longitude, as are surviving; and the said persons, hereby appointed commissioners, shall and may act, to all intents and purposes, for putting in execution the said former acts, and this present act, as fully and effectually, as if they had been appointed commissioners by the said act made in the twelfth year of the reign of her late majesty queen Anne.

Anno Secundo Georgii III. Regis. C A P. XVIII.

An act for rendering more effectual an act made in the twelfth year of the reign of her late majesty queen Anne, intitled,

intituled, An act for providing a public reward for such person or persons as shall discover the longitude at sea, with regard to the making experiments of propofals made for discovering the longitude.

Whereas by an act of parliament made in the twelfth year of the reign of her late majesty queen Anne, intituled, An act for providing a public reward for such person or persons as shall discover the longitude at sea, the commissioners therein named, or any five or more of them, have full power to hear and receive any propofal or propofals that shall be made to them for discovering the said longitude; and in case the said commissioners, or any five or more of them, shall be so far satisfied of the probability of any such discovery, as to think it proper to make experiment thereof, they shall certify the same, under their hands and seals, to the commissioners of the navy for the time being, together with the persons names who are authors of such propofals; and upon producing such certificate, the said commissioners are thereby authorized and required to make out a bill or bills for any such sum or sums of money, not exceeding two thousand pounds, as the said commissioners for the discovery of the said longitude, or any five or more of them, shall think necessary, for making the experiments, payable by the treasurer of the navy; which sum or sums the treasurer of the navy is, by the said act, required to pay immediately to such person or persons as shall be appointed by the said commissioners to make those experiments, out of any money that shall be in his hands unapplied, for the use of the navy. And whereas, for a due and sufficient encouragement to any such person or persons as shall discover a proper method for finding the said longitude, it is likewise enacted by the said act, That the first author or authors, discoverer or discoverers, of any such method, his or their executors, administrators, or assigns, shall be intitled to, and have, such reward as in the said act is particularly mentioned: and whereas by another act of parliament made in the fourteenth year of the reign of his late majesty king George the second, intituled, An act for surveying the chief ports and head-lands on the coasts of Great-Britain and Ireland, and the islands and plantations thereto belonging, in order to the more exact determination of the longitude and latitude thereof, it was enacted, That the said commissioners for discovering the said longitude, or any five or more of them, should have full power to apply such part of the said sum of two thousand pounds, mentioned in the said first recited act, as had not then been laid out in experiments, as they should think necessary for the making such survey, and determining the longitude and latitude of the chief ports and head-lands on the coasts of Great-Britain and Ireland, and the islands and plantations thereto belonging; and that such sum or sums, part of the said two thousand pounds, which the said commissioners, or any five, or more of them, should think necessary, should be paid immediately by the treasurer of the navy, to such person or persons as should be appointed by the said commissioners to make such survey, and determine such longitude and latitude, out of the money that should be in the hands of such treasurer unapplied, for the use of the navy: and whereas by an act made in the twenty-sixth year of the reign of his late majesty king George the second, intituled, An act to render more effectual an act made in the twelfth year of the reign of her late majesty queen Anne, intituled, An act for providing a public reward for such person or persons as shall discover the longitude at sea, with regard to the making experiments of propofals made for discovering the longitude, and to enlarge the number of commissioners for putting in execution the said act, the further sum of two thousand pounds was directed to be applied in such manner as the commissioners for the discovery of the longitude should think necessary, for making further experiments: and whereas the said commissioners have, by virtue of the powers vested in them by the said several acts before-mentioned, heard and received several propofals made to them, at different times, for discovering the said longitude, and have, accordingly, certified the same, from time to time, to the commissioners of the navy for the time being, whereupon, bills have been made out for several sums of money, amounting in the whole to four thousand pounds: all which respective sums have been paid to several persons, by the treasurer of the navy, pursuant to the directions of the said acts of parliament; which the said commissioners, for discovering the longitude, thought necessary for making the said experiments: and whereas, by reason of the several payments made by the treasurer of the navy to the several persons as aforesaid, the said commissioners have, by virtue of the said acts of parliament, expended the whole of the sums thereby granted for the purposes aforesaid: and whereas, from the experiments which have already been made in pursuance of the powers vested in the said commissioners as aforesaid, there is great reason to expect that, by continuing to encourage ingenious persons to invent and make further improvements and experiments, in order to discover the said longitude, such discoveries may at length be produced as will effectually answer that end, and thereby contribute very much to the advantage of the trade and honour of this kingdom: there-

fore, for enabling the said commissioners to cause such further experiments to be made as they shall think proper for the purposes aforesaid, be it enacted by the king's most excellent majesty, by and with the advice and consent of the lords spiritual and temporal, and commons, in this present parliament assembled, and by the authority of the same, That the said commissioners, constituted by the said several acts of parliament before-mentioned, for the discovery of the longitude at sea, and for examining, trying, and judging, of all propofals, experiments, and improvements, relating to the same; or any five or more of them, shall have full power to hear and receive any propofal or propofals that have been, or shall hereafter be, made to them for discovering the said longitude at sea; and in case the said commissioners, or any five, or more of them, shall be so far satisfied of the probability of any such propofal or discovery, as to think it proper to make experiment thereof, they shall certify the same, under their hands and seals, to the commissioners of the navy for the time being, together with the persons names who shall be the authors of such propofals; and, upon producing such certificate, the said commissioners of the navy are hereby authorized and required to make out a bill or bills for any such sum or sums of money, not exceeding two thousand pounds, as the said commissioners for the discovery of the said longitude, or any five, or more of them, shall think necessary for making any experiments in pursuance of this act, or any of the said former acts above-mentioned, payable by the treasurer of the navy; which sum, or sums, the treasurer of the navy, for the time being, is hereby required to pay immediately to such person or persons as shall be appointed by the commissioners for the discovery of the said longitude, to make those experiments, out of any money that shall be in his the said treasurer's hands, unapplied for the use of the navy.

LORINERS, bridle-smiths, or bit-makers. They make all the metallic appurtenances belonging to bridles, harnesses, &c.
LORRAIN and **BAR**, belonging to France, is bounded on the north by Luxemburg and the palatinate of the Rhine, on the east by Alsace, on the south by Franche Comté, and on the west by Champagne. It's length from north to south is about 110 English miles, and it's greatest breadth from east to west about 100.

This country is divided into three parts, viz. I. The dutchy of Lorrain. II. The dutchy of Bar. And III. The three bishopricks.

The air in general is very temperate and wholesome, and the soil fruitful in corn, wine, hemp, and pastures: there are a great many mines of iron, lead, and some of silver and copper.

Their salt-springs are so numerous, that they yield 200,000 l. per ann. The chief rivers are the Maese, the Moselle, and the Sarre, which rise in the south of Lorrain, and run north through this country. In the last war between France and the emperor Charles VI. which ended in a peace concluded in the year 1735, one of the articles was, That the duke of Lorrain should yield his country to France; at least that king Stanislaus, father of the present queen of France, should have the dominion of Lorrain, with the title of duke during his life; and that, after his decease, Lorrain should be united to the crown of France; and that the duke of Lorrain, in consequence thereof, should be constituted grand duke of Tuscany in Italy, after the death of the then reigning grand duke; which happening anno 1737, the duke of Lorrain took possession of Tuscany, and yet remains sovereign of it, and is since elected emperor. See FRANCE, in regard to LORRAIN.

LOTTERY, a kind of public game at hazard, frequent in England, France, and Holland, in order to raise money for the service of the state, which is appointed with us by the authority of parliament, and managed by commissioners appointed by the lords of the treasury for that purpose. It consists of a certain number of blanks and prizes, which are drawn out of wheels, one of which contains the numbers, and the other the corresponding blanks or prizes.

The LAWS of ENGLAND relating thereto.

I. Stat. 10 and 11 Will. III. cap. 17. §. 1. All lotteries are public nuisances, and all patents for lotteries are void and against the law.

II. §. 2. No person shall keep open or draw, or throw at, any lottery, either by dice, lots, cards, balls, numbers, figures, or any other way whatsoever; and every person that shall open or shew, to be played or drawn at, any lottery, shall forfeit 500 l. one third part to his majesty, one other third part to the poor of the parish, and the other third, with double costs, to the party that shall sue for the same; and the parties offending shall likewise be profecuted as common rogues.

III. §. 3. Every person that shall play, throw, or draw at, any lottery, shall forfeit 200 l. one third part to his majesty, one third to the poor of the parish, and the other third with double costs, to the person that shall sue for the same.

IV. Stat. 9 Ann. cap. 6. §. 56. Justices of peace, mayors, bailiffs, head officers, constables, and other her majesty's civil officers,

officers, are required to use their utmost endeavours to prevent the drawing of any such unlawful lottery; and every person who shall set up, or publish the setting up, any unlawful lottery, with intent to have such lottery drawn, shall forfeit 100*l.* one third part to her majesty, one other third to the poor of the parish, and the other third with costs, to the party who shall sue for the same.

V. Stat. 10 Ann. cap. 26. §. 109. Every person who shall keep any office for making insurances on marriages, births, christenings or service, or any office under the denominations of sales of gloves, of fans, of cards, of numbers, of the queen's picture, for the improvement of small sums, or the like offices, under the pretence of improving small sums, shall forfeit 500*l.* one third part to her majesty, one other third to the poor of the parish, and the other third, with costs, to the person who shall sue for the same; and every printer or other person, who shall publish the keeping any such office, shall forfeit 100*l.* to be distributed as the penalty last mentioned; and every person who in any office, before the 24th of June 1712, set up for making insurances on marriages, &c. or under any other the denominations aforesaid, or any like denominations, for improvement of small sums, shall make, or suffer to be made, any new insurances on marriages, births, christenings, or service, or receive any payments for improvement of small sums, shall forfeit 100*l.* to be distributed in like manner.

VI. Stat. 5 Geo. I. cap. 9. §. 43. All subscriptions for sale of the chances, or part of the chances, to arise on the tickets issued by virtue of the act of this session; and all such kind of undertaking, shall be within the meaning of the acts against private lotteries, and the persons buying, selling, subscribing, or taking subscriptions for the purchase of such chances of any tickets made out in pursuance of any act for a public lottery, or on the numbers of such tickets, without having the original tickets in their custody and right, shall be liable to the penalties inflicted on such as shall be concerned in private lotteries; and every such offender shall for every chance, so sold or subscribed for, forfeit 100*l.* over and above any former penalties; one moiety to the crown, the other to such person as in his own right shall, at the commencement of the drawing of such lottery, be possessed of the ticket on which such chance shall be sold or subscribed for.

VII. Stat. 8 Geo. I. cap. 2. §. 36. Every person who shall set up or keep any office or place under the denomination of sales of houses, lands, advowsons, presentations to livings, plate, jewels, ships, goods, or other things, for the improvement of small sums of money; or shall sell or expose to sale any houses, &c. by way of lottery, or by lots, tickets, numbers, or figures; or shall make, print, advertise, or publish, proposals or schemes for advancing small sums of money by several persons, amounting in the whole to large sums, to be divided amongst them by the chances of the prizes in any public lottery; or shall deliver out tickets to persons advancing such sums, to intitle them to a share of the money, according to such proposals or schemes; or shall make, print, or publish any proposal or scheme of the like kind, and shall be thereof convicted on the oath of one witness by two justices of peace where such offence shall be committed or the offender found, the person so convicted shall (over and above any former penalties) forfeit 500*l.* one third to the crown, one other third to the informer, and the remaining third to the poor of the parish where the offence shall be committed, to be levied by distress and sale of goods by warrant of the justices, and shall also be committed to the county gaol for one year, and 'till the 500*l.* be paid; persons aggrieved may appeal to the next quarter sessions.

VIII. §. 37. All persons who shall be adventures in such sales or lotteries, or shall contribute to such sales or lotteries, shall forfeit double the sum contributed, to be recovered with costs; one moiety to the crown, the other to the informer.

IX. Stat. 9 Geo. I. cap. 16. §. 4. If any persons shall, by colour of any authority from any foreign prince or state, set up or keep any lottery, or undertaking in the nature of a lottery, or shall make, print, or publish, any proposals or scheme for such lottery, and shall within this kingdom sell or dispose of any tickets in any foreign lottery, and shall be convicted on the oath of one witness before two justices, &c. where such offence shall be committed, or the offender found, such offender shall (over and above any former penalties) forfeit 200*l.* one third to the crown, one other third to the informer, and the remaining third to the poor of the parish, to be levied by distress and sale of goods by warrant of the justices, and shall also be committed to the county gaol for one year, and 'till the said sum be satisfied.

X. §. 5. Persons, aggrieved by the judgment of the justices may appeal to the next quarter sessions.

XI. Stat. 4 Geo. II. cap. 9. §. 12. A yearly sum of 24,000*l.* out of the additional duties on stamped vellum, parchment, and paper (granted by 9 and 10 Will. III. cap. 25.) shall be a fund for annuities of three per cent. to contributors in a lottery, until redemption by parliament, and shall be paid half-yearly at Christmas and Midsummer to the cashier of the bank.

XII. §. 13. It shall be lawful for any persons to contribute

sums of 10*l.* and for every such sum of 10*l.* they shall be interested in such lot in the said yearly fund, as is herein directed.

XIII. §. 31. The said annuities of three per cent. shall be free from taxes.

XIV. §. 32. The bank of England shall employ one to be their chief cashier, and one other to be their accountant-general; and the said cashier, to whom the said monies shall be issued for payment of the said annuities, shall without delay apply the same accordingly, and render his account thereof according to the course of the Exchequer; and the said accountant-general shall inspect all receipts and payments of the said cashier, and the vouchers relating thereunto; and all persons who shall be intitled to any of the same annuities shall be possessed thereof as a personal estate, and the same shall not be defendable to the heir, and shall not be liable to foreign attachment.

XV. §. 33. The said annuities of three per cent. shall be of one capital or joint stock, on which the same annuities shall be attending, and shall be called the joint stock of lottery annuities for the year 1731; and all persons, in proportion to their respective annuities, shall have a share in such stock; and such shares shall be transferrable and deviseable in the same manner as is prescribed by act of parliament in the first year of his late majesty's reign, touching the annuities after the rate of 5 per cent. and no stamp duties shall be chargeable on such transfers, and the governor and company of the bank of England shall continue a corporation 'till the same shall be redeemed.

XVI. §. 34. No fee shall be taken for paying the said annuities of three per cent. by the said cashier; and no fee shall be taken for any transfer, upon pain that any officer offending shall forfeit 20*l.* to the party aggrieved.

XVII. §. 35. These additional duties upon stamped vellum, &c. shall be applied (charges excepted) to pay the annuities of 3*l.* 10*s.* per cent. and then to pay the said annuities of three per cent.

XVIII. §. 36. Deficiencies shall be made good out of supplies to be granted by parliament, or out of the sinking fund.

XIX. §. 37. Monies issued out of the sinking fund shall be replaced out of the first supplies to be granted in parliament.

XX. §. 38. The surplus of the additional stamp duties shall be reserved for the disposition of parliament.

XXI. §. 39. Upon one year's notice in the London Gazette, and upon the Royal Exchange, by authority of parliament, at any of the half-yearly days for payment, and upon repayment of the principal sum and all arrearages, the said annuities shall cease; and the said additional duties upon stamped vellum, &c. shall be redeemed. And any vote of the house of commons to be signified by the speaker in writing shall be sufficient notice.

XXII. Stat. 6 Geo. II. cap. 35. If any person shall sell or deliver any ticket in any foreign lottery, and shall be convicted upon action or information, or upon oath or affirmation of one witness before two justices of peace where such offence shall be committed or the offender found, the person so convicted shall forfeit 200*l.* one third to his majesty, one third to him who shall make information of the offence, and the remaining third to the poor of the parish, to be levied by distress and sale of goods, and also shall be committed to the county gaol for one year, and from thence 'till the sum of 200*l.* be paid.

XXIII. §. 30. Any persons aggrieved by the judgment of such justices, shall have liberty to appeal to the next quarter sessions.

REMARKS.

In France there have been several lotteries, in favour of hospitals.

M. Le Clerc has composed a treatise of lotteries, wherein is shewn what is laudable, and what blameable in them.—Gregory Leti has also a book on the subject of lotteries.—Father Menestrier has a treatise on the same, published in 1700, where he shews their origin and use among the Romans.—He distinguishes several kinds of lotteries, and speaks of chances, and resolves several cases of conscience relating thereto.

The present lottery in England, established by authority, may be judged very useful; the motive thereto being for the purchase of the MUSEUM, or collection of Sir Hans Sloane, and of the Harleian collection of manuscripts; and for providing one general repository for the better reception and more convenient use of the said collection, and also of the Cottonian library, and of the additions thereto. See the article MUSEUM.

Among the several mistakes that are committed about chance, says the ingenious Mr. de Moivre, one of the most common, and least suspected, is that which relates to lotteries. Thus, supposing a lottery, wherein the proportion of the blanks to the prizes is as five to one, it is very natural to conclude, that therefore five tickets are requisite for the chance of a prize; and yet it may be proved demonstratively, that four tickets are more than sufficient for that purpose, which will be confirmed by often repeated experience.

In the like manner supposing a lottery, wherein the proportion of the blanks to the prizes is as 39 to 1 (such as was the lottery in England of 1710), it may be proved, that, in 28 tickets,

tickets, a prize is as likely to be taken as not; which, though it may seem to contradict the common notions, is nevertheless grounded upon infallible demonstration.

When the play of the royal oak was in use, some persons who lost considerably by it, had their losses chiefly occasioned by an argument of which they could not perceive the fallacy. The odds against any particular point of the ball were 31 to 1, which intitled the adventurers, in case they were winners, to have 32 stakes returned, including their own; instead of which they having but 28, it was very plain, that, on the single account of the disadvantage of the play, they lost $\frac{4}{31}$ of all the money they played for. But the master of the ball maintained that they had no reason to complain, since he would undertake that any particular point of the ball should come up in 22 throws; of this he would offer to lay a wager, and actually laid it when required. The seeming contradiction between the odds of 31 to 1, and 22 throws for any chance to come up, so perplexed the adventurers, that they began to think the advantage was on their side, for which reason they played on and continued to lose.

The principles whereon a knowledge in the doctrine of chances is founded, are as follow, viz.

1. The probability of an event is greater or less, according to the number of chances by which it may happen, compared with the whole number of chances by which it may either happen or fail.

2. Wherefore, if we constitute a fraction whereof the numerator is the number of chances whereby an event may happen, and the denominator and number of all the chances whereby it may either happen or fail, that fraction will be a proper designation of the probability of happening. Thus, if an event has 3 chances to happen and 2 to fail, the fraction $\frac{3}{5}$ will fitly represent the probability of it's happening, and may be taken to be the measure of it.

The same thing may be said of the probability of failing, which will likewise be measured by a fraction, whose numerator is the number of chances whereby it may fail, and the denominator the whole number of chances, both for it's happening and failing: thus the probability of the failing of that event, which has 2 chances to fail and 3 to happen,

will be measured by the fraction $\frac{2}{5}$.

3. The fractions, which represent the probabilities of happening and failing, being added together, their sum will always be equal to unity, since the sum of their numerators will be equal to their common denominator: now, it being a certainty that an event will either happen or fail, it follows, that certainty, which may be conceived under the notion of an infinitely great degree of probability, is fitly represented by unity.

These things will easily be apprehended, if it be considered that the word probability includes a double idea; first, of the number of chances whereby an event may happen; secondly, of the number of chances whereby it may either happen or fail.

If I say that I have three chances to win any sum of money, it is impossible from that bare assertion, to judge whether I am like to obtain it; but if I add that the number of chances either to obtain it or to miss it, is 5 in all, from hence will ensue a comparison between the chances that favour me, and the whole number of chances that are for or against me, whereby a true judgment will be formed of my probability of success: whence it necessarily follows, that it is the comparative magnitude of the number of chances to happen, in respect to the whole number of chances either to happen or to fail, which is the true measure of probability.

4. If, upon the happening of an event, I be intitled to a sum of money, my expectation of obtaining that sum has a determinate value before the happening of the event.

Thus, if I am to have 101. in case of the happening of an event which has an equal probability of happening and failing, my expectation before the happening of the event is worth 51. for I am precisely in the same circumstances as he who at equal play ventures 51. either to have 101. or to lose his 51. Now he who ventures 51. in an equal play, is possessor of 51. before the decision of the play; therefore my expectation, in the case above mentioned, must also be worth 51.

5. In all cases, the expectation of obtaining any sum is estimated by multiplying the value of the sum expected by the fraction which represents the probability of obtaining it.

Thus, if I have 3 chances in 5 to obtain 1001. I say that the present value of my expectation is the product of 1001. by the fraction $\frac{3}{5}$, and consequently that my expectation is worth 601. For,

Supposing that an event may equally happen to any one of 5 different persons, and that the person to whom it happens, should, in consequence of it, obtain the sum of 1001. it is plain, that the right which each of them in particular has upon the sum expected is $\frac{1}{5}$ of 1001. which right is founded in this; that if the 5 persons, concerned in the happening of the event, should agree not to stand the chance of it, but to divide the sum expected among themselves, then each of them must have $\frac{1}{5}$ of 1001. for his pretension.

Vol. II.

Now, whether they agree to divide that sum equally among themselves, or rather chuse to stand the chance of the event, no one has thereby any advantage or disadvantage, since they are all upon an equal foot, and consequently each person's expectation is worth $\frac{1}{5}$ of 1001. Let us suppose farther, that 2 of the 5 persons concerned in the happening of the event, should be willing to resign their chance to one of the other three, then the person to whom these two chances are thus resigned, has now three chances that favour him, and consequently has now a right triple of that which he had before, and therefore his expectation is now worth $\frac{3}{5}$ of 1001.

Now, if we consider that the fraction $\frac{3}{5}$ expresses the probability of obtaining the sum of 1001. and that $\frac{3}{5}$ of 100 is the same thing as $\frac{3}{5}$ multiplied by 100, we must naturally fall into this conclusion, which has been laid down as a principle, that the value of the expectation of any sum is determined by multiplying the sum expected by the probability of obtaining it.

This manner of reasoning, though deduced from a particular case, will easily be perceived to be general, and applicable to any other case.

COROLLARY.

From what precedes it necessarily follows, that if the value of an expectation be given, as also the value of the thing expected, then dividing the first value by the second, the quotient will express the probability of obtaining the sum expected; thus if I have an expectation worth 601. and that the sum which I may obtain be worth 1001. the probability of obtaining it will be expressed by the quotient of 60 divided

by 100, that is, by the fraction $\frac{60}{100}$, or $\frac{3}{5}$.

6. The risk of losing any sum is the reverse of expectation; and the true measure of it is the product of the sum adventured; multiplied by the probability of the loss.

7. Advantage or disadvantage, in play, results from the combination of the several expectations of the gamesters, and of their several risks.

Thus supposing that A and B play together, that A has deposited 51. and B 31. that the number of chances which A has to win is 4, and the number of chances which B has to win is 2, and that it were required in this circumstance to determine the advantage or disadvantage of the adventurers, we may reason in this manner: since the whole sum deposited is 8, and that the probability which A has of getting it is $\frac{4}{6}$, it follows, that the expectation of A, upon the whole sum

deposited, is $8 \times \frac{4}{6} = 5\frac{1}{3}$, and for the same reason the ex-

pectation of B, upon that whole sum deposited, is $8 \times \frac{2}{6} = 2\frac{2}{3}$.

$\frac{2}{3}$.

Now, if, from the respective expectations which the adventurers have upon the whole sum deposited, be subtracted the particular sums which they deposit; that is, their own stakes; there will remain the advantage or disadvantage of either, according as the difference is positive or negative.

And therefore, if from $5\frac{1}{3}$, which is the expectation of A upon the whole sum deposited, 5, which is his own stake, be subtracted, there will remain $\frac{1}{3}$ for his advantage; likewise, if from $2\frac{2}{3}$, which is the expectation of B, 3, which is his own stake, be subtracted, there will remain $\frac{1}{3}$, which, being negative, shews that his disadvantage is $\frac{1}{3}$.

These conclusions may also be derived from another consideration; for if from the expectation, which either adventurer has upon the sum deposited by his adversary, be subtracted the risk of what he himself deposits, there will likewise remain his advantage or disadvantage, according as the difference is positive or negative.

Thus in the preceding case, the stake of B being 3, and the probability which A has of winning it, being $\frac{4}{6}$, the expecta-

tion of A upon that stake is $3 \times \frac{4}{6} = 2$; moreover, the stake of A being 5, and the probability of losing it being $\frac{2}{6}$, his

risk ought to be estimated by $5 \times \frac{2}{6} = 1\frac{2}{3}$; wherefore, if

from the expectation 2 the risk $1\frac{2}{3}$ be subtracted, there will remain $\frac{1}{3}$ as before for the advantage of A; and, by the same way of proceeding, the disadvantage of B will be found to be $\frac{1}{3}$.

It is very carefully to be observed, that what is here called advantage or disadvantage, and which may properly be called gain or loss, is always estimated before the event is come to pass; and, although it be not customary to call that gain or loss, which is to be derived from an event not yet determined, nevertheless, in the doctrine of chances, that appellation is equivalent to what in common discourse is called gain or loss.

For in the same manner as that he who ventures a guinea in an equal game, may, before the determination of the play, be said to be possessor of that guinea, and may, in consideration of that sum, resign his place to another; so he may be said to be a gainer or loser who would get some profit, or suffer some loss, if he would sell his expectation upon equi-

H h table

table terms, and secure his own stake for a sum equal to the risk of losing it.

8. If the obtaining of any sum requires the happening of several events that are independent on each other, then the value of the expectation of that sum is found, by multiplying together the several probabilities of happening, and again multiplying the product by the value of the sum expected. Thus supposing, that in order to obtain 90l. two events must happen, the first whereof has 3 chances to happen and 2 to fail, the second has 4 chances to happen and 5 to fail, and I would know the value of that expectation; I say, The probability of the first's happening is $\frac{3}{5}$, the probability of the second's happening is $\frac{4}{9}$; now, multiplying these two probabilities together, the product will be $\frac{12}{45}$, or $\frac{4}{15}$, and this product being again multiplied by 90, the new product will be $\frac{360}{15}$ or 24, therefore that expectation is worth 24l. The demonstration of this will be very easy, if it be considered, that, supposing the first event had happened, then that expectation, depending now entirely upon the second, would, before the determination of the second, be found to be

exactly worth $\frac{4}{9} \times 90$ l. or 40l. (by art. 5.) We may therefore look upon the happening of the first, as a condition of obtaining an expectation worth 40l. but the probability of the first happening has been supposed $\frac{3}{5}$, wherefore the expectation sought for is to be estimated by $\frac{3}{5} \times 40$ or by $\frac{3}{5}$

$\times \frac{4}{9} \times 90$, that is, by the product of the two probabilities of happening multiplied by the sum expected.

And likewise, if an expectation depends on the happening of one event, and the failing of another, then its value will be the product of the probability of the first happening, by the probability of the second's failing, and of that again by the value of the sum expected.

And again, if an expectation depends on the failing of two events, the rule will be the same, for that expectation will be found by multiplying together the two probabilities of failing, and multiplying that again by the value of the sum expected.

And the same rule is applicable to the happening or failing of as many events as may be assigned.

COROLLARY.

If we make abstraction of the value of the sum to be obtained, the bare probability of obtaining it will be the product of the several probabilities of happening, which evidently appears from this 8th article, and from the corollary to the 4th. Hitherto I have confined myself to the consideration of events independent; but for fear that, in what is to be said afterwards, the terms independent or dependent might occasion some obscurity, it will be necessary, before I proceed any farther, to settle entirely the notion of these terms.

Two events are independent, when they have no connection one with the other, and that the happening of one neither forwards nor obstructs the happening of the other.

Two events are dependent, when they are so connected together, as that the probability of either's happening is altered by the happening of the other.

In order to illustrate this, it will not be amiss to propose the two following easy problems.

1. Suppose there is a heap of 13 cards of one colour, and another heap of 13 cards of another colour, what is the probability of taking two cards at a venture out of each heap, I shall take the two aces?

The probability of taking the ace out of the first heap is $\frac{1}{13}$; now it being very plain, that the taking or not taking the ace out of the first heap has no influence in the taking or not taking the ace out of the second, it follows, that, supposing that ace taken out, the probability of taking the ace out of the second will also be $\frac{1}{13}$; and therefore those two events being independent, the probability of these both happening will be

$$\frac{1}{13} \times \frac{1}{13} = \frac{1}{169}.$$

2. Suppose that, out of one single heap of 13 cards of one colour, it should be designed to take out the ace in the first place, and then the deus; and that it were required to assign the probability of doing it; we are to consider, that although the probability of the ace's being in the first place be $\frac{1}{13}$, and that the probability of the deus's being in the second place would also be $\frac{1}{12}$, if that second event were considered in itself without any relation to the first; yet that, the ace being supposed as taken out at first, there will remain but 12 cards in the heap, and therefore that, upon the supposition of the ace being taken out at first, the probability of the deus's being next taken will be altered, and become $\frac{1}{11}$; and therefore we may conclude, that those two events are dependent, and that the probability of their both happening will be

$$\frac{1}{13} \times \frac{1}{12} = \frac{1}{156}.$$

From whence it may be inferred, that the probability of the happening of two events dependent is the product of the

probability of the happening of one of them, by the probability which the other will have of happening, when the first shall have been considered as having happened; and the same rule will extend to the happening of as many events as may be assigned.

9. But to determine in the easiest manner possible, the probability of the happening of several events dependent, it will be convenient to distinguish, by thought, the order of those events, and to suppose one of them to be the first, another to be the second, and so on: which being done, the probability of the happening of the first may be looked upon as independent; the probability of the happening of the second is to be determined from the supposition of the first's having happened; the probability of the third's happening is to be determined from the supposition of the first's and second's having happened, and so on: then the probability of the happening of them all will be the product of the multiplication of the several probabilities, which have been determined in the manner prescribed.

We have seen before how to determine the probability of the happening or failing of as many events independent, as may be assigned; we have seen, likewise, in the preceding article, how to determine the probability of the happening of as many events dependent, as may be assigned; but, in the case of events dependent, how to determine the probability of the happening of some of them, and, at the same time, the probability of the failing of some others, is a disquisition of a greater degree of difficulty; which, for that reason, will be more conveniently transferred to another place.

10. If I have several expectations upon several sums, it is very evident that my expectation upon the whole is the sum of the expectations I have upon the particulars.

Thus suppose two events such, that the first may have three chances to happen, and two to fail; and the second four chances to happen, and five to fail; and that I be intitled to 90l. in case the first happens, and to another like sum of 90l. in case the second happens also; and that I would know the value of my expectation upon the whole: I say, the sum expected in the first case being 90l. and the probability of

obtaining it being $\frac{3}{5}$, it follows that my expectation, on that

account is worth $90 \times \frac{3}{5} = 54$; and again, the sum expected in the second case being 90, and the probability of obtaining

it being $\frac{4}{9}$, it follows that my expectation of that second sum

is worth $90 \times \frac{4}{9} = 40$; and, therefore, my expectation upon the whole is worth 54l. + 40l. = 94l.

But if I am to have 90l. once for all, for the happening of one or the other of the two aforementioned events, the method of process, in determining the value of my expectation, will be somewhat altered; for, although my expectation of the first event be worth 54l. as it was in the preceding example, yet I consider that my expectation of the second will cease upon the happening of the first, and that, therefore, this expectation takes place only in case the first does happen

to fail. Now the probability of the first's failing is $\frac{2}{5}$; and, supposing it has failed, then my expectation will be 40;

wherefore $\frac{2}{5}$ being the measure of the probability of my obtaining an expectation worth 40l. it follows, that this expectation (to estimate it before the time of the first's being determined) will be worth $40 \times \frac{2}{5} = 16$, and, therefore, my expectation upon the whole is worth 54l. + 16l. = 70l.

If that which was called the second event, be now considered as the first, and that which was called the first, be now considered as the second, the conclusion will be the same as before.

For the application of these principles to the doctrine of chances in general, and, among the rest, to the article of lotteries. But, to understand the rationale of the theorems raised by Mr. De Moivre, for this and other purposes of play, I would refer the reader to that ingenious writer himself; but the reader should be prepared with a competent knowledge of algebra, and then the steps which that gentleman has taken to come at the solution of the various problems he gives, will be easily followed.

In a lottery, whereof the number of blanks is to the number of prizes as 39 to 1 (such as was the lottery in 1710) to find how many tickets one must take to make it an equal chance for prizes.

Multiply 39 by 0,7*, and the product, 27,3, will shew that the number of tickets requisite to that effect will be 27, or 28 at most. Likewise in a lottery, whereof the number of blanks is to the number of prizes as 5 to 1, multiply 5 by 0,7, and the product, 3,5, will shew that there is more than equality

equality of chance in four tickets, for one or more prizes, but less than equality in three.

* For the reason of this and the following rules, as applied to lotteries, see De Moivre's Introduction to the Doctrine of Chances.

REMARK.

In a lottery, whereof the blanks are to the prizes as 39 to 1, if the number of tickets in all were but 40, the proportion abovementioned would be altered, for 20 tickets would be a sufficient number for the just expectation of the single prize, it being evident that the prize may be as well among the tickets which are taken, as among those that are left behind. Again: if the number of tickets in all were 80, still preserving the proportion of 39 blanks to one prize, and, consequently, supposing 78 blanks to two prizes, this proportion would still be altered; for, by the doctrine of combinations, it will appear that the probability of taking one prize or both, in 20 tickets, would be but $\frac{139}{361}$, and the probability of taking none would be $\frac{177}{316}$; wherefore the odds against taking any prize would be as 177 to 139, or very near as 9 to 7.

And, by the same doctrine of combinations, it will be found that 23 tickets would not be quite sufficient for the expectation of a prize in this lottery, but that 24 would rather be too many; so that one might with advantage lay an even wager of taking a prize in 24 tickets.

If the proportion of 39 to 1 be oftener repeated, the number of tickets requisite for the equal chance of a prize will still increase with that repetition; yet let the proportion of 39 to 1 be repeated never so many times, nay an infinite number of times, the number of tickets requisite for the equal chance

of a prize would never exceed $\frac{7}{10}$ of 39, that is, about 27 or 28.

Wherefore, if the proportion of the blanks to the prizes is often repeated, as it usually is in lotteries, the number of tickets requisite for a prize will always be found, by taking $\frac{7}{10}$ of the proportion of the blanks to the prizes.

In a lottery, consisting of 40,000 tickets, among which are three particular benefits, what is the probability that, taking 8000 of them, one or more of the particular benefits shall be amongst them?

SOLUTION.

First, In the theorem belonging to the remark in Mr. De Moivre's Doctrine of Chances, page 76, second edition, there being substituted respectively 8,000, 40,000, 32,000 3, and 1, in the room of c , n , d , a , and p , it will appear that the probability of taking one precisely of the three particular benefits, will be $\frac{8000 \cdot 32000 \cdot 31999 \cdot 3}{40000 \cdot 39999 \cdot 39998 \cdot 125}$ nearly.

Secondly, c , n , d , a , being interpreted as before; let us suppose $p = 2$, hence the probability of taking precisely two of the particular benefits will be found to be $\frac{8000 \cdot 7999 \cdot 32000 \cdot 3}{40000 \cdot 39999 \cdot 39998 \cdot 125}$ nearly.

Thirdly, Making $p = 3$, the probability of taking all the three particular benefits will be found to be $\frac{8000 \cdot 7000 \cdot 7000}{40000 \cdot 39999 \cdot 39998}$.

$\frac{7008}{39998} = \frac{1}{125}$, very near. Wherefore, the probability of taking one or more of the three particular benefits will be $\frac{48 + 12 + 1}{125}$, or $\frac{61}{125}$, very near.

It is to be observed, that those three operations might have been contracted into one, by inquiring the probability of not taking any of three particular benefits, which will be found to be $\frac{32000 \cdot 31999 \cdot 31998}{40000 \cdot 39999 \cdot 39998} = \frac{64}{125}$, nearly; which being

subtracted from unity, the remainder, $1 - \frac{64}{125}$, or $\frac{61}{125}$, will shew the probability required, and, therefore, the odds against taking any of three particular benefits will be 64 to 61 nearly.

To find how many tickets ought to be taken, in a lottery consisting of 40,000, among which are three particular benefits, to make it as probable that one or more of those three may be taken as not.

SOLUTION.

Let the number of tickets requisite to be taken be $= x$, it will follow, therefore, from the remark belonging to the XXth problem in De Moivre, page 76, that the probability

of not taking any of the particular benefits will be $\frac{n-x}{n} \times \frac{n-x-1}{n-1} \times \frac{n-x-2}{n-2}$; but this probability is equal to

$\frac{1}{2}$; since, by hypothesis, the probability of taking one or more of them is equal to $\frac{1}{2}$, from whence we shall have the

equation $\frac{n-x}{n} \times \frac{n-x-1}{n-1} \times \frac{n-x-2}{n-2} = \frac{1}{2}$; which equation being solved, the value of x will be found to be nearly 8252.

N. B. The factors whereof both the numerator and denominator are composed, being but few, and in arithmetic progression, and besides, the difference being very small in respect of n , those terms may be considered as being in geometric progression: wherefore, the cube of the middle term, $\frac{n-x-1}{n-1}$, may be supposed equal to the product of the multiplication of those terms; from whence will arise the equation $\frac{n-x-1}{n-1}^3 = \frac{1}{2}$, or, neglecting unity in both

numerator and denominator, $\frac{n-x}{n}^3 = \frac{1}{2}$, and, consequently, x will be found to be $= n \times 1 - \sqrt[3]{\frac{1}{2}}$, or $n \times$

$1 - \frac{1}{2} \sqrt[3]{4}$, but $n = 40,000$, and $1 - \frac{1}{2} \sqrt[3]{4} = 0.2063$; wherefore $x = 8252$.

In the remark belonging to the second problem, a rule was given for finding the number of tickets that were to be taken to make it as probable that one or more of the benefits would be taken as not; but in that rule it was supposed, that the proportion of the blanks to the prizes was often repeated, as it usually is in lotteries: now, in the case of the present problem, the particular benefits being but three in all, the remaining tickets are to be considered as blanks in respect of them; from whence it follows, that the proportion of the number of blanks to one prize being very near as 13332 to 1, and that proportion being repeated but three times in the whole number of tickets, the rule there given would not have been sufficiently exact; for which reason it was thought necessary to give another rule in this place.

Supposing a lottery of 100,000 tickets, whereof 90,000 are blanks, and 10,000 are benefits, to determine accurately what the odds are of taking or not taking a benefit in any number of tickets assigned.

SOLUTION.

Suppose the number of tickets to be six; then let us inquire into the probability of taking no prize in six tickets: which to find, let us make use of the theorem set down in the corollary of the XIXth problem [see De Moivre, page 75 and 76] wherein it will appear that the number of chances for taking no prize in 6 tickets, making $a = 10,000$, $b = 90,000$, $c = 6$, $p = 0$, $n = 100,000$, will be $\frac{90000}{1} \times \frac{89999}{2} \times \frac{89998}{3} \times \frac{89997}{4} \times \frac{89996}{5} \times \frac{89995}{6}$, and that the whole number of chances will be $\frac{100000}{1} \times$

$\frac{99999}{2} \times \frac{99998}{3} \times \frac{99997}{4} \times \frac{99996}{5} \times \frac{99995}{6}$; then dividing the first number of chances by the second, which may easily be done by logarithms, the quotient will be 0.53143; and this shews the probability of taking no prize in 6 tickets; and, this decimal fraction being subtracted from unity, the remainder, 0.46857, shews the probability of taking one or more prize in 6 tickets; wherefore the odds against taking any prize in 6 tickets will be 53143 to 46857. If we suppose now, that the number of tickets taken is 7; then carrying each number of chances above written one step farther, we shall find that the probability of taking no prize in 7 tickets is 0.47828, which fraction being subtracted from unity, the remainder will be 0.52172, which shews the odds of taking one prize, or more, in 7 tickets, to be 52172 to 47828.

REMARK.

When the number of tickets taken bear a very inconsiderable proportion to the whole number of tickets, as it happens in the case of this problem, the question may be resolved as a problem depending on the cast of a die; we may, therefore, suppose a die of 10 faces, having one of it's faces such as the ace, representing a benefit, and all the other nine representing blanks, and inquire into the probability of missing the ace six times

times together, which, by the rules given in the Introduction *, will be found to be $\frac{9^6}{10^6} = 0.53144$, differing from what we had found before but one unit in the fifth place of decimals: now, if we inquire into the probability of missing the ace seven times, we shall find it 0.47829, differing also but one unit in the fifth of decimals, from what had been found before; and, therefore, in such cases as this, we may use both methods indifferently, but the first will be exact, if we actually multiply the numbers together; the second is only an approximation.

* See De Moivre's Introduction to the Doctrine of Chances, page 9, 10, 11, &c.

But both methods confirm the truth of the practical rule given in the third problem [in De Moivre's Introduction] about finding what number of tickets is necessary for the equal chance of a prize; for multiplying as it is there directed, the number 9 representing the blanks, by 0.7, the product, 6.3, will shew that the number requisite is between 6 and 7. The same things being given as in the before-mentioned problem, suppose the price of each ticket to be 10*l.* and that, after the lottery is drawn, 7*l.* 10*s.* be returned to the blanks, to find in this lottery the value of the chance of a prize.

SOLUTION.

There being 90,000 blanks, to every one of which 7*l.* 10*s.* is returned, the total value of the blanks is 675,000*l.* and, consequently, the total value of the benefits is 325,000*l.* which being divided by 10,000, the number of the benefits, the quotient is 32*l.* 10*s.* and therefore one might, for the sum of 32*l.* 10*s.* be intitled to have a benefit certain, taken at random, out of the whole number of benefits: the purchaser of a chance has, therefore, one chance in ten for the sum of 32*l.* 10*s.* and nine chances in ten for losing his money; from whence it follows, that the value of his chance is the tenth part of 32*l.* 10*s.* that is, 3*l.* 5*s.* and, therefore, the purchaser of a chance, by giving the seller 3*l.* 5*s.* is intitled to the chance of a benefit, and ought not to return any thing to the seller, although he should have a prize; for the seller having 3*l.* 5*s.* sure, and nine chances in ten for 7*l.* 10*s.* the value of which chances is 6*l.* 15*s.* it follows that he has his 10*l.*

Supposing still the same lottery as has been mentioned in the two preceding problems of De Moivre, let A engage to furnish B with a chance, on condition that, whenever the ticket on which the chance depends, shall happen to be drawn, whether it proves a blank or a prize, A shall furnish B with a new chance, and so on, as often as there is occasion, 'till the whole lottery be drawn; to find what consideration B ought to give A, before the lottery begins to be drawn, for the chance or chances of one or more prizes, admitting that the lottery will be 40 days in drawing.

SOLUTION.

Let 3*l.* 5*s.* which is the absolute value of a chance, be called *s.*

1. A, who is the seller, ought to consider, that the first day he furnishes necessarily a chance, whose value is *s.*

2. That the second day he does not necessarily furnish a chance, but conditionally, viz. if it so happen that the ticket on which the chance depends, should be drawn on the first day; but the probability of it's being drawn on the first day is $\frac{1}{40}$; and, therefore, he ought to take $\frac{1}{40}s$ for the consideration of the second day.

3. That, in the same manner, he does not necessarily furnish a chance on the third day, but conditionally, in case the only ticket depending (for there can be but one) should happen to be drawn on the second day, of which the probability being $\frac{1}{39}$, by reason of the remaining 39 days, from the second inclusive to the last, it follows, that the value of that chance is $\frac{1}{39}s$.

4. And, for the same reason, the value of the next is $\frac{1}{38}s$, and so on.

The purchaser ought therefore to give the seller $1 + \frac{1}{40} +$

$\frac{1}{39} + \frac{1}{38} + \frac{1}{37} + \dots + \frac{1}{2}$, the whole multiplied by *s*, or $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \dots + \frac{1}{40}$, the whole multiplied by *s*.

Now, it being pretty laborious to sum up those 40 terms, we have here made use of a rule which Mr. De Moivre has given in the supplement to his *Miscellanea Analytica*, whereby may be summed up, in a very short time, as many of those terms as one pleases, though they were 10,000 or more; and, by that rule, the sum of those 40 terms will be found to be 4.2785 very near, which being multiplied by *s*, which in this case is 3.25, the product is 13.9. will shew that the purchaser ought to give the seller about 13*l.* 18*s.*

COROLLARY.

The value of the chance for one single day that shall be fixed upon, is the value of that chance divided by the number of days intercepted between that day inclusive, and the number of days remaining to the end of the lottery: which, however, must be understood with that restriction, that the day fixed upon must be chose before the lottery begins, or that, if it be done on any other day, the state of the lottery must be known, and a new calculation made accordingly for the value of *s*.

REMARKS.

A knowledge in the doctrine of chances is not only applicable to all kinds of hazards of this nature, but may likewise be a help to cure a kind of superstition, which has been of long standing in the world, viz. that there is in play such a thing as luck, good or bad. I own there are a great many judicious people, who, without any other assistance than that of their own reason, are satisfied, that the notion of luck is merely chimerical; yet I conceive, that the ground they have to look upon it as such, may still be farther enforced from some of the following considerations.

If, by saying that a man has good luck, nothing more was meant, than that he has been generally a gainer at play, the expression might be allowed as very proper in a short way of speaking: but, if the word good luck be understood to signify a certain predominant quality, so inherent in a man, that he must win whenever he plays, or at least win oftener than lose, it may be denied, that there is any such thing in nature.

The assertors of luck are very sure, from their own experience, that at some times they have been very lucky, and that at other times they have had a prodigious run of ill luck against them, which, whilst it continued, obliged them to be very cautious in engaging with the fortunate; but how chance should produce these extraordinary events, is what they cannot conceive: they would be glad, for instance, to be satisfied, how they could lose fifteen games together at piquet, if ill luck had not strangely prevailed against them. But, if they will be pleased to consider the rules given by Mr. De Moivre, they will see, that though the odds against their losing so many times together be very great, viz. 32767 to 1, yet that the possibility of it is not destroyed by the greatness of the odds, there being one chance in 32768 that it may so happen; from whence it follows, that it was still possible to come to pass, without the intervention of what they call ill luck.

Besides, this accident of losing fifteen times together at piquet is no more to be imputed to ill luck, than the winning with one single ticket the highest prize in a lottery of 32768 tickets is to be imputed to good luck, since the chances in both cases are perfectly equal. But if it be said, that luck has been concerned in this latter case, the answer will be easy; for let us suppose luck not existing, or, at least, let us suppose it's influence to be suspended, yet the highest prize must fall into some hand or other, not by luck (for by the hypothesis that has been laid aside) but from the mere necessity of it's falling somewhere.

Those who contend for luck, may, if they please, alledge other cases at play, much more unlikely to happen than the winning or losing fifteen games together, yet still their opinion will never receive any addition of strength from such supposition. For, by the rules of chance, a time may be computed, in which those cases may as probably happen as not; nay, not only so, but a time may be computed in which there may be any proportion of odds for their so happening. But supposing that gain and loss were so fluctuating, as always to be distributed equally, whereby luck would certainly be annihilated, would it be reasonable in this case to attribute the events of play to chance alone? I think, on the contrary, it would be quite otherwise, for then there would be more reason to suspect that some unaccountable fatality did rule in it: thus, if two persons play at crofs and pile, and chance alone be supposed to be concerned in regulating the fall of the piece, is it probable that there should be an equality of heads and croffs?

It is 5 to 3 that in 4 times there will be an inequality; it is 11 to 5 in 6, 93 to 35 in 8, and about 12 to 1 in 100 times: wherefore, chance alone by it's nature constitutes the inequalities of play, and there is no need to have recourse to luck to explain them.

Further, the same arguments which explode the notion of luck, may, on the other side, be useful in some cases to establish a due comparison between chance and design: we may imagine chance and design to be, as it were, in competition with each other, for the production of some sorts of events, and may calculate what probability there is, that those events should be rather owing to one than to the other. To give a familiar instance of this; let us suppose that, two packs of piquet cards being sent for, it should be perceived that there is, from top to bottom, the same disposition of the cards in both packs; let us likewise suppose that, some doubt arising about this disposition of the cards, it should be questioned,

tioned, whether it ought to be attributed to chance, or to the maker's design: in this case, the doctrine of combinations decides the question, since it may be proved by it's rules, that there are the odds of above 26,313,083 millions of millions, of millions of millions, to one, that the cards were designedly set in the order in which they were found.

From this last consideration we may learn, in many cases, how to distinguish the events, which are the effect of chance, from those which are produced by design: the very doctrine, that finds chance where it really is, being able to prove by a gradual increase of probability, 'till it arrive at demonstration; that where uniformity, order, and constancy reside, there also reside choice and design.

Lastly, one of the principal uses to which this doctrine of chances may be applied, is the discovering of some truths, which cannot fail of pleasing the mind, by their generality and simplicity; the admirable connection of it's consequences will increase the pleasure of the discovery; and the seeming paradoxes wherewith it abounds, will afford very great matter of surprize and entertainment to the inquisitive. A very remarkable instance of this nature may be seen in the prodigious advantage which the repetition of odds will amount to; thus, supposing I play with an adversary who allows me the odds of 43 to 40, and agrees with me to play 'till 100 stakes are won or lost on either side, on condition that I gave him an equivalent for the gain I am intitled to by the advantage of my odds; the question is, what I am to give him, on supposing we play a guinea a stake? The answer is 99 guineas, and above eighteen shillings*, which will seem almost incredible, considering the smallness of the odds of 43 to 40. Now, let the odds be in any proportion given, and let the number of stakes played for be never so great, yet one general conclusion will include all the possible cases, and the application of it to numbers may be wrought in less than a minute's time.

* Guineas were then at 21 s. 6d.

I have explained, in my introduction to the Doctrine of Chances, says Mr. De Moivre, the chief rules on which the whole art of chances depends; I have done it in the plainest manner that I could think of, to the end it might be (as much as possible) of general use. I flatter myself that those who are acquainted with arithmetical operations, will, by the help of the introduction alone, be able to solve a great variety of questions depending on chance; I wish, for the sake of some gentlemen who have been pleased to subscribe to the printing of my book, that I could every where have been as plain as in the introduction; but this was hardly practicable, the invention of the greatest part of the rules being entirely owing to algebra; yet I have, as much as possible, endeavoured to deduce from the algebraical calculation several practical rules, the truth of which may be depended upon, and which may be very useful to those who have contented themselves to learn only common arithmetic.

On this occasion, I must take notice to such of my readers as are well versed in vulgar arithmetic, that it would not be difficult for them to make themselves masters, not only of all the practical rules in this book, but also of more useful discoveries, if they would take the small pains of being acquainted with the bare notation of algebra, that might be done in the hundredth part of the time that is spent in learning to write short-hand.

On the abuse of LOTTERIES.

At the beginning of this article we have touched upon the ordinary use that is made of lotteries; it may be likewise necessary to take notice of the ill consequences that attend them; which will be more briefly done from the few following queries.

1. Whether public or state lotteries have not a tendency to uphold the spirit of gaming among the people in general; and whether this does not so corrupt and vitiate the minds of the mass of the people, as to draw them from honest labour and industry in their trading employments, thereby render them poor and indigent, and occasion a general depravity of morals.
2. Whether experience has not shewn, that even the fortunate who become suddenly rich by this means, are more generally unhappy than otherwise they would be?
3. Whether the wisest and best intentioned acts of parliament, in relation to lotteries, are not too often shamefully and scandalously evaded, and give room to lottery jobbing and public imposition; and whether there have not been some late instances of this, in open defiance and violation of the best laws for the regulation of a lottery, which has given a general disgust to the nation?
4. Whether ways and means, far more eligible than those of lotteries, may not always be fell upon, to raise money for any public exigency; and whether lotteries ought not to be the last resource upon these occasions?

LOUISIANA, the extent, as well as the natural history of this country has been variously represented. In relation to the former, father Hennipin and Mr. Sale have extended it at

Vo L. II.

an extravagant rate; nor have the French, who have assumed a right to this part of America, thought proper yet to ascertain it's boundaries at all, for by their accounts it remains boundless. See our first map of NORTH AMERICA, in opposition to that of the Sieur D'Anville, which was executed under the patronage of Louis duke of Orleans, first prince of the blood. See also our article MAPS.

The more modest of their geographers, who are ashamed to assert that this province is without any limitation at all, say it is bounded on the south by the gulph of Mexico, on the north by the Illinois, and by the territories of the Paniasus, Paducas, Osages, Tionontecagas, Chavanons, and other wild nations, on the east by the part of Florida, Georgia, and Carolina, and on the west by New Mexico and New Spain. They say further, it extends itself from north to south about 15 degrees, that is, from 25 to the 40th of north latitude, and from east to west about 10 or 11, that is, from 86 to 96, or 97, for the boundaries are nothing less than certain, according to father Charlevoix. And,

The maps of Mr. De Lisle give those boundaries at a much greater extent, especially on the north side, where they make it contiguous to Canada, so that part of it is bounded, according to him, by New York, Pennsylvania, Virginia, &c. and on the west by the rivers called Rio Bravo and Salado. Other French maps published at Amsterdam, anno 1720, extend it's northern boundaries still farther on the authority of Mont. Le Sueur, who sailed up the river of St. Lewis or Mississippi above 706 leagues from it's mouth, and adds, that the river is known to flow 100 leagues still higher; so that, according to him, the northern boundaries of Louisiana may reach as far as the northern pole.

Neither are those on the north-west less uncertain, the Missouri, a great river, which gives name to a vast tract of land, flowing from that point into the Mississippi, more than 400 leagues above it's mouth; so that if we except the south, where the sea bounds it, all the rest must be left to uncertainty, and so it is like to remain 'till these boundaries are settled on the east with the English, and on the west with Spain: 'till then, they will be still liable to disputes, and, perhaps, to a continual fluctuation, according as either of the three nations shall have opportunity to enlarge their conquests in this part of America.

Certain, however, it is, that Louisiana contains the greatest part of those new discovered lands east and west of the Mississippi river, which, at first, had the name of Florida given to them by Sebastian Cabot, a Portuguese, who was sent upon this design by our Henry VII. See the article FLORIDA.

The Spaniards, indeed, lay claim, if not to the first discovery, at least to the first settlement on this continent, anno 1512, when John Pontio de Leon first unsuccessfully landed and built a fort there. The Spaniards, since then, made several attempts upon this country, but the adventurers were massacred by the Indians, so that it was not 'till the reign of Charles X. of France, that his subjects attempted a settlement on this coast, yet they were defeated by the Spaniards. These last, however, were soon after punished in the same kind by the French, but nevertheless these could not obtain sufficient help to settle a colony there, 'till anno 1684, when Mons. de la Sale discovered, with great difficulty, the mouth of the Mississippi, and built fort St. Lewis on that bay; and, he being assassinated, the place was again abandoned 'till anno 1698, when Capt. Iberville discovered the river Mississippi, and christened the whole country Louisiana, and made several settlements, which have been since very much improved, especially from the year 1720.

For 'till that time the Spaniards had some forts on the coast, particularly that of Pensacola, about 14 leagues east of the isle of Dauphin, the most considerable settlement belonging to the French, where they were ever opposing the French from settling in that country, and disputing their title to it; so that they cannot be properly said to have been rightly fixed in those possessions 'till then: of so late date is their establishment there.

Authors and travellers give variety of accounts in relation to the natural history of Louisiana. With respect to it's being extravagantly extolled about the year 1720, as the Frenchmen's paradise, great allowances must be made for all that was said at that time, by reason of the use that was intended to be made thereof, in order to countenance the system, as it was called in France, which was partly bottomed on the Mississippi scheme. See MISSISSIPPI COMPANY.

Certain it is, that several of their rivers, which overflow at certain seasons, render the country very fertile and pleasant. Nothing is said to be more delightful than their meadows, which are fit for the reception of any feed. In some parts, the soil yields three or four crops in a year, for the winter consists of heavy rains, without nipping frosts. We find there not only all the variety of trees, in great quantities, which Europe affords, but divers others unknown to the Europeans, some of them very valuable, such as their tall and excellent cedars, a tree which distils a gum, said to exceed our noblest perfumes; and the cotton-trees, which are here of a prodigious height. The whole country abounds with no little

1 i

variety

variety of game, fowl, cattle, and every thing that life can desire.

The chief rivers wherewith Louisiana abounds, besides those before-mentioned, are the St. Francis, St. Anthony, Tombau, River of Oxen, the Black River, the Ouisconsin, Illinois, Sabloniere, and many more; but the most considerable is the Mobile, by reason of the fine country it waters on both sides, and the settlement of the Chicachas, Cattas, Naniabas, Mobilans, and other nations that inhabit on each side of it, but more especially for it's fine bay, and the French settlement upon it. It descends from the mountains in the country of the Illinois, about 20 leagues, or more, north of the Chicachas, and, after a course of above 200 leagues southward, through some fine fertile plains and rich meadows, empties itself into the gulph of Mexico. The bay of this river is reckoned 30 leagues broad, and receives two others, viz. that of the Alibamons, which comes from the east, and that of the Chicachas, which flows from the north. It is on the west coast of this bay that the French have settled the most considerable colony they have in all Louisiana, which is likewise inhabited by several nations, such as the Tomez, Apachi, Mobilans, Chattas, &c. who traffic with them at Fort Lewis, on the same bay. They are none of them considerable, except that their vicinity to Georgia, Carolina, and Florida, makes their friendship so valuable, that they are much courted on all sides, especially by the English, who leave no means untried to gain them over to their interest. In regard to the other rivers of Louisiana, their names, courses, lengths, mouths, &c. we refer the reader to our map of North America, they being too many in number to admit of a particular description in a work of this nature.

The chief bays of this country, besides those of the Mississippi and that of the Mobile, are those of St. Rose, Pensacola, St. Andrew, or Sandy Bay, St. Joseph and St. Bernard, or St. Lewis. That of St. Rose is guarded by an island of the same name, which is very long, and extends itself quite to the bay of Pensacola. The channel between it and the land is wide and deep enough for any ships to sail from one to the other of those bays. The island is well wooded, and abounds with variety of game. The tides here are more regular, according to Charlevoix, than in other parts of the Mexican gulph; and the tide flows in 12 hours regularly. Pensacola hath often passed from the Spaniards to the French, and been fortified and dismantled by turns, but was, at length, yielded by the latter to the former, and is now part of Florida.

The bay of St. Lewis, called by the Spaniards St. Bernard, is most western on all this coast, is large and commodious. It was discovered, according to the French, by Mons. de la Salle, a French gentleman, anno 1685, who landed and made a settlement, and built a fort there, and called it St. Lewis. This bay, however, must not be confounded with another small one of the same name, which lies more eastward of this, over-against Pont-Chartrain. This settlement proved but of short duration.

The places of note in Louisiana, besides those we have already had occasion to mention, are New Orleans, Pont-Chartrain, and Maurepas, about 10 or 12 leagues above the country of the Oumas, and 18 from the sea, which yet may be sailed, with a good wind, in 20 hours. The soil about it is rich and fertile, and the climate, in general, excellent.

Pont-Chartrain is chiefly noted for the lake of it's name, by which the French have found out a more safe and expeditious communication with the river Mississippi, to avoid the danger and difficulty of sailing up that river by it's principal mouth. From this lake they enter into that of Maurepas, from which they go on, by means of the canal or river Iberville, into that of Mississippi. When that cannot be easily done, they carry their merchandizes by land from the bay, into the lake Pont-Chartrain, which discharges itself quite to the country of the Oumas, who are seated on the banks of the Mississippi, a little above New Orleans, and thence pursue their journey up that river, according to La Martiniere. If this be the case, it shews that this mouth and bay is not of so easy and quick passage to that town as father Charlevoix would insinuate.

REMARKS ON LOUISIANA before the last war.

Under the articles BRITISH AMERICA, CANADA, and FLORIDA, we have shewed the nature and extent of those colonies, and also of the dangers that may one day attend the vicinity of the two latter to the British colonies in North America.

That the boundaries of Louisiana and Canada are very great, and yet very uncertain, is manifest from all the accounts the French have given of them. To what end can the limits of so extensive a country, close upon the back of all our colonies in North America, be left in such a state of uncertainty by the French, but with a view that, when the occasion offers, they may become as near neighbours as they please to the British colonies, in order to take such advantage therefrom as may best quadrate with their grand system of commercial dominion in America? See BRITISH AMERICA. Is it not necessary, therefore, that the boundaries of the French, as well as those of the Spaniards at Florida, should

be so justly settled and ascertained, that no misunderstandings may thereby be occasioned between the said crowns? Have not the Spaniards, as well as the English, experienced what unjustifiable incroachments have been made by the other power in this part of America? Should not the late accounts which we have had from America, in relation to a very considerable illicit commerce said to be carried on by the French, from the Mississippi to Mexico, alarm the Spaniards infinitely more than a little logwood-trade being carried on by the English in the bays of Campeachy and Honduras, where the English have so apparent a right of trade? See the article LOGWOOD. Will not a large contraband trade, carried on by the French from hence to Spanish America, proportionably injure the lawful trade carried on by the English and Dutch, by the way of Old Spain to New Spain? Is the neighbourhood of the French to the Spaniards upon the Mississippi less dangerous to the latter than to the British colonies? If the before-mentioned accounts from America should prove true, does not an opportunity offer itself to the English and Dutch, to make some advantage of with the court of Madrid?

Is it not notorious, that the French, by virtue of their Louisiana and Canadian settlements, have gained, and are still endeavouring more and more to gain, such an ascendancy over the Indian nations in general, that may one day prove unspeakably injurious, if not absolutely destructive of the very being of the British colonies: provided the Indian affairs are not made as much the study of the English as of their politic competitors?

Nothing more manifests the wisdom of the French measures pursued in North America than that, although there is hardly any single neighbouring colony but what might soon become a match for all CANADA alone, yet the French, by a proper management of their INDIAN ALLIES, keep ALL the British northern colonies, both in time of peace and war, in a constant alarm, dread, and apprehension of danger. But it is to be feared, that those affairs have not been so clearly and faithfully represented in England as could be desired by every true friend to the interests of this kingdom; for, had that been the case, it is not to be doubted but the most effectual measures would have been taken by the crown of Great-Britain, to prevent every kind of danger that might be reasonably apprehended to attend those colonies, which England has nursed with so much tenderness, and with so great prosperity to those colonies themselves, as well as emolument to herself. And that the reciprocal ties of interests may be the more and more cemented between this kingdom and her American colonies in general, is a point which I have sincerely laboured throughout this work; and, as the article before us affords me a fresh opportunity to pursue the same principles, I shall, with what brevity I can, submit a summary of the best intelligence I have been able to collect in relation to the further secure possession and the commercial prosperity of those colonies. The crown of England, it is certain, has not hitherto been sparing in expence to cherish those important plantations, in order to raise them to the pitch of splendor wherein we at present behold them; and, therefore, those plantations themselves should not, nor do I believe they will, be at all lukewarm, now it is in their power, in regard to their own maintenance, safety, and felicity: they have, indeed, given testimony to the contrary, and the crown and parliament have not shewed any insensibility to their late laudable zeal; nor will they ever shew, we may presume, any indifference towards their trading interests, when they are not repugnant to those of their mother-state.

The people of England are already sufficiently incumbered with taxes, though it must be allowed that many wise measures have been taken to render the burden light and easy; and it is to be hoped, that the like consistency of public measures will prevail, to render it lighter and lighter. The colonies themselves, therefore, jointly, should cheerfully contribute towards whatever expence may attend the more effectual regulation of their trade and frontiers; for it is full time that they should look to their security, and most unnatural to expect ever to hang on the breast of their mother-country.

Whatever pretences may be made, it is most certainly true, that the preservation of the whole range of British colonies upon the continent of America depends in a great measure upon a proper regulation of the SIX INDIAN NATIONS, and the security of the frontiers of NEW YORK, both to the northward and southward. It has been, therefore, proposed by those who seem to be well acquainted with the interest of those colonies, and to have their welfare and prosperity at heart, 1. That a good strong regular fortification is absolutely necessary to be erected, without delay, at WOOD CREEK, or near it, because it is not impossible to bring great guns to bear against it from CROWN-POINT; from whence the French always pour in their parties upon our more northern colonies, in time of war. Here, also, it will be necessary to have a magazine of all kinds of warlike stores, both for the offensive and defensive, with snow shoes, small hatchets, &c.—This will, in a great measure, protect the British possessions; and from thence a descent upon Canada, when occasion shall require, may not be impracticable.

2. That

2. That such fort be able to contain 500 men in time of war, and never less than 100 in time of peace.
 3. That there be an addition of 200 independent companies, to the four already established here, from the Highlands of Scotland; the wilder the better for a common garrison there.
 4. That all the lands from FORT NICHOLSON to FORT ANNE, that is, all the lands upon the CARRYING-PLACE, and those adjacent, be set apart for the use of such Highlanders only as will settle there, and to be properly allotted in their settling for the first two or three years: to each man and his wife 100 acres, and to each single person 50 acres, without fee or reward, to them and their heirs for ever.
 5. That near this fort, at a proper distance, there be erected a small Block-House, sufficient for 30 Indians, to be maintained there on constant pay, during a war, viz. five from each of the Six Nations, to be relieved and regulated in such manner as the Six Nations themselves think most proper.
 6. That commissioners from all the colonies be appointed to meet annually at NEW YORK, or ALBANY, in order to settle their respective quota's towards the general expence, and for the erecting such other forts and block-houses as may be thought necessary.
 7. That those commissioners jointly be empowered to lay out lands (not already granted) most conveniently situated for a good frontier; and that these lands be laid out in townships, after the NEW ENGLAND manner, for a competent number of families, to be granted to them and their heirs, ten years at least, clear of all taxes and quit-rents.
 8. That in each township there be erected a good strong church, with loop holes, and a few field pieces, which may serve for a retreat upon occasion.—That these townships should not consist wholly of Germans, or other foreigners*.
- * 'Philadelphia may one day repent,' says our author, who seems to be a worthy, honest, old British foldier, 'the vast importation of those people among them; they are most of them old soldiers. I have reason to know something of their spirit, having had some hand in disarming 600 of them, upon account of a mutiny in this province; and it was my fortune to command some of them upon the expedition against Canada, in 1711. A society of free-men, as the Philadelphians are, absolutely disclaiming the use of arms, and, at the same time, encouraging the introduction of great numbers of old foreign foldiers, who hardly know what the word Liberty means, is a contrast which they only can account for.' See the Importance of gaining and preserving the Friendship of the Indians to the British interest considered.
9. That a firing of block-houses be erected, so as to make the communication, or an alarm, from one garrison, or block-house, to another, easy, by smoaks, properly disposed, in the day-time; or by throwing up a number of rockets, or firing great guns in the night-time*.—Such an expedient would be of great use during the war, as the Indians never attack but by surprize, and would greatly discourage the parties of the Indian enemies, as it would keep our own garrisons upon the watch, and our out-scouts strictly to their duty.
- * I do not think it at all impracticable to convey an alarm from Albany to New York in one night, if rockets or great guns were properly disposed and attended. Let us suppose, for example, a party of French and Indians abroad, which seldom happens without being discovered by some out-scout or other: upon discovery, if in the day-time, let there be one great smook, and one great gun fired; which, if taken up by the other garrisons, I am confident that party would hardly proceed. In order to discover what course the party may take, let there be three smoaks, two pretty near to one another, and the third at a proper distance, either to the eastward or westward, &c. which will point out the course taken.—This may be improved.
10. That in each of the SIX NATIONS there be built a fort of some kind or other, where, and in what manner, that particular nation shall best approve.
 11. That in the ONONDAGO country, where their general councils are held, and the archives of the Six Nations are preserved, something more than common be erected: this will do honour to the British nation, and greatly encourage the Indians, especially in time of war; and while their old men, women, and children, are secure in a fort, with a small party of Christians, their excursions will be more free and frequent: but this security ought to be left altogether to their own choice; whether by erecting one single fortification for the retreat of the whole (the SENECA I should chuse, being a fine country, where great encouragement ought to be given to settlers, and where the Indians are less tainted with Christian vices) or whether each nation should have their proper retreat, or security.
- What has hitherto prevented our Indians in their excursions against the enemy is, in my humble opinion, in a great measure owing to the apprehensions of having their cattle cut off in their absence; they have been often threatened, and, indeed, at present, they have nothing to trust to but their heels. And nothing has prevented the attempt, but the resolutions of the CACHNAWAGES, their principal fighters (but deserters from our MOHAWKS) not to spill the blood of their relations and countrymen.

And the same natural affection has prevented our Indians from doing, what I am confident they would have done, had they been sure not to have met with their friends and countrymen, the CACHNAWAGES. Proper methods, therefore, ought to be taken to recover those Indians; which, I conceive, is very far from impracticable.

The villainous treatment those people have met with at ALBANY, from the handlers, was the original cause of that desertion: and undoubtedly, for the same reasons, many more do, and will desert, if proper remedies are not speedily applied. For this purpose it is requisite to observe, that, without a proper REGULATION OF THE TRADE BETWEEN THE INDIANS AND THE ENGLISH, ALL OTHER ENDEAVOURS ON THE SIDE OF THE LATTER, TO GAIN AND PRESERVE THE FRIENDSHIP OF THE FORMER, WILL AVAIL BUT LITTLE. I shall not, at present, enter into a detail of the GREAT INJURIES DONE BY THE ENGLISH TO THE INDIANS, IN THEIR INTERCOURSE OF COMMERCE: certain it is, that these poor people have, for many years, been under the direction of the people of ALBANY, whose interest it was TO DECEIVE AND DEFRAUD THEM; and, that they have been deceived and defrauded, is too notorious to be gain-said: instances in abundance might be produced, but they are really too shocking to relate. Nor is this any new thing, as appears from the following preamble to an act of parliament of the 13th of queen Anne.—But I have not heard of any act of the like kind since, though the mischief has been daily increasing.

'Whereas great endeavours have, from time to time, been used by her majesty's governors and commanders in chief of this colony, to settle a trade, and to have commerce with such Indian nations as live beyond our five confederated nations; which, in process of time, might not only be very advantageous, but also of great security to the frontiers of this colony, at or near Albany, in time of war; and several of the said Indians being lately come to the city of Albany, in order to trade with the inhabitants thereof; but several private persons, not regarding the safety of this colony, but only designing their own private lucre, have, and do daily, use many indirect means to ENCROSS THE TRADE INTO THEIR HANDS, by their contrivance with those who are employed by the said Indians to carry them in their wagons to Albany; and, having once gotten the peltry, beavers, or other furs of the said Indians, in their possession, hinder them to make the best of their market, to the ruin of the said trade, and the ALIENATION OF THE AFFECTIONS OF THE SAID INDIANS FROM THIS COLONY; and, instead of securing the friendship of the said Indians, will, if not prevented, cause them to be our enemies, &c.' This act to continue for two years.

The chief principles to be laid down in the management of our Indians are, first, by all means to endeavour to underfell the French: and the next is to do justice to the Indians in those sales. For which reason, I should advise that this trade, instead of being wholly under the direction of the people of Albany, who are most of them, if not altogether, traders or handlers, and whose interest it is to take all advantages of those poor people, and that with impunity, as they have no body to complain to, the principal directors being all traders themselves, and, of course, Socii criminis.

2. That it be put under the direction of one single person of capacity and integrity, of his majesty's appointment, during good behaviour, with a handsome allowance, in the nature of a SUPERINTENDENT OF INDIAN AFFAIRS, with full powers to do summary justice upon all occasions.

3. That he be debarred trading directly or indirectly, upon the severest penalties.

4. That he take his instructions from the governor and council; and report to them, at least twice a year, a state of our Indian affairs, in order to be laid before his majesty or the board of trade.

5. That he be obliged to make a tour through the SIX NATIONS, once a year at least, with a proper equipage, and some small presents for the chief men; when and where he may receive complaints, and redress grievances.

6. In order to save the crown the expence of such an officer, it may be advisable, that, as there are two surveyors-general of the customs upon this continent, at an allowance of a guinea a day, and 60l. sterling yearly, each of them, for a clerk, upon the demise of either, that officer be set apart for this use: one surveyor-general being sufficient here for all the purposes of the customs, those officers being rather in the nature of preventive officers, that is, their chief business is to prevent any European goods being imported from any part but from Great-Britain and Ireland, and to prevent the exportation of any of the enumerated commodities to any parts but to Great-Britain, &c. There are no revenues collected by the officers here, nor no accounts worth mentioning to comptroll: so that it seems, that one of those officers at least, may be very well spared for the above purposes, and much better employed.

7. That there be a handsome allowance made for two interpreters at least; one, indeed, for each nation, I should not think too much, and one of them always to attend the principal officer.

8. That

8. That there be a smith * appointed by the principal officer, with a proper allowance, in each nation, with two apprentices, in order to multiply interpreters; for want of which, I doubt, we have often been misled and imposed on; and, if those smiths were obliged to teach one or two Indian youths of the best capacities to read and write English, it might be of no small service, as nothing is more wanted than honest interpreters.

* This is the most useful mechanic than can be among the Indians, especially a gunsmith to keep their arms constantly in good order, their whole subsistence and traffic depending on hunting and shooting.

9. That every person, employed by the public in this service be prohibited trading, directly or indirectly, under severe penalties, and give security for the due execution of his duty; and to be on oath obliged to represent faithfully, every grievance which, he conceives, the Indians meet with from the traders. As monopolies in general are the bane of trade, this commerce should be open and free for all his majesty's subjects; by which means a number of bush-lopers, as the Dutch call them, and the French, who are indefatigable in this point, coureurs de bois, are created; a set of men, who, from their acquaintance with the woods and Indians, are importantly useful upon many occasions, especially, in time of war.

10. That there be lodged in the hands of every smith, or agent for that purpose, Indian goods, to the value of 1. always by them, which they are to dispose of for the use of the public, according to invoices from New York, fixing the prices of the goods, as well as of the furs and skins, and by no means to exact further upon the Indians. This is the method, and the only method, I humbly conceive, by which we can undersell the French, and will prove a means to regulate the whole Indian trade: and this is the method taken in the government of New-England, which is in the following manner, viz.

By an act of 12 Geo. 1. it is enacted, ' That provisions, cloathing, &c. suitable for carrying on a trade with the Indians, not exceeding the value of 4000l. be procured at the cost and charge of the province, and the produce applied for supplying the Indians, by such persons as shall be annually chosen, &c. and likewise annually produce fair accounts of their proceedings; which supplies shall be lodged to the eastward, at, &c.

' That a suitable person be chosen annually at each of the places where any of the goods, &c. are lodged, which truck-masters shall be under oath, and give sufficient security for the faithful discharge of that trust, and such instructions as they shall receive from time to time: and shall keep fair accounts of their trade, and dealings with the Indians, and shall return the same, together with the produce, to the person or persons who shall be appointed to supply them with goods. And they shall not trade with the Indians, directly or indirectly. That the truck-masters sell to the Indians at the price set in the invoices sent them from time to time, without any advance thereon; and shall allow the Indians for their furs, and other goods, as the markets shall be at Boston, according to the latest advices from the person or persons that shall supply them for the same commodities of equal goodness.

' Rum to be given to the Indians in moderate quantities, by the truck-masters only.

' No person whatsoever, other than the truck-masters, and they only as such, shall or may presume by themselves, or any other for them, directly or indirectly, to sell, truck, barter, or exchange, with any Indian or Indians, any wares, merchandizes, or provisions, within six miles of any truck-house, &c. on penalty of forfeiting 50l. or six months imprisonment.'

From hence I have only to observe, that, had our Indian trade been under such a regulation, or indeed any regulation at all, we should have less to apprehend at this time of day; and it is certainly high time to make a beginning.

11. A grand fair yearly established in the Six Nations, to be kept alternately, would be extremely useful; to begin first in the ONONDAGO country, the next year in the SENECA country, &c. of which all the nations, far and near, may have due notice; and where the superintendent, or inspector-general before humbly proposed, should always attend: and, the prices of goods being fixed from the latest invoices from New York, it would be a great inducement to the distant nations of Indians, as well as our own, to purchase, and would at the same time be a check upon the handlers at Oswego, as well as elsewhere.

One essential article in our trade with the Indians, and upon which, in a great measure, the whole depends, has been hitherto much neglected on our part; and that is, from us they have the cheapest English arms and ammunition, and of course the worst upon the face of the earth: the French take the utmost care to supply them with what is really good, and at a cheaper rate than we can afford the best of ours: by which means, I doubt, they will ever be able to undersell us in that essential article, unless some effectual methods are

fallen upon to prevent it. The French purchase Indian goods both in Holland and in England for those very Indians. Or, why might not those colonies manufacture their own powder in the MOHAWK's country, where saltpetre may be had in abundance, from those vast beds of pigeon's-dung? In short, the Indians must have good powder and arms; and, where the best is, there they will go; and, according to the present situation of things, they will depend upon the French for it. Could we get the better of this one article, all that attachment and intercourse our Indians have at present with CANADA, would, I am confident, soon be at an end.— This is a matter well deserving consideration.

12. That instead of supporting this trade by way of licence, which has hitherto been but oddly managed, there be a duty, applicable only to Indian affairs, and thrown into the joint stock, upon all Indian goods exported hither by land or water; and likewise upon all furs and skins imported, under the direction of the officers of his majesty's customs; those, appointed by the country, have generally more regard to their friends than their duty. This has been formerly practised, and, it is humbly conceived, will answer every purpose much better.

As this affair will create a yearly expence, such as no one colony can well bear, let there be a scheme prepared for each colony's paying their proportion. Most certain it is, as before observed, that, if ever NEW YORK, ALBANY, and HUDSON'S river, should get into other hands, every other colony would soon follow; and, while that is secure, all the more northern colonies will be so too. If what has been said should appear true, is it possible to doubt but that they will readily comply? In answer to that trite objection, viz. as we have all the trade to this part [meaning NEW YORK and ALBANY] we ought to be at all the expence: in God's name, let each contributing colony have it's township upon the frontiers, with proper magazines, and one or more trading houses, and a sloop, and make the most of it.

The names of the provinces that form the republic of Holland, with their several rates towards the yearly expence of the government, according to the proportion of 100 guilders, and the order in which their deputies to the states general vote, are as follows:

	Guil.	Stiv.	Den.
Guelderland, with the county of Zutphen	5	12	3
Holland, with West Friesland or North Holland	58	6	2½
Zealand	-	9	3 8
Utrecht	-	5	16 5
Friesland	-	11	13 2
Overijssel	-	3	11 5
Groningen, with the Omlands	-	5	16 7½

100 00 0

(This may serve for something of a model.)

The people of New York have been at an infinite expence upon the whole, from the beginning, in fortifying, and in presents to the Indians, with very little assistance from their neighbour colonies; a charge which that province is hardly able to bear, and most unreasonable, as every other colony upon the continent is, in some degree or other, concerned in the preservation of the friendship of the Indians, and the security of our frontiers. This, however, has been but palliating matters, and doing things by halves: whenever the colonies think fit to join, the Indian affairs will wear quite another aspect. The very name of such an happy confederacy will greatly encourage our Indians, strike terror into the French, and be a means to prevent their insupportable insults and incroachments, which they daily make with impunity.

A long series of ill usage from the traders has given the Indians but a very indifferent opinion of our morals; and of late, from several abortive expeditions, they begin, I doubt, to suspect our courage; than which, nothing can more affect our interest with them. They of themselves are honest, such at least as have not been debauched by the Christians, and brave in their way, and despise knaves and cowards. It will, therefore, require some address, and not a little expence to recover our character.

If all this is to no purpose, and that they will stand out, let us not despair, but that, upon a proper representation to his majesty, of the absolute impossibility for this colony alone to bear the expence of settling and preserving our Indian affairs upon such a footing as they really ought to be, his majesty, from his wonted goodness, will undoubtedly, not only assist them himself, but oblige the other colonies to assist them; in proof of which paternal care, give me leave here to insert some of his instructions to the late governor Montgomerie in 1727, upon this very occasion.

Instruction 83. ' Whereas it has been thought requisite, that the general security of our plantations upon the continent of America be provided for by a contribution, in proportion to the respective abilities of each plantation: and whereas the northern frontiers of the province of New York, being most exposed to an enemy, do require an extraordinary charge

charge for the erecting and maintaining of forts necessary for the defence thereof: and whereas orders were given by king William III. for the advancing 500l. sterling, towards a fort in the ONONDAGO country, and of 2000l. sterling, towards building the forts at ALBANY and SCHENECTADY; and likewise by letters under his royal sign manual, directed to the governors of divers of the plantations, to recommend to the councils and general assemblies of the said plantations, that they respectively furnish a proportionable sum towards the fortifications on the northern frontiers of our said province of New York, viz.

RHODE ISLAND and PROVIDENCE.

	Plantations l.	150
CONNECTICUT	- - -	450
PENNSYLVANIA	- - -	350
MARYLAND	- - -	650
VIRGINIA	- - -	900

Making together 2500

And whereas we have thought fit to direct, that you also signify to our province of NOVA CÆSAREA, or New JERSEY, that the sums which we have at present thought fit to be contributed by them, if not already done, in proportion to what has been directed, to be supplied by our other plantations as aforesaid, are 250l. sterling for the division of EAST NEW JERSEY, and 250l. sterling for the division of WEST NEW JERSEY: you are, therefore, to inform yourself what has been done therein, and what remains further to be done, and to send an account thereof to us, and to our commissioners for trade and plantations, as aforesaid.

84. And you are also, in our name, instantly to recommend to our council, and the general assembly of our said province of New YORK, that they exert the utmost of their power, in providing, without delay, what further shall be requisite for preparing, erecting, and maintaining of such forts in all parts of that province, as you and they shall agree upon.

85. And you are likewise to signify to our said council, and the said general assembly, that for further encouragement, that besides the contributions to be made towards the raising and maintaining of forts and fortifications on that frontier as above-mentioned, it is our will and pleasure, in case the said frontier be at any time invaded by an enemy, the neighbouring colonies and plantations upon the continent shall make good, in men, or money in lieu thereof, their quota of assistance, according to the following repartition, viz.

	Men.
MASSACHUSETT'S BAY	350
NEW HAMPSHIRE	40
RHODE ISLAND	48
CONNECTICUT	120
NEW YORK	200
EAST NEW JERSEY	60
WEST NEW JERSEY	60
PENNSYLVANIA	80
MARYLAND	160
VIRGINIA	240

Making together 1358

Pursuant whereunto you are, as occasion requires, to call for the same; and, in case of any invasion upon the neighbouring plantations, you are, upon application of the respective governors thereof, to be aiding and assisting to them in the best manner you, and as the condition of your government will permit.

As to this instruction, his majesty, I doubt, has not been thoroughly informed, because, upon an invasion, considering the distance and dilatoriness of assemblies, the mischief, in all probability, would be over before we could have any assistance. I should, therefore, think it advisable, that those proportions be immediately detached to the frontiers, upon the first news of a war; there to remain, and to be recruited during the war, at the expence of the said colonies. I shudder, continues the author, to think what would have been the fate of ALBANY, had not these troops, designed against CANADA, been accidentally there; more especially as the people of ALBANY, at that time, were afflicted with an epidemical distemper, which carried off great numbers.

From hence his majesty's care is apparent; and why those instructions have not been hitherto duly observed, is what I shall not take upon me to determine: I cannot, however, help thinking, that, from upwards of forty years observations upon the conduct of our colony assemblies, and the little regard paid by them to the royal instructions; if it is left altogether to them, the whole will end in words and altercation only. By the above instructions it appears, that his majesty has been fully apprized of the consequences of leaving this colony unguarded, as well as of its inability to answer his most gracious intentions.

VOL. II.

I should therefore advise, that the quota's be doubled, which they can now very well bear, and both the CAROLINA's added, and the whole enforced by an act of the British legislature. In that case, if this scheme, or something similar to it (as I am very far from thinking but that it will admit of many improvements, and for that purpose it is offered) is duly executed; I will venture to prophesy, that, in a few years, the whole fur-trade will be in British hands, and that the fur-trade company in CANADA will sink, upon which the very being of that company depends.

I have only further, adds this honest gentleman, with great submission to advise, that the meeting of the Indians be alternate, one year at New YORK, which will add but very little to the expence, and where the commissioners from those contributing colonies may more conveniently attend; and where, it is to be hoped, the Indians may receive some better impressions of our people than they have hitherto done at ALBANY; the next year any where but at ALBANY or SCHENECTADY: that the presents made to the Indians upon those occasions, as soon as viewed, and divided by the particular nations, be packed up again, in such manner as may make the carriage the easiest, of which they themselves will be the best judges, and locked up, and the keys to be delivered to the principal SACHEM of each nation, and not to be opened till they arrive in their own country: for I believe I may venture to affirm, that the greatest part of those presents, made them upon these solemn occasions, seldom go further than ALBANY or SCHENECTADY, but are bought up by the handlers for rum, and afterwards sold to the Indians, when drunk, at an exorbitant rate: I would propose this method, being well assured there is no law can be contrived, or oath framed, to bind a handler.

As to our southern frontiers, the city, &c. I mean of New YORK, let those be altogether under the direction, and at the expence of the colony of New YORK, hoping withal, his majesty will be graciously pleased to favour them with a small detachment of gunners, and one engineer, for a time at least, together with some artillery and ammunition. Large sums have been expended, or rather squandered away, on this account, by the country, to very little purpose. Let there be two batteries erected at the NARROWS, one on each side, in proper places, and with breast-works only; any fortifications there may fall into the enemy's hands, and have bad consequences. These batteries should be under the care of the adjoining counties; that on the east side under the care of the regiment of King's County, and that on the west side under the care of the regiment of Richmond County.

Our utmost endeavours must be, in the first place, to prevent the enemy's landing; and also, in the next place, to prevent a bombardment. For this purpose it may be necessary to view the coast below the two first batteries. Should an enemy land at or near New UTRICHT, the march is easy, even with cannon, from thence to the ferry, of which we should soon feel the effects. Low batteries, as I would have all those to be, even with the water, if possible, at RED of YELLOW HOOK, will be a means to prevent a bombardment, and the enemy's landing upon LONG ISLAND. A small battery upon KENEDY'S ISLAND may be of use. Let there be several small batteries fixed round NUTTEN ISLAND, of heavy cannon, and it were to be wished they were all such; and one strong intrenchment in the middle, for a number of troops.

At the east end of the town a good battery will be necessary, as well as several along HUDSON'S RIVER.

I would not have any of those batteries exceed five guns, but to be placed the thicker: ships generally aim at one battery at a time; besides, it is impossible to know where a ship may lie: in this case, it is odds but some of our batteries may take her up. Breast-works, with block-houses, instead of stockadoes, would answer all purposes much better, be of much less expence, and last longer.

As to the fort, and the lower batteries, they are altogether ill designed, and as badly executed; but as our late engineer has reported, to his excellency the governor, the failures, and the improvements that may be made, so as to resist any sudden attack, we hope a matter of this consequence will be no longer disregarded.

It is a constant rule, that every detached work, however insignificant in itself, should have its ammunition at hand, to be come at without difficulty or danger; one hundred weight at least of powder to each gun.

The regiments of Suffolk, Queen's, and King's Counties, Richmond, and Westchester, will be force sufficient to defend the city, if they can be brought together with regularity and certainty: to which, however, may be added the militia of Connecticut and Essex County. Let all the other counties bend their force towards the frontiers.

Beacons, or rather smokes, in the day-time, and rockets, or great guns, in the night, for this purpose, will be absolutely necessary. It will be no great difficulty to carry an alarm to the east end of Long Island, to Richmond County, and Westchester, at the same time, in a very few hours, upon which, every man that keeps a horse ought to make the best of his way to the city, and not to wait the forming into

K. k

con-

companies, 'till they arrive at the city; where I will suppose the colonel, or lieutenant-colonel, to be executing, while the other, who may have full power to press horses, is bringing up the rear; where transportation is necessary, the city to take care to have boats at the proper landings.

During a war, let there be one stout sloop of war provided, at the expence of the governments of Rhode Island, Connecticut, New York, New Jersey, and Pennsylvania; one other at the expence of North and South Carolina's, Virginia, and Maryland; and one at the expence of the Massachusetts, New Hampshire, Halifax, and Nova Scotia; which, if under proper regulations, together with the station-ships, will be sufficient to protect our trade.

Give me leave to prophesy again, that, in case of a war, we shall sorely repent it, if timely provision is not made against the efforts of the people of Cape Breton, and upon our settlements from Crown-Point.

If these things, or something of this kind, perhaps, from an abler hand, be duly considered and executed, during the calm of a peace, we shall have little to apprehend from an enemy.

Wherefore let our general assemblies, with whom we have intrusted the care of our lives and liberties, answer, if they can, either to God or man, a neglect of their duty, in a matter of so high concernment to themselves, their fellow-subjects, and their posterity. Dulce est pro patria mori, is an old Roman maxim: and, though I have not at present any thoughts of dying for my country, yet I have a real satisfaction in imagining, whether in reality or not I cannot say, that I have pointed out some things, which, if observed, may prevent a great deal of blood-shed, &c. of which I wash my hands, and leave it at the door of those whose proper business it is to look out in time.

REMARKS on the whole of LOUISIANA, as they stood before the last war.

We have seen the sentiments of a worthy, well-intentioned, British old soldier, not only in regard to the proper military measures which he judges requisite to be taken for the safety and preservation of our northern colonies, but also for their trading prosperity in general: and having been informed that what this worthy officer has suggested, in his plain honest way, has really met with the approbation of those abroad who are good judges of what he has submitted, I thought it might prove useful to take due notice of it; for many a good design has been overlooked or neglected, for want of being properly represented and patronized. Whether what has been proposed, in respect to the point of security, cannot be so well judged of but by those who are on the spot, and skilled in the principles of engineering; it looks with a very rational aspect, and may deserve attention, in order to be rectified, if it should, in any respect, be defective.

Our reasons for taking notice of this matter under the article LOUISIANA are, (1.) Because this French province, together with that of Canada, and the alliances and great influence which the French have with various Indian nations, by virtue of these extensive settlements, upon the back of the British colonies, even from Georgia to Hudson's-bay, may one day put it in the power of France to surprize those colonies; unless they are well secured by proper fortifications, and by an inviolable friendship cemented with our Indians, by means of a fair and honourable commerce, and good treatment from the English. (2.) Because what we have here urged is consonant to, and proper to be considered conjunctively with what we have said under the articles BRITISH AMERICA, CANADA, and FLORIDA. See also the articles MISSISSIPPI and FRANCE.

REMARKS on this article LOUISIANA, since the last war, and the DEFINITIVE TREATY OF PEACE of 1763; wherein a succinct sketch of the disadvantages we laboured under before the war, and the benefits we may receive by the last peace, are considered.

It has been generally suspected, that this nation has suffered much from the want of a due knowledge of her dominions in America, which we should endeavour to prevent for the future. If that may be said of any part of America, it certainly may of those countries, which have been called by the French LOUISIANA. They have not only included under that name all the western parts of VIRGINIA and CAROLINA, and thereby imagined, that they had, from this NOMINAL TITLE, a just right to those ancient dominions of the crown of ENGLAND: but what is of worse consequence, perhaps, they have equally deceived and imposed upon many, by the extravagant hopes and unreasonable expectations they had formed to themselves, of the vast advantages they were to reap from those countries, as soon as they had usurped them. See our article MISSISSIPPI.

But when they came to be disappointed, they ran from one extreme to the other, and condemned the country as good for nothing, because it did not answer the chimerical hopes they conceived of it; and indeed, we seem to be misled by

their prejudices, and be drawn into mistakes by their artifice, not their folly, they knowing better. Because their bubbling MISSISSIPPI SCHEME failed in 1719, some people would persuade us, that every other reasonable design of improving that country, and of reaping any advantage from it, must do the same, especially now since all parts east of the Mississippi are ceded to Great-Britain by the DEFINITIVE TREATY. To remove those prepossessions, the following account of these countries may contribute; they appearing both just and reasonable, and agreeable to every thing we know of America.

We have been long told by J. Charlevoix, from whence it is, that many people have formed a contemptible opinion of this country, that lies on and about the Mississippi. They are misled, says he, by the relations of some seafaring people, and others, who are no manner of judges of such things, and have never seen any part of the country, but the coast-side, about MOBILE and the mouths of the Mississippi; which they tell is as dismal to the appearance, the only thing those people judge by, as the interior parts of the country, which they never saw, are delightful, fruitful, and inviting. They tell us besides, that the country is unhealthy; because there happens to be a marsh at the mouth of the Mississippi, (and what river is there without one?) which they imagine must be unhealthy, rather than that they know it to be so; not considering, that all the coast, both of North and South America is the same; and not knowing, that the whole continent, above this single part of the coast, is the most likely, from its situation, and has been found, by all the experience that has been had of it, to be the most healthy part of NORTH AMERICA in the same climates, as will abundantly appear from the following and other accounts.

That a fair general view of those countries may be taken, we should consider them as they are naturally divided into four parts; (1.) The sea-coast; (2.) The Lower Louisiana, or western part of Carolina; (3.) The Upper Louisiana, or western part of Virginia; and, (4.) The river Mississippi.

The sea-coast is the same with the rest of the coast of North America to the southward of New York, and indeed from thence to Mexico, as far as we are acquainted with. The soil for twenty or thirty miles distant from the shore, more or less, is a sandy desert, with few good ports or harbours on the coast, especially from Chesapeake-bay to Mexico. However barren this coast is in other respects, it is covered with tall pines, which afford a great store of pitch, tar, and turpentine. These pines make good masts for ships, which have lasted for upwards of twenty years; when 'tis well known, that our common masts of the New England white pine will often decay in three or four years. There is great plenty of cypress in the swamps on this coast, which is not less serviceable, both for masts, of which it would afford the largest of any tree that we know, and for ship-building. And ships might be built of both these timbers for half the price, perhaps, of any other, as well on account of their vast plenty, as being so easily worked.

In most parts of these coasts, especially about the Mississippi, there is great plenty of cedars, and ever-green oaks, which make the best ships of any that are built in North-America; and we have reason to believe, that the Spaniards built their ships of war at the Havannah of these cedars. Of these there is very great plenty, immediately to the westward of the mouth of the Mississippi; where large vessels can go to the lake of the Chemias, and nothing hinders them to go and cut the finest oaks in the world, with which all that coast is covered,* says Charlevoix, Tom. iii. p. 444. Which moreover, is a sure sign of a very good, instead of a bad soil; and accordingly we see the French have settled their tobacco plantations thereabouts. It is not then without reason that Monsr. Le Page Du Pratz assures us, that the LARGEST NAVIES MIGHT BE BUILT IN THAT COUNTRY, AT A VERY SMALL EXPENCE.

From this it appears, that even the sea-coast, barren as it is, from which the whole country has been so much depreciated, is not without its advantages, and those peculiarly adapted to a trading and maritime nation.

And all along the Mississippi on both sides, Dumont*, says, 'the lands, which are all free from inundations, are excellent for culture, particularly those about Baton-Rouge, Cut-Point, Arkansas, Natches, and Yafons, which produce Indian corn, tobacco, indigo, &c. and all kinds of provisions and esculent plants, with little or no care or labour, and almost without culture, the soil being in all those places a black mould of an excellent quality.'

* Memoires, l. 16.

These accounts are confirmed by our own people, who were sent by the government of Virginia in 1742, to view the western parts of that province; and although they only went down the OHIO and MISSISSIPPI to NEW ORLEANS, they reported, that they saw more good land on the MISSISSIPPI, and it's many large branches, than they judge is in all the English colonies, as far as they are inhabited,* as appears from the report of that government to the board of trade.

What

What makes this fertile country more eligible and valuable, is, that it appears, both from it's situation and from the experience the French have had of it, to be far the most healthful, says Du Pratz, of any in all these southern parts of NORTH AMERICA; a thing of the last consequence in settling colonies, especially in those southern parts of America. All the sea-coasts of our colonies, to the southward of Chesapeake-bay, or even of New York, are low and flat, marshy and swampy, and very unhealthful on that account; and those on and about the bay of Mexico, and in Florida, are very hot; but those lands on the Mississippi are, on the contrary, high, dry, hilly, no great distance from the river, besides the ridges of the Apalachean mountains, that lie to the northward of them; which must greatly refresh and cool the air over all the country, especially in comparison of what it is on the low and flat, sandy and parched, sea-coasts of our old colonies. These high lands begin immediately above the Delta, or drowned lands, at the mouth of the Mississippi; above which the banks of that river are from 100 to 200 feet high, without any marshes about them; and continue such for 900 miles to the river OHIO, especially on the east side of the river. See DU PRATZ, vol. i. chap. iv. p. 262.

Such a situation on rich fertile lands in that climate, and on a navigable river, must appear to be of the utmost consequence. It is only from the rich lands on river-sides (which are, indeed, the only lands that can generally be called rich in all countries, and especially in NORTH AMERICA) that GREAT-BRITAIN can reap any thing of value from all the colonies she has in that part of the world. How ought we then to esteem such rich and healthful lands on the Mississippi? As much surely as some would depreciate them.

It may be observed, that all the countries in AMERICA, are only populous in the inland parts, and generally at a distance from navigation; as the sea-coasts both of North and South America are generally low, damp, and excessively hot; at least all the southern parts, from which we can expect any considerable returns. Instances of this may be seen in the adjacent provinces of Mexico, New Mexico, Terra Firma, Peru, Quito, &c. and far more in our southern colonies, which never became populous, till the people removed to the inland parts, at a distance from the sea. This we are in a manner prevented to do in our ancient colonies, by the mountains which surround them, and confine our people to the coast; whereas on the MISSISSIPPI the whole continent is open to them, and they have, besides, this healthy situation on the lower parts of that river, at a small distance from the sea.

Those things being duly considered, it will appear, that they who are possessed of the navigation of the MISSISSIPPI, and have a competent maritime power to defend that liberty, will, in time, command that whole continent.

The low and drowned lands, indeed, about the mouth of the MISSISSIPPI must, no doubt, be more or less unhealthful; but they are far from being so pernicious as many would represent them. The waters there are fresh, we know by long experience in America, are much less prejudicial to health than the offensive fetid marshes, that are to be found every where else on the salt waters.

The UPPER LOUISIANA we call that part of the continent, which lies to the northward of the mountains above-mentioned, in latitude 35°. This country is in many places hilly and mountainous, for which reason we cannot expect it to be so fertile as the plains below, which will breed and maintain the most people considerably.

One of the most important places in North America, is at the Forks of the MISSISSIPPI, where the OHIO falls into that river; which, like another ocean, is the general receptacle of all the rivers that water the interior parts of that vast continent. Here those large and navigable rivers the OHIO, river of the CHEROKEES, WEBACHE, ILLINOIS, MISSOURI, and MISSISSIPPI, besides many others, which spread over that whole continent, from the APALACHEAN mountains, even to the mountains of NEW MEXICO, upwards of 1000 miles, both north, south, east, and west, all meet together at this spot; and that in the best climate, and one of the most fruitful countries, of any in all that part of the world, in the latitude 37°, the latitude of the capes of Virginia, and of Santa Fe, the capital of New Mexico. By that means there is a convenient navigation to this place from our present settlements to NEW MEXICO, and from all the inland parts of NORTH AMERICA, farther than we are acquainted with: and all the natives of that continent, those old friends of the FRENCH, have by that means a free access to this place; nigh to which the French formed a settlement, to secure their interest on the frontiers of all our southern colonies: in short, this place is the CENTRE OF THAT PRODIGIOUS CONTINENT, and of all the Indian nations on it, and seems to be intended by nature to COMMAND THEM BOTH; for which reason it ought not longer to be neglected by BRITAIN. And if the settlements at this place had been made, as they were proposed, about twenty years ago, they might have prevented or frustrated the late attempts to wrest that

country, and the territories of the OHIO, out of the hands of the ENGLISH; and they may do the same again.

For these reasons, the first settlements we make beyond the mountains we are now possessed of, should be upon the MISSISSIPPI, convenient to the navigation of that river; and in time, those new settlements may come to join to our present plantations; and we may by that means reap the benefit of all those inland parts of NORTH AMERICA, by means of the navigation of the MISSISSIPPI, which will be secured by the port at the FORKS. If that is not done, we cannot see how any of those INLAND PARTS of AMERICA, and the TERRITORIES OF THE OHIO, which were the great objects of the last war, can ever be of any lasting use to Britain, as the inhabitants of all those countries can otherwise have very little correspondence with it.

This famous river, the MISSISSIPPI, is navigable upwards of 2000 miles, to the fall of St. Anthony, in latitude 45°, the only fall we know in it, which is 16 degrees of latitude above it's mouth; and even above that fall, Du Pratz tells us, there is thirty fathom of water in the river, with a proportionable breadth. About 1000 miles from it's mouth, it receives the river OHIO, which is navigable 1000 miles farther, some say 1500, nigh to it's source, not far from LAKE ONTARIO in NEW YORK; in all which space there is but one fall or rapid in the OHIO; and that navigable both up and down, at least in canoes. The other large branches of the OHIO, the river of the CHEROKEES and WEBACHE, afford a like navigation from LAKE ERIE in the north, to the CHEROKEES in the south, and from thence to the bay of MEXICO by the MISSISSIPPI; not to mention the great river MISSOURI, which runs to the north-west parts of NEW MEXICO, much farther than we have any good accounts of that continent.

From hence it evidently appears, that the MISSISSIPPI affords the most extensive navigation of any river we know; so that it may be justly compared to an INLAND SEA, which spreads over nine tenths of all the continent of NORTH AMERICA; all which the FRENCH pretended to lay claim to, for no other reason, but because they were possessed of a pauntry settlement at the mouth of this river.

If those things are considered, the real importance of the navigation of the MISSISSIPPI, and of a port at the mouth of it, will abundantly appear. And this is the only navigation for all the INTERIOR PARTS of NORTH AMERICA, which are as large as a great part of Europe; nor could any of those interior parts of North America be of any service to Britain, with the navigation of the MISSISSIPPI, and the settlements upon it. It is not without reason then, that we say, whoever are possessed of this river, and are masters of a competent maritime power to maintain that navigation, and of the vast tracts of fertile lands upon it, must in time command that continent, and the trade of it, as well as all the natives in it, by the supplies which this navigation will enable them to furnish those people, as well as to awe them upon emergencies.—By those means, if the French, or any other maritime power, had been left in possession of the MISSISSIPPI, while we neglected it, they must have commanded all that continent beyond the APALACHEAN mountains, and had it in their power to have disturbed our settlements much more than they ever did; or were able to do; the very thing the French engaged in the last war to accomplish, and we to prevent.

The MISSISSIPPI, indeed, is rapid for 1200 miles, as far as to the MISSOURI, which makes it difficult to go up the river by water. For that reason, the French have been used to quit the Mississippi at the river St. FRANCIS, from which they have a nigher way to the FORKS of the Mississippi by land. But however difficult it may be to ascend the river, it is, notwithstanding, often done; and it's rapidity facilitates a descent upon it, and a ready conveyance for those gross commodities, which are the chief staple of North America, from the most remote places of the continent: and as for lighter European goods, they are more easily carried by land, as our Indian traders do, over great part of the continent, on their horses, of which this country abounds with great plenty.

The worst part of the navigation, as well as of the country, is reckoned to be, at the mouth of the river; which, however, Du Pratz tells us, is from 17 to 18 feet deep; and will admit of ships of 500 tons, the largest generally used in the plantation trade. And even this navigation might be easily mended, not only by clearing the river of a narrow bar in the passes, which Charlevoix, and others, think might be easily done; but likewise by means of a bay, described by Mr. Cox, from the actual survey of his people, lying to the westward of the fourth pass of the river; which, he says, has from 25 to 26 fathom water in it, close to the shore, and not above a mile from the Mississippi, above all the shoals and difficult passes in it, and where the river has 100 feet of water. By cutting through that ONE MILE then, it would appear, that a PORT might be made there for ships of any burden; the importance of which is evident, from it's commanding all the INLAND PARTS of NORTH AMERICA on one side, and the pass from MEXICO on the other.

Our

Our ancient possessions in North America, between the sea and mountains, appear from many surveys, as well as from all the maps and other accounts we have of them, to be, at a medium, about three degrees of longitude, or 140 miles broad, in a straight line: and they extend from GEORGIA, in latitude 32°, to the BAY OF FUNDY, in latitude 45°, (which is much farther, both north and south, than the lands appear to be of any great value) which makes 13 degrees difference of latitude, or 780 miles: this length, multiplied by the breadth 140, makes 109,200 square miles. This is not above as much land as is contained in Britain and Ireland; which, by Templeman's survey, make 105,634 square miles. Instead of being as large as a great part of Europe, as we are commonly told, all the lands we possess in North America, between the sea and mountains, do not amount to much more than these two islands. This appears farther, from the particular surveys of each of our colonies, as well as from this general estimate of the whole.

Of the extremity of these lands, both north and south, which we possess, are very poor and barren, and produce little or nothing, at least for Britain. It is only in our middle plantations, Virginia, Maryland, and Carolina, chiefly, where the lands produce any staple commodities for this kingdom. In short, it is only the more rich and fertile lands on and about Chesapeake-bay, with the swamps in the Carolinas, &c. like the lands on the Mississippi, that turn to any great account to this nation, in all NORTH AMERICA.

This makes the quantity of lands, that produce any staple commodity for Britain in North America, incredibly small, and vastly less than what is commonly imagined. It is reckoned, that there are more such lands in Virginia, than in all the rest of our colonies; and yet it appeared from the public records, about 26 years ago, that there was not more land patented in that colony, which is the oldest of any in all North America, than is in the county of Yorkshire in England, to wit, 4684 square miles; although the country was then settled to the mountains.

If we examine all our other colonies, there will appear to be as great a scarcity and want of good lands in them, at least to answer the great end of colonies, the making of staple commodities for Britain, and exportation. In a word, our colonies are already settled to the mountains, and have no lands, either to extend their settlements, as they increase and multiply, to keep up their plantations of staple commodities, or to enlarge the British dominions, by the number of foreigners that remove to them, till they pass those mountains and settle on the MISSISSIPPI.

This scarcity of land in our colonies, proceeds from the mountains with which they are surrounded, and by which they are confined to this narrow tract, and a low vale along the sea-side. The breadth of the continent, from the Atlantic ocean to the Mississippi, appears to be above 600 miles (of 60 to a degree) of which there is about 140 at a medium, or 150 at most, that lie between the sea and mountains; and there is such another and rather more fertile tract of level and improveable lands, about the same breadth, between the western parts of those mountains and the Mississippi: so that the mountainous country, which lies between these two, is equal to them both, and makes one half of all the lands between the MISSISSIPPI and ATLANTIC ocean; if we except a small tract of a level champaign country upon the heads of the OHIO, which is possessed by the SIX NATIONS and their dependants. These mountainous and barren deserts, which lie immediately beyond our present settlements, are not only unfit for culture themselves, and so inconvenient to navigation, whether to the ocean or to the Mississippi, that little or no use can be made of them; but they likewise preclude us from any access to those more fertile lands that lie beyond them, which would otherwise have been occupied long ago, but never can be settled, so at least as to turn to any account to BRITAIN, without the navigation of the MISSISSIPPI; WHICH IS, AS IT WERE, THE OCEAN OF ALL THE INLAND PARTS OF NORTH AMERICA, BEYOND THE APALACHEAN MOUNTAINS, WITHOUT WHICH THOSE INLAND PARTS OF THAT CONTINENT CAN NEVER TURN TO ANY ACCOUNT TO THIS NATION.

It is our situation in NORTH AMERICA, that renders all that continent beyond our present settlements, of little or no use to these kingdoms, and makes the possession of the MISSISSIPPI absolutely necessary to reap the benefit of it.

How necessary such settlements on the MISSISSIPPI may be, will farther appear from what we possess on this side of it. The lands in North America are, in the general, very poor and barren; and if any of them are more fertile, the soil is light and shallow, and soon worn out with culture. It is only the virgin fertility of fresh lands, such as those on the MISSISSIPPI, that can render this part of the world permanently advantageous to their mother country. Such lands in our colonies, that have hitherto produced their staple commodities, are now pretty well exhausted and worn out; and when their lands are worn out, neither the value of their commodities, nor the circumstances of the planters,

will admit of manuring them, at least to any great advantage to this nation.

The staple commodities of North America are so gross and bulky, and of so small value, that it generally takes one half of them to pay the freight, and other charges in sending them to England; so that unless our planters have some advantage in making them, such as cheap, rich, and fresh lands, they never can make any; their returns to England are then neglected, and the trade is gained by others who have these advantages, such as those who may be possessed of the Mississippi, or by the Germans, Russians, Turks, &c. who have plenty of lands, and labour cheap: by which means they make more of our staple of North America, TOBACCO, than we do ourselves; while we cannot make their staple of HEMP, FLAX, IRON, POT-ASH, &c. By that means our people are obliged to interfere with their mother-country, for want of the use of those lands, of which there is such plenty in North America, to produce these commodities that are so much wanted from thence.

The consequences of this may be much more prejudicial to this nation, than is commonly apprehended. This trade of North America, whatever may be the income of it, consists in those gross and bulky commodities, that are the chief and principal sources of navigation; which maintain whole countries to make them, whole fleets to transport them, and numbers of people to manufacture them at home; on which account, this trade is more profitable to a nation, than the mines of Mexico and Peru. Though our fishery and sugar trades are of great advantage to us, yet the tobacco trade alone employs more seamen in Britain, than either the fishery or the sugar trade*; and brings in as much money to the nation, as most of the other products of all America at present.

- * There were 4000 seamen employed in the tobacco trade in the year 1733, when that trade was under consideration of the legislature; and we may at least reckon them now 4500.

By the same accounts taken by the custom-house officers, it appeared, that the number of British ships employed in all America, including the fishery, was 1400, with 17,000 seamen; besides between 9 and 10,000 seamen belonging to North America, who are all ready to enter into the service of Britain, on any emergency or encouragement. Of these there were but 4000 seamen employed in the fishery from Britain; and about as many, or 3600, in the sugar trade. In short, the trade of North America is the capital nursery for British seamen, and must be rendered more and more so, as the great staples of hemp, flax, iron, pot-ash, silk, wine, indico, timber, pitch and tar, and every species of naval stores, &c. shall increase.

But those commodities that afford these sources of navigation, however valuable they may prove to the public, and this kingdom in particular, are far from being so to individuals: they are cheap, and of small value, either to make or trade in; and for that reason they are neglected by private people, unless the public takes care to give them all due encouragement, and to set them about those employments; for which purpose nothing can be more absolutely necessary, than the provision of good and proper lands, such as those on the Mississippi; without which, our desirable improvements in this part cannot be expected.

The many advantages of such lands that produce a staple for this nation in North America, are with difficulty duly represented. The whole interest of the nation in those colonies depends upon them, if not the colonies themselves. Such lands alone enable the colonies to take their manufactures and other necessities from Great-Britain, to the mutual advantage of both. How necessary that may be, will appear from the state of those colonies in North America, which do not make one with another, as much as is sufficient to supply them only with the necessary article of cloathing; not to mention the numerous other things they stand in need of, and take from their mother-country; and how they are enabled to pay, is some difficulty to reconcile. Our colonies in North America, have found it extremely difficult to make equivalent returns for what they take from us; and they would find it scarce possible to subsist much longer, if at all, in a state of dependance for all their manufactures, and other necessities, unless they are provided with other lands that may enable them to purchase them; and where they will find any such lands, but upon the Mississippi, is more than we can tell.

When their lands are worn out, are poor and barren, or in an improper climate or situation, so that they will produce nothing to send to Britain, such lands can only be converted into corn and pasture grounds; and the people in our colonies are thereby necessarily obliged, for a bare subsistence, to interfere with Britain, not only in manufactures, but the produce of their lands.

By this we may perceive the absurdity of the popular outcry, that we have already LAND ENOUGH, and more than we can make use of in NORTH AMERICA. They who may be of that opinion should shew us, where that land is to be found, and what it will produce, that may turn to any account

to the nation. Those people derive their opinion from what they see in Europe, where the quantity of land that we possess in NORTH AMERICA will, no doubt, maintain a greater number of people than we have there. But they should consider, that those people in Europe are not maintained by the planting of a bare raw commodity, with such immense charges upon it, but by farming, manufactures, trade, and commerce; which they will soon reduce our colonies to, who would confine them to their present settlements, between the sea-coast and the mountains that surround them.—For more matter, see our article MISSISSIPPI, our REMARKS thereon since the DEFINITIVE TREATY OF PEACE, 1763.

LUBECKERS.

As of old time the common councils of the free and imperial city of Lubeck, and several other towns upon the North and East Seas, have been in union with divers towns of the United Provinces, for defence of the liberty of trade, and of the rights belonging thereunto: and as now the States-General of the United Provinces, together with the burgo-masters and common council of Lubeck, have found it convenient, in the present conjuncture, to treat about renewing the aforesaid union and amity, by their respective deputies, who, after several conferences, and reports made, agreed upon the articles following:

I. That this union shall not be offensive, but only for preserving the freedom of commerce, &c. that the respective citizens and subjects of the union may enjoy the same without molestation, and mutually protect each other; so that the manifold difficulties detrimental to their common trade may be removed.

II. The union shall not, however, prejudice the friendship of the emperor, or holy empire, or of France and Great-Britain. And also the town of Lubeck is willing to remain in obedience to the emperor; and none of the leagues, rights, &c. they have together, shall be changed by these presents, but remain in full power, *salvo præfenti fœdere*.

III. Those of the union shall faithfully observe the articles, and confirm them by oath.

IV. The States-General shall manage this union to the best advantage of the common cause; but so as the common council of Lubeck may have a vote in all the deliberations; for which purpose, a person from that town shall always reside at the Hague, or such other place as the states may meet at. And the States-General may depute some person to reside at Lubeck: provided always, that, if any other of the Hanse-Towns enter into the union, it may be determined, whether it may not be fit the said deputy should reside elsewhere.

V. Those of the union shall contribute to the charges to furnish ships, foot and horse, in such manner as shall be necessary.

VI. And if those who interrupt commerce and navigation, on being amicably required to desist, refuse, those of the union shall defend themselves vigorously against them.

VII. And, if war should follow, those of the union shall recall their subjects from the service of the adverse party, on pain of death and confiscation of estates. Nor shall it be allowable to procure or send to the adverse party money, troops, ships, &c. on pain of corporal punishment.

VIII. And if the adverse party should arrest the subjects persons, ships, &c. of those of the union, or surprize them at sea, orders shall be given to make reprisals, and mutually to assist each other on that occasion.

IX. The ships of those of the union may freely enter each other's harbours, to victual or refit, using no violence, and thankfully paying for what they take.

X. The subjects of the union shall, in all their countries, enjoy the privileges of a citizen, and even the right of succession, without distinction of religion, as that is practised in the holy empire, so they submit to the laws of the place.

XI. None of those of the union shall enter into any treaty, without consent of the others, nor do any thing prejudicial to the others, but mutually endeavour to maintain each other in possession of their liberties and privileges.

XII. So that no truce nor peace shall be made with the enemy, but with common and reciprocal deliberation and consent of all the members.

XIII. This league shall remain in force fifty years; which term, with common consent, may be prolonged; but if, during the same, or when expired, any of the union receive damage by reason of it, they shall mutually assist each other against all persons whatsoever.

XIV. If any potentate, country, or city, especially any of the other Hanse-Towns, desire to enter into this union, they shall be received on reasonable conditions. See HANSE-TOWNS.

In witness whereof, two copies of these presents have been made, and confirmed by oath, and sealed with the seals of the States-General, and town of Lubeck, and signed by their respective clerk and syndic, each party retaining one copy. Done in May 1613, and underwritten,

By order of the States-General,

Signed AERSSSEN.

And by order of the honourable the common council of the town of Lubeck,

Signed MARTIN NORDAMUS,

Syndic of the Republic of Lubeck.

Duchy of LUXEMBURG, in the Austrian Netherlands.

This province is bounded on the north by the bishopric of Liege, a small part of Limburg; and the territory of Strablo; on the east by the country of Eyyfel, and the electorate of Treves; on the south by Lorraine, or rather now by French Luxemburg; and on the west it extends to the river Maes.

The climate here is mild and temperate; but the soil is not equally fruitful every where; but it abounds with game, as stags, deers, hares, &c. There are iron mines here, which furnish almost all Germany with that metal.

Chief rivers are the Moselle, Owitz, Sour, and Semoy.

LUXEMBURG is the capital of this province.

ARLON, situate near the spring-head of the river Semoy, was formerly a considerable place, very well peopled; but having suffered very much by the wars, and been dismantled, it is now only a borough.

BASTOGNE, near the forest of Ardenne, is so well peopled, has such a good trade, and is so well built, that the people of the country call it Paris in Ardenne; though it is considerably decayed from what it once was.

VIANDEN has a considerable trade in woollen cloths, with which they furnish the whole province. There are also here a great many tanners. The adjacent hills produce some wine, pretty much like the Moselle wine.

SAINT VIST has a good trade in cattle, and is the staple town of the whole province, it lying in the great road to Liege, Cologne, Treves, and other cities in Germany.

GRAVE-MACHEREN is a small, but a pretty town, the inhabitants of which have a good trade of Moselle wine, which grows plentifully on the neighbouring hills.

LYONNOIS, in France. This government, or province, is bounded on the north by that part of Burgundy called Maconnois; on the east by the Saone and the Rhône, which part it from Bresse and Dauphiné; on the south by Vivarais and Velay; and, on the west, by the mountains of Auvergne.

This province is pretty fruitful in corn, wine, and fruit; it produces particularly excellent chestnuts.

It's chief rivers are the Rhône, Saone, and Loire, besides several others of less note.

The trade carried on in this government is pretty considerable, and consists chiefly in chestnuts, paper, fine toys, guns, muskets, pistols, and all sorts of iron-works.

The capital city is LYONS, on the conflux of the Saone and the Rhône, and one of the finest and most considerable cities in Europe, for it's situation, extent, and riches, it carrying on a most flourishing trade.

The PRACTICAL BUSINESS of the CUSTOM-HOUSE continued.

THE BUSINESS OF THE CUSTOMS, WITH RELATION TO THE
FOLLOWING PARTICULARS, viz.

SOME LAWS CONCERNING LINENS. See article LINENS.

LINENS, chekered, striped, printed, painted, stained, or dyed, imported, after payment of the duties, are to be marked or stamped with a seal or mark, to denote the same. 10 Ann. c. 19. §. 67, and 12 Ann. c. 9. §. 14, 16.

Stamps or seals to be provided by the commissioners of the customs, which they may alter as occasion requires.

Counterfeiting the stamps, felony.

People felling linen knowingly with such counterfeit stamps, their aiders, abettors, and assistants, are to forfeit 100l. and to stand in the pillory for two hours. 10 Ann. c. 19. §. 94. and 12 Ann. c. 9. §. 15.

If designed to be again exported; before shipping, notice must be given to the proper officer appointed by the commissioners of the customs, when and where they are to be packed up, who is to take off the seals, and return an account of the kinds and quantities to the officer appointed to receive the same. 12 Ann. c. 9. §. 17.

LINENS IRISH, imported into this kingdom, may afterwards be exported to the British plantations in America, DUTY FREE. 3 Geo. I. c. 21. §. 2.

In SCOTLAND, exposed to sale, or designed to be exported, not marked with the stamp of a royal burgh, &c. penalty 5s. per piece. 10 Ann. c. 12. §. 3.

Counterfeiting such stamp, penalty 50l. or a year's imprisonment, if the offender prove insolvent. 10 Ann. c. 21. §. 4.

Printed, stained, painted or dyed, &c. in Great-Britain, exported, the DRAWBACK and REGULATIONS of exportation. See the END OF LETTER D.

British and Irish, the bounty and regulations of exportation. See Ditto.

WITH RESPECT TO LOGWOOD.

LOGWOOD, alias blockwood, may be imported by any persons, and freely used in dyeing. 13 & 14 Car. II. c. 11. §. 26. See the latter end of P. containing an abstract of the laws relative to the PLANTATIONS.

MACE.

M.

M A C

MACE. In the description of the nutmeg, we have occasionally mentioned this spice, which is the second coat or covering of the kernel of that fruit. It is a thin and flat membranaceous substance, of an oleaginous nature, and of a yellowish colour. We meet with it in flakes of an inch or more in length, which are divided into a multitude of irregular ramifications; it is of an extremely smooth surface, and of a tolerable close texture, yet friable, and very easily cut to pieces. It is of an extremely fragrant, aromatic, and agreeable smell, and of a pleasant, but acrid and oleaginous taste. It is to be chosen new, not dry, and of a fragrant smell, tough, oleaginous, and of a good yellow. The people who collect the nutmeg fruit, cut it open and throw away the pulpy substance or external coat; they then see the mace covering the nutmeg, wrapping itself every way round it's outer woody shell. The mace is at this time of a red colour; they take it carefully off from the nutmeg, and lay it in the sun for the whole day. In this time, it's colour, from a strong blood-red, becomes dusky; it is after this carried to another place where the sun has less power, and there exposed again to it's rays the few hours they reach thither.

By this means it dries gently, and remains tough, and retains it's fragrant and colour in a great degree; if it were dried more hastily, it would be whitish, brittle, and would lose much of it's smell. After this it is slightly sprinkled over with sea-water, and then put up into bales, in which it is pressed down firm and close, by way of preserving it's fragrance and consistence.

There is great caution to be had to the state in which it is packed up, for, if it be too dry, it will be broke and lose much of it's fragrance; and, on the other hand, if too moist, it will be subject to breed worms and other insects.

Mace abounds with the same sort of oil that is found in the nutmeg; but it is thinner in the mace, and is in a greater quantity. If the oil be separated by distillation, what comes first over of it is thin and limpid like water, and is of the most fragrant smell; what follows this is yellowish and somewhat thicker; and, finally, a third kind comes over if the fire be made more violent, which is reddish; and all three of these are so subtle and volatile, that, if they are not kept in vessels very closely stopped, they will in great part evaporate into the air, all their finer parts flying off. An oil may also be drawn from mace in the same manner as from the nutmeg, by expression; it is afforded in a larger quantity this way than from the nutmeg, and is of a somewhat softer consistence.

Mace is carminative, stomachic, and astringent; it possesses all the virtues of the nutmeg, but has it's astringency in a smaller degree. It affects the head in the same manner as the nutmeg, if taken in a large dose, and people have become delirious for some hours, after an immoderate use of it. The oils of mace and nutmeg, whether prepared by distillation or by expression, are so much of the same nature, that they may be indiscriminately used for one another on all occasions. They give ease in cholics, and often in nephritic cases, taken internally from one drop to five or six of the distilled oil, or an equal quantity of the expressed; and, externally, they are of use to rub paralytic limbs; they also assist digestion, and will often stop vomitings and hiccoughs, only by being rubbed on the regions of the stomach. The nurses have a custom of applying oil of mace by expression to children's navels to ease their gripes, and that often with success; and we are assured by authors of credit, that, rubbed on the temples, it promotes sleep. The oils by distillation are very properly added to the stronger cathartics in form of pills, and prove excellent correctives.

MACE DONIA; it's boundaries are Servia and Bulgaria on the north, Bulgaria and the Archipelago on the east, Levadia on the south, and Albania on the west. It is rich in divers mines of gold, abounds with corn, pasture, cattle, venison, and in some parts it produces wine and oil. Here are many rivers and mountains, but none very remarkable, except mount Athos.

The Turks divide it into three parts, viz. **JAMBOLI**, which extends, from the gulph of Salonichi on the south, to the

borders of Romania on the north-east and north, having Macedonia Proper on the west, and the Archipelago on the east.

MACE DONIA PROPER, has Jamboli on the east, Comenolitari on the south, Albania on the west, and Bulgaria on the north.

COMENOLITARI, is the most western and southern part of Macedonia.

SOLONICHI, or **SALONICA**, the metropolis of all Macedonia, and the seat of a Turkish præfect, stands at the bottom of a gulph, to which it gives it's name. It is 150 miles distant from Sofia in Bulgaria towards the south, 260 from Constantinople to the west, 160 from the isthmus of Corinth to the north-west, and 140 from the nearest coast of the Adriatic Sea to the east. In the neighbourhood of it, towards the west, runs the river-Vardar, which abounds with fish, and the banks of which are adorned with beautiful trees.

MACHINE, in general, signifies any thing that serves to augment, or to regulate moving powers: or it may be defined any body destined to produce motion, so as to save either time or force.

Machines are divided into simple and compound.

Simple machines, are those otherwise called mechanical powers. See **MECHANICAL POWERS**.

The simple machines are the balance, lever, pulley, wheel, wedge, and screw; the compound are constituted of several simple ones combined together. The latter are innumerable, as well in their form as their application.

REMARKS.

The lower branches of manufacture, wherein the price is paid chiefly to labour, contribute most to the increase of labouring hands. The price of art rises above mere labour, in proportion as genius is a scarcer commodity than strength. Commercial states regard an increase of riches as synonymous to an increase of power, though it be only a mark or sign of it, and that not infallible. The following instance may serve to set the worth of ingenuity above bodily strength in a full light, as well as to shew their different effects on numbers and real power.

In Russia, they had no other way of making planks, 'till near the end of the last century, but by hewing or chipping away a whole tree to the necessary thickness; notwithstanding which, they could afford to sell them cheaper than their neighbours. Two Russians might, possibly, with hard labour, finish a plank in a day in this inartificial way, in the same time, two common sawyers could, with ease, cut out 20 good planks.—Without troubling ourselves with the loss of timber, if both are sold at a neighbouring port for the same money, it is plain the Russian must work for $\frac{2}{5}$ part of the sawyer's wages: if a sawyer in Sweden can get ten pence a day, the Russian must be paid with one halfpenny. It is said their renowned Czar, when in London, gave a hundred guineas for the picture of a favourite lady, finished probably in the space of a day. This sum is more than one of his subjects would earn, in the above-mentioned way of hewing planks, by the labour of sixty-nine years and fifteen days, or as much as fifty thousand four hundred of them would gain in one day. Should the returns of two nations be equal, whilst one traded in paintings alone, and the other in planks, hewed in this method, it is evident there must be fifty thousand four hundred subjects in the latter, for every single one in the former.

An increase of wealth may attend a decrease of numbers and real strength, for which reason the balance of money is less to be regarded. The exports of our nation may, at present, exceed a million in the lower branches of bays, serges, druggets, and flannels, and this may employ a million of hands. In a course of years we will suppose this trade to be changed for that of wrought works, tapestry, painting, and statuary, in which our exports might amount to two millions; for which a thousand hands, full employed, would be more than sufficient.

Here we see it possible that our wealth may be annually increased a million, whilst our real strength is decreased in the proportion

proportion of a thousand to one. There is nothing incompatible in the arts of ingenuity and those of labour, and all the plainer trades may be retained, notwithstanding the higher arts are introduced, in which case we should be both a richer and greater people.

The above instances may bear a farther application; the carpenter, by the contrivance of the long saw, performs as much in a day, as twenty Russians with the axe; but, beyond this, there are in Sweden a kind of mills turned by water, and so contrived, as to take in large trees on the upper side the stream, and deliver them out on the lower, sawed into planks, in a few minutes. One of these mills will, at least, make 500 planks, whilst the poor Russian could hew out a single one, when the way of hewing was practised; so that it performs the business of 1000 Russians, or 50 common sawyers, in a day, with the attendance of a single person.

If these two nations yearly brought to market an equal quantity of planks at the same price, they who used the method most artificial, would be least numerous; but, as there would be a greater plenty of money in proportion to inhabitants here, they would to appearance be richer, in the same proportion as they were fewer. Apparent plenty of money is a strong attractive. The conveniences of life are generally plentiful, where money appears so. Perhaps the smaller nation may make up its numbers equal to the other, by these temptations to invite strangers. Ingenuity in one instance is never single, the same genius will strike out new trades, which invents compendious methods of performing the old ones, and new employments call for new hands.

The more ingenious nation will likewise stand the best chance to gain the whole market; for, besides that machines generally do the work truer and better than the hand, the labour saved by them is so very great, that, if the materials are equally plentiful, they who use the machine must undersell the others in a vast disproportion. For, as in this instance, both are supposed to work only to live, provisions can be in no part of the world dearer than another, in the proportion of 500 to 1. A larger quantity, wrought in a more compendious manner, may call for as many hands, as a less quantity in a way more laborious. All these considerations tend to make up their numbers, which will be richer, more improved, and more ingenious, either to defend or acquire; for ingenuity is generally an overmatch for strength.

On the other hand it may be argued, that here, as in the mechanics, what we gain in expedition we lose in strength: it can never be that the foreign market, by the use of the machine, or all the consequences of ingenuity, can be so much increased as the home one is lessened, or in the proportion of 500 to 1. Numbers of men are real power: an equal number of labourers are generally stronger than the same number of mechanics. A good writer of the present age explodes the use of machines, even of water-mills for grinding corn, *L'Esp. des Loix*, vol. ii. p. 116, 117. The best constituted states have restrained them by laws; by what appears from authors, the Romans used chiefly hand-mills, and, if we may judge from the silence of Aristotle, Pliny, and Seneca, machines were very few and simple, either amongst the Greeks or Romans. These arguments a little vindicate the absurd policy of the old duke of Muscovy, who, when a person offered him a project for towing up a barge with eighteen hands, which then employed an hundred and ten, ordered him immediately into banishment.

In such a variety of reasons, it is not easy to determine, to what degree the use of machines in general should be admitted. States without commerce regard chiefly the increase of numbers and their home markets; and commercial states are too apt to consider wealth alone, and foreign markets. Without prejudice to either, machines or engines may be allowed in the following cases.

1. When they do such business as cannot be performed by hand at all. Of this kind are pumps, fire-engines, water-engines, looms, wine and oil-presses, hand-mills for grain, and perhaps horse-mills.

2. Where the commodities wrought by them are such as would not be used at all, except they were done by the machine, either being not cheap enough or not good enough for consumption, when prepared by hand. Under this head are the mills for making paper, those for forging, drawing, slitting, iron, copper, fulling of cloth and leather, and making gunpowder.

A people without commerce may safely refuse to admit stocking-looms, sawing-mills, throwing-engines, weaving or spinning-engines, mills for striking files, cutting watch-wheels, making nails, and all the variety of inventions produced by a rivalry amongst nations contending for commerce; and private men for orders.

Commercial states must have their eyes on their neighbours, and, if they design to engross foreign markets, must provide for the cheapness of labour at home; goods must be made cheap to render them of general use abroad and at home. Engines for shortening business ought to be rejected, or not admitted in commercial states; when the commodity is not at all sold abroad, when it affects not the price of labour,

when the machines would lessen our home markets, more than increase our foreign ones. See the article *LABOUR*.

MADDER, is one of the long and small roots, distinguishable from all the others by its remarkable red colour and firm texture. It is brought to us in pieces of four, five, or more inches in length, but seldom in the thickest part exceeding the bigness of a goose quill. Its surface is wrinkled, with a number of furrows running principally in a longitudinal direction; it is light, though of a firm texture, and, for a root of that small size, not easily cut. Its colour is a strong but somewhat dusky red, both on the outside and within, but somewhat brightest where fresh cut. It has very little smell, but it is of a very remarkable taste, and distinguishes plainly in it a mixture of sweet and bitter, and a very manifest astringency with this.

Madder is to be chosen in long and thick roots found throughout, hard to be broken in any part, and, when cut, of a good colour. It is not subject to adulterations, so that, if it be found and well dried, it is always good, unless it have been kept too long, and this is easily discovered by its wanting taste. Madder is cultivated in vast quantities in several parts of Holland; the Dutch supply all Europe with it, and make a vast advantage of the trade in it; it is very wonderful, that no other nation has attempted the cultivating it; there is no doubt but it would succeed very well in France, Germany, or with us, and much ground might be employed this way, to ten times the advantage that it is at present. What the Dutch send over for medicinal use is in the root, which is only dried and sent over without any preparation; the greatest quantity, however, is used by the dyers: this they usually send in coarse powder, ground in mills; they make two kinds of this ground madder, the one is the whole root ground, just as taken out of the earth and dried; the other is cleaned from the cortical part, which is of a duskier colour than the rest, and then ground to powder. This is distinguished from the other, by its being of a paler and more agreeable colour.

The plant which produces the rubia root is of the number of the tetandria monogynia of Linnæus, and one of the herbæ stellatæ of Mr. Ray. It grows to two feet high; its stalks are square and rough; its leaves are oblong and narrow, and stand four at a joint in manner of a star. Its flowers grow in clusters at the upper part of the stalks, and are very small, and of a pale yellowish-green colour; these are followed by a fruit consisting of two seeds. It has been described by all the botanical writers under the name of rubia sativa, and rubia tinctorum.

The root is an attenuant, and has the credit of being a vulnerary of the first rank. It is at present given with success in chronic cases, where there are obstructions of the viscera. It promotes the menes and urine, and is good in jaundices, dropries, and obstructions of the spleen. Its dose is from five grains to fifteen, but it is seldom given singly. It frequently makes an ingredient in infusions and decoctions, among other medicines of the same intention, and it gives these an elegant colour.

It is also used in great quantities by the dyers, for red and other colours.

MALT, is barley prepared, to fit it for making a potable liquor called beer or ale.

OBSERVATIONS on the manner of MALTING.

This subject is of large extent, and, if duly prosecuted, might tend to the enrichment of the present arts, or the discovery of new ones. For, on regulating the growth, and curing of vegetable productions, depends the perfection of corn, wines, malt, bread, sugar, tobacco, spice, drugs, simples, dyeing stuffs, and the like. And new discoveries, either in vegetation, or curation of vegetables, might easily introduce new trades; as has been the case in sugar, tobacco, wines, spirits, &c.

By experiments in vegetation, we here propose to shew the methods of regulating or conducting this natural power for the service of arts, by directing it to answer particular ends. Thus, by stopping short towards the beginning of vegetation in barley, we procure malt; and, by permitting the grapes to hang till they grow not only ripe, but almost dry, upon the vine, we procure rich sweet wines. And thus we may stop vegetation at any period, or continue it longer than ordinary, according as the occasions of different arts require. By experiments in curation of vegetables, we have shewn the methods of collecting, preparing, and securing vegetable commodities, so as that they may long remain sound, perfect, and fit for service. And thus our present design will consist of two parts: the one relating to the ways of growing vegetables, according to the uses for which they are intended; and the other to the gathering and preserving them, so as to have them constantly ready at hand, when they come to be required in use.

The first experiment, therefore, is calculated to shew the method of stopping the natural process of vegetation in the seed, so as to prepare grain, pulse, nuts, malt, and roots, for the making of beer, vinegar, and spirits. The second

is designed to shew the method of curing both fermented and unfermented vegetable juices, so as to make them keep sound and good for several years. The third experiment tends to shew the method of curing vegetable juices by decoction, or inspissation, for the service of brewing and distilling.

A parcel of garden-beans being plucked up, after they had been suffered to lie in the ground about six weeks in the winter season, each bean was found beginning to split, or separate, into it's two lobes; whilst the radicle was shot out some inches downwards, and had begun to take root in the ground; the plume also, which becomes the stalk of the bean, being risen to the height of two inches. In this state a few, being dried over a clear fire, were found turned to a kind of bean-malt, that tasted sweetish, but mealy betwixt the teeth, and dissolved freely in warm water, so as to afford a wort fit for fermenting, with yeast, into a kind of beer or ale.

This experiment instructs us in the ordinary process of malting, which, in the case of barley, is conformable hereto; and, in the case of malting Indian corn, is the process itself.

In making malt from barley, the usual method is to steep the grain in a sufficient quantity of water for two or three days, till it swells, becomes plump, somewhat tender, and tinges the water of a bright brown, or reddish colour. Then, this water being drained away, the barley is removed from the steeping-cistern to the floor, where it is thrown into what they call the wet couch; that is, an even heap, rising to the height of about two feet. In this wet couch the capital part of the operation is performed; for here the barley spontaneously heats and begins to grow, exactly in the same manner as in our present example of beans; shooting out first the radicle, and, if suffered to continue, then the plume, spike, or blade. But the process is to be stopped short at the eruption of the radicle, otherwise the malt would be spoiled. The way of stopping it, is to spread this wet couch thin over a large floor, and keep it turning once in four or five hours, for the space of two days, laying it somewhat thicker each time. After this, the malt is again thrown in a large heap, and there suffered to grow sensibly hot to the hand, as it usually will in twenty or thirty hours time; then, being spread abroad again and cooled, it is thrown upon the kiln, to be dried crisp without scorching.

This is the general process of malting, wherein almost every malster has his secret, or particular way of working. But, to render the operation perfect, the following cautions must be observed: (1.) That the barley be newly thrashed, or at least newly winnowed. (2.) That it be not mixed, or made up of different sorts. (3.) That it be not over-steeped in the cistern, or so long as to make it soft. (4.) That it be well drained. (5.) That it be carefully looked after in the wet couch, so as to stop the first tendency of the blade to shooting. (6.) Another caution is, to turn the wet couch inside outmost, if the barley comes, that it shoots more in the middle than on the sides. (7.) To keep it duly turning after it is out of the wet couch. (8.) To give it the proper heating in the dry heap. (9.) To dry and crisp it thoroughly upon the kiln, but without a fierce fire, so as to be several days in drying a kiln of pale malt. And, if these directions be carefully observed, the malt will always be good. The method of malting Indian corn, or Virginia wheat, is much less laborious. For, if this corn be buried two or three inches deep in the earth, and covered with the loose mould, dug up to make room for it, in ten or twelve days time the corn will sprout, and appear like a green field; at which time being taken up, and washed or fanned from it's dirt, it is immediately committed to the kiln, and by this means it becomes good malt, exactly as beans so treated would do.

It is observable of this corn, that both it's root and blade must shoot to a considerable length, before it will make malt. And, perhaps, this is the case, in all large-bodied grain and roots.

REMARKS.

It might be of service to transfer this easy experiment to the making of malt for barley, rice, and the other small grains and seeds; but the attempt may be attended with difficulties, because, in the making of malt, the barley must only be suffered to grow in it's root, and not in the blade; whence it would be difficult, at first, to hit the exact time for taking it out of the ground. And, again, as the grain is so small, it might prove troublesome to separate it from the earth or mould. However, the thing may deserve to be tried.

It is a consideration of a higher nature to determine the physical effect procured by malting, and whether the end may not be obtained by cheaper and less laborious means. The physical difference betwixt malted and unmalted corn appears to be the production, or extrication of a sweet saccharine substance in the malt, which is wanting under that form in the corn. And it is this sweet substance alone, which we require in malt for the making of beer, ale, vinegar, and inflammable spirits. But even unmalted corn, duly treated, may be made to afford beer, ale, vinegar, and spirits: this, therefore, may intimate to us a way of making such liquors, without the formal extrication of any remarkably sweet sac-

VOL. II.

charine substance. And, according to some trials, unmalted corn affords half the quantity of inflammable spirit by fermentation and distillation, as the same corn would do when malted. And, suppose that unmalted corn were to be made into a kind of dough or paste, fermented with yeast, as is usual for bread, and then baked, would not this be a cheap substitute for malting? They are said to brew after this manner in some countries. At least it deserves to be tried, how much beer, ale, vinegar, and spirit, might be procured this way, compared with that other of malting.

On the other hand, if only a sweet saccharine substance be required in malt, are there not cheaper and easier ways of procuring it than by malting? Do not many trees afford such a saccharine juice, by tapping in the spring, without prejudicing the trees? Is not young green corn itself remarkably sweet; and does not this sweet juice enter the composition of the ear, and there remain fixed, or almost lost in a saccharine form, 'till recovered by malting? Here is a door opened for explaining the nature of sweetness, and deducing the particular history of sugar; which is a work, that, for it's usefulness in trades and ordinary life, deserves to be considered. And, 'till some considerable progress is made in a work of this kind, the art of malting, and all those that depend upon it, will not arrive at perfection. See the article SUGAR.

Those who are disposed to go upon the enquiry, may please to compare the art of starch-making with that of malting; and particularly try, whether some considerable uses might not be made of the refuse-liquors produced in both arts. The high-coloured liquor drained away in the steeping-cistern is a vegetable tincture, that might, if not by itself, yet by being used instead of water to ground malt, be worth fermenting and distilling for spirit: and the starch-makers refuse liquors have been observed to contain a quantity of inflammable spirit.

Our present experiment may in this respect be made general, that it shews us there are different times of stopping, or preventing, the farther growth of vegetables, for the service of arts. And this doctrine may be extended to the forming a set of general rules, for gathering the different parts of plants, at different seasons of the year, for different uses.

Thus roots, for instance, to be had perfect, should be gathered and dried in the spring, before the leaves are formed; leaves should be gathered, when they are fully opened, but before the flowers appear; flowers when they are not fully opened, and some, as red roses, in the bud. Seeds are to be gathered when full ripe, and beginning to dry, before they fall spontaneously; and trees are generally best felled and flaved for their bark in the beginning of the spring. But all this is to be understood of the common uses of the subjects; for there are many particular occasions, which require them immature. Thus buckthorn-berries should be ripe gathered, for making the syrup; but unripe, for making the painter's colour called sap-green.

AN ABSTRACT of the acts of parliament which have been made in relation to MALT.

I. Malt imported from beyond the seas before the 24th of June yearly, forfeited, or the value. See the acts of 13 and 14 of Will. III. cap. 5. §. 27. and 12 Ann. sess. 1. cap. 2. §. 25, 28.—12 Ann. sess. 2. cap. 3.—And the malt act yearly.

II. — Made in Scotland, and brought into England, Wales, or Berwick upon Tweed,

By sea, { Must be entered with the proper officer of the port, and the 6d. per bushel paid before landing, unless certificates be produced that the 3d. per bushel has been paid in Scotland; in which case only 3d. must be paid, on forfeiture, or the value.

By land, { Must pass through Berwick or Carlisle, and be there entered, and the like duty of 6d. or 3d. per bushel paid in ready money, on forfeiture, or the value.

III. — Brought by land beyond the said towns, without entry, or payment of duty, forfeited, or the value. 11 Geo. I. cap. 8. §. 6. 12 Geo. I. cap. 4. §. 10. And see the malt-act yearly.

IV. — Exported, not to draw back the excise.—9 Geo. I. cap. 3. 11 Geo. I. cap. 8. §. 7. 12 Geo. I. cap. 4. §. 48. For the bounty and regulations of exportation, see the article CORN.

V. — Barley, oats, or other grain unmalted, mixt therewith for exportation, the forfeiture is 5s. per bushel.—1 Geo. I. cap. 2. §. 13. 6 Geo. I. cap. 21. §. 4.

VI. — Entered and made for exportation only, not to be charged with excise. 13 and 14 Will. III. cap. 5. §. 22, 23, 24, 32. 12 Geo. I. cap. 4. §. 48.

VII. — Designed to be made for exportation, previous notice must be given to the malt officer, of the quantity of corn intended to be continued in each steeping, and of the hour when it is designed to be taken off the kiln. 12 Geo. I. cap. 4. §. 49. 3 Geo. II. cap. 7. §. 16, 17.

M m

VII.

VIII. —Such corn to be kept separate, upon forfeiture of 5s. per bushel; and each steeping to be kept separate 'till measured, upon forfeiture of 50l.—And see the malt-act yearly.

IX. —When fit for exportation, must be measured, in the presence of an officer, and carried directly on ship-board, or else locked up separately, under the joint locks of the proprietor and officer, 'till delivered out for exportation, upon forfeiture of 50l. 12 Geo. I. cap. 4. §. 51. 3 Geo. II. cap. 7. §. 17.—And see the malt-act yearly.

X. —Locks or doors opened, or entrance made into the storehouse where secured, or any quantity of the malt conveyed away without the knowledge or consent of the officer, the penalty is 100l. 3 Geo. II. cap. 7. §. 18.—And see the malt-act yearly.

XI. —Storehouses to be cleared, and all the malt therein exported within every nine months after the beginning to make use of them, upon penalty of 50l. 12 Geo. I. cap. 4. §. 57. 3 Geo. II. cap. 7. §. 19, 20.—And see the malt-act yearly.

XII. —When designed to be removed for exportation, 40 hours previous notice must be given to the officer, that he may see the same measured and delivered out, and remain on board the vessel 'till it is cleared out. 6 Geo. I. cap. 21. §. 5, 53, 55. 12 Geo. I. cap. 4.

XIII. —The officer to give a certificate, directed to the officer at the place of exportation, expressing the quantity, maker's name and place. 12 Geo. I. cap. 4. §. 54.

XIV. —Such certificate not delivered, forfeiture 50l.

XV. —When designed to be shipped, at least 48 hours previous notice must be given to the officers, on forfeiture of 5s. per bushel. 6 Geo. I. cap. 21. §. 6. 12 Geo. I. cap. 4. §. 57.

XVI. —During the time of shipping, when goods are not actually putting on board, the hatches must be locked down, with two locks to each hatch, one to be provided at the charge of, and to be kept by the proprietor, and the other by the officer: the hatches to be kept so locked down from the time of being fully loaded, 'till the time of sailing out of port. 12 Geo. I. cap. 4. §. 56.

XVII. —Makers, neglecting or refusing to perform the requisites of this act, forfeit 50l.

XVIII. —Opposing officers, or breaking the hatches locked down, penalty 50l. 12 Geo. I. cap. 4. §. 58.

XIX. —Makers to be allowed 3d. per quarter, in consideration of the charges of storehouses, measuring, &c. 12 Geo. I. cap. 4. §. 59.

An excise certificate for malt made for exportation.

No. 9.—Hants collection.—Southampton division.—January 2, 1730.

These are to certify whom it may concern, that Mr. A. B. of C. maltster, did, between the 29th day of November and the 14th day of December 1730, enter one hundred and five quarters and one bushel of barley [or other grain] and made the same into one hundred and seventeen quarters and two bushels of malt, for exportation; and that, on exportation thereof, the said A. B. is, by virtue of an act of the 3d of George II. intitled to the bounty, or premium, of 2s. 6d. per quarter, upon one hundred fifty-seven quarters and four bushels of malt, being according to the allowance of thirty quarters of malt for every twenty quarters of barley, or other grain, so malted for exportation: which said allowance amounts to the sum of 19l. 13s. 9d.

D. E. Officer.

One of which certificates must be produced for every separate parcel of malt shipped on each vessel, and must be carefully examined by the collector and comptroller, and, if found to be interlined, obliterated, or erased, must not be accepted; but, if regularly made out, must be preserved, in order to be annexed to the debenture, as a voucher for the computation of the bounty.

A debenture for malt.

As to the form of a debenture for malt exported, it will appear, by the following example*, that it is not much different from those before prescribed under the article CORN; but that which is to be particularly noted is, that the bounty for malt is not to be computed on the real quantity shipped off, as for all other corn, but † after the rate of thirty quarters, and no more, for every twenty quarters of barley, or other corn or grain entered and made into malt, as shall appear by a certificate from the officers with whom the corn or grain intended to be made into malt for exportation was entered; although, in the making of such malt, the barley, or other grain, should either be actually run out to a greater, or should

not be run out to so great a quantity, as is in proportion to thirty quarters of malt, for every twenty quarters of corn from which it was made.

* 12 and 13 Will. III. cap. 10. §. 91, &c.

† 3 Geo. II. cap. 7. §. 14, 15.

The form of the debenture.

Port of Southampton.

Jurat A. B. That the maltherein mentioned is not relanded, or intended to be relanded in Great-Britain, or the islands of Guernsey or Jersey.

14^{to} die Januarii 1730, coram nobis,

B. C. Collector.
D. E. Comptroller.

These are to certify, That I A. B. of Southampton, did, on the 10th day of January, 1730, enter for Rotterdam, on the ship Goodfellow of Hull, a British ship, whereof William Miller the master, and two-thirds of the mariners, are his majesty's subjects, one hundred and seventeen quarters and two bushels of malt, Winchester measure, and that the price of malt, Winchester measure, in the port of Southampton, the last market-day, did not exceed twenty-four shillings per quarter. Witness my hand, the 10th day of January, 1730.

A. B. ———

Juravit A. B. That the contents of the abovementioned certificate are true, coram nobis,

B. C. Collector.
D. E. Comptroller.

By a certificate produced to us from the proper officers of excise (which is hereunto annexed) it appears, that the aforesaid one hundred and seventeen quarters and two bushels of malt were made from one hundred and five quarters and one bushel of barley, or other grain.

Bond is taken in the penalty of 50l. that the malt abovementioned (the danger of the seas excepted) shall be exported into parts beyond the seas, and not be again landed in the kingdom of Great-Britain, or the islands of Guernsey or Jersey.

And, by an act of the 3d of Geo. II. the said A. B. is intitled to a bounty, or premium, of two shillings and sixpence per quarter, upon one hundred fifty-seven quarters four bushels of malt, being according to the rate of thirty quarters of malt for every twenty quarters of barley, or other grain, malted for exportation.

B. C. Collector,
C. D. Customer,
D. E. Comptroller.

B. C. Collector,
D. E. Comptroller.

The one hundred and seventeen quarters and two bushels of malt abovementioned were shipped in the said ship, the 12th day of January, 1730.
Certified the 14th of January, 1730.

E. F. Searcher,
F. G. Surveyor,
G. H. Land-Waiter.

The vessel abovementioned is British-built, the master and two-thirds of the mariners his majesty's subjects.

H. J. Surveyor of the act of navigation.

On the back of the foregoing malt debenture.

The bounty-money to be paid for the malt within }
mentioned, amounts to nineteen pounds, thir- } l. s. d.
teen shillings, and nine-pence } 19 13 9
B. C. Collector, C. D. Customer, D. E. Comptroller.

And, if the collector has not money in his hands sufficient to pay the bounty, it must be certified to the commissioners, in like manner as for other corn.

And to these debentures must be annexed the excise certificate or certificates, from which the bodies of the debentures were filled up, as a voucher for the computation of the bounty.

And when, for want of money, any corn-debentures are not paid at the port, but certified to the commissioners of the customs, before they are delivered to the exporters, they must be entered in a particular book, to be kept for that purpose, after the following form: and from thence must be transcribed a duplicate, in the same form, which must be signed by the collector and comptroller, and transmitted to the commissioners as often as any debentures are made out and certified, in order to be compared with the debentures when produced for payment.

Port of Southampton.

Corn-debentures certified to the honourable the commissioners of his majesty's customs.

When certi- fied.	Date of deben- tures.	Exporter's name.	Ship's name. and place.	Master's name.	Whither bound.	Species of corn.				Bounty, or fums certified.	When duplicates sent to the com- missioners.

A. B. Collector.
B. C. Comptroller.

A bond for the exportation of malt.

Noverint universi, &c.

Whereas, in pursuance of an act of parliament passed in the 3d year of his majesty's reign, intituled, 'An act for continuing the duties upon malt, mum, cyder, and perry, in that part of Great-Britain called England, and for granting to his majesty certain duties upon malt, mum, cyder, and perry, in that part of Great-Britain called Scotland, for the service of the year 1730; for exempting from the said duties cyder and perry used for distilling; for ascertaining the bounty for malt exported; for the better preventing fraud in the malting corn for exportation; for making good the deficiency of a late malt-act; and for giving further time to clerks and apprentices to pay duties omitted to be paid for their indentures and contracts:' the above-bounded Caleb White hath produced, unto the collector of his majesty's customs in the port of Southampton, a certificate from the office of Excise, certifying that the said Caleb White did, between the 29th day of November and the 14th day of December, 1730, enter one hundred and five quarters and one bushel of barley [or other grain] and made the same into one hundred and seventeen quarters and two bushels of malt, for exportation; and that, on exportation, the said Caleb White is, by virtue of the aforesaid act, intitled to the bounty, or premium, of two shillings and six-pence per quarter, upon one hundred fifty-seven quarters and four bushels of malt, being according to the allowance of thirty quarters of malt for every twenty quarters of barley, or other grain, so malted for exportation: which said allowance amounts to the sum of nineteen pounds, thirteen shillings, and nine-pence. And whereas the said Caleb White hath entered for exportation the said one hundred and seventeen quarters and two bushels of malt, on board the Goodfellow of Hull, British-built, whereof William Miller, the master, and two-thirds of the mariners, are British, bound for Rotterdam. Now the condition of this obligation is such, That, if the said one hundred and seventeen quarters and two bushels of malt, and every part thereof, shall be exported into parts beyond the seas (the dangers of the seas excepted) and that the said malt, or any part thereof, shall not be again landed in Great-Britain, or the islands of Guernsey or Jersey; then this present obligation to be void, and of none effect, or else to remain in full force and virtue. But, for the greater ease of the exporters, by preventing any difficulties that they may lie under, by being obliged to give bond at the time of entry; it is thought that the intention of the law will be fully answered, though such bond be not taken till after the malt is shipped; and then the bond may be taken in the following form:

A bond for the exportation of malt, to be taken after the shipping.

Noverint universi, &c.

Whereas the above-bounded Caleb White hath this day entered for exportation, with the collector of his majesty's customs in the port of Southampton, to be shipped on board the Goodfellow of Hull, whereof William Miller is master, now riding at an anchor in ———, and bound for Rotterdam, one hundred and seventeen quarters and two bushels of malt. Now the condition of this obligation is such, That, if the said one hundred and seventeen quarters and two bushels of malt, and every part thereof (except so much thereof as shall be endorsed on the back of this bond, by the above-bounded Caleb White, and certified by the searcher not to have been shipped) shall be exported into parts beyond the seas (the danger of the seas excepted) and that the said malt, or any part thereof, shall not be landed again in Great-Britain, or in the islands of Guernsey or Jersey: that then this obligation shall be void and of none effect, or else remain in full force and virtue.

Sealed and delivered in the presence of

A. B. Collector,
B. C. Comptroller.

The form of the certificate to be produced, in order to discharge the aforementioned, and all other bonds, and the confirmation of the truth thereof, may be as follows:

We the under-written British merchants, residing at Rotterdam, do certify that there were landed, out of the Goodfellow of Hull, William Miller master, ninety-one quarters of wheat, forty-nine quarters of rye, thirty-eight quarters five bushels of barley, for the account of Caleb White, merchant in Southampton. In witness whereof, we have hereunto set our hands and seals. Dated in Rotterdam, the 17th of March, 1730, N. S.

Charles Wells*,
Joseph Farrel*.

I know the above signing to be the hand-writing of Mr. Charles Wells of Rotterdam.

George Jones.

I know the above signing to be the hand-writing of Mr. Joseph Farrel of Rotterdam.

Samuel Palmer.

And if, upon a careful and diligent examination, the collector is satisfied of the truth and reality of such certificates, and of the credit of the persons certifying, he may cancel the bonds taken at expiration, and forthwith deliver them up, noting the same on the certificate, as follows:

5th of April, 1731.

Cancelled the bond, by virtue of the above certificate.

A. B. Collector,
B. C. Comptroller.

In the 26th year of the reign of his late majesty Geo. II. an act was made for allowing interest upon certain debentures for the bounty granted on the exportation of corn, the substance of which is as follows, viz.

That whereas, by an act in the 1st year of Will. and Mar. for encouraging the exportation of corn, &c. [see the article CORN] every one who shall put on ship-board, in such manner as by the said act directed, any sort of corn therein mentioned, with intent to export the same to parts beyond the sea, and shall duly perform every requisite therein required, as before shewn, shall have and receive of the commissioners, collectors, or other persons appointed to collect the duties of customs, in any port where the same corn shall be so shipped, for every quarter of barley or malt, 2 s. 6 d. for every quarter of rye, 3 s. 6 d. for every quarter of wheat, 5 s. which sums the said commissioners or collectors are authorized and required to pay to such exporter, on demand: and whereas, by a clause in an act made in the 12th and 13th years of the reign of king William III. for granting an aid to his majesty for defraying the expence of his navy, &c. it is enacted, That, if the collector of the customs of any port wherein corn shall be exported, shall not have sufficient in his hands to pay such sums of money which shall be due to any exporter, by virtue of the said act of Will. and Mar. arising out of the duties out of which it ought to be paid, upon demand, that then such collector shall give the exporter, without fee or reward, a certificate under his hand of what is due to such person for the corn, &c. exported; certifying to the commissioners of the customs at London that he hath not monies in his hands to pay the same; which certificate being annexed to the debenture, and produced at London as aforesaid, the said commissioners of the customs there are authorized and required, on demand by the person that shall bring the same, to cause the monies thereby due to be paid in three months, by the general receiver or cashier of the customs, &c. And Whereas, by reason of the great quantity of corn which of late hath been exported, the revenue applicable to the payment of such bounties, &c. hath not been sufficient to pay all such monies, and divers debentures for such monies remain unpaid: now, for making a reasonable compensation for such delay of payment, and to the end that the nation may continue to enjoy the benefits designed by the said bounties, be it enacted, &c.

That if, after the 25th day of March, 1753, any debenture for the bounty on corn exported, payable as aforesaid, shall remain unsatisfied more than six months next following the day when the same shall have been produced to the commissioners of the customs at London, then, and in such case, for the forbearance of such money as, after the expiration of the said

aid six months, shall be due on such debenture, interest, after the rate of three pounds per cent. per annum, shall be allowed to the proprietors thereof, his, her, or their executors, administrators, or assigns, such interest money to be computed from the end of the said six months, until the money due on such debenture, together with such interest, shall be paid; or until money sufficient shall be received in the hands of the said general receiver of the customs for that purpose, and proper notice shall be given thereof.

That such to whom such monies may be due, may not avail themselves of their neglect to demand the same, it is further enacted, That, when money sufficient shall be reserved as aforesaid, for payment of the principal and interest due on such debentures, the said general receiver shall give notice in writing, to be fixed on three or more doors of some public place or places in the Custom-House London, and to be advertised in the London Gazette, that, on a certain day, to be limited in the said notice, and on the four days next following such day (so as six days, at the least, intervene between the date of such notice, and the day so limited, and so as Sundays and holidays be not included in the number of such four days) he shall be ready to pay the principal and interest due on such debentures; after the expiration of which five days, if the payment of such principal and interest shall not be demanded pursuant to the said notice, all interest on such debenture shall cease.

Provided always, that the principal monies due thereon, with such interest as shall be likewise due thereupon, before the expiration of the time limited in the said notice, shall be paid on demand, at any time afterwards.

And if there shall be, at any time thereafter, money in hand sufficient to discharge the debentures, and notice be given thereof, the interest thereon shall cease, &c.

Provided nevertheless, that the principal and interest be paid in course, without undue preference to any of the proprietors.

The day of presentment to be indorsed on the certificate of debenture; and an order for the payment and interest to be signed by the commissioners, &c.

The payment to be made of the principal and interest without fee.

Debentures made assignable.

Where there is not money in hand to pay the bounty on corn exported from Scotland, a certificate to be granted. And

The debenture to be paid by the receiver-general in three months.

Such debentures, remaining unsatisfied for six months, to carry 3 l. per cent. interest.

Notice to be given when the same are ready to be discharged, and interest to cease from thence.

If there shall be, at any time thereafter, money in hand sufficient to pay off the debentures, and notice be given thereof, the interest thereon shall cease, &c.

Debentures in Scotland to be paid by the general receiver, and without undue preference.

MAN, [the ISLE of MAN,] lies between Britain and Ireland. It is, from north to south, twenty-eight miles long, nine broad, and 160 square miles. The soil is very fruitful, and produces such store of barley, wheat, rye, and oats, as does not only furnish the necessary uses of the island, but likewise gives leave for the exportation of great quantities. According to the distinction of north and south it is different; in the first it is healthy and gravelly, and in the other they have good meadow and pasture-ground; and the air in general is esteemed extremely wholesome.

A ridge of mountains runs almost the length of the island, which supply the inhabitants with exceeding good water, and excellent peat for fuel.

The black cattle are generally less than those of England; the gentlemen have good draught and saddle-horses: there is a very small sort bred in the mountains, about three feet three inches high.

They have no coal-mines yet discovered, but good quarries of a black marble, and other stones for building. They have mines of lead, copper, and iron, which have formerly been worked to good advantage.

This island was given by Henry IV. anno 1405, to John lord Stanley; and in this honourable house it has ever since continued, except for 12 years during the civil wars, when it was granted to the lord Fairfax, but returned to its ancient lords at the Restoration.

Upon the death of the late lord Derby without issue male, it devolved to the heirs female; and the present lord of Man and the Isles is the duke of Athol.—They have most of the prerogatives of kings.—The number of inhabitants are about 20,000.

The principal towns are only four, which are all situate near the sea; each of them has its harbour, or a castle or fort to defend it.

CASTLE-TOWN, to the south, about 210 miles from London, longitude 4. 37. latitude 53. 56.—Here the governor and most of the lord's officers reside; and here the courts of justice are held.

PRINCE OF HOPE-TOWN, to the west.—Within these few

years several merchants have settled here, and built good houses and noble vaults, &c.

DOUGLAS-TOWN is much the richest, has the best market, and is the most populous of any in the whole island. As it has of late increased in trade, it has done so in buildings. The harbour, for ships of tolerable burthen, is the safest in the island; and, within these few years, they have built a fine mole into the sea, which, when perfected, will be one of the best harbours in any part of the three kingdoms, and will be of great service for ships to find shelter in distress.

RAMSEA, to the north, is the most noted for a spacious bay, in which the greatest fleet may ride at anchor, with safety enough in all winds, but the north-east; and, in that case, they need not be embayed. They have lately made a good harbour, that will bring more trade to the town, which formerly subsisted on fishing.

The trade of this island was very much improved before the year 1726, when foreign merchants found it their interest to touch here, and leave part of their cargoes, either to bring the remainder under the custom of butlerage, or because the duties of the whole would be too great a sum to be paid at once in England; or, lastly, to lie here for a market, the duties and cellarage being so small.—But, the late lord Derby having farmed out his customs to foreigners, the farmers insolence and impudence drew on the just resentment of the government of England, who passed an act, anno 1726, by which the people of the island were cut off from the liberties and privileges of a fair trade with England.

They improve their lands either by lime, by sea-wreck, or by folding their sheep and cattle in the night, and during the heat of the day, in little inclosures, which are removed from place to place every year; and the lands are soon so enriched by the urine and dung of the cattle, that they yield plentiful crops of corn; but oat-cakes are the common bread of the country.

The commodities of this island, besides their black cattle (of which 600 may, by the act of navigation, be imported yearly into England) are lamb's-wool, fine and coarse linen, and coarse woollen cloth, hides, skins, honey, and tallow; but it's great and staple commodity heretofore was herrings, of which near 20,000 barrels have been exported in one year.

The herring-fishing season is between July and Allhallow-Tide. The fleet of boats (which are about two tons burthen) is under the government of the water-bailiff on shore, and under one called a vice-admiral at sea, who, by the signal of a flag, directs them when to shoot their nets, &c.

There is due to the lord of the isle, as a royalty, 10 s. out of every boat that takes above 10 meale (every meale being 500 herrings) and 1 s. to the water-bailiff.

Here are mills both for corn and fulling of cloth, which are worked in the summer-time, when there is greatest plenty of water, many of the rivulets not having sufficient to drive a mill the greatest part of the year; which has put them upon inventing a sort of mill, so cheap that it is no great loss, though it should stand still six months in the year.

Notwithstanding the strictness of the laws against offences committed in the island, it is a place of refuge for crimes that are committed out of it, as well as for debts that are not incurred in it.—This island is also a sanctuary for goods, there being no custom paid, nor officers to receive it; so that wine and brandy from France, rum from the West-Indies, and calicoes, and other East-India goods from Holland, are often put ashore here into warehouses, and afterwards run, in small boats, into Ireland, Scotland, and the west of England.

Since the inhabitants, who were formerly chiefly employed in husbandry, have turned their heads to this more gainful trade of smuggling, they have much more shipping than they had, and dwell more upon the sea-coast than they used to do, where, as may be judged of the increase of their port-towns, new buildings, and gay appearance, &c. they grow rich. This coast, except the harbours abovementioned, is rocky and dangerous, and not practicable without good pilots.

REMARKS on the SMUGGLING TRADE carried on at the ISLE of MAN before the last WAR.

Extract of a letter from Newry, dated October 3, 1753, concerning running of goods from the Isle of Man, and published in the principal news-papers in London, and in the country.

Our tea-trade is long since lost, and is likely to be followed by that for spirits and tobacco, such quantities being daily run from the Isle of Man, that, if the commissioners do not soon find some means of effectually preventing it, the fair trader must be obliged either to fall in with the practice, or be ruined. It is computed that his majesty's revenue suffers at least 10,000 l. per annum by such clandestine dealings in those parts, as this illicit trade is now most in the hands of persons of property: so that the dealers all around are supplied at home, on much easier terms than they can be from the fair trader here. One great encouragement is, the freight being paid down on shipping the goods, and the wherries, if taken, not only suffered to escape, but the boatmen rewarded with a few anchors, to induce

induce them not to be over-diligent in getting away another time; so that, when a barge is not in sight, they boldly make their port in open day, and thus find their account in this destructive commerce, their freight being two English shillings for an anchor of 10 gallons, which is almost equal to that for goods imported from the West-Indies.

Nor are the smugglers here less daring than numerous; for, notice being lately sent by them to the coast-officers, that such a day they intended to carry a considerable quantity of run goods from the neighbouring mountains, the officers and their assistants, on coming to prevent it, found near 60 persons, mounted and in arms, who divided into parties, and the officers doing the like, and, by this means being prevented from assisting each other, they attacked, disarmed, and grossly abused them. One of the officers having in the engagement fired among them, and shattered a man's leg, examinations have been sworn against him, and all his companions, to take off their evidence: who must now undergo a trial, for having endeavoured to discharge their duty.

These are the effects of a petty independent sovereignty subsisting in the heart of the British dominions, which serves for an asylum to out-laws and bankrupts, and may be considered as a fortress in the hands of our enemies (that trade being principally supported by the French) a constant drain of our cash, and the ruin both of his majesty's revenue, and the fair trade of these kingdoms.

SOME REASONS FOR ANNEXING THE ISLE OF MAN TO THE CROWN OF GREAT BRITAIN.

In the 12th of George I. cap. 28. by an act then passed, the lords of the Treasury were empowered to treat with the earl of Derby, and his heirs, for the purchase of all right to the Isle of Man; and this act was founded upon the almost impossibility of preventing smuggling from that island, while it remained as a petty sovereignty in the hands of a proprietor. The late lord Derby, from some notion he had formed of being able to leave the Isle of Man by will, would not treat with the Treasury. The duke of Athol, the present proprietor, may probably be disposed to part with it, upon good terms, especially when it is considered the most part of his revenues arise from small duties and customs paid the island upon prohibited goods entered, and afterwards smuggled upon the coasts of England, Wales, Ireland, and Scotland, which, though no method has yet been found out to prevent in any degree (not one in an hundred of the boats or vessels concerned in the smuggling trade being taken at sea, or seized afterwards) it cannot therefore be supposed that the legislature will suffer it long to be carried on to such an enormous height, which now calls loudly for the serious attention of every person that wishes well to the trade and welfare of these kingdoms.

The Isle of Man is situated in the midst of the three kingdoms, not above six or seven hours sail from the nearest parts of Scotland, Ireland and England. It is the greatest storehouse, or magazine, for the French, and other nations, to deposit prodigious quantities of wines, brandies, coffee, teas, and other India goods, which are carried off in small boats and wherries, built for that purpose. To ascertain the quantity, the house of commons may order the collectors of the noble proprietor's customs in the island, to lay before them their books of entries, for the last seven years, of goods; 999 parts of which, out of 1000, are smuggled upon our coasts; upon such an examination of these officers, the whole scene would come out.

Of late years, a new and destructive trade has been set up by Irish Papists, who have cheated their creditors, and carried their effects to the Isle of Man; and that is, by importing such quantities of teas, and other India goods, as ought greatly to alarm the India company. Perhaps they do not know to what a height it is come; or else it is hardly possible they should sit still, and not complain of whole ship-loads of teas, and other India goods, brought in for some years past from Denmark, as well as Holland and France; and all smuggled upon our coasts. The captain of a cruiser, did venture to do his duty, and attempted (as he thought he was warranted to do by act of parliament) to seize a Dutch dogger, valued at 12,000*l.* sterling, which run from him ashore upon the island, where she was bound. But the man found himself mistaken. Acts of parliament, and English commissions, could not protect him in that petty principality; they seized his men, who had taken possession of the dogger, threw them into a goal, where 5 of them will lie, perhaps, till their death. The captain himself narrowly escaped, with two men and a boy, to Whitehaven, from which place he wrote his complaints to the commissioners of the customs. If these gentlemen were called upon by the house of commons, not only for these papers, but also for such informations as they have received for some years passed, from the collectors of Whitehaven and Liverpool, and their officer in the Isle of Man, no doubt could remain of the absolute necessity of annexing this island immediately to the crown of Great-Britain.

Query, Whether the officers in the Isle of Man are not guilty of an act of rebellion, in seizing the king's boats and

VOL. II.

arms, and detaining them? Another pernicious practice carried on by some Irish fugitive Papists settled in the island, who are countenanced and protected, is this; they enter tobacco in rolls from several ports of Great-Britain for some foreign parts, receive the drawback, then carry it to the Isle of Man, and run it back again from thence to Scotland, England, or Ireland, and Wales. This must always be attended with perjuries, very little regarded by such persons who have first cheated their own creditors, and then rob the public. Here the customs are actually robbed of great sums of money.

The Isle of Man is likewise a great detriment to the British distillery. Most of the ships that now go from Liverpool to Guinea, &c. touch there for their brandies, wines, and India and other goods, &c. not of British manufacture.

These, and many other inconveniences and mischiefs arise from suffering this island any longer to be in a manner independent of Great-Britain. And a fuller account of the practices carrying on there will be published, if these be not sufficient to awaken all true friends of Great-Britain.

The remedy proposed is, To agree with the present proprietor to relinquish his right to the Isle of Man, and, in lieu of it, to grant him, and his heirs, an annual sum out of the customs of England for ever, or in any other way that shall be deemed more eligible: and such an annuity will be a saving to the government of some thousands a year, expended to very little purpose, in maintaining cruisers and officers, &c. to guard against its illicit and pernicious trade, and ten times the number will never prevent smuggling from that island. This article alone cannot be less than 15 or 20,000*l.* a year, including, in this estimation, the officers in Ireland, who are kept there on the same account; besides the loss to the revenue, upon the most moderate computation, of at least 200,000*l.* a year; and the loss to the fair trader, and particularly the India company, which may be as much more.

The late purchase of the hereditary jurisdictions in Scotland, hath set an excellent example, which deserves imitation. And, indeed, the reasons of annexing this petty royalty to the crown hold stronger than in any of the others. For the detriment which the whole kingdom sustains by the alienation of it, is much greater than that which arose from all the royalties and jurisdictions of Scotland. The loss to the nation, and the gains to the French, are inexpressibly great. And, as all the sums drained from us are employed by them, in time of war, to hire troops, and pay armies to fight against us, it will be no exaggeration of the truth to say, that, since the peace of Utrecht, they have drawn more money from us, by means of their trade with this small island, than was sufficient to maintain 30,000 men with a train of artillery, during the late war in Flanders. Would the French have suffered a like sovereignty of Bellisle, formerly in possession of the family of the famous duke of that name? It plainly shews they would not.

In short, this island may be looked upon as a fortress in the hands of our enemies, draining us of our specie (for all these goods are paid for with English coin): and also continually annoying us in the sensible parts, our trade and commerce. And the whole question is, Whether we ought to dispose of them or not? A question that admits of no dispute, if the public good and welfare of our country are to determine it!—Nor can there be any one good reason assigned, why this island should remain so long in a manner independent of Great-Britain.

If we look back, and consider how many millions of debt the honest part of these kingdoms is burthened with, by submitting for so many years to be plundered by such gangs of thieves, can we possibly call ourselves a civilized people? Have we the least right to complain of groaning under such a load of taxes, without so much as looking back to one of the principal causes of our miseries, or even thinking, as the past is irretrievable, of a preventive remedy, against our absolute future destruction, and against our becoming, if not a prey to one another, certain victims to a power, ever aiming at our ruin? Now then, let that British spirit awaken, with that attention to the national good, it has so often signalized itself for; directed by those calm, serious, and deliberate consultations, which are alone the surest means, to perfect the cure of the greatest evils, without pique or resentment against any set of men, without seeking vengeance for, but rather pardoning all past offences. Thus shall we see the morals of our people, corrupted by the little attention paid to the enforcing the execution of the laws, recover their former soundness, and those innumerable and invaluable lives preserved for our employment, strength, and happiness, which are now suffered to be wasted by spirituous liquors, under the thin pretence of incapacity of redress, lest the revenue should suffer a diminution. See SMUGGLING.

MANUFACTURERS.

The principal LAWS of ENGLAND relating to MANUFACTURERS and ARTIFICERS.

Persons employed in making up the woollen, linen, fustian, cotton, or iron manufactures, embezzling or purloining any

N n

wefts,

wefts, thrums, or ends of yarn, or any other materials of wool, hemp, flax, cotton, or iron, with which intrusted, or that shall reel false or short yarn, being thereof convicted by oath of one witness, or confession, before one justice, &c. shall forfeit double the value of damages done, for the use of the poor. On neglect or refusal to pay, to be sent to the house of correction 'till satisfaction made; if not able, to be kept there not above fourteen days, publicly whipped, and kept to hard labour. Buyers and receivers of, &c. liable to the same punishment, 1 Ann. c. 18. This act at first was temporal, but by 9 Ann. c. 30. was made perpetual.

By 13 Geo. II. If any person working woollen, linen, fustian, cotton, or iron manufactures, shall embezzle or illegally dispose of the materials, or shall reel short yarn, being convicted as prescribed by 1 Ann. shall forfeit double the damages sustained with costs: and, in case immediate payment shall be neglected, the justice shall commit the offender to the house of correction, to be whipped, and hard labour, not exceeding fourteen days. And, on further conviction for embezzling any of the materials, the persons shall forfeit four times the value (whether the same be or be not made up) sustained, with costs. And, if payment with costs be neglected, such justice shall commit to the house of correction and to hard labour, not exceeding three months, nor less than one, and to be publicly whipped in the market-town, at the market-place or cross, once or oftener. And, by Geo. II. every person who shall buy or take by way of gift, pawn, sale, &c. from any in the act of 1 Ann. mentioned, any woollen, linen, fustian, cotton, or iron manufactures, knowing the same to be embezzled, shall suffer the like forfeiture as the persons purloining the materials; all which forfeitures are by 13 Geo. II. to be applied, one moiety to the use of the party injured, and the other to the poor of the parish, with benefit of appealing. If any person employed in cutting or manufacturing of gloves, breeches, leather, boots, shoes, or other goods, shall fraudulently embezzle any of the said goods or materials, or shall purloin or exchange any gloves, &c. when manufactured, or lessen the value, either before or after made into wares, the person must make a reasonable recompence, not exceeding double the value of the goods; one half thereof to the party aggrieved, and the other to the poor. But if no goods, and shall refuse to pay, the offender shall be for every offence committed to prison, and kept to labour fourteen days, and shall be whipped; and for a second offence shall forfeit four times the value which the owners shall sustain, with costs adjudged by the justice. And, not paid, such justice may commit to the house of correction or prison to labour, not exceeding three, nor less than one month, and shall cause the offenders to be whipped in the market-place or cross once or oftener. And every person, who shall knowingly buy or receive by way of pawn, &c. from any person whatsoever (except of or from the person in whom the property is) such person shall make such suitable recompence, within two days after the fact shall be determined, or else be subject to distress, and, for want thereof, liable to the like punishment as is directed on persons as shall embezzle goods, &c. and so for any subsequent offence. The stat. 13 Geo. II. proving deficient, the 22d of Geo. II. enacts, if any person hired to make any felt or hat, or work up any woollen, linen, fustian, cotton, iron, leather, furr, hemp, flax, mohair, or silk manufactures made up of wool, &c. or any of the said materials mixed, shall, after the 24th of June 1749, purloin or dispose of materials, whether wrought or not into merchantable wares, or shall reel false or short yarn, the justices may commit the person to the house of correction or public prison, to labour, for fourteen days, and to be once publicly whipped at some public place; and, if a further offence, the justices may commit to the house of correction or public prison to labour, not exceeding three, nor less than one month, and may order the persons to be whipped at some public place, &c. twice or oftener.

If persons shall buy, or take in gift, pawn, &c. from any employed to make any felt or hat, to work up the woollen, linen, &c. manufactures made of wool, &c. or silk, or any of the said materials mixed, thrums, or ends of yarn, whether made up or not, knowing the person to be hired, and not having the consent of the person hiring; or shall buy or take, in any manner whatsoever, from any person, any of the said materials, whether wrought or not, knowing the same to be embezzled, the person convicted shall, for the first offence, forfeit 20l. and, if not paid, shall be committed to labour for fourteen days, or 'till payment; and, if within two days before the said fourteen, the same shall not be paid, may order the person to be publicly whipped, once or oftener; and, if a further conviction, shall forfeit 40l. and, in case the same be not immediately paid, the justice shall commit to labour, not exceeding three, nor less than one month, unless forfeitures be sooner paid; and, if not paid within seven days before the time, may order such offenders to be publicly whipped twice, or oftener; and the said forfeitures of 20l. and 40l. after satisfaction to the party injured, with costs, shall be distributed amongst the poor.

If aggrieved, may appeal; and the justices, in the general or quarter-sessions, are finally to determine the appeal, and award

costs; and if, on hearing, the judgment of the justice shall be affirmed, such appellant shall pay the sum adjudged, or, in default, shall suffer the penalties inflicted upon persons who shall neglect to pay.

If any shall be convicted of purloining the materials, or receiving the same, justices may issue a warrant to any person, in the presence of a constable, &c. in the day to search the houses, and other places, and, if there shall be found any materials of wool, &c. to bring such materials before the said justice, to be detained; and, if within 24 days, it shall appear the persons from whose houses, &c. the said materials shall be taken, are the owners, then such materials shall be restored; but, if it shall not appear, the same shall be deemed purloined, and the justices may direct them to be sold, and the money (charges deducted) to be distributed to the poor. The said justices shall, within three days after materials brought, give notice, under hand and seal, to the person convicted, appointing time and place for his proving his property so detained, which shall be within twenty, and not less than eighteen days, after notice is given; and, if the person convicted shall be detained in prison, the justice may cause a copy of the notice to be delivered to the keeper, who is to bring before such justice the person named in such notice; and, if such keeper refuse, he shall forfeit to the person in such notice the value of the materials, to be recovered by distress and sale of the goods of such keeper.

Any aggrieved may appeal to the general or quarter-sessions; and, in the mean time, the disposal of materials shall be postponed. Notice under the hand of the person intending to appeal, signifying his intention, given to the justice before the disposal of such materials. The justices may summon and examine witnesses, and may determine the appeal, and, if the appellant should not prosecute, the judgment of the justice shall be affirmed, and may award costs.

If any persons, intrusted with materials to manufacture, shall not use them, and shall delay, for twenty days after such materials shall be manufactured, to return (if required by the owner) so much as shall not be used, such neglect shall be an embezzling; and, being convicted, shall suffer as persons convicted of embezzling.

Any one justice, upon complaint on oath or affirmation of any offence within the county, may issue his warrant, and may determine the matter.

If any person who, after the 24th of June, 1749, shall work up any of the manufactures for any one master, shall neglect the performance thereof, by procuring himself to be retained by any other, before he shall have completed the work, he shall be sent to hard labour, not exceeding one month.

This act not to repeal any of the provisions in the 13th, 14th, and 20th Car. II. for regulating the trade of silk-throwing, or in 8 and 9 Will. III. for the further encouragement of the manufacture of lustrings.

No person shall, by virtue of the said acts, or of this act, suffer punishments twice for one fact.

By 22 Geo. II. the several clauses in the 12th of Geo. I. and all the provisions and forfeitures shall, after the 24th of June, 1749, extend to journeymen dyers, hot-pressers, and all employed about the woollen manufactures, and journeymen, servants, and labourers, and others, making of felts or hats, or in any of the manufactures of silk, mohair, furr, hemp, flax, linen, cotton, fustian, iron, or leather, or about any manufactures of wool, &c. or of any materials mixed, in as ample manner as the provisions and forfeitures are by the said act to extend to the several persons therein: and the forfeitures incurred against the said act, by any employed about the said manufactures, shall be recovered as the forfeitures contained in the act of 12 Geo. I. are directed to be recovered.

REMARKS on the ENCOURAGEMENT of MANUFACTURES in FOREIGN COUNTRIES.

It is a maxim generally received, that one of the most effectual means to settle and improve commerce, or any other political interest, is the patronage of princes. Dispensing rewards, and exciting emulation, by investing with honours, and other marks of distinction, those persons who, by the force of genius or application, have made new discoveries, or improved upon any thing laudable, and conducive to the interest of the public; more especially such as, upon the strength of their own genius, and at their sole charge, have set up and maintained manufactures, and other works beneficial to the community; and when the introduction of them has been intirely owing to their industry and public spirit.

This point we shall only treat in a general way, as it is not possible to prescribe rules for the conduct of it on particular occasions, since the honours, as well as rewards and encouragements, are always to be dispensed according to the station, and other circumstances of the claimants, and with an eye to the charge they shall have been at, and the benefits that shall result to the public from them.

It is good policy to give yearly pensions, in order to draw over, and engage to stay in any country, able masters in manufactures, fulling, dyeing, and other works, either to introduce

introduce these sorts of businesses, or to improve such as have been already established, by advancing them to a degree of perfection and goodness that is certain to make them esteemed, and procure them a market every where.

As this has been the case of the tapestries of Flanders, the cloths of Abbeville, England and Holland, as also the silks of Lyons in France, so artificers, or workmen, setting up new and profitable manufactories in foreign countries, it is usual also to allow, for a certain term, an immunity from all troublesome offices, houses to live in, workshops, and a dispensation from some duties; numerous instances of which have been produced in divers parts of this work; and, at the same time, for a further encouragement, sums of money have been granted, to enable them to bear the first expence, which usually runs high. But, in respect to this advance of money, or the other encouragements, we are as little able to prescribe stated rules, as there must necessarily be a variety of cases, according to the situation of the projectors, and the benefit that will arise from the undertaking. However, it will be always prudent and necessary, perhaps, for them to give sufficient security to repay, at stated times, all monies that shall be advanced to set up and maintain the manufactories, and other works, which they have laid themselves under an obligation to do, both in respect to the number of looms, the quality of the manufacture, and the time that shall be stipulated with them; all of them circumstances very essential, and for which it behoves trading states to explain and covenant very fully; for, should there be a failure in any one of them, the main purpose would not be attained, all the pains, and all the indulgences that had been dispensed them, thrown away, and the prince have a just right to withhold what had been offered on his side, as also to put their bonds in execution; and, if there be still a deficiency, to call upon their securities immediately to replace the monies that had been advanced, and to return the houses, and other things, in the state and condition they were received.

And yet it will be always reasonable to shew some favour and moderation, and not treat them with the utmost rigour, when it shall appear that the miscarriage arose from accidents that could not be foreseen, and not from villainy, or a deliberate intent to defraud; both because they merit indulgence, as they erred involuntarily, and, for fear of the rigour they shall be treated with, discourage the honest and ingenious from entering into the like covenant and undertakings.

As often as masters or directors of any manufactures faithfully execute what they undertake and covenant, and from the establishment and continuance of their manufactures there will ensue great advantages to the public, it is also customary, and good policy, to remit them a part, or even the whole advance money: for it may serve as a reward, and a fresh encouragement, and also a means of raising emulation in others, to project such other things that are conducive to the public interests.

It has been usual, also, to grant an exclusive privilege for undertakings of this kind, that, for a certain number of years, no other person manufacture the commodities they are under an obligation to introduce and establish; but, before indulgences of this nature are ever dispensed, we ought to consider the affair thoroughly; and when, for special reasons, it is found absolutely necessary, in order to obtain a national end, they are even then to be limited and guarded with the utmost precaution, lest they be converted into monopolies, that are of great profit to the proprietor, but of the utmost prejudice to the public. Moreover, in dispensing them, though it be with all possible precaution, it ought at least to be attended with the following circumstances; of it's being a new fabric of some kind, and very difficult to be set on foot; that there will ensue an improvement to commerce, and a considerable advantage to the public, as it happened in France, and lately in Spain, in order to revive and establish glass-houses.

To this end was granted an exclusive privilege, for a certain number of years, in consideration of it's being an undertaking of great fatigue and considerable charge; and as the event was uncertain, they put to great risque their pains and money therein employed.

Lewis XIV. king of France, in the year 1665, during the ministry of John Baptist Colbert, granted also an exclusive privilege, and other advantages, in order to settle a tin manufacture in several parts of that kingdom, as it is a very useful commodity, and of great consumption every-where; and, at the expiration of the term covenanted, the patent was renewed, in the year 1695, in favour of Isaac Robelin, engineer, director of the fortifications of Burgundy, and company; to which partnership, it was renewed for another term, in the year 1700, as appears from the patent granted them.

When it shall be found expedient to grant an exclusive privilege, it should be done for as short a time as possible, and under due limitations, in order that the manufacture and traffic thereof may become the more freely and expeditiously extended. But those privileges ought to be the more generally restrained to fabrics that are entirely new, or of an extraordinary improvement upon the old.

Other advantages, of an inferior kind, and attended with less public inconvenience, will prove sufficient for works and inventions of a lower nature. When goods, taken to be manufactured by private hands, are nearly of the same sort as some already made in the country, though they may be of superior quality, as it is from this very superiority that, with a little diligence, they may be imitated in their own manufactures, there will be no reason to grant privileges, indulgences, and other distinguishing encouragements, which some have moved for, as in such cases they ought to be common and general; for any thing singular and exclusive would be a great prejudice to other manufactories of the kingdom; which being of equal moment, or little inferior, may, with equal propriety, claim and enjoy the same advantage; and, if they should not obtain it, the consequence will certainly be, that, favouring a branch, we shall destroy the root.

The sage Spaniard Uztaritz observes, That, by the tariff which Lewis XIV. assented by the great penetration and skill of his vigilant minister, John Baptist Colbert, published in the year 1664 and 1667, all foreign cloths imported into France paid a duty of above 25 per cent. while those manufactured in his own kingdom were allowed to go abroad, paying only one per cent. and other commodities were exported free of all duty. This appears from the various edicts, and other ordinances, that we have quoted throughout this work; and I may add, that, to encourage the manufactories of that large and plentiful province of Languedoc, the government of France settled a premium, of about 13 shillings sterling, to be given to the masters for every piece of fine cloth measuring 30 French yards, that they should manufacture and send abroad.

In regard to materials, they observe a rule so contrary (but equally advantageous) that they impose heavy duties upon the exportation of them, and sometimes prohibit it entirely, under rigorous penalties, as we do in England with our wool, that our own country may reap the benefit of that large gain which arises from working it up. But they lay very small duties, often none at all, upon the importation of materials which they are in want of, especially for their manufactures. This is practised in Holland with respect to Spanish wool, which is imported free, as appears from their own tariff, published at Amsterdam in the year 1710; for so dextrous are they, and attentive to the general interest of the state, that they have constantly in their eye, and gather the fruits of a piece of experience, that this is a mine more fruitful of gain, riches, and plenty, than those of Potosi; since, by working up into cloth a certain portion of wool, that stands then in 20 shillings, they produce from it the amount of above five times that sum: [see the article Wool:] for they calculate that, in a yard of fine cloth, the wool it is made of amounts to a fifth of it's value, and the rest is labour, dyeing, and other expences: so that there remains, as it were, to the manufacturer, an interest of four fifths; and a million of money in materials he can improve to the value of five millions: and this shews how expedient it is to encourage manufactures, in order to trade, in a great measure at least, without our own commodities.

The present system of Spain to advance in their manufactories of every kind, as published before the last war.

The same author adds, in another place, in order to rouse the Spaniards to trade, that, in regard to manufactories, care must be taken to estimate the advantages of each particular, according to the quality, number of people, materials, fruits, and address of the respective districts: for, in the article of manufactories, success does not entirely depend upon the goodness and plenty of fruits and materials a country produces: these defects and wants may be made up by management and industry. In proof of it, many examples might be produced, were it not sufficient to mention Holland and Genoa, in whose districts, though barren of silk, good wool, and dyeing materials, many and prime manufactories of these and other sorts are flourishing. And, as Spain possesses these and other materials in great plenty and perfection, and is equally furnished with all the necessary provisions, for the working hands, which the territories of Holland and Genoa are also destitute of, and the nation is still the same as in former times, there is reason to believe that every thing which has been formerly, may be again, whenever due encouragement shall be given by them in power, especially when those heavy fetters are taken off, which with our own hands we have laid upon the manufactures, and the sale of them both at home and abroad, as well by excessive taxes upon provisions consumed by the working hands, and the materials they make use of, as by the heavy and repeated duty of the alcavala at every sale of them, and the 15 per cent. which manufacturers, by the book of rates, are to pay upon exportation, contrary to the natural and political maxim observed by other nations.

Nor can I forbear dwelling upon these two points, manufactures and a reform of the duties, and frequent mention of them, as they are the root, which, by a prudent cultivation, is to produce the remedy for our misfortunes, and give new

life to the monarchy: for it is certain, that the excess of these duties is the original cause of the destruction of our manufactories, a necessary consequence of which is the loss of an advantageous commerce (which is now fallen into the hands of foreigners) as also the dispeopling, and present inability of Spain.

For a better illustration of this point, and the happy consequences that depend upon it, suppose there were set on foot, for instance, 60,000 new looms in these kingdoms, which would be replacing a considerable part of those which are said to be in ancient times.

As I am satisfied there are now in the kingdom of Valencia above 2000 looms, of silk and wool; in the principality of Catalonia above 500; and in the kingdom of Granada 1000, including both sorts; and there are also in other provinces manufactures of silk, though not very considerable, and in almost all of them no contemptible number of looms for the several fabrics of wool, such as the middling and coarse cloths, bays, serges, camblets, druggets, &c. one may, I think, without rashness, suppose the silk and woollen looms that are now in Spain, to be 10,000. Now these, with the 60,000 new ones that have been imagined to be set up, would amount to 70,000; and one may reckon 14,000, or about a fifth part of them, to be silk looms, and the remaining 56,000 of fine, middling, and coarse wool, of which last there is no less consumption, &c. See the article CATALONIA.

R E M A R K S.

Throughout the whole of this work, much has been urged for the encouragement of manufactures in general, from representations of what has been done to this end in France and Holland, &c. as well as what is, at present, doing in Spain, for revival of their old manufactures, and the establishment of new of every kind that their country will advantageously admit of. We have likewise endeavoured to animate our artists of every denomination with such a spirit of emulation, not only in relation to each other, but foreigners, as we hope may tend to the advancement of our old, as well as the invention of new arts and manufactures. Some of the articles, under which these particulars may be turned to are, ARTIFICERS, BISCAY, BLEACHING, BLACK, BLUE, CALICO-PRINTING, CANDIDATE, CATALONIA, CHEMISTRY, CLOTH, FLAX, HEMP, FRANCE, FULLER'S-EARTH, GLASS, ROYAL SOCIETY, and divers other heads referred to from these.

We begin to be now convinced, that we are nearly as much enriched by the labours of our fellow-creatures, as by the productions of the earth; and, if we have reason to rejoice at the abundance which nature, from year to year, produces for us, we may reap no less reasonable satisfaction from all the variety of employments in human society, and especially by means of our manufactural arts. The first proofs of this have been taken from the numberless kinds of business, which our servants and the very meanest labourers perform for us; not in our houses only, but from one end of the earth to the other: what they are doing on the banks of Newfoundland, at Potosi, at Mocha, or in the island of Amboyna, concerns us no less than the being decent in our apparel and habitations. Let us consider the reasons we have to esteem artizans of every kind for their industry, and find new motives, from the numberless services they do us, to rectify our way of thinking concerning them.

It is customary for all such as are under no necessity of labouring with their hands, to place themselves at an infinite distance above the working trading people; some affix an idea of meanness to their condition, and their contempt of it is universal. The man who draws up a conveyance, or a bill in Chancery, would think himself disgraced by marrying his daughter to a clothier, a weaver, or a taylor. He may, indeed, be very dextrous, cautious, and judicious, in his draughts and pleadings, and extremely well versed in the forms and precedents of the courts; but these qualifications demand not less the admiration which is due to the industry of a man, who makes us cloth and silk for our apparel.

A person, whose business is to recover certain rights, is treated by us with abundance of ceremony and respect, and yet we scarce vouchsafe to take notice of a labourer or a gardener, to whom our enjoyment of the fruits of the earth is owing. But this mistake is not a new thing: it has constantly made its way into the most polite nations, in proportion as their luxury had introduced a false taste of delicacy. That Scipio*, who had declared war against Jugurtha, standing candidate for the office of curule ædile, when he was a young man, and, (as the custom was) passing through the place where the country tribes, as well as those who resided at Rome, were then assembled, bowed to one, spake obligingly to another, and, amongst the rest, shaking hands with a labouring man whom he knew, and feeling them hard and callous, he could not forbear joking with him upon it. We gentlemen, says he, walk only upon our feet, and shall you bring up a fashion of walking upon your hands also? This jest cost him dear; for it was told immediately from one to another, even thro' the very lowest ranks; and all the tribes, being offended to think they were reproached for their love of labour, unani-

mously rejected this banterer, whom the effeminacy of the city had rendered arrogant and impertinent.

* Scipio Nafica Valer. Maxim. Lib. VII. cap. 5. n. 2.

Most of those who follow a working trade, have been so accustomed, among us, to be set aside, and treated without any sort of civility or regard, that we find them quite confounded, or appearing under an extreme surprize, whenever the magistrates, the clergy, or other persons of distinction, condescend to converse or talk with them as to fellow-citizens and freemen; such they are in reality: our treatment of them is therefore a dishonour to ourselves, and our own haughty airs ought to make us blush.

The laws of subordination have never, in strict justice, authorized any person to talk to manufacturers as if they were slaves. We should inspire them with some sentiments of honour, and encourage their industry, would we only seem to be sensible of their worth, and speak to them with good nature and affability. But we shall be always very far from forming their manners, or attaching them to us, if we entertain a contempt for their persons, or remain so ignorant as we are at present of the excellency of their arts: our very ignorance of their merit in society is the cause of our indifference towards them.

When our reason first begins to open, we are talked to for six years together about the future in rus, and the supine in um, without hearing one word of the perfection and usefulness of the arts, or the industry of people that follow employments by which our lives are supported. When our reason begins to acquire more strength, it is put under the direction of masters, who, after a vast deal of preparation, demonstrate that we have a body, and that there are other bodies round us: or spend whole hours, nay even days in proving, that of two propositions contradictorily laid down, concerning a possible future which may never happen, the one is determinately true, and the other determinately false, and the like metaphysical jargon.

The learning to distinguish rightly the productions of the globe which we inhabit, the ties whereby all the people dwelling on it are united, and the various labours they are employed in, are things the most neglected. Every one of us has seen the fall of a windmill, and the wheel of a water-mill in action: we know also, that these machines grind corn, and reduce the bark of trees to powder: but we know nothing of the structure of them, and can hardly avoid confounding a carpenter with an hewer of wood.

We all carry watches in our pockets, but do we know the mechanism of the fusee round which the chain is wound? Do we understand the use of the spiral line which accompanies the balance? It is just the same as to the most common trades: we know the names of them, and no more. Instead of endeavouring to gain a reasonable knowledge of commerce, manufactures, and mechanics, which are the delight and ornament of that society wherein we are to spend our lives; we pique ourselves on attaining all the niceties of quadrille, or bury ourselves in solitude, upon speculations that have no foundation but in our whimsical imaginations. And, if little judgment is shewn in the choice of our pleasures, a still greater want of it will probably appear in our studies. We run after whatever makes the most noise, and the most sensible people are at last obliged to confess, that they repent more the loss of the time they have employed in studying the subtleties and fooleries of the schools, the arts of pedantry, and the crack-brained altercations of enthusiastic zealots, than of what they have spent in the learning of music, which is sometimes an amusement to them.

The father or mother of a family, the head of a community, a merchant, a lawyer, a justice of peace, or any of those who have the government either of the actions or consciences of others, may be never the worse for not understanding the monades of Leibnitz, or the disputative bombast of the dogmatists. But there is no one of them who would not acquit himself better in his employment, was he to acquire a true knowledge of the arts and trades wherein the common people are busied. This kind of philosophy is a thousand times more to be esteemed, than those systems whose inutility is their least fault.

Some philosophers, considering that diversity which appears in the labours and inclination whereby men are distinguished, have attributed the cause of it to the dispositions alone of certain bodies that govern them, and have from thence drawn objections against the spirituality of the soul; being more forward, as is commonly the case, to decide concerning the nature of such things as God has hid from us, than to make us see and adore that all-wise hand, which, by regulating the differences of our abilities as well as of our wants, has thereby prepared all the links of the great chain of society. Others have been of opinion, that the variety of arts is owing to the discovery philosophy has made of the wants of mankind, and the means of providing for them. The only reason they have not mentioned, is what they should have found out first.

If we are supplied with shoes, linen, and woollen cloths, or candles, &c. it is not because there are pedantic philosophers

in the world. It is not they who have taught us to whiten the wax, or handle the shuttle: they move commonly in spheres very distant from us; and, if they ever do condescend to give their opinion of the instruments we make use of, it is only to inform us, that such and such a thing is wanting, without endeavouring in the least to supply such defects by any better inventions. The chiefs of colonies have assembled workmen, and legislatures have appointed regulations for different professions: but the workmen, as well as peoples wants, were before the colonies were founded; and the legislature, who establishes rules for the exercise of mens talents, is by no means the inventor of them. Human prudence employs what it has received, not what it has created. Most speculative philosophers have nothing to be proud of: they cannot claim any thing as their own, except useless opinions and questions that cannot be answered. We owe every thing to a wise providence, which has made no account of them, as to bearing any part of the labours necessary to society, but which has provided for them effectually by the rich variety it has infused into the minds of men. In a word, we don't invite a man of a very mean capacity to take upon him the conduct of great affairs, nor one of a fine genius to lop the trees in a forest.

The different bias of our minds precedes our wants; and, as God is the author of our wants, he is also the real author of the different dispositions which are found proper to provide for them. He has likewise, by another precaution, rendered his work infallible: for, lest the wants, the interests, or the constitution of each particular should be insufficient to breed up and perpetuate the different kinds of workmen necessary to the bulk of mankind, God has inspired an inclination in all children to imitate whatever hits their fancy.

We regard this as a trifle of no consequence; whereas it is, in truth, something resembling, as it were, an inspiration of the Deity, productive of the greatest good; for it is this that affords us a constant supply of the most useful workmen, and fills the meanest professions as well as the most exalted.

A child conceives an advantageous idea of what he sees his father do: he follows him step by step, and goes on in his profession; or, if he quits it, it is because he is more industrious, and finds himself capable of rising higher. One may truly affirm, that imitation is of much greater service to us than invention; for inventions appear but very seldom, whereas imitation is found in all countries, and at all times.

If, from the first and only original of so many useful trades, we would descend to what is to be found curious in them (and often the most common things deserve our greatest attention) we should find throughout, that the progress we may make in these entertaining and really useful researches, leads the mind equally to emulation and gratitude.

Our countryman Mr. Locke says, in his treatise of Education, 'that I have one thing more to add, which, as soon as I mention, I shall run the danger of being suspected to have forgot what I am about, and what I have above written concerning education, all tending towards a gentleman's calling, with which a trade seems wholly to be inconsistent. And yet, I cannot forbear to say, I would have our young gentlemen learn a trade, a MANUAL TRADE; nay, two or three, but one more particularly.

The busy inclination of children being always to be directed to something that may be useful to them, the advantages, proposed from what they are set about, may be considered in two kinds; 1. Where the skill itself that is got by exercise, is worth the having. Thus skill not only in languages, and learned sciences, but in painting, turning, gardening, tempering, and working in iron, and all other useful arts, is worth the having. 2. Where the exercise itself, without any consideration, is necessary or useful for health. Knowledge in some things is so necessary to be got by children whilst they are young, that some part of their time is to be allotted to their improvement in them, though these employments contribute nothing at all to their health: such are reading and writing, and all other sedentary studies, for the cultivating of the mind, which unavoidably take up a great part of gentlemen's time, quite from their cradles.

Other manual arts, which are both got and exercised by labour, do many of them, by that exercise, not only increase our dexterity and skill, but contribute to our health too, especially such as employ us in the open air. In these, then, health and improvement may be joined together, and of these should some fit ones be chosen, to be made the recreation of one, whose chief business is with books and study.

For a country gentleman I should propose one, or rather both these, viz. gardening or husbandry in general, and working in wood, as a carpenter, joiner, or turner, these being fit and healthy recreations for a man of study or business. For, since the mind endures not to be constantly employed in the same thing or way, and sedentary and studious men should have some exercise, that at the same time might divert their minds and employ their bodies; I

VOL. II.

know none that could do it better for a country gentleman than these two, the one of them affording him exercise, when the weather or season kept him from the other, &c. The great men among the ancients understood very well how to reconcile manual labour with affairs of state, and thought it no lessening to their dignity, to make the one the recreation of the other. That, indeed, which seems most generally to have employed and diverted their spare hours, was agriculture. Gideon amongst the Jews was taken from threshing, as well as Cincinnatus amongst the Romans, from the plough, to command the armies of their countries against their enemies; and it is plain, their dextrous handling of the flail, or the plough, and being good workmen with these tools, did not hinder their skill in arms, nor make them less able in the arts of war or government. They were great captains and statesmen, as well as husbandmen. Cato Major, who had with great reputation borne all the great offices of the commonwealth, has left us an evidence under his own hand, how much he was versed in country affairs; and, as I remember, Cyrus thought gardening so little beneath the dignity and grandeur of a throne, that he shewed Xenophon a large field of fruit-trees, all of his planting. The records of antiquity, both amongst the Jews and Gentiles, are full of instances of this kind, if it were necessary to recommend useful recreations by examples.

Nor let it be thought that I mistake, when I call these, or the like exercises of manual arts, diversions or recreations: for recreation is not being idle (as every one may observe) but easing the wearied part by change of business: and he that thinks diversion may not lie in hard and painful labour, forgets the early rising, hard riding, heat, cold and hunger of huntsmen, which is yet known to be the constant recreation of men of the greatest condition. Delving, planting, inoculating, or any the like profitable employments, would be no less a diversion, than any of the idle sports in fashion, if men could but be brought to delight in them, which CUSTOM AND SKILL IN A TRADE will quickly bring any one to do. And I doubt not, but there are to be found those, who, being frequently called to cards, or any other play, by those they could not refuse, have been more tired with these recreations, than with any the most serious employment of life; though the play has been such as they have naturally had no aversion to, and with which they could willingly sometimes divert themselves.

Play, wherein persons of condition, especially ladies, waste so much of their time, is a plain instance to me, that men cannot be perfectly idle, they must be doing something. For how else should they sit so many hours toiling at that, which generally gives more vexation than delight to people, whilst they are actually engaged in it? It is certain, GAMING leaves no satisfaction behind it to those who reflect when it is over, and it no way profits either body or mind: as to their estates, if it strikes so deep as to concern them, it is a TRADE then, and not a RECREATION, wherein few, that have any thing else to live on, thrive; and, at best, a thriving gamester has but a poor trade on it, who fills his pockets at the price of his reputation.—Thus far Mr. Locke.

Altho' this recommendation of the exercise of manual trades to the gentry, by so great a man as Mr. Locke, seems to be intended only for health and recreation, yet I cannot help thinking but this remark may be extended still to a greater degree of public utility. For, if the British nobles and gentry were, from their infancy, habituated to the manual exercise of any manufacture, and thereby became so far experimentally knowing in its nature and operation, as to have a distinct idea of each part, and thence be capable of forming a good judgment of the whole thereof: if our people of distinction in general should, by this means, obtain a relish to pry deeply into the practical nature of the various manufactural and mechanic arts, and, to this recreative knowledge and salubrious exercise, they should add the political study of the commercial and money affairs of the state; is it not reasonable to conceive, that the conjunctive wisdom of the representatives of the nation, in general, could never be liable to deceit and imposition by any distinct order of manufacturers, in opposition to the interest of the whole? Among a numerous gentry, if this once becomes fashionable, there would arise tastes for the exercise of different manual trades and arts; and, from their united knowledge, they would discern not only the true interest of every distinct branch, but the connection and dependency of each upon the other; and be thereby capacitated to judge of the real benefit of the whole, without detriment to any peculiar part: committees of the honourable house of commons would be capable of so prying into the nature of all trades, and every branch of commerce, foreign as well as domestic, that it would be scarce possible to be deceived by those who consulted their own advantage, in opposition to that of the community. Would not manual exercises of this kind tend more to the interest and glory of the nation, as well as the benefit of individuals, than that

itch of gaming which so unhappily prevails, for want of more rational amusements, which contribute to invigorate the body, and instruct the mind in useful practical arts?

Would it not be more honour for a gentleman in parliament to be able to say, when any thing in relation to the woollen, linen, filken, &c. manufactures, came before that great assembly, that I have exercised myself at the loom, and made several pieces of woollen or linen cloth, and silk, &c. and I know the management of the wool from the fleece, and the flax from the seed, and the silk from the worm; and, therefore, in what such manufacturers represent to the house is false and impositious in such respects, &c.—Would not, I say, this redound infinitely more to the glory of such a gentleman, than to have the reputation of the keenest gamester, or the boldest fox-hunter?

Throughout several parts of this work we have shewn the usefulness of many branches of experimental philosophy to the interests of land and trade; and, as gentlemen stand in need of exercise and amusement, here also is another scene, which will for ever delight and inform; a scene that will administer endless improvement to all the manufactural and mechanic arts.

But, lest some persons of honour and quality should still remain unconvinced from what we have already urged throughout this work, in relation to the reciprocal dependency between the interest of land and trade, it may be useful to give a further idea of the national advantages arising from the manufactural arts.

It would certainly be worth the while of any gentleman to understand the whole progress of a manufacture, from its commencement to its consumption, and how much it pays to the subsistence of the people. This appears from the supposition of 100 broad cloths sent to Turkey, and the returns of raw silk, that are manufactured for our own consumption, which is as follows:

Suppose a clothier buys at market 50 packs of wool, picked and sorted, at 10l. per pack	l. s. d.
With which wool he makes 100 broad cloths; and the manufacture thereof, in carding, spinning, weaving, milling, dressing, &c. as they are usually brought to, and sold white at Blackwell-Hall, will amount to about the first cost of the wool	500 — —
So that these 100 cloths are sold by the clothier to the merchant at 10l. per cloth	1000 — —
And the merchant pays for dyeing of the said 100 cloths, $\frac{2}{3}$ part in grain colours, at 7l. and two-thirds in ordinary colours, at 30s. per cloth	333 6 8
Also, for setting, drawing, pressing, packing, &c. 15s. per cloth	75 — —
The said 100 cloths will cost the merchant 14l. 1s. 8d. per cloth on board, which amounts to	1408 6 8
And, to repay him their cost and charges here, and their charges abroad, with a bare allowance for insurance, and the interest of his money, they cannot purchase less, I should think, than 22 great pounds of sherraffee (or Persia fine raw silk) for every cloth.	
Thus he probably receives, for the said 100 cloths, 2200 pounds weight of the said raw silk.	
Now, if the half-part of this silk is wrought up into plain coloured tabbies, the manufacturers will receive 13s. 7d. per lb.	747 1 8
And, if the other half-part is wrought up into rich flowered silks brocaded, the manufacturers will receive 1l. 19s. 9d. per lb.	2186 5 —
And the additional charge of dyeing, suppose but of $\frac{1}{4}$ part of the said silk, into grain colours, at 9s. per lb.	123 15 —
Then the cost and charges of 100 woollen cloths, shipped from London to Turkey, and the manufacture of the raw silk, brought from thence in return thereof, must amount to	4465 8 4
The freight of the said 100 cloths, and of the said 2200lb. of raw silk, is computed at	40 12 6
Customs on the said 2200lb. of raw silk, at	156 15 —
English factor's commission abroad on the sale of the cloth, and on investing the returns in silk as aforesaid, computed at	100 — —

It is here clearly represented to the view of the reader, that every 2200lb. weight of raw silk imported from Turkey, and manufac-

tured here for our consumption, without 1. s. d. paying any thing to the merchant's or mercer's gain, pays to the landholders, the labourers, and the crown, the sum of 4762 15 10

If any thing is to be added for the merchant's and the mercer's gain (and we may depend upon it they will not be at the trouble of driving their trades for nothing) we may very well affirm that the whole cost of this manufacture for consumption cannot be less than 5000l. so that 2200 pounds weight of Turkey raw silk, manufactured here, pays the sum of 5000l. to the subsistence of our own people.

This account takes the return upon 100 cloths exported to Turkey, and makes them pay 5000l. to the subsistence of our people; but we have heretofore exported annually two hundred times as many cloths for Turkey, and received, for about half that quantity of cloth, the same kind of returns in raw silk for our own consumption; and, consequently, our own consumption of Turkey silk paid for the subsistence of our own people the sum of 500,000l. per annum, besides what is paid by the other half of that trade.

But if the consumption of 5000l. value of Turkey silk manufactured pays 500l. to the landed interest, for the wool that is exported to Turkey in manufacture, then the annual consumption of 500,000l. value of that silk must pay 50,000l. per annum to the landed interest.

And yet this is not all that the landed interest might receive annually by means of this half-part of the Turkey trade; the crown and the subjects, who receive nine times as much for customs and labour, pay, perhaps, a ninth part of what they receive to the landed interest for cloaths and provisions; by which means the consumption of Turkey silk manufactured in England, either directly or indirectly, pays a fifth part of its whole value to the landed interest; that is, it pays directly one tenth part of the value of the silk by the woollen manufacture exported, and as much more by enabling the people to purchase necessary cloaths and provisions, of which as much more is paid to the landed interest.

It will be objected here, that the 10l. above-mentioned upon a pack of wool is not paid to the landed interest, since a part of it is paid to the shepherd's wages, and a part to the labour of picking and sorting this wool.

It is very true: but then, considering how much of the product of the lands is exported to purchase dyeing goods, and especially cocheneal, for our purchasing of which with English manufactures, the tenth part of the price of the whole silk manufacture may be very well said to be paid for the product to the landed interest.

But what a condition would the lands be in, if it were not for this trade and manufacture? It is evident, that, of every 5000l. value of manufacture from Turkey silk, 500l. is paid for the manufacturing of the English wool that is sent abroad, 333l. 6s. 8d. to the charge and labour of dyeing, 75l. to other labour bestowed on that manufacture, 747l. 1s. 8d. for manufacturing one half of our returns, and 2186l. 5s. of the other, besides 123l. 15s. for dyeing the same in grain colours; add to this the freight of 40l. 12s. 6d. besides the charges to factors abroad, and merchants and mercers at home; and it will appear that near 4000 of every 5000l. value, or that near 400,000 of every 500,000l. value of Turkey silk wrought in England, is paid to the labour of the manufactures and others bestowed upon it.

Now what shall the people do for subsistence, when they are deprived of this 400,000l.? Certainly they must come to the parish and the lands for a maintenance. We are obliged, therefore, to this part of the Turkey trade, this which imports raw silk from that country, that it has paid formerly 100,000l. per annum to our lands, and saved them from maintaining as many people as are now subsisted, at their own charge, to the value of 400,000l. per annum. I think this is enough to shew, that the TURKEY TRADE ought to be the care of every gentleman in England.

Further REMARKS.

The improvement of practical arts and manufactures does greatly depend on the judgment and ingenuity of artizans and manufacturers themselves; I mean, chiefly upon those who are at the head of any manufacture; for the fancies of mankind are soon tired with the same fashion; artists and manufacturers, therefore, must ever be upon the wing of invention: our neighbour nation, we know, is famous for being the grand parent of all modes and fashions in dress, furniture, and almost every thing else. From hence they seem to derive a sort of dominion, in this respect, over the whole world, the consequence of which may, one day, give them the dominion in commerce; for that nation which shall carry the newest and most ornamental modes to foreign countries, in their manufactural and mechanic trafficable inventions, will, at length, carry away the trade.—If our British manufacturers will plod merely in their old-fashioned roads, while our competitors are daily striking into such new ones as please the general taste more, will not the trade of the one gradually grow out of date, whilst that of the other is ever growing young and flourishing?

We are surprized that French fashions should be so prevalent in England, as well as all Europe. Is not this a sign that they have, some-how and by some means, obtained the knack of gaining an ascendancy, in this respect, over all other nations? Our British manufacturers, and other well-meaning Britons, may blame the taste of the world herein, and may be so fond of their own modes, 'till they may only keep them within themselves, and thereby lose all their foreign traffic. The taste of the world must be pleased, and our artists must follow that taste, or the traffic will infensibly leave them.—We may boast of our being the old shop for the woollen manufacture, but the French have cut us out with their new one; we may value ourselves upon the substance, strength, and excellency of our manufactures, but, if foreign nations like rather the slight and tawdry than what we call the solid and substantial, the substance will be converted into shadow, and the shadow into substance! I mean, in plain English, the French slight and showy manufactures, which can be had for two-thirds, perhaps, of the expence of what the English call their solid and substantial, will become the substantial commodities, and the solid the shadowy; for, in this sense, I term that manufacture the substantial, which sells the more universally.

It is not my intention to insinuate any thing to the disparagement of our British manufactures in general, or to depreciate the skill and ingenuity of our artists: on the contrary, I am persuaded their labours, in general, are rather superior, than otherwise, to any nation whatever.—All that I would mean to signify is, that I have observed an over-fondness in our manufacturers to stick too tenaciously to one and the same form of fabrics, whereby they lose the trade, while our rivals, who pursue the contrary measures, gain it out of their hands.—This I take to be the true state of the case; and, therefore, may deserve the most serious attention of the public.

Throughout the course of this work I have shewn, from numerous instances, founded on FACT and REALITY, the wise and vigilant measures that have been, for above half a century, and still are steadily taken, by our most dangerous trading competitor, to bring every branch of their mechanic and manufactural arts to the last perfection.—This is done by bringing up every class of their practical artists to excel in their respective employments.—None are admitted to the freedom of any of their trading corporations, without the actual performance of a master-piece of workmanship, in the real presence of a number of jurats, solemnly sworn for that purpose. See the article CANDIDATE. See also the various manufactural trades and arts described in this performance.—The servitude of their apprentices to the arts and manufactures is longer, and better regulated, than that of other countries.—See the article APPRENTICE.—The art of DESIGNING, which highly tends to the improvement of our capital manufactures, has been long publicly encouraged in FRANCE, and shamefully neglected in England. See the article DESIGN, and the article ENGRAVING.—In short, the men of learning in France have, within these few years, greatly turned their studies to the improvement of the old, and invention of new arts and trades, thinking the value of their old-fashioned studies of infinite less use to their country than what they have adopted.—To such a degree is this spirit now arrived in that kingdom, that, by late accounts from thence, we are informed that they have begun to set on foot SOCIETIES FOR THE PERFECTING OF TRADES AND MANUFACTURES, EXCLUSIVE OF THEIR SEVERAL ACADEMIES, IN HOPES THE FORMER MAY HAVE AS APPARENT AN EFFECT IN PROMOTING THE MECHANIC AND MANUFACTURAL SKILL AND INDUSTRY, AS THE LATTER HAVE VISIBLY CONTRIBUTED TO PROMOTE TRUE SCIENCE, AND A SPIRIT OF ENQUIRY. Would it be any discredit to copy MODES of this kind from our neighbours?

So unspeakably great are the advantages arising to commercial states from manufactures, that it is not to be admired those states should endeavour to decoy the subjects of such importance from each other. Nor will the most rigorous laws and severest penalties prevent it; there seem to be but two things which will prove effectual to this purpose: the one is, a love that such people must have to their native country; the other is, to live comfortably and get money.

In regard to the former of these, nothing can be more conducive thereto than the wisdom of our constitution, both in church and state; yet experience shews that alone will not do; for men will sooner live prosperously under the worst government, than they will starve under the best. The great point, therefore, is to advance our commerce, that they may all live well, and their families prosper, so that we may have a constant race and succession of the most experienced and adroit artists of this kind.

As so much depends upon the art and ingenuity of this class of people, should any wise measure tending thereto be neglected? With respect to apprentices in this employment, we have shewn, throughout this work, what other nations do; but the ordinary methods taken by us, in relation to this great point, are nothing like so wisely calculated to render them ingenious.—Nor, when they are out of this juvenile

state of servitude, the methods taken by us to know, whether they have well or ill spent their time, are not so well adapted as those of our competitors, which we have repeatedly shewn. How, therefore, can we but expect that our own artists should decline in ingenuity, while those of our rival nation are advancing.—This is the case of our common laborious working manufacturers and artizans, when comparatively considered with those of France.—And, in regard to the principal undertakers and conductors of our capital manufactures, who find the fortunes wherewith to carry them on, and who are, or should be, the great instruments to improve our old manufactures, as well as to strike out such new that will hit the taste of foreign countries, they have met with no encouragement in this kingdom like unto what they have met with in France, as hath been made appear in variety of instances.

People are convinced now, that the chief states of Europe are striving for the dominion in commerce; knowing, if they once obtain that, they cannot want the like in empire. And, since it is self-apparent, that the superiority and dominion in commerce so materially depends on our manufactural arts, does it not nearly concern the constant prosperity and happiness of these kingdoms, to think of every measure that may contribute to the advancement of those important arts amongst us?

In the management of the more estimable manufactures, there is required not only an extraordinary dexterity, care, and ingenuity, on the part of the common workmen, to execute their respective parts to the necessary perfection; but there is required also, in the principal undertakers and managers of such manufactures, a judgment and sagacity requisite to conduct and controul every distinct part, in order that the whole may turn to profit and honour.

Too many, perhaps, may imagine, that the meanest capacity and the most awkward wretches are equal to the working and laborious part of our manufactures, and therefore that the ordinary methods whereby those persons are trained up from their infancy, are adequate to their employment. I cannot help differing from such who think so. Where great agility and dexterity of limbs are required in a manufacture, the stature, make, and disposition of youth, should be taken into consideration, in order that a right judgment might be made, whether he is formed by nature for the employment intended. The human species differ as much among themselves as the brute creation; the horse that is fitted by nature for the race or the saddle, will not do for the coach, the waggon, or the plough, &c.

Those children who are brought up at the public expence, either in charity-schools or hospitals, &c. are so much the children of the public, that they have a right to dispose of them. And, as the nation stands in need of a constant supply of the manufactural and mechanical artists, the public have a right to bring up these children who are maintained by charitable benefaction, in such a manner as they shall judge proper, in order to render these children the more skilful and ingenious in those arts. Wherefore, in regard hereunto, the following queries are submitted, viz.

1. Whether the education of the children of the poor, who are maintained by public charity, does not require a general reformation, to the end that they may become more ingenious in the mechanical and manufactural arts, than their present manner of bringing up will admit of?
2. Whether such children of the public should not be duly classed out, from their make and genius, at a suitable age, by proper governors, inspectors, and directors of parishes, &c. and apprenticed out to such manufactural and mechanic business, as they may prove the most fitted for by nature?
3. Whether the sooner they are brought to practise those manual trades, that do not require strength beyond their years or their natural make, the nation is not likely to have a more dextrous and ingenious race of working manufacturers, &c.?
4. Whether such schools should not be constituted, by LAW, WORKING SCHOOLS, and that only two hours of their time in the day should be allotted to learn to read and write, &c.?
5. Whether it may not be expedient to think of proper ways and means to excite an emulation among these manufactural children, to excel in their respective manual trades?
6. Whether those children, being apprenticed out to master-manufacturers 'till they are 24 years of age, might not somewhat contribute to enable our manufacturers so to lower the price of their goods, that the nation might not sustain such injury as we do, from other countries underselling us?
7. Whether master-manufacturers should not be allowed a certain number of those children for apprentices, and no more; and whether those trades, that are in the most declining condition, should not be entitled to more of these children as apprentices, than those which are in a pretty flourishing condition?
8. Whether infant children at two years of age, whose parents cannot maintain them, and therefore are willing to resign them to the public to be brought up to some honest manufacture, should not be duly provided for by the public for that

That purpose; and whether such measures would not prevent many infant children being brought up by their distressed parents, in a scene of theft and iniquity; and whether this would not be making such a useful and happy provision for poor children, as to lay the axe to the root of those immoralities, which might otherwise grow up with them, from the bad example of their parents?

9. Whether it would not greatly conduce to encourage these youths, to excel in their peculiar manual arts, provided they were entitled, after the expiration of their apprenticeship, to a certain premium, proportionate to their ingenuity and good behaviour in their master's service?

If, from the preceding, or such-like measures, the kingdom should be always well supplied with a succession of adroit and ingenious working manufacturers, the master-manufacturers and undertakers will never want hands to execute their most delicate inventions, which will greatly contribute to the national improvement of these arts; for, if those upon whom the inventive arts depend, cannot have a number of proper workmen to execute what they contrive, it is a discouragement to invention.

The next matter that naturally falls under consideration, according to this train of thinking, is, how, and in what manner, the inventive faculty of our master-manufacturers may be so assisted, as to design such a perpetual series of new modes and fashions in their fabrics, as may scarce ever fail to hit the taste of foreign nations.

Having dwelt so long upon this head already, for brevity's sake, what I have further to suggest, may be best done by a few short general propositions.

1. That, in order constantly to please the taste of foreign countries in our British manufactures, it is necessary to consult the climate, the disposition, and way of thinking and judging of the several ranks of people in such countries, what manufacturers they supply themselves with, and what they generally import from other nations.

2. Of these particulars our master-manufacturers should not only inform themselves by reading the best accounts we have of these things, but should consult and advise with our merchants; and, before they put themselves to too great an expence in their inventions, to get such merchants to send over patterns of their new improvements to such foreign countries, in order to have the opinion thereon of the foreign merchants and tradesmen in such countries.

3. That various foreign markets be thus tried with one and the same improved manufactures: for what will suit one, frequently will many.

4. That our master-manufacturers constantly obtain of our merchants, from foreign countries, the patterns of such manufacture as are sent by France, or any other foreign nation, and sell well in other countries, and the price which our merchant exporters can afford to give our master-manufacturers for such goods.

5. That our master-manufacturers think of every kind of materials which the earth, or the brute creation, affords, whereby they might chiefly improve any sort of our old manufactures, or by means thereof might invent any new kind.

6. That our master-manufacturers, from having all sorts of such-like materials always before them, may think of the most natural, cheap, and elegant methods of compounding and working divers materials together, so as always to afford some new improvement.

7. That they make constant enquiry after various sorts of foreign materials, and obtain such small samples of them, as may be compounded and worked strongly and beautifully with some of our own materials, or with our own and the materials of several foreign countries, &c.

8. That our master-manufacturers gain a knowledge of any new invented looms, or other machines, or any kind of inventions, which are used in foreign countries, whereby they make such fabrics that please the taste of foreign nations better than the present British.

9. That, in order to obtain such knowledge, the master-manufacturers concerned in the same branches contribute by a joint purse, to send deputies over to any foreign country, either some one or more of their own body, with intent to get a thorough knowledge of such new invented looms, machines, &c.—Or, that they send a person abroad for that purpose, who is well skilled in mechanics, so as they may be able to bring away such new invention into their own country.

10. That, as some peculiar improvement in divers sorts of fabrics of wool, silk, velvet, tapestry, &c. may frequently depend on new invented machines, &c. it seems necessary that our master-manufacturers should endeavour so to inform themselves of the principles of mechanical powers, as to be able to think for themselves, in what manner any improvements in their fabrics might be made, by means of such new invented looms, machines, &c.—Or, when they have designed any new invention in their mind, which they cannot execute, by means of their ordinary looms and machines, such manufacturers, if they cannot themselves invent a machine suitable to the occasion, should apply to some able practical mechanic, or consult some skilful mathematician, who

may have more particularly turned himself to mechanical inventions, &c.

11. That our master-manufacturers be bred up regularly to the art of DESIGNING; more particularly those in the silk, linen, velvet, and tapestry, &c. fabrics, which will greatly help their invention with what may please the fancies of foreigners. See the articles DESIGN and ENGRAVING.

12. That public rewards be given to all such, although they are not manufacturers, who shall make any capital improvements in any of the old British fabrics which are exported to foreign markets, or shall invent any new ones for the benefit of exportation.

13. That all British master-manufacturers endeavour, to their utmost, to keep their capital discoveries as much as they can a secret from foreigners, who may send their spies over to obtain a knowledge of them.

For more matter that has consonancy herewith, see the several articles referred to at the beginning of this article.

An abstract of an act of parliament for the effectual punishing of persons convicted of seducing artificers in the manufactures of Great-Britain or Ireland, out of the dominions of the crown of Great-Britain; and to prevent the exportation of utensils made use of in the woollen and silk manufactures from Great-Britain or Ireland, into foreign parts, and for the more easy and speedy determination of appeals, allowed by another act relating to persons employed in the same manufactures therein mentioned.
23 Geo. II.

Whereas by an act of the 5th of Geo. I. intitled, An act to prevent the inconveniencies arising from seducing artificers in the manufactures of Great-Britain into foreign parts, it is enacted, That if any person or persons shall contract with, or endeavour to entice, any manufacturer or artificer of or in wool, iron, steel, brass, or any other metal, clock-maker, watch-maker, or any other artificer or manufacturer of Great-Britain, to go out of this kingdom, into any foreign country out of his majesty's dominions, and shall be lawfully convicted thereof, in the manner prescribed by the said act, the person or persons, so convicted, shall be fined any sum not exceeding 100*l.* for such first offence, &c. and shall be imprisoned for the space of three months, 'till such fine shall be paid.—And, if any person or persons, having been once convicted as aforesaid, shall offend again, and be so convicted a second time of the like offence, in such case, the person, so convicted a second time, shall be fined at the discretion of the court, and shall be imprisoned for twelve months, 'till such fine be paid.—And whereas, notwithstanding the penalties to which offenders against the said act are thereby subjected, divers wicked persons have of late seduced into foreign parts several artificers in the woollen and other manufactures; and it is become necessary to make some more effectual provision to prevent evils so destructive to the trade of this kingdom, &c. Therefore, for preventing the said pernicious practice for the future, &c. be it enacted, &c. That if, at any time after the 24th of June 1750, any person or persons shall contract with, entice, persuade, or endeavour to persuade, solicit, or seduce any manufacturer or artificer, of or in wool, mohair, cotton, or silk, or of or in any manufactures made of wool, mohair, cotton, or silk, or any of the said materials mixed one with another, or of or in iron, steel, brass, or any other metal, or any clock-maker, watch-maker, or any other manufacturer, workman, or artificer, of or in any other of the manufactures of Great-Britain or Ireland, of what nature or kind soever, to go out of this kingdom, or out of the kingdom of Ireland, into any foreign country, not within the dominions of, or belonging to, the crown of Great-Britain, and shall be lawfully convicted thereof, &c. the person or persons so convicted shall, for every artificer, workman, or manufacturer, so by him, her, or them, respectively contracted with, enticed, persuaded, solicited, or seduced, severally forfeit the sum of 500*l.* and shall suffer imprisonment for 12 calendar months without bail or main-prize, and until such forfeiture shall be paid.—And, for a second offence, they shall forfeit 100*l.* and be imprisoned for two years.—Prosecution to be commenced within twelve months after the offence committed.

Persons, exporting the utensils made use of in the woollen and silk manufactures from Great-Britain or Ireland into foreign parts, shall forfeit the tools and 200*l.* penalty.

Officers of the customs and revenue empowered to seize all such tools as shall be found on board ships bound to foreign parts, and the same to be sold after condemnation, and the produce to go to the king and the officer. Captains of vessels, permitting such utensils to be put on board, to forfeit 100*l.* Captains of his majesty's ships to forfeit 100*l.* and to be cashiered.

Officers of the custom-house, signing cockets, &c. for the exporting of such tools to forfeit 100*l.* and his employment. One moiety of the forfeitures to go to the king, the other to the prosecutor.

Prosecutions to commence within six months after the fact committed, and the person so sued may file common bail, and

plead

plead the general issue.—And, if found not guilty, may give this act, and the special matter in evidence.—If the prosecutor become nonsuit, &c. the defendant shall recover treble costs.

MANURE for land. The matters used for this purpose are various, as well in different countries, as in different parts of the same countries. The most ordinary are dung, lime marle, and peat, sea-shells, such as those of cockles, periwinkles; all which must be applied according to the quality of the soil.

R E M A R K S.

The temperaments of earth in general may be distinguished into three classes, sand, loam, and clay. Sand is a collection of solid, stony, and loose particles, and scarce capable of cohesion alone. The parts of this earth, in proportion to their enlargement and variation from a globular figure, are gradually changed into gravel, or a couch of pebbles. These different stony soils are capable of receiving water, oil, salts, fire, air, and all the principles of vegetation into their interstices; but can never retain them for any considerable time, since the nutrimental mixtures slide through the vacuities as easily as they at first filled them. To prepare this kind of land for cultivation, it must be properly tempered with a suitable loam, clay, or marle.

Pure earth is a mass of little clods, extremely fine, and qualified for an immediate conjunction with each other, and for continuing imbedded in that manner. When the earth is very compact, and its constituent particulars are not separated by any cavities, it forms soils of clay, marle, or chalk, which retain the juices they receive, but are not very tractable to the impressions of water, heat, or air. The fibres of plants can hardly penetrate these soils, and their culture is rendered very difficult; but, if these are duly mixed with a sand that will keep them suitably open, they may be profitably cultivated.

Loam, or that earth which is a medium between sand and clay, is a powder which partakes of the pliancy of sand and the consistency of pure earth, and may be called a composition of minute supple masses, something spongy in their nature, and easily diffused by labour. They readily open to the influences of the air, and are very retentive of what they receive. Plants can shoot their fibres into this soil without obstruction, and are accommodated with a copious nutriment.

The just temperament of the soil, which we call loam, is manifest by the pliancy of the parts that compose it, and by the vigour of its productions. But we too often meet with a disproportion in its qualities, and this earth of an intermediate nature may be sandy in several degrees, without being sand itself; or it may resemble marle, without having any real intermixture of that substance.

When a soil is either too lean or compact, they are corrected with variety of manures, according to the intention. Horse-dung, which is light and dry, is laid to advantage on a soil of mould, where little clods are apt to imbody with each other; and an intermixture of cow-dung, which is fat and binding, is appropriated to a sandy soil. By these expedients consistence is given to the one, and rarefaction to the other, which is a judicious and profitable proceeding.

The more indolent have recourse to a method still more efficacious and durable in its effects, since it strikes at the cause of the evil. They open the ground to a certain depth, either in their garden or some adjoining spot, and endeavour to find a bed of earth entirely different in its qualities from the land they would rectify. They intermix and thicken a dry and sandy soil with a proper quantity of mould, or at least with a marly earth, which is frequently no more than a black and binding loam. But they open and disunite a marly earth, by mixing it with a large quantity either of river sand, or of that which is found in subterranean veins of gravel. When the earths are thus blended together, they are thrown into heaps, till the different ingredients have had time to incorporate in a proper manner. The beams of the sun, the winds and frosts, together with the constant action of the air, will complete the preparation of the whole, and we may then plant in a soil entirely new.

But, as we acquire knowledge by very imperfect steps and degrees, and may be easily deceived in the choice of a soil, which appeared to us sufficiently qualified to improve our own land; it will be prudent to make the first experiments on a small quantity of earth, till we are satisfied by very apparent success, that our endeavours to meliorate the whole will not prove ineffectual.

The essential particulars to be regarded are, your permitting the blended, or artificial sort, to be fallow, a year at least, before you begin to plant; and your compleating the mixture not in a parsimonious manner, but to the depth of three or four feet: otherwise, whatever you plant will inevitably perish, when their roots begin to penetrate into another vein of earth, which will wound them by its unpliant cohesion, or parch them up by its dryness.

If the soil be gross and difficult to be moved, or spongy to an extreme degree, your lands should be raised towards the

VOL. II.

middle, and sunk at the extremities into suitable slopes; by which means the water that would otherwise chill your lands, were it to remain upon them too long, flows off towards the alleys, and may sink into such a drain, as will convey it to the ditch that bounds the fields.

Whatever may be the nature of the soil, we find an excellent effect from clearing the alleys, in the winter-season, of their snow, and throwing it on the beds, where fertility is greatly improved by this method.

Upon estates of any considerable size, where lands lie united, there are often variety of soils, and by a proper mixture and composition of the one with the other, according to the principles before laid down, the one sort of land or soil will contribute, in a great measure, to meliorate the other; so that, with due judgment, grounded upon repeated experimental trials, by small quantities, the proper manures for many lands very frequently lie contiguous to each other, and yet remain unknown to the proprietor or the farmer, for want of a competent knowledge in the proper mixture and compositions of earths, so as reciprocally to aid and assist each other; in order to make a compost soil, which will help to forward, expedite, and increase the general principle of fertility. But,

I fear there is one general mistake, in relation to the nature of manure, that runs through all our practical principles of agriculture; which is, that we are too apt to imagine that the great principle of fertility depends upon the application of certain kinds of gross matter to particular soils: whereas I humbly conceive, that all gross matter, as dung, lime, marle, or any other gross earth whatever, have not inherent and essential to them those great virtues which are generally imagined; but, by the admixture and incorporation of these sorts of earths with others, either to open or shut different soils, suitable to their respective qualities; such compositions of earths contribute to prepare soils only for the more effectual reception of the virtues of fertility; for those augmentative virtues of fertility may, perhaps, upon due experimental trials, be found to exist in the water, the air, the dew, snow, light, and fire; and that soils, or gross earths of any kind, are no more helpful to the great principle of vegetation than as a **MATRIX**, constantly to receive and nourish the incessant influence of fertility.

If then it shall appear, that the nature of vegetation in general, by repeated unerring experience, is grounded upon these plain and obvious principles, it may possibly open an extraordinary door for universal improvements in every branch of vegetation. For, if this be the real case, it will naturally lead us to the mixture of such sorts of earths as will necessarily tend either to loosen or shut others, so that the spongy principle may be the better promoted, in order to receive more copiously the influences of fertility that are inherent and essential to the water, the rain, the dew of heaven, as the sacred oracles of God stile it, light and fire, &c.

We are but too sensible that our reasonings about the wonderful and intricate operations of nature are so full of uncertainty, that, as the wise man truly observes, hardly do we guess aright at the things upon earth, and with labour do we find the things that are before us.

And this observation we find sufficiently verified in vegetable nature, whose abundant productions, though they are most visible and obvious to us, yet are we much in the dark about the nature of them; because the texture of the vessels of plants is so intricate and fine, that we can trace but few of them, though assisted with the best microscopes.

We find, by the chemical analysis of vegetables, that their substance is composed of sulphur, volatile salt, water, and earth; which principles are all endued with mutually attracting powers, and also a large portion of air, which has a wonderful property of strongly attracting in a fixed state, with a power which is superior to vast compressing forces; and it is by the infinite combinations, action, and reaction of these principles, that all the operations in animal, as well as vegetable bodies, are affected.

These short observations may excite to further researches of this nature, which is the chief end of introducing them in a work of this kind. See **AGRICULTURE, CHEMISTRY, EARTH, FARMING, HUSBANDRY.**

On the **MANURING** and **CULTIVATING** the **LANDS** of **GREAT-BRITAIN** and **IRELAND** in general, in order to render **LABOUR** and **COMMODITIES** cheap.

In order to introduce what I have further to say upon the manuring or cultivating of lands, which is, at present, a point ardently laboured in France, with a view to lessen the price of commodities in general, it may be proper to lay down and illustrate some principles relating to money, which may deserve to be regarded as maxims perhaps.

This, indeed, I intended to have done under the article **MONEY**; but, considering that it would not be so properly adapted to what I would urge in relation to lands; and also that I should have matter of a different kind to come under the head of **MONEY**; I judge, upon the whole, it will be best to come in here.

I. Money, i. e. gold and silver, being, by the consent of most nations, become counters for adjusting the value of all things else, and balancing accounts between man and man, and the means by which commodities of all kinds are procured and transferred from one to another, is hence become the sole medium of trade.

II. Money can be brought into a nation that hath no mines, by the means of trade only, i. e. by such nations exporting more goods in value than they import: for, in proportion as the value of the exports exceeds the value of the imports, money, which must balance the account, increaseth faster or slower [see the article *BALANCE OF TRADE*]; and, contrariwise, where the imports exceed the value of the exports, the cash of such nation must proportionably diminish: this is called, and doth constitute, the general balance of the trade of all nations that have not mines.

III. Money will be most plentiful where the mines are: as the quantity of coals will be greater at Newcastle, than at any place that is supplied only with coals from thence: and, consequently, I mean, that gold and silver will as certainly be less valuable where the mines are, than at any other place which is supplied by them with those metals.

IV. That the prices of the produce of manufactures of every nation will be higher or lower, according as the quantity of cash circulating in such nation is greater or less, in proportion to the number of people inhabiting such nation. See the article *CASH*.

To illustrate this, let it be supposed that we have ten millions of cash, and as many people in England; it is evident they have twice as much money amongst them, in proportion to their number, as they would have, if their number were doubled, and the quantity of cash remained just the same. And therefore I think, they could give but half the price for things in general in this case, that they could do when they were but half the number, with the same quantity of money circulating amongst them. Wherefore, if the people increase, and the cash doth not increase in like proportion, the prices of things must fall; for all the people must have necessaries, to procure which they must all have money: this will divide the same quantity of cash into more parts, that is, lessen the parts; and then it is evident they cannot pay so much for their necessaries, as when the same cash, divided into fewer parts, makes the parts greater.

The prices of all things in this kingdom, some centuries ago, were vastly lower than they are now. In the reign of king Henry VIII. it was enacted, that butchers should sell their meat by weight; beef at an halfpenny, and mutton at three farthings per pound: and, if we look back to the reign of king Edward III. we find wheat was sold at two shillings per quarter, a fat ox for a noble, a fat sheep for sixpence, six pigeons for a penny, a fat goose for two pence, a pig for a penny, and other things in proportion. See Baker's Chronicle.

Since the great difference of the prices of these things now, to what they then sold for, is undoubtedly owing to the great quantity of gold and silver, which since that time hath been brought into this kingdom by commerce, it follows, that the prices of things will certainly rise in every nation, as the gold and silver increase among the people; and, consequently, that, where the gold and silver decrease in any nation, the prices of all things must fall proportionably to such decrease of money, or the people must be distressed, unless the number of people decrease in as great proportion, as the cash decreaseth in any such nation.

V. Banking, so far as one is paid with the money of another, that is, where more cash notes are circulated, than all the cash the bankers are really possessed of will immediately answer; so long, we say, as this credit is maintained, it hath the same effect, as if there was so much more cash really circulating amongst the people, and will be attended with those consequences; that, as the price of things will hence be raised, it must and will make us the market, to receive the commodities of every country whose prices of things are cheaper than ours.

And, though we should lay on duties, or prohibit such goods, this will not prevent the mischief, because we shall not be able to carry our commodities thus raised to any nation, where things are cheaper than ours; and because such nations will hence be enabled to set up many of our manufactures, &c. and by their cheapness so interfere in our trade at all other foreign markets, as to turn the balance of trade against us, which will diminish the cash of the nation. The same thing must be understood of all public securities whatever, that operate as money amongst us.—This shews the ill effects to commerce of a large paper circulation, by means of our national debts, stocks, funds, duties, and taxes. See the articles *CIRCULATION*, *DEBTS* [NATIONAL DEBTS], *FUNDS*, *DUTIES*, *BUBBLES*, *TAXES*.

VI. The plenty or scarcity of any particular thing is the sole cause whence any commodity or thing can become higher or lower in price; or, in other words, as the demand is greater or less, in proportion to the quantity of any thing, so will such thing, whatsoever it is, be cheaper or dearer.

Nor can any arts or laws make this otherwise, any more than laws or arts can alter the nature of things.

VII. All things that are in the world, are the produce of the ground originally, and thence must all things be raised. The more land, therefore, shall be improved and cultivated, &c. the greater will the plenty of all things be, and the more people will it also employ. And, as the produce will hence be increased, so will the consumption of all things increase too; and, the greater the plenty becomes this way, the cheaper will every thing be.

And thus will money become plentiful, because less money will purchase every thing, in just the same proportion as the plenty of every thing shall reduce the prices, by the increase of every thing in respect of the demand. And, if this method be sufficiently pursued, the plenty may be increased so much, as to make victuals and drink half the price that they are at now; which will make the price of the labour of working people much lower, for the rates of labour are always settled and constituted of the price of victuals and drink: and all manufactures will be vastly cheaper, for the value of all manufactures is chiefly constituted of the price or charge of the labour bestowed thereon. This therefore shews how to make money plentiful, viz.

First, By thus making the necessities of life cheaper, to such a degree as shall be found effectual to reduce the present rates of labour, and thereby the price of every thing else so much, that the money, now circulating amongst the people, may extend a vast deal further than it now will do.

Secondly, We shall hence be enabled to make and export our manufactures at much lower prices, and this must needs cause us to export abundance more of them to those nations that now take them of us; besides, this will enable us to carry our produce, &c. further and cheaper, to induce other nations to take them of us; who now perhaps do not take any of our goods; whence the cash of the nation will certainly increase, by raising the value of our exports above the value of our imports; that is, the general balance of trade will thus be in our favour, or money will thus be made plentiful.

VIII. Plenty of money never fails to make trade flourish; because, where money is plentiful, the people in general are thereby enabled, and will not fail to be as much greater consumers of every thing, as such plenty of money can make them: therefore trade is always found to flourish, i. e. increase, as money grows more plentiful amongst the people. The year 1720 was a proof in fact of this maxim. And hence the revenue must needs increase likewise, if the duties are always levied on the things which the people consume and use.

IX. Where trade flourishes (we mean where the balance of trade is considerably in favour of any nation) there the people always increase greatly, and become generally happy, whence such nations ever grow potent and formidable. This hath always been found true in fact, and is almost self-evident.

X. It is the strength, honour, and interest of every government, that their subjects be as numerous, as the continent they govern will support in an happy condition; and, as the happiness (i. e. the riches) and numbers of the subjects are greater or less, so will the strength, honour, and revenue of every government be.

XI. A kingdom or state may have more people in it, than the land it contains can well support; that people therefore must be wretched, and that government weak, 'till so many of the poor people, as distress each other by their numbers, are removed where they can have land to support them. The case is the same exactly in every nation, where the land which is cultivated doth not afford enough to make all things very plentiful, for this alone can make people happy.

XII. The quantity of land to be further put to cultivation and tillage, must be so great, as to increase the plenty of every thing to such a degree, that the PRICE of every thing may by that plenty be so greatly lowered, that the rates of labour may also thereby be lowered, 'till MONEY thence come to be plentiful amongst the people in general. 'Till this end be answered, nothing material is effected, nor can trade be effectually enlarged abroad, or relieved at home: for the cultivation of land is the principal natural encouragement which trade can receive; because all things must first come out of the ground, and, according as the produce of the earth is more or less plentiful, so will the consumption of all things be greater or less; that is, so much more or less trade will there be amongst the people. On this the revenue of the nation doth so much depend, that the whole amount of it will be greater or less, as this is, or is not duly encouraged; besides, the same sums will effect more or less accordingly.

XIII. The cash of any nation will always decrease and become scarce, in proportion as the rents are raised, above what the plenty of money, circulating in trade amongst the people, will well enable them to pay; and, where there is not land enough cultivated to keep down the rents, and thereby to remedy this mischief and support the people, it may go to such an extremity, as to leave very little money in the nation. For, where rents are raised, every thing else must and will rise too: whence other nations will be able to supply

supply our market; and, as most of our commodities will hence become too dear to be taken by them in return, so we shall send much less of our goods to other foreign markets; whereby the balance of trade will turn against us, and draw off our money, as long we have any.

XIV. Rents have been advanced, from this principle, which alone can possibly raise the price of any thing, viz. a demand for farms, &c. in greater proportion than they were well to be had.

And, as this hath in a greater measure hindered the people from going on, as such demand for farms shews they naturally would, in cultivating more land, as they increased in numbers, so that the surplus or increase of the people have been obliged to employ themselves in TRADES, MANUFACTURES, and PROFESSIONS, 'till they have so much overstocked and embarrassed all these, that their trades, &c. will not answer to support them, whilst at the same time the necessities of life, and rents have been greatly advanced, to what they were formerly.

This, therefore, must be remedied, or multitudes must be ruined: nor can the gentleman escape: for, if money becomes so scarce (as it certainly in a great measure is at present amongst the people) that the fruits of the earth will hardly bring money enough to support the farmers, and pay all charges exclusive of rent; as many gentlemen already find, who, on that account, are obliged to take their farms into their own management: this being the case, the gentlemen, we say, can fare no better than to become skilful industrious farmers themselves, and get their living by that means, 'till money, as it hath heretofore been, becomes plentiful enough to pay all charges, with a surplus to pay rent; which will be done, whenever the rents are lowered enough to make money plentiful amongst the trading part of the people, but not sooner.

XV. If all the gentlemen in the nation would lower their rents at the request of the people, this could not answer the end; because the demand for the fruits of the earth, which the land at present cultivated can produce, is, and will continue to be so great, if the people be not diminished, as necessarily to keep the price higher than the money circulating amongst them will well enable them to pay for; and because, until many more of the people are employed in cultivation, &c. to lessen the number of poor, and make greater plenty, all kinds of trade, manufactures, and professions, must needs continue so overstocked with numbers of people employed in them, as absolutely to spoil them all, as to the profits, which is the sole end of trade. Wherefore, the natural way to lower the rents, can only be, by putting such very great tracts of waste land into cultivation, as may make farms abound; which will lower and make the rents easy, and will employ the people, not in cultivation only, but in every kind of manufacture, trade, and calling. For all this will be the necessary consequence of cultivating such large tracts of waste land, as must be cultivated to make farms abound, and rents easy.

Sensible we are, that propositions of this kind, 'till they are thoroughly examined and scrutinized, will meet with objections at first from gentlemen of landed estates: since, say they, if the plenty of all productions of the land be so greatly increased, that the whole thereof should become a great deal cheaper than at present, the general rental of the kingdom must necessarily be lowered, in proportion thereto: we are so apprehensive of the temporary prevalence of this prejudice against what has been suggested on this head, that it may not be easily removed: but, supposing that the consequence of inclosing and cultivating great quantities of more lands, both in Great-Britain and Ireland, should occasion a fall in the general rental, we conceive it will not prove any real loss to the proprietors. For,

What has been urged is a weighty argument to shew, that the scarcity of money among the people will unavoidably disable the farmers to pay their rents. To this cause, which naturally lessens the consumption of all things, in proportion as the national cash grows scarcer, and thereby keeps the fruits of the earth from rising to a price, that might enable the farmers to pay their rents, it must be ascribed, that corn, &c. frequently scarce fetches money enough to pay all charges, exclusive of rent, and not to the plenty of corn, considered in itself. For, cheap as corn is, the number of poor, as most parishes find, is greatly increased of late years: this is apparent, from the numbers we are continually transporting, and the necessity of erecting workhouses for the poor, and the complaints of tradesmen all over the kingdom, which have been, and are very great, and very just. Now suppose corn, &c. considerably advanced, to enable the farmers to pay their rents, what must become of the trading part of the nation, who already, with justice, complain they can hardly get money to support themselves, at the present rates of things? And how much more would the poor and their calamities increase, by such a rise of necessities, together with the still greater decay of trade it must occasion; since, if the prices of things were to be advanced, the people in general, for want of money, must, if possible, be still less consumers, and consequently occasion

just so much less business amongst them, who have already much too little? Besides, it is always found that as trade lessens (or is divided amongst more particulars, which is much the same thing in effect) the profits of trade lessen in still greater proportion to the business transacted.

But to proceed: To shew that gentlemen will lose nothing by falling the rents, let it be supposed, that all the land in the kingdom were to be raised 20 l. per cent. per ann. since the land would bear no more corn, graze no more cattle, &c. than it now doth, must not the corn and cattle, &c. be considerably advanced? and must not the labourer, whose necessities must then cost more, have more for his labour? and must not timber to make carriages, and for every other use, cost more to fell and hew it, &c. and must not horses, to draw the fruits of the earth, &c. to market, be more valuable; and consequently carriage, and every manufacture cost more too? All things would certainly thus be raised, if money could be found to circulate them at such an advance. And then, since gentlemen are consumers, and must buy every thing as well as others at this advance, what would they be advantaged by receiving 20 per cent. per ann. more, and paying that at least, if not more, for what they want?

But if gentlemen should say, this would be so as to what they spend, yet what they save and lay up, would be more: for instance, Suppose a gentleman of 1000 l. per ann. now spends 500 l. and lays up 500 l. per ann. if estates were thus raised, he would at the same rate spend 600 l. and lay up 600 l. per ann. But how would he be the richer, since, the price of every thing being raised in like proportion at least, which is an unavoidable consequence, his 600 l. would purchase no more than 500 l. did before? Wherefore, gentlemen would, in this case, be not one jot advantaged.

If, therefore, rents should fall 30 per cent. per ann. every thing would certainly fall, in at least the same proportion; so that gentlemen would lose nothing but the name of so much per annum; which, I think, the argument above doth sufficiently evince. But, lest the name of losing so much per annum should be a prejudice, strong enough to prevent the execution of this so necessary proposal, let it be further considered, that empty houses, the number of which at present is very great, and will be greater still, if this method be not taken to fill them; I say, empty houses, if they can be filled, are real estates as well as land. Now, if money be thus made plentiful, as it certainly may, this plenty of money will soon make trade flourish; and a flourishing trade will soon enable the people to occupy more houses, and hereby the NUMBER OF PEOPLE likewise will soon be increased; so that landlords taken in their full extent*, including landlords of houses, as well as of land, will thus certainly be gainers, by falling their estates so much as shall be needful to make money plentiful, which will soon fill their houses.

* Dr. Nichols, in his Conference with a Thief, page 64, says, To consider farther, how mightily this nation of ours hath increased within a century or two; notwithstanding the many civil and external wars, and those vast drains of people that have been made into our plantations, since the discovery of America: how the city of London hath doubled itself within these forty years, notwithstanding the last great plague; and how the country hath increased, though not in the like, yet in a considerable proportion, &c.

But it may be said, if lands must fall 30 per cent. which is near a third, to fill the houses, and but an eighth, or a ninth of the number of houses, as I shall shew, remain to be filled; how are landlords, taken in the full sense of the word, including landlords of houses as well as of land, gainers? To which we answer, that the rents are now raised above their proper value; for the proper value of any thing is really no other than what the money circulating among the people will well enable them to pay; nor can any greater value be long supported, by any means whatsoever.

But it will be asked, How shall we know when the prices of things are at this proper value? I answer, that as the price of labour is always constituted of the price of necessities, and the price of all other things chiefly of the price of labour, whenever the price of necessities is such, that the labouring man's wages will not, suitably to his low rank and station as a labouring man, support such a family, as is commonly the lot of many of them to have, the price of necessities being then evidently so much too high, every thing else is so too, or then may the prices of things justly be said to be above this proper value.

But it will appear, perhaps, that gentlemen will be the richer for falling all the lands in the kingdom 20 or 30 per cent. per ann. provided this fall be effected only by the addition and cultivation of so much more land, as will make farms so plentiful, as to reduce the rents of lands to such degree. For,

If it shall appear that landed gentlemen would be the poorer, if all the lands in the kingdom were raised 20 per cent. per ann. it should seem the reverse must necessarily follow; i. e. that he would be the richer, if all the lands were fallen 20 or 30 per cent. per annum; that is to say, 70 or 80 l. would certainly

certainly purchase more, if all the lands were so fallen, than 120*l.* would do, if all the lands were so raised: which we shall endeavour to prove.

If all the lands were raised 20 per cent. per ann. it is certain they would not produce more, but, perhaps, less, than they now do, by putting it, in some degree, out of the farmer's power to exercise so much skill and be at so much expence to cultivate them, as they could do before the rents were so raised: we say, since the land could, however, produce no more than it now does, all the produce, whatever it consists of, must be sold, not only for all the 20 pounds more, but there must be profits likewise on all those 20 pounds to enable the farmers to buy whatever they want at higher prices; which every thing must needs be advanced to, from thus raising the produce; which, as it passes through every mechanical and manufactural hand, must still have proportionably increased profits on the thus raised prime cost, before it comes to the consumer; who, therefore, must thus certainly, in the end, not only pay all the advanced 20*l.* rent, but likewise the necessary profits thereon through all the several hands it must pass: and, since the price of labour [see the articles LABOUR and MANUFACTURERS] which adds the greatest value to every thing, must be enhanced also, it is manifest, the same quantity of produce must be dearer, by all the first advanced 20*l.* rent, and by suitable profits to all the several hands through which it must pass, together with a greater charge of labour thereon; whence it follows, that if the same quantity of produce must thus cost a great deal more, than all the 20*l.* rent, by which it was first enhanced, the parts must cost more too in such proportion; so that we need not scruple to assert, that 140*l.* could not, in this case, purchase what 100*l.* now doth: whence it appears, that gentlemen, who are consumers in common with others, would thus evidently be much the poorer for so raising their estates; and, therefore, it should seem an undeniable consequence, that they would be the richer by lowering their estates 20 or 30 per cent. per ann. since it must be equally certain, that 70 or 80*l.* would purchase more, in this case, than 100*l.* does at present; as it is certain 120*l.* in the other case, would not purchase so much as 100*l.* now does.

And this both accounts for, and verifies an observation, which some gentlemen make, and wonder at, viz. that they experience they cannot live so hospitably on the same estates as their ancestors did, who had vastly much less income from them, than their successors now have, who make this observation.

If therefore, gentlemen find themselves straitened, by raising rents above what the circulating money will enable them to pay, how great must the straits and difficulties prove which are brought on the people, out of whom such heavy rents are raised?

It may probably be objected, that this argument concludes too much; since, if 70*l.* will, in this case, purchase more than 120*l.* why will not nothing purchase more than something? To which it may be answered, There is a proper point, at which it will stop of itself, which is this: whenever the wages of the labouring man and price of necessaries are made so near equal, that he can, suitably to that low rank in life, maintain such a family as he, in common with all the human kind, may be presumed to raise: when the labouring man's wages will do this, the rent the lands will then bear, is that proper and fit rent, which will enable gentlemen to purchase more of every thing, than any larger rents can enable them to do: which may be proved thus:

Suppose the rents raised so much, as necessarily to carry the price of goods, to consumers in general, to higher rates than the money they can get will enable them to purchase what they really want; this will make a kind of unnatural plenty of goods, presenting themselves for buyers, who, though they really want them, cannot find money wherewith to purchase them, and therefore are compelled to abridge their necessary wants as much as they can: this depresses the value of those goods (which thus in the end must want buyers) below the rates which the rents have made necessary; and this will inevitably keep the produce of the land which the farmers bring to market so low, that they cannot make it answer to bear all charges, and pay their rents; whence gentlemen must find it difficult, if not impossible, to get their rents; whilst, at the time, whatever they buy, as hath been proved, will necessarily be dearer in a greater proportion, than ever the rents can be raised; whereby it seems plain, that such rents of land in general, as will nearest comport with the point above-mentioned, will always purchase most of every thing.

There is yet another weighty argument to induce gentlemen to make money plentiful, by an annual additional culture of a due proportion of land; that is, a due regard to the happiness of their own families. For, let it be considered, that men come into this world to raise a new generation, and depart out of it. Now, the term of life, men will be found to have one with another, from the time of marriage to their death, is very little more than 20 years: in which time, one marriage with another, we may suppose, produces about four children, who live to man's estate: suppose a gentle-

man of 2000*l.* per ann. to make provision for his children, lays up 500*l.* per ann. which, in 20 years, will be 10,000*l.* saved for them, and which divided into four parts, including the widow's share, which must often happen, can be but 2500*l.* for each child's share: and, since this is not only much inferior to the estate it was saved out of, but hardly sufficient, viz. the interest thereof, to maintain a single person handsomely, most of the children must be introduced into trade, to improve their money for their families, or they will soon reduce it to nothing. If trade be languishing and distressed, it cannot be expected but many such will sink in the general difficulties trade lies under: wherefore, if there be any way practicable to make the money plentiful amongst the people in general, which never fails to make trade flourish, it ought to be done, not only from a common principle of affection to the public good, but for the particular benefit of every gentleman's own immediate offspring, many of whom are sure to be affected, as trade prospers or decays.

But the languishing condition of trade is by some ascribed to the luxury of people, concerning which let it be considered: It is expected of every man, that he provide for himself and family a support; but this expectation is unreasonable, if things are not so wisely constituted in their own nature, that every one may attain this end.

The ways men have to attain this support, are the exercise of their several occupations.

These arise solely out of the mutual wants, &c. of mankind. Children, who can do little or nothing towards supplying themselves, make about half the business of the world, since more than half the human race die under 17 years of age.

If the people must retrench in their expence, they must do some or all these things, viz. wear fewer and worse cloaths, &c. eat less and worse victuals, employ fewer or no servants, occupy less house-room, and use less light and fuel, and spend little or no money in any pleasure or diversion; and, instead of wine or strong beer, drink small beer or water, and avoid marriage, as many certainly do, because it creates a greater expence than they can support. Would not this lessen the consumption of every thing, and hinder many from supporting themselves and families, by making so much less business amongst the people, and thereby greatly increase the number of poor; who, if no other way be found to employ them, which tillage alone in this case can do, must become a much greater burthen than they are? Besides, where the poor increase, the profits of trade will be still more and more reduced, through losses, and want of trade, and the efforts of such great numbers of indigent people, as must be striving to support themselves in the reduced quantity of trade that remains. And must not the revenue be greatly diminished likewise, since in this case the consumption of things, on which the revenue entirely depends, must be lessened very much? A beggarly people can neither pay great taxes or great rents.

Instead, therefore, of urging the people to be less consumers, things should be made so plentiful, that they might be greater consumers, that trade and commerce might increase, and not diminish. Hereby luxury would find its natural and proper bounds, which, if any man transgressed in an extraordinary measure, he would be sufficiently whipped with his own rod.

Moreover, with respect to the nature of luxury, those that are not influenced by the natural motives to frugality, will not easily be restrained by any other whatsoever.

The natural motives to frugality are these, present provision for families, and fortunes for children.

They who neglect the former, must soon suffer want; and they who would provide for the latter, must consider what the term of life is, which they may reasonably hope for, and take care that their gains and expences are proportioned to the end designed.

As persons must, generally at least, have tolerable fortunes themselves, who shall be able to provide fortunes for their children, let it be supposed, that a man sets out with 2000*l.* and by skilful and prudent management he gains, one year with another, about 500*l.* If men who have such fortunes must not live a little decently, whence can trade, which entirely depends on, and terminates wholly in the consumption of things, arise? How can landlords expect any considerable rents for their houses, &c. and to pay rent and taxes, and all other charges, and maintain a middling family in London, with decency suitable to a reputable tradesman, when 250*l.* per ann. is nothing superfluous, even where all things are managed with great economy?

But suppose, in this case, such a man should lay up, one year with another, 200*l.* and that for 20 years, which is, I believe, much about the term men have to raise and provide for families, he then would add 4000*l.* to his first 2000*l.* which makes 6000*l.* together, to be divided amongst four children, which I take to be the number one marriage with another raises; this sum, therefore, will be but 1500*l.* for each child's share, if a like sum be reserved for the widow; and if there should be no widow, but 1500*l.* for each child, which will not often set them in better circumstances than their parents

rents set out in: but, if things must be worse than this, families must soon sink into poverty. And, since these things are subject to many and great contingencies, nobody ought to think 25 l. per cent. per ann. even on such a capital employed in trade, too great gain; especially, considering what skill and pains are necessary to reach this end, and to what great risk money employed in trade is always exposed, beside the present and future provision with which families are to be supplied out of it.

Nothing ought to be deemed luxury in a tradesman, whilst he lives at about half the income of his business; yet in prudence he ought not to make too great a figure, because of the uncertain and fluctuating nature of trade, which may happen some time or other, by misfortune, if not otherwise, to turn against him; and because, the more he can lay up for his children, the more will he have done towards raising them to better stations in life.

Nor ought it to be deemed luxury in a tradesman if he spends the whole income of his business, if such expence be unavoidable, when the utmost frugality and good management are exercised in such a man's family.

Peace and plenty comprehend all the felicity mankind were designed to enjoy in this mortal state; and are so well known to constitute the happiness of the world, that they are proverbial terms to express the completest general felicity; which undoubtedly suggests, that they have by experience been found to answer the end.

Wherefore, if there be any difficulty among the people, it must be owing to the defect of one or both of these.

As we are now in peace, it must be owing to the deficiency of plenty that the trade of this nation is in such a languishing condition; the truth of which the numerous complaints to the parliament, and great number of empty houses, abundantly evince.

Where tillage and cultivation of land are not annually to a considerable degree increased, even peace, and the natural increase of mankind, do necessarily produce a general decay of trade.

For peace, which puts an end to the vast business which war necessarily creates, obliges those that were employed, and found their livelihood by the affairs of war, to employ themselves in the trade and business which the peaceable state of affairs produce; and, as hereby there is a much greater number of people to be subsisted on so much less business as the ending a war puts a period to, it is apparent this must divide the remaining business into a great many more parts; whence the profits, which ought to be so much augmented as the business to each particular becomes less (because the expence of living will not be less) are always found by experience to lessen, in a greater proportion than the business to each particular lessens. This is the inevitable consequence of having a greater number of people in any trade, where the business transacted by them all is no greater than when the same trade and business were in so much fewer hands; and hence ruin must happen to many whose trades are thus unhappily circumstanced.

Besides, peace, lowering the interest of money, brings many more people into trade, who either cannot live on the reduced interest of their money, or are not satisfied to do so, and, therefore, enter on trade to improve their money to better advantage; and such, having abundance of money to employ, must needs take a great deal of business from those that had it before, by doing business at much less profit than it was before done, that they may employ the large sums they bring into trade. This must needs make it very difficult for people of much less fortunes to get a living, greatly increase the number of poor, and empty the houses too, by disabling the people to pay such rents as they did before. This state of things will also drive many out of the nation, to get their livings by the arts they have learned here.

The heavy debts and taxes which war hath laid this nation under, sufficiently evince that war is not the natural means to make trade flourish, since the consequences are still so burdensome to us. And, if we look back to the condition France was reduced to by queen Anne's war, which introduced both famine and pestilence amongst them, and occasioned the people to surround the dauphin's coach in crowds, and cry out, Peace and bread! Bread and peace! Surely these things may fully convince us that war is a very great calamity.

Peace, therefore, being the only natural foundation of happiness to any nation, and trade the particular means whereby the people can be employed and subsisted, the promoting and improving trade should be always consulted, and especially in time of peace, which is favourable to such a design.

In general, there should never be any restraints of any kind on trade, nor any greater taxes than are absolutely unavoidable; for if any trade, by this means, be cramped and fettered, those who subsisted by the business, which now hath restraints and burthens laid upon it, will be rendered incapable of pursuing it, and, of consequence, they must be employed some other way, or drove out of the kingdom, or maintained at the public charge; which last is always an additional grievance, and ultimately falls upon trade, and should, if there

VOL. II.

be any possible way which might employ them, be prevented.

That there are natural means to subsist all mankind in a happy condition, manifestly appears from the wisdom and goodness of the Supreme Being, who hath taken such ample care of all the creatures below us, that they want no good thing, nor suffer any hardships but what unreasonable men bring upon them. Wherefore, if the Almighty hath so wisely and graciously provided for all the creatures below us, for whose happiness other beings evidently appear to be designed, it must be absurd to imagine he hath disposed things so, that unhappiness in any degree should unavoidably arise to man, whom he hath placed at the head of all his works in this world. Therefore, whatever difficulties mankind meet with must be owing to their own mismanagement, in not looking through the nature of providence with respect to themselves.

One branch of that providence, which men should attend to and consider, is, that mankind as certainly increase as other animals and vegetables, and, therefore, that increase must continually be employed in cultivating proportionably more land: for otherwise, being all consumers, there must continually be greater numbers subsisted on the produce of the same land which was before cultivated; and this will increase the demand for the produce, and enhance the price of it, whilst the increasing people must employ themselves solely in trades, manufactures, &c. to enable them to subsist: whence it must needs come to pass, that trades, manufactures, &c. will soon be overstocked; that all the increase of the people cannot be subsisted this way, seeing the necessities of life, for which they all ultimately work, will all the while be growing dearer, and the people less able to purchase them. And, as I take this to be very much our present case, so this proposition of cultivating proportionably more land, appears to me to be one natural remedy to be applied; the happy effects of which, if sufficiently executed, will soon discover to be an universal benefit, notwithstanding any imaginary appearances to the contrary.

But I think it needful here to observe at what rate mankind increase, because their happiness certainly depends on cultivating still more and more land in such proportion. We will consider this matter upon the principles of Sir William Petty, who has endeavoured to shew that mankind will absolutely double themselves in 360 years, notwithstanding the contingency of wars and plagues; therefore, accordingly, the quantity of land which every year should be taken in and new cultivated, must be at least a 360th part of the quantity at present in cultivation.

Now, if England be 320 miles long, and 290 miles wide, it must, supposing it's length and breadth to be every-where alike, contain 92,800 square miles: but, as England is not so regular a figure, I suppose it will be needful to deduct a third of it's contents for it's irregularity, towns, and rivers, and then there will be about 62,000 square miles contained in it.

Suppose that at present but about half, that is, 31,000 square miles, are cultivated, a 360th part of that, viz. 86 square miles at least, should every year be further added, and taken into cultivation, to hold proportion to the natural increase of mankind: and if a greater part of England be already improved than I have supposed, or if mankind increase much faster than Sir William Petty above asserts, then the addition every year must be greater in such proportion.

But, as nothing like this hath hitherto been done, it is evident to demonstration that hence all trades, occupations, manufactures, and professions, are overstocked with numbers, and embarrassed: and hence rents have been advanced, by the demand which the increase of people hath occasioned for land; consequently living is become much more chargeable than formerly, and the people less able to support themselves: besides, the enhancing the price of necessities hath either advanced our commodities, or made them so much worse in quality, that our neighbour-nations have not taken so many of them as they would otherwise have done; and we probably must have taken more commodities from them for this reason. And thus, it is to be feared, that the general balance of trade and money is against us; that is, the gold and silver of this nation have, by this means, been really diminished, notwithstanding the great increase of paper credit and circulation; and the prodigious exportation of gold and silver, of late years, is a strong indication of it, whatever pretences may be advanced concerning it to the contrary.

And, if our trade goes on so, and our competitors, more or less, supplant us therein, we shall, in time, lose our real cash, and be obliged to carry on our business with paper currency only.

But if, to prevent these evils, we do, as fast as possible, put a very great quantity of land into cultivation more than at present is cultivated, our poor will be employed, the empty houses filled, and our manufactures become much cheaper and better; and this will both increase our exportations to the nations we now trade with, and give rise to other foreign markets to vend our goods at, and prevent the excessive importation of foreign goods amongst ourselves: by which po-

Q q

licy,

lity, the general balance of commerce will not only be turned in our favour, pro tempore, but, in conjunction with the other measures we have submitted throughout this work, the same may always be kept so, and money thereby become plentiful enough amongst the people in general, and their happiness be increased in proportion to their steady pursuit of such honest and industrious measures: and, perhaps, there is no other way in nature to compass this end, and effectually to recover the trade of the nation: for those nations that can work cheapest, must have the money, so certain as they always will have the commerce; to which I will add, that the people will always flow into those nations that get the money (i. e. have the general balance of trade in their favour) because trade, which is the means of procuring money and landed estates, is that which employs and subsists them. And it may deserve consideration, whether these measures, steadily backed and forwarded by such others which we have occasionally submitted, may not prove a more effectual way than some that have been proposed, so to multiply our own people, without giving any disgust or uneasiness to the native-born subjects, that we may have as little scarcity as dearth of labour among ourselves. And as to the purchase of estates, which is always governed by the interest of money, they will be valued at as many years purchase as they would, if the annual rental had not fallen; and, though the sums they sell for must be less in proportion as the rents shall be lowered, yet the money will have, at least, all the same effects apply it how you please. The great number of empty houses within the cities of London and Westminster, and places within the bills of mortality*, will certainly, in time, be attended with reducing the rents, perhaps, full one half, if the methods proposed be not applied to prevent it.

* By the bills of mortality of the year 1730, which, by the preceding and succeeding years, appears to be a moderate year, there died in London and Westminster, and the suburbs thereof,

By the no. of deaths, 26,761, div. theyea. they lived, 623,713,

and 23 years, and about one third, according to this bill of mortality, appears to be the par-term of human life; multiply the deaths by this term, shews the number of people living in the bills of mortality to be about 624,423 persons; and, if we suppose the houses, one with another, to contain 10 souls, then the number of houses inhabited will be 62,442.

By a survey taken in the year 1732, 8000 houses appeared to be empty in the cities of London and Westminster, and places within the bills of mortality; most of which lett, at an average, for 20 l. per ann. at which rate, there was upwards of 160,000 l. rent yearly lost in the bills of mortality, more than a ninth part of the whole building being empty. By this bill of mortality it also appears, that more than half the human race die under 10 years of age: and, if we consider the number of young persons, under and over this age, who live to supply the places of those that die in all the stages of life above this term, there can be no doubt that children make about half the business of the world, as I have asserted. And though it appears, by this bill of mortality, that the term of life, on the par, is about 49 years, excluding all those that die at 20 years and under, yet I cannot imagine the term men have to raise and provide for families in the marriage-state doth much exceed 20 years, since it is pretty certain marriages in general commence a few years at least later than the age of 20 years, and are undoubtedly generally dissolved by the death of one of the parties, before they both reach the term of 49 years.

We are sensible the great number of empty houses is ascribed to the increase of buildings: but, whoever considers that there are not less than 6 or 700,000 people in the bills of mortality, and that, according to the natural increase of mankind, at the lowest computation, of doubling in 360 years, the in-

crease will be near 40,000 people since that time*; he will be necessarily obliged to ascribe the empty houses to other causes, and not to the increase of building solely. However, since they are built, and their being inhabited, or standing empty, will certainly have such an influence on the rents of the kingdom, and the revenue likewise, it behoves us to take the proper methods to fill them; which I am confident will soon be effected by cultivating land enough to make a plenty of money amongst the trading part of the people in general, but not otherwise.

* We are not insensible that Mr. Derham, in his Physico-Theology, shews that the deaths in London, as in most great cities, are greater than the births; whence an objection may seem to arise to the increase above-mentioned; which I think is of no weight, because if a nation will absolutely double itself in about 360 years, notwithstanding wars and plagues, cities must do so too: nay it is plain, by what Dr. Nichols says, London increased at so much greater rate as to double itself in 40 years, notwithstanding the last great plague, which happened in that period.

But further, if the people increased, as Dr. Nichols says they did, so as to double themselves in London in forty years, notwithstanding the last great plague, which happened within the period he wrote of; and the country increased, though not in the like, yet in a considerable proportion (and I hope his authority is sufficient to bear me out) then the buildings since the peace of Utrecht, which hath by no means, I think, been in proportion to one fourth of such an increase of people, cannot be the reason to which the vast number of empty houses can be ascribed.

But the empty houses must be ascribed to such a diminution of trade, and, consequently, of cash amongst the people, which makes it so difficult for the people to get money to support them, that many are become incapable to pay their rents, and many must have forsaken the nation on this account: for the people will diminish where the means of getting a livelihood is not well to be attained suitable to their several ranks and stations; which is a necessary consequence where the general balance of trade becomes against any nation.

For it is evident, such a nation hath amongst them just so much business less than their own several wants create, as the amount of the balance against them is, which lessening their cash, at the same time, in the like proportion, brings a double inconvenience with it, viz. want of money and employment: and, if things are suffered to go on so, the people must disperse and diminish. And therefore this maxim, well known amongst merchants, appears well founded, it being only the reverse of what is shewn above, That the people always increase in whose favour the balance of trade is considerable; as it must needs have been in ours, in that period of time Dr. Nichols wrote of; since, notwithstanding so great an increase of the people, the prices of every thing, as is well known, rather advanced all the time, which they could not have done if the cash of the nation (without the great paper circulation, occasioned since by our public debts and taxes) had not increased in yet greater proportion than the people increased, as I think the illustration of the fourth preceding maxim evinces.

Hence therefore it appears, that every nation ought to keep trade on such a foot, as always, on the whole, to have the balance in their favour: for, if mankind double themselves only in 360 years, if the real cash of the nation be not augmented every year 360th part, the people must in a few years be distressed for want of money, unless all things be made at least so much cheaper to prevent it.

And, as the means of doing this is in the power of every nation, that has waste land enough to improve to increase their plenty*, and thereby reduce the price of things; so the improving so much waste land as answers this end; will furnish employment, and consequently a livelihood for the people; and will always, not only prevent a considerable number of houses from standing long empty, but will continually cause more to be added all over the kingdom; as the vast increase Dr. Nichols asserts there was, particularly in London, within forty years, besides the great increase in the country in the same time, doth fully shew.

* Dr. John Laurence, in his System of Agriculture, p. 45, says, Without all question, improvement of lands, of what kind soever, makes riches and plenty, and plenty calls together inhabitants, and people to consume it. And p. 47, he says, So plain it is, that inclosure is the greatest encouragement to good husbandry and remedy for beggary, the poor being employed by the continual labour bestowed on such land, which is doubly repaid by the fruitful crops it annually yields.

That we may put this matter past all doubt, let it only at present be granted, which we shall shew hereafter, that the people in London and Westminster were really doubled in about forty years; since this, nor any thing like this, could be the effect of the natural increase of mankind, it must have some other powerful cause: this cause, we apprehend, was a flourishing trade, which we thus prove, viz.

The people were doubled in the city of London, and increased too in the country, though not in the like, yet in a considerable proportion; nevertheless, the prices of necessities, and all other things in general, were higher than those things were forty years before: now this, by our fourth preceding maxim, was absolutely impossible, if the cash of the nation had not been vastly increased also. Wherefore, as we have no mines, the cash could be increased only by exporting so many more goods in value than we imported. As this is, in itself, that which constitutes a flourishing trade in any nation; so we see the effect was the doubling the people in London; wherefore, let our trade be again put on such a foot, that we may be able to raise our produce and commodities of every kind, as cheap as any nation can raise, or make any thing, whereby they may interfere in any branch of our trade; and the same effect will again manifest itself, and consequently not only fill the empty houses, but cause more to be added.

As it hence appears absolutely needful to keep trade on a foot, whereby the balance may always, on the whole, be in our favour; so it is certain, the mines which are continually giving gold and silver, do afford sufficient to supply such a needful balance. For the gold and silver, which the mines, since the Europeans have possessed them, have not only furnished Europe in general with quantities equal to the increase of mankind since that time, but so much more gold and silver, as to enhance the price of all kinds of commodities throughout Europe in general; and especially in those nations who have, either directly or indirectly, had the most considerable trade with the countries where the mines are: and this, in all probability, they will always continue to do; but, if not, we shall shew, in some future parts of this work, how to do that which will always be equivalent.

And, with respect to the countries which are thus continually furnishing this balance to the rest of the world, they, having the mines, have that which is equivalent to such a balance in their favour.

We have before laid it down as a maxim, that gold and silver (i. e. money) will be most plenty where the mines are: let it then be supposed, that the people possessed of the mines could furnish themselves with the necessities and pleasures of life by the produce of their own country, and therefore should think fit to prohibit the exportation of gold and silver, and should thereby be effectually able to prevent the exportation thereof, which is undoubtedly impossible: if we suppose these nations to make such prohibition, and at the same time continue to work those mines, so that they are perpetually yielding more and more gold and silver, how great must the increase of those commodities soon become? And, since gold and silver are of little use, besides procuring the necessities and conveniences of life, which alone are real riches, and for which gold and silver are now universally exchanged; would not the great plenty of these commodities, thus continually increasing, cause proportionably so much more gold and silver (with which they would at length be incumbered) to be given for the more necessary produce and fruits of the earth? And would not this so depress the value of gold and silver, by their plenty amongst them, as to give occasion and encouragement to all the world to go to this market with their produce and manufactures, which they can and will sell for a vast deal less gold and silver, than what such goods of their own raising would in this case be sold for? Nay, they would find it a convenience to be eased of the burthen of the gold and silver, which the mines, if continually worked, would produce, as certainly as it is a relief to any country to export any other superfluous commodities: for, if they do not cease to work the mines, when they have raised gold and silver enough to be burthenome, they must and will certainly drop their cultivation and manufactures; since men will not easily be induced to labour and toil, for what they can get with much less trouble, by exchanging some of their excess of gold and silver for what they want.

And, if they should be supposed, as is natural enough in this case to drop their cultivation of land and manufactures, which are much the slowest and most laborious way of supplying themselves with what they could so easily and readily procure by exchanging gold and silver, which they too much abound in, they would certainly, in a great measure, lose the arts of cultivation of land, and that of manufactures also; which has long been the case of a neighbouring nation, by the accession of wealth which the West-Indies afforded: whence they are at best but a beggarly nation, with their immense treasure, and the conduit pipes to disperse the gold and silver thro' other parts of the world; which other nations drain them of, by making goods cheaper than they can do, and that to such a degree, that the mines are scarcely sufficient to answer their ordinary occasions, even in times of peace: and, though they are sensible of this, yet they find by experience they can't prevent it.

The case is the very same, in some degree, in every nation, whose quantity of real or artificial cash is large enough to support the prices of their goods, considerably above the rates such goods bear in other nations round about them. Whence it is obvious, that all prohibitions, with regard to

coin and bullion, as well as all other commodities, must be injurious to commerce; because, besides all other mischiefs thereby occasioned, they are always designed to restrain the money from going out of the nation; which will be eternally impracticable, whilst the general balance of trade is against a nation.

We confess that we judge it most nationally beneficial to prevent the importation of all foreign commodities, as much as possible, but not by acts of parliament, such restraints, perhaps, being no good to commerce in general; it is therefore we recommend the raising such goods ourselves, so cheap as to make it impossible for other nations to find their account in bringing them to us: as this is the only natural and effectual prohibition of such things as we would not receive from abroad; so I wish every nation in the world would do the like, as much as ever they can; for then the plenty of every thing would be so great, that all mankind would be happy, if this world is capable of making them so; for we are not partial to our own country, but wish all mankind to be as happy as I with my country and myself. Upon the whole, the reader will observe what we aim at.

First, That it is of no consequence, whether any nation hath a vast deal of gold and silver, or very little money amongst them, if sufficient care be taken to make the plenty of every thing great enough, to render the money they have amply extensive, to circulate their trade in every branch, and fully to employ and support all their people; which must and will make them all happy, and certainly cause them to have vastly more foreign trade, by their thus being able to make and sell their manufactures, and produce them at lower rates than their neighbour nations can do. And this is absolutely in the power of every nation, that will cultivate land enough to effect it, unless any nation should have more people in it than they have land to support them; which may easily be known, from the demand there will be for land, and raising the rents in consequence thereof, till the prices of necessities become so dear, that the wages of the labouring people will not purchase what is needful for the support of their families; and there be no more land left to cultivate, and remove this mischief, which will fall more or less on every occupation, in proportion as the poor become thereby poorer and more and more distressed.

In this case, there is no relief but transporting the people wher they can have land enough for them.

Secondly, It is of little or no consequence to the trade of any nation, whether the people spend near or all their gains, provided they do not spend more than they really gain, for this disables them to make good their contracts; or whether they are generally frugal, and lay up considerably. For the trade of a nation doth very little depend on these things, but entirely on employing the people in cultivation of land in general, in proportion to the other employments of mankind; that the necessities of life, which all ultimately work for, may be so plentiful, that the meanest of the people may easily attain a sufficiency of them, for plenty of these comprehends all human felicity.

REMARKS on the whole of this article of MANURING and CULTIVATING additional quantities of LAND.

Reducing the present RATES OF LABOUR appears so absolutely necessary to increase our foreign and domestic trade, that we have endeavoured to shew, as well under this head, as others synonymous and correspondent therewith, how this very important and interesting matter may be effected, to the great advantage of every class of people within the community; and the way that has been proposed at present, till taxes upon our native commodities can be greatly lessened, or absolutely annihilated, is, perhaps, the only one whereby to procure so great a blessing: and this method will cause multitudes of the British subjects to become the possessors of property, who otherwise will never have a shilling to spare.

What we have urged, upon this occasion, we shall endeavour to corroborate in the sequel, where any natural opportunity shall offer: for, as the principles of trade in general, whereon we have endeavoured to proceed, seem to be founded in the eternal and immutable nature of things, and the constitution of the world itself; so we are inclined to think that they are capable of strict demonstration, let them be viewed in whatever national light they can.—As certain branches of trade, indeed, may, in the process of time vary, either by increasing or otherwise, or shifting their channel, or by any great alteration in the state of public affairs, &c. in such cases, perhaps, it may be necessary to deviate occasionally from some of those maxims which prevail throughout this work.—This will ever be the fate of what is mutable; but the necessity of any temporary variation, in the application of our general principles, will scarce be thought an argument of their imperfection and invalidity.

M A P, a plain figure, representing the surface of the earth, or a part thereof, according to the rules of perspective*.

* Perspective is the art of delineating visible objects on a plain surface, such as they appear at a given distance or height, upon a transparent plane, placed perpendicularly to the horizon between the eye and the object.

Though nothing can represent the heavens or the earth in their natural appearances so exactly as a globe, yet the two hemispheres, either of the heavens or of the earth, may be represented upon a plain superficies, which are generally called projections of the sphere*.

* Projection of the sphere in plano, is a representation of the several points or places of the surface of the sphere, and of the circles described thereon, or of any assigned parts thereof, such as they appear to the eye situate at a given distance, upon a transparent plane placed between the eye and the sphere.

The most usual projection of maps of the world is that on the plane of the meridian, which exhibits a right sphere, the first meridian being the horizon: the next is that on the plane of the equator, wherein the pole is in the center, and the meridians the radii of the circle.—This represents a parallel sphere.

If you suppose a globe to be cut in halves just at the equator, and each hemisphere represented on a plane, it is called a projection of the globe upon the plane of the equator. Then the equinoctial line will be the circumference, and the two poles of the world will be the centers of those two projections, and all the meridian lines will be so many straight lines, or semi-diameters, meeting in the center. This is the most common method of representing the celestial globe and the stars. If the globe be cut asunder at the horizon of any particular place, and thus represented on a plane, it is called the projection on the plane of the horizon: then the zenith and nadir will be the centers of those projections, and the horizon is the circumference: the two poles will be placed at such a distance from the circumference, as the pole of the world is elevated above the horizon of that place; and the meridian will be represented as curve lines, meeting in the pole-point, excepting only that meridian that passes through the zenith, which is always a right line. This is a more uncommon projection of the sphere, tho' it is much used in dialling.

The most usual way of describing the earthly globe on a plane, or a map, is to suppose the globe cut in halves about the first meridian, at the island Faro, or Teneriff: this is a projection on the plane of the meridian; then the first meridian will determine the circumference: the pole-point will stand in the upper and lower parts of that circle, and the other meridians will be curve lines, meeting in the pole-points, except that which passes through the center of the projection, which is a right line.

Here the equator will be a straight line, or diameter, crossing all the meridians at right angles, and at equal distances from the two poles.

Here the two tropics of Cancer and Capricorn are drawn at their proper distances, of $23\frac{1}{2}$ degrees from the equator; and the two polar circles are at the same distance from the poles. In this projection the ecliptic is sometimes a straight line, cutting the middle of the equator obliquely in each hemisphere, and ending where the two tropics meet the meridian: but sometimes the ecliptic is drawn as a curve line, or an arch, beginning where the equator meets the meridian, and carried upward just to touch the tropic of Cancer in one hemisphere, and downward to touch the tropic of Capricorn in the other. It is in this form the maps of the world are generally drawn, in two large hemispheres.

Note here, that it is impossible to represent a spherical body exactly in it's due proportion upon a plane; and, therefore, the artificial meridians, or lines of longitude, parallels of latitude, &c. are placed at such different distances, by certain rules of art, and the degrees, marked on them, are often unequal, but so drawn as may most commodiously represent the situation of the several parts of the earth with regard to one another.

The meridian, or circumference of these circles, is divided into four quarters, and each marked with 90 degrees, beginning from the equator, and proceeding towards the poles. These figures, or numbers, shew the latitude of every place in the earth, or it's distance from the equator; and, at every 10 degrees, there is a parallel of latitude drawn on purpose to guide and direct the eye in seeking the latitude of any place.

The equator of each hemisphere is divided into 180 parts, which makes 360 in the whole; and the several meridians, or lines of longitude, cutting the equator at every 10 degrees, direct the eye to find the longitude of any place required. As the equator, the several lines of longitude, of latitude, &c. cannot be represented on a plane exactly as they are on a globe, so neither can the several parts of the world, kingdoms, provinces, islands, and seas, be represented in a map exactly in the same proportion as they stand on a globe; but, as the divisions of degrees in a map are bigger or less, so the parts of the land and sea are represented there bigger or less, in a most exact proportion to those lines of longitude and latitude amongst which they are placed.

Therefore, though the length, breadth, or distance of places on a map of the world, cannot be measured by a pair of compasses, as they may be on a globe, yet you may count the

number of degrees to which such lengths, breadths, or distances correspond, and thereby you may compute their real dimensions, though not always so well as on a globe.

Thus much shall suffice concerning maps that represent the whole world, or the globe of earth and water. Let us next consider those maps which represent particular parts of the world, kingdoms or provinces: these are generally drawn in a large square, and are to be considered as parts of a projection on the plane of the meridian.

From the top to or toward the bottom of the square are drawn meridians or lines of longitude; and the number of degrees of longitude are divided, and marked on the upper and undermost line of the square.

From side to side are drawn parallels of latitude, and the degrees of latitude are marked on the two side lines.

Thus you may easily find on a map what is the longitude or latitude of any place given, or you may find the point where any town stands, or should stand, when the true longitude and latitude of it are given.

Note, In such maps of particular countries the longitude is not always reckoned from the first meridian, as Faro, or Teneriff, but oftentimes it is reckoned from the chief city of that kingdom which is described in the map.

Observe farther, that, though in globes and maps of the whole world the longitude is reckoned from the west toward the east, yet, in smaller maps, it is often reckoned both ways, as Bristol is $2\frac{1}{2}$ degrees of western longitude from London, Amsterdam has near five degrees of eastern longitude.

Note also, that, when a small country is represented in a large map, the lines of longitude and parallels of latitude are drawn not merely at every 10 degrees, as in the globe, but sometimes at every five degrees, and sometimes at every single degree.

Let it be observed, also, in large maps, that describe any particular country or province, as a single or double crooked waving line signifies a river, when it is made strong and black; so a public road is described by a single or a double line, drawn from town to town, not quite so curled nor so strong as a river is, but straight or winding, as the road itself happens: and, where the roads lie through a broad plain, or great common, without houses or hedges, they are sometimes described by a double row of points.

As villages and smaller towns are described by a little circle, or small round o, in maps of larger countries, where the cities are represented by the figure of a house or two, with a spire or steeple: so, in maps of smaller countries or provinces, the little towns and villages are described by the figure of a house or two, and great towns or cities are marked like several buildings put together, in prospect, or else the naked plan of those very towns or cities is drawn there, and distinguished according to their streets.

As maps are drawn to describe particular countries by land, so a description of coasts or shores, and of the seas, for the use of mariners, is called a sea-chart; and it differs from a map chiefly in these particulars:

I. A map of the land is full of names and marks, describing all the towns, countries, rivers, mountains, &c. but, in a sea-chart, there are seldom many parts of the land marked or described, besides the coasts or shores and the sea-ports, the towns or cities that border upon the sea, and the mouths of rivers.

II. In a map the sea is left as an empty space, except where the lines of longitude and latitude, &c. are placed: but, in sea charts, all the shoals or sand, and shallow waters, are marked exactly according to their shape, as they have been found to lie in the sea, by sounding the depth in every part of them.

III. In sea-charts, the meridians are often drawn in straight and parallel lines, and the lines of latitude are also straight parallels, crossing the meridians at right angles. This is called Mercator's projection; and the points of the compass are frequently repeated and extended through the whole chart, in a multitude of crossing lines, that whereforever the mariner is upon the sea, he may know toward what point of the compass he must steer, or direct his vessel, to carry it toward any particular port; and that we may be able to see, with one cast of an eye, the various bearings of any port, coast, island, cape, &c. toward each other.

IV. The sea is also filled, in sea-charts, with various numbers or figures, which denote the depth of water, and shew how many fathom deep the sea is in those places where the number stands: these are called soundings.

V. In sea-charts there is not such care taken to place the north parts of the world always directly upright and before the face of the reader; but the coasts and countries are usually described in such a position as may afford the fittest room to bring in the greatest variety of shores and seas within the compass of the same chart, whether the east, west, or north, be placed directly before the reader.

Maps are laid down and proportioned to a certain scale, which is always taken from the degrees of latitude.

The degrees of latitude are always marked on the east and west sides of the map.

The degrees of longitude are always marked on the north and south sides of the map.

A degree of latitude is always of the same breadth: wherefore the distance of two places seated directly north and south, is immediately known by knowing the different latitudes; but a degree of longitude is of different extent, for this is the distance of a place from the first, or some other meridian.

When Ptolemy invented the way of distinguishing the situation of places, he did it by parallel and meridian lines; the latter passing round the globe through the equator and poles, and the former lying parallel to the equator; which parallel lines were found very convenient for marking the latitude into degrees and minutes. Then, for longitude, he fixed upon Teneriff, one of the Canary Islands, as the most western part of the then known world; which, having a very high mountain, was a good mark for mariners, and the fittest place from whence to begin a general computation.

Accordingly, all the old maps begin their east longitude from Teneriff; and, because then only one side of the globe was known, the degrees were only 180; but, since the discovery of America, they are carried quite round to 360. This method was always esteemed, and Teneriff reckoned a good standard meridian, 'till the French, who like nothing which they themselves do not invent, thought proper to alter it, and make the island of Faro their new meridian, which, by late observation, lies just two degrees more west: wherefore, to prevent confusion, our modern geographers and delineators of maps make the metropolis of their own nation the first real meridian: and, in this case, longitude is two-fold, being, from London, either west or east, as at sea it is computed from some known port or head-land. The longitude of any place from London being known, the difference in the hour of the day is also known: for, as the sun performs his diurnal circuit in 24 hours, he gains in each hour 15 degrees, being a 24th part of 360, or one degree in four minutes; so that, at any place 15 degrees east of us, noon is an hour sooner with them, as it is an hour later with those who live 15 degrees west from us.

If a clock, or any time-piece, could be so made as to go equal and true, at any season or distance, the theory of longitude at sea would be no longer a mystery: but, as that is impracticable, our modern astronomers have contented themselves with observing the solar and lunar eclipses; for, if their appearances and calculations are exactly known with us, and the same appearances are observed in any other part of this globe, the difference arising from those times will settle the difference in longitude, by the foregoing rule. See LONGITUDE. The eclipses also of Jupiter's moons, and the spheroidal figure of the earth, two important discoveries of the seventeenth century, will each, in their turn, lead us farther on a true system of longitude.

Lastly, though all degrees of latitude are equal in length, yet degrees of longitude vary in every new parallel of latitude: for, all the meridian lines meeting and intersecting each other at the poles, the degrees of longitude do naturally diminish, as they proceed either way from the equator.

The latitude and longitude of a place being known, you may find it immediately in the map, by drawing a line or thread cross the map both ways, and, where the two lines cut one another, the place stands.

The earth being a globe, a map of the whole earth most necessarily consists of two parts, both sides of the globe not being visible at once. Accordingly, in an universal map, the right-hand circle shews the old world, or Europe, Asia, and Africa; and the left-hand circle shews the new world, or America.

Upon the general map are marked the circles correspondent to those in the sphere, namely, the equinoctial line, the two tropics, and the two polar circles, all which cross the map from east to west; and the first meridian surrounding the two hemispheres from north to south, the parallels lying from north to south, at 10 degrees distance; and the meridians, at the same distance from west to east, are also marked upon general maps. Particular maps, being part of this, retain the meridians and parallels belonging to that particular part, which are made smaller or larger, as the paper on which it is drawn will admit; and the distance of places mentioned in it are always exactly proportioned to the breadth of the parallels: so that, let a map be ever so small, the distance of places is exactly shewn, if measured according to the degrees of latitude in that particular map.

REMARKS RELATIVE TO THE PERFDIOUS DESIGN OF FRANCE IN THEIR MAP-MAKING.

The utility of maps and charts is so well known, that it is needless to say any thing concerning them, in relation to that point: but they have their abuse, as well as use, more especially the former, viz. maps; and this has been practised with no little artifice and effrontery, in order to deceive the whole world, if such a thing was possible: for certain it is, that some foreign map-makers have taken unaccountable liberties in parceling out the globe of the world at their pleasure. Whether this may be looked upon as their own *Sic volo, sic*
VOL. II.

jubeo, or that of some body else behind the curtain, with a view to answer some purposes not so honest and laudable as could be wished, we shall not take upon ourselves to determine: yet we think it incumbent on us to take some notice of a matter of this nature, that the English reader may be so put on his guard as not to receive French coin for sterling.

Whoever is acquainted with the history of our British colonies and plantations, and the cause and foundation of those first royal grants and charters given by the crown of Great-Britain to its subjects, for raising these colonies and plantations, must be sensible, that some neighbouring nations have attempted to make unwarrantable and shameful inroads upon the British rights of trade and possessions in the American world, as well as elsewhere: and those rights are not only usurped by their map-makers by dint of scale and compass, but are assumed and justified in many respects elsewhere; which always has, and ever will tend to destroy the public tranquillity, 'till those points are impartially and honourably settled and adjusted between the interested potentates.

We are sorry to be under the disagreeable necessity of saying this, in regard to any nation, the end of our labours being to promote peace and good harmony with all, and to be as little instrumental in stirring up broils between one foreign country and another, was it in our power, as between our own and others. But nothing can be so effectually preservative of general peace and tranquillity among all nations, as the just éclaircissement of their respective rights of commerce and possessions; for, if these are left uncertain, it will always give a handle for animosities.

That our readers may judge how far our British rights of commerce and possession remain as yet undetermined, we refer them to the following articles, viz. BRITISH AMERICA, CANADA, CALIFORNIA, FLORIDA, LOUISIANA. And how far a certain foreign map maker has attempted to invade the British rights, by the means of pen, ink, and paper, we also refer the reader to our MAPS OF NORTH AMERICA, placed at the end of our First Volume, where he will find the following rectification of the French map by Monsieur D'Anville, viz.

That Monf. D'Anville has very partially included within the bounds of French Canada, to the south and east of the lake Ontario, the country possessed by the five Indian nations, named by the French the Iroquois: whereas they are the allies, and under the protection of the crown of Great-Britain by treaty*: so that, in right of them, the English have a claim, not only to all the lands south of the river St. Lawrence (including the French settlements about the Champlain, and other lakes) which were the original property of those Indians and their dependents, but also all the lands in and about the five great lakes, viz. lake ONTARIO, ERIE, the HURONS, MICHIGAN, and the UPPER LAKE, which the Five Nations have subdued, or made tributary.

* According to the treaty of Utrecht it is stipulated, — Gallia subditi Canadæ incolentes, alique, quinque nationes (a), five cantones Indorum, Magnæ Britannia imperio subiectas, ut & cæteros Americæ indigenas eidem amicitia conjunctos, nullo in posterum impedimento aut molestia afficiant, &c. That is to say, the subjects of France inhabiting Canada, and others, shall hereafter give no hindrance or molestation to the five nations, or cantons of Indians, subjects to the dominion of Great-Britain, nor to the other natives of America, who are friends to the same, &c.

(a) The five original confederate Indian nations are the SENEKAS, CAYNGAS, ONONDAGAS, ONEIDAS, and MOHOCKS; the TUSCARROES, MISSISSAGOS, and other tribes, and since incorporated with them. Therefore, as all the land south of St. Lawrence's River is the original property of the Five Nations, with their allies and tributaries, the French can have no shadow of pretence to any part of this country; and their settlement about CHAMPLAIN LAKE is mere depredation, contrary to the British title, which is derived from agreement and purchase.

The limits of NEW SCOTLAND, or ACADIA, by the same treaty, are St. Lawrence's River on the north, Penobscut River on the west, and St. Lawrence's Gulph on the east: therefore the boundary line drawn by Monf. D'Anville in his map, cross these provinces, from lake ONTARIO to the ISTHMUS at the bottom of FUNDY BAY, is an ARBITRARY FICTION, false and unjust, and seems to be done for our British map-makers to copy, and misguide the whole nation, if possible; for which reason we have struck it out, having just authority so to do, and have put the whole word CANADA on the west side of St. Lawrence's River.

The line that parts French Canada from British Canada was settled by commissioners after the peace of Utrecht, making a curve from Davis's Inlet, in the Atlantic Sea, down to the 49th degree, through the lake Abitibis to the North-west Ocean: wherefore Monf. D'Anville's dotted line east of James's Bay is likewise false.

The French map-makers having also excised near one half of our settlements, by drawing a pretended line from St. Lawrence's River down to Georgia, we think it our duty to inform the public that the same is a romantic presumption, void of all authority; for, by public Indian treaties, our right is far beyond the great lakes, and south-west to the Chickasas

nation, by the branches of the Mississippi: and, since many of the Indian people among the said lakes are united with the Iroquois Indians near New York, either by covenant or conquest, it is an idle vanity to suppose a dotted line in a French map will exclude the English from all those nations, where their trade and dominions so visibly extend.

In this respect, also, we have in our maps endeavoured to restore the English settlements to part of their just pretensions: and, indeed, by the grants of our kings we might, perhaps, have carried our pretensions quite through Louisiana, westward to the South Sea, without being guilty of encroaching on the just rights of the French, as the French map-makers have been of encroaching on ours.

By several treaties made and renewed with the CHERAKEES, the CHIKASAS, the NAUTCHES, and the other CREEK NATIONS, the subjects of his BRITANNIC MAJESTY have a right of possession at least from LAKE ERIE to the CHIKASAS, at the river Mississippi: whereas, in many of those parts, the French have no other title but that of intrusion and force. Their map-makers, therefore, are advised to put their LOUISIANA farther west, as is partly rectified in our first map of North America, for no part of the APALACHY MOUNTAINS is any fixed boundary to the BRITISH EMPIRE in AMERICA.

These instances, with a great many others we could give, which relate as well to other countries as our own, point out, perhaps, the true reason and motive why the French have long endeavoured to engross the care of geography to themselves; and it must be confessed, by the measures taken by them, they have brought it to greater perfection than any nation in Europe. This is owing to the proper encouragement which it's professors meet with in France, who were never so numerous as at present.

Our neighbours appear to be particularly zealous for the advancement of geography, in order, it may be, to extend their commerce and dominions first upon paper, to pave the way to do it hereafter in reality; for, by their map-makers throwing out their encroachments and depredations in this seemingly harmless and inoffensive way first, they so feel the pulse of other nations, that they can pass a good judgment what lengths they may presume to go in any important n——n; and may, with a better grace, authenticate their pretensions, by producing to our commissaries their own infallible maps.

There is an office in the French marine, for depositing charts and plans, to be made use of for the benefit of navigation: a regulation proper to be established in every maritime trading nation*.

* Monsr. Bellin on this occasion observes, in the preface to his Collection of Memoirs, 'That it is difficult to correct the charts effectually, since it requires extraordinary helps, out of the power of a private man to procure, and which those only who are at the head of affairs are able to provide. There is no possibility of collecting all the materials necessary for such a design, but by establishing an office for the purpose, like that of charts, plans, and journals, belonging to the marine of France.'—And will not the same hold good in relation to maps? And would not such an institution as this, both with regard to charts and maps, and the journals of all curious navigators, well become the wisdom of the British nation? Certain it is, that the great disagreement which is apparent between charts and maps, renders something of this kind absolutely necessary. Those maps published by Monsr. D'Anville, and which we have translated into English for this work, and greatly corrected and improved, especially in regard to the security of our British rights of trade and possessions, cost the duke of Orleans, by whose order they were undertaken, several thousand pounds sterling: and whether our maps, engraved by those great artists Mr. Emanuel Bowen, geographer royal to his Britannic majesty, Mr. Kitchen, and Mr. Seale, are not executed with respect to the engraving parts full as well as the French, and better than any before done in England, is submitted to the public. But these are not the only specimens we have of the great abilities of those English artists in the art of engraving: their general maps of England and Wales, together with their particular maps of the counties, printed on superfine atlas paper, and sold by J. Tinney, at the Golden Lion in Fleet-street, London, demonstrate that they are inferior to no artists in their way, in the whole world. And, till these gentlemen did exert themselves, it cannot be denied but the French greatly excelled us in this particular; but, since we have such celebrated artists of our own, it is to be hoped they will receive all encouragement from the public, that their merits entitle them to. Maps are not only of important use to the nation, by asserting our rights of commerce and possession to the face of the whole world; but, by being a general manufacture, will now be acceptable in all foreign nations, since, at length, we have the honour of being inferior to no country whatever in this particular. I am very sorry to say, but it is matter of fact, that not only our map-makers and map-engravers, but our engravers in general, have long laboured under great difficulties and discouragements. There is one thing I would crave leave to mention at present; that, as a neighbouring nation gives such remarkable encouragement for the ad-

vancement of geography, it is very strange the royal geographer of Great Britain should enjoy only the title without a salary. Certain I am, if this matter was properly represented to his most gracious majesty, so superlatively good and benevolent is our beloved sovereign, that he would as cheerfully grant his geographer a stipend as a title.

The count de Maurepas, being at the head of the marine, about the year 1737, to remove the complaints which at that juncture lay against the French charts, and provide an accurate sett for the use of the king's ships, ordered Mr. Bellin to undertake the task, and publish by degrees a sett of new charts, for all parts of the ocean: which task he has at length in a great measure performed.

Another instance we have of the care of this nation to excel in their charts, is that of *Le Neptune Oriental*, ou *Routier Général de Côtes des Indes Orientales, & de la Chine*, par Monsr. Manneville, published in the year 1745, and dedicated to Monseigneur Orry de Fulvy, counsellor of state, intendant of the finances, and royal commissary to the East-India company.

The ingenious and elaborate author tells his patron in the dedication, 'That till now, my lord, says he, our navigation to the East-Indies hath depended on foreigners. Guided only by the English and Dutch charts, we learnt, as it were, only from those two nations, the way to conduct ourselves at our first establishment. Upon their instructions the good or ill success of our voyages depended. At the beginning of our navigation into these seas, it was necessary to make use of their helps, they having more frequented those seas than we. But, since our own experience has procured us more certain knowledge to be relied on, we have discovered their charts to be very erroneous; they are no longer useful to navigators, than to reunite in one body all the discoveries successively made, and therefrom to compile charts more correct.'

ESSENTIAL REMARKS ON MAPS, since the last war, and the DEFINITIVE TREATY of 1763.

The foregoing remarks, we think proper to let remain, that posterity may know in what a precarious and unsettled state our possessions were in NORTH AMERICA, before the DEFINITIVE TREATY ascertained their boundaries; which are now so clear and explicit as to admit of no future disputes, either between Great-Britain and France, or the former and Spain, with relation to the colonies upon the American continents. See AMERICA, for the DEFINITIVE TREATY at large, BRITISH AMERICA, FRENCH AMERICA, CANADA, LOUISIANA, and such other articles we from them refer to.

MARBLE is a kind of beautiful stone, dug out of quarries, in large masses; and is of so compact a texture, as to take a delicate polish: it is greatly used by way of ornament in columns, statuary, tombs, altar-pieces, chimney-pieces, slabs, tables, &c.

There are great varieties of marble, which are denominated from their colour, their country, their grain, their degree of compactness and hardness, their weight, &c. Some are of one colour, as white or black, others variegated with stains, clouds, and veins, &c. They are all opaque, excepting the white, which, when cut thin, is something transparent.

It is both endless and useless to describe the infinite different varieties; it is sufficient to observe, that those which are of the firmest texture, and greatest gravity, and take the finest polish, appear the most beautiful to the eye, and are the most estimable for every kind of ornament.

MARCASITE, a sulphureous metallic mineral.

As it is generally found among the metallic ores, it is always impregnated with the qualities of them, and of other fossils, whence they assume various colours, and degrees of cohesion. There are only three distinct species of it in the shops, viz. marcasite of gold, silver, and copper; the one of a bright silver colour, the other of a bright gold colour, and the third of a dull white.

The silver-coloured is a very beautiful body, of compact texture, though somewhat irregular, and very ponderous. It is found constituting whole strata of great extent, though not of great thickness; sometimes, like many other bodies naturally consisting of strata, it is found in irregular and broken masses. It is, when broken, of an uneven surface, and made up of multitudes of irregularly shaped flaky bodies, of various sizes, wrapping round one another.

It very freely and readily gives fire with steel, and makes no effervescence with aqua fortis.—When put into the fire, it cracks and bursts, yielding a blue flame with a sulphureous smell: it burns thus for a considerable time; and calcines to a strong deep red.

This is it's usual appearance, but it is liable to great varieties; sometimes it contains a lead ore, sometimes of tin, and often a ferrugineous matter.

It is found in abundance in the lead and tin mines of several parts of England, and is no less common in other countries; our counties of Devonshire, Derbyshire, and Cornwall, have large quantities of it.

The golden-coloured marcasite is rather more beautiful and glittering than the former. It is of less compact texture than any other marcasite. It is considerably heavy, and usually found in long but thin strata, sometimes in large and misshapen modules. In some parts the texture is, as in the other marcasites, more lax and open than in others; and it is to this irregularly foliaceous structure, that all their other varieties are owing. 'It is naturally of a fine strong gold yellow, but varies at times into a paler or redder hue, and, like the others, sometimes exhibit the rainbow colours in reflection.

It gives fire pretty readily with steel, but much less freely than the silver species. It makes no effervescence with aqua fortis, and, when put into the fire, it seldom bursts, but is gradually covered with a pale blue flame, which burns less time than that of the former, and calcines to a deep purple.

The other sort is a species of less beauty than the preceding kinds in its ordinary state; it is a very solid substance, of a compact and firm texture, and is considerably heavier than any of the other. It is extremely hard, and requires a strong blow to break it: and is of a pale and dead white, like the colour of tarnished pewter, and somewhat bright, but much less so than the other kinds: when broken, it appears at a slight view an uniform mass, but, when more strictly examined, is found composed of irregular flakes like the other kinds; but these are more closely laid together than in any other species, and differ from all the rest, in that, when strictly examined, they are found to be of an obscurely striated texture.

It freely and readily strikes fire with steel, and gives larger and brighter sparks than any other body of this sort.

It makes no effervescence with acids, and bursts in the fire, burning violently with a deep blue flame of a strong sulphureous scent.

It is liable to all the varieties of the first kind, but has them much more rarely; it is common in Devonshire, Cornwall, and many other counties, and lies at all depths, sometimes in regular strata, sometimes filling up the horizontal cavities of those of coal, or different stones.

R E M A R K S.

By marcasites, metallurgists generally understand all those mineral, earthy, and sulphureous matters, that are otherwise called pyrites, fire-stones, brass lumps, mundics, or the like. For, though these may be distinguished in respect of lesser differences, yet in general they are all a composition of sulphur, unflammable earth, and a small proportion of metal.

A short analysis of marcasites.

Take half a pound thereof reduced into powder, and put it into an earthen retort; which being placed in a naked fire, fit on a capacious glass receiver, and lute the junctures well with a mixture of loam and horse-dung, then give degrees of fire up to the strongest: let all cool, and take off; you will find at the bottom of the receiver a small proportion of acid liquor, like the spirit of sulphur made by the bell, and a considerable quantity of flowers of sulphur sublimed to the top.

The caput mortuum being taken out, and fluxed with about half its weight of iron filings, will afford generally a small lump of a reguline metallic substance.

Hence we see, that marcasites chiefly resolve into sulphur, and a more fixed earthy part; which, being treated as an ore, yields a proportion of metal. And hence, perhaps, all the pyrites, brass lumps, mundics, and marcasites, are but cruder kinds of ore, and, if brought to maturity, they would have proved real ores.

Marcasites, upon lying long in the open air, attract its humidity, and thence grow hot, in some measure dissolve, form an effervescence on their surface, and gradually turn into a vitriol, of the same kind with the metal they contain. Thus, if that metal were iron, the vitriol becomes green or martial; if copper, blue or cupereous. On this is founded the artificial method of making vitriol, now practised in several parts of England. See VITRIOL.

From the heating, fuming, and firing of these sulphureous earths, by the moisture of the air, we may, perhaps, learn the origin of hot baths, mineral waters, damps, and fires in mines. For it is found, that a pile of these sulphureous earths, being barely moistened, will at first smoke, and at length take fire, and burn like glowing coals.

These experiments likewise shew us a way of examining these marcasites (which have been taken frequently for rich ores, both in England and elsewhere) and of extracting the metal they may hold, after having first separated their sulphur. Many skilful metallists have been imposed upon by a specious shew of these marcasites, for they usually have a great specific gravity, and some of them a greater than real ores: whence again they may possibly contain the matter of metals, though in a crude, imperfect, or unfixed state. But to bring this matter to the test, to try the validity thereof, requires a more than ordinary knowledge in metallurgy. See METALLURGY.

MARINERS.

Of mariners and seamen.

A mariner, or seaman, is under the command of the master of a ship, that is hired to work therein, and do all common business for the sailing and preservation of the ship. The ship's crew are called mariners, and owe obedience to the master, who hath the supreme rule on shipboard, and therefore his authority is much countenanced by law.

If a mariner rebels or commits a fault, and the master lifts up the towel three times before him and he do not submit, the master at the next place of land may discharge him: and, if he refuses to go ashore, he shall lose half his wages, and all his goods in the ship; but, if the mariner submits, he is to receive his whole wages.

A master of a ship may justify the giving moderate and due correction to his men: but, if a mariner assaults the master on shipboard, he shall pay five shillings, or lose his hand; yet it is said he may after one stroke defend himself. Leg. Oleron. c. 14. By the ancient Rhodian laws, the masters, mariners, &c. that sail together, were to take an oath of fidelity, or mutual engagement. SEA LAWS 83.

Mariners are not to depart from on shipboard when they are in full pay (which is always when they break ground) without the master's licence for so doing; nor may they in any case quit the ship, without leaving a sufficient number to guard her: they must assist one another both at sea and in port, or upon the oath of their fellows of any refusal shall lose their wages: if mariners in a strange port leave their ship, not having the licence of the master, or without fastening her with four ropes, the loss, if any happen, falls upon them; they are also to attend the ship until she be discharged, and ballasted anew; and, if any mariner, during the time of her discharge or lading, labours not with the rest of the mariners but absents himself, he shall pay a fine to the others pro rata: and the mariners are not only to discharge and deliver goods out of the ship, but likewise, if no porters or carriers be in those parts, they must carry the same themselves for such hire as other workmen should have had for it. Lex Mercat. Malines, 104, 105.

In a strange country, the one half of the seaman, at least, ought to remain on shipboard; and those who go ashore, are to keep sobriety and abstain from suspected places, and not be absent on pain of being punished, like unto him who absents, when the ship is ready to sail. If it happens otherwise than well with the master, the mariners are obliged to bring the ship to the port from whence she was freighted, without any delay, except it be otherwise provided: and a mariner shall forfeit his wages, if the ship break in any part, and he doth not help with all his diligence to save the goods on board. Ibid.

Where a mariner is hired, and he deserts the service before the voyage is ended, by the law marine and the common law, he shall lose his wages: and it has been adjudged, that if the ship do not return, but perishes at sea, either by tempest, enemies, fire, &c. the mariners shall not have their wages; for, if they were allowed to have wages in these cases, it is presumed their best endeavours would be wanting to preserve the ship; and the mariners shall lose their wages, as well as the owners their freight. If the ship unlade any part of the cargo, the mariners shall have their wages; but, if after they have unladen the vessel at any port abroad, they demand the same, with an intention of leaving the ship, the master may detain a reasonable proportion thereof as his security, 'till they have brought back the ship. Leg. Oleron. c. 18. 1 Siderf. Rep. 179. 1 Keb. 830.

It was held by Holt chief justice, That, if a ship is lost before she arrives at any port of delivery, the seamen lose all their wages; if she be lost after she comes to a port of delivery, then they only lose their wages from the last port of delivery; but in case they run away, though after they come to any port of delivery, they lose all their wages. Hil. 13 Will. III. 3 Salk. Rep. 23.

A mariner being hired for a simple mariner, if afterwards in the voyage he finds hiring to be a pilot, or other officer of a ship, by the law marine he may pass over, restoring his former hire, and so it is, if he marry abroad: but if a mariner shall depart the ship, at the master's command, and the master do not take another, if any damage happens to the ship or goods, the master must answer. Mariners may not carry out of the ship any drink, nor above one meal of meat; and, if they embezzle the goods on board, &c. they are accountable to the master, the master to the owners, and the owners to the merchant or freighter. Though in case of a storm, if goods are cast overboard for lightening the ship, the mariners, making oath that it was done for preserving the vessel, shall discharge the master; so if goods or merchandise in such case receive damage at sea, by the oath of the master and mariners they may be cleared. Leg. Oleron. c. 7, 14.

If a mariner shall commit any fault, by reason of which the master, owners, or the ship, answers damage to the merchant, an action will lie against him. But, when a mariner is on shipboard, he ought not to be arrested by any one for

for debt, nor to be taken away from thence, for the ship is compared to a man's dwelling-house, which is as his castle, and a sure refuge by law; unless it be for a sworn debt, or penalty to the king, &c. the wages and goods of such mariners shall in these cases be liable; and, if a mariner takes up money or buys clothes on credit, and the same is entered in the purser's books, this will entitle a discount of so much of his wages, as the same amounts unto. *Moll.* 212. *Lex Mercat. of Malines*, 105.

In case a ship happens to be seized for debt, or otherwise become forfeited, the mariners shall receive their wages, except, through any act of theirs, there be a forfeiture of all; if the ship be laden with prohibited goods, as wool, and the like, though it subjects the vessel to forfeiture, yet it deprives not the mariners of their hire, who have faithfully performed their parts, and for which the ship is obliged. *Trin.* 7 *Jac. B. R.* A mariner may either keep his portage or allowance of goods in his hands, or let the same out to freight, by the laws of Oleron. *Lex Mercat. of Malines*, 104.

The act 2 *Geo. II. c. 36*, for better regulations of seamen in merchants service, has ordained, That no master or commander of any ship or vessel shall carry any seaman or mariner, except his apprentices, to sea, without first coming to an agreement or contract for their wages; which agreement shall be in writing, signed by the master and mariners, on pain of forfeiting 5*l.* to the use of Greenwich-hospital, to be recovered by information, upon the oath of one or more witnesses, before a justice of peace, &c.

And, if any seaman or mariner shall desert, or refuse to proceed in the voyage on board any vessel, after he has signed such contract, he shall forfeit to the owners of the ship the wages due to him at the time of his deserting, or refusing as aforesaid: and, in case he deserts or absents from any such ship, wherein he hath so contracted to serve, upon application to any justice of the peace, he may issue his warrant to apprehend such seaman; and, on his refusal to proceed on the voyage, the justice may commit him to the house of correction, to be kept to hard labour not exceeding thirty days, nor less than fourteen. And by the same statute, if any seaman shall absent himself from the vessel to which he belongs, without leave of the master, or other chief officer having the charge of such ship, he shall, for every day's absence, forfeit two days pay, for the use of Greenwich-hospital; and, if he shall leave the vessel to which he belongs, before he hath a discharge in writing from the master, he shall forfeit one month's pay, to the uses aforesaid: and the masters or owners of ships are impowered to deduct, out of the wages of any seaman, the penalties and forfeitures incurred by this act; and those penalties which are to be applied to the use of Greenwich-hospital, shall be paid by the masters of ships, to the officer at any port, who collects the 6*d.* a month, deducted out of seamen's wages for the use of the said hospital; and, neglecting to do it within three months, they shall forfeit treble value. *Ibid.*

Also by the said act, on the arriving of any ship in Great-Britain, from parts beyond the seas, the master shall be obliged to pay his seamen their wages, within thirty days, if demanded (except the contract for serving be to the contrary) or at the time the seamen shall be discharged, which shall first happen; deducting thereout the penalties and forfeitures, and not paying the same, shall be liable to a penalty of 20*s.* over and above the wages due to each seaman, to be recovered by the same ways as the said wages are recoverable; and no seaman or mariner shall fail in any suit for recovery of his wages, for want of producing the contract with the master on whom it lies, to produce the same, if necessary. This act shall not extend to debar any mariner or seaman, belonging to any merchant ship or vessel, from entering into his majesty's service, on board any of his ships; nor shall such seamen or mariner, for his entry therein, forfeit the wages due to him during the time of his service in such merchant-ship or vessel; nor shall such entry be judged a desertion from the ship. *Stat.* 2 *Geo. II.*

By the statute of 1 *Geo. II. sess. 2. c. 14.* for encouraging seamen voluntarily to enter into the king's service, &c. the governors, ministers, and consuls in foreign parts, or where none such are resident, any two or more British merchants there residing, are authorized and required to provide for all seamen, subjects of Great-Britain, that shall by shipwreck, or other unavoidable accident, be driven or cast away in such foreign parts or places, and shall subsist them by an allowance after the rate of 6*d.* per diem each, &c. and put them on board the first ship of war arriving there in convenient time, or they may be sent by any merchant ships wanting men, or others bound for any port in Great-Britain.

Masters of ships abroad shall take on board four men for each hundred tons of which their vessels consist, and receive from the commissioners of the navy 6*d.* a day, for the passage and provision of every seaman, from the day of their embarkation homewards, on producing a certificate of the man's being taken on board, and the time when, &c.

By the acts 9 *Geo. II. c. 25.* and 10 *Geo. II. c. 14.* a small sum of so much per ton is to be paid by all masters of vessels, &c. trading from any part of his majesty's dominions to Ca-

diz, and port St. Mary's in Spain, or to the port of Leckora, to persons appointed by the consuls and a majority of British merchants there; and such masters paying it shall be reimbursed by their freighters, or the persons to whom the goods are consigned, &c. and the money to be applied for relieving seamen shipwrecked, or taken in war, and other persons being English subjects in distress in the said ports.

REMARKS since the last WAR, and the DEFINITIVE TREATY of 1763.

In what a precarious and unsettled state the boundaries as well as the trade of our colonies in North America have been for many years, see our articles *BRITISH AMERICA*, *FRENCH AMERICA*, *LOUISIANA*, *CANADA*, and the article *MAP*. In what manner the boundaries of the colonies on that continent have been ascertained between Great-Britain and France, by the *DEFINITIVE TREATY*, see our article *AMERICA*, and such other to which from the preceding we refer.

As it is expected, that from the present British southern colonies on the continent of America, we shall produce hemp, flax, silk, pot-ash, wine, oil, raisins and currants, we may hope for a proportionable increase in our navigation to these parts, and in consequence thereof a suitable augmentation of *BRITISH MARINERS*, who will contribute to defend our new acquisitions in time of war, and advance their trade in time of peace.

Some authentic law cases, determined in the courts of judicature in England, in relation to mariners.

Hooke versus Moreton.

Mr. Eyre moved for a prohibition to be directed to the admiralty court, to stay a suit there upon a libel by the mate of a ship for mariners wages, upon suggestion of the several statutes, which restrain the admiralty from proceeding upon contracts made upon the land. And (by him) the admiralty has no original jurisdiction of such suits, 13 *Rep.* 51. And, though they are in their nature maritime, yet the place where the contract is made, alters the case, 12 *Rep.* 79, 80. Therefore the admiralty has no jurisdiction of charter-parties, nor of policies of assurance, 4 *Inst.* 141. Prohibition granted to a suit is for a mariner's wages, 1 *Sid.* 331. Besides, that in this case the suit is by a single mariner; and, therefore, it is the same thing to him, to sue here at common law, or in the admiralty. And the case of Woodward vers. Bonithon, *Raym.* 3, is a case in point. For, though the suit was for other things as well as for mariners wages, yet, if a prohibition had not lain for the wages, the prohibition should have been granted quoad, &c. Objection, 1 *Ventr.* 343. Answer, That is no authority in this case, because the motion was made there after sentence; and, if it does not appear in the libel that the court had not jurisdiction, no prohibition shall be granted after sentence. See 2 *Roll. Abr.* 318. 12 *Co.* 77.

Mr. Pratt against the prohibition argued, That, if all the mariners sue for wages in the admiralty, the King's-Bench at this day will never grant a prohibition, 1 *Ventr.* 343. and there is no difference where the suit is by one mariner or many, 2 *Ventr.* 181. *Alleston v. Marth*, in point; and the mate of the ship is but one mariner. Objection. *Raym.* 3. Woodward v. Bonithon. Answer. There the contract was for other things as well as for mariners wages, and the contract is entire; and, per curiam, there is no difference where one mariner libels and where many: for the reason why the King's-Bench permits mariners to libel in the admiralty for their wages, is not only because they are privileged to join in suit in the admiralty, whereas they ought to sever at common law, because the contracts are several; but also by the maritime law mariners have security in the ship for their wages, and it is a sort of implied hypothecation to them: therefore the King's-Bench allows mariners to sue in the admiralty for their wages, because they have the ship there for security. But the question is here, whether the mate of a ship differs from any other mariner; for, if the plaintiff had been a single mariner, doubtless no prohibition would have been granted. And it seemed to the court, that the mate is but a mariner; and, per Holt chief justice, heretofore the common law was too severe against the admiralty, it did not allow stipulations; but at this day they are always allowed. Ruled, That Mr. Pratt move the court for their opinion at another day. Lord Raymond, 397.

Clay versus Snelgrave.

The defendant, as executrix to the master of a ship, libelled in the admiralty court for the wages owing to the testator by the owner. On which the plaintiff, to have a prohibition, suggested the statute of 15 *Rich. II. cap. 3.* that the admiralty court shall not have cognizance of contracts made upon the land, and shews this contract to have been made upon the land. And this case was several times moved by Sir Bartholomew Shower, and Mr. Acherley, for the prohibition, as well

well in Michaelmas as Hilary and Easter terms last past, as in this present term; and it was opposed by Mr. Northey and Mr. Hall; and the counsel for the prohibition argued, That prohibitions are grantable de jure, and are not discretionary in the court. Raym. 3, 4. That the case in Winch. rep. 8. was the first case where a prohibition was denied in case of a suit by mariners for their wages in the admiralty court; and the denial was grounded upon compassionate reasons, because they were poor men, and because there they might join in action, but here they must sever; but the said case is contrary to the reason and grounds of the law, for, where the contract is made upon the land, though the service was done upon the sea, it is out of the jurisdiction of the admiralty; and so vice versa, if the service was done upon the land, and the contract upon the sea. 12 Co. 79, 80. Staunf. 51. C. Hob. 212. A consultation is always denied in case of a suit by mariners, if there is a charter-party [see CHARTER-PARTY] and the sealing of a writing cannot make any difference in reason, Raym. 3, a prohibition granted where the master libelled alone. Mr. Northey and Mr. Hall è contra for the defendant said, That the case of mariners was now settled, and ought not to be stirred; but that the great reason why they are permitted to sue there is, the ship is the debtor, and, by the law of the admiralty, they may attack her, which they cannot do by the common law; and, in the admiralty court, they may all join in suit, whereas, by the common law, they must bring several actions: that the case of the master is not different, for the ship is security to him, and he is but a mariner, and his wages are wages at sea.

But however, where the master dies in the voyage, as he did in this case, there can be no reason to exclude his executors from suing in the admiralty, because he had no opportunity of bringing his wages to account with the owners; and in 2 Ventr. 181, Alleston versus Marsh, the purser, though an officer of the ship, was allowed to sue for his wages in the admiralty; and in 2 Keb. 779. Pl. 6. Rex versus Pike, a prohibition was denied, where the master and mariners joined in a suit in the admiralty for their wages. (But Holt said, that a prohibition ought to have been granted quoad in the said case.) And he cited a case, Hil. 27 and 28 Car. II. C. B. between Cooker and Older, where Atkins and Ellis justices were of opinion, That a prohibition ought to be granted to the suit in the admiralty court by the master of a ship for his wages; but North chief justice, and Windham justice, held the contrary opinion. But Holt chief justice said, That it is an indulgence that the courts at Westminster permit mariners to sue for their wages in the admiralty court, because they may all join in suit; and it is grounded upon the principle, Quod communis error facit jus; but they will not extend it to the master of the ship, especially if he was master at the beginning of the voyage here in England, and the contract was made with him here. Possibly if the master of a ship died in the voyage, and another man took upon him the charge of the ship upon the sea, such case might be different. As in the case of Groffwick versus Louthley, where it was held in this court lately, that, if a ship was hypothecated, and money borrowed upon her, at Amsterdam, upon the voyage, he who lent the money may sue the admiralty for it: and this court granted a consultation in the said case. But in another case, where the money was borrowed upon the ship before the voyage, the King's-Bench granted a prohibition, and the parties acquiesced under it. There are many precedents, in the court of admiralty, of suits by the mariners for their wages, but none for the master of the ship. And the cases differ; for the mariners contract upon the credit of the ship, and the master upon the credit of the owners of the ship, of whom generally he is one. The opinion of lord Hobart, That, where there is matter of property to be tried, a prohibition shall be granted is a little too hard. Gould justice agreed with Holt, and said, he was of opinion that prohibitions were grantable of right, though it had been controverted in his time. To which Holt chief justice said, That Hale chief justice, and Windham justice, held prohibitions to be discretionary in all cases; but Kelynge chief justice was of the contrary opinion; and he said, He did not esteem them to be matter of right. Then Mr. Northey moved, That the court would compel the plaintiff to put in bail to the action, to be brought for the wages at common law, or otherwise deny the prohibition; which, he said, had been done often. Holt chief justice confessed, That the court had sometimes interposed, and procured bail to be given; but it was by consent, and in case of the proprietor himself; but, in regard that in this case the plaintiff was a purchaser without notice, there was no reason; and a prohibition was granted. Lord Raymond, vol. i. p. 397.

Baily versus Grant.

Upon the motion of Mr. Raymond, towards the end of last Michaelmas term, a rule was made to hear counsel of both sides, the first day of this term, why a prohibition should not be granted to the court of admiralty, to stay a suit there by the mate of a ship, for his wages. And he urged, That the admitting the mariners to sue there, was rather an indulgence

VOL. II.

than any proper jurisdiction that they had to hold plea there of wages arising upon a contract made upon the land; and that it was a long while before it was permitted, but that now it ought not to be extended any farther: that, in the case of a master of a ship, a prohibition was granted last Trinity term, between Clay and Snelgrave (ante 576.) that this seemed to be a middle case, but rather inclining to that of the master; because, in case of the death of the master, he succeeded in the government of the ship, and was always overseer of all the other mariners: that the same motion was made Mich. 10 Will. III. B. R. between Hooke and Moreton (ante 397.) and that the rule was made as here, to hear counsel, &c. and, upon it's being many times moved, no prohibition was made, and they proceeded no farther in the admiralty; for which, &c. But è contra serjeant Hall argued, That no prohibition ought to be granted; and of that opinion was the whole court, because the mate is not distinguishable from other mariners, only in title: he contracts with the master, and is as his servant, and, therefore, does not differ from the mariners. But the master contracts with the owners upon their credit; whereas the mate contracts only with the master, and not upon the credit of the owners, but upon the credit of the ship: and, therefore, the rule was discharged. The same rule was made this term, upon a motion in the Common-Pleas. See 2 Ventr. 181. Marsh versus Alleston. Lord Raymond, vol. i. p. 632.

Upon a motion for a new trial in an action for a seaman's wages, Holt chief justice said, That, if the ship be lost before the first port of delivery, then the seamen lose all their wages; but, if after she has been at the first port of delivery, then they lose only those from the last port of delivery; but if they run all away, although they have been at a port of delivery, yet they lose all their wages. Lord Raymond, vol. i. page 639.

John Edwards, and Elizabeth his wife, widow and executrix of Capt. Jenefer, versus Sir Richard Child, Shepherd, and others, owners of the ship Success, and the East-India company.

In 1693, Jenefer was appointed captain of the ship Success, on a voyage to India, at 101. per month wages, and to have two servants, the one at 30s. per month, and the other at 20s. per month wages. Jenefer, the master, and the defendants, the part-owners, enter into a charter-party with the East-India company, in which recital was made, that the company had paid to the master and mariners in part of freight, 1200l. by way of imprest-money; and further agreed, that the seamen, at the end of every six months during the voyage, should receive one month's wages, and that, until six days after the return of the ship to the port of London, the East-India company were not to pay any freight, save the said imprest-money, which was not to be returned, although the ship should be lost in the voyage: and therefore, by the direction of the company, Jenefer the commander, when he hired the seamen, took bonds from them not to demand any wages 'till the return of the ship to the port of London, and that they should not demand any wages, if the ship was lost before her return to London.

The ship failed to Bengal, and there delivered her outward-bound cargo. In her return home the ship was taken by the French, on the coast of Ireland, and the captain and mariners made prisoners.

The captain was sued by the mariners for their wages, being four months, that became due at Bengal, the first delivering port; and, although the bonds were given in evidence, yet the mariners recovered their wages, in an action tried before the lord chief justice Holt.

The bill by the plaintiffs, the wife being the executrix of Capt. Jenefer, was to recover about 800l. he had been forced to pay to the mariners, and likewise to have the captain's own wages, and the wages of his servants, for four months, that became due at Bengal, the first delivering port.

Upon producing of precedents, where relief had been given in like cases, viz. the case of Sir Humphry Edwin and Capt. Stafford, against the East India company, in 1695, and the case of Buck and Sir Thomas Rawlinson, affirmed upon an appeal in the house of peers: notwithstanding the East-India company had taken bonds from the mariners, not to demand their wages, unless the ship returned to the port of London, the lord chancellor decreed the plaintiffs to be paid the wages due to Capt. Jenefer, for himself and servants, and likewise what Jenefer had paid to the seamen, with interest and costs. Vernon's Reports, vol. ii. p. 727.

MARITIME, or MARINE AFFAIRS, and MARINE TREATIES, relating to trade and navigation.

Under the following articles we have represented, in our First Volume, many essential particulars which have relation to marine commerce, of which it may be requisite to apprise the reader; viz. ADMIRALTY, ASSURANCE of shipping and merchandizes, AVERAGE, BARATRY, BILLS of LADING, BOTTOMRY, CAP-MERCHANT, CHARTER-PARTY, CONVOYS and CRUIZERS, FLOTEAM, GREEN-

WICH HOSPITAL, HANSE-TOWNS, HYPOTHECATION, and INDULTO.

In this our Second Volume we continue the same subject, under these several particular heads, viz. MARINERS, MARQUE, LETTERS OF, MASTERS OF SHIPS, NAVAL AFFAIRS, OLERON, it's LAW of marine trade, PILOTS, PORTS and HAVENS, PIRACY, PRIZES, QUARENTINE, RHODIAN LAWS of marine trade, SEA LAWS, SALVAGE, SHIPPING, WISBUY LAWS of marine trade, WRECKS, &c. &c.

Under the present article, we shall give an abstract of the principal MARINE TREATIES concluded since the year 1600, between the chief princes, states, and sovereigns of Europe, which may be useful to have recourse to upon peculiar occasions.

The first piece of this nature that occurs is the memorable league into which the STATES-GENERAL entered with the republic of LUBECK, in the year 1613, which was solemnly confirmed about two years and eight months afterwards, and strengthened by the accession of most of the other HANSE-TOWNS, upon the following occasion :

The king of Denmark having, some time before, laid heavy taxes upon their ships sailing through the straits of the Sound, &c. [see the article DENMARK] they found the new impositions not a little detrimental to their navigation ; and the northern traffic being none of the most inconsiderable branches of the Dutch trade, as well as of that of the HANSE-TOWNS, they soon began to let their uneasiness appear, and so negotiated their business among themselves ; and the town of Lubeck first brought the business to a conclusion, by means of the following treaty with the States-General ; in which, though not a word is said of his Danish majesty, that prince easily penetrated into the design of that combination ; and, the new confederates being, on the other side, apprehensive of his repentment, it was thought convenient to fortify the alliance, by receiving into it several of the other HANSE-TOWNS, who judged it their interest to join with the others, with a design to enter into a vigorous war with the king of Denmark, whose late impositions they were resolved not to pay : for though they pretended that their alliance was only defensive, they certainly intended to reduce that prince to a necessity of abolishing the beforementioned taxes ; which may be gathered from the treaty as it hereunder follows :

A treaty between the States of the United Provinces of the Low-Countries, and the town of Lubeck, concluded in the year 1613.

As of ancient time the honourable the common-council of the free and imperial city of Lubeck, and several other towns situate on the northern and eastern seas, have been in union and amity with divers towns of the free United Provinces, for the defence of the liberty of navigation, trade, and commerce, &c.—And as now their high mightinesses the States-General of the United Provinces, &c. have found it necessary to negotiate and treat about the renewing the aforesaid union, by the noble deputies, &c.—Who, after several conferences, have agreed together, treated, consented, and concluded upon the points and articles following :

I. That this union be only for maintaining the freedom of navigation and commerce in the northern and eastern seas, the sole intent being, that the respective subjects of the union, according to the law of nations, &c. may accordingly enjoy the same without molestation ; so that the subjects of the said union may reciprocally defend and protect each other, against such as would disturb them, that the difficulties detrimental to the common trade and navigation may be removed, &c.

II. In so doing, this union shall not be prejudicial to the friendship of his imperial majesty, nor the holy empire, nor to their royal majesties of France and Great-Britain. &c.

III. Those of the union shall faithfully observe these articles, and confirm them by oath.

IV. The States-General shall manage this union to the best advantage of the common cause ; but in such manner, as the common-council of Lubeck may give a voice in all the deliberations ; for which purpose a person from Lubeck shall always reside at the Hague, on behalf of the town ; and the States-General may depute some person to reside at Lubeck, the better to deliberate with the council of that place.

V. Those of the union shall contribute towards the charges, according to the obligations into which they are entered, in order to furnish ships, foot and horse, &c.

VI. If such who interrupt commerce and navigation, after having been amicably required to desist, refuse, against justice and reason, to do it, those of the union shall defend themselves vigorously, to secure to them such liberty of commerce and navigation.

VII. If the consequence hereof should be a war, those of the union shall recall their subjects from the service of the adverse party, on pain of death, and confiscation of their estates. Nor shall it be allowable to procure, or send to the adverse party, money, troops, ships, ammunition, arms, provisions, &c. on pain of corporal punishment ; and all endeavours shall

be used to prevent their receiving such succours from other places.

VIII. And, if the adverse party shall arrest the subjects, ships, merchandizes, or debts of those of the union, or surprize them at sea, and carry them off, orders shall be given to the towns and countries of the union to make reprisals, and mutually to assist each other.

IX. The ships of those of the union may freely enter into the harbours and rivers of each other, to provide necessaries, or to refit ; but no violence shall be used, and they shall pay for what they take.

X. The subjects of the union shall, in all their countries, enjoy the privileges of a citizen, and even the right of succession, which shall descend without distinction of religion, as permitted in the holy empire ; but every one shall submit himself to the laws of the place.

XI. None of those of the union shall enter into any treaty, or be reconciled to the enemy, without the consent of the others : on the contrary, all the members shall endeavour to keep their citizens, inhabitants, ships, merchandizes, and effects, free from all damage, and to maintain them in their liberties and privileges, &c.

XII. So that no peace or truce shall be made with the enemy, but with the reciprocal consent of all the members.

XIII. This league shall remain in force for 50 years, which, with the common consent, may be prolonged.—If, during the same, or even after the expiration thereof, any of the union receive any damage by reason thereof, whether by sea or land, they shall mutually assist each other against all persons whatsoever.

XIV. If any potentate, country, or city, and especially if any of the other Hanse-Towns, desire to enter into this union, they shall be received upon reasonable conditions.

In witness whereof, two copies of these presents have been made, and confirmed by oath, and sealed with the seals of their high mightinesses the States-General, and of the said town of Lubeck, and signed by their respective clerk and syndic ; of which copies each party has retained one.—Done in the month of May, in the year 1613, and underwritten,

By order of the States-General,

Signed AERSSSEN.

And, by order of the honourable the council of the town of Lubeck,

Signed MARTIN NORDAMUS,

Syndic of the republic of Lubeck.

Here follows the second league, concluded between the Dutch and the republic of Lubeck, together with several of the other Hanse-Towns ; which, though it be much to the same effect with the former, is of too great importance not to deserve a place in this work.

A treaty of alliance, between the United Provinces of the Low-Countries and the Hanse-Towns, concluded in the month of December, 1615, in consequence of that concluded with the town of Lubeck in the year 1613.

As not only the Hanse-Towns of the east, situate upon the Eastern Sea, together with those upon the Wexel, the Oder, the Elbe, and the Weser, and the neighbourhood thereof, but likewise several towns of the Low-Countries, situate upon the Northern and Southern Seas, as also those situate on the Maese, the Wale, the Rhine, and the Yssel, and other streams and rivers flowing into the Northern and Southern Seas have been comprehended in the common league of the Hanse-Towns, and have remained in a firm union and friendship with one another, and have obtained of the neighbouring kingdoms and countries many common liberties, privileges, and prerogatives, which, by their united counsels, strength, and forces, and by the defensive arms of several of them, have been defended and maintained ; and, as the Hanse-Towns of the Low-Countries have, in latter times, by reason of a tedious war, and other accidental misunderstandings, being hindered from assisting at the general meetings of the Hanse-Towns, and, by reason of their own burthens, have not been able to bear the charges of the common league, which some of their neighbours have taken to be a rupture and separation, and which has occasioned several uneasy burthens upon the freedom of traffic, commerce, and navigation, which ought to be remedied ; that has put a fresh obligation upon the parties concerned, to think of ways and means by which, with the divine assistance, these inconveniences may be removed, and the aforesaid liberties and common rights and prerogatives may be re-established and confirmed. And as, in this succession of time, the greater part of the Hanse-Towns do look upon their high mightinesses the States-General of the United Provinces as members of their state, and not judging it convenient to labour separately towards the said re-establishment,

re-establishment, but in conjunction with their high mightinesses, since, by that means, the treaty that shall be concluded will be more useful, more profitable, and more convenient, there having been of late years, several deliberations upon that subject, upon which the burghermasters and the common-council of the free and imperial city of Lubeck did treat with the aforesaid lords the States-General, in the month of May in the year 1613: for these causes, after mature deliberation, the said lords the States-General have, by their deputies, together with those of the Hanse-Towns of the east, renewed the antient friendship and union that was between them; and, in order to unite themselves yet more closely, have concluded and agreed upon the points and articles following:

I. That this union shall not be offensive with regard to any; but only for maintaining and preserving the freedom of navigation and commerce in the Northern and Eastern Seas, and shall not be any otherwise understood: so that those of the union respectively, and their subjects, may, without any impediment, enjoy the benefit of the laws of nations, and all the liberties, rights, and privileges usual in the aforesaid Northern and Eastern Seas, and in the rivers, streams, and other currents. All those of the union shall defend conjointly, and protect their citizens, inhabitants, and subjects, who may be by unjust means molested by others, and to whom commerce may be forbidden, or upon whose merchandizes any particular impost may be laid in going or coming; to the end that the said impediments and redoubled imposts, so prejudicial to commerce and navigation, may be abolished, and the same may be freely carried on throughout the holy German empire, and may be increased for the benefit and advantage of those of the union.

II. Wherefore this union shall not be prejudicial to the friendship contracted with his imperial majesty and the holy empire, with their majesties of France and Great-Britain, and with the evangelical electors and circles of the holy empire, and which has been hitherto maintained with their lordships the States-General, and likewise with the honourable Hanse-Towns, who have been 'till now under the protection and obedience of his imperial majesty and the holy empire, and every town that has a mediate authority, all the leagues, rights, statutes, ordinances, and obligations, shall remain in their full force; the whole, however, *Salvo præfenti foedere*.

III. Those of the union shall sincerely observe and maintain the present articles, which they shall confirm by oath.

IV. Their lordships the States-General shall manage this union to the best advantage of all the members thereof; but in such a manner, however, that in all undertakings, each party shall freely give their voice: for which end there shall always be a resident at the Hague from the Hanse-Towns of the east, who shall give his advice in what concerns the union; and the States-General may appoint another person to reside at Lubeck, or at such other place as occasion shall require; to the end that the mutual advices and opinions may be the more easily communicated, and what shall be necessary may be effected.

V. Those of the union shall keep in good order, and well provided, at their expences, the ships, and troops of foot and horse, and all things belonging thereto, according to the contributions which each is obliged to furnish, and for the time that shall be judged convenient; and shall cause them to repair to the places whither it shall be thought necessary to send them, according as the name of every Hanse-Town of the union, and the quotas of the said contributions, are contained in the particular writings.

VI. And, in case it happens that those that would cause any impediments to be given to navigation and commerce, against the aforesaid privileges and treaties agreed to, will not desist, after having been thereto amicably required, and according to the rules of justice, reason, and equity, those of the union shall proceed against them defensively; the design of the union being only to assure the liberty of commerce and navigation. And if it should happen that any of the towns of the union should, because thereof, or by reason of any particular privilege, suffer any damage, the said town shall be forthwith assisted, 'till liberty is obtained, and reparation of damage made.

VII. And if, by the common consent, war should break out, those of the union shall command their inhabitants and subjects, whether seamen or soldiers, that are in the service of the adverse party, to abandon the same under pain of death and confiscation of effects. Nor shall it be allowable to send from the towns and countries of their obedience, to the said adverse party, money, troops, ships, ammunition, arms, provisions, or such other things; but, on the contrary, that shall be forbidden, on pain of corporal punishment; and all endeavours shall be used, as far as it is possible, to hinder others from furnishing them.

VIII. And in case, also, the adverse party should arrest the persons, ships, merchandizes, and debts of the subjects of those of the union, or if they are surprized at sea, or taken or carried off, they shall make reprisals in the countries of those of the union; and, in that case, they shall mutually assist and defend one another.

IX. The ships of those of the union may frequent the rivers and harbours of each other, without any let or hindrance, and there refit their vessels, and provide themselves with all manner of necessities; upon condition that no violence be used, but that they thankfully pay for every thing they take.

X. The subjects of those of the union shall every-where enjoy, in the towns and countries thereof, the rights of citizens, and shall inherit such successions as belong to them, according to the customs of the place, without any distinction of religion, as it is practised and permitted in the holy empire; but every one shall behave himself as a citizen, and shall submit and conform himself to the laws of the place.

XI. None of those of the union shall make any agreement with the adverse party, without the consent of the others, nor suffer any thing to be done to the prejudice and damage of the others; but, on the contrary, shall endeavour to maintain the common tranquillity, and to keep each others citizens, inhabitants, subjects, ships, merchandizes, and effects, free from all molestation, and secure to them the enjoyment of the liberties and privileges aforesaid.

XII. A peace, or truce, with the adverse party, must be concluded with the common advice and consent of all, and not otherwise.

XIII. This league shall remain in force twelve years, and shall be prolonged with the common consent. But if any of those of the union, during the said league, or even after the expiration thereof, should be attacked or injured by reason thereof, all the members shall mutually assist one another.

XIV. If any potentate, country, or town, desire to enter into this league, they shall be received, with the common consent, upon reasonable terms.

In witness whereof, divers uniform copies of these presents have been drawn up, for their high mightinesses and the Hanse-Towns, which shall be confirmed by oath, and by the apposition of the reciprocal seals, after that a report thereof has been made. Concluded in the month of December, in the year 1615.

R E M A R K S.

These leagues having, for the most part, wrought the desired effect, and deterred the enemies of the Hanseatic liberties from prosecuting the designs that were suspected to have been formed against them, things continued much in the same condition till the year 1640, or thereabouts, that the Hanse-Towns, being again disturbed with fresh jealousies, began to renew and fortify their former league, and take all the other necessary measures for preventing a surprisal from any of their real or supposed enemies.

In order thereto, the towns of Lubeck, Bremen, and Hamburgh, first began to enter into a strict alliance among themselves, by a negotiation then set on foot, and at last brought to a conclusion between them, by a treaty dated the 24th of November, 1641; which being pretty long, we shall here content ourselves with taking notice only of what is most material.

In the preface to that treaty they declare, That, finding the present posture of affairs to be such as might give them just grounds to provide for the security of their proper rights and privileges, both in spiritual and in temporal matters, the most effectual means, for preserving them from being liable to foreign violence and oppression, would be to renew the ancient amity and good intelligence with the rest of the Hanse-Towns; in order to which, and for the interest and advantage of his imperial majesty, and of the holy empire, they agree upon the following articles:

I. That they shall forthwith put themselves in a good posture of defence, by fortifying all their towns, and raising in proportion to their strength, a competent number of regular troops, and putting their own citizens and servants in condition to protect them against all sudden insults and attempts that might be made against the Hanseatic towns, or any of them.

II. That they shall upon all occasions, and especially in the present critical conjuncture, live in a perfect repose and union with one another, and without giving any subject of offence to any other person or persons whatsoever.

III. That, in case of any sudden hostility committed against any of their members, the injured party shall not expect any succour from the others, 'till, by their interposition in an amicable manner, the others endeavour to compose the differences, and procure them a reasonable satisfaction.

IV. But that, if such friendly methods of proceeding should prove at last ineffectual, and the aggressor should unreasonably persist in oppressing any of their towns, in their spiritual or temporal rights, liberties, privileges, prerogatives, commerce, navigation, persons, or effects, by sieges, blockades, building of fortresses, hostile invasions, exacting of contributions, arms, ammunitions, provisions, or other violent and unjust oppressions, then the party injured shall be speedily and effectually assisted, according to the necessity and circumstances of the case, with men and money, and every other thing that might be necessary for them.

V. That none of the confederates, nor their subjects, shall give in any manner of succour or necessities to the enemy, openly

openly or secretly; and that such as shall be convicted of the same shall be severely punished.

VI. The aforementioned succours and assistance shall be given as is above expressed, against all and every person and persons that shall do any damage to any of the league, by sea or land, or in the ports and rivers.

VII. If the town insulted be of opinion that the imminency of the danger cannot admit of a preliminary deliberation, the inhabitants may immediately call the others to their assistance, and then an assembly shall be appointed.

VIII. If any town be so suddenly attacked that the others cannot send a timely succour, those that are nearest shall not only send thither their soldiers, but shall likewise advance at least one month's pay, and shall also raise immediately other troops; of which charges they shall be reimbursed by the other confederate towns, with all convenient speed, &c.

IX. If two or three towns should be attacked at one time, the whole confederate towns shall nevertheless succour and assist one another, to the utmost of their power.

X. For the more speedy dispatch of affairs, the oppressed town shall immediately make known its condition to its nearest neighbours, who shall forthwith acquaint the other confederates that they, without any delay, may appoint a diet, and send thither their deputies.

XI. And, if the danger be very imminent, the oppressed town shall have power to appoint a diet, according to the exigency of the case.

XII. The direction of any defensive war shall reside in those to whom the succour is sent; but, if they require it at their hands, the other confederates shall send deputies to assist at the deliberations.

XIII. If any town is so suddenly attacked or blocked up, as that the others cannot send in any persons to them, they shall endeavour to find means to send out one or more persons, to let their confederates know their circumstances.

XIV. However, such as have been, or still are oppressed, being succoured by the confederates, shall not conclude any treaty without their privacy and consent.

XV. And, if things can be brought to any reasonable accommodation, all possible endeavours shall be used to obtain satisfaction to the injured party, and to bring the treaty to such a conclusion that the parties may have no occasion left for future quarrels.

XVI. This league, which is in confirmation of the eighth article of the former, shall subsist during ten years, and may then be renewed and prolonged; and, in case of a war, reasonable satisfaction shall be made to such as have been at the charge thereof.

XVII. If, after the expiration of this league, any of the members thereof should come to be attacked by reason of it, they shall, notwithstanding that the league be expired, mutually assist each other.

XVIII. Lastly, all the Hanseatic towns that will enter into this league upon the aforementioned conditions, shall be received by the common consent.

All which articles shall be faithfully and sincerely observed. Signed and sealed, &c.

R E M A R K S.

This treaty being so concluded, the states of Holland found it their interest to enter into another, with the towns of Bremen and Hamburg, on the 4th day of August, in the year 1645; of which you may take the following short account, which I have carefully extracted out of the Latin original.

The preface to the treaty insinuates, That there having been of ancient time a firm and sincere friendship between their high mightinesses the States-General and the honourable cities of Bremen and Hamburg, and the other Hanseatic towns, and it being necessary, for their common interest and security, to cultivate and augment that good intelligence, by renewing their former engagements, they oblige themselves to observe the following articles:

I. The league shall not be offensive to any, but shall only tend to the security and freedom of commerce and navigation, according to the laws of nations, and the rights and privileges formerly granted them by several treaties and contracts.

II. The said league shall not be prejudicial to the friendships of the states and their confederates with his imperial majesty and the holy empire, nor to the obedience that some of the said confederates owe to his said majesty; and that the other confederates shall not, by virtue of this league, be under any obligation to concern themselves in the present war between the king of Spain and them.

III. That if any of the confederates should be oppressed in their trade, or otherwise, the other shall endeavour to compose all matters amicably; and, that means failing, all the members should contribute toward the charges of a defensive war.

IV. That the states shall manage the affairs of the confederates, to the common advantage, with the advice of the other members; and deputies shall be appointed to reside for that purpose, at convenient places.

V. That the ships of all the confederated towns, &c. shall freely enjoy each other's ports and harbours, &c. paying for what provisions they shall have occasion.

VI. That if any dissension should happen among the confederates themselves, they shall be amicably composed.

VII. That none of the parties shall act any thing to the prejudice of the other members, or any of them, but shall, as much as in them lies, contribute to the interest, honour, and advantage of each other.

VIII. That the league shall subsist fifteen years.

IX. That the other Hanseatic towns shall be received with the common consent.

X. And, lastly, That the ratifications shall be exchanged within two months.

Signed and sealed the 4th of August, 1645.

R E M A R K S.

This treaty being so concluded, nine days afterwards another was brought to a period at Christianople, between the ambassador of the king of Denmark and those of the States-General; by which it is agreed:

I. That there shall be a firm and sincere friendship between the subjects of both parties, who shall mutually perform all good offices to one another, in so far as the treaties of either party with other princes and estates could allow it.

II. That, for the forty years next ensuing, the tolls shall be paid in the Baltic Sea according to a regulation signed and confirmed between them; and that, during that time, they should not be augmented; but that, after the expiration thereof, things should be regulated according to the treaty concluded in the year 1544, except another treaty should intervene within the aforesaid time.

III. The searching of the ships and goods belonging to the inhabitants of the United Provinces, and passing through the Baltic Sea, shall cease, and intire credit shall be given to the mariners that produce their cockets*, who, thereupon paying the toll, shall be dismissed without any trouble or molestation, and shall not be detained in the customary place (called Den Drooghen) near Copenhagen. But if, in time to come, it should appear that his Danish majesty is defrauded in the toll, their high mightinesses, being acquainted therewith, shall think upon convenient methods for remedying the same, and shall take care that no injustice of any nature be done to his majesty.

* Cocket signifies a certificate and clearance, ordinarily given by the officers of any custom-house to ships going to sea.

IV. The transportation of no goods (what name soever they bear) shall be forbid through the Baltic Sea.

V. All goods that shall be proved really to belong to the subjects of the United Provinces, whether exported or imported, shall not pay any greater duties in the kingdom of Denmark and Norway, than are paid by the subjects and inhabitants of the said kingdoms themselves: nor shall his Danish majesty's subjects pay any greater duties in the said provinces than the inhabitants.

VI. Ships fully laden in any port of the kingdom of Norway, being once searched there, and having paid their tolls, shall not be searched again in the same, nor in any other port at which they may touch, but, upon producing the receipt thereof, shall be freely dismissed; but, if they lade in several ports, they shall be searched there, and not elsewhere: and, as the exportation of oak is prohibited and forbidden, if any person is convicted of exporting any of the said wood, he shall be fined in double the price of the oak.

VII. The toll shall be paid in Norway, in the same quantity and manner that was usual in the year 1628, nor shall any greater be exacted till his Danish majesty and their high mightinesses agree about the method of exacting the duties for all sorts of wood; concerning which affair his majesty and their high mightinesses shall enter into a treaty, as soon as that can be conveniently done, that something more certain may be determined about it.

VIII. The merchants and mariners of the United Provinces, shall by no means be obliged to purchase their planks of some certain persons in Norway, but shall buy the same at such places, and of such persons as they please.

IX. The ships of the subjects of the United Provinces trading to Norway, shall be measured by two Norwegian and as many Dutch mariners, to whom that service shall be intrusted; and, being signed by them, shall be confirmed by the magistrates of the place, and recorded in the books of his judicature, that the mariners, in case of necessity, may have recourse to the same; and afterwards the measure shall be marked upon the mast and beak-head of the ship, that the toll may be the more conveniently determined, till it be otherwise agreed, as is already said.

X. Full and ample restitution shall be made for all the extortions that the subjects of the United Provinces can prove to have been made, against his Danish majesty's command, after the year 1641 (4 per cent. of the price or quantity of the wood being deducted) as of every thing that has been exacted contrary to the treaty then entered into.

XI. The present treaty concluded between his Danish majesty and their high mightinesses shall be signed and sealed by his majesty and the most serene prince of Denmark, and all and every one of the counsellors of the kingdom.

XII. The rights and privileges granted to the towns of the United Provinces of the Low-Countries by the treaty of Spire, and published and confirmed by the authority of the ancient kings of Denmark, shall not be in any manner diminished by the present treaty, but shall remain as formerly, in their full and entire force, &c.

XIII. His Danish majesty obliges himself that he shall not, upon any account, detain any of the ships belonging to the subjects of the United Provinces, nor take any goods or merchandizes out of them, nor force any of them into his service, without first agreeing with the masters and proprietors thereof, and paying them the full price of the same; nor shall he, without the consent of the possessors, take out of the said ship any men or warlike necessities, or other things, under any pretence whatsoever, and it shall be free for them to sail through the mouth of the Baltic, and to trade through all his majesty's dominions.

XIV. Goods exported out of the United Provinces, in foreign ships, shall be suffered freely to pass through the mouth of the Baltic Sea, paying the same toll that is usually paid for goods exported out of the United Provinces: but, upon this condition, that it shall be made appear, by sufficient testimonies either from the cities of the said United Provinces, or others situate upon the ocean, that the said goods belong to no other but the subjects and inhabitants thereof.

XV. All the subjects of the said provinces that reside in the eastern cities, carrying either their own goods, or those of the other subjects or inhabitants of the said provinces through the Baltic, shall be treated in the same manner as the other inhabitants thereof.

XVI. The ships of the United Provinces having paid the toll, and being searched in any port of Denmark, shall not again be searched in any other port of Denmark and Norway, except they take aboard goods there; but, on the contrary, they shall be freely dismissed.

XVII. The receivers, and other officers of the tolls in Norway, shall not exact of the mariners any more than what is due, nor take any more for their discharge, than the king's order bears; and his majesty shall cause such as do otherwise to be severely punished.

XVIII. As to what concerns the toll at Glückstadt, if that affair cannot be accommodated by the treaty now commenced for that effect with the city of Hamburg, the subjects of the United Provinces, producing their ordinary certificate, shall be free from the effect thereof.

XIX. And as, by virtue of the present articles, all differences between his Danish majesty, and their high mightinesses the States-General of the United Provinces, are composed and entirely removed, it is mutually agreed and promised, by the ambassadors and commissaries of either part, that the ratifications shall be delivered on both sides within three months. Signed and sealed, &c. at Christianople, the 13th day of August, 1645.

REMARKS.

To this treaty (of which we have left out some tedious formalities, not material to our point) there is annexed a promise of the Danish ambassadors, by which they oblige themselves, in the king's name, to cause the * tariff, according to which the tolls were paid by the Hollanders in the year 1628, to be renewed and published with all convenient speed, and that nothing should be exacted of the subjects of the United Provinces, contrary to the contents of the said tariff.

* Tariff is a term properly expressing what we call the book of rates in England, being a book in which are written down the duties and customs to be paid on all sorts of goods.

Thus much being said of the circumstances and affairs of the Hollanders, and of the Hanse-Towns with the Danes, we thought it necessary to interrupt, for some time, the relation given of their marine intrigues and negotiations; to oblige the public with a treaty concluded on the very same day, viz. the 13th of August 1645, between the crowns of Sweden and Denmark, which being a curious and useful piece, and pertinent to our present subject, we shall here give a translation of as much as concerns navigation and marine affairs.

In the preamble of this treaty, the ambassadors, &c. of all parties set forth, That several misunderstandings and differences having of late arose between the crowns of Sweden and Denmark, and that especially concerning the immunity of commerce and navigation, and of the duties, &c. exacted in the narrow passage of the Sound; which differences having at last broke out into a war, to the great loss and disadvantage of both kingdoms, in the name of the most serene and mighty prince Lewis XIV. the most Christian king of France and of Navarre, his mother, the queen-regent, out of her sincere compassion towards those kingdoms, and her care for the welfare of all Christendom, and desire to prevent the further miseries and calamities of war, and to give repose and peace to Christendom, his most Christian majesty aforesaid, having, for that effect, sent the year before his ambassador extraordinary in the North, to the courts of Sweden and Denmark, with orders to exhort both to a re-

VOL. II.

conciliation, by representing to them the miserable condition of the Christian world, and by offering to interpose the mediation of France, for the composition of their differences. For those causes her Swedish majesty, out of respect to his most Christian majesty, as well as out of the earnest desire she has to put an end to the war, and to enjoy and preserve peace within the limits of her kingdom, and to maintain a sincere friendship, and good correspondence with all her neighbours, and especially with Denmark and Norway, who, because of the vicinity of their situation, and for several other reasons, have many things in common with the kingdom of Sweden, has received the friendly counsel of his most Christian majesty, and accepts and acquiesces in the offers made of the interposition of the mediation of France, and his Danish majesty having likewise declared, that he accepts of the same mediation, a meeting being appointed at Bromsbroo upon the frontiers, on the 3d of February, between the commissaries and plenipotentiaries of both kingdoms, being four on each side, and of equal quality, where the said ambassadors being assembled, with the help and assistance of the ambassador of France as mediator, they concluded a firm and solid peace, and agreed to the following articles:

I. As to the passage and navigation through the strait of the Sound and Belt, and from the Baltic sea into the ocean, and likewise from the ocean into the Baltic sea, and the immunity from paying all tolls and taxes, because of the said passage and navigation, the certificates for goods, and the searching, visiting, stopping, and judiciary arrests and proceedings, established for ships and goods to prevent fraud, and preserve the ships and goods from all danger, and likewise for preserving the liberty of commerce, the interruption of which has given occasion to the present war and commotions, after many conferences, in which all means of reconciliation have been proposed and examined, it is agreed as under, viz.

I. It is promised in the name and on the behalf of his Danish majesty and his successors, and of the kingdom of Denmark, that, in time to come, her Swedish majesty, and her successors, kings and queens of Sweden, and their subjects and inhabitants in the kingdom of Sweden, great dutchy of Finland, Ingria, Esthonia, and Livonia, shall have right, liberty, and power to navigate, whether in their own, or in hired ships, with all sorts of vessels great or small, armed or unarmed, men of war or merchantmen, and to transport their goods and effects of any kind or sort whatsoever, through the straits of the Sound and the Belt, according to the opportunity and pleasure of every man; nor shall that privilege be forbid them, nor they any ways troubled and molested in the enjoyment of the premises.

II. And this shall be so understood, that it shall be free for her Swedish majesty and her successors, and her and their said subjects, inhabiting in Sweden, Finland, Ingria, Esthonia, and Livonia, to transport, according to their power and pleasure, through the straits of the Sound and the Belt, all sorts of merchandize and effects, without distinction, exemption, or limitation, whether it be goods bought or purchased in other towns or kingdoms, or whether it be the product of the earth or manufactures; more especially all sorts of munitions of war, and every thing that may be useful therein, and particularly brass or iron guns, great or small fusils, muskets and arms, swords, ball, gunpowder, salt-petre, and every other thing belonging to war or arms, by what name soever it may be called, without any impediment, detention, inhibition, charge, or tax; whether such things be transported from Sweden, Finland, Ingria, Esthonia, Livonia, Pomerania, Mecklenburgh, Lubeck, or from the towns of Prussia and Courland, into the lands along the ocean; or whether they be transported from the aforesaid places thro' the Baltic sea into Sweden, and the aforesaid provinces, or directly into Pomerania, Mecklenburgh, Lubeck, the towns of Prussia and Courland, or others.

III. All ships and goods of what kind soever, belonging to her Swedish majesty, and her subjects and inhabitants in Sweden, Finland, Ingria, Esthonia, and Livonia, their mariners, merchants, and other passengers, whether the ships belong entirely to them, or whether they have only a share in the same, shall be free from all tolls and taxes in the straits of the Sound and the Belt, that now are in practice, or that the mind of men can in time to come invent, under any pretence whatsoever, not only during their abode in the said straits of the Sound and the Belt, but likewise during the whole course of the voyage, whether in going or coming; but, if the vessels do wholly belong to strangers, or if they have any share therein, and the same may be only sailed by her Swedish majesty's subjects, they shall pay to the king of Denmark, for their passage through the Sound and the Belt, what ought to be paid according to treaties and customs, whether for the whole ship, if it entirely belongs to strangers, or for any part thereof proportionably; preserving, however, in every thing, the liberties and immunities of the Swedish ships, effects, and persons.

IV. It is agreed, as to the liberty of navigation of the Swedes and their exemption from tolls, and his Danish majesty pro-

misses and determines them in this manner, in his own name, and in that of his successors, kings of Denmark, and of that kingdom, that her Swedish majesty, and her subjects in Sweden, Finland, Ingria, Esthonia, and Livonia, shall, without distinction, enjoy these rights and liberties, in their persons, ships, goods, and merchandizes, whether of the product of the earth, or manufactures; and, in time to come, all the aforesaid ships of Sweden, and all others carrying Swedish goods and effects, writings and persons, shall be free from all searching, visiting, measuring, and other vexations in the passage of the Sound and the Belt, and that no right of superiority or jurisdiction shall be exercised over them in any thing concerning their passage, traffic, and navigation; and much less shall any ships be seized, or any effects taken out of the ships, or any ships forced into the Danish service, without the consent of the owners.

V. And because the certificates, and the different expostitions and explications of them, have very much contributed to the establishing of the custom of searching of ships in the passage of the Sound, and given occasion to the differences that have happened, and to the present war between these kingdoms: for these causes, and for preventing such misunderstandings in time to come, and for the more easy distinguishing between the free ships and goods of Sweden, and those that are subject to the taxes, it is finally concluded and agreed by these presents, that all Swedish ships of war, great or small, laded or unladed, whether there be one alone, or several together, passing through the straits of the Sound, and failing to Cronenborg (which shall not be practised in any other place of the passage of the Sound) shall strike the main sail in passing by the citadel of Cronenborg, and salute the same with the ordnance, which salutation shall likewise be returned by the citadel; and, if the ships of war continue their voyage, without coming to an anchor, it shall be free for them to fail on without any further ceremony; but, if it happens that any Swedish man of war come to an anchor in the strait of the Sound, and the governor of Cronenborg send to the captain to enquire of him, in a friendly manner, whence he comes, and desire him to shew his certificate, without picking otherwise any quarrel with him; the captain shall not decline shewing his passport to the person sent by the governor, but they shall receive and entertain one another with all imaginable respect and civility, and the captain shall not be troubled in any other manner whatsoever. And, as for the narrow passage of the Belt, the Swedish ships of war may freely pass by Nyburgh, according as the wind and their conveniency will allow them; but, if they come to an anchor, before, or near the citadel, the same thing shall be observed, that has been already expressed concerning the citadel of Cronenborg in the strait of the Sound.

VI. And besides, that all Swedish ships or vessels belonging to her Swedish majesty's subjects, and to the inhabitants of her majesty's dominions in Sweden, Finland, Ingria, Esthonia, and Livonia, wholly laden with the goods and effects of the merchants and inhabitants, shall be according to these articles and conventions free from all charge and vexation, provided they have general certificates for their free passage from her majesty and her officers in special matters, and in other cases from the consuls and senators of the towns, to have a jurisdiction over the ships and goods belonging to the citizens and inhabitants of the kingdom, by which it shall be certified in general terms, that the ships and goods do really belong to the subjects and inhabitants of Sweden, which certificate shall be conceived according to the following manner:

A form of the general maritime passport for a Swedish ship, entirely laded with Swedish goods; which (changing what is to be changed) may likewise serve for foreign ships, entirely laded with Swedish goods.

We consuls and senators of the town of _____ certify, that the ship _____ commanded by _____ belongs to our town of _____ (or some other town) in Sweden, and is only laded with goods belonging to Swedes, and is bound for the ocean, as the master and the owners thereof (if they be more than one) have declared before us in our court, desiring this certificate as a proof thereof: the ship and goods being thereby to be exempted from all taxes and vexations in the passage of the Sound and the Belt, according to the treaties between the two kingdoms. In testimony whereof, we have caused the seal of the town to be put to these presents, which we have likewise caused to be signed by the clerk. Given, &c.

Which certificate shall be shewn and consigned in the hands of the officers of his Danish majesty's custom-houses at Elfsineur and Nyburgh, in the passages of the Sound and the Belt, who thereupon shall be obliged forthwith to discharge the ships, with a testimony that they have passed with their lading; which testimony shall be conceived according to the following model:

A model of the testimony to be given by the officers of the custom-houses of Elfsineur and Nyburgh, to such as shew their certificates.

In the year one thousand _____ N. N. master of the ship the _____ belonging to the town of B. has delivered his certificate for ships and goods, dated at B. the _____ day of _____ in the year _____. In witness whereof we have given him this testimony. &c.

Which being done, such masters may freely depart with their goods and men, without any hinderance, prejudice, charge, or vexation.

VII. Ships hired by merchants and inhabitants in Sweden, and only laded with Swedish goods, shall be treated in the same manner; and after shewing their certificates conceived in general terms, and leaving the same at Elfsineur or at Nyburgh, and receiving a testimony thereof (which is to be done without delay) paying what is due for ships that are wholly, or partly foreign, without prejudice to the rights of Swedish persons and goods, according to their proportions, it shall likewise be free for them to continue their voyage, without any further trouble or molestation.

VIII. And so if any Swedish merchant-ship, not laded, pass through the straits of the Sound and Belt, the master shall make it appear (as is already said) at Elfsineur and Nyburgh, by a general certificate, that he belongs to Sweden, Finland, Ingria, Esthonia, or Livonia, after which he shall pay what is due, and depart at his own conveniency, without any other tax, vexation, hinderance, or detention.

IX. If any vessel, great or small, pass through the straits of the Sound or the Belt, laden partly with Swedish, and partly with foreign goods (which latter are liable to pay all the duties levied at that place) the master must have certificates of all the goods and effects he has aboard, belonging to the merchants of Sweden, Finland, Ingria, Esthonia, and Livonia, in which shall be particularly expressed the weight of the goods in such manner as one may distinctly see all the heavy goods that are uncovered, and are not bound or packed up, with their weight, number, and measure, according to the custom of the sea; such as copper, brass, iron, pitch, of all sorts, corn, salt, salt-fish, butter, tallow, hemp, flax, and such other goods; and, as for small goods that can be put up in casks and barrels, they shall not be specified, but they shall be marked with a Swedish mark upon the casks and barrels, and it shall be expressed in the certificate, that the said casks and barrels, and the goods they contain, and which are not specified, belong to merchants and inhabitants of Sweden. And for the greater clearness of the thing, and avoiding all occasions of difference, there is here under added a model of the said certificates.

A form of the certificates to be given to the Swedish ships, laden partly with Swedish, and partly with foreign goods, which are subject to pay the taxes; which, making some alterations, may likewise serve for foreign ships hired by Swedes.

We consuls and senators of the town of N. certify, that, upon the day under-mentioned, P. P. citizen (or inhabitant) of our town of N. _____ (or some other town) in Sweden, appearing before us at our court, declared, that he had shipped on board of the ship R. of which his owner S. S. and master T. T. the number of _____ pounds of copper, iron, or flax, or tons of wheat, rye, or barley; or the number of _____ beams, planks, or masts, or of _____ tons of wine, or the number of casks or barrels of goods and merchandizes, marked L. L. belonging to Q. Q. citizen (or inhabitant) of the town of C. _____ in Sweden; and the said P. P. requiring this certificate to indemnify the ship and goods from all taxes and vexations in the straits of the Sound and the Belt, according to the treaties between the two kingdoms; we have granted him the same, after having caused it to be sealed with the seal of the town, and signed by the clerk. Given, &c.

Which certificate agreeing with the quantity of goods, and being shewn to the officers of the Danish custom-houses at Elfsineur and Nyburgh, the said Swedish goods, expressed in the certificate, shall be free and exempt from all other searching, visiting, detention, judiciary proceeding, or confiscation. But, if it happens that there be reason to search the ship for other prohibited goods, or others that are subject to the taxes; in that case, such goods as shall be called in question, shall be taken out of the ship and deposited, and examined at Elfsineur or Nyburgh, which shall be performed within the space of eight days at most, so that, within the said time at furthest, any Swedish or other ship, freighted by Swedes, may be free to depart with all the Swedish goods, without any further retardment; and that the ships and vessels, merchandizes and effects, belonging to the subjects and inhabitants of Sweden, Finland, Ingria, Esthonia, and Livonia, be not _____ in

in the least tormented with unnecessary searchings and vexations, by reason of the said mistakes and errors.

X. If any ship of Sweden, Finland, Ingria, Esthonia, or Livonia, be freighted by strangers, and laden with foreign goods that are subject to pay the taxes, the ship and persons shall nevertheless enjoy the liberties, privileges, and immunities, which are rightly due; as by these present articles are granted to the Swedes, and the foreign merchant shall give an account of his goods, without any violation of the immunities of the Swedes in the straits of the Sound and the Belt.

XI. And, that no retardment or damage may be caused to the Swedish ships and goods in their voyages, contrary to the intent of these presents, it has been promised in the name of his Danish majesty, that things shall be disposed at Ellsineur and Nyburgh; that the master of the custom-house, or some other officer in his place, shall attend at certain hours, before and after noon, every day at the said custom-house, there to receive the certificates; and, immediately upon the receipt thereof, to give others to the masters in the form above prescribed, in such manner that the Swedish ships and goods may continue their voyages, and freely pass, without any hinderance or molestation.

XII. And, if it afterwards should happen, that her Swedish majesty's ships, or those of her subjects, whether they be their own or hired ships, being forced by tempest, or otherwise, should desire a safe port in Norway, or any other place of the king of Denmark's dominions, it shall be freely granted them, and they shall not be molested in any manner, neither for taxes, searches, nor any other thing, but shall only pay the duties that other friends and strangers pay for anchorage, and such other conveniencies, in places where such things are usually levied. But, as to their goods and merchandizes, they shall have the liberty to purchase necessities for their money; and the Danish ships of war, and others, shall have the same privilege in the like case in the ports in Sweden.

XIII. If it happens, that either her present Swedish majesty, or her successors, kings of Sweden, should levy soldiers, either horse or foot, in the kingdoms or dominions of their friends along the ocean, or send any to the provinces in their neighbourhood of the Baltic sea, or into Ostrogoth, and they pass on one side or other through the Baltic sea, it is agreed, that her majesty and her successors shall have entire liberty to do it without any opposition; provided, however, that there shall not pass together above 1200 men, and that notice be given to his Danish majesty three weeks before, that thereby all suspicions may be removed, and the passage may be free. But, if any Swedish officers, or others, would pass through the Baltic sea, with their own horses and equipages, they may freely do it in one, or several ships, without giving any notice.

XIV. And, to prevent differences between the two kingdoms in time to come, or if the fleets of the two kingdoms meet, or one ship of war meets another; or if by accident the Swedish fleet enters into any of the straits of the Baltic sea or the Belt, and there meets that of Denmark; or if the ships or fleet of the latter enters into any place or port where the Swedes are before them; it is agreed in the following manner, that if the fleet of either of the kingdoms meet the other in the Baltic sea, or in the ocean, they shall mutually receive one another with marks of friendship, and shall salute and honour one another in the same manner, firing guns according to the custom; and neither the one nor the other shall attempt any thing further, nor endeavour to exercise any act of superiority, whatever pretension they may believe they have; the same shall be observed when one or two ships meet; but, if one or two ships of either of the kingdoms meet the fleet of the other, they shall salute it by firing of guns, and striking their main topmasts, 'till the fleet be past, or 'till it come to an anchor in some port, but they shall not be obliged to strike their flags: and, if there be more than two ships of either side together, and they form a fleet, they shall content themselves to fire guns on both sides without striking their sails, and the one shall not oblige the other to do it.

XV. It shall be free for one, two, three, four, or at most five, Swedish men of war, to pass through the straits of the Sound or the Belt, without giving previous notice to his Danish majesty or his successors; and when they are arrived at the strait of the Sound, and have saluted after the Swedish manner, with two guns (as has been already said) they shall lower their main topmasts before the castle of Cronenborg 'till they be past it; and, if it happens that his Danish majesty's ships or fleet be there before them, they shall be satisfied with the two guns aforesaid, without being obliged to any thing further, and much less shall any other marks of honour or deference be required of them. But if her Swedish majesty or her successors be obliged to pass the strait of the Sound or the Belt, with a fleet of ships of war, it is agreed that his Danish majesty shall have notice of it three weeks beforehand, that the arrival of such a fleet may give no ground of suspicion or mistrust; and, such notice being given, the Swedes shall have free liberty to pass without any opposition or damage to the Danes.

XVI. And as to what concerns the island of Burgen, where his Danish majesty has kept for some time a gallery, and levied custom; his said majesty by these presents yields, and entirely renounces that practice, and promises to make use of the same no more, and that henceforth he will not pretend to exact any toll there.

XVII. With respect to the duty which his Danish majesty has levied of late years at Gluckstadt, upon ships and goods going from one place or another to Hamburg, it is likewise agreed in the following manner, that, as his Danish majesty is now in a negotiation with the Hamburgers, concerning the differences between them, and for abrogating of that custom, if they agree between themselves, and the aforesaid duty be abrogated, the subjects of his Swedish majesty who trade that way, shall also enjoy the same privileges; and though, against all appearance, the difference with the Hamburgers about that duty continue, or though they should consent to pay it, in that case the Danish commissioners have promised in his Danish majesty's name, and in that of the duke of Holstein, and have obliged themselves, that all her Swedish majesty's subjects and inhabitants in Sweden, Finland, Ingria, Esthonia, and Livonia, that trade upon the Elbe, shall be freed therefrom; and that they shall not be molested nor detained, by reason thereof, by any of his Danish majesty's, nor the duke of Holstein's ministers, whether they reside in forts or ships; and that they shall be free from all taxes and uneasy searchings, and further that they shall not so much as be obliged to shew any testimonies in writing, and much less to produce certificates, or give any other account of that nature.

XVIII. And, as the experience of by-past times has demonstrated, that the privileges and liberties granted to the Swedes in Denmark and Norway, and to the Danes and Norwegians in Sweden, to trade together, and be exempted from all duties introduced partly by ancient custom, and partly by the transactions and treaties concluded between the two kingdoms, has given birth to several differences, and has even occasioned a hatred and animosity between the kingdoms, and as often set the king and subjects of the kingdoms at variance with those of the other, inasmuch that that has been the principal cause of breaking the ancient friendship which subsisted between the two kingdoms, and there has scarce been any conference between the commissioners of both parties where that grievance has not been represented; besides that, at this time, that liberty cannot be so conveniently continued as it formerly was. For these causes, it is agreed on both sides, that all immunities of duties and taxes cease and be removed, for the Danes and Norwegians in Sweden, and for the Swedes in Denmark and Norway, without prejudice of the exemption of duties, and of the free passage of the Swedes in the straits of the Sound and the Belt, and likewise passage shall be forbidden to the Swedish merchants with their merchandizes, to go into Denmark and Norway beyond their limits; and the same thing shall be forbidden to the Danes and Norwegians to go into Sweden, as well into the country as into the maritime towns and provinces. However, any Swedish merchant trading, for the time to come, into Denmark and Norway, shall have the privilege of trafficking in the maritime staple towns appointed for it, whither it is lawful for merchants to go; and he shall there enjoy the same liberties and privileges granted to other friends and foreigners, according to the laws and statutes of Denmark, preserving always the privileges of the towns; and, on the other hand, a Danish or Norwegian merchant, trading in Sweden or any of the provinces depending upon it, shall enjoy the same privileges and liberties of trading in staple ports appointed for that purpose, and in which other foreigners and friends are allowed to come, according to the statutes and laws of Sweden, preserving always the privileges of the town. And, to the end that their Swedish and Danish majesties may not be troubled or molested in their kingdoms, they shall dispose of their subjects, according as every one's occasion and condition requires.

XIX. The trade and navigation upon the river of Trotheat between Westgoth and the territory of Bahus, shall remain under the same condition, liberty, and privilege, that it anciently was, and shall not be hindered nor interrupted at either of the entries towards Gothburg and Kongel, and all buildings that have been erected, or other things that have been sunk in it's channel, that may be any ways prejudicial to the one or the other, shall be removed, and the channel shall be cleaned without any opposition, and especially what was thrown into it, to stop it's entry towards Bahus, shall be taken away, and, after an exact search, it's ancient current shall be restored to it, and what damage is done shall be repaired. The Swedes shall not be in any manner disturbed by the Danes and Norwegians, nor shall the latter by them, but, on the contrary, navigation and commerce shall be carried on with equity, and ships shall go up and come down the same river on the side of Gothburg, without any hinderance, charge, or grievance, as it has been formerly practiced.

XX. And further it is agreed, that her Swedish majesty shall have in time to come, as she has had hitherto, a post-master

at Elfsineur, and a post between Sweden and Hamburg, who shall pass on all sides without hinderance or molestation; and she shall likewise have persons to carry her majesty's letters, and those of her subjects, and others that are sent out of the kingdom, or into it, and that without any obstacle, retardment, or searching; and his Danish majesty shall have the like power, that is to say, to keep an agent at Stockholm, for his own and his subjects business.

XXI. The estates enjoyed by the Swedish gentry in Denmark and Norway, and those enjoyed by the Danish and Norwegian gentry in Sweden before this war, shall be restored to the right owners, who shall possess the same according to the ancient treaties, and according to the laws and statutes of each kingdom, without any molestation or hinderance whatsoever.

XXII. And, because the war has occasioned some confiscations on both sides, and some losses to the subjects whilst it lasted, all things shall be forgot on either side, upon consideration of this peace, and all that has been adjudged, and actually confiscated, and all private losers shall remain in the condition they now are, and nothing shall be paid on either side by the subjects; nor shall any molestation be given, nor any action intended against such as by reason thereof have contracted debts, and have not lawfully paid the same as well within as without the kingdom.

XXIII. But, if any thing be found (whether it be adjudged or not) that is not actually confiscated, and all debts that the subjects and inhabitants of Sweden had right to demand before this war of his Danish majesty, or the Danes and Norwegians of her Swedish majesty, upon due proof, shall be forthwith paid on both sides.

XXIV. And if, during the course of this war, any sentence has been given either in Sweden or Denmark, to the prejudice of any Swede in Denmark, or to the prejudice of any Dane or Norwegian in Sweden, it shall be of no effect; and it shall now be free for every man to pursue and prove his right.

XXV. As her majesty the queen Christiana of Sweden has, during this war, reduced to her obedience several of his Danish majesty's forts, provinces, territories, and towns in Jutland, Scania, Halland, Belking, Bornholm, and Holstein; and likewise in Stormaren and Dittmarsen, and namely Christianople, Pinnenberg, Helsingburgh, Lanseeroon, Laholm, Engelholm, Saltzburgh, Hammerfusen, or by what other names forever they are or may be called, now possessed by right of war; for that, and several other considerations, and by the mediation and diligence, and the continual exhortation and persuasions of his most Christian majesty's ambassador; her majesty, the queen of Sweden, makes over, and consents to give, to his Danish majesty and his successors, all the title she may have acquired, by the right of war, to the said provinces, lands, forts, houses, fields, towns and territories; all which things shall depend on him and his successors, according to the tenor of this peace; and that, because of the desire she has to prevent the extraordinary miseries with which the continuation of the war would be attended; well considering how necessary a reconciliation between the northern kingdoms is, for breaking a way for the peace and repose of Christendom, so long wished for: and, that the care and desire of their majesties, the most Christian king, and the queen regent his mother, to end the differences and wars between these kingdoms, may not be without effect, his Danish majesty especially, being persuaded by his most Christian majesty's ambassadors, having promised in his own name, and for his successor, and the kingdoms of Denmark and Norway, as effectually by these presents, he consents and promises to her Swedish majesty and her successors, kings of Sweden, and to the said kingdom, that, in compensation for the provinces, fortresses, towns, and territories, which are to be restored, he makes over all Jemtland, including Heredafia, &c. as likewise Gothland, and the town and citadel of Wisby, and the islands and arms of the sea depending on the same, as likewise Oesfel and Arnfburgh, with all the islands and appurtenances, and every thing depending thereon, with the superiority, royal privileges, and ecclesiastical and political jurisdiction, tributes, revenues, and dues, by sea and land, in the same manner as the kings of Denmark, and particularly Christian IV. now reigning, has enjoyed the same; which shall belong, and appertain in time to come, to her Swedish majesty, and her successors to the kingdom of Sweden, to be by them possessed by a perpetual right, as the special instrument of cession drawn up for that, and signed and sealed by his majesty, and by the counsellors of Denmark, do more fully testify.

And, besides, his Danish majesty consents and promises in his name, and for his successors, and for the kingdom of Denmark, to the end that her Swedish majesty, and her successors, and subjects in Sweden, Finland, Ingria, Ethhonia, and Livonia, may have security for enjoying, without molestation, the freedom of commerce and navigation in the straits of the Sound and the Baltic sea, according to these present articles, to give to the said queen, her successors, and to the kingdom of Sweden, as a pledge and security for the observation of the said articles and conventions for the

thirty years next ensuing, all Halland with its forts, Hölmt, Helmsfadt, and Warburg, together with all the towns and villages situated within that territory, as well the aforesaid Holm, Helmsfadt, and Warburg, as Falkenburg and Kaningsflachen, and all the lands and fiefs there contained, according to the ancient bounds, limits, and borders of the aforesaid countries; upon condition that her majesty and her successors, and the kingdom of Sweden, shall enjoy and possess the said province of Halland, with all its forts, towns, magistracies and rights, revenues, ordinary and extraordinary superiorities, royal rights and jurisdictions, ecclesiastical and civil, and all other emoluments arising from the lands, waters, rivers, seas, isles, ports and fields, without excepting any thing whatsoever, by whatsoever name it may be called, in the manner that the kings of Denmark have possessed the same, and especially in the manner that the present king Christian IV. possesses and enjoys them, and all the inhabitants of that province, as well in the country as in the towns, ecclesiastical or secular, gentry and commonalty, inhabiting and dwelling therein, shall not be obliged, during the aforesaid term of thirty years, to take any oath of allegiance, fidelity, or obedience, but to her Swedish majesty and her successors, and to the kingdom of Sweden, until the said term of thirty years, without any interruption, be expired, according to the tenor of the present convention, as in the particular instrument for the pledge and security given by his Danish majesty, and signed and sealed by all the counsellors of his kingdom, it is more fully expressed. And it is further agreed, concerning this pledge and security, That, the aforesaid term of thirty years being expired, his Danish majesty and the kingdom of Denmark shall be obliged, before the restitution of the said province, either to let it still remain for security to her Swedish majesty, and to the kings her successors, and to the kingdom of Sweden, or to give in lieu thereof as good a pledge, with which her said majesty, and the kings her successors, and the kingdom of Sweden may be satisfied, that they may have security for the observation of the present articles.

REMARKS.

As this long article does not particularly concern the marine affairs, I should not have troubled the reader with it, if I had not observed a very remarkable passage, from which a weighty inference may be reasonably drawn, in favour of what we have said under the article SEA, viz. that the sea is capable of, and subject to, dominion; which, we think, does very plainly appear to have been the sentiment of the princes concerned, and of the plenipotentiaries and other politicians employed in the management of this treaty, since in the perpetual and temporary cession that the king of Denmark makes, in favour of the crown and kingdom of Sweden, of several lands and territories, most expressly mention is made of the arms of the sea, seas, waters, &c. depending on the same, &c.

As the fifteen following articles have but little relation to maritime affairs, we shall leave them out, in order to have the more room for what is most essential to my present purpose.

XXI. It is also agreed by these articles, that all the towns, comprehended in the Hanseatic league, shall have a share therein, and shall enjoy the freedom of commerce by land and sea in both kingdoms, reserving the observation of the ancient treaties between these kingdoms and the Hanseatic Towns for a better time; and no injury shall be done to any town, citizen, or subject, for any action perpetrated during the war.

XXII. Particularly the town of Dantzick is comprehended in this peace, and shall enjoy, in the same manner it has hitherto done, the liberty of commerce by sea and land, in both the kingdoms; and all offences, happened during this war, shall be buried in perpetual oblivion.

XXIII. This treaty, for the greater security, shall be ratified, and signed and sealed with the privy-seal of Sweden and Denmark, and likewise shall be signed and sealed by the counsellors of both kingdoms.

XXIV. Each kingdom shall send a splendid embassy, into France, to return thanks for their mediation, and invite that kingdom to take care of the observation of the treaty concluded the 13th of August 1645, &c.

REMARKS.

This treaty being so brought to a conclusion on the 13th of August, two days afterwards another treaty of guarantee was concluded at Suder-Okra, between the ministers of the queen of Sweden and the States-General, by which those two powers agreed, That, in case the king of Denmark should in any manner infringe his treaties with either party, they should mutually assist each other, and strenuously vindicate and maintain the freedom and immunity of commerce and navigation, according to the laws of nations to ancient custom, and to the particular conventions and treaties between them.

The 25th of November following, was brought to a conclusion, at Copenhagen, a treaty between Lewis XIV. and his

his mother the queen regent of France on one part, and the king and kingdom of Denmark on the other, by which they agree:

I. That there shall be in time to come, between the two kingdoms, a perfect and inviolable friendship, &c.

II. The subjects of either prince shall freely trade between the two kingdoms, according to the respective laws established in the same.

III. His most Christian majesty's subjects going into Denmark or Norway, about their own or their master's affairs, whether concerning commerce or any other thing, shall have liberty of conscience; and the king's ministers, residing there, shall be allowed the exercise of the Roman Catholic religion in their own houses.

IV. The ships of either kingdom, entering into the ports of the other, shall be favourably received and kindly treated, &c.

V. The subjects of either crown trafficking by sea, and passing by the coasts of the other kingdom, shall not be forced to enter into any port whatsoever, except they be bound thither; and, if they come to an anchor, they shall not be obliged to unlade their goods, nor to exchange or sell them, but shall have free liberty to do what they think most convenient and advantageous for their affairs.

VI. When French ships, or ships hired or laded by Frenchmen, pass through the straits of the Sound, whithersoever they are bound, or from whatsoever place they come, or what goodssoever they may have aboard, they shall not be obliged to pay any other toll than that which the king of Denmark has ordered in a special treaty upon this subject, concluded the 27th of September of this present year, under the counter-seal, of which there is a table of the tax or toll. And if, in time to come, the Dutch pay any thing for sea-marks and fires, the French shall do the same.

VII. The subjects of the king of France that shall carry into Norway the product of their country, or shall go thither in ballast to purchase the commodities they have use for, shall pay no more for the entry of the goods they carry thither, nor for the custom of those they purchase there, than what is now, or shall be in time to come, imposed upon the king of Denmark's own subjects.

VIII. And likewise the subjects of the king of Denmark, trading into France, shall not pay any other, nor greater duties than the French themselves, or their other friends or confederates; and they shall be allowed to sell and dispose of their goods to whom they please, and at the price they think fit.

IX. Ships of war and others, going into the ports of either kingdom, shall be kindly received, paying for the necessities they want.

X. No ships of war or others, belonging to either of the kingdoms, shall be forced into the service of the other, without the consent of the prince, the ships of war belonging to or of the owners of the others; and that, though the captain of the vessel should consent.

XI. The two kingdoms shall use their utmost endeavours for the advancement of commerce and navigation, and shall suppress pirates, &c.

XII. And, as the liberty of commerce does principally consist in maintaining the state of things in the western, northern, and Baltic sea, in the same condition that they have been hitherto, both kings shall use their endeavours to preserve entire, and without any alteration, the ancient balance and equilibrium that has been hitherto found to be the surest foundation for the public peace and tranquillity.

Note, The other five articles of this treaty are not very material to our point.

Signed and sealed at Copenhagen, Nov. 15, 1645, &c.

REMARKS.

The next treaty of this nature that occurs, is that by which the town of Lubeck renewed their old league with the States-General, who notwithstanding their late accommodation with Denmark, the better to bring that court to a compliance with their desires, gladly entered into a fresh alliance with the said towns, in which they more plainly discovered their discontents with the Danish imposts upon their ships than in any precedent treaty; for there they plainly declare their resolution of maintaining the freedom of their navigation in the Baltic; which resolution of theirs, and the measures they had fallen upon to make it effectual, did probably incline the court of Denmark to come to an agreement with them, by a treaty concluded by his ambassador at the Hague, the 12th of February, 1647; which treaty, though it be very long, as it contains a great many things that are not unworthy the perusal of the curious and attentive reader, we have thought fit to give the world a full and exact translation thereof in the following terms: to which I was so much the more inclined, that it may serve to give the world some distinct notions of the great trade that the Hollanders have drove in the Northern Seas.

ARTICLE III.

A treaty of commerce concluded between Christian IV, king of Denmark, and the United Provinces of the Low Countries.

tries, concluded at the Hague the 12th of February, in the year 1647.

I Corfitt Ulefeldt, counsellor of state, first master of the household, and governor of the isle of Moon, &c. ambassador extraordinary from his majesty the king of Denmark, Norway, &c. my most gracious king and lord, to the high and mighty lords the States-General of the United Provinces, on one part: and we John lord of Ghent, and one of the nobles of Guelderland; Gerard Scaep, ancient burgher-master and counsellor of the university of Leyden; Nanning Keyser, counsellor and pensioner of the town of Horn in West-Friesland; Jacob Veth, counsellor and pensionary of the town of Middleburgh in Zealand; Gilbert Vander Hooick, ancient burgher-master of the town of Utrecht; Charles Van Roorda, grietman of Idaderabel; John Vander Beeck of Doornick and Crytenberg, burgher-master of the town of Davenport; Hieronymus Eyben, hoovelings of Niehoue, burgher-master of the town of Groningen, commissaries deputies, and provided with full powers from the high and mighty lords the States-General of the United Provinces, on the other part: be it known by these presents, that, on the 13th day of the month of August, in the year last past, 1645, there was a treaty agreed to, and concluded at Christianople, between his majesty the king of Denmark and Norway, and the high and mighty lords the States-General of the United Provinces, containing, amongst other things, that, in time to come, there should not be levied any greater duties, or toll, in Norway, nor in any other manner, or upon any other account, than was practised in the year 1628, till his majesty and their high mightinesses should agree upon a sure and certain method, according to which the tolls and taxes upon wood should be paid at so much per last: and, his majesty having offered to treat with their high mightinesses concerning that affair, with all convenient speed, we the abovementioned lords commissaries, being for that effect assembled, have, after a diligent negotiation, agreed and concluded what is under:

I. In the first place, all the subjects of the United Provinces of the Low Countries, from the day of the date of this treaty till the 23d of August, N. S. in the year 1685, shall pay the tax or toll in Norway as follows:

II. All ships, sailing from the said United Provinces of the Low Countries to Norway, shall repair to five or six commodious havens of the said provinces, to be there measured and marked by such as shall be appointed for that service on both sides; for which there shall be three persons named by the king of Denmark, besides another person who shall have an inspection over them; and their high mightinesses, if they please, may also appoint the like number of persons, with one inspector, also on their side.

III. The ships shall be exactly and faithfully measured, according to their depth, length, and breadth.

IV. And, that no misunderstanding may arise between the Danish and Dutch measurers and inspectors, we have thought it convenient to propose a model, according to which those calculations and measures shall be made, copies of which model, or table, as it is here incorporated in this treaty, shall be delivered into the hands of the measurers and inspectors, who shall be regulated thereby.

A table, or model, for measuring the ships, according to the measure of Amsterdam.

The length shall be taken from the exterior part above the beak or beak-head of the ships in one end, to the same part of the beak in the other end.

The breadth shall be taken from the opposite inner planks of both sides of the ship, before the main-mast.

The depth, or capacity of ships, shall be measured between the main-mast and the mizen-mast, where it is most shallow, and widest near the pump, from one side to the other, and afterwards they shall measure from the middle of the measuring line, through the wood, to the bottom of the hold; after which they shall proceed in the following manner:

A ship 125 feet in length, 25 feet in breadth, and 14 feet in depth, with a half-deck the length of the hatches, shall be adjudged to contain 155 lafts.

A ship 123 feet in length, 24 $\frac{1}{2}$ in breadth, and 14 in depth, with a half-deck, 146 lafts.

A ship 122 feet in length, 24 $\frac{1}{2}$ in breadth, and 13 $\frac{1}{2}$ in depth, with a half-deck, 138 lafts.

A ship 120 feet in length, 24 in breadth, and 13 $\frac{1}{2}$ in depth, having a half-deck, 130 lafts.

A ship 118 feet in length, and 13 in breadth, with a half-deck, 123 lafts.

A ship 116 feet in length, and 13 in breadth, with a half-deck, 118 lafts.

A ship 114 feet in length, 23 $\frac{1}{2}$ in breadth, and 13 in depth, with a half-deck, 112 lafts.

A ship 112 feet in length, 23 in breadth, and 13 in depth, with a half-deck, 107 lafts.

A ship 110 feet in length, 23 in breadth, and 12 $\frac{1}{2}$ in depth, with a half-deck, 101 lafts.

A ship 108 feet in length, 22 $\frac{1}{2}$ in breadth, and 12 $\frac{1}{2}$ in depth, with a half-deck, 96 lafts.

U u

A ship

A ship 106 feet in length, 22 in breadth, and $12\frac{1}{2}$ in depth, with a half deck, 91 lafts.

A ship 103 feet in length, 22 in breadth, and $12\frac{1}{2}$ in depth, with a half-deck, 86 lafts.

A ship 95 feet in length, $21\frac{1}{2}$ in breadth, and 12 in depth, 73 lafts.

A ship 90 feet in length, $21\frac{1}{2}$ in breadth, and 12 in depth, 66 lafts.

A ship 85 feet in length, 21 in breadth, and $11\frac{1}{2}$ in depth, 60 lafts.

A ship 80 feet in length, 21 in breadth, and 11 in depth, 50 lafts.

A ship 126 feet in length, 25 in breadth, and 13 in depth, with a complete upper-deck, having four feet in height between decks, shall be judged to contain about 172 lafts.

A ship 124 feet in length, 25 in breadth, and 13 in depth, with a full deck, $3\frac{1}{2}$ feet high, 162 lafts.

A ship 122 feet in length, $24\frac{1}{2}$ in breadth, and 13 in depth, with a deck of $3\frac{1}{2}$ feet high, 153 lafts.

A ship 120 feet in length, $24\frac{1}{2}$ in breadth, and 13 in depth, with a deck $3\frac{1}{2}$ feet high, 145 lafts.

A ship 118 feet in length, 24 in breadth, and $12\frac{1}{2}$ in depth, with a deck of $3\frac{1}{2}$ feet, 134 lafts.

A ship 130 feet in length, 28 in breadth, and 12 in depth, with an upper-deck 6 feet high, shall be judged capable of carrying about 195 lafts.

A ship 126 feet in length, 26 in breadth, 12 in depth, and having a deck as above, 170 lafts.

A ship 124 feet in length, 25 in breadth, and $11\frac{1}{2}$ in depth, having a deck $5\frac{1}{2}$ feet high, 166 lafts.

A ship 122 feet in length, 25 in breadth, and 11 in depth, with a deck 5 feet high, 156 lafts.

A ship 120 feet in length, $24\frac{1}{2}$ in breadth, and 11 in depth, with a deck $4\frac{1}{2}$ feet high, 146 lafts.

A ship 118 feet in length, 24 in breadth, and $10\frac{1}{2}$ in depth, with a deck of $4\frac{1}{2}$ feet high, 135 lafts.

A ship 116 feet in length, $23\frac{1}{2}$ in breadth, and 10 in depth, with a deck of $4\frac{1}{2}$ feet high, 120 lafts.

A ship 112 feet in length, 23 in breadth, and 10 in depth, with a deck of $4\frac{1}{2}$ feet high, 113 lafts.

A ship 110 feet in length, 22 in breadth, and 10 in depth, with a deck of $4\frac{1}{2}$ feet high, 110 lafts.

Such vessels as shall not be found to be precisely of the same form or burthen abovementioned, shall be taxed by the measurers and inspectors, conformably to the aforesaid regulation, and in proportion to their burthen.

And the aforesaid calculation being made by the last of St. Ubes, of eorn or salt, as the vessels cannot be so deeply laden with wood, because of it's lightness and stiffness, one fifth part of the calculation of every vessel shall be abated.

V. The ships, being measured in the aforesaid manner, shall be marked upon the sail-yards and upon the beak-heads, fore and aft, with a hot iron; and two acts, or certificates, shall be drawn up for the ship, which shall be signed by the measurers and inspectors of both sides, one of which shall be delivered to the master of the ship, and another deposited in the hands of the magistrates of the place where the ship is measured.

VI. There shall likewise be kept two records, or comptrolls, of ships so measured, which shall likewise be signed by all the persons that measure the same, one of which shall be sent into Denmark, to be communicated to the commanders of the castles, and other officers, that recourse may be had to the same, in case of need, and the other shall remain at the disposal of their high mightinesses.

VII. Such vessels shall be measured before the end of the month of April at latest, and sooner, if it be possible, in order to which, both parties shall use the utmost diligence.

VIII. All vessels sailing from the United Provinces to Norway, and having aboard a certificate of their measure in due form, shall pay, at their going out of the kingdom, according to their burthen, as under: that is to say, any ships carrying, according to the certificate of the measures, 125 lafts, shall pay the tax but for 100; and so all ships carrying wood out of Norway shall pay but for four-fifths of their burthen, the other fifth being abated, in consideration that they have been well and faithfully measured; concerning which, his majesty shall give the necessary orders to all his custom-houses of Norway.

IX. Vessels sailing from the United Provinces of the Low-Countries to Norway, and carrying merchandizes thither, shall only pay for such merchandizes the duties his Danish majesty's subjects are obliged to pay; so that the inhabitants of the said Low Countries shall not be at any greater charge than those of Denmark and Norway.

X. All the ships sailing from the United Provinces of the Low-Countries to Norway, and having aboard a faithful certificate of their measure, as is above expressed, shall give a rixdollar per laft, deducting, as is above said, one fifth of the number of lafts.

XI. The said vessels, lading wood, may likewise, in the same harbours, lade pitch, tar, skins, singlafs, or any other commodity that may be transported, paying the aforesaid duty of one rixdollar per laft, and no more.

XII. This shall only be understood of vessels transporting

wood from Norway, and in the harbours where wood is sold, but not from other places, and especially from Bergen, where that trade is not driven; in which harbours the subjects of the United Provinces shall pay the same duties for other goods that his Danish majesty's subjects pay; and this shall only be understood of vessels laden with wood from Norway, and from the harbours where that trade is driven, and no where else.

XIII. All the other duties and by-tolls, of what name soever, that have been hitherto imposed upon that trade, shall be, and are abolished, by these presents, and none other shall be imposed in time to come but that already mentioned, called the toll of the laft of the wood, of whatsoever name or nature it may be.

XIV. Any of the said vessels laden with wood, having paid the toll according to the certificate of it's measure, the said fifth part being deducted, shall be no further troubled or molested with searching or unlading, under any pretence whatsoever, but shall be in full liberty to depart, upon the payment of the said duty or toll.

XV. There shall be no distinction made of the quality of the wood that is laded, whether it be of the best, or of the middle, or coarsest sort; and much less shall such vessels be searched, unladed, or detained; so that, if the said vessels of the United Provinces of the Low Countries should load any oak, or other prohibited wood, no search shall be ordained, but the prohibited wood shall be detained, only when it is found out of the vessels: in which case the subjects of the said United Provinces shall not suffer in any manner, neither in their persons or effects, nor shall be incommoded or molested, under any pretence whatsoever.

XVI. The expences laid out in the harbours of Norway, for the preservation of foreign ships, such as iron rings, and other conveniences, shall not be required of the ships that have been taxed and measured, as is above expressed; but, on the contrary, all necessary conveniences and assistance shall be given them, without any further charge.

XVII. During the term expressed in this treaty, no alteration nor innovation shall be made, directly nor indirectly, by heightening the tolls of taxes upon the laft of wood, or in any other manner, or under any pretence whatsoever; but all things shall remain in the same state as is herein expressed, viz. one rixdollar per laft for every ship lading wood, and carrying it out of the kingdom.

XVIII. If any new ship, or others not measured, sail to Norway to lade wood, they shall be measured and taxed in Norway, by three or more Danes or Norwegians, and as many Dutch boat-men, according to the model already inserted; and the exact capacity, or burthen of the ships, shall be marked and signed by those that measure them, and the duties paid accordingly, deducting one fifth as above.

XIX. And it shall be henceforth allowable for the subjects of the United Provinces of the Low Countries to transport from Norway linden trees, ash-trees, elm-trees, wood for sail-yards, and masts, from 16 to 20 palms, and no distinction shall be made with regard to the toll between the different sorts of wood that are exported, but all shall pay by the laft, as is above expressed.

XX. When his Danish majesty, for the exigencies of his own dominions, shall have need of linden, ash, and elm-trees, and of sail-yards and masts of 16 palms, the merchants shall not, in that case, export such timber without his majesty's express permission, provided, however, that, in that case, what is said and stipulated in the 15th article concerning oak be duly considered.

XXI. If, in any time to come, it should happen that the tolls and duties should be diminished in Norway, in favour of his majesty's subjects, or those of other nations that transport wood out of Norway, and not into the proper dominions of his majesty, but into foreign countries, in that case the subjects of their high mightinesses shall pay no more than they, but be taxed conformably to them.

XXII. The whole without prejudice to the precedent treaty of the 13th of August, N. S. in the year 1645, concluded at Christianople, between his said majesty and their high mightinesses, which, in all it's parts, shall remain in full force and power, in as far as it is not altered by this.

XXIII. And as, by the precedent articles agreed to by us the respective ambassadors and commissaries, such things as could not be brought to a conclusion concerning the 7th and 9th articles of the aforesaid treaty, in the year 1645, between his majesty the king of Denmark and Norway, and the high and mighty lords the States-General, are now entirely determined: we have reciprocally consented and promised to each other, that each party shall cause to be delivered to the other, in the name of their respective masters, within three months after the delivery of this treaty, a ratification thereof in good and due form: and their high mightinesses may make use of their resident in the Sound, or any other that they think convenient for the delivery of theirs, which, as soon as his majesty has received, he shall sign the other, and cause it to be signed by the prince of Denmark and the lords of the council, in order to the delivery thereof.

XXIV. All which points and articles have been agreed to and concluded by us, the respective plenipotentiaries and com-

commissaries mentioned at the beginning of this treaty : in witness whereof we have signed these presents with our hands, and confirmed the same with our seals ; of which two instruments have been drawn up of the same tenor, of which each party has taken one. Done at the Hague the 12th of February, 1647.

The most illustrious and most mighty prince and lord, Christian IV. king of Denmark, Norway, and of the Goths and Vandals, &c. having been pleased to send, to their high mightinesses the States-General of the United Provinces, the Heer Corfits Ulefeldt, Knt. and governor of the isle of Moon, &c. first steward of the household, and counsellor of state to his Danish majesty, and his ambassador extraordinary, to negotiate with the said lords the States-General concerning several matters of importance, and, among other things, to agree upon a duty, or toll, at so much per last, on all the wood transported out of Norway : and, at the same time, his excellency having been acquainted, by an order of their high mightinesses, with the great inconveniencies occasioned to the vessels of the United Provinces navigating through the Sound towards the east, by reason of passes from the custom-house, and the counting of 12 barrels of round feed for a last, instead of 24 barrels ; the said lord ambassador has promised and obliged himself to use his endeavours with his said majesty for obtaining orders for causing the said complaints to cease, and that the vessels belonging to the subjects of their high mightinesses may be and remain free from all extortion of money, and from the inconveniencies of searching, and other retardments. And further, that 24 barrels of lint-feed, and other round feeds, be allowed to the last, according to the custom of merchants, and in consequence of the 3d article of the last treaty, concluded between his Danish majesty and their high mightinesses, in the year 1645.

And the said lord ambassador has further promised, in the name of his said majesty, that, in time to come, for preventing all misfortunes, there should be buoys, and other sea-marks put up, for the utility and conveniency of commerce and navigation, provided that each ship in her lading should pay to his majesty, or his officers, four rixdollars, and each ship in ballast two. In witness whereof, we his majesty's said ambassadors, and we the commissaries and deputies of the said lords the States-General, have signed these presents with our hands, and put our respective seals thereto, by virtue of our reciprocal full powers and procurations ; and two instruments of the same tenor have been drawn up, one for each party. Delivered at the Hague, the 12th of February, in the year 1647.

And as, during the years 1645 and 1646, several laden vessels belonging to the United Provinces have passed the Sound towards the east, and likewise vessels in the ballast, without having paid in passing or repassing, any toll or impost, or without having been any-where recorded, so that on this occasion it might be difficult to state a clear account : for these causes, I Corfits Ulefeldt, ambassador, &c. aforesaid, as one part, and we the commissaries and deputies of the States-General, likewise aforesaid, on the other part, have consented and agreed that the states shall pay for the said failures, in paying of tolls upon the sum of 120,000 rixdollars, which shall be paid in this country, upon the production of his majesty's discharge, by such as his said majesty shall authorize for that effect, at the delivery of the ratifications of this present treaty, which are to be interchanged on both sides, within three months after the date of these presents. In witness whereof, we the ambassadors of the said king, and we the commissaries and deputies of the States-General, have signed these presents with our hands, and confirmed them with our respective seals, by virtue of our full powers. And two instruments of the same tenor have been drawn up, and one delivered to each party at the Hague, the 12th of February, 1647.

R E M A R K S.

After this account of the situation of the marine affairs in the northern countries, and the treaties between the crowns of Sweden and Denmark, the United Provinces and the Hanse-Towns, we shall now return to Britain, where civil dissensions were at the greatest height.

The first of these acts that comes in order to be mentioned, is a manifesto published by the parliament of England against the States-General of the United Provinces, the 31st of July, 1652, in which they set forth, That it is an almost incredible ingratitude in the Dutch, so basely to requite the generous efforts by which the people of this nation had rescued them from the tyrannical oppression of the Spaniard, at a great expence of English blood and treasure ; in return of which, they represent, That the Dutch, after having severely fomented the divisions during the civil wars of England, did afterwards, both openly and secretly, obstruct the peace of the kingdom ; and, in the year 1648, made considerable preparations to carry on a war against it.

They likewise call to mind the cruelty and treachery with which they assaulted and massacred the English in Amboyna, and transiently accuse them of many other sinister attempts of the like nature.

In the next place, they accuse them of having neglected the friendly measures proposed by the parliament of England for accommodating of all differences, and confirming their mutual liberty and freedom, &c. adding, That, after they had sent an envoy to the Hague, and the States had refused him audience, the parliament having sent thither a second, he was there most barbarously and villainously murdered ; and the States had not taken any care to punish the perpetrators of that horrid crime.

They further represent, That, while the Dutch ambassadors were in England, to amuse the government with disingenuous promises and protestations, they secretly and clandestinely assisted the enemies thereof, and only spun out the time with sham pretences, without any likeness of reality or sincerity. To which they add, That the commonwealth of England having, after the pacification of their own intestine divisions, sent over a splendid embassy to Holland, with sufficient instructions for ending all former controversies ; and to give all possible marks of their sincerity and good-will towards those of the United Provinces ; their ambassadors were contumeliously used and reviled, and all sorts of indignities offered to them, without any regard to their character, or respect to the nation they represented : they themselves having been insulted and affronted, and their servants and attendants abused to a high degree, and no notice taken, nor satisfaction given to the States, for such an unaccountable practice.

But that, notwithstanding the sincere inclinations of the commonwealth of England, to cultivate a good friendship and correspondence with the United Provinces, they always delayed and protracted the negotiations concerning the same ; 'till, seeing the success the English had every-where obtained, they at last sent over their ambassadors to England, where, when they were arrived, they still delayed, under various pretences, the negotiations that were set a-foot, alledging that they were not sufficiently impowered, and pretending to write over about those matters to their principals, so that nothing could be determined 'till the States-General should be conveniently assembled ; by all which it plainly enough appeared, that the friendship they affected was no ways real or sincere.

After which their ambassadors having, during the conferences, acquainted the parliament that the States had resolved to arm 150 ships, besides the fleet they already had at sea, which they only did with a design to protect their trade, and encourage navigation, without any insidious intention against England ; though the States themselves are not ignorant of the design they had in setting out so great a fleet, and though there was no appearance of any thing like an enemy in these seas.

To all this, however, the parliament (which they thought to have lulled asleep by these pretences) did not give any answer, but sedulously applied themselves to provide for their own defence ; and, in the mean time, omitted nothing that was in their power to bring the negotiations that were depending with the Dutch to a happy conclusion.

Notwithstanding which, the Dutch immediately got together their whole fleet in one place, under admiral Trump, whose design will sufficiently appear to any person that considers his behaviour, joined to some other passages precedent to that equipment, and particularly that of a certain Dutch ship, who, meeting an English man of war, commanded by Capt. Young, and being friendly required by him to pay the honour that is usually paid to the ships of war of this nation, as another ship in company with the same had done, and that not only as a customary piece of civility, but as a testimony of the undoubted right the English have to the dominion of the adjacent sea, which is acknowledged by all the neighbouring princes and republics, and which, particularly, the States themselves, and their predecessors, have acknowledged ; the master of the said ship did nevertheless refuse to comply with that desire, affirming that it would be deemed a capital crime in him to do it.

This passage was followed by that hostile and heinous insult of admiral Trump, perpetrated against friends and neighbours that had given many remarkable testimonies of their sincere desire to continue and confirm the same ; and with so much arrogance and injustice was that action performed, even during the conferences that were holding in order to enter into a stricter league, that Trump himself pretended to usurp what he refused to pay to us (though our own undoubted right) and carried the affront to such a height, that, pursuing the ships of this republic, he attacked them in an hostile manner, upon their own coasts, and in their own friths and roads, with a design to begin an unexpected war, in hopes to ruin entirely the trade and navigation of the commonwealth of England.

The rest of this manifesto does only contain some further remonstrances, by which the then government of England endeavoured to vindicate their proceedings against the States of Holland, with whom they declare that they are forced, against their inclination, to go to war ; who answered the English manifesto with a declaration given at the Hague, the 2d of August following ; in which they, on the other hand, pretend to lay all the blame of those confusions upon the English ; whose manifesto, as well as that of the Dutch, is in effect,

effect, nothing else but a declaration of war, as may be observed by the foregoing compendium of the first, and the following abridgment of the latter.

ARTICLE IV.

An abridgment of the manifesto of the States-General against the nation and government, &c. of England. Given at the Hague the 2d of August, 1652.

The States-General, &c. being sensible that all lawful powers being ordained of God, for the good of their subjects, are not only obliged to govern them with moderation and order, but likewise to endeavour to prevent, and prudently to avert whatever may threaten them from abroad; and being also sensible of the necessity of living well with, and procuring, by all sorts of good offices, the amity and friendship of other States, and especially of their neighbours, knowing that, in case of any accidental, or other misunderstandings, they ought to exert themselves to the utmost of their power, by endeavouring to remove the same in a peaceable and friendly manner; they are not, however, ignorant, that, when all other methods prove ineffectual, it is reasonable and necessary to make use of the power that God has put in their hands, and to repulse vigorously and courageously, by force of arms, the violence and injuries exercised upon their subjects and people, in order to procure satisfaction and reparation for the damages suffered, and restitution for what has been unjustly taken away.

And accordingly, having hitherto endeavoured to maintain our ancient amity and friendship with the English nation, and having of late seen that nation divided in itself, and torn to pieces by intestine commotions, our hearts were filled with grief and heaviness, and we took as much care as in us lay, that nothing should be transported from our country and ports that might foment their divisions, and, by the continuation of the war, might render their cure more difficult, and less possible; but, on the contrary, understanding that their divisions had produced very great desolations and miseries, and that the famine raged in several of their provinces, being thereto required by both houses of the then parliament, we and our good subjects were so sensibly touched at the recital of so many complicated miseries and mischiefs, that, by virtue of our permission, granted at the earnest desire of the parliament aforesaid, a considerable sum of money, amounting to several tons of gold, was raised by the liberality of these provinces, and sent over to relieve the necessities of such as were in misery; for which we received letters of thanks from the said parliament, confirmed verbally by their resident with us. But, for a further proof of the sincerity of our affection, of which we had given them such evident marks, in order to compose the differences and misunderstandings between them, we sent over, for the advancement of so great a work, an embassy to the king and parliament; but the Almighty, whose judgments are incomprehensible, not having suffered their divisions to be terminated by such a friendly agreement, that nation having now received a form of government quite different from that it then had, the aforesaid government having, under specious pretences, afterwards offered to enter into a treaty of a fair alliance and friendship with us, believing that they were ingenuous and sincere, and looking upon that project as very convenient and necessary for the tranquillity and security of commerce and navigation, as well for ourselves as for all our neighbours and other kingdoms and states that support themselves by trade. And, for avoiding all the rising difficulties and differences occasioned by the concurrence of the same interest between the aforesaid government and ours, we gave them to understand, that the offer they made us was very acceptable; and they having sent over their ambassadors extraordinary, the Sieurs Oliver, John, and Walter Strickland, we endeavoured by all possible methods, as much as the constitution of our government could allow, to find out means to bring that treaty to a conclusion; so that the said ambassadors entering into a conference with our deputies, and the former having delivered general projects, though they were earnestly required by our deputies to explain their general propositions, and descend to particularities, a counter-project being proposed to them, when they had but lightly touched the matter, soon after the first audience, they pretended to be going; but having, after many persuasions, consented to stay a little longer, and having presented a more special project, we so industriously handled the matter on our part, that they easily saw there was but little difference between us; and finding us come home to the purpose, desiring of them a more express and positive declaration, they declined that, under pretence of their sudden departure: notwithstanding which, considering that a short delay could not operate any considerable alteration in the thing, we preferring the excellence and benefit of so good a work to the outward ceremonies and formalities, upon the protestation the said ambassador made us, at their departure, of the sincerity of the intentions of that government towards us, we resolved to send a considerable embassy into England, which we accordingly did, in the month of December last;

though that government, since the departure of their ambassadors had published a certain decree that neither favoured of the good neighbour nor the good friend, since thereby the accustomed liberty of commerce, and the correspondence between the two nations, was very much diminished. Nevertheless, in hopes that all dissensions should have been suddenly ended by the treaty, we did our utmost endeavours to bring it to a happy conclusion; but, on the contrary, the said government, far from having any regard to the requests we made them, that the execution of that decree should be suspended 'till the conclusion of the treaty, and the ships and goods of our good subjects, that had been seized and taken by them, restored to the proprietors, they did under several pretences, attack on every side our vessels; and pirates, under their cloak, did the same every where, and no reparation could be obtained by our ambassadors in any manner. And, though such a multitude of reasons gave us just cause to right ourselves and subjects, by way of reprisals, we absolutely refused to do it, and would not suffer any injury to be done them, in hopes that all things should have been composed according to equity and justice. And having endeavoured, on one side, by our ambassadors, and, on the other side, having equipped a considerable fleet, to put a stop to the insolence of the pirates, we at the same time declared, That it was not with any intention to incommode any of our friends, or allies, and particularly them with whom we designed to entertain a good friendship and correspondence.

And though this declaration ought to have been taken as a mark of our sincerity and candour, the aforesaid government did only endeavour, under various pretences, to weaken our states, by ruining of our commerce, as does plainly appear by that instance of their admiral, who meeting with vice-admiral Trump, whom we had made commander of our fleet, the said Trump, not having soon enough (according to his fancy) lowered his flag, though it be evident, by the testimony of several indifferent persons, that he was actually striking his sails, and occupied in hoisting his boat to send and compliment the said admiral; he nevertheless gave him a full broadside, and forced him and the ships that were with him to defend themselves; who, notwithstanding, were so moderate, although they were superior in number, and could have destroyed the aggressors, if they had pleased, they only kept upon the defensive: to which discretion their adversaries had so little regard, that, another of their squadrons coming up, they fell upon the hindmost vessels of our fleet, destroying one, and taking another with them. Which action, that the regency may cover with some specious pretences, they have caused a report to be spread abroad, as if we had been the first aggressors at that rencountre, and accordingly put themselves in a posture to demand reparation of the injury they pretend to have received from us.

But, on the contrary, that accident no sooner came to our knowledge, but we protested solemnly, by our ambassador, that it had not been committed by our order, and that we were entirely ignorant of what had passed, as more fully appeared by a letter from our admiral, in which he recited, word for word, the commission and instructions we had given him. And, for a further proof of the sincerity of our intentions to live well with that state, we earnestly prayed that an exact enquiry might be made into the matter, and that the treaty, which we thought to be in a very great forwardness, might not be retarded by reason of that unlucky rencountre, by which we had been mightily surprized.

But the aforesaid government, having no regard to such a reasonable desire, did forthwith give order to seize both men of war and merchant ships, as many as they possibly could find belonging to us and our subjects; which accordingly has been done, and all sorts of injuries and violences whatsoever committed against us; by which a great deal of innocent blood has been shed, and many of our good citizens ruined.

Notwithstanding all this ill usage, we have sent a second embassy extraordinary, to endeavour to bring all matters, and especially that difference concerning the rencountre of the two fleets, to a friendly accommodation; they injuriously alledged, for covering their own pernicious and odious designs, that we had equipped that fleet on purpose to attack them as enemies, though the Heer Hadrian Pauw, our ambassador, whose employment of pensionary of Holland giving him a right to be present at all the assemblies and deliberations of the States, did most solemnly protest, that never any such thing had been projected here, and that, far from any commission to do the English, or any other body any injury, the admiral had orders to give that government all possible marks of our peaceable and friendly dispositions.

And, because the aforesaid regency pretended to make quite another thing of that action than it really was, and demanded reparation for what was passed, and assurance that no such thing should happen in time to come, our ambassador aforesaid told them openly, That, in order to remove that stumbling-block, or principal difficulty occasioned by the accidental combat between the two fleets, and the easier to bring the treaty (which was then so far advanced) to a happy conclusion, a convenient regulation should be established, and punctually observed in time to come, by the vessels of both nations, protesting

reſting that this ſtate had never any thought of diſputing with the Engliſh nation the honour and dignity we had hitherto yielded them; requiring afterwards, that, during the negotiations, all hoſtile attempts and actions ſhould ceaſe; and farther deſiring, that a due enquiry might be made into the whole matter, with promiſe that, if our admiral ſhould be found to be the aggreſſor, the States ſhould not only diſown the act, but puniſh the actor according to the importance of the thing; upon condition that the Engliſh ſhould treat their admiral in the ſame manner, in caſe he ſhould be found to be in the wrong.

But they ſtill rejecting all means of reconciliation, and reſuſing themſelves to propoſe any project, by which things might be brought to an accommodation, did continue to ſeize and plunder our ſhips, and, at laſt, were not aſhamed to demand of us an imenſe ſum of money for the loſs and damage they ſaid they had ſuſtained, and the charges they had been put to, upon account of the fleet we put to ſea; after payment of which ſum, or ſecurity given for the ſame, all acts of hoſtility ſhould ceaſe: ſo that they, having heaped up injuries upon injuries, and committed all ſorts of violences againſt us and our good ſubjects, with a deſign, by all theſe inſupportable proceedings, by ruining our trade, to weaken our ſtrength at ſea, and ſo take poſſeſſion of the imaginary empire to which that government pretends over the ocean, and, beginning with us, to extend it over all other nations, and render them tributary, if they could. For theſe cauſes, being reſolved to make uſe of the power that God has put into our hands for our own defence, and that of our good ſubjects, &c.

R E M A R K S.

The following lines of this manifeſto contain, in ſum, a declaration of war; which being made public at the Hague, the 2d of Auguſt, 1652, the 5th of December following there was an ordinance publiſhed by the States-General, forbidding their ſubjects all commerce with England, and with all exhorting other nations to abſtain from ſuccouring the Engliſh with ſuch things as might be neceſſary in the war, and ſo might fall under the notion of what is taken to be in that caſe contraband goods, according to the cuſtom of nations; threatening, otherwiſe, to ſeize and conſiſcate the ſame, as in the aforeſaid ordinance is more largely expreſſed; with which we ſhall not trouble the reader, ſince it is not material to our preſent purpoſe.

The Dutch, being thus entered into a war with England, in the end of the year 1652, were glad to take advantage of the miſunderſtandings which then aroſe between this country and Denmark, and ſo concluded a treaty of alliance with Frederic III. then reigning in that kingdom, containing in ſubſtance.— That the Engliſh having not only paſſed the Sound with armed merchant ſhips, but likewiſe with a fleet of eighteen men of war, without giving any previous advertiſement; and having likewiſe ſeized and taken ſeveral of his Daniſh majeſty's ſhips at ſea, and detained others in England, and in divers ways interrupted the free courſe of trade; an edict ſhould be publiſhed forthwith after the ſigning of the treaty, whereby all Engliſh ſhips, whether men of war or others, ſhould be forbid, under pain of conſiſcation of ſhips and goods, to paſs and repaſs the Sound or the Baltic ſea, during the continuation of the war with Holland.

That the king of Denmark, for the ſecurity of commerce, ſhould keep, in and about the Sound, the number of twenty ſhips of war well equipped, according to a liſt already given, from the firſt of April 'till the firſt of November yearly; and, if any of them be loſt, he ſhall ſupply their place with others of the like burthen.

That the States ſhall pay the king 192,000 rixdollars yearly, for his charges during the war, &c.

That they ſhould mutually aid and aſſiſt one another againſt all enemies whatſoever, by ſea and land.

That the ſaid twenty Daniſh men of war ſhould, at the requeſt of the miniſters of the States, fail to attack the Engliſh in Cartegat and Schagrack, but no farther into the northern ſea, except in ſome extraordinary caſes.

That the Daniſh and Dutch ſhips meeting in the north, or elſewhere, ſhould jointly attack the Engliſh, and do them what harm they could.

That they ſhould mutually protect one another's ſubjects, ſhips and effects, in both countries.

That, in caſe of a conjunction of both fleets, the Daniſh admiral ſhould have the firſt voice, and then the Dutch admiral, and ſo a Daniſh and Dutch officer of equal poſt, alternately ſhould give their voices, the Dane always firſt.

That, if their united fleets ſhould take any prizes, the ſame ſhould be diſpoſed of in the country, which had moſt ſhips at the taking of the prize; but that not without the privacy of the reſident of the other country, and to his ſatisfaction.

That the ſhips of war of either ſide ſhould aſſiſt the other with ſuch neceſſaries as they might have occaſion for, at a reaſonable rate; and that they might refit and provide themſelves in each others ports and harbours, with the permiſſion of the governors or magiſtrates thereof; and that privateers,

VOL. II.

&c. might carry their prizes into one another's ports, and ſhould there receive protection.

That ſuch other princes, ſtates, and potentates, as thought fit, might enter into the league.

That all former treaties ſhould ſubſiſt.

That this treaty ſhould ſubſiſt 'till the liberty of commerce and navigation was reſtored, and the diſturbers thereof brought to reaſonable terms.

- That neither of the allies ſhould make peace nor truce without the other.

That, if the twenty Daniſh men of war were not all in good order and condition, a proportionable deduction ſhould be made out of the ſubſidy promiſed, &c.

R E M A R K S.

The effect of this good underſtanding between the Danes and the Dutch appeared by another treaty concluded between thoſe two powers at Copenhagen, the 26th of September of the following year, 1653; by which that of 1644, touching the imposts in the Sound, is annulled, all former treaties in favour of the United Provinces renewed, and their men of war allowed to lie in the roads of Lubec, and before Elſineur; and are likewiſe (obtaining his majeſty's permiſſion) allowed to be cleaned and refitted, even at Copenhagen; with ſeveral other benefits and privileges of that nature.

But, notwithstanding this ſtrict union with the crown of Denmark, the Dutch, beginning very ſoon to be weary of the war with this country, were glad to relinquish all other advantages to conclude a treaty of peace, of which here follows an abſtract.

An abſtract of a treaty of peace and union between Oliver Cromwell, as protector of England, and the United Provinces of the Low-Countries.

I. In the firſt place, it is agreed, that, from this day forth, there ſhall be a firm and inviolable peace, and ſincere friendſhip, &c. between the republic of England, and the States-General of the United Provinces of the Low-Countries, and the lands, regions, and cities, ſituate under their juriſdiction without diſtinction, and between their people and inhabitants of any degree whatſoever.

II. That henceforth all enmity and hoſtilities ſhall ceaſe.

III. That all offences, injuries, damages, and charges, ſuffered after the 18th of May, O. S. 1652, ſhall be entirely buried in oblivion; and no ſuits ſhall be moved, nor actions be intended for the ſame, excepting ſuch depredations as ſhall henceforth be committed in the Britiſh ſeas, after the ſpace of twelve days, and between the Britiſh ſeas and Cape St. Vincent ſix weeks; and thence in the Mediterranean ſea, and to the equator, after the ſpace of ten weeks, and beyond the equator after eight months from the publication of this treaty, or immediately after due notice of the peace; and reſtitution ſhall be made of all things taken, and injuries done, after that time.

IV. That all priſoners of war, of whatſoever degree or condition, and in whatſoever place they be, ſhall be ſet at liberty without ranſom.

V. That ſuch as attempt to diſturb the peace of either ſtate, ſhall be reputed enemies.

Note, The ſix next articles are not much to our purpoſe.

XII. It is agreed, that the ſubjects of either ſtate ſhall freely travel through and trade to all the dominions of the other in Europe, without prejudice of the laws and cuſtoms of particular places, &c.

XIII. It is likewiſe agreed, that as well the ſhips of war, as the other ſhips of the United Provinces, meeting with the ſhips of war of this ſtate in the Britiſh ſeas, ſhall ſtrike their flag, and lower their topſail, in the ſame manner as has been done in any former time, under any government whatſoever.

XIV. That, for the greater ſecurity and encouragement of trade, all pirates be duly puniſhed in the dominions of either ſtate, and the effects, ſeized in their cuſtody, reſtored to the right owners, if any can be found.

Note, The four next articles are foreign to our preſent purpoſe.

XIX. That the merchants, mariners, failors, and pilots, &c. of each ſtate, nor their ſhips, goods, nor effects, ſhall either be detained or arreſted, nor forced into the ſervice of the other, without an abſolute neceſſity; in which caſe too, ſatisfaction ſhall be given for the ſame.

XX. That the ſhips of war of either ſtate ſhall take into their protection, and under their convoy, all ſhips belonging to the other ſtate, as long as they ſteer the ſame courſe with them.

XXI. That if the ſhips belonging to the ſubjects of one of the ſtates be taken in the ports of the other, by thoſe of a third nation, the ſtate under whoſe juriſdiction ſuch ſhips are taken, ſhall do their endeavours to recover the ſame.

XXII. That if any injury ſhall be done on either ſide, no letters of reprisal ſhall be granted 'till three months after juſtice has been demanded in a friendly manner, and reſufed.

X x

XXIII. That

XXIII. That such as obtain letters of reprisal of either state, shall give in security before the judge, which delivers them the same, for their behaviour.

XXIV. It is further agreed, that the vessels of both nations, whether ships of war or others, shall be free to enter into each other's ports, and there buy provisions and other necessities, or refit, if need be; provided always, that not above eight ships of war enter into any port of either ally, except they be forced in by tempest or enemies; in which case they shall forthwith acquaint the governor, or chief magistrate of the place, and shall not remain any longer there than necessity requires.

XXV. It is likewise agreed, that the Dutch shall do justice upon all those concerned in the slaughter of the English at Amboyna, if there be any of them remaining.

The following articles of this treaty only contain some stipulations for receiving the king of Denmark into it, and for procuring the restitution of some English effects seized in that country, and reparation of damage, &c. together with some other things no ways material to our purpose, and therefore I shall pass by them.

R E M A R K S.

The next important marine treaty that occurs, is one between his majesty king Charles II. after his restoration to his dominions, and the States-General of Holland; in which they compose all ancient differences, and amongst other things expressly confirm that former article, concerning the homage to be paid by all Dutch ships to English men of war, which article only we shall here insert.

Art. X. It is likewise agreed, that the ships and vessels of the said United Provinces, as well men of war as others, meeting any of the ships of war of Great-Britain, within the extent of the British seas, shall strike their flag, and lower their main top-sail, in the same manner that it has been observed in any former time whatsoever.

The next treaty that followed after the war between Great-Britain and Holland, was a treaty of peace and alliance concluded between king Charles II. and the States-General. the 21st of July, O. S. 1667.

And, as the first eighteen articles of that treaty do not particularly relate to marine affairs, the nineteenth being precisely the same with the tenth article of the precedent treaty, but just now inserted, we shall begin at the twentieth article, and insert the rest of the treaty in the same order we find it.

XX. And, for the greater freedom of commerce and navigation, it is agreed and concluded, that the said king of Great Britain, and the said States-General, shall not receive into their havens, cities, and towns, nor suffer that any of the subjects of either party do receive pirates or sea-rovers, or afford them any entertainment, assistance, or provision, but shall endeavour that the said pirates and sea-rovers, or their sharers and abettors, be found out, apprehended, and suffer condign punishment, for the terror of others: and all the ships, goods, and commodities, piratically taken by them, and brought into the ports of either party, which can be found: nay, although they be sold; shall be restored to the right owners, or satisfaction shall be given, either to their owners, or to those who by letters of attorney shall challenge the same; provided the right of their property be made to appear in the court of admiralty, by due proofs according to law.

XXI. It shall not be permitted to the subjects of the said king of Great-Britain, and the inhabitants of the kingdoms and countries under his obedience, or to the inhabitants and subjects of the said United Provinces, to do or offer any hostility or violence to each other, either by land or by sea, upon any pretence or colour whatsoever: and, consequently, it shall not be lawful for the said subjects or inhabitants to get commissions or letters of reprisal from any prince or state, with whom either of the confederates is at difference, or in open war: and much less, by virtue of those letters, to molest or damnify the subjects of either party. Neither shall it be lawful for any foreign private men of war, who are not subjects to one or the other party, having commissions from any other prince or state, to equip their ships in the harbours of either of the aforesaid parties, or to sell or ransom their prizes, or any other way to truck, as well the ships and goods, as any other lading whatsoever. And it shall not be lawful for them to purchase any provisions, but what shall be necessary to bring them to the next port of that prince, from whom they obtained their said commissions. And, if, perchance, any of the subjects of the said king of Great-Britain, or of the said States-General, shall buy or get to themselves by truck, or any other way, such ship or goods which have been taken by the subjects of the one or the other party; in such case the said subjects shall be bound to restore the said ship or goods to the proprietors without any delay, and without any compensation or reimbursement of money paid or promised for the same; provided that they make it appear before the council of the said king of Great-Britain, or before the States-General, that they are the right owners or proprietors of them.

XXII. That in case the king of Great-Britain, or the said

States-General, do make any treaty of amity or alliance with any other kings, republics, princes or states, they shall therein comprehend each other and their dominions, if they desire to be therein comprehended, and shall give to the other notice of all such treaties of friendship or alliance.

XXIII. That in case it happens, during this friendship, confederacy, and alliance, that any thing shall be done or attempted by any of the subjects or inhabitants of either party against this treaty, or any part thereof, by land, sea, or fresh waters, nevertheless this amity and alliance between the said nations shall not thereby be broken or interrupted, but shall remain and continue in it's full force; and that only those particular persons shall be punished, who have committed any thing against this treaty, and none else; and that justice shall be rendered, and satisfaction given to all persons concerned, by all such who have committed any thing contrary to this treaty, by land or sea, or other waters, in any part of Europe, or any places within the Straights, or in America, or in any lands, islands, seas, creeks, bays, rivers, or in any places on this side the Cape of Good Hope, within twelve months space after justice shall be demanded; and in all places whatsoever on the other side of the Cape (as hath been aforesaid) within eighteen months next ensuing, after demand of justice shall be made in manner aforesaid. But in case the offenders against this treaty do not appear, and submit themselves to judgment, and give satisfaction within the respective times above expressed, proportionably to the distance of the places, they shall be declared enemies of both parties, and their estates, goods, and revenues whatsoever, shall be confiscated for the due and full satisfaction of the injuries and wrongs by them offered; and their persons also, when they come within the dominion of either party, shall be liable unto such punishments as every one shall deserve for his respective offences.

XXIV. That the subjects of the said king of Great-Britain, and those which trade under his jurisdiction, may freely and securely travel in all the provinces of the Low-Countries, and all their dominions in Europe, and through them by sea or land pass to other places there or beyond them, and through all quarters of the United Provinces, cities, forts, or garrisons whatsoever, which are in any parts of the United Provinces, or elsewhere in their dominions in Europe, as well they themselves exercising trade in all those places, as their agents, factors, and servants, may go armed or unarmed (but, if armed, not above forty in company), as well without their goods and merchandizes as with them, where-foever they please. The people also and inhabitants of the United Provinces shall enjoy the same liberty and freedom in all the dominions of the said king in Europe, provided that they, and every of them, do, in their trade and merchandizing, yield obedience to the laws and states of either nation respectively.

XXV. That, in case the merchant-ships of the subjects of either nation shall by storm, pirates, or any other necessity whatsoever, be driven into any haven of either dominion, they may depart securely at their pleasure, with their ships and goods, without paying any customs or other duties, provided they break no bulk, nor sell any thing; nor shall they be subject to any molestation or search, provided they do not receive on board any persons or goods, nor do any thing else contrary to the laws, ordinances, or customs of the places, where they (as aforesaid) shall happen to arrive.

XXVI. That the merchants, masters, and seamen of either party, their ships, goods, wares, or merchandizes, shall not be arrested or seized in the lands, havens, roads, or rivers of the other, to serve at war, or any other use; by virtue of any general or special command, unless upon an extraordinary necessity, and that just satisfaction be given for the same; but so as the same shall not derogate from the seizures and arrests duly made in the ordinary courts of justice of either nation.

XXVII. That the merchants on both sides, their factors and servants, and also the masters and other seamen, as well going as returning by sea and other waters, as also in the haven of either party, or going on shore, may carry and use, for the defence of themselves and merchandizes, all sorts of weapons, as well offensive as defensive; but, being come into their lodgings or inns, they shall there lay by and leave their arms, until they be going on board again.

XXVIII. That the men of war, or convoys of either nation, meeting at sea any merchant-ship or ships belonging to the subjects of the other, holding the same course, or going the same way, shall be bound, as long as they keep one course together, to protect and defend them against all and every one who would set upon them.

XXIX. That if any ship or ships of the subjects of either nation, or of a neuter, be taken by a third party in the harbours of either, not being of the subjects or inhabitants of either nation, they, in or out of whose haven or jurisdiction the said ships shall be taken, shall be bound to endeavour, with the other party, that the said ship or ships be pursued, brought back, and restored to the owners; but all this shall be done at the charge of the owners, or whom it concerns.

XXX. That searchers, and other like officers on both sides, shall regulate themselves according to the laws of either nation,

tion, and shall not impose or demand more than they are allowed by their commissions or instructions.

XXXI. That if any injury be done or practised by either nation, or the subjects of the same, against the subjects of the other, or against any of the articles of this present treaty, or against common right; yet nevertheless no letters of reprisal, marque, or counter-marque, shall be granted by either side, 'till justice hath been first demanded according to the ordinary course of law; but, in case justice be there denied or delayed, then that the said king of Great-Britain and the said States-General, or commissioners of that nation, whose subjects or inhabitants have suffered the wrong, shall publicly require justice from that other party, where (as above said) it was denied or delayed, or from that power appointed to hear and decide such difference, that there may be a friendly composition, or due process of law. But if still there happen more delays, and neither justice be administered, nor satisfaction given within three months after such demand, that then letters of reprisal, marque, or counter-marque, may be granted.

XXXII. It is also agreed, if at any time it happen (which God of his mercy forbid) that the differences, now composed between his said majesty and the said States-General, should fester and break out again into open war, that then those ships, merchandizes, or any kind of moveables of either party, which shall be found to be and remain in the ports, and under the command of the adverse party on either side, shall not, for all that, be confiscated, or made obnoxious to any inconvenience; but the space of six months shall entirely be allowed to the subjects and inhabitants of either party, that they have leisure to transport from thence the forementioned things, and any thing else that is theirs, whither they shall think fit, without any kind of molestation.

XXXIII. That they who have obtained private commissions from either party, before they receive such commissions, shall give good and sufficient security before the judge of the court where they receive such commissions by responsible men, who have no part or share in such ships, that they shall do no damage or injury to the subjects or inhabitants of either side.

XXXIV. It is also agreed and concluded, that the subjects and inhabitants of either party shall always have free access to each other's sea-ports, there to remain, and from thence to depart with the same freedom; and not only with their merchantships and lading, but also with their men of war, whether they belong to the said king or States-General, or unto such as have obtained private commissions, whether they arrive through violence or tempest, or other casualty of the seas, or to repair their ships, or to purchase provisions, so they exceed not the number of eight men of war, when they come there voluntarily; nor shall remain longer in the havens or places adjacent, than they shall have a just cause to repair their said ships, or to purchase provisions, or other necessities: and, if a greater number of men of war should upon occasion desire to come into such ports, they shall in no case enter thereinto, until they have first obtained leave from those to whom the said havens do appertain, unless they be compelled so to do by storm, or some force or necessity, whereby they may avoid the danger of the sea: in which case also they shall presently make known the cause of their coming, unto the governor or chief magistrate of the place, and shall stay no longer than the governor or chief magistrate shall permit them, and shall not commit any acts of hostility or other prejudice in the aforesaid havens, during their abode there.

XXXV. Furthermore, it is agreed and concluded, that both parties shall truly and firmly observe and execute this present treaty, and all and every the matters contained therein, and effectually cause the same to be observed and performed by the subjects of either nation.

XXXVI. Also, for further caution and assurance, that this treaty and confederacy shall be duly and bona fide observed on the part of the said States-General of the United Provinces and their people, it is concluded and agreed, and the said States-General by these presents do agree, and firmly bind themselves, that all, and every one of whom they, or the states of the provinces, shall at any time chuse, appoint, or make captain general, governor, or chief president, or stadtholder, general of armies or military forces by land, or admiral or general of the fleets, ships, or forces at sea, shall be bound and obliged by oath to confirm this treaty, and all the articles thereof, and promise sacredly upon affidavit, that they shall as far as it is possible, religiously observe and execute the same, and, as much as concerns them, cause the same to be observed and executed by others.

XXXVII. Under this present treaty of peace, those shall be comprehended, who may be named by either party with common consent before the exchange of ratifications, or within six months after. But, in the mean time, as the covenanting parties do thankfully acknowledge the friendly offices, and unwearied endeavours, whereby the most serene king of Sweden, interposing his mediation, hath, through the assistance of God, promoted and carried on this beneficial work of pacification, unto the desired conclusion; so, to testify their like affection, it is decreed and covenanted by the common consent of all the parties, that his above-mentioned ma-

jesty of Sweden, with all his kingdoms, dominions, provinces, &c. be comprehended in the present pacification, in the most effectual manner that may be.

XXXVIII. It is also covenanted, concluded, and agreed, that the present treaty, and every thing therein contained, shall be confirmed and ratified by the said king of Great-Britain, and the said States-General of the United Provinces, by letters patents on both sides, sealed with the great seal in due and authentic form, within four weeks next ensuing, or sooner, if it can be done; and that, within the said time, the ratifications on both sides shall be exchanged at Breda; and that, presently after the delivery and exchange of the same, this treaty and alliance shall be published in such form and place as is usual.

Done at Breda the $\frac{24}{11}$ day of July, 1667.

The same day was likewise concluded another treaty concerning marine affairs; but, as that was only the forerunner of another of the $\frac{27}{2}$ of February, 1667-8, we shall only insert the latter, which is more methodical and positive, and consequently fitter for our purpose.

ARTICLE VI.

Articles touching navigation and commerce, between the most serene and mighty prince, Charles II. by the grace of God, king of England, Scotland, France, and Ireland, &c. and the high and mighty lords the States-General of the United Netherlands, concluded at the Hague the $\frac{17}{2}$ of February, 1667-8.

Whereas by the blessing of almighty God, for the mutual safety of the two parties, as well as the common good of Christendom, a perpetual defensive treaty was concluded, and signed on the 23d day of January last past, between the most serene and most potent prince Charles II. and the high and mighty lords the States-General of the United Netherlands, with stipulation of considerable succours, to be mutually given by the parties, as well by sea as land: and whereas the said king and states did on the same day, and by another instrument, readily enter into a solemn treaty and agreement for composing the affairs of their neighbours, and restoring peace to Christendom, so as nothing seems now remaining that can at any time hereafter interrupt a friendship and alliance renewed with so equal desires, unless such controversies as may otherwise hereafter happen to arise about determining the different sorts and natures of merchandize; which, being left dubious and uncertain, would give occasion to the further growth to such differences: and therefore, that it may appear with what sincerity and good faith, the said king, and the said states, desire to preserve and entertain, not only for the present, but to all posterity, the amity they lately contracted between them, they have at last, for the taking away all ground, not only of differences and misunderstandings, but even of questions or disputes, and so utterly to cut off the hope and expectation of those, whoever they are, that may think it their interest, by new controversies, to endeavour the disturbance or interruption of the said peace, mutually agreed on these following articles, which are to be on both sides, and for ever observed as the measure and rule of such maritime affairs, and mutual settlement of trade, or at least so long, 'till by the joint consent of both parties, commissioners be appointed, and do meet in order to the framing a more ample treaty concerning this matter; and the laws and rules of commerce and navigation, as by farther experience shall be found most advantageous to the common good of both parties.

I. All the subjects and inhabitants of Great Britain may, with all safety and freedom, sail and traffic in all the kingdoms, countries, and estates, which are or shall be in peace, amity or neutrality with Great Britain, without being troubled or disquieted in that liberty by the ships of war, galleys, frigates, barks, or other vessels belonging to the States-General, or any of their subjects, upon occasion of the hostilities which may hereafter happen between the said States-General and the aforesaid kingdoms, countries, and estates, or any of them, which are or shall be in peace, amity, or neutrality with Great Britain.

II. This freedom of navigation and traffic shall extend to all sorts of merchandize, except those of contraband.

III. This term of contraband goods is understood to comprehend only all sorts of fire-arms and their appurtenances; as cannon, musquets, mortar-pieces, petards, bombs, grenades, fire crancels, pitched-hoops, carriages, refts, bandoliers, powder, match, saltpetre, bullets, pikes, swords, morions, head-pieces, coats of mail, haberts, javelins, horses, great saddles, holsters, belts, and other utensils of war, called, in French, *Assortifemens servant a l'usage de la guerre*.

IV. In this quality of contraband goods, these following shall not be comprehended; corn, wheat, or other grain, and pulse; oils, wines, salt, or generally any thing that belongs to the nourishment and sustenance of life; but shall remain free as other merchandize and commodities not comprehended in the precedent article; and the transportation of them shall be permitted, even unto places in enmity with

the said States-General, except such cities and places as are besieged, blocked up, or invested.

V. It hath been agreed, for the due execution of what is above said, that the ships and barks of the English, laden with merchandize, being entered into any port of the said States-General, and purposing to pass from thence unto the ports of their enemies shall be only obliged to shew unto the officers of the port of the said States, out of which they would go, their passports; containing the specification of the lading of their ships, attested and marked with the ordinary seal of the officers of the admiralty of those places from whence they first came, with the place whither they are bound, all in a usual and accustomed form: after which, shewing of their passports in the form aforesaid, they may not be disquieted nor searched, detained nor retarded in their voyages, upon any pretence whatsoever.

VI. The same course shall be used in regard of the English ships and vessels which shall come into any roads of the countries under the obedience of the said States, not intending to enter into the ports, or being entered therein, not to unlade and break bulk; which ships may not be obliged to give account of their lading, but in case of suspicion that they carry unto the enemies of the said States any contraband goods, as was above said.

VII. And, in case of such apparent suspicion, the said subjects of his majesty shall be obliged to shew in the ports their passports, in the form specified.

VIII. But, if they were come within the roads, or were met in the open sea by any of the said States ships or private men of war their subjects, for avoiding of all disorder, the said ships of the United Provinces or of their subjects, shall not come near within cannon-shot of the English, but shall send out their long-boat, and cause only two or three men to go on board the English ships or vessels, unto whom the passport and certificates of the propriety of the ships be shewn by the master or captain of the English ships, in the manner above specified, according to the form of the said certificates, which shall be inserted at the end of this treaty; by which passport and certificate, proof may be made, not only of the lading, but also of the place of the abode and residence of the master or captain, and name of the ship itself, to the end that by these two ways it may be known, whether they carry contraband goods; and that the quality as well of the said ship, as of its master or captain, may sufficiently appear. Unto which passports and certificates entire faith and credit shall be given. And, to the end that their validity may be the better known, and that they may not be in any wise falsified and counterfeited, certain marks and counter-signs of his majesty and the said States-General shall be given unto them.

IX. And, in case any merchandize and commodities of those kinds which are before declared to be contraband and forbidden, shall, by the means aforesaid, be found in the English ships and vessels, bound for the ports of the said State's enemies, they shall be unladen, judicially proceeded against, and declared confiscate before the judges of the admiralty of the United Provinces, or other competent officers: but so that the ship and vessel, or other free and allowed goods, merchandize, and commodities, found in the same ship, may not, for that cause, be in any manner seized or confiscated.

X. It is furthermore agreed and covenanted, that whatsoever shall be found laden by his majesty's subjects upon any ship of the enemies of the said States, although the same were not contraband goods, shall yet be confiscated with all that shall be found in the said ship, without exception or reservation: but, on the other side also, all that shall be found in the ships belonging to the king of Great-Britain's subjects, shall be free and discharged, although the lading or part thereof belong to the said State's enemies, except contraband goods, in regard whereof such rule shall be observed, as hath been ordered in the precedent articles.

XI. All the subjects and inhabitants of the said United Provinces shall reciprocally enjoy the same rights, liberties, and exemptions in their trade and commerce upon the coasts, and in the ports, roads, seas, and estates of his said majesty (as was now said) which his said majesty's subjects shall enjoy in those of the said States, and in open sea; it being to be understood that the equality shall be mutual every way on both sides, even in case the said States should hereafter be in peace, amity, and neutrality, with any kings, princes, and states, who should become enemies to his said majesty; so that either of the parties are mutually to use the same conditions and restrictions expressed in the articles of this present treaty, with regard to trade and commerce.

XII. And the more to assure the subjects of the said States, that no violence shall be offered them by the ships of war belonging to his majesty of Great-Britain or his subjects, all the captains of the king's ships, and all his majesty's subjects, that send out private men of war, shall be charged and enjoined not to molest or endamage them in any thing whatsoever, upon pain of being punished and made answerable in their persons and goods for all cost and damages, until due restitution and reparation be made.

XIII. And, for this cause, the captains and capers shall from

henceforth every one of them be obliged, before they go out, to give good and sufficient security before competent judges, in the sum of 1500*l.* sterling, or 15,000 livres Tournois, that they will give full satisfaction for any injuries or wrongs they may commit in their courses at sea, and for their captains and officers that shall violate this present treaty, and the orders and proclamations of his majesty, which shall be published by virtue and in conformity to, the regulation therein made, upon pain of forfeiting their said commissions and licences; which shall in like manner be practised by the subjects of the said States-General.

XIV. If it should happen that any of the said Dutch captains should make prize of a vessel laden with contraband goods, as hath been said, the said captains may not open nor break up the chests, nails, packs, bags, casks, or sell or exchange, or otherwise alienate them, until they have landed them in the presence of the judges or officers of the admiralty, and after an inventory by them made of the said goods found in the said vessels, unless, the contraband goods making but a part of the lading, the master of the ship should be content to deliver the said contraband goods unto the said captain, and to pursue his voyage: in which case the said master shall by no means be hindered from continuing his course, and the design of his voyage.

XV. His majesty, being desirous that the subjects of the said States may be used in all countries under his obedience as favourably as his own subjects, will give all necessary orders, that judgments and decrees upon prizes which shall happen to be taken at sea, may be given with all justice and equity, by judges not suspected nor concerned in the matter under debate; and his majesty will give precise and effectual orders, that all decrees, judgments, and orders of justice, already given and to be given, may be readily and duly executed according to the tenor of them.

XVI. And, when the ambassadors of the said States-General, or any other of their public ministers residing in his majesty's court, shall make complaint of the judgments, which shall be given, his majesty will cause a review to be made of the said judgments in his council, to examine whether the orders and precautions contained in the present treaty have been followed and observed, and to provide for the same according to right and equity; which shall be done, within the space of three months at the farthest: nevertheless, neither before the first judgment nor after it, during the time of the review, the goods and effects which are reclaimed, may be sold or unladen, unless it be with the consent of the parties interested, to avoid the spoiling of the said commodities, if they be perishable.

XVII. When process shall be moved in the first or second instance, between those that have taken the prizes at sea, and the persons interested therein, and those persons shall come to obtain a favourable decree, the said decree shall have its execution, upon security given, notwithstanding the appeal of him that took the prize: but the same shall not hold on the contrary, where the sentence goes against the claimers. And that which is said in this present, and in the precedent articles, for the causing of good and speedy justice to be done unto the subjects of the United Provinces in the matter of prizes, shall be understood and practised by the States-General, in regard of prizes taken by their subjects from those of his majesty.

XVIII. But, since the conveniences and inconveniences of things and agreements cannot be discovered but in procedure of time, and by observations drawn from mutual experience, it is therefore agreed between the king of Great-Britain, and the lords the States of the United Netherlands, that at any time hereafter, when both parties shall so think fitting, certain commissioners, by each party respectively chosen, shall meet by the common consent of both, who shall make it their care and business to supply whatever shall be found wanting in the aforementioned articles, to change or limit whatever shall not be convenient and commodious for both, and fully compleat a further treaty, both concerning these things, and all others relating to the laws of navigation.

XIX. All these agreements, &c. shall be confirmed and ratified by the said king of Great Britain and the States-General of the United Provinces, by letters patents of both parties, sealed with their great seal in due and authentic form, within four weeks next ensuing, or sooner, if it may be; and mutual instruments shall be exchanged by each party, within the time aforesaid.

REMARKS.

Here follow certain forms, whereof mention is made in the eighth article.

A form of the certificate that ought to be given by those that have the ordinary power of the admiralty of England, to the ships and vessels that go out thence, according to the eighth article of the present treaty.

high admiral of England,

To all who shall see these presents, greeting,

These are to certify, That we have granted leave and permission to
master and captain of the

the ship called _____ of the city of _____ of the
burden of _____ tons, or thereabouts, being at present in
the port and haven of _____ to go to
laden with _____ after search shall have been made of
the ship, and he before his departure shall have made oath be-
fore the officers that exercise the jurisdiction of maritime
causes, that the said vessel doth belong to one or more of his
majesty's subjects, an act whereof shall be put at the bottom
of these presents, as also to keep and cause to be kept, by those
aboard him, the orders and rules of the marine, and shall
put into the registry a list signed and certified, containing
the names and surnames, the nativity and habitation of the
men that are aboard him, and of all that shall embark them-
selves, whom he may not take on board without the know-
ledge and permission of the marine officers; and, in every
port or haven where he shall enter with his ship, shall shew
the officers and marine judges his present licence; and,
having finished his voyage, shall make faithful relation of
what hath been done, and hath passed during all the time of
his said voyage, and shall carry the flags, arms, and colours
of his majesty throughout his whole voyage. In witness
whereof, we have signed these presents, and caused the seal
of our arms to be put thereunto, and the same to be coun-
ter-signed by our secretary of marine, the _____ day of
one thousand six hundred _____

Signed _____
And underneath by _____
And sealed with the seal of the arms of the said high admiral.

A form of the act containing the oath to be taken by the
master or captain of the ship.

We _____ of the admiralty of
do certify, That _____ master
of the ship named in the passport above, hath taken the
oath therein mentioned. Given at _____ the day of
one thousand six hundred, &c.

In testimony whereof we have
hereunto set our hands.

The form of the certificates that ought to be given by the
burghermasters of the cities and sea-ports of the United
Provinces, to the ships and vessels that go from thence,
according to the eighth article above said.

To the most serene, most illustrious, most mighty, most no-
ble, honourable, and prudent lords, emperors, kings, com-
mon wealths, princes, dukes, comtes, barons, lords, burgher-
masters, sheriffs, counsellors, judges, officers, justices and
regents of all cities and places, as well ecclesiastical as secu-
lar, who shall see or read these presents. We burghermasters
and governors of the city of _____ do certify, That

_____ ship-master, appearing before us, hath
declared by solemn oath That the ship called _____
containing about _____ lasts, of which he is at present
the master, belongeth to inhabitants of the United Provinces.
So help him God. And, as we would willingly see the said
ship-master assisted in his just affairs, we do request you and
every of you, where the above said master shall arrive with
his ship and goods, that you will please to receive him cour-
teously and use him kindly, admitting him, upon paying the
usual dues, tolls, and other customs, to enter into, remain
in, and pass from your ports, rivers, and territories, and
there to trade, deal, and negotiate, in any part or place, in
such sort and manner as he shall desire. Which we shall
most readily acknowledge on the like occasion.

In witness whereof, we have caused the seal of our city to
be thereunto put.

In witness and confirmation of all and every part whereof,
we the commissioners of his said majesty the king of Great-
Britain, and of the said lords the States-General, having suf-
ficient power given us thereunto, have signed these tables,
and sealed them with our seals. At the Hague in Holland,
the 17th of February, in the year 1668.

De Gellicum,	G. Hoolck,
B. D'Afperon,	V. Unckell,
John de Witt,	Jan Van Iffelmuden,
Van Crommon,	L. T. Van Sturkenborck.

This marine treaty being so concluded between his majesty
and the States, for their dominions in Europe, another was
some time after set a foot, and agreed to, for regulating their
naval affairs all over the world, which very well deserves a
place in this collection, and which the reader may take in the
following terms.

ARTICLE VII.

A treaty marine between the most serene and mighty prince
Charles II. by the grace of God, king of England, Scot-
land, France, and Ireland, defender of the faith, &c. and
the high and mighty lords the States-General of the United
Netherlands, to be observed throughout all and every the
VOL. II.

countries and parts of the world, by sea and land, con-
cluded at London the 1st day of December, 1674, S. V.

I. That it shall and may be lawful for all and every the sub-
jects of the most serene and mighty prince, the king of Great-
Britain aforesaid, with all freedom and safety to sail, trade,
and exercise any manner of traffic in all those kingdoms,
countries, and estates which are, or at any time hereafter
shall be in peace, amity, or neutrality with his said majesty;
so that they shall not be any ways molested in their naviga-
tion or trade, by the military forces, nor by the ships of war,
or any other kind of vessels whatsoever, belonging either to
the high and mighty States-General of the United Nether-
lands, or to their subjects, upon occasion or pretence of any
hostility, or difference which now is, or shall hereafter hap-
pen between the said lords the States-General, and any other
princes or people whatsoever in peace, amity, or neutrality
with his said majesty: and likewise, that it shall and may be
lawful for all and every the subjects of the said high and mighty
lords the States-General of the United Netherlands, with all
freedom and safety to sail, trade, and exercise any manner of
traffic in all those kingdoms, countries, and estates which
are, or at any time hereafter shall be in peace, amity, or
neutrality with the aforesaid lords the States; so that they
shall not be any ways molested in their navigation or trade,
by the military forces, or by the ships of war, or any other
kind of vessels whatsoever, belonging either to the most serene
and mighty king abovementioned, or to his subjects, upon
occasion or pretence of any hostility or difference which now
is, or shall hereafter happen between his said majesty and any
princes or people whatsoever in peace, amity, or neutrality
with the said lords the States.

II. Nor shall this freedom of navigation and commerce be in-
fringed by occasion or cause of any war, in any kind of mer-
chandizes, but shall extend to all commodities which shall
be carried in time of peace, those only excepted which follow
in the next article, and are comprehended under the name of
contraband.

III. Under this name of contraband, or prohibited merchan-
dizes, shall be comprehended only arms, pieces of ordnance,
with all implements belonging to them, fire-balls, powder,
match, bullets, pikes, swords, lances, spears, halberds, guns,
mortar-pieces, petards, granadoes, musquet-rests, bandeliers,
salt-petre, musquets, musquet-thor, helmets, corselets, breast-
plates, coats of mail, and the like kind of armature; soldiers,
horses, and all things necessary for the furniture of horses;
holsters, belts, and all other warlike instruments whatso-
ever.

IV. These merchandizes following shall not be reckoned
among prohibited goods, viz. all kind of cloth, and all other
manufactures woven of any kind of wool, flax, silk, cotton,
or any other materials; all sorts of cloathing and vestments,
together with materials whereof they use to be made; gold
and silver, as well coined as not coined; tin, iron, lead, cop-
per, and coals; as also wheat, barley, and all other kind of
corn or pulse; tobacco, and all kind of spices; salted and
smoked flesh; salted and dried fish, butter and cheese, beer,
oils, wines, sugars, and all sorts of salt; and, in general, all
provision which serves for the nourishment and sustenance of
life; likewise all kind of cotton, hemp, flax, and pitch, and
ropes, sails, and anchors; also masts and planks, boards and
beams, of what sort of wood soever, and all other materials
requisite for the building or repairing ships; but they shall be
wholly reputed amongst free goods, even as all other wares
and commodities which are not comprehended in the next
precedent article, so that the same may be freely transported
and carried by the subjects of his said majesty, even unto places
in enmity with the said States; as also, on the other side, by
the subjects of the said States, to places under the obedience of
the enemies of his said majesty; except only towns or places
be seized, invironed, or invested; in French, blocquées ou
investies.

V. And, that all manner of differences and contentions on
both sides, by sea and land, may from henceforth cease and be
utterly extinguished, it is agreed, that all kinds of ships and
vessels whatsoever, belonging to the subjects of his said ma-
jesty, entering or being entered into any road or port under
the obedience of the lords the States, and purposing to pass
from thence, shall be only obliged to shew unto the officers
acting in the ports of the said States, or to the captains of the
States ships, or of private men of war (if any happen there to
be) their passport, commonly called a sea-brief (the form
whereof is added at the end of these articles) nor shall any
money, or any thing else, be exacted from them under that
pretence: but, if any ship belonging to the subjects of his
majesty of Great-Britain shall, in the open sea, or elsewhere
out of the dominions of the said States, meet the ships of war
of the said lords the States, or private men of war of their sub-
jects, the said ships of the lords the States, or of their subjects,
shall keep at a convenient distance, and only send out their
boat; and it shall be lawful for them, only with two or three
men, to go on board the ships and vessels of the subjects of
his majesty, that the passport (or sea-brief) and the propriety
thereof, according to the form hereafter specified, may be
Y y shewn

shewn to them by the captain or master of such ship or vessels belonging to the subjects of his majesty; and the ship which shall shew the same shall freely pass; and it shall not be lawful to molest, search, detain, or divert the same from her intended voyage: and all the subjects of the lords the States shall enjoy, in all things, the same liberty and immunity, they, in like manner, shewing their passports (or sea-briefs) made according to the form prescribed at the latter end of this treaty.

VI. But if any ship or vessel belonging to the English, or other subjects of his majesty, shall be met making into any port in enmity with the lords the States; or, on the other side, if any ship belonging to the United Provinces of the Netherlands, or other subjects of the lords the States, shall be met in her way making into any port under the obedience of the enemies of his said majesty; such ships shall shew not only a passport (or sea-brief) according to the form here under prescribed, wherewith she is to be furnished, but also her cockets, expressing the contents of the goods on board, given in the usual form, by the officers of the customs in the port from whence the same; whereby it may be known whether she is laden with any merchandize prohibited by the third article of this treaty.

VII. But if, by the shewing the above said cockets, expressing the contents of the goods on board, given in the usual form by the officers of the customs in the port from whence the same (concerning the shewing whereof it is above agreed) either party shall discover any kind of merchandizes which, in the third article of this treaty, are declared to be contraband or prohibited goods, consigned to any port under the obedience of their enemies, it shall not be lawful to open the hatches of such ship in which the same shall happen to be found, whether she belongs to the subjects of his majesty, or of the lords the States: nor to unlock, or break open chests, mails, packs, or casks in the same, nor to convey away any the least part of the merchandizes, before the whole be first landed in the presence of the officers of the admiralty, and inventoried; neither shall it be any ways lawful to sell, exchange, or otherwise to alienate the same, until such prohibited goods are rightly and lawfully proceeded against, and that the judges of the admiralty have, by their respective sentences, confiscated the same: provided always, that, as well the ship itself, as the rest of the commodities found in the same, which by this treaty are to be reputed free, shall not, upon pretence of their being infected by such prohibited goods, be detained, much less confiscated for lawful prize: but if not the whole, but a part only of the lading consists of contraband or prohibited commodities, and that the master of the ship shall be willing and ready to deliver them to the captain who seized the same, in that case the captor shall not compel the ship to go out of her course to any port he thinks fit, but shall forthwith dismiss her, and upon no account hinder her from freely prosecuting her designed voyage.

VIII. It is further agreed, that whatsoever shall be found laden by his majesty's subjects, upon any ship whatsoever belonging to the enemies of the lords the States, although the same be not of the quality of contraband goods, may be confiscated: but, on the contrary, all that which shall be found in the ships belonging to the subjects of his majesty, shall be accounted clear and free, although the whole lading, or any part thereof, by just title or propriety, shall belong to the enemies of the lords the States; except always contraband goods, which being intercepted, all things shall be done according to the meaning and direction of the precedent articles: and, for the same reason, whatsoever shall be laden by the subjects of the lords the States, in any ship whatsoever belonging to the enemies of his majesty, although the same be not of the quality of contraband goods, may be confiscated; but, on the other side, all that which shall be found in the ships belonging to the subjects of the lords the States shall be accounted clear and free, although the whole lading, or any part thereof, by just title of propriety, shall belong to the enemies of his majesty; except always contraband goods, which being intercepted, all things shall be done according to the meaning and directions of the precedent articles. And, left any damage should by surprize be done to the one party who is in peace, when the other party shall happen to be engaged in war, it is provided, that a ship belonging to the enemies of the one party, and laden with goods of the subjects of the other, shall not render the said goods liable to confiscation, in case they were laden before the expiration of the times hereafter mentioned, after the declaration or publication of any such war, viz. if the goods were laden in any port or place between the limits called the Soundings, and the Naz in Norway, within the space of six weeks after such declaration; of two months, between the said place the Soundings and the city of Tangier; and of ten weeks in the Mediterranean Sea; or within the space of eight months in any other country or place of the world: so that it shall not be lawful to confiscate the goods of the subjects of his majesty taken or seized in any ship or vessel whatsoever of any enemy of the lords the States, upon that pretence, but the same shall be without delay restored to the proprietors, unless they were laden after the expiration of the said terms of time respective-

ly; but so that it may not be lawful for them afterwards to carry to the enemy's ports the said merchandizes which are called contraband, and, for the reason aforesaid, shall not be liable to confiscation: neither, on the other side, shall it be lawful to confiscate goods of the subjects of the lords the States, taken or seized in any ship or vessel whatsoever of an enemy of his majesty, upon that pretence; but the same shall be forthwith restored to the proprietors thereof, unless they were laden after the expiration of the said terms of time respectively: but so that it may not be lawful for them afterwards to carry to enemy's ports the said merchandizes which are called contraband, and, for the reason aforesaid, shall not be liable to confiscation.

IX. And, the more to assure the subjects of his majesty and of the said States, that no injury shall be offered to them by the ships of war, or private men of war of either side, all the captains of the ships, as well of his majesty as of the said States, and all their subjects who shall fit out private men of war, and likewise their privileged companies, shall be enjoined not to do any injury or damage whatsoever to the other; which if they do, they shall be punished, and moreover be liable to satisfy all costs and damages, by restitution and reparation, upon pain and obligation of person and goods.

X. For this cause all the commanders of private men of war shall from henceforth be obliged, before they receive their commissions, to enter, before a competent judge, good and sufficient security, who have no part or interest in such ship, in the sum of 1500l. sterling, or 16,500 guilders; and, when they have above 150 men, then in the sum of 3000l. sterling, or 33,000 guilders, that they will give full satisfaction for any damages or injuries whatsoever, which they or their officers, &c. shall commit in their courses at sea, contrary to this present treaty, or any other whatsoever, between his majesty and the said States, upon pain of revocation of their said commissions; in which it shall be always inserted, that they have given such security as aforesaid: and likewise it is agreed, that the ship itself shall be also liable to make satisfaction for injuries and damages done by her.

XI. His majesty and the said States, being desirous that the subjects of each other may be mutually treated, in all countries under their obedience respectively, with the like kindness as their own subjects, will give all necessary and effectual orders that the judgment upon prizes taken be given according to the rules of justice and equity, by judges beyond all suspicion, and not any way concerned in the cause under debate; and his majesty and the said States will likewise give strict orders that all sentences already given, and which shall be hereafter given, be (according to the tenor thereof) duly put in execution, &c.

XII. And whensoever the ambassadors of the said lords the States, or any other their public ministers, resident at the court of his most serene majesty of Great-Britain, shall complain of the unjustice of sentences which have been given, his majesty will cause the same to be reviewed and examined in his council, that it may appear whether the orders and precautions prescribed in this treaty have been observed, and have had their due effect, and will also take care that the same be fully provided for, and that right be done to the party complaining, within the space of three months: and likewise when the ambassadors, or other public ministers of his majesty, resident with the States-General, shall complain of the unjustice of sentences, the said States will cause a review and examination thereof to be made in the assembly of the States-General, that it may appear whether the orders and precautions prescribed in this treaty have been observed, and had their due effect; and they will likewise take care that the same be fully provided for, and that justice be done to the party complaining within the space of three months: nevertheless it shall not be lawful to sell or unlade the goods in controversy, either before the sentence given, or after it, during the review thereof on either side, unless it be with the consent of the parties interested.

XIII. A suit being commenced between the takers of prizes on the one part, and the claimers on the other, and decree being given for the party reclaiming, the said decree (upon security given) shall be put in execution, notwithstanding the appeal made by him that took the prize, which shall not be observed, in case the sentence shall be given against the claimers.

XIV. And whereas the masters of merchant-ships, and likewise the mariners and passengers, do sometimes suffer many cruelties and barbarous usages, when they are brought under the power of ships which take prizes in time of war, thereby to extort from them such confessions as they would have to be made: it is agreed that both his majesty and the lords the States-General shall, by the severest proclamations or placarts, forbid all such heinous and inhuman offences; and as many as they shall, by lawful proofs, find guilty of such acts, they shall take care that they be punished with due and just punishments, which may be a terror to others; and shall command that all the captains and officers of ships, who shall be proved to have committed such heinous practices, either themselves, or by instigating others to act the same, or by conniving while they were done, shall (besides other punishments, to be inflicted proportionably to their offences), be forthwith

forthwith deprived of their offices respectively; and every ship brought up as prize, whose mariners or passengers shall have suffered any torture, shall forthwith be dismissed and freed, with all her lading, from all further examination and proceeding against her, as well judicial as otherwise.

XV. It is also agreed, that the like severity of punishments shall be inflicted upon those who, contrary to the meaning of the 21st article of the treaty of peace concluded at Breda, shall take commissions from enemies to seize the ships of either ally, contrary to what is provided in the said article.

XVI. Lastly, It is agreed and concluded, that this present treaty, &c. shall be, with all convenient speed, on both sides ratified and confirmed; and that the ratifications thereof shall be, within two months from the date thereof, reciprocally exchanged between both parties: and also, that the said treaty shall, within one month after such exchanging of the ratifications, be delivered, in due and authentic form, to the governors of the English East-India and African companies, and to the directors of the Dutch East and West India companies; and shall, with the first conveniency, be also sent by his said majesty, and by the said lords the States, to their respective governors and commanders in chief of their colonies and plantations in every part of the world out of Europe, to the end that it may be by them, and all others within their dominions and under their power, punctually observed and fulfilled.

The form of the passport (or sea-brief) to be required and given by the lord high admiral, or by those to whom the exercise of admiralty-jurisdiction is ordinarily committed, or by the mayor, or other chief magistrate, or by the commissioners, or other principal officers of the customs in their respective ports and places within his majesty's dominions, to the ships and vessels sailing out thence, according to the purport of the 5th article.

To all unto whom these presents shall come, greeting. We lord high admiral of we lords commissioners executing the office of the lord high admiral of or we judges of the high court of the admiralty of or we the mayor, or other magistrate of or we com-missioners, or principal officers of the customs in the city or port of do testify and make known, That master or commander of the ship called the hath appeared before us, and hath declared, by solemn oath, That the said ship or vessel, containing about tons, of which he is at present master or commander, doth belong to the inhabitants of within the dominions of the most serene and mighty prince, the king of England, Scotland, France, and Ireland, &c. So help him God. And in regard it would be most acceptable to us, that the said master or commander be assisted in his just and lawful affairs, we do request you, and every of you, wheresoever the said master or commander shall arrive with his ship, and the goods laden on board, and carried in her, that you would please to receive him courteously, and use him kindly, and admit him, upon paying the lawful and usual customs and other duties, to enter into, remain in, and pass from your ports, rivers, and dominions, and there to enjoy all kind of right of navigation, traffic, and commerce, in all places where he shall think fit; which we shall most willingly and readily acknowledge upon all occasions. In testimony and confirmation whereof, we have with our hand signed these presents, and caused them to be sealed with our seal. Dated at in the day of in the year of our Lord

The form of the passport (or sea-brief) to be required of, and given by, the burgher-master of the cities and ports of the United Netherlands, to the ships or vessels sailing from thence, according to the purport of the 5th article.

To the most serene, most illustrious, most mighty, most noble, most honourable, and most prudent emperors, kings, governors of commonwealths, princes, dukes, earls, barons, lords, burghermasters, schepens, counsellors, judges, officers, justices, and rulers of all cities and places, as well ecclesiastical as secular, to whom these presents shall be known: We the burgher-master and rulers of the city of do certify, that master or skipper of the ship appeared before us, and declared by solemn oath, That the said ship, called the containing about laists, of which he is at present master or skipper, belongeth to the inhabitants of the United Netherlands. So help him God. And, in regard it would be most acceptable to us that the said master or skipper be assisted in his just and lawful affairs, we do request you and every of you, wheresoever the said master or skipper shall arrive with his ship, and the goods laden on board and carried in her, that you would please to receive him courteously, and use him kindly, and admit him, upon paying the lawful and usual customs and other duties, to enter into, remain in, and pass from your ports, rivers, and dominions, and there to enjoy all kind of right of navigation, traffic, and commerce, in all places where he shall think fit;

which we shall most willingly and readily acknowledge upon all occasions. In testimony and confirmation whereof we have caused the seal of our city to be hereunto put: Dated at in the day of in the year of our Lord

In testimony and confirmation of all and singular the premises, we the commissioners of his majesty and the lords the States-General aforesaid, being sufficiently empowered thereunto, have to these presents subscribed our names, and sealed them with our seals, at London, the 1st day of December, 1674.

An explanatory declaration upon certain articles of the marine treaties concluded between his majesty and the States-General of the United Provinces, February 17, 1667, and December 1, 1764.

Whereas some difficulty hath arisen concerning the interpretation of certain articles, as well in the treaty marine which was concluded the 1st day of December, 1674, as in that which was concluded the 17th of February, 1667, between his majesty of Great-Britain on the one part, and the States-General of the United Provinces of the Low-Countries on the other, relating to the liberty of their respective subjects to trade unto the ports of each other enemies: We Sir William Temple, Bart. ambassador extraordinary from his said majesty of Great-Britain, in the name, and on the part of his said majesty; and We William Van Heuckelom, Daniel Van Wyngaerden, lord of Werckenham, Gaspar Fagel, counsellor and pensioner of Holland and West-Friesland, John de Mauregnault, John baron of Rude and Renfoude, William de Haren, retman of the Bilt, Henry Terborgh, and Luke Alting, deputies in the assembly of the said States-General for the States of Guelderland, Holland, Zealand, Utrecht, Friesland, Overijssel, Groningen, and the Ommelands, in the name, and on the part of the said States-General, have declared, as we do by these presents declare, That the true meaning and intention of the said articles is and ought to be, that ships and vessels, belonging to the subjects of either of the parties, can and might, from the time that the said articles were concluded, not only pass, traffic, and trade from a neutral port or place to a place in enmity with the other party, or from a place in enmity to a neutral place: but also from a port or place in enmity to a port or place in enmity with the other party, whether the said places belong to one and the same prince or state, or to several princes and states, with whom the other party is in war. And we declare that this is the true and genuine sense and meaning of the said articles: pursuant whereunto we understood that the said articles are to be observed and executed on all occasions, on the part of his said majesty and the said States-General, and their respective subjects; yet so, that this declaration shall not be alledged by either party for matters which happened before the conclusion of the late peace in the month of February, 1674; and we do promise, that the said declaration shall be ratified by his said majesty, and by the said States-General, and that within two months, or sooner if possible, reckoning from the day of the date of this declaration, the ratifications of the same shall be brought hither to the Hague, to be here exchanged. It witness whereof we have signed these presents at the Hague, the 30th day of December, 1675.

After the conclusion of this marine treaty with Holland, the next material one that occurs is another of the same nature with France, which may deserve a place here, amongst the rest.

ARTICLE VIII.

A treaty marine between the most serene and mighty prince Charles II, by the grace of God, king of England, Scotland, France, and Ireland, defender of the faith, &c. and the most serene and mighty prince Lewis XIV. the most Christian king, concluded at St. Germain en Laye, the 24th day of February, 1676.

I. That it shall and may be lawful for all and every the subjects of the most serene and mighty prince the king of Great-Britain

Britain aforesaid, with all freedom and safety, to sail, trade, and exercise any manner of traffic in all those kingdoms, countries, and estates, which are, or at any time hereafter shall be in peace, amity, or neutrality with his said majesty: so that they shall not be any ways hindered or molested in their navigation or trade by the military forces, nor by the ships of war, or any other kind of vessels whatsoever, belonging either to the most Christian king, or to his subjects, upon occasion or pretence of any hostility or difference, which now is, or hereafter shall happen between the said most Christian king, and any princes or people whatsoever in peace, amity, or neutrality with the said king of Great Britain. And likewise, that it shall and may be lawful for all and every the subjects of the said most Christian king, with all freedom and safety, to sail, trade, and exercise any manner of traffic in all those kingdoms, countries, and estates, which are, or at any time hereafter shall be in peace, amity, or neutrality with the aforesaid most Christian king: so that they shall not be any ways hindered or molested in their navigation or trade by the military forces, nor by the ships of war, or any other kind of vessels whatsoever belonging either to the king of Great-Britain above-mentioned, or to his subjects, upon occasion, or pretence of any hostility or difference which now is, or shall hereafter happen between his majesty and any princes or people whatsoever, in peace, amity, or neutrality with the said most Christian king.

II. Nor shall this freedom of navigation and commerce be infringed by occasion of any war, in any kind of merchandizes, but shall extend to all commodities which shall be carried in time of peace, those only excepted which follow in the next article, and are comprehended under the name of contraband.

III. Under this name of contraband, or prohibited merchandizes, shall be comprehended only arms, pieces of ordnance, with all implements belonging to them; fire-balls, powder, match, bullets, pikes, swords, lances, spears, halberts, guns, mortar-pieces, petards, granadoes, musquet-rests, bandoliers, salt-petre, musquets, musquet-shot, helmets, corsets, breast-plates, coats of mail, and the like kind of armature; soldiers, horses, and all things necessary for the furniture of horses; holsters, belts, and all other warlike instruments whatsoever.

IV. These merchandizes following shall not be reckoned among prohibited goods, viz. all kind of cloth, and all other manufactures woven of any kind of wool, flax, silk, cotton, or any other materials; all sorts of clothing and vestments, together with the materials whereof they use to be made; gold and silver, as well coined as not coined; tin, iron, lead, copper, and coals; as also wheat and barley, and all other kind of corn or pulse; tobacco, and all kinds of spices; salted and smoked flesh; salted and dried fish, cheese, butter, beer, oils, wines, sugars, and all sorts of salt; and, in general, all provision which serves for the nourishment and sustenance of life; likewise all kind of cotton, hemp, flax, and pitch, ropes, sails, and anchors; also masts and planks, boards and beams, of what sort of wood soever, and all other materials requisite for the building or repairing ships; but they shall be wholly reputed amongst free goods, even as well as all other wares and commodities which are not comprehended in the next precedent article; so that the same may be freely transported and carried by the subjects of the most serene king of Great-Britain, not only from one neutral place to another neutral place, or from a neutral port or place to a place in hostility with the most Christian king, or from a place in hostility with him to a neutral place, but also from one place in enmity with the most Christian king to another port or place in enmity with him; be it that such ports or places do belong to the same prince or state, or to several princes or states, with whom the most Christian king shall happen to be in war; and in like manner that the same may be freely transported by the subjects of the most Christian king, not only from one neutral place to another neutral place, or from a neutral port or place to a place in hostility with the king of Great-Britain, or from a place in hostility with him to a neutral place; but also from one place in enmity with the king of Great-Britain to another port or place in enmity with him; be it that such ports or places do belong to the same prince or state, or to several princes or states with whom the king of Great-Britain shall happen to be in war, except only towns or places besieged, invironed, or invested; in French, *blocquées ou investies*.

V. And, that all manner of differences and contentions on both sides, by sea and land, may from henceforth cease and be utterly extinguished, it is agreed that all kind of ships and vessels whatsoever, belonging to the subjects of his said majesty of Great-Britain, entering or being entered into any road or port under the obedience of the most Christian king, and purposing to pass from thence, shall be only obliged to shew unto the officers acting in the ports of the said most Christian king, or to the captains of the most Christian king's ships, or private men of war (if any happen there to be) their passports, commonly called a sea brief (the form whereof is added to the end of these articles) nor shall any money, or any thing else, be exacted from them under that pretence:

but, if any ship belonging to the subjects of his majesty of Great-Britain shall, in the open sea or elsewhere, out of the dominions of the said most Christian king, meet his ships of war, or privateers of his subjects, the said ships of the most Christian king shall keep at a convenient distance, and only send out their boat, and it shall be lawful for them, only with two or three men, to go on board the ships and vessels of the subjects of his majesty of Great-Britain, that the passport (or sea-brief) and the propriety thereof, may be shewn to them by the captain or master of such ship or vessel belonging to the subjects of his majesty of Great Britain: and the ship which shall shew the same shall freely pass; and it shall not be lawful to molest, search, detain, or divert the same from her intended voyage: and all the subjects of the most Christian king shall enjoy in all things the same liberty and immunity, they in like manner shewing their passport, made according to the form prescribed at the latter end of this treaty.

VI. But if any ship or vessel belonging to the English, or other subjects of his majesty of Great-Britain, shall be met by any man of war making into any port in enmity with the most Christian king; or, on the other side, if any ship belonging to the most Christian king, or others subjects of the said most Christian king, shall be met in her way making into any port under the obedience of the enemies of his said majesty of Great-Britain; such ship shall shew not only a passport, wherewith she is to be furnished, but also her cockets, expressing the contents of the goods on board, given in the usual form, by the officers of the customs in the port from whence she came; whereby it may be known whether she is laden with any merchandizes prohibited by the 3d article of this treaty.

VII. But if, by the shewing the aforesaid cockets, expressing the contents of the goods on board, given in the usual form, by the officers of the customs in the port from whence she came, either party shall discover any kind of merchandizes which in the 3d article of this treaty are declared to be contraband or prohibited, confined to any port under the obedience of their enemies, it shall not be lawful to open the hatches of such ship in which the same shall happen to be found, whether she belongs to the subjects of his majesty of Great-Britain, or of the most Christian king; nor to unlock or break open the chests, mails, packs, or casks in the same, nor to convey away any the least part of the merchandizes, before the whole be first landed in the presence of the officers of the admiralty, and inventoried: neither shall it be any ways lawful to sell, exchange, or otherwise to alienate the same, until such prohibited goods are rightly and lawfully proceeded against, and that the judges of the admiralty have, by their respective sentences, confiscated the same: provided always, that, as well the ship itself, as the rest of the commodities found in the same, which by this treaty are to be reputed free, shall not, upon pretence of their being infected by such prohibited goods, be detained, much less confiscated, for lawful prize; but if not the whole, but a part only of the lading consists of contraband commodities, and that the master of the ship shall be willing and ready to deliver them to the captor who seized the same, in that case the captor shall not compel the ship to go out of her course to any port he thinks fit, but shall forthwith dismiss her, and upon no account hinder her from freely prosecuting her designed voyage.

VIII. It is further agreed, that whatsoever shall be found laden by the subjects of his majesty of Great-Britain, upon any ship whatsoever belonging to the enemies of the most Christian king, although the same be not of the quality of contraband goods, may be confiscated: but, on the contrary, all that which shall be found in the ships belonging to the subjects of his majesty of Great Britain, shall be accounted clear and free, although the whole lading, or any part thereof, by just title of propriety, shall belong to the enemies of the most Christian king: except always contraband goods, which being intercepted, all things shall be done according to the meaning and direction of the precedent article; and, by the same reason, whatsoever shall be found laden by the subjects of the most Christian king, in any ship whatsoever belonging to the enemies of his majesty of Great-Britain, although the same be not of the quality of contraband goods, may be confiscated; but, on the other side, all that which shall be found in the ships belonging to the subjects of the most Christian king, shall be accounted clear and free, although the whole lading, or any part thereof, by just title of propriety, shall belong to the enemies of his majesty of Great-Britain, except always contraband goods, which being intercepted, all things shall be done according to the meaning and direction of the precedent article; and, lest any damage should by surprise be done to the one party who is in peace, when the other party shall happen to be engaged in war, it is agreed that a ship belonging to the enemies of the one party, and laden with goods of the subjects of the other, shall not render the said goods liable to confiscation, in case they were laden before the expiration of the times hereafter mentioned, after the declaration of any such war, viz. if the goods were laden in any port or place between the limits called the Soundings and the Naz in Norway, within the space of six weeks after such declaration; of two months between the said place,

the Soundings, and the city of Tangier; and of ten weeks in the Mediterranean Sea; or within the space of eight months in any other country or place of the world; so that it shall not be lawful to confiscate the goods of the subjects of his majesty of Great Britain, taken or seized in any ship or vessel whatsoever of any enemy of the most Christian king, upon that pretence; but the same shall be without delay restored to the proprietors, unless they were laden after the expiration of the said terms of time respectively; but so that it may not be lawful for them afterwards to carry to enemies ports the said merchandizes which are called contraband; and, for the reason aforesaid, shall not be liable to confiscation: neither, on the other side, shall it be lawful to confiscate the goods of the subjects of the most Christian king, taken or seized in any ship or vessel whatsoever of any enemy of his majesty of Great-Britain, upon that pretence; but the same shall be forthwith restored to the proprietors thereof, unless they were laden after the expiration of the said terms of time respectively; but so that it may not be lawful for them afterwards to carry to enemies ports the said merchandizes which are called contraband, and, for the reasons aforesaid, shall not be liable to confiscation.

IX. And, the more to assure the subjects of his majesty of Great-Britain, and of the most Christian king, that no injury shall be offered to them by the ships of war, or privateers of either side, all the captains of the ships, as well of his majesty of Great-Britain as of the most Christian king, and all their subjects who shall fit out privateers, and likewise their privileged companies, shall be enjoined not to do any injury whatsoever to the other; which if they do, they shall be punished, and moreover be liable to satisfy all costs and damages, by restitution and reparation, upon pain and obligation of person and goods.

X. For this cause, all the commanders of privateers shall from henceforth be obliged, before they receive their commissions, to enter, before a competent judge, good and sufficient security, by able and responsible men, who have no part or interest in such ship, in the sum of 1500*l.* sterling, or 16,500 *livres*; and, when they have above 150 men, then in the sum of 3000*l.* sterling, or 33,000 *livres*, that they will give full satisfaction for any damages or injuries whatsoever, which they or their officers, or others in their services, shall commit in their courses at sea, contrary to this present treaty, or any other whatsoever, between his majesty of Great-Britain and the most Christian king, upon the pain of revocation and annulling their said commissions; in which it shall be always inserted, That they have given such security as aforesaid; and likewise it is agreed, that the ship itself shall be also liable to make satisfaction for injuries done by her.

XI. His majesty of Great-Britain and the said most Christian king, being desirous that the subjects of each may be mutually treated, in all countries under their obedience respectively, with the like kindness as their own subjects, will give all necessary and effectual orders that judgments upon ships and merchandizes taken at sea be given according to the rule of justice and equity, by judges beyond all suspicion, and not any ways concerned in the cause under debate. And his majesty of Great-Britain and the most Christian king will likewise give strict orders that all sentences already given, and which shall be hereafter given, be according to the tenor thereof duly put in execution, and obtain their effect.

XII. And whensoever the ambassadors, or other public ministers of the king of Great-Britain, residing at the court of the most Christian king, shall complain of the unjustice of sentences which have been given concerning ships or merchandizes taken at sea, and belonging to the subjects of the king of Great-Britain, then the said most Christian king, on demand of the said ambassadors or ministers of the king of Great-Britain, shall cause the said sentences to be reviewed and examined in his privy-council, and shall confirm or revoke the sentences wheresoever given; and likewise the said most Christian king shall take care, that right be done to the party complaining within the space of four months, to be accounted from the day of making such demand.

In like manner, if the ambassadors, or other public ministers of the most Christian king residing at the court of the king of Great-Britain, shall complain of the unjustice of sentences, which have been given concerning ships or merchandizes taken at sea, belonging to subjects of the said most Christian king, the said king of Great-Britain shall forthwith commission, under his great seal, nine of his privy council to adjudge such matters, or to confirm or revoke the sentences wheresoever given; and the said commissioners shall meet within the space of one month from the day of delivering the complaint: and likewise the king of Great-Britain shall take care that right be done the party complaining within the space of three months, to be computed from the first day of the meeting of the said commissioners.

XIII. A suit being commenced between the takers of prizes on the one party, and the claimers thereof on the other, and a sentence being given for the party reclaiming, the said sentence, upon security given, shall be put in execution, notwithstanding the appeal made by him that took the prize;

VOL. II.

which shall not be observed, in case the sentence shall be given against the claimers.

XIV. And whereas the masters of merchants ships, and likewise the mariners and passengers do sometimes suffer many cruelties and barbarous usages, when they are brought under the power of ships which take prizes in time of war, the takers in an inhuman manner tormenting them, thereby to extort from them such confessions as they would have to be made; it is agreed, that both his majesty of Great Britain and the most Christian king shall, by the severest proclamations or edicts, forbid all such heinous offences, and as many as they shall by lawful proofs find guilty of such acts, they shall take care that they be so punished, as may be a terror to others; and shall command that all the captains and officers of ships, who shall be proved to have committed such heinous practices, either themselves, or by instigating others to do the same, or by conniving while they were done, shall, besides other punishments to be inflicted proportionably to their offences, be forthwith deprived of their offices respectively; and every ship brought up as prize, whose mariners or passengers shall have suffered any torture, shall forthwith be dismissed and freed, with all her lading, from all further examination and proceeding against her, as well judicial as otherwise.

XV. It is also agreed, that the like severity of punishments shall be inflicted upon those, who shall take commission from enemies to seize the ships of either ally or party.

XVI. Lastly, it is agreed and concluded, that this present treaty, and all and singular the things therein contained, shall be, with all convenient speed, on both sides, ratified and confirmed, and that the ratifications thereof shall be within two months from the date hereof reciprocally exchanged.

Dated at St. Germain en Laye, the 24th day of February, in the year of our Lord 1677.

The form of the passport, or sea-brief, to be required, and given by the lord high admiral, or by those to whom the exercise of admiralty jurisdiction is ordinarily committed: or by the mayor or other chief magistrate, or by the commissioners, or other principal officers of the customs, in their respective ports and places within the dominions of the king of Great-Britain, to ships and vessels, according to the purport of the fifth article.

To all unto whom these presents shall come greeting. We

lord high admiral of
We lords commissioners executing the office of the lord high admiral of
or we the mayor, or other magistrate of
or we the commissioners, or principal officers of the customs in the city or port of
do testify and make known, that
master or commander of the ship called the
hath appeared before us, and hath declared by solemn oath, that the said ship or vessel containing about
tons, of which he is at present master or commander, doth belong to the inhabitants of

within the dominions of the most serene and mighty prince, the king of England, Scotland, France, and Ireland, defender of the faith, &c. So help him God. And, in regard it would be most acceptable to us, that the said master or commander be assisted in his lawful affairs, we do request you and every of you, wheresoever the said master or commander shall arrive with his ship, and the goods laden on board and carried in her, that you would please to receive him courteously, and use him kindly, and admit him, upon paying the lawful and usual customs and other duties, to enter into, remain in, and pass from, your ports, rivers, and dominions, and there to enjoy all kind of right of navigation, traffic, and commerce, in all places where he shall think fit; which we shall most willingly and readily acknowledge upon all occasions: in testimony and confirmation whereof, we have with our hands signed these presents, and caused them to be sealed with our seal. Dated the
day of
in the year of our Lord

And the like form of passport, mutatis mutandis, shall be used by the subjects of the most Christian king.

R E M A R K S.

After the conclusion of this marine treaty between Great-Britain and France, we do not find any other of the same nature in which this crown is much concerned, 'till the time of king James II. who, in the month of August, 1685, renewed all former alliance with the Dutch, and particularly the six following treaties, viz.

I. A treaty of peace and alliance, concluded the 21 of July, in the year 1667.

II. A treaty of commerce and navigation of the same date.

III. A treaty of peace and friendship, concluded at Westminster the 4 of February 1673-4.

IV. A marine treaty, concluded at London the 1st of December 1674, together with a declaration by which some articles of the aforesaid treaty, as well as of another marine

Z z

treaty

treaty of the 1st of February 1667-8, are more fully explained and expounded.

V. Articles concluded at London, the 8th of March 1674-5, for terminating all differences between the English and Dutch East-India companies.

VI. A league defensive, concluded at London the 3d of March 1678.

The next remarkable marine treaty that occurs is that between their late majesties king William and queen Mary, and the States-General, concluded at Whitehall, the 29th of April 1689, in pursuance of the treaty concluded between king Charles II. and the States, of the 3d of March 1678, which is confirmed by this with some additions. The articles are to this effect :

I. That their majesties shall put to sea 50 large men of war, viz. 1 of the 2d, 17 of the 3d, and 32 of the 4th rate, with 15 frigates, and 8 fire-ships, having on board in all 17,155 effective men.

II. That the States should put to sea 30 large ships, viz. 8 from 70 to 80, 7 from 60 to 70, and 15 from 50 to 60 guns, with 9 frigates and 4 fire-ships, which shall have on board 10,572 effective men.

III. That the fleets shall join, where the king of Great-Britain shall think fit.

IV. That the fleets of the two nations shall be divided into three squadrons; the first to be of 50 large ships, six frigates, and eight fire-ships, to serve in the Mediterranean; the second of 30 large ships, 8 frigates, and 4 fire-ships, to serve in the Irish sea and in the channel, except it be otherwise stipulated, by consent; and the third of ten frigates, to serve between the mouth of the channel and Yarmouth, on the coast of England and the aforesaid place, and the isle of Wafchere on the coast of Zeland: the two last squadrons to assist occasionally each other.

V. Each of the squadrons shall be composed of the ships of both nations proportionably.

VI. All the ships of both squadrons shall be provided for one year. What cannot be conveniently kept aboard the ships of the Mediterranean squadron, the king of Spain, the duke of Tuscany, and the republic of Genoa, shall be desired to give them a favourable reception.

VII. Each squadron shall be commanded by the English admiral or commander in chief.

VIII. The councils of war shall be composed of all the flag officers of both nations in equal number; when the votes are split, the captains shall be called; the English admiral shall be president, and the English officers of equal rank shall have the precedence of the Dutch.

IX. All causes relating only to the officers, seamen or affairs, of either of the nations, shall be tried by a council of war of that nation; but, if both nations are concerned, the officers of both shall be present at the trial.

XI. All prizes shall be divided between their majesties and the States in proportion to the share they bear in the charge of the fleet. That is to say, their majesties shall have $\frac{2}{3}$, and the States $\frac{1}{3}$.

XII. Prizes shall be adjudged by the admiralty of the nation by whose ships they were taken, and none but necessary charge shall be allowed, without any fees for officers.

XIII. And, if the prizes are taken by ships of both nations, they shall be adjudged by the admiralty of the nation, to whom the strongest ships present at the caption do belong.

XIV. The ships of either nation shall have special orders to protect each other's merchant-men and plantations in the West-Indies.

XV. This treaty to be ratified by both parties.

REMARKS.

This treaty which I have here abridged, contains such remarkable stipulations and regulations for marine affairs, that I thought it very well deserved to be inserted. And that, and all precedent treaties between these kingdoms and that state, were renewed and confirmed with additions, by a treaty of friendship and alliance, concluded at London in the month of August following. And after that, in the month of October 1692, a treaty was concluded by the king of Great-Britain and the States of Holland with the king of Spain, by which that prince obliged himself to put to sea at least 16 men of war of 60 guns each (which perhaps, was more than he could) with 4 fire-ships, and 25 galleys, and provisions for ten months; to be joined by 16 other English and Dutch men of war of the same force, and 4 fire-ships; upon condition, that all friendly offices should be done them by the Spaniard.

It is observable, that as to the ceremonial of the salutation, and other such punctilio's, which neither of the kings thought fit to yield to the other in the Mediterranean, (but which the king of Spain must have yielded to his British majesty in the British seas) for avoiding all differences on that account, it is agreed, That there shall be no such thing at all; as may be observed by the 10th article, which follows:

X. The men of war, galleys, and fire-ships, shall meet at the rendezvous which shall be assigned them, without any ceremony, salutation, or counter-salutation; which shall be

observed, all the time they act together, as well by the whole fleet as by detachments.

And so nice have princes, and especially the kings of England, always been upon this tender point of the marine, that for fear any small condescension of any of their commanding officers should afterwards militate against them, and be looked upon as a deference paid to the Spaniard, it is agreed by the eleventh article, That they should meet the first time on board the Dutch admiral, or other commanding ships of that nation, asunder.

XI. And, for the first time, the commanding officers shall meet in the ship of the first Dutch officer, there to regulate matters, according to the tenor of the separate articles, which shall be agreed on for the purpose.

Which separate articles here follow.

The commanding officers shall meet without any ceremony of rank at the first joining of the fleet, in the ship of the first Dutch officer, and shall concert amongst themselves, according to their orders, the necessary measures for acting against the enemy with the greatest appearance of success.

After this we do not meet with any other marine treaty very remarkable, 'till that concluded at the general peace of Ryfwick, between France and Holland; in which, besides several other matters relating to commerce, it is agreed, That the French and Dutch may freely frequent, with their ships and merchandizes, the countries, lands, towns, ports, and places of each other, with equal and reciprocal privileges, and without paying any other or greater duties in each other's countries, than the natural subjects of the country.

That the ships of war of either nation shall always be free to come in, lie at anchor, and go out of roads, rivers, ports, and harbours of each other, without being subject to any search, provided they give not any reasonable cause of jealousy.

That the ships of war of either nation, whether belonging to the sovereign or the subjects, shall have liberty to conduct, whether they please, the prizes they take from their enemies, without paying any duties or fees; and, on the contrary, no retreat shall be allowed to such as have made prize of any of the ships of his majesty, or the States-General, or their subjects: but, if they be forced in by tempest or otherwise, they shall be obliged to depart as soon as possible.

That the ships of either nation, coming to an anchor at any port in their passage upon a longer voyage, shall not be obliged to sell any part of their goods: and that the ships, nor goods, nor mariners, or other subjects of either nation, shall be arrested or detained by the other, under any pretence whatsoever, except it be for a just cause, and according to the due forms of law.

That it shall be lawful for the subjects of either nation to trade with the enemies of the other, and to carry thither all sorts of goods that are not contraband; under which term are only comprehended arms and ammunition, and warlike accoutrements of all sorts for men and horse. And the ships of both nations, whether at sea or any port or road, shall shew their passports and other sea-papers in due form, to which entire credit shall be given.

That all goods belonging to the subjects of either party, being seized on board an enemy's ship, shall be confiscated, except such as have been laden; if between the mouth of the channel and Norway, more than four weeks after the declaration of the war; if between the mouth of the channel and cape St. Vincent, more than six weeks; if further in the Mediterranean or elsewhere on this side of the Line, more than ten weeks; and if beyond the Line, all the world over, more than eight months after the declaration of war: and it is agreed, That neither the goods nor persons of enemies shall be seized by either nation in the ships of the other, except the persons be in the immediate service of the other.

That any captain of either nation, making prize any ships laden with contraband goods, shall not break open coffers, chests, bails, or any other thing 'till the same be done, in due form, by the officers of the admiralty; except the captain of any ship, having only a part of his lading contraband goods, consent to deliver the same up, and pursue his voyage with the rest.

That judgment shall be given with all justice and expedition, concerning all ships taken at sea; and, upon the complaint of the minister or envoy of either party, the cause shall be heard over again in council; and, notwithstanding the appeal of the captor, sentences, pronounced in favour of the owners of ships taken, shall be put in execution, upon their giving security to be forth-coming.

That the subjects of either nation may freely freight, or cause to be built in the dominions of the other, all manner of ships, whether for war or commerce, and that the enemies of either shall not enjoy that privilege.

That in case of shipwreck upon the coast of either nation, the effects that can be saved shall be restored, if reclaimed within the year and day, without any form of process.

That neither party shall suffer the ships of the other to be made prize in their ports or harbours.

That this treaty shall subsist 25 years.

By a separate article of the same date, the duty of 50 sols a ton imposed upon all foreign ships in France was taken off the Dutch, except only, when the latter should land in one port in France, to unlade at another in the said kingdom. But the breaking out of the ensuing war put a stop to the execution of this treaty.

R E M A R K S.

We have dwelt the longer upon the point of maritime affairs and treaties, in discharge of our promise made to the public; and, in the subsequent parts of this work, we shall give the substance of other the most material treaties of this kind, which have subsisted between the chief potentates of Europe. The use hereof is not only to convey some knowledge of the history of Christendom, in relation to the state of commerce, but to give readers, who may not have been conversant with affairs of this nature, such an idea thereof from what is past, as may enable them the better to judge of the rectitude of what has been transacted of the like kind since. And, from due attention to what shall be laid before the public on this head in the course of our undertaking, it will appear, that those who take upon them to make treaties of commercial or maritime concerns, cannot be too well acquainted with the subject of trade and navigation; they cannot have too minute and familiar a knowledge of practical trade, who would judge of it to good purpose in any respect: a general notion, which only flimsies over the surface of commerce, can only afford an imaginary, not such a real and substantial knowledge, as will enable a man to promote the public interest himself, or capacitate him to judge of the measures of others. For confirmation of the truth hereof, this work affords no little variety of instances. See in particular the articles COLONIES, CHAMBERS OF COMMERCE, BRITISH AMERICA, CONSULS, FRANCE, GRATIAS, LEVANT TRADE, NAVAL AFFAIRS, TRADE, TREATIES OF COMMERCE, CUSTOM-HOUSE BUSINESS, DUTIES, &c. See also several of the other articles referred to at the beginning of this article, which have affinity with this subject.

MARLE, for the manuring and cultivation of land, is of various kinds and different colours. The earth generally known by the name of marle, is a light friable substance, of a middle nature between clay and chalk, but neither so fat as clay, nor so dense as chalk, and sticks to the tongue.

R E M A R K S.

Under the articles EARTH, FARMING, HUSBANDRY, MANURE, we have shewed the necessity of advancing the arts of agriculture, and have opened a scene to the improvement thereof in general. Likewise under such other heads as we refer to from them, the same subject is pursued with all brevity and perspicuity with relation to its fundamental particulars that concern trade, which is as much as the reader will expect in a work of this nature.

The most ordinary help for fertilization of land, is stercoration. Sheep's dung is one of the best, the next is the dung of kine, and, thirdly, that of horses, which is held somewhat too hot unless it be mixed. That of pigeons for a garden, or a small piece of ground, is excellent.

The method of applying the dung to arable land, is to spread it immediately before ploughing, so as to plough it in; for, if it spread long before, the sun will exhale much of it's fatness. For grazing ground, the way is to spread it somewhat late, towards winter, that the sun may have less power to dry it up.

The second kind of compost is, divers kinds of earth; as marle, sea-sand, chalk, earth upon earth, pond earth, and mixtures of them. Marle is thought the best, as having most fatness, and not heating the ground too much*. The next is sea-sand, which obtains a particular virtue from the salt, for salt is the first rudiment of life. See the article SALT. Chalk overheats the ground a little, and therefore does best upon cold clay, or moist ground.

* See Sir Hugh Plat's Jewel-House of Art and Nature, page 114, &c.

It is a common error to think chalk is so great a help to arable, but not to grazing ground. The error proceeds hence, that, after chalking of the ground, they wear it out by many crops without rest, and then, indeed, it will bear little grass. It was a good experiment to lay chalk upon arable ground a little before ploughing, and plough it in as they do dung; but then it must first be made friable by rain or lying. Earth is a compost to earth. A garden, that had a field, as it were, poured upon it, bore fruit excellently the first year, for the surface of the earth is always the most fruitful. And earth so prepared has a double surface. But such earth as affords saltpetre, if procurable without too much charge, is best. The way to hasten the growth of saltpetre, is to exclude the sun; and, therefore, to make a large thatched hovel over some quantity of ground, or even to plank the ground over, will produce saltpetre. Pond-earth, or river-earth, is a very good compost for manure; especially if the pond has been long uncleaned, and so the water

be not too hungry; and we judge it would be yet better, if mixed with chalk.

Another help for ground is procured by means of some other substances, though not merely earthy, having a virtue to fertilize: wherein ashes excel, inasmuch that the countries about Ætna and Vesuvius have a kind of amends made them in the exceeding fertility of the soil, for the mischief done them by the eruptions; which fertility is caused by the ashes scattered over the ground.

Soot also, though thin spread in a field or garden, is found a very good compost. Salt is generally too costly: it has been tried, that mixed with feed-corn, and sown together, it proves serviceable; and we are of opinion, that powdered chalk, mixed with feed-corn, would do good, perhaps as much as chalking the ground all over.

The suffering vegetables to die into, and so fatten the ground is another help; as the stubble of corn, especially of pease. Brakes cast upon the ground, in the beginning of winter, will make it very fruitful. It were proper also to try, whether leaves swept together, and mixed with some chalk and dung, to give them more heat, would not make a good compost, for there is nothing wasted so much as the leaves of trees: and, as they lie scattered and without mixture, they rather make the ground sour than otherwise.

Heat and warmth is likewise a good help to ground. It has been anciently practised to burn heath, ling, and sedge, with the advantage of the wind, upon the ground. We find that the warmth of walls and inclosures is an amendment; so is lying open to the south, and the folding of sheep, as well by their warmth as their compost: and, perhaps, the covering of ground with brakes in the beginning of the winter, may help by means of the warmth. The usual way of gathering flints in flinty ground, and laying them in heaps, is no good husbandry; because they are magnets to heat, and would keep the ground warm.

Another help to fertility is watering, which may be done two ways; the one by letting in and shutting out the water at seasonable times: for water let in at some times, if it stay not too long, does good; but at others, if it stay too long, hurt. And this only serves for meadows, adjacent to a river. The other way is, to bring water from some high grounds, where there are springs into the lower, carrying it in long furrows; and from these furrows drawing it transverse, to spread the water, which makes an excellent improvement both for corn and grass: though the expedient proves the richer, if these hanging grounds be fruitful, because the water thus washes down some of the fatness of the earth. Generally where there are great overflows in fens, or the like, the drowning them in water makes the following summer more fruitful, as keeping the ground warm and nourishing it. But the farmers hold it, that the sewers may be kept so as to continue the water too long in the spring, 'till the weeds and sedge be grown up; because then the ground, like a wood, will keep out the sun, and so continue the wet, and never graze well that year. For more matter corresponding hereunto, see the articles EARTH, FARMING, FLAX, HUSBANDRY, MANURE.

Marles, besides their application with other proper composts for vegetation, they afford a fit matter for the making of vessels; such as crucibles, retorts, bodies, &c. in chemistry. They likewise serve to procure the discontinuation and division of certain salts and other materials, that would otherwise rise and boil over in the operation. These are, therefore, employed in the distillation of nitre, turpentine, wax, &c. They also contribute more materially, more intimately, and more essentially, as to quantity, in the fixation of certain bodies; as of oils, for example, of common sulphur, and even of mercury. For which see Becher's first supplement to his *Physica Subterranea*.

MARQUE.

Of letters of marque and reprisal, granted on depredations committed on trade and navigation, and of restitution, &c.

Letters of marque are extraordinary commissions granted by authority for reparation to merchants, taken and deploied by strangers at sea: and reprisals is the retaking, or taking again of one thing for another.

The goods of others may be taken upon the sea, by letters of marque and jus reprisaliarum; but the same cannot be done by any private authority, only by the power of that prince or state, whose subject the injured person is; nor is it grantable by authority, but where the party damaged has justice denied him, or the same is delayed contrary to the laws of nations: this law or custom of reprisals was established by the consent of nations, and, without it, licence would be tolerated for the committing of depredations; but princes, by the laws of nations, are answerable for public injuries, and should by prudent measures, prevent those that are private, not suffering foreigners to receive wrongs in their countries: nor should the prince of the person injured value his misfortune at so low a rate, as to deny him letters of request for satisfaction; and, if justice be denied after such request, it is reasonable to arm him with power, to take satisfaction by reprimand and military force.

And there are usually sent two or three letters of request, according to the satisfaction returned in answer, before the reprisal is awarded; and such letters generally assign a time certain for damages to be repaired; if not, reprisals to issue forth.

King Charles I. after the massacre of the Dutch at Amboyna, granted letters of request to the States of Holland for satisfaction within eight months, otherwise letters of reprisal were to follow. King Charles II. on the petition of Mess. Gouler and Canham, granted one Lee letters of request to the great duke of Tuscany, for redress against the government of Leghorn.

In the year 1674, the same prince issued out the like authority to the king of Spain, requiring satisfaction for the depredations committed on the ship and goods of Mr. Stampe at the Havanna. He also published the year following a proclamation, promising a reward for apprehending the offenders dead or alive.

In the prosecution of these letters there must be, 1. The oath of the party injured, or other sufficient proof, touching the injury thereby sustained. 2. A proof of due prosecution for obtaining satisfaction in a legal way. 3. The deferring or denial of justice. 4. A complaint to his own prince or state. 5. Requisition of justice made to the supreme head or state, in the ordinary course it was denied. 6. Persisting still in the denial of justice. After all which, letters of reprisal under such restrictions and limitations as are consonant to law, and as the case requires, may issue not only by the civil, but by the municipal laws of this kingdom: and then the prince of that country, against whom the same are awarded, must repair the damage out of his or their effects, who committed the injuries, or, if that proves deficient, it ought to fall as a common debt on his country.

Such authorities grantable by the laws of England are twofold, ordinary and extraordinary: the ordinary are either within the realm, or without the same; the first are grantable where British merchants have suffered in their persons, and their merchandize are spoiled or seized beyond the seas, by merchant strangers, and the British merchants upon suit, or the king's demanding of justice by his ambassadors, &c. cannot obtain satisfaction to the person injured; then the parties proving they have prosecuted the offenders in a due course of justice, and have been denied or delayed illegally to have right done them, shall, in such case, have a writ out of Chancery to arrest the merchant strangers of that nation, or their goods in these kingdoms. And the lord chancellor, in this case, has always the approbation of the king and council for so doing.

The other reprisals without the realm, are by patent under the great seal, and cannot be ordinarily revoked; because, after the person injured has petitioned, and according to law proved his loss, obtained letters of request, and no reparation has been made: as soon as the letters patents are sealed, the same does immediately create and vest a national debt in the grantee, to be satisfied in such manner, and by such means, as the said letters patents direct, out of the goods and estates of that prince's subjects, who refused, or illegally delayed justice.

But, if the supreme power thinks the execution of these letters of reprisal cannot well be effected without endangering the peace of both states, it may be repited till a more convenient time; and princes are careful, in granting such letters patents, to have them made so as they may not be reckoned a breach of the peace; but the granting of them for particular satisfaction does not, in the ordinary way, amount to a breach.

As to the extraordinary reprisals, they are by letters of marque, for reparation at sea, or any place out of the kingdom, granted by the secretaries of state, with the approbation of the king and council; but they are only during the king's pleasure, and generally in time of war, so that they may at any time be revoked.

In king Henry the IVth's reign, on the complaint of the commons of England, who had suffered many wrongs and injuries in the loss of their ships and goods upon the main sea, contrary to leagues, &c. which were violated by the subjects of other nations; and reciting the willingness of the parliament to provide remedy and relief for the grieved; a law was made, by which it is enacted, that, upon application to the keeper of the privy seal, he shall sign letters of request to demand reparation; which, if not made in convenient time, then the lord chancellor of England shall grant letters of reprisal in due form of law, to obtain the same by force, and for the indemnity of the persons injured: this is confirmed by stat. 4 Hen. V. cap. 7. and other statutes.

But letters of reprisal were granted long before these statutes, by the kings of England, by virtue of their prerogatives; nor was the king's prerogative in the least diminished by them, but remained at the common law, to judge when it was expedient to grant them; and the before-mentioned act of king Henry IV. notwithstanding it ordains letters of request and of reprisal, doth not restrain the king's prerogative therein.

The cases where reprisals will or will not lie, are thus stated: on wrong judgment given in a prosecution abroad, in matters not doubtful which might have been redressed, and the which was apparently perverted or denied, reprisal may be granted: though, if the matter be doubtful, it is otherwise; for in causes dubious, there is presumption that justice was truly administered. If an Englishman prosecutes a person in any legal court beyond the seas, whereupon the military governor opposes the suit, and by his means the debtor and his goods are conveyed away, but a sentence or judgment is obtained: by this the execution is frustrated, and letters of reprisal shall be had.

Yet, if a merchant of England shall commence a suit in the courts of law, beyond the seas, and judgment passes against him, from which he appeals to the supreme court, and there the first judgment is confirmed and allowed; though the complainant hath received a judgment contrary to the right of the cause, here he shall not have letters of reprisal; but it may, in an extraordinary case, occasion such letters to have a rehearing.

If any person shall be killed, wounded, or any way damaged in an hostile manner, in the territories or places of any king or potentate, to whom letters of request are transmitted, and no satisfaction shall be made to the person injured, there is no compulsion to resort to the ordinary prosecution, but letters of reprisal shall be issued: but, where misfortunes happen to persons, or their goods, residing in a foreign country in time of war, reprisals are not to be granted; in this case, they must be contented with the loss, for they are at their liberty to relinquish the place on the approach of the enemy, when they foresee the country is subject to devastation; and, if they continue, they must partake of the common calamity. It is not the place of any man's nativity, but of his habitation, that subjects him to reprimise; for the law doth not consider so much where he was born, as where he lives: therefore, if letters of reprisal should be awarded against the subjects of the duke of Tuscany, and a native of Florence, but denizen or living in England, should have a ship on a voyage for Leghorn, if in such case a capture be made of this ship, it is not lawful, nor can the same be made prize.

There are certain persons, as well as ships and goods, that are exempted or privileged from reprisals; such as ambassadors and their retinue; travellers through a country, staying but a little while there; ecclesiastical persons, &c. And a merchant of another place than against which reprisals are granted, although the factor of his goods were of that place, is not subject to reprisals. Molloy Jur. Marit. 21.

Where ships are driven into port by stress of weather, they have an exemption from the law of reprisals, according to common right; but by the laws of England it is said to be otherwise, unless expressly provided for in the writ or commission: and, if such ship flies from his own country to avoid confiscation, or for some other fault, and is driven to by stress of weather, she may then become subject to be prize. But it is unlawful to make seizure of ship for reprisal in any ports, but in that prince's who awarded the reprisals, or his against whom the same are issued; the ports of other princes or states are not to be disturbed, but be peaceably maintained.

If a ship, having letters of marque or reprisal, shall take the ships and goods of that nation against whom they are awarded, and bring the same into a neuter port, the owners may there claim and seize her; or the admiral may make restitution, according to law, of the ship's goods to the owners, and the captives to their liberty; for that the same ought first to have been brought infra præsidia of that prince or state, by whose subjects they were taken: and, if it be not so done, it has been resolved, that such ships cannot become lawful prize, nor are the owners of such a capture divested of their property. Trin. 17 Car. I. in B. R. Marsh's Rep.

When any ship that hath letters of reprisal attacks a vessel, and she refuses to yield, she may be assaulted and entered; and if it falls out, that by accident some of those which make resistance are slain, the fault will be at their own doors, for hindering the execution of what is legal and granted by authority. But in case a letter of marque shall knowingly take a ship and goods belonging to another nation, against whom the commission is not awarded, but of some other state in amity, this amounts to piracy; whereupon the offenders will incur a forfeiture of their vessel, &c. Roll. Abr. 530.

Though if such letters of marque be assigned over to another person, who takes any such ship or goods of another nation, on a presumption that it belonged to the right of him, against whom reprisals are granted: here, if the sufferers recover their goods and ship, yet the captors are not to be punished criminally, nor the grantees of the letters patents civilly. The captors nevertheless may not be excused from answering the damages, but the grantees are excusable both as to that and punishment, unless they are privy to the capture: it is like unto the case of an officer arresting a wrong person, he is liable to answer the damage to the party arrested, but not the person that employed him. Stat. 4 Hen. V. cap. 14. Sea Laws 470.

A person

A person who had letters of marque in the Dutch war, took an Offender instead of a Dutch ship, and brought her into harbour, and was prosecuted for damage, &c. And one Broom, by letters of marque, &c. under others, having taken a French ship at sea, he carried the same into Africa, and the admiralty there condemned her as prize; afterwards he sold her, and applied the money to his own use, and then, coming into England, he was sued in the admiralty to give an account, and sentence was given against him; though he appealed for a prohibition, but it was denied. 1 Lev. 248. 1 Salk. 32.

A ship being lawfully taken and brought into port, the captor must exhibit all his ship-papers and captive mariners to be examined, in order to adjudication; 'till when, and the goods are legally condemned, bulk ought not to be broken; nor may the captain permit any embezzlement of the lading, or sell, barter, or dispose of any part, without commission, for the king hath a proportion in all prizes [see PRIZES]: and the common profits of prizes are to be equally divided among all the ships present, and not be solely to the captor; so that if letters of reprisal are granted to two ships, and they happen both of them at sea to meet a prize, and the one attacks and enters her, by means whereof she becomes conqueror, although the other did nothing in the engagement, he hath a right to an equal distribution with the captor, because the preference of the other vessel, armed and prepared for battle, becomes a terror, and will occasion a ship the sooner to yield. 3 Eliz. cap. 5. 2 Leon. Rep. 182.

If the caption of any ship or goods be by men of war, the property will immediately be in the captors; except it be lost again, and the ship or goods are recovered by the persons from whom they were taken, or be in battle regained. And, by the law of nations, the dominion of the things taken by those to whom letters of marque are granted, become the captors, 'till the debt and costs, that is, the original damage and subsequent charges are satisfied; which being done, the residue ought to be restored: so the Venetians used their equity, having taken the ships of Genoa; they did not spoil any of the lading, but preserved the same very carefully, until the debt was paid; and then they made restitution of the things entirely, without diminution. Molloy, 23.

In case the king of England should be in enmity with the States of Holland, and one of their ships of war takes an English merchant-man, and afterwards another ship of war of England meets the Dutch ship and his prize, and regains the same, there restitution is commonly made, the owners paying the salvage: so where the prize is recovered by a friend in amity, or comes into his ports, restitution is to be made. And the taking of ships and goods by force and arms is so odious, that if, by any possibility, the right owners may have restitution, the same hath been granted. Ibid. 6, 7.

Where, for the fault, perhaps, of a few, a debt becomes national, the goods of the guiltless become liable (if taken) for satisfaction; but such party ought to have contribution by the law of England, as when one is put to the whole burden, and more are bound to do one thing. Though when depredations have happened here to foreign merchants, and complaint hath been made concerning them, our kings have often issued commissions to enquire of the same, and awarded satisfaction: and, upon the petition of some merchants of Genoa, who complained against the inhabitants of the isle of Guernsey for a depredation, in taking away and detaining their merchandize and goods to a considerable value, out of a ship wrecked by tempest near the said isle; on this a commission was granted, by which the commissioners were empowered to punish the offenders, and make restitution and satisfaction for the damages sustained. For as the English subjects may have their goods by way of reprisal, for the satisfaction of a debt from foreigners, so they may have the benefit of these commissions, to make themselves whole out of the estates of the offenders. Pat. 26 Edw. III. See stat. 31 Hen. VI. cap. 4.

But he that will sue to have restitution in England for goods taken at sea, must prove that the sovereign of the party was in amity with the king of England, &c. and letters of reprisal make no war, or enmity between nations. 22 Edw. III.

MASTERS OF SHIPS. See our article **COMMANDERS OF SHIPS**, containing something curious relating to the discovery of the **LONGITUDE** at sea. See also **LONGITUDE**.

Mercatorial laws and usages relating thereto.

The master of a ship or vessel, is to be chosen by the part owners in proportion to their concerns, not by the majority; and that man which is most able, is to be preferred. As the whole charge of the vessel and lading are committed to the master, the owners should be very careful who they admit to be commander of their ship; and he ought to be a person of honesty, as well as ability and experience.

The law looks upon a master as an officer, who must give an account for whatever he has under his care, and on failure to render satisfaction; therefore, if any misfortune happens by the negligence, wilfulness, or ignorance of himself or his mariners, he must be answerable for it. As soon as goods and

VOL. II.

merchandize are laden aboard the ship, whether she be riding in port, haven, or any other part of the seas, he that is master is chargeable therewith; and, if the same be there lost or purloined, or sustain any damage, either in the haven or port before, or upon the seas after she is in her voyage, he must answer the damage; for the very lading of the goods on board the ship doth subject the master to answer the same. Hob. Rep. 11. Molloy Jur. Marit. 197.

A merchant sends goods aboard a ship, and the master having signed his bills of lading for the same, the goods were stowed; but in the night divers persons, under pretence that they were preps-masters, entered the ship and robbed her of those goods and merchandize; and, in an action brought by the merchant against the master of the ship, it was made a question, whether he should answer for it? And it was alledged on his part, that there was no default or negligence in him; for he had a sufficient guard, the goods were all locked up under hatches, and that the thieves came on the pretence aforesaid and robbed the ship, and he could not have prevented the same; but it was notwithstanding adjudged, that, as master, he must at his peril see that all things are forth-coming that were delivered to him, let what accident will happen (the act of God or an enemy only excepted) and from fire, thieves, and the like, he is obliged to answer, and is in the nature of a common carrier; though it is at the merchant's election to charge either the master or the owners, or both, at his pleasure, but he can have but one satisfaction. Hil. 23 Car. II. B. R. 2 Lev. 69. See also 1 Mod. 85.

Where the master is subject to answer damage, is generally to be understood in such cases, where the lading was brought abroad either by his consent or his deputed servant's; for any other, or such goods, as shall be secretly brought in not being entered in his deputed servant's book, or in the bills of lading, the master shall not be compelled to see forth-coming; unless it be such things as the parties bring into the ship about them, as cloaths, money, or the like, which being seldom entered, yet commonly are visible, and the master by law is responsible for them. So likewise if a master forewarn a passenger to keep his goods, and that he will no way take care of them, and, if they be lost, or purloined by the ship's crew, he will not be obliged to see them forth-coming; here the master is not held answerable in case of a loss, especially if there be any thing of an agreement concerning it. Molloy, 215, 216.

But, if goods shall be sent aboard a ship, and the master shall appoint a cabin for the same, and deliver the key thereof to the lader, and tell him he will not be answerable if a loss happens, yet, if the goods are stole, he must make satisfaction. And if a master shall receive goods at any key, or send his boat for them, and they happen to be lost, he shall likewise answer both by the maritime and common law. Moor's Rep. Trin. 25 Eliz. Moll. 216, 198.

If a master commits any offence wilfully, or through negligence, he shall be answerable to his owners, who may compel him to make satisfaction for the damages, and, in such case, they may sue separately: so, also, if the ship hath earned freights, and some of the owners have received their parts, and the rest have not, they may bring an action for their share, without joining with the others. Hil. 26 and 27 Car. II. And, when goods are transported for hire, and no contract is made with the proprietors of the ship, there the master is chargeable for the goods in respect of his wages; and the owners are so in respect of their freight, that they receive for the carriage thereof. Per Holt chief justice.

It is said, That, where goods are once delivered to a master, the cargo is not subject to be attached in his hands; for they are in law, as it were, bailed to the ship, until the freight and all other charges are paid. And it has been held, That, as the master or owners of a ship may have an action for the freight, either the one or the other are answerable, where goods are damaged in a ship; but, in case there are several owners, and one differs from the voyage, he shall not be liable to any action afterwards for a miscarriage, &c. Comberb. Rep. 116.

If goods are so embezzled or damaged, that the seamen or mariners must answer, here the owners and masters are to deduct the amount of the damage out of their freight to the merchants, and the master shall deduct it out of the wages of the mariners: for, though freight is the mother of wages, it is also the very father of damage; and, before a mariner can claim his wages out of what the ship hath earned, the ship must be acquitted from the damage that the merchant hath sustained by the negligence or fault of the mariners: and the reason is, for that, the goods being obliged to answer the freight, so the freight and ship are tacitly engaged to clear the damage; and, when that is done, the mariners shall then be let into their wages. Molloy, 212.

The law doth impute the offences committed by mariners, or if done by passengers aboard the ship, or others, to be the negligence of the master, to make him liable; and, were it otherwise, the merchant would be in a very dangerous condition: and further reasons why he ought to be answerable for his men are, because the mariners are of his own choosing, and

A a a

under

under his correction and government, and know no other superior on ship-board but himself; and, if they are faulty, he may punish them, and likewise, if the fact is apparently proved against them, may reimburse himself out of their wages due. Pasch. 11 Jac. I. B. R. 1. 2 Roll. Abr. 530.

A master of a ship hath power to freight out the vessel, take in goods and passengers, mend and furnish the ship; and, for that purpose, if need be in a strange country, he may borrow money, with advice of his mariners, upon some of the tackle, or sell some of the merchandize; and, if part of the goods shall be sold in such necessity, the highest price that the remainder are disposed of for must be answered and paid to the merchant; after which, such merchant is to pay for the freight of those goods, as well as for the remaining merchandize; but, if the ship in the voyage happens to be cast away, then only shall be tendered the price that the goods so sold were first bought for. Leg. Oleron. 1.

Such is the duty of a master of a ship that is provident, that he ought not to make sail and put forth to sea, without the consent of his company; if he doth, he shall answer the damages arising thereby. And he is not to set sail without a sufficient number of able mariners, nor in tempestuous weather; neither must he stay in port or harbour, without just cause, when a fair wind invites his departure. Also he must not proceed in his voyage with insufficient rigging or tackle, or with other or fewer cables than are usual and requisite, respect being had to the burthen of the vessel: and, if any damage happens by the delivery of the goods in the lighter, as that the ropes break, and the like, there he must answer; but, if the lighter come to the wharf, and then, in taking up the goods, a rope breaks, the wharfinger is liable. Leg. Oleron. 2 Co. Entr. 3.

If a commander of a ship shall break ground, or endeavour to fail away, after an embargo is laid upon shipping by the state, he shall be answerable for all damages which shall accrue: the reason is, because his freight is due, and must be paid, though his goods be seized. He ought not to refuse payment of the just and ordinary duties and port-charges, to the hazard of any of his lading; but, if the officers insist upon more than is due, and he offers what is just, and which he ought to pay, then he shall be excused. If, by the master's default, confiscation of goods, or other damage happen, for non-payment of customs, or false bills of entry in the custom-house, or for transporting of unlawful merchandize, the master shall answer for the same, with the interest: but, concerning the suing for such goods, the master may well do it; and, notwithstanding, if it be found that the merchant is in any fault, then, if the master and four of his mariners swear that there was no fault in them, he will be cleared thereby. Leg. Oleron. Molloy, 198. Lex Mercat. of Malines, 103. The master of a ship, taking linen or cloths aboard, shall provide good canvas, lest the goods be damaged; he must not overlade the ship above the birth-mark, or take into his ship any persons of an unknown or obscure condition, without letters of safe conduct; nor ought he to lade any of his merchant's goods on board the ship of an enemy (though his own ship be in distress) without such letters of safe-conduct; for, if he does, the same may be made prize, and he must make good the damage. And he must not lade any prohibited goods; in which case, he is not only answerable, but also for any damage happening by any unreasonable flowing or breaking of goods, and therein he and his company may be put to their oath. He ought not to ship any merchandizes, but only at the public ports and kays [see KAYS], and he may not make use of any unlawful colours, ensigns, pendants, jacks, or flags, whereby his ship or lading would be subject to seizure. 18 Hen. VI. 19 Eliz. cap. 9. 12 Car. II. cap. 18. 26 Car. II.

He may not deviate in his course, without good cause, or steer a dangerous and unusual way, when he can have a more secure passage (though, to avoid illegal impositions, it is said he may somewhat change his course) nor may he sail by places infested with pirates, enemies, &c. or notoriously known to be unsafe, or near rocks, or remarkable sands, if he be not thereto necessitated by violence of wind and weather, or deluded by false lights. He shall not sneak into the creeks, or other places, when laden homewards, but come directly into the king's great ports (unless he be driven in by tempest), for, in such case, he would incur a forfeiture of the merchandize, and is obliged to answer. Molloy, 200. 4 Hen. IV. cap. 20. If several ships are in company on the same voyage, the masters are obliged, by the marine laws, to stay for one another, or shall be liable to the damages that the others shall sustain from an enemy, or pirates. Sea Laws.

A master is to deliver to the owners the names of all the persons whom he is to transport, and of his mariners before he departs the kingdom; and, at his return, shall make a true inventory of the goods of any person which shall happen to die, to be delivered to them, that his kindred and friends may have intelligence of it, and the goods may be forthcoming for one whole year: but of these goods, in the mean time, the bedding and appurtenances may be taken by the master and mate to their uses; as also the cloathing, and

other things upon the deceased's body, may be delivered to the boatswain and the company. The master shall keep his company in peace; and, if any seaman be hurt in doing service, he must take care that he be cured; and, if done by his companion, the charges shall be recovered of the other mariner: in case a mariner falls sick, the master shall order him to be laid in a house, with all sustenance necessary and usual in the ship, but shall not stay until he recovers; and, when he is recovered to health, must pay him his wages, or, if he dies, shall give it to the wife, or his nearest friends. Lex Mercat. Malines, 103.

If mariners want money during the voyage, the master ought to lend it them; but he shall not be answerable for the contracts of his men, for, in such case, they may be detained: he ought to give his mariners flesh three days a week, and the other days fish, or such-like victuals, with sufficient drink. If, through the master's fault, the ship-boat perish, with any mariners in it, then shall the master pay one whole year's hire to the heirs or executors of the persons drowned. Lex Mercat. Malines.

On a ship's arrival safe in port, a master is first to see that the ship be well moored and anchored, and then he must not relade or set sail again, until he hath been legally cleared, so as to have made satisfaction for damage, if any happened by default of him or his men, &c. And, when any master of a ship shall arrive at Gravesend, he shall not be above three days coming up the river to London, nor shall he touch at any kay or wharf, 'till he comes to Chester's Kay; and he or his purser are there to make oath of the burthen, contents, and lading of the ship, to the best of their knowledge; also where the took in her lading, in what country built, and how manned, who was master during the voyage, and who the owners. Stat. 12 Car. II. cap. 18.

Nor shall the master lade on board any goods outwards, to any place whatsoever, without entering, at the Custom-House, the name of the ship and of her master, the burthen, guns, ammunition, and to what place bound; and, before he sets out, shall bring in a note, under his hand, of the names of every merchant that shall have laid aboard any goods, with the marks and numbers of all such goods, and be sworn as to the same, under the penalty of 100*l.* by 14 Car. II. cap. 11. And if any goods are landed, on the coming of a ship into port, for which duties are to be paid, without entry made, and the customs agreed, they may be seized, and a door broke open for that purpose, &c. 12 Car. II.

By late statutes, if any master of a merchant-ship or vessel shall, during his being abroad, force any man ashore, or wilfully leave him behind, or refuse to bring all his men home again, who are in a condition to return, he shall suffer three months imprisonment. Stat. 11 and 12 Will. III. cap. 7. But no master of a ship shall bring into this kingdom from Ireland, Jersey, &c. or the plantations, any vagrant rogue, on pain of forfeiting 5*l.* And masters of ships bound for Ireland, &c. shall, upon a warrant to them directed by a justice of peace, transport vagrants at the rates set at the quarter-sessions, under the like penalty. 12 Ann. cap. 23.

Masters of ships are to take poor boys apprentices, such as are 13 years old, whose parents are chargeable to the parish; they must be bound with the consent of two justices, &c. to serve 'till they are 21 years of age; and the church-wardens and overseers of parishes shall pay the master, when such boy is bound apprentice, 2*l.* 10*s.* for cloathing and bedding, to be allowed them on their accounts, and shall send the indentures to the collector of the customs of the port to which the master shall belong, who shall register them, &c.

A master of a ship from 30 to 50 tons shall take one such apprentice, one more for the next 50 tons, where the ship is larger, and one more for every 100 tons, above the first 100; and refusing such apprentices, are liable to a penalty. Poor boys, bound to other employments, may be turned over to any master of a ship; and the widows and executors, &c. of such masters, have power to assign such an apprentice to any other master of a ship. 2 Ann. cap. 6. 4 and 5 Ann. cap. 19.

Every seaman serving on board any ship, and person employed upon the coasts of Great-Britain or Ireland, in the taking of fish which are brought fresh to shore, and boats that trade in from place to place, or in open boats upon the coasts, shall pay 6*d.* per month for the better support of Greenwich-Hospital [see GREENWICH-HOSPITAL], and the master of every ship or vessel is to detain the sum out of the mariners wages, and pay it to the person who shall be appointed by the admiralty to receive it, and is to give an account upon oath, on pain of 10*l.* But masters and servants of hoys, smacks, or other vessels belonging to London, and employed in bringing corn, fish, or other provisions, shall not be liable to this duty. 10 Ann. cap. 17.

By 8 Geo. II. cap. 29. it is enacted, That, in case any seaman, on board any merchant-ship belonging to the subjects of his majesty, shall be maimed in fight against any enemy, such seaman shall be admitted into the royal hospital at Greenwich, as any other seaman wounded in the service of his majesty.

Some other authentic LAW CASES adjudged in the COURTS
of JUDICATURE in ENGLAND.

Bofon verſus Sandford, & al. Mich. J. W. & M. B. R. intr.
Hil. 1 and 2 Jac. II. Rot. 302.

Cafe againſt A. and B. part owners of a ſhip, for that he put goods on board, and the defendants undertook to carry them ſafely for hire, but yet were ſo negligent that the goods were ſpoiled: upon not guilty pleaded, in evidence it appeared, That C. and D. were alſo part owners, and that the ſhip was under the care of a maſter, to whom the goods were delivered; and, this being found ſpecially, it was argued pro quer. That the action is grounded on the wrong, and may be againſt all, or any of the proprietors: there was alſo another doubt ſtarted, and that was, whether the owners were liable, when in truth they did not undertake, but, in fact, the maſter ſuper ſe ſuſcepit.

Eyre juſtice held, There was no difference between a land-carrier and a water-carrier, and that the maſter of a ſhip was no more than a ſervant to the owners in the eye of the law; and that the power he has of hypothecation, &c. is by the civil law. Et per Holt, chief juſtice, The owners are liable in reſpect of the freight, and as employing the maſter; for, whoever employs another, is anſwerable for him, and undertakes for his care to all that make uſe of him.

2dly, The court held, That all the owners were liable, for they are charged in point of contract, as employers, and are all equally intitled to the freight: either maſter or owners may bring an action for the freight; but, if the owners bring the action, they muſt all join, ergo, they muſt all be joined; as the freight belongs to all, ſo all are equally undertaking; and a breach of truſt in one is a breach of truſt in all: as, where two make one officer, the act of one is the act of the other.

3dly, The court held this was not an action ex delicto, but ex quaſi contractu, and it was not the contract of one but of all: that there was no other tort but a breach of truſt. Therefore the court gave judgment for the defendant, becauſe all the owners were not joined. Salk. p. 440.

Wilſon verſus Bird.

The ſhip was libelled againſt in the admiralty, for that the maſter, being taken by a French privateer, had ranſomed the ſhip for 300l. and had ſued for the payment of it, and was carried priſoner to Dunkirk, and the money was not paid, &c. and ſentence was given in the admiralty againſt the ſhip; and, upon motion for a prohibition, it was denied by Holt chief juſtice, then alone in court, becauſe, the taking and pledge being upon the high ſea, the ſhip, by the law of the admiralty, ſhall anſwer for the redemption of the maſter by his own contract. Lord Raymond, vol. i. p. 22.

Benzen verſus Jeffries.

Motion was made for a prohibition to the court of admiralty, where a ſuit was profecuted againſt a ſhip, which the maſter had hypothecated for neceſſaries, being upon the ſea in ſtreſs of weather. And the ſuggeſtion was, That the agreement was made, and the money lent, upon the land, viz. in the port of London, it being a Venetian veſſel, which came here by way of trade, and not ſtreſs of weather.

But, per Holt chief juſtice, the maſter of the ſhip has power to hypothecate it, but he cannot ſell it; and, by the pawning, the ſhip becomes liable to condemnation. This was reſolved in ſolemn debate, in the caſe of *Coſtard verſus Lewſtie*, 2 Will. and Mar. B. R. Then there is no remedy here for the hypothecation, but by way of contract: therefore, ſince the King's-Bench cannot do right to the parties, it will not hinder the admiralty from doing them right; for the King's-Bench allows the hypothecation, and yet denies the remedy: it will be a manifeſt contradiction. An action was brought upon the ſtatute 2 Hen. IV. cap. 11. for ſuing in the admiralty upon a hypothecation, and it was held to be out of the ſtatute, in the time of my lord Hale. And as to the objection, That the contract was made upon the land, and the money paid there, it muſt of neceſſity be ſo, for, if a man be in diſtreſs upon the ſea, and compelled to go into port, he muſt receive the money there, or not at all. And, if his ſhip be impaired by tempeſt, ſo that he is forced to borrow money to reſit, otherwiſe ſhe will be loſt, and for ſecurity of this money, he pledges his ſhip: ſince the cauſe of the pledging ariſes upon the ſea, the ſuit may well be in the admiralty court; but, becauſe there was a precedent where a prohibition in ſuch caſe had been granted, the court granted the prohibition, and ordered the plaintiff to declare upon it, for the law ſeemed clear to them, as before is ſaid. Lord Raymond, vol. i. p. 152.

Tranter verſus Watſon.

Watſon was maſter of a merchant's ſhip, which was taken at ſea by a French privateer. Watſon agreed with the cap-

tain of the privateer for the ranſom of the ſhip and goods, at 1200l. and as a pledge or ſecurity for the payment of the money, Watſon was detained and carried into France, but the ſhip and goods were releaſed, and were brought into Briſtol, where the ſhip was unladed, and the goods landed (after cuſtom paid) and delivered to one Day, but whether in truſt for the benefit of the maſter, or for the uſe of the owners, was not agreed.

Watſon commences his ſuit in the court of admiralty, againſt the owners, to compel them to pay the 1200l. and redeem him; and, thereupon, a warrant was iſſued out of that court to arreſt the ſhip and goods, in quadam cauſa ſalvagii, in order to compel the defendant to appear there; and the ſhip and goods were ſeized thereon. Mr. Broderick and Mr. Dee prayed a prohibition as to the goods, ſuggeſting the ſeizure on land infra corpus comitatus, and ſo not within their jurisdiction. He inſiſted, That the maſter has no power to make ſuch an agreement, nor to ſubject the goods to the payment of his ranſom, without the expreſs authority and conſent of the owners. The power of hypothecation in a voyage for neceſſaries is incident to his office, and allowed for the neceſſity of the thing, and the benefit of the owners; but this is not ſo, for this is a redemption, and a new buying of the ſhip, and, if this be allowed lawful, it will give a power to the maſter to do an injury to the owners, by obliging them to the performance of an agreement of his making, upon any terms never ſo unreaſonable, and to compel them to pay more than the ſhip and goods are worth, as the agreement in this caſe is.

Befides, the power of the maſter is only over the ſhip, and he has no power over the goods and lading, to make any diſpoſition thereof. Admitting the maſter has ſuch power, to ſubject the goods to the payment of this ranſom, yet he ought not to bring the ſuit in his own name, but the ſuit ought to be carried on in the name of the vendee or purchaſer of the goods. Admitting the ſuit proper, yet the ſeizure is illegal, for the court of admiralty cannot award ſuch proceſs as their firſt proceſs to compel the party to appear, in the nature of an execution againſt the goods; and they can no more begin with ſuch proceſs than an inferior court; and, as a prohibition ſhall be awarded to an inferior court in ſuch caſes, ſo ought it in this, though the party have not yet appeared, nor any libel be as yet exhibited. And ſo it was done in the caſe of *Capt. Sands and Sir Joſiah Child*, 5 Will. and Mar. a prohibition was there granted on the warrant, before any libel.

On the other ſide, it was inſiſted by Mr. Eyre and Mr. Montague, That no prohibition ought to go in this caſe, for that the maſter has power, in this caſe, to ſubject the goods to the payment of his redemption; and it is founded on the ſame reaſon as his power of hypothecation, the neceſſity of the thing, and the benefit of the owners, by parting with ſome part of the goods to ſave the reſt; whereas, otherwiſe, the whole would have been loſt. So is *Molloy*, 213, 214. *Hob. 11, 12.* [Note, Holt chief juſtice, upon his citing *Molloy*, ſaid, Cite the authorities there mentioned, if you will, but do not cite the book itſelf;] but this, being a matter and a cauſe properly within the jurisdiction of the admiralty, ſhall be determined there. And in a maritime cauſe, whereof they have cognizance, the proceſs of the court may be executed upon land, infra corpus comitatus.

Befides, the ſale or delivery of the goods upon land will not take away the jurisdiction of that court, ſince they have jurisdiction of the original matter. And ſo it is adjudged, 1 Sid. 320. *Thompson verſ. Smith*. 3 Cro. 685. 2 Sand. 259. *Radley verſ. Eggleſfield*. 1 Lev. 243. *Turner verſ. Neale*. As to the objection, that the ſuit in curia admiralitatis ought not to be in the maſter's name, they answered, That it is moſt proper in his name; for the captors, to whom the ranſom belongs, and who have the maſter in their cuſtody, cannot ſue in their own names, becauſe they are enemies; but, if the ſuit be not carried on between proper parties, it is good cauſe for an appeal, and ſhall be determined by the rules of the marine law, but it is no ground for a prohibition.

But admitting the merits of the cauſe to be againſt the maſter, yet the owners came too ſoon for a prohibition before they have appeared, and before any libel exhibited, ſo that it cannot appear to this court what the nature of the ſuit is.

The court deſired to hear a civilian, before they made any rule in this caſe: and, accordingly, Dr. Lane attended for the plaintiff in curia admiralitatis. He argued, That ſalvage, or cauſa ſalvagii, as it is mentioned in the warrant, is of admiral jurisdiction: that the maſter represents both the owners of the ſhip and the traders, and has a truſt reſeſed in him, which extends to the goods as well as the ſhip; the maſter may detain the goods of the merchant for the freight of the ſhip, or wages of mariners. The maſter, in this caſe, by the marine law has an hypothecation of the goods to him, to keep 'till payment be made of the money agreed, and not only a bare poſſeſſion, and, therefore, though he part with the poſſeſſion of the goods before payment, that does not diſveſt his intereſt.

The goods were in the power and poſſeſſion of the enemy, who might have kept or deſtroyed them all, if they had not been redeemed by the maſter, which is for the benefit of the owners,

owners. Redemption is a redemption by the master, and gives security for the payment of the money agreed, by subjecting the person as a pawn or pledge; so that he has, as it were, paid for the goods. This power of redemption is not founded on the Rhodian laws, or the laws of Oleron, but arises from the custom and law of nations, and the same custom or law, gives the master, in this case, an interest in the ship and goods. See OLERON LAWS and RHODIAN LAWS. Here Holt chief justice interrupted him, and said, We are not now upon the merits of the cause, for that is not before us upon this motion.

It was agreed by the whole court, that no prohibition should be granted in this case.

Holt chief justice said, You come too soon for a prohibition, before appearance, and a libel filed, for you are not yet in court. If this process be an illegal process, and not justifiable by the rules of their law, you may take your remedy by an action of trespass or replevin. The case of Sands and Sir Josiah Child was on an action upon the statute of Rich. II. and not on a prohibition, as was suggested.

We cannot try the legality of the process upon a motion. If it come before us on an action of trespass, we shall then judge both of the legality of the process and the power of the master. If a replevin or an action of trespass be brought, and there be a jurisdiction, we must determine whether what was done was legally done or no, upon whatever law it is grounded, whether ecclesiastical, maritime, the law of nations, or whether [H. J.]. It seems very just and reasonable in this case, that the owners of the goods ought to pay the redemption. If a pirate should take the ship and goods, and the master redeem them, the owners shall make him satisfaction; and then much more in this case when taken by an enemy.

When the master makes a composition for the benefit of the owners, it is highly reasonable that he should be indemnified. The whole ship and goods would have been prize, if he had not made this composition; therefore, where there is an instant danger of losing ship and goods (as in this case, when they were under the capture and power of the enemy) and no hopes of saving them then appears (though afterwards it may happen that the ship may be rescued on fresh pursuit) cannot the master make such an agreement as this, as well as he may throw part of the goods overboard, in case of a tempest, to save the rest? The master has the custody and care of the ship and goods: supposing then that the master has such a power of compounding, the goods then remain to him as a security to him, and he may detain them 'till payment, as he may for freight. But then it is to be considered, whether when he has once delivered them to the owner, or to his use, he has not parted with his security, and has no way to come at them again, as it is in case of freight? These things are considerable, if we go into the merits of the cause; but, that not being before us, I give no opinion therein.

Powell justice. This process being only to compel the parties to appear, you come too soon for a prohibition before libel. We cannot determine the legality of the process in this manner: if that court has a power in any case to proceed against the goods, and to seize them on process, we ought not to grant a prohibition; for how does it appear to us, but that this process is awarded in such a case, wherein it lawfully may? As to the merits, it seems very reasonable, that the master should have power to make such a redemption, as he may throw part overboard in a tempest, to save the rest. And here the goods seem to remain in the nature of a pawn to the master, to secure the payment; and if the master, by delivering out of the goods, has lost his interest therein, and so the seizure illegal, yet we cannot determine that on the return of the process before libel: you may plead that matter there, but we cannot take notice that the process is illegal; if it be, you have your remedy.

Gould agreed; Powis absent. Lord Raymond, vol. ii. p. 931 to 934.

Clay versus Snelgrave.

The defendant, as executrix to the master of a ship, libelled in the admiralty court for the wages owing to the testator by the owner. Upon which the plaintiff, to have a prohibition, suggested the statute of 15 Rich. II. cap. 3. that the admiral court shall not have cognizance of contracts made upon the land, and shews this contract to have been made upon the land, &c. And this case was several times moved by Sir Bartholomew Shower and Mr. Acherley, for his prohibition, as well in Michaelmas, Hilary, and Easter terms last past, as in this present term: and it was opposed by Mr. Northey and Mr. Hall: and the counsel for the prohibition argued, That prohibitions are grantable de jure, and are not discretionary in the court. Raym. 3, 4. That the case, in Winch. Rep. 8. was the first case where a prohibition was denied in case of a suit by mariners for their wages in the admiralty court; and the denial was grounded upon compassionate reasons, because they were poor men, and because there they might join in action, but here they must sever; but the said case is contrary to the reason and grounds of the law; for where the contract is made upon the land, though the service

was done upon the sea, it is out of the jurisdiction of the admiralty; and so vice versa, if the service was done upon the land, and the contract upon the sea. 12 Co. 79, 80. Stanf. 51. b. Hob. 212. A consultation is always denied in case of a suit by mariners, if there is a charter-party: and the sealing of a writing cannot make any difference in reason, Raym. 3. A prohibition granted where the master libelled alone. Mr. Northey and Mr. Hall è contra for the defendant said, That the case of mariners was now settled, and ought not to be stirred; but that the great reason why they are permitted to sue there is, the ship is the debtor, and, by the law of the admiralty, they may attach her, which they cannot do by the common law; and in the admiralty court they may all join in suit, whereas, by the common law, they must bring several actions. That the case of the master is not different, for the ship is security to him, and he is but a mariner, and his wages are wages at sea. But, however, where the master dies in the voyage, as he did in this case, there can be no reason to exclude his executors from suing in the admiralty, because he had no opportunity of bringing his wages to account with the owners.

And in 2 Ventr. 181. Allison vers. Marsh, the purser, though an officer of the ship, was allowed to sue for his wages in the admiralty. And in 2 Keb. 779. Pl. 6. Rex versus Pike, a prohibition was denied, where the master and mariners joined in a suit in the admiralty for their wages. [But Holt said, That a prohibition ought to have been granted quoad in the said case.] And he cited a case, Hil. 27 and 28 Car. II. C. B. between Cooker and Older, where Atkins and Ellis justices were of opinion, That a prohibition ought to be granted, to the suit in the admiralty court by a master of a ship for his wages; but North chief justice said, and Wyndham justice held the contrary opinion. But Holt chief justice said, That it is an indulgence that the courts at Westminster permit mariners to sue for their wages in the admiralty court, because they may all join in suit; and it is grounded upon the principle, Quod communis error faciat jus; but they will not extend it to the master of the ship, especially if he was master at the beginning of the voyage here in England, and the contract was made with him here. Possibly, if the master of a ship died in the voyage, and another man took upon him the charge of the ship upon the sea, such case might be different, as in the case of Grosswick versus Louthly, where it was held in this court lately, That, if a ship was hypothecated, and money borrowed upon her at Amsterdam, upon the voyage, he who lent the money may sue in the admiralty for it; and this court granted a consideration in the said case. But in another case, where the money was borrowed upon the ship before the voyage, the King's Bench granted a prohibition, and the parties acquiesced under it. There are many precedents, in the court of admiralty, of suits by the mariners for their wages, but none for the master of the ship. And the cases differ; for the mariners contract upon the credit of the ship, and the master upon the credit of the owners of the ship, of whom generally he is one.

The opinion of lord Hobart, That, where there is matter of property to be tried, a prohibition should be granted, is a little too hard. Gould justice agreed with Holt, and said, He was of opinion that prohibitions were grantable of right, though it had been controverted in his time. To which Holt chief justice said, that Hale chief justice, and Wyndham justice, held prohibitions to be discretionary in all cases; but Kelynge chief justice was of the contrary opinion: and he said, He did not esteem them to be matter of right. Then Mr. Northey moved, That the court would compel the plaintiff to put in bail to the action to be brought for the wages at common law, or otherwise deny the prohibition; which, he said, had been done often. Holt chief justice confessed, That the court had sometimes interposed, and procured bail to be given; but it was by consent, and in case of the proprietor himself: but, in regard that in this case the plaintiff was a purchaser without notice, there was no reason: and a prohibition was granted. Lord Raymond, page 576.

MATHEMATICS. We shall not enter into the origin of this science of sciences, nor attempt, under this single head, to convey a competent knowledge of any of the several branches whereof it consists; because that would be only to amuse and deceive our readers, and make them believe they receive great benefit, when they obtain only a very superficial and confused notion of they know not what. Wherefore we shall, at present, content ourselves with giving the man of business such an idea of these studies, that he may be able to judge what parts may be necessary for him to pursue, and what to let alone; which is the view in touching on this article at all.

In all ages and countries, where learning hath prevailed, those sciences have been esteemed as the most considerable branch of it. Amongst the sciences that are reckoned to be the seven liberal arts, four are mathematical, to wit, arithmetic, music, geometry, and astronomy.

It is strange, that, notwithstanding their usefulness and excellency, a general supineness and indifference to these studies should of a sudden spread itself among us; when, within these 30 years, nothing has been more fashionable; which

must be owing to an aversion in the greatest part of mankind to serious attention and close reasoning, or to their not comprehending sufficiently the necessity and great utility of these in the other parts of useful learning: or, perhaps, from an opinion that this knowledge requires a peculiar genius and turn of head, which few are so happy as to be born with. For these, and probably some other reasons, this study begins to be as generally neglected as it was warmly cultivated, and is now regarded only by some few, whose genius and curiosity have prompted them to it, or who have been forced upon it by its immediate subserviency to some particular art or employment.

We think, therefore, it may be of some public service to shew, that, of all parts of human knowledge, the mathematics, for the improvement of the mind, for their assistance and subserviency to other arts, and their usefulness to the commonwealth, and its trade, commerce, and navigation, deserve still to be highly encouraged, and universally studied. The advantages which accrue to the mind from this kind of knowledge, consist chiefly in these things: (1.) In accustoming it to attention. (2.) In giving it a habit of close and demonstrative reasoning. (3.) In freeing it from prejudice, credulity, and superstition.

1. These studies make the mind attentive to the objects which it considers. This they do by entertaining it with a great variety of truths, which are delightful and evident, but not obvious. Truth is the same thing to the understanding as music to the ear, and beauty to the eye. The most part of other sciences consisting only of probable reasonings, the mind has not where to fix; and, wanting sufficient principles to pursue its searches upon, gives them over as impossible. And youth is generally so much more delighted with mathematical knowledge than with the unpleasant tasks that are sometimes imposed upon them, that many have been reclaimed from idleness and neglect of learning, and have acquired a habit of thinking, assiduity, and attention; qualities which we ought early to beget in their desultory and roving minds.

The second advantage which the mind reaps from this knowledge, is a habit of clear, demonstrative, and methodical reasoning. We are formed by nature to learn more by imitation than by precept: and we believe, in that respect, reasoning is much like other arts (as dancing, singing, &c.) acquired by practice. By habituating ourselves to reason closely about quantity, we acquire a habit of doing so in other things*. It is surprizing to reflect, what superficial, inconsequential reasonings, satisfy the most part of mankind. A witticism, a jest, a simile, or a quotation of an author, passes for a mighty argument with too many: with such things as these, are the most part of authors stuffed; and, from those weighty premises, they infer their conclusions.

- * He that has to do, says Mr. Locke, with young scholars, especially in mathematics, may perceive how their minds open by degrees, and how it is Exercise alone that opens them. Sometimes they will stick a long time at a part of a demonstration, not for want of will and application, but really for want of perceiving the connexion of two ideas; that, to one whose understanding is more exercised, is as visible as any thing can be. The same would be with a grown man beginning to study mathematics: the understanding, for want of use, often sticks in a very plain way; and he himself that is so puzzled, when he comes to see the connexion, wonders what it was he stuck at, in a case so plain.
- I have mentioned mathematics, as a way to settle in the mind an habit of reasoning closely and in train; not that I think it necessary, that all men should be deep mathematicians, but that, having got the way of reasoning, which that study necessarily brings the mind to, they might be able to transfer it to other parts of knowledge, as they shall have occasion. For, in all sorts of reasoning, every single argument should be managed as a mathematical demonstration; the connexion and dependence of ideas should be followed, till the mind is brought to the source, on which it bottoms, and observes the coherence all along, though, in proofs of probability, one such train is not enough to settle the judgment, as in demonstrative knowledge.
- Where a truth is made out by one demonstration, there needs no farther enquiry: but in probabilities, where there wants demonstration to establish the truth beyond doubt, there it is not enough to trace one argument to its source, and observe its strength and weakness, but all the arguments, after having been so examined on both sides, must be laid in balance, one against another, and, upon the whole, the understanding determine its assent.
- This is a way of reasoning the understanding should be accustomed to, which is so different from what the illiterate are used to, that even learned men oftentimes seem to have very little, or no notion of it. Nor is it to be wondered, since the way of disputing in the schools leads them quite away from it, by insisting on one topical argument, by the success of which the truth or falshood of the question is to be determined, and victory adjudged to the opponent or defendant; which is all one, as if one should balance an account by one sum, charged and discharged, when there are an hundred others to be taken into consideration.

This, therefore, it would be well, if men's minds were accustomed to, and that early; that they might not erect their opinions upon one single view, when so many others are requisite to make up the account, and must come into the reckoning, before a man can form a right judgment. This would enlarge their minds, and give a due freedom to their understandings, that they might not be led into error, by presumption, laziness, or precipitancy; for I think no body can approve such a conduct of the understanding, as should mislead it from truth, though it be ever so much in fashion to make use of it. To this, perhaps, it will be objected, that to manage the understanding, as I propose, would require every man to be a scholar, and to be furnished with all the materials of knowledge, and exercised in all the ways of reasoning. To which I answer, that it is a shame for those that have time, and the means to attain knowledge, to want any helps or assistance for the improvement of their understandings, that are to be got, and to such I would be thought here chiefly to speak. Those, methinks, who, by the industry and parts of their ancestors, have been set free from a constant drudgery to their backs and their bellies, should bestow some of their spare time on their heads, and open their minds, by some trials and essays, in all the sorts and matters of reasoning.

I have before mentioned mathematics, wherein algebra gives new helps and views to the understanding. If I propose these, it is not, as I said, to make every man a thorough mathematician, or a deep algebraist, but yet I think the study of them is of infinite use, even to grown men; first, by experimentally convincing them, that, to make any one reason well, it is not enough to have parts wherewith he is satisfied, and that serve him well enough in his ordinary course. A man in those studies will see, that, however good he may think his understanding, yet in many things, and those very visible, it may fail him. This would take off that presumption which most men have of themselves in this part, and they would not be so apt to think their minds wanted no helps to enlarge them, that there could be nothing added to the acuteness and penetration of their understandings.

The study of mathematics would shew them the necessity there is, in reasoning, to separate all the distinct ideas and see the habitudes that all those, concerned in the present enquiry, have to one another, and to lay by those, which relate not to the proposition in hand, and wholly to leave them out of the reckoning. This is that, which, in other subjects, besides quantity, is what is absolutely requisite to just reasoning, though in themselves it is not so easily observed, nor so carefully practised. In those parts of knowledge, where it is thought demonstration has nothing to do, men reason as it were in the lump; and if, upon a summary view, or upon a partial consideration, they can raise the appearance of a probability, they usually rest content; especially if it be in a dispute, where every little straw is laid hold on, and every thing that can but be drawn in any way, to give colour to the argument, is advanced with ostentation. But that mind is not in a posture to find the truth, that does not distinctly take all the parts asunder, and, omitting what is not at all to the point, draw a conclusion from the result of all the particulars, which any way influence it. There is another no less useful habit to be got, by an application to mathematical demonstrations, and that is, of using the mind to a long train of consequences. Thus Mr. Locke.

This effeminacy of mankind, in being persuaded where they are delighted, have made them the sport of orators, poets, and men of wit. Those lumina orationis are indeed good diversion for the fancy, but not the proper business of the understanding. Even formal logical precepts are more useful. But, in the search of truth, an imitation of the method of the geometers will carry a man further than all the dialectical rules. Their analysis is the proper model we ought to form ourselves upon, and imitate in the disposition and gradual progress of our enquiries; and even he who is ignorant of the nature of mathematical analysis, uses a method something analogous to it. The method of the geometers in demonstrating truths already discovered, viz. by definitions of words agreed upon, by axioms, and propositions that have been already demonstrated, is practicable in other subjects, though not to the same perfection, the natural want of evidence in the things themselves not admitting it, but it is imitable in a very great degree. One who has been trained up in the several branches of those sciences, which they have cultivated, will hardly bear with the confusion of other sciences, but endeavour to reform them.

Thirdly, Mathematical knowledge adds a manly vigour to the mind, frees it from prejudice, credulity, and superstition. It does this two ways, 1st, By accustoming us to examine, and not to take things upon trust. 2^{dly}, By giving us a clear and extensive knowledge of the system of the world; which, as it creates in us a profound reverence for its great author, so it frees us from the mean and narrow thoughts, which ignorance and superstition are apt to beget. How great an enemy mathematics are to superstition, appears from this, that, in those countries where Romish priests exercise their barbarous tyranny over the minds of men, astronomers, who are fully persuaded of the motion of the earth, dare not speak out: but, though the inquisition may extort

a recantation, the Pope and a general council will not find themselves able to persuade to the contrary opinion. Perhaps this may have given occasion to a calumnious suggestion, as if mathematics were an enemy to religion, which is a scandal thrown both on the one and the other; for truth can never be an enemy to true religion, which appears always to the best advantage, when it is most examined. On the contrary, these studies are friends to religion; inasmuch as they charm the rational passion, restrain the impetuosity of imagination, and purge the mind from error and prejudice. Vice is error, confusion and false reasoning, and all truth is more or less opposite to it.

What we have said, may serve to recommend mathematics for acquiring a vigorous constitution of mind; for which purpose they have been experienced as useful, as exercise is towards the health and strength of the body.

We shall now touch upon their extent and usefulness in other parts of knowledge. And here it might suffice to observe, that mathematics is the science of quantity, or the art of reasoning about things that are capable of more or less, and that the most part of the objects of our knowledge is such; as matter, space, number, time, motion, gravity, &c.—We have but imperfect ideas of things without quantity, and as imperfect a one of quantity itself without the help of mathematics. All the visible works of nature are made in number, weight, and measure; therefore, to consider them, we ought to understand arithmetic, geometry, and statics: and, the greater advances we make in these arts, the more capable we are of considering, for all the useful purposes of life, such things as are the ordinary objects of our conception. This will further appear from particulars.

i. If we consider, to what perfection we know the courses, periods, order, distances, and proportions of the several great bodies of the universe, that fall within our view, we shall have cause to admire the sagacity and industry of the mathematicians, and the power of numbers and geometry well applied.

Let us consider astronomy in it's infancy, or rather let us suppose it still to begin; for instance, a colony of rude country people, transplanted into an island remote from the commerce of all mankind, without so much as the knowledge of the calendar, and the periods of the seasons, without instruments to make observations, or any the least notion of observations or instruments. When is it we could expect any of their posterity should arrive at the art of predicting an eclipse? Not only so, but the art of calculating all eclipses that are past or to come, for any number of years, which has proved of unspeakable use and consolation to mankind. When is it, we could suppose, that one of those islanders, transported to any other place of the earth, should be able, by the inspection of the heavens, to find how much he were south or north, east or west of his own island? Though we know this may be, and is daily done, by what is known in astronomy, yet when we consider the vast industry, sagacity, multitude of observations, and other extrinsic things necessary for such a sublime piece of knowledge, one would be apt to pronounce it impossible, and never to be hoped for.

Now we are let so much into the knowledge of the machine of the universe, and motion of it's parts by the rules of this science, perhaps the invention may seem easy. But when we reflect, what penetration and contrivance were necessary to lay the foundations of so great and extensive an art, we cannot but admire it's inventors: as Thales Milesius, who, as Diogenes Laërtius and Pliny say, first predicted eclipses; and his scholar Anaximander Milesius, who found out the globous figure of the earth, the equinoctial points, the obliquity of the ecliptic, the principles of gnomonics, and made the first sphere or image of the heavens; and Pythagoras, to whom we owe the discovery of the true system of the world, and order of the planets. Though it may be, they were assisted by the Egyptians and Chaldeans. But, whoever they were that first made these bold steps in this noble art, they deserve the praise and admiration of all future ages.

Though the industry of former ages had discovered the periods of the great bodies of the universe, and their true system and order, and their orbits pretty near, yet was there one thing reserved for the glory of this age, and the honour of the English nation, the grand secret of the whole machine; which, now it is discovered, proves to be (like the other contrivances of infinite wisdom) simple and natural, depending upon the most known, and most common property of matter, viz. gravity. From this the incomparable Sir Isaac Newton has demonstrated the theories of all the bodies of the solar system, of all the primary planets and their secondaries, and among others the moon, which seemed most averse to numbers: and not only of the planets, the slowest of which compleats it's period in less than half the age of man, but likewise of the comets, some of which it is probable spend more than 2000 years in one revolution about the sun; for whose theory he laid such a foundation, that after-ages, assisted with more observation, are able to calculate their return. In a word, the precession of the equinoctial points, the tides, the unequal vibration of pendulous bodies in different latitudes, &c. are no more a ques-

tion to those, that have geometry enough to understand what he has delivered on these subjects: a perfection in philosophy, that the boldest thinker durst hardly have hoped; and, unless mankind turn barbarous, will continue the reputation of this nation, as long as the fabric of nature shall endure. After this, what is it we may not expect from geometry, joined to observation and experiments?

The next considerable object of nature we take to be LIGHT. How unsuccessful enquiries are about this glorious body without the help of geometry, may appear from the empty and frivolous discoveries of a sort of men, whom nothing will serve, forsooth, but the knowledge of the very essence and intimate causes of every thing: while, on the other hand, the geometers, not troubling themselves with those fruitless researches about the nature of light, have discovered two remarkable properties of it, in the reflection and refraction of it's beams: and from these, and their straitness in other cases, have invented the noble arts of OPTICS, CATOPTICS, and DIOPTRICS; teaching us to manage this subtle body for the improvement of our knowledge, and useful purposes of life. They have likewise demonstrated the causes of several celestial appearances, that arise from the inflection of it's beams, both in the heavenly bodies themselves and other phenomena, as parhelia, the iris, &c. and by other experiments they have discovered the celerity of it's motions. And we know yet more surprizing properties of light, from the works of that superlative philosopher Sir Isaac Newton.

The fluids which involve our earth, viz. air and water, are the next great and conspicuous bodies, that nature presents to our view: and it may be we know little of either, but what is owing to mechanics and geometry.

The two chief properties of air, it's gravity and elastic force, have been discovered by mechanical experiments. From thence the decrease of the air's density, according to the increase of the distance of the earth, has been demonstrated by geometers, and confirmed by experiments of the sublimity of the mercury in the Torricellian experiment*. From this also, by assistance of geometry, they have determined the height of the atmosphere, as far as it has any sensible density, which agrees exactly with another observation of the duration of the twilight. Air and water make up the object of the hydrostatics, though denominated only from the latter, of which the principles were long since settled and demonstrated by Archimedes, who has demonstrated the causes of several surprizing phenomena of nature, depending only on the æquilibrium of fluids, and of solids swimming or sinking therein. Here also the mathematicians consider the different pressures, resistances, and celerities, of solids moved in fluids: whence they explain a great many appearances of nature, unintelligible to those who are ignorant of geometry.

* A term frequently used among physical writers, in the phrases, Torricellian tube, and Torricellian experiments, on account of the inventor Torricelli, a disciple of the great Galileo.—The Torricellian tube is a glass tube about 3 feet long, and $3\frac{1}{4}$ of an inch diameter, whose upper orifice is hermetically sealed. The Torricellian experiment is performed by filling the tube with mercury, then stopping the orifice with a finger, inverting the tube, and plunging that orifice in a vessel of mercury.—This done, the finger is removed, and the tube sustained perpendicularly to the surface of the mercury in the vessel.—The consequence is, that part of the mercury falls out of the tube into the vessel, and there only remains enough in the tube to fill from 28 to 31 inches of it's capacity, above the surface of the stagnant mercury in the vessel.—Those 28, &c. inches of mercury are sustained in the tube by the pressure of the atmosphere on the surface of the stagnant mercury; and according as that atmosphere is more or less heavy, or as the winds, blowing upwards or downwards, heave up or depress the air, and so increase or diminish it's weight and spring, more or less mercury is sustained from 28 inches to 31.—The Torricellian experiment makes what we now call the barometer.

If we descend to the animal kingdom, there we may discern the brightest strokes of divine mechanics. Whether we consider the animal oeconomy in general, either in the internal motion and circulation of the juices forced through the several canals by the motion of the heart, or their external motions, and the instruments wherewith these are performed, we must reduce them to mechanical rules, and confess the necessity of the knowledge of mechanics, to understand them, or explain them to others. Borelli, in his excellent treatise *De Motu Animalium*; Steno, in his *Myologiae Specimen*, and other mathematical men on the one hand, and the nonsensical, unintelligible trash, that the common writers on these subjects have filled their books with on the other, are sufficient instances to shew, how necessary geometry is in such speculations.

The only organ of an animal body, whose structure and manner of operations are fully understood, has been the only one, which the geometers have taken to their share to consider. It is incredible, how filly the greatest and ablest physicians talked of the parts of the eye and their use, and of the *modus visionis*, before Kepler, by his geometry, found it out,

out, and put it past dispute, though they applied themselves particularly to this, and valued themselves on it: and Galen pretended an extraordinary divine commission to treat of it. Notwithstanding the full discovery hereof, some go on in copying their predecessors, and talk as ungeometrically as ever. It is true, we cannot reason so clearly of the internal motions of an animal body, as of the external, wanting sufficient data and decisive experiments: but what relates to the latter (as articulation, structure, insertion, and vires of the muscles) is as subject to strict mathematical disquisition, as any thing whatsoever; and, even in the theory of diseases and their cures, those who talk mechanically, talk most intelligibly. Which may be the reason for the opinion of the ancient physicians, that mathematics are necessary for the study of medicine itself, for which we might bring long quotations out of their works.

If one of the reasons of the ancients for this was heretofore unfashionable, to wit, because they thought a physician should be able to know the situation and aspects of the stars, which they believed had influence upon men and their diseases (and positively to deny it, and say, that they have none at all, is the effect of want of observation*) we have a much better and undoubted one in it's room, viz. That mathematics are found to be the best instrument of promoting natural knowledge.

* See Dr. Mead on the Sun and Moon.

If also we consider, not only the animal œconomy in general, but likewise the wonderful structure of the different sorts of animals, according to the different purposes for which they were designed; the various elements they inhabit, the several ways of procuring their nourishment, and propagating their kind; the different enemies they have, and accidents to which they are subject; here is still a greater need of geometry. It is rare, that the qualities of an expert anatomist and skilful geometer meet in the same person. Such, however, have discovered a whole terra incognita of delightful knowledge, to employ their time and reward their industry. As for the other two kingdoms, Borelli, and others mathematically turned, seem to reason very clearly of vegetation*: and Steno, another mathematician, has applied this part of learning very handsomely to fossils, and some other parts of natural history. We shall add only one thing more, That if we consider motion itself, the great instrument of the actions of bodies upon one another, the theory of it is entirely owing to the geometers; who have demonstrated it's laws, both in hard and elastic bodies; shewed how to measure it's quantity, how to compound and resolve the several forces by which bodies are agitated, and to determine the lines which those compound forces make them describe: of such forces gravity, being the most constant and unerring, affords a great variety of useful knowledge†, in considering several motions that happen upon the earth, viz. as to the free descent of heavy bodies, the curve of projectiles, the descent and weight of heavy bodies when they lie on inclined planes, the theory of the motion of pendulous bodies, &c.

* See Dr Stephen Hales's Vegetable Statics.

† See Sir Isaac Newton's works, and those of his illustrators.

From what has been said, we shall draw but one corollary, That a natural philosopher, without mathematics, is a very odd sort of a person that reasons about things that have bulk, figure, motion, number, weight, &c. without arithmetic, geometry, mechanics, statics, &c.*

* So wild and extravagant have been the notions of a great part of philosophers, both ancient and modern, that it is hard to determine, whether they have been more distant in their sentiments from truth, or from one another; or have not exceeded the fancies of the most fabulous writers, even poets and mythologists. This was owing to a precipitate proceeding in their enquiries, and a neglect of geometry and experiment; without the assistance of which, it is impossible the powers of natural agents should be discovered. The manner of philosophizing, among the ancients, was to ascribe to bodies certain arbitrary properties, such as best served their purpose in accounting for the phenomena of nature; from whence proceeded so many various sects of philosophers, every one assigning a different cause to the same appearance, as his particular genius and imagination led him.

The chief agreement, observable among most of them, consists in this, viz. that they conceived all bodies, as compositions of air, earth, fire, and water, or some one or more of them, from whence these acquired the name of principles or elements, which they still retain.

Epicurus advanced a little farther, and asserted, that tho', bodies consisted of some one or more of these, yet that they were not strictly elements, but that these themselves consisted of atoms; by an accidental concurrence of which (as they were moving through infinite space in lines nearly parallel) all things received their form and manner of existence (a).

(a) For the opinions of the ancient philosophers, consult: Diogenes Laërtius, and Stanley's Lives.

Des Cartes has contrived an hypothesis very different from the rest: he sets out with a supposition, that the universe at first was entirely full of matter; that from this matter, when first put in motion, there would necessarily be rubbed off (by the grinding of the several parts one against another) some particles sufficiently fine to pass through the hardest and most solid bodies, without meeting with any resistance: of these consists his *materia subtilis*, or *materia primi elementi*. Those which did not so far lose their first figure, as to come under the denomination of *materia primi*, or *secundi elementi*, he called *materia tertii elementi*; and maintained, that all the variety which appears in natural bodies, was owing to different combinations of those elements.

He likewise supposes, that God created a certain quantity of motion, and assigned it to this mass of matter; and that that motion (being once created) could no more be annihilated, without an omnipotent hand, than body itself: in consequence of which he was obliged to teach, that the quantity of motion is always the same: so that, if all the men and animals in the world were moving, yet still there would be no more motion than when they were at rest, the motion which they had not, when at rest, being transferred to the æther. So unaccountable are the notions of this great philosopher, that it is surprizing his doctrine should have met with such universal reception, and have got so strong a party of philosophers on his side.

Des Cartes has been said, by a late writer (a) to have joined, to his great genius an exquisite skill in mathematics, and, by mixing geometry and physic together, to have given the world hopes of great improvements in the latter. But this writer ought to have considered, that what he looked upon in Des Cartes's book of Principles, as demonstrations, are only illustrations, there not being a demonstration from geometry in all his philosophical works (b).

(a) Mr. Wotton, in his Reflections on Ancient and Modern Learning.

(b) See this subject discussed in Keil's Introduction to his Examination of Dr. Burnet's Theory.

The present method of philosophizing, established by Sir Isaac Newton, is to find out the laws of nature by experiments and observations. To this, with a proper application of geometry, is owing the great advantage the present system of philosophy has over all the preceding ones, and the vast improvements it has received within the last age. It is, indeed, in vain to imagine, that a system of natural philosophy can be framed by any other method; for, without observations, it is impossible we should discover the phenomena of nature; without experiments, we must be ignorant of the mutual actions of bodies; and, without geometry, we can never be certain whether the causes we assign be proportionate to the operations we would account for, as the various systems of philosophy built on other foundations evidently shew.

This way of searching into nature was first proposed by my lord Bacon, [see the article PHILOSOPHY,] prosecuted by the Royal Society, the Royal Academy at Paris, the Hon. Mr. Boyle, Sir Isaac Newton, &c.

What wonderful advancement in the knowledge of nature may be made by this method of enquiry, when conducted by a genius equal to the work, will be best understood by considering the discoveries of that excellent philosopher last mentioned.

To him it is principally owing, that we have now a rational system of natural philosophy; it is he, who, by pursuing the sure and unerring method of reasoning from experiment and observation, joined with the most profound skill in geometry, has carried his enquiries to the most minute and invisible parts of matter, as well as to the largest and most remote bodies in the universe, and has established a system not subject to the uncertainty of a mere hypothesis, but which stands upon the secure basis of geometry itself.

Every body knows, that chronology and geography are indispensable preparations for history: a relation of matter of fact being a very lifeless thing, without the circumstances of time and place. Nor is it sufficient for one, that would understand things thoroughly, that he knows the topography, that is, the name of the country, where such a place lies, with those of the near adjacent places, and how these lie in respect of one another; but it will become him likewise to understand the scientific principles of the art: that is, to have a true idea of a place, we ought to know the relation it has to any other place, as to the distance and bearing, it's climate, heat, cold, length of days, &c. which things much enliven the reader's notion of the very action itself. Just so, it is necessary to know the doctrinal part of chronology, if a man would be thoroughly skilled in history, it being impossible without it to unravel the confusion of historians. Dr. Halley, I think, has determined the day and hour of Julius Cæsar's landing in Britain, from the circumstances of his relation. And it is well enough known, how great use our incomparable historian, Mr. Dodwell, has made of the calculated time of eclipses, for settling the times of great events, which before were, as to this essential, circumstances almost fabulous.

Both chronology and geography, and also the sun and moon's motions, so far as they relate, not only to the constitution

of the calendar and year, are necessary to a divine, but in order to the right understanding of the scriptures: we have a remarkable instance of this within the present year, by the Rev and learned Mr. John Kennedy, author of the *New Scripture Chronology*.*

* See the reverend author's *New Scripture Chronology*—And the Doctrine of Commensurability, between the diurnal and annual motions, illustrated and confirmed by above a hundred calculations, which are all adjusted to the meridian of Greenwich, and published to ascertain the astronomical principles of the Pentateuch of Moses.—The most accurate observations which can be made for the current year, & seq. are appealed to as the only proper test of their truth.

If this reverend and learned author's discovery should prove true, it will be of unpeakable service to the cause of religion, and have a happy tendency to convince learned men of the divine authority of the scripture.—But this is beside my province.

No body, we suppose, will question the interest that mathematics have in painting, music, and architecture, which are all founded on numbers. Perspective and the rules of light and shadows are owing to geometry and optics: and we think these two comprehend pretty near the whole art of painting, except decorum and ornaments; which are only a due observance of the history and circumstances of the subject represented.

If mathematics had not reduced music to a regular system, by contriving it's scales, it had been no art, but enthusiastic rapture, left to the roving fancy of every practitioner. This appears by the extraordinary pains which the ancients have taken to fit numbers to three sorts of music, the diatonic, chromatic, and inharmonic: which, if we consider, with their nicety in distinguishing their several modes, we shall be apt to judge they had something very fine in their music, at least for moving the passions with single instruments and voices.

But music had been imperfect still, had not arithmetic stepped in once more, and Guido Aretinus, by inventing the temperament, and making the fifth false by a certain determined quantity, taught us to tune our organs, and intermix all the three kinds of the ancients, to which we owe all the regular and noble harmony of our modern music.

As for civil architecture (of military we shall speak afterwards) there is hardly any part of mathematics, but is somewhat subservient to it. Geometry and arithmetic for the due measure of the several parts of a building, the plans, models, computation of materials, time and charges: for ordering right it's arches and vaults, that they may be both firm and beautiful: mechanics for it's strength and firmness, transporting and raising materials: and optics for the symmetry and beauty. And no one should assume the character of an architect, without a competent skill in all these. Vitruvius requires these and many more, for making a complete architect.

It must be acknowledged, that should any one set up to practise in any of the aforementioned arts, furnished only with his mathematical rules, he would produce but very clumsy pieces. He that should pretend to draw by the geometrical rules of perspective, and compose music merely by his skill in harmonical numbers, would shew but awkward performances. In those composed subjects, besides the stiff rules, there must be fancy, genius, and habit. Nevertheless, these arts owe their being to mathematics, as laying the basis of their theory, and affording them precepts, which, being once invented, are securely relied upon by practitioners. Thus many design, that know not a tittle of the rules they practise by; and many, no more qualified in their way, compose music better, perhaps, than he could have done that invented the scale, and the numbers upon which their harmony is founded.

As mathematics laid the foundation of these arts, so they must improve them; and he that would invent, must be skilled in numbers. Besides, it is fit a man should know the true grounds and reasons of what he studies: and he that does so, will certainly practise in his art with greater judgment and variety, where the ordinary rules fail him.

We shall now proceed to shew the more immediate usefulness of mathematics in civil affairs. To begin with arithmetic; it were an endless task to relate it's several uses in public and private business. The regulation and quick dispatch of both seem entirely owing to it. The nations that want it are altogether barbarous, as some Americans, who can hardly reckon above 20. And I believe it would go near to ruin the trade of the nation, were the easy practice of arithmetic abolished: for example, were the merchants and tradesmen obliged to make use of no other than the Roman way of notation by letters, instead of our present. And, if we should feel the want of our arithmetic in the easiest calculations, how much more in those, that are something harder; as interest, simple and compound, annuities, logarithmical tables, &c. in which it is incredible, how much the ordinary rules and tables influence the dispatch of business.

Arithmetic is not only the great instrument of private commerce, but thereby, in conjunction with the incommensurable art of debtor and creditor properly applied, are, or ought to be, kept the public accounts of the nation: we mean not only the accounts of the public revenue in all it's branches, but those likewise that regard the whole state of a commonwealth, as to the number, fructification of it's people, increase of stock, improvement of lands and manufactures, balance of trade, coinage, military power by sea and land, &c.—Those that would judge or reason truly about the state of any nation, must go that way to work, subjecting all the forementioned particulars to calculation. This is the true political knowledge. In this respect the affairs of a commonwealth differ from those of a private family, only in the greatness and multitude of particulars, that make up the accounts. Machiavel goes this way to work, in his account of different estates. What Sir William Petty and several others have wrote in political arithmetic, does abundantly shew the usefulness of such speculations. It is true, for want of good information, their calculations sometimes proceed from erroneous suppositions, but that is not the fault of the art. But what is it the government could not perform this way, with regard to our own dominions in particular, who have the command of all public records?

Lastly, numbers are applicable even to such things, as seem to be governed by no rule, such we mean, as depend on chance: the quantity of probability, and proportion of it to any two proposed cases, being subject to calculation as much as any thing else. See the articles ANNUITIES, LEASES, LIVES [ANNUITIES ON LIVES], LOTTERIES, MORTALITY [BILLS OF MORTALITY.]

Upon this depend the principles of game. We find sharpers know enough of this, to cheat some men that would take it very ill to be thought bubbles: and one gamester exceeds another, as he has a greater sagacity and readiness in calculating his probability to win or lose in any proposed case. To understand the theory of chance, thoroughly, requires no little knowledge of numbers, and a pretty competent one of algebra.

The several uses of geometry are not fewer than those of arithmetic. It is necessary for ascertaining of the property both in planes and solids, or in surveying and gauging. By it land is sold by the measure, as well as cloth: workmen are paid the due price of their labour, according to the superficial or solid measure of their work: and the quantity of liquors determined for a new regulation of their price and duty. All which do wonderfully conduce to the easy dispatch of business, and the preventing of frauds and controversies. We need not mention the measuring distances, laying down of plans and maps of countries, in which we have daily experience of it's usefulness. These are some familiar instances of things, to which geometry is ordinarily applied: of it's use in civil, military, and naval architecture, we shall speak afterwards.

From astronomy we have the regular disposition of our time in a due succession of years, which are kept within their limits as to the return of the seasons, and the motion of the sun. This is of no small advantage for the due repetition of the same work, labour, and actions. For many of our public, private, military, and country affairs, appointments, &c. depending on the products of the ground, and they on the seasons; it is necessary, that the returns of them be adjusted pretty near to the motion of the sun, and we should quickly find the inconvenience of a vague undetermined year.

Beside, the adjusting of the moon's motion to the sun's is required for the decent observation and celebration of the feasts and fasts of the established church, according to the ancient custom and primitive institution; and likewise for the knowing of the ebbing and flowing of the tides, the spring and neap-tides, currents, &c. So that, whatever some people may think of an almanack where all these are represented, it is sometimes the most useful paper that is published the same year with it: nay, the nation could, perhaps, better spare all the voluminous authors in the term catalogue, than that single sheet.

The mechanics have produced so many useful engines subservient to convenience, that it would be a task too great to relate only the several sorts of them: some of them keep life itself from being a burthen. If we consider such as are invented for raising weights, and are employed in building and other great works, in which no impediment is too great for them; or hydraulic engines for raising of water, serving for great use and comfort to mankind, where they have no other way to be supplied readily with that necessary element; or such as, by making wind and water work for us, save animal force and great charges, and perform those actions, which require a great multitude of hands, and without which every man's time would be too little to prepare his own aliment and other necessities; or those machines that have been invented by mankind for delight and curiosity, imitating the motions of animals, or other works of nature; we shall have reason enough to admire and extol so excellent an art. What shall we say of the several instruments, which are contrived to measure time? We should quickly find the value of them, if

if we were reduced to the condition of those barbarous nations that want them. The pendulum-clock, invented and completed by that famous mathematician Monf. Huygens, is an useful invention. Is there any thing more wonderful than several planetary machines, which have been invented to shew the motions of the heavenly bodies, and their places at any time?

Here we should not forget to mention the sciatherical instruments, for want of which there was a time, when the Grecians themselves were obliged to measure the shadow, in order to know the hour; and, as Pliny (cap. ult. lib. vii.) tells us, the Romans made use of an erroneous sun-dial for 99 years, 'till Q. Marcius Philippus their censor set up a better; which at that time, doubtless, was thought a jewel. And, at last, that famous pyramid was set up in the Campus Martius, to serve for a gnomon to a dial marked on the street. To this sort of engines ought to be referred spheres, globes, astrolabes, projections of the sphere, &c. these are such useful and necessary things, that alone may recommend the art by which they are made. For by these we are able in our closet to judge of the celestial motions, and to visit the most distant places of the earth, without the fatigue and danger of voyages; to determine concerning their distance, situation, climate, nature of the seasons, length of their days, and their relation to the celestial bodies, as much as if we were their inhabitants. To all these might be added those instruments, which the mathematicians have invented to execute their own precepts, for making observations either at sea or land, and for surveying, gauging, &c.

The catoptrics and dioptrics furnish us with variety of useful inventions, both for the promoting of knowledge, and the conveniences of life; whereby sight, the great instrument of our preception is so much improved, that neither the distance, nor the minuteness of the object, are any more impediments to it. The telescope is of so vast use, that besides the delightful and beneficial purposes it is applied to here below, as the descrying ships and men, and armies at a distance, we have by it's means discovered new parts of the creation, fresh instances of the surprizing wisdom of the supreme and almighty cause. We have thereby discovered the satellites of Jupiter, the satellites and ring of Saturn, the rotation of the planets about their own axes, besides other appearances, whereby the system of the world is made plain to sense, as it was before to reason.

The telescope has also improved the manner of astronomical observations, and made them much more accurate, than it was possible for them to be before. And these improvements in astronomy have brought along with them correspondent improvements in geography. From the observation of Jupiter's satellites, we have a ready way to determine the longitude of places on the earth. On the other hand, the microscope has not been less useful in helping us to the sight of such objects, as by their minuteness escape our naked eye. By means hereof men have pursued nature into her most retired recesses, so that she can hardly any more hide her greatest mysteries from us. How much have we learned, by the help of the microscope, of the contrivance and structure of animal and vegetable bodies, and of the composition of fluids and solids?

But if these sciences had never gone further than, by their single specula and center, to give those surprizing appearances of objects and their images, and to produce heat unimitable by our hottest furnaces, and to furnish infallible, easy, cheap, and safe remedies for the decay of our sight, arising commonly from old age and from purblindness: they had merited the greatest esteem, and invited to the closest study: especially if we consider, that such as naturally are almost blind, and either know not their nearest acquaintance at the distance of a room's breadth, or cannot read, in order to pass their time pleasantly, are, by glasses adapted to the defect of their eyes, set on a level again with those that enjoy their eye sight best, and that without danger, pain, or charge.

Mathematics are likewise highly serviceable to a nation in military affairs. I believe this will be readily acknowledged by every body. The affairs of war take in number, space, force, distance, time, &c. (things of mathematical consideration) in all it's parts, in tactics, castramentation, fortifying, attacking, and defending. The ancients had more occasion for mechanics in the art of war than we have: gun-powder readily producing a force far exceeding all the engines they had contrived for battery: and this we reckon has lost us a good occasion of improving our mechanics; the cunning of mankind never exerting itself so much as in their arts of destroying one another. But, as gun-powder has made mechanics less serviceable to war, it has made geometry more necessary: there being a force or resistance in the due measures and proportions of the lines and angles of a fortification, which contribute much towards it's strength.

This art of fortification has been less studied of late years in this kingdom than in some neighbouring ones, which was too apparent in the late war: nor dare we affirm that it has attained it's utmost perfection in any: and though, where the ground is irregular, it admits but of small variety, the measures being pretty well determined by geometry and experience,

VOL. II.

yet, where the ground is made up of natural strength and weaknesses, it affords some scope for thinking and contrivance.

But there is another much harder piece of geometry, which gun-powder has given us occasion to improve, and that is the doctrine of projectiles, whereon the art of gunnery is founded. Here the geometers have invented a beautiful theory, and rules and instruments, which have reduced the casting of bombs to great exactness. As for tactics and castramentation, mathematics retain the same place in them as ever; and some tolerable skill in these is necessary for officers, as well as for engineers.

An officer that understands fortification will, *cæteris paribus*, much better defend his post, as knowing wherein it's strength consists, or make use of his advantage to his enemy's ruin, than he that does not. He knows, when he leads ever so small a party, what his advantages and disadvantages in defending and attacking are, how to make the best of his ground, &c. and hereby can do truly more service than another of equal courage, who, for want of such knowledge, it may be, throws away himself and a number of brave fellows under his command: and it is well, if the mischief reaches no further. As for a competent skill in numbers, it is so necessary to officers, that no man can be safely trusted with a company that has it not. All the business is not to fire muskets; the managing of affairs, the dealing with agents, &c. happen more frequently: and, the higher the command is, the more skill in all the aforesaid things is required. And I dare appeal to all the nations in Europe, whether, *cæteris paribus*, officers are not advanced in proportion to their skill in mathematical learning, except that sometimes great names and quality carry it; but still so, as that the prince depends upon a man of mathematical learning, that is put as director to the quality, when that learning is wanting in them.

Lastly, Navigation, which is made of astronomy and geometry, is so noble an art, and to which mankind owes so many advantages, that, upon this single account, those excellent sciences deserve most of all to be studied, and merit the greatest encouragement from a nation that owes to it both it's riches and security. And not only does the common art of navigation depend on mathematics, but whatever improvements shall be made in the *architectura navalis*, or building of ships, or ships of war, whether swift-running, or bearing a great sail, or lying near the wind, be desired; these must all be the improvements of geometry.

Ship-carpenters, indeed, are very industrious; but, in these things, they acknowledge their inability, confess that their best productions are the effects of chance, and implore the geometers help. Nor will common geometry do the business; it requires knowledge of the most abstruse geometry to determine the different sections of a ship, according as it is designed for any of the aforesaid ends.

The great objection that is made by some against the necessity of mathematics, in the forementioned great concerns of navigation, the art military, &c. is, that we see those affairs are carried on and managed by such as are not great mathematicians, as seamen, engineers, surveyors, gaugers, clock-makers, glass-grinders, &c. and that the mathematicians are commonly speculative, retired, studious men, that are not for an active life and business, but content themselves to sit in their studies, and pore over a scheme or a calculation.

To which there is this plain and easy answer: the mathematicians have not only invented and ordered all the arts above-mentioned, by which those grand affairs are executed, but have laid down precepts, contrived instruments and abridgments so plainly, that common artificers are capable of practising by them, though they understand not a title of the grounds on which the precepts are built: and in this they have consulted the good and necessities of mankind.

Those affairs require so great a number of people to manage them, that it is impossible to breed so many good, or even tolerable mathematicians. The only thing then to be done was to make their precepts so plain and familiar, that they might be understood and practised by a multitude of men. This will best appear by examples.

Nothing is more ordinary than dispatch of business by common arithmetic, by the tables of simple and compound interest, annuities, &c. extraction of the square and cube roots, logarithms, &c. yet how few men of business understand the reasons of common arithmetic, or the contrivance of those tables, and rationale of those rules, now they are made, but securely rely on them that are made? They were the able mathematicians that made those precepts so plain, and investigated those rules, and calculated those tables, that facilitate the practice so much. Nothing is more universally necessary than the measuring of plains and solids: and it is impossible to breed so many good mathematicians as that there may be many that understand all the geometry requisite for surveying, and measuring of prisons and pyramids, and their parts, and measuring frustums of conoids and spheroids, in every market-town where such work is necessary.

The mathematicians have therefore inscribed such lines on their common rules, and sliding rules, and adapted so plain

C c c

precepts

precepts to them, that every country carpenter and gauger can do the business accurately enough, though he knows no more of the rational foundation of those instruments, tables, and precepts he makes use of, than a hobby-horse.

So, in navigation, it is impossible to breed so many good mathematicians as would be necessary to sail the hundredth part of the ships of the nation. But the mathematicians have laid down so plain and distinct precepts, calculated necessary tables, and contrived convenient instruments, so that a seaman that knows not the truths on which his precepts and tables depend, may practise safely by them. They resolve triangles every day that know not the reason of any one of their operations. Seamen, in their calculations, make use of artificial numbers, or logarithms, they know nothing of their contrivance: and, indeed, all those great inventions of the most famous mathematicians had been almost useless for those common and great affairs, had not the practice of them been made practically intelligible to those who cannot understand them. Whence it is plain, that it is to those speculative retired men we owe the rules, the instruments, the precepts for using them, and the tables which facilitate the dispatch of so many great affairs, and supply mankind with so many conveniences of life. They were the men that taught the world to apply arithmetic, astronomy, and geometry to sailing, without which the needle would be still useless. Just the same way, in the other parts of mathematics, the precepts that are practised by multitudes, without being understood, were contrived by some few great mathematicians.

Since then it has been shewn how much mathematics improve the mind, how subservient they are to other arts, and how immediately useful to the commonwealth, and it's commercial emolument, there need no other motives to governments to encourage them. This is the natural conclusion from these premises. Plato, in his Republic, lib. 7, takes care, That whoever is to be educated for magistracy, or any considerable post in the commonwealth, may be instructed first in arithmetic, then in geometry, and thirdly in astronomy. And, however necessary those arts were in Plato's time, they are much more so now: the arts of war and traffic requiring much more the assistance of those sciences now, than they did then, as being brought to a greater height and perfection. And accordingly we see these sciences are the particular care of princes that design to raise the force and power of their countries. It is well known that this is none of the least arts whereby the French king has brought his subjects to make that figure at sea which they at this time do; I mean the care he takes for educating those appointed for sea-service in mathematical learning: for in the ordinance marine, title 8, he orders that there be professors to teach navigation publicly in all the sea-port towns, who must be well skilled in designing, and teach it to their scholars, in order to lay down the appearances of coasts, &c. They are to keep their schools open, and read four times a week to the seamen, where they must have charts, globes, spheres, compasses, quadrants, astro-labes, and all books and instruments necessary to teach their art.

The directors of hospitals, also, are obliged to send thither yearly two or three of their boys to be taught, and to furnish them with books and instruments. Those professors are obliged to examine the journals deposited in the office of admiralty, in the place of their establishment, to correct the errors in presence of the seamen, and to restore them within a month, &c.

King Charles II. who well understood the importance of establishments of this nature, founded one such school in Christ's Hospital, London. And his majesty king William III. during the time of the war, established a mathematical lecture to breed up engineers and officers, as knowing very well the importance thereof. And this continued some time after the peace. And it is worthy the consideration of the wisdom of the nation, whether the restoring and continuing this, even in peace, be not expedient for the breeding of engineers, who are so useful and valuable, and so difficult to be had in time of war, and so little dangerous in times of peace.

Besides the croud of merchants, seamen, surveyors, engineers, ship-carpenters, artisans, &c. that are to be instructed in the practice of such parts of mathematics as are necessary to their own business respectively, a competent number of able mathematicians ought to be entertained, in order to apply themselves to the practice; not only to instruct the former sort, but likewise to remove those obstacles, which such as do not think beyond their common rules cannot overcome. And doubtless it is no small impediment to the advancement of arts, that speculative men and good mathematicians are unacquainted with the particular defects of those people, and the several circumstances in them, that render things practicable or impracticable.

But, if there were effectual public encouragement, we should have skilful mathematicians employed in those arts, who would certainly find out and remedy the imperfection of them. The lords commissioners of the admiralty knowing that there are still two great desiderata in navigation, viz. the theory of the variation of the magnetic needle, and a method of finding out

the longitude of any place that may be practicable at sea [see the article LONGITUDE] and being sensible of what importance it would be to find out either of them, formerly employed a very capable person, the learned and ingenious Dr. Halley, who had joined an entire acquaintance in the practice to a full and thorough knowledge of the more abstruse parts of mathematics. And, although that great man was not able to make those discoveries, yet he has been of important service to navigation, by correcting the situation of the coasts where he touched, and, by them, others.

The next thing that is necessary for the improvement of mathematical learning is, that mathematics continue to be more generally and constantly studied at our universities * than they at present are. From those seminaries the state justly expects and requires those who are acquainted both with the speculation and practice. In those are all the encouragements to them imaginable, leisure and assistance: there are at hand all requisite books and instruments, as also other scholars that have made equal progress, and may be associates in study, and the direction of the professors. There are also in perfection all the incitements to this study, and especially an acquaintance with the works of the ancients, where this learning is so much recommended. Here other faculties are studied, to which those studies are subservient. There also are the nobility and gentry bred, who, in due time, must be called to their share in the government of the fleets, army, treasury, and other public employments, where mathematical learning is absolutely necessary, and without which they, though of never so great natural abilities, must be at the mercy and discretion of their servants and deputies, who will first trick them, and then laugh at them for suffering it. And not only public employments, but their private concerns, require mathematical knowledge. If their fortunes lie in woods, coal, salt, manufactures, &c. the necessity of this knowledge is open and known: and, even in land estates, no undertaking for improvement can be securely relied upon without it. It not only makes a man of quality and estate his whole life more illustrious, and more useful for all affairs, but, in particular, it is the best companion for a country life. Were this ever to continue a fashionable study (and the mode exercises it's empire over learning, as well as other things) it is hard to tell how far it might influence the morals of our nobility and gentry, in rendering them serious, diligent, curious, taking them off from the more fruitless and airy exercises of the fancy, which they are apt to run into.

* Does it not well deserve a public enquiry, how and from what causes it proceeds, that so many of the British nobility and gentry are sent in their youth to foreign universities, for their education? It cannot be pretended that travelling is the motive, while they are confined in a college?

The only objection I can think of that is brought against these studies is, that mathematics require a particular turn of head, and a happy genius that few people are masters of, without which, all the pains bestowed upon the study of them are in vain: they imagine that a man must be born a mathematician. To which it may be answered, that this exception is common to mathematics with other arts. That there are persons who have a peculiar capacity and fitness to one more than another, will hardly be denied: and from experience, we presume, it is not in any higher degree true concerning mathematics than the others: a man of good sense and application is the person that is by nature fitted for them, especially if he begins betimes: and, if his circumstances have been such that this did not happen, by prudent direction the defect may be supplied, as much as in any art whatsoever. The only advantage, I am afraid, this objection has is, that it lies on the side of softness and indolence, those powerful allies.

In order to obtain a fundamental knowledge of these sciences, we would lay it down as a principle, that no gentleman should be taught the practice of any rule without the true and solid reason and demonstration of the same. Rules without demonstration must and ought to be taught to seamen, artisans, &c. as has been already observed; and schools for such people are fit in sea-ports and trading towns; but it is far below the dignity of the noblemen or gentlemen, or any who are designed for solid and true learning, to do this. It is by such measures that all must be raised, who are able to remedy the defects of the practical and commercial arts: and, therefore, nothing on them must be taken by trust. Seamen and surveyors, gaugers and accountants, &c. remember their rules, because they are perpetually practising them: but scholars, who are not thus employed, if they know not the demonstration of them, presently forget them.

Secondly, It has been thought a great mistake by our ablest mathematicians, that any part of their sciences should be taught by compendiums: this follows from the former. Compendiums are fit to give a general and superficial knowledge, not a thorough one. It's time, and not the bulk of books, we ought to be sparing of: and we may appeal to any person of experience, whether solid knowledge is not acquired in shorter time by books treating fully of their subjects, than by compendiums and abridgments.

From

From hence it follows, that the elements of arithmetic and geometry are to be taught. Euclid, in his thirteen books of Elements, gives us both: but our present way of notation supercedes some of those of arithmetic, as demonstrating the rules from the operations themselves. There remain then the first six books for the geometry of plains, and the last three for stereometry. The rest ought to be read in their own place, for the perfection of arithmetic. In teaching these care ought to be taken to make use of such examples as suit with the condition of the learner: for instance, merchants accounts and affairs for examples of the operations of arithmetic, to one that is afterwards to have a concern that way; whereas, to a man of the first quality, examples should be drawn from keeping an accurate account of his estate, either in land or money, &c. from the increase and decrease of the people, the state of the public revenue, and from land or sea-force, and other principles of political arithmetic. For it is certain nothing makes one tired sooner than the frivolous and trifling examples that are commonly brought for the exercise of the rules of arithmetic, debtor and creditor, and geometry, &c. tho' this is common to them with the other arts, as grammar, logic, &c.

The manner of writing of the mathematicians of this and the former age makes trigonometry, with the manner of constructing it's tables, almost elementary; and the practical geometry, commonly so called, is very fit to come next, as an elegant application of the elements of geometry to business, as surveying, gauging, &c.

After the elements of spherics, a full insight into the principles of astronomy will be necessary. Mechanics follow after to be read, which are the ground of a great part of natural learning; and afterwards optics, catoptrics, and dioptrics.

But none of these, except the elements, can be fully understood until one is pretty well skilled in conic sections; and all these are made more easy by some tolerable skill in algebra, and it's application to geometry.

These foundations being laid, any one may, with great ease, pursue the study of the mathematics, as his occasions require, either in it's abstract parts, and the more recondite geometry, and it's application to natural knowledge; or in mechanics, by prosecuting the statics, hydrostatics, &c. or in astronomy, by it's application to geography, navigation, gnomonics, astrolabes, &c. But, in most of these, a particular order is not necessary: any one may take that first which he is most inclined to, after he has laid the requisite foundation in arithmetic, algebra, and geometry.

REMARKS on the article MATHEMATICS.

Our intention, by this summary of the universal utility of mathematical learning, is with a view to give the commercial class of people, as well as others of quality and distinction, such an idea of those studies, that they may apply themselves only or chiefly to such parts as may be suitable to their condition and plan of life. And, from what has been said, it is manifest beyond contradiction, that this kind of literature, taken in it's comprehensive latitude, has been, and is ever like to be, while duly cultivated, the grand parent of numberless beneficial arts and trades; and, therefore, cannot be too much encouraged in commercial states: yet we are sorry to observe, that these studies rather decline than advance among us, for want of their professors being suitably cherished and distinguished.

The victories which take up the greatest part of history, and attract admiration the most, have generally no other effects but the desolation of countries, the destruction of cities, and the slaughter of men. Those so-much boasted heroes of antiquity, have they made a single man the better? Have they made many men happy? And if, by the founding of states and empires, they have procured posterity some advantage, how dearly have they made their contemporaries pay for it, by the rivers of blood they have shed! Those very advantages are confined to certain places, and have a certain duration.

Of what utility to us, at this day, are either Nimrod, Cyrus, or Alexander? All those great names, all those victories which have astonished mankind from time to time, those princes and conquerors, with all their magnificence and vast delights, are returned into nothing with regard to us; they are dispersed like vapours, and are vanished like phantoms. But the inventors of all arts aiding to the commercial industry and prosperity of mankind have laboured for all ages of the world. We still enjoy the fruits of their application and industry. They have provided, at a great distance, for all our occasions: they have procured for us every convenience of life: they have converted all nature to our uses: they have reduced the most indocile matter to our service: they have taught us to extract from the bowels of the earth, and even from the depths of the sea, the most precious riches; and, what is infinitely more estimable, they have opened to us the treasures of other sciences, and have guided us to knowledge the most sublime, the most useful, and the most worthy of our nature. They have put into our hands, and placed before our eyes, whatever is most proper to adorn the mind, to direct our

manners, and to form good citizens, good magistrates, and good princes. These are part of the benefits we have received from those who have invented, and brought arts and sciences to perfection.

The better to know their value, let us transport ourselves in imagination back to our infancy of the world, and those gross ages when man, condemned to eat his bread by the sweat of his brow, was without aids and instruments, and obliged, however, to cultivate the earth, that he might extract nourishment from it; to erect himself huts and roofs for his security; to provide clothing for his defence against the frosts and rains; and, in a word, to find out the means to satisfy all the necessities of life. What labours, what difficulties, what disquiets! All which are spared us.

We do not sufficiently consider the obligations we are under to those equally industrious and laborious men, who made the first essays in arts, and applied themselves in those useful but elaborate researches. That we are commodiously housed, that we are clothed, that we have cities, walls, habitations, temples, shipping, navigation, and commerce; to their industry and labour we are indebted for them all. It is by their aid our hands cultivate the fields, build houses, make stuffs and habits, work in brass and iron; and, to make a transition from the useful to the agreeable, that we use the pencil, handle the chisel and graver, and touch instruments of music. These are solid temporal felicities and emoluments, which have always been increasing from their origin, which extend to all ages and nations, and to all mankind in particular; which will perpetuate themselves throughout all times, and continue to the end of the world. Have all the conquerors together done any thing that can be imagined parallel with such services? All our admiration, however, turns generally on the side of these heroes in blood, whilst we scarce take notice of what we owe to the inventors of the mathematic and philosophic arts, which are the grand sources of all the security, joy, and splendor of life. The progress of those arts and sciences whereon the mutual intercourse of commerce between nations depends, and the history of those persons who have most eminently distinguished themselves therein, is the history of the human wisdom, which does not give place to that of princes and heroes, whom common opinion places in the highest degree of glory.

The principal law and justest title to deserving solid praises in this useful empire of literature is, that every member of it be contented with his own place; that he be void of all envy for the glory of others; that he looks upon them as his colleagues; destined, as well as himself, by providence, to enrich society, and become it's benefactors; and that he remembers with gratitude from whom he holds his talents, and for what ends they have been given him. Can they believe they may use them at their own pleasure, and seek, in the application they make of them, only their own reputation and glory? As providence places kings upon their thrones solely for the good of their people, it distributes also the different talents of the mind solely for the benefit of the public.

But, in the same manner as we sometimes see in states usurpers and tyrants, who, to exalt themselves alone, oppress all others; there may also arise amongst the learned a kind of tyranny of the mind, which consists in regarding the successes of others with an evil eye; in being offended at their reputation; in lessening their merit; in esteeming only one's self, and in affecting to reign alone: a hateful defect, and very dishonourable to learning. The solid glory of the empire of learning is not to labour for one's self, but for mankind; and this is what places it exceedingly above all the other empires of the world.

Useful REMARKS, tending to the further advancement of the MATHEMATICAL SCIENCES, in order to the further promotion of COMMERCE, by the learned Dr. John Pell; which as well deserve attention at this time, when these studies seem to be upon the decline, as they did heretofore.

'I. As to what I formerly considered, says that learned gentleman, about the improvement of the mathematical sciences; the result was chiefly this: while men are destitute of inclination, genius, assistances, and leisure necessary for these studies, no wonder if they make no greater progress in them: therefore it seems probable to me, that, by the help of the following means, a tolerable good remedy may be found for this evil. That is, if,

1. A mathematical monitor (as we may call it) be composed, which may give proper answer to these three questions, 1. What advantages, and of what kind, may be expected from the study of mathematics? 2. What helps are now in being for attaining so advantageous a knowledge? 3. What order is to be observed in making use of those assistances? Therefore this monitor should contain,

1. An easy and perspicuous discourse upon the limits or extent of the mathematical arts, and of the considerable advantages that will accrue not only to the persons themselves that study them, but likewise to a nation that abounds in skilful mathematicians.

2. A catalogue of mathematicians, and of works published by them; which is to exhibit, 1. A synopsis of all kinds of mathematical books, whether such as are already published,

or such as are yet unpublished, and, being in manuscript, lie concealed in public libraries; proper numbers, or references, being affixed to every kind. 2. A chronological catalogue of all the celebrated mathematicians, disposed according to the ages in which they flourished; always subjoining the year of our Lord in which their works were first printed.

3. A catalogue of the same works, according to the series of years in which they were printed in any language. In digesting of which, I would proceed in such manner, that, marking the year of our Lord, I would add (as in common catalogues) the names of all the mathematical books that were published that year, in any country or any language: 1. Shewing in each how much the volume contained, by marking not only whether it was in folio, quarto, &c. but the whole number of pages, so that the bulk of the work might easily be known.

2. Before the title mentioning the year, to which any one might turn back who should desire to know when the book was wrote, and when it was last published in any language. 3. Marking in the margin after the title, 1. The year in which any work was last printed. 2. The number referring the reader to the synopsis, which was given in the first page of the catalogue. Now, by the help of these numbers, any one might easily and readily run through all the mathematical books belonging to one subject.

3. An admonition to the studious, which are the best books in every kind, in what order and method they are to be read, what is to be chosen and what omitted in reading some of the minor mathematicians; how we are to proceed so as to retain every thing in memory.

4. An exhortation and encouragement to all those who are sufficiently provided with wealth, opportunity, and ingenuity for the pursuit of these studies; that, 1. Having regard to the great advantages that redound from hence, not only to themselves but to all mankind in general. 2. As likewise to that pure and sincere pleasure which arises from the search of hidden truths, and from striving with difficult problems, and the conquest of them; that they may seriously apply themselves to the advancement of science, and so much the rather, as, 3. More expeditious methods are now found out than were known to our ancestors, which save us much labour, time, and expence.

Then an exhortation to all such as are eminent for setting a right value on these studies, and are likewise distinguished for power and wealth (which surely may be made instrumental to perpetual fame, if prudently dispensed) that they may become patrons to ingenious men of this kind, by proposing handsome rewards to the most deserving of them, to encourage them to complete such discoveries as their own genius's may prompt them to. Lastly, to all princes and commonwealths who cannot easily procure a greater ornament to their dominions, than by making it their endeavour, 1. That they may abound with persons skilled in these arts. 2. That the way leading to them may be made as little laborious and expensive as possible. 3. That mathematical genius's may be more publicly known, and meet with such encouragement as they shall deserve.

For this end it will be very necessary that,

II. A public library may be founded, which may be furnished with all the books abovementioned, and with one instrument of every sort that has been yet invented; and besides may have an endowment sufficient, 1. To purchase copies of all the mathematical books that shall be yearly published anywhere abroad. 2. To maintain a library-keeper, whose business it should be,

1. To read over all the books of this kind which are published in his own country; 1. Suppressing those which are not wrote according to the rules of art, that their mistakes may not lead their readers into error. 2. To admonish authors, lest they should only republish things already known, and treated of by others.

2. On peril of their reputation that they should approve of notable inventions, and heartily recommend the inventors to proper patrons.

3. To receive, to enter into their catalogue, and dispose in their proper repositories, one copy of the books so read over, when presented to the library well bound up, at the charge of the author or bookseller.

4. To give a civil and ready answer to any studious person who shall consult him about any problem, whether it is already solved or no; lest he should attempt any thing that is well done already, or, on the contrary, suppress his discoveries, out of fear they may be already known, and perhaps discussed in some of the books of the library.

5. To receive, &c. all manuscripts that may be presented to the library, or bequeathed to it by legacy.

6. To keep a constant library correspondence with all persons of this kind that reside in foreign countries, lest he should be ignorant of what books are published there.

7. To take notice among his countrymen who are fittest and most expert in instructing others in these arts.

8. To have an acquaintance with all kinds of artificers who excel in the constructing of mathematical instruments and contrivances, whether they work in wood, loadstones, metal, glass, &c.

9. After a fair trial, to give their testimony, both of specu-

lative knowledge and practical dexterity, to practical men of all kinds, whether masters of ships, surveyors, accountants, &c. that such as have occasion for this kind of men may not be imposed on by ignorant pretenders, to their great loss.

The catalogue will easily inform which, in such a multitude of books that almost overwhelm the world, belong only to this kind of study. The library will exhibit a copy of every such book, and inform where more copies may be bought. It will also be a kind of storehouse both to natives and foreigners, whence they may easily learn what assistances that country can supply to these studies.

And this, in my opinion, is the readiest way of making use of the helps we are already in possession of. If more are wanting, it will be necessary that, by the assistance of skilful artists.

III. The three following new treatises may be composed and published:

1. Mathematical pandects, containing, as perspicuously, methodically, compendiously, and ingeniously as can be done, whatever may be collected or deduced, by way of corollary, from the mathematical books or discoveries made before our time; quoting the most eminent authors in which they are found, at the end of every period or proposition; and so marking in all the following authors, where they have been caught in a theft, or where they have borrowed without making any acknowledgement, or (what is worst of all) have boldly claimed to themselves the inventions of others. By this means that large library would be contracted into a much narrower compass, to a great saving of labour, time, and expence, for those that come after; and this much more than any would imagine at present. But now, since this work would hardly make a portable volume, there should be prepared also,

2. A mathematical companion, containing in a manual (and therefore as concisely as may be) all the most useful tables, with precepts to shew their application to solving of problems, whether of pure mathematics, or applied to other subjects. Finally, that we may not always be confined to books in this kind of learning, there should be contrived,

3. The self-sufficient mathematician, or an instruction to shew how any mathematician, who is no enemy to labour, may acquire so much skill that, without the assistance of books or instruments, he may attain the solution of any mathematical problem, and that as easily as another would solve it by turning over books.

And this is that idea of mathematics which, in my manner, I have long ago figured to myself; being always firmly persuaded, that then only we can hope for assistance in great undertakings, when we have conceived an exact idea of them in our minds, and of the most apposite means of putting them in execution. And, if we cannot express this idea in fact, yet it is something to come as near it as may be.

I imagine this is so far from being above human power, that I think the industry of one man alone to be equal to it, who is not hindered by his own domestic affairs, or immersed in a multitude of busy cares: for it is evident that the library and catalogue may easily be provided, if money is not wanting; and as to the pandects above described, if the task of composing them were committed to me, I should impose upon myself much feverer conditions than I have mentioned there.

For first I would delineate the infallible process of human reason, in the investigation of whatever it proposes to itself, by shewing how it proceeds from the first principles or rudiments, by an uninterrupted chain, to the most sublime as well as the lowest application of them. Which art, perhaps, men would not be long without, if hereafter they should carefully examine, by what means such thoughts have arose in the minds of certain men whom they admire, how such apt means have been found out to obtain such an end. How these pandects may be abridged into a manual, such as may be fit for common use, may not be difficult to understand.

But so to fix them in their minds that they shall have no farther need of books (which is what is aimed at by our self-sufficient mathematician) will be thought, by most, to exceed the power of the human mind: since no one that I know of has yet ventured to conceive such a thing in his mind. Yet I believe that men will dimiss something of their incredulity, when they consider seriously with themselves what arts have been found out for strengthening the imagination, for assisting the memory, and for directing the reasoning faculty, and what wonderful effects may be produced by their conjunction and constant exercise.

To this the learned Merfennus made some objections, concerning the collection of the various writings of the mathematicians; but, upon receiving Dr. Pell's answer, Merfennus replied,—‘I had no sooner read your letter, learned Sir, but I became wholly yours, and was ready to subscribe to your opinion, which I intirely approve: an unusual ardor of mind hurried me on: so that I would recommend this undertaking of yours, great as it is, to the great ones of the world, if I could have free access to them. But where is the king that will make a beginning? for I cannot but call it a truly royal design.’—This likewise was approved by the great Des Cartes, See the article *MUSEUM* of Sir Hans Sloane.

MEASURES and WEIGHTS of England.

The following being the most accurate and satisfactory account that I have met with, in regard to the standard weights and measures of England, I should be wanting to my readers if I did not give it them as it is, without any alteration whatsoever: and, although the weights are incorporated with the measures, I do not judge that reason sufficient to make any variation, having the lefts to say hereafter under the article WEIGHTS.

A state of the English WEIGHTS and MEASURES of capacity, as they appear from the laws, as well ancient as modern; with some considerations thereupon: being an attempt to prove that the present avoirdupois weight is the legal and ancient standard for the weights and measures of this kingdom. By the learned Sam. Reynardson, Esq; F. R. S.

It is declared by * Magna Charta, that there should be, throughout the realm, one measure of wine †, one of ale, and one of corn, viz. the quarter ‡ of London; and that it should be of weights as of measures.

* 1 C. 25.

† Bishop Fleetwood says, it was a good law of king Edgar, that there should be the same weights and the same measures throughout the realm, but it was never well observed. Chron. Preciosum, p. 34.—And, 2 Inst. p. 41. says, this law was grounded upon the law of God, Deut. xxv. ver. 13, 14.—And that there were good laws for weights and measures made before the conquest by Canute. See Custom. de Norm. c. 16.

‡ See hereafter the contents of a quarter.

This declaration has been repeated in many subsequent laws*; and, by several of them, the treasurer is directed to provide standards of bushels, gallons, and weights of brafs, and to send them into every country; and all measures are to be made according to the king's standard, the assize whereof is established by several laws †, as follows: the English penny, called a sterling round, without clipping, to weigh 32 grains of wheat dry, and taken from the midst of the ear: 20 pence make an ounce; 12 ounces a pound; 8 pounds make a gallon of wine ‡; 8 gallons of wine make a London bushel §, which is the eighth part of a quarter. And by other laws § it is declared, that the ton of wine, oil, and honey, should contain of the English measure, according to the ancient assize, 252 gallons; the pipe, or butt, 126; the tertian 84; the hogthead 63; and every barrel 31 ½, according to the old assize, and to be gauged by the king's gauger.

* 51 Hen. III. stat. 6. 14, 25, and 27 Edw. III. 13, 15, and 16 Rich. II. 9 Hen. VI. 2 Hen. VII. cap. 4. 16 Car. I. and 22 Car. II. cap. 8.

† 51 Hen. III. stat. 1. cap. 3. 31 Edw. I. 12 Hen. VII. cap. 5.

‡ The 12th Hen. VII. cap. 5. says wheat.

§ 9 Hen. VI. c. 8. says,—Buyers of corn in London, bought by a vessel called a fat, containing 9 bushels of corn; which is forbid by the act.

§ 2 and 18 Hen. VI. 1 Ric. III. cap. 13. 5 Ann. cap. 27. sect. 19. 23 Hen. VIII. cap. 7. 2 Hen. VI. cap. 11.

In the reign of Edward III. * an act passed to take away the weight called ancel †, whereby, and by subsequent statutes, it is directed that every sale and buying should be by the even balance.

* 25 Ed. III. stat. 5. cap. 9. 34 Ed. III. cap. 5. 8 Hen. VI. cap. 5. 9 Hen. VI. cap. 8.

† King Stephen, says Knighton, settled measures of length and of land, and made appointments de anulis, bilancibus &c. Decem Scriptores, p. 2391.

In the 11th year of Hen. VII. complaint being made to the parliament that the ancient statutes and ordinances of the realm relating to weights and measures had not been observed and kept, it was therefore enacted, That there should be delivered, to the knights and citizens of every shire and city, one of every weight and measure, which the king had caused to be made of brafs, according to his standard in the Exchequer, to be delivered to the respective places mentioned in the act; and that the inhabitants of all cities, boroughs, and market-towns, should make and use weights and measures made according to the weights and measures so delivered as aforesaid. In the next year, another act passed, reciting, That the king had made such weights and measures of brafs, according to the old standard thereof remaining within his Treasury; which weights and measures, upon more diligent examination, had been proved defective, and not made according to the statutes and old laws, and were therefore recalled, and ordered to be broken, and other new bushels and gallons were directed to be made and sized, according to a new bushel and gallon to be made according to the assize, to remain in the king's Exchequer: where we now find a bushel, in the custody of the chamberlain, called the Winchester bushel *, and a gallon agreeing thereto. Upon the bushel there is the following inscription: Henericus Septimus, Dei gratia, rex Angliæ et Franciæ.

VOL. II.

* The first time I find it called so by any law, is in an act 22 Car. II. cap. 8. And afterwards it is called by this name in several acts of parliament; but, in the act just now mentioned, it is said to be commonly called the Winchester measure: perhaps it first took that name from the statute made at Winchester, 16 Rich. II. which directs the clerk of the market to have all his weights and measures ready, and marked and signed according to the standard of the Exchequer.

In the last mentioned act, the assize for weights and measures is in substance the same as in the old statutes, only the pound is said to be the pound Troy of 12 ounces. But since, by this and the former assize laws, the pound is directed to be raised from 240 sterling pennies, it follows, that the gravity of the assize pound was always the same; but the dimensions of measures of capacity respectively, raised from a pound of wine and a pound of wheat, will be in proportion to each other as the specific gravity of wheat is to that of wine or water.

Thus continued the laws relating to the English standard of weights and measures, till after the restoration, when, a duty of excise * being laid upon beer, ale, and other liquors, 36 gallons taken by the gauge, according to the standard of the ale quart. (4 whereof made the gallon remaining in the Exchequer) were to be reckoned as a barrel of beer, and 32 such gallons a barrel of ale; and, afterwards, † 34 such gallons of vinegar (and of beer or ale, stronger or smaller) without the bills of mortality, were directed to be a barrel; and all other liquors liable to the excise-duty were to pay according to the wine gallon.

* 12 Car. II. cap. 24. § 20.

† 1 Will. and Mar. cap. 24. §. 5. 10 Will. III. cap. 21. 11 and 12 Will. III. cap. 15.

We now find the officers of the revenue determining the contents of our measures of capacity with great exactness: for, on the 25th of May, 1688, two general officers of excise, in the presence of the lord mayor, the commissioners of excise, Mr. Flamithead, and others, upon an exact trial found, that the old standard wine gallon, kept in Guildhall, did contain but 224 cubic inches; nevertheless, at that time, it was thought convenient to continue the former supposed content, being 231 cubic inches, as the standard wine gallon, and which has since been established by law *.

* 5 Ann. cap. 27. §. 17.—This act says, Any cylinder 7 inches diameter, and 6 inches deep, or any vessel containing 231 cubical inches, and no more, shall be a lawful wine gallon.

In the year 1696, an experiment was made, in order to fix the true and exact contents of the brafs standard bushel of Henry VII. which being filled with common spring water, and the water measured out with great nicety and exactness, the bushel * was found to contain 2145,6 solid or cubic inches; and the water being weighed by the standard weights in the Exchequer (and by a beam, which would turn with six grains put into either scale, with 30 pounds in each scale) was found equal to 1131 ounces 14 pennyweights Troy; and at the same time and place the standard Troy weights were compared with the standard avoirdupois, and 15 pounds of the latter were found equal to 18 pounds 2 ounces 15 pennyweights Troy, which fixes the pound avoirdupois at 7000 grains.

* Everard's Stereometry, p. 193.

* Such grains as the Troy pound weighs 5760; and upon three several trials, made by the gentlemen of the council of the Royal Society, at the Exchequer, upon a medium, the avoirdupois pound was found equal to 7000,25 Troy grains.

* Ward, in his Young Mathematician's Guide, says, 6999 ½ grains. Phil. Trans. No 465. p. 181. and No 470.—Bishop Hooper 10. Pharmacopœia Londin. says—The avoirdupois pound is said to be about 7000 grains.

By the first * malt act, which passed soon after the making the experiment upon the Winchester bushel, it is declared, that every bushel 18 inches and half wide, and 8 inches deep, should be esteemed a legal Winchester bushel: and the coal bushel is directed † to be made 19 inches and a half diameter, and to contain the last bushel and one quart of water. The first contains 2150,42 cubic inches, the last 2217,47. We now see different measures established by law §, and, under the excise laws, two different gauges or measures, used for taking the dimensions of wine and ale vessels. The wine gallon contains 231 cubic inches, and the ale gallon 282; but upon what foundation this last measure was established, is difficult to determine.

* 13 Will. III. c. 5. §. 28. and 1 Ann. stat. 2. c. 3. §. 10.

† 12 Ann. stat. 2. c. 17. §. 11.

§ Though contrary to magna charta, and several other laws not repealed.

Troy weights had for some time been established and used for the money affairs in the mint, and for weighing gold, silver,

D d d

silver, and some few commodities; and the avoirdupois were in general use for weighing all heavy and gross commodities. Wine measure was generally looked upon as equal to Troy weight: from hence the managers of the excise duty were, perhaps, led to fix the standard of the ale gallon, bearing the same proportion to the wine gallon, as the avoirdupois pound did to the Troy; and, according to this conjecture, the two gallons answer pretty exactly*, the ale gallon exceeding the proportion by somewhat more than one cubic inch and one quarter; but it exceeds the Winchester gallon, or 268,2 cubic inches, by very near 14 cubic inches: and not one of these measures is agreeable to the words of the assize, which directs †, 'That the bushel shall contain 8 gallons of wheat, the gallon 8 pounds of wheat of Troy weight, the pound 12 ounces of Troy weight, &c. according to the old laws of this land.' It is very plain the law-makers, in Henry the VIIIth's time, took the Troy weight for the standard; and most authors who have wrote upon this subject, have followed their example.

* For, as 144 : 175 :: 231 : 280,729—And as 144 : 175 :: 224 : 272,222. This last comes very near the vulgar dry gallon.

† 12 Hen. VII. c. 5.

The great difficulty we are under in fixing upon a standard pound, agreeable to the assize, arises from the uncertainty of the rule laid down in our laws of assize for raising the pound from 7680 grains of wheat; as these grains differ in weight in different countries, and in different years, I might have said in the same field and in the same year.

The uncertainty of a pound fo raised might, with great probability, occasion the variety in our weights and measures, so often complained of in our ancient laws, and for the prevention whereof Edward III. in his 14th year, ordered 'Standard weights and measures to be made of brass, and sent into every city and town in the kingdom.'

The laws of assize never received any alteration, except by the 12th of Hen. VII. when the pound is declared to contain 12 ounces of * Troy weight, and the gallon 8 pounds of wheat of Troy weight; and, since the laws have received no change, we have great reason to conclude, that the standard weights themselves never suffered any addition or diminution; but, however this be, we † now find, in the custody of the proper officer of the Exchequer, two sets of weights, kept there as standards; one called Troy, the other avoirdupois weight.

* This is the first time the standard weights are called Troy weights. But, in an act 2 Hen. V. stat. 2. c. 4. and 2 Hen. VI. c. 13. relating to goldsmiths, there is mention made of the pound of Troy.

† Phil. Transf. No 470.—The avoirdupois weight of 14 pounds is marked with a crowned E, and inscribed, XIII Pounde Averdupoiz. Elizabeth. Regina. 1582.

The Troy weights, marked with a crowned E, are ounces, from 256 down to the 16th part of an ounce: and there are no whole pounds Troy, pennyweights, or grain weights, at the Exchequer. There not being pounds, or greater weights, seems to be a proof, that the E weights were never designed or used for determining the weight of large bodies or heavy goods.

As there is no account handed down to us by our ancestors, shewing at what time, and upon what occasion, these weights, differing considerably in gravity from each other, were there first deposited, we are at a loss to determine which is the ancient standard weight described by the laws of assize. The act in the 12th of Hen. VII. has called the standard weight by the name of Troy weight; this is the first time the weights are so called in any of our assize laws; and, notwithstanding this authority, it will be found very difficult, if not impossible, to reconcile the Troy weight and measure raised therefrom with the words of the assize, and any measure now in being; for the natural and most ready way to determine this question, is to compare both the Troy and avoirdupois weight with measures raised from each, according to the rule laid down in the assize, and with such measures as are or have been used by authority.

'The most exact * geometrical way of expressing the capacity of any vessel or measure, is by expressing in known terms the solidity of a body, which will precisely fill it: the fittest will be water. The solidity of all bodies is best expressed by the help of a cube, whose equal sides we know by a standard measure of length; and it appears, that this way of determining measures of capacity is not only the most geometrical, but also exceeding ancient †.'

* Bishop Cumberland's Essay, p. 60.—who also says, The Egyptians made their ardeb the cube of their known standard the cubit.—And that the Romans made their quadrantal the cube of their standard the foot.

† Measures of bodies are either determined by their solid contents, or weight. Measures of contents are formed from cubes of assigned lengths. Bishop Hooper, p. 2.

By this rule some gentlemen at Oxford, in the year 1685, determined the weight of a cubic * foot of spring-water, or 1728 solid inches, to be 1000 ounces avoirdupois, and by the same rule the capacity and contents of the standard bushel in the Exchequer were determined in the year 1696, with great care and exactness: by the same rule, the contents of other vessels of capacity have been settled; and in the following table, I have inserted the names of such measures as are of any authority, whose contents are known; by which the proportion they bear to each other, and to measures raised according to the assize, as well from the pound Troy as the pound avoirdupois, will be readily observed.

* Phil. Transf. No 169.

In the next place, let us compare the experiment made upon the cubic foot of spring-water with that upon the Winchester bushel, and we shall find an uniform and perfect agreement between them; and that, upon each trial, a cubic vessel, the sides whereof were equal to an English foot, did contain * 1000 ounces avoirdupois of spring-water. From hence we are led to the discovery of a natural and universal standard for the English weights and measures; and such an one as is, in every respect, agreeable to the words of the assize recorded in our most ancient laws.

oz. pw. cu. in. oz. cu. in.

* For as 1131 : 14 Troy : 2145,6 : 1000 avoird. :: 1,728,041. Some writers upon this subject say, that a cubic foot of spring-water is equal to 76 pounds Troy, which is 10 pennyweights 20 grains more than the 1000 avoirdupois. See Arbuthnot's Tables explained, p. 80, 283. Bishop Hooper's State, &c. p. 11.—But the explainer of Arbuthnot's Tables seems to have been quite ignorant of any experiment since Sir Jonas Moore's time; and to have disregarded the due proportion between the avoirdupois and Troy pound; and, for 175 to 144, his tables, he says, are calculated at 17 to 14.

Magna charta points out the quarter of London, as the only standard for measures and weights of that time, but we are left to guess of what measure or weight it was the quarter part. If we suppose it the quarter of a ton, or 2000 pounds weight, then the quarter was 500 pounds, and the eighth part of that, or a bushel, was equal to a cubic foot, or 62 $\frac{1}{2}$ pounds, from whence less measures and weights were easily deduced. Subsequent assize laws direct the greater measures to be raised from the less; that 8 pounds should make a gallon, 8 gallons a bushel, which was to be the eighth part of a quarter; and by this rule the quarter is raised to 512 pounds, and the ton to 2048 pounds. These measures and weights are raised with ease from known parts of the foot. For a cubic vessel, whose sides are equal to $\frac{1}{16}$ of a foot, will contain a cube of spring-water equal to an ounce avoirdupois; and from hence, by a regular geometrical progression, we shall obtain cubes equal to * 8—64—512 ounces, or to 4—32—256—2048 pounds avoirdupois: and, from a cubic vessel containing one such pound, we shall have other cubic vessels, equal in weight 8—64—512 pounds; and in measure to the gallon, bushel, and quarter, according to the assize.

* Eight ounces are equal to a mark, whereof two, or twice the contents of that cube, make a pound avoirdupois.

The * gallon, bushel, and quarter, are called dry measures, and are used for ascertaining the quantity of corn, and other dry goods; the gallon † is also a liquid measure raised from a pound, in liquids now called a pint §, from whence all the other liquid measures are raised; but with this difference in the proportion, that the liquid bushel is not 64, but 63 pounds or pints, eight whereof make the hoghead equal to 63 gallons; from whence the contents, as well of the larger as smaller vessels or measures of capacity, are settled.

* The half bushel, peck, gallon, pottle, and quart, are directed by 25 Edw. III. stat. 5. c. 10. to be made according to the king's standard.

† See bishop Hooper, p. 6.

§ See note hereafter.—The pint is not mentioned in the assize laws; but bishop Hooper has given a long and learned dissertation upon that measure, and calls it the pint of old, p. 458.

The measures of capacity, thus raised, are sufficiently convenient for common use, and are generally retained at this time; but, for weights, there has been some variety from time to time, in the composition of the larger sort, used for determining the weight of merchandize and heavy goods, as will appear from the following extract from several old acts of parliament.—The stone for weighing lead was settled at 12 pounds *; for wax, sugar, spices, and allum, at eight pounds; of which last, 13 $\frac{1}{2}$, or 108 pounds, made the hundred weight: the sack of wool † was to weigh but 26 stone, 14 pounds to each stone: a weye of § cheese 32 cloves,

* Cay's Abridgment, title Weights, §. 9.

† 25 Edw. III. stat. 5. c. 9. 13 Rich. II. c. 9.

§ 9 Hen. VI. c. 8. The weye equalled 224 pounds.

each

each clove 7 pounds. And, for many years past, the hundred weight has been fixed * at 112 pounds avoirdupois, and that by a general consent, and without any particular law to establish it.

* That is, 14 stone at 8 pounds, or 8 stone at 14 pounds each, according to the old laws, and present usage of the stone weight. The 112 pounds is a very convenient weight for a standard, because it is divisible into more even parts than any less number — And it is compounded from the aſſize buſhel, it's half and quarter; that is to ſay, 64, 32, and 16 pounds.

These weights have been univerſally and immemorially * uſed in England, with an exception to the weighing of gold, ſilver, and ſome very few commodities, for which the Troy weight has been uſed for a great many years. When it was firſt introduced into this kingdom, does no where appear; but Mr. Folkes, in his Tables of the Engliſh Silver Coins †, tells us, it was not eſtabliſhed or uſed at the mint before the 18th of Hen. VIII.

* The apothecaries (who, next to the goldſmiths, are ſuppoſed to make the moſt uſe of Troy weights) ſeldom keep weights adjuſted to the Troy pound heavier than two drachms; but, for all above, buy and ſell by avoirdupois: and with them, by the term libra in meaſure, is meant the wine pint; though this meaſure is not, ſay they, ſo denominated, from it's containing an exact pound weight of any liquor, and the term uncia in meaſure does not denote a twelfth part of the pint, but the ſixteenth: though in weight, agreeable to it's ſignification, it is uſed to expreſs one twelfth part of a pound; ſo that an ounce in meaſure is ſcarce more than three quarters of an ounce in weight. See Pemberton's Diſpenſatory, p. 44.

† Page 4. Mr. Folkes ſays, The pound uſed at the mint before that time, called the tower or the moneyers pound, was equal to 5400 Troy grains: and, p. 13, 14, that the weight of the groat, from 13 Hen. IV. to 4 Edw. IV. was equal to 60 ſuch grains. Which is agreeable to what is ſaid in an act of parliament of 2 Hen. VI. that the pound Troy of coined money was worth 32 ſhillings; for 32 ſhillings, or 96 groats, 60 grains each, weigh 5760 grains, or a pound Troy. Though by the ſame act, by reaſon of the ſcarcity of ſilver money, and in order to bring bullion into the mint, it was enacted, That ſilver uncoined, of the ſame goodneſs as the money, ſhould be ſold only for 30 ſhillings the pound Troy.

By reducing the liquid buſhel, or one eighth of the hoghead, from 64 to 63 pints, it ſeems plain, that our anceſtors took the cubic foot for their model; the contents of ſuch a veſſel being $62\frac{1}{2}$ pints or pounds: and from hence, and from what has been ſhewn before, it is not very unnatural to conclude, that at firſt our anceſtors fixed and eſtabliſhed, as well their weights as meaſures, from known parts of this model; taking always a whole number for each primary weight or veſſel, and from thence proceeding, by a regular geometrical proportion, to raiſe the greater weights or meaſures: ſo that the Engliſh foot (the undoubted and univerſal ſtandard of all meaſures of length within this realm) is alſo the ſtandard for the avoirdupois * weights, and all meaſures of capacity.

* The very name avoirdupois, by which our common weights are known, has by ſome been looked upon as a proof that they were of foreign extraction. The firſt time I find the word uſed in our laws, is in an act of Edw. III. ſtat. 1. where it is applied to wines as well as corn; as it is afterwards in 25 Edw. III. ſtat. 3. c. 2. and 16 Rich. II. c. 1. And in an act 27 Edw. III. ſtat. 2. c. 10. there is the following clauſe:—“Because we have perceived ſome merchants buy avoirdupois merchandizes by one weight and ſell by another, we will and eſtabliſh, that one weight, one meaſure, and one yard, be through all the land; and that wools, and all manner of avoirdupois, be weighed by even balance. This king, in his 14th year, had directed ſtandard weights to be made of braſs, and ſent into every city and town; and I conjecture, that thoſe ſtandards, from the words of the foregoing clauſe, took the name of avoirdupois, and were the weights by which the merchant uſed to buy. What were the lighter weights by which they ſold, does not appear, perhaps the pound Troy. That the former were the lawful weights, appears by an act 24 Hen. VIII. c. 3. where they are ſo called; and butchers, who before that time fold their meat by hand, were thereby obliged to provide themſelves with beams, ſcales, and weights ſealed, called haberdepois (for avoirdupois); and, in the next reign, the avoirdupois weights, now remaining as ſtandards in the Exchequer, were depoſited there, as appears from the name and inſcription thereon.

Upon the whole, therefore, I think it is ſufficiently proved, that a cubic veſſel, whole ſides are equal to an Engliſh foot, will contain 1000 ounces avoirdupois, or very near the weight of ſpring water: that weights and meaſures, deduced by a regular geometrical progression from ſuch a veſſel, or from cubic veſſels, whole ſides are equal to known parts of an Engliſh foot, bear an exact analogy to each other, and to

weights and meaſures raiſed from a pound, according to the words of our moſt ancient aſſize laws. This being conſidered, and that the avoirdupois weight is now in common uſe for determining the gravity of all heavy bodies; that this weight now is, and immemorially has been uſed, for ſettling the ancient duty of tonnage and poundage, upon all goods and merchandize taken by weight (except ſome few drugs, which are charged in the book of rates by the ounce Troy); and that there is not the leaſt proof, either in our ancient or modern laws, to induce a belief that this duty was ever generally taken by the Troy weight, or that Troy weights were ever in general and common uſe in this kingdom; it muſt ſurely be allowed, that the weight mentioned in our old laws, or acts of parliament, was the avoirdupois weight.

POSTSCRIPT.

The learned biſhop Cumberland, in his * treatiſe, ſays, ‘That our Engliſh avoirdupois ounce is the ſame as the Roman ounce; and was probably introduced into this kingdom by the Romans, when they gave laws and planted colonies here, and hath thence continued unchanged to this day; which is not commonly obſerved, becauſe we uſe the avoirdupois weights only about heavier commodities; not in weighing ſilver and gold, which are weighed by the Troy ounce; which I ſuppoſe was introduced by the Normans, becauſe it takes it's name † from a French town, Troyes, in Champagne.’ Moſt authors ‡ have been of this opinion. This leads me compare our Engliſh foot with the Roman foot, which Mr. Greaves takes as equal to 967 ſuch parts, as ours is 1000. The Roman amphora, or quadrantal, is generally allowed § to be equal to a cubic Roman foot; and to contain 80 pounds, or 960 ounces. Then the ſide of the amphora is equal to ¶ 986 parts of the Engliſh foot, agreeing exactly with the foot deduced by Villalpandus from the congius of Veſpaſian; and a cubic veſſel, whole ſides are equal to 967 parts of the Engliſh foot, will not contain † quite 904 $\frac{1}{2}$ ounces; which, if true, reduces the Roman ounce to $412\frac{1}{2}$ grains Troy.

* See p. 11, 103, 107.

† Biſhop Hooper, p. 432. is of another opinion as to the derivation of the name.

‡ See Hooper's Enquiry, p. 10, 14, 92. and Arbuthnot's Tables explained, p. 16, 283.

§ See biſhop Hooper, p. 152, 175. Greaves's Miſc. Works, p. 198, 199, 297, 303.

¶ For the cube root of 960 is 986,1.

‡ The cube of 967 is but 904,231063. And Mr. Greaves himſelf ſays, an amphora made by the pes Colotianus held only $7\frac{1}{2}$ congi, equal to 900 Roman ounces; which comes as near the cube of 967, as can be expected from the uncertain method we took to determine the contents of that amphora, which was by filling it with 7 congi, and as he gueſſed, about an half of milium. See his Miſcellaneous Works, (1737) p. 225.

The TABLE of Buſhels in Gallons in Pints in Wht of the gall. in avoirdupois pounds.

The following are not ſupported by any law or authority.

* The vulg. dry meaſ.	2178	272,25	34,0625	9,8468
† The ale meaſure -	2256	282	35,25	10,1995

* Dr. Arbuthnot gives a table of the vulgar dry meaſure, as the contents of the Wincheſter meaſure. And he had ſo little regard to the avoirdupois weight, that he does not give any table thereof.

† The ale meaſure even exceeds the coal meaſure.—And the exceſs of the ale meaſure above the Wincheſter is more than one in twenty of the laſt meaſure.

¶ See what is ſaid before.—So far Mr. Reynardſon.

All meaſures whatſoever are either receptive or applicative. The meaſures of capacity, or receptive meaſures, are again comprehended under the denomination of liquid and dry meaſures.

The liquid, for wine, brandy, vinegar, cyder, beer, ale, and ſuch other goods.

The dry, for grains, ſalt, coals, and ſuch like.

Applicative meaſures are either,

The yard, ell, cane, aune, and other ſuch meaſures, for linen and woollen cloth, filks, laces, ribbons, and other ſuch goods. Or,

The

M E A

The inch, foot, &c. for wood, or other longer measures of that nature, for land, &c.

Not to speak of the fractions of an English pint, which are not worth the mentioning in a book of trade, the reader may observe, that two pints make a quart, two quarts a pottle, and two pottles a gallon; which measure contains 282 solid inches, and holds of rain-water ten pounds three ounces, or a little more, avoirdupois weight; eight gallons make a firkin of ale, two firkins make a kilderkin, two kilderkins a barrel, and twelve barrels a last.

It is otherwise in measuring of beer; for, though the small measures for ale and for beer be the same, yet they reckon but eight gallons of ale, and count nine of beer to the firkin; two such firkins to the kilderkin, and two kilderkins to the barrel. One barrel and a half, or three kilderkins, or six firkins, or 54 gallons of beer, make a hoghead of beer; two hogheads make a pipe or butt, and two pipes a ton, consisting of 1728 pints, weighing so many pounds.

The wine measures are smaller than those for ale and beer, to which they bear the same proportion as four to five γ to that four gallons of ale and beer are very near five gallons of wine. And each gallon of wine is 231 cubical inches, and holds eight pounds, one ounce, and four drachms, avoirdupois weight, of rain-water; eighteen of these gallons make a rundlet, 42 a tierce, 63 a hoghead, 84 a puncheon, 126 a pipe or butt, and 252 a ton.

One pint of wine weighs one pound $\frac{1}{2}$ ounce Troy, and a ton 1700 pounds avoirdupois.

Note, What we generally call a tierce, in speaking of wine measure, is one third part of a puncheon, and one sixth of a ton.

Formerly they made use of the wine measure for beer, ale, cyder, &c. But now that is forbid under severe penalties, and none but the Winchester measure is used. And as for vessels, in which beer, ale, &c. are contained, there is a statute, 23 Hen. VIII. giving power, to the wardens of the mystery of coopers within the city of London, to search and gauge all vessels made for ale, beer, &c. (and also for soap) to be sold within the city, suburbs, or two miles thereof; and examining their contents and weight, and finding them right, to mark them with St. Andrew's cross.

And, by stat. 31 Eliz. all brewers are forbid to sell, or put to sale in London, the suburbs, or within two miles compass of the suburbs, any beer or ale in butts, pipes, punchions, hogheads, tierces, or such other foreign vessels, 'till they be gauged by the master and wardens of the coopers of the city of London.

By statute 16 and 17 Car. II. It is ordained that all sea-coals brought into the river of Thames shall be sold by the chaldron, to contain 36 bufhels heaped, according to the bufhel fealed for that purpofe at Guildhall, London. And coals, fold by weight, are to be fold after the rate of 112 pounds to the hundred, under the penalty of the forfeiture of all the coals, and double the value thereof, to be recovered in any court of record, or upon complaint to the lord-mayor and juftices; one half to the perfon complaining, and the other to the poor, or repairing of the highways within the parifh. &c. And, by the fame ftatute, the lord-mayor and court of aldermen of London are impowered to fet rates and prices upon coals to be fold by retail, allowing a competent clear profit to the retailer. This ftatute by 7 and 8 Will. III. c. 36. is made perpetual.

The received proportion in the weights of liquids is thus :
The amphora of the Romans held, of rain-water or wine,

M E A

50 pounds of Antwerp weight; 107 $\frac{5}{8}$ of which make 112 pounds of London; so that it is a little more than 5 per cent. larger than ours.

And a measure, containing of wine or rain-water	50 pounds
Contains of river-water	-
Of butter or oil	53
Of linseed oil	45
Of honey	39
Of quick silver	35
	850

Of receptive measures for dry goods, such as corn, and all sorts of grains, &c. there is

First, the gallon, which is larger than the wine gallon, and smaller than the ale gallon, contains $272 \frac{1}{2}$ inches cubical, and holds the weight of 9 pounds, 13 ounces, $12 \frac{1}{2}$ drachms, avoirdupois weight; 2 gallons make a peck, 4 pecks a bushel, 4 bushels a coomb, or cumock, 2 cumocks a quarter, 4 quarters a last, and 10 quarters a last, which contains 5120 pints, and the same number of pounds Troy weight.

This is called Winchester measure, and by it, salt, lime, and coals are measured: but, in measuring the two latter of these commodities, the measures are heaped, or else 5 stricken pecks are allowed to the bushel. 36 Bushels make a chaldron of coals, and, on shipboard, 21 chaldrons are allowed to the score.

A TABLE of DRY RECEPTIVE MEASURES.

									Pints
								Qrts.	2
							Pott.	2	4
						Gal.	2	4	8
					Peck	2	4	8	16
			Bush	4	8	16	32	64	
		Qrtr	8	32	64	128	256	512	
	Wey	5	40	160	320	640	1280	2560	
Last	2	10	80	320	640	1280	2560	5120	

A bushel, water measure, contains five pecks. Some make six quarters of meal a weye, and one weye three quarters a laft.

The smallest applicative measure is a barley corn, of which, Three make one finger's breadth or inch.

Four inches one hand, or hand's breadth.

Three hands one foot.

One foot and a half, or four hands and a half, one cubit.

Two cubits one yard, of sixteen nails.

One yard and a quarter one ell.

And again,

Five feet make one geometrical pace.

Six feet one fathom; and

Sixteen feet and a half one perch, pole, or rod.

Forty perches one furlong; and

Eight furlongs one English mile, according to the statute
11. Hen. VII.

Sixty English miles and a half, make a degree (though a degree be generally computed only fixty miles.)

A TABLE of LONG MEASURES.

[illegible]

M E A

Another TABLE of LONG MEASURE.

				Inches
			Feet	12
		Yard	3	36
	Pole	5½	16½	198
Furl.	40	220	660	7920
Mile	8	320	1760	280163360

In this table, the pole or perch is computed to be sixteen feet and a half, which is the statute measure; but there are some customary measures which are more, as for fens and woodlands they reckon eighteen feet to the pole, and for forests twenty-one.

A TABLE of SUPERFICIAL MEASURES.

				Feet
			Yard	9
		Pole	30¼	272¼
	Rood	40	1210	10890
Acres	4	160	4810	43560
Mile	640	2560	102400	3097627878400

In this table, you have in a square mile 640 square acres, 2560 square roods, &c. in a square acre 4 square roods, 160 square poles, &c. in a square pole 30¼ square yards, and 272¼ square feet, and in a square yard 9 feet square. Which being rightly understood, all the tables of reduction are sufficiently explained.

The English mile, by statute law, consists of 5280 London feet, or 1760 yards, or 8 furlongs; of these miles, the experiments of Mr. Norwood and Mr. Picart, demonstrate 69 and somewhat more, to be a degree of the earth's surface, though a degree has generally been reckoned but 60 miles. A marine league is the 20th part of a degree, and most nations agree to reckon so for distances at sea.

A French league is the 25th part of a degree, being near two English miles and three quarters.

A German mile is reckoned to be the fifteenth part of a degree, or better than four English miles.

A Dutch mile, or such as are used in Holland, is near the nineteenth part of a degree, being about three English miles and an half.

An Italian mile is 1000 paces of five Roman feet each, and the Roman foot being ¾ of an inch less than the London foot, or as 29 is to 30, it follows, that 76 Italian miles are nearest to a degree, and the Turkish miles are reputed equal to the Italian.

The Danes, Swedes, and Hungarians, make long miles, about a German mile and a half, or at least five or six English miles; the Polish miles are near equal to the Dutch miles, and reckoned about 20 to a degree.

The Scotch and Irish miles are longer than the English by about half.

The Spanish league is estimated at four Italian miles, and are reckoned 17½ to a degree.

The Russians use a short measure they call vorst, which is a little more than three quarters of an English mile.

The Arabian mile, both ancient and modern, is about an English mile and a quarter.

Things that are not sold by weight and measure, are sold by tale.

In the primitive ages of the world, when mankind was but little acquainted with numbers, they counted by their fingers, as many Indian nations do at this time: and thence, probably it is, that the numerical letters, cyphers, and words are at most but ten, and in some places only five.

Several sorts of goods are counted after that manner, such as fish, hides, paper, parchment, fables, and other things.

Cod and ling, and such fish, have 134 to the 100.

Eels 25 to the strike, and 10 strike to the bind.

Herrings 120 to the 100, and 1200 to the 1000, which make a barrel, and twelve barrels make a last.

Of furs, fitches, grays, jennets, martins, mincks, and fables, forty skins make a timber; and other skins have five score to the hundred.

Of paper, twenty-four sheets to the quire, twenty quires to the ream, and ten reams to a bale.

Of parchment, twelve skins make a dozen, and five dozen a roll.

Of hides, ten go to a dicker, and twenty to a last.

Hay is sold by the truss, containing fifty-six pounds, or the load of thirty-six trusses*.

* Stat. 2 Will. and Mar. cap. 8. §. 16. every truss of old hay offered to be sold in the cities of London and Westminster.

M E A

ster, and within the bills of mortality, between the last of August and the first of June, shall contain 56lb. and every truss offered to be sold between the first of June and the last of August, being new hay of the summer growth, shall contain 60lb. being old hay, 56lb; and the person bringing the same shall forfeit for every truss of less weight, 1 s. 6d.

Glas by the scam of twenty-four stone, and the stone of five pounds.

A last of gunpowder contains twenty-four barrels, and the barrel a hundred pounds.

By avoirdupois weight is weighed all things that have waste, as all grocery wares, rosin, wax, pitch, tar, tallow, soap, hemp, flax, wool, &c. all base metals and minerals, as iron, steel, lead, copper, allum, copperas, &c.

The ton avoirdupois is 20 hundred of all things, except lead, which has but 19 hundred and a half to the ton, or fodder.

The hundred weight avoirdupois contains 112 pounds, the stone, or half-quarter of the hundred, is 14 pounds.

But allum, cinnamon, nutmegs, pepper, and fugar, have but 13 pounds and an half to the stone, or half-quarter of the hundred; 27 lb. to the quarter, 54 lb. to the half, and 108 lb. to the whole hundred.

Effex cheese and butter are weighed by the clove, or half-stone, allowing 8 lb. to each clove, and 32 cloves, or 156 lb. to the weye; and in Suffolk they allow 42 cloves, or 336 lb. to the weye.

Wool is sold by the clove, allowing but 7 lb. to the clove, 14 lb. to the stone, 28 lb. to the tod, 182 lb. to the weye, 364 lb. to the sack, and 4368 lb. to the last.

A faggot of steel is 120 lb. a burthen of gad steel is 9 score, or 180 lb. 56 lb. of butter, or 60 lb. of soap, make a firkin, and 2 firkins of either make a barrel.

Butchers allow but 8 lb. to the stone.

OF MEASURES for EXTENDED BODIES.

In England they make use of the aune or ell, for linen only; the yard, or verge, being the ordinary measure for cloth, silks, and all other such goods.

As for timber, and other such goods which have likewise length and breadth, as well as stuffs, they are measured by the foot, which is composed of inches, and the inches of lines; those measures being likewise longer and shorter, according to the usage of each country.

The vessels in which liquid goods, such as wine, brandy, vinegar, beer, oil, honey, &c. are kept, as every other thing, have also different names in several countries, such as barrel, pipe, hoghead, butt, tierce, muid, futaille, &c. of which more in the sequel.

The measures for grain, salt, and other such goods, are also different from one another, and have their different names, as we shall see in it's place.

All sorts of metals, such as gold, silver, brads, tin, lead, &c. as well as many sorts of silks, wool, thread, and several other sorts of goods, as spiceries, soap, tallow, cheese, butter, &c. are sold by certain quantities called weights, which likewise are different from one another in their names and sorts.

Of the division of MEASURES for extended bodies, their differences, and the addition of fractions by the aliquot parts, &c.

OF FOREIGN MEASURES.

The measures for extended bodies, as aunes or ells, canes, verges, or yards, &c. for measuring of cloth, of gold and silver, silk-stuff, linnen and woollen cloth, &c. are commonly divided by merchants into the following parts:

$$\frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \text{ and } \frac{1}{16}, \text{ or } \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \text{ and } \frac{1}{16}.$$

REMARKS.

As for the aunes, and other measures in foreign places, whither merchants may go to buy goods, it is very easy to measure them, either with a compass or a geometrical foot of England, Holland, or any other country; for knowing how many feet, inches, and lines, there is in the aune of Paris, or any other city, it is easy to reduce it into our yard of London, and to discover the difference that is between them.

For the comparison of the English ell with that of the principal trading countries of Europe, see the article ENGLAND, where you will find them represented by tabular inspection, with regard to those several places.

MEASURES for LIQUID GOODS.

Having given a succinct account of the measures made use of for extended goods, and of their difference and conformity with one another, the next thing that falls under consideration, is the different sorts of vessels used for containing of liquids; such as wine, vinegar, brandy, cyder, beer, oil, &c. of which I shall treat with as much order and brevity as possible.

OF MEASURES for WINE and VINEGAR.

The vessels for containing wine and brandy have different names, according to the quantities they contain, and the countries where they are made use of.

The vessel called in Germany woeder, made use of for keeping the wines that grow upon the Rhine and the Moselle, do ordinarily contain 14 aams of Amsterdam, but sometimes they contain more and sometimes less.

The aam of Amsterdam is a measure of 4 anckers, reckoning the ancker of 2 steckans. See the article AAM.

The steckan contains 16 mingles, each of which makes two pints.

The verge, or verteel, of the wines upon the Rhine and the Moselle, &c. is reckoned but 6 mingles, that of brandy is counted $6\frac{1}{2}$ mingles, as we shall see hereafter.

The hoghead of Bourdeaux, according to the just measure, should contain $12\frac{1}{2}$ steckans, or 200 mingles of wine and lee; and 12 steckans, or 192 mingles clear wine; so that the tun of Bourdeaux, consisting of 4 hogheads, contains 50 steckans, or 800 mingles, wine and lee, and 48 steckans, or 768 mingles clear wine.

The tun of Bayonne, and other places thereabout, is reckoned 240 steckans, measure of Amsterdam, there being likewise 4 hogheads to a tun.

In England, and especially at London, they reckon the hoghead 63, and the tun 252 gallons. The said gallon weighs $7\frac{1}{4}$ pounds weight of London; so that the 63 gallons, or the hoghead, should weigh $472\frac{1}{4}$ pounds, and the tun 1890 pounds weight of London. The said gallon is said to contain 4 Paris pints.

The hoghead of Bourdeaux should contain 110 pots with the lee, and 100 pots clear wine, measure of the said place; so that the said pot of Bourdeaux contains about 2 mingles of Amsterdam.

The Bourdeaux tun of wine should weigh with the hoghead, 2000 pounds weight; and, in marine terms in freighting of ships, by a ton, is meant 2000 pounds weight; so that, when it is said any ship is of so many tons, it is to be understood that the ship can carry so many times 2000 pounds weight; though in Holland, Flanders, and other northern countries, they only talk of lasts, containing 2 tons each, or 4000 pounds weight.

The Rhenish and Moselle wines are ordinarily sold at Amsterdam, the former at so many florins of about 20 each, current money, and the latter so many rixdollars, of 50 stivers each, current money, for the aam of 20 verges, or verteels, the verge being, at that rate, 6 mingles, as already said.

French, Spanish, and Portugal wines are sold at so many pound gros the tun of 4 hogheads, and there is ordinarily 1 per cent. rebate for payment in ready money, both buyer and seller paying brokerage, each 6 stivers per tun.

The muid of Paris contains 150 quarts, or 300 pints with the lee, and 280 pints clear wine, measure of Paris.

There are all over France a great many vessels for keeping of wine, different from one another, according to the custom of the several provinces where they are made use of; of which, though there be scarce any possibility to give an exact account, we shall here set down the regular fractions of the muid of Paris, 3 of which make the tun of France; and, as we have occasion to speak of the measures of the other provinces of France, we shall give as distinct an account as we can of their contents.

The pint of Paris is a measure pretty well known all over the world; 2 of those pints make 1 quart, 4 quarts 1 sextier, and 36 sextiers 1 muid of Paris; 3 of which (as is already said) make 1 tun of France.

The measure they make use of in Provence is called a millerole; that of Thoulouze should weigh 130 pounds, and ought to contain 66 Paris pints, which is about 100 pints of Amsterdam.

At Montpellier, and several other places of Languedoc, their muid contains 18 sextiers, and the sextier 32 pots; so that the muid, which makes but 35 steckans, or 560 mingles of Amsterdam, makes 756 pots of Montpellier; by which it appears that the pot of Montpellier is $\frac{1}{3}\frac{1}{8}$ less than the mingle of Amsterdam. However, you must here take notice that the casks of Montpellier are not all of an equal measure, some being bigger than others; and, in several places of Provence, as well as High and Low Languedoc, they frequently transport wines, oils, and other such goods, in vessels made of goat-skins.

The butts and pipes of Seville, Malaga, Alicant, Lisbon, Port a Port, Canaries, and Isles of Fagel, &c. are likewise of different sizes; for the tun of Malaga, consisting of 2 butts or pipes (which they call Persemyn at Amsterdam) is reckoned only 36 or 37 steckans; and those of other places are reckoned at 25 or 26 steckans the butt or pipe.

As for the wine at Hamburg and Lubeck, it is sold at so many rixdollars of 48 stivers, or 3 marks lubs per tun.

OF BRANDY.

French Spanish, and Portuguese brandy, is ordinarily put into big casks, which some call pipes, others butts, others pieces, viz. according to the custom of the places, there being no positive measure regulated for that liquor.

In France it is ordinarily put into great casks, which they call at Bourdeaux pieces, at Rochelle, Nantes, Cognac, Mont-

guion, the Isle of Rhé, &c. pipes, which (as we have already said) contain some more than others, there being some which hold at Amsterdam from 60 to 90 verges, or verteels; and they reduce those measures into hogheads, by reckoning as under, for

1 Hoghead makes	27 Verges of Cognac, Montguion, Rochelle, and the Isle of Rhé.
	29 Of Nantes, and other places in Britany and Anjou.
	32 Of Bourdeaux, and other places in Guienne.
	32 Of Bayonne, and places thereabouts.
	30 Of Amsterdam, and other places of Holland.
	30 Of Hamburg and Lubeck.
	27 Of Embden.

In Provence and Languedoc they sell it at so much the quintal, or 100 weight with the cask.

At Bruges they call the verges festers, of 16 stoups to a fester, which they sell at so much a stoup.

At London, and generally through all England, they count only by gallons, as we have said already.

The mingle of brandy weighs, at Amsterdam, 2 pounds 4 ounces; and the verge, or verteel, about 14 pounds; at which rate the 30 verges must weigh about 320 pounds.

At Bourdeaux, though pieces of brandy contain from 50 to 90 verges, they reckon but 32 to the hoghead; the verge is something less than $3\frac{1}{2}$ pots.

You must know that whatever there is at Bourdeaux in a piece of brandy more than 50 verges, is called by the farmers of the king's duty excess, or an excess, and pays so much per verge besides the duties of sortie, or exportation (as they call it) for the 50 verges.

Those that make brandy seldom or never put it in small barrels, or tierces, except it be designed for some particular places in America, or elsewhere, where those small measures are advantageously sold to people, who, perhaps, would not be able to buy a pipe at a time; for a piece of brandy that contains perhaps $1\frac{1}{2}$ of an ordinary piece, costs but very little more of freight and carriage than one that contains $\frac{1}{2}$ or $\frac{1}{4}$ less.

At Hamburg it is likewise sold at so many pounds gros, of $7\frac{1}{2}$ marks lubs per pound gros, or at so many rixdollars in banco; but at Lubeck it is paid in current money, there being no bank.

At Bremen, Copenhagen, and Embden, it is also sold at so many rixdollars; and in this last place the hoghead is counted but 27 verges.

At London it is sold by the ton of 252 gallons; and, in short, in every country according to the custom of the country, which must always be strictly enquired into by the dealers for their government.

OF MEASURES for OIL of OLIVES.

The oil of olives is ordinarily kept in butts or pipes, containing from 20 to 25 steckans, at 16 mingles a steckan; and there go 717 mingles, or 1434 pints of Amsterdam, to the tun of oil. They reckon at Genoa that the barrel of oil of olives weighs $187\frac{1}{2}$ pounds nett, of their weights, which make 125 pounds of Amsterdam; and 14 barrels make 717 mingles of the said place, or thereabout.

At Leghorn, the barrel of oil of olives weighs 85 pounds of their weight, which is a little more than 59 pounds of Amsterdam.

In Provence they sell it by the measure of that country, called millerolle, containing 66 Paris pints, which make about 100 pints of Amsterdam: and, in some places of that country and of Lower Languedoc, they put it in certain vessels made of goat-skins, as they do the wine.

In Spain and Portugal it is put in butts and pipes, to be carried over seas, and sometimes in great earthen vessels called jars.

OF MEASURES for FISH-OIL.

Coarse fish-oil is ordinarily kept in barrels, containing from 15 to 20 steckans each.

OF MEASURES for HONEY.

Honey is kept in many different sorts of vessels of wood and earth, and sold in some places by measure, and in other places by weight.

At Amsterdam they sell it at so many pounds gros per ton, consisting of 6 tierces or aams, or by so many florins the barrel, or the 100 weight. The Bourdeaux and Bayonne honey is sold at Amsterdam from 30 l. to 40 l. gros the tun.

OF ROUND MEASURES for GRAIN, &c.

As the great diversity of measures of capacity renders it very troublesome for merchants to calculate the quantities thereof, it will be very necessary to give an account of those that are used in the principal places of Europe for trade.

The last is of several sorts, but all comprehended in these two, viz. the sea-last and that used by land.

A last is reckoned at sea both with regard to measure and weight according to the nature of the goods.

In measure, there are allowed to a last of goods 2 tuns, or 8 hogheads of wine, 5 pieces of brandy or prunes, 12 barrels of herrings or pease, 13 barrels of pitch, 4 pipes or butts of oil of olives, and 7 quarters or barrels of fish-oil. By weight, there is generally allowed to the last 4000 lb. but, as wool is bulky, they reckon only 2000 lb. to the last thereof, and 3600 lb. of almonds; and so likewise they make some abatements of several other sorts of goods, in proportion to their bulk.

The land last is not the same in all places, there being some difference introduced by custom in the several countries of Europe.

Of the MEASURES of CAPACITY of AMSTERDAM and HOLLAND, &c.

The last of Amsterdam contains 27 muds, and each mud 4 scheppels.

Or, otherwise, the last of Amsterdam contains 36 sacks, and the sack 3 scheppels.

So that the mud is $\frac{2}{3}$ of the scheppel, and the chéppel is only $\frac{1}{3}$ of the mud.

A last of wheat commonly weighs between 4200 and 4800 lb. Rye between 4000 and 4200 lb. and barley between 3200 and 3400 lb.

But those commodities are so much subject to alteration by their humidity, &c. that there is but little certainty in their weight.

The last of Amsterdam makes 19 sextiers of Paris, or 38 bushels of Bourdeaux; and three lasts make 4 muds of Rouen.

The last of Munickendam, Edam, Purmeran, and several other places of North Holland, is reckoned equal to that of Amsterdam.

But that of Hoorn and Enchuyfen, being likewise towns in North Holland, is of 22 muds, or 44 sacks; of 2 scheppels each; and so is that of Muyden, Naerden, and Weefoop, small towns in the neighbourhood of Amsterdam.

At Haerlem they reckon 38 sacks to the last, their sacks consisting of 3 scheppels, 4 of which make 1 hoedt of Rotterdam, and 14 of those sacks make 1 hoedt of Delft.

The last of Alckmaer, in North Holland, contains 26 sacks. They reckon 44 sacks to the last of Leyden, and 8 scheppels to the sack.

The last of Rotterdam, Delft, and Schiedam, is composed of 29 sacks, and the sack of 3 scheppels, of which $10\frac{2}{3}$ make 1 hoedt; where, it is to be observed, that the last of those places is 2 per cent. more than that of Amsterdam.

At Tergow they reckon 28 sacks to the last, 3 scheppels to the sack, and 32 scheppels to the hoedt.

Of the LAST of UTRECHT.

At Utrecht they reckon 25 muds, or sacks; to the last, $10\frac{1}{2}$ of which sacks make 1 hoedt of Rotterdam.

The last of Amersfort is composed of 64 scheppels.

That of Montfoort, Yffelsstein, Vianen, &c. is greater than that of Rotterdam; it is composed of 18 muds, and the mud of 2 sacks.

Of the LAST of FRIESLAND.

The last of Leeuwarden, Haerlingen, and other towns of West Friesland, is composed of 33 muds.

And that of Groningen in East Friesland is of the same measure.

Of the LAST of GUELDERLAND, and the country of CLEVES.

The last of Nimeguen, Arnhem, and Drefburgh, is composed of 22 mouvers, and the mouver of 4 scheppels, 8 of which mouvers make 1 hoedt of Rotterdam.

At Thiel they reckon 33 scheppels to the last.

At Burenande 68 scheppels.

At Haerderwick they reckon 11 muds to 10 of Amsterdam.

Of the LAST of OVER-YSSEL.

The last of Campen is of 25 muds for corn, 9 of which make 1 hoedt of Rotterdam.

And 9 muds of Zwoll make likewise 1 hoedt of Rotterdam.

The last of Deventer contains 36 muds of 4 scheppels each.

Of the LAST of ZEALAND.

The last of Middleburgh is composed of $4\frac{1}{2}$ sacks of 2 scheppels each, or a little more; and that of Fleissing, Zirickzee, the Brill, and some other places, is somewhat different from it, the sack being there reckoned $2\frac{1}{2}$ scheppels.

Of the LAST of BRABANT.

The last of Antwerp is composed of 38 verteels, of which $37\frac{1}{2}$ make 1 last of Amsterdam.

1 their verteel is composed of 4 mukens, and 32 verteels make the sack for oats.

At Brussels they reckon 25 sacks equal to the last of Amsterdam.

At Malines they reckon 28 verteels equal to the last of Amsterdam.

The last of Louvain is composed of 37 muds, and each mud of 8 halfsters.

At Breda and Steenbergue they reckon $33\frac{1}{2}$ verteels to the corn-last, and 29 for oats; and 13 verteels make 8 sacks, or 1 hoedt of Rotterdam.

At Bergen-op-Zoom, they allow 34 verteels to the last of corn, and $28\frac{1}{4}$ for oats.

That of Bois-le-Duc is composed of $20\frac{1}{2}$ mouvers, 8 of which make 1 hoedt of Amsterdam.

Of the LAST of several towns in FLANDERS.

The last of Ghent is composed of 56 halfsters for corn, and of 38 for oats: their mud is composed of 6 sacks, each sack of 2 halfsters.

At Bruges the last is composed of $17\frac{1}{2}$ hoedts for corn, and $14\frac{1}{2}$ for oats, equal to the last of Amsterdam.

At St. Omers, the last is reckoned $22\frac{1}{2}$ raziers, the razier consisting of 2 scheppels.

At Dixmude, they reckon $30\frac{1}{2}$ raziers to the last of wheat, and 24 for oats.

At L'Isle, they reckon 41 raziers to the last of wheat, and 30 for oats.

At Gravelin, they reckon $22\frac{1}{2}$ raziers to the last of corn, and $18\frac{1}{2}$ for oats.

Eighteen raziers of Dunkirk are equal to one hoedt of Rotterdam.

Of the LAST of LIEGE.

The last of Liege is composed of 96 sextiers, of 8 muds each: they reckon the corn-last of Tongres 15 muds, and that for oats but 14.

Of the LAST of GREAT-BRITAIN and IRELAND.

The last of London consists of $10\frac{1}{2}$ quarters, or barrels, composed of 8 bushels each, and the bushel of 4 gallons.

The bushel weighs between 56 and 60 lb. and 10 bushels of England make about 1 last of Amsterdam.

In Scotland, they reckon 38 bushels to the last, and 18 gallons to the bushel; and in Ireland the same thing.

Of the LAST of DANTZICK.

At Dantzick they reckon 36 scheppels to the last, which is equal to 58 scheppels of Amsterdam.

They likewise reckon 16 schipponts to the last, and 340 lb. to the schippont, which makes 5440 lb. to the last; but they give only 15 schipponts or 5100 lb. weight the last of oats.

They likewise divide their last at Dantzick into 16 sextiers, measure of Paris, or 20 bushels of Bourdeaux.

They buy and sell their corn at Dantzick, as every other thing, by Polish florins and grofs.

Of the LAST of RIGA.

At Riga they reckon 46 looper to be equal to the last of Amsterdam; and they buy and sell it by rixdollars of 3 florins, or 90 Polish grofs.

Of the LAST of KONINGSBERG.

Six last of that place are equal to 7 of Amsterdam.

Of the LAST of COPENHAGEN.

They have there several lasts, which differ from one another considerably, according to the different sorts of grain, or other commodities that are measured by them. Ricard makes mention of three several sorts of lasts usual in Copenhagen, viz. of 42 barrels, of 80 scheppels, and of 96 scheppels.

Of the LAST of STOCKHOLM.

At Stockholm they reckon 23 barrels to the last.

Of the LAST of HAMBURGH, BREMEN, and EMBDEN.

The last of Hamburg consists of 90 scheppels.

At Bremen they reckon 40 scheppels to the last; and 8 lasts of Bremen have held out to 7 lasts, 18 muds, and 1 scheppel, at Amsterdam.

At Embden they reckon $15\frac{1}{2}$ barrels to the last.

Of the MUID, &c. of FRANCE.

The principal measure made use of for grain, &c. at Paris, and most other places of the kingdom is called muid.

The muid contains 12 sextiers, and the sextier 12 bushels.

The sextier of good wheat weighs between 244 and 248 lb. marc weight.

They divide the sextier of oats into 24 bushels, which again are subdivided into several smaller measures.

Nineteen sextiers of Paris are reckoned equal to 1 last of Amsterdam.

The muid of Rouen contains 12 sextiers, which are equal to 14 of Paris: it ought to weigh about 3360 lb. marc weight, and makes 28 bushels of Bourdeaux.

Four muids of Rouen are reckoned equal to 3 lasts of Amsterdam.

The sextier of corn weighs 210 lb. weight of Rouen, and is divided into 2 mines, and the mine into 4 bushels.

The muid of Orleans ought to weigh 600 lb. and is composed of 12 mines, equal to $2\frac{1}{2}$ sextiers of Paris, or 5 bushels of Bourdeaux.

The

The measure made use of at Lyons, called *afnée*, is divided into 6 bushels, equal to $1\frac{1}{3}$ sextier, measure of Paris, or $2\frac{2}{3}$ bushels of Bourdeaux.

Eight bushels of Rouen make 1 sextier of Paris, and 2 bushels of Bourdeaux.

The *afnée* of Macon makes $1\frac{2}{3}$ sextiers of Paris, or $3\frac{1}{3}$ bushels of Bourdeaux.

The 5 bushels of Avignon make 3 sextiers of Paris, and 6 bushels of Bourdeaux.

The sextier of Montpellier is composed of 2 emines, and the emine of 2 quarters. The sextier, weighing between 90 and 95 lb. weight of that town, being between 75 and 80 lb. marc weight: so that 100 sextiers make 1 last 22 muds of Amsterdam.

The sextier of Castres is composed of 2 emines, and the emine of 16 bushels. The sextier weighs about 200 lb. weight of that place, which is about 170 lb. marc weight; so that it may be reckoned that 1001 sextiers of Castres make 4 lasts of Amsterdam.

The sextier of Abbeville is composed of 16 bushels, and is equal to that of Paris.

The sextier of Amiens weighs from 50 to 52 lb. and 5 sextiers. The sextier of Bologne weighs 270 lb. small weight; and 8 sextiers of that place render 5 of Paris.

The sextier of Calais weighs 260 lb. and 12 of them render 13 of Paris.

Which sextier of Paris renders,

At	St. Valery	-	-	1 Sextier,
	Dieppe	-	-	18 Mines,
	Havre de Grace	-	-	$5\frac{1}{4}$ Bushels,
	Amboise	-	-	14 Bushels,
	Saumur	-	-	1 Bushel,
	Tours	-	-	14 Bushels,
	Blois	-	-	20 Bushels,
	Aubeterre	-	-	5 Bushels,
	Barbefieux	-	-	5 Bushels,
	Perigueux	-	-	5 Bushels.

The sextier of Arles weighs only 93 lb. marc weight, and the load is 360 lb. weight of that country.

The load of Beaucaire is 2 per cent. greater than that of Arles.

The load of Marfeilles is composed of 4 emines, and weighs 300 lb. weight of Marfeilles, or thereabout, which make 343 lb. marc weight; 100 lb. of which make $123\frac{1}{2}$ lb. weight of Marfeilles; so that the emine weighs 75 lb. weight of Marfeilles.

The load of St. Giles's is 18 or 20 per cent. greater than that of Arles.

The load of Tarfeon is 2 per cent. less than that of Arles.

The load of Toulon is composed of 3 sextiers of that place, and the sextier contains $1\frac{1}{2}$ emines, 3 of which make 2 sextiers of Paris; or otherwise, they reckon that the bushel weighs 31 lb. and that $7\frac{3}{4}$ bushels make 1 sextier of Paris.

The ton of Auray in Brittany is reckoned 2200 lb.

That of Audierne 2300 lb.

That of Brett is 2240 lb.

That of Hennebon 2950 lb.

Port Lewis the same.

Quimpercorentin the same.

The ton of Nantes is composed of 10 sextiers, and the sextier of 16 bushels: it weighs between 2200 and 2250 lb. the measure being heaped, and 18 or 20 per cent. less, if otherwise.

The ton of Rennes weighs 2400 lb.

That of St. Malo the same.

The ton of Brieux 2600 lb.

That of Rochelle and Maran 42 bushels.

OF SPAIN.

At Seville they reckon 4 cahys to a last, each cahy consisting of 12 anegras.

The fanegue of Cadiz weighs $93\frac{1}{2}$ lb. weight of Marfeilles, $3\frac{1}{2}$ lb. of which make the load of 300 lb. weight of Marfeilles aforesaid, or 243 lb. marc weight.

OF PORTUGAL.

At Lisbon they reckon 4 alguiers to the fanegue, 15 fanegues to the muid, and 4 muds to the last of Amsterdam.

OF ITALY.

Grain is sold at Genoa by the mine.

Two sacks of wheat at Leghorn make 288 lb. weight of Marfeilles.

Corn is sold at Venice by the sextier or fvaro, which is the ordinary measure, two of which make a load of Marfeilles.

Of the chief MEASURES OF CONSTANTINOPLE, and of the EAST-INDIES in general.

There being but about 3 per cent. difference betwixt the aunes of Amsterdam and pico's of Constantinople, 100 aunes of Amsterdam make 103 pico's of Constantinople; 100 pico's of Constantinople make 97 aunes of Amsterdam.

MEASURES OF FORT ST. GEORGE, OR MADRAS.

GAINR MEASURES.

1 Measure weighs about - 2 lb. 10 oz. avoird.
8 Ditto is 1 merca - 21 -
3200 Ditto is 400 ditto, or 1 garfe 8400 -
1 Madras rupee weighs 7 dwts. 11 gr. Troy, and is better than English standard 14 dwts. 10 gr. in 1 lb: it is country-touch 9 $\frac{1}{2}$, China-touch 98 $\frac{3}{4}$. See EAST-INDIA COMPANY.

LIQUID AND DRY MEASURES.

1 Measure is equal to $1\frac{1}{2}$ pint English of 423 cubic inches.
8 Ditto are equal to 1 merca of 3384 cubic inches.
400 Mercals are equal to 1 garfe of 1,353,600 cubic inches.
1 Coid is equal to 18 $\frac{6}{8}$ inches.
N. B. One measure weighs about 2 lb. 8 oz. avoirdupois.
Eight ditto weigh about 21 lb. or 22 lb.
3200 Ditto is 400 mercals, or 1 garfe, which weighs 8400 lb. which is $3\frac{3}{4}$ tons, or 100 Bengal bazaar maunds of 82 lb. 2 oz. 2 dr. each.

BENGAL MEASURES.

One measure is five feer.

Eight ditto are forty feer.

The coid (in cloth-measure) is nine inches.

OF MALACCA MEASURES.

A Malacca quoin is 3200 chupas, or 800 cantins, equal to 5000 Dutch pounds, or 5475 lb. English, or Canton peculs (according to the Dutch calculation of 125 lb. to a pecul) 40 peculs.

A last is 2000 chupas, 500 cantins, 3000 Dutch pounds, 24 peculs, 3285 lb. English.

ANJENGO MEASURE.

One Anjengo coid is eighteen inches English.

CALCUTT AND TELLICHERRY MEASURE.

One coid is eighteen inches English; and the Callicutt guz, made use of in measuring timber, is equal to 28 $\frac{7}{8}$ inches English.

They likewise, sometimes at Callicutt, measure their timber by the coid and borrebl; twelve borrebls is one coid when the timber is sawed, and twenty-four borrebls is one coid when unsawed: the price generally is one Callicutt fanam per solid coid.

CARWAR MEASURE.

One coid is eighteen inches English.

SURAT MEASURES.

Are the larger and lesser coid, viz.

One coid of 36 inches, and one coid 27 inches.

By the latter all things are sold except broad cloath, velvet, and fatten, which are sold by the large coid, or English yard.

GOMBRON LONG MEASURE.

93 Guz are equal to 100 yards English.

MOCHA MEASURES.

Rice, and other grain, are sold by the kalla and tomand; forty kallas is one tomand, and weighs about 165 lb. but the governor's custom (of half a kalla per tomand upon all grain sold) being deducted, and the intolerable cheat in the measuring, together with the pilferage from the water-side home, being allowed for, the Bengal maund will not come out above nineteen kallas; whereas one bag, or Bengal maund, ought to hold out more than a tomand; but, for the foregoing reason, two Bengal maunds seldom come out above thirty-eight kallas, and rarely that. See EAST-INDIA-COMPANY and EAST-INDIA TRADE.

Oil is sold by the cudda, noosfia, and vakia.

Sixteen vakias is one noosfia.

Four noosfias, or measures, one cuddy poise, about 18 lb.

Of late years the price has been from three to five noosfias per Mocha dollar; and, computing the dupper of two Bengal factory maunds to hold out about 67 or 68 measures each, at which rate the noosfia, or measure, weighs about $2\frac{1}{4}$. Cotton is sold by the hearf, and nine hearfs is $11\frac{1}{2}$ Mocha dollars: it generally sells from 30 to 40 hearfs per bahar.

LONG MEASURE.

The guz is twenty-five inches English.

The coid is nineteen inches English.

CHINA.

CANTON MEASURE.

Ten punt is one coid in piece goods, equal to $14\frac{1}{2}$ inches.

REMARKS.

The following conformity of measures in regard to grain being of use, we shall give the reader the same from La Bibliothéque des Jeunes Negocians, by the Sieur Larue, merchant at Lyons, dedicated to the count de Maurepas, and published in the year 1747; which is esteemed the most modern and authentic account that is published in Europe.

Of the CONFORMITY of the MEASURES of AMSTERDAM, PARIS, and BOURDEAUX, with regard to GRAIN.

Names of places.	Different measures.	Measure of Amsterdam.	Measure of Paris.	Measure of Bourdeaux.

OF ROUND MEASURES for SALT.

Salt is sold by different measures in the several places where that commodity is made, and whither it is transported and exposed to sale.

The most considerable places where it is made, are Marenne, Brouage, Tremblade, Rochelle, Maran, Nantes, and other places in the provinces of Britany, Sainteonge, and the country of Aunis in France; and the islands of Rhé, Oleron, and others, upon the coast of that kingdom; and Cadiz and St. Ubes, and other places in Spain and Portugal.

And from thence it is transported in vast quantities to several parts of Europe.

In France it is sold by the muid, which is greater or less, according to the custom of the several provinces where it is made, and where it is sold.

At Paris, they divide the muid into twelve sextiers, and the sextier into four minots.

At Marenne, the Isle of Rhé, and other places in France, where salt is made, they sell it by the hundred, which they divide into 28 muids, and the muid into 24 bushels.

The hundred renders commonly at Amsterdam 11 $\frac{1}{2}$ lafts, or 23 tons.

At Bourdeaux, that muid renders 42 pipes, or 252 sacks or minots.

The minot commonly weighs about 240 pounds, marc weight.

But the salt that is made at Brouage and in the Isle of Rhé, is heavier than that of Marenne, Tremblade, and Oleron.

The hundred of Brouage, the Isle of Rhé, &c. renders 11 $\frac{1}{2}$ or 11 $\frac{1}{4}$ lafts, which weigh about 45 or 46,000 weight.

At Copenhagen it renders 9 $\frac{1}{2}$ lafts, or 18 tons.

At Konigsberg it renders about ten lafts, or 40,000 pounds weight. And it is to be observed, that strangers are not allowed there to keep salt in storehouses to sell.

At Riga it likewise renders about 10 lafts, nor are strangers allowed any greater privilege about it than at Konigsberg.

At Dantzick it renders 11 $\frac{1}{2}$, and sometimes 12 lafts: 7 $\frac{1}{4}$, or 7 $\frac{1}{2}$ of which, make the great hundred of Amsterdam.

Strangers may sell salt at Dantzick to the inhabitants, but not transport it by the canals, nor sell it to other strangers.

At Stetin in Pomerania, it renders 10 lafts, or 40,000 pounds weight.

In Portugal salt is sold by the muid, four of which make one laft, and seven the hundred, of 404 scheppels, measure of Amsterdam.

The muid of France renders about 7 $\frac{1}{2}$ lafts, measure of London.

It is sold at Amsterdam by the hundred of 404 scheppels, which is reckoned 7 lafts, or 14 tons, or 28,000 pounds weight, which is also counted 208 sacks.

Some **EXAMPLES**, to illustrate the conversion of the MEASURES of one country into those of others.

Suppose that you would know how many aunes of Troyes in Champagne 100 aunes of Paris will make, and that to discover the same you have no other knowledge than what follows; which we shall exhibit and operate according to the rule of conjunction, that we have exemplified in variety of cases throughout this work. See the articles **ARBITRATION OF EXCHANGES, HAMBURGH, HOLLAND, EXCHANGE.**

Antecedents.		Consequents.	
If	7 Aunes of Paris make	9 Yards of London,	
And	36 Yards of London	49 Aunes of Holland,	
	7 Aunes of Holland	9 Braces of Milan,	
	3 Braces of Milan	2 Vares of Arragon,	
	5 Vares of Arragon	2 Canes of Montpellier,	
	9 Canes of Montp.	10 Canes of Touloufe,	
	4 Canes of Toul.	9 Aunes of Troyes—	

How many of Troyes will 100 aunes of Paris make?

Rule—Multiply the antecedents together for a divisor, and the consequents for a dividend, and you will find the quotient to be 150 ells of Troyes to be equal to 100 ells of Paris.—Or abbreviated according to what is taught under the article **ARBITRATION OF EXCHANGES, &c.** will stand thus, which is performed in a minute's times, without those tedious multiplications, and will stand thus by way of equation.

$$\begin{array}{rcl}
 7 & = & 9 \\
 36 & = & 49 \\
 7 & = & 9 \\
 3 & = & 2 \\
 5 & = & 2 \\
 9 & = & 10 \\
 4 & = & 9
 \end{array}$$

So that the product of all the antecedents, abridged, is reduced to 2 for a divisor, and the product of the consequents to $3 \times 100 = 300$, and divided by $2 = 150$ the answer.

EXAMPLE II.

Suppose that you owe 100 ânées of wheat at Lyons, and that you would know what quantity you must purchase at Mâcon to replace them, and that you have no other knowledge to come at the same than by saying, viz.

If	3 ânées of Lyons make	4 Sextiers of Paris,
And	1 Sextier of Paris	2 Bushels of Bourdeaux,
	38 Bushels of Bourd.	27 Muds of Amsterdam,
	27 Muds of Amfter.	46 Fanégas of Cadiz,
	230 Fanégas of Cadiz	57 ânées of Mâcon :

How much does 100 of Lyons make?

The whole abridged will stand thus :

$$\begin{array}{rcl}
 3 & = & 4 \\
 1 & = & 2 \\
 38 & = & 27 \\
 27 & = & 46 \\
 230 & = & 57
 \end{array}$$

Ergo $46 \times 2 \times 100 = 80$ ânées should be bought at Mâcon to replace 100 at Lyons.

REMARKS.

If the rules that we have laid down, and the reasons thereof which we have demonstrated, in the several parts of this work to which we have referred, be duly attended to, these operations can require no farther elucidation. The same method of calculation is applicable to weights as well as measures. See **WEIGHTS.**

MECHANICAL ARTS. Throughout the course of this work, we have endeavoured to shew, that artificers, mechanics, and manufacturers, are the grand basis of all our present commerce; and that our students and experimentalists in arts and philosophy, in conjunction with these practical artisans, and the sagacity and industry of our merchants, are the very life and soul of all our trafficable advancements and splendor. See the articles **ARTIFICERS, MANUFACTURERS, MATHEMATICS, MERCANTILE COLLEGE, MUSEUM, ROYAL SOCIETY.**

What has been amply urged under the two former of these heads, will, in a great measure, hold good under this article of **MECHANICS and MECHANICAL ARTS**; and, therefore, we shall have the less to say upon the present occasion. As nothing more evidently shews the high value and importance of this class of people to commercial states, than the daily artifices of our rival nations in trade, to decoy the most ingenious of our mechanics and manufacturers out of the kingdom; so nothing would shew the wisdom of the nation

more, than to make it for the interest of such to remain among us, and to increase the number, as being the chief instruments to preserve and advance the trade of the nation. To which end, nothing can so much contribute as the advancement of our old and established branches of foreign trade, and the promotion of new: and these depend on the wisdom of parliament, and that of the royal councils.

One general strain that runs through this work, the reader will please to observe, is, to shew, how great a variety of trades depends upon sound philosophy: that is, philosophy founded on repeated and unerring experiments, and appositely applied, in conjunction with the mathematical arts to practical trades. See the above articles. And, if this be the case, it follows, that, in order to improve the old mechanic arts, and to discover new, such philosophy and mathematics must be encouraged, or our practical artisans will be deprived of some of their best coadjutors; for it would be no difficulty to shew, that most trades and arts have been derived from this class of men; who, although they pass silently through life in their serene and contemplative way, yet their memories deserve to be eternally revered.

How that philosophy may be effectually promoted, which has been the parent of all trades, and will ever continue to advance them, will not be judged incompatible with a work of this nature. It is therefore we have interlarded so much philosophy, as is requisite to shew how far particular trades depend thereupon; and we have also under the heads referred to endeavoured to shew, in what manner philosophy ought to be encouraged by trade, since trade is so highly indebted to philosophy.

At present, I shall only add, to what has been observed upon similar occasions, a recommendation to our British artists to endeavour to imitate all those curious arts, which are practised to any superior degree of perfection in all other nations whatsoever; for this will prove one great means to advance the interest of particular trades. That I may not be misunderstood, it may be proper to intimate a few instances.

REMARKS ON MECHANICAL ARTS.

The country of Bengal furnishes materials or mechanic arts and sciences equal to most countries. The artisans here have wonderful skill and dexterity: they excel particularly in making linen cloth, which is of such fineness, that very long and broad pieces of it may easily be drawn through a small ring. If you tear a piece of muslin into two pieces, and give it to one of their fine-drawers to set it together again, it will be impossible for you to discover where it is joined, though you mark it on purpose to know it. They will place together so artfully the pieces of glass or China ware, that one cannot perceive it was ever broken.

Their embroiderers work in filigreen very curiously: they imitate exactly any work made in Europe, though the engine they make use of, and all their other utensils, do not cost them above the value of a crown.

The looms that their weavers use, do not cost them more: with these they fit in in their courts and yards, or on the side of the highway, and work those fine stuffs that are so highly esteemed over all the world.

They have here no need of wine to make aqua vitæ, but make it of a syrup, sugar, some certain sorts of barks, and raisins; it burns better, and is stronger than that made in Europe.

They paint flowers, and gild very finely upon glass. I was surprized, says our author, to see their vessels which they use to cool water in, and are not thicker than two leaves of paper pasted together.

Their watermen row after a different manner from ours; they move the oar with their feet, and their hands serve instead of the hypomochlion, or roller on which it turns.

The liquor which their painters use, does not any way lose it's colour, nor is it tarnished by lye.

They make use of a kind of hand-mill to break their sugar-canes, which does not cost them above the value of ten pence. The person that grinds, works and fashions the stone himself with lac and emery.

Their masons will pave the largest room with a sort of cement made of brick dust and lime, so that it shall seem to be but one stone, and is much harder than gravel. I saw them make a sort of pent-house, says our author again, that was 40 feet long, 8 feet broad, and 5 or 6 inches thick; which they raised up in my presence, and fixed it to the wall on one side only, without putting any prop under it to support it.

Their pilots take the altitude (or latitude of places) with a cord that has several knots in it. They put one end of the cord between their teeth, and by means of a piece of wood fixed to it, that has a hole through it, they easily observe the tail of Urfa minor, which is commonly called the polar star, or north pole.

Their lime is usually made of sea shells: that which is made of snail-shells, serves to whiten their houses; and that which is made of stones they chew with the leaves of betel. I have seen some of them that would take as much of it in a day, as the quantity of an egg.

They make their butter in the first pot that comes to hand; they cleave a stick into four quarters at one end, and, stretching them out asunder in proportion to the size of the pot that contains the milk, they turn the stick round different ways (backwards and forwards) by means of a cord twisted about it, and by this means in a short time make the butter.

Those that sell butter have the art of making it pass for fresh, when it is old and rank: To do this they melt it, and pour upon it four curdly milk; and in eight hours after they take it out in lumps, and strain it through a cloth for sale.

Their chemists make use of the first pot they meet with to revive cinnabar, and other preparations of mercury, which they do after a very simple manner. They easily reduce all metals into a powder, as I myself can witness. They set a great value upon talc and brags, which confume, as they say, all viscous humours, and remove the most stubborn obstructions.

The Chinese gild paper with leaf-gold and silver, laid on with a very good sort of varnish they have, which is the same wherewith they varnish their lacquered wares; all which, after it is thoroughly dry, they put in a screw-press, and, with an instrument like our plane, shave it as fine as they please. They also gild paper on one side with leaf-gold, then cut it in long pieces, and weave it into their silks, which makes them, with little or no cost, look very rich and fine. The same long pieces are twisted about silk thread by them so artificially, as to look finer than gold-thread, though it be of no great value.

Among the Japanese, they have the art of making lacca in a manner superior to the Europeans: there is some so fine and curious, that whereas, in this country, one may buy an ordinary small box for three or four crowns; one of the same size, when made in Japan of exquisite lacca, will sell for more than eighty crowns. The author of this account hath four cabinets of his workmanship, which he affirms to have cost him about 40,000 crowns, which he will not sell under 80,000 crowns. *Philos. Trans. n. 49.*

The colours wherewith they dye their stuffs never fade: I have seen one of them, which our vermilion and *couleur de feu*, as the French call it, come not near to. It is extracted out of a flower like to saffron, and one pound of it costs an incredible price. To try whether the colour will not change by lixivium or lye, they apply an hot iron to it; and, if there it holds, they assure themselves of the durability of the colour.

The method of making salt, at Chusan and China, may deserve regard: it is this: all the shores here being mud, instead of sand, in the summer-season they pare off the superficial earth which has been overflowed with the salt-water, and lay it up in heaps for use: when they are to use it, they dry it in the sun, rubbing it small; then, digging a pit, they cover the bottom thereof with straw, at which, through the side of the pit, they pass a hollow cane that leads into a jar, which stands below the level of the pit's bottom; they fill the pit almost full with the aforelaid earth, and pour salt water thereon till it be covered two or three inches with water, which drains through into the aforelaid jar, and is afterwards boiled into salt.

Upon the whole, in whatever mechanical or manufactural arts other nations may excel Great-Britain, our artists should be upon the watch, not only to imitate, but surpass, if possible. Throughout this work, those particulars appear wherein other nations do excel us, under the several countries of the world, whose natural history and traffic we have described, and may well deserve the attention of our artists. But those which are imported, and which they can see, handle, and minutely examine, they are the most likely to imitate or excel.

As we have arrived at a great perfection in the China ware, why may we not in divers other eastern arts and manufactures?

REMARKS in another light, consistent with this work.

It is a maxim generally received, that one of the most effectual means to settle and improve commerce, or any other political interest, is the patronage of princes, dispensing rewards, and exciting emulation by investing with honours, and other marks of distinction, those persons, who, by the force of genius or application, have made new discoveries, or improved upon any thing laudable, and conducive to the interest of the public; more especially such, as upon the strength of their own genius, and at their sole charge, have set up and maintained manufactories, and other works of the mechanic arts beneficial to the community, and when the introduction of them has been entirely owing to their industry and public spirit. This point I shall only treat in a general way, as it is not possible to prescribe rules for the conduct of it on particular occasions, since the honours, as well as rewards and encouragements, are always to be proportioned and dispensed according to the station and other circumstances of the claimants, and with an eye to the charge they shall have been at, and the benefits that shall result to the public from them; things of such a nature, that it is absolutely necessary to rely upon the judgment and prudence of the mini-

VOL. II.

sters, whom his majesty shall intrust with the conduct of such interesting affairs.

It is customary, and a piece of good policy, to give yearly pensions and rewards, in order not only to cherish among ourselves, but to draw over and engage to stay in any country, able masters in manufactures and the mechanic arts, either to introduce new sorts of businesses, or to improve such as have been already established; by advancing them to a degree of perfection and goodness, that is certain to make them esteemed, and procure them a market every-where. To artificers or workmen setting up new and profitable commercial arts, it is usual in France and Spain to allow, for a certain term, an immunity from all troublesome offices, houses to live in, workshops, and a dispensation from some duties; and at the same time, for a farther encouragement, sums of money have been granted to enable them to bear the first expence, which usually runs high. But in respect to this advance of money, or the other encouragements, we are as little able to prescribe stated rules; as there must necessarily be a variety of cases, according to the situation of the projectors, and the benefits that will arise from the undertaking. It is usual also to grant an exclusive privilege of this kind, that, for a certain number of years, no other person manufacture the commodities, they are under an obligation to introduce and establish. But, before we ever dispense indulgences of this nature, we ought to consider the affair thoroughly; and when for special reasons it is found absolutely necessary, in order to obtain our end, they are even then to be limited and guarded with the utmost care, lest they be converted into monopolies, that are of great profit to the proprietor, but of the utmost prejudice to the public; moreover, in dispensing them, though it be with all possible precaution, it ought at least to be attended with the following circumstances, of it's being a new undertaking, and very difficult to be set on foot; that there will ensue an improvement to commerce, and a considerable advantage to the public. See the articles MONOPOLIES and PATENTS.

Lewis XIV. king of France, in the year 1665, during the ministry of John Baptist Colbert, granted an exclusive privilege and other advantages, in order to settle a tin manufacture in several parts of that kingdom, as it is a very useful commodity, and of great consumption every-where; and, at the expiration of the term covenanted, the patent was renewed in the year 1695, in favour of Isaac Robelin, engineer-director of the fortifications of Burgundy, and company, to which partnership it was renewed for another term in the year 1760, as appears from the patent granted them. In like manner the woollen and other capital manufactories and mechanical arts have been introduced and established in this and other trading kingdoms. See the articles ARTIFICERS, FRANCE.

But we are always to be very careful, that the term of the privilege (if it be exclusive) be granted for as short a time as possible, and under due limitations, in order that the manufacture and traffic carried on, both at home and abroad, may be freely and quickly extended.

When trafficable commodities of any kind are undertaken to be established in a nation by private hands, and are nearly of the same sort as some already established in the country, and though they may be of superior quality, as it is from this very superiority, that with a little diligence they may be imitated, there will be no reason to grant privileges, indulgences, and other distinguishing encouragements which some have moved for, as in such cases they ought to be common and general; for any thing singular, or exclusive, is a great prejudice to other manufactures of the kingdom, which being of equal moment, or little inferior, may, with equal propriety, claim and enjoy the same advantage; and, if they should not obtain it, the consequence will certainly be, that, favouring a branch, we shall destroy the root.

It would be impolitic and unjust to indulge a few artisans, upon no reasonable plea, with immunities and other indulgences, that are denied to those of the rest of the kingdom. For this reason, all encouragements which we have recommended in favour of commerce and manufactural and mechanical arts, tend to put all, as near as possible, upon an equal footing under the same circumstances, unless very particular cases require an exemption, as sometimes it does find a place in general provisions, and upon the very principle of an equal distribution of justice; in order, that, at the time of carrying those indulgences into execution, an equality may be better preserved in distributing relief; just as stronger and more costly medicines are administered for a cure under dangerous diseases, while, in maladies of an inferior kind, health is recoverable by gentle physic.

MECKLENBURG, called also MECKELBOURG, a duchy in Germany, has Pomerania on the east; part of the marquisate of Brandenburg, and the duchy of Lunenburg, on the south; the Baltic on the north; and Holstein and Saxe-Lawenburg on the west; being about 100 miles long, and 60 broad. It abounds with corn, fruit, fish, and fowl; it is well watered with lakes and rivers, and extremely well situated on the Baltic for a foreign trade, some of the principal Hanse-Towns lying in this duchy, viz. Rostock, Wismar, Swerin,

G g g

&c.

&c. [see HANSE-TOWNS] which are it's principal places of trade.

At ROSTOCK, their chief commodity is beer, that which was formerly called Lubec beer, which they export in large quantities: some years since they had no less than 250 privileged brewers, who, it is said, brewed as many thousand tons, a year, besides what particular persons brew for their own use: so that the duke's revenue, arising from the excise on beer, is greater than that from all the other articles together. It's river is navigable to the very walls, but large ships come no farther than Wamemunde, a little town seven miles lower, where the Swedes built a fort formerly.

MEDAL, a piece of metal, in the form of a coin, with some peculiar stamp thereon, destined to preserve to posterity the portrait of some distinguished personage, or the memory of some illustrious action.

REMARKS.

It not being consistent with the tenor of our work to consider this article in the mere light of an antiquarian, we shall take notice of it only as an object of traffic among the learned and curious, where interest frequently is no way concerned, the emulation among such being to enrich their cabinets, and to complete their collections of those estimable monuments of antiquity.

There are, however, as Mr. Patin remarks, in many of the principal cities of Germany, many dealers who may properly enough be called antiquarian merchants, since they collect medals only with a view to sell them again for gain; a traffic, says the beforementioned learned author, that has it's frauds as well as most others, and wherein the purchaser should well examine the merchandize, if he would not receive those for rare and valuable which are of a counterfeit stamp, for such medals that are really antique and curious.

Messieurs Tournefort, Cornelius le Bruyn, and Paul Lucas, the latter in his accounts of Egypt, and the two others in their voyages to the Levant, speak of the like commerce carried on in the islands of the Archipelago, and in almost all the scales of the Levant, where the inhabitants of the country, well informed of the taste that strangers have for curiosities of this nature, take pains to collect them together, and dispose of them at a dear rate, and often with less fidelity than the German antiquarians.

Besides this commerce in medals in Germany and the Levant, which relates only to antiquity, there is a traffic carried on in France for those of a modern kind, which is more to be depended on.

This trade consists chiefly in that numerous and rich series of medals which were struck in order to perpetuate to posterity the most celebrated events in the reign of Lewis the Grand, and those that are yet struck every day, says our author, in regard to the reign of Lewis XV.

The director-general of the coinage of these medals, who disposes of them, furnishes those only of gold, silver, or bronze.

The elegance and beauty of these medals, and the skill of Monsi. Launay, who has the direction thereof (1723) gives so great a value to them, that it is scarce to be doubted but they will one day be in as high esteem as the most beautiful of those of antiquity.

The Sieur Launay has also caused medals to be struck of all the kings of France, from the commencement of the monarchy to the present time, which contain on one side the effigy of the prince, on the other a short, but exact abridgment of the most remarkable events of every reign. These also have entered into the commerce of the modern medals at Paris, and are not of the least important sort.

We shall conclude this article with a short account of those medals in France which concern the trade and navigation of that kingdom, and which were struck in the reign of Lewis the XIVth; being persuaded, says Monsi. Savary, in his French Dictionary of Commerce, in favour of that nation, that his work would want that perfection expected, if the reader did not find those remaining monuments that France has struck of her commerce, and of the protection that so great a king has given to it.

MEDALS struck in France during the reign of Lewis the XIVth, upon various extraordinary establishments made in that kingdom for the benefit of their trade and navigation.

The establishment of a number of new manufactories in France, and the old ones being brought to their perfection, make the subject of the first medal. This was struck in 1664, a year remarkable for the great number of commercial enterprizes, which commenced from that era: and which were continued during the administration of Monsieur Colbert, whose memory will ever be revered and adored in that kingdom.

Upon this medal there is a Minerva, who has by her a spindle, a shuttle, bottoms of wool, and a piece of tapestry: the legend, MINERVA LOCUPLETRIX, signifies the kingdom

enriched by arts, of which Minerva is the symbol; the exergum, ARTES INSTAURATÆ, which signifies the Arts re-established, M.DC.LXIV.

The subject of the second medal is the re-establishment of navigation, which had been a long while neglected in France: but the grand monarch, applying to their re-animation, rendered his kingdom as powerful by sea as land, and as flourishing by it's commerce as by it's arms.

This medal is of the year 1665. It represents a ship in full sail: the words of the legend are, NAVIGATIO INSTAURATA, which signifies NAVIGATION RE-ESTABLISHED: the exergum shews the date.

The French East-India company, established in the year 1664, and which took possession of the island of Madagascar in 1665, gave occasion to the third medal.

This colony, in manner of the ancient medals, is designed by one of those bunch-backed oxen which are in great plenty in the island: it stands nigh to an ebony-tree, which is very common in that country. The words of the legend are, COLONIA MADAGASCARICA, which signifies the colony of Madagascar: the exergum denotes the date, M.DC.LXV.

The union of the two seas, so commodious and beneficial to the domestic and foreign commerce of France, is represented in the fourth medal, struck in the year 1667.

Neptune armed with his trident, with which he strikes the earth, seems to complete this important enterprize: the gushing out of the water, which pours forth by the strength of the blow which he has given, and which spreads itself to the right and left, indicates the ocean and Mediterranean, that the canal unites. It has, for legend, JUNCTA MARIA, which signifies the joining of the seas: the exergum has FOSSA A GARUMNA AD PORTUM SETIUM; A CANAL EXTENDING FROM THE GARONNE TO THE PORT OF SETE. M.DC.LXVII.

The fifth medal was struck in the year 1680, in order to preserve the remembrance of the establishment of the several classes of the marine. See the article NAVAL AFFAIRS of FRANCE.

The classes were three at the first establishment, each consisting of 20,000 sailors, one of which was to serve on board their men of war, the other on board their merchant-men, and the other to rest one year in three.—These classes have since been augmented to five, but they make only 60,000 seamen.

This medal represents a sailor by the sea-side, leaning upon a broken pillar; he holds in his hand a rudder, covered with a flower-de-luce: the legend has these words, BELLO ET COMMERCIO, signifying, FOR WAR AND FOR COMMERCE; the exergum has SEXAGINTA MILLIA NAUTARUM CONSCRIPTA. M.DC.LXXX. SIXTY THOUSAND SAILORS ENROLLED.

The sixth and last medal is on occasion of the establishment of the CHAMBER or COUNCIL OF COMMERCE. As we have described this establishment at large under the article CHAMBER OF COMMERCE, we shall here only give the type, and the legend of the medal, which was struck upon this account in the year 1700.

It represents Justice, and near her stands Mercury, the god of commerce, who, with one hand, holds his caduce, or snake staff, and with the other a purse. The words are, SEX VIRI COMMERCIIS REGUNDIS; which signifies, SIX COMMISSIONERS PROPOSED FOR THE REGULATION OF COMMERCE.

REMARKS on the article MEDAL, since the last war, and the DEFINITIVE TREATY of 1763.

We have not learned that the FRENCH have struck MEDALS to commemorate their extraordinary successes and glorious victories, which they obtained during the last war; nor to celebrate the memorable advantages they gained by the last peace, concluded at Paris, the 10th day of February, 1763, by the DEFINITIVE TREATY of friendship and peace between his Britannic Majesty, the most Christian King, and the king of Spain; to which the king of Portugal acceded on the same day. See our articles AMERICA, BRITISH AMERICA, FRENCH AMERICA, CANADA, FLORIDA, and others referred to from them.

From the time of striking these medals, to what degree the French have raised and extended their trade and navigation, see the articles FRANCE, FRENCH AMERICA, BRITISH AMERICA, LEVANT TRADE.

MEDITERRANEAN SEA, extends from the straits of Gibraltar to the coast of Syria and Palestine, being above 2000 miles in length, but of very unequal breadth; the west part of it separating Europe from Africa, and the Levant, or east part of it, dividing Asia from Africa, Spain, France, Italy, Turkey in Europe, and Natolia, or the Lesser Asia, bounding it on the north; and the empire of Morocco, Algiers, Tunis, Tripoli, Barca, and Egypt, bounding it on the south. The strait of Gibraltar, between Europe and Africa, being about 16 miles over, a strong current sets through it, out of the Atlantic Ocean, into the Mediterranean constantly, which requires a good gale of wind to stem it.

REMARKS

REMARKS, shewing the important utility of GIBRALTAR to the BRITISH EMPIRE.

The whole British trade carried on by means of the Mediterranean Sea being of the last consequence to Great-Britain, and the permanent preservation thereof depending upon the town and fortifications of Gibraltar; it is necessary to take some notice thereof.

Gibraltar lies in west longitude 6, latitude 36, and is a port-town situate, when it belonged to Spain, in the principality of Andalusia, and on the straight between the ocean and the Mediterranean. It stands at the foot of Mount Calpe, one of Hercules's pillars, about 16 miles north of Ceuta in Africa, 40 south-west of Cadiz, and 80 south of Seville. It is built on a rock, in a peninsula, and can only be approached on the land side by a very narrow passage, between the mountain and the sea, cros which the Spaniards have drawn a line, and fortified it, to prevent the garrison having any communication with the country. It was taken from the Spaniards in the year 1704. Several attempts have been made to retake it, but have proved fruitless.

Gibraltar is but a small, though ancient town. Since the English have been masters of this town, it is become a place of considerable trade, which it was not before, especially between the coast of Barbary and this place; the English merchants at Gibraltar having great warehouses of all kinds of goods of the growth of Barbary, so that they furnish the merchants in London on as good terms as they usually had them in Barbary; and, by the convenience of shipping, can send them to England in smaller quantities than by loading vessels wholly, as they were obliged to do before.

They likewise have a great trade here, by barco longo's, with the empire of Morocco; so that the trade is seldom shut up; and Gibraltar is now the market for the wax, copper, almonds, drugs, and other products of Barbary.

That a just and adequate idea may be formed of the real importance of this place to these kingdoms, we shall sketch the heads of those reasons that have been occasionally urged, both in parliament and without doors; which, as they have been too much mixed with the temporary acrimony of party, may not, perhaps, have had such weight with many as if they were stripped of that personal spleen and satire, which generally attend our political altercations. The reasons are simply as follow, viz.

(1.) Because Gibraltar preserves to us the convenience, protection, and security of our commerce to the Straights, above that of all other nations, more especially in regard to the Algerines and Salleemen, who are influenced by it to keep their treaties made with us; which they never do longer with any other nation than till they find it their interest to break them.

(2.) Because in respect to the great advantage which the possession of that place hath already given us, when in war with France and Spain; and, consequently, will always give us again upon the like occasion, whilst we continue to keep it.

(3.) With regard to our trade in general up the Mediterranean; for, as it commands the passage or entrance of all our navigation into that sea, both in time of peace and war; so it is equally necessary, and as much our interest, to keep it ourselves, as for any gentleman to keep possession of the gate which leads to his own house; it being in the power of those who possess this port, at all times, to interrupt, annoy, or hinder whom they shall think fit in their trade, by keeping two or three ships of war constantly on that station; in the same manner almost as the Danes, by the possession of Elsinore command the passage into and out of the Baltic: so that, if this port and fortification were in the hands of any other nation, it would be in their power likewise either to permit us to navigate our trade within those straights, or not, as they should think fit, unless a very strong squadron was constantly kept at the entrance of the straight's mouth, to secure the passage, and to be relieved, from time to time, by fresh ships, which would put us to a much greater expence than we are now at in keeping this place.

(4.) Because, before England was in possession of Tangier, on the opposite side of the straight, we were never able to deal with the Algerines, and other Turkish rovers; who, for near a century, had carried on a successful piratic war against the commerce of this nation, and never could be reduced 'till, by the situation and our possession of the abovementioned place, we distressed them so much, not only by taking their ships going in and coming out of the Straights, but also by retaking such of their prizes as they had taken in the ocean, that at last they were forced to be content with such a peace as we would give them; the continuance of which is owing to nothing so much as to our having been, for many years past, and at present, in the same condition to chastize those rovers, by the possession of Gibraltar, as we were before by the possession of Tangier.

(5.) Because the security of our Italian, Turkey, and sibtrades intirely depends on our possession of this place; and, should we ever lose it, or part with it, it is very reasonable to believe, that both the Algerines and Salleemen would soon break with us again; so that, in such a case, the abovesaid branches of trade would almost wholly fall into the hands of our rivals, the French from Marseilles, who, by their situa-

tion, are always ready at hand to furnish those markets, as soon as they are in want, while we, on our part, shall be obliged to carry on that trade by the tedious method of fleets and convoys, and at last, perhaps, come long after the market is supplied by our rivals. Besides all this, the article of insurance, which would certainly run much higher than usual under these circumstances, would prove a heavy charge on our goods, more than those of other traders, which would thereby very much affect those branches of our trade and navigation. (6.) Because the mischief would not stop here: for as the Algerines, of late years, often cruise at the mouth of our channel, and as some of them have also heretofore come into our very ports two or three years successively; so it is possible that, if we should lose Gibraltar, they may become, being so well acquainted with our channel, a much more dangerous enemy to us than ever they were formerly, and may attack all our trade in general, as the St. Malo privateers did in the wars of queen Anne, whenever they shall find that they can carry home their prizes without any interruption; which is not to be done, unless we should be dispossessed of Gibraltar, and thereby take the bridle, which has hitherto restrained them out of their mouths.

(7.) Because, in respect to our neighbours, Gibraltar is situated in such a manner, that it is in the power of the present possessors to cut off any naval communication between one port and another, of each of those very powerful kingdoms; with which we have had such frequent occasions to be at war for almost these fifty years past, who would soon turn the tables upon us, if they should recover this place out of our hands, especially in time of any rupture between us; nothing being more self-evident than that it gives, to those who are masters of it, the sovereignty and command of the commerce and navigation of the Mediterranean Sea, and makes it impracticable for any other nation to trade there without their leave. And farther, by our possession of this place, all nations within the Mediterranean will be obliged to court our friendship, or fear our power, particularly the piratical states, who, beholding vengeance so near at hand, will be thereby deterred from attempting to interrupt our trade, while they are destroying that of all others.

(8.) Because this advantage is not all that we reap from the possession of Gibraltar; for it hath put into our hands occasionally a great proportion of freight-trade into the Mediterranean, especially that of the Hamburgers and Hollanders, who have made use of British bottoms to carry on their commerce in those seas, 'till the Dutch obtained a peace with the Algerines, whereby we lost one great advantage that belonged to the navigation of Great-Britain, which we before enjoyed, whilst those merchants made use of English ships, finding it dangerous to venture their estates in any other.

(9.) Because, laying aside all other considerations, there cannot be a stronger proof of the importance which the possession of this place hath proved to us, than that it hath been a formidable check to the naval power of France, from the hour of our taking it, to the conclusion of the last French war: nor, indeed, could they ever send any naval stores round about into those seas, without an apparent danger of their falling into our hands in going through the Straights; so that the greatest part of their fleet hath thereby, as it were, become useless ever since. And, had not such unhappy misunderstandings fell out as did between two admirals in the late war, we should have more feelingly experienced the invaluable benefit of this possession.

(10.) Because it's proximity to Cadiz, the great mart and center of almost all the riches of Spanish America, gives us the greatest opportunity of commanding that port, and the trade frequenting it from the West-Indies; which, in time of war with Spain, may be reckoned of no small consideration or importance.

(11.) Because, as the advantages of Gibraltar which result to this kingdom from the foregoing particulars, are fully confirmed and demonstrated by the experience of many years past, so the preservation of it, at all times, is of much greater concernment than it ever was before, as will appear by considering the present state of public affairs: that many capital manufactures are springing up in most parts of Europe, and particularly in France and Spain, and that several other powerful states are endeavouring to vie with us in commerce and a maritime force; which ought to put us on the strictest guard, and determine us not to part with a place which is manifestly of so much advantage, by securing and improving our own trade and navigation, as well as by defeating the attempts of our enemies and rivals therein.

(12.) Because the Spaniards continue their unjustifiable captures and depredations on our logwood trade in America, which they have more or less done for these thirty years past; and that, if we part with Gibraltar, we have reason to believe that the same fate may attend our whole Mediterranean trade, to it's absolute ruin and destruction. See the articles LOGWOOD and SPANISH AMERICA.

(13.) Because Spain and France in conjunction, if not others, will ever have their eye upon this possession, in order to wrest the same out of her hands, to ruin the whole maritime power of Great-Britain.

(14.) Be-

(14.) Because Gibraltar lies in hand to intercept their East and West-India fleets, with the spoil and riches of both worlds: it separates and divides Spain from itself, and hinders all communication by sea from the different parts of their dominions, and, consequently, must keep them in a perpetual dependance, and put them under a necessity to court our friendship, as well as fear our enmity: it gives us an opportunity to pry into all their measures, observe all their motions, and, without the most stupid remissness on our part, renders it impracticable to them to form any projects, or carry on any expeditions against us or our allies, without our having due notice.

(15.) Because it will ever check the rise of the naval power of France, which can never be above our match at sea, whilst Gibraltar remains in our hands. It hinders the communication between their ports and squadrons in the ocean and the Mediterranean: it makes it impossible for them to supply their southern harbours with naval stores either for building or repairing of fleets; of which they were so sensible in queen Anne's war, that, as soon as Sir George Rook had possessed himself of it, they saw themselves under a necessity to lay aside their usual caution, and dare him in open battle; and, not meeting the success they hoped for, the very same year, to the unspeakable prejudice of their other affairs, besieged it in form, and lost a French and Spanish army before it, and never afterwards appeared with a fleet upon the seas again during the whole war, but suffered their great ships to moulder and rot in their harbours, for want of the means to fit them out again.

(16.) Because long experience has evinced, that we can never, with security, depend on the faith of France; and, therefore, if Britons are determined never to become vassals to the dominion of that crown, they can never part with any thing that is so substantial a preservation of their maritime power, and consequently of their liberties and properties, as that inestimable fortress of Gibraltar.

(17.) Because it appears throughout this work, from a series of facts incontestible, that the commerce and navigation of France have been increasing ever since the time of that great and able French minister Mons. Colbert; and that they are now settled upon so broad a bottom, and with such peculiar and extraordinary advantage for their daily rise and encouragement, that, if Great-Britain gives up Gibraltar, she may be so eternally imbroiled in wars with that nation, as to increase her national debts and incumbrances to a degree so enormous, that her whole trade must inevitably sink under them.

(18.) Because the possession of Gibraltar will always give us reputation and figure in those seas, which are always rewarded with power and riches. It will oblige all nations who trade in the Mediterranean, or have empire there, to court our friendship, and keep measures with us. It will awe even the courts of Rome and Constantinople, and make them afraid to disturb or provoke us.

(19.) Because the charge and expence of keeping Gibraltar bears no proportion to the advantages we reap by it, and the detriment and injury our trade and navigation must sustain, if ever we part with it.

(20.) Because PORT-MAHON, cannot possibly answer all the purposes of Gibraltar: which must be evident to any one, who but looks into the map; for the island of Minorca lies many hundred miles further up towards the gulph of Lyons, and, in truth, out of the road of all ships trading to Sicily, the Adriatic, the Levant, or Africa. It is situated at such a distance from France and Spain, that the greatest fleets can escape unobserved, unless we keep perpetually before their ports to watch and pursue them; which is exceeding dangerous, if not impracticable in those seas. We shall be out of the way of all intelligence. And, if we should by chance have it, in all likelihood, shall be too late to take advantage of it; besides, I am told, there are but few winds with which ships can get in or out of Port-Mahon; and, when they are once there, the passage is so narrow, that a very small squadron can keep the greatest from failing out.

(21.) Because nothing is plainer, than that it will be exceeding difficult, if not impossible, to keep the island of Minorca without the possession of Gibraltar; at least it will be more expensive to us than both are now, especially if France and Spain should join again; which event, I think, we ought to keep always in view, for then Gibraltar will be the only resource we have to carry on any trade in the Mediterranean, and to prevent the union of the French and Spanish fleets with themselves or each other.

(22.) Because all the objections, made against the facility of a communication of the different ports of France and Spain with one another, will be stronger against us; for they have others near to Gibraltar, where fleets may lie safe, and have a chance to escape us, by catching at favourable opportunities, and the advantage of winds; whereas we must run all hazards, and trust to our strength alone, without any harbour to retreat to, in case of storms or other accidents.

(23.) Because we have no means of sending naval stores and recruits to our garrisons, and often provisions for them, without a port to protect us during a thousand leagues sailing. Portugal will not be suffered to receive or relieve us, and

then we must run the gauntlet by single ships, with scarce a chance to escape, or send convoys upon the smallest occasions, capable of fighting the united French and Spanish power.

(24.) Because we ought not to be surprized, if the nations of Europe and Africa should wish it in hands less potent at sea, and who would consequently enjoy it more harmlessly to its neighbours: it must be undoubtedly terrible to any people who would be our rivals in trade or naval power, or indeed to any state that aspires to empire, which can never be accomplished without fleets as well as armies.

(25.) Because we are not fallen into such contempt with our enemies, our neighbours, or our allies, nor can they have so mean an opinion of our sense and discernment, and the integrity of our statesmen, as even to hint such a thing to them.

(26.) Because, if we part with Gibraltar, to what purpose have we made war? To what purpose bestowed great sums, and gained great victories? Did we beat the enemy, and force them to beg peace, and yet must bribe them to accept of it? Have we conquered, and shall they give terms, and get towns by losing battles? Or, if we do not part with Gibraltar for the sake of peace, pray what consideration are we to receive for the sake of Gibraltar? What can be given as an equivalent?

(27.) Because there can be no substantial reasons to take such a thorn out of the foot of Spain and France, and to remove such an obstacle to their greatness: the enterprising genius of the latter is as well known, as it is formidable to all its neighbours, but in particular to us. And Spain, it is also well known, are taking large strides to raise manufactures and maritime power. I would ask, in case of a new rupture, what resource have we but in our fleets, and by the help of Gibraltar, to make it impracticable for their squadrons in the ocean and Mediterranean to join? We know, by woeful experience, what help we are to expect from our allies, when we have no more millions to give. We are not able to keep great standing armies at home, nor is it consistent with our liberty to do so; and therefore we ought to take every measure to increase our naval strength, and to put new bridges upon those who are, or may soon be, our rivals therein.

(28.) Because the nation in the world whose power we have most reason to guard against, is that of France; and yet I don't know by what fatality it has often so happened, that we have been the unhappy instruments of promoting it. Oliver Cromwell gave the first rise to its greatness at land, and king Charles II. at sea: the late queen, by an ignominious peace, restored it, when it was reduced to the lowest extremity, and must have submitted to any conditions she had thought fit to impose. But sure it will never be said that any British ministry, who profess to be the patrons of liberty, the constant and declared enemies of those proceedings, should act so far in defiance of all their known principles, as, voluntarily and unconstrainedly, to throw away any part of that national security, which former betrayers purchased at the expence of their country's honour; and which are the only rewards and recompence of a tedious, successful, and glorious war, carried on at an immense expence of blood and treasure, of which we and our posterity shall long feel the severe effects.

(29.) Because there seems to be more reason for our being tenacious in preserving this possession, at this time, than there ever was since we had it; for it is to be feared, that we are the only maritime power that must alone stand against those of France and Spain, and such allies as they shall be able to influence; since our old and natural allies, the States-General of the United Provinces, do not appear either to be able, or so sanguinely inclined as heretofore, to unite with Great-Britain, and act with vigour, when occasion may require.

(30.) Because it should seem that another naval power is about to arise, by their establishment of a great East-India company*, the weight of whose power both by land and sea, is more likely to be thrown into the scale of France and her allies, than into that of Great-Britain and hers.

* When the Ostend East-India company was some years since established, the Dutch acted vigorously in concert with Great-Britain to effectuate its abolition, and did so. How it comes to pass, that times should be so changed within these few years, as to suffer another company of the like kind to be established, without any attempt to its annihilation, we leave those to ruminate on, whom it may one day nearly concern to think of. See the article OSTEND COMPANY.

(31.) Because the Spaniards (if I am rightly informed) give more encouragement, by certain artifices, to the French in their trade, by the way of Old Spain to New Spain, than they do to the English; and that, in consequence thereof, our commerce in that channel declines, while that of France increases: and also that the Spaniards seem to favour the French more in the South-West-India trade, which they carry on from their colonies, than they do either the English or the Dutch in theirs.

(32.) Because the treatment of the English in particular, by the Spaniards at present in America, is said by some to be with a view to compel us, at length, to give up Gibraltar; which,

which, for that very reason, we ought to be the more sanguine to preserve.

(33.) Because Great-Britain has already done enough in favour of the court of Spain without sacrificing Gibraltar, to induce them to desist from their obstruction to our trade and navigation to and from our own colonies, even if they were really as unjustifiable as the Spaniards themselves have mistakenly represented them. [See the articles LOGWOOD, and SPAIN.]

The conduct of Great-Britain towards Spain, in order to influence them to preserve that good understanding, which is so apparently requisite for the reciprocal benefit of both nations, is notorious to the whole world, and may be chiefly comprehended under two articles. (1.) Our making two sovereigns in Italy to oblige the court of Spain; and (2.) Our giving up the assiento contract, and liquidating the affairs of the South Sea company, upon terms so advantageous to Spain, and so detrimental to Great-Britain in general, and the South Sea company in particular. See the articles ASSIENTO, and SOUTH SEA COMPANY. And, if Great-Britain should even acquiesce to the creating of a third sovereign to gratify the insatiable ambition of a certain p——s at I——so, and to give up Gibraltar also, what security should this nation have, that her logwood trade, and other navigation in America, should remain uninterrupted? Does not the system of that court for above these 30 years shew, that we are never to expect any such security, 'till we have a Gibraltar for that purpose in America? See the article WEST-INDIES, where we shall endeavour to shew how easily that might have been accomplished, and still may.

(34.) Because men in power will always know, that a fortress conquered by the fleets and armies, by the blood and treasure of England, and solemnly yielded up by treaty made with England, becomes part of the English dominions, and subject to the legislative power of England, and could not be disannexed but by act of parliament; and, consequently, any agreement to deliver up such a fortress to an enemy, is high treason within the statute of the 25th of Edward III; and to give it to any one else is one of those high treasons reserved by that act for the judgment of parliament.

For more reasons, if more should be required, to induce us never to give up GIBRALTAR, see the articles FRANCE and SPAIN, and all other articles, which tend to shew the nature and extent of their power and commerce.—For the particular state of the trade carried on through the Mediterranean Sea, see the articles ARCHIPELAGO, GENOA, LEVANT TRADE, NAPLES, ORIENTAL TRADE, TURKEY TRADE, TUSCANY, VENICE.

Note, The discerning reader will easily believe, from the preceding summary heads of argument, that we could have wire-drawn them to a great length, if we were not rather studious of communicating as much matter as we can in the fewest words, than to act the contrary part.

REMARKS ON OUR ARTICLE MEDITERRANEAN SEA, before the last war.

One part of the grand system of the court of Spain, in the time of Alberoni, was to preserve the rights of Spain and of the house of Parma to Spanish princes; and to make a settlement for Don Carlos and Don Philip worthy of their birth, out of the states which the emperor possessed in Italy: and has not this part of the system been steadily and successfully pursued? But how could these sovereignties be effectually secured, says a certain prince, without the possession of Gibraltar? This, therefore, was a point to be gained, in order the better to secure the other. The system, at present in Spain, is bottomed on the same principles; it is not only to provide for a third prince in Italy, or elsewhere, but to fall upon the establishment of manufactories, with a view to supply their extended American colonies themselves, instead of taking them from the other nations of Europe. Will not this affect Great-Britain, in proportion to what she now supplies Spain with? Some late accounts from Spain tell us, that it appears, by an authentic list of the ships which entered the Spanish ports last year, their number amounted to 1142: of which 643 were English, 277 French, 148 Dutch, and 74 of different nations.

Supposing this to be true, some people may infer from hence, perhaps, that the trade of England must be far superior to any of the rest: so it is, indeed! But what sort of trade are we carrying on with that nation? We are sending 6 or 700 ships or more, I am certain, annually to purchase their wines and their fruits, while France sends between 2 or 300 to carry their own manufactures. If this be the case, does not France, therefore, gain far more by their smaller quantity of shipping, than we do by double the number? The fact is, that we decline in our exports to Spain, and increase in our imports; while France increases in their exports to Spain, and decrease in their imports from thence. Is this then a nation from whom we are still to bear insults and depredations? Have they not allured away our manufacturers and shipwrights out of the kingdom, with a view to turn the hands of our own artists against us?

VOL. II.

That our readers may have a just idea of the measures which Spain are really pursuing at this time, which must inevitably tend to the detriment of the British commerce, as they shall advance that of the Spaniards; we refer them to the articles BISCAY in Old Spain, CATALONIA, DUTCH AMERICA, INDIA-HOUSE OF SPAIN, LOGWOOD TRADE, SPAIN, WEST-INDIES. What is urged under these heads, and in divers other parts of this work, will enable us to judge, whether it can ever be advisable to acquiesce in the giving up Gibraltar; and especially so, if we add to these considerations what we have said also under the articles BRITISH AMERICA and FRANCE; because we shall there see, that SPAIN is now following the example of France, in order to ruin the commerce and navigation of these kingdoms: for the system of the two courts seems really to be what is said in a tract lately printed, called the Political Testament of cardinal Alberoni. 'While the navy of the two crowns [meaning those of France and Spain] says the writer, is not superior to that of the English and Dutch together; while MINORCA and GIBRALTAR are not in possession of the proper masters; while DUNKIRK is not raised from the state to which it was reduced by the treaty of Utrecht, a descent on the coast of ENGLAND and IRELAND, will be always ineffectual, &c.'

Of the CUSTOM-HOUSE affairs in relation to the Mediterranean trade.

I. If a ship be bound to any port in Portugal or Spain, or to any port on the Christian shore in the Mediterranean Sea, a bill of health must be granted at the loading port, or else the persons on board will not be permitted to come on shore in any of the said ports, 'till they have performed quarantine: the form of which bills of health must be as follows:

Portus Southamptoniæ,

Omnibus Christi fidelibus, ad quos presentes literæ pervenerint. Nos ministri serenissimi principis domini nostri Georgii secundi regis, in portu Southamptoniæ, in regno Magnæ Britanniciæ, salutem. Cum pium sit & honestum veritati testimonium perhibere, ne error aut deceptio præjudicii ipsam opprimat: cumque navis nuncupata Diligentia, de Briskolia, cujus naclerus (sub Deo) est Henricus Hopkins, quæ jam parata est e dicto portu discedere, & abhinc (Deo volente) ad Italiam, & alia loca transmarina, cum viginti hominibus in eadem nave appellare. Hinc est, quod universitati vestræ tenore præsentium innoteffimus, fidemque indubitam facimus, quod (Deo optimo maximo summa laus attribuat) in hoc dicto portu, nulla pestis, plaga nec morbus aliquis periculosus, aut contagiosus, ad præsens existit.

In cujus rei testimonium, sigilla officii nostra apponi fecimus, Datum hoc in regio telonio prædicti portus Southamptoniæ, decimo die Februarii, anno salutis Christianæ, secundum computationem ecclesiæ Anglicanæ, millesimo septingentesimo tricesimo primo, annoque regni dicti serenissimi domini nostri Georgii secundi, Dei gratia, Magnæ Britanniciæ, &c. regis, fidei defensoris, &c. quarto.

A. B. Collector,
D. E. Comptroller,

* If the ship be British, and comes from any part of the Mediterranean Seas, beyond the port of Malaga, and hath two decks, and both carry sixteen guns mounted, with two men for each gun, and other ammunition proportionable (which is called an act or qualified ship) or if one moiety of her full lading outwards, the last voyage, was fish, laden in any of his majesty's dominions; the goods imported in such ships are not liable to the duty of one per cent. which is payable when ships are not so qualified, or laden with fish: therefore in these cases, after the places names, there must be added as follows, viz.

* 14 Car. II. cap. 11. § 35, 36.

If the ship be qualified.—Which said ship has double decks from stem to stern, with sixteen [or more, as is the case] guns mounted, and other ammunition proportionable.

If the ship went out with fish.—Which said ship went out from Yarmouth to Leghorn this last voyage thither, full laden [or at least one moiety of her full lading] with fish of British taking and curing, and delivered the same at the said port of Leghorn.

But, if a ship that is not qualified, or was not laden outwards with fish, has taken in some part of her lading beyond the port of Malaga, and some on this side; the different places where the goods were taken in must be particularly distinguished in the report, as indeed in strictness should be practised in all cases where a ship loads at several ports: which distinctions may be made as follows:

Taken in at Leghorn,

A. B.—1 a 5—5 Cakes—Silk—Andrew Bird.

Taken in at Cadiz,

B. C.—8, 9—2 Bales—Kid skins—Benj. Crofs.

And, if the goods are such, that they are liable to forfeiture, or subject to a different duty, upon account of the

H h h place

place at which they were taken in; the truth of their being taken in, at the particular place alledged by the master, must be confirmed, by making the following addition to the oath of his report, viz.

And that the goods above-mentioned to be taken in at— were really there laden on board, and were not landed at —, nor any other place whatsoever, but have been kept on board the above ship, ever since the first shipping thereof at—.

MEDITERRANEAN PASSES.—Counterfeiting, altering, or erasing them, or knowingly uttering or publishing such counterfeited, altered, or erased passes, is felony without benefit of clergy. 4 Geo. II. cap. 18. §. 1.

MELLI, with the country of the **MUNDINGOES**, in Africa. The country formerly called Melli, now chiefly inhabited by the Mundingoes, who still retain pretty much of the character ascribed to the people of Melli, lies to the south of the river Gambia; on the west it borders on the kingdom of Kabo, on the south it has Melli properly so called, and the mountains that part it from Guinea, and on the east it extends to the kingdom of Gago.

A great part of this country we are little acquainted with, as is the case with regard to most of the inland territories of Africa, but towards the sea-coast this country is a little better known.

The first place of note we meet with is, **KACHAO**, a Portuguese colony, situated on the river of St. Domingo, which falls into the sea about 26 leagues below this town.

About 26 leagues above Kachao, on the same side of the river, is another trading town called **FARINI**, where, in the months of October and November, one may trade for about half the quantity of wax and ivory, which is traded for at Kachao. Here are also some slaves to be bought.

BOT is a village near the mouth of the river Gefves, where most of the traders buy rice, which is in great plenty there, and very good.

GESVES is a village on a river of the same name, on which the Portuguese have a factory. At Gefves one may trade yearly for 250 slaves, 80 or 100 quintals of wax, and as many of ivory.

Near the mouth of the river of Gefves, is a village called **KUR-BALI**, where there is a considerable trade for salt: here are also fold some slaves and ivory.

RIO GRANDE, or the **GREAT RIVER**, runs about 10 or 12 leagues to the south of the river of Gefves. About 80 leagues from the mouth of it is a nation of negroes, who are good traders in ivory, rice, millet, and some slaves. They are called Analons.

Over-against the mouth of Rio Grande, is a cluster of islands called Billago Isles, the most considerable of which is **CASA-OUT**, being about six leagues long and two broad: it's soil is very good, and produces millet, rice, and all kinds of pulse, besides orange and palm-trees, and many others. This island, with these of **CARACHE**, **CANABAC**, and **LA GALLINA**, are the only ones where the Europeans may trade with some security. They trade, however, sometimes at the other islands, but they must be extremely cautious; and yet, after all their precautions, they will be robbed and murdered, if they venture to go ashore.

The river **NUNHO**, runs 16 leagues to the south of Rio Grande; it is very considerable, and comes from a vast distance in land. One may buy here 300 quintals of ivory, and 100 slaves a year. Rice grows here admirably well, and is very cheap. There are every-where sugar-canes, which grow naturally, and plants of indigo, which might turn to good account. The trade is carried on here from March 'till August.

In the river of Sierra Leone, the late Royal African company of England had, in the year 1728, two islands; the one, called **TASSO**, a large flat island, near three league in circumference, in which the company's slaves had a good plantation: the rest of the island is covered with wood, among which are silk cotton-trees of an unaccountable size.

The other island is **BENSE**, whereon stood a regular fort. It was formerly the residence of one of the English chiefs. For more matter relating to the African trade, see the articles **AFRICA**, **AFRICAN ISLANDS**, **ENGLISH AFRICAN COMPANY**, **FRENCH AFRICAN TRADE** and **COMPANY**, **PORTUGUEZE AFRICAN TRADE**. See also **BRITISH** and **FRENCH AMERICA**.

MENSURATION.

Under the article **ARITHMETIC**, we have given the whole art, both in rationale and practice, within the compass of a few pages; which, if well understood, what we have to add, can be no difficulty.

Of the customary way of taking dimensions, and measuring the several artificers works concerned in building.

As there are several sorts of work in building, which require the dimensions to be taken in feet and inches, for finding the superficial, or solid content thereof, before we proceed to treat of the measuring the several artificers works, it will be necessary, first, to shew how to multiply feet and inches by

feet and inches duodecimally, vulgarly called crofs multiplication. For the better understanding of which, observe the following rules:

That, if feet are multiplied by feet, the product is feet.

If inches are multiplied into feet, every 12 of the product is one foot, and any number less than 12 are inches.

If inches are multiplied into inches, every 12 of the product is one inch, and any number less than 12 are parts of an inch.

If parts of an inch are multiplied by feet, every 12 of the product is one inch, and any number less than 12 are parts of an inch.

If parts of an inch are multiplied by inches, every 12 of the product is one part, and any number less than 12 are seconds.

If parts of an inch are multiplied by parts, every 12 of the product is one second, and any number less than 12 are thirds.

CASE I.

To multiply feet, inches, and parts, by parts.

Rule. First, Place a cypher under the last place of the multiplicand, instead of an integer, and also another cypher in the place of inches, and then the parts next following to the right-hand.

Secondly, Multiply the parts of the multiplier in the multiplicand, carrying 1 for every 12.

EXAMPLE I.

Multiply 7 feet 6 inches and a half, by a half inch, or 6 parts. Note, That for a quarter of an inch you must set down 3, for half 6, and for three quarters 9; those numbers being the quarter, half, and three quarters of 12.

OPERATION:

6 Times 6 is 36, the twelves in 36 is 3 F. I. P.
times, and nothing remains, therefore set 7 6 6
down 0 and carry 3; and 6 times 6 is 36, 0 0 6
and 3 I carry is 39, set down 3 and carry 3;
then 6 times 7 is 42, and 3 I carry is 45, 3 9 3 0
the twelves in 45 is 3 times, and 9 remains.
Now, as the whole multiplication is ended, set down the 9
that remains under the parts, and 3 under inches, the number
of twelves is 45, and the whole product is 3 inches, 9
parts, and 3 thirds.

CASE II.

To multiply feet, inches, and parts, by inches and parts.

Rule. First, Place a cypher under the last place of the multiplicand, instead of an integer, and the inches and parts in their places towards the right-hand.

Secondly, Multiply the parts into the parts, inches, and feet, and carry one for every 12.

Thirdly, Multiply the inches into the parts, inches, and feet, in the same manner; and, in adding the products, carry 1 for every 12, from one denomination to the other, and the sum will be the product required.

EXAMPLE II.

Multiply 15 feet, 7 inches, and 3 parts, by 9 inches 4 parts.

OPERATION.

First 4 times 3 is 12, that is 0 and carry F. I. P.
1; 4 times 7 is 28, and 1 I carry is 29, 15 7 3
set down 5 and carry 2; 4 times 15 is 60, and 2 I carry is 62, set down 2 and
carry 5, which set under the next deno-
mination. 5 2 5 0
11 8 5 3
Secondly, 9 times 3 is 27, that is 3 and
carry 2; 9 times 7 is 63, and 2 I carry is 65, set down 5 and carry 5; 9 times 15
is 135, and 5 I carry is 140, the twelves in 140 is 11, and
there remains 8; set down the 8 under the inches, and 11
under the feet, and then add the two products together, and
the sum will be 12 feet, 1 inch, 7 parts, and 8 thirds, the
product required.

CASE III.

To multiply feet, inches, and parts, by feet, inches, and parts, when the feet of the multiplicand and multiplier do not exceed 20.

Rule. First, Place the feet of the multiplier under the feet of the multiplicand, and the inches and parts in their places to the right-hand.

Secondly, Multiply the feet, inches, and parts of the multiplier, each separately into the parts, inches, and feet of the multiplicand, as before in the preceding rules; and their several products, being added, will be the true product required.

EXAMPLE III.

Multiply 12 feet, 9 inches, and 5 parts, by 9 feet, 20 inches, and 2 parts.

M E N

OPERATION.

First, 2 times 5 is 10, set down 10 and carry 0; 2 times 9 is 18, set down 6 and carry 1; 2 times 12 is 24, and 1 carried is 25, set down 1 and carry 2, which set down.
Secondly, 10 times 5 is 50, that is 2 and carry 4; 10 times 9 is 90, and 4 carried is 94, set down 10 and carry 7; 10 times 12 is 120, and 7 carried is 127, the twelves in 127 is 10, and 7 remains, which set down.
Thirdly, 9 times 5 is 45, that is 9 and carry 3; 9 times 9 is 81, and 3 is 84, which contains 12 7 times, and 0 remains, set down 0 and carry 7; 9 times 12 is 108, and 7 carried is 115, which being the last figure to multiply, set down the whole product; and, lastly, add the three products together, and their sum will be 125 feet, 10 inches, 8 seconds, 8 thirds, and 10 fourths.
Having by this time, I hope, sufficiently instructed the reader in the multiplication of feet and inches, by feet and inches, I shall in the next place proceed, as I proposed, to the measuring the several artificers works concerned in building. And,

I. Of CARPENTERS WORK, &c. to measure:

The works done by carpenters, are chiefly framing of houses, barns, stables, floors, partitions, roofs, &c. making of doors, windows, stair-cases, cornishes, frontispieces, modillion-cornices, cove-eaves, and boarded floors of all sorts, weatherboarding, and boarded and cleft pale fencing.

1. To measure the body of a timber building, viz. of a house, barn, or stable, &c.

This sort of work is done by the square, containing 100 superficial feet. In measuring the outside carcase of a house, &c. take the length of one side and one end, and add them together, and their sum, multiplied into the height taken from the under-side of the sill, to the upper side of the rafting, gives the content of one side and one end; which, being doubled, is the content of the whole body, or outside carcase of the building, in feet.

To bring the content found into squares, divide the product by 100, or cut off from the product two figures to the right-hand, and the remaining figures are so many squares, and the figures cut off are feet.

EXAMPLE IV.

Suppose a house, &c. 40 feet long, 20 feet wide, and 20 feet high, how many square of framing is contained in the body or outside carcase of the said house, &c.

OPERATION.

Add 20 feet the breadth to 40 feet the length, and the sum is 60, which multiply by 20 feet, the height, the product is 1200, the content of one side and one end; which being doubled, or multiplied by 2, gives 2400 feet for the content of the whole body or outside carcase, in feet: from which, if you cut off 2 figures to the right-hand, there remains 24, the number of squares required.
Note, That in framing there are no deductions to be made for doors, windows, &c. in the measuring.

2. Of roofs. This sort of work is also done by the square of 10 feet squared, or 100 superficial feet, the particular to be observed in measuring of which is, that let the roof be true pitch or not, and the ends thereof gable or slipped, they may be either of them measured by this general rule, viz. Multiply the length of the building by the length of the rafter, and twice that product is the content in feet.

EXAMPLE V.

In the aforesaid building of 40 feet long by 20 feet wide, admit the roof to be true pitch, viz. the length of the rafter, equal to $\frac{5}{4}$ of the breadth of the building, or 15 feet.

OPERATION.

Multiply 40 feet, the length of the building, by 15 feet, the length of the rafter, and the product is 600 feet, the content of one side; which doubled, or multiplied by 2, the product is 1200 feet, or 12 square, the content of the whole roof.
3. To measure the gable end of a house, &c. observe this rule, multiply the perpendicular by half the base or breadth of the building, or the whole base by half the perpendicular, and the product is the content.

M E N

In the gable end of the above-mentioned roof, the perpendicular is 11 feet 2 inches near, and the base 20 feet, what is the content?

OPERATION.

Multiply 20 feet, the whole base, by 5 feet 7 inches, half the perpendicular, and the product is 111 feet, 8 inches, which is 1 square, 11 feet, 8 inches, the content required.

4. Note, That the same rule will hold good for measuring the hip end of a roof, by observing that the length of the rafter in this case is the perpendicular.

N. B. The rafters, feet, and eaves-board, are measured at per foot, running.

5. Of floors. In naked flooring allow 9 or 10 inches for the length of the joist laid into the wall, or measure to the extremity of the joist, and from thence compute the squares contained therein.

6. In boarded flooring you must take your dimensions to the very extreme parts, and from thence compute the squares, out of which you must make deductions for stair-cases, chimnies, &c.

7. Weather-boarding is done by the yard square, and sometimes by the square, containing 100 superficial feet.

8. Framed partitions. The particular to be observed therein, is only that they are measured by the square.

9. Boarded partitions are also measured by the square, out of which, you must deduct the doors and windows contained therein, except they are agreed to be included.

10. Of windows. Windows are generally made and valued by the foot, superficial measure, and sometimes by the window. When they are measured, the dimensions must be taken in feet and inches, from the under side of the sill, to the upper side of the cap-piece, for the height; and for the breadth from outside to outside of the jambs; and the product of the multiplication is the superficial content.

11. Stair-cases are measured by the foot superficial, and the dimensions are taken with a string, girt over the raider and tread, and, that length or girt, multiplied by the length of the step, the product is the superficial content.

12. Door-cases are measured by the foot superficial, and the dimensions must be taken with a string, girt round the architrave and inside of the jambs, for the breadth; and, for the length, add the length of the two jambs, to the length of the cap-piece, taking the breadth of the opening for the length thereof, and the product of their multiplication is the superficial content.

13. Frame-doors are measured by the yard square, containing nine square feet, and, if of whole deal, they are allowed work and half work, or double work, if of two inch stuff, in consideration of their being wrought on both sides.

14. Note, The same is to be said in regard to the measuring and valuing of window-shutters, as of doors.

15. Modillion cornices, coves, &c. are generally measured and valued by the foot superficial. Their dimensions, in respect to the breadth or height, are taken with a string, girt into the mouldings, and those dimensions, multiplied by the length, is the superficial content.

16. Fencing of all sorts is done by the rod, lineal measure, containing 16 feet and a half.

17. Wainscoting or joiner's work. Wainscoting is a work generally done by joiners, and is measured by the yard, square, and their dimensions are taken in feet and inches. Thus, they girt down every moulding with a string, contained between the floor and ceiling, for the height, and the circumference of the room for the length, deducting the doors, windows, and chimney. The seats of windows, checks, sophetas, linings, &c. are all to be taken by themselves, and doors and window-shutters are to be measured and valued as at number 13 and 14 hereof.

18. Frontispieces are measured and valued by the foot superficial, and every part thereof measured separately, viz. the architrave, frieze, and cornice, each of them by themselves, also the pilasters or columns by themselves, and, lastly, add all the several measurements together, and the product is the content of the whole.

Note, That, in taking the dimensions, you must girt the moulding with a string.

II. Of BRICKLAYERS WORK to measure.

The principal work in a building done by bricklayers, is walling, tileing, rough-casting, &c.

1. Of brick walls. What is to be observed therein is, that the measure by which brick-work is measured is a square rod, or 16 feet and a half squared, whose product is equal to 272 feet and a quarter, the content of one rod of brick-work at the statute thickness of one brick and a half: and, if the wall is more or less than that thickness, it must be reduced thereto by this rule: multiply the number of feet contained in the superficial content of the wall, by the number of half bricks that

that the wall is in thickness, and divide the product by 3, and the quotient is the true content required.
 Note, That, although there be 272 feet and a quarter in a rod of brick-work at the standard thickness, yet workmen measuring brick-work always reject the quarter, and divide by 272 only.

E X A M P L E I.

How many rods of brick-work are contained in a wall 40 feet long, 8 feet high, and 2 bricks thick?

Feet.
 Length 40
 Height 8
 ———
 320 feet in the superficial content of the wall
 Half bricks 4
 ———
 3)1280(426 feet $\frac{1}{2}$, the superficial content reduced, which to bring into rods, divide the 426 feet by 272, and the quotient will be rods; and, if the remainder be divided by 68, the feet contained in a quarter of a rod, the quotient will be quarters, and the last remainder feet.
 8
 6
 ———
 20
 ———
 2 Note, That the $\frac{3}{4}$ remaining in the first work is equal to 8 inches.
 272)426(1 rod.
 272
 68)154(2 quart.
 136
 18 feet.
 The whole reduced content of a piece of brick-work 40 feet long, 8 feet high, and 2 bricks thick, is 1 rod, 2 quarters, 18 feet, 8 inches, as required.

When you measure brick-work, observe to measure every thickness by itself, and that you make every deduction out of it's proper thickness; also, that, when you measure two walls that constitute an angle, the length of one must be taken to the outside, and the other to the inside.

2. Chimnies must be measured and valued as a solid wall, out of which deduct the vacancy between the jaumbs and the mantle; the funnels are allowed solid, in regard to the trouble of them, and the pargetting the inside. This of square chimnies.

3. Angle chimnies, such as stand in a square corner, and are equal each way from the corner, observe this rule: multiply half the breadth of the breast, or front, by the height of the story, and that product by the number of half bricks contained in the inches of the half breadth of the breast, or front, and divide this last product by 3, and the quotient will be the true reduced content in feet, out of which must be deducted the vacancy as in square chimnies.

4. If the chimney do not stand equal from the corner of the room on both sides, or the corner be not square, it is usual to lay out the angle parallel to the walls, and take one side of the angle, and multiply by the height of the story, and half the other side of the angle for the thickness; then proceed in every respect as before directed, and it will give the true reduced content required.

Remember to measure the trimmers that support the hearths, taking the length by the girt of the arching of them, accounting them half a brick thick; so that if they are 6 feet long, and 1 foot 6 inches girt, there is 3 feet of reduced brick-work therein.

E X A M P L E II.

Suppose a chimney that stands in the corner, or angle of a square room, be 7 feet in front, and the height of the story 9 feet 6 inches, and the opening 3 feet square, and 18 inches deep, how many feet of reduced brick-work is contained therein?

feet. inches.
 9 6 height of the story
 3 6 half the front
 ———
 4 9 0
 28 6
 ———
 33 3 0
 9 half bricks in 3 feet 6 inches, or half the length [of the front
 3)299 3 0(99 1 quotient
 27
 ———
 29
 27
 ———
 2 equal to 8 inches.

feet.

3 } the opening
 3 }
 ———
 9
 4 half-bricks deep
 ———
 3)36(12, reduced feet in the opening to be deducted
 6
 ———
 0
 99 9, the reduced content of the chimney
 12 0, opening to deduct
 ———
 87 9 remains, the content required.

By the above operation, it appears there are 99 feet 9 inches of reduced brick-work in the chimney; for, there being 99 feet 1 inch in the quotient, the 2 that remains is equal to 8 inches, being two-thirds of the divisor, which, added to the 99 feet 1 inch, makes it 99 feet 9 inches in the whole; from which if you subtract 12 feet, the content of the opening, there remains 87 feet 9 inches nett brick-work, for the content required.

5. Besides this rough brick-work, there is other kind of walling performed by foot-measure, and such are facio's, arches over doors, windows, &c. architraves, friezes, cornices, rustics, returns, &c. piers, columns, pilasters, &c.

6. Tiling is measured by the square of 10 feet, as carpenters measure their roofs. You must observe, in taking dimensions of tiling, that you measure the whole length, that is, as far as the tiles are laid, for your length, and take from the ridge to the eaves for your breadth, and thereby you will have the true content required. When many hips and vallies happen in a roof, every foot remaining must be added to the measure as square feet.

Note, Observe to deduct the chimnies out of the tiling.

7. Thatching is a work performed by the square, and is measured the same as tiling.

8. Besides all the above work, there comes to the bricklayer's hands the paving of kitchens, cellars, &c. with brick, or paviours, which work is measured by the yard square, containing 9 square feet.

III. Of PLAISTERERS WORK to measure.

Rough-casting, plaistering, ciellings, &c. are done by the yard square, and the dimensions taken in feet and inches.

The principal things to be observed in measuring of which are as follow:

1. To make deductions for chimnies, windows, and doors.
2. To make no deductions for rendering upon brick-work, for doors and windows, by reason the jaumbs and heads generally exceed the vacancies.
3. If the workmen find materials for rendering between quarters, you must deduct one fifth for quarters, bafes, &c. but, if workmanship only is found, you must measure the whole as whole work, for the workman could have performed the whole much sooner, if there had been no quarters.
4. That such summers and girders as lie below a cielling be deducted, if the workman finds materials, otherwise not.
5. In measuring of whitening and colouring between quartering, there must be a fourth part allowed extraordinary, for the returns of the quarters, or take the length with a string, and so girt the quarters, which is the truest way.

IV. Of MASONS WORK to measure.

1. Masons work, which is measured by foot measure, either lineal, square, or cubical. The principal thing to be observed herein is, that they girt all their mouldings as joiners do, and take their dimensions in feet, inches, and parts.

The solids are blocks of stone, marble, or any kind of stone, columns, cornices, &c. the superficies are pavements, slabs, chimney-pieces, and the like. It is to be observed, that masons first measure the cube of the stone, and their superficial plain work, also superficial moulded work (if any) as follows: First, They account all such stones as are above two inches thick at so much per foot, solid measure, and, for the workmanship, they measure the superficies of the stone, but then they measure no more of the stone than what appears without the wall.

But, as their method of measuring is not so well understood by many as some others, it may be proper to give an example how to measure a chimney piece, as a guide to all others.

First, then, take the length of the mantle, or head-stone, and the slab (whose extent is generally the same) for one sum of the dimensions, and the breadth of both add together, with an inch or more for the under edge of the mantle, and half an inch (or whatever it is) for the upper edge, which, being all added, is the other sum of the dimension.

Secondly, Take the length of the jaumbs, or sides, allowing an inch longer than is seen (they going in below the slab) for one

one sum, and the breadth of one girting, all that is seen, and double it for the second sum of the dimension.
Thirdly, If there be slips and noifings to the chimney-piece, measure the length by all the girt that is seen in breadth, or make the dimension twice.
Fourthly, Fire-stone hearths, and coving-stones, must be cast up by themselves, and all that appears in sight measured.

V. Of GLAZIERS WORK to measure.

Glaziers work is measured by the superficial foot, and the dimensions are taken in feet, inches, and parts, or by feet, and the hundred parts of a foot, as their rules are generally divided: therefore the measurer of glaziers work should understand decimals; allowing the feet as integers, and the parts as decimals; so that three quarters, or 9 inches, is 75; half a foot, or 6 inches, is 50; and a quarter, or 3 inches, 25 of these parts.

1. Therefore, admit a pane, or light of glass, that is leaded, be 2 feet 6 inches long, and 1 foot 6 inches wide, they set it down as on their rules, 250 by 150.
To shew the agreement between the decimal and duodecimal way of working, I will give the above example wrought both ways as follow:

By decimals.	By duodecimals.
	Feet. Inches.
2,50	2 6
1,50	1 6
<hr/>	<hr/>
1,2500	1 3 0
2,50	1 6
<hr/>	<hr/>
3,7500	3 9 0

By the above operation it appears, that the aforesaid pane of glass, by the decimal way of working, is 3 feet 75 parts, equal to 3 feet and three quarters: and, by the duodecimals, 3 feet 9 inches, equally the same: for, as 75 is three quarters of 100, so is 9 three quarters of 12. Should there be several lights, or panes, of the same bigness, you need measure but one, for multiplying that product by the number of lights, gives the contents of the whole. As for

E X A M P L E.

Suppose a sash-window contains 12 squares, and each square of glass 125, or 1 foot 3 inches long, and 75, or 9 inches broad, and the content required.

By decimals.	By duodecimals.
	Feet. Inches.
1,25	1 3
75	0 9
<hr/>	<hr/>
625	11 3
875	Number of squares 12
<hr/>	<hr/>
9375	11 3 0
No. of squares 12	
<hr/>	
18750	
9375	
<hr/>	
11,2500	

The content of the whole by both ways is 11 feet and $\frac{3}{4}$.

To measure circular, or oval windows, take the same length and breadth as their diameters, as if they had been square windows, because in cutting out the quarries of glass there is a great waste, and more time expended therein, than if they had been square windows.

VI. Of PAINTERS WORK to measure.

Painters work is measured the same as joiners work, by the yard square, only with this difference, that, instead of accounting the doors and window-shutters work and half, they have double work, as being painted on both sides; and they also measure all edges, &c. where the brush goes.

1. Sash-frames, sash-lights, window-lights, and casements, are done at per piece.
2. Modillion, and other outside cornices, at per foot running.

Of such measures as are used in lands and buildings.

1. A square foot is 144 square inches.
2. A cubical foot is 1728 cubical inches.
3. A square yard is 9 square feet.
4. A cubical yard is 27 cubical feet.
5. A square is 100 square feet.
6. A load of rough timber is 40 feet.
7. A load of squared timber is 50 feet.
8. A load of 1 inch plank is 600 square feet.
9. A load of $1\frac{1}{2}$ inch plank is 400 square feet.
10. A load of 2 inch plank is 300 square feet.

VOL. II.

11. A load of $2\frac{1}{2}$ inch plank is 240 square feet.
12. A load of 3 inch plank is 200 square feet.
13. A load of $3\frac{1}{2}$ inch plank is 170 square feet.
14. A load of 4 inch plank is 150 square feet.
15. A load of statute bricks is 500.
16. A load of plain tiles is 1000.
17. A load of lime is 32 bushels.
18. A load of sand is 36 bushels.
19. A hundred of lime is 35 bushels.
20. A hundred of deals is 120.
21. A hundred of nails is 120.
22. A thousand of nails is 1200.
23. A ton of iron is 2240 lb. weight.
24. A fodder of lead is 19 hundred and a half, or 2184 lb.
25. A hundred of lead is 112 lb. weight.
26. A table of glass is 5 feet, and 45 tables is a case, but Newcastle, Normandy glass, 25 tables is a case.
27. A geometrical pace is 5 feet in length.
28. A geometrical perch is 10 feet in length.
29. A statute pole or perch is $16\frac{1}{2}$ feet in length.
30. A square statute pole or perch is $272\frac{1}{4}$ square feet.
31. A woodland pole or perch is 18 feet in length.
32. A square woodland pole is 234 square feet.
33. A forest pole or perch is 21 feet in length.
34. Four statute perches is one chain's length.
35. Ten chains length is a furlong, or acre's length.
36. Four chains length is an acre's length.
37. Forty square perches is a rood, or a quarter of an acre.
38. Four roods, or 160 perches is one acre.
39. A hide of land is 100 acres.

R E M A R K S.

Since the sliding rule hath come into general practice among men of business, these operations have been greatly facilitated; and, as these are so easily and mechanically learned, few tradesmen concern themselves to enter deeper into the principles of geometry, whereon the whole art of mensuration is bottomed.

Of SOLID and CUBICAL MEASURE, and the Use of the CARPENTER'S RULE therein.

This measure respects length, breadth, and thickness or depth, being applicable to timber, stone, &c. the dimensions whereof, suppose, are taken in feet and inches.

1. When the breadth and thickness are the same from one end to the other.

The GENERAL RULE.

Multiply the length by the breadth, and that product by the thickness, and the last product will be the content; or, if the breadth and thickness be multiplied together, and their product by the length, it will give the content.

E X A M P L E.

Suppose a parallelopipedon to be a piece of timber, stone, &c. whose length is 18 feet, it's breadth 3, and thickness 2 feet, $18 \times 3 \times 2 = 108$ feet, the content.—Or $3 \times 2 \times 18 = 108$.

By the SLIDING RULE.

The breadth and thickness being so reduced to the mean side of a square, set 1 upon D, to the length upon C, and opposite to the mean side, upon D, will be found the content upon C.

E X A M P L E.

The mean side, found as hereafter taught	2,45	} Feet.
The length	18	
The content	108	

By the CARPENTER'S RULE.

Set the length in feet on the sliding-piece to 1, on the square or girt-line; and, opposite to the mean side, in inches on the square or girt-line, will be found the content in feet, on the sliding-piece.

In the foregoing example, the dimensions were given only in feet, therefore the product was feet. But,

2. When the length is given in feet, and the breadth and thickness in inches, the last produce must be divided by 144 (the square inches in a foot) and the remainder (if any) by 12, and the quotient will be the content in solid feet and inches.

E X A M P L E.

Suppose a piece of timber, &c. to be 15 feet long, 13 feet broad, and 8 inches thick,

$$\therefore 15 \times 13 \times 8 \text{ Feet. Inches.} \\ \underline{144} = 10 \text{ 10 the content.}$$

By the SLIDING RULE.

The breadth and thickness being reduced to the mean side of a square, set 12 upon D, to the length upon C, and, opposite to the mean side upon D, will be found the content upon C.

I i i

E X A M P L E.

M E N

EXAMPLE.

The mean side, found as hereafter taught - 10,2 Feet.
The length - - - - - 15 Feet.
The content - - - - - 10,8 Feet.

By the CARPENTER'S RULE.

Set the length in feet on the sliding-piece, to 12 on the square or girt-line, and, opposite to the mean side in inches on the square or girt-line, will be found the content in feet on the sliding-piece. Or,

3. If all the dimensions are given in feet and inches, they must be first reduced into inches, and the last product of the multiplication of the dimensions by each other, must be divided by 1728 (cubical inches in a foot) and the remainder, if any, by 144, and the quotient will be the content in solid feet and inches.

EXAMPLE.

Suppose a piece of timber, &c. to be 22 feet 3 inches long, 1 foot 5 inches broad, and 1 foot 2 inches thick,

$$22,3 \times 1,5 \times 1,2 = 36,9 \frac{1}{12} \text{—The content.}$$

Note, When the contents are required in loads, the contents in feet must be divided by 50 (the solid feet in a load) and the quotient will be the answer. And,

If the contents of any solid be required in cubical yards, divide the contents in solid feet (found as before taught) by 27 (the cubical feet in a yard) and the quotient will be the contents in cubical yards.—Or the dimensions might have been reduced into yards, and the operation performed as for feet. If any solid be exactly square (which in timber scarce ever happens) multiply the side into itself, and that product by the length, and the last product will be the content.

And, if the sides are not exactly equal, they may be reduced to a square by the following methods :

To reduce the breadth and thickness of a solid to the mean side of a square : the true way.

Multiply the breadth and thickness together, and the square root of the product will be the mean side of a square.

EXAMPLE.

Suppose a board, whose breadth is 13 inches, it's thickness 8 inches, and it's length 15 feet 6 inches, 13×8 , and extract the root of the product, the answer is 10,198—Mean side of the square.

By the SLIDING RULE.

Set the breadth on C to the breadth on D, and, opposite to the thickness on C, will be found the mean side of a square on D.

By the CARPENTER'S RULE.

Set the breadth on the sliding-piece to the breadth on the square line, and, opposite to the thickness on the sliding-piece, will be found the mean side of a square, on the square-line.

But the way commonly practised for unequal-sided timber is, to add the breadth and thickness (taken about the middle of the piece) together, and then take half that sum (or $\frac{1}{2}$ of the 4 sides) for the mean side of the square of the piece.

This method, indeed, produces a content more than the truth, by a piece equal to the whole length, and whose square is equal to half the difference of the breadth and thickness ; but, if the breadth and thickness are pretty near equal, the difference will be near enough for ordinary practice.

The breadth and thickness, or side of the square, being given in inches, to find how many inches in length will make a solid foot.

RULE.

Divide 1728 (the cubical inches in a solid foot) by the product of the breadth and thickness, and the quotient will be the length of the cubical foot.

By the SLIDING RULE.

The breadth and thickness being reduced to a mean side of a square, set the mean side on D, to 1 upon C, and opposite to 41,5 upon D, will be found the answer upon C.

MENSURATION OF PLANKS.

Though the mensuration of planks is properly by solid measure, yet the solid contents may be found by the directions given for superficial, if the respective thicknesses are afterwards accounted for.

RULE.

Multiply the length in feet and decimal parts, and the breadth in inches and decimal parts, together, and divide their product by 12 ; or find their square by the sliding or carpenter's rule, and the quotient, or square, being divided by the following respective divisors, will exhibit the solid contents in loads of 50 feet each.

M E N

The square of the length and breadth of planks of

Inches thick	4	3	2½	2	1½	1	¾
Being divided by	150	200	240	300	400	600	800
The quotient will be loads,	3	4	6	8	12	16	
And the remainder (if any) being divided by	3	4	6	8	12	16	
The quotient will be the odd feet.							

When the breadth and thickness are not the same throughout, but the solid is broader and thicker at one end than the other,

The rule for the true method.

Multiply the breadth and thickness at the greater end together, and also at the lesser, and the two areas by each other, and to the square root of that product add the two areas, the total whereof multiply by half of the length, will produce the content.

But the usual way is to take the breadth and thickness in the middle of the piece, or, rather, half the sums of the breadth and thickness at each end, for the mean breadth and thickness (or find a mean side of a square equal thereto) and then work as before taught, which will produce a content less than the truth : but, if the ends are pretty near equal, the difference will be but very small.

MENSURATION OF ROUND TIMBER.

1. When the circumference is the same from one end to the other,

The rule for the true method, according to the utmost cylindric circumference.

First find the diameter of the circumference, from which the proportion is, as 22 is to 7, so is the girt or circumference to the diameter. Or,

By the SLIDING RULE.

Set the point C 3,141 upon B, to 1 upon A, and, opposite to the circumference on B, will be found the diameter upon A. Or,

By the CARPENTER'S RULE.

Set 3,141 on the sliding-piece, to 1 upon the upper line, and, opposite to the circumference on the sliding-piece, will be found the diameter on the upper line.

The diameter being found, multiply it by $\frac{1}{4}$ of the girt, and that product by the length, which will produce the solid content.—Or, multiply the circumference into itself, and that product by ,07958 (the area of a circle whose circumference is unity) and the last product by the length, which will produce the content.—Or multiply the number 2821 (being the side of a square equal to a circle whose circumference is 90) by the girt in inches, and the product will be the side of a square equal to the girt or circumference ; which multiply into itself, and that product by the length in feet ; then divide the last product by 144, and the quotient will be the content in feet and decimal parts.

By the SLIDING RULE.

Set { 42,53 when the circumference is inches } upon D, to the { 3,545 when the circumference is feet } length in feet C, and, opposite to the circumference on D, will be found the content in feet upon C.

The number 42,53 is the circumference of a circle, whose area is 12 ; and 3,545 the circumference when the area is unity.

But the customary way is, to girt the piece in the middle with a string, and take $\frac{1}{4}$ of the girt for the side of a square ; which side multiply into itself, and that product by the length, and the last product will be the content.

If the circumference, or girt, be given in inches (having worked as before) divide the last product by 144, and the remainder (if any) by 12, and the quotient will be the content in solid feet and inches.

If the circumference and length are given in feet and inches, having reduced them into inches, and worked as before, divide the last product by 1728, and the remainder, if any, by 144, and the quotient will be the content in solid feet and inches. Or, (having taken $\frac{1}{4}$ of the girt for the side of a square) the operation may be performed

By	Taking the aliquot parts of a foot for the odd inches, Cross multiplication, Reducing the dimensions into decimals, Sliding rule, Carpenter's rule,	As before taught for squares.
----	---	-------------------------------

This customary way produces a content less than the truth by above $\frac{1}{4}$ part ; for as

The area of that circle whose circumference is unity, is ,07958
And the square of the $\frac{1}{4}$ of the unity is but ,0625
Therefore the true content is to the customary content as ,07958 is to ,0625, or as 14 to 11 ; so that, if the customary content be obtained, the true content may be found by proportion.

Yet this method is generally practised, as being a medium between the content of the utmost cylindric circumference, and the following method of taking the square within the circle, which is only mentioned for demonstration sake.
